The reason why a Currant or a Gooseberry-bush throws up suckers is that the cutting, which now forms the bush, has been made either with a heel to it, or cut so close to the mother-branch, as to carry with it part of the latent buds generally found there. To prevent this, the propagator cuts off the lower portion of the shoot as far as he sees traces of these latent buds; he also cuts off the top part of the shoot if too weak for his purpose, and then he disbuds the middle portion, leaving only three or four buds near the top to form the future head. No kind of cutting, not even the Lilac, thus made, ever throws out suckers above the collar of the plant; that is, above the roots. This is a simple fact, well known to cultivators, but the extent of its application has not yet been fully appreciated, and I am not aware that the principle involved in it has been explained by any one. A wider application of it, however, is all I have in view at present, now that we are entering on the great business of propagation, &c. I shall state another simple fact by way of illustration:—Suppose a strong sucker from a black Currant-bush, with the buds taken out, as in the case of the above cutting, but still growing on the parent stock—lay it in the soil as you would any other layer, and by the end of the growing season you will have a strong plant that will never throw out a sucker above the roots;—a practical refutation of the old maxim, that a plant, propagated from a sucker, will afterwards be disposed to throw up suckers in its turn. Now, if the propagator in the "stool-ground" were to apply this rule of disbudbing to the Nut and Filbert-stools, we should hear no more complaints about these bushes throwing up suckers; more especially, if in connection with it, he were to give up the present mode of cutting down his layers to within an inch or two of the ground, and leave them a foot or two in length, with only two or three eyes at the top to form a head. The Quince and Paradise layers need not be longer than six or eight inches, sufficient to have room to graft on the disbudded part; and the same with all other layers according to the purposes for which they are propagated. These are no speculative notions; I have adopted the plan for more than ten years, and I have many proofs of its good effects. I have not in a single instance been disappointed by a plant, so treated, having thrown out suckers or side-shoots afterwards where I did not want them.

To the list of plants given last week for keeping up a succession of flowers in the conservatory, the following may be added:—FROM THE GREENHOUSE AND PITS.—*Lucilia gratissima*, *Syphocampylus bicolor* (always in flower), *Chorozema varium*, and *cordatum*; *Correa speciosa*, *pulchella*, *Harrisii*, *longiflora*, *rosea* (these supply the place of *Fuchsias* all winter); *Primula sinensis*, single and double; *Cineraria Waterhousiana*, and hybrid varieties; *Camellias*, many sorts; *Mignonette*. HEATHS: *Erica alata*, *ardens*, *arbuscula*, *Blandfordiana*, *caffra*, *carinata*, *colorans*, *concolor*, *cerinthoides*, *exurgens*, *gracilis*, *grandinosa*, *hyemalis*, *mutabilis*, *princeps*, *pyramidalis*, *praestans*, *paniculata*, *Sebania*, *tenella*, *vernix*.

FROM THE FORCING-PITS.—*Azalea indica* alba, and varieties; *Rhodora canadensis*, *Acacia armata*, *Persian Lilacs*, *Calla* (*Richardia*) *Ethiopia*, *Pelargonium album multiflorum*, *Admiral Napier*, *Gen. Washington*, *Ne Plus Ultra*, and some scarlets; *Tulips*, several early varieties; *Narcissuses*, *Soliel d'Or* and double Roman being the earliest; *Hyacinths*, *Jonquils*, *Crocuses*, *Lily of the Valley*, *Violets*. ROSES: *Fairy*, *Old China*, *Tea-scented*, *Bourbons*, and hybrid perpetuals; *Fabvier*, a *China Rose*, is one of the best for bouquets at this early period; and *Fulgore*, a hybrid perpetual, the sweetest.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—The earliest of the fruiterers will now be showing fruit, and will require rather more water and a little additional heat, with gentle syringing on fine mornings. The succession ones, if grown in dung heat, will want but little water yet and no increase of temperature, till they are fresh potted by the end of this or beginning of next month. See that proper composts, &c., are ready for them before that time.

VINERY.—Those who cut Grapes next April are now thinning their bunches, and keep up a good brisk heat of 70°, with a liberal use of the syringe, according to the state of the weather. The different stages below this require their different treatment; those in flower had better be kept rather dry until the fruit is set, and those breaking their buds must be gently dealt with, in order to get all the eyes forward about the same time; they require a moist atmosphere.

PEACH-HOUSE.—The heat here should now be about 60°, and rather more regular than in the Vineries. Very little air can yet be given by the front ventilators; cold draughts being very injurious to the young fruit and foliage. As soon as the blossoming is over, the syringe must be in full requisition morning and evening, and a strict look out must be kept after the green-fly or red-spider.

CHERRY-HOUSE.—The observations on the Peach-house are applicable here also, and the temperature in both houses need not differ much.

FIGS.—These are more accommodating than the two last tribes, and will do well enough in either of the last three houses if they are in pots or tubs. Where a house is devoted to them, about 65° is the proper temperature for them now. They should not get dry at the roots when in growth.

CUCUMBERS AND MELONS.—These require strict attention while the weather is rough, or when sudden gleams of the sun break forth; but of all the misfortunes to which they are liable, the steam from dung linings is the most fatal, and must be strictly guarded against.

POTATOES, KIDNEY-BEANS, RHUBARB, AND ASPARAGUS, with *Radishes* and other salads, require the routine culture formerly recommended, and a due regard to successions and the casualties of the weather.

ORCHARD.—Any newly transplanted trees should be mulched on frosty mornings, if not already done. Planting all sorts of fruit-trees should be finished before the end of the month, even on the heaviest soils. Peaches and Apricots must be pruned and nailed now without delay.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Another crop of the dry bulbs and roots might now be set to grow for a successional bloom. It is too soon yet for potting to any extent, if the *Orchidaceae* are finished. A few plants here and there may indeed be so forward in their growth as to require fresh pots. There is no such a thing thought of now as a regular potting-time; every week, until September, will bring its own operations with it in this way.

GREEN-HOUSE.—Many plants in this house will now begin to grow, and though they need not be encouraged, they should be preserved from cold draughts through the front sashes, when the weather is not favourable. All the beautiful little climbers on trellises will require constant attendance in training and stopping the shoots as they advance.

CONSERVATORY.—The early *Epacris*, *Acacias*, and forced plants of the *Azalea* and *Rhododendron* tribes, with forced bulbs and *Pelargoniums*, will weekly increase the interest here. I have been found fault with for saying that stove-plants, and especially the *Orchidaceae* which I have named, would flower well in the Conservatory. There never was a greater mistake in the world. Some of our finer *Dendrobiums* have been in flower in my own sitting-room for the last month, where the heat is hardly ever up to 40° in the morning; and I am satisfied they will grow with increased vigour when I move them to the stoves. I have proved this to be the case frequently.

PITS AND FRAMES.—If any amateur wishes to try experiments in inarching *Camellias*, this is a good time to remove his stocks into gentle heat, to set the sap in motion before the operation is begun. Grafting *Camellias* in spring never answers well with any one; it succeeds so much better in summer, after the young growth has a little ripened. This is the best time, however, to graft little *Orange-trees* for forcing and blooming in the drawing-room or conservatory. The young stocks for this purpose ought to be brought in advance of the grafts by a gentle heat. A few *Wall flower* seeds might now be sown, to raise plants for forcing next winter, for which purpose they are well adapted, as they may be had in flower from Christmas until they bloom in the open ground. We force another plant here extensively, which I never saw in a 1st of forcing-plants; namely, *Philadelphus coronarius*, or *Mock Orange*, which forces as well as the *Deutzias*.

Out-door Department.

Some of the flower-beds should now be trenched or renewed for transplanting the autumn-sown annuals, which are to flower next May, before the half-hardy plants are planted out for summer flowering. In some parts of the country the month of May is the least gay time of the season in the flower-garden. Lime-water, to clear the Grass of worms, has been a source of vexation to many, but an ever ready nostrum in the hands of writers for that purpose. If you have access to good stone-lime, your lime-water will certainly kill worms if it gets at them, but that made from chalk-lime has no more effect on them than barley-water. Hence the different results of which we hear. Where stone-lime is difficult to be procured, corrosive sublimate seems to be the next best resource, according to the late testimonies of correspondents. Lawns cannot now be too often rolled when the ground is in a half-dry state.

FOREST AND COPPICE.—From the middle of February to the middle of March has always been the time for general planting on the Highland hills. Except pitting some of the best ground in the warmer valleys, no other preparation was ever thought of. In England, on the contrary, no preparation of the soil is thought too good for planting, and the whole is finished, when possible, before the end of February.—D. Beaton, *Shrubland Park Gardens*.

State of the Weather near London for the Week ending Feb. 16, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.			THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 25th in 1830—thermometer 59°; and the lowest on the 23d in 1842—thermometer 18°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Feb. 17, 1843.

In consequence of the late severe weather, several of the more delicate kinds of vegetables have advanced in price; amongst fruit there has been little alteration. Trade is far from being brisk. *Fruit*: Pines are tolerably abundant, from 5s. to 8s. per lb. Foreign Grapes continue good, at the prices quoted last week. *Pumpmeles* are plentiful, from 6d. to 1s. each. The supply of dessert Pears is becoming very limited, fair samples of the *Beurré Rance* and *Ne Plus Meuris* fetching from 4s. to 6s. per doz. Amongst the dessert Apples, *Newtown Pippins* are selling at 3s. per dozen, and the best *Nonpareils* from 1s. to 2s. per dozen. *Culinary Apples* remain the same as in our last Report, the sale for them being very dull. *Cucumbers* are occasionally offered, from 3s. to 6s. each. *Vegetables*: At the commencement of the week *Asparagus* advanced considerably in price; it is now somewhat cheaper, but still fetches from 8s. to 12s. per 100; the smaller bunches being from 3s. to 6s. each. *Seakale* is well supplied, from 6d. to 2s. per punnet. The few French Beans to be met with have risen to 3s. 6d. and 4s. per 100. A few New Potatoes have just arrived from Lisbon in good order. *Brussels Sprouts* are becoming inferior. *White Broccoli* continues good, from 1s. to 1s. 6d. per bunch. Turnips are somewhat dearer, being from 1s. 6d. to 3s. 6d. per doz. bunches. Lettuce and Endive are of fair quality; the latter fetch from 1s. 6d. to 3s. per score. Good Onions are selling from 5s. to 6s. per bushel. Leeks are plentiful, from 2s. to 3s. per dozen bunches. Of Mushrooms there is a good supply, from 6d. to 1s. per pottle. *Flowers*: The cut flowers consist of *Poinsettia pulcherrima*, *Amaryllises*, *Hyacinths*, *Roses*, *Pelargoniums*, *Lilacs*, *Camellias*, *Kalmias*, *Azaleas*, &c.

PRICES, SATURDAY, Feb. 18, 1843.—FRUITS.

Pine Apple, per lb. 5s to 8s	Cucumbers, each, 3s. to 6s
Grapes, Spanish, per lb. 1s to 1s 3d	Walnuts, per bush., 12s to 16s
Portugal, 1s to 2s 6d	Chestnuts, per peck, 2s to 3s
Apples, dessert, per bush., 4s to 12s	Almonds, per peck, 6s
— Kitchen, 3s to 6s	Sweet Almonds, per pound, 3s
Pears, dessert, per hf. sieve, 3s to 14s	Pilberts, English, per 100 lbs. 60s
Pumpmeles, per doz., 6s to 12s	Cob Nuts, per 100 lbs., 65s. to 75s.
Oranges, per doz., 9d to 2s	Nuts, per bushel—
— per 100, 6s to 12s	— Brazil, 16s
— bitter, per 100, 8s to 16s	— Spanish, 18s
Lemons, per doz., 1s to 2s	— Barcelona, 24s
— per 100, 5s to 12s	

VEGETABLES.

Savoy, per doz. 6d to 1s 3d	Parsneps, per dozen, 6d to 1s
Cabbage, White, per doz. 2s to 4s	Spinach, per sieve, 1s 6d to 2s
— plants, per doz. 1s 6d to 2s	Leeks, per doz. bun., 2s to 3s
— Red, for pickling, 2s to 5s	Onions, per bushel, 5s to 6s
Brussels Sprouts, per hf. sv. 1s to 2s	— Pickling, per hf. sv., 3s 6d to 4s 6d
Broccoli, White, per bunch, 1s to 1s 6d	— Green, per doz. bun., 3s to 4s
— Purple, 6d to 1s	— Spanish, per doz. 2s to 5s
Beans, Kidney, forced, per 100, 3s 6d to 4s	Garlic, per lb. 6d to 8d
Potatoes, per ton, 70s to 80s	Shallots, per lb., 1s
— per cwt. 3s 6d to 4s	Asparagus, large, per 100, 8s to 12s
— per bushel, 2s to 3s 6d	— Second, 3s to 6s
— Kidney, per bush., 1s 6d to 2s	Sea-kale, per punnet, 9d to 2s
— Scotch, per bushel, 2s 6d	Lettuce, Cab., p. sc., 6d to 9d
— New Autumn, per lb., 4d to 6d	— Cos, 9d to 1s
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Endive, per score, 1s 6d to 3s
Turnips, per doz. bun., 1s 6d to 2s 6d	Celery, p. bd., (12 to 15) 6d to 2s
Red Beet, per dozen, 9d to 1s	Rhubarb Stalks, per bdle, 6d to 1s
Scorzenera, per bundle, 1s 3d to 1s 6d	Small Salads, per punnet, 6d to 8d
Salsify, per bundle, 1s 3d to 1s 6d	Corn Salads, per hf. sv., 9d to 1s
Carrots, each, 1s 6d to 2s	Watercress, per doz. sm. bun., 4d to 6d
Horse Radish, per bundle, 2s to 4s 6d	Parsnys, per half-sieve, 1s to 1s 6d
Radish, per doz. hands (24 to 30 each) 9d to 1s	Tarragon, per doz. bun., 2s to 3s
— Turnip, p. doz. bch., 1s to 1s 6d	Fennel, per doz. bun., 2s to 4s
Carrots, per doz. bunch, 4s to 6s	Sage, per doz. bunches, 2s to 3s
— Young Horn, per bunch, 4d to 6d	Mint, per doz. bunches, 2s to 4s
	Mushrooms, per pottle, 6d to 1s
	Truffles, per lb., 8s to 4s

Notices to Correspondents.

AGRICULTURE.—*B. K.*—Lea land which has lain so long in Grass, must be rich enough for any crop without any manure. Quicklime laid on before ploughing would do good; the quantity must depend on the quantity of calcareous earth in the soil; perhaps 50 bushels per acre may be sufficient. Begin with Barley, then Potatoes, with soot. You may try guano, mixed with earth into a compost: 4 cwt. per acre put into the drills, when the land is moist; or Poitevin's manure, 1 hoghead per acre. Much depends on the season for success. Artificial manures without stable or yard dung will not keep up the fertility of the soil. Kohl rabi will do on a rich heavy soil, well pulverised. Chou a mille têtes, for the leaves to give to cattle, is a large branching Cabbage, which spreads considerably, and is much cultivated in France. The Drumhead Cabbage produces the heaviest crop. *M.*—**SUBSCRIBER.**—If your sand is of a gritty nature it will not be of much use in the compost; but it might be so if well mixed with the stiff soil acting mechanically on it. If it is fine, you may add it to any compost, but you had better use your stiff soil for the mixture with nightsoil. There is no way of making silicious sand finer than we know of, unless you sift it. *M.*—*R. B.*—Youatt's work on "Cattle," published by the Society for the Diffusion of Useful Knowledge, contains much good advice. The less physic you give to your cows the better. It is, perhaps, an advantage, not to have a country cow-doctor near you. *M.*—*J. S. P.*—You had better plant the whole with Potatoes. The Ash-leaved Kidney is early and productive. After the Potatoes are taken up, you may immediately sow spring Tares to feed off with sheep in autumn; or the small Turnip called Nimble Turnip. Mangel Wurzel is not so likely to succeed between Potatoes. *M.*

MANURES.—*Devonian.*—Brewers' grains would no doubt be a useful manure, if they had gone through the acid fermentation and begun the putrefactive: they may be used mixed with earth. But where there are pigs or cows to give them to, it is wasteful to use them as manure, unless they are quite spoiled. *M.*—*A. L. M.*—From some experiments we have made we find that 1 lb. of common oil of vitriol, worth 1½d., if bought in quantity, will fix 7 pints of the concentrated gas-water prepared in some of the London gas-works. We doubt whether the country gas-works ever make it of half or one-third the strength. If you add 170 gals. of country gas water to 830 gals. of liquid manure, we should expect that 1 cwt. of common oil of vitriol would be sufficient. If the smell is likely to be troublesome it would be as well to throw some bleaching-powder into the tank, and to stir it up in the first instance. But if the tank has a lid, the escape of sulphuretted hydrogen gas, which causes the bad smell, will be of less importance. In mixing the oil of vitriol, it should be done in small quantities at a time, or the effervescence may be inconvenient. *T. G.*—We shall be greatly obliged by an account of your experiments with Guano. *T. G. K. B.*—It is probable that guano at the rate of two or three cwt. per acre, is the best manure for your purpose. Your inquiry is gone to Mr. A. *Amicus.*—Your butcher is a very good neighbour: the bottom of his pond will no doubt be good stuff. You had better consult Sprengel's directions, at p. 524 of last year, to see how you can best treat the substance. It will require to be a good deal weakened by mixing it with soil before it is applied as manure. That done, it should be excellent. *T.*

MANGEL WURZEL.—*M. C.*—Mangel Wurzel are excellent food for sheep as well as for cows: they should be cut, and given with pease-haulm or clover hay, as all roots should for fattening sheep; a small portion of bean or pease-meal sprinkled over the cut roots will be found very advantageous. Mangel Wurzel are not quite so non-nourishing as Swedish turnips, but more so than the white. Give the sheep lumps of rock salt to lick. *M.*

SPIRIT OF TAR.—*Peter Parley.*—This is not applied as a manure, but as a preventive against the attacks of insects. Where Potatoes are infested with slugs, it would no doubt be a useful application. For the manner in which it is used we must refer you to p. 105 of Vol. i. *J. L.*—We have our doubts as to whether Spirit of Tar will be found a useful remedy against those insects which do not carry on their ravages beneath the soil. If applied to the Roses growing over the walls of your house, this mixture would probably destroy the green fly which infests them; but it would communicate a highly-disagreeable odour to the building. Many kinds of blight are occasioned by small parasitical fungi, and if this is the case, Spirit of Tar would have no effect upon them. *T.*

VINES.—*H. T. S.*—The sudden drooping of the shoots upon your Vine on the morning of the 15th was occasioned by the frost having taken effect upon the stem; this would check the flow of sap, and the foliage would necessarily suffer. You will find another communication upon this subject in a different part of the Paper. *R. C.*—We do not see the object of your communication. Of course the atmosphere of a Vinery with a metallic roof will be colder near the roof than elsewhere. But what then? It is the temperature of that part which has to be observed; and in our opinion from 59° to 67° is much too high for early forcing. You should put mats on the roof when the nights are cold, or protect them by some other means; in which case you will find the variation of temperature inside the house very much prevented. *T.*

ANNUALS.—*A. Y.*—The best annuals, amongst which are many of late introduction, are *Portulaca Thellusonii* and *splendens*, *Martynia fragrans*, *Torenia scabra*, *Didiscus cæruleus*, *Schizanthus retusus*, *Rhodanthé Manglésii*, *Lobelia ramosa* and *heterophylla*, *Loasa Hébertii* and *Pentlandia*, *Scyphanthus elegans*, *Phlox Drummondii*, *Clintonia pulchella*, and *Brachycome iberidifolia*, which are tender. Hardy ones are, *Nemophila insignis*, *Godetia albicans*, *vinosa*, *rubicunda*, and *Lindleyana*, *Malope grandiflora*, *Calandrinia discolor* and *speciosa*, *Limnantes Douglasii*, *Leptosiphon androsæus* and *densiflorus*, *Tropæolum peregrinum*, *Lupinus Cruikshankii* and *nanus*, *Lathyrus azureus*, *Sphenogyne speciosa*, *Campánula Lóreyi*, *Calliopsis Atkinsonii*, *Collifolia bicolor*, *Schizanthus pinnatus*, and *Indian Pinks*. *T.*

PERENNIALS.—*A Subscriber* had better procure the following hardy perennials for planting in his clumps:—For the centre, *Delphinium Barlowi* and *grandiflorum*, double var., *Phlox paniculata*, and *Thompsoniana*, *Lupinus polyphyllus*, *Aster Novæ Angliæ*, *Aconitum versicolor* and *ochroleucum*; to these may succeed *Stenactis speciosa*, *Aster elegans*, *Pæonia officinalis*, *albiflora*, *Whiteleyi*, and *Himeii*, *Phlox omniflora*, *cærnea*, and *maculata*, *Pentstemon gentianoides*, *hybridus*, and *ovatus*, *Potentilla Russelliana*, *Hopwoodiana*, and *splendens*, *Oenothera speciosa*, *Campánula lactiflora* and *persicifolia*, *Aster elegans*, *Lobelia syphilitica*, *Lythrum virgatum* and *Antirrhinum majus*. The plants near the margin may consist of *Dodecatheon Meadia*, *Trollius europæus*, *Helleborus niger* and *odoratus*, *Veronica gentianoides*, *Epimedium alpinum*, *Gentiana septemfida*, *asclepiadea*, and *acaulis*, *Phlox stolonifera*, *aristata*, and *setacea*, *Campánula carpatica* and *Alyssum saxatile*. The following bulbs may also be added:—*White and Martagon Lilies*, *Irises*, *Fritillaries*, *Narcissuses*, *Eranthis hyemalis*, *Parrot Tulips*, *Crocuses*, *Snowdrops*, and *Dog's tooth Violets*. The plants for the centre, and the *Pæonias*, should not be placed nearer than two feet to each other. The others may be planted nearer, in proportion as they approach closer to the margin of the clumps. *T.*

CONIFEROUS PLANTS.—*T. G.*—who finds it difficult to preserve plants of this genus when newly raised from seed, should pot them off singly into small pots in a mixture of loam and sandy peat. Place them in a close frame for a few days, and water sparingly; afterwards give air freely, and all they will then require will be an occasional shifting into larger pots. *T.*

HOLLIES.—*J. R. W.*—Do not syringe your Hollies in cold weather. If it is mild, to do so will be advantageous, if performed in the morning. Your proceedings appear to have been very judicious. *T.*

MISTLETOE.—*Peter Pindar.*—Your previous letter never reached

us. The Mistletoe is found in this country upon the Lime, Maple, Apple, Oak, Willow, and Poplar. In Germany it grows in great quantities upon the common Pine. *T.*

FLORICULTURE.—*G. A. C.*—From your brief description we suppose you allude to *Iris variegata*. *T.*

EVERGREENS.—*Alpha.*—The best time for procuring Evergreens, Cedars, &c. for planting out, is late in the autumn. *T.*

CREPERS.—*T. R. W.*—If *Cobæa scandens* attached itself last season to a rough-cast wall without any fastening, *Ecceomocarpus scaber*, *Ampelopsis quinquefolia*, and the hardy *Passion-flower*, would probably do the same. It is necessary, however, that there should be some projections round which the tendrils can clasp firmly, otherwise the plants will be beaten down by wind and rain. *T.*

CLIMBERS.—*A Subscriber.*—Those mentioned last week had better be trained separately. As you prefer Roses, you may plant against your porch the *Boursault*, de *Lisle*, *Bougainville*, and *Ayrshire* Roses. You had better defer planting them until there is no danger of their suffering from severe frost. *T.*

ORNAMENTAL TREES.—*A. F. S.*—The following ornamental Trees and Shrubs will grow where the soil is rich, but wet in winter: *Æsculus cærnea*, *Guelder Rose*, *Snowy Mespilus*, scarlet flowering *Hawthorn*, *Laburnum*, *Siberian Crab*, *Bird* and *double-flowering Cherry*, *Philadelphus speciosus*, and *Gordonianus*, *Ribes æquum* and *sanguineum*, and *Spiræa arifolia*. *T.*

WHITE HELLEBORE.—*J. P. G. H.*—We really do not know where the seed of this plant can be obtained; but you can procure the plant itself of any nurseryman. *T.*

IN-DOOR PLANTS.—*T. G.*—who wishes for something besides *Fuchsias*, *Camellias*, &c., for blooming in windows, may try the Chinese Primrose, *Acácia armata*, *Azalea indica*, white and purple varieties, *Chorozema vârium*, *Genista canariensis*, *Hóvea Celsi*, and *Sólyia heterophylla*. *T.*—*Junius.*—We apprehend that tender annuals grown in pots, plunged in sawdust, heated by hot-water, and suspended within a short distance of the skylight of a covered passage, would not repay the trouble which they would occasion. *T.*—*E. D.*—For a room into which the sun shines during most of the day we should recommend *Fuchsias*, *Myrtles*, *Pelargoniums*, *Aloes*, and *Cacti*, in preference to *Dahlias*, which would not do well in the confined atmosphere of a room. *T.*

CACTI.—*T. G.*—The chief point in managing these plants is to allow them an alternate period of growth and rest. They should be grown in a mixture of lime-rubbish and loam, with a little cow-dung, and in well-drained pots. In summer, they should be fully exposed to the sun, and well watered; but from October to March they should be kept perfectly dry. *T.*

ACHIMENES ROSEA.—*V.*—This, as well as others of the genus, frequently forms scaly bulbs at the axils of the leaves, by which, in addition to those formed underground, the plant may be propagated. It is unusual for this plant to bear seed. *T.*

CONSERVATORY PLANTS.—*J. D.*—For the partially-shaded part of a Conservatory no plants will be better adapted than *Camellias*, *Orange-trees*, and *Myrtles*. *T.*

IPOMÆA.—*A Subscriber.*—It is better, in potting *Ipomœas*, to raise the upper portion of the tuber above the soil. *Ipomœa tyrianthina* would do better in a prepared border of the greenhouse than in a pot; its flowers are of a deep purple colour, quite distinct from those of *I. purga*, which are rose-coloured. The latter is a beautiful species, but it is very difficult to bloom. *T.*

KENNEDIAS.—*Miscellaneous.*—It is probable that your *Kennedias* damp off from being over-watered or kept in a shady place, where they do not obtain sufficient light and air. Cut them back to where they are sound, repot them into loam and sandy peat, and plunge them into a gentle bottom-heat to recover them. *T.*

GRASS-TREE.—*A. S.*—The Grass-trees are greenhouse plants from New Holland. Of the one called *Kingia australis* there are several plants at Kew Botanic Garden. We do not suppose that they can be obtained in the London Nurseries. *T.*

PANSIES.—*S. T.*—The following 8 Pansies are first-rate, and may be added to those mentioned at p. 78. *King's sulphurea elegans*, *Brown's Countess of Orkney*, *Thomson's Nymph*, *Raphael*, *Cyclops*, *Attila*, and *Regulator*, and *Major's Bridegroom*. *T.*

HYACINTHS.—*J. S.*—Hyacinths intended for blooming in glasses should be placed in them about the middle of November. The bulbs should barely be allowed to touch the water until roots begin to protrude from them. They should be placed in a dark room for the first fortnight, when the water will require to be changed; the bulbs may then be brought to the light, and all that they will need until they have done blooming will be fresh water twice a week. *T.*

BULBS.—*T. G.*—The best season for planting *Amaryllis belladonna* in the open ground is the spring. It may be procured of any respectable nurseryman. *T.*

MELON.—*A Young Beginner.*—The Cassaba Melon requires the treatment of the Persian kinds; respecting which we will shortly give you further information. *T.*

GRAFTING.—*H. S.*—Grafts of the Plum will take readily on three-year-old branches, if the operation is properly performed. *T.*—*Discipulus.*—Apples may be grafted on Pear stocks; but, although they may take well enough at first, after a few years they begin to linger and fall in producing young wood. This will most probably be the case with the *Ribstone Pippin*, grafted on the *Jargonelle*. *T.*

MULBERRY TREES.—*Discipulus.*—The removal of large limbs from your Mulberry-trees, which you state are two feet in diameter, has doubtless been the occasion of their throwing out shoots too luxuriant for bearing fruit at present; but, if you refrain from lopping, the flow of sap will gradually moderate, and you may then expect them to bear fruit. *T.*

LATE APPLES.—*A. K.*—Some of the best Kitchen Apples for use in the months of December, January, February, and March, are the *Royal Russet*, *Bedfordshire Foundling*, *Alfriston*, *Dumelow's Seedling*, *Brabant Bellefleur*, and *Easter Pippin*. *T.*

VEGETABLES.—*A. Z. A.*—The 12 best sorts of Broccoli are the *Early White*, *Grange's Early Cauliflower*, *Early Purple Cape*, *Green Cape*, *Sulphur-coloured*, *Sprouting*, *Purple Cape*, *Knights Protecting*, *Green Close-headed*, *Portsmouth*, *Chapel's cream-coloured*, *Latest Green* or *Danish*. The 12 best sorts of Lettuce are—*Brown Dutch*, *White Dutch*, *Imperial*, *White Silesian*, *Malta*, *Marseilles*, *Hammersmith*, *Black-seeded Gotte*, *Tennis Ball*, *Brown*, *White Paris*, and *Green Paris Cos*. 6 sorts of Cabbage, which will probably answer your purpose better than a greater number of inferior kinds, are the *Early York*, *Battersea*, *Vanack*, *Cornish*, *Portugal*, and the *Small Dark Red* for Pickling. The 10 best sorts of Onions are *Silver-skinned*, *Madeira*, *Reading*, *Globe*, *Strasbourg*, *Brown Portugal*, *Blood-red*, *James's Keeping*, *Potato Onion*, and *Nocera*. The best Dwarf Kidney-beans are—*White Long-pod*, *Early Dwarf Dutch*, *Large Dwarf Dutch*, *Pale Turkey*, *Dwarf Black-spotted*, and *Negro*. *T.*

POTATOES.—*B. K.*—For an early crop we recommend the *Ash-leaved Kidney*. *T.*

CELERY.—*Discipulus.*—You will succeed better with your Celery if you do not earth it up so early as you have usually done; but at the same time it will be advisable in your case not to defer it till November, and then earth it up at once; begin when it is half-grown, taking care to preserve the heart uninjured as you go on. *T.*

SLUGS.—*Abrus.*—Lime-water is the best remedy for destroying slugs in greenhouses. If they attack any favourite plant it is a good plan to place Cabbage-leaves near it, to attract the slugs, which may be collected and shaken into a pan containing lime. *T.*

ANTS.—*L.*—We recommend you to strew arsenic and wetted sugar in those parts of your conservatory most frequented by ants, which will be attracted by the sugar, and be destroyed. *T.*

VERMIN.—*J. W. B.*—Your Apple-trees are infested with caterpillars, which it is difficult to destroy. We should recommend washing

the trees, before the flowers expand, and again as soon as the fruit is set, with a mixture of soap-suds and strong tobacco-water, at the rate of two gallons of the latter to five of the former. Not having had any experience in the application of spirits of tar in such cases, it would be most prudent to try it, diluted, upon a tree of little consequence, or to wash over a single bough when the fruit is set, as an experiment, which, if successful, might then be more extensively employed. *R.*—*R. B.*'s beetles are the *Othiorhynchus picipes*, whose history, with the best means for their destruction, have been given in Vol. i. p. 292. *R.*

BOOKS.—*T. T. H.*—Professor Low's work may be procured of any of the principal booksellers in London. *T.*

COTTAGERS' CALENDAR.—*A Curate.*—Mr. Paxton's Calendar was printed in the *Gardeners' Chronicle*, Feb. 6, 1842. If you would like to judge of it before ordering any for distribution, enclose six postage-stamps to the office, and the publisher will forward you a copy by post. *T.*

STORING FRUIT.—*Abrus.*—Apples will always retain their freshness when kept in a room where there is no fire. All that we know respecting the preservation of Walnuts is stated at p. 693 of last year's *Chronicle*. Chestnuts require to be well dried before they are stored away. *T.*

LAWNS.—*Discipulus.*—The drainings from a cow-shed will not, if mixed with a sufficient quantity of water, prove injurious to a lawn, shrubs, or trees. At this season it may be applied with little or no previous dilution, as the rains will render it weak enough before vegetation becomes active. *T.*

IRON LABELS.—*A. F. S.*—The iron labels to which you allude are cast expressly for the Horticultural Society. *T.*

MISCELLANEOUS.—*J. Dunlop.*—Your plant is a new *Oxylóbium* allied to *O. obovatum*, but not handsome enough to be of any importance. *T.*—*Theresa* is thanked. *T.*—*A Subscriber* may probably obtain *Bignonia picta* and *Tweediana* of the principal London nurserymen. *T.*—*Dr. C.*—Your New Zealand seeds are, not those of an Apple, but apparently of a plant called *Achras costata*, allied to the *Sapodilla* of the West Indies. *T.*—*D. K.*—We see nothing to object to in the Regulations. Good conduct among the members is of far more importance than rules. *T.*—*A Countryman.*—We cannot describe what a union joint is. You should inquire of the nearest engineer. *T.*—*Anon.*—We do not understand you. If a person is ignorant as those of whom you complain, and so are we, and so are all of us, only in different ways; at least such is the opinion of *John Lindley*. *T.*—*A Subscriber.*—The eye of your seedling Pansy is fine, and the lower petal is particularly well formed; the flower being imperfect in other respects, no decided opinion can be given. *T.*—*J. L. C.*—We must refer you to our advertisements. *T.*—*Hoppliana.*—The insect is the Black Vine Weevil, described at p. 292 of the *Chronicle* for 1841. *T. S.*—Both the Elms are *Ulmus glabra*. *T. R. W.*—Your plants are, 1, *Rhipsalis Cassythia*; 2, *Cacalia tomentosa*; 3, *Crassula squamulosa*; 4, an *Equisetum*. *T.*—*J. C. L.*—Certainly, Irish produce is excellent. A thousand thanks. *T.*—*D. H. B.*—Send them in two parcels by post. *T.*—*G. P.*—Your Evergreen Oaks appear to be, 1, *Quercus Ilex oblonga*; 2, *Q. I. crispa*. *T.*—*Amicus.*—Your Oak, which retains its leaves through the winter, is the *Fulham Oak*; the other is not the *Lcombe Oak*, but probably an American species. *T.*

MR. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenants may have them delivered in any part of London by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies. As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE services of our Naval and Military forces in the course of the recent operations in China have been acknowledged by the unanimous approbation of Parliament—the vote of thanks proposed by Ministers having been carried in both Houses without a dissentient voice. In the Lords, the Duke of Wellington bestowed unqualified praise on the discipline, forbearance, and humanity of the troops; and characterised the achievements of the united forces, from the attack of the heights of Canton to the conclusion of the war, as unprecedented in the Naval and Military history of this country. The value of this praise was strikingly pointed out by Lord Brougham, who adverted to the fact that every man who would receive the vote would prefer the single opinion, the single panegyric of the Duke of Wellington to votes of thanks from both Houses of Parliament. In the Commons, the services of the united forces were acknowledged with equal unanimity by Members of both sides of the House. Lord Stanley, in proposing the vote, remarked that there had been victories which had involved more bloodshed, but never any which more merited the thanks of the country. Lord Palmerston seconded the motion; and while praising the forbearance of the troops, expressed his satisfaction that long years of inactivity had not impaired the efficiency of the British forces; that their swords, though they had rested in their scabbards, had not rusted there. Sir Charles Napier said that "he had been himself accustomed to go up rivers and storm batteries, and knew what it was, and he could therefore declare that the skill displayed by Sir W. Parker was unequalled in Naval history."—The Chancellor of the Exchequer on Monday submitted the scheme proposed by Government in reference to the holders of the forged Exchequer Bills. He followed the plan adopted by the Commissioners in dividing the holders into four classes; the first being those to whom no suspicion could attach; the second and third being those to whom a want of care and prudence might be attributed. To these three classes he proposed that compensation should be awarded; but the fourth class, including persons amenable to grave suspicion, and implicated in dealings with the guilty parties, would be altogether excluded from compensation. He proposed to provide the sum required by the issue of Exchequer bills, so that out of forged bills to the value of 377,000*l.*, compensation may be awarded to the amount of 262,000*l.* After a short discussion, a resolution in accordance with the proposal of Government was brought in.—Lord Howick's motion for an inquiry into the distress of the country, after five nights' debate, was brought to a close

at a late hour this morning, when the House divided, negating the motion by a majority of 115.

The leading feature in our foreign news is the announcement that the long-pending differences between France and Spain have been satisfactorily adjusted, the Spanish Government having formally disavowed the imputations made against the French Consul by the political chief of Barcelona. The Regent has also excused Barcelona from the payment of the remaining sum due on the war contribution, and has ordered the state of siege to be raised. It is expected that this act of clemency will restore tranquillity to the city, and that the municipal elections will now take place without interruption.—We have accounts of another insurrection in Portugal, the inhabitants of Oporto having resolved not to pay the new taxes, which had been somewhat rigorously levied. A collision has taken place between the people and the military, in which the former were completely successful; and apprehensions are entertained that the movement will spread to Lisbon, where the taxes are equally unpopular.—From the Levant we learn that a misunderstanding has occurred between the Turkish Cabinet and the Austrian Minister, who has refused to hold any communication with the Porte until he has received instructions from his Government. The British Ambassador, however, has offered his services as mediator, which both parties have accepted, and there is little doubt that the affair will be satisfactorily settled by diplomacy.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, left Windsor Castle yesterday afternoon for Buckingham Palace, for the season, and arrived in town soon after three o'clock, by a special train on the Great Western Railway. Viscount Hawarden has succeeded the Earl of Hardwicke as the Lord in Waiting; Admiral Sir Robert Otway has succeeded Sir Frederick Stovin as the Groom in Waiting; and Viscountess Canning has succeeded the Countess of Charlemont as the Lady in Waiting on her Majesty.

Parliamentary Movements.—Mr. G. A. Hamilton has been elected Member for the University of Dublin, in the place of Mr. Justice Jackson; and Sir Samuel T. Spry, Knt., of Tregolls, Cornwall, has been elected Member for Bodmin, by a majority of 4 over Mr. Sawle, the Liberal candidate. It is rumoured that the Marquis of Donegal is about to present a petition against the return of Mr. Emerson Tennent for Belfast.

Official Appointments.—Lieutenant-General Lord Seaton has been appointed Lord High Commissioner of the Ionian Islands.—Captain Sir Thomas Fellowes, C.B., has been appointed Captain-Superintendent of the Victualling-yard and Naval Hospital, Plymouth, in the place of Capt. Coode, whose time of service has expired.—The Queen has been pleased to appoint William Garnett, of Lark-hill and Bleasdale-forest, Esq., to be Sheriff of the County Palatine of Lancaster for the year ensuing.—Sir Herbert Jenner Fust, Dean of the Arches and Judge of the Prerogative Court, has been elected Master of Trinity-hall, Cambridge, vacant by the death of Dr. Le Blanc.—Mr. N. Clarke, of the Midland Circuit, and Mr. Byles, of the Norfolk Circuit, have been promoted to the dignity of Serjeants-at-Law.

Foreign.

FRANCE.—The Paris papers are chiefly occupied with domestic matters, and with speculations on the stability of the Ministry. The election of a deputy for the third district of Paris has concluded since our last report, and the result has been favourable to the Opposition, whose candidate, M. Taillandier, a Councillor in the Cour Royale of Paris, has been returned by a small majority—his votes amounting to 826, and those of M. Legentil, the ministerial candidate, to 805. This defeat was not an unexpected one, though it might perhaps have been avoided by the Conservative party concentrating their whole strength, on the first day, on one instead of two candidates. The journals announce increased activity in the ranks of the Opposition, who profess to hope that, on a question to be raised respecting the appointment of Admiral Roussin to the Ministry of Marine, they will be able to overthrow the Ministry. This expectation does not appear to have prevailed in political circles, more particularly as the Cabinet on Friday obtained some compensation for the defeat they sustained, the day before, in the third electoral college of the capital. The Chamber of Deputies proceeded to the monthly renewal of their bureaux, or standing committees—to the result of which much interest is attached at all times, but more especially when there is no question of any magnitude under discussion. Out of the eighteen selections made on that day Ministers secured sixteen, and the Opposition only two. The more importance is attached to this advantage, as the committees thus organised will have to appoint the commissions that are to report upon the budget and secret police fund. It would appear that, notwithstanding the recent long debate, the Right of Search question will not be allowed to rest, but that explanations will be demanded from the Ministry, as to whether they understand the paragraph of the Address in the same sense as the English journals, which the Ministerial journals of France have repeated without comment.—Nearly 3,000 workmen of Paris have enrolled their names at the Ministry of Marine as colonists for the Marquesas Islands. On Thursday they sent a deputation with an offer of their services to the Minister of Marine, who

replied that no plan had yet been adopted for the colonization of those islands.—The *Journal des Débats* states, that by a note attached to the budget of the Minister of Marine, it appears that Government demands an increase of 4,000,000*fr.*, to be applied exclusively to the military marine, which will increase the navy budget for the year 1844 to 111,000,000*fr.* The effective of the seamen will then amount to 30,872 officers and privates, and the effective of the troops employed in the seaports and colonies to 20,378 officers and privates. The fleet will be composed of 160 sail, divided into three classes. The first will comprise 140 ships, of which 8 are ships of the line, 12 frigates, 8 corvettes, 21 brigs, and 26 gunboats, mounting 2,000 guns, and 39 tenders, measuring 20,000 tons. These 140 ships are intended to be kept constantly at sea, and will protect French commerce, on the 11 following stations:—the coasts of the Peninsula, the Brazils, and La Plata, the Pacific Ocean, the Antilles, Cayenne, Mexico, the coast of Africa, the Levant, Bourbon, Newfoundland, and Algiers. The second class comprises 16 ships laid up in ordinary—12 ships of the line and 4 frigates. A French periodical states that a Prefect of Corsica, M. Guibega, having lately examined the registers of the town of Calvi, has discovered in them the act of birth of Christopher Columbus, making him consequently a countryman of Napoleon. Hitherto Genoa, Savona, Cogoleto, Nervi, and Zuccarello, have all laid claim to the honour of being the birthplace of the great navigator.—A correspondence has been published between M. de Tocqueville and Lord Brougham in reference to a passage in his Lordship's speech in Parliament, in which he attributed to the former gentleman "marvellous ignorance" on the subject of the Right of Search Treaties. M. de Tocqueville states that his speech was misreported, and that he was not ignorant of the facts adverted to. Lord Brougham, in reply, contends that, if this be the case, it was his duty to have given the information to the French Chambers during the recent angry debate on the Address, and not to have allowed erroneous notions to be disseminated.

Algeria.—Accounts from Algiers of the 5th inst. state that the intelligence received from the interior of the Regency was of a satisfactory nature. General Changarnier, who was to have returned to Milianah on the 3d, had chastised the tribes residing to the west of that town for their participation in the last insurrectionary movement, which was then completely appeased in the province of Tittery. The Governor-General, favoured by the weather, appears to have experienced no obstacle to his march. He was, by the last accounts, on the limits of the territory where the insurrection had originated. Abdel Kader had retired before him into the mountains bordering on the Desert.

SPAIN.—The long-pending differences between France and Spain on the affairs of Barcelona have been adjusted, the Spanish Government having disavowed the imputation made by the ex-political chief of Barcelona, M. Gutierrez, against the French Consul, M. de Lesseps. The official Gazette of Madrid of the 10th inst. contains this disavowal, under the form of a letter addressed to the Minister of the Interior by the Minister of War, and of which the last paragraph is couched in the following terms:—"Consequently the Government of her Majesty, which ever acts with justice and impartiality, deems it just to declare that the assertion of the Political Chief was not accurate, and had not, without doubt, any other foundation than the rumours circulated by persons flying from Barcelona—rumours which the inquiries of the Captain-General had dissipated." A telegraphic despatch, dated Perpignan, the 10th inst., had also been received, announcing that the Regent has excused Barcelona from the payment of what remained due on the war contributions. The journals of the 8th contain the letter of General Seoane to the Municipality and Chamber of Commerce, announcing the above intelligence. The editor of the *Papagayo* has been restored to liberty, and the state of siege was to be raised on the 12th. Prior to the arrival of this intelligence, the state of Barcelona had become more serious. The Municipality had published a proclamation relative to the troubles of the 30th and 31st; but the Military Governor had ordered it to be torn down, and he published another, much more peremptory. A conspiracy had been discovered in the fortress of Montjuich, and 12 sergeants were arrested. The inmates of the houses from which stones were flung on the soldiers, had all, to the number of 100, been arrested and sent to the citadel. General Seoane had addressed a despatch to the Government, dated the 30th ult., in which he describes the state of excitement prevailing in Barcelona, and which every moment threatened to lead to open revolt. He attributes that effervescence to the intrigues of "a class of individuals interested in fomenting fresh disorders;" "for otherwise," says the General, "it is impossible to comprehend that a city disarmed and garrisoned by 15 battalions, who could in an instant silence all clamour, should indulge in acts of that kind without any means of conquering, and with the certain prospective of being chastised in an exemplary manner. I am consequently compelled to take efficacious measures against those who, in the clubs, or by incendiary speeches or writings, appear to have undertaken the task of completing the ruin of this city." The clemency of the Regent is expected to restore tranquillity; and it is hoped that the municipal elections will take place without interruption. Prince Jerome Napoleon, son of the ex-king of Westphalia, had arrived at Barcelona. A singular state of things exists at Madrid, where the citizens protest against the tendencies and falsehoods of the press, and make a declaration in favour of the Regent; whilst, on the other hand, the press menaces the Government, and utters the deepest imprecations upon General Seoane, because, by virtue of martial law, proclaimed in conse-

quence of the insurrection, he has suppressed the journals of Barcelona.

PORTUGAL.—We have accounts from Lisbon to the 6th inst., with the particulars of some serious disturbances at Oporto, the people having resolved not to pay the assessed taxes, which had been somewhat rigorously levied. It appears that immediately after the publication of the lists of the assessment of the *Decima Industrial* (Income-tax), a universal determination to disobey took possession of all parties, owing to the arbitrary manner in which this new impost had been levied. The lists were torn down, and the inhabitants publicly expressed their intention of resisting claims made upon them which they were unable to bear. The authorities, actuated by fear, threw all the odium upon the Government, and a conference having been held betwixt the Civic Chambers and the Governor of the place, a proclamation was issued, announcing that the Home Government had been made acquainted with the complaints of the people, and that the lists had been recalled for reconsideration. This proclamation was taken down and torn to pieces in the Praça of Don Pedro, amidst loud cries of "Long live the Queen and Charter, and down with the Taxes." At five in the evening a troop of cavalry arrived in the square, and formed in line, in readiness to charge upon the people. The scene which followed can scarcely be described—with the rapidity of lightning the whole mass fell upon the military, dismounted them, and scouted them from the square, thousands of voices vociferating, "Long live our Queen," "Down with the Ministry," "No Taxation," "Down with the thieves who are plundering us." Shortly after a body of municipal infantry came into the square, the commander of which, upon seeing the attitude taken by the populace, prudently returned to the barracks. At 11 o'clock on the morning of the steamer's departure, from the multitudes which were congregating from all quarters, a repetition of these scenes was expected. It is, moreover, to be feared, that Lisbon will also be the theatre of some similar commotion, as the new taxes are equally unpopular in that city. The distress of the Douro wine district is said to be extreme, and must finally compel the Government to cede to the views of England; and it is admitted by all, that their refusal regarding the tariff has brought upon them a universal feeling of distrust.

GERMANY.—Accounts from Hanover received this week mention that great preparations are making for celebrating the marriage of Prince George of Cumberland. It was arranged that the festivities were to commence yesterday the 17th, with the entry of Princess Mary, and were to last, it is said, a whole week. Two operas were in course of rehearsal, and the manager is said to have composed a piece for the occasion. The magistrates were to have the honour of receiving the Princess at the triumphal arch erected at the gate. It is said that the King of Prussia and all the Princes of the Royal Family of Prussia have accepted his Majesty's invitation to be present on the occasion. It is understood that the marriage of the Marquis of Douglas with the Princess Mary of Baden, will be solemnised this day the 18th inst. Letters from Berlin mention the death, in that city, at the age of sixty-six, of the Baron de Lamotte-Fouque, known through all the world of letters as the author of the beautiful legend of "Undine." A letter from Vienna, in the Frankfort papers states, that Marshal Marmont was dangerously ill at Venice, from an attack of apoplexy.

GREECE.—Letters from Athens of the 21st ult. inform us that the long expected bankruptcy of the Greek Government has been officially announced, the Cabinet having notified to the representatives of the allies that it can no longer attempt to pay the interest of the guaranteed loan; and this announcement, it appears, was accompanied by a demand for further advances. It has also transpired that the Greek Government, in thus notifying its inability to pay the allies, does not attempt to conceal the fact that it sees no prospect of being able to do so for years to come. Private letters state, in reference to this subject, that "It remains to be seen how people in England will like to be called upon, every six months, for twenty-five thousand pounds, to pay in reality for King Otho's new palace and its furniture, and to encourage him in pursuing that system of misgovernment by which he has not only driven to despair his own subjects but has disgusted Europe, which had reasonably expected very different results when Greece was erected into a kingdom."

TURKEY.—The Levant mail has brought advices from Constantinople to the 29th ult. of considerable interest. A suspension of diplomatic communications between the Porte and the Austrian Court had just taken place, in consequence of some intrigues on the part of the Turkish Ministers, whereby the Austrian Steam Navigation Company had for some time suffered, from the unfair competition of the rival Armenian Company, who had prevailed on the Turkish Ministers to issue orders preventing the subjects of the Porte from embarking in the Austrian vessels on the Trebizond line, and raising other obstructions, by which their navigation would have proved a loss. The Austrian Chargé d'Affaires had suspended his relations with the Porte, but Sir S. Canning had offered his services as mediator, which had been accepted by both parties.—The English and French Consuls at Belgrade have, in consequence of positive instructions from their respective Governments, formally recognised and opened relations with the newly-elected Prince of Servia.—We noticed last week the occurrence of two remarkable innovations in Turkish manners; we have this week the particulars of another, which is thus given by the correspondent of the *Morning Post*:—"Last Saturday a juvenile Christmas party, or fancy ball, was given at the English palace, and invitations were issued not only to the Frank, Perote, and Armenian families, but, to the astonishment of every body, to those of respectable Turks. This experi-

ment, if it may be so called, proved successful beyond all expectation. The arrangement of the affair did great credit to the taste and judgment of Lady Canning. The little Pachas and Effendis, Khanouns, Leilas, &c., conducted themselves with due decorum, and doubtless on their return to their respective harems were the innocent instruments of a propagandism to which nobody can reasonably object.—The Hon. Mr. Curzon, private secretary to Sir S. Canning, who was to act as the British commissioner at the deliberations of the Turkish and Persian plenipotentiaries at Erzerum, sailed for Trebizond on the 27th. Capt. Williams, at first appointed to fill that mission, had been unable to undertake it in consequence of indisposition.—We regret to state that the rumoured murder of Col. Stoddart and Capt. Conolly in Bokhara is confirmed. The Ameer had thrown them into prison on the receipt of news from Cabul announcing the disasters of our troops on their first expedition; and on the 17th of June last, at the instigation of Akhbar Khan, the Bokhara chief ordered that Col. Stoddart should be put to death, in the presence of Capt. Conolly. They were both led into a small square near their prison, where Col. Stoddart was beheaded, and, on Capt. Conolly refusing to embrace Mahometanism, he also fell under the headsman's knife. They were buried on the spot, in graves which had been dug in their presence.

MALTA.—The Levant Mail has brought recent advices from Malta, with accounts of the fleet, and the movements of our ships of war in different parts of the Mediterranean. On the 31st ult., the inhabitants of Malta had an opportunity of witnessing a spectacle as magnificent as it is rare;—the heaving down of her Majesty's ship *Formidable*, of 84 guns, in the presence of Sir Edward Owen, commander-in-chief, and an immense concourse of spectators. Upwards of 800 men were employed in the work: in an incredibly short space of time the ship yielded to their power and gracefully fell into the desired position. In an instant the full extent of her damage, caused by her running ashore at Barcelona, was ascertained, and moulds of the required repairs having been taken, she was again righted. It is said that the plan sent to the Admiral by the ship's carpenter, who went down in a diving dress to survey her at Barcelona, represented in the nicest degree the damage received; and that his report was fully confirmed when she was hove down.—On Wednesday, the 31st ult., a sight altogether new in Malta was witnessed at Valetta,—the confirmation by the Bishop of Gibraltar of some 300 persons of both sexes and of all ages. After the morning service had been read, the Bishop delivered an address appropriate to the ceremony. Among the persons confirmed were several midshipmen and boys from the fleet.

UNITED STATES.—By the Royal Mail str. *Caledonia*, from Boston and Halifax, we have received papers from New York, to the 2d inst. The papers are occupied with accounts of the discovery made by Mr. Sparks in reference to Lord Ashburton's treaty, and state the particulars given in our last, confirming the fact that Dr. Franklin's map was produced by Mr. Webster in the Senate. Indeed it appears that the publication of the proceedings in secret session of the Senate, upon the question of approving the treaty, has brought this communication to light. The *New York Express*, after describing the discovery of the map, observes, "After reading this letter of Dr. Franklin, it can hardly be said that Great Britain had no grounds to set up a claim to the disputed territory, and may not every American rejoice that this matter is now definitively settled, and can never more be brought in controversy." An abstract of the Bill now pending in the Senate of the United States has appeared in the papers. It proposes the occupation and settlement of all the territory claimed by the United States north of 42d degree of north latitude, and south of 54 degrees 40 minutes. The whole north-western coast, it is known, has been claimed by Russia, Great Britain, the United States, and Mexico. The ground of the claim of the American Government rests upon the following basis:—1st. That of the priority of the discovery by Capt. Gray, of Boston, in 1788, of the mouth of the Columbia. From this, according to the universal rule among civilised nations, follows the right to the country watered by such river to its sources. This discovery was afterwards more completely explored by the expedition under the command of Captains Lewis and Clarke. 2d. The cession by Spain of all her rights of territory north of the 42d parallel of latitude. 3d. The French claim, to which the United States succeeded. 4th. Contiguity of territory. On the other hand, Great Britain sets up her title to the same territory on the following grounds:—1st. That she can plead priority of discovery by Mearns, sailing under Vancouver. 2d. That by the convention of Nootka Sound in 1790, Spain yielded to Great Britain free and open access, trade, and settlement to British subjects, in common with her own, upon this coast. 3d. She claims also the French rights, ceded to Spain in 1763, by treaty between those two nations.—Accounts from New Orleans mention an attempt to assassinate Mr. Clay, one of the candidates for the Presidency, while he was leaving the Supreme Court; but the assassin was believed to be insane.—Letters from the West Indies received at New York state, that any hope, however remote, that might have been entertained of the safety of Her Majesty's ship *Victor*, 16, Commander Otway, must now be entirely dispelled. No intelligence had been heard of her when the last packet left, and there is not a doubt that she must have foundered, and all hands perished.

Parliament.

HOUSE OF LORDS.

Monday.—The Duke of WELLINGTON laid papers on the table relating to the military operations in Afghanistan; and postponed his motion for a vote of thanks from Thursday to Monday next.—Lord BROUGHAM, on this intimation, postponed, from Monday till Thursday next, his motion respecting the London

Corporation.—The Earl of RIFON, in answer to Lord CLARENDON, stated that Government intend, in the course of the present session, to introduce a bill respecting the building of houses in the metropolis, and that it is in contemplation to issue a commission on the sanitary condition of the people.—The Duke of WELLINGTON intimated, in reply to Lord MONTAGUE, that Ministers entertain no intention to propose any alteration in the law by which the Bank of England charter is to continue in operation till the end of a term of ten years from 1834; that there is no alteration to be proposed in the banking laws; and that Government purpose to continue the Act relating to the Usury Laws.—Lord CAMPBELL moved for a select committee on the law of defamation and libel, which was agreed to.—The Attorneys and Solicitors Bill was read a second time, and ordered to be committed.

Tuesday.—The Duke of WELLINGTON moved that the paragraph in the Queen's speech which related to our victories in China be read; and then proposed that their Lordships should express their approbation of the services of her Majesty's fleet and army in the course of the operations by which such important success had been attained. He enumerated in succession the places at which the forces had been engaged, and the circumstances of their achievements from the first commencement of hostilities, comparing, as he proceeded, the relative difficulties which the troops had respectively to overcome, and especially characterising the series of operations by the united services from the attack of the heights of Canton to the conclusion of the war, as "unprecedented in the naval and military history of this country, and attended by wonderful success." The excellent arrangements by which ships and soldiers had been in each instance so combined as to co-operate most effectually, and the good understanding which subsisted between the commanders of the naval and land forces, deserved, in his opinion, particular commendation, as it was to this that their uniform, rapid, and almost bloodless victories were to be attributed. He enlarged upon the advantages to be expected from the treaty which our success had extorted from the Emperor, the admirable discipline, forbearance, and humanity of the troops; and concluded by requesting their Lordships' unanimous concurrence in the resolutions he proposed.

Lord AUCKLAND had the more satisfaction in expressing his perfect accordance with the high praise which had been bestowed upon the forces, as he had selected Sir H. Gough and Sir W. Parker for the service. The noble Lord then drew attention to the claims of the Native Indian Army, which he considered to have been somewhat overlooked; but the omission was instantly supplied by the Duke of WELLINGTON.

The Marquess of LANSDOWNE regretted that the name of Sir H. Pottinger, who had acted as Her Majesty's Plenipotentiary, was omitted in the resolutions. The Duke of WELLINGTON, however, explained, that as the vote was one of thanks for military services alone, his name could not with propriety be included.—Lord BROUGHAM cordially supported the motion; and adverted to the remarkable fact that "the vote was proposed by a man with respect to whom every man who would receive it would prefer his single opinion, his single panegyric, to votes of thanks from both Houses of Parliament."—Lord HADDINGTON and Lord MINTO expressed their entire concurrence in the vote; and after a few words of high eulogium upon Sir H. Pottinger from Lord ABERDEEN, the resolutions were carried unanimously, including by name Sir H. Gough, Sir W. Parker, Sir Gordon Bremer, and Generals Lord Saltoun, G. Burrell, Sir R. Bartley, and Sir J. H. Schoede.

Thursday.—Lord BROUGHAM made some explanations relative to the Slave-trade Treaty proposed by America in 1823, and stated that the exemption claimed by the United States only related to the coasts of America.

The Duke of WELLINGTON, in reply to the Marquess of LANSDOWNE, stated that his motion respecting Lord Ellenborough and Indian affairs would be the same in substance as it originally stood.—The Marquess of LANSDOWNE put some questions about the omission of certain documents from the lately-published Blue Book, on the military operations in Afghanistan.—The Duke of WELLINGTON said he would inquire whether such documents were in existence; and also stated that the proclamations about the gates of Somnauth will be produced.

Friday.—A conversation took place relative to the documents lately published upon the military proceedings in Afghanistan. The principal point was the Duke of WELLINGTON and Lord WHARNCIFFE's denial of any disobedience by Gen. Nott of orders forwarded to him by the Governor-General.—Lord WHARNCIFFE, in reply to Earl FITZWILLIAM, stated that 25,000*l.* had been raised by private subscription, and 75,000*l.* in consequence of the Queen's Letter, for the distressed manufacturers. The amount already expended was about 63,000*l.*

HOUSE OF COMMONS.

Monday.—The CHANCELLOR of the EXCHEQUER, having moved for a committee of the whole House, submitted the scheme proposed by Government in reference to the mode of dealing with the holders of the forged Exchequer-bills issued through the criminality of Beaumont Smith. He divided the holders into four classes, the first being those to whom no suspicion, either of collusion or of culpable negligence, could attach; the second and third classes being those to whom imputations, varying in degree, on the score of care and prudence, might be attributed, but not strong enough to warrant their exclusion from the consideration of Parliament. To these three classes, therefore, he should propose that compensation should be awarded. But the fourth class, including persons amenable to grave suspicion, as those implicated in dealings with Rapallo, Solari, &c., are to be altogether excluded from compensation. The result is, that, out of a sum of 377,000*l.* forged bills, compensation is proposed to the amount of 262,000*l.*; the sum to be provided for by the issue of Exchequer bills. While the Right Hon. gentleman admitted the weight of the call thus made on the public, he adduced several reasons in exposition of the justice and propriety of providing compensation to the three first classes of holders named, and reminded the House that the forgery had been committed by an officer of the Crown.—Mr. WILLIAMS, Mr. BARING, Colonel STANTON, Mr. HUME, Sir T. WILDE, and other Members addressed the House, and a resolution in accordance with the Chancellor of the Exchequer's proposition, was brought in.

Lord HOWICK brought on his motion.—That this House do resolve itself into a committee of the whole House, to consider so much of her Majesty's speech as refers to "that depression of the manufacturing industry of the country which has so long prevailed, and which her Majesty has so deeply lamented." He apprehended that he was taking the most regular and parliamentary mode of bringing on this question, which he did not do in any spirit of hostility to the Government. The duration of the distress of the country was now to be reckoned, not by months, but by years; agriculture, as well as manufactures, was suffering. The mining and the shipping interests were also affected; retail tradesmen in the country felt, in their diminishing incomes, the growing scarcity of employment; and not merely the lower, but the higher classes, shared in the general depression. We might be told that the worst had passed, and that symptoms of improvement were apparent. He trusted it might be so; but we had been, and might again be, disappointed. We had no right to expect permanent improvement, without the interference of Parliament to remove some of the causes of that distress, whose longer continuance was full of peril to our security and institutions. An inconvertible paper currency had been proposed as a remedy; but Sir Robert Peel had demolished that notion in a late remarkable correspondence. Reduction of taxation had been also proposed; but, in proportion to its means, this country was as lightly taxed as any country in Europe. Over-speculation had been assigned as a cause of our distress; but the Government, he was sure, were in possession of information which would keep them from giving any countenance to that idea. How could a nation suffer from an over-supply of every thing which its population required? The English poor-law, too, had been affirmed

to be a cause of the suffering of the working classes; but Scotland had shared in the distress as well as England. The real cause was the remarkable coincidence of a very low rate of profit and a low rate of wages, produced by intense competition, which again was produced by the want of an adequate field for the employment of capital and labour. To extend this field ought to be the great object of all our exertions; the natural field for our industry was confined by barriers and restrictions: there were laws on our statute-book which had been passed for the express purpose of restricting our foreign trade, especially in the important article of the food of the people. Our export was measured by our import trade. Happily, our internal trade had been practically but little hampered with restrictions, and the consequence was a degree of prosperity unknown in those countries where internal restrictions impeded intercourse; and this was a practical confutation of those who said that the removal of commercial restrictions was a theoretical idea. But this very policy of restriction rested on a theory now universally exploded; and he called upon them to abandon a policy whose fruits were a distressed people and an impoverished exchequer. The principles he had advocated had been adopted and expounded by Sir Robert Peel, when he said that we should "sell in the dearest and buy in the cheapest market;" and if the Government were not prepared to carry out their principles, why had they unsettled every thing? They should not, in the present condition of the country, halt between two opinions.

Mr. GLADSTONE admitted the existence of great distress, but argued that great and peculiar exciting causes had existed during the past year. The Income-tax he defended on the ground that it reached those large accumulations of capital which could not be touched by any other mode of taxation. The marked increase in the savings' banks deposits was one satisfactory subject of contemplation. He took the county of Lancaster as an instance of this, and remarked, that the circumstance went far to prove that though employment might be more scarce than formerly, the aggregate amount of prosperity was not less. Why had not the noble Lord himself proposed his remedy for the distress of which he so loudly complained? For although he (Lord Howick) said that trade should be unfettered, he would not venture to declare that it ought to be entirely free. The whole question was not as to the abstract impolicy of restrictions, for the commercial legislation of this country, during the last 25 years, had recognised the necessity of their removal. But the question was simply, what *are* judicious relaxations? The principle of the Government in their measures of last year, was to effect changes with the least shock to existing interests, and the smallest displacement of labour; and both the new tariff and the new corn bill, while extending the means of employment for capital and labour, had not materially affected established interests. What was the proposed substitute for the Corn-law? A moderate fixed duty for protection or for revenue? It was asked why we applied to corn a different principle of legislation from that which was applied to other articles? The answer was, that corn had been differently dealt with for ages; and, under a system of long-continued protection, enormous investments of capital had taken place, which it would be ruinous suddenly to disturb. It was true in the abstract that corn and cattle should be similarly dealt with; and in the revolution of ages and of circumstances the time might come when they might be so treated. He would readily admit that no commercial law could be permanent; but that of protection to home agriculture was so, and he was not prepared to abandon it, so long as protection was applied to any interest. He agreed that an extension of the field of employment for capital and labour was the great thing required by this country; but Burke had said that the statesman who legislated without reference to circumstances was "stark mad, metaphysically mad." He did not argue that an additional importation of foreign corn would displace British agricultural labour. But he was not prepared to sacrifice a certain employment of our labouring population to a speculative notion that an increase of our foreign trade would necessarily follow the abandonment of our Corn-law. The noble Lord, when he said that the example of this country, if she went farther with relaxation, would be followed by other countries, should bear in mind that these countries, and America in particular, had been acting on the restrictive principle.

Mr. LABOUCHERE spoke in support of Lord Howick's motion, and was followed by Mr. FERRAND, who proposed an amendment, that this House "do resolve itself into a committee of the whole House, to consider so much of her Majesty's speech as refers to 'that depression of the manufacturing industry of the country which has so long prevailed, and which her Majesty has so deeply lamented;' and also to inquire into the effects of machinery upon the moral and physical condition of the industrious classes; and also, to inquire into the origin of the late outbreaks, which are also alluded to in her Majesty's speech."—On the motion of Mr. EWART, the debate was then adjourned.

Tuesday.—Lord STANLEY moved a vote of thanks to the officers and men employed in the recent naval and military operations in China. He would mix no disputable topics with it, the motion; nor had he any party feeling connected with it, the commanders having all been appointed under the late administration. The commencement of the war in China might be properly dated from about February, 1841, the operations in 1840 having been on a very small and partial scale. In that month it had been judged expedient to advance our naval force into the interior waters of China, under the very walls of Canton. The fortifications there were of great strength; but, almost impregnable as they seemed, they were forced by a comparatively insignificant squadron. A second attack on Canton was afterwards rendered necessary by the misbehaviour of the Chinese; and whereas the former had been chiefly a naval operation, this was principally, though by no means exclusively, a military one. By a force hardly amounting to 3,000 men in all, a line of hills was occupied, and the forts captured, in the manner described in Sir Hugh Gough's despatch, against a body of from 35,000 to 45,000 Chinese troops. His Lordship mentioned with especial honour the conduct of a company of Sepoys, who, out off from all assistance, had, in circumstances of great difficulty, kept at bay a force of many thousand Chinese. He then described the subsequent expedition to Amoy, and eulogised the skill with which the captains laid their ships in line within the harbour, and the gallantry of the escalade by which the troops possessed themselves of the town. Not less gallantry and ability had been exhibited in the capture of Chinghai and Ningpo. The good order and discipline of the troops, naval and military, British and Indian, had merited the highest praise, and had left among the native population a deep sense of respect for the British name. He then proceeded to give a narrative of the expedition upon the Yang-tse-Kiang, and of the capture of Ching-Kaing-Po. He enlarged upon the difficulties and important consequences of this achievement, which had placed in our power Nankin, the second city of China, and forced the Emperor to a final pacification. Victories there had been which had involved more bloodshed—never any which more merited the thanks of the country. It had been usual to vote separate thanks to the naval and the military forces; but here both had been so generally and so zealously combined in their services to their country, that he thought it best to couple both in the expression of her gratitude.—Lord PALMERSTON, in seconding a motion upon a subject with which it had been his lot to be connected, would introduce no topic that could cast even a shade of difference. He applauded the skill and courage of the British, and did justice to the personal valour which had distinguished the Chinese amid their utter ignorance of the arts of war. He gave especial credit to our officers for their restraint of all license on the part of the troops—a forbearance which had much conduced to establishing among the Chinese a favourable opinion of, and disposition towards, the British. He rejoiced that long years of disuse had not impaired the efficiency of the British forces—that their swords, though they had rested in their scabbards, had not rusted there.—Sir C. NAPEL bore testimony to the merits of several of the officers mentioned

in the motion. He had himself been accustomed to go up rivers and storm batteries, and he knew what it was; and he must say that he thought the skill displayed by Sir W. Parker was unequalled in naval history.—Sir G. STANTON and Mr. HUME wished that Sir H. Pottenger's name had been included; and Sir R. H. INGLIS desired that the House, in voting thanks to those who were the agents in obtaining peace, should not forget their gratitude to Divine Providence, for the blessing which secured it.—Sir R. PEEL declared his cordial concurrence in the general praises of our officers. To Sir H. Pottenger he had before paid his tribute of applause. He wished it had been consistent with usage to introduce his name; but precedent did not sanction the mention of services merely diplomatic in votes of this nature. He was happy, however, to acquaint the House, that the Government, sensible of Sir H. Pottenger's high services, had offered to him whatever official employment in China he might be willing to undertake, with the assurance of their entire confidence in him. The vote was then passed.—Mr. MACKINNON moved for leave to introduce a bill prohibiting interments within the limits of towns. A pamphlet, he said, had been put forth, accusing him of a wish to injure the Dissenters, which he wholly disclaimed. The pamphlet had been industriously circulated, probably through the agency of persons who now made a great profit of a few acres situate in the heart of large towns. He proposed to exempt certain suburban cemeteries from the operation of the bill. The principle of his measure must sooner or later be carried, though he felt that there was a good deal of difficulty in the details.—Mr. HUME seconded the motion. The measure was very important to the health of the poor, and would require the best assistance of the Government to uphold it against probable opposition from private interests. The attention of Government to the whole question of drainage was urgently needed.—Sir J. GRAHAM approved the principle of the bill, but had great doubts about details. Careful inquiries were now in progress on the part of Government; but as no measure had yet been digested by them, he would not oppose the introduction of this bill. Hoping, however, as he did, for further information which might enable the Government, perhaps in this very session, to bring forward a measure of its own, he must decline to answer for its co-operation in the present bill. As to drainage in general, he intended to recommend the appointment of a commission of men of science, for the purpose of fully considering and advising upon this matter.—Some objections were made by Mr. HAWES and Mr. ESCOTT, but Mr. MACKINNON, with the utmost disposition to attend to any remedy proposed by Government, declared his intention to proceed with his own bill for the present. Sir W. CLAY, Dr. BOWRING, and Mr. M. PHILIPS, endeavoured to dissuade him, but he persevered, and leave was given to introduce the bill.

The House then proceeded to the adjourned debate on Lord Howick's motion respecting the distress of the country. This adjourned debate was begun by Mr. EVART. He laid before the House a series of details, from which he inferred the evils of the restrictive system. He afterwards cited a variety of returns, for the purpose of showing the increased competition which our manufacturers have now to sustain from those of the Continent, and the consequent necessity of some measures which may enable our own manufacturers to produce at a cheaper rate, by a reduction in the duties on raw materials—namely, the duties of Customs and Excise—and by a diminution in the price of food. He pressed, therefore, for the repeal of the Corn-laws; and expressed his hope that Sir R. Peel would not long be able to resist that repeal.—Mr. LINDSELL apprehended that this motion was neither more nor less than a question of confidence or no confidence in the Government. He denied the assertion that no part of the existing distress was owing to the Poor Law; on the contrary, that law had most grievously increased the rates. Lord Howick had argued that the one thing needed was a larger field for commerce. No doubt such an extension was desirable, but there was great exaggeration in the calculation of its advocates. He would not now enter upon what was not the proper question before the House—the question of the Corn-laws. On that head he was satisfied with the declarations of Sir R. Peel. It was in vain to assail that right hon. baronet's character either by insinuation or by direct attack; the gentlemen of England would rally round him, and support him by their voices and their votes.—Lord WORSLEY denied the alleged confidence of the Agriculturists in the Minister, and affirmed the existence of considerable distress in his own county. But, if the House should go into committee on this distress, would any remedy be found there? He feared the result would be only a Corn-law debate; and he should therefore, though thus differing from those with whom he usually acted, oppose both the motion and the amendment.—Mr. G. KNIGHT thought that much of the evil complained of would be neutralised by a judicious system of emigration to the colonies. In opposition to Lord Worsley, he maintained that the agriculturists were satisfied with the conduct and declarations of the Premier, and with the Corn Law as it now stood. The main cause of distress was the unconstitutional agitation of the Anti-Corn Law League, which had brought about the distress of last autumn.—Mr. WARD supported the motion, but thought it too vague in its terms. He entered into various statements descriptive of the distress prevailing in Suffield, and protested against the restrictive principle as destructive of trade and industry, and of the interests of the people. Mr. DISRAELI contended that commerce could be extended and prosperity promoted by the cultivation of friendly negotiations with European and other nations. The consummation of the commercial treaty of 1840 with France, would do more to prevent distress than anything which could be looked to from America, and mutual candour and frankness would remove any feeling hostile to the treaty that might exist in France. He should not bind himself to the present Corn Law, or make adhesion to a fixed duty or a sliding scale the test of his political consistency, but would support no proposal which, in his belief, would remove from the agricultural interest its preponderance in the country.—Mr. ROSS recommended the adoption of a fixed duty, commencing at eight shillings a quarter, and falling by gradations of a shilling yearly.—Mr. B. HOPKES condemned Lord Howick's motion as futile and unnecessary, and attributed the distress to over population and over luxury.

On the motion of Dr. BOWRING the debate was again adjourned. Wednesday.—In answer to Dr. BOWRING, Sir R. PEEL stated his fear that there could be no doubt of Col. Stoddart and Capt. Conolly having been murdered by order of the Ameer of Bokhara, and further added, in justice to the Emperor of Russia, that whenever British subjects were in danger, he had exercised all the influence in his power for the preservation of their lives.

The adjourned debate on Lord Howick's motion was then resumed. Dr. BOWRING described the great distress prevailing in Bolton, which he attributed to the restrictive system. If haste were not made, legislation would be too late. He only wished that the Premier and the Vice-President of the Board of Trade would give effect to their own words, and put in practice the free-trade principles which they professed. While the Members of that House were revelling in luxury, would they tell the wretched people that nothing should be done for them? The opponents of free-trade were doing as much injury in France as in this country. A relaxation was necessary, to take advantage of the terms of the Chinese treaty.—Mr. STUART WORTLEY condemned the inflammatory language of the preceding speaker, and denied that the Corn Laws were the cause of the dearth and destitution that prevailed. If the Corn Laws were repealed tomorrow, the price of bread would fall, but greater evils than the present ones would accompany the fall. The learned Member ought not to reserve all his sympathy for those who were not engaged in cultivation, and to bear in mind that two-thirds of the population were dependent on agriculture.

Mr. ESCOTT did not see how the noble Lord's motion could lead to any result that would relieve the wants of the people. Amongst

the noble Lord's own friends the greatest differences prevailed on the subject of the import duties. The Opposition were calculating on dissatisfaction amongst agriculturists and others out of doors to get up a cry against Government. He (Mr. ESCOTT) would trust no Prime Minister who would utter so foolish a saying as to pledge himself against change in the provisions of any particular law—the Corn-law for instance; but it would be quite as great a folly to go on unsettling in one session what had been so solemnly settled in the one preceding.

Mr. C. WOOL supported the motion as one rendered necessary by the state of the country. The enormous increase of pauperism and insolvency in Leeds and elsewhere, the falling off in wages, the increase in the proportion of deaths, and the spread of distress in the agricultural districts, proved that a state of more severe and general pressure was never before known in this country. All he wished Sir Robert Peel to do was what the latter had formerly required the then existing Government to do—to give a pledge to provide a remedy for the distress. The distress of our manufacturers was mainly owing to the falling off in the foreign demand, and the remedy for this was the removal of the restrictions which bygone ignorance had imposed upon commerce. The diminution in the consumption of wheat, as exhibited by returns from various places, showed the frightful state to which the people were reduced. In many ways the reverses of the manufacturers fell heavily on the agricultural interests, and in these facts lay an additional argument for the repeal of the Corn-law. There was a growing feeling among those connected with the land that a fixed duty was preferable to the sliding scale. Let the intentions of Government be fairly avowed. The people ought to know why the principles enunciated last year, if good in themselves, should not be applied to sugar and other articles. The object of the present motion was to call on Government to go forward with the course they had begun.

Sir J. GRAHAM said that the present motion was destitute of heart as well as of aim. He admitted that a great falling off in our commerce demanded the attention of the Government and the Legislature; but the representatives of the people should pause before they held up the condition of the country as one of permanent decay. Thus, in contradiction of one assertion, returns exhibited a positive diminution instead of increase in the amount of mortality in all our great manufacturing and commercial towns. An unsound system of credit was amongst the causes of our present difficulties; and, under the unhealthy influence of fictitious credit, there had been an extraordinary increase in mills and machinery. But though the influence of that state of things was not yet over, there were indications of improvement, and a gradual increase in the demand for employment. The changes which had been effected by the new tariff were unquestionably the greatest which had ever been made at one time in the commercial legislation of this country; and though sugar had not been included, on the distinct principle of maintaining our faith, in the face of the world, on the subject of slavery, yet the price of that article had slightly fallen, stocks were increasing, and demand was improving. He admitted the great importance of our commerce, and the necessity of providing for our increasing population by extending the field for their employment; and none were more interested in this than the landed interest. But the utmost caution was requisite in measures affecting that interest; otherwise agricultural might be superadded to manufacturing distress, and the greatest and most wide-spread misery result. He cited Colonel Torrens and Mr. McCulloch in support of his argument; and contended that no law that could be devised could prevent speculation in corn, for that depended on the nature of the seasons. It was the duty of a statesman to apply principles to particular instances; and though not setting up the home against the foreign market, nothing could be more disastrous to the manufacturing interest than sudden changes in the domestic economy of this country. Mr. Labouchere had said that when the regular pilot did not undertake to carry the vessel of the state in a given direction, a chance passenger might undertake the duty. But it was requisite, in the first instance, to dispossess the regular pilot of the rudder; and if the Opposition sought a change in the administration, let them frankly avow their purpose, and try the issue of the question. He concluded by a general defence of the measures of the Government, and anticipated the rejection of the motion by a commanding and decisive majority.—After a few words of explanation from Mr. WALLACE, the debate was adjourned.

Thursday.—After various inquiries on matters connected with the general business of the House, the adjourned debate was resumed by Mr. PETER BURNWICK, who compared the risks and profits of agriculturists with those of manufacturers, and severely censured the Anti-Corn-law agitators. The Government were doing what Lord Howick wished them to do, applying restrictively the principles of free trade.—Sir C. NAPEL said the distress was now more severe than at any former period; but the cause, as well as the remedy, was involved in mystery. The enormous duties we levied on Portuguese wines, and other produce, caused that country to retaliate. We imposed a duty of 700 per cent. on Portuguese wines, and was it reasonable to complain because Portugal laid a duty of a 100 or 150 per cent. on our manufactured goods? Again, with regard to the sugar question, he did not see why the interests of the entire country should be sacrificed to the West India proprietors. On the subject of the Corn-law, he wished the Government would come to a compromise with the League, and adopt a fixed duty.—Mr. B. COCHRANE felt that the condition of the country was full of danger. Repeal the Corn-laws, was the perpetual cry; but he looked beyond the Corn-laws, to the growth of luxury, the demand for wealth, consequent speculation, and their attendant evils. Confidence was essential to the profitable exercise of agricultural operations; a total and instant repeal of the Corn-law would be preferable to uncertainty, and a tottering Government with vacillating principles was preferable to a strong Government with vacillating ones. He did not suppose that permanence was necessary to any particular law, such as the present one, which aimed at keeping corn between 54s. and 58s. the quarter. But he hoped that the Government would inspire a feeling of stability and secure it.—Mr. VILLIERS remarked, that in all the indications of the state of the country there was much ground for alarm. Why did not Government carry out the principles it professed? The best part of the new tariff was the change in the timber duties, but the reductions of duties on the necessities of life were only made to meet new taxes. Within the last 200 years there had been about 40 different Corn-laws, which showed how badly they accomplished their object. Why did not the Legislature administer the true remedy to the depression of the people? He would not condescend to answer the charges brought against the Anti-Corn-Law League, which he considered was doing a service to the country, and could not be put down except by the concession of justice.—Viscount SANDON said the great question was, how could the largest amount of employment be given to the people? He would remind Honourable Gentlemen opposite that the home market was the most extensive and the most steady. If any branch of the industry of the country were to be protected, the great fundamental one of all should not be deprived of it. Was it not unreasonable to ask for the repeal or alteration of so important an Act as the Corn Law, after only a few months of its operation? An unsound system of credit, and the convulsed state of America, had no doubt inflicted much mischief on this country. His own conviction was, that by repealing protective duties we should lose more than we should gain; but it was a miserable mockery to think a motion like this could give any relief.—Mr. MUNTZ thought the motion was not straightforward enough, but some inquiry was necessary. The Premier had deceived no one; for, before coming into office, he stated that no legislative measures would cure the distress. He (Mr. Muntz) thought they ought to adopt one of two courses—repeal the Corn Law, or alter the value of silver.—Sir J. HANMER objected to the motion, as not sufficiently specific, but hoped the House would extend commerce, and give up the policy of protection.—Mr. P. M. STEWART

supported the motion, and condemned the sliding-scale as main cause of the general distress.—Mr. COLQUHOUN thought over-production had principally led to the depression of the manufacturers, and that if protective duties were abolished, England would be met with increased duties by other countries. The course of gradual and moderate change adopted by Government was that best adapted to the interests of all classes.—Mr. F. BARRING denied that the state of the commercial world had been settled by the tariff. Could parties calculate on the existence of the present duties? And if they could not rely on permanency for even one year, was it not silly to talk about unsettling things? The farmers had no confidence in the present law, which, it was universally believed, could not stand. In the melancholy state of the country he must protest against the conduct of Government in refusing inquiry.—The CHANCELLOR of the EXCHEQUER replied generally to Mr. Barrington, and opposed Lord Howick's motion, as calculated to deceive and disappoint the people. The debate was then adjourned.

Friday.—After the Exchequer Forfeitures Bill had been read a second time, the adjourned debate was resumed by Sir A. L. HAY, and continued by Mr. BLACKSTONE, Mr. M. PHILIPS, Mr. ATTWOOD, Lord F. ERSKINE, and other Members. Mr. COBDEN said that "Sir R. Peel had it in his power to carry the measures necessary for the people; and if he had not that power as a Minister, he would have it by resigning his office. Sir R. Peel should be held responsible individually, and the electoral body would force him to do them justice." A scene of great excitement followed this speech, and Sir R. PEEL, amidst immense cheering, and with much solemnity of manner, called the attention of the House to Mr. Cobden's declaration that he held him individually responsible for the distress of the country. "Be the consequences," he said, "what they may" (the cheering was here renewed with increased vehemence) "never will I be influenced by menaces to adopt a course which I consider inconsistent with my public duty."—Mr. COBDEN here interrupted the right hon. Baronet, and denied that he had said that he held him individually responsible, but he was met by loud cries of "You did," "You did;" and some time elapsed before order could be restored. Sir R. PEEL then proceeded at great length to show that the present motion could not alleviate the sufferings of the people, and to state that he contemplated no alteration of the Corn law, but he would give no pledge never to alter it.—Lord J. RUSSELL followed in support of the motion.—Mr. ROXBURGH adverted to a report of one of the League meetings, at which a Dissenting Minister suggested the drawing of lots to take Sir R. Peel's life, and called the attention of the House to Mr. Cobden's threat that if he (Mr. Roxburgh) took a particular course in this debate, a mission from the League should pay a visit to Bath.—Mr. COBDEN, (amidst great uproar, during which the SPEAKER had to interfere, said that he had warned Mr. Roxburgh in friendship, that "if he interfered with the League, he would get into trouble at Bath." Lord HOWICK replied on the debate generally, and the House divided, giving for the Motion, 191; against it, 306—Majority against it, 115. The House then adjourned at a quarter to 4 o'clock this morning.

CITY.

Money Market, Friday.—Consols closed to 95 to $\frac{1}{2}$ for Money and Account; and at 95 $\frac{1}{2}$ to $\frac{1}{2}$ for the new Account (April 11); Three per Cents. Reduced, 95 $\frac{1}{2}$ to $\frac{1}{2}$; Three-and-a-half per Cents. Reduced, 102 $\frac{1}{2}$ to $\frac{1}{2}$; New Three-and-a-half per Cents., 101 $\frac{1}{2}$ to $\frac{1}{2}$.

Metropolis and its Vicinity.

The Weather.—The frost has returned this week with increased severity, and Wednesday was beyond doubt the coldest day of the season. The weather up to 12 o'clock on Monday night was exceedingly variable, and slight showers of rain fell at short intervals throughout the day. On Tuesday morning a marked change in the temperature took place, and the thermometer fell to two degrees below freezing point. The wind blew steadily from the north-west, and the cold became more intense as the day advanced. In the evening there was a fall of sleet, and the night set in with every prospect of a hard frost. On Wednesday morning the thermometer stood as low as 26 degrees, and all the ponds in the vicinity of the metropolis were covered with ice. On Wednesday the ornamental waters in the Regent's Park were completely frozen over in the narrower parts, and several gentlemen amused themselves by skating during the day, though the ice was, as may be supposed, very thin. The round pond in Kensington-gardens, and the water in St. James's Park, are now covered with thick ice. The lateness of the period at which this sudden change of the weather has set in almost precludes the possibility of its continuance. The severe frost in 1814, when booths were erected on the Thames, ended on February 14th, the day on which the present frost commenced.

The late Gales.—The sacrifice of life and property at sea during the last six weeks has been without parallel in the history of our mercantile marine. Upon reference to Lloyd's books and other authentic documents, it appears that the total number of vessels lost during the hurricane on the night of the 13th ult., was about 180, and that the number of persons who perished with them amounted to not less than 453. On the coast of England 154 vessels were wrecked, and 190 lives lost; on the coast of Ireland, 5 vessels were lost, with 104 lives; on the coast of Scotland, 17 vessels were lost, with 39 lives; and on the coast of France four vessels and 100 lives were lost. The value of the vessels and cargoes have been roughly estimated at 585,000*l.*—the vessels at 405,000*l.*, and the cargoes at 180,000*l.* On the three following days after the 13th, numerous other wrecks occurred, to the extent of nearly 60, the losses on which were upwards of 240,000*l.*; this, with the others, making a total of 825,000*l.* To this is to be added the great loss of vessels that occurred in the storm of Friday and Saturday week, the particulars of which have not been fully ascertained.

The Temple Church.—The choral service introduced at this church when it was lately opened after the restoration of the building, was unexpectedly suppressed on Sunday week by order of the Master, the Rev. C. Benson. The immediate consequence of the change was so great a diminution in the number of the congregation, that the leading members of the bar have presented a memorial to the benchers, from which we extract the following passage:—"Your establishment of a complete and effective choir is in such perfect harmony with the recent architectural restoration of the church, and in such full consistency

with their character, spirit, and design; and is, moreover, so consonant with the feelings of your members, that they do not hesitate to express to you, and through you, to the Rev. the Master, their deep regret that any change should have been made. The undersigned take this opportunity of acknowledging with gratitude your exertions in the restoration and decoration of the church, and the excellence of your arrangements in the conduct of divine service there. They now beg you to continue those exertions in the same spirit; and trusting that you will, on this occasion, evince your usual consideration for the feelings and wishes of your members at large, they respectfully request that the choral service of the church may be restored to its original beauty and completeness."

Royal Academy.—On Friday, the 10th inst., a general meeting of academicians was held in Trafalgar-square, when Sir William Charles Ross was elected an academican, in the room of the late Sir Francis Chantrey. Mr. J. T. Willmore was elected an associate engraver, in the room of the late Mr. Bromley; and Mr. H. Timbrell was elected a travelling student.

Wood Pavement.—On Tuesday a special meeting of the Commissioners of Sewers took place at Guildhall, for the purpose of considering the motion of which Sir P. Laurie had given notice, with respect to the question of wood-paving; and for the first time this court was thrown open to the public, on the understanding that the public importance of the subject was the sole ground of the privilege being granted. Sir P. Laurie moved, "That it is the opinion of the Court that the wood-pavement in the Poultry is dangerous and inconvenient to the public, and ought to be at once taken up and replaced with granite paving. He said that whatever differences of opinion might exist as regarded the principle of wood-paving in other parts of the Metropolis, there could be but one with regard to that laid down in the Poultry. The evidence of the policeman stationed at the spot was, that no less than 55 horses had fallen down during 8 days. The Norwich mail had its whole four horses down at once; and it was wholly unsafe to ride or drive over it. Since this had happened he had had a return with respect to Newgate-street, and the result was, that 26 horses had fallen there in 9 days, whilst in Cheapside only 4 had taken place during that period. He would not confine the Court to his own opinions merely, he would give them the opinions of others. He then went on at great length to describe the practice of the Recorder, the Sheriff, and others, to go a round of various streets paved with granite in order to avoid wood-pavements; and after many observations condemnatory of the system of wood-paving, he asserted that to pave London with wood would cost 24 millions of money, and that in two years' time the whole of that laid down would be taken up. Mr. Deputy Gordon seconded the motion. Mr. R. L. Jones spoke in favour of wood-pavement, and combatted the arguments of the mover and seconder of the resolution. He concluded by moving the previous question. Mr. Deputy Peatress seconded the amendment; which, after some observations from the Common-Serjeant, Sir C. Marshall, and others, in favour of wood, was carried by a very large majority. At the conclusion of the debate, Sir P. Laurie gave notice that he should move that the future proceedings of the Court be thrown open to the public.

The Cattle Markets.—The contagious disorder which has now for nearly four years attacked the cattle and sheep brought to the London markets has this year returned with redoubled violence. On every market-day both Smithfield market and all the leading lines of intercourse from it are crowded with sheep, which are seen lying in a condition incapacitated for walking. The principal effects on the sheep are shown upon the hoof, where inflammation and subsequent suppuration takes place, and the hoof is at last thrown off. The disease is also extremely prevalent amongst cows and other cattle, and since Christmas the principal dairies in the neighbourhood of town have sustained great losses. The epidemic, if such it may be termed, is not so prevalent on the Surrey as the Middlesex side of the river; although Bermondsey, and particularly the Grange-road, have recently suffered much.

The Docks.—The distress which has so long been felt in the manufacturing districts has begun seriously to affect the shipping interest. In Sunderland, where more ships are built than in any other port, the distress is so great, that the poor-rates in one part of that place have reached 16s. 6d. a year in the pound. In London, a circular has been addressed by Sir John Hall, secretary of the St. Katherine's Docks, to the owners of several vessels now lying in that establishment, stating that the stagnation in the export trade, which retards the despatch of the ships loading outwards, and the unusual number of ships unemployed, lying in the docks and for sale, has rendered it necessary for the Dock Company to remove some of the ships to other docks on the Surrey side of the river, in order to make room for fresh arrivals.

Accidents.—On Thursday afternoon Major Charles Jones, of Upper Montagu-street, Montagu-square, was suddenly deprived of life by the accidental discharge of a pistol. It appeared that the deceased gentleman, who had served throughout the whole of the Peninsular war, was subsequently appointed aide-de-camp to the King of Hanover. Having recently received an invitation to the Court of Hanover, he was about to proceed to that country in a few days. On Thursday afternoon he took from his cases two holster pistols, which had been loaded upwards of five years, and, while drawing the charge of one of them, it accidentally went off, and the contents lodged in his chest, causing instant death. An inquest has been held on the body, but the verdict has not yet been returned.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Satur-

day, Feb. 4:—West districts, 125; North districts, 153; Central districts, 142; East districts, 176; South districts, 184. Total, 780; (390 males, 390 females.) Weekly average for the last five years, 903, (461 males, 442 females,) and for the last five winters, 1004.

Provincial News.

Barnstaple.—The island of Lundy, in the Bristol Channel, the possession of which constitutes the proprietor Sovereign Lord of the Island, is about to be sold by auction; it includes 2,000 acres of land, occupies a space of eight miles in circumference, is exempt from all taxes, tithe, and poor-rate, and has an extensive right of fishery, which brings in a large revenue.—The local papers state that upwards of thirty special warrants have been granted by the magistrates against persons concerned in plundering the wrecks on this coast, noticed by us about three weeks since. Several men of respectable station, have been held to bail, with sureties of 200l. each for their appearance at the county sessions. Part of the sails and oars belonging to the wrecked vessels have been discovered secreted in the Baptist chapel at Appledore, in the pew in which the minister performs the ceremony of baptism.

Bolton.—A requisition, signed by 541 electors of this town, has been presented to Mr. Ainsworth, calling upon him to resign his seat, in consequence of his recent refusal to act with the Anti-Corn Law League. In reply to this communication, Mr. Ainsworth has addressed to them a letter, in which he says—"Gentlemen, I have received your requisition, calling upon me to resign my seat for the borough of Bolton. I must at once decline complying with your request, as I have not 'violated any of my public pledges' on the subject of the Corn-laws, nor acted in any way which ought to forfeit the confidence reposed in me at the last election." He then goes on to refer them to different passages of his speeches, delivered on various occasions, "as his recorded opinions" on the point in dispute.

Brighton.—The attempt to make an Artesian well at the head of the Chain Pier is still in progress, though as yet no successful result has been obtained. The pipe for the water has now been sunk to the full depth intended—80 feet, which is sufficient to prevent any mixture of the salt with the fresh water. The bore extends some feet deeper, and will be proceeded with till it attain a depth of 100 feet below the surface; when it will be a matter of deliberation whether the experiment shall be continued further. It is expected, however, that before this point is reached a spring will be found. The soil through which the bore has been made is soft chalk.

Lancaster.—The trial of Mr. Feargus O'Connor, and the other Chartists connected with the Manchester conference and disturbances, will take place in this city on the 25th inst., a month earlier than they expected, and a special jury has been struck for the purpose. Mr. O'Connor has given directions that Sir James Graham, Mr. Birley, of Manchester, and some others of similar standing, should be subpoenaed to give evidence in his favour. Mr. Roberts is the attorney for the fifty-nine Chartists included in the indictment. Mr. O'Connor, in his address, states that he has expended upwards of 2,000l. in law expenses, and that, as the "Victim Fund" is exhausted, "fifty-nine innocent men will be tried and sacrificed," unless the Chartists come forward and contribute towards their defence.

Nottingham.—The *Globe* states that a very splendid meteor appeared over the north of this county on Sunday week. It is said to have resembled a large body of fire, assuming various shapes, and its velocity was not less than fifty or sixty miles per minute.

Liverpool.—A person connected with a collection of wild beasts, now exhibiting in this town, was arrested for debt last week. After some conversation with the sheriff's officer, he invited him and his followers to view the animals, to which they consented; he described each particular attraction, and finished by entering the den with the lion. The consternation of the officers may be easily imagined when he informed them that he preferred the company of the lions to their own, and stated his intention of remaining where he was, until after twelve o'clock on Saturday night, when the strong arm of the law, for the time being, would be powerless. Threats and persuasions were alike unavailing; all the satisfaction they could obtain was, that if they wanted him they might come and take him. After some time, the plaintiff appeared, and was so well pleased with the joke, that an amicable arrangement soon took place.

Leeds.—Nothing of importance bearing upon the mysterious case of mutilation noticed in our last, has been made public since the adjourned inquest on Monday week. There is little doubt that a murder has been committed in Leeds or its immediate neighbourhood. The Coroner has been informed that a young woman has been missing from Stanley-lane-end, near Wakefield, since the 7th January; but whether she be the party whose body has been found, there is no evidence to show.

Manchester.—The promenades at the Free-trade Hall, in this town, appear to have been the favourite resort of the inhabitants for the last fortnight; no less than from 1,400 to 1,600 persons of various classes having been present on each evening. Last week the numbers of visitors were as follow:—on Saturday evening upwards of 1,200; on Monday evening more than 1,530; on Tuesday about 1,620; on Wednesday, 1,487; on Thursday, 1,331; and on Friday, 1,154; making a total, in the six nights, of 7,322 persons.

Newcastle.—The distress at Newcastle is at present so great, that 5,120 are receiving in-door or out-door paro-

chial relief; and there are 480 inmates in the Union workhouse. In Leeds, the relief granted to out-door paupers is now 9,250l. above what it was three years ago; and, within the same period, the number of applications for relief has increased from 3,481 to 14,839.

Rotherham.—The warfare against turnpike gates, which has prevailed for some time past in Wales, has lately spread to Yorkshire and the neighbouring counties; but rather for purposes of plunder, than in connection with an organised conspiracy. About one, A.M., on Wednesday week, the toll-bar house, called the Brown Bar, and, about an hour afterwards, the toll-house, called the Aldwark Bar, both in the West Riding, were entered and robbed by a gang of five or six men. In each case the leader was mounted on a horse which had been stolen from a stable in the neighbourhood. A late number of the *Nottingham Journal* described a precisely similar outrage committed a week previously at another toll-house, no doubt by the same gang.

Stroud.—The Woodchester property, near this town, one of the estates of the Earl of Ducie, is coming into the market early in the spring. It is said to be the largest estate that has been subject to public competition since the memorable sale of Lord Ormonde's property in 1815, when his estates were sold by Mr. G. Robins for 500,000l. and it is said he expects to obtain for Lord Ducie's more than 300,000l.

Windsor and Eton.—The bust of the Duke of Newcastle, lately executed by Mr. Behnes for the members and masters of Eton College, is to be placed in the library with those of the Marquis Wellesley, Lord North, Lord Grenville, and Mr. Fox. The following are the particulars of the Newcastle scholarships, recently founded by the Duke:—There are three scholarships of the value of 50l. per annum each, to be held for three years, and open to competition for all boys of the sixth form, and upper division of the fifth, and such of the middle division who should leave school before the next examination. The estates of the Duke at West Markham and Egmont in Nottinghamshire, have been charged by his Grace with the payment of 206l. per annum for ever, by deed directed to be executed between the Duke of Newcastle on the one part, the Archbishop of Canterbury on the second part, and the Provost and College of Eton on the third part, to whom the above sum is ordered to be paid half-yearly, in trust for the above purposes, and to be applied accordingly. Each scholar receives the first year 40l. in money, and is presented with books to the value of the remaining 10l., bearing the arms of his Grace on one side, and those of the College on the other.—It is stated that Mr. Cook, the joint patentee with Professor Wheatstone, of the Voltaic Telegraph, has been commissioned to lay down a line from the Paddington station of the Great Western Railway to Windsor Castle, and carry it thence to the houses of Parliament and Buckingham Palace, so that on important occasions, when the Queen may be at Windsor, any intelligence of extraordinary interest may be immediately transmitted to her Majesty.—The Commissioners of Woods and Forests have given directions that an ornamental palisading be erected in lieu of the iron fence, which now divides that portion of the Great Park, in the Long-walk, known as the double gates. This will be a great improvement, especially when viewed from the Castle. The palisading will be nearly 170 feet in length, with an ornamental gate in the centre of the Long-walk, embellished in the Elizabethan style, to harmonize with the architectural character of the keeper's lodge. On either side will be two smaller ornamental gates for foot passengers.—Considerable alarm was created at Windsor on Thursday morning, in consequence of flames being perceived issuing from the roof of the Castle at the western extremity of the North-terrace. It appears that the soot in the chimney of the room beneath a portion of the state apartments had ignited, but the flames were subdued without much difficulty.

Worcester.—We have before alluded to the hostility shown in this county to the establishment of the rural police. We now learn by the Worcester papers that the rate-payers of this county have been busily employed during the last month in calling vestry meetings to give answers to the questions in the circular issued by the magistrates' committee. These answers are said to have been opened by the committee last week, and though the result cannot be officially known until the report has been brought forward at the next Easter sessions, rumours are current that it will be a decisive and almost unanimous expression of dissatisfaction with the present force. It is reported that offers have been made of employing at liberal wages, under Sir J. Graham's Act, considerably more paid constables than now exist in the rural police. These offers are contingent upon the abolition of the rural police in the county, and the opinion is now becoming general among all parties that it cannot be maintained.

York.—The local papers mention that Mrs. Wood, formerly well known on the London stage as Miss Paton, has become a convert to the Roman Catholic faith, and is at present staying at the convent of Micklegate Bar, near this city. She was expected to make her first communion on Sunday last.

Railways.—The following are the returns for the past week:—Greenwich, 663l.; Eastern Counties, 800l.; Liverpool and Manchester, 3,864l.; Croydon, 199l.; Brighton, 2,882l.; Grand Junction, 6,741l.; York and North Midland, 1,337l.; Blackwall, 498l.; Grand North of England, 1,241l.; Edinburgh and Glasgow, 1,471l.; Sheffield and Manchester, 282l.; Manchester and Birmingham, 2,493l.; Manchester and Leeds, 3,901l.; Glasgow and Paisley, 738l.; Midland Counties, 2,282l.; Hull and Selby, 811l.; Birmingham and Gloucester, 1,558l.; Birmingham and Derby, 1,201l.; North Midland, 3,703l.; South Western, 4,789l.; Great

Western, 11,090*l.*; Dover, 1,262*l.*; Birmingham, 13,974*l.*; Northern and Eastern, 1,192*l.*—The half-yearly meeting of the London and Birmingham Company was held on the 10th inst., when the attendance of proprietors was larger than usual. The directors' report showed that the receipts for the last half-year were 426,679*l.*, being a decrease of 8,355*l.* on the corresponding half-year, chiefly owing to the general depression under which every branch of trade and manufacture has been suffering. The greatest falling off is in the receipts of the 1st class passengers, while on the other hand there had been an increase of those of the 3d class. The diminution in the expenses of working the line had been, during the three years, 41,397*l.* The net profit to be divided among the shareholders was 248,818*l.* 13*s.* 5*d.*, and a dividend of 5*l.* per cent. on the capital stock was recommended and unanimously adopted. The balance is to be carried to the credit of the next half-year, and the income-tax to be deducted from the dividend of each proprietor.—The half-yearly meeting of the Northern and Eastern Company took place on Thursday. The report stated, that during the six months ending the 31st December, the receipts from passengers and parcels amounted to 35,746*l.*, which exceeded the previous half-year's receipts by 6,760*l.* 7*s.* 8*d.* After deducting 3,906*l.* 15*s.*, the interest on debentures, there remained a balance of 9,702*l.* 3*s.* 4*d.*, from which the Directors recommended a dividend, at the rate of 4 per cent. per annum on the paid-up capital, or 18*s.* per share, which would leave a sum of 1,276*l.* to be carried forward. A motion for a committee of investigation was expected, but it was not pressed, as the directors themselves frankly acknowledged that they could not be said to have displayed ability in their administration. They appeared rather to throw themselves upon the consideration of the shareholders, since the point of depression was past, reminding them of pecuniary help which two or three of the Directors (Messrs. Crawshaw, Routh, &c.) had afforded in bringing the company through its early difficulties to its present position, which is asserted to be one that will, with care and caution in future management, enable the declaration of a dividend from actual revenue of at least 7 or 8 per cent. The increased revenue is expected to result from the development of the goods traffic on the Bishop Stortford district and the Hertford and Ware branch when completed. Several new directors were elected before the meeting broke up.—The half-yearly general meeting of the London Grand Junction Company was held on Saturday, when a resolution was passed empowering the Directors, now that the Act incorporating the Company had expired, to call in the certificates of shares, with a view to winding up the affairs, and of dividing the balance in hand of 3,599*l.* on the 7,600 paid up shares. The chairman, in acknowledging a vote of thanks in behalf of himself and colleagues, said he believed that the termination of the Company's affairs would be more satisfactory than its commencement, and that the expenses had been kept down as closely as possible.—A dividend of 5 per cent. has been declared to the Edinburgh and Glasgow Railway shareholders, the profits for the half-year being 40,813*l.* The visit of the Queen to Scotland had contributed much to this revenue, and it was therefore determined to increase the reserved fund with a larger appropriation of revenue than usual. The line is worked at the rate of 33 per cent. for expenses.—At the meeting of the Chester and Birkenhead Company last week, it was resolved to announce a dividend of 10*s.* per share for profit, amounting to 5,297*l.* on the half-year's traffic. Retrenchments have been made in the working expenses of the line to the extent of 1,781*l.* in the last six months.—Another letter has been addressed by the Board of Trade to the directors of the North Midland Railway with reference to the late fatal accident on that line, and to the reductions in the establishment. It states that the Inspector-General, after investigating the railway, has not only confirmed the opinion expressed by the Board in their former letter respecting "the inexpediency of sudden and sweeping reductions affecting the class of servants upon whose skill and good conduct the safety of the passengers depends, as a general principle; but has also led their Lordships to regret that, in the particular instance of the North Midland Railway Company, the directors should have adopted measures which their Lordships cannot but consider, from the circumstances as reported by the Inspector-General, to have been calculated to compromise, and to have, in fact, compromised, the safety of the public travelling by that line." They also express a hope that the directors will omit no opportunity of replacing the working establishment of the line on a footing efficient in all respects as regards the public safety, as it was before the recent reductions were enforced.—The half-yearly general meeting of the Great Western Railway Company was held on Thursday. The report stated that the revenue for the last six months showed an increase of 21,311*l.* over the corresponding period of 1841, which was partly to be ascribed to the additional distance opened between Bridgewater and Taunton. The number of passengers conveyed during the half-year had been 869,444, and the total traffic receipts 358,664*l.*; of which 302,084*l.* was the exclusive earnings of the Great Western Railway proper. The working expenses had been reduced to 36 per cent., exclusive of the cost for depreciation of stock. The disposable balance in hand was 108,482*l.*; out of which, in accordance with the recommendation of the Directors, a dividend was declared for the half-year at the rate of six per cent., leaving a balance, after deducting the income-tax, of 2,607*l.* to be carried to the current account. The board also proposed to reduce the remuneration voted to the twelve directors to 1,200*l.* per annum.

IRELAND.

Dublin.—Mr. G. A. Hamilton was last week elected representative for the University of Dublin, in the room of Judge Jackson. There was no opposition, the opponents of national education having led the Attorney-General and the government to retire from the field. Mr. Hamilton spoke at great length on the education and Maynooth questions, in opposition to the policy adopted by government on those subjects.—On Saturday the governor of the Marshalsea received an application from Mr. Joshua Jacob, the leader of a new sect called the White Quakers, "for liberty to go forth into the city to do the work of the Lord," with which he refused to comply. He then begged to be allowed to attend the Catholic chapel, promising "to be a silent spectator, unless an overwhelming impulse of the Spirit come upon him." The deputy-marshal was sent to him, by the directions of the Governor, to state that this application would be acceded to, if he gave an unconditional promise not to create any disturbance. He made no immediate reply, but after staring at the deputy for about twenty minutes, exclaimed, "Thou art like unto a dead man before me by the power of the Lord God." Under these circumstances it was considered [unadvisable to allow him to attend the chapel, more especially since the recent proceedings of the sect have rendered it desirable to give no encouragement to the public manifestations of their enthusiasm.—The Poor-law Guardians in different parts of the country continue to express dissatisfaction at the removal of Mr. Phelan from his office of assistant-commissioner. At the meeting of the board of Guardians of the Abbeyleix union on Monday, Lord de Vesci presiding, a resolution was adopted describing Mr. Phelan as a most efficient and impartial officer, and expressing an "anxious hope that his services as assistant Poor-law Commissioner may be continued." This resolution was moved by Mr. Price, agent to the Marquess of Lansdowne, and supported by gentlemen of Conservative, Whig, and Radical politics, who concurred in condemning the measure as one of unnecessary harshness.—At the meeting of the Repeal Association on Monday, an abstract of the accounts from the 6th Sept. last to the 26th of last month, was produced. The receipts during this period were 2,566*l.* 17*s.* 8*d.*, including a balance in hand of 253*l.* 12*s.* 2*d.* The expenditure was 2,233*l.* 1*s.* 3*d.*, leaving a balance in favour of the Association of 333*l.* 16*s.* 5*d.* Mr. O'Connell advertent to this unusually large balance, said that the association was never so completely free from debt, nor were their prospects for repeal ever so bright. The spirit was spreading in every quarter, and the Presbyterians of the north were joining them in all directions. He then proceeded at great length to enlarge upon the future movements of the Repealers, and on the present state of European policy. The leading topics were those which he has so frequently urged, namely, that Ireland always obtained concessions from England when she was in a state of embarrassment, and that if he had three millions of Repealers now, no one could doubt that he would carry a repeal of the Union. He dwelt at length upon the present distressed state of England in her domestic and foreign relations, as furnishing strong grounds of hope for Ireland. "Many persons," he said, "had asked him why he did not attend Parliament now? What was the use of it? What good could he do in Sir R. Peel's packed Parliament? He had never looked for French or any foreign alliance. He relied upon Ireland and the Irish, but he would not refuse to receive [the co-operation or sympathy of any good and wise nation. The great mistake in the career of Napoleon was, that he undervalued Ireland. If, instead of going out to Egypt, he had brought 40,000 men to Ireland—if, instead of going to Russia, amid its snows, he had sent 50,000 men to Ireland, his story would have been different. The wealthy inhabitants of the country might have opposed him, but the people would have asked each other if they would not do better under the sway of Napoleon than under that of England, and the connexion between the countries would have been severed in less time than he was addressing the meeting."—An action brought by the Rev. Mr. Hurst, of St. Catherine's parish, against Mr. Whaley, for defamation of character, which had excited a great deal of local interest, and occupied many days in trial, was brought to a conclusion on Tuesday. The court was crowded at an early hour to hear the charge of the Chief Justice, who stated the case at great length; after which, the jury returned a verdict for Mr. Hurst, acquitting him of the charge of intoxication on the days specified in the pleadings; on the other issues they found for the defendant, thus exonerating him from the imputation of malice in preferring his complaint to the Archbishop, on which the present action was founded.

SCOTLAND.

Edinburgh.—The *Caledonian Mercury* states that the Government have raised, in name of the officers of state, an action of damages against a Presbytery in Argyleshire, for refusing to settle an unacceptable presentee in the parish of Muckairn, and that the damages they claim amount to 15,000*l.*, although, by a recent decision of the court, the patrons get the vacant stipend. This step on the part of the Government is decisive, and puts an end to all prospect of a settlement of the Church question, if any such remained after the letter of Sir J. Graham.

Glasgow.—The local papers inform us that a richly-chased tea and coffee service of plate, together with a silver candelabrum, have been presented to Mr. Alison, sheriff of the county, by an unknown individual in one of the commercial cities of England. The following inscription is engraven on the tribute:—"To Archibald Alison, Esq., Author of the 'History of Europe during the

French Revolution,' in testimony of the sense entertained of the benefits he has conferred upon his country. From an Unknown Donor."—On Wednesday last, at the half-yearly meeting of the Glasgow Railway Company, the question of Sunday travelling was again brought forward. Mr. Henderson moved the discontinuance of the Sunday trains, which, after a long discussion, was put to the vote. There appeared of those present:—For the Sunday trains, 301 votes; against them, 323. Majority 22. Scrutineers were appointed to examine the proxies, when the gross majority, so far as could be ascertained, was 1,307 in favour of the Sunday trains.

THEATRICALS.

DRURY LANE.—On Saturday night a new tragic drama, in three acts, called *A Blot in the 'Scutcheon*, from the pen of Mr. Browning, was produced at this theatre with complete success. The interest of the plot hinges on the anxiety of Lord Tresham, a haughty noble, proud of his stainless 'scutcheon, and of his long line of illustrious ancestors, that the present representatives of the family, himself and his sister, should transmit to their posterity the lineal honour pure and untarnished as they had received it. He discovers that this sister has brought dishonour on her family, and the piece closes with her death after her lover has fallen by the hand of her brother. The principal characters were sustained by Mr. Phelps, Mr. Anderson, and Miss H. Faucitt, who were called for at the close of the play, together with the author, to receive the applauses of the audience.

COVENT GARDEN.—On Monday night the most formidable uproar took place that has been known within the walls of a theatre for years—formidable, because there was nothing ironical on the part of the audience; the expression of feeling being one of unmitigated indignation. Scarcely any females were in the boxes, and though the house was thinly attended, there was from the first something ominous in the appearance of the audience. The public had been made aware some days before, through the medium of advertisements, that on Monday evening Mr. Gregory, known to many as the editor of a weekly paper notorious for its attacks on private character, was to make his appearance upon the stage in the character of *Hamlet*. He accordingly did make his first, and, no doubt, his final appearance on that night. The curtain rose, and the first scene, in which the ghost is visible to Horatio, was allowed to proceed quietly. The scene changed; the King and Queen, followed by their retinue, entered in peace, but as soon as *Hamlet*, who is the last person in the procession, was seen, the audience broke out into a yell that surpasses description. Finding that the uproar did not abate, he commenced in the very midst of it his part of the performance. The first opening of his mouth seemed to call forth fresh elements of confusion. The play was, however, continued, but not a syllable was heard except the mingled hisses and groans of the audience; and the first act of *Hamlet* was, perhaps, for the first time, performed in dumb show. An attempt was made to proceed with the second act, but the uproar rather increased than diminished, and at length, finding it impossible to go on with the performance, Mr. Bartley, the stage-manager, came forward, but could not obtain a hearing. He was, however, understood to say he was satisfied that the majority of the audience were opposed to the continuance of the play, and that it should be instantly discontinued in obedience to their will. With this promise the audience appeared satisfied, and the uproar ceased for a while. To occupy the intervening time before the ballet opera of *The Maid of Cashmere*, a part of the farce of *Cousin Lambkin* was played, but the confusion was still as great as ever, although it now arose from a different quarter. A party of persons who are said to have attended in order to secure the triumph of Mr. Gregory, were determined that the substitute for *Hamlet* should be a failure. Mr. Bartley, however, persevered, and finished the piece, although the dialogue, during the whole time, was completely inaudible. With this, however, the uproar ceased, and the rest of the performances went on without interruption.

Miscellaneous.

Expedition to the South Pole.—Lieut. M'Murdo of the Terror has arrived in town from this expedition, which he left at the Falkland Islands, all well, and in the highest spirits. He reports that Captain Ross had triumphantly accomplished every object for which the expedition was undertaken, and that the Government at home, sensible of this, had left it entirely to Captain Ross's discretion, as to his returning home at once or remaining out for a longer period, for the purpose of exploring other objects of interest in this hitherto imperfectly known portion of our globe; that Captain Ross has made choice of the former, and that we may therefore expect the expedition home early in May. Lieut. M'Murdo states, that in consequence of the excellent discipline observed on board the Erebus and Terror, and the great care and attention paid to the health of their respective crews, the expedition had lost but four men since leaving England, viz., one blown overboard in a gale at the Cape, another from some constitutional disease, and the other two from natural causes. Lieut. M'Murdo is also the bearer of several valuable specimens of grapes and seeds, collected at the Falkland Islands and various other places in the southern hemisphere. It appears that Captain Ross has penetrated the Antarctic Circle to 71° 40', has surveyed the coast discovered by him along its western boundary, and has proceeded to do the same along the eastern line.

The Poet Laureate.—The following melancholy extract from a communication from Mrs. Southey (formerly well

BIRTHS.—On the 14th inst., at Edmondthorpe-hall, Leicestershire, the Hon. Mrs. Edwards, of a daughter.—On the 16th inst., Mrs. C. Craufurd, Chatham place, Camberwell-grove, of a daughter.—At Tickledo House, near Hitchin, in the Wimpole street, the Hon Mrs. Hall, of a son.—On the 17th inst., at the Lady Mayress, of a son.—On the 27th ult., at Hall House, Kent, the residence of her mother, Lady McCreagh, wife of W. J. Armstrong, Esq., of Kippure Park, county of Wicklow, of a son.

MARRIED.—On the 11th inst., at Chiswick Church, Mr. Rene Langeler, of Jersey, to Elizabeth, second daughter of Mr. Sich, of Chiswick.—On the 15th inst., at Oaklam Park, Sir G. W. Craufurd, Bart., to the Hon. Hester King, eldest daughter of the late Lord King, and sister to the Earl of Lovelace.—On the 25th Oct. last, at Mulmein, Capt J. A. West, of the 64th Regiment, to Emma, only daughter of Capt Day, 14th Regiment.—On the 13th inst., at St. Pancras New Church, W. L. Andersen, Esq., of the Admiralty, Somerset-house, to Mary, second daughter of J. Spurrier, Esq., Deputy Commissary-General, of Camden-road.

DIED.—On the 9th inst., at his seat, Newpark, Waterford, for which city he was the representative, Sir John Newport, Bart.—On the 10th inst., Sir F. M. Hesketh, Bart., aged 44.—On the 12th inst., suddenly, the Rev. W. M. Pitt, rector of St. Sepulchre, London.—On the 13th inst., Lord Robert Seymour, of Arms, aged 67, son of Lord Robert Seymour, and for many years Sergeant at Arms to the House of Commons, at Larnaca, in the beginning of January last, of fever, aged 39, Dr. James Liburn, H.B.M.'s Consul for the Island of Cyprus.—At Airthrey Castle, aged 74, the Rt. Hon. Lord Abercromby.

PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., &c., upon the above system, which has (at an immense cost to the inventor), been brought to great perfection, and heats the same by HOTWATER APPARATUS, with improved Tube or Conical Boilers. **W. HILL** also adapts **DR. ARNOTT'S NEW BALANCED REGULATOR** to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. **PENN'S SYSTEM** only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the inventor's Residence, Lewisham. The great end gained by adopting this system, is a perfect and rapid Circulation, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer heat, with as much comfort as could possibly be derived from an out-door temperature equally high. **W. HILL** would refer any, who may desire to apply the above system to Forcing-Houses in particular, to **MR. JOHN WILLMOT**, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to **W. HILL**, Builder and Surveyor, Lewisham.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by **DANIEL and EDWARD BAILEY**, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—**STEPHENSON and Co.**, 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of **Dr. Lindley** to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4*l.* 4*s.* and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.

N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

THE TANK AND TROUGH SYSTEM OF HEATING HOTHOUSES AND OTHER BUILDINGS.

J. THOMSON'S IMPROVED PLAN of applying the Tank and Trough Mode of Warming Horticultural and other Buildings with his NEWLY-INVENTED and ECONOMIC BOILER, which has been adopted and may be seen in use at two of the most extensive Horticultural Establishments in the three Kingdoms, viz., Messrs. Lums' Nursery, Hammersmith, and Mr. Wilmore's, Brentford.—Designs only, or Plans and Estimates furnished for Building and Warming Horticultural Erections, on application to **J. THOMSON**, Landscape Gardener and Hothouse Designer, No. 4, Chapel-place, Hammersmith, late Head-Gardener to the Duke of Northumberland, Stion House, and many years in the Garden Establishment of Her Majesty; and Author of "A Practical Treatise on the Construction and Heating of Horticultural Buildings," published 1838.

J. T. has applied the above system for Bottom Heat and other purposes at Lord Prudhoe's and several other places in England, with great success, within the last four years.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. **WIRE-WORK** in Trainers, Arches for Walks, Bording, Flower-stands, Pheasantries, &c. **HORTICULTURAL BUILDINGS**, Green and Hothouses, Conservatories, &c. The same heated by **HOT-WATER APPARATUS**, on improved and economical principles.

Partes waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

THE ILLUSTRATED POLYTECHNIC REVIEW, No. VII., with a Portrait of Brunelleschi, and numerous Illustrations, will contain—Fine Arts: British Institution (Second Notice), Exhibition at Rome, &c.—Science: Crosse's Acarus, Grove's Gaseous Battery, &c.—Reviews—Notices on Science, Art, Music, the Drama, &c., &c.—Price 4*d.* unstamped; 5*d.* stamped. Office, 143, Strand.

TO AGRICULTURISTS.

Now ready,
1. ON GUANO AS A FERTILIZER. By C. W. JOHNSON, Esq. Price 1*s.* 6*d.* 2. ON FERTILIZERS IN GENERAL. By C. W. JOHNSON, Esq. 1 vol. 8vo. Price 12*s.* 3. THE COTTAGE FARMER'S ASSISTANT. By C. W. JOHNSON, Esq. Price 1*s.* 4. THE FARMER'S ALMANAC for 1841-2-3, by JOHNSON and SHAW, are still on sale. Price 1*s.* each. In the Press, 5. AGRICULTURAL CHEMISTRY. By C. W. JOHNSON, Esq. Price 1*s.* 6. MORTON ON THE NATURE AND PROPERTY OF SOILS. Third Edition, 7*s.*
JAMES RIDGWAY, Piccadilly, and all Booksellers.

Two vols. 8vo. with 5 coloured Plates, 31*s.* 6*d.*, cloth,
AN INTRODUCTION TO ENTOMOLOGY; or, Elements of the Natural History of Insects: comprising an Account of Noxious and Useful Insects, of their Metamorphoses, Food, Stratagems, Habitations, Societies, Motions, Noises, Hybernation, Instinct, &c. By **W. KIRBY**, M.A., F.R.S., and L.S., Rector of Barham; and **W. SPENCE**, Esq., F.R.S., and L.S. Sixth Edition, corrected and considerably enlarged.

* * * The first two (or popular) volumes of the "Introduction to Entomology" are now published as a separate work, distinct from the third and fourth volumes; and, though much enlarged, at a considerable reduction in price, in order that the numerous class of readers who confine their study of Insects to that of their manners and economy, need not be burthened with the cost of the technical portion of the work, relating to their anatomy, physiology, &c.

"Let no man think he knows how to enjoy the country who has not studied the volumes of Kirby and Spence's delightful 'Introduction.'"—*Quarterly Review*, No. 141, Dec. 1842.

"This work, the delight of youth, and the admiration of our mature age, is well known as the most entertaining account of insects ever put into a popular form."—*Dr. Lindley*, in the *Gardeners' Chronicle*.

Lately published, in 2 vols. 8vo., with about 2,500 Figures, 2*l.* 7*s.* cloth,

AN INTRODUCTION TO THE MODERN CLASSIFICATION OF INSECTS. By **J. O. WESTWOOD**, F.L.S., &c. Intended as a Sequel to Kirby and Spence.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Lately published, illustrated by several Plates, price 3*s.*
THE HISTORY AND MANAGEMENT OF BEES, with Notices of a New Hive, on the Polish plan, invented by the Author, **JOHN WIGHTON**, Gardener to Lord Stafford.

"We strongly recommend this book to all who keep bees, more especially to gentlemen's gardeners."—*London's Gard. Mag.*
"A Treatise on the subject, apparently the result of experience and careful observations, cannot be without its interest."—*The Editor of the Gardeners' Chronicle*.

London: Longman & Co., Paternoster-row. Norwich: Bacon & Co. May be had through any Bookseller.

Foolscap 8vo., price 1*s.*

HARRISON'S GARDEN ALMANACK and FLORAL CALENDAR for 1843, containing ample Directions for Gardening—by **JOSEPH HARRISON**, Editor of the "Floricultural Cabinet."

CLARKE'S LADIES' HANDBOOKS, impl. 32mo., cloth edges, price 1*s.*

1. Fancy Needlework and Embroidery.—2. Knitting, Netting, and Crochet.—3. Knitting, Netting, and Crochet.—4. Plain Needlework.—5. Baby Linen.—6. Embroidery on Muslin and Lace-work.—7. Millinery and Dress-making.—8. The Toilette.
H. J. CLARKE and Co., Old Bailey.

HISTORICAL WORKS FOR SCHOOLS AND PRIVATE INSTRUCTION. WHITTAKER and Co., Ave Maria lane.

WHITTAKER'S IMPROVED EDITIONS OF PINNOCK'S GOLDSMITH'S HISTORIES, in 12mo.

HISTORY OF ENGLAND. The 32nd edition, 6*s.* bound.
HISTORY OF ROME. The 21st edition, 5*s.* 6*d.* bound.
HISTORY OF GREECE. The 17th edition, 5*s.* 6*d.* bound.

Several Hundred pounds have been expended on these works, since they have become the property of Messrs. WHITTAKER and Co., and they have been embellished with numerous portraits, woodcuts, and coloured maps and plans, and edited on the explanatory and interrogative systems, copiously illustrated by notes, genealogical tables, and maps, and the latest elucidations of classical antiquarians. By **Dr. W. C. TAYLOR**.

THE HISTORY OF THE OVERTHROW OF THE ROMAN EMPIRE, and the Formation of the Principal European States. By **Dr. W. C. TAYLOR**. 12mo, 6*s.* 6*d.* cloth.

HISTORY OF FRANCE AND NORMANDY, on the plan of Pinnock's Histories. By **Dr. W. C. TAYLOR**. Second edition, 12mo, 6*s.* bound.

PROFESSOR WILSON'S MANUAL OF HISTORY AND CHRONOLOGY. In 12mo, 4*s.* 6*d.* bound.

THE STREAM OF HISTORY. Mounted on rollers. Price 1*l.* 16*s.*

HAMILTON'S CHRONOLOGY, HISTORY, and BIOGRAPHY. A Companion to the "Stream of History." Price 3*s.* 6*d.*

PINNOCK'S HISTORY OF THE BIBLE. 12mo, 3*s.* bound.

WHITTAKER'S IMPROVED EDITIONS OF PINNOCK'S CATECHISMS.

Ancient History	History of Rome.
Bible and Gospel	" Greece.
History of England	" The Jews.
" Scotland.	Modern History.
" Ireland.	Scripture History.
" France.	Universal History.
" America.	Mythology.

In which the important and leading facts of each History are narrated so as to impress the minds of young persons. 18mo., 9*d.* each, sewed.

GEOGRAPHICAL WORKS FOR SCHOOLS AND PRIVATE INSTRUCTION. WHITTAKER and Co., Ave Maria lane.

ROBERTS'S MODERN GEOGRAPHY and HISTORY, with Engravings and 12 Maps. 12mo, 6*s.* 6*d.*

WOODBRIDGE'S ATLAS; exhibiting, also the Religions, Forms of Government, Degrees of Civilization, Comparative Size of Towns, Rivers, and Mountains, and the Climates and Productions of the Earth. Royal 4to., 8*s.* half-bound.

WOODBRIDGE'S GEOGRAPHY; illustrative of the foregoing Atlas. With numerous Engravings. Fourth Edition, 18mo., 3*s.* 6*d.* bound.

WHITTAKER'S IMPROVED EDITIONS OF PINNOCK'S CATECHISMS:—

British Geography (Five Parts).	General Geography.
England and Wales.	Use of the Globes (Two Parts).
Scotland.	Geology.
Ireland.	Botany.
Colonies of Europe & America.	Natural History.
Colonies, Asia, Africa, &c.	

In each of these little treatises the elements of the various subjects are explained in the simplest and clearest manner. 18mo., price 9*d.* each.

Price Two Shillings, in cloth.

FRUIT-TREES: a Hand-Book for Cultivators; being a Practical Exposition of the Art of Pruning Fruit-Trees; shewing the Defects and Difficulties of Modern Practice, with Proposed Remedies; including Advice and Information, founded on long Experience and extensive Observation. By **JAMES MAIN**, A.L.S.—Recommended in *Gardeners' Chronicle*, Feb. 5, 1842.
R. TYAS, 8, Paternoster-row.

SCULPTURE, PAINTING, AND ARCHITECTURE.

LECTURES at the ROYAL ACADEMY.—The very general satisfaction that has been expressed at the publication of **PROFESSOR COCKERELL'S LECTURES ON ARCHITECTURE**, has induced the Proprietors of THE ATHENÆUM to make such arrangements as will ensure Full and Correct Reports of **SIR RICHARD WESTMACOTT'S LECTURES ON SCULPTURE** and **PROFESSOR HOWARD'S LECTURES ON PAINTING**. The First by **SIR RICHARD WESTMACOTT** appears in THE ATHENÆUM of THIS DAY, Feb. 18, which also contains the Fifth of **Professor Cockerell's Lectures on Architecture**; with the customary Reviews of New Books, &c. &c. The First Lecture by **W. HOWARD**, Esq., will appear in THE ATHENÆUM of Saturday next, Feb. 25.

POPULAR FLOWERS.—On the 28th inst., price Sixpence, **THE CARNATION** (with Coloured Plate), its Propagation, Cultivation, and General Treatment in all seasons. CONTENTS:—History, Bizarres, Flakes, Picotees, Properties of a first-rate Flower, Time of Sowing, Seedlings, Layers, Flowering, Drainage, Destructive Insects, Composts, New Varieties, Choice Kinds, &c., &c.

* * * The GERANIUM and the PANSY have both been reprinted, and may be had of every Bookseller in the Kingdom. Price 6*d.* each, with a coloured Plate. **R. TYAS**, Paternoster-row.

ROSES IN POTS.

THE GARDENER AND PRACTICAL FLORIST, No. 27 will contain a most complete Treatise on the Culture, Management, and Exhibition of Roses in Pots, by **GEO. GLENNY**, F.H.S., together with the usual information by the Editor.

* * * Four Postage Stamps sent to the Publisher, **R. GROOMBRIDGE**, 5, Paternoster Row, will insure the free delivery of this Number per post.

COTTAGE BY THE SEA.—TO BE LET, Furnished or Unfurnished, a DETACHED COTTAGE RESIDENCE, with Good Garden, at Hayling, Hants, with good Views, and near the Sea and Baths, and about five hours' journey from London. Apply at the office of **Mr. Wm. Bromley**, Solicitor Gray's Inn square.

H. WALKER'S NEEDLES (by Authority the "Queen's Own"), with the New Large Eyes, are easily threaded (even by blind persons), and worked with great ease, having Improved Points, Temper, and Finish. The Labels are correct Likenesses of Her Majesty and His Royal Highness Prince Albert in relief, on coloured grounds.

H. WALKER'S Improved Fish-hooks, Steel Pens, Hooks and Eyes, Bodkins, &c., are particularly recommended to notice.

For the Home Trade, neat packages of Needles or Pens, from 1*s.* to 10*s.* value, can be sent free by post by any respectable dealer, on receipt of 13 penny stamps for every shilling value. Every quality, &c., for shipping.

H. WALKER, Manufacturer to the Queen, 20, Maiden-lane, Wood-street.

ROWLAND'S MACASSAR OIL.—Under the Special Patronage of Her Most Gracious Majesty the QUEEN, the Royal Family, and the several Courts of Europe. This Oil is universally acknowledged to be the ONLY ARTIFICIAL that will effectually produce and restore Hair, prevent it from falling off or turning grey, free it from scurf and dandruff, and will render it delightfully soft and flexible. It will also preserve the coiffure in the heated atmosphere of crowded assemblies. CAUTION.—Much pernicious trash is now offered for sale as "MACASSAR OIL," it is therefore of great importance to purchasers to see that the words "ROWLAND'S MACASSAR OIL" are engraven on the wrapper. All others are "GROSS IMPOSITIONS." The Proprietor's Signature is also engraven on the wrapper, thus:—**A. ROWLAND & SON**, 20, HATTON GARDEN, LONDON; Countersigned "ALEX. ROWLAND." Price 3*s.* 6*d.*—7*s.* Family Bottles (equal to four small), 10*s.* 6*d.*, and double that size 21*s.* per bottle. Ask for "Rowland's Macassar Oil." Sold by them and by Chemists and Perfumers.

NOTICE TO ALL.—"I should be obliged by your sending me a Waterproof Coddington Frock, the same size as the one I purchased from you March 20th, 1841. I have found that one answer well; I never got wet in it, and it is still Waterproof, though it has been exposed to all weathers, both at sea and on shore, and has been worn on all occasions, &c.; and I would strongly recommend the same kind to every one, &c.—**JOHN A. BARTLETT**, master and part owner of the barque Hannah, of Exeter.—Tor, near Torquay, Devon, Feb. 2d, 1843."—The garment referred to is **BERDOE'S** well-known VENTILATING WATERPROOF FROCK (in lieu of the Macintosh), a gentlemanly and established garment, adapted for general use at all seasons, and warranted (without confining perspiration) to exclude any description or quantity of rain whatever.—Made only by **W. BERDOE**, Tailor, Waterproof, &c., 69, Cornhill, eight doors from Bishopsgate-street.

SHIRLEY VINEYARD, near Southampton.—The Proprietor of this Establishment respectfully announces that he has now made sufficient progress in it to enable him to commence, forthwith, a series of experiments of a most important character, and on an extensive scale, relative to the Culture of the Vine under Glass; the object of which will be to free that interesting and valuable branch of Horticulture from the difficulties and uncertainty which have hitherto surrounded it, and to place it on such a basis, as to ensure the production of very superior fruit, with ease, certainty, and economy.

In the prosecution of this design, and in that of cultivating the Vine on open walls; and also in the propagation of Vine Plants in the nursery department of the Vineyard, he is desirous of having associated with him a few respectable Youths, as Articled Pupils, who, in addition to being taught the most improved mode of Vine Culture in all its various branches, and (as necessarily involved in it) the Theory and Practice of all the grand Principles on which the delightful Science of Horticulture is based, will also enjoy a great number of valuable EDUCATIONAL ADVANTAGES, of a sterling practical character, and such as, in combination with the above, will enable them, with industrial application, to occupy, at the expiration of their pupilage, a superior and independent rank in society.

To Parents who are desirous of providing for their Sons the knowledge of a superior and profitable pursuit, in preference to their becoming dependent on the precarious issue of mercantile or trading occupations, the opportunity thus offered may be considered as highly deserving of their attention.

As the Pupils will be considered as members of the family, and treated in every respect in the most liberal manner, a suitable Premium will be required.

Applications, personally or by letter, may be made to **Mr. CLEMENT HOARE**, at the Vineyard.

It is intended to limit the number of Pupils for the present to four, and **Mr. H.** will be ready to receive them in the ensuing month of March. February 8, 1843.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 2, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, February 18, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 8—1843.

SATURDAY, FEBRUARY 25.

Price 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Achimenes, forming bulbs in the axils of the leaves . . .	105 b
Amaryllis Belladonna, its treatment . . .	102 b
Amateur's Garden . . .	100 c
Annals, good kinds . . .	105 a
Ants in houses, to destroy . . .	105 c
Apple-tree caterpillars, to destroy . . .	105 c
Asparagus, to grow in bottles . . .	105 c
Avaries, their construction . . .	101 c
Barley, bulbous-rooted . . .	103 b
Bees, their habits and winter treatment . . .	101 b
Botany, new work on . . .	103 b
Brewers' Grains, as manure . . .	105 a
Cacti, their treatment . . .	105 b
Caledonian Hort. Soc. Garden noticed . . .	103 c
Camellias, their treatment . . .	103 b
Cattle, good work on . . .	105 a
Celery, treatment of . . .	105 b
Charming Roses . . .	105 b
Clover, probable cause of its failure . . .	99 b
Coniferous plants, their treatment when young . . .	105 a
Conservatory, plants for . . .	104 b
Copple-wood, treatment of . . .	101 a
Couch-grass, to destroy . . .	103 a
Creepers, to run up a rough-cast wall without fastening . . .	105 a
Cuttings, peculiar mode of striking . . .	102 a
Cuttings, to prepare . . .	104 b
Dahlia, remarks on the properties of . . .	102 a
Daubeny, Dr., his letter respecting sulphate of ammonia . . .	99 c
Earnings, to destroy . . .	102 c
Familiar Botany, No. XII. . .	99 c
Fish, gold, their treatment . . .	101 c
Fox-hunters, crops injured by . . .	103 b
Gardeners' Benevolent Society, remarks on . . .	99 a
Grafting, remarks on . . .	102 b
Grass-tree . . .	105 b
Hollies, treatment when transplanted . . .	105 b
Hovea racemulosa . . .	103 b

NEW AND SUPERB SEEDLING DAHLIAS ON SALE by F. and A. SMITH and Co., FLORISTS, &c., HACKNEY, LONDON:—

BIANCA, Wildman, pure white, cup petals, large size, the centre well up, very deep flower (having from 25 to 30 rows of petals), first-rate form, of excellent habit, and very free bloomer: the flowers have long upright foot-stalks. It was pronounced a first-class flower by the Floricultural Society of London, Aug. 3, 1841; obtained a second prize at the South London Floricultural Show, Sept. 14; and a first-class prize at the Floricultural Soc. of London, Sept. 23; a first-class opinion was pronounced by the Floricultural Soc. of London, Aug. 16, 1842; it obtained a prize at Salisbury Plain, Aug. 31; the first prize at the Hammersmith Show, Sept. 27; and was pronounced a first-class flower by the Floricultural Soc. of London, Sept. 27, when 24 blooms were produced, although that Society very fairly qualified their approbation upon other occasions, when the flower, for reasons afterwards explained, appeared before them in a less perfect state. Opinions of the Press:—See *Gardeners' Gazette*, Sept. 24, p. 625: "This flower has been unfortunately very badly grown during the season; being exclusively cultivated in the neighbourhood of London, it has not been fit for competition at either of the shows for the cup. The blooms produced on Tuesday, though by no means equal to those of last season, or the early part of the present, gave promise that it will be a decidedly first-rate variety, when it comes into the hands of country growers, the centre being in every instance perfectly up, the petals cupped, and the flower well formed." See Report in same paper, Oct. 1, p. 639: "Wildman's Bianca, which has scarcely produced a bloom fit for showing until the latter part of the season, was in fine condition, a great number of blooms being shown, the whole of them first-rate." See Report in the *Florists' Journal* of Nov. last, p. 251: "We some little time since paid a visit to Messrs. Smith's Nursery, at Hackney; the Dahlias were in fine bloom, though evidently struggling with the smoke, &c., of that confined district. Too much credit cannot be given to these gentlemen for their strenuous exertions to overcome so great an obstacle. In the collection which is large, we particularly noticed that beautiful white, Wildman's Bianca; there were several plants of it, and all held good flowers." 10s. 6d.

DUKE OF WELLINGTON, Smith, rich scarlet crimson, fine cup petals, the centre well up, is of great depth and substance, a first-rate flower, a very profuse bloomer, and quite new in colour; it has obtained a prize at the South Essex Show, in Sept.—See Editor's opinion in the *Gardeners' Chronicle*, Sept. 3, 1842: "In the Duke of Wellington, rich scarlet crimson, the centre is full, although a little depressed, and the petals are well arranged: it is a desirable flower, and rich in colour." 10s. 6d.

GENERAL SIR R. SALE, Smith, crimson purple, cup petals, well up in the eye, of good size, and great depth of petals, very profuse and constant bloomer, with long upright foot-stalks; and is considered by competent judges the best flower of its colour yet offered to the public; it was pronounced a first-class flower by the Floricultural Society of London, Aug. 16, 1842; obtained a prize at Salisbury Plain, Aug. 31; a prize at South Essex, Sept. 8; a prize at Kingston, Sept. 15; a prize at Salt Hill, Sept. 16; a prize at Victoria Gardens, Stepney, Sept. 19; a prize at the Floricultural Soc. of London, Sept. 20; a prize at Sunbury, Sept. 22; a prize at Hammersmith, Sept. 27.—See Editor's opinion, *Gardeners' Gazette*, Aug. 6, 1842. "So far as we have seen, during the present season, the growers appear to be aware of the properties required in a show Dahlia, and most of those exhibited on Tuesday possessed them in a considerable degree. Decidedly the best of these is Smith's Sir Robert Sale, a beautifully-formed dark flower, shown at both meetings, but not adjudicated on by the Floricultural Society, on account of no more than one bloom being shown."—See Editor's opinion, *Gardeners' Chronicle*, Sept. 3. "Your crimson purple Dahlia (Sir R. Sale) is a flower of first-rate properties, fine, general form, centre well up, with great depth of petals." 10s. 6d.

RIVAL YELLOW, Smith, deep golden yellow, fine cup petals, of great substance and depth, the centre well up, of excellent form, very constant and good habit. This Dahlia is warranted the best of its colour yet offered to the public. As the stock is very limited, early application is necessary to secure plants, many orders having already been received; no allowance on this variety. 10s.

RAINBOW, Smith, yellow, beautifully edged with rosy purple, of good form, very constant, free bloomer, and excellent habit; the flowers have long straight footstalks; quite a new and distinct variety from any other in cultivation. The form of this flower improves as the season advances, sufficient to constitute it a show flower. 10s. 6d.

ORION, Smith, light yellow, cupped petals, of good form, very constant, and profuse bloomer; 3 ft. 7s. 6d.

FANNY WAUGH, Forster, deep lilac, of fine form; it has obtained a first-class prize at Hexham, and was in the second stand of 18, and the second of 24 blooms at the same place; was placed first in its class at the Dahlia Show near Corbridge, and second at the Great North of England Open Show at Jesmond, near Newcastle. This variety is very constant, of medium size, great depth of petals, the centre well up, and of good general habit; 4 ft. 10s. 6d.

EARL OF LEITRIM, Ogilvy, deep purple, cup petals, large, and of good form; has obtained several prizes; 5 ft. 10s. 6d.

SULTANA, Appleby, dark maroon, occasionally striped with light purple, fine form. 10s. 6d.

ORYNTHIA, bluish edged, and tipped with rosy purple; good form; 4 ft. 10s. 6d.

GREAT WESTERN, Bragg, shaded purple, very large, good shape; 7s. 6d.

PERPETUAL GRAND, Brown, maroon, fine form, 10s. 6d.

BELSIZE RIVAL, Pipe, rosy blush, cup petals, fine form, good habit, and very constant; 4 ft. 10s. 6d.

SURPRISE, Oakley, crimson, tipped with white; 4 ft. 10s. 6d.

EMPRESS OF WHITES, G. Smith, creamy white, good form, very dwarf grower; 2 ft. 10s. 6d.

CONFIDENCE, Cook, shaded orange, good form, very constant, fine habit; 4 ft. 7s. 6d.

VIRGIL, Mountjoy, maroon, good shape, very constant; 4 ft. 10s. 6d.

WINDMILL-HILL HERO, Miller, rich deep crimson, cup petals, round shape, good form; 4 ft. 10s. 6d.

VAN AMBURGH, Miller, rosy lilac, good shape, and constant show flower, 3 ft. 10s. 6d.

PET RIVAL, Bushell, red crimson, cup petals, and very constant; 3 ft. 10s. 6d.

NORTH MIDLAND, Evans, deep crimson, cup petals, and fine form; has taken several prizes; 3 ft. 7s. 6d.

ESSEX TRIUMPH, Turville, fine dark, fine form; 4 ft. 10s. 6d.

BEAUTY OF SUSSEX, Mitchell, white, deeply edged with carmine; 4 ft. 10s. 6d.

MRS. JAMES RICHARDSON, Edwards, bluish white, occasionally tipped, good form, has taken several prizes, 4 ft. 10s. 6d.

LADY SALE, Todd, ruby carmine, good form, 4 ft. 10s. 6d.

MIRANDA, Brown, bluish white, shaded with rose. 7s. 6d.

QUEEN OF SUMMER, creamy white, with crimson purple tip and dark centre, good form. 10s. 6d.

RETRIEVER, Dewar, ruby crimson, fine form, 4 ft. 10s. 6d.

IMOGENE, Dewar, lilac, first-rate, 2 ft. 10s. 6d.

CLAUDINE, Forster, white, tipped with rosy pink, fine form, 3 ft. 10s. 6d.

GREAT MOGUL, Atwell, deep maroon, 4 ft. 10s. 6d.

F. and A. S. take this opportunity of informing those of their friends who may not be aware of it, that their Dahlias being grown in the immediate vicinity of London, they cannot produce their blooms in such perfection as those who have every advantage of a country situation; added to this, their plants were from August to the end of September so infested with the thrip, that they could not produce even a tolerable specimen of Bianca, to compete at any of the three shows for Mr. Wildman's prize; as a proof of this, at the first show there was no competition, they could not produce a bloom; at the Salt-hill (the second), and the Floricultural (the third), the plants were not sufficiently recovered to compete with effect; as the season advanced, the plants produced fine blooms in profusion, so as to enable them to exhibit twenty-four fine blooms at the Evening Meeting of the Floricultural Society, when it was pronounced a first-class flower. In conclusion, they recommend Bianca as a white of first-rate qualities, and second to none.

The same observations as regard the thrip may be applied to Rival Yellow; and having but three plants, they had not an opportunity to compete for prizes.

VERBENA SPECIOSA, Kyle, colour bright vermilion, with bluish or rosy eye, large trusses, and very free bloom of strong upright growth; it obtained a certificate of merit at the Exhibition of the Horticultural Society of London, July 9, 1842. The Verbena is handsome and very brilliant; it is no doubt a good variety. See p. 425, *Gardeners' Chronicle*, Editor's opinion. Plants in May, 6s.

PAULOVNIA IMPERIALIS; strong plants, in 60-sized pots, in May, 7s. 6d.

A large Collection of Pelargoniums, comprising most of the new varieties; also Fuchsias, Ericas, Calceolarias, Camellias, Greenhouse and Stove Plants.

Orders for Exportation promptly executed. A satisfactory reference required from unknown correspondents.]

CULTIVATION OF PINES WITHOUT POTS.—

One of the many advantages derivable from RENDLE'S "Tank System of Heating," is the easy practicability of Cultivating Pines without Pots, an object of paramount importance to the cultivators of this delicious and much-esteemed Fruit.

A Treatise, with Engravings, will shortly be published, containing every information to set up or adapt the apparatus, with cost of materials, fixing, &c. Price 6s. each copy to Subscribers. Orders are requested forthwith to be sent to Mr. WM. RENDLE, Union-road Nursery, Plymouth.—Feb. 15th, 1843.

FUCHSIA TODDIANA.

THOS. CRIPPS, Florist, &c., Tonbridge Wells, Kent, respectfully informs his friends that he has purchased of Mr. TODD (late Gardener to Capt. MONYPENNY, and raiser of the Fuchsia "Monypenny"), the above extraordinarily beautiful and distinct Variety of this now justly-esteemed and popular class of Flowers, specimens of which were submitted to the inspection of the Editor of the *Gardeners' Chronicle*, in August last, under the initials "A.B." the opinion of which was as follows:—

"A.B.—Your Fuchsia is one of considerable beauty, and differs in the great length of the divisions of the calyx from any which we have yet seen. Its colour is also bright, and not dimmed with that dirty tinge which usually prevails amongst this class of flowers."—*Gardeners' Chronicle*.

After the opinion of so distinguished an authority, it would be useless to attempt further to extol the merits of this charming flower than to state its size and colour; the latter of which is—calyx, a very bright red, with corolla of a pale puce; and the former excels that of any other Fuchsia extant, being nearly four inches in length, and of proportionate magnitude, the plant itself being of a most vigorous growth, and foliage beautiful.

Coloured engravings of it may be seen at Mr. CHARLWOOD'S, Seedsman, Covent Garden; Mr. LOWE'S, Clapton Nursery; and Mr. PAWLEY'S, White Hart Inn, Bromley, Kent; at which places, and of Mr. HARRISON, Downham, Norfolk, orders will be received for plants, to be sent out at the end of April, at 10s. 6d. each, with the usual discount to the trade, if six or more are taken at once. As small plants can be safely transmitted through the post, by forwarding a Post-office order for 10s. 6d., persons will have them sent free of postage. All the new Fuchsias can be had at the same time. Strong plants of Manettia bicolor, the new Greenhouse Climber, from 7s. 6d. to 10s. 6d. each, are now ready.

A Catalogue of T. C.'s extensive collection of Roses can be had on application, inclosing two Postage-stamps.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, Nurseryman, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undernamed low prices—including the following Fuchsias:—*Conspicua arborea* (Catleugh's), *Venus victrix*, (Cripps'), *rosea alba*, *Money-penny*, *compacta*, *racemiflora*, &c. Also the following distinct Verbenas:—*Queen*, *Aurora*, *Stewartii* variegata, *Mortlock's Superb*, *Burleyana*, &c. &c. Fuchsias, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents.

W.M. obtained a Prize of 10l., open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

W. BRAGG will repeat the List containing the names of the Nurserymen and Florists, among those who have ordered in the interval, and who will be able to supply Plants in May next, of his Superb White Dahlia **ANTAGONIST**, which will be let out to the Trade only. On the first occasion of this Flower being shown for Mr. Wildman's Prize at the Floricultural Society, Sept. 6th, the Judges pronounced it to be "decidedly first-rate." The *Gardeners' Gazette*, in report of Salt-Hill Show, speaks of it thus:—"The Seedlings were both numerous and beautiful; among them BRAGG'S **ANTAGONIST** was successfully shown for Mr. Wildman's Prize of Five Guineas offered for the best White Dahlia. This Flower, which has been remarkably constant through the season, was shown in great perfection, and was placed first by the Judges of all the other Seedlings exhibited." The *Gardeners' Chronicle* describes it, when shown at Salt-Hill, as follows:—"BRAGG'S **ANTAGONIST**, White; this is a full-sized and finely-formed flower, with good petals, and great purity of colour, was placed first." The *Gazette* of Oct. 1, in its report of the Floricultural Society's meeting, in speaking of it as a flower of first-rate excellence, adds, "This White Dahlia, which has been extensively shown from a small stock, and carried off the Cup for the best white, was still able to produce one good bloom, which for form, substance, and arrangement, was all that could be desired; the remainder, to make up the number required, were young blooms imperfectly expanded." North Star Tavern, Slough, Feb. 9, 1843.

PET RIVAL DAHLIA (BUSHELL'S), and **KENNINGTON ROSE** (WELDON'S).—These Dahlias (though risen and grown within one mile of the General Post Office, London, have obtained prizes) will be sent out through the Trade in May next.

PET RIVAL—Purple Maroon, finely-cupped, and depth of Petals never showing the eye, good habit, and always true; height 3 ft. Plants, 10s. 6d.

KENNINGTON ROSE, superior to Wheeler's **MARIA**, constant and fine habit; height 4 ft. Plants 7s. 6d. Exchanges and liberal discount to the Trade on early application to J. BUSHELL, 12, Hall-place, Kennington Lane.—Feb. 3.

J. T. WILLMER begs most respectfully to say he has a fine assortment of the under-mentioned to dispose of at moderate prices; the plants are fine, and well rooted:—Strong Walnut Trees; Fine Quince Trees, fit for bearing fruit; Green Hollies, of all sizes; Striped Hollies, strong plants from 3 to 6 feet high; Striped Box, Laurustinus, Portugal and Common Laurels, Arbor vitae, Aucuba japonica, Yews, Sweet Bay, Swedish Juniper, Arbutus, Rhododendron, Red Cedar, Alexandrian Laurel, Spruce, Scotch, and Larch Firs, Siberian Lilac, Syringas, Guelder Rose, Honeysuckles of various sorts, Irish Ivy, Dwarf Roses, Standard do., Beech, Hornbeam, Lime, English Elm, Poplars of various sorts, Oaks, &c.

J. T. W. has likewise a fine Stock of Carnations and Picotees, of first-rate quality, well wintered, and now in a good state to be sent out, in Collections of Bizarres and Flakes—

Carnations, 25 pair, with their names, £2 0 0
Picotees, 25 do. do. 1 10 0
Auriculas, 12 plants, do. 1 10 0
Pinks, 25 pair, do. 1 0 0

The selection to be left to J. T. W., which he has no doubt will give satisfaction to those who may honour him with their favour. The above for cash, including basket and packing. Sunbury Nursery, Middlesex, Feb. 23, 1843.

CHOICE PANSIES.

J. HENCHMAN begs to state that he has a few good healthy PANSIES to offer at the following moderate prices. In consequence of the late unfavourable season, the stock this year is very limited. Six good Seedling varieties, including Success, one of the best dark flowers out, 21s.; Good Show varieties, named, from 9s. to 18s. per dozen. Orders accompanied by a Post-office order will receive immediate attention. Edmonton, near London, Feb. 25.

THE FASTOLFF RASPBERRY, Patronised by HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, AND MANY OF THE NOBILITY.

For particulars of the highly-valuable qualities of the above superior Raspberry, YOUNELL and Co. beg to refer the readers of the *Gardeners' Chronicle* for their Advertisement of it in this Paper of last week.—Great Yarmouth Nursery, Norfolk, Feb. 23, 1843.

WILLIAM CATLEUGH'S LIST of first-rate PELARGONIUMS, raised by E. FOSTER, Esq., and the Rev. R. GAERT, and other Amateur Raisers, is now ready. **CALCEOLARIAS**, raised by Messrs. BARNES and GREEN, will be let out in a Collection of 12, for 6l. Good unnamed Varieties that have flowered, at 18s. per dozen.

KINGHORN'S Dahlia, the **CHIEFTAIN**, a fine rosy-purple, beautiful stiff Petals, fine Outline, of good size, with particularly strong Footstalks. Flowers all well above the foliage, good Show-flower, 4 ft. 10s. 6d.

BETTRIDGE'S MILTON, shaded-rose, good substance, and good Show-flower, 3 ft. to 4 ft. 7s. 6d.

BASKETT'S PRINCESS SOPHIA MATILDA, Primrose, beautifully tipped with white, quite a distinct and new Variety, and good Show-flower, 4 ft. 7s. 6d.

Also a List of Carnations, Picotees, Pinks, Auriculas, Roses, Chrysanthemums, Verbenas, &c., &c., Hans-street, Sloane-street, Chelsea.—Feb. 24, 1843.

CARNATIONS AND PICOTEEES.—**YOUELL & Co.** have now ready for sending out several thousand pairs of the above flowers, consisting of the finest sorts in cultivation, upon the following terms:—

23 pairs of extra fine and first-rate show flowers	5 0 0
12 " ditto ditto	2 10 0
25 pairs fine show flowers	3 0 0
12 " ditto ditto	1 10 0
12 pairs extra fine show Pinks	0 12 0

The selection being left to **YOUELL & Co.** The plants are remarkably strong and healthy, and warranted true to name and colour. Great Yarmouth Nursery, Feb. 24, 1843.

SELECT AND SHOWY HARDY HERBACEOUS PLANTS, SPLENDID CALCEOLARIAS, NEW HYBRID FUCHSIAS, &c. **WILLIAM MAY** begs to announce to the Nobility, Gentry, and the Public generally, that he has still a few hundred of select Showy Hardy Herbaceous Plants that he can supply by name at 42s. per hundred, leaving the selection to himself; he has also ready to send out his splendid Calceolaria, "Lady Constable," which has been repeatedly pronounced the best Calceolaria in England, price 10s. 6d. each; many other very superb varieties. He will also have ready to send out the last week in April his new and beautiful hybrid Fuchsia "Bartoloni," this is a most superb variety, of large size, globular form, fine dark crimson purple, with very dark distinct foliage, price 10s. 6d. each. He can also supply all the leading varieties in present cultivation.

W. M. has a few packets of his very select Hollyhock-Seed (all warranted saved from double flowers), 200 seeds for 2s. 6d., 500 for 5s. Selected Pansy-seed at 2s. 6d. and 5s. each; and a limited number of packets of Picotee seed, saved from prize-flowers 5s. each. The Calceolaria, Fuchsia, and seeds sent post free on receipt of a post-office order.—**Hope Nursery, Leamington-lane, near Bedale, Yorkshire.**—Feb. 24, 1843.

NEW AND SUPERB FUCHSIAS.

YOUELL & Co. beg leave to refer the readers of the *Gardeners' Chronicle* to their Catalogue, with prices of the above, as advertised by them on the front page of last week's Paper. It will be found to contain a selection of such as are really good to the exclusion of many that are mere nominal varieties. They beg also to call attention to their new and splendid **FUCHSIA ST. CLARE**, a description of which will be found in the same Advertisement.—**Great Yarmouth Nursery, Norfolk,** Feb. 23, 1843.

EXHIBITION OF CAMELLIA JAPONICA, or JAPAN ROSE.—A Collection of these beautiful Exotics is now in bloom at **CRANDLER and Sons' Nursery, Vauxhall.** Admittance gratis.

ORANGE AND LEMON TREES, JASMINE PLANTS, &c., &c.—Noblemen and Gentlemen seeking an opportunity of replenishing their Stock, or commencing an Orangery, may have an opportunity of so doing, by inspecting the Stock of **A. COBBETT**, at his Italian Warehouse, 18, Pall Mall, who has just received his annual Importation from Italy, in a good and healthy condition. The trees are from 3 to 6 feet high in the stem, and from 10s. to 30s. each, and will be packed and sent safely to any part of the Kingdom.

DOUBLE ITALIAN TUBEROSE ROOTS.—The annual Importation of these truly fragrant and delightful Bulbs has just been received in a good and healthy condition, and may be obtained at the above address. Price 4s. per dozen.

N.B.—Importer of choice Lucca Oils, Honeycomb, [Parmesan and Gruyere Cheese, Anchovies, &c., &c. Lists with Prices may be had, per post, &c.

SOUTHAMPTON NURSERY GROUNDS.—Of the Stock advertised in the Autumn (*Gardeners' Chronicle*, p. 665) the following may still be obtained on early application:—
Scotch Fir, 2-year seedling, fine, 2s. per 1000.
Ash, 1-year ditto, 1s. per 1000.
English Oak (the true Durmast), 1 and 2-year seedling, 5s. and 7s. 6d. per 1000.

Sea Pine (*Pinus maritima*, excellent for exposure to the sea), 2-year seedling, 5s. per 1000.
Pinasters, 2-year seedling, 3s. 6d. per 1000.
Bedded Rhododendron, 8s. 4d. to 12s. 6d. per 100.
Bedded Spruce Fir, 12s. 6d. per 1000.
Laurel, 20s., 40s., and 80s., per 1000.
Tamarisk (for exposure to the sea), 40s. per 1000.
Poplar (Black Canada), 4 to 6 feet, 40s. to 60s. per 1000.
Ribes sanguineum, 25s. per 100.
Mahonia aquifolium, 40s. per 1000.

With every description of Transplanted Forest-tree, Shrub, Evergreen, and Fruit-tree.—**Wm. ROGERS & Son, Nurserymen and Contracting Planters, Southampton, Feb. 24, 1843.**

PINE PLANTS FOR SALE, HEALTHY AND CLEAN.—About 1000 Fruiting and Succession Pine Plants to be sold. A great Bargain.—For particulars apply on the Premises, **S. ROSLINE'S, Peckham Rye Terrace.**

HARDIE'S EARLY CANTALOUPE MELON.

WM. HARDIE begs to inform Melon-growers that he has still a quantity of his very superior **EARLY MELON SEED** to dispose of, and that if sown now he will warrant that with proper treatment its fruit will be ripe the first week in May. He will also warrant it to set its fruit under the most adverse circumstances in which a Melon plant can be placed. He has shewn it these last two seasons at Chiswick, in May, and had a Banksian Medal awarded to it each time.

From these plants and two crops, he cut 60lbs. weight of fruit last year, and with attention there may be three crops taken from the same plants. He grows it on a common dung hot-bed. The flavour is excellent, and size from 3 to 6 lbs., according to the number of fruit on each plant. To be had of **W. H.**, at **J. JARRETT'S, Esq., Carneston Court, near Bath, at 2s. 6d. per packet**; will be forwarded directly, on receipt of an order for the money. Carneston Court, Feb. 6, 1843.

NEW FLOWER-SEEDS.

MESSRS. SUTTON and SONS respectfully intimate that as they devote a great portion of their Nursery Grounds to the growth of **FLOWER SEEDS**, and have excellent connections on the Continent and in England for obtaining the New Sorts as soon as introduced, they can supply every known kind of Flower Seeds worthy of cultivation, and at very moderate charges, either in collections or otherwise. The sorts particularly recommended may be had in the undermentioned collections, with instructions inclosed.

Hardy Flower Seeds, 60 most showy kinds	5 0 0
Ditto 30 ditto	15 0 0
Hardy and Tender ditto, including the most superb German Stocks, Balsams, German Asters, Zinnias, Brachycome, Portulaca, Mesembryanthemums, Phlox, &c. &c., 50 sorts	20 0 0
30 ditto	12 6 0
100 choice Ranunculuses, in 50 varieties by name	25 0 0
50 ditto, in 50 ditto	15 0 0
Double Italian Tuberoses, fresh imported, per dozen	4 0 0

N.B.—Parcels delivered free to the Railway-stations, or any part of London.—**Reading Nursery, Berks, Feb. 21st.**

AMERICAN OAK ACORNS.

J. & C. WHALLEY, Seedsmen and Nurserymen, have just received an importation of American Tree and Shrub Seeds, in excellent condition. Catalogues and Prices will be furnished to the Trade on application (prepaid).—**St. George's Crescent, Liverpool.**

SION NURSERY, CROYDON.
ROBERT COOPER, SEEDSMAN, &c. begs to offer the following selection of **CHOICE FLOWER SEEDS** from his General Catalogue.

per packet—s. d.	per packet—s. d.

February 21, 1843.

SELECT CULINARY VEGETABLE SEEDS, &c.

WILLIAM MAY has now ready to send out his new second early Kidney Potato, "The Lapstone," raised from seed between the early Ash-leaved Kidney and the Scotch Kidney, both varieties of great merit. It is a great bearer, medium size, of very first-rate excellence, and of very dwarf habit. Mr. LONDON, in noticing it in his Magazine of the present month, says—"A few of these Potatoes were sent to us; we found them full-eyed, very mealy, boiling soft, and of an excellent quality. We think this a most valuable kind of Potato." May be had in peck bags at 5s. each. New Superb Dwarf Imperial Crimson Beet: this is decidedly the best variety in cultivation; in packets of 1,000 seeds each for 5s. Fuller's New Hybrid Winter Radish, a very desirable variety for winter use; in packets 2s. 6d. each. May's new large late "Victoria" Red Currant, bunches generally six inches long, berries from 1 to 1½ inch in circumference; a fine scarlet, and of excellent flavour, 20s. per dozen. The seeds will be sent post-free on receipt of a Post-office order. May be had of **MR. CHARLES FARNES, Seedsmen, St. John-street; Messrs. NOBLE, Seedsmen, Fleet-street, London; and of Wm. MAY, Hope Nursery, Leamington-lane, near Bedale, Yorkshire.**

NEW AND CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, and Co., have a large Stock of all the newest and choicest Flower Seeds, to the cultivation of which great attention has been paid, and which are this season more than usually fine. L. P. and Co. can therefore with confidence recommend them, as being in every respect to be depended on; and beg leave to offer for sale,

25 packets	for 15s.
50 do.	25s.
100 do.	35s.
150 do.	42s.

Delivered, carriage free, to any part of the kingdom. Catalogues may be had on application as above.
Exeter Nursery.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on **THURSDAY, March 2nd, 1843, at 12 o'clock**, about Three Hundred Standard and Dwarf Roses, Fine Hybrid Rhododendrons, Azaleas, Magnolias, Kalmias, &c.; also a splendid assortment of Dahlias. May be viewed the morning of Sale; catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and the PUBLIC.

MESSRS. PROTHEROE and MORRIS take the liberty to announce they are instructed to dispose of the capital Stock of Greenhouse PLANTS, on the Premises, the corner of London Lane, Hackney, by Auction, on **TUESDAY, March 14, 1843, at 12 o'clock**. This truly interesting Collection comprises fine Specimens of Camellias, in high perfection, Lemon and Orange-trees, Cacti, choice Pelargoniums, Amaryllis, Carnations, and Picotees; six, one, and two light Boxes, &c. May be viewed one day previous to Sale. Catalogues may be had of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—**STEPHENSON and Co.,** 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.
N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

PENN'S SYSTEM OF HOTHOUSE BUILDING

WARMING, and VENTILATING.—The superiority of the principle first introduced by **JNO. PENN, Esq.,** for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, **W. HILL** respectfully acquaints the Nobility, Horticulturists, and the Public generally, that having, in conjunction with the Inventor, devoted much time and study to perfect the same in the construction of Conservatories, Stoves, Greenhouses, Pits, and other Horticultural Erections, and to heat them with **IMPROVED HOT-WATER APPARATUS**, to ensure ANY DEGREE OF TEMPERATURE, earnestly solicits their inspection of the working of this system at the Inventor's residence, Lewisham.

The peculiar advantages in Houses erected upon, or altered to, this principle, are—Free and rapid Circulation, Equality of Temperature, and safe and agreeable access, at all times, to the most delicate constitutions.

Churches, Chapels, Manufactories, or other large Public Buildings and Dwelling-houses, warmed and ventilated. The Heating Apparatus, which is of the very best description, combining Durability and Simplicity, with Economy in the Consumption of Fuel, is manufactured by and fixed under the superintendence of **JNO. PENN, Esq., Engineer.**

Reference is permitted to **JNO. WILLIAMS, Esq.,** Isleworth, and numerous other Gentlemen, who are practically acquainted with the merits of **W. HILL'S** mode of applying **MR. PENN'S** principle.

Designs, and every information, may be obtained on application to **W. HILL, Builder and Surveyor, Lewisham.**

WANTED, in a quiet regular Family, a Youth who can wait well at table, clean plate, and is willing to make himself generally useful. He must also understand the management of a Garden, which is indispensable. Apply between the hours of 11 and 5, at **MESSRS. HODGSON'S Library, No. 9, Great Marylebone-street.**

WANTED, in a Country Nursery, a middle-aged honest, sober, industrious Man, as **WORKING FOREMAN.** He must well understand the Management and Propagation of Greenhouse, Frame, and Pit Plants, &c., &c. His Character must bear the strictest investigation. Apply by letter, prepaid, for **A. B.**, at the office of this Paper.

WANTS a SITUATION, as GARDENER, a young Man, 28 years of age. He can be highly recommended for strict integrity and a general knowledge of Gardening in all its various departments by some of the Noblemen's Gardeners he has lived with.—Address, **C. S., Gardeners' Chronicle Office, 3, Charles-street, Covent Garden.**

WANTS a SITUATION, in a Nobleman or Gentleman's Family, as GARDENER, or GARDENER and BAILIFF, a Married Man. Can produce the most satisfactory testimonials of his competency to fill these situations, as well as to his general character and conduct. He has lived upwards of 9 years in his present situation, which he is about to leave in consequence of the estate being sold.—Address, **MR. ROBERT DUNCAN, Mrs. Labouchere's, Chislehurst, Kent.**

WANTS a SITUATION as GARDENER, or GARDENER and BAILIFF. A Single Man, aged 31, who has a good knowledge of his business, and can have a good character from his last employer.—Address to **H. H., Post-office, Tonbridge Wells.**

WANTS a SITUATION, as ASSISTANT in the SEED-LINE. A Young Man, bred to the Seed and Nursery Business. Satisfactory references will be given.—Letters addressed **A. R., Office of this Paper**, will have immediate attention.

WANTS a SITUATION as GARDENER, a steady, active, single young Man, aged 27, who has a practical knowledge of Gardening in all its branches, particularly in the Flower department, having spent the whole of his life in the profession. A satisfactory reference can be given from the gentleman he is about to leave. Direct **A. W., Mr. CATLEUGH, Florist, Hans-square, Chelsea.**

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of **INVISIBLE WIRE FENCE**, to resist Grazing Stock, and rendered Rabbit-proof. **WIRE-WORK** in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. **HORTICULTURAL BUILDINGS**, Green and Hothouses, Conservatories, &c. The same heated by **HOT-WATER APPARATUS**, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

NURSERY and SEED BUSINESS to be DISPOSED OF.—The Proprietor of an old-established Nursery and Seed Business (in the country) being desirous of retiring, would be glad to treat with any person wishing to embark in such a concern.—For particulars apply by letter, addressed **C. B. Gardeners' Chronicle Office.**

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at **Worton Cottage**, upon application to the Gardener (Sundays excepted).

WILLIAM LYNN, NURSERYMAN, SEEDSMAN, and FLORIST, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a **GARDEN TOOL WAREHOUSE**, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. **W. L.** begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit-Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which, he trusts, with industry, punctuality, and attention, will secure to him general patronage.

W. L. solicits particular attention to his new **PEA, LYNN'S DWARF WRINKLED MARROW**, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn Pea ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, inclosing a postage-stamp.

TO NURSERYMEN and Others.—To be **LET**, a large HOUSE, with sundry out buildings, and about four acres of excellent land, with right of common. It is situated on the Southamptn-road, near the Staines gate, and will only be let on lease. Was formerly the poor-house, and has been built about 20 years. The rent is 35l. per annum.—Apply to **MR. HODGE, Builder, Staines.**

GARDEN NET.—New Garden Net, viz., Herring Net, one inch mesh, made with machinery, 1½d. per yard, in any length or width. Old Fishing Net, properly mended up, in lengths, 30 or 40 yards, 8 and 10 feet deep, 3d. per yard square. Woollen and Worsted Net, fine Blossom and Wasp Net, made from Hemp, Bunting, Screens, &c. &c. Woollen Tie for Flowers. Also Sheep-folding Nets, Fishing Nets, Rabbit and Hare Nets. Nets for Fences against Rabbits, Dogs, Poultry, &c., 2d. per yard; also for covering in Poultry-yards, Pheasantries, &c., 2d. per yard. Superior expanding Tents for Lawns, &c., 5l. 3s. 6d. per round. Tarpaulins for Waggon and Stack Covers, Garden-frames, &c., 2s. per square yard made up.

ROB. RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New Road, near Euston-square, London.

N. B.—1000 London Policemen's Capes for Farmers' Servants, 1s. 9d., 2s., and 2s. 6d. each.

AGRICULTURE.

THE ILLUSTRATED POLYTECHNIC REVIEW, No. VIII. (with a SUPPLEMENT, Gratis), with a Head of Baccio Bandinelli, and numerous Illustrations, will contain an Article on **AGRICULTURE**, by **CUTBERT JOHNSON, Esq., F.R.S.**—Fine Arts—Art in the Churches of Paris—Steinle's Paintings in the Cathedral of Cologne—British Institution (Third Notice).—Reviews—Gutzkow's Letters; Stories of the Greek Heroes, related to his Son by **B. G. Niebuhr, &c. &c.**—Notices on Science, Fine Arts, Literature, &c. &c. Price 4d.; stamped, 5d. Office, 143, Strand.

Just published, price 10s. 6d., cloth lettered, a **MEMOIR ON IRELAND, NATIVE AND SAXON**, humbly inscribed to Her Most Gracious Majesty, the Queen of Great Britain and of Ireland. By **DANIEL O'CONNELL, M.P.** Vol. I., 1172—1660.

"On our side is virtue and Erin,
On theirs is the Saxon and guilt."—**MOORE.**

Dublin: Printed for **CHARLES DOLMAN, 61, New Bond-street, London.**

ARCHITECTURE.—Professor COCKERELL'S Lectures at the Royal Academy. — THE ATHENÆUM of this day (32 large quarto pages, price 4d.) contains a full and accurate Report of the Sixth and Concluding Lecture. THE ATHENÆUM Parts for January and February, price 1s. 4d. each, contain the whole Six Lectures, and may be ordered of any Bookseller.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 25, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Friday, Mar. 3.	Botanical	8 P.M.
Monday, Mar. 6.	Entomological	8 P.M.
Tuesday, Mar. 7.	Horticultural	8 P.M.
Wednesday, Mar. 8.	Linnean	8 P.M.
Thursday, Mar. 9.	Physiological	7 P.M.
Friday, Mar. 10.	Geological	8 P.M.
Saturday, Mar. 11.	Medical Botanical	8 P.M.
Sunday, Mar. 12.	Royal Botanic	3 P.M.

In the event of a good Act of Parliament being passed for securing the general drainage of the country, we think, and this is the opinion of some of our correspondents, that the carrying out its objects will require far larger funds than can be raised conveniently through any of the ordinary channels. We would therefore suggest that, under these circumstances, capitalists cannot do better than unite to form public companies, in the same manner as has been so extensively done for the formation of canals and railways, the objects of such companies being either to execute the works under the superintendence of skilful engineers, or to advance capital at a certain rate of interest; long leases being regarded as good security for such advances as well as actual ownership. A correspondent remarks that this might be easily done through one or two adjoining counties, so that the shareholders might have a personal interest, besides the profitable investment of their money.

Another subject in which we think capital might be advantageously invested, if sufficient powers could be obtained from Parliament, would be to rescue and embank from the sea some of the numerous shoals and sandbanks left dry at low water at the mouths of large rivers, and along much of our coast. Thousands of acres of invaluable land might be thus recovered if the operations were carried on by skilful engineers, while navigation would in many cases be rendered safe. In fact, a serious attempt was made a few years since to effect this at Lynn, by embanking the shores of the great estuary called the Wash. Sir John Rennie was employed to examine the outfalls of the Ouse and the Nene, which flow into the Wash; and he reported in an elaborate statement, now before us, that it would be perfectly practicable to recover 150,000 acres of land worth 6,000,000*l.*, at a cost of 2,000,000*l.*, besides improving the natural drainage of 900,000 acres of lowlands, all at present badly drained; and, to the extent of 160,000 acres, comparatively valueless in their actual state. Had this project been executed, the country would have gained by that one operation a tract half as large again as the whole county of Rutland, and capable of producing annually 160,000 quarters of Wheat, 200,000 quarters of Oats, 100,000 quarters of Beans, besides feeding 70,000 sheep and 30,000 or 40,000 bullocks. This great plan was, however, stopped by private influence, and the worthy corporation of Lynn have for the present succeeded in depriving that town of the immense advantages that must have followed the addition of a million and a half a year to the produce of the land around their port.

Such a case as this is an instructive example of what may be expected by those who embark in such undertakings as we have here ventured to recommend, and we mention it in order that the public, if they should invest their money in drainage or embankment speculations, may take care that the Acts of Parliament under which the operations are to be conducted shall give them such powers as will enable them to deal effectually with the numerous opponents whom they are pretty sure to encounter.

We have introduced this subject as a sequel to the articles on drainage which have recently appeared in our columns; we have, however, no intention of pursuing it further. It is for capitalists, and not journalists, to occupy themselves with the details of such affairs, if they think it worth their while.

THE application to the land of animal manure mixed with vegetable substances has, from the earliest times, been considered as the best means of producing fertility in the soil, or restoring it when diminished; and if we trace the steps of the decomposition of this mixed manure in the soil, we shall find that it resolves itself into humus as soon as the volatile principles of the dung have escaped, and the vegetable portion has been completely disorganised and reduced to a black earth, which, in fact, is humus more or less pure. A very large addition of common stable or yard manure, after it has been allowed to go through the first stages of fermentation and decomposition, and lost its tendency to heat, as is the case in the residue of hotbeds used to force early vegetables,

gives to the soil a manure exactly similar to that of decayed vegetables: it never stimulates the plants too much: it is decomposed slowly, and in every respect acts as vegetable mould. If a sufficient supply of this effete substance could be procured, no manure could be better suited to the growth and maturity of all kinds of vegetable productions. Gardeners well know this, and in the cultivation of delicate and valuable plants they use nothing else; the expense is not regarded, but only the healthy vegetation of the plants they cultivate. But those substances that escape in a volatile form, and which form a large portion of the component parts of fresh dung, can be rendered extremely effective if they are fixed and combined, so that they shall only escape slowly and uniformly in the earth, and give a constant and regular supply of the elements from which plants are formed. They do not form humus, nor anything like it; but while the humus is chiefly giving out moisture and carbonic acid, they give out ammonia, by which the plants obtain nitrogen, and add to the soil various salts with earthy bases, which are soluble in water, and being found in most plants or their seeds, may be supposed necessary to their perfection, and to enter by the roots with the water in which they are dissolved. To retain these elements and to make them subservient to the growth of plants and the increased fertility of the soil, is one of the great objects we have in view, in enlisting science in the service of agriculture; and the hints which chemists have given on this subject—leading to practical experiments without at once blindly adopting any new theory—have already had the most beneficial results, and, with cautious proceeding on the part of intelligent and experienced farmers, we may hope to establish a system of manuring which shall fully confirm the discoveries of science; and, being founded on carefully-repeated experiments, will be ultimately adopted by the most sceptical and purely practical farmer.

The garden is an admirable school in which to learn agriculture; but in the garden, results only are looked to, without regard to the expense. The market-gardeners are, it is true, men who cultivate land for profit; but their customers are mostly in the class where everything which contributes to comfort or enjoyment is liberally paid for. Every growth is more or less forced and unnatural; and the situation of market gardens near towns gives them unusual facilities in disposing of their produce, and obtaining an unlimited supply of manure. But a little observation on the practice of gardeners in the management of manure, and a comparison of it with the principles laid down by science, would greatly assist the practical conclusions of the larger farmer. Prudence and economy are the soul of agriculture; and the balance of accounts at the end of the year is the criterion of the system pursued; yet this is not all: if a farmer realizes the same net profit by an expensive outlay in labour and manure, which implies a corresponding increase in his produce, he confers a double benefit on his country—he gives a livelihood to more individuals by the additional labour, and more food to the community by his greater crops—two most important objects where population is redundant and profitable employment scarce. This is a digression, but perhaps not devoid of utility, and is intimately connected with our subject.—M.

Now that the proceedings of the worthy gentlemen who rejoice in the name of Custom House Officers are under examination, we do trust that those who have charge of the investigation will make some inquiry into the history of the infamous plunder that notoriously takes place when packages of plants arrive at our ports. For more years than we can remember, this has been a constant source of well-founded complaint, more especially as regards the ports of London and Liverpool; and we appeal with confidence to the Horticultural Society of London, and to all the great importers of plants, for a confirmation of our statement.

When packages of living plants arrive from the tropics, especially if they contain Orchidaceous plants, they have been continually robbed, unless some active agent has been on the spot to see them opened, and to secure them from the official plunderers.

Specific instances enough might be named, but as we do not desire, on the one hand, to expose the sufferers to the annoyance of an examination by the Court of Inquiry now said to be sitting; and, on the other hand, are not prepared to point out the delinquents, we shall content ourselves with mentioning one single case of recent occurrence.

A gentleman was advised that certain packages containing valuable plants had been despatched for him from Belize. Gaining no intelligence of them from the Custom House agents, he travelled to town for the purpose of inquiring after them. The people on board the ship that brought them assured him they had been taken possession of by the Custom House officers: the Custom House officers denied all knowledge of them. He, however, rummaged over the warehouses in which it was supposed they might

have been deposited, and succeeded in finding—not, indeed, his plants—but the directions of the boxes, which had been torn off, and remained behind in testimony of the dishonesty of Her Majesty's servants. And this kind of robbery, we affirm, is an event of far from uncommon occurrence.

FIXING AMMONIA.

THE high interest at present attached to various processes for fixing ammonia, and the great attention which is now paid to the subject throughout the country, induce me to trouble you with a few observations upon some of the means which are taken to fix ammonia. Professor Henslow has recently published a letter to the farmers of Suffolk, in which he draws their attention to a plan proposed for fixing ammonia by the use of common salt. After describing the plan as it reached him, he proceeds to remark on the probable value of the suggestion, pointing out several theoretical objections, and concluding by advising them to ascertain for themselves whether or not the plan possesses any practical value.

I do not think it necessary to copy the whole of the statement respecting this new mode of fixing ammonia. The author of it adverts to the loss of ammonia constantly going on in stables and other similar situations, and then says, "There is, however, a cheap and simple remedy for this. Before you begin to clear out your stable, dissolve some common salt in water; if a four-horse stable, say 4*lbs.* of salt, dissolved in two buckets of water, and poured through the rose of a watering-pan over the stable floor an hour or so before you begin to move the manure. The volatile salts of ammonia will become fixed salts from their having united with the muriatic acid of the common salt, and the soda thus liberated from the salt will quickly absorb carbonic acid, forming carbonate of soda; thus you will retain with your manure the ammonia, which would otherwise have flown away, and you will also have a new and most important agent thus introduced, viz., the carbonate of soda. As this is a most powerful solvent of all vegetable fibre, and seeing that all manures have to be rendered soluble before they can act upon vegetation, it will be at once apparent that the carbonate of soda so introduced must be a most powerful and valuable agent."

There is no doubt that if such a plan as this were found to answer the purpose, it would be more economical, and more generally employed than any of the processes which have been hitherto proposed, but I feel very doubtful whether it would produce any such effect as that above described; and I rejoice to see Professor Henslow recommending farmers to try for themselves the value of the plan, at the same time most properly cautioning them against implicitly believing the truth of the statement.

He observes, that if ammonia is thus fixed, it is probably not in consequence of the decomposition of salt by ammonia, but by the mutual reaction of common salt and carbonate of ammonia. Common salt is not acted on by ammonia; the latter cannot decompose salt, and therefore salt would be of no value in fixing caustic ammonia, besides which, it is not ammonia but carbonate of ammonia which is formed in manure. The question then is, does salt decompose carbonate of ammonia? will it convert that volatile pungent-smelling agent into a fixed solid substance? In the first place, it must be remembered that though dry pure salt is described by chemists as being "chloride of sodium," or when combined with water is called muriate of soda, yet the common salt ordinarily met with in commerce is by no means chemically pure. It contains a considerable quantity of impurities, amounting frequently to several per cent. of the salt. The impurities, for the most part, consist of muriate and sulphate of lime and magnesia; and, generally speaking, the cheaper the salt the more of these impurities does it contain. These earthy salts are readily decomposed by carbonate of ammonia; and, therefore, upon adding carbonate of ammonia to impure common salt, the impurities are decomposed, muriate and sulphate of ammonia are formed, together with carbonate of lime and magnesia; here, then, is one way in which common salt is useful in fixing ammonia. The second point to be considered is, does muriate of soda, or pure common salt dissolved in water, decompose carbonate of ammonia? When solutions of these salts are mixed together, it is found that they do, to a certain extent, react upon each other; but that whilst one portion of the ammonia is fixed, another is rendered caustic and even more volatile than it was when in a state of carbonate. It is possible to decompose pure salt by carbonate of ammonia; but the process must be carefully conducted, and a number of conditions must be attended to. Although, by the addition of salt to manure, a portion of ammonia, which would otherwise be lost as carbonate, may be fixed; yet, I believe that it is only a very small portion compared with what escapes. So far from its being in accordance with chemical principles to say that muriate of soda will decompose the carbonate of ammonia of manure, and give rise to the formation of muriate of ammonia and carbonate of soda, it is, on the contrary, evidently opposed to them;—for carbonate of soda and muriate of ammonia decompose each other, and when two solutions of these salts are mixed together under ordinary circumstances, common salt is formed, and the mixture acquires the strong pungent smell of ammonia from the escape of the volatile carbonate of that alkali. I therefore suspect, that the more impure the salt employed is, the more valuable will it be, as a means of fixing ammonia; whilst, if pure muriate of soda is employed, it will be found, I fear, of comparatively little practical value in fixing the carbonate of ammonia of manure.—E. Solly. Jun.

MANURING WITH GREEN CROPS.—No. X. (By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 84.)

[The common Magdeburg acre consists of 180 square rods, or 25,920 feet Prussian, which is about $\frac{1}{16}$ of an English acre.]

3. *Seaweed* (*Fucus*).—The waves of the sea throw several plants ashore in large quantities; for instance, *Fucus esculentus*, *F. saccharinus*, *F. canaliculatus*, *F. palmatus*, *F. vesiculosus*, and *F. serratus*, which are used as a manure with great advantage. In England, land which is in a situation to be manured with *Fuci* pays 25 per cent. more rent. The bladder *Fucus* (*Fucus vesiculosus*) contains only 16 per cent. water; and 1,000lbs. of the dry herbage contain 32lbs. of chlorates (of lime, soda, and magnesia), 35lbs. carbonate of lime, 64lbs. gypsum, and 30lbs. phosphate of lime. It contains also a great quantity of nitrogen, all which fully explains its high manuring properties, even if only 5,000lbs. are applied to the Magdeburg acre. Its effects are somewhat increased by the numerous small sea-shells which adhere to it. It is either conveyed at once to the land, and ploughed in, or is collected into heaps for rotting, in which case decomposition soon ensues, and many fertilising gases are evolved. It is therefore best to bury *Fuci* as soon as possible. As their chlorides of lime and magnesia attract much humidity from the air, they are best suited to dry soils. With *Fuci*, *Seawrack* (*Zostera marina*) is also driven on shore, and is, in like manner, used as manure.

4. *Mushrooms and Fungi* (*Fungi*).—The wise farmer who would neglect no means of increasing the productivity of his soil, will permit nothing to be wasted, would do well to turn his attention to *Fungi* as a manure. In some forests these plants grow to such extent, that a person may collect 1 cwt. in one day. For manure, both eatable and venomous *Fungi* may be used, but they must be first exposed to putrefaction. They decompose very soon; during which process they evolve much ammonia, which shows the great amount of nitrogen they contain, as well as their value as a manure. How powerfully indeed they operate may be judged from the fairy rings so often met with on pastures and meadows, which are only caused by *Fungi* having decayed in such places. Their use as a manure is not new; it has been known long since to small farmers in Germany. They are usually added to the dunghill, but it would be much better to mix them with humous earth and dung in the compost heap, in which case none of the ammonia produced by the *Fungi* would be lost. From the chemical analysis of several species of *Fungi*, I find that they are rich in phosphorus, sulphur, and chlorine; and, consequently, are composed of substances most essential to crops. They approach, indeed, in their chemical composition, to animal matter; and we have seen already that this affords the most powerful manures. Admitting that the large farmer can employ his people to more advantage than in collecting *Fungi*, it is very different with the spade-husbandman, and cottager, to whom they may be of great utility.

(To be continued.)

ENTOMOLOGY.—No. XL.

THE WOOD-LOUSE DEATH-WATCH, named *Atropos pulsatorius*.—There are several kinds of insects called Death-watches, from their producing a ticking or knocking at regular intervals, sometimes for 60 or 70 seconds, when it ceases for a short time and the beating is again resumed. These sounds being heard best in the stillness of night, and probably being noticed in sick chambers, where superstitious nurses found marvellous solutions for every uncommon occurrence, they became condemned as bad omens, as the precursors of death, and were forthwith called Death-watches. The minute insects before us have been accused of having this ticking propensity, and it is now supposed to be produced by their little horny jaws when they are feeding; but I am rather disposed to attribute the sound to some means the females possess of discoursing with their friends at a distance, and thereby attracting the males to join their society. However this may be, their jaws are certainly most mischievously employed, which is my inducement for discussing their economy. No one suffers more from the attacks of these marauders than the naturalist, whose well-stored boxes and presses of insects and plants are frequently entirely ravaged by these little pests, so that the delicate wings and bodies of the former, as well as the petals of the latter, disappear altogether, if collections be neglected for twelve months together. Fortunately, in this favoured land, we are not subject to the assaults of the numerous insects, which, even in the South of France and in North America, render it ten times more difficult to preserve objects of natural history than it is in England, where, by a little care and proper attention, such collections may be preserved for an indefinite period.

These tender little animals are particularly fond of damp situations, and have a great antipathy to the light of day; on opening a box of insects, for instance, which has been shut up for a few weeks only without any camphor or essential oils, they will be seen running to and fro in every direction, and secreting themselves as fast as possible in old pin-holes, or under the specimens surrounded by little heaps of dark dust, which they themselves have deposited, and which is their excrement. It is the same in *Herbaria*, birds'-skins, &c.; their motions are peculiar, they seem to glide along when disturbed sometimes with a jerk, like a skip, and they move sideways or backwards with equal facility, occasionally remaining perfectly quiet, when it is very difficult to detect them. In the winter they disappear, but as soon as the vernal sun raises the temperature, they are again actively employed, and keep up their annoying operations until

the close of autumn. It has been my opinion that they breed amongst the dry paste, by which the paper is fastened down in boxes and drawers and to the walls, or the eggs, being invisible from their minuteness and pale colour, may be in existence and lie unhatched in the pin-holes for long periods, which seems the more credible as specimens of insects that have been for many years perfectly free from them, will, in a few days, exhibit signs of their presence if placed in an unprotected box or drawer, however close it may shut. Derham, in his "Physico-Theology," says that they feed upon the dust of bread, fruits, &c., and they appear to be found everywhere in kitchens, on old furniture, wainscot, papered walls, and window-frames, amongst neglected books and papers, in gardens, on the trunks of trees, &c.

Fig. 1 shows the natural size of the *Atropos pulsatorius*, which is soft, shining, yellowish white; the head large, with two minute granulated black eyes; the feelers rather long; the antennæ slender, tapering, nearly the length of the animal, and composed of 15 joints and upwards; the collar and the thoracic segment are narrow, sometimes with a long black spot which extends to the base of the head; the abdomen is large and somewhat ovate, a little hairy at the extremity, with a black spot at the base, and another at the apex, which vary in form and size according to the quantity of food in the intestines; the six legs are short, the hinder thighs very stout, the tarsi are triarticulate, and terminated by little claws (fig. 2, magnified); at some periods of the year I believe they are a little larger and more ochraceous.

I once entertained an idea that this minute insect, which does not agree with either of the Linnæan descriptions, was the larva of a little *Psocus* (from which genus *Atropos* has been separated by Dr. Leach), not uncommon in houses; but as this Deathwatch sometimes abounds in my neglected boxes, and I have never detected the *Psocus* with it, I have relinquished that opinion. I have since thought it not improbable that our *Atropos* might be the young or larva of the large species (fig. 3), but I never found them together, indeed the only specimens I ever saw of the latter were in the comb of some vagrant bees!†

This large species, which from its size I suspected was the *Termes fatidicum* of Linn. is ochraceous; it has large brownish eyes; the palpi are rather short; the horns are not longer than the head, slender, and 11-jointed; the collar is short; there are two small pilose elytra; the abdomen is large, the incisures are distinct and rusty, as well as numerous irregular spots between them, and there are one or two black spots towards the apex; the legs are slender, the thighs stout, the hinder pair the least so (fig. 4, magnified). The large eyes, and four stout anterior thighs at once distinguish this from the foregoing insect, independent of the variation in their size, and the short horns, which may be a sexual character, or it is possible they may have been injured in the specimen figured.

These helpless insects have a natural enemy, which feeds upon them, called a *Chelifer*, having two pair of claws like a lobster, with which it seizes its prey; and the most effectual way of protecting cabinets of insects and presses of dried plants from their attacks, is to keep them in a dry situation; the cases should be rendered as airtight as possible, when a small supply of camphor will preserve the contents from injury; the drawers, however, must be replenished at least annually, but every six months would be better. I have thus kept my collections of insects for nearly 30 years, free from the slightest infection. I have tried experiments with spirits of turpentine, petroleum, aniseed, and various essential oils, without any permanent effect; the fact being, that they very soon evaporate and escape; consequently, the confined atmosphere is not rendered destructive to the lives of these little plagues, as it is when fairly impregnated with camphor.—*Ruricola*.

AMATEUR'S GARDEN.—No. VIII.

I do not recommend the formation of slight hotbeds for raising annuals; I object to this practice—firstly, because those requiring heat can be more conveniently raised in pots; secondly, because most annuals flower best when sown where they are to bloom; and thirdly, because, if a proper stock is sown in the autumn, there is no necessity for the extraneous assistance of heat. To the hardier annuals recommended a fortnight back, may be added *Portulaca splendens* and *Lobelia ramosa*, two beautiful plants, with *Isotoma axillaris*, *Ipomopsis elegans* and *Schizopetalon Walkérii*. *Thunbergias* should now be sown in heat, as should also *Cockscombs*, *Balsams*, and *Globe Amaranths*, if wanted to bloom early; but fortunately these formal things are little called for, as the blank they used to fill in the greenhouse is now occupied by *Fuchsias* and other better things.

In the greenhouse and pits, proceed with potting plants for bedding out. *Calceolarias* and other soft-wooded plants that require it may also be potted, taking care to

* Curtis's Brit. Ent., fol. and pl. 648.
† Ibid., fol. and pl. 769.

drain the pots well; on this subject I shall offer a few remarks next week.

The propagation of plants for bedding out may now be proceeded with, according to the number required; but clumps should not be kept shabby for the want of a few plants, as they are readily propagated at this season. For cutting-pots I generally use 48s, prepared in the following manner:—Over the hole at the bottom I place an inverted 60-sized pot, and round it potsherds, broken small; over these some moss, and then fill up with a compost of peat, sand, and leaf-mould, in equal quantities, leaving about half an inch at the top for white sand, which runs into the holes as the cuttings are inserted. A stock of pots thus prepared should be kept in a frame or propagating house; as nothing is so injurious to cuttings taken from plants growing in heat, as to put them into cold soil. Cuttings cannot be too short if they have the necessary buds to form a plant; neither can they be inserted too shallow if they are made firm in the pots.

In the vegetable department, sow either on a slight hotbed or in pans the first crop of Seymour's superb White Celery; also some early Cauliflower, and a small crop of impregnated early White Broccoli. If the crops before recommended are not sown, no time must be lost in getting them in; make your first sowing of Marrow Peas, and also put in the last crop of early ones. Spinach, Lettuce, Radishes, both long and Turnip-rooted, Dutch Turnip, and Early Horn Carrot, if wanted early, must be sown without delay. A good breadth of early Potatoes must be planted; and get the ground ready for Onions, Carrots, &c., next month.

On comparing the practical part of my preceding articles with the Calendar by Mr. Beaton, there is so much sameness in the directions that, in future, I shall not attempt to detail all that is required to be done in the Amateur's Garden, but confine myself to the elucidation of the more important parts of garden culture. This, I trust, will be agreeable to the readers of the *Chronicle*, as it will remove the sameness that has hitherto existed, and render these papers more valuable than otherwise it would be possible to make them.—*W. P. Ayres*.

HOME CORRESPONDENCE.

Vegetation of Afghanistan.—Your correspondent inquires of "R." what are the geological features of the Afghan mountains, which produce such remarkable barrenness in the neighbourhood almost of the richly-clothed Himalayas. In this question it seems to be taken for granted that the distribution of plants depends chiefly upon the mineralogical nature of the soil. This I am not inclined to deny, nor am I prepared to admit; for I believe that in different climates the same circumstances will have a very different influence in favouring or preventing the growth of plants. To proceed, however, to your correspondent's query. I must say that I know not whether any precise information has been published respecting the geological features of these Afghan mountains. Mr. Griffith, in his report on the subjects connected with Afghanistan, published in the Journal of the Asiatic Society of Bengal, mentions it as a general remark in the Army, that, if stones in 1841 could be made a source of riches, what a wealthy country Afghanistan would become. No account is given of the structure of these mountains, but very generally their surfaces are immediately rocky. Some of the offsets are composed of sand in all degrees of softness and induration, in which last state it becomes tabular. Alternating layers of a conglomerate, often exceedingly hard, are to be met with in this sandstone. On both sides of the Valley of Bamean, the offsets are composed of earthy or clayey materials, of varied and rather vivid colours. Generally speaking, Mr. G. says the Afghan mountains are not difficult of access, they may be ascended and descended by making use of the beds of the draining streams, which are very generally dry, except in the season of floods. A section of an Himalayan ravine may, he continues, be correctly taken as wedge-shaped, V; that of the Afghanistan ravines would be a broadly-truncated wedge. Mr. Griffith has well represented the general structure of these valleys; the mountains which bound them being usually composed of bare rock, while their sides, composed of boulders and shingle, from their very gradual nature, have been called glacis slopes. In the centre of the valley there is a portion of tillable soil, consisting of a strip on either side of the line of drainage. Another feature which distinguishes these mountains is the smallness in number and size of its rivers and streams; owing, no doubt, to the general dryness of the climate; and in consequence of this dryness, little evaporation can take place from the soil, and therefore little or no dew falls, which would otherwise be the case in so clear an atmosphere. The Himalayas, on the contrary, though more steep, are clothed with vegetation, in consequence, chiefly, of the abundant supply of moisture. I say, chiefly, because great difference may be observed between the comparative barrenness of the clay-slate ranges, when compared with those composed of lime-stone, mica slate, or Gneiss; of these, sections are given in "Royle's Illustrations of the Himalayan Mountains," as well as a statement of the nature of the climate. From the abundant snow which falls in the interior and higher mountains, a constant supply of water is furnished to the numerous rivulets and rivers. The snow has hardly melted from these situations, when the rainy season comes on, and the mountains are enveloped in clouds—(those mists of the mountains)—or bathed with showers, so that the climate is moist, and the temperature moderate and equable. These mountains, from their oblique direction, running S.E. and N.W., are influenced throughout by their rainy monsoon, which cannot, however, cross their lofty summits, so that the

country, in their northern face, is as dry and nearly as barren as Afghanistan. These rains extend only partially into the latter country, as has been well shown by Mr. Elphinstone, in his work on Cabul. This is, no doubt, owing to the strength of the monsoon being nearly exhausted, even before it reaches the confines of Afghanistan, as well as to the direction of the range of mountains which runs parallel to the Indus, being opposed to their further progress, and thus preventing the country to the north being benefited by many showers which might occasionally extend further than ordinary, if not thus impeded; at all events, the dryness of this country is excessive, and the power of the sun great, and to these chiefly must be ascribed the barrenness not only of the mountains, but of the country in general. In studying, therefore, the laws which influence the geographical distribution of plants, it is necessary to pay attention to the meteorology of a country, at the same time that we examine the nature of its soil: and it is equally essential to do so, when we wish to cultivate in one place or country the useful or ornamental productions of another.—R.

Fixing Ammonia.—It is only under certain circumstances that sulphate of lime will decompose or fix ammonia, and these circumstances are not to be found in a dunghill. Chloride of calcium (muriate of lime of commerce) will answer this purpose exceedingly well, and is cheap enough, being about 4*l.* per ton. I am inclined to think, however, that chloride of sodium (common salt) will be found the best thing a farmer can use for fixing the ammonia in his dung. I have put it to the test in a variety of ways, and have always succeeded in obtaining chloride of ammonia and carbonate of soda. I know you have frequently stated that salt will not decompose ammonia; and this is the prevailing opinion; let it, however, be put to the test, and the result will, I am confident, prove successful. The manner in which you have brought Professor Henslow's opinions before your readers is excellent; I should like, however, to see you recommend three dunghills instead of two, and one of them to be treated with common salt. I am only afraid that you will tell your readers, if you notice the matter at all, not to be at the trouble and expense of putting salt to the test, as it is well known not to answer. Some of your known and talented correspondents might assist me in this matter with you, by trying the following simple experiment, and reporting the result:—Take equal parts of carbonate of ammonia and salt, mix them, and give the mixture the same moisture and temperature they are likely to be subjected to in a dunghill for 48 hours, and if they should report to you that they found chloride of ammonia and carbonate of soda, I think that would be sufficient to authorize you in recommending more extensive experiments.—J. C. [We would beg to refer our readers to a letter from Mr. Solly upon this subject in another column. We presume our correspondent means muriate (hydrochlorate) of ammonia, when he speaks of chloride of ammonia.]

Fixing Ammonia.—A few practical observations may not be unacceptable on the subject of the fixation of ammonia by gypsum. I have long been in the habit, in the manufacture of sulphate of ammonia on the large scale from the ammoniacal liquor of the gas-works, of using gypsum for this purpose. It is well known that gas-liquor is composed principally of water holding in solution variable quantities of carbonate, hydrosulphate, and hydrocyanate of ammonia, and generally some uncombined ammonia. There are some other substances present, but which we need not now notice. I may here corroborate a recent remark of yours, that the gas-liquor of the country gas-works is weaker than that produced in London. This is certainly true, as far as my observation goes. A few years since I contracted for the entire quantity of liquor produced at the West Bromwich gas-works, amounting to more than half a million of gallons yearly; and the average strength was, that one gallon required rather less than six ounces of strong oil of vitriol for its saturation. The liquor of the London works (near Vauxhall-bridge), averages, according to my experience, 12 ounces oil of vitriol per gallon. I may also remark that the liquor produced from inland coal (which generally abounds with iron pyrites) contains much more sulphuretted hydrogen than that made from sea-coal, which is the sort generally used in the London gas-works. When gypsum in powder is added to gas-liquor, cold, the first effect is, that the water present dissolves a portion, which is simultaneously decomposed by the carbonate of ammonia also present. This it does by virtue of a complex affinity, forming an insoluble carbonate of lime and a soluble sulphate of ammonia. It seems quite essential that there should be sufficient water to dissolve readily the sulphate of ammonia as fast as produced, or the process grows sluggish, or stops altogether. It is only that portion of the gypsum which dissolves, from time to time, that acts upon the carbonate of ammonia. But it is only the carbonate of ammonia that is decomposed, and its volatile base fixed. The free ammonia, and the hydrosulphate and hydrocyanate, remain untouched and unfixed, ready to fly off into the atmosphere, on exposure or increase of temperature. It was from this inability of gypsum to fix the whole of the ammonia existing in gas-water, that compelled me to add to my liquor, after the action of the gypsum had terminated, so much oil of vitriol as was found sufficient to saturate the free ammonia, and to decompose and fix the fugitive hydrocyanate and hydrosulphate. By these means I succeeded in fixing the whole of the ammonia. Now the composition of the liquid of the dung-heap, which first saturates the solid portion and then flows away as a rich brown liquid, is almost identical with gas-liquor. It certainly contains all the substances mentioned, though not, it may be, in the same

proportions. Any one may prove for himself the truth of the remarks which have been made. He need only provide himself with a little very finely pounded unburnt gypsum, some solid carbonate of ammonia, and a little pure ammonia. Let him dissolve sufficient of the carbonate in water, so that the solution may smell tolerably pungent of ammonia, then add by degrees the gypsum, shaking frequently: the smell will soon go off. Now add a little of the pure ammonia, enough to restore to the liquid an ammoniacal odour; all the gypsum you can now apply will not deprive it of this. It is now easy to understand Mr. Pusey's remark, that gypsum has not been found to answer, and also to account for its failure on scientific principles. Two circumstances seem necessary for its success—a sufficient quantity of watery liquid, and that the ammonia be combined with carbonic acid. When urine putrefies, pure ammonia is first formed, which only gradually combines with carbonic acid. In the commencement of its putrefaction gypsum is of no use. The circumstances being the same, the pure ammonia would be lost with as much celerity from urine with which gypsum had been mixed as from urine in its natural state. How far its presence may possibly modify the decomposition of the urea, is a point upon which I am not prepared to pronounce an opinion. The two volatile ammoniacal salts already mentioned would fly off and be lost quite as soon, and as entirely, with gypsum as without. I think therefore that Professor Henslow's plan of arranging his dung-heap with dry pounded gypsum will not be found to answer, or at most very imperfectly. If exposed to the rain out of doors, the sulphate of lime would by degrees be dissolved, and act as we have said; and even supposing the liquid proceeding thence be saved, all the free ammonia and the other volatile salts would infallibly be lost in the air. If the heap be under cover, the gypsum would not act at all, or very inefficiently. I think enough has been said to show that although gypsum may succeed in retaining part of the ammonia present in decomposing urine and farm-yard manure, yet it cannot retain the whole. I think, therefore, Mr. Pusey was quite justified in his remark, which, though perhaps originating either from his personal observation, or the experience of some of his friends or correspondents, science fully confirms, and shows that it could not be otherwise. But agriculturists are not confined to the employment of gypsum for the purpose of fixing ammonia; and what they may do, and do efficiently on this point, may, if the subject interests sufficiently, be the topic of another letter.—W. H. Potter, *Chemical Works, Upper Fore-street.*

Manure for Flower Clumps, &c.—I have two flower gardens under my charge; in both these are 40 good-sized clumps and flower-borders, one half of which every second season have a sufficient dressing of good manure, cheap and easily attained. This is prepared by collecting all walk-sweepings, refuse of flowers, short grass, and fallen leaves, which are thrown into a heap for a twelvemonth, but turned several times during that period. It is then in a fit state to be wheeled on the land, and I find it sufficiently rich to keep the clumps in good condition for the growth of flowering plants. As I never allow weeds to flower, I am not afraid of their seeds being brought upon the land with the compost.—R. D.

Economical Manure.—In the several plans which have appeared in the *Chronicle* of late for the preservation and accumulation of manure, whether by the gardener, farmer, or cottager, I beg to offer to your notice a plan I followed last autumn, and which, if there is any truth in the theory of decomposed vegetables producing the most proper food for their respective species, a mass of manure is formed on the spot with little trouble and expense. It is usually the practice to clean the garden thoroughly when most of the summer and autumn crops are over; instead, then, of raking and wheeling all the refuse away to the yard appropriated, fix on an open or spare part of the garden, and throw out with a spade a trench five or six feet wide, and as long as you judge you have refuse to fill up to the height of five feet, making the trench one foot deep. Next put a layer of fresh horse-litter on the bottom, and wheel on a layer of your refuse, decayed haulm, stumps, leaves, weeds, or any other thing you wish to clear away, putting a layer of dung (fresh) between each layer of refuse; finish in a ridge similar to a Potato-pit, five feet high, and cover the whole up with the adjoining soil, to prevent the escape of steam. Violent fermentation will soon take place, and the covering must occasionally be looked to, to make up the cracks that will occur by the heap subsiding, and to keep in the steam; in three months you will on the spot have a rich mass of that description of manure peculiarly fitted to enhance the growth of vegetables. Would not an old oil-cask make a good vessel for cottagers to keep their manure in, with a top to it to prevent the smell from escaping?—John Spencer, *Bowood.* [Yes; but it would soon rot.]

Potatoes.—I last spring planted some bread-fruit and kidney Potatoes, which turned out of the ground in fine condition for table, being very mealy and properly flavoured; but after having kept them with the greatest care in the dark in a cool and well-ventilated store-room, which was not damp, I am at a loss to know why they are now absolutely useless for table. They are quite watery and unwholesome, although apparently in as fine condition as ever. These Potatoes are, moreover, covered to a great thickness with straw. Will you or any of your correspondents have the kindness to solve this problem?—Rus.

Garden Produce.—I should be much obliged if you would inform me, through the medium of your Paper, what produce I may reasonably expect from my garden at this season of the year. I have 2 Vineries, each 30 feet long; 2 Peach-houses, of the same length; 1 Forcing

house, and 1 Green-house, about 50 feet in length together, and one 9-light pit, 38 feet in length. The height and depth are, of course, proportionate, and the gardener has as many frames as he requires. The kitchen-garden comprises one acre of ground within the walls; and round the outside, fruit and vegetables are cultivated. There is an old kitchen-garden, containing about half an acre, nearly adjoining which, although rather overgrown by trees on the outside, yet being more sheltered than the other, is found useful for early vegetables, &c. The information I am anxious to obtain, is, what flowers at this season of the year I may expect to be brought in from the houses in succession? What vegetables, roots, &c. for household consumption? My family consists of 18 or 20 persons, who require to be well supplied with vegetables, which at the present moment I do not find the case, or indeed much later in the year. I ought perhaps to state, that, fuel being very expensive in this country, we do not commence forcing till the end of December. The natural soil is chalk and clay (in some parts), but the garden soil was artificially made about ten years ago; the gardener has as much manure as he requires, and there is abundance of loam, peat, &c., in the neighbourhood, besides rotten leaves, road-scrappings, &c., any quantity of which he can always have when he requires it. The flower-garden is under his direction also; but as it is chiefly American and Rose garden, it is not so troublesome as a mixed garden usually is. The gardener has six men and one woman under him, for his exclusive use, all the year round. I have stated all these particulars, as I am anxious that my garden should produce as much as possible, without being unreasonable in my requests; and I should be much obliged to you, or any of your correspondents, if they would give me some information on the subject.—G. L. E. [We must refer this question to some good practical Gardener.]

Camellias.—At p. 102 are some remarks on Camellias by Mr. Sherwood: I beg to say that I entirely agree with Mr. S., and I trust Mr. Beaton will excuse me for thus adding my testimony, and also for doubting the propriety of placing the pots in warm water. If it is bottom-heat alone which they want, by all means let them have it, in the shape of tan, or leaves, or Rendle's Tank mode, if novelty is desired. If moisture at the root is required, let them be freely watered, and that too with liquid manure. Nothing is more frequent, however, than to meet with Camellias in a "pot-bound state;" in which case the old ball is frequently as hard as a brick, and if it once becomes thoroughly dry, a score of waterings will not suffice to penetrate it. The only plan in this case is to plunge the pot, containing the plant, overhead in tepid water; if there is a little liquid manure in it, so much the better. A plant, in this state, ought to remain in the water for an hour or two: in may then be removed to its place, and after a day or two may be regularly watered with the rest. One caution, however, is necessary, and that is, that no plant ought to be repotted immediately on being taken out of the water, for this reason—the outer part of the ball will have become saturated before the moisture can have penetrated the interior. The plant or plants must by all means be allowed to stand in an airy situation for two or three days before potting; and the ball should then be, what gardeners term, in a "mellow" state. With regard to "forcing them into wood," I agree with the principle, but it should not be carried too far. The middle of March is a good time for beginning this process, and if plants now in blossom, or just done blooming, are placed in a cool, moist atmosphere of 40° to 50°, it will greatly benefit them, and in this respect particularly: plants excited into blossom, the excitement being carried on without interruption, through the growing process, are apt, (especially if there is not a powerful action of root) to push few buds; especially if the heat recommended by some Camellia forcers is followed. Whereas, the mode I now recommend will give them time to break more buds and consequently become more bushy: added to which, the accumulation of excitability, (the basis of forcing) will cause them to develop larger leaves, and in proportion to the healthiness of these important organs (provided the subsequent treatment be right) will be the size and perfection of the flowers. I may perhaps be pardoned for observing that I made some observations on Camellias at p. 139 of last year's *Chronicle*. When I wrote that article, I felt myself warranted in doing so, by the success which I had met with in following the mode of culture there detailed. I have pursued through another year a similar plan, and my success has been still greater. My plants began blooming in the last week of October, have bloomed incessantly from that time, and will continue until the beginning of March; thus, for four months, (in the depth of winter too), a small conservatory about 26 feet long has been in a continual blaze. I have, in fact, had thousands of blossoms, and the plants now are of so good a colour in the leaf, that they rival the healthiest Portugal Laurel. Having excellent roots, my plants are now endeavouring to push into wood: I am, however, as resolute on the other side the question, and shall endeavour, as far as is consistent with the condition of the late bloomers, to keep them back until the middle of March, when I shall manage them nearly as Mr. Sherwood does, excepting that I shall not place them out of doors. I live, however, in a different degree of latitude from Mr. S., and being within 30 miles of Liverpool, as well as on the edge of Delamere Forest, "the cooling gales" are more frequent than refreshing.—Robert Errington, *Osulton Park.*

Salvia patens.—Several correspondents have stated, in the *Chronicle*, that the above plant will survive unprotected in the open ground during winter: my experience, however, proves otherwise. In the neighbourhood of Edinburgh, where the climate would be supposed to be milder than at

Holme Gardens, Inverness, a specimen was planted out in the summer of 1840, in a dry part of the garden. It bloomed beautifully until November, when it was cut down, close to the ground, and covered to the depth of eight inches with leaf-mould. On removing the leaf-mould, in the following summer, the root was found to be completely rotten. I have known many more perish in the same way, but I cannot pledge myself that they were planted in such favourable situations as the former.—*William Proctor, Gardener to J. H. McKenzie, Esq., Tarrat House, Ross-shire.*

Thawing Plants.—My greenhouse, like that of many other persons, was exposed to the severity of the unexpected frost on the night of Feb. 3rd, without any injury being sustained by the plants, which consisted of hard as well as soft-wooded things, but chiefly of Pelargoniums. On the morning of the 4th, the temperature of the house was raised as quickly as possible to between 50° and 60°; the plants were copiously syringed and well steamed; the sun was allowed to shine upon them, and air was admitted at ten o'clock. It will be seen that my *modus operandi* differs very materially from that recommended by Mr. Ayres, at p. 84.—*J. Doran, Lavender Hill.* [Mr. Ayres' directions are, in our opinion, correct; and the practice of our correspondent wrong. Mr. Ayres speaks of frozen plants; it does not appear that Mr. Doran's have been frozen at all.]

Heavy Pine-Apple.—I have often seen in the *Chronicle* accounts of heavy Pine-Apples, not one of which has, I believe, exceeded a fruit grown 9 or 10 years ago at Wallington Hall, in Northumberland, by Mr. Robert Elliott, the then gardener. The Pine was a Providence, and the fruit when cut weighed 11½ lbs. avoidupois.—*G. G. Watson, Vicarage, Norton, Stockton-on-Tees.*

Varnish for Cotton Frames.—Amongst the miscellaneous articles at p. 55, there is one headed a "Substitute for Glazed Frames in Hotbeds." Will the author have the kindness to explain to me how the proportions of cheese, lime, oil, and eggs, can form transparent varnish?—of what use is cheese? I have used a light cotton frame this winter with great success, but the cotton has only been soaked with linseed oil. As this is an economical mode of making useful frames, I should feel obliged for information as to the best varnish to use. I should like to know whether the article sold under the name of gelatine would mix with oil; and whether a small portion of corrosive sublimate would prevent the attacks of the black fungus, which troubled my cotton last autumn?—*Xylinus.*—[Corrosive sublimate will prevent the attack of fungi, and rot the canvas.]

To Destroy Slugs.—I informed you, p. 653, of 1842, of the method which I had adopted for destroying slugs by placing traps (Savoy leaves) about my garden, and I stated that I had killed 36,000 in a few months; I likewise said that I had used lime, lime-water, and salt, to little purpose. The result of my adopted plan this year has given me only about 3,000, and I am persuaded that by a strict attention to it, I shall eventually annihilate the breed.—*Cestus.*

Musty Hay.—Will you have the goodness to give me your opinion on a practice which is becoming very prevalent in this neighbourhood? Every one is aware that cattle will not eat mouldy hay, and if they would, that it would be very injurious to them. It is customary here to cut such hay into chaff, and then to steam it; after which process the cattle eat it greedily, and appear to thrive upon it. Will you say how it is that the steam thus renovates it? and will you tell me if, after it has undergone this process, it is as wholesome and nutritious as hay which naturally is sweet? Though cattle may thrive for a time upon it, will it not in the end affect them, and be productive of some disease which might not show itself for a length of time? Cattle which are intended for slaughtering have not time to show any ill effect; but will it be equally well for a horse who will have to live upon it for years?—*A Leicestershire Farmer.* [The instinct of cattle in choosing or refusing any natural food is chiefly guided by the smell, and there it is nearly infallible. When you cook vegetables they lose some of their peculiar qualities, and in general are improved. Musty hay is rejected by cattle, both on account of the smell and the taste; but when it has been thrashed, so as to drive off the musty fungus, or washed in water, they no longer refuse it. It is, of course, not so nourishing as good hay; but there is no reason to think that it is injurious. A very little attention to the quantity eaten and the subsequent condition of the cattle will settle the question.—*M.*]

The Owl.—The owl is one of the gardeners and foresters' best friends, annually ridding them of legions of their foes; but notwithstanding his valuable services we too frequently see him heedlessly destroyed. In some parts of Europe, however, this most sensible bird is kept in families, like a cat, whom he equals in patience, and (if possible) surpasses in alertness. It is a well-known fact that wherever the barn-owl has been killed off, or very few left, field-mice have increased enormously, and they, in their hunger, do peel, and of course destroy, the young Hollies and other trees in new plantations.—*C. K.*

FOREIGN CORRESPONDENCE.

Paris.—The royal parks and gardens of France are large and numerous; those of Neuilly, Mondon, and Eu, are the King's own property; Chantilly belongs to the Duc d'Aumale; and the Tuilleries, Luxembourg, Versailles, Triansons, St. Cloud, Fontainebleau, Sevres, and Compiegne, to the State. The expense of keeping those last mentioned in anything like decent order is very considerable; indeed, the whole, or nearly all the money allowed for their maintenance, is expended in this one

item, leaving little or nothing for the purchase of new plants. Yet, go into them when you will—spring, summer, or autumn—they always look gay; a continual succession of delicious perfumes or beautiful colours are ever coquetting for your admiration. French artists, in whatever department, fine arts, *beau monde*, or flowers, are justly celebrated for beauty of design and exquisite taste in the arrangement of colours; the latter point is not, I believe, so well understood on the other side of the Channel. It is no uncommon thing to hear English ladies, when visiting Paris, complaining of some fashionable *modiste*, who has positively objected to some favourite colour in a bonnet or other article of dress, simply because it was not in harmony with their complexion. The same attention is given to grouping flowers, whether natural or artificial; in fact, a good gardener is as much known by his skill in arrangement as by the health and vigour of his plants. Another thing observable in these gardens, is, that herbaceous plants, as well as annuals, are grown in masses. Who can enter the English garden of the unfortunate Marie Antoinette (now called the King's Garden), in the park of Versailles, and not stop on the threshold to gaze with delight on the harmonious *coup d'œil* before him? and yet this is entirely attributable to a just knowledge of colours for scene effect. Let him examine the objects of [this earthly Elysium—what does he find? absolutely nothing but groups of the most common kinds of Petunias, Verbenas, Pansies, Asters, Roses, and Larkspurs, and the gay scarlet flowers among the tall shrubs to be the very oldest Pelargoniums. It is not, therefore, their individual beauty,—for these varieties have long since given place to improved ones in Amateurs' gardens,—but the excellent taste in arrangement, which renders this spot so enchanting. But some one will naturally say, how can all this be done without money to purchase plants? The difficulty was foreseen by Louis XIV. and his Ministers, and has been provided for by the formation of three distinct royal horticultural establishments at Sevres, Versailles, and Triansons. The first supplies the King's palaces with flowers, the second with fruit and vegetables, and the last the parks and gardens of the state with trees and shrubs. The whole is under the direction of M. Massey, whose uniform kindness to foreigners desirous of seeing either the nursery, orchard, forcing or floricultural departments, is proverbial. The nursery of the Triansons is solely for forest and fruit-trees, hardy flowering shrubs, and a few Chinese, Cape, and New Holland plants for the conservatory. All these are propagated in sufficient number to answer the demand, which is presumed to be about 20,000 annually. Rhododendrons, Kalmias, Azaleas, Andromedas, and other American border plants, are growing here in luxuriant vigour, and the whole reflects the highest credit on M. Breot, the chief gardener. One of the principal attractions in this establishment last summer was a splendid plantation of nearly 1,000 plants of Paulownia imperialis, varying from 4 to 14 feet high, on one of which I measured a leaf 3 feet long. There is also a noble 3-year old tree, about 30 feet high, which has not, however, yet shown any signs of bloom. The floricultural department is at Sevres, in a most unpropitious situation, abutting on the high road to Paris, the dust of which, in summer, is sometimes as palpably thick as a November fog in London. This, unfortunately, is not the only evil: the soil is of a burning arid nature, and, moreover, exposed to the mid-day sun, without one particle of shade. The hot and greenhouses are in a bad condition, and quite unworthy of such a country as France: the wonder is that M. Gondouin, the superintendent, can produce the immense number of plants and bouquets which are required for the Tuilleries and St. Cloud, amounting to between 15,000 and 20,000 a year; and as the Court reside there nearly six months out of the twelve, the daily supply is from 50 to 70 large bouquets for vases, about the same number of small ones, beside a continual succession of plants in pots. These are indispensable requisites in every Parisian society, from the saloons of the Tuilleries to the miserable attic of the grisette of the faubourg St. Antoine. To accomplish this M. Gondouin forces from 2,000 to 3,000 Lilacs, the same number of Tulips, Hyacinths, or other bulbs, large quantities of Roses (chiefly Rose du Roi), Jasmynes, Azaleas, Mimosas, Ericas, Epacris, Diosmas, Gloxinias, Primulas, Fuchsias, Verbenas, Chrysanthemums, and a variety of other showy things. It was in this garden that the Rose du Roi was obtained, and the original plant is still in a healthy state. I have often heard M. Gondouin speculate upon what his fortune would have been had he received but 10 sous for each plant that has been sold since he first gratuitously distributed it; certainly no Rose ever had so large a sale, or was so worthy of it. The Potager of Versailles is another, and, by a vast majority of Frenchmen, considered the most important of these establishments. The houses and forcing-pits are not only numerous, but well stocked with every kind of fruit in sufficient number to satisfy the most fastidious connoisseurs of comestibles. I have before given you (p. 150, 1841) the number of fruiting Pines; every thing else is upon the same extensive scale. Unfortunately the outside of the buildings is not in keeping with the dainties within; most of them (at least to an Englishman) have an unsightly appearance, for want of paint, which, no doubt, is attributable to the very inadequate sum allowed for their support. But *malgré* every drawback, the Potager is worthy of its fame, whether you consider the quantity of fruit produced or the individual fineness of the specimens. M. Massey is not biased by any of those narrow prejudices of time and country which unfortunately affect so great a portion of the horticulturists of France: he does not fail to adopt any improved system that may come under his observation. The improvement in the culture of the Pine-apple, at least so far as open frame culture is concerned, is due to him and

his chief gardener, M. Grisard: the utility of this plan is generally acknowledged, and almost universally followed in this country; no doubt it will ere long be as extensively practised elsewhere. Mr. Edwards, from the gardens of Chatsworth, is now in the pinery of Versailles for the express purpose (as I have been informed) of making himself fully acquainted with the French treatment, previously to its introduction in the gardens of the Duke of Devonshire. The ground occupied by these three establishments is upwards of 100 acres; and from them are obtained those delicacies and floral beauties which alike charm the inmates of the palace and the promenader of the gardens of the Tuilleries, Versailles, or St. Cloud.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

DENDROBIUM SANGUINOLENTUM. Blood-stained Dendrobium. (*Stove Epiphyte*). Orchidaceæ & Malacæ. Gynandria Monandria.—Probably there is no plant among all the species of Dendrobium now known to our gardens which is more delicately beautiful than this. Its colours, too, are so singular as on that account alone to render it an object of much interest; for here we have the cyanic and xanthic tints in one and the same flower. We are always prepared to find red spots on a yellow ground, or *vice versa*: but it is a most unusual thing to find clear pure violet on petals the whole remainder of whose tint is yellow. In this plant, however, the combination occurs, producing a very gay and unexpected effect. It was sent from Ceylon to His Grace the Duke of Northumberland, by Mr. Nightingale, and flowered at Lion in August last. It has pendulous stems like those of D. Pierardi, but of a delicate purple when young; the leaves, too, are stained underneath, and at the edges with the same colour. The flowers are as large as those of D. aggregatum, of a clear fawn colour, with the tips of the segments and lip stained with a deep rich violet. There is, moreover, a scarlet spot in the middle of the lip.—*Botanical Register.*

BEGONIA COCCINEA. Scarlet-flowered Begonia. (*Stove Herbaceous Plant*). Begoniaceæ. Monœcia Polyandria.—Unquestionably the most beautiful of the many handsome species of Begonia now known to our collections, and, apparently, a very free flowerer. It was imported by Messrs. Veitch, of the Exeter nursery, from the Organ mountains of Brazil, that rich storehouse of vegetable beauties; being there detected by Mr. Lobb, in 1811. It blossomed at Messrs. Veitch's nursery soon after it was received, and was exhibited at the meeting of the Horticultural Society. When the plants become larger, and the blossoms consequently more copious, it will be a truly splendid species; as, like most of the Begonias, its flowers continue a long time in perfection. The leaves are thick and fleshy, their margin being sinuated and bordered with red. The flowers are bright scarlet, exceedingly beautiful.—*Curtis's Botanical Magazine.*

ILEX PARAGUAYENSIS. Paraguay Tree. (*Greenhouse Shrub*). Aquifoliaceæ. Tetrandria Monogynia.—Although not possessed of splendidly coloured flowers, this plant must be acknowledged to be a production of some public and commercial interest, since it has afforded for a century and a half the common beverage of an equally large portion of the inhabitants of South America as the Tea of China in the old world. Yet, strange to say, till within these few years the plant has been quite unknown to botanists. A specimen has lately bloomed in the Glasgow Botanic Garden; it is cultivated in a warm greenhouse. The flowers are pale green, and are produced in umbellate clusters at the axils of the leaves.—*Curtis's Botanical Magazine.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Feb. 21.—R. W. Barchard, Esq., in the chair. M. W. Attwood, W. Broadhurst, K. Lewis, and J. Luscombe, Esqrs., were elected Fellows. Mr. Goode, gr. to Mrs. Lawrence, exhibited some remarkably well grown specimens of *Epacris nivalis*, impressa, and a hybrid bearing considerable resemblance to *E. variabilis*; a very beautiful plant of *Erica melanthera*, a complete mass of tiny lilac flowers; *E. Lambertia rosea*, a free-blooming flesh-coloured variety; *Mirbelia floribunda*, interesting on account of its deep violet colour; *M. grandiflora*, a pretty species, with yellow and dark-brown flowers, and *Cologne flaccida*, bearing a graceful spike of white blossoms, having the labellum delicately marked with yellow and brown; for these a Knightian medal was awarded. From Mr. Appleby, gr. to T. Brocklehurst, Esq., were cut specimens of *Dendrobium Paxtoni*, an exceedingly rare and beautiful species, with flowers of deep orange, having the interior of the labellum strongly marked with dark-brown, and the margin most delicately fringed; *D. nobile*, the best of the group to which it belongs, and cut from a plant bearing upwards of 100 flowers; a dark variety of *Cyrtorchilus maculatum*, and *Oncidium longifolium*, with bright yellow flowers, remarkable for being paler at the back than on the front: a Banksian medal was awarded for them. From Mr. Mylam, gr. to S. Rucker, Esq., an exceedingly fine cut specimen of *Oncidium Cavendishianum*, with *Lissochilus grandiflorus*, a newly-introduced terrestrial Orchidaceous plant, bearing a tall spike of singular, violet-coloured flowers, and a pretty species of *Dendrobium*, also new, with smooth, shining leaves, from the axils of which its fragrant, light buff-coloured blossoms, are produced separately and in pairs; for these a Knightian medal was awarded. Mr. J. Wells, gr. to W. Wells, Esq., exhibited a cut specimen of *Rhododendron arboreum album* in great perfection, and a pretty seedling *Epacris*, with the habit of *E. impressa*, but with flowers of a deep scarlet. From Messrs. Veitch, of Exeter, a new and elegant species of *Passiflora*, called, from its resemblance to the rays of an Actinia, *P. actinia*; it was raised from Brazilian seed, and will probably succeed in the temperature of a greenhouse. From Mr. Redding, gr. to Mrs. Marryatt, a showy hybrid *Rhododendron*, apparently obtained between *R. arboreum* and *caucasicum*; and a fine plant of *Banksia Cunninghamii*, bearing a multitude of its curious brown spikes of flowers: a certificate was awarded for them. From Mr. Clarke, gr. to M. T. Smith, Esq., of Shirley Park, a magnificent specimen of *Leschenaultia formosa*, trained upon a hemispherical trellis, at least 2½ feet in diameter, which it entirely covered: a Banksian medal was awarded for it. From Mr. Conway, a seedling Pelargonium, called P. Lanci, said to be more suitable than any other variety for early forcing. From Mr. Hally, of Blackheath, a collection of cut Camellias. From the Hon. W. Strangways were branches of Camellias, from plants growing in the open air, in Dorsetshire, in different soils—loam and peat; that from the former presented a very unhealthy appearance, the tips and margins of the leaves being completely dried up; the others, from a plant removed a few years back into an American border, were in a most healthy state. With these were cut flowers of *Helleborus purpurascens*, *Euphorbia veneta*, *Characias*, and *Myrsinites*, which, although not producing showy flowers, are valuable on account of their blooming, in favourable situations, during the earliest months of the year, when few other plants are in blossom; both the latter *Euphorbias* are hardy, but the former, unless protected, will only stand out in the milder parts of the country. A cylindrical guard of iron wire, for protecting trees from hares and rabbits, made by Messrs. Burn, of Epsom, was likewise exhibited by the same gentleman; it was about 3 feet high and 1½ foot in diameter, the wire being secured to three iron rods, for keeping it steady in the ground. Mr. D. Judd, of Southill Gardens, Biggleswade, exhibited three exceedingly good Cucumbers, one called Young's Champion, the others Mills' Frame, with the following account: "They were grown in a steep-roofed house, according to Ayres' system; the house is heated by hot water, and although 20 feet long, the

Next follow some observations on the different modes of propagating the Vine, among which that by single eyes is preferred. His treatment of the young plants while growing does not differ materially from that of many gardeners who raise plants in one year strong enough to bear fruit in the next; but after the wood "is perfectly ripened to the length of five or six

feet (the length I recommend for outside planting), prune back to that, then disbud the whole cane, that is, cut every bud clean out (leaving the leaves uninjured), with the exception of the two uppermost, as there will now, by keeping the pit cool, be no danger of breaking, and the food, still gathered and stored up by the roots, will go to the support of the remaining buds, and cause them to break more strong and bold in their new situation in the following spring." The Author plants his young Vines before vegetation has commenced in spring, burying the disbudded part of the stem not more than three inches below the surface of the border, and spreading the roots out singly "in the fan manner." He advises watering at the time of planting, which, however, can hardly be necessary at such a season of the year. To encourage the *layered* part of the stem to emit roots, he lays "over the roots and stems stable litter and leaves in a good state of fermentation, to the width of eight feet, and two feet or two feet six inches thick." Bearing in mind that the first year's wood is the foundation, as it were, of the future stem, the greatest attention is paid to the summer treatment of the advancing shoots, the aim being to obtain a "round, robust, and short-jointed cane."

The system of management recommended is, to begin with a night temperature of 50°, increasing to 60° as the foliage becomes fully expanded, with a range of 20 or 25 degrees higher by solar heat, keeping up a very moist atmosphere in the day. A good warmth is also maintained at the roots by the means before mentioned. Caution is advised in taking off the laterals, especially after the leading shoots have been stopped, which is done when they have attained a length of twelve feet, to "throw the strength back, to the increasing and maturing the stem and eyes and increasing the roots." As soon as the wood is ripe, and while the foliage is still fresh, a sufficient number of the best-placed buds are selected to produce spurs for future bearing, and all the others are cut out without injuring the leaves; thus, in a space of 8 or 9 feet (to which length the wood is to be cut back when pruned), 4 or 5 pairs of buds are retained, independently, of course, of a terminal one to give a leading shoot in the following year. So far as we are aware, this practice of early disbudding is peculiar to Mr. Roberts; and, in conjunction with early pruning, and the timely removal of all useless growths, is strongly inculcated by him, on the principle of not wasting the strength of the plants. To encourage the roots to the surface, he top-dresses the border in September with "ground bones, loamy soil, rotten manure, and decayed carrion, covering the whole with an inch or two of half-rotten stable manure, to prevent evaporation."

In the second year, the Vines are permitted to bear fruit, one bunch only upon each side shoot. In general management, no material deviation is made from the system of which we have given an outline. Fires are applied in March, beginning with a night temperature of 45°, which is gradually increased to 65° or 68° by the time the Vines are in blossom; the temperature in the day being at all times 15 or 20 degrees higher. After the fruit is thinned the range is still greater—from 65° to 95°. Among other directions for the application of heat, the author says, "Maintain your heat by day, giving a little air as before mentioned; if cloudy, cool, weather should intervene, keep up a brisk heat by stirring well your fires early in the morning, and up to mid-day, keeping up to 80° or 85° with a very humid atmosphere. By allowing your fires or boilers to cool down in the after part of the day, you will be able to do without fire in the night, as before; it is my practice to give heat with light, and to reduce it with approaching darkness." This rule is generally too little observed in forcing; at the same time, in its application, the utmost caution is necessary to keep within safe limits, for a crop of fruit might very easily be lost by experimenting upon temperature. Artificial warmth is maintained at the roots till the beginning of July, when the fermenting material is wholly removed and the border exposed to the summer sun. The advantage of continuing this protection to the roots is strongly insisted upon, and it is argued that a deficiency of warmth at the root is the great cause of that baneful disease, "shanking," about which so much has been written to so little purpose. We have always maintained that the primary cause of this defect is want of food. When a Vine is overloaded with fruit, or when a profusion of useless shoots are permitted to ramble at will, or tied one upon another like sticks in a faggot, one leaf overshadowing the other, so that none can perform their proper function of assimilating nutriment; or when the soil is exhausted and poor, or the delicate rootlets checked in their action by cold and wet, the supply of food to the whole system of the plant must of necessity be diminished, and the young fruit, having less attractive power than the leaves, is, in consequence, the first to suffer. It will be found that shanking and shrivelling of the berries always take place at the time when the greatest demand is made upon the plant for their support, which is when they are finally swelling off after stoning. At that stage the berries will, in a short time, increase to nearly double their previous size; and for that rapid increase a great quantity of new matter must of course be required. The author's remarks upon thinning are very judicious. He advises it to be done as soon as the berries are fairly set, and cautions the operator against touching the bunches with head or hands wet with perspiration, which is well known to produce a disease of the cuticle called "rust."

In the third year, a similar course of treatment is followed, only forcing is commenced about a month sooner. Almost every good Grape-grower has some favourite method of training. Mr. Roberts prefers the spur sys-

tem, and gives sound reasons for that preference; not, however, the spur system of the neighbourhood of London, which leaves a pruned Vine like "a dressed Crab walking-stick," but one more consonant with nature. His method is to prune (before the leaves have fallen) to a promising bud, even though it should be the fourth from the base of the shoot, cutting the intermediate ones between it and the first bud clean out. Each spur therefore bears two buds, the uppermost of which is intended to produce a fruit-bearing shoot, and the lowermost a shoot without fruit—to form a spur in the following year. The principal objection urged against long spurring by its opponents is, that, in a few years, the spurs become inconveniently long and very unsightly; this, however, is the fault of bad management rather than of the system, as it is possible to keep them very near home for a number of years by judicious cutting. To obtain large bunches, there can be no question of the superiority of Mr. Roberts's method. We are told by physiologists that the bud for the next is nurtured by the leaf of the present year; consequently, the perfect formation of a bud must mainly depend upon the perfect development and proper action of the leaf that feeds it. Now, if a growing shoot is examined, it will invariably be found that the first leaf, and perhaps the second also, is much smaller and less perfect than the third and fourth; therefore science as well as experience teaches us that the third or the fourth bud will produce the finest fruit. There are others, again, who condemn every modification of spur pruning; because it involves the necessity of a permanent main stem which consumes a great deal of sap for its maintenance that would otherwise be expended in the formation of fruit; but this objection is more theoretical than practical. Taking a period of ten years from the planting of the Vines, the weight of wood cut away in pruning, including the objectionable permanent stems, would not be much greater in the spur than in the long-rod system; and we believe that the weight of fruit would be in favour of spurring.

It is not stated how the Vines are treated when dormant, but it would appear that they are turned out of the house in winter, after having been pruned, peeled, and anointed with a mixture of sulphur, soft soap, tobacco, and nuxvomica, laid on while warm.

The leading features of the Author's practice are therefore, 1st—the provision of an ample supply of food; 2ndly—to procure strong and well-rooted young plants; 3rdly—to supply a genial warmth to the roots, so that they may be in a condition to act in unison with the leaves; 4thly—by a skilful application of the agents of culture, to obtain solid wood and well-formed buds; 5thly—by the timely removal of all useless parts, such as tendrils, laterals, and superabundant fruit, to cause all the aliment prepared by the plant to be profitably expended in the formation of fruit and bearing wood; 6thly—not to excite too hastily, but to call all the organs of the plant into gradual action.

So many points in Mr. Roberts's practice have demanded notice, that these remarks are extended considerably further than was at first intended. It now only remains for us to recommend every person who has the management of Vines under glass to read this little Treatise; which, if it should not teach him anything absolutely new, will at least make him acquainted with an excellent course of culture. The Author is a plain, practical man, evidently more accustomed to the use of the pruning-knife than of the pen; his style therefore, although easily understood, will admit of a little improvement in another edition.—W.

CALENDAR OF OPERATIONS for the ensuing week.

No kind of weather hinders the operations of the gardener and farmer at this season so much as wet. Seeds can hardly be entrusted to the ground when the soil is very damp, particularly on heavy lands: no wheeling can be done, and to turn composts when they are thoroughly wet is worse than useless. The prevalence of such weather as we have lately experienced must have thrown many of our gardening operations behind. Every opportunity must therefore be turned to the best account, when the state of the weather will permit us to bring up our arrears. In many places the autumn-sown Peas and Beans have been so forward and tender, as to have suffered materially from the late frosts and cold easterly winds; additional crops of these should now be brought forward in boxes, &c., placed in a forcing-house: indeed, where there is the convenience of an early vinery, or even forcing-pits or frames, Peas and Beans forced in these, from the middle to the end of February, and carefully planted out after being inured to the change, will come in fully as soon, if not sooner, than those sown in the borders in November.—I cannot resist the temptation of referring to two sensible letters in the last *Chronicle*, called forth by some observations I made in the Calendar. Mr. Alexander's valuable remarks on coppice-wood and planting, p. 101, are so convincing, that they carry more weight with them than a volume of learned disquisitions on planting, pruning, and thinning. Mr. Sherwood's letter, while it will counteract any erroneous impression which my remarks might possibly lead to, conveys a sensible epitome on the culture of the Camellia. Letters like these never fail in their object: they instruct, without ruffling the feelings of the reader. It is much to be regretted that young gardeners should so often indulge in personal abuse while suggesting or explaining points of practice; whatever instruction may be gleaned from their discussions, they may depend on it no advance in respectability is made by such a course.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If the succession plants are in a forward state at the roots, and the weather should prove favourable, they may now be potted; but if the tan is not ready, and other pressing business should require to be attended to, they will lose nothing if not potted for the next three weeks. Pines, like Orchidaceae, are not very fastidious in their habits, and may be dealt with according to circumstances more than many other tribes of plants. The early fruiters will now require more water, more heat, and more air, to assist them in throwing up firm stocky fruit-stems; without which recourse must be had to the necessary evil of staking them.

VINERY.—The earliest Grapes being thinned, the shoots tied up, and the laterals stopped above the first joint, the principal management of the earliest house may be considered as finished. If the long-rod system is pursued, the advancing shoots for the next crop require to be tied in from time to time, keeping their

leaves from being shaded by those of the present bearers. If on the spurred system, some of the strongest spurs near the top of the house often require an extra joint or two in length to be left at first, to prevent the premature breaking of the eyes for the next crop; and if on the close spur system, the latent eyes at the junction of the old and new wood must be encouraged, by not only stopping the bearing shoot at the first joint beyond the bunch, but by picking out the newly-formed eyes at the axils of the leaves.

PEACH-HOUSE.—Continue to disbud those eyes which are not wanted next season, and stop the shoots along the bearing branches, as they advance, two or three joints beyond the fruit. Keep the air in a mild, moist state, and let no green-fly or other enemy get a footing in the house.

CHERRY-HOUSE.—The Cherry, being produced on spurs, does not require close disbudding, like the Peach. A mild, moist atmosphere and abundance of air, whenever the weather admits, are essential to them.

FIGS.—Same as last week.

CUCUMBERS AND MELONS.—Stop the laterals of these above the first joint, until you think the plants are strong enough to begin bearing; and keep up a uniform temperature at their roots.

Slight hotbeds may yet be made, to forward Radishes, Carrots, Potatoes, Lettuce, and Cauliflower seeds; also Peas, Beans, and some sweet herbs, if wanted early. If these auxiliary beds are hooped over, and covered with mats, they will answer well enough after this time.

Out-door Department.

PARSLEY.—Of all the vegetable seeds, that of Parsley requires the longest time to vegetate; it should therefore be one of the first sown.

CABBAGES.—A few seeds of the earliest and the red Cabbages may be sown on a warm border; also some more Radish and Lettuce-seeds. All these early-sown seeds in the open ground require to be protected from birds by throwing a piece of net over the beds: hardly anything will frighten them so early as this, when their food is scarce; and it is a cruel thing to shoot them.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—There will be no want of work here for the next six weeks. A practical eye, in looking over the houses, can easily detect what are the gardener's favourite plants; more, perhaps, at this than at any other period of the year. These are sure to be found occupying those shelves nearest the glass, or plunged in front of the tan-bed. Perchance some of them are removed to one of the frames at work, into which none but some favourite, belonging to the "profession," is allowed to peep at this early period, or perhaps for the next three months. Potting and fresh labelling the plants, gentle syringing, tying and training pot-plants and climbers, are the principal operations now.

GREENHOUSE.—Few of the mixed plants here will require potting yet; but more watering will be needful, and more attention to giving front ventilation when frost or cold cutting winds prevail. A gentle syringing early in the day, when the weather is fine, if only once in a week or ten days, will greatly improve the appearance of the plants, and add to their health and vigour.

CONSERVATORY.—Those who want their Passion-flowers, Ipomoeas, and other strong-growing climbers, to begin flowering early in the summer, pruned their plants last October and November; those, on the other hand, who want them late in the season, when families return to their country seats, will now begin to prune their conservatory climbers. Of all ornamental plants, beautiful streaming festoons of free-flowering climbers excite the greatest interest. Nothing but a general outline on any part of gardening can be given in a Calendar; and for climbers it is sufficient to say that two plants of the same species should never be pruned at the same time, if you want a long succession of bloom.

PITS AND FRAMES.—Gardenias, Roses, and other plants for forcing, will be removed from hence to the forcing-house as they are wanted for succession, and their places may be filled up with return-plants from the conservatory, which have done flowering. The rest of the permanent inhabitants require only to be protected from frost, cutting winds, and heavy rains.

Out-door Department.

As soon as the soil is in a fit state, the Rosary may have the spring-dressing, and as much rotten cow-dung as can be got for the purpose; where that is scarce, use liquid manures. As to pruning Roses, the same observations apply to this as are given above for climbers; the later they are pruned the later they will flower, and *vice versa*. Walks and Grass require great attention from this time. All the perennial tribes of herbaceous plants may now be divided and arranged for the season, according to the taste of the owner.

NURSERY AND FOREST DEPARTMENT.

COPPICE AND FOREST.—I cannot do better this week than to refer all readers to Mr. Alexander's paper on this subject in the last *Chronicle*. Last autumn I wrote out a receipt of all the abominable things that have been used to prevent hares and rabbits from nibbling the young plantations. It has, up to this time, kept them off. It consists of equal quantities of cow-dung, soot, and cloacine, mixed up with soap-suds to the consistence of thick paint; and to 10 gallons of this mixture add half a gallon of gas-tar. Use it in a flat wooden tub, and dip all the plants in it; place them over another tub to drain, and when dry, plant them.—D. Beaton, *Shrubland Park Gardens*.

State of the Weather near London for the Week ending Feb. 23, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETR.			THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 27th in 1828—thermometer 60°; and the lowest on the 28th in 1829, and 4th in 1840—thermometer 24°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending Feb. 24, 1843.

THE late favourable change in the weather has somewhat increased the supplies during the past week, and trade in some respects is rather more brisk. Fruit: Pines are of good quality, and

consist chiefly of Envoles and Queens. Dessert Pears are becoming exceedingly scarce; the Beurré Rance, from 4s. to 8s. per dozen, seems to be the only kind offered. Catillac Pears for baking, from 4s. to 5s. 6d. per bushel, are more plentiful. In the price of Apples there has been a slight advance. Nonpareils fetching from 12s. to 18s., and Golden Knobs from 5s. to 7s. per bushel: a few Ribston Pippins may also be obtained at the latter price. For culinary use, the Gooseberry Pippin, from 6s. 6d. to 8s., and the Wellington at 6s. 6d. per bushel, are excellent. A few Tangerine and Malta Blood Oranges are offered, from 2s. to 4s. per dozen. A small quantity of forced Strawberries have appeared during the week. Cucumbers are becoming more numerous, from 5s. to 10s. per brace. *Vegetables*. The quality of Asparagus has greatly improved of late, and its price has somewhat fallen; the best bunches fetch from 5s. to 10s., and the inferior ones from 2s. to 3s., each. Seakale is abundant, from 9d. to 2s. 6d. per punnet. French Beans are rather more numerous. White Broccoli of good quality is less plentiful, and it has consequently made a slight advance. Onions and Leeks are also somewhat dearer than in our last Report. Celery is small and indifferent, from 6d. to 1s. 6d. per bundle. Young winter Radishes are tolerably good, from 1s. to 1s. 8d. per punnet. Mushrooms have risen to 8d. and 1s. 3d. per pottle. *Flowers*: The Cut Flowers of late have exhibited great variety; amongst them we noticed Provence, Tea, and China Roses; Anna Boleyn Pinks, Lilies of the Valley, Jonquils, Cinerarias, Cyclamens, Double Tulips, Mignonette, Epacris, Amaryllises, Burchellia capensis, Tropæolum tricolorum, Acacias, &c.

PRICES, SATURDAY, Feb. 18, 1843.—FRUITS:—

Pine Apple, per lb. 5s to 8s
Grapes, Spanish, per lb. 1s to 1s 8d
Portugal, 1s to 2s 6d
Apples, dessert, per bush. 4s to 15s
Kitchen, 3s to 7s
Pears, dessert, per hfl. sieve, 3s to 14s
Pummelo, per doz., 6s to 12s
Oranges, per doz., 9d to 2s
per 100, 4s to 14s
bitter, per 100, 5s to 10s
Lemons, per doz. 1s to 2s
per 100, 5s to 15s

Cucumbers, per brace, 5s to 10s
Walnuts, per bush., 12s to 16s
Chestnuts, per peck, 3s to 6s
Almonds, per pack, 6s
Sweet Almonds, per pound, 3s
Filberts, English, per 100 lbs. 60s to 65s
Cob Nuts, per 100 lbs., 65s to 70s
Nuts, per bushel—
Brazil, 10s
Spanish, 18s
Herculeana, 24s
Cob, 12s to 14s

VEGETABLES:—

Savoy, per doz. 6d to 1s 3d
Cabbage, White, per doz. 2s to 4s
plants, per doz. 1s 6d to 3s
Red, for pickling, 2s to 5s
Brussels Sprouts, per hfl. sv. 1s to 1s 6d
Broccoli, White, per bunch, 1s to 2s 6d
Purple, 9d to 1s 6d
Beans, Kidney, forced, per 100, 3s to 4s
Potatoes, per ton, 40s to 75s
per bushel, 1s 6d to 2s
Kidney, per bush., 1s 6d to 2s
Scottish, per bushel, 1s 6d
New Antwerp, per lb., 4d to 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d
Turnips, per doz. bun., 1s 6d to 2s 6d
Red Beet, per dozen, 9d to 1s
Scorzonera, per bundle, 1s 3d to 1s 6d
Salsify, per bundle, 1s 6d to 1s 8d
Cardoons, each, 1s 6d to 2s
Horse Radish, per bunch, 2s to 4s 6d
Radish, per doz. hands (24 to 30 each) 1s to 1s 8d
Turnip, p. doz. boh., 1s to 1s 6d
Carrots, per doz. bunch. 4s to 6s
Young Horn, per bunch, 4d to 6d

Parsneps, per dozen, 6d to 1s
Spinach, per sieve, 1s 6d to 2s
Leeks, per doz. bun., 3s to 4s
Onions, per bushel, 5s to 6s 6d
Pickling, per hfl. sv., 3s 6d to 4s 6d
Green, p. doz. bun., 2s to 4s
Spanish, per doz., 2s to 4s
Garlic, per lb., 6d to 8d
Shallots, per lb., 1s
Asparagus, large, per 100, 5s to 10s
Second, 2s to 3s
Sea-kale, per punnet, 9d to 2s 6d
Lettuce, Cab., p. sc., 6d to 9d
Cos, 9d to 1s
Endive, per score, 1s 6d to 4s
Celery, p. bd., (12 to 15) 6d to 1s 6d
Rhubarb Stalks, per bd., 6d to 1s
Small Salads, per punnet, 9d to 1s
Corn Salads, per hfl. sieve, 9d to 1s
Watercress, per doz. sm. bun. 4d to 6d
Fennel, per half-sieve, 1s 6d to 2s
Tarragon, per doz. bun., 2s to 4s
Fennel, per doz. bun., 2s to 4s
Sage, per doz. bunches, 2s to 4s
Mint, per doz. bunches, 2s to 4s
Mushrooms, per pottle, 6d to 1s 3d
Truffles, per lb., 3s to 4s

NOTICES TO CORRESPONDENTS.

PERMANENT PASTURES.—*Rector*.—The answers to correspondents are adapted to the circumstances detailed in their letters, and must not be considered as applicable to every case. In a light soil in good condition, Barley sown thin is rather advantageous to the Grasses, by shading them from the sun. The time of sowing, in this case, is about the end of March.

MANURE.—*Amicus*.—Your Butcher's heap is a treasure. Mix it with ashes, or charcoal, or cinder-siftings, or peat, or black mould of any sort, and it will be fit for all purposes, capital for Asparagus, and all vegetables.

LIQUID MANURE.—*Ignoramus*.—The best time for applying liquid manure is when plants have just commenced to grow freely, and it may be continued at intervals during their growing season. If applied to plants in a dormant state, it will do them great injury.

HEAVY LAND.—*A. B. C.*—Pare and burn your land if you can; or mix brick and lime-rubbish with it; or lime it well. Or give it gypsum, which is better than lime.

DYERS' WOOD.—*J. K.*—All the refuse woods of the dyers are good manure if you can get them to rot. Should that be impossible char them, and they are admirable for destroying the offensiveness of cloacine. If you cannot do that, burn them, and their ashes are good manure. If, however, you will mix them with putrefying animal manure, such as fish, or blood, or carcasses, they will probably decay. Those which are impregnated with sulphuric or nitric acid are the best; the acids themselves must decay them somewhat. As to any salts of tin they may contain, we do not know whether tin is injurious. And, at any rate, if you add lime to the mass, the tin will be separated in an insoluble state, and can do no harm.

VINES.—*A Country Vicar*.—In a greenhouse where the height of the front sashes is 6 feet, and where Vines are considered as a secondary object, we would recommend you, now that you have trained the Vines to the required height, to rub off all the buds which appear between the lower part of the stem and the angles of the roof. The Vines should be trained singly under each rafter, and as light is essential to the welfare of your other plants, they should be pruned upon the close spur system, mentioned at p. 603 of the *Chronicle* for 1842. As a means of checking the bursting of their buds too early in the spring, you might secure the Vines close to the glass of the roof, where the temperature, particularly at night, is several degrees below that of the lower portion of the house. *Cambridge*.—The best white Grape for growing in a house with the Black Hamburg is the White Sweetwater. There is no Muscat which we can recommend as sufficiently hardy to place with them. Wilmot's New Muscat is the Chasselas Musqué. *A. S.*—We can easily believe that the flowers of the Vines were destroyed, although the leaves were not affected. Only consider the difference between these organs; the leaves firm and half-matured; the flowers young, tender, and quite incapable of resisting any evil atmospheric influence. At the same time we must beg to doubt whether the mischief you describe could have arisen from not giving air. Depend upon it, the cause was something else.

ROSES.—*Mary*.—We must refer you to any of our British Floras for information as to the wild Roses of this country. The term "Dog" seems one of reproach.

YELLOW ROSE.—*J. V. M.*—The new Persian Double Yellow Rose, advertised at p. 82, is an entirely different variety from Rosa Harrisonii; it is very like the old double yellow.

TROPÆOLUM TUBEROSUM.—*A. P.*—The conditions under which the tubers of this plant are most likely to flower, are, when they are incited into growth early in the season, and planted out at the foot of a warm south wall, where the soil is very dry. The tubers should be rested, or taken from the soil annually, otherwise they will deteriorate.

PHLOX DRUMMONDI.—*A Country Vicar*.—It is singular, in a genus where all the other species are perennial, that this alone should partake of the character of an annual. Strictly speaking, it can scarcely be considered as such, because its duration may be prolonged during a second season; but although this is the case, it never succeeds so well, as when fresh plants are raised from seed every year.

MIMULUS.—*Paidos*.—The following are some of the most distinct varieties of Mimulus:—*M. cardinalis*, *roseus*, var. *Macleanianus*,

roseus, variegatus, and *Smithii*. They may be procured of any respectable nurseryman.

TURKEY OAK.—*J. J. C.*—The Levant or Turkey Oak is very common, and may be procured of any nurseryman.

BANANIC GLOBE THISTLE.—*J. J. C.*—This plant is only grown in Botanic Gardens in this country, from whence possibly the seed can be procured.

ICE-PLANT.—*A Young Lady*.—The Ice-plant is one of the annual Mesembryanthemums, and succeeds best when sown on a slight hot-bed towards the end of March. The young plants, when large enough, should be potted off, several in a pot, in poor, sandy soil, and kept in a frame or greenhouse, protected from frost. Towards the end of May they may be planted out in the open border, as they will bloom much more freely there than when kept in pots.

CLIMBERS.—*M. N. O.*, who has a brick summer-house, which he is desirous of surrounding with climbers, had better procure for the S. side *Clématide azurée grandiflora*, *Bignonia radicans*, and *Jasminum officinale*: for the W., *Clématide Hendersonii*, *De Lisle* and *Bougainvillea* Roses: for the N. and E. sides, *Caprifolium gratum* and *sempervirens*, *Clématide flammula*, and *Ampelopsis quinquefolia*. As the soil consists of pure clay, he should remove it at least 3 feet from the wall to the depth of 2 feet, and replace it with a mixture of turfy loam, leaf-mould, and lime-rubbish: a layer of the latter being placed at the bottom previously to throwing in the soil.

EGYPTIAN SILK PLANT.—*J. J. C.*—It is not likely that this plant, mentioned at p. 69, can be obtained in the nurseries; it may, perhaps, be met with in the gardens of the curious.

CEREUS SPECIOSISSIMUS.—*A Country Vicar*.—It is an unusual thing upon a plant of this description for a perfectly healthy bud, which did not open last year, to continue vigorous throughout the winter, and to be expanding now.

GESNERA ZEBRINA.—*J. M.*—By no means cut down this plant, but let it gradually die back and sink to rest. Those who advise you to cut it down cannot be gardeners; or, if they are, they do not understand the first principles of their business.

POLIANTHES TUBEROSA.—*R. D.* and *I. K. S.*—To flower the Tuberose in the open air, the bulbs should be started in a moderately warm frame, and planted out, towards the end of May, in a sunny, sheltered, border. The bottom of the border should consist principally of well-decomposed manure, and should be covered to the depth of six inches with light sandy loam, in which the bulbs should be planted. Success in this case will depend greatly upon the season, and upon having good bulbs, which should be planted just as they are received. When grown in pots the same soil should be used, the plants should be kept near the glass, and they should receive a liberal supply of water when growing.

LIANTHUS PUNICUS.—*Z.*—This plant belongs to the Leguminous order, and is a native of the banks of the Thames, in New Zealand. It is only in very favourable situations that it will succeed in the open air in this country. To grow it in perfection, it should be planted in the border of a conservatory, in a mixture of loam and peat, with plenty of room for both its roots and branches to spread. It may likewise be cultivated in a pot, but seldom repays the trouble. The atmosphere of the house should be kept moist, and the plants should be occasionally syringed on fine mornings, as it is extremely liable to be attacked by the red spider.

PELAGONIUM.—*C.*—It is not advisable to stop Pelargoniums later than the present month or the beginning of March, if you wish to insure their blooming well. If this operation is performed at a later period, the flowering is weak and uncertain. A portion of your stock should be kept back by shifting it into larger pots, and by keeping those not in bloom in a situation where they are not exposed to excitement; by removing the most forward to the greenhouse as the buds show colour, you will be able to maintain a succession of flowering plants for a considerable time.

AURICULAS.—*G. C. W.*—The gradual disappearance of your seedling Auriculas is not the effect of an insect, but is to be attributed to their shanking or damping off. This is occasioned by watering on the top, or by sudden changes of temperature. It was injudicious to remove them to a Vinery and place them on a fire; and we recommend you to replace them in a frame and cover them with a handglass in addition. If they require watering, set the pots in pans of water until the moisture rises to the surface, and give air very gradually. We recommend you in future to sow in February, keeping the seeds in the pots during winter; after sowing, press the soil gently down, that the young plants, when they make their appearance, instead of being loose, may be firmly attached to the earth.

DAHLIAS.—*D. M. C.*—Not knowing the sorts you already possess, we cannot recommend you 12 Dahlias to add to your collection. You had better refer to Vol. ii. p. 793, and choose a dozen not at present in your possession; or to p. 239, where the colours are given.

PEACH-TREES.—*G. G. W.*—Supposing Peach-trees to be trained on a wire trellis, removed one inch or more from the wall, there is little doubt but it would occasion a current of air between the branches and the bricks, which would retard the ripening of the fruit, and might cause the wood to be less matured than when nailed to the wall.

GOOSEBERRIES.—*S. G.*—In point of flavour no Gooseberry with which we are acquainted equals the Red Champagne.

FIGS.—*S. G.*—The brown Turkey Fig is one of the very best for forcing, as well as for out-of-doors cultivation. It is the same as Lee's Perpetual.

APRICOTS.—*S. G.*—The Royal Apricot is equal to the Moorpark in size and quality, and ripens about 10 days earlier.

STRAWBERRIES.—*J. J. C.*—The proportion in which nitrate of soda has been successfully applied to Strawberries, is 3 oz. to the square yard, sprinkled regularly over the surface of the bed just as the plants are beginning to grow. Although it may injure the foremost leaves, the succeeding ones will soon push forth with redoubled vigour.

PRUNING.—*Perry*.—Whether the shoots of your vigorous young Pear-tree should be cut little, or much, or not at all, will depend upon whether you intend it to be trained as a standard, or dwarf, or against a wall. In the latter case you must cut immediately above such buds as would be desirable for furnishing shoots in the ensuing season.

PEARS.—*Cestus* says—"I grafted a Swan's egg Pear on a Summer Bergamot, and had therefrom last year, the first of its bearing, a fair crop. Every Pear rotted; but the produce of the parent tree kept sound till very nearly the middle of January." [Fruit from young trees that are growing vigorously or from such as have been recently grafted, does not generally keep so well as that from older trees, in which the sap is not so watery.]

GRAFTING.—*B. W.*—Where grafting-clay can be employed, no pitchy composition is equal to it, inasmuch as cuttings will keep alive for a much longer period in substances of an earthy nature than they will in those which are impervious to moisture. This has been proved to be the case.

CUCUMBERS.—*W. G. K. B.*—We are not aware that Young's Champion Cucumber can be procured in the trade.

INSECTS.—*Amicus*.—You cannot get rid of your insects without running the risk of injuring your Peas. If you could sulphur them, you would probably have the best chance of gaining your object.

BOOKS.—*Paidos*.—You must consult the advertisements. *M. N.*—All such inquiries should be addressed to Booksellers.

CHINESE SEEDS.—*A. P.*—The treatment of the seeds of tender annuals will no doubt be applicable to Chinese seeds. Sow them in any light soil, in well-drained pots, and place them in a warm greenhouse; covering the seeds with more or less soil, according to their size.

FLOWER POTS.—*Bristol*.—The scale of dimensions given at p. 577, of 1842, is correct, and gives the average size of the flower-pots

in use in the neighbourhood of London. Your suggestion is good, but the method of distinguishing them by the cast is now so universally adopted that it would be almost impossible to alter it.

LAWNS.—*Amicus*.—Your lawn appears to want draining. If that is done, and you water it with gas-water, diluted, you will get rid of Moss and reedy Grasses. You may then make good bare places with Lawn-grass-seeds.

HARES.—*J. G.*—We fear there is no means of keeping these animals off plants, except by surrounding the latter with a net, or wire-fence. A good and cheap plan of one was exhibited at the last meeting of the Horticultural Society.

WARD'S CASES.—*Mary*.—Plants in these contrivances are not excluded from the air; it is chiefly dust which is kept off them. It is impossible to exclude air from anything not hermetically sealed.

PACKING PLANTS.—*A Subscriber*.—Ward's cases are the best medium in which Fuchsias, Camellias, and similar plants, can be forwarded to the Cape.

MISCELLANEOUS.—*W. B.*—Your first question we do not understand. With regard to the second, your plant is *Griffinia hystrix*, a very rare and fine bulbous plant with blue flowers.

—*R. G. Y.*—We cannot advise you. *Flora, Brighton*.—Enclose your address with six post-office labels to the office, and the Number shall be sent you. *H. H.*—We should suppose that one coat of the varnish recommended at p. 55 will be sufficient. *A. B. Z.* will find an answer to his question in another part of the Paper. *J. C. L.*—Your plant is *Isoschilus prolixa*. *M. B.*—Your insect is the Humming-bird Hawk-moth. The Oak is *Quercus coccinea*. *Z. Z.*—We apprehend that those who wish to procure hybridized Fuchsia-seed must save it themselves. *Flora*.—Send them to the office.

—*W. J.*—The Horticultural Society is infinitely obliged to you, and would be glad to know whom to thank. The Acacia is *A. verticillata*; the two other plants are apparently *Callitris australis*. *H. T. S.*—You asked us what *Quercus virens heterophylla* is, and we told you we did not know it. You now say, the nurseryman who sold it you refers you to "London's Magazine for January." If so, that nurseryman is in the wrong. In the February, not January, Number for 1843, mention is made of a *Quercus heterophylla*; said to be growing in the nursery of Mr. Rivers, of Sawbridgeworth. That plant has long since been described, and, as it is Philadelphia, is probably hardy. But what has *Quercus heterophylla* to do with *Quercus virens heterophylla*? the two species have nothing in common. *Q. heterophylla* is probably hardy.

—*J. T. C.*—Your plant is *Acacia pubescens*. *J. S. M.*—Infinite obliged for your hints, which are sent to the author of the Amateur's Garden, and to our agricultural correspondent, *M. J. B. W.*—An assistant secretary, who receives an annual salary for his services, is not entitled to vote as one of the committee in virtue of his office; he must be specially appointed a member of the committee, otherwise he is only their servant. *I. K. S.*—The article was printed exactly as we received it, at least we read it so; and we do not understand how the allusion to Forsyth is to be altered. *B. W.*—The Pears you mention are not known. *A Subscriber*.—Your Apples are—1, 10, Fearn's Pippin; 2, Dutch Mignonne; 3, 6, King of the Pippins; 4, Norfolk Beaufin; 5, Blenheim Pippin; 6, Court of Wick; 9, Scarlet Nonpareil; 11, Rymer; 12, Hollandbury. The Pears are—13, Catillac; 14, Buchanan's Spring Beurré, or Winter Beurré of some. *W. F.*—Fivepence each will be allowed for your duplicate Numbers, if in good condition. *A Constant Reader*.—Try the Early Nimble Pear.

As usual, many letters have arrived too late for answers this week. Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them delivered in any part of London by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies.

NEWS OF THE WEEK.

THE thanks of both Houses of Parliament were unanimously voted on Monday night to the Governor-General of India, and to the officers and men, Native as well as British, for their services during the military operations in Afghanistan. The vote was moved by the Duke of Wellington in the House of Lords, and by Sir R. Peel in the House of Commons. The Duke entered into a succinct historical narrative of the disturbances which led to the insurrection in Cabul, and traced the course of operations adopted by the respective Generals, from the arrival of Lord Ellenborough, down to the final triumph on the walls of the Bala Hissar. He dwelt with admiration on the conduct of the troops, and claimed for them the honour of having vindicated the British name, and the character of the British Army, by their persevering and heroic gallantry. Sir R. Peel also eulogised the achievements of the Generals, and particularly adverted to the meritorious conduct of the inferior officers. He alluded to the heroism of Lady Sale, and paid a high tribute of respect to the memory of Colonel Dennie. It was impossible, he said, to describe all these services without feeling pride in the British name. Such services had proved that it was a name which the long interval of peace had not impaired; and they were an earnest that further efforts, when occasion should require, would continue to be made with glory and with triumph. Mr. Hume moved an amendment for the purpose of deferring the vote to the Governor-General, but it was negatived without a division, and the vote was carried without a dissentient voice, with the exception of Mr. Hume. On Tuesday Mr. Duncombe brought forward his motion for a Parliamentary inquiry into the conduct of Lord Abinger while presiding over the late special commission in the manufacturing districts; but, after a long debate, it was negatived by a majority of 155. On Thursday, in both Houses, Ministers announced their intention to abide by the decision already made public by Sir James Graham's letter to the Moderator of the General Assembly, in reference to the non-intrusion question. Mr. Walter's motion for a revision of the Poor-Law was negatived on the same night by a majority of 68.

The accounts from France relate chiefly to the speculations of parties on the approaching struggle respecting the Secret Service Bill. In the preliminary discussions on the appointment of the commission, Ministers obtained a majority of 24, although the Opposition brought all

their strength into the field. The division on the Bill is looked for with great interest, the result being regarded as a vote of confidence in the Cabinet.—The Madrid papers contain a long and able manifesto addressed by the Regent to the Spanish nation on the occasion of the approaching elections. After denouncing the intrigues which had succeeded in two instances, at Madrid and Barcelona, in disturbing the peace of the kingdom, he recommends the electors to bestow their confidence on none but men of acknowledged probity, and declares that his sole ambition is to preserve and consolidate the liberties of Spain, to protect the throne of Queen Isabella against all attempts, and to resign into her hands the authority which he exercises in her name on the day fixed by the fundamental law. The accounts from Barcelona state that the citizens have received the concessions of the Regent with little apparent gratitude, and continue to display determined hostility to the garrison.—The Portuguese insurrection has been effectually suppressed, and a special commission has been issued for the trial of the rioters. The tranquillity of Oporto has not been disturbed since our last accounts, and the population of Lisbon have shown no desire to participate in the movement.—An insurrection broke out at Genoa on the 13th inst., in opposition to a law authorizing domiciliary visits. Several persons were killed or wounded, but the affair ended by the proclamation of an amnesty to the insurgents.—Accounts from the Levant inform us that the differences between Austria and the Porte are in progress of adjustment, by the mediation of the British ambassador, and that the diplomatic relations between the two Powers have been renewed.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and Princess Royal, are quite well. Her Majesty has taken walking exercise during the week in the gardens of Buckingham Palace. The Queen held a Court on Monday, at which His Serene Highness the Prince of Tour and Taxis was presented to her Majesty by the Bavarian Minister. Her Majesty the Queen Dowager will leave Canford on the 3d March, and proceed from Southampton by a special train for the Metropolis. Her Royal Highness the Duchess of Kent has arrived for the season at Clarence-house, from Frogmore-lodge.

Parliamentary Movements.—Dr. Boyd has been elected Member for the borough of Coleraine by a majority of 22 over Sir Hervey Bruce. Mr. Leslie, of Glasslough, has been elected, without opposition, Member for county Monaghan, vacant by the accession of Lord Rossmore to the peerage. The Hon. Capt. Maxwell has been elected Member for county Cavan without opposition, in the room of the late Col. Clements.

Official Appointments.—William Marshall, of Tre-worrey, Esq., has been appointed Sheriff of the county of Cornwall for the present year. It is said that Sir Francis Bond Head is to be appointed Governor of the Cape of Good Hope. A rumour prevails in military circles that Sir Robert Sale will be appointed to the vacant colonelcy of the 44th Regiment.

Foreign.

FRANCE.—The leading topic in the Paris papers is the selection of the commission which is to examine and report upon the Bill just presented by Ministers for granting an additional sum of 1,000,000 francs for the Secret Police service. As this annual demand has, of late years, been viewed as a vote of confidence in the Cabinet, and party animosity has seldom been more violent than it is at the present moment, the preparations for the impending struggle excite great interest. In presenting the Bill, the Home Minister adverted thus to the state of France:—"We ask for a million of francs, as in preceding years. In the one just elapsed, a deep calm has prevailed in the country. No disturbance or agitation has checked the rapid progress of public prosperity; yet all evil passions are not extinguished, and all criminal designs are not relinquished. An active vigilance can alone maintain the repose of society, and preserve it from fatal hazards; since the frightful calamity which has befallen France, that vigilance has become more necessary than ever. We should be guilty if we demanded not the means of exercising it to its whole extent. We have the firm confidence that they will not be denied us." The selection of the commission took place on Saturday, when 413 Deputies were present, 410 of whom voted. Of the nine selected for the examination of the Bill, four belong to the Opposition, and five to the Ministerial party. Among the former are M. Odillon Barrot, and M. de Lamartine, who has now deserted the Conservative ranks. In this preliminary trial of strength, Ministers obtained 217 and their opponents 193 votes, although the Opposition brought all their force into the field. Whole columns of the journals are filled with the discussions which took place in the several committees previous to the selection of the commission. Ministers were harassed with questions of various kinds—the right of search continuing the prominent topic. Nor were the recently-adjusted differences with the Spanish Government suffered to drop into oblivion. Though unwilling to revive the recollection of the disagreement, M. Guizot was obliged to declare that he had never asked for the mediation of any foreign Government, and that far from engaging to recal M. de Lesseps from Barcelona, he had even declined listening to any demand to that effect.—The Court of Cassation on Friday last rejected the appeal

of Jacques Besson, who, as our readers will recollect, was tried and convicted at the late assizes of Lyons for the murder of his master (M. de Marcellange), and condemned to death. This is the third time that the case had been brought before the Court of Cassation. The prisoner was first tried at the assizes of Puy, when he was convicted, but the Court of Cassation ordered a new trial at Riom, with a similar result. Some informality having been discovered in the proceedings before that Court, the conviction was again quashed, and a third trial was ordered to be held at Lyons, where Besson was again convicted.—It is announced that the King will proceed to the Invalides on the 5th May, the anniversary of the death of the Emperor Napoleon, to lay the first stone of the tomb destined to receive his remains.

Algeria.—The column which had marched from Cherchel, under the Governor-General of Algiers, against the tribes of the west, had returned to that place on the 7th inst. General Bugeaud had begun to lay the country waste with fire and sword; but in consequence of dreadful weather and storms of snow and hail, during which it was impossible to erect a tent or make a fire, he was obliged to make a hasty retreat into Cherchel. Steamers had gone from Algiers to supply his troops with provisions.—The deputies of the commission of the budget, express great discontent at the expenses of Algeria. In addition to the three millions sterling ordinary, there are two millions sterling extraordinary expenses.

SPAIN.—The Madrid papers received this week contain a manifesto addressed by the Regent, and signed by all the Ministers, to the Spaniards, on the occasion of the approaching elections. After denouncing to them the intrigues and artifices of the enemies of the country, who had succeeded, in two instances, at Madrid and Barcelona, in disturbing the peace of the Monarchy, and reminding them of the clemency he had shown in repressing those two rebellions, the Regent proceeds to vindicate his motive for having dissolved the Cortes and convoked a new Legislature. He then recommends his countrymen, before they give their votes, to consider maturely if the citizen whom they are about to invest with their confidence be competent and worthy to discharge the great and glorious mission which would be reserved to the new Cortes. They should be, he says, men of reason and sound advice, conversant with the wants and resources of the country; it mattered little to what party they belonged, if they were attached to the constitution, and men of acknowledged probity, averse to intrigue, and inaccessible to corruption. The Regent then explains how he understands the duties imposed upon himself by the confidence of his fellow-citizens and the constitution. "I said, and I have sworn a hundred times," he says, "that my sole ambition was to preserve and consolidate the political and civil liberty of our country, to protect the throne of Isabella against all attempts, and to deposit at her feet the authority which I exercise in her name on the day fixed by the fundamental law. My desires are clear, precise, determined, and require neither explanation nor interpretation. Rest assured I will keep my word. It is that firm resolution that has exposed me to the inveterate hostility with which I have been assailed—I, a man of the people, a soldier of fortune, favoured by chance, and less indebted for my military successes to my capacity than to the courage of our troops and the goodness of the cause which I defend—the pacificator of the country, the defender of the constitution of the throne and our political institutions, could not expect to escape the attacks of the deadly enemies of those objects of which I am the tutelar ægis. They have strained every nerve and had recourse to conspiracies, menaces, insults, and calumnies to separate me from you and from Europe, to deter me from my noble object, and, if it were possible, to intimidate me!" The Regent, in conclusion, observes, that he is, in some measure, the representative of that national will which 30 years since opposed the direful aggression of Napoleon, and notwithstanding the desertion of their princes, successfully maintained itself against that colossus. "I am the representative of that will which required civil and political liberty, in order that Spain should not be exposed a second time to such an ignominious outrage; the same which proclaimed Isabella II., and defended her heroically against the efforts of Don Carlos, and finally protected her in September, and preserved her from the dangers of the last insurrection. In this will is my force—in it I place my confidence; and if the legislators which you are about to elect are penetrated with the same sentiments, the grand work shall be crowned with success." Private letters state that the composition of this document is attributed by some to S. Quintana, her Majesty's preceptor, and by others to S. Antonio Gonzalez. The Opposition papers continue to animadvert on the satisfaction given to France by the Spanish Cabinet, which they stigmatise as a most shameful proceeding. The manifesto of the Regent is also a subject of angry comment. From Barcelona we have received journals and advices of the 13th. The population of that city is stated to have received with little apparent gratitude the Regent's recent concessions, and to display the same determined hatred towards the garrison, which was again to consist of ten battalions, or 9,000 men. The political chief, Señor Gutierrez, had left Barcelona for Madrid and Corunna, to which latter place he has been transferred in the same capacity of political chief. On the 12th the municipal elections commenced, and were expected to prove favourable to the Moderados, or anti-Government party. The Spanish troops were being withdrawn from the neighbourhood of the French frontier, and marched to Barcelona, in consequence of the unsettled state of that city.

PORTUGAL.—We have Lisbon news to 13th inst. Oporto remained tranquil, and the spirit of insurrection appeared

to be effectually suppressed. There had been no loss of life or limb, and but two wounded persons had been carried to the hospital. One of the Opposition journals had been suppressed. Four Septembrist leaders had been arrested, and awaited trial by a special commission; while two others had been ordered to leave the Portuguese territory without delay by the military authorities. Lord Aberdeen's reply to the so-called *ultimatum* of Portugal had not been yet received, but in the highest political circles the belief prevailed that the tariff would be speedily reduced. Memorials had poured into the Chambers from Carcavellos, Oeiras, Almada, &c., praying for the relief of the distressed wine interests of Estremadura. The 10th instant was celebrated at Lisbon as a grand gala-day, in commemoration of the restoration of the Charter.

BELGIUM.—The Government papers last received contain the official promulgation of the treaties between Belgium and the Netherlands. The Belgian Colonization Company having announced that every society ought to have religion for its basis, has applied to the Provincial of the Jesuits in Belgium, who has appointed two members of that order as missionaries. The church of St. Thomas will be dedicated to St. Louis, as a testimony of gratitude to the Queen of the Belgians, who has been pleased to become the protectress of the first settlers.

SWITZERLAND.—An insurrectionary movement manifested itself at Geneva on the evening of the 13th inst. The tocsin was immediately sounded, and the insurgents, who mostly belonged to the suburb of St. Gervais, the centre of the partisans of the movement, gained possession of two of the city gates. A collision took place between them and the troops, in which 30 persons were said to have been either killed or wounded. Among the dead were Messrs. Fournier, Major of the place, and M. Fech, a Councillor of State. The insurgents marched against the Hotel de Ville, the seat of the Government, but failed in their attempt to carry it. An attack was equally made against the powder-mill, which was vigorously defended, and remained in the hands of the Government. The movement was occasioned by a law voted on the 13th by the Council of State, authorizing the police to institute domiciliary visits in order to discover the hiding-place of a foreigner expelled from the Canton. The affair ended by the Grand Council issuing, on the proposal of the Council of State, an amnesty to the Radical insurgents. The papers of the 17th state that the tranquillity of the city has not been again disturbed since the termination of the collision and the publication of a general amnesty. The affair is said to be distressing to the interests of the inhabitants, for several of the foreign families who, even at this season of the year, usually reside at Geneva, and contribute largely to its prosperity, have naturally taken alarm, and quitted it; but in other respects it appears to have been of little importance. As regards loss of life, very few persons on either side were killed, and the number of wounded, as stated above, does not exceed thirty.—The *Zurich Gazette* of the 10th inst. states, that at a meeting of the great Council of Argau, held on the 8th inst., the important question of the convents was discussed, and that a commission appointed to examine the affair, had reported to the following effect:—"Argau does not acknowledge the right of the Vorort to criticise its interpretations; it therefore rejects its intervention, and renders it responsible for whatever may happen." The conclusions of the commission were adopted by the Council by a majority of 105 votes to 46.

GERMANY.—According to the last accounts from Berlin, the Council of State had terminated the examination of the project of a new penal code for the entire kingdom, prepared by the committee charged since 1825 with the revision of the Prussian laws. Among the modifications introduced in the new code are the abolition of hard labour in chains, branding and mutilation, the suppression of all accessory penalties intended to aggravate the pain of death, except as regarded parricides and regicides, who are to be attached to a cow or ox-hide, and drawn by two horses through the principal streets of the town, from the prison to the scaffold, and the substitution of the axe for the sword and guillotine.—The Hanoverian papers are filled with accounts of the ceremonies at the marriage of the Crown Prince on the 18th; and of the reception of the King of Prussia, who arrived from Berlin on the 17th inst.

GREECE.—Letters from Athens of the 31st ult. announce that the Greek Government had at last prepared a regular budget, which had been communicated to the Ministers of the three protecting Powers. The receipts of the kingdom were calculated for 1843, at 15,669,795 drachmas, and the expenditure at 18,666,482, showing a deficit of 2,996,687 drachmas. A Royal decree had been issued, ordering the establishment of post-offices.

TURKEY.—Accounts from Constantinople to the 1st inst. state that the diplomatic relations between the Porte and Austrian Legation have been renewed, and the differences that were likely to have caused much inconvenience to both parties will be finally settled in the course of a few days, assurances having been given that the Ottoman Government will take immediate steps to make such arrangements relative to the steam navigation of the Black Sea by Austrian vessels, as will be satisfactory to the Court of Vienna and the parties interested.—It is now rumoured that Russia has shown a determination to resume the Servian affair with pertinacity, and that the language held by the Russian Ambassador is an echo of the Emperor's letter. Hitherto this language has produced no effect upon the Porte. Captain Williams, R.A., having recovered from his indisposition, was on the point of taking his departure upon his mission to Erzzerum, accompanied by Mr. Curzon, private secretary to Sir S. Canning.

EGYPT.—Letters from Alexandria of the 27th ult. state that the mortality amongst oxen throughout Egypt still prevailed, and that the Pasha was about to despatch

an officer to Constantinople, to solicit permission to purchase oxen and horses at Erzeroom. Mehemet Ali had been slightly indisposed, but was by the last accounts convalescent, and was expected to return to Alexandria, in order to dispose of his stock of cotton and corn.

WEST INDIES.—The mail-steamer Trident arrived at Falmouth on Wednesday, bringing Mexican, West India, and other mails, having sailed from St. Thomas's on the 27th January, from Bermuda the 4th, and from Fayal the 14th inst., with 52,000 dollars on freight and 13 passengers. The accounts from Jamaica are to the 17th Jan., and are, on the whole, satisfactory, the only exception being that occasioned by a recent visitation of severe weather, experienced on the north side of the island, where the heavy rains had so swollen the rivers as in many places to cut up and carry away portions of land and live stock. St. Mary's, Trelawney, Hanover, and St. James's, appear to have been the parishes more particularly visited by the floods, but in the former alone do they seem to have been so violent in their effects, and there, happily, not attended with any loss of human life.

Parliament.
HOUSE OF LORDS.

Monday.—The DUKE OF WELLINGTON brought forward the motion of which he had given notice, of thanks to the Governor-General of India, to the commanders, officers, and men employed in the late military operations in Afghanistan. He entered into a succinct historical narrative of the disturbances which prevailed throughout Afghanistan, and which led to the insurrection at Cabul; and traced the subsequent disasters of our army through the disorganisation, and discouragement, and treachery that beset them, until, being reduced to a mere undisciplined mass, they were either destroyed or taken prisoners, with the single exception of Dr. Brydon. He attributed much of the disorganisation and discouragement that followed the insurrection at Cabul to the continuance of the negotiations with the persons who were considered to be at the head of it, and said these disasters were chiefly owing to the wants of provision and transport under which the army suffered. After this series of misfortunes, the Government had made an effort to collect troops, and to save the garrisons and troops in Jellalabad and other places. The present Governor-General had arrived on the 28th Feb., and gave his first order on the 15th March. The junction of Sir Robert Sale's forces with those under General Pollock was the first operation accomplished, and the object of the Government then was to have a communication established between the several garrisons, and to obtain a release of the prisoners. Lord Ellenborough continued his efforts to carry out this policy by reinforcing the garrison at Candahar, and by supplying the other troops with the means of conveyance, with ammunition, and provisions, and by corresponding constantly with all persons likely to aid or assist him in his objects. He endeavoured to ascertain the time when it would be most expedient, in reference to their health, for the troops to return; and the order of the 15th March clearly indicated that he did not intend they should again embark in the conquest of Afghanistan. The order of the 19th April had been given after Lord Ellenborough had received information of the failure of a detachment to force the Bolan Pass, and when it was determined the army should remain until the period most convenient for their health to retire. The published correspondence showed that the opinions of the Generals were that it would have been inexpedient to withdraw the troops from Afghanistan until October, and it was on account of these opinions that the Governor-General, on the 4th July, "sent instructions of the handsomest kind" to General Nott at Candahar: "the handsomest that any officer ever received." General Nott had accepted that order in the most gallant spirit, and had executed his instructions in the most honourable and noble manner; Having placed himself in correspondence with General Pollock, the latter moved forward, and in the very valley where the disaster occurred to our troops, he gained a signal victory, following success after success, until he arrived at Cabul, and on the 16th September hoisted the English standard on its walls. His brother-General, who had advanced from Candahar on the same day, destroyed Ghuznee, and thus were our calamities repaired. The Governor-General had given his first order on the 15th March, and between that day and the 16th September, the misfortunes that had occurred were remedied. But this was not all. The prisoners who had been in the hands of the enemy had been liberated. By the 25th Sept. they were all restored. He would not say a word as to the policy of the former Governor-General, but felt bound to say that in resigning his position he had done all he could to assist his successor. For the signal services he had mentioned, the noble Duke called upon their Lordships to record the vote of thanks of which he had given notice.

accord the vote of thanks or money and given notice. Earl Auckland, while he acknowledged with satisfaction that no blame had been cast on him by the Duke of Wellington, was anxious to point out what the conduct of the Indian Government had been while he presided over it. The disaster had been unexpected, and though a large force had been destroyed at Cabul he had been advised that the force there had been more than sufficient for any emergency. He had been even pressed to withdraw a portion of it as unnecessary. He had been placed in an embarrassing position, having sent in his resignation three or four months before the news of the disaster reached him. When he heard of the insurrection his successor was on the seas, and nothing then remained for him to do but to give to him all the assistance he could. He had sent several regiments, amounting to 7,800 men, across the Punjaub; and on hearing of the death of Sir W. M'Naughten he directed an increase of 3000 men to be made to that force. Measures had also been taken to supply General Nott with transports. For the farther relief of General Nott, he had directed General Pollock to penetrate the Bolan Pass; and it was by the prosecution of these measures that success had been attained. The Noble Lord who succeeded him had acted with zeal and ability in supplying the wants of the army. No man could more cordially join in every satisfaction at the glorious results of the military operations under the administration of the Governor-General.

The Marquess of LANSDOWNE, after considering the words of the noble Duke's motion, felt that he could consistently concur in the praise it bestowed. To the means left by his predecessor, Lord Ellenborough had undoubtedly brought all the means necessary for the success of his plans. From peculiar circumstances three at least of the generals had been left to take upon themselves a responsibility which they could not have expected, involving the character and honour of this country. The conduct of Generals Sale, Pollock, and Nott, was certainly such as Parliament should acknowledge. The extreme caution of the Governor-General in his despatches was remarkable; but he did not refer to it for the purpose of casting any censure on his conduct, but of doing full justice to the services of the military officers.—Lord FITZGERALD would be able to show from the documents produced that the extreme caution imputed to Lord Ellenborough did in no instance prevent the advance suggested to the general officers serving under him. Even the de-patch in which he directed the withdrawal of the troops held out the hope of future operations, and showed that his object was to seek retribution for the disasters that had occurred.—The Marquess of CLANRICARDE did not agree in the great merit attributed by Lord Fitzgerald to the instructions issued on the 15th March. It did not appear that Lord Ellenborough had made any stipulation for the restoration of prisoners, as he only said it "might become a question."—Lord BROUGHAM drew from the universal acquiescence in this vote the conclusion that the general conduct

of Lord Ellenborough was distinctly approved, and deprecated the tone in which "his caution" had been treated by the Marquess of Lansdowne. He then proceeded to show, by extracts from his orders and despatches, how erroneous were the various imputations which had been laid to the Governor-General's charge, especially with respect to the recovery of the prisoners, and contrasted the language of the Opposition within the House with that which had been used by their ordinary supporters elsewhere. If any were yet unconvinced, he challenged them to bring forward their complaints for immediate discussion. He would not comment upon the style of the proclamations which had been the subject of so much censure, but which were unworthy of notice when his public conduct was taken into account. He declared that Lord Ellenborough was a truly pious Christian, and that the proclamations did not bear the interpretation put upon them. He joined heartily in the expression of approbation and thanks to all those for whom such honours were now demanded, and in gratitude to Providence for having vouchsafed to relieve our armies of the great, though temporary, stain that was upon them, our councils of a most grievous embarrassment, and our Indian empire from the peril which at one moment appeared almost greater than the unaided efforts of man could have sufficed to overcome.—The Bishop of SALISBURY guarded himself from being considered as agreeing with the words used by Lord BROUGHAM with respect to the proclamation about the gates of Sonmauth. Should the subject of that proclamation be brought before their Lordships, he was sure it would be considered by every one of them a most unhappy accompaniment to these proceedings.—The Bishop of CHERESTER concurred with his Right Rev. Friend.—Lord BROUGHAM insisted that neither he nor any one else had dreamt of showing any preference to one pagan religion over another in defending the words of this proclamation. Notwithstanding what he would call the miserable clatter raised about this proclamation, he was ready to prove that the words used in it could not be forced into any such construction.—The Earl of MINTO rose to save himself from being supposed to express more than his satisfaction at the ability and judgment with which Lord Ellenborough had applied the resources of the empire, in aid of the operations begun by his predecessor. This was, in his opinion, an unprecedented motion, for he was not aware of the thanks of Parliament having been previously voted for such services to a person who had not been the author and originator and conductor, at the same time, of the successes.—The vote was then passed without opposition.

successes.—The vote was then passed without opposition.

Tuesday.—LORD WHARFCLIFFE replied to a question by Lord Brougham, referring to the erection of the new Houses of Parliament, and stated that the Victoria Tower being the heaviest part of the building, which would probably settle down considerably, it would be desirable to wait until it was carried to a certain height before the remaining portion of the pile should be constructed. Both houses would be carried up together, but that would not prevent that for the use of their Lordships from being completed before the other. He understood it would be ready for their reception in 1845. He thought that perhaps the appointment of a committee to make inquiries into the matter would be desirable. On the motion of the Marquess of CANNIBARDE the appointment of a committee to examine the architect was agreed to.—The Archbishop of CANTERBURY, the Bishop of ROCHESTER, the Bishop of LINCOLN, and the Bishop of BANGOR presented petitions against the union of the sees of Bangor and St. Asaph. The Archbishop of CANTERBURY expressed himself opposed to the prayer of the petitions.

prayer of the petitions.

Thursday.—In reply to a question by Lord CAMPBELL, Lord WHARNCLEIFF said there had lately been a decision of the Court of Session respecting what were called the *quoad sacra* parishes, and an appeal against that decision had been sent up to the House of Lords. Until that appeal had been decided, it would be impossible for her Majesty's Government to determine whether or no they would propose a measure on the subject to Parliament. Should that decision be confirmed, Government were of opinion that inconveniences might arise with respect to church extension; and, therefore, should the decision be confirmed, Government would feel disposed to originate some measure to meet the inconvenience. With respect to the question of what was generally called non-intrusion, her Majesty's Government had lately laid down their views on the subject in a letter which had been made public, and to those views it was their intention strictly to adhere.—Lord BROUGHAM said that with respect to the question of non-intrusion, he was glad to find that his noble Friend adhered strictly to the able, luminous, and learned argument of his right hon. Friend the Secretary of State for the Home Department. He had read the whole of that letter, with the exception of one phrase, with the greatest satisfaction. The Court of Session had frequently decided on this point, and their Lordships had repeatedly confirmed by a unanimous vote the decision of the Scottish courts of law. The law had, therefore, been declared to the Church of Scotland by the highest authority, and he must say that it was discreditable to the majority of the representatives of that church to adhere so pertinaciously to their own views instead of setting, as they were bound to do, an example of submission to the laws of their country. No man grudged them the right of deciding upon all spiritual matters; but their intolerable claim was, that on every question they should be the sole judges as to what was or was not a spiritual matter. No country, no Government could exist if a power greater than that of the law was to be vested in any body but the Legislature. They had no chance, however, of accomplishing their vain and extravagant claims; and to give them new laws to break, new Acts of Parliament to violate, would be bootless, vain, and, in his opinion, an undignified procedure on the part of Parliament.—The Earl of MINTO felt quite sure that the answer of the noble Lord (Lord Wharncleiff) would give great satisfaction in Scotland, since it would tend to put an end to that uncertainty which more than anything else tended to keep up agitation in the country.—Lord CAMPBELL said that demands made by the Church of Scotland were wholly inadmissible, and had very properly been rejected by her Majesty's Government. He (Lord Campbell) might, however, be allowed to express a hope that a reasonable view would still be taken of the question, and that the calamity might yet be averted out of a secession of nearly half the clergy from the church. He looked to the consequences of such a secession with grief and apprehension. Not that he sympathized with the leaders in the movement. The *calamity* that they would acquire would secure them against any serious inconveniences, even if they should renounce their connexion with the Church. But it would be very different with the poor clergymen in obscure parts of the country, and it made his heart bleed to think of the situation in which they would place themselves and their families. Their Lordships might be aware that there was a fund for the widows and orphans of the ministers of the Church of Scotland, which was of the greatest benefit, but the advantages of which would be lost by the families of those ministers who seceded from the church. He hoped, however, there was still time for reflection, and that many of them would move for returns respecting the

church. —The Earl of Minto moved for returns respecting the navy, and asked why there had been less ship-building last year than had been contemplated.—The Duke of WELLINGTON doubted the propriety of furnishing the information required.—The Earl of HADDINGTON explained, that the reason why there was less ship-building last year than had been contemplated, was, that it was deemed more economical to keep vessels already built in good repair than to build new ones. The reduced estimates for the present year had been adopted with great reluctance; but it was felt that, owing to the state of the finances, some reductions should be adopted.—Lord ASHURTON expressed his regret that the information had been given.—The Duke of WELLINGTON said he had given his opinion of the impropriety of furnishing the information, but his advice was neglected; and the two noble Lords, in defence of their respective governments, had published to the whole world information which should never have been communicated, and which might prove mischievous to the country.—After some debate Earl Minto withdrew his motion.

HOUSE OF COMMONS.

HOUSE OF COMMONS.

Monday.—Sir R. PEEL, in pursuance of his notice, moved the thanks of the House to the Governor-General of India, and to the officers and men, both British and native, for their services in the late military operations of Afghanistan. He began by disclaiming all intention of casting any political reflection, even in the remotest way, upon the course previously pursued by Lord Auckland's government; and, after alluding to the general character of wild and romantic interest attaching to those distant services, explained the position of affairs at the accession of Lord Ellenborough. He related the outbreak of the rebellion, the movement of Sir R. Sale from Cabul to Jellalabad, and the attack then made upon the British, including the murder of Sir A. Burnes; the preparation of a military force by Lord Auckland, the news which reached him of further disasters, and his subsequent orders to Generals Pollock and Nott for the withdrawal of the forces. It was but just to say, that with the discretion thus exercised by Lord Auckland, Sir Jasper Nicholl's opinion had coincided. It was easy to criticise that discretion at this distance, and after the event; but in his Sir R. Peel's judgment, the resolution taken by Lord Auckland was justified by the circumstances under which it had been adopted. The state of affairs, however, at the arrival of Lord Ellenborough, being undoubtedly very discouraging, he adopted a new policy, of which the objects had been all accomplished. True, he had on the 19th April, directed General Nott to retire from Candahar; but Lord Ellenborough had then received news of the surrender of Ghuznee, and of the failures of General England in the attempt to relieve General Nott. and, meanwhile, General Pollock and General Nott had been writing to the Governor-General to represent the difficulties of their respective positions. The loss of beasts of burden, indispensable for securing a supply of food, had amounted in a few months to the number of 30,000 animals. These circumstances were an ample justification of Lord Ellenborough's first order of withdrawal. He then proceeded to specify the services of Generals Pollock, Nott, and Sale. General Pollock, on arriving at the scene of his duty, had visited the hospitals—had provided for the care of the sick, as well as for the comfort of the effective troops—and had brought them back from a state of unpleasant feeling to a zealous and loyal spirit, as it appeared from Quintus Curtius, that Alexander had done, in those very regions, more than two thousand years ago, when discontent had crept in among the Macedonian forces. He recapitulated the successive military achievements of General Pollock, terminating with the capture of Cabul. He then traced the victorious progress of General Nott; and after paying a tribute to the services also of the Captains and Lieutenants, did justice to the high English spirit which breathed in General Nott's letters. He eulogized the many and great services of Sir R. Sale, his fortification of Jellalabad, interrupted as it had been by the shocks of an earthquake, his gallant defence of that city, and his successful attack on Akbar Khan, chequered only by the loss of the brave Colonel Dennie. He then alluded to the heroism of Lady Sale, and of the late Lieut. Sturt, whose valour she has touchingly commemorated. It was impossible, he said, to describe all these services without feeling pride in the British name; those services had proved that it was a name which the long interval of peace had not impaired, and they were an earnest that further efforts, when occasion should require, would continue to be made with glory and with triumph.

and with triumph. Lord J. Russell expressed his concurrence in these sentiments, and his sympathy with the brave men who were the subjects of this motion. He praised the letters of General Nott, which he admired the more for the absence of all preparation and attempt at fine writing. He applauded the military services of that officer, as well as of Gen. Pollock and Sir R. Sale. The proposal of thanks to Lord Ellenborough raised another class of considerations. Was that nobleman the general director of those operations? He himself did not wish to detract from any praise which Lord Ellenborough might have merited; but he must claim some credit for Lord Auckland, since it was to Lord Auckland's previous orders that much of the ultimate success was due. The option of advancing, which was given by Lord Ellenborough to General Nott, was not of a nature which entitled the Governor to share the praise with the General. It was not a positive direction to advance, but rather an intimation of the danger of advancing. He would not, however, take upon himself the responsibility of refusing a vote of thanks, which he believed was in accordance with precedent.

believed was in accordance with precedent.

Mr. BANKES thought, as the Noble Lord had shrunk from giving his vote, he should also have shrunk from the invidious observations he had made respecting Lord Ellenborough.—Sir HENRY HARRINGTON supported the motion in a speech replete with military details. Never, in his opinion, had a British army deserved better of their country.—Sir E. COLEBROOK rejoiced to find the House ready to accord their thanks and gratitude to the brave men who composed the army in Afghanistan, and he hoped there would be no dissent from the motion.—Sir R. WATKINS, though he had opposed some of the proclamations of Lord Ellenborough, concurred entirely in his military policy.—Mr. HUME concurred in the military vote; but could not consent to the vote to the Governor-General. He moved that the thanks to Lord Ellenborough be deferred.—Mr. HOGG thought the Hon. Member would act wisely in withdrawing his motion. There never was a time when the native troops were more severely tried, and never did they conduct themselves with greater valour and perseverance. With such troops, under the officers we possessed, there was little fear that we could successfully maintain our Indian empire.—Mr. MANGLES thought Lord Ellenborough was entitled to the thanks of the House on the smallest possible grounds. But for the accidental inability of the generals to retreat, and the unwillingness of the Afghans to accede to the terms of peace proposed, the successes which had been gained would never have been achieved. Colonel THOMAS WOOL supported the motion.—Captain BERNAL, having read the Blue-book attentively, concluded from it that Lord Ellenborough had fully earned for himself the thanks of the House for the share he had had in these military successes. He hoped that Mr. Hume would withdraw his amendment.—Sir H. DOUGLAS considered that the Governor-General, in not giving positive orders to the generals to advance in the first instance, when he was ununiformed of their precise position, acted most wisely. He had, in doing so, adhered to the good French maxim, "reculer pour mieux sauter."—Captain LAYARD warmly supported the motion, and regretted that the Hon. Member had thought proper to move any amendment.—Mr. C. WOOL insisted that it was not for want of necessary supplies that General NORT had not advanced, as would appear from the papers, but in accordance with the orders which he had received. The amendment was then negatived without a division, and the motion carried without a dissenting voice, with the exception of Mr. Hume.

Mr. HURT, moved for leave to bring in a Bill for giving to the Crown the sole power of naturalizing foreigners and enabling them to have seats in the House of Commons and at the Council Board. Sir JAMES GRAHAM, while expressing his unwillingness to oppose the bringing in of the Bill, expressed his surprise that a proposition to transfer this power from the Parliament and the Crown to the Crown absolutely should come from the opposite side of the House.

Tuesday.—Mr. T. DUNCOMBE brought forward his motion relative to the conduct of Lord Chief Baron Abinger, with the view of summoning witnesses to the bar, in order to ascertain the precise language used by the Judge in charging and summing up while on the late special commission in the manufacturing districts. He complained that Lord Abinger had acted in an unconstitutional, malignant, and oppressive manner towards the prisoners whom he tried; quoted the observations of the newspapers on the subject; adduced precedents for his motion, particularly the case of Baron Smith, in the debate on which Lord Abinger, when Sir James Scarlett, had taken part, and whose sentiments were cited by Mr. Duncombe; and contrasted the conduct and language of Lord Abinger with those of Chief

Justice Tindal while on the special commission. He concluded by reading and commenting on Lord Abinger's charge at Liverpool, with which, he said, some of the jurymen expressed themselves disgusted.—The ATTORNEY-GENERAL met the motion with a direct negative. No petitions complaining of Lord Abinger's conduct had been presented from any person who had heard and witnessed the proceedings; and the language of the Judge was directed, not against the discussion of the Charter, but against the system of combination, intimidation, and insurrection which had been directed by what was called a "Committee of Public Safety," a body which, in the exercise of its assumed functions, gave licenses for the performance of whatever work they might deem to be of paramount necessity, and therefore, permissible as an infraction of the general system of suspension of labour. The sentences passed by Lord Abinger, and which had been condemned as severe, had proceeded from the united deliberations of three Judges. He concluded with a warm eulogium of the character of Lord Abinger, and said he was anxious to shield him, in his old age, after a life of brilliant and honourable service, from that species of mortification and disgrace which an inquiry into his conduct on a particular occasion would bring with it.—Mr. Ross did not think that a good defence had been made out, concluding, as it did, with an appeal to their feelings. He would support the motion.—Mr. THORNTON felt satisfied that if such motions as the present were acquiesced in, the independence of the Judges would be at an end. There was not the slightest foundation, in the instance in question, for the censure passed upon Lord Abinger's charge. Instead of inflaming the minds of the grand jury, his tone was that of compassion and mercy towards the deluded prisoners. If there were any severity in the sentences, it would have been only fair to have included the other Judges who were associated with him on their trials.—Mr. SERJEANT MURPHY professed respect for the character and genius of Lord Abinger, but censured him for having, in the instance before them, departed from the rigid impartiality which was the general characteristic of the judges of the land. Instead of calming the minds of the grand jury, in a time of great excitement, he had added to it, and had reversed the course which had been pursued by Chief Justice Tindal. This country had an abhorrence of political judges.—Mr. J. S. WORTLEY was surprised that the Learned Serjeant had entered into the discussion of this subject without having read the charge, which it was clear he had not. Had he considered the whole, and not merely a part of that charge, he could never have attempted even to insinuate that Lord Abinger had in the slightest degree sought to stimulate the feelings of the jury. The strictures made on that charge had been made without reference to the peculiar situation of the country at the time, or to the nature and objects of the insurrection.—Mr. WALLACE would like to see the judge who, were he on the jury, would address such a charge to him; he would "pull him out," and tell him to keep to his duty. It appeared to him that Lord Abinger thought there was justice in this country only for the holders of landed or funded property, and that those who had only their ten fingers were not entitled to the equality of the law. He thought this a most grave question, and amused the House by reminiscences of meetings during the Reform Bill agitation.—Mr. SCARLETT rose to express his feelings on a motion affecting one to whom he was so nearly related. His father's offence lay in the fact that he chose to differ from the Chartists, and, in the exercise of his discretion and duty as a judge, had given utterance to his sentiments. Lord Abinger had always been a strenuous defender of the constitution, and it was remarkable that, at different periods of his political life, he had been engaged in a struggle with the *Clodios* and the *Catalines* of the day. He read extracts from speeches, to show the *animus* of those who had petitioned against Lord Abinger's conduct.—Lord J. RUSSELL thought that the independence of the judges was a matter so sacred, that nothing but the most important considerations should induce the House to entertain such a motion as the present. The general acquiescence in the propriety of Chief Justice Tindal's charge, showed that there was no disposition to find fault with the conduct of the judges without a reason, and the fault of Lord Abinger's charges was a mixing up of political matters with legal explanations, and thereby tending to confuse the minds of the grand jury. Having a great deal both of political and legal knowledge, the Noble Lord had brought his political knowledge into a charge where only his legal was required. But, though not at all convinced that Lord Abinger had acted wisely or discreetly, he would oppose the motion.—Sir J. GRAHAM agreed in the general principles and practical conclusions laid down by Lord J. Russell. Such a motion as the present ought not to be agreed to, without a conviction that badness of heart had led to perversion of judgment. Lord Abinger, in his charge to the grand jury, acted on the knowledge which he had, from the perusal of the depositions, of a general combination to alter the established order of things; and it was his duty, as a sworn servant of the Crown, to point out the danger arising from it. He would not be the fulsome piqueurist of the Noble Lord; but he would not shrink from the defence of a man of his high character, when convinced that he had manfully and honestly done his duty.—Mr. S. CRAWFORD commented on the severity of Lord Abinger's sentences, and supported the motion.—Mr. WATSON also supported the motion, on the ground that a *prima facie* case for inquiry had been made out.—Mr. CARDWELL, having been a witness of the demeanour of Lord Abinger on the occasion in question, bore testimony to his moderation towards the prisoners.—Mr. T. DUNCANBELL replied, and quoted the words of Sir J. Graham, when he termed Sir James Scarlett "a recreant Whig;" and on a division there appeared—for the motion 73; against it 238.

Wednesday.—After the presentation of petitions, and the advancement of some private bills, Mr. S. CRAWFORD gave notice that, when the army estimates were brought forward, he should move, as an amendment, that these estimates be postponed until the expenses of the year were ascertained.—The House then proceeded to the consideration of Mr. LIDDELL'S Personation of Voters' Bill in committee. It was suggested that it ought to form a portion of the Government Registration of Voters' Bill; and some conversation arose on the propriety of including Ireland in the measure. Mr. LIDDELL declined to do so; but Sir JAMES GRAHAM expressed his opinion that the measure should apply generally to the United Kingdom, and also stated one or two objections to the details of the bill, especially the taking a party accused of personation into custody for 12 hours, in order to compel him to prove his identity. Ultimately the bill was postponed, on Sir James Graham's suggestion, till after the second reading of the Registration Bill.—The Forged Exchequer Bills Bill was read a third time, after some discussion as to the case of Mr. Inglis, who was excluded from the compensation.—The Coroners' Inquests Bill was also read a third time.

Thursday.—Sir JAMES GRAHAM, in answer to Mr. CAMPBELL, made a statement relative to the Church of Scotland. The appeal in the Stewarton case, involving the question of *quoad sacra* parishes, was yet pending before the House of Lords. Should the decision of the Court of Session be affirmed, and should that affirmation have the anticipated effect of crippling the efforts of the Church of Scotland in carrying out its extension and discipline, the Government would not be indisposed to legislate, with a view of providing a remedy. But with respect to what was called the non-intrusion question, the deliberate opinion of her Majesty's Government respecting it had been placed upon record, in a letter addressed by him Sir J. (Graham) on the part of the Government, to the Moderator of the General Assembly. To the principles and opinions contained in that letter her Majesty's Government strictly adhered; and beyond the limits of these principles and opinions it was impossible for her Majesty's Government to proceed.

Mr. WALTER proposed a series of five resolutions, the substance of which expressed that in a document entitled, "Measures submitted by the Poor-Law Commissioners to her Majesty's Minis-

ters," there was a certain suppressed passage, indicating the principle on which the Poor-Law had been based; and that this real, though unavowed principle involved such a cruel and impracticable interference with the rights and comforts of the poor, as to justify the demand that the Poor-Law be so revised as to make it "conformable to Christianity, sound policy, and the ancient constitution of the realm."—Sir JAMES GRAHAM explained that the document alluded to had been drawn up by the professional individual who had been employed by the Poor-Law Commissioners to give their propositions a tangible and technical shape. Some 20 copies of this informal document had been printed, and a copy had been given, under the strictest confidence, to a friend of Mr. Walter's, and, after the period of ten years which had passed, this confidence had been violated. The propositions contained in the document had been submitted to Lord Grey's Government, and had been distinctly repudiated; the affirmation, therefore, that they formed the basis of the new Poor-Law was entirely incorrect. The law was based on the policy of "feeding the hungry, and clothing the naked;" its tendency was to elevate the character of the labouring population; the proportion of those relieved out of doors as compared with those relieved within the workhouse, was as six to one; the law was, therefore, not opposed to Christianity or sound policy; and he would meet the first resolution by the previous question, and the others with a direct negative.—Mr. WATLEY censured Sir James Graham for attributing improper motives to Mr. Walter. It now turned out that there was such a document in existence, and it was quite right of Mr. Walter to produce it. It was the composition of some monster in human shape, of some fiend-like spirit, who must have had an extraordinary opinion of Earl Grey's Government, to dare to submit to it such a proposition. The Secretary of State should give the name of the writer.—Mr. BORTHWICK seconded the resolutions, and expressed himself resolved to support the spirit of the motion whenever the Poor Law came before the House.—Mr. AGLONY did not believe the passages quoted from the document were made the basis of the law, but he considered the spirit of them appeared in the operation of it. He could not give the go-by to the resolution proposed by voting for the previous question.—Col. STANHOPE would be contented with nothing short of the annihilation of the Poor Law Commission. Mr. Walter was entitled to thanks for making the exposure he had done of the origin of the new Law.—Mr. STUART WORTLEY had never pledged himself to his constituents to vote for the repeal of the Poor-Law. He was opposed to many of its provisions, and wished it to be improved, but he could not support the resolutions.—General JOHNSON'S great objection to the Poor-Law was that it put the people out of the pale of the constitution, and placed them under three individuals at Somerset-house.—Sir ROBERT PEEL denied that the principle of the amended Poor-Law was opposed to the Acts of 34th and 43d Elizabeth, or that it was more harsh in its provisions. This he illustrated by citing some of the provisions of these Acts, especially the power given by the 43d of Elizabeth over the children of such parents as were unable to maintain them. The workhouse test in lieu of the labour test was enacted by the 9th George I.; and therefore it was neither a novel nor an unconstitutional principle. No great measure was ever passed without suggestions having been submitted for the consideration of the Government; and it would lead to much practical inconvenience if such confidential communications, whether they had been adopted, or, as in the present instance, they had been rejected, were produced and publicly made use of. He adduced the amounts paid for the relief of the poor, as showing that there was more expended on them than on the poor of any other country; and expressed his surprise at the course which Mr. Aglionby had avowed he would adopt. He concluded by warning the House against tampering with the Poor-Law.—After some remarks from Mr. MUNTZ, Lord J. MANNERS, and Sir W. JAMES, Mr. FERRAND denounced the Poor-Law as iniquitous, atrocious, and blood-thirsty, and made a long speech, the greater part of which was a vindication of himself, an attack on Mr. Mott, with reflections on Sir James Graham, &c., and on the conduct of the Assistant Poor-Law Commissioners in the north of England.—Mr. S. CRAWFORD cordially supported the resolutions, considering them to be borne out by facts. The workhouse test, which it had been attempted ineffectively to carry out in England, had been rigidly applied in Ireland.—After a short conversation, having reference to certain allegations of Mr. Ferrand, with respect to abuses in the Keighley Union, Mr. MILLER declared his conviction that the Poor-Law had saved the country from destruction, especially the agricultural districts. He strongly repudiated the resolutions, as asserting what was opposed to facts. After some farther discussion, including a controversy relative to Mr. Ferrand's assertions, Mr. WALTER replied, and withdrew all his resolutions except the last, on which a division took place, when it was rejected by 126 to 58.

Sir V. BLAKE, amidst great laughter, moved the following resolution:—"For a committee of the whole House to consider the great commercial, political, financial, and other advantages which will accrue to the United Kingdom, and to the distressed portion of its population in particular, by the adoption of the safest and shortest, instead of the present dangerous and circuitous line of packet communication across the Atlantic Ocean; the urgent necessity of giving every facility to the operation of the sliding scale, as enacted by the present Corn Laws, and of forthwith selecting the most commodious port on the western coast of Ireland as a packet station, to expedite the post-office intercourse between North America and Great Britain." After some delay, it was seconded by Sir DAVID ROCHIE; but, upon the recommendation of Sir R. PEEL, who stated that such a proposition would cost the country about six millions, the motion was withdrawn.

Friday.—On the motion for going into a committee of supply, Mr. HUME and Mr. WILLIAMS called attention to the state of the revenue and the expenditure; and were answered by Sir R. PEEL, who deprecated the discussion, as the House was not prepared to go into the commercial and financial part of it. Information on matters of detail were best given in committee.—Mr. F. BARING brought on his motion respecting Mr. Hoskins, and moved for papers relating to it, but ultimately withdrew the motion, as all the information he required was before the House.—Mr. BLEWITT called the attention of the House to the North Boundary question between this country and the United States.—Sir R. PEEL hoped that Mr. Blewitt would not infer the disposition of the American Government from the speech or bill of a member of the Senate. Friendly communications were now passing between the two Governments on the subject.

The House then went into a Committee of Supply; and Mr. SYDNEY HERBERT rose to move the Navy Estimates. Compared with the previous year, there is to be a reduction of 4,000 men, and a decrease in expense of 143,000*l.*; and on the entire estimates there will be a saving of 435,000*l.* A discussion followed, after which the sums were voted without a division.

CITY.

Money Market, Friday.—Consols closed at 95½ to 96 both for time and Money; Three per Cents. Reduced, 96 to 96½; Three-and-half per Cents. Reduced, 103½ to 104; New Three-and-half per Cents., 102½ to 103; Bank Stock, 177 to 178; India Stock, 268½; Exchequer Bills, 64s. to 66s. prem., and 65s. to 67s. prem.

Metropolis and its Vicinity.

The Weather.—Since our last the atmospheric changes have been very sudden. The wind, which in the early part of last week had been at north and north-east, accompa-

nied with intense cold, the mercury being between 10 and 15 degrees below the freezing point, on Saturday veered towards the south, followed by a heavy fall of snow, which continued throughout the day. The storm was not confined to the Metropolis, but extended a considerable distance into the adjoining country districts, rendering the roads in some places almost impassable, and causing great obstruction to the mails, stage-coaches, and other vehicles.—On Saturday evening, the inhabitants of the Commercial-road, Lambeth, Bankside, and Tooley-street, were again alarmed by the rapidity at which the tide was rushing up the neighbouring streets, and inundating the lower parts of their houses. Great damage was done to the premises and stock of several manufacturers, and boats were plying in the streets to the assistance of the inhabitants.

New Houses of Parliament.—On Tuesday night a conversation took place in the House of Lords, in reference to the New Houses of Parliament, which is in many respects so remarkable, that we notice under this head those particulars which do not properly come within the scope of our Parliamentary summary. The Marquis of Clanricarde, in alluding to the agreement that the House of Lords should be the first portion completed, said, that he could not find fault with anything that had been done, for he had no information on the subject; but, as far as he could learn from general observation, he believed that this agreement had been more or less lost sight of, for it was generally supposed that there was a desire to perfect a merely ornamental part of the building, the great tower; but he thought for no tower there should be one single hour's delay in giving peers that accommodation which they now stood so much in need of. If he thought that the Government would not attend to this matter, he should move for a committee to examine the architect on the subject.—Lord Wharncliffe said he had made it his business to inquire into the matter, and he found that the Victoria Tower would be the heaviest part of the whole building, and that, in the opinion of the architect, there was a great probability of its settling considerably, and that, therefore, it would not be desirable that the rest of the building should be carried on until this tower had been carried up to a certain height. With respect to the building of the House of Lords before the rest of the building, the architect said it was desirable that the whole should be carried up together; but he said also that would not prevent the House of Lords from being completed considerably before the House of Commons, and the other parts of the building. He understood that the House of Lords would be ready in 1845, but he had not made any specific inquiry on this point.—Lord Brougham said he very much regretted to hear the very unsatisfactory statement just made by the Lord President, whose reason was not a whit satisfactory. The tower was to be made for pure ornament, without any pretence for use, and he agreed with the opinion which had been expressed of it, that it was a bad specimen of the barbarous Gothic taste of the middle of the 19th century. The tower was intended merely for ornament, but it was so weighty, and was likely to be so expensive to the public, that he felt inclined to refer the architect to the epitaph written for Sir John Vanbrugh:—

"Lie heavy on him, earth, for he
Laid many a heavy load on thee!"

He wished his noble friend to apply himself to the matter and to urge Mr. Barry to the fulfilment of the absolute contract which had been made, namely, that the House of Lords was to be completed first. Mr. Barry said it was highly desirable that the whole building should go on together; but to this his (Lord Brougham's) answer was, that nothing was so desirable as to have the bargain which had been made performed.—Lord Duncannon said that the works had now been eight years in progress, and he had always been informed that the House of Lords would be completed in the course of the seventh year. He also wished to call their attention to the fact that the House would soon be deprived of light and air by the progress of the new buildings. He thought a committee ought to be appointed.—The Marquess of Lansdowne said he thought the best way would be to have a committee on the subject; but then that committee ought not to reconsider the style in which the houses were to be built. With regard to Sir John Vanbrugh, he could only say that Sir Joshua Reynolds had described him as a most effective and picturesque architect. Their Lordships had been the first to make sacrifices for the general convenience, and therefore their accommodation ought to be attended to according to the agreement. He should be sorry to see the tower laid aside, because it was not only a most important and ornamental feature, but it would be useful also, for it was intended to be the place of reception for the public records. But he still said, as a mere matter of ornament, it ought to give way to providing for the accommodation of their Lordships in the first instance.—Lord Campbell complained of the inconvenience of the house while the Law Lords sat there in the mornings to hear appeals; and Lord Sudeley said he saw no reason why the interior of the building should not be completed before the exterior, and why the new House of Lords should not be completed in 1844.—Lord Wharncliffe said it was only fair that the architect should have the opportunity of stating his reasons before the committee.—The Marquess of Clanricarde then moved for the appointment of a committee, which was agreed to.

Improvements of the Thames.—The Lords of the Treasury, the Commissioners of Public Works, and the Corporation of London, caused, some time ago, a report and estimate to be made on embanking some portions of the river Thames. A select committee of the House of Commons took up the inquiry upon a more extensive scale, and engineers of first-rate eminence were employed to

examine the river within the whole of the jurisdiction of the Lord Mayor, and to report upon the entire question of making the river advantageous in every respect to the public. By a great deal of labour the most satisfactory evidence has been collected and laid before the Government and the corporation; and, from the active proceedings adopted, it is reasonable to calculate that the health, beauty, and convenience of the Metropolis will, without much delay, be considerably augmented. On Wednesday special courts of conservancy were held by the Lord Mayor at Westminster, the Borough, Greenwich, and Stratford, for the several counties whose lands embank the Thames, with the view to commence the great work. The Recorder, in his charge, alluded with approbation to the plan for embanking the river. The juries, he said, would be expected to recommend such measures as might be, in their opinion, best calculated to meet the new state of circumstances, and what new alterations might appear to them most effectually adapted to advance the public utility. It was impossible not to admit that a most extraordinary change had occurred, in consequence of the progress of steam navigation: the use of the Thames as a public highway had increased beyond all imagination. Five minutes did not elapse through the day without testifying to the energies of that power, by conveying from one place to another thousands of persons who thus found an accommodation which it would be impossible to remove or fetter. Those considerations having been presented to the juries, their duty, they would see, was plain and obvious. They would point out every encroachment on the bed of the river, without balancing convenience against inconvenience. The public had a right to all the advantages which could be yielded in the width and depth of the stream, and therefore no permanent encroachment could be tolerated. It would readily occur to the jurors that in a river which, to say nothing of its prodigious commercial importance, constituted the great drain of the metropolis, it was essential to preserve the activity and depth of its water. When he spoke of the Thames as being the drain of the metropolis, he by no means intended to be understood as intimating that the inhabitants on its banks would be tolerated in letting flow into it the refuse of gas or other noxious filth. Every offence of that description must be presented, and would be punished. It was matter of congratulation, however, that by means of an improved embankment the public health was capable of being seriously benefited by the depth and activity of the stream, whatever might be the pollution to which the water might be subjected. The juries would in their surveys find numberless encroachments which had in former days been altogether innocuous, but which had become, by the remarkable changes to which he had adverted, very injurious to the navigation. They would present those encroachments to be dealt with according to law; and they would have the able assistance of the City Solicitor, who would afford them all the necessary facilities. It was the determination of the Lord Mayor, under the extraordinary circumstances to which the attention of the juries had been called, to make these courts as efficient as they were capable of being made, consistently with the law and the constitution. The 11th of March was appointed for the next courts, on which day the several presentments will be made by the juries.

Custom House.—The proceedings of the Commission appointed to inquire into the recent Custom-house frauds have assumed additional importance during the past week, two officers of the establishment, searchers and landing-waiters, and a Custom-house agent having absconded. It is said that the investigation is pressing so heavily on the guilty parties, that these persons thought it necessary for their own safety to take themselves out of the way. The Government, however, have offered a reward of 200*l.* to any person who may apprehend them, or give evidence leading to their capture. It is expected that Government will follow up the advertisement, and that measures will be taken for claiming them from foreign governments as fugitives from justice, if they have escaped either to the Continent or to America. It has been repeatedly stated that leading houses in the City were in league with the delinquent officers, and that large profits have been acquired by them through such dishonest practices. It is difficult to believe that extensive frauds could have been perpetrated, unless the guilty officers had been in league with the owners of the goods; this fact has given rise to great anxiety in the City, in every department of foreign trade, to have a full and searching inquiry, and great impatience is expressed for the speedy publication of the Report of the Commission. It is stated by the *Globe* that "a firm in Watling-street, largely implicated in these frauds, has been exchequered for 160,000*l.* Independent of this sum, others of minor importance, and particularly one firm, rather celebrated at the West-end, have had the same process served on them."

Christ's Hospital.—A special Committee of the Governors of Christ's Hospital was convened on Monday, to agree upon an appropriate form of address to the Queen, in acknowledgment of Her Majesty's munificent gift of 1000*l.* to the funds of this institution. The meeting of the Committee was preparatory to a Court being called to vote the address.

University College.—The annual general court of the proprietors of this College, was held on Thursday, in the theatre of the institution. Mr. Crabbe Robinson in the chair. The report stated that in the session of 1841-2, the pupils in the College and the junior classes numbered 886. Of those, 336 were students in medicine, 155 in the arts, and 395 were pupils in the junior school. The amount of receipts from students and pupils was 12,756*l.* 4*s.* 6*d.*, of which sum 9,081*l.* 18*s.* having been paid to the professors and masters, 3,675*l.* 2*s.* 10*d.* fell to the share of the

College. The year's income from other sources was 4,039*l.* 11*s.* 4*d.*, and the disbursements for the establishment department, including payment for several permanent additions to the property of the College, interest upon mortgage, &c., amounted to 4,000*l.* 17*s.* 11*d.*, thus showing that the expenses were covered by the receipts. Of the sum above mentioned, of 12,756*l.* 4*s.* 6*d.* received for education, 5,570*l.* 10*s.* was derived from classes of the medical faculty, and 2,570*l.* 14*s.* 6*d.* from those of the arts and law. To the library a set of works, 100 in number, printed at the Government press at Cairo, had been presented by Lord Brougham, who had received them from the Pasha of Egypt. The junior school produced during the year 4,615*l.*, a sum less by 282*l.* than the year before. The collection made at the public dinner in June last was 1,120*l.* Since the last meeting a very fine collection of geological specimens had been offered to the College for the use of students, by Mr. Greenough; but on account of the expense of providing rooms for its reception, and keeping it in proper order—an expense the council did not at present feel themselves justified in incurring—they had been compelled, though reluctantly, to decline the offer.

Colonel Leicester Stanhope mentioned, with regret, that he had heard that the Duke of Somerset had resigned the office of vice-president, and proposed a resolution expressive of the great value they set upon his Grace's past services, and of regret at his resignation. The resolution was passed unanimously. Lord Brougham was then elected president, and Earl Auckland vice-president, for the year ensuing.

Anti-Corn-Law League.—On Wednesday evening the first weekly meeting of this association was held at the Crown and Anchor Tavern. Long before the hour of meeting, the great room was crowded to excess. Mr. Hamer Stansfield was in the chair, supported by Mr. Cobden, Mr. Hume, Mr. Ewart, Dr. Bowring, and other Members of Parliament. The chairman, after some prefatory observations, alluded to the conduct of a false friend towards Mr. Cobden, and said that nothing would deter the hon. Member from pursuing the course he had marked out for himself and the League for the abolition of the Corn-laws. Mr. Cobden then presented himself to the meeting, and was received with loud cheers. He was sorry the chairman had alluded to what took place elsewhere, but for his vindication of the charge brought against him, he would only ask them to read his speech in the *Times* paper—an organ not over favourable to him. He was charged in the House of Commons with meditating murder, but he would confidently refer to his speeches before he was a Member, and they would find that he was always a peace-maker, and no person was more opposed to the use of physical strength than he was. He then went on to state that the Anti-Corn-Law League was a confederacy formed to get rid of an oppressive law, the existence of which was productive of the greatest possible evil. Four years since had the League been formed in Manchester, and if the people of London had joined them, the law would have been long since repealed. In allusion to what had been said in the House of Lords by Lord Brougham, of the intemperate language used by an individual of the League, it was not fair to cast censure on the whole body for the fault of one. His Lordship might have expressed his disapprobation by letter. The hon. Member concluded a long speech by declaring himself an advocate of free trade, and an enemy to monopoly of every description. Mr. Bright, of Manchester, next addressed the meeting. He commenced with a severe censure on the House of Lords and her Majesty's Government, who, though the heads of them perfectly agreed with the League as to the expediency of the repeal of the Corn-laws, yet for the sake of place opposed it. The meeting was subsequently addressed by Colonel Thompson and Dr. Bowring.—On Tuesday evening a public meeting of the inhabitants of Marylebone took place in Albany-street, for the ostensible purpose of considering the question of a repeal of the Corn-laws. Mr. John Bagshaw, ex-member for Sudbury, was advertised to take the chair, but on his making his appearance, accompanied by Mr. Hume, Sir De Lacy Evans, Dr. W. C. Taylor, the members for Marylebone, and other supporters of the League, a scene of extraordinary confusion took place. The Chartists, who had assembled in large numbers, tore up the seats, and drove the Anti-Corn-Law party from the platform; and after a violent struggle between the parties, the platform broke down, and the Chartists were precipitated into the body of the meeting. The League Members immediately took possession, but the Chartists returned to the assault with redoubled vigour, and effectually drove the Leaguers from the platform, when their chairman and the borough Members quitted immediately. Mr. Smart, in dumb show, proposed a resolution in support of the objects of the League, to which an amendment in favour of the Charter was proposed and carried by a large majority. Three cheers having been given for the Chartists, and three groans for Mr. Hume and the League, the riotous assembly broke up at a late hour.

The Wrecks of the Conqueror and Reliance.—On Monday night the concert for the relief of the widows and orphans of the seamen who perished in the *Reliance* and the *Conqueror* took place in the Hall of Commerce in Threadneedle-street. The hall was crowded to the doors; and its appearance, brilliantly illuminated, and filled by and its appearance, was magnificent in the extreme. The such an assembly, was magnificent in the extreme. The orchestra was led by Mr. Cramer, and the whole was conducted by Sir George Smart. The overtures to the "Zauberflöte" and to "Euryanthe," commenced each of the acts. Mrs. Shaw sang an air by Benedict, full of bravura passages for a soprano voice, and succeeded so well as to gain an encore. In the trio in the "Matri-monio Segreto," she was much more at home; the other

parts were sung by Miss Birch and Miss Rainforth. Madame Caradori Allan gave her favourite "Una voce poco fa," with great spirit. Besides the above the most remarkable performance was the old cantata "Alexis," of Dr. Pepusch, sung by Mr. Hobbs, with Mr. Lindley's accompaniment on the violoncello. Its effect was admirable; Mr. Lindley's brilliant execution produced loud applause. The benevolent object of this concert must be fully answered; as in addition to the tickets sold to a crowded audience, large donations were sent by many individuals who could not attend.

Accidents and Inquests.—The Coroner's inquest on the body of Major Jones, late Aide-de-Camp to the King of Hanover, whose death we noticed in our last, was concluded on Saturday, when the Coroner, after several witnesses had been examined, remarked that the only thing which gave the slightest rise to any suspicion in the case was, that a man who must have been so well experienced in the use of fire-arms should have handled pistols in so careless a manner. He had no doubt, however, from what they had heard, that the case was purely one of accident. The jury, coinciding in this view of the case, returned a verdict of Accidental Death.—On Friday the Rev. Edmund Drax Free, D.D., late rector of Biggleswade, Bedfordshire, was run over by a chaise in Gray's Inn-lane, and so seriously injured that he died in the hospital on the following morning. The jury on Monday returned a verdict of Accidental Death.—On Wednesday night the police succeeded in entering a house in St. James's-street, known for some time past as a gaming-house, and capturing several of the players, and a quantity of gambling implements. An unfortunate circumstance attended their proceedings, which has terminated in the death of Mr. Henry Smart, the son of the reputed proprietor of the house, and who had attempted to escape by the roof of the house adjoining, but, his foot slipping, he fell from a height of 60 feet into the area of the adjoining house, and was so much injured that he died on Thursday morning, in St. George's Hospital. It appears that the young man was not implicated in the gaming proceedings. He was in bed at the top of the house when the police made their entry, but it is supposed he became alarmed on receiving information of what was going forward, and that, fearing he also should be captured, he climbed upon the roof to get away. The evidence given before the magistrate in the case of the parties captured was conclusive as to the character of the house; but in consideration of the calamity which had happened, they were fined in mitigated penalties, varying from 3*l.* to 30*l.* A coroner's inquest was held yesterday, when a full investigation into the cause of the young man's death was gone into, and a verdict of "Accidental Death" was returned.

Mortality of the Metropolis.—A summary of the weekly tables of mortality in the Metropolis for the year 1842 has just been published. These tables relate to a population of 1,875,493, spread over an area of 70 square miles, and of which 878,767 are males, and 996,726 females. Dividing this area into five districts, the following are the results exhibited in regard to the yearly mortality in each:—In the west district, the population is calculated at 301,480; during the last year the number of deaths was 6,826, and the rate of mortality 2.209 per cent. In the north district, with a population of 366,482, the number of deaths was 8,550, and the rate of mortality 2.289 per cent. In the central district, with a population of 374,640, the number of deaths was 8,373, and the rate of mortality 2.363 per cent. In the east district, with a population of 333,148, the number of deaths was 9,947, and the rate of mortality 2.493 per cent. In the south district, with a population of 439,443, the number of deaths was 11,076, and the rate of mortality 2.476 per cent. The total number of deaths in the Metropolis amounted, for the year, to 45,272, of which 22,842 were males, and 22,430 females; and the annual rate of mortality throughout the whole population was 2.381 per cent. The number of deaths of persons under 15 years of age is stated to have been 21,266; from 15 to 60 years, 14,836; and from 60 upwards, 9,093. The number of deaths caused by epidemic, endemic, and contagious diseases, amounts in the year to 7,696. The number of deaths caused by diseases of the nervous system amounts to 7,505. The number of deaths caused by diseases of the respiratory organs amounts to 13,990. Of that number 3,923 resulted from pneumonia, 1,109 from asthma, and 7,145 from consumption. The number of deaths caused by diseases of the digestive organs amounted to 870. 3,396. The number of sudden deaths amounted to 3,346; The number of deaths from old age amounted to 3,346; from intemperance, 22; from starvation, 20; and from violence, 1,225. The following is the number of deaths registered in the week ending Saturday, Feb. 11:—West districts 120, north districts 161, central districts 174, east districts 176, south districts 223: total 864. Weekly average for the last five years 903 (461 males, 442 females), and for the last five winters 1004.

Provincial News.

Bristol.—In the Court of Peculiars on Saturday, it was stated that the proctor for Mr. Woolley, the Bristol timber-merchant, who was hoaxed in the affair of matrimony which has lately become so notorious, had no libel to offer in the cause he had instituted to annul his marriage; and the cause was therefore dismissed. A suit on the part of the wife, for the restitution of her rights, was mentioned as probable.

Cambridge.—In January of last year, a gentleman named Hopwood, a graduate of St. Peter's College, was found nearly dead in a ditch near Chesterton, under circumstances which excited suspicion that he had not been fairly dealt with. He breathed and groaned when first

discovered, but died without uttering a word. An inquest was held upon his body, and, in the absence of evidence of foul play, a verdict of "Died by the visitation of God" was returned. It appears, however, that a young woman, now imprisoned in Cambridge jail for robbery, has made a confession that Mr. Hopwood was murdered for the sake of robbing him. The woman states that she was at Milton feast, in company with other women and two men, and that the latter, on their return, murdered a man, by smothering him in the snow in Cottingham-fields. The names of the parties implicated by this confession are at present withheld, for the purposes of justice.

Carmarthen.—The Welsh papers give an account of the origin of the disturbances that at present exist in Pembroke-shire and Carmarthenshire, and in which "Rebecca and her daughters" take so prominent a part. It appears that about seven years ago a turnpike-road was made between Pembroke and Carmarthen, with the view of securing a great thoroughfare by it between Ireland and London. The Liverpool railway has, however, frustrated the object by leaving but thirty-two miles of road from Carmarthen to Hobb's Point, or Milford, as a passage for the mail. Very little thoroughfare else exists along it, so that there is not sufficient money raised to pay the interest for the capital expended, much less to keep the road in repair. The trustees have put up toll-bars on the lanes and by-roads, and thrown the expense of the main road on the parishes, which appears to have excited the peasantry to the late acts of violence. Rebecca has already destroyed the St. Clear, Prendergate, and Pime toll-gates. She also boasts of having an auxiliary force of 500 men, at Haverfordwest. By order of Sir J. Graham, the Marines from Pembroke Dock-yard have been recalled, and the duty of pursuing the malcontents has devolved upon the Yeomanry, who in 1798 distinguished themselves under Earl Cawdor against the French troops at Fishguard. On Monday, at midnight, a mob of forty or fifty persons destroyed two turnpike-gates at Trevuchan, in Pembroke-shire, one leading to Tavernspite, the other to Lampeter, and entirely demolished the turnpike-house, which the gate-keeper had just left for the night. There is little doubt that these men were from the English part of Pembroke-shire, as they were heard to converse in English, not a word of Welsh being spoken by any of the party. It is said that some of the less educated people pretend to have Scripture warrant for their doings, quoting the 24th chapter of Genesis:—"And they blessed Rebekah, and said unto her, Thou shalt be the mother of hundreds of millions, and thy children shall possess the gates of them which hate them." This text, which is somewhat applicable to the situation of affairs near St. Clears, is expatiated upon by many itinerant preachers, and the multitude believe they have a warrant for their lawless doings.

Cheltenham.—About a fortnight since the Rev. Hugh Percy Rennett, of Evington Cottage, Coombe-hill, and perpetual curate of Naunton, in this county, was shot by his wife, Mrs. Anna Maria Rennett, and Montagu Clark, a lad about 17 years of age (a son of Mrs. Rennett by a former husband). It appeared from the evidence given before the magistrates, that Mr. Rennett and his wife had been married several years; and that the younger prisoner resided with them. In consequence of family disagreements, Mr. Rennett and his wife had been for some time separated, but still resided in the same house; Mr. Rennett occupying and taking his meals in one room, and the remainder of the family in the other parts of the house. On Thursday evening some dispute arose which attracted the attention of a policeman in the street, and on entering he found Mr. Rennett on the ground, bleeding profusely, the younger prisoner having shot him in his neck with a pistol. The bullet could not be extracted immediately, and the reverend gentleman is still in considerable danger. The magistrates committed both the wife and son to prison to take their trial for the offence, but their health has suffered so much since their committal, that it has been necessary to remove them to the hospital.

Coventry.—It is stated that a requisition has been presented to the Archdeacon of Coventry, requesting him to take measures for drawing up an address from the clergy of that Archdeaconry, condemnatory of Lord Ellenborough's proclamation respecting the gates of Somnauth, and that the signatures of all the masters of Rugby school are attached to the requisition.

Hereford.—On Saturday evening a fatal accident happened to the Aberystwith mail on its up-journey from Hereford to Cheltenham. The coach was leaving Hereford, the weather being very boisterous at the time, and when clearing the turnpike near the city, the wind caused the gate to rebound against the leaders, who immediately took fright and darted off at a rapid pace, and coming in contact with a donkey-cart, the poor woman who was driving was trampled under their feet and severely injured, and the donkey was killed. The coachman, in endeavouring to rein in his horses to avoid the catastrophe, lost his seat, and was precipitated on the road, and falling on his head, survived the injury but a few minutes. The guard and passengers jumped off the coach the moment the horses took fright, and escaped without injury.

Hull.—We lately noticed under this head the measures taken by the shipowners of Hull in reference to Captain Fitzroy's bill, requiring qualifications from masters and mates in the merchant-service. It is now stated in some of the provincial journals that Capt. Fitzroy has withdrawn his bill for the present, finding that the measure was not satisfactory to those whose interests would be chiefly affected by its operation.

Lancaster.—The local papers give the detailed particulars of the discovery of a murder perpetrated as far back as April, 1817, at Pendleton; when the house of a Mr.

Littlewood was entered and robbed, and Mrs. Marsden, the housekeeper, and a female servant, were murdered in open day. Five men were tried for the crime before Baron Richards, at the assizes of September, 1817, in this city, when four of them were convicted on circumstantial evidence, and executed. It now appears that on the 9th inst. an old man, aged 74, the uncle of one of the men who were hung, finding himself on the point of death, confessed to two women, whom he called to the bedside for the purpose, that he was the perpetrator of the murder, but did not commit the robbery. He died the day after he had made this confession.—A correspondent informs us that on Sunday last a flock of sheep, amounting to no less than 57, were stolen from the farm of Mr. Moffat, in the neighbourhood of Hornley, by an Irishman and a lad belonging to Lancaster. They drove the flock into the city and attempted to sell them in open day, but the price demanded was so small as to excite suspicions; both parties were accordingly apprehended, and after a long examination before the magistrates, were committed to take their trial at the assizes.

Leeds.—The adjournment of the coroner's inquest on the mutilated body of a female found a few weeks since in the river Aire navigation, has led to no other evidence at all bearing on the case, beyond some of a negative character, proving that the body found is not that of either of two young women who were missing from the West Riding of Yorkshire. A verdict of "Wilful Murder against some person or persons unknown" has been returned by the coroner's jury.

Liverpool.—At the annual meeting of the Liverpool Insurance Company, held last week, the chairman stated that the loss which the company had sustained by the recent conflagrations in the town had been confined almost entirely to the mercantile districts of Liverpool. They had been driven to a painful experience, like all other companies, that the mercantile premiums formerly charged were totally inadequate to protect them from the risk which they ran, and, though they regretted to place the commerce of the port under additional burdens, they had been compelled in their own protection to increase the premiums upon insurance. The report showed that the loss during the year had been 46,528*l*.

Manchester.—The Quarterly Table of Mortality just issued by the Registrar General, shows that the mortality in Manchester and its suburbs during the past year was 10,555 in a population of 356,373 souls. The mortality in the spring quarter was 2,312; in the summer quarter, 2,816; in the autumn quarter, 2,744; in the winter quarter, 2,683. The average of the four autumn quarters from 1838 to 1841 was 2,718. It is remarkable that of the four quarters of 1842, taking 113 districts of England and Wales, including nearly all the large towns, but excluding the metropolis, the mortality is largest in the winter quarter (32,083); next in the summer quarter (28,050); then in the autumn quarter, the spring quarter showing the lowest mortality; while in Manchester, as will be seen above, this order is not observed; the summer quarter showing the largest mortality, surpassing the winter by 183 deaths; and even the autumnal quarter exceeds the winter quarter by 61 deaths.—The local papers mention that the applicants in the Manchester workhouse are 746 weekly more than at this season last year, and that many of the mills are again stopping.—In consequence of a contradiction given by Mr. M. Philips to a statement made by Mr. Ferrand in the House of Commons on the night of the 13th inst., respecting certain cruelties to which unprotected females were said to be subjected in the mills of Mr. Greg, near Wilmslow, a special general meeting of the Lancashire Central Short-time Committee was held in this town on Wednesday, in order to corroborate Mr. Ferrand's statement. The meeting resolved unanimously that they "are prepared to prove that Mr. Ferrand's statement gives but a very faint idea of the hardships to which those females were subjected; and that the contradiction which Mr. Mark Philips was instructed to make to Mr. Ferrand's charges is characterised by equivocation and a total disregard to truth. That the thanks of this committee be given to Mr. Ferrand for his praiseworthy and fearful exposure of the cruelties practised by the manufacturers generally on the defenceless children committed to their care."

Sheffield.—The second meeting of creditors under the fiat of bankruptcy issued against Messrs. Parker, Shore, and Co., the bankers, was held on Friday. The meeting was for the proof of debts and for the choice of assignees. The amount of debts proved during the day, including those proved on the 16th inst., was 185,352*l* 17*s*., being about one-third of the whole to be proved against the bankrupts. The trade assignees were then appointed, all of whom were residents in Sheffield.

Shrewsbury.—The local papers state that at one of the recent audits of Sir E. Blount, Bart., of Mawley Hall, in this county, several of the tenants were contesting as to which of their families could boast of having rented for the longest period on the estate, when a farmer named Allen satisfactorily proved that himself and ancestors had either been in the employ or rented under the Blount family for a period of nearly 780 years!—that, in fact, his ancestors had immigrated from Normandy with that family at the time of the Conquest, and from father to son each succeeding generation had been retained on the estate.

Stourbridge.—The Worcester papers state that the distress at Stourbridge has become so alarming, that numbers are subsisting on turnips alone. From one field as many as from five to six tons a week have been taken for several weeks past; and the owner does not think it expedient to attempt to put a stop to the speculation.

Railways.—The following are the returns for the past week:—Northern and Eastern, 1,019*l*; Greenwich, 614*l*;

Eastern Counties, 790*l*; Croydon, 191*l*; Liverpool and Manchester, 3,456*l*; Brighton, 2,394*l*; Grand Junction, 5,889*l*; York and North Midland, 1,394*l*; Blackwall, 513*l*; Great North of England, 1,350*l*; Sheffield and Manchester, 2,667*l*; Manchester and Leeds, 3,498*l*; Glasgow, Paisley, Kilmarnock, and Ayr, 793*l*; Midland Counties, 2,197*l*; Edinburgh and Glasgow, 1,437*l*; Birmingham and Gloucester, 1,447*l*; Birmingham and Derby, 1,027*l*; North Midland, 3,527*l*; South-Western, 4,083*l*; Great Western, 10,188*l*; London and Birmingham, 13,071*l*; South-Eastern, 1,343*l*.—The Birmingham and Gloucester Company held their half-yearly meeting on Wednesday. The total receipts for the half-year had been 50,310*l*., and the charges, 41,694*l*. The surplus, added to the balance in June, formed a sum of 12,963*l*., from which a dividend of 25*s*. per share was ordered to be paid. This would leave 1,245*l*. to be carried over to the next half-year's account. No general discussion was raised at the meeting, a committee of inquiry having been instituted into the general management of the undertaking.—A special meeting of the Cheltenham and Great Western Company was held at Cirencester last week, in reference to an arrangement with the Great Western Company for completing the line from Cirencester to Gloucester, and then leasing or selling the whole line from Swindon on specified terms. After some discussion, a resolution authorizing the directors to treat with the Great Western Company for a sale on the basis of the Great Western Company's proposal, was unanimously carried.—The report of the Directors of the Hull and Selby Railway Company states the receipts of the half-year to have been 28,894*l*., and the expenses of working the line 13,689*l*., showing a profit of 15,205*l*. From this, however, has to be deducted 5,074*l*. interest on loans, 227*l*. income-tax, and 725*l*., the price of a new engine; leaving a balance of 9,179*l*. available for a dividend, which it is proposed shall be 1*l*. per share; after paying which upon 8,000 shares, there will remain 1,179*l*. applicable to the future purposes of the Company. The report mentions that the sum taken in the last six months exceeds that for any former half-year.—On Monday last, the half-yearly meeting of the Newcastle and Darlington Company, by which another important link will be added to the chain of Railway communication between England and Scotland, was held at York. The report stated that the whole of the works on two portions of the line, one extending from the Durham Junction Railway to Shincliffe, including the branch to the city of Durham, and the other from Darlington to Brafferton, comprising together rather more than twelve miles in length, have been let at prices below the engineer's estimates; and the chairman stated his opinion, that the line will be opened throughout from Darlington to Newcastle, by which an uninterrupted Railway communication between London and Carlisle will be accomplished in July, 1844.—At the York and North Midland Meeting, a dividend of 2*l*. 10*s*. on the original shares, and a dividend of 20*s*. on the half-shares, were declared, leaving a surplus, after the payment of all expenses, of 2,669*l*. to be carried to the guarantee fund, now amounting to 6,672*l*. The traffic for the half-year had amounted to 46,385*l*. 11*s*. 11*d*.—The half-yearly meeting of the Great North of England Company was held at Darlington on Tuesday. The balance of profit in the half-year, after deducting the usual amount for the reserve fund and Income-tax, amounted to 8,538*l*., from which it was recommended that a dividend of 1*l*. 5*s*. per share should be made. A more economical system of expenditure had been introduced, whereby the charge for repair of way for the past six months was reduced to 4,207*l*.; and, as the last quarter showed 700*l*. less than the preceding, it was expected that a further reduction would be effected in the ensuing half-year. The number of passengers conveyed by the rail last half-year was 80,738. It was recommended that about 2,000*l*. should be laid out in the erection of cottages on the banks of the line for the convenience of the labourers employed on it; as, while the rent would return the Company about 7 per cent. on the outlay, and enhance the price of the land, these dwellings would conduce much to the comfort of the men, and add greatly to the security of passengers, in case of obstruction on the line, or delay of the trains.

IRELAND.

Dublin.—Meetings are still in progress to petition for the total repeal or modification of the present Poor-law. The Guardians of the Tuam Union have resolved to adjourn for a month, and suspend the ordinary business, pending a motion of the Marquess of Clanricarde in the House of Lords, on the subject of the Poor-law. Meantime, great difficulty exists in collecting the rate in most places. In the county and city of Waterford and in Kilkenny scarcely anything can be collected. At the petty sessions of Carrickfergus, on Thursday week, a considerable number of persons, chiefly poor cottagers, were summoned for non-payment of the rate, in several cases amounting only to 5*d*. "These people," the *Northern Whig* remarks, "are paupers, and fitter objects themselves to be relieved from the poor-rate, than to relieve others." The Assizes in the different circuits have commenced this week, and it is said that petitions against the Poor-law will be brought forward at all the grand juries.—The Repeal Association met, as usual, on Monday, when Mr. Ray read a letter from New York, inclosing 4*l*. 16*s*., and another communication from Judge James, of Boston, containing a bill of exchange for 50*l*., being the subscriptions of "The Boston Association of the Friends of Ireland." The next document read was an address from the Repealers of Halifax, Nova Scotia, dated Feb. 3, accompanied by a remittance of 80*l*. Mr. O'Connell addressed this meeting at great length, and explained his reasons for ab-

DIED.—On the 18th inst., in Castle street, Leicester square, M. Tauli Pouches, aged 108.—On the 18th inst., at her house, 23, Grosvenor place, the Right Hon. Lady Louisa Hughes, wife of T. Hughes, Esq., and sister of the Grace the Duke of St. Albans.—On the 21st inst., at No. 1, Adelaide square, Cumberland, Mrs. Binney, wife of the Rev. T. Binney, Esq., Queen's Counsel, aged his chambers, Lincoln's Inn, Sutton Sharpe, Esq., Queen's Counsel, aged 45.—On Tuesday last, at his house, in Duke street, Westminster, aged 48, R. Alexander, Esq., M.P., and one of the Benchers of Lincoln's Inn, and the senior Queen's Counsel on the Northern Circuit.

 John Bull . . . 45,000 Watchman . . . 51,500

In professing a desire to maintain the union of Church and
 State, we exclude all principles and views hostile to the Estab-
 lished Institutions of the Empire. We have no sympathy either
 with the Adversaries of the Reformation, or with the Champions
 of the Reformation in opposition to Primitive Truth. We war
 against all doctrines, the tendencies whereof are on the one hand
 to Popery, and on the other hand to Dissent and Sectarianism.
 We support the State as the Nursing Parent of the Church—and
 the Church as the Guide and Counsellor of the State. We believe
 that the Empire has prospered, under Divine Providence, in pro-
 portion as Church and State have understood and fulfilled these
 their respective functions—in proportion as they have appreciated
 the design of their union—in proportion as each has strengthened
 each—and especially in proportion as the State has become reli-
 gious. Believing, moreover, that the vast majority of the reflect-
 ing, the educated, and the pious people of this country, concur
 in these views, of which we do not perceive in the Public Press
 any adequate Representative, we have entered the field and estab-
 lished our Newspaper.

We challenge no opposition and profess no rivalry, but simply
 desire to supply a defect through which false views have obtained
 an unsuspected and unwarrantable currency. Had we doubted
 of the expediency of the course we have adopted, the violence of
 Party spirit, at the present moment, and the lamentable misap-
 prehensions to which that violence has given rise on most solemn
 and important topics, left us no alternative, and justified our
 decision.

Truth, like air, is useful only in circulation. To circulate
 truth has been and is our one object—to be useful will be our
 reward. Cautiously, therefore, we avoid each extreme of Party,
 and fearlessly address ourselves to the correction of every error.
 We expect as much the disfavour of all violent partisans, as the
 countenance of moderate men and sound thinkers.

We rely for support not only upon the Nobility and Gentry,
 who, from high birth and station, may be considered hereditary
 patrons of Church and State principles, but also upon the
 thoughtful Middle Classes, who, in the gradual formation of right
 convictions, require both a guide and an interpreter. It is
 scarcely necessary to say, that in politics we are CONSERVATIVE;
 as willing to improve as we are unwilling to impair—reverencing
 the hoarded wisdom and rich experience of the past, as the best
 guides in principle for the conduct of the details both of the present
 and the future.

It becomes us not to speak of the talent and abilities with
 which our Publication is supported. The public, indeed, have a
 right to require at our hands, industry, thoughtfulness, and can-
 dour—a holy and reverent love for all things sacred and venerable
 —an unswerving maintenance of all things true—an impartial
 judgment upon all things doubtful. Without these, talent is mis-
 chievous, and our object would be unattainable.

The GAZETTE contains Original Articles on Matters affecting
 the Church, and on the Leading Topics of the Day—on Dissent-
 ing Tactics—Foreign and Home Correspondence—a Weekly
 Resume of Foreign News—Original Reviews of Books of Interest
 —Ecclesiastical and University Intelligence, and all the news
 interesting to the Clergy and Laity of the Church—the Proceed-
 ings of Charitable and Religious Societies—Naval and Military
 Intelligence—Court and Fashion—Finances, Markets, and Funds
 —and a Miscellaneous Department replete with the most inter-
 esting facts of each week.

SCALE FOR ADVERTISEMENTS.

Advertisers are respectfully informed that a further reduction
 has been made in the Scale of Prices for Advertisements, viz.:—
 Seven lines and under £0 5 0 Half a Column . . . £1 7 0
 Per line after . . . 0 0 6 Column . . . 2 10 0
 Quarter of a Column 0 15 0 Page . . . 6 10 0

(A line to average ten words.)

Advertisements received until 12 o'clock on Friday morning, at
 the Publishing Office, 342, Strand. Annual Subscription, 22s. (if
 paid in advance, 20s.), may be transmitted by Post-office Orders,
 payable to Mr. WILLIAM EDWARD PAINTER, 342, Strand; where
 all communications for the Editor, and Advertisements, will be
 received.

TO AGRICULTURISTS.

Now ready,
 1. ON GUANO AS A FERTILIZER. By C. W. JOHNSON,
 Esq. Price 1s. 6d. 2. ON FERTILIZERS IN GENERAL.
 By C. W. JOHNSON, Esq. 1 vol. 8vo, Price 12s. 3. THE COT-
 TAGE FARMER'S ASSISTANT. By C. W. JOHNSON, Esq.
 Price 1s. 4. THE FARMER'S ALMANAC for 1841-2-3, by
 JOHNSON and SHAW, are still on sale. Price 1s. each. In the
 Press, 5. AGRICULTURAL CHEMISTRY. By C. W. JOHNSON,
 Esq. Price 1s. 6. MORTON ON THE NATURE AND PRO-
 PERTY OF SOILS. Third Edition, 7s.
 JAMES RIDGWAY, Piccadilly, and all Booksellers.

Just published, Fifth Edition, enlarged, 5s. 6d., boards.
ON NERVOUS DISEASES, Liver and Stomach
 Complaints, Low Spirits, Indigestion, and Gout; also, on
 Disorders produced by Tropical Climates, with Cases. By Geo.
 ROBERT ROWE, M.D., F.R.S., Member of the Royal College of
 Physicians, and of the Royal College of Surgeons, London, &c.
 "This is a clever as well as useful work, and should certainly
 be read by all martyrs to indigestion and other ills which flesh is
 heir to, as they may derive many useful, not to say invaluable
 hints."—*The Times*.
 London: JOHN CHURCHILL, Princes-street, Soho.

MODERN WORKS on NATURAL HISTORY, GARDENING, and BOTANY.

In small 8vo, price 7s. 6d. cloth lettered, and 10s. 6d. with
 coloured plates,

THE FLOWER-GARDEN;

Its cultivation and general arrangement, with Select Lists of the
 most desirable Annual, Biennial, and Perennial Flowering Plants,
 arranged according to their height, colour, and time of flowering.

Uniform with the above, price 6s. 6d. cloth lettered, and 10s. 6d.
 with coloured plates,

THE ORCHARD AND FRUIT-GARDEN;

Including the Management of all Wall, Standard, and Espalier
 Fruit-trees, and the Forcing-pit; with Select Lists of the most
 choice varieties, and their synonyms. By CHARLES M'INTOSH,
 F.C.H.S.

Also uniform with the above, price 6s. 6d. cloth lettered, and
 10s. 6d. with coloured plates,

THE GREENHOUSE, HOTHOUSE, AND STOVE;
 Including Directions for the Cultivation and Management of
 Exotic Flowering Plants, the erection and management of Green-
 houses and Conservatories, and the most approved mode of
 warming and ventilating, with Lists of the most choice species.
 By CHARLES M'INTOSH, F.C.H.S.

THE NATURAL HISTORY AND ANTIQUITIES OF SELBORNE.

By the Rev. GILBERT WHITE, A.M.
 A new edition, carefully revised, with Notes, by EDWARD BLYTH.
 A Map of the Locality, beautifully engraved on Steel, and
 copiously illustrated with highly-finished Engravings on Wood,
 and an interesting account of the state of Selborne in the sum-
 mer of 1836, by Mr. MUDIE.

In 9 vols., super-royal 8vo, price in Sets reduced to 12l., half-
 bound morocco,

PAXTON'S MAGAZINE OF BOTANY,

AND REGISTER OF FLOWERING PLANTS.
 Each Volume contains 48 Plates, beautifully coloured from
 Nature. The text comprises Botanical Descriptions of the Plants
 figured; the time of their Introduction; the best Mode of Cul-
 ture; and every other particular essential to their perfect
 growth. Every beautiful plant newly introduced worthy of
 notice and general cultivation, is described, and, if of sufficient
 importance, accurately figured.

In one thick vol., royal 8vo, price 18s. cloth lettered, and illus-
 trated with 27 etchings on Steel, by Mr. T. Landseer, 24s.,

CUVIER'S ANIMAL KINGDOM,

ARRANGED ACCORDING TO ITS ORGANISATION.
 By the late BARON CUVIER, Member of the French Academy, and
 of the Royal Societies of London, Berlin, Petersburg, &c. &c.
 Translated from the last French edition, and brought down to
 the present state of knowledge.
 The Mammalia, Birds, and Reptiles; by Mr. Edward Blyth. The
 Fishes; by Mr. Robert Mudie. The Mollusca; by George
 Johnston, Esq., M.D. The Crustacea and Insects; by J. O.
 Westwood, Esq., F.L.S.

Just published, price 4s. each, sewed in paper covers; or 9s.
 bound together in cloth boards,

VEGETABLE PHYSIOLOGY AND BOTANY; BEING THE FIRST VOLUME OF THE

POPULAR CYCLOPEDIA OF NATURAL SCIENCE.
 By W. B. CARPENTER, M.D.,
 Author of "Principles of General and Comparative Physiology,"
 and "Principles of Human Physiology."

In small 8vo, price 2s. cloth, gilt edges,
EVERY LADY HER OWN FLOWER-GARDENER.

By LOUISA JOHNSON.
 Third Edition, containing a Chapter on Window Gardening, by Mr.
 M'INTOSH, and Instructions in the use of Domestic Greenhouses.

Uniform with the above, price 2s. cloth boards, HINTS ON LANDSCAPE GARDENING, AND LAYING-OUT GROUNDS.

By JAMES MAIN, A.L.S., Author of "Popular Botany," &c.

Also in small 8vo, price 2s. cloth, gilt edges, ON THE CULTURE OF THE VINE IN POTS AND ON THE COILING SYSTEM.

By J. MEARNS, F.H.S., Curator of the Botanic Garden, Leeds.

Just ready, in small 8vo, price 5s. 6d., cloth, lettered, a new edi-
 tion, with Six coloured Illustrations,

THE ENTOMOLOGIST'S TEXT-BOOK.

An Introduction to the NATURAL HISTORY, STRUCTURE, PHY-
 SIOLOGY, and Classification of INSECTS, including the CRUSTACEA
 and ARACHNIDA. By J. O. WESTWOOD, Esq., F.L.S.

In 3 vols. 8vo, price 14. 16s. Illustrated by numerous Engravings.

A HISTORY OF BRITISH LAND BIRDS. INDIGENOUS AND MIGRATORY: INCLUDING THEIR OR- GANISATION, HABITS, AND RELATIONS; REMARKS ON CLASSIFICATION AND NOMENCLATURE.

By WILLIAM MACGILLIVRAY, A.M.
 Member of the Wernerian Natural History Society of Edinburgh;
 of the Natural History Society of Philadelphia, of the Lyceum
 of New York; of the Literary and Philosophical Society of South
 Carolina; and Professor of Natural History, Marischal College,
 Aberdeen.

In four volumes, fcap. 8vo, price 20s.,
MAN MORALLY and PHYSICALLY CONSIDERED.

By the late ROBERT MUDIE.
 The Volumes treat respectively of—
 PHYSICAL MAN, or the Powers of Observation and Action.
 INTELLECTUAL MAN, or the Reasoning Powers, with
 their Uses.
 MORAL MAN, or the Desires and Motives as affecting Conduct.
 SOCIAL MAN, or the Duties of Man to Society.

London: WM. S. ORR & Co., Paternoster-row.

This Day is published, price Four Shillings,
MECHANICAL PHILOSOPHY, and its Application to the Arts,
 Being the Third Part of

THE POPULAR CYCLOPEDIA OF NATURAL SCIENCE.

By Dr. W. B. CARPENTER, Author of
 "Principles of General and Comparative Physiology."
 The object of the present undertaking is to produce a con-
 nected Series of Treatises, embracing the whole circle of Natural
 Science, embodying the PRINCIPLES of the Science, with the
 FACTS of most striking interest, so as to furnish the reader with
 entertainment as well as instruction. With this view, each
 Treatise will be complete in itself, and executed by one Writer,
 but so arranged as to form parts of one general plan.

The Publishers announce, with confidence, that the execution
 of these Treatises has been confided to Dr. Carpenter, a gentle-
 man whose position in the scientific world, united with an ardent
 zeal for the dissemination of knowledge, affords the best
 guarantee that the Work will be completed in a manner worthy
 of its importance.

The Treatises on VEGETABLE PHYSIOLOGY and BOTANY, already
 published, will be the best indication of the style in which the
 whole will be written.

It is intended that the following Volumes shall be produced
 during the present year, viz.,—

Part III.—MECHANICAL PHILOSOPHY and its APPLICATION
 to the Arts, on February 28.

Part IV.—ASTRONOMY, on April 30th.

Part V.—ANIMAL PHYSIOLOGY, July 30th.

Part VI.—ANIMAL PHYSIOLOGY, September 30th.

Part VII.—HYDROSTATICS, December 30th.

W. S. ORR & Co., London; W. & R. CHAMBERS, Edinburgh;
 and W. CURRY, Jun. & Co., Dublin.

ECCLESIASTICAL ARCHITECTURE.

Just published, in 8vo, cloth lettered, price 9s.,
THE PRESENT STATE of ECCLESIASTICAL
ARCHITECTURE in ENGLAND; with 36 Illustrations. By
 A. WELBY PUGIN, Architect. Republished from the "Dublin
 Review."—London: CHARLES DOLMAN, 61, New Bond-street.

Lately published, illustrated by several Plates, price 3s.

THE HISTORY and MANAGEMENT of BEES, with Notices of a New Hive, on the Polish plan, invented by the Author, JOHN WIGHTON, Gardener to Lord Stafford.

"We strongly recommend this book to all who keep bees,
 more especially to gentlemen's gardeners."—*London's Gard. Mag.*
 "A Treatise on the subject, apparently the result of experience
 and careful observations, cannot be without its interest."—*The
 Editor of the Gardeners' Chronicle*.

London: LONGMAN & Co., Paternoster-row. Norwich: BACON
 & Co. May be had through any Bookseller.

SCREENS for PROTECTING TREES in Blossom,

and Fruit from Injuries by Wasps and Flies, and for Shading
 Hothouses and Conservatories, Pines and Melons, Tulips-beds, &c.
 —N. HULME, Paradise Green, Knutsford, Cheshire, manufac-
 tures the following articles: Canvas Netting, of three different
 textures, at 5d., of a stronger quality, at 7d., and of Yarn
 doubled, at 8d. per square yard. Woollen Netting, of different
 sorts, at 5d., 7d., and 10d. per square yard. The above articles
 are made from one to four yards in width, as may suit the pur-
 chasers. N. H. has for many years had the honour to supply
 the Nobility, Gentry, and others, in various parts of the King-
 dom, with the above articles, and has had the happiness to give
 general satisfaction. N.B.—Patterns, with the prices annexed,
 sent (if desired) to any persons wishing to become purchasers.

STONE-COLOURED CEMENT.—FELIX AUSTIN, of

the New Road, Regent's Park, begs to inform Architects,
 Builders, Plasterers, &c., that during the process of manufactur-
 ing a very superior Composition, which has greatly improved
 his well-known artificial stone ornaments, he has succeeded in
 making an excellent STONE-COLOURED CEMENT adapted to
 all building purposes, which he can supply at 2s. 6d. per bushel,
 at his Manufactory, near the Thames Tunnel, Rotherhithe. It is
 particularly suited for repairing decayed stonework.

SHIRLEY VINEYARD, near Southampton.—The

Proprietor of this Establishment respectfully announces
 that he has now made sufficient progress in it to enable him to
 commence, forthwith, a series of experiments of a most impor-
 tant character, and on an extensive scale, relative to the Culture
 of the Vine under Glass; the object of which will be to free
 that interesting and valuable branch of Horticulture from the
 difficulties and uncertainty which have hitherto surrounded it,
 and to place it on such a basis, as to ensure the production of
 very superior fruit, with ease, certainty, and economy.

In the prosecution of this design, and in that of cultivating the
 Vine on open walls; and also in the propagation of Vine Plants
 in the nursery department of the Vineyard, he is desirous of
 having associated with him a few respectable Youths, as Articled
 Pupils, who, in addition to being taught the most improved mode
 of Vine Culture in all its various branches, and (as necessarily
 involved in it) the Theory and Practice of all the grand Principles
 on which the delightful Science of Horticulture is based, will
 also enjoy a great number of valuable EDUCATIONAL ADVAN-
 TAGES, of a sterling practical character, and such as, in com-
 bination with the above, will enable them, with industrial ap-
 plication, to occupy, at the expiration of their pupillage, a superior
 and independent rank in society.

To Parents who are desirous of providing for their Sons the
 knowledge of a superior and profitable pursuit, in preference to
 their becoming dependent on the precarious issue of mercantile
 or trading occupations, the opportunity thus offered may be con-
 sidered as highly deserving of their attention.

As the Pupils will be considered as members of the family, and
 treated in every respect in the most liberal manner, a suitable
 Premium will be required.

Applications, personally or by letter, may be made to Mr.
 CLEMENT HOARE, at the Vineyard.

It is intended to limit the number of Pupils for the present to
 four, and Mr. H. will be ready to receive them in the ensuing
 month of March. February 8, 1843.

CAUTION.—Several Perfumers of apparent Respect-

ability, for the sake of gaining a trifle more profit, basely at-
 tempt to impose their pernicious compounds upon the public as the
 real "MACASSAR OIL" for the Hair, and "KALYDOR" for the
 Complexion. They copy the bills and labels of the original arti-
 cles, substituting either a fictitious name, or the word "GENUINE"
 in the place of "ROWLAND'S." To frustrate such imposition,
 it is necessary, on purchasing either article, to see that the word
 ROWLAND'S is on the wrapper, as follows, without which none
 are genuine. ROWLAND'S MACASSAR OIL, for the growth, and for
 Beautifying the Human Hair. Price 3s. 6d., 7s., or Family Bottles
 (containing four small) 10s. 6d.; and double that size, 21s. per
 bottle. ROWLAND'S KALYDOR, for the Skin and Complexion.
 Price 4s. 6d. and 8s. 6d. per bottle. A. ROWLAND AND SON,
 20, HATTON GARDEN, LONDON, is written in red on the
 wrappers of the MACASSAR OIL and KALYDOR, and engraven on
 the Government Stamp affixed on the Kalydor. Be sure to ask for
 "ROWLAND'S" Articles, Sold by them and by respectable Chemists
 and Perfumers.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in
 the Precinct of Whitefriars, in the City of London, and Published by them at
 the Office, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex,
 where all Advertisements and Communications are to be addressed to the
 Editor.—Saturday, February 26, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 9—1843.

SATURDAY, MARCH 4.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Affghanistan, vegetation of	116 c	Lawns, to improve	121 a
Amateur's Garden	116 b	Manures, animal and vegetable,	115 a
Ammonia, to fix with salt	115 c	their application	115 a
to fix with gypsum	117 a	— economical	117 b

noticed	119 c	Seaweed, as green manure	116 a
Fig, best forcing kind	121 b	Shoals, to embank	115 a
Filberts, to preserve	119 a	Slugs, to destroy	118 a
Fungi, as green manure	116 a	Spain, Dr. Dainton's journey to,	119 b
Garden produce, query respecting	117 b	announced	119 b
Gesnera zebrina, its treatment	121 b	Strawberries, nitrate of soda for	121 b
Gooseberry, best flavoured	121 b	Tropaeolum tuberosum, to flower	121 a
Grafting, clay recommended for	121 b	Varnish for cotton Frames	118 a
Grass-seeds, to sow barley with	121 c	Vines, in a greenhouse, to train	121 a
Guards, for protecting trees	121 c	— flowers of, destroyed with-	121 a
Hay, musty, not injurious to	118 a	out the leaves being affected	121 a
cattle	118 a	— their treatment	120 a
Ice-plant, its treatment	121 b	Ward's cases, to transmit plants in	121 c
Ilex Paraguensis	118 c		
Land, heavy, to improve	121 a		

BRAGG'S "ANTAGONIST," the successful White DAHLIA, and pronounced to be decidedly "first-rate," will be let out to the Trade only. Plants 10s. 6d., with the usual allowance. The following are the names of the Nurserymen who have already ordered, and who will be able to retail plants in May next:—

Messrs.—	Messrs.—
Brown, Slough	Little and Ballantyne, Carlisle
Mitchell, Pittdown	Gaines, Battersea
Stein, Highgate	Paul, Cheshunt
Lodge, Broughton	Lealy, Bristol
Harrison, York	Spary, Hungerford
Whale, Elcot	Knight, St. Leonard's-on-Sea
Salter, Versailles	Bunney, Covent Garden
Appleby, York	Lockhart, 156, Cheapside
Girling, Stowmarket	Carter, 238, High Holborn
Earl, Birmingham	Chariwood, Covent Garden
Smith, F. and A., Hackney	Lawson and Son, Edinburgh
Miell, Lillie	Harrison, Downham
King, Iver	Scott, Brothers, Belfast
Edwards, York	Saunders, Jersey
Mayle, Leamington	Brown and Attwell, Uxbridge
Union, Paddington	Cooper, Croydon
Soden, Woodstock	Schofield, Rudsthorpe
Small, Colbrook	Barrett, Wakefield
Heale, Devizes and Caine	Ashworth, Bury
Vitch, Exeter	Marnock and Manley, Hackney
Drummond, Bath	Henderson and Son, Brechin
Warner and Warner, 28, Corn-	N.B.
hill	Horwood, Bicester
Cook, Longwick	Backhouse, York
Foster, Strand	Henbrey, Croydon
Rendle, Plymouth	Dickenson, Guildford
White, Poole	Major, Rudsthorpe
Alexander, Kingsland	Cameron, Uckfield
Kernan, Covent Garden	Protheroe and Morris, Leyton-
Gregory, Cirencester	stone
Nutting, Cheapside	Rogers and Son, Uttroter
Cormack and Oliver, New-cross	Ingram, Southampton
and Covent Garden	Daniels, Hull
Stewart, Salt-hill	Millman, Calcut
Holland, Middleton	Langley, Mirfield
Handasyde, Musselburgh	Newton, Newcastle
Low, Clapton	Widnall, Granchester
Maule, Bristol	Smith, Bath

Nurserymen who have not ordered Plants will have their names added to this list as soon as received.—Slough, Feb. 16.

PELARGONIUMS, AURICULAS, CARNATIONS, PICOTEEES, and SELECT PLANTS.

H. GROOM, Clapham-Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Public, that his Catalogue of new and fine PELARGONIUMS, &c., is ready, and may be had on application.

CARNATIONS, PICOTEEES, &c.
JOHN HOLLAND, Florist, Market-place, Middle- ton, near Manchester, Lancashire, begs to call the attention of his Friends and the Floricultural Public, to his superb Collection of CARNATIONS, PICOTEEES, &c., consisting of the finest sorts in Cultivation; and that he can still supply first-rate varieties, including a few pairs of that superb rose-flake, 'Somes' Marchioness of Westminster, &c. &c. Amateurs, Florists, &c., purchasing, would find it an advantage to possess his Catalogue, which will be forwarded on application.

J. H. having also a very large stock of the common show varieties, begs to call the attention of Nurserymen, &c. &c., who will be supplied on very liberal terms.

N.B.—A large Collection of Auriculas, Polyanthus, &c. &c.—Market-place, Middleton, March 2, 1843.

N. GAINES, Florist, Surrey-Lane, BATTERSEA, begs to inform the Nobility, Gentry, and others, that his STOCK of PELARGONIUMS now ready for sending out are strong healthy plants. The following are a few of his Seedlings, which have been proved, and can be recommended, viz.:—

Gaines's Duchess of Suther-	Gaines's Lady Duncannon
land	42s
" Pride of Surrey	63s
" Orange Perfection	63s
" Amulet	63s
" Lady Sale	42s
" Emperor Superb	42s

DAHLIAS.	
Gaines's Lord Prudhoe—dark crimson	10s 6d
" Lady Prudhoe—blush white	7 6
" Lady Duncannon—blush, shaded with lilac	10 6
" Lady of the Lake—Peach blossom	10 6
" Venus—clear white	10 6
" Surpassing Primrose—fine large primrose	7 6
" Elegans—rosy purple	10 6
" Golden Yellow—bright yellow	7 6

Catalogues of Pelargoniums, Dahlias, Pansies, Calceolarias, Verbenas, Fuchsias, &c., may be obtained by applying as above.

Feb. 2, 1843.

LIVERPOOL BOTANICAL INSTITUTION.—

EXHIBITIONS at the GARDEN for the year 1843.—The Exhibitions will take place on Friday, May 5, Friday, June 23, and Friday, September 8, when the following Prizes will be awarded at each Meeting.

Letters for Exhibition.	CLASS I.	No. of Plants to be exhibited.	Amount of Prizes.		
			First.	Second.	Third.
A	Greenhouse Azaleas in collections, not more than 2 plants of a sort	6	15	10	0
B	Cape Heaths, in collections of 6 species	6	25	0	0
C	Exotic Orchidaceae, 3 specimens	3	40	0	0
D	Pelargoniums in pots, in collections of 10 varieties	10	60	0	0
E	Pelargoniums in pots, ditto of 6 varieties	6	30	0	0
F	Garden Roses, including Moss, Provence, &c., 12 bunches of 3 blooms each, and not less than 12 varieties	36	10	7	6
G	Chinese Roses, or Chinese Hybrids, such as the Noisettes, Bourbon, &c.; 12 bunches of 3 blooms each, 12 varieties	36	10	7	6
H	Fuchsias, in 6 distinct varieties	9	20	0	0
I	Stove or Greenhouse Plants, in miscellaneous collections	6	60	0	0
K	Stove or Greenhouse Plants, ditto	4	30	0	0
L	Stove or Greenhouse Plant, best ornamental single specimen	1	25	0	0
M	Forced Hardy Plants in pots; as Roses, Rhododendrons, Azaleas, Verbenas, &c. &c.	12	30	0	0
N	Herbaceous Calceolarias, in 6 varieties, in pots	6	10	7	6
O	Shrubby Calceolarias, ditto	6	10	7	6
P	Carnations and Picotees, in pans, all distinct	18	12	0	15
R	Pinks, ditto ditto	18	12	0	7
S	Dahlias, ditto ditto	24	12	30	0
T	Tulips, ditto ditto	24	12	30	0
V	Pansies, ditto ditto	24	12	0	5
W	Cut Flowers, in ornamental groups or baskets	—	15	0	0
X	Miscellaneous Flowers in pots, set in boxes, baskets, or stands; including Auriculas, Ranunculuses, Hyacinths, the newest varieties of tender annuals, &c. &c.	12	12	10	7
Total			50		

Letters for Exhibition.	CLASS II.	Amount of Prizes.	First.	Second.	Third.
AA	Grapes, the best dish	20	15	0	0
BB	Pines, the best	20	10	0	0
CC	Melons, the best	12	6	7	6
DD	Peaches, the best dish of 8 specimens	15	0	7	6
EE	Nectarines, the best dish of 8 specimens	15	0	7	6
FF	Miscellaneous collections of Fruit, consisting of at least 6 different kinds of Hothouse or Wall-fruit, in dishes	60	0	40	0
GG	Miscellaneous collections of other Fruits, consisting of at least 6 diff. kinds, in dishes	20	0	10	0
HH	Miscellaneous collections of Frame or Early Vegetables, including Cucumbers, Rhubarb, French Beans, Lettuces, &c., to be exhibited at the May Meeting only, in Baskets.	20	0	10	0
Total		16	0		
EXTRAS at discretion of the Judges		4	0		
Grand Total to be contended for		70	0		

Exhibitors will be required to sign a declaration that all Plants exhibited have been in their possession Two Months, also, that all Flowers, Fruits, and Vegetables exhibited, are of their own growth and production; and if such declaration cannot or shall not be duly signed, the Premiums awarded will be withheld; and all Fruit must be set out in dishes with leaves, the same as if served up for Desert.

In order to facilitate the regulations as far as possible, in cases of specimens brought from a distance, arrangements will be made to receive all such as shall be brought during the afternoon of the previous day, into one of the greenhouses of the Institution, which will be cleared for the purpose.

A printed copy of the regulations (which resemble as closely as local and other circumstances will permit those of the Horticultural Society of London) may be had by application to Mr. SHEPHERD, the Curator at the Garden; or, to

JOSEPH DICKINSON, M.D., Hon. Secretary.

24, Great George-square, Liverpool. Jan. 27, 1843.

FLOWER-SEEDS; 36 packets, 10s.; 18 do., 5s., forwarded postage-free to any part. Apply to Mr. BROWN, Curator, Botanic Garden, Colchester. Any preferred species may be specified in the order. A mixed selection, containing 30 varieties, for sowing indiscriminately on Borders, 5s. Pelargonium, Petunia, and Heliotropium, 1s. per packet.—P.S. Remit a Post-office order or Stamps.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, Nurseryman, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undervalued low prices—including the following Fuchsias:—Conspicua arborea (Cateugh's), Venus victrix, (Cripps'), rosea alba, Money-penny, compacta, racemiflora, &c. Also the following distinct Verbenas:—Queen, Aurora, Stewartii, variegata, Mortlock's Superb, Burleyana, &c. &c. Fuchsias, in tin cases (post-paid), or in pots 12s. per doz.; 10s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents.

W. M. obtained a Prize of 10l., open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

FLORISTS TO HER MAJESTY, THE QUEEN DOWAGER.

BEAUTIFUL AND DISTINCT FUCHSIAS.—

YOUELL AND CO., in submitting their Catalogue of Fuchsias for 1843, take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attended their mode of selecting last season collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL and Co. also feel desirous of calling attention to their peculiar method of executing orders for this tribe of plants; namely, that they will deliver them free of postage, on the receipt of a post-office order, to any part of the United Kingdom, in the first week of April next, in collections, upon the following terms: Twelve fine show varieties 12s. Twelve extra fine show varieties 16s. eties, very superior . . . 21s.

The selection being left to YOUELL and Co.

DESCRIPTION OF FUCHSIA ST. CLARE.

This magnificent Fuchsia was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last it was submitted to Dr. LINDLEY for his opinion, which will be found in the *Gardener's Chronicle* of the 14th of that month, as follows:—"Our Seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus." As a proof of its being a most profuse bloomer, Y. & Co. had a plant in flower on Sept. 15, 1842, on one branch of which were upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower-garden. Price 10s. 6d. per plant, sent free of postage to any part of the United Kingdom.

"Lacoonii," a fine blue, delightfully fragrant, of vigorous, but compact habit, and the heads of flowers measuring upwards of three and a half inches in diameter. 5 6

"Princess Royal," of the purest snowy white, the flowers remarkably large, and extremely fragrant; nothing can exceed the purity of the white in this beautiful variety, and it possesses that acquisition, not to be found in any of its class,—of retaining its clear white during fading. 5 6

It would be as well to remark, that the petals of the flowers of the above meet so closely, as to form a perfect ball. They will be ready for sending out by post, free, to any part of the United Kingdom, in the second week of April.]

Agents for the sale of STEPHENSON & CO.'S IMPROVED CONICAL BOILERS, which may be seen on application.

Packages containing 30 varieties of the most select Flower Seeds 8s. each, sent free of postage to any part of the Kingdom.

Great Yarmouth Nursery, Norfolk, Feb. 16, 1843.

CARNATIONS, PICOTEES, AURICULAS, &c.
MESSRS. DICKSON, Nurserymen and Florists,
 Acre-Lane, Brixton, respectfully solicit the early attention of Amateurs and the Trade to their extensive and choice collection, which comprises all the best show-flowers of the day. Gentlemen wishing to compete for prizes at public exhibitions will find this a most desirable opportunity of making their selection. The plants are in fine healthy condition, and warranted true to their kinds. Messrs. DICKSON also have a few more pairs of that splendid red Picotee, *BARRAUD'S CORNELIUS* to dispose of: it is a beautiful and distinct variety, and as a show-flower, is unrivalled in its class. Catalogues may be had on application to Messrs. DICKSON, or Messrs. WARNER & WARNER, Seedsman, &c., Cornhill, London.

CARNATIONS AND PICOTEES.—YOEUELL & Co.
 have now ready for sending out several thousand pairs of the above flowers, consisting of the finest sorts in cultivation, upon the following terms:—

	£	s.	d.
25 pairs of extra fine and first-rate show flowers	5	0	0
12 " ditto	2	10	0
25 pairs fine show flowers	3	0	0
12 " ditto	1	10	0
12 pairs extra fine show Pinks	0	12	0

The selection being left to YOEUELL & Co. The plants are remarkably strong and healthy, and warranted true to name and colour. Great Yarmouth Nursery, Feb. 24, 1843.

WOOD'S SUPERB SCARLET PHLOX DRUMMONDII.—The colour of this most beautiful of annuals is a dazzling scarlet; the flowers are perfectly round, without any space between the petals, forming, unexceptionably, the most brilliant and striking object that can possibly be imagined. J. Wood having grown no other sort, it is impossible that it can be deteriorated by impregnation. It was awarded an extra prize at the Summer Show of the Huntingdon Horticultural Society. Packets, containing 12 seeds, 2s. 6d. each, postage included, either in cash or postage stamps.

The following gentlemen of the neighbourhood will vouch for the truth of the above description:—**JOHN PRICE, Esq.,** Godmanchester, Hon. Secretary to the Huntingdon Horticultural Society; **E. MAULE, Esq.,** Huntingdon; **Mr. HESTER, Gardener** to the Right Hon. Earl of Sandwich, Hinchbrook, near Huntingdon; **Mr. LAIRD, Gardener** to Lady Sparrow, Brampton Park, Huntingdon; **Mr. BETTS, Gardener** to G. Thornhill, Esq., M.P., Diddington, Huntingdon; **Mr. GIDDINGS, Florist,** Hemingford, Huntingdon.

N.B. March is the best month for sowing, and the seed should be vegetated in a gentle heat.
 Nursery, Huntingdon, March 2, 1843.

SELECT AND SHOWY HARDY HERBACEOUS PLANTS, SPLENDID CALCOLARIAS, NEW HYBRID FUCHSIAS, &c.

WILLIAM MAY begs to announce to the Nobility, Gentry, and the Public generally, that he has still a few hundred of select Showy Hardy Herbaceous Plants that he can supply by name at 42s. per hundred, leaving the selection to himself. He has also ready to send out his splendid Calceolaria, "Lady Constable," which has been repeatedly pronounced the best Calceolaria in England, price 10s. 6d. each; many other very superb varieties. He will also have ready to send out the last week in April his new and beautiful hybrid Fuchsia "BALZONI," this is a most superb variety, of large size, globular form, fine dark crimson purple, with very dark distinct foliage, price 10s. 6d. each. He can also supply all the leading varieties in present cultivation.

W. M. has a few packets of his very select Hollyhock-Seed (all warranted saved from double flowers), 200 seeds for 2s. 6d., 500 for 5s. Selected Pansy-seed at 2s. 6d. and 5s. each; and a limited number of packets of Picotee seed, saved from prize flowers 5s. each. The Calceolaria, Fuchsia, and seeds, sent post free on receipt of a post-office order.—**Hope Nursery, Leamington-lane, near Bedale, Yorkshire.**—Feb. 24, 1843.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON, and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842:—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—*From the Gardeners' Chronicle and Gazette.*

Also obtained the following prizes:—No. of Blooms Exhibited.
 1st prize at Hull, Aug. 30th 12
 1st prize at Beverley, Sept. 7th 2
 Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th 4
 1st prize at Leeds, Sept. 21st 12
 1st prize at Newcastle, Sept. 21st 6
 1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th 6
 1st prize at the York Floral and Horticultural Society, Sept. 28th 18
 1st prize at the York Floricultural Society, Oct. 1st 12
 1st prize in its class as the best white or blush, ditto.
 Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10s. 6d.

All orders addressed J. EDWARDS, Layerthorpe, Florist, Nursery and Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

MAGNIFICENT NEW VERBENA, "PRINCE OF WALES."

WILLIAM WOOD and SON, having obtained the entire Stock of the above very splendid VERBENA, beg leave to offer it to the Public, feeling assured that they can with the greatest confidence recommend it as worthy of especial notice. This desirable variety is a beautiful Flesh Colour; the flowers measuring $\frac{3}{4}$ inches in diameter, and exceedingly fragrant.

Plants of the above will be ready for delivery in May, at 3s. 6d. each; the usual discount to the Trade when 6 plants or more are ordered.

W. W. & SON would also solicit attention to their superb Collection of all the New Verbenas, Fuchsias, &c., and other spring Plants adapted for Bedding, Catalogues of which will be sent FREE on application.

Verbenas, consisting of the best varieties, and left to their own selection, in tin cases, per post, at 3s. per doz., or in pots at 4s. per doz. Fuchsias, per post, at 4s. per doz.
 Please address—Woodlands Nursery, Maresfield, near Uckfield, Sussex.

THE NEW WEEPING WILLOW (Salix Americana pendula).
RIVERS, JUN., has a few very fine Plants of this beautiful WILLOW grafted on straight stems, seven to nine feet in height, 7s. 6d. each, carriage paid to London. Sawbridgeworth, Herts, March 2, 1843.

LARCHES, &c.

VERY fine Two Year Seedlings, and One and Two Year transplanted Larches, and other Nursery stock are still on sale, at moderate prices, by W. URQUHART and SONS, Dundee.

SEEDLING DAHLIAS.

D. KING, SEEDSMAN, FLORIST, &c., PORT-CHESTER, begs to call the attention of the Trade and Public generally to his two Splendid Seedling DAHLIAS, being of first-rate Quality. They have been shown at all the principal Shows in Hampshire, where they have taken Seedling Prizes in 1841 and 1842, and where they were considered to surpass all the older Sorts, in present cultivation; *COMPACTA*—dark Maroon, fine Cup and stiff Petals, good Size, fine Form and Habit, well up in Centre, Flowers standing well above the Foliage, 4ft., 10s. 6d. *BEAUTY OF HANTS*—fine Blush, sometimes tipped with Purple, being equal in Quality to "Compacta," 3ft. to 4ft., 10s. 6d. The usual allowance to the Trade when 6 Plants are taken. Good strong Plants sent out the first week in May.

D.K. begs also to acquaint his friends who may favour him with their Orders, that in consequence of his not being able to show them last year at the London Exhibitions, he will not receive any money for them if they do not prove according to Advertisement. Orders will be received at G. P.M.'s, Nurseryman, Iver; or at D. KING'S, Seedsman, &c., Portchester. The Stock being limited, to prevent disappointment, early Orders will greatly oblige.

ORANGE, LEMON, AND CITRON TREES.

J. MARSANO has just imported from Italy, 300 of the above TREES of various sorts, from 2ft. to 5ft. high. Price from 5s. to 15s. each Plant. The Nobility may be supplied with these splendid Trees. Country Nurserymen will be served at the wholesale Prices, with Italian TUBEROSES, on early application to **JOHN MARSANO, Oilman, Seedsman, and Florist, 2, Beauchamp-street, Brook's Market, Leather-lane, London.**

ORANGE AND LEMON TREES, JASMINE PLANTS, &c., &c.—Noblemen and Gentlemen seeking an opportunity of replenishing their Stock, or commencing an Orangery, may have an opportunity of so doing, by inspecting the Stock of **A. CORBETT**, at his Italian Warehouse, 18, Pall Mall, who has just received his annual Importation from Italy, in a good and healthy condition. The trees are from 3 to 6 feet high in the stem, and from 10s. to 30s. each, and will be packed and sent safely to any part of the Kingdom.

DOUBLE ITALIAN TUBEROSE ROOTS.—The annual Importation of these truly fragrant and delightful Bulbs has just been received in a good and healthy condition, and may be obtained at the above address. Price 1s. per dozen.

N.B.—Importer of choice Lucca Oils, Honeycomb, Parmesan and Gruyere Cheese, Anchovies, &c., &c. Lists with Prices may be had, per post, &c.

J. T. WILLMER begs most respectfully to say he has a fine assortment of the under-mentioned to dispose of at moderate prices; the plants are fine, and well rooted:—Strong Walnut Trees; Fine Quince Trees, fit for bearing fruit; Green Hollies, of all sizes; Striped Hollies, strong plants from 3 to 6 feet high; Striped Box, Laurustinus, Portugal and Common Laurels, Arbor vitae, Aucuba japonica, Yews, Sweet Bay, Swedish Juniper, Arbutus, Rhododendron, Red Cedar, Alexandrian Laurel, Spruce, Scotch, and Larch Firs, Siberian Lilac, Syringas, Guelder Rose, Honeysuckles of various sorts, Irish Ivy, Dwarf Roses, Standard do., Beech, Hornbeam, Lime, English Elm, Poplars of various sorts, Oaks, &c.

J. T. W. has likewise a fine Stock of Carnations and Picotees, of first-rate quality, well wintered, and now in a good state to be sent out, in Collections of Bizarres and Flakes—

Carnations, 25 pair, with their names,	£2	0	0
Picotees, 25 do.	1	10	0
Auriculas, 12 plants,	1	10	0
Pinks, 25 pair,	1	0	0

The selection to be left to J. T. W., which he has no doubt will give satisfaction to those who may honour him with their favour. The above for cash, including basket and packing.
 Sunbury Nursery, Middlesex, Feb. 23, 1843.

HARDIE'S EARLY CANTALOUPE MELON.

WM. HARDIE begs to inform Melon-growers that he has still a quantity of his very superior EARLY MELON SEED to dispose of, and that if sown now he will warrant that with proper treatment its fruit will be ripe the first week in May. He will also warrant it to set its fruit under the most adverse circumstances in which a Melon plant can be placed. He has shewn it these last two seasons at Chiswick, in May, and had a Banksian Medal awarded to it each time.

From these plants and two crops, he cut 60lbs. weight of fruit last year, and with attention there may be three crops taken from the same plants. He grows it on a common dung hot-bed. The flavour is excellent, and size from 3 to 6 lbs., according to the number of fruit on each plant. To be had of W. H., at J. JARRETT'S, Esq., Carneston Court, near Bath; at 2s. 6d. per packet; will be forwarded directly, on receipt of an order for the money. Carneston Court, Feb. 6, 1843.

SELECT CULINARY VEGETABLE SEEDS, &c.

WILLIAM MAY has now ready to send out his new second early Kidney Potato, "The Lapstone," raised from seed between the early Ash-leaved Kidney and the Scotch Kidney, both varieties of great merit. It is a great bearer, medium size, of very first-rate excellence, and of very dwarf habit. Mr. LONDON, in noticing it in his Magazine of the present month, says—"A few of these Potatoes were sent to us; we found them full-eyed, very mealy, boiling soft, and of an excellent quality. We think this a most valuable kind of Potato." May be had in peck bags at 5s. each. New Superb Dwarf Imperial Crimson Beet: this is decidedly the best variety in cultivation; in packets of 1,000 seeds each for 5s. Fuller's New Hybrid Winter Radish, a very desirable variety for winter use; in packets 2s. 6d. each. May's new large late "Victoria" Red Currant, bunches generally six inches long, berries from 1 to 1½ inch in circumference; a fine scarlet, and of excellent flavour, 20s. per dozen. The seeds will be sent post-free on receipt of a Post-office order. May be had of Mr. CHARLES FARNES, Seedsman, St. John-street; Messrs. NOBLE, Seedsman, Fleet-street, London; and of Wm. MAY, Hope Nursery, Leamington-lane, near Bedale, Yorkshire.

NEW FLOWER-SEEDS.

MESSRS. SUTTON and SONS respectfully intimate that as they devote a great portion of their Nursery Grounds to the growth of FLOWER SEEDS, and have excellent connections on the Continent and in England for obtaining the New Sorts as soon as introduced, they can supply every known kind of Flower Seeds worthy of cultivation, and at very moderate charges, either in collections or otherwise. The sorts particularly recommended may be had in the undermentioned collections, with instructions inclosed.

Hardy Flower Seeds, 50 most showy kinds	15	0
Ditto 30 ditto	10	0
Hardy and Tender ditto, including the most superb German Stocks, Balsams, German Asters, Zinnias, Brachycome, Portulaca, Mesembryanthemums, Phlox, &c. &c., 50 sorts	20	0
30 ditto	12	6
100 choice Ranunculuses, in 50 varieties by name	25	0
50 ditto, in 50 ditto	15	0
Double Italian Tuberoses, fresh imported, per dozen	4	0

N.B.—Parcels delivered free to the Railway-stations, or any part of London.—Reading Nursery, Berks, Feb. 21st.

SOUTHAMPTON NURSERY GROUNDS.—Of the Stock advertised in the Autumn (*Gardeners' Chronicle*, p. 665) the following may still be obtained on early application:—

Scotch Firs, 2-year seedling, fine, 2s. per 1000.
 Ash, 1-year ditto, 1s. per 1000.
 English Oak (the true Durmast), 1 and 2-year seedling, 5s. and 7s. 6d. per 1000.
 Sea Pine (*Pinus maritima*, excellent for exposure to the sea), 2-year seedling, 5s. per 1000.
 Pinasters, 2-year seedling, 3s. 6d. per 1000.
 Bedded Rhododendron, 8s. 4d. to 12s. 6d. per 100.

 Laurel, 20s., 40s., and 80s., per 1000.
 Tamarisk (for exposure to the sea), 40s. per 1000.
 Poplar (Black Canada), 4 to 6 feet, 40s. to 60s. per 1000.
 Ribes sanguineum, 25s. per 100.
 Mahonia aquifolium, 40s. per 1000.

With every description of Transplanted Forest-tree, Shrub, Evergreen, and Fruit-tree.—**WM. ROGERS & SON, Nurserymen and Contracting Planters, Southampton, Feb. 24, 1843.**

NEW AND CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, and Co., have a large Stock of all the newest and choicest FLOWER SEEDS, to the cultivation of which great attention has been paid, and which are this season more than usually fine. L. P. and Co. can therefore with confidence recommend them, as being in every respect to be depended on; and beg leave to offer for sale,

25 packets	for	15s.
50 do.		25s.
100 do.		35s.
150 do.		42s.

Delivered, carriage free, to any part of the kingdom. Catalogues may be had on application as above.

Exeter Nursery.

NORLAND NURSERY, NOTTING HILL, NEAR LONDON.

BLACK and GOWEN beg leave most respectfully to inform the Nobility, Gentry, and the Public generally, that they have taken the above establishment, situate on the Bayswater and Uxbridge road; where they intend carrying on every department of the Floricultural, Nursery and Seed trade; and they earnestly trust, through strict attention in supplying a genuine article at moderate charges, to gain a share of public patronage. The under-named they can confidently recommend as being of undoubted quality.

Buck's true Intermediate Stock, 6d. to 1s. per packet, or 5s. per oz.	<i>Mimulus moschatus</i> , 1s. per packet.
German Stocks, 6d. per packet, or 1s. per oz.	<i>Nemophila aurita</i> , 6d. per packet, or 1s. 6d. per oz.
Aster, German, fine, 6d. per packet, or 1s. 6d. per oz.	<i>Papaver Marshallii</i> , 6d. per packet, or 2s. per oz.
Calandrinia discolor, 6d. per packet, or 2s. 6d. per oz.	<i>Petunia phoenicea</i> , 6d. per packet, or 3s. 6d. per oz.
Calceolaria platyglossa, 6d. per packet, or 1s. 6d. per oz.	<i>Do. nictagiflora</i> , 6d. per packet, or 1s. 6d. per oz.
Hollyhocks, German, mixed, 3d. per packet, or 9d. per oz.	<i>Phlox Drummondii</i> , 1s. 6d. to 2s. 6d. per packet.
Do., named sorts, 6d. per packet, or 1s. per oz.	<i>Schizopetalon Walkerii</i> , 1s. 6d. to 2s. 6d. per packet.

Do. nanus, 3d. per packet, or 1s. 6d. per oz.	<i>Thunbergia</i> , of sorts, 1s. 6d. to 2s. 6d. per packet.
Loasa aurantiaca, 6d. per packet, or 3s. 6d. per oz.	True Early Snowball Turnip, genuine.

Together with a general Assortment of Horticultural, Agricultural, and Floricultural Seeds, too numerous to quote, but of which a Descriptive Catalogue can be had, upon application.

B. & G. will be glad of a List of Prices from Nurserymen who may abound in Hardy Evergreens, &c.

TO GENTLEMEN, NURSERYMEN, GARDENERS, AND OTHERS.

MR. GEORGE TRIST (late with Mr. HOGGART) is instructed to sell by Auction, on the Premises, the Nursery Ground (late in the occupation of Messrs. WARNER, Cornhill), close to the Half-way House, Old Kent-road, on WEDNESDAY, March 8, at 11, (the ground being required for building purposes), the whole of the STOCK and CROPS, consisting of about 15,000 Myatt's British Queen, Elton, and Eliza Strawberries; 22,000 of one and two years' Giant Asparagus, 9,000 Sea-kale, a quantity of Rhubarb, Tarragon, and other Herbs; about 500 Maiden Peaches, Nectarines, and Apricots; a quantity of Horse Chestnuts, and Seedling English Oaks, Bulbs, named Hollyhocks, and a variety of Growing Stock. May be seen two days prior to the Sale. Catalogues had of Mr. BUNNEY, Conservatory, Covent Garden; at all the principal Seed-Shops in the City; at the Half-way House Inn, and of Mr. GEORGE TRIST, Auctioneer and Estate Agent, 76, Old Broad-street, Royal Exchange.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on TUESDAY, March 7, and THURSDAY, March 9, 1843, at 12 o'clock, about Five Hundred STANDARD and DWARF ROSES, of the best varieties. Also a splendid assortment of Dahlias. May be viewed the morning of Sale; and catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

ECONOMIC LIFE ASSURANCE SOCIETY,
 No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON.
 Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16l. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31l. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being sea-faring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
 CAMPBELL JAMES DOWNER, Secretary.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from **JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.**

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

On Saturday next, in One small vol., 12mo.

In the *Guernsey Star* newspaper of September last appeared the following statement:—"The splendid Tussack Grass is the gold and glory of the Falkland Islands. Every animal there feeds upon it with avidity, and fattens in a short time. It may be planted and cut like the Guinea Grass of the West Indies. The blades are about six feet long, and from 200 to 300 shoots spring from one plant; about four inches of the root eats like the Mountain-Cabbage; it loves a rank, wet, peat bog, with the sea-spray over it; it is nutritious throughout the year, and all the smaller Falkland Islands are covered with it."

This could not fail to excite attention; and so many of our correspondents have made inquiries about it, that we have endeavoured to ascertain what the facts are relating to it.

The earliest notice that occurs of the plant appears to be in Pernetty's *Voyage aux Isles Malouines*, published in Paris in the year 1770. We are not acquainted with this work, but the statement contained in it is, we presume, the following, quoted by Burney in his "Collection of Voyages," (vol. v. p. 144.)—Pernetty says, "We were half a league distant from two flat islands, which, at first view, appeared as if covered with small copse-wood, but, as we afterwards discovered on landing, they were only tall Bulrushes or Cornflags: they grow each of them about two feet

and a half high, and afterwards shoot forth a tuft of green leaves nearly of as much height more."

The next trace of it is in Bougainville's account of his voyage in La Boudeuse, in 1766:—"All the sea-coast," says this navigator, "and the islands in the interior of the Falklands, are covered with a plant which is improperly called a Cornflag; it is, however, a species of Grass, of the most beautiful green colour, and growing to the height of six feet. It forms a hiding-place for lions and sea-wolves, and served as a shelter for ourselves during our travels. A house is formed in a very short space of time; the inclined stems, when fastened together, serve as a roof, while the dry straw makes a tolerably good bed. It was with this plant that we likewise thatched our houses. The root is sweet and nutritious, and is preferred by beasts to any other food."

Later travellers speak of it in similar terms. Gaudichaud says that the base of its stem has the pleasant taste of the Cabbage Palm, so much esteemed in tropical countries. And in the account of Freycinet's Voyage, p. 143, we find the following statement:—"Finally, there is a plant of still greater interest, which furnishes nearly all the year round abundance of nutritious food, namely a large Grass (*Festuca flabellata*), which covers two-thirds of the Isle of Penguins, and other small islands in the French Bay; and which, according to M. Orne, is met with in equal profusion on the coast of all the Falklands. This plant grows from four to six feet high; its leaves are sheathing and compressed. The interior of the stem, to the height of five or six inches above the root, is white and soft, of an agreeable flavour, resembling that of a Filbert. This substance consists of the lower sheath, with the young central leaves and stem firmly encased within each other. Its flavour may be also compared to that of the Cabbage Palm, so highly esteemed."

The most complete account, however, that we have seen, is the following, which Sir William Hooker has been so obliging as to extract from the letters of his son, Dr. Joseph Hooker, now with Captain James Ross's expedition:—"Near the sea-coast a very noble Grass grows in immense abundance, called Tussac. It forms quite an extraordinary feature in the landscape, covering immense tracts of land, especially on a sandy soil. Its roots form great balls, which rise

high as 75° in summer, and sometimes falls to 26° in winter; he, however, confirms the French statements, that snow disappears in a few hours, and that ice is seldom above an inch thick. (*Journal of Geog. Soc.*, iii. 95). The days of summer are described by the same authority, as long and warm, with occasional showers, producing a rapid vegetation. All this would suit the west and south of Ireland well enough, but would hardly justify our entertaining expectations of the Grass succeeding in England or Scotland, except in particular localities, even if the plant should so far change its southern habits as to forget that our winter is its summer.

We learn from Sir Wm. Hooker that only a few days since a packet of the seeds of the Tussack Grass was received at the Royal Botanic Garden, Kew, but they were in bad condition, and offered small promise of germinating; although from the same parcel of seed a plentiful supply of young plants was coming up in Dr. Joseph Hooker's Garden at the Falklands where they had been drilled in rows, like Turnips. Let us hope that some of these young plants will be introduced in the Ward's Cases which have been sent out from Kew for the purpose.

It is right to add that there is another sort of Tussack Grass at the Falklands, much inferior to the *Festuca flabellata*, and produced, as we are informed by Sir Wm. Hooker, by the *Carex trifida* of Cavanilles. This is probably what is mentioned in Burney's *Voyages* (vol. v. p. 144) as "A kind of Grass, a foot and a half high, which spreads over every part to the tops of the hills. The soil is of a dark-brown colour, and is formed into a mould by the annual decay of the Grass. It rises with a spring under your feet from the roots of the Grass being interwoven with it."

Those who interest themselves in procuring the Tussack should take care to distinguish between the two kinds.

For the opportunity of publishing a view of the places in the Falklands, where this Grass occurs, we are indebted to Sir William Hooker, who has kindly placed at our disposal a drawing made on the spot by W. E. Wright, Esq.

It would be difficult to name any department of gardening, or indeed of vegetable physiology, concerning which so little is positively known, even to those most conversant with such matters, as the nature of vegetable diseases. The number of writings on the subject is inconsiderable, and the information afforded by them still more so. Even De Candolle, with all the aid of his great learning, could find but little on which to build a theory of vegetable nosology; and more recent writers have added almost nothing. Yet the subject is one of grave import; it does not concern merely the luxurious tables of the wealthy, but it is intimately connected with the prosperity of our forests and the productiveness of agriculture.

From the first day of the existence of this Journal we have been searching for facts relating to vegetable disease; but we find little beyond opinions, many of which, absurd as they evidently are, continue to find their believers. If you ask a man what causes canker, what the gum, or whence it happens that his Potatoes curl and his Peaches blight, you get as many conflicting explanations as you consult individuals. One tells you the cause is in the air, another finds it in the earth; "constitutional debility" satisfies one class of inquirers, "peculiar habits" a second; while others are quite content to talk of "blight" and "mildew," or their neighbours' nuisances. But what do all such phrases really mean? what earthly information do they convey, by which a man may profit to his own good?—they may be fruitful in lawsuits: for vagueness and uncertainty are choice cates for our legal friends; they may be profitable to people who terrify the directors of gas-works or the owners of manufacturing factories into compensation for imaginary injuries. But their value extends no further.

Let us, therefore, endeavour to collect evidence, point by point, upon the diseases which wood is heir to; and if our correspondents will help us, a body of really useful information may, it is hoped, be gradually secured. To do this, however, much co-operation in a definite manner is required. Of vague and uncertain statements we have more than enough; what we now want is exact information upon particular points. If the advice given by us, and by Professor Henslow, in another place, to the farmers, is adopted by gardeners,—and they will do, each for himself, what they can, following the directions we may give them, as nearly as their means will permit,—we shall be sure to get truths for them which they cannot possibly obtain for themselves.

In order to make a beginning, let us take the Vine, and investigate the causes of some one of its many diseases. Mr. Loudon, indeed, says the Vine has no diseases except bleeding (which is not a disease; see *Encycl. of Gardening*, edition of 1835, p. 785); but to this, we suspect, he will hardly gain the assent of those gardeners who know anything of rusting, and

five or six feet above the ground, and are often as much in diameter. The culms spring from the top of them, bearing long leaves, which hang down all round in the most graceful manner, and are themselves six or seven feet in length. These heaps, or tussacks, grow generally apart, but within a few feet of one another, the intermediate space of ground being generally quite bare of vegetation; so that, in walking among them, you are quite hidden from view, and the whole Tussac ground is a perfect labyrinth. Cattle thrive admirably, and soon get fat upon this Grass; and so fond are they of it, that when they can get it they will touch nothing else: and with horses it is the same."

Such is Dr. Joseph Hooker's graphic account of this plant. Gaudichaud describes it as a handsome Grass, from four to six feet high, with fan-shaped leaves, like those of some Iris, from which circumstance, no doubt, Lamarck called the species *Festuca flabellata*.

The soil on which this plant grows is described by Gaudichaud (*Ann. Sc. v. 90.*) as a spongy bog, utterly uncultivable; and D'Urville adds (*l. c.*, vi. 47 l.),

that at its edges this bog forms in many places a cliff (*escarpement*) four or five feet high. Dr. Hooker also states that the whole district is covered with peat bogs or grass lands. It would therefore seem as if the plant might be introduced with advantage into Ireland; that, however, is a point that cannot be determined otherwise than by actual experiment.

Concerning the climate of the Falklands, we have tolerably exact information. D'Urville states that it is much more temperate than might have been expected from its latitude. From the observations made by himself and others, he concludes that the thermometer scarcely rises above 15° cent. (59° Fahr.), or falls below zero cent. (32° Fahr.); and according to Bougainville the winter is very mild, and snow lies on the ground only for a short time. M. D'Urville also states that in 1822, at the beginning of December, the month which answers to June in Europe, the highest temperature observed was almost always between 12° and 15° cent. (51° to 66° Fahr.) On the other hand, Sir Woodbine Parish tells us that in the Eastern Island, the thermometer generally ranges as

shrivelling, and shanking, and scorching, and not setting, and not colouring, every one of which is as much a disease as the gout or rheumatism in a man. Let us begin with the rust of the Vine.

The rust of the Vine is a disease which attacks the Grapes, covering them with a tough brown skin which is incapable of natural extension, and which stops their growth. Wherever the disease appears the crop is injured, or even ruined. Now, in this, as in all such cases, if we are to cure the evil we must find out its cause; and it is to that we would ask our gardening friends to attend, by way of beginning a formal investigation of vegetable diseases. One person says it is caused by the attacks of the Thrips insect; another is convinced that it arises from his having planted his Vine too deep; others are perfectly satisfied that it is caused by the perspiration or greasiness of the hands of those employed in thinning the berries; a fourth observer refers it to a period anterior to the setting of the berries. One of our correspondents, who ascribes the rust to the Grapes having come in contact with greasy substances, at the same time throws the blame upon the Thrips (see Mr. Bromley's remarks, p. 853); and in a subsequent letter, now before us, he gives as a reason for preferring the long-rod mode of pruning to that of spurring, that old spurs are difficult to clear of Thrips: so that here are two totally different causes assigned by the same observer for the same malady. Finally, to close the catalogue of opinions, we have a letter from Mr. Webster, who conceives the rust to arise from the use of excessive moisture previously to the opening of the flowers.

Which of all these speculations is to be regarded as correct? that is what should be proved experimentally; and the season is now arrived when the matter may be investigated by thousands of observers. We would therefore propose the following plan:—

1. Grease a few bunches, just as much as it is probable they would be soiled in the operation of thinning, and leave the remainder of the crop without being touched. This will settle that part of the question: if indeed it is not decided by the fact that Grapes on the open wall, unthinned, are occasionally as rusty, or more so, than in houses.

2. Where the rust prevails, examine the plants well, and see whether Thrips abound; if so, observe the effect of removing this insect.

3. Direct attention also to the red-spider, and ascertain, if possible, whether that pest has not something to do with the rust.

4. Watch the Greengage and other sweet Plums in the same way, and observe whether Thrips, or red-spider, or greasy substances produce the mischief there; for we presume that the rust of Plums is of the same nature as that of Grapes.

Here are some experiments, trifling in the amount of observation they demand, but very important in their results; and we trust they will find observers among a good many of our readers.

In another column we give the Report of the Floricultural Society upon the seedling Dahlias exhibited before it during the last year. That the owners of second-rate flowers should be discontented at their being so classed, and that in carrying out its objects the managers of this Society should have made some enemies, is only what must be expected by all those who venture to expose fraud and discountenance imposition. Nevertheless, in the long run, honesty of purpose, as well as honesty of action, is sure to bring its own reward; and we entertain no doubt, that, in proportion as the Society is out of favour with self-seeking florists, it will gain the good opinion of their customers.

As we have stated on a former occasion, the great point to attend to in the formation of the committees of all such Societies as this, is the exclusion of every person whose character is at all doubtful; this has been attended to most scrupulously by the Floricultural Society, and must secure for them the support of all honest and respectable florists. As for those of a different description, they may always be known by their associates.

FOLDING Sheep on Turnips, where the land is light and dry, is the most effectual and economical mode of manuring. Much attention is required to make the profit on the Sheep pay something towards the great expense incurred in raising a good crop of Turnips: and, in this, great improvements have been introduced of late years. The principal are: the cutting of the Turnips in slices, or rather strips, by means of a machine worked by hand, feeding the Sheep in narrow troughs, and regularly, so that nothing is lost, or soiled, to disgust the animals. The troughs are placed on the spot from whence the Turnips were drawn to be cut, and moved so that the droppings of the dung may be equally distributed; cut Clover, Hay, or Pease-haulm, is given, mixed with crushed oil-cake, or Pease or Bean meal, or Oats. This not only corrects the cold watery

nature of the Turnip, but also materially improves the manure; that from Sheep fattened in this way may be considered as of double the effect to that of store Sheep merely fed on Turnips and some Hay. The advantage of the old mode of folding Sheep at night on fallows, when they had run in poor pastures all day, is problematical: for not only are the dung and urine of a much less fertilising nature, but the Sheep suffer, and in many cases the loss on this account makes the manuring, such as it is, be dearly paid for. Hence some good farmers have a prejudice against folding Sheep, and not without some reason; but the mode we are describing is very different: here, the Sheep are well fed, and not driven from a pasture to a fold, which is only robbing one part of a farm to improve the other. They very soon fill themselves and lie down to ruminate, and thus communicate considerable warmth to the soil. It is extremely useful, not only to their general health, but likewise to stimulate their appetite, to place lumps of rock-salt here and there in a trough for them to lick at. We have invariably found that with salt to lick they could digest more Turnips, and thrive faster, while their dung and urine are certainly improved by the salt dissolved in them. The quantity of oil-cake or meal which is most advantageous to be given must depend on the time when it is desirable the Sheep should be fat for the butcher. They should never be overfed, but as long as they eat up all that is placed in their troughs, after having had a full meal of Turnips, they may be safely supplied; cut Clover-hay may be mixed with crushed oil-cake or meal, in the proportion of one peck of meal to two or three bushels of cut hay; of this mixture they may be allowed to eat as much as they like, twice a day, after they have eaten their cut Turnips. The same system may be pursued for ewes and lambs. Bean-meal and oil-cake increase the milk of the ewes, and all the fat will go to the lambs as long as they suck; when Turnips are cut into short strips, it is astonishing how soon lambs begin to nibble at them, and learn to lick up the meal; by the time the lambs are weaned or sold off, the ewes will be in good condition; and whether they are fatted or kept for breeding, will be much the better for good feeding. The calculation of the difference in the expense, compared to the benefit received by the improved method, depends so much on circumstance and situation, that we cannot enter into them. It will take women and boys to pull up the Turnips, clean them of earth, and cut off the greens, which are left on the ground to be first picked up by the Sheep when they are let into the fold; there is not much nourishment in the green leaves. When Turnips are carried off the land to be eaten in the yards, or stored for winter and spring use, it is best to leave the tops to be ploughed in as manure; and in this way they are useful. A flock of 300 wethers will require the constant attendance of a man and a boy. They are to set the hurdles and change the folds regularly, put the food into the troughs, and clean them out—a very useful practice after every meal. Two women, or a woman and a boy, can pull up the Turnips and cut them, the shepherd and his boy helping occasionally. The hay and meal are supposed to be prepared in the barn, and brought to the field daily, taking back a cart-load of Turnips for the cows at home; if no bullocks are fatted in the yards this expense must be added, deducting the value of the Turnips carried off. If the value of the Turnips can be estimated at what they could be sold to carry off the land, this must be set against the profit on the Sheep, after the hay, meal, and attendance are reckoned: the balance is the cost of the manure, which can only be valued by its effects on the subsequent crops. The form of the account is as follows:—

300 tegs or wethers, valued or purchased,	£	s.	d.
at per head			
— acres of Turnips, at per acre			
— loads of Clover-hay, at per load			
— quarters of meal, or bruised oil-cake, at per quarter			
Expense of cutting			
Carting and grinding			
A shepherd, boy, and two women, weeks, at per week			

Total cost £

Contra.	£	s.	d.
Sold 300 fat Sheep, average per head (deducting loss by death or accident), including the wool			
Balance, as the cost of manure			

This balance must be carried to the account of the next crops in the rotation.

Without correct accounts no accurate result can be obtained; and after two or three experiments it will be soon ascertained what is, upon the whole, the most profitable method. It is well known from the discoveries of the first chemists that Turnips are defi-

cient in nitrogen, and that all animals require a portion of it for their healthy nourishment. Clover and meal contain, besides other nourishing substances, a sufficiency of nitrogen for the supply of animal flesh, and their addition greatly increases the fattening qualities of Turnips; much of the juice of the Turnips remains undigested, and is voided without any change when they are the only food of the Sheep, which more nitrogenous food would enable the stomach to decompose—at least such is the prevailing theory; and it is very plausible. Experiments and accurate observations alone can substantiate it, or refute its truth. We can only repeat the excellent advice of Professor Henslow to the farmers around him, to make numerous accurate experiments, which they can do with little trouble and expense, and by the multitude of the results they will be able to ascertain what is real fact under dissimilar circumstances, and whether the theories of scientific men are proved or disproved by these facts.—M.

SANDAL-WOOD.

YOUR readers, like every one else, must have heard so much of the Sandal-wood gates of Somnauth, that some account of the tree producing it, as well as some circumstances connected with its history, may prove not devoid of interest. Mr. Atkinson, indeed, throws some doubt upon the famous gates having been made of Sandal-wood at all. "The door," he says, "is part of the spoil brought by Mahomed himself from the Hindoo temple at Somnauth, in Guzerat, said to be made of Cedar or Sandal Wood; but the smell is certainly gone, if it ever had any. It is in panels, carved, and well put together. Two folds, hinged, form one-half of the door, which seems to be about 8ft. wide, by 14ft. high. It is a massive door, and the same which Runjeet Singh coveted so much, that he at one time demanded it as part of his recompense for aiding in the cause of Shah Soojah's restoration. He coveted it because he wished to rescue it from the Mahomedans, and to restore it to the temple of Somnauth; thereby hoping to merit the gratitude and admiration of the Hindoo world." But notwithstanding this doubt, the probability is that Sandal-wood would alone be employed in a temple on which the riches of the East seem to have been lavished. That it was the practice in the East to make gates of Sandal-wood is evident, from the observations of Joseph Barb. *viaggia alla Persia*, quoted by Celsius. "La porta della camera era di Sandali entarsiata con fili d'oro." And again—"Mi monstrarono etandio due porte lavorate grandi di Sandali, di piedi sei l'una," &c.

The term Sandal-wood has been applied to the wood of several trees, which have nothing to do with the subject of this article: for instance, there is a red Sandal-wood, yielded, I believe, by two trees, one *Pterocarpus santalinus*, and the other *Adenanthra pavonina*. There is also a yellow Sandal-wood, which may or may not be produced by the same tree as white Sandal-wood. This wood has long been famous in the East for its very agreeable and fragrant odour, on which account it has been much employed for different articles which are much handled, such as fans and rosaries; in Europe we find it esteemed for ladies' work-boxes, cabinets, &c. An oil is also distilled from it, which is much esteemed in Turkey in the present day. From such applications Sandal-wood might be supposed to be an article of little importance; but from the price currents of Calcutta and of Canton, we find that about 200 tons of this wood are annually imported into the former, and about double that quantity into the latter. These two ports are not, however, supplied from the same places, Calcutta being supplied from the Malabar coast, and Canton chiefly from the Feejee, Marquesas, and Sandwich islands, as well as from India. It might be that the same species of tree yielded the Sandal-wood of all these localities; but as two species have been formed by Botanists, we shall first notice the Indian species, and then that which has been more recently discovered.

The Indian Sandal-wood is produced by *Santalum album*, of the natural order of Santalaceæ, and which has been made more interesting from the many valuable observations made on the development of its ovule by Mr. Griffith. This species is common on the Malabar coast. The fullest accounts of it have been given by Dr. Buchanan in his Journey through Mysore, Malabar, and Canara, where he says it is called *Sri-gunda*. It is also found in the central forests of Mysore, that is, to the westward of Bangalore, and likewise in those on the Malabar coast between Seringapatam and the sea-ports of Tellichery and Calicut. The tree is usually about 25 feet in height, with opposite, oblong, and smooth leaves, which are glaucous on the under surface. The flowers are small, at first straw-coloured, afterwards purplish, and without odour. The tree resembles the Myrtle, more, perhaps, than any other plant which is common. When felled, the stems are usually about 9 inches in diameter, but they are occasionally 3 cubits in circumference, though it is not probable that they have been allowed to attain their fullest size in modern times. About two-thirds of the diameter is white wood, nearly devoid of smell, and the remaining third more highly coloured and fragrant. The scent, indeed, is said to be in proportion to the depth of colour; and hence some of the yellow Sandal-wood may be yielded by this species, as well as by that to be subsequently mentioned. The lowest part of the stem, or that immediately above the division into roots, is the best, and that grown on steep rocky soil is far superior to such as is produced in low rich situations. The trees

require from 20 to 30 years to come to perfection, and were all the property of the native governments within whose territories they grew. When cut down they were brought to the public servant, whose office it was to sell to the merchant or contractor, who divided the wood into three different kinds, according to size and quality. Dr. Buchanan states that the merchants sometimes divide Sandal-wood into red, yellow, and white; but these, he says, are all different shades of the same colour. The largest pieces are sent to China, and the middling-sized to India. The chips and fragments answer best for the Arabian market, as from them the essential oil is distilled. It is sometimes said that Sandal-wood is buried in the ground to enhance its value; but this seems to be done for the purpose of concealment, as individuals cutting down trees conceal them in the ground until a favourable opportunity occurs for smuggling them into a neighbouring territory. Sometimes, also, Dr. B. says, this may be useful in enabling the white ants to destroy the white and sappy part of the wood, which is devoid of smell. The quantity procurable from the different forests is difficult to estimate; from 1700 to 2200 candies, each of 560 lbs., used to be obtained from Tippoo Saib's eastern forests. Coorg used to yield a further supply, as well as the central forests of Mysore.

Besides these, a less valuable, but larger-sized Sandal-wood is obtained from the more northern districts of Onore, which is produced in the low tract which lies between the ghauts and the sea-shore. Though this, like all other Sandal-wood grown in similar situations, is less fragrant, it becomes a larger tree, from being more freely grown; and is interesting as being easily accessible, and from Onore having been one of the early ports, might have been known to and obtained by foreign merchants resorting to this coast.

The Chinese, besides being supplied from India, obtain a still larger quantity of Sandal-wood from Timor, the Feejee, and Marquesas islands. This was long supposed to be yielded by the same, that is, the common Indian, species; M. Gaudichaud, however, considers it to be a distinct species, which he has figured and described from the Sandwich Island, and has named *S. Freycinetianum*. The Chinese, besides manufacturing various articles from this Sandal-wood, make use of the fragments, &c., by reducing the whole to sawdust, which they mix up with Rice paste, and make into slender candles. These are burnt as incense in their houses and temples.

We shall pursue the historical part of this fragrant wood in a future communication.—R.

VEGETABLE REFUSE AS A MANURE.

(By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

[The common Magdeburg acre consists of 180 square rods, or 25,920 feet Prussian, which is about $\frac{1}{10}$ of an English acre.]

The principal vegetable refuse used in manuring fields and meadows consists of oil-cake, malt-dust, fruit and Vine husks, and stubble.

1. *Oil-Cake*.—The oil-cake of Rape has not been so much used in Germany as in Belgium and England, where, for some years past, it is in such demand as a very strong manure, that the importation of it is yearly increasing. It is, indeed, so powerful, that we must take care not to use too much, or the crops of all Corn will be laid. Oil-cake affords the most convincing proof that the animalization of food, on which so much stress was formerly laid, is not so very important, for here we find that vegetable matter which has not passed through the bodies of animals, is a more powerful fertilizer than any equal quantity of animal manure. The effect of oil-cake is, however, transient, for (in the quantity in which it can be safely used) it lasts but one year. This is owing to its chemical constitution, and to the fact that the substances of which it is composed are easily decomposed, and very soluble in water. It consists chiefly of albumen, vegetable gluten, gum, and mucilage, so much so, that out of 1000 parts of oil-cake, 350 are soluble in water without the aid of decomposition. According to my analysis, 1000 lbs. of oil-cake consist of

80.5 lbs.	of water in fluid form
54.5 "	nitrogen
2.5 "	potash
1.5 "	soda
15.0 "	lime
0.1 "	magnesia
1.9 "	sulphuric acid
15.5 "	phosphoric acid
0.5 "	chlorine
550.0 "	carbon
278.5 "	hydrogen, oxygen, silica (13.5), and traces of alumina, oxide of iron, and manganese.

1000.0 lbs.

If, therefore, 1000 lbs. are brought on the Magdeburg acre of land (and this is a strong dose), the quantity of substances above mentioned will be conveyed to the soil. It cannot, however, be doubted, that it is the carbon and nitrogen of the oil-cake which act so powerfully, with the assistance of phosphoric acid and lime.

It has been often asserted, that Rape-cake principally acts as a manure, in consequence of the oil it contains, but according to my experiments, this is not the case. Admitting that Rape-cake contains 5 per cent. of oil—600 lbs. of cake, which is what is mostly used for one acre of land, will not convey to that acre more than 30 lbs. of oil, containing in the whole about 23 lbs. of carbon, the substance to which the manuring quality of oil is chiefly to be ascribed. But 23 lbs. of carbon cannot produce any great influence on the crops of one acre of land, as is evident when we consider that to form 100 lbs. of straw,

50 to 60 lbs. of carbon are required. It is also quite certain that the albumen and vegetable gluten of Rape-cake are of the greatest importance for Corn crops, because of the supply of nitrogen which they afford. The Wheat crop of an acre contains, at the most, 30 lbs. nitrogen; but as 600 lbs. of cake convey to the soil 32 to 38 lbs. of nitrogen, this will be not only sufficient for the Wheat, but will also leave a small surplus for the succeeding crop.

Rape-cake will be always most effective in light soil, because the roots of Corn can, in such land, search most readily for the manuring particles contained in the cake, or produced from it. If, on the contrary, clayey land is manured with cake, its fertilizing substances cannot penetrate the soil, and will evaporate without producing good effects. A clayey soil, therefore, must always have somewhat more manure in order to obtain the same effect.

In England the dust of Rape-cake is usually drilled into the ridges at the same time that Wheat, Turnips, &c., are sown. By these means the manure is brought close to the plants, which not only occasions a saving of cake but prevents the danger of the manuring substances being lost by evaporation, which always will be the case if it is strewn merely on the top, or even harrowed in. For winter crops 600 lbs. are used per acre. I have found by experiment that in light land 1000 lbs. will be so strong, that the crop will be easily injured; such a quantity, however, also acts the second year. If Rape-dust is put in the holes where Potatoes are planted, care must be taken that the dust does not come in contact with them, or the eyes will be destroyed, especially in dry weather. This is caused by the albumen and gluten of Rape-cake developing a great quantity of ammonia, which, as we know, kills all vegetable sprouts. For this reason Rape-cake will be most useful in wet weather, because in that case the ammonia which is developed will be diluted and distributed in the soil and neutralized by the humic acid. If oil-cake is applied in dry seasons to summer crops, it will be of little value, especially if used as a top-dressing or just harrowed in. In such a case, all the best parts of the manuring substances will be converted into gas.

In Belgium the dust of Rape-cake is often added to sinks of urine: water is added, and the whole is left rotting for five or six days. Although such a manure will be very powerful, yet I cannot recommend it, because a part of the ammonia will be always lost. But it is more common, even in Belgium, to strew it in the autumn over the Rye and Wheat crops, or it is harrowed in with the seed for summer crops. The Belgian practice (which cannot be too much recommended) is, not to use much of this manure at one time, but rather to repeat it every year, or at least every alternate year: they consequently take at one time not more than 250 to 300 lbs. of cake for a Magdeburg acre. In some places the dust of oil-cake is also mixed (8 or 10 days previously to using it) with 1-7th part of its volume of slaked lime; I, however, think that this operation always causes a loss of nitrogen, because the lime will induce the vegetable substances containing nitrogen to form ammonia, which will escape as gas.

It is said that on fields manured with oil-cake the mole-cricket (*gryllotalpa*) will disappear; this, if true, would be of some consequence, for these insects often injure Rye to a great extent.

Linseed-cake is seldom used as manure, because it is thought better to give it to cattle as food. In Belgium, Linseed cake is used in manuring Flax, which succeeds very well after it.

2. *Malt-dust*.—In countries like England, where an immense quantity of beer is brewed, Malt-dust is also used as manure. It acts nearly as powerfully as oil-cake, and its effects are equally fugitive. 800 to 1000 lbs. are applied to an acre as a top-dressing for sickly winter crops, or are harrowed in with the seed of summer crops. According to my analysis 1000 lbs. of dry Malt-dust contain

40.0 lbs.	of nitrogen (probably).
20.0 "	potash and soda.
14.0 "	lime.
2.0 "	magnesia.
7.2 "	phosphoric acid.
6.0 "	sulphuric acid.
3.0 "	chlorine.
550.0 "	carbon.
357.8 "	hydrogen, oxygen, silica (very much), alumina, oxide of iron, and manganese.

1000.0 lb.

It is evident that Malt-dust derives its manuring quality from carbon, and especially nitrogen; for the 20 lbs. of potash and soda, and the 14 lbs. of lime, &c., which 1000 lbs. convey to the land cannot produce much effect.

3. *Husks of Fruit*.—In countries where Apples, Pears, or Grapes are grown for the sake of making wine or cider, these are used as manure; but they are of little value. They are mixed with lime until they are putrified.

4. *Corn Stubble*.—In farming very clayey land, it may be advantageous to leave a long stubble, because it will (when ploughed in) loosen the soil for some time. As a (when ploughed in) loosen the soil for some time. As a manure, however, it is (as the analysis shows) of no great value. In dry sandy lands, long stubble does more harm than good, for it makes the soil still looser and drier, while the want of moisture will prevent its rotting. In such soil it is much better to collect the stubble into heaps, and to burn it on the spot.

Before concluding this chapter, I may as well mention a manure which the French have much praised. The late M. Jauffret made a compound of stubble—Thistles, Heath, peat, mud, and sand, and poured over it a sort of *hot ley* (the composition of which he kept secret), and thus obtained a manure which was so much decomposed after

10 or 12 days that it was fit for immediate use. It is, however, obvious, that this was nothing more than well-known compost, brought more speedily into a state of fermentation and decomposition by the *hot ley*, which was probably made of wood-ashes, or perhaps urine. It is, however, now exploded.

ON HEATING HORTICULTURAL BUILDINGS.

THE recent discoveries of Bude and Boccus for rendering gas-light pure and brilliant, and the known value of light in addition to heat in the proper treatment of plants introduced into this country from tropical or warm climates, so as to ensure their uninterrupted enjoyment of health, and the production of magnificent, rich, and vivid-coloured flowers, equal to those borne by the same species in their own unclouded, bright, and sunny lands, suggest the application of gas as an eligible medium to attain this most desirable end in conservatories and other buildings devoted to Horticultural purposes in the variable and trying climate of our sea-girt island.

The Great Being who governs the world has shown in the wonderful works of creation his Almighty power, and has given to various lands their varied charms, both of animated and inanimate nature. In the human race, especially in this highly-civilised country, he has implanted a more than ordinary affection for the beautiful productions of the soil; and many a happy hour is spent in nursing and tending them, and in watching their progress from the time the minute seed is committed to the earth, until it germinates and becomes a pleasing object, producing beautiful flowers, or until it forms a handsome shrub or magnificent tree, clothed with the richest tints, in many instances bearing delicious fruit, gratifying to the eye, pleasant to the taste, and adding to the enjoyment of mortals.

On examining the harmonious system of nature, and the almost invariable rules by which certain results are accomplished, it is evident that the present modes of heating Horticultural buildings, although eminently successful under the able management and unceasing attention of the highly intelligent class to whose charge they are confined, are not in accordance with the laws by which nature appears to be governed. As an illustration, it may be observed, that on entering the great majority of these buildings in this country for the protection or propagation of foreign plants, the respiration of the human frame is materially impeded, owing to the impurity of the air occasioned by the requisite heat being communicated through the medium of iron or metal pipes, disengaging from these substances a subtle and invisible kind of gas, which renders the air as dry and intolerable as it could be found in the sandy deserts of Africa. The same effects are experienced in churches and public buildings heated on the same principles; and it is only by the aid of a profuse evaporation of water that these places become at all endurable. When these effects take place on the naturally strong constitution of the human race, their action on the tender fibres of plants must be either to entirely destroy them or prevent their assuming the fine form or the brilliant and cheerful colours which they put on when enjoying the pure air of the open country, with the delightful and cooling breezes of heaven.

The introduction of gas, either in the form of Bude or Boccus lights, or argand or jet burners, as might be most approved of for heating Horticultural buildings, after experiments being made to ascertain their respective advantages, would probably not incur a greater expense than is entailed by the present system, especially when required on a large scale. When only needed on a small scale, a sufficient supply of gas may be always obtained in the vicinity of almost every town in the kingdom. On an extensive scale, such as would be requisite for the splendid conservatory of the Duke of Devonshire at Chatsworth, or for that in the Horticultural Society's Garden at Chiswick, it would be advisable to have gas-works exclusively attached to them: and these works, now that means have been discovered for consuming the smoke and thoroughly purifying the gas, might be made highly ornamental instead of being considered a nuisance, as when first introduced.

It is much easier for the imagination to conceive the beauty of Horticultural buildings heated by gaslight, and presenting a brilliancy equal to the light from the hundred lamps of Aladdin, described in the Arabian Nights' Entertainments, than to attempt to convey any idea of the effect of the pages of the *Gardeners' Chronicle*. The suggestion is, however, worthy of a trial, as the following will show: Several years ago, the writer had a pair of fine canary birds, and the place in which their cage was placed being within a few feet of an Argand gas-burner, lighted at sunset, and allowed to burn until 8 o'clock, P.M.; these birds continued to breed during the whole of an average severe winter, and brought up their young quite healthy. It did not occur at the time that this unnatural mode of conducting themselves in this country might have taken place in consequence of their proximity to the gaslight; but it is now evident this was in reality the cause which produced the effect stated, as the mate never ceased to sing, nor the birds to be as lively, and to eat and drink as well during the evening, until the gas was put out, as they were during the day. In the same window where the gas-burner was placed, were several Pelargoniums, which continued in a remarkably healthy state throughout the winter; and on reflecting on their appearance, although it is many years since, it is easy to remember the tender leaves of an evening turning to receive the full rays of light from the Argand gas-burner.

The introduction of hot water in tanks or troughs for heating Horticultural buildings is a decided improvement, and must be far more congenial to the plants than heat transmitted through metal pipes; and were the tanks con-

structed of any substance not liable to oxidation and consequent evolution of noxious gases, they might be made valuable auxiliaries in dispensing heat and moisture. It is not, however, at all probable that the tank system derives its value on the principle of bottom-heat, which is contrary to that of nature. The only heat given out by the sun, the life of vegetation, enters the ground at the surface; and it is, therefore, more than probable that the success of the tank system depends upon the steam arising from the hot water in the troughs falling upon the leaves, becoming condensed, and running down the plants in a genial form, penetrating the earth, and nourishing the roots—infusing life, beauty, and vigour into all their parts. Should this view of the action of hot water in Horticultural buildings be found by experiments to be correct, instead of being placed in iron tanks under the plants, open aqueducts might be formed on an economical principle by substituting troughs made of the same material, and nearly similar in shape to house-tiles, which could be joined together by cement, so as to convey the hot water by its own natural gravity to any part of the buildings. Under the superintendence of an intelligent gardener, an artificial hot-water miniature river might be made to flow throughout the whole extent of a conservatory, diversified by numerous miniature waterfalls, which would add much to the purity of the air; and the water, when nearly cool, might be received in reservoirs for gold and silver fish, and again enter the boilers to be heated, and perform a perpetual round, diffusing warmth and moisture equal to that of tropical climates, or graduated to suit the productions of every country warmer than our own.

The writer, instead of submitting his views on this subject, would have preferred making the experiments himself; but his other avocations prevent him at present. He feels convinced, however, that any experiments carried on by the admirers of Horticulture will be freely made public in the columns of the *Gardeners' Chronicle*.—*John Grant, Editor of the "Army and Navy Register," Woolwich.*—[We insert this letter from our ingenious correspondent, without at all advocating the view he has taken of the subject, in some of its details, especially as regards light by night, and bottom heat.]

ON THE CONSTRUCTION OF ARTIFICIAL ROCK.

THE pleasure-ground of a mansion can scarcely be considered complete unless it contains a piece of rockwork, either natural or artificial. There are, however, few persons who can imitate natural rock successfully. I have heard several gardeners remark that the most difficult task which they had to perform was that of raising an artificial mass, so as to present a natural appearance; and this is not to be wondered at when we consider the unfitness of the materials which are oftentimes employed. The common method is to raise mounds of large rough stones, and I have seen some tolerably good imitations made in this way: it is an operation, however, which requires much skill, especially when the stones are ill-suited for the purpose.

It is desirable, then, that the construction of artificial rock should be better understood; for, in addition to the romantic effect which rocks in most places present, there are numerous plants which grow admirably upon them, and which seem more at home in such a situation than when growing in the common border. The following method of constructing artificial rockwork is now coming into use; and as it is greatly superior to the old or usual method of employing rough stones only, I doubt not but a description of it will be received with pleasure by your readers.

Where a large piece of artificial rockwork is to be formed, it is advisable first to sketch the surrounding scenery, and afterwards to introduce a drawing of the rock itself. This, though not absolutely necessary, gives a good idea of the effect which rockwork would produce in that place. The operator having the future appearance of the mass in his "mind's eye," must proceed to stake out the foundation, which, as the form of the rock should be irregular, must be so likewise. If the body of the rock is intended to be raised much above the ground level, a quantity of soil and rubbish should be carted into the centre of the space. This soil, besides serving to support the rockwork, will also form a border for the plants to grow in.

Having at hand plenty of large, rough stones, broken bricks, or stony rubbish of any kind or colour, proceed with these to imitate the form of natural rock as nearly as possible. Rough, bold, angular projections, and deeply-formed chasms, are the principal features in natural scenery which please us most. A rock with a flat, unbroken surface, whether horizontal or perpendicular, presents too much sameness to be pleasing to the eye; therefore, in imitating nature, the projections should be varied and bold; and unless raggedness and intricacy form principal features in its composition, it will lose much of its effect. If the rockwork be on a large scale, it should not be one continued line, but broken at intervals; in one part lost beneath the surface of the earth, and again rising in another part, and resuming its sinuous form.

So far, there is little difference between this and the common method of making artificial rock. When, however, every stone has been arranged to suit the eye, the interstices between them are to be filled up with any kind of rough mortar. Of course, fissures and similar places, intended for the plants which are to cover the rock, must be left open, so that the roots may penetrate to the soil beneath the stones. The next operation is to daub the whole mass over with roman cement. For this purpose the latter should be mixed with water, until it is of the

consistence of thick paint, in which state it may be applied to the stones with a large painter's brush. The spaces between the stones having been filled with rough mortar, prevents the cement from being wasted. The thickness of the latter on the stones need not be more than the eighth of an inch; it will unite the whole into one mass; and rockwork thus constructed, is, beyond all comparison, far more natural than that made in the usual way. It has none of that disjointed appearance which usually accompanies rockwork made without cement.

After a few months exposure to the weather, rockwork thus formed (if skilfully made) cannot, without careful examination, be distinguished from a natural mass; it will soon assume the appearance of nature, for mosses, lichens, &c. will soon cover all but the most prominent parts. If the cement be of too light a colour, which, for some situations, may be the case, a little lamp-black or soot may be mixed with it. Care must, however, be taken that no substance which may make the cement more porous is used, otherwise it will peel from the stones after a hard frost. For the benefit of those who are not accustomed to using cement, I may mention that no more should be moistened at once than can be used in a short time; if the cement be good, it will quickly harden, and will then be in a manner useless.

In preserving cavities in the rock for plants, care should be taken that no places are left in which the water may lodge; or in frosty weather, the ice, by expansion, would split and peel off the thin crust of cement; therefore, all hollows or cavities should have a hole at the lowest part of them, communicating with the soil beneath the stones, so that the water may drain off.

There are many plants which thrive much better on rockwork than in the open border. I fear, however, that a list of them would occupy too much space; and by enumerating a few I should undoubtedly leave out many interesting ones. There are, nevertheless, several Saxifrages and Veronicas, hardy Heaths, Ferns, and Vincas, which grow remarkably well in such a situation. They should never be allowed to cover entirely the rock on which they grow; considerable portions of it should be left bare, or it will assume the appearance of a shrubbery, especially if viewed at a distance. I have seen several fine pieces spoiled by being too thickly planted.

Much of the good effect of rockwork depends upon its situation. It may, in itself, be beautiful; but if it be improperly situated, nothing can be a greater eyesore. The choice of the situation, then, should be left to the experienced landscape-gardener, or to one well versed in the picturesque, who can distinguish between the proper and the improper situation. After the site has been chosen, its formation after the manner that I have just described would be easy. Nature furnishes us with an abundance of excellent examples; any one after an attentive observation of a natural rock, might direct a labourer to make a rough likeness of it. Thus an imitation of the dropping well at Knaresborough, or even of the rocking-stone in Cornwall, might be made. It is not, however, every piece of natural rock that is worthy of being imitated; a little taste will be required in the selection.

It is not in the pleasure-ground alone that rockwork might be advantageously introduced. There may probably be many romantic and appropriate situations in the length of the approach, or in sequestered drives, where masses erected here and there would greatly heighten the beauty of the scenery. Even where rocks naturally exist, their appearance might, in many cases, be much improved by the help of stones and cement. Additions to their height or length, or to the diversity of their forms, might be easily made.

Rocks, where they exist naturally, or where artificial ones are judiciously introduced, tend greatly to beautify a piece of water. What can be more appropriate than rocks for the high banks of a lake? The introduction of one or more islands of a proportionate size would add much to its picturesque beauty, and what more suitable for the banks of such islands than rocks? Crowned by the pendent branches of the Weeping Willow, studded over with the modest little Heath, or clasped in the embrace of the tortuous Ivy, they seem, with their rocky-bound coasts, and their miniature bays and promontories, to exult in their triumph over the angry waters dashing at their feet. In harmony with the whole, a boat-house, in the form of a cave, might be built in some retired corner.

A fantastic appearance may be given to any piece of rockwork, by fixing with cement to its more prominent parts large pieces of calcined coal or clinkers, and covering them with cement of the same colour as the rest of the rock. These clinkers will impart to it a singular, but certainly not a natural, appearance. If it is desirable to form a piece of rockwork without reference to its natural appearance, these clinkers may be used; but under any other circumstances I cannot recommend them.

Chairs, vases, and similar ornaments, having a rude resemblance to the antique, may be easily imitated and placed where fancy may dictate.

A grotto built of rough stones and coated inside with cement will form an interesting retreat during the heat of summer. An unnatural effect is produced by having shells, &c., studded over the roof in diamonds, stars, circles, and half-moons; but petrified substances, spars, crystals, curious stones, &c., scattered carelessly about, would have a much more pleasing effect than if disposed in fancy figures. Externally, the grotto may be filled up as a piece of rockwork. There should not, I imagine, be an extensive view from the grotto, nor should it open on the highly-finished lawn and pastures. It may easily be secluded by being surrounded with shrubs, and it will then tempt the fatigued wanderer to take refuge in its refreshing coolness. There are numerous Ferns and

other plants which will grow in a subdued light, and these may be planted inside the grotto.

In making artificial rock for waterfalls, or other constructions where the cement may be constantly exposed to the action of water, the best water-cement should be used. Any preparation that does not quickly indurate under water will, in a short time, be washed away, and leave nothing but the bare stones. It will be seen that I have spoken principally of making rockwork on a large scale; the principles are the same, however, whether applied to covering a rod or an acre of land. In conclusion, it must ever be borne in mind, that "the greatest triumph of art is to conceal art."—*Observer.*

A DESCRIPTIVE LIST OF CARNATIONS AND PICOTÉES.

It is possible that the opinions given below may be at variance with the ideas of other cultivators of these beautiful and fragrant flowers. With all due deference to my brother florists, who may have a different standard of perfection to that of Nottingham, I beg leave to state that, with us, purity of the white is indispensable; and that an equal distribution of colour, whether in bizarres or flakes, is also requisite: form and regularity of marking take the precedence of size, and the pod must be long and well-formed. Petals either very thin or serrated are disqualifications which cannot be overlooked. The following list will contain a description, which may be taken as the opinion of Nottingham florists, of about 20 sorts in each class, cultivated by myself.

SCARLET BIZARRES.

Jolly Dragoon (Ely's).—A large and rather coarse flower, colour high, and white tolerably pure.

Game-boy (Rainforth's).—Does not crown well, yet is a great favourite with many, on account of its beautiful markings; too thin for a first-rate flower.

Leader (Hepworth's).—Finely-marked, and a high-coloured flower; rather small, but a general favourite. The layers appear to be more shy in making roots than some other varieties; it therefore requires to be layered early.

Don John (Merchant's).—Thin of leaf, muddy, and worthless.

Lady of the Manor (Milwood's).—Rather small; often deficient in dark stripes; may occasionally be caught fine, and requires to be grown strong.

Patriarch (Hutton's).—Pod good, inclined to be thin; but when grown fine there are few in its class that can excel it; the colours and disposition of the stripes are good.

Union Jack (Ward's).—A fine and large flower; colours well distributed; of excellent shape and petal, crowning well: its only drawback is that the white is flushed when the flower is opening.

Sir Robert Peel (Grove's).—A well-shaped, finely-marked, and useful flower.

Locomotive (Marris').—Raised a short time ago at Leicester; the stripes are good, on pure white ground; and it promises to become a favourite.

Duke of Leeds (Hoyle's).—Thin; the white seldom pure; by no means first-rate, although it wins many prizes in Lancashire.

Prince Albert (Hale's).—Fine pod and very large flower; well-marked, and decidedly the best of its class which I have yet had from the south.

Splendid (Martin's).—A finely-shaped flower, though not so "splendid" as I was led to expect. With me, there was not a fair proportion of bizarre; the colours were not properly balanced, although having only grown it one season, I am not sure that this is its usual character.

Conquering Hero (Wilmer's).—Large; rather coarse; colours inclined to be dull; sometimes comes fine.

Brutus (Colcut's).—A very large and finely-formed flower; indispensable to a first-rate collection. It is a question whether *Splendid* or *Don John* can beat it.

Juba (Colcut's).—A flower of later date than the above; of first-rate shape; a good marker, and a decided acquisition.

Charles the XIIth (Mansley's).—Sometimes rather deficient in dark stripes; when in good order it is a superior flower.

William the IVth (Walmsley's).—High-coloured; white impure; decidedly second-rate.

Colonel (Lee's).—Good shape, but rather thin; the white has a yellowish tint, otherwise it is a meritorious flower.

Duke of Devonshire (Fletcher's).—Not large, but with stiff, well-formed petals; generally the succession blooms have less bizarre than the first.

Mars (Walmsley's).—The white rather impure, but the petals are broad and the stripes are extremely rich and well distributed; sometimes very fine.

CRIMSON BIZARRES.

Duke of Bedford (Ely's).—A beautifully-marked flower; white pure, and shape good.

Count Paulini (Holmes').—This, although much admired by many, appears to want that due proportion of colours which constitutes a first-rate flower.

Duchess of Kent (Brown's).—A beautiful, high-coloured flower, of good form and substance; rather late.

Bloomsbury (Soorn's).—The petals are rather narrow and thin; the white often impure; still it is a pleasing flower.

Hector (Brown's).—Improperly called *Toone's Conductor*; late, but highly-coloured; is sometimes met with extremely fine; the petals are stout and well-formed.

Lord Milton (Ely's).—A great favourite; form good; colour high and well-distributed; extremely apt to run, but, when in colour, first-rate.

Lord Brougham (Greasley's).—Quite as good as the preceding, but much scarcer; the grass is apt to mildew, more than that of most other sorts; form excellent; white good; colours bright, and well balanced.

Squire Plumtree (Hufon's).—A fine flower; petals rather long; colour well distributed; the layers are rather difficult to root.

Mrs. Brand (Ely's).—Large and well-formed; rather deficient in dark stripes; when strongly grown and in proper colour it is first-rate: with us, it is termed a "catch flower," from its uncertainty.

Wm. Canton (Ely's).—Pod long, not apt to burst; the flower is of medium size, thin of petal, but marks well.

Robert Burns (Mansley's).—A fine and double flower, equal in point of marking to Ely's Lord Milton and Greasley's Lord Brougham; consequently ranking in the first class.

Tallyho (Woolley's).—Serrated, as one of the exploded Picotees; utterly worthless as a show flower.

Bonpland (Wilmer's).—Finely marked, with a good pod; petals rather long, but a clean, useful flower.

Lord Durham (Tomlinson's).—Fine and very lively-coloured; of good form and size.

Rainbow (Cartwright's).—A good old sort, apt to expand with its petals much disordered; a shy propagator, and difficult to get first-rate.

Squire Ray (Hufon's).—A remarkably clean flower, with its colours well balanced; follows close in the wake of the first-rate ones before alluded to.

Betsy (Lovegrove's).—Large, but will not do for this part of the country, one-half of the petals being almost destitute of bizzare; desirable only as a border flower.

King Alfred (Gregory's).—An old flower, with good properties; a superior second-rate.

Eclipse (Easom's).—A large and gaudy flower; outer petals large and well-formed; strongly-marked, the centre often coming rather confused.

Tagioni (Pickering's).—A beautifully-marked and showy flower, of medium size, differing in colour from most other sorts; in this variety there appears to be almost too great a preponderance of the crimson markings.—**J. F. Wood, The Coppice, Nottingham.**

(To be continued.)

AMATEUR'S GARDEN.—No. IX.

THE potting of plants is an operation easily performed, though the principles upon which success is founded are not so well understood as the proper treatment of plants makes it necessary that they should be; a fact rendered sufficiently obvious by the miserable specimens too generally met with. And why is this? Simply because the cultivator, instead of examining for himself whether his manipulations are in accordance with the laws of nature, rests satisfied with following in the footsteps of his predecessors, without inquiring whether their practices were right or wrong; and hence but little pains have been taken to apply properly the necessary elements of vegetable organism, which nature everywhere so bountifully spreads around us.

It is an undoubted fact, that all plants like fresh soil and leaf-mould; and any person who has a supply of these two, with good peat and silver sand, may, without any further assistance from soils, grow any plant in existence.

A plant in a pot is in the most artificial state in which it can be placed; as its roots instead of being some degrees warmer than the atmosphere which surrounds them, as they would be if planted in the natural soil, are from the current of air constantly passing round the pots, and the consequent evaporation from its surface, some degrees colder. This circumstance alone is enough to account for our precarious success; but when in addition to this, it is recollected that the roots are constantly alternating between drought and moisture—that they are violently excited at one time and actually flagging for the want of water at another,—the wonder is, that the cultivation of delicate and finely-rooted plants is not attended with more disappointment than has hitherto been experienced.

The general method pursued in potting plants, till within the last ten years, was to sift the soil as fine as possible,—to use little or no drainage; and when the plant required more pot-room, to give it only a very small shift, and that at some stated period. In truth, plants were subjected to a regular routine of management, as invariable as day succeeded day; quite irrespective of their constitutional peculiarities and diametrically opposed to nature. But since the sifting of soil has been to a considerable extent dispensed with, larger pots have been necessarily used; and a consequent improvement in cultivation has been the result.—Almost all the garden authors from the time of Abercrombie to Sweet, and from Sweet to the present day, with few exceptions, recommend soil to be sifted, and the indispensibility of giving plants a small shift in repotting is insisted upon. And what is the result of this? the roots, from their disposition to extend themselves laterally, are constantly matted round the side of the pot, and as the action of the root and branch is reciprocal, so soon as the root ceases to extend itself, so will the branch likewise, at least to a considerable extent, and, as a natural consequence, small, stunted, bushy plants must be the result; whereas, if the same were planted in the open ground, or the well-prepared border of a conservatory, the roots would extend themselves with vigour, and the branches grow with a luxuriance unknown under other circumstances. As a proof of this I may point to the new conservatory in the Horticultural Gardens at Chiswick: the plants in the border are growing with a luxuriance which in some instances has given them a character quite dissimilar to that under which they are known in pot-culture, while the plants in pots are

little better than those we see in ordinary greenhouses, except that they are more profusely set for bloom—a difference mainly attributable to the highly-elaborated secretions of the plants consequent on the superior lightness of the house. These things teach us that confinement of the root is confinement of the branch, and that, if we wish to rival the luxuriance of nature, we must approximate nature more closely in the pot-culture of our plants.

Having now said sufficient to prove that "our ways are not nature's ways," I will introduce to the Amateur's notice a new system of potting, which may be designated the *one-shift system*. The distinguishing difference of this system is, that, instead of taking a plant through all the different sized pots, from a thumb to a 24 or 16, or any other size that it may remain in permanently, it is removed to the permanent pot at once, or at any rate to one very considerably larger than is the general custom; thus, in purchasing small specimens of new plants, they may be placed at once in a 24, 16, or 12 sized pot, in which they will remain for four or five years.

The first hint which I received of this system was some years back, when *Clanthus puniceus* was first let out. A cutting of it was at that time given to Mr. Caie, gardener to the Duchess of Bedford; who at the end of twelve months had grown from this cutting a plant 7 feet in height, beautifully branched, and covered with bloom; while the original plant under my care, although attended with regularity, would not bear a comparison with it. I learnt from Mr. C., that his cutting, directly it was established in a small cutting-pot, was removed to a No. 4 sized pot, well drained, and filled with rough turfy loam fresh from the field, and a little leaf-mould. About the same time Mr. C. offered me some small plants of *Erica physodes* and *pinifolia*, but they were in such a deplorable condition that I did not consider them worthy of carriage. To show me, however, how much I was mistaken, Mr. C. removed them from the small pots in which they were then growing into 16s, in rough turfy peat and silver sand, and in two years they were handsome specimens, 18 inches high, from four to five feet in circumference, and beautifully furnished with branches.

Since that time, I have practised this mode on various plants with success; but to Mr. Goode, gardener at Ealing Park, belongs the credit of applying this system more extensively and with greater success than could have been expected. Amongst the valuable collection of plants at that place, he has a great number in 24, 16, 12, and 8 sized pots, forming magnificent specimens, which are on an average from three to five feet in circumference, and which a year since were either in small 60 or thumb-pots. They have, in reality, made from three to four years' growth in one season, and are flowering in the greatest profusion. Among other genera, may be mentioned *Boronia*, *Eriostemon*, *Leschenaultia*, *Pimelea*, *Gnidias*, *Helichrys*, *Ericas*, *Epacris*, *Chorozemas*, *Polygalas*, *Ruellas*, *Mirbélis*, *Dillwynias*, *Cróweas*, and *Gompholobiums*. It is to be hoped, however, as Mr. Goode is a constant exhibitor at the Horticultural Society's meetings, that he will in future point out the specimens thus grown, to afford visitors an opportunity of judging for themselves, and to demonstrate the superiority of the system. Some gardeners who have seen the plants at Ealing Park object to the system, and contend that though the plants may grow well for a year or two, they will after that time die off. On what principle they found their objections I am at a loss to determine.

The principal thing to attend to in this system will be, to have the pots thoroughly drained; for if water stagnates in such a mass of soil, all hope of success will be at an end. In growing specimen plants, it is a good plan to drain the soil with an inverted pot, as directed at p. 116 for cutting-pots, taking great care to prevent the soil from falling among the drainage, by covering it securely with Moss. Porous stones of various sizes, in considerable quantities, sticks in a half-decomposed state, and even charcoal for some plants, have been used, with satisfactory results. The roots of *Leschenaultia formosa* and of *Chorozemas*, thus treated, wrap round the porous stones and charcoal in the most beautiful manner.

As charcoal is said to be the "life and soul of plants" by one individual, and a no mean cultivator either, a few remarks on its use may not be out of place. In propagating plants, cuttings root freely in it; but if they are not removed into other soil directly after they have rooted, the roots will almost invariably die off. Whether this is from the great supply of carbonic acid, formed by the carbon of the charcoal combining with the oxygen of the atmosphere, and causing the roots to perish in the midst of plenty, I will not pretend to say; but such a result is not improbable, as we know that a plant is soon killed by supplying it constantly with strong liquid manure. "Common wood charcoal," observes Liebig (2d Edit., p. 63), "by virtue merely of its ordinary well-known properties) can completely replace vegetable mould or humus," and as it is the "most indifferent and unchangeable substance known," it must be an excellent thing to use in permanent potting; because, if the soil is sufficiently porous to admit the atmospheric air amongst it, it must form a perpetual manure, though it is difficult to imagine how adding carbon to carbon, as must be the case in adding charcoal to peat-earth, can exercise any beneficial influence. By mechanical action in all soils it will do good, as well as chemically in soils deficient in carbon; but to add to peat-earth is, in my opinion, a mere waste of an excellent manure. Mr. Barnes, of Bicton, attributes the whole of his success to using charcoal; but the charcoal he uses is prepared from vegetable refuse, and therefore partakes as much of the character of vegetable ashes, which are an excellent manure, as of the

properties of charcoal. Nature supplies plants with charcoal in the shape of decaying vegetable substances, and that is the best charcoal that can be used; but, as in moderation it will do no harm, the amateur may use it until by multiplied experiments he proves whether it is advantageous.

In concluding this article, it may be remarked that the principal things to be attended to in this system of potting are, to use the soil as rough as possible. Plants potted in this way will not require so much attention as those potted in the usual manner; because one watering will serve them for several days—whereas in small pots, they would require constant attention.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Firing Ammonia.—I see that several of your correspondents have alluded to an experiment which I have been proposing to the farmers of Suffolk, and of which you took notice two or three weeks ago. I forward you a copy of the *Bury Post*, in which will appear my Eighth Letter: and if you can find room for its insertion, I shall feel obliged, as it will show your correspondents that I have not been so anxious about proposing this experiment under a form which would be considered unexceptionable by chemists as I have been desirous of stimulating the farmers to adopt a mode of experimenting which may be of importance to their interests. My previous letters have pretty fully discussed the subject of firing ammonia with gypsum and other substances, and if your correspondents have an opportunity of referring to them, they will see that I have forestalled some of their remarks. I have now superintended the preparation of one experiment, and hope in a day or two to superintend one or two more, with the aid of my more practical neighbours; I shall then draw up the Schedule referred to in my letter, and if you can find room for its insertion at some future period, it may be the means of inducing some one to improve upon it. I think you will agree with me that some such scheme of extensive experimental co-operation as that which I have advocated, and as (I am happy to say) the farmers of Suffolk have now proved to be feasible, is the most likely mode of rapidly accelerating the progress of Agriculture.—*J. S. Henslow.* [The following is the letter alluded to:—

To the Farmers of Suffolk.

Gentlemen,—I must allow the leaves to go on with their exhalations and respirations, without interfering further with these functions for the present, whilst I request your serious attention to a few observations I wish to make on the result of my appeal to you. When I announced my intention of calling for not less than fifty to co-operate in the way I have proposed, I found a very decided opinion expressed in all quarters that I should not be able to prevail upon so large a number. I had calculated on the well-known spirit and energy of Englishmen, whenever fairly convinced that any particular course is the right course to be adopted: my only fear being that I should not succeed in persuading many of you to see, as clearly as I do myself, what your present course ought to be for securing the speedy improvement of Agriculture. I had also witnessed, during the last two years, the great desire expressed by the members of the Hadleigh Farmers' Club for any description of information which might bear directly or indirectly upon your pursuits. I find that I have not miscalculated in the inferences which I drew from these premises. I have received the addresses of 42 gentlemen who are willing to accept my challenge, and I find from two quarters that I can calculate upon receiving from 10 to 15 more. Before another week has expired I hope I shall have superintended the preparation of the proposed experiment on two or three farms in this parish. I will then print my promised circular, with precise directions how you are to proceed, and with it I will transmit a *Schedule A* (for rotten dung-hills!) containing blank spaces to be filled up by each experimenter. These schedules will be returned to me some months hence, when the results have been obtained. Now that I consider we are fairly embarked, I must be allowed to speak a little more gravely than I have always found myself inclined to do. I must feel myself quite sure that you correctly understand all that I am aiming at. One point, certainly, is to ascertain whether the addition of gypsum to a common dunghill will improve the quality of the manure—which is putting this question in its simplest Agricultural shape, divested of all chemical and theoretical notions. But the decision of this question I hold to be a very subordinate purpose to one of still greater importance which I have had in view. I am chiefly desirous of giving you an example of the manner in which your Agricultural experiments ought to be conducted, if you would hope to render them available for scientific purposes. I believe our gypsum experiment to be only one of several which must be tried before the question at issue can be fully settled. But every such experiment, thus tried by a numerous body of experimenters, upon a correct principle, will add something so positive to the general stock of knowledge, that it is impossible it should not become of real importance to your interests. The little trouble or very trifling expense which each individual experimenter may happen to incur in such cases is no way increased by his having 49 co-operators, whilst the value of his single experiment may possibly be augmented more than fifty-fold. It would be a ridiculously trifling tax upon any farmer to perform yearly one such experiment. We can all appreciate the advantages which flow from a division of labour; and many who may not be qualified for suggesting correct methods of experimenting for themselves, might be prevailed upon to act upon the suggestions of others, provided the precise mode of performing

an experiment were laid down for them. The old proverb declares that "Lazy folk take most pains," and I almost question whether this proverb was not made prospectively, to apply to the manner in which certain so-called experiments have been conducted in our times. There is no lack of Agricultural experimenters. It should seem that we are overstocked with them in England. A gentleman, high in your confidence, writes thus to me: "The fact is, that whereas farmers were formerly averse to all change, many of them are now ready to try every thing which is recommended, and it is necessary to be cautious not to mislead them into expense." Now, this struck me marvellously as a very lamentable necessity. You are to be restrained in your anxiety to improve, and to be prevented from doing what science has been urging you to do. I have no doubt the remark was just, from the high authority from whence I received it; but it is equally obvious that the reason it was so must be because farmers in general have not qualified themselves for experimenting in a safe and judicious manner. Most certainly there have been many experiments of late, conducted in a correct and skilful manner by eminent and practical men, but too many even of these were undertaken with no other than some economical object in view, and not with any scientific aim. The results have mostly been tested by pounds, shillings, and pence, without regard to what might be the real cause of success or failure. Hence no new principles have been worked out. But it is only when these shall have been discovered, that it will be time to test their application to practice by the pocket-argument. For instance, the following comparative experiment was lately placed in my hands by an intelligent gentleman of this neighbourhood. It is performed in the approved way of obtaining comparative results; but from want of detail, and from standing single, very little can be inferred from it with respect to the nature of the influence exerted by the nitrate of soda. Half an acre sown with, and half without the nitrate of soda.

	cb.	bl.	pk.	lbs.
With the nitrate, Wheat	3	2	3	840
Without ditto	3	1	2	746
Increase from nitrate	0	1	1	94
Cost of the nitrate of soda				13 6
Value of the 1b. 1p. of Wheat, at 7s. 6d., 9s. 4½d.; 94lbs. of straw, at 2l. per ton, 1s. 8d.				11 0½
Loss on the half-acre				2 5½

Here the balance being against the pocket, no more attempts were made with nitrate of soda. The inspection of the above induced me to ask the experimenter whether he had thought of trying only one-half or one-fourth the nitrate of soda, to see whether the increase might not still be the same. If it should have turned out that such was the case, the pocket would then have pleaded in favour of its application. Before we can expect to understand the precise relation which nitrate of soda or any other salt bears to the effect it produces on a particular crop, there must be many well-digested experiments performed in many parts of the kingdom; and their results registered with a sufficient degree of uniformity to admit of their being compared together. Now, with the ready machinery of your numerous local Agricultural Societies, and the great central society in London, together with the invaluable advantages offered by the penny postage, you might very easily organize a system of co-operation throughout Great Britain, which I am persuaded would work with rapidity and an efficiency that would surprise you all. Of course, every one who may be desirous of promoting such a system must be at some trouble, but this will generally not be greater than is required to direct and superintend a labourer for two or three hours, whilst he is trimming a hedge or digging a ditch; the personal trouble to the farmer himself would literally be no greater than that. The intellectual part of these proceedings might be all transacted within the skulls of a few chemists, who would suggest, and within those of the more active members of your various Agricultural Societies, who might busy themselves in preparing and circulating, the different *schedules* to be filled up by the several experimenters. All that is now wanting to the adoption of such a scheme, is to convince the farmers of England generally, that unless they will consent to co-operate, they cannot expect to avail themselves (otherwise than by very slow degrees) of the information which modern science has placed at their disposal. I am no enthusiast in this opinion—I am speaking the words of sobriety. I am only repeating what others wiser than myself have continually asserted. I have already referred you, in my address to the Hadleigh Club, to the opinion of De Candolle, and I have within these few days met with a similar declaration in an agricultural work in course of publication by Mr. Johnston, of Durham. This gentleman is a chemist of high reputation; and, in his Lectures on Agricultural Chemistry and Geology, he has suggested several experiments in practical Agriculture. In speaking of the effects produced by special manures, either on particular soils or on particular crops, he remarks:—"Now, neither of these subjects, which it is so important to investigate, can be determined, either from theory or from experiments devised and executed in the laboratory of a chemist. The aid of the practical farmer, of many practical farmers, must be called in. Numerous experiments or trials must be made in various localities, and by different individuals; all, however, according to the same rigorous and accurate method; in order that, from the comparison of many results, some-

thing like a general principle may be deduced." The whole question then evidently turns upon this—whether the farmers of Great Britain are prepared to co-operate in making experiments under the guidance of persons qualified for directing their efforts. There is, in fact, an important link yet wanting in the chain which is to connect science with practice; and if science is only permitted to hold the pincers whilst practice plies the blows, that link may be forged and fastened. My hopes are now much strengthened that this will soon take place. I shall in future listen with impatience to any desponding surmises about your not being sufficiently awake to the importance of co-operating for such a purpose. "My own experience (says a valued correspondent) in this neighbourhood (Surrey) is against expecting the present race of adult farmers to become much of readers; and so my hopes rest on their sons." But I conceive it is not necessary, for that description of co-operation which is required of you, that the present race of farmers should become "much of readers." Let them act upon the suggestions of others; and then, whilst Liebig is uttering lamentations over his Germans, and consoling himself by talking of what will be done by a generation to come, the present race of British farmers will have forestalled that generation of foreigners yet to come, and have left the present generation behind. Why should we doubt that the farmers of Great Britain generally would be less prepared to co-operate than the farmers of Suffolk have shown themselves to be? No doubt there are some, and probably not a few, among you, as among every other class of men, who would indolently prefer a shorter road than that which science points out to them. Perhaps it would have been easier for me to have enlisted twice fifty co-operators if I had assured the Agricultural world that my past studies in Botany had led me to the discovery of a marvellous composition, a certain incomparable vegetable elixir, in which it was merely necessary for the sower to steep his seed, and he would at once be able to double his crops! But to have found more than fifty willing to proceed in the legitimate spirit of philosophy, and without anything promised about reaping an immediate return is an event which I must consider of most excellent omen. From what I have heard since my last letter, I believe a little further delay would have greatly increased our numbers; for I find that several farmers of this neighbourhood have not seen my challenge, and had only heard of it through others. If not more than twenty-five of you had come forward, I should still have asked each man to procure a double, and I make no doubt that we should thus have got our number completed. As it is, I think it will be advisable to increase our numbers, rather for the sake of experimental instruction, than for the issue of the experiment; and I shall have a hundred copies of *Schedule A* struck off, that I may be prepared to supply any additional recruits. Whilst you are performing this experiment, I must call upon you to toss all prejudices and antiquated opinions to the winds; and to proceed as closely as possible upon the instructions with which you will be furnished. There must indeed be a certain latitude allowed, because it may not be convenient for one person to use any but littered straw, or for another to apply it to a particular crop: but the very object of requiring so many as fifty is to merge the inconvenience of such contrarieties as these in the general results obtained. We are not in the position of chemists operating upon weights which it is necessary to test to the tenth of a grain; and we require no costly apparatus for determining our quantities. For the present experiment, your agricultural laboratory need be furnished with no more than the following instruments:—1. A dung-fork. 2. Pair of scales or steelyard. 3. A common basket and a pint measure. 4. Sieve. 5. Watering-pot. The gypsum must be finely powdered; and not burnt into Plaster of Paris.

Your obedient servant,
J. S. HENSLAW.

Hitcham Rectory, February 25, 1843.

Brewers' Grains as a Manure.—I noticed, at p. 105 of the *Chronicle*, some remarks on *Brewers' Grains* as a manure. I need not remind you of the importance of having the component parts of every substance proposed or employed as a fertiliser determined by chemical analysis. Previous to your notice, I had been engaged in the examination of *Brewers' Grains*, with a view to determine the proportion of water, organic matter, and earthy ash. The result of my inquiries was as follows:—One hundred parts of the Porter Grains of the Brewhouse contain—

Water separable at 212°	70
Organic matter	28
Chlorides of potassium, sodium, and calcium, and trace of sulphates	.25
Phosphates of lime and magnesia	.50
Silex, and a little alumine	1.25
	100.00

The proportion of water will probably vary considerably, and could a ready mode be devised of getting rid of this before carrying the Grains away, it would be beneficial in two ways—by saving the carriage of so much water, and by preventing the rapid fermentation and heating during the transit so much complained of. Whether this could be done economically is another question. I understand Porter-Grains can be obtained at the large breweries in quantity at 1s. per quarter of 8 bushels. Supposing them in the dry state, they would contain about 1½ per cent. phosphates of lime and magnesia; which is nearly half that present in that curious vegetable production called Vegetable Ivory, which I find contains 4 per cent.—*W. H. Potter, Upper Fore-street.*

Transplanting Walnut-trees.—Your correspondent "Totty," who, at p. 809, Vol. ii., requested information

upon transplanting large Walnut-trees, was, at p. 5 of this year, answered by Mr. Busby, who, instead of giving the desired information, described his own system of removing large Apple and Pear-trees. If the method described by him be at all necessary, would not a well-decomposed light turfy loam, or even any good soil, be preferable to leaves, particularly when a whole year intervenes between the operation of digging the trenches and that of transplanting the trees? The former material would encourage the root, cut in the operation of trenching, to push out numerous young fibres; the latter, I think, would not. In the large park fronting the Mansion-house at Ardgowan, I saw during the springs of 1836-7 and 8 spots successfully embellished with large and stately forest-trees, many of which were in the season previous treated according to Mr. B.'s system, with this difference, that good pulverized soil and chopped turf were carefully put round the balls instead of leaves. This greatly encouraged the formation of spongioses. In transplanting them, open weather was preferred to frozen balls; the young fibres indeed kept the balls entire in that operation. I am of opinion that the system of freezing the balls of trees previously to transplantation is unnecessary, if not improper; and I think there is nothing in the progress of the trees experimented upon by Mr. Busby, as well as others which I have seen, to prevent me from coming to this conclusion. For the better information of "Totty," as well as Mr. Busby, who doubts not, if the system practised by himself were adopted, that large Walnut-trees would succeed, I may state that at this place Walnut-trees have been transplanted which, from the authority of a creditable workman, who assisted in the operation, were taken up regardless of that great and due precaution so much insisted upon by the scientific transplanters of the day, having had neither the unnecessary and often impracticable ball of 16 cwt. of earth, nor yet a frozen one. They have been removed several years, and are quite healthy, and in keeping with the neighbouring fruit and forest-trees. When transplanted, they were of sufficient size to ensure any one success in removing large Walnut-trees, provided they were manageable as to weight and bulk.—*J. M'Lean, East Hampstead Park.*

On Planting.—At page 84 of this year's *Gardeners' Chronicle* is an article by "R." on Planting. Allow me to make a few observations thereon, and to thank "R." for bringing my experience and knowledge on the subject into more notice. But had "R.," with some others who have written on this subject, condescended to inform the readers of the *Gardeners' Chronicle* where they got their knowledge from—would it not have redounded much more to their credit, than to bring it forward as from their own experience—when it is clearly evident they have gleaned it from my book, entitled, "Facts, Hints, &c., on the Management of Young Plantations," published about 17 years ago! I beg of those who may be possessed of my work to compare the article on Planting by "R." with the following numbered pages in my book, and they will be fully convinced how and where he culled his knowledge from, as he has in most places used my very words verbatim. I would not have noticed such conduct, only it is so grossly palpable. "R." might well be ashamed to avow his real name. Pages referred to in my work:—first paragraph or division of "R.'s" article, refer to page 157; second do., 168; third do., 169; fourth do., 176, 7; fifth do., 182, 3; sixth do., 184—189; seventh do., 189, 196; eighth do., 214, 235; ninth do., 235, 238, 242.—*W. Billington, Underhill, Oswestry, Salop.*—[We regret to find on referring to these places, that Mr. B.'s complaint is perfectly well founded.]

Training Forest Trees.—Permit me once more to reply to "Quercus," who, at p. 37, still seems to misunderstand me; and I will therefore again endeavour to set him right. Had he availed himself of seeing my publication on this subject, he would, as he appears open to conviction, have been at once convinced. I entirely agree with him as "to the injury proprietors and managers of woods do to timber, by following the pernicious systems laid down by theorists, and adhered to in too many instances with a confiding pertinacity which is truly astonishing." "Quercus" says—"Mr. Billington sees flourishing timber through the medium of his system;" and he himself says, "he sees it as good, or superior without any pruning at all." True. "Quercus" might see here and there a chance tree as good; but my system is to make every tree profitable, good timber. He then asks, how is pruning by any system likely to increase the timber in trees, if that increase depends upon the "number of branches and leaves?" and again says, he cannot think of any system of training that does no counteract the intention. I have now exchanged the term pruning for training merely from the erroneous and conflicting opinions about pruning; and I maintain that the increase of timber is from the number of branches and leaves, including their healthiness—and that my system of training is to increase the number of both branches and leaves, as well as their health and vigour—to regulate the branches to a moderate size, and keep them in bounds until the head shall begin to be formed; and no to curtail them at all, except in some rare cases and species, but to increase them when necessary. "Quercus" says, "Mr. B.'s system of training is simply to regulate those parts (branches and leaves) according to science, as to aid those properties in accelerating the elongation and regular increase of the timber in the stem, and not to expand itself in useless branches;" this is true. He then asks, "How can branches be useless if the increase of the stem depend on their number and healthiness?" What I mean by useless branches is, when trees have arrived at maturity, and the branches have performed

their functions; when the trees have to be cut down for use, then it is that the branches are useless, except for "spray, firewood, and faggot;" and all on account of not having been trained in a proper way when young, so as to have increased the timber in the stem, instead of running all to branches—as most trees naturally will in open places. To be sure, by leaving trees to nature, you may have one good tree in fifty, or perhaps a hundred; but train them in a proper way while they are young, and you will have every tree valuable, and in much less time. We may, however, write and inculcate the true system all our life: it will produce little good effect until an Arboricultural Society is established, and experimental plantations are formed for training forest-trees, to exemplify by example and practice, and to show the certainty of the system accomplishing what it professes. It is become a cuckoo's song at the present day with most landed proprietors, as few will listen and fewer heed the strain. I am surprised that "Quercus" should still persist in saying that he "fears I have some latent clinging in my mind to the old notion—that what is taken from the head of a tree by pruning is necessarily laid on the stem;" whereas, I distinctly said in my last reply, and again repeat, that the increase of timber or wood is from the descending filaments from the annual leaves and leaf-buds; whereas, were those parts diminished, it is evident that the increase of the timber would be also; and that my system, intended to increase and regulate them is so as to form profitable timber instead of useless branches. As to my not furnishing a more expressive term for "reciprocity between the roots and branches," by which I presume "Quercus" means an equality, I confess I cannot see my way clearly on that point; for I cannot conceive an equality of roots with the branches, on trees with immense heads, growing in fissures of bare rocks and similar places. As to a mutual connexion between roots and branches, there can be no doubt of that.—W. Billington, Underhill, Oswestry, Salop.

Thawing Plants.—During four years that I had charge of an extensive collection of Ericas, I frequently went to bed fully conscious that on getting up on the following morning, 2° or 3° of frost would be in the Heathery, on account of its elevated and exposed situation. In such instances I invariably resorted to the plan recommended by Mr. Ayres, at p. 84; by which means I soon thawed the plants, while at the same time I kept down the temperature during the day, compared with what it would have been, had fire-heat been applied. I hope I shall not be misunderstood, when censuring elevated and exposed situations for a Heathery. It is an extreme case which I have in view, and therefore it is the abuse of the principle, and not the use of it, which I censure. I would not have 1°, 2°, or 3° of frost in the Heathery, if I could avoid it. I have had Ericas subject to many degrees of frost, which they have survived, with a loss of their foliage; but this injury from frost was affected by the very principle which I have censured, namely, a free exposure to light and currents of air; whereby the Ericas were rendered capable of resisting the frost. It is to this last-mentioned fact that the gardener must look for his success in enabling plants not indigenous to this country to survive our winters: and what is true of Ericas is equally true of other plants, if we make allowance for the different circumstances that have made them what they are.—J.

Hardenbergia monophylla.—This pretty greenhouse climber, like all others, if not submitted to a regular mode of training, will become one confused mass of shoots, which, if allowed for a short time only to become entangled, are difficult to restore to order without injury to the plant. Scarcely anything connected with gardening is a greater eyesore than to see climbing plants neglected from want of proper training, or having the shoots tied together like a broom; for whatever may be the natural habit of a plant, in regulating its branches we should imitate nature as nearly as possible, unless it is desirable to train them into any artificial form, similar to the wire trellis lately figured in the *Chronicle*. My method is to train the *H. monophylla* with five leading shoots, one from the centre of the pot, to which a long, small, neat stick is placed; the other four being fastened to four similar sticks, at regular distances round the edge of the pot. From each of these leading shoots proceed numerous side branches, which are densely covered with flowers. When the plant has done blooming, which is by the end of May or beginning of June, I still allow it to remain in the greenhouse, until the shoots are well ripened. During this time, the plant is watered sparingly; for it is only by moderating the supply of water that we can imitate those periodical seasons of rest, to which this, as well as all other exotic plants, is exposed in its native climate. By the first week in August it is taken from the greenhouse and well soaked with water, then placed in the open air in a sheltered situation, but fully exposed to the sun, being double potted to prevent the sun's rays from destroying the small fibres, which are the principal feeding organs. The whole of the side shoots are pruned to one or not more than two eyes, and the leading shoots cut back according to their strength, so as to call into action the whole of the remaining buds. As soon as the new shoots are from one to two inches in length, the plant is taken from the pot, and nearly the whole of the soil is shaken from its roots; the stronger roots are at the same time cut back to smaller fibres. It is then repotted in a new or clean-washed pot, thoroughly drained; for there is no plant with which I am acquainted that suffers more than this from imperfect drainage. The soil in which it thrives well is chopped turfy heath-mould, mixed with a little sand. After forcing, it is placed in a shady place for a short time, and by degrees exposed fully to the sun, being taken into the greenhouse by the end of September. *Hardenbergia mono-*

phylla, when treated annually in this way, will amply compensate for the trouble it occasions. As the leading shoots only are secured, the side branches become pendant, and the plant has a graceful and pleasing appearance.—G. G. Watson, Vicarage, Norton, Stockton-on-Tees.

Cultivation of Roses in Pots.—I commend you for the encouragement which you give for growing Roses in pots. It will not only add a fresh and lovely feature to exhibitions, but it will create a much greater interest in the Queen of Flowers, from the fact of amateurs, like myself, being able to purchase them when in bloom. I have grown Roses for several seasons to what I consider great perfection; and I think the Bourbon family particularly adapted for growing and exhibiting in pots, from their hardier growth and strength of petal enabling them to stand more rough usage than a delicate China. There are many who say that the Rose can never be cultivated so as to form a leading feature like the Pelargonium in our exhibitions, on account of the frailty of its bloom, and of its not producing a sufficient succession of them to enable a moderate cultivator to exhibit at any given time. I say, give them a fair trial, allow it the cultivation which the Pelargonium receives—it will not be done in one or two seasons, but cultivators will soon find out and grow those varieties which are best adapted for exhibiting in pots, and the best method of bringing them to perfection. Then what will be the effect in the course of a few seasons? Doubtless, we shall see "potted Roses forming the most attractive part of our exhibitions," and, from their improved culture in pots, many fine varieties bloom which before would not; while many of the best kinds will bear seeds in this country, which could not be induced to do so in the open air.—A Rose Fancier.

On the Decortication of the Eucalypti in Australia.—One of the most curious phenomena which strikes the traveller in Australia is the appearance of so many of its forest-trees undergoing the above process. It appears and manifests itself in many different shapes and forms. The bark of several species of Eucalypti, being brittle, drops down and lies about, either around the foot of the trunk, or is scattered by the wind to some distance around the tree. As the fibre of the Eucalypti is brittle and dry, it is obvious that the fact above mentioned contributes greatly to the sterility of the soil of Australia. Portions of the loosened bark, not sufficiently dried to drop from the trees, sometimes surround the branches like the skin of a serpent about to be stripped off. This is the case with those species of Eucalypti whose bark is rather brittle; but there are many others whose rind consists of a long and more flexible fibre, and such trees present appearances somewhat different when in a state of decortication. The bark hangs down in strips of different lengths, which when sufficiently loose also fall to the ground. These strips at times exhibit such varied colours that they impart to the forests a strange and extraordinary appearance. The part of the trunks or branches thus denuded present an original aspect, as their colour, soon after the period of decortication, varies from pure white, through all possible shades, to a deep red. The trunk of Eucalyptus resinifera, piperita, and some other species, have then a perfectly white appearance, just the same as if they had been whitewashed; while others, whose bark is brown or grey, present a glossy appearance, far more remarkable than that of our Platanus, to which, however, they bear some slight resemblance. I have observed, that most of the Eucalypti are in a state of decortication at the beginning of spring (August and September); it should therefore be the aim of subsequent travellers to determine,—1. Whether the decortication of the different species of Eucalypti takes place at any certain season of the year, or is dependent on other circumstances. 2. Whether all species lose their bark at the same period, or whether this is done by various species at different periods, or is dependent on the soil, temperature of the season, &c.—The cause of a phenomenon apparent in so many species of a tree most widely scattered over the Australian Continent, is an especial matter of importance to physical geography and botany. A clue towards its explanation may, in the first instance, be attained by that botanical axiom, that the concentric layers of the wood and bark are the reverse of each other; the former increasing externally, the latter internally. As Exogenous plants (like the Eucalypti) increase by annual additions of new matter on their outside, it is natural to suppose that, as the growth of the Eucalypti is very quick, and as the alburnum swells so rapidly, the stratum of the liber becomes first so distended that it cracks and finally separates from the trunk. I frequently had an opportunity of observing the rapid growth of these trees in the swollen appearance which their branches at certain periods exhibited. Such as are crooked (and they bend most fantastically) bear the aspect of a wrinkled human limb, and have the same fulness and rotundity which characterise it. The cracking of the bark is still more assisted in Eucalypti by the delicacy of the fibre previously mentioned. The liber, also, of most of these trees is brittle, very dry, and spongy; and it is from these species that portions of the bark fall, and are scattered about the ground. If the liber is more fibrous (as is the case in those Eucalypti, which in the colony are called stringy-bark gum trees), the same disproportionate extension of the alburnum takes place; the bark cracks and becomes loosened, but on account of its fibrous and tenacious nature, adheres longer to the mother trunk. It is also obvious, that in all trees where cambium abounds, decortication will not take place, as this substance is capable of softening the liber, and consequently of making it more capable of distension. It is evident that Eucalypti, with their scanty astringent and resinous sap, possess but little cambium,

which accelerates their loss of bark. As in this process the outermost part of the alburnum has to become the epidermis of the future bark, a series of changes takes place in this respect, and it is obvious that those parts of the Eucalypti which after decortication have the appearance of being whitewashed, are the places where the alburnum has been changed into cortical epidermis. As the Eucalypti are evergreens, and the period of their rest is less distinctly marked than in our northern trees, and, moreover, as this decortication shows their growth to differ from that of most others, it is difficult to determine the age of such trees by the number of concentric layers of wood; some of them must, however, be very old, being 22 feet in circumference. It is customary now to connect the phenomena of the vegetable world with the economy of man; it may therefore be stated that the natives of New Holland have availed themselves largely of the phenomenon which is the subject of this memoir. Like the pendent faded leaves of tropical Palms, which form, as it were, a natural hut, and are the prototypes of the dwellings of the aborigines—the large sheets of bark which hang down from the Eucalypti of New Holland must have reminded these savages that they may be of use to them. The huts, or rather sheds, which they occupy temporarily, are made of such sheets of bark, which, if not already separated by nature, they cut off with instruments made of Serpentine, Trap, or other hard rocks. It is on such sheets that the New Hollanders repose, and protect themselves from the humidity of the soil. They also make most rude canoes of them, only fit for navigating inland lakes. They bend and tie them in the required form, and fill the crevices with soil and some melted gum of the *Xanthorrhoea*? But, as it is difficult for them to strike a light, they carry on their hunts (either aquatic or inland) ignited branches of the Eucalypti, which, from their resinous nature, burn like tinder. Taking this, and other facts not suited to our present purpose, into consideration, the New Hollanders may, with some propriety, be called the *Eucalypti men*.—John Lhotsky.

Amaryllis Belladonna.—The *Amaryllis belladonna* has always been a great favourite of mine, and I think I may call myself a successful bloomer, having seldom less than 60 or 70 blooming stems every season; still I do not know that I can give any information to the inquiries of your numerous correspondents, for I have distributed scores of bulbs at various times amongst my neighbours, which have never, I believe, shown a bloom since they were in their possession. Mine are planted in various situations, in some of which they do not bloom; nor do they in any case where they are not planted at the foot of a warm south wall, and are there left undisturbed. They flourish most in the front of the outside wall of a small Pinery; and, from my own experience, they never bloom well except they have some warmth at the roots, either from sun or fire. They are planted about six inches deep, in a stiffish loam, are occasionally covered with a mat in very severe weather; but I have frequently seen the leaves destroyed by the frost, without the bloom being injured in the following season. Having a large number of bulbs, many, of course, do not bloom every year; and I have frequently seen the blooms of such as have not bloomed in the autumn thrown up very strong in the spring; but these never expand. I cannot bloom them in pots (unless taken up in the early part of the summer, when the flower-bud has been formed for the season) nor can I bloom them in the border of a conservatory, though with the best situation possible for light and air. I have tried them under a common glass hotbed frame (planted in the ground), but the bulbs have had every care there for the last four or five years, and every sort of winter protection, yet without success—except that last year I had two blooms close to the uppermost edge of the frame, and they were the largest stems that I have ever seen. It is singular that in those situations where they do not bloom, they always increase the most rapidly by root, and form by far the healthiest bulbs. Notwithstanding my own success with this delightful plant, I fear I have added nothing to the general information, and can only recommend the bulbs to be planted about six inches deep, close to the foot of the warmest south wall there may be (or in case there are any fire-flues in the garden, they are sure to bloom near them) and to be left quite undisturbed, giving them some trifling shelter in severe frost. They require little or no care; but as far as my experience goes, if any one expects bloom before they have been established for three or four years, even in a suitable situation, he will be disappointed. They may bloom the first year after removal, as the blooms may be previously formed. In contradiction, however, to this, I recollect a few years ago going over Mr. Biddulph's beautiful grounds at Ledbury, and the gardener told me he always took the bulbs up every year, and had never any difficulty in blooming them. They were then planted in a small bed in the open part of the garden. The temperature of that part of the country is much higher than with me. I saw no bloom there, but it was then too early in the season.—Beta.—

If a "Country Vicar" will give his bulbs of *Amaryllis belladonna* a fair trial as they are treated here, I have no doubt they will repay him for the trouble and expense, viz.:—At 14 inches from the bottom of a south wall or greenhouse, lay a brick in a bed of mortar, and one on edge in cement; the upper edge of the lower brick to be level with the border. This will allow the narrow strip of ground between the brick and wall to be raised about 4 inches above the border. Mr. Beck's slate edging would answer the purpose as well, or perhaps better, as it would take up less room and look neater. With a broad board, or any other contrivance (we cover with decayed leaves) to keep off the rain in winter, the bulbs will neither be rotted nor excited to grow till all danger of frost is over.

Before planting, the soil should be taken out, to the depth of 20 inches or 2 feet, and replaced, rather above the level, to allow for settling, with good turfy loam—rather stiff than otherwise—and about a sixth or seventh part of leaf-mould; or, if that is not at hand, they will do in the loam alone. Indeed, most of the genera *Amaryllis*, *Crinum* and *Hæmanthus* do best in pure loam and a small quantity of silver sand; in this the bulbs are not so apt to decay or "shell off," as it is called, as when planted in any rich compost. In such a border as the above, but under the wall of a greenhouse and plant stove, we have *Amaryllises* of one kind or other in flower from the end of March till November. Even now (February 13), *A. reginæ* and formosissima have flower-buds two inches above the ground, in front of the stove; these, with *A. Johnsoni*, *vittata*, &c., will flower till towards the end of May, and throw up an occasional flower throughout the summer. In May, *A. longifolia* will begin to flower and continue till July. About the end of July, *A. belladonna* will begin in front of the stove, and by the middle of August, it will flower in front of the greenhouse. About the same time *Lilium venustum*, and several *Hæmanthus*, will have made their appearance; and by the beginning of October, *Amaryllis lutea*, and *africa* will be in flower, and will continue till cut off by frost; so that in a strip of ground forty-five feet long by fourteen inches wide, we have a succession of flower for nearly eight months. *Oxalis Bôwei*, and several others, do equally well in the same place.—*J. B.*—This is much harder and flowers more freely than many persons suppose. In the south border of the Botanic garden, Bury St. Edmund's, several bulbs were, 12 years ago, planted about 9 inches deep; since that time they have not had the least care bestowed upon them, and, with only one exception, they have flowered beautifully every year. They are not protected in the least; but the soil is light, and very dry. They will also succeed in a heavy, cold soil; for in a neighbouring garden, where the soil is far from being either light or dry, I saw them blooming well last year. It is fair, however, to state that they were planted in a narrow border immediately in front of the conservatory; and from that they no doubt derived some small portion of heat, and of course were drier than if planted in an exposed border.—*H. T.*

Tobolsk Rhubarb.—I do not force Rhubarb; but I have a collection in an open quarter of the garden, where many species and varieties are planted near to each other, all having the same attention bestowed upon them, i. e., no attention at all. The Tobolsk has been planted four years, and it is invariably two or three weeks later in the spring than several other varieties; and therefore, judging from that fact, I should say it is not the most desirable variety for early forcing.—*H. T.*

Asparagus.—I observe at p. 102, that "S. C." has tried the plan of putting a glass bottle over Asparagus, with the same ill-success that I and many other readers have had. The same has been the result in every case which has been tried in this part of Ireland; the Asparagus so treated, being hard and not eatable. I made the experiment with various kinds of glass, but none succeeded. A few years since a friend of mine told me that he had seen, in Germany, Asparagus of great size, white, and very tender; and that there the following mode of treatment was adopted: so soon as the young shoot was perceived issuing from the ground, a piece of hollow reed, cane, or elder, about eight inches long, and of sufficient bore, was stuck down into the clay above the shoot, for the latter to grow into. The longer and wider the joints of the tube were, the greater was the success. The Asparagus, when it had filled the tube, was cut; and my friend says that it was excellent, and of an enormous size. The same year, in consequence of my hearing of this, I placed a number of common flower pots over my Asparagus beds, and the shoots which came up under them were of great size, perfectly white, and particularly tender. In some instances, where the pot was not sufficiently high for the growth of the shoot, it had, when it met the bottom of the pot, coiled itself round, but still continued close-headed, and did not branch out, nor become hard. I have no doubt the tin tubes to which your correspondent alludes have been suggested by the German plan, above stated, and that the tenderness of the plant, in the cases I mention, arose from the exclusion of light, by placing over it an opaque hollow tube. I think it was stated that the upper part of the tube was stopped; in the case of the flower-pots, I covered the holes in the bottom with a piece of slate.—*W.*—[We have formerly seen this practised, and with the greatest success. Joints of Bamboo would perhaps be the best contrivance.]

Cabbage.—Amongst the lists of Cabbages given from time to time, there is one variety omitted, which I think deserves to be more generally known. It is sold by the Bristol seedsmen, under the name of "Nonpareil." It is something like the Vanack, but smaller and more compact; and is, I think, much superior.—*Lusor.*

Fastolf Raspberry.—In reply to "L. L.," p. 102, respecting the "Fastolf Raspberry," we beg to say that he will find, on referring to our advertisement, that it is cultivated with the greatest success in Derbyshire, and that it requires nothing more than the ordinary treatment; therefore, it does not claim its superiority from any application of sea-sand or burnt sea-weed. Should "L. L." have any further doubts of its merits, if he will favour us with a line by post, we will forward him the address of some gentlemen in this neighbourhood as well as in Derbyshire, who, if he thought it necessary, would attest to its valuable qualities.—*Youell and Co., Great Yarmouth Nursery.*—In answer to the inquiry of "J. L.," p. 102, I beg to state that 10 or 12 years ago, some Raspberry canes were brought from Yarmouth into this neighbourhood, and planted in a private garden, 30 miles

from the nearest point of the sea-coast. The fruit of the canes from this garden has frequently gained prizes at the Horticultural shows in the neighbourhood. Canes from this garden have been distributed to other gardens from 3 to 10 or 12 miles distant; where, in every instance, the fruit has maintained the same character for size and superiority of flavor. The original canes, I should have stated, came from Caistor, near Yarmouth. Whether it is the original Fastolf I know not; but I presume this will answer "J. L.'s" inquiry, as to the plant succeeding well at a distance from the sea. I have Youell's Fastolf Raspberry which I have planted with canes from the stock brought from Caistor; but as the former have not yet come into bearing I cannot draw any comparison between them.—*P. H. S. Lee.*

Gold Fish.—Observing in your late Numbers several communications upon this subject, I am prompted to send you the following remarks, in the hope that some correspondent will favour me with his opinion respecting them. In September, 1840, I prepared in my garden a pond of considerable size, about three feet deep around the margin, and five feet in the centre. The bottom I cemented, and covered three inches thick with common field-mould. This pond I filled in the same month with spring-water, and stocked with 20 large fish of the Dutch breed. Until December all the fish were apparently in good health, but after a sharp frost of a week's continuance, not noticing them as formerly, I let off the greater portion of the water, and found that several of the fish were dead, and more than half buried in the mud, while the remainder seemed to be dying fast. These latter I removed from the pond, and tended carefully in the globes, but not one could I save, although many rallied considerably. In January, 1841, I again filled the pond with water, and put in 14 fish of fair average size, and of the same breed as the last. In February there was a severe frost, and when the thaw set in, six of my poor fish came to the surface, and remained there deadly sick, their scales ruffled up, their eyes nearly closed with a thick film, and their bodies (particularly the fins, tails, and gills), covered with a white slime, having a very foetid smell. After a few days, for I would not remove them, they died. I then again ran the water off, and taking up the other eight fish, put them into large earthen vessels, renewing the water every two days—for I had them in the house. Of these eight fish, five died in a few weeks, presenting the same appearances, of slime, film, &c. About April, 1841, I removed all the mud from the pond, cleansed it thoroughly, covered the bottom with well-washed white sand, and turned in the three surviving fish, with eight others of the sharp-nosed breed. A month had scarcely elapsed before one fish of the old stock which had been of a brilliant red, turned of a deep purple, and kept always on the surface. Upon looking at it, I observed on its back a large raw spot, which in a short time became covered with a green moss-like substance, and the fish died. From that period I have not lost one; they have thriven well and bred abundantly. Since the late frost in this year, the young brood have, however been, affected in a similar manner to my February stock; and I fear, although not one is yet dead, that I shall lose them all. The old fish do not appear to be injured. The pond contains Rushes, Waterlilies, &c., and is fed by the rains, and a spring occasionally; the purity of the spring is beyond doubt, as I and my family use it daily. The ice has been carefully broken, and no means have been left untried to insure success. The fish I bought in Covent-garden; but, excepting the last lot, which were fresh from a pond in Essex, they had probably been some time in globes before I purchased them.—*Agricola.*

Killing Insects for the Cabinet.—When "D. H. W." took upon himself "to say a word to 'S.'" on what he is pleased to designate "a most cruel mode of killing insects for cabinets," and "a system of torture," it would at all events have been more satisfactory if he had pointed out some speedier and less barbarous method of depriving them of life ere he applied such terms to mine. A more careful perusal of my letter will, I am sure, convince him that nothing I have recommended can be called "cruelty" or "torture;" and I can conscientiously plead "not guilty" to the charge; for I am one who feels—

"The heart is hard in nature, and unfit
For human fellowship, as being void
Of sympathy, and therefore dead alike
To love and friendship both, that is not pleased
With sight of animals enjoying life,
Nor feels their happiness augment his own,"

and can say, that I never wantonly deprived a single insect of life. Nay, I may go further, and affirm, that I have saved the lives of more insects than I ever killed for my cabinet, as I invariably rescue them from any danger I may observe them in, and

—"forewarned,
Will tread aside, and let the reptile live;"

since I hardly allow that the poet was justified in saying—

"If man's convenience, health,
Or safety, interfere, his right and claims
Are paramount, and must extinguish theirs."

But to return to my letter. The only media of destroying insect life I have recommended are, "boiling-hot water," "a hot fire," and "oxalic acid;" and I repeat, I am not aware that any quicker mode can be suggested; for a "few moments" and "instantaneous" are the terms I used to mark the duration of their pain. I hope, however, that "D. H. W." has discovered one, which I beg of him to make known at once, and save the "tender sensibilities," as Matthews used to say, of those he warns against my barbarities. Cruelty and torture in such cases, according to my views, mean the infliction of a greater amount of pain, or its protraction beyond what is necessary; and I am sure that every one conversant with the subject will agree that these terms are inapplicable to my

method. Perhaps, however, "D. H. W." ranks with those who believe that—

"The poor beetle that we tread upon
In corporal sufferance finds a pang as great
As when a giant dies;"

and if so, it is useless arguing the point further with one so ignorant of the first principles of physiology. For the sake, however, of the "young readers" to whom "D. H. W." alludes, and to save them unnecessary "pity" and "grief," I would merely observe that the all-wise and beneficent Creator has most mercifully endued the cold-blooded animals with an obtuseness of feeling to which those with warm blood are strangers, and that although it is very probable they experience some degree of the sensation we call pain, yet it is far removed from what is generally meant by that term. Every practical entomologist knows that it is chiefly to free itself from restraint that the transfixed insect struggles on the pin, and the Tipulidæ escape from the spider's web by the voluntary sacrifice of one or more of their legs. Were these creatures, therefore, constituted as those having warm blood, speedy death must in either case be the natural consequence; whilst, on the contrary, we see them fly away as if no such injury had been sustained. This comparative immunity from pain constitutes one of the principal safeguards to insects, since without it the accidents to which they are so liable, both from their mode of life and the delicacy of their frame, would in most cases terminate in their death, instead of proving mere inconveniences. Let not, therefore, the young be deterred from the pursuit of one of the most interesting branches of natural history, through the fear that great sufferings to these beautiful creatures must necessarily be entailed on the specimens captured for the cabinet; for such, in truth, is not the case. At the same time, let not a single life be wantonly sacrificed, or any needless cruelty inflicted; for the specimens once safely preserved, will last 80 or 100 years without renewal. Entomology is particularly adapted to youth, requiring a quick eye and a light step; whilst the wonders your "young readers" will discover in the study of these most exquisite works of the creation will force them to exclaim with the old Roman naturalist, "In his tam parvis tamque ferè nullis quæ ratio! quanta vis! quam inextricabilis perfectio!" and tend more to humanize and refine their feelings than any mere appeals, however touching, to their unreflecting pity. To end this scrawl, I would tell "D. H. W." that I have ever practised the lesson contained in the adage he quotes, "The merciful man is merciful to his beast;" and perhaps at some future time I may send you a few anecdotes connected with that practice for your naturalists' corner. If he means to insinuate the contrary, I can assure him he has not "placed the saddle on the right horse."—*S.*—[Most certainly he has not, as we beg to assure him.]

Bees.—"T. G. Clitheroe," p. 101, may be assured that there is no practical way of preventing his Bees from sealing the holes in the ventilation tubes in their hives; and it often unfortunately happens that Bees will swarm in spite of an improved habitation. I noticed this in reply to Mr. Nutt, in the "Gardener's Magazine" for 1838, p. 540. As "C.'s" complaint is becoming prevalent, and coincides with what I then stated, I cannot do better than give an extract from it. "The collateral boxes were new, and would have deserved praise, if they could have prevented swarming, and if the queens did not deposit their eggs in them. The tin tubes are a mere fancy. They might be of use in hives crowded with Bees and combs, but they are speedily rendered useless by the Bees sealing them up." I was wrong, however, in saying that the collateral boxes were new; they are a very old invention. After all that has been said about Nutt's plans of Bee-keeping, his attempt at ventilation is the only thing new about them, and enough has been said by others as well as myself to show the fallacy of it, especially by his metal tubes.—I perceive that Mr. Grant has, at p. 101, noticed my remarks on his previous communication respecting Bees, and that he differs from me in opinion, viz., that it is better to keep Bees cool during winter by ventilation than by shading the hives. When it is known, however, that Bees have a dislike to air, or rather to a draft admitted into their dwelling, especially in winter, the latter plan must be most agreeable to them, as well as the surest way to keep the Bees at rest; for the warmth of the sun at the entrances of the hives will entice the inmates abroad in spite of air-holes. Mr. G.'s explanation about the three dead Bees from his hive may be correct; but the best way to test such a thing is to close in the Bees a few days. When let out, they will most probably turn out their dead, and, if the weather be fine, fly off with them to some distance. I may observe that, in general, fewer Bees die during winter than in spring or autumn; even the numbers in a healthy hive are greatly reduced by Michaelmas. This fact led practical Bee keepers to reduce their hives by their respective plans about that time. Mr. G. mentioned in his former communication that his hive was to prevent swarming; but now he says—"My views relative to forming artificial swarms, so as to increase the number of stocks, and to prevent swarming when preferred, are as yet only theories in my mind." After such a candid statement, I may be intrusive by alleging that Mr. G.'s artificial swarming plans will be founded upon Schirach's theory of the creation of Queen Bees; and, if so, I may ask what use can such swarms be? colonies would not be increased by them with any success in our climate. If Mr. G.'s statement be correct, viz., that water, passing through lead pipes, paralyzes dogs, it must also be injurious to ourselves; a subject I never heard broached before.—*J. Wighton.* [It is very true nevertheless; and the purer the water the greater the mischief produced by lead-pipes.]

Bees.—It appears to me that Bee-keepers do not make

sufficient allowance for their own bad management, when the system which they have adopted fails of success. This remark I am led to make by observing the general censure which Amateurs throw upon their endeavours to work Nutt's collateral boxes. Certainly, some of Nutt's statements appear scarcely compatible with truth; for instance—the alleged weight of certain boxes of honey. I once questioned him on the weight of a cubic inch of well-filled comb, and he betrayed rather a waspish disposition in answering, or rather not answering, my question. But, making some allowance for exaggerated statements, I think the system is not altogether to be condemned. I have one set of collateral boxes; from these I took, in the bad honey-year of 1841, twelve pounds of beautiful honey; in 1842, forty pounds of equally pure and white honey. With this I am quite satisfied. But I am not so much pleased with my old-fashioned straw hives. In 1841, a most magnificent swarm left the hive, and, without waiting for one moment, went away at so fast a rate, that though my servant and myself did our best to keep up with them, we were fairly beaten after a run of a mile. That swarm was lost. In about eleven days the trumpeting of the queens prepared me for a cast, and my hopes were not disappointed. I safely housed them in a second set of collateral boxes; but three days after, the weather broke up, and the wet summer of 1841 took away all chance of their succeeding. This last year the Bees in my straw hive never once showed a symptom of swarming. I have one more remark to add in reference to an observation in last week's *Chronicle*—"that if Bees are such sagacious animals, why should they close the ventilators, which are said to be so agreeable to them?" I think the Bees in this really display great sagacity; they know that if the hive is very hot, the Queen-bee will deposit her eggs in the cells which they have made, and thus the species will be increased. But propagation of the species is not the object for which we keep Bees—we want to have the largest quantity and the best quality of honey—and the quality most assuredly is affected by the temperature of the hive. The argument is of equal weight with his who shall allege, that, because cattle would be much more natural in a field, they would be better there than fattening in a stall.—*Agger*.

Bees.—Can you or any of your correspondents inform me whether the eggs of Bees are transmutable? Writers differ on this subject. I think Wighton says they are not transmutable.—*Apis*.

Prejudices.—Supposing some old bachelor were to offer a silver pap-bowl and cradle to the parent that could show the most beautiful children—would the parents themselves be considered fit judges? Why, there is not an exhibitor that would not laugh at the parent who, catching up his children after the exhibition, went grumbling off, exclaiming that—"Kissing went by favour." Yet no one has attended the shows at Chiswick without meeting with the same thing, if we say flowers instead of children. We are so prejudiced in favour of our own productions, that we immediately proclaim those who differ from us—no judges. Now, to say the least of it, this is bad taste. We go there upon an understanding that we submit to the judgment of officers carefully selected by the Horticultural Society for their suitability: we are bound to give them credit for honest intentions; and whilst there exists such a variety of tastes, we must not expect an entire agreement. There is no harm in retaining our prejudice in favour of our plants or flowers, but we must good-humouredly allow others to differ from us. As a general rule, I think we shall find the opinion of the judges confirmed by the judgment of the disinterested portion of those practically acquainted with the subject.—*K*.

Gardeners' Discussions.—I assent, without hesitation, to Mr. Beaton's remark, that "It is much to be regretted that young gardeners should so often indulge in personal abuse, while suggesting or explaining points of practice;" but I must say, that I almost despair of its cessation so long as the feeling prevails, that there is more wisdom exemplified by them in "showing up" the faults of their fellow-gardener than in tracing out what is really good in their profession and adopting it. This latter process is not consistent with their notions of discussion—for to expect the stream pure when the fountain is contaminated, would be to expect impossibilities. As long as gardeners are more interested in reading palpable frivolity, and in encouraging the authors of it, so long will they be hoodwinked, and their minds be occupied with puerile subjects, to the exclusion of what is really useful and entertaining.—*C*. [After all, the fault lies more with the masters who permit such conduct, than in the young gardeners who indulge in it: for they know no better.]

Garden Produce.—Your correspondent "G. L. E.," p. 117, from the size of her garden, conveniences, and number of hands, should have a full supply of all the common and forced vegetables that she could possibly desire. She should have a profusion of everything in and out of season, excepting fruit, which must, of course, depend upon the time of forcing. I have known families as large, with less ground and fewer men, provided with all the luxuries usually derived from forcing-pits and a clever gardener. It would be easier to enumerate what she ought not to expect, which would be a very limited list indeed.—*W. W.*—Under the circumstances mentioned by "G. L. E." I should imagine that the following things might easily be produced by any good practical gardener: namely—Jerusalem Artichokes, Carrots, Parsneps, Beet, Onions, Leeks, Shallots, Broccoli, Savoys, Brussels' Sprouts, Coleworts, Salsify, Scorzonera, Skirret, Cardoons, Celery, Endive, Lettuce, small Salad, Rhubarb, Asparagus, and Seakale. The supply of Kitchen and Dessert Apples and Pears will depend entirely on the sorts cultivated. The forced flowers should comprise Lilacs,

Azaleas, Rhododendrons, Roses, Crocuses, Hyacinths, Narcissuses, Violets, Lily of the Valley, &c. The quantity of Greenhouse plants in flower will be regulated by the number in the collection which flower at this season of the year.—*F. K.*—I do not hesitate to say that "G. L. E." ought, with the conveniences which she possesses, to be well supplied with most of the dainties of the season. First, from the glass-houses, pits, frames, &c., she has a right to expect at this period, the following fruit and vegetables:—Strawberries, Cucumbers, French-beans, Asparagus, Seakale, Rhubarb, Mushrooms, with small Salad, Radishes, &c., &c. I do not mean to assert that these are all to be expected daily; but there should be a sufficient supply to create a change with the assistance of more hardy vegetables from the Kitchen Garden, which ought to be well stocked with a good portion of Celery, Broccoli, Spinach, Cardoons, Salsify, Scorzonera, Jerusalem Artichokes, and a good portion of roots and Greens, which ought to be sufficient for the servants' hall. Potatoes in great quantities are consumed in most families; therefore, where the size of the Kitchen Garden is under two acres, I would recommend that the main crop be planted on the farm, although a good portion of the Ash-leaved Kidney should be cultivated in the garden for summer and autumn use. This is rather a dull time for flowers; still, from the stove, "G. L. E." might expect a few Roses in pots, Azaleas, &c., Lilacs, Camellias, Hyacinths, &c., &c.—*W. Gordon, Castle Kimbolton*.—If "G. L. E." has got a good gardener, I think she cannot do better than consult with him respecting the subject of her inquiries, at p. 117, viz., "what flowers at this season of the year she may expect to be brought in from the houses in succession, what vegetables, roots," &c.; but if her gardener does not understand his profession, she should find one that does.—*J. W.*

Varnish for Cotton-Frames.—As to the varnish made of eggs and toasted cheese, I was foolish enough to try it in a water-bath, in a sand-bath, and afterwards in an open ladle; it formed a spongy, brittle substance, utterly worthless, as it would not adhere to the cotton, nor was such a mixture calculated to do so.—*Taliesin Ap Jones*. [This receipt was taken from the "Annals of Chemistry," as we stated, and was not recommended by us.]

To prepare Canvas for protecting Frames, &c.—I have read with interest the account of your correspondent, who has applied himself to the construction of a machine for making Oil Cloth. In a former communication, I suggested the use of common fat; but after trying both that and linseed oil, I am inclined to prefer the latter, though considerably more expensive. There is one point your correspondent appears to have overlooked; which is the necessity of employing some antiseptic to check the tendency of all canvas, when saturated with oil, after a time, to decay. This will be completely answered by using common resin, to the extent of one-half or thereabouts; and a small addition of bees-wax may be advisable, to keep the cloth flexible; and also as being in some degree antiseptic. There is one observation which should be strongly impressed on those who may try this most useful and valuable experiment, that of not rolling up or putting away the prepared canvas for some time after it is made. If this is not attended to, there is great danger of the oil causing the whole to heat and rot, or even fire, if in quantity and in a close place; a secret well known in our arsenals, where the painted cloths used in the Navy are long exposed to the air before they are rolled or folded up, in order to avoid these serious consequences. There is one remark I must make on the machine. There does not appear to be any necessity for saturating the canvas, which is the case in the use of it, and in consequence more oil is used. If laid on on one side with a brush, the purpose is answered; the oil being, of course, heated, and made quite liquid. There is another advantage to set off in using the brush against the small economy of labour in using the machine; which is, the cloth can be made up previously to preparing. By this means the sewing is more easily done, and the thread used in it is secured as well as the canvas. If, however, any of your readers prefer the mode of preparing the canvass for it, and having it sewn together afterwards, I strongly recommend them to have the thread well cased with resin and bees-wax; otherwise, the stitches will give way long before the canvas is decayed.—*W*.

Description of the Pine Stoves at Bamford Hall.—In accordance with the wish expressed by "A. B.," at p. 872 of your last year's Volume, I send you a description of my fruiting Pine stove. It is unequally span-roofed, the front rafters being 11 feet long and the back ones 6 feet. Its length is 25 feet, and its breadth 15 feet, having a walk 3 feet wide round the interior. It is fitted up with a shelf at the back, 3 feet from the glass, and with another in front, 5 feet from the glass. The front of the house is 6 feet high above the walk, and the upper portion is glazed to the depth of 4 feet. At both ends of the house there is a flight of 6 steps from the front walk to the back one, which is on a level with the front of the pit. The latter stands in the centre of the house, its slope corresponding with that of the roof; but instead of being heated by bark in the ordinary manner, the roots of the plants are warmed by means of hot-water pipes passing beneath them. For this purpose, the pit is surmounted by a boarded stage, containing 4 shelves, with openings in them, to receive the Pine-pots up to the rims. Each shelf is 2 feet in width and capable of containing 9 plants. The hot-water pipes in the pit and those which warm the house are on the same level, and communicate with each other, so that only one fire is required. These pipes are all dished, for the purpose of holding water to create steam. The dishes in the pit are filled by means of one-

inch leaden pipes, one end of which comes through the stage; and these are filled twice every day with hot-water. There are also 6 small one-inch iron pipes, about 18 inches long, which stand upright, and are screwed into the main pipes beneath the stage; the tops of these you can open or close, according as more or less moisture is required. The succession-house is 25 feet long, 18 feet wide, and 12 feet high. One half of the stage is appropriated to suckers, the other half to year-old plants. It is capable of containing 30 year-old plants and 36 suckers. I find that suckers strike root more quickly on this plan than in bark. I have lately potted 30 plants, which were put in pots as suckers on the 25th of January, 1842; they are now sufficiently large for fruiting; and I think that plants may be grown to a larger size on this plan in two years, than they could in three if placed in bark. It will soon be two years since these houses were finished and stocked with Pines, but owing to the latter requiring to be re-potted at that time (as I was obliged to have certain sized pots to fit the holes in my stage), it was very late in the season before they showed fruit. This year also they were late in fruiting, the first Pine being cut on the 1st of August, and others succeeding up to the end of December. I have cut 41 Pines this season, the total weight of which was 112 lbs. 3 oz.; 12 of them (Montserrats) weighed 40 lbs. 4 oz. Had they put up in March, instead of June and August, the fruit would have been much heavier. I have now some fine plants, which I hope will throw up large fruit. My fruiting pots are 11 inches wide inside at the top, 6 inches wide at the bottom, and 16 inches deep, with a good strong rim, an inch wide, made quite flat, to fit close to the stage. My succession-pots are 7 inches wide inside at the top, 4 inches wide at the bottom, and 12 inches deep. Several Pines have fruited in these small pots, some of which weighed as much as 3 lbs. 4 oz.; those grown are chiefly Montserrats. I forgot to mention that there are throttle valves in my pipes, so that I can shut out the water from the pipes in the house, and thus gain more bottom-heat in the pit during the summer, or from the pipes in the pit, if I wish to give the Pines a check. I have no trouble in keeping the bottom-heat up to 90° or 95°; but the latter is my standard heat. Pines grown on this plan are not in danger of receiving any check from being potted. I find that when the pot is replaced in the stage, the fresh soil soon becomes heated.—*George Cherry, Gardener to James Fenton, Esq., Bamford Hall, Rochdale*.

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Feb. 22.—P. Pusey, Esq., M.P., in the chair. Twenty gentlemen were elected Members.—Mr. J. Gillott communicated the result of his trial of the Bokhara Clover, which was referred to the general committee; the author being requested to state the nature of his soil and the result attending his trials during the ensuing summer. Mr. Pusey and Mr. Miles expressed their intention of instituting trials of the Bokhara Clover and Khelat Lucerne on peat soils, and Mr. Gibbs undertook to obtain further information on the subject.—Mr. Illingworth submitted his suggestion for a systematic establishment of farmers' clubs in connexion with the Poor-law unions and local associations throughout the country, for collecting and transmitting to this society the result of their practical inquiries.—Mr. Pusey, as chairman of the journal committee, reported the result of a correspondence with the Duke of Portland and the Rev. W. Thorpe, and the reception of various papers for the journal.—Mr. Stratton presented a series of lithographic drawings of his waggons and implements exhibited last year at the Bristol meeting.

LINNEAN SOCIETY.

Feb. 21.—E. Foster, Esq., in the Chair. E. Doubleday, Esq., and D. F. B. White, Esq., were elected Fellows. A branch of Scotch Fir, presented by the Duke of Northumberland, was exhibited, in which, by an abnormal development of the buds, only a lateral development of the wood of the branch had taken place, giving it a flat, instead of a round appearance. A male and female specimen of the Goliathus Drurii was presented to the society by Mr. Savage, through the Rev. F. W. Hope. This insect is remarkable for its beauty and size, as well as exceedingly valuable on account of its rarity. It is an inhabitant of the southern parts of Africa, within the tropics.—A paper was read from Professor Croft on the manufacture of sugar from the Corn-stalk (Zea Mays). From late experiments in Indiana it appears that the Corn-stalk is capable of producing sugar. The juice of the stalks contains more than three times as much sugar as the Beet, and five times more than the Maple, equalling, if not exceeding, that of the ordinary Sugar-cane, as raised in the United States. The sugar is more easily obtained from the Corn-stalk than from the Sugar-cane, and the cultivation of the former is much easier. The Sugar-cane is 18 months in coming to perfection, whilst the Corn-stalk requires only from 70 to 90 days. The refuse of the Maize, after the expression of the sugar, forms an excellent fodder for cattle. The quantity of sugar is said to be increased by removing the ears of the Corn during its growth.—The Rev. F. W. Hope had a paper read on the portraits, painted and engraved, the busts, medallions, &c. representing Linnaeus. A great number of these works of art, produced or existing in the various nations of Europe, were criticised, and the remarks were illustrated by an interesting collection of engravings of many of the portraits, busts, and medallions of the great naturalist who gives his name to the society.

STATISTICAL SOCIETY.

Feb. 20.—T. Tooke, Esq., V.P., in the chair. A paper was read, entitled, "The Agricultural Statistics of Five Parishes in Middlesex—Norwood, Greenford, Perivale, Hanwell, and Ealing," by Mr. H. Tremenhare. Norwood contains 22.9 acres; it is divided by the Uxbridge road into two nearly equal portions; that of the north is composed of a heavy clay soil; that on the south of a light loam, and of gravel. The rent of land varies from 40s. to 50s. per acre, and the farms in the southern division let for 20s. per acre more than those in the northern. The surface of the soil in the northern part indicates that almost the whole of it was within no very remote period in a state of arable cultivation. It is now almost entirely pasture land. The soil is richly manured, abundance of dung being procured from London; but there is a very general inattention to the preservation of manure made on the farms. The liquid produce of the stables and outhouses is permitted to run into the farm-yards, and to stagnate in black ponds in the winter, and evaporate in the summer. There is a strong prejudice against all modern inventions for facilitating or abridging labour. The wages of labour vary from 12s. to 15s. per week. A farm of 250 acres gives permanent employment to 14 labourers. The produce of wheat, in 1842, was 32 bushels per acre. Barley, 40; oats, 32; potatoes, 7 tons, and hay three-fourths of a ton. The number of live stock was 886. Greenford consists of 2,032 acres; it contains

about twelve farms, the largest 221 acres. The rent of land varies from 32s. to 37. per acre. There are 1,605 acres of meadow-land, 371 of arable land, and 54 of woodland. The soil is a strong clay, well calculated for the growth of wheat, beans, and tares. Much of it is susceptible of improvement by a good system of draining. In some parts the land in winter becomes so saturated with water as to be unfit for the support of cattle. No modern machinery of any kind was observed. The agricultural produce, in 1842, was as follows:—wheat, 24 bushels per acre; barley, 3s; oats, 40; and potatoes 74. The number of live stock was 673. Perivale consists of 626 acres. It belongs entirely to one proprietor, and is divided into five farms. The soil is a heavy clay, requiring four and occasionally six horses to plough it. The most profitable mode of managing the land is found to be the production of hay for the London market. The drainage is very defective, and the farmers are little disposed to attempt any mode of improvement. The wages of labourers vary from 12s. to 14s. per week. The agricultural produce per acre was, wheat 22 bushels, and hay three-fourths of a ton. The number of live stock was 599, of which 531 were sheep, these animals being taken in to feed at the rate of 2s. 6d. per score. Hanwell contains 1,363 acres. The rent of land is about 50s. per acre. Manure is supplied from London. The agricultural produce, in 1841, was, wheat, 34 bushels per acre; rye, 24; oats, 43; potatoes, 6 tons; and hay 1 ton. The live stock amounted to 186. Ealing consists of 3,807 acres. It is composed of two different descriptions of soil, the heavy, or clay and light rich loam, the former constituting meadow or pasture land, the latter arable farms and market-gardens. The rent paid for arable and pasture land varies from 40s. to 60s. per acre. Farms are generally held on leases for 21 years. Little use is made of modern agricultural machinery. The implements of husbandry are of the same kind that were in use 30 years ago. A considerable portion of Ealing consists of market gardens, and forms a part of that large area in the vicinity of the metropolis, lying on both sides of the western road, which may be regarded as the great fruit and vegetable garden of London. The fruit-gardeners have an upper and an under crop growing on the land at the same time. The soil is an excellent dry loam, and is abundantly manured. The number of labourers employed on these gardens is very great, and is estimated at 30 persons to each acre. The average rent paid is 10s. per acre. The wages of labour vary from 10s. to 15s. per week, and the proportion of women to men employed is as two to one. An important benefit was conferred on the labouring population, and on the poor of this parish, in the year 1832, by the Bishop of London, as lord of the manor, who granted 20 acres of waste land for the purpose of inclosure and allotment. The proportion allowed to each person is 20 rods, at a yearly rent of 5s. The land is now divided into 146 allotments, and so great is the demand for those that are vacant, that there are, at the present time, 50 applicants. This system is found to be attended with most beneficial results. The occupier undertakes to live soberly, and to abstain from working on the Sabbath, on pain of forfeiting his allotment in case of non-compliance. The average assessment for the relief of the poor, from 1827 to 1833, was 4s. in the pound, and from 1835 to 1841 it has been reduced to 2s. 8d. The wages of labour vary from 12s. to 15s. per week. The agricultural produce of 1842 was, wheat, 35 bushels per acre; barley, 50; oats, 43; potatoes, 85; and hay, 1 ton per acre. The number of live stock was 1430, of which 1200 were sheep.

FLORICULTURAL SOCIETY.

The following is a List of the Seedlings which have been selected by the Society in the year 1842, and considered to possess sufficient merit to be placed in the First or Second Class:—

	When Raised.	FIRST CLASS.
Auriculas	1842	Goldham's Duke of Wellington
Tulips	1842	Brown's Polyphemus
	—	Goldham's Queen
Heartsease	1841	Lane's Sir J. Sebright
	1842	Do. Alpha
	—	Cook's Alicia
	—	Welsh's Blue Perfection
	—	Brown's Garland
Pinks	1841	Do. Model
	1842	Do. Eclipse
	—	Willmer's Prince of Wales
	—	Norman's Princess Royal
Carnations	1840	Bates's Briseis
	1842	Willmer's Marquis
Picotees	1841	Hedley's Nanette
	1842	Neville's Dr. Lindley
	—	Bernard's Mrs. Lindley
Dahlias	1841	*Turvill's Essex Triumph
	—	*Mountjoy's Virgil
	—	Smith's Sir R. Sale
	—	Bragg's Antagonist
	—	Wildman's Bianca
	—	Edwards's Mrs. Richardson
		SECOND CLASS.
Auriculas	1842	Goldham's Diamond
	—	Do. Viola
Tulips	1841	Willmer's Squire Chillman
	1842	Norman's William
Heartsease	1841	Goldham's Napoleon
	1842	H. Bridge's Commissioner
Pelargoniums	1842	King's Princess Royal
	—	Bridges's Martha
Pinks	1842	Catleugh's Omega
	—	Gaines's Pride of Surrey
	—	Hodges's Oberon
Carnations	1842	Willmer's Attila
	—	Do. Black Prince
	—	Do. Hero of Middlesex
Picotees	1841	Brown's Vivid
	—	Willmer's Mary Ann
	—	Dover's Jemmy Webb
	—	Hedley's Sarah
	—	Robinson's Nottingham Hero
	—	Holliday's Queen of England
	1842	Edwards's Emily
	—	Norman's Henry
	—	Willmer's Maria
	—	Do. Miss Jane
Dahlias	1841	Oakley's Surprise
	—	Whale's Hero of Stonehenge
	1841	Kinghorn's Chieftain
	—	Mitchell's Pride of Sussex
	—	Smith's Sir R. Sale
	—	Edwards's Mrs. Richardson
	1842	Wildman's Bianca
	—	Brown's Queen of Trumps
	—	Do. Miranda
	—	Smith's Empress of Whites
	—	Mitchell's Blanche Shelley
	—	Teebay's Sure Enough
	—	Davis's Asmodeus
	—	Bragg's Great Western
	1842	Hale's Queen of Roses
	—	Spary's Aurantia
	—	Smith's Washington
	—	Hodges's Cheltenham Queen
	—	Brown's Belle Forme

* These two Dahlias were exhibited upon several occasions, and uniformly pronounced First Class. The approbation bestowed upon the others was qualified; and some of them having been previously or subsequently placed in the second class, or rejected,

they cannot be considered as having consistently maintained their character. Of Seedlings of 1842, the only flowers which were thought to promise first class properties were Alexander's Primrose Perfection, and Stein's Sir R. Chester; but they were not positively placed in that class.

COUNTRY SHOWS.

Ipswich Cucumber Society, Feb. 1.—The first show for the season took place at the Mechanics' Institution. The specimens were not only abundant, but very fine, and the exhibition attracted many spectators. The Society's Standard is Length, combined with the annexed qualities:—straight, slender and uniform in size, dark green, short neck, black spine, ribbed, bloomy, blossom, fresh cut, and in every respect fit for table. The following is the Judges' description of the specimens exhibited.

Exhibitor.	Prize.	Sort.	Mode of Growth.	Length.	Form.	Size.	Colour.	Neck.	Spine.	Rib.	Bloom.	Blossom.	General Appearance.
Mr. T. Laker, Gr. to Capt. Ap. Jm. Alden 1 day, Suffolk. Exhibited 8 brace, from 12 to 21 inches long.	Silver Cup.	Kerrison's St. e. Dr. Lindley's Perfection and Porcupine.	Hot Water Pit. Seed sown in September. In Boxes.	12½ in.	Straight.	1½ inch diam.	Dark Green.	Short & thick.	Black.	Slight.	Very bloomy.	Perfect.	Very handsome.
Mr. J. Hamilton, Gr. to F. A. Phillips, Esq. Thetford, Norfolk. Exhibited 1 brace.	Second Prize.	Hamilton's White Spine.	Hot Water Pit. Seed sown in September. In Boxes.	12½ in.	Straight.	1½ inch diam.	Dark Green.	Short & thick.	Black.	Slight.	Very bloomy.	Perfect.	Very handsome.
Mr. J. Mowbray, Gr. to Lord Wensford, Norfolk. Exhibited 1 brace.	Third Prize.	Mowbray's Unknown.	Hot Water Pit. Seed sown in September. In Boxes.	12½ in.	Straight.	1½ inch diam.	Dark Green.	Short & thick.	Black.	Slight.	Very bloomy.	Perfect.	Very handsome.
Mr. W. Stannard, Gr. to Archdeacon Palmer, Norfolk. Exhibited 1 brace, from 10 to 13 inches long.	Fourth Prize.	The Leaves, Emperor and Jewess.	Hot Water Pit. Seed sown in September. In Boxes.	12½ in.	Straight.	1½ inch diam.	Dark Green.	Short & thick.	Black.	Slight.	Very bloomy.	Perfect.	Very handsome.
Mr. J. M. Reid, Gr. to F. A. Phillips, Esq. Thetford, Norfolk. Exhibited 6 brace, from 10 to 14 inches long.	Fifth Prize.	Improved Stone House.	Hot Water Pit. Seed sown in September. In Boxes.	12½ in.	Straight.	1½ inch diam.	Dark Green.	Short & thick.	Black.	Slight.	Very bloomy.	Perfect.	Very handsome.
Mr. A. Hedley, Gr. to W. J. M. Reid, Esq. Thetford, Norfolk. Exhibited 1 brace.	Willow's Hero.	Hot Water Pit. Seed sown in September. In Boxes.	12½ in.	Straight.	1½ inch diam.	Dark Green.	Short & thick.	Black.	Slight.	Very bloomy.	Perfect.	Very handsome.	Very handsome.

The Judges were, Messrs. GILKING, Stowmarket; GILDING, Hadleigh; and CLARK, Ipswich.

During the evening, Mr. Smith, gr. to D. Alexander, Esq., directed attention to a brace of Cucumbers, grown by Mr. T. Latter, and called "Dr. Lindley's Perfection," which, in his opinion, possessed every property requisite, according to the standard lately laid down by the Editor of the *Gardener's Chronicle*, to constitute perfection. He then proceeded to show the principal points in which this differed from the standard of the Society, and to defend the qualities at variance in the latter; alleging that the admission alone, that such fruit as are required to constitute perfection in Ipswich are not good seeders, was a sufficient proof of their excellence.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

ACHIMENES MULTIFLORA. Many-flowered Achimenes. (*Stove Annual*). Gesneriaceæ. Didymia Angiospermia.—This very beautiful stove plant inhabits dry banks, in woods, on the Serra de Santa Bida, and near Villa de Arayos, in Brazil, whence seeds were sent home by Mr. Gardner. The plants flowered first at the Royal Botanic Garden of Glasgow. They continue for a length of time in bloom, with a succession of flowers continually expanding. The stem is simple, about a foot high. The flowers are nearly two inches long, deep lilac within, paler without, especially the tube, which is funnel-shaped. The limb consists of five nearly equal, rounded lobes, strongly fringed at the margin.—*Curtis's Botanical Magazine*.

COMPARETTIA ROSEA. Rose coloured flowered Comparettia. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria.—This is one of those interesting objects which are occasionally met with, especially in the Orchidaceous tribe; and which, while they do not dazzle us with their brilliancy, or powerfully arrest us by their showiness, yet exercise a considerable and pleasurable influence on the mind of the real admirer of nature, on account of their peculiar delicacy, and loveliness. Although diminutive in regard to size, there is a grace in its aspect, and its blossoms are of such a rich rosy tint, that, when in flower, it is a general source of attraction. It is a native of the Spanish main, from whence it was obtained by Messrs. Loddiges, of Hackney, with whom it has flowered for the last two years. The leaves are few, and quite sessile, and the racemes of flowers are drooping. They have a delicate, wiry stem, and the pretty rose-coloured blossoms are borne near their extremity. So scanty and weak are the roots of this and the equally delightful *C. coccinea*, that unless they are securely fastened to the log that supports them, they are very liable to become detached, fall off, get broken, or have their growth otherwise impeded. The best way of fixing them is to pass thin wire round them and the block, almost close to the base of the leaves, taking care that this wire does not injure them, by placing a little moss beneath it. The moss will be further beneficial, if kept moist in summer, by encouraging them to develop more and stronger roots. They should always be grown on logs of wood, in preference to being kept in pots.—*Paxton's Magazine of Botany*.

VRIESIA PSITTACINA. Parrot-flowered Vriesia. (*Stove Epiphyte*). Bromeliaceæ. Hexandria Monogynia.—This is an extremely pretty stove plant, for which we are indebted to C. B. Warner, Esq. It is said by Sir W. Hooker to be a native of the neighbourhood of Rio Janeiro. In cultivation it requires to be potted in leaf-mould, with a quantity of potsherds for drainage. Plenty of water should be given during the summer months, but sparingly in winter. Or it may be grown suspended in a wire basket, like an Orchidaceous plant. It is propagated by suckers. *Botanical Register*.

MISCELLANEOUS.

Horticultural Society of London.—We are happy to announce that the arrangements for the despatch of a collector to China have been completed, and that Mr. Fortune has sailed for Hong-Kong in the ship *Emu*, amply provided with the means of forwarding the objects of the Society, and furnished with most valuable letters of introduction, both from her Majesty's Government, and from numerous private individuals. In addition to his duties as an agent of the Horticultural Society, Mr. Fortune will occupy himself in the collection of objects of natural history in general; and we doubt not that he will reap a rich and abundant harvest. If any gentlemen desire to participate in the collections of dried plants and zoological preparations which Mr. F. will form, it will be as well for them to communicate with Dr. Lindley on the subject.

Presentation of Plate.—We learn that at a recent meeting of the Morningside Practical Gardeners' Society, the chairman presented Mr. Liddell, formerly gr. at Canaan House, and late Secretary to the Society, with a handsome silver snuff-box, on which was a suitable inscription, as a testimonial of the respect in which he was held by the members, for the diligence and attention with which he had discharged the duties of that office.

The Araceæ Order.—These plants abound in an acrid principle which is volatile, and therefore dissipated by heat; being soluble in water, it is also removed by washing, and easily separated from the fecula with which many of their tuberous roots abound. Hence several have been employed as articles of diet from very ancient times, as *Colocasia antiquorum*, mentioned by Herodotus and Theophrastus, and remarkable as an Indian plant cultivated in Egypt, and now in most parts of the south of Europe. The roots are without acrimony, as is the case with many other long-cultivated plants. They are universally cultivated in India, and known there under the names of Kuchoo and Gagee. *Arum nymphaefolium*, which Dr. Roxburgh considers only a variety of *C. antiquorum*, is but rarely cultivated in Bengal. *Arum indicum*, Man-kuchoo and Man-guri of the Bengalese, is a species much cultivated about the huts of the natives for its esculent stems and small pendulous tubers. *Arum campanulatum*, now *Amorphophallus*, Ol of the Bengalese, and which deserves to be called the Telinga Potato, is also much cultivated, especially in the northern Circars, according to Dr. Roxburgh, where it is highly esteemed for the wholesomeness and nourishing quality of its roots. In the Himalayas, the species which I have called *Colocasia himalensis* forms the principal portion of the food of the hill-people; so *Colocasia macrorhizon* and *esculentum*, forming the Tara, Taka, Taya, and Kopeh, and Cocoa roots, Eddoes, and Yams of the Pacific and other islands, yield a considerable portion of the food of the inhabitants. The stalks and leaves also of some of the species are eaten in many places; those of *Arum sagittifolium* are said to be called Chou Carabe; so also in the south of Europe, *Arisarum vulgare*, and *A. Dioscoridis*, which is perhaps only a variety of *A. italicum*, are occasionally eaten; but even *Arum maculatum*, and other acrid species, deprived of their acidity, are sometimes made to yield food in times of scarcity. Some of these, however, from their acidity and irritating nature have been used as vesicatories; *Arum maculatum* has been used medicinally even from the time of Hippocrates; *Typhonium orixense*, having exceedingly acrid roots, is, when fresh applied in India by the natives in cataplasm to scusdis, or bring forward tumours. Dr. Roxburgh pronounces it to be certainly a most powerful stimulant; other species are likewise employed, as *A. montanum*, Roxb., (*macrorhizon*, Ainslie); the plant called by the latter *Dracontium polyphyllum* is exhibited internally when its acrimony has been subdued, it is considered antispasmodic, and is also said to be useful in asthmatic cases. An emmenagogue is said to be prepared from it in the Society Islands. *Scindapsus officinalis* (Guj-pipul of the natives), forms an article of considerable repute in Hindoo Materia Medica; it is described as acrid, diaphoretic, and anodyne; but the statements of authors differ on the subject.—*Royle's Illustrations*.

The Abaca.—Abaca is a name which the natives of the Philippine Islands apply both to the vegetable fibres of which they make their cordage, and to the plant that yields them. This is a species of Plantain, the same which is called by Rumpf, *Musa sylvestris*, and in the Malay language Pisang Utang. It is found wild on the Philippine and Mindanao Isles, and is also most carefully cultivated, on account of the singular advantages which the inhabitants have learned to derive from it. Extensive plantations of it are to be met with on the island of Luzon, in the provinces of Albay, Laguna, and Camarines, but particularly in the vicinity of Mount Mayong, the base of which is about 15 leagues in circumference. The soil of this extensive tract is well adapted to the cultivation of the Abaca, which thrives only in moist, shady, and fertile ground. In such situations thickets are formed by their trunks and young suckers, which last are sheltered from the intense heat of the sun by the beautiful and wide-spreading foliage with which the full-grown trees are crowned. The stems issue from a sort of tuber furnished with fibres, and grow in less than 18 months to the height of 7 feet, their thickness being that of a man's thigh. The leaves forming the crown of the tree are from 10 to

purpose, a mixture of equal parts of hydrochloric acid of commerce and water should be used. Arrow-root comports itself in the same manner as Rice powder with the hydrochloric acid; while Wheat starch resembles Potato starch in this respect. M. Marageau, as is known, has proposed hydrochloric acid as a means of detecting Potato starch in flour, by the strong smell of formic acid which it develops in contact with the acid; but as the same effect is produced, in this respect, with Rice powder and Arrow-root as with Potato starch, the hydrochloric acid cannot be used in this way for detecting the admixture of these latter.—*Annalen der Chemie und Pharmacie.*

Soda produced in Cornwall.—The manufactory is at Bisso-bridge, near Carnon, and one of the materials is mundic, hitherto the refuse of the mines. The process is this:—mundic, which is a combination of sulphur and iron mixed with a proportion of nitrate of soda, is fixed to retorts similar to those in a gas-work, but not closely shut up. The sulphurous and nitrous vapours are carried into a chamber lined with lead, as in the ordinary manufacture of sulphuric acid, which it is the object of this part of the process to obtain. The weak sulphuric acid thus obtained is employed to decompose common salt, from which it expels the muriatic acid and forms a sulphate of soda. This is decomposed by exposing it to a high temperature in contact with carbonaceous matter, and the result is a very impure soda, which is dissolved, purified, and placed in evaporating vessels to crystallize. The crystals are very fine and pure. Perhaps, however, the most valuable part of the process will be the manufacture of sulphuric acid, the demand for which is enormous, and for which the vast quantities of sulphur imported from Sicily are chiefly used. It is understood that the value of the acid consumed annually is 50,000*l.*, an immense sum, considering the cheapness of the article, but it is largely used in almost all manufactures.—*Mark Lane Express.*

Chinese Egg-Plant.—This bears a cylindrical and very long, white fruit, and is stated by M. M. Audibert to be an excellent variety, with more melting and less stringy flesh than any other kind. The fruit which has ripened upon plants at Paris has not, however, in our opinion, proved of better quality than that of several other sorts.—*Bon Jardinier.*

THE NATURALIST'S CORNER.—No. X.

(Continued from page 87.)

33. *The Myrtle* was with the ancients a very favourite plant, and always expressive of triumph and joy: the hero wore it as a mark of victory; the bridegroom on his bridal-day; and friends presented each other with Myrtle garlands in the conviviality of the banquet. Venus is said to have been adorned with it when Paris decided in her favour the prize of beauty; and for this reason it was deemed odious to Juno and Minerva. It was probably from this cause that, when all other flowers and shrubs might be used in the festival of the Bona Dea, at Rome, Myrtle alone was excluded. Harmodius and Aristogiton, when they slew the Athenian tyrant, had their swords concealed beneath wreaths of Myrtle, of which incident, as recorded by Alcæus, Sir William Jones has made a happy use in his poem to Liberty.

34. *A Naturalist*, giving instructions to a young traveller in South America, requested he would collect for him everything ugly in preference to the beautiful; and certainly, were the same industry exercised in obtaining the least attractive of nature's productions that now exists in procuring the most beautiful, our knowledge of natural history would become immensely enriched, and many connecting links in the genera and species more satisfactorily accounted for.

35. *Sir Walter Raleigh*, in his "History of Guiana," alludes to men "whose heads do grow beneath their shoulders." In "Hakluyt's Collection of Voyages," published in 1598, he finds a nation "reported to have their eyes in their shoulders, and their mouths in the middle of their breasts;" and as late as the time of Linnaeus, a well-compact story of men with tails found a place in that naturalist's highly valuable work, the "Amoenitates Academicæ." Such relations, doubtless, belong to a state of infrequent and imperfect intercourse with distant countries, just in the same way that the belief that the elephant had no joints in his legs, and the hyæna no vertebrae in his neck, could only be received before natural history was established as a science.

36. *Opinions of the Ancients respecting Animals.*—Many of the notions of antiquity, with regard to the structure and habits of animals, were quite irrational. It was gravely maintained, for instance, that the elephant had no joints, and, being unable to lie down, slept leaning against a tree; that the badger had the legs on one side shorter than those of the other; that the bear brought forth her cubs imperfectly formed, and licked them into shape; that deer lived several hundred years; that the camelion derived its support solely from the atmospheric air. These, and many other fancies, proceeded either from a literal construction of metaphorical expressions, or a complete ignorance of the economy of nature with regard to the laws by which animal life is regulated.

37. *Wild Boar.*—It would seem from the accounts of ancient authors, that the ravages of the wild boar were considered as more formidable than those of the other savage animals. The conquest of the Erymanthian boar was one of the fabled labours of Hercules; and the story of the Calydonian boar is one of the most beautiful in Ovid.

38. In the heads of deer and antelopes there are cavities embedded in a bony case, varying in size in different species of these animals. The French call them *larmiers*, believing them to be receptacles for tears, of which, the

thinner part evaporating, a substance remains called *larmes de cerf*. To this circumstance may be attributed the belief of the poets that the deer weeps.

39. The Camel often travels three or four days without water, drinking 50, 60, or even 100 pounds weight, when he has an opportunity; and the best camels for transport will sometimes endure a thirst of 10 or 12 days, though many of them perish under this privation. When we see what the man and the horse require in those arid countries, such a power in the camel must appear one of the most remarkable provisions of nature.

Reviews.

A Narrative of a Visit to the Australian Colonies. By James Backhouse. 8vo. Hamilton and Adams. pp. 560.

THE author of this work informs his readers that his Visit to Australia was undertaken solely for the purpose of discharging a religious duty; but that having been trained to habits of observation, he kept a Journal, in which records were made of the productions of the countries visited, the state of the aborigines and of the emigrant and prisoner population, &c. We have to do only with the Natural History, in which the work is unusually rich.

Mr. James Backhouse is a brother of the very respectable nurserymen of that name, at York; he was himself educated as a nurseryman; he always took great interest in Botany and other branches of Natural History; and, moreover, his early pursuits brought him acquainted with the details of practical cultivation; so that a better man could not have been easily found to report the facts connected with vegetation which came beneath his notice. Accordingly, we find at every step in the volume before us, useful or entertaining information upon such subjects.

Van Diemen's Land, or Tasmania, was first visited, then Flinders's Island, Sydney, Norfolk Island, Moreton Bay, Port Philip, South Australia, King George's Sound, and, finally, Swan River; concerning all which places there is an ample supply of valuable evidence, from which, notwithstanding the crowded state of our columns, we must snatch a few gleanings.

Those who have their thoughts turned towards emigration will be glad to know what manner of place is a log-house:—"When a place is first occupied by a settler, a hut of the simplest kind is formed, often like a mere roof resting on the ground; and when other needful things have been effected, one of upright logs is built, and covered with shingles. This is usually divided into two rooms; one of which is fitted up with broad rough shelves, for sleeping-berths; and the other, which has a square recess for a fire-place, built of stones, at the outer end, and continued into a rude chimney a little higher than the roof, is used for a cooking and sitting-room. The crevices between the logs either remain open, or are filled with wool or some other material. A square opening, closing with a shutter, admits light into each room, and short logs of wood or rude benches, serve for seats. Many families that have been brought up in England in respectable circumstances, live for several years in a hut of this description, until they can find time and means to build themselves a better habitation; and a hut of this kind is generally to be seen contiguous to a better house, and is occupied by the male servants, who are mostly prisoners."

The following description of a bit of wild scenery in Van Diemen's Land furnishes materials for a charming picture, the sketch for which is, indeed, supplied by a clever etching.

"The brook that supplies Hobart Town with water flows from Mount Wellington through a valley at the foot of the mountain. Here the bed of the brook is rocky, and so nearly flat as scarcely to deserve the name of The Cascades, by which this place is called. Many dead trees and branches lie across the brook, by the sides of which grows *Drymophila cyanocarpa*—a plant, allied to Solomon's Seal, producing sky-blue berries on an elegantly three-branched, nodding top. *Dianella cœrulea*—a sedgy plant—flourishes on the drier slopes: this, as well as *Billardiera longiflora*—a climbing shrub, that entwines itself among the bushes—was now exhibiting its violet-coloured fruit. In damp places, by the side of the brook, a princely tree-fern, *Cybotium Billardieri*, emerged through the surrounding foliage. A multitude of other ferns, of large and small size, enriched the rocky margins of the stream, which I crossed upon the trunk of one of the prostrate giants of the forest, a Gum-tree of large dimensions, which had been uprooted by some blast from the mountain; and, in its fall, had subdued many of the neighbouring bushes, and made a way where otherwise the forest would have been inaccessible. On descending from this natural bridge, to examine a tree-fern, I found myself at the foot of one of their trunks, which was about 5 feet in circumference and 10 in height. The lower part was a mass of protruding roots, and the upper part clothed with short remains of leaf-stalks, looking rough and blackened: this was surmounted by dead leaves hanging down, and nearly obscuring the trunk from distant view: above was the noble crest of fronds, or leaves, resembling those of *Asplenium Filix-femina* in form, but exceeding 11 feet in length, in various degrees of inclination between erect and horizontal, and of the tenderest green, rendered more delicate by the contrast with the dark verdure of the surrounding foliage. At my feet were several other ferns of large size, covering the ground, and which, through age and their favourable situation, had attained root-stocks a foot in height, crowned by circles of leaves three times that length. Other plants of tree-fern, at short distances, concealed from my view, by their spreading fronds, the foliage of the lofty evergreens that towered a hundred feet above them. The trunk of one of the tree-ferns was clothed with a *Trichomanes* and several

species of *Hymenophyllum*—small membranaceous ferns of great delicacy and beauty. On a rocky bank adjoining, there were other ferns, with creeping roots, that threw up their bright green fronds at short distances from each other, decorating the ledges on which they grew. In the deepest recesses of this shade I could enjoy the novel scene—ferns above, below, around—without fear of molestation; no dangerous beasts of prey inhabiting this interesting island. The annexed etching will give the reader some idea of a tree-fern, many species of which exceed in beauty the stately palms of warmer climates."

Of the timber-trees of this part of the Australian colonies we have the following account:—

"The timber about Macquarie Harbour is very fine. Huon Pine, supposed to be a species of *Dacrydium*, which is much valued for ship-building and general purposes, abounds on the eastern side: the wood is closer grained and more durable than White American Pine, and has an aromatic smell. This tree attains to about 100 feet in height, and 25 in circumference, and is of a pyramidal form: the branches from the trunk are a little below horizontal, and are clothed with numerous, slender, pendant, scaly branchlets, of lively green, serving the purpose of leaves, as in the Cypress and Arbor-vitæ. Celery-topped Pine—*Thalamia asplenifolia*—so called from the resemblance of a branch clothed with its dilated leaves, to the leaf of Celery, is well calculated for masts. Myrtle, allied to Beech, but with leaves more like Dwarf Birch, is suited for keels. Light-wood—*Acacia Melanoxylon*—clothed with leaf-like spurious foliage, resembling the leaves of a Willow, is also fine timber, and its roots make beautiful veneering. It derives this name from swimming in water, while the other woods of V. D. Land, except the pines, generally sink; in some parts of the colony it is called black-wood, on account of its dark colour. Other timber-trees are known here by the names of Pink-wood, *Carpodontos lucida*; Hard-wood, a species of *Olea*; Sassafras, *Atherosperma moschata*; Slinkwood, *Zieria arborescens*, &c. Forest Tea Tree, a species of *Leptospermum*, is valued for fuel; some crooked portions of its trunk are finely veined, and well adapted for fancy-work. The black substance forming part of the stems of tree-ferns, is used for reeding, in inlaying, for which purpose it is superior to Ebony. Respectable hats have been manufactured from the shavings of some species of Acacia, as well as from broad-leaved sedges, *Lepidosperma gladiata*, the leaves being first boiled and bleached."

When on Flinders's Island, Mr. Backhouse found the Grass-trees in great perfection. To a drawing of them is added the following description:—"We visited the Grass-tree plains that extend toward the east coast. The soil is sandy and poor, and clothed with thin rigid herbage, and scattered, low Gum-tees, low scrub, and large Grass-trees, *Xanthorrhœa australis*? Some of the last are from five to seven feet high, and as many in circumference; they have leaves three to four feet long, and flower-spikes five to ten feet high, thickly clothed with hard scales, and small, white, star-like flowers, except for about one and a half feet at the base, which is bare. All the trunks are charred from the burning off of the scrub. Abundance of red resin, capable of being used in the manufacture of sealing-wax and French-polish, is exuded by them. This substance fills up the places left by the decay of the flower-stems of former years, and by injuries; it is also lodged abundantly around the base of the trunk, which is thus defended from an excess of moisture. The blanched base of the leaves, which our swarthy companion obtained for us, by beating off the head of a Grass-tree that had not thrown up a flower-stem, is pleasant eating, and has a nutty flavour."

In etchings of wild scenery Mr. Backhouse excels; among other things, he has given a view of the trees in Norfolk Island, which is worthy of the Garden of Eden. Among them is a kind of Palm Tree, resembling the Cabbage Palm of the West Indies.

"In the woody gullies, the Norfolk Island Cabbage-tree, *Areca sapida*, abounds. It is a handsome palm, with a trunk about twenty feet in height, and from one and a half to two feet in circumference, green and smooth, with annular scars, left by the fallen leaves. The leaves or fronds form a princely crest, at the top of this elegant column; they are pectinate, or formed like a feather, and are sometimes nineteen feet in length; they vary from nine to fifteen in number. The apex of the trunk is inclosed in the sheathing bases of the leaf-stalks, along with the flower-buds and young leaves. When the leaves fall they discover double compressed sheaths, pointed at the upper extremity, which split open indiscriminately, on the upper or under side, and fall off, leaving a branched spadix, or flower-stem, which is the colour of ivory, and attached by a broad base to the trunk. The flowers are produced upon this spadix: they are very small, and are succeeded by round seeds, red externally, but white, and as hard as horn, internally. As the seeds advance toward maturity, the spadix becomes green. The young, unfolded leaves of this Cabbage-tree rise perpendicularly in the centre of the crest. In this state, they are used for making brooms; those still unprotruded, and remaining inclosed within the sheaths of the older leaves, form a white mass, as thick as a man's arm; they are eaten raw, boiled, or pickled. In a raw state they taste like a nut, and boiled, they resemble artichoke bottoms. The seeds furnish food for the Wood-quest, a large species of pigeon, which has a bronzed head and breast, and is white underneath, and principally slate-coloured on the back and wings. This bird is so unconscious of danger, as to sit till taken by a noose at the end of a stick; when one is shot, another will sometimes remain on the same bough, till itself also is fired at. We measured a Norfolk Island Pine, twenty-three feet, and another twenty-seven

feet in circumference. Some of them are nearly two hundred feet high. The timber is not of good quality, but it is used in building; it soon perishes when exposed to the weather. This is said to be the case with all the other kinds of wood on the island."

But we have already exceeded our prescribed limits; and for the rest we must refer our readers to the work itself, which is filled with details such as these.

A Treatise on the Cultivated Grasses, and other Herbage and Forage Plants. By Peter Lawson & Son. 8vo. Blackwood.

THIS little work commences by informing us that the culture of plants for the food of domestic herbivorous animals has always been confined to nations distinguished in the practice of agriculture and other arts attendant on civilisation; and that although the cultivation of the cereal grains, pulse, Flax, &c., was carefully attended to by the Egyptians, Jews, and Greeks, yet the growth of plants for the exclusive purpose of feeding cattle did not appear to have been practised prior to the period when the power of Rome had reached its climax. Then—in addition to the cereal Grasses—Lucerne, red Clover, and other leguminous plants, were cultivated. After the fall of the Roman empire, however, this branch of husbandry was the first to decline, and, if practised at all, was only carried on to a limited extent for many centuries.

The culture of herbage-plants appears to have been introduced into England from the Low Countries towards the middle of the 17th century; which period is further distinguished by the cultivation of the true Grasses for hay and pasture, for which purpose Rye-grass was first employed. The culture of this, however, as well as of all true Grasses, did not extend for several years, because it "produced many small hair-like roots, which filled the soil, and therefore could not but be very impoverishing and hurtful thereto." It was only towards the middle of the 18th century that the attention of practical agriculturists was directed towards the growth of the most useful Grasses; and it was at this period that different terms were adopted to distinguish between Clovers and true Grasses, the former being called artificial, and the latter natural Grasses. This interest in the cultivation of natural Grasses was increased by prizes, offered by the "London Society for the encouragement of Arts and Manufactures," for seeds of the Meadow Fox-tail, Meadow Fescue, and Sweet Vernal Grasses, gathered by hand; and for the greatest quantity of land sown with Vernal Grass in drills; a gold medal being likewise offered "to the person who should give the most satisfactory account of the different properties and comparative merit of any two or more of the several natural Grasses." Both in Scotland and Ireland the introduction of artificial and natural Grasses appears to have been of much later date than in England; but from the increased facilities of communication which have of late years been effected, improvements may now be said to go on simultaneously in both countries.

Several of the succeeding pages are devoted to an enumeration of the most deserving additions which have been made to herbage and forage plants within the last forty years; during which period 29 valuable species or varieties have been introduced or brought into more general notice. Many exotics, as well as native Grasses were, in 1820, experimented upon under the direction of the late Duke of Bedford, at Woburn Abbey; the results of which are contained in the "*Hortus Gramineus Woburnensis*," a work which first directed attention to this valuable tribe.

The remaining portion of the Pamphlet is one of no ordinary interest to agriculturists, since it includes Tables of the most approved Grasses—showing the quantity of seed required of each, upon various soils, for sowing an imperial acre. These Tables, thirteen in number, are each adapted for a different purpose; for instance, the first enumerates those kinds best suited for alternate husbandry; the second, those for permanent pastures: they are rendered still more valuable by the addition of a brief description of all the Grasses and plants recommended in them. In a horticultural point of view they are also useful, as they comprise a good list of Grasses for fine lawns, bowling-grounds, &c.

With regard to obtaining a Corn crop during the first season in which the seed is sown, the Authors make the following remarks:—"It is not our purpose here to discuss the question, as to whether it is better to sow Grass seeds for permanent pasture with or without a Corn crop. Both systems have their advocates, as well as their advantages and defects, and depend, in a great measure, on the varied circumstances which present themselves in practice; and therefore, in the following tables, separate columns are given for each of these methods; it being always expedient to sow a somewhat larger portion of seeds without than with a Corn crop; and, in that case, it is farther advisable, for affording shelter to the young plants, to add a bushel of Rye to the mixture, when sown in autumn, and a bushel of Barley, when sown in spring; to be depastured or cut green along with the young Grass crop."

We may state, in conclusion, that the Tables and descriptions appear to have been carefully compiled; and that to persons interested in laying down land in Grass—whether for pasturage, lawns, or covers for game—this work will be a useful guide.

On the Food of Plants and Drill Husbandry of Turnips. Ridgway. 1842.

THIS little book may be useful to those who desire to have some notion of the manner in which different manures are supposed to act, and who have not leisure or inclination to enter deeply into such matters. One

object, no doubt, of the publication, is to recommend *Lance's Manure*, which, if properly prepared, is of use on light sandy soils.—M.

- 1.—*Remarks on thorough Drainage and deep Ploughing.* By James Smith, [Esq., of Deanston Works, near Stirling. Oliver and Boyd, 8vo. 6th Edition.
- 2.—*Observations on Thorough Drainage as the Basis of Agricultural Prosperity.* By O. O. Roberts. Simpkin and Marshall, 12mo.
- 3.—*Drainage*; an Article in the last Number of the "Westminster Review."

THE rapid and extensive sale of Mr. Smith's excellent pamphlet, the appearance of others in quick succession, speeches at public dinners, and reiterated articles in newspapers and reviews, all show the great interest that is taken by the public in one at least of the means which science and common sense point out as conducive to the augmented productiveness of land. People have at last found out that swampy fields and roads fetlock deep in mud are not merely a personal annoyance, but a serious injury to their pockets, if not to their constitutions, and all the world is turning its attention to draining. May the good work prosper!

We fear, however, unless the works in progress are conducted on sound principles, and executed in a substantial manner, cases of disappointment will be frequent, and the expense incurred will be heavier than was either necessary or anticipated.

We therefore strongly recommend all those who are occupied in the work of drainage to read the two pamphlets at the head of this article. Mr. Smith, of Deanston, may be called the father of good drainage, and his advice, the result of long and successful practice, deserves the most implicit confidence. Mr. Roberts's work may be regarded as a sort of commentary on it, and contains much sound advice, with many useful directions. The subject has so often been treated of lately in our columns, that we need not dwell upon it further.

With regard to the article in the *Westminster Review*, ascribed, we believe, to Mr. Bailey Denton, we have only to state that it is ably written, and full of important generalization. He insists more particularly upon the importance of saving the refuse matters of towns, of combining sewerage with land-drainage, and of converting the latter into a means of conveying the former into the country. All these considerations are of the first degree of interest, and cannot be too frequently or forcibly impressed upon the minds, not of the landed interest alone, but of the rate-payers and inhabitants of towns. If the refuse matters now wasted in every town in Great Britain were taken care of, they alone would furnish no inconsiderable sum in diminution of the poor-rates; and if a diminution took place from such a cause, it would be immediately attended with other advantages, the most immediate of which would be a reduction of fever cases, and a further saving in doctor's bills. The newspapers tell us that the contents of the cesspools in Paris have just been sold for 22,000*l.* a year. Why cannot we do the same? Are we too rich—or too proud—or too ignorant?

The Year Book of Facts, for 1843 (Tilt and Bogue), has appeared. We expressed a favourable opinion of the volume for 1842, and we find ourselves justified in speaking in the same manner of the present. Such works are of great use as depositories of little facts which are too recent to be incorporated in formal works on science; and which, till that happens, are forgotten by the mass of mankind. The matter is clearly arranged, well condensed, and rendered available by a good index. Among the various kinds of information which it contains are particulars of the completion of the Artesian well of Grenelle, after eight years' labour; of Liebig's views of Animal Physiology; and of Bischof's investigations of the Cause of Tropical Miasmata.

CALENDAR OF OPERATIONS for the ensuing week.

REARING ornamental plants from seeds is one of the most interesting and, in some cases, the most difficult occupation in which the amateur or young gardener can be engaged at present. Every precaution may have been taken in sowing the seeds in suitable composts and in well-drained pots, or boxes, yet they either do not vegetate at all, or, if they do, a great portion of them often damp off without any apparent cause. To guard against this damping off it is a good plan to prepare the composts for seed-sowing and propagation in the previous summer, by exposing them in thin layers to the sun, and by turning them over frequently, till all their natural dampness is evaporated, and then to put them by in an open airy shed for future use. In large establishments you will always see a portion of loam, sand, and peat thus prepared in open sheds. Florists often dry their seed-compost over the fire in an iron vessel; this is a ready way of procuring it free from all extraneous matters, but for general purposes is not so effective as the former mode. Now, after all these precautions, if you water the seed-pots with pond-water, alias liquid mud, or with that which has stood a long time in a tank, the chances are that you have again impregnated the whole with the elements best calculated to ensure dampness to the young progeny; half dried soil, and fresh damp sand from the pit, watered with soft pond-water full of animalculæ, and the confinement of a close, cold or warm pit, are the best means that could be taken to damp even seedling Oaks. When you see the surface of a seed-pot turn green, or of a black shiny colour, either the soil or water, perhaps both, are at fault. If the seeds were large, and covered a quarter of an inch thick, the crust of soil over them may easily be removed, or the seeds may be sown in a fresh pot. In the case of very small seeds, let the soil get dry, and with a small stick make a row of small holes round the side of the pot down to the drainage; you may also make a hole all over the surface. These holes will soon improve the condition of the soil, by letting large portions of air into it; the soil will be filled up, after a few days, with dry sand, which will imbibe another portion of the superfluous moisture, and afterwards act as so many drains. As soon as the young seedlings appear, sprinkle a little dry sand occasionally over the surface; if the sand is hot from the top of the fire, all the better, provided it is not too hot for the young plants. After a few days you may transplant them in little colonies of half-a-dozen or ten seedlings each,

removing little patches of the soil along with them, to keep them together and to establish them on the surface of a fresh pot; you can fill in between these little patches with equal quantities of sand and peat in a dry powdery condition; and as soon as the plants are strong enough you can transplant them singly in the usual way.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—When the stock of young plants are fresh potted, they stand in need of more assistance to enable them to take hold of the fresh soil; this is given them in the increased heat of the fresh beds, and by keeping them more close for the first fortnight or three weeks. I wish the weather would enable me to advise shading them till their new roots were established. At the spring potting the whole stock is to be regulated, some of the fruiterers fresh surfaced, new beds made, and the whole re-arranged according to their sizes. From this time liquid manure must be given occasionally, say at every other watering.

VINERY.—Another useful treatise on the cultivation of this fruit has lately been added by Mr. Roberts. I never recollect such an unfavourable February for early forcing and for gardening in general. A large class will now begin to force Vines by shutting up their houses and keeping them about 50° during the day, and by letting out the fires at night for the first fortnight or three weeks, according to the state of the weather. The other stages require the usual routine already described.

PEACH-HOUSE.—These, as their leaves are now fully expanded, require large portions of air, and the atmosphere kept steady and moist.

CHERRY-HOUSE.—Same as the Peach-house. When we do get a sunny day, see if the trees want a little shade; their leaves seem very tender at present.

FIGS.—These require to be constantly kept moist at the roots, to enable them to swell their fruit. If any of the shoots have not shown fruit, or if the fruit has dropped off, pinch back the shoots to two eyes, and they will show fruit with their next growth.

STRAWBERRIES.—The earliest crop of these will have no flavour, unless we get a sudden change to sunny weather. Kidney Beans and Cucumbers suffer less from dull weather than any other plants we force early.

SEEDLINGS.—All young seedlings of hardy plants, such as Celery, Cauliflower, Lettuce, Onions, Peas, Beans, &c., raised in heat require great attention this dull season. Remove them to a cooler place, where they can have more air, as soon as they are fairly above the ground. Capsicums, Tomatoes, Egg Plants, Tobacco, and Sweet Basil, may be sown in pots and boxes any time during the first half of this month, and treated as half-hardy plants after they come up. It will not be requisite that I should occupy much space with points so obvious and so well known as these, especially as the subject is so fully treated of in former volumes.

Out-door Department.

It is disheartening enough in-doors at present, but more so in the open air. The soil has seldom been in a less workable state on the 1st of March, and we have every indication of a late spring. This and the following month are proverbially the busiest time in the year for the gardener. To save time and space, I shall divide the sowings into two classes: those for permanent or perennial crops, as Asparagus, Seakale, Rhubarb, Onions, Carrots, and Parsneps, &c., and those required for successional crops, such as Peas, Beans, &c. As soon as the soil is in a fit state, the permanent crops above may all be sown except the two last, Carrots and Parsneps; these will answer better a month hence.

TURNIPS.—The Stone and Early Dutch Turnips may now be sown on a warm border; but sow a few every ten days for the next six weeks in preference to a large breadth at once, as the earliest sown ones will run, more or less, to seed.

CABBAGES.—A few seeds of the early varieties may now be sown for young summer Cabbages, also Cauliflowers, White Autumn Broccoli, Savoys, and Brussels' Sprouts.

ORCHARD.—Little is to be done here now except finishing the nailing of Peaches and Apricots, and providing for them against frost.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—Orchidaceous and other stove plants which have been kept in a temperature of 60° during winter, will require a gradual increase to 65°. Young or weak specimens of Orchidaceæ had better be kept in the coolest part of the house, till all their buds or eyes are fairly in growth; otherwise, the more forward buds may take the lead, and the rest may not start at all. It is too soon yet to increase the temperature for the hardier Orchidaceæ in the intermediate stove. Cuttings made now of the strong tops of all the showy Clerodendrons will make handsomer plants than their parents; they are very useful and showy as late summer and autumn plants for the conservatory. Continue to pot as the plants begin to grow.

GREENHOUSE.—From this time to the end of May, some of the tribes here will want potting, beginning with seedlings and stove pots. The traffic between this house and the cold pits would form a goodly calendar of itself for the next two months.

CONSERVATORY.—An unknown friend has sent me a long list of blue-flowering plants for the conservatory, which will be made use of shortly. Hardly any air could of late be given to this house, owing to the dampness of the atmosphere, and consequently less watering was required. I have just heard that herbaceous Perennials are good forcing plants for spring flowers, and I have potted a few on trial, but this ought to have been done when the plants died down last season.

PITS AND FRAMES.—It is now too late to graft Rhododendrons or Camellias. By the time they would be fairly united, they would begin to grow; and from the confinement and want of nourishment, they would only make a weakly growth, and thus lay the foundation of future debility. When the lower part of their next growth is fully ripe, that will be the best time in the year for this work, for which I shall give ample directions.

Out-door Department.

The whole of the pleasure-grounds should now have a regular cleaning; grass, gravel, borders, beds, and all; except, indeed, where alterations are going forward. Get all the planting finished as soon as possible, if other parts of the alterations have to stand still for a time. When digging the Rosary, or trimming the arcades of Roses, recollect what has been said lately about Rose-stocks in the *Chronicle*. I shall probably have a paragraph on Rose-stocks next week.

PLANTATIONS.—The work here should now be finished for the present.—D. Beaton, *Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the Week ending Mar. 2, 1843, as observed at the Horticultural Garden, Chiswick.

Feb. 24. Foggy; cold easterly haze; overcast.
25. Overcast; some snow-flakes, slight drizzle; stormy with snow.
26. Sleet; overcast; dark hazy clouds; slight rain.
27. Stormy and wet; barometer very low; hazy with rain.
28. Densely clouded thro' gloom.
Mar. 1. Slight frost; snow-flakes occasionally; frosty at night.
2. Sharp frost and clear; fine with sun; cloudy; clear and frosty.
Mean temperature of the week 62° below the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending March 11, 1843.

Mar.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained	Greatest quantity of Rain.	Prevailing Winds.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending March 3, 1843.

The supplies have been well kept up during the past week, and prices, except in a few instances, remain the same. The demand still continues small. **Fruit:** Pines are tolerably numerous, from 5s. to 8s. per lb. Foreign Grapes are abundant: Lisbon fetching from 1s. to 2s. per lb., and White Portugal from 9d. to 1s. per lb. A few forced Strawberries have made their appearance, which are offered at 3s. per oz. The supply of Beurré Rance Pears is very limited; they are selling from 12s. to 18s. per half-sieve. A tolerably good eating kind, called the Black Pear of Worcester, is fetching from 6s. to 7s. per bushel. Dessert Apples are numerous: the best are the Golden Pippin, from 10s. to 12s.; Nonpareils, from 5s. to 11s.; and Ribstone Pippins, from 5s. to 7s. per bushel. Culinary Apples consist of Russets, from 3s. 6d. to 5s. London Pippins, from 3s. 6d. to 5s. 6d., and Wellingtons, from 3s. 6d. to 6s. per bushel. Cucumbers, from 2s. to 6s. per brace, are pretty numerous. **Vegetables:** The supply of Asparagus continues good, and there is a slight decrease in the price of the best bunches. Sea-kale is of excellent quality, and is literally offered from 9d. to 2s. 6d. per punnet. French Beans are somewhat cheaper, but not numerous. White Broccoli is tolerably abundant, from 9d. to 2s. per bunch; the Purple is smaller, and fetches from 6d. to 1s. Savoys are good, from 6d. to 1s. per dozen. A small quantity of new spring Potatoes are offered, from 1s. to 3s. per lb. Cardoons may be obtained at 1s. each. Onions have advanced considerably in price, and fetch from 6s. to 9s. per bushel. Rhubarb is also somewhat dearer, being from 9d. to 1s. 6d. per bundle. Parsneps are excellent, from 6d. to 1s. 3d. per dozen. Lettuces are very small, and are selling from 6d. to 9d. per score. Endive is tolerably good, and fetches from 1s. to 3s. per score. Mushrooms are plentiful, from 9d. to 1s. 3d. per punnet. **Flowers:** The cut flowers consist of Amaranthus, Acacias, Gardenias, a great variety of Azaleas, Roses, Camellias, Heliotrope, Narcissuses, Hyacinths, Tulips, Pinks, and double Chinese Primroses; with a few sprigs of Templetaria retusa, Abutilon striatum, Poinsettia pulcherrima, and yellow Jasmine.

PRICES, SATURDAY, March 4, 1843.—FRUITS.—

Pine Apple, per lb. 5s to 8s	Chestnuts, per bush. 2s to 6s
Grapes, Spanish, per lb. 1s to 1s 3d	Walnuts, per bush. 12s to 16s
— Portagal, 1s to 3s	Chestnuts, per peck, 3s to 6s
Apples, dessert, per bush. 4s to 8s	Almonds, per peck, 6s
— Kitchen, 1s to 3s	Sweet Almonds, per pound, 3s
Pears, dessert, per half-sieve, 5s to 14s	Filberts, English, per 100 lbs. 6s
Strawberries, forced, 1s 6d to 2s	Ch Nuts, per 100 lbs. 6s to 7s
Pummeles, per doz. 6s to 12s	Nuts, per bushel—
Oranges, per doz. 1s to 2s 6d	— Brazil, 16s
— per 100, 7s to 20s	— Spanish, 12s
— bitter, per 100, 2s to 20s	— Barcelona, 24s
Lemons, per doz. 1s to 2s	— Cob, 12s to 14s
— per 100, 4s to 14s	

VEGETABLES.

Savoys, per doz. 6d to 1s	Parsneps, per dozen, 6d to 1s
Cabbage, Red, per doz. 2s to 5s	Spinach, per sieve, 1s 6d to 2s
— plants, per doz. 1s 6d to 2s 6d	Leeks, per doz. bun. 3s to 4s
Broccoli, White, per bunch, 9d to 2s	Onions, per bushel, 6s to 9s
— Purple, 6d to 1s	— Pickling, per hf.-sv. 3s 6d to 5s
Beans, Kidney, forced, per 100, 2s to 3s	— Green, p. doz. bun. 3s to 4s
Potatoes, per ton, 50s to 75s	— Spanish, per doz. 2s to 6s
— per bush. 1s 6d to 2s	Garlic, per lb. 6d to 8d
— Kidney, per bush. 1s 6d to 2s	Shallots, per lb. 1s
— Scotch, per lb. 1s 6d to 2s	Asparagus, large, per 100, 6s to 8s
New, per lb. 1s 6d to 2s	— Spruce, or Small, 2s to 3s
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Sea-kale, per punnet, 9d to 2s 6d
Turnips, per doz. bun. 1s 6d to 2s 6d	Lettuces, p. score, 6d to 9d
Red Beet, per dozen, 9d to 1s	Endive, per score, 1s 6d to 2s
Scorzonera, per bundle, 1s 3d to 1s 6d	Calery, p. hd. (12 to 15) 6d to 2s
Salsify, per bundle, 1s 3d to 1s 6d	Rhubarb Stalks, per bdle. 9d to 1s 6d
Cardoons, each, 1s	Small Salads, per punnet, 2d to 3d
Horse Radish, per bundle, 2s to 4s 6d	Corn Salads, per hf.-sieve, 9d to 1s
Radish, per doz. hands (2s to 3s each)	Watercress, per doz. sm. bun. 4d to 6d
1s to 1s 3d	Parsley, per half-sieve, 1s 6d to 2s 6d
— Turnip, p. doz. bch. 1s to 1s 6d	Fennel, per doz. bun. 2s to 4s
Carrots, per doz. bunch. 4s to 6s	Sage, per doz. bunches, 2s to 4s
— Horn, per bunch, 4d to 6d	Mint, per doz. bunches, 2s 6d to 4s
	Mushrooms, per punnet, 9d to 1s 3d

Notices to Correspondents.

MANURES.—Warwickshire.—The proper quantity of Guano which will equal in effect 20 bushels of bones per acre for Turnips cannot yet be stated, there not being a sufficient number of accurate experiments recorded. We would recommend 3 or 4 cwt. of Guano to be mixed intimately with 10 bushels of ashes, 3 bushels of pounded chalk (carbonate of lime) and this with 3 or 4 cart-loads of earth, the richer the better. Spread this mixture evenly in the drills, and cover it with an inch of the soil; then drill the turnip seed over this, if possible, in wet weather. In dry weather, the Guano will have no effect, and, in contact with the seed, will be injurious. If necessary, it will repay the expense to water the rows in the evening, till the plants are safe, which they will be very soon. We shall be glad to hear the result of the experiment. **M.**—**Uxwater.**—For meadows, the Guano may be mixed with ashes only, about 10 bushels of ashes to 1 cwt. of Guano. Sow the mixture evenly in moist weather, or when the ground is moist. Bush-harrow and roll afterwards, unless the Guano is well washed in, its effect will not be perceptible. In very dry weather it may turn the grass yellow. **M.**—**T. A. N.**—Urine and Cloacine should be kept in casks or tanks till they become putrid, before they are employed as manure. Then add as much oil of vitriol, or muriate of lime, as will fix the ammonia, and it is fit for use. It should be diluted with water from time to time in order to hasten the putrefaction. **A Grateful Reader.**—We entertain no doubt that the drainage you speak of is well worth preservation. Such substances if not diluted at first, as yours are, must be so afterwards. We have no means of judging of the size required for a tank. Cannot you convert the cesspool into a tank sufficiently water-tight by some such cheap plan as that mentioned in a leading article at p. 83. A month or six weeks will be about the period required for the putrefaction of the liquid, unless the weather is very cold. **A. H.**—We see no reason to alter our opinion respecting the value of gypsum for fixing ammonia, notwithstanding what has been said about it. All that is requisite to ensure its action is that it should not be in lumps, and that the dunghill should be wet. But no one who knows how to manage a dunghill would think of keeping it dry. It should always be kept wet by pouring back over it the water that drains from it, until it is made. **Liquid Manure.—Rus.**—You may apply this to any plants or seeds when in a growing state, but not at any other time. Take care, however, that it is well fermented, and that it does not make them rank. **Liquid Guano.—R. S.**—This should only be applied when plants are in a growing state, at intervals of a week or a fortnight, according to the strength of the plant to which it is given. **Gypsum.—T. A. N.**—When this substance is used for fixing am-

monia it should be reduced to powder, and not burnt. Plaster of Paris will not do.

ROAD SCRAPINGS.—J. M.—The scrapings of roads are an excellent material for lightening heavy soils.

OLD PASTURE.—An Original Subscriber.—Instead of removing the surface of your old pasture previously to planting Potatoes, you would find great advantage, both as regards the quantity and quality of the crop, in trenching it down. All other circumstances being the same, Potatoes grown above turf are the best.

HEATING.—J. M.—We believe that zinc pipes are not suitable for circulating hot water in forcing-houses. **P. H.**—The cost of a hot-water apparatus for heating a Vinery 26 feet long by 11 feet wide would probably be from 15l. to 20l. One of Stephenson's portable boilers, erected inside the house, would perhaps answer your purpose, and would not cost above half that sum.

VINES.—Clericus.—The proportions of the liquid for washing the stems of Vines are: 1 lb. of soft soap and 1 lb. of sulphur to every four gallons of water, boiled together for half an hour, and afterwards thickened with lime to the consistency of paint. If a little soot is added to the mixture, it will take off the glaring effect of the lime. **A Dabbler in Gardening.**—The Fringe-tree is called Chionanthus. It requires a very hot summer to bring it into a flowering condition. It is probable, therefore, that your plant will bloom this season.

MAGNOLIA.—A Dabbler in Gardening.—Your Magnolia will be more likely to flower if you do not water it during the growing season; such treatment only induces a fresh growth of wood, instead of encouraging the formation of flower-buds.

IVY.—Discipulus.—We apprehend your Ivy is sheltered by an overhanging roof; and as it has a border only one foot wide to grow in, before it encounters a drain, that its partial failure has been occasioned by drought. This is rendered still more probable from its having grown remarkably well until the late dry and warm season.

HOLLIES.—Desirous.—Hollies prefer a light soil, but the application of manure is useless to them. The best time for pruning them is late in March or early in April. **J. M.**—The best season for clipping Hollies is early in spring, before they make their annual growth.

YUCCA.—Y.—This genus contains 30 supposed species. The term Adam's Needle is usually applied to Yucca gloriosa.

INDIAN CORN.—Hibernia.—We will shortly give you some information upon this point.

LARCH.—J. W.—The Larch does sow itself, although we cannot state at what period the cones open to let the seeds fall out. We should imagine that it takes place in the spring, when the cones, after being saturated with the winter rains, are first acted upon by the warmth of the sun.

SEEDLING OAKS.—J. W.—It is, no doubt, a good plan in taking up seedling Oaks, and, in fact, all other young trees, to cut off a portion of the tap-root.

NATIVE TREES.—J. W.—For the names of the trees indigenous to Great Britain we must refer you to the catalogues of British plants.

VERBENAS.—Clericus.—You may procure the following, which are good kinds, and combine a great variety of colour: V. pulchella alba, Sabini, tauricoides rosea, t. lveryana, and t. carnea; Neillii, ignea, Chandleri, Tweediana, grandiflora, Melindres, latifolia, purpurea, Hendersnii, Ingrami, and versicolor.

FUERGAS.—Paul Peter and Clericus.—The following kinds may be easily procured, and are well adapted for greenhouse cultivation: F. fulgens, Lanei, Chandleri, Standishii, Brewsteri, Monceppennii, Wormaldi, stylosa conspicua, roseo-alba, pendula terminalis, eximia, and formosa elegans. For planting in the open border we would recommend F. gracilis, globosa, globosa major, Riccartonia, Thompsonia, Clintonia, reflexa, erecta, conica, and virgata.

ERYTHRINA.—C. D.—We think it would be better to cut down your Erythrina. It will then perhaps flower from the young shoots. It is not probable that your Annona flower will set its fruit, and therefore it is not worth preserving the flower, unless for your gratification. You will find it something like a small Magnolia, with triple sepals and petals.

WINDOW PLANTS.—M. C.—In addition to the Maurandya and scarlet Verbena, you may procure a Chinese Primrose, or a Cineraria, for the centre of your basket, and Mimulus moschatrus—red, blue, and pink Anagallis, Lysimachia nummularia, and Cereus flagelliformis, to hang down round the sides. The Camellia is C. albaeflora.

CALCEOLARIAS.—Paul Peter.—We recommend you to procure the following sorts: Shrubby or half shrubby; Magnum Bonum, King (Green's), Prince Albert, Miss Antrobus, Royal Standard, Standishii, Phyllis, Floribunda, Alba atropurpurea, Sulphurea superba, Solomon, Prima Donna. Herbaceous: Delicatissima, Ne plus Ultra, Priam, Pride of Kent, Rosea, King (Barnes'), Criterion, Bride of Abydos, Mabel, Madonna, Adonis, Viola. **D. D.**—We must refer you for prices to the lists of the growers. The accompanying are superior kinds: Standishii, large dark spots upon a yellow ground, shrubby; Miss Antrobus, white large crimson spot, h. s.; Floribunda, white dark centre, h. s.; Sulphurea superba, h. s.; Prince Albert (Green's), yellow ground, s.; Solomon, lemon ground, fine spotted eye, s.; Ne plus Ultra, buff spotted, h.; Delicatissima, h.; Emperor, crimson and yellow; Royal Standard, yellow and brown, s.; King (Green's), dark self, s.; Prima Donna, white, crimson spot, h. s.

ROSES.—An Admirer.—If you wish to obtain a succession of forced Roses from December until March, it will be necessary for you to pot your plants early in the previous season, and to get the wood well ripened in good time. It is to be hoped that the house which you have erected for this purpose is well situated for receiving the full benefit of the winter's sun; otherwise it is doubtful whether you will attain your object.

BULBS.—A Dabbler in Gardening.—You had better examine the bulbs of your Snowdrops, and see if they are not attacked by some animal or insect. There must be some cause for the flowers not expanding, and that seems the most probable one. We should think the single Snowdrop might be obtained of most nurserymen; if not they will drive you, like many others, to go to Holland for supplies.

OXALIS.—A Dabbler in Gardening.—To bring your O'xalis floribunda to a state of rest, you must withhold water from it, and afterwards place the pot in a dry situation.

ANOMATHECA CRUENTA.—Hibernia.—This bulb is a native of the Cape; it is readily propagated by seeds or offsets, and succeeds best in a warm greenhouse.

MELON.—Paul Peter.—We are not aware that seeds of the Beechwood Melon can be procured in the trade; they may be obtained by means of the Fellows of the Horticultural Society.

PEACHES.—Discipulus.—Seymour's method of pruning and training the Nectarine and Peach is one which may be recommended. An account of it will be found at p. 128 of Vol. i., and p. 295 of Vol. ii. of the "Gardeners' Magazine." Your last question will be answered in another form.

PEACH-TREES.—W. N.—Your Peach-trees which have rotted at the roots must have been very badly situated as regards soil and drainage. It is essentially necessary to attend to the latter previously to planting fresh trees; and you cannot do better than form your borders of rich maiden loam, such as will keep moderately open, both in wet and dry weather. **A Late Subscriber.**—The cause of your Peach-trees failing in setting their fruit, supposing the blossoms to have been uninjured by frost, is most likely owing to the very general error in the management of these trees,—that of not shortening sufficiently the bearing shoots. If you aim at obtaining only one fruit on each shoot, or two upon such as are strong, and shorten and thin accordingly, you will probably not be disappointed in having as abundant a crop as the trees can well perfect.

GRAFTING.—An Original Subscriber.—The French, in grafting Pears on Quince stocks, very properly work them close to the ground, but not below the surface, for if the Pear had an opportunity of striking root, the object of grafting on the Quince would be defeated. At the same time, as little as possible of the Quince should be above ground; because its growth is more contracted than that of the Pear, and the disparity in many cases becomes ultimately so great, that the sap is too much impeded and the Pear ceases to thrive. **R. S.**—Apple-trees for standards are best worked on free stocks, raised from seeds of the Crab or Wild Apple; and for dwarfs, the English Paradise is the most proper, unless the trees are to be kept in the smallest possible compass, in which case, the French Paradise is to be preferred. If you do not procure Pear-trees ready worked from the nurseryman, the best plan is to purchase properly reared stocks. Your Cherry stocks, planted last January, will only be fit for working twelve months hence.

PEARS.—An Essex Subscriber.—The following are select varieties, which are good bearers, and will succeed as dwarfs:—Dunmore, Althorp Crassane, Flemish Beauty, Marie Louise, Beurré Bosc, Beurré de Capiaumont, Fondante d'Automne, Beurré Diel, Louise Bonne (of Jersey), Hacon's Incomparable, Thompson's, Winter Nelis, Glout Morceau, Passe Colmar, Knight's Monarch, Ne Plus Meuris, Easter Beurré, Beurré Rance, Winter Crassane (Knight's), Jean de Witte. **H. D.**—The Merveille d'Hiver Nouvelle is the same as La Fortunée, a variety chiefly esteemed for its long keeping; it is middle-sized, roundish, obovate, somewhat irregular, with a small deep eye; the colour is a yellowish russet; flesh, somewhat astringent; it keeps till May. There is no Pear known under the name of Styles d'Hiver. Your country nurseryman probably meant Neils d'Hiver, a much higher-flavoured Pear than the preceding or, in fact, than most other varieties.

SEA-KALE.—A Correspondent.—All that you can do towards accelerating the growth of your newly-planted Sea-kale will be to keep it clear of weeds and to water it occasionally, while growing, with salt and water of about the same strength as sea-water.

POTATOES.—An Original Subscriber.—The Ash-leaved Kidney is a well-flavoured, rather mealy, Potato. Any nurseryman ought to be able to furnish you with the Lady's Finger Potato. It blossoms, grows to a medium size, and is fit for use in autumn and winter. Potatoes for sets should be of fair size, and cut to one or, at most, two eyes; they should be planted at the distance of 7 inches in the rows, the latter being from 24 to 30 inches apart, according to the vigour of the sort and richness of soil.

ONIONS.—An Original Subscriber.—The Nocera Onion is small, roundish, or oblate, with one or two small leaves; in colour it resembles the Silver-skinned, and, like that, is not adapted for keeping. It is, however, excellent for pickling. The Silver-skinned is of medium size. The Strasburg is large, roundish, and of a reddish-brown colour.

ASPARAGUS.—A Correspondent.—Let the seedsmen say what they will, there is only one sort of Asparagus; and any that will grow will give you what you want.

INSECTS.—T.—The mealy insect which infests the roots of your Gooseberry-bushes has no connection with the red-spider upon the leaves. The former might perhaps be destroyed by watering the ground around the bushes with a solution of spirits of tar: the latter can only be kept under by either dusting the bushes with sulphur, or washing them with the garden-engine, in dry weather.

SLUGS.—K. wishes to be informed whether, since the compost prepared for the frame, and also that for pots (designed for seeds, &c.) to be inserted in the frame usually contains abundance of slugs' eggs, it would be safe as regards the plants, and effectual in the destruction or expulsion of the young slugs, to moisten both soils with spirits of tar or lime-water; or whether any other expedient is to be preferred.

MILDEW.—Z. A.—We recommend you to remove from your Cucumber plants, and burn, those leaves which are most infested with mildew, and to dust the remainder, when dry, with flowers of sulphur.

BOOKS.—Boron.—Rural chemistry is about to appear in a small volume, as you will see by the advertisements. **X. Y. Z.**—Begin with Lindley's School Botany and Lady's Botany (the abridgement); then take the same author's Elements of Botany and Natural System. After that, if you understand them, you will be able to run alone.

FALL OF THE LEAF.—W. W.—The author of Familiar Botany supposed the last of his articles to be a full explanation of what you did not understand. If not, pray state specifically the point on which you are in doubt, and we will engage for him that he will answer you.

BAD GARDENING.—Planta genista presently.

WARD'S CASES.—T. H.—We apprehend that the collapse of the Indian-rubber stretched over the mouth of your glass vessel containing a growing plant must be caused by the condensation and assimilation of the air beneath it by the plant itself. The plant has been eating up your air.

SOCIETIES.—J. W. N.—If a Member of a Horticultural Society absents himself from the meeting of a Committee of which he is a Member, it is unusual, but not improper, that he should call in question or endeavour to rescind the resolutions passed at that meeting by the other Members of the Committee when he was not present, if he thinks them unwise. But if the resolutions have been carried into effect, it must be a very strong case indeed which would justify him in interposing.

MR. FORTUNE'S MISSION.—C. D.—The cost of getting home live plants is considerable; and besides, Mr. F. cannot send them to any one except the Horticultural Society. It is only dried plants and objects of natural history, not horticultural, that he can collect on his own account. If you wish to have his dried plants, no time should be lost in applying to Dr. Lindley.

CROPS.—J. N., Post-office, Exmouth.—We do not wonder at your being out of place: you are exactly where impertinent people ought to be.

ACORNS.—A Constant Reader.—We are delighted to find that we put you on the right road to manage your little experiment with the acorn successfully. You now see the importance of comprehending the reasons of things. You had better not plant it out till May; in the meanwhile keep it in any damp place exposed to light.

FROZEN PLANTS.—Hibernia will find at p. 84 directions for recovering frozen plants.

GOLD FISH.—W. M. K.—Calced flint must be prepared by burning it. The flints are common enough in all chalky districts.

DERIVATION OF WORDS.—J. W.—We cannot give any explanation of the origin of the word Gann: it seems probable that it has the same origin as the French term Guigne.

ALMONDS.—Housewife.—Scald them so that their skins will come off; that is all.

MICROSCOPES.—Wyeside.—The most convenient microscope for botanical purposes is Ellis's, which packs into a box the size of an 8vo volume. Its price is from two to five guineas.

MISCELLANEOUS.—A Florist.—Rhododendrons and all such plants will come quite safely from Ghent. Tecoma picta is a very pretty twining greenhouse plant, with white flowers, veined with violet. We do not know the other plants, which are, in all appearance, nurserymen's names. You had better be cautious. **Sprengeli.**—Your plants are Bignonia Pandorae and a species of Hermannia. **J. B.**—Your plant is a variety of Maxillaria picta. **Newport.**—Your specimen seems to be the Athenian Poplar. **Διαβος.**—We will bear your request in mind. **Rougham.**—Euphorbia jacquiniiflora. **B. B. B.**—The Cuscuta is C. epithymum. Nephródium filix mas. is synonymous with Aspidium filix mas.; either or both terms are correct. Lámium molle is generally purple; the white is a variety of it. **W. B.**—It is impossible to determine Liliaceous plants from

the leaf. You had better wait until the plant flowers, when we shall be better able to determine. *Wye-side.*—The fungus, which resembles a piece of dark, putrid flesh, and which you have lately found on decayed pieces of Beech and Oak, is probably some species of *Tremella*. *Rev. J. H.*—Your plant is *Hovénia acerba*, and is not quite hardy. *M. G.*—We cannot name the *Auricula* sent; the paste, or circle of white surrounding the eye is pure and good, but the circle of colour encroaches too much upon the green edge, and breaks through to the margin, which is a great defect; it is a pretty flower, but not a good one. *P. R.*—Your seedling *Cineraria* is beautiful in colour, but the petals are too narrow. *Junius.*—Either of your samples of sand may be applied with good effect upon stiff garden land, or in potting plants of vigorous habit; but they are not at all adapted for Heaths and plants with delicate fibrous roots. *H. S.*—We cannot undertake to name crowds of bad specimens of plants. *J. R. L.*—Your *Rhododendron* is not the true *R. arboreum*, but one of the numerous hybrids raised from it. *T. D.*—The tree is the *Lucombe Oak*. *Fair Play.*—We can give you no information.

As usual, many letters have arrived too late for answers this week. Mr. FAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them delivered in any part of London, by remitting a Post office order to this Office, at the rate of 5s. for every 25 copies.

NEWS OF THE WEEK.

THE debate in the House of Commons on Tuesday night, on Lord Ashley's motion for an address to the Queen praying her Majesty's immediate consideration of the best means for diffusing a moral and religious education among the working classes, will be read with the deepest interest. The importance of the measure is attested by the fact that all party and political considerations were laid aside by every Member of the House, and that the motion was received and carried with that general unanimity which nothing could have produced but an overpowering sense of its necessity. Lord Ashley drew a melancholy picture of the continued increase of crime. He said that the country is weary of mere palliatives; the evil is wider and deeper than can be reached by the schemes of prison discipline and mere corrective processes; and if it be not grappled with at once, we may anticipate, in twenty years, a general convulsion of the whole system of society. The time is come, he said, when the upper classes must bear in mind that they owe to the humbler ranks the long withheld debt of kinder language and more intimate intercourse; and that the imprudence and immorality of their poorer countrymen are the result, in a great measure, of their own neglect, and, in no slight degree, of their own example. Sir James Graham concurred cordially in these sentiments; the question, in his opinion, is utterly different from those of mere party struggles—it is an immense and awful duty which the House owed to the mass of the people; late events were pregnant with solemn warning; the time is come when the religious and moral instructor must go forth, and the destinies of the country are involved in the proper education of the rising generation. He then detailed the measures now contemplated by Government: in the first place, district-schools will be provided for the education of pauper children in the Metropolis and large towns, under the superintendence of the Clergy of the Established Church, with provision for the instruction of children of Dissenters by ministers of their own persuasion; the experiment will first be made in the manufacturing districts, and other measures will necessarily follow. Lord John Russell gave his warm support to the motion, and Sir Robert Peel in expressing his gratitude to Lord Ashley for his exertions, said that the interference of Parliament will have little effect, unless the educated and wealthy classes can be convinced that they are all to blame, unless those possessed of wealth and the responsibility for its use can be made to feel that they have all been individually neglectful of the education of the poor. He apprehended that the unanimity of the House will have the best effect upon the country, and that the moral influence of such a demonstration, in which party-feelings were forgotten in a sense of public duty, will do more good, by encouraging individual exertion, than the interference of the Legislature.—In comparison with this debate, the Parliamentary proceedings of the week are interesting only as party questions—if we except Lord Aberdeen's announcement in the Lords respecting the satisfactory progress made in the suppression of the Slave-trade. Lord John Russell, on Monday, called the attention of the House of Commons to the circumstance of the Duke of Wellington, as Commander-in-Chief, holding a seat in the Cabinet; but Sir R. Peel claimed for himself and his colleagues the entire responsibility of the appointment, and appealed to the whole conduct and character of the Duke as sufficient pledges that he would never allow his political opinions to interfere with the public service. On Wednesday Mr. Roebuck moved a Committee of inquiry into the circumstances that led to the war in Afghanistan, and commented with extraordinary severity on the late Administration. The motion gave rise to an animated debate, but was negatived by a majority of 114. The House has also been occupied with the consideration of a question affecting its privileges, arising out of the arrest of Mr. Howard, the attorney, in a case which has often been

before the public. The main object of the House was to avoid a compromise of its independence by recognising the jurisdiction of a court of law. For the details of the proceedings we must refer to our Parliamentary Report.

From France our news is confined to the particulars of the great struggle in the Chamber of Deputies, the result of which will decide the existence of the Ministry. The debate commenced on Wednesday, and is not likely to be concluded for some days.—In Spain, the elections, which commenced on the 27th, are the chief topic of the day; great uncertainty prevails respecting their result, and it is expected that most of the large cities will return Opposition Members.—The negotiations between Great Britain and Portugal for the tariff convention have at length been broken off, the British Cabinet having decided on the rejection of the last Portuguese proposals, and on losing no further time in the attempt to negotiate.—From the Levant we have accounts of hostilities on the Persian frontier, which will no doubt increase the difficulties of the Commissioners in arranging the dispute between the Shah and the Turkish Government. The accounts from Syria mention that the works of the Protestant church at Jerusalem have been suspended by order of the Pacha, and that the affair has been referred by the Bishop and the Consuls to the Ambassadors at Constantinople.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Prince of Wales and the Princess Royal, left Buckingham Palace on Thursday afternoon for Claremont. During the week, the Queen and Prince Albert honoured Covent Garden theatre and the performance of the French plays with their presence.—The Prince presided on Monday at a meeting of the Commissioners for promoting the Fine Arts in the rebuilding of the Houses of Parliament.—The Queen Dowager and her Court returned from Canford House, yesterday, to the metropolis.—The Duchess of Norfolk has succeeded Viscountess Canning as the Lady in Waiting on the Queen; the Earl of Warwick and Capt. Hood have succeeded Viscount Hawarden and Admiral Sir R. Otway, as the Lord and Groom in Waiting; and Colonel Buckley has succeeded Colonel Arbutnot as Equerry in Waiting. Major-General Sir E. Bowater has succeeded Colonel Wyld as the Equerry in Waiting on Prince Albert.

Parliamentary Movements.—The representation of North Warwickshire is vacant by the appointment of Sir Eardley Wilmot to the Governorship of Van Diemen's Land, and Mr. Newdigate, of Atherstone, has announced himself a candidate in the Conservative interest.

Official Appointments.—The Duke of Montrose has been appointed Lieutenant and Sheriff Principal of the shire of Stirling, in the room of the late Lord Abercromby.—General Sir Hugh Gough has been appointed Commander-in-Chief of the Company's Forces in India, and an Extraordinary Member of the Council of India.—It is understood that Mr. Thomas Pottinger, brother of Sir H. Pottinger, has been selected by Government as Resident Officer at Hong Kong.—Mr. Turnbull has been appointed to the office of Commissioner of the Mixed Commission Court established in Jamaica for the suppression of the slave trade.

Church Preferment.—The Rev. T. B. Murray, rector of St. Dunstan's in the East, has been appointed by the Bishop of London to a prebendal stall in St. Paul's.

Foreign.

FRANCE.—The Paris papers continue to discuss the chances of the Ministry in the great struggle on the Secret Service Money Bill, which commenced on Wednesday. The contest has assumed greater interest, because the majority, which has hitherto supported the Cabinet, is split into so many small fractions, that it is impossible to calculate to a certainty the result of the debate; but it is admitted by all parties that it will decide the existence of the Ministry. M. Viger presented to the Chamber on Saturday the report of the committee to which the bill had been referred for examination. He said that Ministers had justified the use to which they intended to apply the additional million claimed for that service, and that the majority of the committee had been of opinion that the Cabinet was entitled to their confidence, inasmuch as it had preserved abroad an honourable peace, and encouraged the development of public property by maintaining order at home. It had accordingly rejected the reduction in the amount of the supplies moved by the minority, and recommended to the Chamber to grant the whole credit. The debate commenced on Wednesday and attracted an immense audience to the Hall of the Chamber of Deputies, every part of which was thronged. The diplomatic gallery was also filled. After some preliminary business the debate was opened by M. Ledru-Rollin, who commenced by observing that if the Cabinet were subverted it would be the twenty-third since 1830, and then inveighed successively against the principles, system, and persons of the Cabinet. M. Guizot was the particular object of his attacks, but he declared also against his predecessors, Count Molé and M. Thiers, and insisted that a mere change of persons would not satisfy the Opposition, who require a complete change of policy. M. de Gasparin followed in favour of the Bill. He addressed the House in such a way as to denote that the Cabinet are determined on having a decided opinion pronounced upon their policy, and to prevent such harassing attacks being renewed whenever any of the Bills they have introduced shall come under discussion. The debate, after a speech

from M. Guizot, which produced great effect on the Chamber, was adjourned to Thursday.

ALGERIA.—The official papers are completely filled with despatches from the Generals employed in Africa, including the Duke d'Aumale. These reports detail their operations in pursuit of Abd-el-Kader, who has once more escaped their grasp, and plundered such Arab tribes as had submitted to the French, while the French have plundered those which have yielded to the Emir. General Bugeaud admits that Abd-el-Kader is at the head of 2,000 horse, 600 foot, and 3,000 Kabyles; and it was from this force that the French were recently obliged to seek momentary refuge in Cherchell. It appears from the late debate in the Chamber of Deputies on the additional demand of 20,000,000 francs for the African possessions, that the present occupation of the country requires annually an expenditure of near 100,000,000 francs, the maintenance of an army of near 100,000 men, 10,000 of whom perish every year, and that no less than 88,000 entered the hospitals in 1841. Several Deputies adverted to the fact, that all the attempts at colonizing the country have hitherto failed—that the army derives all its supplies from Europe—and that "Algiers is to France but an abyss which swallows up her money and men, yields her no commercial advantages, weakens her in a political point of view, and is the worst school for her army."

SPAIN.—Our accounts from Madrid are of the 21st ult. The elections, which were to commence on the 27th, continue to be the all-absorbing topic of the day. The utmost uncertainty, however, prevailed respecting their result; and it was expected that those of Barcelona and Valencia would be carried by the Opposition. The Electoral Committee of Madrid had published an appeal to the citizens, in which it endeavoured to impress on them the necessity of proceeding in a spirit which might secure to the nation, in all its extension, the advantages of a truly representative Government. The Committee had drawn up a list of candidates for the province of Madrid, from which the names of Messrs. Gonzales, Mendizabal, and Arguelles, were excluded. This list, however, required the sanction of the districts previous to its adoption, and in two of them it had been burned by the citizens. Prince Jerome Napoleon, who intended at first to remain but a few days in Madrid, had made arrangements to stop three months in that capital. On the Sunday after his arrival he heard mass in the palace chapel, but the Queen was prevented from attending by indisposition. He was presented to the Regent on the 19th, and had previously been visited by the French Minister and the Dutch Chargé d'Affaires. His residence in Madrid had given rise to many conjectures connected with the marriage of the Queen. These advices corroborate the rumour that the Regent has insisted on the French Government recalling M. de Lesseps from Barcelona, threatening to withdraw the *exequatur* of the Consul unless the demand be complied with. The official *Gazette* publishes, by order of the Minister of Finance, the terms of the public auction of the quicksilver mines of Almaden and Almadenejos, which are to be adjudicated at Madrid on the 28th inst. These mines are to be farmed for four years, from the 20th Sept. next to the 19th Sept., 1847. The contractor will be held to advance to the Treasury, in ten successive monthly instalments, 50,000,000 reals in current gold and silver coin. The reimbursement of the 50,000,000 reals will be effected in the four years, at the rate of 12,500,000 reals annually. There is little doubt that M. Rothschild, the present contractor, will endeavour to renew his lease; although another great capitalist, M. Fould, of Paris, has arrived at Madrid, with the view, it is supposed, of bidding at the auction.—The Barcelona journals of the 19th ult. contain a proclamation of the Captain-General Seoane, announcing to the inhabitants, that tranquillity and order being then completely restored, he had thought proper to raise the state of siege imposed upon Barcelona and its suburbs on the 4th December last, to reinstate the civil authorities in the exercise of their respective functions, to dissolve the military commission, and to direct that the prosecutions pending before that tribunal should be tried by the ordinary courts of justice. Later accounts, by way of Perpignan, state that the city was again in a state of extreme agitation, in consequence of a resolution of the Provincial Deputation annulling the Municipal Elections, which had terminated favourably to the Opposition.

PORTUGAL.—We have Lisbon news to the 21st inst., informing us that Lord Howard de Walden has received instructions from England to break off the negotiations for the tariff convention; the British Government not being disposed to accept the last Portuguese proposals, or to lose further time in negotiations. The Portuguese appear to have anticipated this result; and, while keeping up high duties to protect their manufactures, the Fishery Company are striving to conciliate the Douro interests by grants of public money. The bill endowing a privileged company, with one-half the present export duties on Port wine, has passed the Chamber of Deputies almost unanimously. This company will have an income of 150 contos, or about 35,000£ a year, which it is to spend among the Douro wine-growers, taking 20,000 pipes of their inferior wines at higher prices than they now get, and disposing of them as it best can. The proposal to give the company the monopoly of brandy, at the cost of the exporters, and of the other provinces of Portugal, was rejected by a majority of 3, the Ministers voting for it, but not making it a ministerial question. A new tax will have to be imposed to supply the deficit caused by making over the 150 contos of present revenue to the company. The French privilege question is expected to be amicably settled. The affair of the Gloria slaver will be arranged by the Spanish Government buying in the vessel and paying the original fine.

GERMANY.—The marriage of the Prince George of Cumberland to the Princess Mary of Oldenburg, which took place on the 18th ult., is the chief topic in the German papers. The King of Prussia was present on the occasion, and it is remarked as a singular fact, that no member of the Royal family of England took any part in the festivities. Among the twenty-three sovereigns and princes present at the marriage, there were seven reigning sovereigns, viz.:—the Kings of Hanover and Prussia, the Grand Duke of Mecklenburgh Schwerin, the Dukes of Saxe-Altenburgh, Brunswick, Nassau and Anhalt-Dessau, and the Hereditary Princes of Prussia, and Mecklenburgh.—The King of Prussia returned from Hanover to Berlin on the 22d ult. His Majesty gave a grand fête to the city of Berlin, on Shrove Tuesday, in the state apartments of the Royal Palace. All the Princes, Ministers, foreign Ambassadors, the principal authorities, and, above all, the respectable citizens of Berlin, were invited. According to some accounts, the number of guests were not less than 10,000. The fête was a round of balls. The bands of all the regiments, and those of the theatres, and of the Royal Chapel, performed. There was a supper for the ladies and a cold collation for the gentlemen. The festival, as might have been expected, has caused a great sensation; the citizens were delighted at His Majesty's invitation, and no pains nor expense were spared to appear in a manner suitable to such an honour.—The King has revived the Order of the Swan, created by Joachim I., Elector of Brandenburg, in 1440, in honour of the Virgin, and as a reward to persons eminent for their Christian virtues. The order was abolished by Joachim II., 1539, when he had embraced the doctrines of Luther. The first person on whom the King has bestowed the order is the Queen, on whose neck his Majesty recently placed the image of the Virgin, which is the principal ornament of the order, in presence of the whole Court.—The Leipzig papers state that the health of Prince Metternich had become impaired within the last few days, and the departure of the Austrian ambassador for Frankfurt had been in consequence postponed. The Prince's relapse is attributed to the fatigue and uneasiness which the situation of the provinces of the Danube and the negotiations commenced on that subject had caused him.—Letters from Prague mention that a great number of labourers in Bohemia, being in considerable distress for want of employment, and the partial failure of the harvest, the Emperor has given orders that public works, to the amount of 300,000 florins, shall be immediately commenced at the public expense. A pamphlet, entitled "Austria, and her future Prospects," has just appeared, and has made a considerable sensation in Germany. It is understood to be from the pen of the Baron von Reden, who is known as the author of a work on Hanover, and has since filled an important post in the Imperial Chancery of Austria, under Prince Metternich. In the opinion of this writer, the prospects of the Austrian Empire are all but hopeless. During 25 years of peace, while other Governments have effected large reductions in taxation, and in their public debts, Austria has more than doubled her incumbrances. In 1815, the nominal amount of the Austrian debt was 500,000,000 of florins; in 1840, it was 1,021,000,000; and at this time the annual charge of the state debt (including the payments to the Sinking Fund) is equal to 5,000,000Z. sterling annually. The entire Austrian revenue, in 1839, was about 16,000,000Z. sterling; [the public expenditure exceeded that amount, and there has been an annual deficit for many years past. The commerce of the country has not been developed in proportion to the increase of the public burdens, and consequently some immediate and effectual changes are considered necessary for the stability of the empire.—The marriage of the Princess Maria of Baden, daughter of the Dowager Grand Duchess Stephanie, with the Marquess of Douglas, son of the Duke of Hamilton, was solemnized on the 23d ult., in the chapel of the Grand Ducal Palace at Mannheim, according to the Lutheran rites. Immediately afterwards the ceremony was again performed according to the Anglican rites, in the apartments of the Palace inhabited by Mr. Wellesley, the British Chargé d'Affaires at the Court of Karlsruhe.

HOLLAND.—The Dutch papers mention that his Majesty King William Frederick, Count of Nassau, has been suffering for several days from severe cold and shortness of breath. The bulletin of the 17th stated that "The early part of the night was restless; in the latter part his Majesty slept at intervals. The symptoms of the disorder remain the same." Subsequent accounts mention that "the changes observed in the convalescence of his Majesty are so inconsiderable, that no more bulletins will be issued for the present."

BELGIUM.—The Louisa Maria will very soon sail from Ostend for the new colony of St. Thomas. M. Simons, director of the expedition, will be on board with the persons under his order. The expense of this first step taken by the company exceeds, it is said, 300,000 francs. M. Simons takes with him 80,000 francs in money and bills. He likewise takes the presents intended for the chief persons and generals of Guatemala, consisting of uniforms and arms. The Antwerp papers state that the English ship Orissa has brought a quantity of rats from Manila. They are of the size of a common cat; several escaped, and have been killed on the quay. They are so numerous that if a workman leaves any part of his clothes in a corner they are immediately devoured.

DENMARK.—It is reported in Germany that the Prince Royal of Denmark intends to adopt the hereditary Prince of Oldenburg, who would thus unite under his sceptre all the dominions of the King of Denmark. The branch of Augustenburg would obtain as a compensation the Grand Duchy of Oldenburg, and the Prince of Hesse receive two

millions of crowns. According to another account, the Prince Royal will not ascend the throne after the death of the King of Denmark, but abdicate in favour of the Prince of Oldenburg on the above conditions.

RUSSIA.—A joint-stock company has been formed, for the purpose of establishing a communication by steamboats along the south coast of Lake Ladoga, between Schlüsselburg and Sermar, at the mouth of the Swir, and along the coast of Friedland, between Schlüsselburg and Sestobol; the boat to touch at Kexholm and the coasts of Kennowetz and Walgamm. At present 800 vessels from Sermar annually navigate that lake. It is expected that the profits of towing these, and of conveying 30,000 pilgrims every year to the two monasteries, will make the speculation prove successful.

ITALY.—A letter from Rome states that, on the 8th ult., the Tiber overflowed its banks, and invaded a third of the city. In the Corso and its environs, and more particularly the quarter inhabited by the Jews, the inhabitants had been compelled to abandon the ground-floors, and their provisions were brought to them in boats.

TURKEY AND SYRIA.—We have accounts from Constantinople of the 7th ult., confirming the report that the city of Kerbelah had been taken by storm on the 13th of Jan. by the Pacha of Bagdad, after a gallant resistance on the part of the inhabitants and pilgrims, aided by a few irregular Persian Kurds, who chanced to be there for devotional purposes. It is feared, at Constantinople, that this impolitic act of Nezib Pacha, will produce such excitement at the court of Teheran, and throughout Persia, as will frustrate all the attempts on the part of the mixed commission to arrange the differences between the Porte and the Persian Government. Much interest had been excited by the death of Saliha Sultana, sister to the Sultan, and wife of Halil Pacha. It appears that the seraglio law, which dooms to death all male issue of the Imperial collateral branches, and which Sultan Mahmoud suspended in a moment of agony, at the death of his favourite daughter, who poisoned herself in order to anticipate the terrible mandate, was recently revived, and that the infant son of Saliha Sultana, after being allowed to live forty-eight hours, was strangled almost in the mother's arms. This cruelty produced the most violent effects upon the princess, who had flattered herself that her child's life would be saved. Hysterics, fever, and delirium ensued, and, after lingering about two months, she expired on the 4th, and was buried with great pomp on the same day in the late Sultan's mausoleum near the Burnt Column.—The accounts from Syria state that on the 14th ult. Izzet, Pacha of Jerusalem, forwarded a message by one of his effendis to Mr. Nicolayson, the chaplain of Bishop Alexander, enjoining him, as he had no authority for building a Protestant church at Jerusalem, to cause the works to be suspended. Mr. Nicolayson having vainly remonstrated with the Pacha, it was resolved that the Bishop should repair to Beyrout, to take the advice of the British and Prussian Consuls-General, and his Lordship accordingly started from Jerusalem on the 20th for Jaffa, where he embarked for Beyrout. On the 23d he reached the latter city, and laid the case before those functionaries, who thought proper to refer it to their respective Ambassadors at Constantinople. Assad Pacha, to whom they applied in the meantime for an explanation of the motives of this prohibition, pleaded total ignorance of the affair.

CAPE OF GOOD HOPE.—By Her Majesty's ship Andromache, papers to the 18th December have been received from the Cape. The rebellious spirit of the Boers at Port Natal had increased, and they had declared, that as soon as the truce was at an end they would proceed "to drive the English out of their territories, and would invade our settlements if we attempted to interfere between them and the natives." They had also laid claim to the whole of the lands, and stated that they considered the chiefs as holding their own possessions merely as vassals of the Dutch republic. Invitations to immigrants had still been continued, and as an inducement for parties to join them, titles to property were offered to be given. These allurements had had the effect of causing many farmers to accept the terms, and others were preparing to join the rebels, though notice had been given by the British officers that all persons who should engage in such transactions would be held liable to the penalties for treason and sedition. At the earlier stage of this outbreak, some circumstances transpired which led to the suspicion that it was chiefly caused by foreign interference. This opinion was strengthened by a Dutch vessel having entered and left the port clandestinely, and it has been since ascertained that she must have sailed directly from Natal to Batavia, at which place her arrival has been announced. A further confirmation has been found in a current report that a Batavian officer had appeared among the Volksraad, dressed in full uniform, and decorated with an order, and had promised them assistance from that place by the middle of January. Meanwhile, the Government had not been idle; the Lieutenant-Governor had marched against the Boers with all the disposable force that could be collected, which would augment the army to about 1,200 men. This, it was expected, would be sufficient to overcome the rebels, though it was feared a serious loss of life would result. The accounts from the Frontier are extremely distressing. The drought had not been relieved by rain, and the loss of cattle from the want of food and water had been of serious moment. The Caffres suffered most severely, and, their principal sustenance being milk, many had died from want. Instructions had been sent to the Government agents to furnish them with food at the public expense.

SOUTH AMERICA.—The Danish schooner Randers arrived at Falmouth, on Wednesday, from Monte Video,

from whence she sailed on the 20th December, and brings intelligence of an action having been fought on the 11th, between the allied forces of the republic of Monte Video, under the command of General Rivera and the army of Buenos Ayres, in which the former were defeated with considerable loss. She also brings decrees and proclamations issued by the Monte Videan Government, and a memorial from the Senate and Chamber of Representatives of the Oriental Republic of the Uruguay to the Executive Government for the immediate abolition of Slavery. The able-bodied men who have been slaves, colonists, or wards, whatever may be their denomination, will be appointed to the service of arms, for such time as the Government shall consider necessary, and those who are unfit for military service, and women, are to remain as pupils in the service of their masters, subject for the present to the constitutional law in regard to pupils or African colonists.

Parliament.

HOUSE OF LORDS.

Monday.—Lord CAMPBELL moved for copies of Lord Ellenborough's proclamations, and gave notice, on the part of the Marquess of Clanricarde, of a motion on the subject on the 9th inst. —Lord MONTEAGLE, at the request of the Duke of Wellington, postponed his motion on the Corn Laws, on account of the indisposition of the Earl of Ripon.

Tuesday.—Lord CAMPBELL inquired if the Government intended to bring in a bill to settle the question of non-intrusion.—Lord WHARNCLOFFE referred to the letter addressed to the Moderator of the General Assembly, and signed by Sir James Graham.—Lord BROUGHAM inquired if the Government had received any information or report respecting the search of slave vessels on the coast of Africa?—The Earl of ABERDEEN, in reply, expressed his conviction that explanation only was necessary to remove the jealousy with which, in spite of the anxiety of France to put an end to the slave trade, our exertions were still regarded in that country. Four gentlemen, Dr. Lushington, Mr. Robinson, Captain Denman, and Mr. Bandinel, had been for some time engaged in revising all the various instructions issued during the last 20 years to the slave-cruisers, and the several treaties into which we had entered on the subject of the slave trade, for the purpose of forming them into one uniform code of instruction for the guidance and assistance of the officers employed on this most difficult and responsible service. As England had nothing to conceal, had none but her ostensible objects to attain, these instructions should be made public, and would, he trusted, disabuse the candid portion of the French public of the unfounded prejudice they now entertained. The noble Lord then, by way of illustrating the success with which our efforts to extirpate the traffic in slaves had been attended, read a report, from which it appeared, that in Cuba the number of vessels so employed had been diminished within the last four years from 71 to 3, while the number of slaves imported, which in 1839 amounted to 25,000, was in 1842 only 3,150. These great results had been in a great measure achieved through the exertions of the Governor, General Valdez, whose integrity of conduct and honourable disregard of private interest merited the highest approbation.—Lord CLARENDON bore personal testimony to the generous conduct of General Valdez, and Lord BROUGHAM and Lord HADDINGTON expressed their satisfaction at Lord Aberdeen's statement.

Thursday.—Lord BROUGHAM brought under consideration the constitution, condition, and management of the Corporation of the City of London, and moved an Address to her Majesty on the subject. In the great measure for the reform of the Municipal Corporations of England and Wales, the Corporation of London had been expressly omitted, on account of the magnitude and importance of the interests involved. But Lord J. Russell, on the part of the late Government, had distinctly pledged himself to bring in a separate bill, which would deal exclusively with the Metropolitan Corporation. No measure, however, made its appearance; and in 1839 light was thrown on the causes of the delay. A Metropolitan Police Bill had been introduced in that year, which proved to be exceedingly distasteful to the citizens, who, availing themselves of the political weakness of the Government, compelled the abandonment of all the clauses relating to the police of the City. But if the smaller corporations throughout the country needed reform, the metropolitan required it a great deal more. Its vast importance, from the numbers of the population over whom it possessed authority, the wealth which it partly distributed, and partly misapplied, and partly prevented from being accumulated—the influence which it derived from its ancient fame, and the immortal services it had rendered to the State, at all times—from the power it possessed over the community—made it, beyond all the other corporations which had been reformed, deserving of the fatherly but scrutinising care of the Legislature. After expressing his high veneration for the Corporation of London, glancing at its history, and describing its constitution, the noble Lord entered into details respecting its income and expenditure, the privileges and monopolies possessed by the different companies, the responsible powers enjoyed by the administrators of the affairs of the corporation, and the jobbing which naturally ensued. The corporate body was a remnant of the bad feudal times; and the abuses which arose out of the feudal privileges and duties of the Aldermen and Common Councilmen were conspicuous in what, by a perversion of terms, was called the administration of justice in the City. He accused the Aldermen of general unfitness, principally from personal interest, of satisfactorily performing their duties as police magistrates, but especially laid to their charge the encouragement of a practice whereby parties, having no case which would be listened to in a court of law, appeared before the Aldermen under pretence of asking advice, and by stating their grievances publicly, obtained by means of the newspapers the ear of the public, and frequently the assistance of the magistrates, in cases with which they had no right to interfere. He related a number of instances in which parties had been thus shamed or bullied into a compromise; but trusted that, after this warning, the Aldermen would not, either from excusable ignorance or culpable vanity, or to court false popularity, or with a spurious charity, persist in such an illegal course.—The LORD CHANCELLOR thought that, as no notice had been given of the resolutions now proposed, and as he and other of their Lordships were now prepared to engage in the discussion, it should for the present be withdrawn. To this Lord BROUGHAM assented; and, after a few words from Lord CAMPBELL, in which he hinted that Lord Brougham must intend to become a member of the present Government, or he would not have so readily acquiesced in the Lord Chancellor's suggestion, the motion was withdrawn.

Lord TYNHAM then gave notice of the following resolutions to be submitted to the House on Tuesday next:—"1. That it is the opinion of this House that the separation of man and wife—of parents and children—which takes place in the union work-houses, is an exceeding evil, and the cause of evils. 2. That its abolition ought, therefore, to be forthwith sought. 3. That, by a judicious administration of out-door relief, the use of the work-house for married paupers, except for casual poor, and in cases of exigency, might be, and ought to be, abolished."

Friday.—The Royal Assent was given by commission to the Forged Exchequer-Bills Bill and to the Coal Vender's Penalties Bill. Lord BROUGHAM presented a petition from the Marquis Townsend complaining of the assumption of the title of Earl of Leicester by an individual who had no connexion with his family,

Several Peers agreed that the House ought to lose no time, considering the age of the Marquess Townsend, in taking immediate measures to vindicate the privileges of the House and the dignity of the Peerage; and on the suggestion of the Lord Chancellor it was referred to a committee.

HOUSE OF COMMONS.

Monday.—Mr. T. EGERTON entered into explanations with respect to the treatment of the Chartist prisoners confined in Knutsford House of Correction, which had been commented on by Mr. T. Duncombe, in his speech on the motion relative to Lord Abinger. Mr. T. DUNCOMBE defended the correctness of his allegations, reading statements in support of them. If he got a committee of inquiry into the state of our prison discipline, he would see that the condition of Knutsford gaol was particularly inquired into. Sir JAMES GRAHAM undertook that the whole matter in dispute should be investigated on the part of the Government, and the report would be laid on the table of the House.

Lord ASHLEY directed attention to a case of cruel treatment of an orphan apprentice, belonging to the Halifax union, and reminded the House that on two previous similar occasions Lord J. Russell and the Marquess of Normanby, when they were in the Home-office, had each of them promptly caused investigation to be made into the respective cases. Sir J. GRAHAM promised that he would make inquiry into this fresh instance, with a view to a prosecution, if the facts alleged should prove to be true.

Lord J. RUSSELL called attention to the almost unprecedented circumstance (with the exception of the case of General Conway) of the Duke of Wellington, as Commander-in-chief, holding a seat in the cabinet. As a conspicuous political leader he could not be supposed to be free from political bias; and his Grace had himself, on a former occasion, declared his opinion that the commander-in-chief should not be a member of the cabinet. Sir R. PEEL replied that there was no constitutional rule against it, and many instances could be cited in favour of the practice. The case of Marshal Conway was in point. But in very recent times, the Duke of York, Sir David Dundas, and Lord Hill had been commanders-in-chief under similar circumstances. It was true, that these latter personages were not political characters, but then the Master-General of the Ordnance and the First Lord of the Admiralty had frequently seats in the Cabinet, and the principle was the same in all. Upon the retirement of Lord Hill, he had no hesitation in recommending to her Majesty to give the Commandership to him who had so often led our armies to victory. The whole conduct and character of the Duke of Wellington were sufficient pledges that he would never allow his political opinions to interfere with the public service. He (Sir R. Peel) claimed for himself and his colleagues the entire responsibility of this appointment, which he felt satisfied was in unison with the public feeling, and conducive to the public advantage.

On the motion for a committee of supply, Mr. S. CRAWFORD moved the postponement of all further supplies till the estimate of the whole expenditure of the country should be first furnished to the House. The amendment, after a short discussion, was lost by a majority of 47.—Sir H. HARDINGE moved the army estimates for the year. The decrease from the charge of last year, on the whole effective and non-effective force, would be 139,225*l.*, and the reduction of men proposed was 5,740.—Mr. HUME moved a further reduction of 5000 men. The committee divided, and the amendment was lost by a majority of 86.—The next vote was for 3,619,327*l.* for the expenses of the army, which was agreed to, as were the remaining votes. The vote for the expenses of the volunteer corps was objected to by Mr. Williams, but was carried by 98 to 28.

Sir JAMES GRAHAM then moved the second reading of the Registration of Voters Bill, reserving discussion to a future stage.

Tuesday.—In answer to Dr. BOWRING, Sir R. PEEL said that the Porte had never given its formal sanction to the building of the Protestant church at Jerusalem, or to the residence of Bishop Alexander, in his Episcopal character. But no official confirmation of the rumour had reached the Government that the Porte had interfered to stop the building of the church.—Sir R. PEEL, in reply to Lord J. MANNERS, said that it was the opinion of the present, as it had been of the late Government of this country, that an unrestricted and unqualified permission to Don Carlos from the French Government, to reside wherever he pleased, might seriously affect the tranquillity of Spain.—The SOLICITOR-GENERAL brought under consideration a statement of the Sergeant-at-Arms with respect to an action at law brought against him and Mr. Bellamy for trespass and false imprisonment, in the case of Mr. Howard, the attorney. There were two courses, either of which might be adopted; to order its officers to let judgment go by default, in which case there would be no opportunity for explanation, and a jury might naturally assess heavy damages; or to direct the Sergeant to plead the authority of the House, and thus bring the matter to an issue before the Judges of the land. The latter course had been adopted on previous occasions, as in the celebrated case of Sir F. Burdett; he would therefore propose that the officers of the House should be instructed to appear in the present action, and plead its authority.—Sir THOMAS WILDE urged the House, while they gave every consideration to the proposal of the Solicitor-General, not to come to a decision without further thought. He suggested the appointment of a committee to inquire into the merits of the arrest, and to make a compensation to Mr. Howard, should the justice of the case demand it.—After some discussion it was suggested by Sir T. WILDE and the SOLICITOR-GENERAL that the Sergeant asking time to plead could not be considered as a recognition by the House of the jurisdiction of the court of law in the matter; the Sergeant-at-Arms was therefore desired, without any formal resolution, to serve notice to that effect, and to report his proceeding to the House.

Lord ASHLEY then brought on his motion for an Address praying her Majesty's immediate consideration of the best means for diffusing moral and religious education among the working classes. After enlarging on the general importance of education, and the great increase of population during the present century, he drew the attention of the House to the present state of crime and ignorance, and of moral and intellectual degradation, in Manchester, Birmingham, Leeds, and other populous districts, among the lower classes, especially the younger portion of them. They knew no religion—no God; the only knowledge possessed by great numbers of them was that of the exploits of Dick Turpin and Jack Sheppard. There was evidence which established the fact that not less than 25,000,000*l.* sterling are annually expended in ardent spirits; and it was proved by medical men that a large proportion, perhaps half, of all the cases of insanity are produced by the intemperance thus widely prevalent. He was aware that what he asked would occasion some expense; but if we would not consent to tax ourselves for the prevention of crime, we must be taxed more heavily still for the punishment of it. The expense of one convict for one year would educate more than 100 children. He attributed much of the existing evil to the truck system, to the payment of wages at public-houses, and to the miserable condition of the people's habitations. The country was weary of mere palliatives, schemes of prison discipline, and so forth; the evil was wider and deeper than could be reached by mere corrective processes; and if not grappled with, we might anticipate in 20 years a general convulsion and displacement of the whole system of society. There could be neither comfort nor peace but in a virtuous and religious people. He begged the House to recollect what were the proceedings a few years ago in Bristol and Nottingham, when plunder and violence were openly perpetrated, and when a state of things little short of anarchy prevailed, and where houses were fired for he knew not how many hours at the pleasure of the mob. If we could retrace our steps, and could apply with faith and fear to this necessary work, there yet remained before us many prospects of peace, for they had the authority of some of the best and greatest men, that the safest of all proceedings

to ensure the happiness of a nation was the establishment of a sound and religious system of education. He could quote on this point the testimony of distinguished officers, both in the Navy and the Army, and he found that they uniformly admitted that no discipline for those who served with them was so good as that which was implanted by education. They declared that virtuous conduct almost uniformly followed a religious education; and the House would find the same opinion expressed on a recent occasion, in most emphatic language, by that good man and Christian Judge, Chief Justice Tindal. Men who had received the benefits of a religious education were not found among the insurgents against the public peace, because such men knew that however grievous their wrongs, they owed obedience to the law, not from a calculation of the consequences of violating the law, but from conscientious motives. Never let them put out of their minds this great and stirring consideration, that the moral condition of England seemed destined by Providence to lean the moral condition of the world. Year after year did we send out thousands to colonise far-distant lands. The Anglo-Saxon race would, ere long, pervade one-half of the entire world; and how great the blessing if they but carried out with them our freedom, our morality, and our religion. These were the grounds, such the arguments, and such the plan which he had ventured to bring forward. It was, he was aware, but a portion of what the country expected, but the rest would come. The poorer classes of our countrymen were often accused of improvidence, of immorality; and the charge, unhappily, was but too well founded; but let the upper classes bear in mind that that imprudence, that immorality, were the result, in a great measure, of their own neglect, and, in no slight degree, of their own example. They owed to the humbler classes the long withheld debt of kinder language, of more intimate intercourse. This was no fanciful obligation on them; the people of this country were more alive than the people of any other country to an honest zeal for their welfare, to a sympathy with their distress, on the part of those above them in condition; which zeal, which sympathy, fall, though it oftentimes might, on unimpressible hearts, never failed to find many that it comforted, many that it saved. He trusted that the Parliament of the country, that the more favoured classes of the country, would without delay enter on a better course than they had hitherto pursued; that they would earnestly seek to secure the temporal peace, the eternal welfare of their humbler brethren, and in this noble effort half their task would be accomplished. The blessing of God would rest on their labours; and the oldest among them might, perhaps, live to rejoice for himself and for his children at the opening dawn of the immortal, because the moral, glories of the British empire. The noble Lord concluded by moving, "That an humble Address be presented to her Majesty, praying that her Majesty will be graciously pleased to take into her instant and serious consideration the best means of diffusing the benefits and blessings of a moral and religious education among the working classes;" and sat down amidst loud cheers from all parts of the House.

Sir JAMES GRAHAM said the noble Lord had spoken with that glowing fervour, with that elevated generosity of soul, with that fervent piety, which so eminently distinguished his character. For himself, he had been rebuked as seldom rising above the low level of party strife; it had been asserted that political hostility was the feeling which predominated in his mind, and which actuated his entire conduct. If the rebuke were a just one, he could only say that his example was one which it behoved all other men to avoid; but, without staying to vindicate himself from the charge, as to other occasions and other subjects, this let him say, most honestly and sincerely, that upon this occasion, and this subject, all party, all political considerations were utterly absent from his thoughts. The sole question here was a duty—an immense, an awful duty—which they owed to the mass of the people of this country. This was no question of party, nor should it for a moment be considered or treated as a question of party; the matter was simply and assuredly this, that in the great course of public affairs, it now behoved them carefully, and calmly, and kindly, to consider the present moral and religious condition of the working classes. The Government had entrusted Mr. Chadwick with the preparation of a measure for the improvement of the habitations of the poor; and whatever they could do to put down the evils of the truck system, would be done. Late events were pregnant with solemn warning; the time was come when the religious and moral instructor must go forth: the destinies of the country were involved in the proper education of the rising generation. If all party feeling were laid aside, and a measure framed which would pay due regard to the Established Church on the one hand, and the honest scruples of the Dissenters on the other, no greater boon could be conferred on the people. After showing, from what the Committee of Privy Council on Education had done, what might be done, he proceeded to state what the Government were contemplating. It was not desirable, at first, to attempt too much. District schools are proposed to be established for the education of pauper children in the metropolis and large towns under the superintendence of the clergy of the Established Church, with provision for the instruction of the children of Dissenters by ministers of their own persuasions. These schools to include an area, having a diameter not exceeding fifteen miles, and to be erected by a rate not exceeding one-fifth of the annual assessment for the previous three years. Factory children had been already legislated for, but the intentions of the Government and the Legislature were rendered inoperative by various causes. He proposed to prohibit the employment of factory children, between the ages of eight and thirteen, for more than six hours and a half in any one day, certificates of their attendance at school to be granted by the National and the British and Foreign Schools, and by the Roman Catholic Schools, in the case of Roman Catholic children; the schools to be open to the inspectors appointed by the committee of Privy Council on Education; grants by the Government, to be made in aid of local exertions for the erection of such schools; and a sum not exceeding three-pence per week, or one-twelfth of the earnings of each child, to be retained by the employer in aid of a fund for education. In these schools religious instruction to be administered, through the medium of the authorized version of the Scriptures, with the aid of portions of the Liturgy, under the superintendence of the clergy of the Established Church, but with a proviso in favour of the children of Dissenters. Two bills were already prepared for carrying out the objects he had stated; he hoped that they would not be viewed in a party light; and if they were passed during the present session, a large advance would be made in favour of the moral and religious improvement of the rising generation.

Lord JOHN RUSSELL read an extract from the second report on the employment of children, in order to show the condition of a portion of the juvenile community of Yorkshire—a county which annually raised large sums to send out missionaries abroad. Whilst anxious to protect the feelings both of Churchmen and Dissenters, he thought that in the present condition of the country it would almost be wickedness to cavil at the details of the measures stated by the Home Secretary. It was of importance to provide for the training of schoolmasters; and, looking at the aversion of parents to send their children to school, whenever any pecuniary temptation presented itself, he thought that some advantages might be held out to them in order to overcome their reluctance. It was also worth consideration to provide for the education of the class immediately above the working classes.—Lord SANDON expressed his satisfaction at the prospects which this evening had opened.—Mr. EWART desired to wave theological differences, for the sake of the great object now in view.—Sir C. BURRILL concurred, but Mr. SHAW was disappointed that nothing had been said about the extension of the educational principle to Ireland.—Mr. C. BULLER reminded the House of the vast total of charity funds specifically applicable to education, amounting to about 300,000*l.* a year. There was another class of charities, founded for giving small sums to the poor. Such small sums were not only useless,

but mischievous; they were generally expended in drink, and would be much better applied in education. The amount of the foundations for this purpose was not less than 170,000*l.* a year.—Sir R. INGLIS could not approve, in a system of national education, the avowal of an intention to exclude proselytism, since it must always be a duty to attempt the propagation of what we ourselves believed to be the truth. Still less could he approve the suggestion of diverting any charitable foundations from the purposes of their founders, unless those purposes could be proved to be immoral.—Sir G. GREY hailed the prospect of improvement which now appeared to present itself through the cordial spirit of all parties. He believed that Lord Cottenham was in communication with the Government on the subject of a legislative measure for rendering certain classes of educational charities more available than at present.

Sir R. PEEL said he was afraid the interference of the Legislature would be of little effect, unless among the educated and wealthy classes the conviction could be pressed upon their minds that they were all to blame; unless they felt, and were all convinced—manufacturers as well as landowners—those possessed of wealth, and the responsibility for the use of wealth—that they had been all individually neglectful of the education of the poor; and he trusted more to the moral effect of the demonstration of to-night encouraging individual exertion than he did to the interference of the Legislature. In expressing his gratitude to Lord Ashley for the time and attention which he had devoted to the subject, and the manner in which he had introduced it to the House, he could not but feel that it was greatly owing to him, to his character and discretion, that they might attribute the general unanimity which had prevailed in the House during the debate. He apprehended that that unanimity would be productive of the best effect throughout the country, in convincing the public that when all party feelings were forgotten in a sense of public duty, there must be in this arena, so continually, and, from the very nature of things, so necessarily devoted to party warfare, a strong and overpowering sense of the necessity of the case which could produce such general unanimity. With respect to the objection on the subject of proselytism, the question was one of balance between good and evil; and he was not willing, for the sake of the occasional good of conversion, to let the present enormous evils, moral and religious, continue to press upon us. He would be content to admit some modifications of educational charities, where the change of times and circumstances had rendered the original purposes impracticable; but he could not concur in a proposal for diverting, even to so good an object as that of education, a bequest intended for small donations to the poor. He defended the limited scale on which Government proposed to begin their plan. Success in the manufacturing districts, where the experiment was first to be attempted, would open the way for it in the rural districts.

Mr. HAWES thought the Dissenters would not like a trust of which the clergymen of the parish was to be at the head.—Mr. AELAND was content that the comprehensive principle should be adopted in public schools, but he hoped that Government would not discourage the establishment also of such schools as private parties might wish to found for the education of children in the principles of the Church of England alone.—Lord ASHLEY, in reply, thanked the House for the reception which it had given to his motion, which was then unanimously carried.

Wednesday.—Mr. ROEBUCK brought forward his motion for a select committee to inquire into the circumstances that led to the war in Afghanistan, and to report the evidence and their own observations thereon. He accused the late Administration of rashly running into a war which was wholly unnecessary, impolitic, and unjust—and without the sanction of Parliament. The mischievous activity of Lord Palmerston had excited war and injustice from the western shores of America to the coast of China. Lord Auckland had issued proclamations which contained positive falsehoods, and which were therefore derogatory to the honour of the country. He reviewed the transactions that had led to and followed the expedition into Afghanistan, and denounced them as contrary to all international law, as disgraceful to the British name, as foolishly conceived, and shamefully executed. Sir Alexander Burnes's papers, which had been suppressed, proved that he was altogether opposed to the war, and his despatches had been garbled by the late Government in the extracts they had thought fit to place on the table of the House. He concluded a speech marked by passages of extraordinary severity by declaring that all he asked then was inquiry, and not condemnation.—Mr. HUME seconded the motion.

Lord J. RUSSELL maintained that the whole substance and form of the motion was unusual and unparliamentary. Mr. Burke's motion for an inquiry into the war in India could not be held as a precedent, for that took place pending the war, whereas in this case the war was brought to a termination. The same argument applied against the other cases cited by Mr. Roebuck. The terms of falsehood lavished upon Lords Auckland and Palmerston were not such as applied to those persons; and on hearing them he thought of what the Prince of Condé had said of motives that would actuate themselves if they were in our places. The favourite par-uits of Lord Auckland were those of peace; and it was only when he was obliged to adopt a warlike policy that he engaged in these military operations. Lord Palmerston had been accused of eternally pursuing a meddling policy, which tended to endanger the peace of the world; but his able conduct in the complicated affairs of Belgium and Turkey sufficiently proved that he had maintained the peace of the world, and that he was not subject to the ignorant calumny and the vituperative abuse which had been heaped upon him by the Member for Bath. The noble Lord said he should negative this motion, intended, as it was, to be a condemnation, and supported by a speech of unparalleled invective, which had been reserved for a House of Commons, of which the enemies of the late Government formed the majority, with the hope that they, actuated by paltry party motives, would be induced to give their votes in its favour.—After some remarks from Mr. DUNSTON and Mr. ESCOTT in favour of the motion, Sir R. PEEL said that these two questions, not necessarily connected together, were to be discussed—one, whether or not the expedition undertaken by the late Governor-General of India was consistent with sound policy; and the other, whether or not it was now fitting for the House of Commons to appoint a select committee to inquire into the circumstances that led to it. He had entertained from the first, strong doubts of the policy of the expedition, and the Duke of Wellington, with great prophetic wisdom, had foretold that, if undertaken, it would not succeed. If, therefore, he could not support the motion, it should not be supposed that he had abandoned his original opinions of the policy of the expedition—on the contrary, subsequent events had confirmed that opinion. But then, could he lend his sanction, as a Minister, to the appointment of a committee to inquire into the policy of military operations undertaken four years ago, which, when in opposition, he had not thought fit at the time to move for? He could not; nor would the public interest be advanced by the inquiry. Were this committee acquiesced in, others would be demanded, and the result would be, that the Executive Government would be transferred from the Crown to the House of Commons. The disasters had been retrieved, and the insults avenged; and his counsel to the House was not to risk a disturbance of our present most friendly relations with Russia, or sanction a precedent which would act most disadvantageously to the public service, by voting for this committee.

Lord PALMERSTON accepted the unintentional compliment paid to him by Mr. Roebuck when he accused him of mischievous and reckless activity; for, as that gentleman's notion of mischief was notoriously peculiar, and as activity was the duty of every man engaged in the public service, such an accusation was as high a compliment as could be paid to him. Language such as that used by the Member for Bath was derogatory only to him who employed it, and he would not condescend to imitate it. It

was erroneous to say that the papers already before the House were garbled, and it was equally erroneous to say that Sir Alex. Burnes was unfavourable to any of the proceedings. Such was the danger that encompassed our Indian empire simultaneously on every side, that no other course remained for Lord Auckland to pursue save that which he had adopted—of establishing in Afghanistan some regular authority, with which relations of peace and alliance could be permanently maintained. The papers before the country fully justified the necessity of the expedition; but, should the Government think it desirable to publish any other documents, he had no objection to their production.—Sir R. Inglis feared that if the argument used by Sir R. Peel, that the House could not inquire into such cases as the present, were allowed to prevail, the functions of the Commons for inquiry would be at an end: he would support the motion. Lord J. MANNERS thought that Mr. Roebuck was entitled to the thanks of the House for giving them the opportunity of expressing their disapprobation of the Afghan war. On a division, the motion was lost by a majority of 114.—For the motion, 75; against it, 189.

Thursday.—There were only twenty-one members present at four o'clock, and the House was consequently adjourned.

Friday.—The question of privilege, which had been fixed for discussion this day, was adjourned to Tuesday. Lord PALMERSTON gave some explanations, repelling Mr. Roebuck's charge against Lord Auckland of having published false statements announcing that Shah Soojah would enter Afghanistan surrounded by his own troops. His Lordship said that the officers were British, and the troops were paid by the Shah, but admitted that he derived the money with which he paid them from a subsidy of the East India Company.—The House then went into a Committee of Supply, proceeding with the Navy Estimates. After a good deal of desultory discussion, an amendment was moved to the re-appointment of the Deputy Accountant-General, but the vote was carried on a division. Several votes for the different departments then passed, after a discussion on technical questions, in which several naval Members took part.

CITY.

Money Market, Friday.—Consols closed at 95½ to ¾ for money, and 95½ to ¾ for account; Three per Cents. Reduced Stock, 95½ to ¾; Three-and-half per Cents. Reduced, 103½ to ¾; New Three-and-half per Cents., 102½ to ¾; Bank Stock, 166½ to ¾; India Stock, 267 to 8; Exchequer Bills, 67s. to 69s. prem.

Metropolis and its Vicinity.

Metropolitan Improvements.—At a meeting of the Metropolitan Society last week, it was stated that a letter had been received from Sir R. Peel, announcing that the new Commission had commenced its labours by inquiring into the expediency of an Ordnance survey and map of London upon the largest scale, and it was understood that the Committee was now engaged in considering the various plans proposed for an embankment of the Thames. At a meeting of the Common Council on Monday, Mr. R. L. Jones moved "That it be referred to the London Bridge Approaches committee to consider what improvements it is expedient to make in the public streets and avenues within the City, and to report thereon to the Court, together with the opinion of the committee as to the best means of accomplishing the same. In bringing forward the motion, he thought it necessary to advert to a petition which had been presented by Sir John Key, from the inhabitants of Lime-street and its vicinity, praying that the Court would adopt means to widen that thoroughfare. Looking to that petition, and to the petitions of the inhabitants of other great thoroughfares, which certainly required improvement, he considered that the best course would be to refer them all to the committee to which his present motion related, in order that in that committee the merits of all should undergo investigation. He was convinced that the examination to which they would be subjected would be of the most searching and scrupulous nature, and the committee would have, at the same time to determine from what fund the corporation would pay off the amount required for accomplishing the vast improvements which were undertaken. These improvements were to go hand in hand with the improvements projected by the Government in other parts of the Metropolis. The Government would not doubt render the corporation every assistance they might require. Mr. Godson seconded the motion. Nothing could give him greater satisfaction than to see the funds of the corporation applied to such admirable purposes. It was with great anxiety he looked forward to the long-expected improvements of Holborn-hill, and he rejoiced that the Court had refused to sanction the enormous outlay proposed by the erection of Courts of Justice in the City. He disapproved of the frequent applications for little peddling sums to effect this or that improvement, and trusted that a great general measure, which would be felt by the whole body of the inhabitants, would be immediately adopted. Several members expressed their satisfaction that the Government and the corporation were to co-operate in the great project of metropolitan improvement. The motion was then carried, and there is no doubt that the improvements most worthy of selection will meet with immediate attention.

East India House.—A Court of Directors was held on Wednesday, when the thanks of the company were voted unanimously to Lord Ellenborough, for the ability and judgment with which the resources of the British empire in India have been applied in the support of the military operations in Afghanistan; and to Major-Generals Pollock, Nott, M'Caskill, Sale, and England, and to the other officers of the army, both European and Native, for the intrepidity, skill, and perseverance displayed by them in the military operations in Afghanistan, and for their indefatigable zeal and exertions throughout the late campaign. It was also resolved unanimously, that the thanks of the Court be presented to the non-commissioned officers and private soldiers, both European and Native, for their gallant behaviour in Afghanistan.

Anti-Corn-Law-League.—The weekly meeting of the Anti-Corn-law League, and of the representatives of the Metropolitan Anti-Corn-Law Associations, took place on

Wednesday evening at the Crown and Anchor Tavern. The great room was crowded long before the commencement of the proceedings. Mr. George Wilson, of Manchester, presided, and gave an account of the prospects and operations of the League. In one week, he said, they had put in circulation upwards of one million of publications. They did not intend to adopt any other force to effect their object than the artillery of the printer and the might of the public press. He then proceeded to present the address to Mr. Cobden, voted to him by the meeting at Manchester, which we have noticed in our Provincial news. It was signed by 32,000 inhabitants of that town, and was offered as a tribute of their sympathies with him in the late attack in the House of Commons, and of their sense of his exertions in furthering the objects of the National Anti-Corn-Law League. The meeting was afterwards addressed at great length by Mr. Villiers, Sir De Lacy Evans, and other members of the League.

Christ's Hospital.—A general court of the Governors of Christ's Hospital was held on Tuesday, to take into consideration an address to the Queen, praying her Majesty to accept their humble but hearty thanks for her munificence, in the gift of 1000*l.*, lately presented by her to that institution. The treasurer who moved the thanks of the meeting, mentioned, that, from the foundation of the institution by the youthful sovereign, Edward VI., no sovereign has ever bestowed one farthing upon the institution, with the single exception of her Majesty.

Dinner to Sir C. Metcalfe.—On Monday a public dinner was given to the new Governor-General of Canada, in the rooms of the Colonial Society, in St. James's-square. Sir Augustus d'Este presided, and was supported by the Vice-President of the Board of Trade, the Under Secretary of State for the Colonies, Sir Francis Head, and a numerous body of gentlemen connected with the Colonies. After the usual loyal toasts, the chairman proposed the toast of the evening. He said that in Sir Charles Metcalfe's presence it would not become him to talk of his merits as they deserved. When he looked at his long career of service, he hardly knew where to begin passing his encomiums upon it. He had commenced his career in the East under the immortal Wellington; and when they considered the services he had rendered in so many situations requiring, what he so well supplied, talent and industry, they would be really lost in wonder. After a course of fame in India, he was summoned to the West Indies. It was unnecessary for him to expatiate upon the manner in which he had conducted himself there. Having fulfilled his duties in that Colony to the entire satisfaction, not only of the Government, but of the whole nation which claimed him as its own, his services in a time of certain difficulty were again claimed. Again they found him ready to quit the comforts of his home and country, and to plunge into the duties of a novel and important situation. Of the manner in which those duties would be fulfilled no one could entertain a doubt. Perhaps one of the most honourable testimonies ever bestowed was the tribute paid by the present Administration to the merits of this illustrious statesman. He would conclude by proposing "The health of Sir Charles Metcalfe, wishing him a prosperous voyage, and every success which could attend him." Sir Charles Metcalfe said, I return you my warmest thanks for the honour you have done me. I may say the honour, when I think that you have invited me to this splendid entertainment; that you, sir, have proposed my health in the generous manner in which it has been proposed; and that you, gentlemen, have drunk that toast in the cordial manner in which it has been done honour to. I shall ever remember this proof of your confidence, and it shall be my endeavour never to prove myself unworthy of it. Allusion has been made to my residence in Jamaica. It is an island of which I cannot think but with gratitude. I received the greatest kindness there from the first day I arrived until the day I departed—kindness I shall never forget. When I return from Canada—a colony which shall have my utmost devotion and attention—I shall be glad indeed if I can do so with your approbation.—Sir Francis Head said he congratulated the North American Colonies on the Governor they were about to welcome. To succeed in his mission, that Governor must be a man of high talent, of great judgment—of calmness—of firmness—of decision. The North American Colonies required, as a Governor, a man who would possess the confidence of all classes of his country; and they required still more urgently a man whose principles were based upon a solid religious foundation. There was not a man in England who possessed these qualifications in a higher degree than their illustrious guest. He had pleasure in feeling that he would leave this country supported by universal good wishes, and he trusted that the people of Canada would abstain from forming any opinion of his measures until he had time to look about him and determine the course he would think it advisable to take. With respect to himself, he was obliged to disclaim the compliment lately paid to him. It was not himself who had put an end to the late rebellion—it was the loyal population of Canada. That portion of the people, when called upon, came forward and performed their duty; they performed their part of the contract, and he hoped and trusted that the day would never arrive when this country would forget their exertions.—Lord Mountcashel proposed "the health of the Chairman," which Sir Augustus d'Este briefly acknowledged; after which several toasts were given in connection with the prosperity and success of the various Colonies.

The Excise.—For some weeks past the Commissioners of Excise have obtained several convictions of chemists and druggists for selling spirits of wine without a license. Many of these cases were proved last week, and fines of 50*l.* inflicted. Where, however, it would appear the

parties had transgressed the law in ignorance, the Commissioners held out hopes of mitigation.

The Temple Church.—In reference to the petition lately presented to the benchers for the re-establishment of the choral service, it is announced that the benchers have decided on the permanent formation of a double choir. They have authorised the choir-master to engage a sufficient number of professional singers to perform the duties required; and it is expected shortly, when all the appointments are completed, that the full cathedral service will be again resumed.

The Scotch Church.—On Wednesday evening the Scotch Church, London-wall, was the scene of a violent uproar, occasioned by a lecture on the state of the Church, delivered there by the Rev. Dr. Candlish, one of the leaders of the non-intrusion party. The Rev. Dr. Brown, one of the senior presbyters of the establishment, and minister of the church in Swallow-street, Piccadilly, rose at the conclusion of the lecture, and stated that some days since he had received a message from Dr. Candlish requesting to be allowed the use of his pulpit for the delivery of such a lecture as that which had just been heard. He (Dr. Brown), consented, on condition that if he considered it necessary, he should be allowed to reply at its close; this was objected to, and Dr. Candlish had expressed his determination not to allow his opinions to be called in question. The Assembly ought to be informed that the principles of Dr. Candlish and his party were distinctly disclaimed by a very large majority of the members of the Scottish Church; that the statements made were, to say the least of them, challengeable statements, and that the alleged aggressions of the civil courts had been brought about by the unwarrantable proceedings of the General Assembly. (Dr. Brown was here interrupted by such groaning and hissing, that it became impossible to hear a sentence he uttered for some minutes.) Silence having been partially restored, the Rev. Gentleman stated that he regretted, as much as any of them, the lamentable prospect of so large a secession from the Church of useful and influential men, and that he would do all he could to remove the difficulties, and to save the Church from the shipwreck which threatened it. Here the uproar was renewed, upon which Dr. Candlish said he would not be provoked into discussion. Dr. Brown again attempted to be heard, but his words were lost in the noise that ensued, and the meeting broke up in great disorder.

The Polish Anniversary.—The anniversary meeting of the Polish refugees was held in the hall of the National Association on Monday. Mr. Worcell sat on the right of the chair, in which the spirit of Konarski, the patriot of Poland, was presumed to preside. Mr. Worcell made some prefatory observations in French, after which Mr. Rogers addressed the meeting, and alluded particularly to the necessity of union, and a firm reliance on the justice of the cause of Poland. The manner in which Sir R. Peel at the close of the last session alluded to the wrongs of Poland, induced an inference from his speech that he felt deeply interested in the advancement of her freedom. Major Benyowski then addressed the meeting in French. He said that men would cease to be men if they were unmoved on the present occasion. They had assembled to commemorate the anniversary of the greatest martyr ever offered up on the altar of patriotism—Konarski. They were all martyrs in the cause of liberty, but all must bow before the spirit of Konarski, which was then presiding over their councils. He concluded by expressing a confident hope that Sir Robert Peel would not allow the generous spirit which animated the bosom of every great man to die in him. While he preserved the liberty of England, he would not deny Poland his generous sympathy, but see her righted. Signor Bonissani, an Italian, who spoke in French, congratulated the meeting on the union of the Poles and Italians, who traversed the world, as it were, to make all men brothers. The meeting was addressed by several other speakers in Polish, German, French, and Italian.

The Law Courts.—On Tuesday a general meeting of the members of the Incorporated Law Society was held, for the purpose of receiving a report from the committee appointed by the great meeting of the legal profession held on the 8th May, 1840, relative to the removal of the courts of law from Westminster. Mr. Foss, chairman of the Society, presided. The report stated that petitions had been presented to the Lords by the Lord Chancellor Cottenham, and to the Commons by Lord Campbell, in addition to petitions from other societies, which had been referred to a special committee of the House of Commons, who were directed "to consider the expediency of erecting a building in the neighbourhood of the Inns of Court for the sittings of the Courts of Law and Equity, in lieu of the present Courts adjoining to Westminster Hall, with a view to the more speedy, convenient, and effectual administration of justice." The evidence of several judges, solicitors, counsel, &c., had been taken in 1841 and 1842—a report of which had been made; the committee of the House of Commons had given no opinion thereon, but it appeared that effect should be given to such evidence by presenting petitions forthwith to both Houses of Parliament. Several gentlemen addressed the meeting, and expressed their belief that the removal of the Courts would be publicly beneficial and convenient, and afford an opportunity of improving the neighbourhood of Westminster Abbey by throwing open Westminster Hall to the public view. Resolutions were then moved and carried unanimously, to the effect that the necessity for removal had been generally acknowledged, that petitions be presented to the House of Lords by the Lord Chancellor, to the Commons by the Attorney-General; and that a committee of management be appointed to carry the other resolutions into effect.

House of Correction.—On Monday evening, Mr. Wakley held an inquest in the House of Correction, adjourned for the fourth time, on the body of a prisoner called Doyle. It appears that on the 15th ult., Mr. Wakley held two inquests in the prison on the bodies of deceased prisoners. In the case of the first no suspicion was excited of improper treatment, and the jury returned a verdict of "Natural death." With respect to Doyle the inquiry assumed an opposite complexion, in consequence of a witness stating his belief that Doyle had been neglected (medically) in the prison, and made to work in an unfit state. The coroner, on the 15th, did not think it right to examine the witness at length in the absence of Mr. Wakefield, the prison surgeon, and advised the adjournment of the inquiry to the 20th inst., in order that Mr. Wakefield might be present, and that Dr. Quain, house-physician of the University College Hospital, and Mr. Erasmus Wilson, lecturer on anatomy at the Middlesex Hospital, might examine the body. At these adjourned meetings, witnesses were examined who proved that the prisoner was suffering under a fatal malady, and that he required careful treatment and a nutritious diet. On Monday, the jury returned a verdict that deceased was ill from the 6th Nov. to the 11th Feb., on which day, for the first time, he was treated by the medical officer, adding, "that they could not separate without expressing their opinion that the deceased had not that proper treatment from the warders and medical officer that the nature of his case required." The jury desired it to be understood that they exonerated the governor of the prison from any blame. Mr. Wakefield wished to be informed if the verdict was an imputation on his character, and ultimately declared his intention of taking the case into the Court of Queen's Bench to set it aside.—Another inquest was held on Wednesday, on a deceased prisoner, a market-gardener, called Tickner, who had been sentenced to 21 days' imprisonment for having in his possession two heads of seakale, the property of Mr. G. Bagley, of Kensington, without being able to give a proper account of them. It was proved that he was in bad health when admitted, but was immediately sent to the treadmill. After a long inquiry the jury returned a verdict, "That deceased died a natural death," accompanying it with an expression of their regret that, considering the known condition of deceased on his admission, as the surgeon's book testified, he was put to labour on the treadmill, for which labour he was totally unfit; and added that they trusted the governor would convey to Mr. Wakefield, the surgeon, a statement to this effect.

The Russia Company.—On Wednesday evening the Russia Company gave their annual dinner at the London Tavern. Mr. Astell, M.P., in the chair. The chief event of the meeting was the speech of Baron Brunow, the Russian Ambassador, who adverted to the treaty of commerce lately concluded with this country. When, a few years ago, he had first the honour of addressing the Russia Company; under circumstances of great difficulty, when great anxiety prevailed in the public mind respecting the affairs of the Levant, he did not hesitate to tell them, that, owing to the good understanding and concert happily established between Great Britain and Russia, he was confident the general peace would be maintained. The general peace had been maintained, and they continued to enjoy the benefit of that state of general tranquillity in which the great Powers of Europe had a concurrent interest, and which it was their mutual desire to consolidate and maintain. In regard to the new treaty he might be permitted to add, when he remembered that during half a century no commercial treaty whatever had existed between Great Britain and Russia—when he considered that during that long period many conventions had been concluded for the purpose of war, and that this was the first for giving encouragement to the pacific enterprise of navigation and trade, he thought he was fully justified in congratulating them—which he did from the bottom of his heart—that under the auspicious reign of her Majesty Queen Victoria such a treaty had been concluded, which he trusted would form a new bond of amity between Great Britain and Russia. Sir J. L. Lushington, on behalf of the East India Company, said it was peculiarly gratifying to hear from the representative of his Imperial Majesty that there was felt on his part a sincere desire for the maintenance of amity between two such great nations, because, from the situation he had himself the honour to fill, he might be allowed to say the peace, security, and prosperity of our Indian Empire mainly depended on the friendship—he hoped it would be perpetual—between Russia and Great Britain.

Marylebone.—On Monday, Dr. Arthur Farre and Mr. Hancock, special Poor-law Commissioners, assembled at Fladong's hotel, to investigate the alleged ill-treatment and improper management of the pauper children in the workhouse of this parish. Some opposition was offered to the inquiry on the part of the vestry, on the ground that it was illegal, the parish being governed by local acts. The Commissioners, however, proceeded to examine witnesses, who deposed to the general management of the infant school, and to its sanitary condition. The evidence was given at great length, but most of the facts elicited have been already before the public.

Accidents.—On Monday afternoon, as General Hopkins, of Gloucester-place, was riding on horseback over the wood-pavement in Newgate-street, the horse, which was valued at 100 guineas, slipped down opposite Christ's Hospital, and dislocated its back. It was got up with difficulty, but died soon afterwards. The General escaped without much injury, although several vehicles were passing along the street at the time.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Feb. 25:—West districts, 132; North districts, 173; Central districts, 179; East districts, 215; South dis-

tricts, 222. Total, 921; (422 males, 499 females.) Weekly average for the last five years, 903, (461 males, 442 females,) and for the last five winters, 1004.

Provincial News.

Carmarthen.—On Monday, the 12th ult., a large meeting of the magistrates and farmers of the neighbourhood was held at St. Clear's, the scene where the outrages of "Rebecca and her daughters" first broke out, when the former addressed the farmers on the folly of their proceedings, and pointed out the serious consequences likely to result to themselves from persevering in such a course, particularly in the increased amount of county stock they would have to pay to the police and yeomanry. This apparently produced its effect, and about 50 farmers voluntarily came forward and were sworn as special constables to preserve the peace; and the yeomanry were sent home that evening. On the same night, however, a mob assembled and destroyed the toll-house and gate at Irevaghlan, in the county of Pembroke, about six miles below St. Clear's. From information obtained by the police, two persons were apprehended on Sunday, charged with being principals in this outrage; and after a lengthened examination they have been committed upon very clear evidence to take their trials at the next assizes. One of the men is a farmer, occupying a farm called Llwyndryssi, of the value of near 200*l.* per annum, and is one of the persons who came voluntarily forward and was sworn a special constable at St. Clear's. The outrages are spreading, for on Thursday night a toll-bar, with the toll-box, was destroyed at a place called Llandarog, on the road to Swansea.—The Welsh papers state that Sir John Guest and Co. have contracted with the Russian Government for 45,000 tons of railway iron, and it is not improbable that this order will be doubled.

Chester.—In reference to last week's debate on Mr. T. Duncombe's motion for an inquiry into the conduct of Lord Abinger, during the late special commission, the local papers state, that the report of His Lordship's charge was supplied to the *Times* by the Lord Chief Baron himself. They state that the two reporters sent down by that journal, on some alleged cause of deficiency, applied to His Lordship to furnish them with a copy of it; but he told them that he had no copy, and could not furnish it in any other way than by writing the whole from memory. His Lordship consented to do this, and after completing his task, he is said to have declared, that it was the very last time he would ever accede to such a request; nor would he have done so on that occasion, if he had had an idea of the time and trouble which the undertaking involved.

Falmouth.—A rumour is current in this port, that on the 1st April the Brazil mail, now conveyed monthly by sailing vessels, will be carried by steamers; and that her Majesty's ship *Astræa*, and the packets now on their voyages, as they arrive home, will be forthwith paid off.

Halifax.—The local papers are filled with details of the case of cruelty practised on an orphan child belonging to the Halifax Union, which Lord Ashley brought before the notice of Parliament on Tuesday. It appears that he was apprenticed to a collier at Blackley, near Elland, when nine years of age, and was sent daily at six o'clock into the pit, where he was cruelly beaten, and allowed only three meals of thin water-porridge for his support. Latterly he had been confined in a cellar, without even straw to lie upon, and with a heavy bag of iron suspended round his neck. The boy, however, escaped, and was found by the overseers of Elland in so revolting a state, that the magistrates interfered, and after placing him under medical treatment in the workhouse, issued a summons against the master on the charge of cruelty.

Huddersfield.—A meeting of manufacturers, merchants, and woolstaplers, on the subject of the wool duty, was held in this town last week. The meeting was unanimous in its condemnation of the tax, and in its determination to endeavour to obtain its repeal. As the first step towards this object, a memorial to Government was adopted, and, after having received the signatures of the principal manufacturers, it will be presented to Ministers by a deputation appointed for that purpose.

Lancaster.—The daily papers state that the paragraph which has gone the round of the newspapers, stating that a man named Holden, recently deceased in this county, had confessed before his death to two women, that he was one of the perpetrators of the murder at Pendleton in 1817, is entirely a fabrication—no such confession having been made. The constable of the place has made inquiry from the women referred to, and other parties, and has ascertained that there are no grounds for the statement.

Manchester.—An extraordinary meeting of the League was held on Friday, to repudiate the charges made in Parliament against the League, and particularly against Mr. Cobden. The hall, which is capable of holding 1,000 persons, was so full that many hundreds were unable to obtain admission; about 600 ladies were in the galleries. Mr. G. Wilson presided. The following resolution was carried unanimously:—"That in consequence of the attempts to throw odium on the character of Mr. Cobden, this meeting feels called upon to express its fullest approbation of that honourable gentleman's conduct in the cause of justice and humanity; and whilst tendering to him its sincere thanks for his unwearied labours and eminent services, this meeting pledges itself to give to him and his excellent parliamentary coadjutors its best assistance and support, and to persevere in employing all just and constitutional means for the total repeal of those laws which, limiting the food of the people, are opposed not only to the best interests of our fellow-men, but to the benevolent designs of Divine Providence." In accordance with these views, an address to Mr. Cobden was adopted, acknowledging his services in the cause of

Corn-Law Repeal, and expressing the hope of the meeting that he will persevere in his exertions.—In connection with this subject, Mr. Bayley, the dissenting minister of Sheffield, has addressed a letter to Mr. Cobden, in reference to his speech about 100 persons drawing lots to assassinate Sir R. Peel. He states his belief that Mr. Cobden was not in the room when the speech was delivered, and admits that a day or two afterwards Mr. Cobden expressed his wish that Mr. Bayley had not related the anecdote, whereupon Mr. Bayley said he could vouch his authority, and believed it to be true. He had accompanied the recital of it with a protest against all such acts; he could produce his informant, although he neither knew where the scene occurred nor the persons engaged in it; he regarded the fact "as a terrible sign of the times, and as such only he quoted it." Mr. Bayley has also addressed a letter to the *Times*, denying that the day on which he related the anecdote was a Sunday, and stating that he never knew the person nor the locality where the drawing of lots was proposed. He denies that he ever advocated an application "to the Parliament of force," declares that he accompanied the narration of the anecdote with a strong protest, and says—"If I had concealed the anecdote, and evil had been perpetrated, I should have reproached myself with not having given warning to Government. I deserve thanks for making the anecdote public, and not abuse."

New Romney.—A letter from this place dated February 26, has appeared in the daily papers, giving an account of the wreckers on the Kentish coast during the recent storms. The writer states that a schooner from London to Ireland went on shore to the east of Dungeness, in the gale of Saturday the 18th. The Coast Guard did all in their power to save the crew, but owing to the heavy sea breaking continually over the vessel, every soul perished. The vessel soon broke up, and her cargo, consisting of tallow and dye-wood, was washed along the beach. Hundreds of the inhabitants from the different towns came down to the beach; and notwithstanding the efforts of the Coast Guard and agents, they managed to carry off property to a large amount. On the very day of the disaster and on the Sunday, tallow was openly sold in Lydd by the cwt., for threepence halfpenny and fourpence per pound; and some of the more respectable plunderers bought the tallow from the minor thieves, and sent it to Rye and other places in waggons and carts.

Rochester.—On Thursday a case of felony was heard in the County-office against two Officers of the 44th and another person, who had been apprehended under warrants granted by the county justices. The court was inconveniently crowded with civilians and military men. The prisoners gave their names as follows: Ensign R. D. Chapman, of the 44th Regiment, Ensign J. Le Marchant Carey, of the same regiment, and John Foster, landlord of the Star Inn, and late a cornet in one of her Majesty's Dragoon Regiments. The warrants charged the two first prisoners with having on the 22d ult. killed and stolen three fowls, and John Foster with aiding and abetting in the felony; the fowls so carried away being the property of a Mrs. Walker. After witnesses had been examined the magistrates ordered the officers to be released, as they were, from the evidence adduced, wholly guiltless of the charge alleged against them; and they were, therefore, honourably acquitted. Their evidence, however, was taken against the other prisoner, as the principal in the felony, who was committed for trial at the Maidstone assizes on the charge of felony, but was admitted to bail.

Stockport.—A letter from the Mayor of this town to Mr. Cobden announcing that an address had been forwarded to him, expressive of the grateful thanks of the inhabitants of Stockport for his exertions, in the House of Commons, in aid of the manufacturing and general interests of the country, has been published in the daily papers. In acknowledging this communication, Mr. Cobden states his reasons for the course pursued by him in Parliament. He says that although the Queen's Speech had borne testimony to the sufferings of her people, no measures were announced by her responsible advisers; and when a motion was brought forward by a member of the Opposition for entering upon the consideration of the distress of the country, it was resisted by the Government. "It was under these circumstances," he says, "that I felt it to be my duty to remind the Prime Minister of his responsibility to the country and to his Sovereign for the consequences which might ensue from his policy." He then alludes to the construction put upon his words by Sir Robert Peel, and says that it was not till after he had endeavoured to make his first explanation that he was made aware of the construction which had been put upon his words, by some of the Members beside him. He ridicules the absurdity of attempting to infer political assassination, a crime unknown in this country, from acts such as those which Sir R. Peel had endeavoured to connect with his speech on the 17th; and with respect to the violence with which he was assailed in the House of Commons, he thinks that such violence will not be lightly repeated after public opinion has fixed its stigma upon the proceeding.

Tavistock.—On Monday week an attempt was made to assassinate Mr. Benson, the steward to the Duke of Bedford. He had been confined to his bed for some time past, and it was considered necessary that a man-servant should sleep in his room. About 6 o'clock on Monday morning, the man was crossing the apartment to administer some medicine to his master, with a light in his hand, when as he passed the window a fowling-piece was fired into the room from the yard below. The window was shattered and several slugs were found in the walls, but the man escaped unhurt. There is no doubt that the shot was intended for Mr. Benson, and a reward of 80*l.* has been offered for the apprehension of the offender.

Railways.—The following are the returns for the past week:—Greenwich, 626*l.*; Eastern Counties, 873*l.*; Croydon, 170*l.*; Liverpool and Manchester, 3,326*l.*; Brighton, 2,223*l.*; Newcastle and Carlisle, 1,203*l.*; Grand Junction, 6,087*l.*; York and North Midland, 474*l.*; Blackwall, 465*l.*; Great North of England, 1,109*l.*; Sheffield and Manchester, 273*l.*; Manchester and Birmingham, 2,229*l.*; Manchester and Leeds, 3,613*l.*; Midland Counties, 2,083*l.*; Hull and Selby, 800*l.*; Edinburgh and Glasgow, 1,592*l.*; Birmingham and Gloucester, 1,460*l.*; Manchester and Derby, 998*l.*; North Midland, 3,400*l.*; Great Western, 10,426*l.*; London and Birmingham, 12,647*l.*; Northern and Eastern, 1,011*l.*; South-Eastern, 1,065*l.*.—The half-yearly meeting of the South-Western Company took place on Saturday. A dividend of 1*l.* 12*s.* 6*d.* per share was declared for the last half-year, being an addition of 2*s.* 6*d.* per share on comparison with the previous six months, and a surplus was left of nearly 7,000*l.*, the shareholders to pay the income-tax. The gross revenue for the half-year, (including a balance of 515*l.* 6*s.* 7*d.* from the former account, 857*l.* 13*s.* 1*d.* for rent, interest, and pier dues), amounted to 173,630*l.* 11*s.* 4*d.*, and the proportion of the working expenses to the receipts had been reduced from about 39½ to 35½ per cent.—The meeting of the North Midland Company took place on Friday last at Leeds. It was expected, from the great opposition raised to the course the new directors have pursued, to have furnished much discussion on the subject of the general management; but it appears to have passed off quietly, notwithstanding the disapprobation expressed at the reduction made in the working of the establishment. The Report states the net profit for the last six months to be 52,442*l.*, out of which a dividend of 1*l.* 12*s.* 6*d.* per share on the 100*l.* shares, of 16*s.* 3*d.* per share on the 50*l.* shares, and of 10*s.* 10*d.* per share on the 33*l.* shares, was declared payable on the 10th inst. The accounts showed a decrease of receipts of 527*l.* 7*s.* 4*d.*, as compared with the corresponding period of 1841, and a decrease of 11,294*l.* 8*s.* 4*d.* in the expenditure. The directors expect an accession to their traffic during the present half-year, by the conveyance of passengers to the meeting of the Agricultural Society, which is to be held at Derby this season.—At a meeting of the Statistical Society last week, a paper by Mr. Tremeneere, on the Agricultural Statistics of various parishes in Middlesex, was read; in which the effect produced on the Oxford road by the Great Western Railway was particularly noticed. It appeared, from the facts stated in this Paper, that not only had the posting on the road been almost destroyed, but the prices in the Southall cattle-market had been seriously affected by the railway. Much discontent prevails among the farmers in consequence of the facility which the railway affords for the rapid transfer of stock from one county to another, and which deprives them of the advantages of their proximity to London. 500 head of sheep and 100 head of cattle are often suddenly introduced into the market, by means of the railway, from the west of England; so that the prices have been forced down, and the Middlesex farmer compelled to sell at a loss, or to withdraw himself from competition. The sale of hay and corn is also at a discount, in consequence of the diminution in the number of post-horses. Since the grand blast of Round Down Cliff, to the westward of Dover, on the line of the South Eastern Railway, many thousand tons of chalk have been blown into the sea, by a similar process, on a smaller scale; and another blast, by which 50,000 yards of chalk were dislodged, took place on Thursday, consisting of about 7,000*lbs.* of gunpowder, which were ignited by the voltaic battery.—On Monday a special train left the Shoreditch station of the Eastern Counties Railway, conveying the directors of the company, and those of the Northern and Eastern Railway, together with 300 or 400 of the shareholders, and the greater portion of the company's staff, for the purpose of inspecting the line on the opening from Brentwood to Colchester. The total length of line proposed to be opened was 51 miles; 17½ of which have been opened to the public for some years past. The train proceeded smoothly as far as Brentwood, where they were retarded in their progress through the cutting in consequence of the unfinished state of the works and rails, which had only been completed on the previous day. Another impediment occurred at Shenfield, where large piles of timber had been temporarily erected in lieu of the embankment, which it was found could not be completed in time. The trains having with difficulty crossed over this, arrived at that part of the line which lies between Shenfield and Mountnessing, at which place another timber structure, several hundred yards long, carried over a chasm of many feet deep, had to be encountered. There the trains came to a halt, from its having been discovered that the necessary timbers had not been thrown across. In this spot the trains waited for nearly four hours, for the purpose of enabling the carpenters to bridge the way over. The necessary closure having been effected, a pilot-engine was sent forward in order to try the stability of the rafters, but even under the burthen of a single engine, the structure was observed to bulge and give way, and the engineer pronounced it would be unsafe to proceed. A return to town was the consequence, the shareholders strongly expressing their disappointment at the day's disasters. The half-yearly meeting of this company was held on Tuesday, when the particulars of the above disappointment were officially made known. Mr. Braithwaite, the engineer, attributed the failure to the saturated state of the ground in consequence of the late wet weather, and stated that an experimental engine had subsequently traversed the line with perfect safety. Gen. Pasley, the Government inspector, had undertaken to examine the line in the course of the present week, and there was no doubt that it would be open for public traffic in about a fortnight. The Directors

Report announced a balance in hand of 13,144*l.*, out of which it was resolved to declare a dividend of 3*s.* per share on the new shares, and 2*s.* 9*d.* per share on the original shares. In the passenger traffic there had been an increase for the half-year of 4,000*l.*, and the accounts of the general management show a decrease in expense to nearly the same amount.

IRELAND.

Dublin.—The installation of the Hon. Henry Pakenham, as Dean of St. Patrick's, took place on the 24th, with the usual solemnities.—The subscriptions to "the Mathew Testimonial," which is likely to be a great public building, for literary and scientific objects, are pouring in from all quarters. The following letter has been received from the late Lord-Lieutenant, Earl Fortescue, dated Feb. 21:—"I request that you will add the inclosed 25*l.* in my name to the subscription for a testimonial to the Rev. Mr. Mathew, as a small mark of that interest which all who have the welfare of Ireland at heart must, I think, feel in the success of his exertions. Few men on record, in any age or country, have, within the same space of time, contributed as much as he has to the moral improvement of their fellow-creatures—none, I am sure, ever devoted themselves to any good work with more untiring zeal, or more unaffected and single-minded benevolence." From Lord Ashburton, who is not connected by property with Ireland, the following communication has been received:—"Although personally unconnected with Ireland, I beg to have my name added to the list of subscribers towards the testimonial to be erected to commemorate the eminent services of the Rev. T. Mathew to his country and to humanity."—The Commissioners of Education in Ireland have issued circulars to the managers of the National Schools, stating that they are desirous to introduce Wilhelm's system of Vocal Music, and that if they are disposed to make a trial, on notifying their wishes to the Commissioners, grants of books, &c. will be made.—The weekly meeting of the Repeal Association took place on Monday, when Mr. O'Connell addressed the meeting at great length on the usual topics. He stated that the American sympathy for Ireland had been re-echoed in the more southern latitudes of the Mexican Republic, and that the Hon. W. Thompson, the Minister of the United States in Mexico, was also the Minister of the Irishman and the stranger. The rent for the week was 185*l.* 4*s.* 7½*d.*

Tuam.—An occurrence of a very tragical nature took place a few days since near this town, which has caused great sensation in the county. It appears that Mr. Michael Ward, son of Mr. Ward, of Doon Castle, in the county of Galway, and his wife, had not for some time been on amicable terms. A serious difference arose between them, to avoid which Mr. Ward retired to the kitchen for the purpose of seeing his dogs fed. Mrs. Ward followed, and shot him with a pistol loaded with slugs. After a vain struggle to detain her in his grasp, Mr. Ward sank down bleeding and exhausted, and is said to be in great danger. The lady, who is a grand-niece of the late Lord Clanmorris, has for the present escaped.

Lab.

COURT OF COMMON PLEAS.—*Moore, Clerk, v. Drummond, Clerk.*—This was an action of slander. The circumstances which gave rise to it made, at the time, considerable noise, and were fully noticed in this Paper. The plaintiff is the Rev. William Carter Moore, B.A., curate of St. Peter's and St. Mary's, at Boston, in Lincolnshire; and the defendant is also a clergyman, and the incumbent of the Chapel Royal, Brighton. On July 30, the plaintiff, accompanied by his son, a member of St. John's College, Cambridge, went to Brighton for the recovery of his health; and on Sunday morning, the 31st, the plaintiff and his son, being then entire strangers to defendant, entered the Chapel Royal, just as the Litany was concluded, having been detained until that time at the baths. At the close of the sermon the defendant said—"My dear friends, I know it is not usual to address you after the sermon, but I beg to inform you that there are two notorious pickpockets in the congregation, and therefore be careful." That announcement turned the eyes of the congregation to the strangers, who had before attracted some attention by coming late into the church; considerable confusion ensued, and the plaintiff and his son were followed from the chapel by a crowd of persons. Upon inquiring the cause of the assemblage, they were informed that they were the persons against whom the defendant had cautioned his congregation. Necessarily annoyed at such a suspicion, they with difficulty persuaded a person to accompany them to the hotel where they were staying, and thence to the house of a lady in Cannon-place, where their respectability was unquestionably proved. That was the offence of which the plaintiff now complained, and in support of his case he called several persons who were present on the occasion, and heard the words spoken, to depose to the above facts, and also several witnesses to prove the perfect respectability of his character. Sir T. Wilde addressed the jury for the defendant, and contended that this action ought not to have been brought, inasmuch as the defendant, as soon as he discovered he had made a mistake in respect of the persons whom he considered the plaintiff and his son to be, wrote a letter to the plaintiff, expressing in the strongest terms his regret that the circumstance had occurred, and stating the manner in which it had happened—viz., that shortly before the plaintiff and his son entered the church, information had been received by the defendant that two notorious pickpockets had been driven from Christ Church, having come there in a fly, and that they had afterwards gone to several other chapels in Brighton. That the close arrival of the plaintiff and his son led him to believe they were the parties, and to make the address to his audience which had given rise to these proceedings. Evidence was called to prove this statement. The Lord Chief Justice having summed up, the jury, after having been absent for some time, found a verdict for the plaintiff—Damages, 40*s.*

ASSIZE INTELLIGENCE.—**WESTERN CIRCUIT (Winchester).**—**Incendary Fires.**—Charles Parrott and William Sparkes were indicted for having set fire to a barn and outhouse at Havant on the 28th April. It appeared, that on the night of the 28th April Mr. Atherley's barn was on fire. The prisoners, who lived in the neighbourhood, were at a public-house at 11 o'clock that evening; they asked for some lucifer matches, which the landlord gave them. The prisoners left the house together. The house was shut up, but upon their calling, the landlord opened the door, and upon their request gave them the matches. Soon after this the barn was observed to be on fire. The prisoners were seen in the neighbourhood immediately upon the fire being discovered, and they assisted to extinguish it. The statements made by the prisoners before the magistrates were put in, wherein

they made a full confession of having set the premises on fire. Mr. Serjeant Atcherley then summed up; the jury found the prisoners Guilty, and they were sentenced to be transported for life.—*William Barnes*, a butler, and *Elizabeth Pollard*, a lady's maid, were indicted for having, on the 1st September, burglariously entered the dwelling-house of the Dowager Lady Lisle, at Millbrook, near Southampton, and stolen therefrom a very large quantity of jewellery, bank notes, sovereigns, and guineas, her property. The particulars of this robbery were noticed in this Paper at the time, and our readers may remember that it was discovered chiefly by the vigilance of the gardener. After a long examination of witnesses, the jury acquitted the female, and found the butler Guilty. Sentence, transportation for 15 years.

OXFORD CIRCUIT (Oxford).—*James Hickman* was indicted for having, on the 17th November, set fire to a rick of clover hay, in the parish of Clifton Hampden. It appeared that on the day in question the prisoner went to the police station at Abingdon, and preferred the unusual request that the police would take him into custody. He was, however, informed that it was contrary to the regulations to deprive any person of his liberty without first receiving a charge against him; and upon this the prisoner stated that he had just set fire to a rick of hay belonging to Mr. Latham. He was then locked up, but had not been long in the cell before he cried out for water, and when he was supplied with it said that he could not rest easy in his mind, as he had committed a very grave offence. This offence, he said, consisted in his having set fire to Mr. Latham's rick, which he had done with some lucifer matches. Counsel addressed the jury for the prisoner, contending that the jury ought not to give credence to the prisoner's own confessions, as many men were induced to accuse themselves of crimes from a morbid love of notoriety. Mr. Justice Erskine summed up, and the jury found the prisoner Guilty. He was sentenced to transportation for 15 years.

OXFORD CIRCUIT (Reading).—*Thomas Paice*, a lad 19 years of age, was indicted for maliciously setting fire to the dwelling-house of his master, the Rev. John Sloper, on the 6th February, the prosecutor and his wife then being therein. The evidence in this case, though it established a strong suspicion of the prisoner's guilt, was not sufficient to convict, and he was accordingly acquitted. He was then tried upon a second indictment, for setting fire to the prosecutor's house, on Tuesday, the 9th February. It was here proved that the prisoner had fired the premises by means of tow and turpentine. The jury found him Guilty, and sentence of death was recorded, accompanied by an intimation that he would probably be transported for life.—*Richard Wallis* was indicted for having, on the 7th November, 1838, set fire to certain ricks and farm-buildings, at Hampstead Norris. The jury found the prisoner Guilty. Sentence was deferred. At a later period of the day, Jesse Wallis (son of the last-named prisoner), Richard Wallis, and three other prisoners, who had all been convicted at these assizes of arson, were placed at the bar to receive judgment. Mr. Justice Wightman, in passing sentence, said that the prisoners had all most properly been convicted of one of the deepest and most dangerous offences known to the law, and one which, he very much regretted to find, had prevailed in this county to an alarming extent. It was, therefore, absolutely necessary that a severe example should be made of those who were proved to have been guilty of the commission of such offences. Distress and want, although no excuse for crimes, might occasionally tempt men to acts which the law would not justify, but which were committed for the purpose of relieving themselves from hunger; but crimes like those of which the prisoners at the bar had been found guilty had no such palliation. They were committed to gratify the most malignant feelings, and he hoped that the result of these trials would satisfy all those who had heard of the conduct of the prisoners, that however securely crimes might be supposed to be perpetrated, justice would at last overtake those who were guilty of them. His lordship then sentenced all the prisoners, with the exception of Jesse Wallis, to be transported for the remainder of their respective lives. Jesse Wallis, on account of his youth, and the belief which his lordship entertained that he had been instigated by others, was transported for 15 years.—*Samuel Prentiss*, a respectable-looking man, described as a whitesmith, was indicted for having, on the 27th January, feloniously broken into Windsor Castle, with intent to commit a felony. The particulars of this case have been so recently before the public, that it is unnecessary to repeat them. It was proved that the prisoner had entered the store-room by a skeleton-key at 5 in the morning; but it appeared in evidence that he had for eight years been employed in the work-rooms, and bore an excellent character. The Judge, in summing up, pointed out the improbability that a person in good circumstances, and with a good character, would enter the stores with felonious intentions, and the jury at once returned a verdict of Acquittal.

NORTHERN CIRCUIT.—(Lancaster).—*John O'Neil* and *John Braithwaite* were charged with stealing 57 sheep, the property of Mr. W. Morphet, a farmer, residing at Hornby, near Lancaster, on the 12th February, the particulars of which were given in our last. It appeared that on the night in question, the prisoners entered the prosecutor's field, and drove away the whole of his flock of sheep. Next day they offered them in the neighbourhood to several butchers, but at so cheap a rate as to excite suspicion, and, in consequence, they were taken into custody, and the sheep restored to the owner. The jury found the prisoners Guilty. The Judge sentenced O'Neil to 15 years' transportation, and the other prisoner to 3 months' imprisonment.—**The Chartist Trials.**—The trial of Mr. Feargus O'Connor and the other Chartists implicated in the late riots, commenced on Wednesday before Mr. Baron Rolfe and a special jury. All the defendants, amounting in number to 59, appeared except Dr. M'Donnell, who was represented by Mr. Serjeant Murphy, and who, it is understood, will abide the event of the trial, and come in for judgment accordingly. The Attorney-General opened the case with a speech of considerable length, in which he stated to the jury the nature of the evidence which he was about to adduce, and the effect which that evidence would have upon the defendants. His speech was chiefly remarkable for the calmness of its tone, for the temper and forbearance which it exhibited towards the defendants, and for the pride which he condescended he felt, that during an outbreak of so serious and extensive a character as that of August last, Englishmen had so far remembered what was due to themselves and to their country, that, though many acts of illegal character and dangerous consequences had been committed, yet on the whole a most remarkable degree of moderation had been exhibited by the working classes. The charge against the defendants, as stated by the Attorney-General, was endeavouring, by large assemblies of persons combined, by force, violence, menaces, and intimidation, to produce such a degree of alarm and terror throughout the country, as to produce a change in some of the fundamental points of the Constitution. The evidence of the different witnesses was, on the whole, rather favourable to the defendants, as showing continual exhortations to peaceful and orderly conduct, and that the original cause and the general character of the turnout was for "a fair day's wages for a fair day's work," and not for the promulgation of the Charter. It appeared from their testimony, that it was not till some days after its commencement that a portion of the turnouts thought it advisable to mix up the Charter question with the wages, nor did they do it at length without considerable opposition and division. It also appeared that at Staleybridge, where the first turnout took place, the men were under notice from their masters to give up work unless they consented to a reduction of 25 per cent. upon their wages; and that, therefore, it did not altogether bear the character of a voluntary strike. It was also proved that though many of the men wanted to return to work, they were prevented by a combination of the mill-owners, who determined to shut their factory doors for a month; and had they not done this, it was alleged that there was every probability that the strike, and its consequent disturbances, would have much

LAMBERTIAN HERBARIUM.
THE late PROFESSOR DON'S ACCOUNT of the various Collections of the LAMBERTIAN HERBARIUM; being an "Appendix to the History of the Genus Pinus." Atlas folio, boards. A few copies of this interesting account of the now-widely dispersed Botanical Museum remain for sale. 10s. WILLIAM PAMPLIN, 45, Frith-street, Soho-square.

PRUSSIAN HORTICULTURAL TRANSACTIONS.
VERHANDLUNGEN des Vereins zur Beförderung des Gartenbaues in den Königlich Staaten. 4to., coloured and plain Plates; complete in 14 vols. A fine Copy 12 guineas. Berlin.—Many of the Numbers may also be had separately. W. PAMPLIN, 45, Frith-street, Soho.

BEE-HIVES.—A SHEET of ILLUSTRATIONS of HIVES, published by JOHN MILTON, price 1s., may be had of Messrs. RIVINGTON'S, Waterloo-place; J. W. PARKER, West Strand; and of J. MILTON, 10, Great Marylebone-street, Wimpole-street. All letters to be paid.
These are "Illustrations of Hives" referred to in "The Practical Bee-keeper." A Treatise on Bees now publishing.

On the 1st of March, price 1s., No. III. of the
NEW ILLUSTRATED MAGAZINE of NATURAL HISTORY, or "ZOOLOGIST."
The papers are by Messrs. Bladen, Jordan, Bell, Salmon, Reece, Newman, Holme, Yarrell, Couch, Landborough, Quekett, Walker, Dr. Drummond, and other naturalists. The figures represent a new British fish, a gold fish bearing a living vegetable, and the minute anatomy of the horse-leech.
London: JOHN VAN VOORST, Paternoster-row.

MESSRS. H. LANE and SON beg to announce that their select Catalogue of PELARGONIUMS, FUCHSIAS, VERBENAS, HEARTSEASE, &c. &c., for the present year may be had on application at the Nurseries, Great Berkhamstead, Herts. For Character, &c., of FUCHSIA LANEII, see Advertisement in *Gardeners' Chronicle* of Dec. 17, 1842. Great Berkhamstead, March 1, 1843.

THE "LADY'S BLACKWOOD" MAGAZINE of FASHION and LITERATURE for March 1, price 2s. monthly, and each succeeding Number will excel in the splendour of its embellishments anything of the kind ever published; containing the choicest Parisian Fashions, a Series of elegant Steel Engravings, entitled Views in India, and nearly 200 royal 8vo. pages of letter-press, equal to four other Magazines. The illustrations consist of a series of magnificent Views taken in India, including (in this Number), a highly-finished Lithographic Drawing, from an original and authentic Sketch by an Officer, representing the heroic LADY SALE on Horseback, as she appeared under a heavy fire from the Ghilzees, in the Advance Guard of the British Army, in the late disastrous Retreat from Cabul, during the Passage of the Khoord Cabul Pass, just before the Massacre of the Troops and Camp Followers.
The works are better adapted for country Presents than the half-yearly Volumes of "BLACKWOOD'S LADY'S MAGAZINE." Each Volume (of Six Two Shilling Parts), contains an enormous variety of pleasing Tales, equal in letter-press to four guineas and a half Novels, and of a far more interesting character, by the first authors of the present day, including Georgiana, Duchess of Devonshire, the late Miss Landon, Miss M. A. Roberts, the Hon. Miss Beadclerks, Miss L. M. Beavor, Miss Agnes Strickland, J. E. Carpenter, Esq., Mrs. George Cruikshank, W. H. Farn, Esq., Mrs. Gould, J. C. Hall, Esq., Maurice Harcourt, Mrs. Hofland, Mary Howitt, Sheridan Knowles, Esq., Miss Pardoe, Mrs. Segourney, "The Hermit in London," the late F. Yates, Esq., with upwards of 70 Portraits of the Modern Beauties of France, attired in the latest Parisian costumes of the day, and a series of magnificent steel engravings, entitled "Belgian Scenery," sketched from Nature, with an illustrative article to each. Vols. I. to XII. may be purchased of the Publisher, at the Office, 154, Strand, or ordered of any respectable Bookseller in Town or Country, at 10s. the single volume, or the first six at 7s., and a further reduction of 2s. by taking the whole twelve volumes, the price then being but 5s. each, elegantly bound in green and gold. It is unnecessary to offer any remarks of the press, as the public are already aware that the work has been spoken of in terms of the highest and most flattering praise, by all the London and country newspapers. The monthly numbers of BLACKWOOD'S LADY'S MAGAZINE ARE PATRONISED BY ALL THE COURTS OF EUROPE, and it may be said to be the leading Periodical for Fashion, General Female Costumes, and Polite Literature.

SHIRLEY VINEYARD, near Southampton.—The Proprietor of this Establishment respectfully announces that he has now made sufficient progress in it to enable him to commence, forthwith, a series of experiments of a most important character, and on an extensive scale, relative to the Culture of the Vine under Glass; the object of which will be to free that interesting and valuable branch of Horticulture from the difficulties and uncertainty which have hitherto surrounded it, and to place it on such a basis, as to ensure the production of very superior fruit, with ease, certainty, and economy.
In the prosecution of this design, and in that of cultivating the Vine on open walls; and also in the propagation of Vine Plants in the nursery department of the Vineyard, he is desirous of having associated with him a few respectable Youths, as Articled Pupils, who, in addition to being taught the most improved mode of Vine Culture in all its various branches, and (as necessarily involved in it) the Theory and Practice of all the grand Principles on which the delightful Science of Horticulture is based, will also enjoy a great number of valuable EDUCATIONAL ADVANTAGES, of a sterling practical character, and such as, in combination with the above, will enable them, with industrial application, to occupy, at the expiration of their pupillage, a superior and independent rank in society.

To Parents who are desirous of providing for their Sons the knowledge of a superior and profitable pursuit, in preference to their becoming dependent on the precarious issue of mercantile or trading occupations, the opportunity thus offered may be considered as highly deserving of their attention.

As the Pupils will be considered as members of the family, and treated in every respect in the most liberal manner, a suitable Premium will be required.

Applications, personally or by letter, may be made to Mr. CLEMENT HOARE, at the Vineyard.

It is intended to limit the number of Pupils for the present to four, and Mr. H. will be ready to receive them in the ensuing month of March. February 8, 1843.

CULTIVATION OF PINES WITHOUT POTS.—One of the many advantages derivable from RENDLE'S "Tank System of Heating," is the easy practicability of Cultivating Pines without Pots, an object of paramount importance to the cultivators of this delicious and much-esteemed Fruit.

A Treatise, with Engravings, will shortly be published, containing every information to set up or adapt the apparatus, with cost of materials, fixing, &c. Price 5s. each copy to Subscribers. Orders are requested forthwith to be sent to Mr. WM. RENDLE, Union Road Nursery, Plymouth.—Feb. 15th, 1843.

NURSERY and SEED BUSINESS to be DISPOSED OF.—The Proprietor of an old-established Nursery and Seed Business (in the country) being desirous of retiring, would be glad to treat with any person wishing to embark in such a concern.—For particulars apply by letter, addressed C. B. *Gardeners' Chronicle* Office.

NEW BOOKS FOR SCHOOLS AND SELF-INSTRUCTION.
MECHANICAL PHILOSOPHY and its APPLICATION to the ARTS. Price 4s.; being the Third Part of the
POPULAR CYCLOPEDIA of NATURAL SCIENCE.

By Dr. W. B. CARPENTER,
Author of "Principles of General and Comparative Physiology."
Treatises already Published, price Four Shillings each—
Part I.—VEGETABLE PHYSIOLOGY,
Part II.—BOTANY.

THE EARTH;
ITS PHYSICAL CONDITION AND MOST REMARKABLE PHENOMENA.
By W. M. HIGGINS.
Illustrated by 10 coloured Engravings by FELIX BLUNT. In small 8vo, price 8s. 6d., cloth lettered.

THE ENTOMOLOGIST'S TEXT-BOOK.
An Introduction to the NATURAL HISTORY, STRUCTURE, PHYSIOLOGY, and Classification of INSECTS, including the CRUSTACEA and ARACHNIDA. With numerous Woodcuts and Six Coloured Plates. By J. O. WESTWOOD, Esq., F.L.S., &c. &c.
A New Edition, price 5s. 6d., cloth lettered.

LESSONS ON ASTRONOMY.
By ROBERT MUDIE.
A New and improved Edition, illustrated by FELIX BLUNT. In small 8vo, price 4s. 6d., cloth lettered.

JOHNSON'S DICTIONARY OF THE ENGLISH LANGUAGE,
With Walker's Pronunciation of all difficult or doubtful Words. (Corrall's Diamond Edition). Price 2s. 6d. roan lettered, and 3s. embossed roan.

A PRACTICAL GRAMMAR OF THE FRENCH LANGUAGE.
By Dr. PEITHMAN.
Second Edition. Price Five Shillings, cloth lettered.

A PRACTICAL GRAMMAR OF THE LATIN LANGUAGE.
By Dr. PEITHMAN.
Second Edition. Price Three Shillings, cloth lettered.

These works, although comparatively unknown in schools, have procured their author a high reputation amongst scholars and private teachers, by whom they are chiefly used.

PINNOCK'S IMPROVED EDITION OF MURRAY'S ABRIDGED ENGLISH GRAMMAR,
With numerous Exercises. Accompanied with Questions for Examination, and Explanatory Notes. Eighteenth thousand. Price 1s. 6d., cloth lettered.

In royal 18mo, price 1s. 6d., cloth lettered, a New Edition of
WALL'S GRAMMATICAL SPELLING-BOOK;
Intended to facilitate the simultaneous acquisition of Orthography and Grammar.

DOWER'S ATLASES.
In royal 4to, price 1l. 1s., half-bound roan, for Schools; or for the Library, 25s. half-bound Russia,

A GENERAL ATLAS OF MODERN GEOGRAPHY;
Comprised in 50 Maps, full coloured, and a view of the Comparative Height of Mountains, and Length of Rivers, coloured, so as to indicate the Quarters of the World in which they occur, with a copious Consulting Index of many thousand Places, with their Latitude and Longitude.

In royal 8vo, price 12s. half-bound and coloured,
A SCHOOL ATLAS OF MODERN GEOGRAPHY;
Containing 36 Maps of the Hemispheres, Quarters of the Globe, and the chief Countries, with a copious Consulting Index.

In royal 8vo, price 7s. 6d. half-bound and coloured,
THE MINOR SCHOOL ATLAS;
Containing 21 Maps of the Hemispheres, Quarters, and the more important Countries and Provinces in the World, with a Consulting Index of many thousand Names.

In royal 8vo, price 5s. half bound and coloured,
A SHORT ATLAS OF MODERN GEOGRAPHY;
Containing 12 Maps of the Hemispheres, Quarters of the World, and Countries and Provinces suited for the Young to be first acquainted with.

* * * The above Atlases recommend themselves to the Heads of Schools and Families, and also to the general Reader, for reference, by their fullness of detail, by the care and accuracy with which they have been prepared, and from time to time revised with modern geographical discovery, and by their prices, as compared with similar works.

WM. S. ORR & Co., Amen-Corner, Paternoster-row.

EXHIBITION of CAMELLIA JAPONICA, or JAPAN ROSE.—A Collection of these beautiful Exotics is now in bloom at CHANDLER and SONS' Nursery, Vauxhall. Admittance gratis.

GARDEN NET.—New Garden Net, viz., Herring Net, one-inch mesh, made with machinery, 1½d. per yard, in any length or width. Old Fishing Net, properly mended up, in lengths, 30 or 40 yards, 8 and 10 feet deep, ¾d. per yard square. Woollen and Worsted Net, fine Blossom and Wasp Net, made from Hemp, Bunting, Screens, &c. &c. Woollen Tie for Flowers' Also Sheep-folding Nets, Fishing Nets, Rabbit and Hare Nets. Nets for Fences against Rabbits, Dogs, Poultry, &c., 2d. per yard; also for covering in Poultry-yards, Pheasantries, &c., 2d. per yard. Superior expanding Tents for Lawns, &c., 5l., 36 feet round. Tarpaulins for Waggon and Stack Covers, Garden-frames, &c., 2s. per square yard made up.

ROA. RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New Road, near Euston-square, London.
N. B.—1000 London Policemen's Capes for Farmers' Servants, 1s. 9d., 2s., and 2s. 6d. each.

TO NURSERYMEN and Others.—To be LET, a large HOUSE, with sundry out-buildings, and about four acres of excellent land, with a valuable right of common. It is situated on the Southampton-road, near the Staines gate. It will only be let on lease. The rent is 35l. per annum. Apply to Mr. HENDOR, Builder, Staines. It was formerly the poor-house, and built about 20 years.

H. WALKER'S NEEDLES (by Authority the "Queen's Own"), with the New Large Eyes, are easily threaded (even by blind persons), and worked with great ease, having Improved Points, Temper, and Finish. The Labels are correct Likenesses of Her Majesty and His Royal Highness Prince Albert in relief, on coloured grounds.

H. WALKER'S Improved Fish-hooks, Steel Pens, Hooks and Eyes, Bodkins, &c., are particularly recommended to notice. For the Home Trade, neat packages of Needles or Pens, from 1s. to 10s. value, can be sent free by post by any respectable dealer, on receipt of 13 penny stamps for every shilling value. Every quality, &c., for shipping.

H. WALKER, Manufacturer to the Queen, 20, Maiden-lane, Wood-street.

TO BE LET or SOLD, INGATESTONE NURSERY, long known as one of the most desirable situations in Essex, on the London and Norwich road, and contiguous to the Eastern Counties Railway. The grounds, about five acres, have been lately cleared; but the fine specimen plants and a choice collection of fruit-bearing trees are left, sufficient to pay a good rental. There are three Greenhouses, with other erections, and a good dwelling house. This affords a good opportunity to any one commencing business, having an excellent connexion of forty years attached. May be entered upon immediately at a moderate rental, or purchased by private contract; 2½ miles from London and six from Chelmsford. For particulars apply to Mr. PROTHMER, American Nursery, Leytonstone, or to Mr. HOGG, on the premises.

MARDER'S GRAFTING COMPOSITION.—From the Expansive and Adhesive properties of this Paste, it neither retards the progress of swelling nor admits the air, moisture, or frost, in the process of healing the graft; thereby insuring a remedy against the failures so prevalent from the adoption of the present imperfect, dirty, and troublesome mode. It is the only article of the kind ever offered to the public; being partially introduced last season. Parties who then made trial of it (with entire success), feel the utmost confidence in recommending it. In 2s. 6d. and 1s. 6d. pots. Wholesale, by Mr. REPLEY, Hooker's Court, Nicholas Lane.

CUCUMBER and MELON BOXES and LIGHTS.—For Sale, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two-light Boxes and Lights complete, from 1l. 8s. Garden Lights made, glazed, and painted, from 1s. per foot. Sashes and Frames made, glazed, and hung complete, 1s. 6d. per foot.—At JAMES WATTS' Sash Manufactory, 3, Claremont-place, Old Kent-road.
* * * Reference given.

TO LADIES.
ROWLAND'S KALYDOR.—Under the special Patronage of Her Most Gracious Majesty the QUEEN, and the Royal Family.—This elegant and fragrant preparation thoroughly eradicates all Pimples, Spots, Redness, Tan, Freckles, and other Defects of the Skin; heals Chilblains, and renders a chapped and rough skin, pleasantly soft and smooth. It imparts a youthful roseate hue to the Complexion, and renders the Arms, Hands, and Neck delicately fair and soft. CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR";—it is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper.—All others are "GROSS IMITATIONS." * * * To protect the Public from Fraud, The Hon. Commissioners of Stamps have authorized the Proprietor's Signature to be engraved on the Government Stamp, thus:—"A ROWLAND and SON, 20, Hatton Garden," which is affixed to each bottle. Price 4s. 6d. and 8s. 6d. per bottle, duty included. Ask for ROWLAND'S KALYDOR. Sold by them, and by Chemists and Perfumers.

WANTED, an OUT-DOOR APPRENTICE to the Nursery and Seed Business, near London, a respectable Youth 15 or 16 years of age. He must write a good hand, as he will have to assist in Book-keeping. A Premium will be required. For further particulars apply by letter only, with name and address to A. B., WARNER'S Seed Warehouse, 3, Laurence-Pountney-lane, Cannon street, London.

WANTED a respectable young Man, as PROPAGATOR in a Nursery near London. He must have a thorough knowledge of Plants. None need apply but those whose character will bear the strictest investigation as to ability, &c. Address to J. MILNE, Nurseryman, Stoke Newington, Middlesex. Personal application will not be attended to.

WANT PLACES.—All Letters to be post-paid.
AS GARDENER, a Married Man, aged 35, who perfectly understands his business; also the management of land or stock of any description, if required. Has had a practical knowledge of cattle from his childhood. Wife, if required, could manage a Dairy. Can have four years' good character from the gentleman he is leaving. Direct to A. B., Messrs. PAUL & SON, Nurserymen, Cheshunt, Herts.

AS UNDER-GARDENER, a young Man, of good experience, where he may have the advantage of improvement in the business generally.—Address, A. Z., *Gardeners' Chronicle* Office.

AS SHOPMAN in the SEED-TRADE.—The Advertiser, who has been for the last three or four years in an old-established Seed House in the City, will be glad to hear of a situation as SHOPMAN, &c., in some London House. Apply by letter to W. A., Post-office, 24, Cornhill.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed, to the Editor.—Saturday, March 4, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 10—1843.

SATURDAY, MARCH 11.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Abaca described	110 c	Maize, sugar extracted from	139 c
Achillea millefolium	140 b	Malt-dust as a manure	133 b
Amaryllis Belladonna, its treatment	137 c	Manure, liquid, to apply to plants	144 a
Amateur's Garden	135 a	Microscope for botanical purposes	144 c
Ammonia, to fix	135 c	Mildew, to check	144 c

Hillies to prune	144 b	Vine, wash of, remarks on	132 a
Insects, remarks on killing	138 b	Vriesia psittacina	140 c
Ipswich Cucumber Show	140 b	Walnut trees, to transplant	136 b
Lawson's Treatise on cultivated Grasses revd.	143 a	Window plants	144 b
		Year Book of Facts revd.	143 b

DAHLIAS.

JOHN KEYNES, Florist, Salisbury, most respectfully begs to thank his Friends for their support last season in ordering "Dodd's Prince of Wales," and "Twylford Perfection," and to assure them that it shall be his study to offer nothing but FIRST-RATE SHOW FLOWERS. In announcing varieties for May, 1843, he hopes to merit their continued approbation and confidence.

LIST OF DAHLIAS, 1843.

Favourite (Dodd's)—clear white, edged with pink; the finest of its class; full centre; great depth of cupped petals; large and circular; not to be surpassed for form, and is safely warranted as a grand show-flower; most distinct. Plants in May	10 6
Colonel Baker (Dodd's)—dark claret; fine show-flower; most certain; very deep; cupped; rising centre; finest form; new colour; quite distinct from any other. Warranted. Plants in May	10 6
Viola Perfection (Keynes)—deep purple, with most vivid light violet shade in the centre of each petal; fine form; shape and growth of Metella. The shading of this flower is so prominent as to make it indispensable as a first-rate show-flower. Warranted. Plants in May	10 6
Paul Pry (Brown's)—light ruby; fine show-flower; perfect shape; not new in colour, but superior in its class. Plants in May	10 6
Virgil (Mountjoy's)—dark maroon; first rate	10 6
Surprise (Oakley's)—purple, distinctly tipped with white; finest of its class	10 6
Confidence (Cook's)—orange buff; first rate; best of its colour	10 6
Great Mogul (Atwell's)—dark red	10 6
Asmodeus (Wheeler's) very dark	10 6
Queen of the Isles (Low's)—white, edged with crimson; beautiful colours; quite distinct; first-rate form	10 6
Hero of Stonehenge (Whale's)—dark crimson; first-rate	10 6
Swindon Rival (Compton's)—dark rose; decidedly first-rate	10 6
Prince of Wales (Dodd's)—finest yellow	3 6
Mrs. Slelly (Mitchell's)—fine dark peach	5 0
Competitor (Hodges's)—light rose; extra fine; first-rate	5 0
Prince of Wales (Girling's)—shaded purple; fine	3 6
Princess Royal (Hudson's)—light buff, tipped with purple	3 6
Bedford Surprise (Shepherd's)—shaded rose; extra fine	3 6
Admiral Stopford (Trenfield's)—very dark; first-rate	3 6
Twylford Perfection—shaded rose; first-rate form	3 6
Horace (Mountjoy's)—dark	2 6
Prince Albert (Adams's)—orange buff	2 6

General Catalogues can be forwarded by post, as well as any packets of the above.

Union Road Nursery, Plymouth, March 8, 1843.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, Nurseryman, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undervalued low prices—including the following Fuchsias:—*Conspicua arborea* (Cateleugh's), *Venus victrix* (Cripps'), *rosea alba*, *Money-penny*, *compacta*, *racemiflora*, &c. Also the following distinct Verbenas:—*Queen*, *Aurora*, *Stewartii* variegata, *Mortlock's Superb*, *Burleyana*, &c. &c. Fuchsias, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents.

W. M. obtained a Prize of 107, open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

NEW AND SUPERB SEEDLING DAHLIAS on SALE by F. and A. SMITH and Co., FLORISTS, &c., HACKNEY, LONDON:—

BIANCA, Wildman, pure white, cup petals, large size, the centre well up, very deep flower (having from 25 to 30 rows of petals), first-rate form, of excellent habit, and very free bloomer: the flowers have long upright foot-stalks. It was pronounced a first-class flower by the Floricultural Society of London, Aug. 3, 1841; obtained a second prize at the South London Floricultural Show, Sept. 14; and a first-class prize at the Floricultural Soc. of London, Sept. 23; a first-class union was pronounced by the Floricultural Soc. of London, Aug. 16, 1842; it obtained a prize at Salisbury Plain, Aug. 31; the first prize at the Hammersmith Show, Sept. 27; and was pronounced a first-class flower by the Floricultural Soc. of London, Sept. 27, when 24 blooms were produced, although that Society very fairly qualified their approbation upon other occasions, when the flower, for reasons afterwards explained, appeared before them in a less perfect state. Opinions of the Press:—See *Gardeners' Gazette*, Sept. 24, p. 625: "This flower has been unfortunately very badly grown during the season; being exclusively cultivated in the neighbourhood of London, it has not been fit for competition at either of the shows for the cup. The blooms produced on Tuesday, though by no means equal to those of last season, or the early part of the present, gave promise that it will be a decidedly first-rate variety, when it comes into the hands of country growers, the centre being in every instance perfectly up, the petals cupped, and the flower well formed." See Report in same paper, Oct. 1, p. 639: "Wildman's Bianca, which has scarcely produced a bloom fit for showing until the latter part of the season, was in fine condition, a great number of blooms being shown, the whole of them first-rate." See Report in the *Florists' Journal* of Nov. last, p. 251: "We some little time since paid a visit to Messrs. Smith's Nursery, at Hackney; the Dahlias were in fine bloom, though evidently struggling with the smoke, &c., of that confined district. Too much credit cannot be given to these gentlemen for their strenuous exertions to overcome so great an obstacle. In the collection which is large, we particularly noticed that beautiful white, Wildman's Bianca; there were several plants of it, and all held good flowers." 10s. 6d.

DUKE OF WELLINGTON, Smith, rich scarlet crimson, fine cup petals, the centre well up, is of great depth and substance, a first-rate flower, a very profuse bloomer, and quite new in colour; it has obtained a prize at the South Essex Show, in Sept.—See Editor's opinion in the *Gardeners' Chronicle*, Sept. 3, 1842: "In the Duke of Wellington, rich scarlet crimson, the centre is full, although a little depressed, and the petals are

well arranged: it is a desirable flower, and rich in colour." 10s. 6d.

GENERAL SIR R. SALE, Smith, crimson purple, cup petal, well up in the eye, of good size, and great depth of petals, very profuse and constant bloomer, with long upright foot-stalks; and is considered by competent judges the best flower of its colour yet offered to the public; it was pronounced a first-class flower by the Floricultural Society of London, Aug. 16, 1842; obtained a prize at Salisbury Plain, Aug. 31; a prize at South Essex, Sept. 8; a prize at Kingston, Sept. 15; a prize at Salt Hill, Sept. 16; a prize at Victoria Gardens, Stepney, Sept. 19; a prize at the Floricultural Soc. of London, Sept. 20; a prize at Sunbury, Sept. 22; a prize at Hammersmith, Sept. 27.—See Editor's opinion, *Gardeners' Gazette*, Aug. 6, 1842. "So far as we have seen, during the present season, the growers appear to be aware of the properties required in a show Dahlia, and most of those exhibited on Tuesday possessed them in a considerable degree. Decidedly the best of these is Smith's Sir Robert Sale, a beautifully-formed dark flower, shown at both meetings, but not adjudicated on by the Floricultural Society, on account of no more than one bloom being shown."—See Editor's opinion, *Gardeners' Chronicle*, Sept. 3. "Your crimson purple Dahlia (Sir R. Sale) is a flower of first-rate properties, fine, general form, centre well up, with great depth of petals." 10s. 6d.

RIVAL YELLOW, Smith, deep golden yellow, fine cup petals, of great substance and depth, the centre well up, of excellent form, very constant and good habit. This Dahlia is warranted the best of its colour yet offered to the public. As the stock is very limited, early application is necessary to secure plants, many orders having already been received; no allowance on this variety. 10s.

RAINBOW, Smith, yellow, beautifully edged with rosy purple, of good form, very constant, free bloomer, and excellent habit; the flowers have long straight footstalks; quite a new and distinct variety from any other in cultivation. The form of this flower improves as the season advances, sufficient to constitute it a show flower. 10s. 6d.

ORION, Smith, light yellow, cupped petals, of good form, very constant, and profuse bloomer; 3 ft. 7s. 6d.

FANNY WAUGH, Forster, deep lilac, of fine form; it has obtained a first-class prize at Hexham, and was in the second stand of 18, and the second of 24 blooms at the same place; was placed first in its class at the Dahlia Show near Corbridge, and second at the Great North of England Open Show at Jesmond, near Newcastle. This variety is very constant, of medium size, great depth of petals, the centre well up, and of good general habit; 4 ft. 10s. 6d.

EARL OF LEITRIM, Ogilvy, deep purple, cup petals, large, and of good form; has obtained several prizes; 5 ft. 10s. 6d.

SULTANA, Appleby, dark maroon, occasionally striped with light purple, fine form. 10s. 6d.

ORYNTHIA, bluish edged, and tipped with rosy purple; good form; 4 ft. 10s. 6d.

GREAT WESTERN, Bragg, shaded purple, very large, good shape; 7s. 6d.

PERPETUAL GRAND, Brown, maroon, fine form, 10s. 6d.

BELSIZE RIVAL, Pipe, rosy bluish, cup petals, fine form, good habit, and very constant; 4 ft. 10s. 6d.

SURPRISE, Oakley, crimson, tipped with white; 4 ft. 10s. 6d.

EMPRESS OF WHITES, G. Smith, creamy white, good form, very dwarf grower; 2 ft. 10s. 6d.

CONFIDENCE, Cook, shaded orange, good form, very constant, fine habit; 4 ft. 7s. 6d.

VIRGIL, Mountjoy, maroon, good shape, very constant; 4 ft. 10s. 6d.

WINDMILL-HILL HERO, Miller, rich deep crimson, cup petal, round shape, good form; 4 ft. 10s. 6d.

VAN AMBURGH, Miller, rosy lilac, good shape, and constant show flower, 3 ft. 10s. 6d.

PET RIVAL, Bushel, red crimson, cup petals, and very constant; 3 ft. 10s. 6d.

NORTH MIDLAND, Evans, deep crimson, cup petals, and fine form; has taken several prizes; 3 ft. 7s. 6d.

ESSEX TRIUMPH, Turville, fine dark, fine form; 4 ft. 10s. 6d.

BEAUTY OF SUSSEX, Mitchell, white, deeply edged with carmine; 4 ft. 10s. 6d.

MRS. JAMES RICHARDSON, Edwards, bluish white, occasionally tipped, good form, has taken several prizes, 4 ft. 10s. 6d.

LADY SALE, Todd, ruby carmine, good form, 4 ft. 10s. 6d.

MIRANDA, Brown, bluish white, shaded with rose. 7s. 6d.

QUEEN OF SUMMER, creamy white, with crimson purple tip and dark centre, good form. 10s. 6d.

RETRIEVER, Dewar, ruby crimson, fine form, 4 ft. 10s. 6d.

IMOGENE, Dewar, lilac, first-rate, 2 ft. 10s. 6d.

CLAUDINE, Forster, white, tipped with rosy pink, fine form, 3 ft. 10s. 6d.

GREAT MOGUL, Atwell, deep maroon, 4 ft. 10s. 6d.

F. and A. S. and Co. take this opportunity of informing those of their friends who may not be aware of it, that their Dahlias being grown in the immediate vicinity of London, they cannot produce their blooms in such perfection as those who have every advantage of a country situation; added to this, their Plants were from August to the end of September so infested with the thrip, that they could not produce even a tolerable specimen of Bianca, to compete at any of the three shows for Mr. Wildman's prize; as a proof of this, at the first show there was no competition, they could not produce a bloom; at the Salt-hill (the second), and the Floricultural (the third), the Plants were not sufficiently recovered to compete with effect; as the season advanced, the Plants produced fine blooms in profusion, so as to enable them to exhibit twenty-four fine blooms at the Evening Meeting of the Floricultural Society, when it was pronounced a first-class flower. In conclusion, they recommend Bianca as a first-class flower, and second to none.

The same observations as regard the thrip may be applied to Rival Yellow; and having but three plants, they had not an opportunity to compete for prizes.

VERBENA SPECIOSA, Kyle, colour bright vermilion, with bluish or rosy eye, large trusses, and very free bloom of strong upright growth; it obtained a certificate of merit at the Exhibition of the Horticultural Society of London, July 9, 1842. The Verbena is handsome and very brilliant; it is no doubt a good variety. See p. 425, *Gardeners' Chronicle*, Editor's opinion. Plants in May, 6s.

PAULOVNIA IMPERIALIS; strong plants, in 60-sized pots, in May, 7s. 6d.

A large Collection of Pelargoniums, comprising most of the new varieties; also Fuchsias, Ericas, Calceolarias, Canellias, Greenhouse and Stove Plants.

Orders for Exportation promptly executed. A satisfactory reference required from unknown correspondents.

PELARGONIUMS, AURICULAS, CARNATIONS, PICOTEES, and SELECT PLANTS.

H. GROOM, Clapham-Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Public, that his Catalogue of new and fine PELARGONIUMS, &c., is ready, and may be had on application.

FUCHSIA EPPSII.

WM. PAWLEY, of the White Hart Hotel, Bromley, Kent, having purchased the entire Stock of this magnificent FUCHSIA, which is pronounced by the most competent Judges, to be the best Grower, the largest Flowerer, and for fineness of Habit and richness of Colour not to be surpassed by any Fuchsia yet in cultivation. A Specimen of it may be seen in Bloom at the above Hotel, by the end of this month, when Plants may be had at 10s. 6d. each, and sent free to any part, upon the receipt of a Post-office order. The usual discount where half-a-dozen Plants are taken. The Stock is limited.

FUCHSIA TODDIANA.

THOS. CRIPPS, Florist, &c., Tonbridge Wells, Kent, respectfully informs his friends that he has purchased of Mr. Todd, (late Gardener to Capt. Monypenny, and raiser of the Fuchsia "Monypennii"), the above extraordinarily beautiful and distinct Variety of this now justly-esteemed and popular class of Flowers, specimens of which were submitted to the inspection of the Editor of the *Gardeners' Chronicle*, in August last, under the initials "A. B." the opinion of which was as follows:—

"A. B.—Your Fuchsia is one of considerable beauty, and differs in the great length of the division of the calyx from any which we have yet seen. Its colour is also bright, and not dimmed with that dirty tinge which usually prevails amongst this class of flowers."—*Gardeners' Chronicle*.

After the opinion of so distinguished an authority, it would be useless to attempt further to extol the merits of this charming flower than to state its size and colour; the latter of which is—calyx, a very bright red, with corolla of a pale puce; and the former excels that of any other Fuchsia extant, being nearly four inches in length, and of proportionate magnitude, the plant itself being of a most vigorous growth, and foliage beautiful.

Coloured engravings of it may be seen at Mr. CHARLWOOD'S, Seedsman, Covent-garden; Mr. LOWE'S, Clapton Nursery; and Mr. PAWLEY'S White Hart Inn, Bromley, Kent; at which places, and of Mr. HARRISON, Downham, Norfolk, orders will be received for plants, to be sent out at the end of April, at 10s. 6d. each, with the usual discount to the Trade if six or more are taken at once. As small plants can be safely transmitted through the Post, by forwarding a Post-office order for 10s. 6d. persons will have them sent free of postage. All the new Fuchsias can be had at the same time. Strong plants of *Manettia bicolor*, the new Greenhouse Climber, from 7s. 6d. to 10s. 6d. each, are now ready.

A Catalogue of T. C.'s extensive Collection of Roses can be had on application, inclosing two Postage-stamps.

SPLENDID NEW CACTUS.

CONWAY'S GIANT.—Extract from Dr. LINDLEY'S opinion on this unequalled production, vide *Gardeners' Chronicle* of the 4th of June, 1842: "New Cactus.—A new Seedling, of most extraordinary beauty, has just been sent us by Mr. CONWAY, Nurseryman, Old Brompton. It is a cross between *speciosissimus* and *Ackermanii*, having the large size of the former, and the rich scarlet colour of the latter, with only a tinge of violet inside. Although the plant has only now flowered for the first time, and is quite small, the blossoms measured 8 in. in diameter. The petals have a fine broad oblong outline, and the stigma is a bright violet. It is much the handsomest sort yet raised. It is to be called 'Conway's Giant,' and its name is no exaggeration." Good strong Plants of the above, with 3 shoots to each, will be sent out next month, at 2 guineas each.

Also, CONWAY'S New Pelargonium "LANEII." This handsome Seedling forces equally as well as *Alba multiflora*, and cannot be too fully appreciated by those who are desirous of having a variety during the winter months; its flowers are similar to that of *Alicia*, but the spot on the upper petal is much larger and darker. It is of an excellent stiff habit, a strong grower, and perpetual bloomer. Specimens may be seen here and at Mrs. JOHNSON'S, Florist, Covent Garden. Strong Plants at 7s. 6d. An allowance to the trade where two or more plants are taken.

SCARLET PELARGONIUM.—The following varieties are also ready to be sent out, viz.—*Shrubland*, good bushy plants, from 6 in. to 4 ft. in height; *Compactum*, *Frogmore*, *Ingram's Dwarf*, *Pink Nosegay*, *King*, &c. &c. Seeds of *Hollyhock* in 20 varieties; *Primula sinensis*, good mixed *Petunia*, *Scarlet Pelargonium*; *Prize Cockcomb*, *Balsam*, and all the best Annuals.—Old Brompton Road, March 10th, 1843.

NEW AND SUPERB FUCHSIAS.

VOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Catalogue and Prices of the above elegant tribe, inserted on the advertising page of last week's Paper. Also to the description of their "FUCHSIA ST. CLARE," which is already ordered for Her Majesty's Gardens at Claremont.—Great Yarmouth Nursery, Norfolk, Mar. 9, 1843.

TO DAHLIA-GROWERS.

RÉNE LANGELEIR, NURSERYMAN AND FLORIST, Clarendon Nursery, St. Helier, Jersey, has the honour to inform Amateurs and Growers that he intends sending out early in May the four following Seedlings, which have been acknowledged to be the best that will be sent out this season, and for which three medals were awarded at the Jersey open Show, and were generally admired as being the best Show Dahlias in the Exhibition. R. L. can with confidence recommend them as First-rate Show Flowers.

WHITE CONQUERER—a splendid white, well cupped, rising well in the centre; a superior show flower; obtained the large silver medal at the Jersey open show. This splendid Dahlia will be the first in cultivation for a first-rate show flower. Plants in May, 10s. 6d.—No discount on this noble flower.

UNRIVAL—yellow; positively the best yellow in cultivation; well cupped, and rising well in the centre; fit for any stand; was also awarded a silver medal, as the best yellow. Plants in May, 10s. 6d.—No discount on this superb Dahlia.

ELIZABETH SICH—superb dark purple; well cupped, and a superior show flower, 10s. 6d.

HONEYMOON—also a superb purple, well cupped, rising well in the centre; a superb show flower. Plants in May, 10s. 6d.

A List of the above Seedlings will be sent on application, post paid.

CARNATIONS AND PICOTEE.

MESSRS. BENJAMIN ELY & SONS, FLORISTS AND SEEDSMEN, Rothwell Haigh, near Leeds, Yorkshire, beg to offer to the Nobility, Florists, and the public in general the following new Carnations and Picotees with which they have won Prizes at most of the principal Exhibitions in Yorkshire, in 1841 and 1842.

Ely's Hugo Meynell, Ingram, Pink Bizarre	per pair—s. d.
" Wm. Beckett, Scarlet Flake, figured in the "Florist's Guide" for Feb.	10 0
" Princes of Wales, Scarlet Flake, very fine	10 0
" Leviathan, Purple Flake, large and fine	10 0
" George Lane, Fox, Scarlet Picotee, light edge	7 6
" Mrs. Bosville, do. do.	5 0
" Mrs. Meynell, Ingram, Scarlet Picotee, fine	7 6
" Emperor, Scarlet Picotee, heavy edged	5 0
" Great Western, Purple Picotee, large & good	10 0
" Field Marshal, Purple Picotee, extra fine	10 0
" Empress, Purple Picotee, light edge	5 0
" Marchioness of Waterford, Rose Picotee, fine	5 0
" Ada, Rose Picotee	5 0
" Mrs. Bland, Rose Picotee	5 0

N.B.—In addition to the above, Messrs. BENJAMIN ELY and SONS, have a fine collection of most of the principal winning flowers, Catalogues of which may be had by Post, on application. * * A remittance or reference will be required from unknown correspondents.

FINE HEARTSEASE.

W. EARL, Virginia Place, Bristol Road, Birmingham, has a few plants of his beautiful Seedling HEARTSEASE, William Tell, Mountain Maid, and Werner, at 5s. each to dispose of; also very superior Heartsease-seed, in packets, at 1s. 6d., 2s. 6d., and 5s. each, gathered from the finest varieties.

MAGNIFICENT NEW VERBENA, "PRINCE OF WALES."

WILLIAM WOOD and SON, having obtained the entire Stock of the above very splendid VERBENA, beg leave to offer it to the Public, feeling assured that they can with the greatest confidence recommend it as worthy of especial notice. This desirable variety is a beautiful Flesh colour; the flowers measuring $3\frac{1}{2}$ inches in diameter, and exceedingly fragrant.

Plants of the above will be ready for delivery in May, at 3s. 6d. each; the usual discount to the Trade when 6 plants or more are ordered.

W. W. & S. would also solicit attention to their superb Collection of all the New Verbenas, Fuchsias, &c., and other spring Plants adapted for Bedding, Catalogues of which will be sent free on application.

Verbenas, consisting of the best varieties, and left to their own selection, in tin cases, per post, at 3s. per doz., or in pots at 4s. per doz. Fuchsias, per post, at 4s. per doz.

Please address—Woodlands Nursery, Maresfield, near Uckfield, Sussex.

EXHIBITION of CAMELLIA JAPONICA, or **JAPAN ROSE**.—A Collection of these beautiful Exotics is now in bloom at CHANDLER and SONS' Nursery, Vauxhall. Admittance gratis.

WOOD'S SUPERB SCARLET PHLOX DRUMMONDII.

The colour of this most beautiful of annuals is a dazzling scarlet; the flowers are perfectly round, without any space between the petals, forming, unexceptionably, the most brilliant and striking object that can possibly be imagined. J. Wood having grown no other sort, it is impossible that it can be deteriorated by impregnation. It was awarded an extra prize at the Summer Show of the Huntingdon Horticultural Society. Packets, containing 12 seeds, 2s. 6d. each, postage included, either in cash or postage stamps.

The following gentlemen of the neighbourhood will vouch for the truth of the above description:—**JOHN PRICE**, Esq., Godmanchester, Hon. Secretary to the Huntingdon Horticultural Society; **E. MAULE**, Esq., Huntingdon; **MR. HESTER**, Gardener to the Right Hon. Earl of Sandwich, Hinchinbrook, near Huntingdon; **MR. LAIRD**, Gardener to Lady Sparrow, Brompton Park, Huntingdon; **MR. BETTS**, Gardener to G. Thornhill, Esq., M.P., Diddington, Huntingdon; **MR. GIDDINGS**, Florist, Hemingford, Huntingdon.

N.B. March is the best month for sowing, and the seed should be vegetated in a gentle heat. None are genuine but those sold by J. W. and his sole Agents, Messrs. HURST and M'MULLEN, Nos. 6 and 7, Leadenhall-street.

Nursery, Huntingdon, March 2, 1843.

NORLAND NURSERY, NOTTING HILL, NEAR LONDON.

BLACK and GOWEN beg leave most respectfully to inform the Nobility, Gentry, and the Public generally, that they have taken the above establishment, situate on the Bayswater and Uxbridge road; where they intend carrying on every department of the Horticultural, Nursery and Seed trade; and they earnestly trust, through strict attention in supplying a genuine article at moderate charges, to gain a share of public patronage. The under-named they can confidently recommend as being of undoubted quality.

Buck's true Intermediate Stock, 6d. to 1s. per packet, or 5s. per oz.	Minulus moschatus, 1s. per packet.
German Stocks, 6d. per packet, or 1s. per oz.	Nemophila aurita, 6d. per packet, or 1s. 6d. per oz.
Aster, German, fine, 6d. per packet, or 1s. 6d. per oz.	Papaver Marshallii, 6d. per packet, or 2s. per oz.
Calandrinia discolor, 6d. per packet, or 2s. 6d. per oz.	Petunia phoenicea, 6d. per packet, or 3s. 6d. per oz.
Calichroa platyglossa, 6d. per packet, or 1s. 6d. per oz.	Do. nyctaginiflora, 6d. per packet, or 1s. 6d. per oz.
Hollyhocks, German, mixed, 3d. per packet, or 9d. per oz.	Phlox Drummondii, 1s. 6d. to 2s. 6d. per packet.
Do. do., named sorts, 6d. per packet, or 1s. per oz.	Schizopetalon Walkerii, 1s. 6d. to 2s. 6d. per packet.
Iberis coronata (splendid), 3d. per packet, or 1s. per oz.	Schizanthus Hookerii, 1s. 6d. to 2s. 6d. per packet.
Lupinus Hartwegii, 6d. per packet, or 2s. 6d. per oz.	Salpiglossis, mixed, 6d. to 1s. per packet.
Do. nanus, 3d. per packet, or 1s. 6d. per oz.	Thunbergia, of sorts, 1s. 6d. to 2s. 6d. per packet.
Loasa aurantiaca, 6d. per packet, or 3s. 6d. per oz.	True Early Snowball Turnip.
	Laing's new Swedish Turnip, genuine.

Together with a general Assortment of Horticultural, Agricultural, and Floricultural Seeds, too numerous to quote, but of which a Descriptive Catalogue can be had, upon application.

B. & G. will be glad of a List of Prices from Nurserymen who may abound in Hardy Evergreens.

CHOICE PANSIES.

J. HENCHMAN begs to state that he has a few good healthy PANSIES to offer at the following moderate prices. In consequence of the late unfavourable season, the stock this year is very limited. Six good Seedling varieties, including Success, one of the best dark flowers out, 21s.; Good Show varieties, named, from 9s. to 18s. per dozen. Orders accompanied by a Post-office order will receive immediate attention. Edmonton, near London, Feb. 25.

DILLISTONE'S APPLE, the STURMER PIPPIN.

S. and J. D. are again induced to offer this as the very best late Apple known, for Kitchen and Dessert, as it keeps firm and fine-flavoured till the latter end of June. It is a great bearer; as a proof of this, they gathered this last autumn, from young dwarf standard trees, upwards of 90 bushels. Although this Apple has been raised some years, its true merits have not been fully known till within the last four or five years; it only requires to be known to be extensively cultivated. To the Cotager it is invaluable, as it is a constant bearer.—Scions from the original tree may be sent by post, on the receipt of Post-office order for 3s. 6d.—Nurseries, Sturmer, near Halstead, Essex, 7th March, 1843.

HARDIE'S EARLY CANTALOUPE MELON.

W. M. HARDIE begs to inform Melon-growers that he has still a quantity of his very superior EARLY MELON SEED to dispose of, and that if sown now he will warrant that with proper treatment its fruit will be ripe the first week in May. He will also warrant it to set its fruit under the most adverse circumstances in which a Melon plant can be placed. He has shown it these last two seasons at Chiswick, in May, and had a Banksian Medal awarded to it each time.

From these plants and two crops, he cut 60lbs. weight of fruit last year, and with attention there may be three crops taken from the same plants. He grows it on a common dung hot-bed. The flavour is excellent, and size from 3 to 6 lbs., according to the number of fruit on each plant. To be had of W. H., at J. JARRETT'S, Esq., Carneston Court, near Bath, at 2s. 6d. per packet; will be forwarded directly, on receipt of an order for the money. Carneston Court, Feb. 6, 1843.

THE NEW WEEPING WILLOW (*Salix Americana pendula*).

T. RIVERS, JUN., has a few very fine Plants of this beautiful WILLOW grafted on straight stems, seven to nine feet in height, 7s. 6d. each, carriage paid to London. Sawbridgeworth, Herts, March 2, 1843.

ORANGE AND LEMON TREES, JASMINE

PLANTS, &c., &c.—Noblemen and Gentlemen seeking an opportunity of replenishing their Stock, or commencing an Orangery, may have an opportunity of so doing, by inspecting the Stock of A. COBBETT, at his Italian Warehouse, 18, Pall Mall, who has just received his annual Importation from Italy, in a good and healthy condition. The trees are from 3 to 6 feet high in the stem, and from 10s. to 30s. each, and will be packed and sent safely to any part of the Kingdom.

DOUBLE ITALIAN TUBEROSE ROOTS.—The annual Importation of these truly fragrant and delightful Bulbs has just been received in a good and healthy condition, and may be obtained at the above address. Price 4s. per dozen.

N.B.—Importer of choice Lucca Oils, Honeycomb, Parmesan and Gruyere Cheese, Anchovies, &c., &c. Lists with Prices may be had, per post, &c.

NEW HORTICULTURAL & AGRICULTURAL SEED ESTABLISHMENT, 6, LEADENHALL STREET, (SIX DOORS FROM CORNHILL.)

WILLIAM HURST and WILLIAM GEORGE

M'MULLEN, (for many years past engaged in the House of Messrs. WARNER and WARNER, 28, Cornhill,) beg respectfully to acquaint their friends in the Seed trade, and the Public generally, that they will commence Business as Wholesale and Retail SEEDSMEN and FLORISTS at the above-named premises on Monday the 13th inst., and they can confidently assure ALL who may kindly favour them with orders, that from the numerous resources they possess, through an extensive connexion with the best Seed-Growers, both in this country and on the Continent, and from many years practical experience in the various branches of the Business, they will be enabled to offer every article of first-rate, genuine quality, and no exertion will be spared in giving prompt attention to every order, and endeavouring to merit a continuance of their support.

HURST and M'MULLEN, Seedsmen and Florists, 6, Leadenhall-street, City, beg to offer to the Nobility, Gentry, and Public generally, a choice and carefully-selected assortment of the most approved Kitchen, Garden, Agricultural, and Flower Seeds; of which general Catalogues may be had on application. Among the novelties of the season will be found the following:—

FLOWER SEEDS.	
per packet—s. d.	per packet—s. d.
Alonsoa grandiflora . . . 1 0	Mesembryanthemum tri-color . . . 1 0
Alstroemeria, choice var. . . 1 0	Mimulus, from fine varieties . . . 0 6
Anagallis Philippii . . . 1 0	Nemophila cramboides . . . 0 6
" monelli major . . . 1 0	Oenothera macrocarpa . . . 0 6
Anemone, New Hybrid Russian . . . 1 0	Pelargonium, from best sorts . . . 1 0
Argemone grandiflora . . . 0 6	Pentstemon, from choice varieties . . . 0 6
Aster, fine imported, mixed . . . 0 6	Petunia, from impregnated seed . . . 1 0
Auricula, — from stage-flowers . . . 1 0	Phlox Drummondii, new . . . 0 6
Balsam, Camellia-flowered . . . 0 6	" Wood's new scarlet . . . 2 6
" 12 var., mixed . . . 0 6	Picotee, finest imported, yellow . . . 2 6
Brachycome iberidifolia . . . 1 0	Polyanthus (Sheppard's), fine . . . 1 0
Calceolaria, fine vars. . . 1 0	" alba . . . 1 0
Campanula tracheloides . . . 0 6	Primula sinensis rosea . . . 0 6
Carnation, — from stage-flowers . . . 1 0	" alba . . . 1 0

Lisianthus Russelii . . . 1 0	" aurantiaca . . . 1 0
Lobelia ramosa, or heterophylla, — new and splendid . . . 1 0	Tropæolum, in var. . . 1 0
Martynia fragrans . . . 1 0	Verbena, fine, mixed . . . 1 0
Malva maritima, new . . . 0 6	Violet, Russian . . . 0 6
Marygold, new superb French . . . 0 6	Wallflower, New Blue . . . 0 6
" African, extra fine . . . 0 6	Xeranthemum robustum, white and yellow . . . 0 6
	Zinnia elegans, fine var., mixed . . . 1 0

Collection of Imported German Asters, 20 varieties . . .	6 0
" Stocks . . .	7 0
" (Tinnias) 8 varieties . . .	3 6
" Balsams, 12 . . .	5 0
" Hollyhocks, 24 . . .	5 0
" Larkspurs, 12 . . .	3 0

[The above are from the first German growers known.]

Broccoli.—Walcheren (true). [This fine variety, if sown in April, June, and August, will produce a succession for the table throughout the year]	2 6
" Chappell's Cream and Early White . . .	1 0
" New Late Hardy Pink Cape (fine) . . .	1 0
Beet.—Blood-red, improved variety . . .	0 6
Brussels Sprouts.—Fine imported . . .	1 0
" Couve Tronchuda (delicious winter vegetable) . . .	0 6
Cauliflower.—Large Asiatic . . .	1 0
Cabbage.—New Victoria (early) . . .	0 6
" Lee's Nonsuch . . .	1 0
Carrot.—Superb Scarlet Studley . . .	0 6
Celery.—Seymour's Superb White . . .	1 0
" Laws' Giant White . . .	0 6
" Perkins' Giant Red . . .	0 6

Cucumber, Frame.—Warwickshire Hero (new superior), Allen's Victory, Improved Manchester, Weedon's Frame, Prizefighter, each kind . . . 1 0

Lettuces.—Fine Impo. Red Paris Green Cos . . .	1 0
" New Hardy Bath Cos (requires no tying) . . .	1 0
" Victoria Cabbage . . .	1 0
Melons in many choice varieties . . .	1 0
Onion.—New White Globe . . .	0 6
Turnip.—Howard's Nonsuch . . .	0 6
Potatoes.—Loden's Oxford, earliest known, per peck . . .	3 6
Asparagus.—Grayson's Giant (strong 2 years' old) per 100 3 0	

[Printed directions for planting.]

Rhubarb.—Myatt's Victoria . . .	each 1 46
Strawberries.—Myatt's British Queen . . .	per 100 21 0
" Currants.—New Dutch, Red Grape . . .	per doz. 6 0

A constant supply of Greenhouse and choice Herbaceous plants during the present season. Fine Carnations and Picotees (in named varieties) 1s. 6d. per pair.

Seeds and Plants carefully packed for all climates. Choice specimens in bloom of the following can be seen through the season, viz.: Roses, Dahlias, Pansies, Carnations, Pinks, Picotees, Pelargoniums, Auriculas, Polyanthus, &c. &c.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLE-WORTH, upon application to the Gardener—Sundays excepted.

The Gardeners' Chronicle.

SATURDAY, MARCH 11, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
Tuesday, Mar. 14 . . . Zoological . . . 8 P.M.

Saturday, Mar. 25 . . . Royal Botanic . . . 3 P.M.

Among the errors not uncommonly committed by gardeners is one which we suspect has been productive of as much mischief to greenhouse and hothouse plants as high night temperature to Vines.

In former days gardeners were unacquainted with the importance of maintaining a moist atmosphere, when they cultivated plants naturally found in the hot and damp parts of the world. Water-plants, indeed, they put into water, and they had what were called damp-stoves, as distinguished from dry-stoves. But the first differed from the last in having a tan-bed in the middle, and in the moisture derived from it, more than in any other respect. At the present day, however, he must be a very ignorant gardener indeed who does not avail himself of syringes, and evaporating-pans, and sphagnum, wherever stove-plants are to be managed. It is only, therefore, here and there that vegetation suffers from undue dryness.

We are, however, obliged to add, that people are to be found who now run to the opposite extreme, and who, because they find tropical plants bettered by a certain amount of water, under certain circumstances, fancy they cannot have too much of it. This is the case with our correspondent "Planta-Genista," who has a gardener, a Londoner, from a great establishment, who, in the dark weather of winter, deluges the stoves with water, and suffocates the plants with heat. This is "keeping up the steam" with a vengeance. It is of no use for his master to show him that the plants are poor, spindled, drawn-up things, or to point to their dying extremities; the gardener is too great a man to regard such trifles; he has lived with My Lord this, and My Lady that, and, above all things, he comes out of the great London establishment, and it was always done so there, and therefore must be right. As for the plants dying, they are treated according to rule, and if they will die under these circumstances, who is to help it? It is impossible for a plain country gentleman to resist such an appeal to the experience of those who kill *secundum artem*. Let us try whether we can resist it.

Tropical plants require a moist atmosphere, that is certain. So is it certain that a man requires exercise; but if he is kept incessantly walking all day and all night, what will become of him? A man requires to be awake sometimes; but if you never let him close his eyes, what will become of him in that case? A gardener must have the means of allaying his thirst; but if you attach a forcing-pump to his mouth, and keep it always in action, all day and all night, he will find the supply rather too abundant, even though the pump discharged good ale. We see, then, that a man may have too much of a good thing; and why not a plant?

Again, as to heat; tropical plants demand a high temperature; certainly: so do we require warm clothing. But a heavy blanket coat, which suits the depth of winter, would be a somewhat inconvenient article of dress for a gardener in the dog-days. He would soon feel its effects, we apprehend, and become thin and spindled, like Planta-Genista's unlucky shrubs.

It should never be forgotten, that what is fit or unfit for a gardener to do is altogether dependent upon circumstances. That which may be indispensable in March may be most improper in July. With regard to the matter now before us the fact is this. Although tropical plants require a high temperature and a moist atmosphere, it is only when there is an abundance of light in addition. The effect of heat and moisture is to cause rapid growth, and, as a necessary consequence, to compel plants to feed abundantly; but the food which they take in can only be digested under the influence of light; the more light the quicker the digestion, the less light the slower the digestion; and consequently the brighter and longer the days, the greater the quantity of heat and moisture they will bear: the darker and shorter the days, the less of these agents can be applied to them.

Let us illustrate this by an extreme case. Take a root of Sea-kale; grow it just below the glass of a forcing-house in March, freely exposed to light; it will be short-jointed, broad-leaved, green, and firm. In mid-winter take such another plant; place it in the forcing-house at a distance from the glass, where light

reaches it but feebly; it will be long-jointed, almost leafless, pallid, and watery: continue to grow it there; it will lose the ends of its leaves, and in course of time will die. Now this is only a strong illustration of the inevitable consequence of forcing plants into rapid growth in the absence of bright light; and perfectly explains to those who can understand, the reason why the operations of the great gardener "from the great London establishment, who had lived with My Lord this and My Lady that," are so bad. If his hothouse-plants were intended to be eaten, his practice might be good, but as they are intended by his master for a somewhat different purpose, no mismanagement can be greater.

All good growers of stove plants will diminish the temperature and moisture as light declines, and increase them again as it becomes stronger. In the winter they will only give them just so much as is required to preserve them in a state of healthy rest.

ONE of the fundamental principles of this Paper is its avoidance of politics; and we think it must be conceded that we act upon that principle with perfect fairness. We therefore trust that what we are now about to say, if it should seem to savour of Anti-Corn-Law views, will be understood as having no political bearing whatsoever. We say nothing about the Corn-Laws: we advocate neither Sir Robert Peel nor Mr. Cobden; we merely express an opinion, in which we think all reasonable persons must concur, when it is plainly set before them.

Whether protecting duties are necessary to the farmer or not—this, we submit, is undeniable, that he can best claim them after he has pushed the resources of Agriculture, and all possible skill, to their utmost limits. Having done this, and being still unable to compete with the foreign markets, notwithstanding all his efforts, in consequence of the peculiar fiscal condition of his country, he would appear to make out a strong case for protection. But, on the other hand, if he does none of these things—if he passes his life in apathy, neither exercising his own talents, nor availing himself of his neighbours'; if he perseveres in standing stock-still while all the world around him is moving onwards, it is evident that to protect him under such circumstances is to offer him a bounty for indolence or perverseness; and, we may add, that no protection can save him in the long-run.

It is impossible for the warmest friends of protecting duties to advocate them on behalf of men who will do nothing for themselves. On the contrary, when they cry for help, they must be answered as Hercules replied to the countryman in the fable.

Now we do not say that all farmers are of this description; we are far from insinuating that they all stand supinely still, refusing either to learn or to improve. On the contrary, we recognise a very considerable and important move in advance. But we do say, and with much regret, that this move does not appear to be what it surely might be. There is not that universal stir among the agriculturists which their political position and the imminency of their danger loudly call for; and for hundreds who are helping themselves, there are thousands that trust to others for assistance. We are not, however, among those who blame them; on the contrary, their bad education disarms the critic, and we are convinced that if they do not move, it is rather because they do not know how, than because they are unwilling.

We would therefore represent to country gentlemen, to the rural clergy, to the people of good education throughout the country, that they should all bestir themselves, each in his own circle, in order to induce the farmers to try whether they cannot better their condition by bettering their husbandry, rather than by waiting helplessly upon Parliament. We are convinced that if this were generally done an immense deal of good would result.

We shall probably be told that farmers are an impracticable race, and that it is hopeless to expect to influence them. We were assured, indeed, not a month since, when urging these arguments upon an excellent man, well acquainted with farmers, that it was useless to attempt to do anything with them; and when we suggested that they might be induced to try experiments, which cost nothing, with a view to improving their crops, he asserted that a man might talk till he was hoarse without making the smallest impression upon them. Upon pointing to an appeal to the farmers of Suffolk, by Professor Henslow, calling on fifty of them to combine for the purpose of testing the value of gypsum as an agent for fixing ammonia in manure, he replied, "Ah! it is very well; but he will never get a dozen of them to join in his plan, even if he give them the gypsum and the manure to boot." But what turns out to be the fact? why the fifty men have been found, ready to try the experiment fairly, at their own cost; and thus we see that when sensible and zealous persons will set in good earnest about pushing on the occupiers of land, it is not so impossible to rouse them as some

imagine. Let every county furnish but one Henslow, and the science of Agriculture will move more in one year than it would in half a century without such an impulse. We would only refer our readers to a communication from him in our last, in order to shew how this can be set about.

People take fright at the very name of experimenting; and yet, that there is nothing so very awful in the word, may be gathered from the following extract from one of the very useful letters, published by the gentleman whose name we have been compelled to take the liberty of introducing into these remarks:—"In those preliminary experiments," says Professor Henslow, "which Chemists or Botanists may attempt for the purpose of interrogating nature, there cannot be too minute or laborious attention paid to all the details; but when the results of such experiments appear to have ascertained some natural law of vegetation, which may be considered as bearing directly on the pursuits of Agriculture, then the further experiments which the Agriculturist himself is called upon to make are of a much coarser and less elaborate character, and none of them need be made a tax upon his time, patience, or pocket, to any very formidable extent. An ordinary degree of attention to weights and measures is generally all that will be called for—little more, in fact, than the practice of the market itself requires. But success is mainly to be looked for in the multitude of co-operators accumulating a sufficient number of positive facts. All England might be converted into one great experimental farm, if our different Agricultural Societies would prepare accounts of the exact mode in which some hundred farmers might perform a set of easy comparative experiments at the same time, and send in the results of them. This is what is most needed for accelerating the present jog-trot progress of Agriculture into something like a railroad pace of advancing."

In the latter part of this paragraph, as well as the first, we entirely concur, and we would most strongly urge upon the many Agricultural Societies now forming in this country, the propriety of directing their resources to so great a purpose. We entertain no doubt that if they would but call into their councils judicious men, who do not ask for too much at a time, and who are capable of distinguishing theoretical facts having a direct bearing upon possible practice, from speculations of a less valuable description, and if they would plainly set the same experiment, in exactly the same form, before a large number of farmers, the very first year of such an operation would give birth to results of the most valuable description. All men of science would readily assist them, even those whose time seems already so over-occupied as to be hardly susceptible of any further application, as will appear from a liberal offer to the Suffolk farmers made by Mr. Potter in another column. But we have much more to say on this subject next week.

A DESCRIPTIVE LIST OF CARNATIONS AND PICOTEES.

(Continued from page 135.)

SCARLET FLAKES.

- Beauty of Cradley* (Wallis's).—Fine pod, rather thin; petals finely shaped, ribboned with intense scarlet; white not very pure.
- Ringleader* (Toone's).—A vigorous and strong grower; flowers large, colours bright, and petal good. This variety is excellent as the male parent in cross-breeding, the anthers affording abundance of farina for fertilization.
- Bright Venus* (Ely's).—Anything but bright.
- Premier* (Creswell's).—The white sometimes flushed, but occasionally a first-rate flower.
- Lord Morpeth* (Ely's).—This variety, I am sorry to say, is nearly lost. I believe it is one of the Messrs. Ely's early seedlings; it is a first-rate flower, sufficiently full of petals, without being crowded; form excellent, and colour well distributed; a weak grower.
- Captain Ross* (Ely's).—This flower has a bad pod, otherwise it is beautifully marked, with a good petal.
- Mary Anne* (Greasley's).—Has a good pod, and is a most excellent flower; form fine and white pure; the scarlet being rich and well distributed.
- Ann Page* (Lovegrove's).—Large and coarse.
- Marquess of Granby* (Simpson's).—Scarlet very fine; petals good; rather thin; white often impure.
- Earl of Errol* (Wilmer's).—Rather loose; the white not very pure, but the scarlet fine and well laid on.
- Wellington* (Foster's).—A variety of strong habit; pod and colour good; the flower large and well formed; rather late.
- Earl of Leicester* (Wigg's).—A large and fine flower; scarlet rather dull; the white, however, is pure, and the colours are well balanced; the form also is good, but it is a rather late variety.
- Rob Roy* (Orson's).—A high-coloured and showy flower, winning often in this part of the country.
- Madame Mara* (Pearson's).—An old and universal favourite; beautifully ribboned, and the white pure; it has been the leading sort at most exhibitions in this part of the country for many years, but is headed this season by
- William the IVth* (Wilson's), which is as well marked as

the preceding, being likewise a fuller flower, and of excellent shape.

Lady Hill (Pugh's).—Large, with a fine petal and good form, sometimes coarse, and the scarlet not so bright as in many other varieties.

Fox-hunter (Hufton's), sometimes, I believe, called *Hogg's*.—It is of fine form, large, and with good colours; it is scarce, although raised in this neighbourhood, and from its style of blooming it promises to be in the first rank.

Donna Maria (Milwood's).—Small and impure; decidedly third rate.

Red Rover (Fletcher's).—Thin, and quite second rate.

Bishop of Gloucester (Brown's).—Flowers large, and, generally speaking, fine; it is distinct in character from most others, and may be depended on, the colour being good and well distributed.

ROSE-FLAKES.

Lovely Ann (Ely's).—A delicate and beautiful variety of excellent shape, and crowning well; first-rate, but by no means plentiful.

Rosea (Hufton's).—This is one of the late J. Hufton's best rose flakes; it is apt to make rather long, straggling layers, and blooms early. The flower is of the largest size, of very fine petal, and beautifully marked.

Queen Victoria (Hyron's).—Rather pale pink, white pure, size good; a delicate and distinct variety.

Lady Gardiner (Ely's).—This sort is indispensable to every collection, however small, as it combines, with a thick petal, all the good qualities of a first-rate flower.

Lady Ely (Ely's).—The foregoing description applies also to this excellent variety; it is hardly so strong in its habit as *Lady Gardiner*, but the ribbons are of a more intense pink.

Elizabeth (Easom's).—Is not quite so good as the foregoing; still it has an excellent rose-leaf, combined with fine form and vigorous growth.

Village Maid (Greasley's).—A most delicate and beautiful variety, not quite so large as the abovementioned sorts; white very pure and form compact; unfortunately it is exceedingly scarce.

Lady Flora (Hudson's).—Very highly coloured, form good, white pure, and well distributed.

Sarah (Hasting's).—One of the best-podded flowers I ever saw; petals large and finely formed; rather too thin for the "Nottingham Standard."

Beeswing (Hoyle's).—Large, of good form, and of course crowning well; the white is pure, and the markings are distinct and delicate.

Miss Walker (Ashworth's).—This is a decided acquisition, the pod being good, the markings distinct, and of a different shade to most others; the white too is pure, and though the flower is not large, and blooms early, still it is a very great favourite.

Mrs. Pickering (Pickering's).—A seedling, taking premier prize in the class at the Midland Counties Exhibition, Nottingham, in 1842; not yet let out, but decidedly first-rate; it is able to cope with any of the flowers previously described.

Lovely Nancy (Hoyle's).—A flower of great merit, and though only raised a few years since, ranking fifth in the Lancashire Show Book of last season.

Eliza (Parkinson's).—This is a variety of about four years standing, large, and of fine form; well marked with delicate Peach-bloom; the petals are, however, rather thin, and consequently will not bear much sun.

Emma (Lakin's).—A promising seedling, lately raised at Derby; it gained a first prize there last season, but with me, it is too thin of petals for the amended system of judging.

Miss Molly (Ely's).—Flower large, and full of petals, confused in the centre; inferior to many of this grower's sorts.

Queen of England (Fletcher's).—A superb variety, highly coloured, large, and of good shape. I grew it for the first time last season, and certainly it was equal to any which I had in my collection.

Luna (Brown's).—Petals rather narrow, otherwise a desirable flower, as the white is pure and the colour good.

Lady Egerton (Low's).—In size rather small; petals stiff and shape excellent; colours good and well distributed; the layers have a spindling habit.

Lady Grey (Malpa's).—A fine old flower; petals large and well formed; when in character, first-rate.—J. F. Wood, *The Coppice*, Nottingham.

(To be continued.)

AMATEUR'S GARDEN.—No. X.

WHAT can be done with the limited means of a two-light frame towards producing a supply of flowers for the drawing-room throughout the year? is a question frequently asked by correspondents, but difficult to answer; inasmuch as we often see green-houses, containing extensive collections of plants, almost destitute of flowers from October until the following April. However, if too much is not attempted,—for the amateur more frequently fails from attempting too much, than in being satisfied with a few easily cultivated but good plants—I am confident that it is possible to have a few flowering plants at all seasons, with the aid of a two-light frame, and other little inexpensive contrivances which I shall hereafter explain. Before proceeding to show with what plants this desideratum may be accomplished, I will first premise that there must be no huddling of them together, merely because they have a solitary flower or a few green leaves upon them; but the whole frame must be given to the plants enumerated, and after they have done flowering they must not be returned to the frame, but be either thrown away or preserved in a room or window until the following summer.

A two-light frame, of the usual dimensions, will cover

an area of 36 square feet, and, allowing on an average each plant to occupy half a square foot, will hold six dozen flowering plants; or, as they will not all be in flower at the same time, say nine dozen plants.

Supposing, then, the season, when there is the greatest difficulty in producing flowers, and when, in consequence, they are the greatest luxury, to commence in October and end in April, the following plants will be the most suitable:—From October until Christmas—Chrysanthemums, Pelargoniums, *Sálvias*, *Cinerárias*, *Primulas*, *Russian*, *Neapolitan* and tree *Violets*, with *Collinsias*, *Clinónias*, and *Mignonette*; from December until March—the above annuals, with *Violets*, *Primulas*, *Cinerárias*, and the following bulbs,—*Scillas*, *Crocuses*, *Snowdrops*, *Hya-cinths*, *Tulips*, *Narcissuses*, and *Jonquils*; from April until June—the whole of the above annuals, with *Schizanthuses* and ten-week *Stocks*, a variety of Chinese, Tea-scented, Bourbon, and other *Roses*, and a general assortment of *Pelargoniums*. In summer, plants in rooms are not so much cared for, and if they are, a list of the kinds suitable is not necessary, as there are few persons who are not acquainted with the plants most adapted for that season.

To give the treatment of all these plants would require considerable space, but as the time to commence their culture is at hand, the necessary information respecting them will be given shortly. In the meantime, persons intending to cultivate them cannot do wrong in purchasing good varieties of any of the above genera.

After frosty nights and sunny days the ground is in a good state for sowing seeds; but as there is little warmth in the earth, there will be no advantage in sowing annuals in the borders for a fortnight to come. A collection of German, Russian, and ten-week *Stocks*, may, however, be sown at the foot of a south wall, or in any other warm situation where they can be protected by night in severe weather.—W. P. Ayres.

TRELLIS FOR CLIMBERS.

ENTOMOLOGY.—No. XLI.

THE WHITE-SHOULDERED WOOLLEN-MOTH, *Tinea sarcitella* of Linnaeus.—People are well aware that their clothes, furniture, blankets, &c., are often moth-eaten, as it is incorrectly termed; but I find that one of these insects is likewise very destructive to the property of the agriculturist. I shall therefore make its economy the subject of the present communication. During the greater portion of the spring, summer, and autumn months, we often find in our houses, especially in the bedrooms, a Moth sitting upon the windows, and elsewhere, with its wings folded, and resting flat upon its back, as shown at fig. 4, but the male is smaller; it is of a dull-grey colour, shining like silk, and on touching it, the little slippery scales come off; the head and thorax are densely covered with white scales, and this alone will distinguish it from allied species; the antennæ are like short bristles, but ciliated in the male; and the palpi are slender, curved upward, and pointed; the upper wings are rather long and narrow, grey, mottled with brown, having a patch at the base, and another upon the pinnion edge; and there are four brown spots around the disc, more or less distinct; the apex is margined with white spots, and a beautiful long fringe; the underwings are silky grey, narrow, and lanceolate, the entire margin beautifully ciliated; the abdomen is ochreous white, the apex is pointed in the female, the legs are spotted with black, the hinder long, especially the tibiae, which are also very hairy (fig. 5, a female flying, a little larger than life).*

* See Curtis's Brit. Ent., pl. 735, for dissections, and his "Guide," Gen. 1009, *Anacampsis* and *Laverna*, Nos. 17 to 43.

These Moths likewise inhabit gardens, outhouses, granaries, stables, woollen and fur warehouses, &c., and I believe they are most abundant in July. The female lays her eggs upon clothes and woollen articles; and when the little maggots hatch they begin to feed upon them, eating off the surface, and forming cases of the particles to live in; and when they are full grown, they change within their cases, or in a cocoon, to a brown chrysalis (fig. 3), from which the Moths again issue at their appointed time. It is therefore evident that clothes cannot correctly be said to be moth-eaten, as it is the caterpillars which do the mischief, and this is sometimes to a serious amount; they are soft and whitish, a little inclining to yellow, sparingly clothed with long hairs; the head is chestnut-brown and horny, with little horns and jaws; the first thoracic segment is also horny, and similar in colour, but paler; they have six pectoral, eight abdominal, and two anal feet (fig. 1, magnified; 2, the natural length.)

If clothes be shut up in drawers or dark closets for any length of time, they are sure to suffer from the attacks of these and similar larvæ; and if the situation be damp, it is so much the more suited to their tastes. In this way also blankets, carpets, stuff and moreen curtains, sofas, muffs, feathers, and similar articles, become injured and destroyed, if neglected. It is not, however, the housekeeper alone who has to fear their ravages; for I learn from various Correspondents, that they commit most extensive depredations in barns, stables, and seed-stores. Last April, some Beans were transmitted to me from Essex, with portions of the sacks "which were so strongly cemented together by the larvæ, that some of them actually required the strength of two men to part them." In December I received others from some Beans which had been housed in a damp condition; and the larvæ, after the Beans had been cleared off, were found revelling amongst piles of Pea-sacks, having introduced themselves between the sacks, in sticky rings, to a considerable extent. Similar instances occurred in Surrey, at the end of September of the previous year; I have also been informed by two other parties, who sent me the corks with the caterpillars in them, that they were doing much mischief in their wine-cellars, by eating round the sides of the corks, close to the necks of the bottles. It is very remarkable, that these caterpillars should feed upon such very different substances; and, in addition to the foregoing, M. Duponchel says they live upon the *Boletus* of the Birch, and of other trees, as well as in rotten wood; and in Germany they have been detected generating amongst blotting-paper, in a paper-warehouse; and even the meal-tub is not secure from them; it is therefore evident that both animal and vegetable productions supply suitable food for these mischievous animals.

To keep free from these pests is exceedingly difficult; but it is evident that, as far as possible, we ought not to seclude from air and light any woollen apparel or furniture for any length of time; and gardeners, farmers, and seedmen should be most careful not to use old sacks that have been mended with worsted instead of hemp; much less any sacks in which woollen is spun in the thread, as I think I have seen in some of foreign manufacture; for I am pretty confident, if sacks were clean, sound, and only composed of vegetable thread, that they would never be attacked by such caterpillars; neither would coarse blotting-paper, were it not for the quantity of wool which it contains; and owing to the pitch and tar in the old ropes, of which our brown paper is manufactured, nothing, perhaps, is better adapted for protecting goods from the attacks of the insects which infest our habitations.

It seems singular that these insects should feed upon corks and rotten wood; but as they will live in *Boleti*, it is probable that some such productions, although minute, may be generated upon old, moist, or decaying corks; and we know that on rotten wood in cellars, such vegetables are far from uncommon. It is therefore very essential that such substances should not be left about, neither should any woollen articles; for an old piece of a coat, or flannel, lying by accident for any length of time in an outhouse, or in the garden, may breed thousands of these troublesome pests, which would fly in at the windows in the evening, and soon establish themselves in the house. As I shall shortly return to this subject, I will leave the remedies for future consideration.—*Ruricola*.

HOME CORRESPONDENCE.

Martagon.—I grieve to find that your researches amongst the dusty tomes of Paracelsus, Van Helmont, Albert Groot, and the numerous spawn of Geber, and Hermes Trismegistus—a task surely only equalled by that

"Sage philosopher,
Who read all Alexander Ross over,"

have met with no better success. However, your labours stand as another proof (hardly required) of the pains you take to go to the roots of things; and of how well you can vary your studies, and amplify the "*amenitates Academicæ*" of your great predecessor, for the amusement and

instruction of your readers. Your speculation on the derivation of this word from *Mars* and *ago* is certainly ingenious; and I wish it may prove a "perfect magistry" in your etymological alchemy. But have you not opened a better road to the desired object in your article (p. 854) on the Lily of Scripture? You suppose, and you quote Dr. Bowring's opinion in support of your supposition, that the Lily in question was the Scarlet Martagon. Now, as the Martagons all came into the hands of our early gardeners from the Levant, is it not probable that the name was imported with them, and properly belongs to some of the Saracenic, Turkish, or Syriac dialects? and is it not more likely that, if the philosopher's stone was ever called Martagon, it got that name from the flower rather than the flower from it? It would be in full accordance with the Eastern style of figure and hyperbole to speak of "the great secret" as the Lily of perfection, the Martagon of metals, the glory of the gardens of Paradise, the delight of Solomon, and the joy of the pre-Adamite world. It would look something like "malice prepense" to send you another wild-goose-chase in this new direction, with no greater prospect of success than the probability I offer to your notice; and perhaps to end with no greater reward than the small meed of thanks from idle wights, whose curiosity is only exceeded by their love of ease: every one, as ready as myself to subscribe, your friend and obliged servant—P. P. [Our kind correspondent R. finds nothing in the language of the East which seems explanatory of the meaning of Martagon. He says, indeed, that *Mar-ian* signifies in Persian, "having a body like a serpent;" *Mar*, the name of serpent, being frequently compounded with other words, and he suggests that possibly the spotting of the Martagon Lily may have given rise to the name; and this etymology may be the true one, if the name was transposed from the plant to the philosopher's stone, as seems probable; for we now find in an abstract of the Chemistry of Paracelsus, published in the *Theatrum Chemicum*, the following sentence, in a chapter concerning the errors of those who had been searching for the philosopher's stone. "Many occult names have been given to the material of this stone, chiefly derived from similitude. It has been called vegetable, mineral, and animal, but not in a literal sense, as those well know who are acquainted with the divine secrets and miracles of this stone. Of this kind was Raymond Lully's *Lunaria*, whose flowers, well known to philosophers, possessed wonderful virtues. The author of that name, however, did not understand that it was to be projected on metals, or that anything like it was to be prepared from them; but the abstruse mind of the philosophers regarded it far otherwise. In like manner they called the material *Martagon*, to which therefore they ascribed some occult chemical action, notwithstanding that it really meant nothing more than some hidden similitude." In this obscure language there is nothing to show distinctly whether the name Martagon was transferred from the plant to the material of the philosopher's stone, or *vice versa*, or whether indeed Martagon had anything to do with plants; yet as the writer immediately goes on to speak of vegetable substances, it is to be inferred that he included Martagon among them; and if so, Martagon may be its oriental root.]

Lime-Water.—Opinions and practice seem very much at variance as to this liquid's destroying worms. I tried it a short time ago on several collected together; it appeared to incommode them a little, as they moved off in double quick time; but as to dying, I, at least, could see no signs of it. The lime was good stone-lime, and the lime-water had just been made.—*Hibernia*.

Manures.—I may perhaps be excused for saying a few words on the subject of concentrated manures generally. It appears to me that we have more to learn of the best mode and time of applying, and perhaps also the best quantity, than of the composition of this class of fertilizers. Chemical science indicates with tolerable precision the latter; but a varied, patient, and extended practice can alone inform us of the former. As might be supposed, in the infancy of a new system mistakes will be made and disappointments ensue. This may generally be traced to the neglect of some plain principle, or to the want of sufficient experience. One of the most fruitful causes of error has been the idea that almost any quantity, however small, of these concentrated preparations, applied to the land, is to produce astonishing effects, as if by some magical or mysterious influence, and not by merely restoring to the soil those inorganic and other substances which had been withdrawn in the crops. The manure-maker has perhaps unconsciously encouraged this error, by his recommendation of quantities too small to produce any marked effect. Another mistake has been, neglecting the sufficient dilution of the manure, and thus injuring or destroying the crop. These two sources of failure are obvious, and easily avoided; but there are others about which we cannot pronounce so decidedly—I allude to the mode and time of application. Here we must have recourse to the practical agriculturist; for it is only by carefully conducted, judiciously contrived, and varied comparative experiments performed by himself (not left to his underlings), that we can ever arrive at the truth in this matter. If he deny his active assistance and cordial co-operation, the man of science must toil in vain; he can never benefit him to any great extent. It is a question which can be decided by actual trial alone, whether, for instance, any particular manure had better be drilled in with the seed, deposited, mixed with it, above or below it, and to what extent; whether it should be applied broadcast, harrowed in, and the seed sown upon it; whether it should be applied as a top-dressing after the plant is up; whether the whole should be thus applied, or by instalments, how many, and when? Where are we to look for satisfactory answers to these and the like queries, but to

practice and practical men? I wish it were possible to organise an extensive set of experiments, tending to illustrate and prove the things I have mentioned; for anything is preferable to doubt and uncertainty. Glorious prospects are before us, and it seems we can all but touch them; but the space between is to be traversed only by patient labour. Would it not be practicable to interest some dozen or two of intelligent agriculturists to experiment upon this subject after the manner of Professor Henslow in respect of the gypsomed dunghill—not so much to try manure against manure—but to observe and prove the condition under which any one of them produces its maximum effect. The greater variety of conditions that these experiments are made to include, though exacting more time and patience, the more perfect, comprehensive, and satisfactory they will be.—Since writing the above, I have perused Professor Henslow's eighth letter to the Suffolk farmers, and while I cannot but admire his patient pains-taking to bribe them, as it were, to promote their own interests, I think that unless some precaution is taken to ensure that what each experimenter uses as gypsum is really so, a loose screw will be introduced into the experiment; perfect as it may be in every other respect. Now, although I have not much time to give away, yet so anxious am I that the Rev. Professor's views should be carried out in an unexceptionable manner, that if he will allow me to co-operate with him to the extent of my feeble ability, in the following manner, my services are at the command of himself and of his constituents:—I propose, then, for the purposes of this experiment, gratuitously, to examine any sample of "gypsum" that may be sent me, through Mr. Professor Henslow, and to give my opinion of it. As much as can be conveyed in a penny letter will be sufficient. I think, Sir, you will agree with me that unless some sort of security is afforded, that the "gypsum" employed is bona fide sulphate of lime, (unmixed with carbonate or fine sand), that the experiment which it is so much to be desired should be as perfect as possible, may be vitiated to a very considerable extent.—*W. H. Potter, Chemical Works, Upper Fore-street, London.*—[We are sure the Suffolk farmers will be grateful to Mr. Potter for his liberal offer; and we trust that such of them as avail themselves of it will inclose a penny stamp along with the sample, in order that he may not have to pay back postage.]

Cattle.—It is stated at p. 103, that sheep kept in a cow pasture injure the butter. This fact wants confirmation, as newspapers say: "Cows and sheep have always fed together here without bad effect." The fallen leaves of the Ash, however, really do spoil milk; this occurs also if the cows can get at cabbage-leaves or garden refuse—in which latter case I know the butter is detestable.—*C. D.*

Cucumbers.—In looking over the list of winners at the Ipswich Cucumber show of the 23d ultimo, I conceive, with many of my brother gardeners in this district, that the judges have, on this occasion, departed from the standard laid down by the said Society, for they assert length to be the first property. I think that the second prize ought to have been first, and the third to have been second; for the second brace of fruit measured $19 + 16\frac{1}{2} = 35\frac{1}{2}$ in.; and the third $17 + 16\frac{1}{2} = 33\frac{1}{2}$ in.; whereas, the winning brace was only $21 + 12 = 33$ in.: so that you will perceive the third to exceed by $\frac{1}{2}$ in., and the second by $2\frac{1}{2}$ in., the length of the first. The second and third likewise beat the first in two other properties—viz., the neck, which in the first was long and yellow; whereas, in the second and third it was short and of a good colour: the first was light green, whilst the other two were of a dark-green colour. The second and third likewise equal the first in all other qualities. Now, how can the censors justify their award, or expect that patronage and support which I wish to see all such societies have? The precedent, too, is a bad one for our Manchester and other local exhibitions in the country, for if it is followed, all the rules may be trampled on with impunity, and regulations will become useless. I would add, that the public supposed the competition to have been for the best brace, and not for a single fruit.—*Justitia*.

Seeds of Vegetables.—You have on a former occasion declined recommending any particular seedsman on whom the amateur can depend for his supply of vegetables, and I suppose you will also object to allow your friends to do so through the pages of the *Chronicle*. Perhaps you are right in refusing to expose the present system personally, but unless some plan is devised to remedy the evil of seeds being sold under false names, the amateur who is limited to space must continue to bear his annual disappointment. Last year I procured seeds of the Cabbage and Cauliflower from London. The tradesman being respectable in position, I never thought of being deceived; but, alas! my Broccoli, Savoys, Cabbages, Lettuces, &c., turned out perfect rubbish, and the Cauliflowers, which I have with great care saved through the winter, are all of a spurious sort, not worth the trouble of growing for pigs; the leaves being coarse, and without any signs of producing good heads. The only chance we amateurs have of obtaining true seeds, is by entering into an agreement to employ any man who will advertise in the *Chronicle* to the effect "that he will guarantee all seeds sold by him to be genuine, and that he requests his customers will publicly state either their satisfaction or dissatisfaction, after a fair trial." The question is, How can a man insure a true breed? Simply by sending plants of the various species to different cottage gardeners at a distance from each other, only allowing one sort to be grown by the same individual, thus guarding against the mixture of the fertilizing property amongst the Brassica tribe. The labourer's garden would be turned to a most profitable account without much labour. A man with a small capital, who would give his attention

to this department of horticulture, with common care and attention, might in a few years realize a comfortable independence; the outlay in the first instance would be small, and the return certain, provided diligence and discretion were shown in selecting the plants for seedlings, and occasionally visiting them in their progress towards maturity. It is quite impossible to seed Broccoli and Cauliflower in the same garden, with any chance of preserving them true to their kind. They must be situated at a certain distance from each other, in order that Bees and insects may visit many other flowers in their flight from patch to patch, and thus get rid of the pollen of the Broccoli before settling on the Cauliflower, and unless this important fact is attended to, we shall in vain look for fine vegetables.—*W. W.* [We are sure that our correspondents will see that we cannot with any propriety recommend one seedsman in preference to another. The best rule to observe in this and all other cases is not to give the same party an opportunity of selling bad seeds twice.]

Madia sativa.—In your "Notices to Correspondents," page 89, you say that *Madia sativa* has no English name. Is it not called the "Salad Oil Plant?" We received under that name, four years ago, a packet of seeds from Germany, accompanied with a short description of its properties to the following effect:—"The superiority of this plant over all others known till this time is proved by experiment. The seed should be sown in the end of October or the beginning of spring, in any soil; from 4 to 6 lbs. of seed is required for an acre. It ripens in three months after being sown in the spring, and does not suffer in the least from frost nor insects, yielding about 450 lbs. per acre of sweet oil of the first quality. It has been proved to be much superior to the Olive oil used in this country (Germany)." Not having convenience to try the experiment, I cannot say much as to its utility as a salad oil plant, but I believe it has been tried in Scotland, and found not to be of sufficient importance to be grown on an extensive scale.—*Geo. McI.* [We never heard of any really English name for *Madia sativa*. It may, however, have had some such name as you mention. Our climate is too damp in summer to render it an object of profitable cultivation.]

Amaryllyis speciosissima.—I would recommend "A Country Vicar," p. 85, to take up his bulbs of *Amaryllyis speciosissima*, which probably have, in their present situation, more aqueous food than they can assimilate in a low temperature, which will cause them to produce nothing but leaves. He should, after potting them 3 in a pot, 7 inches across, and well drained, remove to a greenhouse, and supply them well with water until their leaves are full grown; they should then be more moderately watered, but still kept warm, and when the leaves are quite dead the pots may be placed anywhere secure from frost until next February, when the bulbs should be repotted, a pot or two at a time according to his stock, into turfy loam and sand; little water should be given until the leaves are in action. By introducing into a gentle heat two pots at one time, he will find no difficulty in flowering this pretty *Amaryllyis*, and he will also obtain a succession of flowers. Perhaps some other correspondent will give him directions for flowering others of this genus.—*G. G. Watson, Vicarage, Norton, Stockton-on-Tees.*

Practical Philosophy in a small Way.—Many persons may have noticed the great rapidity with which the sacks of malt are raised to the tops of the lofty London brew-houses, and may, without knowing wherefore, have observed that they shoot upwards like an arrow, notwithstanding that being drawn from various parts of the waggon, they must often start with a tendency to swing about. This, and all other causes of irregular movement or vibration, are counteracted by the man in the cart, who gives the sack a slight twirl as it leaves his hand, which rifles it as effectually as if it were discharged from a twisted barrel. This is, perhaps, as pretty an example of science applied to humble matters as will be easily met with.—*A.*

Antiquities of Gardening; Market Gardeners; Pigs.—In the "Dictionnaire de Commerce" will be found the account of a singular privilege enjoyed by the common executioner of Paris. All persons who brought vegetables to the public market were compelled to pay him a certain toll. That functionary himself, with assistants, attended to receive the same, and used a novel mode of giving a receipt, by marking the amount with chalk upon the back of the person paying. These tolls were afterwards abolished, the public officer receiving compensation in some other way. Le Grand d'Aussy, writing in 1782, says, "There are yet many people living who can testify to this fact; and I have myself questioned several market gardeners on the subject, not very old men either, who remember having been thus marked in their youth." A similar custom formerly prevailed in Scotland, where the common hangman took toll of meal and coal, &c. in the markets of Dumfries, Edinburgh, and Inverness. Some other curious privileges were also possessed by the French headsman; for instance, when an execution had taken place within the territory belonging to a monastery, the holy brotherhood were compelled, besides other fees, to present him with a pig's head. He attended annually on St. Vincent's day, walked first in the procession in honour of that saint, and, after the ceremony, received a pig's head, provided for that purpose by the Abbot of St. Germain's. During the twelfth century, it was the custom of the inhabitants of Paris to breed pigs, which were allowed to roam about the streets during the day-time; thus gaining a scanty living at the public expense, and at the same time creating an insufferable nuisance, which led to the following serious accident: On the 2nd Oct., 1131, as Prince Philippe, son of Louis le Gros, was riding between

the Hotel de Ville and the Church of St. Gervois, a pig ran between the horse's legs, and frightened the animal so much, that the Prince was thrown from his saddle, and his skull fractured so severely that he died the next day. This accident caused certain police regulations regarding pigs to be promulgated. They, however, met with considerable resistance; the monks of St. Anthony especially, on account of their patron saint being represented as attended by pigs, claimed to be exempted from the operation of the new laws, and ultimately succeeded in obtaining the privilege of being the only proprietors whose pigs were allowed to roam about the city. The public executioner was appointed to seize any pig found astray which did not belong to the holy fathers; and, upon taking it to the Hôtel Dieu, he exacted a fine of five sous from the owner, or decapitated the animal, reserving the head for his own emolument.—*T. Smith.*

Bees.—If "Agger" will have the goodness to mention the primary cause why Bees store up honey, I shall, perhaps, have a word or two to say to him respecting his statement at p. 129: viz., "That propagation of the species is not the object for which we keep Bees."—*J. W.*

Bees.—I find that your correspondent "Apis," who wishes to know if Bees' eggs are transmutable, is under the impression that I consider them not to be so. I certainly have always thought this a mysterious subject, and perhaps some of the readers of the *Chronicle* may recollect a controversy respecting it, which appeared in the *Gardener's Gazette* during 1841. Though I then stated some things in favour of the belief of their being not transmutable I at the same time advised others to put the question to farther test. Since then I have done so myself, and found that Bees can rear a queen provided they have a brood comb. For the sake of "Apis," and others who may be ignorant of this subject I shall enter into it a little at length. That working Bees' eggs are transmutable was first advanced by Shirach; but if I mistake not, Huber went so far as to say that their grubs can be changed into Queen Bees although two or three days old; and that it was accomplished by peculiar food and treatment. The casual observer may see nothing remarkable in this, but the accurate naturalist will readily do so; for he sees it favours the belief of the transmigration of the species. When Shirach broached this startling doctrine, Bonnet condemned it, on the ground that it was against all the known laws of nature for different food or treatment to change or make one kind of animal into another. In spite of this, however, Apianians believed it, though they could not explain so strange a phenomenon. This, nevertheless, appears less startling when Huber's belief is known; viz., that working Bees are queens in an undeveloped state, or half-queens, if I may say so; but that different food and treatment make up the other half I am not prepared to prove, nor can I assert that eggs which produce working Bees are transmutable, far less that their grubs are so. It is almost useless for me to mention that there is but one queen or head Bee in a colony, and that without one it cannot long exist; for she deposits the eggs and is, in fact, the mother of the whole. As head Bees are only reared at certain periods, the question is, how are they supplied in cases of casual or accidental loss? The following statement will, I think, show how Bees are prepared to meet the emergency. During August last, I took the queen from a weak hive containing only three combs; the inside one contained eggs and brood. The queenless Bees were soon in an uproar, as they always are when they lose their queen. I confined them in the hive to prevent their dispersion, as well as to keep out their neighbours who were bent on their destruction. At the end of a week, a queen's cell was begun on the centre of the brood comb; in ten days afterwards it was sealed up, and after the same space of time it was empty. I found a queen in the live which differed in no way, except in age, from the rightful one which I had taken. The cell in which it was reared differed a little from the usual form of queen cells, being less of a pear shape and not so deep; the latter, however, was made up by the length of the cocoon of the insect, in a way similar to that of the cells of queen wasps and hornets. Mr. Baxter, in his work on Bees, has given an interesting account of this subject, which shows how far the various organs of the grubs of working Bees must undergo transmutations to become Queen Bees. He seems to think that this is not enough; for he observes that those adopted queens are educated by the Bees to supply the loss of the others. Mr. B. is not the only one who tells us of the education of insects; but to enlarge upon this project would lead to the difficult question of instinct, from which I must refrain. I may notice, however, that I never could detect *Royal jelly* in a bee-hive. I mean the peculiar mixture that is said to change the larvæ into Queen Bees. Having stated that working Bees are said to be Queens in an undeveloped state, it may be alleged that the enlargement of the cells gives room for the complete growth of the insects. This is a more likely thing than *Royal jelly* changing them; still it is open to objection, for more growth could hardly give colour or the marks peculiar to Head Bees, nor different instinct, nor longer period of life. Queen Bees live four or more years, while working ones exist only one season. Those who disputed this curious subject with me, perhaps may say, Now he begins to see that he was wrong, but "bide you a wee," recollect I have not said that it was a live grub that the Bees put into the cell, nor formed a cell round one, neither an egg that ought to have produced a working Bee. To ascertain the former, nothing but grubs ought to have been in the cells; as for the latter, Bees may have eggs in store that produce Queen Bees; this, however, is not likely. But there is another obstacle in the way:—Huber asserts that working Bees can deposit eggs, and

may, in such cases, those that produce Head Bees. Perhaps the best way to test this mysterious thing would be to take the larvæ from the Queens' cells, and replace them with those from workers' cells; this, however, would require the perseverance of a Huber or Bonner.—*J. Wighton.*

Lichen on Fruit-trees.—When fruit-trees are infested with Lichens and Moss, not only is the health of the trees impaired to a certain extent, but the fruit also. The application of lime-water, prepared in the following way, will effectually displace the Lichen:—a common water-barrel, placed on a wheelbarrow, is best suited for the purpose, and it should be filled as full of water as a person can conveniently wheel it. Put in plenty of quick-lime, as water will only take up a certain portion; it cannot be made too strong, but it should not be so thick as to prevent its being applied with a syringe, having a coarse rose. It is best, I believe, to wheel it immediately to the trees, even when warm, which it will be by the slacking of the lime. It will be necessary for one person to keep stirring it while another syringes the trees; by this means a portion of the lime is carried with the water, and adheres both to the wall and trees. This mode of destroying Lichen is nothing new, but it may not be generally known. I last year tried the experiment on two Plum-trees, and to my great satisfaction the Lichens were quite destroyed, both on the wall and trees; the latter now present a healthy appearance, and the bark is quite clean. It is an almost invariable practice to wash garden-pots thoroughly after the plants have been turned out of them, before they are made use of again; and many pots which have been occupied by plants, requiring a liberal supply of water, are covered with a green vegetable production; if, after being washed, the pots are dipped into strong, clear, lime-water, it will quite destroy this substance. As the present is a good time for applying it to trees, no time should be lost where they are attacked by this pest.—*G. G. Watson, Vicarage, Norton, Stockton-on-Tees.*

Canvas Coverings for Frames.—I do not think that anything is more suitable for canvas coverings than plain painting with drying oil. This should be done in the autumn, the canvas being fully exposed to the sun and air for some time afterwards, by being spread on the Grass. Though this method does not make it quite transparent, it is much better and more simple than any other.—*Hibernia.*

Refuse Hops as a Substitute for Stable Manure.—Some few years back, being unable to obtain a sufficient quantity of stable manure, I was (at the instance of a friend) induced to procure from a neighbouring brewery two loads of hops, which had undergone the usual process in making beer. The hops were carted to me in a warm, moist state, and immediately made up into a couple of hot-beds. The frames were then put on, the surface covered with about three inches of common garden mould, and the lights shut down. Never having before tried the experiment, I was fearful of putting in cuttings (Dahlias) too precipitately, lest sudden steam should arise; but on the morning of the third day, no steam or rank smell being perceivable, I ordered one of the frames to be filled with the cuttings, and the result was, that they struck remarkably well. By the time they were well rooted, the other bed had been cleared, and I directed the Hops to be turned over, well watered, and again made up. This caused them to heat moderately a second time; and the plants having been potted off into 60's, were at once placed in the frame, where they made a vigorous and rapid growth, seeming to delight in the genial warmth emitted from the Hops. I have adopted the foregoing plan for three successive years, and am now fully convinced that, although the heat arising from Hops is not so powerful in the first instance as common dung, yet that it is more *lasting and equal*. For those individuals who do not keep a regular gardener, and who are often compelled to leave their frames for the whole day without being attended to, the method will be found most useful; as on no one occasion during the above period were my plants ever injured by the sudden rising of steam or rank smell, a disaster which too often occurs when stable manure is used, unless the beds are very carefully looked after.—*C. K.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

March 7.—*R. W. Barchard, Esq.*, in the chair. The Rev. J. Antrobus, W. Brown, and G. Green, Esqrs., and Mr. J. Garraway, were elected Fellows. Mr. Goode, gr. to Mrs. Lawrence, exhibited a collection of plants, containing very handsome specimens of *Colchæa scandens*, its light green foliage drooping gracefully around the pot, and each shoot bearing at its extremity large light crimson flowers; *Oncidium bifolium*, an elegant species, with a small, chocolate spotted perianth, and a large, bright yellow labellum; *Brassavola glauca*, in excellent health, which appeared to be owing to its being grown in earth instead of upon a block of wood; *Aschynanthus maculatus*, with dark fleshy leaves, amongst which its numerous clusters of scarlet blossoms produced a pretty effect; a species of *Hippeastrum*, with bright scarlet flowers, having a greenish centre; a large plant of the new *Begonia coccinea*; *Oncidium incurvum*, and the beautiful *Burlingtonia rigida*: a Knightian medal was awarded for the *Colchæa*, *Burlingtonia*, and *Begonia*. From Mr. Brazier, gr. to W. H. Story, Esq., well-bloomed plants of *Erica ardens*, *vernix rubra*, and *Petiveriana bicolor*, the latter having pretty greenish-yellow tubular flowers, with a reddish tinge at the base, and prominent brown stamens; several handsome hybrid *Epacris*, one called *coruscans*, with long crimson tubular blossoms, six plants of which were exhibited; *E. rosea umbrata*, of the same form, but lighter than the preceding; and *E. magniflora*, of a deep rose-colour, and remarkable for the freedom with which it blooms: a Banksian medal was awarded for the *Epacris*. From Mr. Beck, very healthy and well-bloomed plants of *Cytisus racemosus*, *Leschenaultia formosa*, *Erica transparentis*, *bicolor*, and three *Cinerarias*, called *Hendersoni*, *Madonna*, and *Urania*; all grown in slate pots, and affording a further convincing proof of the success with which plants of any description may be cultivated in this material. From Mr. Smith, of Norbiton, five very

handsome hybrid varieties of *Rhododendron*, called *Smith vârium*, raised between *R. caucasicum* and the white arboreum the habit of all is dwarf, and they are stated to possess a considerable degree of hardiness, having been exposed to the weather during winter until taken into the house to forward them blooms with these was a small plant of a *Rhododendron*, called *Rolisoni*, with leaves of a rusty colour on the under side, and fine deep crimson flowers, produced in a dense cluster, this appeared to be identical with the Ceylon variety of *R. arboreum*; it is stated to be hardy, but doubts are entertained upon this point a Banksian medal was awarded for the hybrid varieties. Mr. Gaines exhibited a seedling *Rhododendron*, two *Camellias* (one called *Henri Favre*), with neatly-cupped petals, of a bright rose colour; the other *C. monstrosa*, red, with a double row of outer petals, and having the centre filled up with smaller petals, of various forms. From Mr. Kynock, gr. to Alderman Copeland two seedling *Epacris*. From Messrs. Veitch, several fine blooms of a *Camellia* called *pulehrima*, a variety introduced from the Continent several years since, and bloomed by H. Porter, Esq., of Winslade House, Exeter; the flowers resemble those of *C. althæiflora* in size and form, and are of a deep rose-colour, mottled and striped with white; if it should always bloom as large, and retain its mottled character, it will prove a valuable variety. From Mr. Dennis, a Persian *Lilac* in bloom. From Mr. Conway, two plants of *Pelargonium Lancei*, which appears to be a free bloomer, and well suited for early forcing. Messrs. Rolison exhibited a plant of the beautiful *Cœlogyne cristata*, with white flowers, having the labellum strongly marked with light yellow: a Banksian medal was awarded. Mr. Small, of Colnbrook, sent a seedling *Fuchsia*, apparently raised between *F. fulgens* or *cordifolia*, and some of the older and darker varieties. From the Hon. W. F. H. Strangways, a dish of Pine Golden Russet Apples, in good preservation. From Mr. Henderson, gr. to Sir G. Beaumont, Bart., a fair specimen of the Queen Pine Apple, weighing 3 lbs. 10 oz., sent for the purpose of showing that fruit of this variety may be well swelled in winter, if kept at a low temperature; the plant from which the present fruit was cut having been grown in a house never higher than from 50° to 55° by night, and from 60° to 65° by day, unless under powerful sunshine. From Mr. Stewart, gr. to W. Bagge, Esq., a leath of hybrid Cucumbers, called the Ringleader, grown in a Pine pit, in pots, on Ayres' system, and watered with a solution of nitrate of soda, in the proportion of 10 oz. to 3 gallons of water. From Mr. Martin, of Thames Bank, a bundle of *Asparagus*, of large size. Mr. Dredge, of Wallington, Surrey, exhibited the root of a Pear-tree, which had been taken out of a well; this root was 33 feet long, and resembled a small rope, having only one or two ramifications during its entire length. From Mr. H. Scott, of Charles-street, New-road, specimens of cast-iron pipes, for the conveyance of water and other fluids; these are so constructed that by means of movable nuts, and screw-pieces cast upon the pipes, a series of pipes can be securely joined together, without soldering or brazing. The same person also exhibited an ingenious contrivance, in the form of a slide-expanding and contracting box, to allow for the alternate expansion and contraction of pipes containing steam or hot water. From the garden of the Society were plants of *Oncidium altissimum*; the large and small varieties of *On. ampliatum*, the former bearing a fine spreading panicle of large, bright yellow flowers; the showy *On. leucocolum*; *Dendrobium aggregatum*, with a drooping spike of sulphur-coloured flowers, having the centre of the labellum strongly marked with orange; the delicate little *D. secundum*, and *Acacia Ricciana*, an elegant species, with drooping branches, loaded with a profusion of light yellow, feathery spikes of flowers. Cuttings were distributed of the *Royale Hâtive Plum*, an early purple sort, of exceedingly rich flavour; *Knight's Monarch Pear*, stated to be hardy and a good bearer, succeeding best as a standard, and bearing rich and melting fruit, which will keep well till January; *Winter Crassane*, which differs from the Old Crassane, in bearing abundantly as a standard; and the *Vicar of Winkfield*, described at p. 20 of the *Chronicle* of this year.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

March 1.—*P. Pusey, Esq.*, in the chair. Twenty-one Members were elected. Mr. R. Barker presented the monthly report of the accounts, and state of the Society's funds, from which it appeared that in addition to invested capital the current cash balance was 1,593*l.* It was resolved, "That in future the carriage shall not be paid for the Journals of Members whose subscriptions are in arrear; but that, on their receipt a letter shall be addressed to the parties, informing them that their journals may be had at the Office of the Society, on application with a written order, and can either be forwarded immediately at their own expense, or with the next number of the Journal, at the expense of the Society." Col. Challoner presented the general balance-sheet of the accounts connected with the late Bristol Meeting, from which it appeared that, independently of 1,300*l.*, given in prizes, and the various sums offered for Prize Essays, the Society had contributed 573*l.* out of its own funds to supply the deficiency between the expenditure and the receipts, the latter being 4,202*l.*, while the outlay amounted to 4,775*l.* Col. Challoner then read the Report of the Committee in reference to the arrangements for the Derby meeting. This was adopted, and the contract with Mr. Manning for the works connected with the showyard and Pavilion for 2,200*l.* confirmed. Mr. Pusey informed the Council he had applied to the Earl of Aberdeen for letters of introduction and safeguard in favour of Dr. Daubeny, who in a few days would proceed on his tour of inquiry through Estremadura and other districts in Spain, where the phosphoric mineral (containing so large a proportion of the earth of bones) was known to abound. Mr. Pusey also stated that Dr. Playfair having declined to accept an appointment of 200*l.* per annum, that he might remain in England to devote himself to the study of Agricultural Chemistry, he should propose at the next Monthly Council that Dr. Playfair be appointed the "Consulting Chemist" of the Society, giving gratuitous opinions on questions of a chemical nature, and making a charge, according to a given scale, for such analyses only as might be required. Prof. Sewell reported that he had communicated with the Duke of Rutland respecting the cow whose case had attracted the notice of the Members, and that Mr. Batchelder had ascertained it to be affected by a ventral or abdominal hernia. Prof. Sewell having informed the Duke of Rutland that the case would be instructive to pupils attending the Veterinary College, His Grace had sent the animal to the College infirmary. Mr. F. Hobbs stated that he had lately met with a Clover which he thought might prove useful. His attention had been called to it by a gentleman who had originally sown a few seeds presented to him by a friend, the same plants having seeded two or three consecutive years without any apparent exhaustion. Its growth is described as very strong, the plant throwing out sometimes from the same root as many as thirty stems, resembling those of the common Red Clover, while the blossom had a pink hue, bearing, with the seed-pods and leaves, great analogy to the White or Dutch Clover; the roots throwing down tap-roots like the one variety, and shooting out numerous small lateral fibres like the other. From these striking similarities to the two common varieties, it was concluded that the Clover must be a hybrid between them. It was strongly recommended that this hybrid Clover should be sown with the Red Clover, on account of its great length of stem when grown on rich land, and its inadequacy to support itself erect, the plant becoming bent and difficult to mow without loss, excepting by very careful labourers. From the smallness of the seed, from six to seven pounds per acre, carefully distributed, would be sufficient, or half that quantity mixed with half a peck of red seed. Mr. H. Gibbs stated this to be the Alsike Clover, or *Trifolium hybridum*. A foreign correspondent of Messrs. T. Gibbs and Co. had cultivated it for six years, and had found it to withstand the greatest degree of frost, which other Clovers would not do there. On muddling descriptions of soils it produced fair crops; on richer soils, very heavy ones. The stalks are said not to harden like those of the

Red Clover, but remain soft. After being cut, it soon shoots again, and seed-crops had been taken three successive years from the same plants, which had been top-dressed with stable manure in the winter. They had also received some seed and specimens from Mr. Sewell, the gentleman referred to by Mr. Hobbs, who stated that, "It was likely to prove a valuable acquisition, as it was a perennial, and possessed all the good qualities of the common Red and White Clover as a sheep feed, &c., but its produce was nearly or quite double that of the latter." Mr. Sewell grew some acres of it last year, which were fed all summer with sleep, and he had reason to be highly satisfied with it, both for quantity and quality. The Duke of Richmond transmitted a communication from the Moray Farmers' Club; Mr. Read various specimens of cylindrical tiles, with an account of their manufacture, price, and peculiar merits; Mr. Squarey a specimen of phosphate of lime; Mr. F. Clowes a communication of experiments with various manures; and Mr. Danson Dr. Ure's Report on Analysis of Guano. Mr. Cherry explained the advantages of his equalizing roller for land, and his portable forge, which he had employed for twenty years.

LINNEAN SOCIETY.

The Lord Bishop of Norwich in the chair. Messrs. T. C. Janson and W. Solly were elected Fellows. Mr. Smith presented a fine print of *Banksia grandis*. Mr. Westwood presented two curious productions obtained from plants of *Sonneratia acida*. They had been sent to this country by Mr. Templeton, of Ceylon, in which island the *Sonneratia* grows abundantly. These bodies were spindle-shaped, looking like great Clavarias. In a letter from Mr. Templeton, they were stated to be produced as off-shoots from the roots of the *Sonneratia*. The end most distant from the root had a distinct bark and pith; whilst that which was near the root sent off several distinct rootlets of its own. The middle portion, which was very much enlarged, as compared with the two ends, consisted of an exceedingly light, soft, fibrous, woody tissue. On this account it had been used with great success as a lining for insect-cases. As no discussions are allowed at this Society, of course no opinion was given to the Members by the able botanists present on the nature of these curious productions. A continuation of Mr. Griffith's paper on the development of the ovulum of *Santalum* was read to the Society, and accompanied by drawings illustrative of the author's views.

FLORICULTURAL SOCIETY.

March 7.—Mr. Mauger in the chair. The following propositions relative to the exhibitions of the ensuing season were made by Mr. Wildman:—"That until the funds of the Society will bear the expense of public exhibitions on a scale suited to its character and ultimate objects, no separate days be set apart for that purpose; but that in lieu thereof the Society do meet upon two occasions during the season of each particular flower, at an earlier hour on the usual days of meeting, in order to afford opportunities for competition, or for the exhibition of specimens." Carried, for one occasion only. "That the prizes on these occasions be for the present restricted to seedlings and single specimens in class showing, unless any of the members should desire to enter into any arrangement amongst themselves." "That in order to encourage the exhibition of seedlings, prizes be awarded, without entrance money, for all that may be placed as first or second-class flowers throughout the season; the prizes to be equal in value to those offered on the days of competition. But, with the view of extending the interests of the Society, and of creating a reasonable distinction between members and non-members, that no such prizes be paid to any but subscribers." Both the latter propositions were agreed to. It was further proposed—"That prizes be offered from time to time for essays upon the various flowers which fall within the objects of the Society, embracing their properties and defects; the best mode of exhibition and of judging, and naming the best varieties of each sort." On account of the late hour at which the business of the evening was brought to a close, the reading of Mr. Osion's paper upon the Carnation was deferred until the next meeting.

MISCELLANEOUS.

Treatment of Lachenalias.—The bulbs which are not large should be potted in September, three in a pot. The soil should be a mixture of peat and sand, about three parts of the former to one of the latter, with a small quantity of leaf-mould. Select good sound bulbs for flowering, and pot the small offsets by themselves. The pots should be well drained, and after the bulbs are planted, remove them to a frame, where they will have light, and not be exposed to the cold autumn rains. Keep them in this situation until November, or when the nights become quite frosty, giving just sufficient water to keep the earth moist. At that time they may be removed to the parlour or greenhouse, placing them in a light situation, and watering them cautiously until they begin to grow. In February the flower-stems will appear, when more water should be given, though with care; the flower-stems will now shoot up, and in the course of a few weeks will be beautifully in bloom, remaining so for two or three weeks, or much longer if they are kept in a partially shaded place. In May, when the foliage begins to turn yellow, the pots may be removed to the open air for a few weeks, when the bulbs should be taken out of the pots and laid away in a dry, cool place, until wanted for planting again in the autumn.—*Hovey's Magazine of Horticulture.*

Bulbous-rooted Chervil.—Offsets and seeds of this plant were presented to the Horticultural Society of Paris by M. Lissa, who reported that it was grown in Germany for culinary purposes. A few offsets, about the size of nuts, are produced at the base of each plant. At present, we are of opinion, that, in consequence of the poisonous qualities of many umbelliferous plants, it will be prudent, until more is known respecting it, to use this vegetable with circumspection.—*Bon Jardinier.*

New Potatoes.—In consequence of the extreme mildness of the season at the close of last autumn, a novel experiment in gardening was attempted by a lady in Madeira-street, North Leith, near the opening of Queensferry-road, which has turned out completely successful. About the middle of October she planted some Potatoes in boxes under shelter—these, when the roots struck, were removed to drills in the garden, and warmly protected against the contingencies of winter. The stems grew, giving promise of an early crop. On Saturday last the earth was removed, and a plentiful supply taken up; the Potatoes varying in size from a pheasant's to a hen's egg.—*Edinburgh Paper.*

Sulphur in Plants.—Among the plants which are known as containing sulphur, the garden Cress may be particularly adduced. There can be no doubt that these plants are capable of decomposing the sulphuric acid contained in the saline sulphurets of the soil, so as to take

therefrom the sulphur. Vogel, however, sowed seeds in a soil which contained neither free sulphur nor saline sulphates; and notwithstanding these plants contained a considerable quantity of sulphur. The soil consisted of a coarse powder of white glass. Before it had been put into the vessel the glass had been strongly heated, but not to the point of fusion, and then washed with a considerable quantity of water, which, however, did not take therefrom any sulphates. Vogel sowed in this soil Cress-seeds, and kept the soil moist with distilled water. When the young plants had attained the height of some inches, they were extracted, together with the roots; the white roots were then cut off, and, after being washed, quickly dried, together with the plants. Both were then exposed to the action of heat in a retort, and it now appeared that not only the green leaves and stalks, but likewise the white roots contained a considerable quantity of sulphur. This was indeed the case with the seeds employed; but the quantity of sulphur contained in the plants is much more considerable than that contained in the seeds. The juice pressed from the plants of Cress grown on powdered glass, as previously described, also contained saline sulphates in considerable quantity. Vogel also caused some Cress-seeds to vegetate in coarsely-ground quartz, and in pulverized flint-glass, and also in fine and well-washed silica, previously disengaged from fluosilicic acid by means of water. (The vegetation proceeded much slower in the last than in the two first.) The plants grown in a soil of this description always contained sulphur and saline sulphates. In order to fix approximately the quantity of sulphur contained in the seeds of Cress, as well as in the plants grown therefrom, Vogel further undertook the following experiments:—100 grains of Cress-seeds were heated gradually in a retort to a red heat, and the gasses which meanwhile formed received in a ley of potassa. To this ley acetate of lead was then added, until no further precipitation ensued. The brown precipitate thus produced, after being well washed, was found to consist of hydrated oxide of lead, together with carbonate of lead, and of black sulphuret of lead. The two former were dissolved in dilute and boiling nitric acid, and a quantity of sulphuret of lead was then left behind, which, after being washed with a good deal of water, and then dried, weighed 0.95 grains, corresponding to 0.129 of sulphur. In order to obtain in like manner a quantitative estimation of the sulphur contained in the Cress-plants, Vogel then submitted a number of plants grown from 100 grains of seeds to another examination. They weighed after being dried 2,040 grains, which, treated in the same manner as the seeds, yielded 15.1 grains of sulphuret of lead, corresponding to 2.03 grains of sulphur. How this surplus of sulphur may have been introduced into the plants, the writer has in vain endeavoured to explain.—*Annals of Chemistry.*

British Guyana.—Mr. Schomburgk, after an absence of thirteen months, has returned with his party from the interior. He represents the climate in the vicinity of the Sandstone Hills, which stretch for several miles across the country, to be temperate, the thermometer before sunrise never standing above 51°; a further evidence of which is that blackberries are there found in abundance. In traversing the savannahs and forests, Mr. Schomburgk saw hundreds of acres of Plantains growing wild, and so luxuriantly that he represents some of them to be as thick as a man's body, and 40 or 50 feet high. He has brought with him suckers from these trees, which he is desirous of cultivating; being confident that they are not tainted with the disease which affects so large a portion of the Plantains in a cultivated state. The health of Mr. S. and his party has been generally good throughout the whole period, with the exception of occasional attacks of fever, and suffering from want of food.—*Extracted from the Guyana Herald.*

Very curious Fact, if true.—A gentleman living in the vicinity of Dumfries lately bought some gas-work lime in order to make a compost of manure for farm purposes. The hens in his poultry-yard, which were laying eggs, had access to this compost; and as it is well known that fowls partake readily of lime, which enters largely into, and is necessary to, the formation of the shell, they fed, it is supposed, according to their appetite, upon it. The consequence was, that in a few days, with much astonishment, the eggs on being opened, were found to have such an intolerable smell of gas that no one could eat them.—*Dumfries Herald.*

Mildness of the Climate in Devonshire.—There is now growing at Brookhill, the residence of A. H. Holdsworth, Esq., at the entrance of the river Dart, a Mimosa, of most delicate foliage, and covered with a profusion of yellow flowers. It is 20 feet high, was raised about 12 years since, from a seed brought from the Cape of Good Hope, and during the whole time it has withstood the rigour of our climate, which indeed is scarcely felt in that warm and sheltered spot.—*Exeter Gazette.*

GARDEN MEMORANDA.

Messrs. Chandler's Nursery, Vauxhall.—The extensive collection of Camellias at this Nursery will, if the weather is favourable, be in full perfection in a few days. A great variety of sorts are already in flower, and the various shades of red and white, which the thousands of blooms exhibit on entering the house, produce a striking effect. Amongst those in bloom may be mentioned, *Danekia*, semi-double, with beautifully mottled flowers of red and white; *Lady Hume's Blush*, a delicate pinkish buff, with small, well-arranged, pointed petals; *Colvillei*, white, prettily streaked and mottled with rose; *eximia*, a large deep rose-coloured flower, well filled up. *Chandleri*, a handsome variety when it comes true to its character, being dark red, mottled with white; *fimbriata*, a delicate white, possessing all the good properties of the old white, and having the petals finely fringed; *minuta*, a small rosy carmine flower, somewhat cupped and well filled up in the centre; *elegans*, rosy pink, a large, bold flower; *Woodsi*, resembling the last in colour, but better filled up in the

centre; *Anemoneflora alba*, a white variety, approaching the old *Waratah* in form, *florida*, a bright carmine, with beautifully-cupped petals, *albicans*, a pretty white; *conceana*, a bright rose, with neatly-formed flowers; and *imbricata alba*, the white of which is not very clear. *C. imbricata*, planted out in the border of the house, is producing some remarkably fine blooms, and those of *C. althæiflora*, in pots, are unusually large. Small plants of *C. tricolor* in pots, are expanding their beautifully striped flowers in great abundance; in fact, this seems to be one of the most free-flowering kinds. *C. Albertus*, a handsome variety of late introduction, is very double, and promises to be one of the best of its class. *Gilesiana* is also a good and distinct kind, with small dark red flowers, mottled with white. The hybrid *Rhododendrons* in the show-house will shortly be in full bloom. The graceful little *Cyclamen coum*, with *Heaths*, *Epacris*, *Fairy Roses*, *Azaleas*, *Hyacinths*, *Tulips*, &c., already render it lively. One of the prettiest flowers for early forcing is *Kalmia glauca*, which is here blooming in great perfection; the double-blossomed *Peach* is also well adapted for the same purpose.—*R. A., March 6.*

Reviews.

A Treatise on the Culture of the Vine in Pots. By J. Mearns, F.H.S. 12mo. Orr and Co.

MR. MEARN'S has long been celebrated for the success which has attended his cultivation of the Vine by the coiling system; a work, therefore, which promises to convey the necessary information relative to this method of treatment can scarcely fail of being well received.

To render the treatise as complete as possible, the author has briefly entered upon the Natural History of the Vine; tracing its progress from its first introduction into Britain, and instancing some of the most remarkable Vines now existing. It appears that no regular mode of classifying the numerous varieties of the Grape has yet been adopted, although the catalogue of the Luxembourg collection, published in 1802, recorded 267 sorts. For the list contained in this work Mr. Mearns is indebted to the catalogue of the Horticultural Society, containing 183 sorts.

The author, in his description of soils, states that after numerous experiments he found pot-Vines "to luxuriate in a loose, fresh-chopped, turfy soil, taken from the top of a magnesian limestone rock, and which had been a sheep-walk for ages, laying so thin upon the surface, that in many places it was only three inches deep." With this were mixed road-scrappings, containing silicious matter and brick-rubbish, in a mellow state, and in sufficient quantity "to allow the water to drain freely through all its parts, and to permit the young roots to ramify freely therein."

In the propagation of Vines by coiling, the author's practice, if single rods are contemplated, is not to leave them longer than four or five feet, and to remove all the buds but the uppermost. These rootless cuttings are coiled into long narrow pots; being so placed that the bud of the apex of the shoot, although the highest part, is still two inches beneath the surface of the soil, at the same time sufficient room is left beneath the coil for the roots to extend themselves. These cuttings, being put in between the middle of January and the end of March, are plunged at once into a hotbed, between 90° and 100°, where they remain until they require more pot-room: they are then shifted, and placed in a suitable situation until again excited in November or December. When the cutting begins to grow, the shoot is trained upright, until it is seven, eight, or ten joints long, when the top is pinched off.

After this stopping, the laterals are displaced as they appear; and if the Vines have done well, two or three of the buds will also be excited at the same time, in which case the shoots are cut down to the lowest excited eye. The single shoot is then trained upright and divested of all laterals and tendrils. None of the plants are allowed to grow longer than from four to six feet, at which length the tops are pinched off; the uppermost lateral, which is also stopped at the first joint, being left to carry off the remaining sap. At this season the plants are removed to a warm and sheltered situation in the open air; and when the leaves fall, they are headed down to one, two, or three joints, according to their strength, and are placed against a northern aspect. When cold weather sets in, they are taken back to a sheltered spot and plunged in the ground to protect the roots; the pots being mulched over and the rods covered to protect them from frost.

When these yearling potted Vines are brought early into action, it is recommended to bow a piece of wire above the pot, with both its ends running down the inside; of sufficient height to allow the whole length of the stem to be attached to it, as represented in the accompanying figure. The buds, from the stem being thus bent, break more regularly, and when this is effected the Vine is untied and secured to an upright stake or sloping trellis. To prevent evaporation, the stem is wrapped loosely in moss, which is kept constantly moist, until the Grapes are set, when it is removed. The plants, up to this period, are encouraged by bottom-heat and shifting; and the quantity of fruit is regulated by the size of the pot and quality of the Vine.

The author next treats upon a more expeditious mode of culture by the coiling system, by which the shoot of a Vine is brought into bearing in the same season as it is planted. For an account of this we must refer our readers to the work itself. There is one point insisted upon, which should never be lost sight of in the production of early Grapes; namely, to have the plants situated near the light. Upon

this subject Mr. Mearns has judiciously observed: "The Vines, also, must be as near the glass as circumstances will permit. At any other season it is not of so much importance; although at any time I like the leaves to be near the glass roof, that is, within from 3 to 6 inches, yet never allowed to touch it. In most hot-houses the Vines are placed too near the glass; and the consequence is, the leaves which accompany the fruit are scorched, or so much injured that they very rarely bring the fruit to perfection; they are also much more subject to the attacks of red-spider and thrips than if at a fair distance from the glass."

The remainder of the work details the author's practice in the routine culture of established Vines in pots, with remarks on Situation and Solar Influence, Watering, Atmospheric Influence, and Pruning; concluding with an analytical list of papers on the Vine, to be met with in various works. The directions throughout are clear and explicit, and will enable any person, with care and the necessary conveniences, to obtain Grapes upon this system at a season when those of the previous year are consumed, and before the principal early-forced crop is expected to be ready for use.

Scotch Farming in England; a Second Letter. By Robert Hyde Greg. Ridgway & Son. 8vo.

THERE is no doubt that the general system of farming in Scotland is much superior to that of a great part of England. The Scotch are more industrious, more attentive to minute circumstances, and they do not allow pleasure to interfere with their business. The labourers are better instructed, and work more steadily than the English. The Scotch farmer has either more capital, or better credit, and calculates nicely every prospect of profit, by laying out money on his farm. He gets more work out of his horses and labourers, and keeps them more economically, in proportion to their work. All this enables him to pay higher rents, and still have a fair profit.

As to the comparative produce of an English and a Scotch farm of the same extent and similar soil, we think that Mr. Greg, for the sake of argument, has contrasted some of the most slovenly farming in England with the best in Scotland. We can scarcely credit the assertion that 70 acres in Scotland averaged 8 quarters of Wheat per Scotch acre (or 6½ per statute acre) in 1842, worth 60s. (see note, page 8) which price must include tailing corn or light grains; while the average of 100 square miles of country very near Durham gives a produce of only 1¼ quarter of Wheat per statute acre. Yet this is given as a correction of a former statement!

That the only ploughs observed at work (note, page 9) in going from Hertfordshire to London had each five horses attached, in land by no means stiff, may be true, as a fact, but not a fact to found an argument on.

The French proverb "Qui dit trop ne dit rien" might fairly be applied here, and the very judicious observations of Mr. Greg are neutralized by these statements.

We most heartily concur in the assertion that the more generally diffused and more practical education of the Scotch is the main cause of their superiority in farming, as well as in anything they undertake; that the system of leases is also an advantage, and the credit given to the farmer in consequence. The objections to new modes of cultivation and to the introduction of machinery, said to be entertained by English labourers, and even farmers, is much exaggerated. Let Mr. Greg travel through Suffolk, Norfolk, and Essex, and he will find very little corn threshed by the flail. The chief cause of the greater profit of the Scotch farmers is the sobriety and steadiness of the labourer, who is chiefly paid in the produce of the farm, and also the greater attention of the farmer himself. We much doubt whether the Scotch farmer on land of the same quality raises more produce per acre than a Suffolk or Norfolk farmer, or that his land is kept in as clean a state; but he raises it at less expense.

It were much to be wished that the English farmer would imitate the Scotch in many of his operations, and the Scotch might, perhaps, not regret a journey to the best-managed English farms—not to find fault, but to learn something. There is but one degree of perfect cultivation, which neither have yet arrived at, and all should strive to reach without invidious comparisons. Wherever the cultivation is most economical, the rents will be higher in proportion. With respect to questions of political economy, we confess our inability and our unwillingness to enter upon them.—M.

Every Man his own Brewer. By Samuel Child. Ridgway. 12mo. Thirteenth Edition.

THE large sale of this excellent little treatise is some indication of its value in the eyes of the public; and its trifling price puts it within the reach of everybody.

"A quarter of Malt," says the author, "with all the ingredients to make good Porter, exclusive of time and trouble, (for time and trouble must have different values in different families, therefore cannot be well estimated by an average calculation,) cost little more than 3l. 10s. From one quarter of Malt and the ingredients, may be produced five barrels of Porter, which may be sold to the publican at 1l. 10s. per barrel, equal to 7l. 10s., which, retailed by the publican at seven farthings per pint, or 1s. 2d. per gallon, amounts to 2l. 2s. per barrel, or ten guineas for the produce of one quarter of Malt; so that the tradesman, mechanic, or artificer, whose family consumes in process of time five barrels of Porter, pays ten guineas for what his own care and his wife's attention might supply him with for less than three and a half."

The object of Mr. Child's book is to show how this can be done.

Of Stephens's *Book of the Farm*, the XIIth part, just published, contains information upon Corn-markets,

Dunghills, Liquid Manure Tanks, and Cows and Calves. As usual, the information upon all these heads is valuable; but that relating to Manure has, upon the whole, disappointed us. Considering the permanent interest of the subject, we had hoped to see it treated very much at length in a standard work like that of Mr. Stephens. Possibly, however, he reserves the matter for a future part of his publication.

CALENDAR OF OPERATIONS for the ensuing week.

Euphorbia jacquiniiflora stands at the head of a small group of house plants, having such a tendency to become naked at the bottom, that it is no easy matter to form them into handsome bushy specimens. The more you prune them the more straggling they become. They are more easily managed as standards, and as such they are very useful in the conservatory when in flower. In large conservatories, indeed, standard specimens are indispensable, though not much sanctioned by the prevailing fashion of the day. But the difficulty lies in converting these stragglers into bushy specimens. Let us take E. jacquiniiflora, which has now done flowering. Do not prune it, nor shift it at present, but keep it nearly dry until all the shoots have grown a few inches long; then give it a good watering to encourage its growth, and prevent it from making use of this stimulus by laying it down on its side. The increased energy of the sap, instead of following the horizontal direction towards the head of the plant will, by following its natural tendency to flow upwards, break out into shoots at the base of the stem. Turn over the plant every two or three days to prevent its growing one-sided, and to get the shoots to break equally around the base of the stem, and supply it liberally with water every time you turn it. When these young shoots at the bottom are a few inches long, you may set your plant in its natural position. These shoots will afterwards act in the capacity of suckers, in clothing the head of the plant, and by preventing it from growing so freely they will enable you to arrange the head into a better form. When the growing season is nearly over, you may stop the bottom shoots at different heights, and by keeping your plants rather under potted, and pruning very sparingly, by only pinching out the tops of the stronger shoots as they advance in growth, you will ultimately have a fine bushy specimen without the assistance of stakes or trellis-work. My attention was first called to this expediency by seeing a Camellia, with a long stem as thick as a walking-stick, break out at the surface of the pot by being turned down on its side to inarch from it.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—After shifting and arranging the stock, a slight syringing to clean off any dust from the leaves is a usual and useful practice. Such of the young stock as have been disrooted must be shaded a few hours in the middle of sunny days, and be kept rather close and moist. Advantage may now be taken of sun-heat to close the houses early in the afternoon, while the sun yet shines on the glass.

VINERY.—Abundance of moisture will now be very useful in all stages of growth, except where the Vines are just in flower. The usual routine of thinning and tying up the shoots is all that is necessary now. All the houses had better be shut up early in the afternoon; sun-heat is far more congenial to vegetation than fire-heat.

PEACH-HOUSE.—Keep up a steady moist atmosphere, and when you have an hour to spare, look over the disbudded shoots to see whether the buds have been properly removed. When they are rubbed off with the finger, they often break again from the bottom; indeed, disbudding with the finger is a slovenly method—the point of a knife is far preferable. If the house is near 55° in the morning, it is enough, and you may shut up when it stands about 70° by sun-heat.

CHERRY-HOUSE.—This house also requires a steady moist atmosphere. Stone-fruit, whether forced or grown in the natural way, suffers more from sudden changes than other kinds.

FIGS.—This is the safest time in the year to begin forcing Figs, and they will do in any of the houses where forcing has lately commenced. The early ones are now swelling their fruit, and require a constant supply of moisture.

MELONS AND CUCUMBERS.—Those who are beginning to grow these plants will now have fewer difficulties to contend with. It is better to commence with Cucumbers and to raise early Melons in the Cucumber-frame. This is the common practice; but those who care nothing for Melons unless grown by sun-heat with as little forcing as possible, will not sow the seed till the beginning or middle of April. For the mode of preparing the beds the amateur must be referred to the index of the two former volumes.

BALSAMS AND COCKSCOMBS for the first crop, as well as any foreign seeds, may be sown now in the Cucumber-frame. A great number of cuttings may also be struck; but they are dangerous things to introduce into Melon or Cucumber beds, as they are so liable to insects.

Out-door Department.

The out-door department of the Kitchen-garden will be a lively scene for the next six weeks. Young aspirants often commit great mistakes at this time by being in too great a hurry; the work is either not half done, or if it is, ten to one if the soil is in a fit state. It is one of the characteristics of a good servant, that he is never seen in a hurry. If you get the successional crops in at the first opportunity, the permanent ones will not suffer much for a week or ten days either way; and if time is taken to do the work in a proper manner, it may save time afterwards and also disappointment.

ASPARAGUS.—Where this is regularly forced, a few rows must be sown annually to keep up the supply. Any time this month will do for this sowing.

ARTICHOKES.—It is a good plan to plant out every year during this month a few rows of suckers; these will come in after the permanent beds have done bearing. An equal quantity of the older stools may then be destroyed annually; plant them in single rows.

HORSE RADISH.—This should be treated exactly like the Artichoke, by planting a few rows annually and trenching up the oldest bed, picking up every morsel of the roots. Plant late Potatoes rather thickly in the bed, in order to destroy what remains of the roots.

SEA-KALE.—Either sow a few rows or plant cuttings from the crowns.

RHUBARB.—This should be planted without loss of time where new plantations are wanted or any new sort is to be tried. Do not trust to seedlings from superior sorts; they sport as much as Broccoli.

PEAS AND BEANS.—It is a good plan to sow early and late sorts at the same time, to prolong the succession; but rather sow often than a large breadth at one time; say every other week till the end of April. The forced ones should be planted out as soon as these severe frosts are over.

ORCHARD.—The chief business here is to provide coverings for the Peach and Apricot trees; and any of these, which are not yet nailed, must be finished forthwith. Whatever covering is used for protection, it should be made to lift up in the daytime. More harm is often done by close-fixed covering than when the trees are not protected at all.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—Recollect, when potting stove plants, that those called shy flowerers are often made to bloom freely by cramping them for pot-room and by using poorer composts, which have the same effect as ringing fruit-trees. A few bulbs of the different

sorts of Achimenes, for the first bloom, should now be fresh potted. Those who exhibit these may now have them several inches high; but for general purposes, this is early enough to begin with them. The different varieties of Hippeastrum will now be showing flower, and may be regulated for succession. The grand point to be attended to, with every large family of plants, is to get them to come in at different times and in as great a succession as possible.

GREENHOUSE.—The Orange tribe, in nine cases out of ten, is, in this country, kept in the greenhouse or conservatory; they, nevertheless, require more heat in winter than the Asiatic Dendrobiums. There is no plant that will stand more bottom-heat than the Orange, or that will better pay for the luxury, provided it is not over-potted. Half the Orange trees in England are in pots and boxes four times too large for them, but more of this hereafter.

CONSERVATORY.—More air, more water, and more plants in flower will be wanted here every week. Orange-trees that can be removed to some of the Vineries at work should now be looked to. If they are in the least unhealthy, prune their heads rather close, shake the whole of the soil from their roots, which you must also prune; and repot them into good fresh loam and leaf-mould, with a little sand and about one-third of rough-ground bones and charcoal, in equal quantities. Give ample drainage, and let the pots or boxes be no larger than just to admit the roots with a little squeezing; place them under the shade of the Vines for two months, and keep their leaves and stems constantly damp.

Out-door Department.

If any alterations are likely to interfere with the regular garden work, a few more extra hands should be put on. Whoever gets behind in the spring is sure to keep so throughout the season; besides, the gardener's time is as much taken up in looking after and directing ten men, as if the number were doubled.—D. Beaton, *Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the Week ending Mar. 9, 1843, as observed at the Horticultural Garden, Chiswick.

Mar.		BAROMETRICAL.			THERMOMETRICAL.			Wind.	Rain.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending March 10, 1843.

THE late sharp frosts have rendered some of the forced vegetables less abundant, but the supply of other kinds has been good. **Fruit.** Amongst the Pines are excellent specimens of the Queen and Providence, from 5s. to 8s. per lb. Forced Strawberries, in small quantities, are offered at 2s. per oz. A few Beurre Rance pears remain, which are selling at 6s. per doz. The supply of Apples is large: Newtown Pippins continue to sell for 3s. per dozen; Golden Pippins fetch from 10s. to 12s., Nonpareils from 7s. to 20s., and a few samples of the Reinette Grise, 10s. per bushel. Kitchen Apples are numerous; the Wellington is selling from 6s. to 7s., French Crabs and Norfolk Beauties from 4s. to 5s., and London Pippins from 4s. to 6s. per bushel; a few Blenheim Oranges are also offered from 5s. to 6s. 6d. per bushel. Cucumbers are not scarce, from 1s. to 6s. each. **Vegetables:** The supply of Asparagus has been somewhat limited, and it has, consequently, made a slight advance, the best bunches being from 6s. to 9s. each. Seakale is also less abundant, and fetches from 1s. to 3s. per half-sieve. French Beans are becoming more plentiful, and may be had from 1s. 6d. to 3s. per 100. White Broccoli of good quality is offered from 9d. to 2s. per bunch. Turnips are well supplied, from 1s. to 2s. per doz. bunches, but there are many of them inferior. Carrots are excellent, and fetch from 4s. to 6s. per dozen bunches; young ones are still selling from 4d. to 6d. per bunch. A few new spring Potatoes may be met with, from 1s. 6d. to 4s. per lb. Onions have made another advance, being from 7s. to 10s. per bushel. Mushrooms are also much dearer, and sell from 1s. to 2s. per punnet. Good Celery is becoming scarce. Spring Radishes are improving, and fetch from 9d. to 1s. per punnet. **Flowers:** Chinese Primroses, Hyacinths, Tulips, and Heaths, in pots, are abundant; the cut flowers contain yellow and Chinese Roses, Pinks, Camellias, Coronillas, Azaleas, Mignonette, Amaryllises, Acacia verniciflua and longifolia, Passiflora racemosa, Burchellia capensis, and the Tree Pæony.

PRICES, SATURDAY, March 11, 1843.—FRUITS.—

Pine Apple, per lb. 5s to 8s	Cucumbers, each, 1s. to 6s
Grapes, Spanish, per lb. 1s to 1s 6d	Walnuts, per bush., 12s to 16s
— Portugal, 1s to 3s	Chestnuts, per peck, 3s to 6s
Apples, dessert, per bush., 4s to 12s	Almonds, per peck, 6s
— Kitchen, 3s to 6s	Sweet Almonds, per pound, 3s
Pears, dessert, per hf. sieve, 6s to 16s	Filberts, English, per 100 lbs. 60s to 65s
Strawberries, forced, per oz., 3s	Cob Nuts, per 100 lbs., 65s. to 75s.
Pumpkin, per doz., 6s to 12s	Nuts, per bushel—
Oranges, per doz., 9d to 2s 6d	— Brazil, 10s
— per 100, 5s to 16s	— Spanish, 18s
— bitter, per 100, 8s to 24s	— Barcelona, 24s
Lemons, per doz. 1s to 2s	— Col, 12s to 14s
— per 100, 5s to 14s	

VEGETABLES.

Savoy, per doz. 6d to 1s	Paraspe, per dozen, 6d to 1s
Cabbage, Red, per doz. 2s to 5s	Spinach, per sieve, 1s 6d to 2s
— White, per doz. 1s 6d to 2s	Leeks, per doz. 3s to 4s
Broccoli, White, per bunch, 9d to 2s	Onions, per bushel, 3s to 10s
— Purple, 6d to 1s	— Picking, per hf. sv., 3s 6d to 5s
Beans, Kidney, forced, per 100, 1s 6d to 3s	— Green, p. doz. bun. 3s to 4s
— per ton, 50s to 70s	— Spanish, per doz. 2s to 6s
— per bushel, 1s 6d to 2s	Shallots, per lb., 6d to 8d
— Kidney, per bush., 1s 6d to 2s	Asparagus, large, per 100, 6s to 9s
— Scotch, per bushel, 1s 6d	— Spruce, or Small, 2s to 3s
— New, per lb., 1s 6d to 4s	Sea-kale, per hf. sieve, 1s to 3s
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Lettuce, p. score, 6d to 8d
Turnips, per doz. bun., 1s to 2s	Endive, per score, 1s to 3s
Red Beet, per dozen, 9d to 1s	Celery, p. bd., (12 to 15) 6d to 2s
Scorzoner, per bundle, 1s 3d to 1s 6d	Rhubarb Stalks, per bdle, 9d to 1s 6d
Salsafy, per bundle, 1s 3d to 1s 6d	Small Salads, per punnet, 9d to 3d
Cardoons, each, 1s	Corn Salads, per hf. sieve, 1s to 1s 6d
Horse Radish, per bundle, 2s to 4s 6d	Water-cress, per doz. bun. 4d to 6d
Radish, spring, per punnet, 9d to 1s	Parsley, per half-sieve, 1s 6d to 2s 6d
— Turnip, p. doz. bun., 1s to 1s 6d	Fennel, per doz. bun., 2s to 4s
Carrots, per doz. bunch. 4s to 6s	Sage, per doz. bunches, 2s to 3s
— Horn, per bunch, 4d to 6d	Mint, per doz. bunches, 2s 6d to 4s
	Mushrooms, per pot, 1s to 2s

Notices to Correspondents.

TO OUR CORRESPONDENTS.—In a publication of this nature, in which a large proportion of the signatures is in initials, it is not wonderful that the same letters should be taken by very different writers, and that this should lead to some confusion. There is probably half-a-dozen contributors rejoicing in the name of S., and as many in that of A., while all the other letters of the alphabet furnish their quota. Of the inconvenience of this system a rather unfortunate instance occurred last week. We have at least three R.s; one writing on Indian affairs, another on Roses, and a third on Planting. The public, knowing nothing of this, may possibly believe them to be all the same person; and in that case R. the first may bear the discredit attaching to R. the third, and R. the second may appropriate the honour due to R. the first. Indeed, if two Sosias cause confusion, the appearance of three on the same stage can hardly fail to bewilder an audience. On the occasion to which we allude, R. the third was convicted of the discreditable act of appropriating to himself the property of Mr. Billington; and as Mr. B.'s complaint was lodged against R. generally, no R. in particular could avoid escaping from the discredit without some special explanation. We therefore beg, in the first place, to assure our readers that R. the pilferer is not R. the learned and high-minded Asiatic, nor R. the intelligent Rose-fancier, nor R. the learned forester, nor any other R. than that one against whom Mr. Billington's accusation was directed; and in the second place, to suggest to our correspondents that it would be much better for themselves and the public if those who wish to preserve an incognito would employ imaginary names rather than initials.

OLD PASTURES.—S. X.—When Grass land is broken up to plant Potatoes, it should always be trenched, and the sod buried deep. If it is ploughed up, the best plan is to sow Oats for the first crop, as is invariably done in Scotland. The next year the sod will be rotten, and then a root crop may be taken and horse-hoed, which the clouds would not admit of the first year.—M.

SALT.—J. D.—Where land is not thoroughly drained, it will perhaps be better to dress with salt sand only as is destined for Celery, Seakale, Asparagus, and similar crops.

SPIRIT OF TAR.—A Subscriber will find an account of the manner in which spirit of tar is applied to land at p. 821, of 1842. The proportions in which it is used are one gallon to every 60 or 70 square yards.

CHARCOAL.—J. D.—Your plan of sowing charcoal-dust, which has long been exposed to the atmosphere, in drills with Onion-seed, is a good one.

BONE-DUST.—J. D.—No injury would proceed from using bone-dust in the preparation of Onion or Asparagus-beds, provided it is not employed in too large quantities.

MANURES.—W. C. A.—Two hundred weight of guano will be enough for a dressing of an acre of Grass-land; but if you can afford 3 cwt., so much the better. Try Potter's guano against the foreign, half an acre of each. Pray remember the allotments, our remarks on which will next week begin to appear.

SOIL.—M. W. K.—It would be desirable to use sand to lighten your soil; and as it is very heavy, eight barrowfuls would not be too much. If there is iron in the sand, you can detect it by mixing it with water, and adding a little powdered nut-galls to it; when, if iron is present, a black colour will appear.

PLANTING.—Patience.—In planting the precipitous sides of cliffs the following rules should be observed:—1. Employ good once transplanted seedlings, not above one foot high. 2. Cut a niche in the side of the cliff, slanting inwards, loosen the soil in that hole as much as you can, and after planting leave the opening to catch and retain the rain. 3. Ashes, Yews, Oaks, or almost any hardy trees, will grow if such precautions are taken. If your soil is hot and dry, you must place Sphagnum, or some other substance which absorbs moisture, such as rotten dung (or chopped rags steeped in muriate of lime), over the earth round the stems, so as to keep them moist until the plants have got hold.

SNOKE.—Emma.—It is impossible to advise your good neighbour how to consume his smoke without inspecting his means. If he can construct a descending flue, like those used in the stoves placed in the middle of the London shops, that will do it effectually and cheaply.

HEATING.—H. C.—Much obliged for your note; but we see no cause to change our opinion. We did not say who should do the work; but we think that if such a boiler, costing 4l. 4s., and two-inch pipes were put together by the village blacksmith, heat enough for our correspondent's purpose would be obtained for the money we named.

VINES.—M. C.—The best mode of training your young Portugal Vines, which are planted in pots, and have stems 3 ft. high and nearly an inch in diameter, will be to allow all the buds to break, and, as soon as you can distinguish which are likely to produce fruit, to rub off the barren ones. Not more than six or eight should be retained on each plant. The stem should be secured to a stake, but the young shoots, which are to be stopped at one leaf above the bunch, will not require any support until the berries have attained a considerable size.

J. L.—If you can cover your Vinery well with mats during the two nights in which you will be obliged to dispense with fires on account of the alterations which are being made in the house, we should imagine that the temperature within might be kept above 45°, from which the Vines would receive no injury. If you are doubtful, however, of being able to keep the temperature above that point by covering, you might introduce a stove, with a pipe to convey the smoke out of the house; but the stove must have a good draught, otherwise the gas from the coke will escape and destroy the foliage of the Vines. Wet moss should also be spread over the pathways, to prevent the atmosphere from becoming too dry. It will be advisable to cover the house with mats as early as five o'clock in the afternoon, that all possible advantage may be taken of sun-heat; and they should be removed in the morning as soon as the sun's rays fall upon the house.

J. D.—To protect the stems of Vines from cold, and at the same time not to give them an unsightly appearance, you may have square wooden boxes, about 6 in. in diameter, with one side wanting, made to fit over each stem, and secured to the front of the house by hooks and staples. The intervening space between the Vines and the sides of the box may be filled with hay or dry moss. In summer, these boxes may be removed without injury to the stems of the Vines.

SCOTCH FIRS.—Condiscipulus.—We have much doubt about the Highland Pine being really different, or at least distinct, from the common Scotch Pine; and we are confirmed in our doubt by Dr. Dickie, who, in his late report on the Forest Trees of Aberdeenshire, says, that the Highland Pine yields white wood in the low grounds. We shall notice his paper fully next week. Mr. C. is a very respectable man, and we have no doubt about his believing his seeds to be genuine. A pound of Scotch Fir seed contains about 40,000 seeds.

AVOCADO.—A. J.—This plant has not produced its fruit in Europe, and therefore some uncertainty exists as to its natural affinity, it however probably belongs to the Cornaceae order.

FLOWER-BEDS.—Trochilus.—You cannot procure anything better for keeping your flower-clumps gay during summer than Verbenas, Anagallis, Senecios, Petunias, Dahlias, scarlet Pelargoniums, Fuchsias, Heliotrope, Alonsoas, Nicotianas, and Lantanas.

TUSsock GRASS.—Klampicos has sent us the dimensions of some tufts of Carex (paniculata) growing in his neighbourhood, with a bunch of leaves, which, when gathered, was 7 ft. 6 in. long, and was only of the average length. The height of the tufts or balls from which the leaves spring exceeds 4 ft., and their circumference is fully 8 ft. The magnificent head of leaves falling to the ground on all sides, with a diameter of 10 or 12 ft., must make these plants nearly equal in appearance,

if not in usefulness, to the "Festuca flabellata." It is a pity that so fine a Sedge should be of so little agricultural value.

IPOMOEA LEARII.—W. X. Y. Z.—Instead of allowing your plant of Ipomoea Learii to remain unpruned, you should cut it back to a bud, which is likely to break strongly, within a foot or two of the root. You had better excite it into growth in gentle heat.

THUNBERGIA ALATA.—A. K.—This plant and its varieties will flower well in a warm greenhouse, if potted in a mixture of equal parts of sandy peat and loam, provided it is kept in a moist atmosphere and occasionally syringed, to prevent the attacks of the red spider. It will also bloom during the summer months, when planted out in a sheltered corner of the flower-garden.

CYRILLA PULCHELLA.—V. L. C.—We are in possession of a paper relative to this plant, which will be published shortly.

TROPEOLUM TUBEROSUM.—A. K.—We have already stated the conditions under which this plant is most likely to flower at p. 121.

GLOXINIAS.—Francesca.—By starting your Gloxinias at this season, and growing them in a hotbed until they show signs of flowering, you might perhaps be able to bloom them in a warm corner of the greenhouse during the summer months. You had better try G. speciosa, speciosa alba, candida, and caulescens.

CAMELLIAS.—M. W. K.—By all means repot your Camellias as soon as the blooms have fallen, if the roots are appearing through the bottoms of the pots.

ORANGE-TREES.—Trochilus.—If you can plant your Orange-trees in the border of a conservatory, they will grow more luxuriantly than if they are kept in tubs.

LISIANTHUS RUSSELLIANUS.—Trochilus.—The seeds of this plant, if not sown as soon as ripe, will lie for a long time in the ground before they vegetate. It is best to sow them at once in a close, damp atmosphere, where the temperature is not very high. The soil should be rather strong and shaded.

PELARGONIUMS.—W. X. Y. Z.—A mixture of two parts turfy loam to one of well-decomposed cow-manure, not less than three years' old, with a small portion of silver sand, will be found a suitable compost for blooming Pelargoniums in.

TROCHILUS.—We are unacquainted with the effect of nitrate of soda upon Pelargoniums. If applied to them, you had better first try it in the proportion of half an ounce dissolved in six galls. of water.

PATIENCE.—Having so many as 600 seedling Pelargoniums, we should advise you to economise space, not to shift them into larger pots unless they really require it. They will be thrown into bloom much earlier by allowing them to remain as they are; and although the flowers may not be so large, their good or bad properties will still be apparent. The soil in which they are potted should not be so rich as that generally used for blooming Pelargoniums in.

ROSES.—E. H.—Bourbon and Perpetual Roses, with their hybrids, may all be classed amongst the varieties of the Chinese Rose. They have been so repeatedly crossed that it is impossible to refer them to any particular species.

A. K.—There will be no necessity for root-pruning the pillar Roses to which you allude, provided they are planted in a warm situation and where the roots cannot penetrate into a cold wet subsoil. Should this not be the case, they had better be taken up and replanted with the roots nearer the surface, after spreading a good layer of lime-rubbish at the bottom of the trench.

M. C.—The cause of Roses occasionally opening with their centres green and distorted has never been satisfactorily explained.

FRANCESCA.—We recommend you to procure the following Roses for your west wall: Aimée Vibert, De L'Isle, Marie Leonida, Garland, Well's Noisette, Blairi, and common China. Donna Maria, Banksiaeflora, and Rampant are good evergreen kinds.

SNOWDROPS.—A Dabbler in Gardening.—Klampicos says that if you will give your address, he will, at the season, supply you with any quantity of the single Snowdrop, as it grows in the meadows near him in the greatest abundance.

MELONS.—Trochilus.—The Beechwood is an excellent Melon, and a good bearer.

PROTECTING FRUIT-TREES.—A. B.—A coping of deal affixed to the wall above fruit-trees will not materially protect the blossoms from frost, unless it is very broad. Its efficacy will entirely depend upon the direction of the wind or stillness of the night.

CABBAGE.—K.—The Cæsarean Cabbage is another name for the Cow Cabbage. In Jersey, favoured by the mildness of the winters there, this variety has been stated to attain 12 ft. in height, and many absurd exaggerations have been propagated. The produce in this climate is not equal in weight to that of the Drumhead Cabbage. Like others of the same tribe, it requires to be sown in August, and to be planted out 24 ft. apart.

TOSOLSK RHUBARB.—We cannot spare more room for the discussion of the merits of this variety, further than to say that Messrs. Youell and Co. state, in a letter before us, that they invariably find it full three weeks earlier than any other variety cultivated by them. H. J. had better apply to them upon the subject.

BOOKS.—A Shropshire Subscriber.—M'Intosh's Practical Gardener will answer your purpose.

PLANTS IN ROOMS.—J. K.—You will find our opinion of the effects produced by plants in sitting-rooms at p. 571, of 1842.

LAWNS.—V. L. C.—Bone-dust is of little value as a top-dressing for lawns; unadulterated soot is a better material.

CANVAS FOR FRAMES.—A Young Gardener.—Our correspondent alluded to the article at p. 55. Canvas may be rendered durable and transparent, if prepared in the manner stated at p. 36; or by being painted over with heated linseed oil, as recommended at p. 139.

BEE-HIVES.—A. S. R.—We are making inquiries, and will answer your question shortly.

SHADED GROUND.—Q. in the Corner.—In a plot of ground which you state is shaded by houses from the sun, you can grow before autumn, Early York Cabbage, Lettuces, Onions for drawing young, Early Stone Turnip, Radishes, and Spinach.

MISCELLANEOUS.—Original Subscriber.—Your plants are Jasminum humile and Zichya inophylla.

P. R. W.—Your specimens are—1, A White Poplar, 2, a species of Hazel, 3, Cornus mascula.

A Constant Reader.—Your plant is Mesembryanthemum stellatum. Those of your seeds most worthy of cultivation are—Nos. 3, 5, 6, 8, 9, 12, 19, and 20.

P. Q.—Your plant is Edwardsia microphylla, and is by no means rare.

J. K.—We cannot assist you respecting the seeds. If the parcels sent out are too large and expensive, why not divide them yourself into smaller portions?

H. K.—Your Pear is the Grosse Romaine, only fit for stewing and drying. It is also called Carmélite Musquée.

W. Birmingham.—Beautiful and varied in colour as your seedling Cinerarias are, they are all deficient in the breadth of their petals, and they differ but slightly from those raised by other growers; the two best are 1 and 8, the latter is a very clear and beautiful blue.

Truro.—Some of the Pelargoniums mentioned in your list have not (we believe) been flowered in the neighbourhood of London; the following are new to us—Glory of Jersey, Reward, Acme of Perfection, Countess of Cornwall, Fascination, and Wonder of the West. The remainder of your list contains many fine flowers, and all are worthy of cultivation.

W. J. B.—We will endeavour to procure you the number.

ERRATA.—In Mr. John Holland's advertisement, inserted Mar. 4, for "Some's Marchioness of Westminster," read "Lowe's." As usual, many letters have arrived too late for answers this week. Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them delivered in any part of London, by remitting a Post office order to this Office, at the rate of 5s. for every 25 copies.

NEWS OF THE WEEK.

THE trial of M'Naughten for the murder of Mr. Drummond terminated on Saturday. The defence turned, not on any denial of the act, but on the state of the prisoner's mind when he committed it. The medical witnesses examined on this point unanimously deposed that the prisoner was labouring under a delusion which impelled him to the act, and deprived him of all moral control, and consequently that he was not a responsible agent at the time. The Lord Chief Justice considered this testimony so strong as to compel him to stop the case, and the jury under his direction acquitted the prisoner on the ground of insanity. This result has been received with much astonishment; and a general impression is abroad—strengthened by subsequent threats of assassination addressed to Sir R. Peel and Mr. Goulburn—that some legislative measure is necessary to protect the public from that form of partial lunacy which is now recognised as an exemption from punishment. The subject has been submitted to both Houses of Parliament, by Lord Brougham in the Lords, and by Mr. Mackinnon in the Commons; and the Lord Chancellor has given notice that he will bring the question before the House on Monday, with a view to some immediate provision. The debates in Parliament this week have been unusually long and important. On Tuesday, Mr. Fox Maule brought forward his motion on the Church of Scotland, supporting the claim of the church to a jurisdiction independent of the Civil courts, and to the abolition of patronage, or at least to such a recognition of the principle of non-intrusion, as will satisfy the people of Scotland and prevent the threatened secession of a large body of ministers from the establishment. The motion was opposed by Government on the ground that the claims of the church are inconsistent with the constitution; and that if they were conceded the House would overrule the supremacy of the Law, by which the church itself was established. Sir R. Peel declared that a settlement might certainly be effected consistently with the privileges and rights of the Church of Scotland, but that it could hardly be done if the present demands were persisted in. After two nights' debate the House negatived the motion by a majority of 135. On Thursday a series of resolutions was submitted to both Houses condemnatory of Lord Ellenborough's proclamation, and particularly denouncing his letter to the Princes of India in regard to the gates of Somnauth as encouraging idolatry and Paganism. After a long debate the resolutions were negatived in the Lords by a majority of 58, and in the Commons by a majority of 85.

From France we learn that the important debate in the Chamber of Deputies on the Secret Service Bill has been carried by Ministers, after a struggle of four days, by a decisive majority. On the amendment, which was first disposed of, the division gave a majority of 45 to Ministers; while the Bill itself was carried by a majority of 89. This result was altogether unexpected, and according to the Government Papers it was due in a great measure to the speech of M. Guizot, which appealed so powerfully to the reason of the Deputies, that many who had previously been unsettled, were induced to become supporters of Government. Our Spanish news relates chiefly to the progress of the elections, and to the prospects of parties at the ensuing crisis. The preparatory movements in Madrid have been favourable to the Government, but many of the provincial towns have returned Opposition candidates, and the final result is considered to be extremely doubtful. From Portugal we learn that the Government, on learning the intention of the British Ministry to suspend the negotiations on the tariff, have at length resolved to propose further reductions on articles of British produce, and there is now some chance that the long-pending question will be brought to a settlement. From the United States we learn that the Bill for the occupation of the Oregon territory has passed the Senate by a majority of 2, and has been submitted to the House of Representatives. We have accounts from the West Indies of a disastrous earthquake, which has laid waste the islands of St. Thomas, Antigua, and Montserrat, and has been felt, it is feared, in others, from which, at present, we have no advices. The India mail has been expected for two or three days past, but we have not yet received any tidings of its arrival at Marseilles.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Prince of Wales and the Princess Royal, returned to Buckingham Palace, from Claremont, on Thursday. During their stay at Claremont, the Queen and Prince Albert took daily exercise on foot in the Park, and her Majesty continues in excellent health. The Hon. Miss Stanley has succeeded the Hon. Miss Devereux as one of the Maids of Honour in Waiting on the Queen. The contemplated marriage between his Serene Highness the Hereditary Grand Duke of Mecklenburg-Strelitz and the Princess Augusta of Cambridge is not expected to be solemnised until the middle of May. The bridegroom-elect

is expected to arrive at Cambridge-house from the Continent at the close of the ensuing week. — The Earl of Ripon was able to leave his room on Monday for the first time since his illness.

Parliamentary Movements. — Viscount O'Neill has been elected one of the representative Peers of Ireland in the place of the late Viscount Gort. Mr. Matheson has been elected Member for Ashburton in the room of the late Mr. Jardine; the numbers at the close of the poll were, for Mr. Matheson (Liberal), 141; for Mr. Horsley Palmer (Conservative), 96. A vacancy has occurred in the representation of Tavistock by the retirement of Mr. Rundle; Mr. J. S. Trelawny has announced himself a candidate on the Liberal interest. — Mr. Newdegate has been elected Member for N. Warwickshire without opposition.

Gazette Announcements. — The Queen has been pleased to appoint Commander H. W. Hill, R.N., to be Lieutenant-Governor of her Majesty's Settlements on the Gold Coast.

Post-office Money Orders. — The following are the numbers of money-orders issued at some of the principal Post-offices during the last three months. At the General Post-office, in round numbers, 15,000; Dublin, 11,000; Edinburgh, 7,000; Liverpool, 18,000; Manchester, 13,000; Glasgow, 8,000; Birmingham, 8,000; Charing-cross, 8,000; Bristol, 7,000; Bath, 5,000; Brighton, 6,000; Lombard-street, 7,000; Cavendish-street, 5,000. Some idea may be formed of the immense sums paid into the various Post-offices in the kingdom by the fact that above a quarter of a million of pounds sterling were paid into the few offices just mentioned, in small sums, varying from 1s. to 5s., during the space of three months. The commission on such a sum must have amounted to between 2,000l. and 3,000l. The money-order department increases in extent at a rapid rate, and there are already upwards of 100 clerks in the Post-office order department in the General Post-office.

Foreign.

FRANCE. — The great debate in the Chamber of Deputies on the Secret Service Bill has been carried by Ministers by a triumphant majority, after a struggle of four days. The papers of all parties concur in representing the closing debate of Thursday as the most brilliant that had yet occurred. Only three speeches of any note were delivered — viz., those of M. de Tocqueville, of M. de Lamartine, and of M. Guizot. The oration of M. de Lamartine is praised by the journals of his party, and indeed generally by all those of the Opposition; but even his own paper feels obliged to confess that the discourse of M. Guizot surpassed it in a manner the most remarkable. That journal states that "the immense effect produced by the truly gigantic contest between M. de Lamartine and M. Guizot, orators of such dissimilar, although equal, talent and understanding — the one so diffuse, the other so concise — the one enthusiastic and generous, like poetry — the other cool and inexorable, like history — cannot be described." The *Journal des Debats* describes it as a masterpiece. "We bear witness that the emotion it occasioned was universal. Shouts of admiration burst from all mouths. No eloquence ever clothed in finer forms the austere language of reason and of patriotism, and talent never gained a more remarkable or a more just triumph. Injustice itself has its limit; but this fire of improvisation, this admirable well-timed reply, and the immense emotion of a numerous audience, cannot be reproduced by even the most faithful report." At the close of the debate on Friday, the Chamber divided, when there were — for the amendment 197, against it 242 — majority for Ministers 45. The announcement of the numbers appeared to overwhelm the Opposition, while it elicited shouts of triumph from the friends of Government. The discussion on the bill was concluded on Saturday. Previous to the ballot, M. de Labourdonnaye asked M. Guizot if a Frenchman named Lefevre, who had been ill-treated at Girona by General Zurbano, had obtained satisfaction for that offence? M. Guizot replied, that he had demanded of the Cabinet of Madrid not only a disavowal of the conduct of that General, but also an indemnity for the injury sustained by M. Lefevre; and that the affair was now pending between the two Governments. After a few words more from the Minister, relative to the capture of a French vessel by a Spanish cruiser, the discussion was closed. The grant of 1,000,000f. for secret service purposes was then put to the vote, and carried by 244 against 155, giving Ministers a majority of 89 votes. — A proposition submitted to the Deputies by M. Jaubert, for granting 13,000,000f. towards finishing the Louvre, and connecting that building with the Palace of the Tuileries, has been rejected by a large majority.

SPAIN. — Our accounts from Madrid are of the 27th ult. The preparatory elections commenced on that day, and in 11 of the 12 colleges the candidates returned to constitute the respective committees were favourable to the Ministry. Few electors, however, came forward; in several colleges composed of 500, not more than 65 took part in the operations. The Government has been defeated in Biscay; the Opposition having returned members for Bilbao, Portugalete, Durango, and other places. The Opposition were expected to prevail also in Guipuscoa, and had already been successful in the province of Burgos. From Barcelona we learn that the municipal elections were to take place on the 5th inst., the Government having approved of the annulling of the late ones.

PORTUGAL. — Letters from Lisbon of the 1st inst. announce that the Portuguese Government have at last on learning the rejection of their former proposals, and the intention of the British Government to suspend negotiations, resolved to propose further reductions on woollen cloths and salt fish, which they had hitherto resisted. It

was thought at Lisbon that the present offers, if not accepted, would be met by proposals that would bring the question to a settlement. In the Cortes, the peers had at last passed the bill of indemnity; and the deputies had voted the authority to raise 900 contos of reis on the tobacco revenues. There were, however, reports that further changes in the Ministry were likely to take place. Much damage had been sustained by the inundations caused by the heavy rains. Many farmers, near the Tagus, had suffered great losses in seed destroyed and cattle drowned, and some wine-stores had also been damaged. At Oporto and St. Ubes serious losses had also been sustained from the same cause.

GERMANY. — The Berlin official papers give, in several columns, a detailed account of the brilliant masquerade, on Shrove Tuesday, in the Royal Palace. The number was 3,500 — not 7,000, as previous reports had stated; 1,000 persons sat down to supper, and 2,500 were accommodated at the side tables. They also publish the instructions to the censors of the public press announced in the Cabinet order of the King of Prussia. They are of too great length for the general reader, but they are chiefly directed against anti-religious works. The censors are to forbid all works "the tendency of which is in opposition to the fundamental principles of religion in general, and the Christian faith in particular." In politics, the censors must forbid any works "developing theories tending to shake the constitution of the monarchy, or any constitution in existence in the German states." They must also forbid anything to be printed of a nature to wound the reputation and honour of individuals. — Accounts from Vienna state that the weather has been so mild in that city, that the fruit-trees in the neighbourhood are already in full blossom. The Government, taking advantage of the weather, have put 30,000 workmen on the railroads to be constructed, 6,000 of whom will be employed on the line between Vienna and Prague.

TURKEY. — The Levant mail has brought accounts from Constantinople to the 27th February. They state that the Sultan's autograph letter, in reply to that of the Emperor, was delivered to the Russian Minister on the 13th ult. This letter contains a positive refusal on the part of the Sultan to consent to the revocation of his acts. It is also announced that Tahir, the Captain Pacha, has been dismissed, and replaced by Halil Pacha, son-in-law of the late Sultan.

UNITED STATES AND CANADA. — The packet-ship *United States*, which sailed from New York on the 16th ult., arrived off Belfast on Wednesday morning. The papers received by her are nineteen days later than those brought by the last steamer. The only proceeding in Congress interesting to the English reader was the progress of the Oregon Territory Bill in the Senate. The bill, it will be recollected, is for the protection of American settlers in the territory of Oregon, and for the enforcement of the right of sovereignty and jurisdiction of the United States Government over the said territory. It had given rise to long and animated debates. Mr. Calhoun made a long speech against the bill. He showed conclusively that the course recommended by the bill is contrary to existing treaties, and that, if attempted to be carried into effect, it would, in all probability, lead to a war with England; a war in which, as far as the occupancy of that territory is concerned, she would have decided and irresistible advantages over the United States. The immense armies now in India, he said, are free to be directed to any other point that is necessary to sustain her power, and on the first moment of a demonstration on the part of the United States to violate the treaty, she would transfer those forces across the Pacific, and take possession of the territory. This she could do in 40 days, while, had the United States sufficient troops and a navy necessary to their transportation, they could not reach the Columbia river in less than six months; and to send troops thither overland would take nearly as long by uninterrupted marches. He also demanded where the means were to be provided to sustain these fleets and armies. On the final vote, however, "that the bill do pass," the numbers were 24 to 22; majority in favour of the passage of the bill 2. The voters were indiscriminately senators of both political parties. The bill has been submitted to the Representatives, who are expected to reject it. The Court of Inquiry into the late mutiny on board the *Somers* has given its verdict, acquitting Commander McKenzie of all blame. — The news from Canada comes down to the 9th ult. The last bulletin issued by Sir C. Bagot's medical attendants, stated that his health has, during the last few days, undergone a change for the worse; and he was rapidly approaching his end. Dropsy had made its appearance, and he was not expected to survive many days.

WEST INDIES. — The mail-steamer *Forth* arrived on Saturday evening at Falmouth, with Mexican, West India, and other mails, having left St. Thomas's on the 9th ult. She brings the tidings of a dreadful earthquake, which occurred at St. Thomas's on the 8th ult., and extended, as we learn, by later advices, to Montserrat and other islands. The Thames steamer, when abreast of English Harbour, Antigua, felt the shock so severely, that all hands thought the vessel had struck. The land was suddenly enveloped in clouds of dust, and the effect on the crew is said by the captain to have been indescribable. The mail-steamer *Actæon*, which arrived at Falmouth on Tuesday, has brought additional particulars of this melancholy intelligence. It appears, as was too truly feared, that it had extended to other portions of the West India Islands, and that in order to ascertain the particulars, the *Actæon* was despatched to visit them successively, prior to taking home the information. Distressing as the accounts are from the different islands, it is satisfactory to know that the sacrifice of life has been comparatively trifling, though

the injury has been most serious to churches and other public buildings, both civil and military, to dwelling-houses, sugar-mills, &c., more particularly at Antigua, where the largest amount — eight lives, were lost; at Montserrat, five, and at St. Christopher, two. At St. Thomas and Nevis, it appears no lives were lost. When the *Actæon* took her departure no positive news had been obtained either from Guadaloupe, Dominica, St. Eustatia, Martinique, or St. Lucia, though it was thought they must have shared in the calamity. The *Dee* man-of-war steamer, which left Antigua on the 11th Feb. for Bermuda, will most probably be the next arrival from the West Indies, but she is not likely to bring more detailed intelligence. The Governors, Members of Council, and principal inhabitants of the different islands were actively applying all their exertions to meet the exigencies occasioned by the catastrophe, but it was much feared the crops, which were promising and abundant before its occurrence, would, for the most part, perish, from the sugar-houses, mills, and machinery being destroyed to so great an extent. By the mail from St. Domingo we have advices from Port-au-Prince, to the 28th Jan., which state that a fire on the 9th of that month had destroyed upwards of four hundred houses, and among them the shops and stocks on hand of the principal merchants. The loss was estimated at six million dollars currency. At Trinidad some apprehension was entertained that the crops might possibly be injured through the unwelcome and unusual presence of "a shower of caterpillars." Parts of the city had been visited for upwards of a fortnight by these insects, in numbers sufficient to take complete possession of the trees, and to destroy not merely the leaves but every appearance of vitality, and it was feared that their migrations might be extended to the cane-fields, cocoa plantations, &c.

NEW ZEALAND. — The *New Zealand Gazette* of the 1st October brings the melancholy intelligence of the death of Capt. Hobson, the first Governor of this settlement. He died at Auckland, on Friday, the 10th Sept., from a severe attack of paralysis, which from his youth appears to have made great inroads upon his constitution. His burial was attended by a vast concourse of natives, who, on the morning of that ceremony, performed the "uhunga," or funeral dirge, as if for one of their own most valued chiefs, and in their general behaviour on the occasion evinced the respect they entertained for the deceased. Mr. Willoughby Shortland, the colonial secretary, was filling the post of Governor, in addition to the discharge of his own duties.

Parliament.

HOUSE OF LORDS.

Monday. — Lord BROUGHAM said that, unless his noble and learned friend on the woolsack, or his noble and learned friend the Lord Chief Justice of the Queen's Bench, intended to bring in any measure, or to make some proposal for the purpose of calling the attention of their Lordships to the state of the law relative to persons who committed crimes whilst labouring under partial insanity, he should feel it his bounden duty to give their Lordships an opportunity of taking that most important subject into their serious consideration. He begged leave to add that, in his opinion, such a measure would have a much better effect, and would be much better introduced to the consideration of Parliament by either of his noble and learned friends, who had, as it appeared to him, official duties, to some extent, connected with the mooted question. He would answer for this, that as far as his humble assistance might tend to facilitate the adoption of any course which might be expedient in this emergency, he should at all times be most anxious and willing to afford it.

The Lord CHANCELLOR said he was happy that his noble and learned friend had called his attention to the subject. He had already directed his attention to it, for he was anxious to see whether anything could be done to obviate the evils which might arise under the present state of the law. He was about to put himself in communication with persons likely to possess correct information on the subject, and if that information would lead to any practical result, he would communicate it to their Lordships. He must add that he was glad to have the assistance of his noble and learned friend in furtherance of an object which everybody must have in view.

Lord BROUGHAM said he was satisfied that nothing could be more satisfactory to the country at large than the declaration of his noble and learned friend.

Lord DENMAN said that he had not at all turned his mind to the consideration of the subject; but he had opinions arising out of late events which induced him to think that it was highly proper that the matter should form the subject of grave consideration in Parliament. He thought that the more his noble and learned friend (Lord Brougham) considered the subject, the more firmly he would be impressed with the opinion that the measure should be brought forward by her Majesty's Government. He could only say, on the part of himself and the other learned Judges, that if it should be thought that their counsel or testimony would be useful in the framing of such a measure, that they would be most happy to give it.

Lord CAMPBELL said he was glad that the subject would be brought under the consideration of Parliament by her Majesty's Government. His noble and learned friend (Lord Brougham) had made use of one expression which he was afraid would lead to some misconception. His noble and learned friend had spoken of "partial insanity." Now from that it might be supposed that a person labouring under partial insanity was not accountable for his actions; whereas, the fact was, that, unless the person was insane when he committed the act, there was no immunity from punishment. He hoped that some measure would be speedily introduced, for it was monstrous that society should be exposed to the dangers to which it was at present exposed from persons in this state being allowed to go about.

Lord BROUGHAM said that he made use of the expression "partial insanity," instead of using the more learned word "monomania," which, perhaps, was the correct term. Partial insanity was that state in which a person was at times insane, whilst monomania was that state in which a person was at all times under the influence of one delusion.

Lord MONTAGUE postponed his motion on the Corn-laws till next Tuesday. — The committee on the Townshend Peerage reported that they had searched in vain for precedents; and that no relief could be given to the petitioners in this case except by means of a private Bill.

Tuesday. — Lord TREYNHAM brought forward the subject of the Poor-law, with the view of obtaining an abrogation of the power of separating husband and wife in workhouses. The Ecclesiastical and Civil Courts did not grant a divorce, except on the score of cruelty or adultery. Yet the Poor-law separated mar-

ried couples for no other cause than poverty, and added imprisonment to separation. Besides, the same treatment was applied indiscriminately; the drunkard and the thief were placed on the same level with the unfortunate. He did not ask for an opinion on the general policy of the law, but simply for a condemnation of that which was a violation of common sense and propriety, and the removal of which would tend to the durability of the law itself.—The Duke of WELLINGTON complimented the noble Lord on the success of his maiden effort, but felt bound to oppose the motion. There was no such thing as divorce in workhouses; there was only a separation of the sexes; during the day the members of a family might see each other as often as they wished. Officers in the army and navy were compelled to submit to separations of greater duration from their wives and families. A new measure had been for some time under the consideration of the Government, with the view of mitigating some of the hardships of the existing law, which would be introduced perhaps before Easter. He, therefore, hoped that their Lordships would not agree to indefinite resolutions; and moved, as an amendment, the adjournment of the House.—Earl STANHOPE condemned the existing Poor-law, but after a short debate, the Duke of Wellington's amendment was carried without a division.

Thursday.—The Marquis of CLANRICARDE brought before the House the proclamation issued by Lord Ellenborough, dated the 1st October, 1812, and his letter of the 16th November, addressed to the Hindoo Princes, and moved thereon a resolution condemnatory of them as commenting on the policy of Lord Auckland, and as encouraging idolatry and Paganism. It was, he said, unprecedented for one Governor-General of India to comment on the acts of his predecessor. The principle of the Government of India was averse to such criticism, for it was unnecessary upon a change of Government at home to change also the Governor-General of India; and, from the time of Warren Hastings, it was agreed by all statesmen that on that soil political and party differences were to end. Documents similar to those issued by Lord Ellenborough had never previously been sanctioned by the Board of Control, or by the India House. The evident meaning of the proclamation was to set forth the wisdom and policy of Lord Ellenborough in opposition to the wisdom and policy of his predecessor in office; and its effect upon the people of India would be most injurious to the future government of our empire there. With respect to the words of the letter to the Hindoo Princes, however ridiculous they might be, they implied that the expedition into Afghanistan had been undertaken for the express purpose of carrying away the gates of Somnauth, and of restoring them to the temple from which they had been formerly taken. This was, therefore, a most gratuitous tribute to the Hindoo worship; and, to any man of plain understanding, it appeared a direct encouragement given to a gross and horrible superstition. It was also most calculated to excite religious animosities between the Hindoos and Mahomedans, which if Lord Ellenborough wished to do, he could not have more effectually done than by the issuing of such a document.

The Duke of WELLINGTON condemned as unusual and unjust the construction of a cumulative resolution like that proposed by Lord Clanricarde, upon two papers written on subjects entirely distinct. In one document not a word was said that could be even supposed to reflect on the acts of Lord Auckland; and in the other there was not even a hint at the gates of Somnauth. Yet on these two a resolution of condemnation had been framed. In fact, it had become absolutely necessary for Lord Ellenborough to publish the proclamation, on account of the previous one issued by his predecessor. Lord Auckland had, in October, 1838, published a declaration, in which were set forth the circumstances attending the commencement of the operations, and the arrangements that were determined on; and as it fell to the lot of Lord Ellenborough to put an end to these arrangements, it was reasonable and right for him to make known the then existing state of things, in what form he had found affairs, and what he intended to do. The errors alluded to by Lord Ellenborough were not the errors of the policy of his predecessor, but the errors that had been committed by the expedition. These errors were many and great. That of forming an army for the Afghan Sovereign, composed of Englishmen and Hindoos—but not of Afghans—who were involved in all the details of his revenue and Government, was one great error. To allow the territory to remain not properly occupied, indeed scarcely conquered, was another error. The Resident at Cabool not being a military officer was a third. These and others of a like nature were the errors to which Lord Ellenborough adverted in his proclamation as having led to the disasters that he had to repair. With respect to the Somnauth triumph, the gates were ordered to be carried away simply as a trophy of the army's successful march. Neither Moslem, nor Jew, nor Hindoo was excepted from bearing a part in this triumph: all of them had been parties to the great service performed at Ghuznee, and they all joined in celebrating the triumph. No danger possibly existed of religious animosities being excited between the Hindoos and Moslems by this letter; the only danger of such an occasion would arise from motions similar to that made by Lord Clanricarde, diffused and enlarged upon by the licentious press here and in India. It was absurd to suppose that this paper gave any encouragement to idolatry. It was simply a song of triumph. The temple never had been a Hindoo temple at all. Nobody knew in truth what it had been. At all events there were none remaining now in India of that particular idolatrous sect for whose worship this temple had been originally designed. Moreover, the words used by Lord Ellenborough, in the identical document in question, were the strongest refutation possible of the unfounded charge made against him of giving encouragement to idolatry. His Grace concluded by calling on their Lordships to reject the motion.

Earl ARKLAND said the responsibility of the errors attributed by the Duke of Wellington to Sir William M'Naghten, as Resident, ought to be shared by the person who directed the military operations.—Lord COLCHESTER defended the Governor-General from the charge of wishing to accuse his predecessor.—The Bishop of LONDON believed the construction put on the proclamation to be a mistaken one. In the removal of the gates Lord Ellenborough contemplated nothing more than did the Duke of Wellington at the time Paris was occupied by the Allies, when the various trophies were returned to the nations from which they had been torn.—The Bishop of NORWICH never supposed that Lord Ellenborough intended to uphold idolatry, but his proclamation certainly tended to discourage the progress of Christianity in India. As he did not agree with the political part of the motion, he could not support it.—The Bishop of CROIXSTON condemned the Somnauth proclamation, and regretted that the documents on which the resolution was framed had been mixed together. He felt convinced the Governor-General had a military, and not a religious object in view, and on these grounds he could not concur in the motion.—The Earl of CLARENDON supported, and Lord FITZGERALD opposed, the resolution.—Lord BROUGHAM ridiculed the forced interpretation attempted to be put on Lord Ellenborough's proclamation and letter to the Princes. He could not conclude that the Governor-General had meant to pass any censure on his predecessor; but if he even did so, no objection could be made to such a course on the ground of want of precedents, nor could any danger be imagined which would be likely to arise from it. The gates were manifestly regarded as a military, and not a religious trophy. They originally belonged not to the Hindoos or Brahmans, but to a sect of Buddhists. They had nothing to do with the religious feelings of Mussulmans or Hindoos, but they had to do with the national spirit of the whole people of India, as trophies formerly taken from their common country by their conqueror Mahmood, and now recovered. In the absence of Lord Ellenborough, and putting a plain charitable construction on the words made use of in the proclamation and letter, their Lordships could not avoid giving a verdict in his favour by rejecting this motion.—The Marquess of LANSDOWNE would not but think that the indiscreet letter of Lord Ellenborough was most calculated to raise imputations, however

unfounded, that his Government was favourable to Hindoo idolatry. This letter was a great misdirection, and the proclamation reflecting on the conduct of his predecessor was in the highest degree impolitic and unusual.—Their Lordships divided—for the motion, contents, 25; non-contents, 83; majority against the motion, 58.

The LORD CHANCELLOR gave notice that he would, on Monday, call the attention of the House to the subject of the late trial and plea of lunacy.

Friday.—The House met for a short time to receive petitions.—Lord BROUGHAM called attention to the state of the law respecting aliens, in presenting a petition from a gentleman born in Germany of English parents, during their temporary absence in that country, and who, by the fact of his accidental birth abroad, is now precluded from holding the most important office in the State or becoming a Member of Parliament. The LORD CHANCELLOR admitted that some of these restrictions might well be spared, but the House ought to weigh well the consequences of admitting aliens indiscriminately to the Council Board or the Parliament.

HOUSE OF COMMONS.

Monday.—MR. MACKINNON introduced his Health of Towns Bill, which was read a first time.—The privilege question was adjourned till next Wednesday.

The Earl of LEICESTER complained of the conduct of Lord Brougham in the House of Lords, as reported in the newspapers, upon presenting petitions in the Townshend peerage case. That learned Lord had taken on himself, upon an *ex parte* statement, to pronounce an opinion most injurious to the Earl of Leicester and to the legal question in dispute. He entreated the House of Commons to suspend their judgment until all the evidence of the case was before them.

MR. FERRAND complained of what he considered a breach of privilege, committed against himself by Mr. Clements, the Assistant Poor-Law Commissioner, he having remained present while the board of guardians at Halifax passed resolutions condemning the conduct of Mr. Ferrand in Parliament. He moved that Mr. Clements be called to the bar.—Sir J. GRAHAM thought Mr. Clements might, by a stretch of the doctrine of privilege, have acted irregularly in not having withdrawn while this resolution was passed; but, "without attaching too much credit to the hon. Gentleman's accuracy," taking his own statement, it would not be expedient to call Mr. Clements to the bar.—Mr. Ferrand's motion was supported by 6 and opposed by 195.

Sir J. GRAHAM, in reply to Mr. LIDDELL, said that no treadmill had been ordered to be erected in the workhouse of Halifax, as stated by Mr. Ferrand, but only a handmill.

The House went into a committee of supply on the Navy Estimates. On the vote for 234,868*l.* for works, improvements, and repairs in the naval dockyards of the kingdom, Mr. HOME moved a reduction in the vote of 10,000*l.*—On a division, Mr. HOME's amendment was lost by a majority of 49.—The other votes were agreed to.

Capt. BOLDERS moved the Ordnance Estimates for the year, which, compared with those of the preceding, exhibited a diminution of 258,129*l.* Had it not been for the fire at the Tower of London, the diminution would have been 358,000*l.*—Several votes were agreed to, and the Chairman reported progress.

The SPEAKER informed the House that he had received a letter from Sir Gordon Bremer, in reply to that conveying the thanks of the House to him and the officers and men employed on the coast of China.—The Speaker's letter and Sir G. Bremer's reply were ordered to be entered on the Journals.

Tuesday.—MR. MACKINNON asked whether it was the intention of Government to bring in a bill to alter and amend the law now existing in reference to capital offences committed by parties only occasionally subject to delusions of the mind. He wished to know whether a more stringent law would be brought forward, so as to prevent individuals from taking advantage of the delusions of former times in pleading to crimes which they had committed.—Sir J. GRAHAM said that he was sure the House would feel that it was of the utmost consequence that caution and deliberation should be used in dealing with the subject alluded to. It was impossible that the attention of Government, as well as that of the public at large, should not have been directed to this matter. But he was sure the House would feel that it would be highly inexpedient upon his part to pledge the Government to the introduction of any measure for altering the present state of the law upon a subject of such paramount importance—a subject requiring caution at all times; but which he was convinced the House would admit called, at this particular juncture, for the most calm deliberation; and when it was particularly necessary that nothing should be decided from the feelings of the moment, or in haste.

The LORD STEWART delivered the following message from her Majesty, in answer to the address on Education:—"I have received your loyal and dutiful address. The attention of my Government had been previously directed to the moral and religious education of the working classes of my people. The assurance of your cordial co-operation confirms me in the hope that this blessing may be realised by legislative enactments."

Mr. FOX MAULE brought on his motion, "That this House will immediately resolve itself into a committee to take into consideration the petition of the Commission of the General Assembly of the Church of Scotland, and the matters therein contained." The Commission he described as having somewhat the same relation to the General Assembly as a committee of the whole House bears to the House itself, with the Speaker in the chair. Its petition, therefore, was that of the Assembly of the Church of Scotland; and it complained of two grievances—an infringement of jurisdiction by the civil courts, and the civil of patronage. The official letter of the Government, signed by the Home Secretary, had adopted the misrepresentation, that the Assembly claimed to be the exclusive judges in matters ecclesiastical. Such was not the case; the Assembly merely claimed to be independent within its own sphere, and to have the right of defining, in matters coming before them, the limits between the civil and spiritual jurisdictions. Quoting the earlier Scotch statutes, and the Act of Security at the Union, on which the General Assembly, as representing the Church of Scotland, rests its claim, he contended that they evinced the intention and determination of their framers to perpetuate and secure the rights and privileges of the Presbyterian established religion, and to give to its courts an independent jurisdiction in matters ecclesiastical; and cited the opinions of Lord Moncrieff and Cockburn as confirming the view he had taken. Seeing that the question was so nicely balanced in the Scotch supreme civil court, it became the Legislature, as the regulator of the constitution, to interfere. The Court of Session had mistaken its functions in this matter: it had assumed to be the State, and sought, by its own authority, to over-ride another court, having equally, by the law, an independent jurisdiction. In this conflict of jurisdictions, it was the duty of Parliament to interfere, and by passing a declaratory act, put an end to the dispute, and confirm the Church in its rights. The other evil, that of patronage, was an old standing grievance. Patronage dated from the Act of Queen Anne, in 1712, but it was not till 1790 that the first fixed settle-ment of a clergyman took place. It was strongly protested against at the time, amongst others by the celebrated Dr. James Forbes, of Edinburgh, the first lawyer of his age. But Presbyterianism in Scotland became lukewarm, patronage was tolerated, and it was not till the revival of an evangelical spirit in Scotland that it was once more protested against. The Veto Act was passed by the General Assembly in 1834, in conformity with the general feelings of the people of Scotland, and it was passed with as little possible encroachment on the so-called rights of the patron as was consistent with conviction of duty. During the three years and a half in which that Act had been permitted to work unmolested, it had not only been beneficial to the people, but comfortable to the patrons themselves. But the Auchterarder case came to disturb this prosperity. In the litigation

which has arisen, the General Assembly pleaded to the actions brought, in the expectation that the civil court would restore its rights and privileges. But in this expectation they were disappointed, as the House of Commons had been, when its privileges were questioned in a court of law. If the Legislature refused now to interfere, there would be a very large accession both of ministers and people from the Established Church to a result which, looking at all she had effected, not only at home, but in the colonies, would be disastrous to the country at large. He did not ask for a sweeping abrogation of patronage, but a recognition of the principle of non-intrusion as would satisfy the people of Scotland, and save the church from a shock which might react on other institutions.

Sir J. GRAHAM complimented Mr. Fox Maule for the calm and dispassionate manner in which he had treated the subject, and declared himself fully alive to its importance. The House was bound to look at the question, not in an English or an English light, but in the spirit of the Union; and the Government in announcing their decision through the medium of the letter which he had signed, had done so in perfect respect for the Church and people of Scotland. No other institution in Christendom had effected more good at less cost; and he was satisfied that at the time this sad controversy broke out, the Church never had a stronger hold on the affections of the people. But the dominant party were deeply resented, whatever might be the unhappy result. If it were consistent with principle, there was no effort which, as an individual, he would not be willing to make, in order to bring about a satisfactory arrangement. Judging from the language of the General Assembly, which he quoted, their claims were inconsistent with law, liberty, and the constitution. No doubt, in a certain sense, the independence of the Church of Scotland was secured by statute. But the State, in forming an alliance with the Presbyterian Church, had entered into a solemn compact, one condition of which was to secure the permanence of the faith and doctrines of that Church, and another was the assignment of certain specific advantages, so long as she remained the State instructor of the people. But the real question was as to the supremacy of the civil law—with whom the ultimate decision was to rest in cases of dispute. The Church of Scotland was not required to be bound by the acts of the Court of Session; there was the higher and ultimate appellate tribunal of the House of Lords. He freely conceded the claim of the Church to its right of jurisdiction in matters ecclesiastical, but the question continually recurred, what was civil and what ecclesiastical? As to patronage, he considered that by the law of Scotland, as it now stood, there existed, coincidently with the right of the patron to present, a right on the part of the people to object, and it was the duty of the Presbytery to examine these objections, and adjudicate accordingly. A declaratory Act would not remove the existing difficulty, because disputes would still be as likely to arise between co-ordinate jurisdictions, which would require a reference to a supreme authority. No bill could be introduced for abolishing patronage without the consent of the Crown; and though he might have waived the objection, for the purpose of seeing the mode in which Mr. Fox Maule would have dealt with patronage, had he brought forward resolutions on the subject, he felt bound to resist the present motion.

Mr. RUTHERFORD asked nothing, nor made any claim for the Church of Scotland, except what was founded upon the statute-law. It was erroneous to suppose that the courts of law were coming out of this conflict with honour. The courts of law were in arms against the Church; there was no one to settle the divisions that had been the consequence, and which would destroy the framework of society in Scotland, and bring her courts of law into disrepute. This, then, was a case for the most serious consideration of the House. The consequences to Scotland would be fearful if Parliament gave the same negative reply to the petition as that given by Sir J. Graham.—Mr. COLTHERTON did not think it was yet too late for the Government to bring in a measure on the basis of that of 1814-15, or that it would be unacceptable to many of the ministers of the Church of Scotland. It might not stop secession from the Church, but it would be a simple-minded man would be glad to adopt it.—Mr. P. M. STUART entreated honourable Members who did not understand the question to retire from the House without voting, as the peace of Scotland and the good faith of England were at stake on the decision.—The debate, on the motion of Mr. C. BRUCE, was adjourned.

Sir J. GRAHAM obtained leave to bring in a bill for regulating the employment of children and young persons in factories, and for the better education of children in factory districts.

Sir V. BLAKE moved for leave to bring in a bill to abolish the plea of insanity in cases of murder, or attempts to murder, except where it can be proved that the person accused was previously known and reputed to be a maniac, and to be afflicted by partial insanity only. And further, he asked the House to suspend the standing orders, in order to accelerate the progress of the bill. No Member having been found to second the motion, it fell to the ground.

Wednesday.—MR. HITT moved the second reading of the Foreigners Naturalization Bill.—Sir J. GRAHAM thought that Mr. Hitt had failed in demonstrating that any practical inconvenience had arisen from the present state of the law, and he believed that the law afforded every reasonable facility to foreigners to obtain every privilege to which they could lay a claim. The only privilege from which foreigners were excluded were those of sitting in Parliament and at the Council. It was only reasonable that our Legislature should be composed of British subjects, and he should, therefore, oppose the motion, by moving that the Bill be read that day three months.—This amendment was carried without a division. The adjourned debate on Mr. FOX MAULE's motion for a declaratory Act respecting the petition of the Commission of the General Assembly of Scotland, was resumed.—Mr. C. BRUCE opposed the motion, because if the claims of the Church of Scotland were granted, the evils at present existing would be aggravated, the ancient purity of the Church would be injured, and the interests of the nation would suffer.—Sir G. GREY was prepared to give his vote for going into the committee, and to follow that up by legislative measures, though he did not agree entirely to the propositions of Mr. F. MAULE. To any resolution sanctioning the principle of non-intrusion, as established by the Veto Act, he would give his hearty consent. He would also concur in a motion for an address to the Crown to grant its consent to the introduction of a Bill. He felt, however, great difficulty as to the exclusive jurisdiction of the Church in ecclesiastical matters, but in the state of things which had arisen, he thought the House ought not to refuse to entertain the question.—Mr. S. WORTLEY dissented entirely from the motion. He never would consent that the House should go into committee to consider a petition praying for the alteration, if not the total abolition, of patronage in the Church of Scotland.—Sir A. L. HAY assured the House, as the advocate of neither party, that if they refused this committee, and checked for ever legislation on this important subject, they would be doing a lasting injustice and a fatal injury to the nation.—Mr. B. COCHRANE thought it a sad spectacle to see the creature of the State place itself in a hostile position to the Government which it was its duty to support. He hoped that the effect of gaining the application of the Veto Act would be worse than the present uncertainty, but if the concessions asked were made, a most serious injury would be inflicted on the Church itself.—Lord J. RUSSELL contended with the utmost anxiety so great a calamity as the secession of the clergy of the Church of Scotland hanging over a large portion of the people of this empire. The clergy had given the strongest proofs of their sincerity, and steadfastness in the conscientious feelings they entertained. With every desire, however, to effect a settlement of the disputes unhappily existing, he could not vote for going into this committee, because he could see no advantage that could result from the adoption of any mere

abstract resolution. Neither could he assent to the claims which had been put forth by the Church of Scotland. He hoped that while disposing of this motion, no declaration would be made by the Government which would preclude them from attempting hereafter some amicable arrangement by legislative means, should a favourable opportunity for so doing offer itself.—Mr. A. CAMPBELL had heard it asserted that the pretensions of the Church of Scotland should be extinguished; but he would tell the House that the principles of civil and religious liberty would never be extinguished in Scotland. He supported the motion.

The Solicitor-General entered into an exposition of the statutes on which the Church of Scotland was established and regulated, and maintained that the principle of patronage was clearly acknowledged and recognised by them. It was undeniable that the Church was attempting to act in defiance of the statutes on which it was founded, and were the House to acquiesce in the claims made by the Church, they would be overruling the supremacy of the law. The General Assembly ought to have paid obedience to the law, as pronounced by the highest tribunal in the kingdom. The effect of the resolution proposed would be to put on record the opinion of the House as being that the statute of Anne was not binding, and that patronage in Scotland should be abolished. To these principles he could not assent, and therefore he should vote against the motion.

Sir R. PEEL felt the full importance of this subject, and was well aware of the magnitude of the evil which threatened Scotland from the secession of the ministers of its Established Church. A state of things never contemplated by law had arisen—a Church established by statutes at variance with the Courts by which those statutes were interpreted. Two proposals had been made—one that patronage should be abolished, and the other that a definition should be attempted, by legislation, of ecclesiastical and spiritual power. He had the greatest doubt of the policy of abolishing patronage, and he could not admit the propriety of attempting to define the boundaries of civil and ecclesiastical authority. He refused to go into committee, because he did not think there was any probability of his agreeing in the views which would be there propounded by Mr. Manie, and not because, if he saw any prospect of a satisfactory solution of the difficulties that surrounded the question, he was not willing to legislate. A settlement might certainly be effected consistently with the privileges and rights of the Church of Scotland, but that could hardly be done if the present demands of that Church were insisted on.

Mr. F. MAULE replied, and the House divided, when the numbers were—For the motion, 76; against it, 211—Majority, 135.

The Punishment of Death Bill was read a third time and passed.

Thursday.—A resolution similar in its intention to that proposed in the House of Peers, but differing from it in being based on the general orders of the 16th November, and the letter to the Princes of India, in reference to the gates of Somnath, was submitted by Mr. V. SMITH. The substance of this resolution was a declaration that the conduct of Lord Ellenborough was unwise, indecorous, and reprehensible. After a speech from Mr. E. TENNENT in defence of the Governor-General, Mr. MACAULAY said that the two most serious dangers which the British Government in India had known were caused by religious interference with the Mahomedans; at Vellore, in the affair of the turbans; and at Bangalore, in the affair of the Mosque. Now did Ministers mean to let their Governor-General act upon his own proclamation? Was he to govern upon Brahminical principles, and restore the temple with its dancing girls? No doubt they would take care to countermand him; but was it no evil thus to make announcements and abandon them, to be always doing and undoing? Other Governors-General might have been hated, but now, for the first time, a Governor-General was laughed at. Turgid passages from Eastern compositions had been cited, but ought their style to be imitated by a British Governor-General? Ought he, because the native princes deck their horses with beads and have black faces, to ride out upon a palfrey so adorned, and paint his own face black? The Indians, whatever their own dress, habits, and style, yet perfectly understood and respected the sobriety of the English in all these particulars. The proclamation, however, in truth, was imitated, not from Indian compositions, but from the trashy manifestoes of the French revolutionary generals, who loved to talk nonsense about ancient Rome. He was sure such a document had not been sanctioned by any of the civil servants, by any of those who understood the country and the people; but, indeed, Lord Ellenborough kept those civil servants at such a distance that none of them ever ventured to offer their advice. Really the vast power of an Indian Governor-General was not to be trusted to a man who was thus wanting in discretion of his own, and thus unwilling to profit by the discretion of others.—Mr. HOGG admitted that a Governor-General ought not to be absent from his Council, but opposed the motion.—Mr. MANGLES and Mr. HUME spoke in favour of it, and Mr. ESCOTT and Mr. WYNN opposed it.—Mr. PLUMPTRE and Sir GEORGE GREY called on the House to censure the proclamation on religious grounds.—Lord STANLEY gave full credit to both the preceding speakers for sincerity of Christian feeling; but he thought they were following somewhat blindly in the wake of those whose objects were not religious, but political, and who were now mustered in more than usual numbers on the opposite benches. He had never known an instance where a political party had so studiously avoided the great features of the case, and so carefully fastened on a small and insulated point. The Mahomedans in India had hitherto seen in this proclamation no intent of insulting their religion; he warned the House of Commons against exciting them now by a declaration that this document did involve such an insult. Its style had been said to betoken a mind unequal to the duties of government; but he would remind the House that quite as bad taste had appeared in the military manifestoes of a man whom Europe and the world had certainly thought not wholly incapable of wielding empire. He concluded with a glowing panegyric on the services of Lord Ellenborough.—Lord PALMERSTON declared that he and his friends were ready to defend their own policy in India; but that this was not the subject now before the House. It was essential that the House should take notice of this proclamation. It would be a want of courage to abstain from expressing an opinion which everybody entertained. He did not believe that the effect of such a censure would be to recall Lord Ellenborough; but even if it should, that noble person would be less dangerous to his country in the House of Lords than at Calcutta.—Sir R. PEEL said, that what had passed to-night must have fully dissipated the suspicions of those who had imagined the Government to have made a compromise with the Opposition on the subject of Mr. Roebuck's late motion. He then enumerated the successive disasters, of which the tidings were then daily flowing in upon the Governor-General, and eulogised the courage with which he met those difficulties. But it was necessary for him to abandon Afghanistan—it was important to him to do so without dispiriting the Hindoos, and therefore it was that he had been anxious to secure, for the sake of their national feelings, that military, not religious, trophy, to which they attached the highest value. In conclusion, Sir R. Peel inveighed especially against the party spirit which animated the present motion, and warned the House that such a vote as this would strike a heavier blow at the British prosperity in India than any of our past disasters.—Lord J. RUSSELL entered into a defence of Lord Auckland's general policy, but confessed himself convinced, after his perusal of the published papers, that the abandonment of Afghanistan was a wise measure. He was not desirous to deny to Lord Ellenborough such praise as properly belonged to him, but he could not consent to deck him with laurels unjustly wrested from the generals, from those able men who had in reality decided the policy of the campaign, and restored the spirit of the troops. In regard to the proclamation, it showed in many of its passages a sort of inflation, which looked as if Lord Ellenborough had been flushed by success into a notion that he was become a permanent and sovereign Prince. Such a man was not a fit person to superintend the great destinies with which England was entrusted

in the East. The House then divided: Against the motion, 242; For it, 157; Majority against it, 85.

Friday.—At 4 o'clock there were only 34 Members present, and the Speaker consequently did not take the chair.

CITY.

Money Market, Friday.—Consols closed at 96½ to 7 for money, and 96½ to 7 for account; New Three-and-half per Cent. Annuities, 102½ to ½; Exchequer Bills, 71s. to 73s. prem.

Metropolis and its Vicinity.

Charge of Threatening to Shoot the Queen and Sir R. Peel.—It is again our painful duty to record the apprehension of another "monomaniac," who has been apprehended on the charge of threatening the lives of the Queen and Sir R. Peel. At his examination before the Lord Mayor yesterday, he gave his name James Stevenson, and said that he belongs to the parish of Lochwinnoch, in Renfrewshire. He spoke in a broad Scotch accent. The clerk to the packet owners at Hull stated that the prisoner booked his passage on board the Gazelle for London, and said he was going to London to see the Queen, and that it was quite improper for a woman to rule. No woman had a right to take the reins. He said further that he wished the woman to be put on one side—the woman was to be destroyed, and the man was to take the reins of the affairs of this nation. The captain of the steamer stated that the prisoner during the voyage told him that he had written letters to Sir R. Peel, who had not answered them, but there were plenty of people who would show him Sir R. Peel, and that he would finish both the Queen and Sir Robert Peel. The prisoner in reply, said "I never said I'd finish them. I don't think I did; but I said I'd strike at the root of the tree, if I should catch a minister of the kingdom who would not do what he was bound to do. My attention was first drawn to the subject of Sir R. Peel being in power when the man shot at the Queen. I wrote the letter to Sir R. Peel at that time. I read of his being in power in the newspaper."—The result of the examination left no doubt that the mind of the prisoner was quite disordered, and on the suggestion of Mr. Maule, Solicitor to the Treasury, he was committed by the Lord Mayor to the Compter, in order that medical men might have the opportunity of examining him, to ascertain whether he could be at large without danger to others.

Threatened Assassination of the Chancellor of the Exchequer.—On Tuesday, the Chancellor of the Exchequer, accompanied by his private secretary, the Right Hon. G. R. Dawson, and Mr. Maule, attended at Bow-street to swear an information, and demand a warrant for the apprehension of Mr. John Dillon, late an officer in the navy, for having on different occasions threatened, by letter and otherwise, to take away his life. The information of Mr. Goulburn stated that, on or about the 22d February, he received a letter, bearing the name of John Dillon, complaining of alleged injustice done him, and containing certain threats, which he considered did not assume any definite character. He believed the letter was sent by the person whose name it bore; and about the 28th February he received another letter, bearing the same signature, and containing similar threats. It mentioned in strong terms the case of M'Naughten, and although the writer abhorred the name of assassin, still he considered he would not be doing wrong if he had shot any person through whose means he had suffered an injustice. On the 4th inst. Mr. Goulburn received a third letter, bearing the same date, and signed "John Dillon, 157, Strand," in which the writer made claims upon Her Majesty's Government for a considerable sum of money alleged to be due to him for boarding the *Peru*, and which he accused Mr. Goulburn of being the means of keeping back from him ten years ago, when he was in office as Chancellor of the Exchequer, on the grounds that a charge of cowardice was hanging over him, and that the amount he claimed could not be paid until such charge was cleared up. The letter also mentioned that Mr. Goulburn had admitted the charge to be removed, and unless the money was paid, he (the writer) would be driven to follow in the steps of M'Naughten. The information further stated, that Mr. Goulburn never had any communication with the person whose name was signed to the several letters, except in his official capacity, and through the letters referred to, and he had every reason to apprehend that John Dillon would do him some grievous bodily harm. He also stated, that he did not lay the information against him from any malice he bore to the said John Dillon, but solely from personal apprehension of danger. Mr. Pemberton, private secretary to the Chancellor of the Exchequer, corroborated many of the leading facts of this statement; and John Walsh, a colourman residing in Bernard's Inn, deposed that he knew Mr. John Dillon, and saw him one day last week in a coffee-house in Westminster, when he commenced a conversation with him respecting M'Naughten. He also referred to the case of Bellingham, who shot Mr. Percival, and said there was a wide difference between his case and that of M'Naughten, as Bellingham had received a *bona fide* injury, by which he was driven mad, whereas the other had received none at all. He contended that Bellingham was perfectly justified in shooting Mr. Percival. He continued this conversation with two strangers present, and told them he had a claim upon the Government, and unless it was satisfied, he would have a pop at some of them, and if he did shoot any one, it should be Mr. Goulburn. This occurrence took place late in the evening, and he appeared to be quite sober, and determined to put his threat into execution, saying, "When I'm tried, I'll not plead insanity, but injustice." One of the strangers observed, "Why not petition the House of Commons upon the subject, and wait for a reply to your petition, after it will be laid on

the table?" He replied, "Before I can receive any answer to any petition that I may make, I'll have taken Mr. Goulburn's life, and swing for it." The warrant for the apprehension of Mr. John Dillon was ordered to issue immediately. Immediately after Mr. Goulburn had laid his information, and the warrant had been issued for Mr. Dillon's apprehension, the services of the police were put into requisition, in order to discover his retreat, and in the course of the evening the inspector discovered that he had been, the day previously, arrested for debt, and lodged in Whitecross-street prison. As he is, under these circumstances, virtually in the custody of the sheriff, a writ of *habeas corpus* must be obtained for the purpose of bringing him up before the chief magistrate, to answer the charge contained in the information, and a detainer has been lodged against him.

The Custom-House Frauds.—A numerous meeting of the operative weavers of Bethnal-green, Spitalfields, and their vicinity, was held a few days since, to take into consideration the practice of passing silk manufactured goods through the Custom-house without collecting the duty, and to adopt such means as may be expedient under existing circumstances. The Chairman stated, that for years past the trade of the Spitalfields weavers had suffered great grievances; and to add to their distress, a quantity of goods have been passed through the Custom-house without paying duty. If they had to contend with goods legally imported, they would have sufficient difficulties, considering that the principles of free-trade were only partially in operation. But officers receiving good salaries had been bribed to an extent not to be conceived, and the silk-weavers had suffered to a very serious degree. Another speaker said that, when Mr. Labouchere was in office a deputation of silk-weavers waited upon him, and he then stated to them that from the French returns he had ascertained that the exportations of silk goods into this country were double the amount of what was registered as imported at the Custom-house. If that were the case, there was no doubt that the quantity not accounted for at the Custom-house had been smuggled. It appeared that 1,000,000*l.* worth of silk goods were imported; but there was the same amount which was not legally imported, with which they could not come into competition. Had that not been smuggled, it is calculated that there would have been employment for 6,663 persons throughout the year. It was also stated that one of the defaulters had sold 30,000*l.* out of the funds a few days previous to his departure from the country. Memorials to the Treasury and Commissioners were then passed, declaring that the frauds practised at the Custom-house had "overstocked our markets with foreign manufactures, to the exclusion of British industry, depriving thousands of the already-depressed silk-weavers of employment, and reducing the miserable pittance, called wages, of those in employment," and expressing the opinion of the meeting, that, "in cases where frauds are detected, no compromise should be allowed, but that the penalty should be strictly enforced, and imprisonment added to the fine; the frauds not only injuring the revenue, but undermining and depriving the British artisan of his only capital, (that is, his labour,) which, in the opinion of the meeting, must be allowed to be one of the most important interests of this country."

East India House.—On Wednesday a special general Court of the Proprietors of stock was held at the India-house, for the purpose of laying before the proprietors documents relative to the military operations in Afghanistan, and the resolutions of thanks adopted in consequence by the Court of Directors. A long and desultory discussion took place on the form of the resolutions, but they were ultimately carried as proposed by the Directors.

Arrival of the Chinese Silver.—On Friday evening, six waggons arrived at the Royal Mint, escorted by a detachment of the 60th Regiment, with the Chinese silver, amounting to 1,000,000*l.* sterling, being the first consignment of the indemnity to be paid by the Celestial Empire. The treasure was brought over by the Modeste sloop-of-war, which arrived at Portsmouth on Thursday, and was forwarded to London by the Southampton Railway. The procession attracted a good deal of notice, and an immense crowd followed the waggons to the Mint, and as the outer gates closed upon them, three cheers were given. The Sycee silver was contained in large wooden boxes, and on passing along the Minorities one of them burst, but owing to the precautions taken, not a particle was lost. On Tuesday, another train of waggons, escorted by a party of the 10th Regiment, arrived at the Mint, from the Southampton Railway, with 20 tons of the Chinese silver, in value 750,000 dollars, brought over by the Columbine.

City Antiquities.—Several excavations for the formation of sewers are now in progress in the City, which have led to the discovery of various relics, connected with its former history. In Liverpool-street, Bishopsgate, where the sewer is about 15 feet in depth, the labourers have come against the old Roman wall, which was continued from the London-wall, across Bishopsgate-street, to the Minorities and the Tower. In Finsbury-pavement the excavations are carried to a considerable depth, and numerous bones of persons supposed to have been buried there during the great plague have been discovered. In Cloth-Fair another sewer is constructing, through the former site of the burial-ground attached to the monastery of St. Bartholomew the Great, by which numerous bones, coins, and other relics have been brought to light.

The Thames Tunnel.—The annual meeting of the proprietors took place on Tuesday. The chairman, Mr. B. Hawes, M.P., stated that a resolution had been come to on Monday by the Directors, requesting the Duke of Wellington, who had always been a warm admirer of the undertaking, to appoint a day between the 18th and the 25th inst., for the opening of the Tunnel for foot-passengers, and requesting his Grace to honour the Court of

Directors with his presence at an entertainment to be given on the occasion. The interest taken by the public in the work was increasing, as was exhibited by the fact that 4,440 persons had visited the works last year more than in any previous season. Last year upwards of 40,000 persons had paid for admission to the Tunnel. The Directors had received a certificate from Sir I. Brunel, the engineer, declaring that there was not the slightest settlement in any part of the works. The trustees of the Kent-road were about to make three lines of road in the direction of the Tunnel. It was then resolved—"That the cordial thanks and congratulations of the meeting be tendered to Sir I. Brunel, for the distinguished talent, energy, and perseverance evinced by him in the design, construction, and completion of the Thames Tunnel—a work unprecedented in the annals of science and ingenuity, and exhibiting a triumph of genius over physical difficulties declared by some of the most enlightened men to be insurmountable."

The Literary Fund.—The annual general meeting of the Members of this excellent Society took place on Wednesday, Mr. Hallam, the historian, in the chair. The report stated that the sum of 1,255*l.* had been dispensed in relief to distressed authors, their widows and children, during the past year, and that no less a sum than 29,000*l.* has been applied to this purpose since the foundation of the Society in 1790. A letter was read from the Russian Ambassador, Baron Brunow, to the Marquess of Lansdowne, announcing that the Emperor of Russia highly appreciating the benevolent purposes of the Institution, has been pleased to present it with 1000 silver roubles, 155*l.* This is the more gratifying as a similar testimony was given to the value of the Literary Fund last year by the King of Prussia, who presented it with 100*l.* The Marquess of Lansdowne was re-elected President; the Vice-Presidents were re-elected, with the addition of the Earl of Arundel and Surrey, and Mr. Bond Cabbell; and the vacancies in the Committee were filled up by the election of Dr. Fraser, the Hon. C. A. Murray, Master of the Queen's Household; Mr. James, the Novelist, and Mr. Nolle.

The Parks.—In consequence of the recent intrusions into the parks, a notice has been issued by the Duke of Sussex, by command of her Majesty, that no hackney-coach, or hired cabriolet, be allowed, under any pretence whatsoever, to pass through St. James's or Hyde-parks, except through the Birdcage-walk, from Great George-street, to James-street, Piccadilly. That no return post-horses be allowed to pass through the parks, and that the permission for hackney-chaises, conveying Government messengers, to pass through St. James's-park, shall not extend to any other hired carriages. That the gates of St. James's-park, with the exception of those communicating with the Birdcage-walk, be kept half-closed; and that no carriages or horses, but those belonging to such persons as have permission, be allowed to pass through such gates. That no carriages but those occupied by members of the Royal Family, or by the Grand Falconer, be permitted to drive in the Queen's ride in Hyde-park. That the gates of the Birdcage-walk be left open through the night, during the sitting of Parliament. That no stage-coaches, omnibuses, carts, waggons, drays, trucks, wheelbarrows, or persons carrying burdens, be allowed to pass through the gates of either of the parks, and that the keepers and sentinels have orders accordingly.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Feb. 25:—West districts, 145; North districts, 181; Central districts, 206; East districts, 219; South districts, 252. Total, 1003, (515 males, 488 females.) Weekly average for the last five years, 903, (males 461, females 442,) and for the last five winters, 1004.

Provincial News.

Chichester.—At the Court of Bankruptcy on Monday, an application was made by the junior partner in the Chichester old bank (Mr. Wm. Ridge), for his certificate. It was urged upon the part of the bankrupt, and in favour of his application, that having been only a stipendiary partner, he had little or no control over the management of the bank, and that there was nothing in evidence to show that he was at all aware of those improper transactions which had been alleged so strongly against the bank. Mr. Commissioner Faue, in giving judgment, said, that as a partner in the bank he must hold him responsible to the public. He was an executor to his father's will, and it was his duty at that time to have looked into the affairs of the bank, and have further ascertained whether his father's estate was solvent or not. It was impossible for the Court to consider that he was ignorant of the proceedings of the bank. He must surely have been cognizant of some of the facts; for instance, in the case of Gardner, who, although having embezzled in the year 1834, 3,000*l.* or 4,000*l.*; and in 1838, from 7,000*l.* to 8,000*l.*, was yet continued in the situation of chief cashier to the bank, even down to the period of the bankruptcy in 1841. But admitting that the bankrupt had not the same degree of control over the books as his brother, still it was impossible for him not to have known that a robbery had been practised upon the public. Under all the circumstances of the case, the Court must come to the same decision as it had formed upon the application of his brother, which was, that the certificate be delayed for three years, with the condition that all property acquired by will, or as heir at law, or in other way coming to him, except as the produce of his own industry, should at once pass to the creditors of the bank.

Halifax.—We alluded in our last to the cruel treatment of a collier-boy near Elland, which Lord Ashley had

brought before the notice of Parliament. On Saturday, Joseph Whiteley, the master, was summoned before the magistrates, charged with ill-using the lad, and an application was made on behalf of the overseers of the township that the indentures might be cancelled, and an adequate penalty inflicted upon the master. The lad detailed the particulars of the treatment he had received. A surgeon said he was called on by the out-township to examine the boy. He found the lad full of bruises from the top to the bottom of his back. The wounds were of different colours, some appearing of an older and some of a more recent date; and appeared as if made with a rough board. The magistrate said that he had sat on that bench for a number of years, but never had such a case of cruelty come before him. He would leave the master to the compunction of his own conscience, believing that he would never be able to hold up his head in society for years to come, and that he would be shunned by every one as "unworthy to associate with." The application for cancelling the indentures was granted, and the churchwardens were bound over to prosecute the master at the sessions.

Heileybury.—About ten o'clock on Saturday night, a fire broke out in a room belonging to Mr. Watson, a student in the East India College, during the time of his absence at a meeting of the Debating Society. Immediately upon opening the door of his apartment, Mr. Watson was met by dense volumes of smoke, which were quickly fanned into flame by the current of air thus admitted, and the room was soon enveloped in a blaze. The supply of water was deficient, and as it is not laid on throughout the building, it was necessary to bring it from a distance in buckets. The students, however, exerted themselves successfully, and the flames were subdued before they had spread beyond the apartments in which they broke out. An inquiry into the origin of the fire was instituted by the college authorities; but no certain conclusion has been arrived at: it is considered probable that a hot coal had fallen out of the stove upon a sofa, the wadding of which ignited, and thence rapidly communicated the fire to the wainscoting of the room. From the defective arrangements in regard to water, it is supposed that if the fire had not been so speedily detected, the entire college would have been destroyed.

Liverpool.—Another destructive fire broke out in this town on Tuesday, by which the boiler-workshops, and a great part of the foundry of Messrs. Fawcett and Preston, the engineers, and two warehouses, were destroyed. The fire broke out in the paint-shop belonging to the foundry, and though the fire-police were immediately on the spot, it was impossible to do anything effectual for a long time, owing to the want of water. At last a supply was procured, but not until the flames had got such a head as to make it impossible to extinguish them, and they had destroyed the greater part of the foundry and an adjoining warehouse, together with another on the opposite side of Lydia Anne-street. This calamity will deprive from 300 to 400 workmen of employment, and thus add to the distress existing in the town. Owing to the pressure of the times, the number of men employed in this establishment had been reduced from nearly 700 to 358, and of these a very large proportion, if not the whole, will be unable to obtain employment until the workshops are rebuilt.

Manchester.—During the last two or three years a number of silk-warehouses in this town and neighbourhood have been broken into and robbed of goods, the amount of which is said to have exceeded 10,000*l.* in value. The robberies have been so ingeniously planned and executed, as to have defied the utmost vigilance of the police either to trace the goods or the thieves at the time, and not the slightest information on the subject has, till lately, been obtained. About a fortnight ago, it was rumoured that parties were connected with these robberies who stood higher in the world than the police had ventured to look—that they had been planned and effected at the instance, in fact, of master silk-manufacturers and dyers. It was said that these parties, entering the warehouses of different merchants and tradesmen in the way of business, had thus the means in the day-time, without suspicion attaching to them, of observing the fastenings of doors, and ascertaining the most valuable or most suitable goods for their purpose; that then they laid their plans, and submitted these plans to workmen in their employ, by whom the robberies were effected; that the goods so stolen were mostly yarns, which, on being brought to them, were immediately consigned to the dye-tub; and that thus, with the change of colour, the possibility of detection was removed. The police have not been long in acting on their newly-acquired information, and have obtained search-warrants against Messrs. Nathaniel and Edwin Lucas, silk-manufacturers and dyers, carrying on business at Leigh, near Manchester, and who have also a place of business near Macclesfield. They were apprehended a few days since in consequence of stolen goods found in their possession, and were brought up for examination at the New Bailey on Monday, when so many extraordinary facts were elicited, in the course of a long examination, that the magistrates remanded the prisoners, and refused to accept bail.

Marlborough.—The Council of the new School for the sons of clergymen and others have appointed the Rev. Matthew Wilkinson, late fellow of Clare-hall, Cambridge, and head-master of the proprietary school, Kensington, to be head-master of the establishment in this town.

Marlow.—On Tuesday night a fire broke out within the manor of Swilly Pond, near this town. The old Manor House, the property of Mr. Colborne, was burnt to the ground, nothing remaining of the structure but one stack of chimnies. At one time the Pear-tree, so famed in the annals of Marlow elections, was in great

danger; but from the exertions of the inhabitants not a branch was injured. The fire is supposed to have been the work of an incendiary.

Merthyr.—The Welsh papers mention as a remarkable feat in the iron manufacture, that a bolt was rolled at the Cyfarthfa Works last week, of 25 ft. in length and 6 ft. in diameter. It was of cable quality, and weighed 2,600*lbs.* The bar rolled at the Dowlais Works some time since was 14 ft. long, and 8½ ft. in diameter, weighing about 22 cwt.

Portsmouth.—A jury has decided that the claim of the Duke of Norfolk, as lessee of the right of ferry between Holyhead Island and Cumberland Point, near this town, is established by what is called "user," or long uninterrupted right. This gives his Grace's lessees, the ferry-men, the exclusive right to take the toll, which is 2*d.* for strangers, and 1*d.* for inhabitants. The grant of the ferry was made by Charles I.

Railways.—The following are the returns for the past week:—Greenwich, 516*l.*; Eastern Counties, 824*l.*; Liverpool and Manchester, 3,373*l.*; Croydon, 173*l.*; Brighton, 2,110*l.*; York and North Midland, 1,290*l.*; London and Blackwall, 176*l.*; Great North of England, 1,064*l.*; Sheffield and Manchester, 275*l.*; Manchester and Leeds, 3,637*l.*; Glasgow and Paisley, 762*l.*; Edinburgh and Glasgow, 1,696*l.*; Birmingham and Gloucester, 1,368*l.*; Birmingham and Derby, 971*l.*; North Midland, 3,340*l.*; South-Western, 4,014*l.*; Great Western, 10,465*l.*; South-Eastern, 1,157*l.*; London and Birmingham, 12,587*l.*; Northern and Eastern, 1,318*l.*—At the half-yearly meeting of the North-Midland Company, held last week at Leeds, the correspondence was read which had passed between the Directors and the Board of Trade, by which it appeared that the representations of the Board have been attended with good effect as regards the public safety, and that the Directors have agreed to allow additional intervals of rest to the engine-men driving passenger-trains.—The half-yearly meeting of the Manchester and Leeds Company was held last week. The total income for the half-year was stated to amount to 119,113*l.*, including receipts for passengers 65,985*l.*, and goods 52,433*l.*, out of which a dividend of two and three-quarters per cent. was declared, leaving a balance in hand of 15,500*l.* The Directors proposed the establishment of a reserve or depreciation fund, to meet the diminution in the value of the carriage and locomotive stock. There is every expectation that the branch to Halifax will be completed by the summer of 1844; and the Directors are now applying themselves to a reduction in the expenditure, so far as is consistent with the safety of the public.—The half-yearly meeting of the Sheffield and Manchester Company took place last week. The receipts during the past year amounted to 14,065*l.*, leaving a balance, after deducting the expenses, of 3,944*l.* Though 512,276 passengers had been conveyed upon the line, during the last six months, no accident had taken place. The works of construction were proceeding favourably, and it was expected that the entire line, from Sheffield to Manchester, would be opened early in 1845.—The half-yearly meeting of the Birmingham and Derby Company took place on Thursday. During the half-year 98,000 passengers were carried on the line without any accident. The third-class passenger-traffic had increased at the rate of 72 per cent., and in the goods department there had been an increase of 5000 tons, or 3,412*l.* The amount received for passengers was 194,870*l.* The balance in hand 8,978*l.* The meeting recorded its approbation of the conduct of the Directors, in their recent negotiations with the Midland Counties Railway.—The half-yearly meeting of the Bristol and Exeter Company was held on Thursday, at Bristol. The report stated that the whole of the line to Exeter would be ready for opening in the course of the ensuing year, long before the current period. The statement of receipts and expenditure showed a balance of 327,433*l.*, out of which a dividend of 1*l.* 8*s.* per share for the half year was declared, clear of income-tax.—The Directors of the Blackwall Railway have announced that the increase of their fares has produced a decrease in the receipts, from the moment the change was introduced; and they are now about to fall back upon their old prices.—The share-list of the Yarmouth and Norwich Railway is completed, and the chairman stated, at the first half-yearly meeting, held at Norwich, on the 24th ult., that the works would speedily be commenced.—The works on the Eastern Counties Railway, which we noticed last week, have been completed, so as to allow the passage of the trains. The goods' traffic has been commenced, and a luggage-train now runs daily between London and Colchester. There are upwards of seventy bridges and viaducts on the line, thirty-six culverts and drains, besides numerous crossings and cuttings. The cutting at Brentwood-hill is more than two miles long, and seventy feet in depth.—The first general meeting of the Pontop and South Shields Company was held last week, Mr. Rennie in the chair. It appeared that the Company had recently taken possession of the Stanhope and Tyne Railway, which they were now working at a profit, under the title of the Pontop and South Shields Railway. The accounts exhibited a net revenue for the half-year of 42,802*l.*, leaving a balance, after the payment of 27,618*l.* for expenses, of 15,183*l.* This amount had been charged with the interest on the loans and liabilities of the late Company, out of which a dividend at the rate of 30*s.* per share for the half-year was declared. The traffic in coal and passengers on the line exhibited a steady increase.

IRELAND.

Dublin.—During the greater part of last week this city was in a state of excitement, occasioned by a discussion

in the corporation on a motion submitted by Mr. O'Connell in favour of Repeal. It commenced on Tuesday, and lasted for three days. The house was crowded to excess, although strangers were admitted by tickets. Mr. O'Connell brought forward his motion in a speech of great length. He founded his arguments in favour of self-government on several reasons. The first, he said, was the capacity of the Irish nation for domestic legislation; 2d, the perfect right of Ireland to legislate for herself; 3d, that that right was fully established by the transactions of 1782; 4th, that the most beneficial results to Ireland would follow from the repeal of the Act of Union; 5th, the utter incompetence of the Irish Parliament to pass the Act of Union; 6th, that it was no contract, being brought about by fraud, bribery, corruption, and coercion; 7th, that the most disastrous results to Ireland have flowed from the Union; 8th, that the Union might be abolished without an infringement of the constitution; and the 9th, that the most salutary results would follow to the British empire by the repeal of the Act of Union. He had come there to establish these propositions, and he had no doubt the assembly would consider he had opened a very wide field. He then proceeded, in detail, with his propositions, illustrating his argument by statistical and other facts. Upon the evils of absenteeism, as "one of the disastrous results to Ireland which have flowed from the Union," he dwelt at some length, and read documents showing the deplorable distress at present existing. After speaking for four hours and a half, he concluded by moving that a petition should be adopted in favour of a repeal of the legislative Union. Councillor M'Loughlin having seconded the motion, Alderman Butt observed that he and those who agreed with him had nothing to complain of in the tone and mode of argument of Mr. O'Connell, and submitted the following amendment:—"That believing the discussion of the question of the repeal of the legislative Union between England and Ireland, in the corporation of the city of Dublin, as calculated to produce political discussions, prevent all cordial co-operation between persons of different political opinions, and to prevent this body from exercising its municipal functions for the good of the citizens at large, this assembly repudiates in the strongest manner the introduction of the question, and that, therefore, the consideration of the question be adjourned *sine die*." On Wednesday the discussion was resumed, and after a long sitting was again adjourned. On Thursday several members of the Corporation spoke on both sides of the question, and Mr. O'Connell replied in a speech of considerable length; after which a division took place—the result was, for the motion 41, for the amendment 15—giving a majority of twenty-six for Mr. O'Connell's motion. On the numbers being announced, Mr. O'Connell assured the "twenty-six" that their names should be inscribed upon a column in College-green, and handed down to posterity in the imperishable record of Irish history. He then moved that a committee should be appointed from the majority, to prepare the draught of a petition to Parliament for a repeal of the Union. The debate was conducted throughout in good temper and with much courtesy among the opposing parties. Mr. O'Connell seemed particularly anxious on this head, and exerted himself successfully to effect the object. The meeting of the Repeal Association took place on Monday. The proceedings were of the usual character, and the rent for the week was announced to be 259l. 11s. 0½d.

Carlisle.—Last week some persons broke into the church of St. Mullins, in this county, and attempted to remove a large flag which covered the entrance into the vault belonging to the ancient family of Kavanagh. Whether they were unable to remove it, or were alarmed and fled, is not certain, for they only succeeded in disturbing it. Their design is involved in mystery. Government have offered a reward of 30l. for such information as will lead to the discovery of the offenders.

Newry.—On the 26th ult. an attempt was made to assassinate a Presbyterian clergyman in the pulpit, at Rathfriland. It appears that the Rev. J. Dickie, one of the Presbyterian ministers of that place, had an evening service in his own church, when he preached a sermon on the progress of Puseyism, and its alleged tendency to Popery. Just at the conclusion, and whilst the rev. gentleman was engaged in prayer, some one fired through the windows, and wounded him severely in both arms. It is hoped that the wounds will not prove fatal. The perpetrator of the outrage escaped in the darkness of the night, but the tracks of his feet were traced in the direction of Lessie. The Lord-Lieutenant has issued a proclamation, offering a reward of 100l. for the discovery of the assassin.

Donegal.—Some days since, while the Wesleyan Methodists of Mountcharles, in this county, were holding a missionary meeting in the market-house of that place, which has been occupied as a chapel of ease by the minister belonging to the Established church, some person fired a gun through one of the windows, breaking 14 panes of glass. The assembly were at prayer at the time, or, in all probability, the lives of many would have been in danger, as the shots passed over them, and struck the opposite wall.

Kilkenny.—The Marquess of Ormonde has made a reduction of 20 per cent. on the rent of his tenants-at-will in this county, to continue as long as the present depression of agriculture shall last. In announcing this to the tenants, his agent states that Lord Ormonde is induced to come forward to relieve his tenants thus liberally to enable them to apply sufficient manure to their farms, and to carry on the necessary improvements which this abatement of rent will fully enable them to effect.

SCOTLAND.

Edinburgh.—The Edinburgh and provincial papers state with expressions of regret, that the Non-Intrusionists are proceeding vigorously with preparations for seceding. Their agents (chiefly females), are going from door to door distributing printed statements and soliciting subscriptions; while the great body of the public are wholly unmoved by their agitation. The leading clergymen of the movement have given proof of their determination to sacrifice their endowments by giving up their expensive houses for cheaper dwellings. Plans for new wooden churches have been ordered, and other symptoms appear of a real intention of carrying the long-deferred threat of seceding into execution.

Glasgow.—On Saturday evening, the 25th ult., the shock of an earthquake was distinctly felt at Oban. It came on with a sudden dull shock, as of a heavy body falling, and then resembled the rumbling of a carriage. It appeared to pass from east to west, and occupied from forty to fifty seconds in its transition. There were the usual accompaniments of shaking of furniture, rattling of glass and earthen vessels. A flash of lightning was observed about the same time, although there was none seen previous. About two years ago a similar shock was felt in the place, and a still severer one about fourteen years ago.

Aberdeen.—On Thursday, the Marquis of Breadalbane was elected Lord Rector of Marischal College. Of the four nations, viz., Mar, Angus, Moray, and Buchan, the Marquis had the majority of votes in the first three. The election turned upon the church question. The other nominees were, Sir James Macgregor, Lord March, and the Marquis of Waterford.

Labo.

CENTRAL CRIMINAL COURT.—*Trial of M'Naughten.*—The proceedings in this case were resumed on Saturday. The judges took their seats on the bench at nine o'clock, and immediately after, Mr. Cockburn commenced his address for the defence. The French Ambassador and numerous visitors were present, as on the previous day, and the Court was very much crowded. Mr. Cockburn said, he rose under a deep sense of the responsibility he had undertaken, and his own inadequacy. He felt himself to be in one of the most painful positions in which an advocate could be placed, being called on to defend a case of so singular a description. However, he had full confidence that the defence he was prepared to make would be found effectual, considering all the peculiar circumstances that surrounded the case. When he recollected how deeply implanted in the human heart was the horror of assassination, and, above all, how that horror was interwoven in the nature of Englishmen—when he recollected the deep sympathy that existed for the deceased, and the worth of his character, to which his learned friend the Solicitor-General had paid so eloquent a tribute, and in which tribute he (Mr. Cockburn) fully concurred—he felt bound most earnestly to appeal to the impartiality of the jury, and he felt convinced that that appeal would not be made in vain. His learned friend had, with his usual accuracy, anticipated the line of defence intended to be set up. Most unquestionably it was not his (Mr. Cockburn's) intention to touch for a moment the main feature in this case. He was not there to deny that the hand of the prisoner had inflicted the mortal wound on the deceased. No, the defence would turn not on the deed, but on the state of the prisoner's mind when he committed it. There could be no doubt that according to our law insanity absolved a person from the consequences of a violation of the law, and in this the law of England went no farther than the law of civilised nations—no farther than reason prescribed—no farther, if he were not presumptuous in saying it, than the will and ordination of God. He trusted he should not be thought presumptuous in saying that, when the Almighty thought fit to lay an individual under the heaviest calamity of which human nature was susceptible, he must have, at the same time, released such individual from the consequences of acts of which he did not feel or know the enormity. Therefore the law ordained that when there was a disease that troubled and obscured the very sources of reason, and converted a human being into the similitude of a lower animal, which left him the slave of the wildest impulses, and led him with ungovernable fury to acts which reason would have abhorred, the individual so circumstanced should be free from all personal responsibility. This principle of the law admitted of no exception, but at the same time it would be idle to say that in particular applications of this great principle difficulties did not occur, and it was, therefore, that he asked for the patient attention of the jury while he laid before them the peculiar features of this case. He had stated that the defence for the prisoner would be his mental deficiency at the time when he committed the act, and he trusted that the evidence he intended to put forward in support of that defence would meet with their most serious attention. That evidence would be of two sorts; it would not be such as his learned friend had supposed—of a vague and negative kind—it would be testimony positive and precise. And he said this from the bottom of his heart—such as would carry conviction to the minds of everyone present. The testimony of persons who had known the prisoner from his youth—who had been brought into immediate contact with him—and the friends with whom he had associated. And, lest the evidence of persons so situated might be met with distrust, he had also evidence beyond suspicion—the evidence of persons in authority in his native place, to all of whom this unfortunate calamity had been made clearly known, and to all of whom the prisoner had appealed for protection from the fancied dangers which his imagination had created. The evidence would show that the prisoner had been the victim of fearful delusions, which had gradually destroyed his self-control, until he had committed the deed for which he was now placed on his trial. In addition to this, he (Mr. Cockburn) proposed to place before the jury the evidence of gentlemen connected with the medical profession—men of intelligence and skill—who would tell the jury that it was their internal conviction that the man was mad, and the creature of delusions and ungovernable influences, to such an extent as would release him from the character of a responsible assassin. He would impress upon the jury the great importance of this latter kind of testimony. He trusted he should not be deemed presumptuous in observing, that of all questions that could come before a tribunal like the present, the question of insanity was, except in cases where the whole mind was disordered, the most difficult to decide. Madness was not a disease, apparently at least, of the body. Its operation was on the mind, through the cerebral organization, affecting the intelligence of which that organization was the seat, and the knowledge of such a disease was only accurately to be ascertained by those who had made the observation of the disease the study of their lives, and who had devoted to it their whole experience and capacity. He need not remind the jury that from the very nature of this disease it insulated the victim from the rest of his kind, making it the more difficult for the latter to decide on the nice degrees of intensity of which the disease was susceptible. He did not say that the jury were wholly to surrender their judgments to evidence such as he had last mentioned, he had only thought it his duty fully to point out to them the importance of

such testimony, and to press on them the paramount necessity of listening to it with the most patient attention. He then proceeded at great length to lay down the law as applicable to the case, and afterwards called witnesses to show that the prisoner for years had laboured under unaccountable delusions, fancying that he was followed by persecutors, who were present during all the occupations of his life and even during his sleep. That they threw straws at him in the streets and followed him to London, and even to France; that sometimes he thought they were Catholic priests and Jesuits, and at others that they were Tories persecuting him on account of his having once voted for a Whig candidate at Glasgow. So strong was this delusion that he had called on the commissioners of police for protection. Several of these witnesses deposed that they considered him two years ago a dangerous lunatic, and that he ought to have been put under restraint. The interest of the trial, however, turned on the evidence of the medical witnesses. We shall, therefore, confine ourselves to the facts stated in their testimony. Dr. Monro said that the act with which the prisoner was charged, coupled with the history of his past life, left not the remotest doubt on his mind of the presence of insanity, sufficient to deprive the prisoner of all self-control. He considered the act of the prisoner in killing Mr. Drummond to have been committed whilst under a delusion; that the act itself he looked upon as the crowning act of the whole matter—as the climax—as a carrying out of the pre-existing idea which had haunted him for years. Mr. Cockburn.—Is it consistent with the pathology of insanity, that a partial delusion may exist, depriving the person of all self-control, whilst the other faculties may be sound? Witness.—Certainly; monomania may exist with general sanity. He frequently knew a person insane upon one point exhibit great cleverness upon all others not immediately associated with his delusions. He had seen clever artists, arithmeticians, and architects, whose mind was disordered on one point. An insane person may commit an act similar to the one with which the prisoner is charged, and yet be aware of the consequences of such an act. The evidence which he had heard in court had not induced him to alter his opinion of the case. Lunatics often manifested a high degree of cleverness and ingenuity, and exhibited occasionally great cunning in escaping from the consequences of such acts. He saw a number of such cases every day. Cross-examined by the Solicitor-General.—You have stated that Drs. Bright and Sutherland were present at the examination. Did they hear your examination of the prisoner? Witness.—Yes, they were present with Sir A. Morrison and Mr. M'Clure, and heard the examination. They were there on the part of the Crown. I asked all the questions. On the two last occasions on which I saw the prisoner, Mr. Hutchinson and Dr. Crawford were present at the request of the friends of the prisoner. They examined the prisoner almost exclusively on that occasion, and in accordance with the usual practice, gentlemen in behalf of the Crown also attended. The Solicitor-General.—Did he not say he would not have fired if he had known that it was not Sir Robert Peel? Witness.—No, I think he did not. On this point he observed, that the person at whom he fired gave him as he passed a scowling look. At that moment all the extingings of months and years rushed into his mind, and he thought that he could only obtain peace by shooting him. He stated this in answer to my questions. I avoided all leading questions. The Solicitor-General.—What do you mean by insanity? Do you consider a person labouring under a morbid delusion of unsound mind? Witness.—I do.—The Solicitor-General.—Do you think insanity may exist without any morbid delusion? Witness.—Yes; a person may be imbecile; but there is generally some morbid delusion; there are various shades of insanity. A person may be of unsound mind, and yet be able to manage the usual affairs of life. The Solicitor-General.—May insanity exist with a moral perception of right and wrong? Witness.—Yes; it is very common. The Solicitor-General.—A person may have a delusion and know murder to be a crime? Witness.—If there existed antecedent symptoms I should consider the murder to be an overt act, the crowning piece of his insanity. Re-examined by Mr. Cockburn.—You said, Dr. Monro, that a person might labour under a particular form of insanity without having his moral perceptions deranged. For illustration—a man may fancy his legs made of glass. There is nothing in that which could affect his moral feelings? Witness.—Certainly not.—Mr. Cockburn.—You have not the slightest doubt that M'Naughten's moral perceptions were impaired? Witness.—No. Sir A. Morrison examined by Mr. Clarkson.—Was one of the gentlemen who saw the prisoner with Drs. Monro, Sutherland, and Bright. Has been in court during the whole of the day. Was present during the whole of the examination of the prisoner in Newgate. After the conclusion of that examination he arrived at an opinion as to the prisoner's state of mind. After having heard the evidence adduced that day in court, his opinion had not undergone any change. He concurred with the evidence of Dr. Monro. He believed he committed the act when insane. His morbid delusion consisted in his fancying that he was subject to a system of persecution. This delusion deprived the prisoner of all restraint or control over his actions. He had not the slightest doubt on the point. The evidence brought forward on the part of the prisoner had strengthened that opinion. His attention had been directed for half a century to this subject. Cross-examined by the Solicitor-General.—Do you think the prisoner of unsound mind? Witness.—I do. Mr. M'Clure sworn and examined by Mr. Bodkin.—He said he was a surgeon, and had practised in London 30 years. He had examined the prisoner on four separate occasions with Drs. Monro and Bright, and Sir A. Morrison. He thought that the delusions under which M'Naughten laboured were real, and not assumed. He had no doubt on the point. He heard all the evidence given in the case, and was of opinion that when he fired at Mr. Drummond at Charing-cross the prisoner laboured under an hallucination which deprived him of all ordinary restraint. He considered that his moral liberty was discharged. Cross-examined by the Solicitor-General.—Did you ask the prisoner if he knew whom it was that he fired at? Witness.—I did not. The Solicitor-General.—Did he not say that if he had not thought it was Sir R. Peel at whom he fired he would not have shot Mr. Drummond? Witness.—He did not say so. I was present at all the meetings. Dr. W. Hutchinson sworn and examined by Mr. Cockburn.—Is physician to the Royal Lunatic Asylum at Glasgow. Has had much experience in cases of insanity. He had visited M'Naughten whilst in Newgate in conjunction with the other medical men. He had found him labouring under a morbid delusion of mind. The delusions were real, and not assumed. He considered them sufficient to account for the act with which the prisoner was charged. He thought that his state of mind deprived him of the power of exercising any self-control over his actions at the moment when he committed the offence in question. He considered the act flowed immediately out of the delusion. Cross-examined by the Solicitor-General.—Do you mean to say that the delusion prevented the prisoner from exercising any control over his actions? Witness.—I said that the act was the consequence of the delusion, which was irresistible. The delusion was so strong that nothing but a physical impediment could have prevented him from committing the act. It might have done the same thing in Glasgow if the disease of the mind had reached the same point. I date his insanity from the period when he called on Mr. Wilson, the Commissioner of Police, for protection. I think he was insane at that time. That was about 18 months ago. Even at that time I do not think he could have resisted any impulse springing from the morbid delusions under which he suffered. By the Solicitor-General.—Diversing your mind of all the evidence you have heard, and all the facts connected with the case, and forming your judgment on the examination to which you subjected the prisoner, what would be your opinion of his state of mind? Witness.—I should have no hesitation in certifying that he was a dangerous lunatic. Re-examined by Mr. Cockburn.—When patients exhibit symp

DIED. On the 2d inst., at Bath, George Godart Henry De Rueda-de-Gimkell, Esq., of Athlone, co. Wick, of Roscommon, and Baron of Anghrim, county of (Cavan), in the Peerage of Ireland, Baron de Rueda-de-Gimkell, &c., in the Netherlands, in the 35d year of his age—Residence, in Gloucester-place, Portmarn-square, St. Gregory Osborne Place, Turner, Bart., of Battledun Park, Bedfordshire. LARCHES, &c.
VERY fine Two Year Seedlings, and One and Two Year transplanted Larches, and other Nursery stock are still on sale, at moderate prices, by W. URBART and Sons, Dundee.

FLOWER-SEEDS; 36 packets, 10s.; 18 do., 5s., forwarded postage-free to any part. Apply to Mr. Brown, Curator, Botanic Garden, Colchester. Any preferred species may be specified in the order. A mixed selection, containing 30 varieties, for sowing indiscriminately on Borders, 5s. Pelargonium, Petunia, and Heliotropium, 1s. per packet.—P.S. Remit a Post-office order or Stamps.

WILLIAM LYNN, NURSERYMAN, SEEDSMAN, and Florist, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a GARDEN TOOL WAREHOUSE, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. W. L. begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit-Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which, he trusts, with industry, punctuality, and attention, will secure to him general patronage.

W. L. solicits particular attention to his new PEA, LYNN'S DWARF WRINKLED MARROW, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn Pea ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, inclosing a postage-stamp.

NEW AND CHOICE FLOWER SEEDS.
LUCOMBE, PINCE, and Co., have a large Stock of all the newest and choicest FLOWER SEEDS, to the cultivation of which great attention has been paid, and which are this season more than usually fine. L. P. and Co. can therefore with confidence recommend them, as being in every respect to be depended on; and beg leave to offer for sale,

25 packets	for 15s.
50 do.	25s.
100 do.	35s.
150 do.	45s.

Delivered, carriage free, to any part of the kingdom. Catalogues may be had on application as above.
 Exeter Nursery.

NEW FLOWER-SEEDS.
MESSRS. SUTTON and SONS respectfully intimate that as they devote a great portion of their Nursery Grounds to the growth of FLOWER SEEDS, and have excellent connections on the Continent and in England for obtaining the New Sorts as soon as introduced, they can supply every known kind of Flower Seeds worthy of cultivation, and at very moderate charges, either in collections or otherwise. The sorts particularly recommended may be had in the undermentioned collections, with instructions inclosed.

Hardy Flower Seeds, 50 most showy kinds	s. d.
Ditto 30 ditto	15 0
Hardy and Tender ditto, including the most superb German Stocks, Balsams, German Asters, Zinnias, Brachycome, Portulaca, Mesembryanthemums, Phlox, &c. &c., 50 sorts	20 0
30 ditto	12 6
100 choice Ranunculuses, in 50 varieties by name	25 0
50 ditto, in 50 ditto	15 0
Double Italian Tuberoses, fresh imported, per dozen	4 0

N.B.—Parcels delivered free to the Railway-stations, or any part of London.—Reading Nursery, Berks, Feb. 21st.

NATURAL GRASSES.
MESSRS. SUTTON having been engaged many years in growing and collecting Permanent GRASSES for eminent Agriculturists in Berkshire and the surrounding counties, have great confidence in soliciting the commands of the readers of the *Gardener's Chronicle* in any part of the United Kingdom, to whom will be given references to Noblemen and others who have expressed themselves desirous of recommending Messrs. Sutton's Seeds. It is necessary that the nature of the soil should be described, when the most proper Seeds and proportions will be supplied; the names of which and other relative information may be previously obtained by application.
 Cost of Seeds this season 30s. to 34s. per acre. Reading Nursery, March, 1843.

TURNIP-SEED and NEW STRAWBERRY.—The Subscriber has for sale a large Stock of genuine Purple-topped Swedish Turnip (own growth) at 8d. per lb.; Laing's Swedish, 9d. per lb.; White Globe, 8d. per lb.; Dale's Hybrid, 9d. per lb.; Yellow Bullock, 9d. per lb. Also Hare's Scarlet Pine Strawberry, superior in flavour to Kean's Seedling, an excellent bearer, and a fine juicy fruit; raised at the Pavilion, near Melrose, in 1841, and gained the first prize at the Kelso Horticultural Society in 1842, price 10s. per 100. Early orders requested. A remittance from unknown correspondents.
 A. LOCKIE, Kelso, Roxburghshire, 7th March, 1843.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHEROE & MORRIS will submit to Public Competition at the Auction Mart, Bartholomew-lane, on THURSDAY, March 16, 1842, at 12 o'clock, about 300 Standard and Dwarf ROSES, of the finest varieties; choice PINKS, PEONIES, &c.; also a splendid assortment of DAHLIAS. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and the PUBLIC.

MESSRS. PROTHEROE and MORRIS take the liberty to announce they are instructed to dispose of the capital Stock of Greenhouse PLANTS, on the Premises, the corner of London Lane, Hackney, by Auction, on TUESDAY, March 14, 1843, at 12 o'clock. This truly interesting Collection comprises fine specimens of Camellias, in high perfection, Lemon and Orange Trees, Cacti, choice Pelargoniums, Amaryllis, Carnations, and Picotees; six, one, and two-light Boxes, &c. May be viewed one day previous to Sale. Catalogues may be had of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.
 N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

PENN'S SYSTEM OF HOTHOUSE BUILDING
 WARMING, and VENTILATING.—The superiority of the principle first introduced by JNO. PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the Nobility, Horticulturists, and the Public generally, that having, in conjunction with the Inventor, devoted much time and study to perfect the same in the construction of Conservatories, Stoves, Greenhouses, Pits, and other Horticultural Erections, and to heat them with IMPROVED HOT-WATER APPARATUS, to ensure ANY DEGREE OF TEMPERATURE, earnestly solicits their inspection of the working of this system at the Inventor's residence, Lewisham.

The peculiar advantages in Houses erected upon, or altered to, this principle, are—Free and rapid Circulation, Equality of Temperature, and safe and agreeable access, at all times, to the most delicate constitutions.

Churches, Chapels, Manufactories, or other large Public Buildings and Dwelling-houses, warmed and ventilated. The Heating Apparatus, which is of the very best description, combining Durability and Simplicity, with Economy in the Consumption of Fuel, is manufactured by and fixed under the superintendence of JNO. PENN, Esq., Engineer.

Reference is permitted to JNO. WILLMOT, Esq., Isleworth, and numerous other Gentlemen, who are practically acquainted with the merits of W. HILL's mode of applying Mr. PENN's principle.

Designs, and every information, may be obtained on application to W. HILL, Builder and Surveyor, Lewisham.

HOTHOUSES, CONSERVATORIES, &c., Made and Fixed Complete in all parts of the Kingdom. One two, and three-light Cucumber and Melon Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two light Boxes and Lights complete, from 1l. 8s. Garden-Lights Made and Glazed from 1s. per foot, at Jas. WATTS, Sash Manufactory, Clarendon-place, Old Kent-road.

*** Reference given.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12l. 12s.

In one thick Vol., Eighth Edition, much enlarged, price 16s.

MODERN DOMESTIC MEDICINE: A POPULAR TREATISE, exhibiting the Symptoms, Causes, and most efficacious Treatment of Diseases; with a Collection of approved Prescriptions, Management of Children, Doses of Medicines, &c. Forming a comprehensive Guide for the Clergy, Families, and Invalids. By T. J. GRAHAM, M.D., &c. "It is evidently the result of great professional talent, experience, and judgment; the author everywhere appears conscientious and candid. One object is prominently evident—a sincere desire to benefit his suffering fellow-creatures. To recommend a work like the present to our readers, is only to manifest a proper regard for their welfare."—*Literary Journal*, Feb. 1843.

"It is altogether deserving of permanent popularity."—*London Weekly Review*.

SIMPSON and Co., Paternoster Row; and HATCHARDS, 187, Piccadilly. Sold by all Booksellers.

Also, by the same Author, in 8vo., 11s., Third Edition, enlarged, 2. **ON THE DISEASES OF FEMALES: A Treatise**, illustrating their Symptoms, Causes, Varieties, and Treatment. With numerous Cases, and a Medical Glossary. Including the Diseases and Management of Pregnancy and Lying-in.

"It contains a mass of information indispensable to those for whom it is intended, and surpasses in value any other book of its character."—*Blackwood's Lady's Magazine*.

ENTOMOLOGICAL PRIZE ESSAYS.—At a Meeting of the Entomological Society, Feb. 6, the Rev. F. W. Hope offered the two following Prizes:—Five Pounds for the best Account of Insects injurious to Market Gardeners; in which must be described the ravages caused by Insects destructive to Fruit trees, such as the Apple, Pear, Gooseberry, Currant, &c.; to Stove and Greenhouse Plants, Culinary Vegetables and Seeds. The remedies which have been used to counteract their effects must be stated, and methods suggested to check their future ravages. To be written in such a manner that the Labourer, as well as the Agriculturist, may be able to understand it; and, if necessary to use scientific names, the same to be added in notes, and not in the text. Five Pounds for the most complete Synopsis of British Entomologists and their Writings, commencing with Monst., in 1641, and terminating at the end of 1842. The different Editions of each work should be added. Distinct Catalogues to be given of Authors and Works upon the Crustacea and Arachnida. The Memoirs to be delivered to the Secretary of the Entomological Society, 17, Old Bond-street, London, on or before the 28th November, 1843.

Just Published, in 8vo., price 1s. 6d.,

HISTORICAL SKETCH of the PROGRESS of PHARMACY in Great Britain, from the time of its partial separation from the Practice of Medicine until the establishment of the Pharmaceutical Society. By JACOB BELL. London: JOHN CHURCHILL, Princes-street, Soho.

SALICUTUM BRITANNICUM, or Dried Specimens of the WILLOWS of BRITAIN. By the Rev. J. E. LEEFE, A.M. Fasciculus I., containing 100 Specimens. The Specimens fixed down in a Book, with Remarks, Synonyms, Synoptical Table, &c. Price 1l., or loose in a Portfolio, 10s. WHITTAKER and Co., Ave Maria Lane; and THOS. and A. BOWMAN, Richmond, Yorkshire.

IMPORTANT.—"After more than two years' constant trial, I can give the most unqualified and decided testimony in favour of your Ventilating Waterproof Frocks. I have been much exposed in an open chase to all weathers, frequently for six hours at a time, to the most drenching rain, so as to appear externally like one sheet of water, but never found your coat fail in keeping me perfectly dry (and this, too, without the least appearance of confined perspiration). I cannot express the comfort and satisfaction it affords me. If my testimony is of any value, pray make any use you please of it. DUFFY and SON, Surgeons, 9, Alfred-place, Newington, Surrey. Feb. 10, 1843, 'To Mr. Bird &c.' The garment referred to is BERDOE'S VENTILATING WATERPROOF FROCK, a respectable and established garment, made only by W. BERDOE, tailor, waterproofer &c., 69, Cornhill, (eight doors from Bishopgate-street).

DESTRUCTIVE ANIMALCULÆ.—As Spring approaches, the larvæ of DESTRUCTIVE INSECTS are propagated in infinite multitudes, and impregnate with millions of insects the very air we breathe. J. READ begs to inform every person interested in the practice of Horticulture, that he has made considerable improvements in his ENGINES and MACHINES for the purpose of destroying those Animalculæ which make such deadly havoc on all choice Fruit-trees and Plants at this season of the year. The above are fitted with tubes that will bear any degree of pressure required, and are water, air, and steam proof. From 31 years' practice in Horticulture, and 21 years in Manufacturing and Improving Engines, J. R. can warrant them the best adapted for the above purposes of any hitherto made; the valves being solid spherical metal are never liable to be out of repair, even in the hottest climates.

Manufactured only by the Patentee, 35, Regent Circus, Piccadilly, where they may be seen and proved.

N.B.—None are genuine except stamped with the words, "READ'S Patent."

BEE-HIVES, &c.—Illustrations of Apiaries, Bee-hives, Feeding-Machines, and all the Apparatus connected with the Apiary; a Sheet-List, price 1s., published by J. MILTON, may be had of Messrs. PARKER, West Strand; also at J. MILTON'S, Italian Warehouse, 10, Great Marylebone-street, Wimpole-street. "These are illustrations referred to in the Practical Bee-Keeper," a Treatise on Bees now publishing. All letters prepaid.

NURSERY and SEED BUSINESS to be DISPOSED OF.—The Proprietor of an old-established Nursery and Seed Business (in the country) being desirous of retiring, would be glad to treat with any person wishing to embark in such a concern.—For particulars apply by letter, addressed C. B. *Gardener's Chronicle* Office.

WANTED, in a Large Nursery, a FOREMAN. He must have a thorough knowledge of his business, and be able to bring such testimonials of character as will be unquestionable. None need apply unless fully competent. Address, A.R.S., Messrs. MURDIE and Sons, Coventry-street, Piccadilly.

WANTED, a GARDENER and DRAUGHTSMAN.—J. WEEKS & Co., Hothouse Builders and Hot-Water Apparatus Manufacturers, Gloucester-place, King's-road, Chelsea, will be glad to meet with a practical Gardener, who can draw good Plans of Horticultural Buildings, &c.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, a Man aged 33. Has had extensive experience in the business in all its various branches, particularly the management of Pines, Vines, &c. An unobjectionable character. N.B.—In or out of the house.—Address A. B., 23, Norton-street, Portland-place, London.

AS GARDENER, an industrious middle-aged Married Man, without incumbrance, who has a knowledge of Plants and Fruits generally; has paid considerable attention to the Growth and Training of the Grape-Vine, and from which he will undertake to produce a crop in 16 months after the Vine is planted. To any gentleman whose Gardens or Vinery have been neglected, and who is desirous of re-establishing them, more especially the latter, the Advertiser flatters himself he will be found serviceable. He can be recommended by R. CRAWSHAY, Esq., and can have a character of 6 years' standing from his present employer. Letters addressed post-paid to O. P. Q., Post-Office, Brandon, Norfolk, will meet with immediate attention.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER and BAILIFF, a middle-aged Married Person, without incumbrance. He has had great experience in all the branches of Gardening, as well as Farming, the Breeding and Rearing of Stock, &c., &c. He can be highly recommended by the Noblemen he has left, in consequence of the estate being disposed of, and where he has been directing the Management of Garden and Farm for a number of years; and also by other highly respectable Gentlemen. Address C.K., to the care of Messrs. HENDERSON and Co., Nurserymen, &c., Pine-Apple-place, Edgeware Road, London.

AS HEAD-GARDENER.—P. WALKER, Gardener to R. W. Grenfell, Esq., is about to leave his Situation, and will be glad to engage in a Nobleman or Gentleman's service. Age 28; he has had 11 years experience, under excellent Gardeners, in Laying out Grounds and in every department of Horticulture, prior to entering his present situation. Unexceptionable reference from his present employer.—Address, till 31st inst., Maesteg, near Swansea; afterwards to the care of Mr. WALKER, Priskilly, Haverfordwest, Pembrokeshire.

AS GARDENER, a Married Man, 34 years of age; he has had great success in the Forcing of Pines, Grapes, Peaches, &c. &c., as also in the management of Stove and Greenhouse Plants. He will be highly recommended by the family he last lived with, for strict integrity and a perfect knowledge of Gardening in every department. The Advertiser has also been accustomed to the Management of Tillage and Pasture Land.—Address A. B., 54, Milton-street, Dorset-square, London.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER or FORESTER, a middle-aged Married Man, without incumbrance, a native of Scotland, who thoroughly understands his business, also Forcing in all its departments. Has served in a Nobleman's family, in one of the first places in Scotland, for 13 years as Principal, and in the place he has just left, nearly 4 years; the most satisfactory reference can be given.—Address, prepaid, to A. Z., Messrs. BROWN and Co.'s Nursery, Croydon, Surrey.

AS GARDENER. Understands the Management of Cows, and would make himself generally useful. His Wife is a good Cook, and can take charge of a Dairy or Lodge. Can have a three years' good Character from their last place. Direct to B.C., Mr. PRICE, 7, Park-row, Greenwich, Kent.

AS GARDENER, a Single Man, aged 26, who has a thorough knowledge of Plant Growing, Forcing in all its Branches, Kitchen Garden and Pleasure Ground. Can have an excellent Character from his last Situation. Other references can be given as to Ability and Character. Has no objection to any part of England. Address A.Z., Mr. PAWLEY, Horticultural Grounds, Bromley, Kent.

AS GARDENER, a young Man, aged 27. Left his last employment in consequence of the death of his Master, with whom he lived three years. Can give an unexceptionable character. Has had the Management of Frames for Forcing, Vineries, Greenhouses, &c. An inferior Situation objected to. Address to A.N., Mr. ROBINS', Corn-chandler, Dartford, Kent.

TO NURSERYMEN and GARDENERS.—Ten Pounds will be given to any one who will procure a Situation in some good Garden for a Young Man, 22 years of age, who has been six years at his business, and wishes for further improvement.—Direct A.B., at Mr. SHIPTON'S, 1, Chapel-street, Pentonville, Islington.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 8, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed, to the Editor.—Saturday, March 11, 1843.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

PRICE 6d.

WILLIAM HURST AND WILLIAM GEORGE M'MULLEN, (for many years past engaged in the House of Messrs. **WARNER AND WARNER**, 28, Cornhill,) beg respectfully to acquaint their friends in the Seed trade, and the Public generally, that they commenced Business as Wholesale and Retail **SEEDSMEN AND FLORISTS**, at the above-named premises, on Monday the 13th inst., and they can confidently assure all who may kindly favour them with orders, that, from the numerous resources they possess, through an extensive connexion with the best Seed-Growers, both in this country and on the Continent, and from many years' practical experience in the various branches of the Business, they are enabled to offer every article of first-rate, genuine quality, and no exertion will be spared in giving prompt attention to every order, and endeavouring to merit a continuance of their support.

HURST & M'MULLEN, Seedsmen and Florists, 6, Leadenhall-street, City, beg to offer to the Nobility, Gentry, and Public generally, a choice and carefully-selected assortment of the most approved Kitchen, Garden, Agricultural, and Flower Seeds, of which general Catalogues may be had on application. Among the novelties of the season will be found the following:—

FLOWER SEEDS.

Thirty packets of select Flower-seeds, 8s.; sent free of postage to any part of the United Kingdom.

Agents for the sale of STEPHENSON & Co.'s improved CONICAL
 BOLLERS, which may be seen on application. Also, Agents for
 the sale of POTTER'S ARTIFICIAL GUANO.
 Great Yarmouth Nursery, Norfolk, March 11, 1843

One of the many advantages derivable from RENNIE'S "Tank System of Heating," is the easy practicality of Cultivating Pines without Pots, an object of paramount importance to the cultivators of this delicious and much-esteemed Fruit.

A Treatise, with Engravings, will shortly be published, containing every information to select or adapt the apparatus, with cost of materials, fixing, &c. Price 5s. each copy to Subscribers. Orders are requested forthwith to be sent to Mr. WM. RANDLE, Union road Nursery, Plymouth.—Feb. 15th, 1843.

MONDRI. The colour of this most beautiful of dahlias is a dazzling scarlet; the flowers are perfectly round, without any space between the petals, forming, unexceptionably, the most brilliant and striking object that can possibly be imagined.—J. Woon having grown no other sort, it is impossible that it can be deterred out by impregnation. It was awarded an extra prize at the Summer Show of the Huntington Horticultural Society. Packets, containing 12 seeds, 2s. 6d. each, postage included, either in cash or by stage stamps.

The following gentlemen of the neighbourhood will vouch for the truth of the above description.—JOHN PRICE, Esq., God-ma-chester, Hon. Secretary to the Huntingdon Horticultural Society; E. MAULE, Esq., Huntingdon; Mr. HESTER, Gardener to the Right Hon. Earl of Sandwich, H. chubbrook, near Huntingdon; Mr. LATRO, Gardener to Lady Sparrow, Brampton Park, Huntingdon; Mr. BETTS, Gardener to G. Thornhill, Esq., M.P., Diddington, Huntingdon; Mr. GIDDINGS, Florist, Heming-bury, Huntingdon.

N.B. March is the best month for sowing, and the seed should be vegetated in a gentle heat. None are genuine but those sold by J. W. and his sole Agents, Messrs. HURST and M'MULLEN, Nos. 6 and 7, Leadenhall-street.
Nursery, Huntingdon, March 2, 1843.

Y. OUELLE & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Catalogue and Prices of the above elegant tribe, inserted on the advertising page of this Paper of the 4th inst. Also, to the description of their 'FUCHSIA ST. CLARE,' which is already ordered for Her Majesty's Gardens at Claremont.

Great Yarmouth Nursery, Norfolk, March 16, 1843.

CARNATIONS, PICOTEEES, AURICULAS, &c.
MESSRS. DICKSON, Nurserymen and Florists,
 Acre-Lane, Brixton, respectfully solicit the early attention
 of Amateurs and the Trade to their extensive and choice col-
 lection, which comprises all the best show-flowers of the day.
 Gentlemen wishing to compete for prizes at public exhibitions
 will find this a most desirable opportunity of making their
 selection. The plants are in fine healthy condition, and warranted
 true to their kinds. Messrs. DICKSON also have a few more pairs
 of that splendid red Picotee, **BARRAUD'S CORNELLS**, to dispose
 of; it is a beautiful and distinct variety, and as a show-flower,
 is unrivalled in its class. Catalogues may be had on applica-
 tion to **Messrs. DICKSON**, or **Messrs. WARNER & WARNER**, Seedsmen,
 &c., Cornhill, London.

JOHN HOLLAND, Florist, Market-place, Middleton, near Manchester, Lancashire, begs to call the attention of his friends, and the Horticultural Public, to his superb collection of **CARNATIONS, PICOTEES, &c.**, consisting of the finest sorts in Cultivation: and that he can still supply first-rate varieties, including a few pairs of that superb rose flake, **Lowe's Marchioness of Westminster, &c. &c.** Amateurs, Florists, &c., purchasing, would find it an advantage to possess his Catalogue, which will be forwarded on application.

He having also a very large stock of the common show

N.B.—A large Collection of Auricula, Polyanthus, &c. &c.—
Market-place, Middleton, March 2, 1843.

FLORISTS, beg to offer the above splendid flowers, in good plants, now ready to send out at 75. cts. each, for 100, prepaid, in recognition of the amount with the order. It grows in prizes at the Uffoxeter Royal Horticultural Society, and was named as above by the Committee. Blooms also were sent to the *Gardeners' Gazette* office, and reported a very large and beautiful flower, one of the best seen this season. For description, &c. see the *Gardeners' Gazette* for the present week, and Horticultural Cabinet for March. *Campanula grandis*, 25. cts. each, or 100. per dozen. Myatt's Eliza Strawberry, 125. cts. per 100. Merrill's Royal Victoria Vine, 25. each.

W. K. and Sons List of Dallas, Pansies, Pelargoniums, Phloxes, Fuchsias, Cinerarias, &c., &c., may be had on application, per post, prepaid.—L. W. Foster, Stationer.

YEOUELL & CO. will send, free of postage, to any part of the United Kingdom on the receipt of a post-office order for 16s., a pair of that **SUPERB ROSE-FLAKED CARNATION**, **WILSON'S HARRIET**; also a pair of that highly-valuable Red Picotee, "**JOAN OF ARC**," both of which ought to be grown by every Amateur who intends competing for Prizes at the Horticultural Shows of the ensuing season.—Great Yarmouth Nursery, March 16, 1843.

FUCHSIA BROCKMANIA.—This splendid variety, so confidently recommended as a show-flower, (as already described in the *Chronicle*), will be sent out, price 7s. 6d., to those who have favoured the raiser with orders, during the last week in March, or the first week in April. A few strong plants may still be had by an early application, to Mr. PADDEN, Gardener, Beachborough, Hythe, Kent.—March 16, 1843.

ASMODEUS.—The Colour of this DAHLIA is very dark Crimson, with beautiful velvet Petals of extraordinary depth; it may justly be said to be the TRUE SHAPE, a three-quarter Globe, and is as constant and perfect as perfection is. The flower has been very generally exhibited, and has won the following prizes:—

1841	1842
1st prize at Bath	2d prize at Salisbury Plain
1st prize at Chippenham	1st prize (a piece of plate), Bath
4th prize at Saltsbury	1st prize at Chippenham
	2d class, London Horticultural

Plants 1s. 6d. each, early in May (with the usual allowance to the Trade), may be obtained of Mr. BROWN, Nursery, Slough. Early application is requested, in order that a list of those Nurserymen who may be able to supply the AMATEUR CULTIVATORS may be published.

FUCHSIA TODDIANA.

PLANTS of this MAGNIFICENT FUCHSIA, (the Flowers of which, in point of size, rival any other of its kind yet sent out, being nearly four inches in length, will be ready by the end of April, at 10s. 6d. each, with the usual discount when six are taken. For description, see *Gardeners' Chronicle* of the 11th inst. Agents for London, Mr. CHARLWOOD, Seedsman, Covent Garden; and Messrs. LOWE and CO., Clapton Nursery, at which places also drawings may be seen.—THOMAS CRIPPS, Tunbridge Wells Nursery, March 16, 1843.

RARE ALPINE CRYPTOGAMIC PLANTS OF SCOTLAND.—Four more 10s. Packets have been made up, *this season*, each including in them 120 species, besides BUXBAUMIA ARVILLA, and many of the rarer Mosses, &c., with specimens of the rare *Moneses grandiflora* and *Scheuchzeria palustris*. Also two 12. parcels, each containing 250 specimens of Flowering Plants, Ferns, Mosses, Lichens, Hepaticæ, and Algæ. Early application is requested, addressed WM. GARDINER, 40, Overgate, Dundee.—March 13, 1843.

MESSRS. H. LANE and SON beg to announce that their select Catalogue of PELARGONIUMS, FUCHSIAS, VERBENAS, HEARTSEASE, &c. &c., for the present year may be had on application at the Nurseries, Great Berkhamstead, Herts. For Character, &c., of FUCHSIA LANEI, see Advertisement in *Gardeners' Chronicle* of Dec. 17, 1842. Great Berkhamstead, March 1, 1843.

EXHIBITION of CAMELLIA JAPONICA, or JAPAN ROSE.—A Collection of these beautiful Exotics is now in bloom at CHANDLER and SONS' Nursery, Vauxhall. Admittance gratis.

ORANGE and LEMON TREES, JASMINE PLANTS, &c., &c.—Noblemen and Gentlemen seeking an opportunity of replenishing their Stock, or commencing an Orangery, may have an opportunity of so doing, by inspecting the Stock of A. COBBETT, at his Italian Warehouse, 18, Pall Mall, who has just received his annual importation from Italy, in a good and healthy condition. The trees are from 3 to 6 feet high in the stem, and from 10s. to 30s. each, and will be packed and sent safely to any part of the Kingdom.

DOUBLE ITALIAN TUBEROSE ROOTS.—The annual importation of these truly fragrant and delightful Bulbs has just been received in a good and healthy condition, and may be obtained at the above address. Price 4s. per dozen.

N.B.—Importer of choice Lucca Oils, Honeycomb, Parmesan and Gruyere Cheese, Anchovies, &c., &c. Lists with Prices may be had, per post, &c.

ORANGE, LEMON, CITRON, AND SHADDOCK TREES.—G. MARSANO has just imported from Italy three cases of the above-named trees, from 8 to 9 feet high, at 6s. to 12s. each tree; Tuberoses, 3s. per dozen; each case of Orange-trees contains 80 trees. The Nobility and Nurserymen may be supplied on applying to G. MARSANO, Oilman, Seedsman, and Florist, No. 2, Beauchamp-street, Brooks-market, Leather-lane, Holborn, London.

DILLISTONE'S APPLE, the STURMER PIPPIN.—S. and J. D. are again induced to offer this as the very best late Apple known, for Kitchen and Dessert, as it keeps firm and fine-flavoured till the latter end of June. It is a great bearer; as a proof of this, they gathered this last autumn, from young dwarf standard trees, upwards of 90 bushels. Although this Apple has been raised some years, its merits have not been fully known till within the last four or five years; it only requires to be known to be extensively cultivated. To the Cottager it is invaluable, as it is a constant bearer.—Scions from the original tree may be sent by post, on the receipt of Post-office order for 3s. 6d.—Nurseries, Sturmer, near Halstead, Essex, 7th March, 1843.

CUCUMBER SHOW.—The Fifth Annual Cucumber Show will take place at Mr. LIDGARD'S, the Thatched House Inn, Hammersmith, on Monday next, March 20, 1843. Each Exhibitor to show only one brace of Fruit; entrance-money to Members, 5s.; non-Members, 10s. Open to all England. Dinner at two o'clock precisely. The Cucumbers must be in the Show-room by one o'clock; none received after that time.

TURNIP-SEED and NEW STRAWBERRY.—The Subscriber has for sale a large Stock of genuine Purple-topped Swedish Turnip (own growth) at 8d. per lb.; Laing's Swedish, 9d. per lb.; White Globe, 8d. per lb.; Dale's Hybrid, 9d. per lb.; Yellow Bullock, 9d. per lb. Also Hain's Scarlet Pine Strawberry, superior in flavour to Kean's Seedling, an excellent bearer, and a fine juicy fruit, raised at the Pavilion, near Melrose, in 1841, and gained the first prize at the Kelso Horticultural Society in 1842, price 10s. per 100. Early orders requested. A remittance from unknown correspondents.

A. LOCKIE, Kelso, Roxburghshire, 7th March, 1843.

T. & C. LOCKHART, FLORISTS and SEEDSMEN, 156, Cheapside, London, respectfully inform their Friends and the Public that the firm of their house will henceforth be T. & C. LOCKHART & DUNCAN, in consequence of Mr. ANDREW DUNCAN, of Brompton, becoming their Partner. They beg leave to solicit for the new firm the continuance of the patronage which they have for so many years experienced. Orders for India and the Colonies punctually executed. Their manner of packing seeds and bulbs for long voyages has been attended with uncommon success, as well as their selection of those best adapted for different climates.

Their EXTENSIVE COLLECTION of CROCUSES is now in full bloom, and FREE ORDERS for admission will be given either at 156, Cheapside, or at the Nursery, Parsons Green-lane, Fulham. They venture to affirm that it will be found one of the most pleasing and novel exhibitions in or near the metropolis. Omnibuses pass their Nursery to and from the City every quarter of an hour.

Lists of Seeds, Plants, and Dahlias forwarded post-free on application.—March 17, 1843.

NEW FLOWER-SEEDS.

MESSRS. SUTTON and SONS respectfully intimate that as they devote a great portion of their Nursery Grounds to the growth of FLOWER SEEDS, and have excellent connections on the Continent and in England for obtaining the New Sorts as soon as introduced, they can supply every known kind of Flower Seeds worthy of cultivation, and at very moderate charges, either in collections or otherwise. The sorts particularly recommended may be had in the undermentioned collections, with instructions inclosed.

Hardy Flower Seeds, 50 most showy kinds	8. 6d.
Ditto 30 ditto	15 0
Ditto 30 ditto	10 0
Hardy and Tender ditto, including the most superb German Stocks, Balsams, German Asters, Zinnias, Brachycome, Portulaca, Mesembryanthemums, Phlox, &c. &c., 50 sorts	20 0

Six best sorts . . . 5 0	Six best sorts . . . 5 0

His New Catalogue of Seeds for 1843 may be had gratis on application.—238, High Holborn, London.

JAMES DICKSON & SONS, NURSERYMEN, SEEDSMEN, and FLORISTS, have much pleasure in announcing that they have succeeded in making a valuable addition to their extensive stock of CALCEOLARIAS, by the purchase of the entire stock of those richly-spotted varieties raised by Isaac Anderson, Esq., which took the first prize for seedlings at the Royal Caledonian Horticultural Society's meeting of the 15th July last, and were justly described as being the finest varieties yet exhibited. There are six distinct varieties, named as follows—George Heriot, Graham, Greigiana, Anadine, Margaret, Neillii. These will be sent out in rotation of order, early in April next, at 30s. per set, or 7s. 6d. each. Early orders will oblige, and meet with prompt attention; but as the stock of some of the varieties is very limited, early application can only be guaranteed execution. Seed Warehouse, 32, South Hanover-street, Edinburgh; Nurseries, Inverleith, and Broughton Park.

Note.—Messrs. J. D. & Sons are now sending out plants of that beautiful and distinct variety of Epiphyllum truncatum, called Epiphyllum truncatum elegans, which attracted so much notice at the Horticultural Society's Show.

NATURAL GRASSES, Separate or Mixed.—Poa trivialis, P. pratensis, P. nemoralis, P. fertilis, P. angustifolia, Festuca pratensis, F. duriuscula, F. ovina, F. rubra, F. elatior fertilis, F. gigantea, F. lolacea, Agrostis stolonifera, A. palustris, Dactylis glomerata, Cynosurus cristatus, Alopecurus pratensis, Anthoxanthum odoratum, Avena flavescens, A. pratensis, A. pubescens, Phleum pratense, Lolium perenne, L. perenne Russelianum.

The above, together with Perennial Clovers and other ARTIFICIAL and NATURAL GRASSES, may be had separate by name, or will be supplied in mixtures of such sorts, and in such proportions, as to suit the soil and situation for which they may be required. The cost of the seeds, this season, is from 80s. to 34s. per acre.

Messrs. Sutton and Sons have, for many years, supplied Noblemen and Gentlemen with GRASS SEEDS for laying down permanent Pastures and mending old ones, and have the privilege of referring to estates in many parts of England, where the Proprietors have expressed themselves desirous of recommending Messrs. Sutton's Seeds.

THE FINEST SORTS for LAWNS mixed. Warranted free from Weeds, 4s. per Gal.; 31s. per Bush.—Reading Nursery, Berkshire.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition at the Auction Mart, Bartholomew-lane, on THURSDAY, March 23d, 1843, at 12 o'clock, a fine Collection of CARNATIONS, PICOTEES, PINKS, DWARF ROSES, FUCHSIAS, VERBENAS, HEARTSEASE, PEONIAS, DAHLIAS, &c. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25l. to 500l., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of FREDERICK LAWRENCE, Resident Secretary, 112, Cheapside.

HEATING WITH HOT WATER on all its improved Principles, for Horticultural and other purposes, by JAMES M'LATCHIE, Millwright and Engineer, Cottage-lane, Commercial-road East. J. M. returns his sincere thanks to those Noblemen and Gentlemen who have already honoured him with their favours, and hopes by his economical Prices and sound Workmanship to merit their lasting favours. N.B.—Attends personally to all Erections.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS & Co., Architects, &c., Gloucester-Place, King's Road, Chelsea, Hothouse-builders, and Hot-Water Apparatus manufacturers, seeing that several parties pretend to lay claim to the Open Trough, Tank, or Gutter system of heating, J. W. & Co. here lay before the Horticultural world their practice respecting it, they having fixed and circulated water in open Troughs now upwards of 16 years; and their works are now to be seen that have been fixed that time, at DAVID PUGH'S, Esq., Welsh Pool, Montgomeryshire; the Duke of Bedford's, Woburn; Sir EDMOND ANTOBUS, Cheam, and up to the present time they could give a list of 200 names, where they have fixed that principle, or their improvement on it. The above sketch represents a pit, shewing the principle for the purpose of Bottom-Heat, which answers well. J. W. & Co. solicit an inspection of their improvements in Building, Heating, and Ventilating, at their Horticultural Manufactory, Gloucester-Place, Chelsea.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.

N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

MANURES.—Guano, Nitrates of Soda and Potash, (pure), at the Importers' prices. Also Gypsum, Potter's Guano (superior to the Foreign), Urate, Bone-Dust, Sulphate of Ammonia, and all other Chemical Manures, on the lowest terms for cash. Rock Salt and Agricultural Salt.—Sold by MARK FOTHERGILL, Merchant and Agricultural Agent, 40, Upper Thames-street.

*** Pamphlets treating on the above may be had of Mr. F.

This day is published, price 1s.

THE SCIENTIFIC and LITERARY TREASURY; a Copious Popular Encyclopedia of the Belles Lettres. The Second Edition. Fcp. 8vo., 10s. cloth; embossed roan, with gilt edges, 12s. London: LONGMAN, BROWN, GREEN, and LONGMANS.

BEE-HIVES, &c.—Illustrations of Apiaries, Bee-hives, Feeding-Machines, and all the Apparatus connected with the Apary; a Sheet-List, price 1s., published by J. MILTON, may be had of Messrs. PARKER, West Strand; also at J. MILTON'S, Italian Warehouse, 10, St. Marylebone-st., Wimpole-st. These are illustrations referred to in the Practical Bee-keeper, a Treatise on Bees now publishing. All letters prepaid.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS at the GARDEN for the year 1843. These will take place on the following days; viz., Saturday, May 13; Saturday, June 17; Wednesday, July 12. The Garden will be opened, on each day, at one o'clock, under the following regulations:—All Fellows of the Society will be admitted without tickets, from one till six o'clock, on signing their names in a book at the entrance. Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society. N.B. The presentation of the visiting card of a Fellow of the Society cannot be regarded as an authority to receive tickets. All Fellows who shall apply on or before Tuesday, the 18th of April, may obtain at the rate of *Three Shillings and Sixpence* each any number of tickets not exceeding Twenty-four; but no applications for such tickets will be received after that day. It would be a great convenience to the Society, if the Fellows would take their tickets personally, and not by written orders; or, in the event of their not so taking them, if they would at once order the whole number which they may require for the season. After the 18th of April any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket. Each ticket will be available for the admission of one Visitor, after one o'clock, to either of the three Exhibitions, at the option of the Visitor. All applications for tickets must be made at the Society's Office, 21, Regent street.

The Gardeners' Chronicle.

SATURDAY, MARCH 18, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.	
Tuesday, Mar. 21 . . .	Horticultural . . . 8 P.M.
	Linnean . . . 8 P.M.
	Floral . . . 7 P.M.
Wednesday, Mar. 22 . . .	Geological . . . 3½ P.M.
	Medico-Botanical . . . 8 P.M.
Saturday, Mar. 25 . . .	Royal Botanic . . . 8½ P.M.
Tuesday, Mar. 28 . . .	Zoological . . . 8½ P.M.

WHEN we some long while ago ventured to oppose the vulgar prejudice in favour of soft-burnt flower-pots and against hard ones, we heard on all sides only one outcry, and that against the absurdity of supposing that plants could be grown in any material except such as is porous. We, however, maintained our ground, urged the objectors to examine the question experimentally, and not prejudicially, if we may apply that word in so new a sense; and the issue of the investigation has shewn that we were right—that plants can be grown in slate as well as in the softest and rudest earthenware. Thus encouraged, and seeing that what gardeners are the most certain about is not always the most certain, we will venture to enter the lists against another of their prejudices.

A fortnight since, our correspondent, Mr. Ayres, very properly called attention to the modern plan, adopted here and there, of potting young plants at once in large pots, so as to avoid the necessity of frequently shifting them, and he mentioned instances of the obviously good effect of the system. This, like the hard-baked pots, has raised a host of objectors, who point to their own experience as an unanswerable argument against what some are desirous of calling the "one-shift system." "We have grown plants," they say, "all our lives; we always adopted the good plan of frequent potting; and we are reckoned pretty good gardeners, we believe. We never heard of such a thing as putting small plants into pots as large as they are likely to require when old, and we wonder that the Editor of the *Gardeners' Chronicle* should allow his Paper to contain such stuff." These correspondents do not say that they ever tried the one-shift system themselves; all that they insist upon is, that their own method being right, the other must necessarily be wrong. We ought not to expect gardeners' logic to be worthy of that of the Professor of Casuistry at Cambridge, but we confess that such as we have literally quoted from a paper or two before us, reminds us of an Irish story worth telling on this occasion. A man was indicted at the Clonmel assizes for stealing a pig; on his trial he produced a dozen witnesses, who swore that they knew the prisoner well, that they did not see him steal the pig, and did not believe him capable of doing such a thing: unluckily one witness appeared who did see him drive it away, and to the man's great surprise that one positive evidence was preferred by the jury to the prisoner's twelve negatives. So it is with this question about the "one-shift" system: twelve men may say that they never saw it done, and do not believe it possible; but one man who has seen it, and found it answer, will be regarded by the public as the better evidence.

With these remarks we beg to introduce to the notice of our readers a letter written upon shifting plants by a correspondent calling himself *Observer*. That letter seems to include all the objections that gardeners are likely to make to the method; and as we anticipate no more valid reasons against it, we shall take it to pieces, and, as we proceed, explain what we conceive to be the fallacies it involves.

"I, amongst others," says *Observer*, "have been rather startled by Mr. Ayres' description of the 'one-shift system,' as he designates what he appears to consider an improved method of potting plants,—startled, because I have always been taught to consider that if a plant were put into a pot three or four sizes larger than the one it had been growing in, it could not by any means be made to thrive healthily, or if it

did thrive, it would run into such a wild exuberance of growth as to be quite unmanageable; and as to its flowering, that would be entirely out of the question until it had filled its pots with roots, and consequently its supply of nourishment had been in some degree exhausted. I have always been taught to carefully guard against the 'over-potting' of plants: how great was my surprise, then, to find that I and all my sage tutors have been pursuing the wrong path to excellence of cultivation; and, though we may have turned out some tolerably good specimens of plants, yet it could only be by mere chance—we owed nothing to skill! What an immense saving of labour might have been made, had we been earlier made acquainted with the 'one-shift system'! However, it is never too late to mend our ways; and the sooner we do it, especially as our ways are not 'Nature's ways,' the better. Now that we have got a system by which we may hope to make our plants form a three years' growth, and probably a three years' crop of flowers, in one year, we have indeed a very strong stimulus to exertion—to say nothing of the great saving of labour we shall effect."

Thus far, we find the usual appeal to what men are accustomed to, and nothing more; it is a good specimen of the bad way in which some people dispute when they fancy they are arguing.

"But," continues the writer, "however good in theory the 'one-shift system' may seem at first sight, I have some latent misgivings as to its efficacy, at least in all cases. Nature is not always the safest guide."

Nature not the safest guide! why, what other guide are we to take? Is there anybody vain enough to imagine that his knowledge of what is fitting for the well-being of a plant is better known to himself than to the Creator of all things? On the contrary, we venture to affirm that there is not a single good mode of cultivation that is not conformable to Nature's ways, that all cultivation is good in proportion as these ways are followed, and that all bad cultivation is in direct violation of important natural laws. Our friend "Observer" should have said, *We often do not sufficiently understand Nature, and therefore we are apt to fancy we are following her when we are going the other way*; but let that pass for the present.

"If," says our correspondent, in continuation, "we place a plant in an artificial situation, it is by artificial means, to a great extent, that we must keep it in a healthy existence. I do not mean to assert that in pot-culture the laws of nature should be entirely disregarded, for in our potting and watering, and other attentions to plants, we are imitating nature; but we may exceed the proper limits, and in attempting to imitate nature too exactly, we may find that her laws are not, in all cases, applicable to plants placed in an artificial situation."

Here we have a string of phrases the precise bearing of which seems to our apprehension rather obscure. Plants artificially grown are to be artificially treated—no doubt; but artificial treatment need not be in opposition to natural laws—on the contrary, it should follow them as nearly as circumstances will permit. But, says "Observer," the laws of nature are not to be entirely disregarded, only we may exceed the proper limits—that is to say, instead of following Nature we may run before her; and then, when we have so exceeded them, we may find that her laws are not applicable to plants in an artificial situation—which, being put into plain English, is the same thing as saying that a violation of the laws of nature produces bad effects, *ergo* the laws themselves are not fit to be observed.

We confess our inability to comprehend this process of reasoning; let us hope for more success next week, when we resume the consideration of the remainder of our worthy correspondent's letter.

THE subject of experimenting on a large scale, to the importance of which Professor Henslow has lately so skilfully directed attention, and upon which we last week made a few remarks, is one, the importance and possibility of which become more evident the more we consider it in all its bearings. When a philosopher works carefully in his cabinet, acquainted accurately with the nature of all the agents spread before him, and alive to all the disturbing influences that may affect his results, he knows that one experiment is as good as a hundred, and a necessity for repeating it may not be felt; for when natural causes are exactly alike, the same effects must as surely follow them as when figures are dexterously combined by the arithmetician. But the cultivator of the soil is in a wholly different position: he has to deal with materials which, although they are called by the same name, may be really very different in their nature; he knows very little about them; a thousand circumstances unobserved by his untrained eye may exist to disturb his results, and the consequence is that all his experiments must be varied and repeated till a series of averages shall form a rough but sufficient check to his conclusions. We may fairly doubt whether the coarse operations of Gardening and Agriculture will

ever bear to be examined in any other way; and if they would bear it, the new results of new practices will certainly fail of carrying conviction to the minds of the mass of the people, unless supported by evidence accumulated upon evidence.

For example: A. dresses an acre of his land with nitrate of soda, tries a cheap experiment—gains an ample return, and concludes that this substance is the best of all manures; his neighbour follows his example, buys nitrate of soda for 20 acres, incurs considerable expense, watches his field with anxious looks, sees little promise of advantage, gathers in his crop, and finds that his experiment is a losing one. This is talked of at the Corn-market, reported in the county paper, and nitrate of soda is, in the minds of many, condemned for ever. But how different would have been the result if a hundred farmers had dressed a piece of half an acre under certain instructions, and then compared notes? Some would find that they had succeeded, others would see no advantage; but as the results would probably be almost balanced, it would become manifest to the most obtuse understanding, or to the most prejudiced mind, that if nitrate often failed, it often turned out well; the causes of failure in the one case and of success in the other would then be canvassed and discussed, new experiments would be suggested, and by degrees the land where, and the times when, and the crops to which nitrate of soda can be advantageously applied would become understood experimentally. Every man would know the facts, because he would have witnessed them, and the evidence of our senses is, it must be granted, about the best that is procurable.

Such being our opinion, we say to the farmers and gardeners of Great Britain, with Professor Henslow: "Trust not implicitly to the suggestions of the most celebrated chemists, nor adopt their notions into your practice, without previously making a set of comparative experiments for yourselves, in order to test the value of their suggestions. Secure co-operation; act together by hundreds and thousands in attending to directions, and in registering results. Such decided improvements in the art of culture will then be struck out for you, that your important interests will be able to maintain that state of prosperity which is so essential to the general well-being of the country."

But it may be asked, how is this to be arranged? whence are to come the suggestions and directions which the cultivators are to follow? to whom are we to look with confidence for that superintending intelligence and skilful leading which are indispensable to secure the success of such endeavours? We might point to the many men of science now occupied with such inquiries; to the Daubenys, Henslows, Johnstons, Maddens, Playfairs, Sollys, and others, as safe and trustworthy guides, whose advice is easily and speedily to be procured through the medium of the weekly press. But we feel that it is unfair to impose such duties on private individuals while there are everywhere Societies in existence whose officers can be readily charged with their execution. "If," says Professor Henslow in one of his letters, "the arrangements of our various Agricultural Societies were only as complete for securing abundant returns of comparative experiments as they appear to be perfect for exhibiting fat cattle and fine roots, or even for discussing good dinners and promoting good fellowship, I should then hope to live long enough to see the farming produce of Great Britain double that which is now extracted from the soil."

Now we can discover no reason why Societies should not be as efficient for one purpose as for another: in point of fact, the Highland Society has already taken up the subject by offering numerous premiums for experimental researches in Agriculture, and we trust that its example will be followed and improved upon elsewhere. What could be a more worthy object of the great resources of the Royal Agricultural Society of England than to plan, direct, collate, register, abstract, and publish, in a very cheap form, the results of thousands of experiments? The example set by the Suffolk farmers shows its practicability, and about its importance no one, we think, would entertain a doubt.

Professor Henslow, however, inclines to the opinion that it would be better to establish a new society for the especial purpose of encouraging and directing experiments. As the views of so judicious a friend of the cultivators of the soil cannot have too much publicity given them, we subjoin the following extract from a letter now before us:—

"Although you have repeatedly assured practical men of the necessity of experimenting for themselves, and have probably produced some good effects by so doing, yet I hope you will excuse my once again insisting upon the necessity of something more being done than merely pointing out to them what are the experiments they should undertake. There is no doubt great satisfaction in measuring the length of an invisible animalcule, and I am one

"of the last to be insensible to such a gratification ; but I hope the President of the Microscopical Society will agree with me in thinking it would be no waste of time for himself and a few other zealous Botanists, Chemists, and Geologists in London to hold monthly meetings for the express purpose of devising experiments to be conducted on some such plan as the one I have suggested to the farmers of Suffolk. There must be some sort of organisation for furnishing mere practical men with the proposed Schedules, and with precise instructions for filling them up. Possibly a joint association of co-operating experimenters among farmers and gardeners would be a preferable scheme to calling upon the present Agricultural Societies. Might not a small sum be levied annually from the various Horticultural and Agricultural societies for carrying out a plan which ought not to involve the class of experimenters to whom we should apply in any personal expense beyond mere postage? Might not a page or two be added to the *Gardeners' Chronicle*, to be expressly devoted to the discussion of the experiments proposed?"

In the latter part of the proposition we at once express our concurrence, if such a Society should become desirable; but we trust, as we have already stated, that the existing Societies will render a new Association unnecessary; and that the intention expressed by Mr. Pusey of moving for the appointment of a consulting chemist by the Royal Agricultural Society is an indication that some such step is about to be taken by that great body.

MANY have been the attempts to increase the quantity and effect of common stable and farm-yard manure by mixing it with other substances, which alone would not have had any fertilising effect, or which are supposed to increase its activity. It may not be uninteresting, both to gardeners and farmers, to consider the principles on which these composts or mixens, as they are sometimes called, are made; using only experience and common sense, and such chemical facts as are universally admitted, even by those who have no pretence to science.

It is well known that fermenting dung has the property of dissolving vegetable and animal fibre, dispersing its volatile elements, and only leaving those which are more fixed. Thus, a mixture of dung and straw, especially when moistened with urine, produces a considerable heat, which is taken advantage of by gardeners to make hotbeds for forcing vegetation. But when the object is to obtain the most effective manure with the least loss, it is evident that the heat should not be permitted to rise to such a degree as will disperse the volatile elements which arise from the decomposition of the substances heaped together. The process should be so gradual, that the gases evolved may be absorbed and condensed by some substances added for this especial purpose. The dung of animals, especially that of horses fed on Corn, very soon enters into putrefaction, and serves as a ferment to induce putrefaction in those substances, such as straw and woody fibre, which otherwise would scarcely heat, and would only moulder away very slowly by exposure to air and moisture. Vegetable fibre may thus be readily decomposed, even when united with an astringent principle, which resists putrefaction, as in Peat. A mixture of dung, straw, Peat, and any kind of vegetable fibre moistened with water or with urine, will soon heat, and decompose; and if a portion of earth be mixed with this in layers and form a covering to the heap, it will absorb the volatile gases as they slowly arise, especially if there be vegetable mould in it. Thus, substances which in themselves would be inert become highly fertilising, and the actual manure is increased.

The mixing of lime, chalk, or marl with dung, and turning this over frequently, does not seem to add any fertilising matter to the heap which it had not before; and, unless we could show a beneficial action of these substances on the animal and vegetable fibre, it admits of a doubt, whether this mixing and turning of a large heap of manure may not be labour thrown away. Lime is excellent in heavy soils, which are not exhausted; it makes the humic acid soluble, according to some: at all events, its good effect is matter of experience. Chalk and marl improve the texture of the soil, and likewise afford calcareous matter to act on the humic acid; but these substances add nothing to the strength of the manure in the compost, more than when they are spread over the surface and ploughed in with the dung. What, then, could have given rise to this practice of making such mixtures? Probably the idea that, as lime, chalk, and marl are sometimes called manures, and land which has these substances added to it produces better crops, with the same quantity of dung, than the lands where they have not been added, they have been supposed to contain a fertilising power in themselves similar to that of dung. Hence the mistaken idea, that liming is a substitute for a

dressing with dung, and consequently, that it must improve the compost.

We are aware that we are opening a door to controversy on this point, on which practical farmers differ widely—so much the better, if it excites them to make comparative experiments. We desire not to lay down the law: we only express doubts, which may be confirmed or removed, when well-authenticated facts shall be brought forward for or against our position. In the mean time we will explain our practice. As the time when the greatest part of farm-yard manure is put on the land is in the spring on young Clover, and in summer on root crops, it is carried out of the yard into the field at such a time, that, when it is wanted for the land, the straw shall be partially decomposed, the fibres readily separating and breaking off short. The practical farmer knows well how to manage the dunghill, so as not to heat too rapidly. At one time he may throw earth over it, at another he may water it; according to the state in which it comes out of the yard, he throws it out lightly with the fork, or he drives the horses and carts over it to check the putrefactive process, by excluding atmospheric air. No specific directions can be given on this point. If he thinks chalk or marl useful, and can readily obtain them, he carries them on the land after harvest, when it has had its last ploughing before winter, spreads it, and lets the winter's frost divide and pulverise it. If he uses lime, he puts it on after the dung is incorporated, or at the same time with it, ploughing both in together, or on his Clovers about to be ploughed up for Wheat; in short, when he thinks it will have the best effect. The farm-yard dung needs no other turning than what it had when carted to the field, and when it is spread over it. If there is room in the yard for throwing it together and inducing the proper fermentation, it will save much labour at a busy time of the year. In that case, the farmer will calculate how long it should be heaped up before it is carried. The more animal matter it contains, the sooner it will be ripe. It should never be in very high heaps, so as to heat unequally; and the process should be watched carefully. A little attention may save great loss.

Sir Humphrey Davy maintained that the farm-yard dung could not be used too fresh; as in this case nothing would be lost, and the straw would slowly decompose in the earth. Theoretically, this is correct; but we find, in practice, that long, undecomposed straw ploughed into the land, in dry weather especially, allows the moisture to evaporate too rapidly; whereas short dung absorbs it, or even produces it. The seeds of many weeds, which a gentle heat would have caused to germinate in the heap and have decomposed, are thus sown in the land and interfere with the crop. Thus experience modifies theory, while theory directs useful experiments.—M.

THE CORAL-TREE AS AN OPEN-AIR PLANT.

IN confirmation of your Limerick correspondent's statement, at p. 742 of last year's *Chronicle*, relative to the blooming of *Erythrina laurifolia* in the open air, I may state that in 1832 there was a plant of *E. Crista-galli* in the garden at Welbeck, which had then stood out a number of years, and which annually produced thousands of flowers. This plant was growing in a border, 6 feet square, at the east end of a fruiting Pine-house. The treatment it received was as follows:

In autumn, after the frost had destroyed its beauty, it was cut down, and the bed, which also contained some *Fuchsias*, was covered about a foot thick with old dry tan; to make a neat finish, the mound was afterwards turfed over. The tan was carefully removed about the middle of April, by which time the young shoots, as thick as strong Asparagus, had generally protruded several inches. These were thinned out, about a dozen of the strongest being retained, which in the course of the season formed a bush from 4 to 5 feet in diameter, being in autumn one mass of bloom. The bed was annually mulched with rich compost, and the plant was occasionally watered with liquid manure.

As this plant enjoyed peculiar advantages, inasmuch as the ground was high and dry, and the situation sheltered; the heat being also reflected during the day, and slowly radiated by night, both by the end of the house and the stone pavement with which the bed was surrounded, I think a somewhat different treatment will be necessary to ensure its flowering in a more exposed locality. From what I have observed, I doubt not but the following mode of treatment will ensure its blooming in a moderately sheltered situation.

Cuttings of the young wood taken off with a heel when about 3 inches long, and planted round the edge of a large pot, or singly in small ones, in sandy peat, and plunged in a brisk bottom-heat, will root in the course of a few weeks. This is suitable for those cuttings which are taken from plants in heat; but cuttings from the open air will not bear such treatment. The transition to a close warm frame appears too much for them, and they become paralysed; but if, after being planted, they are placed in a moderately warm frame until the cuttings are cicatrised, and then removed to a brisk bottom-heat, they will root with great freedom. Propagation may also be effected by division of the roots; but this is not a good practice. After the cuttings are rooted, they must be repotted into rich light compost, and en-

couraged to make robust growth. As it is indispensable that the plants should become strong before they are planted out, they must have at least one season's cultivation in pots; the flower-buds must also be removed as soon as they are perceptible, so that the whole organizable matter may be concentrated in the young plant.

In the spring of the second season, therefore, the ground may be prepared for the reception of the plants, and as the preservation in winter of the roots of all tender plants depends as much upon the dryness as upon the warmth of the soil, it will be advisable to give them an elevated but not an exposed situation; and where the subsoil is not porous, make it so artificially. Therefore, where it is necessary, excavate the natural soil to the depth of two feet, and in the bottom place a layer of brick rubbish, at least six inches thick; over that lay some small sticks, leaves, or moss, to prevent the soil from getting into the drainage; and in filling up, raise the bed six inches above the level of the surrounding soil, with a compost consisting of rich turfy loam, leaf-mould, and turfy peat, in the proportions of two parts of the former to one of each of the latter; to which sandstone or porous bricks, broken to the large size of large eggs may be added, to the extent of one-eighth of the whole mass. This mixture will never become solid; on the contrary, it will always be permeable to both air and moisture, without any risk of becoming saturated with the latter. The plants in the first season may be planted 18 inches apart; but, in the third year, half of them may be taken out to form a new plantation; and in the fifth or sixth year, each plant when in flower will acquire an area of 16 or 20 square feet. When large specimens for immediate effect are desired, four or five may be placed in juxta-position. The best time to plant them out will be from the last week in May to the middle of June, as the ground will then be a little warm, and the plants will sustain no check.

Towards the end of October the plants should be cut down, and the crown of each covered with a box or flower-pot filled with dry leaves; the whole being spread over with dry peat, leaf-mould, or sawdust, to the depth of a foot, and then turfed over neatly. The latter will be found advantageous, especially if the sides of the bed have a sharpish inclination, as it will throw off much of the rain that would otherwise soak into the mould, and impair its protecting properties.

In spring, when the covering is removed, and the plants are established, the surface of the beds should be renewed to the depth of the roots with the above compost; the whole being afterwards covered two inches thick with sandy-peat or leaf-mould. This, from its colour and good conducting properties, will absorb considerable heat during the day; but as it will part with it quite as freely when the sun does not shine, it will be necessary to protect each plant with a handglass after the sun is down, and to cover the whole bed with mats during the night. This covering should be continued until the middle of June, or later, if the weather requires it. Water during the growing season may be freely administered in dry weather; and if liquid manure is occasionally given, it will add to the strength of the plants; but after they are in bloom the less water that falls on the bed the better it will be for the preservation of the roots through the winter.

The situation in which the plant was placed at Welbeck did not show it off to advantage; but planted on a lawn, either as a single specimen or in a group, the Coral-tree would be one of the finest things imaginable; certainly nothing inferior to *Clianthus puniceus*.—W. P. Ayres.

ON THE TREATMENT OF SEEDS HAVING LARGE FLESHY COTYLEDONS.

THERE are many operations connected with gardening, which, although apparently trifling and unimportant in the performance, are nevertheless far otherwise in their results. One of these is the sowing of a seed; and as an Acorn will be a fair type of the class of which I speak, I shall select it as an example.

It is a general rule, I believe, to place the seed at a considerable depth below the surface of the soil, this depth being regulated by the magnitude of the seed. Nothing can be more injurious to the future progress of the tree in every stage of growth than this treatment, the reasons for which I shall endeavour to explain.

Every one is aware that seeds, such as Acorns, Beans, Chesnuts, &c., are composed of two fleshy lobes or cotyledons, connected on one side by the embryo or future plant, the whole being inclosed by a thick outer covering. The seed being placed in a situation favourable to vegetation, the cotyledons imbibing moisture, and consequently becoming much swollen, the shell or covering not being of a nature to accommodate itself to the increased size of the cotyledons, bursts, and a small radicle or root penetrates the earth for a double purpose; first, in search of nourishment for the infant plant; and secondly, to secure it firmly in its place. But the nourishment furnished by the root is but a secondary source to the embryo; for we find that nature has furnished other means of support to the delicate and as yet minute plant. The cotyledons are the organs by which the elements suitable for its food and nourishment are extracted from the atmosphere, digested, and prepared for the delicate infant tree; in short, the cotyledons are to a seedling plant what leaves are to one of larger growth.

To place a seed, then, below the surface of the soil, where it would be hidden from the full actions of the atmosphere, is a gross mistake, and a wide deviation from the rules of nature; for when do we find a seed, sown by nature's own hand, hidden several inches below the soil?—and nature's

instructions are seldom of such a nature as (if rightly observed) to cause us to err.

"Read nature, nature is a friend to truth."

From the observations I have made, it appears evident that the seed should be placed near the surface; indeed, if covered at all, it should be but very slightly, although nature always [not always; not in the Oak—*Ed.*] makes an effort to raise the cotyledons above the soil for the full benefit of light and air. But when placed at a great depth, it is necessarily some time before they can be raised to the surface; and consequently proper nourishment is denied to the embryo at the first stage of its vegetation; and an injury done at that stage of growth is irreparable.

I feel satisfied that when the seeds of timber-trees are treated in such a manner, it produces a great effect on the value of the timber, or at least on its durability; *i. e.*, the timber of trees planted naturally is far superior to that from trees artificially treated, or treated after the deep planting method. Forest-planters would do well to turn their attention to the subject, which, though trifling in itself, is important in its results.—*A. Tyro.*

ABSENCE OF TREES IN THE PRAIRIES OF NORTH AMERICA.

In North America, the plains watered by the Illinois and Western streams of the Mississippi and Missouri contain extensive grass-covered tracts, the Savannas or Prairies, where no trees will grow, excepting in Arkansas, along the banks of the Mississippi, and other watercourses where woods are occasionally met with. That plains (alluvial?) which are represented by all who have visited them to possess the richest sward should not afford growth to a single tree is a striking phenomenon; and, as such, ought, before now, to have elicited an explanation from geographers.

Flint, an American writer, divides the Prairies into three kinds: 1st, the heathy or bushy, which have springs, and are covered with small shrubs, Grape-Vines, &c., very common in Indiana, Illinois, and Missouri; 2nd, dry or rolling, generally destitute of water, and of almost all vegetation but grass; the latter are the most common and extensive; the traveller may wander for days in these vast and nearly level plains, without wood or water, and see no object rising above the horizon; 3d, the alluvial or wet prairies, the smallest division; these are covered with a rich vegetation of tall, rank grass; the soil is deep black, friable, and fertile; abounding in pools without issue, left by the flooding of the rainy season.

In the above description of the Prairies, as well as in many others which I have read, I meet with no particulars which in any way account for the complete absence of trees. Where the soil is represented to be dry, this would occur in the greatest degree at the surface; and since that is not so dry but that grass will grow upon it, surely a little below that surface the roots of trees would find support, provided the ground were deep and open enough. But when, in elucidating a case of this kind, facts are wanting, not, perhaps, in the Prairies themselves, but in the writings of those who describe them, I think, that, by turning our attention towards the known causes which affect vegetation in similar circumstances elsewhere, we may better arrive at the knowledge of them in the case in question. A. Balbi, the French geographer, states that the plains of Rio de la Plata, or Pampas of Buenos Ayres, are remarkable for the absence of trees, and for the innumerable Grasses which cover their vast surface; being similar in that respect to the Savannas or Prairies of the Mississippi, Mackenzie-plain, which they fully equal in extent—amounting, according to Humboldt, to 1,215,000 square miles. Next, Azara (a Spanish writer) says, that throughout the whole of this country (Pampas) there is neither river, lake, nor well, that is not brackish. Even the Pilcomayo and the Rio Grande, the two greatest branches of the Paraguay, partake of this saltiness; and the same author assures us that he has seen in lagunas, dried up by the heat, a layer of Epsom salts, above three inches in thickness.

From this account of the Pampas, and those given by other travellers, all tending to corroborate the fact that the soil is highly impregnated with salt, I think we may fairly infer that one great cause why trees will not thrive in these plains (Pampas) is owing to the presence of a salt, which, whether a sulphate of magnesia, a muriate of soda, or a carbonate, still, by pervading the soil in excess, must, independently of other causes, rather check the growth of trees than that of certain herbaceous plants; amongst which, many might no doubt be found to be benefited rather than harmed by their presence in certain quantities, and whose roots, penetrating less deep, are confined to the surface-soil, which, no doubt, is less impregnated with saline particles, owing to the heavy rains which visit these countries and carry off the greater portion.

From these statements it will be seen, that, although no travellers have as yet collected any particulars within the territory of the Prairies tending to show that, like the Pampas of South America, the waters which penetrate the soil are brackish, yet the case may be suspected to be the same in both instances. Several rivers which cross the Prairies of North America from West to East flow, not far from their source, through an upland district (Desert of Nuttal, at the foot of the Rocky Mountains, extending between the superior Arkansas and the Paduca, "remarkable," says Balbi, "for its rich mines of rock salt. In various parts," observes the same writer, "but more especially along the borders of the Great Plain, in Arkansas, Missouri, and Illinois, salt is found."

A knowledge, then, of the nature of the subsoil and waters comprised within the limits of these plains, as well

as the different species of plants indicating by their habits the nature of the soil in which they grow, would be desirable, in order to decide the question. Much, I imagine, may be attributed to the icy winds which sweep over these plains from North to South.—*C. W.*

ON THE CULTURE OF TREVIRANA OR ACHIMENES.

THIS genus, like many others, has had its name frequently changed within the last few years. If this is to be considered a mark of distinguished merit, no one can dispute that it has been judiciously awarded to this tribe of plants, combining, as it does, neatness of foliage, regularity of branches, and a conical, uniform shape. When grown singly in pots and properly attended to, it amply rewards the cultivator in the profusion of flowers which it bears, varying from the bright scarlet of the old *Cyrilla pulchella* to the deep violet of the superb *Achimenes longiflora*.

The following mode of treatment I have found equally well adapted to all the species: After the plants have done flowering, and the tops die down, (generally in November), I allow the bulbs, which resemble the catkins of the Hazel, to remain undisturbed in the pots, which are laid on their sides beneath the greenhouse-stage, or some other place where frost and wet cannot reach them. Here they remain until the latter part of January, when they are placed in a gentler heat, and watered, until the soil becomes sufficiently moist to encourage vegetation. When the small scaly bulbs have made shoots about two inches in length, I plant them singly in small sixties in a mixture of leaf-mould and a small portion of silver sand. At the subsequent shiftings, until the plants are finally in June placed in sixteens, the compost consists of light rich turf-loam and peat, or leaf-mould when peat cannot be procured, in equal proportions, and on no account sifted. The pots are thoroughly drained, a point which forms the basis of all good culture both in pots and in the open ground.

For growing several plants in one pot, I prefer the No. 12 size, into which I turn five of the plants previously kept in sixties, placing one in the centre and four round the edges. These form a noble mass when in bloom, but never assume the uniform conical shape of a single specimen. The main stem and side branches are neatly sticked and tied up as they advance in growth.

The temperature of an early Vinery is well adapted for these plants until the end of May, at which period they should be taken to a cool pit, where a steady moist heat can be maintained. They should be shaded in hot days between 11 A.M. and 2 P.M. to prevent the sun from scorching the foliage, and they should never be watered overhead. The pots should be placed upon others inverted, and the bottom of the pit should be kept moist, closing up early in the afternoon and giving air in clear weather about eight in the morning, so that the damp may disperse before the rays of the sun fall directly upon the plants. By pursuing the above course of treatment my efforts have always been crowned with success.

It is to be regretted that this genus is not more generally placed amongst the list of articles for competition at the various Horticultural exhibitions.—*D. R.* [The obvious reason is that they travel badly.]

TRELLIS FOR CLIMBERS.

AMATEUR'S GARDEN.—No. XI.

ALTHOUGH much has been said and written relative to the importance of arranging plants in flower-gardens according to their complementary colours, but little attention, in a practical point of view, has been paid to the subject. This is the more to be regretted, because the theory of colours is not an imaginary one, but is founded on nature; and therefore as nature demands that, to produce an harmonious whole, certain colours must be properly blended, we ought not to distribute plants at random, but to place them so that, by mutually enhancing each other, the *tout ensemble* will be more harmonious

and agreeable than it could be under any other circumstances. "Every decided colour, (observes Goethe,) does certain violence to the eye, and forces the organ to opposition;" thus, let any one fix his eye intently on the brilliant scarlet flowers of *Verbena ignea*, and in a few seconds the colour becomes oppressive to that organ; but no sooner does he remove it to the green foliage that surrounds the flower than the pain ceases, and the observer experiences relief.—And why is this? because green is the opposite or complementary colour of red; and in the same manner yellow demands purple; orange—blue; and *vice versa*; and so on throughout the whole range of colours, as all the intermediate gradations reciprocally demand each other, the simpler colour requiring the compound, and the contrary.

Again, colours are divided into two classes, viz., warm and cold; the warm colours are red, orange, and purple, and their shades; and the cold or complementary colours, green, blue, and yellow, in their various gradations; while white, which for gardening purposes takes the place of green, may be considered complementary to the whole of them; as all colours are improved by being brought in contact with it, with the exception of pale pink or yellow, to which it gives a rather dingy appearance.

Where the flower-beds are surrounded by grass, it is not advisable to introduce cold colours, as yellow and blue, to any great extent; but, on the contrary, warm colours, as red, orange, and purple, should prevail; and the opposite when the beds are on yellowish brown gravel, which is a warm colour. For this reason it is that some persons object to certain colours in their flower-gardens; but if, when cold colours are placed on grass, the beds are surrounded by a narrow margin of the complementary colour, the effect of the flowers will be much enhanced; and the same will occur when the beds are on gravel.

These remarks are offered at this time with a view to the arrangement of colours in sowing spring or planting autumn-sown annuals, which must be got into their permanent quarters as soon as possible. Good lists of annuals and perennials will be found in previous Numbers, especially at page 105 of this volume. In arranging the plants, I would particularly insist upon a due proportion in their height, as well as in the colour of their flowers.

The best way to sow annuals is first to loosen the earth where it is intended to place them, avoiding raking the beds at present, unless the ground is very light; then make a slight drill, by pressing the rim of a 32-pot upon it; sow the seeds very thinly, and cover with loam and leaf-mould finely sifted, and in about equal proportions. In borders that are viewed in the length and breadth, the colours should be arranged in the following order: red, white, yellow, purple, orange, blue,—repeating the same colour or some shade of it at regular distances throughout the length of the border. But in all symmetrical flower-gardens, by which is meant such as have a centre or centres, the colours should be arranged symmetrically; or, in a word, one half of the platform should reflect the other. For those disposed to follow this subject further, excellent directions will be found at p. 291 of the vol. for 1841; but before the time arrives for planting out, a plan will be given with the colours arranged as they will look best.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Bees.—Your columns have occasionally been occupied with the subject of Bee-keeping; and judging from what has been said by the expert, of their various practices, and by the inexpert of their many disappointments, one might suppose that nothing certain was yet known of the proper treatment of this useful little insect, and that nothing had been written that could be relied on, although so many authors lie open for consultation, from Virgil to Huber, and from Huber down to Triptolemus Yellowly.* That great success, however, does attend the nurture of Bees is pretty evident from the large quantity of honey annually brought to market; and that there can be no great art required in the "keeping" is as clear, from the exhibition of so many straw-thatched hives in the cottage-gardens of our southern counties, whose owners have neither opportunity nor leisure to bestow much care upon them. Two objects are alternately made most prominent in Bee-keeping—the amusement to be derived from observation of their habits, and the profit of their honey: the curious Bee-keeper will take advantage of both. But, for whatever purpose Bees are kept, whether for pleasure or profit, success must mainly depend on a management or a manipulation (if I may so speak), which can only be acquired by practice and observation, with a due regard to the natural habits of the insect. The case is the same as in gardening; much may be learned from a theoretical study of the subject, and much from books; but the power of using the knowledge so acquired to the best advantage can only be learned by practice. It is on this principle that we must account for the various fortunes of Bee-fanciers, in their attempts to follow prescribed methods. Slight differences in the time chosen, or in the mode of performing little offices about the hive, constitute the essence of success or of failure. The best summary on Bees and Bee-keeping which I have lately met with, is to be found in the articles "Bee" and "Apiary," in the latest edition of the "Encyclopædia Britannica;" these I recommend to the notice of your correspondents. It is not my object in this communication to lay down rules for their management; but I have a word or two to say in favour of the vulgar method of keeping Bees, as now practised by our cottagers, if they are to be kept for profit. In this method, indeed, all the prominent features of their economy, and their most interesting habits, may

* Vide Scott's "Pirate."

be almost as well brought into view as by the ordinary practices of the apiarian. The universality and antiquity of this mode of keeping Bees are, perhaps, not good pleas for the practice, because many bad habits may claim the same inveteracy; still the constant recurrence to it after trial of many others, and in the face of many attempts at improvement, is of itself a powerful recommendation. Beside the acknowledged advantages of the material used in the construction of the common hive—its warmth in winter and coolness in summer—the ready and firm attachment it gives to the comb, and its general congeniality, it affords the darkness and privacy so necessary to the well-being of the insect. This love of privacy is an instinct which must be kept always in view by the fancier in the adaptation of his contrivances for watching its operations. In fact, in everything else, he cannot do better than to keep, as strictly as his object will allow, to the principles of this parent model abode. Much has been said about ventilation, but it would appear that most of the contrivances for favouring this object have been, or are likely to be, resented as impertinent, if we may judge by the fondness of the Bee for a domicile which has only one outlet, and that one it endeavours to keep no bigger than sufficient for free ingress and regress. Any mode of ventilating the hive which, in the height of summer, might save the insect the trouble it takes in that way, would probably destroy it, or its larvæ, at any other season. Again, it is scarcely possible to construct a Bee-house free from sharp draughts at one time and reverberated heat at another; whilst the single isolated stool and the thatched straw-hood are free from these objections, and being once well adapted require no farther attention. But the curious observer must have greater facilities than these simple arrangements afford; and he will do well to observe the principle in the fittings of the supplemental hives and glass cases required for his experiments. As regards the securing the honey and the disposal of the Bees at the end of the season, the keeper who would have most profit by them must, I fear, follow the ordinary practice of destruction, however repugnant to his feelings. The laws of animal life, which give the preponderance to productiveness over the means of subsistence, are irresistible; and in anticipation of the work of famine it matters little whether we use the knife, the halter, or the brimstone-match—always observing Macbeth's injunction, that if the deed were done, "it were well that it were done quickly." This industrious and prolific little insect breeds fully up to the limits of its own bare subsistence. You cannot keep your Bees and eat their honey yourself, unless you supply them with its only proper substitute, sugar; and then there is an end of the profit. In ordinary seasons, it is never safe to allow any but the heaviest hives to stand for "stock." It is difficult to bring even these safely through a very mild winter; and they often perish for want of a little artificial aid. The rich and ample harvest of the last summer was a good preparative for the winter we have just now experienced; and, but for that provision, I doubt much if half the "stock hives" of the country could have survived it without feeding. The practices of Wildman and others for removing the honey in the course of the summer, and taking the chance of the Bees making up the deficiency, cannot be very extensively followed; and, if it were attempted, it is doubtful if more destruction to life would not be the consequence in unfavourable seasons; at least, than takes place by the common mode of autumnal execution. In bringing these cursory observations to a conclusion, I will endeavour to remove the gloom that overshadows this part of the subject, and better bespeak the interest of your readers by the relation of a little anecdote, strongly illustrative of the superior intelligence of the Bee, abounding as its history does, in examples of this description. My father kept Bees in the ordinary way of the country, and when a boy it was my task, (partly imposed, partly chosen,) amongst other ruralities, to watch their progress. It happened that three stock-hives had been left standing through the winter, in one of which the Bees had died from want. From negligence, or want of leisure to work up the comb for its wax, the dead hive was allowed to stand on its stool till the following May, when the remaining hives began to send out their swarms. A swarm took place from one of these, and it was hived in a newly-prepared straw hive in the usual way. At first they appeared to take kindly to the habitation offered them; but after the lapse of about half an hour they swarmed again, and settled (or clustered) as before, and were hived a second time. As it was supposed that the great heat of the sun or some such annoyance, was the cause of their rising again, the hive was this time shaded with green boughs, and an umbrella placed over it; but notwithstanding these enticements, in a very few minutes they rose again, and without waiting the usual process of settling, they were observed to be rushing to the entrance *pêle-mêle* into the above-mentioned ready-furnished but untenanted (except by its own dead) hive. In a quarter of an hour from thus taking possession, they were observed busily employed in bringing out the dead Bees, small fragments of honey-comb, dead insects, and other dirt; and by the middle of the following day a little conical heap of their cleansings was to be seen on the ground in front of the hive; before night, well-loaded labourers were seen entering to repair the dilapidations and refurnish the empty cells. In the end, this hive was one of the heaviest of the season, after giving out its swarm like an old stock-hive. We all know the story of the refutation of the philosopher's definition of the distinctive character of the human race, their "ability to draw an inference," inasmuch as, that, although the dragsman could not, or did not know that he could do so, his horse could, "for he could draw anything." A double instance

of this faculty is shown in this anecdote of the swarm of Bees. First, their preference to the ready-furnished house, previously engaged by their scouts before swarming, to the empty one in which they were hived; and secondly, their avoidance of the usual act of clustering in their third rising, after finding that that act subjected them to the annoyance of being thrust into the empty tenement they were not in want of; and it may be noted, that, although they seemed to deliberate for half an hour after the first hiving, their resolution being taken, they rose almost immediately after the second, to betake themselves at once to their destined abode.—P. P.

Bees.—"J. W." wishes "Agger" to mention the primary cause why Bees store up honey. "Agger" conceives that Bees store up honey that it may support them in bad or cold weather, and would add to his statement quoted in p. 158 by J. W., "that propagation of the species is not the object for which we keep Bees," that the object for which he keeps them is the production of honey.

Killing Insects for the Cabinet.—As "S." has, at p. 138, inserted a clever letter in answer to mine, which was merely intended to advocate the cause of poor persecuted and oppressed insects, I am anxious that these few lines should appear in return. As "S." says, with reason, that if I condemn one mode of killing insects, I am bound to provide one that is quicker and less painful; this I will do to the best of my ability. I spent the years of 1829 and 1830 in the South of France, and while one day walking under that lovely sky without a cloud, I was stopped by a large and powerful insect crossing my path, and running as fast he could go from fear of me (and not without reason), for I took him up, and held him with difficulty in a piece of thick letter-paper. His struggles to free himself astonished me, from the strength of limb that he displayed. I was near the house of a friend who was staying at Thiers at the same time, and while walking thither, I passed in one of the vineyards a labourer, of whom I inquired the name of the insect? He said it was a *taille-pied*, and that it was most destructive to the Vines, gnawing through their roots. I took it to the house of my friend, and asked if he knew of any method of killing insects in a moment; for that, although I was anxious to take him to England as a specimen, I would let him loose rather than he should suffer from a lingering or painful death. My friend said he would kill him in one instant, which he did by dropping two or three drops of ether on his head or back: its death was instantaneous. I have never done it myself, but I was a witness to this. I am rejoiced to find that "S." approves with me of using every means to check cruelty to that part of God's creation which has not, like ourselves, the power of self-defence; and that with all, but especially with the young, cruelty to insects and animals only leads the mind to exercise more and more tyranny in after life; and of all tyrants, "subaltern tyrants are the most intolerant and intolerable." I hope that if this has the same result as my former letter, that of bringing a clever answer from "S." that he will, while he defends himself, give me credit for addressing him with the sole motive of anticipating that happy time still folded in the volume of prophecy, "When the wolf shall dwell with the lamb, and the leopard shall lie down with the kid, and the calf and the young lion, and the fatling together; and a little child shall lead them; and the cow and the bear shall feed, their young ones shall lie down together; and the lion shall eat straw like the ox; and the sucking child shall play on the hole of the asp, and the weaned child shall put his hand on the cockatrice den. They shall not hurt nor destroy in all my holy mountain, for the earth shall be full of the knowledge of the Lord, as the waters cover the sea." Isaiah xi. 6.—D. H. W.

Cultivation of the Pine-Apple in France.—Having noticed, at p. 118, some observations on the Royal Gardens of France, which I have lately visited, a few general remarks upon the manner in which the Pine-Apple is cultivated in that country may perhaps be interesting to the readers of the *Chronicle*. Amongst the various places which I visited while at Paris, there is none in my opinion at which the Pine is grown to such perfection as at the Meudon Gardens, by M. Pervillan. There, quantity and quality are combined, and the whole of the plants are fruited without pots, on what I believe is termed the system of open-frame culture; which is a very great saving, both in time and expense, as it does away with the cost of pots and the trouble of potting, and in a great measure with the fermenting materials required for bottom-heat. The information which I gained upon this subject is as follows:—The suckers produced by the fruiting plants of last season are allowed to remain on the plant after the fruit is cut until the following March, at which period, if the plant be a strong one, the sucker, when taken off, will be almost a full-grown succession plant. These suckers are not potted, as is generally the case in this country, but planted out in a frame, previously prepared with half-rotten leaves, made into a bed, from three to four feet high, with little or no heat in it, except what is produced by linings; as at this time (March) we look forward to a daily increase of solar heat. This is particularly the case in France, which is favoured with a clearer sky. Half the trouble in linings of dung, which are so necessary in this country, is thus dispensed with. The linings added to the bed of half-rotten leaves, before mentioned, are found to produce heat sufficient to induce the plants to form roots. These are soon followed by others into the mould on the surface of the bed, and when this takes place, the rapidity of their growth may easily be imagined. The principal attention they require after being rooted, is to syringe them almost daily with tepid water, and to keep up a humid atmosphere. As the plants advance in growth, the frame must be raised to give them head room. By judicious treatment, I consider fruiting

plants may be grown on this system in nearly half the usual time. About the month of August, the plants will be large enough to remove to their fruiting quarters, which at Meudon, and at the Baron de Rothchild's, are a low-roofed house or pit, just wide enough for containing three rows of plants, with a walk at the back. This is heated by flues or fire-heat, which, for plants of that size, is equally as good as hot water, being only intended for drying up the damp, and keeping up a moderate warmth during the winter months. There is no doubt, however, but hot water would be the best for practising the above system in this country. The floor of the house is filled in, to the depth of 16 or 18 inches, with the best soil that can be procured. I may here mention that loam is very difficult to obtain in the neighbourhood of Paris: in fact, good loam, such as Pines are grown in near London, is not to be procured by any means; so that while Pine-growers in France have the advantage in climate, we, on this side of the water, have a decided advantage in soil. The principal part of their Pines are grown in peat; at the Baron de Rothchild's I saw above a thousand Pine plants, all growing in that soil. When the plants are ready for removing, it is performed in the following manner:—the frame is first lifted from the plants, so that they can be got at from all sides; then the plants are raised with a spade, care being taken to remove them with as much soil adhering to their roots as possible. They are then planted carefully in the pit above mentioned, three or four inches deeper than they originally were, to encourage new roots, which, by being kept close, and shaded for a few days if necessary, they will soon make. After the plants are thus established in their final quarters, no other attention is required but the general routine of culture adopted for fruiting plants generally, viz., plenty of heat and moisture. I have no hesitation in saying, that plants of the Providence, Enville, Cayenne, and other large kinds, may, on the above system, and without the use of a single pot, be made to produce fruit weighing from 8 to 10 lbs. each.—W. Dunsford, *Capesthorpe Gardens*.

Achimenes longiflora.—It is now time to plant this species. It does not start as early as the old *Achimenes coccinea*, and it delights in very coarse leaf-mould, containing many large fragments of leaves. It should have a large and broad-mouthed pot, drained by inverting another within it and plenty of crocks round; very sandy leaf-mould over the crocks, and coarser, with less sand, above. The bulbs should be planted fully an inch deep.—J. R.

Ipswich Cucumber Society.—Connected as I am with the above society, I cannot allow the observations of "Justitia" to pass unnoticed. Permit me then to direct his attention to the *first line* in the judges' description of the prize specimens, as inserted at p. 140 of the *Gardeners' Chronicle*. He will there find that the first prize was awarded to Mr. T. Latter, for a brace of "Kerrison's Stove" Cucumbers, each 15½ inches long, both perfectly straight, 1½ inches in diameter, dark green, with short necks, black spines, slight rib, very bloomy, blossoms perfect, handsome fruit—in short, they were perfection, and, although not the longest, they were the best. I am glad, also, that I am able to prove that the standard of the society was strictly adhered to in every point, and I should be happy to see the arrangements and judgment of all Horticultural and Floral Shows give the same universal satisfaction. I trust the time is not far distant when the standards of the Horticultural and Floricultural Societies of London, with that of the Ipswich Cucumber Society, will be introduced into every one established for improving the cultivation of fruits, flowers, and vegetables. I would also request "Justitia" to bear in mind that the Ipswich Cucumber Society recognises length only when combined with the qualities expressed in the standard.—Thomas Wild, *Honorary Secretary*.

Camellia in the open Ground.—In a gentleman's garden in this vicinity there is now in full flower a red *Camellia*, which has been planted in the open ground for ten years, the last eight of which it has been without covering or any protection whatever.—*Stamford Hill*.

Economical Pump.—I am aware of the economy of supplying Plant-houses, etc., with water, by having the Pump placed in the back shed, and the water pumped into a cistern situated above the furnace, where it becomes tepid, and is conveyed by pipes to the plant or forcing departments. Although not new, I consider the above system to be better than Snowdrop's (see p. 22), which is nothing more than changing the situation of the Pump for the worse. He seems to think that there can be no objection to his system, except to the ornamental head of the Pump, which "may be covered with creepers." I always understood that, in Gardening, disagreeable objects only should be concealed. There is, however, a great saving of labour, which, in my opinion, is the only advantage he obtains. He nevertheless finds himself in want of a cistern, in which the water might become tepid; and he proposes that a concealed cistern should be constructed beneath the bark in the pit, and that the water should be conveyed to the other houses by means of pipes. If Snowdrop can do what he proposes, he must be a conjuror.—I do not understand how it can be done without an extra Pump. A plant pit is generally more or less sunk in the floor, so that the bottom of the proposed cistern would not be less than three feet below the level of the house: it is impossible, therefore, to convey water to other departments without an extra pump and cistern. Snowdrop ought to be aware that water will not rise higher than the fountain, by merely having the end of a pipe placed in it: if such is the case, how does he expect to convey the water, by pipes, to a situation so much higher than the proposed cistern? My reason for making these

remarks is to caution others, lest, in following the above system, they ultimately find themselves labouring under similar disadvantages with Snowdrop, whom I would recommend to place a cistern, sufficiently elevated, in the corner of the pit, close to the pump, that he may have the advantage not only of tepid water, but also of conveying it to other departments by pipes; and that the accommodation for Plants may not be diminished, the cistern should be covered with a lid, and plants placed above.—*Auricula*. [How much better than all these contrivances with pumps is it to conduct the rain-water from the roof into large slate tanks!]

Feeding Sheep.—I beg to communicate the result of an experiment, made according to Liebig's principles of warmth and feeding. I have a flock of sheep which are fattening on Turnips, and of these, six weeks ago, I shut up two, in a warm roomy outhouse, and fed them in the same manner as those out of doors. Those which I killed from the out-of-door flock weighed from 60 to 70 lbs. each; but of the two which were shut up, one died yesterday of the rot, and the other is pure skin and bone.—*St. Faith*.

Musty Hay.—Having observed at p. 118 a method whereby musty hay may be made palatable to cattle, I beg to ask your "Leicestershire Correspondent" what process of steaming is necessary to insure such a result; whether by having boiling water poured over it, or by being placed in a basket or similar porous vessel and held over the steam of a boiling copper? As I, in common with many others, have some musty hay of the growth of 1841, which, when cut into chaff, is refused by cattle unless mixed with corn, malt-dust, or some other more favourite food, a detailed account of the process will be very acceptable.—*A Hertfordshire Farmer*.

Inclosing Land from the Sea.—Having seen at p. 115 your remarks upon the advantages which England would derive in draining and inclosing land from the sea, I send you an account of what has been done in this island. About forty years ago there was a part of land called the Braye du Valle, containing about 100 acres, which the sea continually covered at high water. Our then Lieutenant-Governor, Sir John Doyle, applied to Government for leave to inclose it, which was granted. It was afterwards offered for sale, but as it consisted of nothing but sand, shells, and a portion of clay, the farmers would not buy it at any price. Some enterprising gentlemen bought it, who have since cultivated and converted it into as good land as any in the island; and for grazing cattle, far superior to any other. There are in England many thousand acres of valuable land, which are covered with only a few feet of water, and were they to be embanked from the sea in the same manner, they would afford employment to the poor as well as a profit to the undertaker.—*H. C.*

Effect of Food upon Eggs.—At p. 159 of the *Chronicle* mention is made of the smell of gas in eggs: the following statement will, I think, go towards corroborating the fact. I once met with a boiled egg (in a small town in Germany) which had, until opened, no smell whatever, when there was so strong an odour of gin that I did not believe it possible to proceed from the egg: the spoon was my own, therefore I knew it was not that which caused it. Being determined to leave no doubt upon the subject, I tasted the egg, and the flavour of gin in the yolk was as strong as the smell. Two other persons followed my example, and we all came to the conclusion that the hen had picked up something on which gin had been spilled. It is probable that if one of the eggs complained of had been tasted, the same thing would have been remarked; but though curiosity may tolerate gin, gas is another matter.—*A Subscriber*.

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

March 8. — P. Pusey, Esq., M.P., in the chair. Thirty-two Members were elected. A letter was read from J. Rodwell, Esq., accompanied by some dried specimens of the Bokhara Clover, of his own growth in 1841 and 1842. The plants were nearly 13 ft. long. J. A. Stokes, Esq., communicated on the loss of a five year old thorough bred mare, up recently from common inflammation and thorough bred mare, but on a post-mortem examination it was found to proceed from an extraordinary strangulated hernia, the intestines having passed through the diaphragm, and thereby the caused inflammation and death. Dr. Lloyd having preserved the specimen in spirits, Mr. Stokes presented it to the Veterinary Department of the Museum of the Society. The Secretary stated that in addition to the 9,000 impressions of Mr. Main's paper on that in addition to the 9,000 impressions of Mr. Main's paper on the Cottage Gardening already reprinted for cheap distribution, the 3,000 impressions of Mr. Burke's compilation on Cottage Economy and Cookery were nearly exhausted, and a new reprint required. From the Bavarian Ambassador—who had on a former occasion expressed his willingness to effect a communication between the Royal Academy of Sciences at Munich—were received various Transactions of that Academy, containing many papers of an agricultural character, along with a treatise on the Potato-sickness in Germany. Prof. Henslow transmitted 33 specimens of wheat for the Library, each specimen (with its root, plant, ear, and seed) being carefully arranged on a white papered ground, and the frame inclosed with glass; the particulars relating to the specimens being recorded on the back of the respective frames. Mr. Pusey adverted to the labour which these specimens had cost Prof. Henslow in their arrangement, and stated that they formed a portion only of the specimens which that gentleman had undertaken to arrange. Mr. Pusey also stated that as their weekly meetings (namely, all meetings during the session, not held on the first Wednesday of the month, and which any Member was privileged to attend), were intended to be set apart for the reception of papers of agricultural interest, he would proceed to read an account of experiments with various manures, conducted by Mr. F. Clowes, of Hemsby, near Yarmouth.—[No account of this paper has appeared.]

HORTICULTURAL SOCIETY OF CORNWALL.

At the eleventh annual meeting, J. D. Brownie, Esq., in the chair, it was resolved that thanks be offered to Miss Warren and Sir W. J. Hooker for their attention to the Society's Herbarium, and to other Members, for valuable presents. The committee, in the annual report, suggested that a prize should be offered at the next summer exhibition for the best collection of Roses in pots. It was announced, that, in consequence of a grant of 20l. at the last annual meeting, several valuable additions had been made to the library; that the funds of the Society remained in a

healthy state, having experienced no material alteration during the last twelvemonth; and that since the adoption of the report, the Council of his Royal Highness the Prince of Wales had been graciously pleased to direct payment of an annual donation of ten guineas to the Society.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

SCYPHANTHUS ELEGANS. Elegant Scyphanthus. (*Half-hardy Annual*.) Loasaceæ. Polyadéphia Polyándria.—The stems of this plant are of an elegantly twining character, the leaves ample and agreeably pinnatifid, and the flowers large, copious, and of a lively yellow tint. Kept in a greenhouse, it will make a very excellent addition to a somewhat limited supply of flowering plants in August and September, and should be placed in the nearest as well as lightest situation. The branches should be trained spirally round about six slender stakes, put at equal distances round the pots, and from 3 to 4 feet in height. When they reach the summit of these, they should be left to hang down of themselves, as they will thus assume a more natural aspect. The best way of treating it, however, is to plant it at the foot of a south wall, or trellis, in the open air, or to employ it in helping to form a slight summer fence of flowers, or to place it at some distance from the front of a broad conspicuous border, and give it two or three branched stakes to ramble over, or to put it in a small plot on the lawn, and train it as in the last-mentioned case. By either of these plans, it will become a very showy summer climber, and by its peculiar form and the colour of its flowers, will give variety to those commonly grown.—*Parton's Magazine of Botany*.

LILIUM TESTACEUM. Yellow Japan Lily. (*Half-hardy Bulb*.) Liliaceæ. Hexándria Monogýnia. This plant flowered in the nursery of Messrs. Rolison, of Tooting, in June last. It is said to be a Japanese species, and although very inferior in point of beauty to *L. speciosum*, *Thunbergianum*, and their varieties, is a plant that well deserves to be cultivated. It is a handsome frame or half-hardy bulb, growing best when planted out in a cold pit, where the bulbs can be kept dry during winter. It should be planted in the pit in autumn, or very early in spring, and when once established should not be afterwards disturbed, for all these plants suffer injury by removal, in consequence of the loss of their tender perennial fibres, and by the bulbs becoming dry. Whether planted or potted, the bulbs should be placed rather deep, because they make fibres above the bulb as well as below it; and when they must be shifted, it should be done while they are dormant. The greatest care should be taken during the operation of turning them out of the pots, to remove the crocks from amongst the fibres, without shaking off much of the soil. They should then be fresh potted in a mixture of sandy peat, loam, and a small portion of well-rotted dung or leaf-mould, with ample drainage. They should afterwards be kept dry till they begin to grow, when water should be given, but rather sparingly at first. Much damage is done to fresh-potted bulbs by keeping them damp directly after potting, and while in a state of rest. It is easily increased by separating the scales of which the old bulb is composed, which are to be placed in pots filled with very sandy soil and exposed to a gentle heat. They will be two or three years before they flower. The plant grows from 1 to 4 feet high, according to the strength or size of the bulbs, and flowers from July to September, according to the manner in which it is treated.—*Botanical Register*.

AGAPANTHUS UMBELLATUS; var. MAXIMUS. Large-flowered African Blue Lily. (*Greenhouse Bulb*.) Liliaceæ. Hexándria Monogýnia.—This plant bloomed in the nursery of Mr. Groom, of Clapham Rise, in September last. It is a beautiful object; and those who wish to grow it successfully, should treat it in the following manner:—About the end of February the plant should be fresh potted, in a mixture of rich loam and well-decomposed leaf-mould, or well-rotted dung, and placed in a warm part of the greenhouse, where it will soon begin to grow freely. It will then require to be freely supplied with water, and about the end of May should be removed to the open air, if it is intended that it should flower out of doors. The pot should be placed in a sheltered situation, in a large pan filled with water, so that one-third of the pot is immersed; or the pot may be placed by the side of a pond, and the plant treated as subaquatic, in which situation it will flower freely during the summer. If retained in the greenhouse during the blooming season, it must have plenty of air and water, or it will become weak, and lose that beautiful deep blue colour, which so much distinguishes it. When it has done flowering in the autumn, it should be gradually dried, by withholding water, and finally, when the soil in the pots has become tolerably dry, and there is danger of frost, the pot should be removed for the winter, either into a cold pit, or under the stage of the greenhouse. Or it may be placed in a cellar, but then it must be kept very dry, and should be removed from such a situation as soon as it shows signs of vegetation. This plant will also force freely, if well supplied with moisture and bottom-heat; but in that case the flowers become very pale. It is easily increased by dividing the old plant when in a dormant state. It seldom requires shifting when once established, if supplied once or twice, during the growing season, with a little liquid manure.—*Botanical Register*.

HYPOCALYMYA ROBUSTUM. Larger Peach Myrtle. (*Greenhouse Shrub*.) Myrtaceæ. Icosándria Monogýnia.—This is one of those beautiful little Myrtaceous plants peculiar to the south-west of New Holland, which might be easily mistaken for small Almond or Peach bushes, so much are the flowers like them, and so seldom do we find bright rosy blossoms among the Myrtles. It is a native of the Swan River Colony, and has been raised by Messrs. Lucombe, Pince, and Co., of Exeter. The leaves when bruised smell very agreeably of lemon. It is a greenhouse plant, and requires to be potted in a compost, consisting of loam and peat-mould, with a small portion of silver sand. The pot must be well drained, so as to allow all noxious matter to pass off. Water should be freely given during summer, and plenty of air at all times, except during frost, when the temperature should not be below 35°. It may be propagated by cuttings in the ordinary way.—*Botanical Register*.

CATASETUM PLANICEPS. Flat-headed Catasetum. (*Stove Epiphyte*.) Orchidaceæ. Vandææ. Gynándria Monándria.—This plant is a native of the Spanish Main, whence it was imported by Messrs. Loddiges, with whom it flowered in June, 1841. It may be cultivated in a similar way to the other species, by being potted in mossy turf and potsherds mixed with some small pieces of wood. Like other fleshy-stemmed Orchids, this requires three seasons; namely, that of growth, of flowering, and of rest. In spring, while in a vigorous state, plenty of water and a humid atmosphere are requisite, at a temperature of not less than 70° at night, nor yet above 80° by day, and shaded during sunny weather. As the flowering season advances, water should be diminished gradually, and in winter, when the plant is in a dormant state, it should be withheld altogether for a few weeks, and the temperature not allowed to rise above 60°, nor fall to below 50°.—*Botanical Register*.

MISCELLANEOUS.

Irish Flax Society.—We have received a report of the proceedings of this Society for 1842, from which we collect that the growth of Flax in Ireland is becoming of greater importance every year, chiefly through the assistance offered by the friends of the Society. Belgian flax-growers and dressers have been brought over for the purpose of teaching the Irish how to cultivate and prepare it in the manner practised in that country; and young Irishmen have been sent to Belgium to acquire knowledge on

the spot. There is no doubt that Flax may be grown as well in this country as in Flanders, and we should expect it to prove, under good management, very remunerating, for every part of the produce is worth money in the market. We learn that a move is taking place in the same direction in Norfolk, where the farmers are not likely to take anything in hand which will not pay them. We regret to see that the Irish Society's funds are exhausted in their past operations; but we trust that the appeal which has been made by the Society to the landlords will enable it to resume its proceedings this year with renewed energy. Not that we perceive any necessity for regarding such an association as a permanent body; all that it can do is to give a new impulse and a better direction to the Flax cultivation; that effected, the Irish farmers must do all the rest. Up to the present time the Society's operations seem to have been judiciously directed, and, if carried on, will in a short time have done all that any society can do in such matters.

Tuckermania maritima.—This plant, which has also been called *T. californica*, was found by Mr. Nuttall upon the rocks at St. Diego, on the coast of California; he named it, as was stated, in honour of Mr. Tuckerman, of Boston. It is a Composite plant, showy, with bipinnately-divided leaves, with linear-entire segments, nearly all borne towards the base of the stem, which terminates in a naked peduncle, a foot long. It will make a tolerably good border plant; the leaves are very succulent, the flowers few, but very yellow. It may improve on cultivation.—*Hovey's Magazine of Horticulture*.

Large Currants.—A Correspondent of the *Central New York Farmer* sent the Editor of that paper a basket of Currants, which the Editor pronounced to be the largest he ever saw, some of the berries measuring 1½ in. in circumference, and several 1½ in.; the clusters were also large and fine. Mr. Berry, of Whitetone, who raised these Currants, states that he sent them to the Editor, to show what a little cultivation will do towards improving this most common and most neglected of fruits. The bushes are made to grow in the form of trees—they are, in fact, small trees. In this shape they bear for five or six years, and sometimes longer. The bushes are planted at least 6 ft. apart, and every spring or autumn, the new wood, which shoots out vigorously from the old branches, is cut off, with the exception of three or four joints. Mr. Berry prefers autumn pruning. By this method the fruit is produced in rich heavy clusters upon all parts of the tree, even to the extreme points of the branches, and does not dwindle away, as in the common mode of treatment, into little, puny, pigeon-shot berries, hanging upon solitary stems, in a wide waste of bush.—*Hovey's Mag. of Hort.*

Treatment of American Maize.—The land should be well ploughed and prepared, and, if necessary, manured; a considerable period being allowed between the first and second ploughings, in order that the soil should derive full benefit from exposure to the sun and atmosphere. The seed should be sown in rows, sufficiently far apart to admit of a plough being used after the plants have reached a certain height. The distance between the rows being fixed (say about four feet apart), a small quantity of manure is to be thrown down at intervals of 18 inches, on which three or four seeds should be placed; these are to be covered thinly with mud, which should be pressed down with the foot. When the plants are three or four inches high, the ground should be carefully hoed to remove the weeds, shortly after which it should have the first ploughing. When the tapel or male blossom appears, the plough should a second time be put through the field, and on both occasions the share should pass very near the roots. The earth after the second ploughing should be gathered round the roots of the plants with a hoe, and all shoots from the parent plant should be removed, as they weaken it and produce nothing. American Maize might be sown in beds, and afterwards transplanted. Where this mode of culture is adopted, the plants should be raised three or four inches apart, and a small quantity of earth should be allowed to adhere to the roots when removed. When the grains in the ears are formed and begin to harden, so as not to yield to the pressure of the thumb-nail, the top and leaves of the plant should be removed, and tied up (after drying two or three days), for fodder for cattle. The grain, when hard and ripe, should be gathered, well dried, and put away in an airy place, either in the husk or shelled.—*Transactions of the Agri-Horticultural Society of India*.

Guano as used in South America.—"Guano, or Huano as it is termed in Peru, is scarcely used in the neighbourhood of Arequipa for any land but that upon which Maize and Potatoes are planted, but there it is invariably in requisition at a certain stage of the growth of the plant; as without it, the farmers say it is impossible to get a remunerating crop of either of these from their land. The time for applying guano to the Maize is when the plants are about two feet high; then a small quantity of it is dashed round the plant on the surface of the ground; a labourer immediately follows with a spade, throws up the earth round the bunch of stalks in the form of a mound, with the double object of covering the guano and supporting the plant; which, after being watered, is apt to fall when there is any wind. A single handful is sufficient for the roots of three different bunches of stalks. Water must be let on within three days after the guano is applied, otherwise it does injury to the root. To Potatoes it is applied after the plant rises a few inches out of the ground, in about the same proportion as is used for Maize; but, instead of being thrown on the ground, it is placed near the level of the roots by first making small holes. The ground must be irrigated within two days after; otherwise the roots are, if not destroyed, considerably injured by the guano."—*Mark Lane Express*.

GARDEN MEMORANDA.

Dalkeith Palace.—Alterations and improvements have been going on here lately in a most spirited manner. The old kitchen-garden, which was in a very bad situation, has now been abandoned, and a new one made on the bank north of the town of Dalkeith, the extent of which is about 20 imperial acres. The length of the houses and pits, exclusive of the large conservatory, which was built some years ago in the old flower garden, is 1680 feet, viz., 370 feet in the principal range, consisting of three Peach-houses, three Vineries, one plant stove, one Heath-house, one greenhouse, 160 feet of Pine stoves, in four divisions, 370 feet of Pine pits, forcing pits, &c., heated with hot water; 180 feet of plant-houses, consisting of one Orchidaceous-house, one greenhouse, and one Camellia-house, which is not yet finished. There are 600 feet of cold pits, in two ranges of 300 feet each, one-half of which is adapted for forcing early vegetables and wintering salads and tender vegetables; the other half is intended for wintering half hardy plants, bulbs, Alpine plants, &c. The fruiting Pines are plunged in beds of sand, under which a system of hot-water pipes is used for supplying bottom-heat, which seems to answer well. The collection of plants, greenhouse and herbaceous, is, perhaps, the best private one in Scotland. The offices and cellars behind the principal range are so complete and commodious as to merit particular description. The cellars extend under the offices behind the principal range, and are of the same length; they are used for keeping roots, tools, &c., growing Mushrooms on shelves, blanching salads, and wintering vegetables. There is also a kitchen, for the men's use, and for various other purposes. The range of offices above them are, five rooms for garden men, seed-room, store-room, fruit-room, carpenter's shop, garden office, and a room for cleaning and packing vegetables, and preparing them for the kitchen. This room is supplied with water, and has two boilers for heating it in winter. It is fitted up with shelves, on which a supply of vegetables, &c. is kept during winter, to prevent the disagreeable process of collecting them daily, when the ground is frozen or covered with snow. Under the cellars an abundant supply of water is collected in large tanks, which are furnished from the roofs of the buildings and the drainage of the higher ground around the garden. Cisterns are also placed over the furnaces, and the water is carried through the wall over the boilers to the inside. At present the water is raised by a common pump from the large reservoir to a cistern, whence it is conveyed by pipes to iron cisterns placed at convenient distances. This, however, is merely temporary, and it is intended hereafter to raise the water by means of a small steam-engine. In front of one of the plant-houses is placed a brick and stone tank, 50 feet long, 5 feet deep, and 4 feet wide, into which the rain-water which falls on the pits and hothouses in the back range is collected; should this be at any time insufficient, it can be supplied from the larger reservoirs already mentioned. The brick walls are hollow, and are built upon rather a novel plan, being heated by hot water pipes. They are the finest walls hitherto built in Scotland, Mr. McIntosh having brought brickmakers and bricklayers from England for the purpose. The trees are not fastened in the ordinary manner, with nails and shreds, but cast-iron eyed studs are driven into the joints (never into the bricks); to these the branches are tied with twine steeped in pyroligneous ether, to make it more lasting. These studs are not at any time intended to be taken out, and the evil of destroying walls by driving in and drawing out the nails, as is usually the case, is thus remedied. In planting the trees, we observed that they were all placed near the surface, indeed higher than is done by most advocates for this mode of planting. The trees on the walls are also arranged as follows:—*South wall*: Peaches and Nectarines from the centre to the east end; Apricots from the centre to the west end; on the north side of this wall, Morello Cherries occupy one half, and the best sorts of table Cherries the other. *West wall*: West aspect, Apples; east aspect, Plums. *East wall*: On both sides, the best kinds of Pears. The other walls are planted in a somewhat similar manner. We were glad to see that Mr. McIntosh had planted many of the French and Flemish Pears as standards, as well as against the walls. The formation of the principal part of the garden must have cost much labour, as it is calculated that 10,000 cubic yards of gravel were taken out, and nearly the same quantity of earth brought in; the original soil in many instances not extending six inches in depth. Many other alterations and improvements are in progress. On the east side of the kitchen-garden a new flower-garden or arbutum is in the course of formation, intended principally for specimens of ornamental plants; and in the valley opposite to the Palace, on the north side of the river, the new flower-garden is to be placed. The width of the walks in the pleasure-grounds is nine feet; sufficiently wide for a pony carriage to be driven round, which is a great convenience in a place of this extent.

Reviews.

A Cyclopædia of Practical Agriculture. By Martin Doyle. A New Edition, enlarged. How, Fleet-street. Part XI.

We have always expressed our good opinion of this work; and we are glad to find it confirmed by the following memorandum from our agricultural friend "M."

Martin Doyle is well known as a perspicuous and sensible writer on several popular subjects. The name is assumed, and the real author is a worthy Irish clergyman, who has much experience in Agriculture, which he has practised with assiduity, if not with much profit, for many years. The work, in the present enlarged edition, will be found extremely useful as a book of reference. There are no theories in it which are not founded on well-established facts. There is a tone of great humanity to the brute creation running through it, and occasionally some naïve and lively illustrations. We can safely recommend this work to all those who are interested in practical husbandry.—M.

Martin's Thames and Metropolis Improvement Plan (Ridgway, 8vo.) is a full explanation of the views taken by the author as to the most judicious means, among other things, of preserving the sewerage of London, and conveying its valuable contents to the agricultural districts. As the pamphlet is entirely one of detail, we must refer our readers to its pages for the manner in which Mr. Martin proposes to carry out his comprehensive plans.

CALENDAR OF OPERATIONS for the ensuing week.

We are indebted to Belgian and German gardeners for a modification of side-grafting, founded on the disposition of the sap to flow upwards after a plant is laid down horizontally—a subject on which I remarked last week. Side-grafting, or this modification of it, is not at all new. It has been often treated of by Mr. London in his different works, but it is not practised so generally as it deserves to be. It is one of the easiest and most beautiful modes of grafting delicate house-plants, especially those which do not succeed so well when headed down to work on—such as Rhododendrons, Camellias, Correas, Passions flowers, and all soft-wooded plants. The operation is simple, and may be thus performed: fix on a smooth part of the stock, near the surface of the pot, and make a downward slanting cut an inch and a half long, and from the sixteenth to a quarter of an inch

in depth at the bottom, according to the size of the stock; then make a cross-cut at the bottom, which will leave a notch on the stock; cut the graft to correspond, resting the bottom of it on the notch; tie it in the usual way, and lay down the pot horizontally, taking care to keep the graft side uppermost, in order that the ascending sap may flow into it, instead of forcing the latent buds into shoots. It is also necessary to prepare the graft so as to have the back of its leaves towards the stock, in order that they may be kept in their natural position when the stock is laid down horizontally. This method will succeed with or without claying, if the stocks are placed in a close, moist hotbed, or under a handglass. In summer, many tribes will do well enough in a close cold frame, if they are kept rather damp; but in that case the safest way is to clay them. I have seen nurserymen use bell-glasses over the grafted portion, but they are only serviceable in hastening the process. Perhaps it may be as well to caution amateurs not to lay down their grafted plants, unless they are grafted quite low; if the grafts are placed more than six inches above the pot, to lay them horizontally would impede the union. Out-of-door grafting is now more or less performed in almost every garden. Nurserymen always begin with those plants which vegetate soonest. The Cherry is generally the first to be grafted in the kitchen-garden; Plums follow next; Apples and Pears are left to the last, as any time before the middle of April will do for them.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—For the first three weeks after potting, pay particular attention to the bottom-heat of the fresh beds; if they should get over-heated, your care for the last six months, and your hopes for the next six, as far as Pines are concerned, may in one night be rendered useless. Keep the young stock in a close, moist heat, to encourage their fresh rooting and assist the fruiter to throw up strong fruit-stems.

VINERY.—The late Vines that are not to be forced till all their buds break naturally require particular attention from this time. Probably this house, like the rest, is full of plants; but from this time its temperature must be treated to suit the Vines. Keep the top and bottom sashes as open as they will allow, both day and night. Continue to watch the forced ones in their different stages, and see that the young wood and fruit do not get crowded. Try the experiment suggested at page 132 with the Sweetwater and Frontignans.

PEACH-HOUSE.—When the fruit in the first house is fairly stoned, begin to thin by degrees, and regulate the crop according to the strength of the trees.

CHERRY-HOUSE.—If these have set thickly they must also be thinned to a fair average crop; but having hardly seen the sun while in flower, these and the Peaches have in general set rather thinly this season.

FIGS.—A correspondent has just asked how it is that his forced Figs always cast their first crops, &c. Upon this point I shall make some remarks next week. Continue the usual routine, as already directed.

MELONS AND CUCUMBERS.—Train the plants regularly as they advance, and keep the shoots thin; a few leaves, if well exposed to the light, will ripen more fruit, and that of a better quality, than a greater number crowded, and shading each other. Keep a sharp look-out after woodlice. To see my Melon-beds without a toad would be like the loss of an old friend; but I do not believe that he destroys woodlice; he thinks they are prisoners like himself, and he is too generous to take advantage of his superior strength. In the open air he may think and act otherwise, but assuredly he never touches them in confinement.

SEEDLINGS.—Never let seedlings in this department remain any length of time without transplanting them into fresh soil, as soon as they can be safely handled. How often do you see Tomatoes, Capsicums, &c., drawn up by too much confinement, and for want of being early transplanted and inured sooner to a cooler situation. Some people prick out their seedling Balsams and Cuckoos into the soil of the hotbed, and take them up and transplant in the same place, in order to make them dwarf stocky plants, and increase their roots: this is worth trying.

Out-door Department.

Although we have not yet seen any "March dust," the soil has much improved in texture; and the weather, on the whole, has been favourable for sowing seeds. It has, however, received but little assistance from the sun; the first half of the month having been as dull and sunless as February.

CROPS IN ROWS.—As soon as the soil is dry, or even half dry, all crops in rows should have the soil well stirred between them; and this should be done three or four times before the end of April. If you are near a farm-yard or common sewer you need not wait for manure to ply between the rows of Spinach, Cabbages, &c. Now is the best time to begin to apply liquid manure to standing crops. A peck or two of soot will make good liquid manure, if no better is at hand.

SUCCESSIONAL CROPS.—The first March sowing of all these being now finished, and well guarded from mice, rats, slugs, and birds, the whole strength of the garden may be turned to the permanent crops, of which only one sowing or planting is required for the season. A weekly mention of the names of the plants for these sowings would fill the Calendar to no purpose.

POTATOES.—A large breadth of the different sorts should be planted before the end of the month.

ORCHARD.—It would be a good plan to take one-third of the trees annually, and paint over their trunks and main branches with thick lime paint, with a little soot dusted in it to take off the white glare of the lime. If any of the standards showed signs of moss or insects under this triennial dressing, they should be oftener painted over; while all the stone fruit on the walls should, about this time, be done over every year. Have coverings ready for the Peaches, but do not use them till there is an actual necessity for it.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—Recollect that this is the best time to put in cuttings of stove plants, and especially root-cuttings, which can easily be got as the different families are potted. If we had no physiology at all to direct us how to manage stove plants in winter, root-cuttings at this time would supply the deficiency. Pieces of the roots of plants that have been in a dormant state since last October are full of sap, and will break forth into young plants at the first excitement; not so, however, with those of plants kept struggling against nature; their juices and energies are already expended, and they will yield unwillingly even to the strongest stimuli. If you have any doubts on the subject, take a cutting of a Clerodendron root now, and again from the same variety next June, and observe the difference; the roots in June are the railroads for the ascending sap, not the repositories of it; but this any one can ascertain by experiment.

GREENHOUSE.—Many tribes here will now require shifting, and some of the more hardy and less showy kinds may be removed to the cold pits, or even placed out in a sheltered situation, to be protected with straw mats. If some contrivance of this sort is not made, the finer plants will suffer daily from their crowded state. It will be better now not to admit so much air at night, if the wind is at all cold. Although it would be bad management to encourage the growth of the plants, yet it would be still worse to retard it by cold currents of air. Syringe once or twice a week early in the day, and propagate by cuttings such plants as are wanted for keeping up the stock in a young healthy state.

CONSERVATORY.—The Azaleas have now a double demand on their stock of food—to maintain their flowers and make their young wood; they must therefore be well supplied with moisture at the roots. Pelargoniums, at this season, keep so long in flower that they are sure to have green-fly on them, from standing so long without having sufficient air; remove them, and every other infected plant, to be smoked elsewhere, if the con-

servatory is attached to the living rooms. Any plant that can be made to flower at this time is a valuable addition to the conservatory.

PITS.—Many of the hardier plants here may now be removed to more temporary shelter, to make room for others from the greenhouse, and for newly-potted store plants for the flower-garden. Florists' flowers require more room also; in short, every tribe now should be attended to, according to the wants and wishes of the owner.

CUTTING PITS.—This is the most essential part of this department at present. For cuttings of all soft-wooded plants, use half sand and half peat for the compost, and about half an inch of sand on the top; the shorter the cuttings and the shallower they are planted, the more likely they are to succeed, and, like seedlings, the sooner they are potted off after they are rooted, the better. To save room, you may at this stage plant many of them in one pot; and after they are more hardened they may be potted singly.

Out-door Department.

THE ROSARY, from one end to the other, should now have a thorough soaking of rich liquid manure. Those who want a late bloom from the June Roses, will not prune their plants till the end of the month; those that are pruned, especially standards, should now be done over in the same manner as the Peach-trees, with lime, sulphur, soot, and soft-soap.—D. Beaton, Shrubland Park Gardens.

State of the Weather near London for the Week ending Mar. 16, 1843, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 10th in 1836, and 20th in 1838—thermometer 69°; and the lowest on the 21st in 1837—thermometer 21°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending March 17, 1843.

THE SUPPLY OF VEGETABLES during the past week has been rather limited, but fruit has been tolerably abundant. Trade is beginning to assume a more brisk appearance. **Fruit:** Of Pines there is a fair supply, consisting principally of Queens; a few Strawberries are occasionally offered, from 1s. to 2s. per oz.; a small quantity of Beurré Rance and Easter Beurré Pears are to be met with, the latter fetching 12s., and the former 20s. per half-sieve. The price of Apples has varied but little since our last report. Cucumbers are becoming more plentiful, and are selling from 2s. to 6s. per brace. **Vegetables:** At the commencement of the week Asparagus was rather scarce; it is now however more plentiful, although far from being abundant. Seakale continues good, from 1s. to 2s. 6d. per punnet. Broccoli is not plentiful; the white fetches from 1s. 3d. to 2s., the purple from 1s. to 1s. 6d. per bunch. Cabbage-plants are abundant, and sell from 1s. 6d. to 2s. 6d. per dozen bunches. French Beans remain scarce, and are selling from 2s. 6d. to 3s. 6d. per 100. Lettuces are small, and sell from 9d. to 10d. per score. Endive is of good quality, and fetches from 1s. 6d. to 2s. 6d. per score. Spring Radishes are supplied in small quantities, from 1s. to 1s. 3d. per punnet. Rhubarb is becoming more plentiful, and fetches from 12s. to 15s. per dozen bundles. Mushrooms are a little cheaper, and may be obtained from 1s. 3d. to 1s. 6d. per punnet. **Flowers:** The Cut Flowers have been exceedingly good during the past week, consisting of Calla æthiopica, Phaius grandifolius, Epiphyllum truncatum, Sparrmannia africana, Burchellia capensis, Hoya carnosa, with a variety of Pelargoniums, Roses, Camellias, Epacris, Azaleas, Kalimias, Acacias, Anemones, &c.

PRICES, SATURDAY, March 16, 1843.—FRUITS:—

Pine Apple, per lb. 5s to 8s	Cucumbers, per brace, 3s to 6s
Grapes, Spanish, per lb. 1s to 1s 6d	Walnuts, per bush, 12s to 16s
Portugal, 1s to 3s	Chestnuts, per peck, 4s to 7s
Apples, dessert, per bush, 4s to 10s	Almonds, per peck, 6s to 7s
Kitchen, 2s to 6s 1	Sweet Almonds, per pound, 3s
Pears, dessert, per hf. sieve, 6s to 20s	Pilberts, English, per 100 lbs. 60s
Strawberries, forced, per doz., 1s to 2s	Cob Nuts, per 100 lbs., 65s. to 70s.
Pumpkins, per doz., 8s to 12s	Nuts, per bushel—
Oranges, per doz., 1s to 2s	— Brazil, 16s
— per 100, 6s to 10s	— Spanish, 18s
— bitter, per 100, 8s to 24s	— Barceus, 24s
Lemons, per doz. 1s to 2s	— Cob, 12s to 14s
— per 100, 5s to 14s	

VEGETABLES: I.

Savoy, per doz. 6d to 1s	Paraspe, per dozen, 6d to 1s
Cabbage, Red, per doz. 2s to 5s	Spinach, per sieve, 1s 6d to 2s 6d
— Portugal, 1s to 3s	Leeks, per doz. bun., 3s to 4s
Broccoli, White, per bunch, 1s 6d to 2s	Onions, per bushel, 8s to 10s
— Purple, 1s to 1s 6d	— Pink King, per hf. sv., 4s 6d to 5s
Beans, Kidney, forced, p. 100, 2s 6d to 3s 6d	— Green, p. doz. bun. 3s to 4s
Potatoes, per ton, 50s to 75s	— Spanish, per doz. 2s to 3s
— per cwt. 2s 6d to 4s 6d	Garlic, per lb., 6d to 8d
— per bushel, 1s 6d to 2s 6d	Shallots, per lb., 1s
Kidney, p. bush., 1s 6d to 2s 6d	Asparagus, large, per 100, 6s to 8s
Scotch, per bushel, 1s 6d	— Sprue, or Small, 2s to 3s
New, per lb., 2s 6d to 4s	Endive, per score, 1s to 2s
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Lettuce, p. score, 9d to 10d
Turnips, per doz. bun., 1s 6d to 2s	Celery, p. bd., (12 to 15) 6d to 2s
Red Beet, per dozen, 9d to 1s	Rhubarb stalks, per bdle, 1s to 1s 3d
Scorzonera, per bundle, 1s 6d to 1s 8d	Small Salads, per punnet, 3d to 4d
Salsify, per bundle, 1s 6d to 1s 8d	Corn Salads, per hf. sieve, 9d to 1s
Cardoons, each, 1s	Watercress, per doz. am. h. n. 4d to 6d
Horse Radish, per bundle, 2s to 4s 6d	Paraspe, per half sieve, 1s 6d to 2s 6d
Radish, spring, per punnet, 1s to 1s 6d	Fennel, per doz. bun. 2s to 4s
— Turnip, p. doz. bun., 1s to 1s 6d	Sage, per doz. bunches, 2s to 3s
Carrots, per doz. bunch. 4s to 6s	Mint, per doz. bunches, 2s 6d to 4s
— Horn, per bunch, 4d to 6d	Mushrooms, per pottle, 1s 6d to 1s 8d

Now ready, price 4s. 6d.,

RURAL CHEMISTRY.

By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London,
Hon. Mem. of the Royal Agricultural Society, and Lecturer
on Chemistry at the Royal Institution.
London: 3, Charles-street, Covent-Garden.

Notices to Correspondents.

MANURES.—S. D.—Sawdust is good manure if properly prepared; unprepared, it is a bad material. Cause it to rot, if you can, by mixing it with putrefying animal matter, such as blood, or offal, or cloacine; if you cannot do that, char it; that being impossi-

ble, burn it and use the ashes. If added to animal refuse, putrifying fish, or any such matter, it will decay, and then becomes an excellent substance. *—A Subscriber.*—Dilute Gas-liquor with 5 or 6 times its bulk of water; add oil of vitriol by degrees, till it ceases to effervesce: let it stand a day; and apply it immediately. We cannot give any directions as to quantity; you had better be guided by the price; as much as you can get for 30s. an acre ought to be enough. *—L. G.*—It is not probable that sulphuretted hydrogen would be hurtful to vegetation, unless in very large quantities; for it is continually floating in the air. Mr. Solly has proved experimentally, and our direct experience shows, that it is beneficial rather than contrary, (see the Proceedings of the Chemical Committee of the Horticultural Society). Neither will the Coal Tar do any harm. *—L. D.*—In using Gypsum for fixing the manure of a dunghill, you should proceed thus. Make a layer of the stable litter; soak it with water; dust gypsum over it. Add another layer; soak it again; dust on more gypsum; and so proceed till the heap is made. Then at one corner of the dunghill make a hole water-tight by puddling; into this conduct gutters from the other sides of the heap, so that all that flows from it may run into the hole; let it be some one's business every day, or as often as is necessary, to throw the drainings back upon the dunghill. If the weather is dry, add water or urine to keep it moist, and suffer none of the drainage to escape. In this way your dunghill will be the perfection of such a thing. You must keep it wet at all events, if it is ever to be what it should be; and gypsum will not fix its ammonia unless it is wet. We shall treat especially of these matters very soon. *—X. Y. Z.*—Gypsum is by no means so good as sulphuric acid for fixing ammonia in urine. *—Bugs.*—Tan is not at all suitable as a manure until it is thoroughly decomposed. If, however, it is mixed with cloacine or some similar substance, it will decay rapidly and become a valuable material. *—H. S.* will find our opinion of Brewers' Grains as a manure at p. 105. It is a general principle, that, where any substance affords nutritious food to animals, it is best to give it as food, and use the dung of the animals so fed, mixed with straw or earth. Brewers' Grains are excellent for cows and pigs, and Malt-comb for cows and sheep; but if there is an abundance of these, and no animals to eat them, they will do well for manure. Malt-comb has been successfully drilled with Barley, and will, no doubt, promote the growth of Turnips. As much as 20 bushels per acre may be drilled with the seed. *—Guano-agua.*—Guano, mixed with water from a tank into which the refuse of a farm-yard and rain-water run, can be applied with advantage to Grass in pasture, or laid up for hay; it must be well diluted, and may be applied now. Four lbs. to 8 galls. of water is a proportion only suited to gardening purposes; two or three cwt. an acre is abundant. *—CHARCOAL.*—*X. Y. Z.*—When this substance is mixed with soil for potting plants, it should be broken into small fragments about half as large as a small marble. Wood-ashes from a baker's oven are unfit for the purpose. *—CHALK.*—*Flora.*—Small pieces of chalk are unsuitable for the drainage of pots. *—BOG-EARTH.*—*A Subscriber.*—Oil of vitriol is not at all a good material to mix with bog-earth; wood-ashes are much better; but the best plan is to throw it up with decaying animal or vegetable matter, dead fish, offal, cloacine, and such substances; thoroughly incorporating them into a compost. *—CATTLE.*—*H. S.*—Warts on the teats of cows may be removed by tying a small cord, well waxed, tight round their base, to stop the circulation, when they will drop off. If they are too much clustered to be tied, wash them with a strong solution of common potash. They may be eradicated by actual cautery, or by nitrate of silver; but this should only be used under the direction of a skilful veterinarian. *—VINES.*—*Merlin.*—The number of shoots to be left upon your Vines in pots must be regulated by the strength of the plant. If bunches are visible upon six or eight of the shoots, let all the others be removed; but where only two or three show fruit, a few of the barren shoots should be retained, which may be stopped at the sixth or eighth joint. *—A B.*—Your Vines appear to have been pruned too closely. There is usually, at the base of each shoot, a protuberance which should never be injured in pruning. In the close-spur system, the shoots are cut back almost close to this callosity, which is furnished with numerous buds, although scarcely visible to the naked eye. To make your Vines break more regularly throughout their entire length, you had better secure them along the front of the house, inside, about a foot distant from the glass. *—A Prentice.*—Where Vines are trained upon the spar system, it is the usual practice to stop the shoots at one joint above the bunch as soon as they are sufficiently elongated to allow this to be done. You will find an answer to your inquiries respecting Roberts's Treatise at p. 848 of 1842. To raise Vines from eyes or buds, you must choose well-ripened wood of last year, and take a single bud, with about an inch of wood on each side of it; insert it about half-an-inch deep in a well-drained pot of light soil; press the earth firmly round it, and plunge the pot in a gentle hotbed. *—GRAPE.*—*A Correspondent* is desirous of learning the reason why bunches of Grapes, in their earliest stage, wire off or become converted into tendrils, more particularly near the bottom of the house, although just above the flue; and whether they are more likely to do so when trained upon the spur system. *—CUTTINGS.*—*A Young Beginner.*—The period at which it is best to propagate hardy plants by cuttings will depend greatly upon the nature of the plant from which they are taken. In most cases, any time between the beginning of June and the end of August will be found suitable. *—CLIMBERS.*—*A Young Beginner.*—For a pitched paling, 6 feet high, the following climbing plants will be suitable: Ampelopsis quinquefolia; Clematis grata, flammula, viticella, and montana; Caprifolium gratum, and Periploca graeca. *—ANNUALS.*—*Clericus.*—Where these have not been sown in the previous autumn for early blooming, they should be sown about the commencement of this month in a slight hotbed, from which they could be transferred to the open border so soon as all danger of severe frost was over. *—FUCHSIAS.*—*Ordsall.*—Any light, rich garden-soil will suit Fuchsias, when planted in beds. The best sorts for the purpose are named at p. 144. *—CASTOR OIL PLANT.*—*Clericus.*—The seeds of this plant should be sown immediately in sandy soil, in 60-sized pots, plunged in a gentle hotbed. Shade the young plants during bright sunshine, until they have formed two or three rough leaves; when they may be shifted into 48's, in rich soil. Give them plenty of air in favourable weather during the day, but protect them from cold at night. When they require it, repeat them into 24's, and as soon as the weather will admit, place them in a cool frame to harden, and water them once or twice a week with liquid manure. About the middle of May they may be planted out in the open border. *—TREES FOR MARSHES.*—*G.*—For growing on marshy land which is occasionally overflowed by the sea, no trees or shrubs are better adapted than Alder, any of the species of Willow, and Viburnum Opulus. *—DRACENA.*—*Ignoramus.*—Your plant of Dracena draco will probably be several years before it blooms. It is not ornamental, but bears a large panicle of flowers, not unlike those of the Asparagus. *—CAMELIAS.*—*Rhodamanthus.*—If you can place your Camellias in a warm greenhouse from the time that they have done flowering until they ripen their wood and form flower-buds for the succeeding season, you might keep them for the rest of the year in a room where they would receive a full portion of light and air upon all favourable occasions. Unless in very severe weather, they would be better in a room where there was no fire. *—ROSES.*—*W. R.*—Madame Lafay is a handsome hybrid perpetual

Rose for a wall or trellis work, but we doubt much whether any of this tribe will bloom upon a N. and N.E. aspect. *—TUBEROSE.*—*W. J.*—The treatment of this plant is given at p. 121. *—CHINESE IRIS.*—*Tristan.*—The amount of bottom-heat that you have given this plant by pouring boiling water into the pan of its flower-pot, seems to have been too great. You have forced it into the production of leaves, and you have not enabled it to form the mat of required for the organisation of leaves. Whenever such stimuli as you have used are applied to plants, you should expose the leaves to all the light you can possibly command. A more manageable way of cultivating such plants is to place them in a pot of rich compost at the foot of a south wall during summer, where they require no protection; to water them well, so as to keep off the red spider and prevent scorching, and in the winter to remove them to the window of a sitting room, if you have not a greenhouse. With such management, both the Chinese and Chalcedonian Iris will flower regularly. The great point is to give them heat, light, and moisture, when growing, and never to allow the leaves to be injured, but to permit them to die away naturally. *—PEARS.*—*A Subscriber ab initio.*—Late Pears, some of which will keep till the end of April, are—Fondante du Bois, Jean de Witte, Neplus Meuris, Easter Beurré, Beurré Rance, Holland Bergamot, La Portunée de Parmentier. As you intend to plant some against walls, the Easter Beurré, Beurré Rance, and Holland Bergamot, are the most proper for such a situation, but unless the aspect be south, or inclining thereto, the fruit will be higher-flavoured from standards. We do not know the Barnadiston Pear. *—STRAWBERRIES.*—*MacGregor.*—The best kinds for succession are the Roseberry, Keen's Seeling, Old Pine, Myatt's Pine and British Queen, Elton, American Scarlet, and Coul Late Scarlet. The most convenient way of planting them is in rows 9 inches or a foot apart, in 4-foot beds. If a certain breadth of land is planted annually, those plants which have borne fruit for two seasons may be trenched in, and a constant succession of productive beds will thus be ensured. *—LEMONS.*—*M. B.*—Your Lemons will keep for some time if you spread them thinly in a cool, airy situation. *—MELONS.*—*A. C. G.*—From your account we should suppose that the leaves of your Melons were last year destroyed by thrips. The best method of getting rid of these pests is to dust the foliage with sulphur by means of wheel-bellows, as recommended at p. 164 of 1841. *—GRAFTING WALNUT-TREES.*—*O. L.*—If Walnut-trees are cut in spring, before their leaves expand, the flow of sap from the wounds is such that grafts cannot succeed. Mr. Knight, with all his skill, uniformly failed; but at last he resolved to defer the operation till after the buds had burst, and he then succeeded in getting 23 scions to take, out of the 28 which he tried. When the trees have pushed a little, the shoot to be grafted must be cut above the place where a young shoot is pushing; this shoot must be preserved, and the scion must be placed opposite to it, being fitted in the manner of whip-grafting, care being taken that the inner barks coincide. When the buds of the scion begin to swell, the point of the shoot left opposite on the stock must be pinched; and when the graft has fully burst into leaf, and is consequently in a condition to appropriate the whole of the sap, the shoot on the stock may be then dispensed with. The scions should be taken off now, and their ends laid in the ground till required for use, as above mentioned. *—PEAS.*—*J. H.*—Any respectable nurseryman will supply you with the Milford Marrow Pea. *—WOODLICE.*—*W. B.*—With perseverance you may keep your Cucumber beds clear of Woodlice in the following manner: Put a cold boiled potato into a small pot and cover it loosely with moss; place this trap in the corner of the bed which the insects most frequent. A few of these traps would soon reduce their numbers, if they were looked to every morning, and all the insects collected in them destroyed in boiling water. *—BOOKS.*—*J. W. F.*—Roberts's Treatise on the Vine is advertised at p. 848 of 1842. Your bookseller at Edinburgh could procure it through his London agent. *—A Repeater.*—We do not know. You had better get them all. *—J. H.*—The work entitled "Every Man his own Brewer" may be obtained of any bookseller. *—LAWNS.*—*W. M. R.*—On no account use Hay-seeds for your new lawn; they may fill your land with weeds and bad Grasses. Instead of them take 6lbs. of Crested Dogstail, 5lbs. of the hard Fescue, 90lbs. of Rye Grass, 3 or 4lbs. of Poa trivialis or pratensis, and 6 or 7lbs. of White Clover. If you find this too expensive, you can reduce the quantities proportionably: what we have mentioned will make a good lawn immediately. *—THE FIGUA PLANT.*—*S. H.*—We know nothing of a Figua plant; but we know something of Fiqua Tea; which is some preparation of herbs, coloured and flavoured artificially. It is very poor stuff. *—WORMS.*—*S. H.*—The corrosive sublimate will do no harm to the roots of your Peach-trees, if you employ it to destroy worms. *—FERN FOR POTS.*—*K.*—There is no preparation by which the leaves of Fern, gathered in a young state, can be preserved fit for use during the remainder of the year. *—OLD MELON SEEDS.*—*T. H.*—We have sent the seeds to Oxford, where, in the Botanic Garden, the experiments on old seeds are carrying on. *—ALLOTMENTS.*—*Red Cap.*—Detailed observations upon the allotment system will appear forthwith, probably next week. *—PUMP-WATER.*—*Bugs.*—Pump-water should never be applied to plants when either rain or pond-water can be procured. When, however, it must be used, it should be previously exposed to the atmosphere for several hours. *—BEE-HIVES.*—If A. S. R. applies to Mr. Savage, of Swaffham, Norfolk, who is an able apiarian, and constructs amateur Bee-hives, he will be able to obtain information respecting the "Ladies' Safety Hive." *—BARKING TREES.*—*W. J.*—The only effectual means of preventing sheep from barking trees, is to inclose the stems with tre-guards; one kind is described at p. 6 of this year's Chronicle. *—MISCELLANEOUS.*—*J. W. F.*—Your plant is Polygala chamaebuxus. *—Your plants are,* 1. Correa speciosa. 2. A species of Hermaphrodite. 3. Brachycoma latifolium. 4. Adenandra speciosa. *—J. N.* *Cardif.*—Your Pear is the Beurré Rance. *—A. K.*—The Moss is Hypnum sericeum. *—An Angler.*—We have attentively perused your communication, and do not find that its contents amount to anything. *—G. S.*—Your seedling Azalea is not sufficiently distinct from other well-known varieties to be of any importance. *—G. S. W.*—We were unable to discover any grub in your letter, or in the paper inclosed in it. *—The best book we can recommend to A Subscriber* is Kirby and Spence's Introduction to Entomology; the 3d and 4th vols. of which will give the information required. *—T. P.'s* collection of Eggs were laid by the "Lackey Moth," *Cisticampa Neustria*, whose history will form an Entomological subject for the Gardeners' Chronicle. *—A. G.*—We really do not know how to execute your task; there is no end to such establishments; and a list of them would only bewilder you, as it did us when we once attempted it. *—S. M.* The bright appearance of your Tropaeolum seems to have been brought on by inefficient drainage, causing water to stagnate about the roots. *—Clericus.*—We are unacquainted with Wood's scarlet Phlox. *—Anthony.*—Next week. *—G. M. E.*—We know nothing of the Calorific Ventilator. *—A. C. R. G.*—What is "Tuft Fungus"? *—T. T.*—We do not publish Almanacs. *—Erica.*—The Epacris is E. impressa. The Heath is 1. Erica Willmoreana, a variety of E. perspicua; 15. E. jasmiflora; 44. E. ignescens; 62. E. vestitula; 100. E. verux; 126. E. grandinosa. *—J. A.*—The Erica appears to be E. refulgens. *—Rusticus.*—We are unacquainted with the seed sent. *—Uphill.*—No. 52 of last year may be had, price 6d. *—G. B.*—We will notice the days of exhibition in our usual manner a

short time previously to their taking place. To publish them in the manner proposed would be an advertisement. *—A Constant Reader* had better consult a lawyer. *—Mowbray.*—Of your Acorns No. 2 seems intended for Quercus Egilops. We do not recognise the other from the drawing. *—N. H.*—Your Acacia is A. dealbata. *—Londonderry.*—We know nothing further respecting the boller to which you allude than is stated in "Paxton's Magazine of Botany." *—M. B.* The shrub, which grows so plentifully in the neighbourhood of Baden Baden, and bears clusters of red berries, is Sambucus racemosa. You may sow the seed either in the open ground or in a pot, from which the young plants may afterwards be shifted into the open border. *—Cactus Rubes.*—There is no such plant as Rubes hispanica; you must have been mis-informed. *—As usual, many letters have arrived too late for answers this week.*

NEWS OF THE WEEK.

THE Overland Mail from India brings advices from Bombay to the 3d ult., and from Hong Kong to the 31st December. The news from China is the most important, comprising two untoward events—the massacre of the crews and passengers of two British vessels in the island of Formosa—and the burning of the English factory at Canton, by the Chinese, in a formidable riot on the 7th December. The massacre at Formosa has naturally excited the most immediate interest. It appears that more than a hundred British subjects, who had been wrecked on the coast of Formosa in the early part of the war, were put to death in August last by the Chinese authorities, who pleaded the order of the Emperor in defence of their proceedings. Sir H. Pottinger became acquainted with the circumstances on his arrival at Amoy, and lost no time in demanding from the Emperor the degradation and punishment of the local officers, and the confiscation of their property for the benefit of the families which have suffered from the effects of this barbarity. This demand was accompanied by a threat of the renewal of hostilities in case it were not complied with. The riot at Canton had for its immediate cause the disorderly conduct of some Lascars, who quarrelled with the Chinese and roused their feelings of exasperation against the English. The mob became so violent that the authorities could not control them; they attacked the factories, pillaged the buildings, and finally destroyed them by fire. Greater excesses would probably have been committed, but they were checked by the timely arrival of Sir Hugh Gough, on his return from Hong Kong to India. The authorities of Canton have disclaimed all participation in these outrages, and have expressed their willingness to pay the damages and severely punish the offenders. It is therefore presumed that the riot, although calculated to keep up anxiety and suspense, is not likely to lead to any serious differences.—The Indian news relates chiefly to the proceedings of the Governor-General, and to the festivities on the arrival of the army from Cabul. Lord Ellenborough had broken up the Camp at Ferozepore and proceeded to Delhi, with a large escort, in order to have some explanations with the Emperor. The affairs of Cabul are involved in some uncertainty; but it is rumoured that Akbar Khan has returned to it with the assistance of the Kuzilbashes, and that the young Sovereign, whom Gen. Pollock left there on the retreat of the troops, had fled for safety to Jellalabad.—Next in interest to this intelligence are the disastrous accounts of the great earthquake in the West Indies. As anticipated in our last, the effects of the catastrophe were felt far beyond the limits which were first assigned to it. In addition to its ravages at St. Thomas and Antigua, we have advices from Guadaloupe, surpassing in disaster all that had previously been reported from the other islands. The town of Pointe-à-Pitre, the commercial capital of the colony, has been destroyed, and what the earthquake spared was consumed by two or three hundred fires, which broke out a few minutes after the houses were levelled to the ground. The earthquake lasted only 70 seconds, and yet in the entire town, which contained nearly 20,000 souls, not ten houses are habitable. 1800 wounded were extracted from the ruins on the day of the calamity, and upwards of 1000 dead bodies were found on the day following; but no accurate idea of the number of the victims had been formed at the date of the last despatches. To complete this melancholy catalogue, subsequent arrivals inform us that the effects of the earthquake extended to Dominica; but we are not at present in possession of any particulars of the disasters it occasioned.

At home, the subject of the Corn-laws has been again under discussion in both Houses of Parliament. It was brought forward in the Lords by the motion of Lord Montague, for a committee to inquire into the effects of the Corn-law passed last Session; but the motion was negatived by a majority of 122. In the Commons it was incidentally introduced in the debate on Mr. Ward's motion for a committee to inquire into the peculiar burdens that press upon land, and into the peculiar exemptions which it enjoys. Sir R. Peel, in opposing the motion, declared his conviction that no further change in the Corn-laws is required by the general interests of the country, and the motion was finally negatived by a majority of 99. We can only briefly

notice the interesting debate in the Lords, on Monday, on the legal questions arising out of M'Naughten's trial, and to the debate in the Commons, on Wednesday, on the privilege question. In the former case, the Judges are to be summoned to a conference on the general law bearing on the treatment of lunatics; and in the latter, the Officers of the House are to be allowed to plead in the action now pending, so that the question will again be submitted to the decision of the Courts of Law.—The concluding report of the Chartist trials which we give this week will be read with interest; the public will be gratified to learn that the prisoners themselves, and Mr. T. Duncombe on their behalf in the House of Commons, have united in bearing testimony to the moderation with which the prosecution was conducted on the part of the Crown, and to the impartial conduct of the Judge who presided at the trials.

Home News.

COURT.—Her Majesty and Prince Albert, the Prince of Wales, and the Princess Royal, remain at Buckingham Palace, and are quite well. During the week Her Majesty and the Prince have honoured the French plays and Covent Garden Theatre with their presence. The Queen has enjoyed her usual daily walk in the Palace Gardens, and took a carriage airing on Wednesday. The Countess of Charlemont has succeeded the Duchess of Norfolk as the Lady in Waiting. Viscount Sydney and Captain Duncombe have succeeded the Earl of Warwick and Captain Hood as the Lord and Groom in Waiting on her Majesty.

Parliamentary Movements.—Sir A. Grant has resigned his seat for Cambridge, on being appointed a Commissioner of the Audit Office. Mr. Fitzroy Kelly has addressed the electors on the Conservative interest, and Mr. Richard Foster has announced himself a candidate on the Liberal interest. The nomination of candidates for the representation of Tavistock took place on Wednesday, when Mr. Trelawney was proposed as the Liberal candidate, and Mr. H. Vincent was brought forward by the Chartists. On Thursday Mr. Trelawney was elected by a majority of 44.

Official Appointments.—Col. Sir W. L. Herries has been appointed chairman of the Commissioners for auditing the public accounts, in the room of Mr. F. S. Larpent, who retires, after having filled the office for many years; and Sir A. C. Grant has been appointed a commissioner in the room of Sir W. L. Herries. It has been stated that Lord Abinger's retirement from the Bench will take place previous to Easter Term; that Sir F. Pollock will be his Lordship's successor; that Sir W. Follett will become Attorney-General, and the Solicitor-General's place will be supplied by Mr. Fitzroy Kelly: but the report is contradicted, on authority, in the *Times* of this morning.

The Navy.—The following are the numbers of all the flag and other officers, petty officers, seamen, and boys of all her Majesty's ships and vessels in commission, and at the Royal dock-yards, on the 1st January, 1843:—Admirals, 2; Vice-Admirals, 4; Rear-Admirals, 7; Commodores, 2; Flag-Lieutenants, 11; Secretaries, 14; Clerks, and retinue of Flag-Officers, 125; Captains, 62; Commanders, 84; Lieutenants, 521; Master of the Fleet, 1; Masters, 121; Chaplains, 54; Inspector of Hospitals and Fleets, 1; Deputies, 2; Surgeons, 141; Purasers, 116; Naval Instructors, 28; Mates, 489; Second Masters, 144; Assistant-Surgeons, 232; Warrant Officers, 755; Engineers, 118; Midshipmen, 555; Masters' Assistants, 224; Volunteers, 330; Clerks, 223; Schoolmasters, 23; and Petty Officers, 6,518. Total officers of all grades, 10,909.—Able and ordinary seamen, landmen, and boys, including Kromen and Chinese coolies, 19,135.—Total for effective naval service on the 1st January last, exclusive of Marines, 30,044. The vote for the year 1842-3 for the number of seamen was 30,500; that taken for the ensuing financial year 1843-4, is 26,500 seamen and 2,000 boys.

The Army.—The following is a return of the number of men voted for the army in each year, from 1835-6 to 1842-3, both inclusive, the number of all ranks serving in Great Britain, including the recruiting troops and companies in the pay of the East India Company; and showing also the number of all ranks serving in India:—

	Great Britain.	India.	Total.
1835-6	81,271	19,720	100,991
1836-7	81,319	19,720	101,039
1837-8	81,311	19,720	101,031
1838-9	89,305	19,722	109,027
1839-40	89,351	20,467	109,818
1840-1	93,471	27,641	121,112
1841-2	92,051	29,070	121,121
1842-3	101,455	30,399	131,854

The number of men of all ranks actually serving on the 5th of April—

	Great Britain.	India.	Total.
1840	94,979	23,434	118,413
1841	94,468	27,330	121,798
1842	97,792	27,359	125,151

Foreign.

FRANCE.—The Paris papers supply us with few topics of political interest. They are almost exclusively filled with details of the calamitous earthquake at Guadaloupe, of which we have given an account under our West Indian news. The Government has appointed a committee under the Presidency of Vice-Admiral Baron Mackau, for the purpose of receiving and forwarding the subscriptions for the relief of the sufferers. A pastoral letter of the Archbishop of Paris was read on Sunday, in all the churches of the capital, ordering that on Sunday the 19th, during high mass, a collection be made through the diocese, for the surviving victims of the disaster. All the theatres are to give benefits in favour of the inhabitants of La Pointe

à Pitre, and subscriptions are to be opened in every company of the National Guard. The Royal Family have already set the example by liberal contributions. The King has subscribed 20,000*fr.*, the Queen 10,000*fr.*, Madame Adelaide 10,000*fr.*, the Duchess of Orleans 10,000*fr.* for herself and the Count de Paris, the Duke and Duchess de Nemours 3,000*fr.*, the Duke de Montpensier 1000*fr.*, and Princess Clementine 1000*fr.*—It appears that the rumour of the conclusion of a commercial treaty between this country and France is premature. On Saturday the Minister for Public Instruction, in reply to a question put to him in the Chamber of Peers, declared, that although Great Britain might, like any other Power, make overtures to France for a treaty of commerce, nothing in that respect was settled, nor did it appear that any such arrangement would be concluded for some time. It is generally believed in Paris, that the differences between France and Spain will be very soon adjusted, through the mediation of the British Cabinet. M. Lesseps will be promoted, and consequently withdrawn from Barcelona; and thus a principal impediment to the long-desired reconciliation will be removed.

SPAIN.—Our accounts from Madrid are of the 6th inst. The elections of that capital were over, and terminated in favour of Ministers. The Ministerial candidates were returned by a majority of from 1,553 to 1,874. The Opposition candidate foremost on the list only counted 505 votes, and none of the other candidates obtained more than 280. The returns hitherto received from the provinces indicated that the Ministry would probably obtain the majority in 24, and the Opposition in 17, colleges. Those of five others were doubtful; but as the greatest number of returns was still to come in, no decided opinion could be given as to the probable result of the elections. In the operations preliminary to the Corunna elections, the Infante Don Francisco de Paulo obtained 486 votes, being one less than his most successful opponent. At Saragossa, his Highness obtained very few votes, and the Opposition prevailed. At Barcelona, where all was quiet on the 6th, the elections for the Cortes had terminated, and are represented as favourable to the Moderado party.

PORTUGAL.—We have Lisbon news to the 6th instant. A very important decision had been taken by the Chamber of Peers, negating the pretensions of the Pope's Inter-nuncio, and pronouncing that the Royal nomination, independently of the Papal confirmation, is sufficient to confer upon bishops the right of sitting in the Upper Chamber. The deputies had taken up the subject of these negotiations warmly, and strongly censured the Government for conceding to the Court of Rome even two out of the eight episcopal nominations, as a clear infringement of the privileges of the Lusitanian Church.—In regard to the tariff question, the speculations at Lisbon are less satisfactory than the statements made in the House of Commons on Tuesday night by Sir R. Peel, who said that the Portuguese Government had made considerable advances towards the views of our Government in the pending treaty, but not to an extent that could be considered as yet satisfactory.—Another month would enable him to say whether or not we were to have a commercial treaty with Portugal.

GERMANY.—The Berlin papers give long accounts of the historical festival given by the King of Prussia on Shrove Tuesday. It was a representation of the Court of Ferrara at the end of the 16th century, and nearly all the guests were in appropriate costumes. The entertainment consisted of a series of *tableaux*, illustrative of the Jerusalem of Tasso; followed by a ball and supper. Some idea may be formed of the brilliancy of the fête from the fact that the celebrated painter Cornelius, Meyerbeer the composer, and the poet Baupach, were employed to superintend the arrangements.—In consequence of the new edict on the censorship, noticed in our last, which orders that the truths of religious belief shall no longer be discussed on philosophical deductions, Professor Markeinecke has been refused permission to print his lecture on the tendency of Hegel's philosophy and theology. The people of Berlin are anxious to see whether this prohibition will be confirmed by the superior board.—It is understood that the marriage of the Prince of Saxe Coburg Gotha with the Princess Clementine of France will be solemnized in May next. The Prince and Princess propose to pass the summer at Coburg, and the winter at Paris. Accounts from Vienna state that the Archduke Charles is dangerously ill.

MALTA.—By the Levant mail, we learn that a melancholy occurrence took place at Valletta on the 6th inst., in the murder of Dr. Martin, the Chief Surgeon of the Malta Naval Hospital. He was shot dead by a sentry of the 88th Regiment, on duty at the Victualling Office, as he was stepping out of the door of Sir John Louis, where he had been on a professional visit. No cause has been assigned for this atrocity, but the authorities are engaged in investigating the circumstances.

TURKEY AND SYRIA.—The Levant mail has brought advices from Constantinople to the 22nd ult. They announce that accounts have been received from Belgrade of the detection of a conspiracy, having for its object the assassination of Prince Alexander and his Ministers. The conspirators have been seized, and, if their confessions are to be believed, they acted at the direct instigation of the Russian Consul; one of them, moreover, having been found with 5,000 ducats in his possession, which he had received as an earnest of his crime. The Government, upon the discovery of the plot, had removed from Belgrade to Cragowitz. The Turkish Government and the Ambassadors have been struck with consternation at this open attempt to bring about a solution of this question, which diplomacy had failed to settle at Constantinople.—Intelligence from Beyrout, of the 8th ult., men-

tions that Bishop Alexander was still there, awaiting the arrival of the imperial firman, authorizing him to proceed with the construction of the Protestant Church at Jerusalem. The schismatical Greeks of Lebanon had petitioned Assad Pasha to be allowed to appoint a chief of their own religion. The Catholic Greeks had refused to acknowledge the Maronite Kaimacan.—An elaborate specimen of English manufacture, intended as a present from Ali Effendi, the Turkish Ambassador, to the Sultan, has just been completed by Mr. Taunton, of Islington, at a cost of 500 guineas. It is an umbrella of the ordinary size, covered with crimson satin, manufactured in Spital-fields expressly for the purpose. The metal of which it is composed is of pure gold. The handle, which opens with a secret spring, contains, in addition to other articles, a gold chronometer, a sun-dial and compass, set with brilliants of the first water.

CHINA.—The news by the Overland Mail comes down to the 3d Feb. It is of the highest importance, and particularly that relating to China. It appears that on the 23d Nov., Sir Henry Pottinger published a proclamation declaring that since his arrival at Amoy he had learned with extreme horror and astonishment that more than 100 British subjects, who had been wrecked in the Nerbuddah and Ann, in Sept., 1841, and March, 1842, on the coast off the Island of Formosa, had been put to death subsequently to the treaty of Nankin, by the Chinese authorities, who pleaded the order of the Emperor in defence of this cruelty. The Nerbuddah had 240 natives of India on board, sailors or camp-followers, all of whom were executed or died, save two. The Ann had 57 souls on board, of whom 14 were Europeans. From this ship but six of the Europeans and five others escaped. Their ill-treatment appears to have been of the most inhuman kind. It seems from a more detailed account, previously issued by Sir H. Pottinger, that, immediately on their reaching shore, the crew of the Ann were seized, "stripped, and marched some distance without a particle of covering, exposed to a cutting north wind. Two men died from cold, and several others dropped from the same cause and fatigue, and were carried on in baskets to the capital (about 90 miles from the spot where the brig was wrecked), where they were separated into small parties, and put into distinct prisons in irons." They were almost starved, and those who did not die under this treatment were, for the most part, beheaded in or about August last. The proclamation concludes by stating that the British Plenipotentiary was resolved to demand from the Emperor the degradation and punishment of the local officers, in consequence of whose false representations these enormities had been committed, and that their property should be confiscated for the benefit and relief of the families which had so severely suffered from the effects of this barbarity. It is also stated that a renewal of hostilities was threatened in case the demand were not complied with. In addition to this, a formidable riot broke out at Canton on the 7th Dec., caused, it is said, by the disorderly conduct of some Lascars, from the ship Fort William, who were allowed to go ashore without any superintending authority. The British factory was attacked, the flag and flagstaff burnt, the doors and windows forced open, and the building pillaged, fired, and consumed. How far the riots might have proceeded it is impossible to say; they were, however, checked by the timely arrival of Sir Hugh Gough in the Proserpine steamer. The merchants at Canton began a correspondence with Sir H. Gough, who remained there until the 14th, and also with Sir H. Pottinger, who was at Hong-Kong, requesting the latter to order a protective force to be sent to Canton, in order that they might carry on their commerce in security. This application received a decided refusal from Sir H. Pottinger, who, in his reply, made some severe comments on the conduct of the merchants; who are said to have created much distrust in the minds of the Chinese authorities by smuggling opium, and other goods, at Whampoa and Canton. The Imperial Commissioners who were to have been at Canton early in December had not arrived, and some doubt was entertained at Macao that the Emperor would break faith. In the meantime, the arrival at Singapore, on the 1st January, of 43 transports, having on board the Sepoy part of the China expedition, proves that the Envoy had not then entertained any serious apprehension of the renewal of hostilities. Several regiments had reached Madras in January. There were, nevertheless, more than 20 British vessels of war, with five steamers, remaining on the Chinese coast. The land force then consisted principally of about 6,000 European troops, most of them living in the garrisons of the still-occupied places. From Hong-Kong we have favourable accounts of the rapid advancement of this, the newest of our colonial possessions. An English weekly newspaper has been regularly published for nearly a year, and the advertisements give a curious insight into the progress and requirements of civilisation in that distant island. Among the announcements are the European comforts of soap, candles, claret, champagne, an hotel, a solicitor, and the sale of "A Manilla horse, an Amoy mare and colt, and an omnibus!" The following advertisement, announcing the progress of a theatre, may amuse our readers:—"Advance Hong-Kong!!!—Theatre Royal. Messrs. Dutronquoy and Co. have at length the satisfaction of announcing to the nobility, gentry, and clergy of this flourishing and opulent colony, that their theatre is advancing most rapidly towards completion. It is on a most splendid scale, and what with the pieces that will be performed, the scenery that will be introduced, and the splendid assemblage of rank, beauty, and fashion which they hope to be honoured with, there is no doubt but that the blaze of splendour will dazzle the eyes of all beholders.—VIVAT REGINA!—N.B. The actresses have

arrived during the last week—their beauties and talents are only to be surpassed by their spotless virtues." Another curious announcement is that a newspaper is about to be published in the Chinese language. "We had hoped, ere this," says the Editor, "to have issued a newspaper in Chinese, but the types, which were very handsomely loaned to us by his Excellency, the Plenipotentiary, have hitherto been, and still are, we believe, employed at Macao in printing some works introductory to the study of the Chinese language." Nearly all the Chinese population, it is said, are able to read, but all classes evince an "extraordinary avidity" to obtain information, provided it be conveyed to them in their own language.

INDIA.—The Indian newspapers are busily discussing Lord Ellenborough's proceedings, and give long accounts of the procession in honour of the gates of Somnauth, the movements of the army of reserve on the Sutlej, and the festivities at Ferozepore. On the arrival of Generals Pollock, Nott, Sale, and M'Caskill (the latter in charge of the Somnauth gates), at Ferozepore, they were met at the end of the bridge of boats by the Governor-General. A salute of nineteen guns was fired as Sir Robert Sale passed the troops, in honour of himself and the "illustrious garrison." On the morning of the 26th December there was a grand review there, at which about 40,000 of the troops were assembled. In the evening the Governor-General gave a ball, for which, it is said, 26,000 seers of sweatmeats were ordered. Shere Singh is about to send valuable presents to the British Sovereign, in token of his friendly disposition. Bundelkund is described as quiet: its tranquillity will be effectually supported by the force of 14,000 troops lately sent thither for the purpose. Lord Ellenborough, who received a visit at Ferozepore from the son and Prime Minister of Shere Singh, and who then sent his secretary and other official persons to Lahore to return it, broke up the camp at Ferozepore on the 5th ult., and proceeded to Delhi, with an escort of 10,000 men, in order to have an explanation respecting certain intrigues with the Emperor. It is stated that his Lordship contemplates fixing his official residence for some time at Agra, or perhaps Meerut. The Courts-Martial held on Colonel Palmer for the surrender of Ghuznee, and on Captains Anderson, Troup, Boyd, Eyre, and Waller, have terminated in the acquittal of those officers from the charges brought against them for their conduct during the last campaign in Afghanistan. The investigation into the conduct of General Shelton and of Major Pottinger was still going forward. Nothing certain appears to have been known of the state of affairs at Cabul, but it was rumoured that Akbar Khan had returned to it, with the assistance of the Kuzilbashes, and that Shah Poor, whom Gen. Pollock left in the Bala-hissar with six guns, had fled to Jellalabad. The financial prospects of India are considered satisfactory, and attention is now directed towards its internal improvement. An act has been proposed in the Legislative Council which tends to put a final stop to all descriptions of slavery in its extensive districts. From Madras we learn that the transport Gertrude, with 200 of the 6th Reg. Madras Native Infantry, from China, had been wrecked about seven miles to the north, but that every soul had safely reached the shore on the evening of the 25th. Much loss was sustained in baggage, accoutrements, and tent equipage. The ship was within 40 yards of the shore, and had five feet water in her hold. It was expected that the surplus stores would be nearly all damaged. We also learn that a second transport from China, the Malikel Babor, had struck on a reef about four miles north of Pulicat flag-staff, but that being teak, and strongly built, she was on the 26th Jan. safe at anchor between two sandbanks in seven fathoms. The troops, about 200 in number, were safely landed.

WEST INDIES.—The anticipation mentioned in our last respecting the probable extent of the dreadful earthquake which visited St. Thomas and Antigua, on the 8th ult., has unhappily been realised by accounts from Guadaloupe. The details of the catastrophe in that island surpass all that can be imagined in horror and disaster. Pointe-à-Pitre, the commercial capital of the island, with a population of at least 20,000, not more than one-third of whom were slaves, has been utterly destroyed; and what the earthquake spared was devoured by a fire, which broke out a few minutes after the houses fell. A great portion of the town was new, built of stone, and, contrary to the old custom, raised to many stories; but enough of the habitations were built of wood to supply fuel to the catastrophe. This took place at half-past ten, on the morning of the 8th. The clock on the front of the church, almost the only piece of wall left standing after the shock, marked the hour at which it stopped. The shock only lasted 70 seconds, but it was sufficient to bury the whole population in the ruins of the town. At the moment of this calamity, to complete the work of death, two or three hundred fires broke out, and consumed all that was wood of the ruins, with the dead and wounded lying among them. 1,800 wounded were extracted from the ruins, and 600 dead. It is stated that 15,000 wander about without shelter or food. The Governor in his official despatch states that all the quarters of the colony have suffered, as well as the dependencies. The town of Moule is destroyed, with the loss of thirty inhabitants. The rural parts have had their share of this dreadful calamity. The little towns of St. François, Ste. Anne, Le Port Louis, L'Anse, Bertrand, and Ste. Rose, have been subverted; there are dead and wounded almost everywhere. The following are extracts from letters in the French papers, written the day after the earthquake:—"Basseterre has suffered but little, and, although a number of houses are uninhabitable, all remain standing, and no person has been injured; but at Pointe-à-Pitre all was overturned, except the wooden houses. Immediately after the shock fires broke out in 200 or 300

places together, and totally consumed the houses. At present the flames are playing over the remains, and in the whole of the town, which contained 16,000 souls, there are not ten houses habitable. No description can give an idea of this disaster. We can scarcely credit what we see before our eyes. I left Basseterre with the Governor yesterday, a few hours after the accident, and came here. We are about to set out for Moule, which has, alas! been destroyed. The number of victims is considerable, but much smaller than could have been expected. Only one soldier has perished. There are under the ruins a number of dead bodies, which are being gradually taken out, and the presence of which causes great uneasiness, on account of the corruption that must speedily take place. The number of wounded is exceedingly great. Women and young girls may be seen with two or three limbs fractured. The scene is a hundred times more horrible than a field of battle. Most of the sugar-mills are destroyed, and the crop of sugar-canes will be lost." A letter of Feb. 10 says, "I have just come from Moule. During the hour that I passed in the ruins I cannot describe what I felt. I could not imagine that the calamity was so great, and all that I could say would give you but a poor idea of the sad reality. From the Quai de la Poissonnerie to the hospital, nothing whatever remains but some shells of houses, which are to be knocked down with cannon. All other earthquakes have been less disastrous than the present one. I was witness of the disasters at Port Royal, and can declare that they were nothing in comparison with this at Point-à-Pitre. Upwards of a thousand dead bodies have been found, but the number of victims cannot yet be ascertained. The colony is ruined, but the fortitude of the creoles is great; no person is borne down by the blow." Another letter of Feb. 11 says, "At Point-à-Pitre the number of the dead is so great, that no interment takes place. They are thrown outside the passes, and the number is unknown. In several places the earth opened, and threw up water and sand." Since the receipt of the above, we learn by the Acadia steamer, that a vessel had arrived at New York, having been off Dominica on the 8th ult., the commander of which reported that the earthquake was also experienced in Dominica on that day, the damage arising from which was evidently very great, and on the south side of the island large volumes of smoke were visible, as issuing from the shore. This is the only account yet received from Dominica; the Actæon, lately arrived, not having visited that colony. Three more vessels, however, have arrived at New York, announcing shocks of the earthquake in the Atlantic. There has been a heavy shower of ashes in Missouri, and a lighter one near Philadelphia city. These are supposed to be the ashes of burnt prairies, or of far-off volcanoes (perhaps in the Andes), brought by the late storms.—An insurrection had broken out in St. Domingo, but had been suppressed. Its object was to make the constitution more republican, after the fashion of that of the United States.

UNITED STATES.—The packet-ship Rochester, which sailed from New York on the 16th ult., and the England, which sailed from the same port on the 20th, arrived at Liverpool on Saturday; and the Acadia steamer from Boston and Halifax, arrived on Tuesday. The accounts brought by the latter vessel come down to the 28th ult. Congress was still in session: Mr. Adams, chairman of the committee of foreign relations, brought up a report from that body in the House of Representatives, in which the rejection of the bill passed by the Senate for taking possession of the Oregon territory was recommended. That the bill would be rejected there existed not the least doubt. The other items of news are the repeal of the Bankrupt Law by Congress, though hope is held out in some quarters that the President will veto it; the fact that no further loan is wanted by the Government, and the increasing popularity of the project to assume the State Debts. A convention of its friends in all parts of the country is to be held early in the summer to concert measures to carry it into effect. The following are said to be authentic statistics of two religious communities in the United States:—Communicants of the Methodist church, 1,008,001; Travelling preachers, 4,244; Local preachers, 7,921; Increase since 1841, 120,123; Roman Catholics in the United States, 1,500,000; Ditto Churches, 574; Ditto in process of construction, 82; Increase in one year, 200,000. Several singular particulars have transpired in relation to a recent earthquake in the valley of the Mississippi. Between St. Louis and the Ohio, portions of the bottom of the Mississippi have literally fallen out, or, at least, sunk to a depth not yet fathomed. On a farm in Illinois, a hole has appeared in the ground filled with steaming mud, from which a sulphurous vapour issues that is easily ignited. Sometimes an inflammable gas, flashing with flame and emitting smoke, also proceeds from it. In several places, patches of the forest near the Mississippi have sunk down and become swampy lakes, in some cases taking hunters down into the abyss. Other and more extensive geological changes are supposed to have occurred near the Rocky Mountains, some of which are evidently volcanic.—The *New York Inquirer* of the 20th Feb. contains a list of bankrupts, occupying six columns, printed in small type, and comprising at the lowest computation 700 defaulters. This is for New York alone, and is said to display, without exception, the most frightful picture of insolvency ever exhibited.—From Canada we learn, that notwithstanding the contradictory accounts last received, the health of Sir Charles Bagot is improving, and hopes are now entertained of his recovery. The following account, dated Feb. 15, has been received at New York from Montreal:—"We understand from Kingston that a most remarkable change for the better had taken place in the health of the Governor-General. On Saturday evening his life was despaired of. On Monday morning, how-

ever, he was seized with a violent fit of vomiting, which relieved him completely—his disease having been an abscess in the stomach, and not dropsy. His Excellency was so much better that fears were no longer entertained for his safety."—Letters had been received from the American consul at Tahiti, one of the Society Islands, dated September 11, which stated that the French admiral, Dupetit Thouars, arrived there on the 8th, and made a demand on the Tahitians of the sum of 10,000 dollars, in reparation for abuses, and as a guarantee for their future adherence to the treaties. A negotiation was commenced, which ended in the surrender of the island to France.

Parliament.

HOUSE OF LORDS.

Monday.—The LORD CHANCELLOR, pursuant to notice, brought forward the circumstances of M'Naughten's trial for the consideration of the House. After a brief reference to the melancholy death of Mr. Drummond, his Lordship remarked, that in consequence of the impunity which had, after a judicial investigation, been conceded to the assassin, the public mind had received an impression that the criminal law of the land required revision, to prevent a repetition of such outrages. He, therefore, took this opportunity of reminding the House of the great difficulty which must ever attend investigations so delicate as those which propose to discover the existence of a latent insanity; and after illustrating this difficulty by many remarkable instances, he proceeded to caution their Lordships against supposing that, even if the verdict in M'Naughten's case should appear to have been given upon faulty or inconclusive evidence, it would therefore be necessary to alter the law upon the subject; and he also combated the opinion that the evidence was insufficient, or that the course pursued by the Lord Chief Justice was any other than what was fully warranted by the cumulative testimony produced. His Lordship read several charges delivered by eminent judges on trials where the plea of insanity had been urged on behalf of the accused. In all these charges the law on the subject was laid down in the same way as it was by Chief Justice Tindal on the late occasion—in all these the jury were directed to consider whether, from all the evidence they had heard, they believed that the prisoner at the very moment in which he committed his crime was conscious that he was acting wrongfully—whether he was at that moment capable of "distinguishing between right and wrong?" In the present case, not only did six medical witnesses on the prisoner's behalf depose to his insanity, but even two whom the Government had deputed to examine into his state of mind, and to scrutinize with minuteness whether his insanity were feigned or no—these two attended in court, and, if called on, would have been prepared to corroborate the testimony of Drs. Munro and Morrison. Was not, then, the learned Chief Justice, when he discovered that the Solicitor-General could advance no countervailing testimony to rebut this cumulative evidence—was he not justified in following the example set by Lord Kenyon in Hatfield's case, and at once bringing the trial to a conclusion? The strong feeling which prevailed at the time might indeed have made it more advisable that the trial should take its usual course; but no one who was present during its progress, or who is acquainted with the general tone of the evidence, could for a moment suppose that this would have made any difference in the verdict. His Lordship then combated the doctrine of the Archbishop of Dublin, who, in laying down the maxim that "the object of punishment is the prevention of crime," states his belief that although a man may be under the influence of an insane delusion at the time he shoots another man, yet that the madman may and ought to be hanged forthwith, because "we punish to prevent others from imitating him." The Archbishop, after stating this position, gives, by way of illustration, the case of a dog habituated to the worrying of sheep, 'who has no moral sense, but who, nevertheless, is punished, for the purpose of correction. Now, he (the Lord Chancellor) would contend that, in order to punish for example's sake, the example ought to be perfect, and that it is no lesson to the guilty to punish an innocent man: it is no warning to a murderer to hang a man who has committed no murder; and as to the illustration, you punish the dog, not as an example to other dogs, but for his own correction; so that the illustration is as inapplicable and extravagant as the theory is incorrect and unfounded. His Lordship concluded by repeating his conviction that, whatever sentiments or opinions the result of this trial had excited, it would be absurd to dream of altering the law, or the manner in which the law is administered; it was possible, indeed, that legislation might, if it could not wholly prevent a recurrence of such evils, at least diminish the frequency of their recurrence. With this view he gave notice that he would shortly introduce a bill on the subject; and, finally, recommended the House to take the united opinions of the Judges upon the general law bearing upon the case.

Lord Brougham complained of the premature conclusion of the trial, and expressed regret that it had not proceeded to its natural and legitimate termination; that every witness had not been called; that the Solicitor-General had not replied; and that the Judge had not summed up the evidence at length. He declared his belief that he had seen a most erroneous report of the trial; for, from the account which he had read, it would appear that the usual rules of evidence had been entirely disregarded, and that questions had been put which were quite improper and unwarranted by practice; for instance, one medical man, who had been in court throughout the trial, was asked what opinion he should form upon the testimony given by the other medical men—a mode of examination by which the duties of a witness were confounded with the functions of a jurymen—and which for that reason was expressly discountenanced by Lord Hardwicke on the trial of Lord Ferrers. In regard to the accountability of insane persons, and the use of the terms "right and wrong," "good and evil," in the charges of the Judges, he said many a man would think it right to shoot another of whom he entertained any suspicious or jealous sentiments. But, surely, this was not the test the Judges intended. What they meant by consciousness of right and wrong, was the consciousness that particular acts were crimes punishable by law. Why then did they not say so? Why should it not be understood at once generally that the consciousness of right meant the consciousness of what was right according to law; and of wrong, of what was punishable by law? If the law was not so—if he had misunderstood the learned Judges—if they meant by right or wrong what any man by the idiosyncrasy of his own nature might deem right or wrong—then he agreed with the Lord Chancellor that it would be best to call the Judges before their Lordships, not only to answer the question what was meant by right and wrong, but to answer five or six other questions. The noble Lord, after stating on his own authority that M'Naughten had been four or five times to Sir R. Peel's house to ascertain his person, that he meant to kill Sir R. Peel, and that he twice appeared to fire at him, said that he differed from persons who, like the Archbishop of Dublin thought that the rationality evinced in these proceedings made him obnoxious to punishment, for that he Lord Brougham should take into his consideration the state of the man's mind at the time he committed the deed; and if at that time the man did not know that the deed was punishable by law, he should conceive this ignorance a test of insanity.

Lords COTTENHAM and CAMPBELL expressed their wish that the law was more authoritatively declared upon the subject, and their satisfaction that the Lord Chancellor had suggested the propriety of calling in the Judges. After denouncing the theories on the subject of "homical propensities" and "homical monomania," with which modern medical books teem, Lord CAMPBELL concluded by suggesting the propriety that persons acquitted on the ground of insanity should be kept out of public

view ever afterwards, to deter others from following their example. After a few words from the Lord CHANCELLOR the discussion terminated; and it was arranged that the Judges should be summoned to a conference.

Tuesday.—The Townsend Peerage Bill was read a first time.—The Earl of ABERDEEN laid on the table the convention entered into between her Majesty and the King of the French for the mutual surrender of fugitives from justice.

Lord MONTAGUE brought forward his motion for a committee to inquire into the effects and consequences of the Corn-law passed last session, and supported it at considerable length in a speech full of statistical details. The distress that existed in the manufacturing districts had, he said, extended to the agricultural classes, and it was necessary to inquire how far that extension was owing to the operation of the Corn Bill of last year. Sufficient time had elapsed since that Act passed to judge of its effects, and there was no danger to be apprehended of disturbing the great interests involved in agriculture, because they were already in a state of uncertainty and insecurity. He was himself ready to condemn the law, though he only asked their Lordships to consent to an inquiry into its working. He would, should the committee be granted, be able to show that the same fluctuation in price had taken place under the present Bill as under the preceding one; and that the effects of the sliding-scale were to increase gambling, and to render this country dangerously dependent on foreigners for its supply of food.

Lord WHARNCLIFFE, though he fully admitted the distresses of the country, could not agree in thinking that an alteration of the Corn Law would relieve them. The question was not whether the present law was perfect, but whether it was not the best under the present circumstances. In his opinion the wise course was to see how the existing law worked, before any proposition for the withdrawal of that protection which agriculture had so long enjoyed should be entertained. His conviction was, that if the present system were continued, none of the evils apprehended from it would occur; and it was important to the safety of the country that their Lordships should exhibit a steadiness of purpose on the subject. With the view of satisfying the country he hoped their Lordships would reject the motion.

The Earl of CLARENDON believed the Corn-law to be the keystone of the commerce of the country. The landowners themselves felt the inconvenience and uncertainty of the present system, and every day the public feeling against the law was growing stronger. The protection which the landed interest fancied they had secured to themselves by the sliding scale had been found to be wholly vain. Under such circumstances, his Lordship could not refuse to concur in the motion for inquiry. A free trade would be the only means of opening foreign markets for our manufactures.—Lord ASHBURTON said he had drawn a very contrary conclusion from the extensive details with which Lord Montague's speech had been crowded, and was convinced that the principal cause of manufacturing distress was the almost entire failure of the American market. No argument had been adduced to show that the distress, which all admitted and which all lamented, had been caused by the state of the Corn-laws; and he warned their Lordships not to attempt an alteration which might spread wider the existing depression, until its connexion with the alleged cause was clearly made out. Corn-laws in some shape or other were in force in every part of Europe, and under their operation our manufacturing prosperity had grown up and the price of food been maintained with fewer fluctuations than in any other country. He combated the opinion that by admitting foreign corn free of duty we should at once obtain a reciprocal advantage for our manufactures in foreign markets, and advocated only a degree of protection which would be a fair compensation to agriculture for the charges which it exclusively sustained.—The Duke of RICHMOND, in answer to a statement by Lord Montague, denied that Lord Grey's Cabinet had ever been divided upon the subject of the Corn laws. He deprecated the disunion which the League had endeavored to introduce among the three great classes of the community, and contended for a protection in favour of the heavily-taxed English farmer against his more fortunate competitor abroad. He highly approved the firmness of Government in maintaining the present law, and was delighted to hear that there was no present intention of a change.—Lord FITZWILLIAM admitted that the present law was an improvement upon its predecessors, inasmuch as it in some degree approximated to a fixed duty. He supported the motion for a committee, and from the constant variation to which the Corn-laws had been subject from their first institutions, and the constant disappointment and distress they had occasioned, drew the conclusion that it would be ever so until the true principles of commercial legislation were acted upon, and all artificial restrictions abolished.

Lord BROUGHAM contrasted the ability and the absence of party feeling with which the question had been brought before their Lordships with the spirit of factious injustice in which the concessions of last session—great in themselves, though, as he thought, insufficient—had been received by the League, and denounced in indignant terms the blind partisan violence which had led them to cavil at the carrying out even of their own principles. He defended himself from the calumnious imputation, that he had offered his services to the League, and explained the real character of the conversation which had been thus misrepresented. He excoriated the more respectable members of the League from a connexion with this falsehood, as well as with the speech of the Dissenting minister who had hinted at assassination, but complained that they did not take pains to sever themselves from the pollution they must contract from such companionship. They had abundant opportunities, and yet the only disclaimer yet published was in a speech full of ribaldry and jest, turning into laughter the counselling to murder, dealing with incitement to assassination as a matter of merriment and jest, and attempting to run down Sir R. Peel, by contrasting him with an illustrious individual, and painting him as winking in that energy and nerve which was possessed by that illustrious individual, although of the other sex, because of the feeling shown by him when reminded of the tragedy which had so lately been enacted. Could any man, he asked, possessed of the feelings of human nature think the worse of his right hon. friend for having felt, and felt most painfully and acutely, and for feeling to the end of his days, anything but horror at the catastrophe, which, since the verdict of the jury, he must now call an unfortunate accident—at the violent death of his private friend and public servant, who lost his life through being mistaken for himself? He hoped in God that he would never be possessed of other feelings than those shown by the right hon. baronet. He could not sleep in peace if he knew that a dear friend had lost his life through being mistaken for him (Lord Brougham); for, although he might be bound, as in this case, to call it an accident, he should feel that he was the innocent cause of the catastrophe. The man who could find fault with the feeling shown by the right hon. baronet, must have a mind callous to all the best feelings of human nature, or else perverted by faction; no other could for a moment doubt of the origin of the feelings by which Sir R. Peel was overpowered. He supported the motion for the appointment of a committee; and after showing by the example of the years in which the continental system was in full operation, and in spite of which there had been an extensive importation, that the apprehensions of those who feared a dependence on the foreigner were unfounded, concluded by explaining, that although an advocate for free trade, he would not oppose the levying of a duty upon foreign produce for the purpose of revenue; he objected only to the principle of protection.

After a few words from Lord St. VINCENT and Lord MONTAGUE in opposition to the motion, Lord MONTAGUE replied, and their Lordships, upon a division, negatived the motion by a majority of 122.

Thursday.—Lord LYNCHURST presented a petition from the Law Institution, complaining of the inconvenience of holding the law courts at Westminster.—Lord BROUGHAM observed that this subject of late had attracted much attention amongst the

members of the legal profession. Although he did not deny some of the inconveniences insisted upon, he still confessed that he had a very strong prejudice in favour of keeping the courts at Westminster-hall, where they had sat for time out of mind. He would remark, also, that there was one great advantage in their remaining where they were, namely, their contiguity to the houses of Parliament.—Lord LANGDALE thought that the subject was one that might very properly be inquired into.—Lord LYNCHURST pointed out the advantage which resulted from the members of the bar being kept constantly in the courts in which they practised, watching the proceedings in cases in which they were not immediately engaged, and gathering experience from all that passed before them. He knew from his own experience that counsel would not attend the courts, except in cases in which they were immediately concerned, if the courts were brought into the vicinity of their own chambers. A proof of this was afforded by the practice of the bar when the court sat at Lincoln's Inn. There were then few counsel in court beyond those engaged in the case actually under hearing—all the rest were occupied in their chambers, whence they could easily be summoned to the court when their services were actually required. He thought that this was a decided disadvantage. He concurred therefore with Lord Brougham in deprecating a removal of the courts of law from Westminster Hall.—Lord CAMPBELL perfectly coincided as to the advantage derived from compelling counsel to attend in court. To the working barrister attendance in court afforded at once a means of increasing his experience and of relaxing his mind from the severe studies and labours of chambers. "All work and no play makes Jack a dull boy." It was highly desirable that the barrister should be drawn from his chambers to the court, where, if he only criticised the judge, or cracked a joke with his fellows at the bar, he was still in a field to add to his practical knowledge and experience, without any severe or irksome labour of the mind. He was, therefore, strongly opposed to the proposition for removing the courts of law. There was a prestige in the very name of Westminster-hall, and he sincerely hoped that nothing would be done to remove the law courts from within the walls of that venerable edifice. Under any circumstances, he should strongly and decidedly object to their being removed to Lincoln's inn-fields. That noble square was one of the lungs of the Metropolis, and was as useful as it was ornamental. He should deprecate any proposition that would cover it with bricks and mortar. If the proposition were to carry the courts to Alsatia, and so to sweep away the impurities of Whitefriars, he should not so strongly object to it; but he hoped never to see the administration of justice removed from Westminster Hall. The petition was then laid upon the table.

Friday.—The Attorneys' and Solicitors' Bill was read a third time and passed.—The Punishment of Death Bill was committed and reported.—The Marquess of LANSDOWNE moved for the production of the correspondence between Sir H. Pottinger and the merchants of Canton, in order to adopt some legislative measures framed to put our intercourse with that country on a proper footing. The Earl of ABERDEEN, while agreeing to the production of the correspondence, thought that it would be unjust to Sir H. Pottinger to proceed to legislation without waiting for his advice and information. As soon as the Government were in a position to legislate on this important subject calmly and advisedly, they would not hesitate in doing so. The motion was agreed to.

HOUSE OF COMMONS.

Saturday.—In consequence of there having been "no House" on Friday, the usual adjournment to Monday could not take place; the House, therefore, met necessarily on Saturday, and sat for two hours. A conversation arose respecting the Ecclesiastical Courts' Bill, which was to have been discussed on the previous evening. After some observations of a desultory character, the second reading was fixed for April 10.

Monday.—Lord STANLEY, in answer to Mr. Mackinnon, said that the Government had not yet received any other than imperfect accounts from Antigua; but he feared that the details in the newspapers, as to the extent of the damage from the earthquake, were not exaggerated. It might hereafter be the duty of the Government to call on the House to aid the colony with a loan, the only shape in which they could afford relief.

On the motion for going into a Committee of Ways and Means, Mr. M. GIBSON adverted to the late Chartist trials, and to the particular evidence of Mr. Wilcox, who had stated that he had been in communication with Sir J. Graham, and wished to know if there were any objections to the production of the correspondence.—Sir J. GRAHAM had received numerous communications from the disturbed districts at the time, but could find no trace, and had no recollection of any correspondence of the nature alluded to.—The ATTORNEY-GENERAL explained the circumstances under which he had been led to propose to release Sir J. GRAHAM from further attendance on the trials, by substituting the evidence of Wilcox, and defended his impartiality in conducting the prosecutions on the part of the Crown.—Mr. T. DUNCOMBE said that he had received many communications, all bearing testimony that the impartial conduct of the Attorney-General, on the trials, had given the highest satisfaction to men of all parties.

Mr. FERRAND revived the subject of a mill being erected in the workhouse of the Halifax union, which Sir J. Graham had described, on the authority of the poor-law commissioners, as a hand corn-mill, but which he affirmed was a rag-mill, in which rags, collected on the Continent, and impregnated with diseases, were to be crushed. There had also been lately put up, in the Lambeth workhouse, another mill, the crank of which was so large, that once in each of its revolutions the persons working it were obliged to bend themselves down to the ground. He now moved for papers and returns of the proceedings of the guardians of the Halifax Union.—Sir J. GRAHAM said, that as he had had no opportunity of inquiring into the suggestion respecting the Lambeth workhouse, he would abstain from any observation upon that point. But as to the Halifax case, he must say that what he had denied, in opposition to Mr. Ferrand, was the existence of a *tread-mill* at the Halifax Union. The mill there was, in fact, as he had stated it to be, a *hand-mill*; and though certainly it was not, as he had supposed, for the grinding of corn, but for the grinding of rags, he apprehended this made no substantial difference. After some further conversation, the gallery was cleared for a division; but Mr. FERRAND withdrew his motion.

The House then went into a Committee of Ways and Means, and a formal vote was taken; after which, on the motion for going into committee on the Registration of Voters Bill, Sir J. GRAHAM, in reply to Mr. LINDSELL, intimated that clauses had been prepared in order to provide against the fraudulent personation of voters, which would be added to the Bill.—Mr. HUME did not anticipate much good from the Bill, unless more ample protection were given to the voters.—The House then went into Committee on the Bill. On the fifth clause a division took place, on an addition moved by Mr. T. DUNCOMBE, that the grounds of objections to voters should be added, instead of the simple words, "objected to;" but this was rejected by 57 to 47.—Mr. TURNELL proposed, that when an overseer objected to a vote, he should be compelled to give notice of the objection to the voter. This amendment was resisted by Sir J. GRAHAM, and rejected by 91 to 38.—At the 11th clause, Mr. ELPHINSTONE objected to the tax-paying clauses of the Reform Act, as being unnecessary to the qualification of a voter; and moved their omission. He considered that the payment of taxes should have nothing to do with the exercise of the franchise.—Sir J. GRAHAM said that, at the time the Reform Bill passed, it was understood that, had it not been for the tax and rate paying qualification, a higher basis for the franchise would have been demanded. The clause under discussion in the present Bill was an amelioration of the existing law. After some discussion, the amendment was rejected by 118 to 58. The amount of the penalty to be inflicted on the raisers of frivolous objections raised considerable debate, the amounts suggested varying from 20s. to 5l.—Colonel SIA-

THORP proposed 3l. instead of 20s., which was resisted by 154 to 84. Having arrived at clause 48, the further progress of the Bill was adjourned, and the other orders were disposed of.

Tuesday.—Mr. WARD, in a speech of considerable length, introduced his motion for a committee to inquire into the peculiar burdens that pressed upon the land, and into the peculiar exemptions enjoyed by it. He could show that the power of the landlords had been systematically applied to the exemption of themselves from taxation, and that a combination existed amongst them dangerous to the other interests of the country.—Mr. G. BANKES moved, as an amendment, that the attention of the House should be directed to certain associations dangerous to the public peace, and inconsistent with the spirit of the constitution; and, in doing so, took occasion to refute the charge which Mr. Cobden had, on a previous evening, made against him, of paying to the men in his neighbourhood the worst paid, worst clothed, and most illiterate people in England. He read several letters, which showed that his labourers received, none lower than 9s., and some as high as 25s. a week, with other advantages, the principal number ranging between these sums. He also showed that the peasantry of his neighbourhood were as well, if not better, with respect to wages, clothes, and education, than those in any other part of the country. In regard to the subjects of his own amendment he said the Anti-Corn-law Leaguers, if they did not actually violate the law, were certainly upon the very verge of it. They raised large sums of money; and he should like to ask Mr. Cobden, who had on the former night put so many questions to him, where that money was lodged? They announced that their income would annually increase; to whom, he begged to know, was the Chancellor of the Exchequer to apply for the Income-tax? The Anti-Corn-law League appeared to be treading in the path of Lord George Gordon's rioters; they announced great meetings; they aimed at public excitement; and by public excitement they expected to work. Returned as he was for his county by the general feeling of the yeomanry and tradesmen, as well as of the richer classes, he did not want the support of Ministers for the purpose of his seat; but he did ask and demand of them to protect him and the other gentlemen of the country from the visits of emissaries deputed by such societies as he had characterized.—Mr. COBDEN explained that he had not spoken particularly of Mr. Bankes, but of the system which he upheld.—Mr. COCHRANE thought the House was indebted to Mr. Bankes for directing its attention to the dangerous and treasonable proceedings of the Anti-Corn-law Association. Such associations had been put down before; and there could be no doubt that the machinery of the League might be applied to insurrectionary purposes.—Mr. GIBSON hoped the House would not suffer an amendment, attacking men's characters, to be withdrawn, without a vote marking their general sense upon it. Much was said of the Anti-Corn-law League; did no Corn-law leagues exist? Had the country gentlemen never countenanced proposals for robbing the public creditor? Such projects were going on even now, and the landed proprietors had admitted the fact by their support of the new Corn-law.

Sir R. PEEL could not vote for the amendment, because it had no immediate connexion with the motion, and because it would be only right to give a negative or affirmative to Mr. Ward's motion. To that motion, also, he could not agree. Mr. GIBSON had most unfairly taunted the landed classes with having admitted themselves, by their support of the new Corn-law, to have been previously defrauding the public. What would Mr. GIBSON have said if the same taunt had been thrown upon the manufacturers in consequence of their declaration, just now made through Mr. GIBSON himself, of their willingness to abolish their own protections? He strongly denied the charge of having ever sneered at the manufacturing interest. "If I had ever indulged in sneers against the manufacturing interests of this country, it would come," he said, "with a bad grace from me, as a Minister of the Crown, and with a particularly bad grace from me as an individual, who owe all I possess to manufactures. I may, in the heat of debate, and in replying to arguments to any one who was wishing to take advantage of such expressions, have rendered myself open to such misconstruction; but the hon. Member does me the grossest injustice if he supposes that I am unmindful of the deep obligation I am under to the manufacturers of this country, or that I would indulge in sneers upon the tall chimneys of the factories, to which I can never forget I owe all of worldly wealth I possess. I remonstrate, therefore, and protest against that misconstruction." Though he should object, he said, to a committee, he should not object to returns on the subject for which such a committee was proposed. It had been alleged that the land was altogether exempt from probate and legacy duty: the law was not so; the land bore a great portion of both these duties: let a return of the amount of these duties, and of the duties on conveyances, be called for, and then the House would see whether the land enjoyed the exemptions alleged in these particulars. So with respect to other taxes, from which the land had been erroneously represented to be exempt. The profits of stock had lately been relieved from poor-rate, and the land had been left to make up the difference; let all this be seen from returns to be printed for the House. It had been said that the highways kept up by the land were necessary for the transport of its own produce; but were not the highways equally useful to those who had no land at all? Then, as to tithe. Tithe fixed by way of commutation was less a burden on land than variable tithe, but both were burdens. Mr. Ward might think they were not; Dr. Adam Smith and Mr. Ricardo thought they were: was the House to appoint a committee for the purpose of settling whether Mr. Ward was right, or Messrs. Smith and Ricardo? Surely this was a proper subject for Members to decide for themselves. He enlarged upon this subject, supporting the opinions of Ricardo and Smith. For his own part, he had never rested the defence of protection on the mere difference of burdens. He had grounded himself in a great measure on the considerations of general benefit, and of the dangers that must arise from a rash destruction of existing interests, so vast in amount as those of, and connected with, the landed classes. He had never applied the general principle of buying cheap and selling dear without this qualification of it. "If the House," he said, "contemplates any further change it would be better to propose that change at once, but I do not think it fair to ask for a committee, and next week vote for the repeal of the law about which that committee is to inquire. I stated last session, as the organ of the Government, that our object was to attempt doing justice by adapting our measures in conformity with the general interests of the country, and that it was impossible to touch the question of admitting foreign cattle and corn without seriously affecting the agricultural body. I believe that the panic caused by the changes then made was much more injurious than the operation of the law itself. If I considered, or could be convinced, that any further alteration in the Corn-laws were now required for the general interests of the country, nothing should induce me to advise a continuance of those laws. But, believing that the agricultural body have a right to expect from me that I will maintain those laws until I am convinced of the necessity of a change;—hon. gentlemen opposite may cheer, but if they imagine that I make any reserve for party purposes they are very much mistaken;—I say again, that if I see from conviction that it is for the interests of the country at large that the present law should be altered—if that alteration were to lose power for me to-morrow, I would not hesitate one moment to adopt such a course, for I hope I have the courage to act always upon conviction which I feel to be right. But I have not now that conviction as to the Corn-laws that any change is necessary; and after the support I have experienced from the agricultural body, I feel that I should be acting with great injustice towards that body if I were to disturb their minds by agreeing to the motion."

Mr. BLACKSTONE congratulated the House and country on the declaration made by Sir R. Peel, of his fixed determination to maintain the present law. That declaration would give universal satisfaction, and put an end to the hopes that existed in some

quarters of being able to tamper with the law. He trusted also, that the threat of importing American corn, at a nominal duty, through Canada, would not be again heard of.—Mr. W. MARTIN, Mr. WOODHOUSE, and other Members spoke against the motion, and it was supported by Mr. WILLIAMS, Mr. M. GIBSON, Mr. VILLIERS, and Lord HOWICK.—On a division, it was rejected by a majority of 99—there being, for the motion, 133; against it, 232.

Wednesday.—Mr. GLADSTONE stated, in reply to a question from Mr. GREGG, that if American salted meat had found its way into our ports under the name of Canadian provisions, it was against the intention of the Government and of the Act. He had not heard of any such importation, and the revenue officers had received strict instructions to prevent it.—Sir J. GRAHAM declared his intention not to discuss the Poor-law Amendment Act before Easter, though he should lay it on the table previous to the recess.—Mr. FRENCH, on the suggestion of Lord ELLIOT, withdrew his Medical Charities Bill.—The Dogs Bill, after a division, in which there were 119 ayes and 35 noes, passed through committee.

The adjourned debate on the question of privilege arising out of Mr. Howard's action was then resumed.—Lord J. RUSSELL rose to move, as an amendment to the proposition of the Solicitor-General, to direct the defendants to plead—that Thomas Barton Howard be summoned to attend at the bar of the House. He believed, that, after the resolution of the 3d May, 1837, declaring the bringing of any action like the present a breach of the privileges of the House, the Solicitor-General should have proposed, not only to plead to the present action, but to go into committee to alter the resolutions that stood on the journals, and propose some other mode of dealing with this sort of actions. The course he should recommend was, to call Mr. Howard to the bar, and to inquire from him whether he proceeded in his action for an excess of the lawful authority of the House by its officer, or whether he disputed the authority of the House itself? Great embarrassment and great peril would depend on the House if they resolved no longer to assert their privileges, but to submit them to the decision of the Courts of Law.—The ATTORNEY-GENERAL was not prepared to abandon the privileges of the House, nor was he willing to go along with those who were the advocates of committal. But, on precedent, and on the ground that it was the course most consistent with the dignity of the House, he was of opinion that the defendants should be directed to plead to the action, and that the cause should be tried in Westminster Hall. By calling the plaintiff to the bar they would be giving him an opportunity to insult the House, and visiting him in the way he most desired. Mr. Howard only wanted a grievance, and to adopt towards him the course proposed by Lord J. Russell would be playing his game and lowering the dignity of the House of Commons.—Sir R. PEEL, though his first inclination was against pleading, said, if they did not plead, the action would proceed, and damages would be given, and they would be driven to the necessity of committing innocent men, the agents of the courts of law; he could not, therefore, avoid coming to the conclusion that the best thing that could be done would be to plead to the present action. But while consenting to plead in this case, he was quite alive to the importance of not in any degree submitting the privileges of the House of Commons to the authority of any court of law. To plead and commit at the same time, as was proposed by Lord J. Russell, would be quite beneath the dignity of the House.—Mr. C. W. WYNN felt convinced that the only way to set the question properly at rest was by legislation, and to that they would be obliged to have recourse at last. Although in favour of committal, he, thought, under the circumstances of the present case, the course recommended by Sir R. Peel the most advisable to adopt.—Sir T. WILKES, while he rejoiced to hear the opinions expressed by Sir Robert Peel, regretted that he had not thought proper to recommend a course of proceeding in concurrence with them. Any unpopularity which might follow the assertion of the privilege of the House could not be admitted as a legitimate reason at any time for not exercising that privilege when circumstances imperatively demanded it. All ancient precedents were in favour of commitment, and in those modern instances in which the House had pleaded they had surrendered their privilege to the Courts of Law. To do so in the present instance would be putting in peril the constitutional authority of the House. They were bound, if not to commit Howard, at least to refuse to plead to his action.—The SOLICITOR-GENERAL could not discover amidst the learning and research exhibited by Sir Thomas Wilde, what practical mode he had suggested for excommunicating the House out of its difficulty. If it were decided not to plead, what would be done with the action? Judgment would go by default, and a Jury would be empanelled to assess the damages; and would the House then call the Jury, or the Under Sheriff, or the Judges to the bar? It was not to be supposed, because in erroneous judgment had been given by the Court of Queen's Bench in the case of Stockdale and Hansard, that, were they again to plead, a similar decision would be pronounced against their privilege. There was no instance prior to 1810 in which the House had imprisoned the Sheriffs or other officers for executing the due process of the law. They had the modern precedents of Burdett v. Abbott, and of Stockdale v. Hansard, in favour of pleading; and, after the maturest consideration of the present case, the same course was that which he felt it his duty to recommend. Should the court of law again decide against the House, he then could see no means of preventing a collision between them, except by some legislative enactment. He should decidedly oppose Lord J. RUSSELL's amendment.—After some remarks by Lord HOWICK, Sir R. INGLIS, and other hon. Members, Lord J. Russell's amendment was rejected by 157 to 84; and the original motion was carried by 135 to 71.—A select committee was appointed, on the motion of Mr. HURT, to inquire into the disabilities of foreigners resident in this country.—Returns connected with the Halifax Union were ordered.

Thursday.—Mr. FERRAND gave notice to move, on the 30th inst., for leave to bring in a bill to compel the allotments of waste lands inclosed to the labouring classes.—Lord LINCOLN gave notice to move, on the 30th inst., for leave to bring in a bill for the better regulation of buildings in this Metropolis.—Colonel SMITH gave notice of a motion, for after Easter, touching the reduction of the duty on fire insurances.—An hon. Member having moved the counting of the House, and 35 Members only having been found present, the House adjourned.

Friday.—Sir J. GRAHAM stated his intention to bring on the second reading of the Education Bill on Friday next. He did not propose to divide that part of it which regarded factory regulations from the educational portion. Both subjects would be comprised in one Bill.—The House went into committee on the Registration of Voters Bill.—The clauses relating to an appellate jurisdiction, viz. from 58 to 75, were postponed. Lord HOWICK moved an amendment to clause 76, to the effect that only one of the joint occupants of land should be entitled to vote, but it was negatived without a division. The remaining clauses and the schedules of the Bill were agreed to. Mr. W. COWPER proposed the addition of a clause limiting the duration of the poll at elections for counties to one day. On a division, the clause was rejected by 143 to 66. Sir J. GRAHAM moved the clauses, of which he had given notice, providing for the detection and punishment of persons guilty of personation at elections; which were ordered to stand part of the Bill.

CITY.

Money Market, Friday.—Consols left off at 96½ to 3 for money, and 96½ to 2 for account; New Three-and-half per Cent. Stock, 102½ to ½; India Bonds, 77s. to 79s. prem.; Exchequer Bills, at 70s. to 72s. prem.

Metropolis and its Vicinity.

More Monomaniaes.—On Tuesday, a middle-aged man, named Edward Colley, a working-ironmonger, from

Browsley, Salop, was brought before the magistrate at Bow-street, charged with being insane, and attempting to obtain, under suspicious circumstances, an entrance into the residence of Sir R. Peel. A policeman said he was on duty in Downing-street, in plain clothes, about one o'clock in the afternoon, when the defendant drove up in a cab to the official residence of Sir R. Peel, and on alighting from it he inquired at the door for Sir Robert, when he was informed by the office-keeper he did not reside there. He then walked along Downing-street, and crossing over to the Duke of Buccleugh's, rang the bell and inquired where Sir R. Peel lived, upon which the porter directed him to the residence of the Right Hon. Baronet, in Whitehall Gardens. He accordingly proceeded to the door, followed by witness and the cabman, and being told by the porter he should make any communication to Sir Robert in writing, he went away and held a short conversation with the cabman, and having then walked away in a strange manner, the policeman went up to him, and told him he was connected with the Government offices, and if he wished to communicate with Sir Robert, he would give him paper or would write a letter for him. To this he made no answer, but his eyes appearing very wild, and witness finding he could not induce him to leave the place, called two other constables to convey him to the station-house, where, on searching him, were found a newspaper, and several letters relating principally to religious subjects. On examination before the magistrate, the man said that he did not want to annoy Sir R. Peel, but thought he might make some suggestions to him. Several witnesses deposed that the prisoner's manner and conduct were often very strange, and that lunacy was hereditary in his family. The magistrate did not think it safe that he should be allowed to go at large, and ordered him to be taken care of by the parish authorities of St. Margaret's, Westminster, where the offence was committed.—On Wednesday, a person of respectable appearance, named George Edward Blythe, was brought before the Lord Mayor in custody of a constable of the Board of Customs, and charged as a person whom it was dangerous to allow to go at large. The solicitor to the Customs stated that the prisoner, who had formerly been employed on the Newfoundland station, as an officer, had been very urgent in his application to have an interview with the commissioners, and acted violently and incoherently. After having remained in the service of the Customs until 1840, he was sent home to England as an insane person, and his leave of absence was continued from time to time till October, 1841, when he was discharged on a gratuity. On his arrival in London, it appeared that he made some noise at the Horse Guards about the Queen, and was conveyed before a magistrate. He subsequently was confined in St. Luke's and at Dr. Warburton's establishment, from which he had been lately discharged as incurable. He had that morning called at the Custom House, and wished to see the commissioners, of whom he spoke in a very incoherent manner. In the course of a long examination by the Lord Mayor, the prisoner was unable to tell the ages of his children, or whether they were boys or girls; and Mr. Phillips, the superintendent of Dr. Warburton's asylum, deposed that he was quite incapable of taking care of himself. He was accordingly sent to the Compter, with the view of making some arrangement for his future provision.

Removal of M'Naughten.—On Monday this prisoner was removed from Newgate to Bethlem Hospital, by order of the Secretary of State. He received with evident satisfaction the intimation that he was about to leave Newgate, and walked with a quick, firm step to the outer prison gate, where a hackney cab was in waiting to receive him. The governor of Newgate alone accompanied the prisoner, and on arriving at the hospital handed him over to the custody of the governor. He was immediately conveyed to that portion of the building appropriated to the reception of criminal lunatics, where an apartment had been prepared for him. The number of criminal lunatics at present confined in Bethlem exceed sixty.

Sir George Cockburn.—This gallant officer has so far recovered from his late serious illness as to be able to attend to public business for several hours every day. On Saturday morning he left his house for the first time since his recovery, and took an airing in the Parks.

Anti-Corn-Law League.—The meetings of the League having been found too large to obtain accommodation at the Crown and Anchor, the meeting last week was held in the great Hall of Freemasons' Tavern, and it was announced that their next weekly meeting would take place in Drury-Lane Theatre. The chairman stated that since their last meeting the council of the League had issued upwards of four or five tons, in weight, of tracts, which were put in circulation in all parts of the country. In accordance with the above intimation, the meeting on Wednesday evening took place in Drury Lane Theatre. In the beginning of the week, the applications for admission were so numerous, that it was found necessary to limit the issue of tickets, and long before the commencement of the proceedings, the theatre was crowded in every part. Mr. Wilson presided, supported by the leading members of the council. The business of the evening was opened by Mr. Ewart, who was followed by Mr. Cobden and Mr. Bright, who addressed the meeting at great length on the prospects and proceedings of the League.

Wood Paving.—On Saturday one of the largest vestry meetings which has occurred for some time took place in Marylebone, to consider a minute with respect to a memorial signed by 150 ratepayers of Baker-street, Oxford-street, York-place, and Portman-square, praying the vestry to lay down wood-paving in lieu of the present macadamized road. This memorial had opposed to it the signatures of 90 job-masters, and 81 omnibus proprietors,

deprecating wood-paving as injurious to horses, and praying the vestry not to carry wood-paving any further. On the previous Saturday, resolutions had been carried by a majority of 19 to 8, "that in order properly to test the principles of wood-paving, as already laid down, the vestry determine not to entertain the subject of paving any of the streets of Marylebone with wood for the space of three years." Mr. Joseph now moved the non-confirmation of the minute. After a long discussion a show of hands was taken, but the chairman declared the number so equal that he was unable to decide. A division was demanded, when there appeared—For the non-confirmation, 30; for the confirmation, 34; majority refusing to entertain the question for three years, 4.

City Improvements.—It is said that all the obstructions between the Mansion-house and the new Royal Exchange will be cleared away within a fortnight or three weeks; and that the late Sir F. Chantrey's equestrian group of the Duke of Wellington, to be erected by the City in gratitude for His Grace's municipal services, will be opened on the 18th June; but some doubt exists in regard to the latter part of this statement.

Metropolitan Improvements.—We have before alluded to the encouragement given by Sir R. Peel to an extensive and systematic plan of metropolitan improvement. In the House of Commons, on Tuesday, the Right Hon. Bart. gave notice of his intention to move, on the 28th inst., for leave to bring in a Bill to facilitate the completion of a survey map of the metropolis, on a large scale. On Tuesday, by direction of the Commissioners of Woods and Forests, several houses in the line of the new street, from Oxford-street to Holborn, to be called Oxford-street East, were sold by auction, and will be immediately pulled down. Rapid progress has been made during the last few weeks, and a great many houses have been disposed of in a similar way. Nearly all the houses on the west side of Plumtree-street, and on the north side of Hyde-street, are levelled with the ground. The street will be in a straight line, about 1,300 feet long, and 50 feet wide. We may mention under this head that the Bishop of London has received from an anonymous donor the sum of 5,000*l.*, to be expended in building a new church in some part of the metropolis.

Improvements of the Thames.—On Saturday four courts of conservancy for the Thames were held before the Lord Mayor and the City officers, for the purpose of receiving presentments from the grand juries of Middlesex, Kent, Surrey, and Essex. Unusual interest has been excited in reference to the presentments, as the Recorder, in his address at the former courts, in addition to the customary objects of their presentments, charged them to inquire into the plan proposed by Mr. Walker, Capt. Bullock, and other engineers, for the improvement of the river, according to a line laid down by those gentlemen. All the juries have, within their several districts, inspected the banks of the river, and examined witnesses in reference to these proposed improvements. At each of the courts the jury made separate presentments as to the general state and condition of the river, and upon the proposed mode of rectifying the existing defects, besides presenting as nuisances several steam-boat piers and other encroachments in different parts of the river within their jurisdiction. They were unanimously in favour of the proposed embankment of the river, and of preserving as far as possible a road, walk, or quay along the banks for the use of the public, and for the purposes of business, health, and recreation.

Kensington.—On Monday a meeting of the ratepayers of the parish of St. Mary Abbots was held in the vestry-room of the old church, "to consider what steps should be taken to procure a dissolution of the Kensington Union by the separation of the parish of Kensington therefrom." The requisition for the meeting was signed by the local magistrates, the clergy, the whole of the parochial officers, and above 100 influential inhabitants of the parish. It was then resolved, "That petitions be presented to each house of Parliament, praying that a clause might be introduced into the New Poor Law Amendment Bill, to enable parishes having a population of more than 2,000 inhabitants to separate from unions whenever a majority of two-thirds of the ratepayers or the guardians of that parish consent to such a separation, and when no union-house has been already built."

Woolwich.—It is announced in the daily papers that the Duke of Wellington will visit Woolwich this day at noon. It was originally anticipated that there would be a review, but it is now said to be probable that his Grace's visit will be for the exclusive purpose of personally witnessing the efficiency of the 7th Dragoon Guards, previous to their departure for the Cape of Good Hope. Preparations are in progress for a *déjeuné* to be given to his Grace in the mess-room of the Royal Artillery.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Mar. 11:—West districts, 155; North districts, 211; Central districts, 196; East districts, 194; South districts, 265. Total, 1021, (518 males, 503 females.) Weekly average for the last five years, 903, (males 461, females 442,) and for the last five winters, 1004.

Provincial News.

Carmarthen.—On Monday "Rebecca and her daughters" appeared at the Plaindealings and Cotts Gates, in the neighbourhood of Narberth. It is said that the party mustered about 100 strong, and in each instance the gates were completely demolished in the space of ten minutes. The Pembrokeshire Grand Jury have found a true bill for felony against Thomas and David Howell, two of the farmers apprehended about a fortnight since on suspicion of being implicated in the recent outrages.

Liverpool.—The loss caused by the late fire at Messrs. Fawcett's foundry has been much underrated. Instead of amounting to only 30,000*l.*, it will, it is said, approach 50,000*l.* Of this aggregate loss, Messrs. Fawcett's forms an item of not less than 18,000*l.*—The adjourned meeting of the borough magistrates on the state of the workhouse was held in the Town-hall on Friday, when a series of resolutions was adopted urging the insufficiency of the building for the accommodation of the inmates, the impossibility of proper classification, the necessity for an increase in the number of paid female officers, and the commencement of the new building.—A shock of an earthquake was felt here yesterday at 1 A. M.; it awoke the people from their sleep, and extended to both banks of the Mersey.

Newcastle-on-Tyne.—On Saturday last a meeting, consisting of several hundreds of pitmen, was held at Scaffold-hill, near Longbenton. The condition of the pitmen of the Tyne and the Wear, which is now very much depressed, was adverted to; and one of the speakers stated that he had been in communication with Lord Ashley, who was ready to support their cause if they would only be true to themselves, and had sent him one of the Commissioners' Reports, containing statements and pictures that must harrow up the feelings of every man of common humanity. Resolutions were passed in favour of a national union of coal-miners for the protection of their interests; of the repeal of the export duty on coal, and of the retention of Lord Ashley's Mines and Collieries Bill unimpaired. Thanks were then voted to the noble Lord for his humane and zealous efforts to improve the condition of the people.

Portsmouth.—The Blenheim, 72, and the Blonde frigate, arrived on Saturday from China. The Blonde had on board 3,000,000 dollars, on account of the Chinese indemnity. She came into harbour for the purpose of landing her treasure, which was forthwith conveyed by railway to the Mint. The Erebus, Terror, and Philomel, were at Port Louis, Falkland Islands, on the 1st December, the two former arrived from Hermit Island, Cape Horn, on the 13th November, having completed the various observations there, where they had been employed for the three preceding months. The officers left at Port Louis, having completed their observations, had broken up the mud cottage establishment, and embarked on board their respective ships. The ships were to sail about the 6th for the Antarctic Ocean; all hands were healthy and sanguine of again making additional discoveries of land, and filling up the space toward the South Pole, having had the pleasure of seeing their "Victoria Land" already published in the map of the world. Capt. Sullivan was about to proceed with the survey of the islands. Lieut.-Governor Moody was laying out the lands in sections and town settlements; two or three of the latter had been sold to families who had been located there for several years previously. He supplied beef at 2½ per lb., very indifferent in quality; no vegetables, milk, or any supplies could be had.

Reading.—Another incendiary fire took place in this county last week, at Cutbush-farm, Shinfield. When first observed, it was found that the stable at one end of the farm-buildings was fired, and at the same time flames were seen at the eastern extremity of the range of buildings, a distance of ninety feet from the stable; proving that an incendiary had set fire to the premises in two places. The horses and cattle, and the stock of beans, were saved from the flames; there was fortunately no other corn on the premises. The fire burnt with such fury, that in about an hour's time the whole of the farm buildings were destroyed, all efforts to stop the progress of the flames being in vain. The value of the property thus destroyed is estimated at about 300*l.*

Shrewsbury.—The will of Lord Hill has just been proved in the Prerogative Court of Canterbury. The effects have been sworn under 30,000*l.* The following curious legacies are bequeathed:—Five guineas per annum to the person who has charge of the column in this town; ten guineas per annum for the purpose of lighting the top of the column at night; and ten guineas per annum to the person who has charge of the light.

Teignmouth.—The religious sect which sprung up a few years since in Devonshire, under the name of the "Plymouth Brethren," have established a branch chapel in this town. Lord Congleton preached in it on Sunday last, and it already numbers a very large congregation.

Railways.—The returns of traffic for the week on the principal lines are as follow:—Northern and Eastern, 1,159*l.*; Greenwich, 684*l.*; Eastern Counties, 832*l.*; Croydon, 204*l.*; Liverpool and Manchester, 3,685*l.*; Brighton, 2,196*l.*; Grand Junction, 7,007*l.*; York and North Midland, 1,359*l.*; Blackwall, 463*l.*; Great North of England, 1,103*l.*; Manchester and Leeds, 4,060*l.*; Midland Counties, 2,076*l.*; Edinburgh and Glasgow, 1,682*l.*; Birmingham and Gloucester, 1,520*l.*; Birmingham and Derby, 1,142*l.*; North Midland, 3,376*l.*; South Western, 4,203*l.*; Great Western, 10,517*l.*; London and Birmingham, 12,969*l.*; South Eastern and Dover, 1,295*l.*; Manchester and Birmingham, 2,253*l.*—The final official inspection of the new portion of the Eastern Counties Railway, from Brentwood to Colchester, was made on the 8th inst. by Major-General Pasley, the Inspector-General of railways, accompanied by the directors and engineer of the line, when General Pasley expressed his unqualified approbation of the excellence and stability of the works. On the following day the first cargo of live stock was transmitted from Colchester to Smithfield, and it is understood that the whole line will be opened for passenger traffic on Monday next.—The half-yearly meeting of the West London Railway Company was held last week. The report stated that in order to resuscitate the undertaking, certain creditors had agreed to take the amount of

their claims in shares, and that preferred shares had been also offered to the original shareholders and the public; a dividend of 10 per cent. being guaranteed on the amount of money paid up. Contracts had been already commenced for carrying on the works from Paddington to Kensington, which are expected to be completed by August next, at a cost of 20,000*l.*, exclusive of stations. It was stated, in the course of the meeting, that the inhabitants of Brompton are very favourable to the line, and that it will eventually be carried on to Knightsbridge. Lord Kensington assured the meeting, that as far as his influence as a landowner was concerned, he would do all in his power to promote the undertaking, and the chairman intimated that no opposition had been met with from any of the influential landowners.—The accounts laid before the shareholders of the Brandling Junction Railway at their general meeting, stated the amount received for the conveyance of passengers during 1842 to have been 19,362*l.*; and the total revenue, 40,737*l.* The expenses of working the line during that period had been 19,419*l.*; general management, 6,207*l.*; the total expenses, 30,537*l.*; leaving a profit of 10,200*l.*; the interest of money raised on debentures, &c., amounting to 11,175*l.*, left the original shareholders deficient by 975*l.* The traffic for 1842, as compared with that of 1841, exhibited a falling off of 4,404*l.*, of which diminution 2,733*l.* was from passengers alone.—The station for the general use of the Manchester and Liverpool and the Manchester and Leeds Companies, at Hunt's Bank, Manchester, will be one of the most extensive buildings of its kind in the kingdom, the Derby one alone excepted. It will be 700 feet long, and 200 feet wide, and covering two statute acres, and the roof will be of wrought iron.—A meeting of the Warwick and Leamington Company, now incorporated with that of the London and Birmingham, was held last week at the Euston-station, when resolutions were passed, confirming the purchase by the Birmingham Railway of the Warwick and Leamington branch, and a bill, now before Parliament, was agreed to, for its more effectual transfer.—The half-yearly meeting of the Croydon Company took place on Thursday the 9th, when a dividend of 4*s.* per share was declared for the profits of toll and traffic for that period. From the discussion which took place on this occasion, no further progress in the dispute between the Greenwich and Croydon Companies, relative to the consolidation of tollage, has been made, although the Board of Trade have interfered with the view to a settlement. It appears from the published correspondence that the Board of Trade were of opinion that the details of the arrangement would be a fair subject for a reference to arbitration, and accordingly recommended the Greenwich Company to accede to the offer made by the Croydon Company, of adopting that mode of settling the differences between them. This recommendation, however, has not been acceded to, and as their Lordships had no means further of enforcing it, they express their regret that their interposition has not proved more successful in effecting an arrangement by which the public inconvenience apprehended from the abandonment of the Croydon traffic might have been obviated.

IRELAND.

Dublin.—The papers give long accounts of the passive resistance shown to the Poor-law in different parts of Ireland. In the county of Waterford it has been necessary for the guardians to obtain the assistance of the Government and the police; but, on their first circuit, they were followed by thousands of persons, and the cattle were carried off by the farmers as soon as they saw the police approaching.—The subscription for the Mathew testimonial advances favourably. Lord Lansdowne has remitted 25*l.* to the fund, Lord Shannon 10*l.*, and Lord Desart 5*l.* A brother of Mr. Mathew is to be superintending agent of the new Roman Catholic emigration colony in North America.

Clonmel.—The three men charged at the late assizes in this city with the murder of Mr. Scully's herdsman have, for the present, escaped the punishment of the law. The evidence for the prosecution was conclusive against the prisoners; their counsel subsequently admitted that his cross-examination of the witnesses had totally failed to shake their direct testimony; the Judge charged directly for a conviction; and yet the Jury, after being locked up the whole night, could not agree to a verdict, and were consequently discharged. The counsel for the Crown stated that he did not wish to attribute intimidation or improper motives, but he had seen so much disinclination in Clonmel with challenged juries to agree to their verdict, that he saw no prospect of any good from their protracted confinement. The prisoners are kept in custody.

Newry.—A Presbyterian clergyman, who had been deprived of his congregation by the Rathfriland Presbytery, has been arrested on suspicion of being implicated in the attempt upon the life of the Rev. Mr. Dickie, noticed in our last.

SCOTLAND.

Edinburgh.—The first division of the Court of Session on Friday, affirmed, by the judgment of a majority of the judges, the interlocutor of the lord ordinary, sustaining the competency of this court to suspend and reduce the sentence of deposition against the Strathbogie ministers, and to give decree to that effect, with expenses. This was the judgment of the Lord President, Lords M'Kenzie, Meadowbank, Medwyn, Murray, Cunninghame, and Wood. The minority consisted of Lords Fullerton, Jeffrey, Moncrief, Cockburn, and Ivory. In the Auchterarder case, the same majority, with the addition of the Lord Justice Clerk, have affirmed the opinion of the lord

ordinary, that the minority of the presbytery is competent to induct Mr. Young, notwithstanding the recusancy of the majority to discharge that duty. The petition and complaint for breaches of interdict at the instance of the Rev. Mr. Edwards, minister of Marnoch, against the minority of the presbytery of Strathbogie and others, was next taken up; and, after hearing counsel, the court unanimously found the respondents had been guilty of the breaches complained of, and granted warrants for calling all the respondents to the bar of the court, in the first *sederunt* day in May next. The complaint of the presbytery of Strathbogie, against certain members of the presbytery, was postponed; and the note of suspension and interdict, at the instance of Dr. Bryce, against the presbytery of Edinburgh and Commission of Assembly, was passed, and the interdict granted.—The Wesleyan ministers of London have presented a petition to the House of Commons on behalf of the Church of Scotland, in which they state that while they fully and entirely recognise and maintain the duty incumbent on Christians, both collectively and individually, to render a cheerful and conscientious obedience to the requirements of the civil power in all matters whatsoever which are purely civil and temporal; they are, however, equally convinced of the duty and importance of a meek but firm and unwavering adherence to another great principle—namely, that it is the right of every Christian church to claim, in matters which are plainly, and in their very nature, ecclesiastical and spiritual, and especially in reference to its sacred functions, an unfettered freedom to act according to those deliberate convictions which it may have been led to form and to embody in its standing rules and discipline, as to what is required in such cases by the laws of Christ, contained in the Holy Scriptures; they therefore entreat the House forthwith to take the case of the church of Scotland into their serious consideration, and adopt such legislative measures as will relieve it from its present embarrassments.

THEATRICALS.

ITALIAN OPERA.—Her Majesty's Theatre opened for the season on Saturday evening. The great stars of the opera do not generally appear till Easter; but this season we already have Madame Persiani in the opera, and Fanny Elssler in the ballet; in other respects, too, the company, in both departments, is stronger than usual at the beginning of the season. The new opera of "Adelia," by Donizetti, was chosen for the opening of the campaign. The performance was chiefly remarkable for the appearance of the new tenor, Signor Conti, who was summoned before the curtain, with Madame Persiani, at the close of the opera, to receive the applauses of a house unusually crowded for the first night of the season. In the ballet of "L'Aurore," which followed, an accident happened to M. Perrot; in the midst of one of his most difficult movements, a sharp noise like the cracking of a whip was heard, and M. Perrot, evidently in great suffering, rushed to the side scenes, holding one of his legs with both hands, and was carried off the stage by the Chorus. It was at first feared that he had broken the tendon Achillis, but it appears from the surgical certificate that some fibres of a minor muscle gave way, and thus caused the sudden incapacity of supporting himself. It is hoped, however, that he will be able to appear again in a few days. This accident was unfortunate in many respects, more especially as a new dancer, Mlle. Dumilatre, made her first appearance in the ballet. She was most favourably received, and justified the admiration bestowed on her by a remarkable combination of physical strength with singular elegance of action. On Tuesday night she was loudly called for at the conclusion, and received those honours of which the mishaps on the night of her *début* had deprived her.

COVENT GARDEN.—Mr. Bunn's benefit, which took place on Monday night, and which was honoured by the presence of her Majesty, was attended by the most crowded audience of the season. The pit, boxes, and gallery were completely thronged before the curtain rose, and at half-price there was scarcely a vacant place in the slips. The revival of "Oberon" had perhaps something to do with this satisfactory state of the theatre, but a far more important cause was to be found in the appearance of Fanny Elssler, for that night only, in the "Maid of Cashmere." The reception she met with far surpassed what has been recorded of her triumphs at New Orleans and the Havannah. During the *pas-de-deux* in the second act, the audience were in complete raptures, and there was one continued clamour from its commencement to its close. On few occasions has such a scene of enthusiasm been witnessed within the walls of this theatre.

Miscellaneous.

The Earthquake at Antigua.—In addition to the newspaper accounts of this catastrophe, published in our last, the following extracts from a despatch, addressed to Lord Stanley, by Sir C. Fitz Roy, the Governor of Antigua, may be interesting to our readers. After stating that the earthquake is "the most awful convulsion ever recorded in the history of this portion of the West Indies," his Excellency proceeds as follows:—"On the 8th inst., without the slightest atmospheric or other indication of the approaching calamity, as nearly as possible at 20 minutes before eleven o'clock in the forenoon, an earthquake of the most terrific kind shook the island to its centre, and in the short space of a few moments converted its fair and pleasing aspect of security and prosperity into one entire scene of destruction and desolation. At least one fourth of the houses in the city of St. John's are levelled with the ground, and the majority of the remainder are irretrieva-

BIRTHS.—On the 13th inst., in Chapel-street, Belgrave-square, the lady of Myrora Baskerville, Esq. M.P., of a son.—On the 16th inst., in Eccleston-street, the lady of Capt. J. W. Montagu, R.N., of a son.—On the 16th inst., in Osnaburg-terrace, the lady of G. Hardv, Esq., of a daughter.—On the 16th inst., at Amsterdam, in the U. inst., the Baroness F. A. A. C. Van Lynden tot Sandenburg, of a son.—On the 16th inst., in Wimpole-street, the lady of T. B. T. H. and, Esq., of a son and heir.

MARRIED.—On the 18th inst., at St. John's, Paddington, A. Magnay, Esq., of the 66th Regiment, to Maryanne Charlotte, second daughter of H. de Bruyn, Esq., of Hyde Park-square.—On the 18th inst., at St. Pancras New Church, Ralph, only son of H. Ashton, Esq., of Liverpool and of Domesday, to Emma Frances, second daughter of F. Waller, Esq., of Donghy street.—On the 8th inst., at Chelsea, T. J. Smith, of the 56th Regiment, to Harriett, youngest daughter of the late J. Hardv, Esq., of Tinsley-street.

DEATHS.—On the 16th inst., at the residence of Mrs. J. W. Lewis, in Dymchurch, at Margate, near Margate, the late Mr. J. W. Lewis, 1st Lieut. of Her Majesty's 66th Regiment, in the 65th year.—In the afternoon, at Chusan, on board her Majesty's transport Thames, on the Canton expedition, James William, eldest son of the late Mr. J. Dyer, of Blackhead, born in the 21st year of his age.—On the 7th Jan., at the residence of J. W. Lewis, Esq., H. T. Normansell, superintendent of the Royal Dockyard, Garden, aged 27.—On the 16th inst., in the Camberwell New-road, the late Mr. J. W. Lewis, 1st Lieut. of the Ordnance-office.—On the 16th inst., at her house, 1, Domesday, Jane, relict of the late Mr. Robinson, in the 70th year of her age.

ELEGANTLY ILLUSTRATED WORKS.

In Imperial 4to, price 25s. half-bound morocco, and 30s. morocco, gilt edges.

THE ROYAL GALLERY of PICTURES;
Being a selection of 32 Pictures from Her Majesty's Private Collection at Buckingham Palace, and Engraved by eminent Artists. With descriptive Letter-press by LINNELL.

Price One Guinea and a Half in cloth, Thirty-eight Shillings plain morocco, and Forty-eight Shillings morocco elegant, both bound by Hayday.

GREECE;

PICTORIAL, DESCRIPTIVE, AND HISTORICAL.

By CHRISTOPHER WORDSWORTH, D.D.

Illustrated by 26 highly-finished Line Engravings on Steel, after Fielding, Creswick, Cox, and Sargent; Two Maps of Greece, and upwards of 350 highly-finished Engravings, drawn on wood by Harvey, Sargent, Meissonier, Paul Huet, Daubigny, Stanley, and Jacques.

INSECTS.

BY J. O. WESTWOOD, ESQ., F.L.S.

In Ten Volumes super-royal 8vo, price 7l. 10s. cloth, and 8l. 8s. half-bound morocco,

THE BRITISH CYCLOPEDIA

OF

THE ARTS, SCIENCES, LITERATURE, GEOGRAPHY,
NATURAL HISTORY, AND BIOGRAPHY.

The division of the Work into Four Sections was adopted as a more natural arrangement of subjects, and for the accommodation of purchasers whose taste or pursuits might render the whole work unnecessary. In its present form, each Division forms a complete Work on branches of knowledge closely and naturally connected together.

FIRST DIVISION—ARTS AND
SCIENCES. 2 vols., price 80s.
cloth.

SECOND DIVISION—LITERA-
TURE, GEOGRAPHY, AND
HISTORY. 3 vols., price 45s.
cloth.

THIRD DIVISION—NATURAL
HISTORY. 3 vols., cloth,
price 45s.

FOURTH DIVISION—BIOGRA-
PHY. 3 vols., cloth, price
30s.

London: Wm. S. ORR & Co., Amen-Corner,
Paternoster-row.

PRACTICAL GARDENING.—Lately published, price 1s. 6d.

THE KITCHEN GARDEN; or, Monthly Calendar of Practical Directions for the Culture of Vegetables; with a catalogue of Fruit Trees adapted for the climate of Ireland. By MARTIN DOYLE. Fourth Edition. Also, lately published, price 2s., **THE FLOWER GARDEN;** or, Monthly Calendar of Practical Directions for the Culture of Flowers. By MARTIN DOYLE. New Edition, enlarged. The two may be had bound together, price 4s. Dublin: W. CURRY, Jun. & Co., 9, Upper Sackville-st. London: LONGMAN & Co., and sold by all Booksellers.

PELARGONIUMS, AURICULAS, CARNATIONS, PICOTEEs, and SELECT PLANTS.

H. GROOM, Clapham-Rise, near London (removed from Walworth), by Appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Public, that his Catalogue of new and fine PELARGONIUMS, &c., is ready, and may be had on application.

ORNAMENTAL WIREWORK FOR THE GARDEN,
390, OXFORD-STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in FANCY WIREWORK, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hothouse Engines, Syringes, Fumigating Bellows, and other Horticultural Implements. **G. B. Thompson's** Improved Waterpots, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

COMPOUND DECOCTION OF SARSAPARILLA.

—Scurvy, Scrofula, Eruptions on the Face, Roughness of the Skin, Chronic Rheumatism, Indigestion, Chronic Liver Affections, General Debility, particularly when caused by excess; the effects of taking Mercury are among the numerous diseases and affections for which this invaluable alterative is almost a specific. To those effected with, or predisposed to, any of the above disorders, a course, spring and autumn, is generally recommended by the Faculty. The preparation of this Decoction is, however, difficult, and its dose somewhat large. All its virtues are possessed in a portable and pleasant form, by the Concentrated Compound Decoction of Sarsaparilla, prepared by BENJ. MOXON and Sons, Chemists, Hull.

Sold in Bottles, at 4s. 6d., 12s., and 22s. (equal to 6, 16, and 32 pints of the Decoction), by all respectable medicine vendors.—London Agents: Barclay & Sons, Sutton, Edwards, Newberry, &c.; York, Dennis and Son; Dublin, at Butler's Medical Hall; Edinburgh, J. and R. Raine; Quebec, J. Musson.

TESSELLATED and MOSAIC PAVEMENT, exe-

cuted by WYATT, PARKER, & Co., Albion Wharf, Holland-street, Surrey, foot of Blackfriars-bridge.—W. P. & Co. invite the Public to INSPECT their SPECIMENS of TESSELLATED and MOSAIC PAVEMENTS, copied from the finest remains of Roman pavement, and also examples from modern designs. For brilliancy of colour, accuracy of form, and uniform hardness of material, these specimens are allowed to excel any of the ancient examples. The material is similar to that of porcelain, and highly vitrified, and the colours are throughout the entire body of the material. Baths and fountains may be lined with the tesserae. It will bear the roughest ordinary usage, and attacks of the most severe frost, without injury, and can be as easily cleaned as a piece of earthenware. The tesserae may be had gilt, or with flowers and other devices painted upon them, for inlaid table-tops or chimney-pieces, or for illuminating monuments. Floors are prepared in slabs, and laid with the same facility as Portland-stone paving.

TO BE SOLD.—The Patent Copyright Design of

HUMPHREY'S FUMIGATOR for destroying insects in Greenhouses, Hothouses, Pits, and Frames, forming a most complete, cheap, and excellent mode of effecting the hitherto tedious process of Fumigation. It is in a compact and portable form of inexpensive materials, and requires no attention. The patent copyright for three years, which has been obtained, will be sold cheaply, and offers a most advantageous opportunity for a small investment to any party who has an opportunity of pushing the invention into public notice.—Apply by letter to Mr. HUMPHREY, 228, Bermondsey-street, Southwark.

BEARD'S PATENT GARDEN BORDERING, so

constructed of Strong Iron Rod as to be light and elegant in form, and being of various patterns in detached pieces, which are easily though firmly fixed in the ground by square wooden plugs, the beds may be varied in form, or the border in pattern, at pleasure. Prices may be obtained, and patterns seen, at CHAS. BEARD'S, Ironmonger, Bury St. Edmunds, or at BOLUS and FOX's wholesale Wirework Manufactory, 59, Skinner-street, Snow-hill, London, where every article of fancy and ornamental wirework may be obtained at the lowest prices.

SHIRLEY VINEYARD, near Southampton.—The

Proprietor of this Establishment respectfully announces that he has now made sufficient progress in it to enable him to commence, forthwith, a series of experiments of a most important character, and on an extensive scale, relative to the Culture of the Vine under Glass; the object of which will be to free that interesting and valuable branch of Horticulture from the difficulties and uncertainty which have hitherto surrounded it, and to place it on such a basis, as to ensure the production of very superior fruit, with ease, certainty, and economy.

In the prosecution of this design, and in that of cultivating the Vine on open land; and also in the propagation of Vine Plants in the nursery department of the Vineyard, he is desirous of having associated with him a few respectable Young Men, as Articled Pupils, who, in addition to being taught the most improved mode of Vine Culture in all its various branches, and (as necessarily involved in it) the Theory and Practice of all the grand Principles on which the delightful Science of Horticulture is based, will also enjoy a great number of valuable EDUCATIONAL ADVANTAGES, of a sterling practical character, and such as, in combination with the above, will enable them, with industrial application, to occupy, at the expiration of their pupilage, a superior and independent rank in society.

To Parents who are desirous of providing for their Sons the knowledge of a superior and profitable pursuit, in preference to their becoming dependent on the precarious issue of mercantile or trading occupations, the opportunity thus offered may be considered as highly deserving of their attention.

As the Pupils will be considered as members of the family, and treated in every respect in the most liberal manner, a suitable Premium will be required.

Applications, personally or by letter, may be made to Mr. CLEMENT HOARE, at the Vineyard.

It is intended to limit the number of Pupils for the present to four, and Mr. H. will be ready to receive them in the ensuing month of March. February 8, 1843.

A GENTLEMAN taking a Lease has a small sum allowed for the erection of a GREENHOUSE, and wants Estimates for the building of it, with flues, stage, sliding-glasses, open fronts, &c. There is no back wall required, as the whole must be attached to the dwelling-house. The situation is Camberwell. No offers exceeding 40l. need be sent; but any proposals within that limit, detailing the extent of the Greenhouse, with the quality of wood, &c., may be directed to B. S., 6, St. Ann's Road, North Brixton.

CUCUMBER and MELON BOXES and LIGHTS.

—For Sale, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two-light Boxes and Lights complete from 1l. 8s. Garden Lights made, glazed, and painted, from 1s. per foot. Sashes and Frames made, glazed, and hung complete, 1s. 8d. per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road. ** Reference given.

ROWLAND'S MACASSAR OIL.—Under the Spe-

cial Patronage of Her Most Gracious Majesty the QUEEN, the Royal Family, and the several Courts of Europe. This Oil is universally acknowledged to be the ONLY ARTICLE that will effectually produce and restore Hair, prevent it from falling off or turning grey, free it from scurf and dandruff, and will render it delightfully soft and flexible. It will also preserve the coiffure in the heated atmosphere of crowded assemblies. CAUTION.—Much pernicious trash is now offered for sale as "MACASSAR OIL;" it is therefore of great importance to purchasers to see that the words "ROWLAND'S MACASSAR OIL" are engraven on the wrapper. All others are "GROSS IMITATIONS." The Proprietor's Signature is also engraven on the wrapper, thus:—A. ROWLAND & SON, 20, HATTON GARDEN, LONDON; Countersigned "ALEX. ROWLAND." Price 3s. 6d.—7s. Family Bottles (equal to four small), 10s. 6d., and double that size 21s. per bottle. Ask for "Rowland's Macassar Oil." Sold by them and by Chemists and Perfumers.

FOUNTAINS, VASES, TAZZAS, FIGURES, &c.

In Marble, Artificial Stone, and Parker's Cement, to be seen at WYATT, PARKER & Co.'s WHARF, Holland-street, Surrey, foot of Blackfriars-bridge. Also, a large collection of Chimney Shafts, Pedestals, Capitals, Consoles, Trusses, &c.

STONE-COLOURED CEMENT.—FELIX AUSTIN, of

the New Road, Regent's Park, begs to inform Architects, Builders, Plasterers, &c., that during the process of manufacturing a very superior Composition, which has greatly improved his well-known artificial stone ornaments, he has succeeded in making an excellent STONE-COLOURED CEMENT adapted to all building purposes, which he can supply at 2s. 6d. per bushel, at his Manufactory, near the Thames Tunnel, Rotherhithe. It is particularly suited for repairing decayed stonework.

PLANT FOREMAN WANTED.

WANTED, in the EXETER NURSERY, a FOREMAN of the PLANT DEPARTMENT. He must thoroughly understand the management of Plants of all descriptions, and be in every respect a FIRST-RATE CULTIVATOR, as an extensive and very valuable collection of Exotics and Florists' Flowers will be placed under his care. A liberal salary will be given, and none need apply who cannot produce the most unexceptionable testimonials of their experience, abilities, and moral character. He need not possess any knowledge of Propagation, as that department is kept quite distinct.—Apply to LUCOMBE, PINCE, & Co., Exeter Nursery.

WANTED IMMEDIATELY, a Young Man, of active

and persevering habits, as PROPAGATOR in the Plant department. Apply to MARNOCK & MANLEY, Nurserymen, Hackney, stating terms, age, and other particulars. Personal application not attended to.

WANTED, in a quiet Family in the country, a respectable steady Youth, who can wait at table, clean plate, and make himself generally useful. He must be able to mow, and understand the management of the garden.—Apply personally or by letter to A. Z., 4, Carthusian-st., Aldersgate-st.

WANT PLACES.—All Letters to be post-paid.

AS LAND-STEWARD and GARDENER, or in either of the above Capacities, a Single Man, who has had extensive experience in rural affairs, and is well acquainted with the most recent improvements in Agriculture. Can give the most unexceptionable references as to character and ability to Noblemen of the first rank, whom he has served, and also to eminent practical men. Letters addressed to F. K., at Mr. FORRESTER'S Nursery, Kensington, London, will meet with prompt attention.

AS UNDER-GARDENER.—A young Man, who understands his business, and wishes to place himself under a Head-Gardener of experience. Can have a good character from his last employer, and has been brought up in the garden from his infancy.—Direct to R. R., at Mr. ROBERTSON'S, Gardener, Ember Court, Thames Ditton, Surrey.

AS GARDENER.—A married Man, aged 33. Has, by experience, a practical knowledge of the most recent improvements in the management of Hothouse, Conservatory, &c., Flower and Kitchen-gardens, &c. Can offer a four years' unexceptionable character.—Address, WM. JAMES, at Mr. Jeffery's, Tooting Grove, Tooting, Surrey.

AS GARDENER, an Active Young Man of most respectable character, 30 years of age, who perfectly understands his business, and would prove an acquisition to any one in want of such a person. His Wife could, if required, take charge of a Laundry, being in every way qualified for such a situation. Address J. M., at Mr. RICHARD POTFIELD'S, Chertsey, Surrey.

AS GARDENER, a respectable Young Man, aged 31. Has a practical knowledge of Gardening in its various departments, and can be well recommended as to capability, &c., from his present employer, with whom he has lived six years. Address H. M. R., Mr. WARNER'S, Garforth, Leeds, Yorkshire.

AS GARDENER, a Single Man, aged 26, who has a thorough knowledge of Plant Growing, Forcing in all its Branches, Kitchen Garden and Pleasure Ground. Can have an excellent Character from his last Situation. Other references can be given as to Ability and Character. Has no objection to any part of England. Address A. Z., Mr. PAWLEY, Horticultural Grounds, Bromley, Kent.

AS UNDER GARDENER, in a Gentleman's Family, or Single-handed, by a Respectable, Steady, and Industrious Young Man, 26 years of age, who can have upwards of seven years' character from one of the head nurseries in London, which he is about to leave. No objection to town or country. Address A. B., 15, Sussex-street, University College.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Piedmont of Whitechapel, in the City of London, and Published by them at the OFFICE, 2, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed, to the Editor.—Saturday, March 18, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 12—1843.

SATURDAY, MARCH 25.

Price 6d.

Hay, musty, to render palatable	175 a	Woodlice, to destroy . . .	177 b

WARNER AND WARNER, SEEDSMEN, No. 28, Cornhill, London, beg respectfully to return their best thanks to their friends for the liberal patronage bestowed upon them for many years past, and at the same time to contradict a report which has been circulated of their intention of retiring from business.

W. & W. most respectfully make it known to their friends that they have no such intention. Having made a change of some of the hands they had engaged for many years, their situations are filled up with men of general and practical abilities, and they trust they will ever give satisfaction to those who kindly favour them with their support.

W. & W. have the pleasure to annex a few articles, which have been selected with much care and attention.

Alstroemeria aurea . . .	s. d. 1 0	with superb pink flow- ers from the beginning of July to the end of October . . .	s. d. 0 6

True Walcheren White Broccoli 1s. per packet. To be sown in April and June; this new Variety surpasses all others in flavour. With many other varieties too numerous for insertion.—See General Catalogue.

NEW AND SUPERB FUCHSIAS.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Catalogue and Prices of the above elegant tube, inserted in the advertising page of last week's Paper. Also to the description of their "FUCHSIA ST. CLARE," which is already ordered for the Royal Gardens at Claremont.—Great Yarmouth Nursery, Norfolk, Mar. 9, 1843.

NEW HORTICULTURAL AND AGRICULTURAL SEED ESTABLISHMENT, 6, LEADENHALL-STREET (SIX DOORS FROM CORNHILL).

WILLIAM HURST AND WILLIAM GEORGE

M'MULLEN, (for many years past engaged in the House of Messrs. WARNER and WARNER, 28, Cornhill,) beg respectfully to acquaint their friends in the Seed trade, and the Public generally, that they commenced Business as Wholesale and Retail SEEDSMEN and FLORISTS, at the above-named premises, on Monday the 13th inst., and they can confidently assure all who may kindly favour them with orders, that, from the numerous resources they possess, through an extensive connexion with the best Seed-Growers, both in this country and on the Continent, and from many years' practical experience in the various branches of the Business, they are enabled to offer every article of first-rate, genuine quality, and no exertion will be spared in giving prompt attention to every order, and endeavouring to merit a continuance of their support.

N.B.—To prevent any person from supposing the Report which Messrs. Warner in their Advertisement of last week thought fit to contradict (of their being about to retire from Business) was in any degree referable to the Hands which they inform the Public they have lately changed, the parties who thought proper to leave Messrs. Warner's Establishment on the 10th of March beg distinctly to state that until their attention was called to it in Messrs. W. and W.'s Advertisement, they never heard of such a report in any shape whatever.

HURST & M'MULLEN, Seedsmen and Florists, 6, Leadenhall-street, City, beg to offer to the Nobility, Gentry, and Public generally, a choice and carefully-selected assortment of the most approved Kitchen, Garden, Agricultural, and Flower Seeds, of which general Catalogues may be had on application. Among the novelties of the season will be found the following:—

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, Nurseryman, Ramsgate, Kent,

having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undernamed low prices—including the follow-
ing Fuchsias:—*Conspicua arborea* (Catleugh's), *Venus victrix*, (Cripps'), *rosea alba*, *Money-penny*, *compacta*, *racemiflora*, &c. Also the following distinct Verbenas:—*Queen*, *Aurora*, *Stewartii*, *variegata*, *Mortlock's Superb*, *Burleyana*, &c. &c. Fuchsias, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents. Fuchsias for Bedding or borders at 3s. 6d. per dozen, post-paid, or 4s. in pots.

W. M. obtained a Prize of 10l., open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

PANSIES.

J. FRYER begs to remind his Patrons that he is now able to supply very superior, strong, healthy plants in pots of most of the leading varieties of PANSIES, from 1s. to 2s. 6d. each; or a collection of fine named sorts, from 1 doz. to 100 varieties, from 9s. to 12s. per dozen, if left to J. F.'s selection—in which case any sorts not required should be specified by parties ordering. J. F. can likewise supply, at 5s. each, a few strong plants of his beautiful seedling Pansy "Empress"—Dr. Lindley's highly-favourable opinion of which is quoted by J. F. in his advertisement in the *Gardeners' Chronicle* of Oct. 25, 1842. Pansy seed, from first-rate sorts, at 1s., 2s. 6d., and 5s. per packet.

A few packets of fine Tulip seed, selected from a named collection, Verbenas seed (from best varieties), fine Thunbergia, Petunia, &c., at 1s. each. Also a general collection of genuine Flower and Vegetable Seeds, in packets, assorted for the convenience of Customers, Catalogues of which, and of Pansies, may be had on application, inclosing a postage-stamp.

All the new varieties of Fuchsias, Verbenas, &c., at moderate prices.—N.B. A respectable Youth wanted as an Apprentice.

Clarendon Nursery, Camberwell, March 24, 1843.

SUPERB CARNATION AND PICOTEES.

YOUELL & CO. will send, free of postage, to any part of the United Kingdom, on the receipt of a Post-office order for 15s., a pair of that SUPERB ROSE-FLAKED CARNATION, WILSON'S HARRIET; also a pair of that highly-valuable Red Picotee, "JOAN OF ARC," both of which ought to be grown by every Amateur who intends competing for Prizes at the Horticultural Shows of the ensuing season.

Great Yarmouth Nursery, March 16, 1843.

WILLIAM CATLEUGH'S List of first-rate PELARGONIUMS, raised by E. FOSTER, Esq., the Rev. R. GARTH, and other Amateur Raisers, is now ready. CALCEOLARIAS, raised by Messrs. BARNES and GREEN, will be let out in a Collection of 12, for 6l. Good unnamed Varieties that have flowered, at 18s. per dozen.

Collections of the above, if left to the selection of F. and A. S. and Co., from 6s. to 12s. per dozen. A Catalogue of Dahlias is now ready, and may be had on application.

THOMAS ASH begs to inform **PELARGONIUM** GROWERS, that he intends sending out his two splendid SEEDLINGS, "Prince Albert," a beautiful flesh-colour, and dark Spot, fine Trusser, large Bloom, fine Form, and good Habit; and his "Conqueror of the World," deep Pink, very dark Spot, free Bloomer, and good Habit. Plants now ready, one guinea each. Usual allowance to the Trade. Orders addressed to T.A., 3, Charlotte-place, Upper Grange Road, Bermondsey.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON, and TODD'S
LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842:—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—*From the Gardeners' Chronicle and Gazette.*

Also obtained the following prizes:—No. of Blooms Exhibited.
1st prize at Hull, Aug. 30th 12
1st prize at Beverley, Sept. 7th 2
Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th 4
1st prize at Leeds, Sept. 21st 12
1st prize at Newcastle, Sept. 21st 6
1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th 6
1st prize at the York Floral and Horticultural Society, Sept. 28th 18
1st prize at the York Floricultural Society, Oct. 1st 12
1st prize in its class as the best white or bluish, ditto.
Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft. Plants, 10s. 6d.

All orders addressed J. EDWARDS, Layerthorpe, Florist, Nursery and Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

N. GAINES, FLORIST, SURREY-LANE, BATTERSEA, begs to inform the Nobility, Gentry, and others, that his STOCK of PELARGONIUMS now ready for sending out are strong healthy plants. The following are a few of his Seedlings, which have been proved, and can be recommended, viz.:—

PELARGONIUMS.		GAINES'S	LADY DUNCANNO	42s
GAINES'S Duchess of Suther-		land		
"	63s	"	Royal Adelaide	42s
"	63s	"	Prince of Wales	42s
"	63s	"	Countess Eldon	42s
"	63s	"	Princess Royal	42s
"	42s	"	Conspicuum	42s
"	42s	"	Emperor Superb	42s

DAHLIAS.		GAINES'S	LADY DUNCANNO	42s

"	7 6	"		
"	10 6	"		
"	7 6	"		
"	10 6	"		
"	7 6	"		

Catalogues of Pelargoniums, Dahlias, Pansies, Calceolarias, Verbenas, Fuchsias, &c., may be obtained by applying as above. Feb. 2, 1843.

SPLENDID LISIANTHUS RUSSELLIANUS.

JAMES CUTHILL, FLORIST, Denmark Hill, Cam-berwell, begs to inform the public that he has strong healthy, and very bushy Plants of the LISIANTHUS RUSSELLIANUS, much finer than he has ever had them, from 2s. 6d. to 10s. a plant. Also, the best bearing Black and White Spine Cucumber Seed, with various sorts of Melons, Scarlet Phlox Drummond, New Spotted Digitalis, at 2s. 6d. each packet. The Seeds sent postage free upon the receipt of an order on the post-office, Camberwell-green.

VERBENAS.

J. HALLY, Nurseryman and Florist, Blackheath, Kent, begs to offer the following New VERBENAS:—"Rosy Queen," a large-flowering, very bright rose-coloured variety, with round truss of flowers, and fine shrubby habit. "Roseo alba," a beautiful rosy pink, with white centre, carrying a large flat truss. HALLY'S "Lilacina," a bright lilac, with very large flower and compact truss. The above are all of fine bushy habits, and very free bloomers, and are now ready to send out in Autumnal plants at 3s. 6d. (or 42 penny postage stamps) each. The three Varieties 10s. Fine healthy Plants of Rosa Devonensis, from 30s. to 42s. per dozen. The "Monarch" Camellia, from 10s. 6d. to 42s. each. "Marchioness of Exeter," do. from 21s. to 63s. The usual allowance to the Trade.

DAHLIAS.

JOHN KEYNES, FLORIST, Salisbury, most respectfully begs to thank his Friends for their support last season in ordering "Dodd's Prince of Wales," and "Twynford's Perfection," and to assure them that it shall be his study to offer nothing but FIRST-RATE SHOW FLOWERS. In announcing varieties for May, 1843, he hopes to merit their continued approbation and confidence.

LIST OF DAHLIAS, 1843.

Favourite (Dodd's)—clear white, edged with pink; the finest of its class: full centre; great depth of cupped petals; large and circular; not to be surpassed for form, and is safely warranted as a grand show-flower; most distinct. Plants in May	s. d.
Colonel Baker (Dodd's)—dark claret; fine show-flower; most certain; very deep; cupped; rising centre; finest form; new colour; quite distinct from any other. Warranted. Plants in May	10 6
Violet Perfection (Keynes)—deep purple, with most vivid light violet shade in the centre of each petal; fine form; shape and growth of Metella. The shading of this flower is so prominent as to make it indispensable as a first-rate show-flower. Warranted. Plants in May	10 6
Paul Pry (Brown's)—light ruby; fine show-flower; perfect shape; not new in colour, but superior in its class. Plants in May	10 6
Virgil (Moutjoy's)—dark maroon; first rate	10 6
Surprise (Oakley's)—purple, distinctly tipped with white; finest of its class	10 6
Confidence (Cook's)—orange buff; first rate; best of its colour	10 6
Great Mogul (Atwell's)—dark red	10 6
Asmodeus (Wheeler's) very dark	10 6
Queen of the Isles (Low's)—white, edged with crimson; beautiful colours; quite distinct; first-rate form	10 6
Hero of Stonehenge (Whale's)—dark crimson; first-rate	10 6
Swindon Rival (Compton's)—dark rose; decidedly first-rate	10 6
Prince of Wales (Dodd's)—finest yellow	3 6
Mrs. Shelly (Mitchell's)—fine dark peach	5 0
Competitor (Hodges)—light rose; extra fine; first-rate	5 0
Prince of Wales (Girling's)—shaded purple; fine	3 6
Princess Royal (Hudson's)—light buff, tipped with purple	3 6
Bedford Surprise (Shepherd's)—shaded rose; extra fine	3 6
Admiral Stopford (Trenfield's)—very dark; first-rate	3 6
Twynford Perfection—shaded rose; first-rate form	3 6
Horace (Moutjoy's)—dark	2 6
Prince Albert (Adams)—orange buff	2 6
Marquess of Lansdowne (Brown's)—buff	2 6
Sir F. Johnstone—purple	2 6
America (Drummond's)—shaded purple	2 6
Lady Alice Peel (Jackson's)—light rose	2 6
Rose Unique (Ansell's)	2 6
Westbury Rival (Hall's)—purple	2 6
Northern Beauty (Robinson's)—light edged pink	2 6
Candidate (Silverlock's)—dark purple	2 6
Lady Anne Murray (Catleugh's)—light mottled	2 6
Gipsy Maid (Girling's)—very dark	2 6
Duke of Cornwall (Low's)—rose	2 6

The following first-rate Varieties, 12s. per dozen:—

Fanny Keynes (Keynes)	Maria (Wheeler's)
Scarlet Defiance (Cozens)	Metella (Brown's)
Argo (Widnall's)	Nicholas Nickleby (Cormack's)
Andrew Hofer (Holmes)	President of the West (Whale's)
Beauty of the Plain (Spary's)	Pickwick (Cormack's)
Optima (Thurteill's)	Phenomenon (Whale's)
Lady Dowager Cooper (Jack-	Satirist (Headland's)
son's)	Rouge et Noir (Ansell's)
Burnham Hero (Church's)	Triumph (Milliez)
Euclid (Ward's)	Springfield Purple (Gaines's)
Conservative (Low's)	Climax (Jeffrey's)
Tournament (Catleugh's)	Queen (Widnall's)
Eclipse (Ditto)	Eclipse (Ditto)
Tournament (Union)	Majestic (Ditto)
Admirable (Spary's)	Duchess of Richmond (Fowler's)
Indispensable (Girling's)	Egyptian King (Wilmer's)
Bridesmaid (Brown's)	Grace Darling (Dodd's)
Lady Middleton (Jeffrey's)	Ne plus Ultra (Widnall's)
Le Grand Bedouin (Low's)	Rival Sussex (Standford's)
Maid of Bath (Davis's)	Springfield Rival (Inwood's)
Hope (Neville's)	Unique (Ansell's)

CARNATIONS, PICOTEEs, AURICULAS, &c.

MESSRS. DICKSON, Nurserymen and Florists, Acce-Lane, Brixton, respectfully solicit the early attention of Amateurs and the Trade to their extensive and choice collection, which comprises all the best show flowers of the day. Gentlemen wishing to compete for prizes at public exhibitions will find this a most desirable opportunity of making their selection. The plants are in fine healthy condition, and warranted true to their kinds. Messrs. DICKSON also have a few more pairs of that splendid red Picotee, BARRAUD'S CORNELIUS, to dispose of; it is a beautiful and distinct variety, and as a show-flower, is unrivalled in its class. Catalogues may be had on application to Messrs. DICKSON, or Messrs. WARNER & WARNER, Seedsman, &c., Cornhill, London.

FUCHSIA EPSHII.

W.M. PAWLEY, of the White Hart Hotel, Bromley, Kent, having purchased the entire stock of this magnificent FUCHSIA, which is pronounced by the most competent Judges to be the best Grower, the largest Flowerer, and for fineness of Habit and richness of Colour not to be surpassed by any Fuchsia yet in cultivation. A specimen of it may be seen in Bloom at the above Hotel, by the end of this month, when Plants may be had at 10s. 6d. each, and sent free to any part, upon the receipt of a Post-office order. The usual discount where half-a-dozen Plants are taken. The Stock is limited.

TO THE PUBLIC.

THE FASTOLFF RASPBERRY.—YOUELL & Co. beg leave to inform their friends that they have not appointed any person as Agent for the sale of the above in London, and therefore will not guarantee the genuine variety unless purchased from their Nursery.—Great Yarmouth, Mar. 17, 1843.

PELARGONIUMS, AURICULAS, CARNATIONS, PICOTEEs, and SELECT PLANTS.

H. GROOM, Clapham-Rise, near London (removed from Walworth), by Appointment Florist to her Majesty, begs to inform the Nobility, Gentry, and Public, that his Catalogue of new and fine PELARGONIUMS, &c., is ready, and may be had on application.

CHOICE STOVE, ORCHIDACEOUS, GREENHOUSE, AND HERBACEOUS PLANTS, SHRUBS, TREES, &c.

T. JACKSON'S PRICED CATALOGUE for 1843 may be obtained on application by Post, by forwarding two penny postage-stamps to T. JACKSON, Nurseryman, Kingston, Surrey; or, on personal application, gratis. Kingston Nursery, March 23, 1843.

CORSTEN, Florist to HER MAJESTY and His Royal Highness PRINCE ALBERT, 19 A, Davies-street, Berkeley-square, has just imported from Holland fine trees of the following description: New Orange Apricot, 5s. each; Double Montanque Peach, 5s. do.; Pear and Apple Trees, from 4s. to 5s. each; New Dutch Cherry Currant, 6s. per doz.; Fine Rhododendrons, with numerous bloom-buds, 1s. 6d. to 3s. each; Splendid Orange-Trees, with fruit, from 10s. to 2l. each; Dutch Potatoes, 4lb. for 1s.

TO PINE-GROWERS.

TO BE SOLD, a Great Bargain, about SIX HUNDRED FRUITING and SUCCESSION PINE PLANTS, (clean and healthy,) in small or large quantities. For particulars, apply on the premises, S. ROSLINE'S, Rye Common, Peckham, near London.

WILLIAM LYNN, NURSERYMAN, SEEDSMAN, and FLORIST, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a GARDEN TOOL WAREHOUSE, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. W. L. begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit-Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which, he trusts, with industry, punctuality, and attention, will secure to him general patronage.

W. L. solicits particular attention to his new PEAS, LYNN'S DWARF WRINKLED MARROW, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn Pea ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, inclosing a postage-stamp.

TO GENTLEMEN, FLORISTS, and OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition at the Auction Mart, Bartholomew-lane, on TUESDAY, MARCH 28, and THURSDAY 30th, 1843, at Twelve o'clock each day; a Fine Collection of CARNATIONS, PICOTEEs, PINKS, AMERICAN PLANTS, ROSES, DAHLIAS, HEARTSEASE, FUCHSIAS, VERBENAS, &c. May be viewed on the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

MR. JOHN KING begs to give notice that he is instructed to sell by Public Auction, on the 27th and following days of March, 1843, the property of the late Mr. CURTIS, Nurseryman, Balham-hill, Surrey, on the premises, at 10 o'clock each day, the LEASE, 22 years unexpired, all the Erections of Green and Hothouses, Pits, Frames, and all the Plants, Camellias, Ericas, Pelargoniums, &c., Auriculas, Primulas, Herbaceous plants, Bulbs, Shrubs, Standard and Dwarf Apples, Pears, Plums, Cherries, Gooseberries, Currants, &c. Also the Horse, Carts, Ploughs, Harrows, and Implements; the Erection of a Stable, Sheds, &c. May be viewed until the Sale. Catalogues had of Mr. GIBBS, Seedsman, Piccadilly; of Mr. LARK, Seedsman, Bishopsgate-street; and of the Auctioneer, Hackney-road.

ECONOMIC LIFE ASSURANCE SOCIETY

No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV. LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The Bonus declared in 1834 amounted upon an average to 16l. per cent. on the premiums then paid; and in 1839 a second Bonus was awarded, amounting on the average to 31l. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned. Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

ENGLISH AND SCOTTISH LAW LIFE ASSURANCE AND LOAN ASSOCIATION.

Offices, 147, Strand, London; and 119, Princess-street, Edinburgh.—Subscribed Capital, 1,000,000l.

This Association embraces every description of risk contingent upon Life. A Liberal system of Loan. An extensive legal connexion, and a direction and proprietary composed of all classes. A union of the English and Scotch systems of Assurance. For tables of Rates of Assurance, Annuities, and Endowments, or any other information, apply at the Offices, or to the Agents of the Association. J. S. PIDGEON, Actuary.

PENN'S SYSTEM OF HOTHOUSE BUILDING

WARMING, and VENTILATING.—The superiority of the principle first introduced by JNO. PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the Nobility, Horticulturists, and the Public generally, that having, in conjunction with the inventor, devoted much time and study to perfect the same in the construction of Conservatories, Stoves, Greenhouses, Pits, and other Horticultural Erections, and to heat them with IMPROVED HOT-WATER APPARATUS, to ensure ANY DEGREE OF TEMPERATURE, earnestly solicits their inspection of the working of this system at the inventor's residence, Lewisham.

The peculiar advantages in Houses erected upon, or altered to, this principle, are—Free and rapid Circulation, Equality of Temperature, and safe and agreeable access, at all times, to the most delicate constitutions.

Churches, Chapels, Manufactories, or other large Public Buildings and Dwelling-houses, warmed and ventilated. The Heating Apparatus, which is of the very best description, combining Durability and Simplicity with Economy in the Consumption of Fuel, is manufactured by and fixed under the superintendence of JNO. PENN, Esq., Engineer.

Reference is permitted to JNO. WILLIAMS, Esq., Isleworth, and numerous other Gentlemen, who are practically acquainted with the merits of W. HILL'S mode of applying Mr. PENN'S principle.

Designs, and every information, may be obtained on application to W. HILL, Builder and Surveyor, Lewisham.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS at the GARDEN for the year 1843. These will take place on the following days, viz., Saturday, May 13; Saturday, June 17; Wednesday, July 12. The Garden will be opened, on each day, at one o'clock, under the following regulations:—All Fellows of the Society will be admitted without tickets, from one till six o'clock, on signing their names in a book at the entrance. Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society. N.B. The presentation of the visiting card of a Fellow of the Society cannot be regarded as an authority to receive tickets. All Fellows who shall apply on or before Tuesday, the 18th of April, may obtain at the rate of *Three Shillings and Sixpence* each any number of tickets not exceeding *Twenty-four*; but no applications for such tickets will be received after that day. It would be a great convenience to the Society, if the Fellows would take their tickets personally, and not by written orders; or, in the event of their not so taking them, if they would at once order the whole number which they may require for the season. After the 18th of April any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket. Each ticket will be available for the admission of one Visitor, after one o'clock, to either of the three Exhibitions, at the option of the Visitor. All applications for tickets must be made at the Society's Office, 21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, MARCH 25, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Mar. 28 Zoological 8½ P.M.

Monday, April 3 Entomological 8 P.M.

Tuesday, April 4 Horticultural 8 P.M.

Wednesday, April 5 Innean 8 P.M.

Friday, April 7 Horticultural 7 P.M.

Saturday, April 8 Geological 8½ P.M.

Saturday, April 8 Botanical 8 P.M.

Saturday, April 8 Royal Botanic 3½ P.M.

HAVING, as we believe, disposed of the introductory matter of our correspondent "Observer's" letter on the one-shift system of potting, let us proceed to consider his details.

"When a plant is removed from a smaller to a larger pot, its roots, finding no impediment, strike through the new layer of soil in a nearly horizontal direction, until their further progress is impeded by coming in contact with the inside of the pot; should the plant, at this stage, not soon be supplied with a larger pot, the roots for the most part will take a downward direction until they reach the bottom of the pot—still, however, keeping near to its sides, and not often pushing into the centre of the ball of earth."

No doubt. "Thus situated," says our correspondent, "the plant is almost entirely dependent on the occasional waterings which it receives for its supply of nourishment. But if a larger pot has been supplied in time, that is to say, before the roots have become matted round the inside of the pot, the plant suffers no inconvenience; but should it have stood too long in its pot, the principal roots will have descended to the bottom, and there will be inextricably intertwined with each other, and the plant will be a long time before it recovers and acquires a vigorous growth—indeed it generally happens that it remains stunted and sickly for the rest of its life. The principal roots having been destroyed or rendered nearly useless, the plant, when it emits new ones, generally produces mere fibres, and though they may be more numerous, yet they cannot convey that volume of sap to the stem which the larger roots would have done. The principal roots may be considered the grand arteries which convey the sap to the stem, and the fibres as indispensable auxiliaries, which, with their thousand mouths, run in every direction, sucking in all fluids which present themselves, and conveying them to the principal roots, whence they are passed into the stem. There can be no doubt of the reciprocity of action between the roots and branches; but the root does not cease to elongate on reaching the side of the pot; but possibly, for a time at least, it receives as much nourishment in its downward movement as it would have done had it continued its horizontal direction. But, as I have just pointed out, if the principal roots are permitted to continue this downward direction, from which, alas! they rise no more, the growth of the plant is arrested, and it will not easily recover."

To all this we have nothing of importance to object; in fact, as far as it goes, it is in favour of the proposed system of not shifting. We fear, however, our agreement with "Observer" has almost arrived at its termination.

"Now," says he, "with regard to the 'one-shift system,' it is evident that when a young plant is transferred from a small to a very large pot, its roots meeting with no obstruction, proceed directly to the sides of the pot, and thence to the bottom; some solitary ones may possibly re-penetrate the ball of earth, but it will, in a great measure, after the leading roots have passed through it, be but of little service to the plant."

Here we find as many errors as sentences. It does not seem to us at all evident, that when a plant in a small pot is transferred to a very large one, the young roots will gallop off to the extreme limit of their new boundary. No such growth ever takes place; and we trust to convince "Observer" of his mistake, by pushing his argument a little further. Sup-

posing the large pot to be ten yards wide, does he imagine that the little plant, turned out of the little pot, will send its little roots fifteen feet in every direction, commanding them to grow as fast as they can till they reach the sides of the huge pot, and then only to stop? Such a result could scarcely occur, unless there was some powerful attraction between the roots of a plant and the pot it grows in; and we presume "Observer" will hardly contend for that.

Well, then, if no such event as "Observer" describes would occur in such a pot as we describe, it is sufficiently evident that there must be a limit somewhere to the horizontal spreading of the roots; and upon this fact the whole argument may be said to hinge. We conceive that the reason why the roots of a plant always direct themselves to the sides of a small pot are these: in the first place, all plants spread their roots, or some of them, horizontally, in search of food, and in order to gain room to branch; if they turn down when they touch the sides of the pot, it is because it is easier for them to do so than to double back. But if the pot were not small, they would not reach the sides of the pot, consequently they would not turn down; but, on the contrary, they would burrow among the mass of earth in which they are placed. The leading roots will not pass through it, but they will throw off laterals in all directions, and profit immediately by the fertilising ingredients with which they may come in contact; and there will be this inestimable advantage in addition, that the young and tender roots, instead of finding themselves in contact with a substance sometimes hot and sometimes cold, dry one hour and soaked with moisture the next, will be immersed in a medium of uniform temperature and moisture, or at least not subject to violent changes.

The extent of these changes Gardeners are hardly aware of: a few years ago we took the trouble to ascertain them, and we found in a conservatory, in the months of May and June, that the temperature of the soil in a small flower-pot was as low as 40° at one period of the day, and as high as 90° at another period.

"Observer," indeed, admits the importance of the principal roots making laterals: "The principal roots," he says, "ought to be encouraged to make fibres by all possible means, and this they will very readily do if they receive a slight check every time that they reach the sides of the pot: this may be done without allowing the roots to become matted. It is true that the leading roots of most plants put forth lateral fibres in their progress, when they are not checked; but they are much more liable to do so when a temporary stop is put to their elongation, or their direction is changed from horizontal to perpendicular."

Nothing can be more true than that slight checks are favourable to the ramification of roots; nothing can be more untrue than that the sides of the pot, and the obstacle they present to onward progress, are essential to this result—quite the contrary; mechanical obstacles in the earth, a little difference in humidity, will produce the same effect, to say nothing of that natural tendency which nature has given roots to ramify, in order that they may change their pasture and visit new sources of supply. The natural branching of roots in the absence of all mechanical interference is plainly shown in those cases where roots are formed in water or in wet air. In fact, the power of ramification inherent in roots is one of the most beautiful instances of design that we meet with in so fertile a field as that of vegetation, for it effectually compensates for their want of the power of moving from place to place. This is so very obvious and well-known a fact, that we cannot but wonder at our correspondent adding such a sentence as the following:

"In the common method of potting, this advantage at least is gained, that the roots, being checked, throw out an abundance of fibres, and these valuable auxiliaries ramifying in all directions through the ball of earth, extract all the nourishment it may contain, and thus make the most of the small space allotted them. For this reason I think that the common method of shifting from size to size is likely to prove in the end more efficacious than the 'one-shift system.'"

Surely no gardener can be ignorant that the production of a large quantity of fibres in the centre of balls of earth in small pots is precisely what does not happen; and if it did, of what use would it be? In the centre of the ball of a flower-pot little moisture penetrates, and that circumstance alone is an effectual bar to the production of roots in the direction of the centre, even if it were not prevented by the rapid consumption of the organisable matter contained in it by the first roots that get there when it is still open.

Passing from these considerations, "Observer" proceeds to another series of objections to the one-shift system, more valid, and requiring a separate consideration, which they shall have next week.

MR. PUSEY on Wednesday week brought into Parliament his Bill for facilitating the Drainage of Land, and Lord Lincoln, on behalf of the Government, did

the same with the Sewerage of Towns Bill. We have therefore to express our hope that the two objects to be effected by those bills will receive the most considerate attention of our Agricultural Members, and that their care will be extended to future profit as well as to immediate benefit. They must not forget that it is more difficult to cure an evil than to prevent one; and that whether or not the two measures are combined, they may severally be made conducive, by scientific administration, to incalculable advantage to the country—the drainage of land by a profitable distribution of the drain-water, and the sewerage of towns by a preservation of the refuse for manure to the land. We must refer our readers back to our former articles on this subject, when we canvassed Mr. Denton's suggestions, for an elucidation of our views.

THE increase of the population in the rural districts of the country, and the consequent superabundance of labourers, has given rise to many schemes by which the wants of the unemployed might be supplied. Emigration naturally suggests an immediate relief, and acts as bleeding does in case of too great fulness of blood in the human body. But if the blood be the life of man, the people is the strength of a nation; and it is only in very peculiar cases that the diminution of either is conducive to the general health. Useful and profitable employment not only feeds the population, but converts labour into wealth; and if we can at the same time save the food which is uselessly consumed by the idle, and add to the general wealth by increased production, we confer a double benefit on society. The great point is to find out the best means of doing so; for by attending only to the immediate evil to be remedied, without considering the more remote consequences, we may act like an unskilful physician, who removes the symptoms of a disease without radically curing the patient.

We shall devote a few short papers to the consideration of this important question, examining the various schemes which have been suggested, and their immediate and more remote consequences; and, without presuming to decide dogmatically, we shall suggest what appears to us, on the whole, the most useful and practical means of giving additional employment to our Agricultural labourers.

The most obvious mode of relieving those who are in want of employment is to set them to work, at fair, but moderate wages, without any expectation of deriving profit from their labour, if not with a certainty of loss. As a temporary relief, this is no doubt highly praiseworthy, and is the most rational way in which charity can be bestowed. By judicious management, a very small sum, comparatively, will do much more good than a much larger distributed gratuitously. By setting men to do the work which otherwise would have been done by horses and machinery, we give useful employment and feed the poor; but if this is done at a loss, it cannot be expected that the example will be generally followed, and the difference between the value of the work and the cost of it, is a loss to the community. In particular cases of distress it may be advisable, and is, at all events, a commendable charity, to give employment to the idle at any loss; not only to relieve want, but also to keep up the moral character of the people, which nothing tends more to corrupt than great indigence and idleness, unless it be excessive riches. But, as a general scheme of useful labour, which shall give increased employment to an increasing number of labourers, something must be devised to make the labour profitable to those who employ their capital to this purpose. Manufactures generally originate in a surplus of labour, beyond what is required to feed the nation; but when manufactures have increased beyond the demand for the commodities manufactured, and a manufacturing population has started up fully sufficient for its own purposes, there must soon be a surplus of Agricultural labourers, and means must be found for their profitable employment; the subdivision of land certainly gives much additional employment, because the occupier of a small portion cannot make use of those improved implements by which labour is lessened, much less erect expensive machinery to supersede manual labour. But, in a national point of view, the great subdivision of land tends to general poverty; and it is not a doubtful principle in political economy, that the less the cost of production the greater the increase of wealth to the nation. This cost, however, is not to be reckoned in the money-payments to labourers, but in the food and other necessities consumed by them. The example of France, where landed property is subdivided by the law to the greatest possible extent, practically shows that this does not diminish individual poverty, while its tendency is confessedly to impoverish the nation. Ireland, where occupations are small beyond credibility, owes its poverty chiefly to this source. A family can exist on the produce of an acre, or less, of potatoes; but this acre cannot afford profitable employment for

all its members, and the consequence is much unprofitable idleness.

These examples show that small occupations, although they prevent absolute dependence on charity, do not ameliorate the condition of the labourers, unless they have other means of occupying their time usefully.

The small farms of Western Flanders may be adduced as a refutation of our conclusion. We are well acquainted with the beautiful garden culture of that district, especially of the Waes country. Nothing can exceed the industry of the inhabitants, their sobriety, their assiduity, and their knowledge of what their soil will produce. But they are not to be held out as patterns for the imitation of the English labourer. Their habits are so different, their ideas of comfort so wide of each other, that we can scarcely hope to see the occupier of from six to ten acres of a moderate sandy soil in England bestow so much labour upon his farm, or reap such a produce. (For the particulars, we must refer to the "Outlines of Flemish Husbandry," published by the Society for the Diffusion of Useful Knowledge.)

The next remedy, and one which has generally been attended with good effect, is the allotment system, where labourers have a small portion of land let to them, which they cultivate at their leisure hours, and where their wives and children find a useful and interesting employment, while the labourer is doing his usual work for his employer. This excellent plan tends much to the individual comfort of the industrious labourer, and to his moral improvement, and that of his family. It induces him to spend his evenings in summer in cultivating his allotment, when he might be tempted to join his more idle companions at the beer-shop. His children, instead of running about in idleness, take a pleasure in working in a garden, the fruits of which they know they will partake of; for moderate labour is a pleasure to the youthful frame, as much as it is a toil to old sinews or weakened nerves. We cannot too much approve of those who, without any loss to themselves, give to their labourers a small spot of ground near their cottages to cultivate, at a full fair rent, including all other burdens, such as rates, tithes, &c., for these small demands annoy the labourer more than his annual rent. There is no fear that the allotment shall not be attended to, if proper regulations are made. In all the cases where allotments have been let to labourers, we have scarcely heard of an instance where the rent was not regularly paid; and we know of many cases, which we could quote, where a labourer who had no allotment has advanced the rent due by a defaulter as a premium to obtain the allotment. But an essential condition in the holding of all allotments should be, that in no case shall the occupier cease to be a regular farm-labourer, or leave the farmer's work, except for a few days now and then, and with his master's especial consent; and that he may not have the temptation of becoming an Irish cottar, and living on his allotment, this should never exceed half an acre; in general, a quarter of an acre is sufficient. With respect to the management of the land, we would never fetter the occupier with any set mode of cultivation; he will soon find out what is most profitable in the end. A pig will be essential, and he will soon have one. He will find it more profitable to spend the straw in litter to make manure, than to sell it; and while many a great farmer is doubting whether it may be worth his while to make a tank to receive the drainings of his yard and of his stables, the labourer, on the slightest hint given him, has an old tub sunk into the ground, to hold all the refuse liquid of his cottage and his pig-stye. In this respect we have always found intelligent labourers much readier to adopt new practices, which accord with their own observations, than their employers. This may be accounted for by the simple reflection, that they do at once, and without much trouble, what the farmer or proprietor must have first planned, and then executed at a considerable expense.

A WEEK or two since, a correspondent sent us some inquiries concerning the death of his gold-fish (p. 138). As this is a subject in which a great many others are interested, we have obtained from a friend thoroughly acquainted with the habits of fish the following memorandum, which we trust will be found useful to many besides *Agricola*:-

"The death of the gold-fish referred to at p. 138 appears to have been occasioned by the hard artificial bottom of the pond and the want of sufficient soil upon it, in which the fish would have completely imbedded themselves, and would then have been secured against the usual low temperature of our winter months. Water has a higher power of conducting heat than mud, and the more animal heat abstracted from the fish at such a cold season by a good conductor, the more likely they would be to suffer. The Trench, and the four or five species of Carp known, of which the Gold-fish is one, all of them elude, as it is called, or go to mud, if they can, during

the winter months. If the fish are not seen at this period, it may be inferred that they have imbedded themselves, and are safe; but when one or more are seen roving about the water, it may be assumed that they have not found mud sufficiently soft and deep in which to lay themselves up. To afford them this security, in a pond with a paved bottom there should be a trench of 3 or 4 feet wide, and 12 or 18 inches deep, carried throughout the whole length, or the greater part of the length, of the pond, where it is deepest; the sides shelving towards the centre of the pond is perhaps the best form that can be adopted. In this trench some soft soil should be placed, and more allowed to accumulate till it is as high or higher than the general level of the bottom along the upper edge of the sides of the trench. In this soft soil the roots of the water-plants may be placed, and the Carp will imbed themselves in this mud during winter.

"The young fish are injured before the older ones, because, possessing less vital power, they are less able to resist the depressing effect of low temperature. The green moss-like substance that appeared on the back of the diseased fish proves the death of the part beneath. Until decomposition commence, animal substance affords no support to vegetable growth."

FAMILIAR BOTANY.—No. XIII.

The Fall of the Leaf. No. 2.—There are those who doubt whether the cause of the fall of the leaf can really be that which was formerly (p. 724, 1842) assigned to it, namely, because its texture becomes "furred" with a sediment deposited within its organic cavities. The observations upon hardening, at p. 100, were intended as a reply to these objections, but as they have not proved satisfactory to some minds, a few additional statements seem desirable.

That the interior of plants is hardened by the slow deposit in their interstices of sedimentary matter, partly organic and partly derived from mineral substances, is too well known to admit of any argument. It is therefore to be presumed that the objections taken to the fall of the leaf being caused by the same circumstance, are made upon the supposition that that organ forms an exception to the rule. It is, however, somewhat singular that a difficulty should be found in admitting the existence of sediment introduced into the leaves from foreign substances, when it is considered that they are the great seat of change in the nature of the fluids which plants absorb. Leaves are to the economy of the vegetable what the saucepans and kettles are to that of a kitchen, the places where evaporation, and combination, and all the other processes of change, from one substance into another, go on. What wonder, then, that the result of such processes should be so similar in both cases, and that the little cells of a leaf should be furred over, even as the larger cells of a kitchen?

However, the fact of a large sediment taking place in leaves, independently of the charcoal that is formed there, and which helps the fixation of foreign matters, is a matter of evidence, not of theory, and capable of demonstration by other means than the microscope. Now, too, is a good time to examine it. Let any one take the old yellowish leaves of the common Laurel and burn them, he will find a large quantity of ashes, which are the sediment in question. Then burn in like manner the leaves, still green and healthy, which were formed late last year; the quantity of ashes will be found much smaller, the sediment is less. Then burn the young and tender leaves as soon as they can be unrolled, and they will hardly present a trace of ashes or sediment; nothing is there to obstruct the free action of their internal organs.

This kind of evidence seems conclusive; and is universal in all leaves. The leaves of the Oak contain from $4\frac{1}{2}$ to $5\frac{1}{2}$ per cent. of ashes, the Sweet Bay 2 per cent., the Beech 3 per cent., the Birch 5 per cent., the Elm nearly 12 per cent., and the Parsnep nearly 16 per cent., according to the testimony of chemists who have analysed them.—*R. E.*

THE DICEIOUS CHARACTER OF THE STRAWBERRY.

SEVERAL of the late Numbers of "Hovey's Magazine of Horticulture," an American monthly publication, contain interesting statements relative to the diceious character of many kinds of Strawberries. That some plants of the Hautbois Strawberry abound in male flowers, while other plants of the same kind produce blossoms containing the female organs only, has long been ascertained in this country, and means have been taken to render them productive by planting runners of the different sexes together. We are not aware, however, that the fact of the American species frequently producing imperfect flowers has yet engaged the attention of English cultivators.

To such an extent has this defect been observed in America, that one writer states his plants of Keen's Seedling to be so destitute of male flowers, that an acre of them, unless mixed with runners bearing male blossoms, would not produce a perfect fruit. The same has been observed, but to a less extent, on Wilmot's Superb, and on Downton Strawberries. The same writer adds, "There is no Strawberry which produces abundantly and large fruit when the male and female organs are perfect and in the same blossom. In some varieties only, it amounts to a complete separation of the sexes; in others, those abounding in the female organs never produce perfect fruit. Those which abound in the male

organs sometimes bear a fair crop, and where a few fruit only are perfected, they are often of a large size. In raising plants from seed, both kinds are produced, but if suffered to run together, as the male runner is more vigorous, it will make 10 plants where the female forms one, and will soon root out all the bearing runners."

Another singular circumstance connected with the above is, that the wild Strawberry of America which usually abounds in male flowers, has not, when planted in parallel beds with the cultivated kinds, been found efficient in fertilising the female blossoms of the latter. Is this to be attributed to any effect produced by cultivation upon the organs of the garden varieties, or to the flowers of the wild Strawberry not expanding until the others are too far gone to be influenced by them? The latter seems to be the most probable inference.

The failure of Strawberries when forced early is a complaint of frequent occurrence, technically called by gardeners "running blind," and usually ascribed to want of sun and air. Is it not probable that this failure may be occasioned by the partial absence of one or other of the sexual organs, and by there being no bees to fertilize the flowers, as occurs when they expand in the open air? Now that the season is arrived, however, when this important point may be ascertained, it is as well to call the attention of gardeners to the subject; so that it may be determined whether their want of success proceeds from the imperfect character of the flowers, or from the weakness of the plants themselves.

We have, in the open air also, occasionally observed whole beds of apparently healthy Strawberries, which have been anything but productive, and want of moisture or poverty of soil have each been assigned as the cause of their unfruitfulness. It might, perhaps, be found, upon examination, that beds of this description were composed of plants in which the flowers of one sex greatly preponderated. In this case, advantage would be derived by planting beds of various kinds in proximity with each other; leaving sufficient space between each to prevent the runners from becoming mixed. Some sorts might abound in male, others in female flowers; and they would thus be rendered beneficial to each other.—*R. A.*

ENTOMOLOGY.—No. XLII.

Bruchus granarius, the Grain Bruchus of Linnaeus.—These Beetles were so intimately connected with the Moths alluded to in our last communication, in the destruction of the Beans, and they so frequently injure the Pea and Bean crops in our fields, and destroy them after being housed, that their history is well deserving the attention of the cultivator. On examining a sample of Beans which was sent from Essex, after having remained in the sacks for twelve months, I found holes in most of them; some were small (fig. 1), and on removing the horny husk or skin, a dead *Bruchus* was invariably lying in the cavity, which was only just large enough to contain it; other Beans had much larger holes in them (fig. 5); from these protruded a sort of web, covered with little feculent pellets, and inside was an excavation sufficiently large to contain the cocoon and pupa of "the white-shouldered woollen Moth."

About 160 species have been described by the family Bruchidae, from various parts of the world, and many which have been discovered in tropical climates are handsomely marked, and inhabit a variety of leguminous seeds, some of which have shells as smooth and hard as marbles. Our *B. granarius* is often found in gardens in various flowers, especially in the Rhubarb and Spiræa; in March, April, and May, these Beetles are alive, but do not always come forth so soon as they are hatched, and during the winter they probably lie dormant in the seeds in the pupa state. As early as February I have found them abundant in the flowers of the Furze, and again in May in the Whitethorn blossoms, and they are not uncommon in waste fields as late as August; so that there are either two broods, or a succession of them is produced throughout the spring and summer months. The female seems to select the finest seeds for the deposition of her eggs, and the maggot when hatched feeds concealed within them, and there changes to a pupa; when it is perfected to a Beetle, it either eats its way out, or a lid formed in the outer hard skin is forced out, and the prisoner is at once liberated. I cannot clearly understand why such vast numbers of the Beetles are found dead in their cells, unless, as De Geer suspects, they return to the seeds to feed after having left them. In seeds imported from warmer climates than ours they may be killed by a lower temperature, but this would scarcely account for the multitudes that have been found dead in the various samples of Beans that I have examined in England.

I have understood that the Bean and Pea-fields in Kent suffer very severely sometimes from the attacks of the *Bruchus granarius*, which appears to have been confounded in this country with the *B. Pisi*; the former is thickly punctured and black, the underside and legs grey, with fine silky pubescence; the head is rather small and drooping, the mouth forming a short wedged-shaped beak; the eyes are prominent, with a deep notch, at the entrance of which the antennæ are placed; they are not longer than the thorax, a little thickened towards the apex, 11-jointed, the 4 basal joints bright ochreous; the thorax is semioval, and much broader than the head, especially at the base, which is sinuated, and forms two acute angles, and on each side is a little tooth; it is variegated with ash-coloured pubescence, having a whitish patch before the scutellum, which is also whitish; elytra much broader, somewhat quadrate, the apex rounded, leaving the extremity of the body exposed; this is grey, with two, and sometimes with four, black dots: the elytra have 10 punctured striæ on each; they are variegated and spotted

afterwards be set under hand-glasses in a stove or forcing-house, where a temperature from 60° to 70° is kept up; and in a few weeks the graft and stock will unite. Whip-grafting without the tongue is perhaps the best method, and it is advisable to retain a few leaves upon the stock above the graft, to draw up the sap. Not only Camellias, but Azaleas and Rhododendrons (and probably many other things) can be readily propagated in the same way.—*Hortulanus*.

Physianthus albicans.—I send you a specimen of the fruit of this plant, as I am not aware that it has hitherto fruited in the open air in this county. The plant from which it was obtained was planted about six years since, against the south-west front of my house, where it has been exposed without any protection to the full force of the blighting winds which prevail from that quarter in this county, and has grown vigorously and flowered freely. Last autumn for the first time it formed seed-pods, which have not ripened until now. There are six upon the plant.—*Wm. Tweedy, Alverton, Truro*.—[This plant occasionally fruits near London.]

Pelargoniums.—In an answer to your correspondent "Truro," p. 161, you mention some *Pelargoniums* as being unknown to you, but about which I can give you some information. *Acme of Perfection* is a first-rate shaped flower, with a fine spot on the upper petals; *Fascination* is a very bad-shaped flower, but with a beautiful white centre to the under petals; *Countess of Cornwall* is a first-rate flower, in shape and spot; *Wonder of the West* has the same character as the preceding one; *Reward* (Russell's) I understand to be good, but I have not seen it.—*Patience*.

Potatoes.—It is a great pity to spoil so good a thing as a good Potato. "Rus," p. 117, will find his Potatoes much improved by being spread under an airy shed, where they cannot be frostbitten, and by having a basketful taken into the kitchen two or three days before being used, to get quite dry. If there is reason in roasting eggs, there is quite as much, and more, in boiling Potatoes. It may be the cook's fault; but they were most likely taken up before they were quite ripe, without being exposed to the air before they were housed.—*Breadfruit*.

Another Problem in Cookery.—Much learned matter having been elicited by the discussion about the inverted cup and Currant-juice, I beg to propose another to philosophical correspondents, the solution of which may possibly save the waste expenditure of Currant-juice, and anxiety by those who cultivate these and other soft and small fruits. Is it absolutely essential to the manufacture of good Currant jelly, Strawberry, or Raspberry jams, that these fruits should be gathered quite dry? You are aware that in seasons when St. Swithin labours at his watering-pot for 40 consecutive days, how difficult it is to get these fruits dry; and by waiting one drizzling day after another, they soon deteriorate and often completely spoil. I have, during the last 30 years, lost many bushels by such means. Though gathered moist with dew, or wet with rain, would not the fiery process to which they are soon after subjected dissipate every particle of water? Again—Is not water in some degree a constituent part of these fruits? and if so, is not that as likely to be injurious as a little rain or dew on their exterior surface? If some *artiste* would test the matter and tell us the result, it would possibly save both vexation and loss. I am tempted to remark, before closing, that in gathering Roses and Elder-flowers, and such things for distillation, the injunction generally is, "Be sure and get them dry." "Oh, they must be gathered dry." This I do not understand, for they are immediately crammed into a still and immersed in water. Will you answer another query—viz., is the Pine-Apple a mucilaginous fruit? Will it make jelly?—*Quercus*. [So far as we know, all succulent fruits contain pectin, the substance which constitutes the jelly of fruits.]

To preserve Eggs.—As the season for an abundance of eggs is at hand, the following simple recipe may be useful to your readers:—Take a tub, pail, box, or jar of the size you require; lay fine salt to the thickness of two inches evenly on the bottom of it, and place the eggs with the small end downwards on the salt, so as not to touch each other. Then strew more salt, so as to cover the eggs, shake all gently, and add a layer of eggs and a layer of salt, till the vessel is full. Put it in your cellar, and you will find the eggs good during the whole of next winter.—*H. S.*

Bees.—"M. A. P." will be much obliged if Dr. Bevan will kindly give her advice on the following subject:—She had an old straw hive of Bees given her in 1840, and as it is now very much decayed, she wishes to remove them into another hive, and would be glad to know the best time and manner of doing so without injuring the brood comb; also, when supering or nading is resorted to, in which live ought the external entrance to be?

The Fern-shaw Beetle.—There commonly appears in June, in meadows and gardens, a Beetle about as large as the common seven-spotted Lady-bird, with brown and somewhat glossy wing-cases, locally known by the name of "The Fern-shaw." Last summer, these insects were so abundant in the neighbourhood of Stroud, in Gloucestershire, that they became quite a formidable pest in lawns and gardens, devouring, like the locusts of Egypt, everything green. The larvæ seemed to exist in myriads beneath the surface of the ground, whence the beetles, on attaining their perfect form, were seen to arise in swarms. Such is the account given by some who were both eye-witnesses and victims of this plague. If your correspondents can suggest any practicable means of destroying the larvæ of these beetles, before they have commenced their work of devastation, they will confer an obligation on many, and especially entitle themselves to the gratitude of "Two Ladies, who have lawns and gardens."—[The

Beetles complained of are the *Anisoplia Horticola*; we are unable to suggest any remedy for the destruction of their larvæ, which live beneath the turf. If rooks and starlings be suffered to search for them, they will destroy vast quantities; but in the opinion of some persons, the birds do more mischief than the insects, by pulling up the loose turf.—*R.*]

Our Prejudices.—Amongst these, I think, may be reckoned the opinion so generally entertained, that hard and soft-wooded plants cannot be grown together in the same house, and under the same system of management. I know I am now treading upon delicate ground, and that I shall have the judgment of men of great experience against me. Yet it is worth while to consider for a moment the treatment hard-wooded plants require. Take Heaths, for example; exclusion of frost, plenty of air, room for its free circulation, open training, careful watering, and free drainage; the nearer the glass the better; when in bloom, shade to preserve the colours:—can any better rules be laid down for the successful cultivation of *Pelargoniums*, *Calceolarias*, &c.? The fact is, few of us are wise enough boldly to discard such a portion of our collection as shall give the remainder the room they require to ensure their superior growth; and so the houses get crowded, shelves are stuck here and there, light and air are excluded, and the result is found in the succulence of the one and the mildew of the other. No one who may attempt the cultivation of the two species together need be discouraged if the mildew should appear; that he must be prepared to remedy—and who is the grower of Heaths alone, that must not be the same? I never yet visited a collection of this tribe of plants where I did not hear this pest complained of, or witness its effects. I may perhaps add, that gardeners are often placed in situations of considerable difficulty, by their employers purchasing additions to their stock, without permitting them to discard older varieties, and thus collections suffer from want of space. With very few exceptions, repletion is a disease with which all Horticultural buildings are affected.—*K.*

FOREIGN CORRESPONDENCE.

Wellington, New Zealand.—We are making rapid advances in our Horticultural pursuits. At a late meeting of our Horticultural society, the pleasing information was communicated that a draft for 50*l.* had been forwarded by Col. Wakefield, from the directors of the New Zealand Company, to be placed at the society's disposal; and that a packet of valuable plants and seeds had been received from the Botanical Gardens at Sydney. The plants consisted of Olives, Limes, Pomegranates; China, Provence, and other Roses; white and red Cedars, Oleanders, two species of Hibiscus, the Coral-tree, English Oak, Hydrangea, *Ficus elástica*, and various other things. It was moreover resolved at this meeting, that a sum not exceeding 10*l.* should be devoted for the purpose of preparing two sets of drawings of the most interesting, indigenous Botanical objects, and specimens of native woods; one series of which should be forwarded to the Directors of the New Zealand Company, and the other to the Horticultural Society of London. A Mr. Lyon is represented to have stated in a lecture recently delivered at the Mechanics' Institute, that good Coal was not to be found in New Zealand, although it was not improbable that our brother-colonists at Taranaki might discover rich beds of Lignite or wood-coal, similar to those found on the Continent of Europe. To this, however, I believe the most positive contradiction may be given, as an abundance of good bituminous coal exists in Massacre-bay, and probably in other places in the neighbourhood of the settlements. The Bishop of New Zealand, in answer to an address presented by M. Murphy, Esq., upon his arrival at Wellington, adverted in a complimentary manner to the magnificence of the country, now undergoing the great change of colonization; and remarked that under Divine aid and the exertions of the British people, New Zealand would one day be the brightest gem in Britain's crown; her noblest effort at colonization. He anticipated this, independently of any superiority of climate or soil, from the prospect and practicability of preserving and civilizing an aboriginal race of natives. By the wisdom and forethought of the New Zealand Company, the system of native reserves not only at once provided for the safety of the race, but held out a prospect almost amounting to certainty of leading the New Zealander to prefer the blessings connected with a civilised life; and he had no doubt but the natives would one day bless the happy period when Britons first settled amongst them. The following brief list will give some idea of the prices of provisions: Bread, per 2*lb.* loaf, 7*d.*; fresh Beef, per lb. 9*d.*; Mutton, 9*d.* to 11*d.*; Pork, 7*d.* to 8*d.*; fresh Butter, per lb. 3*s.* 3*d.*; Cheshire Cheese, per lb. 1*s.* 6*d.*; Potatoes, per ton, 4*l.* to 6*l.*; eggs, per dozen, 4*s.* The price of Brood Mares is from 50*l.* to 90*l.* each; working Bullocks, per pair, from 40*l.* to 60*l.*; and Sheep from 23*s.* to 28*s.* each. Fowls are selling from 8*s.* to 16*s.* per pair, and Turkeys at 20*s.* each. The weekly wages of mechanics are from 2*l.* to 3*l.*, and of labourers from 1*l.* 10*s.* to 1*l.* 16*s.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

March 21.—Sir O. Mosley, Bart., in the chair. Messrs. W. H. Holmes and W. E. Rendle were elected Fellows. A paper was read upon the Tussac Grass, being an extract from a letter, dated October 1, 1842, from the Lieut.-Governor of the Falkland Islands, to Lord Stanley; from which it appears that some seeds which had been sown in the Government Garden at a short distance from the sea, in good soil, but different from that in which it grows naturally, had shot up and seemed to show that it would thrive in any soil, provided it were supplied with moisture. In its native state it succeeds best in spots most exposed to the sea, and in the rankest peat-bogs. So fond are horses and wild cattle

of its herbage, that their tracks may be seen extending towards it for several miles from the interior of the country. It is recommended in cultivating the Tussac, to sow the seed just below the surface of the ground in patches two feet apart, to be afterwards thinned out as the plants grow 6 or 7 feet high. The herbage should not be grazed, but reaped or cut in bundles: when grazed it is liable to be injured, particularly by pigs, who tear it up to get at the sweet, nut-like roots. The wild west coast of Ireland would, no doubt, be well adapted for its cultivation. Mr. Goode, gr. to Mrs. Lawrence, exhibited a collection of plants, containing a very well-grown specimen of *Phaius Wallichii*, a pretty variety of *Epacris impressa*, clothed with countless numbers of crimson flowers; a fine plant of *Erica bicolor*, with light-green and crimson blossoms; *Burchellia capensis*, in a vigorous state of health, bearing clusters of beautiful orange at the end of every branch; with the old and much-neglected, but nevertheless pretty, *Gnidia pinifolia*, covered with its numerous heads of delicate white flowers: a Knightian medal was awarded for the *Phaius* and *Burchellia*. From Mr. Gaines were three pretty hybrid *Rhododendrons*, called *Princess Royal*, the *Prince of Wales*, and *Victoria Regina*, the latter being of a delicate flesh colour, and having the throat marked with well-defined dark brown spots; several seedling *Cinerarias*, the best of which were *Ne plus Ultra*, resembling the King, but with larger flowers, and *True Blue*, of a deep purple colour, with a reddish tinge in the centre; with these were a very well-cultivated specimen of *Camellia Donckelaeri*, exhibiting the peculiar mottled character of that variety in great perfection, and *C. Nicholsii*, a small, well-formed, light-red flower, also spotted in a slight degree, and well worthy of cultivation; a Banksian medal was awarded for the two latter. From Mr. Smith, of Norbiton, nine hybrid varieties of *Rhododendron*, of the same beautiful dwarf and free-blooming character as those exhibited at the preceding meeting; a specimen of the rose-coloured variety of *R. arboreum*, and an *Azalea*, called *A. aurantia superba*, of a dark brick-red colour, but rather deficient in form. Mr. J. Wells, gr. to W. Wells, Esq., of Redleaf, brought two seedling *Azaleas*, raised from seed presented by the late Lady Amherst, and stated to be that of the *Nepaul Rhododendron arboreum*; one of the plants exhibited, however, bore a great resemblance to the yellow Chinese *Azalea*, and the other was an exceedingly pretty variety, with large, finely-formed, yellow flowers, tinged and spotted with reddish brown; Mr. Wells also exhibited some very fine blooms of *Camellia reticulata*, and other good kinds, with cut specimens of *Rhododendron arboreum album*, and several beautiful hybrid varieties: a Banksian medal was awarded for the *Azalea* and hybrid *Rhododendrons*. From Mr. Beck, a large collection of plants in slate pots, comprising well-bloomed specimens of *Acacia armata*, *Cytisus racemosus*, *Leschenaultia formosa*, *Cineraria*, *Urania*, *Unique*, *Madonna*, and several others, in the most perfect health, with a new kind of slate tray for containing pot plants, intended for rooms, verandahs, &c., being fixed upon castors so as to be easily moved in any direction, and made watertight to prevent any inconvenience which might arise in such situations from the drainage of the plants. From Mr. Appleby, gr. to J. Dobinson, Esq., a seedling *Fuchsia*, stated to have been raised between *F. cordifolia* and *splendens*, but not differing in the least from the latter species. From the Very Reverend the Dean of Manchester were a seedling *Camellia*, called *foliolosa*, of a very brilliant colour, and remarkable for the exceeding fulness of the flower, being composed of an exterior row of petals, densely filled up in the centre with others of irregular form; and a *Muscari*, raised from seed gathered in the Durrood Pass, near Mesned, in Persia, and apparently a small variety of *M. racemosum*. A certificate was awarded for the *Camellia*. Messrs. Davies and Co., of Wavertree, Liverpool, also exhibited a very handsome seedling *Camellia*, raised from the seed of *C. Colvillii*, fertilised with the pollen of *C. reticulata*; in the foliage it resembles the older sorts, but the flower, which is large and well filled up, partakes of the form and colour of its male parent; a certificate was awarded for it. From Mr. T. Williams, of Oldford, a cut specimen of *Cyrtopodium Andersonii*. From Mr. J. Pamplin, a pretty dark blue *Cineraria*, called *Royal Purple*. From Mr. Hally, a large plant of the *Camellia* called *Monarch*, with mottled flowers, occasionally coming well filled up in the centre. From Mr. W. Lee, of Bradmore, Hammersmith, several forced *Provence* and *Moss Roses* in a large pot. Sir J. T. Tyrrell, Bart., exhibited some very fine *White Versailles Lettuces*; a certificate was awarded to them. Mr. R. Ayres, of Chicksands Priory, sent a brace of *Ayres' Pot-forcing Cucumbers*. From the Garden of the Society was a collection of plants containing *Spiranthes orchioidea*, a pretty terrestrial species with pink flowers; *Acanthophippium bicolor*, with clusters of singular wax-like flowers, edged with deep crimson; *Phaius bicolor*, bearing lofty spikes of yellowish brown and white; *Boronia anemonefolia*, a handsome free-blooming species, with small rosy star-like flowers; a vigorous specimen of *Euphorbia splendens*; *Acacia mucronata*, a showy sort, with sulphur-coloured flowers, which, with *A. hispida*, is well adapted for a limited greenhouse. Cuttings were distributed of the following Pears: *Comte de Lamy*, a middle-sized, very sugary and rich fruit, ripening in October; *Eyewood*, a hardy and vigorous variety, with rich, buttery flesh, ripening in October and November; *Thompson's*, a highly-flavoured Pear, resembling in that quality the *Passe Colmar*, and ripening in Nov.; and the *Pearson's Plate Apple*, so called from a piece of plate having been presented to Mr. Pearson, a nurseryman, of Nottingham, by whom it was first exhibited; it is a handsome rich *Desert Apple*, nearly equal in point of flavour to, but larger and a better bearer than, the *Golden Harvey*, and coming into use from December till March.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Mar. 15.—The Duke of Richmond in the chair. Fifteen Members were elected. The Duke of Richmond stated that a successful operation had been performed by Mr. Simmonds on the cow presented by the Duke of Rutland, whose remarkable case of hernia had excited so much interest; it was decided that Prof. Sewell should be requested to furnish an account of it to the Journal Committee. F. Hart, Esq., gave notice of his intention to introduce the Dyock Oat on the Derbyshire hills. R. Illingworth, Esq., suggested the publication of concise practical tracts on particular topics of agricultural interest, as the best mode of applying Guano, &c. E. Oldfield, Esq., communicated the case of a foal, which had died from obstruction caused by the accumulation of a compact substance, 2½*lbs.* in weight, 9 inches long and 13 inches in circumference. This, as well as the specimen, was referred to Prof. Sewell. Prof. Johnston transmitted copies of the third Number of his printed "Suggestions and Experiments in Practical Agriculture," containing the results of experiments made in 1843. These papers were considered of great value, not merely for the actual information they contained, but on account of the new suggestions to which they gave rise, and the hopes they held out for the future. Mr. Fuller, M.P., Col. Challoner, Sir J. Johnstone, and Mr. Browne, having reported their experience in the amount of Turnips grown on different soils, under different management, and with different manures, the Duke of Richmond explained the success which, in Scotland, had attended the trials made with bones converted, at a cheap rate, into a manure of a modified character, the details of which he had communicated to the Journal Committee.

LINNEAN SOCIETY.

March 21.—The Lord Bishop of Norwich in the chair. Mr. A. Henfrey was admitted an Associate. Capt. Jones presented specimens of a rare Lichen, the *Placidium canescens*, found in Sussex. J. Janson, Esq., exhibited living specimens of the *Paspalum exile*, grown from seeds of the plants which had afforded the description read a short time since to the Society. A collection of 19 Ferns from the Himalayas, and not in the Society's Herbarium, was presented by T. Edgeworth, Esq. A paper was read from Prof. Forbes on several new species of

Star-fishes, belonging to the family Ophiuridae, which he had discovered in the Aegean sea. A continuation of Mr. Griffith's paper on the Development of the Oculum of Santalum, Viscum, and allied genera, was also read. A packet of seeds of the Cæsalpinia coriaria, the Dividivi or Libidibi plant, was presented for distribution amongst the Fellows.

FLORICULTURAL SOCIETY.

March 21.—Mr. Mauger in the chair. Mr. Orson read a paper upon the properties of the Carnation and Picotee, in which he stated that he should not enter into the botanical characters of these flowers, but proceed to point out that although the Carnation was originally divided into three classes, viz., Bizarres, Flakes, and Picotees, yet that the latter were now considered a distinct variety. Bizarres were distinguished by having two colours, and Flakes by having only one colour, upon a white ground; these two principal classes being subdivided into scarlet, crimson, pink, and purple Bizarres;—scarlet, purple, and pink or rose, Flakes. In some counties, pink, purple, and crimson Bizarres were all classed under the head of pink Bizarres, whereas in other parts of the country they were known as crimson Bizarres. The author considered that a good Carnation should possess the following properties:—The calyx, or pod, should be long, firm, and entire, of sufficient substance to support the petals, which should be thick, broad, and substantial, smooth, and free from indenture on the edge. The guard petals should rise gracefully above the pod, and turn in a horizontal direction, having a gradual disposition to cup, but not terminating in an abrupt curl at the outer edge; the whole forming a complete circle. The interior petals should rather decrease in size as they approach the centre, each row being regularly and alternately arranged above the other, so as never to be crowded, nor, on the other hand, to have a loose and gaping appearance; in fact, the spaces should be only sufficient to display the colouring distinctly. The number of petals in a first-rate flower should not be less than 17, three of them being placed in the centre, to form a crown. The whole would then, if well arranged, produce the form of the half of an oval, or elliptic, when held on a side view; having, when seen from above, a circular appearance. The colours, whether Bizarre or Flake, should be strong, brilliant, and distinct throughout. The ground colour should be a pure white, free from speck, spot, tint, or tinge of any sort. The Flakes should be broad and bold, commencing at the extreme edge, of a proportionate width to the petal, running through to the centre, or so far as the eye can discern, and diminishing in breadth as they approach the centre, in the same ratio as the petal. The distribution of colours should be equal in every respect; in a Flake, not less than three divisions on each petal; in a Bizarre, not less than five divisions; and when properly arranged, their respective and united beauties should be strikingly apparent. Size should not be lost sight of, though it should never take precedence, unless the other general properties were equal. The disqualifications of a Carnation are—a dead, loose, mutilated, or split petal; a petal having no white on the upper side; a petal having (if a Flake) no colour upon the white on the upper side; a petal upon which (if a Bizarre) there are not two colours upon the white on the upper side; if the pod be split down to the sub-calyx, or cut away in any part. Mr. Orson then proceeded to state that size was the only material point upon which there was any great difference of opinion. In some places two rows of petals were thought sufficient; while some writers upon this subject argued that a Carnation should be as double as a Dahlia or a Ranunculus. A statement was put forth last summer to the effect that the height of the former flower, when viewed sideways, should represent the half of a ball, a word which did not convey any definite meaning as to circularity; and further, that the beauty of the Carnation and Picotee would be increased tenfold if they possessed the fulness of the Dahlia. A flower possessing the latter property would, however, present only a confused mass of deformity; and although Carnations and Picotees were not shown with a single row of petals, it did not follow as a matter of course that they should be as double as a Dahlia. A flower with only two rows of petals was quite as objectionable, although the growers in some counties were satisfied with them. One of the flowers most in note was Brooks's Flora's Garland, possessing fulness and size, peculiarity of colour, and pureness of white, but having one imperfection which, from its fulness, has been overlooked, viz., irregularity of marking; the colour in many of the petals not running through from the edge to the centre of the flower, but appearing in stripes and spots, and terminating abruptly midway in the petal. Other flowers were also named, which exhibited the same defect. Upon this account, therefore, extreme fulness in a Carnation was objectionable. Mr. Orson next read a list of the number of times which each flower had been successfully exhibited during the last season in the neighbourhood of London. From this it appeared that the most successful flowers were Ely's Lady Ely, Brooks's Flora's Garland, Mansby's Beauty of Woodhouse, and Roi de Capucins; and that not more than 10 or 12 of the whole number were old varieties, but had been raised within the last five or six years. The best of these were Ely's Duke of Bedford, Regular, Lady Ely, Mrs. Beard, and Mungo; Mansby's Robert Burns and Bonnie Bess; Twichett's Don John and Queen of Scarlets; Martin's Splendid and Phoenix; Wilson's Harriet, Chadwick's Brilliant, Marsden's Jolly Angler, Batts' Briseis, Puxley's Prince Albert, Holmes' Count Paulina, and Wigg's Earl of Leicester. The properties of the Picotee were next described. These, with regard to form and petal, were the same as in the Carnation, with this exception, that as the colour of the Picotee is, or ought to be, confined to the margin of the petal, a greater degree of fulness was admissible, proportionate with the lightness or narrowness of the marking. The colour should be clear and distinct, confined to the edge of the petals, and not running down or barring; neither should the white in the slightest degree run through to the edge of the petal, but whether lightly or heavily marked, the colour should be regular, at an equal distance from the edge all round the petal, each petal having the same regularity of colouring throughout the flower. Although a full flower was not so objectionable as in the Carnation, yet a very full Picotee was not to be advocated; a medium fulness was best. The same disqualifications, with regard to the petal and pod, were applicable as to the Carnation. Mr. Orson concluded with hoping that the time was not distant, when any flower in which the colour runs in the least from the regular edging down the petal, or the white through the colour to the edge of the petal, would be disqualified. A communication was also read from Mr. Bates, relative to the properties of the Carnation. In this, the observations were divided into four general heads: 1st, form; 2d, white or ground colour; 3d, colour or marking, with its distribution; and 4th, size. Form: The guard or outer petals should be broad, firm, smooth, almost flat, having when expanded their base sufficiently long to throw themselves out of the calyx, so as to extend from $\frac{1}{4}$ to $\frac{1}{2}$ inch from the centre; an inflated air-balloon, cut $\frac{1}{4}$ to $\frac{1}{2}$ inch in two, would represent their most desirable form. The proportion which each guard petal should bear to the diameter of the bloom should be two-fifths. The most objectionable petals of the bloom were the serrated, as in Walker's British Beauty, and in Capucin when deficient in colour; narrow petals, as in Hales' Prince Albert; too much cupped and liable to split, as in Twichett's Don John; and plaited or crumpled, as in Waterhouse's Rising Sun. In the general form of the flower, the guard petals should be six in number, nearly equal in size, and arranged so as to form a complete circle; the next tier should consist of five petals of a proportionate size, so placed as to cover the interstices of the guard petals: four petals would complete the third tier, within which should be two or three, to form a centre or crown to the flower, which would thus contain 17 or 18 petals. When necessary, six petals might be taken to follow the guard leaves, which might be succeeded by 5, 4, and 3, making in all 25 petals; thus showing that 25 may not be too large a number,

nor 17 too few, for perfecting a first-class flower. Ground colour: This should be pure, as in Sharpe's Defiance, not freckled as in Wamsley's William IV., nor flushed as in Wallis's Beauty of Cradley or Alloway's Wonder of the World. In the distribution of colour two classes were distinguishable; viz., Bizarres and Flakes. In the former, the colour should cover two-thirds of the flower; in the latter, three-fifths; the remaining portion being white. When properly diffused, these proportions approached the nearest to perfection; it was difficult, however, to find flowers possessing such rare qualities. In a large petal there should be at least five and not more than eight divisions of colour, each bold and distinct, commencing at the outer part of the petal and gradually diminishing to the centre. The diffusion of colour in a Bizarre might differ materially from that in a Flake, inasmuch as in the former a large portion of colour is sometimes distributed on one side, with perhaps only one stripe of an opposite colour on the petal. This, though not very objectionable in a Bizarre, would be most decidedly so in a Flake; in which latter class the colour should be divided into not less than three, or more than five, stripes on each petal. Every petal, whether Bizarre or Flake, must possess the requisite colour and white. A self petal should disqualify the flower, as well as a petal in a Bizarre having only the white and dark colours developed. Size: The writer stated it to be desirable, with regard to the minimum size of a show-flower, that a standard should be fixed, and that he thought $\frac{2}{3}$ inches in diameter would not be too small for a lower tier in a stand of 12. In summing up his observations, he endeavoured to convey his sentiments on the qualifications of a perfect flower in the following manner:—Take the size of Puxley's Albert, composed of the rigid petals of Brutus, exhibiting the pure unsullied white of Sharpe's Defiance combined with the bold markings of Count Paulina, and displaying the brilliant colours of Roi de Capucins and Paul Pry. As a Flake, if Willmer's Solander possessed the ribband of Millwood's Premier, with the colour of Princess Charlotte, Simpson's Marquess of Granby, or Hitcher's Duchess, those who were fortunate enough to possess such a concentration of excellence, would obtain the five classes in the highest perfection.

MISCELLANEOUS.

Nitrate of Soda.—In February, 1841, some old worn-out garden Roses had a portion of this salt applied to them, at the rate of one cwt. per acre, or $\frac{1}{2}$ lb. to the rod. It was sown broadcast all over the ground, which is easily done by mixing it with dry sand. About the end of April, the ground became covered with a greenish appearance, such as is frequently seen in damp situations in the autumn. As the dry weather advanced that appearance ceased. The plants became much more healthy, and of a fine dark green; in the autumn they appeared far more robust than those adjoining: they were also less infested with insects than the latter, but this may have arisen from their being in a more healthy state. Dahlias were also tried with nitrate of soda, each plant having about $\frac{1}{2}$ oz. given to it, mixed with water. The plants operated upon became like the Roses, of a fine dark green, more robust and compact in their growth; flowering rather more freely, and earlier than others which had no nitrate: it had no effect on the colours of the flowers. A few of these Dahlias were, about three weeks after, again supplied with an additional ounce, mixed with water as before; but without any additional effect being perceptible, nor was any further result obtained when some of the same plants had a third $\frac{1}{2}$ oz. administered to them about a month after. Some Verbenas, Petúnias, Pentstemons, and various other plants, were watered with the nitrate, at the rate of $\frac{1}{2}$ lb. to the rod, and with the same results; except that they seemed to become exhausted in the autumn sooner than those which were not dressed with the nitrate. This, however, may have been owing to the long wet autumn. Nitrate of soda acts very quickly on plants; some stunted Oaks and a Silver Fir in pots became of a fine healthy green in about ten days after its application. It should be given in all cases where plants are beginning to be in full vegetation, and not when they are dormant; if applied then, it seems to have little effect. It should also be always given in damp weather; if applied in dry weather, and over-head, it acts in the same way as common salt, by destroying the leaves and young shoots. It has been found very effectual for killing slugs, of which the ground has this season been so full, that the entire crop of some kinds of vegetables has been destroyed in the market-gardens near London. The solution of nitrate of soda is more efficacious than lime-water where it can be applied without touching the foliage.—*Proceedings of the Hort. Soc., No. 17.*

Large Pear-tree.—About 10 miles north of Vincennes, Indiana, in the United States, there is a remarkable Pear-tree, said to have been raised from seed about 35 or 40 years ago, which at one foot above the ground measures 10 feet in circumference, and $6\frac{1}{2}$ feet at nine feet above the ground. The diameter of the space covered by the branches is 69 feet. In the year 1834 it yielded 134 bushels of Pears; in the year 1839 it produced 80 bushels; and in the year 1840 it produced 140 bushels. The tree is a rapid grower, a constant bearer, and an enormously productive kind. The fruit is about the size of a turkey's egg, rating, as to quality, with the third grade of dessert Pears.—*Hovey's Magazine of Horticulture.*

Agri-horticultural Society of India.—We learn from Indian papers, brought over by the last mail, that Mr. Hume has been elected Honorary Secretary of this Society. On account of some irregularity in the proceedings, however, in excluding the votes of non-resident members, another day has been appointed for reconsidering the matter, when it is expected that his election will be disputed.

GARDEN MEMORANDA.

Horticultural Society's Garden, Turnham Green.—At this early period we cannot expect to find much that will prove attractive in the hardy department. Upon the south wall, however, the white variety of Cydonia japonica, with blossoms varying from white to rose, and the sweet-scented Magnolia conspicua are blooming profusely; to which, in a few days may be added, Berberis aquifolia, fascicularis, dulcis, and trifoliata; the latter, a species of recent introduction. The majestic Pinus insignis has stood through the winter unprotected without sustaining the slightest injury. Many of the Mexican Coniferae have also survived two seasons under the protection of a handglass: they consist of Pinus tenuifolia, apulcensis, macrophylla, Teocote, Montezumae, Hartwegii,

Leiophylla, Ayacahuite, Devoniana, Russelliana, pátula, filifolia, oocarpoides, and pseudo-strobus: of these the three latter only appear to have suffered. Abies religiosa, sheltered in the same manner, was killed by the first severe frost in autumn. Cupressus thurifera and flaccida, both Mexican species, have stood unprotected; the former has suffered severely, but the latter does not appear to have been much affected. Euonymus japonicus, a handsome evergreen, seems likely to prove hardy, a large plant having stood out without being in the least injured. In the conservatory the plants appear to be enjoying the most perfect health. The Camellias planted in the centre are producing fine blooms, those of elegans in some instances being as much as six inches in diameter. The tribe of Acacias, however, at the present time forms the most striking feature in the house. A. tristis and hybrida bearing their golden rod-like shoots erect, whilst those of the elegant A. pubescens appear to droop, from the weight of the numerous feathery spikes of bright yellow with which they are loaded. A. libiciana, a species whose stems and foliage have the appearance of being covered with a white powder, is producing its dark golden flowers in great profusion; A. heterophylla is blooming less abundantly, its blossoms being of a pale primrose colour. Numerous other species of equal beauty are flowering in pots. Amongst other plants in bloom are the interesting Podaliria styracifolia, with pale lilac and white pea-shaped flowers; a tall standard of a variety of Rhododendron arboreum; Polygala grandiflora, resembling a tree in miniature, with a cluster of purple flowers at the extremity of every branch; P. gracilis, a more delicate and free-flowering species, of a deeper colour; the singular Eucalyptus cordata; Clanthus puniceus, drooping with the burden of its curious scarlet flowers; and Veronica speciosa, a free-blooming pale-blue species, forming quite a bush. The beautiful Kennedia Marryattæ, trained upon chains on the south side of the house, is growing luxuriantly, and producing its clusters of bright scarlet in great profusion. In other parts of the house Camellias in pots, with Cinerarias, double Chinese Primroses, Correas, &c., keep up a gay appearance. The greenhouse and curvilinear stove, which have recently undergone some important alterations, noticed at p. 640 of 1842, have given perfect satisfaction; in the former is placed the collection of Heaths, amongst which several pretty species are now in flower. The latter house is heated by two of Rogers's Improved Cornical Boilers, which have given some trouble from bad setting, but seem now likely to answer, the plants are in a good state of health; Euphorbia splendens, Hibiscus hybridus, with bright rose-coloured flowers; Melastoma heteromalla, purple; and Begonia crassicaulis, with thick fleshy stems and white blossoms, slightly tinged with rose, are flowering freely. Amongst the Orchidaceous plants in bloom are, Phaius bicolor, reddish-brown, with a white labellum, afterwards changing to yellow; Acanthophippium bicolor, bearing its singular reddish-purple and yellow flowers in clusters amongst the leaves; Leptotes bicolor, pale green, having the throat marked with bright purple; Epidendrum virgatum, chocolate colour, with a yellow labellum; the large and small varieties of Oncidium amphitum; Spiranthes orchioidea, a terrestrial species, with pink flowers; Catasetum laminatum, and the beautifully-marked Cyrtorchilum maculatum. Numerous experiments have been going forward with different manures upon the grass in the Arboretum; divisions, each containing a rod, being marked out upon the lawn for that purpose. Many of these experiments have been carried on with ammoniacal liquor, in different quantities, or fixed by means of various materials, and diluted in six times its bulk of water. In all cases the grass turns brown within 48 hours after its application, but rapidly recovers. Its effects appear most beneficial where applied at the rate of 2 gallons to the rod, fixed with 2 oz. of sulphuric acid; when fixed with 2 oz. of sulphate of iron, not quite so good; and still less so when 2 oz. of sulphate of copper were used. Ammoniacal liquor, acted on by chloride of lime seems also to be advantageous; the Grass looks well, whilst the Moss is totally, and Clover partially, destroyed. Where it has been applied at the rate of 4 gallons to the rod, the grass in many places is quite burnt up; the most useful proportion appears to be 2 gallons. To show more clearly that this quantity is the most serviceable, six other experiments have been made with ammoniacal liquor, fixed with sulphuric acid, 2 gallons being applied to the first rod, and the quantity used to each successive one diminishing, so that the last only received one quart. The effects were strikingly visible in the first, while in the last they were scarcely perceptible. A cheap compost heap, containing about 15 cubic yards, has been prepared from grass-sweepings and leaves, over which 30 gallons of ammoniacal liquor had been thrown as the matter was mixed, the ammonia being fixed with a barrowful of gypsum, the drainings of the heap were collected in a pool at one end, and thrown back over the fermenting mass. In like manner, a large heap, containing 30 double horse cart-loads of powerful manure has been formed from cloacine and refuse vegetable matter; the cloacine having, previously to removal, been disinfected at a trifling expense, by means of a few shovelful of bleaching powder. From the refuse prunings of trees a considerable quantity of charcoal has been prepared, either by covering in the heaps with turf in the usual way, or when that could not be procured, with old mats damped and surrounded with earth. The charcoal from this refuse matter appears to be as well adapted for horticultural purposes as a more expensive kind; it has been sown with Onion seed, in alternate rows, to determine its efficacy in preventing the attacks of the maggot. The greater part of the ground, which was formerly occupied with annuals for bearing seed, is set apart for experiments with different manures upon Wheat, Peas, Potatoes, and Turnips, being divided for that purpose into four divisions, each subdivided into 12 equal portions, containing nearly a rod of ground, to be treated with as many different chemical compounds.—*K. A., March 20.*

Reviews.

On Guano, as a Fertilizer. By Cuthbert Johnson, F.R.S. 1843. 8vo. pp. 44. J. Ridgway.

Science with Practice, or Guano the Farmer's Friend. By J. Trimmer, F.G.S. 8vo. pp. 30. M. Fothergill, Upper Thames-street.

An Account of the Manure Guano, and authentic Experiments made with it, &c. 1843. 8vo. pp. 15. Liverpool.

There is perhaps no substance proposed as a manure which has excited greater interest than Guano, and of this the number of pamphlets published respecting it is evidence. Although Guano has been known for a very long time, and indeed used as a manure for centuries in South America, yet it is only during the last few years that it has been imported and employed on a scale of any magnitude in this country. At a period when agriculturists in all parts of England were turning their attention to the subject of manures, and when the greatest eagerness was everywhere shown to try new fertilizing substances, the Guano of South America was introduced, and large quantities were purchased by experimental farmers, who, having heard much of the wonderful effects attributed to its use, were anxious to ascertain for themselves its value as a manure. Their experiments here led to somewhat contradictory conclusions, for whilst some have lauded it as the very best of manures, others have met with nothing

but loss and disappointment from its use. Guano has been analysed both in this country and abroad by skilful chemists, who have shown that it consists of certain ammoniacal and earthy salts, together with a small quantity of animal matter; but the proportions of the different substances of which it consists, appear to vary very considerably in the different samples which have been examined. It is evident that if the nature of this substance is variable, the effects which it produces on vegetation must likewise be variable and uncertain.

Amongst the most recent publications respecting the use of this curious natural manure are the three at the head of this article; and each, in its way, is valuable, as collecting or recording experiments which have been made with it.

Mr. C. Johnson commences his account of guano by some general observations on the nature of those vegetable, animal, and saline substances which commonly exist, though in small quantity, in the water of rivers, and to the presence of which much of the fertilizing powers of such water is due. He points out the early use of the excrement of birds as manure, and then proceeds to sketch out the nature, extent, and situation of the guano-beds, which exist on the shores of certain islands off the coast of Peru. The chemical composition of guano, and the probable mode in which it acts as a manure, are next discussed; and lastly, numerous experiments which have been made with it are described. The experiments appear to be well selected, and present a mass of useful information. Mr. Trimmer has taken up the subject in a more general point of view. He draws attention to the present state of Agriculture, the general want of manure, and the prejudices which exist in favour of the use of farmyard dung. The value of the most important natural and artificial manures is then discussed, together with the principles on which the action of manures is supposed to depend; the superiority of compound over simple manures is pointed out, and numerous experiments are quoted to illustrate the comparative effects produced by the use of these substances generally, and guano in particular.

The general conclusion to be drawn from the experiments which are described in these three pamphlets is that guano is a most valuable fertilizer, possessing the good qualities of farmyard manure, but far less bulky and more easily applied to the surface of the land. It is to be regretted that the composition of guano is so uncertain, and that it is easily adulterated without much fear of detection, which renders its use far less convenient and certain than it would otherwise be. On this point, however, all that can be said is that farmers must only go to respectable dealers, whose interest it is to supply them with the genuine article. The natural variations in its composition cannot be guarded against, but artificial adulterations may thus, to a certain extent, be avoided.

Guano is a strong manure, and therefore, in many cases, when applied by the drill, or when used in too large a quantity, it is found to burn up the plants and destroy vegetation. The best effects seem to have been produced when it was sown broadcast in moderate quantities, or well mixed with about four times as much earth and drilled in. The uncertainty which exists respecting the strength of the manure is, as has already been stated, the chief objection to its use. It was with the view of getting over this objection that Potter's artificial guano was first prepared. This is certainly an excellent material, but it remains to be seen whether it is the best mixture which could be proposed as a manure. That an artificial fertilizer of this kind, uniform in nature and strength, will eventually be found more economical and useful than foreign guano appears to us beyond the reach of question.

The Emigrant's Hand-book of Facts (McPhun, Glasgow, 1843,) is a well-arranged little pocket companion, containing good maps and very useful information, relating to all those British colonies to which the stream of emigration is flowing. Mr. Butler seems to have selected his evidence with judgment, as he certainly has condensed it with skill. Everybody who is thinking of emigrating should provide himself with this little volume.

Popular Cyclopædia of Natural Science; Mechanical Philosophy (Orr and Co.) This volume, which forms the third of its series, is, in our opinion, the best. It is well written, clearly arranged, and skilfully adapted to the comprehension of those who are seldom capable of understanding such subjects as the properties of matter, and the laws of force and motion. The work is the best we know for schools or mechanics' libraries, or for young gardeners, who wish to know something more than their neighbours about the mighty, though unseen, physical powers which surround them and control their operations.

Of Jesse's well-known Gleanings in Natural History Mr. Murray has lately brought out a small edition, arranged and adapted for schools. It forms a pretty pocket-volume, and will, we doubt not, be acceptable to the young folks for whom it is intended.

CALENDAR OF OPERATIONS for the ensuing week.

The premature dropping of the Fig under natural conditions was as familiar to the patriarchs of Israel (Isaiah xxxiv. 4), as it is in our own day under artificial treatment, and is one of those mysteries in gardening known to us only by their effects. The best remedy that can be suggested is to cultivate those varieties only which long experience has proved to be constant bearers, and less liable to drop off. The three best sorts for forcing, and for the open air, in this country, are the White Genoa, Brown Ischia, and Brown Turkey. The French gardeners have given the name of Perpetual Fig to the last variety, owing to its constant and long bearing; their name—*La Perpetuelle*—having been corrupted by some gardeners into Lee's Perpetual, a name by which the Brown Turkey Fig is better known in our nurseries. (See page 121). On account of fresh Figs not being generally

esteemed in this country, the varieties have not been duly studied, and we know less of the different Figs than of any other fruit which we cultivate; the consequence is, that many spurious varieties find their way into our forcing-houses, and hence the many complaints we hear of Figs falling before they are half ripe. The English traveller, after tasting "such delicious Figs" in the South of Europe, forthwith sends home cuttings to his friends; and if these should fall into the hands of an old practitioner, who knows how ill-suited our climate is to the best productions of Italy, he throws them away, and takes cuttings from his old trees in their stead, and the mischief goes no farther. Not so, however, when they get into the hands of the novice; in that case they are reared, distributed, and prized as highly as the famed Melon-seeds from Malta, Beyrout, or Cabul; and before the last of them are proved to be quite worthless for our climate, and unsuited for forcing, a fresh batch of cuttings finds its way here, by a similar route, to go the same round, and to produce similar disappointments. (See vol. i., p. 579). All this I have often witnessed, and more than once have I acted the part of the old gardener, by getting rid of seeds and cuttings that have cost considerable expense and trouble to procure. Half-grown Figs, which now show symptoms of dropping, in remaining stationary or turning yellow near the stalk, may be made to hang and ripen by the process of capriciation (described in vol. ii., p. 317), which I saw successfully practised last season by a gentleman in this neighbourhood. The best cure, however, is to provide cuttings from old trees which have been known to bear regularly, and there are many such trees cultivated all over the country.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If all has gone on well since these were shifted, shading the young stock may be dispensed with, and the usual routine of heat, air, and moisture continued.

VINERIES.—All the Vineries are now in a moving state, not excepting even the Vines in the greenhouse and in the latest house; the two latter require the most attention from this time, to see that the top eyes are not over-excited. It is more essential to late Vines than to those in the earlier houses that they should be laid horizontally as low along the front of the house as they can be bent down. This keeps the whole plant in an equal temperature, and equalises the force of the ascending sap in all the eyes.

PEACH-HOUSE.—The swelling fruit and young wood will now draw liberally on the roots; see that these are well supplied with moisture, and imitate as far as possible fine mild summer days, with genial showers in the afternoon. The ease with which this can be done, with our improved machinery, is the grand secret of our success in gardening.

CHERRY-HOUSE.—The atmosphere of this house may, like the last, be rendered similar to those moist, mild days, so congenial to vegetation out-of-doors in the beginning of summer.

FROS.—Although the Fig requires an abundance of water when swelling its fruit, yet, unless the pots are well drained, this only aggravates the evil of dropping fruit, of which I have lately heard many complaints.

MELONS AND CUCUMBERS.—The earliest Melons should be kept much thinner in the shoots, and nearer to the glass, than later ones; they should also extend farther over the bed before they are allowed to set their first fruit. If weeds appear in the fresh soil, being British plants, they cannot long endure the heat without getting sickly; they will thus encourage a brood of insects. Anything that tends to this result should be carefully guarded against.

TOMATOES, CAPSICUMS, AND TOBACCO may yet be sown, and for the next three weeks, if circumstances require it; let them have a corner of the hottest frame till they vegetate, then remove them to a cooler place, to come on more slowly.

MUSHROOMS.—As soon as a sufficient quantity of droppings are collected, a new bed may be made to succeed the one now in bearing.

LETTUCE AND CAULIFLOWER plants not yet transplanted from their winter quarters will suffer if left much longer. The early spring-sown of these and other seedlings of this date must be thinned as soon as you can get hold of them, otherwise they become drawn up, and so tender that you can do little good with them afterwards.

Out-door Department.

A celebrated nurseryman, late of Edinburgh, is said to have given the following trite advice to all young gardeners when he sent them out to their "first place." "Sow thickly, thin in time, and keep on good terms with the cook." All kitchen-garden seeds are said by the growers to be in excellent condition this season, with the exception of Carrot-seed, those plants having been blighted last season, when ripening seed. Carrot-seeds must therefore be sown thicker than usual this season; indeed, I agree with the above advice, to sow all seeds rather thickly, and to thin in time.

ASPARAGUS.—About the end of March is the best time to make new Asparagus beds. There are many useful papers on this subject in former volumes of the *Chronicle*.

SEA-KALE AND RHUBARB.—New beds of these should be finished before the end of the month, especially of Rhubarb, which begins to grow earlier than Sea-kale.

CARROTS.—As there are some doubts about the soundness of Carrot-seed this season, see that the ground for it is in a thoroughly pulverised state. Where the land is stiff, or otherwise uncongenial, it would be a good plan to get two or three barrow-loads of light sifted compost, to cover the seeds with. A careful man should follow the sower with a basketful of the covering, which he could sprinkle along the drills as fast as the seeds were sown.

SUCCESSIONAL CROPS.—The last March sowing of these must now be put in.

CELERY.—The early sown must be pricked out as soon as they form two rough leaves: the last of the Lettuce and Cauliflower plants should also be planted out from their winter quarters, and if any of the autumn-sown Cabbages remain in the seed-beds, plant them out, and fill up any blanks in the youngest rows. Where young Cabbages are in demand throughout the season, a few seeds should be sown every fortnight or three weeks until the end of June.

WEEDS.—Instead of pointing out the great advantage of taking early means to keep down weeds, I would refer the reader to page 555, vol. ii.

ORCHARD.—If the weather continues dry, and free from gales and sudden changes, which generally occur about this time, the blossom of Peach and Apricot trees will stand a good deal of cold, and set freely; nevertheless, coverings should be at hand to put over them in case of hard frost. Any trees or bushes transplanted this winter should not remain much longer without some mulching, if not already secured in this way.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—The temperature here should now range from 60° to 65° in the morning, and air should be admitted as soon as the sun-heat raises it to 70° or 75°. More frequent syringing and a moist atmosphere should now be kept up. Potting and propagating must now be added to the routine of this department for the next two months. As all our gardening periodicals team with notices of new plants, I imposed on myself to notice only some of the best old plants, many of which are fully as fine and as useful as the greatest novelties, and more suited to the means of the generality of growers. *Allamanda cathartica* is one of these, and when trained on some kind of trellis and well covered with bloom, it is as fine a plant as can be brought into the conservatory; where it will flower freely for two or three months. It is of a succulent nature, and requires less pot-room than any other strong climber with which I am acquainted.

GREENHOUSE.—The same routine of potting and propagating must also be proceeded with here for some time to come, and

the house must be kept damper and warmer. Syringe in the mornings, and damp the paths only in the evenings.

CONSERVATORY.—From the middle of March to the middle of May is perhaps the gayest time in the year for the conservatory. Nothing seems to be wanted but the flowers of the climbers. Violets, Hyacinths, Lilacs, Roses, Wall-flowers, Sweetbriar, Musk, and a great many other sweet-smelling flowers are now in their prime, and fill the air with their odours. The finest of all the Musk-scented plants at this time is *Mimulus Denhamii*, which is among the seeds given out by the Horticultural Society. The *Glycine sinensis* forces beautifully at this time; taken as a whole the Papilionaceous tribe furnishes many plants for early forcing, that have not yet been thought of.

PROPAGATING PITS.—Dahlias and Chrysanthemums should now be propagated, to have stout early plants. Every young shoot of the *Gardenia* should be propagated; there is scarcely a sufficient number of them in any establishment. Any shelter that will do for *Fuchsias* will suit them in winter, and they will force all the better by being kept cool in winter. To have nice standards of them, by way of curiosity, graft *G. radicans* on the tallest plants of *G. florida*; they will unite in two or three weeks, and may be trained with fine bushy heads.

Out-door Department.

It is not safe to delay pruning common Roses any longer. All perennial plants which are divided for propagation, or for better arrangement, should also be finished without delay; indeed, every sort of planting should now be got through with as soon as possible. Sow *Mignonette*, where the soil is light, for the first crop; it will cover the ground, before dry weather sets in, in places where it could not otherwise be easily established. Every gentle shower will encourage worms, and unless the grass can be regularly swept and rolled they must be kept under. Let every place in and about the flower-garden be kept as clean and tidy as possible, to make up for the dearth of flowers, and as an earnest of what you would like to do at a later period if you had the means.—*D. Beaton, Shrubland Park Gardens.*

State of the Weather near London for the Week ending Mar. 23, 1843, as observed at the Horticultural Garden, Chiswick.

Mar.	BAROMETER.			THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 27th in 1830—thermometer 79°; and the lowest on the 1st of April, 1838—thermometer 16°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending March 24, 1843.

The late genial weather has considerably increased the supply of Vegetables. Foreign fruits are abundant, but those of home growth, with the exception of Apples, are rather scantily supplied. **Fruit.** The supply of Pines is limited; their price has advanced to 6s. and 10s. per lb. Strawberries appear in small quantities, at 2s. per oz.; Easter Beurré Pears, of which a few still remain, are selling at 15s. per half-sieve. Apples are abundant; the supply has been augmented by great numbers which have lately been imported from France, and which render the trade in this department rather dull. Nonpareils fetch from 4s. to 15s. per bushel; Cockle Pippins, from 4s. 6d. to 7s.; Stone Pippins, from 4s. to 6s.; and there are a few Ribston Pippins, in good condition, from 5s. 6d. to 7s. per bushel. The best culinary kinds are the Gooseberry Pippin, from 4s. to 6s. 6d.; French Crabs, from 3s. to 4s. 6d.; and the Hanwell Souring, from 3s. to 5s. per bushel. Good Cucumbers have made a slight advance, and fetch from 4s. to 10s. per brace. **Vegetables.** The quality of Asparagus continues good, and it is now becoming more general; the best bunches sell from 6s. to 9s. each. Sea-kale is more abundant, from 9d. to 2s. 6d. per punnet. The late warm weather has increased the supply of Broccoli, which is excellent; the white fetching from 6d. to 1s. 6d., and the purple from 6d. to 1s. per bunch. Cabbage plants are selling from 1s. 6d. to 3s. per dozen bunches. French Beans are the same as quoted in our last Report. Spinach is tolerably plentiful, from 1s. 6d. to 2s. 6d. per sieve. Onions, which the warm weather has caused to grow, are reduced in price to 6s. and 8s. per bushel. Celery is becoming inferior. Endive is small but good, and sells from 1s. to 2s. 6d. per score. Rhubarb is plentiful from 6d. to 1s. per bundle. Mushrooms are somewhat cheaper, being from 6d. to 1s. per pottle. **Flowers.** The supply of Cut Flowers keeps increasing; Roses, Azaleas, and Camellias of various kinds abound, with *Gardenias*, *Kalmias*, *Pinks*, *Dogs'-tooth Violets*, *Double Wall-flowers*, *Lilies-of-the-Valley*, *Pæonies*, &c.

PRICES, SATURDAY, March 25, 1843.—FRUITS:—

Pine Apple, per lb. 6s to 10s	Cucumbers, per brace, 4s. to 10s
Grapes, Spanish, per lb. 1s to 1s 6d	Walnuts, per bush., 12s to 20s
— Portugal, 1s to 3s	Chestnuts, per peck, 4s to 7s
Apples, dessert, per bush., 5s to 12s	Almonds, per peck, 6s
— Kitchen, 3s to 6s	Sweet Almonds, per pound, 3s
Pears, dessert, per hf. sieve, 4s to 14s	Filberts, English, per 100 lbs. 45s to 55s
Strawberries, forced, per doz., 2s	Cob Nuts, per 100 lbs., 60s. to 70s.
Pomegranates, per doz., 6s to 12s	Nuts, per bushel—
Oranges, per doz., 9d to 2s 6d	— Brazil, 16s
— per 100, 5s to 15s	— Spanish, 11s
— bitter, per 100, 12s to 24s	— Barcelona, 24s
Lemons, per doz. 9d to 2s	— Cob, 12s to 14s
— per 100, 4s to 14s	

VEGETABLES.

Savoy, per doz. 6d to 1s	Parsneps, per dozen, 6d to 1s
Cabbage, Red, per doz. 2s to 5s	Spinach, per sieve, 1s 6d to 2s 6d
— White, per doz. 1s 6d to 3s	Leeks, per doz. bun., 2s to 3s
Broccoli, White, per bunch, 6d to 1s 6d	Onion, per bushel, 7s to 8s
— Purple, 6d to 1s	— Pickling, per hf. sv., 4s 6d to 5s
Beans, Kidney, forced, p. 100, 2s to 3s 6d	— Green, p. doz. bun. 2s to 4s
Potatoes, per ton, 45s to 70s	— Spanish, per doz. 2s to 6s
— per cwt. 2s 6d to 4s	Garlic, per lb. 6d to 8d
— per bushel, 1s 6d to 2s 6d	Shallots, per lb., 1s
— Kidney, p. bush., 1s 6d to 2s	Asparagus, large, per 100, 6s to 9s
— Scotch, per bushel, 2s	— Spruce, or Small, 2s to 3s
— New, per lb., 1s 6d to 3s 6d	Sea-kale, per punnet, 9d to 2s 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Lettuce, p. score, 4d to 6d
Turnips, per doz. bun., 1s to 2s 6d	Endive, per score, 1s to 2s
Red Beet, per dozen, 6d to 1s	Celery, p. bd., (12 to 15) 6d to 2s
Scorzoneria, per bundle, 1s 2d to 1s 6d	Rhubarb Stalks, per bdle, 6d to 1s 2d
Salsify, per bundle, 1s 2d to 1s 6d	Small Salads, per punnet, 2d to 3d
Cardoons, each, 1s	Corn Salads, per hf. sieve, 9d to 1s
Horse Radish, per bundle, 2s to 4s 6d	Watercress, per doz. am. bun. 4d to 6d
Radish, spring, per punnet, 1s 3d to 1s 6d	Parsley, per half-sieve, 1s to 1s 6d
— Turnip, p. doz. beh., 1s to 1s 6d	Tarragon, per doz. bunches, 2s to 3s
Carrots, per doz. bunch, 4s to 6s	Fennel, per doz. bun., 2s to 4s
— Horn, per bunch, 4d to 6d	Mint, per doz. bunches, 5s to 6s
	Mushrooms, per pottle, 6d to 1s

Now ready, price 4s. 6d.,

RURAL CHEMISTRY.

By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London,
Hon. Mem. of the Royal Agricultural Society, and Lecturer
on Chemistry, at the Royal Institution.
London: 3, Charles-street, Covent-Garden.

Notices to Correspondents.

TO CORRESPONDENTS.—We have to solicit the patience of R. Preston, and a host of other correspondents: their communications shall appear as soon as we can possibly find room.

FRENCH GORSE.—W. P. P.—The variety of the Gorse which is found in France, and there called *Ajone*, is of quicker growth and more juicy than the common Gorse which grows in England and Scotland, and probably better adapted for fodder; but we have no personal experience of it. The seed could only be obtained genuine from France. The safest mode of obtaining it is to order some from Messrs. Vilmorin and Andrieux, through some correspondent at Paris. It will not be expensive. It will probably succeed well in your soil, if your soil is not wet and springy. Very little preparation is necessary beyond stirring the surface and sowing the seed. We are not aware that any pamphlet has been written upon this subject. We understand that an article appeared some time since respecting it in the "Farmers' Magazine."

MANURES.—*Oriola*.—In applying sulphuric acid to a liquid manure-tank proceed thus: Purchase it of the wholesale dealers, who will let you have a carboy of it. Pour into a stone jug as much as will fill a quarter fill it; gradually add water till the jug is full. Then pour it among the liquid manure a little at a time; if much is added at once, violent effervescence takes place, and the liquid will probably be thrown over you. Stir up the fluid when the effervescence begins to diminish, leave it for a few hours, and then add more sulphuric acid, provided it causes a renewal of effervescence. The cessation of the latter is a sign that the ammonia is fixed. *Stowmarket*.—We have read Mr. Bree's letters, but we do not understand them. He says this is a law, and that a law, but we know nothing of such laws. *A Subscriber*.—Nitrate of soda and guano suit all kinds of crops, but they must be used with caution. The first should be used in small quantities at a time, dissolved in the proportion of 3 oz. to 8 galls. of water, and applied when plants are beginning to grow. Guano is a very strong substance, and should be used either mixed with water till it is of the colour of small beer, or with five or six times its bulk of earth or charcoal powder. It is very similar in its action to putrid yeast, or pigeons' dung. *Anon.*—You will find at p. 5 the result of an excellent experiment on guano, which we would advise you to repeat with your Carrots. We this week give you another on Wheat. The best disinfecting powder to apply in emptying your cesspool, &c., is bleaching-powder, which costs, wholesale, 6d. a pound. Two or three pounds will go a long way. You cannot use a worse substance than quicklime, which drives off all the offensive odour, instead of fixing it. If you cannot get bleaching-powder, charcoal dust will do service; and in the absence of that, the siftings of the house-cinders may be employed; even peat-earth may be employed, or saw-dust; but these substances act slowly, require to be mixed with the cloacine before it is removed, and the two last must enter into fermentation before they are fit to carry on land. Bleaching-powder, dissolved in a large quantity of water, acts instantaneously. A pound of the powder will impregnate half-a-dozen pails-full of water. The best way is to mix the powder with water some hours before it is wanted, and to stir the fluid frequently. *C. G.*—We advise you to try guano, artificial guano, the coarse sulphate of ammonia, nitrate of soda, and the sulphate of ammonia in crystals: 2 cwt. per acre of each. You will see the mode of applying them upon reference to former pages, and to numerous answers to correspondents. If you find the expense too great you can reduce the quantities. Our advertising columns will inform you who deal in such articles: we never recommend one person in preference to another.

LIQUID MANURE.—T. A. N.—Cloacine and Urine, after being disinfected, should be diluted with at least four times their bulk of water previously to being used upon plants in the open ground.

PLANTING.—*Patience*.—If Ivy will not grow on the precipitous sides of your bank, we should have small hope of anything else succeeding; but surely you must be mistaken; for Ivy will grow almost anywhere. The following are also worthy of a trial: *Hypericum calycinum*, *Vinca major*, *Ampelopsis quinquefolia*, *Vitis odoratissima*, *Clematis Vitalba*, flammula, and other species of that genus.

VINES.—T. W. T.—You had better defer painting the partition between your Vineries until the leaves fall from the Vines. It would be running a great risk to paint it now when the Vines are just breaking. *Cornish Man*.—For growing in a Vinery where fire-heat is dispensed with, you may add to the Black Hamburg and Sweetwater, the Chasselas Musqué and Royal Muscadine. With Kirke's Black Hamburg we are unacquainted. The Verdello is a small sweet Grape, of good quality, and usually bears abundantly. We should imagine that you might with safety allow strong Black Hamburg Vines, four years planted, to ripen from 12 to 16 lbs. each. Grafting the Vine by approach must be performed when both plants are in full growth, and is done by paring away the bark and a small portion of the wood, to the length of two or three inches, on that side of the shoot where it can be most readily united to the stock. Pare away the stock in a similar manner, make a slit upwards in the shoot, as in layering, and a downward slit in the stock for the reception of the heel thus formed. After joining the two accurately together, tie them closely up with bast and cover the part with damp Moss. We will tell you more about grafting the Vine next week.

COLD PIT.—*Alnus*.—The height of a Cold pit above the ground must depend entirely upon the use for which it is intended. For general purposes about 4 feet at the back, and 3 feet in the front, will be found most serviceable.

HOTBED.—T. A. N.—The best height for a brick pit, on which to place a small frame 3½ feet long by 2½ feet wide, is 3 feet. As it is intended for raising half-hardy annuals and striking cuttings; and as stable dung is inadmissible on account of the inconvenience of carrying it through the house, we have no doubt that refuse hops, as stated at p. 158, would answer the purpose. *G. A. C.*—Your Gardener is right. Your Melon bed, only 1½ foot high, will soon lose its heat, in which case your only resource will be to form linings around it, renewing them occasionally as the heat in the bed declines.

POMONA RUBRO-CARRULEA.—*Georgius*.—If seeds of this plant are sown now in a hotbed, and the young plants are carefully tended and hardened off, they may be planted out in a warm and sheltered border in May, where they will bloom until cut off by Autumn frosts.

CORREA SCANDENS.—*Georgius*.—This is a climbing plant, which will succeed against a south wall, provided it is protected from severe frost.

CHIMONANTHUS.—*A Novice*.—The best time for pruning *Chimonanthus fragrans*, or *Calycanthus præcox*, as it was formerly called, is the present, after the flowers have fallen. It merely requires those shoots which cannot be conveniently trained in to be cut away.

WATER LILY.—*E. D.*—This plant is easily multiplied by raking up the old stems, and transferring them to any place in which it is desirable to plant them; taking care to sink the roots by some means into the mud at the bottom of the pond.

CROWFOOT.—*A. E.*—There is no better method of destroying the bulbs of Crowfoot or Ranunculus, when thrown into heaps, than by chopping them to pieces or burning them.

GLYCINE SINENSIS.—*Veronica*.—It is not unusual for this plant, when newly removed, to make but little progress for a considerable time, and afterwards to commence growing vigorously. This will perhaps be the case with yours. As your soil is not rich, it would benefit it to water the roots occasionally with liquid manure.

CLEMATIS.—*Veronica*.—*Clematis azurea*, Sieboldi, and viticella, are hardy. They will grow in any light rich soil, such as a mixture of turfy loam and peat or leaf mould. We have forwarded your letter to the author of the *Amateur's Garden*.

RAMPION.—*A Subscriber*.—The treatment of this plant is described at p. 364 of 1842.

SHAMROCK.—*W. R. W.*—The true Shamrock is now believed to be the Woodsorrel, and not any of the Trefoil kind.

HEMLOCK SPRUCE.—*A Subscriber*.—This plant likes good light dry land, but it is not very particular. Like all the Pine tribe, it dislikes soil that has been long manured. Nitrate of soda applied in small quantities, dissolved in water, to the roots of Conifers when they are pushing, will probably do them good, unless they are very unhealthy, and then it may do harm. You must, however, take care that the Nitrate is not much adulterated with salt.

POMEGRANATE.—*F. H.*—If you manure this plant too freely, it will run to wood without blooming. It flowers best when planted in moderately rich, dry soil, in a warm south place, where it will make a rather stunted growth, and ripen its wood well. The more it is pruned, the less likely it is to flower.

EVERGREEN OAK.—*A. E.*—The Evergreen Oak grows most vigorously in rich loamy land: but it will thrive in almost any soil. We do not know whether it will grow in chalk.

ORANGES.—*Berkshire*.—It is not improbable that the cause of the leaves falling from your Orange-trees proceeds from the plants having received too much water when not in a growing state, and from the soil having become hardened about the roots. This may easily be ascertained by examining one. As the leaves did not fall until December, it does not appear that the roots were injured by the pots having been exposed to the sun during summer. They will soon recover if repotted and placed in a close, moist atmosphere.

CACTUS.—*A young Beginner*.—If you are anxious to forward the blooming of your Cacti, they will not be injured by being transferred to the stove, provided you give them plenty of water.

ROSES.—*A Subscriber*.—Both the Yellow and White Banksian Roses are admirably adapted for training upon pillars. A southern aspect is best for them. *T. A. N.*—If, after pruning Roses in winter, the terminal buds are killed by frost, it is proper to cut back the shoots in spring to the next living bud. We have had no experience in the action of Bone-dust and Guano upon Roses. The best time for potting Roses is directly after the leaves have fallen: if performed at this season, it should be done before the buds have pushed to any extent. *Corycius*.—There is no doubt but the Scotch Rose may be budded on the Dog Rose. It is not likely, however, that they would continue to thrive long together.

PINES.—*A Pine Grower*.—As far as we can judge from the specimen sent, we should imagine that the scalded appearance of your Pine-leaves is occasioned by their having been recently shifted, and not afterwards shaded from the force rays of the sun. During such bright days as we have lately experienced, a net, two or three times doubled, should be spread over Pine-stoves containing newly-potted plants.

STRAWBERRIES.—*W. B.*—The most approved kinds are Keen's Seeding, Elton, Myatt's Pine, and British Queen, Roseberry, Downton, Old Pine, Grove End, American, and Coul Late Scarlets.

PEARS.—*A Subscriber*.—We are not sufficiently acquainted with the Van Mons Leon Le Clerc Pear to state whether it is sufficiently hardy to bear as an open dwarf standard. The Lewis is an excellent Pear, equal in point of flavour to the Monarch and Beurré Rance; but ripening much earlier in the season. The Ne plus Meuris, Easter Beurré, and Beurré Rance are all late Pears of first-rate excellence. The two former are the most hardy; but the fruit of the latter, from a standard, in favourable seasons, is the most highly flavoured of the three. *A Subscriber ab initio*.—Mr. Dillistone of Sturmer informs us that the Barnadiston Pear obtained its name from an aged tree of this kind which grew at Kedington Hall, formerly the seat of the Barnadiston family. The Pear is stated to be of good quality, and to keep till June, being about the size and form of a large Swan's Egg. If you are desirous of obtaining scions, Mr. D. will forward them to you upon receiving your address and two postage-stamps.

GRAFTING.—*E. S.*—It is impossible to graft the Pomegranate on the Orange, or the Rose on the Vine. *Amateur*.—It is much better to bud Roses than to graft them. It may, however, be done now, and in the way you describe; we advise you to employ clay rather than grafting-wax.

VEGETABLES.—*Lusor*.—The vegetables of which you have received packets of seeds from the borders of the Rhine are, with one exception, known in this country by the following names:—No. 1, Weisser Kohlrabi, or common White Kohlrabi; 2, Libau Kohlrabi: when you have grown this Russian variety we shall be happy to receive your account of it; 3, Rosenkohl, Brussels' Sprouts; 4, Erd Kohlrabi, Turnip-rooted Cabbage; 5, Forellen Kopf, Spotted Cos Lettuce; 6, Pariser Kopf, Paris Cos; 7, Montze Ballenfuss, Tennis-ball Lettuce; 8, Grosser Mogul, Imperial Lettuce; 9, Schwarze Lange Rettig, is the Black Spanish; and 10, Rothe Lange Rettig, the Red Spanish Radish. All the above may be sown now, with the exception of the Spanish or Winter Radishes, the sowing of which should be deferred till July.

PEAS.—*E. S.* cannot sow the Portugal Sugar Pea at a better time than the present.

GOURDS.—*Junius*.—The largest Gourd is the Potiron jaune, which sometimes weighs as much as 2 cwt.

CUCUMBERS.—*An Amateur*.—We doubt the propriety of applying so strong a solution of Nitrate of Soda to Cucumbers as 10 oz. to 3 galls. of water. You had better try it in the proportion of 1 oz. to the gall, which may be applied at intervals of ten days or a fortnight. *An Amateur*.—We apprehend that the cause of your Cucumber plants producing only barren flowers is owing to your having obtained seed of a bad kind. So great is the difference in this respect between various sorts, that, under the same treatment, one will show fruit as soon as it has formed half-a-dozen leaves, while another kind will cover the whole bed before you can obtain the same result.

SLUGS.—*Bedfordshire*.—The remedy alluded to at p. 118 for destroying slugs is to place, about the borders, Savoy leaves, with a stone laid on them to prevent the wind from blowing them about. These traps are to be examined daily; the slugs may be killed by being shaken into a pan of salt or urine.

WORMS.—*J. J.*—Nothing is better for getting rid of these creatures than good fresh lime-water, prepared from fresh burnt lime. Gas-water will not drive them away. We have repeatedly stated that this fluid is an excellent manure for grass land, mixed with about three parts water. The quantity should not be less than 160 gallons of the gas-water, and as much more as the price it bears will enable you to afford. Now is the right season to apply it.

ANTS.—*A young Beginner*.—As long as you keep the sand in which your Pines are plunged dry, so long will you be annoyed by ants. We would recommend you to saturate the sand with water, and afterwards to water it with a solution of chloride of lime. Most of the ants may be destroyed as they are endeavouring to escape.

WIREWORM.—*A Sufferer*.—Spirit of tar is the best remedy with which we are acquainted for destroying this pest. The mode of application is described at p. 821 of 1842.

DRAINAGE.—*T. A. N.*—When moss is placed over drainage in a pot, it should be removed every time the plant is repotted. In

planting out, however, it is better to retain it, because it will serve as a reservoir of moisture in time of drought.

DRIED PLANTS.—*Hertford*.—You will find a full account of the method of drying plants at p. 527 of 1842. The use of camphor is to prevent the attacks of insects, by keeping a supply of it constantly in the drawers or cases in which the specimens are preserved.

SPURRING.—*T. A. N.*—To spur the shoot of a plant means to cut it back to a certain bud or eye, situated at a short distance from the base of the shoot.

TRELLIS.—*Asbestos*.—In our opinion no plants would look better upon a trellised paling 4 feet high, and facing the south, than China Roses, which would continue to bloom from June till the end of November. From their being planted on the north side their roots would be kept in a more equable state of moisture.

NEW ZEALAND.—We have received Mr. Wansley's circular, relating to the losses sustained by his son in consequence of the hostility of the natives. The conclusion to which we arrive is, that he ought to seek redress from the Colonial office, and not from the New Zealand Company. Outrages connected with disputed possession, or arising out of any other circumstances, should be guarded against by the civil authorities acting under the Government of New Zealand; and nothing can be more clear than that they have neglected their duty—provided Mr. Alfred Wansley has performed his. We should be glad to know why this complainant could not have acted in the same way as Mr. Wickstead in similar circumstances at the Waitea, when the quarrel was effectually settled by a police magistrate and the show of a few muskets?

FLOWER-POTS.—*O. S.*—The usual dimensions of a 24-sized pot are 8½ inches in diameter at top, by 8 inches deep.

SLATE POTS.—*New Subscriber*.—Slate pots are square, and are more expensive than those made of clay. You will find where they are to be seen and purchased by referring to our advertisements.

GOLD FISH.—*W. T. C.*—The Gold and Silver Fish bred in this country are quite as large as those from Holland. They may be procured in Covent Garden market. The best time for removing them is in May: it may, however, be done now, if cautiously performed, in which case the fish will spawn in their new habitation.

WOOLLEN NETTING.—*Oriola*.—If Bees will not pass under the Woollen Net, placed over Peach-trees when in bloom, that is not unlikely to prove detrimental to the fruiting of the trees, unless the blossoms are disturbed by high winds, or by some artificial means.

MISCELLANEOUS.—*W. A.*—It is impossible to determine plants from such fragments of leaves without a flower. *T. T.*—We think it very probable that great mischief may be done by the larvae of insects, conveyed into frames with rotten manure, but we cannot specify any particular kind. If those that are suspected of being mischievous are forwarded to us, we will readily give our opinion upon them. *R.*—*Clericus*.—Be so good as to send us the little white worms alluded to, and we will tell you what they are. At present, we cannot undertake to illustrate the Wire-worm, but we hope to do so in the course of the year. *R.*—James can have it by sending six postage-stamps.

H. T.—The *Acacia* is *A. lophantha*. *T.*—*R. S.*—Your insect is the Vine Weevil, figured and described at p. 292 of Vol. i.

D. M. Q.—Your plant is *Malvaviscus arboreus*, alias *Achánia malvaviscus*. *Amateur*.—We are so accustomed to be plundered, that we are not at all surprised at what you point out. Much obliged for the information.

Myrtus.—We regret we cannot give you the information you ask for. We never state nurserymen's prices, or recommend one person rather than another. Your question can be answered by any respectable nurseryman. *P. W.*—We wish we could say we approve of your plan of heating; on the contrary, we think it a decided step backwards. It is the business of the patentees to make their invention known, if it has the merit claimed for it. *F. W. C.*—We really cannot undertake to name Cryptogamic plants, when they have no connexion with Horticulture. *A. K.*—Yes. *Veronica*.—It is impossible to say what your Anemones are from the inspection of a leaf. *An Inquirer*.—Your plants are—1, *Acácia armata*; 2, *Erica Mediterránea*; 3, *E. carnea*; 4, *Omphalodes verna*. *G. C.*—Your plant is *Gesnera Douglasii*. *A. C.*—The Apple is the Hawthorn Souring, excellent for kitchen use. As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE Parliamentary proceedings of the week present few subjects for comment, with the exception of Lord Palmerston's motion on the Ashburton Treaty. The chief features of this debate were the speeches of Lord Palmerston and Sir Robert Peel on Tuesday night, which may be regarded as an epitome of the great questions which for half a century have endangered the relations between Great Britain and the United States. Lord Palmerston contended that, instead of resting on the case established by the decision of the King of the Netherlands and by the investigation of the British Commissioners, viz., that the St. John was a British river, in accordance with the terms of the treaty of 1783,—Lord Ashburton had granted to Mr. Webster concession after concession, surrendering a tract beyond that river to which the Americans had not a shadow of title, and obtaining no concession in return for advantages gratuitously bestowed. The effect of this weakness, in his opinion, was manifested in the tone assumed by the United States with respect to the disputed boundary on the shores of the Pacific, and if the Oregon bill had been passed by Congress he considered that it would have amounted to a declaration of war against this country. Sir R. Peel, in reply, claimed credit for Lord Ashburton and the present Government, in having settled a question "the festering sore of half a century," which Lord Palmerston, although ten years in office, was unable to adjust. Its settlement, he said, was essential to the security of Canada and to the maintenance of peace; and in adopting a conventional line, Lord Ashburton had obtained a boundary better calculated to protect our Canadian provinces than that awarded by the King of Holland, while it secured to us much greater advantages, and a larger amount of the disputed territory. He disclaimed the reference to the celebrated map "with a strong red line" in the archives of the Foreign Office at Paris, and contended that there was no evidence to connect the map with Dr. Franklin's despatch. After some remarks from Mr. Macaulay on the tone assumed by Lord Ashburton in his correspondence with Mr. Webster, the debate was adjourned. It

was again resumed on Tuesday by Sir C. Napier; but shortly after its commencement, the House was counted out, and the motion, as a matter of course, fell to the ground. Lord Palmerston on Thursday explained that it was not his intention to renew the subject; he was anxious only for discussion, and was satisfied with having elicited the opinions which had been expressed on both sides of the House. Mr. Hume then gave notice of a motion for the 31st, expressing the thanks of the House to Lord Ashburton and the Government for having brought the boundary question to a satisfactory settlement. On Thursday Mr. S. O'Brien brought forward a motion for a select committee on the Irish Poor-Law, but it was opposed by Government, and negatived on a division by a majority of 85.

From France, we learn that the Secret Service Money Bill, which was so recently the object of angry discussion in the Chamber of Deputies, was passed by the Peers on Tuesday by a large majority. The seizure of Otaheite by the French squadron is officially confirmed, and there is some probability that the Sandwich Islands will also recognise the supremacy of France.—Accounts from Spain mention that the results of the Elections are considered on the whole satisfactory to the Ministry, and that the British and Spanish Governments have agreed upon the principle of a commercial treaty.—Our German news conveys the gratifying intelligence that the Archduke Charles, the heir presumptive to the Crown of Austria, has somewhat rallied from the effects of his late illness, and that hopes are entertained of his recovery.—Further advices from the West Indies give additional particulars of the recent earthquake; slight shocks were felt at Barbadoes, Trinidad, Demerara, St. Lucia, and Berbice, but they appear to have been unattended with destruction of property or loss of life.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Prince of Wales and the Princess Royal, left town on Saturday for Claremont, and remained there until Thursday, when they again returned to Buckingham Palace. His Royal Highness Prince Adalbert, of Prussia, arrived in London on Monday, from Lisbon and the Brazils, and immediately proceeded to Claremont, to pay a visit to her Majesty. On Tuesday his Royal Highness visited the other members of the royal family, and went over the works of the new Houses of Parliament and Westminster Abbey. On Wednesday the Prince embarked at the Custom-house for Hamburg, on his return to Berlin.—Notice has been issued from the Lord Chamberlain's office that Prince Albert will, by the desire of her Majesty, hold Levees at St. James's Palace, on behalf of her Majesty, on Wednesday, the 29th instant, and on Wednesday, the 26th of April next, both days at two o'clock. It is her Majesty's pleasure that presentations to his Royal Highness at these Levees shall be considered equivalent to presentations to the Queen. Addresses to the Queen may either be forwarded to her Majesty through the Secretary for the Home Department, or may be reserved until her Majesty shall hold a Levee.

Parliamentary Movements.—The Cambridge election has terminated in the return of Mr. Fitzroy Kelly, by a majority of 18; the numbers at the close of the poll were, for Mr. Kelly, 703, for Mr. Foster, 685. Mr. T. B. C. Smith, the Attorney-General for Ireland, has been elected Member for Ripon, in the room of Mr. Pemberton, who has retired from public life. The Athlone election committee have concluded their inquiry, and reported to the House that Mr. Farrell had not been duly elected, that the election was void, and that he and his agent, Mr. French, had been guilty of treating. A new writ has accordingly been ordered for the election of a Member. The Nottingham election committee have reported to the House that Mr. Walter was not duly elected; that the last election for the borough was a void election; that Mr. Walter, through his agents, was guilty of bribery and treating; but that it has not been proved that such bribery was committed with the knowledge and consent of Mr. Walter. The new writ was ordered to be suspended for a week, until the evidence be printed.

The Mint.—By a Parliamentary paper issued last week, respecting the transactions of the Mint during 1842, it appears:—1. That 194,229l. 0s. 6d. were issued out of the Consolidated Fund for the purchase of bullion for coinage. 2. That the total amount of purchases of silver bullion and dollars was 191,924l. 18s. 2½d., the Mint value of which, at 66s. per lb. Troy, was 208,746l. 2s. 11½d., showing a seignorage difference between market and Mint value of 18,664l. 2s. 3½d. 3. Old worn silver coin from the Bank of England, purchased for re-coinage, nominal value, 20,000l.; Mint value, 18,157l. 2s. 5d.; showing a loss on the purchase of 1,842l. 17s. 7d. 4. Copper bullion purchased, 499l. 12s. 2d.; Mint value at 224l. per ton, 1,189l. 3s.; seignorage, 689l. 10s. 10d. 5. The silver and copper coin delivered into the Mint-office amounted to 192,852l. of silver, and 1,344l. of copper. 6. Payments of silver and copper coin were 190,472l. 13s. 3d. 7. Payments made into the Exchequer out of cash received for silver and copper monies, 175,317l. 0s. 4d.

Foreign.

FRANCE.—There is little news of general interest from Paris. The Chamber of Peers has been occupied for some days with the discussion of the Secret Service Money Bill, which passed on Tuesday by a large majority. The only

event of the debate which requires notice, is the speech of M. Guizot, which is admitted by all parties to be fully equal to his former orations on the general policy of France. We can only quote the following remarks in reference to this country. "In England you know the difficulties of our situation during the last two years. You know the efforts that were necessary to maintain amicable relations between the countries, and prevent them being disturbed by passions, national and legitimate even in some of their motives, but full at once of error and of peril. Notwithstanding the difficulty, the desired result has been obtained. Not only have the friendly relations between the two countries been maintained, but a great number of delicate questions existing between them have been solved, and in a manner conformable to our interests and our desires. In fine, it is at the present day evident to all the world, that the passions so lively awakened amongst us, have begun to grow calm; that a more just and equitable feeling prevails with respect to England; and that thanks to the perseverance and moderation of our policy, as well as that of England, there is every reason to hope that the amicable relations between the two countries will soon be solidly re-established." In the Chamber of Deputies there has been little novelty, excepting on a motion for abolishing the vote by ballot in the house, which was lost on Wednesday by a majority of eight. Much attention has been excited by the elections of the officers of the National Guard, which commenced on Tuesday. The tranquillity of France depends so greatly on the tranquillity of the capital, that the feelings of the National Guard towards the Government are naturally watched with solicitude when about to be manifested in the selection of its commanders.—The *Moniteur* officially confirms, in the following terms, the taking possession of Otaheite by the French squadron:—"The Government has received despatches from Rear-Admiral Dupetit Thouars, announcing that the Queen and the chiefs of Otaheite had asked to be admitted under the protection of the King of the French. The Rear-Admiral acquiesced in their demand, and had taken effective measures for the purpose until the receipt of the ratification of the King, which is about to be forwarded to him." We may possibly soon hear of the Sandwich Islands having also acknowledged the supremacy of France, for the *Quotidienne* mentions the arrival at Paris of an Envoy from them, of the name of Thomas Halillo. This personage is stated to have come on the subject of reparations required of the King of the Sandwich Islands by the commander of the French ship of war L'Ambuscade, also for sundry injuries done to French missionaries, and other offences against a treaty entered into with France in 1839.—It appears that definitive arrangements have been made relative to the railroad from Paris to Amiens, and from thence to Lille and to Calais. The Government has entered into terms with Messrs. Rothschild, Mills, and Co., a company of French and English capitalists, to have all the road completed in five years. The Chambers, last week, rejected the demand of Ministers for a grant of two millions of francs for the completion of the Bordeaux and La Teste Railroad.—The town of Les Andelys, in imitation of other towns of France which have erected statues to such of their townsmen as have distinguished themselves in arts or sciences—as Rouen to Pierre Corneille, Paris to Molière, Chateau-Thierry to La Fontaine, and Montbéliard to Cuvier—has determined on paying a similar tribute to Nicholas Poussin, the painter. A subscription to this effect has been opened under the auspices of the Minister of the Interior.

SPAIN.—Accounts from Madrid of the 14th inst. state, that the British and Spanish Governments had at length agreed upon the principle of a commercial treaty. As far as the election returns had been published the results had been considered satisfactory to the Government, although MM. Mendizabel and Gonzales had failed in their attempt to be returned for Madrid. The Infante Don Francesco de Paula has been returned for Saragossa, and much curiosity was excited as to the part his Royal Highness would enact in the Cortes. Considerable attention was also bestowed on the presence of Prince Napoleon Bonaparte, who had just had a private audience of the young Queen.

PORTUGAL.—We have Lisbon news to the 13th inst., brought by the Montrose steamer, in which Prince Adalbert of Prussia came passenger from Lisbon, where he had been spending a week, having arrived there from Bahia on the 6th, in a Sardinian frigate. A great number of important projects of law had been submitted to the Chambers. One was for the introduction of an extensive scheme of primary and secondary instruction throughout the kingdom; another for improving the navigation of the Tagus near Santarem, and cutting a canal through the valley of Azambuja; and a third for the construction of a general system of roads. This latter project had already passed the Deputies. The accouchement of the Queen was expected daily, and prayers for her safety had been directed to be said in all the churches of the country.

BELGIUM AND HOLLAND.—We learn from Brussels that it is in contemplation to establish a Belgian colony in the Sandwich Islands, and that the Belgian Colonisation Company of St. Thomas is in negotiation with the King of these islands. The private secretary of that Sovereign, M. Halillo, lately arrived at Brussels from the United States, and has since proceeded to Paris. The emigrant-ship Theodore has sailed from Antwerp for the new colony in Central America. The Brussels papers state that Holland has just lost one of its most honourable citizens, and the house of Orange one of its most able servants, in M. Falck, minister of King William II., who died on the 16th, at Brussels, of an attack of gout.

GERMANY.—Letters from Vienna, of the 12th inst., state that the illness of the Archduke F. Charles, the

Emperor's brother, and presumptive heir to the crown, assumed so serious an aspect last week, that the sacrament had been administered to him; but that he had rallied within the last few days, and hopes were entertained of his recovery. The Archduke was one of the most distinguished commanders of the Austrian Army during the last great struggle with Napoleon. They also state that intelligence has been received from Uppeis, in the Bannat of Hungary, of a crime which has excited great indignation, the victim being a member of one of the most noble families in Germany. Count Ferdinando Nieperg, captain of hussars in that town, had forbidden those under his command from going to visit the inhabitants of a village, because there had lately been some affrays between the military and citizens. But going himself to the place, to see if his commands had been obeyed, he was attacked by two subaltern officers who were present, and who at once fired two pistols at him, by which he was mortally wounded, and died in a few hours. The two perpetrators of the murder have fled.—It appears that the reaction against the liberty of the press is making rapid progress among the Germanic Confederation, and that the censorship is become more strict than ever. The *Rhenish Gazette* will cease to appear after the 1st of April. The *Allgemeine Zeitung* of Leipsic is refused admission into Prussia, and the *Augsburg Gazette* has lost its importance in consequence of the proscription enforced by Bavaria and Prussia.—Letters from Prague mention that the family of Count Waldstein, descendants of the Duke of Friedland (and erroneously called Wallenstein), have commenced an action to recover the great estates, on the ground of the imperial rescript of 18th July, 1628, which confirms the testament of the Duke *per extensum*. The Imperial Exchequer has reported the suit as a matter already decided, but the tribunal at Prague does not recognise this objection; and thus this remarkable claim, which has been so often brought forward, rejected, and again taken up, will be brought to a legal decision.—Another German railroad, that from Magdeburg to Halberstadt, is to be opened in its full extent on the 15th July next. This will be of great convenience to those English tourists who choose Hamburg for their route, on their visits to the Continent next summer. The steam-boats proceed from Hamburg up the Elbe to Magdeburg, and the railroad from Magdeburg to Halberstadt will carry the tourist at once into the midst of the romantic beauties of the Brocken and the Harz Mountains, with Berlin, Dresden, Leipsic, Stettin, Frankfurt-on-the-Oder, &c. Magdeburg has been for some time in constant railroad communication.—Accounts from Hanover state that several of the Orders of Knighthood, medals, and honorary insignia (given on the occasion of the marriage of the Crown Prince) have been sent back to the Government.

MALTA.—Letters from Malta give further particulars of the melancholy death of Dr. Martin, noticed in our last. It appears that the shot was almost immediately fatal, and that death ensued within the hour. The ball entered at the lower part of the back, and completely traversed the stomach, so that nothing could be done to save his life. The murder was committed by the sentry at Sir John Louis's door, as Dr. Martin was passing from the house to the Admiral's steps. Had his visit been a little earlier, his life would have been saved, for the sentinels were changed at twelve o'clock. The soldier was not two yards from Dr. Martin when he fired; he has been examined by the magistrates, and says that his musket went off by accident; but this is contradicted by the evidence of an eye-witness, who saw him the instant after the gun went off, holding it still presented, in the way a soldier takes aim. The result of the coroner's inquest is not yet known.—A Court Martial was lately held at Malta, which admonished Capt. Sir C. Sullivan, of the Formidable, which ran ashore near Barcelona, "to be more careful in future in reference to the use of the lead and line," and reprimanded the master on the same grounds.

GREECE.—The accounts from Athens relate chiefly to the death and funeral of Theodore Colecrotoni, the most remarkable of the Greek chiefs who fought for the national independence during the revolution. He died at the age of 74, on the 15th, of an attack of apoplexy. The funeral was attended by several thousand persons, including the garrison, and was accompanied to the burying ground, about half a mile beyond the temple of Jupiter, by the entire population of Athens, and by the carriages of the whole *corps diplomatique*, except that of the French Minister. Even the Turkish Ambassador was not ashamed of being seen doing honour to the warrior, though he had fought against the country he represented. Among the pall-bearers was Sir Richard Church, the former Colonel of the deceased when in the English army.

WEST INDIES.—The mail steamer Tay has brought accounts from Trinidad to the 15th, Barbadoes to the 16th, St. Lucia to the 17th, Jamaica, St. Kitt's, and Demerara to the 18th, and Dominica and St. Vincent to the 19th February. The papers do not afford much news in addition to what has been received by previous arrivals. They are, of course, principally occupied with the details of the earthquake experienced in the neighbourhood of the Northern West India Islands, the particulars of which are already known to our readers. Slight shocks had been felt at Trinidad, Demerara, Berbice, and St. Lucia, but it does not appear that they were attended with destruction of property or loss of life, though the populace have been in a complete state of consternation, owing to the great damage done in Antigua, Nevis, Guadeloupe, and Martinique, by the late awful visitation. The Barbadoes journals express with much satisfaction their escape from the calamity which has befallen the sister colonies, and add, that the prospects of the crops were good, notwith-

standing the sultry state of the weather. The canes are said to present a luxuriant appearance, while the agricultural population were working with the greatest activity in carrying out the operations of the fields. The representatives of the Legislative Council of Barbadoes, sympathising with their fellow colonists of the neighbouring islands, who have suffered by the earthquake, prayed the Governor to make a grant from the public treasury for their relief; and, in compliance, a sum of 15,000 dollars was voted by them, to be applied in such proportion and in such manner amongst the sufferers in the neighbouring islands as his Excellency and the Council may see fit.—From Trinidad we have accounts of the continuance of emigration from the shores of Africa, to supply the wants of the colonists with labour. The Kroomen were the class of people mostly engaged. A fire had occurred on the Matilda estate, supposed to be the work of an incendiary. It is remarked that the crime of arson is much on the increase, and that the local authorities do not exercise proper vigilance for its suppression. The Tay does not appear to be the bearer of more recent accounts from Guadeloupe than have already reached us from France, nor of anything new from Cuba since the conflagration at Port-au-Prince, on the 9th January. A Court-martial has been held upon the Hon. Captain Elliot, of the Spartan frigate, for inflicting corporal punishment on Mr. Delacy M. Gleig, a midshipman of that vessel. The court found Capt. Elliot guilty of the charges alleging the infliction of corporal punishment; but in consideration of the very high testimonials as to character and conduct adduced by the prisoner—the extraordinary and parental anxiety manifested on all occasions for the well-doing and general instruction of all the young men on board his ship, and particularly of Mr. Gleig himself—and also looking at the nature of the punishment complained of, the circumstances under which it was inflicted, the feeling which dictated it and which animated the prisoner towards all under his command, as proved in evidence, the court decided that the authority and the rules and regulations of her Majesty's service, and the dignity of the law, as applicable to an infringement of them, will be fully vindicated and upheld by merely adjudging that the prisoner be severely reprimanded. Upon Captain Elliot's return to his own ship, the crew received him with loud and continued cheering, which was heard on board every ship in harbour and in Port Royal.—An extraordinary phenomenon was observed from the Tay to the W. and S.W. during the homeward passage on the 6th, 7th, 8th, 9th, 10th, 14th, 15th, and 17th inst. In appearance it was like a bright sunbeam, resembling in shape a comet's tail, but more parallel, the altitude of the upper limb being about 32 degrees, and terminating downward about 8 degrees above the horizon in an oblique direction; it was generally visible from half-past six until nine in the evening. This is, no doubt, the comet we have noticed under our Miscellaneous article. Among the passengers by the Tay were a black prince and princess, the Prince Louis Napoleon Christophe, of St. Domingo, brother of Christophe, King of Hayti, and his wife. They had been visiting the West India Islands for pleasure, and have come to England in the same pursuit.

Parliament.

HOUSE OF LORDS.

Monday.—Lord DENMAN called the attention of the House to a paragraph he had read in the *Morning Chronicle* of Thursday last, in what professed to be the report of a speech delivered the preceding evening by Sir T. Wilde in the House of Commons. In that speech he, the learned Chief Justice of England, found himself accused of having declared from the Bench "that licentious and profligate writings, and their use by prisoners, had nothing to do with prison discipline." He could not lose a moment in vindication of his own character, and of the administration of justice, in giving such an accusation the most unqualified contradiction. He had never uttered nor entertained a single sentiment that bore the least affinity to what had been ascribed to him. His judgment, delivered in the case of *Stockdale v. Hansard*, was evidently that alone to which such an accusation could point; but in that case the words used by him, as reported by Adolphus and Ellis, were, "that whether the book found in the possession of a prisoner in Newgate were obscene or decent could have no influence in determining how prisons could best be regulated." He made no motion on the subject, but contented himself with this refutation of the calumnious report.—Lord BROUGHAM produced an additional contradiction of the *Chronicle's* report in the shape of a letter from Sir T. Wilde, who positively denied having ever made use of the words attributed to him. Lord Brougham took that opportunity of recording how entirely and from the bottom of his heart and soul he agreed in every one particular with the judgment then pronounced, and how heartily he concurred in the renewed statement of that decision, and the grounds of it that had been made that night by his noble and learned friend. He rejoiced at having now an opportunity of thus declaring his opinion in favour of that judgment, relieved from all those scruples which would have restrained him at the time when that judgment might have come before him in his judicial capacity in that House.—Lord CAMPBELL maintained that the bill of 1841, agreed to by their Lordships, and which recited in its preamble that the power of inquiring into abuses was the necessary privilege of both Houses of Parliament, amounted to a Parliamentary reversal of the judgment delivered in the Queen's Bench. He also asserted as a fact, that all the eminent lawyers in Westminster Hall were unanimous in condemning that judgment.—Lord ABINGER doubted Lord Campbell's fact, for he knew the opinions of eminent lawyers were generally in favour of the judgment.—Lord DENMAN reminded Lord Campbell that the universal cry of the supporters of the House of Commons at the time the bill was passing, was that, by the mere act of bringing in such a bill the House of Commons was surrendering the privilege it had been contending for.—The Duke of WELLINGTON referred to the statement of Lord Campbell, that the act of Parliament was contradictory to, or inconsistent with, the judgment of the Court of Queen's Bench. He wished to state that it was the Lord Chief Justice who supported and pressed that bill when laid before their Lordships, and who prevailed upon the House to adopt that measure. He knew he could answer for one whom that noble and learned Lord persuaded to vote for that measure—namely, himself. He voted for that measure in consequence of the speech of the Lord Chief Justice, who would not have urged that bill if it had been so entirely inconsistent with the judgment of the Court of Queen's Bench.—Lord BROUGHAM said that if there were any authority lighter than a feather in the balance, in order to countervail the great, grave, and venerable judgment of

the King's sworn Judges, administering justice and the law according to their oaths, it was precisely that testimony, that authority, that opinion of such a person as Lord Campbell on the present occasion—namely, the advocate in the cause—not a sworn judge, but the retained counsel in the cause, who had been defeated by the reasons on the opposite side; and which had been condemned by the universal judgment of the Court he had addressed; and if anything could by possibility still more detract from the weight and authority of that opinion, it was the supposed possibility of the learned counsel not bearing very meekly his entire discomfiture, after having argued for 16 hours, as his noble and learned friend admitted he had done, by those judges, who all agreed in deciding against him.

Tuesday.—Lord BROUGHAM rose to complain of a new breach of privilege—of a certain statement which he had seen in a newspaper relative to himself and Lord Lynedoch, and which he designated as a most absurd and ridiculous, yet malignant falsehood. This statement, he said, was evidently fabricated for the purpose not only of bringing him into contempt, but of exciting a cause of duel between him and his noble and gallant friend. The origin of the fabrication was this: he (Lord BROUGHAM) having expressed in their Lordships' House on a late occasion his supposition that Lord Lynedoch was a member of the Anti-Corn-Law League, and having subsequently found himself in error in that supposition, had undertaken, at the request of Lord William Russell, to correct his misstatement in the same place as he had spoken it. Before he had the opportunity of doing so, however, a paragraph came from Edinburgh, setting forth as a fact that a hostile message had been sent by Lord Lynedoch, and that the retort which he (Lord BROUGHAM) was to make was the consequence of that message. This paragraph, than which nothing would be more ridiculous as well as false, had been copied by all the London and other newspapers. He concluded by announcing that he was engaged tracing out the author of this slander, and that it was his fixed determination to bring him to the bar of that House.

The Duke of WELLINGTON, in reply to Lord Beaumont, said that it was the intention of Government to bring in a bill to give effect to the Act of the Canadian Legislature, with respect to the introduction of American grain, through Canada, at a fixed duty of 3s., and into this country as Colonial produce.

Thursday.—The Sudbury Disfranchisement Bill was read a first time; a committee was appointed to arrange and control the future proceedings, and it was ordered that one set of counsel only should be heard on each side, for and against the disfranchisement of the borough.

Friday.—Lord BROUGHAM gave notice that he would lay on the table his Bill for the suppression of the slave trade on Monday or Tuesday week, and move the second reading after Easter.—Lord CAMPBELL brought in a Bill to effect, by means of a short and simple form, the conveyance of freehold property, in lieu of the present lengthy and verbose form of lease and release. It was read a first time.—On the motion of Lord WHARNCLEFFE the Coroners Bill was read a third time and passed.

HOUSE OF COMMONS.

Monday.—On the motion for going into a committee of supply, Mr. T. DUNCANER adverted to the treatment of the Chartist prisoners in Knutsford Gaol, and read a letter from the chaplain, complaining of the conduct of the magistrates towards him, in consequence of information he had communicated to the prison inspector, sent down specially by the Home-office to make inquiry.—Mr. TATTON ECERTON said, that the chaplain had for several years kept a private memorandum-book of what was going on in the gaol, instead of communicating what he thought to be wrong to the magistrates, who were anxious that all the facts of the case should be made known.—Sir JAMES GRAHAM complained that this proceeding was premature, as it was his intention to lay the report of the prison inspector on the table of the House. The Home Secretary had no control over the appointment or removal of the chaplains of gaols, which was vested in the magistrates.—Mr. WILLIAMS asked why the rate of interest on Exchequer bills was not reduced, seeing the current rate for money in the market was not more than one per cent.—The CHANCELLOR of the EXCHEQUER replied, that the rate on public securities could not be arranged with reference to the fluctuating and temporary rate in the market.

The House having formed itself into a committee of supply, a vote was taken of 18,182,000l. to defray Exchequer bills.—The votes for the commissariat raised some debate, Mr. HUME and Mr. WILLIAMS objecting to the extravagant scale of our military establishments.—Sir R. PEEL, Mr. BERNAL, and other members argued that these establishments were reduced to as low a rate as was compatible with due relief to regiments serving abroad, and to the effective protection of our colonial empire.—Mr. HUME and Mr. WILLIAMS having urged the postponement of the civil contingencies, on account of not having had time to consider the amount and nature of the votes, Sir R. PEEL assented, remarking, in reply to Mr. Williams, who had complained of the rapid manner in which the entire estimates were hurried forward, that it was no wonder, seeing that the Government had taken the House by surprise at the extent of the reductions which they had been enabled to effect, and had thereby commanded universal acquiescence. The House then resumed; and transacted some routine business, including a discussion, in committee, on the Coast of Africa Bill; the third reading and passing of the Sudbury Disfranchisement Bill; the appointment of a committee, on the motion of Mr. HUNT, to inquire into the laws affecting aliens; and a short discussion on a motion of Mr. HUME's, for a return relating to the Mint, on which there was a division, rejecting it, by 39 to 15. The returns, excluding the private emoluments of the officers, were subsequently granted by the Government.

Tuesday.—Sir T. WILDE rose to disavow the expressions attributed to him in reference to the Lord Chief Justice, during the late debate on the privilege question. The extent of what he had said on that occasion was that that noble and learned person had held that whether licentious books were or were not used by prisoners was not relevant to the consideration of the question of prison discipline. Sir T. WILDE having, in making this disavowal, nearly repeated his former oration, he was reprimanded by the SPEAKER, who informed him that for a Member, under pretence of giving a short explanation, to make a long speech, was highly irregular and productive of great confusion. Sir T. WILDE pleaded the practice of the other House in his justification.

Lord PALMERSTON then brought on his motion with reference to the Ashburton Boundary Treaty. Various opinions were entertained respecting this treaty, but nobody thought it an advantageous bargain; while others, amongst whom he was one, thought it deserving of blame; and in entering on its discussion, he would disregard the stale and hackneyed argument of wishing to disturb the friendly relations between the two countries. War he deprecated; he admitted the great importance of maintaining intimate connexion between national "blood relations;" but they were independent political communities, having distinct interests. The first dispute which arose out of the treaty of 1783, was, which was the St. Croix?—there being several rivers to which that name had been given; the next, where were the "highlands?"—the British Commissioners finding them south of the St. John, the Americans near the St. Lawrence; and the laying down of the forty-fifth parallel of latitude, which excited long-continued dispute, the Americans, in order to gain a given territory, contending ingeniously for its determination by "geocentric" latitude, instead of by astronomical observation. The King of the Netherlands, in making his award, had decided that neither the British nor the American lines met the conditions of the treaty of 1783, and he chose an intermediate line; and though it was felt that this award was very disadvantageous to England, it was nevertheless submitted to by the British Government. But the Government of the United States had rejected it, and it was thereupon intimated to them that the Government of this country had with-

drawn its offer of adopting it. The foundation of the British claim lay on the decision of the question, whether or not the St. John, falling into the Bay of Fundy, was an "Atlantic" river, according to the terms of the treaty. It had been determined in our favour by the King of the Netherlands; and though the reopening of this question was refused by the British Government, it had been agreed that a convention should be appointed to re-investigate and decide on the disputed points of the boundary. But the proposition of the American Government, that commissioners from the state of Maine should be associated with the general commissioners, was rejected by the British Government, on special grounds of objection. The British commissioners, Colonel Mudge and Mr. Featherstonhaugh, had laboriously discharged their duty, and had ascertained that the line claimed by this country conformed with the conditions of the treaty, while the American line did not. They had not, indeed, the additional evidence in their possession of the map marked by the "strong red line;" but the American Government were aware of this corroboration of the justice of our claims. Instead, then, of resting on our case, and conducting it through the ordinary intervention of our ambassador at Washington, a special mission was resorted to, which in itself was disadvantageous, because a functionary so going out with pomp and parade would have the natural reluctance to return empty-handed. The individual selected was an additional important consideration. He spoke with all respect of Lord Ashburton, whose public character and private virtues commanded the esteem of all; but he laboured under special disadvantages, arising from his connexion with America, and his unacquaintance with diplomacy; while there were other individuals, some of whom he mentioned, who might have been more fitly chosen. On Lord Ashburton's arrival, he was met by Mr. Webster with the demand of, what proposal have you come to make to us—an advantageous position, by which he ultimately "check-mated" the British negotiator. Lord Ashburton made his proposal, which he unskillfully termed an "ultimatum," but the Americans played with him, obtaining concession after concession, Madawaska settlement and all, until they brought Lord Ashburton to a stand-still, and ascertained the compressibility of the "squeezeable material." A river boundary had been admitted to be a natural one by Mr. Webster; yet he refused to abide by it, and claimed a tract of territory north of the St. John, to which the Americans had not a shadow of a title. Here Lord Ashburton should have frankly taken his ground; the negotiation had been based on the concession of mutual equivalents; and if Mr. Webster had insisted on drawing the boundary line to the St. Francis, so as to secure this territory north of the St. John, there were various important considerations which Lord Ashburton might have bargained for it. But by the time the negotiation had been brought to this point, all these advantages had been given up; they were gone; Lord Ashburton had thrown the bag containing them at Mr. Webster's feet, and the American minister had coolly picked it up, with a profusion of thanks, but as coolly refusing any concession in exchange for advantages gratuitously bestowed. The military road from Quebec to St. John's was indeed secured; but the concession of the navigation of the St. John brought the Americans, in time of war, close to it. After referring to other points in the boundary, the noble lord proceeded to that portion of the treaty which relates to the slave-trade, expressed his conviction that since the accession of the present Government to office we had made a retrograde step with respect to this great question, and gave a sketch of the proceedings connected with the refusal of the French Government to sign the Right of Search Treaty—a circumstance of which the Americans took advantage, through their agents at Paris, in order to raise more difficulties in the way. The letter of Lord Aberdeen to the Admiralty, with respect to the burning of the slave barracks on the coast of Africa, had been another discouragement; and the correspondence between Lord Ashburton and Mr. Webster was another, as, with reference to the case of the "Creole," Lord Ashburton appeared to admit that slaves on board American ships in British ports were to be regarded as slaves still upon American territory. He trusted that this would not be conceded, but that slaves brought into our possessions would be regarded as human beings. The effect of our concessions was visible in the tone taken with respect to the disputed boundary on the shores of the Pacific; had the Oregon bill passed the American Congress, it would have been a declaration of war against this country. He concluded with commenting on the imprudent conduct of Lord Ashburton, at the dinner given to him in Boston, when he termed it the "cradle of American liberty;" and though he could not suppose that a treaty so deliberately settled should not be ratified, he hoped that this surrender of our rights to the Americans would not have the effect of indisposing them to equitable arrangements hereafter.

Sir R. PEEL said that Lord Palmerston had occupied upwards of three hours in attacking a treaty and its negotiator, though he had been ten years in office without being able to effect any settlement of the dispute. The noble lord shrunk from the more manly course of impeaching the treaty or its authors by a specific resolution, and contented himself with moving for papers which he knew could not be produced. Addressing himself, in the first instance, to the latter portion of Lord Palmerston's speech, he contended that, instead of having made a retrograde step on the question of slavery, by the treaty with the United States, the present government had made a step in advance, and one which the late government had been unable to make. Lord Palmerston had blamed General Cass for obstructing the conclusion of the treaty with France for an extended right of search; but the cause was not General Cass; it was the noble lord himself whose policy had prevented the conclusion of that treaty. With respect to the destruction of the barracks, he would go to the length of the law in suppressing slavery, but it was impolitic to go beyond it; we must conciliate other powers by respecting their rights. In the case of the "Creole," Lord Ashburton had entered into stipulations, but he had laid down the broad principle, that slaves landing on British territory were entitled to their freedom. Lord Ashburton had not undertaken to adjust every cause of dispute, because he was anxious to confine himself to the one great question, the festering sore of half a century, and which had, on the accession of the present government, placed us in a position bordering on war. As to the Oregon territory, negotiations were going on, which promised that in a few months that question would be amicably settled, if no attempt were made to excite and exasperate mutual animosity. As to the north-eastern boundary, sixty years had elapsed without bringing us nearer to a settlement. It had been attempted by the treaty of Ghent: the King of the Netherlands, after several years' consideration, had declared it to be impossible to execute the treaty, and recommended a conventional line as a compromise; and it had been accepted by this country. But the United States had refused it in 1832; yet for three successive years afterwards Lord Palmerston, being under no obligation to abide by the award, had nevertheless continued to press its acceptance on the United States—a boundary which he now thinks would have endangered the security of Canada. From 1835 what had been the course of the late government with relation to this question, having skilled diplomats at their command, directed by the "master-mind" presiding in the Foreign Office? In 1838, despairing of effecting a settlement on the terms of a treaty, they had suggested a conventional one, by which the disputed territory was proposed to be equally divided, on a principle similar to that which has been adopted by the treaty of 1842. When the present Government came into office, in 1841, they felt that it was desirable to settle this question, without the proposed additional expense and delay of a convention, especially as Lord Palmerston, on the eve of quitting office, had left negotiations more than ever embroiled, by the peremptory and cavalier terms in which he had rejected the latest propositions of the American Government. Nay, more, Lord Palmerston had made the preposterous proposition that the kings of Prussia, Sardinia, and Saxony should each appoint a scientific man to arrange an arbitration, while Mr. Fox, the British Minister at Washington,

exclaimed, "For God's sake, if you go to arbitration, don't have professors!" The noble Lord relied on his Mudge and Featherstonhaugh; but Mr. Webster had his Mudge and Featherstonhaugh; while the expense of another survey might have cost more than the worth of the entire territory in dispute. There were questions which admitted of no delay; and this was one of them: the tide of population was pressing onwards, and Sir Howard Douglas, to whom he appealed, would bear testimony to the dangers which arose from the unsettled boundary, one of them being described by the late Lord Sydenham as the strange anomaly of an armed body belonging to a foreign power being placed within a territory over which her Majesty exercised jurisdiction. The settlement of the question was essential to the security of Canada, and the maintenance of peace; and Lord Ashburton in effecting it, deserved well of his country, not only for undertaking the mission, but for the manner in which he had accomplished it. The American people were strongly persuaded of the justice of their claims, and in adopting a conventional line the British Government, after consulting high military authorities, had agreed to a boundary which would be better calculated to secure our Canadian colonies than the boundary awarded by the King of Holland, while it secured to us much greater advantages. By the award of the King of Holland this country would only have gained two-fifths and America three-fifths of the disputed territory; while by the Ashburton treaty, seven-twelfths are given to America and five-twelfths to England. After contending that the great bulk of moderate men in both countries were in favour of the treaty, and that it had given especial satisfaction to the inhabitants of the north-west American provinces, whose peaceful relations were secured by it, he passed to the map with the "strong red line," which had been found in the archives of the Foreign-office at Paris. Nothing could be more fallacious than this reference to maps. A map existed in our royal library, which had belonged to the late King, on which was traced a red line, according to the boundary as claimed by the Americans, and which was set forth as being the boundary as settled by the British negotiator of the treaty of 1783. The map attributed to Dr. Franklin had been sought for in 1826, on the request of the British Government, who were then seeking for information on the subject; it had not then been found, because it was preserved, not in the political, but in the historical department, where it had been found by Mr. Jared Sparks. Yet there was no evidence to connect that map with Dr. Franklin's despatch. He concluded with a vindication of Lord Ashburton, and called upon the House to stamp its approbation of the Government and its representative by negating the motion.

Mr. MACAULAY disclaimed everything inconsistent with friendly feelings towards the United States and personal regard towards Lord Ashburton, and also admitted the importance of a settlement of the question. But the correspondence between Lord Ashburton and Mr. Webster indicated, on the part of the English plenipotentiary, a caressing and wheedling tone unworthy of his position, and derogatory to the country, to an extent unparalleled in the history of diplomacy. Of this he quoted specimens from that portion of the correspondence relating to the cession of the Madawaska settlement, and contrasted them with the tone and spirit of Mr. Webster. The eighth article of the treaty, relating to the slave trade, had been ratified in opposite senses in London and Washington, for in America it was viewed as abandoning the right of search, neither power being there considered as having the power to search the vessels of the other. What a settlement of a question was that which rendered it necessary for the Prime Minister of England to contradict publicly in Parliament the official language of the President of the United States! The last eight or nine months had brought out a stronger disposition to pugnacity on the part of the United States than the previous eight or nine years had manifested; and every French newspaper exposed the impolicy of receding from a calm, firm demand, by echoing the opinion that America was the country which was able to deal with the proud islanders, and bring them on their knees. If this great country, the envy of others, did not find peace in firmness and dignity, she would never do so in submission and shame.

Sir HOWARD DOUGLAS narrated his experience, as Governor of New Brunswick, in the controversy which had arisen between himself and the Governor of Maine, with respect to the disputed territory. The Americans had endeavoured to goad him into a military demonstration, in order to embroil the two countries; but he appealed to the law, and was enabled to vindicate the right and jurisdiction of the Crown over the territory in dispute. He had effectually protected the Madawaska settlement, had resisted encroachment, but he fully approved of the conventional line adopted by the treaty, not as the most desirable on all points, but as the best which could be obtained without a rupture of the negotiations, which the value of the disputed territory did not warrant.—On the motion of Sir C. NAPIER, the debate was adjourned.

Wednesday.—In reply to a question from Mr. DIVER, the CHANCELLOR of the EXCHEQUER said that the Custom-house authorities had not entered into any compromise with the parties implicated in the late smuggling transactions.

The report upon the Dogs Bill was brought up, after a division, in which there were 100 for and 54 against it; and the third reading was fixed for Thursday, after another division, upon an amendment for the postponement—there being for the amendment, 36; against it, 97.

The adjourned debate on the Ashburton Treaty was resumed by Sir C. NAPIER, who complimented Sir R. PEEL on the bewitching effect of his eloquence, which had prevented him from being able to stay to listen to Mr. Macaulay's speech, in every word of which, however, as he had read it, he perfectly agreed. He then contended that Lord Ashburton had permitted himself to be outwitted by the "smart" dealings of Mr. Webster.—Mr. D'ISRAELI considered Lord Palmerston's speech of the previous evening to have been a great Parliamentary exhibition,—one of the ablest and most luminous expositions he had ever heard. But what was the state of the case? We had given up a strip of land bordering on Vermont and Hampshire, and had received another strip adjoining New Brunswick; and for the angle of land formed by the sources of the Connecticut, we had received a considerable territory forming an important military frontier: that is, we had given up one hundred thousand acres, and had received one million. The navigation of the St. John gave the Americans no peculiar advantages, as, on that part of the river running through British territory, they must be subject to British law; and the concession of House's Point was not of importance, as it did not command the entrance of Lake Champlain, and, moreover, was in ruins. He had seen the celebrated "red line" map, which was a small one of 18 inches square, by D'Anville, of the continent of North America, too minute to be an authority; and he read an extract from the correspondence of Dr. Franklin, as published by his grandson, in which it was distinctly stated that the map used by the negotiators was Mitchell's. The British negotiator of the treaty of 1783, Mr. Oswald, had been objected to, and defended on grounds very similar to those on which the appointment of Lord Ashburton had been questioned and supported. He concluded with a criticism on Lord Palmerston's foreign policy.—Mr. HAWES proceeded to address the House, but there not being forty Members present, the House was counted out, and the motion, as a matter of course, fell to the ground.

Thursday.—Mr. HUME adverted to the discreditable termination of the debate on the Boundary Treaty, and asked Lord Palmerston if he meant to renew the discussion.—Lord PALMERSTON replied he did not; he was satisfied with the result of the discussion, so far as it had gone, as it was impossible for him to go to a division after the declarations of Sir R. Peel.—Mr. HUME then gave notice, for the 31st, of a motion approving of the settlement of the boundary question, and declaring that the Government and Lord Ashburton deserved the thanks of the House.—Lord PALMERSTON afterwards took the opportunity of correcting a statement he had made with respect to Lord Ashburton—namely, that he was not only a British subject, but an

American citizen. He had been apprised by Lord Ashburton that he was in error, and he now acknowledged it.

Mr. WILLIAMS moved for a specific return of public money expended on each of the royal palaces, gardens, and parks, &c., with the salaries or other emoluments received by the rangers and deputy-rangers, from 1811 to 1842.—The Earl of LINCOLN was willing to give all the information in his power, but objected to a return for the long period required, and recommended that it should be limited to an account from 1833 to the present time.—After some remarks from Mr. HUME, Sir R. PEEL deprecated the practice of calling for unnecessary returns, which interfered with the regular business of the departments, and defeated the objects of the advocates of economy, by rendering extra aid requisite. The money expended on the royal parks was as much spent for the enjoyment of the people as the gratification of Her Majesty. Hampton-palace was open to the public; and it was unfair to hold up the necessary establishments essential to the dignity of an ancient monarchy, as an exclusive and unnecessary burden on the people.—Mr. WILLIAMS accepted the offer of the modified return, which was accordingly ordered.

After some conversation respecting the production of documents, which Mr. HUME was desirous of obtaining, in order to illustrate the state of our commercial intercourse with Naples,

Mr. SMITH O'BRIEN rose to move for a select committee to inquire into the manner in which the Irish Poor-Law Act has been carried into operation, and also as to the results of that measure upon the condition of the poor, and of society at large in Ireland, with power to report their opinion to the House in reference to any modification which may appear desirable. While he was addressing the House notice was taken that there were not forty members present; but it turned out that the required number was within the House, and the honourable Member expressed himself indignantly on the attempt which he considered to have been made to interrupt the discussion of an important Irish question. He entered into considerable detail, particularly objecting to the workhouse test as unfitted for Ireland.—Lord ELIOT said that the Government entertained no particular predilection for or against the law, but he had received very general testimony from influential individuals as to the fact of its working well. No doubt considerable dissatisfaction prevailed in Ireland respecting it, but that arose from certain defects, to remedy which the Government were about to introduce a Bill, until which he would postpone any general discussion on the subject. There were 35,000 paupers in the workhouses in Ireland; and though it appeared that the Irish poor would not go into the workhouse except as a last resource, these establishments afforded an asylum to many of the most wretched in that country, and were beneficial in conducting to habits of order and subordination. After defending the management of the Poor-law Commission in Ireland, he contended that a committee of inquiry would lead to no useful result, as the necessary remedies for any defects would be better provided for by the proposed measure of the Government, and he therefore resisted the motion.—A debate ensued in which Sir D. NORREYS, Mr. SHAW, Mr. S. CRAWFORD, Mr. ESCOTT, Sir H. BARRON, Lord C. HAMILTON, Mr. FRENCH, Mr. GREGORY, Sir R. FERGUSON, and Lord BERNARD took part.—Sir J. GRAHAM reminded the House that both Lord ELIOT and himself, in answer to questions, had repeatedly intimated the intention of the Government to bring in a remedial measure, for the introduction of which leave would be asked before the Easter recess. That measure would not circumscribe the powers of the commissioners, and would affirm the workhouse test as the only safe one which could be adopted in Ireland. Admitting the defects of the law, and proposing to remedy them, they were yet determined to uphold it generally, and therefore the grant of a committee of inquiry would only serve as a delusion, by tending to excite doubts in the minds of the Irish people as to its stability.—Mr. ROSS was satisfied with the declaration of the Government, and could not, therefore, support the motion.—Mr. S. O'BRIEN replied; and, on a division, his motion was rejected by 109 to 23.

Friday.—The Aerial Transit Bill was, on the motion of Mr. ROEBUCK, read a first time, amid much laughter.—An animated preliminary discussion arose on the motion for the second reading of the Factories Bill. It was urged by various Members that both the principles and details of the bill required careful and mature consideration; and Sir J. GRAHAM promised that, if the second reading were now taken, he would not propose the committee on the bill till after Easter. The motion for the second reading was then put. Mr. EWART objected to some of the clauses on the part of the Dissenters, and the Earl of ARUNDEL and SURREY objected on the part of the Roman Catholics. Sir R. H. INGLIS claimed for the Established Church the exclusive right of being supreme instructress of the people, and Lord J. RUSSELL complimented the House on the good temper with which the question had been met. The bill was ultimately read a second time. The Dogs' Bill, after three divisions, was read a third time, and passed by a majority of 23.

CITY.

Money Market, Friday.—Consols closed at 96½ to 7 for account, and 96½ to ¾ for money; New Three-and-half per Cents., 102½ to ¾; Bank Stock, 184 to 5; India Stock, 268½; Exchequer Bills, at 64s. to 66s. prem.

Metropolis and its Vicinity.

New Houses of Parliament.—The Select Committee of the House of Lords have met, and considered the subject of the delay in the progress of the building to which we recently adverted, and have come to the following resolution:—That considering the great inconvenience of the present House of Lords, and that such inconvenience will be greatly aggravated by the progress of the new buildings before the commencement of the session of 1844, no delay should take place in building and preparing the new House of Lords beyond what is absolutely required for the safety of the work; that the architect be directed so to conduct his operations as to secure the occupation of the new House of Lords, with temporary fittings, at the commencement of the session of 1844; that in case the architect, in the progress of the work, shall find that more time will be required, in consequence of any apprehension of injurious consequences to the building, he shall report the same to the Commissioners of Woods and Forests, in order that such report may be communicated to the House in due time; and that it does not appear to the Committee that it is advisable that any alterations in the ventilation in the present House of Lords, which would lead to additional expense, should be adopted.

Christ's Hospital.—His Royal Highness Prince Albert, on Saturday last, sent to Alderman T. Johnson, as a donation to this Hospital, the sum of 500*l.*, which the Alderman immediately transmitted to the treasurer. In reference to the previous donation of 1000*l.* presented by her Majesty, and which was stated to be the first bestowed by any Sovereign of these realms since the foundation of the charity, a *Subscriber* has sent us the following extract, from the Feb. Number of the "English Journal of Education," showing that the name of the "Merry Monarch"

ought not to have been forgotten as one of its Royal benefactors. "The institution was enriched by a succession of pious benefactors, most of them citizens of London. King Charles II., at the suggestion of Sir Robert Clayton, the Lord Mayor, granted a second charter, in the year 1676, with a gift of 1000*l.* yearly for seven years, to endow a Mathematical school for 40 boys; and an annuity of 370*l.* was added for the purpose of educating and placing out, yearly, ten boys for the sea-service."

East India House.—On Wednesday a Quarterly General Court of the Proprietors was held, for the purpose of considering various subjects of importance connected with the affairs of India. Sir J. L. Lushington took the chair, and acquainted the Court that certain papers relative to appointments in the civil, military, and ecclesiastical services, which had been laid before the House of Commons, were now laid upon the Proprietors' table, for their information. He had also to acquaint the Court that the Board of Control assented to a proposition, granting a pension to Captain John Charrat of 150*l.* per annum, to commence from the 14th September, 1838. Several motions were then brought forward, and a long discussion ensued, but the details would have little interest for the public.

The Thames Tunnel.—On Saturday, at a meeting of the directors, it was definitively arranged that the ceremony of opening this national work should take place this day, the 25th inst. The Duke of Wellington was expected to officiate on the occasion, but has been compelled by public business to decline the invitation. The first stone of the tunnel was laid in 1824, by the late Mr. Smith, afterwards one of its most active parliamentary opponents, when the occurrence of the first casualty obliged the directors to apply to Government for aid. The time during which the works have actively proceeded is scarcely more than ten years, and 600 feet, or nearly half the whole distance, was completed in the first two years. The circular staircases and the eastern roadway are now finished, but some time will elapse before the thoroughfare for carriages can be opened. Both archways are perfectly dry. At the conclusion of the ceremony, the directors will dine with their friends at the London Tavern.

Bethlehem Hospital.—At a meeting of the Governors of this Hospital on Friday, Sir Peter Laurie, the President, in the chair, it was moved by Lord Shaftesbury, and agreed to unanimously, that when visitors go through the wards, the attendants be ordered not to mention the name of any patient, even if requested to do so by the visitor. All the criminal lunatics are dressed alike, and no distinction is to be made in the treatment of any of them.

Scottish Hospital.—The election of Secretary to this ancient charity, which has for some weeks occupied the attention of the Scotch residents in the metropolis, terminated on Monday. At the close of the poll the numbers stood thus:—For Major Adair, 186; Mr. Bernie, 153; Mr. Blair, 130; Mr. Aiken, 106. Major Adair was therefore elected by a majority of 33.

Exeter Hall.—On Wednesday the first choral meeting of the Upper Singing Schools took place in Exeter Hall. There must have been at least 3,000 persons present. Amongst the visitors were, the Lord President of the Council, the Marchioness of Lansdowne, the Marquess of Cholmondeley, the Earl of Auckland, and Hon. Misses Eden, the Earl of Bandon, the Bishop of Norwich, &c. After the performance of the national anthem, Lord Wharnccliffe, who was on the platform, addressed the classes, complimenting them on their improvement, and expressing his hopes that they would continue to practise and progress. His Lordship's speech was received with great enthusiasm.

Monument to John Bunyan.—The daily papers state that it is proposed to raise 500*l.* by subscription for the purpose of erecting a suitable monument over the place where the remains of this extraordinary man were interred, in Bunhill-fields burying-ground. The tomb and tablet that once marked his memory are now crumbling into dust.

The Scottish Monument.—An application has been made to the Duke of Bedford by the promoters of this monument for permission to erect it on the south side of Bloomsbury-square, opposite Southampton-street. His Grace has submitted the memorial to the inhabitants of the square, who, with only one dissentient voice, expressed themselves so averse to the proposal, that there is no doubt of his Grace withholding his consent. The ground of opposition was the annoyance to the inhabitants, and the injury to their property, from a monument which would probably become the rallying-point of all the movement mobs of the metropolis.

Artists' Benevolent Fund.—The annual meeting of that branch of the corporation of the Artists' fund called the Benevolent Fund was held on Monday at the Freemasons' Tavern, Mr. R. H. Solly in the chair. From the report, it appeared that the institution still continued to receive the patronage of her Majesty, and that it had secured the support of the King of Prussia. During the past year the names of five orphans, who had attained the age of 16 years, were removed from the list of annuitants. At present there were 28 widows and 26 orphans receiving relief. The receipts, during the year, were 1,247*l.* 11*s.* 4*d.*, and the expenditure left a small balance in hand. The anniversary dinner was announced to take place on the 8th May, when Lord John Russell will preside.

New Churches.—It is announced that the Archbishop of Canterbury will consecrate the new Chapel Royal at Buckingham Palace in about ten days.—On Friday last, the ceremony of consecrating the new French Protestant church, in St. Martin's-le-Grand, was performed in the presence of a very crowded congregation. This church, which originally stood in Threadneedle-street, was founded

in 1550, by King Edward VI.; but in the beginning of 1841 it was pulled down to make room for the improvements consequent upon the rebuilding of the Royal Exchange, and upon its site the present Hall of Commerce has been erected. A plot of ground was subsequently obtained in St. Martin's-le-Grand, and the present structure was commenced about eighteen months ago. It is in the Gothic style, and is capable of containing from 300 to 400 persons. The cost of the erection has been defrayed out of the funds granted to the church by the charter of King Edward VI.—A subscription is in progress, under the patronage of the Bishop of London, for the erection of a French Protestant Episcopal church, in the new street now forming from Oxford-street to Holborn.

St. Patrick's Day.—The annual festival of St. Patrick took place on Friday last at the Freemasons' Tavern, Prince George of Cambridge in the chair. More than usual interest was attached to this year's festival, from the fact that it was the first occasion on which his Royal Highness had presided at a public dinner. In returning thanks for the manner in which his health was drank, the Prince said he felt the greatest possible pleasure in presiding on such an occasion. He would ever look back with pleasure on the time he had spent in Ireland, and would never forget the hospitality and kindness with which he was treated in that country.

Anti-Corn Law League.—The second weekly meeting of the Anti-Corn-Law League was held on Wednesday, at Drury Lane theatre; when the house, in boxes, pit, gallery, and stage, was again filled to overflowing. The business of the evening was commenced at seven o'clock, when Mr. G. Wilson took the chair, and gave an account of the proceedings of the League during the past week. The meeting was subsequently addressed by the Hon. C. P. Villiers, Mr. Christie, M.P., Mr. Leader, and Mr. Moore, all of whom spoke at great length on the prospects of the Corn-law Repeal.

Woolwich.—On Saturday morning Woolwich presented a very animated scene, in consequence of the visit of the Duke of Wellington to inspect the 7th Dragoon Guards, previously to their embarkation for the Cape of Good Hope. The troops assembled on the Common shortly before 12 o'clock, at which time the Duke arrived accompanied by the Marquess and Marchioness of Douro. The 7th Dragoon Guards formed in line, and his Grace, as he viewed them in parade order, was received with all the honours. After parade, the public were allowed to close in to the inner square, to witness the evolutions of the troops, who passed in close and open review order, and afterwards went through the sword-exercise. At the conclusion of the inspection, his Grace rode up to the line, and complimented the officers on the efficiency of the regiment, bidding them a hearty and soldierlike farewell. His Grace returned to his carriage, accompanied by a numerous suite; and it is much to be doubted whether, at any period of his career of glory, he met with more spontaneous or general expressions of respect. The square was formed of carriages, private and public, and thousands arrived from London by steam-boats, railroad, and on foot. No accident occurred, save one private being dragged off his horse, his accoutrements entangling with the next horse, but he escaped uninjured.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Mar. 18:—West districts, 149; North districts, 226; Central districts, 177; East districts, 228; South districts, 260. Total, 1040, (528 males, 512 females.) Weekly average for the last five years, 903, (males 461, females 442,) and for the last five winters, 1004.

Provincial News.

Liverpool.—We briefly noticed in our last the occurrence of an earthquake which visited Liverpool on the previous day, and extended to both sides of the Mersey. The particulars had not then reached town, but the following details since received will show that its effects were much more extensive than was at first imagined. It commenced in this town about five minutes before 1, A.M. The most precise narrative is that of the head constable, who was in the parlour of his house at the time, when he suddenly heard and felt a violent agitation of the windows and of the floor. Being accustomed to hear loud explosions from the works in Albert dock, now excavating, he was not much surprised at the noise; but in less than a minute afterwards another shock followed, more violent than the first—the house shook from top to bottom, and a rumbling noise was heard under the house, as if a dozen railway trains had been running through a tunnel underneath. The shock and the noise were so loud and violent as to awaken all the family, who assembled on the stairs in a state of great alarm. After this, the house was examined, and it was found that the windows on the second floor had been forced open by the shock, and some furniture had received a trifling displacement; but no damage was done, and the alarm soon subsided. The head constable adds, that the shock appeared to him to proceed from east to west, and that nothing could be more distinctly perceptible. The policeman on duty at George's Dock-bridge was leaning against one of the pillars there, when suddenly he thought he heard a carriage run rapidly across the bridge, and the ground rumbling and shaking around him. This officer perceived two shocks. The policeman on duty at the north end of Canning Dock stated that he first observed some casks, lying on the quay, move as if they were alive: they tumbled and shook as if some men were concealed in them. The first shock lasted from three to five seconds; the second from seven to ten seconds; and at first it appeared as if the tower of a church at some distance had fallen down at one crash. Not the least remark-

able circumstance was the agitation of the horses in the stables throughout the town, particularly in the south division. The shock is variously described by different individuals. Some felt the bed rise like the heaving of a vessel, and heard a noise resembling that of a coach running along the street; others describe it as like the report of a cannon. One man compared the noise to that of a large dog running round the room; but the accounts generally agree that it lasted for about four seconds, and was accompanied by a buzzing or rumbling noise, like the starting-stroke of a locomotive steam-engine. The motion was vibratory, horizontal, and vertical, lifting those who were sufficiently awake to discern it, like the motion of a coach in swift movement on unequal ground; and many persons arose from their beds in great fright. In the Custom-house, decidedly the heaviest building in the town, the keeper of the house, who sleeps at the top, felt it severely, and became alarmed, but could not account for the shock. The watchman stationed in the building below also felt it simultaneously, and states that it made the windows and the doors shake and rattle in a violent manner. The shock extended to the Cheshire side of the Mersey, and was felt more severely there than in Liverpool; the inhabitants of New Brighton, Egremont, Seacombe, Woodside, and Birkenhead, were much alarmed by it, and its effects were strongly felt in Manchester, Wigan, Preston, and their immediate neighbourhoods. The guard of the London mail, when waiting at Parkside, saw the line undulate very visibly, and remarked upon the circumstance to another person in the employment of the company.

Manchester.—The earthquake was felt severely in this town and neighbourhood. A slight shock was experienced about 20 minutes after 8 o'clock, on the morning of Friday week, through a considerable part of the district to the north-eastward of Manchester; its centre apparently being in the chain of hills which separate Yorkshire and Lancashire, but it was felt by several families residing in this immediate neighbourhood, and more particularly at Cheetham Hill. The shock on Friday last was somewhat more violent, and appears to have been generally felt throughout the suburbs, particularly in the neighbourhoods of the Cheetham Hill-road and Crumpsall; Strangeways, Higher and Lower Broughton, Kersal Moor, and Prestwich; Ardwick and Longsight; Greenheys and Rusholme, Moss Side, the Stratford New-road, and Strretford; Pendleton, Pendlebury, Eccles, and Barton-upon-Irwell. Almost all the persons who noticed the time concur in stating that it commenced from five to three minutes before 1 A.M., and, in one or two instances, a sensation is said to have been experienced for an hour previously of an oppressive heat and closeness in the atmosphere. There was but little wind, and that from the south-east; the barometer exhibited no remarkable fluctuation. The *Manchester Guardian* states, that about an hour previous, the moon, which was full at 6 A.M. on Thursday, although shining unclouded, presented a dim and filmy appearance, as though a thin veil of cloud were drawn over her whole disc. In connection with this fact, they also mention that, perhaps an hour before the earthquake which caused so much alarm in this town in September, 1777—occurring about eleven o'clock on a Sunday morning, and causing the people to rush affrighted out of the churches and other places of worship—the sun, though shining in a clear unclouded sky, was observed to be so dim as to be looked at steadily with the naked eye without dazzling the vision, and immediately after the earthquake the sun shone out again with great brilliancy.

Lancaster.—About one o'clock on Friday morning, this town and its vicinity experienced several smart shocks of the earthquake, which continued for about 50 seconds, and created considerable alarm. The force of the shocks was such that many persons were shaken in their beds, whilst windows and furniture rocked to and fro in every direction, and the houses trembled to their foundations. The river is likewise reported to have been considerably agitated. No personal injury has been sustained, though considerable damage has been done amongst the china, glass, and other brittle materials. The fetters and other prison implements hung up in the gateway tower of the castle, clanked against each other with great violence. A few hours previous to the earthquake, three men, belonging to Bolton-le-sands, were engaged on Lancaster sands in the occupation of shrimping, when they were overtaken by the flowing tide and drowned. The tide appears to have set in a considerable time before the usual period of high water, and the circumstance is supposed to have been the precursor of the earthquake.

Preston.—The earthquake was felt here more severely than in most other towns of Lancashire. Its approach was intimated by an unnatural buzzing noise, gradually increasing louder and louder until the moment when the convulsion passed a given point, and then the sound and the effects produced on the instant became very alarming; windows and doors rattling—and the very houses apparently staggering to their foundations. The watchmen of the town and the public officers on duty describe the sensations which it excited as appalling, the ground appearing to them to be sinking under them, and themselves feeling as though they were descending to a great depth. The bells rang in several houses, and great alarm was experienced in many families.

Isle of Man.—The earthquake was felt in the Isle of Man at the same time it occurred in Lancashire. The following letter, dated Douglas, March 18, describes the shock:—"A slight shock of an earthquake was felt in this town and its vicinity yesterday morning, about one o'clock, A.M. The shock lasted a few seconds, and, in some cases, produced considerable alarm to the inhabitants, who were awake by the oscillation felt in their houses. It

was preceded by a rumbling noise, and followed by a sensible vibration from east to west. At the time of the shock the wind became instantly calm, but a considerable motion was observed in the sea after it had subsided, and the waves dashed violently against the adjacent shore. After the lapse of a few minutes, the wind rose again to a stiff breeze. From all we can hear, the earthquake appears to have been felt throughout the island, and particularly at Charlestown, where the inhabitants of the college were fearfully alarmed by the shaking of the buildings. We are happy to say that no worse results happened than alarm to the timid, and general surprise to those who were disturbed in their midnight slumbers by its occurrence."

Carlisle.—The earthquake was distinctly felt at Carlisle about 1 o'clock on Friday morning. The night was unusually close, and there was little or no wind; but at the time mentioned a smart shock was perceivable—the windows in most of the houses shook violently, and the glasses and china, and even the articles upon the mantelpieces, rattled in an alarming manner. The shock did not last more than a few seconds. It is mentioned as a curious fact, in connexion with this occurrence, that at the time of the great earthquake at Lisbon, a similar shock was felt in this country, and the waters of Conniston Lake rose to an unusual extent.

Kendal.—The earthquake occurred in this neighbourhood, and in other parts of Westmoreland, about 20 minutes past one on Friday morning. On the previous evening the air was sultry and the clouds lowering, and the night was so unusually dark that it might be likened to a total eclipse of the moon, although a full moon rose at four minutes past seven on the same evening. After the shock the darkness still continued, and there was a yellowish blaze in the sky, accompanied by a strong rush of wind. The violence of the shock was so great as to cause the inhabitants to suppose they were rolling out of bed, and all agree in the testimony that the doors and windows of their habitations rattled as shaken by a whirlwind, and the furniture of the rooms, especially those of a light brittle description, were violently agitated by the collision of one piece against another. Numbers of persons simultaneously arose from their beds, who had become suddenly awakened by the rumbling of the earthquake and the tremulous motion of their houses. About two miles from Kendal, and at a village called Sedgwick, are extensive powder-mills, and several soothed themselves with the calamitous consolation, "that it was only the powder-mills that had blown up!" In several houses the inmates became so alarmed as to make a sudden egress into the street, and when the cause of their fright could not be ascertained, were seized with the utmost fear and dismay. At the Nelson Tavern the proprietor and family had not retired to rest, and the shock caused the greatest terror. The decanters and wine-glasses on the shelves began to dance and knock against each other. At several of the other inns the bells were suddenly rung, and the inmates, who had retired to rest, awoke in great consternation. The shock appears to have been felt generally with great severity in all parts of the county. At Kirkham, Blackpool, Poulton, Fleetwood, Whitehaven, Ambleside, and Keswick, the shock was very sharp, and caused considerable alarm.

Guernsey and Jersey.—The earthquake was distinctly felt in this island a little before 1 o'clock on the morning of Friday. It was accompanied by a noise resembling the rumbling of a carriage, and is described by those who felt it to have proceeded vertically from the earth. A gentleman residing at Mount Durand states that he distinctly saw the furniture in his bed-room agitated by the shock. The Jersey papers state that the shock was felt in that island nearly at the same time.

Carmarthen.—The local papers continue to give accounts of fresh outrages committed by "Rebecca and her daughters." On Tuesday night, about eleven o'clock, they visited Nanty-clawdd turnpike-gate, between Newcastle Emlyn and this town, and gave the toll-keeper notice to quit, which he did without any further ceremony. They afterwards unroofed the toll-house, demolished the windows, and broke the gate and posts to atoms.—On Thursday, at the Pembroke Assizes, Thomas and David Hewells were indicted for having, in company with other persons, riotously and tumultuously assembled together, and for having demolished and pulled down the toll-house of William Rees. The facts of the case, which are already familiar to our readers, were stated by the prosecutor, and by an accomplice named Griffiths; but in consequence of the jury disbelieving his testimony, both prisoners were acquitted.

Cardiff.—The Welch collieries are again in such an unsettled state, that at Aberdare, last week, it was considered necessary to call out the military. In Monmouthshire the whole of the colliers still continue on strike, to the number of about 5000, and continue meeting in various parts of the hills. In Glamorganshire the works on strike are those of Gelly Gaer, of Pont-y-Preedy, the Duffryn Works, and one or two others. The strike in Monmouthshire having now continued for ten weeks, a number of the Monmouth colliers, to the number of about 700, came from Monmouthshire, and having crossed the Taaf Vale Railway, compelled the men of the Duffryn Aberdare Works and the Gelly Gaer Works to strike; and from this the strike extended itself to the other collieries. Numerous meetings have been held, both by the colliers and by the magistrates, but nothing of a satisfactory nature has yet been arranged. A large meeting of colliers was held last week at Cross Penmaer, which was attended by deputations from forty-two collieries. On the same day some volunteers had been procured from the neighbourhood of Dowlais, but on their arriving at the Duffryn Aberdare Works, they were met by the men and

their wives, and attacked in a violent manner with stones, &c., and driven off the ground. Warrants were obtained against some of the ringleaders, who have been apprehended, and sentenced to various terms of imprisonment.

Railways.—The returns of traffic on the principal lines, for last week, were as follow:—London and Brighton, 2,176 $\frac{1}{2}$; London and Croydon, 203 $\frac{1}{2}$; London and Greenwich, 705 $\frac{1}{2}$; Sheffield and Manchester, 320 $\frac{1}{2}$; London and Blackwall, 499 $\frac{1}{2}$; Manchester and Birmingham, 2,290 $\frac{1}{2}$; Eastern Counties, 903 $\frac{1}{2}$; York and North Midland, 1,866 $\frac{1}{2}$; Hull and Selby, 891 $\frac{1}{2}$; Birmingham and Gloucester, 1,609 $\frac{1}{2}$; Liverpool and Manchester, 3,575 $\frac{1}{2}$; Great North of England, 1,362 $\frac{1}{2}$; Birmingham and Derby, 1,056 $\frac{1}{2}$; London and Birmingham, 13,003 $\frac{1}{2}$; Grand Junction, 6,833 $\frac{1}{2}$; Glasgow, Paisley, and Kilmarnock, 913 $\frac{1}{2}$; North-Midland, 3,609 $\frac{1}{2}$; Great Western, 10,669 $\frac{1}{2}$; Northern and Eastern, 1,169 $\frac{1}{2}$; Newcastle and Carlisle, 1,360 $\frac{1}{2}$; South-Western, 4,099 $\frac{1}{2}$; Manchester and Leeds, 4,110 $\frac{1}{2}$; Edinburgh and Glasgow, 1,827 $\frac{1}{2}$. The report of the railway department of the Board of Trade has just been published, and is by far the most satisfactory they have yet issued. They state that the number of railway accidents of a public nature, attended with personal injury, during the last five months of 1840, amounted to 28, by which 22 deaths and upwards of 131 cases of injury were occasioned; while during the twelve months of 1841, the number of accidents of a similar description amounted to 29, with 24 deaths, and 71 cases of injury. During the past year (1842), the number of accidents of this description have been only ten, the number of deaths five, of which only one occurred to a passenger while travelling by a train and observing the proper degree of caution, and the number of cases of injury were only fourteen. These do not include accidents which happened to individuals owing solely to their own inadvertence and misconduct, nor accidents to servants of the company under circumstances involving no danger to passengers, neither of which can be fairly classed among railway accidents of a public nature. With respect to the comparative safety of railway travelling, a comparison of the number of accidents attended with death or injury to passengers with the number of passengers conveyed by railway during the same period, it would appear that the science of locomotion, as far as the public safety is concerned, has arrived at a very high degree of perfection, seeing that out of more than 18,000,000 passengers conveyed by railway in the course of the year 1842, only one was killed while riding in the train, and observing the common degree of caution. The first instance occurred on the London and Birmingham Railway on the 7th December last, and the other recently on the North Midland Railway. While the Board of Trade admit this great improvement within the last two years, and are satisfied that a degree of security has been attained upon well-managed railways, decidedly superior to that of any other mode of locomotion; they, at the same time, think it right to state that the evidence furnished by the official returns shows that the extraordinary exemption from fatal accidents during the past year cannot be expected to attend upon future years, if there be any relaxation of vigilance on the part of the directors and officers of railways, or a diminution in the efficiency of their working establishments, which on the contrary will very probably engender a recurrence of serious disasters. On the whole, it appears that, although decidedly safer than the modes of locomotion which it has superseded, railway travelling is still exposed to certain sources of danger, some of which can never be entirely obviated. The report then enters into an analysis of the causes of railway accidents, classifying them under two separate heads:—first, accidents resulting from management; and secondly, from unavoidable causes. Under the first are placed accidents arising from collisions, level crossings, and fences; and under the second, those arising from the breaking of axles, slips of earth, and other causes. After some strictures upon the recent accidents and reductions on the North Midland Railway, and an allusion to some complaints of a trifling character being made against two or three of the lines by private individuals, the report concludes by stating that the total number of passengers carried upon 56 railways during twelve months, from the 1st July, 1841, to the 1st July, 1842, amounted to 18,453,504, of whom 2,926,980 were first-class passengers, 7,611,966 second-class, 5,332,301 third-class, and 2,582,057 passengers whose class was not distinguished. The returns of six railways are not yet completed, which, if added to the above, would make the total number of passengers for the year about 19,000,000, of whom 18 per cent. travelled by the first-class, 50 per cent. by the second, and 32 per cent. by the third class. The gross receipts during the same period on the above fifty railways, from passengers, amounted to 2,731,687 $\frac{1}{2}$; and from goods, 1,088,835 $\frac{1}{2}$. The appendices of statistical returns, reports, &c., present a voluminous mass of information, of which it is impossible to give an abstract.—The half-yearly meeting of the Midland Counties company took place last week at Derby. The net profit for the half-year amounted to 70,738 $\frac{1}{2}$; out of which a dividend was declared at the rate of 30s. per share for the half-year, after the payment of all expenses. The total reduction effected in the expenditure for the half-year amounted to 6,436 $\frac{1}{2}$, and further reductions will be carried out, so far as is consistent with the safety of the public and the efficient working of the line. The old directors were re-appointed by a majority of 437, and their proceedings in regard to the question at issue between the company and the Birmingham and Derby, relative to the right of traffic on the line, were unanimously approved.—The meeting of the Sheffield and Rotherham company took place last week, when a dividend of 15s. each, on the original shares, and 6s. on the half-shares, was declared. The directors

stated that they have determined upon a plan whereby the North Midland traffic and trains will fall in with the Rotherham up-trains at the Holmes station, and the down-trains will be detached at that point. By this arrangement it was considered that a saving of at least 1,000 $\frac{1}{2}$ per annum will be effected, without diminishing in number the trains between Sheffield and Rotherham, and without materially interfering with the convenience of the public.—The meeting of the Lancaster and Preston company took place last week, when a dividend of 16s. per share on the whole shares, and of 10s. 7d. per share on the three-quarter shares, was declared, subject to deduction for the income-tax. The bill for the extension of the line to Carlisle has been given up for the present.—It appears that there is at length some probability of an arrangement between the Croydon and Greenwich companies, on the basis of a proposal entered into during a recent interview between the contending parties at the Board of Trade—namely, that the opposition of the Greenwich company to the bill for an extension to the Bricklayers' Arms should be withdrawn, and the tolls on the Greenwich railway be levied on the principle of a proportionate toll according to distance; the South Eastern and Croydon companies guaranteeing to the Greenwich company an annual income of at least 6 per cent. on the whole capital expended by them for that portion of their railway used by the Brighton, Croydon, and South Eastern companies.

IRELAND.

Dublin.—St. Patrick's Day passed off in this city with great éclat. The people assembled in great numbers at the relieving of the guard in the Castle-yard, which took place in the presence of the Lord Lieutenant and several officers of the Court. It is remarked that there was not a drunken man in the multitude. The usual St. Patrick's ball took place at the Castle in the evening, and was attended by nearly 1000 persons. A plan is in progress for expediting the communication between this city and England; and several meetings on the subject have been held in the metropolis. A company of capitalists propose to make a line of railway from Chester to Holyhead, at their own expense, provided the Government consent to make Holyhead and Dublin the sole mail communication between England and Ireland, and pay the Company for the conveyance of the mails what it now costs. By this plan, Government, without further expense, will get the London mails expedited to Dublin in fourteen hours instead of twenty-four, and the country will receive a corresponding benefit.—The Windsor Castle, Indianan, which was abandoned by her crew near Ireland, has been brought into Scattery Roads. She is very richly laden, and is valued at 90,000 $\frac{1}{2}$.—At the meeting of the Repeal Association on Monday, it was announced that a great meeting of American sympathisers had been held at Washington, at which Mr. Tyler, the son and Secretary of the President of the United States had made a remarkable speech in favour of repeal. He referred to Bunker's Hill, and said, "Who could have dreamt of the beneficial effects which civil and religious liberty had imparted to a great people? A free constitution would bring home similar results to the doors of the Irish people, and when we see that people amount to nine millions, and when we know they are brave in the field, eloquent in the senate, wise in the cabinet, united and determined to be free, we cannot suppose for a moment their freedom is impossible or even difficult. The libation to freedom must sometimes be quaffed in blood. The Irish heart he looked upon as true freedom's pole, true as the magnet to the north, and their lives are given cheaply in the purchase of liberty. Such being the character of her people, we have no fears but she will soon work out her freedom, and he for one wished and hoped it might be speedy and comprehensive." The thanks of the Association were voted to the Washington meeting for this demonstration, and after a long speech from Mr. O'Connell, the week's rent was announced to be 351 $\frac{1}{2}$.

Waterford.—We noticed in our last the opposition made in this county to the collection of the Poor-rate. It appears that the multitude had made so formidable an incursion into the barony of Gaultier, that the collector abandoned all idea of enforcing the rate. During the progress of the mob along the quays, Capt. Newport deemed it necessary to read the Riot Act; and subsequently the mayor, the high-sheriff, and other magistrates, brought out the military; but fortunately there was no occasion for their services. The accounts since received state, that the Government, disapproving of the course adopted by the local magistrates, have determined to resume operations for the enforcement of the rate, and that the military have been called out for that purpose.—The Waterford papers announce that the alleged miracle at the convent of Youghal, which has obtained some celebrity under the name of the "Munster Estatica," has been investigated by four Roman Catholic clergymen and two physicians, and proved to be a complete fraud.

Tuam.—Mr. Michael Ward, the gentleman who some time since was fired at by his wife, is quite recovered from the effects of his wounds. On the night of the occurrence, the lady deeming that matters were much worse than they really were, fled the house, and travelled on foot, without taking rest, to the residence of a near relative in the mountains, 30 miles from her own house. It is said that all further proceedings have been stayed.

Miscellaneous.

Earthquakes in England.—The daily papers state that it is exactly 800 years since the first earthquake is recorded to have taken place in this country, it having happened at Worcester and Derby, in 1043. Four similar visitations are stated to have fallen on England during the following half-century. An earthquake that was generally

felt throughout the country occurred in 1090, and was followed by a scarcity of food. In 1199, the county of Somerset suffered from a like cause; and St. Michael's-on-the-Hill, without Glastonbury, was thrown down by shocks that were also felt throughout the country in 1247. Earthquakes were experienced in England during each of the three succeeding years. The greatest earthquake ever known in this country occurred in 1318; and in April, 1580, another caused great damage in various directions. It lasted only one minute; but the shock was so severe, that many churches and houses were much shattered, and many lives were lost. According to the quaint phraseology of Stow—"The great clocke bell in the Palace at Westminster stroke of itself against the hammer with shaking, as divers clockes and belles in the city and elsewhere did the like." This earthquake extended into many parts of England; and in Kent there were three distinct shocks that caused much damage. In 1583, one occurred in the county of Dorset, that "removed a considerable piece of ground." Earthquakes were felt at London and several other places in Britain, in March, 1749, and in 1750, and gave rise to the publication by Dr. Stukely, in which he attributed the phenomena, not to vapours or fermentations generated in the bowels of the earth, but to electricity. On one of these occasions it is stated that "a sound was observed to roll from the Thames to Temple-bar, just as the electrical snap precedes the shock." In 1750, the same counties now visited suffered from an earthquake that caused much damage in Liverpool, Chester, Manchester, &c.; and in the beginning of 1761, great alarm was excited throughout the metropolis and its neighbourhood by two shocks, on February 8 and March 8. In 1786, earthquakes occurred in different parts of the north of England. In Westmoreland, in 1790; in the counties of Bedford, Leicester, Lincoln, Nottingham, &c., in March, 1792; at Shaftesbury and Salisbury, in September, 1793, &c. The above are but a few of the earthquakes that are recorded to have visited England.

The New Comet.—The following letter, dated Collingwood, March 19, has been addressed by Sir John Herschel to the *Times*:—"I wish to direct the attention of your astronomical readers to the fact, which I think hardly admits of a doubt, of a comet of enormous magnitude being in the course of its progress through our system, and at present not far from its perihelion. Its tail, for such I cannot doubt it to be, was conspicuously visible, both last night and the night before, as a vivid luminous streak, commencing close beneath the stars kappa and lambda (κ and λ) Leporis, and thence stretching obliquely westwards and downwards, between gamma and delta (γ and δ) Eridani, till lost in the vapours of the horizon. The direction of it, prolonged on a celestial globe, passes precisely through the place of the Sun in the ecliptic at the present time, a circumstance which appears conclusive as to its cometic nature. As the portion of the tail actually visible on Friday evening was fully 30 degrees in length, and the head must have been beneath the horizon, which would add at least 25 degrees to the length, it is evident that, if really a comet, it is one of the first-rate magnitude; and if it be not one, it is some phenomenon beyond the Earth's atmosphere of a nature even yet more remarkable. 8 p.m., March 19.—The tail of the comet, for such it must now assuredly be, is again visible, though much obscured by haze, and holding very nearly the same position." In a second letter from Sir John Herschel of the 21st, he states that the line of the axis of the tail has evidently advanced northward, and that we shall very probably soon see the head.—On Tuesday night, Sir James South addressed the following letter to the *Times* from the Observatory at Kensington:—"The brilliant train of light of which notice is given in the *Times* of this day was seen here on Friday evening at a little after 7, and had very much the appearance of the tail of the comet of 1811. Its highest point, when I first saw it, nearly reached theta Leporis, and passing through the constellation Eridanus, became invisible to me from interposed trees when about 2 degrees from the horizon. More than 45 degrees of tail were measurable; stars of the 5th magnitude were visible through it by the naked eye, and with a 42-inch achromatic of 2 $\frac{1}{2}$ inches aperture, those even of the 8th were perceptible. At 7h. 33m. 22sec. (sidereal time) a bright meteor issued from the very tip of the tail. No trace of the above light could be detected here either Saturday, Sunday, or Monday nights, in consequence of cloudy weather. This evening (Tuesday), at about 10 minutes before 8, the clouds cleared away; but no vestige of the train could be perceived in the neighbourhood which it had illumined on Friday night; but a diffused and amorphous light, commencing at the Pleiades, and spreading over the entire constellation Aries, even through the haze, was too conspicuous to escape observation. If this be the tail of the comet, it indicates a very rapid motion of it northward. By a letter which I received yesterday from Mr. Shorts, of Christchurch, Hampshire, he has seen it earlier than any one I have yet heard of, inasmuch as he observed it three nights previous to the date of his letter, which is the 19th inst.; hence he saw it Thursday, Friday, and Saturday."—The *Bristol Journal* of Saturday has the following:—"A singular meteor was observed in the heavens last night about half-past eight, which extended from twenty to thirty degrees in the sky, shedding a line of brilliant light, following the direction of the sun. A correspondent states that, about eight days ago, a comet was observed from Madrid over the sun in the daytime, and the supposition is, that the meteor seen last night was the tail of a comet."—Private letters have also been received from Oporto, dated the 14th inst., which mention that a splendid comet becomes visible there at sunset, appearing in the west;

THOMSON'S IMPROVED MODE OF APPLYING THE PIPE, TANK, AND TROUGH SYSTEM FOR BOTTOM AND TOP-HEAT, connected with his new plan of CONSTRUCTING AND VENTILATING CURVE-ROOFED and other shaped HORTICULTURAL ERECTIONS, to which the PIPE, TANK, and TROUGH SYSTEM is APPLICABLE.

THOMSON'S ECONOMICAL BOILER and plan of warming Hot-houses, &c. has been adopted, and may be seen in use at the two largest Horticultural establishments in the Kingdom: viz., Messrs. LEE'S Nursery, Hammersmith, and Mr. WILMOT'S, Brentford. Plans and Estimates furnished for Building and Heating Green-houses, &c., on application to J. THOMSON, Landscape-Gardener and Hothouse Designer, 4, Chapel Place, Hammersmith.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS & Co., Architects, &c., Gloucester-Place, King's Road, Chelsea, Hothouse-builders, and Hot-Water Apparatus manufacturers, seeing that several parties pretend to lay claim to the Open Trough, Tank, or Gutter system of heating, J. W. & Co. here lay before the Horticultural world their practice respecting it, they having fixed and circulated water in open Troughs now upwards of 16 years; and their works are now to be seen that have been fixed that time, at DAVID PUGH'S, Esq., Welsh Pool, Montgomeryshire; the Duke of Bedford's, Woburn; Sir EDMOND ANTHOBY, Cheam, and up to the present time they could give a list of 200 names, where they have fixed that principle, or their improvement on it. The above sketch represents a pit, shewing the principle for the purpose of Bottom-Heat, which answers well. J. W. & Co. solicit an inspection of their improvements in Building, Heating, and Ventilating, at their Horticultural Manufactory, Gloucester-Place, Chelsea.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

RENDLE'S TANK SYSTEM OF HEATING.—A TREATISE, with Engravings, will shortly be published, which will contain every information for setting up or adapting this most excellent plan, without the aid of engineers or hothouse designers. Orders must be sent to the Inventor, Union-road Nursery, Plymouth.

PRACTICAL GARDENING.—Lately published, price 1s. 6d., **THE KITCHEN GARDEN;** or, Monthly Calendar of Practical Directions for the Culture of Vegetables; with a catalogue of Fruit Trees adapted for the climate of Ireland. By MARTIN DOYLE. Fourth Edition. Also, lately published, price 2s., **THE FLOWER GARDEN;** or, Monthly Calendar of Practical Directions for the Culture of Flowers. By MARTIN DOYLE. New Edition, enlarged. The two may be had bound together, price 4s. Dublin: W. CURRY, Jun., & Co., 9, Upper Sackville-st. London: LONGMAN & Co., and sold by all Booksellers.

Just published, price 1s., by LONGMAN and Co., London; W. CURRY, Jun., and Co., Dublin; FRASER and Co., Edinburgh, **TRIALS and EFFECTS of New CHEMICAL FERTILIZERS,** with various Experiments in Agriculture, for Aerating Soils and Composts—Increasing the Food of Plants—Improving Irrigation—and abating the ravages of Insects. By Sir J. MURRAY, M.D., Member of the Royal Agricultural Societies of England and Ireland.

Sir JAMES MURRAY'S New Fertilizers for Early Crops, 20s. per cask, eight casks to a ton, may be procured of the London agents, GIFFORD & LINDER, 104, Strand; or EVANS, 79, Dame-st. Dublin.

THE LATE PROFESSOR DE CANDOLLE.—An excellent Engraved PORTRAIT of this distinguished Botanist has just been published; size 15½ inches by 12. Price: Prints, 10s. 6d.;—Proofs, 15s. W. PAMPLIN, 45, Frith-street, Soho-square.

NEW WORK ON BEES.

In small 8vo. (with 70 Engravings on Wood), price 12s., **MY BEE-BOOK.** By the Rev. W. C. COTTON, M.A., Student of Christ Church, Oxford; and Chaplain to the Lord Bishop of New Zealand.

"One of the most elegant volumes that ever graced a library—table—with its exquisite woodcuts, perfection of dress, prelude of mottoes, list of Bee-books, appendices, reprints, extracts, &c., we hardly know a book that has pleased us more; it is the perfection of a scrap-book for the gentleman or lady Bee-keeper."—*Quarterly Review*.

Also, now ready, by the same Author, **TWO LETTERS TO COTTAGERS on BEES.** Letter I.—On BEE-MANAGEMENT. Letter II.—On the NATURAL THEOLOGY of BEES. Price 6d. each, or 5s. per dozen. RIVINGTONS, St. Paul's Church-yard, and Waterloo-place.

FLORIST'S JOURNAL, No. XLI., for April 1, contains articles on Ericas (with a superior Coloured Illustration), on Orchidaceae, Improvement in Garden-Pots, Preparation of Composts, Visits to Nurseries, List of New Plants, Calendar for April, The Letter Box, &c. Price only 6d.

The FLORIST'S JOURNAL for 1842, forming Vol. iii., illustrated with 14 superior Coloured Engravings, may be had in Cloth, Price 8s.

London: ALFRED ADLARD, Wardrobe-place, Doctor's Commons, and all Booksellers.

New Edition, with a New Supplement, One very large Volume, 8vo., with nearly 10,000 Engravings on Wood, 3l. 13s. 6d., cloth,

ENCYCLOPÆDIA of PLANTS; including all the Plants which are now found in, or have been introduced into, Great Britain; giving their Natural History, with such Descriptions and Figures, as may enable a beginner who is a mere English reader, to discover the name of every plant which he may find in flower. Edited by J. C. LONDON, F.L.S., &c.

"The most useful and popular botanical work which has ever appeared in the English language."—*Professor Jameson's Philosophical Journal*.

By the same Author, **ENCYCLOPÆDIA of GARDENING.** 2l. 10s.

ENCYCLOPÆDIA of AGRICULTURE. 2l. 10s.

HORTUS BRITANNICUS. 1l. 11s. 6d.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

New Edition corrected, with a Supplement, containing above 160 additional pages of Letterpress, and nearly 300 New Engravings, bringing down the Work to 1842; one very thick Volume, 8vo., of above 1,300 pages, and 2,000 Engravings on Wood, 3l. 3s., cloth, An

ENCYCLOPÆDIA of COTTAGE, FARM, and VILLA ARCHITECTURE and FURNITURE; containing Designs for Cottages, Villas, Farm Houses, Farmeries, Country Inns, Public Houses, Parochial Schools, &c., with the requisite Fittings-up, Fixtures, and Furniture, and appropriate Offices, Gardens, and Garden Scenery; each Design accompanied by Analytical and Critical Remarks, illustrative of the Principles of Architectural Science and Taste on which it is composed, and General Estimates of the Expense. By J. C. LONDON, F.L.S., &c.

"No single work has ever effected so much good in improving the internal arrangement and the external appearance of country dwellings generally."—*Times*.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

One thick Volume 8vo., with upwards of 2,000 Engravings on Wood, 2l. 10s. cloth, An

ENCYCLOPÆDIA of TREES and SHRUBS; being the "Arboretum et Fruticetum Britannicum," abridged; containing the Hardy Trees and Shrubs of Great Britain, Native and Foreign, scientifically and popularly described; with their Propagation, Culture, and Uses in the Arts; and with Engravings of nearly all the Species. Adapted for the use of Nurserymen, Gardeners, and Foresters. By J. C. LONDON, F.L.S., &c.

"In its present form, this valuable work is placed within the reach of thousands who could not hope to obtain it unabridged, and we strongly recommend it to universal patronage."

DR. LINDLEY, in *Gardeners' Chronicle*.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

BEE-HIVES, &c.—Illustrations of Apiaries, Bee-hives, Feeding-Machines, and all the Apparatus connected with the Apiary; a Sheet-List, price 1s., published by J. MILTON, may be had of Messrs. PARKER, West Strand; also at J. MILTON'S, Italian Warehouse, 10, St. Marylebone-st., Wimpole-st. "These are Illustrations referred to in the Practical Bee-keeper," a Treatise on Bees now publishing. All letters prepaid.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener (Sundays excepted).

H. WALKER'S NEEDLES (by Authority the "Queen's Own"), with the New Large Eyes, are easily threaded (even by blind persons), and worked with great ease, having Improved Points, Temper, and Finish. The Labels are correct Likenesses of Her Majesty and His Royal Highness Prince Albert in relief, on coloured grounds.

H. WALKER'S Improved Fish-hooks, Steel Pens, Hooks and Eyes, Bodkins, &c., are particularly recommended to notice.

For the Home Trade, neat packages of Needles or Pens, from 1s. to 10s. value, can be sent free by post by any respectable dealer, on receipt of 13 penny stamps for every shilling value. Every quality, &c., for shipping.

H. WALKER, Manufacturer to the Queen, 20, Maiden-lane, Wood-street.

MOXON'S EFFERVESCENT MAGNESIAN APERIENT may be had of all respectable medicine-venders throughout Great Britain and Ireland, and nearly every part of the civilized world. In all parts it has met with the sanction of members of the medical profession, who recommend it to their patients as the best *Family Purgative* ever discovered. It is of eminent service in pains in the Head, casual or Habitual costiveness, Bilious Affections, Nausea, Sickness, Heartburn, Indigestion, Gout, Piles, Fistula, and as an aperient saline draught in all febrile affections. It is an effectual remedy for derangement of the stomach and head, resulting from excess either in eating or drinking. It possesses all the medicinal powers of the most approved saline Aperiens, without the disagreeable taste which distinguishes medicines of that class, and is so agreeable that even children can take it without dislike. Prepared only by BENJAMIN MOXON & SONS, Chemists, Hull. Sold in bottles at 2s. 9d., 4s. 6d., and 11s. Observe—the genuine medicine has "MOXON & SONS" (then co-partners), Chemists, Hull, engraved on the Government stamp.—Wholesale Agents, BARCLAY and SONS, &c., London.

IMPROVED WIRE FENCING.

J. W. GIDNEY begs to inform Noblemen and Gentlemen that in consequence of the increased demand and improvements in the machinery for producing his IMPROVED STRAINED WIRE FENCING, coupled with the depression in the Iron trade, he is enabled to offer the same at a considerably reduced rate, and warrants this Fence, as constructed by him, to stand against all kinds of cattle, and for neatness, strength, durability, and cheapness, to excel all other kinds of Fencing. List of Prices, with a sketch, may be had by applying at his Manufactory, East Dereham, Norfolk.

SEED BUSINESS (old-established) to be Disposed of; principally Garden; with a wide country connexion. A good House, Stabling, Coach or Cart-house attached; Rentlow. Letters to be addressed to X. Y., care of Mr. KING, 21, Finsbury-place north, London.

SHIRLEY VINEYARD, near Southampton.—The Proprietor of this Establishment respectfully announces that he has now made sufficient progress in it to enable him to commence, forthwith, a series of experiments of a most important character, and on an extensive scale, relative to the Culture of the Vine under Glass; the object of which will be to free that interesting and valuable branch of Horticulture from the difficulties and uncertainty which have hitherto surrounded it, and to place it on such a basis, as to ensure the production of very superior fruit, with ease, certainty, and economy.

In the prosecution of this design, and in that of cultivating the Vine on open walls; and also in the propagation of Vine Plants in the nursery department of the Vineyard, he is desirous of having associated with him a few respectable Youths, as Articled Pupils, who, in addition to being taught the most improved mode of Vine Culture in all its various branches, and (as necessarily involved in it, the Theory and Practice of all the grand Principles on which the delightful Science of Horticulture is based, will also enjoy a great number of valuable EDUCATIONAL ADVANTAGES, of a sterling practical character, and such as, in combination with the above, will enable them, with industrial application, to occupy, at the expiration of their pupilage, a superior and independent rank in society.

To Parents who are desirous of providing for their Sons the knowledge of a superior and profitable pursuit, in preference to their becoming dependent on the precarious issue of mercantile or trading occupations, the opportunity thus offered may be considered as highly deserving of their attention.

As the Pupils will be considered as members of the family, and treated in every respect in the most liberal manner, a suitable Premium will be required.

Applications, personally or by letter, may be made to Mr. CLEMENT HOARE, at the Vineyard.

It is intended to limit the number of Pupils for the present to four, and Mr. H. will be ready to receive them in the ensuing month of March. February 8, 1843.

CAUTION.—Several Perfumers of apparent Respectability, for the sake of gaining a trifle more profit, basely attempt to impose their *pernicious compounds* upon the public as the real "MACASSAR OIL" for the Hair, and "KALYDOR" for the Complexion. They copy the bills and labels of the original articles, substituting either a *fictitious name*, or the word "GENUINE" in the place of "ROWLAND'S." To frustrate such imposition, it is necessary, on purchasing either article, to see that the word ROWLAND'S is on the wrapper, as follows, without which none are genuine. ROWLAND'S MACASSAR OIL, for the growth, and for Beautifying the Human Hair. Price 3s. 6d., 7s., or Family Bottles (containing four small) 10s. 6d.; and double that size, 21s. per bottle. ROWLAND'S KALYDOR, for the Skin and Complexion. Price 4s. 6d. and 8s. 6d. per bottle. A. ROWLAND and SON, 20, HATTON GARDEN, LONDON, is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraved on the Government Stamp affixed on the Kalydor. Be sure to ask for "ROWLAND'S" Articles, Sold by them and by respectable Chemists and Perfumers.

WANTED, for a BLIND, one or two large EVER-GREEN TREES, about twelve feet high. If they are bare half-way up, it is of no consequence. Yew, Holly, or Cedar, would be preferred, as Pine or Fir will not suit well near the metropolis.—Direct to J. L., 7, Haymarket, London.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, a respectable sober Man, aged 29 who has a thorough knowledge of his Business in all its branches; he perfectly understands the management of Meadow Land and Cows; can take charge of a horse and chaise, and make himself generally useful. He can have two years' good character from the gentleman he has just left. Direct to A.B., at Mrs. GAMBLE'S, No. 8, Little Guilford-street, Russell-square.

AS GARDENER, a middle-aged Man, who perfectly understands his Business in all its various branches. Has a perfect knowledge of the Suffolk mode of Farming, and can have a five years' character. Direct to P. G., at Mr. KERNAN'S, Great Russell-street, Covent Garden.

AS GARDENER, a middle-aged married Man, without encumbrance, who understands his Business in all its branches; has no objection to the management of a small Farm. Can have the most satisfactory references as to character and conduct from his present employers, whom he has served the last three years. Direct to A.B., Manor House, Lee, Kent.

AS GARDENER, a middle-aged Man, who understands his Business. His wife can, if required, take charge of the House, and the Management of a small Dairy; and understands plain Cooking. Can have a good character from the place he has just left. Direct to E.R., Parson-street, Hendon.

AS GARDENER, a Married Man, aged 38, without encumbrance, who perfectly understands his Business, in the Hothouse, Greenhouse, and all its various branches; could also undertake the laying out of Pleasure Grounds, the care of Stock and Meadow Land, if required, where a man or two is kept. His Wife could also engage as Laundress, being fully competent, and having served in such capacity. They can both have a 4 years' character from their last place, which they have just left. Direct to A.B., 15, King's Road, Chelsea.

AS GARDENER, a middle-aged Married Man without encumbrance; has had the management of Pines, Grapes, Early Forcing, and Gardening in general: can have a good character from his last place, which he held upwards of 10 years.—Direct to A. B., 8, Orchard Row, High-st., Camberwell.

AS GARDENER, a thorough Practical Man. Can be highly recommended by the family he has left, as well as by some of the first-rate Noblemen's Gardeners. Direct to W. H., 54, Milton-street, Dorset-square, London.

TO NOBLEMEN AND GENTLEMEN **AS GARDENER,** a Married Man, aged 30, who has a thorough knowledge of his Business in all its branches; the most satisfactory references can be given as to ability, sobriety, and industry, from his late Employer, with whom he lived upwards of 4 years.—Direct to W. S., Mr. ALGAR'S, Nurseryman, Market Deeping.—N.B. Wages 70l., with a Cottage, &c.

AS GARDENER, a Single Young Man, 31 years of age, who has a thorough knowledge of his business and can be well recommended from his last place. Direct to H. H., Post-office, Tonbridge Wells.

AS UNDER-GARDENER.—A Young Man, of good character and sober habits. Would prefer a situation where he would have an opportunity of improvement. Salary not so much an object as a comfortable situation. Direct to A.F., Post-office, Oundle, Northampton.

Printed by Messrs. FRANKLIN and EVANS, Lombard-street, Fleet-street, in the Printing Office of W. L. GOSNOLD, in the City of London, and Published by them at the Office, 2, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, March 25, 1843.

UNIVERSITY COLLEGE, LONDON.—ELEMEN-
TARY COURSE OF BOTANY.—PROFESSOR LINDLEY will
commence a Course of LECTURES on BOTANY to a Junior
Class, on Monday, April 3. Subject—The Distinctions between
the Principal Natural Classes and Orders of Plants belonging to
the Flora of Europe. The Course is adapted for Persons com-
mencing the Study of Botany, and for Students preparing for the
Matriculation Examination at the University of London. Fee 2s.
The Course to the Senior Class will commence early in May.
GEORGE LONG, A.M., Dean of the Faculty of Arts.
THOMAS GRAHAM, Dean of the Faculty of Medicine.
CHAS. C. ATKINSON, Secretary to the Council.
March 24, 1843.

EXHIBITIONS, to be held at the Gardens of the
ROYAL BOTANIC SOCIETY OF LONDON, Inner Circle,
Regent's Park, on the following Days:—
WEDNESDAY, May 24,
WEDNESDAY, June 28,
WEDNESDAY, July 19, 1843.

The Prizes to be awarded consist of Gold and Silver Medals,
Silver Vases, and other pieces of plate. Successful competitors
may, at their option, receive their prizes in medals, plate, or
money.

TERMS OF ADMISSION.
All Fellows and Life Members of the Society, and the Bearers
of Ivory Tickets, will be admitted to the Gardens from Two until
Seven o'clock, upon signing the book at the gate.
Visitors will only be admitted by Tickets, to be obtained by
the Orders of Fellows and Life Members.

All Fellows and Life Members may obtain, on or before the
6th of May, any number of Tickets at the rate of 4s. each; and
after the 6th of May, and until Two o'clock on the days of Exhibi-
tion, any further number at the rate of 6s. each, by application at
the Offices in the Inner Circle of the Regent's Park.

Each Ticket will entitle one person to admission between the
hours of Two and Seven on any one of the three days of Exhibi-
tion, at the option of the holder.

Tickets may be obtained at the Garden on the days of Exhibi-
tion after Two o'clock, at the rate of 10s. each.

No Tickets whatever will be issued except on the personal
application or written Order of a Fellow or Life Member of the
Society, and the number of Tickets required must be stated in the
application.

N.B.—Exhibitors coming from the North-east of London may
approach the Gardens from Albany-street by the Cambridge-gate.
Exhibitors from the South and from the West may approach by
Portland-place and the New Road, and enter by the York-gate.

* * * The Schedule of Prizes, with the Regulations to be observed
by Exhibitors, and all further particulars, may be had at the
Gardens.

JAMES DE CARLE SOWERBY, Secretary.

SPLendid NEW HYBRID FUCHSIAS.

WILLIAM DEANS, NURSERYMAN & FLORIST, Jed-
burgh, North Britain, begs to intimate that he intends
sending out the following six NEW HYBRIDS, which were exhibi-
ted at the Roxburghshire Horticultural Society's Show in Sep-
tember last, and at the Grand Horticultural Fête at Kelso during
the same month; they were staged at both places against all the
NEWEST and BEST FUCHSIAS then out, and declared to be UNRI-
VALED, and gained the first prize at both Shows. They will be
found indispensable to those who grow for competition; no
better proof of their superiority need be adduced than the numer-
ous orders already received for them from those who have seen
them in bloom. Plants in May, 1843.

1.—FUCHSIA DEANSIA: The Tube of great thickness; Sepals
broad, and of a deep crimson colour; Petals large, rosy purple;
Blooms of great size and substance; a free grower, profuse
bloomer, and of a very fine habit, 10s. 6d.

2.—NOBILIS: Tube and Sepals dark crimson; Petals light
purple; Blooms very large and of great substance; free bloomer,
vigorous grower, and fine habit, 7s. 6d.

3.—RECURVA: Tube and Sepals light crimson; Petals rosy
purple; Blooms large; the Petals beautifully recurved; free
flowerer, and very distinct, 3s. 6d.

4.—EFFUSA FASCICULATA: Tube and Sepals of a carmine
colour, with green tips; Petals rosy purple; immense bloomer,
some of the joints producing Thirty Blooms; same size or rather
larger than F. Standishii, being thicker in the Tube; free
grower, 3s. 6d.

5.—RACEMIFLORA ELEGANS: size and colour of the Blooms
very much resemble F. Money-penny; points of the Sepals tipped
with green, but greatly superior in habit to the latter, the
branches presenting beautiful racemes of flowers; a free
grower, 3s. 6d.

6.—INFILATA ARBOREA. Tube and Sepals very deep crimson,
tipped with bright green; Petals purplish; quite a tree Fuchsia;
Foliage large, and quite distinct from any other yet out, and but
for the Blooms, would hardly be recognised as a Fuchsia, 3s. 6d.

Orders addressed to Wm. Deans, Jedburgh, or to Messrs. COR-
MACK and Co., New Cross, or their Conservatories, Covent
Garden, London; to Messrs. RONALDS and Co., Brentford, or to
HURST and McMULLEN, Seedsmen and Florists, 6, Leadenhall-
street, London, will be duly attended to. The above parties having
seen them in bloom, can testify to their excellent habit and
superior qualities. Any person purchasing the lot will, upon
receipt of a post-office order for 14. 10s., have the six sent, post
free, to any part of the United Kingdom, carefully packed in a
tin case with Moss. A reference required from unknown Corre-
spondents.—Jedburgh, Feb. 7, 1843.

HUGH LOW & CO., NURSERYMEN, &c., Upper
Clapton, London, beg to inform their friends and the public
that they will have Plants of the undervalued DAHLIAS ready
for delivery in May, 1843:—

Colonel Baker (Dodd's), dark claret, extra-fine show-flower	10 6
Favourite (Dodd's), clear white, edged with pink, very dis-	10 6
tinct, and first-rate show-flower	10 6
Miranda (Brown's), blush, shaded with rose	7 6
Perpetual Grand (Brown's), fine crimson	10 6
Paul Pry (Brown's), light ruby, extra-fine flower	10 6
Queen of the Isles (Low's), white, laced with crimson, very	10 6
distinct in colour, and of fine form	10 6
Sultana (Appleby's), maroon, shaded with light purple,	10 6
good flower	10 6
Surprise (Oakley's), red, tipped with white, a very distinct	10 6
and beautiful variety	10 6
Violet Perfection (Keynes'), deep purple, shaded with light	10 6
violet, first-rate show-flower	10 6
Virgil (Mountjoy's), dark maroon, extra-fine show-flower	10 6
Admiral Stopford (Trentfield's), extra-fine, dark maroon	3 6
Anna Minerva (Girling's), fine rose	1 6
Array (Walters'), dark crimson	1 6
Attila (Whales'), rosy lilac	1 6
Beauty of Wakefield (Barratt's), white, edged with purple	2 0
Bedford Surprise (Sheppard's), shaded crimson, extra fine	3 6
Candidate (Silverlock's), deep purple	2 6
Conqueror of the Plain (Spary's), shaded crimson	1 6
Coronation (Harrison's), crimson	2 6
Duke of Cornwall (Low's), bright rosy ruby	2 6
Evêque de Tournay, purple, tipped with white	1 6
Frederick the Great (Attwell's), rose	1 6
Hon. Miss Abbot (Smith's), bright lilac	1 6
Lady Ann Murray (Catleugh's), white, edged with purple	2 6
Lady Harland (Jeffries'), lilac	2 6
Liberty (Girling's), lilac	1 6
Minerva (Hodge's), lilac	1 6
Marchioness of Exeter (Widnall's), white, laced with rose	2 0
Marquess of Lansdowne (Brown's), shaded red	1 6
Miss Chester (Stein's), creamy white	1 6
Mrs. Shelley (Mitchell's), fine peach	5 0
Northern Beauty (Robinson's), white, laced with pink	2 6
Oriental Pearl (Attwell's), creamy white	1 6
Phoenix (Headley's), scarlet	1 6
Ploughboy (Girling's), puce	2 0
Prince of Wales (Dodd's), bright yellow	2 6
" (Girling's), crimson, shaded with purple	2 6
Princess Royal (Horswood's), primrose	1 6
" (Hudson's), sulphur, edged with rose	2 6
" (Sharp's), rosy lilac	2 6
Prince Albert (Adams'), large, salmon red	2 6
Rose Unique (Ansell's)	2 6
Sambo (Girling's), dark	1 6
St. George (Fawcett's), rose	1 6
Sir F. Johnstone (Hillier's), rosy purple	2 6
Sir R. Throckmorton (Sadler's), puce	1 6
Snowflake (Mitchell's), white	1 6
Tournament (Catleugh's), light red	1 6
Twyford Perfection (Young's), crimson	2 6
Westbury Rival (Hall's), crimson purple	1 6

The following varieties at from 9s. to 12s. per dozen:—

Conservative, Le Grand Bedouin, Countess of Pembroke, Pene-
lope, Frances, Duchess of Richmond, Duke of Richmond, Climax,
Rosa, President of the West, Grand Turk, Amato, Rival Per-
fection, Eva, Lady W. Powlett, Perfection, Rival Sussex, Mares-
field Hero, Miss Johnston, Glory of Plymouth, Wallace, Windmill
Hill Rival, Viola, Contender, Charles XII., Duchess of Portland,
Marquess of Lothian, Egyptian Prince, Lancashire Witch, De-
fiance, Hope, Essex Rival, Unique, Mary, Rienz, Mungo Park,
Model of Perfection, Diomedea, Sir John Ashley, Miss Goulburn,
Director, Stuart Wortley, Defiance (Squibb's), Diana, Bishop of
Salisbury, Windsor Rival, Pericles, Andrew Hofer, Scarlet Rival,
Advocate, Defender, Nicholas Nickleby, Bloomsbury, Amulet,
Argo, Optime, Phenomenon, Crichton, Rouge et Noir, Tantalus,
Countess of Lincoln, Sir W. Middleton, Emulator, Edward, Pom-
pous, Chef d'œuvre, Lady Mill, Pickwick, Iver Champion, Horn-
sey Surprise, Unrivalled of South Hants, Janthe, Lord Dudley
Stuart, Rival, Marchioness of Breadalbane, Maid of Bath,
Unique (Walter's), Porphyrea alba, Regina, Fanny Keynes, Con-
stance, Scarlet Defiance, Eclipse (Widnall's), King of Roses,

Competition, Hope, Triumphant, Bee's-wing, Sir J. Mill, Are-
thusa, Tancred, Rufus, Red-wing.

A reference to some house in London will be required from
unknown Correspondents.

CARNATIONS, PICOTEES, AURICULAS, &c.

Messrs. DICKSON, NURSERYMEN and FLORISTS,
Acre-Lane, Brixton, respectfully solicit the early attention
of Amateurs and the Trade to their extensive and choice col-
lection, which comprises all the best show-flowers of the day.
Gentlemen wishing to compete for prizes at public exhibitions
will find this a most desirable opportunity of making their
selection. The plants are in fine healthy condition, and warranted
true to their kinds. Messrs. Dickson also have a few more pairs
of that splendid red Picotee, BARAUD's CORNELIUS, to dispose
of: it is a beautiful and distinct variety, and as a show-flower,
is unrivalled in its class. Catalogues may be had on application
to Messrs. DICKSON, or Messrs. WARNER & WARNER, Seedsmen,
&c., Cornhill, London.

SPLendid NEW PELARGONIUM, "THE ARCHBISHOP OF CANTERBURY."

WILLIAM MASTERS begs to offer the above new
Seedling, at 42s. each. It is a remarkably free bloomer,
having its upper Petals rosy crimson, with a deep and well-de-
fined spot; the lower being of a delicate pink, inclining to white
in the centre.—Exotic Nursery, Canterbury.

SEEDLING FUCHSIAS, "IVERYANA," AND "GEM."

WIVERY, FLORIST, Peckham, near London, begs
to offer the above distinct varieties, having been exhibited
at Regent-street Rooms last autumn, and greatly admired. For
size, substance, and brightness of colour, have not their equal:
of superior habit and abundant bloomers. W. I. being a grower of
all the newest varieties can, with confidence, recommend the
above Plants. Can be had after the 15th April, at 7s. 6d. each.—
A select Catalogue may be had, on application, of the newest
FUCHSIAS, CINERARIAS, VERBENAS, &c.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

BEAUTIFUL AND DISTINCT FUCHSIAS.—
YOUELL & CO., in submitting their Catalogue of Fuchsias
for 1843, take the present opportunity of drawing the attention of
admirers of the above elegant tribe of plants to their select and
superb Collection. They have spared no expense in forming a
selection of such as are really good, to the exclusion of many
that are mere nomina, varieties; and they would refer to the nu-
merous testimonials of success which attended their mode of se-
lecting, last season, collections for Amateurs for competition at
the various Horticultural Exhibitions throughout the Kingdom.
YOUELL & Co. also feel desirous of calling attention to their
peculiar method of executing orders for this tribe of plants,
namely, that they will deliver them free of postage (on the re-
ceipt of a Post-office order), to any part of the United Kingdom, in
the first week of April, in collections, upon the following terms:
Twelve fine Show varieties 12s. Twelve fine Show varieties,
Twelve extra fine do. 16s. very superior 21s.

The selection being left to YOUELL & Co.

DESCRIPTION OF FUCHSIA ST. CLARE.

This magnificent Fuchsia was raised by Mr. Meehan, gardener
to Colonel Harcourt, at St. Clare, Isle of Wight, from whom
Messrs. YOUELL obtained the entire stock. In May last it was
submitted to Dr. LINDLEY for his opinion, which will be found in
the *Gardeners' Chronicle* of the 14th of that month, as follows:
"Your Seedling Fuchsia is by far the finest hybrid we have
seen, the flowers being three inches in length, with the tube and
sepals of a bright carmine colour, and the petals of a rosy purple.
If, as you say, it is a strong grower and a free bloomer, it will
prove a valuable addition to this beautiful genus."

As a proof of its being a most profuse bloomer, Y. & Co. had a
plant in flower Sept. 15th, 1842, on one branch of which were
upwards of 200 blooms, forming a splendid object for the green-
house, conservatory, or flower-garden. Price 10s. 6d. per plant,
sent free of postage to any part of the United Kingdom.

Great Yarmouth Nursery, Norfolk, March 30, 1843.

SPLENDID NEW CACTUS "CONWAY'S GIANT."

P CONWAY begs to inform those Friends who have favoured him with orders for the above that their Plants will be ready on the 10th of April. A few good Plants still to be disposed of, 2 guineas each.

CONWAY'S New Pelargonium "LANEI" decidedly the best yet raised for early forcing, which is fully admitted by the principal London Florists who have seen it in bloom—7s. 6d. each. An allowance to the Trade where two plants are taken.

For description of these two new productions see advertisement in the *Gardeners' Chronicle* of March 11.

SCARLET PELARGONIUMS. The best varieties for potting and bedding out.—Old Brompton, March 29, 1843.

NEW AND SUPERB SEEDLING DAHLIAS on SALE by F. and A. SMITH and Co., FLORISTS, &c., HACKNEY, LONDON:—

BIANCA, Wildman, pure white, cup petals, large size, the centre well up, very deep flower (having from 25 to 30 rows of petals), first-rate form, of excellent habit, and very free bloomer: the flowers have long upright foot-stalks. It was pronounced a first-class flower by the Floricultural Society of London, Aug. 3, 1841; obtained a second prize at the South London Floricultural Show, Sept. 14; and a first-class prize at the Floricultural Soc. of London, Sept. 23; a first-class opinion was pronounced by the Floricultural Soc. of London, Aug. 16, 1842; it obtained a prize at Salisbury Plain, Aug. 31; the first prize at the Hammersmith Show, Sept. 27; and was pronounced a first-class flower by the Floricultural Soc. of London, Sept. 27, when 24 blooms were produced, although that Society very fairly qualified their approbation upon other occasions, when the flower, for reasons afterwards explained, appeared before them in a less perfect state. Opinions of the Press:—See *Gardeners' Gazette*, Sept. 24, p. 625: "This flower has been unfortunately very badly grown during the season; being exclusively cultivated in the neighbourhood of London, it has not been fit for competition at either of the shows for the cup. The blooms produced on Tuesday, though by no means equal to those of last season, or the early part of the present, gave promise that it will be a decidedly first-rate variety, when it comes into the hands of country growers, the centre being in every instance perfectly up, the petals cupped, and the flower well formed." See Report in same paper, Oct. 1, p. 639: "Wildman's Bianca, which has scarcely produced a bloom fit for showing until the latter part of the season, was in fine condition, a great number of blooms being shown, the whole of them first-rate." See Report in the *Florists' Journal* of Nov. last, p. 251: "We some little time since paid a visit to Messrs. Smith's Nursery, at Hackney; the Dahlias were in fine bloom, though evidently struggling with the smoke, &c., of that confined district. Too much credit cannot be given to these gentlemen for their strenuous exertions to overcome so great an obstacle. In the collection which is large, we particularly noticed that beautiful white, Wildman's Bianca; there were several plants of it, and all held good flowers." 10s. 6d.

DUKE OF WELLINGTON, Smith, rich scarlet crimson, fine cup petals, the centre well up, is of great depth and substance, a first-rate flower, a very profuse bloomer, and quite new in colour; it has obtained a prize at the South Essex Show, in Sept.—See Editor's opinion in the *Gardeners' Chronicle*, Sept. 3, 1842: "In the Duke of Wellington, rich scarlet crimson, the centre is full, although a little depressed, and the petals are well arranged: it is a desirable flower, and rich in colour." 10s. 6d.

GENERAL SIR R. SALE, Smith, crimson purple, cup petals, well up in the eye, of good size, and great depth of petals, very profuse and constant bloomer, with long upright foot-stalks; and is considered by competent judges the best flower of its colour yet offered to the public: it was pronounced a first-class flower by the Floricultural Society of London, Aug. 16, 1842; obtained a prize at Salisbury Plain, Aug. 31; a prize at South Essex, Sept. 8; a prize at Kingston, Sept. 15; a prize at Salt Hill, Sept. 16; a prize at Victoria Gardens, Stepney, Sept. 19; a prize at the Floricultural Soc. of London, Sept. 20; a prize at Sunbury, Sept. 22; a prize at Hammersmith, Sept. 27.—See Editor's opinion, *Gardeners' Gazette*, Aug. 6, 1842. "So far as we have seen, during the present season, the growers appear to be aware of the properties required in a show Dahlia, and most of those exhibited on Tuesday possessed them in a considerable degree. Decidedly the best of these is Smith's Sir Robert Sale, a beautifully-formed dark flower, shown at both meetings, but not adjudicated on by the Floricultural Society, on account of no more than one bloom being shown."—See Editor's opinion, *Gardeners' Chronicle*, Sept. 3. "Your crimson purple Dahlia (Sir R. Sale) is a flower of first-rate properties, fine, general form, centre well up, with great depth of petals." 10s. 6d.

RIVAL YELLOW, Smith, deep golden yellow, fine cup petals, of great substance and depth, the centre well up, of excellent form, very constant and good habit. This Dahlia is warranted the best of its colour yet offered to the public. As the stock is very limited, early application is necessary to secure plants, many orders having already been received; no allowance on this variety. 10s.

RAINBOW, Smith, yellow, beautifully edged with rosy purple, of good form, very constant, free bloomer, and excellent habit; the flowers have long straight footstalks; quite a new and distinct variety from any other in cultivation. The form of this flower improves as the season advances, sufficient to constitute it a show flower. 10s. 6d.

ORION, Smith, light yellow, cupped petals, of good form, very constant, and profuse bloomer; 3ft. 7s. 6d.

FANNY WAUGH, Forster, deep lilac, of fine form; it has obtained a first-class prize at Hexham, and was in the second stand of 18, and the second of 24 blooms at the same place; was placed first in its class at the Dahlia Show near Corbridge, and second at the Great North of England Open Show at Jesmond, near Newcastle. This variety is very constant, of medium size, great depth of petals, the centre well up, and of good general habit; 4ft. 10s. 6d.

EARL OF LEITRIM, Ogilvy, deep purple, cup petals, large, and of good form; has obtained several prizes; 5ft. 10s. 6d.

SULTANA, Appleby, dark maroon, occasionally striped with light purple, fine form. 10s. 6d.

ORYNTHIA, bluish edged, and tipped with rosy purple; good form; 4ft. 10s. 6d.

GREAT WESTERN, Bragg, shaded purple, very large, good shape; 7s. 6d.

PERPETUAL GRAND, Brown, maroon, fine form, 10s. 6d.

BELSIZE RIVAL, Pipe, rosy bluish, cup petals, fine form, good habit, and very constant; 4ft. 10s. 6d.

SURPRISE, Oakley, crimson, tipped with white; 4ft. 10s. 6d.

EMPRESS OF WHITES, G. Smith, creamy white, good form, very dwarf grower; 2ft. 10s. 6d.

CONFIDENCE, Cook, shaded orange, good form, very constant, fine habit; 4ft. 7s. 6d.

VIRGIL, Mountjoy, maroon, good shape, very constant; 4ft. 10s. 6d.

WINDMILL-HILL HERO, Miller, rich deep crimson, cup petals, round shape, good form; 4ft. 10s. 6d.

VAN AMBURGH, Miller, rosy lilac, good shape, and constant show flower, 3ft. 10s. 6d.

PET RIVAL, Bushel, red crimson, cup petals, and very constant; 3ft. 10s. 6d.

NORTH MIDLAND, Evans, deep crimson, cup petals, and fine form; has taken several prizes; 3ft. 7s. 6d.

ESSEX TRIUMPH, Turville, fine dark, fine form; 4ft. 10s. 6d.

BEAUTY OF SUSSEX, Mitchell, white, deeply edged with carmine; 4ft. 10s. 6d.

MRS. JAMES RICHARDSON, Edwards, bluish white, occasionally tipped, good form, has taken several prizes, 4ft. 10s. 6d.

LADY SALE, Todd, ruby carmine, good form, 4ft. 10s. 6d.

MIRANDA, Brown, bluish white, shaded with rose. 7s. 6d.

QUEEN OF SUMMER, creamy white, with crimson purple tip and dark centre, good form. 10s. 6d.

RETRIEVER, Dewar, ruby crimson, fine form, 4ft. 10s. 6d.

IMOGENE, Dewar, lilac, first-rate, 2ft. 10s. 6d.

CLAUDINE, Forster, white, tipped with rosy pink, fine form, 3ft. 10s. 6d.

GREAT MOGUL, Atwell, deep maroon, 4ft. 10s. 6d.

F. and A. S. and Co. take this opportunity of informing those of their friends who may not be aware of it, that their Dahlias being grown in the immediate vicinity of London, they cannot produce their blooms in such perfection as those who have every advantage of a country situation; added to this, their Plants were from August to the end of September so infested with the thrip, that they could not produce even a tolerable specimen of Bianca, to compete at any of the three shows for Mr. Wildman's prize; as a proof of this, at the first show there was no competition, they could not produce a bloom; at the Salt-hill (the second), and the Floricultural (the third), the Plants were not sufficiently recovered to compete with effect; as the season advanced, the Plants produced fine blooms in profusion, so as to enable them to exhibit twenty-four fine blooms at the Evening Meeting of the Floricultural Society, when it was pronounced a first-class flower. In conclusion, they recommend Bianca as a white of first-rate qualities, and second to none.

The same observations as regard the thrip may be applied to Rival Yellow; and having but three plants, they had not an opportunity to compete for prizes.

VERBENA SPECIOSA, Kyle, colour bright vermilion, with bluish or rosy eye, large trusses, and very free bloom of strong upright growth; it obtained a certificate of merit at the Exhibition of the Horticultural Society of London, July 9, 1842. The Verbena is handsome and very brilliant; it is no doubt a good variety. See p. 425, *Gardeners' Chronicle*, Editor's opinion. Plants in May, 5s.

PAULOVNIA IMPERIALIS; strong plants, in 60-sized pots, in May, 7s. 6d.

A List of Dahlias, Fuchsias, &c. may be had on application. Orders for Exportation promptly executed. A satisfactory reference required from unknown correspondents.

SUPERB SHOW CARNATIONS AND PICOTEES.

YOUELL & Co. having selected from their Collection of the above Flowers (which is the most extensive and select in Europe) the following superb Varieties, beg to recommend them with confidence to the Nobility, Gentry, and all who intend competing at the Horticultural Exhibitions of the ensuing season. The plants are remarkably healthy, and will travel with the greatest safety to any part of the United Kingdom. The stock of some of the sorts being limited, early orders are respectfully solicited.

Siphocampylus betulifolius (see Paxton's Mag. of Bot.)	7 6
Syphanthus elegans (Loasa volubilis), beautiful creeper, will continue in flower from May till December (see Sweet's Flower Garden, and Pax. Mag. of Bot.)	5 0
Statice Dicksonii	10 6
Verbena Howardiana, the finest bluish rose-coloured Verbena yet out, very fragrant	3 6

A reference to same House in London will be required from unknown Correspondents. The usual Allowance to the Trade.

Clapton Nursery, London, March 29th, 1843.

FUCHSIA TODDIANA.

PLANTS of this MAGNIFICENT FUCHSIA, (the Flowers of which, in point of size, rival any other of its kind yet sent out, being nearly four inches in length) will be ready by the end of April, at 10s. 6d. each, with the usual discount when six are taken. For description, see *Gardeners' Chronicle* of the 11th inst. Agents for London, Mr. CHARLWOOD, Seedsman, Covent Garden; and Messrs. Lowe and Co., Clapton Nursery, at which places also drawings may be seen.—THOMAS CRIEPPS, Tunbridge Wells Nursery, March 16, 1843.

DAHLIAS.

W. R. WHALE, FLORIST, &c., Elcot, Hungerford, Berks., begs leave to call the attention of FLORISTS generally to his select List for 1843.

WHALE'S HERO OF STONEHENGE—a dark mulberry colour, of great substance, circular form, with short stiff cupped petals, full centre, constant the whole season, fills when young, good habit; height, 4 feet.

(The usual discount where a dozen plants are taken.) Took the following Prizes, viz.—First at Stonehenge, on Salisbury Plain. First at Devon and Exeter, Silver Medal, 4 ounces. Second at Marlborough. First in a winning stand of Twelve. A Prize at Salt Hill; and several at the Metropolitan Shows, the only places exhibited at.

NOVELTY (WHALE'S)—ruby ground, tipped with buff, quite new in colour, of good substance and full size, circular form, short stiff cupped petals, of large size: an every day flower, constant of dwarf habit, 2 to 3 ft. high.

APPLAUSE (WHALE'S)—a pale orange, new in colour, fine clear stiff cupped petals, circular form, rather flat in the centre, but rises in water, a good back row flower. This variety will be scarce, all having perished but two roots. Height 4 feet.

FAVOURITE (Dodd's)—clear white, edged with pink, good show flower.

COLONEL BAKER—dark purple, show flower.

SIR R. SALE (Smith)—dark, first rate.

VIOLET PERFECTION (Keynes)—first rate.

PAUL PRY (Brown's)—ruby, show flower.

VIRGIL (Mountjoy's)—dark purple extra.

SWINDON RIVAL (Compton's)—rose extra.

SULTANA (Appleby)—very dark extra.

MRS. J. RICHARDSON (Edwards)—light-edged with purple, first rate.

MRS. SKELLEY (Mitchell's)—peach blossom, first rate and scarce.

ADMIRAL STOFFORD—dark maroon, good show flower and scarce.

CORONATION (Harrison)—good show flower.

LADY ALICE PEEL (Jackson)—rose, good.

SALFORD RIVAL UNION—dark, good show flower.

PRINCE OF WALES (Dodd's) yellow.

PRINCESS ROVAL (Hudson), light, tipped buff.

HORACE (Mountjoy's)—dark, good show flower.

BERFORD SURPRISE, Sheppard, fine show flower.

NORTHERN BEAUTY light t. p. c., useful show flower.

ATTILA (WHALE)—rosy, lilac, fine shape.

SIR F. JOHNSTONE (Hillier)—good show flower.

AMERICA (Drummond)—fine dark show flower.

TWYFORD PERFECTION—shaded rose.

WHITE DEFIANCE (Langelier)—fine.

Candidate (Silverlock)—dark puce, fine.

Marchioness of Exeter (Widnall)—light tipped with purple.

Lady Glentworth (Widnall)—shaded purple.

Majestic (Widnall)—rosy lilac, good show flower.

Lady Ann Murray (Cateugh's)—light mottled.

Gipsy Maid (Girling's)—dark, useful show flower.

Prince of Wales (Girling's)—purple, fine shape.

Westbury Rival—purple.

Miss Abbot—lilac, good.

Welbeck (Tillery)—rose.

Rose Unique—Ansell.

Stanley (Jones)—light tipped.

Nearly every other variety in cultivation may be obtained of W. R. W. at moderate prices.

VERBENAS.

J HALLY, NURSERYMAN AND FLORIST, Blackheath, Kent, begs to offer the following New VERBENAS:—"Rosy Queen," a large-flowering, very bright rose-coloured variety, with round truss of flowers, and fine shrubby habit. "Roseo alba," a beautiful rosy pink, with white centre, carrying a large flat truss.

HALLY'S "Lilacina," a bright lilac, with very large flower and compact truss. The above are all of fine bushy habits, and very free bloomers, and are now ready to send out in Autumnal plants at 3s. 6d. (or 42 penny-postage stamps) each. The three Varieties 10s. Fine healthy Plants of Rosa Devonensis, from 30s. to 42s. per dozen. The "Monarch" Camellia, from 10s. 6d. to 12s. each. "Marchioness of Exeter," do. from 21s. to 63s. The usual allowance to the Trade.

FUCHSIA EPSII.

W. M. PAWLEY, of the White Hart Hotel, Bromley, Kent, having purchased the entire Stock of this magnificent FUCHSIA, which is pronounced by the most competent Judges to be the best Grower, the largest Flowerer, and for fineness of Habit and richness of Colour not to be surpassed by any Fuchsia yet in cultivation. A Specimen of it may be seen in Bloom at the above Hotel, by the end of this month, when Plants may be had at 10s. 6d. each, and sent free to any part, upon the receipt of a Post-office order. The usual discount where half-a-dozen Plants are taken. The Stock is limited.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, NURSERYMAN, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undervalued low prices—including the following Fuchsias:—*Conspicua arborea* (Catleugh's), *Venus victrix*, (Cripps'), *rosea alba*, *Money-pennii*, *compacta*, *racemiflora*, &c. Also the following distinct Verbenas:—*Queen, Aurora, Stewartii* variegata, *Mortlock's Superb*, *Burleyana*, &c. &c. Fuchsias, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 8s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents. Fuchsias for Bedding or borders at 3s. 6d. per dozen, post-paid, or 4s. in pots. W. M. obtained a Prize of 107, open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

CHOICE STOVE, ORCHIDACEOUS, GREENHOUSE, AND HERBACEOUS PLANTS, SHRUBS, TREES, &c.

JACKSON'S PRICED CATALOGUE for 1843 may be obtained on application by Post, by forwarding two penny postage-stamps to T. JACKSON, Nurseryman, Kingston, Surrey, or, on personal application, gratis. Kingston Nursery, March 23, 1843.

J. & T. GOODE, FLORISTS, &c., Ponder's End, Middlesex, beg to inform their friends and the public, that their select PRICED CATALOGUE of new and choice PANSIES and FUCHSIAS is now ready, and may be had on application.

T. AND C. LOCKHART and DUNCAN, FLORISTS and SEEDSMEN, 155, Cheapside, London, have published their List of DAHLIAS, FUCHSIAS, and VERBENAS, which will be forwarded on application.

Their collection of Early TULIPS, consisting of upwards of 100 Varieties, extending over nearly half an acre, and planted in the Dutch style, will be on show from the 3d to the 15th April.

R. WHITE and CO., NURSERYMEN, SEEDSMEN, Friends and the Public that their NEW CATALOGUE of Pelargoniums, Calceolarias, Verbenas, Dahlias, and Greenhouse Plants, containing all the newest and choicest kinds, is now ready, and may be had gratis on application.

All kinds of Garden Tools, Edging and Pruning Shears, &c.: improved Iron Hand-glasses, painted and glazed, complete, 16s. each.

WARNER AND WARNER, SEEDSMEN, No. 28, Cornhill, London, beg respectfully to return their best thanks to their friends for the liberal patronage bestowed upon them for many years past, and at the same time to contradict a report which has been circulated of their intention of retiring from business.

W. & W. most respectfully make it known to their friends that they have no such intention. Having made a change of some of the hands they had engaged for many years, their situations are filled up with men of general and practical abilities, and they trust they will ever give satisfaction to those who kindly favour them with their support.

W. & W. have the pleasure to annex a few articles, which have been selected with much care and attention.

EXHIBITIONS

AT THE GARDEN OF THE HORTICULTURAL SOCIETY OF LONDON, FOR THE YEAR 1843.

The Exhibitions will take place on the following Days: viz., SATURDAY, May 13; SATURDAY, June 17; and WEDNESDAY, July 13.

EXHIBITORS.—All persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition.

DELIVERY OF OBJECTS FOR EXHIBITION.—Exhibitors are earnestly requested to notify in writing, previously to the day of meeting, what plants they intend to supply, in order that due provision may be made for the proper distribution of the specimens on the exhibition tables. The best places will be secured for those who comply with this request. As it is necessary that the Judges should proceed to consider the respective merits of the exhibitions by 10 A.M., and as it is absolutely indispensable that the tables should be arranged by that time, it has been determined that no subject for exhibition shall be admitted into the Garden after half-past eight o'clock in the morning; and if the owners of any locked-up boxes, or other cases, should not be in the exhibition-tent at the said hour, such cases or boxes must be excluded from competition for medals. All specimens whether of fruit or flowers, will remain untouched until after six o'clock, when they will be delivered into the hands of the exhibitors, who are most particularly requested not to give away their cut flowers in the tents, as much confusion has been found to arise from that practice.

ADMISSION OF EXHIBITORS.—Exhibitors or other persons required to assist in bringing in the objects for exhibition, will be admitted before half-past eight at the Carter's Yard Entrance Gate. Every principal Exhibitor of subjects for which medals are specifically offered may be furnished with one pass-ticket, which is not transferable, for which he is requested to apply before ten o'clock, at which hour the Garden will be cleared of all persons not officially detained there. Exhibitors may re-enter the Garden after one o'clock, when they will be required to give up their pass-tickets at the Carter's Yard Gate.

FLOWER-STANDS.—Exhibitors of cut flowers must SUPPLY THEIR OWN BOXES OR STANDS. No box or stand shall exceed eight inches in height at the back, or eighteen inches in depth from front to back. The lids of all boxes must either be loose or made to un hinge.

MEDALS AND REWARDS.—The Society distributes the following Medals and Rewards; namely,

	£ s. d.		£ s. d.
C. The Certificate	value 0 10 0	SG. Large Silver Gilt Medal	value 4 0 0
SB. Silver Banksian Medal	1 0 0	GB. Gold Banksian ditto	7 0 0
SK. Silver Knightian ditto	1 5 0	GK. Gold Knightian ditto	10 0 0
LS. Large Silver ditto	1 15 0	LG. Large Gold ditto	20 0 0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. If within one month after the third Exhibition of the year no intimation shall have been received from an Exhibitor of the manner in which he desires his Medals to be disposed of, all the Medals due to him will be prepared and transmitted to him through the usual public conveyances, without further notice. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter; except in Z, AA, and BB.

SUBJECTS OF EXHIBITION.

These will be divided into Classes, as explained further on. No articles not of horticultural produce will be allowed to be placed upon the tables. Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in ALL CASES BE REQUIRED TO SIGN A PRINTED FORM OF DECLARATION TO BE FURNISHED TO THEM IN THE GARDEN stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the Judges should occur, in consequence of mistakes on the part of Exhibitors in filling up such declarations, the Society cannot undertake to rectify the errors afterwards.

Names fairly written are to be attached by Exhibitors to all Florists' flowers; and the Judges are restrained from awarding any Medal to such Exhibitions, whatever their merit may be, if this regulation is not complied with. By Florists' flowers are meant not only flowers usually so named, but also Fuchsias, Pelargoniums, Roses, and Calceolarias.

CLASS I.—FLOWERS, for which nurserymen and private growers exhibit independently of each other:—

- | | |
|---|---|
| <p>A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast, GB, SG, LS, SK.</p> <p>B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast, SG, LS, SK.</p> <p>N.B. Persons exhibiting in B cannot also exhibit in C.</p> <p>C. Pelargoniums, in collections of six varieties, in pots of 8 to a cast, LS, SB.</p> <p>D. Rhododendrons, in pots; not fewer than 12 plants in 12 varieties. LS, SK, SB.</p> <p>E. Roses, in pots, in collections of 25 distinct varieties, GB, SG, LS. N.B. It is the wish of the Society, in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.</p> <p>F. Moss Roses in loose bunches, as gathered, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties, SK, SB, C.</p> <p>G. Other Roses, exhibited as in the last letter, and in 50 varieties, LS, SK, SB, C.</p> | <p>N.B. No one who exhibits in this letter, can also compete in the following.</p> <p>H. Other Roses, exhibited as in the letter F, and in 25 varieties. SK, SB, C.</p> <p>N.B. Higher Medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.</p> <p>I. Cape Heaths, in collections of 20 distinct varieties. GB, SG, LS. N.B. It is expected that the same plant shall not be exhibited on more than one occasion.</p> <p>K. Cape Heaths, in collections of 6 distinct varieties. SG, LS, SK. N.B. No person who shows in I will be allowed to exhibit also in K.</p> <p>L. Herbaceous Calceolarias, in sixes; in pots of 12 to the cast. LS, SK, SB.</p> <p>M. Shrubby Calceolarias, in sixes; in pots of 12 to the cast. LS, SK, SB.</p> <p>N. Carnations, in pans of 24 blooms. LS, SK, SB.</p> <p>O. Picotees, in pans of 24 blooms. LS, SK, SB.</p> <p>P. Pinks, in pans of 24 blooms. SK, SB.</p> |
|---|---|

CLASS II.—FLOWERS; for which all persons are admitted to equal competition:—

- | | |
|--|---|
| <p>Q. Stove or greenhouse plants, in collections of 40 plants. GB, SG, LS.</p> <p>N.B. Heaths, Calceolarias, Fuchsias, to be excluded from Q, R, and S.</p> <p>R. Stove or Greenhouse plants, in collections of 20 plants. GB, SG, LS.</p> <p>N.B. Persons exhibiting in Q not to compete in R also.</p> <p>S. Stove or Greenhouse plants, in collections of six distinct species. SG, LS, SK.</p> <p>N.B. Persons exhibiting in Q or R will not be allowed to compete in S also.</p> <p>T. Greenhouse Azaleas; to be shown in 12 distinct varieties. GB, SG, LS.</p> <p>U. Collections of Stove or Greenhouse climbers. GB, SG, SK.</p> <p>N.B. The Gold Banksian Medal is not to be awarded for fewer than 12 distinct kinds.</p> <p>V. Exotic Orchidaceæ, in collections of not fewer than six species. GK, GB, SG, LS.</p> <p>W. Exotic Orchidaceæ, in single specimens, SG, LS, SK.</p> | <p>X. Tall Cacti in flower, LS, SK.</p> <p>Y. Fuchsias in collections of 12 distinct varieties, LS, SK.</p> <p>Z. Single specimens of new or rare ornamental plants, SG, LS, SK, SB, C.</p> <p>N.B. These medals will be awarded by the Society's officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter.</p> <p>AA. Miscellaneous subjects, SK, SB, C.</p> <p>N.B. Cockscombs, Hydrangeas, and cut flowers are altogether excluded from exhibition.</p> <p>BB. Seedling Florists' flowers, SK, SB, C.</p> <p>N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting.</p> |
|--|---|

CLASS III.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.

- | | |
|---|---|
| <p>1. Miscellaneous collections of fruit, consisting of at least three different kinds. Peaches and Nectarines being considered as only one kind, GK, GB, LS.</p> <p>N.B.—Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.</p> | <p>2. Grapes. SG, LS, SK, SB.</p> <p>3. Pine Apples. SG, LS, SK, SB.</p> <p>4. Peaches or Nectarines, in dishes of six specimens. SK, SB.</p> <p>5. Miscellaneous fruit. SK, SB, C.</p> |
|---|---|

JUDGES.—The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so. The Judges are also required to bear in mind that the Society's Medals are offered, less for new and curious objects than for fine specimens of Horticultural Skill, the design of the Council in instituting these meetings, being not so much to encourage the collector, as to reward the skillful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

ADMISSION OF VISITORS.—The Garden will be opened, on each day, to Fellows and to Visitors, at One o'clock, under the following Regulations:—All Fellows will be admitted without tickets, from One till Six o'clock, on signing their names in a book at the entrance. Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society. N.B. The presentation of the visiting card of a Fellow cannot be regarded as an authority to receive tickets.

All Fellows who shall apply, on or before Tuesday, the 18th of April, may obtain at the rate of Three Shillings and Sixpence each, any number of tickets not exceeding TWENTY-FOUR; but no applications for such tickets will be received after that day. It would be a great convenience to the Society, if the Fellows would take their tickets personally, and not by written orders; or, in the event of their not so taking them, if they would at once order the whole number which they may require for the season. The Council would also observe that, as the privilege of obtaining tickets for 3s. 6d. has been in some instances abused, the interests of the Society require that those Fellows of the Society to whom such Tickets are issued, should write on the back their own names, and on the face the names of those to whom they give them.

After the 18th of April any further number of Tickets will be delivered to Fellows on their personal application or written order, at the price of Five Shillings each ticket. Each ticket will be available for the admission of one Visitor, after One o'clock, to either of the Three Exhibitions, at the option of the Visitor. All applications for tickets must be made at the Society's Office, 21, Regent Street.

No TICKETS WILL BE ISSUED IN REGENT STREET ON THE DAYS OF EXHIBITION; but, on those days, two Offices, near the Garden Gates, will be opened at noon for the issue of tickets at 7s. 6d. each; still however strictly under the regulations above stated.

S. GIRLING'S Catalogues of ENGLISH and FOREIGN DAHLIAS, PELARGONIUMS, PANSIES, VERBENAS, & FUCHSIAS, are ready, and can be had on prepaid application. The plants are healthy and strong; and the earliest orders will receive the first attention. Plants of most of the varieties can be had after the 20th of April; those cultivated by other growers procured, and forwarded the first week in May. Dane-Croft Nursery, Stowmarket, Suffolk.

EXHIBITION of CAMELLIA JAPONICA, or JAPAN ROSE.—A Collection of these beautiful Exotics is now in bloom at CHANDLER and SONS' Nursery, Vauxhall. Admittance gratis.

TO PINE-GROWERS.

TO BE SOLD, a Great Bargain, about SIX HUNDRED FRUITING and SUCCESSION PINE PLANTS, (clean and healthy,) in small or large quantities. For particulars, apply on the premises, S. ROSLING'S, Rye Common, Peckham, near London.

WHITE FIELD CARROT SEED of the finest quality, at 3s. 6d. per lb., for not less than 7 lbs., may be obtained of GORDON, THOMSON, & BASKETT, Seedsmen, 25, Fenchurch-street, London.

LARGE YELLOW BELGIUM CARROT, or the Daucus of the Low Countries.—On Sale, just imported, a quantity of the above valuable sort of Carrot Seed, being the true kind used throughout the extensive Dairies of Belgium for Cattle; producing from 35 to 40 tons per acre of fine nutritious food. Price, to private Sowers, 4s. per lb.; to Retailers, 3s. per lb.; orders for 10 lbs. charged at the wholesale price.—HENRY CLARKE, Seed Merchant, 39, King-street, Covent-Garden.

HURST & M'MULLEN, SEEDSMEN and FLORISTS, 6, Leadenhall-st., beg to invite the attention of their friends and the Public to their advertisement in "Harrison's Horticultural Cabinet for April," which will be found to contain a very choice selection of Flower Seeds, and other articles well worthy their notice. They likewise beg to offer their best thanks for the many kind tokens of encouragement they have already received from numerous friends; and again assure them that every effort will be used to merit their confidence, and to secure a continuance of their favours. An extensive collection of the best varieties of Herbaceous Plants, Pinks, Carnations, Picotees, Paeonies, Hollyhocks, Rockets, Pansies, Dahlias, Roses, &c. &c., with an assortment of choice Greenhouse Plants, will be kept during the ensuing month. Packets of the True Cabul Lucerne, at 1s. each; True White Belgian or Field Carrot, of fine quality.—City, April 1.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to Public Competition, at the Auction Mart, Bartholomew Lane, on Thursday, April 6, 1843, at 12 o'clock, a splendid Collection of CARNATIONS, PICOTEEs, PINKS, CAMELLIAS, FUCHSIAS, VERBENAS, HEARTSEASE, &c. Also a fine Assortment of Roses and other Plants in bloom. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO NURSERYMEN, FLORISTS, AND OTHERS.

TO BE DISPOSED OF, in one of the High North Roads, within 3½ miles of Covent Garden Market, the important LEASE of a compact NURSERY, with several commodious and substantial well-built Hothouses, Greenhouses, Pits, Potting and other Sheds, recently erected in the best manner, and whole filled with a fine young Stock of Pelargoniums, Verbenas, and other Plants; together with a capital detached Dwelling-house, forming Two cheerful Residences, with Seed-Shop, surrounded by the Nursery Grounds; one Residence is let at 50l. per annum, presenting an eligible undertaking for a practical man. For full particulars apply to Mr. G. HAINES, Auction and Estate Agent, Knightsbridge, and at Grosvenor-row, Piccadilly.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25l. to 500l., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of FREDERICK LAWRENCE, Resident Secretary, 112, Cheapside.

ENGLISH and SCOTTISH LAW LIFE ASSURANCE and LOAN ASSOCIATION. Offices, 147, Strand, London; and 119, Princess-street, Edinburgh.—Subscribed Capital, 1,000,000l.

This Association embraces every description of risk contingent upon Life. A Liberal system of Loan. An extensive legal connexion, and a direction and proprietary composed of all classes. A union of the English and Scotch systems of Assurance. For tables of Rates of Assurance, Annuities, and Endowments, or any other information, apply at the Offices, or to the Agents of the Association. J. S. PIDGEON, Actuary.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS & Co., Architects, &c., Gloucester-Place, King's Road, Chelsea, Hothouse-builders and Hot-water Apparatus Manufacturers, seeing that several parties pretend to lay claim to the Open Trough, Tank, or Gutter system of heating, J. W. & Co. here lay before the Horticultural world their practice respecting it, they having fixed and circulated water in open Troughs now upwards of 16 years; and their works are now to be seen that have been fixed that time, at DAVID PUGH'S, Esq., Welsh Pool, Montgomeryshire; the Duke of Bedford's, Woburn; Sir EDMOND ANTOBUS, Cheam, and up to the present time they could give a list of 200 names, where they have fixed that principle, or their improvement on it. The above sketch represents a pit, showing the principle for the purpose of Bottom-Heat, which answers well. J. W. & Co. solicit an inspection of their improvements in Building, Heating, and Ventilating, at their Horticultural Manufactory, Gloucester-Place, Chelsea.

HOATHOUSES, CONSERVATORIES, &c., Made and Fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1l. 8s. Garden-Lights Made and Glazed from 1s. per foot, at JAS. WATTS' Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.

N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

HEATING WITH HOT WATER on all its improved Principles, for Horticultural and other purposes, by JAMES M'LATCHIE, Millwright and Engineer, Cottage-lane, Commercial-road East. J. M. returns his sincere thanks to those Noblemen and Gentlemen who have already honoured him with their favours, and hopes by his economical Prices and sound Workmanship to merit their lasting favours. N.B.—Attends personally to all Erections.

HORTICULTURAL BUILDING and HEATING by HOT WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-Place, King's-road, Chelsea, Hothouse-builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted. References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

PATRONISED BY THE NOBILITY AND GENTRY.

AN IMPROVED GARDEN ENGINE (Registered); unequalled in Cheapness, Durability, and Effect. This Engine is adapted for every use, where a portable one is required, as in Greenhouses, in cleaning Shop-fronts, &c.; at the same time it can be applied to a variety of purposes. It can be so constructed as to be attached to a tank or well, and by an additional hose will draw water from the depth of 30 ft., and force it to the height of 50 ft. in a continuous stream. It would be found a useful article on board of small craft, for wetting the sails, &c.—Manufactured by P. JONES, High-street, Fulham. E. PARKS, sole agent, 140, Fleet-street, of whom also may be had every description of Garden Tool and requisite.

*** THE LARGEST and BEST ASSORTMENT of IRON and BRASS BEDSTEADS.

MANURES.—Guano, Nitrates of Soda, and Potash, (pure), at the Importers' prices. Also Gypsum, Potter's Guano (superior to the Foreign), Urate, Bone-Dust, Sulphate of Ammonia, and all other Chemical Manures, on the lowest terms for cash. Rock Salt and Agricultural Salt.—Sold by MARK FOTHERGILL, Merchant and Agricultural Agent, 40, Upper Thames-street.

*** Pamphlets treating on the above may be had of Mr. F.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL and BRISTOL.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre, was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. Cotton, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

*** Potter's Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

LIQUID MANURE.—PUMPS of a superior construction for Liquid Manure, portable and stationary. Garden Pumps, Hydraulic ditto, and for deep Wells; also for Ships, Barges, Tanners, Brewers, Soap-boilers, &c. Pumps kept for Hire, for Wells and Excavations.—BENJAMIN FOWLER, late GEORGE TURNER, 63, Dorset-street, Fleet-street.

Just published, the 2d Edition, with additions, price 6s. 6d. cloth, gilt edges.

THE LADIES' COMPANION to the FLOWER-GARDEN. Being an Alphabetical Arrangement of all the Ornamental plants usually grown in Gardens and Shrubberies; with full directions for their Culture. By Mrs. LONDON. London: Published by WILLIAM SMITH, 113, Fleet-street.

Just published, in One Volume 8vo, with upwards of 380 Engravings, price 16s.

THE SUBURBAN HORTICULTURIST; or, an Attempt to Teach the Science of Horticulture and the Management of the Fruit, Kitchen, and Forcing Garden, to persons who have had no previous Knowledge or Experience in these Departments. By J. C. LONDON, F.L.S., F.R.S., &c. London: WILLIAM SMITH, 113, Fleet-street; FRASER & Co., Edinburgh; CURRY & Co., Dublin.

BEE-HIVES, &c.—Illustrations of Apiaries, Bee-hives, Feeding-Machines, and all the Apparatus connected with the Apiculture; a Sheet-List, price 1s., published by J. MILTON, may be had of Messrs. PARKER, West Strand; also at J. MILTON'S, Italian Warehouse, 10, St. Marylebone-st., Wimpole-st. These are Illustrations referred to in the *Practical Bee-Keeper*, a Treatise on Bees now publishing. All letters prepaid.

Just published, price 1s., by LONGMAN and Co., London; W. CURRY, Jun., and Co., Dublin; FRASER and Co., Edinburgh. **TRIALS and EFFECTS of New CHEMICAL FERTILIZERS,** with various Experiments in Agriculture, for Aerating Soils and Composts—Increasing the Food of Plants—Improving Irrigation—and abating the Ravages of Insects. By Sir J. MURRAY, M.D., Member of the Royal Agricultural Society of England and Ireland.

Sir JAMES MURRAY'S New Fertilizers for Early Crops, 20s. per cask, eight casks to a ton, may be procured of the London agents GIFFORD & LINDER, 104, Strand; or EVANS, 79, Dame-st., Dublin.

TO AGRICULTURISTS.—Now ready, price 1s. each. **AGRICULTURAL CHEMISTRY FOR THE USE OF YOUNG FARMERS.** By C. W. JOHNSON, Esq., F.R.S.

2. **THE COTTAGE FARMER'S ASSISTANT.** By C. W. JOHNSON, Esq., F.R.S.

3. **EVERY MAN HIS OWN BREWER.** By Child.

4. **ON GUANO AS A FERTILISER.** By C. W. JOHNSON, Esq., F.R.S. price 1s. 6d.

5. **ON FERTILISERS IN GENERAL.** By C. W. JOHNSON, Esq., F.R.S. price 12s.

6. **SQUAREY'S AGRICULTURAL CHEMISTRY FOR THE PRACTICAL FARMER.** Price 5s.

7. In the press. **THE FARMER'S CALENDAR.** By C. W. JOHNSON, Esq., price 1s.

8. **A SUPPLEMENT to Mr. Morton's Work on the NATURE AND PROPERTY OF SOILS,** being a second Report of Whitfield Example Farm.

9. **MAIN'S PLANTER AND PRUNER'S ASSISTANT.** Price 6s. with plates.

10. **MAIN'S FARMER'S MANUAL.** Price 6s.

11. **SINCLAIR ON GRASSES.** Coloured plate. Price 30s.

JAMES RIDGWAY, Piccadilly, and all Booksellers.

One Volume, 8vo., 20s. cloth,

THE SUBURBAN GARDENER and VILLA COMPANION; comprising the choice of a Suburban or Villa Residence, or of a Situation on which to form one; the Arrangement and Furnishing of the House; the Laying-out, Planting and General Management of the Gardens and Grounds; adapted for Grounds from One Perch to Fifty Acres and upwards in Extent. Intended for the Instruction of those who know little of Gardening and Rural Affairs. With numerous Engravings. By J. C. LONDON.

Also, 8vo., with Portrait and 250 Engravings, 30s., cloth, or, with the Plates coloured, 3l. 6s., cloth.

THE LANDSCAPE GARDENING and LANDSCAPE ARCHITECTURE of the late HUMPHREY REPTON, Esq.; being his entire Works on the Subject. Edited, with an Historical and Scientific Introduction, a Systematic Analysis, Memoir, Notes and full Index, by J. C. LONDON.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

NEW WORK ON BEES.

In small 8vo. (with 70 Engravings on Wood), price 12s. **MY BEE-BOOK.** By the Rev. W. C. COTTON, M.A. Student of Christ Church, Oxford; and Chaplain to the Lord Bishop of New Zealand.

"One of the most elegant volumes that ever graced a library-table—with its exquisite woodcuts, perfection of dress, prelude of mottoes, list of Bee-books, appendices, reprints, extracts, &c., we hardly know a book that has pleased us more; it is the perfection of a scrap-book for the gentleman or lady Bee-keeper."—*Quarterly Review*.

Also, now ready, by the same Author,

TWO LETTERS to COTTAGERS on BEES. Letter I.—On BEE-MANAGEMENT. Letter II.—On the NATURAL HISTORY OF BEES. Price 6d. each, or 5s. per dozen.

RIVINGTONS, St. Paul's Church-yard, and Waterloo-place.

GUANO MANURE.

SCIENCE WITH PRACTICE, or, GUANO THE FARMER'S FRIEND.—A Treatise on the above Manure may be had only of MARK FOTHERGILL, Agricultural Agent, 40, Upper Thames-street, and, by his appointment, of Messrs. WRIGHT, Agricultural Booksellers, 50, Haymarket, and of Mr. PETTITT, Bookseller, No. 1, Old Compton-street, Scho. Also, C. W. JOHNSON'S Treatise on Nitrates of Soda and Potash, Gypsum, and Guano.

DESTRUCTIVE ANIMALCULÆ.—As Spring approaches, the Larvæ of destructive Insects are propagating in infinite multitudes, and impregnate with millions of Insect the very air we breathe, to the great injury of the young shoot of Trees, Vines, Plants, and every species of vegetation put into motion and growth by the genial influence of the season. J. REAN begs to inform Ladies, Amateur and practical Gardeners &c., that he has made such improvements in his Machines for destroying these Animalculæ (which make such deadly havoc on all fruit-trees and plants at this season of the year), that Ladies may enjoy the pleasure of watering their plants and flowers in various densities, from a powerful stream to a gentle shower of dewfall, and may be applied on the choicest Fruit-trees, Vines, Pines, &c., without the slightest injury.

J. R. has also invented a PORTABLE COPPER ENGINE that will pass through a doorway two feet wide, for Conservatories, and may be worked by half the usual labour of any other engine for the same purpose, particularly for Ladies that delight in watering their flowers;—even a child may use it.

Likewise a LOCAL FIRE ENGINE, upon an entirely new principle, which will pass through a common doorway, may be worked by two men, and will discharge 20 gallons of water per minute. This Engine is so arranged, that, by shifting a single pin, it may be worked by one man with ease for all Horticultural purposes—which the Patentee, from 31 years' experience in the science, can safely warrant.—May be seen and proved at 35, Regent Circus Piccadilly.—None are genuine, except with the Patentee's name.

STONE-COLOURED CEMENT.—FELIX AUSTIN, of the New Road, Regent's Park, begs to inform Architects, Builders, Plasterers, &c., that during the process of manufacturing a very superior Composition, which has greatly improved his well-known artificial stone ornaments, he has succeeded in making an excellent STONE-COLOURED CEMENT adapted to all building purposes, which he can supply at 2s. 6d. per bushel, at his Manufactory, near the Thames Tunnel, Rotherhithe. It is particularly suited for repairing decayed stonework.

TO LADIES.

ROWLAND'S KALYDOR.—Under the special Patronage of Her Most Gracious Majesty the QUEEN and the Royal Family.—This elegant and fragrant preparation thoroughly eradicates all Pimples, Spots, Redness, Tan, Freckles, and other Defects of the Skin; heals Chilblains, and renders a chapped and rough skin pleasantly soft and smooth. It imparts a youthful rosy hue to the Complexion, and renders the Arms, Hands, and Neck delicately fair and soft. CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR."—It is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper.—All others are "GROSS IMITATIONS." *** To protect the Public from Fraud, The Hon. Commissioners of Stamps have authorized the Proprietor's Signature to be engraved on the Government Stamp, thus—"A ROWLAND and Son, 20, Hatton Garden," which is affixed to each bottle. Price 4s. 6d. and 8s. 6d. per bottle, duty included. Ask for ROWLAND'S KALYDOR. Sold by them, and by Chemists and Perfumers.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS at the GARDEN for the year 1843. These will take place on the following days; viz., Saturday, May 13; Saturday, June 17; Wednesday, July 12. The Garden will be opened, on each day, at one o'clock, under the following regulations:—All Fellows of the Society will be admitted without tickets, from one till six o'clock, on signing their names in a book at the entrance. Visitors can be admitted only by tickets, to be obtained by the personal or written orders of Fellows of the Society. N.B. The presentation of the visiting card of a Fellow of the Society cannot be regarded as an authority to receive tickets. All Fellows who shall apply on or before Tuesday, the 18th of April, may obtain at the rate of *Three Shillings and Sixpence* each any number of tickets not exceeding TWENTY-FOUR; but no applications for such tickets will be received after that day. It would be a great convenience to the Society, if the Fellows would take their tickets personally, and not by written orders; or, in the event of their not so taking them, if they would at once order the whole number which they may require for the season. After the 18th of April any further number of tickets will be delivered to Fellows on their personal application or written order, at the price of *Five Shillings* each ticket. Each ticket will be available for the admission of one Visitor, after one o'clock, to either of the three Exhibitions, at the option of the Visitor. All applications for tickets must be made at the Society's Office, 21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, APRIL 1, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Monday, April 3	Entomological	8 P.M.
Tuesday, April 4	Horticultural	3 P.M.
Wednesday, April 5	Linnean	8 P.M.
Thursday, April 6	Floricultural	7 P.M.
Friday, April 7	Geological	8½ P.M.
Saturday, April 8	Botanical	8 P.M.
Sunday, April 9	Royal Botanic	3½ P.M.
Tuesday, April 11	Zoological	8½ P.M.

WE have so continually occupied our pages with discussions concerning manures, that some, we fear, regard the subject as more than exhausted. The question, however, is, in our own opinion, but just opened; most of the experiments that have been recorded are rather to be regarded as incentives to further inquiry than as satisfactory solutions of one of the most important—if not the most important—questions connected with cultivating the soil. Gardeners and farmers are alike interested in it, and alike capable of conducting the inquiry; the only difference is, that more expense may be profitably incurred by the gardener than by the farmer—or at least that seems to be the case.

Whatever the value may be of the many artificial manures—and we are the last to question the efficiency of the phosphates and nitrates and sulphates, of guanos, home-made or sea-borne, and all the remnants snatched by the chemist from corruption—whatever the value of them may be, it must never be forgotten that they *cost money*. The cultivators of the land cannot make such substances: for them the true laboratory is the farm-yard—their pneumatic chemistry is confined to the dunghill. The good farmer will use up what he has got before he goes to market for more. He will spend his money upon labour, and only extend his outlay when all the resources of labour are exhausted; then such agents as artificial manures become invaluable, and not till then. It is most imprudent to poison cattle by draining away the strength of manure into a horse-pond and then to run to market for artificial compounds; it is unreasonable, after wasting money thus, to cry out for protecting duties, upon the ground of the peculiar cost of English farming.

We are led to these remarks in consequence of finding that the country is at last becoming alive to the importance of such considerations, and that gentlemen are in many cases strenuously endeavouring to persuade their tenantry to turn their attention to the better preservation and preparation of manure. In Cheshire, Sir Philip Egerton is about to offer three premiums to his tenantry "For the most economical and effective system of *collecting, improving, and employing* the solid and liquid materials within their reach, adapted to fertilise and improve the land." We understand that one premium will be for tenants under 20l., another for those under 100l., and a third for tenants above 100l. a-year. We doubt not that so excellent an example will be quickly followed, and therefore we shall at once proceed to state what we conceive to be the most advisable steps for the competitors to take in order to meet the views of such landlords.

The great principle to start from is, *that all the best parts of manure will either run away or fly away*. The first are seen in the fluids that drain from ordinary dunghills, the second may be discovered by the sense of smell: for the offensive exhalations of manure-heaps are produced in consequence of valuable fertilising substances flying away in an invisible condition. Therefore, a well-made dunghill should neither leak nor smell.

A second and not less important point to be remarked is, *that everything is a manuring substance which has ever been alive*. The dead remains of animals and plants are each in their way equally valuable. People often forget what the origin is of substances in very common use, and do not recognise the fragments of plants and animals, though they are every

day before their eyes. For example, coals are the remains of plants; soap is composed of certain parts of plants and animals, its potash or soda having been obtained from one, and its fat from the other. Manchester goods are made of threads taken out of plants, just as woollen cloths are prepared from threads pulled off animals; therefore, cinders, soapsuds, cotton and woollen rags, are manuring substances just as much as charcoal, stable-litter, or bones.

The third point to attend to is, *that all manuring substances must decay, before they can act as food for plants*. If a man, in his zeal for gardening, were to put his leg into a Vine border, and to sit with it there all his life, his Grapes would make him no return for so uncomfortable a position. But let the surgeon cut it off and bury it there, the effect would be presently seen in the deeper green and stronger wood of his Vines. Now the obvious reason of this is, that, in the first case, the leg remained alive and could not decay, while in the second it had lost its life and immediately began to rot. So it is exactly with all other things; they must decay before they can become manures. Fresh straw is not a manure, rotten straw is excellent; fresh sawdust is useless, when decayed it is of considerable value.

These three principles seem to be those on which the whole art of preparing and economising manure depends. Matter which once had life, whether the carcass of a horse or a basket-full of grubs, an ermine robe or a bundle of rags, will equally become manure; but they must be made to decay, and that being effected, nothing must be allowed to run away in the form of fluid, or to fly away in the disguise of a smell. We conceive that the following plan will effect these objects in the most economical manner.

Mark out the piece of ground on which the dunghill is to be made, on a good slope if possible, and close by a pond. Cut a gutter all round, 6 inches wide and 4 inches deep, and puddle it with clay, so as to make it water-tight. Then, at the *lowest part*, outside the place where the dunghill is to lie, dig a good-sized sink-hole, about 18 or 20 inches deep; let this also be well puddled, and connected with the gutter already spoken of. Things being thus prepared, throw down a layer of such manuring substances as you may have, about a foot deep, and tread them well down; then sift or scatter over it some fixer (what that is will be explained presently); and finally, water it well. Then add another layer of manuring substances, tread down, sift on the fixer, and water well as before. In this manner go on with layer after layer, till the heap is of the desired height—always treading and watering as directed. When the work is completed, a firm mound of manure will be formed, surrounded by a gutter communicating with a sink-hole.

Probably during the operation of making the manure-heap, some water will have drained away; in that case, it will have run into the gutter and collected in the sink-hole. If so, let a labourer scuppet the water out as the work proceeds, and throw it back upon the dunghill. Every morning the sink-hole should be examined, and the drainage that has collected in it be scuppetted back over the heap. If the hole is not large enough to hold all the water that drains off, another can be made near it; *none of the drainage must on any account be lost*. If the heap is properly made, it will heat gently, not strongly; but if it becomes very hot, plenty of water must be thrown over it, caught up in the sink-hole, and scuppetted back, again, and again and again; and, whether it heats or not, it should have, at least once a week, for a month or 6 weeks, a good quantity of fluid of some kind thrown upon it, so as to keep it *thoroughly wet*, it being at the same time well drained. Pot-boilings, soap-suds, or such refuse, are much better than common water; but urine is infinitely preferable to either. If it were possible to collect this fluid and use it instead of water, from the beginning to the end, so much the better.

By these contrivances nothing is allowed to leak away or drain off, but the dunghill is enabled to become a soft pasty mass, holding fast all that belongs to it, except what might fly away. To catch the latter is the purpose of the fixer, which is as indispensable to the operation as the gutter, and sink-hole, and scuppetting, already insisted on. Now there are many kinds of fixers: oil of vitriol, green vitriol, blue vitriol, salt and lime (not however either salt or lime by themselves on any account), gypsum, and other substances, may be used when they can be had cheap; but some of them at all times, and in some cases all of them, have the fault of costing money. A substitute for them, *which costs nothing except labour*, is therefore to be sought for. Such substitutes exist in cinder-siftings, charcoal-dust, good black earth, peat or bog-mould, rotten sawdust, leaf-mould, the black mud from the bottoms of ditches and ponds, the small fragments of wood from the bottom of woodstacks, soot, the brick-dust of brick-fields, or the powder of burnt clay. Some or all of these materials may be had in most places.

Such we believe to be practically the best way of preparing a dunghill, so as to save everything that is

saveable. It is essentially the same as the method followed in Alsace, of which an account has been given in our Volume for 1842, p. 191.—It must be obvious that no harm at least can arise from following our recommendations, which are to be carried out by a *saving* of both material and money. Supposing the plan does not answer, it will have put the person who tries it to no other charge than a little labour; and to so little; even of that, as to be of no moment in either garden or farm. The manure-heap must be made, at all events, and a boy will form the gutters and sink-hole, and keep the heap well moistened while the substance is in preparation.

WHAT we have hitherto said about the "one-shift system" of potting has been in its favour; and there can be no doubt that, under good management, if the object is to make a plant as vigorous as possible, it is better to avoid all the endless, troublesome details of shifting it from one sized pot into another. No better evidence of this is needed than what we see in nature. A plant in the open ground, or in the border of a well-managed conservatory, grows fast, acquires a rich deep green healthy colour, and produces its flowers and fruit as soon as it has arrived at the proper age: on the other hand, the same kind of plant, under the same circumstances, managed by the same gardener, but kept in a pot and tormented by shifting, although it may be healthy at first, soon ceases growing, becomes yellow and lean and starved, and when it flowers brings forth nothing but apologies for blossoms.

Nevertheless the shifting system has its advantages. "It is not the wish of every cultivator to have his Pelargoniums as large as Gooseberry-bushes, especially when a varied collection is kept up; nor does every one desire to grow plants for Horticultural exhibitions. Beautiful as large well-grown specimens may be, it is not in every garden that they can be properly accommodated; and where that is the case, it is worse than useless to attempt it, for small well-grown specimens are quite as interesting. For anything that I have seen to the contrary, a plant may be grown quite as quickly by the common method as by the "one-shift system," with a much better chance of its being established in its pot, and of its blooming in the while."

Now here lies a real objection to the system of putting small plants at once into large pots; they grow too fast for the space of persons having but little room, and it is scarcely to be expected that the possessor of a greenhouse will sacrifice the interior to a small number of large specimens. He would soon weary of their sameness. The lover of flowers wants variety: the diversified forms of nature are what he delights to feed his eye upon; and that he cannot do in a small greenhouse, unless he cramps his plants by frequent shifting from one little pot into another.

While, however, we freely concede this, and admit that it may be more convenient in general to treat plants like a Chinese lady's toes, it does not at all follow that they will be so healthy under such circumstances: the contrary, we are persuaded, is the case. The force of circumstances may compel a gardener to stunt his plants by frequent transfers from one place of confinement to another; and he may, as he often does, by skill and care, preserve them by such means in good health, but he does it at the expense of much labour, and at the sacrifice of all that vigour of constitution which we see in plants whose roots have unobstructed freedom.

We, in concluding this matter, print the remainder of "Observer's" letter, in order that he may not have to complain of his arguments having been misrepresented; but in doing so we have been obliged to enter our protest against some of the statements he makes, even in this part of his communication.

"Allowing," he says, "that by the 'one-shift system' a plant will fill its pot with roots, yet before that can take place, a great portion of the nutritious substances, by the frequent waterings which the plant must receive, will be washed away." This is far less likely to occur in large pots than in small ones; and is of no consequence, because nothing is more easy than to restore to the soil such matters as are washed away, if any.

"This objection," he continues, "may be removed by liquid manures; but plants that have been long used to liquid manures are like irreclaimable drunkards—they have become so accustomed to stimulants, that upon their discontinuance they soon begin to exhibit signs of decay." What is here described is very bad gardening: why cannot a plant have a moderate, as well as an immoderate, quantity of food given it in a liquid state?

"Should the drainage in the 'one-shift system' become obstructed, the soil, by the stagnation of the water, will be soured; and unless the plant be removed into other soil its health will be greatly injured." The same thing happens when the drainage is obstructed upon the common system, and does not affect the argument one way or the other.

"I can say," concludes Observer, "that the practice of inverting a small thumb-pot over the drainage-hole

of the large pot very often proves injurious, for it sometimes fits so closely on the bottom, that a very small space is left for the water to escape, and in spite of the moss, it will carry to the bottom fine particles of soil, which will in most cases effectually prevent the escape of the water, excepting through the hole in the bottom of the thumb-pot. It is preferable to use three or four rather large potsherds, placing the concave side downwards, and putting a rather thin layer of moss over them, not more than a quarter of an inch in thickness, or it will act the part of a sponge and retain the water." All this may or may not be the case; but it has no more to do with the question of frequent shifting than pruning has.

SINCE we first directed the attention of our readers to the state of the labouring poor, and the destitution which so frequently results from mere want of employment, without any fault in the individual, we have had numerous communications on the subject from many of our friends and correspondents. Our limits would not permit us to publish many of these, which are replete with excellent practical observations; but we have not neglected to peruse them carefully; and as they one and all confirm the opinions we entertained before on the advantage of letting small allotments of land for cultivation to Agricultural labourers, we shall only extract from some of them such facts as will clearly show the result of numerous experiments of this kind, which have now stood the test of many years' continuance. We add them as a confirmation of our own experience, and as a guide to those who may be inclined to follow such laudable examples:—

An Account of numerous Allotments let by the Marquess of Lansdowne.—"The quantity of land let out to the poor by Lord Lansdowne in the parishes of Colne and Burnhill is 500 acres, in allotments from half an acre to two acres each, the number of tenants being nearly 700. The price per acre is the same as was given by the farmers previous to giving up the land, and varies from 40s. to 60s. per acre. The crops chiefly grown are Potatoes, the Cabbage tribe, Wheat, and Barley; the grain and green crops alternately, and generally winter Tares are sown after Wheat, and dug in for Potatoes in the spring, with or without the assistance of manure. The rents are regularly paid, with very few exceptions, and the produce of the land is invariably good. A Horticultural Society in Colne has been the means of promoting much good amongst the cottagers by giving prizes annually for vegetables, fruit, and separate prizes for allotment-cultivation and specimens of Wheat and Barley in the ear. From the interest taken in this Society by the neighbouring gentry and landowners I have no doubt that from 30l. to 40l. will this year be distributed amongst them."

A much-valued correspondent, Sir Henry Bunbury, who is most zealous in the cause, writes thus:—"Five-and-twenty years ago I began to assign some small portions of land (for I had but little at that time) to a few labourers. In every instance I found that the man improved in his circumstances, and as his circumstances became more easy he became more domestic and respectable in his conduct. With this encouragement I gladly seized opportunities of letting pieces of land to cottagers; and afterwards, having a good deal within my power, I extended the practice very widely: nor have I ever seen the slightest reason to doubt of its beneficial effects. I do not tie myself down to any fixed quantity of ground; generally, I let but little (say one rood) to a beginner: for the young labourer has no money laid by, and rarely owns a pig (that *rerum necessarium*). But there ought not to be any dry rules about the exact quantity of the allotment, or as to the mode of working it. One sharp active fellow will turn his bit of land to double the profit that could be earned by a dull one. But the crops of the former soon render his practice an object of imitation, and all around him make progress and improve. When there are one or two pigs in the sty, and the land appears in good condition, the advancing labourer gets half an acre instead of his original rood, and so on. Some few of my people have come now to hold one, two, and even four acres—and industrious and thriving fellows they are. But as you ask particularly concerning the size of an allotment, I should recommend half an acre. I find that the man, with the assistance of his wife and children, can keep it in very good condition: nor is he so much occupied by it as to be diverted from his daily labour under the farmer. I am inclined to suspect that gentlemen make the mistake of meddling too much with their allotments as to details. I should say, do not cramp the labourer—let him feel the pleasure of being a free man—stop him when he is going decidedly wrong—give him useful information—and encourage a pride in him as to his crops, and his pigs, and the neatness of his ground."

A lady, who has devoted much of her attention to the letting of land in small portions or allotments to poor people who otherwise would have been a burden as paupers, kindly communicated her experience, in

answer to some questions sent to her, of which we will here give a short abstract. She began with 50 allotments in 1830, and they now amount to 404—varying from eight poles to three, four, and five acres each. Each occupier signs the following conditions:—

Allotments of Land.

Mrs. — agrees to let, and, to hire No. of the in the parish of estimated at A. B. P. until the 29th of Sept., 1843, at the rent of £ and if this rent is not tendered before the 11th of Oct. following, he agrees to forfeit, and give up immediate possession of land, buildings, and crops, without further notice from the owner of the land.

Also to give up the same at any season of the year if convicted of a misdemeanour before a magistrate, or three householders not renting more than himself.

Also, if the whole or any part is assigned or under-let without leave in writing from the owner of the land.

Also, if more land is rented of any other persons except the garden of the house he occupies, and to forfeit double the rent till Michaelmas.

Also, if he removes, or suffers to be removed off the premises, either any hay, straw, or manure, and to forfeit double the rent.

Also, if any land has been ploughed with horses, and to pay twopence a rod over the rent for every pole so ploughed.

Also, if two crops of the same or different kinds ripen their seed without a green or root crop intervening, to be consumed by the Tenant's family and cattle, or other person's cattle, fed off on this land; and in no case to be sold off the premises.

Also, if Game is killed, or permitted to be killed.

Also, if Furze is cut on land not hired.

Otherwise, the land to be occupied till one of the parties give notice in writing to the other to quit and leave, on the day of

Any damage done by a gate being left open to be made good within one week, or his goods or crops seized to the amount, on the valuation of two allotment tenants.

To forfeit sixpence for getting over the wall, or a hole being found in the wall or hedge.

Do. for leaving manure or rubbish on the road.

Do. for trespassing on each other's or the adjoining land.

Forfeits to be kept and divided between the tenants of the same piece.

In any of the above instances the Landlord shall be at liberty to re-enter without any process of Law.

Witnessed by Signed by

There have been only four defaulters in the whole number in twelve years: no legal steps are taken against them; the only consequence of default being the loss of the allotment—they are even allowed to take off their crops. Only eight of the number, who have a cottage and four or five acres of land, and keep a couple of cows stalled up all the year, and some pigs, live chiefly from the produce of the land. All the rest are day-labourers, and for these from 20 to 40 poles are sufficient: 20 of them have manure tanks. A peculiarity in the granting of allotments by this benevolent lady is, that previous good conduct is not essential to their obtaining allotments. All that are willing to subscribe to the conditions and belong to the several parishes are admitted; and she has found that regular occupation and profitable industry have generally been the means of correcting vice, when not too deeply rooted, and greatly encouraged honesty.

But all this, however satisfactory, is not intended as a remedy for that superabundance of agricultural labourers which we desire to see usefully employed: we must show how the proprietors and occupiers of land may employ more manual labour on their land, not only without loss, but with a certain profit; thus, no doubt, increasing the expense of cultivation, but also increasing the produce so much, as to repay the additional outlay with a fair and ample remuneration. If we can do this, we shall have done much to solve the problem.—M.

HEATHS.

In the following advice to the young Amateur, and a detail of my plan of Heath-growing, be acceptable to your readers, they are much at your service. Supposing, then, that the cultivator has entered into the merits of a well-grown Heath, and prefers a bushy, thickly-foliaged plant to one resembling a timber-tree, he will no doubt be desirous of obtaining 100 of the best and most beautiful varieties. He ought therefore to procure two of each; travelling or other incidents may cause the loss of a single plant, and for this reason it is best to have a duplicate. One may be grown for a specimen, and the other to propagate from; but the latter may live to see better days, when cuttings are pretty numerous. In making a selection of plants at the nursery great discretion is requisite, and it is seldom that those in large pots can be recommended. I would advise the amateur to take up the nearest 48-sized pots containing the sort which he requires; if the foliage is healthy and clothes the stem as well as the upper branches, and if on turning it out of the pot the roots are of a silvery white, it shows that the plant is in a growing state. Such a plant may be set aside, and the remaining 199 should resemble it. I would, however, caution him against a large plant in a small pot, with a tolerably healthy appearance, but a thick woody stem, which when turned out discovers the roots matted together, and for the most part of a sandy

colour. Nine times out of ten such a plant will bloom and die; but occasionally it will recover by being repotted, decay not having reached the centre roots. It will, however, lose the foliage for a considerable distance along the stem, in which case it is advisable to cut it back. Even then the plant in the 48 will have the advantage, having fresh roots, and nothing to check it in its onward course.

When your plants are unpacked, supposing it to be March, which is the best time for the purpose, it will save much trouble if they are examined before being placed in the house, to ascertain whether they require shifting. In this particular the greatest discretion must be used. If the roots are evenly distributed round the pot, it seems reasonable to suppose that a larger pot would suit it. I confess I have lost many a healthy plant by my anxiety to push it on and shift it before it was ready. It is well known that the roots of plants, when repotted, seek the sides of the pot in the first instance; afterwards the centre is gradually filled up. Therefore, examine the plant closely, by taking out the crocks and turfy drainage; and if the roots do not make their appearance in the same strength in the centre as the exterior, be assured that the plant had better remain as it is, with the addition only of a little fresh drainage. Experience may, however, prevent this trouble, for there is a peculiar lightness and elasticity to the touch that will show when the exterior and interior of the mass of roots correspond. Some, no doubt, will require a change, and an important question then arises, into what sized pot they may be shifted.

There are some gardeners, who, anxious to spur on their favourites, would not scruple to give them a second size larger; and with some of the free-growing sorts, I admit that even three sizes may not be too much; but a beginner has not the means of discrimination, and the safer plan is to shift from size to size. In some cases you may obtain two shifts in one year—in February, and again in July or August; but if you attempt to force on *Erica Massonii*, *aristata major*, *depressa*, and some others of the slow-growing sorts, which, owing to their tardy movements, cause but a slight demand upon the roots; long before the latter reach the sides of the pot, they become exhausted by the continual wash of the water; the mould becomes sodden, growth is checked, they sicken and die. If *E. aristata major* is in a 48, be content if, on shifting it into a 36 in March, it fills the pot during the summer, and is in a state to receive a further movement in spring, after having increased two inches in the length of the shoots. Not so, however, with *E. tricolor*, *elegans*, and some others. The former has made a growth with me of 8 or 10 ins. in a year, although it had been advanced two sizes. But to proceed with shifting the plant from the 48 to a 36:—Let the pot be perfectly dry; make the hole at the bottom rather larger, and place over it a piece of crock; add some smaller pieces half an inch square, to the depth of half an inch. Select some dry turves of fibrous peat (shaking out the mould), and lay it over the crock an inch in depth. Having collected some small round pebbles of the size of a Horse-bean, mix a dozen with the first handful of mould, that is, before you place the plant in the pot; then insert the Heath, having divested it of the former crock and drainage. Fill in round it with the fresh mould, and firmer than with other plants; be very particular that no fresh soil covers the stem, but that it be raised above the level of the sides, so that in watering, the moisture should fall to the sides, and on no account lodge in the centre. Do not water for one or two days, and during that time place the plant in the shade. The small pieces of crock, drainage-peat, and small pebbles must be increased according to the size of the pot. I would advise that before the plant is placed in the house, it should be staked out in the form in which it is wished to grow. The tender twigs may be brought down, but when hard, they become stubborn and inflexible.—*Erica*.

(To be continued.)

DESCRIPTIVE LIST OF CARNATIONS AND PICOTEES.

(Continued from p. 156.)

PURPLE FLAKES.

- Mango* (Ely's).—One of the best in its class, the pod being good, and the white pure; of medium size, and the colour, violet purple, well laid on; it flowers early.
- Beauty of Woodhouse* (Mansley's).—A new flower of fine properties; with me it is rather deficient in purple; the stripes are broad, and white very pure.
- Bellerophon* (Leighton's).—This stands first in the Lancashire Show-book, though decidedly second-rate, the impurity of the white being a serious drawback.
- Princess Charlotte* (Turner's).—An old flower, of large size and fine colours; it is extensively grown, and is a safe sort to depend on.
- Premier* (Milwood's).—Raised a few years ago at Derby; the white is apt to flush, but the petals are large and well-formed: when clean it is a fine flower.
- Squire Meynell* (Brabbin's).—One of the best we have; the flower is large, pod good, form and colour excellent.
- Sir J. Plastain* (Bates').—Very large, white impure, rather loose in its habit; with me second-rate.
- British Queen* (Elliott's).—White pure, but often deficient in a fair proportion of purple.
- Invincible* (Simpson's).—An old flower, liable to the defect noticed in the preceding variety; when grown strong, however, the colours are better distributed.
- Major* (Spray's).—Good form and white pure, but often short of colour.
- Miss Thornton* (Hudson's).—A strong grower; flowers large and well marked; although esteemed in Lancashire, it is considered rather thin for Nottingham.
- Enhancer* (Pearson's).—Guard leaves rather too large

in proportion to the others; white good, crowns well, and the colour evenly distributed.

Rev. T. Gishbourne (Brabbin's).—Raised the same year and by the same person as Squire Meynell, but far inferior to that flower; I have discarded it altogether.

Magnificent (Ely's).—A full and large-sized flower; stripes dark and numerous, crowns well; white not pure.

Queen Victoria (Ely's).—A useful flower, though not first-rate.

Cleopatra (Weldon's).—Stripes very dark purple, flowers large and confused, white rather impure; second rate.

First-rate (Pollard's).—Well named; the pod is rather short, but the petals, with a little attention, get out well. The flower is large and finely formed; white very pure, ribboned with broad flakes of deep purple; it appears to be shy in rooting, and is very scarce.

Platoff (Hall's).—A compact flower, with fine petals; the purple very dark; white sometimes slightly tinged.

Major Cartwright (Hall's).—This is an old variety, whose day is gone by; occasionally a decent flower is seen. The petals are thin in substance, and there are too few of them; the purple also is not good.

RED PICOTEES.

Mrs. Horner (Ely's).—This is often exhibited in the heavy as well as the light-edged class. The pod is good, and edging distinct; it is a favourite in this part of the country, and wins at most exhibitions.

Miss Bacon (Wollard's).—Neatly edged, but too small.

Little Wonder (Wollard's).—Very much akin to the foregoing, under-sized, but of good shape; the edge distinct and well laid on.

Duke of Wellington (Sharp's).—White pure, and very finely feathered or plaited; the guard-leaves are rather too small, still it stands in the first rank at present.

Mary (Marris's).—A large and finely-shaped heavy-edged flower, sometimes rather too much barred.

Pilot (Marris's).—As large and well formed as the preceding; it is, however, much cleaner and more distinct. A decided good heavy edge.

Will Stukeley (Hutton's).—Heavy-edged; bars too much, and though still winning in some parts of the country, it is certainly an inferior flower.

Derby Willow (Maw's).—Heavy-edged with dull scarlet, only fit for borders.

King of the French (Green's).—Much too thin, and, at the risk of being thought severe, I must say, inferior.

Royal Briton (Hardy's).—Something in the style of Mrs. Horner, but inferior to that flower, the white being impure; still it has a good pod, crowns well, and the edge is well defined.

Matilda (Parkinson's).—A large and distinct flower, white good, edge dark crimson; not quite up to the mark.

Venus (Hudson's).—Light-edged red, a full flower, crowns well, is very clean, and worth growing.

Marc Antony (Benn's).—Rather too thin; the white is very good, and beautifully plaited with dark crimson.

Hector (Sharp's).—Rather light-edged, form good, white pure, edging distinct; first-rate.

Cornelius (Barraud's).—I have not used much ceremony in my short descriptions of north country flowers, and here I am obliged to find fault with the favourite of the south. It has a good pod, the white is pure, edged with dark crimson, of a different shade to most others; with me it bars too much, and should it always flower in the same style, I should pronounce it decidedly second-rate.

Colonel Foreman (Barraud's).—Clean, with a good petal and neat feather.

Teazer (Gidden's).—A large and rather coarse flower; it has, however, fine guard petals and crowns well; it stripes down too much, but when in its best state is undoubtedly a "Teazer."

Cæsar (Gidden's).—Heavy-edged, rather thin, in the way of Marc Antony; an inferior flower.

Criterion (Sharp's).—Neatly-edged, but with a short awkward pod; flowers medium size, and apt to expand confusedly, requiring much care to bloom it well; the layers also root indifferently.

Catherine (Hardy's).—Under-sized, white impure, raised near Nottingham from Bowley's Ann; neatly edged, but second-rate.—J. F. Wood, *The Coppice, Nottingham*.

(To be continued.)

FAMILIAR BOTANY.—No. XIV.

Blown in the morning, thou shalt fade ere noon;
What boots a life, which in such haste forsakes thee!
Thou'rt wondrous frolicking to die so soon,
And passing proud a little colour makes thee.

The Figwort.—The fetters of ice in which the earth was shackled a few weeks ago had hardly been broken; a few scanty sunbeams had but just been playing upon the ground beneath the old oak-tree before our door, when the turf began to sparkle with the surfaces of a thousand glassy emerald leaves, while myriads of golden stars were to be seen glittering amongst the herbage. It almost seemed as if the wand of an enchanter had struck the ground and suddenly commanded the slaves of his will to appear.

A walk among the thickets of our landlord's park and the deeper recesses of his woods brought more of these gay visitors to our knowledge, and showed us that no enchanter had been at work, but that the teeming womb of nature was everywhere producing some early and joyous herald of the spring. The lingering days of autumn, protracted into February, had produced no effect upon the hardy wilding which sturdily awaited its appointed time, and refused to be awakened till the customary frosts had given it energy to spring into vernal life.

The old herbalists knew the Figwort well, and thought it imbued with great medicinal qualities; some mixed it

with honey, and drawing it into their nostrils, thought it cured their headache; others found it hot and dry in the first degree: more sober people pounded it into a paste, and used it as an astringent; the scurvy was driven away by it, as a few said; and many boiled it as a Spinach, which they found agreeable. Some, however, declared it was an acrid, poisonous thing, blistering the skin and causing leprosy. All these fancies are, however, long forgotten, and nothing now remains of the plant but its beauty.

The Figwort is a sort of Crowfoot, called by some Botanists *Ranunculus Ficaria*, and by others *Ficaria ranunculoides*; but although it belongs to the same vile race as the Sardoan herb of the ancients, whose blistering poisonous qualities have gained them an unenviable notoriety, it is a harmless gentle plant, as quiet as it seems to be: which is more than can be said of all fair flowers. It derives its common name from its roots looking like a cluster of small Figs. Its leaves are similar to those of the Arrow-head, but shorter, smaller, and delicately mottled with pallid spots. The flowers grow singly at the end of slender angular stalks; they have three leaves, or rather scales, on the outside, and eight or nine glittering golden petals, dull at the back, but almost metallic in front, where a scale is found near their foot, the sign of the clan *Ranunculus*. Many are their yellow stamens, many their grass-green ovaries heaped upon each other in the middle of the flower, and promising an abundant increase. Yet, strange to tell, the seeds are seldom ripened, and that ready mode of propagation, in forming which nature seems to have taken such infinite pains, is thrown aside as worthless, another mode of multiplying its race being given to the Figwort. According to Vaucher, the tubercles of its roots are of three sorts—the one long and withered, which nourish the plant; another, dilated at the lower end, and afterwards producing other plants; and a third sort, which sprouts out from the crown of the root; besides which it produces in the bosom of its leaves certain bulbs, which disperse themselves as soon as the leaves have perished. In the early spring these bulbs are not to be found, but in the autumn they may be seen lying near the bottom of the leaves, shut up in two furrowed sheaths, in the midst of which is a perfect little leaf, bearing at its base a fourth, which itself gives birth to a fifth, and so on. The ground is said to be filled with these little bulbs at the approach of autumn, and they certainly produce an abundant crop when the spring-time arrives.

The flowers of the Figwort hail the sun like the fire-worshippers of old: as soon as his beams strike them, "and pour their soft luxuriance on the morn," they unfold; but when a cloud interposes, they close again; so that you may find the turf enamelled with sparkling stars in the morning, and as joyless as the "mournful, sober-suited night" in an hour afterwards. Gardeners are its sworn enemies, we know not why, destroying it whenever it dares to intrude upon the ground where the Groundsel and Dandelion are permitted to flourish; so that its life is surrounded by perils, for which its harmless nature gives no cause, and from which its short life might have preserved it, for it springs up in March and perishes in May.

—R. E.

ON VEGETABLE MANURES.

(By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

Under this name are comprised not only different sorts of straw or litter, but also those vegetable substances which are used unmixed for manuring fields. I shall first treat of the different sorts of litter, and then of those plants, or remains of plants, which, without being mixed with animal excrement, improve the fertility of the soil.

a. *Of Plants used for the Absorption of Animal Excrement, and which, thus mixed, serve as Manure.*—Those

plants which have to absorb animal fluids, and which are also employed as a soft litter for cattle, are (with few exceptions) used in a dry state, because it is one of the chief objects to soak up the liquid part of manure. In this way, however, it happens that the materials used for litter are rendered more capable of being decomposed, and of thus becoming a nourishment to crops. The decomposition of dung, on the other hand, is accelerated by its being loosened by means of the litter, and of a free access for the oxygen of the atmosphere, without which no chemical decomposition is possible. The products of the complete decomposition of vegetable substances are, humic acid, carbonic acid, mineral acids, earths, oxides, and alkalis; and since all these belong to the nourishing substances of crops, it is necessary, if we would know the value of different sorts of litter, to make ourselves acquainted with their chemical constituents.

The chief constituent of dry vegetable litter is carbon, which amounts in all cases to more than 50 per cent. It forms, combined with hydrogen and oxygen, humic acid,* a substance which every fertile soil must contain in great abundance, not only because it furnishes plants with carbon, but also because it dissolves and conveys to the roots earths, oxides, and certain salts contained in the soil and required for the crops. Humic acid serves also for the neutralisation of alkalis, which easily destroy vegetation,—as, for instance, ammonia, potash, soda, and lime—so much so, that it must be considered in many respects as a substance quite indispensable for vegetation. Now as humic acid is mostly generated by the substances used as litter, it is evident that they cannot be dispensed with in agriculture, except in cases where humic acid may be obtained by manuring with mould, mud, peat, &c.; for no amount that could be afforded by the decomposition of solid excrement would be sufficient. Litter is also indispensable, because it improves the soil mechanically; it keeps a clayey soil loose as long as it is not decayed, and thus not only facilitates the access of atmospheric air, but accelerates the evaporation of superabundant moisture.

Besides these great advantages which the crops receive from litter, it is also to be remarked that its mineral ingredients are of equal importance. The effects of these have hitherto excited little notice, for it was not generally believed that mineral substances form the nourishment of plants; and this explains the reason why litter has either been undervalued or insufficiently appreciated. The true value of litter can only be determined by chemical analysis.

If we compare with each other the mineral substances contained in litter, we shall find pretty nearly what we have to expect of each in the way of manure; and if we ascertain their amount of nitrogen, their value in regard of any sort of soil may be ascertained almost with mathematical accuracy. If we next determine the chemical constituents of the food of cattle, and deduct this from that which has remained in their bodies, or has been exhaled by them, we shall be able to calculate even to pounds, all the substances which the soil receives from the fresh dung. But, in order to arrive at that, many experiments are still to be made.

It is beyond all doubt that that sort of litter possesses the greatest value which contains the greatest quantity of those ingredients in which soil in general is most deficient; amongst these are potash and soda, lime and magnesia, chlorine, sulphuric acid, phosphoric acid, and especially nitrogen. Carbon, which as we have just seen is amongst the most important ingredients of litter, may here be left out of consideration, because its amount is constantly within a few per cent. more or less, and as we know that all dry litter contains more than 50 per cent. of carbon, it is equally unnecessary to take into account the oxygen or hydrogen of litter, as all crops can take up the water of the soil *ad libitum*.

As some sorts of vegetable matter contain substances either detrimental to vegetation (like tan), or decomposed with great difficulty, such as rosin, wax, and fibre, such substances require a particular preparation previously to being used for litter, or carried on the field, mixed with dung. They require to be well heated, without, however, being carbonised, as it is merely requisite that the tannin should be destroyed, and the fibres rendered more tender. If this is not attended to, they will remain for years in the soil undecomposed, which (as manure is to be considered a capital desirable to be quickly circulated), is attended with much loss; besides which, the plants whose growth we intend to accelerate, will derive no advantage from them. I have stated before that those sorts of litter are easiest of decomposition which contain much nitrogen, phosphorus, and sulphur, or which are soft and delicate, at the same time containing much green mucilage or other substances easily extracted by water. Dry green plants always arrive easier at a state of decomposition than those which are dry and ripe, not only because the texture of the former is more soft, but also because they contain substances which bring on a speedier putrefaction. It is said that litter which has become mouldy is of less value than when fresh; if this be really the case it is to be ascribed to nitrogen having evaporated during decomposition in the form of ammonia.

1. *Straw of Cereal Plants*.—The straw of Cereal plants is, on most farms, the only litter used, and as far as keeping dry the beds of cattle is concerned, it is the best, because its hollow straws enable it to absorb the greatest quantity of moisture. Its value however as a manure is by no means so great as that of other sorts of litter; there is moreover a great difference between the different sorts of straw in respect of their manuring qualities. It may be generally assumed that the straw which is most nutritious is also the best manure. It manures the better, the less it has been subjected to maceration by rain-water;

* Humic acid is composed of 56700 parts of carbon, 4789 hydrogen, and 38511 oxygen.

described by letters to the right of each name, as *t* for trailing, *b* for branching, and *u* for upright.

<i>Ipomœa rubro-cærulea</i>	blue	10
<i>Quamoclit</i>	scarlet	6
<i>coccinea</i>	scarlet	6

Many more might be added to this list, and it must be recollected that old kinds, such as Ten-week Stocks, Asters, Marigolds, &c. &c., are by no means unworthy of notice; in fact there is scarcely any plant which makes so fine a bed as the old double pot Marigold.—*W. P. Ayres.*

REMARKS ON THE CULTURE OF TRILLIUM.

By FREDERICK OTTO. (Translated from the German.)

THESE may be numbered among the many beautiful spring plants which decorate our flower-gardens. Although distinguished in a great degree by their elegant blossoms and curious form, they are only found singly, and not in such large numbers as to create masses of flowers. The ease with which they may be cultivated, renders them suitable for every garden. In Loudon's *Hortus Britannicus* and in its supplement, 15 species are mentioned as being grown in English gardens; it is doubtful, however, whether they are really to be found there, although they can be brought over from North America without much difficulty. It is the same with English gardens as with many more; old plants become replaced by others, more new indeed, but less interesting and beautiful; and thus, during the last twenty years, many have been lost which were once the ornament of our gardens.

C. Sprengel, in his "*Systema vegetabilium*," introduces 14 species; T. H. Schultes, in the "*Syst. Veg.*" vol. vii., Part 2, mentions 17; and Steudel, in the "*Nomenclator Botanicus* (1841), 21 species of *Trillium*. In the most recent North American trade catalogues of plants, we only find from 6 to 8 species, and these not always correctly named, so that it is difficult to obtain them.

Seven species are cultivated in our gardens: namely, *Trillium sessile* L., *erythrocarpum* Michx. (pictum Pursh) pusillum Michx. (pumilum Pursh), *cæruleum* L., *erectum* L. (rhomboidum Michx.), *péndulum* W., and *grandiflorum* Salish. Their cultivation is very simple. They grow freely in the open air without covering, in shady places, and in a mixture composed of marsh or heath soil mixed with river sand. They bloom abundantly every year, in April and May, and are a great ornament to our gardens. As far as my knowledge of these species extends,

it appears to me that the tuberous roots spread rapidly by the formation of lateral eyes; so that after some years, if the plants have not been removed, they will form large, handsome bushes. The seeds ripen in August, and if sown immediately they will come up the following year. They may be sown either in the open ground, in a shady peat border, or in pots. The stronger seedlings will bloom in the third season. From what has here been said, it may be seen that there is no difficulty in cultivating this handsome-tribe of plants. It is well worth the trouble to grow the better species for our flower-borders, as they add greatly to the beauty of spring nosegays.

HOME CORRESPONDENCE.

English and Scotch Farmers.—Is it not too much the fashion of the day to eulogise the Scotch at the expense of the English farmer? Before writers embark in such adulation, they should make themselves well acquainted with the grounds on which they found their praise. In making the comparison, do they consider the causes of the difference of rent paid by the farmers of the two nations? Do they allow for the difference in the size of the acre, the Scotch being about a fifth larger than the English? Do they allow for the difference caused by tithe and poor's-rate? Both heavy items, affecting rents, as hitherto calculated in England, and almost unknown in Scotland. Do they allow for the great advantages the Scotch farmer reaps from his long lease, which enables him to turn whatever capital or energy he may possess to the greatest benefit?—a position of which the English farmer is debarred. I would, in the next place, inquire what great discoveries the Scotch farmer has made, or in what consists the excellence of his arrangements or plans of operation? Thorough draining and subsoil-ploughing are claimed for Scotland. Have they not been practised in some of the south-eastern counties of England for more than a hundred years? And here I admit the English are deserving of reproof. Why should the practice be confined so long to these few counties? because the English character is not national enough to spread the information, and claim for its people every new discovery made in any of its isolated localities. The Scotch pursue a different course, and one that deserves to be imitated: they no sooner hit upon a discovery, or adopt an improvement from their neighbours, than it is published in all their local newspapers, and claimed as a proof of their national intelligence—the national pride thus leading to a public benefit. Did they not so borrow and appropriate tile-draining, wedge-draining, drill-husbandry, and green crops? Have they at all improved on the plans thus imported? In the hot southern counties of England, Turnips cannot be grown advantageously on drills; and how a Scotch farmer laughs at the southern broad-cast, forgetting, or rather not knowing, that it requires the cold moist climate of the north of England and Scotland to grow them in drills. Witness the effects of last summer's heat on these roots in Scotland, where they were as much injured by blight as usually they are in the south of England; and no doubt, were the Scotch farmers annually subject to such summers, they would be glad to resort to broad-cast tillage to have a crop at all. In this case the climate, not the mind, directs the practice. By-the-by, is blight in Turnips the red spider that so annoys the gardener? I almost fancy it is, as the first rain in the autumn puts a stop to its progress, as moisture kills the spider in the Melon-frame. Then as to Wheat. Excepting in those favourite districts, the Lothians and the Carse of Gowrie, have not the Scotch farmers nearly given up its culture? Have they not found it a loss rather than a gain? Next, let me introduce their ploughs—their far-famed ploughs, of which they boast so much. Were they not tried at the great agricultural meeting the year before last at Liverpool, and last year at Bristol, and in both instances found wanting? requiring nearly twice the draught of the poor despised English plough. Next, compare the cheese, the butter, and the hams of Scotland with those of England. Does not their value stand fully twenty per cent. lower in the market?—the place of all others where quality finds its level. I might go farther, and show the deficient practice of the Scotch farmer in breeding and feeding; but I hope I have already said enough to induce reckless writers and speakers at public meetings to reconsider the subject before advancing such erroneous comparisons.—[Our opinions upon this subject are recorded at page 160, of the present year.]

Cattle.—I observe at p. 157 that "C. D." says, "that sheep kept in the same pasture with cows do not injure the butter." In this he is much mistaken, for a house-keeper, who has had 30 years' experience in the dairy, informed me that she could tell by the nauseous flavour of the butter, when sheep had been feeding in the same park as the cows, particularly if it was dry weather. In this case there was neither an Ash-tree nor garden-refuse in the pasture.—*Confirmation.*

Inclosing Land from the Sea.—Having lately perused two interesting articles upon this subject, at pp. 115 and 175, it may perhaps not be uninteresting to your readers to know what is going on on the eastern coast of England. In the reign of King Charles the First a large tract of land, said to contain 2,200 acres, situate in the marsh, in the parish of North Somercotes, in the county of Lincoln, was granted to Endimion Porter, Esq., one of his then Majesty's gentlemen of the royal bedchamber, which marsh land retains, to this day, its name of "Porter's Marsh." This land or marsh was subject to inundations, at particular times of the year, (the Equinoxes,) by the sea; but by an act passed in the year 1630, an embankment was made by which the sea was effectually kept out, and a considerable quantity of very valuable and rich land was recovered, a part of which forms the subject of this

article. This property has at various times fallen into different hands, and amongst the rest, a considerable portion, say 900 acres, came into the possession of the Earl of Yarborough, who a short time ago offered the whole of this property, together with a considerable tract of land called the "Fitties," or derelict land, said to contain 400 acres and upwards, for sale, when the whole was purchased by Messrs. Pyr and Waite, two solicitors of Louth. They soon made the property change hands in convenient lots to a pretty considerable profit to themselves, reserving about 100 acres of "Porter's Marsh," and the whole of the "Fitties," or rich "Salt Marsh." These enterprising gentlemen are now about to inclose the whole of these "Fitties," or "Salt Marsh," by raising a considerable embankment; Mr. Charles Orme, of Louth, has been engaged some time for the purpose of surveying and levelling the same; and it is understood that he has already completed that portion of the works. A public notice has likewise appeared, advertising the works to be finished by contract. They are to be commenced early in the ensuing month. There cannot be the slightest doubt but that this land, or rich salt marsh, as soon as inclosed, will become of first-rate quality. This part of the coast is well known to mariners by the name of "Donna Nook," supposed to take its name from the circumstance of the first body washed on shore on that part after a severe storm. When the embankment is finished, it is determined to inclose a similar but more extensive tract of land in the adjoining parish of Granthorpe; thus affording ample employment for some time to come to a number of poor, and a considerable profit to the undertakers.—*An occasional Reader.*

Effects of Ammoniacal Liquor on Grass.—About this time last year I tried the following experiments with ammoniacal liquor from the gas-works, and I send you the result for the *Chronicle*:—I watered my lawn with ammoniacal liquor, diluted from half-and-half to nine-tenths water. The moss was everywhere destroyed. In many places, as might be supposed from the strength of the mixture, the grass also. Not so the daisies, plantains, and other weeds. Those places where the grass was destroyed are without a blade at the present moment. So far this might have been foreseen, but I did not anticipate that the entire lawn would be again, in so short a time, covered with moss; nor do I perceive the grass in any part to be improved, more abundant, or different from what it was before the application. Under these circumstances, I now propose to weed it, rake it, and sow it with Curly (crested) Dog's-tail, and Dutch clover, and strew a little fresh mould over it. Can you suggest anything better? I presume that wood-ashes would be detrimental after the dressing of ammoniacal liquor, which I take to have the like qualities.—*W. W.*—[On the contrary, we would advise wood-ashes and soot. The effects of gas-water, unfixed, are transient, but always, as far as our experience goes, important at first.]

Soot as a Manure for Pines.—Have any of your correspondents ever tried soot as a manure for Pines? I am induced to ask this question by observing the other day, whilst shifting my Pines, a plant with the roots very much matted at the bottom, and altogether in a more vigorous state than the others. On further examination, I discovered that by some oversight it had been placed in a pot containing a small quantity of soot.—*Scrutator.*

Bees.—To know that Bees' eggs are transmutable is of greater importance to Bee-keepers than they are aware of. Were I not about to make a few remarks on the management of Bees, I would not now place my opinion in opposition to that of Mr. Wighton, who, with Bonner, seems to think that different food or treatment cannot change the sex of Bees. Perhaps he is not aware that proprietors of sheep may, at their option, by means of different food and treatment, have a greater increase of male than of female lambs, and *vice versa*. In the "*Quarterly Journal of Agriculture*" it is said that, "When animals are in good condition, plentifully supplied with food, and kept from breeding as fast as they might do, they are most likely to produce females. But if they are in a bad climate, or on stunted pasture, Nature sets limits to the increase of the race, and produces more males than females." No human being can undertake to say how Nature works in changing the sex; it is far beyond the reach of our limited perception. Our question is, however,—Are Bees' eggs transmutable? Mr. Wighton says, "It is more likely that the queen owes her development to the size of the cell in which she was reared than to a mixture termed royal jelly, administered by the Bees; still it is open to objection," &c. Very open, indeed; for the queen Bee is 14 days only in the cell, whereas the common Bee is 21 days. Hence I affirm, without fear of having my position overturned, that there is something put into the cell that accelerates the growth of the queen. Mr. W. says, "Bees may have eggs in store that produce queens; this, however, is not very likely;" for, he might have added, that the Bees could not sit on them without hatching them. "Huber asserts," continues Mr. W., "that working Bees deposit eggs which may, in such cases, produce dead Bees." One experiment will suffice to show that the change of gender takes place from something added to the egg or grub by the Bees. When from one of the first two swarms we take away the queen, the day after they are put into empty hives, we find that the queenless swarm, after searching one, two, or three days, begin to make royal cells by adding wax to common cells (Mr. W. erred in saying that they are not so deep as royal cells generally are), and put a white, milky, gelatinous substance around the eggs or grubs, which substance is never used for common Bees. And now comes the climax. This queenless swarm rears a queen or queens from an egg or eggs in 14 days—7 days sooner than the

Bees of either swarm when the old queen is not taken from them. I may state that the Bees cannot produce a queen sooner from a grub three days old than from an egg one day old. Both are 14 days in the cell after the gelatinous substance is added; and that if the substance is not added on or before the fourth day, before the grubs are four days old, no queens are produced; which proves that the common or neuter Bees do not—cannot lay eggs. I will hereafter point out the great advantages that Bee-keepers may derive from a knowledge of the transmutability of eggs.—*A. Pettigrew, Wrotham Park, Barnet.*

—As "Agger" has answered my question, as to what is the primary cause of Bees storing up honey, I shall, according to promise, make a few remarks on his previous communication at p. 129 respecting them. He says, "It appears to me that Bee-keepers do not make sufficient allowance for their own bad management, when the system which they adopt fails of success." It is true that no one has a right to exclaim against a system until he has given it a fair trial, but afterwards he is free to do so. I was, perhaps, amongst the first to find fault with Nutt's system of Bee-keeping; since then, many other persons have done so, and though we occasionally hear and see accounts of great produce by this system, how can we always put faith in them? For aught we know, such statements may be made by those interested in the sale of Bee-hives. It may be said that I am suspicious; but when doubtful statements appear under fictitious signatures, there is room for suspicion. Again, "A." states, "that he is not so well pleased with his old straw-hives," because he lost a swarm from one of them, "after his servant and himself had a run of a mile." This might also have happened with his collateral boxes, although he seems to think otherwise. The next and most important part to notice, is where "A." says, "I think that the Bees, in closing the ventilators, really display great sagacity; they know that if the hive is very hot, the Queen-Bee will deposit her eggs in the cells, and thus the species will be increased. But the propagation of the species is not the object for which we keep Bees." Respecting the "sagacity" of Bees, I have, at present, nothing to say. It is enough to mention that they cannot construct their cells, nor rear their brood without heat; and experience tells me that pretty nearly the same temperature is requisite for both. But supposing that the highest temperature were required for the brood, and that the hive were kept cool to prevent increase, would more Bees be abroad in consequence of it? assuredly not. On the contrary, more would remain at home to increase the heat, instead of being amongst the flowers collecting honey. As regards "the propagation of the species," if Bees were long-lived, there might be truth in "A.'s" statement; but as they are not, if it were not for the great increase which supplies the places of the dying Bees, a strong hive would soon become weak. The increase of Bees adds, moreover, to the number collecting honey. I wish what I have said on the last extract to be clearly understood; for upon it Nutt has founded his theory of Bee-keeping. I may mention that I differ in opinion from "Agger," respecting the primary cause of Bees storing up honey; he conceives that it is solely "to support them in bad or cold weather;" though this is the common belief, still it may be asked, if we had perpetual summer, would Bees neglect to store up honey? it is almost useless to say they would not. As Bees in hot climates collect honey during the whole year, so they would with us if we had no winter. Hence I conclude that they have no real instinct, or foreknowledge of winter, and that the primary cause why Bees store up honey is to enable them to increase their species. I am sorry to say that their increase is often weakened by the Bees breaking off (swarming) into small communities, at certain times, when there is no chance of collecting store for winter. Though this propensity does not show much "sagacity" in Bees, still it favours what I have just stated, viz., that they have no instinct, or forethought of winter. I may add, that it is a great obstacle to keeping them. Although so much has been said about cooling Bee-hives, I may safely state, that more injury is done to Bees by damp and cold than by heat. As the breeding season is arrived, their hives, especially weak ones, ought to be kept warm by extra covering and feeding. Since the above was written, a gentleman who has kept Bees for twenty years informs me that he has "set Nutt's boxes aside, and laughs at the immense quantity of honey which Nutt says that he obtains."—*J. Wighton.*

Bees.—Dr. Bevan begs to inform "M. A. P." that the dislodgment of a family of Bees from a common cottage hive, at this season of the year, is an operation which would be attended with considerable hazard. He therefore recommends "M. A. P." to postpone it till the latter end of summer, when, if the family be populous and the hive well filled with combs, it may be readily accomplished by driving, a full description of which is given at page 185, of the "Honey-bee." Whether a family be supered or nadired, the entrance should always be in the inferior box or in the floor-board.—*Llanferry.*

Toads.—I am surprised that Mr. Beaton has never seen toads destroying woodlice. That they do kill them, when confined in a Cucumber frame, I am certain, because I have repeatedly seen them do so in the heat of summer.—*J. Smec.*

On the Education of Gardeners, No. 1.—In the earlier periods of our history, when extensive combinations of individuals were necessary to maintain common or professional rights, the bond by which large bodies of youth were united to a trade for a certain number of years, was rendered subservient to the purposes of the nation or a particular class; and the apprentices of various kinds constituted a powerful engine in the hands of enterprising

leaders. At a later era, the more legitimate object of the system was adhered to, and modern exigencies have extended it beyond mere mechanical trades to the learned professions, and to those engaged in gardening. It is difficult to ascertain at what precise period the plan of apprenticing gardeners was commenced. The tradesmen of London are known to have employed apprentices so early as the thirteenth and fourteenth centuries; but gardening must have been greatly raised in importance above the position it occupied at that time, before apprenticeship could have been adopted as a mode of instructing its agents: and it is only since horticulture has become so widely spread, that the influence of apprenticeships on gardeners has been thought worthy of consideration. To determine the evils or benefits of any system, it is necessary to acquaint ourselves with the ends it is intended to answer, and its efficiency in producing the results contemplated by its establishment. Horticulture, both as a science and an art, is one of the most intricate professions which at present exists, and involves a knowledge of a greater variety of subjects than almost any other isolated occupation. The numerous details of some of these are continually changing, and others cannot be mastered in a whole life-time: but the general rudiments on which all are based, and to which every minute particular may be referred, may, with the ordinary operations needful to be understood, be successfully acquired in rather less than 10 years. A desultory mode of studying any subject is universally admitted to be highly injudicious, and calculated to cause failure. Gardening is not exempted from this rule. By working in several places, according to circumstances, and pursuing the same or a very remote branch of inquiry in each, without passing through the regular routine of labour and investigation, the young beginner is completely unfitted for methodical researches, and will never rise to that eminence in his profession which he might otherwise have attained. Hence will be seen the value of apprenticeships. They secure, in the first instance, a qualified teacher, who binds himself to use his best endeavours to instruct the young man committed to his charge. They next afford a guarantee that the moral conduct of the pupil will be strictly watched, and that, at a season when he is most exposed to danger, and especially susceptible of injurious influences, his employer will be attentive to the removal of these, and the maintenance of moral habits. An additional advantage is gained by the fact that the apprentice is placed in each department in the proper order, and that he thus has every facility for increasing improvement. Anxious to anticipate all that may be urged against apprenticeships, we will first deal with the vulgar notion that they render the profession too exclusive, and, if generally regarded as a passport to distinction, shut out those who have not gone through this preliminary stage. We entirely disagree with such an opinion. Nothing is more to be desired than a clearance from the ranks of gardeners of those usually ignorant pretenders who have entered it late in life, either from misconduct or vacillation of purpose, and who very rarely bring anything but discredit and disgrace on the majority of the profession. We should be sorry to insinuate that there are not some respectable individuals of this class; but it is not to be doubted that those only who have begun to gather information on its different heads at their first starting into the world, when the mind is most vigorous and apt to receive impressions, can ever hope to excel in an art which requires such long and assiduous study. And we are of opinion that both the period at which apprenticeship commences, and the means of obtaining knowledge to which it leads, are productive of benefits which no other conditions can supply. It will perhaps be objected that gardeners seldom personally concern themselves with their apprentices' welfare, either morally or professionally. On the former of these points, it is in the power of every parent to ascertain beforehand the character of the gardener to whom he confides so serious a trust as the management of his son; and if he neglect this, it is easy to decide where the responsibility rests. Of the culpability of gardeners in neglecting their apprentices we may hereafter have to speak. At present, we shall observe that too much is sometimes expected from them, by considering the youth a passive rather than an active agent in his own tuition.—*K.*

The Names of Flowers and their Pronunciation.—The introduction of many new plants, and the production of many varieties by hybridization, have called forth much ingenuity in the invention of names. Even to learn all these requires some attention and a retentive memory. Moreover, the old-fashioned names, by which, in my younger days, I was accustomed to call my flowers, have been compelled to give place to more recent appellations. I am quite *au fait* at calling my ancient Heartsease Pansies, and I never think of applying to a Princes' Feather a name less than *Amaranthus*. I have also discovered that my *Geraniums* are no longer such, but *Pelargoniums*, and my *Convolvulus major* has become an *Ipomœa*. I offer no complaint either against the more correct classification of plants or the application of their specific names; but I do wish that they who invent new names, or require the use of old ones, would teach our gardeners how to pronounce them. Unfortunately, when I was a boy I acquired some knowledge of the classics, which I have not altogether forgotten. I say unfortunately, because my ears are sorely grieved by hearing these names so sadly mangled. Nothing will do but, when the accent should be on the last syllable but two, (the antepenultimate,) to place it on the last but one (penultimate); thus, your gardener has *Tropæolum*, *Arbutus*, *Eutóca*, *Periplóca*, &c., all wrong; and when, on the other hand, the accent should be on the penultimate, he lays it on the antepenultimate, giving us *Erica*, *Cenóthera*, likewise wrong. Our fair friends trust for their mode of pronun-

ciation to the gardener and nurseryman, on the principle that he who knows most concerning the flower should know best what it is called and how to call it. I once advised a lady that, when there were two ways of pronouncing a name, and her gardener chose one, she should choose the other: this, I grant, is *rather* too sweeping. When we see what complications of Greek and Latin are called into existence, and how they are forthwith misspelt, we cannot wonder at their perversion in pronunciation. Had Sheridan survived to this day, Mrs. Malaprop would have transferred her "allegory from the banks of the Nile" to "oracular" pronunciation in a garden.—*Agger.* [This is far too sweeping a charge. It is very unfair to blame gardeners for not having a classical education; and those who have had that advantage should put them right when they are wrong. We will answer for it, gardeners would be very glad to be instructed in such matters. Besides, it must be recollected that gentlemen themselves often make a pretty hash of quantities. Did our correspondent never hear *Arbutus* or *Anemone* in good society; or has he forgotten the *magnum est vecigal parsimoniu* of Burke?]

Forcing Roses.—With this you will receive a small box of Rose-blossoms, which I send to show you in what perfection they may be grown by the cheapest and simplest means. They were cut from low standards, worked on the Dog Rose (Beaton says, never use the Dog Rose stock for forcing! !), and forced in a pit 20 feet long, by 10 feet wide, kept quite close; under which treatment the foliage is well developed. "Prince Albert" is the very best and earliest forcing Rose I know; plants placed in the forcing-pit on the 12th of December were in full bloom on the 24th of January; and, as you will observe, the flowers are highly fragrant. The pit in which these were grown is just high enough to allow one to walk along the centre. It is heated by an Arnott stove placed inside; the fire is lighted about seven in the morning, and except in cases of sharp frost, is suffered to burn out towards the evening. Before being lighted in the morning, water is poured in through the rose of a watering-pot, so as to saturate the ashes, by which means not a particle of dust escapes. I believe the extreme vigour of my Roses is owing to their being kept cool at night. The lighting of the stove in the morning is like sun-rise to the plants; they are syringed every morning at nine, and in the evening at four. An iron pan of water fits on the top of the stove, and creates a genial moisture.—*T. Rivers, jun., Sawbridgeworth, March 16.* [The blooms received from Mr. Rivers were extremely beautiful, and consisted of the following kinds:—*Princesse Helène*, pale cream colour, very sweet; *Pactolus*, like the last, but less sweet, and not so fine a flower. *Duchesse de Mecklenburg*, like *Jaune Desprez*, and smelling more like a *Provins Rose*; *General Allard*, a fine semi-double, deep rose colour, very sweet; *Prince Albert*, a dark rose, resembling the *Tuscany*, and sweeter than any; *Elize Sauvage*, a fine white flower, but rather coarse, and not sweet; *Charles Reybaud*, like a pale China, pretty, but not very sweet: a nice flower; *Moiré*, somewhat flesh-coloured, a fine large flower, not very sweet; *Bougéri*, a good flower, of a French pink colour; *Nina*, something like the last, but not so fine a flower.]

Euphorbia jacquiniiflora.—The treatment of *Euphorbia jacquiniiflora* recommended by Mr. Beaton at p. 160, is, I have no doubt, a good one, where large specimens are desired; but where the houses are small, as in my case, I have been obliged to adopt the following plan, which has answered remarkably well. As soon as the plants have done flowering I cut them down to within six or eight eyes of the bottom, and keep them rather dry until they have made shoots about an inch long, when I shake the mould from them and repot them into 32s, the same size as they were previously in; I then let them grow until they are about two feet high, when I bend down all the newly-formed shoots, and tie them to the original stem, which causes them to break forth again at the principal bends: not a naked stem is to be seen, but the plant is covered with foliage and flower from top to bottom.—*H. H.*

Tropæolum tuberosum.—If your correspondent "A. K." is desirous of flowering *Tropæolum tuberosum*, he may be tolerably sure of succeeding if he plants the tubers in a rich, deep, retentive soil, not too much exposed to the sun. In my last place, I tried it in every variety of soil and situation, in doors and out, and I could only succeed in flowering it by the above means. It was planted in the border of a south wall, but owing to the proximity of shrubberies, backed by a number of Oaks two hundred years old, notwithstanding the confined situation, and the dampness of the soil, a row of them grew luxuriantly and flowered profusely, till cut off by frost. At the same time I had others planted in beds, clumps, and isolated patches, some more or less exposed, as well as against a good south wall; all of which plants became only an incumbrance, as the whole of them did not show more than a dozen flowers; while a third lot, in trellis pots in the greenhouse, showed no symptoms of flowering at all. They should be planted about this time, and provided with good strong branchy supports, which they will soon cover when they begin to grow. Before planting, the ground ought to be well broken to the depth of 18 inches or two feet; from want of this precaution the beauty of many a good flower is lost.—*J. Halliday, Lee's Nursery.*

Thawing Plants.—Although agreeing with Mr. Ayres as to the injury produced on frost-bitten plants by a too sudden transition from cold to heat, I doubt whether what he recommends has half the virtue ascribed to it; and I should be glad to learn whether any of your readers have actually determined it by pursuing the system as described at p. 84, on a portion of their plants, while others in similar circumstances were left to themselves.

J.'s evidence about his Heaths is not conclusive, since it is well known that this tribe, if not in full growth, can bear a little frost; his elevated situation was moreover in their favour, for when frost is not charged with vapour it does far less injury, as any one may have remarked who witnessed the mischief sustained by Evergreens in the winter of 1837-8, in low situations, compared with others on higher grounds. As I live in a low locality, there is not a season in which I am not visited by late spring and early autumn frosts; and I invariably water French Beans, Dahlias, &c.; but I cannot decide whether it has the desired effect or not; if the plants thus treated recover, those that are left unwatered do so likewise. During the severe frost in January, 1841, I had a great many Pelargoniums placed in a large Vinery, and the flues not being clean, I was unable to keep a sufficiently high temperature to prevent those near the glass from being frozen; I watered them with water of the same warmth as I generally used, which soon froze on the leaves, although the temperature in the body of the house was several degrees above the freezing point; the plants did not all die nor lose their leaves, but they were in such a languishing state that I judged it best to throw them away. I have had Pelargoniums repeatedly frozen without sustaining any injury, but on such occasions I apply no fire to them, unless it is likely to be a raw, frosty day. I had two pots of Mustard in a cold Vinery, which, on the morning of the 6th inst., were both frozen; I watered one of them; that which I did not water recovered, the other did not. I am in the habit of placing pans of water under my Apricot-trees while in bloom, having heard it recommended as an infallible receipt, but I cannot see that any benefit is derived from it. Is such a custom common, and in what manner does it operate?—J. M.

Climate in the North of Scotland.—Mr. Proctor remarks, at p. 117, that one would suppose the climate of Edinburgh to be milder than at Inverness. I think, however, that our sheltered Highlands are at least equally as favourable as those near Edinburgh, and that our light sandy soil is more suitable to tuberous-rooted plants that are liable to damp off in winter. The thin stratum of light sandy soil at Holme lying upon gravel must be well suited for tuberous-rooted plants during winter; and I think, from the following facts, that Tarbet Gardens in Ross-shire are, with few exceptions, as favourable to general vegetation as any in the north of Scotland. In 1835, Almonds and Mulberries ripened; Apricots and Peaches bore well; there was a good crop of fine Figs; Maurandia Barclayana, eight feet high, survived the winter; Magnolias flowered, and Dahlias lived through the winter without protection. Asparagus was cut from the open ground ten days earlier than in the neighbourhood of Edinburgh. His Grace the Duke of Buccleuch pronounced the Figs, Peaches, and Apricots to be as fine as his own at Dalkeith.—John Ross, Holme Gardens.

Pinus Laricio.—I find rabbits destroy this species, while they do not touch the common Scotch Fir; neither do they, as far as my experience goes, attack the Weymouth Pine or the Silver Fir, but they eat the Pinaster.

The Aucuba Japonica.—This beautiful plant is not grown half so extensively as it deserves. It is easily propagated, and is well adapted for the purpose of covering the ground under trees in extensive shrubberies with a dense and beautiful foliage; and when planted in masses in a rather sheltered situation, or mixed for the sake of contrast with a few evergreens, such as the common and Portugal Laurel, Ivy, or Laurustinus, it forms one of the most pleasing objects in nature.—J. T.

Vine Borders.—Although aware that your columns are too valuable to admit of many repetitions, yet I am tempted to offer a few remarks on Mr. Roberts's Treatise on the Vine, reviewed at pp. 103 and 119. The soil recommended by Mr. R. is composed of 3 loam: this, in my opinion, is excellent advice. Manures are too absorbent of moisture for this climate, as well as too valuable, to be used with an unsparing hand; top-dressings ultimately are altogether another affair. Loams, however, in point of mechanical texture and tenacity, have so extensive a range, that something more explicit is necessary—especially with the young amateur; and it is to be lamented that, in the present imperfect state of Horticultural knowledge, we have not a more definite mode of conveying our ideas on that head. Mr. R. recommends "strong loam." By this, I presume he means loam in which the clayey principle predominates. I much doubt the propriety of using adhesive loam at the depth recommended, viz., 30 inches. Water percolates but slowly through "strong loam," and I cannot but think that, in capricious seasons, the depth is too great by a foot. The rest of Mr. R.'s directions as to compost are, as I think, very good. I see no reason, however, why the turfy loam should not be thrown into the border as it comes from the field, if in a dry state; more especially (as Mr. R. very justly observes) "atmospheric air is of incalculable benefit to the roots of the Vine." I am, I confess, astonished at the depth of fermenting material recommended by some practitioners for covering the roots. Mr. Roberts, for one, recommends 30 inches; I find also in a description of the course of culture pursued at Oakhill some few years ago, from a diary kept by Mr. Forsyth, in "London's Magazine," that the gardener used a foot of leaves, with another foot of hot dung, and that the whole was covered with reed mats; the heat of the fermenting matter, after the Vines had begun to grow, being 96°. This heavy mass remained in the border until the Grapes were nearly ripe. How can this be reconciled with the necessity of a free admission of air to the roots? I have known repeatedly, trees and bushes killed, or seriously injured, by heaping earth above their roots. Will it be argued that the com-

parative porosity of the material makes the difference? If hot dung, &c., can be heaped up to any indefinite extent above the roots of Vines, why not force early Cucumbers, Seakale, Asparagus, &c., on the Vine border, and thus kill two birds with one stone? I remember about 20 years since, going with a friend to see the forcing establishment of "Breffitt" at Barnes—he was then noted for early Black Hamburgh Grapes. Here we actually found the very thing alluded to, viz., forcing Asparagus, &c., on the Vine border. The houses were in a dilapidated state, and several panes of glass were represented by wisps of hay and rags. Yet the early Grapes certainly looked very well. I have little doubt but that "shanking" is caused by a sudden lowering of the temperature of the soil, by heavy rains, or by a series of unusually cold weather, at the very time when the greatest demand is made on the catering roots. The young spongioles in this case become totally inactive for a while, and that at a most important period, the soil becoming lowered, in all probability, after heavy rains, 10 or 15 degrees. In conclusion, let me ask, is the "shanking" of Grapes known in the vineyards of the South?—Robert Errington, Oulton, near Tarporley.

Garden Frames.—For the encouragement of those cottagers who are anxious to possess garden frames, but who cannot go to the expense of having their lights glazed by the glazier, I can inform them that waste glass may be had of glaziers for a very trifling sum—(indeed a good deal may occasionally be gathered from the refuse which the glaziers throw away,) and may afterwards be cut almost as evenly as with the diamond, simply by holding the glass on the even edge of a piece of red-hot iron—a square-ended kitchen poker will do—[we do not understand this]; when they are easily put into the frames with a little glaziers' putty, made of whiting and linseed oil. This is commonly practised in this neighbourhood by the cottagers, some of whom have frames 6 ft. wide, and from 20 to 30 feet long, which are generally heated by a fire, regulated by having a door to the ash-pit, with a ventilator fixed in it; by which means the expense of heating in this part of the country is not more than 2d. per week.—Cottagers' Friend, Dewsbury.

Economical Pump.—"Auricula," at p. 174, asserts that the pump for supplying forcing houses, which he there describes, is superior to the one alluded to by myself at p. 22, and states, moreover, that it is impossible for water to be conveyed to the adjoining houses without an extra pump and cistern. In this he is mistaken, as the pump referred to discharges the water five feet above the level of the pavement. He also criticises my idea of covering an ornamental object with creepers; but where harmony is concerned, such an occurrence is by no means rare. As for his cautioning others, lest they should fall into a similar error with myself, I can only say that the pump has answered our most sanguine expectations, and that the expense of one upon his principle would be at least three times greater than mine.—Snowdrop. [Here this correspondence must end.]

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

March 22.—T. R. Barker, Esq., in the chair. 32 Members were elected. Sir F. Mackenzie presented a statement of his plan for establishing a Model Farm in each county of England and Wales by public subscription, at an estimated sum of 117,297l.—H. R. Sandbach, Esq., communicated his offer of any quantity of land in North Wales, on reasonable terms, for establishing an experimental farm, provided it were managed under the direction of the Society.—C. Hillyard, Esq., stated that he had been informed of the recent loss of Turnip-feeding sheep in Northampton, in consequence of an accumulation of red-water in the abdomen; and that he had understood that the following recipe had been employed with the greatest success: 6 oz. Epsom salts, 4 oz. nitre in powder, 3 pints boiling water (poured upon the salts and nitre); when new-milk warm, add 4 oz. spirits of turpentine, ½ oz. bole Armenian in powder; mix and shake the whole well together when given. The dose is from 3 to 4 table-spoonsful. N.B.—The sheep must be bled before administering the medicine. "When it is to be given to a large number of sheep, they must be taken from the turnips, or whatever they are feeding on, and put into a pen or fold yard for two hours before it is given. Then a small horn should be provided that will just hold the quantity proper for each sheep. Let the bottle be well shaken each time it is poured into the horn. This method of giving drinks will be found advantageous when many require it at one time. They must be kept from food two hours after the medicine is given; after which, they may be put in their pasture as usual. When this disease is so severe that several die every day, it will be necessary to repeat the medicine every third day, for three times or more, if thought proper, and to change their diet, and remove them into a more elevated situation. This medicine, with bleeding, has been found a powerful preventive to most inflammatory complaints which sheep are liable to, while feeding on turnips, or in a luxuriant pasture. Mr. T. E. Hardy transmitted reports of recent experiments made with Guano in various parts of the country. Capt. Shelden having presented a box containing some fine Field-Peas grown by him last year, a request was made that he would favour the Society with information of their history and cultivation. Mr. E. Solly, Jun., presented a copy of his Rural Chemistry, and Mr. C. Johnson his Agricultural Chemistry for Young Farmers; Mr. Shaw, the Farmer's Magazine; Sir J. Murray, his Trials and Effects of Chemical Fertilizers; Mr. A. Low, his treatise on the Potato Crops, and the Cultivation of Flax; and Messrs. Lawson, their treatise on the Cultivated Grasses.

BOTANICAL SOCIETY OF LONDON.

Dec. 16, 1842.—Dr. W. H. Willshire in the chair. Donations of British plants were announced from the Liverpool Natural History Society, Mr. J. Tatham, and Mr. W. J. West. Mr. A. Gerard presented a small collection of plants from Sierra Leone. Dr. Lhotsky read a paper on the limits of vegetation. Jan. 6, 1843.—J. E. Gray, Esq., President, in the chair. The following donations were announced:—British plants from the Royal Horticultural Society of Cornwall, Dr. Ayres, Mr. J. Merrick, Mr. J. Brown, Mr. W. Baxter, Mr. T. Twining, Jun., Mr. T. Beesley, and Mr. J. Goodlad, Jun.; British Fungi, from Mr. H. O. Stephens. The Rev. W. H. Coleman presented a specimen of Carex Boenhausiana (Weihe), found by him in Herts. A paper was read from Dr. Lhotsky, on the sugar of Eucalyptus. Jan. 20.—A. Gerard, Esq., in the chair. Donations to the library were announced from the Boston Natural History Society, the Manchester Geological Society, the Academy of Natural Sciences, Philadelphia; from the President, and from Messrs. E.

Doubleday, W. Baxter, and S. P. Woodward. British plants had been received from Mr. J. Buchanan, and British Mosses from Mr. W. Gardiner, Jun. Mr. R. Emberton presented a specimen of Majanthemum bifolium (De C., Convallaria bifolia Linn.), found by him at Howick, in Northumberland. A paper was read from Mr. W. Gardiner, Jun., on the localities of the rarer Alpine Hypna. The paper was accompanied by specimens.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

March 2.—The spring meeting was held in the new hall of the Experimental Garden, Inverleith. The following prizes were awarded:—For the six finest and newest varieties of Camellia, the silver medal was awarded to Mr. Alex. Smith, gr. to W. Forbes, Esq., M.P.; for C. Sweetii, Donckelsii, conspicua, Bernardi, splendens, and americana: 2, Mr. J. Young, gr. to T. Oliver, Esq. For the three finest-flowered New Holland plants, the silver medal was assigned to Mr. Young, Newington Lodge, for Pultenaea subumbellata, Epacris impressa, and Hovea Celisi. The display of Hyacinths was splendid, all being grown in pots. For the six finest the medal was voted to Mr. Young, the kinds being La grande Vidette (tall, with very large bells, La Dame du Lac, tubiflora, Blandina, Prince of Orange, and eclatante par faite); a second premium was assigned to Mr. J. Thompson, gr. to W. Keith, Esq., for La grande Blanche, Lord Wellington, Prince of Waterloo, Porcelain Sceptre, L'Ami de Cœur, and Minerva; a third premium to Mr. J. Addison, gr. to the Earl of Wemyss, for Hercules, Lord Wellington, Quentin Durward, Rouge brillante, Bouquet Royal, and Waterloo. A large hamper basket, filled with numerous sorts in flower, for exhibition only, from the Leith Walk Nurseries, was much admired. For a notice relative to the desirable properties of Helleborus odoratus, and Cyclamen vernum and coum, as very early and hardy spring flowers, with specimens, a premium was awarded to Mr. Alex. Forrester, gr. to Capt. Falconar. A number of other fine plants decorated the hall, and added to the interest of the meeting. Some beautiful fruticose exotics, in full bloom, were sent for exhibition from the Inverleith Nurseries, particularly Hovea pungens, Epacris microphylla, a double-flowered Azalea, and a hybrid Rhododendron, between R. arboreum and catawbiense. Mr. Addison exhibited a plant of the lovely Dodecatheon Meadia, in full flower. Mrs. Brown, Primrose Bank, sent a large flowering specimen of Acacia affinis; Mr. MacNaughton, Edmondstone, flowers of a seedling Camellia, having the habit of myrtifolia; and Mr. Smith, a seedling Amaryllis, marked as hybrid between Johnsoni and psittacina. Several curious specimens of tropical Epiphytes and Ferns, growing in balls of Sphagnum and Hypnum, and cultivated in inverted positions, were suspended from triangles, and attracted much notice. These were from the Society's hothouses, under the charge of Mr. J. M'Nab. A collection of 20 select kinds of Apples, preserved in dry sand, and having the names attached to them, was from Mr. W. Sharpe, Pitfour Gaitien, for which a premium was voted. A seedling Apple of pretty appearance was sent by Mr. Henderson, schoolmaster, Dulleton; the tree was described as being very productive, and the fruit adapted for long keeping, and excellent for all culinary purposes. A premium was awarded for this production, which will now be known by the name of the Dulleton Apple. The principal kitchen vegetable in this day's competition was forced Rhubarb, and the specimens were all very large, consisting chiefly of the new kind, called Myatt's Victoria. For the heaviest stalks, the silver medal was awarded to Mr. J. Goodall, gr. to the Marquess of Lothian: 2, Mr. W. Thom, gr. to Alex. M. Innes, Esq.: 3, Mr. R. Watson, gr. to D. Anderson, Esq.: For specimens of well-grown Onions, of different sorts, with a communication detailing the mode of culture, a medal was voted to Mr. W. Findlay, gr. to the Hon. Mrs. Cochrane. The secretary called the attention of the meeting to a section of the trunk of the Huon Bay Pine, Altingia Cunninghamii, presented by T. Hay, Esq.: close to it was placed a living specimen of the same tree, from the Society's collection. The section was brought home by Capt. Gibson, of the Ulswater, from the banks of the Clarence River. This meeting possessed a new feature of much interest, in the reading and discussing of several papers on horticultural subjects. One was on the planting, training, and general management of the finer kinds of wall Pear-trees, by Mr. J. Macdonald, Riccarton. Another was on the advantages of peat moss compost for fertilising dry or sandy soils, by Mr. P. Mackenzie, West Pleas, and was read by Lord Murray (who was in the chair). Dr. Neill read an important communication from Mr. J. M'Nab, curator of the Society's garden, on the superiority of span-roofed plant-houses, extending south and north, over lean-to houses, fronting the south. W. Jameson, Esq., Saharunpore, Director of the Hon. E. I. Company's botanic gardens in the north-west provinces, was elected a Member. The following gentlemen were enrolled as ordinary Members:—R. Bald, Esq., J. Meikleham, Esq., Arch. Campbell, Esq., D. Cousin, Esq., D. Dickson, Esq., W. Whitehead, Esq., and P. Nimmo, Esq.: the following as corresponding Members—Mr. J. Macdonald, Mr. P. Mackenzie, and Mr. J. Blair, Dysart House.

COUNTRY SHOWS.

Hampshire Horticultural Society, March 16.—The first meeting took place at the Corn Exchange, Winchester, and a better display of plants could scarcely have been presented. The following was the award of prizes: BEST ORCHIDACEOUS PLANT (Stenorynchus Orchoides), Rev. F. Beadon. BEST STOVE PLANT (Begonia coccinea), Mr. Wickham. BEST COLLECTION OF STOVE PLANTS, Rev. F. Beadon. BEST GREENHOUSE PLANT (Azalea indica alba), Sir T. Baring, Bart. BEST COLLECTION OF DITTO, Col. Wall. BEST COLLECTION OF PLANTS, Rev. G. C. Rashleigh. FOUR BEST ERICAS, Rev. G. C. Rashleigh. BEST CAMELLIAS, CUT OR IN POTS, Sir T. Baring, Bart.: 2, J. T. Waddington, Esq. TWELVE BEST HYACINTHS, Rev. Dr. Moberly. BEST CUT FLOWERS, named, Sir T. Baring, Bart. FOUR BEST FORCED AMERICAN PLANTS, IN POTS, Sir T. Baring, Bart. SIX BEST FORCED SHRUBS, Sir T. Baring, Bart. THREE BEST GREENHOUSE CLIMBERS, Rev. G. C. Rashleigh. BEST COLLECTION OF ANEMONS, Col. Wall. TWO BEST BULBS IN BLOOM, Rev. G. C. Rashleigh. NINE BEST POLYANTHUSES IN POTS, Rev. the Warden. FOUR BEST CINERARIAS, Rev. F. Beadon. FRUIT: BEST SIX DISHES OF TABLE APPLES, Col. Wall. VEGETABLES: BEST BRACE OF CUCUMBERS, H. Holloway, Esq.; 2, J. T. Waddington, Esq. BEST ASPARAGUS, Col. Wall. BEST SIX STALKS OF RHUBARB, W. J. Campion, Esq. BEST SEAKALE, H. Holloway, Esq. BEST MUSHROOMS, H. Holloway, Esq. EXTRAS: Musa coccinea, Rev. G. C. Rashleigh; Fraxinus corymbiflora, J. T. Waddington, Esq.; Clematis azurea grandiflora, Rev. G. C. Rashleigh; collection of Camellias, Sir T. Baring, Bart.; collections of Plants, Rev. F. Beadon, J. T. Waddington, Esq., and Mr. Wickham; Violets and hardy Plants, Rev. the Warden; Citrus nobilis, R. Rawlins, Esq.; Orange-tree, Rev. G. C. Rashleigh; French Beans, R. Rawlins, Esq.

Hammersmith Cucumber Show, March 20.—The fifth annual meeting was held at Mr. Lidgard's, Thatched House Inn. The following were the successful exhibitors: Mr. Mills, gr. to the Baroness de Rothschild, for a brace of fruit of his own sort, each about 17 inches long; 2, Mr. Smith, gr. to — Mill, Esq., for a brace of Weedon's Cucumbers, 16 inches long; 3, Mr. Thompson, of Ealing (Mills's sort), 16 inches long; 4, Mr. Humber, of Southall (Weedon's), 12 inches long.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

COLUMNEA SPLENDENS. Splendid-flowered Columnea. (Stove Shrub). Gesneraceæ. Didymia Angiospermia.—This extremely handsome plant is now blooming at the nursery of Messrs. Rolissons, where it is treated as a sort of low climbing shrub. The foliage is thick and fleshy, not so distant as that of C. Schiediana

and the blossoms are produced from its axils. One, and sometimes two or three flowers accompany each leaf, and their number, duration, and frequent succession are quite remarkable. Their colour is a superb, deep scarlet, and they are spotted inside with dark, blood-coloured spots. It should be potted in a mixture of very turfy loam, not too much reduced, and well-decayed open leaf-mould. Turfy heath-soil and moss, freely incorporated, would likewise probably be appropriate. It must be kept in a warm stove. As the branches root, almost spontaneously, around every leaf, it can be propagated with the greatest ease by cuttings, and might also doubtless be increased by leaves.—*Paxton's Magazine of Botany.*

PAULOWNIA IMPERIALIS. Imperial Paulownia. (*Hardy Tree*). Scrophulariaceæ. Didymia Angiospermia.—This is one of the finest of Dr. Siebold's introductions from Japan, where it grows to the height of 30 or 40 feet, with a trunk from two to three feet in diameter. Its leaves are excessively handsome, and its flowers, which were last year produced in the Garden of Plants, at Paris, are very like those of *Catalpa syriaca* in shape, besides being borne in similar panicles at the extremities of the branches. When first received at Paris, it was nurtured with great tenderness, and placed in a greenhouse; but after being put in the open ground it grew more vigorously, and though protected for a year or two, was ultimately found to need no artificial shelter. Whether it will succeed as well in England, without covering, is yet rather doubtful. Still, as it will most likely do so in the warmer districts, and as it will certainly get harder after it has been inured to our climate for a few years, it may finally become as great an acquisition as the *Catalpa*. In planting it out, it should be placed in a dry and somewhat open position, and a prepared loamy soil; the latter being shallow and well drained. Perhaps it will be advisable to cover it partially for the first two or three years, especially if the autumn has been unfavourable for ripening its wood; afterwards it may be left unsheltered. In covering it, provision should be made for giving it a good deal of air, and for exposing it on those days when no danger from cold exists. Above all things, it should be kept as dry as practicable in winter, that the plant may not begin growing too early in spring. It may be propagated by cuttings.—*Paxton's Magazine of Botany.*

ONCIDIUM SUAVE. Sweet-scented Oncidium. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria.—A Mexican species, from the nursery of Messrs. Loddiges, very near *O. reflexum*. The flowers are much smaller, the sepals and petals chocolate colour, tipped with yellow; the lip yellow, with a cinnamon-brown middle. The wings of the column are yellow. It has a faint and agreeable odour.—*Botanical Register.*

LYCASTE L'ANIPES. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria.—An Orchidaceous plant, found by Mr. Hartweg at Pacocha, a village on the Andes, in the vicinity of Loja, and sent to the Horticultural Society. It has pale green flowers, two inches and a half long before they expand, without a trace of any other colour. It differs from *L. costata* in the flowers being much larger, while the bract is not longer than the ovary; and from *L. gigantea* in the very short bract, ribbed tubercle, and rounded, not acuminate middle, segment of the lip.—*Botanical Register.*

ONCIDIUM BICALLOSUM. Two-warted Oncidium. (*Stove Epiphyte*). Orchidaceæ. Vandeeæ. Gynandria Monandria.—Among the numerous fine things found in Guatemala by Mr. Skinner, there are not many which are more deserving of cultivation than this plant, which has so much the habit of *O. Cavendishianum* as to seem a mere variety of it, although in reality quite a distinct species. It was also met with by Mr. Hartweg. The flowers are fully two inches in diameter, which is four times the size of *O. Cavendishianum*; they appear in a dwarf erect raceme, not panicle; they are of a rich yellow, with the sepals and petals bordered with cinnamon colour; the labellum has two very small lateral lobes, and for its crest it has a pair of distinct tubercles, the posterior double, the anterior three-lobed, and the two separated by a considerable space. The flowers are, moreover, slightly scented, which is not the case with *O. Cavendishianum*. Many plants are doubtless in the country; but no one has succeeded in flowering them except Mr. Bateman, who sent a fine specimen to the last meeting of the Horticultural Society. It is a stove plant, and requires to be grown in a mixture of turfy peat and potsherds; so that the whole may be efficiently drained. A smaller pot, inverted in the one in which it is potted, allows the warmth to rise through the soil, and makes the whole lighter than when it is drained at the bottom with potsherds. It may also be grown suspended from the rafters of the house like other air-plants, provided it is kept moist enough during the growing season. Like all these plants it requires a humid atmosphere, a liberal supply of water when growing, and partial shade during bright sunshine in summer. A night temperature of 60° in winter and 70° in summer will be amply sufficient for its growth.—*Botanical Register.*

PHILIBERTIA GRANDIFLORA. Large-flowered Philibertia. (*Greenhouse Climber*). Asclepiadaceæ. Pentandria Monogynia.—This pretty twining plant is a native of Buenos Ayres, or rather of Tucuman, whence its seeds were originally sent to the Glasgow and Glasnevin Botanic Gardens by Mr. Tweedie. It varies a good deal in the colour of its flowers and in the quantity of down that covers them; in wild specimens it soon becomes woolly; but these differences do not appear to be specific. It is a pretty slender greenhouse creeper, well adapted for training up the rafters of the greenhouse, or over ornamental trellis-work affixed to a pot. Like most other plants belonging to the order Asclepiadaceæ, it succeeds best when cultivated in friable loam and sand, and if the loam is rather poor, a little leaf-mould may be added. The soil when used should not be sifted, but merely broken fine and mixed with the hand. The pots should be well drained, as the plant requires to be kept nearly dry during the season of rest. When they begin to grow in the spring, they should be fresh potted and cut back to the previous growth; being afterwards placed in a gentle bottom-heat for a few weeks, and having the supply of water increased. During the whole period of their progress, they should be kept in a rather moist atmosphere; here, as they are subject to the attacks of the red spider. It is easily increased by cuttings treated in the ordinary way, and it flowers freely during the summer and autumn. When it has done flowering, it should be allowed to rest, by gradually withholding water until the soil in the pots become tolerably dry. The pots should then be kept in the warmest and driest part of the greenhouse during winter.—*Botanical Register.*

INDIGERFA STACHYOIDES. Long spiked Indigo. (*Greenhouse Shrub*). Leguminosæ & Papilionaceæ. Liadélphia Decandria.—The seeds of this plant were collected in Bhotan, one of the independent states in the north east of India, by W. Griffith, Esq., at the height of 4,000 feet above the sea, and sent to R. H. Solih, Esq., by whom they were presented to the Horticultural Society. It flowered in the gardens at Chiswick, in September, 1840. It is a handsome hardy greenhouse shrub, growing readily in a rich open soil, chiefly composed of sandy loam, with a little leaf-mould. It is easily increased by cuttings of the young wood, partially matured at the base, placed in sand, with a little bottom heat. The plant, when in good health, flowers during a greater part of the summer.—*Botanical Register.*

MISCELLANEOUS.

Swan River.—From a Swan River paper we extract the following letter, written by Mr. James Drummond, who, with several other persons, had just returned from exploring the country in the direction of the Moore River: "We left Hawthornden on the 22d Aug., 1842, and proceeded on our journey to the North, and in about five or six miles we reached some remarkable granite rocks, upon which, in some pools of rain-water, we found a small but curious fresh-water shell, and two plants which

I had not seen before. In about 11 or 12 miles we reached a permanent spring, called Yoolgan, where there is excellent grass. A few miles from Yoolgan we reached Yeinart, a Tea-tree swamp, where there is grass and water to be had throughout the year; the night threatened to rain, and having covered our house with Tea-tree bark, determined to stop until it cleared up; this took place about ten o'clock, when we visited a brush-wood swamp, where we shot several specimens of a beautiful kangaroo with a dark-coloured fur, overtopped with silvery hairs, called by the natives *Marrine*. On the top of a hill north of the swamp I found two distinct species of *Dryandra* new to me, also a fine *Eucalyptus* in flower, distinguished from the *Matigarring* of the natives, the *Eucalyptus macrocarpus* of Sir W. J. Hooker, by having lengthened recurved flower-stalks; the flowers are rose-coloured. On the 25th we proceeded on our journey; I observed two new species of *Acacia* near Yeinart, and found some curious aquatic plants in pools of water among rocks at Badgee-badgee. From some mutilated specimens of plants brought home by a portion of the party, with accounts of others left behind, I determined to visit the new river myself, after botanizing a day in the vicinity of the Mouranpool, where I found a fine glaucous-leaved *Anadenia*, specimens of the blue kangaroo, and several small new quadrupeds—one of them apparently a true rat, almost as large and mischievous as the Norway rat. On the 27th, I found a species of the common poison, which I had not seen before, and a beautiful *Conospermum*, with panicles of blue flowers varying to white. I was informed that a plant like *Horehound*, but with scarlet tubular flowers, about an inch long, grew on the top of a stony hill to the north where I found the plant, which belongs to *Scrophulariaceæ*. I also found a *Manglesia*, allied to *tridentifera*, but having the leaves more divided; with a beautiful blue climbing species of *Pronaya*, on the top of the same hill. On the 28th, I fell in with two splendid species of *Everlasting* flower; one, with golden-yellow flowers varying to white, having the flowers in heads different from any I have seen before, and which will, I think, form a new genus of *Compositæ*; the other, with pink flowers, growing two feet high, something like *Lawrencea rosea*, or *Rhodanthe Manglésii*, but if possible finer than either. Nine or ten miles to the north of Boorbarna, we crossed a curious country, covered with what I consider a variety of quartz, which breaks with a conchoidal fracture, but having much the appearance of flint; in many places the pieces were large, with sharp angles. This tract produces some interesting plants; a splendid *Calothamnus*, with leaves 9 inches long, and showy scarlet flowers, of which I got plenty of specimens. With regard to a new *Banksia*, allied to *Aquifolium*, which had been found here, I was not so fortunate as to procure specimens. After crossing several miles of this quartz formation, we came upon an extensive flat of strong clay, covered with *Eucalyptus* and some curious *Acacias*. We crossed a brook running strong to the west, and in about two miles from this, we made the river we were in quest of at a place called by the natives *Murarine*. Near it I found a splendid plant, which I expect will prove to be a species of *Solanum*; it grows two or three feet high, with large purple flowers, and a calyx like brown velvet; the leaves are irregularly shaped, acuminate, about two inches long, and an inch and a half wide at their broadest parts; the stems are prickly, and all the leaves covered with down, as in *Lasiopetalum*. I am uncertain about the genus, not having seen the seed-vessels, but whatever that may be, it is one of our finest Australian plants. In about four miles further to the north we reached two fresh-water lakes, called *Dalarn* and *Maradine*. Ducks and water-hens were here in thousands, and I found a fine *Bæckia*, with a curious new plant belonging to *Compositæ*, but not yet in flower. The appearance of the country about these lakes, and the plants about them, which are generally met with at no great distance from the sea, seem to prove that the lakes are at no great distance from it, and that the Darling Range does not extend so far to the north. No hills of any description appeared to the west. From the top of a hill to the east, two other remarkable ones appeared, about 30 miles to the north; one of them was observed to have a remarkable peaked top; these were supposed to be Mount Heathcote and Wizard Peak. On the 29th we returned on our track for about seven miles, until we reached the first running river we met on our journey to the north. Our guides agreed to take us back by a different route, and to take us to a hill where a curious kangaroo called "Damar" would be met with. We therefore ascended this river, and soon came upon a grassy country; three or four miles up we stopped to dine at a place called *Nugadrine*; several pairs of beautiful falcons were flying over us, one of which we succeeded in shooting. We travelled on for 10 or 11 miles through a fine grassy country, and met with a large tribe of natives, several of whom had never seen white men before; they were friendly, and offered us some of their favourite root, the *Wyrag*, which grows abundantly among these grassy hills. In the morning of the 30th, we started for our station on the Moore River; and travelled, nearly the whole day, over the most splendid grassy country I have ever seen in Australia; the hill-sides, as far as we could see in every direction, were covered with beautiful grass, and of a golden colour, from the flowers of the beautiful *Everlasting* described above, which is only found in the richest soil. After reaching our station, I employed myself in drying specimens. A beautiful new *Dryandra*, discovered on the top of a hill near the Mouranpool, was shown to me; I have named it *Dryandra floribunda*, from its numerous blossoms, which almost hide the leaves; it grows 12 or 15 feet high, and in such abundance, that the side of the hill actually appears of a

golden colour for several miles. I consider it the most beautiful species yet known.

RURAL SONNET.

APRIL.

THE equinoctial gales are lull'd to rest,
The early singing-birds uplift their strains,
And timid April, by the sun caress'd,
Now, with her breath of Violets, walks the plains:
And, when her lord, like some enamoured youth,
Dwells on the changeful colours of her brow,
She, like some maid, heart-certain of his truth,
Smiles through her tears for bliss to share his vow.
The days extend—in many-tinted green
The buds unfurl their foliage—and the trees
Which, promptest, bloom along the rural scene,
Show, like some 'deck'd regatta, in the breeze.
The swallows re-appear—and, hour by hour,
Both still and moving life mark Spring's engendering power.
J. Jones, Inner Temple.

The Gypsum Experiment.—The following has been published by Professor Henslow, in further explanation of his views:—*Mr. Hitchcock's Experiment*: I went to the ground, accompanied by the experimenter, his brother, and my own gardener, and there found that preparations had been made by shooting down a tumbril-load of soil under the name of "good ditch stuff," a tumbril-load of littered straw, a tumbril-load of clean and fresh horse-dung, two pails of house-urine, with a ditchful of water to dilute it, and a bushel of gypsum in a sack. Over these materials was presiding a labourer, apparently somewhat puzzled to account for our proceedings. The first step was to mark out two spaces, each five feet square, and upon them to place a bottom of the "good ditch stuff" half a foot thick. It should seem that clean straw is a scarce commodity in Hitcham just at present, and so we were obliged to put up with such as had been soaking in a cow-yard for two months amidst all the *et ceteras* of that description of locality. Some sort of rough calculation had been made of the amount of this straw, and also of the horse-dung, by weighing a bushel skep of each; but I looked grave at the idea of our being satisfied with any estimate obtained by weighing only a single bushel, and so the steelyards were sent for. It is not necessary to weigh the whole of the materials used, but four or five basketsful at least should be weighed in order to obtain an average for measuring out the rest. I suppose it is not necessary to remind any one not to forget to deduct the weight of the basket in making his calculations; but I find it is right just to hint that the weight of a basketful should not be altered after it has been prepared, in order to coax the average. Let each be filled by guess as nearly alike as may be, and weighed; and then the whole weight, divided by the number of basketsful will give the average for further estimate. Our zeal, however, on the present occasion was sufficient to keep us warm enough for three hours, and through two or three snow-storms, until we had weighed out the whole of the materials and completed our task. We began with the dunghill to be gypsumed, and placed it to the S. of the ungypsumed, and finished one first before we began with the other. Two basketsful of the straw were spread over the bottom, each weighing between 40 and 50 lbs. Then two basketsful of the horse-dung were spread out, each weighing somewhat less than the wetted straw. A pint of gypsum was then sifted over the horse-dung; and the coarser particles of the gypsum which did not pass through the hair sieve were preserved in order that they might be weighed and deducted from the weight of a pint of gypsum, for the purpose of ascertaining the exact weight of the gypsum used. A gallon of liquid, half urine and half water, was then poured over this first layer of materials through the rose of a watering-pot. Seven layers were thus prepared in succession, except that the topmost had only two gallons of water, there not having been any urine left. The whole was then covered over with two basketsful of the wet straw. The other dunghill was then prepared in the same way, except that no gypsum was used, but the amount of materials employed was exactly the same. The two stood now about three feet high, and their appearance was such that it was presumed they would certainly attract any one curious in Cucumbers to step out of his way to examine them. The experimenter was also of opinion that they would be objects of curiosity to his cows; and therefore he thought fit to inclose them with hurdles, lest these gentle quadrupeds should amuse themselves by poking them into the neighbouring ditch. I think it right to record his precaution here, because it seems that a cow is a very inquisitive and experimenting creature. I well remember that a cow once made a tolerably successful attempt at devouring a waistcoat of my own, which I had thrown off in a field whilst I was occupied in chasing the splendid swallow-tail butterflies, which no one, with the feelings of a naturalist can ever possibly resist running after in the districts about Cambridge, where they are to be met with. My waistcoat looked very much as if it had visited the cow's first stomach, and required only a little further ruminating to render it sufficiently digestible for being re-swallowed. But, besides the precaution against cows, the experimenter found it necessary a day or two afterwards to protect our hillocks against the rooks, who had taken a fancy to them, and were doing their best to pull them to pieces. A covering of "good ditch stuff" stopped their proceedings. In this condition, then, the hills are intended to repose until next October, when they are destined to be applied to land reserved for a Wheat crop. *Mr. Pilgrim's Experiment*: Here I found two bottoms, each 7 feet by 5, had been already prepared of fresh turf and mould. There were also on the ground two tumbril-loads of very wet litter from the farm-yard, two months old; two tumbril-loads of horse-dung, with a little litter also intermixed; a supply of mixed house-urine and much rain-water, somewhat high in odour, which had been collected in a tank. Forty pounds of ready-sifted gypsum was an improved

mode of bringing this material to the field of action; but only 20lbs. of it were used. Four large baskets of the wetted straw, averaging 62½lbs. each, were spread out as a bottom layer; and upon them were spread four baskets of the horse-dung, averaging 57lbs. each. An improvement was introduced in the mode of applying the gypsum, by continually sifting it over the straw and dung as they were spread out, so that it became more thoroughly incorporated with these materials than in the former instance. Two waterpots of the liquid, each holding ten pints, were then poured over the layer. The two dunghills were proceeding at the same time, as we did not weigh out more than the materials for one layer, and could measure out the rest sufficiently rapid to allow of this improvement also. Each was composed of five layers like the first, and covered over with a layer of the wetted straw. The experiment occupied about one hour and a half in preparing, under the engineering of five pair of hands. The hills were covered over with turf and earth; and are intended to be applied in June, to land which is to lie fallow till next spring, when it is to be sown with Barley. *Mr. Carter's Experiment:* Here we found some clean straw in the barn-loft, and proceeded to tie up two large bundles, each of which weighed 61lbs. Notwithstanding the very great difference between the weight of this clean straw, and that of the wetted litter in the former experiments, we built two hills with it of the same size, or nearly so, as those of Mr. Hitchcock. The bottoms, of five feet square, were prepared with soil taken from a Mangel Wurzel bed. The clean straw proved to be rather an awkward subject to deal with in preparing so small a heap; and the result sadly affronted those notions of propriety which good workmen possess about turning out a job in a workman-like manner. It may, therefore, be as well in other cases, where clean straw can be got at, to chop it up into three or four lengths, to make it more manageable. The straw was spread out into five layers, and on each were placed three bushel baskets of horse-dung—the gypsum being continually sifted among the materials as in the last experiment. One water-pot of pure horse urine from a stable-tank was poured on each two of the layers, and two water-pots of much diluted drainings from the farm-yard were poured over each of the other three. The estimate for the whole quantity of dung used, was made by weighing out six basketsful, at 27½lbs., which gives an average of 45½lbs. for each basket. The capacity of the watering-pot used was ascertained to be 19 pints. These heaps were hurdled in and covered over with mould, and are to be applied in October for Wheat. Although I consider this rough mode of performing the experiment will serve our purpose, I strongly recommend to all who possess the opportunity, to be careful in obtaining the separate materials as pure as possible. Clean straw, as in Mr. Carter's experiment; clean dung and pure urine as in Mr. Hitchcock's; sifted gypsum previously weighed out, as in Mr. Pilgrim's and Mr. Carter's. Attention to these sort of minutiae always enhances the value of the experiment; and I dare say that the chemists who are preparing schedules B., C., &c. will be more positive on such points than I have been in this first attempt. *Instructions for filling up Schedule A.:* There will be five separate occasions for referring to the schedule as the experiment progresses; and the memoranda have consequently been arranged under five heads. Most of the memoranda under the first head seem to be too simple to need a comment, and a mere reference to the three experiments already detailed will explain them readily. No. 3 may, perhaps, seem to be unnecessary; but once for all, I must request that experimenters will be content to submit! The noticing whether A. lies to the N., S., E., or W. of B., is to avoid any error or doubt that may hereafter arise as to which of the two dunghills was gypsumed. Some people have very short memories. No. 11. The whole should be secured of the same quality by mixing in one vessel. No. 15 will need a little explanation. The chances of fixing the ammonia will be increased in proportion as the gypsum is more finely powdered. That which I have seen is rather coarsely so, and on sifting it through a flour sieve many large particles are left behind. These coarse particles may be thrown into a tank, where they will probably be useful. I should very much like to find that the experiment has been tried by some persons with gypsum artificially prepared. I have been asked by more than one correspondent whether he could not prepare gypsum for his farm by dissolving chalk in diluted sulphuric acid, which is a very cheap substance; but I have replied that I should conceive there can be very few localities where the native material might not be purchased at a still cheaper rate. It would, however, be very easy to prepare artificially the small quantity required for a dunghill; and I think it would be well worth while for some of you to try our experiment with gypsum procured in this way, because the particles would be in a much finer state than we can hope to procure them by mere grinding. No. 19.—I do not wish it to be supposed that I have been deluding the experimenters to attempt more than I originally proposed; but it has occurred to me that the value of the experiment will be very materially enhanced without much additional labour, by dividing each dunghill into two equal parts, and then proceeding to apply these halves in the manner set forth in the schedule. Nothing further need be done to the two halves of A. But one half of B. may be thoroughly mixed up with half as much gypsum as was employed on A., so that we shall be able to compare the effect of applying gypsum (as in half of A.) before decomposition, with applying it (as in half of B.) after decomposition. Also, there should be six pieces of land marked out of equal size to one of which "nothing" should be applied; and whilst one half of A. is applied to one piece, the other half of A. might be applied through two

pieces. Still I do not press this mode of performing the experiment, though I most strongly recommend it. No. 20. The column headed "Nothing" means where nothing has been done to the land. If A. and B. are not divided into halves, the entries can easily be made to that effect; but if they are, then the length under A. 2 will be twice as much as under any of the others, provided all the pieces of ground are exactly the same shape. Nos. 21, 22. The usual terms in which these are expressed in practice is all that is required. No. 25. It will be better to experiment on a seed crop, if convenient; but still a little variety in this respect is advisable. Nos. 27, 28. The columns headed "Leaves on" refer to a root crop: which should be given, if possible, both with leaves off (under the first columns) and leaves on. No. 30, 31. In using the more general term "stalk," I mean it should apply either to the straw of a grain crop, or to the stems of flax, fodder, &c.

Schedule A.—EXPERIMENTAL CO-OPERATION.

Query.—THE EFFECT OF GYPSUM ON DUNGHILLS?

* PREPARATION OF TWO DUNGHILLS, one (A) with, and the other (B) without Gypsum.

N.B.—Be very careful to make memoranda at the time, and trust nothing to memory.

* * * * * GENERAL OBSERVATIONS.

33. Any general memoranda may be inserted on the back of this sheet.

The Consequences of Experimental Farming without Previous Experience, exemplified in a Dialogue between two Country Gentlemen. Imitated from the French. By Martin Doyle.—"Sanguine. I come to bid you farewell, my dear sir, and to ask if you have any commands for London, where I have taken a house, and where I hope to live for the remainder of my life.—Steady. What! and give up your farming operations!—San. Yes. I shall never open my mouth again about ploughs or harrows, or thorough-draining, or any other country matters. I am almost beggared by farming. Allow me to make you a present of a set of confounded books on husbandry; you will oblige me by taking them, for otherwise I shall burn every one of them.—Steady. To save them from such a melancholy fate, I shall accept your obliging offer; but perhaps they are not so blameable as you think.—San. Just listen to me—it is the last time that I shall ever deliberately touch upon the hateful subject—and you will see how far the books have been the cause of my failures.—Steady. I shall be happy to hear what you have to allege against them.—San. You know the cause of my coming here?—Steady. Not exactly.—San. I had a tenant named Hogg, [Steady nods,] who held 250 acres of my property, and who was as provokingly ignorant of alternate husbandry as I am of embroidering my wife's flounces; and who went on the old system of a fallow every fourth year, and three crops of corn in succession. Just think of that!—Steady. Very bad management, indeed. I recollect Hogg's management perfectly—his meadows, too, were undrained, and never manured.—San. Exactly so; and the produce was nothing but a scanty supply of coarse herbage with a great proportion of rushes. Now, what rational landlord would tolerate such gross mismanagement? [Mr. Steady gives another nod.] Well, sir, I sent Mr. Hogg about his business at the termination of his lease, taking

at a valuation his horses, cattle, sheep, and even some of his farm implements, which were not too bad for use; and then I determined to give an example of the best husbandry to all my tenants and the gentry around me. I went to work—with a set of books at my elbow, as if they were an infallible cabinet council. The first thing I did was to sell off Hogg's long-legged and long-tailed native sheep, and to buy in their place a lot of heavy Leicester, with a ram that cost me 50l.—Steady. What! before your land was able to feed them?—San. Even so. I got rid of the common breed of cows, which I thought were a disgrace to my farm, and sent off to the north of England for a lot of short-horns, including a high-bred bull, for which I paid 100l.—Steady. And perhaps you never had less milk and butter in your life?—San. Never, sir—never; and as to fat cattle for the market, I had not a single one. My whole stock of short-horns was half-starved, and they got the distemper into the bargain.—Steady. But, my dear sir, how could you have expected to maintain that large description of cattle on your bare pastures, and before you had any artificial summer green food for them; and not a turnip, I believe, in prospect for their winter keep?—San. Why, sir, some villainous author persuaded me that they could be kept in good condition during the winter on straw.—Steady. And so they could, and be fattened on it, too, provided they had plenty of oil-cake with it.—San. But I had neither straw nor oil-cake; for, having given up the notion of sowing more than a very little corn that year, as I conceived that the ground was heartily tired of it, I had hardly any straw, and what I had was consumed before the beginning of February, when I found it impossible to purchase any; and hay was enormously dear, and scarcely to be had even for a high price.—Steady. But you neglected to sow Turnips?—San. I did not. I had commenced in Spring the thorough-draining of a field, containing 20 acres, for the purpose of growing a crop of Swedes, but unluckily the weather was very wet, and besides this, some necessary alterations, which I made in the draining, and a disappointment afterwards in the arrival of a cargo of tiles from Glasgow, prevented me from finishing the work until two months after the crops should have been above ground.—Steady. The produce, of course, was —San. Nil—nulla bona—as the sheriff says in his returns.—Steady. May I ask about the nature of the alterations which you made in your mode of draining?—San. I had read in one book that the drains should be cut across the fall; and my field sloped a good deal, and I had the whole surface intersected with drains, 20 feet apart, and at right angles to the descent. Well, just as I was preparing to have them lowered, another book informed me that they should be made obliquely, at an angle of about 45 degrees with the inclination of the land; and as I did not wish to have the farmers of the country laughing at me afterwards for my ignorance of the improved plan, I had those drains filled up again with the earth that had been thrown out, and I set the labourers at work to form the oblique drains.—Steady. These answered your purpose, however?—San. They might have done so, no doubt; but (I have not yet concluded my story) just as they were finished, I got hold of Mr. Smith's pamphlet on thorough-draining, and was immediately convinced by his reasoning that the oblique drains were wrong also, and I had them filled up again with earth [Mr. Steady shakes his head,] and made new parallels directly up and down the slope, at 12 feet apart; so, altogether, Mr. Steady, the draining of that field cost me a pretty round sum; and besides, sir, I went to the expense of carting off all the yellow clay that had been thrown out of the drains; though I now see clearly that it might have been thrown over the stones or tiles, as the water would have entered into the drains at the sides. Then, sir, I sent to Drummond's for one of Smith's subsoil-ploughs, and found that the small horses which I had bought from Hogg were not able to draw it; so that I was obliged to buy six Clydesdales, and when they arrived at my farm some other work pressed so hard that I could not subsoil for that season, and was obliged to employ those fine horses in petty farm labour, and drawing materials for my new building.—Steady. Which Hogg's horses would have done equally well —San. Now I see clearly that I was wrong in incurring so much unnecessary expense at starting; but the truth is, that I wished to see well-appointed teams as soon as possible—and, à propos of this, it cost me a good deal to replace Hogg's old carts and drays with new Scotch ones, though the old ones would have done for all my rough work nearly as well.—Steady. Gentlemen often waste much capital by extravagance of this kind; in the purchase of high-priced machines there is a great want of judgment very frequently. By the way, you have a threshing-mill, and if you wish to dispose of it —San. You may have it at half what it cost me; I put it up before I had a bushel of corn sown, and the very first day on which I tried how it would work, an unfortunate labourer, with a large family, lost one of his hands, by awkwardly letting his fingers slip between the rollers—poor fellow! amputation of the wrist was necessary, and I could not do less than settle an annuity of 20l. a year on him for his life.—Steady. Well, that at least was not money thrown away —San. No, but it is an item to the debtor side of my farming speculations.—Steady. But surely, though you mismanaged your draining so much, and lost your crop of Turnips in the first instance, you had a splendid crop in the ensuing season on the same field, which I suppose you had manured in the previous year for the expected Swedes?—San. There again I was unfortunate, and entirely owing to books. I had been studying Sir John Sinclair's essay on the manufacture of farina from Potatoes, and the modes of preserving Potatoes from year to year by kiln-drying. Mine had been kiln-dried; and when the season came round for planting

some of my work-people, who had been unaware of what I had been doing with the large stock of Potatoes in an out-house, cut them for sets, and planted them, while I, entirely ignorant that the vegetating principle had been destroyed, felt no misgivings on the subject. No Potatoes grew, as you must know; and when the matter was inquired into, I actually bribed the labourers to propagate the report that the crop had failed from dry-rot. Well, sir, we tried Turnips early in July, and they came up well; but in order to secure them from the fly, of which I had read much, I applied a solution of salt in such profusion that I killed every plant.—*Steady.* (Laughing). Well, this was certainly a sad blunder; but you must admit that Sir John Sinclair gave you no reason for supposing that kiln-dried seed of any kind would grow; and I suspect that you made your solution of salt vastly stronger than the prescription warranted. I remember that Hogg used to make a good deal of money by the orchard of Crofton Apples; that, of course, has yielded as formerly?—*San.* Bless you, no; I'll tell you all about that too. Hogg always let his cows have the run of the orchard in winter and spring; and they ate off or broke down all the lower branches, so as to prevent the trees from wooding too much. This system I put a stop to, and closed up the gate by which the cows used to enter, and the consequence was that the trees ran so much to wood, that I had no crop. Hogg's mode of pruning with cows' mouths and horns had been really efficacious, though no one could have supposed that such rude and unscientific practice would have succeeded.—*Steady.* Whoever takes this farm now will reap the advantage, however, of your unsuccessful outlay. You have been, I suppose, ploughing a good deep furrow, and to my knowledge Hogg never gave anything but a scratching to the land.—*San.* Ay, but his scratching brought him crops, which my deep ploughing has failed to do.—*Steady.* How?—*San.* Unfortunately, I insisted that the ploughs should go deep into the under till—which is the worst kind of yellow clay—and bring it to the surface, and the consequence is, that I have poisoned my land. In short, my good neighbour, I have had no return at all for my expenditure; and I leave my malediction on all writers on husbandry, from the greatest to the least, from Jethro Tull down to Martin Doyle.—*Steady.* Oh! pray except Doyle—whatever you may do with all the rest; there are no crotchets in him. I myself have just bought the tenth number of the new edition (in monthly one shilling numbers) of his Cyclopædia. If you will follow the plain and well-selected advice which that experienced writer affords—*San.* Hang me if I do!—(in a violent passion). No, sir, I shall make no exception whatever; they are all a parcel of humbugging, ignorant—*Steady.* My dear Mr. Sanguine, be composed; believe me, you have misapprehended many things, and not exercised discrimination. Excuse my freedom; you have taken isolated cases instead of looking at the whole; and you have ventured to act for yourself in matters requiring skill and experience, without possessing either of those qualifications. If a surgeon writes an able work on surgery, does it follow that a man who has been uninstructed in that art can exercise the knife, the probe, or the saw? The books are not so much to blame as you think, for they all presuppose a knowledge of farming to be possessed by the readers of them.—*San.* Yet, if they give erroneous directions, even a professional farmer may be misled by them. For instance, I read somewhere that a few stones of Wheat would be sufficient to sow an acre, and that thick-sowing is worse than waste of seed; and I tried four stones of Barley to an acre, in drills—why, sir, I had not more than the third part of a crop.—*Steady.* At what distances were your drills?—*San.* Eighteen inches.—*Steady.* No wonder that you were disappointed. Now, I will venture to say that the writer referred to Wheat only, and that he intended horse-hoeing, on Tull's principle.—*San.* Exactly so. But if this treatment was good for Wheat, I took it for granted it ought to be good for Barley.—*Steady.* By no means: there was your ignorance (excuse me), and not the error of the writer; you applied to one kind of grain the instructions given respecting another, and under peculiar circumstances: did you horse-hoe?—*San.* No, for I sowed Clover seeds with the Barley.—*Steady.* Well, even if you had, your field would not have yielded half a crop, because Barley does not tiller, as Wheat does, on every fresh stirring of the earth, and acquire the same invigoration and extension in consequence. The book was not to blame in this instance, nor is it the science of agriculture—as far as I can judge from what you have stated—that is in fault, but your misapplication of its principles. Writers on this subject, as on others, no doubt often publish a great deal of nonsense; but a prudent reader cannot be misled, if he has discretion enough to receive new-fangled opinions, which are in opposition to uniform practice, with great caution, to weigh well all the circumstances, and to adopt the new suggestions slowly, and not until the test of experience has established their correctness. One should begin with experiments on a small scale, and not change the entire system in a moment, as you have done: you drained too extensively at starting, and that before you had ascertained the best method of doing it; then you undid your work as inconsiderately as you had commenced it—you abandoned the system of fallowing all at once, without having a better to succeed it. To take two or three successive Corn crops is contrary to all good theory and practice; but you contrived it so as to have hardly any crops at all. You went at once to an opposite extreme, and deserted the old system before you had established the new, without reflecting that the transition-state should be slow, and suited, in all its proportions, to the new and untried circumstances to which it is to pass. A new arrangement of farm management should be effected as a manufacturer changes from one

branch of manufacture to another: he cautiously and prudently makes his pre-arrangements, and does not abandon the one manufacture until he is ready to commence the other in a well-organized and effective manner; he calculates his probable profits at the lowest rates, and his losses at the highest, with an ample allowance for unfavourable contingencies.—*San.* I have unfortunately acted in the contrary way, and deceived myself in consequence in every item, in proportion to my over-sanguine expectations. For instance, I anticipated from the field which I drained in so needlessly expensive a manner a great return, and when I bought improved ploughs, and insisted on deep furrow-slices, in defiance of the advice which my ploughmen gave me and the infertility of the subsoil, I calculated on an immediate increase of productions.—*Steady.* Just so,—and that reminds me to remark that you ought to have brought up the subsoil very gradually in successive years, allowing time for the atmosphere and manures to fertilize each thin layer of clay brought to the surface, and not to have incorporated in one season an overwhelming mass of bad matter with the shallow surface-earth, from which old Hogg would have had a good crop of Oats. Then, again, Mr. Sanguine, in attempting all at once to bring in the alternate system, you made great mistakes; for example, in buying cattle to consume green food, which was not even in a growing state, and in rejecting Corn crops before you had made adequate preparations for replacing them with artificial green crops.—*San.* Between the two stools I have fallen to the ground completely.—*Steady.* And I believe that you dismissed a very intelligent and prudent though old-fashioned steward, though you had not experience yourself to undertake such great land improvements without a practical guide at your elbow; but, as you have very candidly said that you have fallen to the ground, I must be permitted to express my deep regret at the circumstance, both from apprehension of the consequences which may result to this country—where agriculture is so defective—from your failure of success and consequent distaste to rural improvement, and from the loss which I shall individually sustain by the removal of so kind and valuable a neighbour [Mr. Sanguine bows, he could hardly do less] from this district. The consequences to which I advert are these;—the obstinate and unimproving farmers will be now more than ever convinced that their old plan of fallows and crops of Corn while the ground can yield them, is the best, and that all innovations on this practice, however really necessary and excellent in themselves, are to be avoided. They will refer to your mistakes as unequivocal evidences of the folly of new schemes, and triumphantly say nothing would satisfy Mr. Sanguine but deep ploughing, and the mischief a blade of Corn he had for his pains,—he must have Turnips, and where was his crop? and then, the poor misguided gentleman must drill his Barley,—and what was the end of it? Why, he had not the third part of a crop,—the cattle of the country were not good enough for him, and the big ones he brought here were starved, and scarcely gave a sup of milk, and he was often obliged to buy butter for his breakfast,—the poor foolish gentleman!—This was neither very complimentary nor consolatory to the unfortunate speculator in land improvements, but it was very true. The gentlemen parted with mutual expressions of good-will and regret; and in about a month afterwards, an unimproving but wealthy farmer of the old school was established in the farm which Mr. Sanguine so hastily relinquished; and from all that the former (who was not bound by any obligations as to a routine of culture) perceived of the proprietor's mismanagement and abortive undertakings,—the twenty-acre field, however, was an unequivocal and perpetual record of the advantages of complete draining,—he was confirmed in his opinion that the old and now almost exploded method was the best.—I conclude with the rather too brilliant similitude of the very sensible French writer, whom I have endeavoured to follow as closely as possible in the foregoing sketch:—“In agriculture, as in everything, nothing permanently good can be effected in a moment. Time does not spare what is done without him. Imitate Nature in her order of the seasons and the development of her phenomena. Between the rigour of winter and the heat of summer, she has placed autumn to harmonize between these two extremes. Between daybreak and noon there are many intervening hours: the sky is tinged with many shadowings before it appears in all its brilliancy. So, in order to bring a farm to perfection, it must pass through many stages. Agriculture, like many sciences of inquiry and observation, consists in a perpetual investigation, and while all its principles and fundamental rules could be comprised in the smallest duodecimo, ten quartos would not contain all the exceptions. To observe—to feel one's way—to make an experiment—to advance—to recede—to enlarge—to contract, with due regard to the quality of the soil, the temperature of the seasons, and the success of different crops,—why, this is the whole art.”—*From the Quarterly Journal of Agriculture.*

GARDEN MEMORANDA.

Kensington Gardens.—On the west bank of the Serpentine, nearly the whole water-frontage has been converted into two magnificent beds for flowering trees and shrubs, Rhododendrons, Kalmias, Azaleas (160 varieties), Magnolias, &c. Messrs. Loddiges have just put in six hundred named varieties—so that Lord Lincoln seems determined that these grounds shall be real gardens, and deserve the name of Kensington Gardens.

Groom's Nursery, Clapham Rise.—The extensive collection of Hyacinths in the open ground will be in full perfection in a few days. A large portion of them are already in bloom, and it is scarcely possible to conceive anything more beautiful than the pleasing mixture of colours, varying from the purest white to the deepest shades of rose and purple. An assortment of the choicest varieties is flowering in pots; those more particularly deserving of notice are—Hercules, single white, shaded with

pink; Bouquet pourpre, double, dark blue; Dibbet's, a single flower of the brightest rose colour; Voltaire, large single white; Pyrene, double white; Goudveurs, a fine, double, flesh-coloured flower; La plus Noire, very dark blue, approaching to black; Emilius, single, light blue; Diana, single, light red; Staten General, single, delicate white; Madame Talleyrand, a beautiful single white; Triomphe Blandina, double, pale flesh-colour; Pasquin, a very fine double flower, light blue; La Majestense, single, blue; Croon Van Indien, double, dark blue; and Appellius, single, light pink. The show-house is moreover enlivened with a variety of Camellias. Amaryllis vittata, Magnolia conspicua, and other flowers. The Tulips appear to be in good condition, and the Auriculas, of which Mr. Groom has a great number, are beginning to throw up their trusses. We noticed here two handsome Cinerarias, one called Grand Duke, dark blue; and the other, C. exarulea, light blue, both very clear in colour, and well worthy of cultivation.—*R. A., March 30.*

Messrs. Fairbairn's Nursery, Clapham.—The Camellias at this Nursery, although not large plants, are flowering well. Amongst them are Cliveana, a tolerably good variety, the two exterior rows of petals being deep rose, having the centre filled up with smaller variegated ones; Monarch, a middle-sized flower, red, and sometimes coming mottled; Rossii, not unlike Cliveana in form, but self-coloured and dark-red; Sweetii, not equal to Collivillii in shape, but surpassing it in the beauty of its carnation stripes; and Leeana superba, dark-red, well cupped, but rather thin of petals. Epacris of various kinds are blooming in the greatest profusion, with Erica Willmoreana, verum, the sweet-scented regerminans, the Irish variety of E. mentenana, and discolor. The beautiful, but much neglected Gloriosa pinnatifida is here extensively cultivated. In the open ground is a collection of Hyacinths, which are flowering exceedingly strong. A la bonne heure is good, single light blue; Anna Maria, light buff, and very double; La Déesse, double, cream-coloured; La Vestale, fine double white; L'Or végétale, a beautiful double yellow; Groot Voorst, light pink, very double; and Princesse Marianne, a single, deep, rose-coloured flower. Amongst the herbaceous plants we observed a singular Polyanthus, of a blueish colour, almost passing into green, edged and striped with yellow.—*R. A., March 30.*

Reviews.

Rural Chemistry. By E. Solly, Jun., F.R.S. 12mo.

THE universal attention which has been directed towards the Chemistry of Agriculture and Horticulture since the appearance of Liebig's work has produced a plentiful crop of books intended to teach the principles of what may be almost regarded as a new branch of science, at least in this country. Among such works, Professor Johnston's "Elements of Agricultural Chemistry," published last year by Blackwood & Co.,* deserves especial notice, more particularly with reference to the nature of soils and of fertilising agents. But it has always appeared to us that, in general, such elementary books have failed in placing clearly before their readers those simple facts and laws of Chemistry, upon which all reasoning and practice absolutely depend. Some are too geological, some too learned for ordinary apprehension, while others are ingenious discourses, from which much may doubtless be collected, but not exactly that which the reader requires in the first instance. As to general introductions to Chemical Science, they are quite unintelligible to those who merely desire to understand clearly the exact nature of the gaseous, fluid, or solid bodies they have to do with in their cultivation.

It was in consequence of this inconvenience that we asked Mr. Edward Solly, when the *Gardeners' Chronicle* first appeared, to favour us with a short and simple exposition of common chemical facts, for the understanding of which no apparatus beyond a few glasses or cups, and such substances as are to be found in any country village, would be necessary. This gave rise to a series of excellent articles, headed "Rural Chemistry," and signed E., which we knew from our correspondents were found to be exactly what they wanted. The work now before us is a republication of those articles much altered and improved, with a considerable addition of new matter. They at present form a duodecimo of 169 pages, with a very complete Index, the entire want of which in Professor Johnston's "Agricultural Chemistry," and the badness of which in Liebig's celebrated work, render those valuable books much less useful than they might be.

Independently of the omission of all superfluous matter, which is, as we think, so very good a feature in Mr. Solly's "Rural Chemistry," it has the additional merit of avoiding all statements founded on doubtful or ill-understood experiments. Theory, unsupported by positive evidence, is consigned to the works of speculative writers; and, therefore, the reader will find nothing stated by him which Chemists do not admit to be unquestionably true. If a doubtful point is admitted, it is cautiously distinguished from acknowledged facts, so that no confusion may arise between the certain and uncertain—a merit of some value in these days of speculative reasoning.

A further merit which this book certainly possesses is its *chemical accuracy*. It is of the first degree of importance that what is learnt should be learnt well, for there is nothing more disheartening to a beginner, after he has made himself master of an elementary work, and fancies himself ready to go on a little further, than to find that much of what he has been taking the pains to fix in his mind must be corrected and amended; in short, that what he has been learning is wrong. This capital error in many elementary works Mr. Solly seems to us to have entirely avoided.

Our readers are so familiar with the manner in which the author formerly dealt with this matter in our columns, that extracts from the chemical part of the work seem unnecessary. We therefore select a passage or two from the introduction. In tracing the history of discoveries in the Chemistry of Cultivation we have the following statement:

"The first Chemist who wrote on Agriculture was, I believe, J. G. Wallerius, who in 1754 published a book on the Cause of Fertility. He was succeeded by several other authors, amongst whom ought to be mentioned Gyllenberg, Einhof, and Dundonald; but the speculations of

* This must not be confounded with Mr. Cuthbert Johnson's "Agricultural Chemistry," published by Ridgway.

these authors (though ingenious) were for the most part crude and incomplete. At the commencement of the present century, when Organic Chemistry was rapidly advancing, Berzelius and Davy endeavoured to apply the conclusions to be derived from chemical experiments to Agriculture. If the deductions which they made were not always correct, and if the plans which they proposed did not always produce the effects which they anticipated, it must be remembered that they were amongst the first to take the subject up, and that though they did so under far more favourable circumstances than their predecessors did, yet that even then the science of Organic Chemistry was in many respects very imperfect and incomplete.

"During the last forty years many important additions have been made to this department of Chemistry; improved and more accurate modes of chemical investigation have enabled more exact analyses to be made of the different varieties of organic matter; the composition of those substances which constitute the bodies of animals and plants has been accurately and carefully ascertained. At the same time, many valuable observations have been made respecting the functions of plants, the conditions requisite to germination, the formation of flowers and seed, the chemical changes attendant on the ripening of fruit, the office performed by roots and leaves, and a variety of other important subjects of inquiry. The names of Liebig, Schübler, and Sprengel, in Germany; Braconnot, Boussingault, Chevreul, Colin, Chaptal, Dumas, Edwards, and Payen, in France; and of Daubeny, Johnson, Pepys, Turner, and Christison, in our own country, deserve especial mention."

In another place, speaking of nitrogen, the existence of which in plants some people, whose Chemistry has stood still for the last 20 years, disbelieve, Mr. Solly says—

"It has long been known that plants consist of carbon, oxygen, hydrogen, and nitrogen, and also that they invariably contain a small quantity of inorganic, or earthy and saline matters. The presence of nitrogen was formerly greatly overlooked in analyses of vegetable substances; it is contained in less quantity than the other three elements of organic matter, and was very commonly regarded as being merely accidental, and not a necessary constituent of plants. Improved modes of analysis have established that it always exists in the same proportion in certain constituents of plants; and as it appears that these substances are also those which form the most valuable part of food, it becomes a question of the first importance, whence do the plants derive their nitrogen? They obtain it principally, if not wholly, from the air; they do not absorb it in the free and uncombined form, but they absorb it combined with hydrogen, in the state of ammonia. The importance of the earthy substances in plants was likewise greatly overlooked formerly. It has been proved by repeated experiments that these substances are of the greatest importance in the growth of plants, being quite essential to their development."

The Author concludes his introductory remarks with an observation in which we entirely concur:—

"Although Agricultural Chemistry is in this imperfect state, and though much still remains to be done in that branch of science, yet it is so far advanced as to be able to render substantial assistance to the practical agriculturist. It can teach him the principles which govern the growth of plants, and consequently guide him in the application of artificial means to produce the most beneficial results. He must, however, not expect too much from the aid of Chemistry, nor give himself blindly up to speculations or theories. Whilst he gives due credit and belief to well-authenticated facts, he must always receive theories with caution and doubt."

"Perhaps the most important advantage which a practical man may at present derive from a knowledge of Agricultural Chemistry is connected with the use of manure. If he knows what it is that gives the fertilising powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them; he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much that for the want of such knowledge would otherwise be lost."

But our limits forbid all further extract. We can only add, in conclusion, that if a man really wishes to understand the Chemistry of nature, this work will enable him to do so better than any other with which we are acquainted.

The Quarterly Journal of Agriculture.—No. LX., is one of considerable interest. In the first place, it has a good paper, by Dr. Dickie, on the trees of Aberdeenshire, containing much useful original information. Dr. Dickie regards the mountain Scotch Pine, or the *true* Scotch Pine, as some have called it, as a mere variety of the common sort, produced by accidents of soil and climate. The disease, or rot, to which the Larch proves so unfortunately subject, is referred to frost, and we have some good tables of the rate of growth of this valuable tree under favourable circumstances. We have only room for one regarding the latter subject.

"The average annual increase at the thickest part, at different periods, is as follows:—

"34 years = 3.8 lines (3 trees at Wardhouse).
35 " = 6.6 " (3 do. do.).
45 " = 3.9 " (3 trees at Kinmundy).
60 " = 3.9 " (3 at Aden).
" = 7.5 " (3 at Toney).
70 " = 7.01 " (3 at Brede).
80 " = 6.9 " (3 at Invercauld).

"As it is well known that the Larch is of very rapid and steady growth, it seems very evident that the trees in the above table, of 34, 45, and 60 years, are not in a thriving condition. Exclusive, therefore, of these, the

others show that the increase of the Larch continues steady to a considerable age; at the same time it may be stated, that the comparison would have been more valuable if it had been possible to compare trees of different ages, growing in the same place and similar soil."

Other papers of general interest are "Von Thäer's Principles of Agriculture;" a capital quiz of injudicious experimentalising, which we give entire elsewhere; "Mr. Bell on an economical Tile-work adapted to Farms of an ordinary Size," well worth perusal; and an official statement of the premiums offered by the Highland Society for 1843. We sincerely rejoice to perceive that on the present occasion premiums are offered for experiments on the influence of soil on vegetation, on manures, on excretions by the roots of plants, on planting, on feeding, on mixing soils, &c. &c., as well as for the ordinary topics of agricultural routine.

Agricultural Chemistry for Young Farmers. By C. W. Johnson, Esq., F.R.S. Ridgway. 12mo.

This consists almost exclusively of extracts from the Author's "Farmer's Encyclopædia," our opinion of which has already been expressed on former occasions. The trifling price will render it accessible by persons who are unable to procure the larger work.

The Third Part of the Second Volume of Torrey and Gray's excellent Flora of North America has just reached us. It contains the remainder of Compositæ; so that the most troublesome part of the authors' task is completed.

CALENDAR OF OPERATIONS for the ensuing week.

Those who have sown any quantity of foreign seeds six weeks or two months ago, will now begin to be impatient for the appearance of the last portion of their young seedlings. Unless foreign seeds vegetate within five or six weeks after they are sown, there is no saying when they may appear; some of them may lay in the ground for twelve months, although the seeds in the meantime may be perfectly sound. The quantity of bottom-heat which many of these seeds will endure is astonishing, and had it not been proved that they could be immersed in boiling-water without injury to their germinating principle, gardeners would be laughed at, were they to tell how they had often experimented on doubtful seeds with bottom-heat. A few years back I adopted the following plan with all tropical seeds which did not vegetate within a reasonable time. I placed the pots on the top of a hot-water pipe, where they were supported by an adjoining wall; this pipe was often too hot to place the hand on, and the pots required to be watered three times in the 24 hours. In less than ten days many seeds vegetated: part of the same packet of seeds having been sown and kept in a hotbed in the usual way, never vegetated at all. Those that did not vegetate on the pipe in three weeks were removed to the iron cover of a large square hot-water boiler, where the pots had a constant bottom-heat of nearly 200° (for the water was often boiling), and the pots for many hours every day were so hot, that they could hardly be handled; yet, I have reared many plants from seed on this boiler, particularly Gesneriaceæ, the seeds of which are as small as dust. Although I do not advise people to go to such extremes with seeds supposed to be valuable, I would recommend a very powerful bottom heat for such as are unwilling to come up by the ordinary modes. More hardy seeds from temperate zones will bear the heat of an ordinary hot-bed till they vegetate; when they must be removed to a cooler place. These auxiliaries may be useful when seeds will not vegetate under more ordinary circumstances.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—About the end of spring and beginning of summer, Pines do not like to be exposed to the strong glare of sunshine; more especially, the young stock, which, if they get their leaves browned at this time, will make little progress till after the turn of the season at Midsummer. A slight shading will therefore be useful for a few hours on bright sunny days for the next three months.

VINERY.—The earliest crops will require a little difference in management from this time; a constant strong heat of 70° to 75°, and more air with less moisture will enable them to colour well, and improve their flavour. All laterals may be cut off, with any weak shoots that do not promise well for the next crop.

PEACHES.—With a moist genial atmosphere, the same routine that is pursued in summer with out-door Peaches will do for those in-doors from this time.

CHERRIES.—The same treatment as the Peach-house receives will suit these also.

FIGS.—Where these have not a house for themselves, they must now be brought to the less shady part of the house, as the first crop will soon begin to ripen; or, if the first crop dropped, the second will soon make its appearance. In either case more light is requisite than can be afforded by most Vineries, or even Pine-stoves, where Vines are growing on the rafters. They are more liable to the attacks of red-spider than the Peach or Kidney Bean; syringing is the best remedy.

STRAWBERRIES.—The treatment for these is so easy and uniform, that a weekly notice of it is not necessary. Now that the fruit is ripening daily, it may be as well to say that they should have less water and more air; and if placed on the highest shelves near the top ventilators, it will be better for them. Except on mild days, and then for a short time only, it is a bad plan to give air by the front ventilators while plants are making their young growth.

CUCUMBERS AND MELONS.—The grand secret is to keep these thin by pinching out the young laterals entirely, where more shoots are not wanted, and above the first joint, from which you want a reserve to come on afterwards. The strongest Pear-tree on the walls will suffer from summer pruning if all done in one day, after having allowed it to make a profusion of young shoots; how much more then must a tender annual suffer from a similar treatment! Foresters say, prune often—that is annually—and prune little at a time. In these frames prune daily, and prune little at a time, rather than once a week.

SEEDLINGS.—All the half-hardy plants belonging to the forcing department, that are raised annually from seeds, require pretty nearly the same treatment of thinning, pricking out, and hardening by degrees, so as to have them firm, stocky, little plants ready to turn out when all danger of frost is over. The more pains taken now to get up these in good condition, the less attention they will require afterwards.

Out-door Department.

I think Mr. McIntosh, in one of his works, said that he always made a point of running the Dutch hoe over every part of the kitchen-garden and slips, whenever the ground was in good condition for the work, either this month or the beginning of next. In these busy days this is not an easy task, but it shows the great importance which the best gardeners attach to the subject. In the flower-garden weeds are disliked most on account of their untidy appearance; but in addition to this, they are dreaded in the kitchen-garden for their exhausting powers. A few shillings might entice a boy or two to pull up all seed-weeds after working hours for the next two months, provided always that these boys were not wanted at home to help their parents with their garden

work or allotments. A boy can pull out in one hour as many weeds just coming into flower as would afterwards, if left to scatter their seeds, employ two or three men a whole day.

ASPARAGUS BEDS should now have their spring-dressing; if not yet finished, fork them over slightly, and rake down the soil even. Cut or trim the edges of the beds, and cover over the ground with nitrate of soda; but do not sow Lettuce or any other seeds on the beds.

ARTICHOKES.—If not yet done, lose no time in giving them their spring-dressing; thin out the suckers, dig in a good dressing of dung among them, and plant a few rows of the spare suckers, to succeed the general crop.

SEA-KALE AND RHUBARB.—Finish planting these without delay.

PEAS AND BEANS.—Go on with successions of these every other week.

BROCCOLI AND CABBAGES.—A few seeds of Grange's Early Cauliflower Broccoli should now be sown, if, indeed, you have been fortunate enough to save your own seeds of it. It is quite a lottery to get it true from the great seed-growers. Keep sowing a few early Cabbage-seeds every fortnight.

CARROTS.—These may be sown any time for the next three weeks.

POTATOES.—In many parts of the country people put off planting their Potatoes until too late; the whole crop should be in before the middle of the month, and the sooner the better.

ENDIVE.—Where the last autumn-sown plants have stood the winter, they will now require to be tied up in succession, like Lettuces, to blanch; they will come in very useful with the early Lettuces, a few of which should also be tied up, if they are opening too much in the heart.

ONIONS AND SPINACH sown last August should have the soil well stirred between the rows; let one bed of these Onions remain to be drawn before the spring-sown Onions come in, and transplant the rest, if not already done.

CHIVES.—No garden in the kingdom should be without this useful little plant; a row of it planted along an alley will be a substitute for young Onions all the year round, and when chopped, they are excellent things for young turkeys.

ORCHARD.—Run the hoe between Strawberry rows; or if the ground was dug early in winter you had better stir it with a fork. Hoe also between the Raspberries, Currants, and Gooseberries, if only to loosen the surface of the ground. Watch carefully the state of the weather while the Peaches and Apricots are in blossom; these you may begin to disbud.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Where the Orchidaceæ are to be shaded by climbers, which are now fast advancing, it will save trouble, when the latter are to be thinned out, if they are now trained in a regular manner, like Grape Vines. This remark applies also to climbers in general at this season. Although nothing mars the beauty of strong climbers planted in the borders so much as keeping them tied up stiffly, yet they may be so trained at first as to allow of their being thinned at any time without trouble. Passion-flowers are the best for this purpose, as they can endure scorching heat, and are not affected by insects. Potting, training, and shading, when necessary, will be the principal work here for some time. If you have a few plants of the two varieties of the Madagascan Periwinkle—*Vinca rosea* and *V. alba*, pot them in light, rich soil, and by the end of May they may be taken to the conservatory, where they will grow and flower until the end of September. No stove plant is better suited for the conservatory during summer.

GREENHOUSE.—A few of the smaller plants of the common Cacti may now be forced, to make an early growth; this will enable them to flower early next spring. Potting and propagation, with a more liberal supply of water and less air, must be attended to.

CONSERVATORY.—See that the more common sorts of plants, brought in merely for their flowers or odour, do not crowd on the good specimen plants. Azaleas and many other things are now making their young growth, and if choked up with a profusion of forced plants of little value save for their flowers, it will soon injure them. It may be necessary soon to use blinds, to guard the flowers from strong sunshine; but this should be deferred as long as possible.

PITS AND FRAMES.—Propagating plants for the flower-garden, and hardening them by degrees, are the principal points to be attended to here; many half-hardy plants may also be raised from seeds in these pits. Store-pots of autumn-propagated Roses should now be looked to, and the plants potted singly in very small pots, to be ready for planting out in the borders of the Rosary next May. Auriculas must be carefully kept from cold winds and strong sunshine.

Out-door Department.

It is now high time to look to any defects in the grass, arising from poor soil or otherwise. Look over what has been said in the last volume about killing moss: there is much good advice on this subject. Those parts in which the finer grasses have been killed should be turfed, and upon places where the grass is poor and scanty, some good soil should be sifted rather thickly, and the roller run over it. Let the walks, beds, and borders be neatly dressed, to show off spring flowers to the best advantage; and on the first wet day, get all the old scythes ground, to be ready for the first mowing or two, which would spoil new ones, and render them unfit for the finer work during the whole season. If you contemplate any different arrangement of your spring bulbs, they should be marked while in flower, to enable you to group them, or dispose of them in any regular series, without mixing the varieties; this cannot be done after the flowers are over, as many of them are so much alike in foliage.—*D. Beaton, Shrubland Park Gardens.*

State of the Weather near London for the Week ending Mar. 30, 1843, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending March 31, 1843.

EXCEPT in a few instances, the supplies have been good during the past week; the demand, however, is not brisk. *Fruit:* Pine

continue scarce, at the same price as in our last Report. The supply of foreign Grapes has been limited of late, and they have consequently made a slight advance. Some very good forced Strawberries are offered, from 1s. to 2s. per oz. There are still a few Beuré Rance and Easter Beuré Pears, the latter of which are selling at 20s. per half-sieve. Apples have made a trifling advance, and the demand for them has been somewhat brisker: the kinds offered are the same as named last week, to which may be added the Newtown Pippin, from 3s. to 4s. per doz. The supply of Cucumbers is on the increase; they fetch from 2s. to 12s. per brace. *Vegetables:* Asparagus is of good quality, but it is not plentiful, continuing to fetch from 6s. to 10s. per bunch. Seakale is excellent, and much more abundant. White Broccoli, some of which are very fine, sell from 1s. to 1s. 6d. per bunch. French Beans are becoming more plentiful, and fetch from 2s. to 3s. per 100. Turnips are tolerably good, from 1s. to 2s. 6d. per dozen bunches. Spinach is much cheaper, being from 1s. to 1s. 6d. per sieve. New Frame Potatoes may be had from 1s. 6d. to 3s. 6d. per lb.: a package of early Potatoes, principally Kidneys, have also arrived from Lisbon. Cabbage Lettuces are selling from 4d. to 8d. per score; and Cos, which are much better, from 1s. 6d. to 2s. 6d. per score. Endive is small, and beginning to run: it is consequently somewhat cheaper. Spring Radishes are becoming more abundant, and fetch from 1s. to 2s. per doz. hands. *Flowers:* The display of cut flowers has been very fine during the past week, consisting of *Hibiscus rosa sinensis*, *Magnolia conspicua*, *Calla æthiopica*, *Deutzia scabra*, *Amaryllis*, *Cacti*, yellow *Jasmine*, *Acacias*, a great variety of *Roses*, *Ericas*, *Auriculas*, *Calceolarias*, *Pelargoniums*, &c.

PRICES, SATURDAY, April 1, 1843.—FRUITS:—

Pine Apple, per lb. 6s to 10s	Cucumbers, per brace, 2s to 12s
Grapes, Spanish, per lb. 1s to 1s 6d	Walnuts, per bush., 12s to 18s
— Portulac, 1s to 2s	Chestnuts, per peck, 4s to 7s
Apples, dessert, per bush., 4s to 12s	Almonds, per peck, 6s
— Kitchen, 3s to 6s	Sweet Almonds, per pound, 3s
Pears, dessert, per hf. sieve, 4s to 10s	Filberts, English, per 100 lbs. 50s to 60s
Strawberries, forced, per doz., 1s to 2s	Cob Nuts, per 100 lbs., 60s. to 75s.
Pomegranates, per doz., 6s to 12s	Nuts, per bushel—
Oranges, per doz., 1s to 2s 6d	— Brazil, 16s
— per 100, 5s to 16s	— Spanish, 18s
— bitter, per 100, 8s to 30s	— Barcelona, 24s
Lemons, per doz. 6d to 2s	— Cob, 12s to 14s
— per 100, 5s to 14s	

VEGETABLES.

Savoy, per doz. 6d to 1s	Spinach, per sieve, 1s to 1s 6d
Cabbage, Red, per doz. 2s to 5s	Leeks, per doz. bun., 2s to 3s
— White, per doz. 1s 6d to 2s	Onions, per bushel, 6s to 8s
Broccoli, White, per bunch, 6d to 1s 6d	— Pickling, per hf. sv., 4s 6d to 5s
— Purple, 6d to 1s	— Green, p. doz. bun. 3s to 4s
Beans, Kidney, forced, p. 100, 2s to 3s	— Spanish, per doz. 1s 6d to 3s
Potatoes, per ton, 45s to 75s	Garlic, per lb. 6d to 8d
— per cwt. 2s 6d to 4s	Shallots, per lb., 1s
— per bushel, 1s 6d to 2s 6d	Asparagus, large, per 100, 6s to 10s
— Kidney, p. bush., 1s 6d to 2s	— Spruce, or Small, 2s to 3s
— New, per lb., 1s to 2s 6d	Sea-kale, per punnet, 6d to 2s 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Lettuce, Cabbage, p. score, 4d to 8d
Turnips, per doz. bun., 1s to 2s 6d	— Cos, 1s 6d to 2s 6d
Red Beet, per dozen, 9d to 1s	Endive, per score, 9d to 2s 6d
Scorzonera, per bundle, 1s 3d to 1s 6d	Celery, p. bd., (12 to 15) 6d to 2s
Salad, per bundle, 1s 3d to 1s 6d	Rhubarb Stalks, per bd., 9d to 1s 3d
Cardoons, each, 1s	Small, 4s ad., per punnet, 2d to 3d
Horse Radish, per bundle, 2s to 4s 6d	Corn Salads, per hf. sieve, 9d to 1s
Radish, spring, per doz. hands, 1s to 2s	Watercress, per doz. sm. bun. 4d to 6d
— Turnip, p. doz. buch., 1s to 1s 6d	Parsley, per half-sieve, 1s to 1s 6d
Carrots, per doz. bunch, 4s to 6s	Tarragon, per doz. bunches, 2s to 3s
— Horn, per bunch, 4d to 6d	Fennel, per doz. bun., 2s to 4s
Paraneps, per dozen, 6d to 1s	Mint, per doz. bunches, 3s to 4s
	Mushrooms, per pottle, 6d to 1s

Notices to Correspondents.

MANGEL WURZEL.—*Anthony.*—We have no experience of salted Mangel Wurzel-leaves, nor of the process of salting; and we have no great opinion of the result. If they are salted green, they will undergo a kind of fermentation, like salted French Beans, and we doubt whether, in that state, cattle would eat them. If they are to be first dried in the sun, and then salted, our climate will not permit it. Perhaps the Beet with thick leaves and a small root, which in Germany is a culinary vegetable, may be good when salted. It is grown for cattle and pigs by cottagers in most parts of Germany.—*M.*—A Correspondent is desirous of ascertaining whether genuine Guano has ever been applied to the Mangel Wurzel crop; and if so, he will be obliged by an account of the manner in which it was used, and the result of its application.

GRASS SEEDS.—*G.*—To obtain permanent pasture on a fine loamy soil, we recommend you to sow the following seeds: *Alolopurus pratensis* 1½ lb.; *Anthoxanthum odoratum* and *Avena flavescens*, ½ lb. each; *Dactylis glomerata*, 2½ lb.; *Festuca duriuscula* and *pratensis*, 3½ lb. each; *F. ovina*, 1½ lb.; *Lolium italicum*, 4½ lb.; *L. perenne*, 7½ lb.; *Phleum pratense*, 2½ lb.; *Poa nemoralis* and *trivialis*, 2½ lb. each; *Medicago lupulina* 1½ lb.; *Trifolium pratense*, 2½ lb.; and *T. repens*, 5½ lb.

MANURES.—*Anthony.*—The use of coal-ashes is to absorb the gases which arise from cloacine in a state of decomposition, which is effected by the carbon such ashes generally contain in the form of small cinders. A cheap and excellent substance for disinfecting cloacine is earth very rich in vegetable matter, and mud from ponds. We do not see the peculiar advantage of wood-ashes, to mix with night-soil, as there is no acid to neutralise; and if there is any acid present, in combination with ammonia, the acid will go to the ashes, and the ammonia will be disengaged. Wood-ashes are valuable, but should be applied to land without any other mixture than with earth. The principal gases in manure are sulphuretted hydrogen and ammonia, and earth will absorb both. The mowing of lawns and decaying vegetable matter will fix ammonia, but their decomposition will add to the quantity of sulphuretted hydrogen, which constitutes the most offensive part of manure.—*H. L. F.*

—Gypsum may be bought of all dealers in manures. You must consult our advertising columns. We never recommend one person in preference to another.—*An O. S.*—Soot is excellent manure, and you can hardly have too much of it. But you do not say to what it is to be applied. It, however, suits almost everything.—*W. B.*—Gas-water, as we have repeatedly stated, varies so much in strength in different gas-works, that no rule can be given as to diluting it; four or five times the quantity of water is a good proportion. It generally burns the grass when first applied; but that is of no consequence, for the grass soon overgrows it.—*A. H.*—Guano can be procured in small quantities of the retail dealers, and of nurserymen, many of whom have lately undertaken to sell it.—*A Subscriber.*—Never sow guano in contact with seeds. Always mix it well with sand, or black soil, or cinder-ashes, or some such substance. It generally kills plants when it comes into immediate contact with them. About 2 or 3 cwt. an acre is the quantity to employ; certainly not more than 4 cwt. You can calculate the proportions for yourself. Your proportions of one to four gallons of water, when used as liquid, are good. But let your greenhouse plants not have it more than twice in the growing season. If you would not have your guano adulterated, buy it of respectable persons.—*A new Subscriber.*—Urine and soap suds should drain into a tank or cask, and be allowed to putrify; if there is not much of the former, add two or three times the quantity of water; and throw into the mixture a little bleaching-powder, which should be occasionally stirred up; there will then be no offensive smell whatever. Proportions are immaterial. When the mass has once been prepared, you may add to and take from it without any considerable interval. You will have no occasion to dilute it further, if it has been originally prepared by the addition of water.—*Deumensis.*—We do not think that experiments yet show satisfactorily what soil guano best suits; but it is certainly well adapted to light or well-drained land. We should not anticipate great advantage from either it or any other sort of manure upon swampy ill-drained soils.—*Clericus.*—Instead of strewing charcoal, resulting from your burning, over a wet heavy meadow, it will be more advantageous to use all the

charcoal for disinfecting cloacine, or any other offensive matter. The ashes, after they have been separated by sifting, will be a good manure for all sorts of things; but they would act much better on your grass field, if it were laid dry by draining.—*A. A.*—Nitrate of soda should be applied to garden-plants when they are beginning to grow, and at two or three subsequent periods during the time of their growth. It is best dissolved in water, and used very weak. A very little goes a great way; if no effect is produced, the dose may be repeated till a result is obtained. The danger of using it is in overdoses. You will find some good practical observations on this point at p. 191.—*W. L.*—Yeast, if kept until it becomes putrid, will form a very powerful manure. Hop refuse is used in many places for lightening heavy land. It may be greatly improved by allowing it to dry, and by afterwards mixing it with stable dung.

PEAT-MOULD.—*H. M.*—The peat bricks will not answer the purpose of peat earth for growing plants; but you may make excellent artificial soil of that kind by mixing leaf mould two parts, old cowdung one part, silver-sand one part.

SPIRITS OF TAR.—*A new Subscriber.*—The manner of applying Spirits of Tar is to mix it with sand, in the proportion of one gallon of the former to a barrowful of the latter, which quantity will be sufficient for 60 or 70 square yards of ground. The sand thus prepared is scattered over the land previously to its being dug.

BOILERS.—*Frost.*—No doubt your pipes cannot convey hot water because they descend. The only good remedy is lowering the boiler so much as to give the flow-pipe an ascent to some extent; a little will do, or even a dead level; but a descent is an obstacle difficult to overcome, so as to make the apparatus work well in practice.

VINES.—*A Subscriber.*—Mr. Crawshaw's method of managing the Vine, as described at p. 603 of 1842, is only suitable for the harder kinds of Grape; the Muscat of Alexandria would not ripen if so treated.—*D. W.*—The best Vines for a greenhouse are the Black Hamburgh and White Muscadine. You had better train a single Vine under each rafter, and prune it on the short-spur system, so that it may obstruct the light as little as possible. Broken bones will be a good material for mixing with the border, for the formation of which you will find directions at p. 103.—*A Gleaner.*—The black Hamburgh Vine may be grafted either upon the Lombardy or Nice.

GRAPES.—*W. S. D.*—The Black Hamburgh may be planted against a south wall, but it is only in warm counties, and in such summers as the last, that it will mature its fruit.

RUST ON GRAPES.—*G. A.*—Much obliged; but our table is covered with such opinions; what the public wants is facts, not opinions. Shrivelling is so different from rusting, that in our opinion the two diseases cannot have any sort of connexion.—*BERBERIS TRIPOLIATA.*—*A. H.*—We are not yet sufficiently acquainted with this plant to be able to state whether or not it is hardy. It will probably prove so in the same degree as *B. fasciculata*.

CYDONIA JAPONICA.—*A. H.*—This plant is the same as *Pyrus japonica*, and is really a Quince; it is different from *Cydonia chinensis*, which does not suit this climate.

GARRYA ELLIPTICA.—*E. W.*—This plant is quite hardy; so also are the *Deutzias*.

YUCCAS.—*Oudevos.*—These plants prefer a light loamy soil, in the full sunshine, thoroughly drained; they abhor stagnant water. They are not very particular as to soil. It is better to leave a space round them, for a year or two, when they are planted on a lawn.

BAPTISIA AUSTRALIS.—*F. G.*—This is a pretty Papilionaceous plant, which will thrive well in the open air. You may sow the seeds directly in a slight hotbed, and when they have acquired strength, you may plant them out in the borders.

DEUTZIA SCABRA.—*F. G.*—This plant may be propagated either by layers, cuttings, or division of the roots.

CROWFOOT.—*R. W. B.*—The best method of eradicating Crowfoot from lawns is to cut off the leaves below the soil as often as they make their appearance.

LARCH.—*D. F. S.*—We are persuaded that all the sorts of European Larch are identical, and that those who go to the Tyrol for what they may just as well get here, are only spending time and money in a pursuit without an object. Larch should be from 1½ to 2 feet high when planted out in ordinary plantations. The Weymouth Pine grows well anywhere, except exposed to the sea spray; it should be planted when of the same size as the Larch.

RHODODENDRONS.—*A Subscriber.*—You may strike Rhododendrons from cuttings, in sand, when the wood is half ripe.

DANDELIONS.—*M. W.*—The best plan to eradicate Dandelions is to keep constantly cutting off their crown of leaves with a spade as often as they appear above ground. A little salt dropped on the wounded root would assist in destroying them more speedily.

DWARF PLANTS FOR BEDS.—*Oriola.*—As yellow plants for contrasting with Verbenas, Nierembergias, &c., in beds, you may take *Lysimachia nummularia*, *Alyssum saxatile*, and *Mimulus moschatos*. No blue plant will answer the purpose better than *Anagallis cærulea grandiflora*.

EYEBROW TREES.—*A. H.*—In a north border, screened by trees on the east and west, and only receiving the rays of the mid-day sun, you might plant Yews, Hollies, common and Portugal Laurels, Laurustinuses, and the Arbutus.

SEEDS.—*An Amateur.*—Now is the best time to sow seeds of forest-trees and shrubs; they may be procured of Nurserymen, and are sold both by the pound and peck, according to the kind required.

RESMES.—*T.*—The sweet Rush used at Norwich to strew the Hall is *Acorus calamus*.

CONSERVATORY PLANTS.—*Vigorously.*—Good plants for turning out in the border of a conservatory are *Acacia armata*, pubescens, vestita, and hybrida, *Chorozema varium*, *Templetonia retusa*, *Gordia latifolia* and pubescens, *Eutaxia myrtifolia*, *Cytisus racemosus*, *Podalyria styracifolia*, *Luculia gratissima*, *Hovea celsi*, polygala, grandiflora, *Magnolia fuscata*, *Brugmansia sanguinea*, *Camellias*, *Oranges*, and *Fuchsias*. For pots you may take *Aphelaxis humilis* and sesamoides, *Helichrysum proliferum*, *Boronia pinnata*, serrulata, and *anemonefolia*, *Gardouia Hookeri*, *Crœwea saligna*, *Chorozema ovatum*, *Leachnaultia formosa* and biloba, *Pimelea decussata*, rosea, and spectabilis, *Polygala cordifolia* and oppositifolia, *Witsénia corymbosa*, *Statice arborea*, *Oxalis Böwei*, *Gnidia piniifolia*, *Sollya heterophylla*, with *Correa*, *Epacris*, *Azaleas*, &c. Climbers may consist of *Hardenbergia monophylla* and *macrophylla*, *Mandevilla suaveolens*, *Técoma capensis*, *Bignonia jasminifolia*, and *Tacsónia pinnatifida*, for the border; and of *Tropæolum tricolor*, *brachyceras* and *pentaphyllum*, *Zichia glabrata*, tricolor, and villosa, *Kennedia Marryattæ*, and *inophylla*, *Canavalia bonariensis*, *Gompholobium polymorphum*, and *Sollya heterophylla*.

CLIMBERS.—*Daphne.*—The difficulty which you find in blooming *Kennédias* and other climbers is occasioned by your greenhouse being partially shaded by a shrubbery. Climbers require to be grown in a very light situation, and it is only by raising the plants nearer to the roof, or lowering the shrubs in front of the house, that you are likely to be successful in blooming them. To thin out the shoots would only increase their luxuriance, without accelerating their flowering.

CARNATIONS.—*J. H.*—Carnations and Picotees should have all the air possible; they only require to be protected from heavy rains, and when in blossom, from the scorching rays of the sun.

CAMELLIAS.—*J. S. H.*—The best compost for these plants is three-fourths good peat and one-fourth good light loam. If the loam cannot be had, peat alone will do very well.

ACACIAS.—*Oriola.*—For a greenhouse we would recommend *Acacia armata*, *Riceana*, *verniciiflua*, *pulchella*, *discolor*, *longifolia*, *mucronata*, *platyptera*, and *alata*.

HIBISCUS LINDLEYI.—*E. M. R.*—You had better not cut down your plant of *Hibiscus Lindleyi* lower than where the stem appears to be hard or matured. After being pruned, it should be watered and placed in a moist stove, repotting it as soon as it begins to grow.

CACTI.—*T. P.*—The best mode of raising Cacti from seed is to fill the seed-pots with cinders within two inches of the top, to make them up with sandy peat, and to spread a little clean sand on the top. The pots are then watered and the seed sown; after which as much dry sand is sprinkled over them as will just fill up the spaces between them. The whole is then pressed down gently, and the pots are put by in a warm place, where they should be kept moist.

DAPHNE.—*A. A.*—*Daphne odora rubra* is a greenhouse plant. It grows best in a rich loamy soil, and should be potted after it has done blooming.

FUCHSIAS.—*A. A.*—We must for the present decline giving an opinion upon the comparative merits of the new sorts. They are too little known.

MONSTERS.—*Zeta.*—Your *Mimulus* is handsome, and its monstrosity very curious; we do not understand the structure. Probably the branch which bore these malformations will produce more.

ORANGE TREES.—*W. S. D.*—Seedling Orange-trees, if grafted upon others which have borne fruit, will flower much sooner than when left to take their natural course.

CAPE CORNS.—*H. B. H.*—We will see what can be done. Mrs. Loudon has evidently made a mistake when she says that *Anomatheca cruenta* has large bulbs and is very dear; it is quite the reverse.

GRAFTING.—*A. H.*—Whip-grafting without the tongue implies the simple juxtaposition of the graft and stock, which are secured to each other by nothing but the bast.—*Cratægus.*—In addition to the Medlar, you may graft on the Whitethorn all the species of *Cratægus*, the Service-tree, Mountain Ash, and Pear; perhaps the Apple and all Pomaceous fruits would also take upon this stock.

GOURDS.—*A Subscriber.*—Seeds of the *Potiron jaune* may be procured of any respectable seedsman. It will succeed under the same treatment as the more common kinds. The Bottle Gourd is rather tender, and only comes to perfection in this country in very hot summers, like the last. To the Snake and Orange Gourds you may add the Crown Gourd, the *Potiron d'Espagne*, *Concourzelle*, *Courge sucrière du Brésil*, and *Porte-manteau de Naples*.

CUCUMBERS.—*Cucumis.*—The following sorts may be recommended: Southgate, Syon-House, Kerrison's, Champion, Mills' Frame, Allen's Victory of Suffolk, and the Man of Kent. For early growth the first four are probably the best adapted.

CABBAGE.—*W. W.*—The Portuguese Cabbage should be sown directly, in order that it may be fit for use before the autumnal frosts. It requires the same treatment as the common Cabbage. The stalks of the leaves, which are eaten like Sea-kale, are ready for use early in autumn.

ASPARAGUS.—*An O. S.*—As your land is already pretty full of salt, you cannot expect much advantage from adding more of it to your Asparagus. Yet it seems difficult to give that plant too much of it.

HORSE-RADISH.—*D. W.*—This should be planted now. The ground intended for it should be trenched two or three feet deep. Then, with a long, thick dibber make holes nearly to the depth of the trenched ground, and to the bottom of these drop pieces of the crowns of Horse-radish, filling up the holes with fine soil.

SEA-KALE.—*D. W.*—Sea-kale should be grown in a rich, loose, and deep soil. It is propagated either from pieces of the roots or by seeds; the latter are, however, esteemed the best. Sow them now in rows two feet apart, and in patches two feet distant from each other. The best plan is to trace out three rows and to leave an interval of three feet for an alley, then to mark out three more rows, and so on. The strongest plant only in each patch should be left at thinning; and in the winter a layer of dung and leaves should be spread over the surface, which are to be forked in early in spring. In the third winter the plants will be fit for forcing.

PEAS.—*A Novice.*—The Woodford Marrow Pea grows moderately tall, flowers in tufts, and is, in this respect, somewhat like the Crown Pea; the pods are large, and contain full-sized Peas. It is not so well adapted for early sowing as the Charlton and others.

WORMS.—*X. Y. Z.*—You may effectually destroy them by watering your gravel walks with a strong solution of corrosive sublimate.—*K. L.*—To destroy the Worms in your Tan-pit, you had better first water the pits plunged in it with lime-water, and afterwards give the whole tan-pit a good soaking with the same liquid.

GREEN FLY.—*D. W.*—The best remedy for the green-fly in pits or greenhouses is fumigation with tobacco.

WOODLICE.—*Daphne.*—By "Sow-bugs" your gardener means Woodlice. Methods of destroying them are described at pp. 67, 102, and 177 of this year's *Chronicle*.

BOOKS.—*M. W. K.*—In Geology, read Lyell's Introduction and Mrs. Marcet's Conversations on Geology. In Conchology, take Catlow's Introduction. For Botany, Lindley's Elements and School Botany.

MOSS ON APPLE TREES.—*Union.*—This is always caused by a damp cool atmosphere, and the real remedy is to give your orchard-trees full exposure to the sun and air, and a thoroughly-drained soil. In the absence of these you may employ lime-water, as is done in Kent, and scrape off the moss with an instrument for the purpose. We would also recommend you to try on one tree only, by way of experiment, the effect of washing it with a saturated solution of corrosive sublimate, reporting to us the result.
