BEES.—*Taxy* mentions something at p. 391, concerning Bees' combs and Owls' eggs found in a hollow tree after the Bees were gone; and asks the following questions:—"Had their departure any connection with dead Bees in the neighbouring house? When were the Owl's eggs laid, by whom hatched, or rather sat upon? Were they kept from decomposition by the combs stopping out the outward air?" As regards the first I cannot see what connection, or rather influence "dead Bees in the neighbouring house" could have on the colony in the tree, especially in March. He says they left suddenly. I question that, for in March Bees are often neglected. There being 10lbs. of honey in the hive is not sufficient proof to the contrary, for the like does happen sometimes. During last winter, the Bees in one of my hives died off gradually, and strange to say, the queen was the longest liver, and left about 10lbs. of good honey. Such rare occurrences have given rise to various conjectures. One is barrenness of the queen, there not being a sufficient number of Bees reared in autumn to supply the loss of those dying off. Disease might attack the colony, caused by the effluvia from the fith which fell with the eggs from the Owl's nest above it. This leads to the question respecting the eggs. It is difficult to say when they were laid, or "sat upon" before they got amongst the Bees; but we may safely conclude that the Owl did not attempt incubation in such a place. The heat of the hive might have some influence on the eggs, and though the *Owlets* did not come forth, the like happens occasionally, especially with eggs on the artificial plans of hatching. I think it is doubtful if the combs kept the eggs from decomposition, except they were glazed with propolis in a similar way that we are told Bees once did so to a mouse that happened to die in their hive. Some may think it strange of an Owl to reside so near a colony of Bees, but at present I know of a Tom-tit who enters to his nest at the same hole that a strong colony of Bees enter to theirs, in a spout-head at the top of a tower. —*A Lady, Westbury*, inquires if it is advisable to cut the combs out of her Bee-box, likewise if it is necessary to introduce fresh queens into old stocks of Bees. Respecting the first it is hard to say how long combs hold good. Some say only a few years, and recommend cutting a portion of the brood-comb one season and another the next, but this cannot be done without injury to the brood. At present I have a live eight years old, and it has swarmed four times this season. As "A Lady's" stock is only three years old, there need be little fear of the combs being bad for several years to come; and though they are dark that is of little consequence, for honey is not expected from them, being in the centre box of Nutt's hive. In general the combs in such hives last out the Bees, and when in a bad state it is best to cut them out before the box is replenished with a fresh swarm. I have only to add that both old and new stocks of Bees have a fresh queen every time they swarm; hence the old notion of their becoming superannuated is groundless. I have illustrated this more fully with other information relating to Bees in the *Chronicle* of 10th June. —*J. Wighton*.

INSECTS.—*A. F.*—The excrescence or gall on the branch of your Gooseberry-bush is produced most probably by a species of Cynips. Such a gall appears to be of rare occurrence, as we cannot discover any previous notice of a similar fact. —*S. A. E.*—The grubs, which arrived in good order, are those of a species of Tipula or Crane-fly. They do not appear to have attained their full size, and will probably become much larger. —*S. R. R.*—The small dark-coloured insects infesting the underside of the leaves of your Elton Cherry, is a plant-louse, called Aphis cerasi. It is undoubtedly very injurious to the growth of the young shoots, and may be got rid of by fumigating with Tobacco, syringing with Tobacco-water, as well as by other remedies which you will find in the pages of the *Gardeners' Chronicle*. —*W. W.*—The "thread-like substance 5 inches long," which you extracted from the body of a wire-worm is an intestinal worm, belonging to the genus *Filaria*. Similar worms have been observed in various insects, but still your fact is a very interesting one, showing that the *Filariae* are found in the larvae of insects. —*S. A. Subscriber, near Shrewsbury*.—Two small Beetles appear to be injuring the Malt, &c. in your granary, specimens of which came safely to hand in the quill; the larger, with a long snout, is the Calandra granaria, so well known as the corn-weevil, and for the injury it does to grain stored away in granaries. The smaller we will give you some information about in a future Number of the *Chronicle*. Frequently turning and exposing to the air the Corn, Malt, &c., appears to be the best method of preventing the attacks of the Corn-weevil, and no doubt also the attacks of the other Beetle you are suffering from. The best means of cure when attacked appears to be that of putting the Corn or Malt into a temperature of 140°, as you will find recommended in *Gardeners' Chronicle*, 1841, p. 104, under the head of Entomological Notices. —*S. A. B. C.*—Mr. Beaton is too far off to be consulted on the instant. It is to be presumed that he has ascertained the fact you mention. We, however, have never seen gas-liquor fail to destroy foliage, unless largely diluted; and in that state it will hardly drive off insects. Whether or not the Gooseberry-Caterpillar is an exception we cannot say. Why not try the experiment yourself?

MISCELLANEOUS.—*Zephyrus*.—Your Orchis is *O. ustulata*. —*W. Chapman*.—No. 1, is *Solanum Dulcamara*; 2, *Cynoglossum officinale*; 3, *Atropa Belladonna*; 4, *Equisetum hyemale*. —*Tyro*.—Your Rose does appear to be a hybrid China. —*A Constant Reader's* plant is *Parmica alpina*. —*J. M. Slapton*.—The Lily is a very handsome variety of *L. bulbiferum*. —*An old Subscriber*.—*Rosa austriaca*. —*P. R. W.*—Your plant has no flowers. —*Asterope*.—*Prunus virginiana* and *Philadelphus grandiflorus*. —*C. A. B.*—*Epipactis ensifolia*. —*W. H. M.*—Your specimen is *Triptilion glomeratum*. —*G. W.*—A starved state of *Lathyrus sylvestris*. —*R. Billing*.—A blue variety of *Veronica nivea*. —*Jas. Best*.—Your *Schizanthus* is new and very pretty. Send us a better specimen and we will name and publish it for you. —*Wild flowers*.—Your plant is unknown to us; it is not British, and it growing in the hedges of this country must have been introduced. Will you send better specimens in order to enable us to determine it, and give us its locality? —*T. S. B.*—Your Apple is the Easter Pippin. —*Inquirer*.—The remarks on the construction of a hibernatory, in Vol. i., are at p. 41, in the No. for Oct. 9. We are sorry to find it is out of print. —*A. B. C.*'s Heaths are:—7. *E. ventricosa superba*; 106. *E. ventricosa* var.; 122. *E. ventricosa stylosa*; 134. *E. ventricosa stylosa*; 82. *E. tricolor dumosa*; 124. *E. tricolor*; 30. *E. gemmifera*; 78. *E. bracteata*; 148. *E. odorata alba*; 160. *E. Eweriana*; ? *E. mirabilis*. —*Rebecca*.—Seventy numbers are out of print from the commencement of the Paper.

SEEDLING FLORISTS' FLOWERS.
PELAGONIUMS.—*J. C. L.*—None of your seedlings possess the qualities of good flowers; they are bad in form and very thin. —*A Devonian*.—*Rose of Aragon*, rosy vermilion, with a clean

dark spot in the upper petals; the flower cups well, and retains its form; it is a fine clear, brilliant, and desirable flower, decidedly the best in the collection. The petals of *Devoniensis* had all fallen, but judging from the shape of them, the flower must be a bad form; it is a high-coloured variety, with too much feathering seen in the centre. *Aspasia* was also seen under similar circumstances, and from the appearance of the petals they seem to curl back, the spot is singular in colour, the ground-colour appears uncertain and too much mottled. *Hebeba*, too common; and *Subutor Rosa* is too fringed to be of any use. No 5 L., too long and loose. *Hermione*, bad form, all the petals too long. *Princess Alice* is no improvement; the flower is small and wants brilliancy. *Formosa* is a flower of good form, whitish centre, very dark spot, the remainder of the flower pink; a clear flower of a good cupped form. *Oberon*, good form, with distinct spot, a pleasing flower and rather novel in colour; if it outgrows the unevenness in the upper petals it promises to become a desirable flower. *Antoniou* is a flower of good colour; but what remained was not sufficiently expanded to enable us to judge of its merits. *Titania*, pretty colour, with distinct spot, but all the petals appear to be rather too long. —*P. E. Lynne, Esq., Plymouth*.—The Duke of Cornwall cannot be regarded as a seedling; it is now in many hands, and is well known for its pure and splendid colour. *Imogene*, lower petals broad and well formed; of a very delicate pink, approaching whiteness, large spot nearly covering the upper petals; this changes to rosy crimson, leaving the edges of the petals pink, the feathering is nearly obliterated. This is a large and very fine variety. Seedling No 10, somewhat like, but inferior to, *Princess Alice*. *Enchantress Superb*, under petals pure white, broad, and well formed, the upper petals are covered with a dark plum-coloured spot, excepting a narrow border of white; it is a brilliant flower, of a good cupped form, but the upper petals are rather too high. *Modesty* is a large showy seedling, somewhat in the style of the *Sylph*, but of a deep bright rosy pink, white centre, lower petals broad and well formed, spot small, dark, and terminating abruptly; if this flower retains a good cupped form, it will prove an attractive variety, but although the petals have considerable substance, they appear to want firmness. Seedling 11, too much like *Modesty*, and the under petals not so well formed. *Redworth* and *Celestial* we have not seen in perfection, and as these flowers enjoy considerable reputation in Devonshire, we must reserve our opinion till fresh flowers can be sent us. *Celestial* was too far gone; it is a very large and bold flower. *Redworth* appears to want brightness; the blue in the centre runs through the lower petals, and imparts a dull appearance to the flower. —*James Best*.—Your seedling belongs to a race long since discarded; it is bad both in form and colour. —*Captain Thurtell*.—We admire the rich colour of your *Mars*, but object to the form of the flower; the upper petals are rather pointed, and the set of the side-petals is very peculiar and objectionable, being too elevated, thereby hiding too much of the spot, and leaving deep indentations in the outline of the flower, by the side petal being drawn away from the bottom one; the flower appears to open too flat; this circumstance is, however, difficult to decide, from the pip being cut off so short, that the flower will not revive sufficiently in water to enable us to determine. —*R. H. B.*—*Meteor*, a pretty little flower, but not to be compared to the varieties now raised. *Cancer*, very poor. *Constellation*, good in colour only; these seedlings belong to a race which is now not valued; they have all the same character, pointed upper petals, small spots, a great deal of feathering in the centre, and the petals all narrow and long. —*E. H. M. and Co.*—No. 1, small and common, of no use in the present day. 2 is pretty in colour, spot small, with too much feathering; they arrived in a very imperfect state. —*A. K.*—The upper petals of No. 1 are too pointed, the flower has considerable substance, but the colour is objectionable. No. 2 is too much fringed, and dull in colour. —*C. W. T.*—*Maid of Honour* is beautiful in colour, rather deficient in substance, and the petals do not appear to unfold well; *Spartan*, *Cora*, *Isabella*, and *Attraction*, have the same faults; they are good in colour, but wanting firmness in the petals to retain a good form. —*A Florist*.—*Alice Maud* and *Charles the XIIIth* are varieties of the same character, deficient both in form and substance, the petals are long, narrow, and thin. —*J. S. B.*—Your seedlings are all flowers of the same character; they are very deficient in substance; the petals generally are long and pointed; the flowers altogether loose and badly formed. No. 2 is the best in the collection.

FUCHSIA.—*M. C. T.*—Your Fuchsia is a rich coloured and fine variety, similar to some we have seen, and it depends entirely upon the habit of the plant whether it is a desirable novelty.

PANSIES.—*N. N.*—Your seedlings are not equal to the present race of these beautiful flowers. No. 50 is the best, but we have several purple petals very superior to it; 51, 52, 53 are of no use; 54 and 55 will make very pretty border varieties. The ground-colour is imperfect in both, the lower petals being yellow, and the side ones white. —*W. C. Turner*.—*Brande's Eliza* is a good flower, large and round, the ground-colour pure white, the eye dark and fine; the upper petals are of deep blue purple, a broad belt of the same colour surrounds the lower petals; the petals lie flat, but the edges want a little smoothness. —*T. B.*—*Pluto*, fine general form and good substance; the ground-colour wants purity; it is too undecided for a show flower. *Talma* has a blotched and fine eye, but the rest of the flower wants decided colour and marking. *Murchionness of Thomond*, a good sized and well-formed flower, very peculiar from having a blotched and fine eye of a light purple colour upon a creamy ground; there is a delicate tinge of light blue on the edges of the petals; if the colours prove permanent it will form a desirable variety. *Lady de Vere*, a flower of the same character, with a tinge of blue on the edges of the upper petals only. *Duchess of St. Albans*, this has some resemblance to the two last-mentioned flowers, but the blotch which forms part of the eye in the bottom petal is a deep brown, from which proceeds a yellow tinge, making the ground-colour in this petal uneven; the upper petals are mottled with light blue. *Virgin Queen*, delicate Primrose ground-colour, with a blotched eye of a bright light purple, very delicate and pretty; we should like to see blo ms again, they are peculiar, and if permanent, very desirable.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

In the House of Commons on Monday, Sir J. Graham stated that it is not the intention of Government to abandon any portion of the Factories Bill except the Educational clauses, and that they have no intention to introduce any other measure on the subject of National Education. Lord Ashley and Sir R. Inglis regretted this result, and attributed the failure of Government to their want of decision in dealing with the religious classes of the community. The bill, after some further discussion, was then passed, in order to have it printed in the amended form. The adjourned debate on the Irish Arms Bill is not yet terminated: on Monday a motion for throwing out the bill was negatived by a majority of 154; and after seven nights' debate on the preliminary stages, the House last night went into committee on the bill. The first clause provoked an animated discussion on Irish affairs; and the

postponement of the clause was strongly urged. The House, however, negatived the motion, but ultimately the committee was adjourned to Monday. On Tuesday the second reading of the Townshend Peerage Bill was carried by a majority of 104; Mr. Hawes's motion on the Danish claims was negatived by 57 to 42; Mr. Crawford's motion for a repeal of the Septennial Act was rejected by 46 to 23; and Captain Berkeley's motion condemning the conduct of the Admiralty in fitting out the old class of ten-gun brigs under commanders, was rejected by 75 to 41. On Wednesday the Princess Augusta's Annuity Bill was read a third time and passed; and the second reading of Lord Worsley's Bill for the inclosure of waste lands in the country was carried by 64 to 4. On Thursday, the Sugar Duties Bill passed through committee, after two divisions on amendments; the first, proposed by Mr. Ewart, recommended an equalization of foreign and colonial sugar duties, and was negatived by a majority of 85; the second, proposed by Mr. Hawes, recommended the reduction of duty on foreign sugar to 34s., and was negatived by a majority of 81. Last night, on the motion of the Chancellor of the Exchequer, the House resolved itself into a committee on the Excise Acts, and adopted the Government resolutions for the reduction of the duty on Irish spirits.

From France we have accounts of the debates on the various items of the Budget, and of the continued determination of the Commission to enforce a reduction in the expenditure. An animated debate is expected on the Army Estimates, in which the Commission propose a reduction of 14,000 men, and nearly eleven millions and a half francs on the demands of the War Minister.—From Spain we have additional particulars of the progress of the insurrection, which appears to have assumed a more favourable aspect notwithstanding the occasional excesses which have been committed. The Regent has determined to put himself at the head of his troops, and suppress the rebellion in person. He has issued a Manifesto to the Spanish nation, declaring that he will fulfil the duties imposed on him as first magistrate of the nation, and defend them as becomes a soldier.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses, remain at Buckingham Palace, and are in excellent health. On Saturday Prince Albert went to the East India Docks to inspect the "Victoria and Albert" yacht; and in the evening the Queen and Prince honoured the Italian Opera with their presence. On Monday the Prince presided at a meeting of the Fine Arts Commission, and dined with the Duke of Wellington at the banquet given by his Grace in commemoration of the battle of Waterloo. On Tuesday the Queen held a Court, at which the Prince and Princess of Oldenburgh were presented to her Majesty, and several noblemen and gentlemen had audiences to deliver the Insignia of different orders of knighthood worn by deceased members of the respective orders. The Queen and Prince Albert attended the Italian Opera in the evening. On Wednesday the Prince held a levee by desire of her Majesty, which was very numerously attended, and in the evening the Queen and the Prince honoured the French plays with their presence. On Thursday Prince Albert attended the ceremony of opening the Museum of George the Third at King's College. Her Majesty will hold her first drawing-room for the season on Thursday next, at St. James's Palace.—The King of Hanover went to Kew on Saturday, and returned to town on Monday, on which day he gave a dinner party at his residence in St. James's Palace. On Monday evening the King honoured the Lord Chancellor with his company; on Tuesday dined with the Earl of Wilton; on Wednesday attended Lady Peel's assembly, and on Thursday dined with the Duke and Duchess of Buccleugh.—The King of the Belgians arrived in town yesterday, to be present at the marriage of the Princess Augusta, which will take place on Wednesday next.—Viscount Hawarden and Capt. the Hon. A. Duncombe, R.N., have succeeded the Earl of Warwick and the Hon. Capt. Hood, as the Lord and Groom in Waiting on her Majesty.

Foreign.

FRANCE.—The Paris papers are still occupied with the debate on the Budget. The estimates of the Ministry of Foreign Affairs gave rise, during its discussion, to some mention of the treaty of commerce between England and France. M. Guizot said that the project of the treaty with England dated before his Ministry. It went as far back as 1839, and therefore the distress of the last few months could not be attributed to it. Government would always negotiate with a due care for French interests. The Budget of the Minister of Public Instruction gave rise to little discussion. The Commission and the Chamber curtailed the Minister's list of two inspectors and one professor. They allowed him, however, the new professorship of Chinese, with which he professed himself much pleased. The administration of the royal library gave rise to a variety of censures and remarks; but on the whole the Budget passed without much debate or reduction. On Saturday the Chamber refused its subscription to the Italian Opera, and transferred it to the Odeon, where the successful tragedy of *Lucrece* has been lately brought out. On Monday the Commission refused to rescind its recommendation to reduce 14,000 men in the Army Estimates. All the efforts of the king and the Ministers, and all their arguments about the state of

Spain, failed to make an impression on the deputies. The Commission proposed a reduction of 14,000 men, and nearly eleven million and a half francs, on Marshal Soult's demands. The Cabinet procured a meeting of the Commission on Saturday, and four of its members who attended it earnestly entreated them to relinquish the reduction. The Commission met again next day, and almost unanimously persevered in their proposal. The discussion on this portion of the budget was to commence on Wednesday or Thursday, and there was every reason to anticipate that it would prove a very animated one.—A serious panic was produced in the Bourse last week by the alleged arrival of unfavourable news from Spain, and the Opposition papers insinuate that it was produced by the connivance of the subordinate officers of the Government. The *Journal des Debats* admits that several Spanish refugees have just re-entered Spain, including Gen. Carsey, one of the ringleaders in the insurrection of Barcelona in 1842. Some of the other papers supply additional information on this point. *La Patrie* announces that General Narvaez left Paris on Monday week, after receiving instructions from Queen Christina, and that he is repairing to Andalusia.

SPAIN.—We have accounts from Madrid to the 13th inst., at which date the capital remained perfectly tranquil. The news from the South was, that Grenada had asked twenty-four hours to arrange a capitulation. General Alvarez, however, would, grant no terms, and the Revolutionary party in Grenada then determined on resistance, and General Alvarez was preparing to attack the town. The junta of Malaga was dissolved, and another junta favourable to Government appointed, which had sent for the assistance of troops. The news of the events of Valencia, announcing the breaking out of the insurrection and the flight of Generals Valdez, Villalonga, and Liegar with the wife of Gen. Zurbano, on board an English brig-of-war, had reached Madrid on the night of the 12th. It had created considerable sensation, and the Regent had been much affected by the defection of General Zabala, whom he had long considered as one of his most attached friends. It was said, that after declaring in favour of the movement, he had resigned his command. The Regent has determined to put himself at the head of troops, and march without loss of time on Valencia. The 7,000 men left there by Zabala had joined the movement, to avoid bloodshed, but were averse to it, from its being of a Carlist and Absolutist character. Señor Camacho, the political chief, had been enticed to a parley by the conspirators, and treacherously murdered. This was the signal for disorder, and the means of its succeeding. The body of the unfortunate chief was dragged through the streets by a rope. A letter from Reus states that after a bombardment of six hours, which had much damaged the town, it had surrendered at discretion. Gen. Zurbano had refused any parley or communication with Col. Prim, who was obliged to quit the town. Zurbano remained master of it the entire day of the 12th, and had disarmed the inhabitants. Reus was perfectly tranquil and in his power on the evening of the 12th. Lerida had sent away the movement party, and remained true to the Regent. The son of Zurbano was master of Gerona, and stood firm; the garrison of Figueras remained in its fort; and the Commander of the fortress of Montjoui positively refused to give it up, or receive the Catalonian officers named by the Barcelonense Junta to command it. The Captain-General Cortinez had previously issued a proclamation announcing his allegiance to the principles of the Junta. The Regent has issued a decree appointing General Seane General-in-Chief of the united armies of Valencia, Arragon, and Catalonia, and directing the Captains-General of those districts to obey his orders, as respected military operations. The Captain-General and M. Mendizabel had a long conversation on the morning of the 13th with the Regent. Nothing had transpired as to what passed on that occasion, but it was reported that, immediately after the arrival of the unfavourable news from Valencia, the Regent was advised to yield to the movement which was becoming general, and to request the assistance of M. Cortina or M. Olozaga to extricate him from his present difficulties. But all this advice was offered in vain, and it is positively asserted that Espartero replied, "No, gentlemen, I never will yield. I know that my fate is to die like a soldier on the field of battle, sword in hand." Notwithstanding these untoward events, it is generally believed that the appearance of the Regent at the head of his troops will again be attended with success, and that he will effectually suppress the movement. The National Guard of Madrid are still unshaken in their attachment to him, and are fully expected to justify the confidence he will repose in them by committing the young Queen to their charge during his absence in the disturbed provinces. These impressions are confirmed by a manifesto just issued by the Regent, in the form of an address to the people of Spain. In this important document he declares his determination to fulfil his duties as first magistrate of the nation, and to defend them as becomes a soldier.

PORTUGAL.—We have advices from Lisbon to the 12th inst. Tranquillity prevailed at Lisbon, and the Spanish disturbances had not had any corresponding effect there. The Cortes had been occupied with various Government projects. An address to the Queen, praying her to consent to a diminution of income in consideration of a necessitous state of the country, was met by the Ministers declaring that her Majesty had again given up 50 contos this year, and the King Consort 40, and was rejected by 89 votes against 4. An address of thanks both to the Queen and King Consort on the occasion of this concession was carried by 72 against 21 votes. The Court was to remain in Lisbon till after the great annual procession

of Corpus Christi, when it would proceed to Cintra. The Duchess of Braganza left on the 8th for Rotterdam, in the Duke of Cornwall British steamer, and was paid the usual honours in going down the river. The proceedings of Dr. Kaley, an English physician at Madeira, had excited much animadversion by the high Catholic party, and great efforts were made to induce the Government to remove him from the island, but it was not considered that a measure of the kind was either justifiable or probable. Dr. Kaley, it appears, has been in the habit of giving the poor people of Madeira gratuitous advice and medicine, and has acquired great influence there. He has held Scripture readings twice a week, at which everybody who chose attended, and about twenty persons have, it appears, declared themselves Protestants. This has given umbrage to the priests; and great efforts have been made to get Dr. Kaley removed. It is asserted that he preached against images, and, in fact, against the religion of the state; and although the late Catholic bishop attended his lectures, he has been commanded by the Governor to desist, and guards have been placed at his doors, by command of the authorities at Lisbon, to prevent any Portuguese from attending his religious meetings. His conversions were considered to be due, in a great measure, to his benevolence and personal influence.

GERMANY.—Letters from Berlin state that motions have lately been made in several Masonic lodges to receive Jews as brethren, and not to inquire into the religious faith of persons who wish to become Freemasons. These motions, however, found much resistance, and were the cause of serious disputes, which have now been settled by a final decision of the Grand Master, the Prince of Prussia, that neither Jews, nor Jews converted to Christianity, can henceforth be received, but that persons of the latter class who previously have been received into the order are to continue therein.

ITALY.—We learn from Genoa that a treaty has been concluded between the Sardinian Government and the Republic of Geneva, for the purpose of constructing a railway from Chambery to Geneva, at the expense of the two Governments. The neglected state of the navigation on the Rhone making direct communication between Switzerland and the Mediterranean very difficult and slow, this will be of the utmost importance for Swiss commerce.

TURKEY.—Accounts from Constantinople of the 31st ult. inform us that Redschid Pasha had an attack of apoplexy of a decided character, on the evening of the 28th. The principal medical men had been called in, but he still continued in a most unsatisfactory condition, with extreme prostration of strength and faculties. The Sultan being informed of this melancholy event immediately despatched his private physician, with orders to neglect no means which might be conducive to the restoration of his health. Under all circumstances, it is thought the idea of sending him away from Constantinople will now be abandoned. Involuntary respect is paid to him, even by his enemies, notwithstanding the intrigues to which they have sacrificed the ablest Minister in the empire. The Sultan has issued a firman to Hafiz Pacha, announcing that Prince Alexander Georgewitch has sent in his abdication, dated May 16, and that in consequence a new election should take place as soon as possible, under the joint superintendence of Hafiz Pacha, as Turkish Commissioner, and the Emperor's Consul-General, as Russian Commissioner, from which election, however, Prince Michael is excluded on the ground that during his regency his administration was not conducted in conformity with the wishes of the Porte. A general amnesty is also granted to all Servians except Prince Michael and his three Ministers.

EGYPT.—Letters from Alexandria of the 27th ult. announce the intention of the Pasha to proceed with the execution of the long-proposed work of joining the Red Sea with the Mediterranean, by means of a canal to be cut from Suez to Palusium. The epidemic among the oxen still continued in Egypt; more than 5000, lately purchased for Ibrahim Pasha, had died of this distemper. A cloud of locusts appeared in the province of Sharkie on the 13th ult., and spread over the country to Alexandria. The corn having been reaped, they destroyed the cotton crop. It was hoped that the approaching inundation of the Nile would destroy them.

WEST INDIES.—The mail steamer Trent arrived at Falmouth on Sunday, with a valuable amount of specie on freight. Her dates are from St. Thomas's, 24th, and from Bermuda, 31st May. The accounts from Jamaica report favourably of the prospects of the ensuing harvest, while the heat in Barbadoes had been so oppressive, that the young crops were suffering in consequence. A vessel called the Glen Huntly had arrived at Kingston, on the 11th May, from Sierra Leone, with 85 emigrants, which was regarded as a small supply only for the demand occasioned by the Jamaica negroes continuing to settle on their own lands, and which caused a want of field-labourers. Much difficulty had been experienced in inducing the poor Africans to volunteer their labour upon the free principle, but it was expected in due progress of time that their prejudices would be overcome.

Parliament.

HOUSE OF LORDS.

Monday.—The Millbank Penitentiary Bill was read a third time and passed. The Apprehension of Offenders Bill and the Assessed Taxes Bill was read a second time. The Chantable Loan and Deposit Offices Regulation Bill was read a second time, and ordered to be referred to a select committee.

Thursday.—Lord MONTAGUE expressed his satisfaction at the intention of the Government to retrace its steps with respect to the additional duty on Irish spirits. He hoped they would take the bold step of reverting to a duty which would at once check smuggling, and benefit the revenue. Under the operation of a 2s. 4d. duty in 1834, these results seemed to be combined, and he pressed

its adoption.—Some other routine business passed, including the second reading of the Canadian Corn Bill, the discussion of which is postponed till Monday week.

Friday.—Lord DENHAM called attention to the proposed "winter circuit." He thought it a matter too important to be undertaken without the serious deliberation of Parliament, and thought that some measure in the shape of a local commission, acting similarly to the Central Criminal Court, would suffice. The judges were already overburdened, and it was impossible that a third gaol delivery could take place in the year without increasing the number of judges.—Lord CAMPBELL suggested that the Irish Judges should be called upon to assist.—The Assessed Taxes Bill was read a third time and passed.

HOUSE OF COMMONS.

Monday.—In reply to a question from Mr. S. O'BRIEN, asking the reason why soldiers in Ireland went armed to church, Sir H. HARDINGE said it was the practice of the service for the troops to go to church armed in disturbed districts, as it was not considered discreet to leave the arms in the barracks.

In answer to Mr. WYSE, Sir R. PEEL stated that he was not prepared to say that Government would ask for a supplementary vote in addition to the annual grant for the purposes of education. If, however, in consequence of what had recently passed, and of the failure of the plan of the Government, the result should lead to increased demand upon the Privy Council, he should then not hesitate to apply for an additional vote. The Right Hon. Baronet further stated that he had no intention of extending the principle on which the Privy Council now acted. To a question from Mr. HINDLEY, Sir R. PEEL announced that, whatever might be the difficulties attending the Regent of Spain, he would not shrink from observing, with the most scrupulous good faith, the obligations which the British Government were bound to hold towards Espartero. He paid a high compliment to the Regent, whom he described as actuated by the sincerest desire to administer the Government of Spain on constitutional principles.

Sir J. GRAHAM made his promised statement with regard to the Factories Bill. It was not the intention of the Government to abandon any portion of the Bill except the education clauses. But in consequence of the omission of those clauses, it was necessary to make alterations in that portion which was to be retained. He therefore moved the committal of the bill *pro forma*, in order to have it printed in its amended form.—Lord ASHLEY expressed regret at the abandonment of the educational clauses. The Church had made many concessions for the sake of conciliation and peace, which, however, had proved fruitless. The Government had no doubt done what it conceived to be its duty; but though Church and Dissent seemed equally pleased at the abandonment of the educational clauses, the only parties who had no reason to be satisfied were the neglected objects of ignorance. For his part, unless a great change took place in the temper of the two parties, he would never again be a participant in any scheme for bringing antagonistic bodies to act in harmony.—Mr. M. GIBSON protested against the word concession at all.—Sir R. INGLIS urged on the Government the necessity of not abandoning the general subject of education. He assured them that if they had taken a more decided tone, and acted in a more determined manner, they would have received greater support from one class of the community, and by no means such virulent opposition from any other. After remarks from Mr. HINDLEY, Sir G. GREY, Mr. COLQUHOUN, Mr. WYSE, Mr. DARBY, and Mr. S. WORTLEY, Sir J. GRAHAM, in his reply, announced that the Government had no intention to introduce any other measure on the subject of National Education: at the same time that they would offer no impediments to the success of any such measure if proposed by an individual Member.—The bill passed, *pro forma*, through committee.

Mr. BUEWITT then asked if it were consistent with the constitution, and the conflicting duties of the King of Hanover that he should take his seat in the House of Lords, and exercise the rights of a Peer of the realm and a Privy Councillor?—The ATTORNEY-GENERAL declined to answer the question.

The adjourned debate on the Arms Bill was resumed by Mr. GIBBONS, who opposed the bill.—The speakers against the bill were Mr. WILLIAMS, Sir H. W. BARRON, Mr. E. ELLICE, Sir C. NAPIER, Mr. M. J. O'CONNELL, and Mr. MONTZ. It was supported by Mr. COLQUHOUN, Lord J. MANNERS, Mr. HARDY, Mr. M. MUNN, and Mr. LANE FOX.—Mr. E. ELLICE said his original intention to vote for the bill had been changed by Sir J. Graham's declaration that concessions to the Roman Catholics of Ireland had been pushed to their limits.—Lord J. MANNERS urged the propriety of establishing diplomatic relations with the Court of Rome, and gave credit to Mr. O'Connell for sincerity and honesty in his motives. He called on the Government to do something to improve the physical condition of the Irish people.—Mr. MONTZ expressed his opinion that the one great error of the government of Ireland was, a total disregard of the feelings of the Roman Catholic population. Mr. L. FOX quoted several Scriptural passages, and declared his determination to prove that the late Emperor of the French was the seventh apocalyptic head of the Beast, or Roman power. Rome in these days was about to become more terrible than she had ever been since the old she-wolf was wet-nurse to Romulus. He then referred to the scene of the Transfiguration, and to Moses, Elias, and St. John the Baptist, and expressed his conviction that Elias was not far off. God would stand by his true British Church in these latter days; and though her sun was eclipsed by the passing of Catholic Emancipation, still she would shine out more brightly than ever.—On a division, the numbers were—for the amendment, 122; against it, 276: majority 154.

After a discussion the House went into committee on the bill. Lord ELIOT promising to give notice before Friday next of the clauses he proposes to withdraw.—To a question by Mr. HUTT, Sir J. GRAHAM repeated that it was his intention to introduce a Poor-law Bill during the present session.—The Ecclesiastical Courts and other Bills were postponed *sine die*, the Government stating that, in consequence of the practice of adjourning debates, it was impossible to fix with certainty the public business.

Tuesday.—Mr. J. WORTLEY moved the second reading of the Townshend Peage Bill.—Mr. C. BULLER moved that the bill be read a second time that day six months; the principal ground on which he opposed the bill being, that it regulated for a particular case instead of on a general principle. No other member having spoken on the question, the House divided at once, when there were—for the second reading, 153; against it, 49: Majority, 104. The bill was read a second time.

Mr. HAWES moved for a committee of the whole House, on Wednesday next, to take into consideration the propriety of an address to her Majesty, in order to the indemnification of the sufferers whose vessels and cargoes were confiscated by the Danish Government in 1807.—The CHANCELLOR of the EXCHEQUER made a statement of the circumstances of the case, so familiar to the public, and declared his determination to adhere to the example of his official predecessors, by resisting the claims.—Mr. HAWES expressed his disappointment at the speech and determination of the Chancellor of the Exchequer. The Solicitor-General had given a decided opinion as to the equity and justice of the claims, but he now remained silent.—The SOLICITOR-GENERAL explained that, on more fully learning the facts of the case, his opinion as to the justice of the claims had been entirely altered. He was now satisfied that they were such as no Government ought to sanction.—Mr. HUTT, Mr. AGLIONBY, and Colonel SIBTHORP added some observations in favour of the claims. A division then took place, when the motion was rejected by 57 to 42.

Mr. S. CRAWFORD brought on a motion for the repeal of the Septennial Act. He briefly referred to the history of the enactment of that measure, which was passed in the first year of George I., and superseded the Triennial Act, which he would now restore, his object in doing so being to render the House more responsible to the people.—Dr. BOWRING seconded the motion, which was briefly opposed by Sir J. GRAHAM, and on a division rejected, by 46 to 23.

Captain BRERKELEY called the attention of the House to the inexperience and danger of employing the old class of ten-gun brigs under commanders, and re-establishing them as sloops of war in her Majesty's navy. These vessels, which the highest naval authorities had concurred in representing as being not fit to fight, to sail, or

even to swim, were about to be sent out to the coast of Africa, to co-operate with a superior class of American ships of war in repressing the slave-trade, and would thus be exposed to a rivalry disheartening to the officers and creditable to the service.—Captain PEACHELL seconded the motion.—Captain GORDON did not view this class of vessels with so much alarm; and seeing they had been so long employed in the service, the Board of Admiralty would not be justified in declining to use them on any important occasion where they might be considered available. Their present destination, on the coast of Africa, between the tropics, where calms and light breezes prevailed, was the best adapted for their capabilities; and as they were to be employed on a difficult and delicate duty, it was requisite that they should be well manned and competently officered.—Captain PITMILLER said a few words in confirmation of the fact of the worthlessness and danger of these ten-gun brigs. Mr. S. HERRBERT defended the Board of Admiralty, who were not doing what they were charged with, but rather the contrary. A new class of gun-brigs were introduced into the service, superseding the old vessels, not because they were dangerous, but because of their bad sailing qualities, and he therefore hoped the House would not adopt a motion, declaratory of an abstract proposition, based on a misconception, and which would not do justice to the conduct of the Admiralty respecting details which were purely of an executive nature.—Sir C. NAPIER attributed the defects of our naval architecture, and the mismanagement of our naval service, to the constitution of the Board of Admiralty, which was radically defective, and kept us half a century behind the rest of the world in a department essentially connected with our national safety.—After some additional observations from Captains PEACHELL and BRERKELEY, the motion was rejected by 75 to 41.

Captain PEACHELL moved the printing of the returns of appeal cases on the assessed taxes for the years 1841 and 1842, which, being opposed as unnecessary by Sir G. CLERK, was rejected by 79 to 16.—Lord CLEMENTS renewed his motion for the production of the correspondence connected with the disbanding of the yeomanry corps in Ireland, to which Lord ELIOT gave the same reply as on a former occasion, namely, that he was willing to furnish copies of all orders for the disbanding of the yeomanry, with some selections, omitting from the correspondence whatever was of a personal or superfluous nature.—Lord CLEMENTS assented, and the returns were ordered.

Wednesday.—The Princess Augusta's Annuity Bill was read a third time and passed.—The CHANCELLOR of the EXCHEQUER stated that he intended to move that the House should on Friday resolve itself into a committee on the Excise Acts. The year's experiment that had been made of the additional duty of 1s. a gallon on Irish spirits had shown a progressive increase of offences against the Excise laws, while the revenue had not been increased to the extent anticipated. He felt so strongly with regard to the moral effect of the change in the Irish spirit duty that he could not consent to the continuance of the evil.—Lord WORSLEY moved the committal of the Coroners Bill.—On the suggestion of Lord G. SOMERSET, the bill was committed *pro forma*, in order to have the amendments, which were numerous, made, and the bill reprinted.

Lord WORSLEY moved the second reading of the Commons Inclosure Bill.—Colonel SIBTHORP moved, as an amendment, that the second reading be given that day six months.—Lord WORSLEY felt strongly the importance of carrying forward the bill during the present session. There were nearly two million acres of waste land in the country, which could be reclaimed at an expense of 12l. an acre, by which great employment would be afforded to the labouring population. There was a strong disposition to carry out inclosures, but parties were deterred by the great expense of separate inclosure bills. He proposed to carry out his measure by the aid of the tithe commissioners; who, on the application of two-thirds of those interested in an inclosure, should send assistant commissioners to examine and report; the commissioners to report the progress of all inclosures twice a year to the Home-office, and the House of Commons to have a veto on any inclosure, should one-fourth of those interested object to it. He had endeavoured to ascertain the probable expense of the working of his measure, and was satisfied that unopposed inclosures, the expense of which, under the present system, amounts to from 400l. to 600l., would not, by the present bill, exceed 40l. Considering the capital which would be invested in reclaiming land, and the employment which would be afforded, he was satisfied that the bill, if passed, would prove an important boon to the interests of agriculture and the country.—Mr. FERRAND, though objecting to the bill, on the ground that it would forever after deprive the poor of England of their free commonage right, was nevertheless satisfied that some measure for the reclamation and allotment of waste land was essential to save us from a revolution. The measures of Sir Robert Peel had proved failures; food was still beyond the means of the working classes; machinery was still advancing, and throwing multitudes out of employment; and the state of the working classes in the manufacturing districts was appalling. Lord Worsley's bill would be a boon, so far as employment was concerned; but he could not vote for it, on the ground of the deprivation of the right of the poor; his objection, however, would be obviated, were the principle of the allotment of waste lands to labourers incorporated with it, as proposed by his own Allotment of Waste Lands Bill.—Sir C. BURRILL and Mr. MILES approved of the bill.—Mr. ROXBURGH objected to the bill that its tendency was to create a pauper population connected with the land. Depend upon it, an allotment system would raise a pauper agrarian population in this country. It was better that the working classes should be dependent on wages. He did not wish to see such commons as those adjacent to London appropriated; their benefit to the health and enjoyment of the population, especially the working classes, was immense. Moreover, he saw in the bill the seeds of many a lawsuit. Let Lord Worsley, and those who thought with him, repeal the Corn-laws, and they would provide surer and more abundant employment for the population than anything this bill could do for them.—Lord J. MANNERS also wished to see the working classes dependent on wages; but an allotment system would enable them to eke out their subsistence. But he wished Lord Worsley's bill to be postponed until the report of the committee of inquiry on the subject of allotment was made.—Mr. C. BULLER paid a compliment to Lord J. MANNERS for his generous sympathies with the poor and working classes. But he could see no reason for the postponement of the bill, as it established no new principle, and the operation of which, he conceived, would be exceedingly beneficial. Mr. ROXBURGH's objection to the inclosure of commons, on the ground of the health and enjoyment of the population, was met by an express provision of the bill; and he could not possibly understand why the cultivation of waste lands should not be undertaken for a reason like this.—After some observations from Lord SANDON, Mr. S. CRAWFORD expressed his determination to oppose the bill, because it interfered with the rights of the poor. It proposed, indeed, to give them "playgrounds," but the best playground for the working man was the land from which he might derive an independent income. He also totally dissented from Mr. ROXBURGH's position, that the working classes should be dependent on wages. Though himself a staunch advocate of the repeal of the Corn-laws, he, nevertheless, thought it essential for the best interests of the working classes that they should have some dependence on land.—Mr. DIVERT, looking to the deficiency of employment, and the importance of extending it, for the sake of the security of the country, would support the bill.—Mr. AGLIONBY also declared his support of the bill, on similar grounds.—On a division, the second reading of the bill was carried by 64 to 4.

Thursday.—Mr. WARD gave notice, that on the third reading of the Irish Arms Bill he will move an amendment, which will open the question of the Irish Established Church, with a view to the redistribution of its revenues, having due regard to existing proprietary rights, and the maintenance of spiritual instruction, on a scale adapted to the Protestant Episcopal population of Ireland.—Sir J. GRAHAM, replying on several points to Mr. FOX MAULE, having relation to Scotland, stated that the Government did not intend to provide endowments for the *quoad sacra* parishes of that country.

On the order of the day for considering the Sugar Duties, the Earl of LICHFIELD made a statement commenting on the facts adduced in the case of the Townshend Peage Bill, and contradicted the assertion that no property was involved. The contrary was the case, inasmuch as the property entailed on the marquise of Townshend

depended on the issue, and the decision of the House would thereby materially affect him.

On the motion for going into committee on the Sugar Duties, Mr. CONDEN moved "That in the opinion of this House it is not expedient that, in addition to the great expense to which the people of this country are subjected for the civil, military, and naval establishments of the colonies, they should be compelled to pay a higher price for the productions of those colonies than that at which similar commodities could be procured from other countries, and that therefore all protective duties in favour of colonial produce ought to be abolished;" and was proceeding to speak on the subject, when he was informed by the speaker, that as the resolution had reference to import duties generally, and not to the sugar duties, it could not be put.—The amendment having fallen to the ground, the House went into committee. The CHANCELLOR of the EXCHEQUER moved a continuation of the sugar duties of last year. He said it would have given him the greatest pleasure to have been enabled to propose a reduction, whether as regarded foreign or colonial sugar, but the state of the revenue prevented him from so doing. Any experiment in the present financial position of the country could not be attempted by any one in his situation.—Mr. EWART moved as an amendment, a resolution recommending an equalisation of the foreign and colonial sugar duties, imposing indiscriminately on sugars 2s. and on molasses 9s.—The amendment was opposed by Mr. JAMES MR. BERNAL, Mr. SCARLETT, and Mr. G. BERKELEY, and was supported by Mr. BROTHERTON, Mr. VILLIERS, Mr. WARD, Dr. BOWRING, and Mr. M. GIBSON. The committee having divided, there were—for the amendment, 50; against it, 135. Majority, 55. Mr. HAWES then moved his amendment, recommending the reduction of the duty on foreign sugar to 3s.—Mr. GLADSTONE regretted that it was not practicable to deal with sugar on the same principle as had been applied to other articles of consumption in the tariff of last year. But the proposed reduction would not have such an effect on price as materially to stimulate consumption; and the state of the revenue forbade all experiment the result of which was not clear. He had no objection to the proposed reduction on commercial grounds, but he thought it insufficient for the purpose of revenue; and he objected principally to it as an encouragement of slavery.—Mr. LABOUCHERE supported the amendment.—Sir R. PEEL insisted that any reduction in the duties imposed on foreign sugars would operate as a direct encouragement to slavery, and explained the negotiations that had taken place with Brazil, and said that, under present circumstances, it would be impossible to admit slave-grown sugar into our markets. The committee divided, and there were—for the amendment, 122; against it, 203: Majority, 81.—The bill then passed through committee, and was reported.

Friday.—On the motion for going into Committee on the Irish Arms Bill, Sir H. W. BARRON moved as an amendment that its provisions be extended to England.—Lord PALMERSTON addressed the House at great length on the grievances of Ireland, to which Sir ROBERT PEEL replied. A long debate ensued, in which Lord JOHN RUSSELL and several Members took part, when Sir H. W. BARRON withdrew his amendment. Sir J. GRAHAM stated that the Irish Chancellor had acted on the advice of Ministers with respect to the dismissal of magistrates. The House then went into Committee on the Bill, when a postponement was moved and negatived by 177 to 74. The Committee, however, adjourned to Monday. The House then went into Committee on the Excise Acts, and adopted the Government resolutions in regard to the reduction of duties on Irish spirits.

CITY.

Money Market, Friday.—Consols closed at 93½ to 4 for the opening; Bank Stock, 179½; Three per Cent. Reduced, 94½ to ¾; Three-and-half per Cent. Reduced, 101½; Exchequer Bills, 55s. to 57s. prem.

Metropolis and its Vicinity.

The Waterloo Banquet.—The Duke of Wellington, in consequence of the anniversary of the battle of Waterloo occurring this year on a Sunday, gave his annual banquet on Monday night at Apsley House to those officers who shared the dangers and honours of the field. A great number of persons congregated at the entrance-gates of Apsley House and on the opposite side of Piccadilly, so that, what with the arrival of the carriages and the vast concourse of people collected, it was with the utmost difficulty that a passage could be obtained for the different vehicles. Many noblemen and gentlemen and several ladies on horseback took up their position on the western side of the eastern entrance gate, a position which commanded the recognition of those distinguished officers entitled to join the party. His Royal Highness Prince Albert arrived shortly before eight o'clock, and the presence of the Prince was the occasion of the most enthusiastic cheering. Colonel Buckley (a Waterloo officer,) and the Marquess of Exeter, groom of the stole to his Royal Highness, were in the same carriage, in attendance on the Prince. The Duke of Wellington received his Royal Highness immediately on alighting from the carriage. The crowd consequently had an opportunity of seeing his Grace, and a burst of applause from without was the result. It was about a quarter to eight when the Duke and his guests, amounting in number to 81, took their seats at the table. The Duke of Wellington of course presided, supported on the right by Prince Albert, and on the left by General Washington, who had never before attended this annual festival, from his residence nearly 22 years in Prussia. The Marquess of Anglesey sat on Prince Albert's right. The Duke of Wellington first gave the health of the Queen, and then that of Prince Albert, who proposed the Duke's health. "The heroes who fell at Waterloo" was next given by the Duke, and drunk as usual, with solemn silence. "The British Grunks," "The Artillery at Waterloo," "Sir Henry Hardinge," "Prussian Army," coupled with the name of General Washington, and several other toasts succeeded.

Public Testimonials.—At the anniversary dinner of the 7th Hussars, which took place on Friday last at the Clarendon, being the first of the three days commemorative of the battle of Waterloo, Lieut.-General Sir E. Kerrison, in the chair, a piece of plate of the value of 1,000 guineas was presented to their late Colonel the Marquess of Anglesea, as the commander of the regiment for nearly half a century. The memorial represented a corporal of the 7th Hussars engaged with a French Dragoon, and was the work of Messrs. Mortimer and Hunt.—On Wednesday week a number of gentlemen assembled at dinner at the London Tavern, and presented a service of plate, which had been voted to Sir John and Lady Pirie, in December last, in testimony of the courteous, exemplary, and distinguished manner in which they discharged their duties as Lord Mayor and Lady Mayoress.

of the City of London. Mr. Cotton, the Governor of the Bank of England, was in the chair, and was supported by between sixty and seventy gentlemen.—On Monday a meeting of the friends of Mr. Macready assembled at Willis's Rooms, for the purpose of presenting to that gentleman a piece of plate, as a tribute of their approbation of his exertions in reviving the legitimate Drama. The Duke of Cambridge presided, and in a speech of some length presented the memorial to Mr. Macready. His Royal Highness concluded by saying, "You have succeeded in reviving a taste for the Drama, which, for the last twenty years, has been gradually declining, and I believe that the result of your exertions has had a very favourable effect on public morality. It has been stated that you are about to leave England. Wheresoever, Sir, you may direct your steps, rest assured that you bear with you the best wishes and sincere esteem of your countrymen, who earnestly hope that, on your return, they may again see you in the unimpaired possession of those powers which have afforded them such high gratification. I feel convinced that every honest man and lover of the Drama will heartily concur with me in this wish." Mr. Macready then came forward, and was received with a burst of applause which lasted for several minutes. At length he addressed his friends as follows:—"May it please your Royal Highness—I find myself labouring under more than ordinary emotion when I attempt to reply to the too partial terms in which you have thought fit to address me. I stand indebted in a large amount of gratitude, and must still lament my inability to discharge it. I thank you most cordially and earnestly, both for myself and the whole of the theatrical profession who have registered their names as friends and patrons of the drama in this splendid testimonial. There are some persons whose thoughts are like 'the eyes of Mammon, always downward bent'; these persons considered my tenure of Covent-garden Theatre as from sordid motives. Did I merit this reproach the disappointment would have been most bitter; but although I have sustained some personal loss, I trust that the experiment to revive the taste for the legitimate drama was not wholly unsuccessful. I have been accused of having left too much to the mechanic's art, but I have merely endeavoured to furnish the stage worthily for the great poet, whom we all honour." Mr. Macready was here completely overcome by his emotion, and had evidently been for some time making great efforts to suppress his feelings; at length he recovered himself, and concluded an eloquent address with the renewed expression of his thanks to the assembled company. Mr. T. D'Eyncourt then proposed a vote of thanks to the Duke of Cambridge, which was unanimously carried.

Anti-Slavery Convention.—The Convention held its last meeting on Tuesday, being the seventh day of its protracted sitting. The proceedings have run to a great length, and the various questions connected with the progress and suppression of slavery in all parts of the world have been so fully discussed, that it would be impossible, in our brief limits, to give an abstract of the speeches. On Friday a discussion on free trade incidentally took place on a motion by the Rev. T. Spencer, of Bath, who proposed the following resolution:—"That in the judgment of this Convention, the introduction of the slave-grown produce of Brazil and Cuba, into competition with the free-grown produce of the British West India colonies and British India, is rendered necessary, as an act of justice to all parties interested, and is in consistency with the principles on which the Convention is constituted." Mr. E. N. Buxton proposed as an amendment, "That it is the opinion of this Convention that the introduction of the slave-grown produce of Cuba and Brazil into the British markets is calculated to encourage the systems of slavery which exist in the former countries, and of stimulating the African slave-trade." A long discussion followed, in which Mr. Cobden, Dr. Lushington, and other gentlemen addressed the meeting; but it was considered desirable that the Convention should not commit itself by any decision on the subject, and the previous question was ultimately moved, and carried by a large majority. On Saturday the state of the slaves in Cuba and other Spanish colonies was brought forward, and led to a long debate. At the evening sitting, a report was adopted on the condition of the free people of colour in the United States, and an address was voted to the Bey of Tunis, for his co-operation in abolishing slavery in his dominions. On Monday a series of resolutions in favour of voluntary emigration from Africa to the West Indies was proposed, and after a long sitting negatived by a large majority, only three hands being held up in their favour. On Tuesday, a report was read on the state of slavery in Texas, from which it appeared that several of the delegates had been honoured with an interview by Lord Aberdeen on Monday: when his Lordship, who listened with great attention to the information given him by the deputation, promised that no legitimate means should be spared to effect the great object of abolishing slavery in the republic of Texas. His Lordship assured the deputation that no underhand or sinister policy would be adopted, but that the British Government were determined to proceed by the fair and open interchange of diplomatic intercourse with Texas or its accredited representatives. The following resolution was then carried unanimously:—"That, in the deliberate judgment of this Convention, the annexation of Texas to the United States is sought, and would be used by the slaveholders of the southern states, for the purpose of promoting the slave-trade and of perpetuating slavery in the American continent, and it is therefore deprecated by this Convention as one of the greatest calamities that could befall the human race." Lord Morpeth moved a resolution expressive of the sympathy and respect of the Convention for the venerable

John Quincy Adams, late President of the United States. At the afternoon sitting, the Rev. Dr. Ritchie, of Edinburgh, brought up the report of the Committee appointed to consider the effect of the 10th article of the Ashburton treaty, in reference to the fugitive slaves in Canada. The report and the resolutions consequent thereupon gave rise to considerable remark, and several resolutions were ultimately adopted having reference to the escape into the English territories of fugitive slaves from the United States, declaratory of the injustice of delivering them up on the demand of the American authorities, under the sanction of the 10th article of the Ashburton treaty. It was then resolved,—"That it is the opinion of this Convention that the anti-slavery cause would be much promoted and strengthened by the formation of anti-slavery societies, founded on the principle of the fundamental guilt of slavery, and of the moral duty of immediate, thorough, and universal emancipation. That, in order to carry into practical operation the above resolution, the delegates and friends of this Convention be requested to assist such societies in their respective cities and neighbourhoods. That, in conformity with the precedent of the Convention in 1840, it be referred to the Committee of the British and Foreign Anti-Slavery Society to call another Convention, similar in character and objects to the present, whenever the cause would be promoted by it." The Convention was then dissolved.

British and Foreign Anti-Slavery Society.—On Wednesday the anniversary meeting of this Society was celebrated in Exeter Hall, Lord Morpeth in the chair. His Lordship was supported by Lord Ebrington, the Bishop of Norwich, Hon. R. Howard, Sir G. Strickland, and a numerous assemblage. Amongst the ladies present were the Duchess of Sutherland and daughters, and Lady Noel Byron. A large number of the Society's delegates from America and other quarters of the world were present. The Chairman opened the proceedings in an eloquent address, congratulating the Society on its objects and warmly wishing it success. The report of the Convention was then read. It gave details of the objects of the Society, and of its operations in America, British India, Africa, and Asia. It touched upon the present state of the abolition question, the state of the African slave-trade, the results of emancipation in the Indies, and on a multitude of other topics. The general question of slavery as at present existing throughout the world was then discussed by the several speakers at great length.

Peace Convention.—On Thursday "The Friends of Universal Peace" commenced their sittings at Freemasons' Hall, when Mr. Hindley, M.P., presided, supported by a numerous body of the Society of Friends, and various delegates from Paris, New York, Birmingham, Norwich, Liverpool, Bristol, Gloucester, and other places. The chairman stated that the object at which the Society aimed was briefly that of devising the best means for arresting the evil practices of war, and for promoting universal peace. According to the programme of topics which will occupy the consideration of the convention, the sittings are likely to last through the week.

Temperance Conference.—On Monday evening a conference between the members of the National Temperance Society and the delegates from America to the Anti-Slavery Convention was held at the Crown and Anchor. Mr. Samuel Bowley took the chair, and stated that the object of the conference was to assist in the propagation of temperance principles throughout the world. The Rev. Dr. Ritchie then moved a resolution to the effect, that, while many philanthropists were now in London attending the Anti-Slavery Convention, and about to attend the meetings of the Peace Society, the present conference could not separate without calling their attention to the evils of intemperance, and soliciting their assistance in its suppression. The Rev. Mr. Clarke, a missionary, seconded the resolution, and stated that, whilst recently travelling through the State of New York, he visited many families, and at none of their tables did he see wine or spirituous liquors in any form. The resolution having been carried, Mr. S. P. Andrews, from Texas, moved, "That while the use of spirits continues, intoxication must to some extent prevail." The resolution was passed. Mr. Buckingham, Mr. Sturge, and several gentlemen from America, India, Africa, and other parts, addressed the meeting, after which another resolution was passed, that the conference agreed with Sir R. Peel, that, while the use of opium abroad was condemned, an equally destructive poison was tolerated at home.

St. Marylebone.—The special Poor-law Commissioners, Dr. Farre and Mr. Hancock, recently appointed to inquire into the alleged neglect, ill-treatment, and mortality amongst the infant pauper children in Marylebone workhouse, having made their official report, it has been transmitted by the Poor-law Commissioners to the directors and guardians of the poor of that parish. The report is of a voluminous character, occupying nearly 300 pages. It was accompanied by a letter containing certain orders from the Poor-law Commissioners, founded on the report which possessed, in fact, its entire substance. This letter, which was of considerable length, having been read, some discussion followed, after which a committee was appointed to take the subject into consideration, and report thereon at the next weekly meeting. Mr. Bushel then intimated his intention to move a resolution in answer to the Poor-law Commissioners, referring them to the protest made by Mr. Young on behalf of the parishioners at the outset of the inquiry, which denied the right of the Commissioners to interfere in any way with the government of the poor in the parish.

Society of Arts.—The annual distribution of prizes by this Society took place on Monday in the Adelphi. The President, Prince Albert, was received with great warmth

by those who were present on the occasion. His Royal Highness was supported by the Duke of Sutherland, the Marquess of Northampton, and several Vice-Presidents of the Society. His Royal Highness introduced the proceedings with a speech, expressive of the great pleasure which he felt in presiding at the meeting of a society which had been framed with such excellent objects; and after his conclusion, the last year's report of the proceedings was read. It commenced by a brief recapitulation of the history of the society, and touched upon the causes which had led to its decline, but which had happily been removed since the consent of His Royal Highness to take upon himself the office of President, more than 120 members having, during the present session, been admitted into the society. From a change also in its discipline, the range of objects for scientific illustration has been greatly increased, as patented objects have lately been admitted for illustration, although not rewarded by the society. The report also stated that since the establishment of the society, 100,000% had been given in the form of rewards, and mentioned the names of the following eminent artists as having received the medals of the society:—Messrs. Bacon, Flaxman, Sir Thomas Lawrence, Sir W. C. Ross, &c. The prizes were then distributed by His Royal Highness with a few kindly words of congratulation to each of the recipients.

The Wellington Statue.—On Saturday a meeting of noblemen and gentlemen interested in the erection of the statue to the Duke of Wellington, and the column in memory of Lord Nelson, took place at the Mansion-house. The Lord Mayor in the chair. It was moved that the subject of the appropriation of the surplus metal, presented by Government for the City statue of his Grace, should be postponed. An amendment was proposed, that the surplus metal should be handed over to the west-end Wellington statue committee; and nine hands were held up for, and nine hands against the amendment; so that the question remains undecided.

Syrian Medical Aid Association.—On Tuesday a public meeting of the supporters of this institution was held at the Music-hall, Store-street, Lord Ashley in the chair. His Lordship lauded the association formed to establish a British dispensary at Beyrout, for the gratuitous relief of persons of all nations; and in doing so said that the institution not only healed the sick, but what was better, imparted spiritual knowledge and consolation. The Rev. Dr. Colls read the report, by which it appeared that Dr. Kerns had been appointed chief medical agent, and had, with his family, reached Beyrout last year, having obtained a free passage from the Lords of the Admiralty, at the instance of Sir R. Stopford. The Edinburgh Foreign Medical Society had sent the committee a donation of 35%. After defraying the expenses of the past year there remained in the treasurer's hands a balance of 217*l.* 19*s.* 1*d.* During the six months, ending March 1st, that Dr. Kerns had been established at Beyrout he performed several important surgical operations, and relieved, under every disadvantage, no fewer than 2,737 patients, previously destitute of all medical aid. At present, with the exception of Dr. M'Gowan, located at Jerusalem with Bishop Alexander, there was no other resident qualified practitioner but Dr. Kerns throughout the whole extent of Palestine and Syria, containing two millions of inhabitants. The report was received, after which several gentlemen addressed the meeting in support of the association.

The New Royal Yacht.—On Saturday Prince Albert, attended by the Earl of Liverpool, Sir G. Anson, and Sir E. Bowater, went to the East India Docks, at Blackwall, to inspect the Victoria and Albert, fitting out there for the use of her Majesty. The Prince left Somerset House in the Royal barge about half-past ten in the forenoon, which enabled him to proceed to Blackwall with the last quarter ebb, and to return with the flood, giving him a favourable tide both up and down the river. Some of the Lords of the Admiralty and other naval authorities accompanied the Royal party in the Admiralty barge. Prince Albert remained upwards of an hour on board the steam-vessel, and having examined the fittings and accommodation, expressed himself greatly pleased with the arrangements, and with the progress which had been made towards her completion. She will be ready to get her steam up and try her engines on Thursday, the 29th inst. By the 6th next month she will be sufficiently forward to proceed to Chatham, where she will be fitted with her masts, spars, and rigging, and by the 20th of the month she will be ready to receive her Majesty. On leaving the docks, the Prince, with the Lords of the Admiralty, embarked in the Queen's barge at the Brunswick Pier, and returned to Whitehall-stairs. The barge was rowed by 22 watermen in scarlet liveries, and the Admiral's barge, which accompanied it, was rowed by 10 men. The only boats accompanying the Prince were two under the control of the harbour-master, to clear the river, should their services have been rendered necessary by any obstruction.

The Scottish Presbytery.—At a meeting of the Presbytery of London in connexion with the Established Church of Scotland, held at Woolwich on the 13th inst., several members separated from the body and declared themselves attached to the free Presbyterian Church. They appointed a new moderator, and took possession of the Presbytery's records. The old members, however, withdrew from the scene of the tumult, and resumed the proceedings as the Presbytery in connexion with the Church of Scotland.—The Seceders met on Thursday, and received a deputation of Ministers and Elders from Scotland, who stated that they came for the purpose of obtaining money, and would not be satisfied with less than 30,000*l.* Resolutions were then passed, pledging the congregation to give their pecuniary assistance.

Court of Aldermen.—The Committee of Aldermen

appointed to inquire into the circumstances of Alderman T. Wood's connexion with the Talacre Mining Company held their final meeting at Guildhall on Saturday evening. The proceedings being deliberative, were conducted with closed doors, and the result was, that the Committee agreed to report to the Court the evidence which had been presented to them, together with a statement framed by the chairman (Alderman Brown), and designated "a statement of facts." Alderman Wood strongly insisted on the propriety of presenting all the evidence to the Court; but protested against the "statement of facts," as partial, imperfect, and incomplete, and calculated to leave an unfair and untrue impression on the minds of those who had neither leisure nor inclination to go through the many matters of detail of which the evidence consisted. The result of Alderman Wood's objections was, that the Committee agreed to present the whole of the evidence to the Court; but the Committee declined giving an opinion upon the inquiry, in consequence of Alderman Wood being a magistrate.

City Improvements.—At a meeting of the Common Council on Tuesday, Mr. R. L. Jones presented the report of the Select Committee on the proposed improvements in the City. He submitted a motion declaring that the Court agreed with the report, which stated that a favourable opportunity existed for drawing the attention of the Government and the Improvement Commissioners, as to the best means to be adopted for securing the requisite funds for those purposes, and recommended that the Committee should be empowered to confer with them. After some discussion, Watling-street and Newgate-street were added to the list of suggested improvements, and the motion was adopted.

Illness of Earl Grey.—The daily papers announce that Earl Grey, who is now in his 80th year, is seriously indisposed. It is, however, understood that the illness from which the noble Earl is suffering is rather debility consequent upon advanced age than disease, and is not of a character calculated to give grounds for any immediate apprehension. One of the consequences of this debility is that his Lordship's sight is seriously affected.

East-India Company.—The Quarterly Court of Proprietors was held on Wednesday. The business was mostly of a routine character. Mr. Poynder deferred till September his motion respecting the Temple of Jugernaut, but submitted a memorial on the subject from the Baptist Missionary Society, praying that the idols of India may no longer receive support and honour from the public funds. A conversation ensued on the reported massacre of Col. Stoddart and Capt. Conolly, but the chairman said the Directors had received no information except through the newspapers. Major-Gen. Sir J. Bryant made a statement, proving that the accounts of cruelties said to have been practised by the Indian Army in Afghanistan were entirely without foundation. The chairman confirmed this statement, which was received with applause.

Institution of Civil Engineers.—The annual *conversazione* given by Mr. Walker, the president of this institution, has been hitherto so fully attended, that, willing to afford his guests ample opportunity for examining all the works of art and science prepared for their entertainment, he this year issued invitations for Friday, the 16th, and Saturday, the 17th inst. On the former evening about 300 visitors were present, and on the latter occasion a large company assembled, comprising many distinguished persons in science or the arts, and including Prince Albert, the Duke of Wellington, &c. &c.

Wood Paving.—On Saturday there was a very full attendance of the members of the Marylebone Vestry, for the purpose of considering a motion for rescinding a resolution of the vestry with respect to no more wood paving being laid down in the parish for a period of three years. Sir P. Laurie presented a petition, signed by 59 omnibus proprietors and job-masters, against any further extension of wood paving, and praying the vestry not to disturb the resolution they had come to. Mr. Joseph moved that the resolution come to by the vestry on the 4th of March, declaring its determination not to carry out any more wood paving for a period of three years be rescinded. The resolution having been seconded, Sir P. Laurie said it was outrageous to make such a proposal as rescinding a resolution passed three months since. Wood paving was a decided failure, and all those who were formerly in its favour were now against it. He would tell them that all the carriage folks were leaving Regent-street, and were going into Bond-street, on account of the danger of the wood paving. Earl Manvers said he was formerly in favour of wood paving, but his views were changed; and such was the degree of danger he felt connected with it, that if he voted that day in favour of wood paving, and broke his neck in driving over it, he believed no conscientious jury sitting on his body could return any other verdict than *felo de se*. After a long discussion the question was put, when there appeared—for rescinding the resolution, 20; against it, 35; majority against wood paving, 15.

Inquests.—On Saturday afternoon an inquest was held at Woolwich, on the body of Captain W. S. Blount, R.N., who committed suicide under very distressing circumstances. Two pistols were produced, one of them still loaded. Lieutenant Clavel, of the Royal Marines, deposed that the deceased was his brother-in-law. He saw him for the last time alive at his father's house in Greenwich Hospital on Tuesday evening, when he alluded to a certain circumstance which appeared to be affecting his mind. He had been acting as Commander of the royal yacht Victoria and Albert, and from some cause was informed by the Admiralty that he could not have his commission laid before her Majesty. He had been to the Admiralty that day, and was told so, and during the evening, he said

that he should demand a Court-Martial or Court of Inquiry to clear his character. Witness had heard the result of an application to that effect, and the reply was, the Board could not grant it. He had no doubt the deceased was quite deranged. The evening he spoke of, the deceased would not listen to any reason; he walked about in a state of the greatest excitement. He had no doubt that the disappointment was the exciting cause; deceased had from the first announcement fallen off from a stout man to a mere skeleton. Mr. Payne, of Greenwich Hospital, said he had known the deceased for years, and he had successively held many appointments with credit to himself and the Service. He was a most amiable and honourable man, greatly attached to his family, and a strict observer of his religious duties. He was borne on the ship's book until the vessel was commissioned. Witness had no doubt the imagination that his character had been aspersed, had overcome the balance of his mind. A more excellent or amiable father, husband, or man, could be rarely found. The appointment, if obtained, would lead to certain promotion, and he would not have been chosen at all except for his knowledge of steam and his high character. The Jury immediately returned a verdict of temporary insanity.

Mortality of the Metropolis.—The number of Deaths registered in the week ending Saturday, June 10, was as follows:—West districts, 122; North districts, 163; Central districts, 189; East districts, 199; South districts, 175—Total, 848. Males 417—Females 431. Weekly average for the last five years, 903. (461 males, 442 females); and for the last five springs, 854.

Provincial News.

Aylesbury.—We lately noticed the erection of a monument to John Hampden on Chalworth field, the spot on which he received his death wound, June 18, 1643. The ceremony of throwing open the monument to the public took place on Monday, in the presence of a great concourse of spectators. After the ceremony a dinner was given near the spot, at which Lord Nugent presided, supported by Sir John Easthope, M.P., Mr. Tancred, M.P., Rev. Dr. Hampden, Sir S. Hancock, and several members of the University of Oxford and gentlemen from the adjacent towns. A considerable number of ladies were also present.

Carmarthen.—The lawless depredators known by the name of Rebecca and her Daughters appear to increase in power and influence in Carmarthenshire, and if they continue in the same ratio as they have done during the last few weeks, civil power, as far as local authority goes, will be completely subjugated. Their proceedings during the past week affords a striking instance of their success in setting the civil authority at defiance. On the day following the destruction of the Water-street gate at Carmarthen three men passed through the aperture where the gate had previously been, refusing to pay toll. The toll-collector summoned them before the magistrates, to whom they said that Rebecca had given them notice not to pay. They were fined in the penalty of 40s. each, and costs, which not having been paid, a distress warrant against their goods was issued. Some bailiffs and constables were sent to execute the distress warrant, but the officers were summarily ordered by Rebecca's disciples to return, which they readily did. The magistrates, determined to enforce the law, swore in about thirty pensioners as special constables, who, together with a number of policemen, bailiffs, &c., proceeded on Monday week to execute the warrant. They succeeded in making the distraint with little or no molestation, but before they had proceeded a quarter of a mile with their booty, the sound of a trumpet assembled an immense concourse, amounting to several hundreds of Rebecca's Daughters, some of whom had their faces blackened. They immediately compelled the constable to deliver up the goods, together with all the fire-arms and other weapons of defence in their possession. They then proceeded to demolish a wall belonging to Mr. Davies, of Trawsmwr, a magistrate for the county, who had offended them, and they gave the special constables and police their choice, either to assist them in demolishing the wall, or run the risk of being stripped and sent to town naked. The officers made choice of the former alternative, and destroyed the wall, upon which Rebecca allowed them to go home.—The above accounts, however, are far surpassed by the following particulars of a more recent outrage, in which the rioters were dispersed by the troops. At about mid-day on Monday, reports were brought into the town by persons from the Pembroke-road, that the Rebeccaites were assembling in great numbers, horse and foot, and shortly after they were seen marching in due array, headed by Rebecca herself, followed by about 900 horsemen and 8,000 or 9,000 on foot, marching 14 or 15 abreast. They entered the town by Sir Thomas Picton's monument; but previous to entering they divided themselves into two bodies, one portion passing down Lammas-street, and the other down Water-street, shouting and yelling. They carried banners, and were most of them armed with a short kind of pike, such as is used by miners, and many had fire-arms. The inscriptions on the banners were in Welsh; one had "Liberty of toll," "Freedom," "Liberty and better food." On arriving at the Guildhall-square the two bodies again united, and proceeded to the Union workhouse, and immediately commenced a fierce attack upon the gates of the outer court; having carried these by storm, they broke into the workhouse and demolished the furniture. Whilst engaged in this work, a troop of the 14th Dragoons opportunely arrived at full gallop from Neath—two of their horses dropped dead from fatigue as they entered the town. One man was cut down whilst attempting to seize the bridle of one of the dragoons. On the appear-

ance of the soldiers the mob began to fly, and on their arriving at the workhouse the magistrates assembled, and read the Riot Act, but on seeing the preparations to fire, the mob dispersed, leaving their brethren who were within the workhouse in the custody of the authorities, the troop, aided by another which had in the meantime arrived, having surrounded the workhouse. About 250 were captured, together with 60 horses. The magistrates committed the greater number to the county gaol the same night, to which they were escorted by the military.

Crewkerne.—A remarkable case of infanticide has just come to light in this town. For some time past it has been rumoured that a girl named Martha Clark, who lived as servant to a Mr. Alven, a person of independent property, and the son of a former banker of the town, had given birth to a child, of which he was the father, that he acted as accoucheur, and destroyed it. At an adjourned inquiry on Thursday week the girl made a full confession, from which it appeared that Mr. Alven was the father of her child; that he had acted as accoucheur; that he had twisted a hayband round the infant's neck, and then had thrown it amongst some reeds; that she had never seen the child, but heard it cry; that Mr. Alven had never told her what he had done with it, but her suspicions were that he had buried the body in the garden. The magistrates committed both prisoners for trial at the next Assizes, Alven as principal and Clarke as accessory after the fact. Application was made by Mr. Alven's solicitors to the magistrates to take bail for his appearance, and bail to a large amount was offered, but the magistrates refused it.

Huntingdon.—A public meeting was held on Saturday last in this town, in consequence of an invitation from Mr. Cobden and the Anti-Corn Law League to the farmers and inhabitants of the county, to have an open discussion on the causes and remedy of the existing agricultural distress. The meeting was appointed to take place in the large room of the Mechanics' Institution, but in consequence of the numbers brought together by the market held on that day, and the strong excitement prevailing on the subject, the assembly adjourned to the common in the neighbourhood of the town. Mr. George Rust was called to the chair, and was supported by the Earl of Sandwich and the leading landowners and farmers in the county. He opened the business of the meeting by reading aloud a note from Mr. Cobden, stating that a severe cold, which totally precluded the possibility of his addressing any public audience, prevented his presence, and deputed to Mr. Bright the duties which would otherwise have fallen on himself. After the disappointment produced by this communication had subsided, and some preliminary discussion had taken place as to the person who ought first to speak, Mr. Bright addressed the meeting at great length. He was followed by Mr. Moore on the side of the League, and by Mr. James Rush, Mr. Bower, and Mr. Day, in favour of the Corn-laws. A motion in favour of protection was carried by a large majority. It is stated that about 3,000 persons were on the ground, two-thirds of whom voted for the motion. On the previous market-day a meeting of farmers had taken place, when a committee was appointed to ascertain the feeling of the whole county upon the subject. A form of declaration was accordingly drawn up for distribution in every parish throughout the county, and in the course of a week the names of upwards of 1,100 tenant farmers were attached to it, expressing their opinion that, while the present charges upon the landed interest remain they cannot compete with the foreign grower of corn without a protecting duty. This declaration was signed by tenant farmers, occupying upwards of 300,000 acres in the county.

Liverpool.—There is no longer any doubt that the frequent fires which have recently occurred in this town, were the work of incendiaries. On Tuesday morning a piece of cotton and lucifer matches were found inside the cat-hole of a warehouse, in Dundee-street, and some lucifer matches have also been discovered in a warehouse in Great Howard-street, in this town, which had evidently been placed there with the intention of producing another conflagration. Happily, in both instances the attempt proved unsuccessful, in consequence of ignition not having taken place. Every effort is making by the authorities to discover the incendiaries by whom the town is infested, but as yet without success.

Lynn.—On Wednesday the 14th inst., a young man of the name of Sangar, a clerk in the Lynn Bank, absconded with a large sum of money, the property of the proprietors of that establishment. He also contrived to plunder a neighbouring banking concern. Upon investigation it was ascertained that he must have taken away with him between 4,000*l.* and 5,000*l.* Intelligence was speedily communicated to the Committee of Bankers in London, and to the City Police, who have announced that the greater part of the missing property has been recovered.

Manchester.—The following are said to be the verdicts and sentences of the courts-martial held last week, for the purpose of trying the soldiers of the 15th Reg., accused of improper conduct in connexion with the late attack upon the Manchester Police:—Sergeant Nolan, against whom there were three charges, was acquitted on the first and third, and found "Guilty" on the second; and was sentenced to be reduced to the rank and pay of a private soldier. Two privates were found Guilty, and each sentenced to four months' imprisonment; and three Privates were acquitted.

Nottingham.—On Wednesday the 14th a public dinner was given by the Liberal electors of this borough to Mr. Gisborne, their new representative. It took place in the Exchange Hall, Mr. T. Wakefield in the chair. The room was completely filled; and Mr. Gisborne and other gentlemen addressed the company at great length, on the circumstances of the late election.

Oxford.—The case of *M'Mullen v. Hampden* was brought before the Vice-Chancellor's Court in this University a few days since, on a motion for the admission of the libel. Mr. Hope appeared as counsel for the plaintiff. Dr. Twiss, for the defendant, opposed the admission of the libel, first, on several technical objections appearing on the surface of the libel, such as the wrong title given to the court, and to the description of the party propounded, &c. After a long argument the Assessor ordered the libel to be amended in regard to the first objections, and took time to look into the numerous cases cited in regard to the substance of the libel and mode of proceeding.

Plymouth.—Her Majesty's frigate *Warspite*, Captain Lord John Hay, arrived on Monday in the Sound, 18 days from New York. She brought the body of Sir C. Bagot, the late Governor of Canada, which has been conveyed to Liverpool.—The Breakwater Lighthouse, which will prove an important addition to the public works in this port is fast approaching to completion. During the past week the third story of the building was completed, including the oil-room, the store-room, and the living-room. The fourth room, which will be the sleeping apartment, is in a forward state, nearly the whole of it being dry set at the Breakwater quarries at Oreston.

Stafford.—The local papers mention the severe losses which the malignant influenza has produced in this county and in Shropshire. Mr. Taylor, of Thibberton, near Newport, occupying a farm under the Duke of Sutherland, has lost or been obliged to kill, since July last, upwards of 50 head of cattle, suffering from this complaint, exclusive of the loss he has sustained by forcing others into the market from fear of contagion. The skill of the most experienced veterinary surgeons is said to be completely baffled by this destructive disease.

Warwick.—Earl Spencer, at his estate at Wormleighton, for some time past, has kept all the poor in the parish, so that the inhabitants are not troubled with poor-rates. His lordship allows his labourers in the winter 9s. a week if out of employment. The men are employed on his Lordship's estate hedging and ditching, &c., with a house, for which each pays a nominal rent of 1s. per annum.

Windsor.—Capt. Thomas Fernyhough, formerly of the Staffordshire Militia, and now on half-pay in the 40th Regiment, has been appointed Governor of the Military Knights in the room of the late Capt. Cumming. Captain Fernyhough entered the army in 1799, and was appointed one of the Military Knights of Windsor in 1837.

Railways.—The following are the receipts of the principal lines for the past week:—Birmingham and Derby, 1,277*l.*; Eastern Counties, 2,607*l.*; Edinburgh and Glasgow, 2,098*l.*; Grand Junction, 7,297*l.*; Great North of England, 1,419*l.*; Great Western, 15,179*l.*; Hull and Selby, 1,262*l.*; Liverpool and Manchester, 4,846*l.*; Birmingham, 17,252*l.*; Brighton, 3,480*l.*; Croydon, 305*l.*; Greenwich, 1,706*l.*; Blackwall, 1,220*l.*; South-Western, 6,562*l.*; Manchester and Birmingham, 3,588*l.*; Manchester and Leeds, 5,449*l.*; Midland Counties, 2,776*l.*; North Midland, 4,311*l.*; South Eastern, 2,282*l.*—A special general meeting of the Brighton Company was held on Friday at the London Tavern, Mr. J. Harman in the chair, for the purpose of electing ten persons as the future Directors of the company. The meeting was one of the largest of the season, and appeared to excite considerable interest. Mr. Bennett, of Brighton, moved that in the opinion of the meeting the appointment of the new directors should be well considered prior to their appointment, and that the names, addresses, and number of shares held by each of the candidates, should be sent to every shareholder previous to the election, and the meeting be adjourned to some future day. After some discussion on this motion several gentlemen were put in nomination, and a proposal for proceeding to the poll was taken as an amendment, when the latter was carried by a majority. Mr. Earle, the representative of the Liverpool shareholders, making use of a large number of proxies. Considerable discussion, of a noisy and desultory nature ensued; until at length, while the poll was proceeding, exception was taken to the Liverpool proxies, on account of their not being stamped. It was then agreed upon that the meeting be adjourned and the objection referred to the decision of counsel. The adjourned meeting was held on Monday, when the chairman laid before the meeting the opinion of Sir William Follett, Sir Frederick Pollock, and of Mr. Waddington. It stated "that proxies were instruments of procuration, and, as such, required to be stamped; that the chairman ought to reject these proxies, and declare the result of the poll according to the majority of the votes of the proprietors who were actually present, and who voted on the occasion; and that it was now too late to adjourn for the purpose of having the proxies stamped; and that nothing now remained but to declare the result of the scrutiny." The chairman, then, in conformity with the advice of counsel, gave the result of the votes which had been polled on behalf of the candidates who had been put in nomination on Tuesday last. They were as follow:—For Mr. Parsons, 2,561 votes; Mr. Gilbert Henderson, 2513; Mr. Nash, 1,935; Mr. Rowland Hill, 1,939; Captain Kelly, 1,995; Sir John Simpson, 1,210; Mr. Crowley, 1,844; Mr. Wigan, 1,552; Mr. Entwistle, 1,339; Mr. Watson, 1,213; Mr. Ellis, 1,200; Mr. Cooper, 1,028; Mr. Lee, 991; Mr. W. Smith, 983; Mr. Thompson, 849; Captain Heaviside, 666; Captain Hotham, 104; Mr. Flood, 374; Mr. Mansfield, 86. The Chairman then declared the ten gentlemen at the head of the list duly elected, all of whom, with the exception of Mr. Watson, were nominated by the northern deputation.—At the special meeting of the Taff Vale Company, a committee was appointed to inquire into the serious allegations made both against the

general conduct of the directors and the jobbing carried on by several of them connected with the contracts of the Company for coke and other articles necessary in the working of the line.—The annual general meeting of the Dundee and Arbroath Railway Company was held at Dundee, on the 7th inst., at which, after some discussion, a resolution was passed declaring a dividend at the rate of 2½ per cent. per annum for the last two years. The directors regret, in their report, to be obliged to state that, in common with almost every railway in the kingdom, this Company had suffered severely in consequence of the depressed state of trade and commerce. The deficiency in the revenue derived from passengers this year, when compared with last, amounts to no less a sum than 1,219*l.*

IRELAND.

Dublin.—A meeting of the Irish Conservative Peers and Members of Parliament was held at the Earl of Wicklow's on the 17th inst., at which it was unanimously resolved—"That this meeting deeply deplores the present alarming state of Ireland. That they consider the multitudinous assemblages now taking place in various parts of Ireland to be dangerous to the public peace, and calculated to create well-founded terror in the minds of her Majesty's well-disposed subjects of all classes in that country. That in consequence the ordinary occupations of the population are suspended, and the public mind kept in a state of painful and dangerous excitement. That under these circumstances the undersigned noblemen and gentlemen feel it to be their duty to declare, individually and collectively, their anxious desire and firm determination to use their best exertions, in co-operation with her Majesty's Government, for the purpose of upholding the law, preserving the public peace in that part of the United Kingdom, and allaying that dangerous excitement to which they have referred." Signed by the Marquesses of Downshire, Thomond, and Ely; the Earls of Devon, Wicklow, Clare; and 44 other noblemen and Members of Parliament.—A great meeting of Conservatives and Protestant Loyalists, convened by the Metropolitan Conservative Society for the purpose of entering their protest against the existing Repeal agitation, was held last week in Dublin, at which numerous resolutions condemning the agitation, and pledging the meeting to co-operate with the Government in suppressing it, were unanimously passed.—The weekly meeting of the Repeal Association took place on Monday. An American clergyman addressed the meeting, and suggested an appeal to force. Mr. O'Connell said he could not too strongly repudiate anything in the shape of an incentive to force. In the great popular struggle the people relied upon the legal and peaceable assertion of their demands for justice. They contemplated no other means; and it was his conviction that they would succeed by those means. He totally repudiated the contemplation of any other. At the close he announced the rent for the week to be 3,103*l.* 7s. 6*d.*, amidst protracted cheering.—The Lord Chancellor has suddenly left for England, and a number of rumours are afloat as to the cause, the most current of which is, that his Lordship leaves for the purpose of resigning the Great Seal of Ireland.—At the Commission on Tuesday, Robert Lindsay Crawford was indicted for having returned from transportation. The original record of conviction of Lindsay Crawford, in London-derry, 1827, for horse-stealing, was proved. The case turned on a question of identity. It was admitted that the father of the prisoner had been transported; but he had been subsequently pardoned and brought back, and died in Scotland, after he had commenced the prosecution of his claim to the Crawford peerage. It was admitted that the prisoner had been in New South Wales, where it was alleged he had gone voluntarily, and whence he had returned to advance his claim to the peerage on hearing the death of his father. After a long trial the prisoner was acquitted.

Cork.—On Thursday week the Lightning, Government steamer, with Rear-Admiral Bowles, arrived, and soon afterwards his flag was hoisted on board her Majesty's ship *Malabar*, under a salute from the other vessels of war in the harbour. The Cyclops steamer has also arrived, and the following vessels, it is stated, are ordered to that station:—Caledonia, 120; St. Vincent, 120; Vanguard, 80; Inconstant, 36; Tyne, 28 guns. The Dublin papers add—"The official order for the assembling of the squadron states that it is for special service."

Clare.—The great Repeal meeting of this county took place on Thursday week on the race-course of Ballycoree. Mr. Cornelius O'Brien, M.P., presided, and no less than 700,000 persons are said to have been present. At the dinner in the evening Mr. O'Connell spoke at great length. He said, "The Queen made no such declaration as Sir E. Sugden attributed to her. As to the Queen's declaration, somebody had the kindness to communicate to me—although, mind, I do not say she knew it would be done—that her Majesty made no such declaration, and for which I am truly grateful. He had it from her own lips, and I have it from him, who heard her declare in his presence, that she never authorized Peel to make such a declaration. I want to know now who is the loyal man—Peel, who calumniated his amiable and lovely Sovereign, or the agitator, Daniel O'Connell, who would die for her? It is utterly impossible that the Irish people—so determined—so animated—so well instructed in political knowledge—so schooled in adversity—so taught by misfortune—a people who know what an Irish Parliament achieved before—can be conquered by their enemies." Dr. Kennedy, the Catholic Bishop, then addressed the meeting. He said, "Mr. O'Connell's only crime is, that loving his unhappy country more than he loves himself, his family, and his kindred, he has fearlessly exposed to her, and to the execration of the world, the true causes of

her unparalleled misery, points to its only remedy, and dares to lead the way to its peaceful attainment. As to the practicability of the Repeal of the Legislative Union, and of the re-establishment of a national Parliament in Ireland, I will only say, gentlemen, that if I did not firmly believe that, under the guidance of Mr. O'Connell, they can be achieved without blood, without crime, and without the slightest prejudice to our allegiance to our beloved Sovereign, you may rely on it I would not be a party to the present agitation for their attainment."

Law.

HOUSE OF LORDS.—Appeals and Writs of Error.—The Monomania Question.—The Judges, consisting of Lord Chief Justice Tindal, Justices Pattison, Williams, Coleridge, Wightman, Erskine, Maule, Colman, and Barons Parke, Gurney, and Rolfe, attended the House of Lords on Monday, to answer certain questions which had been put to them respecting the law in cases of monomania. The questions were in the following form:—"1. What is the law respecting alleged crimes committed by persons afflicted with insane delusion, in respect of one or more particular subjects or persons; as, for instance, where at the time of the commission of the alleged crime, the accused knew he was acting contrary to law, but did the act complained of with a view, under the influence of insane delusion, of redressing or revenging some supposed grievance or injury, or of producing some supposed public benefit? 2. What are the proper questions to be submitted to the Jury when a person, alleged to be affected with insane delusions, respecting one or more particular subjects, or persons, is charged with the commission of a crime (murder for example), and insanity is set up as a defence? 3. In what terms ought the question to be left to the Jury, as to the prisoner's state of mind at the time when the act was committed? 4. If a person under an insane delusion as to existing facts commits an offence in consequence thereof, is he thereof excused? 5. Can a medical man, conversant with the disease of insanity, who never saw the prisoner previously to the trial, but who was present during the whole trial and the examination of all the witnesses, be asked his opinion as to the state of the prisoner's mind at the time of the commission of the alleged crime, or his opinion whether the prisoner was conscious, at the time of doing the act, that he was acting contrary to law, or whether he was labouring under any, and what, delusion at the time?" Mr. Justice Maule, who differed from the rest of the Judges, first delivered his opinion; but the extremely low tone in which he spoke, rendered it impossible to hear more than a few broken phrases of his speech. He was understood to say, that he regretted being called on to deliver his opinion, without having the advantage of hearing the case argued by counsel. The unsoundness which was to excuse any man for the commission of a crime ought to be that which had long rendered him incapable of knowing right from wrong. The question put to the Jury in such a case was simply that of guilty, or not guilty; but in asking how that question was to be presented to the minds of the Jurymen, it was necessary to know the state of facts in respect of which that question arose, and these facts must be presented to the Jurymen, and they must be asked whether on those particular facts they believed him, before the commission of the act for which he was indicted, and at the moment of its commission, to have been incapable of distinguishing between right and wrong. There were not any particular terms in which this question ought to be put to the Jury. As to receiving the evidence of medical men who had not known the inculpated party before the trial, but who had heard all the evidence on that trial, and who gave their scientific opinion on such evidence, he was understood to be of opinion that such evidence was properly admissible, and that he looked upon that course as having been properly taken by the Lord Chief Justice Tindal, and Justices Williams and Coleridge, at the Central Criminal Court, in the case of *M'Naughten*.—Lord Chief Justice Tindal then read the opinions of the other Judges. He said that their Lordships would have preferred not to enter into a discussion of this kind, when they considered the extreme difficulty of applying to cases, of which the facts were not judicially before them, the abstract principles of the law. There must be every possible shade of difference of facts in each case, and as it was the ordinary duty of the Judges to go upon the facts, and after hearing the arguments of counsel, they could not but feel that it was dangerous to the administration of justice to make, without these aids, any minute application of the general principles of the law. They therefore confined themselves here to giving an answer to the abstract questions proposed to them by the House; and as all but his learned brother Maule were agreed in the answer they intended to give the House, they deemed it unnecessary to give their opinions *seriatim*, and they had therefore desired him (Lord Chief Justice Tindal) to express their opinions to their Lordships. The first question which the House had called on them to answer was—what was the law respecting an alleged crime committed by a person affected with an insane delusion, in respect of making him liable for his acts where he knew that he was acting contrary to law, but where he did the act complained of with the view of redressing some grievance or injury, or of producing some public benefit? In answering that question, the Judges assumed that the inquiry was confined to those persons who laboured under a partial delusion; and they were of opinion that, notwithstanding the party did so act with the view of redressing some injury, or producing some public benefit, he was punishable according to the nature of the crime committed, if he knew that he was acting contrary to the law—by which expression they understood to mean the law of the land. The second question was—what was the proper question to be left to the Jury, in respect of a person labouring under an insane delusion, and such delusion was set up as a defence to the indictment? The third question was—in what terms ought the question to be left to the Jury, where the unsoundness of mind appeared in the course of the trial? The Judges thought that these two questions ought to be answered together, and their opinion was that the Jury ought to be told that every man was presumed to be of sane mind, and in possession of sufficient reason to be responsible for his acts, till the contrary was proved; and that to establish a defence on the ground of insanity, it must be proved that the party was labouring under the defect from such a disease of the mind as not to be in a state to know the nature of the act, or, if he knew the nature of the act, then not to know whether he was right or wrong in the doing of it. The ordinary mode of putting this question had been—whether the party had been capable of understanding the difference between right and wrong. This was certainly not so accurate a mode of putting the question, as if the jurymen were asked whether the party knew the difference between right and wrong in the very act with which he was charged by the indictment. If the question was put with the expression, knew whether what he was doing was right or wrong according to the law of the land, the Judges thought that such mode of expressing the question might confound the Jury, who might think that the party must be shown actually to know the law. But such an impression would be erroneous, for the law was necessarily administered upon the principle that every man must be taken to know the law. If the party was conscious that the act he was engaged in performing was one which he ought not to do, he ought to be punished for doing it. The sole course to be adopted, therefore, was to settle the question whether, at the time of doing the act, he knew that what he was so doing was wrong. This mode of putting the question would be correctly accompanied with such observations as the particular case required. The fourth question was, if the person was under an insane delusion only as to the existing case, what consequence ought to follow—ought he to be thereby excused? The answer to that

question must depend on the nature of the delusion. But making the same assumption as before, that he was labouring under a partial delusion, and was not in other respects insane, he must be considered the same, with respect to his responsibility, as if the fact on which he entertained the delusion was a reality. Thus, if he thought that another man was about to take away his life, and he killed that man in what he believed to be self-defence, he would be free from liability to punishment. If, on the other hand, he killed a man in revenge for an injury which he believed that man to have committed towards him, he would be liable to it. The fifth question put to the Judges was, whether medical men conversant with the subject of insanity, who never saw the person till the time of the trial, could be asked their opinion upon the facts they heard deposed to in evidence, as to the state of the mind of the prisoner at the time of committing the crime, so as to say whether at that time he was in a state to know whether he was acting contrary to law, knew the difference between right and wrong, or whether he was labouring under any delusion which prevented him from knowing it? The Judges were of opinion that a medical man could not, in strictness, be asked a question in the terms above stated; for each of those questions involved the determination of the questions of fact deposed to by the witnesses, and which were therefore fit only for the decision of the Jury, and could not be made a question of science. But whenever a question of science could be put without involving the decision of questions of fact, it might be convenient to put the question in that form, though it could not be so done as a matter of right.—Lord Brougham said that the opinions of the learned Judges, and the very able manner in which they had been presented to the House, deserved the thanks of their Lordships. Mr. Justice Maule had expressed his regret at not having heard these questions argued by counsel. Generally speaking, it was most important that, in questions put for the consideration of the Judges, they should have the great assistance afforded them by an argument by counsel. But it was plain that the House had authority to call on the Judges to answer in this way abstract questions of law, the answers to which might assist their Lordships in their legislative duties. This had been done in the memorable instance of Mr. Fox's bill on the Law of Libel, where, before passing that bill, the House had called on the Judges to give their opinions on the matter of the existing law. In the present instance he observed that ten of the learned Judges agreed, and one of them differed. It seemed to be understood that when they all agreed, their joint opinion should be delivered by one of their number; but he trusted that that was not always to be the case, for the House then lost the advantage of knowing the individual reasons which influenced each learned Judge to form a particular opinion.—Lord Campbell expressed his satisfaction that the noble and learned Lord on the woolsack had carried into effect his desire to ask the Judges to answer these questions. These questions indeed, though apparently mere abstract questions, resolved themselves into the pure law of England, and it was fit that the opinions of the Judges should be asked upon them, for the settling of them was not a mere matter of speculation to their Lordships, who might be called on in their legislative capacity to change the law. It would be desirable to have such questions argued at the bar, but that course could not always be pursued where the House required the assistance of the Judges to determine what was the law. His noble and learned friend had stated one instance where the opinions of the Judges were taken in this manner; but there was even a more recent instance, the Judges having been summoned in the case of the Canada reserves, to express their opinion on what was then the law on that subject. He rejoiced in the course which had been pursued. The answers given by their Lordships were most highly satisfactory, and would be of the greatest use in the administration of justice.—Lord Cottenham concurred in the expression of their Lordships' thanks now given to the Judges. It was true that the Judges could not be required to say what would be the construction of the bill not in existence as a law, but they ought to be called on to assist their Lordships in declaring their opinions upon abstract questions of existing law.—Lord Wynford had never doubted that their Lordships possessed the power to call on the Judges to give their opinions upon questions of existing law, proposed to them as these questions had been. He had himself, when Lord Chief Justice of the Common Pleas, communicated to the House the opinions of the Judges on questions of this sort, framed with reference to the usury laws. Upon the opinion of the Judges thus delivered to the House by him, a bill had been founded, and had afterwards been passed into a law.—The Lord Chancellor entirely concurred in the opinion given by other noble and learned Lords, and for himself thanked the Judges for the attention and learning with which they had answered the questions.

VICE-CHANCELLOR'S COURT.—(Before Sir L. Shadwell.)—*Ashtell and Others v. Mitchell and Others.*—Mr. Stuart moved, on behalf of the defendants, who were certain freemen of the borough of Leicester, to dissolve an injunction granted against them on the 24th of April last, by which they were restrained from digging or breaking up, or parceling out in plots of garden ground, a certain allotment of land in the parish of St. Mary, near the town of Leicester, which had been allotted under an inclosure act, passed in the 44th year of George III., to the freemen and widows of freemen (during their widowhood), in respect of their rights of common of pasture for horses and oxen, after the mowing of the crops, upon certain open common fields called the South-fields and Burgess-meadows, or from otherwise dealing with the allotment in such a manner as to interfere with the occupation thereof as a common of pasture. The inclosure act, after reciting that it would be a great public utility and a general advantage to the persons entitled to the right of common in the open fields and meadows, if a plot or parcel of land were allotted to them in the fields in lieu of their common rights of pasture thereon, respectively appointed commissioners, who were to make an allotment to the freemen and freemen's widows resident in the borough, of so much of the South-fields as in the judgment of the commissioners should be a full equivalent and satisfaction for their rights of common, whereupon their rights of common respectively over the South-fields and Burgess-meadows were to cease for ever and be extinguished, except upon the allotment made to them by the commissioners. The act next provided, that if any part of the allotment made to the freemen and widows should consist of land capable of improvement in the judgment of the commissioners, under sloughing and draining, that it should be properly drained and sloughed, and afterwards fenced out with good oak rails, and protected with a ditch of proper depth and width, and a quickset hedge. The management of this allotment was entrusted by the act to a body of deputies who were to be annually elected from the freemen and freemen's widows, and were empowered to make rules and orders, "as well for the draining, sloughing, culture, and disposition of the crop, and laying down and sowing of grass, or other seeds," upon the allotment, as for limiting the number of cattle to be kept therein, and the prevention of any improper kind of cattle being admitted, and for regulating the times in each year that the allotment should be stocked, and the general management of the common plot, as should appear to them most proper for the advantage of the persons occupying it. Under the provisions of this act the commissioners made their award in the year 1821, allotting to the freemen and widows a plot of land containing about 124 acres, which was immediately laid down in grass, and had been ever since enjoyed by the freemen as a common of pasture, subject to the management of the deputies annually elected. This mode of occupation continued without interruption until January last, when a scheme which had been entertained for some time among the freemen was matured at a meeting of the freemen and widows held at the Townhall, for breaking up the greater part of the allotment into plots of about 500 yards each in length, one of which was to be assigned to each freeman, or freeman's widow, for a garden, and a rent of 1s. paid for every 100 yards, to create a fund to be applied to the

advancement of loans to the freemen and widows without interest the purchase of more land when convenient, and the accumulation of a fund to be directed to the foundation of an educational or charitable institution for the benefit of freemen and freemen's widows of the borough and their children. The affidavits represented that there were about 1,600 freemen and widows of freemen resident in the borough, but that the right of depasturing cattle on the allotment had been rarely exercised by reason of a vast majority being too poor to keep commonable cattle. The scheme therefore of parceling out the allotment in gardens was warmly advocated by 1,429 of the resident freemen and widows, and a plan so benevolent in its object, and so generally beneficial to the body of freemen, was opposed only by about 170, who insisted that whatever the object might be it was contrary to the strict letter of the act of Parliament; and therefore they instituted the present suit to restrain the proceedings by injunction. The argument turned entirely upon the construction of the various clauses of the enclosure act; the learned counsel contending that the deputies were sufficiently authorized under the terms employed in the act, with regard to "culture," "laying down and sowing," and "sowing with grass and other seeds," and especially under the provision which entrusted them with "the general management of the common plot as should appear to them most proper for the advantage of the persons occupying the same," to cultivate the allotment in gardens in conformity with the wishes of nearly the whole body of resident freemen and widows having rights upon it.—Mr. Bethel and Mr. Phillips supported the injunction, but were not called on to address the Court.—The Vice-Chancellor said, he entertained no doubt upon the legal question, and therefore it was the duty of the Court to interfere by injunction to preserve the property until the hearing of the cause. His Honour then read the recital of the act with regard to the rights of the freemen on the common fields, and the declaration that after the allotment by the commissioners in lieu thereof the right should cease; and observed that the obvious meaning of the Legislature was to take away certain pieces of land from the freemen and freemen's widows over which they formerly enjoyed rights of common, and to give them a piece of land in lieu thereof, over which they should continue to exercise a right of pasture. The clause relating to the oak-rails and ditch, with which the allotment was to be surrounded, sufficiently showed an intention to fence it in such a way as to secure to the freemen and widows the right of pasturage. And looking at the other parts of the Act, His Honour thought, that generally speaking, it had by words, which were incidentally as well as expressly used, sufficiently shown what was the view the Legislature took of the matter, and especially in the powers given to the deputies, to consider the allotment as a piece of land given to secure to every freeman his right of pasture which he had given up. The only question was, whether this allotment of land could be legally used for garden-ground. The Act of Parliament enabled the deputies to make rules and regulations for draining, sloughing, culture, sowing, cropping, and disposition of the crop, and laying down and sowing with grass and other seeds the allotment to be made. But the whole of the Act must be taken together; and the latter section meant, that if there should be a cropping or disposition of the crop, the land was to be so laid down as to be fit thereafter for pasturage. The "sowing with grass and other seeds" might be applicable to sowing with clover and barley, but it did not mean to apply to such sowing as would render the ground unfit for pasture; and if the deputies would point out some certain mode of garden-culture, by means of which, if a crop were taken off the land, it would still be fit for pasture, the Court would listen to their case. Attending to what the right was, as defined by incidental and express words of the Act, he was of opinion the Legislature never intended the land to be used as garden-ground. If any new method of culture could be suggested from the reading of the Georgics at Leicester, to show that the land would not be destroyed for pasturage, he should be glad to hear it; but at present he felt it his duty to continue the injunction, with some slight alteration, and refuse the present application with costs.

COURT OF EXCHEQUER.—(*Custom House Frauds*).—*The Attorney-General v. Dean.*—This was an information filed at the instance of the Customs Department against the defendant, who is one of the firm of Dean, Candy, and Co., foreign silk merchants, carrying on an extensive business in Watling-street. The proceeding was founded on the same transaction which formed the subject of an information against Mr. Candy, which was tried at the sittings after Easter Term, and then reported in this Paper. The evidence in the present case occupied two days, but the facts differed little from those of the former trial. The Jury returned a verdict for the Crown, damages 2,000l.

COURT OF COMMON PLEAS.—*Gregory v. the Duke of Brunswick and Another.*—It will be remembered that in February last the bills of Covent Garden Theatre announced the appearance of Mr. Gregory, the proprietor and editor of the *Satirist* newspaper, in the character of *Hamlet*. Mr. Gregory accordingly appeared in that character on the 13th February, and in consequence of the uproar of dissatisfaction which greeted his appearance, the curtain was dropped at the end of the second act. Mr. Gregory subsequently alleged that the uproar had been caused by hired persons, who had been sent into the theatre by the Duke of Brunswick and other parties, for the purpose of hissing him, on account of feelings of anger they entertained towards him for certain articles published in the *Satirist*, and he subsequently instituted this action against his Highness and Mr. Vallance, his solicitor, to recover damages against them for the injury he had sustained in consequence of being deprived of the opportunity of realising the profits which he expected to obtain from the calling of an actor. The cause came on for trial on Tuesday, and occupied the whole of that and the following day. Several witnesses were examined on the part of the plaintiff, among whom were Lord Gardner, the Earl of Belfast, Lord Adolphus Fitzclarence, Lord Beaumont, Count Bathany, the Earl of Errol, Mr. Bunn, &c. The chief object of their evidence was to substantiate the fact that the plaintiff was a good actor, in addition to which, Lord Gardner, Belfast, Fitzclarence, and Beaumont, declared their belief that the wives and daughters of the audience have nothing to do with the private character of an actor. Mr. Serjeant Talfourd replied in a powerful speech, addressing himself particularly to this doctrine, and declaring that the opposition to Mr. Gregory's appearance arose not from conspiracy, but from a strong public feeling against him as a libeller for hire. The Lord Chief Justice summed up, and the Jury returned a verdict for the defendants. The result was received with loud cheers by a crowded Court, which the Chief Justice suppressed, desiring the parties to recollect that they were not then in a theatre.

CENTRAL CRIMINAL COURT.—*Giuseppe Anzopardi*, convicted at the last session, under the commission, of the wilful murder of Rosa Sluyk, a Dutchwoman, at Smyrna, was placed at the bar. An interpreter having been sworn, the clerk of the arraigns informed the prisoner that he had been found guilty of the crime of wilful murder, and asked him if he had anything to say before sentence of death was passed on him. The prisoner said that there were witnesses at Smyrna who could have disproved the charge against him, but they were not allowed to come. Mr. Baron Gurney said that no such intimation had been made upon his trial; had there been, it would have been attended to. His counsel had upon his trial taken an objection, on the ground that his case did not fall within the provisions of the act of Parliament under which he had been tried, he, a British subject, having committed a murder in a foreign country, on a person who was not a British subject. He (Baron Gurney) had reserved the case for the consideration of the learned Judges. The Judges had met and had considered it fully, and they were all of opinion that it fell within the statute; the objection was therefore overruled. He (the prisoner), a British subject, living under the protection of the British Government, was subject to the laws of

Great Britain, and he had offended against those laws by the murder he had committed. Sentence of death was then passed.

JAMES GEORGE HOWSE AND W. CORNELIUS FULLER were indicted with having feloniously stolen a plate-chest, value 21l., containing 54 silver dishes, value 354l., a dozen plated plates, value 12l., a quantity of silver forks, a silver box, and other articles, the property of the late Lord Fitzgerald. There were nine other counts in the indictment, laying the property in other parties. The particulars of the case have already been given in this Paper. The only additional evidence was that of a man named Dignum, who was well known as an attorney defending persons charged with what are called "put up" felonies, who was now confined in prison for debt, and on whom Howse had called in his Lordship's gig at the prison, and asked him if he could recommend any one who could dispose of some plate for him. Dignum had answered that he knew no one who could be trusted in such a matter, and advised Howse not to attempt it. Howse, however, had persisted, as he wanted to make some provision for himself. The Jury returned a verdict of Guilty against Howse, and acquitted Fuller. Mr. Baron Gurney then proceeded to pass sentence. He said, that after a long and patient investigation, the Jury had been compelled to find him guilty, and he must say, that of all the catalogue of crimes of a similar nature which he had ever met with, he considered this the worst. The sentence of the Court upon him was, that he be transported for 15 years.

POUNDS.—A case nearly parallel with that of the Steinberg tragedy, which took place some years ago, was brought under the consideration of the magistrate at Queen-square, on Monday. —*James Abberdine*, a man between thirty and forty years of age, having his head bound up with plaster, and his hands covered with blood, was placed at the bar, charged with having, on that morning, attempted to murder his son, a boy eight years old, and his daughter, an infant of two years of age, and also to destroy himself. It appears that he has for years past been labouring under an impression that he would, sooner or later, come to poverty, and has, under that dread, twice before attempted self-destruction. About five years since he was observed to be in a desponding state of mind, but apparently harmless. One morning he was discovered in the water-butt, which was nearly full, his head downwards; and when got out, it was with difficulty he was brought to a sense of consciousness. He has from time to time declared to his wife his determination of destroying himself and children, and thus prevent the possibility of their ever coming to want. On Monday, he attacked his wife and children with an axe, fractured the skull of the boy, and severely injuring the others. They were removed to Westminster Hospital, and are likely to recover. The prisoner has been remanded for further inquiry.—Another case of the same kind, but attended with fatal results, occurred at Greenwich on Thursday. A man named *Mee*, a fisherman, murdered his wife, and afterwards destroyed himself by cutting his throat with a razor. He had for some time been considered to be insane.

SPORTING.

ASCOT HEATH RACES, FRIDAY.—*The Dinner Stakes*, of 400 sovs. each, 11 ft. for three-year-olds. 12 subs. Mr. Wreford's c by Bay Middleton out of Margellina, walked over.

The Wokingham Stakes (second class), of 5 sovs. each. Three quarters of the New Mile. 15 subs. Lord Chesterfield's Dilbar, 4 yrs, 8st, beat Lord Exeter's Albion, 4 yrs, 7st 5lbs, Mr. King's Dahlia, 6 yrs, 6st 9lbs, and six others.

A Plate of 50l., given by the members for Windsor, added to a sweepstakes of 5 sovs. each: two-years, 7st; three, 9st 2lbs; fillies and geldings allowed 3lbs; the winner to be sold for 200l., &c. Three quarters of a mile. 7 subs. Mr. Braithwaite's f Gaity by Touchstone, 2 yrs, beat Lord Exeter's Antidote (Galata colt), 3 yrs, Mr. Booth's Donnybrook, 3 yrs, and three others.

The Wokingham Stakes (first class) of 5 sovs each. 15 subs. Mr. J. Garrad's Dromedary, 6 yrs, 7st 1lb, beat Lord Exeter's Wee Pet, 3 yrs, 6st 12lbs, Mr. M. Dilly's Temerity, and 6 others.

Sweepstakes of 10 sovs each, with 50 added: for three-year-old colts, 8st 7lbs; fillies, 8st 3lbs. The winner to be sold for 500l., &c. Old mile. 5 subs. Mr. Stephenson's f by Gladiator, out of elegance beat Mr. J. Megson's Vitellius, and three others.

The Selling Stakes of 5 sovs each, with 50 added: three-year-olds, 7st; four, 8st 4lbs; five, 8st 10lbs; six and aged, 9st. Winners once this year, 3lbs; twice, 5lb extra. The second to receive 10 guineas out of the stakes. The winner to be sold for 150 sovs. Old mile. 9 subs. Mr. S. Scott's Windsor, 5 yrs, beat Mr. Pettit's Ends and Odds, Mr. Stanborough's c by Glaucus, and 4 others.

MARK LANE, FRIDAY, June 23.—There have been but few arrivals of English Wheat since Monday, and in consequence of fine weather, our prices have declined 1s. from that day. In Foreign the business has been very limited, and in some instances 1s. less has been taken; the fresh arrivals of bonded are down 2s. per qr. Barley, Peas, and Beans remain as on Monday. The Oat-trade is firm in prices, but not much business doing.

GAZETTE OF THE WEEK.

INSOLVENT.—W. Towney, 5, Church-row, Aldgate, carriage broker. **BANKRUPTS.**—J. Watkins, 65, Exmouth-street, Clerkenwell, draper.—C. States, Southampton, hotel-keeper.—F. Murky, Peterborough, Northampton, common-brewer.—C. Clark, 3, Tower-street, Westminster, dealer.—J. L. Gray, Napper, 43, Upper Stamford-street, Blackfriars, general-dealer.—J. L. Gray, 50, Jermyn-street, St. James's, tailor.—R. Burton, 27, Wood-street, Cheapside, silk-warehouseman.—J. Rowe, 7, Blandford street, Marylebone, ironmonger.—A. Carter, 70, Lower Thames-street, City, ship-broker.—J. Atkins, Birmingham, jeweller.—W. Cooke, Bradford, Yorkshire, worsted-spinner.—G. W. Fray, Sheffield, jun., R. B. Allen, Farmhamby, Yorkshire, luncheon.—R. Waddington, Boston, Yorkshire, grocer.—T. W. Daville, Sheffield, stage-coachman.—J. Frost, Bristol, baker.—J. Harford and W. W. Davies, Bristol, and Esby Vale and Sahwy, Monmouthshire, ironmasters.—T. Huxley, Tunstall, Staffordshire, tailor.—J. L. Bennett, Shropshire, chemist.—R. Price, Waterloo, Lancashire, dealer in coals.—R. Brown, Snodland, butcher.—J. Mee, Wellingborough, Northamptonshire, baker.—T. Hobbs, Nottingham, Oxfordshire, potter.—A. Elum and H. Elum, Oxford-street, ginst.—J. Baylis, jun., and James Baylis, Gutter-lane, Cheapside, crane-manufacturers.—G. Jackson, Hertford, upholsterer.—H. L. Becker and J. E. Becker, Manchester, calico-printers.—J. Ward, Derizes, Louse de-vorant.—J. Garsed, Halifax, cloth dresser and hanger.—J. Brown, Liverpool, broker. **SCOTCH SEQUESTRATIONS.**—W. M'Luckie, Large, Ayrshire, plasterer.—D. Peacock, Dundee, wood-merchant.—J. Provau, Brownknowe, Lanarkshire, farmer.—W. and T. M'Innes, Glasgow, builders.

BIRTHS.—On the 21st inst., at 14, Chesham-place, Belgrave-square, the Hon. Mrs. Hamilton, of a son.—On the 15th inst., at Trinity Lodge, near Edinburgh, Lady Campbell, of Ardenmar, of a son.—On the 17th inst., a Abercrombie-place, Edinburgh, the lady of Major-General Sir M. Bethune Bart., of Kildonnan, of a son.

MARRIED.—On the 20th inst., at Rawcliffe, C. G. Burke, Esq., second son of Sir J. Burke, Bart., of Marble Hill, in the county of Galway, to Emma Jane, youngest daughter of the late R. Creyke, Esq., of Rawcliffe Hall, Yorkshire. **DIED.**—At Paris, on the 16th inst., the Count de Mondreville, son-in-law of the Marquess of Ailesbury.—On the 20th inst., at Brickwell, Berks, the Hon. Mrs. Graves, on the 5th inst., at Haslemere, T. Dupree, Esq., of the Bank of England, in the 72d year of his age.—At his house, in Kensington, on Friday, the 16th inst., J. Hazard, Esq., Deputy-Assistant-Commissary-General, aged 55.—On the 17th inst., at his residence, Highbury-place, T. Wilson, Esq., Treasurer of Highbury College, aged 78.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

THE SUBSCRIBERS to ART-UNIONS are respectfully reminded that the ROYAL POLYTECHNIC UNION of LONDON can receive SUBSCRIPTIONS after the 1st of JULY next, to which period the SEVENTEEN FINE ETCHINGS, illustrative of the SONGS of SHAKESPEARE, on India paper, in an elegant wrapper may be obtained. The Prizes will be allotted on the 8th of July, at Eight o'clock in the Evening, at No. 5, Cavendish-square, in the presence of the subscribers.

In consequence of the Legality of this Union being questioned, a consultation has been held by eminent Counsel, who affirmed its Legality, and have themselves become subscribers. The President and other Members of the Royal Academy are also on the subscription list.

R. J. LONGBOTTOM, Hon. Sec.

AERIAL NAVIGATION.—ROYAL POLYTECHNIC INSTITUTION.—A LECTURE on this subject, illustrated by MODELS of several kinds, which elevate themselves by MECHANICAL FORCE alone, is delivered at Two o'clock daily, and on Monday, Wednesday, and Friday Evenings, at Eight o'clock. The Exhibition of the COLOSSAL ELECTRICAL MACHINE, the DIVER, DIVING-BELL, NEW DISSOLVING VIEWS, and the other varied and instructive Objects of the Institution, continues as usual. The original CRAYON DRAWINGS, from the CARICONS at HAMPTON COURT, by the late Mr. HOLLOWAY, with numerous other WORKS of ART, have recently been placed in the Gallery. Admission, One Shilling; Schools, Half-price. Open Mornings and Evenings, except Saturday Evening.

IMPORTANT INFORMATION.

DR. ROBERTS'S CELEBRATED OINTMENT, called the POOR MAN'S FRIEND, is confidently recommended to the public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs, if of 20 years' standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, cancerous humours, &c., and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1s. 1d., and 2s. 6d. each. Also his

PILULE ANTISCROPHULÆ,

confirmed by more than 40 years' experience to be, without exception, one of the best alterative medicines ever compounded for purifying the blood and assisting nature in all her operations; hence they are useful in scrofula, scorbutic complaints, glandular swellings, particularly those of the neck, &c. They are efficacious also in rheumatism, and form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1s. 1d., 2s. 6d., 4s. 6d., 11s., and 22s. each.

To those who cannot take pills, the proprietors would strongly recommend Dr. Roberts's

ANTISCROBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic complaints; they strengthen the constitution, purify the blood, and promote a circulation of the fluids; are gentle in their operation, and do not require cessation from business. In bottles at 2s. 6d. each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT (who have been confidently entrusted with the preparation of his medicine for many years past), are left joint proprietors of the "Poor Man's Friend," "Pilule Antiscrophulæ," "Larwell's Pills," "Medicated Gingerbread Nuts," and "Antiscorbutic Drops," with the exclusive right, power, and authority to prepare and vend the same.

The still increasing demand for the above medicines, from all ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to such package.

TO GARDENERS and Others, in want of Most

Desirable and Advantageous PREMISES, containing a convenient DWELLING-HOUSE, VINERY, EXTENSIVE PITS, and about TWO ACRES of LAND STOCKED WITH FRUIT-TREES in the highest state of Perfection; the south aspect is bounded by a Wall 15 feet high, exceedingly eligible for Horticultural erections. N.B. A Lease may be had if required.—Apply to ELIZABETH and JOHN WILSON, Coach Proprietors, Holloway-road, Islington.

ALL DISEASES of the KIDNEYS and BLADDER speedily and effectually cured by DR. YOUNG'S MIXTURE. The efficacy of this Medicine in the above Complaints has been long proved by its unparalleled success in a practice of many years' standing, and has induced the present proprietor to make it more generally known.

Sold in Bottles, 2s. 6d. each, by the Proprietor's Agent, J. SANGER, 150, Oxford-street, London; also by Johnson, 68, Cornhill; Prout, 229, Strand; Mr. King, 232, Blackfriars Road; and all Medicine Vendors throughout the country.

ORNAMENTAL WIREWORK FOR THE GARDEN,

390, OXFORD STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in FANCY WIREWORK, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hothouse Engines, Syringes, Fumigating Bellows, and other Horticultural Implements. G. B. Thompson's Improved Waterpots, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

LONDON'S PATENT SPADES.—These superior Spades, noticed in the *Gardener's Chronicle*, Feb. 18, may be obtained by addressing a line to JOHN SAWEN, Ironmonger, Sevenoaks. Prices 36s., 40s., and 44s. per dozen, delivered in London. A Post-office order is expected from unknown correspondents.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT ASPHALTE ROOFING.—The above material has been used and highly approved by the Nobility, Gentry, and Agriculturists generally, as a ROOFING and COVERING TO SIDE of Farm Buildings. Its advantages are—

LIGHTNESS, DURABILITY, AND ECONOMY. BEING A NON-CONDUCTOR, IT HAS BEEN PROVED AN EFFICIENT "PROTECTIVE MATERIAL" TO PLANTS,

AND IS NOW IN USE AT THE "ROYAL HORTICULTURAL SOCIETY'S GARDENS, CHISWICK."

Made in Sheets.—32 inches by 32 inches; 32 do. by 64 do.; and 32 do. by 96 do.

THOS. JOHN CROGGER, 8, Ingram-court, Fenchurch-street, London; N. TUCKETT, 163, Fore-street, Exeter; W. R. LLOYD, 12, Cherry-street, Birmingham; J. ARMSTRONG & Co., Leith; DAVID BOYD & Co., Glasgow; and SAMUEL BOARD, Bristol.

DESIRABLE RESIDENCE for an HORTICULTURIST.—A Mansion-house, fit for the residence of a genteel family; Coach-house and Three-stall Stable; situated in the village of Fulford, one mile and a half from York. The House is surrounded by Three Acres of Garden Ground, soil deep and very productive: Orchard in full bearing; Wall-fruit, Hot-house, Melon-pits, and Tanks (well supplied with water); nearly Four Acres of Meadow-Land, with a stream running through it. To be Sold, or Let by the Year or on Lease; Rent, 80l. per annum. A good Cottage adjacent may be had for the additional rent of 6l. per annum. The premises may be seen by application to JOSHUA GRAY, Esq., solicitor, High Petergate, York.

BUTTER MADE IN TEN MINUTES.

BY THE NEWLY-INVENTED CHURN. REGISTERED ACCORDING TO ACT OF PARLIAMENT. ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Metal Pans for Churns to stand in, 4s. 6d., 6s., and 7s. Larger sizes made to order. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, LEWES.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RICHY'S Brush Warehouse, No. 80, Gracechurch street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore street, Cavendish-square. Export Agents, BARNES & Co., 109, Fenchurch-street.

BULB CUCUMBER-GLASSES, for Watering by

Evaporation during the growth of the Fruit, 2s. 6d. to 3s. 6d. each; GRAPE-GLASSES, with holes, 1s. 9d. to 2s. 6d. each; BEE-GLASSES, 1s. to 2s. 6d. each. Cylindrical CUCUMBER-TUBES, from 6d. to 4s. each; PROPAGATING-GLASSES, Green, 1s. per lb.; white, 1s. 2d. per lb.; or 2s. 6d. to 24s. per dozen; FISH BOWLS, from 1s. 6d. each; ditto, with hole in bottom for Fountains, 2s. 6d. per lb., at APSLEY PELLATT'S Falcon Glass Works, Holland-street, Blackfriars. Orders from the country, accompanied with a Post-office order, will meet with prompt attention.

LITHIC ANTI-CORROSION PAINT, from its

Strength and Durability, forms an excellent coating for Greenhouses, Conservatories, and Outbuildings. Its antiseptic qualities particularly adapt it for the preservation of Wood and Iron Fences; and it may be advantageously employed upon good Brickwork, in place of stucco or other covering. Manufactured in stone and slate colours by JOHN BAZLEY WHITE & SONS, Roman and Keene's Cement Manufacturers, Millbank-street, Westminster.

CORNS, BUNIONS, &c.

THE PROPRIETOR of the ANTI-CALLOSITY, or RUSSIAN CORN AND BUNION PLAISTER, feels great confidence in recommending it as the most certain cure for all Callous Swellings on the Feet that has ever yet been invented. By the use of this Plaister immediate benefit will be found, and in a short time a Radical Cure will be effected by gradually dispersing the Hard or Soft Corn, and entirely removing those painful throbings so severely felt at every change of weather.

Sold, with full directions for use, in boxes, 1s. 1d. and 2s., at SANGER'S Medicine Warehouse, 150, Oxford-street; and all Medicine Vendors throughout the country.

Remember—"THE RUSSIAN CORN AND BUNION PLAISTER."

TONIC MILK of ORANGE, a DELICIOUS CORDIAL

and SWEETENER of the BREATH.—It warms and cheers the Stomach, creates an Appetite, digests the Food, strengthens the Lungs, clears and improves the Voice for Singing, enlivens the Spirits, dispels Nervous Debility, clears the Blood, and thus removes Pimples and Eruptions, while it combines with these admirable properties the inestimable advantage of being the most efficacious agent offered to the Public for beautifying and perfuming the Breath. It should be taken in the proportion of a wine-glass full twice a day, and is particularly recommended to GENTLEMEN on leaving home in the morning, or after smoking a Cigar, &c.; while to LADIES it will be equally grateful on going to a party or a ball, for its invigorating influence on the mind and spirits, and its purifying effect on the organs of the health.

Mrs GULLY respectfully announces to the Nobility, Gentry, and Public at large, that she has disposed of the Right, Title, and Recipe of the TONIC MILK of ORANGE to Messrs. A. ROWLAND and SONS, No. 20, HATTON GARDEN, LONDON; who have appointed Messrs. Barclays, Medicine Vendors, 95, Farringdon-street; Mr. Sanger, 150, Oxford-street; Mr. Johnson, 68, Cornhill; Mr. Prout, near Temple Bar; and Mr. Butler, 4, Cheapside, as Agents.—Half-pints, 2s. 9d.; Pints, 4s. 6d.; Quarts, 9s., Stamp Duty included.

LADIES AND GENTLEMEN, I am desirous of

gaining the Patronage of the Readers of this Journal, and trust that the system upon which I conduct my business, and the moderate prices, will gain a greater portion of confidence and support. The Improved Stamped Postage Envelopes, 1s. per doz. (without advertisements), to purchasers of other articles; Fine Bath Post, 3d. per gr., 5s. ream; do. Note, 2d. per gr., 3s. ream; Small do., 1s. per half-ream; Superfine Foolscap, 8d. per gr., 12s. 6d. per ream; and every article at corresponding prices 10 per cent. off Books and Music. On the receipt of two postage stamps, Samples and List of Prices forwarded postage-free. Purchasers of 2l. value sent free of carriage 100 miles, of 10s. 6 miles, and any amount in London free.—From SLOPER'S Stationery Warehouse, 20, George-st., Portman-square, London.

COOKING UTENSILS with SILVER

LININGS.—At a cost of about one-third more than those lined with tin, the chief advantages of the former being greater durability and cleanliness, and the impossibility of burning—viz., giving a burnt flavour to milk or any gelatinous or farinaceous article of food, the SILVER, by a recent improvement in the ELECTRO PROCESS, adheres so tenaciously to the copper, that no heat in cooking can remove it or any acids injure it. With moderate care it will last for years, and can be renewed at a moderate charge when necessary. J. L. BENHAM considers this particularly important to the Army and Navy, and to families residing abroad, where the difficulty of getting coppers properly tinned is often very great. Old articles can have the tin removed and be lined with pure silver by this process.—19, Wigmore-street, Cavendish square, London.

CAUTION.—Several Perfumers of apparent Respectability, for the sake of gaining a trifling more profit, basely attempt to impose their pernicious compounds upon the public as the real "MACASSAR OIL" for the Hair, and "KALYDOR" for the Complexion. They copy the bills and labels of the original articles, substituting either a fictitious name, or the word "GENUINE" in the place of "ROWLAND'S." To frustrate such imposition, it is necessary, on purchasing either article, to see that the word ROWLAND'S is on the wrapper, as follows, without which none are genuine. ROWLAND'S MACASSAR OIL, for the growth, and for Beautifying the Human Hair. Price 3s. 6d., 7s., or Family Bottles (containing four small) 10s. 6d.; and double that size, 21s. per bottle. ROWLAND'S KALYDOR, for the Skin and Complexion. Price 4s. 6d. and 8s. 6d. per bottle. A. ROWLAND AND SON, 20, HATTON GARDEN, LONDON, is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraved on the Government Stamp affixed on the Kalydor. Be sure to ask for "ROWLAND'S" Articles, Sold by them and by respectable Chemists and Perfumers.

PIANOFORTES.

LUFF AND CO.'S BOUDOIR PIANOFORTE,

25l., package included. LUFF & CO.'S COTTAGE PIANOFORTE, 27l., package included. For tone, touch, style, durability, and cheapness, these Pianofortes are unequalled. Warranted to keep well in tune, and prepared for extreme climates. Luff and Co.'s Patent Pianofortes equally cheap. Pianofortes from hire from 24l. Instruments taken in exchange.

Luff & Co., 103, Great Russell-st., Bloomsbury.

A REAL LUXURY for WARM WEATHER.

Gentlemen who feel the inconvenience and inconsistency of wearing the same clothing in the HOTTEST as in the COLDEST weather, are invited to inspect a new and much-improved material for SUMMER-COATS, resembling the finest Saxony cloth, incomparably lighter, equally durable, and about half the price. BERNOR'S SUMMER VENTILATING WATERPROOF FROCK will also prove well deserving the attention of all who regard a respectable and gentlemanly appearance in opposition to slang, vulgarity, and meanness.—Made only by W. BEADON, Tailor, Waterproofer, &c., 69, Cornhill (eight doors from Bishops-gate-street.)

TO NURSERYMEN, GARDENERS, and OTHERS.

—To be LET or SOLD, with immediate possession, all that well-known NURSERY GROUND and GARDENS situate in the Albion-road, Stoke Newington, with the Stock and Houses, and the Valuable Business and Connexion attached to the same, belonging to the late Mr. JOHN MILNE, recently deceased. For further particulars, apply at the office of Mr. WM. BROMLEY, Solicitor, 3, Grays-Inn-square.

WANTED.—A steady, active man to superintend a Nursery; he must be a good PROPAGATOR of Hardy Trees, Shrubs, and Herbaceous Plants. A married man upwards of 30 years of age would be preferred. Testimonials as to character and ability will be expected from respectable Nurserymen. Direct to W. H. PHILP, bookseller, Launceston.

WANTED.—A steady active young Man as WORKING FOREMAN in a Market Garden, and who will have occasionally to attend the Market. Unexceptionable testimonials as to honesty and sobriety will be required. Application, stating the amount of wages expected, to be made to S. LIVESSEY, Gardener, Burnley, Lancashire.

WANTED, on reasonable terms, for the Grounds of a Charitable Institution, a Second-hand BUDDING'S PATENT MOWING MACHINE.—Direct, post-paid, to W., Post-office, Kirkby Lonsdale.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—J. RODGERS, of middle age, married, and now residing with FRANCIS HURT, Esq., of Alderwasley Hall, Derbyshire, is ready to make an engagement as above. Can have an unexceptionable character, of 10 years' standing. Direct, till the 26th of June, to J. RODGERS, Alderwasley Hall; after that date, at Mr. SMITH'S, Nurseryman, Tansley Nursery, near Matlock.—June 8, 1843.

AS GARDENER, in a Nobleman's or Gentleman's Family.—A married Man, aged 42; can be highly recommended by his present and former employers, with whom he has lived nearly six years; has a perfect knowledge of exotic plants, and of his profession in every department.—Direct to PETER WOOD, Gardener, Loftman House, near Rochford, Essex.

AS GARDENER.—A single Man, aged 28, who has a thorough practical knowledge of the Kitchen and Flower-Garden, Greenhouse, Vinery, &c. Can be highly recommended by the Gentleman with whom he is now living.—Direct to A. B., at Messrs. CHANDLER'S Nursery grounds, Wandsworth-road.

AS GARDENER.—A single Man, aged 25, who thoroughly understands early forcing, hot-houses, greenhouse, flower and kitchen-garden, and has gained several prizes from the Horticultural Society. Can have a good character from his last place.—Direct to W. S., at Mr. SANGSTER'S, Florist, Cowley-terrace, Cowley-road, North Brixton, Surrey.

AS GARDENER.—A respectable married Man, aged 30, who is a Superior Grape-grower; thoroughly understands Pines and Forcing in general, and has a perfect knowledge of his business in all its various departments. Can have an eight years' character from his last situation, which he has just left on account of the death of his late employer.—Direct to A. Z., 40, Britannia-row, Islington.

AS UNDER-GARDENER, or single-handed.—A young Man, aged 26, who understands the management of Cows and Poultry. A single-handed place would be preferred. Can have a long-experienced character from his last situation. No objection to make himself generally useful.—Direct to G. C., at Mr. ENGLISH'S, Baker, Blissett-street, Greenwich.

AS UNDER GARDENER.—A young Man, aged 21, who has been Six years in the business. He wishes to acquire a knowledge of fruit forcing, and the practical cultivation of plants.—Direct to A. B., at Messrs. CORMACK & Co.'s, Bedford Conservatories, Covent-garden.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitechapel, in the City of London, and Published by them at the Office, 3, CHANCERY STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, June 24, 1843.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

MAGNIFICENT NEW FUCHSIA.

“FUCHSIA EXONIENSIS.”
LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised from seed in the Exeter Nursery, and which they have no hesitation in saying is decidedly the finest variety ever produced; indeed, it is at once admitted to be so by all who see it, who are struck with admiration of its noble appearance. The flowers are exceedingly large, being longer as well as broader than those of any other Fuchsia, and are of a very firm, thick, waxy substance, with the corolla of a fine violet blue colour. Plants will be ready for delivery on the 16th of August next, at 10s. 6d. each, and will be sent by post, carefully packed in tin cases. The usual discount to the trade if six plants are taken. For a full description of this Fuchsia, see Advertisement in the *Gardener's Chronicle* of the 17th ult.

500 varieties. Orders taken for the plants when in bloom, and delivered in November next. Admittance Gratis. No Admittance on Sundays. Nursery within three miles of London, Lough.

THE LIST.

Gem	Marchioness	Wheeleriana
Golden Lotus	Mennon	

ROSES.

YELLOW RHODODENDRON.

FUCHSIA ST. CLARE.—A Specimen of this Magnificent FUCHSIA has been again submitted to Dr. LINDLEY. YOUNELL & Co. have therefore much pleasure in referring the readers of the *Gardeners' Chronicle* to the remarks made, and which will be found amongst the "Notices to Correspondents" in last week's Paper, as follows.—"YOUNELL & Co.—From the specimen received, St. Clare appears to be a prolific bloomer and fine variety; we have never seen the colour so fine in any specimen of the kind."—*Gardeners' Chronicle*.

THOMAS CRIPPS, Florist, Tunbridge Wells, has a fine plant of that singularly beautiful Annual, *NEMOPHILA* "DISCOWALSIS," (which was figured in the "Floricultural Cabinet" for the present month,) to offer. The flowers of this fine variety are a beautiful rich velvety black, margined with white. Plants 2s. 6d. each, or, if requested, will be sent per post, without additional expense, on the receipt of 36 postage stamps.

additional expense, on the part of the postage stamps.

SUPERB SEEDLING STRAWBERRY—PRINCESS ALICE
MAUDE.

G. D. FISHER begs to call the attention of the Nobility, Gentry, and the Public to the above splendid **STRAWBERRY** (raised by Mr. JAS. TROLLOR, of Limply Stoke, Wilts.). It is a Hardy Strong Grover, a great bearer, with large-sized Scarlet Fruit, good shape, and fine flavor, and invaluable as an early kind being ripe at least ten days before any other Strawberry grows in the same situation; took an Extra Prize at the Bristol Horticultur. Show on June 20, 1843, and First Prize at Bath on the 22d. Strong well-rooted Plants will be ready to send out the second week in September at 3s. per 100, with the usual allowance to the Trade.

N.B.—See "Notices to Correspondents" in the *Gardeners Chronicle*, June 11, 1842.—Limpley Stoke, near Bath, June 23, 1843.

CHOBHAM AND HORSILE NURSERIES.

H. COBBETT & SONS respectfully inform their Friends and the Public that their extensive collection of Roses are now in full bloom. The **HORSILE NURSERY** is within Ten Minutes' walk of the Woking Station, South-Western Railway, where all the trains stop.

TO NOBLEMEN, GENTLEMEN, FLORISTS, and Others.

MESSRS. PROTHEROE & MORRIS are instructed to submit to Public Competition, at the Auction Mart, Bartholomew-lane, about the middle of July, 1843, at Twelve o'clock, A VERY RARE COLLECTION OF STOVE AND GREENHOUSE PLANTS, the property of a Lady changing her residence, comprising fine specimens of *EUPHORBIA SPLENDENS*, *COMBRETUM PURPUREUM*, *JASMINUM*, *SAMBAC*, *GLOXINIA PANCRATIUM*, *AMARYLLIS*, *ONCIDIUM CRISPUM*, *FLEXUOSUM*, and *LURIDUM*; *CATTLEYA CANDIDA*, *SOPHORONITIS VIOLACEAE*, and a variety of Miscellaneous Plants. May be viewed the Morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE & MORRIS are instructed to sell by Public Auction, on the premises, at COLVILL'S Nursery, King's-road, Chelsea, on MONDAY, 24th July, 1843, and following days, at Twelve o'clock (by order of the Proprietor, retiring from business), the whole of the valuable GREENHOUSE PLANTS, consisting of fine *CAMELLIAS*, of various sizes, *ERICAS*, *AZALEAS*, *PELAGONIUMS*, *HYBRID RHODODENDRON ARBOREUM*, and other Miscellaneous Plants. May be viewed one week prior to sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & Others.

TWO THOUSAND CAMELLIAS, FINE VARIETIES OF AZALEA INDICA, GREENHOUSE AND OTHER EXOTIC PLANTS.

MESSRS. PROTHEROE & MORRIS are instructed to submit to public competition, by Auction, on the premises, Kingsland Nursery, Ball's-Pond-road, about the middle of July, by order of the Proprietor, in consequence of removing to Stratford, about 2,000 DOUBLE & SINGLE CAMELLIAS, consisting of all the approved kinds, in a high state of cultivation. A choice assortment of *AZALEA INDICA*; also a collection of STOVE and GREENHOUSE PLANTS, consisting of *ARAUCARIA EXCELSA*, *CLIVEA NOBILIS*, *BONAPARTIA JUNCIFOLIA*, &c. May be viewed a week prior to Sale. Catalogues may be had on the premises; of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

DUNSTABLE, BEDFORDSHIRE.

TO AMATEUR HORTICULTURISTS, AND SPORTING GENTLEMEN.

MR. W. W. SIMPSON has received instructions from **EDWARD BURR, Esq.**, to sell by Auction at the Crown Inn, on WEDNESDAY, July the 26th, 1843, a superior detached Family Residence, situate in the pleasantest part of the town, in excellent repair, and possessing every convenience. Communicating with the house is a beautiful Conservatory, with Fountain therein, a large Forcing House, containing Vines in full bearing, (both heated by one cast-iron Hot-water Apparatus); together with a large Pleasure Garden, very tastefully laid out, and abundantly stocked with choice Shrubs and Flowers; a Kitchen-Garden in the rear, divided by a lofty brick wall, with Pine-pits and Melon-frames therein. The House contains capital Cellarage, a set of excellent Rooms on the ground-floor, and large Hall, 9 Bedrooms, Dressing-rooms, and Water-closets. The Out-Buildings consist of double and single Coach-houses, Stalled Stables for four Horses, with Harness-room attached and Loft over, Laundry, Coal-house, Piggeries, and Dung-pit. On the opposite side of the street, lying in front of the house, will be included a piece of Pleasure-ground, inclosed by an ornamental Iron-fence, and held on lease for an unexpired term of 47 years from Michaelmas next. On the same day will also be sold 290 acres of Pasture and Arable Land adjoining. The above property is well situated for any Gentleman fond of hunting, being within reach of four packs of hounds.—For further particulars apply to **MR. W. W. SIMPSON, No. 18, Bucklersbury, London.**

NATIONAL LOAN FUND LIFE ASSURANCE

ANNUITY, and DEFERRED ANNUITY SOCIETY,

26, Cornhill, London.

Capital, 500,000*l.*—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
John Elliottson, M.D., F.R.S.
John Griffith Frith, Esq.
H. Gordon, Esq.

Joseph Thompson, Esq.
AUDITORS.—Professor Wheatstone, F.R.S.
Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz:—

Entry	Policy No.	Age.	Sum.	Annual Premium	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	59	1,000	£ 67 8 4	£ 132 14 6	£ 58 19 9	£ 8 19 4
1838	114	56	3,000	£ 175 15 0	£ 296 9 7	£ 123 0 6	£ 16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

BRITANNIA LIFE ASSURANCE COMPANY,

1, PRINCES STREET, BANK, LONDON.

This Institution is empowered by *Special Act of Parliament*, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestably, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of 30, who by the payment of 5*l.* 3*s.* 4*d.* to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000*l.*, subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of eight shillings weekly in his expenditure. Thus, by the exertion of a very slight degree of economy—such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000*l.*, which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the despatch of business.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34*s.*; 20, 44*s.*; 22, 50*s.*; 24 inches, 60*s.*; 26, 75*s.*; 28, 84*s.*; 30, 105*s.* each.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5*s.* 9*d.* each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; **DR. ARNOTT'S STOVES**, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with **COTTAM'S PATENT**, or **ROGER'S BOILERS**. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch £7 0*s.* 0*d.*

(Larger Sizes in proportion.)

Roger's Boiler, small size 3 15 0

Ditto do. large do. 4 10 0

Hot-water Pipe, 4 inch diameter, 1*s.* 3*d.* per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3*s.* 6*d.* each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 4*s.* 0*d.* each.

Strong do. do. do. 45 lbs. at 4 4 "

Ox Hurdles, 4 feet high, do. 45 lbs. at 5 6 "

BEST WIRE for STRAINED WIRE FENCING at 8*s.* per bundle of 150 yards each. Uprights for ditto, 7*d.* each. The Improved continued, and every other kind of Fencing, Fancy Wire work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3*s.* 6*d.*; 20 inches, 4*s.* 6*d.*; 22 inches, 5*s.* 6*d.* each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7*s.*; 4 feet 6, 9*s.*; 5 feet, 11*s.*; 6 feet, 15*s.*; 7 feet, 20*s.* per dozen.

Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. **MR. RENDLE**, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

GUANO ON SALE,

BY THE IMPORTERS,

ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & CO., LIVERPOOL AND BRISTOL.

GUANO ON SALE, as Imported,

of first quality, and in any quantity, direct from the bonded stores, either in Liverpool or London. Also, **NITRATE OF SODA**, Apply to **H. ROUNTHWAITE & Co.**, Merchants, 6, Cable-street, Liverpool.

J. B. LAWES'S PATENT MANURES, composed

of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4*s.* 6*d.* per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4*s.* 6*d.* per bushel.

M'Intosh's New Edition of the

PRACTICAL GARDENER, in ONE VOLUME, containing the latest and most approved modes of Management of KITCHEN, FRUIT, and FLOWER-GARDENS, GREEN-HOUSE, HOTHOUSE, CONSERVATORY, &c.; comprising numerous explanatory Woodcuts and Steel Engravings. In one large 8vo. vol. (976 pages), 21*s.* cloth letter; coloured plates, 25*s.*; and may be had in 10 Parts, at 2*s.* plain, or 2*s.* 6*d.* coloured. By **CHARLES M'INTOSH, C.M.C.H.S.**, Head Gardener to the Duke of Buccleuch, Dalkeith. "The labour and experience of a life devoted to the science of Horticulture we now present to the public."—*Author's Preface.*

London: **THOMAS KELLY, Paternoster-row; SIMPKIN and MARSHALL;** and all Booksellers.

This day, price One Shilling, Part II. of

THE SENTIMENT OF FLOWERS; or, LANGUAGE OF FLORA. By **ROBERT TYAS**, Fellow of the Royal Botanic Society. This Edition is beautifully printed in crown 8vo., and will be completed in Twenty Parts; each Part will contain a Group of Flowers, Drawn and Coloured with fidelity to Nature; the whole forming one thick handsome Volume, with Twenty Coloured Groups of Flowers, for Twenty Shillings.

"The aptness of its poetical quotations, its interesting botanical information, and the eloquence and refinement which pervade its pages, are admirably sustained."—*Floriocultural Magazine.*

R. TYAS, 8, Paternoster-row.

This day, price Sixpence,

THE CHRYSANTHEMUM; its Propagation, Cultivation, and General Treatment in all Seasons. With a Coloured Portrait of that favourite variety, "The Empress." To which is added, a List of Select Varieties.

Also, new editions of the following, price Sixpence each, **THE PELARGONIUM, PANSY, CARNATION, FUCHSIA, DAHLIA, ROSE, CAMELLIA, and CACTUS.**

R. TYAS, 8, Paternoster-row; and all Booksellers.

I.

On the 1st of July will be published, No. I., price Three Shillings, of the New Series of

THE JOURNAL OF AGRICULTURE, AND TRANSACTIONS

OF THE

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

CONTENTS:

I. What may now be done for Scottish Agriculture? By **JAMES F. W. JOHNSTON, F.R.S.L. & E.**—II. Agriculture and Political Economy—III. The Farmers' Note-Book, No. 1. A Calculation showing why Agriculture should be Protected—Emigration and Home Colonization—How to afford the necessary Supply of Air to the Roots of Plants—On Canker and Gum in Fruit-Trees—On Waste Pieces of Land in cultivated Fields—A Gigantic German Green—A Mode of destroying the Gooseberry Caterpillar—On the Advantage of proper Smearing, and Observations on New Salves—On Manures—IV. Report of the State of the Poor in Fifeshire—V. Quarterly Agricultural Report—VI. Table of the Revenue, Prices of Grain, Butcher's-Meat, and Wool—VII. Preliminary Notice—VIII. Experiments and Observations on the Production of Butter. By **Professor Traill.** IX. Experiments made with various Substances as Manures in the Summer of 1842—X. On Protection for Sheep—XI. Improved Turnip-Sowing Machine.

Subscribers' Names received by all Booksellers and Newsmen.

II.

LECTURES ON AGRICULTURAL CHEMISTRY AND GEOLOGY.

BY **JAMES F. W. JOHNSTON, M.A., F.R.S.S.L. & E.,**

Honorary Member of the Royal Agricultural Society, Reader in Chemistry and Mineralogy in the University of Durham.

PART I.—ON THE ORGANIC CONSTITUENTS OF PLANTS, is completed, price 6*s.*

PART II.—ON THE INORGANIC CONSTITUENTS OF PLANTS, price 4*s.* 6*d.*

PART III.—ON THE IMPROVEMENT OF THE SOIL BY MECHANICAL MEANS AND BY MANURES, price 7*s.* 6*d.*

PART IV.—In course of publication—ON FEEDING OF STOCK, &c.

"Unquestionably the most important contribution that has recently been made to popular science, and destined to exert an extensively beneficial influence in this country."—*Silliman's Amer. Jour. of Science (Rev. of the Amer. Ed.)*

"When finished, this book will form the only complete treatise on the whole subject to be found in any language."—*Blackwood's Mag.*

"The most complete account of Agricultural Chemistry we possess."—*Royal Agr. Jour.*

"A valuable and interesting course of Lectures."—*Quarterly Review.*

III.

The Second Edition, price 6*s.*

ELEMENTS OF AGRICULTURAL CHEMISTRY AND GEOLOGY.

This little work is intended to give a familiar and condensed outline of the subjects treated of more fully in the Lectures.

"Nothing hitherto published has at all equalled it, both as regards true science and sound common sense."—*Quar. Jour. of Agr.*

"Of all the different works which have lately been published on the Chemistry of Agriculture, that now before us appears to be most likely to be of real service to the practical man."—*London's Gardeners' Magazine.*

"By their easy style are likely to prove interesting to the least instructed."—*Blackwood's Mag.*

IV.

SUGGESTIONS FOR EXPERIMENTS IN PRACTICAL AGRICULTURE.

No. I.—SUGGESTIONS FOR EXPERIMENTS WITH UNMIXED MANURES, price 3*d.*

No. II.—RESULTS OF EXPERIMENTS IN PRACTICAL AGRICULTURE, MADE IN 1841, price 3*d.*

No. III.—RESULTS OF EXPERIMENTS IN PRACTICAL AGRICULTURE, MADE IN 1842, with Remarks and Additional Suggestions, price 10*d.*

"Competitors are strongly recommended to peruse Mr. Johnston's Suggestions and Account of Experiments received in consequence thereof, and published by Messrs. Blackwood, Edinburgh."—*Highland and Agricultural Society's Directions to Competitors for Premiums.*

V.

In royal octavo, price 30*s.*, Vol. I. of

THE BOOK OF THE FARM:

DETAILING THE LABOURS OF

THE FARMER, FARM-STEWARD, PLOUGHMAN, SHEPHERD, HEDGER, CATTLE-MAN, FIELD-WORKER, AND DAIRYMAID.

By **HENRY STEPHENS, F.R.S.A.,**

Editor of the Journal of Agriculture.

Illustrated with Portraits of Animals painted from the life, beautifully Engraved on Steel by **T. LANDSEER**; and numerous Woodcuts and Plates of Agricultural Implements, with detailed Descriptions and Specifications, by **JAMES SLIGHT.**

The Work when finished will contain upwards of Thirty Engravings on Steel, and Four Hundred Woodcuts.

Of the SECOND VOLUME, which completes the Work, Seven Parts, price 4*s.* each, are published.

WM. BLACKWOOD & SON,

45, George-street, Edinburgh; and 22, Pall Mall, London.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.—The LAST Exhibition will take place on WEDNESDAY, July 12, on which occasion His Grace the Duke of Devonshire, the President of the Society, has kindly directed the doors of his Gardens and Pleasure-Grounds to be opened, for the reception of all persons who shall have been admitted into the Society's Garden by tickets.

The Gardeners' Chronicle.

SATURDAY, JULY 1, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, July 4 . . . Horticultural . . . 8 P.M.
Friday, July 7 . . . Botanical . . . 8 P.M.

COUNTRY SHOWS, Monday, July 3. . . Slough Pink and Heartsease.
Tuesday, July 11 . . . Royal Cornwall Horticultural.

(1.) If all the leaves which a tree will naturally form are exposed to favourable influences, and receive the light of a brilliant sun, all the fruit which such a plant may produce will ripen perfectly in a summer that is long enough.

(2.) If all the leaves of a tree are exposed to such influences, all its fruit will advance as far towards ripeness as the length of the summer will admit of; it may be sour and colourless, but that condition will be perfect of its kind.

(3.) But if all the fruit which a healthy tree will show is allowed to set, and a large part of its leaves is abstracted, such fruit, be the summer what it may, will never ripen.

(4.) Therefore if a necessity exists for taking off a part of the leaves of a tree, a part of its fruit should also be destroyed.

(5.) But although a tree may be able to ripen all the fruit which it shows, yet such fruit will neither be so large nor so sweet, under equal circumstances, as if a part of it is removed; because a tree only forms a certain amount of secretions, and if those secretions are divided among twenty fruits instead of ten, each fruit will in the former case have but half the amount of nutrition which it would have received in the latter case.

(6.) The period of ripening in fruit will be accelerated by an abundant foliage, and retarded by a scanty foliage.

We submit these propositions to Horticulturists as the expression of general truths, which are applicable to all cases, and especially to the Vine; and we would beg them to ascertain experimentally whether they can be infringed with impunity. We do not believe that any quite unobjectionable investigation of this point has ever been made; on the contrary, as far as our experience, or reading, or correspondence goes, no evidence exists to contradict these statements, which are founded on apparently well-ascertained laws. If this be so, the system of rigorous summer pruning of the Vine must be wrong; on the contrary, its leaves should be allowed to form in abundance, and that destruction of laterals at an early period, which is so much recommended, must be injurious; because all those laterals, if allowed to grow, would by the end of the season have contributed somewhat to the matter stored in the stem for the nutrition of the fruit; because the preparation of such matter would have been more rapid; and because the ripening of the fruit, which depends on the presence of such matter, would have been in proportion to the rapidity of its formation. If we are not greatly mistaken, the early maturity and excellence of the Grapes obtained out-of-doors by Dr. Maclean, of Colchester, a veteran horticulturist, well-known for his skill, is entirely owing to the large quantity of wood which he lays in during the summer, as early as he can possibly persuade his Vines to produce it.

It is a mistake to imagine that the sun must shine on the bunches of Grapes in order to ripen them. Nature intended no such thing when heavy clusters were caused to grow on slender stalks, and to hang below the foliage of branches attached to trees by their strong and numerous tendrils. On the contrary, it is evident that Vines naturally bear their fruit in such a way as to screen it from the sun; and man is most unwise when he rashly interferes with this intention. What is wanted is the full exposure of the leaves to the sun; they will prepare the nutriment of the Grape—they will feed it, and nurse it, and eventually rear it up into succulence and lusciousness. We therefore submit to our Horticultural readers that rigorous summer-pruning is wrong.

Let us not, however, be misunderstood. We do not suggest that a Vine should form all the wood it likes; that should be provided against by good winter pruning; and by rubbing off such buds as are not to grow with shoots. What we contend for is, that those shoots which are selected to remain should be permitted to produce as much foliage as possible; and that, as the destruction of laterals is the diminution of foliage, that destruction should be discontinued.

When, however, branches have grown for many weeks, and are in the autumn beginning to slacken in their power of lengthening, theory says it is then right

to stop the shoots by pinching off their ends, because after that season newly-formed leaves have little time to do more than organize themselves, which must take place at the expense of matter forming in the other leaves. Autumn-stopping of the Vine-shoots should therefore be not only unobjectionable, but advantageous; for the leaves which remain after that operation will then direct all their energy to the perfection of the Grapes.

This is, in fact, returning to the practice of the Romans:—

At dum prima novis adolescit frondibus ætas,
Parcendum teneris; et dum se lætus ad auras
Palmas agit, laxis per purum immisissus habenis,
Ipsa acies nondum falcis tentanda, sed uncis
Carpentæ manibus frondes, interque legendæ.
Inde ubi jam validis amplexa stirpibus ulmos
Exierint, tum stringe comas, tum brachia tonde.
Ante reformidant ferrum: tum denique dura
Exerce imperia, et ramos compesce fluentes.

Which we venture thus to translate:—

But when the shoots with new-born leaves are gay,
And scrambling Vines are struggling into day,
O mur not then their first sweet taste of life
With the rude edges of the cruel knife;
But if the crowding shoots more room demand,
Just pinch them gently with judicious hand;
Then when with powerful grasp the full-grown Vine
Shall round the Elm its vigorous arms entwine,
The steel no longer dreaded, trim the spray,
Stop the weak shoots, and bend the strong away.*

HAVING shown the foundation of all the operations of manuring land, we will now say something of the management of the grass land. This must vary with the nature of the soil. Although feeding cows entirely in the stable, winter and summer, be the most profitable, on the whole it may not be so well suited to a family which has few out-door servants, perhaps only one gardener and an occasional labourer. Two cows are essential to the comfort of a family. They should be of a small breed, and selected for the richness more than the quantity of their milk: a well-bred Jersey or Alderney cow is a treasure. The Suffolk polled cow and the Ayrshire are also excellent, when well chosen; and a cross between either of these breeds and an Alderney often produces very good cows. There is one rule which should never be lost sight of: if a cow does not give a reasonable quantity of milk, and this produce a fair quantity of butter weekly, get rid of her, whatever you may lose on the price. Eight or ten quarts of the milk of a good Alderney cow will make a pound of butter, while it will often take fifteen or sixteen quarts of the milk of a large Yorkshire or Durham cow to do the same. An Alderney cow will give from eight to fourteen pounds of butter every week, for three months after calving, if she have rich pasture, and will average half that quantity afterwards. The difference between one cow and another is so great, that no difference in price can compensate for the keeping an inferior one; but a cow must not only be well fed when she gives milk, but also when she is dry and near calving, which will be for two or three months in the year. If she go dry three months before calving she is of less value; but if, on the other hand, she should continue to give milk too long, she should be dried up, if possible, six weeks before calving. This is done by leaving some milk in her udder at each milking, and then milking her only once a day, she will soon be dry in this way; at the same time she may have some hay and less grass till she is quite dry. Many an excellent cow has been spoiled by the carelessness of the person who milks her, in not extracting every remaining drop of milk every time she is milked. It is often useful, when the pasture is very fresh and the cow very full of milk, to milk her three times a day—at five in the morning, at twelve, and at seven in the evening, in summer; in winter this is not necessary.

To have good butter in winter the cows should eat nothing but the sweetest hay. This is not the most economical plan, but good butter is such a luxury that economy in this case may be dispensed with. These particulars are well known to every person conversant with the dairy; but they are not always sufficiently attended to in private families, and our observations are intended more as memoranda than as instructions. If the grass-land is rich, three acres will be sufficient to keep two cows in summer; the remainder may be made into hay, and if the after-grass is abundant some sheep may be fattened on it before winter, if they are in good condition when put in. The cows should always have the first bite of the grass and the sheep after. A pony turned out with the cows will not hurt their feed, provided there is sufficient grass; for horses will eat what cows refuse, and vice versa. In very hot weather, especially when the flies sting, the cows should be in the stable; they will not feed if they are out, and the flies make them run about, to the great

* Altered from the Rev. J. M. King's new and spirited version of the "Georgics," which we trust to be able soon to examine critically.

injury of their milk. They should be in the house from eleven in the forenoon till four in the afternoon, or as long as the sun is very hot: they may have a lock of hay to amuse them, but they do not absolutely require it. The best food, next to grass, is a few beans soaked in water for twenty-four hours; this increases and enriches the milk without giving a bad taste to the butter. When the land is extremely rich and highly manured, a second crop of hay may often be mown the same year; and if the weather is fine in October, and this lattermath hay be well got up, it will be excellent for the cows in winter; it should not be given to horses, as it is apt to affect their wind, especially those which are driven fast.

The making of hay is an important operation where there is only grass-land, and its success, especially in showery weather, depends much on the management of the grass. No minute directions can be given on this subject; but a few general cautions may be useful. Rain will not hurt the grass while it is fresh cut and green; decomposition will not take place till the vital energy is destroyed; or, as one would say, till the grass is dead: so that in showery weather it is not advisable to be in too great a hurry to spread the grass out from the swarth; it is as well to let it lie, and when the outside is dry to turn it over, without much dividing it, then to put it in very small cocks, laid somewhat hollow, that the wind may blow through them: thus it will bear much wet without being materially damaged. Never hurry the stacking in wet weather, the hay will get more harm in the stack, when not quite dry, than it will even lying flat on the ground. If it is discoloured let it lie till quite dry, or you only make bad worse; for spoilt hay put up dry may still be palatable to cattle, only they will waste more of it; but if it comes out musty from the stack nothing will eat it, except when pressed by hunger. If the weather is very fine and the glass steady, grass may be made into hay, and secured in a stack in three or four days. The only danger is from over-heating, and it requires some experience to know when the hay is sufficiently made, and will not heat too much; the larger the stack the greater caution is necessary. These hints may be useful to many who are not conversant with the subject. We shall in another article give some directions about the proper attention to the quality and quantity of the grass.—M.

ON THE CULTIVATION OF COMMELINA CELESTIS.

THIS is a half-hardy perennial of considerable beauty, and well worth a place in the borders of the flower-garden, where it will produce a succession of its beautiful ephemeral azure blossoms from July to September.

It is easily cultivated if treated in the following manner:—About the end of February sow the seeds in pans or pots filled with a mixture of sandy loam and leaf-mould, and place them in a warm pit or dung-frame. The seeds will soon vegetate; and when the young plants are large enough to handle, pot them off singly into sixty-sized pots, and return them to the warm frame or pit for a week or ten days; afterwards admit air, and finally remove them to a cold frame or pit to harden, ready for planting out in the open border, which should be done about the end of May or beginning of June, when the danger from late frost and cold nights is over.

In planting, they must not be put in a dry or shaded situation, but in a warm and rather damp one; and in a rich loamy soil. They will then flower freely all the summer and autumn; but, like the Dahlia, their beauty is destroyed by the first frost in the autumn.

The plants flower freely the first season from seed, but they display their delicate azure blossoms in the greatest perfection the second season, if the roots are taken up and preserved like those of the Dahlia over the winter, which is best done in the following way:—When the plants have done flowering, and there is danger of the roots getting injured by severe frost, they must be taken up and placed to dry for a few days; then procure a box or some large flower-pots, and place a little dry soil at the bottom—(the best substance for packing all kinds of roots in during winter is dry sandy peat);—then place a layer of roots, filling in between with soil—and so on until you have disposed of all the roots, when the whole should be covered over with a thick layer of any dry substance. Place the plants either under the stage in the green-house or in a dry cellar for the winter, out of the reach of damp or frost; they will then require no more trouble until the following March, when they should be taken out, potted, and placed either in a warm pit or dung-frame, to forward them again for planting out.

The roots will survive the winter in the open border if slightly protected and kept dry, but then they are late in starting, and never so fine as when the roots are taken up and preserved through the winter, like those of the Dahlia. The old roots may be divided, like those of the Garden Ranunculus.—George Gordon.

ENTOMOLOGY.—No. XLV.

THE BLACK TURTLE-SCALE. *Coccus testudo* (Curtis).—The Scales, as they are termed by gardeners, are perhaps the most troublesome of all the insect tribes in the greenhouse and hothouse, and there are few conservatories, I believe, entirely free from them; it will, therefore, be of service to give figures and descriptions of the different species. The scale insects vary so considerably in their

habits, that they may with great propriety be divided into three sections, which will form as many genera: 1st, there is the true or typical Coccus, the female of which is covered with a scale, inseparable from the animal; familiar examples are the *C. hesperidum* and *C. vitis* of Linnæus; 2dly, a large number is distinguished by Bouché under the name of *Aspidiotus*, of which *C. Nerii* of that author and *C. Bromeliæ** are examples. In this group the females are covered with a scale, which does not adhere to the animal; 3dly, those species, comparatively few in number, I believe, whose females are not furnished with scales, but are merely powdered over; they are very different, also, in not being stationary, but run about when full grown, as well as when young; I propose calling them *TRECHOCORYS* (Running-bugs), of which the *Coccus adonidum* of Linnæus will be the type.

I have seen several species of Turtle-scales which belong to the 1st section; they generally live upon the leaves and stems of plants, requiring great heat; the species sent to me as the Black Turtle-scale (fig. 1) infests both

sides of the leaves, preferring the undersides, to which the females adhere, generally lying in lines along the midrib. On lifting up one of these female scales several hundreds of eggs and young ones were lying upon the leaf, and in the cavity of the mother: they were of a pale orange colour; the former were oval, cylindrical, and shining; the latter were flat, oval, and like little woodlice; they were furnished with two fine antennæ, hairy at the apex, two little black eyes, six legs, and a notch at the apex of the abdomen, which produces two long hairs or setæ; the back is transversely striated with the lines formed by the numerous abdominal segments. They ran fast, and kept pushing about the eggs, which were only partially and sparingly supplied with the cottony substance so abundant in some species; they were also intermixed with the pale, empty shells of the hatched eggs. Fig. 1 represents part of a leaf of *Brexia spinosa*, with two of the adult females and a younger one between them; they are oval, very convex, dark-brown, and from their similarity to a tortoise, I have named this scale *Coccus testudo*; there is an elevated ridge along the back, with two transverse ones, the first being nearest the middle, the second towards the tail; the whole surface is finely shagreened with small white tufts scattered over the whole. Fig. 3, highly magnified, the upper end being the tail. I have never seen it remarked that the scales are invariably fixed with their heads downward, so that as soon as the young hatch they are ready to ascend the plant, and consequently spread over the fresh and more tender portions. The underside of the scale has a broadish margin, which is ciliated, and there is a long cleft at the tail; the skin of the body is concave, dark, with a purplish tinge, with six minute legs, and a largish lobe towards the anterior portion, which is furnished with a fine proboscis. Fig. 4 shows a multitude of eggs, the young, and the whitish exuviae adhering to the female; and fig. 2 the impression from a scale which has been removed.

In Feb., 1841, I received a twig of a Mexican plant, upon the stalk of which were about 30 specimens of a similar Coccus, but the leaves were free from them; they were of a chocolate colour, somewhat oval, very gibbose, and had a fleshy appearance, resembling rather aphides that had been punctured by parasites than scale insects; the outside was shining chesnut-brown, with irregular punctures, and minute tubercles scattered over the surface; in profile it was very gibbose, being pyramidal truncate, the anterior surface nearly vertical, with a lobe over the apex; the hinder extremity was more sloped off, and when removed from the stem the slender siphon of the rostrum was visible; I could also see six minute legs, the anterior pair moved about whilst I was examining the scale, and was the only evidence of vitality it exhibited; the four hinder legs were closer together, but obscured by the eggs, which amounted to 50 or more; they were larger than usual, oval, dull, ochreous, and shining. I could not detect either eyes or antennæ, neither have I ever seen the males of these scale insects. It is difficult to imagine how these immovable females contrive to get the eggs so completely under their bodies, unless there is an oviduct which is protruded from the anal suture, and directs the eggs to that position.

A third species I saw in vast numbers in July on the underside of the leaves of a plant in a hothouse; they had swarmed over each other like bees, and being of a dark-brown colour were very visible; they were either round and hemispherical or oval, with a smooth and rather shining surface, but, under a powerful lens, appeared covered with minute tubercles; the entire margin was a little reflexed, with a long cleft or suture very visible

beneath at the tail. On removing them there were a few small young ones of an orange colour, and an immense quantity of dirty white skins, leaving the egg-shells from whence the young had escaped, which at once proved that this was a very prolific species.—*Ruricola*.

ON POTTING AND SHIFTING PLANTS.

MUCH, if not the greater part of the success in cultivating plants in pots depends upon a proper method of potting and shifting them, and this as much in the state of the materials employed as in the manner of employing them. But in vain may soil, situation, and treatment be consonant to their natures if care and attention have not been paramount in this branch of their treatment. When plants are in open borders they are in a great measure attended to by Nature herself. But when we place them in pots, we give them an artificial habitation, and they then require of us artificial treatment to reconcile them to an abode foreign to their natures. First, the soil will, of course, be a composition suitable to the particular plant or plants to be potted; but of whatever it may be composed, particular care should be taken that it be not too wet nor too dry. If the former, it becomes, during the process of potting, a compact mass, which, contracting as it gets drier, leaves a vacuum between the exterior of the pot and the ball of the plant; thus allowing the free admission of light and air, which is, of course, anything but beneficial to the plant. If, on the other hand, it be too dry, it prevents for a considerable time the free passage of moisture to the roots; and it will often be found, especially if the plant itself is dry at the time of potting, that it will suffer greatly ere it receive sufficient moisture to recruit the evaporation of its juices. Secondly, the pots, if not new ones, should be scrupulously clean; for if the advantage were nothing more than the facility obtained in turning out the plant to examine or re-shift it, it would amply repay the trouble. But independent of this, a plant enjoys better health in a clean than in a dirty pot; and if no other consideration would urge to cleanliness, appearance would, I presume, decide in its favour. Thirdly, drainage should combine two properties, to allow free exit to the superabundant moisture, and to prevent the entrance of worms; and although the latter object is somewhat difficult of attainment, we should seldom have to complain, if plants, when placed in situations where worms are likely to abound, were set upon a sufficiently thick layer of cinder-ashes, or some similar material; cinder-ashes, I think, claiming the preference, as we seldom see worms attempt to penetrate them, if two inches in thickness. To allow a free passage to the superabundant moisture, let the crock covering the drain-hole be placed so as to form an arch, with a few smaller ones placed round it, covering the whole with a slight quantity of moss, sufficient to prevent the finer particles of soil being washed round the larger crock, which would effectually obstruct the drainage, when the soil would become sour and unhealthy; and, as a natural consequence, the plant would follow its example. Fourthly, the depth of potting should be regulated by the mark which nature points out, and which is always conspicuous in plants raised from seed; at all events, let it not be placed deeper than when it receives its first remove from the cutting or seed-pod. To bury an inch or two of the stem of a plant is very injurious, although a practice of common occurrence with careless potting. Fifthly, in leaving a sufficient space in the pots to receive water, on no account let it form a kind of basin; that is, a hollow round the stem; but let the soil round the stem be as high as the rim of the pot, receding gradually to a depth round the rim, agreeably to the size of the pot, the nature of the plant, or the situation in which it is to be placed.

I feel confident if these few simple rules were followed, many plants which we now see dying, or at best, barely vegetating, would be *vice versa*.—*Tyro*.

AMATEUR'S GARDEN.—No. XXVII.

THE greatest triumph which gardeners have achieved in the management of plants is that by which almost innumerable and very beautiful varieties of flowers have been raised from the weeds of our fields, as in the Heartsease and Tulip; and what, in exotics, are comparatively little better, the single Dahlia, the Dianthus, Pelargonium, and several other genera. This is effected by what is technically designated hybridizing and cross-breeding, by which process the properties of dissimilar but allied species (and in some cases genera) are so intermixed, that the seedling produce will partake of the character of both parents, and the flowers be frequently superior to either.

Nature, unaided by art, has accomplished much, and has produced the Golden Pippin Apple from the Wild Crab, and the Damson and other Plums from the common Sloe; yet it must be confessed that art, properly directed, has effected and will effect more in a few years, than nature, dependent upon accidental circumstances, would do in a long lifetime. As an operation to fill up the leisure hours of the lady gardener and amateur, I do not know anything more pleasing; for there is something akin to creative power in it, as we are bringing new forms into existence; and though all the offspring may not be equally interesting, some may be very pretty, and others superlatively beautiful. 'No one but a parent can have a parent's feeling' is a trite saying, and certainly the pleasure of an enthusiastic florist in viewing a first-rate flower of his own raising, amounts almost in some cases to a species of idolatry.

To explain the method of artificial fertilization, it will be necessary to offer a few remarks on the formation of flowers. In all flowers, when divested of the petals or corolla, there will be found standing in the centre, and

attached to the flower-stalk,—of a Fuchsia, for illustration—a small pin-like substance, which is called the pistillum, or female organ, and surrounding it a number of shorter pins of various lengths, with rather large heads, which are called stamens, or male organs. A slight examination of various flowers will show how beautifully nature has provided for the multiplication of the different species of plants; as, in some cases, the farina falls from the anther upon the stigma, while, in others, it is deposited there by an elastic force in the filament, as is exemplified in the flowers of the *Kalmia*. The pistillum consists of three parts, viz., the ovary, the style, and the stigma, and has been likened to a column, as the first will represent the pedestal, the second the shaft, and the third the capital. The stamen also consists of three parts, which are called the filament, anther, and pollen or farina, a sort of mealy powder which the anther throws out, and which, when it falls upon the stigma, or top of the pistillum, fructifies it, and a production of seed is the consequence.

Now, when gardeners wish to produce hybrid or cross-bred plants, they divest the flowers which it is intended to produce seed from of their stamens, and proceed to fertilize the stigma with farina taken from some other plant: thus, if I wished for a family of plants between *Fuchsia globosa* and *F. Venus victrix*, I should take the stamens from the flowers of the latter directly the flowers were open, and fertilise the stigma with farina taken from *F. globosa*, and the result would probably be plants resembling *F. globosa* in habit, and partaking of the colours of *Venus victrix* in the flowers, as the habit of the plant generally resembles the male parent, and the flowers those of the female; and for this reason particular attention should be paid to the choice of parents, if we wish to make decided improvements in the habits of our plants.

After the stigma is fertilized, it should be guarded from the contact of honey-seeking insects by a muslin bag placed over the flower, or by keeping the plants in a pit or frame covered with strong gauze or fine canvas. The best instrument to convey farina from one plant to another is a camel-hair pencil, and the best time to apply it is early in the morning, when the flower is full grown, and the stigma is covered with its own mucus; but to make assurance doubly sure, it is well to apply the pollen for several days successively.

As it is reasonable to suppose an highly-organised seed will produce a stronger plant than an improperly ripened one, no plant should be allowed to produce more than six pods of seed, and no flowers after the seed-pods begin to swell, but should be encouraged, by proper attention, to grow as healthily as possible.

Where it is inconvenient to fertilize the flowers, as in Heartsease, and many other plants, none but the very best kinds should be allowed to produce seed, as it is probable that the seed from the six best Heartsease known would produce more good flowers than the seed from six hundred indifferent kinds.—*W. P. Ayres*.

HOME CORRESPONDENCE.

Manures: Guano.—I have used Guano on strong brick-earth at the rate of 30 cwt. per acre, with considerable advantage, as you will see by the accompanying Pea, and they are all much of a size in the row. It was applied after they had grown about 12 inches. I mention this fact, as there appears amongst your correspondents considerable doubt as to the maximum of quantity in Guano. Less than the above would kill grass, and no doubt would be dangerous on hot gravelly soils, or even on undrained clays that would cake near the surface. I have applied more than a ton and a half per acre on my flower-garden, in addition to considerable quantities of Bone-dust, Soot, Salt, and Nitrate of Soda; and the extraordinary luxuriance of their growth and the size of the flowers in a cold aspect bear testimony to its utility. Care should be taken to apply it before or during rain, and not to allow it to touch the foliage. My Potatoes and other vegetables appear to like the Guano. On 8 acres of Oats, on recently-drained strong land, I have used 4 cwt. of Guano per acre on 3 acres; 4 cwt. of Guano and 1 sack of Common Salt on 5 acres. In both cases the crops look well, although on poor exhausted soil after Wheat; but where the Salt is added, there is a vast superiority, although that part of the field was sown at least a month later than the other. The difference is perceptible a quarter of a mile off. On another field of Oats, 6 acres sown same time as the 5 acres, with one sack of Salt and no Guano, the Corn looks healthy, but far inferior to that manured with Guano. Two stretches, on which were neither Salt nor Guano, look yellow, miserable, and thin.—*F. J. M.* [The Pea sent was in a state of wonderful strength and luxuriance, and appears to be commencing to bear freely.]

Asparagus.—I followed your advice, and gave my Asparagus plenty of salt much to their advantage in quantity and size; but previously mine were quite green all through. This year there was very little green, but the white was quite tender and good to eat. Did the salt affect it thus?—*I. B. H.* [We apprehend not: and that the want of colour was owing to the cold dark spring.]

Cultivation of Water-cresses.—I observed a paragraph in your last Number upon the 'Cultivation of Water-cresses, which I have not the least doubt is very good; but as it is not in the power of many to grow them in that way, not having a spring of water at their command, I will simply state the way in which I have grown them for the last ten years, a plan which every one has the means of adopting who possesses ever so small a garden. I have no kitchen-garden, but a border for flowers by the side of a north wall, and as I could not get these to do as well as I could wish, it occurred to me that Water-cresses might succeed. About the beginning of May I prepare a piece of ground, 8 feet by 3, with rather rich soil; I then pre-

* Vide *Gard. Chron.*, vol. i., p. 131; figs. 1 to 6.

cure two-pennyworth of Cresses, make them into cuttings about 2½ inches long, caring little about their having roots, plant them about 5 inches apart, water them to set them fast, and repeat the watering once a day if the weather be dry. They very soon cover the ground. When they have grown a few inches, the shoots want a little pegging down at first; they take root at every joint which touches the ground; and in this small space I can gather a good dish every day for about five months, with leaves as large as any of those which appear in the markets, and I think if there is any difference, with a better flavour.—W. P.

Hawthorns.—One of your correspondents complains that his scarlet-blooming Thorns have produced white flowers this year. This is rather a common occurrence. I was charmed with the first pink-flowering Thorns I saw, and gathered the berries. More than half the plants from this seed proved to be the common Whitethorn. One of the finest of the others, in a few years, produced a very abundant bloom of perfectly white flowers, without any leaves. I removed it to an opposite aspect, and it recovered its foliage, but the blossoms have never resumed even a tinge of their former beauty. This year one of my scarlets had a small branch with eight bunches of flowers, one half the number were pink, and the others a vivid scarlet.—J. B.

Bees.—I have observed the controversy between "A. Pettigrew," and "J. Wighton" relative to Bees. The former asks who first put the question which led to the various things in dispute,—"Whether we have or have not proved that Bees' eggs are transmutable?" What I have gathered from both is little more than what is related by Huber and others. "W." however, don't believe like "P." and others, that the grubs which ought to produce working-Bees, are metamorphosed by "Bee-pap" (Royal jelly). "P." mentions a change in the gender,—a thing foreign to the subject, for working-Bees are considered to be Queens in an undeveloped state. Like "W.," I doubt the accuracy of "110 lbs. of run-honey from a hive in one season," and would rather prefer knowing the size of the hive from which such great produce was obtained, than "the address of the person that squeezed the honey out of the combs before he weighed it." Here is a little contradiction; run and squeezed honey are not the same. Perhaps "P." will explain this; also how to make Bees fill a large hive as soon as a small one. "W." goes too far when he says that "P." "got his knowledge of the Queen Bee's age as some get their accounts, from a Ready Reckoner." If Bee-books are meant, I cannot find one author that mentions it. Indeed, the fact of her repeatedly removing renders it difficult to find out. However, I have read or heard of one that lived several years; she was known by her lame leg. "P." finds fault with "W.'s" version how Bees' eggs are hatched, and observes, that "none are hatched except they are set upon." In cold weather, Bees cluster most upon the part of their combs where their eggs and brood are; but when otherwise, their eggs are hatched by what "W." calls "the heat in the hive." "P." mentions that "almost all Queens are bred in June and July; and if they were to die later in the year than August, the Bees would be nonplussed, for they have no eggs to be metamorphosed into Queens." In general, Queen Bees appear from about the 1st of May to the end of June, and strong colonies contain eggs at all times, except, perhaps, in winter.—*Apis*.

Asparagus.—In your Leader of June 10, you quote from some papers of Mr. Beaton, who says that the Asparagus is as hardy as the Oak. I think, Sir, this must be received with some modification. That there is no occasion to cover it down during winter with manure to protect it, is most true; but if the heads come in contact with frost, death will be the certain result. My beds of Asparagus have suffered very severely this last winter from being too bare of soil. One-fourth of the very finest roots were quite killed by the frost. The rains must have washed the soil from off the heads, and the frost killed them. I must also state, that early in the spring some heads pushed a few nice shoots, and that during a frosty night they were quite killed. Are my remarks likely to prevent disappointment to those who might too venturously treat the Asparagus as a hardy Oak? If so, you will perhaps state what I have experienced.—*Discipulus*.—[As Asparagus is a native of England, it is not likely to be very impatient of cold. When growing it is no doubt tender, and so is an Oak; for who has not seen that tree with all its young shoots killed back by late frosts? We understand Mr. Beaton to mean that it is hardy in the winter, and does not require much protection at that time. We are, however, much obliged to our correspondent for producing this explanation, as it is by no means improbable that the observations of Mr. Beaton may have been misunderstood.]

How to Kill Grubs.—As insects of all kinds are likely to be very troublesome this year, I think it may be worth while to mention that, finding my Cabbages very much eaten last year by the Grub, I scattered a small quantity of coarsely-powdered nitrate of soda over them by hand; which entirely destroyed all those that were hatched. This I repeated two or three times during the season with the most perfect success.—*E. Tranin*.

Night-scented Flowers.—I have frequently observed that certain evening-scented flowers—specify, for instance, *Daphne Laureola* and *Habenaria bifolia*, which ordinarily are not fragrant in the day-time, if gathered and laid aside till they are flaccid from want of moisture, become so. We cannot suppose they acquire the quality of diurnal fragrance (if we may use the word) under these circumstances. Would it not be a more probable inference that they lose by this treatment their natural power and property of retaining it? Does the scent of the flowers in question arise from the dispersion of their volatile essential oil?

Does not essential oil usually volatilise by heat? If so, then either the essential oil of these night-scented flowers forms an exception, or else it volatilises as soon as formed, and that under some peculiar conditions, perhaps of light, electricity, or atmospheric influence, which evening alone presents. These are crude suggestions; but the facts stated appear to indicate that "the exhalation of carbonic acid" is not likely to offer a satisfactory solution of the problem.—*G. W. S.*

Bees.—I find that Mr. Golding has noticed my remarks on Mr. Rochet's observations on the fortifications of Bees à la Huber, which appeared in the *Chronicle* of April 22d. To convince me that I am wrong, he refers me to p. 379 of the "Honey Bee." In the volume published in 1827 I find nothing satisfactory relating to the subject in dispute, but was a little surprised to see, at p. 372, that "Bees may frequently be observed to roll their bodies on the flowers, and then with their feet form it into two masses, which they dispose of in the usual way." This happens to be one of the things which I noticed in Mr. Rochet's observations. It is useless for me to repeat what I said respecting it. But as Mr. Golding says he "gave the author of the 'Honey Bee' his unwearied assistance," he probably knows something concerning this mealy Bee story which led to Mr. Rochet's version of it. Mr. G. adverts to his Bees once closing, or "making a curtain at one of the entrances of his Polish hive." I suspect that that was one which the Bees did not enter at. I have a Polish hive myself, having 6 feet of comb; and the Bees endeavoured to make fortifications, or, to be plain, to close the holes they do not enter at. But this only accords with their habits of blocking up all draught holes, especially in the top of their dwelling. I admit that the common entrance to a hive is at times reduced, and, to appearance, like that mentioned by Mr. G.; but that only happens when a part of the combs, or rather propolis, falls down, and the Bees form ways through it. The same may be seen on the floor of a hive. I am aware that much might be brought against what I have said, even the authority of "the ever-amusing Mr. Jessie." But I ask, if such a power resides in Bees to close their door against their enemies,—how is it they seldom do it? and why do they strive to enlarge their door when it happens to be reduced, if their enemies are about? These facts do not argue much in favour of great instinct in Bees regarding self-preservation. I now notice Mr. G.'s statement, viz.,—"Among the many apiarians, correspondents of the *Gardeners' Chronicle*, some of them, if they persevere in their apiarian researches, will see cause to modify certain premature opinions;" and he farther observes,—"There is no one whose general views so nearly accord with my own as those of Mr. Wighton." By this, it is to be inferred that I am not included in the former remarks; be that as it may, whatever opinions I have advanced relative to Bees are from careful observations at the apiary. Huber is wrong; there are not two kinds of working Bees—wax-workers and sculptors. I may observe, whatever I have said respecting Huber is solely with the view of noticing what I consider to be wrong, and not with any view of finding fault with one to whom we are much indebted for our Bee-knowledge. By-the-by, I question if such would have been the case if it had not been for Burnens, who was Huber's servant and friend, and assisted him in his unwearied researches respecting Bees. In short, he was everything. Huber himself says of him, "I must share the honour with him;" and an able writer mentions, "It is only right that this faithful and intelligent man should share whatever of earthly immortality belongs to the name of his master." Perhaps some are not aware that Huber died at the age of 81, so late as December, 1831.—*J. Wighton*.

Hot-water Apparatus.—I think it is very little known that a Hot-water Apparatus should be filled with hard water, not rain-water; the former deposits a thin coating of carbonate or sulphate of lime, which prevents oxidation of the iron pipes,—the latter, on the contrary, rapidly oxidates the iron, producing a sediment of rust of a quarter to half an inch thick.—*Flora*. [But, then, some hard water will throw down such large quantities of sediment as will prevent the action of the fire altogether.]

Bees.—Permit me to thank Mr. Wighton for his kind notice of my recent inquiry respecting two stocks of Bees, which I purchased last autumn, and described as one strong, and one weak; and that I had discovered, as the spring advanced, the weak one had become the strongest, and swarmed three times, namely, on the 17th, 24th, and 29th June; while the strong one had become weak and not swarmed at all. Respecting this latter stock, I wish now to add the following, and to ask Mr. Wighton's (or any other skilled in Bee management) kind attention. About a fortnight since, I perceived in the morning early there had been a slaughter of the drones during the night, which were lying dead about the entrance and under the front of the hive, in great numbers; and it appeared to me, too, that there were very few of the other Bees left, and these in a very weak, almost torpid state. On Saturday evening last, I turned up the hive, and found the colony either deserted or defunct—at any rate, there were no live Bees, and not more than a dozen or a score dead ones. What can have occasioned this? I have described those two stocks as strong and weak; now strong and weak are vague indefinite terms, and it occurs to me that I may have been deceived. That which I supposed was strong has nine regular well-formed combs, full to the bottom—I mean that the hive is filled with these combs, but not a drop of Honey. I am inclined to think that this hive full of combs, with a numerous family of Bees, and perhaps a small quantity of honey, may have induced the belief that the stock was a good one at the time of pur-

chase, and that the other—the weak one—might have had a smaller quantity of comb, but tolerably filled with honey, which might have led me to the conclusion that it was a poor stock; but having been, as I before stated, more liberally fed, has become vigorous, swarmed three times, and is vigorous still; while the other, for the reasons I have given, has died, or flown away, from mere want. Would Mr. W. advise me, supposing I should have another swarm, to take out every other comb, and house them in the deserted hive? It appears quite sweet and clean, and it has occurred to me that this would save the young and late colony the time and labour of building combs for themselves.—*A. J. S.*

Potatoes.—In your last Number, page 413, "R. R. R." mentions the fact of his Potatoes, to the amount of one-third of his crop, producing tubers without foliage, but does not say when he planted them, nor the kinds. I planted, by way of trial, last November, a few rows of the Ash-leaf Kidney, and a few of the Walnut-leaf Kidney, as I suppose it to be. Of the Ash-leaf perhaps one-fourth failed, as mentioned above; of the Walnut-leaf not above one in forty. I planted the Ash-leaf again in March, and not one has failed: thus it might be the weather, or it might be the kind. Is the Ash-leaf getting to be an old variety and therefore subject to disease? Some future day I hope to send you the results of planting Potatoes in November; for though no new practice, it may be new to many, as it was to me. I have reaped from the *Gardeners' Chronicle* much instruction and amusement; it adds to the incessant interest of a garden; in summer it guides practice, and in winter it gives hope and matter for thought as to all coming crops. Through it I obtained from the exemplary liberality of Dr. Bevan, the yellow Kidney Potato of Mr. Knight, which grows beautifully and has plenty of leaves, as I hope it may have of tubers. This led me to read Dr. Bevan's "Honey Bee," a capital book, and anything but common-place. I should like to know the fates and merits of two or three seedling Potatoes of Mr. Knight's, which were growing in the Society's garden at Chiswick about a year since.—*S. H., Norwich*. [Which seedlings?]

Black Nemophila.—Mr. Ayres, in his weekly instructions for the "Amateur's Garden," makes mention, amongst other annuals for sowing at the present season, of a new black *Nemophila*, stated to have been raised from *N. atomaria*, by Mr. Pawley, of Bromley. This I beg to say is incorrect, as it first originated from *N. insignis*, in the garden of a Clergyman, a short distance from this place, about four years since. Shortly after it flowered, a drawing of this singular freak of nature was commenced by the lady of this clergyman, for the purpose of transmitting it to Mr. Harrison, conductor of the "Floricultural Cabinet," but in consequence of the indisposition of the artist, it was never finished. This spring, however, I forwarded a flower of this valuable variety to Mr. Harrison, who has figured it in the Cabinet for the present month.—*Thomas Cripps, Tunbridge Wells*.

Vines.—In my opinion the failure in Mr. Querill's Vines may be attributed to the difference of temperature between the house and border; the same circumstance having happened, though in a less degree, to myself. I have some young Vines planted in front of a Pine Stove, and every year since they were planted the leaves have at first shrivelled in a similar manner to those of Mr. Querill's Vines; but this year they have been much worse, and as the border is a new one and well drained I cannot assign any cause for it but the one I have mentioned; for as soon as the sun becomes powerful enough to warm the border the plants have quite recovered. In my own case I have little hope of effectually overcoming the evil, but would suggest to Mr. Querill keeping his house lower in temperature, covering the border during winter, but particularly from the time he commences forcing, and not forcing so early.—*A Subscriber*.

Ancient Price of Agricultural Labour.—In the year 1352, twenty-fifth of Edward III., wages paid to hay-makers were but 1d. a day; a mower of meadows 3d. a day, or 5d. an acre; reapers of corn, in the first week in August 2d., in the second 4d., per day—and so on until the end of the month,—without meat, drink, or other allowance, finding their own tools. For threshing a quarter of wheat or rye 2½d.; a quarter of beans, peas, barley, or oats, 1½d. By the thirteenth of Richard II., A.D. 1389, the wages of a bailiff of husbandry 13s. 4d. a year, and his clothing once during that time, at most; a carter, 10s.; shepherd, 10s.; oxherd, 6s. 8d.; cowherd, 6s. 8d.; swineherd, 6s.; a woman labourer, 6s.; a day-labourer, 6s.; a driver of ploughs, 7s. From this time up to the twenty-third of Henry IV., the price of labour was fixed by the justices by proclamation. In 1444, twenty-third Henry IV., the wages of a bailiff of husbandry were 23s. 4d. per annum, and clothing of the price of 5s., with meat and drink; chief hind-carter, or shepherd, 20s., and clothing, 4s.; common servant of husbandry, 15s., clothing, 3s. 4d.; woman servant, 10s., clothing, 4s. In time of harvest, a mower 4d. a day—without meat and drink, 6d.; reaper or carter, 3d. a day—without meat and drink, 5d.; a woman labourer, and other labourers, 2d. a day—without meat and drink, 4½d. a day. By the eleventh Henry VII., 1496, there was a like rate of wages, only with a little advance.—*A Quiet Observer*.

PROCEEDINGS OF SOCIETIES.

Chiswick Show.—By an accidental inadvertence, it was not stated in our Report of last week, that Messrs. Lockhart and Co., of Cheapside, obtained the Knightian Medal for an excellent collection of Ranunculuses.

ROYAL BOTANIC SOCIETY OF LONDON.

June 28.—The second exhibition of this Society took place at their gardens in the Inner Circle, Regent's Park. The day was rather unfavourable, there being a somewhat cold northerly

wind, and a heavy shower of rain in the afternoon. The visitors were more numerous than on the last occasion. In conformity with our previous practice, we shall merely specify those plants which were not at the Chiswick exhibition; observing that there were a good many specimens present which had been at Chiswick on the 17th. The things which struck us as most remarkable were some of the Heaths, which were splendidly grown; a very noble flowering specimen of *Nepenthes distillatoria* (the common Pitcher plant), from Mr. Mylam, gr. to S. Rucker, Esq., Wandsworth; two new Pelargoniums, named Shepherd's Queen Victoria and Unique, from Messrs. Henderson, of Pine-Apple Place, the character of which is described in another column; and a very fine new Fuchsia, called Queen Victoria, from Mr. Smith, of Dalston. The last-named plant has very large pale pinkish flowers, with a rich purplish corolla, and appears to be one of the best and most distinct kinds yet made known. Among the collections of plants, there was one from Mr. Barnes, gr. to G. W. Norman, Esq., of Bromley, containing some excellent plants, viz.: a *Gesnera splendens*, exceedingly fine, and both richly cultivated and flowered; *Polygala cordifolia*, in a healthy dwarf state; *Elichrysium proliferum*, singularly luxuriant, bushy, and full of flowers; *Ixora coccinea*, particularly tall and gorgeous, with two or three good smaller plants; a beautiful specimen of *Boronia denticulata*, and a fine one of *B. serrulata*, which was not, however, very thickly clothed with foliage; a handsome low specimen of *Stephanotis floribunda*; a good dwarf *Pimelia decussata*; *Leschenaultia formosa*, particularly dwarf and beautiful; *Pimelia rosea*, fine; an unusually low and well-flowered *Achimenes longiflora*; and some good specimens of *Erica perspicua nana*, *gemmaifera*, *tricolor superba*, *vestita coccinea*, (quite a little tree), *translucens*, *vasæflora*, *elegans*, *Bowieana*, and *odorata rosea*. A large collection was sent by Mr. Green, gr. to Sir E. Antrobus, Bart., but we perceived nothing noticeable in it that was not at Chiswick, save a capital specimen of *Achimenes longiflora*. Mr. Hunt, gr. to Miss Traill, supplied a collection in which were a first-rate plant of *Crœwea saligna*, which ranks with the best of greenhouse species; *Cattleya Forbesii*, an excellent specimen; *Cattleya crispa*, a very good plant, with one spike of its charming flowers; and some magnificent Heaths, the finest of which were *tricolor elegans*, *tricolor superba*, *gemmaifera*, *perspicua nana*, *densa*, *Massoni*, *translucens rosea*, and *Westphalingia*. In a collection furnished by Mr. Cockburn, gr. to the Earl of Mansfield, Caen-Wood, were a very showy plant of *Cassia corymbosa*, finely grown; the white-flowered variety of *Swainsonia galegifolia*; a tall *Brugmansia suaveolens*; *Siphocampylus bicolor*, admirably cultivated, but only just beginning to flower; and a good specimen of the singular *Anigozanthus coccineus*. Mr. Clarke, gr. to T. Smith, Esq., Shirley Park, produced, in his collection, a superb plant of *Erica tricolor*; a very superior specimen of *Diplacus punicus*; *Pimelia decussata*, in a dwarf and rich state; and *Dracocephalum gracile*, beautifully managed. In a group contributed by Mr. Pawley, of Bromley, there were some excellently-cultivated Fuchsias, of various kinds, with one called a seedling, which is very like Eppsi; *Ixora coccinea*, peculiarly dwarf and splendid; *Mahernia pinnata*, a cone of pretty red flowers; and *Alstromeria pelegriana*, very handsome. A collection by Mr. May, gr. to E. Goodhart, Esq., Beckenham, had in it a beautiful plant of *Gardœquia Hookeri*; *Crœwea saligna*, superlatively good; with very exquisite specimens of *Sprengelia incarnata* and *Epacris heteronema*. The collection from Mr. Frazer, Leyton, contained a charming little *Pimelia rosea*, the pot of which had been placed in a larger one, and the space filled up with something to protect the roots; *Erica Bergiana*, a delightful specimen, though with rather dull-coloured flowers; *Euthales macrophylla*, and some extremely handsome plants of *Kalmia latifolia*. Messrs. Henderson, of Pine-Apple-Place, sent (not for competition) a fine plant of the elegant *Marianthus cœruleo-punctatus*, a large and beautifully-flowered *Siphocampylus bicolor*, and *Erica ventricosa coccinea minor*, the specimen of which was one of the loveliest things imaginable. Several persons exhibited groups of Heaths. Mr. Brazier, gr. to W. H. Storey, Esq., Isleworth, sent a collection of hybrid vestitas, to which two other pretty hybrids were added; and very magnificent flowering-plants of *Cavendishiana*, *Halimolobos*, *tricolor coronata*, *grandiflora*, *Jasminiflora nana*, *splendens*, and *ventricosa purpurea*. From Mr. May, gr. to E. Goodhart, Esq., there were specimens, likewise magnificent, of *Humei*, *odorata rosea*, *grandiflora*, *tricolor*, *Westphalingia*, *vestita coccinea*, *Massoni*, and *elegans*. Mr. Barnes, gr. to G. W. Norman, Esq., had splendid plants of *Erica depressa*, *gemmaifera*, *Westphalingia*, *perspicua*, and *Humei*. Mr. Clark, gr. to T. Smith, Shirley-park, showed *E. densiflora translucens*, and *Juliana*, all exceedingly fine. From Mr. Jackson, of Kingston, there were admirable plants of *E. Jasminiflora alba*, *aristella*, *tricolor speciosa* (an elegant variety), *Savilleana*, and a specimen of *odorata*, four feet in height, a wonderful plant. Mr. Barnes exhibited, as a single specimen, *Erica Massoni*, which was in the very highest state of excellence. The Orchidaceous plants were better than those at the last show, and in greater numbers. Mr. Mylam, gr. to S. Rucker, Esq., Wandsworth, exhibited, besides some that were at Chiswick, a very fine plant of *Cycnoches Loddigesii*, with *Cirrheæ tristis*, *C. fusculeta*, *Epidendrum pastoris*, *Peristylia pendula*, *Oncidium lanceum*, *Coryanthes maculata*, *Cycnoches ventricosum*, and a separate specimen of *Aérides affine*. Mr. Goode, gr. to Mrs. Lawrence, Ealing Park, produced a very pale and small-flowered *Barkéria spectabilis*, a large *Dendrobium moschatum*, *Stanhopea grandiflora*, and *Huntleya violacea*. From Mr. Appleby, gr. to T. Brocklehurst, Esq., the Fence, near Macclesfield, there were *Vandates*, *Oncidium divaricatum*, *Brassia verrucosa*, the deliciously-scented *Epidendrum ionosum*, and *Oncidium roseum*, with a fine specimen of *Saccolabium guttatum*. From — Cox, Esq., were *Cirrheæ viridi-purpurea*, *Cattleya Harrisoniæ*, *Stanhopea tigrina*, and *Oncidium luridum guttatum*. From Mr. Barnes, gr. to G. W. Norman, Esq., there was a good specimen of *Oncidium lanceum*, and another of *Cypripedium spectabile*. In Fuchsias, there was little that differed from those shown at Chiswick by Messrs. Lane and Mr. Catleugh. A collection by Mr. Gaines, however, contained *F. princeps*, a short-flowered variety, with good colours, and blooming freely; *ilicifolia*, an elegant old-fashioned kind, with deeply cut leaves; *aurantia*, a light-coloured sort, having an indistinct tinge of pale orange in its flowers; and *excelsa*, which has a good habit. Mr. Brazier, gr. to W. H. Storey, Esq., produced a fine trained specimen of *formosa elegans*; Mr. Tucker, gr. to A. Crofton, Esq., Hampstead, a beautiful tree-like plant of *globosa major*; and Mr. Smith, of Dalston, a new variety, called *incarnata*, the flowers of which are pale pinkish, with a light red corolla. It is pretty, and rather distinct. The collections of cut Roses, by various exhibitors, were more splendid than usual. Those in pots were in no degree remarkable. Of climbing plants, there was a good *Philbertia grandiflora*, *Lophospermum scandens*, an immense specimen of *Hardenbergia monophylla*, *Batatas bonariensis*, and *Tweedia cœrulea*, from Mr. Clarke, gr. to T. Smith, Esq., Shirley Park. The specimens of various plants, exhibited by themselves, were *Statice sinuata*, a very handsome specimen, from Mr. Jackson, of Kingston; a large *Gloxinia maxima*, from Mr. Mountjoy, Ealing; *Mimulus Frazeri*, a dark-flowered variety of *M. cardinalis*, from Mr. Frazer, of Leyton; *Pimelia decussata*, of a great size, and well-grown, from Mr. M'Arthur; *Epiphyllum speciosum elegans*, a variety with large, deep, crimsony pink, and very full flowers; and *Verbena striata*, a red-flowered kind, with small indistinct white stripes in the blossoms. The exhibitions of Shrubby Calceolarias contained some good plants by Mr. Barnes, gr. to G. W. Norman, Esq., of Valentine, Standishii, incomparable, Shrubby perfection, Landmark, Virgin Queen; and by Mr. Gaines, of Celeste, Incomparable, Lavis superba, Attila, and Favourite. The herbaceous kinds, which were very good, by Mr. Barnes, were *Princess Royal*, *Glow-worm*, *Model of perfection*, *Lady Sale*, *Gazelle*

and *Delicatissima*; and by Mr. Catleugh, Commodore, Solomon, Isabelle, Magna, Surprise, and Claudia.

The following collection of PELARGONIUMS was exhibited by Mr. Cock, not for competition:—*Maid of Honour*, *Erectum*, *Flash*, *Marcella*, *Madelina*, Mr. Gaith, *Victory*, *Selma*, *Evadne*, *Rhoda*, *Joan of Arc*, *Flamingo*, *Grand Monarch*, *Mabel*, *Master Humphrey*, *Lord Mayor*, *Corona*. Mr. Henderson showed also, not for competition, —*Erectum*, *Shepherd's Queen Victoria*, *Priory Queen*, *Wilson's Superba*, *Madonna*, *Beauty*, *Coronation*, *Enchantress*. Pelargoniums in collections of 6 varieties, in 24-sized pots:—1st prize, Mr. Dobson, gr. to Mr. E. Beck, Isleworth, for *Luna*, *Leonora*, *Evening Star*, *Meteor*, *Erectum*, *Cleopatra*. 2d prize, Mr. Stains, Middlesex Place, for *Coronation*, *Orange Boven*, *Priory Queen*, *Madelina*, *Prince of Wales*, *Superba*. The number of specimens exhibited in this class by Nurserymen was doubled, and the 1st prize was awarded to Mr. Gaines for *Gigantea*, *Commodore*, *Lady Cotton*, *Shepherd*, *Orange Perfection*, *Madelina*, *Euterpe*, *Royal Adelaide*, *Lady Prudhoe*, *Rising Sun*, *Augusta*, *Cotherstone*, and *Jubilee*. 2d prize, Mr. Catleugh, for *Queen of the Fairies*, *Juliet*, *Angelina*, *Unit*, *Mulberry*, *Symmetry*, *Jubilee*, *Luna*, *Tournament*, *Amina*, *Enchantress*, and *Queen of Beauties*. Pelargoniums in collections of 6 varieties in 12-sized pots:—1st prize, Mr. Bell, Chelsea Hospital, for *Coronation*, *Erectum*, *Comte de Paris*, *Florence*, *Climax*, and *Sylph*. 2d prize, Mr. Bourne, gr. to Sir E. Paget, for *Chelsea Pensioner*, *Erectum*, *Sylph*, *Speculum*, *Mabel*, *Nymph*. 3d prize, Mr. Hunt, gr. to Miss Traill, for *Prince of Wales*, *Jubilee*, *Louis Quartorze*, *Corona*, *Mrs. Stirling*, *Matilda*. The number exhibited by Nurserymen in this class was doubled:—1st prize, Mr. Catleugh, for *Hebe*, *Unit*, *Una*, *Comte de Paris*, *Lord Mayor*, *Duchess of Sutherland*, *Witch*, *Selma*, *Priory Queen*, *Jubilee*, *Victory*, *Matilda*. 2d prize, Mr. Gaines, for *Matilda*, *Juba*, *Alba Perfecta*, *Exquisite*, *Captivation*, *Sylph*, *Joan of Arc*, *Rosea Perfecta*, *Rienzi*, *Lady Isabella Douglas*, *Victory*, *Nymph*. Pelargoniums in collections of 4 varieties, in No. 8-sized pots:—1st prize, Mr. Hunt, for *Erectum*, *Sylph*, *Lelia*, *Jehu*. 2d prize, Mr. Bourne, for *Victory*, *Fanny Garth*, *Horace*, and *Erectum*. Several specimens by different exhibitors were placed in this part of the tent, not for competition.

RANUNCULUSES were exhibited by Mr. Ansh, and by Mr. Alexander. The 1st prize was awarded to Mr. Ansh, for *Prince Albert*, *Hester*, *Catalani*, *Charlotte*, *Herald*, *Skiddaw*, *Rob Roy*, and *Aust*; *Milo*, *Nonesuch*, *Henriette*, *Carmine Superb*, *Mountain Sylph*, *Adeline*, *Wonder*, *Prince of Wales*, *Nelson*, *Victoria*, *Pretiosa*, *British Queen*, *Mirabelle*, *Sir R. Peel*, *Othello*, and *Clarissa*. 2d prize, Mr. Alexander, for *Mrs. Nielson*, *Bartlett's Charlotte*, *Questor*, *Adm. Napier*, *Maggie*, *Princess Royal*, *Tyso*, *Edgar*, *Veder*, *Queen of the Isles*, *Don Roderick*, *Mary*, *Henning*, *Elvira*, *Minos*, *Robert Burns*, *Horace*, *Lady Peel*, *Demosthenes*, *Ninus*, *Alexander's Rienzi*, *Princess*, *Annette*, *Scout*, *Aurora*, *Ensign*, *Mr. Wyse*, *Romeo*, *Tricolor*, *Emancipator*, *St. Paul*, *Nippareil*, *Felix*, *Pactolus*, *Triton*, and *Sir Wm. Wallace*. In PINKS, the 1st prize was obtained by Mr. Norman, for *Bunkell's Queen*, *Hodge's 166*, *Lord Brougham*, *Garrat's Alpha*, *Dean Swift*, *Little Wonder*, *Collins's Majestic*, *Nevill's Hope*, *Norman's Henry*, *Prince of Wales*, *Ibbet's Triumphant*, *Hero of Kent*, *Prince Albert*, *Queen of Roses*, *Dawson's Gauntlet*, *Lady Flora Hastings*, *Cray's Beauty*, *Willmer's Queen*, *Bunkell's Eclipse*, *Church's Rowena*, *Omega seedling*, and *Marianne*. 2d prize, to Mr. Brown, for *Willmer's Victory*, *Cousen's Little Wonder*, *Lady Auckland*, *Omega*, *Norman's Defiance*, *Earl of Uxbridge*, *Lady Flora Hastings*, *Majestic*, *Barret's Conqueror*, *Ibbet's Little Wonder*, *Rainbow*, *White's Warrior*, *Rosanna*, *Keynes's Alpha*, *Diamond*, *Garrat's Alpha*, *Gauntlet*, *Eclipse*, *Model*, *Creed's President*, *Ne plus Ultra*, *Seedling*, *Coronation*, *Countess Stanhope*. A collection of very fine Irises was sent from Mr. Lockhart, embracing all the variations from delicate white to deep purple, many of them beautifully variegated.

SEEDLINGS.—There were several seedling Pelargoniums, most of which would have taken prizes two or three years since; but owing to the improved varieties lately exhibited, these specimens were not considered sufficiently good to have prizes awarded to them. A seedling *Calceolaria* named *Illuminator*, from Mr. Standish, of Bagshot, was selected for a prize, and one from Mr. Green, called *Majestic*. A sweet-scented seedling *Cineraria* came from Mr. Piper, and a flower of good properties was also noticed, named *Princess Royal*.

There were interesting collections of dried and named Agricultural Grasses from Mr. Moore, Albany-st., Mr. G. Turner, and Mr. Coates, Norwood. Those of the first-named exhibitor had been pressed, and were fastened to paper, while the other were free, and stood erectly. Specimens of the Chevalier Barley were sent by Mr. T. P. Herne. A group of the species of *Statice* was furnished by Mr. Wood, nurseryman, of Norwood; and British Ferns, in pots, by Mr. Wood and Mr. G. Turner.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

At a Weekly Council, held at the Society's house in Hanover Square, P. Pusey, Esq., in the chair, C. Arkwright, Esq., of Dunstall Lodge, near Burton-upon-Trent, Staffordshire, was elected a Governor, and 45 gentlemen Members of the Society. R. Creed, Esq., Secretary of the London and Birmingham Railway Company, informed the Council that the Directors had passed a resolution by which, during the Society's ensuing meeting at Derby, no increase is guaranteed on the usual fares for passengers, while on the already reduced charges for the conveyance of cattle and agricultural implements, a further reduction would on that occasion be made of one-third. Mr. Colville, M.P., stated that an office for the registration of furnished houses or apartments, similar to the one established at the Bristol Meeting last year, had been opened at No. 14, Market-place, Derby, where Mr. Moody, the Registrar, would receive and duly attend to all the wishes of parties applying to him on that subject. Mr. Miles, M.P., having read letters received from Mr. Handley and Mr. Graburn, on the character of the soil adopted for the trial of implements and the exhibition of their peculiar principles of action, hoped that satisfactory arrangements would be made for this purpose; when Mr. Pusey stated, that, in order to test the implements on a soil with which the Derbyshire farmers were most familiar, the Council had ordered that every attempt which the weather would allow should be made to effect that trial on the strong land at Mickleover originally selected for the purpose, and which would be brought by the requisite processes of ploughing, harrowing, &c., into as favourable a state as the soil would admit of. The Hon. R. H. Clive, M.P., gave notice that, on the 28th inst., he should propose that prizes be given for long and short Down sheep; Mr. Cherry that an alteration be made in the prizes for horses, and in the mode of their designation; and Mr. E. David, that prizes be given for Dairy cattle. Mr. Clive also proposed that a prize should on some future occasion be given for the best mode of keeping farming accounts and taking stock. Mr. Cherry submitted the model of his new Land Roller in sections, having changeable points of traction; whereby comparatively uniform pressure may be given to uneven surfaces. Mr. Cherry at the same time explained the advantages of a smith's forge, of simple construction and light weight, which he had also presented on a former occasion, and which, being easily transferable from place to place, became suitable for jobbing purposes on extensive farms. Mr. Barton read an interesting case of self-advancement in agricultural industry, which he had met with in passing through Norfolk; Mr. Pusey communicated an account of a new variety of Rye from Mr. Taunton, and a statement of Count de Lichtenburg, of Vienna, on some new seeds he had sent him, which he intended to try, and would report the result to the Council; Mr. Kirberry, of Oxfordshire, communicated the results of his experience in the use of his Dribbling machine; and the Rev. W. D. Bromley, of Derbyshire, the account of his mode of shedding ewes on mountain farms.

A Weekly Council was held at the Society's house, Hanover-square, on Wednesday, the 21st of June, the Right Hon. Lord Portman, Vice-President, in the chair. A. J. Robertson, Esq., of Inshes, near Inverness, Scotland, was elected a Governor, and 36

gentlemen Members of the Society. Mr. Henry Colman, Agricultural Commissioner from the United States, presented a model and sectional drawing of Atwater's Steam Generator, for domestic use, for cooking food for cattle, and for several other purposes to which steam may be applied. Mr. Colman stated that the principal advantages of the invention were the rapidity with which steam might be produced, the little cost of the machine, the small amount of fuel it required, and its portableness. Mr. Colman likewise presented a sample of sugar made from the stalks of Indian Corn, or Maize (*Zea Mays*). This was a fair sugar, and in the state in which it was taken from the pans after the evaporation of the juice. Mr. Colman considered that this sugar might be made a most valuable product wherever the Indian Corn could be grown, and stated that the plant, when sugar is to be made from it, is not allowed to ripen, or even to form its seed, and that the stalk only is used. The leaves or blades and the top of the stalk, commonly called the spindle, may be saved for fodder, and the stalks, after they have been pressed, will furnish feed for cattle. Mr. Colman remarked that it had been already ascertained that more than 1000 lbs. of sugar can be obtained from a single acre, and he had no doubt that probably double that amount would eventually be obtained by proper cultivation and management, the manufacture being yet in its infancy; but that in respect to cost, quality, and the facility with which farmers may supply themselves with this important article of domestic consumption, the best results might confidently be anticipated. The sample then submitted to the notice of the Council was derived from a first attempt at the production of the Indian Corn sugar in America, but there was no reason why similar success should not attend the trials made in this country. Mr. Colman also presented several specimens of Flax, prepared by steam, with a view to its being spun on common Cotton machinery; namely—Specimen No. 1, Green Flax, broken, and the fibres separated entirely by the action of machinery, and called the "Stem Flax"; No. 2, Green Flax, broken, the fibres separated, and the glutinous matter washed out entirely by the action of machinery and pure cold water. No. 3, Flax which had gone through the same processes as the two former specimens; with the addition of hot water, and a small quantity of alkali in the last water; also shortened and equalized for spinning. No. 4, Yarn spun from Flax in specimen No. 3, on a Cotton throstle, with the preparation and carding altered. Mr. Colman at the same time presented a specimen of Perennial Flax, from a plant growing wild in Calhoun County, Michigan, U.S., and transmitted to him by Mr. T. I. Walker, Eckford. The following specimens of Silk and Cotton were also presented by Mr. Colman: 1, a specimen of wild silk found upon the forest tree in the interior of Mexico, produced by an insect, said to be of the spider family; 2, a specimen of Silk Cotton, from a tree of the Bahama Islands, and resembling floss-silk; 3, a specimen of native Cotton, found growing in a wild state in the interior of Mexico, the produce of a large tree. Mr. Davenport submitted and explained a machine invented by his bailiff, Thomas Scragg, for making pressed tiles, at 15s. per 1000, the coal being calculated at 12s. per ton, carriage included. Mr. Davenport stated that this machine would work clay containing stones, and allow the hand to penetrate into it for their extraction. Mr. Pusey, M.P., informed the Council that in his paper on thorough draining in the last Journal (page 48), in referring to the tile machine of Mr. Etheredge, of the Woodlands, near Southampton, he had stated that he understood the inventor to have disposed of his patent to Messrs. Ransome, and to make his tiles without the construction of "sheds!" He had, however, been recently informed by Mr. Etheredge that he had not disposed of his patent, and that he makes his tiles without "shelves," but not without sheds. Mr. Pusey then read an interesting communication he had received on the manufacture and application of pipe-tiles, from Mr. H. Dixon, of Witham, in Essex, whose experience in the use of that system of tile-draining had convinced him of its being the most permanent and economical. Mr. Hobbs stated that he could vouch for the correctness of the details then laid before the Council, and for the goodness of the tiles in question; Mr. Dixon having done more for land-draining and care in the manipulation of tile-making than any other person in the county. Mr. Barnes obtained leave to submit various specimens of Norfolk Flax, and explain the circumstances of their growth and management.

LINNÆAN SOCIETY.

June 20.—Edward Forster, Esq., in the chair. Robert Brown, Esq., Edward Forster, Esq., Sir W. J. Hooker, and Dr. Horsfield, were nominated Vice-presidents. A list of the names of Fellows was read over, whom the Council proposed should be expelled the Society for non-payment of arrears. A paper was read from Mr. Sutor of New South Wales on the Forest-trees of Australia. The author described most of the trees according to their colonial names, and gave some details of the economical and medical uses to which they were applied. The black-barked Gum tree is remarkable for its gigantic height, and is one of the largest trees in the colony. The *Eucalyptus mannifera*, is called Manna tree by the colonists, and yields a saccharine secretion, closely resembling manna. The colonists use this secretion for the same purposes as sugar, and it is said also to have the same medical properties as manna. An account was also given of various trees known by the name of Stringy Barks, also of the Mahogany and Cedar-trees of the colonists. These trees belong to very different families from those known by the name of Mahogany and Cedar in Europe, but there is a resemblance in the character of their woods, and they are applied to the same purposes by the colonists. Mr. Varley exhibited a new microscope with an improved stage phial-holder, and graphic eye-piece. Mr. Powell also exhibited one of his powerful instruments.

FLORICULTURAL SOCIETY.

THE Floricultural Society held their annual exhibition for seedling Pinks, Pansies, and Pelargoniums, on Tuesday, 20th, and for Class-showing in the two first-mentioned flowers. Upon the tables was a very fine collection of Roses, from Messrs. Paul and Son, of Cheshunt; they were in the most perfect condition. From Messrs. Chandler and Son, Vauxhall, specimens of *Pimelia hispida*, *Spiræa japonica*, *Fuchsia St. Clare*, and an extensive collection of cut bloom of *Verbenas*, *Petunias*, and *Pelargoniums*. A very beautiful seedling Moss Rose was brought to the meeting by Mr. Hooker, named *Hooker's Moss*; it bears a resemblance to the *Duc de Luxembourg*, but appears a finer variety; its superiority consists in the flower being fuller of petals, rather deeper in colour, with a tinge of crimson, which takes off the dullness which is apparent in the older flower. The Moss is rich in colour, and abundant. Mr. Hooker also exhibited fine specimens of the double Yellow Persian. Mr. Rendle placed on the table cut bloom of *Lyne's Apollo*, a Pelargonium of great clearness and brilliancy of colour; the flower is well formed, of good substance, with rosy vermillion under-petals, scarlet vermillion upper petals, with a small spot. *Lyne's Sappho*: the beauty of this variety lies in the lower petals, the centre being pure white, and the remainder of the petals of a deep bright pink; the flower is of good substance, but opens too flat; and the white centre appears to encroach upon the upper petals, which give them a coarse appearance. PELARGONIUMS.—A 2nd class prize was awarded to *Lyne's Princess Aber*, a clear and brilliant flower; under-petals salmon-pink, dark upper petals, with a margin of bright rosy vermillion. PANSIES.—*Cook's Delight*, 1st class: this flower was again exhibited; in form this flower is perfect, in colour and marking it is the same as when before shown. *Cook's Prince Albert Superb*, deep rich Mulberry-coloured self; fine form. 2nd Class.—*Triumph*, *Welch*, a very peculiar deep blue, a very desirable colour; texture good, flower rather crumpled. PINKS.—1st Class prizes were awarded to Mr. Willmer, of Sunbury, for *Elizabeth*; and to Mr. Norman, for *Flora*. 2d Class prizes, to Mr. Gaines's *Surprise*, Mr. Norman's *William*, and Sir George Oust, all seedlings of the present year. Willmer's *Elizabeth* is a very chaste flower; the white very good, the lacing dark, and (with the exception of the guard petals, in which there was a little deficiency) good and well defined. Many other seedlings were also shown, but not placed. CLASS-SHOWING.—PINKS.—*Amateurs*: Best Red Lace, 1, Mr. Trevors, *Riton's*

Glory; 2, Mr. Bragg, Countess Stanhope. Best Purple, 1, Mr. Trevors, President; 2, Mr. Bragg, Self's Mary Ann. Best Dark, 1, Mr. Trevors, Navigator; 2, Mr. Trevors, Little Wonder. *Nurserymen's*—Red Lace, 1, Mr. Norman, Hodge's 166; 2, Mr. Willmer, Hardstone's Beauty of Cray. Purple, 1, Mr. Norman, Duke of Northumberland; 2, Mr. Norman, Majestic. A collection was also exhibited by Mr. Norman, consisting of Bragg's Duchess of Cornwall, Hardstone's Prince Albert, Hardstone's Beauty of Cray, Willmer's Queen, and Prince of Wales; Lady Flora Hastings, Burchett's Little John, Hodge's Malona, Hopkins's One in the Ring, Holmes's Coronation, Norman's William, Henry Creed, and a seedling; Hodge's 166 (a very good flower), Bunkler's Lady Berners, and Queen Victoria (a novel and striking variety), Wallis's Beauty, Stevens's Sir G. Cook, and Cousin's Coronation.

SURREY FLORISTS' SOCIETY.

THE Pink Show of this respectable Society took place on Monday last, when the following Prizes were awarded:—*Nurserymen*—Mr. Back, Hornsey-road, best 12: Omega, Diamond, Willmer's Queen, Holmes's Coronation, Joe Miller, Unique, Seeding, Bunkler's Queen Victoria, Navigator, Gem, Iris, and Admiral Stopford. Mr. Back was also awarded an extra prize offered by a Member, for a Collection of Twelve, which consisted of nearly the same flowers as the above. *Amateurs*—Best 12: 1, Mr. Mcade, Lewisham, Navigator, Earl of Uxbridge, Bunkler's Queen Victoria, Coronation, Diamond, Gem, Ibbett's Triumphant, Little Wouner, Unique, Legg's Prince Albert, Barrett's Conqueror, and Earl Stafford. 2, Mr. Trevors, Walworth; Bunkler's Queen Victoria, Lady P. Hastings, Coronation, Omega, Regulator, Miss Jeanes, Sir R. Peel, Little Wonder, Lady Allowell, Hodge's 166, President, and Gem. The flowers were much better than might have been anticipated from the weather and the limited extent of this Society, the principal object in its formation having been for the encouragement of the more humble class of Florists in the neighbourhood, who feel that they would in vain compete with more powerful rivals. We hope they will be patronised by their neighbours.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

THE last general meeting of this Society was rendered unusually interesting, by the reading of several communications on horticultural subjects, and the discussions to which they gave rise. The first was by Mr. James M'Nab, the able curator of the Society's Experimental Garden, on the speedy and certain propagation of Victoria Rhubarb by seed. In the middle of March, 1842, he sowed a well-trenched and manured break with seed saved by himself in autumn, 1841. During the summer the seedlings were thinned out and kept clear of weeds, and on the approach of winter the break was covered with a layer, four inches thick, of old hotbed manure. Towards the end of February last, diluted liquid manure was poured over the litter, just as the plants were pushing through it. By the middle of March this year, or exactly a year after sowing, some of the leaf-stalks were quite fit for culinary use, and by the 1st of June they were quite in size those of the parent plants, as shown by specimens produced to the meeting, and were as crisp and tender as any in cultivation. The next communication consisted of an account of the numerous species and varieties of Rhododendron, cultivated at Dysart House garden, by Mr. John Blair. Of this paper it is scarcely possible to give an abstract; but this is of less consequence, as we have reason to believe that it will speedily appear at full length in Mr. Loudon's "Gardener's Magazine." A communication from an English gardener, Mr. John Hankin, of Hunmanby, on the raising of large Mushrooms, and on preventing the damping off of the young crop, excited a good deal of notice. The bed being formed in the usual way, and well beaten down, spawn which had lain at rest for a year is introduced into holes at regular short distances. The whole is finished off with a layer of small coal, about an inch thick, riddled through a sieve having meshes a quarter of an inch wide. This layer is slightly beaten down with the back of a spade, and is found effectually to prevent the damping off of the Mushrooms as they appear; and the crop comes clean and of large size. A short but important paper by Mr. James M'Nab followed, on the production of damask Rhododendrons. He first briefly explained the mode of hybridizing, and then stated the results which had been obtained by crossing various species, from different countries and climates. For example, when the pollen of the Nepal Rhododendron arboreum, a tender scarlet sort, was used to fertilize the harder purple species, *R. caucasicum*, from the heights of the Caucasus, or *R. catawbiense* from North America, they being previously forced into bloom, the progeny was found to flower considerably earlier than either of the parents employed, and the male generally prevails in determining the colour of the blossom. Mr. James Drummond, gardener at Blair Drummond, gave an account of his mode of cultivating the varieties of *Celosia cristata*, in the production of which, with crests of very large size, he has been eminently successful. He nourishes copiously, employing twice a week a strong liquid manure, consisting of an infusion of sheep's droppings, pigeon-house cleanings, soot, and black soap. A communication from Mr. Wm. Findlay, gardener at Largo House, on the culture of Onions, was likewise read. In preparing the ground, and to prevent the attack of the maggot or wireworm, he employs a sprinkling of soot, a somewhat larger proportion of slacked lime, and a thin layer of dove-cot cleanings. He sows in drills, and is an advocate for early sowing; by the middle of January at latest. He thus very sparingly, finding that the Onions bulb more readily when they are touching or pressing upon each other in the lines. He prefers the white Spanish Onion, as coming earlier, and seldom failing to yield a crop. Lastly, a paper by Mr. James M'Nab was read, giving an account of experiments tried with guano, both in powder and in a liquid form, during the year 1842. From the results of these experiments, he cautioned amateur cultivators against the use of this strong manure for young, soft-wooded plants, grown in pots, such as Pelargoniums, Calceolarias, Cinerarias, or Verbenas, a number of which had suffered greatly from its application. With hard-wooded or succulent plants more freedom may be used; but no decided advantage accrued from the employment of guano. Several experiments were also detailed of its effects on a grass lawn, and on crops of kitchen vegetables. The results were not more satisfactory; but this, he thought, might partly be ascribed to the unusual drought of last summer, and to the sandy nature of the soil of the Society's garden.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

SCUTELLARIA SPLENDENS. Splendid-flowered Skullcap. (*Stove Herbaceous Plant*.) Labiate. Didynamia Gymnospermia.—At the nursery of Messrs Henderson, Pine Apple-place, this pretty species flowered, apparently for the first time in England, during the autumn of 1841, and continued blooming throughout the whole of the winter, and the entire season of 1842. It is said to be a native of Mexico, and is one of the few examples of plants in the genus bearing scarlet flowers. It is a dwarf and compact-growing plant, apparently of an evergreen herbaceous or sub-shrubby habit, and sending up numerous stems, from the tops of which the spikes of flowers proceed. These are of a rather loose elegant character, and the individual blossoms, though somewhat small, are of so splendid a deep scarlet tint that the plant is rendered attractive from this circumstance. Further experience concerning its nature may show the propriety of keeping it in a greenhouse; and if so, it will become a more valuable plant. It is at least desirable that its capabilities of thriving in a lower temperature should be tried. It is propagated by cuttings, which, if taken off in early spring, will strike freely in a warm, moist, and shaded place. Their removal will induce the plant to form a greater quantity of laterals, and thus the amount of blossom will be increased; for a spike of flowers is produced by each of the shoots that is tolerably strong. The plant may be grown in the common mixture of loam and heath-mould, and should be

watered pretty freely while it is growing. It does not need a large pot, and is well suited for placing on a shelf or stage among Gloxinias and other low-growing plants.—*Paxton's Magazine of Botany*.

HOVEA SPLENDENS. Splendid-flowered Hovea. (*Greenhouse Evergreen Shrub*.) Leguminosae. Monadelphica Decandria.—Raised in the nursery of Mr. Knight, King's-road, Chelsea, from seeds collected in the Swan River colony, and presented to Mr. Knight by Captain Mangles, R.N. It flowered about two months ago in a warm greenhouse. In its general characteristics, particularly in the flowers, it bears a considerable resemblance to the best of all Hoveas, *H. Celsii*. On a more attentive inspection, however, and a comparison of the two plants, they are materially different. The leaves of *H. Celsii* are distant, rather oval than ovate, pale green, and retuse at the extremity. Those of *H. splendens* are closer, more thoroughly ovate, a little inclined to be cordate at the base, stipulate, having a strong mucrone at the end, and deep green, even in a stove, on the upper side. The flowers appear always to come in pairs, and the branches seem altogether weaker than those of *H. Celsii*. In regard to the blossoms, they are nearly equal in size, and quite as rich in colour, as those of the species with which we are now comparing them. Unless the roots of these plants are carefully watered, and the soil kept well drained, there is no tribe more likely to die off in a sudden manner when they have attained any size. They should be potted high in the centre of the pot, so as to have the junction of the roots with the stem almost bare; and we would prefer a soil with more of light open loam in it than one containing so much heath-mould as is commonly used. But whatever soil be chosen, it should be well mixed with pieces of broken stone or potsherds for drainage. The species is increased by cuttings.—*Paxton's Magazine of Botany*.

DENDROBIUM TAURINUM. Bull-headed Dendrobium. (*Stove Epiphyte*.) Orchidaceae. Gynandria Monandria.—Among the sections of the genus no one is better marked than that called the spatulate, which consists of species with a stiff erect habit, racemes of flowers placed on a long peduncle opposite the leaves, large showy flowers, and the petals remarkably longer than the sepals. But beyond this there is nothing that differs from *Dendrobium*; and as the three first characters are merely of habit, the last can hardly be regarded of enough importance to authorize the establishment of a genus. The present plant is a native of Manila, whence Mr. Cuming sent it to Messrs. Loddiges. It has large flowers, with yellowish-green sepals, rolled back at the points, very long, deep purple, twisted petals, and a paler purple lip, with three elevated lines along the middle, and a few small tubercles near the apex. The column is short and somewhat pouted at the base, in consequence of the lip being adherent to it at that place. The plant is five feet high. It flowered at Hackney in October last. Dr. Lindley has wild specimens from Mr. Cuming; but they are not nearly so handsome as that now figured from Messrs. Loddiges.—*Botanical Register*.

MISCELLANEOUS.

New Strawberry.—Mr. Myatt, of Deptford, has this year produced another fine variety of this fruit, which he proposes to call the *DEPTFORD PINE*. The foliage is something like that of the Downton, and is very hairy underneath. The fruit which has been submitted to us is magnificent, with the clear rich scarlet colour of the Downton and Elton when nearly ripe. Many of the berries are 5 and 5½ inches round, a little inclined to Cockscomb, and, when not so, having the appearance of an enormous Elton. The flesh is firm and heavy, and well suited to stand travelling. When quite ripe the flavour is very good; not so rich as the old Pine, but most agreeably acid. In warmer and brighter seasons it will probably be first-rate.

Neill Testimonial.—A testimonial of respect has been presented by the Scottish Practical Gardeners to Dr. Neill, in the form of a handsome silver vase, supported on a triangular pedestal, and standing on an appropriate plateau. On one side of the vase is placed a medallion likeness of Dr. Neill, surrounded with a wreath of flowers composed of *Nierembergia calycina*, *Philibertia grandiflora*, and *Tweedia cærulea*; originally introduced by that gentleman. On the opposite side is the following inscription:—"Presented to Patrick Neill, LL.D., F.R.S.E. &c., Secretary of the Royal Caledonian Horticultural Society, by Six Hundred Practical Gardeners, Natives of Scotland, in testimony of their high esteem for his personal character, and gratitude for the zealous and long-continued devotion of his time and talents to the cause of Horticulture, and the interests of its Cultivators. Edinburgh, 22d June, 1843." We regret that our limited space prevents our giving a report of the dinner which took place on this interesting occasion. Few men have deserved better of gardeners than Dr. Neill.

Arrowroot Pudding (Soufflé).—Three table-spoonsful of Arrowroot to half a pint of milk, and one ounce of butter mixed in with it. To be boiled till thick, stirring it all the time. Two ounces of loaf sugar, half a dozen Bitter Almonds, four eggs, the yolks and whites beat separate. Mix the sugar, Almonds, yolks of eggs, with the milk, &c., and add lastly the whites of eggs beat to a froth. Twenty minutes, or half an hour, to bake it.—*Arrowroot Mange*.—Take three table-spoonsful of Arrowroot, with a little milk to mix it. A pint of milk put on the fire, with eight Bitter Almonds chopped fine, or bruised, and two Laurel leaves, and three to four ounces of loaf sugar. Pour the boiling milk on the Arrowroot, stirring it well, and give the whole a boil up till it thickens. It must be turned into a mould. To be made the night before required. It should look like Blanc Mange. [We wonder the West Indian cultivators do not turn their attention more to the production of Arrowroot. If it could be had genuine, at a moderate price, it would be largely consumed in England. But 3s. or 4s. a pound is a prohibitory price.]

GARDEN MEMORANDA.

Messrs. Henderson's, Pine Apple Place.—As is usual at this nursery, all the show-houses are very beautifully decorated with flowering-plants, which in the principal one, are always preserved much longer in flower by a moderately thick shading of canvas during bright sunshine. There is a house full of Pelargoniums in splendid bloom, which are trained rather in a half hemispherical manner, or to one side, than in that more regular and spreading manner which is common with the plants prepared for exhibitions, and from being thus managed, they are well fitted for standing on taller stages, where they make a gorgeous display. Among them we observed a new variety called *Shepherd's Queen Victoria*. It has by no means a fine flower, but the habit is so dwarf and compact, the blossoms so very abundant, and there

is such a pleasing mixture of white and crimson in the flowers that it is likely to be quite a favourite. The plant to which we refer was admirably grown. There was another new variety, too, named *Unique*, a small flower, altogether wanting in form, but of a most novel colour, this being a dark sanguine purple. The great merit of these two plants is that they differ so strikingly from the ordinary kinds, as to be likely by hybridization with others, to introduce a fresh race, and thus maintain the novelty of character, without which all florists' flowers must pass into oblivion. In a border, fronting a wall with an eastern aspect, is a good collection of the newest Verbenas. The plants are very carefully pegged down, and are growing beautifully. The handsomest varieties we noticed were *Hendersonii*, which is in the way of a large *Chamaedrifolia*, with deep velvety purple flowers, and *Princess Royal*, which greatly resembles one named *Queen*, and which has close heads of large whitish flowers, of a very perfect form. This last is the finest *Verbena*, in regard to the size, arrangement, and shape of its flowers, we have yet seen. A variety of *Phlox Drummondii*, raised by Mr. Wood, of Maresfield, and known by his name, is blooming in one of the borders, and, besides being of a very superior habit, has superb dark crimson scarlet flowers. The pretty *Sedum cæruleum* is placed about in pots, in the open air, and is covered with inflorescence. *Calla Æthiopica*, planted in the bottom of a large exposed cistern or reservoir, has lately blossomed, and thrives exceedingly well there without protection. Spreading over several of the borders, and presenting broad trusses of delicate lilac bloom, is the elegant *Malva campanulata*, which is a most desirable plant for summer ornament. A variety of *Anthriscum*, too, bearing the name of *quadricolor*, is exceedingly curious and showy. In greenhouses there is a very large and handsome collection of *Calceolarias*, all extremely gay with their varied blossoms; *Scyphanthus elegans*, a very delightful plant; *Marianthus cæruleo-punctatus*, a beautiful little climber, loaded with neat blue flowers, the fine old *Lambertia formosa*, which is so rarely seen in bloom; *Sollya linearis*, superior to *S. heterophylla*, because having such deep-coloured blossoms; *Leschenaultia biloba* and *Euthales macrophylla*, which contrast well in point of colour; the large variety of *Lobelia heterophylla*, and also of *Lobelia erinus*, the latter just showing flower; and many beautiful Heaths. Some of the *Lobelias* are treated on the large-shift system, and are growing with surprising vigour and regularity. The plan is likewise applied to many other plants, of which the species of *Zichya* and *Boronia serulata* exhibit remarkably pleasing examples. In the stove, too, it is adopted with *Gloxinias*, and there is a noble plant of *G. rubra*, thus managed. Also in a stove, there are numerous plants of *Æchyanthus ramosissimus*, which, by varying its time of rest, is made to bloom now, and at almost all seasons of the year; *Angelonia grandiflora*, a good species; *Betleria pulchella*, a very ornamental old herbaceous plant; *Gloxinia macrophylla* variegata, novel and handsome; *Brugmansia floribunda*, now finely in flower; an excellent plant of *Hoya carnosa*, in a pot, and trained on a low conical trellis, flowering most abundantly; a variety of *Gesnera*, like *verticillata*, though with much darker flowers. *Columnnea Schiediana*, bearing a great number of its pretty white berries, which are almost as pleasing as the blossoms; *Allamanda cathartica*, one of the best of stove-climbers; and the lovely *Stephanotis floribunda*, planted out in a bed, extending over a large portion of the roof, and adorned with hundreds of its sweet scented blossoms. The *Orchidaceae* here are looking extremely well, and there is a fine specimen of *Cycloches chlorochilon* and others in the richest bloom.—*E. K.*, June 27.

Sir Charles Lemon's, Curlew.—There is at present blooming here a specimen of *Callistemon salignum*, raised from New Holland seeds. It forms an elegant shrub for the open border, where it has stood for the last four years without protection, and attained the height of seven feet.—*W. B. Booth*, June 19.

Reviews.

An Inaugural Lecture on Botany; considered as a Science, and a Branch of Medical Education. By Edward Forbes, F.L.S. 8vo. Van Voorst.

THIS discourse, delivered by Professor Forbes, on first meeting his Class in King's College, London, cannot fail to be read with interest by all who are either lovers of Natural History or concerned in the great work of education. It will be found a most skilful exposition of the connexion between Botany and general science, and by far the best plea we have yet seen for its universal adoption as a branch of education.

A few extracts will show the skilful manner in which Professor Forbes has handled his subject.

"Of all the Natural History sciences BOTANY is the most advanced and the most pursued. From an early period in man's history the attention of the observing had been directed towards the vegetable kingdom, partly from the facilities for the study of plants—assembled as they are in their various kinds abundantly around us—and partly on account of their virtues, real or imaginary. In the olden time the herborist and the physician were one: in nations as yet unemerged from their infant or barbarous state they are one still. The objects of the study were at first purely utilitarian. Fanciful resemblances to the forms or symptoms of disease furnished the principles of botanical arrangement. But continued inquiry, even when conducted upon false principles, led at length from empiricism to science, and the herborist ripened into the botanist. A new light broke upon him. Plants were no longer to be regarded as mere depositaries of decoctions and elixirs, but were to be examined for their own sakes. The wonders of their structure were exposed; the variety of their forms compared and classified. Their lives were written. The vital processes, continually going on within their bodies, were explored; their affinities with each other and with the animal kingdom investigated; and their history became a store, from whence could be drawn at pleasure numberless admirable examples of the perfection of design in creation, and of the benevolence and omniscience of the Creator.

"This change in the object and manner of the studies of the botanist did not, however, divorce the science from its union with medicine. On the contrary, it bound their ties firmer together. The true knowledge gained by studying the vegetable kingdom scientifically yielded more benefit to medicine than all the fancies and dreamy theories of the herborist. We learned that the properties of plants were correspondent to their natural affinities; and the discovery of the botanical relations of a species gave us the true clue to its useful qualities. Reason banished fancy from the selection of vegetable remedies, and the gain to medical science was great indeed.

"The teaching of Botany in its relations to Medicine is not one of the least important duties of this chair. But I should be deceiving my pupils and myself if I

encouraged for a moment the supposition that such object is to be gained by the mingling of herboristic notions with the more scientific parts of the subject. That the medical student acquires but little by his attendance at botanical lectures, is not an uncommon fancy among the senior members of the profession. Some eminent men have gone so far as to denounce it as lost time. The utmost the student is supposed to carry away is a knowledge of the names, classes, and orders of such plants as furnish products used in medicine. It seems to me that the true object of the connexion of Natural History studies with more professional pursuits is, as in this case, too generally lost sight of, and I gladly avail myself of this opportunity to urge their claims on your attention, and to plead for them on grounds which have not been put forward sufficiently prominent hitherto, though by no means novel, seeing that the positions I am about to maintain are avowedly acknowledged in private by most scientific teachers, though rarely advanced in the class-room. The plea which I wish to advance is, that the main use of the Natural History sciences to the student is not merely the teaching him a certain number of facts, the recollection of which may be serviceable to him in after-life, but the training his mind, by means of the peculiar forms of research which characterise those sciences, to that tone and vigour which must be of the utmost consequence in giving him power for future professional avocations of a different nature, especially such as are to form the after-occupations of the student of medicine.

"The two qualities most essential to the physician are *correct observation and accurate discrimination*. The first depends mainly on the power of seizing all the features of an object or case with clearness and facility, detecting adventitious characters at sight, and excluding such from all influence on our conclusions. The second implies powers of just comparison, of perceiving the mutual relations of parts or facts, and of testing the possible agreement of statements with the circumstances which accompany them. Now though all men are endowed with the elements of these qualities, all are not born correct observers or accurate discriminators. Men must be educated into such. The mind must be trained to reason justly, the instruments of the mind to observe correctly. The classical and mathematical studies of our youth are not intended merely to teach classics and mathematics, but to train us to the business of life, and to right judgment in the higher pursuits of men. The bodily exercises of our youth have not for their object merely those pleasures which such exercises afford, but the strengthening of our physical powers in order to ensure us a healthy and vigorous manhood. The training of the mind makes the intellectual man, the training of the body the physical man. The end is gained in both cases by means essentially distinct from that end. Now I hold that Natural History should be regarded in a similar light among the studies of the young physician.

"The first lesson of Natural History is observation. The study of an animal or vegetable species is the perfection of observation as far as that species is concerned. The form, the substance, the qualities, the phenomena of existence, the influence of surrounding objects, are all observed with the greatest precision, and defined so as to be capable of expression in words. No point affecting that species is left untouched. The study of a group or genus of animals or vegetables is in like manner the perfection of discrimination. All the members of the group are compared in all their parts with each other, the relations which they have in common are summed up, and their differences recorded in every possible point of view. The causes of those relations and differences are anxiously inquired into, and a survey is taken of the bearings of the whole group to its proximate allies, and, finally, to all equivalent assemblages in organized nature.

"Who can rise up from such a study and not feel mentally strengthened? The mind through such an exercise must gain in both its analytic and synthetic powers. Such an investigation calls into action all the faculties, the perfectionizing of which is essential to the formation of a sound physician. The mental process is the same at the bed-side of the patient and in the cabinet of the naturalist: its first element, correct observation, leading to correct diagnosis; the second, accurate discrimination, leading to sound methods of treatment in the one case, and philosophical views of affinity in the other."

The following is Professor Forbes's view of the value of the Linnæan system of Botany, long so universally followed, and now as universally abandoned—"Those who slightly think of the Linnæan system, as it is termed, forget in the present to look back fully and fairly on the past. They should remind themselves of the state in which Botany was when Linnæus undertook to make its treasures consultable. The understanding of things depends greatly on the perception of their order and relations. When that order and those relations require deep study ere we can comprehend them clearly, the man who gives us a clue, however insignificant it may be in its own nature, is not only conferring on us an invaluable benefit, but endowing the despised instrument with golden value. Such a clue did Linnæus give when he put forth the sexual system. The scientific systematist, surrounded by the stores of his herbarium, should not forget that those treasures were often amassed in the first instance by adventurous and earnest men, rendering good service by their hands and energy, as good in its humble way as that which he gives by his head and philosophy. It was not to be expected of such men that in the field they should occupy themselves with thoughts of arrangement or affinity; their part was to observe and select, and the guide to their observation and selection was in most cases no

other than the Linnæan system. In the scientific hive, as in the apiary, there must be working-bees and neuters as well as queens and drones: it is necessary for the economy of the commonwealth. An easy means of acquiring and arranging information is a great help to the workmen of science, and no department has gained more thereby than Botany, which, through the facilities afforded by the artificial method devised by Linnæus, has had its facts amassed in enormous quantity for the use of its more philosophic votaries, and owes its present advanced state in a great measure to such humble means.

"The clue to the labyrinth then having served such noble purpose becomes a consecrated object, and should rather be hung up in the temple than thrown aside with ignominy. The traveller returning from his adventurous and perilous journey of discovery, hangs up his knapsack with affection on the wall of his study. But travellers must return to the fields, if more is to be done; and so must Botanists, and each must have recourse again and again to those helps which aided them so well in their earliest journeys."

In this we entirely agree. The merits of the Linnæan system were transcendent for its time, but that time has long passed away. We regard it with all veneration as an object of antiquarian interest, but only as such. Like the armour that defended our ancestors, its place is among the relics of bygone times.

The Lecture is terminated with the following excellent remarks:—

"In conclusion, whatever the ultimate view of the student respecting the intention of his Botanical studies may be,—whether to enter upon them as exercises for the training of those faculties which are afterwards to be applied to professional purposes; or to engage in them with a determination of pursuing Botany as a science, and in the end developing its laws—or to gain an acquaintance with its facts in order to lay up an intellectual treasure for future hours of recreation or study in a life of business or leisure,—I would remind him earnestly to bear in mind, at the same time, the more serious benefits which may accrue from the study of Botany. That which Lord Bacon said of all knowledge is especially true of this department, that it "is not a couch whereupon to rest a searching and restless spirit; or a terrace for a wandering and variable mind to walk up and down with a fair prospect; or a tower of state for a proud mind to raise itself upon; or a fort or commanding ground for strife and contention; or a shop for profit or sale, but a rich storehouse for the glory of the Creator and the relief of man's estate."

CALENDAR OF OPERATIONS for the ensuing week.

From the beginning to the middle of July is the best time of the year to increase Roses from layers. The shoots are less brittle now, and on that account easier to handle than when they are ripe. There is much time saved also by summer layering, as the layers will be rooted, and fit to be bedded out in nursing rows next November. Besides, there need be no cold fingers about the business, as when done in February or March. Those who intend to grow Roses in pots for exhibition, or for private use, and for early forcing also, should have their plants worked on some free-growing variety of the Chinese breed. These are now throwing up strong suckers or shoots from near the bottom, which may be layered for stocks, and budded immediately, as recommended by other correspondents in earlier parts of this volume. The proper height at which these should be budded is a matter of taste; for private use you had better follow the common herd, and have yours from nine inches above the pot up to five feet or more. A few standard Roses are very useful in the conservatory in early spring; and you can always hide their ugly stems with other plants. For exhibition, on the other hand, standards will not do at all, unless they are exceedingly well managed, and rather dwarf than otherwise. For mere pot culture, stocks of the common China Rose are as good as any; the Bour-saults, however, possessing the softness and excitability of the Chinas, with the hardness of the Ayrshires, are considered by all growers to be the best stocks for general purposes. Any variety of this section will answer; Drummond's Thornless is one of them; so is the "Rose without a Thorn," as country people call it, and Rose de l'Isle. Either of these, that are readiest at hand, will do equally well with the crimson and common Boursault for stocks. In preparing the shoots for layering be very particular in picking out all the buds below where you intend working in the new ones; this will keep your stocks always free from suckers and side-shoots; not, however, unless the shoots are of this year's growth, as we have no power of this sort over older shoots, which are already coated over with a layer of organisable matter, that can throw out buds at every pore.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If you keep up a very moist atmosphere, you can hardly give too much top-heat to healthy vigorous young plants about this time; and if they stand the sun without shading so much the better; but a slight shade for a few hours will do no harm these long days. The chief attention required by the fruiting plants is to continue their season as long as possible.

VINEY.—The late Vines require the most attention now, except that they are kept more close, and with a greater degree of heat than the earlier ones at the same stage. The usual routine of thinning and tying up the shoulders, with an eye to the leading shoots, and stopping laterals, will do for them.

PEACH-HOUSE.—No fly, spider, or any other enemy, should get a footing in this house till the last leaf of the season is down; and the longer you can keep on the leaves in a healthy state the better will it be for the next crop.

MELONS ripened from this time till the middle of August are more wholesome than the early or late ones, and as this is the warmest period of our summers, you may give the plants abundance of air; but never omit a gentle bottom-heat to their roots, and plenty of soft pond-water till they are swelled out to their full size; and if the shoots have not got too crowded you ought to have them in perfection, according to the merits of the sorts you grow.

Out-door Department.

Symptoms of summer weather have come at last; but gardening summers seldom come in our climate before the turn of the season, by the middle of June. A week or two over, and all our troubles about chilling rains, cutting cold winds, and slow growths, will be forgotten.

CROPS IN ROWS.—The surface of the soil has been battered with the late rains, and baked with the more recent chilling winds, like a pie-crust, and the necessity of deep stirring between rows, and, indeed, all over the garden, was never more apparent than at the present season. Scratching the surface with hoes and rakes does little good. You must break the crust somehow, and allow an inter-communication between the atmosphere and the roots of plants.

COLEWORTS.—Seeds for supplying these should be got in soon.

BROCCOLI.—Large breadths of the winter and spring sorts should now be got out as vacant pieces of ground fall in.

CAULIFLOWERS, ENDIVE, and other autumnal succession crops, you will also plant out at regular intervals, and see that there are no plants left to run to seed among the beds of Carrots, Salsify, Scorzonera, Skirret, and Chicory, all of which are liable to throw up seed-stalks. The remedy is to pull them out at once, and wheel them away.

ORCHARD.—The common routine of thinning and tying in the summer growth, and the destruction of insects, must still be continued. All the stone-fruit may now be budded, the spring-grafts looked over, the clay broken off, and the bandages loosened. The grafts must have stakes put to them, or away they go the first windy day. The blackbirds and the Strawberries require your next attention. If you did not mark your sterile Hautbois while in blossom, you can do so now, as they have no fruit; and unless you root them up their runners will spread all over the beds, and in place of one sterile plant this year you will have 500 next season.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—By this time the growth of Cyrtopodiums is nearly finished; but they are so excitable that a second growth is followed immediately, unless you stint them a little by withholding water, and by removing them nearer the door. A nice point in their culture is to keep them for the next six weeks just as they are at present, or, indeed, as long as their foliage remains green; but you must keep a constant watch over the buds on the lower parts of the recent shoots, for if these are allowed to push, or even to become very prominent, the plants will not flower next spring; or if they do, they will not be good for much. These few simple rules affect at least 400 species of Orchidaceæ.

GREENHOUSE PLANTS will now do well enough with the usual routine of watering, syringing in the evenings, tying, staking, and training, as the different sorts indicate such wants.

CONSERVATORY.—If you are in possession of any of the grand secrets, of which most gardeners have a goodly stock 30 years ago, here is room for their application, to keep plants from being drawn, and to retain their blossoms much longer than they generally last in the dog-days, &c. In the absence of such helps, pour large portions of water over every spare corner, borders, paths, and all; keep light screens between them and the sun through the day, and all the doors, &c. open at night.

PITS AND FRAMES.—These are the best places, after all, to grow the choicest kinds of greenhouse plants in summer. Heaths here, that have not yet flowered, should not have any shade over the glass, as they set their flower-buds much better in the full sun. Syringe all the plants here every evening, which keeps a cool refreshing temperature about the plants all night.

DRY BULBS.—Perhaps it may be as well to remind you that the early Tulips, Hyacinths, Narcissus, &c., may now be taken up, dried, and cleaned in a dry shed, and be put up in the seed-room till planting-out time.

CHRYSANTHEMUMS.—To have beautiful little plants of these, with immensely large heads of flowers, you must begin now by selecting the strongest shoots on the plants growing in the open ground; draw these out along the ground, and at three or four inches from the top, peg them down. They will soon turn up their points again, and in about a fortnight or three weeks you may sink pots under the bends, full of rich mould, and layer these shoots, letting the bend down near the bottom of the pot. The pots will soon get full of roots, and on a damp evening you can cut off the shoots, and remove your plants to a close frame.—D. Beaton, Shrubland Park Gardens.

State of the Weather near London for the Week ending June 29, 1843, as observed at the Horticultural Garden, Chiswick.

June 29	BAROMETER.			THERMOMETER.			Wind.	Rain.

June 28. Clear and very fine with bright sun; clear at night.
29. Slight dry haze; fine, with light clouds; clear.
30. Densely overcast; cloudy and fine; clear at night.
1. Fine throughout.
2. Hot and sultry, with exceedingly dry air; numerous masses of dusky white clouds; fine.
3. Cloudy and fine; air very dry; slight shower in afternoon; clear and cold at night.
4. Overcast; cloudy and fine throughout.
Mean temperature of the week, 33° below the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending July 6, 1843.

July.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.
						N. N.E. E. S. S.W. W. N.W.

The highest temperature during the above period occurred on the 5th, in 1830—thermometer 84°; and the lowest on the 6th in 1842, thermometer 40°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending June 30, 1843.

The Cherries and Strawberries which we spoke of last week as coming in so abundantly are still more common now, and may be had of an improved quality. There are no good Cherries, however, to be had for less than 6d. a pound; nor Strawberries lower than 8d. per pot. In addition to the common kinds of Strawberry, there are now Myatt's British Queen, and one which appears to be the Deptford Pine, a new variety, noticed elsewhere. There are some splendid Pine-apples, and very extraordinary Peaches, with excellent Nectarines and Melons in the Market. Some Gooseberries and Currants are shown in a perfectly ripe state; and large quantities that are partially coloured. The Grapes are not remarkable this week. Peas are exceedingly abundant, though not particularly good; Carrots, Turnips, Onions, &c. are in an excellent condition, and Asparagus is beginning to get smaller and scarcer. Besides the usual supply of ordinary cut flowers, of which the various kinds of Roses constitute a large proportion, there are Orange-blossoms, Crassula coccinea, Leschenaultia formosa, Alstromeria pelegina, varieties of Erica tricolor, Honeysuckle, Sweet Peas, Delphinium Barlowii, and the Venus vitrix Fuchsia; with Thunbergia aurantiaca and alata, and Metrosideros floribundus in pots.

PRICES, SATURDAY, July 1, 1843.—FRUITS.—

Pine Apple, per lb. 4s to 7s	Cherries, English, 1s to 5s
Grapes, hothouse, per lb. 2s to 5s	Lemons, per doz. 1s to 2s
Peaches, per dozen, 6s to 24s	Oranges, per doz. 6s to 14s
Nectarines, per dozen, 6s to 24s	Cucumbers, per brace, 1s to 2s
Melons, 4s to 8s each	Walnuts, per bush, 16s
Apples, Kitchen, per bush, 6s to 12s	Almonds, per peck, 6s
Strawberries, per pot, 6d to 2s	Sweet Almonds, per pound, 3s
Gooseberries, per half-sieve, 1s 6d to 3s 6d	Filberts, English, per 100 lbs. 60s to 55s
Currants, per half-sieve, 2s 6d to 3s 6d	Cob Nuts, per 100 lbs. 60s
Raspberries, per gallon, 10d to 1s 3d	Nuts, per bushel—
Oranges, per doz., 1s to 3s	—Brazil, 16s
—per 100, 9s to 24s	—Barcelona, 22s to 24s
Cherries, French, per 12 lbs., 4s to 6s	—Cob, 12s

VEGETABLES.

Cabbage-plants, per doz. bun., 1s to 2s	Peas, per sieve, 2s to 4s
Cabbages, per doz., 3d to 5s	— per sack, 5s 6d to 7s
Cauliflowers, per dozen, 1s 6d to 5s	Asparagus, large, per 100, 2s to 5s
Beans, Kidney, forced, p. 100, 2s to 3s	— Sprue, or Small, p. bun. 1s to 2s
Potatoes, per ton, 80s to 100s	Lettuce, Cos, p. sieve, 6d to 1s
— per cwt. 3s to 6s	— Cos, per score, 4d to 1s
— per bushel, 2s to 3s, 6d	Celery, p. bd., (12 to 15) 1s to 2s
— Kidney, p. lish., 2s to 3s	Rhubarb Stalks, per bdle, 4d to 1s
— Scotch, per bushel, 2s	Small Salads, per punnet, 2d to 3d
— New, per cwt., 3s 6d to 1s 8s	Green Basil, per bunch, 4d to 6d
Artichokes, green, per doz., 1s to 4s	Watercress, per doz. am. bun. 4d to 6d
Turnips, Spring, per bunch, 3d to 4s	Parsley, per 12 bunches, 1s 6d to 2s
Red Beet, per dozen, 9d to 1s	Tarragon, per doz. bunches, 2s to 3s
Horse Radish, per bundle, 1s to 6s	Fennel, per doz. bun., 2s to 3s
Radish, Spring, per doz. hands, 6d to 1s	Mint, per doz. bunches, 1s 6d to 2s
— Turnip, p. doz. bunch, 6d to 1s	Blanchard, green, per bunch 4d to 6d
Carrots, Young Horn, p. h. inch, 4d to 1s	Muscarons, per punnet, 1s 3d to 2s
— Spring per bunch, 4d to 1s	Sprach, per sieve, 1s to 1s 6d
Garlic, per lb., 6d to 8d	Leeks, per doz. bun., 5s to 6s
Shallots, per lb., 1s to 1s 6d	Onions, Spring per bunch, 2d to 4d
— green, per bunch, 3d to 8d	— Large, per bun., 6d to 1s

Notices to Correspondents.

INSECTS.—It would be very desirable if our Correspondents would take some little pains in forwarding the various grubs and insects which they wish to gain information about. More than half we receive are in such a state that were they not well known it would be impossible to determine them. Those forwarded in a quill generally come to hand quite safely, and that seems to be the only good plan of inclosure for the post.

MANURES.—*Dianthus*.—We cannot give you further information. The nitric acid is only a speculation, and may not succeed. It would be much better for you to try it on a small scale first. Why cannot you take a square foot of the earth, and in about a week after watering it with nitric acid, sow some Mustard or Cress on it? You would soon see the result, and may save yourself two-thirds of the expense, or the whole of it, should the experiment fail. *Choke*.—The only directions that we need give you about your dung-pit is that the floor should be high enough to be thoroughly drained, and that all the fluid that soaks or runs from it should be caught in a hole and poured back continually over the heap. If a dung-pit is much below the level of the ground, it is apt to be filled with water; and manure will not rot in water. The rule is to keep the dung-hill wet and well-drained. *X. Z.*—Bleaching powder mixed with water will remove the smell. Probably it would be greatly diminished if a large pan of sawdust moistened with oil of vitriol were placed in the closet.

BOTTOM-HEAT.—*B.*—We must refer you to the chapter on this subject in the "Theory of Horticulture." In such a climate as this, where we have so little light, it is never desirable to elevate the temperature of a Pine-bed permanently above 84° or 85°. Mr. Phail's practice is bad.

VENTILATION.—*Flora*.—It is advantageous to plants to give them constant supplies of fresh air, if it is moist; it is said to be advantageous to keep the air round plants in motion; but that is doubtful. Many schemes have been devised to accomplish this end; but they seldom succeed, owing to the difficulty of avoiding a great loss of heat. The simplest plan and the best is to direct the ends of drains or pipes communicating with the external air to the surface of tanks of warm water, or pipes heated by hot water. Nothing will ever be found to answer the purpose which can get out of order; and all schemes connected with famers, &c. are therefore objectionable.

HEATING.—*Guchet*.—You may either pull down your cross-walls or connect tanks by short pipes four inches in diameter; but the former is better, because you cannot make a good joint between metal and brickwork. The tanks should be four inches deep. We believe 1½ inch enough for the diameter of the flow and return pipes. Unless you are very much pressed for time, you had better wait a little till we can give you the results of some experiments now in progress. *P. Watson*.—Thanks. The plans are in the wood-engraver's hands, and will appear shortly.

DATES.—*A Subscriber*.—This plant is a native of the borders of the African desert, and requires an excessively hot, dry atmosphere, with access, on the part of its roots, to an abundant supply of moisture, in soil with a mean temperature of 85°. Dates bear fruit in about 20 years from the seed, or rather sooner, and when full grown are from 60 to 90 feet high.

FRUITS.—*Diosma*.—Your Grapes have been chilled by a rush of cold air suddenly admitted when your small Vinery has been very hot. If you find it so again be not alarmed because of the heat, but dread the cold. *H. L. F.*—Such of the fruits of your Bullace-tree as are now dying off, are those which have been injured, in an embryo state, by cold. The outside has kept alive till the commencement of stoning; but the centre is hollow with the exception of the mere rudiments of the kernel, dead two months ago.

FERNS.—*Erinus*.—"The trade" signifies Nurserymen, who trade in plants. Surely no Nurseryman would venture to say that Ferns cannot be bought in the regular course of business. A Nurseryman may not keep Ferns himself, but he can always buy them of those who do. Why at Messrs. Loddiges there are thousands on sale, as all Nurserymen know.

TUBEROSES.—*L. P.*—Your Tuberose roots will probably flower if you keep them warm, well watered, and fully exposed to light, provided their roots are thoroughly drained, and in good soil. Don't turn them out of doors. When the leaves are quite dead take up the roots; put them in a dry place, and force them next year in a good bottom-heat.

FUCHSIAS.—Inquiries are made as to the probability of the Fuchsias described under the signature "Mowbray," in last week's paper, becoming purchasable. In reply, we have to state that we are not in a position to give any further information about them than that they were sent under the signature of Mowbray, and described as of good habit, vigorous growth, and flowering profusely in large clusters upon small plants.

ROSES.—*Choke*.—If you wish your Roses to force well next year, you must get them very strong this year, and ripen their wood thoroughly as early as you can, so as to give them a good long rest before the forcing commences. *J. B.*—Almost all Roses can be propagated by cuttings; but the practice is principally confined to the China varieties. The cuttings are taken off in autumn, planted at the foot of a wall with a south aspect, and having a hand-glass placed over them, are kept there all the winter, when some of them are generally found to have struck in the spring.

AURICULAS.—*A Subscriber*.—There is an excellent Paper on the "Culture of the Auricula," by Dr. Horner, at p. 296 of the volume for 1841.

SWEET-SMELLING FLOWERS.—*B.*—The following are a few fragrant stove and greenhouse plants:—*Stephanotis floribunda*, *Jasminum multiflorum*, *Franciscia Hopeana* and *latifolia*, *Pergularia odoratissima*, *Gardenia radicans*, and *Cymbidium sinense*—for the stove; with *Luculia gratissima*, *Trymalium odoratissimum*, *Erica odorata*, *Aloysia citrodora*, *Mimulus moschatus*, *Daphne indica rosea*, the Tree Violet, and *Gnidia simplex*.

THE CAPE JASMINE.—*H. C.*—This plant is not so hardy as the Myrtle, and cannot be kept in health without some warmth in winter. The Myrtle will bear several degrees of frost if kept in a dry atmosphere and soil.

BOOKS.—*Perth*.—The work most like what you want is "Lindley's Elements of Botany," but if you can read German, and don't regard expense, Bischoff's "Terminologie," a thick 4to full of plates, is the best we know of. *A Notice*.—As the information you want is fully given in the "Penny Cyclopædia," can be bought by you for one penny, and will occupy a good deal of room, you must excuse our again referring you to that work, which any bookseller can procure for you if he thinks proper. Your other question will be answered next week.

A Subscriber.—If you are dissatisfied with Robert's book, get Mearns's "On the Vine." The two together, and the

articles in this Paper, will give you all the information you want. For a penny you may get an excellent article, GRAPES, in the "Penny Cyclopædia."—*No Vote*.—We cannot meddle with matters out of our sphere. All we can say about Mr. Cox's Edition of the Act to amend the Law for the Registration of Voters is that it is what you appear to want. There is a new edition of the book containing an incorporation of the Reform Act and other Election Statutes, with the recent act, as directed by sec. 2 of the latter.

BRITISH WINES.—*Toby*.—The best mode of making these cannot be told in a short answer in a Newspaper. You should consult "Macculloch on Wines," a little duodecimo book.

INSECTS.—*R. K.*—We do not know whether corrosive sublimate will kill wire-worms or other troublesome insects without injuring the plants. Your best way will be to try it on something you do not value. All we can say is that a strong solution of corrosive sublimate may be poured on grass without doing injury to anything except worms. Remember, however, that if you syringe fruit trees with this material you may poison yourself afterwards. It is certainly worth a trial on plants like Roses infested with green-fly, but do not add it to lime-water. *T. P.*—The usual way of destroying green-fly, or, as you call it, blight, is by smoking plants with Tobacco; and you will hardly find a better plan. For this purpose you must drive the smoke on the branches by means of a pair of bellows. *W. W.*—There are various modes of attacking the Pine-bug. Steaming the house will kill it, if the temperature is raised high enough; or allowing the ammonia of fermenting horse-litter to fill the house; probably the vapour of ammonia itself, mixed with steam, only you must take care that the former does not kill your plants as well. All the washes that have been used disfigure the plants so much that it is a pity to employ them. *Horticult.*—The large fly which you discovered making a "murderous attack upon a smaller one" is called *Empis tessellata*. Its victim is also an Empis, with the specific appellation of *livida*. Most, if not all the species of the genus Empis, live by sucking other insects, in the way you have observed *E. tessellata* feast upon *E. livida*. The latter is a noted murderer of a small green moth, common on the Oak, — the Tortrix viridana, *S.*—*D. T.*—Your Myrtle-leaves are attacked by a scale insect, belonging to the genus *Coccus* of Entomologists. The best method for removing these scale insects is by brushing them off with a sufficiently stiff brush, or by washing the leaves with a mixture of lime, sulphur, and water, as recommended in the *Gardeners' Chronicle* for 1841, p. 131, under the head of Mealy Bug, or Scale Insect. To destroy the green-fly, we recommend you, as you find the Hellebore-powder a failure, to try fumigation with tobacco, or syringing with tobacco-water. A brush similar to the brush commonly used in shaving, has also been found of much use in removing the green-fly, particularly from Roses, by brushing the insects off the leaves and buds into a pan of water; but this is a laborious operation, and only applicable to the protection of a few choice plants. The "Worm, and two small insects from the joints of the woodwork of your stable," reached us in such a state, from being merely placed between folds of paper, that we scarcely like to pass an opinion on them. They should have been sent in the tubular portion of a quill. We can, however, state that the "small insects" are of the bug tribe, Cimicidae, and very similar to the common house-bug in a young state. You may get rid of them by washing the joints of the woodwork with gas-liquor, or filling the crevices with gas tar. Washing with strong tobacco-water might also be found useful. *S.*

MISCELLANEOUS.—*R. M.*—*Stigmaphyllon jatrophaefolium*.—*P. R. W.*—*Onopordon acanthium*.—*M. A. G.*—*Mimulus glutinosus*, *Andromeda pulcherrima*.—*Oxon.*—*Cyclotryne canescens*, or a new species of that genus. *Russelliana*.—Probably your *Fasciulus* is *Phaseolus caracalla*, a beautiful but old-fashioned annual, requiring an Italian climate. It is often called the Snail-flower. If it is not this we can offer no information upon the subject. *Observer*.—Your plant is sometimes cultivated in flower-gardens as the White Myosotis arvensis; and a very pretty thing it is. Forget-me-not is applicable to all the blue species of Myosotis, but principally to *M. palustris*, because it is the most beautiful. *Holcus*.—All varieties of *R. canina*; No. 1 is that called *R. dumetorum*. *A. Turnbull*.—Mr. Fortune having left England for China, as you know, the seeds were overlooked till inquiry was made. They have been found and are sown. *Weg.*—*Brassia verrucosa*, *Dendrobium moschatum*.—*R. P.*—Your galls on the *Rhododendron hirsutum* are new to us. They are caused by the puncture of some insect allied to *Cynips*.—*W. W.*—Your flower is a fruit, and apparently of *Acer rubrum*.—*J. B.*—*Eruca sativa*.—*Diosma*.—*Gomphocarpus frutescens*.—*C.*—We have an article in contemplation on the new manures, as applicable to gardens; but we shall wait the result of this year's experience. *Philobotamus*—1 and 3, varieties of *Rosa canina*; 2, *Rosa mollis*.—*J. B. K. L.*—Apparently a small state of *Carex pendula*.—*A Constant Subscriber*.—You mistake Mr. Peter. He did not mention the protection of whitebarrow-handles by iron as anything new; what we understand him to say is, that the particular mode of guarding them by a shield of iron is new. You know that the common way is by an iron hoop, or an iron cap, neither of which answer very well. *J. B. H.*—*Eriobotrya japonica*.—*Robert's* plants are—*Spiræa aruncus*, *Crataegus tanacetifolia*, *Dianthus deltoideus*, *Campánula persicifolia* (blue and white), *Linaria repens*, &c.

SEEDLING FLORISTS' FLOWERS.

PANSIES.—*J. Baillie*.—Your Pansies are too small; they are suitable only for border varieties. *W. Hall*.—No. 7 is decidedly the best seedling in your collection, and will, we doubt not, prove a first-rate show flower. It is of a good size, round, the petals large and well-formed, clean creamy white ground; the eye dark, compact, and clean; upper petals purple, with a broad margin round the lower petals of a deeper colour, with more blue in it; the side petals meet well above the eye; the petals are smooth on the edge, of good substance, and flat. It is a bright and attractive flower. 2, 3, 4, 5, are fine and showy flowers, rough on the edges; 4 and 5 with discoloured grounds; they have all bold and fine eyes, and will make excellent border varieties; we consider them second-rate; 2 is the best, 6 we consider of no value.

PELARGONIUMS.—*J. Baillie*.—The seedlings you have sent up do not possess the properties of the sorts which are now cultivated. The petals are pointed; they are long, narrow, flimsy in substance and deficient in colour, having small spots, with lines extending beyond, and with an abundance of feathering. *J. H. B.*—The large seedling is a very showy variety; the flowers are large; it thrives finely, and it will form a fine object in the greenhouse. The faults of the flower consist in the edges of the upper petals being thin and puckered; the same defect is observable, but in a less degree, in the lower petals, which gives the flower a rough appearance; the upper petals curl back, and the flower is too flat when fully expanded. The colour is clear; the upper petals are well covered, with but little feathering visible; the under petals are broad and round, and the flower altogether of a good shape. The smaller flower is very like the larger one; lighter in colour, having smooth under petals. *G. W. Hayle*.—On opening your box it appeared a complete mass of petals; the only flower remaining perfect was *Mulberry*; the others had been shaken from the stems on their passage to England; we possess several varieties in the way of *Mulberry*, with larger flowers, of a better form, and pure white under petals. The upper petals of *Rosalie* are very beautiful; dark, with a bright rose-coloured margin; and the feathering in this flower must be quite obliterated when perfect. The petals are broad and clear in several of the flowers, for instance, *The Duchess of Inverness*, *Fleur*, and *Gen. W. Napier*, but from their form they appear to curl

back too much. *General Pollock* is high-coloured, but too crumpled. *Unique*, bright and clear, but the petals appear to be too long. We are sorry they did not arrive in better condition. *W. J. E.*—Your seedling *Fairy Queen* is so like, that it may be called a repetition of, Foster's Matilda; the difference is very slight, and consists in the bottom petals being a little longer, and rather more feathering seen at the base of the upper petals; it is a fine flower, and with the difference in the foliage which you mention (that of *Erectum*), it must be a striking object. *J. W.*—It is not necessary to notice your seedlings individually, as they are all of the same character; they are deficient in form, the lower petals being too narrow; the flowers are also too small, and wanting substance. The present race of Pelargoniums are much in advance of your seedlings. *C. D.*—The size of your flower is its only recommendation; it is coarse and wants compactness; the petals all curl back, and what should be a dark spot in the upper petals consists entirely of feathering. *Anonymous* (no letter received).—The petals of No. 1 had been shaken from the calyx, so that we cannot tell what the form of the flower is; the lower petals appear to be too long for a well-proportioned flower, and the upper ones are a little pointed; the petals are very even and clean to their edges; the centre is white, the lower petals terminating in a clear and beautiful pink, with a large dark blotch in the upper petals gradually becoming lighter to the edges of the petals; 2, a flower of good form, common in colour, and wanting the refinement of No. 1. The petals of No. 3 had fallen, this is a flower of a high and desirable colour, with good top petals, having the spot finely graduated to the edge, but the lower petals appear rather small and pointed, and the colour rather dull; 4, a flower of good colour and substance; edged in form, but appears to have the defect technically called blunting; 5 is rather small, and too much crumpled; it does not appear to open well. *Fougere's Surprise*.—The upper petals of this flower are too thin at the edge, and rather pointed, and the lower petals narrow and long, which destroys the colour and compact form it ought to possess. *J. Armstrong*.—No. 1, lad form; lower petals long, narrow, and close set; 2, Clean flower, of a good form, but it opens quite flat, and the edges of the petals are a little rumpled; 4, of no use, the ground-colour impure; 2, under petals narrow and thin; all your flowers are deficient in substance. *J. C.*—None of your seedlings are good; they want substance of petals; they are very deficient in form, having long, narrow petals, and they are also very common in colour. *W. C.*—Your seedling wants substance; it is very common in appearance. *James Curtis*.—*Prince Arthur* is a Pelargonium with good upper petals of a rich and even colour; the lower petals are too long and narrow; it is a second, not a first-rate flower. *R. Miller*.—The under petals of your flower (*Duchess of Sutherland*) are very pretty, and well formed; the white centre is pure and the pink bright, but the upper petals are small, and the spot does not terminate well; the flower also wants substance. *J. H. B.*—All your seedlings appear to want substance; yet there is a quality in the upper petals of your flowers that should encourage you to persevere; the colour generally is fine and evenly distributed, excepting in *Emma*, which is poor and the flower ill-formed. *Formosa*, *Princess Mary*, *Duke of Brunswick*, Nos. 1 and 2 are good in colour, but the flowers want substance, and are generally thin at the edge in the upper petals; a large purple-crimson flower, with broad under-petals and light centre, is the best in your collection. *W. E. R.*—*Rosebud* is furnished with better upper petals than the *Nymph*; but the lower petals are neither so well formed, nor do they possess the firmness of the petals of that variety.

FUCHSIAS.—*J. W.*—*Fuchsia Brownii* is a pretty little bright-coloured flower, having violet-purple petals; but the only novelty we can perceive is in the peculiar form of the tube. *G. S.*—Your seedling No. 26 is a showy variety, having the tube, sepals, and petals of a uniform bright rosy vermilion colour, with large foliage; it is a good flower, but not equal to the best sorts that are out. *G. Imms*.—The flower of your seedling is shorter and brighter than corymbiflora, but the sepals reflex in corymbiflora in the same way as your seedling; it depends upon its habit whether it is worth possessing. *F. B.*—The seedling you propose naming *Lindleyana* is a large and stout flower, with long sepals, very much expanded; the flower is altogether of a rich crimson vermilion, with dark foliage.

PANSIES.—*M. A. G.*—Your Pansy is not a flower of good proportions; it wants roundness in its general form; the lower petals are too small, and instead of meeting above the eye they separate; the eye is very poor, and deficient in marking. *F. B.*—The yellow tinge which emanates from the blotch in the bottom petal destroys the purity of the ground-colour of your flower.

CALCEOLARIAS.—*Robert Miller*.—*Pirate*; large bronzy self, not good in form, and the outline too indented. *Mrs. Bentley*: yellow, with large brown blotches; good and distinct. *Jehu*: bad ground-colour; very poor. *Incomparable*: buff ground, with large and small spots; we have larger flowers superior to this variety of the same character. *A. Godwin*.—*Champion*; a pleasing variety, of good form; front of the flower covered with spots. *T.* in the same way, but smaller and not so good as *Champion*. *F.*; small, and the outline too much indented. *X.*, *G.*, and *V.*; bad and indistinct ground-colour. *M.*; clear yellow ground-colour, with a few spots; a good variety. *Z. L.*; small and not sufficiently distinct from others. *A Subscriber*, *Hull*.—No. 200 is the only desirable flower in your collection; all the others are very inferior in size and quality to the varieties grown near London. 200 is a rich yellow flower, curiously marked with dark-brown blotches and spots in front. *Fairy Queen* is the best of your seedlings, and the only one worth preserving; 2, is common in colour, and too indented at the bottom; 3, is small, and bad in colour; 4, is small, and of a bad form. *J. Plant*.—*Alice Maud Mary* is singular in colour, and covered entirely with very minute spots, it is too small.

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE debate in the French Chambers on the proposed reduction of the army terminated on Friday, in a large majority for Ministers. Marshal Soult strongly resisted the reduction, and hinted that he would resign rather than carry into execution so dangerous a measure. This threat, added to a favourable statement from the Finance Minister on the finances of the country, produced a strong effect upon the Chamber, and upwards of 200 out of 380 members rose against the reduction. Notwithstanding this triumph, the Ministers have found it necessary to give way on some other matters of expenditure, and have consented to reductions to the amount of 7,000,000 francs. The spirit of economy, however, is so predominant in the Chambers that they have refused to entertain for another year the Paris and Belgian Railway Law, though urged to do so by the Cabinet. The accounts from Spain, though in some respects satisfactory, are calculated to give rise to apprehension. The Regent left Madrid for Valencia on the 21st ult., amidst the warmest manifestations of enthusiasm and attachment from the National Guard and

population of the Capital. He was accompanied by 6,000 infantry, 2 regiments of cavalry, and 15 pieces of cannon; and with this force there is no doubt that he will speedily reduce Valencia. If, however, the French telegraph may be relied on, a fresh complication has arisen at Barcelona, in consequence of the precipitate march of Gen. Zurbano upon that city before he had obtained the support of Gen. Seoane. He is said to have been cut off and attacked by Col. Prim, the insurgent leader, and his position is represented as so perilous, from the refusal of his troops to fire upon the insurgents, that a surrender at discretion is considered unavoidable.—From the United States we have accounts of numerous meetings of Irish emigrants in different parts of the Union for the purpose of expressing their sympathy with the Repeal movement in Ireland. At some of these meetings the question appears to have been discussed with much violence of language, and threats of an invasion of Canada, in the event of any attempt being made to coerce Ireland, were thrown out by some of the speakers; but the most respectable journals of New York disavow all participation in these sentiments, and declare that the people of the United States have no right or desire to interfere.

At home, the marriage of the Princess Augusta of Cambridge to the Hereditary Grand Duke of Mecklenburg Strelitz, which took place on Wednesday, is the chief topic of interest. In the House of Lords on Monday the Princess Augusta's Annuity Bill was passed, and on Tuesday the Royal assent was given to it by commission. On Monday Lord Cottenham's motion for the appointment of a select committee to inquire into the Bankruptcy Act of last session was negatived without a division; and the House went into Committee on Lord Aberdeen's Bill relative to the Scotch Church. A division took place on the principle of the Bill, several of the Law Lords contending that the Bill was made to declare what was not the law of Scotland, and was entirely at variance with the judgment of the House in the Auchterarder case; but the disputed clause was ultimately retained by a majority of 22, and the further discussion of the Bill was adjourned to Monday. The long protracted debate on the Irish Arms Bill is not yet concluded. Every clause has given rise to repeated divisions, in which Ministers have had the advantage, although a succession of adjournments has been the result. On Tuesday Sir T. Wilde brought forward his motion for a select Committee on the Management of the Post Office, which led to a long and interesting debate. The motion was agreed to by Ministers with a slight verbal alteration, confining the inquiry to the manner in which the Penny Postage has been carried out. In the course of the discussion Sir R. Peel said, on behalf of the present Government, that they were fully aware of the advantages of the Penny Postage, and that as long as they continued in office, they would exert all their influence to secure the fair working of this great social and commercial experiment.

Home News.

COURT.—Her Majesty and Prince Albert, the Prince of Wales, and the Princesses are quite well, and are still at Buckingham Palace. Prince Albert was indisposed in the early part of the week from an attack of influenza, but we are happy to say that he has now perfectly recovered. The Queen and Prince Albert, the Queen Dowager, the King of the Belgians, and the Duchess of Kent, honoured the Italian Opera House with their presence on Saturday. The Queen, the King of the Belgians, and the Duchess of Kent, attended divine service on Sunday morning, in the Chapel Royal, Buckingham Palace. On Monday the Queen had an evening party, which was attended by the King of Hanover, the King and Queen of the Belgians, the Queen Dowager, the Prince and Princess of Oldenburg, the Crown Prince of Wurtemberg, the Prince Reuss Lobenstein, and several members of the Royal Family. On Wednesday the marriage of the Princess Augusta of Cambridge, an account of which will be found below, was solemnized in the Chapel Royal, of Buckingham Palace in the presence of Her Majesty and the whole Court. On Thursday the Queen held her first Drawing-room for the season, which was very numerously attended. Her Majesty and Prince Albert inspected the Cartoons yesterday in Westminster Hall. It is rumoured that Her Majesty will visit Plymouth in the middle of August, and that Prince Albert will probably attend the meeting of the British Association at Cork, in the same month. It is also said that her Majesty contemplates a visit in the course of the summer to Warwick Castle, which is undergoing extensive embellishments. The King of Hanover on Saturday honoured Sir R. Peel with his company at dinner, and afterwards left town for Kew. His Majesty returned on Monday, dined with the Duke and Duchess of Cambridge, and afterwards attended the Queen's evening party at Buckingham Palace. On Tuesday the King honoured the Duke of Northumberland with his company at the public breakfast given by his Grace at Sion House. His Majesty dined with the Catch Club at the Thatched House Tavern, and in the evening honoured the French Ambassador with his company. On Wednesday the King was present at the marriage of his niece the Princess Augusta. The King of the Belgians during his stay has frequently walked out alone and unattended

through St. James's Park into various parts of Westminster, in the neighbourhood of Westminster Hall and the Abbey, Parliament-street, Cnaring-cross, the Haymarket, Pall-mall, &c. His Majesty on Tuesday held a levee at Buckingham Palace for the reception of the Foreign Diplomatic corps, and on Wednesday presided at the ceremony of opening the new Infant Orphan Asylum at Wanstead.—From the above epitome of the Court movements during the week, it will be seen that there are at present three Queens, two Kings, and four foreign Princes in London—the Queen of England, the Queen Dowager, and the Queen of the Belgians; the King of Hanover, and the King of the Belgians; the Crown Prince of Wurtemberg, the Hereditary Grand Duke of Mecklenburg, the Prince of Oldenburg, and the Prince of Reuss Lobenstein.

Marriage of the Princess Augusta of Cambridge.—The marriage of H.R.H. the Princess Augusta, eldest daughter of the Duke of Cambridge, with H.R.H. Frederick, Hereditary Grand Duke of Mecklenburg Strelitz, was solemnized on Wednesday evening, with great splendour, in the Chapel Royal, Buckingham Palace. Her Majesty and Prince Albert, the Duke and Duchess and Prince George of Cambridge, the Duchesses of Kent and Gloucester, the King of Hanover, the King and Queen of the Belgians, the Crown Prince of Wurtemberg, the Prince and Princess of Oldenburg, the Prince Reuss Lobenstein Ebersdorf, the Foreign Ministers, Cabinet Ministers, and a large number of the principal members of the Nobility, were present at the ceremony. The Hereditary Grand Duke of Mecklenburg Strelitz arrived soon after eight o'clock, attended by Baron Bernstorff. His Royal Highness was habited in a cavalry uniform of dark blue faced with crimson, and wore the ribband and jewel, and also the star of a Knight Grand Cross of the Guelphic Order, and the star of the Black Eagle. The Princess Augusta arrived at a quarter before nine, accompanied by the Duke and Duchess of Cambridge, Prince George and the Princess Mary. The bride and bridegroom, with their supporters and attendants, remained in the Queen's apartments till her Majesty's procession reached the chapel. The Vice-Chamberlain of the Household and the Master of the Ceremonies were in attendance at the chapel, and on the entrance of the Queen's procession, the Officers of Arms and Officers of the Household arranged themselves on either side, when the Vice-Chamberlain, assisted by the Master of the Ceremonies, conducted the royal and illustrious personages to the seats provided for them. The Lord Chamberlain accompanied by the Groom of the Stole to Prince Albert, and the Lord and Groom in Waiting to her Majesty, then returned to the royal closet, and conducted the Bridegroom to the chapel, supported by the Dukes of Beaufort and Devonshire. His Royal Highness having taken his seat, the Lord Chamberlain, accompanied as before, returned to the royal apartments, and conducted the Bride to the chapel, supported by the King of Hanover and the Duke of Cambridge; the train of her Royal Highness being borne by Lady Alexandrina Vane, Lady Elizabeth Leveson Gower, Lady Mary Campbell, and Lady Clementina Villiers. The Archbishop of Canterbury, having the Archbishop of York and the Bishop of Norwich on his left-hand, and the Bishop of London on his right, then performed the ceremony. At its conclusion, the Bride approached the Queen, and was saluted by her Majesty, as also by the Duchesses of Kent, Gloucester, and Cambridge. The Grand Duke received the congratulations of all those about the altar. The Royal Bride and Bridegroom then left the chapel, attended by their suite, and were soon followed by her Majesty and the rest of her relatives and visitors to the great dining-room, where the registration of the marriage was made, and attested by the relatives, and by the ministers and officers of state. The Bride and Bridegroom left immediately afterwards for Kew, where they intend to pass the honeymoon. In the evening her Majesty had an evening party in honour of the occasion.

The Prince of Wales' Tutor.—Various speculations have been hazarded as to the name of the Rev. Divine who has been selected by her Majesty to become the early tutor of H.R.H. the Prince of Wales. It is now understood that the individual who has been chosen by her Majesty and Prince Albert to fill this responsible appointment is the Venerable Archdeacon Wilberforce.

The Army.—The Marquis of Londonderry has succeeded the late Earl Cathcart as Colonel of the 2d Regiment of Life Guards, and General F. S. Rebow, from the 1st Life Guards, is to succeed the Marquis of Londonderry in the Colonelcy of the 10th Hussars.—Government have determined upon adding to the military force in Ireland six experienced field-officers, who are to be selected from the unattached half-pay, and employed on special service in that country, where they will form part of its staff.

Earl Grey.—We have much pleasure in being able to state that Earl Grey still continues to improve. The attack under which his lordship has been suffering for the last few days is one of paralysis, the more severe symptoms of which have now subsided. The last bulletin stated that his lordship has had a good night and is going on well.

The Earl of Ripon.—We regret to hear that the Noble President of the Board of Control was taken unwell whilst attending the Cabinet Council at the Foreign Office on Saturday afternoon, and obliged to leave before the Ministers separated. His Lordship has not since been able to attend his official duties, but is getting better daily.

Royal Commission of the Fine Arts.—The Commissioners have given notice that the exhibition of the Cartoons sent in pursuant to the notices published in April and July, 1842, and March, 1843, will open in Westminster Hall on Monday next, July 3. During the first fortnight the exhibition will be open (from nine o'clock in

the morning till seven in the evening) to visitors paying one shilling; afterwards, for a period hereafter to be fixed, the public will be admitted gratis, except on Saturdays, on which day the exhibition will be closed till two o'clock, and then opened to visitors paying one shilling. The commissioners have also given notice that carved work in wood will be required for various parts of the New Houses, and in the first instance for the doors of the House of Lords, and that various windows in the building will be decorated with stained glass; they therefore invite artists to send specimens in these departments of art, to be exhibited for the purpose of assisting the commissioners in the selection of persons to be employed. The specimens are to be sent in the course of the first week in March, 1844, to a place of exhibition hereafter to be appointed. In the designs for the carved work, the objects forming the details of decoration are left to the choice of each artist, but the material of the carved specimen is to be oak. In the designs for the windows the objects forming the details of decoration may be either figures or heraldic devices relating to the Royal Families of England, or a union of the two, and may be accompanied by borders, diapered grounds, legends, and similar enrichments. The invitation to send specimens for the proposed exhibition is confined, as in the case of the cartoons, to British artists, including foreigners who may have resided ten years or upwards in the United Kingdom. Artists who propose to exhibit are required to signify their intention to the secretary on or before the 1st Jan., 1844.

Official Appointments.—The Queen has been pleased to appoint Commander H. F. Seagram, R.N., Lieutenant Governor of the settlements in the Gambia, to be Governor and Commander-in-Chief of the said settlements; Lieut. R. C. Moody, R.E., Lieutenant-Governor of the Falkland Islands, to be Governor and Commander-in-Chief of the said islands; and Matthew Forster, Esq., to be Comptroller General of Convicts in Van Diemen's Land.

Winter Gaol Delivery.—Our readers will no doubt have perceived from our Parliamentary report last week, that Government has determined to establish a winter gaol delivery, to obviate the inconvenience and frequent injustice of keeping prisoners confined during the long interval between the Summer and Spring Assizes. It is generally understood that the duty of going the circuits at the proposed new assizes will be assigned to the Judges of the Common Pleas.

Foreign.

FRANCE.—The debate on the reduction proposed by the Budget Committee of the Chamber of Deputies on the effective force of the army demanded by the Government for 1844, ended on Friday, and the result proved favourable to the Cabinet. On the previous day Marshal Soult warmly opposed the reduction, and hinted that he would resign if it were carried. He urged that the reduction would "bore through the vital forces of the country, shorten the sword of France, and impose upon her a suicide;" he next exhibited its detrimental effects on the army, and concluded by declaring that he would betray his country and be wanting to his duty if he consented to it, and that he considered it so dangerous a measure that he never could carry it into execution. Thereupon, M. Guizot demanded that so serious a discussion should be adjourned to the following day, which was carried. The Minister of Finance at this adjourned sitting drew so bright a picture of the finances of the country, that it produced a favourable effect on the Chamber, and more than 200 out of 380 members present rose against the reduction. This majority included all the Ministers who are Deputies, M. Mauguin, and the friends of M. Thiers, who openly voted for Ministers, but carefully abstained from participating in the debate. Upon this triumph the organs of the Cabinet comment with great exultation, considering that it is a fresh proof of confidence given to the Administration, and that it will consolidate it until next session. Although, however, the Cabinet successfully resisted the reduction of the numerical force of the army, they found it necessary to consent to a reduction in its expenditure; and it is admitted that the triumph would have been a much more decisive one had not the Marshal, on the very eve of the debate, striven to conciliate the committee by yielding them reductions to the amount of 7,000,000 francs, which is about half of the whole saving they proposed to effect by reducing his estimates. The discussion on these details has since occupied the Chamber, and several reductions have been effected. One of 320,000 francs, proposed by the committee, has likewise been adopted, after a protracted discussion, and notwithstanding the resistance of Marshal Soult. The Chamber, after disposing of these matters, refused to discuss this year the Paris and Belgian Railway law, though pressed to do so by Ministers.—One of the most celebrated public characters of France during the last half-century—Mademoiselle Lenormand, the fortune-teller,—died in that city on Monday, the 26th inst., at the age of 72 years, leaving a fortune of 500,000 francs. She reckoned, it is said, among her clients all the celebrated characters of the age—all the soldiers, gamblers, and other adventurers of both sexes, from the Emperors Napoleon and Alexander down to the sutler and kitchen-maid,—all of whom professed their surprise at the profundity of her knowledge of events, past and future.

SPAIN.—We have accounts from Madrid of the 21st ult. The Regent took his departure for Valencia in the evening of that day. On his passage, on the Prado, from the Palace of Buena Vista to the gate of Atocha, he was welcomed with hearty vivas by the National Guard, who had been called out for the occasion. The banners of each battalion were presented to him as he passed, and

he embraced them with a degree of feeling which excited through the ranks an enthusiasm impossible to describe. The troops preceded him on the 20th to the number of 6,000 infantry, two regiments of cavalry, and 15 pieces of artillery. It was believed that the Regent, after reducing Valencia, would establish his head-quarters in the village of Roda, on the road to that city. This position would enable him to communicate with the right wing of his army operating in Andalusia, under the orders of Generals Van Halen and Infante, and with the left wing commanded by Generals Seoane and Zurbano, the former of whom had left Saragossa and reached Lerida. The Regent could not have left Madrid at a more favourable moment. The attachment and enthusiasm of the National Guards could not be greater, and is marked by an admirable address to their brother National Guards of the kingdom, advocating the Constitution of 1837, Isabella II., the Regency of Espartero during the Queen's minority, and public order. All the officers met on the 18th, and took upon them to watch over the tranquillity of the capital and the safety of the Queen. The Alcaldes, or municipal chiefs, were to exercise in turn the duties of political chief, whilst Evariste San Miguel, as captain-general, and Colonel Lemer, as governor, were to exercise the military command. It was reported that the Regent had conferred the title of Count of Montjuich and the rank of Major-General on Colonel Echalecu, to recompense him for his loyalty to the Government. This gallant officer has resisted all attempts to seduce him from his allegiance, and has made the Barcelona fortress a second time the key of the destinies of Spain. The insurgent leader offered him 100,000 duros if he would surrender. In reply to this, he threatened to bombard the town, if troops marched from it to attack those of the Regent. Colonel Prim is said to have 50,000 men, of all kinds, under his command, which he has mustered at Molina del Rey, six miles from Barcelona, where there is a bridge over the Llobregat. The two roads, that from Madrid and Valencia, unite as they cross this bridge, which is thus an important position. It is said by the last accounts that he has succeeded in giving a check to General Zurbano, in this position, and has captured 60 prisoners in a charge. Zurbano is also reported to have ordered the Governor of Montjuich to bombard Barcelona the moment hostilities commence in the city; but, if the recent advices be true, Zurbano has placed himself in great peril by an injudicious advance upon Barcelona without the support of General Seoane, and has even offered to capitulate. His troops are said to have refused to fire on the insurgents, and it is supposed that he must surrender at discretion. We learn also that General Van Halen arrived before Granada, and began the bombardment on the 16th; but the result is not yet known. The *Espectador* of the 21st states, that on the 14th ult. General Alvarez had entered Malaga, and that the insurrectionary Junta had fled, carrying with them 80,000 piastres, extorted from the citizens. Corunna and Burgos are said to have declared for the insurrection.

PORTUGAL.—We have Lisbon news to the 19th ult. The committee of the Chamber of Deputies appointed to examine the Budget, had declared the ways and means recommended by the Finance Minister to be insufficient to meet the charges on the Treasury; and having come to the conclusion that it was impossible to carry retrenchment to much further length, without detriment to the public service, it had adopted the only other alternative, that of additional taxation; and had, in consequence, recommended new taxes on salt, butchers' meat, and new wine for consumption in the country, independently of the new taxes proposed by Ministers, all of which the committee adopts. By these additional taxes, and by cutting down pensions and half-pay to 60 per cent. of their present amount, the committee calculates that the ordinary deficit of the Treasury will have been provided for.

GERMANY.—We learn from Berlin that several rehearsals have been held under the direction of the poet Tieck, for the performance of the *Medea* of Euripides, in the original. The music to the choruses are composed by Tauber, and are said to be conceived in his happiest style. Baron de Bourgoing, the French minister at Munich, has transmitted to his Government a statistical account of the progress made in the formation of railroads in Germany during the last year, being the complement of a work on the same subject published by him last year. Of this the following is a general table of the results given in kilometres, each kilometre being equal to a quarter of a French post league:—Lines completed within the year: From Heidelberg to Karlsruhe, 62 kilometres; Wolfenbittel to Harzburg, 23; Berlin to Frankfurt-sur-l'Oder, 54; Breslau to Oppeln, 88; Prerau to Leipnick, 16; Vienna to Raab, 80; Presbourg to Tirnau, 48; Leipsic to Altenburg, 40; Vienna to Stockerau, 26; Berlin to Stettin, 80; Berge-dorf to Hamburg, 16; Prague to Pilsen, 100. Total, 634. —Lines nearly terminated: From Nuremberg to Bamberg, 56; Aix-la-Chapelle to Liege, 80; Hanover to Brunswick, 58; Vienna to Raab, 208; Vienna to Presbourg, 36; Altenburg to Crimmnitz, 16; Cologne to Bonn, 32; Glocknitz to Graetz, 100; Karlsruhe to Fribourg, 160. Total, 746. —Lines commenced: From Augsburg to Nuremberg, 200; Bamberg to Hof, 120; Cassel to Halle, 300; Werdau to Zwickau, 20; Altona to Kiel, 104; Wolfenbittel to Magdeburg, 104; Frankfurt to Breslau, 264; Oppeln to Troppau, 112; Breslau to Fribourg, 68; Celle to Hildesheim, 72; Leipnick to Troppau, 104; Olmutz to Trebau, 48; Brunn to Trebau, 64; Milan to Venice, 400. Total, 1,980. —Lines positively determined on: From Ulm to Friedrichshafen, 120; Fribourg to Basle, 80; Bessbach to Rhemchauze, 72; Frankfurt to Heidelberg, 65; Frankfurt to Cassel, 200; Cologne to Minden, 300; Minden to Hanover, 88; Celle

to Harburg, 160; Hanover to Bremen, 170; Hamburg to Berlin, 250; Posen to Frankfort, 240; Vienna to Linz, 144; Budweis to Pilsen, 160; Budweis to Prague, 144; Graetz to Trieste, 300; Stuttgart to Ulm, 100; Stuttgart to Heilbronn, 180; Stuttgart to Pforzheim, 40; Total, 2,713.

RUSSIA.—It is now announced that the Emperor's visit to Warsaw will take place late in July, or early in August, and that his Majesty intends to stay several weeks in that city, for the purpose of making himself thoroughly acquainted with the state of the administration.—The medical commission sent by the Russian Government to Egypt has just announced that the experiments made to purify by heat objects impregnated with the contagion of the plague have perfectly succeeded. They promise to show, by further trials, the efficacy of caloric as a specific means of destroying the pestilential miasma.—Letters from Bessarabia state that for several months past nothing of importance had occurred in the line of the Caucasus. The Circassians had made several attacks on the Russians, but had not obtained any decisive success. Sometimes one party, sometimes the other had the advantage, but it may be assumed that on the whole, the loss of the Russians is the greatest. They have very severe duty, as they are not secure by day or by night from the attacks of the mountaineers. Those corps suffer the most which are sent out to reconnoitre. Scarcely a day passes without one or more men being shot by the enemy, who lie in ambush. Meantime the Russians have erected several forts, and it is believed that as soon as they have completed a line of fortresses and entrenchments, as a basis for their operations, they will proceed to act on the offensive.—The Emperor has appointed M. Boutenief special Ambassador to Rome, to settle the long-pending disputes with the Holy See.—The *Augsburg Gazette* of the 23d announces the arrest of Prince Dolgorouki, and the seizure of all his papers, immediately on his arrival at Cronstadt, where he landed on his passage to St. Petersburg from Paris, where he had published a book which had given offence to the Emperor, and to many powerful families in Russia.

GREECE.—Accounts from Athens of the 10th ult. state that great excitement prevails among all classes, as it is well known that a protocol on Greek affairs has been issued by a conference of the plenipotentiaries of the three Powers now sitting in London. The object of this protocol is to demand payment of the interest due on the Greek loan, but it is evident that King Otho is resolved to obey no wishes but his own, as he has just named Col. Hesse Grand Master of the Ceremonies, the most important place at Court, in the room of Col. Soutzo, a Greek, and has also appointed another Bavarian officer to be one of his aides-de-camp. An additional cause of discontent is mentioned in the fact that the Greek corvette *Amelia* is arrived from Marseilles, with a cargo of lamps and chandeliers only, for the new palace, and that 14 new state horses have also arrived in another Greek man-of-war, from Trieste.

UNITED STATES.—The steam-ship *Acadia* arrived at Liverpool on Wednesday evening from Boston and Halifax, having sailed from the first-named place on the 16th, and from the latter on the 18th ult., thus performing the trip in ten and twelve days respectively from the points of her departure. The papers by this arrival are filled with an account of the President's visit to the cities of Baltimore, Philadelphia, New York, and other places, on his way to Boston, for the purpose of attending the Bunker Hill celebration on the 17th. His reception appears to have been cordial, but by no means enthusiastic, at least in New York. A great Repeal meeting of the Irish inhabitants had been held in the Park, New York, to declare their sympathy with their countrymen in Ireland, and their determination to assist them in obtaining that measure. There were about 5,000 persons present, and some of the speakers threatened to invade Canada, and produce a revolution in that colony, in the event of Ireland being coerced. Another meeting, called for the same purpose, had been held at Buffalo; but it appears to have been a failure compared with the New York display. The seizure of the Sandwich Islands by Lord Paulet is severely commented on in connexion with this sympathy for Repeal, the parties knowing nothing at the time of the explanation which has since been given in the House of Commons by Sir R. Peel.—Important advices have been received from Cuba, announcing that a dreadful negro insurrection has broken out near St. Jago de Cuba, in which a great number of whites have been slaughtered, and many plantations ravaged, and buildings burned. The region of the island which is now supposed to be the prey of civil war, is exactly opposite St. Domingo, and many suppose that the movement is connected in some way with the negro republic of Hayti. Troops have been sent from Havannah, and although the particulars of the revolt have not fully transpired, it is believed to be very formidable. It is now ascertained that the missing Texan schooner-of-war, *San Antonio*, has become a pirate, and is cruising in the West India seas. She has been recognised by two sailors off the coast of Florida. It is known that, on sailing a year ago, she shipped some very suspicious characters at New Orleans, and it is believed that a majority of the crew rose and murdered the officers, and then turned sea-rovers.

EGYPT.—Accounts from Alexandria of the 6th ult. announce the arrival of a special messenger from Constantinople, sent expressly by the Sultan to arrange the payment of the arrear of tribute due by Mehemet Ali, amounting, it was said, to 3,000,000 talaris. The plague still continued to extend at Alexandria. Three new cases had been declared on the 6th ult. A letter from Cairo, in the *Augsburg Gazette*, May 22d, states that the British

mission to Abyssinia to open negotiations with the princes of that country, had returned to Cairo without having succeeded in their object.

CAPE OF GOOD HOPE.—Letters from the Cape of the 18th April mention the capture of three slavers. The first of these, the brigantine *Esperanza*, under Portuguese colours, was chased ashore and destroyed off Quillimaine on the 4th March; the Portuguese barque *Desengano* was captured on the 14th; and the Brazilian barque *Confidencia*, on the 17th of the same month, off Quillimaine, and sent into Simon's Bay by H.M. ship *Lily*.

Parliament.

HOUSE OF LORDS.

Monday.—The Princess Augusta's Annuity Bill was read a third time and passed.—Lord Brougham, in answer to the assertion made in the House of Commons by Lord Leicester, that Lady Townshend had given no authority for saying that she approved of the Townshend Peerage Bill, read a letter from Mr. Ridgway, the Marquis of Townshend's agent, which stated that Lady Townshend had waited on him, and requested him to disabuse Lord Brougham of the impression that she had been a willing party to the attempt to impose her children on the Townshend family.—The Peterborough and Northampton Railway Bill was read a third time and passed.—On the motion of the Earl of Aberdeen, two Bills for giving effect to the treaties lately concluded by this country with France and America respecting the apprehension of offenders, were read a first time.

Lord Cottenham moved for the appointment of a select Committee to inquire into the operation of the Bankruptcy Act of last session. He argued that the law operated injuriously, and aggravated the evils of the system; that it gave a preference to the larger creditors, at the expense of the smaller; and that it frequently compelled, not only creditors, but the officers of the Bankruptcy Court, to travel from seventy to a hundred miles, in order to prove debts, or to take possession of effects—thus in every way leading to loss and expense.—The Lord Chancellor admitted that in individual cases there might have been an increase in the attending expenses, but contended that in the average of cases there was a great diminution. It was not fair to attempt to take the working of the Act out of the hands of the Government, who were watching it with great attention, with the view of remedying whatever defects experience might point out.—Lord Brougham concurred in this opinion.—Lord Campbell, on the contrary, was surprised that the Lord Chancellor did not at once admit the Bill to be entirely wrong, and abandon it, as the Government had done with the additional duty on Irish spirits.—Lord Cottenham, in replying, expressed himself satisfied that the evils which he complained would not long be permitted to exist.—The motion was then negatived without a division.

On the motion of the Earl of Aberdeen, the House went into committee on the Scotch Church Bill.—Lord Campbell said that the bill, in its present shape, was far more objectionable than when first presented to the House, and declared that if it passed it would prove the ruin of the Church of Scotland. He moved, as an amendment, the omission of the words "declared and."—The Earl of Aberdeen denied that the bill revived the *veto*, as a proof of which he expressed his belief that there were many members of the Church of Scotland who would not be satisfied with it. He contended that the bill merely declared what was always the law of the Church, and he altogether denied the intention of making any new law upon the subject. The obstacles he had met with in Scotland arose from the strong feeling on the subject, and the opinion that the bill did not go far enough.—The Duke of Wellington supported the bill, as being consonant with the legal decisions in the Auchterarder case, and as not recognising the principles of the *veto*.—Lord Cottenham challenged Lord Aberdeen to name a single lawyer who would affirm that the provisions of the bill were based upon the existing law of Scotland. He entered at length into the nature of the ecclesiastical law of Scotland, contending that the bill gave power to the Church which it did not previously possess.—The Lord Chancellor said that the question was one of Scotch law, relating to the Scotch Church, on which the opinion of Scotch lawyers was entitled to great weight. The bill had been submitted to the Lord Justice Clerk, who stated his own decided opinion, as well as that of the Judge Advocate and the Solicitor-General, that the bill was only declaratory of the actual law of Scotland. He also read a letter from the Lord President, who, in contradiction of what were affirmed to be his opinions, said that the bill was consonant to the constitution of the Church, as well as the law of Scotland, and did not impeach the decision in the Auchterarder case. These high authorities were an ample justification of Lord Aberdeen, in bringing forward this bill, and he mainly relied on them, for he confessed that he was not sufficiently familiar with the subject himself to speak authoritatively.—Lord Denman also admitted his incompetence to speak authoritatively on a question of Scotch law. But he had been impressed with the reasons which had been assigned for the appellate decision of the House of Lords in the Auchterarder case; and when he found the noble and learned Lords who had pronounced that judgment still adhering to the reasons on which it had been given, he was alarmed by any legislation which would have the effect of fettering the Court of Session. The Lord Chancellor did not proceed on his own judgment, but relied on the privately given opinion of Scotch Judges. Now, he strongly objected to this private canvass of Judges, and he did not think it was safe for them to legislate on a legal subject on which the Lord Chancellor—the highest judicial authority of the land—could not make up his mind. If the law were such as the bill affirmed it to be, it was unnecessary to "declare" it; if otherwise, dangerous.—Lord Campbell reaffirmed his opinion, that the powers declared by the bill to belong to the Church were not to be found in the law of Scotland; and the Lord Chancellor, having concurred in the decision in the Auchterarder case, had been of the same opinion, until his judgment was altered by two private letters.—On a division there appeared, Contents 30; Non Contents 8. Majority 22.

Tuesday.—The Royal Assent was given, by commission, to the Princess Augusta's Annuity Bill, and to several private Bills. The second reading of the Church Endowment Bill was moved by the Bishop of London, who expressed his gratitude for the support he had received in his diocese in aid of church extension. One proof of this was, that ten churches had been required for the parish of Bethnal-green, and nine were already erected.—Lords Montagu and Brougham supported the Bill, after which it was read a second time.

Lord Brougham, in very angry terms, complained of the Earl of Aberdeen for hurrying on the Scotch Church Bill when he was absent from illness. As a declaratory bill, it was an insult to those judges who had given the judgment in the Auchterarder case, and he was therefore determined, on Thursday, to attempt to prove that the decision was sound law.—The Earl of Hardington, in the absence of the Earl of Aberdeen, made a few observations in reply; after which the House adjourned on the motion of Lord Brougham.

Thursday.—On the motion of the Bishop of London the Church Endowment Bill passed through committee *pro forma*.—The Earl of Aberdeen postponed the committee on the Church of Scotland Bill to Monday next, in order to afford Lord Brougham the opportunity of speaking upon it. He apologised to the Noble and Learned Lord for having proceeded with it on Monday last, in his absence, and disclaimed any intentional discourtesy towards him.—Lord Brougham received the explanation, and declared that it was clear both had laboured under a mistake.—Sir Thos. Wilson's Hampstead Inclosure Bill, towards which the attention of the metropolitan public has been strongly directed, was with-

drawn for the present session, by the Earl of EGMONT, who, in doing so, shortly vindicated the motives of its promoter.

Friday.—Lord WHARFURD laid upon the table copies of the correspondence with the Lord Chancellor of Ireland, respecting the dismissal of Irish magistrates.—The Earl of ARBUTHNOT moved the second reading of the Apprehension of Offenders Bill, the object of which is to give the sanction of this country to an international system of surrendering offenders, to be established between this country and America. Lords BROUGHAM and CAMPBELL made some observations on the Bill, which was read a second time.

HOUSE OF COMMONS.

Monday.—On the motion for the House to resolve itself into committee on the Irish Arms Bill, Lord CLEMENTS made a speech complaining of the non-production of some returns, but moved no amendment; and Mr. WALLACE declared himself, though not a Repealer, an approver of the objects which the Repealers advocated—threatening to become a Repealer unless those objects were conceded.—The House went into committee on the bill.—Lord J. Russell said he had supported the bill because he felt that an Arms Bill was required for Ireland. But he considered the existing Act sufficiently stringent; and unless the present bill, which partook of the nature of a coercive measure, were materially altered in committee, he would oppose it on the third reading. Lord ELIOT charged Lord J. Russell with a want of his usual candour in now opposing a bill which he had hitherto supported, and which, instead of being coercive, was much milder than the Arms Act which he had supported when himself in power.—Mr. HUME expressed his satisfaction that Lord J. Russell was now going to oppose the bill, and regretted that he had not done so when the late Government was in office.—The House then proceeded with the bill, or rather attempted to proceed with it, for the first six clauses produced lively discussion and several divisions. The third and fourth clauses were postponed; the fifth clause was agreed to, but the sixth was opposed, and Mr. R. YORKE moved that the Chairman report progress. On this division there were—For the motion, 24; Against it, 229; Majority, 205. The committee then divided on the clause—For the clause, 167; Against it, 96; Majority for the clause, 71. Another discussion ensued on clause 7, the result of which was that progress was reported, and the Chairman obtained leave to sit again on Thursday.

Tuesday.—Sir T. WILDE moved for a select committee to inquire into the subject of Post-office improvement, with reference both to what had been and to what might yet be done. He said that Mr. Rowland Hill, who had first suggested the penny postage and other improvements, partly adopted by the late Ministers, had for three years been retained by Government at a salary, but that his employment had now been discontinued, chiefly in consequence, as appeared from a printed official correspondence, of an opinion entertained by the Treasury, that the retention of an independent officer to advance improvements which it properly belonged to the regular officers of the department to institute would be an inconvenient and dangerous precedent. The public had not yet had the full force of Mr. Hill's plan, they had obtained the benefit of a reduction in postage, but the other projected benefits, those of increased accommodation in the delivery of letters, and economical arrangements for compensating the first loss of revenue, had not been yet afforded. There were 400 rural districts, containing each 1,000 souls and upwards, without one Post-office among them all. This defect had been repeatedly brought under the notice of Government, but the answers had been only that the matter was under consideration. Various mistakes committed by the Post-office had been represented to the Treasury; the Post-office had been referred to, but the Post-office authorities had in each instance evaded the questions, or returned incorrect answers to them. His object was to secure the presence of an officer whose duty it should be to prevent such errors. Ministers had doubtless received explanations from the Post-office, to which they themselves gave credit; but the question was whether after the past experience of such explanations they deserved that credit; and this was a question most properly to be determined by a committee. The motion for a committee must not be resisted on the ground of revenue, for the state of the revenue was the very ground of the motion. Of Mr. Hill's proposal, that part only had been adopted which had tended to diminish revenue; his suggestions for compensating that diminution had not been carried into effect. Mr. Hill was willing rather to serve the public gratuitously than not to serve it at all.

The CHANCELLOR of the EXCHEQUER referred to the terms of the Treasury minute under which Mr. Hill had originally been engaged, and contended that it clearly showed he was engaged, temporarily, in order to carry out the "Penny Postage," and not for any farther or enlarged plan which he might have contemplated. On coming into office he found that Mr. Hill had been engaged for only another year, which was the result of the scrupulous care and candour of Mr. F. Baring, the late Chancellor of the Exchequer, and not to fetter his successors; and for this, and many similar instances, he (the Chancellor of the Exchequer) publicly thanked his predecessor. If in the dismissal of Mr. Hill he had mistaken Mr. Baring's views, he assured him and the House that it was not intended; but it had been found inconvenient to have Mr. Hill superintending such a department as the Post-office, virtually superseding the Chancellor of the Exchequer; a similar principle might be applied to every other department, the Stamps and Taxes, and so forth, entailing great expense on the country, and interfering with the duties of the responsible functionaries. Efforts were making to increase facilities of communication by an arrangement to establish rural posts wherever the number of letters justified it. But Mr. Hill's plan for giving additional facilities of delivery was not universally applicable; as in London, where its operation would involve the employment of a great additional number of postmen, at an expense not counterbalanced by any advantage. The system of transmitting money through the "money order" department of the Post-office was superior to the plan of registration; and the public were now availing themselves largely of it, for if the amounts sent during the first three months of the present year were to be taken as data for the entire year, it would appear that no less than 8,000,000*l.* was transmitted annually by means of money orders. This was a proof that the present Government were not indifferent to improvements. Another proof of this was the selection of Lord Lowther for the office of Postmaster-General—a nobleman whom Mr. Hill had eulogised in his first pamphlet as one of those enlightened individuals who were zealous for Post-office reform and improvement. They had not, indeed, rushed into multifarious plans of improvement, involving great expense, which must be defrayed out of the general taxes, and be a boon to the letter-writing portion of the community, at the expense of those not so much interested in epistolary correspondence; but they were gradually introducing whatever alterations might be thought advisable. Great expectations were held out as likely to result from the adoption of Mr. Hill's views; Sir Thomas Wilde talked of savings to the extent of "hundreds of thousands." But Mr. Hill's original calculations had not been verified, and that experience should make them cautious of exaggeration. By the recent Post-office treaty with France not only had there been obtained a great reduction of the rates, but other advantages of great importance to the commerce of this country. On this and other grounds he vindicated the Government; but not being afraid of the results of any investigation into the working of the Post-office, he agreed to the motion for inquiry, merely making a verbal amendment, confining the investigation to the manner in which the penny postage had been carried out.—Mr. F. BARING said that though the Treasury minute engaging Mr. Hill referred only to the penny postage, yet both he and the late Government certainly comprehended under that expression the entire of Mr. Hill's plan, in order to its gradual adoption. He paid a very high compliment to Mr. Hill, who had evinced qualities, not only of invention, but of administration of the first order; he had seen his retirement from the public service with very great regret; and though the Government had certainly broken no bargain with him, yet they might have found a situation for him in which his abilities could have been employed to the public advantage. It was utterly impossible for the Treasury to control the details of the Post-office; and though in his own official intercourse with it he had given its authorities much trouble, and had received from them ready and valuable information, it was still not to be denied

that they had been hostile to the plan of Mr. Hill, and could not, therefore, be left entirely to their own control in carrying it out. In stating that sums to the extent of 8,000,000*l.* passed annually through the money order department the Chancellor of the Exchequer probably spoke from information furnished by the Post-office; but there was a material error here; the sums were multiplied by two: they had reckoned not only the money paid in, but the money paid out, which was like calculating the quantity of water passing through a pipe by what was poured in at one end and out at the other. He was glad that the committee of inquiry had been agreed to, as it would test the hostile and contradictory allegations and calculations.—The CHANCELLOR of the EXCHEQUER admitted that in stating the amount passing through the money-order office he had cast his eye on the wrong column of figures; but it did not affect his argument whether the amount were 4,000,000*l.* or 8,000,000*l.*—Mr. WALLACE remarked on the obstructive system formerly pursued in the Post-office, and highly lauded the present Postmaster-General, Lord Lowther.—Sir ROBERT PEEL had never doubted the great social advantages which would result from the adoption of the penny postage; he had only hesitated about its immediate application, on considerations of revenue. He gave the fullest credit to the motives and qualities of Mr. Hill. If the Post-office functionaries were as adverse as Mr. Baring had represented them to the plan of Mr. Hill, the proper course for Mr. Baring would have been, not to keep Mr. Hill as a yearly servant of the Treasury, but to make him Secretary of the Post-office, so as to give him the means of overruling all these official objections. Lord Lowther being known to approve Mr. Hill's plan, it was not likely to meet with discouragements under that nobleman. For himself and Mr. Goulburn he would say, that while they should continue in office they would exert all their influence to secure the fair working of this great social and commercial experiment.—Mr. AGLONBY pressed upon the consideration of Ministers the subject of the rural districts; and announced his intention of asking hereafter for some information about the security of money-letters, and the effect of the late enactment respecting the transmission by post of notices of objection under the Voters' Registration Act.—Mr. GOULBURN gave some explanation.—Mr. HUME did not think Mr. Hill's calculations so extravagant as they had been represented; for while all the other branches of public income were falling off, the Post-office revenue was still increasing. He disapproved of the principle which placed the Post-office under the Treasury, but bore his testimony to Lord Lowther's able administration. He rejoiced in this committee, which he hoped would show how the Post-office might best be made useful to the public.—Mr. HURST spoke in praise of Mr. Hill.—Sir T. WILDE, in reply, said that all the purposes of his motion would be answered by the committee which Mr. Goulburn proposed to substitute. It had been intimated that Mr. Hill was blameable for having thus published the information obtained by him at the Treasury; but it was not of a confidential nature, for it related only to his own plan. Nor had it been brought forward with any hostile feeling to the present Board of Treasury; the only objection was, that the Post-office authorities were allowed to exercise too strong an influence against all reforms.—The amended motion was then agreed to.

Mr. MACKINNON moved for a select committee to inquire into the means and expediency of preventing the nuisance of smoke arising from fires or furnaces, which was agreed to.—Captain PEARCE brought on the next motion, which related to the claims of individuals on the Admiralty, to which Capt. GORDON and Mr. CORRY replied. After a short discussion, the motion was rejected on a division. The rest of the evening was occupied by a brief discussion on a motion of Mr. Sergeant MURPHY, relative to "Ministers' money" in Ireland, which was withdrawn.

Thursday.—The first order of the day was the adjourned committee on the Irish Arms Bill, which was moved to be resumed before five o'clock. Mr. SMITH O'BRIEN asked for a short delay on the ground that several Irish Members interested in it had not yet come down to the House. The delay, after a short conversation, was granted; and after some matters of routine the House went into committee on the bill, commencing with the seventh clause, to which there were several amendments. The first division took place on a proviso, that pending the granting of a license the arms shall be deposited with the police, or some licensed person. This was proposed to be omitted by Mr. WYSE, who moved accordingly, but his amendment was rejected. The eighth clause, technically termed the "branding clause," raised a long discussion. Lord J. RUSSELL opposed it, on the ground of its unconstitutionality, and cited the returns to show that crime in Ireland was diminishing. He moved its omission, which was seconded by Lord CLEMENTS, and after a debate, the amendment was rejected and the clause was carried by 158 to 104. The construction of the ninth clause raised a lively discussion. It professes to regulate the mode in which persons not keeping arms at the time of passing the Act, but who may afterwards wish to do so, may apply for a license twenty-one days before the then next session.

Sir R. FERGUSON moved an amendment; and as the Attorney-General for Ireland did not seem clear on the subject, and Sir J. GRAHAM proposed to remedy the clause by a proviso the effect of which was not understood, several other amendments were proposed, to postpone the clause, and also that the chairman report progress.—Sir J. GRAHAM refused to postpone the clause, which provoked a retort from Mr. M. J. O'CONNELL.—Lord J. RUSSELL declared his intention of supporting the postponement of the clause, on account of the unsatisfactory conduct of the Government.—Sir R. PEEL endeavoured to soothe the House, and said that if the course were pursued of debating every clause on the merits, it would be fatal, not merely to this bill, but to all legislation whatever.—Lord PALMERSTON, Mr. WATSON, and other members, exposed the absurdity of pressing a clause, the meaning of which was doubtful to the Government itself.—Lord ELIOT made some explanations, but Mr. MORE O'FERALL remarked that with nine lawyers, two Secretaries of State, and an hour and a half's discussion, they were more distant than ever from understanding the clause, which was a very sufficient reason for postponement.—A division took place on the question of reporting progress, which was rejected by 252 to 92.—Lord CLEMENTS persisted in moving that the chairman do leave the chair, and Sir R. PEEL ultimately consented.

Friday.—Mr. GIBBONS moved for a committee to inquire into the allegations of the late Nottingham petition, which gave rise to observations from Lord LINCOLN, Sir R. PEEL, Mr. T. DUNCOMBE, and Mr. F. BARING. The latter moved an amendment limiting the inquiry to the alleged tampering with the witnesses, but the original motion and the amendment were ultimately withdrawn. On the motion for going into a committee of supply, Mr. HUME brought forward a motion for discontinuing the grant of 21,000*l.* a-year to the King of Hanover, as a waste of public money, and unjust to the people of England. Mr. WILLIAMS seconded the motion, which was opposed by Sir R. PEEL, Lord WORSLEY, &c., on the ground that it would violate public faith. On a division, the motion was rejected by 197 to 91.

CITY.

Money Market, Friday.—Consols closed at 93½ to ¾ for the opening; Bank Stock, 180½; Three per Cent. Reduced, 94½ to ¾; Three-and-half per Cent. Reduced, 101½; Exchequer Bills, 54s. to 56s. prem.

Metropolis and its Vicinity.

Her Majesty's Coronation.—Wednesday being the anniversary of her Majesty's coronation in 1838, the morning was ushered in by the ringing of a merry peal at the different churches throughout the metropolis. The Royal Standard was hoisted at the Tower, Somerset-house, the Opera-house, and the usual public buildings. At 1 o'clock the Park and Tower guns fired a royal salute, and the vessels in the docks and river, English as well as foreign, hoisted their colours, in honour of the occasion.

Accident to the Duke of Wellington.—His Grace met with a slight accident on Thursday afternoon. He was mounting his horse at the corner of Waterloo-place and Jermyn-street, when a carriage drew rapidly up, and the pole caught his right leg, and very nearly precipitated him between the horses, who reared and plunged violently. His Grace, however, recovered his seat, and rode off.

Sale of the Duke of Sussex's Property.—The sale of H.R.H.'s property commenced last week, and will continue until Wednesday week. The portion sold on Saturday comprised a collection of royal and noble portraits in oil, historical and royal miniatures and enamels, and engravings, mostly proofs. The buyers were chiefly dealers, nor was there much anxiety manifested by the public to become possessors of any of the lots. The whole day's sale did not realise more than 770*l.* The engravings were sold for about 73*l.*, the enamels for 42*l.*, the paintings for 241*l.* 9s. 6d., and the miniatures for 412*l.* 5s. The sale of the plate took place in the early part of the week; the trinkets and orders were sold on Wednesday, the rings and seals on Thursday, and the snuff-boxes yesterday. Many of the articles realised high prices.

Court of Aldermen.—On Saturday Alderman Brown brought up the report of the committee appointed to inquire into the connection of Alderman Thomas Wood with the Talacre Mining Company. The report stated that the committee had examined with care the documentary matter submitted to them, which they agreed to lay before the Court, together with a statement of facts drawn up from the papers supplied to them; and they found that Alderman T. Wood's connection with that Company, which appeared to have been formed without any pecuniary foundation, was established. The committee offered no opinion on the conduct of Alderman T. Wood, that being a duty which they considered to appertain to the individual members of the court. Alderman T. Wood considered that the statement which had been read, although professing to be fair and candid, omitted the answers which the evidence contained, at the same time that it detailed the imputations against him. He quoted several of the imputations, and spoke at considerable length to show that the documents were garbled; and that in all his transactions with the Talacre Company he had acted with the greatest probity. Alderman Copeland denounced the Talacre Company as a fraudulent concern, and asserted that the committee had acted with remarkable forbearance. Alderman Brown expressed surprise at the tone in which Alderman T. Wood had met a report so indulgently drawn up. He would call upon the Court to examine the statement which had been drawn up from the documentary matter submitted to that committee, and then say whether there was any want of candour, or fairness, or indulgent feeling to be attributed to him who drew it up, or those who agreed to it? After an angry discussion the Court came to a resolution that, if any member intended to bring forward any motion on the subject of the report, a regular notice should be given, so that a full deliberation might take place.

Election of Sheriffs.—On Saturday Alderman Musgrove and Mr. F. G. Moon, the printseller, were in a Common Hall unanimously elected Sheriffs of London and Middlesex for the year ensuing.

Entertainment at the Mansion-House.—On Wednesday the Lord Mayor gave an entertainment to the Judges and members of the bar. The guests were more numerous than on any similar occasion at the Mansion House, upwards of 150 individuals being seated at table in the Egyptian-hall. Several ladies were among the company.

Diocese of London.—The Bishop of London has addressed a pastoral letter to the clergy of his diocese, explaining his remarks on the subject of the offertory at his late confirmations. His Lordship states that he only recommended his views to the clergy, leaving it to them to adopt his wishes or not, according to their own discretion. He states that on occasions when charity sermons are preached for specific objects, and when there is no communion, the practice of collecting from pew to pew has very generally prevailed in various parts of the country, and that when the collection is so made it is more proper to make it while the offertory sentences are read than during the singing of a hymn. "I believe," he says, "that in almost all cases where this method of collecting has been resorted to, its advantages, in respect of propriety and solemnity, have caused it, after no very long time, to be generally approved of. At all events, my recommendation of this method, which, after all, is nothing more than occasionally applying to the whole congregation a form to which those who communicate submit without question or demur, ought not in fairness to be regarded as indicating a disposition to favour any peculiar theological opinions, least of all those against which I may venture to say few persons have protested more distinctly or emphatically than myself."

The Gresham Lectures.—A new building, in the enriched Roman style of architecture, with a theatre capable of accommodating 800 persons, has just been completed at the corner of Basinghall-street, at a cost of 7,000*l.*, for the delivery of the Gresham Lectures.

Peace Convention.—This Convention held its last sitting on Saturday, and passed several resolutions, the main objects of which were declaratory of the principle that war is inconsistent with the spirit of Christianity and the true interests of mankind. The meeting was addressed by the Marquis de la Rochefoucauld Liancourt in French, and by Mr. Tappan of New York, Mr. Buffon, of Ohio, Mr. Hindley, M.P., Mr. Hume, M.P., and other gentlemen. An address to the Governments of the civilized world was adopted, together with a resolution in favour of a congress of nations to settle and perfect the code of international law, and a high court of nations to interpret and apply that law for the settlement of all national dis-

Bath.—A fatal accident occurred last week in the neighbourhood of Dunkerton, whereby the lives of six individuals were sacrificed. The scene of the calamity was the coal-pit known as Bray's Down-pit, about seven miles from Bath, and three from Dunkerton. From the evidence at the inquest it appeared that the men having

attached themselves to the chain by means of a hook and a piece of rope forming a noose for one leg, they were lifted off the platform by the engine, and were then let down; but, after descending about 100 feet, the drum-wheel was observed to be revolving rapidly, having by some unaccountable means become disconnected with the wheel which should have regulated their descent; and in consequence of the velocity with which they descended, the unfortunate men were dashed to pieces upon a projecting stage erected some few fathoms from the bottom. The jury returned a verdict of "Accidental Death."

Bristol.—The remains of Rajah Rammohun Roy, who died at Stapleton-grove, near this town, about eleven years since, and was buried in the grounds adjoining the house, were removed last week to the cemetery at Arno's-vale, and interred in that portion appropriated to the use of Dissenters. A sum of money has been forwarded from India for the purpose of erecting a stately monument on the spot. It will be in the Hindu style of architecture, and upwards of 30ft. in height.

Carmarthen.—Since our last account of the Rebecca riots everything has remained quiet in this town. The troop of the 4th Dragoons marched from hence on Sunday, for Newcastle Emlyn. Colonel Love, the Commandant of the district, has ordered the marines and Castle Martin Yeomanry from Pembroke, and other troops of cavalry are on the way to this district, it being the determination of the authorities to cover the country with military, so as to prevent any further depredations. There seems to be no doubt that the exciting cause of the recent outrages was the oppressive tax of the toll-gates on the by-roads, and the dislike of the people to the working of the New Poor-law. A meeting was held on Friday last at Newcastle Emlyn, when a conference took place between the county magistrates and delegates from the several parishes. The Vice-Lieut., the Hon. Col. Trevor, presided, and Mr. Lloyd Hall, the barrister, who has been retained by some of the parishes, was present. The following document was submitted at the proposal of the magistrates:—"We are willing that every grievance that can be proved to exist, and which can be remedied, should be removed, either in the administration of the funds of the trusts, or by the erection of new gates, or by increase of tolls. For that purpose we will name a committee of trustees and tally-holders to go into all the accounts of the trust, and at that committee Mr. Hall shall attend, if he wishes it, on your behalf. If any point of law should arise, counsel's opinion shall be taken, by which the trustees must abide until set aside by a court of law. The magistrates have had a force of troops put at their disposal by the Government, and though they are willing to redress all that is amiss, they cannot give way to force, and must put down also all disturbances, the Government being ready to increase the number of troops, if necessary." After some discussion these terms were agreed to, and the committee was appointed. Subsequent accounts state that no less than five gates have been destroyed since Saturday last—three in the immediate neighbourhood of Narbeth, one on the Brecon road, and another at Penygarn, about six miles from Carmarthen, on the London high road. A notice has also been posted on the Holyland gate in the neighbourhood of Pembroke, signed by Rebecca, announcing a speedy visit to the Union workhouse of that town.

Cheshunt.—The Poor Law Commissioners have published their report on the case of James Harvey, a pauper of this parish, who was said to have died of want, occasioned by the neglect of the relieving officer. The Commissioners state that the man was not in want of food for several weeks previous to his death; and that there is no ground for charging the relieving officer with material neglect in the case. But they detail various erroneous entries in the books and returns of the medical officer Mr. Smith, and consider that he neglected his duty in this instance. Under all the circumstances of the case, they think it would be inconsistent with their duty to allow Mr. Smith to continue to hold the office of medical officer, and they have accordingly directed an order to issue for his removal.

Exeter.—The law reports announced last week that the Rev. Henry Erskine Head, rector of Feniton, in this county, had been sentenced by the Arches Court, at the suit of the Bishop of Exeter, to three years' suspension from the office of the ministry, the loss of his living, and the costs of the action, for having published a letter, in which he maintained that the Church Catechism, the Order of Baptism, and the Order of Confirmation, in the Book of Common Prayer, contained erroneous doctrines. Mr. Head, who is a brother of Sir Francis Head, is an evangelical clergyman, and the living is worth 500*l.* a year, so that the sentence is equivalent to the imposition of a fine of 1,500*l.* in addition to the costs of the action, which are supposed to amount to 1,500*l.* Mr. Head preached his farewell sermon last Sunday to a crowded congregation.

Glazenwood.—We find that a floral fête was given by Mr. Curtis in his beautiful grounds on the 16th ult., which was attended by upwards of 3,000 persons. The band of the Coldstream Guards was present, and greatly contributed to enliven the scene, which appears to have been one of unusual beauty and gaiety.

Maidstone.—It will be recollected that a few weeks since, in pursuance of a requisition to the High Sheriff of Kent, a meeting of farmers and others connected with agriculture was held on Penenden-heath, when resolutions in favour of protection to agriculture, and expressive of dissatisfaction at the recent changes made in the Corn-law by the introduction of the Canada bill, were carried by a large majority. As a set-off to this result, the friends of a total repeal invited Mr. Cobden to attend a meeting at

the same place on Thursday last, in order, if they approved of his explanations, to pass resolutions in favour of a total abolition of the Corn-laws, and thus nullify the proceedings of the former meeting. The meeting was addressed by Mr. Cobden, Mr. Villiers, and others on the part of the League; and by Mr. Osborne, a local landowner, on the other side; after which, resolutions were carried in favour of a total and immediate repeal of the Corn-laws.

Norwich.—The exhibition of the West Norfolk Agricultural Association took place on Wednesday week, and was very numerously attended. The members dined together after the show, the Marquess of Hastings in the chair. The speeches were confined chiefly to agricultural topics, a general objection being manifested to any allusion to political matters. A piece of plate was presented to Mr. J. L. Milnes, the honorary secretary, as an acknowledgment of his zeal in originating and promoting the objects of the Society. The Hon. Mr. Wilson, in returning thanks for those gentlemen who had offered extra premiums, suggested the formation of a society for the encouragement of industrious labourers; and the meeting was afterwards addressed at some length by Mr. Hamond, Mr. Lugar, and other well-known agriculturists.

Oxford.—A remarkable scene took place on Wednesday in the Sheldonian Theatre, which has been rarely equalled in the annals of the University. It has occasioned the abrupt termination of the commemorative festival, without the oration of the Professor of Poetry, or the prize essays and poems of the year being delivered. It is usual at the annual commemoration, which always takes place at this time, to propose some distinguished persons to Convocation for a D.C.L. degree. Late on Tuesday evening it became known in the University that Mr. Everett, the American Minister, formerly an Unitarian preacher in the United States, would be proposed for this honour. The news created considerable sensation on the ground of that gentleman's religious opinions, especially among members of that body in which the right of bestowing degrees rests. Accordingly when the convocation assembled, the proceedings were interrupted by a body of Masters, who had filled the area of the theatre, and resisted with loud *non-placets* the degree of the American Minister, which was, however, after some confusion conferred, with a protest on the part of the Tractarians, and amidst loud shouts from the undergraduates, who imitated the parties below, by a successful attempt to terminate the proceedings, unless the junior proctor, who has rendered himself unpopular, would quit the room. The Vice-Chancellor, in consequence of this outrage, dissolved the assembly. A deputation of the protesting members of convocation immediately waited on Mr. Everett, to express their sorrow at being compelled conscientiously to take the course they had, and remove any impression of personal opposition. His Excellency received them with the utmost courtesy.—An accident of a distressing nature occurred here on Thursday, the 22d ult. The youngest son of the Dean of Christchurch, and a son of Dr. Phillimore, both students of Christchurch, lost their lives on that day whilst bathing in the Isis. Mr. Gaisford was seized with the cramp; Mr. Phillimore was dressing himself in the skiff, when, seeing that his young friend was in danger, he jumped in, and was himself carried away by the stream and lost. The jury at the inquest returned a verdict of "Accidental death."

Stafford.—On Monday evening, at one of the pits belonging to the Fenton Park Company, situate at the back of the china manufactory of Messrs. Green and Richards, of Fenton, an explosion of fire-damp occurred, which was attended with the loss of nine lives. The cause of the accident is ascribed to the imprudence of one of the sufferers, who shut a door in the pit, which, when reopened, caused a rush of foul air towards the shaft, which ignited by the candles by which the men were lighting themselves. Two of the sufferers lost their lives by going to the assistance of those who fell victims to the explosion, and four others who were assisting them nearly perished by suffocation. An accident of this nature has not happened in the Potteries for many years.

Railways.—The following are the receipts of the principal Lines for the past week:—Greenwich, 875*l.*; Brighton, 3,791*l.*; Paris and Orleans, 3,964*l.*; Eastern Counties, 2,716*l.*; Paris and Rouen, 3,038*l.*; Croydon, 329*l.*; Blackwall, 1,132*l.*; Great North of England, 1,335*l.*; Liverpool and Manchester, 5,092*l.*; Hull and Selby, 1,236*l.*; Manchester and Leeds, 4,812*l.*; York and North Midland, 1,642*l.*; Manchester and Birmingham, 3,024*l.*; Edinburgh and Glasgow, 2,133*l.*; Birmingham and Derby, 1,220*l.*; Birmingham and Gloucester, 1,831*l.*; Midland Counties, 2,518*l.*; Grand Junction, 8,252*l.*; North Midland, 4,166*l.*; South Western, 6,996*l.*; South Eastern and Dover, 2,503*l.*; Great Western, 17,039*l.*; Birmingham, 17,448*l.*—On Saturday last the chairman and directors of the South Eastern and Dover Railway, with Mr. Cubitt the engineer, and a party of friends, made a trial trip over the line, preparatory to its being opened to the public on Wednesday, which will be before the period at which the engineer promised that it should be ready. The train left London-bridge at 6 A.M., stopped at 5 stations, and arrived at Folkestone, a distance of 81 miles, at 40 minutes past 8 o'clock, the average speed being 30 miles per hour. The party then embarked in a steamer and proceeded to Boulogne, where they arrived in 3 hours, and were entertained by the Sous-Prefet and the French authorities at a public *dejeuner*. The steamer left Folkestone harbour at 19 minutes past 9, and arrived at Boulogne at 25 minutes past 12 o'clock. It started homewards at 38 minutes past 2, and reached Folkestone at 23 minutes past 6 o'clock; the railway train started at 7 minutes past 7, and landed its

freight at London-bridge, after seven stoppages, at 6 minutes past 10 o'clock, P.M.; the party having thus travelled, by land and sea, 225 miles in sixteen hours and six minutes. Thus the entire journey from London to Boulogne and back, was accomplished easily in one day, and there is no doubt that the time is not far distant when a regular communication between London and Paris will be effected in 24 hours.—At a general meeting of the shareholders of the Lancaster and Preston Company the fact of the leasing of the line to the canal proprietors at a clear rental of 4 per cent. per annum for 21 years was officially announced; as also the first half-year's payment of the money, out of which it was proposed to empower the directors, now the actual income of the undertaking is ascertained, to declare half-yearly a dividend of 16*s.* per share on the whole shares, and of 10*s.* 7*d.* on the three-quarter shares. This was unanimously agreed to, and the debt of 15,000*l.* owing will be liquidated by 8,000*l.* in shares, and the remainder in land and cottage property, sufficient to cover it, now in possession of the company.—The committee of inquiry, appointed by the shareholders in the Brandling Junction Company, have given in their report. It embraces a history of the management of the affairs of the company from its commencement. It then notices the appointment of engineers, secretary, &c., and sets forth that injury has been sustained by the non-residence and divided attention of these parties. The directors are also blamed for going into great expense "without plans or estimates," and for allowing a portion of their number "to transact much of the important business of the company, keeping the others ignorant of their proceedings." The report concludes by a severe condemnation of the directors on a variety of charges, which are said to have increased the capital to four times the amount first announced.—An alarming accident occurred on Wednesday, at noon, in the centre of the Summit Tunnel, by the mail train running into a luggage train. The mail train leaves Manchester at ten minutes before 11 o'clock, and travels at great speed. No intimation had been given to the driver on entering the tunnel that a baggage-train was only just in advance, and the steam prevented him from seeing the light at the end of the train. The consequence was, that when about half-way through the tunnel it overtook and dashed into the luggage-train, smashing two or three carriages, but fortunately not hurting any individual.

IRELAND.

Dublin.—A report was current in the beginning of the week, that Mr. Lucas, the Under-Secretary, had resigned his office in consequence of some disagreement with Lord Eliot, on the dismissal of a clerk in the Secretary's office; but it has since been announced that there is no foundation for the rumour. The Protestant nobility and gentry of Cavan, Fermanagh, &c. have issued addresses calling upon the people to avoid all processions and assemblies of large bodies, at the ensuing Protestant Anniversaries. The Archbishop of Dublin delivered his customary charge on Thursday last, at St. Patrick's Cathedral, at the annual visitation of his clergy. Mr. Joyce, of Mer-view, and Sir R. Musgrave, Bart., have resigned the Commission of the peace since our last report. The weekly meeting of the Repeal Association took place on Monday, when Mr. John O'Connell, in the absence of his father, addressed the meeting at great length. The amount of rent for the week was 1,258*l.* 3*s.* 9*d.*—The Malabar line-of-battle ship has left Cork for the coast of Spain.

Skibbereen.—One of the largest Repeal demonstrations which has yet occurred, took place in this remote portion of the island, on Thursday the 22d ult. It is said that 600,000 persons were assembled on the occasion, many of whom came a distance of 30 or 40 miles. Mr. McCarthy, of Loughine Lodge, presided. Mr. Shea Lalor opened the proceedings, and was followed by Mr. E. B. Roche, M.P., and other gentlemen. Mr. O'Connell spoke both at the meeting and at the dinner afterwards at great length on the usual topics connected with Repeal.

Galway.—A Repeal meeting took place on Sunday at Oranmore, about four miles and a half from this town, which was attended by Mr. O'Connell, the Roman Catholic bishop of Galway, and an immense concourse of spectators. Lord Ffrench presided, and Mr. O'Connell spoke at considerable length on the prospects of the Repeal agitation. He concluded by advising the people to organise, and said that all he wanted was that they should pay 1*s.* each, and enroll themselves as associates, and that they should let him have 3,000,000 Repealers before he proceeded to take his next step.

SCOTLAND.

Edinburgh.—The pastoral address by the General Assembly of the Free Church of Scotland has just been issued, and has excited a good deal of interest, the principal topic being, of course, the late secession from the Established Church. After some introductory matter, the address proceeds to describe the circumstances of the secession, which differ in no respects from the statements which are already familiar to our readers. After expressing their gratitude to the Giver of all good for the unity that had attended them from the beginning of the struggle, and that, especially as it approached its crisis, the way of the Church's duty was made so plain and clear, the address alludes at some length to the particular state of society at such an important period, and thus continues:—"Be not deceived by the word schism, which has been, and which will often be, employed by adversaries. Schism is a sinful because an unnecessary separation from the Church; but there is not here, properly speaking, a separation from the Church at all. Whatever in the eye of the law may henceforth constitute the Church of Scotland,

assuredly that church in the eye of conscience and of the law of conscience—that Church, while yet acting freely, and without coercion of the civil power, pledged itself before God and the world in its claim of right to renounce the Establishment rather than submit to those conditions which have since been imposed. It has now only redeemed its pledge. It is the Church, properly speaking, which has separated from the State. Assuredly this is not schism; and those are the true and only schismatics, who by refusing to take the same step when duty required it, have thus, and thus only, caused the disruption of the Church. In like manner you will not be deluded by the supplicating cry, 'How can you quit the Church of your fathers?' The Church of your fathers is that Church which holds the principles that they held, which bears the testimony that they bore, and which is now suffering in the cause of that great truth for which they suffered. Where was the Church of your fathers during the 28 years of persecution which desolated the land two centuries ago? Was it where prelacy held sway, and where curates occupied the pulpits from which the martyr ministers had been expelled? Or was it with the persecuted Covenanters on the waste heaths or moorlands among the wild glens and mountain solitudes, with Welsh and Blackadder—with Cameron and Peden—with Cargill and Renwick? You cannot otherwise quit the Church of your fathers than by cleaving to the present establishment, which no longer retains the principles for which your fathers bore their testimony, even unto death. You cannot otherwise remain members of the Church of your fathers than by adhering to those who are following their footsteps, renewing their testimony, and preparing like them, to encounter every kind and degree of suffering and danger in defence of the Redeemer's crown. One other plausible argument with which you may be addressed is the assertion that we ought to follow the example of our fathers, who in all former struggles never left the Church till they were forcibly ejected. In answer to this, let it be observed, that they were in circumstances totally different from those in which we are placed. During their days religious toleration, such as we enjoy, was unknown. There was no such thing then as leaving the establishment, and having freedom to preach the gospel out of it. The claim of the civil power was that of a universal supremacy over the Church of Christ—supremacy in all causes, civil and ecclesiastical. Between such a claim and the leaving of the Establishment, had that been possible, there was no connexion. The one only step left to our forefathers was to resist the civil power in its interference with conscience, and take the consequences. It is otherwise with us, who have a ground of freedom still left in the constitution without the pale of the Establishment. If still we remain in it, acquiescing in the unlawful conditions, of course we betray the sole sovereignty of Christ in His Church. If we remain in it resisting them, we not only, to all practical purposes, betray that sovereignty, but we dishonourably cling to the emoluments of the State, while we refuse compliance with the express conditions on which they are bestowed." The address then goes on to remark upon matters more peculiarly of a doctrinal character, and concludes by exhorting their people in their religious duties, and calls upon them to labour zealously in rebuilding the walls of their prostrate Zion.

Miscellaneous.

The Heart of St. Louis.—A few weeks ago, the workmen employed on the restoration of the Sainte Chapelle, adjoining the Palais de Justice, in Paris, having discovered behind the high altar dedicated to St. Louis a leaden box, M. Duban, the architect, on being informed of the discovery, made it known to the Archbishop of Paris, who sent his grand vicars to inspect what had been found. The box contained a heart, and with it a writing on parchment, on which it was recorded that the contents having during some repairs made in 1802 been found in another box completely decayed by rust, it was again enveloped in lead, and re-deposited in the same spot. This document is signed by M. Camus, Archivist General of the kingdom, M. Terasse, Keeper of the Archives, and the Secretary of that office. As Moreri, the historian of France, affirms that the heart of St. Louis was carried to the Sainte Chapelle, and placed behind the high altar, it was expected that the investigation ordered by the Minister of Public Works would establish the remains thus found to be that sacred relic. M. Letronne, however, the Keeper-General of the Archives of France, addressed on the 20th ult. a memorial to the Minister in which, after citing and commenting on all the authorities who had written on the subject, he comes to the conclusion that the heart of St. Louis, who died at Tunis, was not brought back to France, but must form part of the relics deposited in the church of Monreale, near Palermo; and that even supposing it to have been brought back to France, it had not been deposited in the Holy Chapel. Since the publication of this opinion, M. Leprevost, a deputy of the department of the Eure, has addressed a long letter to the *Moniteur* in reply to M. Letronne's argument, that the heart of that monarch had not been removed to France, and that if it had been, it would certainly have been inclosed in a box made of a more precious metal than tin. M. Leprevost considers the former assertion as extremely hazardous, and resting on no well-established fact. "As respects the argument drawn from the paltry value of the box," he says, "an argument which has gained many partisans, we will begin by observing that the box in question was neither made of tin, nor lead, but of tinned copper, and we will oppose to it a single fact which appears to us conclusive. The heart of a prince nearly coeval with the French monarch, who was certainly as great a king as St. Louis—I mean Richard Cœur de Lion—was also inclosed in a metal box,

which box, so fortunately discovered by my learned friend, M. Deville, and so shamefully abandoned ever since, in a corner of the Cathedral of Rouen, is not made of gold, gilt-silver, or silver, nor even of tinned copper; it is made of the vilest of metals—lead." A correspondent of a daily paper suggests that the English Government should have claimed this relic in return for the body of Napoleon.

Another Shakspeare Autograph.—Dr. S. Mackenzie has addressed a letter to the *Morning Chronicle*, stating that "within the last few weeks there has turned up what, if authentic, must be by far the most valuable of all the Shakspeare autographs. This is no less than the identical black letter copy of Holinshed's Chronicles which was used by Shakspeare, enriched with his manuscript notes, and above all, by his own autograph signature in full." It was purchased some weeks ago by Mr. Thomas Powell from Mr. Elkins, a bookseller in Lombard-street.

Antiquities of France.—The Paris papers state that there has just been discovered in the ground excavated for the Northern Railroad, between St. Leu d'Essevens and Montalaire, a girdle of solid gold, wrought to imitate a cord, having a hook at each end. The weight of this object is 342 grammes, and the gold is valued at 880*fr.* It was found within two feet and a-half of the surface, and no other article was discovered near it. M. Haubigant, member of the Council-General of the Oise, paid the workmen handsomely for giving it up to him, with a view to having it deposited either in the Museum of Beauvais or the Bibliothèque Royale of Paris. It is supposed to belong to the Gaulish period, about the time of Cæsar.

Law.

HOUSE OF LORDS.—(*Committee for Privileges.*)—The Committee on Tuesday last, after hearing Sir Harris Nicolas for the claimant, unanimously resolved, on the motion of the Lord Chancellor, that the claim of Washington Shirley Ferrers to sit in the House of Peers as Earl Ferrers had been fully established. At a previous sitting the Committee resolved that Mr. Tracy, the claimant of the Tracy Peerage, which has been in abeyance since 1797, had not made out his case.

VICE-CHANCELLOR'S COURT.—(Before Sir L. Shadwell.)—(*Burchall and Others v. Mitchell and Others.*)—Mr. Bethel and Mr. Phillips applied to the Court on behalf of the plaintiffs for an injunction to restrain the defendants, their agents, and workmen, from mowing down, selling, or in any way interfering with or disposing of the crop of hay now standing upon a certain piece of land, situate amidst certain other pieces or parcels of land known as Southfield and Burgess's Meadows, in the parish of St. Mary's, in the borough of Leicester, and which piece of land had been allotted by the commissioners appointed under the provisions of a private and local act of Parliament (the 44th George III.), for the benefit of the resident freemen and free-men's widows of the borough of Leicester, in lieu of their former rights of common of pasture over all these said pieces and parcels of land which they had previously enjoyed immemorially. The piece of land in question in this suit is identical with that which constituted the subject-matter in dispute in the case of "Astell and Others v. Mitchell and Others," a full statement of the details of which, together with the Vice-Chancellor's judgment upon the construction to be given to the act in question, so far as it governed the respective rights of the litigant parties, was given in our Paper of last Saturday. The defendants in this suit are the same as those in the former suit, being a majority of the deputies appointed under the act of Parliament in question, to manage and regulate the enjoyment by the freemen and their widows of this piece of land so allotted to them. In the former suit the chief question at issue between the parties was, whether the defendants in the suit, the deputies, had power under the act to divide this allotment into garden-plots among the freemen and their widows, an object much desired and warmly supported by the suffrages of the great majority of the freemen and their widows. The Vice-Chancellor, on that occasion, was of opinion, upon a minute, critical, and legal construction of the act, that the deputies had not the power to turn this land into garden-plots, or to make use of it for any purpose which would render it unfit for pasturage. The plaintiffs in the present suit were not parties to the former suit; but, as they claimed to have an interest in the enjoyment of this piece of allotted land, they filed this bill, and now applied for this injunction, to restrain the defendants from mowing down or selling the crop of hay now standing on the piece of land in question, notwithstanding that it was conceded to the defendants, at the period of the former decision, that they might be at liberty to cut down the standing crop of hay now on the land, without infringing the terms of the injunction granted and continued by the Court against them in that case. The Vice-Chancellor, in the present instance, without calling on counsel for the defendants to make a single observation in opposition to this application, at once refused the motion with costs.

COURT OF QUEEN'S BENCH.—(*The Queen v. Stowell.*)—This was another of the many cases that have recently come before the Court on the question of venue. It was an indictment found in the Central Criminal Court, and charged the defendant with having endeavoured to dissuade one Esther Harley from giving evidence on another indictment against two persons, named John Williams and John Wakeling. The indictment had the words "Central Criminal Court" in the margin, as the venue given by the statute which created the jurisdiction of that Court; but it did not contain any statement of the offence having been committed within any one of the five counties over which, or parts of which, this jurisdiction extended. The case had been removed into this court on *certiorari*, and the defendant had been tried by a Middlesex jury, and had been convicted. A rule had since been obtained to arrest the judgment, on the ground that the general allegation of "Central Criminal Court" as a venue, without the statement of any particular county, was defective. The case was subsequently argued by Mr. Chambers for the defendant, and by Mr. Richards for the Crown. Lord Denman now delivered judgment. Having stated the nature of the objection, his Lordship referred to the statute 4 and 5 W. 4, c. 36, the third section of which provided that the district situated within the limits of the jurisdiction created by that act should be deemed one county for all purposes of venue, local description, &c. It was not denied that the venue, as it stood in this indictment, would have been sufficient for any case tried at the Central Criminal Court; but the objection arose in consequence of the case being removed into this court. The venue was material as showing the place from which the jury were to be summoned. Here the case, in consequence of the *certiorari*, was tried in this court by a Middlesex jury; but it did not appear on the face of the indictment, that that jury had been properly summoned, or that the court had jurisdiction in the matter. Even in the indictments preferred in the Central Criminal Court, it would be proper to insert a place applicable to the allegation of the act which constituted the offence, alleging that place to be within the jurisdiction of that court; but it was absolutely necessary that such an allegation of venue should exist in cases of indictments removed into this court. In future, where such an allegation of venue was not made, this court would not grant a rule for a *certiorari*, unless the defendant consented to waive his objection to the jurisdiction arising from such want of a special venue. Here the want of it was fatal to the proceeding, and the judgment must therefore be arrested.

Colburn v. Whiting and Brown.—This was an action of libel, to which the defendants pleaded Not Guilty. The Solicitor-General stated the case. The plaintiff in this case carried on for years the business of a publisher. The defendants were the publishers of the *Atlas* newspaper, and the attack which the plaintiff complained of appeared in their paper. The plaintiff was in the habit of inserting advertisements in the *Atlas* newspaper, and in the course of a single year they had amounted to 70*l.* He had reason to think that his advertisements there were not productive to him, and they descended, therefore, to 40*l.* The proprietors of the *Atlas* had a communication with the plaintiff on the subject, and said they came to offer the olive-branch or the tomahawk. In an article in the paper of the 4th of March, 1843, *Ainsworth's Magazine* and *Colburn's New Monthly Magazine* were contrasted with each other. The article began by referring to the opinion of Swift, that there was no honour among book-sellers, though there might be among thieves. This the writers said they did not believe, though the following might furnish an instance of the truth of the opinion. They then referred to the publication by the plaintiff in *Colburn's New Monthly Magazine*, of certain articles on the subject of the life of the late Mr. Elliston. They were the production of Mr. Mercer, and were called "Ellistoniana;" and the defendant's paper referring to them, represented that they were but imitations of some articles on the same subject, published in *Ainsworth's Magazine*, under the title of the "Elliston Papers." The writer in the *Atlas* said he did not know which was the real *Simon Pure*, but that the "Ellistoniana" ought at all events not to have been published, in proof of which he inserted a letter, purporting to come from Mr. Charles Elliston, a son of the deceased, in which it was said that many of the anecdotes were false, and some of them were of a gross character, and that he and his family protested against their publication. In another article in the *Atlas*, the editors of that paper, affecting to ridicule a system of puffing, which they described as resorted to by some unworthy persons, charged the plaintiff with practising it, and distinctly alleged that he used the arts which in their article they denounced. They added, that they, as guardians of literature, were determined to put a stop to this practice. These were the libels of which the plaintiff complained. The case of Sir John Carr had established that criticism on publications might be made, and however severe they were, the writers of them would not be responsible. But, at the same time, that case decided that such writers must not step out of their way to assail the character of the writer of the book criticised, or the publisher of it: for if he did the persons so attacked would have the same legal right to protection as any other person. The learned Counsel then called Mr. Shoberl, as a witness, who said, I am on the establishment of Mr. Colburn, as one of his literary assistants. I remember Mr. S. Whiting coming to Mr. Colburn's. In the middle of his visit he applied for Mr. Colburn's advertisements in the *Atlas*. He mentioned that they had been withdrawn, and he applied for books for review, to be sent as before. I told him that I would make known to Mr. Colburn his application. I did so. Plaintiff refused it.—Cross-examined.—The "Life and Times of Frederick the Great" was published with Mr. Campbell's name as editor. My father was the author of it. I deny that there was any deception practised on the public by that description. I do not know what you mean by a puffer. I know there is something technically called puffer. There is a person kept who sometimes writes fair paragraphs, but there is nothing deceptive in them. Mr. Hurst has not that department. I do not see that any fair little announcement of a book should be called a puffer.—The Solicitor-General objected to this style of question.—Mr. Thesiger contended that the question was most important. The inquiry here was, whether there was not a system of puffing, and whether the article complained of was more than a criticism on a practice which, for the benefit of the public, ought to be put down.—Lord Denman thought that the question was, whether there was a libel or not, but not whether it was so in respect of any particular party connected with any particular person. Mr. Moncrieff was then called, and proved that he was the writer of the "Ellistoniana" in *Colburn's Magazine*. Mr. Thesiger then addressed the Jury for the defendants. He denied that there was anything here that could properly be called an attack upon private character. The defendants had no private motive influencing their conduct. If persons assumed the office of public journalists—if they affected to guide public taste, and to afford to the public the proper means of forming a correct judgment,—they were not merely entitled, they were bound to show in what way that judgment was covertly endeavoured to be influenced. He had himself been wholly ignorant of the manner of puffing—so ingenious but so deceptive—which this article in the defendant's paper had denounced; he had always believed that the recommendations of a work, which he saw first in one periodical and then in another, were so many expressions of different voices honestly and faithfully expressing the opinions of various individuals. It seemed that he was in this quite mistaken—that, in fact, they all proceeded from the same person, were puffing from one publication to another, till they had completed what was called the round of the papers, and had succeeded in inducing simple-minded persons, like himself, to believe that the voices of all the critics were unanimous in favour of the work which appeared to be criticised. No one could doubt that the system was a most improper one—no one could doubt that, if it deceived persons for a time, it must bring discredit on literature itself, and was therefore a system which deserved reprobation. The defendants had done no more than reprobate it, and in doing so they had only pointed out an instance in which, as it seemed to them, the system had been unfairly carried into practice. In what they had done they had not transgressed the bounds within which, for the public benefit, the law allowed them to write without restraint. It was to be regretted that such strictures as theirs were necessary—it was to be regretted that when these puffing paragraphs were presented to publications, they were not always inserted, as they were inserted in what he might call the leading journal of the country, with the word "advertisement" prefixed to them. Such an act of printing them would be distasteful to some persons, and was, no doubt, the cause why so few of them appeared in that journal, but would be serviceable to the country. A publisher of books and of magazines, was, to a certain extent, public property. The case of Sir John Carr authorised fair criticism on his publications, and if he puffing them by insidious means, justified the exposure of the puffing. The public character of such a person was not a public property on which every one might prey; but it was something on which every critic might, for public reasons, and in a fair way, freely animadvert. These defendants had done no more; they had not touched the private character of the plaintiff; they had done no more than they were warranted in doing, and they looked to the jury with confidence for a verdict in their favour. Lord Denman summed up the case. He said that in the imputed article, the subject of puffing had been introduced with a good deal of humour, and if the Editors of the *Atlas* had been able to show any paragraphs of the sort they had humorously described had proceeded from the office of the plaintiffs, and had been sent the round of the papers, the jury would probably think that the defendant had resorted to a fair and proper mode of criticism, and would think that they ought to be allowed great liberty in exercising it. But that had not been done here. The jurors would, under these circumstances, say whether the defendant's articles did or not contain a libellous attack on the personal character and the honour of the plaintiff. If they thought they did, they would find for the plaintiff, and then say to what damages he was entitled. But if they thought that no such libellous attack had been made upon him, they would then find their verdict for the defendants. As to the expression supposed to have been used by Mr. S. Whiting, on which comment had been made, he (Lord Denman) should only observe that that gentleman had no authority to use it so as to cast any responsibility on the defendants; but, at the same time

Printed by Messrs. BRADURNY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitetowers, in the City of London, and Published by them at the Office, 8, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 1, 1840.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 27—1843.

SATURDAY, JULY 8.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Agricultural labour, ancient price of	445 c
Agricultural Society of England, meetings of the Royal	446 b
Amateur's Garden, No. XXVII.	444 b
Arrowroot pudding, how to make	447 b
Asparagus, benefit of salt to	444 c
—hardiness of	445 a
Bees, remarks about	445 a and b
Books, advice about	449 a
Botanic Society of London, exhibition of the	445 c
Butany, review of Mr. Forbes's inaugural lecture on	447 c
Cabbages, how to kill grubs on	445 a
Caledonian Horticultural Society, meeting of the Royal	447 a
Callistemon salignus, notice of	447 c
Calendar of operations for the ensuing week	448 b
Coccus testudo, habits, &c. of	448 c
Commelina coleitis, cultivation of	443 c
Convent-garden market, report on	448 c
Dendrobium aurium, account of	447 b
Entomology, No. XLV.	443 c
Floricultural Society, its exhibition	440 c
Florists' flowers, notice of seed	440 b
Jing	449 b
Flowers, cause of some of them being night-scented	445 a

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

NEW AND SUPERB FUCHSIAS.

YOUELL & Co. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their select list of the above elegant tribe of plants, which appeared on the front advertising page of this Paper of the 27th ult. They are now ready to be sent out per post, free, (on the receipt of a post-office order,) to any part of the United Kingdom, upon the following terms:—
12 fine show varieties, 12s. 12 extra fine and very superior 21s.
The selection being left to YOUELL & Co.
Great Yarmouth Nursery, Norfolk, July 6, 1843.

ROSES.

E. DENYER begs to inform the Nobility, Gentry, and his Friends in general, that his superb collection of ROSES are now in full bloom. The Standard and Dwarf ROSES are planted on each side of a walk, 660 feet long, and consist of 500 varieties. Orders taken for the plants when in bloom, and delivered in November next. Admittance Gratis. No Admittance on Sundays. Nursery within three miles of London, Loughborough-road, North Brixton.

YELLOW RHODODENDRON.

LUCOMBE, PINCE, & Co., have now a few plants for sale of this rare and beautiful RHODODENDRON: and as they purchased from Mr. SMITH, who raised it, the original Plant, which was exhibited in Flower by him at Chiswick, and gained the Large Silver Medal, and have propagated stock from it, their plants may be depended upon as being the true "RHODODENDRON AUREUM," or Smith's Yellow Rhododendron.—Exeter Nursery, June 12.

FUCHSIA ST. CLARE.—A Specimen of this Magnificent FUCHSIA has been again submitted to Dr. LINDLEY. YOUELL & Co. have therefore much pleasure in referring the readers of the *Gardeners' Chronicle* to the remarks made, and which will be found amongst the "Notices to Correspondents" in last week's Paper, as follows:—"YOUELL & Co.—From the specimen received, St. Clare appears to be a prolific bloomer and fine variety; we have never seen the colour so fine in any specimen grown near London."
YOUELL & Co. can supply a limited number of fine strong Plants, 15 inches high, in 48-sized pots, at 10s. 6d. each; or one small St. Clare, with 11 other fine show varieties at 20s., per post, free, on the receipt of a post-office order.—Great Yarmouth Nursery, July 6, 1843.

TO THE ADMIRERS OF NATURAL PRODUCTIONS.

FLEIBOLD, NATURALIST, begs to inform the Nobility, Gentry, and his Friends, that he has just arrived, via New Orleans, from Mexico and Arkansas, with a large collection of Plants, viz.:—
PALM, from three different climates.
CACTI, from do. do.
ORCHIDACEOUS Plants from do., &c. &c.
Also SEEDS of rare CACTI, FERNS, and other choice Plants; Insects from Mexico; Amphibia from Alabama and Louisiana, and Dry Plants from Arkansas, Mexico, &c. Direct to Mr. B. PALMER, 29, Botolph Lane, and 112, Lower Thames-street. July 6, 1843.

LOUIS VAN HOUTTE, FLORIST to the King, Ghent.

Belgium, begs to offer:—
Phlox Van Houttei (see "Botanical Register"), the 6 plants 2 0
Habrothamnus fasciculatus, Endl. (in the sole possession of all the stock), flowers like those of the Burchellia capensis, each . . . 1 1
Musa zebraia, black striped leaves, red below . . . 2 2
Canna indica, with yellow striped leaves . . . 1 1
Achimenes grandiflora (see "Botanical Register" and "Botanical Magazine"), deep pink flowers, the half-dozen . 0 15
Ditto, strong plants, the half-dozen . . . 1 10
Achimenes pedunculata, the half-dozen . . . 1 1
Rhododendron barbatum . . . 1 1
All English letters directed to Belgium must be prepaid.

THUNBERGIA FRYERII.

J. FRYER has the satisfaction to inform his Friends and the Public that he will be able to send out in the first week of November next (at 7s. 6d. each, with the usual allowance to the trade), the above delicate and beautiful new variety of THUNBERGIA, raised from seed this season. It is noticed by Dr. Lindley, in the *Gardeners' Chronicle* of June 17, where he describes it as "having the colour of T. durantiaca, but with a whitish centre instead of a dark one, which feature renders it distinct." The seedling plant may now be seen in full bloom, and orders taken, which will be executed strictly in the rotation they are received.

Also a large stock of T. ALATA and T. AURANTIACA, fine strong plants, from 9s. to 12s. per doz.
J. F. can likewise supply healthy plants in pots of most of the leading varieties of PANSYs, all the new FUCHSIAS, VERBENAS, and an extensive collection of HERBACEOUS PLANTS, at moderate prices.—Clarendon Nursery, Camberwell New Road, July 7, 1843.

SALE BY AUCTION OF VALUABLE AUSTRALIAN AND NEW ZEALAND PLANTS.

MESSRS. J. C. & S. STEVENS beg to announce that they will sell by Auction, at their Great Room, 38, King-street, Covent-Garden, on TUESDAY, 18th July, at Twelve o'clock, a COLLECTION of VERY RARE PLANTS, just arrived from New Zealand and Australia, in a most healthy state, and including a New Species of ARAUCARIA, ACROSTICHUM GRANDE, a New Species of DACTYDIUM, a New JASMINUM GRANDE, a new CARINA, 4 New DENDROBIUMS, (very beautiful), a new CLEMATIS, DACTYDIUM MAI, and other very rare Plants. May be viewed the day prior and morning of Sale, and Catalogues had of the Auctioneers, 38, King-street, Covent-Garden.

RARE ORCHIDACEÆ FROM CENTRAL AMERICA.

MESSRS. J. C. & S. STEVENS beg to announce that they have received instructions to sell by Auction, at their Great Room, 38, King-street, Covent-Garden, on TUESDAY, July 18, at 12 o'clock, A VALUABLE CONSIGNMENT of ORCHIDACEÆ. The principal attraction will be found in the very rare and splendid "SOBRALIA MACRANTHA," in fine order, and an EVELYNA, in their native soil. May be viewed the day prior and morning of sale, and Catalogues had,

TO NOBLEMEN, GENTLEMEN, FLORISTS, and Others.

MESSRS. PROTHEROE & MORRIS are instructed to submit to Public Competition, at the Auction Mart, Bartholomew-lane, on FRIDAY, July 21st, 1843, at Twelve o'clock, A VERY RARE COLLECTION of STOVE AND GREENHOUSE PLANTS, the property of a Lady changing her residence, comprising fine specimens of EUPHORBIA SPLENDENS, COMBRETUM PURPUREUM, JASMINUM, SAMBAC, GLOXINIA FANCRATILUM, AMARYLLIS, ONCIDIUM CRISPUM, FLEXUOSUM, and LURIDUM; CATTLEYA CANDIDA, SOPHRONITIS VIOLACEÆ, and a variety of Miscellaneous Plants. May be viewed the Morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, and Others.

MESSRS. PROTHEROE & MORRIS are instructed to sell by Public Auction, on the premises, at COLVILL'S Nursery, King's-road, Chelsea, on MONDAY, 24th July, 1843, and following days, at Twelve o'clock (by order of the Proprietor, retiring from business), the whole of the valuable GREENHOUSE PLANTS, consisting of fine CAMELLIAS, of various sizes, ERICAS, AZALEAS, PELARGONIUMS, HYBRID RHODODENDRON ARBOREUM, and other Miscellaneous Plants. May be viewed one week prior to sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

TO BE SOLD BY AUCTION, by Mr. WARREN,

on the Premises, Kneller Hall, Whifton, (between Twickenham and Hounslow,) the residence of the late CHARLES CALVERT, Esq., M.P., on TUESDAY next, July 11, at One, 8 peculiarly fine and handsome Alderney, Suffolk, and other Milch Cows, 48 Sheep and Lambs, a fine young Ram, 2 capital Cart Mares, a Bay Horse, 4-year-old Black Horse, 13 Store Pigs, 2 Sows, Poultry, Market Cart, Dung Cart, Dairy Utensils, 175 valuable Conservatory Plants, comprising splendid specimens of Double White Warratah and Red Camellias, Orange and Lemon Trees in fruit and blossom, very fine Myrtles, an Iron Garden-roller, &c.

The Auctioneer respectfully invites the attention of the Public to the very superior description of the Cows and the Conservatory Plants, which he has thus the pleasure of submitting to them for sale. May be viewed the day preceding and morning of sale, on application to the Gardener on the Premises, of whom Catalogues may be had; at the Inns in the neighbourhood; of H. NESBITT, Esq., Solicitor, 6, Gray's Inn Place, and of Mr. WARREN, Land and Timber Surveyor, Isleworth.

PINE PLANTS.

TO NOBLEMEN, GENTLEMEN, AND THE TRADE.

TO BE SOLD, a Growth of PINE PLANTS of the finest quality, all in a healthy and good condition, fruiting and succeeding plants, among which are several New Sorts, which are worth the notice of any party growing them; they will be sold a Bargain, in consequence of the Owner giving up that part of the business. Application to be made to Mr. TRINDER, Forest-Hill, near Sydenham, Kent; or, of Mr. Wm. CLARKE, Fruit Salesman, Covent Garden Market.

TO BE SOLD, Price 25s. each, MUSA CAVENDISHII and SAPIENTUM.

Several healthy plants of the above Valuable Fruit. Apply to Mr. MELVILLE, Welcombe Gardens, near Stratford-on-Avon, Warwickshire. Also some large ORANGE TREES, thirteen feet in height, and 100 years old, in heart-of-oak tubs.

BRITANNIA LIFE ASSURANCE COMPANY.

1, PRINCES STREET, BANK, LONDON.

This Institution is empowered by Special Act of Parliament, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestably, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others. The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of 30, who by the payment of 5l. 3s. 4d. to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000l., subject only to the condition of his continuing the same payment quarterly during the remainder of his life, a condition which may be fulfilled by the mere saving of eight shillings weekly in his expenditure. Thus, by the exertion of a very slight degree of economy—such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000l., which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the despatch of business.

NATIONAL LOAN FUND LIFE ASSURANCE

ANNUITY, and DEFERRED ANNUITY SOCIETY,

25, Cornhill, London.

Capital, 500,000l.—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.

John Elliottson, M.D., F.R.S. George Lungey, Esq.

John Griffith Frith, Esq. John Rawson, Esq.

H. Gordon, Esq. Clement Tabor, Esq.

Joseph Thompson, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:—

Entry	Policy No.	Age.	Sum.	Annual Premium	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	50	1,000	£ 8 4	£ s. d. 132 14 6	£ s. d. 58 19 9	£ s. d. 8 19 4
1838	114	50	3,000	£ 15 0	£ s. d. 296 9 7	£ s. d. 123 0 6	£ s. d. 16 9 7

Policy now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

FOUND, in the *Gardeners' Chronicle* Office, a BANK NOTE. Any party giving the particulars of the amount and number of the Note will have it returned on payment of the expenses of this Advertisement.

TO LET, in Regent-street, Three Rooms on the Second Floor, unfurnished, with the use of a large Meeting Room. They are suited for the purposes of a Society, and have for some years past been so occupied. Apply to the Porter, 21, Regent-st.

FLORICULTURAL SOCIETY OF LONDON.—

The ANNUAL EXHIBITION OF CARNATIONS AND PICOTEES will take place at the CROWN & ANCHOR TAVERN, Strand, on TUESDAY, the 20th inst., at 3 o'clock, when First and Second Prizes will be awarded in all the classes. The Prizes for Seedlings are unlimited, and will be given to all that may deserve them, according to their merits, as first or second class Flowers. Of Seedlings of the present year one Bloom will be sufficient; but of those of previous years three Blooms will be required,—which may be forwarded with the names intended to be given to them, to the Secretary on the day of Exhibition.

T. C. WILDMAN, Hon. Sec.

Grove Place, Southampton-street, Camberwell.—July 5, 1843.

EXHIBITION OF ROSES.—An Exhibition of

ROSES will take place at the ATHENÆUM, Temple Row, Birmingham, on THURSDAY NEXT, July 13. Tickets of Admission from 12 to 2 o'clock, 1s.; and from 2 to 7 o'clock, 6d. each, may be had of Mr. F. DICKINSON, Bristol road; Mr. E. BULL, Bristol-road; Mr. MELLON, New-street; Messrs. POPE and SONS, Handsworth; and at the Journal Office, and Midland Counties' Herald Office, Birmingham.

F. B. S. FLINBELL, Secretary.

N.B.—Persons wishing to enter must apply to the Secretary, at 38, New-street, Birmingham. All specimens must be correctly named and staged by 10 o'clock on the morning of the day of Exhibition.

SUPERB CHRYSANTHEMUMS.

YOUELL & Co., in offering their List of CHRYSANTHEMUMS (for which see their advertisement in this Paper of the 1st inst.), to the notice of Amateurs and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the List will be found highly satisfactory to those who may not only have the above object in view, but also to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants are strong and healthy, and sent free of postage (on the receipt of a Post-office order) to any part of the United Kingdom, at the rate of 12s. per dozen.

Great Yarmouth Nursery, July 6, 1843.

MAGNIFICENT NEW FUCHSIA,

"FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised from seed in the Exeter Nursery, and which they have no hesitation in saying is decidedly the finest variety ever produced; indeed, it is at once admitted to be so by all who see it, who are struck with admiration of its noble appearance. The flowers are exceedingly large, being longer as well as broader than those of any other Fuchsia, and are of a very firm, thick, waxy substance, with the corolla of a fine violet blue colour.

Plants will be ready for delivery on the 10th of August next, at 10s. 6d. each, and will be sent by post, carefully packed in tin cases. The usual discount to the trade if six plants are taken. For a full description of this Fuchsia, see Advertisement in the *Gardeners' Chronicle* of the 17th ult.

ARAUCARIA IMBRICATA PLANTS.

MESSRS. VEITCH & SON having raised a considerable number of this Splendid Hardy Ornamental Tree, are enabled to offer fine healthy plants, from 4 to 6 inches in height, at the following moderate prices, viz.:—
10l. per 100;—5l. 10s. for 50;—and 30s. per dozen.

For the convenience of some purchasers, Messrs. V. & S. have appointed, as their London agent, Messrs. HURST and M'MULLEN, Seedsmen, No. 6, Leadenhall-street. N.B.—A remittance or reference required from unknown correspondents.—Exeter, June 19, 1843.

ANAGALLIS (BREWERI), and SUPERB BLUE CINERARIA SEED.

MICHAEL BREWER, SEN., NURSERYMAN, London Road, Cambridge, begs to offer strong plants of his Splendid deep blue, full and complete round-petaled Seedling Anagallis (Breweri), being of a strong, green, and vigorous habit, and the flower equal in size to a half-crown. It is now ready for sending out, at 5s. per plant, postage free, to any part of the Kingdom. (See "Notices to Correspondents" in the *Gardeners' Chronicle* of June 10.) Also, packets of 1-lb. Brilliant CINERARIA SEED, comprising every shade of Dark and Light Blue; and as the present is the best time for sowing for Autumn, Winter, and early Spring flowering, he is induced to offer Seed, warranted as newly gathered, in packets at 3s. 6d., 7s., and 18s. Applications, inclosing post-office orders, will be immediately executed.

THE FARMERS' AND GARDENERS' HAIL-STORM INSURANCE COMPANY.—Offices, 4, Wellington-street North, Strand, London.

This is a subject which deeply affects the interests of both landlord and tenant, the destruction by Hail-storms being equally fearful and frequently more extensive than damage by fire.

Wheat, Barley, Oats, Beans, Peas, and Tares, insured at 4s. per cent., inclusive of the stamp, subject to the conditions contained in the policy. The Stamp on the Policy is paid by the Office.

All claims settled in the month of November in each year, and should any disputes arise, to be referred to arbitration.

Glass in hothouses, greenhouses, &c., insured at 15s. per cent., subject to certain conditions.

Prospectuses containing every information may be obtained of the Agents of the "FARMERS' FIRE AND LIFE INSURANCE INSTITUTION," who are appointed in all the principal towns in the kingdom, or by letter, pre-paid, forwarded to W. SHAW, Esq., at the Offices, Wellington-street North, Strand, London.

THE FARMERS' CLUB HOUSE.—This Club

House was opened on WEDNESDAY last, the 28th June, at the YORK HOTEL, BRIDGE-STREET, BLACKFRIARS, when upwards of Seventy of the Members dined together. The Subscription is One Guinea per annum. The Entrance Fee will be one Guinea to the 31st December next, and afterwards Two Guineas.

Prospectuses may be obtained at the Club House, or at the Office of the Farmers' Fire and Life Insurance Institution, 346, Strand. WILLIAM SHAW, Honorary Secretary.

HOT-WATER APPARATUS FOR HEATING

HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOATHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch . . . 27 0s. 0d.

(Larger Sizes in proportion.)

Roger's Boiler, small size . . . 3 15 0

Do do, large do . . . 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 4s. 0d. each.

Strong do, do, do, 45 lbs. at 4 4 "

Ox Hurdles, 4 feet high, do, 60 lbs. at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

THE CONICAL HOT-WATER BOILERS, invented

by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical; it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-

place, King's-road, Chelsea, Hot-house-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street,

London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

IMPROVED SYSTEM OF HEATING GREENHOUSES, MELON, PINE, AND CUCUMBER-BEDS, &c.

CALDWELL, PARKER, & Co., IRON-FOUNDERS,

Scotland Road, Warrington, Lancashire, most respectfully solicit the attention of the Nobility, Gentry, Seedsmen, Gardeners, &c. to the improvement which they have made in the system of HEATING HOTHOUSES by Water—a system which supersedes all others in producing the most healthy Plants in the shortest time, for which they can produce the most undeniable reference.

The improved system prevents the scorching of plants, so common to fires, and keeps the house in one regular temperature, with a saving of fuel and labour; and the Improvers warrant their system to be superior to any other, and ultimately, far less expensive.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS.

CROSSKILL'S LIQUID MANURE CART, which received the Honorary Reward of the Roy. Agricul. Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price, delivered in Hull, 25l.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12l. 12s.

J. B. LAWES'S PATENT MANURES, composed

of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

GUANO ON SALE,

BY THE IMPORTERS,

ANTHONY GIBBS & SONS, LONDON;

GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

POTTER'S ARTIFICIAL GUANO.—TURNIPS,

MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

. POTTER'S Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

CULTURE OF THE GRAPE-VINE IN AUSTRIA

AND NEW ZEALAND; with remarks on the Vineyards of Europe, Asia, &c. by GEORGE SUTTON, F.L.S.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL

DICTIONARY.

In what may be called an age of Cyclopedias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published." London: WHITTAKER and Co.

FAMILIAR ASTRONOMY. By GEORGE DARLEY,

A.B., Author of a System of Popular Geometry,—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—Sun.

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

LADIES AND GENTLEMEN, I am desirous of

gaining the Patronage of the Readers of this Journal, and trust that the system upon which I conduct my business, and the moderate prices, will gain a greater portion of confidence and support. The Improved Stamped Postage Envelopes, 1s. per doz. (without advertisements), to purchasers of other articles; Fine Bath Post, 3d. per qr., 5s. ream; do. Note, 2d. per qr., 3s. ream; Small do., 1s. per half-ream; Superfine Foolscap, 8d. per qr., 12s. 6d. per ream; and every article at corresponding prices. 10 per cent. off Books and Music. On the receipt of two postage stamps, Samples and List of Prices forwarded postage-free. Purchasers of 2l. value sent free of carriage 100 miles, of 10s. 5 miles, and any amount in London free.—From SLOPER'S Stationery Warehouse, 20, George-st., Portman-square, London.

COOKING UTENSILS with SILVER

LININGS.—At a cost of about one-third more than those lined with tin, the chief advantages of the former being greater durability and cleanliness, and the impossibility of burning—viz., giving a burnt flavour to milk or any gelatinous or farinaceous article of food, the SILVER, by a recent improvement in the ELECTRO PROCESS, adheres so tenaciously to the copper, that no heat in cooking can remove it or any acids injure it. With moderate care it will last for years, and can be renewed at a moderate charge when necessary. J. L. BENHAM considers this particularly important to the Army and Navy, and to families residing abroad, where the difficulty of getting coppers properly tinned is often very great. Old articles can have the tin removed and be lined with pure silver by this process.—19, Wigmore-street, Cavendish-square, London.

ALL DISEASES of the KIDNEYS and BLADDER

speedily and effectually cured by DR. YOUNG'S MIXTURE. The efficacy of this Medicine in the above Complaints has been long proved by its unparalleled success in a practice of many years' standing, and has induced the present proprietor to make it more generally known.

Sold in Bottles, 2s. 9d. each, by the Proprietor's Agent, J. SANGER, 150, Oxford-street, London; also by Johnson, 68, Cornhill; Prout, 229, Strand; Mr. King, 232, Blackfriars Road; and all Medicine Vendors throughout the country.

HORTICULTURAL SOCIETY'S FETE.

T. PRESLEY, late Gardener at Plaistow Lodge, Bromley, Kent, begs to inform his gardening Friends and the Public generally that he has taken the GEORGE THE FOURTH INN, near the Horticultural Gardens, at Turnham-green, where he will be glad to see any old friends or acquaintances who may think proper to call upon him.—Well-aired Beds, choice Wines and Spirits.

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS AT THE GARDEN.—The LAST Exhibition will take place on WEDNESDAY, July 12, on which occasion His Grace the DUKE OF DEVONSHIRE, the President of the Society, has kindly directed the doors of his Gardens and Pleasure-Grounds to be opened, for the reception of all persons who shall have been admitted into the Society's Garden by tickets.
SUBJECTS FOR EXHIBITION must be at this office on TUESDAY, July 11, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition. The gates will be opened at One, P.M. Tickets are issued to Fellows at this office, price 5s. each; or at the Garden in the afternoon of the days of Exhibition at 7s. 6d. each, but only to Orders from Fellows of the Society. N.B.—NO TICKETS WILL BE ISSUED IN REGENT-STREET ON THE DAY OF EXHIBITION.—21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, JULY 8, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
Wednesday, July 12. . . Horticultural, Chiswick.
Tuesday, July 18. . . Floricultural. . . 8 P.M.
Wednesday, July 19. . . { Royal Botanic, Regent's Park.
Floricultural, Crown and Anchor, 3 P.M.
COUNTRY SHOWS.—Tuesday, July 11. . Royal Cornwall Horticultural.
Thursday, July 20. . . Hoddessdon Cottagers'.

At the last meeting of the Horticultural Society in Regent-street, some most beautiful specimens of the application of the Electrotype process to vegetation were exhibited by Messrs. Elkington, of Regent-street. Upon the surface of leaves a deposit of copper was thrown down, so as to form a perfect representation in metal of the surface of the foliage.

Since that time we have been favoured by Messrs. Elkington with a sight of other leaves coated with gold and silver as well as copper. Among these were a Pelargonium-leaf, having all its glandular hairs preserved with admirable precision; an ear of Wheat; a leaf of Fennel; a Fern, with its fructification; a shoot of the Furze-bush, and an insect, (a Carabus,) with every part of it encrusted with the metallic deposit.

In our opinion this opens quite a new and most interesting field to the application of the Electrotype process. The ornaments required for the decoration of plate may thus be furnished by the unerring hand of nature herself instead of the unskilful tools of a workman; flowers and leaves for the hair or the dress may be prepared with all the lightness and finish of reality; and we see no reason why ladies should not to-day send their favourite flowers to the silversmith to be silvered or gilt for the evening, and then return them on the morrow, in order that the metal may be reduced, and again employed in encrusting other things. But it would lead us too far from our subject if we were to speculate upon the possible application of this most curious process.

SOME weeks ago we called the attention of our readers to the importance, or rather the necessity, of keeping down the temperature of their Vineries at night; and our correspondence tells us that the warning was not given too soon. As Grapes are now generally ripening in forcing-houses we resume the subject.

It will be remembered that our reasoning on the former occasion was partly founded on physiological considerations, and partly on an examination of the climate of those countries where Grapes are finest. Both those sources of evidence may now be employed to show that when Grapes are ripening, the night temperature should be nearly as high as that of the day.

In its favourite regions the Grape ripens its fruit at the hottest and driest period of the year. In Corfu the Grapes are ripe in September; now it appears from Dr. Davy's observations that the range of the thermometer in that island, day and night, is in August from 77° to 84°; and in September from 74° to 82°; that is to say, it is never colder at night than 74° in September, or than 77° in August. At Malta the lowest temperature observed in August was 74°; and in September 69°. In Candahar, Mr. Atkinson found Grapes ripe in June, and at that time his paper curled up and became perfectly crisp while he was writing on it. The night temperature of Candahar in May and June is not given; but we may be very sure that in a country like that, where a burning sun has been shining for three months, and the ground is excessively heated, there must of necessity be a very high temperature at night. In fact, in Persia, which is nearly the climate of Candahar, the midnight temperature of August has been known to be as high as 108°; and it is certain that in all such countries the difference between the temperature of the day and night, at the hot season of the year, when Grapes ripen, is inconsiderable. We may, therefore, assume that a night temperature of from 70° to 80° ought to be secured when Grapes are ripening, and that the temperature of the day should be something higher.

At that period of their existence much atmospheric moisture is unnecessary, or rather injurious to Grapes, for it will inevitably cause the Vine to break into a multitude of little branches to the impoverishment of the fruit. In the Vine countries the air is parching; Mr. Atkinson's paper curled up in Candahar while he was writing on it; and the Vine will bear such a

climate well, if it is gradually inured to it, provided the roots are in a moist soil, and there is a free circulation of air.

It is to be recollected that when a tree is ripening its fruit, it is in quite a different condition from what occurs when it is flowering. At the latter period its energies are all directed to organizing itself, and consolidating the parts that may have been formed; it is growing, and hardening its growth. But at a later period organization and consolidation are accomplished, and it is the elaboration of the fluids, stored up within the plant, that has to be provided for. The fruit of such a plant as the Vine is incessantly sucking fluids out of the branches; but that fluid is little more than water and mucilage; insipid, thin, and worthless. But after reaching the fruit it thickens by evaporation; it changes by the chemical combinations brought about in consequence of a variety of phenomena that need not be here explained; the result of which is the conversion of acid into sugar, and the creation of the delicate flavours which give the Grape its value as a fruit. Now the evaporation that is indispensable to the conversion of watery sap into Grape juice cannot take place unless the air is dry and warm; and it will take place in proportion to the dryness and heat to which, within natural limits, it is exposed; for light and heat quicken all the chemical changes that occur in plants, while dryness renders the juices viscid, and concentrates flavour.

No further argument, then, seems necessary to show that the condition of the atmosphere in which Grapes are to ripen is the reverse of that which is required when the Vines are making their growth, flowering, and setting their fruit. In the latter case, they should have high temperature by day, and be cooled down considerably at night, while a moist atmosphere is carefully preserved at all times. In the former, a high temperature night and day, and a dry atmosphere should be substituted. So says the climate which the Vine loves best,—so says theory,—so says the practice of those who know how to ripen Grapes as well as grow them (and there are not too many gardeners of that sort); and what nature, theory, and practice, alike point out, the gardener may be sure he ought to believe implicitly.

There is only one cause which can render a very high temperature and dry air injurious while Grapes are ripening, and that is dryness at the roots. Of course, under a high temperature and dry air there will be a great loss of water from the surface of both leaves and fruit; that loss must be abundantly supplied by the soil; and to that end water must be ensured at the roots. Perhaps in such a climate as England there is not much to fear under this head, for we are apt to have too much rather than too little water in our soil. Nevertheless, now that the importance of draining Vine-borders is so well understood, it is by no means impossible that they may become too dry, if incessantly acted on by the numerous roots of a strong Vine, loaded with fruit, in a hot and dry air. In such a case water must be applied abundantly to the border. In the dry climate of Persia Vines are regularly irrigated; so they are in the Ionian islands, and in all the best vineyards of Europe the roots of the Vines have free access to moist and cool strata. The famous Vine at Hampton Court probably owes its vigour to the proximity of the Thames, and we shall always find that the finest and best-flavoured Grapes are obtained under similar circumstances.

On a future occasion we shall endeavour to show at what time, and for what reason, a free circulation of air is necessary to Grapes.

It is a very common notion that nothing is required but good land and regular manuring to ensure good pasture and fine hay; but this is a great error. The richer the pasture or meadow, and the more it is manured, the more weeds will be mixed with the grass: we do not mean Nettles, Docks, and Thistles, or the Wild Carrot, which grows under trees; these are so obvious that they are generally noticed and pulled up; but there are weeds which have the character of being excellent food, and to which names are given, indicating good qualities; such are the Buttercups, which are various kinds of Ranunculus, the juices of which are acrid, and which no cattle will eat if they can get better food. When a meadow looks green, with plenty of the yellow flowers of the Buttercup, it is by many thought to be a very rich pasture. It is true that these Ranunculi are only found in good moist meadows, and seldom or never in poor pastures. The yellow flowers found there are Potentillas, and other plants, which thrive in poor soils. But observe a cow feeding: she will eat all around a plant of Buttercup, and leave it standing alone; or if by accident she has got it into her mouth, and it is not too much entangled in the other grasses, she will drop it out. Thus instinct as well as taste teaches her to avoid it. Some fanciful men have ascribed to the Buttercups many of the diseases of cattle, and even of men, from using the milk and butter of cows fed on them. This is absurd; for the cows will not eat them unless

driven by hunger, and then they will neither give much milk nor butter. It is sufficient that it is a useless weed, and takes up the room of good grasses.

The weeding of meadows and pastures cannot be too strongly recommended; and where the extent is only a few acres, and plenty of poor women and children can be found who will gladly work for a mere trifle, the grass may be much improved, and consequently the milk and butter. An acre of good grass, where the weeds are as much as possible eradicated, and where the growth of the best grasses is encouraged by an occasional sprinkling of their seed over the ground after it has been well scarified or harrowed, will give more good feed for cows than two acres of the same kind of soil which has been neglected in everything but manuring. Some of the richest land we ever saw, which might fatten a bullock and five sheep per acre, (this is the mode of valuing land in Ireland as well as in Lincolnshire,) was so overrun with weeds, that it looked like a wilderness of Thistles and Docks, while there were scores of men and women perfectly idle for want of employment; but the idea of weeding grass land never entered their heads. The butter was very fine, for the cows avoided eating the weeds; but there would have been twice as much if the weeds had been kept down. This was in Ireland, and we have seen the same in England, although not to so great an extent.

When grass-land is so infested with weeds and inferior grasses that weeding is out of the question; the best way to have a clean pasture is to pare and burn the surface, plough and pulverize the soil—the deeper the better; take one crop of Oats, which will be luxuriant, and therefore would smother all Clover or grass-seeds sown in it; then let it lie rough from the plough the winter after the crop has been harvested, and in the spring pulverize well, and sow the best picked grass seeds, with some white Clover and Trefoil; weed carefully, and you will soon have a pasture worth double of the old. The manure in the tank and the compost-heap are not to lie useless, but to be carried on with judgment as a top-dressing.

Should your soil not be mellow and rich, the same plan may be followed—only in spring it must be well manured, and then inoculated with tufts of good grass cut into small pieces and scattered over the surface; a heavy roller and a few rainy days will secure the rooting of the grass. When you have a good rich pasture filled with the most nutritious grasses, keep it so by careful weeding and a frequent application of liquid manure.

We say nothing of the artificial manures which are offered for sale everywhere, because we have not yet a sufficient experience of their value; besides, those for whom we are now writing ought to be entirely independent of extraneous help in this respect—that is, if they have followed our instructions. Experiments, however, may be made with various substances; and, provided we come to no hasty conclusions, but patiently observe and calculate the cost and produce, and repeat our experiments year after year, we may throw some light on the expediency of substituting these manures for our tanks and compost-heaps, which, at all events, are much less expensive.

When we have got our grass in a perfect state, the hay will be better in proportion. It may be as well to warn young hay-makers that the richer the grass, the more it must be made—that is, not only freed from moisture, but the juices dried up and reduced to a solid extract; or it will heat in the stack, and either burst out into flame, or at least be so carbonized as to be unfit for horses. The finer the weather the more danger there is of carrying the hay too soon. Every occupier of 20 acres of grass has a rickcloth as a matter of course; if not, the sooner he buys one the better. There is no better outlay in our changeable climate than the price of a rickcloth.—M.

WE trust that the last Meeting in the Horticultural Society's Garden on Wednesday next will include a display of fruit worthy of English Gardeners. We cannot say much in favour of the previous Exhibitions this year, which, although they contained some fine things, were, upon the whole, strikingly inferior to the produce of the flower-gardeners. The fine weather of the last three weeks has been favourable to the ripening of fruit, and it is to be hoped that the reputation of forcing-gardeners will now be upheld without blemish. We may as well add that the Society returns all fruit to the growers without expense to them.

WE learn with great pleasure that his Royal Highness the Duke of Cambridge has presented Ten Guineas to the funds of the GARDENERS' BENEVOLENT INSTITUTION. May we be permitted to suggest once more to our numerous wealthy readers that this is a good charity, well administered, for good purposes; and that contributions to it would be the means of substantially benefitting old Gardeners of respectability, now worn out in the service. On former occasions we have appealed to Gardeners rather than to

their masters; but we would now entreat the latter to follow the example of the Royal Duke, whose kind heart would, we are well persuaded, be in no way more gratified than by finding that he had succeeded in awakening the sympathies of those who can so well afford to part with a part of their abundance for the relief of the old and destitute Gardener.

THE TANK SYSTEM.

I HAVE lately altered the mode of heating my hothouse, by introducing Mr. Rendle's tank system; and as I have differed from the plan proposed by him in some material points, I think that many of your readers may be interested by an account of it, and may possibly be induced to follow the mode which I have adopted, which appears to me to be an improvement in some respects on that of Mr. Rendle. I send you a drawing of the house, with the tanks, as now at work. It is drawn to a scale of $\frac{1}{2}$ inch to a foot, so that a pair of compasses will at once give the dimensions. A is the boiler, the top of which is level with the floor of the house, the fireplace being in a back shed. The boiler is a small conical one, made by Messrs. Hood, ironfounders, Earl-street, Blackfriars. B 1 and

B 2 are the tanks; C is a trap-door, opening into the tank, which I can lift up at pleasure, and fill the house with steam. The arrows indicate the course of the water through the tanks and pipes. The two pipes, though drawn side by side (to show themselves) are really one above the other—the return-pipe being, of course, the lower; above these pipes is a stone shelf. Tank B 1 is made of Oak, the other (B 2) of Elm; the wood of each is $2\frac{1}{2}$ inches in thickness, and they stand on Oak blocks 3 inches thick, to raise them from the floor; this not only tends to prevent their decay, but promotes at the same time a freer circulation of the hot air. The bottom-boards are placed the lengthway of the tank, and not "across the bed," as recommended by Mr. Rendle. All the carpenters to whom I have spoken on the subject agree in saying that they should not be placed across but lengthwise, and as the tank ought invariably to stand on blocks about two or three feet asunder, it is impossible that the boards can be strained by the weight of water, inasmuch as each board receives a support from every block. The bottom as well as the sides of the tanks are bolted together by iron bars, five-eighths of an inch in thickness, passed through the wood, and screwed up as tightly as possible. Each tank is divided by an inch-and-a-half Elm board, and is covered with common roofing slate, those that are generally called "Princesses;" being 24 inches long and 14 wide. Mr. Rendle recommends (p. 15) that "these slates should be $1\frac{1}{2}$ inch thick, that the edges should be cut square, and the joints well stopped with Roman cement or Aberthaw lime, to prevent a superfluity of steam from escaping into the house;" and he adds (p. 30)—"The slates need be of the best quality, to withstand the heat of the water, and care should be taken that their edges be made evenly; the slates for this purpose cost me (at Plymouth), $3\frac{1}{2}$ d. per foot." I found on inquiry that I could not have got slates of such a thickness, of the best quality, and carefully cut square at the edges, under 10d. or 1s. per foot, which would much have increased the cost of the work. I therefore tried the common Welsh roofing-slates, which cost me not quite a penny per foot, and I find that they answer the purpose remarkably well. I did not cut the edges square, but I used them just as I purchased them, and stopped the joints merely with wetted clay. There is no fear of too much steam escaping into the house. I am constantly forced to syringe and open the trap-door, to let out more steam. As the divisions of tank B 1 were 15 inches wide, I had a small strip of Oak nailed on the inside of the tank, of sufficient thickness to allow the slates (which were 14 inches wide, to reach across. Round the edges of the tanks I placed (as Mr. R. recommends) an inch board 11 inches deep, and the plugging material which I use is fine sand. The slates carry the weight of this sand, though 11 inches deep, with ease, not one of them having cracked as yet; indeed, they would bear a much greater weight, for I saw one of the masons stand with his whole weight on one of them, and it did not give way. In a considerable part of tank B 1 I have put rich mould instead of the sand, in which I have planted Pines without any pots, after the French mode; how this may answer remains to be proved, but they appear to be doing well. The most material point in which I differ from Mr. Rendle is the depth of the tanks; instead of being 4 inches deep (as he advises, p. 15), mine are 18 inches deep in the clear, inside. This much increases the bulk of water, the tanks holding 22 hogsheads instead of about four and a

half; and I find that my boiler, though a small one, is fully able to heat this quantity; indeed, I conceive that I could heat with the same boiler another house equally large; I have some idea of trying this soon, and should I do so I will, if you wish it, communicate the result to you. If I carry out my proposed plan, the boiler will have to heat nearly 60 hogsheads of water. I have no fears in my mind as to the result, judging from the apparent ease with which 22 are heated. I have a thermometer fixed in the tank, the bulb being immersed in the water, and the upper part being inclosed in a small box at the side of the tank, by which means I can at any time see the heat of the water, and I find 114° or 115° of Fahrenheit is high enough to keep the house at a temperature of 70° at night. I also find that a moderate fire kept up for five or six hours in the 24 is abundantly sufficient. The hothouse was heated before by four-inch iron pipes, besides having a large bed of tanner's bark (eight large waggon-loads), in the centre, and I could not produce the same heat as that now given by the tanks without keeping up an incessant fire night and day, added to which the temperature of the house was then dry, instead of being moist, as at present. The difference in the colour of the leaves of all the plants, and the rapidity of their growth is surprising already, though the system has not been at work more than six weeks. Every lover of horticulture ought to feel much indebted to Mr. Rendle for his system; for, though there may be nothing new in the principle, to him is justly due the merit of bringing it, in its present form, before the public. The saving in fuel is immense—at least one-half; but the greatest advantage is the equability of temperature which it produces; so large a body of water, when once warm, retains its heat for a very considerable period, rendering the temperature of the house more uniform and regular. To illustrate this I give the following fact: I desired my servant one day not to light the fire (which he generally did about six o'clock in the evening), in order that I might see how much such a body of water (22 hogsheads) would cool in 12 hours. At night, when I last saw it, the thermometer stood at 113° ; the next morning, at about eight o'clock, it was 109° , having sunk only 4° in that time. When the water was perfectly cold it took a good brisk fire for 24 hours before it had attained the temperature of 120° ; but this I found to be too hot, and I now keep it at from 112° to 116° , and this is easily effected by lighting the fire about five or six o'clock in the evening, making it up the last thing, to burn during the night as long as it will. No fire need be applied at any time in the morning or midday. In short, I am delighted with the system, and strongly urge all to adopt it, even if it be for economy's sake alone; keeping this fact in view, that the body of water can never be too large, provided only that the fire applied be able to heat it; and I feel quite confident that 50 hogsheads would not be too much for any of the common-sized conical boilers. —John Huyshe, Clithydon Rectory.

ON THE CULTIVATION OF CYCLAMENS.

In few plants are so much combined, for the admirer of either curious, gay, or fragrant flowers, as in the different species and varieties of Cyclamen; yet they are hardly to be found in cultivation, and any one acquainted with their pretty appearance might well be surprised to find such beautiful objects so much neglected. Flowering, too, as they do, at various seasons, but particularly during the winter and spring months, and lasting in flower for a considerable time, the greenhouse or even the windows of the amateur's sitting-room may be made attractive with such plants during all the spring months, by growing a few of the early flowering kinds.

In cultivating the different sorts of Cyclamen, it must be observed that some are much harder than others, and may remain in the open border all the winter; while some are destroyed by a few degrees of frost. But it must also be remembered, that all suffer alike from excess of moisture during winter; they are, therefore, best calculated for growing in pots, as the summer and autumn-flowering kinds may then be plunged in the open borders through the flowering season in their pots, and taken up again before winter, and placed in some dry situation until the following season.

The Cyclamen is increased in two ways: first, by cutting the largest roots into pieces, which is a bad practice, as they are very liable to rot during the first season after cutting, or while in a dormant state, unless the parts are kept very dry, a thing very injurious to the early-flowering kinds; secondly, by seeds, which should be sown when ripe, whether it be autumn or spring, in pans or pots well drained, and filled with a mixture of equal parts of sandy loam and leaf-mould, to which should be added a small portion of well-rotted dung. Then place the pans or pots in a cold frame or pit, kept close if sown in the spring; but if sown in the autumn, they should be placed on the back shelf of the greenhouse, and kept rather dry during the winter, and gradually watered more as the spring advances.

The autumn-sown plants will be fit for transplanting about the end of May, or beginning of June following, if properly treated, while those sown in the spring should not be removed from the seed-pans before the following spring; they will by that time have formed roots about the size of a Hazel-nut. Prepare then some large pots or pans, well drain and fill them with the same kind of soil as that in which the seeds were sown, and transplant the young roots from the seed-pans into these, placing them about three or four inches apart, according to the size of the roots. Return them to the cold pit or frame, and keep them close until they begin to grow; afterwards, admit air freely by day, but keep the pit close at night till

the beginning of July, when the pots or pans should be plunged, and the plants fully exposed both day and night, taking care, however, that the soil in the pots does not get sodden with too much rain or become too dry. They will require no more trouble, except keeping free from weeds and slugs, till the middle of September, when they should be potted singly into small 48-sized or 60 pots, (according to the size of the roots,) filled with the same kind of soil as that previously used.

In potting, the bulbs should never be entirely covered with the soil, but about one-third left exposed. When potted they should be placed on the back shelf of the greenhouse, or in a cold pit, where they can be kept dry and free from frost until they begin to grow.

If they are the early flowering kinds, a few may be placed in the window of the sitting-room, and but sparingly watered until they commence growing, when they should have a more liberal supply.

The roots will begin to bloom the second season, and may be placed on the shelves of the greenhouse; or if they are of those hardy kinds which flower in summer or autumn, the pots may be plunged in the open border.

When done flowering, they should be returned to the cold pit or frame, where the lights must be kept on during the night in cold or wet weather, but where they can have plenty of air at all times; observing, as they cease growing, that water should be withheld, and, finally, the roots gradually dried. The roots, when dry, should be allowed to remain in the pots, and not be shaken out, as is frequently done; for, when taken out of the soil, they are almost sure to get too much dried before they are again potted. This is particularly the case with the early flowering sorts.

The proper time of the year for resting the flowering roots entirely depends on the sorts. *C. persicum* will be at rest when the *C. Europæum* and *C. Neapolitanum* will be in full bloom, and vice versa.

The roots should be shaken from the soil and repotted directly the least sign of vegetation is observable. But the early spring-flowering kinds may be forced earlier into bloom by potting a few of the strongest roots sooner, and placing them in a warm dry place. They must not be excited too rapidly, or watered freely; for, if they are, the leaves are almost sure to damp off during the dull winter months, and particularly those of the beautiful *C. persicum* and its varieties. —George Gordon.

AMATEUR'S GARDEN.—No. XXVII.

In continuation of the hybridising and cross-breeding of plants, as noticed last week, it is not only necessary where fertilization is impracticable, that seed be gathered from those flowers only which possess the finest qualities, but that they, as far as possible, be kept from the vicinity of inferior flowers. Nor is this practice to be confined to florists' flowers only, but it also applies with equal force to every kind of flower whatever, and to every plant which is commonly propagated by seed. Thus the careful growers of Turnip and Onion-seed plant none but perfectly-formed bulbs, for if they were to do otherwise the kind would degenerate, and after a few years be unworthy of cultivation. Now, if so much care is necessary in saving the seed of plants which are cultivated by the acre, and where a few degenerate plants would be scarcely noticed, how much more so is it requisite in gathering seeds for the flower-garden, where nothing of inferior description should be allowed to grow? For this reason it is necessary, when it is desired to keep seed true to its kind, much more to improve the kind, that all inferior flowers be removed from the garden as fast as they show bloom, and before there is any possibility of their pollen being conveyed to other and better varieties by insects and other means. To raise seeds properly they require to be grown in a garden to themselves, where the removal of inferior kinds and making gaps in the beds would be of little consequence. The most successful raiser of annual seeds was Mr. Weeks, gardener to J. Sheepshanks, Esq., who used to reside in Blackheath Park. There the ground was prepared with as much care as for the choicest plants; and a single row of *Nemophila insignis*, the seeds one foot apart in the row, would generally cover a bed four feet wide. The finest seeds ever seen in London were grown at that place, and no expense was spared to attain perfection.

The amateur, if he has not already commenced, must lose no time in getting in his pipings of Pinks; for, if the plants are not strong in the autumn, no after treatment in the spring will make the flower strong in the summer. The best way to proceed is to make up a bed of spent dung, which you are sure will not heat violently; over that place an old door, plastering the sides securely, to prevent the escape of heat; and on the door place the compost in which the pipings are to be planted. The best compost is two parts perfectly decomposed leaf-mould, with one part of loam and one part of silver sand; these should be well incorporated together, sifted through a rather coarse sieve, and placed on the door to the depth of three inches.

In preparing the cuttings or pipings, all that is necessary is to remove the lowermost pair of healthy leaves, and cut close under the joint with a sharp knife. The pipings must then be pressed into the mould to the depth of one inch, taking care to make the soil firm round their bases, and after they have received a liberal watering, the frame or hand-light must be placed over them, and they will require little more care, except keeping the frame close, shading from the sun, and sprinkling occasionally in an evening with clean water. It is also a good plan to remove the glass on warm dewy evenings; but it must be replaced before the pipings are dry in the morning.

The same treatment applies to the propagation of Carnations and Picotees, which may be increased with equal

facility and with as great certainty as by layering. In truth, in my opinion, the trouble of layering Carnations is a mere waste of time.

I perceive Mr. Cripps, of Tunbridge Wells, has been putting me right about the origin of the black Nemophila. His statement may be correct; but though nature certainly does perform "strange freaks," I think it far more probable that this variety should have originated from *N. atomaria*, which combines the two colours, than that it should sport from *N. insignis*, which does not possess either colour.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Hybrid Plants.—Having noticed in the *Gardeners' Chronicle* of the 8th of last October, that you intend shortly giving to the public a Paper on the Muling of Plants, I think it may be rather an interesting fact for you to know that my late much-lamented father practised it upwards of 50 years ago; he confined himself principally to *Ericas*, with a few exceptions, which I shall notice hereafter. I have heard him many times remark, that the first plant he operated upon was *Erica grandiflora*, which he set with the pollen of *Erica vestita coccinea*. The variety the admixture produced was called by him, "*Erica fulgida*, or *vestita fulgida*." From the period he commenced, viz., 1790, until 1841, he succeeded in obtaining nearly 90 varieties, comprised in the following list:—

<i>Erica acuminata</i>	<i>Erica ostrina</i>
" <i>longiflora</i>	" <i>perspicua</i>
" <i>Ampullacea rubra</i>	" <i>pinea</i>
" <i>vittata</i>	" <i>purpurea</i>
" <i>Ampullaceoides</i>	" <i>Princeps</i>
" <i>Andrewsiana</i>	" <i>carnea</i>
" <i>Archeriana</i>	" <i>pulcherrima</i>
" <i>aristata minor</i>	" <i>punica</i>
" <i>aristella</i>	" <i>tortuliflora</i>
" <i>Batemiana</i>	" <i>retorta major</i>
" <i>Beaumontia</i>	" <i>Rollisoni</i>
" <i>blanda</i>	" <i>rubrocalla</i>
" <i>bucciniflora</i>	" <i>Russelliana</i>
" <i>carinata</i>	" <i>Sprengelii</i>
" <i>Cavendishiana</i>	" <i>spuria</i>
" <i>Celsiana</i>	" <i>suaveolens</i>
" <i>Clowesiana</i>	" <i>Swainsoniana</i>
" <i>curviflora rubra</i>	" <i>Dunbariana</i>
" <i>cylindrica</i>	" <i>Webbiana</i>
" <i>densa</i>	" <i>Templea</i>
" <i>depressa rubra</i>	" <i>translucens</i>
" <i>echiniflora carnea</i>	" <i>tricolor</i>
" <i>eximia</i>	" <i>elegans</i>
" <i>exurgens coccinea</i>	" <i>impressa</i>
" <i>Favoides</i>	" <i>major</i>
" <i>elegans</i>	" <i>superba</i>
" <i>purpurea</i>	" <i>tubiflora</i>
" <i>formosa</i>	" <i>turgida</i>
" <i>grandiflora humilis</i>	" <i>undulata</i>
" <i>Hartnellii</i>	" <i>ventricosa alba</i>
" <i>hybrida</i>	" <i>carnea</i>
" <i>impulsa</i>	" <i>nana</i>
" <i>inflata</i>	" <i>purpurea</i>
" <i>rubra</i>	" <i>stellifera</i>
" <i>Jasminiflora nana</i>	" <i>vernix rubra</i>
" <i>rubra</i>	" <i>vestita blanda</i>
" <i>Lawrenceana</i>	" <i>elegans</i>
" <i>Linnæana superba</i>	" <i>fulgida</i>
" <i>curviflora</i>	" <i>incarnata</i>
" <i>magnifica</i>	" <i>rosea</i>
" <i>metuliflora</i>	" <i>pinnifolia elegans</i>
" <i>bicolor</i>	" <i>discolor</i>
" <i>mutabilis</i>	" <i>coccinea</i>

I may mention now a few other plants upon which he tried the same experiment. From *Azalea nudiflora alba*, crossed with the pollen of *Azalea nudiflora speciosa*, he obtained a variety called the "New Pink;" from *Rhododendron ponticum* and *punctatum*, a very curious dwarf variety; a few plants of which, 40 yrs. old, are not more than 30 inches high, and in habit like *Kalmia latifolia*. I believe also he succeeded in crossing several kinds of *Ixia*, *Sparaxis*, and *Tritonia*, but having no memorandum relating to them I cannot give the names of the varieties so obtained. I must not forget to mention that he raised several varieties of *Pelargonium* as far back as 1796, one of them was called "*Pelargonium quinquevulnerum*," a distinct and pretty variety: I believe it to have been obtained between *Pelargonium ardens* and *Pelargonium triste*.—*George Rollison, F.H.S., Nursery, Tooting.* [Our readers will with us regard this letter as one of great interest. It fixes a date to the first considerable production of hybrid plants in this country, and is in many respects a valuable document for reference. Next week, or the week after, we shall offer some observations upon the great question of procuring hybrid plants; of the first importance not only in gardening, but in husbandry.]

Gold Fish.—In the *Gardeners' Chronicle* of 29th April last are some observations on Gold Fish, by the writer of this note. In the following No. are some remarks thereon, signed "J. M." Absence has been the cause of my not sooner replying to those remarks, and to some queries that "J. M." has put. He asks, "Where did I get the Nuphar minima?" I answer—that I am not sure that my broad-leaved Yellow Water-Lily is the *Nuphar minima*. Our running and stagnant waters, rivulets, and meres, in this neighbourhood of Woodbridge have abundance of it. The Martlesham, Great Bealings and Little Bealings rivers, Rushmere, Loudham (or Ash) mere, and others. My Yellow Lily has been some weeks in bloom. Several of the blossoms have passed away, others are now out; more are coming. There are seldom more than two in full bloom at a time. In my tank I have also a very beautiful White Water-Lily. It has been there I think two years in a pot. It has now for the first time a single blossom. This plant is not very rare in the above situations; but it is not so common as the yellow, nor are the leaves so broad. It has five floating leaves, and others are visible under water; the blossom is going off. It was as large, when fully expanded, in the two or three warm days of last week, as a tea-cup. Its milk-white, waxy-looking flower, with the yellow centre, was and is very beautiful; so is a yellow blossom, now out. My spreading

Buck-bean has had many beautiful flowers; they are gone. The sweet-scented Rushes have, perhaps, a dozen or more blossoms; they are three or four inches long, prettily tapering, nearly as large as one's little finger. I shall gladly assist in furnishing "J. M." with any of these plants. He next asks—"Does not the stagnant water that for four or five years has been in the basin get putrid or discoloured?" I answer—no; I am not aware that it does. It is at times more or less discoloured; that is, not altogether clear or transparent; dead leaves are removed. As I have said, we occasionally start five or six casks of fresher water into the tank. None has been put in since last autumn; the copious rains of this spring and summer have kept the tank nearly full. "Will the Gold Fish," "J. M." next asks, "live in the water after it is saturated with vegetable substances that have been carried into it?" To this I answer—what the fish may do after such saturation I cannot say; mine live and do well, and seem very lively and happy under the circumstances that I have described, and while they continue to do so I shall make little alteration in my way of treating them. I am not aware that I have lost any since my communication of April. In warm days the young fishes seem to enjoy concealment under the broad leaves of the Yellow Lily; gently moving a leaf will show four or five or more. To the last question of "J. M." I can give no further reply. The white-blossomed Lily appears healthy, and, as I have said, its fully-expanded flower is very beautiful.—*Suffolk.*

Salvia patens.—I observe in a late *Chronicle* that Mr. J. Ross is again carping at a statement made by Mr. W. Proctor, maintaining that *Salvia patens* is not hardy enough to withstand without injury, nor to outlive indeed the generality of our British winters in the open ground. Mr. P. adduced an instance confirmatory of such statement, and in instance and affirmation he was quite right. Let Mr. R. try the efficacy of his coal-ash and sawdust covering to *Salvia patens* roots left over winter in a bed of heavy retentive clayey loam, and in spring he will find instead of "bursting buds" a "beggarly account of rotten roots." But let him leave others in a well-drained bed of light porous soil, and he will find that a very slight covering indeed will sufficiently preserve them. It is the humidity and changeableness, not the intense cold of our winters, that destroy *Salvia patens* and many plants besides. Several plants of *Salvia patens* planted in well-drained pots of light soil, and placed in a situation so as to be shaded from the sunshine, but not from the weather, have outlived the last winter well with me; and others left in the open ground in the situation alluded to by Mr. P. have perished, notwithstanding they were, what the potted ones were not, well covered.—*John M'Donald.*

The Onion Maggot.—Some few days ago I observed that the grub was making sad havoc in my Onion-beds, in patches. I directed my man to strew a little nitrate of soda on the places which were affected; the result is, we lost no more Onions, and those parts of the beds dressed with the soda are of a brilliant green, and much finer than any other part,—in fact you can trace to an inch where the nitrate of soda had been scattered.—*Radford.*

Pits for Melons, &c.—Having several years ago at the instance of my master got up a range of pits, &c. for growing Melons and Cucumbers, and having had the whole construction of them committed to my trust, I immediately turned my attention to having them constructed in as satisfactory a manner as I could; and being too well aware that pits of which the walls are composed of brick or other materials, and having only dung and leaves or such like things to constitute the bed on which to grow the plants, invariably fall too far away from the glass, I thought that I might remedy (at least in some degree) that evil, and have made an experiment which has given me such entire satisfaction that I feel induced to send you the particulars of my plan. There may not, however, be anything new in it. I shall just describe my progress in it, from the beginning to the end, in order that your readers may more fully understand me. Having first fixed on the situation and extent of the pits, I had an excavation made to a certain depth, and then a foundation of flat stones laid all round, on which to build my walls, which were of brick. At the same time, I had the whole range divided into two light compartments; this done, the bricks were laid on the old pigeon-hole system, keeping each brick of the first course 5 inches from the other, carrying on the division-walls in the same manner and at the same time as the other; the second course had 2 inches at each end of the brick to rest on the under course, and so on until I arrived at within 15 inches of the intended height of my walls, when I had the bricks bedded close together with lime, in order to prevent the ingress of foul air from the linings outside. On the top of the brick wall I had a wooden wall-plate fixed firmly down with iron rods, from the bottom of the wall, which proves a great support to the walls. The rafters for the sashes to slide on were fitted into the wall-plate, having every second one portable. The remaining ones were all fixed immediately on the top of the division wall, which keeps the whole firmly bound together. I then had a groove cut out of the centre and top of the wall-plate, one inch deep and as wide, in which I placed what I have termed shifting sides. Having previously prepared them of such lengths as exactly to correspond with the length of each compartment, these shifting sides, when placed in the groove in the wall-plate, were all fixed at the ends by a small notch, which kept the whole range, with the assistance of the upper rafters, in a firm position; the two ends of course were made to correspond with the sides in regard to shifting. My reason for having the shifting sides

of short lengths, that is, to correspond with the exact length of my divisions, was (if necessary) to have 1, 2, or 3 parts in operation at one time, when I could put on or take off, more or less, as wanted. The depth of my shifting sides are from 8 to 12 inches; and into the top of them I have slight rafters fitted, which I can put in or take out of their places at pleasure. These last-mentioned rafters are independent of those mentioned for the wall-plate, as part of them are there permanently for the better strengthening of the walls, and consequently would not answer both purposes. Then, before I make up my beds, which are of dung and leaves, I have the portable rafters, which run exactly across the centre of the bed, removed, in order to let me have the beds made up as high as the rafters on the top of the shifting sides will admit, leaving as much room as is necessary for the soil and plants, as soon as the beds are in a fit state to receive them. Now, the advantage of the shifting sides are, that as soon as the beds subside enough to admit of the sashes running on the under rafters without touching the leaves of the plants, I have the shifting sides, with their rafters all removed, and stored by for the season. Then the sashes are let down to the under rafter, after which my plants never fall too far away from the glass. The pits also present a good effect, both with and without the shifting sides. The space I have outside the beds, for linings, is 2½ feet wide, inclosed by a narrow stone wall, not quite so high as the brick wall. The space between the exterior and interior walls is covered all over with movable wooden shutters, made of convenient sizes for retaining the heat in the linings.—*A Reader of the Gardeners' Chronicle.* [We insert this letter; but we do trust that hot dung will be consigned hereafter to the farming steward, and that the reign of linings and all their clumsy adjuncts is at an end.]

Rust on Grapes.—Having sometimes seen remarks in your Paper respecting the rust on Grapes, it will probably confirm the supposition of some, when I state that I am quite satisfied that one cause is greasy matter having come in contact with them. I found in thinning some this spring, that those berries that had unavoidably touched the hair of my head were the next day covered with rust, and appear as though they would never get clear of it.—*F. Y.*

Ferns.—It may be useful to inform your correspondent "Gallicus" that several of the London nurserymen are, through collectors abroad, paying attention to exotic Ferns; also that two or three well-engraved figures of Ferns, most of them late introductions, have appeared every month of late in the "*Floral Register*," attached to "*Maund's Botanic Garden*." If worth notice, I could send you some particulars respecting a few of the newly-introduced species of this tribe—one, by-the-bye, which is rapidly gaining on the affections of the more scientific cultivators. "*Gallicus*" should remember that dried specimens generally afford the means of propagation.—*Cryptus.* [Pray send them.]

New Anagallis.—Observing a blue *Anagallis* advertised by Mr. Brewer at 5s. each, and as large as half-a-crown, I send you two flowers of the now old *A. grandiflora* which, as florists measure, are as large as a five-shilling piece. This being the case, people may buy for 5s. a less flower than they can get for 6d.—*Flora.* [Quite right. A crown-piece exactly covers the flattened flowers.]

Gas-Water upon Grass.—In the beginning of April I watered half a clay-land meadow of 5 acres with ammoniacal liquor, diluted with 5 times the quantity of clear pond water. In three days I perceived that all the moss and many of the finer blades of grass close to the ground were destroyed. The bulk of the herbage, however, appeared to be unaffected; but in a week's time there was a decided improvement on the portion manured, and from that time to this there has been an increased quantity and a very improved quality of grass. Its colour is darker than the other, and my stock prefer grazing on that side of the meadow. In the last week in May, I mixed one part ammoniacal liquor with ten of liquid manure from an open cesspool,—which receives all the rainwater and drainage from my fold and dwelling-house,—and watered the half of a second meadow. The effect is extraordinary: the herbage is much improved and thickened, the colour a healthy dark-green, and the growth materially accelerated. There is double the quantity as compared with the unmanured portion. The cattle, sheep, and horses, prefer the former. Had my cesspool been a covered one I think I part to 10 would have been too strong; but I am this week building an inclosed tank, and intend making other experiments.—*Monmouth.*

Vines.—I think "*A Subscriber*" is quite wrong in attributing the failure of Mr. Querill's and his own Vinea to the difference of temperature between the house and border; for, if this be true, there would be very few grapes grown in the north of England. I have for many years began forcing my Vines early in January, and I generally cut ripe fruit about the latter end of May, with very little covering on the border. Knowing from experience that there are more bad-coloured grapes from covered borders than from any other source, I am fully persuaded they have both planted their Vines too deep, and began forcing them before they had fully established them in the borders. I think, if they will each of them take one of their Vines up, they will find them decayed at bottom, and nearly without roots. I have seen Vines more than once in this state.—*A Subscriber from the beginning.*

Hedge Sparrows.—I have this year, for the first time, observed a Hedge Sparrow busily engaged among the Rose-bushes, and collecting the small green aphids for its young in her nest close to the spot. The above fact proves that such a useful and harmless little bird should be pro-

tested instead of being so persecuted as it always is by Gardeners; there is a strong feeling against it, as being destructive to seeds; whereas it is a soft-billed bird.—*A Subscriber.*

Asparagus.—"J.B.H."—In the *Gardeners' Chronicle*, July 1, p. 444, this correspondent says, "I followed your advice, and gave my Asparagus plenty of salt, much to their advantage in quality and size." How much more obliged would your readers (and of course you, Mr. Editor,) be, if "J.B.H." and other correspondents would be a little more particular, and state when, how much, and under what circumstances—of wet, drought, or other prevailing points,—salt or other fertilisers may have under their direction been applied.—*A.B.*

London Vineres.—About eighteen months since, I took the liberty of asking your opinion upon the following:—I stated that I was about to build a small conservatory on the leads of a projecting room at the back of a house in the Edgware-road—that it should have a span-roof, and that I should plant Vines therein; and you were kind enough to say you thought my plan would answer. I am now about to tell you the result. I did not build the conservatory in time to do much good last year; the plants I brought from the country becoming weak before the house was finished, and the summer being extremely hot, everything was against me. This year I have done much better. I did not plant the Vines till April last, but I then planted them in slate-boxes (made by Mr. Beck), about two feet every way. The Vines have broken extremely well, and are quite strong and healthy; the boxes are so formed that the front can be removed, and the roots pruned, or fresh earth put to them, or an additional length may be made to the boxes, as the Vines grow. All my plants (many of which are of last year), are quite healthy and flowering freely, which I attribute to this—every evening I give them a watering. The Vines and plants that are not in flower I water all over, and I also water over the flooring, and keep pans of water in the house, and I then shut it up entirely; in a few minutes the glass is covered with steam, and in the morning everything is as fresh and healthy as if the place was twenty miles from London; the plants scarcely flag in the day, as I have an awning over the roof when the sun shines: this differs from the plan recommended in a recent paper, of throwing open all the windows at night. I generally find that when there is a draft of air upon wet leaves, they shrivel up; by my method this is avoided. I send you a flower of a seedling Pelargonium, raised by one of my daughters, which has been in the house all the winter, and has now flowered for the first time. I do not send it as being anything extraordinary, except to show that plants may thus be kept in a fair healthy state in such a locality as this, and I send you a Vine-leaf to show the same. The Pelargonium flower is very like its parent, which is a very free flowerer (I don't know its name), except that it seems of a more compact habit, which again shows, as I think, its healthy state. Will you be so good as to inform me what proportions of nitrate of soda and water should be used, and whether you think it would be beneficial; the great difficulty I have to contend with is the extreme heat (the aspect being due west), and being obliged to keep the plants always in the house. My object in this address is to show that even in such a situation plants may be kept healthy, and much rational amusement afforded, particularly to the female part of a family. Instead of the top glasses being let down they are hung upon hinges, and the ends put up to a height sufficient to let in enough of air; whereby the chimney-blacks, instead of falling upon the plants, are entirely kept out, and the whole kept perfectly clean.—*D. X.* [Nothing can possibly be more healthy than the foliage sent us by our correspondent; completely proving the justness of the views we have always taken about the atmosphere of London. It is bad gardening only that has to be blamed for the bad state of London greenhouses. We do not see the necessity for nitrate of soda; but if it is employed, there should not be more than a piece as large as a nutmeg to a common water-pot of water.]

Potato Starch.—Will one of your correspondents inform me of the best mode of manufacturing Potato Starch—the machinery used—and particularly the manner of drying it, whether in kilns or otherwise, and if in kilns, the construction of them?—*M. K.*

Wild Plums.—In the last Number of the *Chronicle*, under the head "Amateur's Garden," we have the following passage:—"Nature, unaided by Art, has accomplished much, and has produced the Golden Pippin Apple from the wild Crab, and Damson and other Plums from the common Sloe." I have seen the same asserted in different publications with regard to the Sloe being the parent of all our Plums. If it is so, I should be glad to have your opinion of the origin of the Plums found in North America. One species which is plentiful in Upper Canada has a handsome fruit of the same shape but larger than the Damson; when ripe, it is finely shaded with yellow and red, which gives it a transparent appearance; the tree has the habit of the Damson. I do not find it described in Pursh's *Flora*—is it grown in this country? Pursh describes the Chicaga Plum, the tree of which I have seen, but not the fruit; the tree has very much the appearance of an Apricot. Now with regard to the Sloe, I believe it has not been found in North America, except in some of the older States about settlements, evidently introduced from Europe.—*B.* [We have not much faith in the statement that the Sloe produced the domestic Plum; on the contrary, we believe that it and the cultivated Cherry really originated in the East, from a different race from our Sloe and wild Cherry. We are unacquainted with the wild American Plums; but there are several, considered by Botanists distinct from those of Europe.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

July 4.—R. W. Barchard, Esq., in the chair. Capt. Du Cane, R.N.; T. Twissden Hodges, Esq., and Marmaduke Salvin, Esq., were elected Fellows of the Society. There were exhibited from D. D. Alves, Esq., two specimens of Sugar Canes, showing the effect of the application of farm-yard manure and crushed bones to the land in which they were growing. It is now being found out by planters that some kind of manure is necessary to the Sugar Cane, and experiments are being made on the relative benefits of the different sorts in use. From Messrs. Elkington & Co., there were some specimens of leaves, covered with copper by the electrolytic process, showing that the natural leaves of plants may now be plated over with silver or other metals for personal ornament, or for house decoration. C. B. Warner, Esq., sent an ornamental basket, made of strong iron-wire, and coated over with copper by the electro process. It is considered preferable, in point of appearance, to that covered with zinc, in a similar manner, which was presented at the last meeting. The exhibition of plants was not extensive, most of the suburban growers probably reserving their specimens for the Chiswick fête. From Mr. Paxton, gr. to his Grace the Duke of Devonshire, Chatsworth, there was a fine plant of *Dendrobium formosum*, a rare Indian species, with very large and love y white flowers, that have a blotch of orange in the lip. This specimen received a Knightian medal. Mr. Appleby, gr. to T. Brocklehurst, Esq., the Fence, Macclesfield, brought a very excellent specimen of a dense-flowered variety of *Saccolabium gattatum*, for which a Banksian medal was given; with good healthy plants of the pretty *Oncidium pulvinatum*, and a variety of *Epidendrum variegatum*. Mr. Field, gr. to S. W. Silver, Esq., contributed a seedling Passion-flower, between *P. Loudoni* and *P. princeps*, partaking of the character of each, yet distinct from both, and being somewhat of a botanical curiosity, from having part of the nectarial fringe attached to the base of the stamens, and the rest forming quite a bunch in the bottom of the flower, instead of issuing in a regularly rayed circle. A certificate of merit was adjudged to this. Mr. Field also had two seedling Pelargoniums, which were rather pretty, but small. Mr. Hugh Low, of the Clapton Nursery, brought a nice and unique specimen of *Drosera macrophylla*, one of the most interesting, as well as the finest, of the Sun-dews, from Swan River. It has broad leaves, which are covered with glandular hairs, and the plant is used for dyeing purposes. A Chilean bulb, which is a yellow variety of the old but scarce *Amaryllis advena*, was also from Mr. Low. From Mr. Mountjoy, of Ealing, was a plant of the showy crimson-flowered *Achimenes grandiflora*, the blossoms of which appear to be borne almost in clusters. It is a good companion to *A. longiflora*. Mr. Stephen Hooker, F.H.S., sent a box of seedling Roses, in which were a few pretty good flowers, but nothing extraordinary; and Mr. R.vers, of Saw-bridgeworth, furnished a stand of Moss Roses, among which we noticed *Princess Royal* and *Celine*, as two new and very dark varieties, the latter particularly good; *Unique de Provence*, the old Rose *Unique*, mossed; *Louis Colet*, with curious foliaceous sepals; *French Crimson* (the *Mousseuse pourpre* of the French), very bright and pretty; *Eclatante*, also very brilliant, and a most vigorous grower; the *Miniature Moss*, a singular and unique variety; *Panachée pleine*, the double-striped Moss; the old or *Shailer's White Moss*, not so pure a white nor so mossy as the *White Bath*, which was also in the collection. From the gardens of the Society there were plants of *Campulula garganica*, in a very beautiful state; *Cynoches chlorochilon*, remarkable for its large and aromatic flowers; an *Asteraceous* shrub from Cabul, which is hardy, bushy, and has numerous heads of lilac flowers; a fine *Clematis Sieboldii*, which is proved to be perfectly hardy; *Achimenes longiflora*, rosea, and *grandiflora*; *Statice mucronata*; a dark variety of *Acropera Loddigesii*; *Oncidium Wentworthianum*, and *Lanceanum*, *Galeandra Baueri*, and cut flowers of *Pæonia albiflora fragrans* and *Humei*, two excellent varieties; with *Stranvësia glaucescens*, a handsome, though slightly tender, evergreen shrub. Mr. Myatt, of Deptford, sent a punnet of his new Deptford Pine Strawberry, to which a Banksian medal was awarded. It was stated that the next meeting of the Society in Regent-street would be held on the 1st of August.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A SPECIAL Council was held at the Society's House, in Hanover square, on the 29th of June, the Earl of Harwicke, President, in the chair, when 36 gentlemen were elected Members of the Society. The Council agreed to the following new classes of prizes to be given specially at the Southampton meeting: namely, 50 guineas for "Short-wooled Sheep not qualified to compete as Southdowns," 50 guineas for "Cattle of the Channel Islands Breed," and 20l. for the "Best Sample of Seed Barley," making the prizes alone, for stock, implements, Essays, &c., to be awarded next year out of the funds of the Society, amount to no less a sum than 1,690l. It was decided that the prizes of 30l. and 20l. for the "Best Stallions for Agricultural Purposes," and those of 20l. and 10l. for the "Best Mare and Foal for Agricultural Purposes," should not, as heretofore, be limited to those of the "cart" breed; that the exhibitors of Seed-Wheat and Barley should next year be required to send along with the grain specimens fairly taken of the Wheat or Barley in the ear, with the whole of the straw, in a bundle not less than one foot in diameter, and with the roots attached; and that the last day for receiving certificates for the Southampton meetings should be the 1st of June, 1844. The Council then selected the judges required for the various departments of the show at Derby. Mr. Thompson gave notice that he should present, at the next monthly Council, a tile made by Lord James Hay, and move "that a select committee be appointed to conduct a model experiment with tiles made on that principle, and to report to the Council on their efficiency." Mr. Clifford Cherry, principal veterinary surgeon to the army, presented a paper on the best mode of improving the breed of horses, which was referred to the next Council.

BOTANICAL SOCIETY OF EDINBURGH.

May.—This Society held its seventh meeting for the season at the Botanic Gardens, Dr. Neill, the President, in the chair. John Kirk, Esq., was elected a Resident Fellow. Mr. Brand read a communication from Dr. Joseph Dickson of St. Helier's, Jersey, respecting some recent discoveries in the *Flora* of that island. Dr. Neill communicated an interesting letter from Mr. Brackenridge, who was at one time a journeyman in the Experimental Garden here, and now holds the post of Botanical Curator at Washington. We insert full excerpts from his letter, the more readily, that his successful career may encourage others of his profession to similar exertions. Mr. Brackenridge writes, "I spent the first fourteen months in the United States very much to my satisfaction, as foreman to Mr. Buist, who has one of the largest plant establishments in America. When the South Sea expedition was organised, I was induced by Mr. Poinsette, the secretary of war, to accompany it in the capacity of Assistant-Botanist and Horticulturist. The voyage lasted nearly four years, and my compensation during the last three years was 1200 dollars per annum. The squadron (under the command of Lieutenant Wilkes) on its way out touched at Madeira, the whole of which we scoured. I ascended the peak of Ruivo (6246 feet high) almost to its very summit. It is covered with dense forests of *Erica arborea* and *Mediterranea* (which some travellers have called Pine trees). Several of these Heath trees are forty feet high, and at eighteen inches from the ground, their stems are two feet in diameter.—*E. Mediterranea*, always the largest. At the very summit is a small species (perhaps new, in habit like Mr. M'Nab's *E. ramulosa*). The *Madeira mahogany* (*Laurus Indica*, and *fetens*) is in great abundance, and as large as the English Oak. In five days we collected 460 species of plants on the island. At the Cape de Verdes, Rubiaceous annuals and grasses were the principal plants found. But Brazil, at which we next touched, may be denominated the head

quarters of *Flora*. I went about 150 miles inland, in a N.E. direction, from Rio de Janeiro, travelling most of the way through forests of flowering-trees, fantastically adorned with innumerable parasitical and epiphytial plants. These trees were often propped up by aerial roots, which reminded one of the rigging or stays of a ship. The undergrowth in such places consists of Palms, arborescent and many other Ferns, with a goodly number of Solanaceous and Rubiaceous shrubs. The Organ Mountains, seventy miles from Rio, after all that Mr. Gardner and others have done, abound in thousands of fine plants not yet known. I spent about eight days on these mountains, and found plants so varied and attractive that I did not know well which to select. On rocks there are *Gesnerias*, *Gloxinias*, *Cacti*, *Tillandsias*, and *Orchideæ*, in the greatest profusion. I calculate that more than one-half of the plants of Brazil are still unknown to botanists. Insects, birds, and quadrupeds are as varied, in proportion, as the vegetable kingdom. We spent about two months on *Tierra del Fuego*. Here was a contrast to Brazilian vegetation: stunted Birches, with *Misodendrons* in tufts like birds' nests on their tops—scrubby *Berberis*—*Winter Bark*—and *Embothrium* (a splendid proteaceous shrub), were the characteristic features. The face of the hills is covered with spongy, mossy turf, in which we found a *Primula* (like *Scotica*), *Drosera*, *Pinguicula*, several species of *Pernettyas*, a *Myrtus*, and the charming *Callixene*—with many nice things which I thought well adapted for your alpine frame. We reached Chili in the dry season, so that we did not find much in flower till we arrived at the mountains. Behind Santiago, on the Andes, in the region of perpetual snow, we found an immense number of Alpine plants belonging to genera and tribes new to us. Figure to yourself 10 or 12 kinds of umbelliferous plants, with Heath-like leaves, and fruit as large as that of *Heracleum*, and yet none of them over one inch in height. In Peru, behind Lima, we crossed the Andes at the height of 16,000 feet, and descended a considerable way on the opposite side, along one of the branches of the Amazon. This was a rich journey for us in plants,—fine *Rhododendrons* (?) at the height of 13,000 feet. At the base of the snow was a dense sward of plants, none of them over an inch high, principally composed of *Saxifragas*, *Compositæ*, *Gentianas*, and curious *Calceolarias*. At 14,000 feet we found vast patches of an *Echinocactus*, so wrapped up in its own wool, that at a distance we took the patches for sheep. The scenery here was of the grandest kind. We saw some splendid *Cacti*, *Alstromerias*, and *Tropæolums*, and on our way down, fields of *T. tuberosum* and *Oxalis crenata*. Very little rain falls in the vicinity of Lima; so that to raise fruit and vegetables recourse must be had to irrigation. The *Cherimolia* (*Annona tripetala*), is here the finest of all fruits I ever tasted. You will, no doubt, have heard of our discovering an Antarctic continent (Ross says it is only a batch of islands). Of this I cannot speak, having been left at Sydney, with the other scientific gentlemen. Here we chartered a schooner, and went to New Zealand, where we spent eight weeks. This same New Zealand is not the fine country that the English Government and land speculators crack it up to be. The climate is very wet, and the soil cold and poor—consisting principally of a stiff yellow loam, on great part of which nothing grows but a species of *Pteris*, whose roots form the principal food of the natives. The surface of the country round the Bay of Islands is very irregular—high ridges and valleys succeeding each other in rapid succession. In some of these valleys, from eight to ten species of Coniferous trees are found—among them the *Coume Pine* (*Agathis Australis*), 120 feet high. Leaving New Zealand, we touched at Tongataboo on our way down to the Fiji Islands—260 in number—all which we surveyed. In doing this, two of our officers were brutally murdered by the natives. We had also a proof of these islanders being cannibals, as they brought in a canoe, alongside of our ship, part of a human body, which they were eating. We discovered several new islands on the line in passing to the Sandwich Isles. The grandest sight seen during our cruise was the volcano on the Island of Hawaii. After spending six months on the north-west coast of America, our voyage lay again by the Sandwich Isles; and searching for a near passage to the China Sea, we were led among the *Sooloo Isles* and *Straits of Balabac*, then down to Singapore, which is a very flourishing place. Here I met a cousin of Sir Walter Scott's, who looks very much like what the old man was. During this voyage we collected and dried upwards of 10,000 (?) species of plants; sending also a great many live ones and seeds to the National Institute at Washington, to which I am at present attached. To me the most interesting of these plants is a species of *Nepenthes* from Singapore, bearing pitchers much larger every way than those of the distillatoria, and, when perfect, capable of holding a pint of water. There are other two species at Singapore, one with many small pitchers in bunches, on a woody stem, found in pools of water, while the other covers a low sandy island in the Strait, about three miles off the roadstead. At Manilla there is a species distinct from any I have seen elsewhere." Professor Graham exhibited some very beautiful and interesting exotics, recently brought into flower in the greenhouses and stoves; and afterwards accompanied the members over the garden, which presented a most charming appearance. Every season it is becoming more and more developed, and the late alterations reflect much credit on the learned Professor and his able coadjutor, Mr. M'Nab.

June.—This Society held its eighth meeting for the season, at the Botanic Gardens, Professor Graham in the chair. Donations were presented to the Library, from C. C. Babington, Esq., Cambridge, (his *Manual of British Botany*); from Dr. J. K. Maly of Graz; L. W. Dillwyn, Esq., and others. 1. Mr. James M'Nab exhibited specimens of *Laburnum*, presenting some remarkable anomalies. He stated that several years ago, a tree was sent from the Epsom Nursery to the Royal Botanic Garden here, as a curiosity, bearing three distinct varieties of *Laburnum* on the same root, without any further engrafting than that of working the red *Laburnum* on the yellow. This tree is now to be seen in flower, the yellow and red flowers being predominant. Last spring he observed a tree of the red *Laburnum* in the Horticultural Garden, bearing several large tufts of *Cytisus purpureus*, with one small shoot of the yellow. The same tree this year has ten distinct shoots of the yellow, and a quantity of those of *C. purpureus*. On Monday last, at Dyart's house, he observed two trees, one bearing *Cytisus purpureus* and *Cytisus Laburnum coccineum*, the other *Cytisus Laburnum* and *C. Laburnum coccineum*; but neither of them having more than two varieties. This afternoon he examined the plants of the red *Laburnum* in Messrs. Lawson's Nursery, three years grafted, and found several of them producing shoots of the yellow, but only one of them having *C. purpureus*; and in the nursery of Messrs. J. Dickson and Sons, several of the plants, two years grafted, have shoots of the yellow, but none of the purple. The red *Laburnum* first appeared at Paris in 1828, in the nursery of Mr. Adam, and was a hybrid between the common *Laburnum* and *Cytisus purpureus*. Dr. Graham observed that it was difficult to explain the cause of this phenomenon, viz., of moles reproducing the different forms on one plant. It had occurred also in plants of the *Cactus* tribe, but had no parallel in the animal kingdom—there the general form and habit merely are affected by crossing. He considered the subject to be one of much interest, as the phenomenon was at variance with existing theories. 2. Mr. M'Nab exhibited recent specimens, in flower, of *Orchis ustulata*, and *Ophrys fucifera* from Kent, which had been kindly procured by Lady Harvey for the meeting. 3. Dr. Douglas MacLagan presented to the Society, from Mr. John Scott, F.B.S., Greenock, a series of specimens of the more important kinds of timber in use for the purposes of ship-building. The author mentioned, among others, the following kinds of timber—Yellow Pine (*Pinus variabilis*), from North America; Pitch Pine (*Pinus rigida*), from Carolina; Red Pine (*Pinus resinosa*), from Quebec. These kinds are chiefly applicable to making deck planks, or for light spars. The American, or Rock Elm (*Ulmus Americana*), the Black Birch (*Betula lenta*), were likewise noticed along with Beechwood, as being the kinds

best adapted for keels, bottom planks, and other parts of ships which are constantly in water. British and American Oak, and East Indian or Malabar Teak (*Tectona grandis*), were remarked as being of very general applicability to the purposes of the shipwright, as also the African teak, or, as it is often called, African Oak—the tree yielding which is still unknown to botanists. Two varieties of hard and heavy woods were pointed out as being occasionally imported among African teak, and having similar qualities, but which are unknown to botanists or wood-merchants. Of timbers imported from the West Indies, two deserve remark. The first is the Mora, or Morra timber, (*Mora excelsa*, Benth.), which is a large and valuable timber, now introduced in considerable quantity from British Guiana. It has a foetid odour when scraped. The other is the Greenheart timber (produced by an unknown tree of British Guiana), a heavy, hard, and valuable timber, well adapted for ship-building, and now extensively used in the Clyde. Dr. MacLagan had sent specimens of the fruit of this tree to Dr. Lindley and Sir W. Hooker, both of whom considered it as Lauraceous, but had been unable to refer it to any known genus. He stated to the Society that this tree was known in Demerara by the Indian name of Bebeern, and also by the Dutch name Sipeeri; and that the bark of it had been found, by Mr. Rodie, to contain a vegetable alkaline matter, which possessed the power of curing agues. Recent experiments of his own had shown that there were two distinct alkalies present in the bark and seeds of this tree. 4. Previous to the reading of these papers, Professor Graham, accompanied by a large party, visited the Greenhouses, where he pointed out some of the more rare and interesting plants with which they are now literally crowded. It was pleasing to see so many specimens, brought together from every climate and region, in the most thriving and luxuriant state, with scarcely an exception.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BARNADESIA ROSEA. Rose-coloured Barnadesia. (*Stove Shrub.*) Composite. Syngenesia Polygamia.—The singular genus Barnadesia consists of South American spiny bushes, with so very similar a foliage that they can hardly be distinguished; but differing in the size, and form, and number of their flower-heads. This, obtained through the kindness of his Grace the Duke of Northumberland, is of the greatest rarity. It is a warm greenhouse plant, and should be kept during winter in an intermediate house, between a stove and greenhouse, where the temperature averages 47°, or as near as possible. It may be grown in a compost consisting of peat, loam, and sand, in equal proportions. Water should be liberally given in summer, but sparingly in winter, otherwise the plant would naturally suffer from damp, being a native of elevated situations. It is propagated by cuttings, or seeds, in the usual manner.—*Botanical Register.*

COMAROSTAPHYLIS ARBUTOIDES. Arbutus-like Gritberry. (*Half hardy Shrub.*) Ericaceæ. Decandria Monogynia.—A native of Quezaltenango, in Guatemala, this plant has been raised in the garden of the Horticultural Society from seeds received from Mr. Hartweg. It produced its flowers for the first time in October, 1842, and is now (May, 1843) again in blossom. In some respects it is much like *Comarostaphylis polifolia*, but its leaves are much broader and larger and thinner, and they are covered beneath with ferruginous down; the flowers are in panicles, standing high above the leaves, are four times as large, and are white, not crimson. In appearance it is much like an *Arbutus*, but it has a drupaceous fruit, covered with the tubercles of that genus. It differs from *Arctostaphylis* in the fruit not being smooth, and in having a five-celled drupe, and from *Arbutus* in the fruit not being many-seeded. It appears, with some other plants, to form a perfectly well marked genus, and is a pretty shrub, which proves rather tender for the climate of London. It grows five or six feet high, and like the common kinds of *Arbutus*, thrives well in a light sandy loam, mixed with a small portion of leaf-mould. It is increased either by seeds or by budding. The seeds should be sown directly they are ripe, in pans filled with light sandy loam, and kept rather dry, until vegetation commences.—*Botanical Register.*

MARCEZIA EXCORIATA. Loose-barked Marcetia. (*Stove Shrub.*) Melastomaceæ. Octandria Monogynia.—This genus consists of a group of curious little Melastomaceous plants, having almost the habit of Heaths. They are all found in tropical America, in mountainous places, or in elevated sandy deserts, and give a peculiar feature to the places where they grow. In our gardens they are almost unknown; that which is now represented, from the collection of his Grace the Duke of Northumberland, at Sion, being the first that we have met with in cultivation. It will succeed best in a stove, potted in one-half leaf-mould, mixed with loam and sand in equal parts. A good drainage is necessary, and plenty of water at the roots at all times. While in flower, syringing should be dispensed with altogether, for the moist atmosphere in a stove is quite sufficient. After the flowering season is over the plant should be cut back, at least all slender branches should be removed, in order to produce a supply of young wood for flowering the following year. It is propagated by cuttings in the usual way.—*Botanical Register.*

MISCELLANEOUS.

The Respiration of Leaves.—At a late meeting of the Royal Society, Mr. Haseldine Pepys gave an account of a series of experiments on the products of the respiration of plants, and more particularly of the leaves; selecting with this view specimens of plants which had been previously habituated to respire constantly under an inclosure of glass; and employing for that purpose the apparatus which he had formerly used in experimenting on the combustion of the diamond, and consisting of two mercurial gasometers, with the addition of two hemispheres of glass closely joined together at their bases, so as to form an airtight globular receptacle for the plant subjected to experiment. The general conclusions he deduced from his numerous experiments, conducted during several years, were, first, that in leaves which are in a state of vigorous health, vegetation is always operating to restore the surrounding atmospheric air to its natural condition, by the absorption of carbonic acid and the disengagement of oxygen: that this action is promoted by the influence of light, but that it continues to be exerted, although more slowly, even in the dark. Secondly, that carbonic acid is never disengaged during the healthy condition of the leaf. Thirdly, that the fluid so abundantly exhaled by plants in their vegetation is pure water, and contains no trace of carbonic acid. Fourthly, that the first portions of carbonic acid gas contained in an artificial atmosphere, are taken up with more avidity by plants than the remaining portions; as if their appetite for that pabulum had diminished by satiety.—*From the Athenæum.*

Purifying the Air of Stables.—Having been invited by Mr. Evans, of Dean House, Enstone, to make some experiments on his excellently-conducted farm and stables, I trust the results of those upon the absorption of ammonia may prove of sufficient interest to entitle them to publication. As gypsum (crystallised sulphate of lime) had been highly recommended for this purpose in some recent works

on agriculture, the stables were in the first instance freely strewn with this salt coarsely powdered; but though the ammonia was evolved during the removal of the wetted straw in sufficient quantity to affect even the eyes of the grooms, I could not, after two days' exposure, detect the slightest trace of it in the gypsum when I examined it with slaked lime. This result was the more surprising, as it is known to every chemist that solutions of carbonate of ammonia and of gypsum are incompatible; the carbonic acid leaving the ammonia to form the precipitate carbonic of lime, the sulphuric acid passing to the ammonia; and I had previously ascertained that in an atmosphere so highly charged with ammonia as to be destructive to animal or vegetable life, a very appreciable proportion was taken up by wetted gypsum. The following experiments appeared conclusive upon the point, that under less favourable circumstances not an atom was absorbed:—200 grs. wetted with distilled water were exposed in a close stable for three days, precautions having been taken to avoid any error from evaporation; it was again weighed, no increase could be perceived, nor was any ammonia evolved on the application of the usual tests; while 200 grs. wetted with diluted sulphuric acid, and exposed the same time, were found to have gained 36 grs. of ammonia. The stables were then strewn with the gypsum moistened with sulphuric acid, and examined the next morning; every portion was found to have absorbed sufficient ammonia to evolve its peculiar pungent odour when brought in contact with slaked lime; the stables had also lost their close, unhealthy smell. To use the words of the grooms, they appeared sweetened. As it was evident the gypsum acted merely mechanically, affording a convenient absorbent surface for the acid, experiments were made, substituting sawdust for gypsum with even more favourable results. That the proportion of free ammonia in stables is very large, may be shown by the simple experiment of placing a moistened piece of litmus-paper reddened with weak acid in a stable. In one badly cleaned or ill ventilated, the effect is instantaneous; but even in those of Mr. Evans, where the greatest attention was paid to these points, the paper was observed in a few minutes to become blue; even the water kept in the stable the over-night as is the habit, to take off the chill, becomes sufficiently impregnated with ammonia to affect tests. As this alkali is justly ranked among the most powerful stimulants, the continual breathing of an atmosphere vitiated by it can hardly fail to have a prejudicial effect. Grooms are observed to be short-lived; and the rapid course of inflammatory diseases in horses, and their distressing predisposition to colds and affections of the chest, are no doubt greatly aggravated by this cause. The increased salubrity and sweetness of the stable, if pointed out to the grooms, would therefore soon reconcile them to the slight additional trouble the adoption of this remedy would incur. At Dean House the acid gypsum was first strewn amidst the straw; but as this was considered likely to injure the feet and clothing of the hunters, it was afterwards spread on trays. One part of sawdust will be found to absorb readily three times its weight of acid solution, which I made with one part, by measure, of sulphuric acid to 15 of water. If intended to be tried as a manure, it should be mixed with the straw when removed from the stable. During the process of rotting, the ammonia is evolved so freely that, at the end of two or three weeks, the acid powder, which should not remain more than three days in the stable without changing, will be found completely neutralized; and as the greatest benefit was derived from covering up and salting dungheaps, by which I believe an additional absorption of ammonia could only have been gained, it may be reasonably hoped that an increased value would result from a manure thus surcharged with ammoniacal salts.—*Journal of the Roy. Agric. Soc. of England*, vol. iv. p. 278.

Saucepans silvered by the Electrotyping Process.—Mr. Warrington, of Apothecaries' Hall, in a recent Number of the *Chemical Gazette*, directs attention to the fact which has come under his notice, that copper vessels, such as saucepans, extract pans, &c. silvered by the electrotyping process, are acted upon by weak acids, as lemon-juice or vinegar, if allowed to remain in them for a short time. This, he says, must arise from the deposited silver being so porous as to allow the acids to permeate its substance, and the action is most likely assisted by the formation of a galvanic circuit.—*From the Pharmaceutical Journal.*

GARDEN MEMORANDA.

Messrs. Lane and Son, Berkhamstead.—The nursery of these gentlemen is situated just on the outskirts of the town, a few minutes' walk from the Birmingham Railway Station. The principal part of it lies in a valley, through which a canal and a small stream run; and apparently on this account, chiefly, the majority of the plants are later than those about London. For example, some Ghent Azaleas, and one or two hybrid Rhododendrons, are still in bloom. There are several greenhouses and frames scattered about the place, in which are a quantity of Roses in pots, an astonishing number of Rose-cuttings for propagation, an excellent collection of the best Fuchsias, among which *F. Lanei* makes a very conspicuous figure, some admirably-grown Gloxinias and Achimenes, especially *A. longiflora*, and *A. grandiflora*, the last of which is just coming into flower, and the usual miscellaneous tribes. We observed particularly a snowy kind of Nerium Oleander, called Rayanot, having five semi-double crimson flowers, streaked with white; a variety of Petunia, named Moore's splendens, with exceedingly large deep purplish crimson flowers; and, in the open ground, a very splendid double Senecio elegans, the size and closeness of the flowers of which are unusual, with a remarkably fine drooping purple Beech, which has very deep-coloured leaves. The Roses that are increased by cuttings here are placed singly in very small thumb-pots, from which it is considered easier and safer to remove them than from pots containing several cuttings. They are plunged in sawdust, over a covered chamber, in a pit heated by an open gutter of hot-water, which is connected with an apparatus that heats a long house and several pits, and was put up many years ago. It is worth noticing, too, that Rhododendrons grown here in pure loam, flourish quite as well as they generally do in moor-soil; and have even a more luxuriant appearance. The

collection of Roses is very extensive and good, comprising nearly all the best sorts in every class; and there is another portion of the nursery, rather more than two miles from this, containing four acres of standard Roses, and two acres of stools. The whole of these, except some of the Bourbons, Chinas, and the autumn-flowering varieties, are now finely in bloom, and give a most glowing idea of how a place may be enriched by this "queen of flowers." Indeed, it is a matter of question whether any tribe can be so suitable for a small place; while no one will doubt that they are essential to the enrichment and decoration of a large one. Glancing over the various groups, we marked a few varieties of the principal classes, which are of a decidedly fine description, and which we here specify, referring the reader for their characters, prices, &c. to Messrs. Lane's well-arranged catalogue, which we believe, anyone can obtain on application. Mosses:—Celine, Crested Damask, Eclatante, French Crimson, Luxembourg, Mottled, Mousseuse Partout, Perpetual White, Splendens, Single Crimson, White Bath, some of which are rather remarkable for being curious than as handsomely-formed flowers. Provence, or CABBAGE:—Blush, Illustre Beauté, Reine de Provence, Unique Striped. GALICA, OR FRENCH:—Agnippe, Belle Douaisienne, Belle Hermone, Belle Helene, Boule de Nanteuil, Colbert, Comte Foy (very fine), Cynthia, D'Aguesseau, Duc de Trévise, Duc d'Orléans punctué (remarkably good), Duchess of Buccleugh, Duchesse d'Arenbourg, Duchesse d'Orléans, Fanny Parisot, Franklin, Général Foy, Guillaume Tell, Grandissima, Horace Vernet, Heureuse Surprise, Kean, La Calaisienne, Louis Philippe, Lélie, Mathieu Mole, Nelly, Pomone, Reboul, Sobieski, Ténébreuse, Tricolore, Triomphe de Beauté, Triomphe de Rennes, Triomphe du Brabant, New Village Maid, Violet Crémier. ALBA: Achille, Blanchefleur, Félicité Parmentier, Madame Campan, Princesse de Lamballe (excellent), Queen of Denmark, Sophie de Marsilly. HYBRID PROVENCE AND FRENCH:—Aspasie, Duchess of Kent, Duchesse d'Angoulême, Emerald, Hip, White Globe, L'Admiration, L'Ingenue, La Volupté, La Ville de Londres, Melanie Walder, Miclaia, New Globe Hip. HYBRID CHINA:—Belle de St. Cyr, Brennus, Blairii (very fine), Beauty of Billard, Belle Marie, Belle Parabere, Coronation, Chenedolle, Coup d'Amour, Charles Duval, Comtesse de Lacedépé, Coup d'Hébé, Dombrowski, Duke of Devonshire, Duchesse de Montebello, Eynard, Emperor, Probus, fulgens, Ambriata, Général Kleber, Great Western, Hortensia, Hortense Leroy, La Grandeur, La Dauphine, Lady Stuart, Las Casas, Lord John Russell, Magna Rosea (extremely good), Madame Plantier, Ne plus Ultra, Prince Albert (Hooker's), Princess Augusta, Richelieu Duval, Stadholder's Triomphe de la Queue, Velours épiscopal. DAMASK:—Arduie, Calypso, Duke of Cambridge, La Ville de Bruxelles, Madame Hardy, Painted Damask. HYBRID PERPETUALS:—Auburnon, Clementine Seringe, Duc d'Aumale, Duchess of Sutherland, Earl Talbot, General Allard, Lady Sefton, Madame Laffay, Miss Elliott, Prudence, Rösser, Reine de la Guillotière, Robin Hood, Will am Jesse (an admirable flower). TEA-SCENTED CHINA:—Delphine Gaudet, Eliza Sauvage, Goubalt (splendid), General Vallé, Hardy, Jeanne Deans, Josephine Malton, M'Carthy. The following are new or scarce. Moss:—Malvina, delicate pink, cupped, large and double. GALICA:—Elopie, pink, expanded, very large, and double; Ellet Parfait, white, beautifully striped with red, compact and double. Cosmo Ridolfi, lilac rose, compact, large, and double; Desire Parmentier, pink, shaded, compact, and very double; Donna Sol, mottled pink, large, and double; Monthon, lilac bluish, globular, large and double. HYBRID PROVENCE:—Néron, rose, tinged with peach, cupped, large, and double. HYBRID CHINA:—Marjolain, black crimson, cupped, large, and double; Madame Rameau, Velvety lake, cupped, and double; Eliza Mercœur, pink, globe, large, and double. HYBRID PERPETUAL:—Docteur Marjolain, pale lilac crimson, cupped, large, and double; Lady Alice Peel, rosy crimson, cupped, large, and double; Prince of Wales, rosy crimson, globular, large, and double.

THE NATURALIST'S CORNER.—No. XIV.

(Continued from page 415.)

52. *Caoutchouc*, now in such common use in various branches of our manufactures, was first brought to Europe about the beginning of the last century; but nothing was known concerning its history till 1736, when, in a memoir presented to the French Academy, it was stated that there is found in Brazil a tree, from the bark of which, when wounded, a milky juice flows, which hardens in the air, and is then called by the natives *Cahuchu*; whence our word *Caoutchouc*. The natives use this liquid to render cloth impervious to rain; and, when hardened, flambeaux are made of it. The same tree has been found in Cayenne, Guiana, and other parts of South America, where it is called Hhevé. The latest name given to it by botanists is that of *Siphonia elastica*, and it is placed in the natural order *Euphorbiaceæ*. Besides the American *Caoutchouc*, a substance has been discovered in the East Indian Islands, and more particularly in Pulo Penang. It is procured from the juice of a climbing plant, called in Java *Bendud*, and by our botanists *Urceola elastica*. The East Indian *Caoutchouc* is dark-coloured on the outside, but light within; that from America, having been more completely dried by the air, is of a dusky grey throughout. Besides these plants, the species of Indian Fig trees furnish Indian rubber of the best quality, especially *Ficus elastica*.

53. *The genus Kydia.*—Dr. Roxburgh, in establishing the genus of trees called *Kydia*, found in the hilly parts both of Peninsular and Central India, as well as all along the foot of the Himalayan Mountains, says—"I have ventured to give it this name in memory of the late Colonel Robert Kyd, of Bengal, whose attachment to botany and horticulture induced him to retire from the high rank he held in the Army, to have more leisure to attend to his favourite study, to the advancement of every object which had the good of his fellow-creatures in view, and to the establishment of the Honourable East India Company's Botanic Garden at Calcutta, where he was particularly attentive to the introduction of useful plants, and to their being dispersed over every part of the world for the benefit of mankind."

54. *The Baobab Tree.*—Cape de Verd is said to owe its name in part to the foliage of the *Adansonia digitata* of Linæus, which adorns the whole of Senegambia and Guinea with its green elliptic arches, a full-grown tree presenting almost at a distance the appearance of a forest. According to Adanson, trunks are met with having a diameter of 30 feet, although the height of the tree is moderate, varying from 50 to 60 feet. The lower branches, however, shoot out to an incredible length, at first in a horizontal direction. These are covered with a dense foliage, which, from its weight, causes them to bend towards the ground; and thus there is presented an immense hemispherical mass of verdure, 120, 140, or even

150 feet in diameter, and perhaps 60 feet in height. A very full account of this wonder of the vegetable kingdom is given by Adanson, in the Memoirs of the Royal Academy of Sciences, at Paris, in the year 1761.

Rebels.

The Culture of the Grape Vine and Orange in Australia and New Zealand. By Geo. Suttor, F.L.S. Smith and Elder. 12mo.

THIS little book consists, in part, of extracts from Jullien's work on Vineyard Cultivation, and in part, of observations on the subject made by the author during his residence in New Holland, or tours through some of the Vine districts of Europe. He strenuously advocates the application of capital to the formation of Vineyards, both in New Holland and New Zealand, and appeals to experience as to the possibility of making good wines, at least in the former colony. To this we ourselves can testify, the quality of some samples of Sydney wines which we have tasted being such as leaves no doubt that at least good marketable wine, far better than that of the Cape of Good Hope, if not of high excellence, may be made in New Holland. With regard to New Zealand, we were not before aware that its climate had been proved to be favourable to the Vine. But Mr. Suttor states that—"The gentle slopes of sheltered valleys, generally speaking,—the land which produces the famous bulbous Fern roots, in New Zealand,—will be found, when well trenched, and the Fern eradicated, very favourable for the planting of the Vine. Peaches have long been grown there, and are very fine; also Melons, at and near the Bay of Islands; and Grapes were there in abundance, when one of my sons visited that place in 1836-38. The summers are in general very fine and temperate in New Zealand, but the winters, though mild, are often wet: this would be in favour of planting the Vine there."

The work is not adapted to the purposes of those who cultivate the Vine in England; but it may be recommended to emigrants as a useful guide to the proceedings of persons who are inclined to direct their attention to Vineyard management.

David's Temperature of the Soil is a sheet of figures explaining the temperature of the soil at one foot below the surface, in latitude 50° to 56° during each month from February to August inclusive, at different elevations above the sea as high as 160 feet. The intention is praiseworthy, and the tables, if to be relied upon for accuracy, useful; but upon the latter point we have not sufficient data to form an opinion. Our readers may, however, test the truth at once, when we mention that, according to Mr. David, at 80 feet of elevation the temperature of the soil on July 10, at one foot below the surface, should be 65° in lat. 50; 64° in lat. 51; 63° in lat. 52; and 61° in lat. 54°; 60° in lat. 55 and 56.

CALENDAR OF OPERATIONS for the ensuing week.

I WAS at Kew Gardens the other day, and among other things I saw a number of men at work painting and reglazing all the old lights that could be spared off the houses. Nothing could be more economical or substantial than the way these men were set to work, and the manner in which the work was finished. Now, when we see such forethought and economy in the arrangements of the officials at Kew, where the public purse bears the burden, we cannot help blushing at the very extravagant manner in which these things are conducted in nine cases out of every ten in private establishments. In our private establishments all sorts of alterations, additions, and improvements in houses, pits, fire-places, &c. &c. are put off till the beginning of winter, and before the last stroke of the hammer, trowel, or paint brush is heard, the frost sets in to harden the work, and thus a fair foundation is laid for future expense and annoyance. But to return to Kew; as work in actual progress or just finished is better for drawing instruction from than any imaginative operations. All gardeners know that the best painted hotheuses, with the best kinds of glazing, will begin to want repairs after a series of years. Now, instead of endeavouring to stop this decay by paint, the people at Kew went to work in the right way. They ordered all the glass to be taken out of the old lights, all the putty and paint to be rubbed off, the glass to be cleaned, and the lights to be "primed" as if new, and the whole to be glazed afresh (using the best putty and paint), and all the laps to be puttied, and not more than one-eighth of an inch over each other. All the broken panes are of course put by for other uses, such as mending handglasses and making Ward's cases, to carry and fetch plants to and from distant parts of the globe. All this work will be well seasoned long before the winter sets in, and will remain good for many years, with a coat of paint every other season. I was rather amused to find from one of the painters at Kew that they intended to finish off the glazing after a manner which I myself adopted for some time, but which has never appeared in print in any work on gardening or hothouse building, as far as my recollection goes. It is this: when the glass is bedded in the putty along the astragals, the usual way is to "front putty" the whole at once, but at Kew the lights are put by after the glass is bedded till the bedding putty is dry. The astragal then gets a coat of paint, and also a strip of the glass the depth of the bedding on the astragal; and when this is dry the front putty is put on. The coat of paint on the glass will cause the front putty to adhere to the glass, and it will remain sound many years longer than when it is put on without this precaution. This is a capital contrivance for lights that slide up and down; but for lights that are fixed, the best way is to have no front putty at all, as recommended by Mr. May, of the Hope Nursery, in vol. i., p. 53.

I.—KITCHEN-GARDEN AND ORCHARD:

In-door Department.

PINERY.—When it becomes necessary to withhold water from a fruiting-house, owing to the fruit being nearly all full swelled or ripe, the suckers on the plants receive a severe check: the best plan, therefore, is to pull off the best of the suckers at this stage and set them growing in a place by themselves. The succession plants you will of course keep growing rapidly by plenty of heat and moisture; and also indulge them once or twice a week with liquid manure.

VINEY.—The leading article of the *Chronicle* of last week has thrown our old notions of stopping laterals overboard; here practice and theory are at issue. Practice says, stop up every channel which diverts the current of sap from the main leaders, as one leaf on a leader is worth four on a lateral; and a theory says, touch not a leaf that can freely be exposed to the light; but it can be proved that stopping laterals will increase the size of the leaves on the main shoots, theory must give way. I would earnestly entreat old practitioners to forward their opinions, accompanied with all facts relating to this most interesting question. Continue to force the late Grapes till you get them full swelled, when you may give more air and allow

them slowly to colour at their leisure, but this stage will not be arrived at for several weeks yet.

PEACH-HOUSE.—As soon as the fruit is gathered let this house be kept in a moist state, with plenty of air day and night; and if the glass is intended to be taken off, see that the leaves are first injured properly for the change; but taking off the glass often does more harm than good.

FIGS.—A good supply of air and moisture, the young shoots stopped at every third or fourth joint, and an occasional dose of liquid manure to the roots, ought to keep these in a healthy, bearing state.

MELONS AND CUCUMBERS.—For late autumn Melons, plant out firm, strong, stocky plants in the frames now being emptied of their first crop; this is always a safer and less troublesome plan than trying to get a second crop from the same plants; good, experienced gardeners can only manage to get a second crop, and such men, of course, never want Calendars. The ridged Cucumbers are now in danger of getting so entangled with shoots that little fruit need be expected from them. See to these; they are very useful.

Out-door Department.

The principal sowings and transplantings will now soon be over for this season; and as the nights lengthen a more vigorous growth will come on. Everything lately planted ought to be watered occasionally till the plants begin to grow freely. Birds are very troublesome to the early fruits, and must be watched; and although the garden has been kept free from weeds all the season, there are thousands of seeds of weeds now floating on every breeze, and those which fall on good ground will soon become troublesome if not looked after.

CABBAGES AND CAULIFLOWER PLANTS for autumn use, should be transplanted at regular intervals; those last planted out should have the ground well stirred about them and a little mould drawn round their stems.

KIDNEY BEANS.—After this time your sowings of these must be made in warm, sheltered places, as they come in late in the autumn, when cold weather prevails.

CELERY.—The main crop might now be got out, and the rows formerly planted should have a little mould drawn to them; first taking the precaution to stir the soil on each side the row which has been battered into a crust with the watering. If the earliest row does not throw up seed-stalks, you may assist it very much by a good dose of liquid manure.

PEAS AND BEANS.—Few people think of sowing Peas after this week; and this is about the time we are so much troubled with mildew on our Peas. A liberal supply of water is the best remedy against this evil.

SUCCESSION CROPS.—These are now reduced to salad plants, which are always sown according to the demand and the state of the last sowing.

ORCHARD.—The principal orchard work now is to guard the fruit from birds, &c., to gather and preserve Strawberries, and to procure plants of these for next forcing time. Get a quantity of 60-sized pots, full of rich compost; take a Potato-dibber and make a row of holes alongside of a row of Strawberries; push a pot into each hole down to the rim; then single out the runners, and pinch off the tops just beyond the newly-formed plant; double the runner on the other side of the plant, and with your forefinger push the doubling down to the bottom of the pot, and by this time the bottom of the young plant is just brought within the soil, and is firmly pegged down by its own runner or string in half the time you could do it with a peg, or with a stone or lump of soil.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—In the morning or forenoon throw water on the paths and under the stages, to keep up a moist atmosphere, and allow large portions of air in the house. See also that the plants do not stand too near to each other. Now is the time to get this season's growth formed, so as to ripen slowly, before the long, cool nights set in.

GREENHOUSE.—Keep the plants here thin also, and sprinkle them well in the afternoon with the engine; this is, perhaps, the worst time in the year to allow plants of any kind to flag for want of water, as, in a few hours, the leaves, being in a very active state, will suck away the juices which ought to go to nourish the plant.

CONSERVATORY.—A cool, refreshing air, loaded with the perfumes in this house, is always agreeable in summer; and the only way of obtaining this is by large portions of air, by slight shading, and by pouring large quantities of water over all spare places round the house. Stove plants brought in here for flowering do not require half the quantity of water which greenhouse plants do in the same place. All the climbers planted out in the borders require a liberal supply of water in the height of summer.

COLD PITS are warm enough now to allow of the glass or canvass to be taken off at night, to give the plants the benefit of the night dews, which seem to suit them better than any sort of artificial moistening. When the sun is out strong; that is, if he shines at all brilliantly this season, throw a slight shade over the Camellias, Azaleas, Rhododendrons, and similar plants.

FLOWER-GARDEN.—The routine business of a well-kept flower-garden is so simple and uniform at this time that few words will suffice on this head. The Grass and gravel are as smooth as carpets; all the flowers staked or trained in some shape or other; no plant or bed stands in need of water for many hours at a time; every flower and leaf is picked off as soon as it begins to decay; and as to weeds, they are not allowed near such a scene.—D. Beaton, *Shrubland Park Gardens*.

State of the Weather near London for the Week ending July 6, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.			THERMOMETER.			Wind.	Rain.
		Max.	Min.	Mean.	Max.	Min.	Mean.		
Friday	30°	29.90	29.873		67	49	58.0	W.

Average		29.919	29.859	74.8	53.8	64.3			

June 30. Fine, with light clouds; overcast; cloudy and mild.
July 1. Overcast and fine; clear and fine at night.
2. Overcast and fine throughout.
3. Fine, with light breeze; rather cloudy; overcast at night.
4. Uniform haze; very fine; clear at night.
5. Sultry; sky deep blue, with dusky white clouds, very hot and sultry; rain at night.
6. Overcast, cloudy, and fine.
Mean temperature of the week 1. 19. above the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending July 13, 1843.

July.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.
1826	73.6	50.8	62.2	8	0.57 in.	1 1 2 3 7 3
1827	74.4	52.0	63.2	4	0.39	1 1 3 7 3
1828	75.4	52.9	64.1	5	0.18	1 2 4 4 3
1829	73.2	51.8	62.5	8	1.10	1 1 1 3 6 4
1830	73.5	50.6	62.1	6	0.72	1 1 1 1 1 1
1831	74.2	51.0	62.6	7	0.60	1 1 1 2 3 5
1832	74.7	50.6	62.7	10	1.36	2 1 1 3 8 1

The highest temperature during the above period occurred on the 11th, in 1836—thermometer 88°; and the lowest on the 13th in 1840, thermometer 41°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending July 7, 1843.

STRAWBERRIES and cherries are daily becoming more abundant in the market, and Raspberries are now added in pretty considerable quantities. Myatt's British Queen and Prince

Albert Strawberries are present in unusual abundance, and of fine quality. Grapes are plentiful, but hardly so good as they have been, except in a few instances. Peaches and Nectarines, too, are scarcely so fine as in previous weeks; though there is a large supply of them. Among the many Pine-Apples, there are two or three of a splendid description; and Melons are both numerous and good. Plenty of Gooseberries and both red and white Currants may now be had in a ripe state. There is a quantity of Chili Capsicums now in the market. The French Beans and Artichokes are particularly fine, as are the Cauliflowers; but the Cucumbers are neither long nor straight. Asparagus is entirely gone; there is only a very little Rhubarb; and the common vegetables are, from the late genial weather, in the finest order. Among the potted plants may be noted a dwarf orange-flowered variety of *Tropaeolum majus*, Tuberoses, varieties of *Pentstemon gentianoides*, Balsams, Sweet Peas, and some particularly handsome Pinks; while, of rarer cut flowers, there are *Erica Aitonii*, *Hibiscus sinensis plena*, and *Eucomis punctatus*.

PRICES, SATURDAY, July 8, 1843.—FRUITS:—

Pine Apple, per lb, 4s to 7s	Oranges, per doz., 1s 6d to 3s
Grapes, hothouse, per lb, 2s to 5s	— per 100, 10s to 20s
Peaches, per dozen, 6s to 24s	Lemons, per doz. 1s to 3s 6d
Nectarines, per dozen, 6s to 24s	— per 100, 6s to 16s
Melons, 4s to 8s each	Cucumbers, per brace, 1s to 2s
Strawberries, per pottle, 6d to 2s	Walnuts, per bush., 12s to 16s
Gooseberries, Green, p. h. sv., 2s to 3s 6d	Almonds, per peck, 6s
— Ripe, p. h. sv., 3s to 5s	Sweet Almonds, per pound, 8s
— Black, 2s 6d to 3s 6d	Filberts, English, per 100 lbs. 60s to 65s
— Red, for wine, 3s to 3s 6d	Cob Nuts, per 100 lbs. 60s
— for dessert, 5s to 6s	Nuts, per bushel —
Raspberries, per gallon, 10d to 1s	— Brazil, 10s
Cherries, English, p. 12lbs., 2s to 4s 6d	— Barcelona, 2s
	— Cob, 12s

VEGETABLES.

Cabbage-plants, per doz. bun., 1s to 2s	Peas, per sieve, 2s to 3s
Cabbages, per doz., 9d to 1s 6d	— per sack, 5s 6d to 7s
Cauliflowers, per dozen, 1s 6d to 4s	Beans, long-pod, p. sieve, 1s 6d to 2s 6d
Beans, kidney, forced, p. 100, 2s to 3s 6d	Asparagus, large, per 100, 2s to 5s
Potatoes, per ton, 70s to 100s	— Sprue, or Small, p. bun. 1s to 2s
— per cwt., 3s 6d to 8s	Lettuce, Cabb., p. sieve, 6d to 1s
— per bushel, 2s 6d to 4s	— Cos, per acre, 2d to 1s 3d
— Kidney, p. bush., 1s 6d	Celery, p. bd., (12 to 15) 1s to 2s
— Scotch, per bushel, 1s 6d	Small Salad, per punnet, 2d to 3d
— New, per cwt., 3s to 7s	Green Basil, per bunch, 4d to 6d
Artichokes, green, per doz., 1s to 4s	Watercress, per doz. sm. bun., 4d to 6d
Turnips, Spring, per bunch, 4d to 6d	Parsley, per 12 bunches, 1s 6d to 3s
Red Beet, per dozen, 9d to 1s	Tarragon, per doz. bunches, 2s to 3s
Horseradish, per bundle, 1s to 6s	Fennel, per doz. bun., 2s to 3s
Radish, spring, p. doz. hands, 6d to 1s	Mint, per doz. bunches, 1s 6d to 3s
— Turnip, p. doz. bunch, 6d to 1s	Marjoram, green, per bunch, 4d to 6d
Carrots, Young Horn, p. bunch, 4d to 9d	Mushrooms, per pottle, 1s 3d to 2s
— Spring per bunch, 4d to 8d	Spinach, per sieve, 1s to 1s 6d
Garlic, per lb., 6d to 8d	Leeks, per doz. bun., 3s to 4s
Shallots, per lb., 1s	Onions, Spring, per bunch, 2d to 4d
— green, per bunch, 3d to 4d	— Large, per bun., 6d to 9d

Notices to Correspondents.

MANURES.—R. L.—We are inclined to think that Potter's Artificial Guano and Mr. Lane's Super-phosphate of Lime are among the most powerful and manageable agents yet known.—J. H. S.—The term *weak* is not applied in a very strict sense in directions for the use of liquid manures; but cultivators must trust to their own experience in determining its meaning. Suppose, however, it were desired to give a plant an ounce of nitrate of soda, it is better to dissolve a 3 oz. in a watering pot of water and apply it at four different times, than to dissolve the whole ounce in the same quantity of water. There is no object in observing great precision in these operations, which are rather a question of labour than of anything else. If such matters are administered in strength they are apt to kill plants; and it will be years before we shall know what the exact limits are between beneficial and deleterious effects. If salts are given all at once they will be washed out of the soil before they can have been absorbed by the plant. You are right in supposing that plants should not have liquid manure after being pricked out, until they have made new roots.—*Flora*.—Liquid manures may be used to all herbaceous plants; but care must be taken not to over-stimulate them, or they will run to leaf. Try super-phosphate of lime or Potter's guano, both excellent.

SAINTFOIN.—J. B. H.—Saintfoin may be used with great advantage for soiling cattle. It is the mode in which it is principally consumed in the south of Europe. The time of sowing is in Spring, in a crop of corn, as Clover is sown; but it may be sown in July or August, and, unless the season be very dry, it will be sufficiently strong to stand the frost. If sown too late it might be injured, as it is rather tender when young. It is the most profitable green crop, next to Lucern, and will grow on much poorer soil, provided it contain a considerable portion of calcareous earth. Be sure to have good seed of the kind called in French *Espargette à deux coupes*.

VINES.—A Subscriber.—Putting manure on the borders in which your Vines are planted will cause the roots to rise towards it, if they be not too deep.

FIG-TREES.—H. K.—Some of these days we will give a paper on the management of Figs; but you do not say whether yours are out-of-doors or forced.

CUCUMBERS.—J. S.—The Cucumbers which obtained the prizes at the last Ipswich Cucumber Show were Hamilton's Black Spine, Hamilton's White Spine, Walker's Pea Green, and Roman Emperor.

STRAWBERRIES.—A Lady.—Give your Strawberries common stable manure; form new beds in August or September; and place the plants about four inches apart in every way. Never mow off the leaves: it is the worst of all practices, and cannot be too much condemned.—G. D. F.—We do not think your "Princess Alice Maud" equal to Keen's seedling, which it is a great deal like. The "Emperor" Strawberry, concerning which inquiry was lately made, is, we hear, in no respect better than Keen's seedling, from which indeed it is said to be undistinguishable.—A Constant Subscriber.—In a week or two you shall have a paper on forcing these fruits.—H. M.—It may be that your Hautbois are blind from over-forcing; or it may also be owing to the cold, wet spring. We would take the gardener's advice, and wait till next year. If the Hautbois he gave you was really a prolific variety it ought not to produce many male flowers. At the same time, if you have certainly ascertained that some of your plants are absolutely barren, there can be no use in preserving them.

ASPARAGUS.—R. S. V. P.—While the Asparagus is growing you cannot do better than water it with a fluid as strong as seawater; and if decayed animal matter is added, so much the better; but only while it is in full growth. Once a week in dry weather will be often enough. It is, however, impracticable to give empirical rules for these things; much will always depend on circumstances that can only be determined on the spot.

A Subscriber.—Late in the autumn (October or November) is the proper time for planting beds of Asparagus. Chalk will not be of much use to clayey soil, though it will certainly help a little to render it porous. But you cannot make a bed in clay. The soil must be light.

CROPS.—Bumpkin.—It is not advisable to plant out Broccoli between standing crops without manuring the ground.

POTATOES.—Rus.—The late Mr. Knight was of opinion that a thousand bushels an acre might be obtained; this would be 26 tons. Mr. Fleming, of Barochan, has obtained 22½ tons (see p. 227 of this volume).—*Ignoramus*.—The word tuber is the same as the mis-called Potato-root, which is not a root at all. The term is necessary in exact language.

GREENHOUSES.—*Tripolites*.—The angle of your greenhouse roof may be anywhere between 35° and 45°. The height of the front should be just enough to get head-room in the front walk. We should try hot-water covered gutters, as described by Mr. Huishe in to-day's Paper. Your propagating-bed may be in front or in the middle; but, if the latter, you cannot have a stage. The best stages are stone or slate, or solid earth held

together by stone or slate-facings. Wood will, however, do very well with good management.

CELLARING PLANTS.—*Flora*.—The main point to attend to in this operation is to keep plants dry—not to dry them up—but away from a moist atmosphere. Take them out of the ground after the first frost; cut back any injured shoots, keep them dry and cold, but not exposed to frost, and either dark or with little light. If they are hung up they will probably become too dry. There is a mean in this respect, for which experience must be consulted.

LAWNS.—*J. J. G.*—For your lawn, sow per acre 5 lbs. of Crested Dog's-tail, 5 lbs. of hard Fescue, 20 lbs. of Rye-grass, 5 lbs. of Meadow Poa, 7 lbs. of White Clover, 2 lbs. of Yellow Clover, or Black Nonesuch. For American borders, any Nurseryman will supply you with the proper plants.

FREEDING.—*Monmouth*.—You can never be much at a loss how to stock your Grass when you have a good store of hay for the winter. The most profitable use of rich Grass would be to keep Milch-cows, and make butter, if you have a good dairy-woman; or you may buy in heifers in calf, and sell them when they have calved. Having a good stock of hay you need never sell to a disadvantage. Or else you may buy sheep, as many as your after-Grass will feed, and in winter give them oil-cake or meal, and fold them on your Grass land till they are fat, which will much increase your next crop. It must depend on local circumstances which of these plans is preferable. *M.*

ROSES.—*Rural Chemistry* should put in cuttings of Roses that are not Chinas at the present time; and if allowed a very trifling bottom-heat, they will form rooted plants before winter commences.

PERLAGEONUMS.—*Rural Chemistry*.—As soon as your plants have ceased to flower, they should be cut down, leaving only two or three joints to each shoot. The prunings may then at once be made into cuttings, and will readily strike under a hand-glass in the front of a south wall, if shaded while the sun can reach them. —*Paul Peter*.—Your collection would be improved by rejecting Joan of Arc, Perfection, and Proserpine, and filling their places by Foster's Favourite, Sir R. Peel, and Lyne's Duke of Cornwall, or Gaines' Rising Sun.*

CHRYSANTHEMUMS.—*Paul Peter*.—In the *Gardeners' Chronicle* for 1842, p. 221, in the article "Amateur's Garden," you will find a list of the best Chrysanthemums.*

ARACARIA.—*X. Z.*—We see nothing materially wrong in your management of Aracaria-seeds; there was no advantage, however, in sticking them upright in the soil. If they were all fresh, the probability is, that you have given them too much water before they were able to make use of it. The history of the Thrips has been already given at p. 228 of 1841.

THE LILY OF THE FIELD.—*R. S. V. P.* complains that under this head we lately (page 429) spoke of our conjecture about the white Lily not being the one intended in the Sermon on the Mount being confirmed by a letter from a gentleman at Aleppo; and he says that he first called our attention to the fact some months ago when he remarked upon the extract from Lady Callcott's book upon that subject, and afterwards sent us a copy of a letter from Dr. Bowring that confirmed the fact that the white Lily was not indigenous to the Holy Land. We trust that our correspondent will, upon consideration, perceive that his complaint is unfounded. We, at p. 744 of vol. ii., pointed out the absence of evidence to show that the white Lily inhabited Palestine; and at a subsequent period Dr. Bowring showed, for the first time, that our Saviour's plant was probably the scarlet Martagon Lily. Our conjecture as to what it might be was overturned by this important evidence; which, however, left untouched our original assertion that be it what it might, it could not be the white Lily. Will R. S. V. P. do us the favour to re-peruse the article at p. 744?

SEEDLING CACTI.—*E. M.*—Your mule between *Cereus grandiflorus* and *speciosissimus* is much like several others, with the same origin, which we have lately received, but it is rather paler. These are all fine flowers, but not equal to either *C. grandiflorus* or *speciosissimus*. —*H. Kenny*.—Your *Cereus Maynardii*, between *C. grandiflorus* and *speciosissimus*, is one of the finest we have seen of this new race. Its colour is nearly that of *C. Ackermannii*.

DRAWING.—*A Constant Reader*.—There is no single work by which a man could instruct himself in architecture as connected with gardening. He must first learn to sketch freely by hand, by copying from a few numbers of "Hillman's Sketch Book," 1s. each. Then procure "Smith's Elements of Classic Architecture," published in Edinburgh at 2s. 6d. For garden structures, he may copy from Austin's work on artificial stone ornaments; and for plans, &c., from Loudon's "Suburban Gardener." The price of the whole would be under 30s. If he wished to attain great proficiency a teacher would be indispensable. *J. P.*

BOOKS.—*Palma*. There is no book in English or French with the generic characters of plants. Endlicher's "Genera Plantarum," in Latin, is the present standard work.

WOODLICE.—*Miss A. G.*—The only effectual way of removing the Woodlice which eat your Melons is to catch them, and this may be done by laying pieces of any tubular material, such as Bean-stalks, about the frames, and blowing out the Woodlice which congregate there into hot water, as is done with earwigs. Or pieces of Turnip or Carrot may be scattered about, which will attract them. Or, as they collect round the sides of the frames, boiling water may be poured down these occasionally, if the roots are not too near them.

GAZES.—*E. D. S.*—We cannot give any certain mode of destroying these amongst Carnations. Nitrate of soda has been lately recommended, and may possibly be effectual. You may prepare your soil in autumn with a dressing of soot and lime.

INSECTS.—*H. M. and others*.—Put a pint of gas-water to 10 pints of pump-water, and syringe your Roses; this will remove the green-fly. Is not your insect enemy the thrips? Try gas-water for it also. —*Ruth*.—Of the insects you forwarded to us, No. 1 is the grub or larva, and Nos. 2 and 3 the sexes of a water-beetle called *Dytiscus marginalis*. The female is distinguished from the male by the elytra or wing-cases being deeply furrowed longitudinally. We are not aware that the insect is injurious to gold-fish, either in the larvæ or perfect state. *S.*

MISCELLANEOUS.—*A Rustic*.—*Ailanthus glandulosa* has no English name. It is a very common hardy tree, and may be had of any respectable nurseryman. You will find it in every good catalogue of plants. —*Carlmet*.—Fungi cannot be named from a pen and ink sketch and slight description. It is probably some *Agaricus* allied to *A. comatus*. —*N. M.*—The Lily appeared a distinct variety of *Lilium bulbiferum*; but we cannot say anything further about it. Its value and novelty can only be ascertained by those who have the opportunity of comparing it with *L. bulbiferum* in the same soil. Your other question should be addressed to a nurseryman. —*A Country Vicar*.—A terrace bank will stand very well in stiff soil at an angle of 45°. It is better to turf its face than to sow it with Grass-seeds. Nothing further is required than to make the face of the slope firm. —*Julius*.—Apply to Mr. Newman, face of the slope firm. —*Regent-street, London*. —*A Female*.—Your plant is *Euphorbia lathyris*, a weed in many parts of the country. It is called English Caper, or Caper-spurge, from the resemblance its fruit bears to the Caper (*Caparis spinosa*), commonly used for culinary purposes; but it would be very dangerous to use it in the same way. In the days of the monks it was cultivated for the same purposes as Castor Oil is now employed for. —*Z.*—Your plant seems to be some *P. rhenium*, but we cannot name such a little bit. —*Oxford*.—*Felium vulgare*. —*P. K. W.*—*Philomis fruticosa*. —*A Constant Reader*.—*Lupinus rivularis*, *Veronica spicata*, *Veronica leucantha*, *Aconitum canmarum*. —*Miley*.—From the massable specimen sent, your *Salvia patens* appears to be *Salvia chana adryoides*. —*J. W. F.*—1, *Sauicula Europæa*; 2, *Symphytum officinale*; 3, *Astrantia intermedia*. —

H. M. J.—1, *Cryptogramma crispum*; 2, *Asplenium trichomanes*; 3, *Scolopendrium vulgare*; 4, *Genista linifolia*; 5, *Polygonum amphibium*. —*C. D. B.*—Countess of Leven Rose, and *Pelargonium melananthum*. —*B.*—*Acer negundo*. Mr. Lawrence's pamphlet is out of print. —*Bumkin*.—*Astrantia carnolica*. —*H. M.*—The plant you have sent is not recognised; it was not raised from the seed-pod sent, which is that of some *Crotalaria*. —*A Descendant of Flora*.—*Dielytra formosa*. —*An Amateur*.—In all probability the air of your houses is much too dry for either *Fuchsias* or *Pelargoniums*. A dry atmosphere is the ruin of greenhouse plants. —*Rural Chemistry*.—The cultivation of Cacti is mentioned at p. 145 of 1841. —*Mowbray*.—If the party under this signature amongst the "Notices to Correspondents," in this Paper of the 17th ult., will favour Messrs. Youell & Co., Great Yarmouth Nursery, with his address, they will feel obliged. —*W. R.*—We are unable to name your *Rhododendrons*. The garden varieties of that genus have no settled names. —*Climax*.—Your *Delphinium* seems to be *grandiflorum*; but whether finer than the single of that species cannot be told without comparing the two, which we have not just now the opportunity of doing. You should have sent some leaves with the flowers. —*W. Gardner, Sandgate*.—We have never received your Hoya. —*J. P. Z.*—*Listera ovata*. There is no doubt about its being indigenous to this country. —*A Subscriber*.—*Astragalus glycyphyllos*. —*An Old Subscriber*.—1, *Bromus mollis*; 2, *Eriophorum angustifolium*; 3, *Carex vesicaria*; 4, *C. stellulata*; 5, *C. pauciflora*; 6, *C. cespitosa* (a starved specimen). —*A Reader*.—1, *Phlox suavolens*; 2, *P. ovata*; 3, *P. maculata*. —*C. E. G.*—*Eryum hirsutum*. —*Zephyrus*.—We do not know what the Madeira Silk Plant is. Soapbuds are very proper as a manure for all sorts of plants, especially if mixed with urine and allowed to become putrid. —*B. K.*—*Eryum tetraspermum* and *Lotus angustissimus*. —*A. B.*—Your varieties of *Schizanthus Hookeri* are very pretty; but will they be permanent? —*J. H. Wanklyn*.—*Stanhopea graveolens*, a variety of *S. venusta*. —*J. B.*—Your *Schizanthus* is quite new, and is worth showing at the next Horticultural Exhibition at Chiswick. It will be called *Schizanthus candidus*, and published in the "Botanical Register." Many thanks for the specimen, and more for the promised plant. The annual is *Gilia tricolor*.

SEEDLING FLORISTS' FLOWERS.

PERLAGEONUMS.—*G. P.*—Your seedling is not so good as you imagine it to be. There is a great want of substance in the flower altogether; the bottom petals are not pure white, and the colour in the upper petals very ragged and uneven near the edge, which is thin; we have several flowers already out very superior to it. —*C. W. Fox*.—*Cœur de Lion* is a fine high-coloured variety, of a bright rosy vermilion, with a light centre; the flower is too long in form. *Patroness* is too small and thin in the bottom petals; and *Marquis* has the same faults. —*E. Burr*.—Neither of your seedlings are worth preserving; the pink variety is bad in form, the petals being too long, and the flower altogether loose, and not preserving the form with which it opens; the top petals are also too veiny beyond the spot, and too feathery at the base. The same observations apply to the white seedling. —*G. W. Hoyle*.—It was very mortifying on opening your box to find it such a mass of confusion that it was impossible to tell to which flowers the different petals belonged. Had you placed over them a thin layer of cotton wool, or screwed up each flower separately in paper, fastening it tight about the stalk, and leaving it open at the opposite end, this disaster might have been avoided. Many of the petals have a promising appearance, particularly a high-coloured flower; generally the under petals seem to want substance, and some of the top petals are too thin at the edge.

—*Mr. Keat*.—It is not necessary to report upon your flowers singly, as the same character, variously modified, runs through them all: take, for instance, "10, bad form, lower petals too long, upper petals high and pointed, with jagged edges;" this description would suit most of them: they want the form, substance, and compactness of good flowers. No. 6 is the best flower among them. —*John Davis*.—Nos. 1, 3, 4, 5, 6, 9, are coarse, loose, and badly-formed flowers; 2 is a pretty good form, but the petals curl back too much; 7, broad under-petals, top ones cloudy, lincy, and uncertain; the best flower is No. 8, both in form, substance, and smoothness on the edge of the petal; 10 has good colour and substance, but the lower petals are too narrow; generally, your flowers are loose in form, and when fully expanded there is a large and deep division between the upper and lower petals, and the latter are commonly too long they want compactness and substance. —*J. D. P.*—*Trentfield Nun* is a pretty little well-formed flower, but wanting purity in the lower petals. In *Cerberus* the upper petals are too veiny. *King of the Gipsies*, upper petals thin at the edge. *Cupid*, singular variety, but not, we think, worth keeping. The upper petal of the three first-mentioned flowers have a tendency to curl back, but the lower petals are short and well formed.

—*E. M.*—Your seedling is too rough for a show-flower, as all the petals curl back and show a puckering at the edges; but in the border it will be very ornamental, as it appears to be a very prolific bloomer. —*H. B.*—Your seedling is no improvement; the colour is common and poor, particularly in the upper petals about the edges. —*W. H. M.*—*Shylock* is a very poor specimen, pointed petals with rough edges. *Llewellyn* is much better, the petals are broader, of a better form, and smooth on the edge; both of them are small. —*J. Davis, Cork*.—Your flowers arrived in a dry and bad state, so that no satisfactory opinion can be given. 1 is evidently too small; 2 is a good form, but the colour was quite gone; 3 is a bad form, the under petals being too long; the under petals of 4 are rather thin, but of a good form, short and round, the upper petals were too far gone; 5 is pretty, but not equal to some we have in the same style.

—*A Devonian*.—1, fine and clear colour, with the lower petals disproportionately long. 2, good general form, the edges of the petals jagged and uneven; the irregular veining in the lower petals is also a defect. 3, good colour, white centre, rich upper petal; this, if it retains a cupped form when open, is a pretty variety. 4, edges of the upper petal rather thin, colour finely spread, leaving a light margin; lower petals short, of a delicate salmon colour, with a light crimson spot in the centre of each—a very pretty flower; from the petals having all fallen, it is impossible to tell the form of the flower. 5, petals too long. 6 (?) uneven and watery edge, lower petals too long. 7, bad form, lower petals too long. 8, upper petals uncertain; flower altogether rather rough; fine colour. 9, good clear colour, upper petals pointed and uneven, bottom ones too long. 10, wants form, all the petals turn back. 11, good spot, which terminates badly; edges to petals rough; 12, lower petals thin and long. 13, bad form. 14, coarse and veiny, upper petals pointed. 15, uneven edge to upper petals, good spot, and pretty colour. 16, uneven and watery edge, spot burns, lower petals too long, and the flower altogether wants substance.

—*J. C.*—No. 5 is a showy flower, but veiny, coarse, and very uneven; puckered both in the upper and lower petals. No. 6 is the best of your seedlings, the colour is clear and good, the spot dark and well defined, the lower petals are broad, but they are, however, rather too long; the flower is altogether of good substance, the petals thick, and even on the edges; it is large, and will make a showy greenhouse variety. No. 7, bad form, all the petals too long. —*A. B.*—The petals of your seedling are all too long and loose, the flower wants substance, and the ground-colour is not sufficiently pure.*

CAIEOLARIAS.—*A Constant Reader, Kendal*.—No. 5 is a curiously-marked seedling; they are all small, and common compared to the varieties grown about London.†

RANUNCULUSES.—*G. Lightbody, Falkirk*.—From the stems of the flowers having been cut very short, they had by the journey been shaken from the paper, so that we cannot refer to them by name; we can only state that they are some of the most beautiful varieties we have seen, perfect in form, some with

perfect and most delicate edging, and others partaking of richer penciling.†

VERBENAS.—*J. D. Parks*.—Your *Verbenas* did not arrive in good condition, but from what was left of them, we cannot discover any novelty or improvement upon the sorts already in cultivation.†

FUCHSIAS.—*J. and C. Whalley*.—Your seedlings are small. No. 1 we think no improvement upon several small varieties that we already have; the sepals having a faded appearance. No. 2 is decidedly better, and for a small variety a very good one; if the foliage is small, and it proves an abundant bloomer, it will make a pretty variety. —*W. Barratt*.—Your seedling is a very graceful variety, flowers long and slender, tube and sepals scarlet crimson, corolla violet purple, pistil and stamens long, foliage small, and blooming freely. —*H. B.*—Your best seedling is No. 4; this is a beautiful variety: seed vessel bright green, tube and sepals bright rosy scarlet, corolla large, of a bright violet purple; it is a well-proportioned flower. We object to 2 on account of the tube being so slender, and prefer No. 1, which is similar to 2 in colour, and having a stout tube; this is a fine flower with less blue in the corolla. 3 is a stout flower, of good colour, with long sepals, which expand freely and expose the corolla, which is of a rosy purple colour. No. 4 is decidedly your best variety. —*E. H.*

—Your seedling is not equal to many of the varieties out. —*A. B.*—The smallest of your seedlings is not worth keeping, nor is there sufficient novelty in No. 3 to make it very desirable, —the light variety with the scarlet corolla is the best; and if a free blooming plant, it will make a desirable addition to this beautiful class. —*Lucombe, Pince, and Co.*—The blooms sent of *Fuchsia exoniensis* prove it to be a very splendid variety; it is a flower of great substance throughout, seed-vessel dark, tube and sepals of a rich crimson carmine, the sepals are long, they expand freely, and disclose the rich crimson purple corolla, which is very large, and of a peculiar denseness of texture.†

PANSIES.—*Polly*.—*Princess Alice* is a large, round, flat, and fine flower of great substance; the top petals are of a deep mulberry-purple, having a very broad band of the same colour round the lower petals, and meeting well above the eye, which is large and bold; the ground colour is yellow, and there is a very slight difference between the bottom and side petals; it is a fine variety. —*W. C. T.*—Our impression was that *Broune's Eliza* would prove a very useful flower; and having pointed out its good qualities it was proper to point out a defect, which you admit. —*Missey*.—Nos. 1 and 3 are the best of your flowers, but they are but miniatures of the *Pansies* now grown. —*W. Hutchings*.—*Dark Perfection*, a good colour, but rather small, and the under petals are not in good proportion to the upper ones; it is much inferior to the selfs we already possess. —*A Lover of Pansies*.—Purity in the ground-colour of the Pansy is an essential qualification, therefore Nos. 1 and 6 being deficient in this respect, must be consigned to the border; 2 and 3 must share the same fate, from the ground-colour of the lip differing from that of the side petals. The serrated edges of the petals to No. 4 is a disqualification, at the same time the general form and proportion of the petals are very good. No. 5 is the best, having a clear bright yellow ground, with a fine dark eye, upper petals of a blue purple, with a very decided band of the same round the lower petals; this appears to be novel in colour, and we should like to see it again. —*A Constant Reader*.—Your flower is round, flat, and well formed, with a good eye; the yellow ground-colour is not even, being deepest in the bottom petal, and it melts so much into the blue of the top petals, and the broad band of the bottom ones, as to change half the colour into a bronzy blue, which gives it an indistinct appearance. We should like to see it again. —*G. Leather, Esq., Knowsthorpe*.—*Mrs. Meynell Ingram* is an extremely delicate and pretty flower, primrose ground, compact eye, of a dark blue purple; the upper petals have a few spots of delicate blue away from the edge; the flower in its present state is rather too small. —*A. B.*—Your seedlings were too much shrivelled up to judge fairly of, they are small, and there does not appear to be anything particularly worthy of notice. —*H. K.*—It is impossible to form an opinion upon a flower sent in so dried and shrivelled a state; it is surely too small. —*M.*—The creamy white is a pretty flower, round, with a good eye, but it appears to be rather deficient in substance. The dark variety wants purity of ground-colour for a show-flower, and the edge of the belting wants to be more clearly defined.*

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE Overland Mail from India has arrived this week with news from Bombay to the 20th May, and from China to the 28th March. The proceedings in Scinde are the chief points of interest in the Indian news. Sir C. Napier's conquest is not likely to be held without another struggle; Shere Mahommed, who was defeated at the battle of Fullalie, has rallied the mountaineers of the Beloochee tribes, and has advanced to within six miles of Hyderabad with a force of about 30,000 men. Sir C. Napier had sent for reinforcements, and it was expected that another battle would take place in the middle of May. All communication by sea will shortly be cut off, and the country will very soon be flooded by the periodical rise in the Indus, so that it was doubted whether any continued military operations could be carried on until the close of the season. Under these circumstances, the result of the anticipated battle is looked for with some anxiety. Akbar Khan is at Jellalabad, negotiating with the mountaineers for the safe passage of his father through the Khyber Pass; the Kuzilbashs are in power at Cabul, and a Persian Chief is said to have established his authority at Candahar. The state of the Punjab was beginning to attract attention; Shere Singh had suffered from a paralytic stroke, which was likely to prove fatal, and thus render British intervention necessary to control the rebellious portions of his kingdom. The affair at Khytul has terminated in the suppression of the disturbance, and our troops are now in secure possession of the place. From China we learn that Colonel Malcolm arrived there on the 16th March with her Majesty's ratification of the treaty, but no arrangement had been made for the exchange with the Chinese Plenipotentiary. Sir H. Pottinger had declared his intention of proceeding to some northern port in order to carry on the tariff negotiations, but every means was put into practice by the authorities around Canton to induce him to remain. The accounts from Spain are extremely unfavourable to the cause of the Regent. The insurrection now comprises two-thirds of the kingdom; and since our last,

Pampeluna and its garrison, and other important towns, have joined the movement. The Royal Army is separated into three bodies, each acting at a distance from the others, and neither of them sufficiently strong to attack the insurgents or to effect a junction with one of the other divisions. In the meantime, the insurrection has spread in a circle around the Regent, and great doubts are entertained whether he will be able to make head against the powerful and well-organized conspiracy which now surrounds him.

At home, the revenue returns for the year and quarter ending the 5th inst. are the chief topic of interest. The general balance for the year shows an increase in the total revenue of the country to the amount of 2,442,942*l.*, as compared with the corresponding period of last year. The increase of the quarter amounts to 1,700,532*l.*; but as this includes the produce of the silver received from China and the Income-tax, it does not give the absolute increase upon the ordinary branches of revenue, which amounts to about 50,000*l.* for the quarter. The Customs and Excise show a steady and satisfactory improvement on the accounts for the quarter, the increase on the one being 135,015*l.*, and upon the other 140,013*l.*; but the decrease on the year, as compared with the year 1842, is 514,926*l.* on the Customs, and 1,013,868*l.* on the Excise. In the Stamps and Taxes, there is a decrease both on the year and quarter; in the Stamps, the decrease on the year is 203,717*l.*, and on the quarter 39,369*l.*; and in the Taxes, the decrease on the year is 249,033*l.*, and on the quarter 74,408*l.* There is a small decrease in the revenue of the Post-office for the quarter to the amount of 9,000*l.*; but on the year the increase is 59,000*l.*—The proceedings of Parliament present few subjects which call for special observation. The adjourned debate on the Irish Arms Bill is not yet terminated, and every clause and sentence of the measure continues to give rise to amendments and divisions. On Tuesday Mr. Smith O'Brien moved that the House resolve itself into a committee for the purpose of taking into consideration the causes of the discontent at present prevailing in Ireland, with a view to the establishment of a system of just and impartial government in that part of the United Kingdom. A long debate ensued, for the details of which we must refer our readers to our Parliamentary Report.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses are quite well, and still continue at Buckingham Palace. On Monday the Queen and Prince Albert took an airing in an open carriage; and the Prince of Wales and the Princess Royal were taken an airing, accompanied by the Dowager Lady Lyttelton. On the same day the Queen had a dinner and evening party. On Tuesday morning Prince Albert reviewed the Scots Fusilier Guards in Hyde Park, and in the evening Her Majesty and the Prince, and the King and Queen of the Belgians, honoured the Italian Opera-house with their presence. On Wednesday the Queen had an evening party, and on Thursday Her Majesty held a drawing-room in honour of her birthday, which was very numerously attended. Viscount Sydney and Captain Meynell have succeeded Viscount Hawarden and Captain the Hon. A. Duncombe, as the Lord and Groom in Waiting on the Queen. Major-General Wemyss has relieved Colonel Buckley in the duties of Equerry in Waiting on the Queen, and Colonel Bouverie has relieved Major-General Sir E. Bowater as the Equerry in Waiting on Prince Albert.—The King of Hanover met with an accident on Friday afternoon at Kew, by stumbling over a stone step. In the fall his Majesty bruised his arm and side, but is now recovered. His Majesty came to town in the evening, and took an airing in an open carriage on Monday and Tuesday. On Wednesday his Majesty went to the Temple in the evening, to honour Sir Charles Wetherell and the benchers of the Inner Temple with his company at dinner. The Lord Chancellor, Duke of Buckingham, Duke of Beaufort, Marquess of Londonderry, the Earls of Eldon, Delawarr, and Digby, Viscount Strangford, Bishop of Rochester, Lords Brougham, Denman, Kenyon, and Lowther, the Attorney and Solicitor-General, &c. were invited to meet his Majesty. After dinner the King returned to Kew.—On Monday the Grand Duke and Duchess of Mecklenburg Strelitz took their departure from Kew for the Continent, and embarked at Dover on Tuesday morning for Calais, under the usual salutes. Her Majesty the Queen Dowager has for the last few days been labouring under the effects of a slight cold, but we are happy to state that she is daily recovering. It is understood that Witley Court, near Worcester, is in a state of preparation for the reception of her Majesty, who is expected to arrive at the end of the month from Marlborough House. It is expected that his Royal Highness the Duke of Cambridge will be present at the annual meeting of the Royal Agricultural Society at Derby. His Royal Highness leaves town on Monday next, and will be the guest of the Duke of Devonshire. On Tuesday his Serene Highness the Prince Reuss Lobenstein Ebersdorf went by railroad to Windsor, to view the Castle, Virginia Water, &c. His Serene Highness left town on Tuesday, and proceeded by water to Woolwich to inspect the Dock-yard and Arsenal. The Governor, Lord Bloomfield, gave orders for the garrison to go through their evolutions on Woolwich-common, and in the evening his Serene Highness dined with her Majesty at Buckingham Palace. H.R.H. the Princess Clementine of Orleans,

now Princess of Coburg, is expected to leave Lisbon so as to reach London on the 15th of this month.

The Army.—The following promotions in consequence of the recent successes in Scinde were gazetted on Friday:—To be Lieutenant-Colonels in the Army: Majors Poole, 22d Foot, and M'Pherson, 17th Foot. To be Majors in the Army: Captains George, 22d Foot, and Conway, 22d Foot. To be Aide-de-Camp to the Queen, with the rank of Colonel in the Army in the East Indies: Lieutenant-Colonel Pattie, 9th Bengal Cavalry. To be Lieutenant-Colonels in the Army in the East Indies: Majors Reid, 12th B.N.I.; Waddington, B.E.; Stack, 3d B.C.; Wyllie, 21st B.N.I.; Browne, 8th B.N.I.; Story, 9th B.C.; Woodburn, 25th B.N.I.; Lloyd, B.A.; Outram, 23d B.N.I.; Leslie, B.A. To be Majors in the Army in the East Indies: Captains Delamain, 3d B.C.; Willoughby, B.A.; Whittle, B.A.; Fisher, 12th B.N.I.; Tucker, 2d B.E.I.; Jackson, 25th B.N.I.; Tucker, 9th B.C.; Stevens, 21st B.N.I.; Green, 21st B.N.I.; Blenkins, 6th B.N.I.

The Navy.—The Lords of the Admiralty have given notice of a change in the Naval uniform. The following are the general directions, subject to the usual modifications applicable to the different ranks of Officers: The coats of all Officers, now having scarlet collars and cuffs, to have white collars and blue cuffs; and the slash in the sleeve, which is now blue, to be white. The buffons of dress epaulettes to be loose, instead of fixed, as at present. All cocked hats to be of the same dimensions as that to be worn by the Admiral of the Fleet, and with the same distinctions heretofore used, except that the binding, which was formerly of black silk lace, 2½ inches, is to be 2 inches in width, and of the oak-leaf pattern.

Order of the Bath.—The Queen has been pleased to appoint Major-General Sir Charles J. Napier, Knight Commander of the Order of the Bath, to be a Knight Grand Cross of the said Order. Her Majesty has also been pleased to appoint the following officers, in Her Majesty's service, to be Companions of the Order, viz.:—Lieutenant-Colonels Pennefather and Poole, 22d Foot; and M'Pherson, 17th Foot; and Majors George and Conway, 22d Foot. Her Majesty has further been pleased to appoint the following officers, in the East India Company's Service, to be Companions of the Order, viz.:—Colonel Pattie; Lieutenant-Colonels Reid, Waddington, Stack, Wyllie, Browne, Story, Woodburn, Lloyd, Outram, and Leslie. Majors Delamain, Willoughby, Whittle, Fisher, Jackson, Tucker, Stevens, Green, and Blenkins.

The Revenue.—The Revenue accounts for the year and quarter ending the 5th inst. were published on Wednesday, and are satisfactory, as showing a small increase in some of the more important sources of revenue, and an indication of reviving trade. The total revenue for the year was 47,780,342*l.*, and that of the corresponding year ending July 5, 1842, was 45,337,400*l.*, showing an increase of 2,442,942*l.* in favour of the present; but this must not be considered an absolute increase, as it includes the Income Tax and the money received from China, without which there would be a deficiency of nearly 1,900,000*l.* The accounts for the year show an increase on the Post-office of 59,000*l.*; Miscellaneous, 1,080,214*l.*, to which must be added Property Tax, 3,317,997*l.*; Repayment of Advances, 142,257*l.*, making a total of 4,599,468*l.* They show a decrease on the Customs of 514,926*l.*; Excise, 1,013,868*l.*; Stamps, 203,717*l.*; Taxes, 249,033*l.*; Crown Lands, 60,000*l.*, to which must be added, Imprest and other moneys, 114,982*l.*, making a total of 2,156,526*l.*; which being deducted from the amount of increase 4,599,468*l.*, as stated above, gives 2,442,942*l.*, as the increase on the year. The accounts for the quarter show an increase on the Customs of 135,015*l.*; Excise, 140,013*l.*; Property Tax, 861,709*l.*; Crown Lands, 2,500*l.*; Miscellaneous (including the money received from China), 849,767*l.*; to which must be added, Repayments of Advances, 35,655*l.*, making a total of 2,024,659*l.* They show a decrease on the Stamps of 39,369*l.*; Taxes, 74,408*l.*; Post-office, 9,000*l.*; Imprest and other Moneys, 200,350*l.*, making a total of 323,127*l.*, which being deducted from the amount of 2,024,659*l.*, as stated above, gives 1,701,532*l.* as the increase on the quarter.

Earl Grey.—Last evening the answer to inquiries respecting the health of the venerable peer was that his Lordship had a comfortable night, and still continues improving satisfactorily. His Lordship is now able, with assistance, to leave his bed-room, and sit up during a considerable part of the day in an ante-chamber.

Post Office.—Lord Lowther, the post-master general, has for some time been making arrangements with the Post-office authorities of Belgium, Holland, Prussia, Austria, Saxony, Denmark, Sweden, Norway, and Russia, for the transmission of letters and newspapers to and from England and those countries, on the same terms as the recent postal convention with France, which came into operation on the 1st of June, either by paying the postage or not. These negotiations are nearly concluded.

Sycee Silver.—By the statement of the account between the Master of the Mint and the Lords of the Treasury, relative to the Sycee silver remitted from China, it appears that the total value is 1,334,480*l.* 7*s.* 7*d.*, the freight and other expenses connected with which is 19,291*l.* 18*s.* 2*d.*, leaving a balance of 1,315,188*l.* 9*s.* 5*d.*; the above-named sum being equal in Chinese value to 6,000,000 dollars, the first instalment under the treaty of Nankin. Of this amount, 1,281,406*l.* 13*s.* 10*d.* has been paid into the Exchequer, and 53,073*l.* 13*s.* 9*d.* reserved for freight, charges of preparation, contingent expenses, allowances, &c. subject to the approbation of the Treasury.

Foreign.

FRANCE.—The news from Paris is chiefly connected with the details of the Budget, and with matters of domes-

tic interest. On Saturday the Bill for opening a credit of 527,241 francs for the Minister of Finance, in order to enable the Government to pay, should King Otho's Government not do so, the half-year's interest due on the portion of the Greek loan guaranteed by France, passed the Chamber of Deputies by a majority of 221 to 13. In the brief discussion which preceded the vote, M. Guizot said that there was every reason to hope that the financial difficulties of Greece would not be of long duration, and that the present Bill would probably be the last of such a nature the Chamber would have to give their assent to. The Chambers were but thinly attended on Monday, in consequence of the funeral of Mlle. Barrot, the only daughter of M. Odillon Barrot, whose early death is deplored by the Journals of all parties. The greater portion of the Members of both Houses were present at the funeral. The Chamber of Deputies commenced on that day the discussion on the project of a railway from Avignon to Marseilles. One of the Opposition papers having stated that when the King came from Neuilly to the Tuileries, on Friday, he alighted at the Perron de la Reine, and that he appeared to be suffering, and was compelled to lean forcibly on the arms of the two officers who accompanied him, in order to be able to reach his apartments, the Ministerial paper says, that nothing can be more false than these details, and that the King was never in better health. The Duc d'Aumale landed at Marseilles from Algiers on the 29th ult. In the beginning of August, his brother, the Duke de Nemours, is to proceed with his consort to the camp formed at Plélan, near Rennes. The Prince and Princess de Joinville arrived at Brest on Saturday last, from Rio Janeiro. Dr. Hahnemann, the founder of Homœopathy, died in Paris on Sunday, aged 88. Summer tourists may be interested to know that a new line of packets has been established on the Loire, by means of which a traveller, leaving Paris at six in the morning for Orleans by the railroad, can arrive at Tours at half-past six in the evening, a distance of 60 leagues.

SPAIN.—The accounts received this week by the French telegraph are of considerable interest, and the state of affairs in the provinces has assumed an aspect of very grave importance to the Regent. Two-thirds of the kingdom have joined the insurrection, which is becoming so general in Andalusia, that Gen. Carratala, the Governor of Seville, who had retired to Cadiz after the outbreak at Seville, has declared Cadiz and its province in a state of siege. Pampeluna and its garrison, all the military posts on the frontier except Irun and Fontarabia, have made their *pronunciamiento* for the insurrection. In Galicia the example of Corunna has spread with great rapidity. Vigo, Pontevedra, Orense, Lugo, and Betanzos, have followed the movement; but at Ferrol the population was still kept down by the Captain-General. Burgos is the seat of a very active and energetic junta, which was organising the insurrection throughout the entire of Old Castile. The General commanding the city was compelled to capitulate for want of provisions, but the Governor of Valladolid still maintained himself in an old convent, converted by the French into a citadel during the Peninsular war. All these circumstances prove that the Burgos insurgents are not yet ready to march upon Madrid with those of Galicia, as they boasted they would in their proclamation. The people of the valley of Aran and of the upper mountains, as well as Huesca and Daroca, in Aragon, had declared against the Regent. Palma, in the Balearic Islands, Ceuta, Algeiras, and the camp of San Roque, had likewise "pronounced." The Regent reached La Ronda on the 24th, and proceeded the next day to Albaceta, where he was received with the greatest enthusiasm by the people and the National Militia. He had found it necessary, however, to wait until he could be reinforced by Gen. Van Halen, who had found the troops of Alvarez so disorganised before Granada, that he was obliged to withdraw them. Gen. Van Halen was still at Jaen on the 25th ult., awaiting the arrival of the Governor of Cordova, with a reinforcement of 1,500 men, to cross the Sierra Morena, and effect a junction with the Regent. By the latest news from Valencia, it appears that the "Junta de Salvation," as they style themselves, commanding in that city, had issued orders to all the country within their reach to pay up within six days the taxes due for the entire year. All bachelors and widowers without children, from the ages of 18 to 40, are ordered to take up arms, and a strong temptation is held out to the Regent's troops to desert by an offer of one real a-day additional pay, and a reduction of a year in the period of their service. The Junta of Barcelona had called upon the members of the Lopez Administration to meet in that city. General Serrano had, in virtue of the powers vested in him by the Junta, pronounced the termination of the Regency of Espartero, and relieved all Spaniards of their allegiance to him. The report of several of battalions of Zurbano's army having joined the insurgents was untrue; but he has found it necessary to enter into an arrangement with General Castro, the insurgent General, by which he has been allowed to fall back upon Cervera without coming to a battle. The terror of a bombardment had subsided at Barcelona, and the population was beginning to re-enter the city. Since the retreat of Zurbano, the Governor announced, that having no instructions to persist in his menaces, he would not open the fire, unless acts of hostility were committed against the place. So long as a superior army shall not compel the insurgents to shut themselves up in Barcelona, the fort of Montjuich will be of little use, since it would now merely batter empty houses. It is in the country round Lerida that the fate of the insurrection may be decided. Castro and Prim are now manœuvring to outflank Seoane and Zurbano, and oblige them to retire into the fortress and open a communication with the militias of

the upper valleys marching upon Balagner. The Madrid journals contain no news from the South, but state that the capital continues tranquil. The officers of the National Guard had assembled, and made an offer of their services to the Government to defend Madrid, without the aid of the troops of the line, until order should be completely restored. Private letters announce that the leaders of the insurrection, despairing of subduing Espartero in the field, had hired a notorious spy, formerly employed by Ferdinand VII., to assassinate the Regent, and he is positively asserted to have left Madrid for that purpose.

PORTUGAL.—We have Lisbon news to the 26th ult. The news of the Spanish insurrection had produced considerable sensation in that city. The revolutionary press of Lisbon published the accounts with avidity, in the hopes of getting up a movement in Portugal, which, from various circumstances, it appeared somewhat difficult to effect. The Chambers, about to close their long session, were occupied with the ways and means of the Finance Minister. The budget had been voted by the Chamber of Deputies, and also the authority to collect the taxes for the ensuing economical year. A mixed commission of both Chambers was about to decide on the fate of the Road Bill.

GERMANY.—Accounts from the Rhenish provinces of Prussia state that the rejection of the Prussian penal code, by the Legislative Assembly of the provinces on the 22d, had been the occasion of joyous demonstrations at Cologne, Dusseldorf, and other towns. The houses of Cologne were illuminated at night, bonfires were lighted on the surrounding heights, bands of musicians traversed the streets, and the National Hymn was sung in all the public squares. In the evening the deputation of the Diet embarked on board two steamers, which were dressed with flags and illuminated with lamps of different colours to their masts' ends. Everywhere along the road and at Dusseldorf, where the intelligence had reached by express, the deputies were saluted with lively acclamations. At Dusseldorf they were received with the greatest solemnity, the principal inhabitants came to meet them, and conducted them in procession to the Palace of the Marshal of the Diet, to whom they communicated the unanimous resolution of the Assembly. The Marshal replied that the Government, whose good faith could not be questioned, had conceived it advantageous for the country generally to establish a uniform legislation throughout all the Prussian dominions, but the Diet having determined to maintain in its integrity the judiciary constitution of the Rhenish provinces, he had no objection to oppose to that resolution. The Deputies then retired, and after partaking of a banquet to which they were invited by the citizens, they again returned to Cologne. The same accounts state with much satisfaction that, by a Ministerial rescript of the 14th May, the 50,000 rix-dollars granted by his Majesty towards the completion of Cologne Cathedral for the year 1843, are placed at the disposal of the committee. Letters from Berlin state that the Rev. Mr. Gerlach, who has been in England for some time for the purpose of making himself acquainted with the Liturgy of the English Episcopal Church, has now introduced in the Elizabeth Church in that city a new Liturgy, for which, however, he has not taken that of the English Church as a pattern. His principal object appears to be to forward good sacred music in the Prussian churches, and by these means to impress religion more upon the mind of the congregation.

MALTA.—The new cathedral will, it is expected, be consecrated by the end of the year; its internal fittings are already commenced, and benches are to be supplied to all instead of pews. It is confidently anticipated that her Majesty the Queen Dowager will be here to honour with her presence the consecration of the building which she has so generously endowed. A singular phenomenon had appeared in the harbour of Valletta, the water suddenly rising to the height of three feet, overflowing the works of the new dry dock; it almost immediately fell five feet and a half: during this period a very strong current was running out of the harbour, which the boatmen could scarcely stem. It is supposed this circumstance must have occurred through some earthquake at a remote distance, and it was reported that at Tripoly in Barbary several severe shocks had been felt.

ITALY.—Letters from Rome state that the Pope is anxious to revive the ancient ceremony (so graphically described by Madame de Stael in her *Corinne*) of solemnly crowning the greatest poet at the Capitol, and that he has offered this distinguished honour to Chateaubriand. The venerable author, however, has declined the intended honour, declaring that he did not believe he had done sufficient to deserve it.

TURKEY.—Accounts from Constantinople state that the Servian people met on the 17th on the plain of Topside. There was no election, because it was feared that the presence of Wucsitsch and Petroniewitsch would invalidate it in the eyes of Russia. But every voice was for Prince Alexander Georgewitsch. It was arranged that the election should take place on the 3d inst.; the Prince Alexander should go to the convent of Ragowitz, and his ministers to Krugewatch, there to await the now certain result. Redschid Pacha had recovered in some measure from his recent illness, and had been ordered to hold himself in readiness to proceed to his pachalic at Adrianople, a journey which, in the precarious state of his health, it is considered probable would be his last.

EGYPT.—The intelligence from Alexandria is of considerable interest. The Pacha had publicly declared that from advancing years and infirmities he found himself unequal to all the cares and necessary application incident to his Government, and that his successor Ibrahim being an invalid, it is his intention to associate with himself his

grandson as wakeel, or assistant, with full powers to act on his behalf. This arrangement, though not looked upon as immediately mischievous, is pregnant with danger in the event of the Pacha's death, because there has existed between Ibrahim and Abbas a long-cherished and deadly hatred, and both parties have numerous and powerful partisans. The plague of locusts still continues; in abatement of the evil the Pacha pays liberally for their collection, giving for them, to the Zellahs who collect, two piastres, or about 5d., for every two pound and three quarters, English weight, which they bring in. Depots for the issue of this reward are established all over the country; in one depot alone there have been seen in one day 120 lbs. English weight of these destructive insects brought in and paid for.

INDIA.—The Overland Mail arrived on Monday with accounts from Bombay to the 20th May. It started ten days before the usual time, in consequence of the approach of the monsoon rendering the navigation difficult from Bombay to Aden. The chief points of interest are connected with the proceedings of Sir C. Napier, in Scinde. It appears that Shere Mahommed, who was defeated at the battle of Fullalia, on the 24th March, had got over the river and incited some of the mountaineers of the Beloochee tribes to join his standard, and approach the banks of the Indus to within five or six miles of Hyderabad, with an army amounting, it is said, to between 30,000 and 40,000 men, with about 20 pieces of cannon. The motive which has induced him to adopt this rash step seems to be that of desperation, since he is said to have written Sir C. Napier to the effect, "that having fought two battles for his country, he must have one more for his religion!" Another chief, Ali Mourad, who had joined the British, was no longer to be depended on. Sir C. Napier had given notice to the former to give up his useless resistance, or he would proceed to rout him. The 15th of May was publicly mentioned as the date of the expected battle. Her Majesty's 28th Regiment had left Kurrachee early in May, and were expected to reach Hyderabad before the 15th. The great portion of the other troops were concentrated around Hyderabad, with the exception of one native regiment, which was stationed on the right bank. The season of the periodical rise in the Indus had begun, and it was much doubted if any continued operations could be carried on for some time, as the country is intersected with overflowing canals. The Bombay Government was most active in sending reinforcements to strengthen Sir C. Napier's position. The 22d Regiment having been much weakened by the two victories of the 17th February and 24th March, had come to Bombay, from which station one wing of the 78th Highlanders had been dispatched to take their station at Kurrachee. The greatest efforts were made to open a communication from Bhooj to Oomercote, whence there is one maintained to Hyderabad. The rush of water at the mouths of the Indus, and the blowing weather, will prevent all communications by that means for two or three months. A considerable British force was collected at Sukkur, from which place some troops were proceeding to Sehwan. The ex-Ameers of Scinde, who had arrived at Bombay in April, have been located in different places. Shahdad, who is accused of being implicated in the murder of Capt. Ennis, has been sent to Surat, in order to be safely guarded in the castle. The other ex-Ameers have been sent to Sassoor, a fort formerly belonging to the Peishwar. The state of the Punjab was beginning to attract attention. Shere Singh, the third in succession to Runjeet Singh, who died about three years ago, had had a stroke of the palsy, and the sovereignty of his family was looked upon as likely to terminate with his life, as the British would have to interfere to keep down the rebellious portions of his kingdom. In Candahar there was, according to report, a new ruler in a Persian Chief: the Kuzzilbashs were also said to be all powerful in Cabul. Akbar Khan was at Jellalabad, endeavouring to make arrangements with the Khyberrees for the passage of his father through their defiles from Peshawur. The Khytul disturbance was completely settled. The disturbances in Bundelkund have been nearly put down, notwithstanding the difficulties that attend mountain warfare. Lord Ellenborough, who is at Agra, expected to be enabled by other arrangements to bring about its complete pacification. The Somnauth gates have turned out to be made of pine, and not of sandal-wood.

CHINA.—The accounts from China come down to the 28th March, but they contain little news of importance. Colonel Malcolm had arrived with her Majesty's ratification of the Treaty; but ratifications could not be exchanged until Elepoo's successor reached Canton, which it was hardly expected he would do in less than two months. It was said Sir H. Pottinger was about to publish the result of his negotiations. The new Tariff had been inspected by the principal merchants, and approved of. The Plenipotentiary had abandoned the idea of proceeding to the northward; and it was reported that he had again urgently requested permission to retire. Colonel Malcolm was about to start again for England, to arrange some details which required a reference to the home authorities. The feeling of enmity against the English, so long prevalent at Canton, appeared to be gradually subsiding. The opium trade continued to flourish, and some clippers had even proceeded with their cargoes to the northward of Chusan. Several daring acts of robbery, murder, and piracy had been committed near Singapore; fourteen Cochin Chinese had been committed for trial, for kidnapping women in Cochin China, and bringing them to Singapore for sale. Commercial transactions were much in the same state, but little else can be expected until the conclusion of the negotiations.

CHILI.—From the *Valparaiso Gazette* of the 16th,

17th, and 18th of March, received this week, we learn that that city has been the scene of a calamity such as has never before been equalled in Chili. At a quarter past 8 P.M., on the 15th March, flames were first seen breaking through the roof of one of the naval stores. An attempt to break down the connexion between the burning edifice and a newly-built house having failed, the fire spread with the utmost rapidity, embracing a wide range, threatening to extend over the whole circumference, which it brilliantly illuminated. Great efforts were made to save the Custom-house, one of the finest buildings in the New World, by pulling down houses in its vicinity, and, fortunately, with success. On the other side of the place, however, where the fire originated, its progress was not arrested till it had destroyed the whole range of houses reaching to the sea. An attempt was made to arrest the conflagration by blowing up a store with gunpowder, but, the quantity of powder being insufficient, no result was produced but a slight earthquake, which increased the terror of the enormous crowd of spectators who occupied the pier, every street, the neighbouring heights, &c., the boats and ships in the bay, whose masts and rigging were crowded with human beings. The crews of the vessels, both French and British, gave the most valuable aid by their courage, promptitude, and discipline. Prompt measures had been taken to repair the consequences of this calamity; to collect in one place all goods rescued from the flames, and to make arrangements for the resumption of business, which had been wholly interrupted. The damage is estimated at 400,000*l*.

Parliament.

HOUSE OF LORDS.

Monday.—The House went into committee on the Scotch Church Bill, when Lord CAMPBELL moved an amendment for the purpose of limiting objections to ministers to spiritual or physical allegations of defect. The Earl of ABERDEEN opposed the amendment, and Lord BROUGHAM made his promised statement. He hoped that for the sake of the bar, the law, and the administration of justice in this country, they would listen to his reasons for opposing the bill, both in form and substance. The judgment delivered by himself and Lord COTTENHAM, in the Auchterarder case, was impugned by this bill, and he felt that he would be unworthy of the position which he held if he did not defend the reasons on which that judgment was founded. As a declaratory bill, its practical effect would be to make the judgment good, but the reasons on which it was founded worthless—a position at once insulting to the Judges, and the most dangerous in its consequences that could possibly be conceived. The bill might give a triumph to the Scotch judges, and even aid the Court of Session in rescinding the appellate jurisdiction of the House of Lords; but at least one evil consequence was likely to happen—the Judges, in delivering their judgments on appeal cases, would refrain from giving the reasons on which they proceeded, if they found that they were exposed to declaratory acts, which set aside their law as bad. In fact a clause ought to be inserted in this bill permitting the Auchterarder case to be re-heard. There was little probability that the bill would pass the House of Commons; but he was anxious that the House of Lords should pursue the right course, and not leave it to the Lower House to correct its errors. If the Church was to be endowed with a power so enormous as this bill proposed to confer, it ought to be given by enactment and not by a declaratory law. The LORD CHANCELLOR felt the importance of maintaining the judgments of the House of Lords unimpaired. The bill, however, was not at variance with the decision in the Auchterarder case—a judgment in the reasons of which he entirely concurred. It was only declaratory on one point—the right to object, not the right to decide, a point which had not been at issue in the Auchterarder case. Besides, it was not declaratory, but enacting on the right of the presbytery to decide, and therefore, altogether, the bill was not opposed to the Auchterarder judgment. Lord COTTENHAM remarked that the Lord Chancellor and the Earl of Aberdeen materially differed in the arguments with which they supported the bill—the one expressing his concurrence in the judgment in the Auchterarder case, and the other abandoning it as bad in law. After repeating at considerable length his former arguments against the bill, he pointed out the inconsistency of making one portion of it declaratory, and the rest enacting. The Earl of GALLOWAY, in supporting the bill, cited opinions formerly expressed by Dr. Chalmers, as sanctioning its principles. The Earl of HADDINGTON opposed the amendment of Lord Campbell as too restrictive. Some such measure as the present bill was requisite after all that had happened in Scotland, to allay the unhappy ferment which had distracted the Church. Lord DENNAN strongly deprecated the course which a majority of the House seemed disposed to pursue with respect to this bill. The reasons on which the Auchterarder judgment proceeded were the lights by which future decisions might be guided, and yet, because it suited some persons to say that these reasons were wrong, they were hurrying a declaratory bill through the House, the effect of which would undoubtedly be to diminish the weight and authority of the law. By the bill, they were about to transfer property and rights from one set of individuals to another, without the decency or justice of hearing the patrons in their own defence at the bar of the House. Should the bill proceed any further with these declaratory words retained in it, he would move that the opinions of the Scotch judges should be deliberately and solemnly taken upon certain questions to be submitted to them—for he highly disapproved of the irregular course of obtaining private opinions. There was nothing more calculated to bring the law into contempt, than a declaration that what was laid down by the highest court in the kingdom was not the law of the land. The Earl of ABERDEEN earnestly affirmed that if the bill were not passed, it would be the cause of the disestablishment of the Church of Scotland. There was nothing of which he was more convinced than the imperative necessity of this measure, which had been, substantially, before the public for three years, inasmuch as it was similar to his former bill. Lord CAMPBELL, in reply, reaffirmed that the passing of this bill was a virtual reversal of the Auchterarder judgment. On a division, the amendment was rejected by 42 to 12. Another discussion took place, on an amendment proposed by Lord BROUGHAM, to convert the bill from a declaratory into an enacting measure, which was rejected by 38 to 10. After some remarks from the Earl of MINTO, the chairman reported progress.

Tuesday.—In reply to the Earl of MINTO, the Earl of ABERDEEN said it was not the intention of the Government to apply what was called free tithes to the endowments of new livings. The Archbishop of DUBLIN presented a petition, praying the House to take measures to remedy the evils occasioned by the want of a Church Government for the United Church of England and Ireland; and called attention to the anomalous position of the Church in relation with the civil legislature. His object was to urge the necessity of constituting some legislative body which should have the power of settling those points on which members of the Church differed in opinion, but without altering the established litanies or formularies. He recommended the subject to the especial notice of the English Prelates who were permanent members of their Lordships' House. The Bishop of SALISBURY also expressed his opinion that some power of self-regulation should be possessed by the Church, to enable it to

accommodate itself to those changes which take place in society. He felt satisfied that there could be no permanent security for the Church unless it were permitted to adapt itself to the changing circumstances of the times, and to make those alterations which should be found necessary.

The Earl of DALHOUSIE moved the Committee on the Canadian Wheat and Flour Bill, and, in so doing, explained the grounds on which it rests.—Lord BROUGHAM, in seconding the motion, expressed his opinion that the measure was in accordance with the other commercial reforms of the Government.—Earl STANHOPE denounced the bill as calculated to injure the agricultural interest, by leading to the admission of a large quantity of American corn. The Government had admitted the principles of free trade to be those of common sense, and all their measures were covertly directed to their practical operation in legislation. He moved, as an amendment, that the bill go into committee that day three months.—The Duke of RICHMOND opposed the bill. The agricultural interest had already been reduced low enough, without superadding another measure, which would either be injurious, or, if not, was a change for the mere sake of change. Millions were invested in Agricultural property, and it could not afford to be tampered with continually.—The Earl of RADNOR opposed the bill, but upon very different grounds. If it would lead to free trade, he would support the bill; but, as he believed it created a new protection, he opposed it.—Lord BRAMMONT also opposed the bill, on the ground that it would raise up a milling interest in Canada, destructive of our home interests.—Lord WEARNCLIFFE declared his conscientious belief that the measures of the Government would prove the salvation of the Agricultural interest. Every reasonable Agriculturist was convinced that a reduction of the protection given to Agriculture was inevitable, and had acquiesced in the Government propositions as calculated to effect that object without injury to any interest. He defended the bill at some length, and declared that Government had no intention of withdrawing the protection which they felt that the Agricultural interests of England required.—Lord MONTAGUE supported the bill, because it admitted the principle of a fixed duty, and expressed his conviction that it would lead to a large importation.—Lord ASHBURTON, on the contrary, while regarding it as a measure of favour and concession to the Canadians, was satisfied that it would not injure the Agricultural interests of this country.—Lord TERNHAM and the Duke of BUCKINGHAM each opposed the bill; the one on the principles of free trade, the other on that of protection.—On a division, there were 57 to 25 for going into committee on the bill.

Friday.—The Canadian Wheat and Flour Importation Bill was read a third time and passed. On the motion of Lord BROUGHAM, his bill for the more effectual prevention of the traffic in slaves, was read a second time. He stated the provisions of the bill, entering at some length into the subject; his object is to render it penal for any British subject to hold property in slaves, unless they come into their possession by heirship, or other involuntary means. The Limitation of Actions Bill was opposed by the Marquess of CLANRICARDE, but supported by the LORD CHANCELLOR; on a division, the bill was supported by 30 to 4, and passed through committee.

HOUSE OF COMMONS.

Monday.—The first public business was the committee on the Irish Arms Bill. Before the House went into committee Lord CLEMENTS vindicated his motives in resisting the progress of the bill. It was a penal measure, and every hour, nay, every minute, in obstructing its passage, was so much additional liberty to Ireland. The House then went into committee, beginning with the 9th clause, which had been postponed on Thursday night last, on account of the ambiguity of its phraseology. The Government now proposed what was practically a new clause, as the phraseology was entirely reconstructed.—Lord J. RUSSELL, Mr. M. O'FERRALL, and Mr. PICOTT dwelt on the fact that, notwithstanding the anger which had been manifested on the part of the Government and its supporters on Thursday night, they had now substantially admitted that they had been in the wrong, and practically confessed that the bill was clumsily constructed, thereby justifying the pertinacious opposition which had been given to it.—Mr. ROEBUCK objected that, according to the forms of the House, the clause must be postponed to the end of the bill, as it was substantially a new one.—The CHAIRMAN decided that it was not substantially a new clause, but an amendment of the existing one.—Mr. ROEBUCK said that this was a point not for the decision of the chairman, but of the committee.—Lord J. RUSSELL said it was a matter of convenience, on which strict rule need not be scrupulously adhered to.—After considerable discussion there was a division, when the clause was carried by 123 to 69.

The 10th clause was agreed to; but the 11th clause provoked a long discussion, with several divisions. Mr. M. J. O'CONNELL, Sir D. NORREYS, and other Members, assailed the ATTORNEY-GENERAL for Ireland, and said he seemed incapable of explaining the meaning of a bill, for which, on the part of the Government, he was responsible. At last, after a struggle through every sentence, and the introduction of several amendments, the 11th clause was ordered to stand part of the bill. The 12th clause, which enacts the penalty for keeping arms without license, after an amendment, to which the Government acceded, was carried; after which the further progress of the bill was suspended, and the chairman reported progress.

Tuesday.—In answer to a question from Mr. HUME, Sir R. PEEL stated that the representations made by the guaranteeing Powers to the Greek Government had produced a good effect, and that an assurance had been given that a considerable reduction in the civil and military expenditure of Greece should be made. He promised to lay the correspondence, when closed, upon the table.—Mr. BLEWITT made inquiries as to the political position of the Duke of Wellington, and whether or not he is a responsible Minister of the Crown? He explained his question by a reference to the language used by his Grace on different occasions, especially in his recent correspondence with Mr. Mulock, stating that he never interfered with matters over which he had no control.—Sir R. PEEL thought the hon. Member had put himself to a great deal of superfluous trouble in order to ascertain the actual position of his Grace. The Duke of Wellington was Commander-in-Chief of the Army, he was a Member of the Cabinet, and as such responsible with the other Members of it for any advice which it might give to the Crown; and his control over public affairs arose from the very great deference paid to his opinion by his colleagues. The Duke was over-burdened with correspondence, and he was very naturally in the habit of referring applicants to the heads of the department to which their business might relate.

Mr. HUTT moved an address to the Queen, praying her Majesty to direct that there be laid before the House copies of any correspondence that might have taken place between her Majesty's Government and that of Hanover, relative to the taxes levied on British commerce and navigation in the river Elbe, under the name of Stade tolls.—Mr. HUME and Sir J. HANMER supported the motion.—Mr. GLADSTONE urged the objections applicable to the premature disclosure of negotiations in progress against the motion, which, if not withdrawn, he expressed his intention of opposing. Progress had been made in this matter, although the negotiations had been broken off, as the parties had arrived at a point on which they disagreed.—After a discussion, in which Mr. LABOUCHERE, Sir R. PEEL, and Lord PALMERSTON took part, the motion was withdrawn.

Mr. W. S. O'BRIEN moved that the House resolve itself into a committee for the purpose of taking into consideration the causes of the discontent at present prevailing in Ireland, with a view to the redress of grievances, and to the establishment of a system of just and impartial government in that part of the United Kingdom. The hon. Member, in a speech which occupied about three hours, went through a long catalogue of Irish grievances from the time of Cromwell to the present. The motion, he said, was justified by the extraordinary organisation now carrying on in Ireland, by which the "Repeal rent" had been raised from the weekly collection of 500l. to 3,000l., and all ranks and classes were combining to express their deep-rooted conviction that the Parliament of this country did not do its duty to their country, and that

nothing but a domestic legislature would remedy their grievances. Sensible of the inconveniences which would attend a repeal of the Union, he felt, nevertheless, that Ireland might have been happier and more prosperous if that Union had not been accomplished; his own experience as a member of the imperial legislature for 12 years had shown him how much Irish interests were neglected; and if the Union were not productive of benefit to his native land, he saw not why he should be afraid of adopting the other alternative. He concluded by warning Ministers that in the actual condition of Europe, and our relations with other states, Ireland, in its present condition, was a source of vital weakness to Britain.—Mr. WYSE seconded the motion. He glanced at the church, defended the Catholic clergy, expatiated on the grievances of the country, and traced the operation of the gradual relaxation of the penal laws, from the first permission to allow Catholics to hold land, down to their admission into the Legislature. Catholic emancipation was the last of one series of concessions, and the first of another; they asked to be governed by the same laws as England, and would continue to ask until they obtained it.—Lord ELIOR complained of the extensive range and variety of the topics embraced in the speeches of Mr. O'Brien and Mr. Wyse. The complaint of the great proportion of Protestants to Catholics in office, was answered by the fact that no Government could promote its political opponents, and the greater portion of the Catholics of Ireland were opposed to the Government. He was astonished that any class of men could be led away with the idea that the repeal of the Union would prove a panacea for the evils of the country. He, for one, was prepared to resist the repeal, as a dismemberment of the empire. The condition of Ireland was not so deplorable as might be inferred; its trade had shared in the general depression of that of the empire; but there had been an increase in its shipping, and in the amounts of the deposits in the savings' banks, all which were evidence of an improved condition. The Government were not open to the charge of neglecting the affairs of Ireland; last session he had introduced 23 bills, on which not a single division took place; and during the present session, out of the 105 Irish members, only about 10 or 12 were attending their duties in the House. Fixity of tenure was a delicate point, which had been rather avoided by Mr. O'Brien. He freely admitted that "Property had its duties as well as its rights," but they were moral duties, not easily to be made legally cognizable. The Established Church must be considered as the establishment not only of Ireland but of England; and the land which contributed the tithe mainly belonged to the Protestant landowners; Mr. O'Connell had himself admitted that not a tenth of the land belonged to Catholics. He resisted the motion, as calculated to impeach the conduct of Government, and to hold them up as not governing Ireland impartially.—Mr. C. WOOD said that the speech of Lord Eliot left them precisely where they were; and in the present appalling state of Ireland, and at the close of the session, they did not know what the Government meant to do. Great and good men had opposed the Union, and it had been carried by infamous means; but after it had lasted so long he felt that to repeal it would be a dismemberment of the empire. But then it was the duty of Government to answer the appeal which had been made to them, and say what they proposed to do for that country.—On the motion of Mr. B. COCHRANE the debate was then adjourned.

Wednesday.—Sir G. GREY withdrew the Charitable Trusts Bill for the present session.—Sir J. GRAHAM stated that the bill which he had formerly mentioned as in preparation on this subject, would be laid before the House in a few days.—Mr. DUNCOMBE then called attention to what he conceived to be a gross breach of privilege on the part of the *Standard* newspaper, which, in allusion to the recent discussion upon the Nottingham election, had represented that Messrs. Gisborne and Duncombe had talked in Parliament of having hired others to the potential sin, at least, of perjury, with as much levity as if they had been mentioning the most indifferent, or even laudable actions; adding, that such men, who were confessed corruptors, confessed suborners of fraud and perjury, were unfit to sit in that assembly. He concluded by moving that Mr. Baldwin, the printer of the *Standard*, should be called to the bar.—Mr. GIBBORNE briefly supported the motion.—Sir R. PEEL expressed his opinion, that if calumnious charges in newspapers were to be made matter of privilege, the House would have ample work on its hands. He entirely acquitted Mr. Duncombe of having said anything which could justify the expressions of the *Standard*, but thought the editor was confounding the speech of last Friday with the ample confessions which Mr. Duncombe had made on a former occasion.—Mr. AGLONY thought the House was far more concerned in the matter than the individual Member who made the complaint, and condemned as monstrous the misrepresentation of the editor.—Lord J. RUSSELL expressed his decided opinion that the expressions in the *Standard*, of which complaint was made, constituted a gross and malignant libel. Statements of that kind did more injury to the press which uttered them than to those against whom they were directed; and he thought it better, after the opportunity which Mr. Duncombe had had of vindicating himself, that no farther notice should be taken of the matter.—After some additional remarks, Mr. Duncombe adopted this advice and withdrew his motion.

Lord WORSLEY moved the re-committal of the Coroners Bill.—Mr. PAKINGTON moved its re-committal that day six months. The House divided—For going into committee, 134; Against it, 41; Majority, 93. The House went into committee, and after many amendments and five divisions, all the clauses were agreed to. On the consideration of the schedules, after a division on a motion for postponement, progress was reported.

On the order of the day for the committal of the Commons Inclosure Bill, Lord WORSLEY moved that the Bill be referred to a select committee.—Mr. BROTHERTON, as an amendment to the motion, moved the adjournment of the House. On a division there were—For the adjournment, 12; Against it, 37; Majority, 25.—Lord WORSLEY again moved that the bill be referred to a select committee. Another motion for adjournment and a division followed, when the debate was adjourned to Monday.

Friday.—The adjourned debate on Mr. O'Brien's motion was resumed by Mr. A. B. COCHRANE, who was followed by Mr. WARD, Mr. E. TENNANT, Sir D. NORREYS, Mr. LASCELLES, Mr. M. O'FERRALL, and Mr. SHAW. Mr. MACAULAY remarked how inefficiently the Government was defended, supporters and opponents alike censuring its policy. He would not destroy the Irish Church Establishment, but would reduce it to the wants of the Protestants, and place the two religions on a footing of perfect equality. The secret why there had been no agitation for Repeal of the Union with Scotland, lay in the fact that Queen Anne's Ministers had recognised the national religion of Scotland. Sir J. GRAHAM replied and said the Government were determined to maintain the Church Establishment, and suppress the Repeal Agitation. The debate was then adjourned.

CITY.

Money Market, Friday.—Consols closed at 94 to $\frac{1}{2}$ for the account; Bank Stock, 180; Three per Cent. Reduced, 94 $\frac{1}{2}$ to $\frac{3}{4}$; Three-and-half per Cent. Reduced, 101 $\frac{1}{2}$; Exchequer Bills, 54s. to 56s. prem.

Metropolis and its Vicinity.

Her Majesty's Birthday.—Thursday being appointed for the celebration of her Majesty's Birthday, it was observed as a day of rejoicing throughout the metropolis. The morning was ushered in by the ringing of bells; the Park and Tower guns fired royal salutes, and the illuminations in the evening were on a most extensive scale. A review in honour of the day took place on the parade in St. James's park, in the presence of Prince Albert, the Duke of Cambridge, and the Duke of Wellington; and the troops in Woolwich garrison were brigaded on the Common. The Duke of Wellington gave a grand ball in the evening at Apsley House, in honour of the day, and by

order of the Duke of Cambridge, the gates of the Park were kept open all night for the egress and ingress of carriages. All the other Cabinet Ministers, with the exception of the Chancellor of the Exchequer, who is suffering from a domestic affliction, gave state dinners to the Ambassadors and other official personages.

Tribute to the Duke of Sussex.—A public meeting was held on Saturday at Willis's Rooms, for the purpose of entering into resolutions for a memorial to his late Royal Highness the Duke of Sussex. The Marquis of Northampton took the chair, and opened the business of the meeting by remarking that it was to show their affection and regard to the memory of one of the Princes of the house of Brunswick. His late Royal Highness was the patron of literature and arts, and the devoted friend and supporter of all charitable institutions. The Duke of Sutherland expressed his great satisfaction that the noble President of the Royal Society, the successor in that distinguished office to the late Duke of Sussex, had consented to take the chair that day. After paying a high eulogium to the merits of his late Royal Highness, his Grace read extracts from the speeches of the Duke of Wellington, Sir R. Peel, Lord J. Russell, &c. in Parliament as to the ability and kind-heartedness of the illustrious Prince, and observed that happy must the memory of that man be whose character was so honoured by such men. They had now met to give an opportunity for offering a public tribute of respect to the memory of his Royal Highness, and he therefore moved a resolution expressive of regret for the loss of the Royal Duke. The resolution was seconded by the Marquis of Breadalbane, and carried unanimously. The Earl of Roseberry moved the second resolution, "That a memorial be erected by public subscription to the memory of the late Duke of Sussex." The Bishop of Durham seconded the resolution, which was agreed to. Other resolutions in conformity with the objects of the meeting were adopted, on the motion of the Earl of Arundel and Surrey, the Bishop of Norwich, the Earls of Zetland and Portescue, and subscriptions to the amount of about 600l. were announced.

Sale of the Duke of Sussex's Property.—The sale of the late Duke's property during the last three days has, from its interesting character, attracted a very numerous assemblage of fashionable company at Messrs. Christie's rooms, independently of the parties usually attending similar auctions. The catalogue included a collection of interesting historical curiosities, many of which realised extraordinary prices. The trinkets were sold on Monday; the regulators, clocks, and watches, on Tuesday; the ornamental furniture and china on Wednesday, Thursday, and Friday. On Monday, Tuesday, and Wednesday next, the pipes, tobacco, and cigars, will be sold.

Duel at Camden Town.—On Saturday a duel, which has terminated fatally, took place at Camden-town. It appears that about a quarter past five on Saturday morning, a police constable, who was on duty near the Camden-road Villas, and the keeper of the toll-gate facing the Brecknock Arms, observed two cabs, the first containing two gentlemen, and the second three gentlemen, pass down Maiden-lane, in the direction of Highgate. In about ten minutes after they were alarmed by hearing a single shot fired, and presently after the two cabs returned at a rapid rate with but three out of the five gentlemen, and drove in the direction of Regent's Park. This circumstance excited great suspicion, and immediately after several labourers, who had come to commence their haymaking in the adjoining field, gave information that a gentleman was lying in the field adjoining, who had been shot. On hastening to the spot the police found a gentleman, who gave his name as Lieut.-Colonel Fawcett, and his address 183, Sloane-street, lying on the grass, bleeding from a wound in the right side, and another gentleman, who gave his name as George Gulliver, and who stated himself to be the surgeon of the Royal Horse Guards Blue, standing by his side. On the police inquiring what had happened, Col. Fawcett replied "What is that to you? It is an accident." Under the direction of Mr. Gulliver a shutter was procured, and the unfortunate gentleman was in the first instance conveyed to the Brecknock Arms' Tavern, but was refused admittance. He was then conveyed to the Camden Arms, Randolph-street, where accommodation was afforded. At the request of Colonel Fawcett his wife was at once sent for, and on her arrival the Colonel confessed that he had been fighting a duel with his brother-in-law, Lieut. Munroe, of the Royal Horse Guards Blue. Mr. Sandys, surgeon of Kentish Town, was then sent for, who deemed it advisable, from the dangerous state of the wound, to call in Sir Benjamin Brodie and Mr. Liston, who arrived about eight o'clock. The result of their consultation was that they discovered the ball had entered the body on the right side, passed through the right lung, and had apparently dropped into the intestines, in a similar manner to that in the case of the late Mr. Drummond. On a consultation it was the opinion of both medical gentlemen that to extract the ball was impossible, but there was some difference as to the nature of the wound, Sir Benjamin Brodie pronouncing it fatal, and Mr. Liston expressing a belief that he might recover. During the whole of Saturday, Col. Fawcett remained in a very precarious state, but on Sunday there was a marked improvement in the symptoms, which continued to give hopes of a favourable result up to 11 o'clock at night. Soon after midnight, however, Mr. Sandys, observing a marked change for the worse, and that the Colonel exhibited symptoms of delirium, lost no time in despatching a messenger for Mr. Liston, who promptly arrived. Medicines were then administered, after which the Colonel became somewhat more rational for a short period. He, however, again relapsed into an insensible state, in which he remained until 6 A.M. on Monday, when death put a period to his sufferings. About an hour prior to the

death of Colonel Fawcett, Mr. Sandys deemed it advisable to acquaint his wife with his approaching dissolution, and also sent for Major Daubeney, of the 55th Regiment, his personal friend. Mr. Sandys describes the death-bed scene as truly heartrending. From the moment that Mrs. Fawcett became acquainted with the fact of her husband's approaching death, she was perfectly frantic, and after the event had taken place it was with the utmost difficulty that Major Daubeney and Mr. Sandys could remove her from the body. She was then conveyed by Major Daubeney in his carriage to her own residence, in Sloane-street. Throughout Sunday Colonel Fawcett was exceedingly cheerful, and once or twice referred to the rencontre which had taken place between himself and Lieut. Munroe. He stated that Lieut. Munroe had been his agent during his absence in China, and that on Friday night, whilst Lieut. Munroe was on a visit at his house, he expressed his dissatisfaction at the way his affairs had been managed. This drew a reply from Lieut. Munroe, who, Colonel Fawcett stated, insulted him three times in such a manner that he rang the bell, and gave directions to his servant to order the Lieutenant's carriage, which was done; and that shortly after Lieut. Munroe sent him the challenge. Mr. Sandys remarked, that the high character of the Colonel in the Army he thought would have justified him in refusing to accept it; to which observation Colonel Fawcett replied that perhaps it might, but he did not think it would ever have come to that. He thought Lieut. Munroe wanted to bully him, and although he told him that he (Colonel Fawcett) did not wish to insult him, he would not submit to be insulted in his own house. He added, that he never intended to shoot Lieutenant Munroe; but that the moment he had taken his position in the field he received his fire, was instantly "doubled up," and fell; and he positively asserted that he did not fire himself at all, although he had raised his right arm with the intention of firing in the air. In the course of the evening Mr. Wakley, the coroner, held an inquest on the body, which was attended by a very large number of military officers and personal friends of the deceased and his antagonist. Mr. Sandys, the surgeon, stated the particulars of the case as related above, and said that on a *post mortem* examination, in conjunction with Mr. Liston, he had ascertained that the wound in the side was about one-quarter of an inch in diameter, the ball having entered the integuments covering the seventh rib, which it fractured, penetrating through the back of the right lung to the spine, and lodging in the ninth dorsal vertebra. The wound was at least six inches in depth. The immediate cause of death was an effusion of blood from the lung into the right cavity of the chest. He had no doubt whatever that the deceased died from injuries consequent on the wound. The ball had become imbedded in the body of the vertebra, but had not injured the spinal marrow. Mr. Liston, the surgeon of University College, confirmed this testimony in every particular. He said that the facts were so clear that there was no possibility of doubting the cause of deceased's death; and that, supposing it to have been possible to have fully understood the nature of the injury, and to have known the course of the bullet, he did not think it would have been possible to save the life of the deceased. The policeman and the toll-collector were then examined, after which the inquest was adjourned to Thursday. So great was the interest felt in the inquiry, that no less than 14 coroners from various parts of the country, who happen to be in London respecting the Coroners' Bill now before the House of Commons, were present to watch the proceedings. At this adjourned inquest, Mr. Isidore Blake, Assistant-Surgeon in the 8th Hussars, a half-brother of the deceased, attended, and identified the body; but there was still a want of material evidence on many important points. Mr. Gulliver, the Surgeon, also attended, but as he had previously appeared before the police magistrates and bailed, another difficulty occurred in regard to the jurisdiction of the Coroner. It was ultimately arranged that the police should be answerable for the safe custody of Mr. Gulliver, and the inquest was then adjourned for a week. The proceedings at the police-court are also adjourned to next week, Mr. Gulliver being held to bail, himself in 1,000*l.*, and four sureties of 250*l.* each, the latter being the Earl of March, Sir W. W. Wynne, Colonel Richardson, and Captain Oliver. It appears that Colonel Fawcett had been stationed in India for some years past with his regiment, and on being ordered to China about two years since, Mrs. Fawcett returned to England, with her two children, one of which is only recently dead. After serving through the principal events of the late war in China, Colonel Fawcett, whose health had become seriously affected by an attack of fever, obtained leave of absence, and arrived in England, in company with Major Daubeney, of the 55th Regiment, on the 18th of last month, taking up his residence in private lodgings, at 188, Sloane-street.

Exhibition of Cartoons.—We announced last week in our Court news that her Majesty and Prince Albert honoured the exhibition of Cartoons with their presence on Friday, preparatory to the private view which took place on Saturday. The exhibition was thrown open to the public on Monday, on payment of a shilling for admission, and during the whole week it has been numerously attended. The Cartoons are 140 in number, and being all of very large dimensions, varying from 15 to 16 feet square, the walls and a large screen placed down the division of the Hall are completely covered by them. Their general appearance shows an advance in good drawing of outline, and a good knowledge of the principles of composition; many of them possess great merit, and are generally considered to prove that the Fine Arts in England, if they have not as yet advanced so rapidly as might be desired, have, at all events, within these few years, made consider-

able progress; and that in historical pictures the artists of this country may be expected to compete successfully with the artists of any other modern school. The following is the award of the judges as to the subjects entitled to the several prizes offered by the commissioners. It will be seen that, although several Academicians have competed, none are included among the fortunate competitors. The undermentioned classes constitute the only gradations of merit upon which the judges have been called on to determine.—**Prizes of 300*l.*** Caesar's first Invasion of Britain, Mr. E. Armitage, 13, George-street, Adelphi, and Prestbury Mansion, Cheltenham; Caractacus led in triumph through the streets of Rome, Mr. G. T. Watts, Robert-street, Hampstead-road; First Trial by Jury, Mr. C. W. Cope, Hyde Park-gardens. **Prizes of 200*l.*** St. Augustine preaching to Ethelbert and Bertha, his Christian Queen, Mr. J. C. Horsley, High-row, Kensington Gravel-pits; Cardinal Boucher, urging the Dowager Queen of Edward IV. to give up from sanctuary the Duke of York, Mr. J. T. Bell, School of Design, Manchester; The Fight for the Beacon, Mr. H. J. Townsend, Blandford-cottage, Brompton. **Prizes of 100*l.*** Unalarmed by the Fairies and Satyrs, Mr. W. E. Frost, Poland-street; Joseph of Arimathea converting the Britons, Mr. E. T. Parris, Grafton-street; Boadicea haranguing the Iceni, Mr. H. C. Selons, Camden-street North; Alfred submitting his Code of Laws for the approval of the Witan; Mr. J. Bridges, Charles-street, Berners-street; Eleanor saves the life of her husband, afterwards Edward I., by sucking the poison from the wound in his arm, Mr. Joseph Severn, 21, James-street, Buckingham-gate. Of the other cartoons it will be sufficient to state that 11 are illustrative of Spenser, 33 of Milton, and 17 of Shakespeare. One represents "David," and is illustrative of the 1st Book of Samuel, c. xvii., v. 57, and c. xviii., v. 1, 6, 7, 8, 9, and 28. All the rest of the cartoons, with three exceptions, are illustrative of passages in the earlier records of the History of England; indeed, with a very few exceptions, there is nothing lower than the 15th century. One of these has for its subject "A Witch led to Execution, about the year 1481." It will be seen from this summary that there are at least as many subjects taken from Shakespeare and Milton as from the whole range of English history, and that there is but one subject from Holy Writ. The arrangement of the drawings in the Hall is the subject of general commendation, and it is only to be regretted that in the performance of their duty the commissioners have been compelled to find room for some very imperfect specimens sent in for competition, which, in some slight degree mar the effect of the more finished productions. Both sides of the hall are covered by three tiers of drawings, which in some places reach nearly to the roof from the ground. The centre of the hall is occupied by a lofty frame-work, on each side of which two tiers of subjects are arranged. Great difficulty has been experienced in securing a proper light for the various drawings, but the result evidences much care and labour bestowed in a satisfactory manner. Mr. Armitage, who has obtained the first prize, was a pupil of the well-known French painter Paul Delaroche, and it is said that he is only 22 years of age. Mr. Parris, who has obtained one of the 100*l.* prizes is known by his drawings for the Book of Beauty, and as the painter of the figures and groups in Mr. Burford's Panoramas. Mr. Cope is also known as connected with art, and Mr. Severn during a long residence at Rome acquired considerable reputation among the English visitors by his historical paintings. With these exceptions all the other fortunate competitors are comparatively unknown. The exhibition will continue up to the close of next week at the charge of one shilling; it will then be thrown open to the public, gratis, with the exception of a few hours on the Saturday in each week, reserved at the price of a shilling for those who wish to examine the drawings more at leisure. The money derived from the exhibition will be applied to the promotion of the Fine Arts, in some way hereafter to be determined on.

Sudden Death of Colonel Ellison.—This melancholy event occurred on Monday morning, about 9 o'clock, under the following distressing circumstances:—The Colonel was commander of the 1st Battalion of the Grenadier Guards, which had but a short time previously entered Hyde-park for field duty. The men had deployed into line, and the Colonel, seemingly in the possession of health and spirits, had just given the word to "Present arms," as a general salute, when he fell from his horse in a fit. Numbers of the officers hastened to render aid, while several galloped to obtain medical assistance. There was, however, a surgeon on the spot, but all efforts were useless, and in the course of a few minutes he was a corpse, and was borne to his residence in Norfolk-street, Park-lane, on a stretcher, attended by a double file of his men. To increase the melancholy character of the scene, his wife, who was talking with her husband but a few minutes before, witnessed the occurrence; at the next moment she was at his side upon her knees, endeavouring to render every assistance in her power, but overcome by deep emotion, she fainted, and was conveyed from the Park by some of her friends. Colonel Ellison was nearly 60 years of age, and entered the army in 1807, and served throughout the Peninsular war, under the Duke of Wellington; at Quatre Bras and at Waterloo, his bravery and gallantry gained the notice of the Commander-in-Chief, and he received the brevet rank of Major. He was at the taking of Peronne in 1815; served in command of the 2d battalion in Canada, 1840; and returned home in 1841, when he took the command of the 1st battalion as its first Major. In 1820, he married the Hon. Mary Montagu, sister of Lord Rokeby, by whom he leaves a family of one son and two daughters. An inquest was held on Tuesday, at which the jury returned a verdict of died by the visitation of God.

King's College.—On Friday the annual distribution of prizes to the students took place in the theatre of the college. In the absence of the Archbishop of Canterbury, who was prevented from attending from indisposition, the chair was taken by the Bishop of London, the President, supported by the Bishop of Llandaff, Lords Radstock, Normanton, and Calthorpe, Sir R. Inglis, Dr. D'Oyley, and numerous other patrons and friends. The Chairman briefly stated the object of the meeting, regretting the occasion which prevented the Archbishop from presiding, and briefly referred to the principles on which the college was founded, designating the institution as eminently and purely a Church of England institution. Archdeacon Lonsdale, the Principal of the college, and the several Professors, addressed the meeting, and announced the names of the prizemen in their respective classes; after which the Bishop delivered the prizes as follows, accompanied by an appropriate address to each:—**Department of General Literature and Science.**—Divinity: First-year's Men, A. Barry, J. F. Hardy; Second ditto, J. F. Vinter, Thompson; Third ditto, S. Trueman, Thrupp. English Verse: J. F. Hardy. Latin Essay: W. Ince. Classical Literature: Prize 1, W. Ince; 2, A. Barry; 3, W. F. Edwards; 4, A. P. Lovekin. Latin Essay—Junior: E. Field. Mathematics: 1, F. W. Vinter; 2, A. Barry, Dunn; 3, Rowe; 4, Edwards; 5, Wigglesworth. English Literature: A. Barry. English History: 1, A. Barry; 2, A. Povah. Hebrew: 1, J. L. Capper; 2, Dickinson. German: A. Barry. French: A. Barry. Stephen Prize: A. Povah. **Department of Engineering, &c.**—Divinity: First-year's Men, J. P. Wormeley; Second ditto, Edward Chance. Mathematics: 1, E. Chance; 2, W. R. James. Natural Philosophy and Mechanics: 1, J. F. Twisden; 2, A. W. Makinson; 3, Edward Chance; 4, W. R. James. Chemistry: 1, W. Clark; 2, J. F. Twisden. Geology: H. Hayter. Arts of Construction: H. Hayter. Architecture: G. Snell. Mineralogy: T. C. H. Deacon. Manufacturing Art: Prize 1, H. Hayter; 2, Haynes; 3, Twisden; 4, Thompson; 5, Henchman. Geometrical Drawing: Prize 1, W. Clark; 2, Makinson. Surveying: Prize 1, W. Clark; 2, J. P. Wormeley. Workroom—1, J. K. Peile; 2, J. Morgan. Associates—F. W. Moody; F. Spurrell; A. J. Biddle; J. S. Lavies; H. J. Clarke; G. Snell. Certificates of Honour in Engineering—Snell, Nichols, Hayter. At the conclusion, the Bishop of Llandaff proposed a vote of thanks to the Bishop of London for his kindness in presiding, which was seconded by Lord Radstock, and carried unanimously. His Lordship returned thanks at some length, and paid a high compliment to the talents of the professors and the general proficiency and conduct of the students. It will be seen from the above list that Mr. Barry, a son of the architect of the new Houses of Parliament, is a successful competitor in several of the most important classes.

University College.—On Saturday afternoon the annual distribution of prizes in the Faculty of Arts and Laws took place in the theatre of the college, W. D. Christie, Esq., M.P., in the Chair. Professor Long, Dean of Faculty, read the report, which gave a satisfactory account of the proficiency attained by the pupils in literature, science, and other departments of study not within the range of an ordinary scholastic course. The number of students in the Faculty of Arts and Laws is now 163, being a considerable increase upon that of the preceding year, and many of those who were last year in the junior classes had become competitors for the highest honours on the present occasion. The Chairman then proceeded to award the prizes to the successful competitors. **Latin**—Professor Long.—Senior Class: Prize 1, W. F. Durant; 2, C. Somerton, of Bristol. Junior Class: 1, C. A. Bowring, of London; 2, J. R. Gibson, of Liverpool. **Greek**—Professor Malden.—Extra Senior Class: 1, B. Lewis, of London. Senior Class: 1, C. Somerton, of Bristol; 2, W. F. Durant. Junior Class: 1, C. A. Bowring. **Hebrew**—Professor Hurwitz.—Senior Class: 1, J. Brown, of Coward College. Junior Class: 1, J. Edkins, of Coward College. **English**—Professor Latham.—1, W. C. Roscoe, of Liverpool. **French**—Professor Merlet.—1, A. Crowley, of Alton, Hants; 2, C. F. Kingston. **Italian**—Professor Count Pepoli.—1, A. Crowley, of Alton, Hants; 2, A. Mott, of London. **German**—Professor Wittich.—Senior Class: 1, C. Beevor, Haigham Hall. Junior Class: 1, J. Forster, of Brompton, Carlisle. **History**—Professor Creasy.—1, A. Crowley, of Alton, Hants. **Philosophy of Mind and Logic**—Professor Hoppus.—1, J. Beighton, of Coward College; 2, A. Crowley, of Alton, Hants. **Mathematics**—Professor De Morgan.—Senior Class, Higher Division: 1, W. R. Wills, of Birmingham. Lower Division: 1, W. H. Hutton, of London. Junior Class, Higher Division: 1, S. W. Waley, of London. **Natural Philosophy and Astronomy**—Senior Class: 1, W. R. Wills. Junior Class, Equal: 1, 2, A. Warren and J. Edkins; 3, C. A. Bowring, of London; 4, J. Rees, of London. **Experimental Class**: 1, R. H. Hutton, of London. **Drawing**—Teacher, Mr. Moore.—1, H. Bankart, of Camberwell. **Architecture**—Professor Donaldson.—1, E. Dobson; 2, J. Croucher. **Botany**—Professor Lindley.—Junior Class: 1, S. C. Griffiths, of London. **Zoology**—Professor Grant.—1, W. Marshall, of Norwich. **English Law**—Professor Carey.—First Course: 1, J. B. Hoskins, of London. Second Course: 1, P. W. Morris, of London. Third Course: 1, W. Morris, of London. **Jurisprudence**—Professor Graves.—1, F. J. Parkes, of London. Equity Course: 1, J. B. Hoskins, of London. Mr. Christie then addressed the meeting at some length on the increasing prosperity of the college.

Peace Convention.—A deputation, consisting of French, American, Belgian, and English gentlemen, waited on Sir R. Peel, on Saturday, to present to him an "address to the civilised Governments of the world," agreed to by

the recent sittings of the Peace Convention in this Metropolis. The deputation was introduced by Dr. Bowring, who briefly stated their object; to present an address from the Peace Convention urging the introduction of a clause in all international treaties, binding the parties to refer all disputes that may arise to the arbitration of one or more friendly Powers. The address was read by the secretary, and very courteously received by the Prime Minister, who promised to place it before the other members of Government, and stated that the principle of arbitration had been frequently and successfully acted upon during the last twenty years.

Meetings of Companies.—On Monday the half-yearly meeting of the proprietors of the Colonial Bank was held, J. Irving, Esq., M.P., in the chair. From the report it appeared that the profit for the past half-year was 14,907l. 9s. 10d. The total assets was stated to be 1,505,030l. 8s. 10d. The directors recommended a dividend of 1l. 10s. for the half-year, which was at the rate of three per cent. per annum. The directors hoped, as a more favourable state of things had arisen in the West Indies, that the losses would not amount to more than was estimated at the last meeting. On the chairman moving the adoption of the report a long discussion arose in respect to the losses incurred by the bank, in which Mr. Wood, M.P.; Mr. Gurney, Mr. P. Stewart, M.P., &c. took part. Mr. Wood proposed a committee of inquiry, but it was afterwards withdrawn, and the report adopted.—The half-yearly meeting of the London Dock Company was held on Tuesday. From the report it appeared that the number of loaded ships which entered the docks from foreign ports, during the six months ending the 31st May, was 434, measuring 96,486 tons—being 7,833 tons less than in the corresponding period of 1842. Notwithstanding the decrease in tonnage there was an increase in revenue, compared with the corresponding period of last year, of 8,226l. The stock of goods in the warehouses was 94,879 tons; at the corresponding date in last year, 94,469 tons. A dividend was declared for the half-year of two per cent. on the company's stock, besides paying the Income-tax.—On Wednesday the quarterly court of proprietors of South Sea Stock was held at the Company's House, in Threadneedle-street. Mr. Franks, the sub-governor, in the chair. After some routine business had been disposed of, the half-yearly accounts having been read, and the usual dividend declared, Mr. Mocatta brought forward a motion for the surrender of the Company's charter to the Crown on equitable terms. Mr. Capel seconded the motion, and after a long discussion on the propriety of entertaining a motion affecting the interests of so large a body without notice, the Chairman put the resolution, when only the mover and seconder held up their hands in favour of it. Nearly all the rest of the proprietors voted against it.

The New Steam Frigate.—The Penelope steam-frigate was commissioned last week by Captain Jones, who formerly commanded the Vestal, and was inspected on Saturday by the Lords of the Admiralty, for the purpose of trying her engines and rate of speed. The attention of the naval world has of late been directed to this vessel, recently converted from a sailing frigate of a useless class to a powerful war steamer, 245 feet long, and fitted with engines of a power surpassing any hitherto made, either for land or sea purposes, the cylinder being 92 inches in diameter. The Penelope is one of the old class 46 gun ships, built on the lines of the French Hebe, at Chatham, in 1830. There are nearly 40 of this class of vessels lying in ordinary at the several ports, none of which are, from their comparative dimensions, suited to cope with the frigates of foreign navies, either in size, capability of armament, or equipment, and have therefore become nothing more than blanks in the list of the British navy, although they could not have been built at a less cost to the nation than two millions sterling. The Lords of the Admiralty, with the view of rendering these vessels serviceable to the country, have caused the Penelope to be converted, as an experiment, into a steam frigate, in order to ascertain if they can be made available to the service as war steamers. If the experiment should prove successful, and of that there is now hardly a doubt, these otherwise useless ships can be converted into a steam fleet of such enormous power as may bid defiance to the navies of the whole world, and at a cost of less than one quarter of the amount it would require to build them. The Penelope can stow fuel to last her 16 days with full steaming power, and by husbanding the consumption of coals by working at the full, half, or quarter stroke in cutting off the steam, the capabilities can be increased to 24 days' steaming, which, with the aid of sail, will take the ship to the Cape of Good Hope in about a month from England, with a regiment of 800 soldiers, in addition to her crew of 300 men, giving ample accommodation to all. She will be furnished with an armament that is astounding to all who are acquainted with the power of naval gunnery: namely, two 10-inch pivot guns of 84 cwt. each; eight 68-pounders, all shell guns; and fourteen 32-pounders on the spar and main decks, making, in all, 24 guns of a description that will enable her, having the power from her steam of taking a commanding position, to bid defiance to any two ships of the line. In the trial on Saturday she proved herself to be a vessel of extraordinary velocity, her maximum rate of steaming, with the tide in her favour, being 13.8-10ths miles per hour, and her minimum speed 10.3-10ths miles per hour. On her return to Blackwall, she was off Erith at 4.37 P.M., and reached her moorings at 5.37, having performed the distance, 11 miles exactly, in the hour, with the tide against her.

Light Gold.—It has been discovered that a considerable number of light sovereigns and half-sovereigns have been making their appearance in the metropolis for the

last few months, and it is ascertained that the bullion-dealers and Jews in Paris, Rotterdam, Hamburg, and other parts of the Continent, have been re-exporting to this country all the light gold they have had in exchange during and since the panic.

Hammersmith.—The business of the Kensington Police Court will, after the 12th inst., be transferred to more commodious premises at Brook-green, Hammersmith, and the Court will be called the Hammersmith Court.

Chelsea Hospital.—The governors of Chelsea Hospital have purchased, at the cost of 12,000l., a piece of ground adjoining the College, for the erection of a church for the pensioners, which will be also free to the public. A Bill is before Parliament empowering the governors to apply a portion of the property bequeathed to the College by Colonel Drotty towards the erection of the proposed church. The building will be almost sufficiently capacious for the accommodation of many of the inhabitants of Chelsea, who are at present without church room.

Millbank Prison.—The Penitentiary at Millbank has been changed into "The Millbank Prison," and placed under the superintendence of inspectors. The practice of visiting justices has been discontinued, and magistrates have now no power over its internal management. The inspectors are to make rules to enforce proper discipline, which are to be sanctioned by Government, and laid before Parliament. These alterations have been effected by an act which came into operation on the 27th ult.

Middle Temple Gardens.—The Benchers of the Middle Temple have issued an order against the gardens being opened to the public in future on Sundays.

Thames Tunnel.—The number of persons who passed through the Tunnel last week was 48,628, making the grand total, since it was opened on the 25th Mar., 928,000.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, June 24:—West districts, 139; North districts, 175; Central districts, 190; East districts, 182; South districts, 199—Total, 885. Males, 450—Females, 435. Weekly average for the last five years, 903. (461 males, 442 females); and for the last five springs, 854.

Provincial News.

Bath.—The Rev. Dr. Baines, Vicar Apostolic of the Western District, was found dead in his bed at Prior-park on Thursday morning. The deceased prelate, who was in his 59th year, assisted at the opening of the Roman Catholic Chapel in Bristol, recently purchased from the Irvingites, on the previous day; and his decease is attributed to an attack of apoplexy, to which he had formerly been subject. Dr. Baines was consecrated Bishop of Siga on the 1st May, 1823.

Bristol.—The liabilities of Messrs. Harford and Co., whose failure was recently announced, amount to about 341,200l., of which security is held for 24,986l.; the assets are estimated at 93,000l., besides the surplus of the price realized by the works above the mortgages. The works were valued, in 1841, at 270,000l., and the mortgages are stated at from 40,000l. to 60,000l.

Carmarthen.—Precautionary measures to prevent the possibility of breach of the peace continue to be adopted by the magistracy. The marines have gone from Pater to Cardigan, and two troops of the Castlemartin Yeomanry have arrived at Narberth from Pembroke. About 30 Dragoons which had left this town for Newcastle, returned on Tuesday night. Other troops are to be stationed here; and, in fact, the whole country is to be studded with soldiers, who are to be kept continually shifting their quarters, so that Rebecca may be quite unable to calculate at any time upon their presence at any particular place. The magazine on Picton-terrace is to be formed into a barrack for troops, and it is said that 200 or more will be permanently stationed in this town. The gate-levellers have continued their nocturnal depredations as usual. The papers report the demolition of three gates near Lampeter, of two or three near Cardigan, of Penygarn-gate and toll-house, which is a heap of ruins; of a gate called New Inn Gate, on the road from Llandilo to Talley; of Trevach Gate, and several others in different parts of the county. At Cardigan they were scarcely less bold than in their attack on the Carmarthen workhouse. About twelve o'clock on Friday night, the 23d, they commenced an attack on the gate and tollhouse erected on the main road leading from that town to Aberayron. "Rebecca" appeared on foot, dressed in white, with a large feather on her cap; one of the daughters, assuming the name of Phoebe, had considerable interest in the command, and she was often called upon, with a loud cry of "More hands, Phoebe!" About ten minutes past one, the toll-house, with about eight perches of well-built stone fence, erected on both sides of the gate, was a mass of ruin. The gate-posts and the timber forming the roof of the tollhouse were smashed to pieces. They next gave a loud cheer, hundreds clapping their hands, followed with cries of "Rebecca for ever!" Then the mob, headed by their leaders, marched in procession through the principal streets of Cardigan, firing now and then as they went towards the Rhydyfowch turnpike-gates, standing about three-quarters of a mile off, the first on the road leading from Cardigan to Newcastle Emlyn. There are two gates, with the toll-house between them. The northern gate was the object of their visit, and it was destroyed in a few minutes, when the depredators disappeared, and none of them have yet been detected.

Devizes.—A meeting has been held in this town for the purpose of establishing an agricultural college for a district comprising Wilts and the adjoining counties of Gloucester, Oxford, and Berks.

Durham.—The local papers mention as a fact, that the trophies won by Mr. Bowes's horse "Cotherstone," the

last winner of the Derby, have actually caused the fame of Cotherstone cheeses to be spread to such an extent, that their price has risen from 9d. to 18d. per pound; and at this moment they are not to be had for money, so great has been the demand!

Guildford.—At the Surrey Sessions last week, the Grand Jury, prior to their discharge from attendance, made the following presentment. It should be stated, that when the chairman delivered his charge to them on the first day of the sessions, he expatiated at considerable length on the importance of persons engaged in agricultural pursuits exerting themselves to the utmost to give employment to the labouring population. "The Grand Jury, whose names are subscribed, in consequence of the remarks of the chairman, in his address to the Jury, beg leave to observe, that they fully coincide with him in his opinion, that idleness is one great cause of crime, and that if labourers had constant employment, with adequate wages, there would be a great diminution of offences; but from the depression in the value of agricultural produce, we cannot expect, neither is it possible with the present rents, taxes, and burthens on the land, that the farmers can improve their cultivation, or employ more labourers than is absolutely necessary."—Mr. Cobden paid a visit to this town on Saturday, for the purpose of being present at a public meeting and explaining his views as to the manner in which the Corn-laws operate upon tenant-farmers and farm-labourers. The meeting was to take place in the Town-hall; but it was soon found that the place was not large enough to accommodate the number of persons anxious to be present, and it was therefore agreed to adjourn to the barrack-field, where some wagons had been placed for the accommodation of the speakers. Nearly two thousand persons assembled, but whether from a want of interest in the proceedings, or from being engaged in the harvest, very few of the number consisted of farmers, the great proportion of the auditory being labourers and inhabitants of Guildford. Mr. Mangles, one of the members for the borough, took the chair. Mr. Cobden then addressed the meeting at great length on the Repeal of the Corn-laws, and was followed by Mr. Maydwell, who opposed Mr. Cobden's arguments, and stated his opinion that steam had been the cause of all the distress, by destroying the demand for labour. Mr. Moore next addressed the meeting at considerable length, after which Mr. Best moved a resolution that, in the opinion of the meeting, all laws intended to give protection to any class of the community, at the expense of the others, ought to be immediately and unconditionally abolished. The motion was seconded, and carried by a majority of about two-thirds of the meeting.

Knutsford.—At the Quarter Sessions on Monday week the Rev. J. Mitchell, assistant-curate of Habersham Eaves, was appointed chaplain of the county gaol. The chairman, Mr. Trafford, complained of a misrepresentation which had appeared in the report respecting the discussion upon Sir J. Graham's letter. He denied that he had put it to the Court whether the letter "deserved" an answer, and held out something like a threat to exclude the press, if misrepresentations were persevered in. He did not, however, state what he had really said. Mr. France stated that the words used were these:—"It is my duty to ask you if this letter requires an answer?" Mr. G. Wilbraham subsequently rose to move, that an answer be given to the letter; but finding the meeting against him, he abandoned his intention, declaring, amid the laughter of the other magistrates, that "it was never too late to repent." A motion was then agreed to, appointing five fresh visiting magistrates. Mr. H. Marsland stated that at the next meeting he should submit a motion on the subject of the dismissal of the gaoler.

Lancaster.—The late Mr. Joseph Ridgway, of Ridgmont, made bequests to public institutions connected with this county of 8,600l., to take effect after the decease of his widow. He also directed investments in the 3 per Cents. to produce annuities, to be applied to churches and schools, amounting to 432l. All this is said to be free of legacy-tax, and the entire sum is not less than 26,000l.

Lynn.—We lately noticed the robbery of the Lynn Bank by a clerk named Sanger, who absconded on the 15th ult. It now appears that he was taken at Pooley Bridge, Ullswater, on Monday last, and the whole of the property, except 20l. spent on his tour to the Lakes, amounting to 4,300l., was recovered. He was sent immediately to Norfolk in custody to take his trial at the assizes.

Liverpool.—A meeting of the subscribers to the monument to Mr. Canning was held last week, when it was decided that the balance of the funds collected, amounting to 872l., should be divided equally amongst the Collegiate, Mechanics', and the Royal Institutions.

Newcastle.—On Saturday night, about eleven o'clock, the timber-yard of Mr. Todd, on the Dean Bank, in this town, close by the terminus of the Newcastle and North Shields Railway, was discovered to be on fire. By midnight nearly the whole of the timber in the yard, valued at between 5,000l. and 6,000l., was enveloped in flames, and before the fire could be subdued, twelve dwelling-houses, inhabited by poor people, were consumed. The value of the property destroyed is estimated at 20,000l., and the fire is supposed to be the work of an incendiary.

Portsmouth.—The Waterwitch, 10, Lieutenant Matson, arrived in this port on Thursday, the 28th. She sailed from the Cape on the 7th March for a short cruise on the coast of Africa, where she arrived on the 12th, and on the 3d April captured a vessel with 390 slaves on board. On the 27th April she boarded a brig, which was run on shore in chase and deserted by her crew, and hove her off, the slaver's men keeping up a fire of musketry from some high cliffs immediately over head, by which one man was wounded. This last prize made the number of the Water-

witch's captures during the period of her service on the coast amount to forty, and from these vessels she released 2,922 slaves. During the whole of her service on the coast of Africa only four of her men have died on board, of whom two were of coast fever and two casualties.

Southampton.—It has been officially announced that this port is finally fixed upon as the starting-point of the steamers carrying the mails to the West Indies and South America, to the East Indies, Egypt, Malta, and all parts of Spain and Portugal, without calling at Falmouth to take in the mails, or on the homeward voyage to deliver them. In future, all the steam mails, with the passengers, are to be dispatched and landed at this port.

Railways.—The following are the returns of the under-mentioned Railways for the past week:—London and Birmingham, 17,698*l.*; Great Western, 15,651*l.*; South Western, 7,098*l.*; South Eastern, 2,485*l.*; Eastern Counties, 2,715*l.*; North Midland, 4,427*l.*; York and North Midland, 1,774*l.*; Greenwich, 855*l.*; Croydon, 384*l.*; Brighton, 4,011*l.*; Blackwall, 1,069*l.*; Hull and Selby, 1,228*l.*; Midland Counties, 2,701*l.*; Paris and Rouen, 3,195*l.*—At a special general meeting of the shareholders in the London Grand Junction Railway held last week, for the purpose of dividing the remaining funds of the company, the directors recommended a return to the shareholders of 8*s.* 6*d.* per share, after paying which, the surplus in hand would amount, it is stated, to 154*l.* 14*s.* 4*d.*, which was ordered to be invested for a time in the hands of trustees prior to a final distribution. This company obtained an act of Parliament some years ago for the purpose of forming a branch line from Camden Town, on the London and Birmingham Railway, to Skinner-street, Snow-hill, so as to bring the northern lines into the city.—The remaining portion of the Bolton and Preston Railway, after having been inspected and approved by General Pasley, the Government Inspector, was opened to the public last week, thus completing an important link of Railway communication between the towns of Manchester, Bolton, and Preston.—At the annual general meeting of the Duffryn and Lynn Company, held at Glamorgan, the report anticipated an augmentation of traffic, and a dividend of four per cent. to the shareholders. The receipts for the year amounted to 5,277*l.*, leaving a balance, after the payment of expenses, of 2,207*l.*—At the annual general meeting of the Arbroath and Forfar company at Dundee, the accounts showed a total revenue for the year of 8,500*l.*, and an expenditure of 6,472*l.*, leaving a surplus profit for the year of 2,068*l.* The directors recommended that this should remain as a sinking fund, which gave rise to considerable discussion, and ultimately a committee of inquiry was appointed to investigate the whole of the company's affairs.

IRELAND.

Dublin.—The following magistrates have been super-added since our last:—Mr. Denis M'Carthy, magistrate for Cork; Sir Valentine Blake, Bart., M.P., Mr. P. P. Daly, and Mr. M. A. Lynch, for Galway; Messrs. Dunne and Lyons, for Queen's County; Mr. Sherlock and Mr. Duckett, for Waterford. The Lord Chancellor has appointed the following magistrates:—Mr. R. W. White, of Springmount, for the county of Tipperary; Mr. J. S. Barry, Mr. Orpen, and Mr. Reid, for the county of Cork; Sir R. Paul for Waterford; Mr. C. M'Garel for Antrim; Capt. J. Johnston for Cavan; Mr. J. Johnston for Fermanagh; Mr. J. Johnston for Donegal; and Mr. H. O'Reilly for Wicklow.—One of the most extraordinary popular demonstrations ever witnessed in this city took place on Monday, on the occasion of the meeting of the tradesmen of Dublin to petition for a repeal of the union. From eight o'clock the streets were thronged by multitudes, anxious to witness the various trades proceeding to the place of rendezvous, the village of Phibsborough, in the northern suburbs. Each of the trades, headed by its temperance band, marched two and two, and, in some instances, four abreast, with the utmost precision and regularity. In the mean time the city was all bustle and animation, especially in the various streets through which the procession was to pass, on the route from Phibsborough to Donnybrook. Along the quays towards the North-wall the shipping in the river Liffey were dressed in colours. In passing through Dublin, the procession halted in front of the residence of Mr. O'Connell, who stood on the balcony to receive them, accompanied by several members of his family, and by Dr. Hughes, the Roman Catholic bishop of New York. The first of the trades having passed, the remainder, in regular order, proceeded by Mr. O'Connell's house, and thence passed on to the Donnybrook road, and, ultimately, into the Fair-green, in the centre of which a platform was erected for the accommodation of the speakers. The *Evening Mail* estimates the numbers at "considerably over 100,000 persons;" but other calculations make it double that number. There were a great number of horsemen, farmers, and others from the neighbouring counties. The Fair-green, containing about 15 acres, was crowded, as well as the road adjacent, and part of the village. The multitude, notwithstanding its immense extent, was perfectly tranquil and orderly throughout the proceedings. Mr. J. O'Connell took the chair, and read a letter from Dr. Blake, bishop of Down, apologising for his absence, but expressing his hearty approbation of the objects of the meeting. Similar letters were read from the Bishop of Ardagh and Lord Ffrench. The following resolution was then carried unanimously:—"That the malignity evinced towards Ireland by the present cabinet, who direct our august Sovereign, and who have coupled her royal name with threats against our beloved country, has not, nor shall not, shake our confidence in our beloved Queen Victoria; and should that Royal lady require the services of her Irish subjects on any emergency whatever, none

amongst that loyal people would be found more ready to shed the last drop of their blood, if necessary, in defence of her Royal person and throne, than the tradesmen of the ancient and loyal city of Dublin." The next resolution was to the effect that, up to the period of the union, Ireland enjoyed the benefit of domestic legislation; that it is preposterous to suppose that foreign legislation could promote the interests of the country; and that, therefore, this meeting demanded a restoration of the Irish Parliament. The third resolution embodied the firm conviction of the meeting that a jealousy of Irish prosperity was the originating cause of the union. Both these resolutions were carried unanimously. Mr. O'Connell then addressed the meeting, congratulating them on the approaching accomplishment of their object, and detailing the progress of the movement. Several other persons followed on the same topics; after which, the immense multitude quietly dispersed.—The weekly meeting of the Repeal Association took place on Tuesday. Mr. O'Connell handed in 1,079*l.* 3*s.* 6*d.* from Boston, New York, Philadelphia, and Brooklyn, in the United States, and 20*l.* from Halifax. At the close of the proceedings Mr. O'Connell announced that the repeal rent, up to Monday, was 2,495*l.* 14*s.* 0*d.*, independent of 300*l.* received on Tuesday, which should go to the next week's account.—The accounts received from the provinces show that the general order of Lord Roden has been obeyed throughout Ulster, and, for the first time during many years, there had been, as far as the intelligence extends, no Orange procession on the 1st of July.—Mr. Gypson, the aeronaut, ascended in his balloon on Thursday, the 29th, for the Portobello gardens, and in his descent fell into the sea near Bray Head. He was fortunately rescued by the Coast Guard and fishermen, after being 20 minutes in the water, and the balloon was also saved. It is rumoured that the Right Hon. A. E. Blake, Chief Remembrancer of the Exchequer, has resigned, "his state of health requiring that he should remove to a more genial climate;" and that the Solicitor-General, Mr. Greene, is to be his successor.

Dundalk.—A repeal meeting, attended, it is said, by 300,000 persons, took place in the neighbourhood of this town on Thursday week. Mr. De Vernon presided, and several resolutions, including a petition for repeal, were adopted. Mr. O'Connell then addressed the people at considerable length, and said he had three provinces with him, and the greater part of the fourth province with him; and he defied all the Wellingtons that ever gained battles, and all the Peels that ever exercised dexterity, to prevent him from having repeal. At the dinner in the evening, Mr. O'Connell explained his plan for the new Irish parliament, and said, the towns that ought to send members to the new Irish parliament will be ascertained by taking up the population of 1831; so that no favour is given to anybody. "Every town having 9,000 inhabitants is entitled to representation; and that, with county members, will make up 300 members. In order to carry out this plan, I will propose that each town so entitled to representation do lay down 100*l.*, and with the aid of the individuals whom they select, we will meet in Dublin to consider the plan I have suggested. Any town that refuses to make that sacrifice, I don't think it would deserve to have a member in the Irish House of Commons. If the individuals chosen are not ready to make that sacrifice for the towns, they don't deserve to be returned for those towns afterwards. I would thus have 300 gentlemen assembled in Dublin by accident. A treasury will be formed by the impounding of the sums I have specified, and they can dissolve themselves the next day, if the law requires it. And what is to prevent my asking those three hundred gentlemen to a public banquet, at which nobody else shall attend but themselves and me? I don't see why we should not have our conciliation board—not sitting as deputies, but merely happening to have the confidence of localities. I have made my plan—I have examined well the Act of Parliament, and will drive 300 gentlemen through every clause of it. There is no legal objection to that plan—there will be 300 men with a nation to their back. There remains only the assent of the Sovereign; and I tell you distinctly it can at once be revived, legally and constitutionally, by the mere exercise of the prerogative of the Crown—revived by the issuing of writs, without going to the British Parliament at all."

SCOTLAND.

Edinburgh.—The Professorship of Divinity in this University having become vacant by the resignation of Dr. Chalmers, the Provost and Council have resolved on proceeding to the election of a successor on September 5. **Glasgow.**—According to announcement the Repealers of Glasgow held a demonstration in favour of their views in the City Hall, Candleriggs, last week. The hall was filled in every part, and the proceedings, which did not terminate until about two o'clock in the morning, were of the most enthusiastic description. It is calculated that nearly 3,000 persons drank tea on the occasion. **Dumfries.**—M. Kirkwood, of Holywood, who signed the Convocation list, and who left the Presbytery of Dumfries along with the other Convocationists in April last, returned to the bosom of the Church last week, and having made a statement of his views, it was moved that his name be entered upon the roll, which was agreed to.

LAW.

HOUSE OF LORDS.—Appeals.—Irish Presbyterian Marriages.—*The Queen v. Mellis.*—Lord Chief Justice Tindal, Justices Williams, Coleridge, Erskine, and Cresswell, and Barons Parke, Alderson, and Rolfe, attended the House to give their answers on the subject of the validity of the Irish marriages. Lord Chief Justice Tindal, in a very long and elaborate argument, declared that the opinions of the consulted judges were against the validity of any marriage, by the old law of England, when such marriage was not celebrated by a priest in holy orders. The con-

tract *per verba de presenti* was looked upon by the judges as a contract of marriage, not as a marriage itself. The law of marriage in this country was, no doubt, founded upon the principle of the canon law, but it was not the canon law; it was the King's ecclesiastical law, and had its own peculiarities. It differed from the canon law in several respects, and in that among the rest. The learned Judge went into a full examination of all the authorities, of all the statutes, and of a great variety of opinions expressed by Judges and by text writers, and referred the opinion that marriage in England *per verba de presenti* had been valid to what he described as a misconception of a dictum of Lord Holt's. As to the case of "Dalrymple v. Dalrymple," the Judges thought that the expression of Lord Stowell in that case, as to what the learned Judge there declared to be the law of England, was mere *obiter dictum*, not being required for the decision of the case, and either without warrant of previous authority, or founded, like those of Lord Ellenborough and some other very learned persons, on a misconception of the opinion of Lord Holt. On the whole, therefore, the judges pronounced their opinion that the marriage which in this case had taken place between two persons *per verba de presenti*, in the presence of a Presbyterian minister at Bainbridge, in the county of Down, was illegal. On the motion of the Lord Chancellor, the Lords deferred their judgment.

VIC-CHANCELLOR'S COURT.—(Before Sir J. Wigram.)—*Lewis v. Adams.*—Mr. Purvis and Mr. Bagshawe, for the defendant, the occupier of titheable lands in this case, contended that the lease under which the plaintiff claimed was void, for want of the confirmation of the bishop or chapter; and that to a lease of two-thirds of the tithes of the parish, the vicar, who was entitled to the other third, ought to be a party. Mr. Boteler, in reply, commented on the authorities produced for the defence. The difficulties which were found with reference to the necessity of confirmation were explained by the state of the law at different periods. The leases of the bishop did not formerly require any confirmation, although those of all other ecclesiastical persons did. The title of the bishop was considered to be a higher and more absolute character. The law in this respect was altered by the Third Council of Nice. By the decree of that council, bishops were restrained from alienating their lands without the confirmation of their chapters. From that time, until the enabling statute of Henry VIII., the lease of the bishop required the confirmation of the chapter; that of a prebendary the confirmation of the bishop, and that of a parson or vicar, of the ordinary and patron. By the statute of Henry VIII., all ecclesiastical parsons, with the sole exception of the rector and vicar, were enabled to make leases, under certain qualifications. The lessor of the plaintiff, the Prebendary of Llanarthney, was not within the exception, and his lease was therefore valid without any confirmation. His Honour, in giving judgment, adverted to the various points of evidence which had been argued. An objection had been made to the admission of a document, proved to be in the writing of one of the bishops of St. David's, only by the comparison of documents in the hand of the same person by the keeper of manuscripts in the British Museum. This was not allowed with respect to modern documents, as it was open to the objection that unfair selections might be made for comparison; but with regard to ancient writings, there was no other means of proving handwriting but by comparison. The title of the plaintiff had in this case been established, and the decree must be made according to the prayer of the bill.

CENTRAL CRIMINAL COURT.—*Francis William Knight and Sarah Knight* were indicted for unlawfully obtaining by false pretences the sum of 25*l.* from Thomas Machin. Mr. Payne having stated the circumstances of the case to the Jury, which he said were of a very singular nature, called Thomas Machin, who stated that on the 11th May last he saw an advertisement in *The Times*, signed "Liber," stating that any respectable person having the command of 100*l.*, and who wanted a situation, could be recommended to the situation of librarian to a public body. The salary was to be 150*l.* per annum, and the perquisites amounted to 50*l.* more. The party was also to have a house rent free, and be supplied with coals and candles gratis. The appointment was for life. Candidates were directed to apply to T. W. Knight, National Address-office, 2-2, Strand. Witness went there, and found that all parties were referred to the private residence of Mr. Knight, at 37, Great Union-street, Borough. He went as directed, and produced the note and copy of the advertisement. Mr. Knight said that he was agent to the secretary of the institution, who had power to appoint any one to the office of librarian, and who wanted a premium of 100*l.* for so doing. At a subsequent interview witness saw the prisoner, who asked him for the money. Witness asked for a reference, and was directed to apply to Mr. J. Smith, Lambeth-walk. He went there, and saw the female prisoner, who said that her name was Smith, that Mr. Smith, her husband, was gone out in business, and that she could give him any information he wanted. Witness said that he wanted to inquire as to the character of a Mr. Knight, and to assure himself of his respectability, as he was transacting some important business with him. The self-styled Mrs. Smith spoke of Mr. Knight in a very satisfactory manner, and said that he bore a highly-honourable character. Witness then went back to Knight, and said that he should like to have some other reference, as Smith was from home. Knight mentioned the names of two parties whom witness knew to be respectable, but said that it would be a waste of time to go to them, as the business must necessarily be finished that day. Witness then paid him 25*l.*, and left him to prepare the agreement, which he received the same day. It merely stated that he had received 25*l.* as part of the sum of 100*l.* for the situation as a security for his good faith. The prisoner bound himself to return the money in case of his not obtaining for him the required situation. Along with this agreement he received a note appointing to meet witness on a certain evening in Berners' Hotel, Oxford street, when he promised to introduce him to the secretary of the institution. Witness went as directed, and after waiting three hours, he received a note from the prisoner expressing his regret that an unexpected engagement had prevented Mr. Montague, the secretary, from keeping his appointment, but said that if he would be at Berners' Hotel at 4 the next day, he would introduce him to the secretary, when they would all dine together. Witness went, and after waiting several hours, he went to Great Union-street to see the prisoner, but, to his utter astonishment, he found that he had left the day before. He then went to Mrs. Smith's house in Lambeth-walk, and found that she also had decamped the day before. Witness never saw either of the prisoners until the 16th June, when they were taken into custody. Other witnesses were examined to prove that the two prisoners were man and wife. Mr. Commissioner Bullock having summed up, the Jury returned a verdict of *Guilty* against Knight, and acquitted his wife. Knight was then indicted for obtaining 10*l.* from Henry Jenkins under false pretences. The circumstances of the case were similar to those of the preceding one. The Jury returned a verdict of *Guilty*, and the Commissioner sentenced him to be transported for seven years.

George Marks was charged with manslaughter, in killing S. W. Kirby Abbott. The deceased, a lad twelve years of age, was standing upon the quay under Waterloo-bridge, when the prisoner imprudently threw a large paving-stone, weighing sixty-three pounds, over the balustrades, and it struck the deceased on the head, fractured his skull, and inflicted such injuries that he died shortly afterwards. Mr. Ballantine for the prisoner submitted that it was purely an act of inadvertence, without the slightest idea of the consequences that might result from it; and that although he would not attempt to rescue the prisoner from a conviction, yet he trusted that it would not be considered a case calling for severe punishment. The Jury returned a verdict of *Guilty*. Sentence deferred.

Mark Marks, a gold and silver refiner, of the Hebrew persuasion, and said to be a person of considerable wealth, was indicted for feloniously receiving of some evil-disposed persons nine gold rings, and other property, belonging to W. T. Middleton, well

knowing the same to have been recently stolen. The prisoner was tried in the Old Court, before the Recorder, about a fortnight ago, for stealing the articles; but the Judge said that the evidence was insufficient to sustain the charge of theft, and the prisoner ought to have been charged as a guilty receiver, or accessory after the fact; the prisoner was, on that ground, acquitted and discharged, but was captured the next day on the present charge. The Common Serjeant said the only question for the Jury to consider was, did the prisoner receive the property with a guilty knowledge? The Jury instantly returned a verdict of *Guilty*, and the Judge sentenced the prisoner to be transported for ten years.

Edward Stewart, alias James Sievright, formerly a lieutenant in the service of the Queen of Spain, was charged upon two indictments with feloniously forging and uttering checks for 57*l.* and 137*l.*, with intent to defraud Messrs. Gosling and Sharpe, the bankers. The prisoner had been known to Lord W. Hervey while his lordship was Chargé d'Affaires at Madrid, and by his lordship's interest received a lieutenant's commission in the Spanish service. How he lost that appointment did not appear; but it would seem that the prisoner applied to his lordship, on his arrival in England, and represented himself to be in great distress. This induced him to give the prisoner a check for 137*l.*, and the prisoner being thus enabled to ascertain where his lordship banked, and to become acquainted with his signature, took the means thus afforded him of effecting the forgeries in question. The prisoner having pleaded guilty, Baron Gurney said that the case was one of very great aggravation, and that it did not possess a single feature of mitigation. The prisoner had applied for relief, which had been liberally given to him, and he took advantage of the opportunity afforded him by receiving a genuine check to forge the name of his benefactor. But a short time ago the offence of which he had been convicted would have rendered him liable to the penalty of death, and that sentence would undoubtedly have been passed, and he might probably have suffered. The sentence now, therefore, necessarily was, that he be transported for life.

SPORTING.

THAMES REGATTA.—This regatta, which has recently been established under the patronage of Prince Albert, commenced on Monday, and lasted until Wednesday. On each day the company began to assemble on the river sides at an early hour, and by one o'clock an immense number of boats of all sorts and shapes were in requisition, and were to be seen making their way towards Putney-bridge. By two o'clock the river presented a most animated appearance; steamers, skiffs, wherries, and all sorts of river craft, were to be seen on their way to the scene of action, freighted with thousands of people of all grades and classes. Putney was all animation, a flag was hoisted on the tower of the old church, and the bells rang out a merry peal. The taverns were filled with company, and along both sides of the river, but more particularly on the north side, stands were erected for the accommodation of thousands. The river was kept in the best order by 12 galleys of the Thames police. No steamers were allowed to move up or down during the races, nor were any boats permitted to cross and recross, or in any way to interrupt the proceedings. The events of the heats or races of Monday did not decide to what boats the cups or money should be given; the first and second boats being merely, by their position, entitled to contend for the prizes on Tuesday and Wednesday.

Monday.—The races of this day were—1, a pair-oared race, by gentlemen, for two silver cups, value 20*l.* each; 2, a scullers' race, by watermen, for 30*l.*; 3, a four-oared race, by gentlemen, for a challenge cup, value 80 guineas; 4, a pair-oared race, for watermen, for 50*l.*; 5, an eight-oared race, for a gold cup, of 150 guineas.

Tuesday.—There were 11 races on the list, all trial heats, amongst which were a four-oared race, by gentlemen; a scullers' race, by watermen; a pair-oared race, by gentlemen; a four-oared race, by landmen; a pair-oared race, by watermen; the double sculls, by watermen; and the final heat with the eight-oared crews. In the final heat of the four-oared race by gentlemen the Leander club beat Guy's club and the Royal Academy club. In the final heat of the pair-oared race, by gentlemen, Messrs. Chapman and Farnshaw beat Messrs. Julius and Bumpstead, and Messrs. Dalgleish and Wallace. In the grand heat of the eight-oared race, by gentlemen, the Oxford University club beat the Oxford Aquatic club by about 100 yards.

Wednesday.—The proceedings of the regatta closed with this day's sport. As usual with races, both upon land and water, the third day did not attract such an assemblage, or excite so much interest as did the first and second. The crowd of people present, although considerable, fell very far short of the immense turn-out of Monday and Tuesday; and there was a corresponding falling-off in the number of boats and steamers upon the river. The matches were—1, apprentices' match, for a coat and badge, three heats; 2, an amateur scullers' match, in four heats; 3, a four-oared match, by watermen; and an eight-oared match for silver medals, by gentlemen, for which six boats started.

MARK LANE, FRIDAY, JULY 7.—Of English Wheat we have very little at Market, and Monday's currency is fully supported. There is a retail trade in old free Foreign at the same rates, and several purchases have been made of Wheat in bond for Holland and Belgium where the prices have risen considerably. Barley, Peas, and Beans are quite as dear, and Oats are a fair sale at Monday's quotations.

Browne, Vice-Master of Trinity College, Cambridge, and rector of Retford, in Essex, aged 69. Lately, at his house at Mount Pleasant, Newburgh, N.B., Alex. Bethune, labourer, author of "Tales and Sketches of the Scottish Peasantry," "Practical Economy," &c.

ORNAMENTAL WIREWORK FOR THE GARDEN, 390, OXFORD STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in FANCY WIREWORK, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hothouse Engines, Syringes, Fumigating Bellows, and other Horticultural Implements. G. B. Thompson's Improved Waterpots, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

CORNS, BUNIONS, &c.

THE PROPRIETOR of the ANTI-CALLOSITY, or RUSSIAN CORN AND BUNION PLAISTER, feels great confidence in recommending it as the most certain cure for all Callous Swellings on the Feet that has ever yet been invented. By the use of this Plaister immediate benefit will be found, and in a short time a Radical Cure will be effected by gradually dispersing the Hard or Soft Corn, and entirely removing those painful throbbings so severely felt at every change of weather.

Sold, with full directions for use, in boxes, 1*s.* 1*d.* and 2*s.*, at SANGER'S Medicine Warehouse, 150, Oxford-street; and all Medicine Vendors throughout the country.

Remember—"THE RUSSIAN CORN AND BUNION PLAISTER."

GOOD NEWS FOR THE AFFLICTED.

DR. ROBERTS'S CELEBRATED OINTMENT, called the POOR MAN'S FRIEND, is confidently recommended to the public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs, if of 20 years' standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, cancerous humours, &c., and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1*s.* 1*d.* and 2*s.* 6*d.* each. Also his

PILULÆ ANTISCROPHULÆ.

confirmed by more than 40 years' experience to be, without exception, one of the best alternative medicines ever compounded for purifying the blood and assisting nature in all her operations; hence they are useful in scrofula, scorbutic complaints, glandular swellings, particularly those of the neck, &c. They are efficacious also in rheumatism, and form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1*s.* 1*d.*, 2*s.* 6*d.*, 4*s.* 6*d.*, 1*l.*, and 2*l.* each.

To those who cannot take pills, the proprietors would strongly recommend Dr. Roberts's

ANTISCROBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic complaints; they strengthen the constitution, purify the blood, and promote a circulation of the fluids; are gentle in their operation, and do not require cessation from business. In bottles at 2*s.* 6*d.* each.

By the late Dr. Roberts's will Messrs. BRACH & BARNICOTT (who have been confidently entrusted with the preparation of his medicine for many years past), are left joint proprietors of the "Poor Man's Friend," "Pilulæ Antiscrophulæ," "Larwell's Pills," "Medicated Gingerbread Nuts," and "Antiscrobutic Drops," with the exclusive right, power, and authority to prepare and vend the same.

The still increasing demand for the above medicines, from all ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to such package.

SUN-BURNS, FRECKLES, TAN, and other disfigure-

ments of the Skin, are pleasingly eradicated by that unique preparation ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR."—It is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper, and "A. ROWLAND & SON, 20, HATTON-GARDEN," engraved on the Government stamp affixed to each bottle. Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle, duty included.

Ask for ROWLAND'S KALYDOR.—Sold by them, and by Chemists and Perfumers.

BUTTER MADE IN TEN MINUTES

BY THE NEWLY-INVENTED CHURN.
REGISTERED ACCORDING TO ACT OF PARLIAMENT.
ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes No. 1 2 and 3
Churn from 7 to 8 lbs. 13 to 15 lbs. 25 to 28 lbs.
Price, carriage paid } 25*s.* 35*s.* 42*s.*
to London.

Metal Pans for Churns to stand in, 4*s.* 6*d.*, 6*s.*, and 7*s.* Larger sizes made to order. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, Lewes.

To be seen in London, at Wright's Range Warehouse, No. 3, Arthur-street, near the Monument; Riegg's Brusa Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & CO., 109, Fenchurch-street.

LITHIC ANTI-CORROSION PAINT, from its

Strength and Durability, forms an excellent coating for Greenhouses, Conservatories, and Outbuildings. Its antiseptic qualities particularly adapt it for the preservation of Wood and Iron Fences; and it may be advantageously employed upon good Brickwork, in place of stucco or other covering. Manufactured in stone and slate colours by JOHN BAZLEY WHITE & SONS, Roman and Keene's Cement Manufacturers, Millbank-street, Westminster.

FUMIGATION.—At a season when Fumigation is of

the utmost importance to Flowers, Trees, Plants, &c., Messrs. CLARK & CO. beg to call the attention of all persons engaged in Horticultural Pursuits to their PATENT FUMIGATING BLOWER, which, having been in use for upwards of nine years by the first houses in the kingdom, is found to be much cheaper and infinitely superior to the best fumigating bellows hitherto tried. Prices, 9*s.*, 11*s.*, 15*s.*, 17*s.*, and 20*s.* each. May be had of all Ironmongers, and of Messrs. CLARK & CO., Engineers, Nelson-terrace, City-road, London.

N.B.—Hothouses heated on the most Improved Principles.

TONIC MILK of ORANGE, a DELICIOUS CORDIAL

and SWEETENER of the BREATH.—It warms and cheers the Stomach, creates an Appetite digests the Food, strengthens the Lungs, clears and improves the Voice for Singing, enlivens the Spirits, dispels Nervous Debility, clears the Blood, and thus removes Pimples and Eruptions, while it combines with these admirable properties the inestimable advantage of being the most efficacious agent offered to the Public for beautifying and perfuming the Breath. It should be taken in the proportion of a wine-glass full twice a day, and is particularly recommended to GENTLEMEN on leaving home in the morning, or after smoking a Cigar, &c.; while to LADIES it will be equally grateful on going to a party or a ball, for its invigorating influence on the mind and spirits, and its purifying effect on the organs of the health.

Mrs. GULLY respectfully announces to the Nobility, Gentry, and Public at large, that she has disposed of the Right, Title, and Recipe of the Tonic Milk of ORANGE to Messrs. A. ROWLAND and SONS, No. 20, HATTON GARDEN, LONDON; who have appointed Messrs. Barclays, Medicine Vendors, 95, Farringdon-street; Mr. Sanger, 150, Oxford-street; Mr. Johnson, 68, Cornhill; Mr. Prout, near Temple Bar; and Mr. Butler, 4, Cheapside, as Agents.—Half-pints, 2*s.* 9*d.*; Pints, 4*s.* 6*d.*; Quarts, 9*s.*, Stamp Duty included.

TO GARDENERS in want of most Desirable and

Advantageous PREMISES, containing a CONVENIENT DWELLING-HOUSE, VINERY in FULL BEARING, EXTENSIVE PITS, and about TWO ACRES of LAND stocked with FRUIT TREES in the highest state of Perfection. The south aspect is bounded by a Wall 15 feet high, exceedingly eligible for Horticultural erections, likewise a south wall 150 feet long and 20 feet high, covered with Peaches and Nectarines, bearing at this time a crop unprecedented; with every extent of Ground that may reasonably be required. The whole may be held on a Lease of 7, 14, 21, or 28 years, if required.—Direct to ELIZABETH and JOHN WILSON, Coach Proprietors, Holloway-road, Islington.

DESIRABLE RESIDENCE for an HORTICUL-

TURIST.—A Mansion-house, fit for the residence of a genteel family; Coach-house and Three-stall Stable; situated in the village of Fulford, one mile and a half from York. The House is surrounded by Three Acres of Garden Ground, soil deep and very productive: Orchard in full bearing; Wall-fruit, Hot-house, Melon-pits, and Tanks (well supplied with water); nearly Four Acres of Meadow-land, with a stream running through it. To be sold, or Let by the Year or on Lease; Rent, 80*l.* per annum. A good Cottage adjacent may be had for the additional rent of 6*l.* per annum. The premises may be seen by application to — LAWTON, Esq., Proctor, York.

HOUSES, CONSERVATORIES, &c., made

and fixed Complete in all parts of the Kingdom. One two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made and glazed from 1*s.* per foot, at JAS. WATTS, Sash Manufactory, Clarendon-place, Old Kent road.

* * Reference given.

AERIAL NAVIGATION.—ROYAL POLYTECH-

NIC INSTITUTION.—A LECTURE on this subject, illustrated by MODELS of several kinds, which elevate themselves by MECHANICAL FORCE alone, is delivered at Two o'clock daily, and on Monday, Wednesday, and Friday Evenings, at Eight o'clock, in addition to the POPULAR LECTURES usually delivered. The Exhibition of the COLOSAL ELECTRICAL MACHINE, the DIVER, DIVING BELL, NEW DISSOLVING VIEWS, and the other varied and instructive Objects of the Institution, continues as usual. The original CRAYON DRAWINGS, from the CARTOONS at Hampton Court, by the late Mr. HOLLOWAY, with numerous other WORKS of ART, have recently been placed in the Gallery. Admission, One Shilling; Schools, Half-price. Open Mornings and Evenings, except Saturday Evening.

WANTED, in the Nursery, at Bath, a FOREMAN

for the Houses. None need apply who cannot have a respectable recommendation as a good Propagator and Cultivator of Plants; also for integrity, and good address for business. He would be required to attend company in the Plant Department only. Application to be made (by letter) to J. SALTER, Nursery Grounds, Bath.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A single Man, aged 27, who has been regularly brought up to the business, and has been Foreman in large establishments, under first-rate Gardeners; consequently he has had the management of both Kitchen and Flower-Garden; he now wishes for a Situation on his own account. No single-handed place will be accepted. His testimonials as to character and ability are unexceptionable. Direct to T. C., at Mr. BROWNLEE'S Nursery, Hemel Hempstead, Herts.

AS GARDENER, in or out of the house.—A single

young Man from the country, aged 26, who can have a good character from his last Situation. No objection to town or country. Direct to W. B., at Mr. MARSHALL'S, Mill lane, Brixton-hill, Surrey.

AS GARDENER.—A young Man, 35 years of age,

who understands his business in all its branches. Has no objection to the superintendence of a small pasture or Arable Farm, having been accustomed to the same in his last and present Situation; in the former he lived seven years, and his present Situation four years. Can have a good and satisfactory character from his present employer. No single-handed place will be accepted.—Direct to A. B., at Mr. CARTER'S, Seedsman, 238, High Holborn.

AS GARDENER.—A respectable single Man, who

has been brought up to the whole routine of gardening by a Gardener of upwards of 40 years' first-rate practice. Can give unexceptionable reference.—Direct to JAMES SYRED, East Malling, Kent.

AS GARDENER, either in or out of doors, a married

Man, without encumbrance, with a good three years' character from his last situation. Understands the management of cows, and would make himself useful.—Direct to B. C., at Mr. PRICE'S, 7, Park-row, Greenwich, Kent.

AS UNDER-GARDENER, or single-handed.—A

young Man, aged 26, who understands the management of Cows and Poultry. A single-handed place would be preferred. Can have a long-experienced character from his last Situation. No objection to make his self generally useful.—Direct to G. C., at Mr. ENGLISH'S, Baker, Blissett-street, Greenwich.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Wharfedale, in the City of London, and Published by them at the Office, 3, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 8, 1845.

ANAGALLIS BREWERII AND SUPERB BLUE CINERARIA SEED.

MICHAEL BREWER, SEN., NURSERYMAN, &C., London Road, Cambridge, begs to offer strong plants of his Splendid deep blue, full and complete round-petaled Seeding **ANAGALLIS (BREWERII)**, being of a strong green and vigorous habit, and remarkably well-adapted for bedding. It is now ready for sending out, at 5s. per plant, postage free, to any part of the Kingdom. Flowers have been submitted for the inspection of Dr. LINDLEY, of which he gives the following description in the Notices to Correspondents in the *Gardeners' Chronicle*, June 10:—"Anagallis (Breweri). M. Brewer, Sen.—The flowers of your Anagallis are very large, and of a brilliant deep blue tint. If, as you say, it is of a green and vigorous habit, it will be a very desirable plant." The Messrs. HENDERSON, Nurserymen, &C., Pineapple Place, Edgeware Road, London with several other eminent Florists, gave orders for it, on the ground of seeing the flower previous. Flowers will be forwarded to any applicant on receipt of two postage stamps.

Also, packets of his Brilliant **CINERARIA SEED**, comprising every shade of Dark and Light Hue tint; and as the present is the best time for sowing for Winter, and early Spring flowering, he is induced to offer Seed, warranted as newly gathered, in packets at 3s. 6d., 7s., and 10s. Applications, inclosing post-office orders, will be immediately executed.

ARAUCHARIA IMBICATA PLANTS.

MESSRS. VEITCH & SON having raised a considerable number of this Splendid Hardy Ornamental Tree, are enabled to offer fine healthy plants, from 4 to 6 inches in height, at the following moderate prices, viz.:

10/ per 100;—5/ 10s. for 50;—and 30s. per dozen.

For the convenience of some purchasers, Messrs. V. & Son have appointed, as their London agent, Messrs. HURST and M'ULLEN, Seedsmen, No. 6, Leadenhall-street, N.B.—A remittance or reference required from unknown correspondents.—Exeter, June 19, 1843.

MAGNIFICENT NEW FUCHSIA,

"FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised from seed in the Exeter Nursery, and which they have no hesitation in saying is decidedly the finest variety ever produced; indeed, it is at once admitted to be so by all who see it, who are struck with admiration of its noble appearance. The flowers are exceedingly large, being longer as well as broader than those of any other Fuchsia, and are of a very firm, thick, waxy substance, with the corolla of a fine violet blue colour.

Plants will be ready for delivery on the 10th of August next, at 10s. 6d. each, and will be sent by post, carefully packed in tin cases. The usual discount to the trade if six plants are taken. For a full description of this Fuchsia, see Advertisement in the *Gardeners' Chronicle* of the 17th ult.

TO THE ADMIRERS OF NATURAL PRODUCTIONS.

F. LEIBOLD, NATURALIST, begs to inform the Nobility, Gentry, and his Friends, that he has just arrived, via New Orleans, from Mexico and Arkansas, with a large collection of Plants, viz.:

PALMÆ, from three different climates.

CACTI, from do. do.

ORCHIDACEOUS Plants from do., &c. &c.

Also SEEDS of rare CACTI, FERNS, and other choice Plants; Insects from Mexico; Amphibia from Alabama and Louisiana, and Dry Plants from Arkansas, Mexico, &c. Direct to Mr. B. PALMER, 29, Botolph Lane, and 112, Lower Thames-street. July 6, 1843.

AMARYLLIDACEÆ.—An Amateur having a number of Bulbs of *Hippeastrum aulicum*, bulbosum, and seedling hybrids; *Crimum scabrum*, africanum, &c., would be glad to exchange some of them for either bulbs of a similar class or other desirable and ornamental Plants. The Bulbs are all fine and healthy, and *H. aulicum* will flower next winter.—Direct to Mr. B. WHITE, Mid-Lavant, near Chichester.

THE QUEEN CABBAGE.

J. & S. SHILLING beg to acquaint the Public generally that they will do well to possess themselves of the above CABBAGE for sowing at this season of the year, which will be found superior for earliness and certainty of Cabbaging to any other. Packets, containing half-an-ounce of seed, will be forwarded by post free, on the receipt of 2s. 6d. in letter-stamps, or a Post-office order. From the great difficulty in getting this sort to bear seed, it will be always scarce, and should be taken care of; it is also very superior in every other respect.—Nursery, North Warnbro', near Odham, Hants.—July, 1843.

RARE ORCHIDACEÆ FROM CENTRAL AMERICA.

MESSRS. J. C. & S. STEVENS beg to announce they have received instructions to Sell by Auction, at their Great Room, 38, King-street, Covent-Garden, on TUESDAY, July 18, at half-past 1 o'clock, precisely, A VALUABLE CONSIGNMENT OF ORCHIDACEÆ, including specimens of the very rare and Splendid "*SOBRALIA MACRANTHA*," in fine order, and an *EVELYNA*, both in their native soil, and other rare plants in the finest state of health. On View the day prior and morning of sale, and Catalogues had of the Auctioneers, 38, King-street, Covent-Garden.

VALUABLE AUSTRALIAN AND NEW ZEALAND PLANTS.

MESSRS. J. C. & S. STEVENS beg to announce that they will sell by Auction, at their Great Room, 38, King-street, Covent-Garden, on TUESDAY, 18th July, at Twelve o'clock, a COLLECTION OF VERY RARE PLANTS, just arrived from New Zealand and Australia, in a most healthy state, and comprising a New Species of *ARAUCHARIA*, *ACROSTICHUM GRANDE*, a New Species of *DACRYDIUM*, a New *JASMINUM* (very beautiful), a new *EARINA*, 4 New *DENDROBIUMS*, 3 New Species of *CLEMATIS*, *DACRYDIUM MAI*, and other very rare Plants. May be viewed the day prior and morning of Sale, and Catalogues had of the Auctioneers, 38, King-street, Covent-Garden.

DUNSTABLE, BEDFORDSHIRE.

TO AMATEUR HORTICULTURISTS, AND SPORTING GENTLEMEN.

MR. W. W. SIMPSON has received instructions from EDWARD BURR, Esq., to sell by Auction at the Crown Inn, on WEDNESDAY, July the 26th, 1843, a superior detached Family Residence, situated in the pleasantest part of the town, in excellent repair, and possessing every convenience. Communicating with the house is a beautiful Conservatory, with Fountain therein, a large Forcing House, containing Vines in full bearing, (both heated by one cast-iron Hot-water Apparatus); together with a large Pleasure Garden, very tastefully laid out, and abundantly stocked with choice Shrubs and Flowers; a Kitchen-Garden in the rear, divided by a lofty brick wall, with Pine-pits and Melon-frames therein. The House contains capital Cellarage, a set of excellent Rooms on the ground-floor, and large Hall, 9 Bedrooms, Dressing-rooms, and Water-closets. The Out-Buildings consist of double and single Coach-houses, Stalled Stables for four Horses, with Harness-room attached and Loft over, Laundry, Coal-house, Piggeries, and Dung-pit. On the opposite side of the street, lying in front of the house, will be included a piece of Pleasure-ground, inclosed by an ornamental Iron-fence, and held on lease for an unexpired term of 47 years from Michaelmas next. On the same day will also be sold 290 acres of Pasture and Arable Land adjoining. The above property is well situated for any Gentleman fond of hunting, being within reach of four packs of hounds.—For further particulars apply to Mr. W. W. SIMPSON, No. 18, Bucklersbury, London.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, and Others.

MESSRS. PROTHEROE & MORRIS are instructed to sell by Public Auction, on the premises, at COLVILL'S Nursery, King's-road, Chelsea, on MONDAY, 24th July, 1843, and following days, at Twelve o'clock (by order of the Proprietor, retiring from business), the whole of the valuable GREENHOUSE PLANTS, consisting of fine *CAMELLIAS*, of various sizes, *ERICAS*, *AZALEAS*, *PELAGONIUMS*, *HYBRID RHODODENDRONS ARBOREUM*, *GARDENIA FLORIDA* and *RADICANS*, and other Miscellaneous Plants. Also, the Conservatories, Greenhouses, Glass, Hot-water Apparatus, a large quantity of Brickwork, several Nests of Seed-drawers, Horse, an excellent Van, rotten Dung, &c. &c. May be viewed a week prior to sale. Catalogues may be had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, FLORISTS, and Others.

MESSRS. PROTHEROE & MORRIS are instructed to submit to Public Competition, at the Auction Mart, Bartholomew-lane, on FRIDAY, July 21st, 1843, at Twelve o'clock, A VERY RARE COLLECTION OF STOVE AND GREENHOUSE PLANTS, the property of a Lady changing her residence, comprising fine specimens of *EUPHORBIA SPLENDENS*, *COMBRETUM PURPUREUM*, *JASMINUM*, *SAMBAC*, *GLOXINIUM PANCRATIUM*, *AMARYLLIS*, *ONCIDIUM CRISPUM*, *FLEXUOSUM*, and *LURIDUM*; *CATTLEYA CANDIDA*, *SOPHRONITIS VIOLACEÆ*, and a variety of Miscellaneous Plants. May be viewed the Morning of Sale; Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

ESTATE and MANSION, Herts.—To Be SOLD, by Private Contract, a FREEHOLD MANSION and ESTATE, in a highly picturesque situation, and within 20 miles of London. The Estate consists of a Park and Farm surrounding the Mansion, and containing about 600 acres, chiefly rich pasture land, with woods and plantations. The Mansion is suitable for a family of distinction, and has lately been put into complete and ornamental repair at a very considerable expense. There is a well-built Farmhouse, with convenient buildings. The property is in the occupation of the proprietor, and possession will be given to a purchaser on the completion of the purchase. For particulars and cards to view apply to Messrs. OLIVER & RAVEN, Solicitors, New Bridge-street, London.

NATIONAL LOAN FUND LIFE ASSURANCE ANNUITY, and DEFERRED ANNUITY SOCIETY,

26, Cornhill, London.

Capital, 500,000*l.*—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
John Elliotson, M.D., F.R.S. George Lungley, Esq.
John Griffith Frith, Esq. John Rawson, Esq.
H. Gordon, Esq. Clement Tabor, Esq.

Joseph Thompson, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age.	Sum.	Annual Premium.	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	59	1,000	£ 8 s. d.	£ s. d.	£ s. d.	£ s. d.
1838	114	56	3,000	67 8 4	132 14 6	58 19 9	8 19 4
				175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

BRITANNIA LIFE ASSURANCE COMPANY.

1, PRINCES STREET, BANK, LONDON.
This Institution is empowered by *Special Act of Parliament*, (1 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestably, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of 30, who by the payment of 5*l.* 3s. 4d. to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000*l.*, subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of eight shillings weekly in his expenditure. Thus, by the exertion of a very slight degree of economy—such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000*l.*, which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the despatch of business.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

COTTAM and HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch . . . £7 0s. 0d.

(Larger Sizes in proportion.)

Roger's Boiler, small size . . . 3 15 0

Do. do. large do. . . 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 4s. 0d. each.

Strong do. do. do. 45 lbs. at 4 4 "

Ox Hurdles, 4 feet high, do. 60 lbs. at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of iron will be found cheaper than any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HOTHOUSES, CONSERVATORIES, &c., made and fixed complete in all parts of the Kingdom. One two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom, warranted best material. Two-light Boxes and Lights complete, from 1*l.* 8s. Garden-Lights made and glazed from 1s. per foot, at JAS. WATTS, Sash Manufactory, Claremont-place, Old Kent-road.

*** Reference given.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

POTTER'S GUANO.—TURNIPS, MANGEL-WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of POTTER'S Guano.

*** POTTER'S Portable Farm-yard Manure, at 4*l.* 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE, as Imported, of first quality, and in any quantity, direct from the bonded stores, either in Liverpool or London. Also, NITRATE OF SODA, Apply to H. ROUNTHWAITE & Co., Merchants, 6, Cable-street, Liverpool.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

POPULAR FLOWERS; Price Sixpence each; their Propagation, Cultivation, and General Treatment in all Seasons. There are already published:—

THE PELARGONIUM, with a Coloured Plate of "Wonder."
THE PANSY, ditto, "Grand Duke of Russia."
THE CARNATION, ditto, "Hogg's Hampden."
THE FUCHSIA, ditto, "Fuchsia Chandlerii."
THE DAHLIA, ditto, "Ansell's Unique."
THE ROSE, ditto, "Moss Provence."
THE CAMELLIA, ditto, "A White Variety."
THE CACTUS, ditto, "A Seedling, C. speciosissimus."
THE CHRYSANTHEMUM, ditto, "Empress."
And on the 31st inst., will appear, THE AURICULA, with a Coloured Plate of "Page's Champion." R. TRAS, 8, Paternoster-row.

RURAL CHEMISTRY.
Now ready, price 4s. 6d.,
By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London,
Hon. Mem. of the Royal Agricultural Society, and Lecturer
on Chemistry, at the Royal Institution,
&c. &c. &c.

Extracts from the Introduction:—
“A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it.”

“If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost.”

Index of Contents.

Acclimatizing	Cherry-tree gum	Growth of plants
Acid, benzoic	Chloride of sodium	Guano
Acid, carbonic	Chlorine	Gum
Acid, humic	Cider	Gum arabic
Acid, lactic	Citric acid	Gum, cherry-tree
Acid, muriatic	Clay	Gum, resin
Acid, nitric	Climate, effects of	Gunpowder
Acid, phosphoric	Clover, analysis of	Gypsum
Acid, sulphuric	Coal, ashes of	Hair
Acid, sulphurous	Coal gas	Hard water
Acid, uric	Cocoa-nut oil	Hartshorn
Acids	Cohesion	Heat, latent

NEW AND USEFUL WORK FOR FARMERS.

THE MUCK MANUAL: A PRACTICAL TREATISE
on the NATURE and VALUE of MANURES, founded from
Experiments on various Crops. With a brief Scientific Account
of Agricultural Chemistry. By F. FALKNER, Esq., the Author
of "British Husbandry." London: JOHN MURRAY, Albemarle-
street, Publisher to the Royal Agricultural Society of England;
and sold by all Booksellers in Town or Country.

CHOICE BOOKS ON NATURAL HISTORY.

SOWERBY'S ENGLISH BOTANY. 36 Vols. in
18, Royal 8vo; 2,600 Coloured Plates, fine copy, in calf gilt,
31l. 10s.

CURTIS'S BOTANICAL MAGAZINE, with Continuation, by
SIMS and HOOKER, 64 Vols., Royal 8vo, 1787 to 1827; 3,625
Coloured Plates, with Index. The first 46 Volumes are neatly
half-bound in 25; the remainder, clean, in Numbers, 36l.

TRANSACTIONS OF THE LINNEAN SOCIETY, Vols. I. to
XVIII., Part II., 4to; the first 15 Vols. Half-Russia, very neat;
the rest unbound—16l. 10s.

TRANSACTIONS OF THE HORTICULTURAL SOCIETY, 7
Vols. 4to, First Series complete; Half-Calf, very neat—7l. 7s.

MURCHISON'S SILURIAN SYSTEM, 2 Vols. 4to, 166 Plates
and 5 Maps—5l. 15s. 6d.

PERSEON, SYNOPSIS PLANTARUM, 2 Volumes 12mo,
sewed, 18s.

J. R. SMITH, 4, Old Compton-street, Soho, London, who has
just published a Catalogue of 1,300 interesting Second-hand
Books, gratis on application, or sent by post on receipt of two
penny stamps to frank it.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL
DICTIONARY.

In what may be called an age of Cyclopædias, when the compres-
sion of a great variety of information into one volume, in order to
bring it within the means of persons of all ranks, is so universally
sought, it is evidently desirable that the Gardener, and those con-
nected with his profession, should be as well accommodated as other
classes in this particular. No such work existing, however, prior
to the issue of the present publication, its value will be at once
apparent; since it combines the more essential features of a Botanical
Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially
adapted for the Amateur and Floriculturist; who may, by carrying
it in his pocket, examine all the plants that are at any time submitted
to his inspection, and immediately derive every intelligence respect-
ing the peculiarities or affinities of particular species which could
reasonably be wished for. This is an advantage that can only be
sufficiently estimated by those who have felt the want of such an
assistant; and to all such individuals, as well as to every agent or
friend of Horticulture, the Pocket Botanical Dictionary is decidedly
indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

For Sale—very Cheap.

LOUDON'S MAGAZINE OF GARDENING; with
about 500 Wood Engravings, 10 thick vols., 8vo. New
in bds. the Series complete, only 2l. 10s., (pub. at 9l.) 1827-1834.
The great mass of Information brought together by Mr.
LOUDON justifies it to be regarded as an *ENCYCLOPEDIA*
OF GARDENING; the Treatises by the first men of Eminence
on Horticulture, Floriculture, Arboriculture, Landscape Garden-
ing, and Garden Architecture, render it as a work of reference
indispensable.

DON'S GARDENER'S and BOTANIST'S DICTIONARY, or
GENERAL HISTORY of PLANTS, illustrated by Engravings,
and preceded by an Introduction to the Linnæan and Natural
Systems, and a Glossary of the Terms used; the whole arranged
according to the Natural System, 4 large vols. 4to. new in bds.
2l. 10s. (published at 14l. 8s.) 1831-1835.

G. WILLIS, Bookseller, Great Piazza, Covent Garden; of whom
also may be had a Catalogue, gratis, of Ancient and Modern
books, priced extremely low.

FUN FOR THE FIRESIDE !!

Bound in cloth, price 5s. 6d.

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions
and alterations only having been made as were required by the
greater decency observed in modern conversation; but, that the
volume might have some substance, and be a good table or trav-
elling book, copious additions have been made from other old
volumes of Facetiae.

Extract from the Preface.

“Another strange circumstance connected with this work is, that
everybody presumes that he himself and everybody else are perfectly
familiar with its contents . . . and yet, if the reader will ask his
acquaintance, it will appear that not one in five hundred ever set eyes
on a copy. It is in consequence of like questions that this edition is
published.” London: WHITTAKER and Co.

SCURVY and IMPURE BLOOD.—Another most

EXTRAORDINARY CURE, by means of HALSE'S SCOR-
BUTIC DROPS.—The following case has excited so much inter-
est, that the Guardians of the Parish of Brent, Devon, have
considered it their duty to sign their names to the accompanying
important declaration. It is well worthy the notice of the
public:—“We, the undersigned, solemnly declare, that before
Thomas Robins Rolins, one of our parishioners, commenced
taking Halse's Scurbutic Drops, he was literally covered with
large running wounds (some of them so large that a person
might have laid his fist in them): that before he had finished the
first bottle he noticed an improvement, and that by continuing
them for some time, he got completely restored to health, after
everything else had failed. He had tried various sorts of medi-
cines before taking Halse's Scurbutic Drops, and had prescrip-
tions from the most celebrated physicians in this county without
deriving the least benefit. Halse's Scurbutic Drops have com-
pletely cured him, and he is now enabled to attend to his labour
as well as any man in our parish. From other cures also made
in this part, we strongly recommend Halse's Scurbutic Drops to
the notice of the public. Signed by JOHN ELLIOTT, Sen.
(Lord of the Manor), John Manning, Henry Goodman, Wil-
liam Pearse, Arthur Langworthy.—June 21, 1843.”

CORNS AND BUNIONS.

Patronised by the Royal Family and Nobility.

PAUL'S EVERY MAN'S FRIEND is a sure and
speedy cure for those severe annoyances, without causing
the least pain or inconvenience. Unlike all other remedies for
Corns, its operation is such as to render the cutting of Corns un-
necessary, (indeed, we may say the practice of cutting Corns is
at all times highly dangerous, and has been frequently attended
with lamentable consequences, besides its liability to increase
their growth; and being prepared on the softest kid leather, it
adheres with the most gentle pressure, producing an instant and
delightful relief from torture, and, with perseverance in its ap-
plication, entirely eradicates the most inveterate Corns and
bunions.

Prepared only by JOHN FOX, in boxes at 1s. 1½d. each, or three
small boxes in one for 2s. 9d.; and to be had, with full directions
for use, of C. KING, 232, Blackfriars Road, directly facing Christ
Church, London; and of all respectable Chemists and Medicine
Vendors throughout the United Kingdom. A 2s. 9d. box cures
the most obdurate Corns.

*** Ask for "Paul's Every Man's Friend."

IMPORTANT TO LADIES.

KEARSLEY'S ORIGINAL WIDOW WELCH'S

FEMALE PILLS, so long and justly celebrated for their
peculiar virtues, are strongly recommended to the notice of every
lady, having obtained the sanction and approbation of most gen-
tlemen of the Medical Profession, as a safe and valuable Medi-
cine in effectually removing obstructions, and relieving all other
inconveniences to which the female frame is liable, especially
those which, at an early period of life, frequently arise from want
of exercise and general debility of the system: they create an
appetite, correct indigestion, remove giddiness and nervous head-
ach, and are eminently useful in windy disorders, pains in the
stomach, shortness of breath, and palpitation of the heart: being
perfectly innocent, may be safely used in all seasons and climates.

*** It is necessary, owing to the numerous imitations, to inform
the Public that KEARSLEY'S is the only ORIGINAL and GE-
NUINE MEDICINE of this description ever made, and has been
prepared by them for more than FIFTY YEARS!! Purchasers are
particularly requested to remark, that as a testimony of authen-
ticity, each Box of Directions contains an affidavit, and bears the
signature or "C. KEARSLEY," in writing, and each box is
wrapped in white paper. Price 2s. 9d.

Sold, Wholesale and Retail, by J. SANGER, 150, Oxford-street,
London; and all respectable Medicine Vendors throughout the
country.

ROWLAND'S MACASSAR OIL.—Under the Spe-

cial Patronage of Her Most Gracious Majesty the QUEEN,
the Royal Family, and the several Courts of Europe. This Oil
is universally acknowledged to be the ONLY ARTICLE that will
effectually produce and restore Hair, prevent it from falling off or
turning grey, free it from scurf and dandruff, and will render it de-
lightfully soft and flexible. It will also preserve the coiffure in the
most beautiful and durable manner. Much precious time is now offered for sale as "MACASSAR
OIL;" it is therefore of great importance to purchasers to see
that the words "ROWLAND'S MACASSAR OIL" are engraven
on the wrapper. All others are "GROSS IMITATIONS." The
Proprietors' Signature is also engraven on the wrapper, thus:—
A. ROWLAND & SON, 20, HATTON-GARDEN, LONDON;
Counter-signed "ALEX. ROWLAND." Price 3s. 6d.—7s. Family
Bottles (equal to four small), 10s. 6d., and double that size 21s.
per bottle. Ask for "Rowland's Macassar Oil." Sold by them,
and by Chemists and Perfumers.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally,
that the Cisterns, Tanks, Shelves, Stages, Conservatory
Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured
by him in Slate, may be seen in use at Wootton Cottage, upon
application to the Gardener, (Sundays excepted.)

NEW AND IMPROVED CHURCH AND CHAMBER ORGAN, MANUFACTURED BY H. C. LINCOLN,

*Organ Builder to Her Majesty The Queen,
And to their late Majesties George the Fourth and William the Fourth;*

AND BUILDER OF THE ORGANS IN

HER MAJESTY'S CHAPEL ROYAL, BRIGHTON.
HER MAJESTY'S PALACE, THE PAVILION, BRIGHTON.
HER MAJESTY'S CHAPEL, DEVONPORT.

Mr. LINCOLN has just had the honour to receive the following testimonial from the Rev. W. F. H. HOOPER, Incumbent of Withington:—

"Withington, Manchester, March 27, 1843.

"Mr. LINCOLN has just completed an Organ for my Church, which was opened by DR. GAUNTLETT on Friday the 17th, and Sunday the 19th of this month. The Instrument has given the most complete satisfaction to me and to all who have felt an interest in its erection. The best judges both amongst my own people and of persons unconnected with the Church have pronounced it perfect—unsurpassed in its softness, richness, and variety of tone. I have pleasure in adding that Mr. LINCOLN has treated us with considerable liberality, has acted with openness and uprightness, and as becomes a tradesman of the highest respectability—has spared neither labour nor (I may add) expense in fulfilling his contract to the utmost, and has devoted himself strenuously, not to say enthusiastically, to the work of turning out an Instrument that should give perfect satisfaction to the Committee of gentlemen concerned in its erection. In this he has completely succeeded; and I shall be happy if my recommendation secures him further patronage.

W. F. H. HOOPER, Incumbent of Withington."

ORGAN MANUFACTORY, 196, HIGH HOLBORN.

Mr. LINCOLN solicits the attention of the Nobility, Clergy, and the Professors and Amateurs of Church Vocal and Instrumental Music, to the peculiarities and advantages of the great and numerous improvements he has recently adopted in the construction of the Church and Chamber Organ. These alterations have been made with a view of affording an increased efficacy to the Organ, in rendering its support to a large congregation, and in the performance of Church Instrumental Music. The effect gained is such as to combine the breadth and variety which distinguish the Continental Organ, with the universally recognised sweet and silvery tones produced by the English mode of voicing and finishing the pipes.

The advantages gained by the adoption of the new mode of construction are unquestionable:—

1st. The Organ has a more weighty and solemn character of tone, which is gained by the introduction of the new Stops, called the Bourdon, Tenoroon, and Quint.

2d. It has a more brilliant and silvery character, from the new mode of arranging the Sesquialteras, Mixtures, and by the use of a new Stop, called the Doublette.

3d. It has a more soft and varied character, from the circumstance that instead of the Instrument only possessing one Flute, it has three, four, or even six, all of which combine with the new Stops in producing an entirely new quality of tone to the Organ, and which is admirably adapted to the purposes of Psalmody. These Flutes are called the Claribel-Flute, the Oboe-Flute, the Wald-Flute, the Snabe-Flute, the Piccolo, and the Flageolet.

4th. It has more breadth and body of tone, from the adoption of a new method of manufacturing the Reed Stops. These are made to speak, so as to combine the weight of a Diapason with the fullest tone which it is possible to give to a Reed Pipe. The new Reed Stops are called the Posaune, the Trombone, the Cornopean, the Soft Horn, the Corno-Flute, the Clarinet, the Trumpet, the Clarion, the Oboe, and the Octave Clarion.

5th. A distant, subdued, and piano effect, combined with brilliancy sufficiently prominent to keep up the voices, is gained by the Tenoroon Dulciana, a new Reedy-toned Dulciana, and the Echo Dulciana Cornet, a Stop of Five Ranks of Pipes, which has been copied from one in the celebrated Organ of Cologne Cathedral.

6th. More Pipes are obtained to each Key than has yet been attained, and at a less expense; and it must be evident the greater number of Pipes of differing qualities of tone that can be brought to bear upon each Key the greater must be the musical resources of the Instrument.

7th. The Sound-boards are made to contain nearly double the work of the ordinary sound-boards, and the wind-chests nearly double the quantity of wind.

8th. No money is thrown away upon useless mechanism, but the greatest attention is paid to create music in every possible variety and combination.

9th. Although the compass of the Keys is apparently contracted to CC, in effect the Organ extends to CCC, as every Key on the Manual has it with its Unisons, the Octave below; thus, in fact, the Instrument has the same compass as the Organ in St. Paul's Cathedral, without the disadvantages attending the old compass.

Mr. LINCOLN begs to refer to the following Organs, as examples of the new manner of combining great power and variety at a small expense.

THE NEW ORGAN IN THE CHURCH OF ST. THOMAS, THE ROLLS, CHANCERY-LANE,
(Opened in November);

THE NEW ORGAN IN CROSBY-HALL, BISHOPSGATE-STREET (Opened in December);

THE ORGAN AT THE NEW CHURCH, WITHINGTON, MANCHESTER (Opened in March);

THE NEW GRAND ORGAN NOW ERECTING AT THE CATHEDRAL CHURCH OF ST. DAVID.

Mr. LINCOLN submits the following TESTIMONIALS from the late Dr. Clarke Whitfield, Mr. Attwood, Mr. Thomas Adams, Dr. Gauntlett, and Mr. Purkis, as to the Character of his style of Organ Building:—

From Dr. J. CLARKE WHITFIELD, Professor of Music to the University, Cambridge.

I have employed Mr. LINCOLN at Trinity and St. John's Colleges during my residence at Cambridge, and therefore can vouch for the superiority and durability of his work, as well as for his moderate charges. It is my opinion that the Diapasons of Mr. LINCOLN possess more of the sweetness of the celebrated "Father Schmidt" than those of any other Organ Builder of the present day.

From Mr. ATTWOOD, Organist of St. Paul's Cathedral, and Composer to the King.

I have the pleasure to inform you that I think the Organ built by Mr. LINCOLN an instrument possessing a fine quality of tone, great power, and very complete in all its parts.

Testimonial from the New Church Committee, Newington, and Mr. PURKIS, Organist.

The undersigned feel highly gratified in expressing their opinion upon the Organ built by Mr. LINCOLN for the said Church, and testifying to the great satisfaction he has given therein, not only with respect to its internal construction, mechanism, and powers, but also to the very fine and superior quality of tone it so eminently possesses, and of which it is scarcely possible to convey a sufficiently just and adequate idea.

(Signed) A. CYRIL ONSLOW, Rector.
GILBERT ELLIOTT, Minister.
JOHN PURKIS, Organist.
(And all the Committee.)

Testimonial from the New Church Committee, Camberwell, and Mr. THOMAS ADAMS, Organist.

The undersigned deem it only common justice to Mr. LINCOLN to express the very high and general satisfaction which he has given in the erection of an Organ in such new Church: without any written contract, he completed, within the time stipulated, all, and even more than in his tender he had engaged to perform, without claiming a single extra. Of the appearance of the Organ, of its internal mechanism and workmanship, and above all, of its powerful yet mellow and most beautiful tone, it is scarcely possible to convey a just idea of the praise which has been bestowed upon it by all who have seen and heard it.

(Signed) JOHN GEORGE STORIE, Vicar.
JOHN VANE, Minister.
THOS. ADAMS, Organist.
(And all the Committee.)

Testimonial from Dr. GAUNTLETT, Organist of Christ Church, Newgate-street, London, and of St. Olave's, Southwark.

Mr. HENRY C. LINCOLN has erected two Organs on my new plan, and has two others in progress. I have much pleasure in recording my opinion of his merits. In the contracts which he has executed under my superintendence, I have ever found him, although exceedingly moderate in his price, yet very desirous to give his employers every advantage. The internal mechanism and the outward decoration of his work have been finished in the best style. The metal and manufacture of his pipes have been of high excellence; and every portion of his instrument has been completed with the same uniform attention to its durability and due effect.

Mr. LINCOLN has the honour to announce

A NEW AND IMPROVED CHURCH BARREL-ORGAN;

ALSO,

THE CONCERT-ORGAN FOR THE SALOON OR DRAWING-ROOM;

AND

THE APOLLONICON, OR SELF-ACTING ORGAN;

For the Mechanical Performance of Symphonies, Overtures, Choruses, &c.

Mr. LINCOLN continues to manufacture the OLD ENGLISH UNISON and GG CHURCH-ORGAN, to which he gives some new Characteristics, by means of his newly-invented Flute, Reed, and Diapason Stops. He also reconstructs the Old Instruments upon the New Plan.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & Co., Patentees, beg to announce that, to meet the increasing demand for this manufacture, they have opened an Establishment at No. 22, REGENT-STREET, (CORNER of JERMYN-STREET,) where every variety of articles for the Side-board, Dinner, Dessert, and Breakfast Tables may be inspected.

They have also a similar assortment at their City Establishment, No. 45, MOORGATE-STREET, where they have a MANUFACTORY for PLATING and GILDING, RE-PLATING and RE-GILDING ARTICLES of every description, and of ALL METALS.

With reference to articles of their manufacture, the Patentees beg to state that they differ from all goods hitherto offered as "Plated Goods" or "Substitutes for Silver," being made in the same manner as SOLID SILVER, from which they cannot be known, and being also composed of a hard white metal, strongly coated with silver by the Electro process.

Silver Articles of every kind or pattern exactly copied. Every article made by the Patentees bears their stamp (E. & Co. beneath a Crown.)

AGRICULTURAL EDUCATION.—The Proprietor of a respectable Academy, some distance from town, who is also connected with Farming, has a VACANCY for two Pupils, between the ages of 8 and 15, who will devote a part of the day to Scholastic pursuits, and the other to those of Agriculture, the practice of which is conducted upon the improved system. English, French, Latin, Greek, Drawing, and the Mathematics, are the principal branches of literature that will be taught.—For terms, &c., apply by letter to X. Y., 6, Old Cavendish-street, Oxford-street.

BUTTER MADE IN TEN MINUTES
BY THE NEWLY-INVENTED CHURN.
REGISTERED ACCORDING TO ACT OF PARLIAMENT.
ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Metal Pans for Churns to stand in, 4s. 6d., 6s., and 7s. Larger sizes made to order. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, Lewes.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIEBY'S Brush Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & Co., 109, Fenchurch-street.

FUMIGATION.—At a season when Fumigation is of the utmost importance to Flowers, Trees, Plants, &c., Messrs. CLARK & CO. beg to call the attention of all persons engaged in Horticultural Pursuits to their PATENT FUMIGATING BLOWER, which, having been in use for upwards of nine years by the first houses in the kingdom, is found to be much cheaper and infinitely superior to the best fumigating bellows hitherto tried. Prices, 9s., 11s., 15s., 17s., and 20s. each. May be had of all Ironmongers, and of Messrs. CLARK & Co., Engineers, Nelson-terrace, City-road, London.

N.B.—Hothouses heated on the most Improved Principles.

LADIES AND GENTLEMEN, I am desirous of gaining the Patronage of the Readers of this Journal, and trust that the system upon which I conduct my business, and the moderate prices, will gain a greater portion of confidence and support. The Improved Stamped Postage Envelopes, 1s. per doz. (without advertisements), to purchasers of other articles; Fine Bath Post, 3d. per qr., 5s. ream; do. Note, 2d. per qr., 3s. ream; Small do., 1s. per half-ream; Superfine Foolscap, 8d. per qr., 12s. 6d. per ream; and every article at corresponding prices. 10 per cent. off Books and Music. On the receipt of two postage stamps, Samples and List of Prices forwarded postage-free. Purchasers of 2l. value sent free of carriage 100 miles, of 10s. 5 miles, and any amount in London free.—From SLOAN'S Stationery Warehouse, 20, George-st., Portman-square, London.

COOKING UTENSILS with SILVER LININGS.—At a cost of about one-third more than those lined with tin, the chief advantages of the former being greater durability and cleanliness, and the impossibility of burning—viz., giving a burnt flavour to milk or any gelatinous or farinaceous article of food, the SILVER, by a recent improvement in the ELECTRO PROCESS, adheres so tenaciously to the copper, that no heat in cooking can remove it or any acids injure it. With no heat in cooking can remove it or any acids injure it. With moderate care it will last for years, and can be renewed at a moderate charge when necessary. J. L. BENHAM considers this particularly important to the Army and Navy, and to families residing abroad, where the difficulty of getting coppers properly tinned is often very great. Old articles can have the tin removed and be lined with pure silver by this process.—19, Wigmore-street, Cavendish-square, London.

MECHI'S TABLE CUTLERY has long been famed for its admirable qualities, combined with Cheapness; his Manufactory is No. 4, Leadenhall-street, four doors from Cornhill. Balanced Handles, in sets of 50 pieces, 2l. 10s., 3l. 10s., and 4l. 10s. Common Kitchen, per doz., 7s. 6d., 12s., 16s. 6d., 21s., and 26s. Table Steels, Patent Sharpeners, Cases of Dessert and Knives, Sheffield Plated Goods, German Silver Forks and Spoons, Tea Trays, Tea-caddies, Dish-covers, &c. Mech's Penknives are excellent and economical, being from 1s. upwards.

TENTS for CRICKET CLUBS, RICK CLOTHS, GARDEN NETS.—100 Second-hand Tents, 42 feet round, at 35s. to 2l. each. Large Tents, 57 feet round, 6 feet high in lowest part, quite new, 8l. each; 42 feet round, 6l., 35 feet round, 4l. 10s. New Expanding Tents, (put up and down like an umbrella,) 30 feet round, 5l. Rick Cloths, dressed with a pliable composition of tar and boiled oil, which vermin will not touch, nor are affected by mildew, at prices as follow:—15 tons Hay, 3l.; 20 tons, 4l. 10s.; 30 tons, 5l.; 40 tons, 6l. 10s. All kinds of Garden, Fishing, Rabbit, and Sheep-folding Nets, made by machinery, at reduced prices. ROBERT RICHARDSON, Net and Tent Maker, No. 21, Tonbridge-place, New Road, near Euston-square.

ROYAL BOTANIC SOCIETY OF LONDON, Regent's Park.—The LAST FLORAL FETE, WEDNESDAY, July 19.—BENJAMIN EDGINGTON, No. 2, Duke-street, Southwark, and No. 208, Piccadilly, respectfully informs the Nobility and Gentry that he has received instructions from the Council to erect a noble CIRCULAR TENT, 50 feet high and 240 feet in circumference, with walls 10 feet high. The attention of the visitors is most respectfully solicited to this tent, it being of a novel character, and as it will be found perfectly waterproof, will form a convenient shelter in the event of rain. Tents and Marquees in great variety ready for immediate delivery, new and second-hand, either for sale or hire, with boarded floors, and elegantly lined, if required. Temporary rooms one story high erected at two days' notice.—Address BENJAMIN EDGINGTON, 2, Duke-street, Southwark.

ARAUCHARIA IMBRICATA, or SIR JOSEPH BANKS'S PINE.
 YOUELL & Co., possessing the most extensive stock
 in the country of the above Splendid Hardy Ornamental
 Tree, beg to offer them on the following advantageous terms:—
 Fine robust, 3 year-old plants, 8 to 9 inches high, 10s. per 100, or
 30s. per dozen.—Great Yarmouth Nursery, July 12, 1843.

The Gardeners' Chronicle.

COGNATE SHOWS.—Thursday, July 20 . . . Hoddesdon Cottagers'.
 Friday, July 21 . . . Northallerton.

EVERY day seems now to produce evidence that AMMONIA—that long-neglected but almost omnipresent substance—is one of the most important of all the elementary matters provided for the use of man. Formed instantaneously, wherever hydrogen and nitrogen can come in contact in a nascent state,—floating in the atmosphere,—hiding in the imperceptible cavities of all porous bodies, or dissolving in water, it necessarily mingles with the food and breath of animals and plants,—entering into their composition, or furnishing them with some of the indispensable elements of nutrition. Reiterated experiments show that the strength of manure is in proportion to its abundance; that the vigour of plants is intimately connected with its presence, as their debility is with its absence; and that, if employed in a proper form and fitting condition, it promises, almost alone, to give a new arm to the arts of cultivation.

But it is not in all or any state that it is found to be thus beneficial; when caustic, it seems to carry death instead of vigour in its train. Even when in such combination with other forms of matter as to lose a part of its natural causticity, it requires to be administered with great caution, for it still approaches the pure state in its tendency to do mischief. No doubt it is the neglect of attention to these circumstances which has led some observers to believe that ammonia is deleterious instead of beneficial to plants. But it is more especially the animal kingdom which suffers under the influence of ammonia in the caustic state. Pure ammoniacal gas, water of ammonia, and the carbonates of this substance, including even the common *sal volatile* of the shops, are all irritating poisons, more or less energetic. Although used medicinally, it is only in small doses, and under particular circumstances.

From some experiments that have lately been made, ammonia, in the caustic state, appears likely to be of considerable importance to Gardeners, on account of its fatal action upon animal life. It has lately been ascertained by Mr. George Gordon, the Superintendent of the Hardy Department in the Garden of the Horticultural Society, that the ammoniacal liquor of the gas-works, diluted with water, is a certain remedy for the green-fly, which has been so unusually abundant during the present year. He has found that although gas-water in its undiluted state burns foliage whenever it touches it, yet that plants do not suffer from it when considerably weakened with water. It appears that when the London gas-liquor is mixed with ten times its measure of water, and applied with a syringe to the parts of plants infected with the green-fly, it causes so speedy a destruction of those insects that the greater part disappear after the first dose, and a second application is sufficient to clear away all the remainder. Upon mentioning this discovery to a person whose garden was four days since in the most deplorable state from swarms of green-fly, he ordered his gardener to repeat the experiment with gas-liquor weakened with twelve times its measure of water; this morning, upon looking over the bushes, it is scarcely possible to detect a living individual; the leaves are green, and much refreshed by the operation: the syringing was only used twice.

The ammoniacal liquor of the gas-works being thus proved to be fatal to aphides, it becomes an interesting question whether or not ammonia cannot be employed with equal success in other cases, either as it is found in gas-water, or in the state of the carbonate and subcarbonate; and this is an inquiry that we commend to experimental gardeners. All we can at present state upon the subject is, that if flies and other insects, including beetles, are put into a dry tube containing a small quantity of smelling-salts (subcarbonate of ammonia), they fall to the bottom in a few minutes after having been exposed to the vapour, and then perish; that green-fly thus treated becomes yellowish in a short time, and then dies, just as if it had been washed with gas-water; and that even the Gooseberry caterpillar, which for a long time resists the action of gas-water strong enough to kill the green-fly, cannot exist in a tube containing a little smelling-salts.

In these instances we apprehend that the effect is

due to the volatile vapour of the ammonia, and to nothing else; for when aphides are plunged into weak gas-liquor, their death does not appear to be hastened by that operation; on the contrary, when exposed in a tube to the vapour of carbonate of ammonia, they died even faster; and caterpillars floating in the weak gas-liquor lived longer than when compelled to inhale its vapour. In all cases the insects make vehement efforts to escape, so that no doubt can exist of the ammonia producing immediate inconvenience and a sense of danger. If a saucer is only moistened with weak gas-liquor, and the Gooseberry caterpillar is thrown on it, the creature becomes immediately convulsed, and throws itself violently backwards and forwards, after which it becomes half torpid. The caterpillars do not, however, die, unless exposed to the influence of the ammonia for some time.

As we foresee that many inquiries will be made as to the proper proportions of gas-liquor and water that ought to be employed, it is as well to anticipate them by saying that it is impossible for us to answer such inquiries except in general terms. Everybody must ascertain the fact for himself, by mixing gas-liquor and water in various proportions, and trying their effect in a small way in the first instance. The fact is, that the quantity of ammonia contained in gas-liquor is extremely variable, the gas-works making it of no uniform strength. That used by Mr. Gordon, and by the gentleman above alluded to, was very strong; effervescence not ceasing in an ounce of it until 50 drops of the sulphuric acid of the apothecaries had been added. Those who wish to determine the *relative* strength of that which they employ can do so by a very simple process: take one fluid ounce of the gas-liquor to be employed, and add to it, drop by drop, such sulphuric acid as may be bought in the apothecaries' shops, until effervescence ceases; then, supposing they find this to occur after 25 drops have been added, they will know that their gas-liquor is only half as strong as that used by the Horticultural Society; and consequently, instead of adding ten parts of water to one part of gas-liquor, they must only add five parts to obtain the same strength, and so on. It is true that this is not a very exact proceeding, because the sulphuric acid of the apothecaries itself varies in strength; but we conceive it to be quite sufficiently exact for gardening purposes.

There is one important advantage that is obtained by this process—namely, that, independently of killing the green-fly, the plants are well manured by the same operation; so that nothing is lost.

When gas-liquor cannot be had, or where its offensive odour is inconvenient, we should try the effect of carbonate of ammonia dissolved in water, in the proportion of one ounce of the carbonate to a pint of water. This would form a solution of about the strength of London gas-liquor, and might then be lowered with ten proportions, or, as none of the ammonia is uncombined, with 7 proportions, of water.

ALTHOUGH this has been a season unprecedented of late years for its coldness and wetness, and therefore as unfavourable as can well be imagined to meetings in the open air, yet the exhibitions in the Garden of the Horticultural Society have been always crowded, and have afforded undiminished enjoyment to the lovers of Horticulture; for, in the midst of almost incessant rain and cold, three fine and thoroughly English days have enabled twenty-three thousand three hundred and thirty-five persons to visit the Society's establishment. On Wednesday the beautiful gardens of the Duke of Devonshire, so kindly opened to the throng, were, as they always must be in fine weather, a great object of attraction. Nothing could well be more picturesque than the groups of well-dressed people seated on the soft turf, or wandering among the fine old trees, while the charm of the scene was greatly increased by the admirable music of the band of the Royal Horse Guards. We have said so much elsewhere, and on former occasions, concerning the exhibitors and their productions, that nothing remains to be mentioned, except that thirty-three gold, fifty-three silver-gilt, and two hundred and fifty-eight silver medals, have rewarded the successful competitors during the present season.

THERE is a very common idea that arable land is troublesome to manage, and leads to expense and loss, when it is not in the hands of a very experienced farmer; and so it is, when there is such an extent of it as may be called a farm. Very few gentlemen who occupy arable land find that they have a profit at the end of the year, allowing for rent, taxes, labour, &c. But a very few acres of a moderately good soil, occupied with a greater extent of grass land, may be very valuable to a man who keeps horses for his pleasure, and cows, sheep, and pigs, for the use of his family. In the country a horse and cart is extremely convenient, if not an essential part of an establishment. This horse may be used in a four-wheeled carriage, alone

or with a companion, and it will be no detriment to him, whether it be a degradation or not, to draw green food for the cows and to transport manure into a field. He may now and then draw a light plough or harrow, or a horse-hoe; and if he is not wanted every day for transporting his master or some of the family from place to place, he is better occupied in light farm-work than in standing idle in a stable. In a larger establishment, where a regular carriage is kept, an *odd horse* is very useful, such a horse as may be substituted for one of the carriage horses, in case of his being lame or wanting a dose of physic; at all other times he is a cart-horse.

The quantity of arable land we would suggest as useful and profitable, in addition to twenty or thirty acres of grass, should not exceed ten or twelve acres, and be chiefly cultivated for green crops—that is, roots, Cabbages, and artificial grasses for green fodder. If Corn is ever sown it must be under peculiar circumstances, for the Wheat raised by gentlemen is often dearer than that which is bought in the market; but crops of roots to feed cattle are a great saving of Hay and Corn in winter, and greatly increase the manure: whereas they cannot be readily purchased, and are heavy to carry to a distance; they require more frequent manuring, but they thus gradually improve the fertility of the soil. Suppose, then, ten acres of a good mellow loam, worth 2l. an acre to let to a farmer, at a distance from a great town, and the other burdens amounting to 10s. more per acre: here is a rent of 2l. 10s. per acre. It may be judicious, at first, to get some neighbouring farmer to plough the whole as deep as possible, and to pulverize it with harrows and scarifiers, after which the whole of the work should be finished with forks, spades, and hoes. It is presumed to lie on a porous subsoil; if not it must be thoroughly underdrained with stones or tiles before any other operation. This necessity will make its original value less than we supposed above; but the result will be the same, if we add the interest on the expense of draining to the original rent. The field should be divided and cropped as follows:—1 acre planted with Potatoes, 1 acre sown with Beet or Mangel Wurzel, 1 with Swedish Turnips, 3 with Rye and Tares, sown at different times; if the ground is not too heavy, 1 acre may be in Carrots, 1 planted with Cabbages, and 2 acres with Lucerne. This last will continue for many years if the soil is deep and mellow, and if the crop is weeded every time it is cut. As fast as the Tares are cut green for cattle, the ground is hoed by hand, and White Turnips are sown in rows. The winter Tares and Rye will be ready to cut in May, and the ground may be hoed over and raked, and liquid manure may be poured over it, before the Turnips are sown, which will be by the end of the month or early in June. Swedish Turnips may yet be sown to advantage, or the Globe, or Red Round Turnips. Later in the season a smaller and quicker-growing sort may be sown as late as the end of August. By a little attention to the succession of the different crops the ground may be kept continually in a productive state; and as all the produce can be consumed at home, the land will always have returned to it, in the shape of manure, all that is drawn from it: no plants ripening their seeds in it, there will be very little exhaustion, and the fertility will be continually increasing.

If it be asked what is to be done with all this produce for cattle,—for, except Potatoes, no food is raised for man,—we will readily answer, there is no fear of any difficulty: if the stock is not sufficient to consume the produce, it is easy to increase it. We suppose a considerable quantity of pasture land; this will keep sheep and young cattle in summer, and the roots, Cabbages, &c. will keep and fatten them in winter. To have a fat sheep or a lamb now and then to kill for the family is a great economy, as you have the butcher's profit as well as the grazier's; a cow or Scotch ox may also be fattened off, and will find its value in the market. The Lucerne must be kept for the horses and milch cows; the Carrots stored for the horses and pigs in winter. It is difficult to calculate the value of this produce when consumed at home, and not sold; but the crops may be valued as they are carried off; and by putting only two-thirds of the market value it will be found, that where these crops are well managed they are far more profitable, on an average of years, than crops of Corn, even if these could be raised every year without intermission. 350 bushels of Potatoes per acre is a very common crop—but say 300, at 1s. per bushel, which they are well worth to feed pigs—here is 15l. The Carrots, if the white Belgian Carrot is sown, will produce from 15 to 25 tons; we will take the lowest average, 15 tons, at 1l. per ton: they would sell for twice that in a town, for horses—here is 15l. more. Tares for horses are readily sold at 1s. the square perch, the buyer cutting and carrying them; this is 8l. per acre—say only 5l., or 15l. for three acres. Lucerne is worth fully as much, or rather more, as it may be cut three or four times; to the consumer they are worth double; set the two acres at 15l. The Cab-

bagas and Swedes first sown will be worth 5*l.* per acre, and the Beet as much. The Turnips, after the Tares, we will set only at 5*l.* the three acres. We shall thus have an average produce of 70*l.*, besides all the manure which is made from its consumption, and which is more than the land requires for the subsequent crops. The rent and taxes were 25*l.*, which leaves 45*l.* for labour. We have set down nothing for the occupier's profit, because we suppose that the convenience and saving in the feeding of his horses, the milk and butter, pigs, poultry, eggs, &c., which he has at a much lower price than he could purchase them, will amply repay him. In the averages, we have made ample allowances for risk from failures, for our experience holds us out in warranting the average produce to be fully what we have stated for any number of years. In some years it might be nearly doubled, but from the variety of produce, a general failure or extraordinary success in all the crops is not to be expected. All the work, as far as is practicable, should be done by the task, except the taking off the crops and carting the manure.—*M.*

WE perceive by the advertisements that another of Mr. Skinner's importations from Guatemala is about to be brought to the hammer. Among the plants, is the rare *Sobralia macrantha*, of which a very large specimen, in its native soil, is mentioned; and the very curious genus, *Evelyna*, of which one specimen flowered some years since at Kew, but which has never since been seen in flower in Europe. At the same time some very interesting New Zealand living plants will be sold. Of the latter, the most remarkable are—1, a new species of *Araucaria*, which, with the habit of the South American species, has, *mirabile dictu*, quite another sort of cone; 2, a noble specimen of a Fern, called *Acrostichum grande*; 3, some very curious species of *Clematis*, *Jasmine*, and *Rubus*, entirely new, and possibly hardy; 4, a new *Dacrydium*; 5, the hitherto unknown *Dacrydium Mai*, a tree about whose hardiness there is little doubt; and, finally, a new species of *Orchidaceæ*, of the curious genus *Earina*, which is not in Europe elsewhere, and is so fragrant, that it was originally discovered in consequence of a passerby being attracted by its sweet smell to the tree on which it grew; it is the *Earina suaveolens* of Professor Lindley. In the same collection are some most curious New Holland *Dendrobia*. We regard the last as one of the most curious collections of plants lately imported.

PROCESS OF MAKING CHARCOAL.

WHERE iron cylinders are not employed for the purpose, charcoal is usually made by setting fire to a pile of wood, so covered that the free access of air is prevented; for if this were admitted freely, the charcoal of the wood would be driven off in the state of carbonic acid, and only some ashes would remain.

The wood should be cut in lengths of two or three feet, and so as it can be packed pretty closely together. The pile may be either placed on the level ground or in a pit; but in the latter case three or four openings should be cut in the sides, from the bottom of the pit outwards, in order to admit a little draught for the ignition of the wood in the first instance. In the centre of the area several long pieces of wood must be fixed so as to leave an opening for introducing the kindling; or an opening may be formed by pieces 12 or 15 inches in length, two of which are laid horizontally, six inches apart; two others are then laid at the same distance from each other across the two first, and so on; thus forming an opening six inches square from the bottom to the summit of the pile. Round this the billets or faggots are closely packed in a nearly upright position. When completed, the pile should be of a rounded conical form. The wood may, however, be disposed in the form of a ridge, several openings being left for ignition. When the pile is completed it must be covered with turf, which may be farther closed by earth or sand, as is found necessary during the process. Where turf cannot be easily procured, old mats or any rubbish that will prevent the earth from mixing with the wood, will afford a tolerably good substitute. When all is covered except the opening at top, and some holes for air near the bottom, fire is introduced down the central opening. As soon as the pile is fairly ignited, the top must be well closed, and the smoke, but not flame, encouraged to issue as equally as possible from every other portion of the surface, by making holes with a pointed stick where smoke does not appear. Some portion of the wood must be consumed before sufficient heat can be obtained to expel the water composing, as regards quantity, the principal portion of the sap. After the wood becomes thoroughly heated to 212°, the water is given off in the form of steam, and the whole mass takes fire readily throughout. Great care is then necessary to prevent flame bursting out; and as the heat increases the openings in the covering must be reduced, and finally closed when the charring is found to be complete. ||

In a late Number of the *Gardeners' Chronicle* a Correspondent inquired how charcoal could most readily be prepared in a state of powder. So many useful hints are derived from the suggestions of your correspondents, that the least return which can be made is to impart any suggestion which may have occurred to oneself, likely to

be of use to other readers. For the purpose of mixing with potting-earth for striking cuttings or growing seeds, &c., charcoal may be readily prepared from saw-dust. A fire of dry sticks, &c. being lighted on the ground, upon a circular space, when it is well alight begin to heap on saw-dust with a shovel, allowing plenty of air at first for a few hours, till the fire has got well hold, then cover the whole over with saw-dust, and pat it down with the shovel, leaving three or four stout sticks projecting to the outside, which can be raised now and then to admit a little air. When such a heap is once well alight, it may be kept so for months, or indeed, for any length of time, taking care always to have a load or two of saw-dust at hand, which is to be thrown on as the fire breaks out at any spot: the heap should be sheltered from strong winds, and never allowed to burn out in the open air. A part of the charcoal thus made may be taken away every month or so from one side of the heap, leaving the rest to keep the fire burning. Any one within reach of a saw-mill can get saw-dust for the trouble of carting it, and may thus make a useful manure of it.—*Carbon*. Nearly all the charcoal is prepared in France by a process which is known by the name of process of carbonization in heaps (*meules*). The wood is arranged in conical heaps of variable size, which are covered over with a thick layer of earth and of coal-ash; the heap is kindled from the centre, where a cavity has been kept open for that purpose, and which descends to the base. In this cavity burning charcoal is placed and some small pieces of wood, and the air is admitted by holes formed at the base and over the whole circumference of the heap. After some hours, during which the central cavity or chimney is allowed to remain open in order to determine a more active combustion, the superior orifice is shut, and the carbonization is directed from above downwards, by piercing holes in the covering nearer and nearer to the base of the heap, as the operation advances.—*Chemical Gazette*.

WATERING OUT-DOOR PLANTS.

As one of the objects of the *Gardeners' Chronicle* is not merely to recommend sound practice in the details of gardening, but to inquire into the reasons of that practice, I beg to offer a few observations on watering out-door plants in dry weather, and to point out the most suitable time at which this operation should be performed. In this neighbourhood I find the practice varies; the watering sometimes takes place in the morning, sometimes in the evening,—the main design being to give water, although evidently a matter of indifference when it is applied. In other parts of the country it may be different; but as the *Chronicle* reaches all parts, I would beg to recommend through its medium the morning as the most proper time in general for watering out-door plants. Two acknowledged agents in vigorous growth are heat and moisture; plants out of doors must take the heat as they find it, and as we cannot increase, our object should be not to diminish it: moisture is under our control, but if we exercise that control, and water our plants in the evening during dry weather, we do so at the expense of a great portion of the heat we desire to preserve. Two influences are at that time brought into operation in cooling down the plants, and retarding their growth, which we thus vainly endeavour to urge forward by moisture: these are evaporation and radiation. Evaporation is the more rapid in proportion to the dryness of the air; and hence it is most energetic, when the necessity for watering is most urgent: but evaporation cannot take place without producing cold, and that cold is proportionate to the rapidity of the process. Chemistry points out the reason of this, vapour having a greater capacity for heat than water, the heat sensible in the water becomes latent in its vapour, and the sensible temperature falls; additional heat to keep up the temperature not being quickly enough supplied by the surrounding media. Let us look at the effect of this evening's supply of water to plants: the air is dry, evaporation goes on briskly; the temperature sinks, the plants are chilled, there are no sun's rays to communicate fresh warmth, and their growth is sometimes even more unsatisfactory than that of such plants as are growing in the apparently arid soil, which have been allowed to take their chance. The other source of diminished temperature I noticed was radiation: every warm body tends continually to throw off its heat to all others of lower temperature, near or remote: but radiation in meteorology is more particularly confined to "the radiation of heat from the surface of the earth and objects on it into a clear sky." All objects do not radiate heat with equal rapidity: rough surfaces do it more readily than smooth, and dark surfaces than those of a lighter shade of colour. Apply the latter remark to the process of evening watering: almost all soils are darkened in their colour by moisture, and hence soil by this practice is reduced to the best possible condition for getting cooled down during the night. It is thus that the combined influence of evaporation and radiation, by evening watering, exerts itself in thwarting the desire of such as heedlessly practise it. The best time for watering exposed plants I consider to be about or soon after sunrise. Evaporation, no doubt, will then also go on freely, but the atmosphere is beginning to get warmer, and the sun's rays to exert their counteracting influence. The darkened surface—that very condition which made the soil throw off its heat more readily during the night—causes it to imbibe the heat of the sun's rays by day with increased facility, so that you thus have the greatest amount of the fostering agencies of heat and moisture for the growth of plants. When evening again comes round, the surface moisture has been dried up, and its colour again rendered of a lighter shade: there is consequently little diminution of

temperature beyond surrounding objects, either from evaporation or radiation of heat.—*J. L. Newburgh*.

ON VEGETABLE MANURES.

(Continued from page 272.)

3. *Cranberries* (*Vaccinium oxycoccos*).—In mountainous and woody countries the herbage of Cranberries is often used as litter. It contains much powerful manuring mineral substances, and probably an equal amount of nitrogen, so that it deserves every attention. It is, however, necessary that the manure thus obtained should be well rotted in the stable or on the dunghill; for it decays with difficulty in the fields, its texture being very woody, and its tannin and wax of considerable amount.

100,000 parts of the green air-dried herbage contain of mineral substances:—

475	parts of silica
957	" lime
178	" magnesia
288	" potash
87	" soda
10	" alumina
14	" oxide of iron
958	" oxide of manganese
149	" sulphuric acid
186	" phosphoric acid
20	" chlorine

3,319 parts of mineral substances.

It contains 4 per cent. tannin, and 3 per cent. wax.

It is to be supposed that its greater amount of lime, potash, sulphuric and phosphoric acid, will render it a better manure than Heath, even if its amount of nitrogen were less. Previous to using it as litter, it should be packed in large heaps, by which it will be heated and rendered softer, while its great amount of tannin will be decomposed.

4. *Bilberry-Leaves* (*Vaccinium myrtillus*).—This herbage is also used as litter in mountainous forest countries. Having a very woody texture and much tannin and wax, it should be treated like the herbage of Cranberries, and well rotted, either under the cattle or on the dunghill.

100,000 parts of the green gathered air-dried herbage contain of mineral substances:—

169	parts of silica
1,036	" lime
224	" magnesia
324	" potash
188	" soda
36	" alumina and oxide of iron
207	" oxide of manganese
131	" sulphuric acid
179	" phosphoric acid
34	" chlorine

2,528 parts of mineral substances.

The amount of nitrogen the Bilberry leaves contain is not ascertained; it is, however, probable that it contains more than Cranberries, and being also richer in lime, magnesia, potash, soda, and chlorine, it deserves to be used in preference where it can be obtained. There are no experiments on this point, but analogy is a pretty sure guide.

5. *Ferns*. (*Polypodium Phegopteris*, *Osmunda regalis*, *Pteris aquilina*, *Aspidium Filix mas.*, and *Aspidium Filix foemina*.)

Ferns form a most desirable litter, not merely because of their containing powerful manuring matter, but on account of their nitrogen. In mountainous and forest countries they are always carefully collected, more especially because they afford a very soft litter for cattle. They are generally cut green, and then dried and used as litter during winter. Mixed with dung, they decompose very fast. I have subjected the common Brakes (*Pteris aquilina*), which is much used, to chemical analysis.

100,000 parts of the fresh-gathered, air-dried herbage contain of mineral substances:—

1,040	parts of silica
433	" lime
152	" magnesia
1,050	" potash
370	" soda
52	" alumina
150	" oxide of iron
36	" oxide of manganese
95	" sulphuric acid
60	" phosphoric acid
258	" chlorine

3,696 parts of mineral substances.

Common Brakes must be a very superior manure, if only on account of their abundance of potash, soda, and chlorine; but they are rendered still more valuable by their richness in nitrogen, for I find that 100*lbs.* of the dry herbage contain 16-100ths of a pound of nitrogen, and consequently 3,000*lbs.* = 45*lbs.* Its roots penetrate from 5 to 6 feet into the ground, and finding there more potash, soda, and chlorine than on the surface, it is a difficult plant to extirpate. It is one of the most troublesome weeds, and every forester will approve of its being gathered and destroyed.

(To be continued.)

AMATEUR'S GARDEN.—No. XXVIII.

THE Calceolarias, especially the finer hybrid varieties, are a family of plants which are very sensitive of ill-treatment, and rather difficult to manage after they are out of bloom; indeed it is no uncommon occurrence, if they are neglected at this season, to see them perish altogether. This is caused in a great measure by the exhaustion of

the plant, consequent upon profuse flowering, aided no doubt by the attack of insects, the want of nourishment in the soil, and the season being rather warmer than is altogether conducive to their well-being. Many amateurs experience considerable difficulty in managing their plants at this season, and therefore a few remarks on their treatment may not be unacceptable.

After the plants have done blooming, or rather after they have become shabby—for they should not be allowed to perfect all their bloom—remove them from the greenhouse, and divest them of all the flower-stems, and such of the leaves as may have an unhealthy appearance; examine the roots to see that the drainage is free; remove the surface-soil to the depth of one inch, and replace it with rich light sandy compost, taking care to place it well up round the base of the plant, so as to allow the young shoots to strike root into it, and if they are at all filthy, fumigate them slightly for several nights in succession with tobacco. When they are clean, they must be placed in a warm shady corner, on a north-west aspect, and if a frame and sash can be spared to cover them in stormy or cold weather, it will be to their advantage; but they must be fully exposed at all other times. In the course of a month or six weeks after they are thus treated, they will begin to produce shoots pretty liberally, and when these are about an inch long they must be thinned out, leaving sufficient to form a specimen-plant for another season, and using the remainder for propagation. At the same time the plant should be cut in to make it form an uniform head in the following season; but the knife must be used cautiously, as the plants are rather impatient of its influence.

In a week after the above operations are performed, the plants will require shaking out of their old pots, and re-potting into smaller ones. In doing this, proceed cautiously; that is, damage the old healthy roots no more than can be avoided, but get as much of the old soil away from them as possible. The compost for autumn potting must be rather poor than otherwise; and should consist of turfy loam, peat, and sand, in about equal proportions, with a sprinkling of leaf-mould for the strongest-growing plants. Be careful to drain your pots thoroughly, which will be best secured by using the inverted pot, and adding a larger sized one every time the plants are re-potted, so that, by the time the plant gets into its blooming pot, there is a hollow cone through the centre of the ball of earth, which secures it against any stagnation of moisture, and also admits of a free ingress of air to the roots. I have practised this mode of draining Calceolarias for some years past, and find it the best that can be adopted. When the plants are potted and replaced in the frame, they will require to be kept close and rather cool until they begin to make new growth, after which air must be freely admitted.

If large handsome specimens are desired, the plants must be kept slowly growing throughout the whole winter, but of course without being forced in the dull months. A young plant, however, vigorously grown from this time until next March, will generally make the finest specimen for exhibition, as for that purpose it is not large plants that are required so much as clean, neat, compact, and luxuriant specimens. During winter, Calceolarias do not require much water (but should not at any time be allowed to flag); in summer, however, they can scarcely have too much of it. The best soil that can be used for growing Calceolarias is in equal parts of turfy loam, peat, and leaf-mould, with about one-sixth of white sand mixed with it. This should be used as rough as possible, and if the leaf-mould is only half decomposed, it will be all the better for the plants.

The only secret in growing Calceolarias is to get the plants strong in autumn; grow them gently, with plenty of air, through the winter; put them into their blooming pots on the one-shift system in the first week in February, and then push them along in a gentle heat, keeping them free from insects, until they show bloom in April, after which they must be grown in a cool, airy place, to prevent the flower-stems from being too much drawn.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Vines.—I was pleased to find you expressing it as your opinion that it is wrong to imagine that grapes require to be exposed to the sun to bring them to maturity, as it confirms a statement which I made on a former occasion, that I have frequently seen them of a better colour when grown under the shade of leaves or beneath a rather than when more exposed, and that they are less liable to shank off in such a situation. I cannot, however, subscribe to the doctrine, that the longer the shoots are permitted to extend the greater the benefit to the growing crop, even if the leaves could be exposed to light, which is impossible in a hothouse, where a bunch of grapes is expected in the space which every half-dozen leaves would require. I am doubtful whether the leaves, instead of secreting juices for the fruit, would not rather be employed in appropriating matter for wood, or storing it for renewed energy during the following season. Theory may be against me, (and I confess my ignorance,) but experience and observation are on my side. In a conversation which I had with an experienced gardener, he assured me that he never saw such good bunches of grapes on the leading shoots of Vines permitted to ramble, as on those that were stopped, and I have nine or ten instances this year of the same proofs, under my own eyes. Indeed, were it not for the sake of a little extra shade, I would stop every shoot at the same joint the fruit proceeds from, and as soon as I could discern the embryo bunch, because I perceive the berries, at least in their early stage, swell the faster for it. In thinning some bunches lately, I observed two shoots that

had proceeded from a double eye; both had a bunch of grapes,—that from the small or hind eye not having even a leaf beyond the fruit, yet the berries are larger than on the other shoot, which has leaves, and is, moreover, much stronger. I am aware that this is a dangerous field for an uninitiated writer to enter upon, when Mr. Knight and others have demonstrated that, unless there are leaves to draw and prepare the juice of a fruit, it will neither swell freely nor have flavour; but I have seen both Peaches and Plums without that auxiliary, as large as others, and have tasted them when ripe, and found them not flavourless.—*J. Murdoch.* [It should be observed, that we do not object to "stopping" in order to make bunches swell. What we doubt the expediency of is the practice of cutting away or destroying all laterals, &c.]—Setting aside your judicious observations at p. 443, I have this year stopped at the bunch those Vines which produce fruit in pots, and judging from the quality of the fruit, I see no cause to abolish this practice. In Spring, when every foot of glass is to be made the most of, it is to be recommended with the pot system: more rods may be admitted with less fear of crowding them; the foliage grows to an immense size, and is so full of sap that if the mid-rib is broken, it soon heals over and appears as capable of producing a plant as a cutting of the *Salvia* or a *Gloxinia* leaf. A Black Hamburg Vine has been subjected to this treatment for many years, and annually bears from 30 to 40 bunches, which are ripe in May. The branches are always kept in heat, and the roots are always warm from the bark-bed in front of them.—*W. Brown, Merevale.* [We trust it will be observed that the roots here are kept warm.]

Vines.—I feel greatly obliged to "A Subscriber," as well as to "A Subscriber from the beginning," for favouring me with their opinion respecting the failure of my Vines, (mentioned at p. 414,) although I do not agree with either of them as to the supposed cause. The failure of my Vines cannot be attributed to the difference of temperature between the house and border, since I do not lose one leaf before the sun attains sufficient power to warm both the house and border. As "A Subscriber" states that his Vines recovered as soon as the sun became powerful enough to warm the border, that is sufficient evidence that his Vines are not affected in the same manner as mine. "A Subscriber from the beginning" says, at p. 461, he is persuaded that I have planted my Vines too deep, but upon examining their roots the other day, I found them ten feet from the front of the house, within an inch of the surface, and quite healthy. In an adjoining house, I have five Vines which were planted a year earlier than the others, and were treated in the same manner; in the third year each bore seven bunches of fine grapes; and this year they have each ten bunches upon them, as fine as a gardener would wish to see.—*S. Querrill, Park Villa.*

Guano was applied to Cauliflowers, and it has been found that those to which it was applied were not injured by the Wire-worm; it was sufficiently tested, the plants having been watered alternately in the rows, and every plant not watered was more or less infested.—*Zephyrus.*

Asparagus.—"Perhaps," says Mr. Wallace, of Kelly, in your Number of June 24, "perhaps at this time of day you will scarcely believe that the great proportion of practical gardeners disbelieve the method which you recommend for raising Asparagus, chiefly because it does not accord with the practice they have been used to, and therefore they cling to the old lazy fashion of trusting to covering them up with manure before winter, and cutting only a shoot here and there in spring." Now, for the life of me, I cannot understand why the champion of reform should condescend to make such an attack upon the majority of gardeners, and take upon himself to say that the majority of gardeners disbelieve your method of raising Asparagus, and I venture to think that they would be equally the same in everything else, could Mr. Wallace's statement be proved; but I stoutly deny the charge, and say that the greater proportion of practical gardeners do believe your method to be very excellent, because they have both seen and heard of the good effects of a top-dressing of guano, and during the summer to apply liquid manure and common salt. The cutting of the Asparagus completely over in spring is not so new in Kelly as Mr. Wallace would have us to believe, for I can prove that the same plan was adopted there by a good gardener some 20 years ago, who has practised it ever since, though not at Kelly. How is it then at all possible that the majority would condemn that which many of their number practise annually. The honourable M.P. calls upon you to "fortify your recommendation from authority." Does he for one moment suppose that the majority of gardeners would question your authority? or does he think that we have not men in the profession who have as much brain, and a vast deal more sound judgment in garden affairs, who would very soon prove the method to be right or wrong? But gardeners are fully aware that you would not be guilty of anything so ridiculous as to advance any doctrine without being fully satisfied of its soundness; ay, and state your views quite specific enough for any one. Verily, Mr. Editor, we must be a very stiff-necked, contumacious, and rebellious race in the west of Scotland, (at least Mr. Wallace would have you believe so,) to be so easily gulled into anything that we may suggest. I am not acquainted with the honourable Gentleman's gardener, —if he is a gardener at all,—but I should like Mr. W. to inform me whether he is at all acquainted with a person who offered, not long since, the very handsome sum of 27*l.* per annum to a gardener. Where, in the name of wonder, that person expected to find a man that would or could conduct his garden affairs for such a sum I know not; but I apprehend neither gardeners nor their masters ought to be astonished if such a gentleman were to com-

plain of "men too often distinguished by their obstinate resistance to everything new which they themselves do not suggest."—*A. Mathison, Clydesdale.*

Nitrate of Soda.—Some persons assert that, although a good crop may be obtained by the use of this salt—the following year, if the salt is not again applied, the produce is poor and the soil is deteriorated. Will some of your readers who have experimented during two years be kind enough to state the fact?—*G. S.*

Potting.—In a late Paper, when treating of potting plants, you say, "to bury an inch or two of the stem of a plant is very injurious." Now, as a general rule, I dare say it is correct; but, had I observed it, my small collection of plants would have been less by six. In August, 1841, I sowed some *Pelargonium* seeds, saved that summer. They came up, and I kept them so warm that they became, when about two inches high, too weak to support themselves—all died excepting one, and that I plunged up to the first leaf in a rich compost; it grew, and is now, as far as form is concerned, a singularly beautiful plant—it is about 3*ft.* 2*in.* in circumference, 17 inches in height, and is supported on a single stem half-an-inch thick; it is one mass of leaves, in which the shoots are hidden, for not one is visible. It has been raised in a room without fire, and, excepting in very severe weather, has never, since re-potting, been in a warm place. I have raised six more this spring, and they bid fair to rival "my pet" in robustness. It has flowered this summer, and I send two of the petals for your opinion.—*E. C.* [We regret to say that the *Pelargonium* here alluded to was so much shrivelled as to be unrecognisable. It did not appear of any value in a floristical point of view.]

Salvia patens.—As "Mr. Ross, Holme Gardens," asserts that *Salvia patens* is hardy, I beg to inform him that a plant was left out last winter in the garden here, by mistake, the soil and situation, however, being as favourable as in most places at Holme. While digging the border, the tubers were turned up. I inspected them minutely, in order that if any vegetation remained, some cuttings might be got from them. However, it proved otherwise; for although the tubers were fresh, the crown of the plant was completely decayed, so that it was utterly useless and good for nothing. Possibly Mr. Ross's plant may be harder than those grown in the neighbourhood of "Avonch."—*Cromdale.*—Considerable doubt seems to be entertained by your subscribers as to the above plant being able to stand the winter unprotected. I was determined last winter to try for myself, and sorry I am that I did so. I give you the result. I had a fine *Salvia* on a south and very dry border, and when it had ceased flowering and the stems had partly died down, I covered it over with what we call pea gravel, and placed a flag-stone on the top to protect it from the heavy rains. In the spring I found, to my regret, that it was dead. Not wishing to risk my other plants, I took them up in the autumn, and potted them in soil; kept them in the window of my cottage, and allowed them occasionally a little water. The consequence was, they started to make shoots early, and I have a fine collection, all being alive. As the latter mode is so simple, and not attended with much trouble, I would advise your correspondents, at all events, not to try the experiment of leaving out all their plants during winter.—*Chemical Jack.* [We think enough has now been said about *Salvia patens*.]

Silk Plant of Madeira.—The beautiful plant in Madeira, called by the natives *Arrore de Seda*, or Silk Tree, is the "*Gomphocarpus fruticosus*." Perhaps this may be the "*Madeira Silk Plant*" mentioned in your answer to "*Zephyrus*," at p. 465.—*E. J. M.*

Arrowroot.—You state at p. 447 your wonder that "the West Indian cultivators do not turn their attention more to the production of Arrowroot," and that "if it could be had genuine, at a moderate price, it would be largely consumed in England. But 3*s.* or 4*s.* a pound is a prohibitory price." Allow me to say that I have imported for my own use, and for the purpose of giving away amongst my poorer neighbours, whatever quantity I have required for many years past, direct and genuine from the West Indies; and that the reason why it is not more cultivated, is, that the price at which it is sold (genuine) there for will not sufficiently repay the producer for trouble—i. e. 1*l.* 12*s.* 6*d.* per cwt. Add to this the present rate of duty, 1*s.* per cwt.; freight, 4*s.*; sundry expenses, say 2*s.* 6*d.*; = 2*l.* per cwt. As I have stated, I obtain my Arrowroot genuine, and at the above price; so that if sold even at 1*s.* per pound, there would be a clear gain of 150 per cent. to the retailer, and at the price you state some 400 or 500 per cent. The fault, then, lies not with the West Indian cultivators, but with the English retailer.—*A West Indian.*

Gladolus communis.—In the heart of the New Forest I gathered, about a week since, the inclosed *Gladolus*, evidently a small variety of *G. communis*. It was growing with many others in the midst of long grass, but has never, that I am aware of, been noticed as having been found in a wild state.—*Pinus.*

Chamomile.—Two years ago I planted three beds of double Chamomile behind a north wall in very strong soil. The following year I was surprised to see that all the blossoms, with the exception of one or two patches, came quite single. Last autumn two of the beds were dug up, and replanted, after receiving plenty of manure and cinder-ashes, with good double-flowering plants from a neighbouring garden, and this year, I think, everyone is single. Will any of your correspondents have the kindness to inform me whether it is the aspect or the soil that does not suit them?—*J. W. T.*

Tank System of Heating.—In the drawing given of my tanks at p. 460, the dimensions are so much reduced

that it may lead to error. It is also *not* drawn by any scale, so that no measurement could be taken from it. To prevent mistake, I may as well state that Tank B 1 is sixteen feet long, and seven feet eight inches wide at the largest end; the two sides of it being each two feet eight inches wide—the walk up the middle being twenty inches wide. Tank B 2 is twenty-two feet long and two feet wide, inside. Both tanks are eighteen inches deep in the clear.—*John Hayshe, Clithydon Rectory.*

Strawberries.—In answer to a "Subscriber," who inquires at p. 464 respecting the method of treatment pursued in preparing Strawberries for forcing, I beg to say, that after having tried at various times all the plans recommended by the best authorities, I consider the following one the ultimatum, and have therefore continued to practise it for several years with unvaried success. Strong runners are taken up in September, and planted about six inches apart, in manured and well-prepared beds four feet wide, in a somewhat sheltered situation; here they are allowed to remain until the following July, during which period they must be kept very clean from weeds, have the flowers and runners regularly pinched off, and be watered whenever likely to suffer from drought. About the middle of July, they are potted in small 32-sized pots, two plants in a pot, taking the greatest care that neither roots nor leaves are damaged in the operation, and an important part of it is to press the earth firmly about them: the soil used is two parts loam, to one of well-rotted dung. Beds which will hold five or six rows of pots, are then formed in the following manner:—level the surface of the ground, and spread upon it a layer of coal-ashes; drive down a sufficient number of stakes to form the bed, to which must be nailed firmly slabs, or any rough boards, as wide as the depth of the pots, which are then to be plunged to the rim in spent bark or ashes. All that they will here require, is attention to watering when necessary, and a slight protection with fern or other light covering during severe frosty weather. I always preserve from 300 to 400 of the latest-forced plants of the above description, and after having carefully reduced their balls, repot them in large 32-sized pots in July, treating them afterwards precisely as the others. I find these, by having their buds formed early (through the slight forcing they have received,) and becoming very strong, are admirably adapted for the first crop, and always repay me for the extra trouble.—*Joseph Paxton.*

Ipswich Cucumber Society.—At p. 464, you state in answer to "S. S.," that the Cucumbers which obtained the prizes at the last Ipswich Cucumber Show were Hamilton's Black Spine, Hamilton's White Spine, Walker's Pea-green, and Roman Emperor." That statement is not, however, correct, as the following were the sorts which then received prizes:—1, Latter's Hybrid, Black Spine; 2, Ringleader, ditto; 3 and 4, Latter's Hybrid, ditto; 5, Masterpiece, ditto; 6, Standard, ditto; 7, New Manchester, White Spine; 8, Gordon's Black Spine.—*Thos. Will, Hon. Sec.* [It seems that we referred to the account of some other meeting, and not to the last one, for evidence about the sorts of Cucumbers.]

Gooseberry Caterpillars.—I have this season found white Hellebore powder completely successful in preventing caterpillars from eating the leaves of Gooseberry trees. I find young trees are more in danger than old ones, and one ounce is sufficient for about 30 or 40 trees. A small quantity dusted over the leaves prevents the work of destruction.—*Omega.*

Bees.—Believing that your readers will fail to recognise in Mr. Wighton's reply to my communication on the fortifications of Bees à la Huber the friendly spirit observable in mine, I shall not further take up your space than by observing that I took it for granted he was conversant with the 2nd Edition of the "Honey Bee," published in 1838; which, to quote the "Quarterly Review," "may be considered the standard work on our domestic Bee," and, if I may be allowed to use the words of the same authority applied to myself, I appeal to your apian readers, whether they think it likely that "so practised a Bee master" would take a fallen comb for an intended fortification, or be easily led away by any "mealy Bee story?"—*Robert Golding, Hutton, Maidstone.*

The Sparrow.—A "Subscriber" observes at p. 461, that he for the first time saw the common Hedge-sparrow busily engaged collecting Aphides from his Rose-bushes, to feed their young. I can bear testimony to the House-sparrow doing so, because, a pair having built their nest in the spout beneath the roof of my house, I was about to shoot them, when I saw the cockbird flying repeatedly backwards and forwards to a standard Rose, which induced me to watch him; when I discovered that he was searching the branches for Aphides, carrying away each time as many as he could. On looking at the branch afterwards, I found that it was clean, although the surrounding ones were covered with the Aphids. I need not say that this discovery saved their lives.—*James Hooper, 7, Park Villas, Holloway.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

July 12.—The weather on this occasion was signally propitious; for, besides the wind being northerly, the sky was a good deal clouded during the afternoon, which prevented the heat being so oppressive as it often is in July. Everything in the gardens, too, had a fresh and vigorous appearance, such as is seldom seen at this season; neither the Grass nor any of the shrubs and flowers being at all parched. In consequence of the Duke of Devonshire having kindly thrown open his beautiful grounds to the company, there was a most large attendance of visitors than usual, about 7500 having been admitted at the gates. Both Chiswick Gardens and those of the Horticultural Society were proclaimed to a late hour; and His Grace's hospitality seemed to be fully appreciated.

Like the displays of former years, the show of flowers was deficient as compared with those of May and June; but this was principally observable in regard to the larger collections of plants, which are now so difficult to make up without an almost unlimited establishment to draw upon. Only one group of forty, and one of twenty plants

were exhibited; and the absence of more in this class necessarily left a vacancy, which was, however, appropriately filled up by plants from the Society's garden. A group of the Mexican species of *Abies* and *Pinus* was particularly admirable among these, presenting a great variety of the most elegant forms, with some excellently-cultivated specimens. The chief collection of plants was contributed by Mr. Goode, gr. to Mrs. Lawrence, Ealing Park; and contained two splendid specimens of the old *Crassula* (*Kalosanthes*) *coccinea*, between two and three feet high, and bearing large heads of the most brilliant flowers, the hue of which was quite dazzling; *Stenochilus maculata*, a singular old plant, with prettily spotted flowers, of which the fine specimen was producing a considerable profusion; *Xanthosia rotundifolia*, beautifully grown, and well clothed with its pleasing snowy blossoms; a very good dwarf plant of *Epacris grandiflora*, which has been proved, by the shows of the present year, to be one of the most ornamental of greenhouse plants, and to be capable of a high degree of cultivation; *Mirabilis dilatata*, laden with rich terminal racemes of deep pink flowers, and a very handsome object; a pot of *Achimenes longiflora*, in an excellent flowering condition; a very tall *Stephanotis floribunda*, nicely in bloom; *Ixora coccinea*, a large plant, richly bloomed. *Hilaeus Cameroni*, sheeted over with blossoms, which would not open beneath the canvas; one of the old species of *Cassia*, admirably grown, and bearing numbers of dark yellow flowers in clusters at the ends of the branches; a very large plant of *Rondeletia speciosa*, with the branches trained so as to be tolerably bushy; *Clerodendron squamatum*, particularly dwarf, with noble heads of its superb flowers; another species of *Clerodendron*, with deeply cut leaves, and white flowers which resemble some *Jasmines*, and are nearly as fragrant; *Cuphea Melvillei*, handsome, but not so fine as it has been produced here; *Begonia sanguinea*, remarkable for the deep sanguine tint of the backs of its curious leaves, and well studded with blossoms; *Erythrina cristagalli*, in a well-cultivated and well-flowered state; *Ixora handhuca*, a noble plant, with few flowers; *Polygala oppositifolia*, grown into a tree, and having a fine expansive, though dense, head, covered with inflorescence; *Begonia parviflora*, a pretty and free-flowering plant; two globular trellises, beautifully adorned with *Manettia cordifolia*; and an unusually fine specimen of *Statice arborea*, bearing a splendid panicle of flowers. The smaller collection of twenty was contributed by Mr. Green, gr. to Sir E. Antrobus, Bart. It was composed, besides other things, of *Calanthe veratrifolia*, in the richest health; the new and specious *Achimenes grandiflora*; *Chorozema ovatum*, trained on a trellis, and flowering extremely well; a singularly good dwarf spreading plant of *Gardenia radicans*; a very capital specimen of *Crocea saligna*, *Stephanotis floribunda*, on a short funnel-shaped trellis, and blooming well; a large plant of *Leschenaultia biloba*; *Siphocampylus betulifolius*, still in the greatest perfection; *Pimelea hispida*, fine; a healthy plant of the showy *Nematanthus longipes*, with thick shining leaves, and scarlet blossoms on long drooping peduncles; *Stigmaphyllon ciliatum*, a pretty new climber; an excellent dwarf plant of *Boronia serrulata*; and a most luxuriant specimen of *Ardisia crenulata*, its clusters of rich red berries forming a good relief to its neat white flowers. In the collections of six there were four competitors, and, as before, these plants were probably the most noticeable in the exhibition for favourable culture. Mr. Clarke, gr. to M. T. Smith, Esq., Shirley Park, produced the lovely *Lilium speciosum punctatum*, in a richly-grown state, with a great number of blossoms; *Dracophyllum gracile*, an admirably-managed plant, loaded with neat white flowers; *Philobertia grandiflora*, having unusually large blossoms; *Roelia ciliata*, a fine plant, though not thoroughly in flower; an uncommonly handsome specimen of *Pimelea decussata*; and a noble plant of *Polygala oppositifolia*. From Mr. Frazer, nurseryman, of Leyton, Essex, there were a superb specimen of *Epacris grandiflora*; *Crassula nitida*, something like *C. coccinea*, and nearly as good, finely grown; a good *Euthalea macrophylla*; a handsome plant of *Statice arborea*; and *Vinca rosea* and *alba*, the latter remarkably beautiful for its cultivation. The collection by Mr. Bruce, gr. to B. Miller, Esq., of Mitcham, contained a first-rate plant of *Geranum tricolor*; *Achimenes longiflora*, in a good blooming state; *Clerodendron speciosissimum*, particularly good and splendid; a stunted plant of some *Burchellia*, apparently different from *capensis*; an excellent *Gesnera*, which appeared to be *faucialis*; and *Elichrysum proliferum*, conspicuous for its bright crimson everlasting flowers, and its moss-like foliage. There was further, a collection from Mr. Pawley, of Bromley, comprising a superlatively good plant of *Stephanotis floribunda*, fastened to a flat trellis, and flowering well; *Ixora coccinea*, dwarf and excellent; *Mahernia incisa*, *Euphorbia splendens*, and *Oncidium flexuosum*.

Heaths were about as abundant as usual; and, in some of the collections, there were magnificent specimens. Those furnished by Mr. Goode, gr. to Mrs. Lawrence, were of the very first excellence. The group included *E. cerinthoides*, exhibiting a dwarfness, closeness, and luxuriance, which are by no means common to it, and showing twenty or thirty young shoots at the base, just springing up to render the plant still more bushy; *E. metuliflora bicolor*, an admirable plant of a very elegant kind; *E. tricolor elegans*, with flowers of the most delicate tints, and the specimen dense to an astonishing degree; *E. inflata*, an immense plant, superbly filled up with branches, and studded with flowers; *E. Juliana* in a most excellent condition; *E. perspicua*, a beautiful plant, but the flowers fading; *E. Cavendishiana*, extraordinarily good; *E. Westphalingia*, dwarf and pretty; *E. radiata*, exquisite; *E. eximia*, fine; *E. tricolor superba*, admirable; *E. jasmiflora alba*, splendid; *E. ampullacea vittata superba*, remarkably fine; *E. inflata*, very large, magnificent; *E. viridis*, four feet high, extraordinary; *E. Bovicana*, very bushy; *E. ventricosa tenuiflora*, lovely; and *E. ventricosa coccinea minor*, a most charming little object. The compactness and healthiness of all these plants were truly surprising, and highly meritorious. Another extensive collection was shown by Mr. Jackson, nurseryman, of Kingston, Surrey; and the plants in it were conspicuous rather for age and size than for a very verdant or magnificent appearance; though there were several of the latter description. Many of them were likewise much encumbered with stakes, each of the branches having a strong support, which gave a constrained and unnatural aspect. The best specimens were *E. tricolor*, a plant of very unusual dimensions; *E. jubata*, four feet high, dense, and splendid; *E. ampullacea major*, dwarf and good; *E. odorata*, three feet in height, a beautiful plant; *E. Savilleana*, a little tree; a variety of *E. princeps*, good; *E. jasmiflora alba*, close and fine; *E. ventricosa breviflora*, curious as well as showy; *E. inflata rubra*, excellent; a beautiful seedling from *E. Shannoni*; *E. Jacksoni*, a delightful little plant; a very delicate coloured seedling variety of *E. tricolor*, with *E. gemmifera* and *aristella*. Mr. Dawson, of Brixton Hill, furnished a beautiful small collection, as did Mr. Clarke, gr. to M. T. Smith, Esq., Shirley Park. Mr. Green, gr. to Sir E. Antrobus, Bart., and Mr. Pawley, of Bromley. The principal plants in Mr. Dawson's group were *E. Massoni*, very good; *E. mutabilis*, excellent; *E. Iriyana*, a remarkably large and handsome specimen; a fine *E. ampullacea*, and *E. Bergiana*. The finest of Mr. Clarke's plants were:—*E. tricolor*, particularly good; *E. perspicua*, splendid; *E. Juliana*, capital; and some superb varieties of *E. ventricosa*. Mr. Green's best specimens were a dwarf and compact *E. Massoni*; a very excellent *E. metuliflora bicolor*; and a well-managed *E. Westphalingia*; Mr. Pawley's were *ampullacea rubra*, *Bovicana*, and *Cavendishiana*, all superlatively rich.

Under the head of *Orchidaceae*, there was a noble exhibition, and while it did not equal that of June in point of numbers, it was composed of exquisite objects, and may be considered to have been the best-supplied class at the show, in the flower department. The plants from Mr. Mylam, gr. to S. Rucker, Esq., Wandsworth, took the precedence, and were of the highest order. They were:—*Maxillaria stapelioides*, beautifully flowered; *M. vitellina*, a richly-coloured species in the flowers, and of a dwarf habit; *M. macrophylla*, (now called *Lycaste macrophylla*), a capital specimen; *Oncidium leucochilum*, with the long flower-spike trained over a taper conical trellis, and looking very well under such treatment; *O. amplatum*, the large-flowered variety; *O. luridum guttatum*, in splendid condition; *Cirrhaea squarosa*, obtusata, *Wareana*, and *tristis*, all graceful, pretty, and laden with blossoms; *Aerides affine*, very handsomely in bloom; *A. quinquevulvum*, a rare species, flowering finely; *Epidendrum alofolium*, a pleasing species, like a *Brassavola* in appearance; *E. Grahami*, one

of the better kinds in the pseudo-bulbous section; a new species, with a charmingly fringed lip; the delightful old *Broughtonia sanguinea*; *Phaius abius*, in a singularly strong and healthy state; *Brassia brachata*, a species with a very broad floral lip; the strange-flowered *Catsetum luridum*, beautifully healthy; *Mormodes citrinum*, a showy plant; *Zygopetalum rostratum*, a fine old species; two varieties of *Stanhopea tigrina*, the one with very deep purplish sanguine blotches in its flowers, and the other having paler stains, the blossoms of the latter being immensely large; a species of *Cymbidium*, with leaves like those of *C. alofolium*, and far larger and handsomer flowers; and *Angreum caudatum*, having curious long tails to its pleasing white and green flowers. Second in merit was the contribution of Mr. Goode, gr. to Mrs. Lawrence. In it were a small *Barkera spectabilis*, deficient in the size of its flower-spikes and flowers, and also in their colour; *Cattleya violacea*, a most glorious specimen, with a great number of its gorgeous deep crimson blossoms; a nice little plant of *Peristeria cernua*; a fine strong specimen of *Cycloches ventricosum*; the strange-looking *Coryanthes macrantha*, admirably bloomed; *Hundleya violacea*, with one of its singular violet tinted blossoms expanded; the lovely *Trichopilia tortilis*, in a somewhat diminutive state; *Oncidium laucanum*, a magnificent object; *O. pulchellum*, very pretty, a very grand specimen of a variety of *Gongora maculata*; *Stanhopea Wardii*, good; *S. grandiflora*, with its delicious odour, and *S. oculata*, with its still more peculiar scent; with a good plant of *S. quadricornis*. Messrs. Rolleston, of Tooting, whose collection came next, brought *Stanhopea Wardii pallida*, a fine specimen, *S. tigrina pallida*, like that described in Mr. Mylam's collection; a seeming variety of *S. Wardii*, with pale yellowish flowers, but several spots in the sepals and petals, and all these plants growing between the arms of a three-forked log of wood, so as to admit of their flower-scapes being sent downwards without interruption; the curious twining-stemmed *Oncidium volubile*; *O. leucochilum*, *Wentworthium*, and *luridum guttatum*, the first of them trained on a flat trellis, which made it appear rather formal; *Lycaste macrophylla*, finely bloomed; a small specimen of the valuable *Miltomia speciosa*, and *Aerides odoratum*; *Renanthera coccinea*, good; and a highly-cultivated plant of the very ornamental *Calanthe Masuca*. By Mr. Carson, gr. to W. F. G. Farmer, Esq., Nonesuch Park, there were sent small plants of *Miltomia spectabilis*, *Cattleya crispata*, and *Oncidium laucanum*; with very excellent specimens of *Cattleya Mossae* and *Brassia Lancana*. Mr. Edmonds, gr. to his Grace the Duke of Devonshire, Chiswick, showed a good specimen of *Mormodes citrina*; a handsome plant of *Cycloches Loddigesii*; a pretty variety of *Gongora maculata*; a very dark-flowered *Acropera Loddigesii*; *Rodriguezia planifolia*, and a plant allied to *Saccolabium*, with numerous minute yellow flowers. There was a single specimen of *Miltomia spectabilis*, large and full of flower, from Mr. Mylam, gr. to S. Rucker, Esq.; a remarkably noble plant of *Renanthera coccinea*, with an immense raceme of flowers, from Mr. Falconer, gr. to A. Palmer, Esq., Chesham; and a deep-coloured variety of *Acropera Loddigesii*, called *orientalis*, from Mr. Pawley.

Of miscellaneous objects, or detached specimens, there was a moderately good exhibition. A dozen plants of the noble *Lilium eximium*, conspicuous for the length of its pure white flowers, and for the stateliness of the plant's general habit, as well as for its adaptation to pot culture, were sent by Mr. Mountjoy, of Ealing. A collection of *Gloxinas*, including *G. rufra*, *candida*, *maxima*, *violacea*, *caulescens major*, and some rather pretty seedlings, was supplied by Mr. Jackson, nurseryman, of Kingston. Six large and finely-grown plants of the elegant *Rhodanthus Manglesii* were exhibited by Mr. Kier, gr. to M. Coulthurst, Esq., Streatham. A neat little shrubby plant, with bright pink flowers, and pinnated foliage, bearing the name of *Lypertia* (a *Carex* genus), *pinnatifida*, was shown, we believe, by Mr. Hooker, of the London Bridge Station. Among the specimen plants displaying good culture, were *Clerodendron squamatum* and *Medinilla erythrophylla*, both splendidly grown and bloomed, from Mr. Goode, gr. to Mrs. Lawrence; *Boronia viminea*, an excellent specimen, and *Nepenthes distillatoria*, very tall, and covered with its interesting pitchers, from Messrs. Lacombe, Pince, and Co., of Exeter; *Pimelea decussata*, a magnificently rich and dense plant, from Mr. Clarke, gr. to M. T. Smith, Esq., Shirley Park; *Erica pulcherrima*, a fine specimen, from Messrs. Rolleston, of Tooting; *Achimenes rosea*, exceedingly beautiful, in a slate tub, from Mr. Johnson, gr. to Mr. Beck, of Islington; *Seyanthus elegans*, from Messrs. Black and Gower, of Bayswater; and Mr. Pawley, of Bromley, the first trained on a flat trellis, and the last on a conical-shaped one, and each highly interesting; *Leschenaultia formosa*, a specimen remarkable for size and verdure, from Mr. Clarke, gr. to M. T. Smith, Esq., Shirley Park, and one of less dimensions, but literally sheeted with brilliant flowers, from Mr. Falconer, gr. to A. Palmer, Esq., of Chesham; *Crocea saligna*, a most admirable object, from Mr. Frazer, of Leyton; *Sollya linearis*, forming a charming cone of deep blue flowers, from J. Hayes, Esq., of High Beech; *Erica viridis*, very large and good, from Mr. Bruce, gr. to B. Miller, Esq.; and *Manettia bicolor*, covering a very ornamental trellis, from Mr. Goode, gr. to Mrs. Lawrence. Plants that were beautifully cultivated, though not equally so with those just specified, were *Sollya heterophylla*, shown by Mr. Leas, of Woodford, Essex; the pretty *Nipharia oblonga*, by Mr. Goode, gr. to Mrs. Lawrence; *Gloxinia Menziesii*, a pale blue and spotted flowered variety, from Mr. Lane, gr. to J. H. Palmer, Esq.; and also a tall and fine *Ixora coccinea*, from the same grower; *Achimenes longiflora*, by Messrs. Rolleston, Tooting, and Mr. Carson, gr. to W. F. G. Farmer, Esq.; a species of *Scutellaria vivum*, allied to *S. tortuosum*, and covered with yellow blossoms, from Mr. Wilson, gr. to W. Piggett, Esq., Newmarket; *Medinilla erythrophylla*, by Messrs. Rolleston; *Gloxinia maxima alba*, very rich, by Mr. Mountjoy, of Ealing; a small *Rondeletia speciosa*, by Mr. Pawley, of Bromley; and *Fuchsia Chandleri*, in a slate tub, by Mr. Johnson, gr. to Mr. Beck. The specimens noticeable for the novelty or rarity of the species, were *Achimenes grandiflora*, contributed by Mr. Mountjoy, of Ealing; *Lilium testaceum*, a handsome plant, and *Gesnera rufula* very showy, also from Mr. Mountjoy, *Nematanthus longipes*, excellently grown, by Mr. Goode, gr. to Mrs. Lawrence, and a smaller plant of the same, by Messrs. Rolleston; *Lemnia spectabilis*, and a *Gloxinia* with deep pink flowers, apparently raised between *rubra* and *candida*, by Mr. Goode; *Schizanthus candidus*, a pretty new species with white flowers, and *Loasa lucida*, having large shining leaves and flowers, which have a dark red and yellow centre, by Mr. Best, gr. to A. Park, Esq., Merton, a charming little *Clintonia*, having deep lilac flowers, paler in the centre, by Messrs. Black and Gower, Bayswater; the gorgeous *Clerodendron splendens*, contributed by Mr. Dawson, of Brixton Hill, with its beautiful lavender-coloured polyantha, *Rondeletia longiflora*, with its beautiful lavender-coloured flowers; *Alstromeria nemorosa*, full of blossom; and a new climber, a small plant, yet bearing many flowers; and a species of *Conium*, with rich scarlet flowers, looking like a species of *Conium*, from South America, all from Messrs. Veitch and Son, of Exeter. A Cut Flower of the *Barringtonia speciosa*, bearing a large bunch of pink stamens, and probably produced for the first time in this country, by Mr. Dodd, gr. to Col. Baker, Salisbury. A kind of *Cereus*, like *speciosissimus* in the flowers, but of a very slender habit, by Mr. Fielder, gr. to W. Linwood, Esq.; and *Mimulus Fendleri*, like a very deep-coloured variety of *M. cardinalis*, from Mr. Baldwin, of Leyton, Essex. A stand of Sweet Williams, from Mr. Frazer, of Turnham Green, contained some showy single and semidouble varieties. Roses in pots, principally standards, were shown by Mr. Rowland, Esq., of Lewisham, but they were in no way remarkable. The exhibition of Cut Roses was, however, particularly extensive and splendid; the flowers being, for the most part, large, the sorts good, and the bunches agreeably varied by foliage and buds. On the whole, they have not perhaps ever been equalled. The chief exhibitors' names will be found in the prize list, among our advertisements. The following were most conspicuous among the 50 Roses exhibited by Mr. Rivers:—*GALLIA*: *Julie*, *Lulu*, edged with purple; *Lee*, brilliant Rose; *Guerni's Gift*, deep rose, most perfect red, exceedingly fine and perfect; *Leonia*, marbled rose, *Boula de shape*; *Pharos*, bright rose, a very superior Rose; *Columella*, red, *Nanteuil*, very large and fine, purplish crimson; *Columella*, edged with white, most beautiful Rose. *ALBA*: *La Séduisante*, edged with white, most beautiful Rose; *Félicité*, delicate flesh-colour, very perfect and beautiful; *Sophie de Marsilly*, blush, with more delicate blush than the old *Celestial*; *Sophie de Marsilly*, with colour, very perfect and beautiful. *DAMASK*: *Duke of Cambridge*, deep rose,

taking the draught and strain off the beam, which is therefore allowed to be much lighter, whilst, by means of a screw, alterations of an inch or more are instantaneously effected without the necessity of breaking the horses. A plough adapted for heavy land, invented by Wm. of Scotland. This has been improved by William Wood, of Knutsford, in the beam for regulating the depth. The draft has been diminished by Mr. Wood's improvements. A plough, invented by W. H. Hyett, Esq., and manufactured by R. P. Chew, of Painswick. A movable apparatus, with three lines, for the purpose of loosening and pulverising the soil in the bottom of the furrow, is attached to the right side of the beam. A one-wheel plough, invented and manufactured by Messrs. Barrett, Exall, and Andrews, of Reading. This is a very light plough, with a divided turn-furrow. A boat plough, manufactured by Mr. B. Mollington, of Asgarby, near Sleaford. It is for making a watercourse in the furrows after sown. A harrow, invented by Mr. Robert H. Min. of Hartington, near Asbourne, which follows a curve in a circular motion. A plough and drill, by Mr. John Menkon. The plough is of the ordinary description, to which a drill is attached, the drill being worked by the action of the plough-wheel. It is also accompanied by a harrow and roller for covering the seed. A set of iron seed or fallow harrows, by Mr. Charles Wright, of Idridgehay, the teeth of which can be gauged to any depth, and can be completely cleansed without stopping the horses. A crusher, by Hall and Co., the weight of which, without the frame, is ten-and-a-half hundred weight. Its peculiarities are, that moveable knives, on the principle of a screw, are placed obliquely on vertical wheels. A winnowing machine, invented and manufactured by Messrs. Samuel and Richard Jackson of Nottingham. This machine will answer for a blower to separate the light corn. There are also improvements in the rising and falling riddles, the shakers, and the connecting rod. Wayte's improved presser drill, for sowing corn, turnips, &c. This implement presents a perfect, simple, and cheap mode of forming regularly, at any distance from each other, six grooves sufficiently deep to receive any description of seed; and scrapers are fixed so as to keep the pressers clean while they are in operation. The apparatus for drilling bones, or other small manure, is fixed in the front of the pressers, so that the manure is forced down by the pressers into the grooves, and mixed with a portion of soil. An agitator is fixed in the manure-box, which is constant in motion, and prevents the manure from setting fast. The seed and manure can be seen in the grooves, and if either is not regularly deposited it is detected. These pressers will act upon every kind of land after it has been ploughed; they break the clods, and pulverise the soil, and in many cases there is no necessity for having the land harrowed. Upon clover ley, the pressers are set to go in the same seams as the plough, and they will be quite as effective, if they are used after the field has been ploughed some time, so that any quantity of land may be ploughed before the pressers are put to work upon it. The pressers have not any tendency to pull up long manure, but press it down. The presser drill turns at the ends of the lands without difficulty, and is not obliged to be lifted out of the ground. If a wheat crop should fail, or be very thin, the improved presser drills will be found of great value in the spring, to sow spring wheat or other grain amongst the wheat without injuring it, but on the contrary, will do it good by pressing it down, which fastens the roots. Six renovators may be applied to this machine in the place of pressers, so that it may be used for drilling seeds, lentils, manure, &c., upon old or new turf. Wayte's clod and soil crusher, or land cultivator. This implement will, in a very short time, convert the roughest land into small particles, and for fallows it is invaluable. It contains fifteen pressers for crushing land, and by taking part of the pressers off, will make grooves to receive seed as follows:—Twelve grooves at six inches asunder, eleven grooves at seven inches asunder, nine grooves at eight inches asunder, nine grooves at nine inches asunder. When it is wanted to be used as a presser, take some of the pressers off the shaft, and put a collar and screw on each side of the remaining pressers, so as to keep them at any distance the seams or grooves are required to be made. The scrapers are only required in wet or damp weather, and one upon every other presser will do when crushing, but when it is pressing, a scraper upon each presser will be necessary.]

Thursday, July 13.—THE SHOW-YARD.—The exhibition of implements improves beyond belief; not only are there very numerous new contrivances and improvements in old implements, but the competition between different manufacturers has caused a great improvement in the workmanship. It would be impossible to enumerate the various implements which are deserving of notice. Many inventors and manufacturers are naturally disappointed if their inventions are not noticed by the Judges, even if they obtain no prize.

Amongst many improvements, there is one on the thrashing-machine, by which the straw comes out unbroken and fit for thatch. I did not see it work, but it was explained to me by Mr. May, the partner of Ransome's, who have taken out a patent for it. A great improvement has also been made by Wenslake on his hay-making machine, by which the motion is readily reversed, and the grass which has been cut is immediately turned over. Lord Ducie had many improvements on his scarifiers, and his chaff-cutter.

Among the prize-implements, the following may be selected as those most deserving notice. We take them from the excellent report in the columns of the *Morning Post*—

The highest number of prizes of 3 l. to the Messrs. Richard Garrett, of Saxmudham, for a drill for general purposes. The general utility of this implement is to perform in one process, manuring, corn and grass seeding, which is accomplished as follows:—Corn and manure may be deposited together down the same conductors, or through separate coulters, rakes being provided to cover the manure with the mould upon which the seed is deposited. The seed-engine accompanying this drill, is adapted to sow at the same time with spring corn and manure, or may be used as a separate implement for Grass-seeds, Broad-cast, or Turnips and Manget-wurzel, in rows, either with or without manure. It possesses the following important additions in the construction of their improved drill, viz., a double-acted stirrer is introduced into the manure-department, having a perpendicular, and also a revolving movement, by means of which the manure (which in the drills hitherto in use has frequently clogged and hung back in the manure-box, so much so, as to require the attendance of a man to prevent it) is, in this, constantly disturbed and pressed forward into the departments for the depositing barrel, and causing an equal distribution in exact quantities, of the most difficult coarse, or badly-prepared manures. In the working of the seed-sowing engine, as before constructed, the difficulty which has hitherto presented itself, of mixing together the heavier with the lighter seeds, the heavier has, by the motion of the engine, been shaken to the bottom of the box, being thereby sown in very unequal proportions. To remedy this, the small heavy seeds, such as Clover, Trefoil, &c. are delivered from the cups, while the lighter Grass-seeds, such as Rye, Grass, &c. are, by the same operation, brushed out of a separate apartment of the box, down the same conductors with the other seeds. This easy and simple method, whereby the required quantities of each seed are nicely mixed, and evenly sown, over the land, deserves particular attention, and is regulated by merely turning the screw at the end of the box for Rye, Grass, and clover, &c. In addition to the above improvements, there is a simple and effectual method of depositing the manure and seed at intervals. The manure is first dropped in any required quantity and covered with the soil, and the seed is then dropped, at the same intervals, on the soil directly over the manure. There is also introduced into the drill a new and more effectual method of steering or guiding, so that on flat ploughed land, the drill in returning may be kept parallel with the preceding rows. A prize of 10 l. to Mr. David Harker, of Mere, for a new implement for draining, invented by himself. This implement consists of a frame supported upon four or more wheels, the wheels are upon cranks for elevating or letting down to the depth required, which is done with an endless screw turned by a handle acting upon a wheel fixed upon the same axle as the cranks, the cutting and throwing out part swings in the centre of the frame, with a movable mould board upon a castor-wheel, that rises or falls according to the depth to throw the soil a little off the side of the drain. Two small wheels are fixed on the front, the one running horizontal, and the other vertical, to guide in the same cut again, so that going or return-

ing it cuts and throws it out so that it requires no spade work at all, at less expense than a penny per rod, about two feet deep, two mould boards are attached to fill it in again. It can cut from one inch to two feet, according to the power. By removing the cutting part, the frame answers the purpose of a cultivator or scarifier, by fixing a tine to it of any description. It is all made of malleable iron. A prize of 10 l. for a patent chaff-cutter, invented by the Earl of Ducie. This machine will cut twelve inches wide, and can be driven by any sort of power; it works by men it requires two to turn and one to feed. This machine is upon an entirely new principle. The cutters consist of thin blades or knives with serrated edges, coiled spirally round a cylinder, which gives a drawing cut, and requires a much less power to cut a given quantity of material than the old machines. From the peculiar arrangement of the cutters, the inconvenience and delay attendant upon removing them for the purpose of sharpening is avoided; this is done by turning the cylinder the back way round, and advancing the emery grinder towards the cutters; care must be taken not to press the emery grinder very hard against the edges: from ten to twenty revolutions of the cylinder is quite sufficient to sharpen the machine. A much more simple method is also adopted for changing the length of the cut, which is done by shifting the strap from one pair of pulleys to another; there are three pairs, thus—when the strap is upon the large pulley on the axis of the cutting cylinder, and the small one on the shaft that drives the feeding rollers, it will cut three-quarters of an inch long, and shorter by a quarter of an inch in every other pair of pulleys. The quantity is in proportion to the speed. A silver medal to Mr. Jonathan Gillett, of Brilles, for a patent rick ventilator, which consists of an iron frame, about two feet in length, and cylinder attached, with a small knife on each side at the lower end, and an iron bar through the centre of the frame and cylinder, with a screw at the bottom, making an aperture of about seven inches in diameter (for ventilation) through hay and corn ricks when too much heated. A silver medal for a corn meter, invented by Mr. John Norton, of Chester. This machine is used for measuring corn for cattle, instead of the man going into the granary. It consists of a cylinder divided into two compartments, each holding a quarter of a peck; the dials are three in number: the first is divided into 16, so that each division represents a quarter of a peck, and each revolution of the dial one bushel; the second is divided into 10, each division being one bushel, consequently one revolution of the dial will indicate 10 bushels; the other dial is divided into 8, each division representing 10 bushels, and one revolution of the dial will be 80 bushels: so that if 80 bushels of corn be put into a granary, it can be known when it is out by inspecting the dials. A silver medal for an improved drain-level, invented by Andrew Notman, of Painswick. It is used for the purpose of draining land in a dry season; its framework are three horizontal bars of wood and two upright legs, with a spirit-level fixed in the uppermost bar; it also has a sight attached to it for taking levels at a distance; one of the legs is movable, and has a vernier scale, so that if the fall be ever so small, the level can be set to it and locked: it can then be put into the hands of the workman, and used the same as a common level. A silver medal for a soil-pulverizer, invented by the Hon. Mr. W. R. Nugent. This is made of wrought iron, and has five times and eight mortices, so that the lines can be put to follow the common plough, at nine or eight inches, to stir the land between the rows of Turnips. A prize of 10 l. to Mr. Alex. Dean, of Birmingham, for a four-horse steam-engine on wheels, with shafts complete, for travellers. This engine is recommended for remarkable simplicity of construction, for absence of all danger from fire or sparks, and for portability and facility, with which two horses will convey it from one farm to another, working in the fields or other convenient place without fixing, and its superior metallic piston and valves, insuring its fitness at all times for immediate use. It is fitted up as a complete steam irrigator, and will be found adapted for irrigating land by means of the hose, from a distant tank, river, or pond, also for draining or flooding lands, emptying ponds, &c., discharging a great body of water at a required higher or lower point, and serving as a fire-engine of immense power, and as a most useful agricultural steam-engine, driving a thrashing-machine, &c., with a power equal to six or seven horses. A Silver Medal to Mr. J. B. Denton, of Southampton, for a map in relief of a district, with instruments. The model is constructed of plaster, or electrolysed in copper, to a true scale; and by means of the instrument accompanying it, any height or distance may be obtained. Its use as a complete guide to draining economically is evident, while the properties of an undulatory surface are made apparent by pouring water upon it, which, flowing to the lowest levels, exhibit how the waters of the higher lands may be profitably applied.]

The exhibition of live stock was good; but except the collecting together more good animals, no great improvement could be perceived in any one breed;—in fact, all the breeds have been long brought to such perfection, that little improvement can be expected; and the great object of the breeders is to keep up the quality of their stock. On the whole, the exhibition of stock was not superior to that at Bristol, while that of implements greatly surpassed it.

A great number of prizes, varying in value from 30 l. to 2 l. were awarded to the most successful exhibitors of stock; but our limited space obliges us to omit any enumeration of them.

THE COUNCIL DINNER took place this day in the County Hall, which is a very fine room. Above 400 tickets had been issued, but only about 350 sat down. Lord Hardwicke, the President, had on his right the Duke of Devonshire, Mr. Everett the American Minister, the Marquis of Northampton, Prof. Lyon Playfair, Mr. Coleman, an American gentleman, sent by his Government to examine the Agriculture of various countries in Europe, Prof. Owen of the College of Surgeons, Mr. C. Price, Sir R. Heron, and Sir C. Lemon. On the left sat the Mayor of Derby, the Marquis of Downshire, Lord Yarborough, Lord Scarborough, Lord Morpeth, and several other gentlemen. After the usual public toasts, which were shortly prefaced by Lord Hardwicke, whose fine-toned voice filled the whole room, Dr. Buckland was called upon to respond to that of the "Science of Agriculture," which he did in his usual manner, showing the great advantage of the application of science to Agriculture, and eulogising the scientific men present.

The award of the Judges of implements not having arrived, the President gave the health of all the exhibitors, and observed that this department was improving every year, both in the number of new inventions, and in the perfection of old, at prices which were astonishing, considering the perfection of the work and materials. Mr. A. Ransome, whose name was joined to the toast, made a very good speech on the subject of Mechanical Improvements in Agricultural Implements and their importance, while he complained of the little attention paid to the part of exhibitions in the comparison with that bestowed on stock. Lord Spencer proposed the health of the Judges, after which Lord Owen proposed "Success to Agriculture all over the World," prefaced by a neat speech, in which he showed that the Sciences of Anatomy and Physiology sprang from Agriculture. He observed that the disposition to extreme fatness in some animals was not a state of disease, as some imagine, but one of high health; that in tropical climates it was a wise provision of Nature, intended to support the animal during the hot season, when vegetation was parched up, and without which they must perish.—Mr. Coleman rose in answer to this toast, and made a good speech, which was a specimen of the discursive and flowery style, and had evidently been prepared for the occasion. He remarked that Agriculture, besides being the source of all wealth, was the most important in a political and moral point of view, its tendency being to produce peace and harmony, and all its pursuits being eminently calculated to form a religious and innocent character.—Mr. Colville gave "The Local Committee," in a good speech.—The last toast of the evening was that of "The President," given by Lord Yarborough, which produced a most excellent and forcible speech from Lord Hardwicke. He strongly recommended the practical farmers to avail themselves of the experience and knowledge they already possessed, and to apply the principles which have been known for ages to the improvement of their farms; to cultivate the soil assiduously—to make all the straw into rich manure, by feeding cattle—and to select the best seeds, by which means he himself had improved a farm in 15 years so as to double its average produce. He read a quotation from a book published above a century ago (Tull's works, I believe), to show that these means were then fully appreciated; and by a most eloquent speech closed the proceedings of the day.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

Caledonian Horticultural Society, June 23.—The third exhibition for the season took place in the Experimental Gardens, Inverleith Row, when the usual promenade took place. The weather was delightful, and in consequence there was a brilliant and fashionable assemblage of visitors. The grounds were in the highest state of order, and, notwithstanding the late ungenial weather, presented many attractions. The exhibition of flowers was rich and varied. In the profusion of blossom which the plants exhibited, no one would have detected the traces of the late ungenial weather; and few exhibitions, at the same season of the year, have equalled the present. The principal feature of the exhibition was the Heaths, of which several varieties were shown, all rich and beautiful. Next in order came the Pelargoniums, which, though rather early for them, were very splendid, particularly a large collection of them from Messrs. Dickson and Co. The Pansies were also much admired, especially several specimens of new varieties raised by Mr. Symington, Newington. One of these, certainly the finest in the collection, has been named in compliment to the Lady of the Lord President, it being her Ladyship's own selection. The tea-dormer presented to Dr. Neill was exhibited in the new hall, and attracted many admirers. The band of the 66th Regiment was present during the day, and played many fine airs. The following were the prizes awarded: FOR THE FOUR FINEST SHRUBBY EXOTICS, silver medal, Mr. G. Stirling, gr to Lord Melville; the plants being *Aphelexis humilis*, *Chorozema varium*, *Polygala oppositifolia*, and *Pimelea sylvestris*; 2, Mr. J. Young, gr to T. Oliver, Esq., Newington Lodge, for *Epacris grandiflora*, *Diplazis punicens*, *Leschenaultia biloba*, and *Pimelea hispida*. FOR THE FOUR BEST FLOWERED CAPE HEATHS, silver medal, to Mr. D. Foulis, gr to Jas. Tytler, Esq., of Woodhouselee, for *Erica Beaumontiana*, *vestita coccinea*, *odora rosea*, and *ventricosa*; 2, Mr. Stirling, Melville Castle, for *E. elegans*, *perspicua*, *ventricosa coccinea minor*, and *Coventriana*. FOR FUCHSIAS there was no proper competition; but one collection of considerable merit having been sent in, consisting of *F. Venus victrix*, *magnifica*, and *Invincible*, a premium was awarded to Mr. Young for the same. FOR THE TWO FINEST TROPICAL ORCHIDACEOUS PLANTS, silver medal, Mr. R. Middleton, gr to Dr. Neill, Canonmills; the kinds being *Epidendrum aromaticum* and *Dendrobium densiflorum*. The prize of two guineas, offered to practical gardeners, by Messrs. J. Dickson and Sons (and placed at the disposal of the Society), for the SIX NEWEST AND FINEST STAGE PELARGONIUMS, was assigned to Mr. Young, for Catleugh's Comte de Paris, Garth's Comte de Paris, Gaines's Prince Albert, Garth's Queen of Beauties, Lane's Lady Cotton Shepherd, and Garth's Queen of Fancies. For another collection, consisting of *Bridesmaid*, *Duenna*, *Flash*, *Fair Maid of Devon*, *Florence*, and *Comte de Paris*, the Committee awarded the Society's silver medal to Mr. P. Thomson, gr, Craigiehall. For the finest specimen of any TENDER EXOTIC SHRUB, silver medal, Mr. P. Crockett, gr to Col. Fergusson, of Raith, for a magnificent plant of *Pimelea decussata*, densely clothed with flowers. And for the finest-grown specimen of any RECENTLY INTRODUCED PERENNIAL HERBACEOUS PLANT, the prize was also assigned to Mr. Crockett, for *Manettia cordifolia*, trained to a light trellis, four feet high, with foliage and flowers in the greatest perfection. FOR THE FOUR MOST CURIOUS OR UNCOMMON NATIVE BRITISH PLANTS in pots, Mr. Stirling, for *Aceras anthropophora*, *Linnæa borealis*, *Asplenium viride*, and *Woodsia hyperborea*. And a smaller award was made to Mr. Alex. Forrester, gr to Capt. Falconar, of Carlourie, for Paris quadrifolia, *Cypripedium calceolus*, *Gymnadenia conopsea*, and *Orchis maculata*. A premium was awarded to Mr. Middleton, Canonmills Cottage, for *Mesembryanthemum tricolor*, as the best recently-introduced annual flower exhibited. From the Leith-walk Nurseries of Messrs. Dickson and Co., there was an extensive collection of showy plants, principally Pelargoniums, and also a tray containing forty choice sorts, a truss of the flower being placed in front of a leaf of the respective kinds. An extra medal was awarded. From the Inverleith Nurseries of Messrs. J. Dickson and Sons there was also an excellent display of plants, including many fine Pelargoniums and Calceolarias. A medal was awarded to Messrs. Purdie and Morries, of the Stanwell Nurseries, for a beautiful collection of Cape Heaths, *Pimelea*, and *Boronia*, with their fine seedling *Fuchsia Stanwelliana*. Several good seedling Pelargoniums were sent from various quarters; but none of them being superior to esteemed kinds now in general cultivation, the Committee abstained from making any award. It is needless to enumerate the fine plants which occupied the tables of the Hall, and of the tent on the lawn. They were gracefully arranged, some noble specimens from the Royal Botanic Garden towering above the humbler beauties. Among these may be mentioned, as remarkable for their great size and splendour, *Grevillea acanthifolia*, *Brachyseta latifolia*, *Erica spuria*, and *E. odora rosea*; and, it may be added, that two magnificent Palms, *Látania borbonica*, from the same establishment, adorned the two ends of the Hall. Some lovely Cape Heaths from the collection of Pr. Dunbar, Rose-Park, were much admired, particularly *Erica vestita rosea* and *cárnea*, and *Thunberg*. A number of beautiful seedling Calceolarias, raised by Mr. Anderson, of Maryfield, by Mr. Sleight, at Lauriston Castle, and by Mr. Thynne, Glasgow, with some choice seedling Pansies, raised by Mr. Symington, of Newington, proved interesting to florist cultivators. Some singular-looking Epiphytes, particularly *Oncidium Papilio*, or the Butterfly plant, were sent by Mrs. Haig, of View Park, and attracted general notice. A large Musk plant, *Aster argophyllus*, in full flower, from the greenhouse at Denholm Green, scented the Hall. From the garden of Capt. Falconar, of Carlourie, there was a rich display of Pæonies and Irises, genera in which that garden excels. Various fine specimens of flowering plants were contributed from the nurseries of Mr. Lawson, Golden Acres, including *Labichea lanceolata* from Swan River, and a succulent *Aster* from the Himalayan Alps. Messrs. Sang, of the Kirkcaldy Nurseries, furnished beautiful specimens of the double-flowered scarlet Thorn. Other fine plants were sent from the gardens of Mr. Wauchop, of Edmonstone; Mr. Keith, of St. James Hall; Sir J. Gibson Craig, Riccarton; Mr. Yule, Broughton Hall; and Mr. Syme, Trinit Cottage. Several admirable specimens from the Society's own hothouses were likewise placed in the Hall; among which *Oncidium divaricatum*, *O. luridum*, *O. Westworthianum*, *Erica elegans*, and *E. florida campanulata*, were conspicuous.

COUNTRY SHOWS.

Aberdeenshire Horticultural Society, June 21.—The second competition for the season took place in the Assembly Rooms. The attendance of visitors was very numerous, and the fine show of flowers and fruit that on every hand met the eye gave the greatest gratification. Prizes were awarded as follows:—*Ranunculus*, 1, D. Gairns, gr, Glenbervie; 2, J. Simpson, gr, Elmhil. *Anemones*, 1, J. Fowle, gr to G. S. Gibb, Esq., of Clunie; 2, J. Mathewson, gr, Links. *Seedling Ranunculus*, N. Glennie, gr, Fintay. *Tulips*, J. Wood, gr, Logie. *Pelargoniums*, 1, A. Mackie, gr, Arbutnot; 2, D. Gairns, Glenbervie; 3, F. Deans, gr, Union Grove; 4, G. Cardno, gr, Cornhill. *Seedling do.*, 1, D. Gairns, Glenbervie; 2, G. Cardno, Cornhill. *Cacti*, T. Darling, gr to Lady Grant, Woodhill. *Heartsease*, 1, A. Mackie, Arbutnot; 2, J. Simpson, Elmhil. *Irises*, J. Barrie, gr, Broadford. *Preserved Apples* (Ribston Pippins), R. Donald, gr, Logie; 2, 3, *Preserved Apples* (other sorts), 1, A. Smith, gr, Pitfour; 2, A. Brown, gr, Heathcot. *Cucumbers*, 1, J. Wood, Logie; 2, D. Gairns, Glenbervie; 3, A. Mackie, Arbutnot. *Early Peas*, 1, W. Riddel, gr, Blackford; 2, A. Hopkirk, gr, Balmogrove Lodge. *Turnips*, 1 and 2, J. Wood, Logie; 3, A. Reith, Esq., of Mill-4, A. Cooper, gr, Aberdeen. *Carrots*, 1, C. Runcy, Esq., Fintay-bank; 2 and 3, J. Wood, Logie. *Cauliflower*, N. Glennie, Fintay-bank; 1, Mrs. G. Collie, Mergie; 2, T. Robertson, gr, Hardgate; 3, A. Reith, Pitmutton; 4, J. Wood, Logie. *Home-made Wine*, A. Mackie, Arbutnot. *Greenhouse Plants*, 1, T. Darling, Woodhill; 2, W. Joss, gr, Banchory. *Greenhouse Plants*,

tion of Greenhouse Plants, including some fine Fuchsias, Pelargoniums, and Calceolarias. From Maj. Beamish's garden, at Beaumont, there were Roses, Pinks, Apples of 1842, and a collection of Vegetables. Miss Lyons's plants were very showy, comprising many fine Pelargoniums; and a large plant of *Maurandya Barclayana*, on a balloon-shaped trellis, had a very good effect. From J. S. Barry, Esq., of Lota, there was a beautiful plant of *Gloxinia rubra*, Greenhouse Plants in great variety, and a collection of Vegetables. There were Roses, Pinks, Pelargoniums, Fuchsias, Calceolarias, and Herbaceous Plants, from S. Lane, Esq., of Frankfield. The Rev. Dr. Hodder, of Lee Bank, sent a pretty collection of Pansies and Pinks. T. Hewitt, Esq., contributed some fine Fuchsias, a variety of Greenhouse Plants, and a small collection of Roses. From J. M. Travers, Esq., of Clifton, there were Melons, Cucumbers, and a large collection of Vegetables, with some Pinks and Roses. The collection of Plants from W. G. Badford, Esq., was decidedly the finest in the room, and bespoke the highest cultivation, consisting of many of the best new Pelargoniums, Calceolarias, Heaths, Pansies, and Roses, with one or two fine *Amaryllis* and *Gladiolus*; also new Peas and Strawberries. From the Victoria Nursery there were above one hundred Greenhouse Plants in blossom, comprising many of the newest Pelargoniums, amongst which the "Queen of the Fairies" was very remarkable; also a variety of new Fuchsias, Petunias, Calceolarias, Verbenas, Cape Heaths, and Pimelcias. Mr. Cutter's collection consisted of Pelargoniums, Calceolarias, Cape Heaths, and some varieties of Cactus.—*Curk Advertiser*.

Cramlington and Seaton Delaval Florists' Society, June 10.—The show of Tulips was held at the house of Mr. John Forman, Ashley Arms Inn, Seaton Delaval, when the prizes were awarded as follows:—**WHITR GROUND**—Mr. J. Lynn, jun., 1st, 2d, and 4th, with *Glosterine*, *Triomphe Royale*, and *Triomphe de l'Isle*; Mr. J. Robinson, 3d, with *Madame Pompadour*; Mr. W. Gray, 5th, with *Bienfite Incomparable*. **YELLOW GROUND**—Mr. J. Mood, 1st and 3d, with *La Canticque*, and *Castrum Doloris*; Mr. W. Gray, 2d, 4th, and 5th, with *Pearl d'Ornement*, *Trafalgar*, and *Grandeur du Monde*. The flowers exhibited were very much admired, and allowed to be of first-rate quality, and much superior to any exhibited during the season.

Dorking Horticultural Society, June 10.—The second meeting of this Society was held at the White Hart Inn, Reigate. For the purpose of the exhibition, tents were erected on a commodious lawn connected with the house, previous experience having proved such an arrangement to be vastly superior—both with regard to an advantageous exhibition of the flowers, and to the facilities afforded to the visitors for minutely inspecting them—than the usual method adopted at local flower-shows of exhibiting the plants in a confined and imperfectly-lighted room. Unfortunately, however, the wetness of the afternoon prevented these advantages from being appreciated on the present occasion; neither was the exhibition itself by any means so attractive as it has been in other years, owing to the unfavourableness of the season, and to the absence of some of the principal exhibitors. The following prizes were awarded by the judges. **Calceolarias** (4 plants), 1, Mr. Goodhew, gr. to J. B. Hankey, Esq.; 2, J. Gadd, market-gr., &c., Betchworth Castle. **Pelargoniums in large pots** (4 plants), 1, Mr. J. Gadd; 2, Mr. Ivery, market-gr., &c., Wotton; 3, Mr. Croucher, gr. to W. Price, Esq. **Pelargoniums in small pots** (4 plants), 1, Mr. Ivery; 2, Mr. Croucher; 3, Mr. J. Gadd. **Cut Roses** (12 distinct sorts), 1, Mr. Ivery; 2, Mr. Haben, gr. to the Duke of Norfolk; 3, Mr. Broadbridge, gr. to the Countess of Rothes. **Roses in pots** (4 plants), Mr. Ivery. **Cut Flowers**, 1, Mr. Broadbridge; 2, Mr. Truelove, gr. to the Misses Carbonell. **Specimen Plant**, 1, Mr. Goodhew, for *Leschenaultia formosa*; 2, Mr. Whiting, gr. to H. T. Hope, Esq., for *Campanula grandis*; 3, Mr. J. Gadd, for *Erica tricolor*; 4, Mr. Ivery, for *Primula sinensis*, double white. **Collection of 6 Plants**, 1, Mr. Goodhew, for *Pimelea sylvestris*, *P. decussata*, *Polygala cordifolia*, *Erica hybrida*, *E. Linnaeana* *superba*, *Euphorbia splendens*; 2, Mr. Whiting, for *Campanula grandis*, *Fuchsia splendens*, *Azalea indica* *alba*, *Oncidium flexuosum*, *Achimenes longiflora*, *Chorozema varium*; 3, Mr. J. Gadd; 4, Mr. Ivery; 5, Mrs. Wood. **Seedling Calceolaria**, 1, Mr. Whiting; 2, Mr. Goodhew. **Seedling Pelargonium**, 1, Mr. Scott, gr. to M. Clayton, Esq.; 2, Mr. Ivery. **Cauliflowers**, 1, Mr. Truelove; 2, Mr. Haben; 3, Mr. Ivery; 4, Mr. Briggs, gr. to C. C. Deacon, Esq.; 5, Mr. Croucher. **Lettuces**, 1, Mr. Johnson, gr. to Mrs. Charrington; 2, Mr. Truelove; 3, Mr. J. Gadd. **Extra Prizes** were awarded to Mr. Truelove, for a collection of vegetables; Mr. Briggs, for do.; Mr. Whiting, for Cabbage Lettuce; Mr. Ivery, for Roses in pots; Mr. Ivery, for a collection of Fuchsias; Mr. Johnson, for a collection of Cut Roses; Mr. Chandler, gr. to J. W. Freshfield, Esq., for Rhubarb; Mr. Broadbridge and Mr. Ivery, for Pansies.

Durham Floral and Horticultural Society, June 21.—This Society held their second Show at the Exhibition-rooms, Saddler street, Durham, when the Judges awarded the following prizes: **FLOWERS**.—(NURSERYMEN'S CLASS).—**Best 24 Pelargoniums**, Messrs. Hancock and Son, Durham, for Masterpiece, Hancock's Pride of the Moor, Effulgence, Queen of Beauty, Una, Exquisite, Victory, Flash, Comte de Paris, Annette, Bridesmaid, Juba, Vulcan, Indian Chief, Decorum, Gem of the West, Splendidum, Firebrand, Duenna, Grand Monarque, Zenobia, Orange Boven, Joan of Arc, and Coronna. **Best 12 do.**, Messrs. Hancock and Son, for Vulcan, Fulgens, Jewess, Masterpiece, Simile, Acme of Perfection, Rosetta, Cyrus, Bridesmaid, Queen Dowager, Florence, and Coronation. **AMATEURS' AND GARDENERS' CLASS**.—**Best 18 Pelargoniums**, Mr. F. Nichol, gr. to H. J. Spearman, Esq., Newton-hall. **Best 12 do.**, Mr. G. Lowery, gr. to Mrs. Fawcett, Durham. **Best 6 do.**, 1, H. J. Marshall, Esq., Durham; 2, Mr. G. Lowery. **Best 3 do.**, Mr. R. Dodds, gr. to the Rev. G. Townsend, Durham. **Best Seedling do.**, 1 and 2, Mr. F. Nichol. **Best 12 Calceolarias**, H. J. Marshall, Esq., for Douglas, Magorina Superb, Neilli, Dusty Miller, Rising Sun, Favourite, Cyrus, Sunbeam, Delicata, Reform, Van Amburgh, Queen Victoria, Argos, and Gem. **Best 6 do.**, 1, H. J. Marshall, Esq., for Miss Antrobus, Lady Constable, Lady of the Lake, Venus, I-abella, and King; 2, Mr. G. Lowery. **Best Seedling Fuchsia**, Mr. F. Nichol. **Best 3 Fuchsias**, 1, Mr. F. Nichol; 2, Mr. G. Lowery. **Best single do.**, Mr. F. Nichol. **Best 3 Cacti**, 1, Mr. F. Nichol; 2, Mr. G. Lowery. **Best Cactus**, Mr. F. Nichol. **Best 12 Exotics**, Mr. G. Lowery. **Best 6 Exotics**, Mr. F. Nichol. **Best Exotic**, Mr. G. Lowery. **Best 6 Roses in Pots**, Mr. F. Nichol. **Best 24 Pansies**, H. J. Marshall, Esq., for Linda, Sobieski, Curion, Prince Albert, Mulberry Superb, Exquisite, Black Prince, Miss Crossing, Bridegroom, Beauty of Knosthorpe, Athla, Beauty of Lucas, Cyclops, Princess Royal, Cernna, Venus, John, Warrior, Nymph, Julius, Regulator, Alca, and Queen of the Whites. **Best 12 do.**, 1, Mr. P. Caldelough, Durham, for Miss Nugent, Peter Dick, Man of Kent, Bathona, Prince of Wales, Jewess, Superb, Eclipse, Miss Stain, Imogene, Duchess of Richmond, Black Bess, and Mulberry Superb; 2, Mr. J. Hall, Durham. **Best 6 do.**, 1, Mr. G. Lowery; 2, Mr. P. Caldelough. **Best 12 Ranunculuses**, H. J. Marshall, Esq. **Best 6 do.**, 1, H. J. Marshall, Esq.; 2, Mr. J. Simms, Durham. **Best 6 Roses** (cut flowers), Mr. F. Nichol. **Best Bouquet of Flowers**, Mr. G. Hindmarch, gr. to W. L. Wharton, Esq., Dryburn. **FRUITS**.—**Best Grapes**, 1 and 2, Mr. J. Thompson. **VEGETABLES**.—**Best Brace of Cucumbers**, 1, Mr. Anderson, gr. to H. Taylor, Esq.; 2, Mr. J. Thompson. **Best Potatoes**, 1, Mr. G. Hindmarch; 2, Mr. J. Thompson. **Cauliflowers**, Mr. G. Hindmarch. **Cabbages**, Mr. T. Robinson, Durham. **Turnips**, Mr. W. Thompson, Jun., Durham. **Lettuce**, Mr. J. Thompson. **COTTAGERS' CLASS**.—**Best 6 Pansies**, Mr. J. Greathead, Durham. **Best Collection of Plants in Pots** window culture, Mr. J. Greathead. **EXTRA PRIZES** were awarded to Edward Shipperdson, Esq., for a collection of Pansies and Rhododendrons; to the Rev. G. Townsend, for *Senecio elegans*; to H. J. Marshall, Esq., for Harrison's seedling

Pansy, the Beauty of Kepier; to Messrs. Hancock and Son, for a splendid collection of Greenhouse Plants; to Mr. J. Herbert, for a collection of seedling Pelargoniums; and to Mr. F. Nichol, for the best specimen. The Show was well attended; and besides the productions for which extra prizes were awarded, a variety of beautiful plants were exhibited belonging to the neighbouring gentry. In the stand of Greenhouse Plants shown by Messrs. Hancock and Son, for which an extra prize was awarded, were some very handsome specimens; amongst the most conspicuous in the collection was the new Rose Bosanquet, Fuchsia Rogersiana, Cineraria Wear Rival, Verbena Ruby, Ardisia crenulata, Petunia Beauty, Dillwynia clavata, and a great variety of Heaths.

Earls Colne Horticultural Society, June 15.—The first show by this Society for this season, the weather being most propitious, was extremely well attended; a general feeling of satisfaction prevailing at the successful efforts of the producers. The prizes were adjudged as follows:—**GARDENERS' CLASS**.—Mr. Nichols, gr. to R. Hills, Esq., of Colne Park, for the best dish of fruit, brace of Cucumbers, 2nd best Peas, best new Potatoes, 2nd best Carrots, 2nd best Lettuce, 2nd best Cabbages, best and 2nd best Rhubarb, best 12 Roses, 2nd best Pansies, do. Greenhouse plants, cut flowers, and extra prize for best design for cottage and garden. Mr. Holden, sen., for the best Peas, extra prize for Gooseberries, and 2nd best 12 Roses. Mr. Holden, jun., gr. to Mr. Unwin, Coggeshall, for 2nd best new Potatoes, best Carrots, best Lettuce, best Cabbages, extra prize for Turnips, best Pansies, and best Greenhouse plants. Mr. E. Fairhead, extra prize for Radishes. Mr. Smee, gr. to E. G. Barnard, Esq. M.P., of Gosfield Hall, showed (not for a prize) some very fine Gooseberries and Currants. **AMATEURS' CLASS**.—Mr. G. Clark, for the best Rhubarb, Pinks, Roses, Greenhouse plants, and an extra prize for design, crown and cushion. Mr. F. Cawston, for 2nd best Potatoes, best Cabbages, Lettuce, and 2nd best Carrots. Mr. D. King, for 2nd best Cabbages, best Carrots, Cucumbers, and Peas, and an extra prize for Gooseberries. Mr. T. Wenden, for the best new Potatoes.

Felton Floral and Horticultural Society.—This Society held their second show of Flowers and Vegetables at Mrs. Melrose's, Widdrington Arms Inn. The meeting was well attended, and, notwithstanding the late unfavourable state of the weather, the flowers and vegetables were in a higher state of perfection than could have been expected. The prizes were awarded to the following competitors:—**TULIPS**.—1st and 2d best three Rose, 1st and 2d best three Yellows, 2d best three Violet, and best one of any colour, to Mr. Pitt, Felton; 1st best three Violet, and 2nd best one of any colour, to Mr. Dawson, Acklington. **CUCUMBERS**, 1, Mr. Riddell, gr. Acton House; 2, Mr. Crossling, Felton Park. **POTATOES**, 1 and 2, Mr. T. Jeffrey, Felton. **CABBAGES**, 1, Mr. Melrose, Felton; 2, Mr. Dawson, Acklington. **LETTUCES**, 1, Mr. T. Jeffrey, Felton; 2, Mr. Melrose, Felton. **RADISHES**, 1, Mr. Mark, Felton; 2, Mr. J. Rochester, Felton. **EXTRA PRIZES** were awarded to the following gentlemen:—Mr. Crossling, Felton Park, for two very superior stands of Pansies, and a splendid Pelargonium, called Sylph; Mr. Riddell, Acton House, for a very fine specimen of a White Moss Rose, rare to bloom in the open air at this season of the year; and Mr. Melrose, Felton, for very fine spring-grown Onions.

Felton Florists' Society, June 12.—The florists of Felton and its vicinity held their annual show of Tulips, being their second exhibition for the season, in the dining-room of the Widdrington Arms Inn, when the prizes were awarded as under:—**ROSES**.—The 1st, 3d, 4th, and 6th prizes, to Mr. W. Scott, Felton, for *Cerise Primo*, *Amadis*, *Triomphe Royale*, and *Ceres Triomphante*; the 2d to Mr. R. Richardson, for *Comte de Vergennes*; and the 5th to Mr. B. Burn, gr. to C. W. Bigge, Esq., Linden, for *Duchess of Clarence*. **BYE-GAMES**.—The 1st prize to Mr. Burn, for *Violet Imperiale*; and the 2d, 3d, 4th, 5th, and 6th, to Mr. W. Scott, for *Madame de Pompadour*, *Grand Prior*, *Alexander Magnus*, *Triomphe de l'Isle*, and *Hugobert*. **BIZARRIES**.—The 1st and 5th to Mr. Burn, for *Demetrius* and *Unknown*; the 2d and 3d to Mr. G. Pitt, for *Old Dutch Catafalque* and *Surpassa Catafalque*; the 4th to Mr. R. Richardson, for *Platoff*; and the 6th to Mr. Scott, for *D'Vey's Trafalgar*. Owing to the late unfavourable weather, the table of flowers was not so large as on some former occasions, but many of the flowers were in a good state of preservation, and attracted general admiration.

Hampstead Florists' Society, June 8.—At the first exhibition for 1843 the following prizes were awarded:—**Calceolarias**, 1, R. B. Foreman, Esq., for *Beauty*, *Britannia*, *Nonpareil*, *Captain Ross*, *Goldfinder*, *Hector*; 2, Mr. Tucker, gr. to A. Crofton, Esq., for *Lady of the Lake*, *Indescribable*, *Cristanthus*, *Phillis*, and two seedlings; 3, Mr. Goulding, gr. T. Turner, Esq., for *Lady of the Lake*, *Emperor*, *Pendula*, *Orange Perfection*, *Polyphemus*, and a seedling. **Pelargoniums**, best 9, R. B. Foreman, Esq., for *Dennis's Perfection*, *Jewess*, *Coronation*, *Joan of Arc*, *Grand Duke*, *Rienzi*, *Climax*, *Lady Denbigh*, and *Garth's Victory*; 2, Mr. Goulding, for *Jewess*, *Beauty of Hampstead*, *Beauty of Ware*, *Rienzi*, *Dennis's Perfection*, *Diadematum*, *Garth's Victory*, *Joan of Arc*, *Louis Quatorze*; 3, Mr. Cockburn, gr. to Earl Mansfield, for *Sylph*, *Alicia*, *Foster's Rosea*, *Lavinia Superb*, *Garth's Perfection*, *Miss Wild*, *Prima Donna*, *Lady Murray's Gem*. **do.**, best 6, 1, Mr. Franklin, gr. to Mrs. Pryor, for *Fair Eleanor*, *Jewess*, *Beauty of Hampstead*, *Garrod's Pearl*, *Dennis's Perfection*, *Eliza Superb*; 2, Mr. Wren, gr. to—Neville, Esq., for *Bridesmaid*, *Priony Queen*, *Una*, *Alicia*, *Dennis's Perfection*, *Sylph*; 3, Mr. Tucker, for *Jewess*, *Speculum mundi*, a seedling, *Pearl*, *Garth's Perfection*, *Garth's Victory*; 4, Mr. Calver, gr. to J. C. Melville, Esq., for *Grand Duke*, *Sylph*, *Beauty of Hampstead*, *Frankliniana*, *Garth's Victory*, *Jewess*. **6 Miscellaneous Plants**, 1, Mr. Wren, for *Achimenes longiflora*, *Cactus speciosus*, *Polygala cordifolia*, *Gloxinia speciosa*, *G. rubra*, *Calceolaria Mabel*; 2, Mr. Cockburn, for *Polygala cordifolia*, *Cactus fulgidus*, *Leschenaultia formosa*, *Gompholobium ericoides*, *Azalea indica* *alba*, *Epacris grandiflora*; 3, R. B. Foreman, Esq., for *Fuchsia fulgens*, *Polygala oppositifolia*, *Clematis* sp., *Epacris grandiflora*, *Pimelea hispida*, *Eutaxia pungens*; 4, Mr. Tucker, for *Pimelea hispida*, *Polygala grandiflora*, *Fuchsia Atkinsoni*, *F. corymbiflora*, *Chorozema Henchmanni*, *Eutaxia pungens*. **Specimen Plant**, 1, Mr. Cockburn, for *Cactus Vandyisii*; 2, Mr. Wren, for *Hoya carnosa*; 3, Mr. Elliott, for *Mimosa prostrata*; 4, Mr. Tucker, for *Polygala grandiflora*. **Coxcombs**, 1, Mr. Purry, gr. to—Ferguson, Esq.; 2, Mr. Wren. **Device in Flowers**, 1, Mr. Abercrombie, gr. to G. Hoare, Esq.; 2, Mr. Franklin. **24 Heartsease**, 1, Mr. Pipe, gr. to G. Herring, Esq., for *Victory*, *Grand Duke of Russia*, *Imogene*, *Vindictive*, *Miss Stainforth*, *Pipe's Black Prince*, *Queen of Whites*, *Prince Albert*, *Thompson's Coronation*, *Venus*, *Brown's Curion*, *Delicata*, *Grand Turk*, *Thompson's Eclipse*, *Jewess*, *Bridesmaid*, *Captain Cook*, *Sultan*, *Sonter John*, *Tam O'Shanter*, *Nabob*, *Jehu*, *Vivid*, and a seedling. **Extra Prizes** were awarded to Mr. Cockburn, for blue Hydrangea, and collection of Plants; R. B. Foreman, Esq., for a collection of Plants; Mr. Elliott, gr. to J. M. Jones, Esq., for a collection of Fuchsias; Mr. Goulding, for a collection of Plants; Mr. Calver, for Coxcombs; Mr. Tucker, for a collection of Plants; Mr. Cockburn, for Coxcombs; R. B. Foreman, Esq., for Fuchsia fulgens.

Haistead and North Essex Horticultural Society, Jan. 16.—This Society held its first show in a spacious marquee, erected for the purpose, in a pasture near the George Hotel. The attendance was both numerous and highly respectable, and in point of number far exceeded that of any show in the previous year. Prizes were awarded to E. G. Barnard, Esq., for the best Melon, second best Potatoes, do. Cucumbers, Bouquet, Roses, and second best greenhouse plants. J. T. P. Ash, Esq., for best Potatoes, extra prize for Rhubarb, best Pelargoniums, and best single plant. E. May, Esq., for best Cauliflowers, Cucumbers, and Lettuce. —Vigors, Esq., for second best Pelargoniums, Greenhouse plants, and for an elegant design—model of a church. Rev. —Hume,

for Peas. R. J. Day, Esq., for Heartsease. R. S. Edwards, Esq., for Cacti, and an extra prize for a splendid Fuchsia corymbiflora, as specimen plant. J. N. Brewster, Esq., for best Strawberries. Mr. Cant, for second best Strawberries, and best Calceolarias. Mr. W. Root, for Grapes and Ranunculuses. Mr. J. Bentall, for British Phenogamous plants, comprising 108 species, many of them rare plants. Several prizes were also given to cottagers. An excellent collection of Ranunculuses, Anemones, Pelargoniums, Roses, &c. was exhibited by Messrs. Bass and Brown, of Sudbury, but was not entered for competition. Some beautiful Pansies, shown by R. Marriott, Esq.; superb Fuchsias, by Archdeacon Burney; very fine Pelargoniums, by the Rev. C. W. Lloyd; and Roses, by G. P. Arden, Esq., were much admired. A display of Vegetables, by Mrs. Griffiths, attracted much attention.

Kent and Canterbury Floral and Horticultural Society, June 8.—The summer show was held in the Old Palace Gardens, and although the morning was most unpropitious, there was a large attendance of the clergy and gentry of the neighbourhood. The present exhibition was not so brilliant as the one that took place in April last; yet as a summer show, it far exceeded any other since the establishment of the Society. The exhibitors were much more numerous than usual, and many of the specimens were admirable examples of good growth, as well as being of rare kinds. The collection of fruit exhibited was of course small. Among the plants most deserving of notice were two collections of succulents from J. G. Shepherd, Esq. Many of the specimens had bloom-buds upon them, and one, *Echinocactus sulcatus*, had four or five lovely white flowers expanded. The same gentleman also sent some beautiful red, purple, and white *Gloxinas*, and a new *Achimenes*, imported from Belgium, *A. Gesorightii*, with rosy purple flowers, spotted in the throat; the leaves are also red beneath, and very rough above, much more so than in *A. pedunculata*, to which species it seems nearly related. The Rev. W. Brockman sent the new *Campanula grandis*; a beautiful *Calceolaria*, with crimson spots on a yellow ground, called *Curiosa*; and a finely-grown plant of *Fuchsia corymbiflora*. From Mrs. Webb there was a very extensive collection, including *Amaryllis vittata*, some good Heaths, and a large assortment of Pelargoniums. D. Deane, Esq., exhibited some splendidly-grown Fuchsias, and also some beautiful cut American plants, including several varieties of *Rhododendrons*, *Azaleas*, and *Kalmias*. From G. Buckley, Esq., there was a very well-grown *Eichrysum spectabile*, covered with flowers; a small *Erica odora rosea*; and a fine basket of cut flowers. The Rev. C. Oxenden sent some excellent Pelargoniums, covered with bloom; the plants were but a few inches high, and were no doubt placed almost close to the glass of the greenhouse or frame in which they have been grown. The Rev. G. P. Marsh exhibited some good Roses, and a floral device like a garden-chair. F. Sankey, Esq., contributed a number of greenhouse plants, some Cacti, and a good stand of *Ranunculus*. In addition to the collection of indigenous plants sent for competition, Mrs. Grayling exhibited an interesting collection of named Grasses and Carices found growing in this vicinity. From Mr. Ald. Masters there was a large collection of plants, among which was his new seedling Pelargonium, the Archbishop of Canterbury. There was also a large assortment of Fuchsias grown on the "one-shift system;" among them were *Brockmannii*, *Money-penny*, and *Magnifica*. Among the *Orchidaceae* there was a fine *Oncidium flexuosum*, with flowers much darker than in the common kind; *Gongora maculata fulgens*; *Oncidium luridum*, *Cattleya Forbesii*, and *Cyrtorchilus filipes*. Mr. Masters also sent a magnificent *Caryota urens*. The productions of the cottagers were of a superior kind; the vegetables in many instances being much better than those offered for competition by the subscribers. The following is a list of the prizes:—**SUNSHINE PRIZES**.—**FRUIT**.—*Best Pine*, W. H. Carter, Esq. *White Grapes*, Mrs. Ramsay. *Strawberries*, 1, the Earl of Winchester; 2, Kearsley Seedling, Lady Montresor. *Dessert Apples*, 1 and 2, R. Francis, Esq. *Kitchen Apples*, 1 and 2, Mr. Vimer. *Peas*, 1, R. Francis, Esq.; 2, Hurrell Rance, T. Dorman, Esq. **EXTRA**.—*White Grapes*, Mrs. Ramsay. **VEGETABLES**.—*Peas*, D. Denne, Esq. *Cucumbers*, Mrs. Ramsay. *Potatoes*, 1843, not forced, Mrs. Ramsay. *Potatoes*, 1843, forced, D. Denne, Esq. *Asparagus*, Mr. Filmer. *French Beans*, W. H. Carter, Esq. *Rhubarb*, F. Sankey, Esq. *Lettuces*, F. Sankey, Esq. *Carrots*, the Rev. W. Brockman. *Cauliflower*, 1 and 2, the Rev. W. Brockman. *Basket of Salad*, Lady Montresor. *Basket of Vegetables*, Lady Montresor. **FLOWERS**.—*Cacti and Echinocacti*, J. G. Shepherd, Esq. *Succulents*, not *Cacti* or *Echinocacti*, J. G. Shepherd, Esq. *American Plants*, G. Buckley, Esq. *Rose in Pot*, 1, Malton, Mr. Parrinton, 2, Yellow China, D. Denne, Esq. *Stove Plants*, *Ceropegia elegans*, *Passiflora phoenicea*, *Euphorbia splendens*, J. G. Shepherd, Esq.; single plant, *Thunbergia alata*, J. G. Shepherd, Esq. **Collection of Greenhouse Plants**, 1, *Pimelea decussata*, *Metrosideros floribunda*, *Diosma capitata*, *Polygala grandiflora*, *Clematis bicolor*, *Grevillea Manglesi*, J. Godfrey, Esq.; 2, *Sollya heterophylla*, *Pimelea decussata*, *Metrosideros floribunda*, *Polygala cordifolia*, *Bouvardia triphylla*, *Sutherlandia frutescens*, F. Sankey, Esq. **Collection of Greenhouse Plants**, four species, 1, *Eichrysum spectabile*, *Metrosideros floribunda*, *Diosma ericoides*, *Eichrysum fasciculare album*, G. Buckley, Esq.; 2, D. Denne, Esq. **Two Greenhouse Plants**, 1, *Campanula grandis*, *Achimenes longiflora*, the Rev. W. Brockman; 2, J. G. Shepherd, Esq. **Stove Pelargonium**, 1, *Matilda*, *Beauty*, *Alicia*, *Victory*, *Corona*, *Gaines's Prince Albert*, the Rev. C. Oxenden; 2, Mr. Parrinton. **Three Pelargoniums**, 1, King, Jewess, *Alexandria*, the Rev. C. Oxenden; 2, D. Denne, Esq. **Two Pelargoniums**, 1, Jewess, *Chef d'Œuvre*, the Rev. C. Oxenden; 2, *Foster's Alicia*, J. Rutter, Esq. **Seedling Pelargonium**, J. Rutter, Esq. **Two Fuchsias**, 1, *F. corymbiflora*, and *F. Youellii*, the Rev. W. Brockman; 2, J. Godfrey, Esq. **New Fuchsia**, 1843, *Brockmannii*, the Rev. W. Brockman. **Cape Heaths**, 1, *Odora rosea*, *ventricosa superba*, *translucens*, G. Buckley, Esq.; 2, *Erica linnaeoides*, *E. hybrida*, *E. ventricosa superba*, the Rev. W. Brockman. **Four Calceolarias**, 1, *Curiosa*, *Rosa*, *Bridesmaid*, *The Bride*, Rev. W. Brockman; 2, T. Dorman, Esq. **Three Calceolarias**, 1, *Chancellor*, *Antiquary*, *Green's King*, J. Godfrey, Esq.; 2, T. Dorman, Esq. **Two Cacti**, 1, *Ackermannii major* and minor, J. Godfrey, Esq.; 2, *Jenkinsonii*, Mr. Parrinton. **EXTRA**.—**Stove Plants**, *Achimenes longiflora*, *A. Gesbrihtii*, *Gloxinia maxima*, *G. caerulea*, *G. Priestleyi*, *Sinningia guttata*, G. Shepherd, Esq. **Two Fuchsias**, for growth, D. Denne, Esq. **Cut Flowers**.—**Greenhouse Flowers**, G. Buckley, Esq. **Nosegay of do.**, 1, Rev. W. Brockman; 2, J. Rutter, Esq. *Ranunculus*, 1, F. Sankey, Esq.; 2, J. Cates, Esq. **Double Anemones**, J. Cates, Esq. **Cut Roses**, 1 and 2, Mrs. Webb. *Tea scented China Roses*, the Rev. G. P. Marsh. **Twelve Pansies**, 1 and 2, *Albia*, *Imogene*, *Vivid*, *Great Western*, *Dark Perfection*, *Miss Stainforth*, *Peter Dick*, *Sulphurea elegans*, *Delicata*, *Cook's Perfection*, *Queen of Whites*, *Curion*, *Eclipse*, *Imogene*, *Amulet*, *Royal Standard*, *Jewess*, *Duchess of Richmond*, *Peter Dick*, *Sulphurea elegans*, *Regulator*, *Triumph*, *Duke of Cornwall*, *Paul Pry*, the Rev. C. Oxenden. *Iris*, of three varieties, J. G. Shepherd, Esq. **Americans**, not less than of three varieties, *Rhododendron maximum*, *R. album*, *Catalpa bignonioides*, *A. punctatum*, *Azalea calendulacea*, *A. nudiflora coccinea*, *A. tomentosa*, *A. glauca scabra*, *Kalmia latifolia*, *K. angustifolia*, *rubra*, *Vaccinium fuscum*, *V. venustum*, *Andromeda catesbaei*, *A. axillaris*, D. Denne, Esq. **Bouquet of Miscellaneous Flowers**, the Rev. G. P. Marsh. **Floral Device**, J. Cates, Esq. **Collection of Indigenous Plants**, 1, the Earl of Winchester; 2, Lady Montresor. **COTTAGERS' PRIZES**.—**FRUIT**.—*Gooseberries*, 1 and 2, J. Tucker. **VEGETABLES**.—(Cabbages), J. Tucker, 2, J. Goodwin, 1 and 2, J. Hooker. *Potatoes*, 1843, 1, J. Tucker, 2, J. Tucker. *Salad*, 1, J. Tucker; 2, J. Hooker. *Bunch of Herbs*, J. Tucker. *Basket of Vegetables*, 1, J. Hooper; 2, J. Tucker. *Rhubarb*, J. Hooper. *Nosegay of Flowers*, 1, J. Tucker; 2, T. Davis. *Pot or Glass of Honey*, 1 and 2, J. Goodwin. *1 lb. of Bees' Wax*, J. Goodwin.

Inverness and Northern Horticultural Society, June 21.—At this

meeting 'here was a decided improvement on previous shows, though the fruit was not so good. The list of prizes is subjoined.

Twelve varieties of Pelargonium, 1, Mr. W. Dallas, gr to L. Mackintosh, Esq., of Raigmore, for *Lie Guardsman*, Sylph, Queen of Beauty, Alexandrina Victoria, Bridegroom, Alicia, Joan of Arc, Annetta, Progeny, Garth's Perfection, Renzi Rosetta; 2, Mr. A. Fraser, gr to J. Thomson, Esq., Springfield Cottage, for Joan of Arc, Alexandrina, Lord Mayor, Lie Guardsman, Ruby, Corona, Comte de Paris, Vulcan, Prince Albert (Basket's), Matilda, Sultan, Garrick. *Six varieties of Calceolarias*, 1, Mr. J. Stephen, gr to Lady Saltoun, at Ness Castle; 2, Mr. W. Dallas, gr, Raigmore. *Six Eadie plants*, 1, Mr. Dallas, Raigmore, for *Epacris grandiflora*, *Chorozema Jacksonii*, *Elchrysium superbum*, *Leschenaultia formosa*, *Alstromeria pulchella*, *Siphocampylus bicolor*; 2, Mr. Stephen, Ness Castle, for *Antia myrtilolia*, *Polygala speciosa*, *Polygala oppositifolia*, *Paeonia decussata*, *Epacris grandiflora*, *Chorizan a cordatum*. *Specimen of any Eadie*, 1, Mr. A. Fraser, for *Epacris grandiflora*; 2, Mr. J. Ross, gr to Lady Rose, of Holme, for *Siphocampylus bicolor*, 8½ feet high. *Eighteen Pansies*, 1, Mr. J. Ross, gr, Holm; 2, Mr. J. Lawrence, gr, Inverness. *Four varieties of Heaths*, 1, Mr. Fraser, for *Luca Wilmoreana*, *E. odorata rosea*, *E. Westphalinga*, *E. Rosea*. *Four Balsams*, 1, Mr. Dallas, gr, Raigmore; 2, Mr. Bain, gr to Lord Lovat, at Beaufort Castle. *Four varieties of Fuchsias*, 1, Mr. Stephen, Ness Castle, for *F. corymbiflora*, *fulgens*, *Dicksonii*, and *Thomsonii*; 2, Mr. Ross, gr, Holme, for *F. corymbiflora*, *Yonelli*, *glabra major*, and Mr. Gilman's seedling. *Best ground Fuchsia of any description*, 1, Mr. Ross, Holme, for *F. Neillii*; 2, Mr. Bain, Beaufort Castle, for *F. ingens*. *Six Ranunculuses*, 1, Mr. K. Tolmie, gr, Mountgerald; 2, Mr. Taylor, gr to Miss Campbell, Kilravock Castle. *Six double Anemones*, 1, Mr. Taylor, Kilravock Castle; 2, Mr. Tolmie, gr, Mountgerald. *Eight varieties of Hardy Herbaceous plants*, 1, Mr. Taylor, Kilravock; 2, Mr. A. Gauld, gr, Geddes. *Four varieties of Iris*, 1, Mr. Lawrence, gr, Inverness; 2, Mr. Taylor, Kilravock. *Four Cinerarias*, 1, Mr. Bain, Beaufort Castle; 2, Mr. Stephen, Ness Castle. *Six varieties of Mimulus*, 1, Mr. Fraser, Springfield Cottage; 2, Mr. Stephen, Ness Castle. *Six Verbenas*, 1, Mr. Bain, Beaufort Castle; 2, Mr. Ross, Holme. *Six Pelonias*, Mr. Dallas, Raigmore; 2, Mr. Stephen, Ness Castle. *Six varieties of American plants*, Mr. Macculum, gr to J. B. Fraser, Esq., of Keang; 2, Mr. Bain, Beaufort Castle. *Cinn Rosas*, 1, Mr. Fraser, Springfield Cottage, for *Caroline*, *Mausais*, *Thé Hymene*, *Thé Hougère*; 2, Mr. Stephen, Ness Castle. *Ornamental Basket of Eadie in Flower*, 1, Mr. Fraser, Springfield Cottage, for, among other plants, *Boronia denticulata*, *Boronia alata*, *Pimelia hispida*, *Leschenaultia formosa*, *Siphocampylus bicolor*, *Euclrysium elegans*, *Spirea japonica*, *Crassula*, *Fuchsias*, *Pelargoniums*, *Heaths*, *Fabiana imbricata*, *Calceolarias*, *Verbenas*, &c.; 2, Mr. Stephen, Ness Castle. *Bouquet of Flowers from hardy plants*, 1, Mr. D. Mackenzie, gr to Lady Mackenzie, of Avoch; 2, Mr. J. Lawrence, Inverness. *Storks*, 1, Mr. Stephen, Ness Castle; 2, Mr. Ross, Holm. *Rockettes*, 1, Mr. Taylor, Kilravock. *Arabis*, 1, Mr. Ross, Holm, for *Rubrum Pippins* and *Nonpareil Russets*; 2, Mr. Bain, Beaufort Castle. *Cucumbers*, 1, Mr. Bain, Beaufort Castle; 2, Mr. Taylor, Kilravock. *Cauliflower*, 1, Mr. Ross, Holme; 2, Mr. Gauld, gr, Geddes. *Dutch Turnips*, 1, Mr. Donald Mackenzie, gr, Avoch; 2, Mr. Stephen, Ness Castle. *For the best Twelve Early Potatoes*, 1, Mr. Taylor, Kilravock; 2, Mr. Gauld, Geddes. *Cabbages*, 1, Mr. Bain, Beaufort Castle; 2, Mr. Ross. *Cos Lettuce*, 1, Mr. Gauld, Geddes; 2, Mr. Dallas, Raigmore. *Six rarest Native plants*, Mr. Lawrence, gr, Inverness, for *Arbutus aquia*, *Epilobium alpinum*, *Saxi boracea*, *Cornus suecica*, *Saxifraga stellaris*, and *Rubus chamaemorus*. An extra prize was awarded to Mr. Stephen, Ness Castle, for a large and varied assortment of seedling *Calceolarias*, sown in 1842.

Isle of Man Floral and Horticultural Society, June 7.—The following is a list of the prizes awarded to the competitors, after the exhibition, at the Kalk Orchard Nursery Grounds. Mr. H. Alexander, best Asparagus. Mrs. Dutton, Moss Rose (extra prize). Mr. Cotter, gr to the Rev. Principal Dixon, 2d best Brompton Stocks, best Tulips, 2d best Ranunculus, best 12 Pansies, best Asparagus. Mr. Moffatt, gr to G. W. Dumbell, Esq., —2d best Tulips, 2d best Annuals, 2d best Bouquet, 2d best Rhubarb, best Cabbages, 2d best Leeks, 2d best Onions, best Salad. Mr. R. Taylor, gr to General Goldie—2d best Veronaeas, 2d best Pelargoniums, best Brompton Stocks, best 12 Pansies, third do., 2d best device in Pansies, 2d best Herbaceous Plants, best rare Native Plant (*Primula farinosa*), best Bouquet, 2d best Mushrooms, best Cauliflowers, best Potatoes, best Turnips, 2d best do., 2d best Salad. Mr. W. Quine, gr to Captain Hay—3d best Cactus (Jenkinsoni), best Greenhouse Plant (*Polypala oppositifolia*), 3d best Greenhouse Plants, 2d best Cucumbers, 2d best Cauliflowers, best Carrots, best blanched Rhubarb, best Seakale, 2d best Cabbage. Mr. Clarke, gr to Mrs. Hodder—best Mushrooms, best Leeks. Mr. R. Edgar, gr to his Honour Dr Heywood—best Cactus (Ackermannii), 2d best do. (Jenkinsoni), best Chinese Azalea (*indica alba*), best Cape Heath (*Erica ventricosa*), 3d best do. (Boweriana), 2d best Calceolarias, 2d best China Roses (odorata, indica alba, semperflorens), 2d best Fuchsias (*globosa*, *fulgens*, *gracilis*), best Annuals *Nemophila insignis*, *Schizanthus pinnatus*, *Eutoca Wrangliana*, 2d best Greenhouse Plants, 3d best Bouquet, 3d best Decoration Plants, 2d best Grapes (Black Hamburg), 2d best Dessert Apples, best Kitchen do., best Onions, 2d best Blanched Rhubarb, best Kidney Beans. Mr. Lyle—best Decoration Plants, extra prize for Selago Gilliesii, and six seedling Fuchsias. Captain Martin—best Stove Plant (*Euphorbia splendens*), 2d best do. (*Russelia juncea*), 3d best Greenhouse Plant (*Swainsonia galegfolia alba*), 2d best Pelargoniums (Nymph, Sylph, Matilda, Conservative, Annette, Alexandrina, Phosphorus, Victory, Alicia, Fostera rosea, Laity Nithsdale, Priory Queen), best three do. Miller's Adonis, Bleda, Sir John Broughton, best seedling do. (Martin's Mary), extra prize for Fuchsia corimbiflora. E. Moore, Esq.—best seedling Pansies, best Cucumbers, best Rhubarb, 2d best Kidney Beans. J. E. Mosley, Esq.—best device in Pansies, composed of a suspension-bridge, with rock and sea scenery, vessels, &c. lying in the foreground and distance, best Cut Flowers, best Dessert Apples, extra prize (Bouquet). Mr. P. Clarke, gr to Major Pollock—3d best Stove Plant (*Gloxinia speciosa*), 2d best Greenhouse Plant (*Pimelea decussata*), best four Calceolarias (Indescribable, Pluto, elegans, Nerene), best China Roses, 2d best do., best Garden Roses, 2d best do. best Verbenas, Henderson, Charlwood, Ivryana, best Pelargoniums (Matilda, Coronation, Sylph, Nymph, Vivid, Alicia, Priory Queen, Vulcan, Jewess, Fostera rosea, Games's King, Games's Grand Duke), best six do. (Bridesmaid, Lady Nithsdale, Lieguard-maid, Victory, Comte de Paris, Alexandrina), 2d best three do. (Firebrand, Bridegroom, Vesta), best new and rare do. (Janus), second best do. (Wildfire), best three Fuchsias (*fulgens*, *cordifolia*, *pendula terminalis*), 2d best do. (*Queen*, *grandiflora maxima*, *racemiflora*), best new and rare Fuchsia (Harris's *Enchantress*), 2d best do. (Blanch), best Ranunculus, best Herbaceous Plants, best Greenhouse Plants in Pots, 2d best Cut Flowers, 2d best Decoration Plants, best Grapes, 2d best Carrots, 2d best Seakale. J. Putnam, Esq.—best three Pelargoniums, flowered in windows. W. Wilders, Esq.—2d best Kitchen Apples, do. Potatoes. COTTAGERS' PRIZES.—Mr. Cullen, sen., Cuckan, best green Gobsberries. Mr. D. Parker—EXTRA PRIZES, Tulips and Rhubarb.

Leeds Floral and Horticultural Society, June 7.—The first exhibition of this Society for the present season took place in the Music-Hall, Albion-street. The collection was scarcely equal in amount to what it has been on former occasions; but there were some very fine specimens of flowers of various kinds, and also of vegetables, especially those for culinary purposes. There was a splendid show of Pelargoniums, and various hothouse and greenhouse plants. Of culinary vegetables there was a good exhibition, both in point of quality and quantity. There were several

fine and well bloomed Ericas and Calceolarias, with some excellent Fuchsias. The Cottagers' things were not very numerous, but some of them—more particularly Gooseberries, Potatoes, Onions, and Cabbages—were fine productions. The following is a list of the prizes:—**FIRST CLASS.**—**FRUITS.**—Gooseberries, Green, 1, W. Clark; 2, J. Schofield; 3, J. Kearsley. Currants, 1, W. Carr, gr to T. Benyon, Esq.; 2, E. Ward, gr to J. Charlesworth, Esq.; 3, W. Clark. *Dessert Apples*, 1, W. Clark; 2, J. Kearsley; 3, J. Walton, gr to Mrs. Dealtry. *Baking Apples*, 1, W. Clark; 2, W. Carr; 3, J. Walton. **SECOND CLASS.**—**PLANTS.**—*Stone*, 1 and 2, W. Carr; 3, L. B. Barker, gr to W. Smith, Esq. *Dicto Coll. of three*, 1, L. B. Barker; 2, L. Barker. *Greenhouse*, 1, W. Carr, 2, T. Dewksbury, gr to J. Purchon, Esq. *Dicto Coll. of three*, 1, Mr. Ripley, 2, T. Dewksbury; 3, L. B. Barker. *Dicto Coll. of three*, 1, L. B. Barker; 2, Mr. Whitley; 3, J. Kearsley. *Successulent*, 1, L. B. Barker; 2, J. Kearsley. *Erica*, 1, T. Dewksbury; 2, W. Carr; 3, T. Dewksbury. *Dicto Coll. of three*, 1, W. Carr; 2, Mr. Ripley; 3, T. Dewksbury. *Pelargoniums*, 1, L. B. Barker; 2, J. Kearsley; 3, Mr. Ripley. *Dicto Coll. of three*, 1, W. Carr; 2, and 3, Mr. Ripley. *Fuchsias*, 1, J. Schofield; 2, T. Dewksbury; 3, J. Schofield. *Dicto (extra)*, T. Dewksbury. *Dicto Coll. of three*, 1 and 2, J. Whitley; 3, J. Kearsley. *Balsam*, 1 and 2, J. Kearsley. *Calceolaria*, 1, 2, and 3, H. Major. *Dicto Coll. of three*, 1 and 2, H. Major, 3, J. Kearsley. *Verbenas*, 1, J. Kearsley; 2, and 3, L. B. Barker. *Collection*, 1 and 2, J. Whitley. *Petunias*, J. Whitley. *Herbaceous, in flower*, 1 and 2, L. B. Barker. *Rose*, in pot, 1, H. Major; 2 and 3, J. Kearsley. *Designs in Flowers*, J. Morrell, gr to W. Watson, Jun., Esq. *Hardy Bouquet*, J. Kearsley. *Tender do.*, L. B. Barker. *Cut Peonies*, 1, W. Clarke; 2, H. Major; 3, T. Peacock. *British Plant*, L. B. Barker. *Seedling Rhododendron*, 1, H. Major; 2, T. Dewksbury. **THIRD CLASS.**—**VEGETABLES.**—*Cucumbers*, 1, W. Carr; 2 and 3, J. Schofield. *French Beans*, W. Carr. *Cabbage*, white, 1, J. Walton; 2, G. Hamlin, gr to G. Smith, Esq.; 3, W. Carr. *Lettuce*, 1, T. Peacock, gr to Mr. Paraby; 2 and 3, E. Ward. *Mushrooms*, 1, J. Kearsley; 2, T. Peacock. *Parsley*, 1, E. Ward; 2, L. B. Barker; 3, E. Wood. *Spinach*, 1, L. B. Barker; 2, E. Ward; 3, T. Peacock. *Asparagus*, 1, E. Ward; 2, W. Carr; 3, G. Hamlin. *Peas*, 1, J. Walton; 2, W. Carr; 3, G. Hamlin. *Capsicum*, W. Carr. *Onions*, 1, J. Walton; 2, W. Carr. *Radishes*, W. Carr. *Turnips*, W. Carr. *Horse Radish*, J. Broughton. *Onions*, spring, 1, unknown; 2 and 3, J. Schofield. *Lettuce*, 1 and 2, W. Carr. *Cabbage*, 1, J. Walton; 2, G. Hamlin; 3, W. Carr. *Extra for Potatoes*, T. Peacock. **FOURTH CLASS.**—**FLOWERS.**—**PANSIES.**—*Best Twenty four*, Mr. H. Major, for Rival yellow, Hector, Surprise, John, Maid of Milan, Prince Albert, Princess Royal, Waltham Abbey, Imogene, Trivernon, Lovely Bride, Premier, Terry, Miss E. Crossland, Countess of Orkney, Curion, Desideratum, Briegroom, Perfection, Westwood Rival, Oliver Moonshine, Conservative, Mrs. Newby, and Princess Royal; 2, Mr. J. Schofield. *Best Twelve*, Mr. H. Major, for Princess Royal, Trivernon, Maid of Milan, Imogene, Lady Glenallan, Waltham Abbey, Lovely Bride, Curion, Earl of Clarendon, Miss E. Crossland, Terry, and Westwood Rival; 2, Mr. J. Schofield; 3, Mr. Kearsley. *Best Six Seedling Pansies*, 1, Mr. J. Schofield; 2, Unknown. **TULIPS IN CLASSES.**—*Feathered Bizarres*, 1, 2, 3, B. Ely, for Monsieur, Chas. Xth, and Gond Beims. *Flumed ditto*, 1, 2, 3, B. Ely, for Polyphemus, Incomparable, Bizarre, and Sir Sidney Smith. *Feathered Byblenems*, 1, 2, 3, B. Ely, for Black Baguet, Transparent Noir, and Light Baguet. *Flumed Bybls*, 1, 2, 3, B. Ely, Bien Fait, Walker's No. 71, Emmant. *Feathered Roses*, 1, B. Ely, Ceres Primo; 2 and 3, J. Mallinson, Doolittle, and Laus's No. 24. *Flamed Roses*, 1, 2, 3, B. Ely, for Roi de Ceres, Tromphe Royale, and Prince Albert. *Selfs*, 1, 2, 3, B. Ely, Min d'Or, Golden Hero, Cenotaph. **PREMIER PRIZE.**—*Best Seven Tulips*, B. Ely, for Polyphemus, Surpasse, Catafalque, Queen Victoria, Transparent Noir, Ceres, Triumphant, Prince Albert, and Golden Hero. **THE SOCIETY'S PRIZE for Seven Tulips, B. Ely, for Polyphemus, Albion, Washington, Walworth, Lord Hill, Lavinia, and Min d'Or. **COTTAGER'S PRIZES.**—*Lettuce*, J. Barstow; 2 and 3, J. Robinson. *Onions*, winter, J. Barstow. *Onions*, spring, J. Robinson. *Cabbage*, J. Barstow. *Potatoes*, J. Barstow. *Parsley*, J. Robinson; 2, J. Barstow, 3, — Jackson. *Radishes*, — Jackson. *Currants*, 1 and 2, J. Robinson. *Gooseberries*, 1 and 2, J. Robinson; 3, — Jackson. *Rhubarb*, J. Barstow.**

Morningside Practical Gardeners' Society, June 13.—The second General Meeting was held in the School room, Morningside, when prizes were awarded as follows:—*Pelargoniums*, 1, J. Downie, gr to Gen. Robertson, for Prince of Waterloo, Sylph, Eretum, Gem of the West, Bridesmaid, Prince Albert; 2, J. Young, gr to T. Ohver. *Pansies*, 1, J. Downie, for Black-eyed Susan (Kinlayson's.) Daniel Defoe, do., Gipsy, do., Flora Macdonald, do., Miss Scott, Miss Russell; 2, T. Ovens, gr to A. Russell, Esq. *Sticks*, 1, H. Gibb, gr to Mrs. Stark; 2, J. Young. *Tulips*, 1, J. Young, for Grand Monarque, Roi de Siam, Washington, Margrave de Baden, Triomphe Royale, Comte de Vergerennes; 2, J. Liddle, gr to G. Ritchie, Esq. *Ranunculuses*, 1, R. Anderson, for Herbert, Queen Victoria, Felix, Luna, Prince Albert, Invariable; 2, J. Young. *Anemones*, 1, J. Young; 2, H. Gibb. *Hardy Shrubs*, 1, J. Young, for Tree Paeony, for Mrs. Gregory. *Hardy Herbaceous Plants*, 1, J. Young, for *Aquilegia glandulosa*, *Onosma tauricum*, *Campanula pyrenaica*, *Linaria Alpina*, 2, J. Fargie. *Roses*, 1, J. Young, for Tod's Scarlet sweet-scented, *Cramoisi superieure*, *Belle de Meaux*; 2, J. Downie. *Rockets*, 1, T. Ovens; 2, J. Downie. *Turnips*, 1, R. Anderson; 2, H. Gibb. *Canthflowers*, 1, J. Douglas, gr to Sir T. D. Lauder, Bart.; 2, T. Wood, gr to A. Falconer, Esq. *Carrots*, T. Ovens. *Potatoes*, 1, H. Gibb; 2, W. Denholm, gr to Sir J. Forrest, Bart. *Cucumbers*, 1, T. Ovens; 2, H. Gibb. *Pansies*, 1, J. Robertson, for Robertson, Shakspeare, Milton, Fair Maid. A prize was awarded by Miss Brown for the best six *Anemones*, to J. Young. There were exhibited from G. Ritchie, Esq., a very fine specimen of *Hydrangea arborea*, and *Crassula coccinea*. A collection of Seedling Pansies from Grange Bank, which were much and deservedly admired, also some Pansies from J. Robertson, Morningside, and fine collections of *Pelargoniums* and *Ranunculuses*, from Newington Lodge, and two good pans of Turban *Ranunculus*, from Falcon Hall and Salisbury Green.

Newcastle Botanical and Horticultural Society, June 13.—The great Summer Exhibition of this Society, which had been deferred from the 2d inst., on account of the weather, was held in the Music Hall, and from the splendid display of fruit and flowers, it was evident that the delay had been attended with great advantage both to the exhibitors and the visitors. The day was fair, though cool and cloudy; circumstances rather favourable than otherwise for the display of cut flowers. There were eight or nine Prize Apples, Queens, and Ripley Queens, and the flavour of the prize specimens was as good as could be wished. Several very fine dishes of Grapes were also on the table. The Potatoes were of excellent size and quality, and the Peas better than could have been anticipated. Of course the Pelargoniums were the great attraction, and never were finer specimens exhibited here. Flowers were so great, and the specimens so compact, that one almost regretted there was not more of the green leaves visible. Another collection from the gardens of John Cookson, Esq., of Benwell House, was also very fine, though not so fully in bloom as that to which the prize was given. The prize collection of 15 specimens contained some most beautiful plants, with more of the foliage visible than in another collection from the garden of Matthew Anderson, Esq., which ranked very nearly equal to the winner. In the collection of three, to which the medal was awarded, the plants were also remarkably well grown; and the two single specimens which received the prizes were all that could be wished, for beauty and symmetry. The Tulips and Calceolarias were very fine. The Petunias comprised some of the best kinds, and were nicely trained to flat trellises, and the Verbenas were well and closely grown. The Alstromerias exhibited the usual gay markings of this pretty genus, whilst the

gorgeous masses of flowers on the Cacti were almost too dazzling for the eye to bear with ease. The *Fuchsias* were well grown, though to most individuals, the good old sorts are more attractive than the pale beauties of the recent hybrids of these plants. There were some fine collections of *Pansies*, and the winning tray contained many choice and large specimens. The *Paeonies* were more numerous than usual. The collections of *Exotics* contained a great number of well-grown specimens, and added much to the beauty of the room, besides that to which the prize was awarded, there were excellent collections from Miss Cuthbert's and Mrs. Surtees' gardens, and another containing two very fine specimens of the beautiful and sweet-scented *Lilium eximium*. The bouquets of flowers were as splendid as usual. The prizes were allotted as follows—*First* 1st and 2nd, Mr. G. Foreman, gr to J. Lamb, Esq., *Avonia Park, Glasgow*, Mr. J. Charlton, gr to J. Straker, Esq., *Point Pleasant, Potatoes* from the open ground, Mr. G. Foreman. *Plants* from the open ground, Mr. G. Foreman. *Best White-ground Tulip* (Rose Cerise Premier, Mr. I. Scott, florist, Newcastle. *Best do.* (Lilias Rose), the florists' silver medal, to Mr. R. Rawling, florist, Walker. *Yellow-ground Tulip* (Surpassa Catafalque), Mr. F. Mitehinson, florist, Newcastle. *Best do.* the florists' silver medal to Mr. F. Mitehinson. *12 White-ground Tulips*, Mr. J. Watson, gr to M. Anderson, Esq., *Jesmond*. *12 Yellow-ground Tulips*, Mr. I. Scott, Newcastle. *12 Yellow-ground Tulips*, Mr. J. Deans, gr to Mrs. Cuthbert, *Benwell*. *1 Light-ground do.* (Acme of Perfection, Mr. J. Watson. *12 Polyanthous* Coronation, Bradshaw, Ventry, Garth's Perfection, Ophelia, Joan of Arc, Decorum, Foster's Anna, Masterpiece, Mabel, Acme of Perfection, Mr. J. Watson. *6 Polyanthous*, Mr. J. Deans. *3 do.*, Mr. T. Charlton, gr to Mrs. Atkinson, *Long Benton*. *3 Ericas*, Mrs. Surtees, Newcastle. *6 pots of Calceolarias*, Mr. J. Deans. *Collection of Roses*, grown in a pot, Mr. W. Kelly, gr, *Jesmond*. *Single Specimen of do.*, Mr. J. Watson. *Aspleniums*, Mr. A. Hedley, gr to S. J. Trevelyan, *1 art.* *Wallington Cacti*, Mr. T. Charlton. *Single Specimen of a Cactus*, Mr. T. Wallis, gr to C. Blackett, Esq., *Wylam Oakwood*. *Potunus*, Mr. T. Charlton. *Fuchsias*, 1, Mr. T. Charlton. 2, Mr. W. Kelly, *Jesmond*. *Single Specimen of do.*, Mr. W. Lang, gr to R. J. Lambton, Esq. *Polyanthus*, Mr. T. Charlton. *24 flowers of Viola trevolor*, Mr. Ranson, *Sunderland Paeonies*, Mr. J. Scott, *1 sand-hoe*. *Exotic Plants*, Mr. W. Kelly, gr to A. Dunk, Esq., *Jesmond*. *Single Specimen of a new ground* *Best Plant*, G. Wales, Esq., Newcastle. *Seedling Flaxseed*, Mr. J. Wilson, florist, *Elswick* a white ground Tulip named *Bienart*. *Bouquet of Flowers*, 1, Mr. T. Charlton. 2, Mr. J. Cook, gr to E. C. Milgwood, Esq., *Dissington*. *Polyanthus*, Mr. J. Cook. *Collection of Plants*, Messrs. I. Anson and Imney, nurserymen, *Gateshead Fuchsia*, *conspicua arborea*, Mr. J. Cook.

Norwich Horticultural Society.—In imitation of the grand exhibitions at Chiswick, this Society held its July meeting in the extensive grounds of Mr. Bell, of Bracondale. The visitors on this occasion amounted to nearly 1,000, and 12s. were taken at the gate. The subjects of exhibition were remarkably fine, particularly the Vegetables, which were stated to be superior to those exhibited at the meeting of the South London Society. The prizes given to Cottagers amounted to 12l. 11s. 6d. The following prizes were awarded: *Best collection of 100 Roses by Nurserymen* Mr. R. R. Burcham, Heddenham, for *Belshazzar*, *Blanc Genevieve*, *Aspic*, *La Tourterelle*, *Queen of Bourbon*, *Gloire*, *E. na*, *Duchess of Orleans*, *Leon the Tenth*, *Princess Helene*, *Baron No. 2*, *French Crimson Moss*, *Coupa d'Hoc*, *White Rose*, *Leons Bu naparte*, *Melane*, *Fulgurie*, *Belle Marie*, *Coquette de Montmorency*, *Charles Duval*, *Grandissima*, *Maitre Bonheur*, *Hybrid de Course*, *Aucelin*, *Aurora*, *La Sausonne*, *Boula de Nanteuil*, *Crisalis*, *Julie*, *Marie Denise*, *Duchess of Beuchamp*, *Conte de Paris*, *Crested Provence*, *Duchess of Devonshire*, *Petit Parer*, *Fanny Perrisot*, *Armosa*, *Legouve*, *Requiem*, *Leontine*, *Edward Jesse*, *Bouquet de Flora*, *Vandael*, *Brilliant*, *Madame Hardy*, *General Bernard*, *Magna Rosa*, *Chenedole*, *Monstrepuze*, *Double-margineu Hip*, *Sir Walter Scott*, *Sylvan*, *W. REPORT ON COVENT-GARDEN MARKET,

For the Week ending July 14, 1848.

THE late fine weather has greatly increased the supply of all out-door fruits, and forced fruit of every description is daily becoming more abundant. Pines of good quality, consisting of Enville and Queens, are well supplied. Both Black and White Grapes are abundant, and very fine. The quality of Peaches and Nectarines has greatly improved, and a few Apricots have made their appearance. Melons are becoming more plentiful. There are some excellent samples of Myatt's British Queen and Elton Strawberries. Cherries consist of Black and White Circassian, Bigarreau, and Mayduke, the two latter being very abundant. Gooseberries and Currants are exceedingly plentiful. In consequence of the late warm weather, Cauliflowers are unusually abundant, and, as well as most other Vegetables, are of good quality. Lettuces are on the decline. A small quantity of Asparagus is still to be met with, but it is inferior. Celery has made its appearance, and, with Onions, promises to be very good. French Beans still continue scarce; but the Windsor and Longpod are plentiful. Tolerably good Vegetable Marrows are also offered. Flowers in pots consist of Sweet Peas, Hydrangeas, Ericas, Polianthes tuberosa, Heliotropes, &c. The Cut-Flowers are very numerous, comprising Gladioli, Alstromerias, Stocks, Pinks, Roses (many varieties), Lilies, Gardenias, Picotees, and Carnations, with Bignonia venusta, Aconitum versicolor, Combretum purpureum, and the Bee Orchis.

PRICES, SATURDAY, July 16, 1848.—FRUITS:—

Pine Apple, per lb., 4s to 7s	Cherries, Wall, 1s to 5s
Grapes, hothouse, per lb., 2s to 5s	Oranges, per doz., 1s 6d to 3s 6d
Peaches, per dozen, 6s to 24s	— per 100, 10s to 24s
Nectarines, per dozen, 6s to 24s	Lemons, per doz., 1s to 2s
Melons, 4s to 8s each	— per 100, 6s to 10s
Strawberries, per pottle, 6d to 2s	Cucumbers, per brace, 1s to 2s
Gooseberries, Green, p. h.-av., 2s to 3s 6d	Walnuts, per bush., 12s to 16s
— ripe, p. h.-av., 2s to 4s	Almonds, per peck, 6s
Currants, per half-sieve, 2s to 3s 6d	Sweet Almonds, per pound, 2s
— Black, 2s 6d to 3s 6d	Nuts, per bushel
— Red, for wine, 2s to 3s	— Brazil, 16s
— for dessert, 3s to 4s	— Barcelona, 24s
Raspberries, per gallon, 5d to 2s	— Cob, 12s
Cherries, English, p. 12lbs., 2s to 3s 6d	

VEGETABLES.

Cabbage-plants, per doz. bun., 1s to 2s	Garlic, per lb., 6d to 8d
Cabbages, per doz., 2s to 1s 6d	Chilis, per 100, 1s to 2s 6d
Cauli-were, per dozen, 1s 6d to 1s	Peas, per sieve, 1s to 2s 6d
Beans, kidney, fed., p. 100, 1s 6d to 1s	— per 100, 1s to 2s
— Windsor, per bush., 1s 6d to 2s	Asparagus, large, per 100, 2s to 5s
— long-pod, p. sieve, 1s 6d to 2s 6d	— Spruce, or small, p. bun. 1s to 2s
Potatoes, per ton, 50s to 70s	Lettuce, Cabb., p. sieve, 4d to 1s
— per cwt. 3d to 4s	— Cos, per score, 9d to 1s 3d
— per bushel, 2s 6d to 3s	Celery, p. bd., (12 to 15) 1s to 2s
Kidney, p. h.-av., 2s to 2s 6d	Small Salads, per punnet, 2d to 3d
Scotch, per bush., 2s to 2s 6d	Green Basil, per bunch, 4d to 6d
New, per cwt., 4s to 7s	Watercress, per doz. am. bun., 4d to 6d
Artichokes, green, per doz., 1s to 4s	Parsley, per doz. bunches, 1s 6d to 3s
Vegetable Marrows, per doz., 1s to 2s	Tarragon, per doz. bunches, 2s to 3s
Turn ps., Spring, per bunch, 4d to 6d	Fennel, per doz. bun., 2s to 3s
Red Beet, per dozen, 9d to 1s	Mint, per doz. bunches, 1s 6d to 3s
Horse Radish, per bundle, 1s to 6s	Marjoram, green, per bunch, 4d to 6d
Radish, spring, p. doz. hands, 6d to 1s	Mushrooms, per pottle, 1s 3d to 2s
— Turnip, p. doz. bunch, 6d to 1s	Spinach, per sieve, 1s to 1s 6d
Carrots, Young Horn, p. bunch, 4d to 9d	Leeks, per doz. bun., 3s to 4s 6d
— Spring per bunch, 4d to 8d	Onions, Spring per bunch, 2d to 4d
Shallots, per lb., 1s	— Large, per bun., 4d to 7d
— green, per bunch, 2d to 4d	

Notices to Correspondents.

One Shilling each will be given for Nos. 2 and 8 for the present year.

MANURES.—*A Devonian.*—Tanner's bark is a bad manure unless thoroughly decomposed, and owing to the difficulty which there is in ascertaining when this is the case, it is a dangerous material to employ as amongst flowering shrubs.

DRAINING TILES.—*Junius.*—We can furnish you with no information respecting the cylindrical draining tiles in addition to the statement which has been already given in a former Number of this Paper.

BOTTOM-HEAT.—*Z.*—We cannot say what is the greatest amount of bottom-heat that a plant will bear without injury to the roots:—probably 120° in some cases.

VINES.—*Guchenet.* In the advantage, in planting young Vines, of removing all the buds from that portion of the stem which is laid under ground is this: it prevents any suckers from forming upon that part of the stem, and causes the latter to emit roots more readily than would otherwise be the case.

GRAPES.—*A Subscriber.*—From the account you give of your Grapes, we should suppose that the Vines are infested by a species of Coccus, the excrements of which fall on the Grapes and present the appearance of what you call "Honey Dew." If such is the case, your best remedy is, after the Vines have received their winter pruning to remove the rough bark from the stems, and scrape off all the insects which you may meet with. The Vines should then be coated over with a mixture of clay, lime, soft soap, sulphur, and urine, made into the consistency of thick paint. When Grapes begin to change colour, they should be allowed plenty of air, and the house should be kept dry.

FRANCIS.—From your statement we suppose that your Grapes are affected with what is commonly termed "rust," the cause of which has not been satisfactorily ascertained. The most probable reason yet assigned is, that the Grapes are in an early stage of their growth injured by thrips. The fact that gold fish are kept in a tank in the same house can have no connexion with the disease.

MELONS.—*Guchenet.*—It is better to allow Melons to remain upon the mother plant until thoroughly ripe, unless they are required to be sent to any distance; in which case the better plan is to gather them two or three days before they are ripe, and after they have reached their journey's end, to place them

in a warm house or frame to mature them perfectly. *Wills* will be obliged if "Cummins," who stated at page 429 that he invariably ripens eight Melons in each light, will be kind enough to inform him of the size of his two-light frames, and the sort of compost which he uses to grow them in; also, whether all the fruit, or only a portion of them, attain the size mentioned?

FIRS.—*Pinus.*—The best time for topping Scotch Firs, which are intended for a sheltering fence, is, when they are beginning to make young shoots.

DISEASED LARCHES.—*A Subscriber.*—We regret to hear that your Larches are suffering from the "heart-rot" which has already done much mischief elsewhere. The cause is unknown; it seems most probable that it is connected with water at the roots. Are you quite sure that your land is not wet below the surface? Dig down 3 or 4 feet and see. We should not replant the wood with Larches, but with some other kind of tree.

AMERICAN BORDERS.—*A Devonian.*—In your mild climate Japan Lilies and hybrid Gladioli would probably succeed in the open border amongst American plants.

NIGHT VIOLET.—*M. S. R.*—There is no such plant as the Night Violet. From your description of the plant it is evident that you allude to the Night-scented Stock.

ANAGALLIS.—We have read a letter from Mr. Brewer, who seems to doubt whether Flora's flowers are as large as a crown-piece. We can only say in reply, that we measured them ourselves. He says that he does not wish any one to buy his Anagallis, without first seeing the flowers: this seems very fair.

HIBISCUS WRAYE.—*A Devonian.*—Not having seen this plant for a considerable time, we cannot state whether it remains a favourite among conservatory plants.

ROSES.—*A Subscriber.*—The leaves of your Roses are attacked by parasitical fungi; the disease is very common, but we know of no remedy for it.

CYRTANTHUS.—*Z.*—Since your bulb continues in such excellent health, you cannot do better than keep it near the glass and in a state of gentle growth during winter. Your question respecting Cyclamens was answered last week at page 460.

ASPARAGUS.—*E. W. S.*—The best strength at which to employ salt water, is nearly that of the ocean; weaker rather than stronger, and once a week. The addition of the liquid from shores will increase its activity: but we should not apply this so often if it is very strong. It is impossible to give precise directions; much depends on circumstances only to be judged of on the spot.

INSECTS.—*Omega* will find it a good plan to syringe the shoots of his Gooseberry bushes, which are infested with the fly, with gas-water, as directed in a leading article to-day. *A Constant Reader.*—Your insect is the *Macroglossa stellatarum*, or Humming-bird Hawkmoth. It does not extract honey from flowers to lay up against winter as Bees do, but merely to nourish it during the short period of its existence, which seldom exceeds 2 or 3 weeks. *E. Smith.*—The "blight" which has attacked your Poplars, causing large excrescences on the leaf-stalks, is called *Eriosoma populi*, and is not at all uncommon, having been observed in many parts of England. *X. Z.*—We can discover nothing in your quill but some specimens of an Aphid in an immature state—so dried up, however, that we cannot make out the species with certainty; they are probably the Aphid *Dahliae*. The other insect you mention must have escaped from the quill before it reached us. *Jacobus.*—The chrysalises which you sent us are those of the common yellow Rose Tortrix, the *Argyrotoza Bergmanniana*. This has been made evident by the moth having come out from one of them. The green caterpillar had turned into a chrysalis before we examined it, and in its present state we decline passing an opinion upon it. If we can rear the moth from it you shall be informed of the name. Hand-picking, as recommended in the *Gardeners' Chronicle*, 1841, page 318, and the same volume, page 328, under the head of "Entomological Notices," is the best means that we know of getting rid of the nuisance you complain of.

J. W. S.—The name of your insect is the Common Golden-eye, *Chrysops perla*. The various kinds of Golden-eye are remarkable for the very offensive smell they give out when touched.

Este.—The insect which you describe, laying "its eggs in the bark of the young shoot, in a row, puncturing the bark," and which, you say, is making great ravages among the Rose-trees at Kensington, is the *Hylotoma rosæ*, one of the Saw-flies. You will find much difficulty in getting rid of this troublesome insect; but you should do your best to exterminate it by hand picking and destroying the eggs and larvae, as well as by destroying as many of the perfect insects as you can catch by shaking the Rose-trees over a cloth spread upon the ground in the cool of the evening, when the insect is at rest, or by any other means that you can devise.

BOOKS.—*J. M'Pherson.*—We can give you no further information respecting the book you mention than is contained in the advertisements: it may be obtained of the booksellers. *Philanthus.*—*Lindley's Elements of Botany*, and "Introduction to Botany," (ed. 3), will furnish you with the information you seek.

MONSTERS.—*L.*—Your Rose has the sepals, or divisions of the calyx, entirely changed into leaves. What can show more plainly that these parts are really leaves, although so different from their usual state? It has also one division of the calyx, half leaf and half petal. Is not that evidence of these two organs being of the same nature, and therefore, as the sepal is a leaf, of the petal being a leaf also? We think it is, and good evidence too.

An Observer.—Your common Marigold, whose flower-heads are like those of the Hen and Chicken Daisy, is quite a curiosity, and we should save its seed, in the hope that some of the seedlings may have the same peculiarity. Should this prove to be the case, and the seed of the seedling is again saved, the habit may perhaps be fixed. It cannot be perpetuated in any other way. *J. C. X.*—*Salix aquatica*, apparently. You may well be puzzled with Willows; who is not? *Pelargonium Robertsonianum*, with white flowers, is not very uncommon. The fungus is *Uredo caprearum*. *Este's Strawberry* is a great curiosity, and we are much obliged to him for it. We shall advert to it soon.

DYEING PLANTS.—*A Young Botanist.*—The simplest of all presses is formed by two stiff pieces of mill-board drawn together by cords or straps passed round them. If you want a wooden press, then make a napkin press very strong, and substitute strong wedges for the screw.

ASPHALTE FELT.—*Zeta.*—This material is the better for being painted. We do not apprehend that salt would injure it; but we are not certain.

GLAZING.—*R. G. L.*—The plan recommended by Mr. May, at p. 53, vol. i., for glazing hothouse lights is this: When the framework is prepared for receiving the glass, a good bed of prepared putty is laid in the rebate, and the glass is firmly placed upon it, the laps of each square being left as narrow as possible to be safe; after which a little white paint is run with a small brush, almost a quarter of an inch wide, down each side of the square. This, when dry, is said to fix the glass securely.

SOFTENING PUTTY.—*Kent.*—The best agent for softening putty is strong caustic Potash, dissolved in as little water as possible. If the putty is well moistened with this solution over night, it will be found quite soft the next morning, and may be removed without fear of breaking the glass.

MISCELLANEOUS.—*W. D. F.*—Your plants are *Francoa appendiculata*, *Stachys lanata*, and *Polemonium ceruleum*: the *Pelargonium* sent without leaves appears to be *P. collinum*. *W. S.*—*Erigeron canadense*. *H. W.*—Your *Petunia* bloom (packed in dry moss) arrived in such a wretched condition that it was impossible to form any opinion respecting its merits.

J. B.—From the appearance of the miserable specimens sent, we should judge your plants to be *Bartonia aurea* and *Dracopis grandiflora*. *R. G. L.*—The plant meant as *Anagallis grandiflora* is the old blue one, probably a variety of *A. Monelli*.

Dumdee.—1, *Melaleuca ericifolia*; 2, *Erica depressa*; 3, *E. perspicua*; 4, *E. Walkeriana*; 5, *E. Humeana*; 6, *E. propendens*; 7, *E. triceps*. *C. J. B.*—1 and 2, *Craspedia Richea*; 3, *Leptorhynchus squamatus*; 4, *Brachycon cincta*; 5, *Ilch chrysanthemum*; 6, a species of *Lonchocarpus*. *Jacobus.*—*Tobacco*, *Stramonium*, *Pemp.*, *Bac Meadot*, *Jacques* when in flower, are plants cultivated in cottage gardens which are not suited to be kept in-doors, on account of the unhealthy odour they emit. *Sarah.*—*Clématis Hendersonii*, *Geranium pratense*, and *Dianthus atrorubens*. *A Devonian.*—There is no duty upon plants imported from Ghent. *J. L., Newburgh.*—We should be much obliged. *R. Martin.*—Your plant is *Ipomoea pes tigridis*, and is scarcely worth cultivating.

Flora.—We cannot say anything respecting your Cactus unless we see a flower of it. *W. B. H.*—Your Strawberries are Keen's Seedling. The beds will doubtless produce finer fruit next season if you give them a good top-dressing. *Zephyrus.*—We cannot undertake to conduct exchanges. *W. G.*—We do not consider your plant *Hoya crassifolia*, whose leaves should not be spotted, and have a different form; it is a well-marked variety of *H. carnosa*. *T. B. E.*—We are obliged by all suggestions, but as they do not require an answer, we see no necessity of noticing them. Indeed, it would be occupying time to no purpose. If we can, we adopt them, which is the best of all answers. *W. M. L.*—*Polygala vulgaris*. You must apply to your booksellers for the information you request. Mr. Paxton's "Botanical Dictionary" gives the accentuation of Botanical words, but nothing further; nor does any other book. *J. M.*—You have forgotten to put the Post Town, we therefore cannot answer your question.

SEEDLING FLORISTS' FLOWERS.

PELARGONIUMS.—*W. E., Dunstable.*—Your seedling is a very coarse and loose flower; the upper petals have watery and puckered edges, and are very uneven; the lower petals are too narrow; and, when fully expanded, all the petals turn back. *Juvenis*, 6. 7. 8.—Your seedlings are thin, and show a great want of substance, and the petals are all too long. *C. H.*—A pretty flower in colour, but very deficient in substance, and the upper petals are uneven at the edge. *One of the Old School.*—The seedling tinged with lilac is a flower of considerable substance, the petals even, and it retains a good form when fully expanded; the top petals are rather too high, and all the petals are rough on their edges; it is the best of its class we have seen, but flowers of this colour are considered of little value. The lower petals of the other variety are too long and narrow, and the flower is altogether of a bad form, and with rough edges to the top petals. *G. W. Hoyle.*—*Alice* is a prettily-formed flower, having broad, round and short under petals; the top petals are very faulty, having a thin and watery edge. *Queen of England*, delicate under petals, rich colour in the top petals, running to the base and edges of the petals, which in this flower are also thin and uneven. The lower petals of *Ungue* are too long and narrow; they are veiny and also deficient in substance; the top petals are dark and rich, bordered with a margin of rose-colour, and running to the bottom of the petals. *Rosalie*, petals too long and narrow; top petals rich in colour, but thin and rough on the edge. *Lady Peel*, good colour, with the same imperfections, want of substance in the lower petals, and thin edges to the upper ones. *Dost Mahomed*, under petals well formed and clean on the edge, and of good substance; top petals again too thin on the edge. The crimson seedling *African* is too small, thin, and of a bad form. *Brabant*, under petals rather narrow, top ones fine and rich in colour, with a brilliant crimson edge, in which there is not that deficiency in substance noticed in most of your seedlings, but well carried out to the edge. *J. Gready, Jun.*—The petals had fallen from *Marie* and the *Duke of Cornwall*, that we could not tell to which of the flowers the petals belonged; the larger flower of the two must be bad in form from the length of the petals; they are also very thin, and not of a pure white; the upper ones are high and bad in colour. The smaller flower, with a distinct spot in the top petals, is better in form and colour, but appears to be deficient in substance. *Elizabeth* is a pretty flower, well formed, top petals are rather thin at the edge, but it appears to retain its form well; this is decidedly your best flower. *Sophia*, bad form, and the flower altogether very deficient in substance. No. 5, the same defects as the last. *X. Y. Z.*—Your seedling is a pretty flower, with broad and round under petals; from its having been pressed we cannot tell its form when expanded; there is too much feathering in the spot, and a dulness in its general appearance, from its wanting a white centre; it is pretty, but quite a second-rate flower. *J. Deane Waite, Esq.*—On opening your box it appeared a mass of confusion; there should have been a thin layer of cotton wool placed over the flowers, which would have prevented the petals from being shaken about; we cannot tell to which of the flowers by name the petals belong. The dark lilac variety must be bad in form; the lower petals are long, narrow, and deficient in substance and the upper petals are too fringed at the edge; flowers of this colour are considered of no value. We can recognise *Minna* from its resemblance to the *Nymph*; the petals of your variety appear to turn back; it wants the firmness of the *Nymph*, and the upper petals appear to be thin and watery at the edge, and the colour too much mottled beyond the spot. The largest of the flowers sent, with very delicate pink under petals, has the same faults in the upper petals, the colour being mottled, and the edges of the petals rough, with too much feathering near the centre; the bottom petals are too long and narrow. The high-coloured seedling appears to be the best in form, colour, and substance; the spot terminates more abruptly, and the colour is clean up to the edge, which is smoother than in the other varieties; the under petals are also broader.

PANSIES.—*J. B.*—None of the specimens you have sent are of any value; better varieties are now cultivated in the borders. *J. K., Liverpool.*—Your seedling is a flower of good substance; the eye is rather poor; we have finer flowers in the same way. *J. Gready, Jun.*—No. 1, ground-colour very imperfect; edges of the petals thin and rough; 2, the ground-colour is rather imperfect, but this may come better, and it appears to promise well; 3, wants clearness and substance; 4 was curled up, but it promises well; 5, 6, 7, are at present deficient in size only; they are well-formed flowers, with good eyes; 8, we have several in this way larger and finer. No. 7 appears a very promising seedling, but the specimen sent is small and seems to want better cultivation, in order to expand the flower well.

PINKS.—*B. J. C.*—*Prince Albert* is decidedly the best of your seedling Pinks; it is perfectly and beautifully laced, and the edges of the petals are tolerably smooth—smoother than we generally see them; the white is pure, and the pod well formed. The specimen you have sent is rather small. *Sir R. Peel.*—We would recommend you to try another season; the form of the petal is good, the lacing perfect, the white pure, and the edges are but slightly serrated. This has been a most unfavourable season for these flowers. 153 and 154 we consider not worth keeping as show flowers.

VERBENAS.—*J. W.*—Your seedling "Venus," white, slightly tinged with purple on its first opening, and having a crimson centre, with the habit of the old *teucrioides*, is a pretty variety. It is also slightly fragrant.

FUCHSIAS.—*Joseph Wood.*—Your seedling Fuchsias are very good varieties, bright in their colours; they are quite equal to, but they do not possess any peculiar quality to distinguish them from many we have seen. We prefer No. 2, on account of its having a brighter corolla. *Mowbray.*—Your seedling (Enchantress), with deep vermilion tube and sepals almost closing over the violet purple petals, is rather a fine flower, but we have already many in the same style. *W. M.*—Your seedling No. 1 is a stout flower, but we have better

varieties which your seedling resembles; the sepals are short, dull in colour, and do not expand sufficiently. No. 2 is a much finer variety; the flower is larger, of a bright, rich, rosy vermilion; corolla the same colour, rather deeper; sepals very long, and expand freely; the flower is stout, large, and is a fine and showy variety.*

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—We are so often applied to for particular Numbers of the *Gardeners' Chronicle*, to complete sets, and so many are now out of print, that we think it will save all parties trouble if we publish a list of the Numbers which may still be had. Any Subscriber who will forward to our publisher Post-office stamps, equivalent in value to as many Numbers as are required, shall have them sent. Those Subscribers who are very anxious to complete their sets should write at once, as we have very few copies of some of the Numbers.

1841:—1, 4, 6, 8, 11, 13, 15, 16, 17, 18, 19, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 33, 34.

1842: 4, 6, 8, 10, 11, 12, 16, 18, 30, 42, 50, 51, 52.

1843: 1, 5, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27.

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE long-pending debate on Mr. O'Brien's motion for a committee to inquire into the grievances of Ireland terminated on Wednesday, when the House negatived the motion by a majority of 79. Sir R. Peel on the previous night made his anxiously-expected declaration on the policy of Ministers. He said they were prepared to administer the affairs of Ireland on the principles of impartial justice—to recognise the equality of civil privileges—to give a substantial and not a fictitious right of suffrage—and to consider the relations of landlord and tenant; but with respect to the Established Church, they were not prepared to make one alteration in the law by which that church and its revenues shall be impaired. The Irish Arms Bill has made but little progress; on Thursday the motion for going into committee for the consideration of the remaining clauses was met by an amendment for throwing out the bill altogether, but the original motion was carried on a division by a majority of 77. Two of the 60 clauses remaining for discussion were then agreed to, and the Bill has consequently advanced as far as the 14th clause. Lord Worsley has withdrawn the Commons Inclosure Bill for the present session, in the hope that Government will originate a measure on the subject next year. In the Lords, the Church Endowment Bill has passed, with modifications; and Lord Aberdeen's Bill on the Scotch Church, after having been re-constructed in order to remove the difficulty with regard to its declaratory portion, has been agreed to.

From France, we learn that the session of the Chamber of Deputies virtually terminated on Friday, after a debate on the Budget, which was voted by a majority of 218 to 53. The closing proceedings of the Chamber present no topics of general interest, with the exception of the decision on the Avignon and Marseilles Railroad Bill, and on the Orleans and Tours Railroad Bill, both of which were passed. Some changes in the Cabinet are anticipated during the recess, among which the retirement of Marshal Soult is mentioned as probable.—The news from Spain is still extremely unfavourable to the Regent. Badajoz, Bilbao, and other important towns, have declared for the insurgents, and an engagement has taken place between Gen. Narvaez, the revolutionary commander, and one of the Regent's brigadiers, in which the latter was compelled to retire, after the defection of some of his most distinguished troops. The Regent still continues at Albacete, apparently unable to effect any movement on the offensive; but it is generally expected that the next telegraphic despatch will bring some decisive result, and announce either the abdication of the Regent or a complete victory over the insurgents.—In Portugal there has been some apprehension of a movement in consequence of the events now passing in the Spanish provinces; but the Ministers appear to have been prepared for such a contingency, and the tranquillity of the country has not been disturbed.—From the Levant we learn that the Servian election took place on the 27th ult., when the unanimous choice of the people fell on Prince Alexander Georgewitsch, the lately-deposed Sovereign.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses, are quite well, and continue at Buckingham Palace. The Queen held a Court on Saturday for the reception of an Address on the Throne from the corporation of the City of London, on the birth of the Princess Alice. Her Majesty and Prince Albert attended divine service on Sunday morning, in the Chapel Royal of Buckingham Palace. The sermon was preached by the Bishop of Bangor. On Monday the Queen and Prince took an airing in an open carriage, and in the evening honoured the performance of the Philharmonic Concert with their presence, accompanied by the King of the Belgians. On Tuesday her Majesty held a Court, at which the Grecian Minister had an audience to take leave. On Wednesday the Queen and Prince Albert took an airing in an open carriage and four, and rode out on horseback on Thursday. Her Majesty and Prince Albert are expected to take their departure for Claremont this day, accompanied by the Prince of Wales and the Princesses. The Court is not expected to prolong its stay in Surrey beyond Wednesday

or Thursday in the ensuing week, when her Majesty will return to Buckingham Palace for about ten days or a fortnight, previous to proceeding to Windsor Castle. The Court will remain at Windsor until her Majesty's anticipated marine excursion to the Kentish coast, and upon the return of her Majesty it is believed the Court will remain at Windsor for four or five months. Her Majesty has given notice of her intention to visit the Italian Opera in state, for the first time since her accession, on Thursday next, the 20th inst.—The King and Queen of the Belgians, attended by their suite, left Buckingham Palace on Wednesday morning for Woolwich, where they embarked for Ostend.—The King of Hanover on Sunday was visited by the King of the Belgians at Kew, and came to town on Monday. In the evening of that day his Majesty honoured the Earl of Aberdeen with his company at dinner. On Tuesday the King dined at the Duke of Cleveland's, and attended Lady Barrington's party in the evening. On Wednesday his Majesty was present at the marriage of Lady F. Vane, daughter of the Marquess of Londonderry, with the Marquess of Blandford, and in the evening dined with the Marquess of Salisbury. On Thursday the King had a dinner party, and honoured Mrs. Beckett's party with his company in the evening. His Majesty will this day dine with the Earl of Chesterfield.—The health of the Queen Dowager has sufficiently improved as to admit of her departure from the metropolis; and her Majesty, accompanied by her Court, has left Marlborough House for Bushy-park for a few weeks.—The Duchess of Kent attended divine service on Sunday at the Temple Church.

The Army.—Her Majesty has been pleased to appoint Major-General Sir G. H. F. Berkeley, at present employed upon the Staff of the Ionian Islands, to serve upon the Staff of the Army in Ireland, vice Major-General D'Aguilar, appointed to the command of the troops in China, in succession to Lord Saltoun. The late Lord Robert Kerr is to be succeeded in his staff appointment of Assistant-Adjutant-General at Edinburgh, by Lieutenant-Colonel Eden, now Deputy Adjutant-General in Canada.

Pensions.—The following is a list of all pensions granted between the 20th June, 1842, and the 20th June, 1843, and charged upon the Civil List:—Sept. 24, 1842—Baroness Lehzen (in consideration of the faithful services rendered by her to her Majesty during a period of eighteen years), 400*l.* Nov. 17, 1842—The Misses Kennedy, sisters of Sir R. Kennedy, late Commissary-General, (Additional pension, in testimony of the public services of their late brother), 200*l.* Nov. 17, 1842—William Wordsworth, Esq. (in consideration of his distinguished literary attainments), 300*l.* Nov. 25, 1842—John Curtis, Esq. (in consideration of his zealous devotion to science), 100*l.* Nov. 25, 1842—Richard Owen, Esq., Hunterian Professor, and one of the Conservators of the Museum of the College of Surgeons, (in consideration of his distinguished exertions in the improvement of science), 200*l.*; Total, 1200*l.*

Foreign.

FRANCE.—The session of the French Chamber for 1843 virtually terminated on Friday last. There was another sitting on Saturday for hearing petitions, and to adjourn till the day fixed for prorogation; but the business of the session is over. The Avignon and Marseilles Railroad Bill was passed on Wednesday, but with considerable modifications. The discussion of the Orleans and Tours Railroad Bill was commenced, and closed on Thursday by the adoption of the measure. On Friday the virtual closing of the session took place by the passing of the Budget. The debate that preceded the vote was totally devoid of interest, the principal items having been voted without any discussion. The Budget was carried by a majority of 218 to 53. The Chamber was occupied on Saturday in hearing the report of the committee of petitions, none of which were, however, of public interest. The Chamber then adjourned *sine die*, with an understanding that when the attendance of the members should be required, notice should be given at their places of residence. A rumour had prevailed in Paris, which was said to have originated at Toulon, that General Lamoricière had been taken prisoner by the Arab troops of Abd-el-Kader; but the *Moniteur* contradicts the truth of it, and none of the other papers mention it at all. The *Courrier Français* states that a modification of the Cabinet would take place immediately after the close of the session. It was rumoured in the Chamber of Deputies on Thursday, that Messrs. Martin du Nord and Teste and Admiral Roussin would then positively retire from office, and be replaced respectively by Messrs. Hebert, Dumon, and Salvandy. It was also rumoured that Marshal Soult had also expressed an intention to retire, but that yielding to "august influence," he had refrained from compromising the existence of the Guizot Cabinet by his retreat. A pamphlet on the marriage of the Queen of Spain, said to be from the pen of Baron Billing, formerly Chargé d'Affaires of France at Naples and Madrid, and who had been for some years attached to the French Embassy in London, has just been published. The object of the work is to show that the idea of marrying Her Majesty out of the house of Bourbon is not to be entertained; that a son of Don Carlos, the son of Don Francisco de Paula, the Prince of Lucca, and a Prince of Naples, are all equally objectionable; and that a son of His Majesty the King of the French ought alone to receive the hand of Queen Isabella. In the domestic intelligence in the Paris papers there is nothing worth mentioning, unless it be the promotion of the young Duc d'Aumale to the rank of Lieutenant-General. Horace Vernet is, moreover, stated to have been ordered to paint a large picture of his late capture of Abd-el-Kader's

"smala," for the Versailles gallery. The heat of the sun on Wednesday last was so intense, that some of the asphalt pavement of the squares and boulevards exposed to its almost perpendicular rays, became much softened. The *Courrier Français*, alluding to this act, goes so far as to relate that a lady on passing, about two o'clock, before the Café de Paris, was unable to extract her shoes, and was obliged to leave them behind her. The announcement of the arrival of the Prince de Joinville and his young bride at Brest was premature, and they are not expected before the 15th or 20th of this month. On Tuesday, the inauguration of the chapel of St. Ferdinand, consecrated to the memory of the late Duke of Orleans, took place. The ceremony, which is described as extremely affecting, was attended by the King and Queen, the Duchess of Orleans, the Dukes d'Aumale and Montpensier.

SPAIN.—The accounts received this week are still very unfavourable for the cause of the Regent, whose difficulties appear every day to become more serious. In Paris, according to the daily papers, it is generally expected that the next telegraphic despatch will announce something decisive respecting the insurrection, the abdication of the Regent, or a complete victory over his foes. Defection is so general in the provinces, that except a few of desperate fidelity, everybody looks for the desertion from the Regent's cause of the whole army. A few still cling, however, to the hope that he will yet make a successful effort. Madrid was tranquil on the 8th, but some towns of the environs had pronounced, among which was Alcala de Henares, but the National Guard had marched upon it to restore order. Badajoz pronounced on the 1st, as also Jaen, lately occupied by General Van Halen. The Captain-General and Political Chief of Badajoz remained firm to the Regent, and had withdrawn. General Zurbano had evacuated Balaguer, and on the 3rd the first serious engagement of the insurgents with the Regent's forces took place in the neighbourhood of Teruel, when General Narvaez attacked Brigadier Erma, the Regent's commander, and relieved the town. The 1st and 3d battalions of the Princessa regiment, a battalion of that of Isabella II., and a squadron of cavalry of the Infante regiment immediately went over to Narvaez; who on the 4th repaired to Daroca, which has effected its *pronunciamento*; but as this movement menaced Saragossa, General Seoane has marched upon it. The tidings of the landing and reception of Generals Narvaez and Concha in Valencia has excited much sensation in the capital, and had somewhat alarmed the Ministers, for an order had been given to Van Halen to fall back on Seville and Cadiz; they had also ordered the formation of a free corps of 800 men and 60 horse at Madrid, and had likewise forbidden the circulation of the Opposition Journals through the Post Office, in consequence of which they have ceased to appear. The Regent was still at Albacete on the 5th inst. General Narvaez, instead of marching against him, had marched first to Teruel, to relieve it, and cut off the communication between the Regent and his Generals in Arragon. General Concha had gone to take the command in Carthage and Alicante, and from thence menace the Regent. Bilbao pronounced on the 4th. There was no collision, but a Junta was immediately formed. Letters from San Sebastian of the 3d inst. state, that, at 11 o'clock on the previous night, a courier had arrived with despatches from the Junta of Vittoria, apprising the inhabitants of the *pronunciamento* in Alava, and inviting them to follow the example. General Hoyos, the Captain-General, immediately called a Meeting of the municipal and military authorities, who remained assembled until a very late hour. On the following evening, two trincadores, or coast-guard boats, carrying one 20,000 duros, and the other 30,000, entered the harbour of San Sebastian, and having joined five others stationed there, soon afterwards sailed out, the crews crying, "Long live the Queen, the Constitution of 1837, and the Lopez Cabinet." They then summoned the city to declare against the Regent. This demand created the greatest agitation, the shops and houses were closed, as well as the city gates, the drums beat to arms, and in less than ten minutes the 500 National Guards of the town were drawn up on the great square. The General, the Chief of the Staff, and their Aides-de-Camp, and the members of the Municipality likewise repaired thither, and it was unanimously agreed not to yield until orders to that effect should be received from the Government. The National Guards then took possession of the military posts and the citadel, and at 11 p.m., the Ayuntamiento having again assembled, sent an officer to order the trincadores to put out to sea, or otherwise the Castle would fire upon them. The Supreme Junta of Barcelona had issued a *bando* declaring public property the ditches, glacis, and other fortifications of the city about to be demolished. They were to be forthwith sold, and the proceeds applied to pay the workmen employed in their demolition. The governor of the fortress of Montjuich continues faithful to the Regent. The *Imparcial* of the 4th states, that the Minister of the Interior had gone to prepare for the retreat of the Regent upon Cadiz, where it asserts that he intends to remove the Queen, and convoke the Cortes, his plan of operations being modified by events. The forces of the Regent are described as greatly reduced by the fatigue of the march, disease, and desertion, and it is said that he has little more than one half of the troops which he brought from Madrid.

PORTUGAL.—We have advices from Lisbon to the 29th ult. The Ministers had been actively engaged, in consequence of information that it was intended to get up some insurrection in the provinces. Oporto, it is said, was the point fixed upon, the Spanish *pronunciamentos* having given an impulse, as might be expected, to the revolutionists of this country. There was no doubt, should

anything occur, that vigorous measures of repression would at once be resorted to, such as the suspension of *habeas corpus*, the calling out of the volunteer battalions, &c. The Queen had been summoned from Cintra to attend a council of state on the subject. The Cortes are about to close, after a long session, in which some important measures have been passed. Among these is, contrary to general expectation, the Road Bill, in which the Peers had made so many amendments, that it was generally expected the bill would have to lie over till the next session. The Mixed Commission of the two chambers, however, have decided the question, by rejecting the amendments of the upper house: so the bill will become law in the shape in which it passed the Chamber of Deputies. The peers have joined with the Deputies in a vote of confidence, under which the Government is empowered to collect the taxes for the ensuing year, and to raise money upon them in the best way it can, by issuing exchequer-bills, &c.

GERMANY.—Letters from Vienna state that the English and French ambassadors have followed Prince Metternich to Ischel, whence the latter will go to Marienbad, a watering-place in the immediate neighbourhood of Konigs-marks, the Prince's principal estate in Bohemia; but the French ambassador will go to England, on leave of absence; and it is rumoured that Sir R. Gordon will not return to Vienna until a new ambassador has been appointed by the Austrian court to that of St. James's. The sudden rise in the price of grain in many parts of Germany, and more particularly in Bavaria and in the countries on the Maine, has caused a good deal of alarm, and most of the local governments have taken measures to check the injurious effects, apparently caused more from mercantile speculation than from actual deficiency. The merchants of Trieste intend to send, at the end of August, commissioners, by way of Egypt and Suez, to Southern Asia, and especially to India, in order to ascertain the possibility of opening an active trade between those countries and the Austrian empire. We noticed in our last the rejoicings in the Rhenish provinces on the rejection of the Prussian Penal Code by the Diet. The following incident, in connection with the same subject, is mentioned in the papers. During the representation of Mozart's "Don Juan" at the Coblenz Theatre, on the evening of the 24th ult., in the scene where Don Juan compels Leporello to invite the statue to sup with him, the terrified valet, according to the text of the German opera, ought to have said, "I would rather suffer the bastinado than invite such a guest;" but M. Seraucturitz, who performed the part of Leporello, substituted for "bastinado" the words "Penal Code of Prussia." This allusion was received with almost frantic applause by the audience. The Commissary of Police, however, construed it into an offence against the Government, and had M. Seraucturitz arrested, and stopped the continuance of the opera. The ill-judged joke of the actor will cause his appearance in a different character before an audience of the Correctional Tribunal.

RUSSIA.—The French Ministerial papers publish a letter from St. Petersburg of the 20th ult., stating that Prince Dolgorouki, the author of a pamphlet on the Russian nobility, which we noticed at the time, and which gave offence to the Emperor, had been arrested immediately on his arrival at Cronstadt, and placed in solitary confinement. After a month's detention in the house of the chief of police, the Prince having said nothing in his book nor in his interrogatories to justify a prosecution for libel, the Emperor offered him permission to enter the military service. The Prince having declined to accept an employment contrary to his taste and literary occupations, the Emperor caused him to be transported to Wiatka, on the confines of Siberia, where he is to remain under the surveillance of the police.—According to the last census of the Russian empire, the total number of inhabitants who can write and read was 4,167,995, or the proportion to the whole population as one to twelve.

TURKEY.—Advices have reached Vienna from the Servian frontier, bringing the news of the re-election of the Prince Alexander Kara Georgewitsch as Sovereign of Servia, on the 27th ult. The only difference between this election and that of last September consists in the presence of Baron Lieven, the Russian Commissioner, the Russian Consul, and Hafiz Pasha, at the election now concluded.

UNITED STATES.—By the arrival of the Rochester and England packet ships, we have accounts from New York to the 20th ult. The annual celebration at Bunker's Hill, which took place this year with more than ordinary splendour, is recorded in the papers at great length. The presence of President Tyler gave it a very imposing character. The papers contain the report of a speech delivered by Mr. Webster at the demonstration, in which the ex-Secretary of State treats largely of the state of public affairs. The topics touched upon are chiefly of a domestic character, and the address altogether, possesses, comparatively, little interest for English readers. The Canada papers contain an account of an outrage committed by the labourers on the Beauharnois Canal, who had struck for higher wages. They entered the house of the contractor, and while he was in bed attacked him and fractured his skull. A detachment of soldiers was soon on the spot, the Riot Act was read, the soldiers fired, several of the mob were killed, and the remainder dispersed. The malcontents had fled in great numbers into the wood, where the soldiers were preparing to attack them.

Parliament.

HOUSE OF LORDS.

Monday.—The law of Libel Bill was, on the motion of Lord CAMPBELL, read a second time, and the Limitations of Actions (Ireland) Bill was read a third time and passed.—The Bishop of London moved the third reading of the Church Endowment Bill.—Lord COTTENHAM objected to certain clauses introduced since

the second reading, by which patrons and incumbents would be deprived of their vested right, and the effect of which would be to repeal the Statute of Mortmain.—Lords BROUGHAM and CAMPBELL also made objections to these provisions in the Bill, though assenting to it generally.—The Bill was read a third time, but the question that it pass was postponed for a day, in order to give time for some amendments calculated to remove the objections.

Tuesday.—Lord BROUGHAM's Slave Trade Suppression Bill was committed for the purpose of having amendments made in it and printed.—The Church Endowment Bill, with amendments obviating the objections made to it by Lords Brougham, Campbell, and Cottenham, was read a third time and passed.—The Earl of ARDEN moved the re-commitment of the Scotch Church Benefices Bill, and stated his intention to accede to Lord Brougham's suggestion, by transferring the last portion of the first clause to the second clause, by which means the difficulty with respect to the declaratory part of the Bill would be removed.—Lord CAMPBELL, notwithstanding this concession, considered the Bill as amended more absurd than before, and moved an amendment to the second clause, which was negatived by 31 to 14.—Another amendment proposed by Lord CAMPBELL on clause 5, to the effect that if the Presbytery exceeded their jurisdiction in deciding on objections personal to the presentee, a remedy should be given to the presentee in the Civil Courts, was negatived without a division, and the remaining clauses with the preamble were agreed to.

Wednesday.—The Royal Assent was given by commission to the Canadian Corn Bill, the Pound Breach and Rescue Bill, the Chelsea Hospital Bill, the Grand Jury Presentments (Ireland) Bill, the Maryport and Carlisle Railway Act Amendment Bill, the Neath Harbour Bill, the Aberdeen Harbour Bill, the Kingston-upon-Hull Waterworks Bill, Lord Grey's Estate Bill, the Ross Inclosure Bill, the Townshend Peerage Bill, and Todhunter's Divorce Bill.

Thursday.—The Episcopal Functions Bill was read a second time. The Church of Scotland Benefices Bill was advanced a stage, and ordered to be read a third time on Monday.

Friday.—The Marquis of CLANRICARDE brought forward a series of resolutions, referring to the recent dismissal of Irish Magistrates. He disclaimed being actuated by party motives, but condemned the letters of dismissal as a hasty and ill-considered act, for which the House could find no precedent even in the worst days of the Stuarts.

HOUSE OF COMMONS.

Monday.—The Chartist "Remonstrance" offered for presentation by Mr. Duncombe, on Friday night, was withdrawn, the SPEAKER having stated his inability to find a precedent for the reception by the House of Commons of a Remonstrance unaccompanied by a petition.—In reply to questions, the CHANCELLOR of the EXCHEQUER said he would propose a vote of money as compensation to the holders of opium delivered up to the Chinese authorities, on the first night on which the House should resolve itself into committee of supply: that arrangement had been made by which parties who had the same amount of stock that they held last year, the interest being less than 150%, would have no deduction made upon it under the Income-tax; and that the report on the Custom-house frauds, with the exception of that portion affecting charges still pending, would be laid on the table very shortly.—To a question from Mr. TURNER, asking if the Government were prepared to advise her Majesty to visit with her signal displeasure all persons who might hereafter become engaged either as principals or as seconds in any duel; or if the Government would, in the next session of Parliament, bring in a bill for the entire prevention of duelling, Sir R. PEEL replied that he was not prepared to give any assurance on the subject. He was not indifferent to the importance of the subject, but he considered that any declarations respecting it should be made only after the most mature deliberation, and that it would not add to the weight and effect of those declarations if they were made suddenly and on the spur of the moment, and in consequence of some particular occurrence. He therefore left the subject altogether in the hands of Mr. Turner.—Sir J. GRAHAM stated that the Government attached great importance to the Ecclesiastical Courts and Local Courts Bills, and that they were determined to press them forward this session.

The adjourned debate on the grievances of Ireland was resumed by Capt. BERNAL, who recommended the construction of railways by the Government, the abolition of the vice-regal court, an increase to the Maynooth grant, and the placing of that college on an equal footing with the Protestant universities.—Sir H. DOUGLAS denounced the agitation, and moved, as an amendment, that the House, deprecating the agitation that prevailed in Ireland, would suspend any measures for the redress of any grievances, real or fanciful, of Ireland, until by the cessation of agitation that country showed itself in a condition to receive as a favour any measures of redress or improvement which the House would never concede to agitation; but the amendment, not finding a seconder, fell to the ground.—Mr. VILLIERS STUART proposed that the whole ecclesiastical revenues of that country should be appropriated to the support of the Roman Catholic Church, and that another tenth should be levied upon the Protestants to support the Protestant Church.—Captain ROUS said that Catholic emancipation was but an instalment—the rest must be paid sooner or later. The state of the Protestant Church was monstrous—a revenue of half a million for 700,000 Protestants, and which was paid for the support of clergymen, many of whom had 1,500*l.* a year for taking care of twenty-five parishioners. Let us change places with the Roman Catholics, and then see what would be our feelings. Strongly denouncing religious war-cries, Protestant ascendancy or Roman Catholic supremacy, he argued that the only way to govern Ireland was by consulting the feelings of the people.—Sir W. SOMERVILLE supported, and Mr. T. B. SMITH opposed the motion.—Lord HOWICK recommended an expenditure of ten millions sterling upon Irish railways; a large sum to educate the industrial and mechanical talents of the people; the abolition of the oath taken by members of parliament; and a confirmation to the Roman Catholic prelates of the titles which they chose to assume. He counselled the sending of some distinguished Roman Catholic nobleman as ambassador to the court of Rome, and considered the soothing of the irritated feelings of the Irish people as the most indispensable point. He was also of opinion that the lord-lieutenancy might be abolished, for power and responsibility were now inconveniently and unequally divided between the Lord Lieutenant and the Home Secretary. There was also another inconvenience: that the Lord Lieutenant's household comprised a number of idle officers, whose only business was to fetch and carry tittle-tattle and party news. Dublin was now nearer London than many parts of England were a few years ago; abolish the lord-lieutenancy, applying the expense of it to public works, and, if necessary, have a fourth Secretary of State in London. In looking back to the past, he exempted no Government from error; he supported the motion in no party spirit, though he feared it was too late in the present session to enter on the comprehensive and statesman-like plan required for the pacification of Ireland. Let the Government apply themselves to the subject during the recess, and call Parliament together early in winter, in order to consider it; an awful responsibility rested on them; and Sir R. PEEL, with the great power in his hands, must adopt a more manly policy, or else he swept along the current down which he is rapidly floating.—Mr. G. KNIGHT said he was willing to give the Catholics all he could get for them; but he it bigotry or not, the people of England and Scotland had made up their minds, and any attempt to subvert the Established Church in Ireland would not only cost any minister his place, but even the Sovereign the crown. He hoped Sir R. PEEL would keep the middle course in his policy, avoiding extremes.—Sir B. HALL considered that the Government did not dare to put down the agitation in Ireland for two reasons—fear of the Orangemen, and fear of Mr. O'Connell. He exhorted to conciliation, and considered the Opposition was justified in obstructing the Arms Bill, until they ascertained what the intentions of Government were.—Lord JOCELYN condemned the agitation, felt that something must be done to abate the alarm which it created, and to preserve the peace, and declared that he had too good an opinion of his Roman Catholic countrymen to think that they would be parties to any measure for the spoliation of the church. He concurred with

the opinions which had been expressed about public works and the promotion of industry; but the agitation, by disturbing tranquillity, drove capital from the country. The objects of the Repeal Association were revolutionary, and sufficiently warranted the resistance of the motion.—The debate was then adjourned.

Lord WORSLEY withdrew the Commons Inclosure Bill for the present session, hoping the Government would originate a measure on the subject next year.—On the motion of Lord LINCOLN, the Holyrood-park Bill passed through committee.

Tuesday.—The adjourned debate on Ireland was resumed by Mr. M. J. O'CONNELL, who urged the necessity of the motion, and complained of the abstinence of Ministers in refraining from indicating their policy with respect to Ireland. He reviewed the policy pursued in past times, and the present position of the Conservative party with respect to that country, reminded them of the obstructive spirit which they had evinced on municipal corporation reform, and the extension of the franchise; and referred to the circumstance when they went the length of threatening the Sovereign with the fate of James II., because Mr. Sheil had been made a privy councillor. Concessions must be made; let them be made in that generous spirit which would unite the two countries, not by the parcelment of lands of the union, but with the more lasting ties of equality and brotherly love.—Mr. SMYTH said the difficulty lay not so much in the "Popery" of Ireland, as in the "No Popery" of England—that bitter spirit which still lingered in the precincts of Exeter-hall. This session there had been thirty-nine petitions against Maynooth: the number seemed sacred in the annals of ecclesiastical bigotry. Catholic Emancipation had been clogged with unfair conditions, and it would have been generous and becoming had Sir R. Peel, on coming into power in 1841, removed them. He had visited Maynooth, in company with Lord J. Manners, and they were particularly struck with the air of decent poverty and humility by which it was characterised. It, instead of treating Ireland with the grudging parsimony of a step-mother, they had governed her with justice, she would at this moment have been a nursery of loyalty. Come forward with large measures of conciliation—do not stand halting on Emancipation—govern Ireland in the spirit of Chesterfield or Pitt; that latter Minister, who, fifty years ago, began with 9,000*l.* to Maynooth, would not now meet the present crisis with an Arms Bill.—Mr. HAWES, Mr. CRAWFORD, and Mr. ROSS, supported Mr. O'Brien's motion, and Mr. COLAUGH, Mr. BATESON, and Mr. M. MILNES opposed it.—Mr. ROEBUCK did not think that the debate reflected much credit on those in whose hands the government of this great country is placed. The only leading Minister who had spoken was Sir J. Graham; and the conclusion of his speech seemed to indicate that the Government could neither retreat nor advance without danger. Ireland must be governed as a conquered country by a garrison of Protestants, or on the broad principle of making millions happy. We were told that the Protestants possessed the wealth and the land; but what if so? They were still but 800,000 men against 8,000,000. If the country had been well governed, one-tenth of the people could not have engrossed its whole wealth and land. What he now complained of was, not that Sir R. Peel had done worse than his predecessors, but that he had not grappled with the state of the country. Mr. O'Connell, he must admit, was alternately dupe and imposter, and certainly could never have really believed that a repeal of the union would bring the golden days he was accustomed to represent to the people as its results. Now with respect to that badge of conquest, the Irish church. If something were not done upon that subject, the Irish church would destroy itself: let Mr. O'Connell only suggest the nonpayment of tithe and rent, and the Irish church was gone. When 7,000,000 or 8,000,000 of Irishmen were writhing under a sense of insult and injury, it would not do to say that the Protestant feeling of England was opposed to all redress. The tithe was not the property of the land-owner, but of the nation. It was created by Roman Catholics for Roman Catholic purposes, which purposes were changed by the nation's will, and might, therefore, by that will, be changed back again. He recommended Government to look to the interests of the poor, and throw off what had been until then the dominant party.

Sir R. PEEL then rose. He was anxious, in the first place, to obliterate all personal or party recollections. He would vindicate his own course, but he would not recriminate. The question was of too deep an interest for that. The real object of this motion was not an inquiry into possible remedies, but an expression of opinion adverse to the Government. If the Government did appear to the House unfit, from party connexions, or from other reasons, to govern Ireland, this vote ought to be against him; for certainly the tenure of office by any party was a consideration of no value in comparison with the welfare of a kingdom. He then addressed himself to the speech of the mover, and defended the Government from his charge of parsimonious treatment to Ireland, referring to the unimpaired vigour, and observing that Ireland pays no assessed tax, no income-tax, no soap duty, no duty on spirits. He was, with some indignation, to the charge that official appointments, particularly judicial and ecclesiastical ones, had been made unfairly, and read the letter containing his instructions to the Lord-Lieutenant on the subject of patronage. He justified the proceeding on the mail coach contract, observing that it was a disparagement to Ireland to treat that trifle as a grievance. Perhaps the most ungenerous charge of all was on the subject of education. It would have been highly gratifying to the supporters of Government, and consequently conducive to its interest, if on this point a different course had been pursued on the part of the Cabinet. The general intention of the Government had been bona fide to fulfil the principle of the Relief Bill, which established equality between Protestant and Catholic. He showed the absurdity of the allegation that Irishmen had not had their fair share of Irish patronage, and cited several instances where Irishmen had been appointed to employments in England. The attention of the House had been called to three sorts of Irish grievances, the social, the political, and the religious. The social, or agrarian, were not new grievances, nor was it possible for the Government to devise any immediate remedy for them; but a committee had been proposed for inquiring into the law of landlord and tenant, he would gladly have agreed to that. As to Lord Howick's plan of advances for railways, he maintained the inexpediency of lending the public money for any public works which did not hold out a reasonable prospect of such a return as would repay the capital; for else the Government would have to come upon the country for repayment, which it would be difficult to adjust and invidious to demand. Next, as to political grievances. He fully admitted, and had admitted long ago, that religion ought not to operate as a disqualification for office. As to oaths, he had long since expressed himself favourable to the modification of them. After stating the reasons why his Government had not yet brought in a registration bill, he proceeded to the question of the church. On this head he would not consent to give the pledge required of him by the Opposition; he would much rather choose the other alternative suggested—of leaving officers, and taking the chance of what some other Minister might do. His proposition was, that as the Protestants are not a sixth of the population, they ought to possess but a sixth of the church endowments. Must the Roman Catholics also retain but a sixth of the churches? Must the Roman Catholic bishops sit equally with the Protestants in the House of Lords? There was a somewhat larger change than had yet been contemplated. Again, what was to be the state of the Roman Catholic religion in England? Thus, there was much beside revenue to be considered, in order to produce perfect equality. He knew that such contracts as that of the union could not be maintained in case of an adverse necessity; but they were not to be departed from unless that necessity were really paramount: any such departure tended to shake public confidence, most injuriously to national welfare. How strong were the assurances given at the time of the Relief Bill to the reluctant people of England, that it would not impair but increase the security of the Protestant church! The subject of a provision for the priests from any other source was one upon which he was not disposed to make any declaration of opinion thus incidentally in the course of a general debate. He now approached the question of repeal, as to which he had said that he was prepared to use all the powers of Government for the maintenance of the union, and in that sentiment he believed there was a very general concurrence on the other side of the House. He was sorry to have heard it argued that the repeal of the union stood upon the same footing with the repeal of any other act. On no other act would the Crown have made the declarations

which it had made on this, in the times both of the late and of the present Ministry. He pointed out the practical absurdities and inconsistencies which must follow a severance of Ireland from England, with separate Parliaments, revenues, armies, and navies. Such a severance could not last a single year without a conflict. To prevent this evil the Government had, without asking for any new measure, resolved to rest upon the existing powers of the law and constitution. "I am asked," said the Right Hon. Baronet, "what course I intend to pursue. 'Declare your course,' is the demand. I am prepared to pursue that course which I consider I have pursued; namely, to administer the Government of Ireland upon the principles of justice and impartiality. I am prepared to recognise the principle established by law, that there shall be equality of civil privileges. I am prepared in respect of the franchise, to give a substantial and not a fictitious right of suffrage. In respect to the social condition of Ireland we are prepared also—but that is a matter for legislation, and we all feel that no partial legislation will be proper or effective—we are prepared to consider the relations of landlord and tenant deliberately, and all the important questions involved therein. With respect to the Established Church, I have already stated that we are not prepared to make one alteration in the law by which that church and its revenues shall be impaired. It is said, on the other hand, why do you nothing? Why stand with folded arms? Why don't you bring in measures at once? I know what a tendency there is, particularly in some quarters, to press for measures of coercion. But we must have regard to the real circumstances before us, and to the means in the possession of the Government. Demands may be made for new measures, upon which to rely for the suppression of disturbance. Sir, I claim for the Government the entire right to judge with regard to the discretion to be exercised, either as to the application of the existing laws, or as to an appeal to Parliament for new ones. I am not ashamed of acting with forbearance and moderation in matters of this kind. I believe that whatever be the clamours for new restrictions and new powers, a hasty and precipitant demand for them does not add to the strength of the Executive. I think that the agitation which exists in Ireland cannot proceed without ranging on the side of the Government many who must be alarmed at the consequences which must inevitably flow from that agitation." He then proceeded to say, that he relied on their abstinence from attaching to the Government all who foresaw the consequences of assembling a new Parliament for Ireland alone; and then, if at length necessity should arise, the claim for new powers would be the stronger for the past forbearance. In his reliance on the loyalty of the Irish people, he made no distinction between Protestant and Catholic. The Catholics could not want motives for rallying round the Union; the events and enactments of the last fourteen or fifteen years had made a great social and political change in their favour, and the favourable feeling to them still subsisted in the Imperial Parliament. He appealed to these considerations, to the long connexion of the two countries, to their common interests and common dangers.

Lord JOHN RUSSELL had not heard with satisfaction the speech of Sir R. Peel. It was more like the speech of a member finding fault with the proposals of a Government, than like the speech of one who was the head of a Government himself. After enlarging upon the magnitude of the present danger, he acknowledged that he approved of the forbearance to ask for any new law of coercion. But the course on which the Government seemed to rely was that of doing nothing at all—of waiting to hear the proposals of other members, and then commenting on the insufficiency of one suggestion and the doubtfulness of another. To him this appeared to indicate a want of capacity and of energy in the Ministers. If they had been afraid to propose measures, it was not because there had been any violence on the part of the Irish members to deter them. He denied that equality of civil rights existed between England and Ireland; in proof of which denial he referred to the numbers of the Parliamentary constituencies, and to the difference between the English and the Irish Municipal Act. He then came to the question of the Church. On this subject he desired to explain the opinions expressed by him on a former evening, by which he had meant to intimate, that though favourable to the principle of an establishment, he thought it a principle much misapplied to a Church like that of Ireland, which had no connexion with nor influence over the bulk of the people; and it was requisite, in order to make such a principle available to its real purpose, that it should be extended in a manner which might put the religion of the majority on the same footing with the religion established in favour of the minority. How that was to be accomplished might require much consideration: at present he did enough in asserting the principle. There remained the question of Ministerial patronage, as to which he considered that the old system of appointing your own partisans ought now to cease, and that the majority opposed to you ought to partake. It might be a curious question by what means Ireland was governed just now? The ranks of repeal were daily swelled by men who joined them partly from disgust at what had been done, and partly from despair of what ought to be done. He called on Ministers to follow the example of concession set by Mr. Fox's Government in the days of the Irish volunteers; and he appealed to the celebrated declaration of the Duke of Wellington in deprecating civil war with Ireland. Let not, then, the present Government think it necessary to be more dignified than Mr. Fox in 1792, and the Duke of Wellington in 1829. The noble Lord concluded as follows:—"The arguments of the Government—the temper of the Government—the fear, which I must say a Secretary of State has exhibited—perhaps I may be allowed to call it a magnanimous fear, will make people reflect on the present condition of Ireland; and they must—they will be forced to take into consideration the state of Ireland with regard to this country. Who knows what will be the effect produced in our foreign affairs? Who knows how soon the attempt of Louis XIV. and of Napoleon to place a member of the French dynasty on the throne of Ireland may be again attempted? We are now on friendly terms with the United States. I hope and believe that those friendly terms will be continued and will be increased. But see! there again the Irish Repealers have proposed to disturb your Canadian frontier for the purpose of weakening your strength in Ireland—and if the people ponder, as they will, they must come to the conclusion that if you are—I will not say conciliatory—I will not say benevolent—but if you are merely just, you will be invincible—if you hesitate you will place yourselves in peril; if you act unjustly, the consequences of all injustice will rightly follow your decision."—Sergeant MURPHY moved another amendment of the debate, on which a division took place. For the adjournment, 82, against it, 218; majority, 136. Notwithstanding this result, Sir R. PEEL consented to the adjournment of the debate, and the House adjourned at a quarter past 3.

Wednesday.—The adjourned debate on the grievances of Ireland was resumed by Mr. Sergeant MURPHY, who spoke in favour of Mr. O'Brien's motion.—Sir H. W. BARRON, Sir W. CLAY, and Mr. HUME, followed on the same side; and Lord BERNARD, Mr. G. A. HAMILTON, and Mr. STAFFORD O'BRIEN, supported the Government.—Mr. ROOME declared, as a Repealer, that if the grievances of Ireland were not redressed by the Imperial Parliament, the Irish people—and he for one of them—were determined to redress them somehow.—Mr. BULLER designated Sir R. Peel's speech as a declaration of his own want of confidence in his own Government.—Lord JOHN MANNERS, looking on the motion as a bona fide one of inquiry, and not as one of confidence in the Government, was prepared to vote for the motion.—Mr. MURPHY wished that England and Scotland had been included in the inquiry, for all were alike in a state of difficulty, and the Government was alike doing nothing for each.—Mr. FERRAND required some member of the Government to state distinctly whether or not this was a vote of want of confidence, as, if so, he could not vote for them, because he believed Sir Robert Peel had deceived every party in the country.

Lord PALMERSTON observed, that this was a debate remarkable

for what had been said, and for what had been left unsaid, for the moderation of the speakers on his own side, and for the course taken against Ministers by many of their own supporters. What were the views of Government he defied any man to infer from their speeches. They were, no doubt, distracted and paralysed by contrary impulses—not only from their friends out of doors, but even in the Cabinet itself. He had said a little while ago that if Ministers should resign their places, the country would call upon them to return; but he had lately seen ground to change that opinion, and he felt bound as a gentleman, and a man of honour, to say so, that he might not mislead them into a resignation. He did not think Repeal was a question which Ministers would have to consider; he rather thought that Repeal was a cry conventionally adopted by the people to express their grievances. The only point upon which Ministers had held out the chance of a remedy, was the law of landlord and tenant; and most happy should he be to co-operate with them on such a subject. On the greatest evil of all, the relative position of the Protestants and Roman Catholics, not the slightest alleviation was intimated. The present amount of Establishment was capable of being considerably reduced; and as Lord Stanley had been the author of the Church Temporalities Bill, there could be no objection by him, or his colleague, Sir J. Graham, to the principle of reduction. In point of justice, perhaps, the Catholics could not complain of the Protestant Establishment; but, considering the state of their own Church, could you expect that they would not? He would say, therefore, suspend those livings in which there is no duty to be performed. But if you would not abate the Protestant Church, put that of the Catholics upon a level with it; authorize the possession of glebe houses, by voluntary gift, perhaps with some aid from the State. The amount of the establishment at Maynooth, too, was far below its proper line. Austria, Bavaria, Belgium, Prussia—each made provision from the funds of the State for more than one denomination of clergy. He condemned the scanty allotment of the Parliamentary, and the too high amount of the Municipal franchise. Under all these difficulties, here was a Government unprepared with any remedy. They were content in office, as out of it, to obstruct. It was the duty of a Government to distinguish the difficult from the impossible; and it was impossible for a Government to go on long as the present Ministers were going on now. The party who supported and withheld them were an inert mass, moored in the tide, and serving only to show how rapidly the current was leaving them behind. To quit that party and retire from office would be far more glorious to high-minded Ministers than to persist in their present course. He hoped, at all events, that nothing would be said from the Treasury benches to strike the Irish people with despair, and that, before another session, measures would be matured for satisfying the just expectations of that nation.

Lord STANLEY declined to adopt the suggestions of Mr. Muntz and Mr. Ferrand, who had required the Government not only to make declarations respecting Ireland, but to point out remedies for all the evils in all the British dominions. He had read this motion as charging the Government with insensibility to the grievances of Ireland, and with indisposition to do her justice; but the speech which had introduced it was a speech upon the general state of Ireland, and against past as well as present Administrations; so that the precise drift of the motion itself was not now very easy to be defined. Some gentlemen called on the Government to exercise the energy of Strafford, others forbade them to take any strong measures at all. The Government had been charged with intending nothing on the subject of the Parliamentary franchise; whereas, at an earlier period of this very session, they had announced their intention to enlarge that franchise, upon the basis of the new valuation contemplated in the Irish Poor Law Amendment Bill; but the working of that valuation must be seen before such an enlargement of franchise could be prudently enacted. Then, on the subject of the Irish Church, what was desired? No five of the members opposite could agree; but some had said boldly, "Abolish the intrusive church of the minority;" and Lord Palmerston had asked how Lord Stanley could object to the principle of a farther reduction in its revenues? Why, it was the very point upon which he had resigned his seat in the Whig Cabinet. He admitted that a high-minded man would abandon office rather than sacrifice an important principle; but he did not think it would become such a man to abandon his office and his principle together. What the proposal of equalising the two religions meant, he did not understand. Did it mean an equal, or did it mean a proportionate division of the Protestant revenues between the Protestant and the Catholic clergy? And to what result would your equality lead? Why, to place in the House of Lords a Roman Catholic prelate, not nominated by the Crown of England, but by the Court of Rome; for Mr. More O'Ferrall himself had declared in this debate that the Roman Catholic clergy would not accept a stipend from the nation, on the terms of permitting any interference with their civil state. The law of landlord and tenant was a difficult subject; and he acknowledged that if the Irish landlords, as a class, dealt with their tenants otherwise than the landlords of England, a case was made out for the interference of the Legislature. He admitted Mr. C. Buller's distinction about the poor's rate: but, on the other hand, the Irish landlord had difficulties in removing a tenant which did not obstruct the landlord in England. To shift a bankrupt tenant from a large farm which he could not manage, to a smaller which his means might compass, was a change which in Ireland would involve the danger of bloodshed. To a committee, however, of mere inquiry into the law of landlord and tenant, the Government would have made no objection. He should be sorry to have it thought that either this or former Governments had neglected the welfare of Ireland. A committee, of which Mr. Spring Rice was chairman, had recommended 19 different measures, 18 of them had since been actually passed into law; and if the House would continue its confidence he would not despair that, by forbearance from extreme measures and a steadfast perseverance in a careful and vigilant policy, the Government would be able to conduct the country through its dangers; but if, through the course taken by certain gentlemen who sat on his own side of the house, and who had some of them hinted, and some of them avowed their want of confidence, the Government were to be additionally embarrassed and impeded, the question of confidence or no confidence could not too soon be brought to issue, in order that the Ministers, if distrusted by Parliament, might at once make way for others more fit to direct the councils of the country.—Mr. S. O'BRIEN having replied, the House divided. For the committee, 164; against it, 243; majority against it, 79.

Thursday.—Lord ELROT having moved that the Speaker leave the chair on the Irish Arms Bill, Lord CLEMENTS again protested against the bill; and Mr. WALLACE moved, as an amendment, that the committee be postponed until that day six months. The amendment was seconded by Mr. S. CRAWFORD, but rejected by a majority of 77. The House then went into committee, and the several clauses up to the 14th were agreed to, after several hours' discussion.

Friday.—Lord ASHLEY, as Chairman of the Durham Election Committee, reported the resolution of the Committee, that Lord Duncannon had not been duly elected Member for Durham, that the last election was a void election, and that Lord Duncannon had, by his agents, been guilty of bribery, but it did not appear that he had himself any personal knowledge of the transactions. The motion for a new writ was postponed to Monday.—The House then resumed the consideration of the Irish Arms Bill.

CITY.

Money Market, Friday.—Consols closed at 97½ for the account; Bank Stock, 180; Three per Cent. Reduced, 94½; Three-and-half per Cent. Reduced, 101½; Exchequer Bills, 54s. to 56s. prem.

Metropolis and its Vicinity.

Meeting on the state of Ireland.—On Monday a meeting of influential electors of the borough of Marylebone, convened by its Parliamentary representatives, took place at the residence of Sir B. Hall, in Portman-square, for the purpose of considering the propriety of making a public demonstration, with reference to the present state and future prospects of Ireland. Sir B. Hall was called on to preside, and was surrounded by a large number of Irish Members of Parliament of all shades of political opinion. Mr. S. Crawford, Lord Clements, and Mr. Wyse addressed the meeting at some length in favour of the proposed appeal to the public; but Gen. Evans suggested the propriety of calling upon the Queen, by a constitutional petition to her Majesty, to dismiss the present Parliament and Ministry from power. Sir B. Hall concurred, that to petition the Queen would be a most proper and dignified course, to direct her Ministers to adopt some measures of justice to Ireland; and if they did not, to dismiss not only them, but even Parliament. He then read a memorial expressive of alarm at the state and indignation of the policy of the present Ministry towards Ireland, and appealing to her Majesty, in the event of their refusal to do justice to the people of that country, at once to dismiss them from her counsels. This was adopted unanimously, as was also a resolution determining to hold a public meeting of the borough, over which Sir B. Hall was requested to preside, on Monday next. A committee was then appointed, with Sir De Lacy Evans as chairman, to arrange the preliminaries for the demonstration.

Sale of the Duke of Sussex's Property.—The sale of the miscellaneous articles closed on Saturday, with the decorative furniture, oriental and Dresden china, and other valuables. The amount of the day's sale was nearly 1,900*l.*, and the sum realised by the auction up to that time was stated to exceed 40,000*l.* The sale of the Duke's tobacco and cigars, which commenced on Monday, excited considerable interest, and attracted a very numerous attendance. The meerschaum bowls realised extraordinary prices, some of them fetching upwards of 30*l.* The cigars varied from 20*l.* to 25*l.*, a thousand, and the tobacco ranged from 10*s.* to 2*l.* 2*s.* per lb. At these high prices, the articles were purchased either as curiosities, or by wealthy smokers. Most of the tobacco and cigars consisted of presents to the Duke from personal friends. The sale closed on Wednesday, when the remaining portions of the tobacco and cigars were sold. Some of the rare cigars sold for more than 2*s.* 6*d.* each; and it is a remarkable fact, that three small parcels of them realised a sum exceeding that fetched by the whole of the carriages belonging to the late Duke, sold on Monday last, by Messrs. Tattersall. The principal purchases made during the day were by gentlemen—the prices ranging far too high for the brokers. 500 Woodvilles fetched 18*l.* 1*s.* 6*d.*; another lot of the same amount, 22*l.* 11*s.* 6*d.*; a box of 49 Havannahs, 5*l.* 10*s.*; 1000 Havannahs, 43*l.* 1*s.*; 2125 cigars, presented to his Royal Highness in 1841 by Chevalier Hebel, were purchased by Colonel Gurwood for 148*l.*; and three lots of 1000 each, presented by Lord J. Churchill, by the same gentleman, for 137*l.* It was generally remarked that on no previous occasion were similar prices known to have been realised by articles of the like description. The proceeds of the day's sale amounted to upwards of 2,000*l.*

Lecture on Drainage.—A very large meeting of noblemen and gentlemen connected with the Agricultural interest took place on Friday morning, at Willis's Rooms, the Duke of Richmond in the chair, for the purpose of hearing a lecture from Mr. Smith, of Deanston, in consequence of a requisition presented to that gentleman, signed by the Dukes of Richmond and Buckingham, the Earls of Hardwicke and Zetland, the Marquis of Northampton, &c. The lecturer, who was aided by a number of diagrams and drawings of soils and farming implements, commenced his address by remarking on the great importance to the agriculturist of a proper system of drainage, whereby loaming wet land, which, in its natural state, would yield nothing but peat or moss, might be rendered fertile. He remarked, that lands in general suffered very little from water rising from springs, but it was that which fell upon it in the shape of rain, that had to be guarded against and carried off. To effect this with advantage, it was necessary to sink drains in the subsoil, at distances of from about sixteen to twenty-one or twenty-two feet apart. In proportion as these drains were sunk, the subsoil would crack, and become interspersed with fissures, whereby the water would the more readily percolate through the upper or active soil down to the drains and thence be carried off. The fissures thus caused in the subsoil allowed the atmospheric air to enter, which also acted very beneficially on the native soil, which soon became converted into mould, and was then capable of retaining with advantage a great deal more moisture than when in its natural state. It was of the greatest importance that the active soil should be of considerable depth. He had seen several instances in Scotland, where there had not originally been more than three inches of active soil, but it had been increased by proper draining and subsoiling to a depth of fifteen inches. Drains as generally constructed were not nearly deep enough; they should be, to be effectual, two feet and a half deep, and might be easily formed by means of a plough going over the ground twice, the second time in the furrow occasioned by the first going over. The cost of this operation would be about 1½*d.* per English chain. Many methods of filling up the drains had been adopted, the usual substance employed being turf, but that was not found to act well, and though perhaps at the same time it might not cost more than half as much as a stone or tile drain, it would not be nearly so desirable, and would be

found the more expensive in the end. A stone or tile drain would last for twenty years, and be in as good condition at the end of that time as when first constructed. He had examined many which had been constructed that time, and he had found them in a perfect condition, and not in the least silted up. The peat drains, on the contrary, would scarcely endure as many months. The stones should be about the size of common road metalling. When the land was properly drained, and the active soil had become dry and friable, it was necessary that the subsoil should be stirred up by means of a subsoil-plough, so as not to be mixed with the active soil. The cost of this subsoil-ploughing, which was most essential in all soils where the land was properly drained, but was otherwise most dangerous, as it only created greater cavities for retaining the water, was from 30s. to 40s. per acre, a sum which, though apparently large, would be found to be amply repaid by the increasing crops. Until land was properly drained it would be much better that the furrows should be shallow instead of deep. Mr. Smith was listened to throughout with profound attention, and concluded an excellent practical lecture by a few general remarks on the advantages which must accrue to all classes of the community from an improved system of agriculture, to be effected by means of efficient drainage and subsoiling. At the close of the lecture, the Duke of Richmond observed that he—and he doubted not all concurred with him—had derived much gratification from the remarks which they had heard, proceeding as they did from a gentleman who had gained his knowledge from lengthened experience. He would therefore suggest that a vote of thanks should be passed to Mr. Smith. The Duke of Cleveland seconded the resolution, which was carried unanimously.

The late Duel.—On Saturday morning the remains of Col. Fawcett were buried in the Kensal-green Cemetery. The funeral was conducted with the strictest privacy, and was attended by Mr. Blake, assistant-surgeon to the 8th Hussars, half-brother, and Lieutenant Tuthill, of the Queen's Bays, as chief mourners; Major Daubeney, of the 55th; Lieutenant Robertson, of the 15th Hussars, and Captain Barrett, late of the 55th, all of whom were particular friends of the deceased. Captain Jackson, of the 57th, was the only other person present. On Saturday last Mr. Gulliver was liberated from the custody of the police by a writ of *habeas corpus*, granted on the previous day by Mr. Justice Coleridge. On Wednesday he attended with his securities at the adjourned inquiry at Marylebone Police Court, when additional witnesses were examined, and the bail was enlarged to Monday, the 24th inst., with the understanding that, should any fresh evidence of importance be forthcoming, Mr. Gulliver should attend. The adjourned inquest took place on Thursday, but as there was no additional evidence it was again adjourned to next week.

Peace Convention.—Last week a deputation had an interview with King Leopold, to present the address adopted at the late Convention "to the Governments of the civilized world," on the importance of inserting a clause in international treaties binding the parties to refer disputes to the arbitration of one or more friendly powers. The deputation was introduced by Dr. Bowring, and graciously received by his Majesty. The King expressed in strong terms his approval of the principle of arbitration, and referred to the satisfaction he had experienced in being employed as mediator in some cases where the danger of war had appeared. He spoke of a continental war as above all things to be deprecated, and regarded it as all but impossible, so long as Austria, France, and England were united in favour of peace. His Majesty also referred to the threatened war in the east of Europe, and to the dispute between France and the United States respecting the payment of a sum of money, as instances in which the remonstrance and friendly interference of other powers had led to satisfactory results.

University College.—In the account we gave last week of the distribution of prizes, we find that we omitted to give the names of those to whom certificates had been granted. We therefore repeat the list, with the addition of the speech delivered by Mr. Christie, M.P., who presided on the occasion. The proceedings of the day having been opened in the usual manner, Mr. Christie alluded to the fact of his having been formerly a student in the College, as one of the circumstances which had led to his being selected "to dispense those honours which in former years he had himself received on the same spot from the hands of others, but by the award of some of the same Professors." This circumstance, he considered, as so far important—that "to an institution, whose beginning was fresh in men's memories, and which was still very generally considered as in its infancy, it was of consequence to show the world (and this, perhaps, could not be done more forcibly than by putting forward one who is now in some degree before the world, who left it ten years ago, and had then spent four years within its walls), that it has lived and prospered long enough to feel no further apprehension from the efforts of its enemies, although the first zeal and excitement attendant upon its foundation have long since subsided—long enough, indeed, to render its continued prosperity a certain proof of extrinsic strength." He mentioned other Members of the Legislature whom the College claims as her sons, and among them noticed especially Mr. Aldam the Member for Leeds, "who having gained at Cambridge all but the very highest honour which that University bestows, was afterwards unable to take a degree, being a Dissenter; who, however, though he was thus denied a degree in the University of Cambridge, and would have been refused even admission to reside in the University of Oxford, finds free admission to the Legislature of the Nation." Referring to the pre-

sent condition of the Institution, he said—"There are not wanting other proud marks of the progress of this College. When I left it in 1833, it was an institution standing altogether by itself, unrecognised by the State. It has now been some years in possession of a charter, and placed in connexion with another chartered Institution, which has the power of conferring degrees, to which it ungrudgingly gave over the name of University of London before held by itself; and if it then made any sacrifice, it has been amply compensated by the satisfaction while it sees many other Colleges, and among them one which began in at least unfriendly rivalry, sharing in the privileges which it was itself mainly instrumental in procuring, and by the vast superiority of success which has attended its own students in the contests for degrees and honours. Hitherto, with but one trifling exception, no substantial privileges have been attached to the degrees of the University of London. The struggle for these privileges has now begun. There is every reason to hope that in a very short time, perhaps in a few days, one of the Inns of Court in the Metropolis will place the degree of the University of London on the same footing with those of Oxford and Cambridge, as regards privileges for admission to the bar. I cannot believe but that the Government will avail itself of the opportunity afforded by the bill now pending for the reform of the Courts of Doctors' Commons, to remove the great grievance on Dissenters from the established faith of entire exclusion from practising in these Courts, and will do this by investing with privileges the law degrees of the University of London. Again, the medical reform which has been undertaken by the Government will also give it an opportunity of attaching privileges to its medical degrees. I cannot help mentioning that there is one member of the Government for whose zealous co-operation in every effort to extend her usefulness or promote her welfare, this College has a special right to hope—who was one among its first proprietors,—who is one of its proprietors still,—who once filled this chair, and whom on that occasion I remember to have heard (I was then a boy sitting there), with that chaste and perspicuous eloquence which ever finds even in the warmest political opponent a willing listener, declare his deep conviction of the importance of this College, and his earnest desire for her prosperity and fame. I trust that Sir James Graham, now that as the Secretary of State for the Home Department he is the official head of the University of London, and must have a principal voice in all questions of legal and medical reform, will not forget his former declarations of zeal for the University College, but will rather be solicitous to show that he has not lost the will on acquiring the power to benefit us; and thus vindicate alike the sincerity of his past professions to this College, and his continued attachment in an altered political position to a cause which is not the cause of party. I venture to think there cannot be a more striking instance of the extent and variety of the advantages which this Institution has conferred and is capable of conferring, than that supplied by the courses of lectures for schoolmasters, mentioned in the report read by Professor Long, the Dean of the Faculty. The want of suitable means for the education of schoolmasters of small unendowed schools, and of ushers in all private schools, is known to every one. The Universities of Oxford and Cambridge are in no way suited, and make no attempt to supply the want. The position of this College in the metropolis makes its efforts in this way, of course, available to a very large number of persons who are either engaged in teaching in the numberless schools around London, or who, being in London, and being anxious, with sufficient inducement and opportunity, to prepare themselves to be schoolmasters, can come to attend lectures in this College, but could not afford to go and reside at a distance to receive instruction. I trust if any legislative attempt be made (and such an attempt is not improbable,) to improve the education and condition of schoolmasters, the past efforts and the great capabilities of usefulness in this respect of this College will not be overlooked. The fees paid by schoolmasters and ushers attending these lectures are 12. 10s. for the four classes of Latin, Greek, Mathematics, and Natural Philosophy, and 12. for each class singly. The College has been able to make the fees thus moderate by devoting to the object the interest of 3,000*l.*, which has been given to the College at different times, in sums of 1,000*l.* and 500*l.*, by an unknown benefactor, who calls himself (and none certainly can dispute the fitness of the name which he has chosen) a Patriot; and this leads me to a gratifying announcement which I am able to make. Within the last fortnight the Council of the College have received an additional sum of 500*l.* from the same unknown benefactor. This is, indeed, a rare example of doing good for its own sake; and there are those perhaps, who, given to mourn over the selfishness and ostentation of our age, might wish that it should remain unknown as it is, and even grieve if the veil in which this munificence has shrouded itself were to be withdrawn. But I think you will say with me that this College has not yet been able so far to forget the virulence of its enemies, or to become so accustomed and indifferent to generous sympathy, as to acquiesce without reluctance in ignorance of its friends; and I will hope, and though I who speak it am the humblest member of the Council of the College, all will echo the hope; and I trust the hope so echoed may reach our unknown benefactor,—it is not impossible but that even now it may fall upon his ear; that, if so long, not longer at least than he can himself enjoy the satisfaction of doing good by stealth, or than fame makes him blush, will be withheld from us a name which we are all so well prepared to love and honour, and which, associated with so much munificence, will itself be a strong support to us, and serve to fix and strengthen his

example for others who might wish to imitate his bounty." The address was concluded with a few words of congratulation to the students who had obtained prizes. "It was an illustrious array of names," said Mr. Christie, "which heralded the College into existence; unremitting has been the assiduity of those to whom from time to time the government of the College has been entrusted; it has gained and kept the assistance of a body of Professors to whose zeal, character and learning the world will admit no superior. The munificence of its founders has raised around us this splendid building replete with every accommodation for instruction, and destined in all future ages to be admired. But no splendour of external means and appearances, no array of fine names, no zeal or reputation of Professors, can carry beyond a certain point the success of a place of education, or do for it that which may be done by a body of devoted students, mindful of the benefits they have received, and eager as far as it may be in their power to repay them—jealous of their *Alma Mater's* reputation, as of their own—jealous of their own because their honour and disgrace must be always shared by the College which has educated them." The following is an authentic list of the students who obtained prizes and certificates of honour.

LATIN.—Professor Long, A.M. Senior Class—1st Prize, W. F. Durant. 2d Prize, C. Somerton. *Certificates of Honour*: 3, P. A. Smith; 4, J. E. Wallis; 5, F. F. Bankart; 6, A. Warren; 7, C. F. Kingdon.

Junior Class—1st Prize, Chas. A. Bowring. 2d Prize, John R. Gibson. *Certificates of Honour*: 3, Wm. Colfox; 4, W. Bagehot; 5, eq., M. Prendergast and G. Long; 7, John Kearney; 8, H. Koenig; 9, N. Turnbull.

GREEK.—Professor Malden, A.M. Extra Senior Class—Prize, Bunnell Lewis. *Certificates of Honour*: 2, eq., Chas. Somerton and R. H. Hutton; 4, P. A. Smith; 5, J. L. Sanford.

Senior Class—1st Prize, C. Somerton. 2d Prize, W. F. Durant. *Certificates of Honour*: 3, J. Edkins; 4, A. Crowley; 5, P. A. Smith; 6, Thos. Beevor; 7, J. L. Sanford.

Junior Class—Prize, C. A. Bowring. *Certificates of Honour*: 2, H. Pratt; 3, W. Bagehot; 4, J. R. Gibson; 5, J. Forster; 6, H. Koenig.

HEBREW.—Professor Hurwitz. Senior Class—Prize, J. Browne. Junior Class—Prize, Jos. Edkins.

ENGLISH.—Professor Latham, A.M. Prize, W. C. Roscoe. *Certificates of Honour*: 2, W. Bagehot; 3, A. Armytage.

FRENCH.—Professor Merlet. 1st Prize, A. Crowley. 2d Prize, C. F. Kingdon. *Certificates of Honour*: 3, F. F. Bankart; 4, J. Smith; 5, T. O. Donaldson.

ITALIAN.—Professor Count Pepoli. 1st Prize, A. Crowley. 2d Prize, A. Mott.

GERMAN.—Teacher, M. W. Wittich. Senior Class—Prize, T. Beevor. *Certificates of Honour*: 2, J. Paget; 3, J. Croucher.

Junior Class—Prize, J. Forster. *Certificates of Honour*: 2, J. H. Reynolds; 3, W. Colfox; 4, C. N. Wornum; 5, H. Bankart; 6, H. H. Marling.

HISTORY.—Professor Creasy, A.M. Prize, A. Crowley.

PHILOSOPHY OF MIND AND LOGIC.—Professor Hoppus, Ph.D. 1st Prize, John Beighton. 2d Prize, A. Crowley. *Certificates of Honour*: 3, S. B. Sutton; 4, J. Browne; 5, A. Mott.

MATHEMATICS.—Professor De Morgan. Higher Senior Class—1st Prize, W. R. Wills. 2d Prize, H. R. Reynolds. *Certificates of Honour*: 3, eq. J. Kearney and H. Field; 4, eq. A. Warren and C. A. Bowring.

Lower Senior Class—Prize, R. H. Hutton. *Certificates of Honour*: 2, W. Bagehot; 3, eq. J. Rees, J. Morris, and F. W. Brady.

Higher Junior Class—Prize, S. W. Waley. *Certificates of Honour*: 2, eq. J. Smith and B. Lewis; 3, eq. S. B. Sutton and H. Bankart; 4, eq. J. Bishop and T. Bird; 5, W. Colfox; 6, eq. T. O. Donaldson and C. Sylvester.

NATURAL PHILOSOPHY.—Professor Kelland. Senior Class—Prize, W. R. Wills. *Certificate of Honour*: 2, H. Field; 3, J. Browne.

Junior Class—1st Prize equal, A. Warren and J. Edkins. 3d Prize, C. A. Bowring. 4th Prize, Joseph Rees. *Certificate of Honour*: 5, W. Bagehot; 6, F. Crowley; 7, B. Lewis; 8, S. W. Waley; 9, F. W. Brady; 10, J. Croucher.

Experimental Class—Prize, R. H. Hutton. *Certificate of Honour*: 2, S. B. Sutton; 3, J. Paget; 4, J. White.

DRAWING CLASS.—Teacher, Mr. G. B. Moore. Prize, H. Bankart. *Certificate of Honour*: 2, T. O. Donaldson; 3, E. Paxton; 4, E. C. Ireland.

ARCHITECTURE.—Professor Donaldson, (as a Fine Art.) Prize, E. Dobson. *Certificate of Honour*: F. Lett, (as a Science.) Prize, J. Croucher. *Certificate of Honour*: 2, E. Dobson; 3, G. Judge.

BOTANY.—Professor Lindley, Ph.D. Junior Class—Prize, S. C. Griffith. *Certificate of Honour*: 2 eq., W. Clapp and C. R. Matthew; 3, A. Mott; 4, W. Filliter; 5, E. Way.

ZOOLOGY.—Professor Grant, M.D. Prize, F. W. Marshall. *Certificate of Honour*: 2, W. J. Macdougall; 3, John Forster.

GEOLOGY.—Professor Webster, F.G.S. Prize, A. Crowley. *Certificate of Honour*: 2, H. Field; 3, Frederick Crowley.

ENGLISH LAW.—Professor Carey, A.M. 1st Course. Prize, J. B. Hoskins. *Certificate of Honour*: W. Morris. 2d Course—Prize, W. Morris. 3d Course—Prize, W. Morris. *Certificate of Honour*: 2, C. Frith; 3, S. Goodbehere.

JURISPRUDENCE.—Professor Graves, A.M. 1st Course; Prize, F. J. Parkes. *Certificate of Honour*: 2d eq., J. L. Sanford and N. W. Bromley, Jun.; 4, J.

Townley. 2d Course (Equity) Prize, J. B. Hoskins. Certificate of Honour: 2, N. W. Bromley; 3, C. Frith; 4, W. Thornthwaite.

The Church of Scotland.—On Tuesday the anniversary meeting of the ministers and members of the Scottish Presbytery in London was held at the Scotch Church, in Crown Court. The Rev. Dr. Brown, Moderator, presided, and addressed the meeting in a speech of considerable length, in which he alluded to the recent secession of so many ministers from the Scottish Church, and regretted that those who had so long worked together as brothers in the same vineyard, should now have thought fit to separate upon mere points of etiquette and law, and on comparatively non-essential matters, and intimated that in the course of a short time a deputation from the Established Church of Scotland would visit the metropolis, in order to set the case in its proper light before the public.

Meetings of Companies.—The meeting of the London Joint-Stock Bank Company took place on Wednesday, when the directors declared a dividend at the rate of 6 per cent., deducting 5,000*l.* from their guarantee fund, now standing at 90,003*l.* 15*s.* 9*d.*, to regulate this payment to the shareholders, the balance of profit and loss applicable to a dividend being 12,183*l.* 17*s.* 5*d.*, and therefore insufficient to this extent for meeting the dividend the directors wish to continue. The depression of trade and the abundance of unemployed capital, with the low rate of interest, are mentioned by the report as sufficient causes to account for this temporary decrease of profits.—At the Union of London Bank, on the same day, the dividend was at the rate of 5 per cent. per annum, adding 2,000*l.* to the reserved fund, which now amounts to 8,297*l.* 3*s.* 4*d.*, and is invested in Government securities. The balance of and unappropriated profits was stated at 29,962*l.* 6*s.* 2*d.*; and this would leave, after the payment of the dividend, clear of income-tax, the addition to the reserved fund, and the deduction of 500*l.* in liquidation of the preliminary expenses, a surplus of 6,317*l.* 6*s.* 2*d.*

Canada Loan.—The bidding for the second portion of the Canada loan, amounting to 300,000*l.*, took place on Friday at the Treasury, and excited considerable interest in the monied circles. The biddings were as follows:—The Mr. Maubert, for the whole amount, 108*l.* 7*s.* 9*d.*; The Bank of England, for the whole amount, 109*l.*; Smith, Payne, and Co., for 50,000*l.*, 109*l.* 1*s.* It is understood that there were other biddings, but all below the two last named, and the consequence was that Messrs. Smith and Co. obtained the amount for which they tendered—namely, 50,000*l.*, and that the remaining amount—namely, 250,000*l.*, was adjudged to the Bank of England at the price offered for the whole. The rate at which the former issue was negotiated was 108 per cent., and the improvement in the terms obtained by Government on Friday is owing to the prevailing abundance of unemployed capital and the increased value of Consols.

Metropolitan Improvements.—On Saturday an inquisition was held before the Under-Sheriff of Middlesex, to decide whether the Crown, the public, or others, would suffer any damage or prejudice, by the Duke of Bridgewater's trustees stopping up and inclosing a high street or thoroughfare, known by the name of Catherine Wheel-yard, which leads from Cleveland-row into Little St. James's-street. It was proposed by the trustees of the Duke of Bridgewater that, in compensation for what was thus meant to be taken away, they should give greater benefits to the public. They proposed to make a road from Little St. James's-street into the park, which would be a much greater boon to the public than that of which they meant to deprive it. The road they meant to make would be wider, more uniform, and much nearer. The Under-Sheriff summed up, and the Jury ultimately returned a verdict, that there would be no damage or prejudice sustained by the Crown or any other person.

Launch of the Chichester.—On Wednesday the fine weather induced a great number of persons to visit Woolwich, to witness the launch of this first-class frigate. The gates of the churchyard, commanding a full view, were opened to the public at an early hour; and at the time of the launch there could not have been fewer than ten thousand persons present, besides those in the numerous steam-vessels on the river. Miss Stopford, daughter of the Admiral, named the vessel, and she glided off the stocks amidst the cheers of the spectators. The frigate is upwards of 1,002 tons, new measurement.

Fires.—On Monday night, shortly after ten o'clock, a fire, which for several hours illuminated a great portion of the metropolis, took place at Greenwich, and in its consequences proved the most calamitous that has happened in that neighbourhood for many years. It originated in the warehouses and stores belonging to Mr. Marks, marine-store dealer, the whole of which were destroyed, together with several cottages inhabited by shipwrights and dockyard labourers.—On Tuesday morning, about four o'clock, a fire broke out among a pile of buildings situate between St. Dunstan's-hill and Idol-lane, belonging to Mr. Ryder, builder, and consisting of his manufactory, workshops, and timber-yard, as well as the manufactories of other parties. The whole of these premises were destroyed, but the fire was prevented spreading beyond the spot. The loss of property is said to amount to several thousand pounds.—On Tuesday night, about half-past ten, a fire broke out on the premises of Messrs. Palmer and Co., patent candle manufacturers, near St. John-street, Clerkenwell. It was not got under before the entire stock was consumed, which consisted of the machinery, tallow, palm oil, &c., amounting, it is said, to the sum of 5,000*l.* A large portion of the oil and melted tallow flowed from the premises into the streets, and all the central parts of the town were illuminated by the flames.—About a quarter past ten on Wednesday

night the town and neighbourhood of Kensington was thrown into a state of alarm by a report that Kensington Palace was in flames. Hundreds of persons instantly hurried to the Palace avenue, when the report received confirmation by the appearance of a dense body of smoke and flame above the stables on the north side of the Palace; and on reaching the spot, a large rick of hay, containing from seventy to eighty loads, which was stacked nearly adjoining the stables, was in flames. There was a great deficiency of water, and the rick was entirely destroyed. When discovered, only a portion of the end was on fire, which leaves no doubt that it was the work of an incendiary.

Harrow School.—On Wednesday, July 5, the second annual speech-day took place, and attracted a numerous assemblage of visitors to Harrow. Together with the speeches, three prize compositions were recited by the successful candidates—the Greek Iambics (Governors) and the Greek Prose (Hope) by the Hon. P. P. Smythe, and the Latin Essay for the Peel Medal by Mr. A. Grant.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, July 1.—West districts, 133; North districts, 173; Central districts, 159; East districts, 184; South districts, 190. Total, 848—(411 males, 437 females.) Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five springs, 854.

Provincial News.

Bridport.—On Tuesday week, at a late hour in the evening, the quiet village of Burton Bradstock, situate a few miles from this town, was visited by one of the most disastrous fires that has occurred in this part of the country for a considerable period. It raged with great violence nearly the whole night, occasioning in its progress the destruction of no fewer than 22 houses, besides other buildings and much property. The families burnt out of their houses have been ascertained to be 23, not one of whom is insured. The origin of the fire is involved in suspicious circumstances, and there is every reason to believe that it is the work of an incendiary. The buildings are the property of Lord Rivers, by whom they were insured; and fortunately there were no lives lost.

Bristol.—It is now announced as certain that the Great Britain steamer is to be launched on the 19th, and that Prince Albert has consented to be present on the occasion. His Royal Highness will leave town by a special train at an early hour in the morning, and will be accompanied by many of the high officers of state, ambassadors, and others. After the launch, a banquet will be given to his Royal Highness and the visitors. The room, erected for the occasion on the company's premises, is fully equal to the accommodation of about 3,000 guests. After the banquet, the Prince will return to Buckingham Palace.

Colchester.—On Saturday last Mr. Cobden, accompanied by the Hon. C. P. Villiers, and Mr. R. R. Moore, paid a visit to this town, for the purpose of meeting the farmers of Essex on the market day, to discuss with them the influence of the corn-laws upon tenant-farmers and farm-labourers. Considerable interest was excited by the event, as it was known that Sir John Tyrrell, Mr. Round, and other agriculturists, would be present to oppose the doctrines of Mr. Cobden. The hustings were erected in a field near the East Bridge. The appearance of the town during the day resembled that usually caused by a contested election; and the oldest inhabitants scarcely remembered having seen the town so full. About 6,000 persons were present on the ground at the commencement of the proceedings. On the motion of Mr. G. Rebow, Mr. Bawtree, banker in the town, and president of the East Essex Agricultural Association, was called to the chair. The chairman having briefly opened the meeting, Mr. Cobden, in a speech which occupied two hours, proceeded to recapitulate the arguments in favour of free trade, and dwelt on the injurious influence of the protective system of the corn-laws upon the interest of all classes, more especially those of the tenant-farmer. Mr. Cobden concluded, at the request of Sir J. Tyrrell, by proposing the following resolution:—"That in the opinion of this meeting the corn-law and every other law which favours one class at the expense of other classes, is injurious and unjust to the community at large." Sir J. Tyrrell then presented himself, and after a few preliminary remarks, moved the following amendment:—"That in the opinion of this meeting, while the present charges on land remain, the home-grower of corn cannot compete with the foreign grower without a protective duty." Sir J. Tyrrell then proceeded to take the sense of the meeting upon his amendment, when somewhat less than one-third held up their hands for it, the remainder of the meeting being in favour of free trade. This proceeding, however, was considered irregular, the amendment having neither been seconded nor put from the chair, and after some discussion it was withdrawn. The meeting was then addressed by Sir John Tyrrell, Mr. Moore, Hon. Mr. Villiers, Mr. Ferrand, M.P. for Knaresborough, and other gentlemen, whose speeches were not concluded till 9 o'clock at night. The chairman then put Mr. Cobden's resolution to the meeting, which at that late hour had been reduced to about 2,000 persons, when it was carried almost unanimously, twenty-seven hands only being held up against it.

Denbigh.—On Wednesday week a meeting was held in the County Hall, convened on the requisition of about fifty tenant-farmers, principally occupying farms in the Vale of Clwyd. The requisition stated, that, "observing the progressive and almost daily depreciation in the value of all Agricultural stock and produce, the tenants by whom the document was signed beg to suggest to their brother tenants of the county the urgent necessity of

calling a meeting of the farming interest, for the purpose of taking into consideration the present unprecedented depressed state of agriculture, and the means best adapted to procure that protection to its labour and capital which their great importance demands." Lord Dungannon, Mr. George Griffith, and other proprietors were present, but the meeting was very thinly attended. Mr. Proby, Mayor of Denbigh, was called upon to preside. Letters were read from Mr. Townsend, Mr. Mainwaring, Mr. Biddulph, the High Sheriff, and other gentlemen, on the object of the Meeting. Mr. Biddulph in his letter, adverted to a moderate fixed duty more as a source of revenue than as a measure of protection. The Mayor then called upon the requisitionists, or some one of them, to address the meeting, but in vain, for no one responded to the call; and this continued for nearly a quarter of an hour. At length some members of the Anti-Corn-Law League were allowed to address the Meeting, upon which Lord Dungannon and others left the Hall, on the ground that such a proceeding was a departure from the requisition. Several resolutions and amendments in favour of Free Trade and protection were moved, but ultimately an amendment in favour of a fixed duty was carried, and petitions embodying the resolutions were adopted for presentation to Parliament.

Derby.—The friends and admirers of the late Earl of Leicester, in Derbyshire, are about to raise a monument to his memory in Longford Church; and the ladies of his family have also subscribed for a marble bust of his lordship, which is in course of execution by Mr. Francis. The whole of the past week has been occupied by the various shows, meetings, dinners, &c. which form the customary routine of celebrating the anniversary meetings of the Royal Agricultural Society of England. A great number of persons were present, among whom were the Dukes of Richmond and Devonshire, the Marquesses of Northampton and Downshire, and most of the members of the council. Friday was the latest day for receiving implements, which were on Saturday arranged by the stewards for the inspection of the judges, which took place on Monday. The implement-yard was opened to the members on Tuesday, and on Wednesday to the public. Tuesday was also the last day for receiving cattle and stock of various descriptions, which had arrived from all parts of the kingdom. Wednesday the stock was inspected, and the prizes awarded. Thursday the cattle and implement-yards were opened to the public, and Friday was the day of sale. Besides ploughing matches, lectures, and incidental matters, there have been three dinners: one given by the mayor to the council of the Society on Tuesday, the council dinner on Wednesday at the County Hall, and the general dinner of the Society in the great pavilion on Thursday, which was followed by a meeting yesterday morning. At the mayor's dinner on Tuesday, the Earl of Hardwicke returned thanks as President of the Society, and the Duke of Richmond acknowledged the toast of the army. The Duke of Devonshire's health was drank as Lord Lieutenant of the county, and in returning thanks his Grace said that had the objects of the present Society been the promotion of, not Agriculture, but its twin sister, Horticulture, he might, as President of the Horticultural Society, have been able to descant more in detail on the various interesting objects which the exertions of those he saw around him had collected this year in Derby and its neighbourhood; but when he saw near him his Noble Friend the Duke of Richmond, himself a practical farmer, and better qualified than most men to give an opinion on Agricultural subjects, he felt that any regret on the matter was unnecessary. He begged to express his high approbation of the objects and exertions of the Royal Agricultural Society of England, and his satisfaction at being one of its governors. He had perused with the greatest interest the last volume of their proceedings, especially that portion of it which described the improvements effected by Lord Lovelace, and the interesting and valuable history which it contained of the process of thorough draining. The speech of the evening was that of Mr. Hillyard, President of the Northamptonshire Farmers' Society, and one of the oldest practical Agriculturists in the country. "The Royal Agricultural Society," he said, "had fully answered general expectations; for, although its establishment could only be called of recent date, there were seen, in many parts of the country, improvements in the cultivation of the land. It had created a desire of improvement in the generality of practical farmers; it had been the means of dissipating many long-standing farming prejudices, and it had opened the eyes of the slovenly and parsimonious, and convinced them they had lost money, by loss of produce, from their niggardly expenditure in manual labour. From improvement of education had arisen expansion of liberal ideas in the rising generation of farmers, and there would, he trusted, be annually a less number of those most unserviceable members of the community. In regard to the union of Science with Agriculture, he professed himself a practical man. He did not mean to say that the present best farming in the country had arrived at such a state of perfection that it could not be improved. On the contrary, he believed that, from mechanical science, which had brought about such great improvements in Agricultural implements, and, combined with chemical and geological aid, some of the mysteries of nature might possibly be so developed as to enable the cultivators of the soil to obtain a larger produce from it than they hitherto had; expressing, at the same time, his firm conviction, drawn from his own practical experience, that, although by potent manure an almost unbounded quantity of stems may be obtained, yet there was a boundary beyond which nature and the soil could not be forced to produce corn. There were many new,

and some he believed to be valuable manures, but it was much to be doubted whether any of them would, by application, be the means of causing such an increase of produce as would repay their great cost with the henceforth expected low price of grain. The national agricultural machine was propelled by the practical farmers. Science was the lamp, useful in the dark; but although there were still clouds hanging over the Agricultural atmosphere, it was not in that complete state of darkness which the theoretical farmers imagined. The opinions he had formed as to the useful connexion of science with practical Agriculture were these: Science, without practice, could do but little, but science joined with practice could do a vast deal. Science and practice now went hand-in-hand; science now took its proper and useful position. It did not stand forward as instructor to the experienced practical farmer, but as his able assistant. With this union of science and practice, joined by the best exertions of tenant farmers, effectually supported by liberal landlords, and all engaged in Agriculture—with all this in prospective, such general improvement in British Agriculture might reasonably be expected, as to place the country in that most desirable situation for every country—that of not being dependent on foreign nations for any part of its supply of food."

Eton.—On Saturday week, between one and two o'clock in the morning the pupils who were sleeping in the Long Chamber of the College were alarmed by the cracking of the ceiling, extending nearly the whole length of the chamber, which is 70 yards long; they rang the alarm bell, and the servants of Dr. Hawtrey were instantly in attendance, when it was discovered that the rafters had given way, in consequence of their ends having decayed from excessive age. The ceiling is now shored up, and will undergo repair during the Midsummer vacation.

Halifax.—The little village of Mount Tabor, about three miles from this town, was thrown into a state of consternation on Tuesday week, by one of the most unnatural murders ever committed in this county. The victim is a poor man, named John Dobson, aged 52, a weaver by trade, who had only lived a short time at Mount Tabor. His son, Joseph Dobson, his son's wife, and two children, came lately to live with him. They were on bad terms, and frequently quarrelled. On Tuesday morning the old man and his son's wife had several quarrels, during which the father declared that she and her children should no longer live with him. The son on hearing this borrowed a gun and shot his father through the heart. It at first missed fire, but he replaced the cap, and fired with fatal effect. The old man died instantly, but the son managed to escape to the woods. The jury returned a verdict of "Wilful Murder."

Liverpool.—Dr. Duncan has just established the fact, that mortality is greater in this town than in any other in Great Britain. One in 54 dies in the country, one in 37 in London, but one in 28 in Liverpool, while in Manchester it is one in 29. Dr. Duncan has shown in explanation of this, that the cellars, 7,000 in number, may be regarded as preparatory graves, for in these damp dens there reside about 21,000 of the labouring population of the town, of whom there die annually of invited diseases not less than 1,000. Between 500 and 600 of the population die annually of fever, while the number attacked by fever is stated to be 7,000, showing that, although originating in courts and cellars, its ravages extend to higher places. In the metropolis, the mortality to females from consumption is one in 464, but in Liverpool it is one in 298. In Manchester the number is less than it is in Liverpool, while in Birmingham it is only one in 404. Infancy, too, suffers in Liverpool by comparison more than in any other place, for whilst the deaths among infants in Manchester, from convulsions and teething, were in two years 1,765; in Liverpool, in three years, they were 4,081. The cause of this high rate of mortality is attributed to want of cleanliness and atmospheric impurity.

Llanrwst.—A murder has just come to light in this remote and secluded part of the principality. About two months ago, a middle-aged widow, named Margaret Davies, acting as servant to one Evan Jones, a husbandry labourer, holding a petty tenement on the mountain Moel Trefrie, within a mile of Capel Garmon, in this parish, was suddenly missed, and various conjectures were formed as to the cause of her absence. Weeks passed away, but still there were no signs of her return. On Friday, however, her body was discovered in a ditch near a dingle, about 300 yards from the cottage in which she had dwelt with her presumed murderer. It was much mangled by dogs, and was discovered accidentally by tracing a dog to the spot. Nothing as yet has transpired to throw light upon the cause which led to the perpetration of the deed. The supposed murderer was immediately taken into custody, and the jury, at the inquest, brought in a verdict of "Wilful Murder" against him.

Manchester.—On Monday morning the neighbourhood of Granby-row was the scene of considerable alarm, in consequence of a fire which broke out in the extensive warehouses of Messrs. Nightingale and Co., and which spread with such rapidity that in the course of an hour and a half the whole building was a heap of ruins. The building was five stories high, twenty yards in length, and nineteen in breadth. It contained upwards of 1,000 bales of cotton and 300 sacks of flour, most of which had been recently removed from Liverpool to Manchester, the latter town being deemed less liable to risk from fires. The entire loss sustained, the building included, is estimated at about 10,000*l.*, which is covered by insurances in several offices. It is not known how the fire originated. Taken in connexion with the late fires of cotton at Liverpool, the matter has excited the utmost alarm here; and

an idea is becoming prevalent that some of the materials used in America for cleaning cotton may be the means of causing spontaneous combustion when it comes to be closely packed in warehouses. Certain it is that fires were not formerly so prevalent in cotton warehouses; but, whatever may be the cause for their recent frequency, the subject is one of such importance to the manufacturing interest, that a searching investigation is demanded, and is likely to be instituted.—Another fire broke out on Tuesday morning, in the extensive print-works of Messrs. Gisburn and Wilson, Salford. The building was fire-proof, so that the flames were confined to one room, otherwise the damage must have been very extensive, the works being situated in the midst of several dye-works and cotton-mills. As it is, the loss is estimated at from 7,000*l.* to 8,000*l.* There were about thirty persons in the room when the fire was first discovered, and such was the rapidity with which it raged, that it was with considerable difficulty they escaped with their lives.—The well-known Father Mathew, the apostle of temperance, arrived in this town on Saturday week, and put up at the Temperance Hotel, and on Sunday celebrated mass at St. Patrick's, Livesey-street, at which about 2,500 children from the Catholic day and Sunday schools of the district attended. He left Manchester on Monday week for York, where he attended the annual conference of the British Temperance Society. He spent a week in Yorkshire, administering the pledge; and then proceeded to Liverpool for a week for the same purpose; and will thence return to Manchester for a similar period, to preach at the opening of the organ at St. Patrick's, on Wednesday, the 19th July, and subsequently to administer the pledge. He will then quit Manchester for London, where it is expected he will remain 3 weeks.

Oxford.—The local papers mention that the religious party in the University, of which Dr. Pusey is the head, have determined on starting a newspaper, to come out early in next term, the management, editorship, &c. to be completely under their control. Dr. Pusey's sermon was published last week, and so great has been the demand for it, that the printer could not work them off fast enough; and Mr. Parker, the publisher, was obliged to avail himself of the services of another printer to assist. Upwards of 3,000 copies have been sent to Ireland. Two editions, of 6,000 each, have been printed; and a third edition, it is expected, will be published next week. It is said that Mr. Marriott and Mr. Sewell, with other dissentients, are determined, if possible, to have the degree of Mr. Everett, the American minister, rescinded. They have been induced to do this, from the opinion expressed by Counsel, that the proceedings at the commemoration, as far as relates to Mr. Everett, were void.

Sheerness.—On Wednesday afternoon, whilst a salute was firing on board the Camperdown flag-ship in honour of the King of the Belgians passing down Sea-reach, one of the portable magazines blew up, forced up the upper deck on the starboard side from the mizenmast as far forward as the mainmast, and knocking down nearly all the cabin bulkheads, fore and aft, on the upper gun deck; scarcely a whole pane of glass is left in the ports on that deck. So great was the force, that the iron horn-knee on the beam-end, at the break of the bulkhead, where the magazine exploded, was broken asunder. Lieut. Blackmore and three seamen were seriously hurt, and two young ladies, who were visiting the ship with their friends, were wounded and burnt. Nearly all the officers received slight injuries by splinters, and were more or less burnt in rescuing the ladies from their burning clothes and the bulkhead boards which were blown upon them.

Sheffield.—During the afternoon and evening of Wednesday week, the district to the northward and eastward of this town was visited by a thunder-storm of unusual severity, which appears to have passed from south to north—the most common direction of the heaviest thunder-storms experienced in this part of the country. The most southerly points at which it seems to have appeared are Nottingham and Derby, where the storm commenced about four o'clock, though distant thunder had been previously heard in the south-west. The storm appears to have passed in a line almost due south and north over Derby, Chesterfield, and this town, visiting the latter about half-past six in the evening; and, to have been experienced at Doncaster at an earlier hour. It was experienced at Bradford in the evening; through the whole range of country from the East Riding of York, to Northamptonshire, in various parts of the Lake districts, and even in Scotland. It was also felt at Ashton-under-Lyne, and other parts of Staffordshire, where the large masses of hail did considerable damage; but from all accounts its centre appears to have been Sheffield.

Stafford.—A meeting of the Staffordshire ironmasters was held last week, at which a deputation was appointed to wait upon Sir R. Peel, and bring before him the depressed condition of the iron trade in this district. The local papers state, that not only is the state of the trade most disastrous and unsatisfactory, but its prospects are still darker; and nothing but an increased consumption of iron can prevent ruin from falling upon thousands.

Wakefield.—A few days since, according to the *York Herald*, Mr. Brierly, son of the chief constable, with his assistant, in searching a notorious lodging-house in Wren-gate, Wakefield, found concealed there an immense quantity of documents, which tend to show the means by which the begging-letters, petitions, and memorials, have been manufactured, with which not only Yorkshire, but the whole kingdom has been supplied by a gang of swindlers. The most remarkable of the manuscripts are many hundreds of genuine signatures of the nobility, clergy, and gentry, residing in different counties in England and Ireland, cut from letters and other papers,

and stuck in rows upon pasteboard, for the purpose of being imitated in duplicate sham petitions. Amongst these signatures are those of many respectable inhabitants at Wakefield, Heath, York, Halifax, Leeds, besides those of persons in the counties of Lincoln, Norfolk, Nottinghamshire, Lancashire, Cumberland, &c. Another set of documents consists of models of petitions and memorials for persons pretending to want funds to emigrate to New Zealand; to make up losses by fires and shipwrecks; to raise funds for those pretending to be afflicted with blindness, lameness, &c. A third set of documents were routes in England and Ireland, for persons travelling with the petitions, giving the names and residences of persons on the roads likely to be called upon, and pointing out where the petitioners should not call, for fear of being detected. Some of the descriptions of parties are curious—such a person is described as "a giver to all callers;" another will give if "stuck to and talked well to;" a third is "drunken, and the *dodge* may be well played;" a fourth "must be seen at breakfast-time;" a fifth must be avoided "any time just before or after dinner;" and so on through an amazingly long list of the nobility and gentry. From these details, there seems to be no doubt that the police of Wakefield have broken into the main manufacture of the begging-petitions.

York.—The committee appointed to report on the affairs of the Yorkshire District Bank have published a lengthy document on the subject, in which they recommend a dissolution of the old concern, with the formation of a new establishment for the conduct of that part of the business hitherto found profitable. A free accommodation to persons in trade who had not sufficient capital or credit to meet the advances they obtained, and the want of sufficient discretion by the general managers of the concern, are mentioned as the causes which have led to the dissolution of the bank. It appears from the details of the report that the losses were found to have been very heavy prior to 1840, and to have considerably exceeded one-fourth of the paid-up capital, no losses of any magnitude having, however, been incurred subsequently to that year. The company had 40,000 shares, the amount paid up on which is, at 17*l.* per share, 680,000*l.* Of this large capital the sum of about 544,000*l.* is said to have been lost, leaving only 136,000*l.* in available assets, with which to prosecute the operations of the new company. The principal losses of the District Bank are believed to be distributed in about these proportions:—Leeds 397,000*l.*, Hull 7,580*l.*, Wakefield 10,067*l.*, Barnsley 52,586*l.*, and Pontefract 11,038*l.*; the localities of the minor branches dividing the residue of the estimated total.

Railways.—The following are the returns for the past week:—Greenwich, 861*l.*; Eastern Counties, 2,725*l.*; Paris and Orleans, 3,987*l.*; Paris and Rouen, 2,998*l.*; Brighton, 3,825*l.*; Croydon, 379*l.*; Blackwall, 1,075*l.*; Sheffield and Manchester, 444*l.*; Great North of England, 1,436*l.*; Hull and Selby, 1,315*l.*; Liverpool and Manchester, 4,910*l.*; Midland Counties, 2,657*l.*; Edinburgh and Glasgow, 2,182*l.*; Birmingham, 16,978*l.*; Northern and Eastern, 1,967*l.*; South-Eastern and Dover, 2,485*l.*; Great Western, 15,689*l.*; South-Western, 7,474*l.*; North Midland, 4,357*l.*; Birmingham and Gloucester, 1,989*l.*; Grand Junction, 8,000*l.*; Birmingham and Derby, 1,192*l.*—The *Liverpool Times* states that Government has at present under consideration plans for quickening the intercourse between England and Ireland, by forming a railway from Chester to Holyhead, on the plan proposed by Mr. Stephenson. The line, according to this plan, will cross the Dee just below Chester race-ground, and will keep the sea-coast along nearly the whole of its course, winding round the base of Penmaenmawr and others of the Welsh mountains, crossing the Menai Straits by the present bridge, and terminating at Holyhead, which Mr. Stephenson considers the best point of embarkation for Ireland. Should the determination to carry out this great work be persevered in, it will have to be executed, either in whole or in part, at the public expense, as the traffic along the line is not expected to pay the cost of so expensive a construction.—A railway between Salisbury and the South Western Railway is now in contemplation, and is expected to form a connecting link between the latter line and the Great Western, and the ports of Bristol and Southampton.—The Birmingham and Gloucester Committee have issued their report, and on the whole it presents a favourable aspect. A reduction in the working staff of about 4,000*l.* per annum is recommended, but it appears to be a question whether some of the higher salaries might not be cut down, instead of making the weight of this saving fall upon the lowest class of servants in the company. The opening of the Bristol and Gloucester Railway is expected to increase the traffic of the line.—The first excursion for the present season on the South Western Railway took place on Monday. A special train left town at 8 A.M., arrived at Southampton at ½ past 10, where the Monarch steamer was waiting to take the party round the Isle of Wight. The day and the tide were extremely favourable, and the trip was performed in seven hours and a half. Some of the party preferred going to the New Forest, others to Netley Abbey, and omnibuses were ready to convey those who preferred land travelling. The special train left Southampton again at 7 in the evening, and arrived in town at ½ past 9, the whole journey, 230 miles, having been performed in 13 hours and a half. This is the first excursion that has taken place this season on the Southampton Railway, and it is expected that several more will be given by the Directors before the close of the summer.

IRELAND.

Dublin.—Mr. Bindon, the oldest magistrate of the county of Clare, who had been, as a leading Conservative in that county, in the full confidence of Sir R. Peel, when

the right honourable gentleman was Chief Secretary for Ireland, has been dismissed since our last report, for joining the Repeal agitation.—The Right Hon. Charles Kendal Bushe, at one time a distinguished political character in Ireland, when opposed to the legislative union, died on Monday afternoon, rather suddenly, at Furry Park, near this city, the residence of his son. Mr. Bushe took office under the Liverpool administration, as Solicitor-General, and upon the death of Lord Downes, became Chief Justice of the Queen's Bench. Soon after the formation of the present Ministry, he retired upon a superannuation, and was succeeded by the present Chief Justice Pennefather. Mr. Bushe had been half a century at the bar, having been called in 1793, and had reached his 76th year. The weekly Repeal meeting took place as usual on Monday. A great number of subscriptions and communications were received. Amongst others was an address to Mr. O'Connell signed by thirty Orangemen of Stewartstown, and professing to have the sanction of one hundred associates—giving in their adhesion to repeal. This address was read by Mr. Clements, with the names at full. It was received with great cheering, and Mr. O'Connell expressed his delight at the event. The proceedings continued till near six o'clock, when Mr. O'Connell announced the week's rent to be 1,690*l.* 5*s.* 9*d.* It was announced in the course of the sitting that the corporation had elected Sir Coleman O'Loughlin their junior counsel, solely on the ground of his being a Repealer.

Belfast.—The sittings of the General Assembly of the Irish Presbyterian Church commenced in this town on Tuesday week, when the Rev. Dr. Stewart was chosen Moderator. On Wednesday the English Presbyterian Moderators, consisting of the Rev. Messrs. Welsh and Gardner, were introduced, and both addressed the assembly. The deputation from the Free Church of Scotland, consisting of the Rev. Dr. Smith, of Glasgow, and Mr. Gray, of Perth, were also introduced. Dr. Smith addressed the assembly in the forenoon. At the evening sederunt, after some preliminary business, Mr. Gray, of Perth, commenced by saying, that it was impossible not to feel that the Free Church of Scotland had been placed in a position to give testimony to the other churches. He then proceeded, at great length, to indicate the character of that testimony. Lord Aberdeen, he said, had introduced a bill, but it would be well if he would tell them what he intended by it. He would tell Lord Aberdeen, that he knew as little of the ministers of the Church of Scotland after as before the disruption; and he also begged to tell him, that he knew nothing about the matter, if he said a hundred and fifty ministers would be kept in by this bill. If he had said that a tithe of that number would be influenced by it, he would have exceeded the mark by at least fifteen. It could not be intended for the moderates either, for the more stringent the law is, so much the better for them; their ministers had been left without houses of worship, and their flocks served God under tents or in the open air, but he was thankful to say that they were not without congregations. No bill that Sir R. Peel could have passed would have done so much to extend their principles as had been done by the disruption of the church. Dr. Edgar stated, that the Irish Assembly had resolved to place, for a month, two of the most hard-working young men connected with their body at the disposal of their brethren in Scotland. At the next sitting of the Assembly the Moderator said it was his painful duty to inform them that intelligence had arrived since they were last in that house, of the decision of the twelve Judges of England, which was, that the marriages performed by Presbyterian ministers, where one of the parties belonged to the Established church, are illegal. Contrary to all expectation this was the result, and the decision came to this, that they were not duly qualified to perform the functions and discharge the duties of their sacred office. It remained with them to consider what course was best to be adopted. Dr. Brown said that it was a useless waste of the time of the house to enter into any discussion upon the decision of the judges at that time. He would only remark, however, that it was but the commencement of coming wars—the shadow of what was yet to come. Dr. Cooke agreed perfectly with Dr. Brown that the present was but the fore-shadowing of what was yet to come. He thought it his duty to the country, to the government, and to the church, to say what was not a newly-formed opinion, but one which he had long entertained, that the present was but the commencement of a series of persecutions similar to those which afflicted their fathers in the reign of Charles the Second. A committee was then appointed to draw up resolutions and addresses to both Houses of Parliament, declaratory of their feelings upon the decision of the Judges.

Waterford.—A repeal meeting was held on Sunday in this city, which is said to have surpassed any of the previous demonstrations. Mr. O'Connell's progress from Kilkenny to Waterford is described as one continued scene of enthusiastic acclamation, the peasantry collecting in great numbers on the road-sides, at various points, to cheer as he passed along. At Carrick-on-Suir the inhabitants made a sort of grove of the town with trees and bannisters, triumphal arches and banners being erected in conspicuous places. Kilmacthomas being fixed upon as the rendezvous, it was thronged to overflowing at an early hour in the morning with persons who had travelled all night from remote distances to join in the procession. This was the grand centre of attraction, the point towards which all the western arrivals necessarily tended, and hundreds of thousands are said to have assembled there. When the first part of the immense multitude that accompanied Mr. O'Connell from Kilmacthomas reached Waterford—nearly six hours had been occupied in getting over twelve miles. As the procession passed along, the

numbers increased; about thirty temperance bands accompanied them, and the scene is described as one of the most extraordinary and animating exhibitions ever beheld. The shipping in the river, along the quay of Waterford, displayed their flags; triumphal arches were erected, and altogether the city wore all the appearances of a day of great public rejoicing. As the procession proceeded to the place of meeting—the hill of Ballybricken—the most enthusiastic cheering was heard upon all sides; whilst ladies, who crowded the windows along the line, waved their handkerchiefs as long as Mr. O'Connell remained in view. As to the numbers, the papers state that it is impossible to speak with any degree of accuracy; and the calculations vary from 100,000 to 300,000, whilst some assert that the multitudes upon the hill of Ballybricken, and all around, exceed even the latter number. The enormous platform upon the hill is capable of accommodating 3,000 persons, and it was quite crowded. Sir R. Musgrave, Bart., was called to the chair. Dr. Foran, Roman Catholic Bishop of Waterford, sat beside him, accompanied by Mr. Meagher, mayor of Waterford, a number of gentlemen from the county and city of Waterford, from Clonmel, Wexford, Kilkenny, &c., and nearly one hundred Roman Catholic clergymen.

SCOTLAND.

Edinburgh.—A number of agriculturists in the Lothians recently formed themselves into a society for the purpose of endeavouring to apply the discoveries of modern chemistry to agriculture. A committee, consisting of six members of this society and three from the Highland Society, was formed, and subscriptions taken for carrying the views of the society into effect. At a meeting held on Monday week, in Edinburgh, this committee reported to the society that 645*l.* had been collected, and that candidates for the situation of agricultural chemist had presented themselves. The result was, that ten chemists offered themselves for the situation, all distinguished for their attainments in chemistry, and two of them foreigners; but the committee recommended that the subscribers should make choice of Professor Johnston, of Durham, who had offered, for a salary of 500*l.* a year, secured to him for five years, to attend in Edinburgh for eight months in the year, and to provide, on his own responsibility, a properly-qualified substitute for the other four. Mr. Johnston's terms were to give two analyses in the year to every subscriber, at rates varying from 3*s.* to 5*s.*, and as many more as they pleased at one-half the price of these two. On the motion of Mr. Alexander, of Southbar, seconded by Lord Murray, the report was approved of, and Professor Johnston elected to the office on the terms specified. The duties of the Professor will be to analyse soils, and also manures; to ascertain what element has been taken from the soil by the previous crop, and the manure which ought to be applied in the circumstances, and according to the nature of the plant to be grown.—An arrangement has been effected with the Earl of Haddington, whereby, for a certain sum of money, his lordship is to divest himself of the office of Hereditary Ranger of the Royal Park of Holyrood, and the whole profits, claims of property, and other rights legally annexed or appertaining to the office, to be vested in her Majesty. A bill will immediately be introduced into Parliament for ratifying and confirming the sale and surrender of the office.

Miscellaneous.

The Regent of Spain.—There is no man upon whom at the present moment the eyes of all Europe are more intently fixed than upon the Spanish Regent; and the journals of all shades of politics, both in Paris and in London, are constrained to do justice to the firmness and political honesty with which he has met the perils of the recent insurrection. "We rejoice to find," says the *Times*, "that, in the midst of the dangers and temptations of the present crisis, Espartero adheres with inflexible energy and good faith to those constitutional principles to which he owes his power, and by which alone his power can be defended. It is in the highest degree creditable to the Regent that he should renew, in the most emphatic manner, his engagement to defend the Constitution and the Throne at the very time when not only his own interests, but the public safety, might furnish a ready and almost a sufficient pretext for stronger measures than the Constitution itself has provided. But his own interests, rightly understood, and the safety of the State, prescribe the wiser and nobler course, to which the Regent appears to be determined to adhere. Within the limits of the law, Espartero is invested with the highest trust that a subject can enjoy, and with that trust he wields in his own defence the royal prerogative, which he is bound to maintain. One step beyond them, he would sink to the level of a soldier of fortune, raised only by the accident of success, the audacity of his followers, or his own desperation, above those military adventurers who are remembered in the dismal annals of the Spanish revolution by a miserable death, inflicted on them by that populace which they professed to serve. We are well aware that it is the fashion in certain circles and in certain countries to depreciate the character of Espartero, and to grudge him, not only those honours which fortune has so lavishly showered upon him, but even those qualities which he owes to nature—an upright mind and a sound heart. But, if we are not greatly mistaken, his merit will outlive the calumnies which have been discharged against him; and we are entirely at a loss to comprehend the tactics of those who profess to respect his character and his qualities, whilst they predict his fall. Those qualities will, as we trust, be vindicated by success. It has already been his fate to affront the greatest perils which can shake an empire, and for the

most part to subdue them. In the utmost penury of the State, he reorganized the army; in a civil war, he not only expelled the enemy, but he pacified the country; in civil government, although he rose to power by the influence of his military achievements, and had before him the tempting path of military power, he alone, of all the men, except Washington, who have occupied a similar position, enlarged the political liberties of the nation; at a moment of unbounded corruption, rapine, and cruelty, he has maintained the dignity of poverty, honesty, and justice; in various emergencies he has invariably displayed more aptitude than those who knew him best had given him credit for; and in spite of the pangs of physical disease and the listlessness of rather a sluggish nature, he has maintained his authority and defended the Queen's prerogative in Spain for several years, without having committed a single action which history will blush to record."

Artesian Wells.—We understand that it is intended to carry the bore for the Artesian well in the Garden of Plants to the depth of 800 or 900 metres, whereas that at Grenelle is only 550 metres deep. The object of piercing so low is to find water of a high temperature. The expectation of doing so is founded on observations made by M. Arago and M. Walferdin, at Grenelle, that the temperature of the water increased in warmth one degree at every 32 metres' depth, and consequently at that of 800 or 900 metres must be at from 36 to 39 degrees centigrade (about from 97 to 104° Fahrenheit), with which the hot-houses of the equatorial plants, and also the lodges of the animals in the menagerie, and even the hospitals in that quarter, may be warmed in winter.—*Paris paper.*

The Census.—By the returns just presented to the House of Commons relative to the population of the United Kingdom, as ascertained by the last census, it appears that the total population of England and Wales amounts to 15,911,646, and of Scotland to 2,620,207; the number of persons travelling by railways and canals on the night of the 6th of June, 1841, being 4,896. It further appears that the total population of Ireland amounts to 8,175,238, of whom 852,064 were ascertained to be members of the Established Church, 6,427,712 to be Catholics, 642,356 Presbyterians, and 21,808 Protestant Dissenters.

Subterranean Forest.—The Belgian papers contain the following extract of a letter from Bruges: "Nearly 500 workmen are employed in digging the canal of Zelsaete. The work, therefore, proceeds rapidly, and has already been commenced on a line of 5,000 yards. These excavations have laid bare on the whole extent of the work, and nearly on the same level, a bed of turf. Near the village of Oostkerke, for above 2,000 yards below the bed of turf, there are the remains of a vast forest of oaks, firs, and other trees. In several places the trunks of the trees have disappeared, but in others they are found lying full well. We must therefore allow that the level of the country to the north of Bruges was one, two, or three yards lower than it is at present, but that vegetation was very flourishing, for in the subterranean forest just discovered there are trunks of trees 8 or 9 ft. in circumference."

Antiquities.—The *Bath Journal* last week announced the discovery of a stone coffin in the vale of Lyncombe. On Monday last a second coffin was found, about fourteen inches beneath the turf. This relic was about six feet and a half in length, formed of one block of oolite, and, excepting its weighty lid, unbroken. The skeleton it contained was much more perfect than the one in that previously found, and the coffin had been sculptured with more care than the other. These interesting relics are for a time left in the vestibule of the Literary and Philosophical Institution. Not far from the coffins were found two copper coins struck by the Emperors Constantine and Carausius.

Isthmus of Panama.—At a meeting of the Academy of Sciences at Paris on Wednesday week, M. Arago made a communication of the steps that had been taken towards the great work of the cutting through the Isthmus of Panama, which has been so long talked of, but which many persons have regarded as chimerical. According to this communication, a contract has been entered into by Messrs. Baring and Co., of London, with the Republic of New Grenada, in virtue of which the republic is to cede to them the line required for the projected canal, with 80,000 acres of land on the two banks, and 400,000 acres in the interior of the country. Messrs. Baring and Co. had, it is said, in the first instance, fixed the amount of toll for the navigation of the canal at the price of 18*l.* per ton, but they have reduced it to 8*l.* The work, upon which from 4,000 to 5,000 men are to be engaged, is to be completed in five years.

New Water Pipes.—The *Courrier de Lyon* states that water-pipes made of thick glass, covered with a coating of bitumen, and made to insert into each other with bitumen joints, are manufacturing at Rive-de-Gier. These pipes, will, it is asserted, bear a higher degree of pressure than those of cast-iron, and are 30 per cent. cheaper.

International Communications.—In reviewing the evidence of the progress of mind and development of civilization, the watchful observer may note the interchange of feelings and sentiments between nations not long since estranged and hostile, between distant races connected by origin and languages, but till lately too far removed to exercise much influence on mutual relations and interests. The extension and simplification of post-office communication has almost reunited families whose members were widely separated. For all purposes of business, for exchange of tokens of friendship, the settler in India, or even China, is now nearer than his father might have been if located in Austria or Italy. The class of travellers who paid an autumnal visit to a point on the sea-coast of their native isle now spread over the more

genial clime of southern France, or traverse the bosom of the majestic Rhine; while the richer and more enterprising visit Italy or Greece, and are likely to be led by curiosity and thirst for novelty to the regions laid open by the discoveries of a Tasman or a Cook. What thoughts are suggested by facts indicative of such mighty changes in society as are shown by the public offer for hire of summer residences on the banks of the Arno or the Tiber, or the approaching sale of a territory in Wisconsin, on the banks of the mighty Mississippi! What in the last generation could have availed an offer of 20,000 acres of land, or the additional seignory of inexhaustible mineral riches? Occupation of such a property westward of Lake Michigan would once have been an exile; now it will merely afford the purchaser an agreeable change of residence. These investments of wealth and exchange of interests are the great guarantees for the friendship of nations, and will do more to render war likely to be superseded, than all the quackeries of peace conventions existing or prospective. —*Times*.

Law.

COURT OF CHANCERY.—*Curtis v. Mason*.—An appeal from an order of the Vice-Chancellor, directing the defendant to be charged with a sum of 806*l.*, lost to the estate of the testator by the insolvency of his co-executor. The question is whether an executor has committed a wilful default by allowing his co-executor to retain possession of a sum of money for the payment of a legatee, when he had notice that the money was not paid at the time the co-executor had promised to pay it, and when he suffered it to remain in the hands of the co-executor for six months, without demanding its reinvestment.—The Vice-Chancellor thought that, under such circumstances, an executor was answerable for the loss of the money. It was argued in support of this decision, that nothing but a case of the strongest necessity would form any justification for an executor permitting the estate of a testator to remain under the sole control of his co-executor, and that in the present case there had been neither necessity nor any justification. To the executor it was argued at some length that the cases of wilful default cited by the other side were not applicable to the circumstances of the present one. Here the executor had parted with money to his co-executor, in order that it might be paid to the legatee, in the same manner as the testator himself would have parted with it to a man in whom he had confidence, because he named him as executor. It was submitted, therefore, that the executor was not liable, as there was no breach of trust, and that the loss must be considered the same as if it had been a loss by the testator.—The Lord Chancellor observed that the case was a painful one; the money had been lost to the legatee by the insolvency of one of the executors, and the only question was, on whom the loss must fall. It appeared that the executors, Mason and Marshall, concurred in selling out the stock, for the order to the broker was in their joint names; both, therefore, were liable. They afterwards met at the house of one of the legatees, and having divided the money in six portions, they paid five to the persons then present, and Mason allowed Marshall to carry away the sixth, in order to pay it to the legatee, who resided at Plymouth. Marshall went to Bath in order to obtain that legatee's assent to the withholding from her trustees at Plymouth a sum which he had previously advanced to her. That consent was not obtained, and a period of six months elapsed, during which Mason made no inquiry about the money, or sought for its reimbursement, although Marshall had pledged himself, on leaving London, to invest it in their joint names within a week if the dispute with the legatee was not brought to a termination. No reason had been assigned for this delay, or for the neglect on the part of Mason to have the money reinvested. Six months after, Marshall died insolvent. The case was one of wilful default; and, however hard it might be, Mason must now replace that portion which had been lost by his negligence as an executor. His Lordship, therefore, affirmed the order of the Vice-Chancellor.

COURT OF CHANCERY.—*Pinniger and Another v. Clark*.—The same *v. Dawes*.—Mr. Thesiger stated that these were actions by Messrs. Pinniger and Westmacott, eminent solicitors, to recover from the defendants compensation for professional services, which resulted in the defendants becoming entitled, as next of kin, to a large proportion of the immense wealth left by the late Baroness de Feucheres. In order to give the jury some idea of the nature and extent of the services rendered by the plaintiffs, or more properly, by Mr. Westmacott (for the business was almost exclusively managed by him), it would be necessary to advert shortly to the singular and eventful history of the Baroness de Feucheres, the details of which, by the exertions of Mr. Westmacott, were now clearly ascertained. The Baroness de Feucheres was of the humblest origin: she was one of ten children; her father's name was John Daw, and she was born at St. Helen's, in the Isle of Wight, in the year 1790. There was no register of her baptism, but it appeared that her parents were in the most destitute circumstances, for Sophia Daw, afterwards the Baroness de Feucheres, was an inmate of the parish workhouse of Newport, in the Isle of Wight, from 1796 to 1805, when she was put out as a parish apprentice. Shortly afterwards she went to live with a gentleman, who settled on her a small annuity, which she afterwards sold, and the produce of which enabled her, in 1809, to apprentice herself at a school in Chelsea, where she acquired the rudiments of that education which afterwards enabled her to make so conspicuous a figure. From 1809 till 1815, Sophia Daw resided in Gloucester-street, Queen's-square. Here she educated herself, acquired a knowledge of languages, and made herself mistress of many accomplishments. During this period she also became acquainted with the Duc de Bourbon, and in the year 1815, after the peace, went over to France, and became acquainted with a nobleman who resided in the establishment of the Duc de Bourbon, and who afterwards became her husband, Adria Victor, Baron de Feucheres. In 1817, Sophia Daw, or as she called herself, Dawes, returned to England, and was living in Poplar-street, New Kent-road. For some purpose she thought it necessary or expedient, whilst living there, to have herself baptised as an adult. In the particulars there registered, she stated that she was born at Southampton, in 1792, and that her parents resided there. In 1818, Sophia Dawes was married to the Baron de Feucheres. She was then possessed of 214,000 francs, which she had derived from the bounty of the Duc de Bourbon. At the time of the marriage, a contract was entered into, under which the parties marrying stipulated that the survivor was to have the property possessed at the time of the marriage, but after-acquired property was to be subject to the control of the parties. On the occasion of this marriage, the baroness got her father, who was then living, to make an affidavit, in which he stated that she was born in 1794. From the time of the marriage until the year 1824, the Baron and Baroness de Feucheres resided together without any remarkable occurrence. The lady's talents and accomplishments enabled her to make a conspicuous figure at the French Court, where it seems she enjoyed considerable influence. It appeared, however, that the Baron de Feucheres entertained some suspicion as to the nature of the intimacy which existed between the baroness and the Duc de Bourbon. To allay his suspicions, the baroness induced the Duc de Bourbon to make a declaration that she was his natural daughter. This served the purpose for which it was intended only a short time, and in 1829 the Baron de Feucheres obtained a regular decree of separation, or what we should call divorce, from the French courts. After this the baroness resided with the Duc de Bourbon until 1830, when he died, leaving her by his will property to the amount of 500,000*l.* There were suspicions that he had come to his death unfairly and by violence. The Baroness de Feucheres was tried for this in the Criminal Court, in France, and acquitted, and it was only in 1831, for the purpose of adding, that from all that had since transpired, and though all the particulars had been thoroughly investigated, there did not appear to be any foundation

for this imputation on her character. Some time after her trial and acquittal, the baroness formed the determination to return and reside in England. She purchased a place near Christchurch for about 20,000*l.* She purchased a house in Hyde-park-square, and transmitted about 100,000*l.* in money to England. She came over herself in 1840, being then in very bad health, and on the 15th December, 1840, she died, leaving no will, but leaving a testamentary paper, by which she left several legacies; amongst others one to the celebrated Oâillon Barrot, and the bulk of her property to a niece, Charlotte Taillennand, the daughter of a sister who had married a Frenchman, Monsieur Taillennand. The validity of the testamentary paper was contested by the next of kin, and amongst those were the defendants, Mary Ann Clark, a sister of the Baroness de Feucheres, who had married an attorney's clerk, and became a widow in 1820, and James Dawes, the brother of the Baroness de Feucheres, who was the defendant in the second action. Mr. Westmacott was their attorney and adviser. The testamentary paper left by the baroness was ultimately set aside, but still there were great difficulties in establishing the claims of the next of kin. It was necessary, in the outset, to identify the Baroness de Feucheres, and prove her legitimacy. This was extremely difficult, under the circumstances. She was born in 1790; at her baptism she declared she was born in 1792; in the marriage contract she stated herself to be born in 1793; and her father, in his affidavit, stated that she was born in 1794. Again, her mother had turned Catholic, and died in a convent at Hammersmith; and, in the register of her death, she was described as a spinster. To render the difficulty of tracing the pedigree greater, this obscure family had, several years before, changed the name from Daw to Dawes. The Baron de Feucheres was still living, and claimed to be entitled as survivor under the marriage contract. Mr. Taillennand and the executors claimed under the testamentary papers. Litigation of the most extensive and complicated kind was carried on, both in France and England. Mr. Westmacott conducted all the voluminous correspondence, and incurred an actual outlay of 5,600*l.*, for which he never could have been compensated if he had not succeeded, as the defendant was poor. It was impossible to describe the labour and anxiety he had undergone for two years. His efforts, however, were at length crowned with success. He entered into an arrangement which would give the defendant, Mrs. Clark, as a minimum share, 70,000*l.* There was a decree of the Court of Premier Instance in favour of the next of kin, but from this there was an appeal to the Cour Royale. The Baron de Feucheres had transferred his rights to a corporation, which was entrusted with the management of the hospitals in Paris. A long negotiation took place with respect to the claims of the hospital administration. The president of the Cour Royale was an active member of the hospital administration, and it was thought advisable to compromise the claims of the hospitals for a sum of about 13,000*l.*, an arrangement which, he was sorry to say, could not be completed until the counsel for the hospitals got 29,000 francs for his private share; an arrangement to which Mr. Westmacott was no party, but at which he expressed his indignation in the strongest manner. When the business was completed, great gratitude was expressed; but, in the end, Mr. Westmacott met with nothing but ingratitude for his services. Those services were of such a nature as made it impossible to charge in the usual manner. The claims of Mr. Westmacott were referred to Mr. Amory, a most respectable member of the legal profession, who awarded that Mr. Westmacott should receive 7,000*l.* beyond his outlay for his services. The defendants refused to submit to this award, but since the action commenced Mrs. Clark had paid into court 1,600*l.*, and the other defendant 1,400*l.*, which did not cover the outlay, so that it would be for the jury to say what Mr. Westmacott was entitled to for his services.—Before any witnesses were examined, Lord Abinger interposed, and observed that there was no doubt Mr. Westmacott's services were of a most meritorious description, but he did not know how a jury could estimate them. He thought the matter ought to be referred to some gentleman in the profession, by whose award the parties would be bound.—Mr. Kelly, for the defendants, asked leave to state that his clients were never disposed to undervalue the claims of Mr. Westmacott; they wished him to be rewarded liberally. But there were other persons who claimed as next of kin of the Baroness de Feucheres, and it was difficult to obtain their concurrence, and unfair that the defendants should pay the whole expense.—After some further communication between the court and counsel, the cause was referred to a barrister, to ascertain the amount to which the plaintiffs were entitled.

PREROGATIVE COURT.—*In re William Martin*.—The testator employed a friend to prepare a will for him, by which he bequeathed the whole of his small property to his children. The friend drew it on a printed form, and the testator and the two witnesses, appearing to mis-understand the form, signed their names in the margin, at the side of the conclusion. By doing so the name of the deceased was placed in the middle of the appointment of the executors. Sir H. J. Fust held that this was not in compliance with the wording of the act of Victoria, which required the signature to be "at the foot or end" of the paper, and consequently rejected the motion for probate.

CENTRAL CRIMINAL COURT.—*Sentence Respite*.—On Monday se'nnight a respite of the sentence of death pronounced against Giuseppe Azzopardi was received by the Governor of Newgate. The prisoner was convicted at the last sessions of the Central Criminal Court of the murder of a female named Rosa Sluyk, residing at Smyrna, who took him into her house as a protection against thieves, and the extreme sentence of the law was pronounced against him, which, at the time, was believed would not be carried into effect. The sentence will ultimately be transportation for life.

SUMMER ASSIZES.—OXFORD CIRCUIT.—ABINGDON.—Robert Alfred and William Aldridge, James Aberdeen, and 26 other persons, were placed at the bar upon an indictment charging them with a conspiracy to cut down the fences, gates, and trees of Robert Fuller Graham, and with having afterwards unlawfully assembled in a tumultuous manner to carry into effect the destruction of the said property. There were other counts in the indictment, charging the defendants with a riot; with assaulting certain constables in the execution of their duty; and with the rescue of James Aberdeen, while in the custody of the constables. It appeared that prior to the year 1836, there were in the borough of Newbury two open fields, called the East-field and the West-field, which were what is generally known as Lammas land; and that from time immemorial the householders of the borough of Newbury had exercised the right, whether a strictly legal right or not, of turning their cattle into these open fields after the corn had been cleared away. This mode, however, of enjoying the property being found by experience to be not free from inconvenience, a public meeting was called in 1836 of the landowners and other parties interested in those open fields, and at that meeting a resolution was adopted by which it was declared that it would be expedient to avail themselves of the provisions of the General Inclosure Act, 6 and 7 William IV., c. 115. A majority of the signatures to the agreement, which was drawn up in order to carry this resolution into effect, consisted of the signatures of householders who were induced to sign the agreement upon a distinct representation made to them by the landowners, on whose behalf Mr. Graham canvassed for signatures, that a compensation either in land or money should be made to them in lieu of the privilege which they had formerly enjoyed. Some doubts, however, were raised about the legality of the claim which the householders made, and a case was submitted to Sir W. Follett, and Mr. Bellenden Ker, who delivered an opinion that the householders had no commonable right upon this Lammas land. At a second public meeting, held in January, 1837, the opinion was produced, and the householders were informed that those who wished might erase their signatures from the agreement. The lands, however, were inclosed, and were held in severalty from the year 1837 to the year 1842, when Mr. Graham had planted his allotment with some ornamental plantations. On the 21st of September in the last-named year, a considerable number of persons, above 100, came to Mr. Graham's residence, and sent in to say that they wanted to speak to him. Upon his coming out Robert Aldridge, who acted throughout as the ringleader, said "You unhang these gates, and let us in, in order to save these fences," pointing at the same time to Mr.

Graham's inclosures. Mr. Graham refused, and said that if they wished to try their right, he would enter into a written agreement to pay the costs of both parties, let the result of the trial be what it might. This, however, did not satisfy the mob; they stated they were determined to have the fields open, and that they would go to Dr. Binney to hear the truth. They then went away, but about 5 o'clock Mr. Graham was informed that some boys and men were trespassing in his home ground, part of the inclosed land, and upon his going out and remonstrating with the men, he was attacked by a large number of persons, knocked down twice, and escaped into his house again with difficulty. Aberdeen and another man were taken into custody, but the violence of the mob was so great, that the magistrates thought it most prudent to release him upon his undertaking to appear before them the next day. This concession, for as such it was regarded by the rioters, incited them to further acts of violence. A bugle was sounded, a large body of people again collected, Mr. Graham's fences, gates, and trees, were pulled down and destroyed, and other portions of his property much damaged. This is an outline of the case, and it is hardly necessary to enter into fuller details, as all the defendants, except three, who were afterwards acquitted, accepted the offer made to them on the part of the prosecutor after the case for the prosecution had closed, and withdrew their plea of Not Guilty, and pleaded Guilty, upon undertaking upon their own recognizances to appear and receive the judgment of the Court when called upon. It was intimated that judgment would not be prayed for unless they were again guilty of breaking the peace.

SPORTING.

TATTERSALL'S, Thursday.—There was so little business done that no quotation can be given, but the following is the betting at Liverpool for the Derby:—4 to 1 agst Scott's lot; 16 to 1 agst Ugly Buck; 1000 to 20 agst Wadastra c, (t); 1000 to 20 agst Poig à Ballagh, (t); 1500 to 50 agst John Day's lot, bar the favourite, (t). St. Leger—7 to 4 on Scott's lot.

Yacht Race.—The match between Lord A. Paget's *Mystery* and the *Enigma*, the property of Mr. Reed, of Ipswich, both iron yachts of 25 tons, belonging to the Royal Thames Yacht Club, took place on Monday from Blackwall to Holyhaven and back for 100*l.* aside. The *Enigma* won the challenge cup a short time since, and the builders of the *Mystery*, in order to fully test the merits of that vessel against the powers of the *Enigma*, sent forth a challenge to sail her for the above-named sum, which was accepted, and they started at a quarter past 12 on Monday; the *Mystery* taking the lead, which she maintained throughout, rounding a vessel at Holyhaven, about five minutes in advance of the *Enigma*, and ultimately winning by eighteen minutes.

MARK LANE, FRIDAY, JULY 14.—There were several parcels of English Wheat at market this morning, which sold readily at 2*s.* advance since Monday. Free Foreign was a good sale at a similar improvement, and bonded is 2*s.* higher. Barley is rather dearer, which is also the case with Peas and Beans. The Oat-trade is improving, and rather more money has been made since Monday.

GAZETTE OF THE WEEK.

BANKRUPTCIES SUPERSEDED.—J. Hopkins, Southwark, carrier.—D. Greatbath, jun., Newcastle-under-Lyme, cabinet-maker.—J. W. Sumner, Reading, builder.

BANKRUPTS.—C. H. Griffiths, Enfield, Middlesex, draper.—G. Candell and J. B. Higgs, City, bill brokers.—T. Coleman, St. Alban's, licensed victualler.—S. Billingsley, jun., Warwick, merchant.—T. Slagg, Manchester, merchant.—J. Wood, Manchester, baker.—B. Dorral, Ironbridge, Salop, mercer.—W. East, Spalding, Lincolnshire, builder.—J. Percival, jun., Whitechapel-road, soap-maker.—J. Mills, jun., Acton, Suffolk, carpenter.—J. Watts, Holborn, licensed victualler.—F. Kennedy, New Bond-street, stationer.—W. J. Roome, Gracechurch-street, cutlery agent.—H. A. Hobbs, Isle of Thanet, Kent, carpenter.—H. Jones, Canterbury, wine-merchant.—J. A. Stirton, Chandos-street, Covent-garden, grocer.

SCOTCH SEQUESTRATION.—J. Heggie, Dechmont, Linlithgow, wright.

BIRTHS.—On the 11th inst., in Park-street, the Lady Robert Grosvenor, of a daughter.—On the 2d inst., at No. 15, Eldon-road, Reading, the lady of Major Gratton, of a daughter.—At Alveston, in Warwickshire, the lady of T. D. Acland, Esq., M.P., of a son.

MARRIED.—On the 8th inst., J. W. Austen, Esq., Lieutenant in her Majesty's 78th Highlanders, son of Sir H. E. Austen, of Shadford House, near Guildford, Surrey, and of Chelmsworth, Suffolk, to Eliza Anne, only daughter of the late Lieut.-Gen. Philpot, Colonel of her Majesty's 8th Hussars. On Wednesday last, the Lady Frances Vane, eldest daughter of the Marquis of Londonderry, to the Marquis of Blandford, eldest son of the Duke of Marlborough. **DIED.**—On Sunday, the 10th inst., at 3, Charles-street, Covent-garden, J. Winston, Esq.—On the 10th ult., at his house, in Sloane-street, T. C. Thompson, Esq.—On the 10th inst., Mr. W. R. Lards, of Mulbrough House, Leekham, Surrey, in the 67th year. On the 19th inst., J. Wedgwood, Esq., of Macclesfield, Staffordshire.—At Richmond, on the 11th inst., Louisa, Countess of Mansfield, in the 85th year of her age.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER.—A single Man, who has a good practical knowledge of forcing in Fruits, &c.; Stove and Greenhouse Plants, Flower and Kitchen Garden, Fruit Trees, and Orchard, Draining, &c. Can have an unexceptionable character from the family he has left.—Direct to J. M., 8, New Road, Chelsea.

AS GARDENER.—A young Man, 28 years of age. He can be highly recommended for strict integrity and a general knowledge of Gardening in all its various departments, by some of the Noblemen's Gardeners he has lived with.—Direct to C. S., 2, Henry-street, Upper John-street, Liverpool-road, Islington.

AS GARDENER.—A respectable single young Man, who has a good practical knowledge of his Business; the cultivation of Pines, Grapes, &c. Can have a good character for integrity, industry, and sobriety. Direct, A. B., 4, George-street, Camberwell, Surrey.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 8, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 16, 1848.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 29—1843.

SATURDAY, JULY 22.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Agricultural Society, account of the meeting at Derby	461 c
Amateur's Garden	478 c
Ammonia, destructive to Aphides and other insects	477 a
Anagallis, new, remarks on	488 b
Arable land, to crop	477 b
Arrowroot, remarks on its value	479 c
Asparagus, hints respecting salt-water for	488 b
Asphalt for coverings	488 b
Back as manure	488 a
Bees, hints on	480 a
Bilberry-leaves as manure	478 c
Bottom-heat, amount which plants will bear	489 a
Calceolarias, their treatment	478 c
Chamomile, singular instance of sprouting in	479 c
Charcoal, hints on making	478 a
Cherries, as manure	478 c
Cyanthus, treatment of	488 b
Drying a nursery noticed	487 a
Drying plants, simple method of	488 b
Ferns as manure	478 c
Fire, time to top the shoots of	483 b
Flower-garden, remarks on planting clumps in	487 c
Forster, Mr., his garden noticed	487 a
Gas-liquor, its value for gardening purposes	477 a
Gladiolus communis, found in the New Forest	479 c
Glazing, peculiar method of	488 b
Gooseberry caterpillars, to destroy	480 a
Gooseberry-trees, to destroy insects on	488 b
Guano, its effect upon Caulis	479 b
Hung, remarks on Huyse's system	479 c
Hort. Soc. exhibition, remarks on	477 b
— gardens, account of the exhibition at	480 a
Ipswich, winning Cucumbers at	480 a
Land, arable, to crop	477 b
Larches, diseased, remarks on	488 b
Lindley's Theory of Horticulture, rev.	487 b
Manures, vegetable	478 c
Medons, time to gather	488 a
Miscellaneous flowers, remarks on	488 b
New Zealand plants, notice of the sale of	478 a
Night Violet	488 b
Nitrate of soda, query respecting	479 c
Plants, out-door, remarks on watering	478 b
Potting plants, hints on	479 c
Putty, to soften old	483 b
Roses, to destroy insects on	488 b
Salvia patens, its hardiness	479 c
Scale on Vines to eradicate	488 a
Silk-plant of Madeira	479 c
Sparrows, their use	480 a
Strawberries, treatment of, for forcing	480 a
Vines, advantage of removing the underground buds when planted	488 a
— benefited by stopping	479 a
Woodville, fine specimen of	487 a
Phormium tenax at	487 a

TO FLORISTS, NURSERYMEN, and Others.
THE WEST LONDON FLORICULTURAL EXHIBITION will take place in the Grounds of the Alma Houses of the BUTCHERS' CHARITABLE INSTITUTION, at Walham Green, Fulham, on TUESDAY the 8th, and WEDNESDAY the 9th of August, 1843; when Prizes of Silver Cups and Medals will be awarded. A List of the Prizes and the Regulations of the Show may be obtained of Mr. J. T. NEVILLE, Ebenezer House, Peckham.

ROYAL SURREY ZOOLOGICAL GARDENS.
SUPERB SUMMER FLOWER SHOW, on TUESDAY, JULY 25.—The Royal South London Floricultural Society, will hold their Second Grand Miscellaneous Exhibition of Flowers, Fruits, and Vegetables, for 1843—upwards of 80 Prizes, consisting of a Silver Vase, Gold and Silver Medals, Ornamental Plate, &c. will be awarded for Picotees, Roses, Heartsease, Carnations, Ericas, Cut Flowers, Specimen and Orchidaceous Plants, various British-grown Fruits, and Vegetables, Honey, Indigenous Plants, and other Floral products of the season, which will be exhibited in splendid Pavilions and Marquees, from 1 o'clock till 7. All the attractive Entertainments of the Gardens will be added, on a scale of extraordinary splendour.
Admission, One Shilling.—Gates open at 1 o'clock.—Firing to commence at half-past 9 precisely.

KINGSTON ROYAL HORTICULTURAL EXHIBITION, SEPTEMBER 14, 1843.
For particulars apply to J. JACKSON, Hon. Sec.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

NEW AND SUPERB FUCHSIAS.
YOUELL & Co. respectfully refer the readers of the *Gardeners' Chronicle* to their select List of the above elegant tribe of plants, which appeared on the front advertising page of this Paper of the 27th ult. They are now ready to be sent out per post, free, (on the receipt of a post-office order,) to any part of the United Kingdom, upon the following terms:—
12 fine show varieties, . . . 12s. 12 extra fine and very superior extra fine ditto . . . 16s. 12 extra fine and very superior extra fine ditto . . . 21s.
The selection being left to **YOUELL & Co.**
Great Yarmouth Nursery, Norfolk, July 19, 1843.

FUCHSIA ST. CLARE.—A Specimen of this Magnificent FUCHSIA has been again submitted to Dr. LINDLEY. **YOUELL & Co.** have therefore much pleasure in referring the readers of the *Gardeners' Chronicle* to the remarks made, and which will be found amongst the "Notices to Correspondents" in this Paper of the 24th ult., as follows.—"**YOUELL & Co.**—From the specimen received, St. Clare appears to be a prolific bloomer and fine variety; we have never seen the colour so fine in any specimen grown near London."
YOUELL & Co. can supply a limited number of fine strong Plants, 15 inches high, in 48-sized pots, at 10s. 6d. each; or one smaller St. Clare, with 11 other fine show varieties at 21s., per post, free, on the receipt of a post-office order.—Great Yarmouth Nursery, July 19, 1843.

SUPERB CHRYSANTHEMUMS.
YOUELL & Co., in offering their List of **CHRYSANTHEMUMS** (for which see their advertisement in this Paper of the 1st inst.), to the notice of Amateurs and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the List will be found highly satisfactory to those who may not only have the above object in view, but also to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants are strong and healthy, and sent free of postage (on the receipt of a Post-office order) to any part of the United Kingdom, at the rate of 12s. per dozen.
Great Yarmouth Nursery, July 19, 1843.

HUGH LOW AND Co. have the following **PLANTS** for SALE:—
Tropeolum azureum, fine flowering roots, in a dry state . . . 3 s. d.
Do. Do. strong . . . 5 5 0
Do. Do. a few; very large . . . 7 7 0
Hydrangea japonica . . . 12 5s. to 3 3 0
Habrothamnus fasciculatus (see description in the "Botanical Register" for the present month) . . . 1 1 0
Paulownia imperialis, strong . . . 0 7 6
Salix japonica, new hardy tree . . . 0 7 6
Podostylus sphaerica . . . 1 1 0
Chorozema ericoides . . . 2 2 0
Fuchsia Stanwelliana, very fine . . . 0 5 0
Phlox Van Houttei . . . 0 7 6
A remittance or reference required from unknown correspondents.
No allowance on the **Tropeolum** unless more than one is ordered.
Clapton Nursery, London, July 20, 1843.

ARAUCARIA IMBRICATA PLANTS.
MESSRS. VEITCH & SON having raised a considerable number of this Splendid Hardy Ornamental Tree, are enabled to offer fine healthy plants, from 4 to 6 inches in height, at the following moderate prices, viz:—
10s. per 100;—5l. 10s. for 50;—and 30s. per dozen.
For the convenience of some purchasers, Messrs. V. & SON have appointed, as their London agent, Messrs. HURST and M'MULLEN, Seedsmen, No. 6, Leadenhall-street. N.B.—A remittance or reference required from unknown correspondents.—Exeter, June 19, 1843.

PELARGONIUMS, FUCHSIAS, &c.
R. WHITE & Co., NURSERYMEN, Poole, Dorset, offer strong Plants of the following beautiful collection of **PELARGONIUMS**, which they will forward free to any part of the Kingdom, on receipt of 5l., or separately at the prices affixed.
Lynes' Duke of Cornwall, 21s.; Do. Sunrise, 21s.; Do. Lord Ebrington, 7s. 6d.; Do. Circassian, 7s. 6d.; Do. Princess Royal, 21s.; Leitch's Fair Maid of Devon, 10s. 6d.; Bassett's Glory of the West, 21s.; Grand Monarch, 10s. 6d.; Queen of the Fairies, 10s. 6d.; Flush, 7s. 6d.; Gipsy, 7s. 6d.
FUCHSIA EXONIENSIS, 10s. 6d.; Lancii, 2s. 6d.; Brockmannia, 2s. 6d.; St. Clare, 2s. 6d.; Venus victrix, 2s. 6d.
VIBURNUM—Rosa purpurea, 2s.; Queen, 1s.; Ne plus Ultra, 1s.; Lacina, 2s. 6d.; Speciosa, 2s. 6d.

ARAUCARIA IMBRICATA, or SIR JOSEPH BANKS'S PINE.
YOUELL & Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—
Fine robust, 3 year-old plants, 8 to 9 inches high, 10s. per 100, or 30s. per dozen.—Great Yarmouth Nursery, July 19, 1843.

B. SAUNDERS, NURSERYMAN, FLORIST, &c.,
Island of Jersey, begs to inform Amateurs of Cape and other Bulbs that he has the following varieties to dispose of in August and September next, many of which are for the first time offered to the public. Orders will be executed in rotation as received, and cash or reference required from unknown correspondents: and as the stock of many of the varieties is very limited, early orders are requested.

P.S.—As many as from four to six dozen of Ixias or Sparaxis can be sent by post, at the moderate charge of from 1s. 4d. to 1s. 6d.—Cesarean Nursery, Island of Jersey, July 10.

MAGNIFICENT NEW FUCHSIA, "FUCHSIA EXONIENSIS."
LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised in the Exeter Nursery, and which is decidedly the finest variety ever produced. Flowers of it were submitted to Dr. LINDLEY, who, in the *Gardeners' Chronicle* of the 8th inst., thus expresses himself:—
"Lucombe, Pince, and Co.—The blooms sent of Fuchsia Exoniensis prove it to be a very splendid variety; it is a flower of great substance throughout, seed-vessels dark, tube and sepals of a rich crimson carmine; the sepals are long, they expand freely, and disclose the rich crimson purple corolla, which is very large, and of a peculiar denseness of texture."
The Plant was also exhibited at the last great meeting of the London Horticultural Society on the 12th inst., and obtained the Society's Certificate of Merit.
Strong Plants will be ready for delivery on the 10th of August next, at 10s. 6d. each, and will be sent, free of all other charge, by the post, carefully packed in stout tin cases. The usual discount to the trade if six plants are ordered. For a full description, see Advertisement in the *Gardeners' Chronicle* of the 17th ult.
N.B.—This Seedling Fuchsia has been fully proved, and will give satisfaction to those who purchase it.

THOMAS CRIPPS, FLORIST, &c., Tunbridge Wells,
respectfully begs to offer the following entirely new **FUCHSIAS**, viz.—St. Clare, 3s. 6d.; Eppsi, 3s. 6d.; Brockmannii, 3s. 6d.; Stanwelliana, (very fine) 5s.; Gem, 3s. 6d.; Iveryana, 3s. 6d.; Toddiana, (extra fine) 3s. 6d.; Enchantress, 3s. 6d.; Rogersiana, 3s. 6d.; or the set, 25s. Twelve Superb and distinct varieties, the selection being left to T. C., 12s. On the receipt of a Post-office order, for any quantity not less than three, the above will be forwarded Post-free.

MYATT'S NEW SEEDLING STRAWBERRIES.
J. AND W. MYATT intend sending out, by the middle of August, their NEW STRAWBERRY, the DEPTFORD PINE, fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and Eliza, 10s. per 100.—Manor Farm, Deptford, July 22, 1843.

THE QUEEN CABBAGE.
J. & S. SHILLING beg to acquaint the Public generally that they will do well to possess themselves of the above CABBAGE for sowing at this season of the year, which will be found superior for earliness and certainty of Cabbaging to any other. Packets, containing half-an-ounce of seed, will be forwarded by post free, on the receipt of 2s. 6d. in letter-stamps, or a Post-office order. From the great difficulty in getting this sort to bear seed, it will be always scarce, and should be taken care of; it is also very superior in every other respect.—Nursery, North Warnbro', near Odiham, Hants.—July, 1843.

ALBION ROAD NURSERY, STOKE NEWINGTON.
MESSRS. PROTHEROE & MORRIS respectfully announce they are instructed by the Executrix of the late Mr. JOHN MILNE, to offer for public competition, in August next, the splendid and choice Stock of **GREENHOUSES**, EXOTIC, and other **PLANTS**, of which Catalogues will be duly published.

ROYAL BOTANIC SOCIETY, REGENT'S PARK.

AWARDS OF THE PRIZES GIVEN AT THE EXHIBITION HELD ON WEDNESDAY, JULY 19, 1843.
For Collections of 35 Stove and Greenhouse Plants, 1st prize to Mr. Barnes, Gardener to G. W. Norman, Esq., Bromley Common; 2d to Mr. G. Clarke, Gardener to M. T. Smith, Esq., Shirley Park; and an equal prize to Mr. Frazer, Nurseryman, Lea-bridge-road.
For Collections of 25 Stove and Greenhouse Plants, 1st prize to Mr. Hunt, Gardener to Miss Traill, Hayes-place, 2d to Mr. Green, Gardener to Sir E. Antrobus, Bart., Cheam; 3d to Mr. Pawley, White Hart, Bromley.
For a Collection of 9 Stove and Greenhouse Plants, 1st prize to Mr. May, Gardener to E. Goodheart, Esq., Beckenham.
For Collections of 6 Stove and Greenhouse Climbers, 2d to Mr. Pawley; 3d to Mr. G. Clarke.
For Collections of 9 distinct Fuchsias, 1st prize to Mr. Laing, Nurseryman, Twickenham; 2d to Mr. Gaines, Nurseryman, Battersea; 3d (Extra) to Mr. Smith, Nurseryman, Dalston.
Extra prizes to Messrs. Lane and Son, Nurserymen, Berkhamstead; Mr. Smith, Nurseryman, Hackney; Mr. Catleugh, Nurseryman, Chelsea.
For Collections of Scarlet Pelargoniums, 1st prize to Mr. Baile, Florist, Hammersmith; Extra Prize, Mr. Baile.
For Collections of Roses in Pots, equal (1st) prizes to Messrs. Lane and Son, and to Messrs. Paul and Son, Nurserymen, Cheshunt.
For Cut Collections of 12 varieties of Moss Roses, 1st prize, to Messrs. Lane and Son; 2d to Messrs. Paul and Son.
For Cut Collections of 150 Roses, 1st prize to Messrs. Lane and Son; 2d to Messrs. Paul and Son; 3d to Mr. Hooker, Nurseryman, Breckley.
For Collections of 50 Roses, 1st prize to Mr. Betteridge, Abingdon; 2d to A. Rowland, Esq., Lewisham.
For Seedling Fuchsias, to Mr. Smith, Nurseryman, Dalston; 1st prize for Reflexa; 2d for Expansa; 3d (extra) for Coccinea vera.
For Seedling Verbenas, 1st prize to Mr. Smith, Nurseryman, Hornsey-road, for Excelca.
Extra prize to Mr. Catleugh.
For a Collection of British Ferns in Pots, 2d prize to Mr. Wood, Nurseryman, Norwood.
For named Collections of Agricultural Grasses, equal prizes to Mr. Moore, Albany-street, and Mr. G. Turner, Portland Town.
Extra Prizes to Mr. Coates, Norwood, Mr. Webb, Clapham, and Mr. Bevis.
For a collection of 6 Pelargoniums, in No. 24 pots (Amateurs' Class). 1st prize to Mr. Staines, Middlessex-place.
For Collections of 12 Pelargoniums, in No. 24 pots (Nurserymen), 1st prize to Mr. Catleugh; 2d, Mr. Gaines.
For Collections of 12 Pelargoniums, in No. 12 pots (Nurserymen), 1st prize, Mr. Catleugh; 2d, Mr. Gaines.
For a Seedling Pelargonium, 3d prize to Mr. Pamplin, Nurseryman, Walthamstow, for Lord Nelson.
For a Collection of 6 Shrubby Calceolarias, 1st prize to Mr. Gaines.
For Single Specimens of New or Rare Plants, 1st prize to Mr. Barnes, for Blandfordia, sp.; 2d to Mr. May, for Erica aristata major; 3d to Mr. Glendinning, Nurseryman, Turnham Green, for Achimenes multiflora; 4th to Messrs. Black and Gower, Norland Nursery, for Scyphanthus elegans.
Extra Prizes to Mr. Mountjoy, Nurseryman, Ealing, for Achimenes grandiflora and a hybrid Gloxinia, and to Mr. Glendinning, for Triptilion spinosum.
For Single Ornamental Specimen Plants, 1st prize to Mr. Barnes, for Ixora coccinea; 2d to Mr. Dawson, Nurseryman, Brixton, for Erica ampullacea; 3d to Mr. Catleugh, for Erythrina crista-galli.
Extra Prize to Mr. G. Clarke, for Leschenaultia formosa.
For Collections of Orchidaceous Plants, 1st prize to Mr. Mylam, Gardener to S. Rucker, Esq., Wandsworth; 2d to Mr. Barnes.
Extra Prize to F. G. Cox, Esq., Stockwell.
For Single Specimens of Orchidaceous Plants, 1st prize to Mr. Mylam, for Miltonia spectabilis; 2d to Mr. Mylam, for Aerides quinquevulnerum.
For Collections of 20 Heath, 2d prize to Mr. Jackson, Nurseryman, Kingston; 3d to Mr. Fairbairn, Nurseryman, Clapham.
For a Collection of 15 Heath, 1st prize to Mr. May.
For Collections of 6 Heath, 1st prize to Mr. Hunt; 2d, equal prizes to Mr. Barnes and Mr. Brazier, Gardener to W. H. Storey, Esq., Isleworth; 3d to Mr. Dawson.
For Collections of Statice in pots, 1st prize to Mr. Jackson; 2d to Mr. Wood.
For stands of 24 Carnations, 1st prize to Messrs. Norman, Florists, Woolwich; 2d to Mr. Ward, Florist, Woolwich; 3d to Mr. Willmer, Florist, Chelsea.
For stands of 24 Picotees, 1st prize to Mr. Ward; 2d to Messrs. Norman; 3d to Mr. Willmer.
A Collection of 24 Pelargoniums, exhibited by Mr. Staines, was considered by the judges as highly meritorious. Extra prizes were also given to Mr. Mountjoy, for a collection of Lilium eximium, and to Mrs. Hoffman, Hanover-terrace, for a collection of Globe Cacti.
Mr. Cock, of Chiswick, exhibited, not for competition, a large collection of Pelargoniums, of extraordinary beauty and perfection of growth.
Mr. Henderson, of Pine-Apple Place, exhibited also, not for competition, a new species of Hibiscus, a collection of Orchidaceous plants, containing Maxillaria Steelii, a rare and beautiful species, as also other rare plants.
By Mr. Webb, of Park Hill, Clapham, was exhibited a complete collection of the dried Ferns of the island of Madeira.
Mr. Toward exhibited models of four of the rustic covered seats, and some models of flower-baskets which now adorn the grounds of the Duchess of Gloucester, Bagshot Park.

The Secretary is directed at the close of the Exhibitions for this year, to convey the thanks of the Society to the numerous contributors, especially to those who have generously sent in Plants not for competition. The extent to which they have promoted the objects of this Society is truly gratifying.
J. D. C. SOWERBY, Secretary.

WOODLANDS' NURSERY, MARESFIELD.
WILLIAM WOOD AND SON beg leave to inform their Friends and the Public, that they intend to exhibit Blooms of their Collection of **ROSES**, during the season, at Messrs. WARNER & WARNER'S, Seedsmen, 28, Cornhill, London.

TO NOBLEMEN, GENTLEMEN, FLORISTS, and Others.
Two Thousand CAMELLIAS, fine varieties of AZALEA INDICA,
Large RHODODENDRONS, ARBOREUM HYBRIDUM, GREEN-
HOUSE and EXOTIC PLANTS, CACTI from Mexico, &c. &c.

MESSRS. PROTHEROE & MORRIS are instructed
to submit to Public Competition by Auction, on the pre-
mises, Kingsland Nursery, Ball's Pond-road, on WEDNESDAY,
August 2d, 1843, and following days, at 12 o'clock, by order of
the Proprietor, in consequence of removing to Stratford, about
2,000 Double and Single CAMELLIAS, consisting of all the
approved kinds, in a high state of cultivation, a choice assort-
ment of AZALEA INDICA, STOVE and GREENHOUSE PLANTS, con-
sisting of ARACARIA EXCELSA, CLIVEA NOBILIS, BUONAPARTIA,
JUNCUS, &c. May be viewed three days prior to Sale, and Cata-
logues had on the premises, of the principal Seedsmen, and of
the Auctioneers, American Nursery, Leytonstone.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS,
and Others.

MESSRS. PROTHEROE & MORRIS are instructed
to sell by Public Auction, on the premises, at COLVILL'S
Nursery, King's-road, Chelsea, on MONDAY, 24th JULY, 1843, and
following days, at Twelve o'clock (by order of the Proprietor, retir-
ing from business), the whole of the valuable GREENHOUSE
PLANTS, consisting of fine CAMELLIAS, of various sizes, ERICAS,
AZALEAS, PELARGONIUMS, HYBRID RHODODENDRONS ARBO-
REUM, GARDENIA FLORIDA and RADICANS, and other Miscella-
neous Plants. Also, the Conservatories, Greenhouses, Glass, Hot-
water Apparatus, a large quantity of Brickwork, several Nests of
Seed-drawers, Horse, an excellent Van, rotten Dung, &c. &c. May
be viewed a week prior to sale. Catalogues may be had on the
premises, of the principal Seedsmen, and of the Auctioneers, Ameri-
can Nursery, Leytonstone.

ESTATE and MANSION, Herts.—To Be SOLD, by
Private Contract, a FREEHOLD MANSION and ESTATE,
in a highly picturesque situation, and within 20 miles of London.
The Estate consists of a Park and Farm surrounding the Mansion,
and containing about 600 acres, chiefly rich pasture land, with
woods and plantations. The Mansion is suitable for a family of
distinction, and has lately been put into complete and ornamental
repair at a very considerable expense. There is a well-built
Farmhouse, with convenient buildings. The property is in the
occupation of the proprietor, and possession will be given to a
purchaser on the completion of the purchase. For particulars
and cards to view apply to Messrs. OLIVER & RAVEN, Solicitors,
New Bridge-street, London.

TO NURSERYMEN, FLORISTS, and Others.
TO LET, in the County of Kent, on a Lease, (part of
which is expired), a NURSERY GROUND, with Trees,
Evergreens, and general Nursery Stock; large Greenhouse, Pit,
Frames, and Plants: with Dwelling-house, Seed-shop, and Fix-
tures; Cottage, Barn, Stable, Sheds, &c. The whole in com-
plete repair, and containing many valuable additions to any per-
son entering into the above business.—For further particulars
apply by letter, post-paid, to Mr. MASTERS, Nurseryman,
Stroud, Kent.

NATIONAL LOAN FUND LIFE ASSURANCE
ANNUITY, and DEFERRED ANNUITY SOCIETY,
26, Cornhill, London.

Capital, 500,000*l.*—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
John Elliotson, M.D., F.R.S. George Lungley, Esq.
John Griffith Frith, Esq. John Rawson, Esq.
H. Gordon, Esq. Clement Tabor, Esq.

Joseph Thompson, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society
will be best understood by a comparison of its principles and a
reference to the last Annual Bonus declared on Policies of five
years' standing, viz.:

Entry	Policy No.	Age.	Sam.	Annual Premium.	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	59	£ 1,000	£ s. d. 67 8 4	£ s. d. 132 14 6	£ s. d. 58 19 9	£ s. d. 8 19 4
1838	114	55	£ 3,000	£ s. d. 175 15 0	£ s. d. 295 9 7	£ s. d. 123 0 6	£ s. d. 16 9 7

Policies now entered upon entitled to participation in next
Annual Division. Two-thirds of all premiums paid can be
borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

BRITANNIA LIFE ASSURANCE COMPANY.
1, PRINCES STREET, BANK, LONDON.

This Institution is empowered by Special Act of Parliament,
(4 Vict. cap. 9), and is so constituted as to afford the benefits of
Life Assurance in their fullest extent to Policy-Holders, and to
present greater facilities and accommodation than are usually
offered by other Companies. The decided superiority of its plan,
and its claim to public preference and support, have been proved
incontestably, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own
Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create
at once a property in reversion, which can by no other means be
realized. Take, for instance, the case of a person at the age
of 30, who by the payment of 5*l.* 3*s.* 4*d.* to the Britannia Life
Assurance Company, can become at once possessed of a bequeath-
able property, amounting to 1000*l.*, subject only to the condition
of his continuing the same payment quarterly during the remain-
der of his life,—a condition which may be fulfilled by the mere
saving of EIGHT SHILLINGS weekly in his expenditure. Thus, by
the exertion of a very slight degree of economy—such, indeed, as
can scarcely be felt as an inconvenience, he may at once realize
a capital of 1000*l.*, which he can bequeath or dispose of in any
way he may think proper.

Detailed Prospectuses, and every requisite information as to the
mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the despatch
of business.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street,
London, Inventors of the IMPROVED CONICAL and
DOUBLE CYLINDRICAL BOILERS, having been much engaged
in heating buildings upon the above system with Tanks of
various materials, solicit the attention of scientific Horticul-
turalists to an Iron Tank now fitting up on their premises, which
offers most decided advantages over every other article hitherto
employed for the same purpose. These tanks which are orna-
mental in appearance can be made from 10 to 100 feet long and
of any width and depth, and can be connected or disconnected
by any working Gardener without the slightest difficulty, thus
affording the opportunity to persons in remote districts of
employing this much approved method of heating without the
assistance of Engineers. The Tanks can be applied to Boilers
and Pipes already fixed, and from the present low price of Iron
will be found cheaper than any other material. Mr. RENDLE,
of Plymouth, has kindly undertaken to receive orders and furnish
information to any persons in his neighbourhood, and prices for
any size will be forwarded upon application to S. and Co.

HOT-WATER APPARATUS FOR HEATING
HORTICULTURAL BUILDINGS, DWELLING-HOUSES,
CHURCHES, and MANUFACTORIES, upon improved prin-
ciples, and at very moderate charges, erected by DANIEL and
EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the considera-
tion of this subject, and had much experience in the erection of
apparatus for the above-mentioned purposes, have, by improve-
ments suggested in their practice, rendered their mode of heat-
ing not only very efficient, but very simple, and have combined
durability in the apparatus with economy in the charge. They
have erected apparatus in England, Scotland, and Ireland, for
many noblemen and gentlemen, and have had the honour to be
employed by the Horticultural Society of London, in executing the
works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of
Horticultural Buildings and Sashes, and invite noblemen, gentle-
men, and the public to an inspection of their various drawings
and models, at 272, Holborn, where they have the opportunity of
exhibiting, amongst other metal works, an extremely complete and
convenient kitchen apparatus, or range, adapted for the continued
supply of hot water, and an arrangement of the oven more com-
plete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvili
near houses to horticulturists, and can refer to the Conservatory
attached to the Pantheon as one of their works, besides many
others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic
Plant Protectors, which are now ready for immediate delivery;
they beg to introduce to public notice a new Trough Pipe, for
Orchidaceous or other Houses where vapour is constantly, or at
intervals required, and which may be seen at their Manufactory,
HORTICULTURAL BUILDING & HEATING BY HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-
place, King's-road, Chelsea, Hot-house-Builders, and Hot-
water Apparatus Manufacturers, beg leave to inform the Nobility
and Gentry, that their business, which has been extensive
throughout the country for many years, is entirely confined to
the BUILDING OF HORTICULTURAL ERECTIONS of every
description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest con-
sumes but a small quantity of fuel, only requiring attention once
in 10 hours, and will heat a range of Forcing-houses 300 feet in
length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means
of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the
Nobility and Gentlemen's seats in the country, nearly the whole
of the London Nurseries, and a great variety of Horticultural
Erections and Hot-water Apparatus, Models, Plans, Estimates,
&c., at their Horticultural Manufactory, Gloucester-place, Chel-
sea, near Sloane-square.

COTTAM AND HALLEN, ENGINEERS, IRON-
FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD
STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34*s.*; 20, 44*s.*; 22, 50*s.*;
24 inches, 60*s.*; 26, 75*s.*; 28, 84*s.*; 30, 105*s.* each.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5*s.* 9*d.* each.
Garden Engines, Mowing Machines, Garden Chairs, Superior
Garden Tools of all kinds, Garden Vases and Pedestals in great
variety, and every description of Horticultural Articles, Agricultural
Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves,
Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low
prices being on account of the depression in the Iron Trade, are
subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most
improved principle, either of iron or of iron and wood combined,
which can be fixed complete in any part of the Kingdom, at very low
prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conser-
vatories, and Greenhouses; Churches, Public or Private Buildings,
&c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15
years experience, and having fixed upwards of 1500 Apparatuses for
the above-mentioned purposes, and by various improvements which
they have made during that time, C. and H. can with confidence
undertake the erection of similar Apparatus upon the most exten-
sive scale. For the convenience of those who wish to fix their own
Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch £7 0*s.* 0*d.*
(Larger Sizes in proportion.)
Roger's Boiler, small size 3 15 0
Ditto do. large do. 4 10 0

Hot-water Pipe, 4 inch diameter, 1*s.* 3*d.* per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft.
long, with five horizontal bars, weighing about 36 lbs., 3*s.* 6*d.* each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., 4*s.* 0*d.* each.

Strong do. do. do. 45 lbs., at 4 " "

Ox Hurdles, 4 feet high, do. 60 lbs., at 5 " "

BEST WIRE FOR STRAINED WIRE FENCING at 8*s.* per bundle
of 150 yards each. Uprights for ditto, 7*d.* each. The Improved
continued, and every other kind of Fencing, Fancy Wire-work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square,
3*s.* 6*d.*; 20 inches, 4*s.* 6*d.*; 22 inches, 5*s.* 6*d.* each.

CAST IRON FLOWER STAKES 4 feet long out of the ground,
7*s.*; 4 feet 6 in., 5*s.*; 5 feet, 11*s.*; 6 feet, 15*s.*; 7 feet, 20*s.* per dozen.

Snow-Rooms at the Manufactory, No. 2, WINSLEY STREET,
where every information may be obtained.

HOTHOUSES, CONSERVATORIES, &c., made
and fixed complete in all parts of the Kingdom. One
two, and three-light Cucumber and Melon-Boxes and Lights of
all sizes kept ready for immediate use, packed and sent to all
parts of the Kingdom; warranted best material. Two-light
Boxes and Lights complete, from 1*l.* 8*s.* Garden-Lights made
and glazed from 1*s.* per foot, at JAS. WATTS, Sash Manufactory,
Claremont-place, Old Kent-road.

* * * Reference given.

THE CONICAL HOT-WATER BOILERS, invented
by J. ROGERS, Esq., may be obtained of any size from JOHN
SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an
extensive practice to bring this apparatus to perfection, begs to
offer it as most efficient and economical: it may be seen at
Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges',
Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch
and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical
Society's Gardens, Regent's Park; and at the Gardens of the Hor-
ticultural Society of London. Considerable improvements have
been effected since last season; particulars of which are in course
of preparation.

HENRY HUNT'S PATENT GARDEN POTS and
STANDS, for effecting improved Drainage and draught of
Air, of which highly favourable notices have appeared in *Paxton's*
Magazine for May, *Gardeners' Magazine* for June, *Practical*
Florist, No. 23, and *Gardeners' Gazette*, May 6. Sold Wholesale
and Retail at No. 29, Queen's-row, Piccadilly; and No. 17, Great
Ryder-street, St. James's. N.B.—Nurserymen wanted as Agents
for the above in many of the provincial towns.

LIQUID MANURE PUMPS of a Superior Con-
struction, fixed and portable for Liquid Manure. Garden
Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps
for Ships, Barges, Tanners, Soap Boilers, Brewers, &c. Well-
Digging and Boring executed.—BENJAMIN FOWLER, (late George
Turner), 63, Dorset-street, Fleet-street.

J. B. LAWES'S PATENT MANURES, composed
of Super Phosphate of Lime, Phosphate of Ammonia, Sil-
icate of Potash, &c., are now for sale at his Factory, Deptford-
creek, London, price 4*s.* 6*d.* per bushel. These substances can
be had separately; the Super Phosphate of Lime alone is recom-
mended for fixing the Ammonia of Dung-heaps, Cesspools, Gas
Liquor, &c. Price 4*s.* 6*d.* per bushel.

POTTER'S GUANO.—TURNIPS, MANGEL-
WURZEL, &c. By the use of the above Manure, the
enormous yield at the rate of 86 tons per acre was obtained
of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hil-
dersham, near Cambridge. On Meadow Land, the Earl of Zet-
land got an increase of Hay of 18 cwt. 2 qrs. per acre, while by
the Foreign Guano the increase was only 8 cwt. 2 qrs. under
similar circumstances. These Facts prove the superiority of
POTTER'S Guano.

* * * POTTER'S Portable Farm-yard Manure, at 4*l.* 15*s.* per ton;
from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st.,
Lambeth.

GUANO ON SALE,
BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

Now Ready, in a small Volume, Fcap. 8vo. price 6*s.* 6*d.*

Friday, Aug. 4 Botanical 8 P.M.

COUNTRY SHOWS.—Wednesday, July 26. Tottenham and Edmonton.

WE must beg our readers to believe that the article published last week on watering plants was not written by us, as some suppose, but by a correspondent, for whose opinions we are therefore not answerable. We considered it a clever piece of ingenious speculation, (which is all that its author intended it for,) without in any way pledging ourselves to defend the writer's opinions—a task which he will be well able to execute for himself, if it should be necessary. As, however, it relates to a matter of considerable importance at this season, we shall now offer a few observations upon it.

Our correspondent objects to the common practice of watering plants at night, because of the cold produced by the operation, in consequence of the united action of evaporation and radiation. And he is, no doubt, right in supposing that the temperature is thus lowered to some extent. But the real questions to be determined are, 1st, Whether such a loss of heat is detrimental to plants? and 2ndly, Whether there may not be some compensating advantages?

We believe that all plants are retained in a more healthy state by lowering their temperature at night, and that no error is greater than that of supposing warm nights advantageous to them. In all countries nature cools down the soil very considerably at those seasons when plants are growing, and she ceases to do so only when vegetation is exhausted—or, perhaps, we ought rather to say, vegetation is exhausted when she ceases to do so. It is doubtless true that this cooling process may be carried too far; but whether that is done when plants are watered at night is a question to be answered by experiment, and experiment alone. It is worth while to place two registering thermometers on two similar and contiguous pieces of ground, one watered in the evening and the other not so, and to ascertain the difference. That the amount of evaporation is not very considerable at night, is shown by the damp state of the soil the next morning after a watering, and it is therefore probable that the loss of heat is principally owing to radiation.

In watering at night the ground is soaked with moisture at a time when plants are exhausted of their fluids in consequence of the perspiration that has been going on all day long; the sooner that loss is supplied the better; and during the night, when perspiration ceases, or very greatly diminishes, a plant is enabled to absorb by its roots the water it wants, so that by the return of day it is filled with fluid, and in the best possible state to resist the renewed action of the sun. But when water is applied in the morning the result is very different. The plant is called on to throw off moisture by its skin before it has been refilled by the absorbing action of the roots; the ground, too, which at night retains its water and conveys it to a plant, is called on to give it up immediately to the dry, warm, and gradually heating air. So that, in fact, a morning's watering cannot convey to the interior of a plant anything like so much water as that of the evening.

Which, then, is the better,—to feed a plant with water copiously at night, at the risk of lowering its temperature too far, or to feed it scantily in the morning, for the sake of keeping it warm? That is the real question, which we refer to our experimental friends for an answer.

Now that the Dahlia season is approaching, we take the liberty of reminding those country friends who favour us with reports of country-shows how indispensable it is that the names of the winning sorts should be furnished as well as those of the winning exhibitors. This would be easily effected if it were insisted of all exhibitors that they should deliver to the manager of the exhibition, at the time when the flowers are entered, a fairly-written list of their flowers. Unless this is done, no prizes should be awarded. There would then be no difficulty in furnishing the reporters with the evidence required, without imposing ungrateful and unreasonable labour upon the Honorary Secretaries.

If the friends and patrons of Horticulture, and the admirers of fine garden scenery had a great treat on Wednesday, the 12th instant, at Chiswick, no less

gratifying to the patrons of Agriculture was the exhibition presented to them at the meeting of the Royal Agricultural Society of England at Derby, on the 11th, 12th, and 13th. It was regretted by many of the latter that they could not enjoy both pleasures; and we hope that another year such arrangements will be made by both Societies as not to interfere with each other.

If Agriculture is of the first importance to the nation,—because food is of all the necessities of life the most indispensable,—Horticulture is no less so, in a state of high civilization, where wealth abounds; and that which ministers to the pleasures and luxuries of life is next in importance to that which merely sustains life. It is not the rich alone for whom exotic fruits and plants are brought to perfection, but they are gradually disseminated through the gardens of the middle classes, and end by adorning those of the day-labourer. Of all luxuries, that of the varied colours and perfumes of flowers, and the rich flavour of domesticated fruits are the simplest, and may be enjoyed by all ranks without any fear of enervating the mind.

We would now draw the attention of our readers to the great importance of the annual meetings of the Royal Agricultural Society of England in the country; and if we should venture to suggest some improvements which may be made in the arrangements, we hope that it will be taken by those who have the management of the details, not as a wish to criticise and find fault, but to improve and perfect, and render these exhibitions still more conducive to the advancement of the science and practice of Agriculture. We have attended every annual meeting of the Society,—from the first held at Oxford to the last held at Derby,—and the impression on our minds is that of a regular and rapid improvement in every branch connected with the shows. The inadvertencies and inconveniences perceived in one year have almost invariably been corrected in the next. Cattle-shows had been long familiar to most of the leading members. The increase in the number of the animals in each class soon suggested more convenient arrangements; and our general impression of the cattle-show at Derby was that of the greatest order, if not perfection. Before the public were admitted into the yard, the judges appointed for each class had carefully examined and compared the qualities of the animals submitted to their judgment. They were fully acquainted with every point by which the perfection of an animal of that class could be ascertained; and in listening to the observations of practical farmers, we heard not the slightest expression of doubt as to the perfect justice with which the prizes were awarded. In short, the cattle-show was the best we ever saw, or probably has ever been seen before; there was a greater number of fine animals to compare; and every farmer who paid any attention to the show must have greatly increased his knowledge of every kind of stock. If we are asked whether the individual improvement in the shape and profitable qualities of the best animals was very conspicuous when compared with those formerly exhibited, we must reply in the negative. The breeding of cattle, horses, sheep, and even pigs, has been for many years brought to great perfection; and we recollect having seen animals exhibited many years ago that would probably have gained prizes at Derby. The superiority of that show consisted in the number of fine animals brought together, affording opportunities of nice comparison, and consequently rendering the task of the judges more difficult. To them every praise is due, and we believe has been generally accorded by the body of farmers.

We come now to another part of the exhibition, which has increased in importance every year: we mean that of Agricultural implements and machinery, to make perfect work and economise manual labour. The most rapid strides have been made in this department. The show of implements at Oxford was not very good; nothing very new or perfect was exhibited there. At Cambridge it was much better; Liverpool and Bristol surpassed the preceding; and at Derby there was the greatest collection of every kind of implement—from the simple plough to the portable steam-engine—which had ever been brought into one spot. For three days we spent many hours delightfully in following the new inventions and the improvements pointed out by the different makers; and many more days would have been required to notice all that was worth the attention of the agricultural mechanician. But, alas! except a tolerably systematic arrangement of the various machines, and a copious catalogue, there was nothing to guide the scientific or unscientific observer to any invention or improvement of merit. On the last day, Friday, no award of the judges had yet been published, although certain tickets might be seen here and there inscribed with the words "Prize of 10*l.*, 5*l.*, 3*l.*," &c., and the reporters for the papers collected from these a list which was obtained by great labour, and without authority, or certainty of its being correct. We will not say where the fault lay,

because we do not know it; but we may venture to suggest how this may be avoided in future.

Experience has fully proved that a public trial of implements is unsatisfactory, and even impracticable. These trials ought to be first made in private, before competent judges, by persons fully acquainted with the ideas of the inventor or improver, in such soils and situations as they are suited to, and not in a field chosen at random, without proper preparation, and where a dense crowd prevents all just appreciation of the merits of the implement. This should have been done some time before the meeting; and where a public exhibition of an ingenious machine is desirable, it should already have been stamped with the approbation of the judges. Allowance would then be made by the bystanders for any failure caused by circumstances over which the exhibitor had no control, and on the recommendation of the judges farmers would purchase such instruments with some confidence, and their use would soon be proved.

The manufacturers complained that, after all the trouble and expense they had been at to bring highly-finished and improved instruments to the show, they were only gazed upon, but no minute examination took place by the public; and few orders were given for want of that guide which the award of the judges would have supplied. It is said that, in the next Number of the Journal, which will probably come out after Christmas, an elaborate report of the judges of implements will appear. Had only a slight outline of such a report been distributed before the opening of the Exhibition on Tuesday, all that is now complained of would have been obviated.

After we had rather minutely gone over the different stands, not scrupling to ask many questions, which were invariably answered with the greatest alacrity, we went away with a strong impression that much of the mechanical ingenuity and accurate execution of the makers of nice and delicate machinery, such as is used in manufactures, was transferred to the makers of agricultural machinery; and, for a sanguine imagination, it was not difficult to anticipate improvements and inventions as great and useful in Agriculture as machines for making stockings, lace, or bobbin-net have been in manufactures, and productive of equally important results;—but we are launching out a little beyond our province, and we shall be reproved by the old saying, *Ne sutor ultra crepidam*.—M.

CONSIDERING how very large a part of the expense of a garden consists in the glass used in the construction of its buildings, it is a matter of the greatest moment to know what is the most economical form of this substance that can be employed. Here we find, as in so many other cases, that the cheapest material is the dearest. It is usual to employ crown glass, and very often a bad description of that kind—thin, brittle, ill-annealed, and cheap. It looks very well when new, but after a few weeks' use a sash is suddenly struck an accidental blow, and smash go a few panes. Then comes frost, and chip go others in all directions from the laps; so that in the short space of a twelvemonth the glazed sashes are full of broken squares, or of new ones in the room of those which have dropped out.

What is called sheet-glass is a dearer material at first, but so thick, elastic, and well-annealed, that it is liable to none of the inconveniences just described; on the contrary, it resists all the ordinary accidents of usage; its elasticity prevents its being broken by frost, and after many years it scarcely demands repair. We leave our readers to judge for themselves which it is preferable to employ under such circumstances.

At the Garden of the Horticultural Society, the great iron conservatory is glazed with this material; and up to the present time not a score of squares has been broken in the roof by frost or accident. It was, however, more particularly for the power which this glass was expected to possess of resisting hail that it was employed by the Horticultural Society in the construction of their conservatory; and although it has been hitherto exposed to no trial in that place, yet it has proved so thoroughly efficient elsewhere that we have been desirous of introducing with these remarks the following important letter from Mr. Paxton, dated Chatsworth, July 19:—

"A most terrific hail-storm raged here, and in some part of Yorkshire and Lancashire, on the 5th inst., doing great damage to the crops by breaking, in many places, nine-tenths of the stems of Wheat, and other grain. The Horticultural buildings have also suffered most severely. At the Sheffield Botanic Gardens 5,000 squares were broken; in the Rectory-gardens, at Darfield, about 1,000 feet were destroyed; and at Mr. Young's, near Sheffield, and many other places, the greenhouses were completely riddled, and the plants in them much damaged. But at Mr. Roberts's, of Queen Mary's Tower, Sheffield, whose houses are glazed with the German sheet-glass, and where the storm raged in its utmost fury, only two squares were broken, and a few starred, and these

were not in the roof, but in the end where the wind drove the hail-stones from the south-west. At Chatsworth, not one square in the great conservatory, or in any of the houses glazed with the sheet-glass, was injured. This is a most decided proof (if any were wanting) of the strength and superiority of this material for Horticultural buildings, skylights, &c.; and when we consider the great size of its squares, its clearness, and comparative cheapness, we may assert that the day is not far distant when it will be universally adopted in all Horticultural buildings, or wherever glass is required to be exposed to storms."

SPRENGEL ON VEGETABLE MANURES.

(Continued from page 478.)

6. *Cotton grass*. (*Eriophorum vaginatum* and *E. polystachyon*).—This plant is largely used as litter in the boggy moors of North Germany, where it is called "Luck." At the first setting in of frost it is cut, and at once carted away. It is generally mixed with Reindeer moss, Sphagnum, and the cross-leaved Heath. The moss of peaty bogs is one of the worst of litters, for 1,000lbs. contain only 7-10lb. potash and soda, 2-10lb. of lime and magnesia, 1-10lb. sulphuric acid, traces of phosphoric acid, and 3-10lb. of chlorine. The value which Cotton grass has as litter is equally trifling, it being nearly as deficient in potash, soda, lime, &c. 100,000 parts in an air-dried state contain of mineral substances:—

1,028 parts of silica
254 " lime
110 " magnesia
3 " potash and soda—(the green plant contains, however, 416 parts of potash and soda).
36 " alumina
118 " oxide of iron and manganese
43 " sulphuric acid
27 " phosphoric acid
4 " chlorine

1,603 parts of mineral substances.

Cotton grass litter is the better the more Reindeer moss (*Lichen rangiferinus*) it includes, because the latter contains much nitrogen; at least it may be presumed so from its nutritious qualities.

Manure obtained from Cotton grass will decompose sooner than that obtained from straw; its effects therefore are not of long duration. Generally speaking, it is not much valued by farmers, the correctness of whose opinion we do not, however, decide upon.

7. *Common Broom* (*Spartium scoparium*).—Wherever Broom grows abundantly it is worth while to gather it for litter; it must, however, be cut and dried when young, else it will be too woody. It is chiefly valuable for the great quantity of nitrogen it contains, which may amount to 12-15 lbs. in 1000 lbs. of the dry plant.

100,000 parts of green-gathered air-dried Broom contain of mineral substances:—

120 parts of silica
296 " lime
52 " magnesia
242 " potash
12 " soda
160 " alumina
70 " oxide of iron
8 " oxide of manganese
15 " sulphuric acid
152 " phosphoric acid
18 " chlorine

1,145 parts of mineral substances.

Common Broom contains much tannin and wax, for which reason the manure obtained from it must not be carried on the fields without due preparation. It must be thoroughly rotted in order to render the woody parts tender.

8. *Forest-litter*.—Under this name are comprehended weeds growing in forests, cut off with iron implements, decayed leaves, the leaves of Firs, Pines, &c., small branches, &c. The weeds contained in Forest-litter consist of various plants, especially mosses; but as the latter do not constitute valuable manure, the importance of Forest-litter is chiefly owing to its phænogamic plants, leaves, &c. It is somewhat better if, instead of mosses, an abundance of lichens is contained in it, and better still if it includes fungi, which are always rich in nitrogen. The value of many plants found copiously in forests, such as Heath, Blackberries, Wortleberries, Ferns, and common Broom, has just been spoken of, and as we also know what value litter composed of different sorts of leaves possesses, we possess a certain scale for determining the value of Forest-litter, so far as the different plants contained in it are concerned.

If Forest-litter contain many of the plants just quoted, or much *Heath*, it is always best to heat it in large heaps before it is used in the stables. If, on the contrary, it chiefly consists of mosses and lichens, it may be employed as litter at once, because in that case a rather too quick decomposition is to be apprehended. 100lbs. of the dry moss, *Hypnum*, contain 1-10lb. potash and soda, 1-10lb. lime, 1-10lb. sulphuric acid, and a trace of phosphoric acid and chlorine. 100lbs. of the dry moss *Polytrichum* contain no potash or soda, some traces of sulphuric acid, phosphoric acid and chlorine, and 1-10lb. of lime and magnesia, being therefore a material of the very worst description.

9. *Flags* (*Iris pseudacorus*, *I. germanica*, and *Acorus calamus*).—Flags abound in most powerful manuring substances, and should therefore be carefully collected. They, however, decay so speedily that the manure thus obtained cannot be buried too quickly.

10. *Refuse of the Flax and Hemp-dressers*.—Experience has shown that the above substances have little value as litter, and that the manure thus produced has no nourishing properties. Flax and hemp refuse afford the surest proof that the goodness of litter chiefly depends on certain chemical constituents. Neither contain potash or soda, very little lime and magnesia, and merely a trace of sulphuric and phosphoric acids and chlorine, which are exactly the substances of which soil is in most cases deficient. Flax and hemp refuse possesses indeed as much, and even more carbon than pea and bean-straw; still it yields a much worse manure, which is to be attributed to the want of nitrogen. It yields humic acid very slowly; and the decomposition is very difficult, on account of the woody fibre, of which it is almost entirely composed. If it is ever to be used as litter it must be packed wet in large heaps, and heated for a considerable time.

(To be continued.)

HEATING APPARATUS.

I HAVE for the last five years heated two Pine-pits, each fifty feet long, belonging to C. Turner, Esq., M.P., by means of an apparatus of my own invention, which has hitherto worked well, and only requires a small quantity of the refuse of coal to keep up the proper heat. As the apparatus is very simple, and can be easily applied to any pit, and that at a small cost, I have been induced to submit to you the inclosed drawings, which I hope will fully explain the nature of my plan of heating. The boilers are quite exposed in the inside of the houses, and have merely as much brick-building in front as is required for conveying the smoke-flue into the wall.

The fire is put into the furnace at B; from thence the heat passes up through the under part of the boiler by the aperture shown in plan B, as indicated by the arrows, and continues on between the upper and under part of the boiler till it reaches the flue, whence it proceeds onward in a horizontal direction along the wall of the house, until it escapes in a vertical flue at the end of the house. The hot-water-pipes are four inches in diameter. They drop down at the extreme ends of the house, and return at the lower level in the same direction to the boilers. There is no building over the water-boiler in the inside of the house. The apertures marked J and K at each side of furnace-door are for the admission of cold air. The two bricks over the furnace-door take out for the purpose of cleaning.—*Peter Watson, Gardener, Stoke Rochford, Colsterworth, Lincolnshire.*

ON THE CULTURE OF PELARGONIUMS.

My treatment of Pelargoniums having proved successful, it has induced me to send you the method which I have pursued for many years, by which I obtain a succession of fine blooming plants throughout the year. In August, cuttings are taken from the old plants, choosing such as have the young wood tolerably matured. These are taken off about six inches long, and close beneath a

joint, each cutting being put into a small 60-sized pot, filled with a compost, consisting of equal parts of vegetable mould, good loam, well-rotted cow-dung (at least a year old), and one eighth part of white sand. Previously to filling the pots, the compost is well mixed together (but not sifted). The cuttings are inserted by making a hole in the centre of the soil, and after placing them in, the hole is filled up with white sand; the soil is then pressed close to each cutting, and after being watered, the pots are plunged in a hot-bed frame. No air is admitted for several days, but they are shaded when required.

As soon as the cuttings push, air is given freely. In four or five weeks, these cuttings are shifted into larger pots, the same kind of compost being used as before. The plants are then placed in a cool frame, or removed into the greenhouse, where they will come into bloom early in March following.

About the end of September, another succession of cuttings is put in, and treated as the others were; but when the plants are about ten inches high, the ends of the shoots are pinched off. This causes them to throw out a number of lateral branches, and makes the plants bushy. These flower early in May. In January, a third stock of cuttings is put in, which are also stopped at ten inches high. The plants are kept in a cool and airy situation, from the 1st of May to July, and are then taken into the houses to bloom, which they will do until the end of September. These plants are removed towards the end of April into pots eight inches wide by nine in depth. In March a fourth lot of cuttings is put in; these, after being stopped, will throw out shoots, which, when they have got six inches long, are also stopped. These plants are kept in a cool, airy situation, from the end of May to September, and are then taken into the houses, and will bloom until December or later.

The plants are frequently syringed with a mixture of soap-suds and tobacco-water, which keeps them perfectly free from insects of any kind. I also water them often at the roots, with strong manure-water and soap-suds. Plants treated in this manner always appear healthy and vigorous, and the blossoms are much finer than those produced upon old plants, that have been cut down and treated in the usual manner. All my spare old plants are finally turned out into the open borders, and flower admirably; and being so dwarf and bushy, they are very suitable for the purpose.—*A Young Gardener, Raheen, near Limerick.*

THE ANTIQUITIES OF GARDENING.

No. I.—Extracts from Sir Thomas Hanmer's Manuscript on Gardening. (Continued.)

"Of Beare's Eares, or Auriculars.—The seed is ripe in June, and best sowed in October. The best way is this:—Take good black mold, mix it with rotten cow-dung, fill pans or boxes with it within a foot or less of the brims; then sift thereon a little sand mixed with salt, to keep worms away; then sift on that Willow earth, above an inch thick, or otherwise soe much of the finest light old rotten dung, on which scatter your seed pretty thick, and passe through a very fine sieve soe much of the same flower of dung as will but just hide the seed."

"Of watering Flowers.—River and pond waters which are constantly exposed to the sun and influence of the heavens are best for watering all things. That drawn out of deepe wells or brought farr underground in pipes is too cold for tender seedes and roots until it hath stood some time in the open warme ayre."

"Of Tulipes.—The Tulip is the queen of bulbous plants, whose flower is beautiful in its figure, but most rich and admirable in its colours and wonderfull variety of markings. It is also a hardy plant, and constant enough, if well ordered. Wee had it first out of Turkey, about fifty years since, where it grows wild in some parts, particularly about Jerusalem as they write, and is thought to be that flower translated ill a Lilly, which was said to be more gloriously arrayed than Solomon."

"There are little shaking things standing up like little heads of spears within the flowers of Tulips, which the Latins call Stamina, and the French Estamyns, and wee Chives; and if these bee yellow, the flowers are seldom valuable, being inconstant commonly, and having the colours faint and confused; but if they bee of a rich purple, it is almost a certain sign of a good kind, so that such single colours as have purple stamyns are only to be chosen to gather good seed from, or to keep in hope of striping well."

"The best properties of earth for Tulipes are lightness and dryness, yet there must be some saltiness in it; one third part of sand, and two parts of Willow earth before spoken of, make an excellent composition for them; but because Willow earth is not to be had everywhere, take instead thereof two parts of fine rich old dry mold out of the fields, or such that is made of leaves and spriggs, and found about old wood piles, with a little very consumed cow-dung and add to them a third part of sand."

"Spanish Jasmyn or Gessamyn.—This flowers later than the common sort. It is so tender that we hardly preserve it all winter in potts or tubs; yet in Paris, where the frosts are sharper than in England, I have seen a south wall planted with this kind enoculated upon the common white, which in October were unrayed and laid downe on the earth, and a low wall of horse-dung, or what else you please, made before them, to keep off the cold, covering them well with mosse, and a penthouse of boards to keep off the snow and great winds, leaving places to give them some aire in faire wynter weather; letting them lye thus till the great frosts of wynter are past, and then moving all the covers and pruning them low, and nailing the stocks up against the walls, where they bore flowers abundantly in summer."

"Betimes in the spring, before this Spanish kind begins to bud, you must every year prune them close down to the stocks, leaving only one eye above it, unless it be a branch of a finger long of new sprouting for a graft;—and, by the way, note, that these come better of grafts than enoculation, or any other way of insition. If they be not yearly pruned thus low to force out new branches, they will be but short lived.

"The Arabian or Alexandrian Jasmyn prospereth well in diverse parts of Italy, where they have had it long. It came first from Egypt, and is called by the Arabians *Sambach*."

(To be continued.)

AMATEUR'S GARDEN.—No. XXIX.

AMONG the plants which now require attention preparatory to another season, Pelargoniums, by almost universal consent, claim the first place, for there are few persons who do not admire them, and not many plants which are more worthy of admiration. It may be said there is little skill required in growing a Pelargonium, and this may be true; but there is some little art required to produce them in that style of excellence which is characteristic of the plants exhibited at Chiswick and other Horticultural fêtes in the neighbourhood of the metropolis. Few persons in the country can form any idea of the magnificence of the specimens grown by Messrs. Cock, Catleugh, Gaines, and others; and many gardeners of the old school would pronounce it impossible to produce them at all. It must be admitted, also, that although there are plenty of gardeners who can produce luxuriant specimens, we have but few cultivators who can procure a head of bloom commensurate with the size of the plants. The reason of this is, that in our desire to grow large plants, we lose sight of an important physiological law,—namely, that whatever conduces to luxuriant growth is unfavourable to the production of flowers, and *vice versa*; and hence prize cultivators never allow their plants to become what they term "autumn proud," that is, gross and luxuriant at that season, but keep them by potting them in poor soil, and supplying them moderately with water, in a healthy but by no means luxuriant growing state. The effect of such treatment is the production of a great quantity of active roots, and the storing up of sap in a highly elaborated state, which, being brought into action by the increased light and heat of spring, is expended in the production of flowers instead of branches. For this reason it may be laid down as a rule of culture, that strong autumn-growing plants will not produce a fine head of bloom the following season, neither can any stimulus in the way of liquid manure induce them to do so.

This is the theory of the cultivation of the Pelargonium, as exemplified in the management of the best cultivators. To apply it to practice—the plants that have done flowering must be turned out of the house and placed in the full sun, under a south wall, to ripen their wood previously to being cut down, and it will be well at the same time, if seed is not desired, to remove the whole of the flower stems, but retaining as much of the foliage as possible. In cutting the plants down, the Amateur must be governed by circumstances, such as the sized plants he wants in the coming season, and the convenience he has at hand for large specimens. As a general rule, I should never recommend the growth of large specimens; small ones in 32 or 24-sized pots are far more interesting, and there is quite as much merit in producing them of that size as of a larger size; that is, if they are grown as plants ought to be, with the branches depending over the side, and hiding the greater part of the pot. Some importance has been attributed to the quantity of old wood left in a plant at the time it is cut down, but the advantage of retaining a quantity of wood, is I think, to a considerable extent, imaginary, though it cannot be doubted but that it is a reservoir of nutriment for the young branches in case of need. After the plants are cut down, they must be placed in a shady place until the forwardest young shoots are one inch long, at which time they must be shaken out and repotted into small pots, using sandy loam and heat only, and placing the plants in a close, cold frame, until they begin to grow again; after which they must be fully exposed to the weather until the approach of frost renders it necessary to house them for the winter. This subject will be again noticed towards October.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Rendle's Tank System.—Prejudice on the part of those engaged in Horticultural pursuits respecting new modes of heating houses for plants, has unquestionably been a great bar to the improvement of that very important principle in the provision of artificial climate; but it is not the only one. Experience has proved that the inventors of almost every new method have claimed for them far more than they really deserved. Instead of demonstrating their peculiar adaptation to particular purposes, they have, by contending against nature's laws and man's common sense, deprived themselves of deserved merit. No one, however, who has read Mr. Rendle's treatise on his Tank system, will, I think, feel disposed to include that gentleman in the above number; neither can there be any doubt as to the superiority of hot water over every other material at present employed for maintaining bottom-heat. But I must beg to state, that I am not quite satisfied that I should be able, by adopting Mr. R.'s plan, to keep a steady heat at the roots of Pine plants, unless I did so irrespective of the temperature of the superincumbent atmosphere. It is very evident, in the first place, that the air in a Pine-house would receive but very little heat from the tank, when covered with a foot or more of saw-dust, which is a bad conductor; and this fact is rendered still more obvious by Mr. R.'s statement, "that when the large

body of water is once heated, it continues so for a considerable time." It is true that Mr. R. proposes to carry the flue round the interior of the house, and says that, "In cases where the heat from the flue is not sufficient to warm the atmosphere of the house, it is better, although not absolutely indispensable, to have carried round the tank, close by its sides, a two-inch cast-iron pipe, which could be joined to the tank with white lead, and caulked in the same manner as the flue-pipe." Admitting that by such contrivances a given degree of heat might be produced around both the roots and leaves of the plants, the question arises—how is the heat within the house to be varied to meet the changes of the weather, without disturbing the regularity of the bottom-heat; seeing that the heat of the flue cannot be raised without first raising the heat of the water, and the hot-water pipe can, of course, receive additional heat only through the tank? And let it be remembered, that the time when the roots will be subjected to an increase of temperature—namely, the middle of winter—is exactly the time when any change should, if possible, be avoided. I certainly do think that, unless an horticulturist can obtain a thorough command of heat for the two purposes to which reference has been made, independent of each other in their application, Mr. R.'s plan can never be made available for horticultural purposes to the extent that he anticipates, or anything like it. I scarcely need to say that the alteration made in it by the Rev. Mr. Huyshe is more objectionable still; and it is, to me, a marvellous thing that Mr. H. should so "strongly urge all to adopt it, even if it be for economy's sake alone," when that gentleman finds it necessary to raise 22 hogheads of water to a temperature of 115 deg., "to keep the house at a temperature of 70 deg. at night," in the middle of summer. If the experiment had been made in January instead of June, I question if we should have heard of economy as being its chief characteristic. Unless, therefore, I have misunderstood Mr. Rendle's treatise, I would still prefer such a plan as Mr. J. Weeks's, by which I could have, from the use of one boiler, any amount of top or bottom-heat which I might want—vapour in any quantity—a circulation of warm air if required, and a perfect control over all.—*W. Sherwood, Gardener to J. R. Mills, Esq., Stamford Hill.*

Bees.—Instead of answering my question, "Apis" says,—"What I gathered from both is little more than is related by Huber." I do not know what Huber or any other author says on the subject, for I have not yet perused a book either on the history or management of Bees. If Huber makes the thing as plain as we have done, why not believe him? Mr. Wighton and "Apis" find fault with me for mentioning "a change of the gender—a thing foreign to the subject, for Working-Bees are considered to be Queens in an undeveloped state." It is not foreign to the subject, for Working-Bees are evidently of the neuter gender, and are as fully developed (i.e. as perfect) as Queens or Drones. Would your correspondents be astonished were I to prove that Queens lay only one sort of eggs, and that either Queens, Drones, or Bees, may be obtained from them at the option of the Bee-keeper? Certainly this would astonish them. How startling soever it may seem, how doubtful soever my friends may be, I were I worth a thousand pounds, and given to betting, would wager it all that I would cause the Bees to metamorphose all the eggs that a Queen may lay into Drones, exclusively; nay, I would cause them to be metamorphosed into Bees in March, and into Drones in April, and so on alternately; and a few into Queens at any given time. Mr. W. and "Apis" must bathe their minds in the stream of oblivion, and forget the theories of the undeveloped schools. Bee-keepers seem to know less of the management than of the history of Bees. I shall prove this with two quotations from the letters of Mr. W. and "Apis," who have read many authors. The former says, "Queens generally perish in the virgin swarms." Supposing, but not admitting that this is true, I ask, can it not be prevented? Yes, and is by all who know the first principles or A B C of Bee management. But "Apis" says, "the fact of the Queen's removing repeatedly renders it difficult to find out her age." When our Apiaries contained 160 hives, we knew the age of every Queen. "Apis" says, "some Queen Bees appear in May;" this is true, but take one year with another, one part of the island with another, we shall find that the greater part of Queens are hatched in June and July; but this is a trifling matter. He says that "run and squeezed honey are not the same. Perhaps 'P.' will explain this; also how to make Bees fill a large hive as soon as a small one." In Lanarkshire, where the 110 lbs were gathered, all honey out of the comb is called by the peasantry, run-honey. The difference is in the act of taking. According to "Apis," squeezed honey is that which is made to run out of the comb by the pressure of the hand, previous to its being put into a bag; and run-honey is put into the bag without being squeezed. The squeezing system is by far the more speedy and profitable. On the 3d of May the gardener here put a small hive into my hand, and requested me to go to a certain field and bring a swarm which was hanging on a tree. In order to prove that large hives are as soon filled as small ones, I shall first tell "Apis" what I have done with this swarm, which was about the size of a tomato; and secondly, what would have been done had it been a large swarm. This small swarm filled a small hive, and was ready to throw a swarm on the 19th of June. I took off a swarm on the evening of that day, and a second swarm on the 30th of the same month. On the 10th July, I will drum all the Bees out of the old hive, and obtain from it about a pound's worth of honey. On that day the three swarms will be worth 30s. Well, if such hives as I recommend were kept by the person who lost the swarm,

it would have been as large as a shepherd's dog. This large swarm would have filled a hive three-fourths larger, and thrown two swarms in the same space of time, and produced fifty shillings' worth of honey instead of twenty shillings' worth; and the three swarms would be worth about 3l. This, then, is plain matter. Some of the Apiarians in this vicinity are in ecstasy with artificial swarming. I have taken off three swarms lately; one in the space of thirteen, another in fifteen, and another in eighteen minutes. An Apiarian from St. Albans, who had heard the gardener here describe the utility and simplicity of the system, exclaimed, as I was going in at the garden-door, "Well, I have kept Bees for thirty years, and thought I knew something about Bees, but really I know nothing. However, a man is never too old to learn."—*A. Pettigrew, Wrotham Park.*

Wasps.—I have adopted a plan recommended in your valuable Journal, in rewarding people who brought Queen Wasps to me. I have, up to the present time, paid for 57 of the above destructive insects.—*A Subscriber.*

Bees.—As the accuracy of the statement made at p. 335, as to the gatherings of our Bees in 1842, has been doubted by some of the readers of the *Gardeners' Chronicle*, I beg leave to state that there is no exaggeration in saying that "the produce of one swarm was 110 lbs. of honey, and that the best of our top swarms gathered in the month of August alone 50 lbs. each." I dare say that they are not more astonished at the quantity produced by our Bees, than I would be on seeing the small hives that are stuck on posts 18 inches high in the environs of London. If attention be paid to what Mr. A. Pettigrew says on artificial swarming, and the folly of keeping small hives, it is probable that some of your readers will make more of their Bees than we do of ours; for this locality is, I think, sometimes overstocked with them. On the 11th of July, I sold for 17s. a box of honey, which I got from one of our top-swarms of this year. This swarm weighs now above 50 lbs. Our top-swarms are gathering 2 lbs. every day.—*William Pettigrew, Carlisle, Lanarkshire.*—Your columns contain so much information connected with the habits of Bees that I feel induced to ask whether you, or any of your Correspondents versed in this subject, have ever observed any wide diversity in the temper and disposition of these little animals. I put the question, being quite a novice myself, because my gardener has several times remarked how spiteful the Bees were in my hives, compared with others which he had met with, adding not long ago an assurance that we had got a swarm which did not proceed from our own Bees, because they were so much better tempered. The fact of a swarm from the hive of one of my neighbours having settled and been hived in my garden close to the other Bees, I believe to be placed almost beyond doubt; but I own I was somewhat incredulous as to the alleged diversity of temper, so perceptible to others. Painful experience, however, stepped in, to shake my doubts, and perhaps punish my former scepticism, for while conversing with my gardener on the very subject, and standing quietly at a distance of at least half-a-dozen yards from the hives, I was furiously attacked and stung by one of the Bees, and nothing but a hasty retreat saved me from undergoing the same treatment from others of the hive, who came buzzing around me. If this difference of temper be a common phenomenon among Bees, it is a most important point to attend to in the selection and propagation of a stock, to see that they are of a kindly disposition, and not like the poets, a "genus irritabile."—*Omicron.*

Cats.—I witnessed an unusual sight a few days since in my garden. A favourite cat of mine was playing with what I took to be a mouse; but on a closer inspection, proved to be a Cockchafer, and after amusing himself with it for some little time, he devoured the whole of it.—*A Subscriber.*

Wrens.—The principal point of discussion seems to be the nature and use of the "cocks" or "bachelors" nests, as they are familiarly termed. I have examined many, and can discover little or no difference in the external appearance, except, perhaps, a little coarser workmanship, the material being the same both in those destined to receive the young family and those which are not. But look at the interior, and all similitude vanishes; not one particle of anything approaching to the nature of a lining can be observed in the "cocks' nests," being formed of the same materials throughout—moss and the finer portions of the dry fronds of the common Fern, if the nest be in a bush or affixed to the trunk of a tree; and if in the eaves of an outhouse or haystack—straw, hay, or a similar material, corresponding as much as possible both in colour and substance with the locality in which the nest is placed, with the view, I should suppose, of avoiding detection as much as possible. With reference to the uses of the "cocks' nests," I should think, as they are generally built in more exposed situations than the others, their only object is to draw attention from the real habitation. The same peculiarity is observable in the habits of the Squirrel; for every nest or "trail" as they are sometimes called in which young are deposited, you will find them answering pretty much to the nature of the "cocks' nests" of the Wren, the form of the nest, except when built in the hollow of a tree, being precisely the same, and probably built with the same view. Now, the nest in which the eggs of the Wren are deposited contains a very thick lining of hair, feathers, down, &c., leaving only sufficient room for the mother and her tiny offspring, and rarely during the time the eggs are being deposited do the old birds enter without carrying something to add to the warmth of the interior, so that they can hardly be said to finish building till the whole of the eggs are deposited.—*Tyro.*

Botanical Destruction.—It appears to me that those

persons who call themselves British Botanists might with great propriety be divided into two classes: Radical Botanists, who root up every rare or fine plant they come near; and Conservative Botanists, who are content to leave plants as they find them, after having provided pretty liberally for themselves. Unfortunately, however, the first class is by far the more numerous, and the consequence of their excessive fondness of plants is, that many of the less common species, especially of Orchidaceæ, are in a fair way for being rooted out from the face of the earth. This, by the way, is a somewhat Irish method of showing one's love of flowers. An Irishman "meets with a friend, and for love knocks him down." A Radical botanist meets with a flower he admires, and for love roots it up. I am told that some of the members of the Botanical Society of London exhibit this destructive propensity in a remarkable degree, and one wholesale collector has been named to me, who transmits specimens by the hundred. Now, if these over-keen investigators would inflict their science upon Dandelions, Docks, and Thistles, no harm would result from their enthusiasm; but when one sees them doing violence to the fair face of Nature, by ruthlessly destroying her loveliest and rarest productions, it is high time to cry out. A word from you would perhaps show these mistaken persons "the error of their ways," and would greatly gratify *A Nettle*. [It is certainly too bad, but it passes our skill to drive greediness out of the world.]

Fastolf Raspberry.—We have received, from Messrs. Youell, of Great Yarmouth, fruit of the Fastolf Raspberry, and we find that it merits all that has been stated in favour of its excellence. The fruit received is very large, obtusely conical, and of rich flavour, far exceeding in this respect some other new and large varieties. The plants bear abundantly, and in long succession.

Strawberries.—In answer to a correspondent at p. 644, respecting the cultivation of Strawberries, you say that mowing off the leaves is the worst of all practices, and cannot be too much condemned. I beg to state that this remark is contrary to my experience. Four or five years ago I should have agreed with you, but since that time I have adopted the following system of cultivating this valuable fruit, viz., to mow off all the leaves as soon as the fruit is gathered, and to give the bed a good coat of rotten manure, so that after it is dressed over it appears nearly all covered. I began this plan upon a two-year old bed, and I find by this way of treatment that the old stools are nearly all cut off, which I consider to be an advantage, as I never take off any of the runners, but let them all remain on the bed. I find, by destroying the old stools in this way, that it gives full vigour to the new runners, and that my beds, by this plan, produce threefold what they did before. I have not selected any one sort in particular, but have practised it upon the six different sorts which I cultivate. My soil is generally of a light texture.—*D. Z.* [Our correspondent will, no doubt, get better Strawberries by mowing off his leaves and adding dung, than by mowing off his leaves and using no dung. But it would be better still if he left his leaves to grow during the autumn, and added his manure in October or November.]

HORTICULTURAL SOCIETY.

List of Prizes.—In the award of the judges at the exhibition of the 12th inst. given at p. 473, it is stated that a Silver Knight medal was awarded "to Messrs. Smith, of Dalston" for 12 varieties of Fuchsia, instead of "to Messrs. Smith, of Hackney."

ROYAL BOTANIC SOCIETY OF LONDON.

July 19.—The third and last exhibition for the season was held in the Inner Circle, Regent's-park. The morning was all that could be wished; but towards noon the sky became clouded, and soon after the gates were opened for the admission of visitors the rain poured in torrents. This, however, was only of short duration, and the remainder of the afternoon, although threatening, continued favourable. Many of the specimens exhibited were present at Chiswick on the 12th inst.; we shall, therefore, as usual, briefly notice the most remarkable of those which were not at that exhibition. Among the collections of plants that of Mr. Barnes, gr. to G. Norman, Esq., Bromley, stood first, and contained some excellent specimens, comprising a beautiful little plant of *Rondeletia speciosa*; *Polygala cordifolia*, trained to a wire trellis, and exhibiting one unbroken mass of bloom; *Achimenes longiflora*, in a state of great luxuriance; *Elichrysum humile*, loaded with flowers, which, on account of the dullness of the weather, did not expand; *Boronia viminea* and *denticulata*, in remarkably fine condition and neatly trained to hemispherical wire trellises; *Ixora coccinea* and *crocata*, dwarf and well bloomed; and very healthy specimens of *Elichrysum prostratum*, *Erica Juliana*, *translucens*, and *eximia*. Mr. Green's collection contained a most perfect specimen of *Erica viridiflora*, completely enveloped in its singular drooping green flowers; *E. Shannoni*, in equally good condition; *Gompholobium polymorphum*, trained to a circular trellis and blooming freely; a fine plant of *Aschynanthus parviflorus*, not fully in flower; a strong specimen of the singular *Nematanthus longipes*, with dark-red flowers hanging on long, drooping peduncles; and *Achimenes pedunculata*, in excellent health, but injured by the carriage. In Mr. Pawley's collection were well-cultivated specimens of *Ixora coccinea*, *Erythrina crista-galli*, with a good spike of flowers; a fine plant of *Mahernia incisa*, and a fair specimen of *Erica ampullacea*. A good collection was supplied by Mr. Hunt, gr. to Miss Traill, of Hayes; this comprised two magnificent plants of *Boronia serrulata*, trained to hemispherical trellises; *Cattleya Mossii*, blooming well; *Crœva saligna*, particularly fine; *Polygala oppositifolia*, exceedingly handsome; *Euphorbia Bronnii*, in a state of great luxuriance; *Rondeletia speciosa*, very large; and *Elichrysum prostratum*, producing its bright star-like flowers in profusion. From Mr. Clarke, gr. to M. T. Smith, Esq., of Shirley Park, were a lovely plant of *Roelia ciliata*; *Erica tricolor*, small, but well grown; *Leschenaultia biloba*, in good health, but not fully in flower, and a very large plant of *Fuchsia corymbiflora*. Mr. Frazier, nurseryman, Lea-bridge-road, exhibited *Pergularia odoratisima*, in great perfection; a robust plant of *Swaïnsonia galegifolia*; the charming *Erica cubica*, loaded with drooping little bells; a fine specimen of *Mahernia pinnata*, with *Vinca rosea* and *alba*, in admirable condition. Among the plants supplied by Mr. May, gr. to E. Goodheart, Esq., of Beckenham, were *Gardœquia Hookeri*, exceedingly well grown; *Polygala oppositifolia*, blooming to the margin of the pot; *Erica Juliana*, with a good head of bloom, but naked below; *E. metulæflora* bicolor, a picture of health; *E. eximia*, perfect as a plant, but with the blooms slightly on the decline. Mr. Jackson, of Kingston, exhibited a magnificent

specimen of *Erica jasminiflora* alba, *Calceolaria Willmoreana*; prettily spotted after the manner of *Standishii*, with good plants of *Státice sinuata*, *Gardœquia Hookeri*, *Sóllya linearis*, and *Hibiscus Cameroni*. Amongst Stove and Greenhouse Climbers were *Philbérta grandiflora*, blooming profusely; *Hoya carnosa*, tolerably good; a gigantic plant of *Ceropégia elegans*, and a large specimen, with few flowers upon it, of *Manettia bicolor*, from Mr. Clarke, gr. to M. T. Smith, Esq.; and from Mr. Pawley, of Bromley, a vigorous plant of *Stephanotis floribunda*, and a small but healthy specimen of *Gompholobium polymorphum*. A large collection of Scarlet Pelargoniums was sent by Mr. Baile, of Hammersmith, for which an extra prize was awarded. The Heaths were singularly fine, particularly those from Mr. Hunt, gr. to Miss Traill, Mr. Barnes, gr. to G. Norman, Esq., and Mr. May, gr. to E. Goodheart, Esq.; in the collection of the former were *Erica tricolor* elegans, in the highest state of perfection, *Massoni*, gemmifera, and *eximia*, scarcely less beautiful; with a fine variety of princeps, and a handsome little plant of *E. Savilleana*. The collection of the latter exhibitor contained a surpassingly beautiful specimen of *E. metulæflora* bicolor; the highly brilliant *E. Parmentieri* rosea; *Savilleana*, densely clothed with flowers; and *ampullacea*, extremely handsome. Mr. Barnes exhibited *E. depressa*, in fine condition; *Massoni*, excellent, but with a few withered blooms; and well-cultivated specimens of *E. Bowieana*, *ampullacea*, *splendens*, and *viridiflora*. Mr. Jackson's collection was good, but consisted principally of the plants exhibited at Chiswick. We must not pass over a splendid plant of *E. tricolor* superba, from Mr. Brazier, gr. to W. H. Storey, Esq., of Isleworth. This was certainly one of the finest in the exhibition. Heaths were also shown by Mr. Fairbairn, of Clapham, Mr. Wilson, of the same place, and Mr. Dawson, of Brixton-hill. The Orchidaceous plants were good, the principal exhibitors being Mr. Mylam, gr. to S. Rucker, Esq., Wandsworth; and Mr. Barnes. The collection of the former comprised *Cymbidium pendulum*, with a raceme of flowers 2½ ft. long; the delicately white *Burlingtônia candida*, growing vigorously on a block of wood; the lovely *Barkéria spectabilis*; the singular *Coryanthes macrantha*; *Stanhœpa grandiflora*, with two dull white flowers, which quite perfumed the surrounding air; and the curious *Angreum caudatum*, with the blooms scarcely expanded. *Oncidium lanceanum*, in healthy condition; *O. altissimum*, very vigorous; a remarkably strong plant of *Gongora maculata*; *Acropera Loddigesii*, bearing numerous drooping racemes of its singular flowers; with *Catasetum lûridum* and *Maxillaria tetragona*, were contributed by Mr. Barnes. F. G. Cox, Esq., of Stockwell, exhibited a pretty specimen of *Oncidium bifolium*, with *Cynoches chlorochilum*, and *Cattleya Harrisoniæ*. *Miltônia spectabilis*, exhibited by Mr. Mylam, as a single specimen, was exquisitely beautiful. Mr. Henderson, of Pineapple-place, sent (not for competition) an exceedingly fine *Stanhœpa oculata*, the lovely *Maxillaria Steelii*, the richly-marked *Oncidium lanceanum*, two plants of *Achimenes grandiflora*, a species of *Hibiscus*, said to be new; *Costus nepalensis*, finely in bloom; and several other plants. Mr. Mountjoy, of Ealing, exhibited a well-bloomed collection of *Lilium eximium*; and Mr. Pearson, of Hampstead-road, some fine seedling *Petunias*. Among the specimen plants most noticeable were *Erica ampullacea*, blooming profusely, from Mr. Dawson, of Brixton-hill. *Ixora coccinea*, 3 ft. high, from Mr. Barnes; *Ceropégia elegans*, covering a flat trellis 4 ft. in diameter, from Mr. Colville, gr. at Ditton House; from Mr. May, a very healthy plant of *Erica aristata* major, not in bloom; from Mr. Dawson, of Brixton-hill, a well-bloomed specimen of the chaste *Erica infundibuliformis*; from Mr. Pamplin, of Walthamstow, a white variety of the Chinese Larkspur; from Messrs. Henderson, a good plant of *Besleria pulchella*; *Achimenes multiflora* from Mr. Glendinning, of Turnham Green; a pretty seedling *Gloxinia*, with flesh-coloured flowers, and *Achimenes grandiflora*, from Mr. Mountjoy, of Ealing; *Erythrina crista-galli*, very handsome, with seven spikes of flowers, and *Plumbago capensis*, neatly tied down to a hemispherical trellis, from Mr. Catleugh, of Hans-place. Flowers of the noble *Beaumontia grandiflora* were shown, but by whom we could not ascertain. Two collections of *Statice* were exhibited, one by Mr. Jackson, of Kingston; the other by Mr. Wood, of Norwood. In that of the former was a pretty species, named *S. pseudo-arméria*, with rose-coloured flowers.

The Roses were particularly fine, especially the cut blooms sent by Messrs. Lane and Son; in this collection there were choice flowers of *Ville de Bruxelles*, *Madame Hardy*, and *Phœbus*—*Dumask*; *Boula de Nanteuil*, *Richehen*, *Beauty of Billard*, *Madame Pisaroni*, *Prince Albert*, *Chênédole*, *Richelieu* (Duval), and *La Grandeur*.—*Hybrid China*; *Bourbon Coquette* de Montmorency, *La Calaisienne*, *Cynthia*, *Fanny Perisot*, *Beranger*, and *Duc de Trevis*.—*Gallia*; *General Allard*, *William Jesse*, and *Madame Laffay*.—*Hybrid Perpetual*: *Duchesse d'Angoulême*, *Adèle Provost*, and *Melanie Walder*.—*Hybrid Provence*; *La Seduisante* particularly beautiful; *Achille*, *Princesse de Lamballe*, and *Queen of Denmark*.—*Alba*; with *Reine de Provence*, *Illustré Beauté*, and *La Vestale*.—*Provence*. Good collections were also exhibited by Messrs. Paul, of Cheshunt; Mr. Hooker, of Brenchley; A. Rowland, Esq., and Mr. Betteridge, of Milton Hill. Moss Roses were shown in collections by Messrs. Lane and Messrs. Paul. Roses in pots were also exhibited in good condition, by Messrs. Lane, to whom an extra prize was awarded; as well as by A. Rowland, Esq., and Messrs. Paul. Very fine collections of *Verbenas* were sent by Mr. Catleugh and Mr. Turner, of Maid Vale; and numerous *Melocacti* by Messrs. Hoffman, 6, Hanover Terrace, Regent's Park.

The Pelargoniums contributed greatly to the gaiety of the exhibition. A superb collection was sent by Mr. Cock, of Chiswick, which consisted of 12 large and 8 smaller plants, comprising *Rhoda*, *Evelyn*, *Evadne*, *Master Humphrey*, *Flash*, *Queen of the Fairies*, *Grand Monarch*, *Prince of Waterloo*, *Flamingo*, *Witch*, *Hebe*, *Erectum*, and *Sapphire*, *Gipsy*, *Unit*, *Erectum*, *Emma*, *Laura*, *Queen of the Faints*, and *Madame Taglioni* (Catleugh's). Another collection, not for competition, came from Mr. Staines, Middlesex-place, New Road; this collection consisted of 24 Pelargoniums, grown in pots of 24 to the cast; they were remarkable for their health, dwarf growth, and the fine development of the flowers, and might be regarded as specimens of this style of growth—the sorts were as follows: *Beauty*, *Glory of the West*, *Exquisite*, *Ivanhoe*, *Erectum*, *Enchantress*, *Cyrus*, *Vanguard*, *Comte de Paris*, *Camilla*, *Gipsy*, *Priony Queen*, *Superb*, *Rhoda*, *Rising Sun*, *Grand Monarch*, *Enchantress*, *Jewess*, *Madeleine*, *Jubilee*, *Fair Maid of Devon*, *Flamingo*, *Consort*, *Rienzi*; the flowers were large, in fine colour, and the plants covered with handsome trusses; the tops of the pots were not to be seen in any of these plants, being covered with stiff healthy foliage. In collections of 6 varieties in pots of 24 to the cast, the only exhibitor in the Amateurs' Class was Mr. Staines, these consisted of 6 specimens selected from his stock for their bloom, with which they were literally covered—the sorts were, *Enchantress*, *Gorhambury*, *Gipsy*, *Priony King*, *Assassin*, and *Bridesmaid*. In the Nursery-men's Class, Mr. Gaines and Mr. Catleugh doubled their quantity, and each supplied 12 plants—the latter grower received the first prize for Nestor, *Angelica*, *Luna*, *Madame Taglioni*, *Celeste*, *Fair Maid of Devon*, *Marcella*, *Mrs. Stirling*, *Sir R. Peel*, *Symmetry*, *Rosetta* Superb, and *Eclipse*. Mr. Gaines's plants were; *Pilot*, *Hermione*, *Madeleine*, *Glory of Jersey*, *Rising Sun*, *Lady Sale*, *Beauty Supreme*, *Douglas*, *Coronation*, and *Morea*. In Collections of 6 varieties in 12 sized pots, the only exhibitors were Mr. Catleugh and Mr. Gaines, who in this class also doubled the quantity, each exhibiting 12 plants. The first prize was awarded to Mr. Catleugh; his collection was equally and very finely grown—there appeared the *Witch*, *Duenna*, *Master Humphrey*, *Lord Mayor*, *Evadne*, *Enchantress*, *Selina*, *Priony Queen*, *Mrs. Stirling*, *Erectum*, *Queen of the Fairies*, and *Nestor*. Mr. Gaines had *Erectum*, *Grand Monarch*, *Mabel*, *Firebrand*, *Black-eyed Susan*, *Matilda*, *Lady J. Douglas*, *Gem of the West*, *Exquisite*, *Coronation*, *Victory*, and *Nymph*. Mr. Gaines showed the only

collection of *Calceolarias*: they were shrubby, consisting of *The Rising Sun*, *Bride*, *Magniflora grandiflora*, *Taglioni*, *Attila*, and *Matchless superb*.

Although the number of Fuchsias was considerable, there was nothing very novel, with the exception of one named *Vesta*, from Mr. Smith, of Dalston; this is a handsome full-sized flower, with flesh-coloured sepals and deep crimson petals. The remainder exhibited a great sameness; the best amongst them being one from Mr. Betteridge, of Milton-hill, Abingdon, Herts., called *Great Western*, a flower of great length, with dark vermilion sepals and crimson petals; and *F. globosa splendens*, very large, but wanting in richness of colour, from F. G. Cox, Esq. Two seedlings were sent by J. Wells, Esq., jun., of Bromley, but they are too much in the style of our old varieties. Some prettily spotted varieties of *Digitalis* came from Mr. Cooper, Paragon Nursery, Brixton-hill.

In Carnations the first prize was awarded to Mr. Norman, for *Prince Albert*, Jones's Brilliant, 47, Count Paulina, Calcutt's Queen Victoria, Martin's Vanguard, Mix's Lady Chetwynd, Flora's Garland, Hogg's Epaminondas, Ely's Lady Gardner, Barnard's Duke of Roxburg, Ely's Earl of Beauty of Woodhouse, Fletcher's Duke of Devonshire, Wood's William IV., Wildman's Buonaparte, Seedling, Knot's Alfred the Great, Marquis of Chandos, Brutus, Ely's Colonel Wainman, Wood's Rosabella, Ely's Mrs. Brand. The second prize was given to Mr. Ward, of Woolwich; his stand consisted of Ely's Duke of Bedford, Wilson's Harriet, Count Paulina, Strong's King, Mansley's Beauty of Woodhouse, Franklin's Dr. Franklin, Cartwright's Rainbow, Wilson's William, Poxley's Prince Albert, Smith's Duke of Wellington, Mansley's Bonny Bess, Willmer's Solander, Addenbroke's Lydia, Puxley's Queen, Smith's Marquis of Chandos, French's Duke of Kent, Ely's Lady Ely, Hall's Prince Albert, 84, Queen of Sheba, Dalton's Lancashire Lass, Willmer's Conquering Hero, and Beauty of Bradley. The third prize was awarded to Mr. Willmer, for Smith's Duke of Wellington, Tally-ho, Martin's High Sheriff, Ely's Mango, Eason's Eclipse, Stud's Alfred the Great, Wild's Standard, Jaque's Georgiana, Hall's Prince Albert, Wood's William IV., Toon's Princess Victoria, Ely's Regulus, Bate's Sir J. Plaston, Wilson's Harriet, Seedling, Ely's Duke of Bedford, Snook's Defiance, Willmer's Duchess of Kent, Eason's Elizabeth, Hepworth's Leader, Lady of the Lake, Parker's Sophia, Maud's Rowton, Willmer's Endymion.

For Picotees, Mr. Ward, of Woolwich, received the first prize for Giddens's Diana, Crask's Queen Victoria, Sharp's Hector, Martin's Union, Lady Chesterfield, Willmer's Miss Browning, Nulli Secundus, Cousins's Seedling, Willmer's Queen, Sharp's Criterion, Wilson's Fanny Irby, Wain's Queen Victoria, Bunkler's Hope, Dickson's Trip to Cambridge, Wood's Alicia, Lady Flora, Garrat's Lady Dacre, Sharp's Duke of Wellington, Miss Willoughby, Lad's St. Maur, Giddens's Teaser, Wood's Agrippina, Kirtland's Princess Augusta, Giddens's Vespasian. 2d prize, Mr. Norman, of Woolwich, for Giddens's Beauty of Hemmingsford, Seedling, Queen of Violets, Duke of Cambridge, Miss Browning, Stanton's Seedling, Crask's Queen Victoria, Giddens's Diana, Lady Chesterfield, Mrs. Brown, Nottingham Hero, Criterion, Gem, Agrippina, John's Prince Albert, Sykes' Eliza, Belle of the Village, Harlequin, Luff's Seedling, Lady Dacre, 60, Giddens's Diana and Vespasian. 3d prize to Mr. Willmer, King's Road, Chelsea, for Giddens's Susan, Isabella, Giddens's Duchess of Kent, Sharp's Hector, Stella, Giddens's Lovely Ann, Willmer's Queen Victoria, Moonraker, Giddens's Bleda, Crask's Queen Victoria, Fair Maid of Perth, Wood's Lady Hussey, Soon's Prince Albert, Jenny Jones, Lady Wynford, Wilson's Pluperfect, Wain's Victoria, Annesley's Plenipo, Foden's Matilda, Wood's Lord Hitchenbrook, Willmer's Charon, Agnes, and 35, and Sharp's Cocked Hat.

SEEDLINGS.—There were but few Seedling Pelargoniums exhibited, and one only selected for a prize; this was *Pamplin's Lord Nelson*, a variety very much in the way of the Queen of the Fairies; the flower expands more freely, but the top petals are not so bright. Seedling Fuchsias from Mr. Smith, of Dalston, of which reflexa and expansa were selected for prizes, the former variety having large flowers with the sepals turning up, and exposing the whole of the corolla, which is of a rosy purple; the latter variety has smaller and shorter flowers, with the sepals standing out horizontally; the corolla is large, and expansa also, of a rosy purple colour. Another variety named *coccinea vera*, a slight improvement upon *Cormackii*, was also recommended for a prize. A seedling *Verbena*, named *excelsa*, having very large and deep rose-coloured flowers, was also selected for a prize.

An interesting collection of British Ferns was shown by Mr. Wood, of Norwood. Dried specimens of the native Ferns of Madeira, neatly arranged, were exhibited by H. Webb, Esq., of Clapham, who also contributed an extensive assortment of Agricultural Grasses. Collections of the latter were also sent by Mr. T. Moore, Mr. Coates, of Norwood, and Mr. Turner, of Portland Town.

ROYAL AGRICULTURAL SOCIETY'S MEETING AT DERBY.

We make the following extracts from speeches reported in the *Derbyshire Chronicle* to have been given at the dinners on the late great occasion, as conveying the sentiments of important persons upon important subjects relating to Agriculture:

"The Duke of Devonshire said—In his opinion, such a Society was not only useful and calculated to produce the most beneficial results, but an honour to the country which originated it. It would advance the knowledge of science, and in dispelling ignorance and self-conceit, it had a tendency to unite all classes in harmony and good will towards each other. It enabled the man with little wealth, who may have an ardent desire for improvement, to contend with those in more affluent circumstances, and conduces to the mutual advantage of all. From the principles it inculcates the labourer will learn to set a proper value on industry and sobriety, and will have opened before him a career of usefulness in the condition of life in which it is his lot to be placed. He knew of no means so certain to increase the prosperity of Agricultural labourers, while at the same time it would conduce in an equal degree to the interests of those they serve.

"The Duke of Richmond congratulated the Society on the splendid show of implements, and upon the prosperity of this great Association. So long as the Society was supported by men of science and practical farmers, they might rely on its increasing in importance and usefulness yearly. Ingratitude could never be charged against the farmers of England. He was persuaded that Agriculture and manufactures were connected by common interest, and that they could not be severed without detriment to both. He would venture to say that they ought all to feel indebted to the founders of the noble Society whose anniversary they had been that day celebrating; but he would venture also to say the Society never would have been formed had not the farmers of England established local societies and amongst themselves; these had connected them in friendly and social intercourse in the same honourable cause; and in doing so, had cemented that bond of union which now embraced the owners and occupiers of land throughout the whole country. He could assure them that to meet them on such occasions afforded him one of the greatest pleasures of his life, and in his conscience he believed these meetings to be of the greatest importance to the country at large. They had led to the reward of meritorious labourers, to whom the farmers had shown gratitude for long services, and their desire to better their condition. They had done more in leading to discussion and experiments advantageous to Agriculture, and they had removed much local prejudice that was a bar to improvement. He begged to propose a toast, and there was no man who called himself a farmer that would not respond to it, for it was their interest as well as their duty to promote the welfare of the class of men to whom he alluded—the labourers of England. When Agriculture prospered, the Agricultural labourer would also prosper. "The MARQUESS OF NORTHAMPTON said, the science of Agri-

* I have a silver coin of Vespasian, found in a hole excavated by sheep on the Worcestershire Beacon, where, perhaps, more lie still concealed.

Hill, near Pershore. The entire length of the hills, from north to south, rather exceeds nine miles; the breadth is variable, at the utmost scarcely exceeding a mile, and this only occurring at the gorge, where the Herefordshire Beacon boldly falls back to the westward, near Little Malvern.

"Three transverse and one lateral valley perforate the hills, and at these points the most craggy aspect of the chain might be expected to present itself; but this is scarcely the case, as the gradual slope of the hills even in these passes, from the friable nature of the rocks, prevents that stern rigidity of feature which would be evident with less disintegrating materials. The pass of the Ledbury road, however, between Little Malvern and 'the Winds' Point,' exhibits a fine view of the Herefordshire Beacon. Besides these valleys that break entirely through the chain, numerous ravines stretch up the sides of the hills, exposing many bare masses of rock, especially in what is called 'the Winding Valley,' between the Worcestershire Beacon and the North Hill, and the Stony Glen, between the North and End Hills. These are some of the best stations to find plants upon the hills. The only lateral valley between two parallel spurs of the chain occurs at the smaller camp, south of the Herefordshire Beacon, where the westernmost height, called Midsummer Hill, forms the highest ground of the fortification; the eastern height, which is included in the entrenchment, is called Holly-bush Hill. This is a good locality for cryptogamous plants."

The Muck Manual. By F. Falkner, Esq. Murray. 12mo.

Of all the subjects connected with Farming that of manure is beyond all comparison the most important next to draining, which is, indeed, in many cases, even second to it. As concerns Gardening, it is also the great field in which the most multiplied and varied experiments are required. We therefore hail with pleasure all practical, and most speculative, essays relating to it. It is for that reason that we have allowed it already to occupy so prominent a place in our columns, and that we have no intention whatever of letting the subject sleep. For the present, however, it is desirable to pause awhile, until the experiments of the season shall have been brought to a head; and as indicating the present views of observant persons this book of Mr. Falkner's will be found useful. It gives a succinct account of the manner in which animal and vegetable manures are best prepared, preserved, and applied; and of the action of the more common mineral and artificial manures now being so extensively employed. In addition to which, the introductory matter gives a brief sketch of the nature and properties of some of the chemical elements which give manure its value. The author very properly insists upon the paramount importance of home-made dung, in which we entirely agree with him, as we have repeatedly stated on former occasions; and although we cannot concur in all his views as to the means of rendering that great mine of wealth most productive—especially when (p. 127) he recommends that no dung should be allowed to ferment until a few weeks before it is put into the soil, and then only in a slight degree—yet the mere fact that the paramount value of home-made dung is strongly insisted upon is an excellent feature.

We have no space for a detailed criticism of this work, and shall therefore only quote a passage relating to the indiscriminate use of simple manures, to the good sense of which we would particularly direct the consideration of our agricultural readers.

"Without knowing of what his (the farmer's) plants are formed—that many different substances are required for their nourishment, and that the presence of all those substances is requisite to the fulfilment of the condition of their growth—he applies one substance only, an individual salt; and if it happens to be the very substance that was wanted to fulfil the conditions of fertility, he gets a crop. Encouraged by this success, the same salt is applied to another field, with the full confidence that it will produce a similar effect. In this instance, however, to the great surprise and disappointment of the farmer, it proves an entire failure. Induced by the success of the first application, other persons try the same salt, some with entire success, others with partial benefit; but the greater number generally without any perceptible advantage. Further experience of this kind plainly proves that there is no dependence to be placed upon this particular salt, and it is ultimately abandoned. Such has been the fate of several different salts in succession; and thus common salt, gypsum, carbonate of soda, nitrate of soda, and nitrate of potash, have each had their periods of favour and disrepute. A few successful experiments with a particular salt have led to an extensive application of it, and to consequent great loss and disappointment."

The American Agriculturist. New York. Wiley and Putnam.

This is an American periodical, occupied with Agricultural and Horticultural subjects. As far as we can judge from the Numbers before us, it appears to contain some useful information, although, of course, less important to England than to the United States, in consequence of the wide difference in their climate. It is illustrated with wood-cuts of Plants and Cattle, and is worth the having of those who wish to know what their brother farmers are about on the other side of the Atlantic.

CALENDAR OF OPERATIONS for the ensuing week.

The summer climbing Roses, such as Ayrshire, Boursault, Banksian, and many of the evergreen and multiflora divisions, are now fading off for the season, leaving blanks in the Rosary, and along the arcades and pillars of Roses, walls, banks, &c. which will not be filled up again in many places till next June. Twenty years ago this

would have been thought of little consequence; but in these days we are so accustomed to a rich display of autumnal Roses that from May to November the "Rosary" is expected to exhibit a perpetual succession of bloom. How to effect this is the object of my remarks this week. We cannot possibly do away with our beautiful summer garlands without losing the best feature of our flower-gardens; we must therefore endeavour to clothe our summer climbers by budding on them autumnal flowering Roses, using those only that are of a dwarfish, compact habit, so that they may not interfere with the free habits of their foster parents, so to speak. Hybrid Perpetuals and Chinas are best suited for this work, unless, indeed, your climbing Roses are against walls with favourable aspects, when you may employ the dwarf Bourbons and a few of the tea-scented kinds, instead of the Chinas. The prevailing tint in summer climbers is whitish, and as some of the sorts to be budded on them may be expected to flower occasionally at the same time with them, it may be as well to make use of higher-coloured varieties; but individual taste will determine this. A few whites would relieve the other colours in the autumn. Among the Chinas, perhaps the best whites for this purpose are Clara Sylvain and Infidélité de Lisette, to which you may add Camellia blanc, or any other white sort you may already possess. Among the higher colours in the section of Chinas there is great room for choice, but private gardeners can hardly be expected to know all the best sorts. Until you find a better list, take the following. Paris, Saint Pern, Cramoisi supérieure, Henry V., Baron de Laage, Camoens, Abbé Mioland, and Fabvier. All these are very fine, and as China Roses are not so particular about the kind of stock they are on as many of the Perpetuals, they had better be wrought on the Ayrshire Roses, while the hybrid Perpetuals should be budded on the Boursault and Banksian. The dwarf Bourbons should also be worked on the freer kinds, and being more tender than the Chinas and Perpetuals, should have the more favourable situations. Any one having a large Banksian Rose against a house or south wall, may easily establish a selection of Bourbon and Tea-scented Roses on it, and in hard winters these could be saved by covering them over with mats. None of the Tea and few of the dwarf Bourbons do well on their own roots in our climate. There are few good white Roses among the Bourbons; perhaps Julie à Joyne and Alcide are the two best of this colour, while there is no want of good sorts with rose, red, and crimson colours. Among the old Perpetuals the Crimson or La Perpetuelle is the best; and William Jesse is perhaps the best among the newest ones, but in this class the difficulty is to pick out a bad one; they are all good.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Besides the routine of watering and giving air, the chief attention must now be turned towards your fine succession plants; and those of them that are to fruit next May cannot now be too soon potted, taking the strongest and best-rooted plants for the first day's potting; the smaller plants will come in better by-and-by. Many good growers use disproportionately large pots for a few of their best plants at this time, and do not fill them quite up at first. Pines of all ages are potted deeper than other plants, as they root from the collar of the plant, near the surface; and whenever a new shift is given them they are kept more close for about three weeks, to induce them to throw out fresh roots in the new soil.

VINERY.—The houses that have now done bearing ought to have a good syringing morning and night, and to have the atmosphere kept rather moist about them, as long as the leaves are green; but they must not be kept close under this treatment, for fear of inducing another growth. The late Vineries, on the other hand, should be kept rather close at present; that is, give them air early in the morning, and shut them up between three and four o'clock in the afternoon, till all your berries are full swelled; then the natural heat of the season ought to be warm enough to colour them slowly, and if it is not you must use fires early in the autumn; but this is seldom wanted when they are properly managed.

PEACH-HOUSE.—Late houses now in bearing cannot have too much air given them in the daytime, but the lights should be well drawn up towards night, to prevent the night dews from affecting the fruit, as the Peach is sooner spoiled by damp than any other fruit we grow. The earliest house may have the lights down now day and night, but the season is too unfavourable to allow the glass to be entirely removed yet. Give the trees a good sprinkling all over the leaves every afternoon, but after this they do not require any water at the roots; indeed, if the autumn rains could be kept off the early Peach borders, it would be in favour of the trees, as, after this cold summer, if we should get a dripping, warm autumn it would induce another growth, which had better be reserved till next forcing time.

MELONS AND CUCUMBERS.—I do not hear much about the flavour of Melons being deficient this year, and my own plants, as well as all I have seen this season, appear in better health than is usual in the height of summer, from which we might infer that a slight shade in very hot clear weather is beneficial, as it certainly is natural to them. Our men have been turning the linings as regular all this summer as we do in spring; but whatever the season is, I believe a constant bottom-heat of about 90° is essential to the well-being of the Melon in all its stages. The only difficulty we have with those we grow on the "tank system," is to know how to dispose of their large crops. The ridged Cucumbers and Tomatoes ought to be kept very thin of shoots, and be well trained out; this season they need all the assistance you can give them.

Out-door Department.

In the Kitchen-garden there is less reason to complain this year than in the Flower-garden. Peas and Beans came up with enormous length of stalks, but there were immense crops upon them. Onions are a good crop in most places. Carrots, Beet, and the lighter crops look as well as one could wish, and the late rains have come in time for the late-planted Broccoli and Cauliflowers, &c. The succession crops are now mostly confined to salad plants, such as Endive, which should be planted out in succession once about every three weeks. Lettuces and small salads as usual; only as the Lettuces do not run to seed in autumn you may sow more of them now at a time than could be done for summer supply without waste.

CELERY.—This is a thirsty plant, and like the Asparagus, delights in the richest liquid manure after it has fairly begun to grow. Never put off earthing up the earlier rows too long; rather the other way—often and but little at a time—indeed, those who prefer earthing up their main crops in succession, instead of altogether at once, should also bear this in mind.

CABBAGES.—If your first sowing for the early spring supply is not yet in the ground, there is no time to spare;—what is nicer than a young early Cabbage?

PEAS.—If we should be scarce of rain give regular waterings to the two last sowings of these; it will enable them to carry good late serviceable crops.

ORCHARD.—The principal work here is to guard the crops from birds and insects, and to keep the trees clean and clear of superfluous shoots. As there is little chance of a crop of out-door Grapes this year, the bunches had better be cut off, except a few on the strongest branches, but do not neglect to train and regulate the Vines as usual.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Few stove-plants will require potting after this time, unless it be newly propagated ones, which must be hastened through their nursery stages with all possible speed. Any little plants that are difficult to preserve in winter should be kept rather dry from this time to harden their growth; and also, if practicable, cuttings of them should be put in. There are many plants that will stand over the winter if stunted in the cutting-pots, and placed near the glass on shelves, when the old plants can hardly be kept by the greatest care. Give more air and less water to stove-plants in general, after this time; this will harden them and prepare them for another long winter.

GREENHOUSE.—If you see well to the watering and staking of those plants in the open air, and that they are not too much crowded together, nor too much shaded by trees or buildings, it is all you can do for them; presuming that all your best specimens and delicate plants that are not in flower in the conservatory are luxuriating under the cool refreshing shelter of your cold pits, where not a leaf or bud is seen out of place, and where the slight sprinklings from the hand-

syringe in the evenings supply the place of the absent night dews, and the thin calico frames ward off the fierceness of the sun when he occasionally breaks forth in his strength.

FLOWER-GARDEN.—Since I wrote the last Calendar I have had another opportunity of seeing many of the public and private gardens round London. A provincial will always see and hear many things about the culture and propagation of plants, and the introduction of new ones to improve his knowledge when he goes to London; but flower-gardening is much better carried out in the provinces. The foolishness of discarding the finer annuals that flower from the middle of April to the end of June was never more apparent than in the London flower-gardens this season. I have in the middle of this month seen fancy-cut flower-beds on beautiful velvety turf, and large beds too, with one-half of the plants in them dead and the other half neither dead nor alive. There will be plenty of time, however, to discuss this subject hereafter. I will only remark at present that we must turn over a new leaf in propagating, storing, and planting, or sowing flower garden plants. This and the two preceding seasons have been unfavourable to flower-gardening in three different ways; these difficulties, with an extensive field of operations here, have suggested to me several plans which may be useful to others.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the Week ending July 20, 1843, as observed at the Horticultural Garden, Chiswick.

July.	BAROMETER.			THERMOMETER.			Wind.	Rain.
	Max.	Min.	Mean.	Max.	Min.	Mean.		
Friday 14	30.069	30.048	76	53	64.5		N.E.	
Saturday 15	30.117	30.048	77	56	66.5		S.W.	
Sunday 16	30.034	30.191	80	58	69.0		W.	
Monday 17	30.242	30.143	81	57	69.0		W.

The highest temperature during the above period occurred on the 24th, in 1835—thermometer 91°; and the lowest on the 27th in 1839, and 23d, 1842—thermometer 49°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending July 21, 1843.

The market has been well supplied with both fruit and vegetables during the past week. Pines are plentiful, and a trifle cheaper; amongst them are fair specimens of the Montserrat and Enville. Black Hamburg Grapes are excellent, and a few Muscats are offered. Peaches and Nectarines are remarkably fine, and still maintain a high price. Foreign Melons are abundant, but those of English growth continue scarce. Dessert Plums have made their appearance, at 2s. per punnet, and a considerable quantity has been imported from France. Cherries are plentiful and good. Strawberries and Raspberries continue very fine. Gooseberries and Currants are now thoroughly ripe, and are offered in great abundance. Kitchen-Apples are selling at 10s. per bushel. Cucumbers are plentiful, from 6d. to 3s. per brace. Cauliflowers of good quality are not scarce, and fetch from 1s. to 6s. per dozen. French Beans have become much more abundant, and sell from 4s. to 7s. per half-sieve. Turnips, owing to the wetness of the season, continue good. Excellent Carrots are selling from 3s. to 5s. per dozen bunches. Vegetable Marrows are becoming more plentiful, from 6d. to 1s. 6d. per dozen. Salading of every description is abundantly offered. Mushrooms fetch from 1s. to 2s. 6d. per pottle. Cut Flowers consist of Ceanothus azureus, Combretum purpureum, Epiphyllum Ackermannii, Hoya carnea, Crassula coccinea, Bignonia venusta, Gardenias, Sweet Peas, Ericas, Heliotrope, Roses, Pico-tees, &c.

PRICES, SATURDAY, July 22, 1843.—FRUITS:—

Pine Apple, per lb., 3s. to 6s.	Cherries, Wall, per lb., 1s. to 4s.
Grapes, hothouse, per lb., 2s. to 6s.	Apples, Kitchen, per bushel, 10s.
Peaches, per dozen, 12s. to 21s.	Oranges, per dozen, 1s. to 4s.
Nectarines, per dozen, 12s. to 21s.	— per 100, 10s. to 20s.
Melons, 2s. to 8s. each.	Lemons, per doz. 1s. to 2s.
Pump, per punnet, 2s.	— per 100, 5s. to 15s.
Strawberries, per pottle, 6d. to 1s. 6d.	Cucumbers, per brace, 6d. to 2s.
Gooseberries, p. hf. sv., 2s. 6d. to 5s.	Almonds, per peck, 6s.
Currants, per half-sieve, 2s. to 3s. 6d.	Sweet Almonds, per pound, 3s.
— Black, 2s. 6d. to 3s. 6d.	Nuts, per bushel —
— Red, for wine, 2s. to 2s. 6d.	— Brazil, 16s.
— for dessert, 3s. to 6s.	— Bracelona, 24s.
Raspberries, per gallon, 5d. to 8d.	— Cob, 12s.
Cherries, English, p. 12lbs., 1s. 6d. to 2s. 6d.	

VEGETABLES.

Cabbage-plants, per doz. bun., 1s. to 2s.	Spinach, per sieve, 1s. 8d. to 2s.
Cabbages, per doz., 4d. to 1s. 6d.	Leeks, per doz. bun., 3s. to 4s. 6d.
Cauliflowers, per dozen, 1s. to 6s.	Onions, Spring p. doz. bch., 1s. 6d. to 2s.
Beans, Kidney, per half-sieve, 4s. to 7s.	— Large, per doz. bch., 4s. to 6s.
— Windsor, per sieve, 1s. to 1s. 6d.	Garlic, per lb., 6d. to 8d.
Potatoes, old, per ton, 20s. to 40s.	Chillis, per 100, 1s.
— new, per cwt., 2s. to 3s. 6d.	Peas, per bushel, 1s. to 2s. 6d.
— per bushel, 1s. to 3s. 6d.	— per sack, 2s. to 5s.
— Kidney, p. bush., 2s. to 5s.	Lettuce, Cabb., p. score, 6d. to 1s.
— Scotch, per bush., 1s. to 1s. 6d.	— Cos, per score, 6d. to 1s. 6d.
Artichokes, green, per doz., 1s. to 4s.	Celery, p. bd., (12 to 15) 6d. to 1s. 6d.
Vegetable Marrows, per doz., 6d. to 1s. 6d.	Small "s" adz., per punnet, 2d. to 3d.
Turnips, per doz. bunches, 2s. to 5s.	Sweet Basil, per doz. bunch, 3s. to 4s.
Red Beet, per dozen, 9d. to 1s.	Watercress, per doz. am. bun., 4d. to 6d.
Horse Radish, per bundle, 1s. to 4s.	Parsley, per half sieve, 1s.
Radish, spring, p. doz. hands, 6d. to 1s.	Tarragon, per doz. bunches, 2s. to 3s.
— Turnip, p. doz. bunch, 1s. to 1s. 6d.	Fennel, per doz. bun., 2s. to 3s.
Carrots, Horn, p. doz. bunches, 3s. to 6s.	Mint, per doz. bunches, 1s. 6d. to 3s.
Shallots, per lb., 1s.	Marjoram, green, per bunch, 4d. to 6d.
— green, per bunch, 4d.	Mushrooms, per pottle, 1s. to 2s. 6d.

Notices to Correspondents.

ONE shilling will be given for No. 33 for 1842.

MANURES.—*W. Ward.*—Guano is the excrement of sea-fowl, and is imported from the coast of Peru. Its action is like that of pigeons' dung.

SOILS.—*Anonymous.*—The plan recommended for preparing leaf-mould in the last Number of "Paxton's Magazine of Botany" is, after the leaves have fallen, to collect them (those of the Oak and Beech being best), and use them first as a hotbed on which to raise Annuals, early Potatoes, &c., and afterwards to throw them into a heap, in any spare corner of the garden. By turning them over occasionally and drenching them with water whenever they get too dry, their decomposition will be accelerated. When they are in a pulverised state, the mould is fit for use. We will endeavour shortly to answer your other question.

GRASS-LAND.—*H. M.*—Add White Clover, Meadow Fescue, and crested Dogstail Grasses, if they are deficient already; if not, Poa trivialis will be useful, or, if you have very good hay-seeds from a field where there are no weeds, throw them on.

VINES.—*J. D.* informs us that he has two Vineries situated at the bottom of a deep descent sloping to the north, so that in wet weather the superfluous water drains down to the border; the consequence is, that upon all the Vines, the Black Prince excepted, the bunches of Grapes shank off as soon as the colouring process commences. Three years since a brick wall was

once, but the committee would proceed with its labours, and endeavour, as far as possible, to establish some general system which would meet with the approbation of the people of Ireland.

From France, we learn that the agitation in Ireland has excited a lively sympathy among the Republicans of Paris. At a meeting on the 14th inst. to celebrate the destruction of the Bastille, a subscription in behalf of Mr. O'Connell's Repeal Rent was set on foot, and M. Ledru-Rollin, a Member of the Chamber of Deputies, was commissioned to visit Ireland and assure the Repealers of the deep interest which the French democratic party take in their present struggle. On the other hand, M. Guizot, in the Chamber of Peers, has declared that France has no right to interfere, and that in the opinion of his Government there is nothing to be apprehended for the tranquillity of the United Kingdom.—The news from Spain is contradictory, although it apparently confirms the unfavourable reports in regard to the prospects and position of the Regent. Madrid is now besieged by the insurgents, and three armies, commanded by their generals, are simultaneously advancing to attack it. Meanwhile the Regent has quitted his former position by forced marches, and is either retiring on Cadiz, or endeavouring to effect a junction with General Van Halen, and then fall upon the insurgents under the walls of Madrid. For the details of these operations we must refer our readers to our Foreign article—premising, however, that all our intelligence is derived from the French telegraphs, and that, although appearances are extremely unfavourable to the Regent, his movements and policy are by no means known, even to his own adherents.

Home News.

COURT.—The Queen held a Privy Council on Saturday at Buckingham Palace, after which Her Majesty and Prince Albert, accompanied by the Prince of Wales and the Princesses, left town for Claremont, from which they returned on Monday. On Tuesday the Queen and Prince Albert took their accustomed walk in the gardens of Buckingham Palace, and in the morning of the same day, the Prince presided at a meeting at the office of the Duchy of Cornwall. On Wednesday the Prince left town for Bristol, by a special train on the Great Western Railway, and after witnessing the launch of the Great Britain steamship, returned to Buckingham Palace in the evening. On Thursday Her Majesty visited the Italian Opera in State, for the first time since her accession. It is announced that Her Majesty intends to give two State balls on the most ample and magnificent scale, the first of which will take place on Monday next, and the other towards the latter end of this month. Lady Portman has succeeded Viscountess Jocelyn as the Lady in Waiting on the Queen; and Lord Byron and Sir F. Stovin have succeeded Viscount Sydney and Captain Meynell as the Lord and Groom in Waiting on Her Majesty.—Their Royal Highnesses the Duke Ferdinand and Prince Augustus and Princess Clementina of Saxe Coburg Gotha landed at Southampton on Thursday evening, from Lisbon, and immediately proceeded by a special train on the South Western Railway, to Buckingham Palace, on a visit to Her Majesty.—The King of Hanover honoured the Baroness North with his company on Saturday at the public breakfast given by her ladyship at Putney. His Majesty afterwards went to his residence at Kew, and returned to town on Monday. In the evening the King honoured the Earl of Chesterfield with his company at dinner. His Majesty dined with Baron Brunow, the Russian Minister, on Tuesday, and with the Marquess of Abercorn, at Stanmore Priory, on Wednesday, returning to town on Thursday morning, to be present at Mrs. de Rothschild's public breakfast, at Gunnersbury Park. His Majesty afterwards went to Kew, and returned on Friday, to dine with the Earl of Mount Edgcombe.—Prince George of Cambridge will forthwith proceed to the Ionian Islands, and be stationed with his regiment at Corfu. His Royal Highness, it is expected, will remain abroad about 2 years.

Earl Grey.—The venerable peer during the last week has rapidly recovered from his late attack of indisposition. His strength has gradually returned, and on Monday he was sufficiently convalescent to take an airing in a carriage for a considerable time. Should his Lordship continue to improve satisfactorily, the family will shortly leave town for a short residence in Northumberland.

Parliamentary Movements.—Mr. Purvis, Q.C., is announced as a candidate for Durham, on the Conservative interest, and the Marquis of Blandford and Lord Seaham have also been mentioned as candidates on the same side. Mr. Bright, of the Anti-Corn-law League, it is said, will offer himself on the Free Trade interest. A vacancy has occurred in the representation of Ayrshire, by the accession of the Earl of Glasgow to the peerage. The names of Col. Macadam Cathcart, of Craigengillan, Colonel Mure, of Caldwell, Mr. Alex. Oswald, and Sir Charles Fergusson, have been mentioned on the Conservative side, and Mr. Rigby Wason on the Whig interest.

Naval Pensions.—The good-service pension of 200*l.* per annum, which has reverted to the Admiralty by the death of Rear-Admiral Sir James Hillyar, has been conferred on Rear-Admiral Sir Charles Bullen, who was captain of the *Britannia* at the battle of Trafalgar.

Church Preferment.—The Queen has been pleased to make the following presentations to livings in the Church of Scotland, void in consequence of the late secession of their respective ministers:—The Rev. David Strong to

the church and parish of Dailly, in the presbytery of Ayr, in the room of the Rev. William Chalmers; the Rev. John Wilson to the church and parish of Forgandenny, in the presbytery and county of Perth, in the room of the Rev. James Drummond; the Rev. David Thompson to the church and parish of Forgan, or St. Phillans, in the presbytery of St. Andrew's, Fife, in the room of the Rev. Charles Nairn; the Rev. Alexander Gardner to the charge and office of Second Minister of the church and parish of Brechin, in the presbytery of Brechin, Angus, in the room of the Rev. A. L. R. Foote; the Rev. Francis MacGill to the united churches and parishes of Larbert and Dunipace, in the presbytery and county of Stirling, in the room of the Rev. John Bonar; the Rev. Robert J. Johnstone to the church and parish of Dunblane, in the presbytery of Dunblane, Perth, in the room of the Rev. William M'Kenzie; the Rev. John Underwood to the church and parish of Kircudbright, in the room of the Rev. John M'Millan; the Rev. Henry Douglas to the church and parish of Kilsyth, in the presbytery of Glasgow, in the room of the Rev. William Burns; the Rev. John M'Donald to the church and parish of Comrie, in the presbytery of Auchterarder, Perth, in the room of the Rev. James Carment; the Rev. John Stewart to the church and parish of Liberton, in the presbytery and county of Edinburgh, in the room of the Rev. James Begg; the Rev. Philip J. Mackie to the church and parish of Elgin, in the presbytery of Elgin and county of Moray, in the room of the Rev. Alexander Topp; the Rev. William Thomson to the church and parish of Belhelvie, in the presbytery and county of Aberdeen, in the room of the late Dr. A. J. Forsyth; the Rev. Maitland Thomson to the united churches and parishes of Dupplin and Aberdalgie, in the presbytery and county of Perth, in the room of the Rev. C. C. Stewart; the Rev. John Gilchrist to the church and parish of Dunbog, in the presbytery of Cupar, Fife, in the room of the Rev. John Murray; the Rev. Lachlan MacLean to the church and parish of Kinfauns, in the presbytery and county of Perth, in the room of the Rev. James M'Laggan; and the Rev. Nathaniel Morren to the charge and office of First Minister of the church and parish of Brechin, in the presbytery of Brechin, Angus, in the room of the Rev. James M'Cosh.

Foreign.

FRANCE.—The Paris papers are filled with comments on the state of Ireland, which appears to create almost as great a sensation in the French capital as in London. The *National* gives a report of the toasts and speeches made at the banquet held in Paris to celebrate the destruction of the Bastille, as well as the sympathies for Ireland expressed as an episode of the banquet. Besides sixty republican electors of the capital, there were present sundry officers of the National Guard, magistrates of Paris, members of the Institute, and the principal writers of the Press, together with deputations from the republicans of Rouen and Orleans. Among the members of the Chamber of Deputies were MM. Arago, Carnot, Ledru-Rollin, de Courtais, Legendre, Viellard, Garnier-Pages, &c. In short, above one hundred persons sat down to table, M. Arago in the chair. The first toast was, "To the 14th July, 1789,"—"to the triumph of democracy in France and in Europe,"—and to "Our two Revolutions." The next was "To Ireland and France, the enemy of all oppressors." This was given by M. Ledru-Rollin, with a speech of which we can notice but the principal features. After summing up the woes of Ireland, he said that the republicans of another hemisphere had appealed to France in her behalf, and that their appeal must be re-echoed. "Let us, then," exclaimed M. Ledru-Rollin, "convey to our oppressed brethren the testimony of our ardent sympathies; let us convey to them the tribute of our labours; let a vast subscription be opened; let it be organized over the whole surface of France; let her pour into the Repeal coffers abundant succour, so long as it shall suit the great politician and powerful orator of Ireland to maintain her calm and on the defensive. But let, also, England know, the moment she shall attempt to prevail by violence over so many legitimate rights, that France has been able to supply nations in their decisive struggles with tried heads, resolute hearts, and valorous arms, and that the independence of the New World was proclaimed by private citizens and brave volunteers, who had sailed from her harbours at their own expense, long before her Government officially acknowledged it." This oration is said to have kindled universal sympathy; and after the toast of the French Canadians, "long victims, like the Irish, of English oppression," M. Marrast, a writer in the *National*, called upon the assembly to commission M. Ledru-Rollin to proceed to Ireland, and convey to the Repealers the assurance of the deep interest democratic France felt in their struggle. The proposal was assented to with universal applause, and M. Ledru-Rollin accepted the mission.—The Chamber of Peers sat on Monday, and discussed the budget of expenses for 1844. The debate derived much animation from various questions of the Marquess de Boissy and other members relative to Spain, Ireland, &c. M. Guizot, in reply, declared that the French Government had not in any manner interfered in the actual affairs of Spain, and that that which had been written from London, Madrid, and Paris on this subject was altogether false. With regard to Ireland, M. Guizot observed that, although he had no right to meddle with the occurrences in that country, he might reply that there was nothing to be apprehended for the tranquillity of the United Kingdom. He was confident that order would be everywhere restored. In the last fifteen years a great deal had been done for Ireland, and the present Cabinet, whilst combining conciliatory views

with firmness, would do all in its power in the interest of the unity of the British Empire.

SPAIN.—The unfavourable anticipations in our last in regard to the prospects and position of the Regent are apparently confirmed by the advices since received. Madrid, declared by the Ministry in a state of siege, is now besieged by an insurgent army. Gen. Aspiroz, after crossing the Guadarrama without difficulty, arrived on the 11th at Pardo, only two leagues from Madrid, and at the date of the last advices was on the mountains overlooking the capital, while his friends were doing their utmost to corrupt the civil authorities and National Guards, but hitherto in vain. The Cabinet, however, would seem disposed to negotiate, for it is affirmed that the Governor of Madrid repaired in person on the 12th to the head-quarters of General Aspiroz, in order to try to come to an understanding with him. Meanwhile, General Urbina was marching on the capital with the garrison of Badajoz, and is probably already co-operating with the former General. On the other hand, Gen. Narvaez was at Guadalajara on the 14th, and had incorporated with his army the two battalions and detachment of Cavalry sent against him from Saragossa, under the command of Colonel Ella. He has, moreover, been joined by forty officers, who had come to meet him from Saragossa. This defection had produced a deep sensation at Saragossa. The large forces which the Junta of Catalonia have just displayed, and the continual defection of the Regent's troops, the moment they are in presence of the insurrection, seem completely to paralyze the operations of Seoane and Zurbano. Narvaez is master of the high road from Saragossa to Madrid, and was expected to reach Madrid on the 15th by forced marches, and operate there in conjunction with Generals Aspiroz and Urbina. The Regent, who left Albaceta on the night of the 7th, with about four thousand men, was on the 10th at Val de Penas. All that can be concluded from that rapid march, through a difficult country, and after so long and so inexplicable an inaction, is, that the Regent now thinks only of securing himself a retreat towards Andalusia, and of reaching the Seville high-road, considering Gen. Van Halen as his last prop. That General, no doubt complying with the Regent's instructions, had taken great care to guard the Seville road, and had posted what remains of his troops on that grand line of communication. But the latest news announces that, having arrived by Carmona before Seville, he has sustained a check, the city having refused to open its gates to him, and resumed the direct road to Cadiz by Alcala de Guadaira, Utrera, and Xeres. His object is probably to effect his junction with General Carratala, who still holds out for Espartero at Cadiz. But by retreating towards Cadiz, Gen. Van Halen leaves Espartero completely isolated on the other side of the Sierra-Morena. General Concha arrived on the 2d at Malaga, where he was organising his army in order to cut off the retreat of the Regent and Van Halen. The central Junta of Catalonia, composed of two delegates from each province, installed itself on the 11th at Barcelona, and the Spanish frigate, *Cortes*, has declared itself at Algeiras. Public attention, for some days, will, of course, be fixed upon Madrid, and on the military operations which may be expected in its neighbourhood. The enemies of the Regent in the capital continue their calumnies even in his fall, and repeat the charge relative to the removal of the Queen, but the Government have formally denied that they have any intention to carry off her Majesty from the capital. During the stay of General Zurbano at Lerida, a horrible attempt on his life was made by an Italian named Luigi Pachierotti, well known as a Lieutenant of a free corps during the late civil war, and subsequently as one of the editors of the *Archivo Militar*. Three species of poison were found on him and on his servant; one was prussic acid, another corrosive sublimate, the third has not yet been analysed. The assassin had gained the General's confidence, and was admitted freely to his house, when he mixed poison with his *eau sucrée*, in the General's absence from the room. On Zurbano's return, he remarked a strange agitation in the manner of the Italian, which increased as he took up his glass. He could not keep his eyes off the draught and the drinker; but Zurbano was not going to drink it. He saw that the water was turbid, and the Italian powerfully excited. He took his keen eyes from the glass, and fixed them on those of Pachierotti. There needed no more, and Zurbano called to a sentinel at the door to enter and seize the confused and self-detected criminal. He boldly confessed all, and marched to death with a courage worthy of a better cause. At the place of execution, when the act of military condemnation was read, and the act specified—"for the guilty attempt to poison the General Zurbano"—the Italian added, "and the other also" (meaning Seoane), then threw away the chair they gave him to sit upon, and received the fire of the platoon in his back, standing firmly!

PORTUGAL.—Letters from Lisbon of the 10th inst. state that the affairs of Spain are still watched with anxious interest by the democratic party in Lisbon. Little doubt is entertained that the fortunes of Portugal will follow, in a great measure, those of Spain, and that in the event of the Regent succumbing, an immediate change may be expected here. Every telegraphic announcement—every movement indicating success to the disaffected party—is caught up in a moment with avidity by the press, and brought to bear accordingly. The arrival of the British packet also with news from Ireland is hailed with the greatest interest, and invective of every kind is launched against England, which is described by the Lisbon papers as about to receive its long-merited chastisement. They hail Mr. O'Connell as "the lightning that is to blight the oak." They call England the "despot of the world,"

the "island tyrant," and rejoice that she is to go down at last to oblivion; while Mr. O'Connell is already designated by them "Lord of the Isles."

GERMANY.—By letters of the 7th inst., from Vienna, we learn that Count de Bombelles, the Austrian minister to the Swiss Confederation, died that morning in the capital, where he had been for some time on leave of absence. The Hungarian Diet has voted the usual address in reply to the speech of the Emperor on opening the session. The address contains one remarkable passage. It calls the attention of the Imperial Government to the undue and extraordinary influence which Russia has acquired of late years in the provinces bordering on the Danube, and it prays the Government to take measures to counteract it. They have also passed a law excluding Latin altogether, as a language to be used in public deliberations; and have brought in a motion to request the Emperor to make a law "that all members of the Imperial family learn and speak the Hungarian idiom." It is stated that a negotiation is about to be opened between the Austrian and French Governments relative to a new arrangement of the postage between the two States, and particularly for putting an end to the necessity of prepaying letters.

RUSSIA.—Letters from Konigsberg announce that the elders of the Jewish community in that city have lately sent an address to the Emperor, in which they request him to revoke the ukase of the 2d May, by which the Jews who live on the frontiers of Russia and Austria are ordered to remove to the interior of the empire.

GREECE.—Accounts from Athens, in the German papers, state that the Greek Government has requested the protecting powers to pay the dividends on the Greek loan up to the 1st March, 1844; but that the Ambassadors have replied that the Greek Government must provide the means of meeting even the dividend due on the 1st September next. It is added that Messrs. Tricoupi and Colletti, the Greek Ambassadors at London and Paris, have been recalled. M. Tricoupi will, it is said, be Foreign Minister, and M. Colletti Minister of the Interior.

TURKEY.—The Levant Mail has arrived, but the details it brings add little to the intelligence already known to our readers. It appears that after the election of Prince Alexander, Baron Lieven had the good sense to sympathise with public opinion, and thus rendered himself so much beloved that he is spoken of in terms of enthusiasm; and he it may be asserted, without fear of contradiction, that he is the most popular man in Servia. The change in the policy of Russia is considered as surprising, but at the same time it has converted all opinions to the interest of the Russian Government.

UNITED STATES AND CANADA.—New York papers to the 27th ult. have been received by the packet-ship Garrick, which arrived at Liverpool on Tuesday. Mr. Legare, the Attorney-General of the United States, who had accompanied the President on his tour, died at Boston on the 20th ult., after an illness of three days. The funeral was attended by the President and the members of his Cabinet, the authorities of Boston, and crowds of citizens. The President, owing to indisposition and the sudden death of Mr. Legare, had stopped in the course of his tour, and returned to Washington. Mrs. Catherine Cochrane, alias Gilmour, charged with having murdered her husband at Paisley, had been arrested at New York, where she had arrived in a vessel from Liverpool, by a Scotch police officer, who had arrived by the Columbia steamer. Having been brought up at the police-office, a plea of insanity was set up on her behalf, and she was not to be delivered to the Scotch officer until the Court should decide the point. This is the first arrest under the new treaty. The Canadian papers brought by the Garrick are to the 25th. The village of Boucherville, one of the most beautiful on the banks of the St. Lawrence, had been totally destroyed by fire; 52 houses, besides other buildings, had been burnt. The church, convent, school-room, and all the principal stores had been destroyed. A verdict of "justifiable homicide" had been returned by the coroner's inquest held on the bodies of the five men shot in suppressing the riots among the labourers at the Beauharnois Canal. The presence of the military had prevented a renewal of the disturbances. The Oxford Packet arrived in this port on Thursday, after a passage of nineteen days. The Great Western reached New York on the 1st inst. Much anxiety has prevailed, both in Liverpool and London, in consequence of the non-arrival of the Columbia in steamer from Halifax and Boston, which has now been due a week; but a vessel arrived on Thursday, which reports that on the 4th she saw the Columbia on the rocks close to Seal Island; there were plenty of fishing-boats assisting, and no doubt the crew and passengers would be safely landed.

WEST INDIES.—By the mail-steamer Tweed, papers have been received from Trinidad and Antigua to June 14th; Barbadoes to June 15th; St. Vincent's and St. Lucia to June 16th; Jamaica, St. Christopher's, and Demerara, to June 17th; and Dominica to June 18th. There are also Havannah papers to June 21st. The weather at Jamaica continued favourable for the planters. Although the heat, as summer approached, was becoming intense, there was but little sickness. The only check that had been given to the encouraging prospects of the island was found in the melancholy death of Lady Elgin, who died in her confinement on the 7th June, after having given birth to a daughter, who also died soon afterwards. This event seems to have cast a general gloom over the community, among whom the Countess had rendered herself extremely popular, as, indeed, the public respect paid to her memory on the day of her funeral abundantly testifies. At Barbadoes the first Legislative Assembly has opened under

the operation of the new Franchise Act. The effect of the change is to increase the number of Members from twenty-two to twenty-four, and that of the voters to about double the former constituencies. The Gomer French steamer of war had been on shore near Guadaloupe, but was got off without receiving damage. Two smart but momentary shocks of earthquake had been felt at Antigua on the 9th and 11th June.

Parliament.

HOUSE OF LORDS.

Friday.—The resolutions of the Marquess of CLANRICARDE, which we briefly noticed in our last, gave rise to a long and remarkable discussion on the affairs of Ireland. Lord CLANRICARDE declared his opinion that the attempt to degrade the question of repeal by the impolitic, unwise, and absurd dismissal of magistrates, had been followed by consequences the very reverse of what its promoters anticipated from it. The present state of Ireland he attributed to two causes—the grinding poverty and misery of the people, and the policy of the present Government, which had found the country tranquil, and had aided in placing it in its present condition within the short period that has elapsed since their accession to office.

The Duke of WELLINGTON followed in a characteristic speech, delivered with considerable animation and vigour. Dismissing at once the question of legality, he proceeded to argue that the mode in which the Repeal agitation is carried on in Ireland, is calculated to inspire terror in the peaceful and well-disposed, and to endanger the public peace; and, therefore, to call for the precautions of a Government, who are entrusted with the protection of life, individual safety, and property. He admitted that the peace of Ireland was in the hands of one man; and quoted the remarks of Mr. O'Connell, about his having at his command and control a finer army than Napoleon led into Russia, or the Duke of Wellington had at Waterloo. "Very possibly," exclaimed his Grace, and thereupon drew the inference that the Government should be prepared for any outbreak, and could not safely leave the commission of the peace in the hands of men who might be called upon to put down what they had aided in bringing about. The duke expressed himself as very sorry to learn that there were two millions of the people of Ireland in a state of extreme poverty; and added that that poverty would not be cured by withdrawing men from their industrial employments, and sending them 20 or 30 miles a day to attend repeal meetings. After warmly defending every portion of the Irish policy of the Administration, he called on their Lordships to give the motion a decided negative.

Lord CLANRICARDE and Lord FORCESCUE followed the former complaining that more energetic measures had not been taken to suppress the Repeal movement, and deprecating a system of conciliation; the latter stigmatising as injudicious the removal of so many gentlemen from the commission of the peace, when their services were especially necessary, and urging the state of the Protestant Church, and the defective law of landlord and tenant, as the main grievances of Ireland.—Lord MOUNT ENGLISHE and Lord GLENAGALL concurred generally in the expression of a wish that the agitation had been more efficiently repressed, and stated their own views as to the means by which they hoped that a return to a better state of things might be effected.—Lord WICKLOW, although condemning the conduct of Sir E. Sugden, approved the Ministerial policy of abstaining from any measures of coercion, and strenuously opposed the motion.—Lord WHARFCLIFFE followed in justification of Lord Chancellor Sugden, and vindicated the apparent inaction of the Government, which was adopted after long and anxious deliberation. They were censured, he said, for doing nothing, but there was a forcible as well as a homely maxim—"that they should not bark before they could bite."—The Marquess of DOWNSHIRE expressed his satisfaction at this defence of the system of non-interference; but Lord CHARLEVILLE condemned a forbearance which had tolerated the growth of so formidable a conspiracy.—The Marquess of LANSDOWNE spoke at some length in support of the resolutions, and was succeeded by Lord BROUGHAM, who defended the Government, and said that the Lord Chancellor Sugden had, by a chance expression in a letter, assigned a bad reason for a good act.—Lord CAMPBELL condemned the whole proceedings of the dismissal of Magistrates, and after an animated speech from the Lord Chancellor, who declared Ireland to be on the verge of a rebellion, the debate was concluded by Lord COTTENHAM.—Upon a division, the numbers were—Content, 29; Not Content, 91. Majority for Ministers, 62.

Monday.—Lord BROUGHAM gave notice that on next Monday he will move that the publisher of the *Kendal Gazette* be called to the bar for a breach of privilege, in assigning improper motives for the introduction of the noble lord's Declaratory Property Bill.—The Earl of ABERDEEN moved the third reading of the Church of Scotland Benefices Bill.—Lord COTTENHAM moved the omission of certain words, which would change the entire bill from a declaratory into an enacting measure.—Lord LYNCHURST opposed the amendment, and after a discussion, shared in by the Earl of ABERDEEN, Lord CAMPBELL, and the Marquess of BREADALBANE, who opposed the Bill, Lord COTTENHAM's amendment was rejected without a division.—Lord COTTENHAM again, on the question that the bill do pass, moved the adjournment of the debate for three months, which also was negatived without a division, and the bill was then passed.

Tuesday.—The Norfolk Island Bill was read a third time and passed. The House went into committee on the Law of Libel Bill. On the seventh clause being read, Lord CAMPBELL dwelt upon its importance, and upon the necessity of giving protection to the publication of *bona fide* reports of proceedings in the courts of law and police, and of the two Houses of Parliament. It could not be denied that it was a great public good to have the debates which took place in the two Houses of Parliament faithfully reported. It was therefore provided by this clause, that no legal proceedings should be maintainable against any party for the publication of a report of any proceedings in courts of law, police offices, or Houses of Parliament. He wished to insert, by way of amendment, the words "for publishing, without actual malice."—Lord BROUGHAM considered that there was no necessity for the amendment. He was of the strongest opinion that, in proportion as there should be an absolute privilege within the walls of Parliament for saying whatever any member might think proper to say, restrained only by his sense of duty, so in the same proportion was the absolute necessity that there should not be given an unrestrained power to the press to publish everything that was said in Parliament. There was no fear of the proceedings of Parliament not being published, and in the course of all his experience at the bar, he did not remember a single prosecution or action for the publication of a speech delivered in Parliament.—After some further discussion, the amendment was put to the vote, and lost by a majority of 11 to 5. The remaining clauses were severally agreed to, and the report was ordered to be received on Friday.

Thursday.—The Lord Chancellor introduced a bill, which was read a first time, for the purpose of legalising Presbyterian marriages in Ireland. It was simply a temporary measure, having reference to such marriages as had taken place, and was introduced in consequence of the great anxiety which existed on the subject in Ireland. A more general measure will hereafter be brought forward.

Friday.—The Lord Chancellor's temporary bill on the subject of Presbyterian Marriages in Ireland was carried through all its stages, and sent down to the Commons, the standing orders having been suspended. Lord Brougham's Slave Suppression Bill was read a third time and passed, and Lord Campbell's Defamation and Libel Bill was forwarded a stage.

HOUSE OF COMMONS.

Monday.—The Durham writ was issued, after a discussion, by a majority of 145 to 17.

On the order of the day for resuming the committee on the Arms Bill, a discussion arose on the state of public business. It was originated by Mr. WALLACE, who asked a question relative to certain Scotch measures; and it was carried on by Mr. EWART, who addressed himself to the state of public business generally.—From the replies of Sir R. PEEL and Sir J. GRAHAM, it appeared that the Government have the present intention of carrying the Irish Arms Bill, the Irish Amendment Poor Law Bill, and Lord Aberdeen's Scotch Church Bill. Sir J. GRAHAM said the Government were not to blame, seeing that the Canada Corn-Law Bill raised the question of the Corn-Laws some seventeen or eighteen times, and the Irish Arms Bill had met with such continued opposition. The Factories Bill, in its present shape, was not an essential measure, though he would like to carry it if he could. He did not intend to bring an English Poor-Law Amendment Bill, nor did he think, after the measure of last year, continuing the commission and amending the law, that he was pledged to do so, though there were some amendments he would like to have introduced if he could. They would persevere with the Irish Poor Law Amendment Bill, but as to the Ecclesiastical Courts Bill and the County Courts Bill, they were not prepared to make any announcement, though indisposed to abandon all hope of carrying them.—Lord J. Russell hoped that the Government would name an early day on which they would state what bills they really intended to proceed with, and what they would abandon. The Scotch Church Bill was likely to meet with determined opposition. The Ecclesiastical Courts Bill had been so altered, that competent authorities had assured him it would in its present shape produce only mischief. The Factories Bill, contrary to general expectation and understanding, still contained objectionable educational clauses; and it was not satisfactory to those who took an interest in the English Poor-law to hear that there was no intention of introducing a measure, in fulfilment of Sir J. Graham's pledge that he would do so early this session. The Estimates had provoked less discussion than he had ever before known, and as to the want of time and opportunity, the Government had no great reason to complain.—Sir R. PEEL admitted that the discussion of the Estimates had not taken up much time, but many Government days had been given up for the discussion of motions on adjourned debates; more gentlemen took part in them than formerly, and the Government experienced great difficulty in bringing forward their measures. They attached great importance to the Scotch Church Bill; but he would take an early opportunity of mentioning what measures will be abandoned and what proceeded with.—After a few observations from Mr. BARNARD, Sir J. GRAHAM complained of the "bitterness of feeling" which Lord J. Russell's speech indicated, and expressed himself indignant at being charged with a breach of faith with relation to the Factories Bill, and the non-fulfilment of his alleged pledge, as to the introduction of an English Poor-law Amendment Bill. The Factories Bill did not retain any compulsory educational clauses inconsistent with the existing law, or otherwise than giving due control to the committee of Privy Council on education.—Lord J. Russell explained that he had not accused Sir J. GRAHAM of a breach of faith.—Mr. HUME said that the impression was very general out of doors that all the educational clauses had been withdrawn from the Factories Bill. He expressed his regret to see the Government in its humbled position, and recommended them to withdraw the Arms Bill, in order to obtain time for other measures of greater importance.—After some further discussion, by Mr. R. YORKE, Mr. DUNCOMBE, Mr. WYKE, and Lord CLEMENTS, the House went into committee on the Arms Bill.—A long debate and a division on clause 24 ensued, but no further progress was made in the Bill.

On the motion for going into Committee of Ways and Means, Mr. C. WOOD moved that the House resolve itself into a committee to consider the propriety of reducing the duty on foreign wool. He contended that the increase of the trade depended upon the reduction of the duties, and that for the benefit of this important trade a loss to the revenue of 50,000*l.* was of no great sacrifice.—The CHANCELLOR of the EXCHEQUER, considering the reductions that had already been made in duties on various articles, and considering the state of the finances of the country, with regret felt compelled to resist the proposition of Mr. WOOD, and to give a negative to his motion.—Mr. WILLIAMS, Mr. SHEPARD, Mr. G. W. WOOD, Mr. A. BRETHER, and Mr. STANSFIELD supported the motion.—Sir R. PEEL could not see how, if he agreed to abandon the duty on foreign wool, he could refuse to give up the duty on cotton, amounting to about 800,000*l.* a year—both standing on the same footing. He could not consent in the proposition to reduce the duty at present, on account of the state of the finances.—The House having divided, there were—For Mr. Wood's motion, 72. Against it, 142. Majority, 70.

Mr. GLADSTONE moved the second reading of the Coal-Whippers Bill.—Mr. WALLACE moved the second reading that day three months.—The House divided.—For the second reading, 50. Against it, 9. Majority, 41.—The Bill was read a second time.

Tuesday.—There being only 18 members present at 10 o'clock, the House stood adjourned.

Wednesday.—Mr. T. DUNCOMBE complained of the conduct of the Government and its supporters, in not assisting to "make a House" on the previous night. Lord J. Russell and his friends had important motions, the one on education, the other on prison discipline; and the Government must not, therefore, complain of obstruction in the progress of public business, seeing that they had prevented the discussion of these important subjects on the only day in the week now left to independent members.—The Government did not wish to become as despicable in public opinion throughout England, as they were already in Ireland; they must manage the House better. He moved that the "dropped orders" should have precedence on Thursday.—Sir R. PEEL said he had come down at twenty minutes past 4 o'clock, and was quite surprised when he found there was no House. The members of the Government had the weight of their official duties on their shoulders; and he thought that the other side were equally responsible for making a House. He trusted that Mr. DUNCOMBE would not press his motion.—After a somewhat lively, but brief discussion, during which Sir C. DOWLAS blamed Lord J. Russell as the cause of there being "no House," Sir G. GREY recommended Mr. DUNCOMBE to withdraw his motion, to which he assented, and it was accordingly withdrawn. The "dropped orders" were then fixed for other days.

During the present session a bill, the Scottish Schoolmasters' Widows' Fund Bill, received the Royal Assent, without certain amendments made by the Lords having been agreed to by the Commons. A committee was appointed to inquire into the informality; and Mr. WYNN now moved, that, according to a similar precedent in 1829, a bill should be brought in to render these amendments valid. The standing orders were therefore suspended, in order to permit this confirmatory bill to be carried through all its stages.—Mr. GREY remarked, that, though the original bill which had caused these proceedings was of a private nature, the principle involved was very important.

The ATTORNEY-GENERAL moved that leave be given to the Sergeant-at-Arms to plead to the action commenced against him by Howard, the attorney.—Mr. T. DUNCOMBE regretted that Sir T. Wilde was not present. The country had already paid enough for the blunders committed in the progress of previous actions; and now that it was seen that the House was in a state of anarchy, their privileges, they might depend upon it that they had not heard the last of it. Their authority was gone, and, therefore, to arrest the progress of the mischief, he moved as an amendment that the individual who had served the writ on the Sergeant-at-Arms should attend at the bar.—Mr. HUME seconded the motion, reminding the House that their privileges were important, not for their own sakes, but that of the public.—Sir R. PEEL reminded the House that the committal of the individual would not stay the action. It would only bring them once more into conflict with the executive authorities of the law, as in the case of

the committal of the sheriffs; and he hoped, therefore, that the House would adhere to its former decision, and permit the Sergeant to plead to the present action.—After a few words from other Members, the motion was carried by 103 to 44.

Mr. MACKINNON'S "Health of Towns" Bill stood for second reading; but Sir J. GRAHAM and other members recommended its withdrawal, as in its present shape the measure was calculated to work prejudicially in many cases.—Mr. MACKINNON yielded, promising to renew the bill next session, unless the Government took up the subject.—Lord WORSLEY moved that the Coroners' Bill be committed *pro forma* in order to introduce certain amendments.—Sir E. KNATCHBULL resisted this, and moved, as an amendment, that the bill be committed that day three months.—Mr. C. BRIDGES seconded the amendment, condemning the bill as a crude attempt at legislation.—After some discussion, the House divided, when the amendment was rejected by 66 to 42; and the bill was carried through committee, *pro forma*.

On the Irish Medical Charities' Bill, which stood for consideration in committee, Mr. FRENCH moved that they should go into committee, in order to consider certain clauses.—While he was speaking, it was moved that the House be counted; but, 40 members being present, he proceeded, charging Lord ELLIOT and the Irish Government with neglect of the interests of Ireland.—Lord ELLIOT entered into explanations; but while he was speaking notice was a second time taken that there were not 40 members present, which proving to be the case, the House necessarily stood adjourned.

Thursday.—Sir R. PEEL stated what measures the Government are anxious to carry during the present session, and what they are disposed to abandon. They are desirous of carrying the Irish Arms Bill, the Scottish Church Bill, the Irish Poor-Law Amendment Bill, and the Exportation of Machinery Bill. They have resolved to abandon the Ecclesiastical Courts Bill, the Factories Bill, and the Law Courts (Ireland) Bill; and every other measure to which any determined opposition may be offered. But they are still desirous of carrying the County Courts Bill, with which are connected two other measures of law reform, the Small Debts Bill and the Superior Courts Common Law Bill. On these he will state the decision of the Government on a future day, as the hope of carrying them depends on the progress of other business.—In answer to Sir G. GREY, it was stated by Sir J. GRAHAM, that as the Government had determined on withdrawing the Ecclesiastical Courts Bill, it would be necessary to renew the act for suspending the operation of the act for effecting the new arrangement of dioceses which had been renewed from year to year.—Lord ASHLEY expressed his deep regret at the postponement of the Factories Bill, a regret which was natural after the period of 10 years he had devoted to the subject. He hoped the Government would bring it forward early next session. After some conversation on this and one or two other subjects the House proceeded to the main business of the evening—the resumption of the committee on the Irish Arms Bill. Clauses from 24 to 33 were agreed to, though not without opposition and several divisions.

Friday.—In answer to Mr. V. SMITH, Sir R. INGLIS stated that the University of Oxford was engaged in the task of revising its statutes, in which considerable progress had been made, as well as in the separate and independent labour of revising the statutes of the different colleges.—Sir R. PEEL, in answer to Lord ASHLEY, said that Government would introduce a Factories Bill early next session.—The long-expected Committee on the Irish Arms Bill was once more resumed, occupying the House, as usual, for the main portion of the sitting. On the present occasion, commencing with clause 35, the committee proceeded as far as clause 54.

CITY.

Money Market, Friday.—Consols closed at 93½; Exchequer Bills at 1½d., 53s. to 55s., and 54s. to 56s. prem. at 1½; Bank Stock, 180½; Three per Cent. Reduced, 94½ to 95; Three-and-half per Cents. Reduced, 101½; New Three-and-half per Cents., 100½ to 101½.

Metropolis and its Vicinity.

The Queen's Visit to the Opera.—Thursday evening was the first occasion of her Majesty's visiting the Italian Opera-house in State, the theatre not having been similarly honoured since the year 1834, when King William IV. and Queen Adelaide occupied the Royal box. The scene was a repetition of the royal visit to the other theatres, upon a greater and more brilliant scale. Her Majesty and Prince Albert on their appearance were welcomed with great enthusiasm, and the National Anthem was sung. The opera was "Il Barbiere di Siviglia," and the ballet was "Ondine," added to which Fanny Ellsler and Cerito between the acts gave a *pas de deux*. It is needless to say that the performances, in every respect, gave general satisfaction. Her Majesty retired amidst loud cheers, the National Anthem being again sung previous to her departure.

Meeting on the State of Ireland.—On Monday the public meeting of the Electors of Marylebone, the preparations for which we noticed in our last, took place in Hall's Riding School, and was attended by about 3,000 persons. Sir B. Hall, one of the Members for the Borough, presided, and was supported by Sir De Lacy Evans, Sir C. Napier, Mr. T. Duncombe, Mr. S. Crawford, Mr. Hume, and Mr. Williams, M.P., Mr. F. O'Connor, Mr. Owen, of Lanark, &c. The chairman opened the business of the meeting by stating his desire that the meeting should be the precursor of others, and that the feelings of the people of England, as manifested towards Ireland, should be made known, not only to the Ministers and Parliament, but should go in the shape of a memorial to the Queen herself. Sir De Lacy Evans moved the first resolution, That the meeting viewed with the deepest sorrow and the most serious alarm the present excited state of public feeling in Ireland, and regard with pain and indignation the present policy of her Majesty's Ministers in reference to that country, as indicated in the stringent and obnoxious provisions of the Arms Bill now before Parliament, and the unconstitutional dismissal of magistrates from their office, and the absence of all adequate plans for the just and equitable rule of the Irish people. Mr. G. Daniell, in seconding the resolution, observed that there was no hope either of sympathy or justice for England or for Ireland from the present Government. Mr. F. O'Connor then addressed the meeting, stating that Ireland would never rest satisfied until it was relieved from provincial legislation. Unless the meeting were prepared to give them that—if they had come there with no better stock in trade than mere justice to Ireland, it was but a poor bundle of sticks to go to the fire with. Mr. O'Connor at great length proceeded to dwell upon the wrongs of Ireland, and implored the meeting, if

they wished to do justice to that nation, not to separate without supporting them in their attempts to obtain a repeal of the legislative union. Mr. Ridley, a Chartist, after denouncing the present meeting as a Whig feeler, moved an amendment that "The meeting was further of opinion that the conduct of the late and present Governments towards Ireland has been unjust and tyrannical, and the Irish nation has an undoubted right to take such legal measures as they may deem best calculated to procure a repeal of the Union." Mr. Fussell having seconded the amendment, Mr. T. Duncombe, M.P., said the resolution and the amendment were both of them so excellent, that he had no choice between them. Had this been a mere Whig meeting, they would not have found him there in support of that old, and, he hoped, defunct policy. He thought that unity in such a question was everything, and that under such circumstances it would be better to amalgamate both the resolution and the amendment. The latter merely called upon them to express an opinion as to whether they thought the Irish people had a right to demand Repeal. It was his opinion that they had the right to demand the repeal of an Act which was adopted in fraud, and executed in iniquity. Mr. M. P. Haynes next addressed the meeting in support of adding the amendment as a rider to the original proposition; and Mr. R. Owen, of Lanark, attempted to address the meeting, but was not heard, from the confusion which prevailed. Sir B. Hall announced that the amendment had been incorporated with the original resolution, which was received with the loudest acclamations. Mr. Baker moved the second resolution—"That the meeting had heard with the deepest regret the opinion avowed by the principal Secretary of State for the Home Department, that concession towards the Irish people had reached its limit, by which they were led to apprehend that a further coercive policy is to be persevered in towards Ireland—a policy which can have no other effect than to exasperate the feelings, without removing the discontent, of our fellow-subjects in that country." Mr. Savage seconded the resolution. Sir C. Napier said it was gratifying to him to find that Marylebone was the first constituency in England to come forward to admit the principle of doing justice to Ireland. The Government looked towards that meeting with a considerable degree of dread, for many would follow it; and if they could but carry it out with unanimity, the dread of the Government would be increased tenfold. He had stated in the House of Commons, and he repeated it there, that the speech of Sir Robert Peel in the Commons, and Wellington in the Lords, regarding Ireland, had done more to advance repeal than O'Connell could have done without those speeches in five years. He might differ from some of them, but as a staunch and determined friend to Ireland, he would yield to no one. But he would candidly and frankly acknowledge that he did not approve of repeal. He thought that under its name a power was given in Ireland to one man, which was a dangerous power, and which ought not to be permitted. He called on them to beware; France was eagerly watching the movement of the Irish people, and would be delighted to see a dismemberment of the empire, and to assist therein, not for the sake of the Irish people, but for the purpose of breaking the power of England. No good end would be answered by a Repeal of the Union. Let justice be done to Ireland, and repeal was not wanted. Let justice be done to her, and Ireland would add to her own greatness and the power and strength of the British Government. Mr. B. H. Smart moved a long resolution on the grievances of Ireland, and recommended that a memorial be addressed to her Majesty embodying the foregoing resolutions, praying that she may be pleased to take the same into her most gracious consideration, that a stop may be put to coercive measures, that such a wise, just, and conciliatory policy may be promoted as will advance both political and ecclesiastical reform, and that her Majesty may dismiss her present Ministers, and appeal to the sense of the people. Mr. Smyth, of Camden-town, seconded the resolution, which was carried unanimously. Mr. S. Crawford then addressed the meeting, announcing his intention to join the Repeal agitation unless justice be done to Ireland; after which it was resolved that a memorial founded on the resolutions be presented to her Majesty by the Earls of Charlemont and Leitrim.

The late Duel.—The fourth sitting of the Coroner's inquest on the body of Lieut.-Col. Fawcett took place on Tuesday, when Sir B. Brodie, Mr. Blake, and other witnesses were examined. Mr. Blake, the half-brother of deceased, produced some papers he had found relative to the duel. They were in Col. Fawcett's handwriting and appeared to be rough copies of what took place between him and Lieut. Munro. They were dated the 30th June, but it could not be ascertained to whom they were addressed, as the name was torn off. Mr. Blake, at the desire of the Coroner, produced the documents, and read them to the Court, as follows:—"June 30, 1843.—My dear — (here the name was torn out). The inclosed gives you the fullest insight to the nature of the quarrel between Mr. Munro and me that I can offer. Had he not been the husband of my wife's sister, and his conduct in flatly contradicting me, and then saying he would have thrown me down stairs, I should have demanded a meeting, not giving him the option of making an apology. And this demanding an apology seems to me as absurd as his language and manners were unjustifiable. It now rests with you, and on the principle of fighting my tailor, if challenged, should Mr. Munro wish it. Oblige me by having the meeting this evening if possible. Yours faithfully, Lynar Fawcett." Mr. Blake then proceeded to read the enclosure, which also bore date the 30th of June, but no address. It was as follows:

"After some conversation with Mr. Munro relative to Mrs. Smith, I said, 'No matter, it was a blunder I might have made had I been acting for you, but she has bamboozled us or you (I cannot say which).' Upon which Mr. Munro in a very loud voice, said, 'This is four times you have accused me of allowing you to be imposed on.' 'No, Munro, I have never said or thought you allowed me to be imposed on; on the contrary, I said it was a blunder which I might have made towards you under similar circumstances. Mr. Munro in a most bullying manner saying, 'I say you have, four times.' On which I said, 'A flat contradiction I shall endure from no man. From this moment, sir, we are strangers, and I desire you leave my house and never enter it again,' on which I stood up, and ringing the bell desired the servant to open the door for Mr. Munro. Mr. Munro said he would not leave the house. I said 'The hall-door remains open until you do.' Mr. Munro after remaining about five minutes and finishing his tea left the house. He returned soon after. He said to apologise to Mrs. Fawcett for having left without wishing her good night. He then addressed me, 'Do not suppose I left the house because you desired me. I would stay here all night in spite of you, and if it was not for the connection of the family, I should on your ordering me to leave the house, an insult such as I have never before received, I should have thrown you head over heels down stairs.' To this ruffianly threat I said, 'Mr. Munro, that is not the way gentlemen settle their differences, and as to our family connection I beg you may cease to think of it.' During this intrusion Mr. Munro continued to swagger his cane, and kept his hat on. I pledge my honour to the above being the truth of what passed between us to the best of my recollection, and when he had left, my wife was surprised at my forbearance in not calling in the police.—(Signed) Lynar Fawcett. June 9, 1843." The Coroner: Have you any other letter?—Mr. Blake; I have one other. The Coroner: I do not know whether the Jury have not heard enough. The Jury had, however, for their own satisfaction, better hear it. Mr. Blake here read the third letter. "My dear — (the name was here again torn away from the letter)—You are fully authorised on my part to assure Mr. Munro, that I never accused him of allowing me to be wronged wilfully. That I neither insulted him, nor had the most distant intention of insulting him in any way; but that I turned him out of my house for most grossly insulting me.—Yours faithfully, Lynar Fawcett. June 30, 1843." Evidence was also adduced to show that the seconds at the duel were Lieut. Grant of the 44th Reg., and Lieut. Cuddy of the 55th Reg. The Coroner then summed up, and the Jury having consulted together for about an hour and a half, returned the following as their unanimous verdict:—"We find Alexander Thompson Munro, Duncan Trevor Grant, William Holland Leech Daniel Cuddy, guilty of 'Wilful Murder,' as principles in the first degree; and George Gulliver guilty of 'Wilful Murder' in the second degree, believing him present only as a medical man." The Jury, by direction of the Coroner, again retired, and ultimately it was understood that Mr. Gulliver was to be forthwith committed on the Coroner's warrant, to Newgate.

The Duke of Sussex's Library.—It is understood that there are doubts whether the valuable collection of Bibles and collection of rare manuscripts and books, constituting the library of the late Duke of Sussex, will be submitted for public competition or not, as the King of Naples is stated to have entered into negotiations for the purchase of the entire collection. It is said the offer of the King was liberal, but it is hoped that Government will endeavour to secure the collection for the British Museum.

The Royal Yacht.—On Wednesday her Majesty's new steam-yacht, the Victoria and Albert, made her first experimental trip to try her engines. The trial was very satisfactory, both as regards the efficiency of the engines and the capabilities of the yacht herself. The machinery worked with the greatest ease, and had been so correctly fixed that it did not require the slightest adjustment. The official inspection was made by the Lords Commissioners of the Admiralty yesterday, when the yacht again proceeded to the Nore, and thence to Chatham, where she will remain to be fitted with her masts, yards, and rigging. As soon as she is completed at Chatham, she will be brought to Deptford to be perfected in her interior decorations. Her furniture is all ready, being the same as was on board the Royal George. In about a fortnight from the present time the yacht will be completely fitted, and perfectly ready in every respect for the use of her Majesty.

Conservancy of the River.—The Lord Mayor, attended by the Recorder, Aldermen, Sheriffs, and other City Officers, held Courts of Conservancy for the counties of Middlesex and Surrey, on Friday, for the purpose of receiving presentments of the Juries appointed to examine the state of the Thames. The presentment of the Middlesex Jury called the attention of the Court to the projecting piers—at Cheyne-row, Chelsea, adjoining the public stairs, or landing; at the front of the Swan public-house, Chelsea; at Milbank-row; adjoining the public-house at Westminster-bridge; at the front of Hungerford-market; at the end of Great George-street, Adelphi; at the eastern side of Waterloo-bridge; at the end of Essex-street, Strand; and near the Thames Tunnel; all of which, in their opinion, "at a certain state of the tide, occasion an obstruction to the free and uninterrupted navigation of the inshore of the river, and lead to the accumulation of mud-banks and other nuisances in the bed and shores thereof; and are unsubstantial, inconvenient, ill-constructed, and, to a considerable extent, unsafe." The Jurors also represented "that an ancient pathway,

formerly open to the public on the banks of the river, between Vauxhall-bridge and the Chelsea waterworks, has been closed by the owners or occupiers of the adjoining land (Messrs. Cubitt); and although the Jurors are advised that such an encroachment upon the rights of the public not having been committed on the river, or the soil and bed thereof, is not within their jurisdiction, they deem it right to include it in their presentment, that the attention of the Conservators may be drawn to the subject, as they are of opinion that if the diversion of the ancient footpath on the navigation of the river be permitted to continue, it may, in the course of time, give to the owners of the adjoining lands, private rights that will prevent the making of walks and other improvements on the banks of the river, which are so much required for the health, comfort, and recreation of the inhabitants of this great metropolis." The Recorder informed the Jurors that he should recommend the Lord Mayor to bring the subject of so serious an encroachment before the Court of Aldermen, who no doubt would instruct the City Solicitor to adopt measures of prevention. In the Court of Conscience for Surrey, the temporary piers were presented as insecure, and calculated to interrupt the inshore passage of the river and cause mud-banks. The Jurors recommended that they should be removed, and that safe and convenient structures should be erected in their place at Battersea, Nine Elms, Lambeth Palace, Westminster-bridge and London-bridge. They also presented several timber-rafts, which are floating in the river, and tiers of barges, moored in the middle channel of the river, and obstructing the navigation of the river.

Exhibition of Cartoons.—The exhibition of Cartoons sent in pursuant to the notice of the Commissioners of Fine Arts, which has been open since the 3d instant in Westminster Hall, on payment of one shilling each person, was closed on Saturday last, and reopened on Monday morning for the gratuitous admission of the public. The receipts during the short interval in which the drawings have been exhibited (only twelve days) have far exceeded the sum originally anticipated. The visitors have averaged upwards of 1,800 per day, and on Saturday (the last day on which payment was taken) they exceeded 2,000. The total sum received at the doors up to Saturday evening for the admission of the public, and by the sale of catalogues, exceeded 1,100*l.*; and the commissioners have determined on apportioning nearly the whole of this money, in sums of 100*l.* each, to the artists of the ten next best drawings. The following are the subjects which have been selected by the judges as entitled to 100*l.* each out of the funds in hand. The figures show the number attached to the cartoon in the catalogue.—No. 11. "Una coming to seek the assistance of Gloriana." An Allegory of the Reformed Religion seeking the assistance of England. *Spencer's Faery Queen.* Mr. Frank Howard, jun.—13. "The Seven Acts of Mercy. Una and the Red Cross Knight led by Mercy to the Hospital of the Seven Virtues." Mr. G. V. Ripplingill.—16. "The Death of King Lear." Mr. F. R. Pickersgill, jun.—31. "The Angel Raphael discoursing with Adam." *Milton's Paradise Lost.* Sir William Ross, R.A.—45. "Man beset by contending passions." He is represented as urged on by pride, ambition, and anger; restrained by love and pity; pursued by grief, hate, envy, revenge, and fear; buoyed up by Hope; chained to the earth by Despair; reason overthrown; horror in the midst. Mr. Henry Howard, R.A.—60. "The Brothers releasing the Lady from the enchanted chair." *Milton's Comus.* Mr. F. R. Stephanoff.—63. "The Brothers driving out Comus and his rabble." Mr. J. G. Waller.—92. "St. Augustine preaching to the Britons." Mr. W. C. Thomas.—103. "Alfred putting on the habit of a harper, went into the enemy's camp, where he was everywhere admitted, and had the honour to play before their Prince. Having thus acquired a great knowledge of their situation, he returned in secrecy to his nobility." Mr. Marshall Claxton.—122. "The Plague of London, A.D. 1349." The bishops and clergy are represented at St. Paul's Cross, praying for the cessation of the Pestilence. Mr. E. Corbould.

German Hospital.—A morning concert was given on Tuesday at the Hanover-square Rooms, the proceeds of which are to be appropriated to the funds of a German Hospital, now establishing in London. Among the instrumental performers at this concert, M. Ernst demands the first notice, since he conferred upon it the distinction of making it the only occasion on which he will perform in public during his present visit to London; and he is, moreover, one of the finest players on the violin that Europe, already so rich in that respect, can boast. Nothing could exceed the enthusiastic demonstrations with which each of his performances was received; shouts broke out on all sides, both from the audience and his fellow-musicians, and he was several times recalled to receive still further applause. Several other vocal and instrumental performers gave their gratuitous services on this occasion, and Mrs. Stirling pronounced an address composed for the occasion, consisting chiefly of a flattering appeal to the sympathies of the British public, which was received with considerable applause. The Concert-room was completely filled, and was honoured with the presence of the King of Hanover, under whose immediate patronage the Concert was given.

Anti-Puseyite Meeting.—A meeting of laymen was held at Freemasons'-hall, on Wednesday, for the purpose of proposing a memorial to the Duke of Wellington, as Chancellor of the University of Oxford, directing his Grace's attention to the rapid progress of tractarian doctrines in that ancient seat of learning. Lord Ashley presided, and opened the proceedings of the day by referring at some length to the prevalence of the tractarian doctrines, and urging on the assembly the necessity of

adopting immediate measures for their suppression. Several gentlemen spoke, and expressed their determination of resisting to the extent of their power the spread of opinions and practices which they declared to be so dangerous to the peace and security of the church. After some discussion, a memorial was unanimously agreed to, and will be presented to the Duke of Wellington in the course of a few days. The Protestant Association has also prepared a memorial, addressed to the archbishop and bishops, on the same subject.

British and Foreign Institute.—A meeting was held on Thursday at the Hanover-square Rooms for the purpose of considering a prospectus, submitted by Mr. J. S. Buckingham, for the establishment of "the British and Foreign Institute," for facilitating personal intercourse between the educated classes of all countries, and rendering the literary circles of the metropolis accessible to visitors from the Continent, colonies, and provinces, more readily, it is said, than is done by the Clubs. The Earl of Devon presided, and Lord Brougham, Lord D. Stuart, and others, addressed the meeting in support of the institution. It was then resolved that a subscription be raised for the erection of a house at the west-end, and that Mr. Buckingham, the proposer of the scheme, be appointed resident director.

Westminster School.—It is stated that the Right Rev. Dr. Carey, Bishop of St. Asaph, has lately placed in the hands of trustees the sum of 20,000*l.* for the benefit, after the death of his Lordship and Mrs. Carey, of students elected from Westminster to Christ Church, Oxford.

Hackney.—A meeting was held last week in the vestry-room of the church to pass the late churchwarden's accounts and make a rate for the ensuing year. The estimate for a new rate was read, from which it appeared, that owing to extensive repairs contemplated on the church, a sum of 647*l.* would be required, which, on a rental of 88,000*l.*, would need a rate of 2*d.* in the pound. It was then moved and seconded, "That a rate of 2*d.* in the pound be granted," to which an amendment was moved, postponing the question for twelve months. After some discussion, the chairman took the numbers, when there appeared—for the amendment, 31; for the rate, 54. The chairman declared the rate carried, but Mr. Powell demanded a poll, expressing his determination to offer every legitimate opposition to the imposition of a church-rate. The polling closed on Saturday, when the chairman declared the numbers to be—for the rate, 373; against the rate, 43. Within the last fortnight the church-rate has been made in the vestries of South and of West Hackney without a poll.

The Greenwich Pier.—The lawsuit between the stonemason company and Messrs. Grissell and Peto, the contractors, has been stayed by proceedings in Chancery. Messrs. Grissell and Co. have obtained an injunction, the case has been referred to eminent counsel, and an amicable arrangement entered into for both parties to bear an equal proportion of the expense to be incurred in putting the permanent pier into really substantial condition. It is stated that to do so at least 17,000*l.* must be expended.

Fires.—On Saturday morning, one of the most serious explosions that has occurred in the metropolis for some time took place soon after 5 o'clock, at the extensive oil and turpentine works belonging to Messrs. Johnson and Co., in the Back-road, St. George's-in-the-East, which not only destroyed the whole factory, which is considered to be one of the largest in London, and contained several thousand barrels of turpentine, but injured part of the Blackwall Railway, and damaged between 30 and 40 houses in the neighbourhood, including the Roman Catholic School in the above road. The factory extended in depth about 50 feet, within a couple of feet of the Blackwall Railway, three arches of which were rented by the firm, and used for the deposit of turpentine and other combustible materials to the amount of at least 2,000 barrels. When the gates of the warehouse were forced open an explosion took place, causing destruction to the entire factory; the roof was blown off, and the walls were forced outwards into the street. For several minutes the whole district was enveloped in clouds of dust and smoke and the burning remnants of the building. The shock resembled that of an earthquake, and the houses for some distance round were shaken to their foundation. Eight subsequent explosions took place, during which it was necessary to call off the firemen. At one period the street in the immediate vicinity of the conflagration presented an extraordinary sight, it being literally on fire with the burning oil and turpentine. The trains on the Railway were not started for some time, until the arches had been examined by Mr. Tite, the architect; but his investigation having satisfied the directors that they were quite safe, the trains commenced running in the course of the morning. After all the danger had subsided, an inquiry was instituted as to the origin of the fire, it being at first suspected that, as none of the workmen had arrived, it was the work of an incendiary. This supposition, however, gave way, and it appears that the fire was occasioned by spontaneous combustion.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, July 8:—West districts, 124; North districts, 169; Central districts, 143; East districts, 163; South districts, 212. Total, 811—(424 males, 387 females.) Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five summers, 846.

Provincial News.

Birmingham.—The quarterly meeting of the iron-masters took place in this town on Thursday week, when a memorial to Sir R. Peel on the depressed state of the iron trade was adopted. The meeting of the Dudley

masters took place on Saturday, and like that held at Birmingham on Thursday, in consequence of the present state of the staple trade of this populous manufacturing district, created more than usual interest among all classes. The nominal price of pig and manufactured iron having been fixed at the meeting on Thursday, the chief, indeed the absorbing points of interest in the conversation of the day, were the state of the mining population, the probability of a strike, and the result of the approaching interview with Sir R. Peel. The contemplated strike took place on Monday at Westbromwich, and is very likely to become general throughout the district. In that neighbourhood the pits belonging to Mr. Bagnall, Mr. Haines, Mr. Wood, and others, have stopped work, the men having refused to accept the proposed reduction of 6*d.* a day. Some of the pits at Hill-top have also struck, and many at Oldbury, Dudley Port, Bilston, and other places, are also brought to a stand. The amount of distress prevailing among the miners may be imagined from a passage in the Masters' Memorial to Sir R. Peel, in which they express their wish to refrain from offering any opinion as to the remedies, but consider it their duty to declare, that a much longer continuance of this frightful depression of the condition of the working classes and productive interests will be incompatible with the peace of the district. The deputation mentioned above had an interview with Sir Robert Peel on Wednesday. They were accompanied by Lord Hatherton and Lord Lyttelton, and the members for South Staffordshire and Wolverhampton. The Chancellor of the Exchequer, the Secretary for the Home Department, and the President of the Board of Trade, were present at the interview. Mr. Foster having stated the facts of the memorial, Sir R. Peel said he should willingly give his best attention to any remedies that might suggest themselves to the minds of the Deputation, but that he feared the production of iron had been forced by the requirements for railroads and other causes so much beyond the ordinary demand, that now that these sources of consumption had been supplied, he could hold out no prospect of immediate improvement from any measures within the power of the Government. The Deputation stated, that they were nearly unanimous in the conviction that the depression under which their trade was suffering, as well as that affecting most other branches of productive industry, was attributable to the great falling off in the demand, occasioned by the vicious operation of our present money laws, and the consequent want of a sufficient circulation to maintain a range of prices adequate to the discharge of the fixed public and private burdens which form so large a proportion of the cost of production in this country; that without some change of these laws there was, in their opinion, but little hope of any improvement in the condition of the working classes, which would gradually approximate to that of the same classes in Ireland. Sir R. Peel expressed his dissent from these conclusions, and after thanking the Deputation for the temperate and judicious manner in which they had stated their views on the important objects which had engaged their attention, the conference terminated.

Bristol.—The launch of the Great Britain steamer, and the visit of Prince Albert to this city, for which so much anxious preparation had been making during the past week, took place on Wednesday, and passed off in the most auspicious manner. According to previous arrangement, his Royal Highness, accompanied by the Marquess of Exeter, Lord Wharfedale, the Earl of Lincoln, and suite, left the Paddington terminus of the Great Western Railway at seven in the morning. The Royal party arrived at the Bath station at nine, where they were met by the Mayor and a deputation from the corporation of that city, to present an address. This ceremony occupied about half an hour, after which the train again took its departure for Bristol, where it arrived at ten o'clock. The Mayor and corporation were in attendance to present an address to his Royal Highness, together with a deputation from the Clergy for the same purpose. The Prince and the local authorities then proceeded to the yard of the Great Western Company, and as the procession passed through the different streets every house throughout the whole line, a distance of seven miles, was decorated, and across the street, at various points, were flags, banners, and triumphal arches; every nook and corner were crammed with anxious faces, while the firing of guns, ringing of bells, and the cheering of the populace, all bore one sound of rejoicing. Arrived at the yard of the company, the chairman and directors were in attendance to receive the Royal party, and conducted them over the magnificent ship, with which his Royal Highness frequently expressed his admiration. After going over the vessel and works, the Prince and the visitors sat down to a *déjeuner* given by the directors, at which the chairman of the company presided. The health of the Prince was of course drank with great applause, and in reply His Royal Highness said—"I thank you for the honour you have done me in drinking my health, and I assure you it affords me great pleasure that I have come here to-day, and I shall always bear a lively remembrance of the cordiality with which you have received me. Allow me now to propose the health of 'The Mayor, and prosperity to the city and trade of Bristol.'" Several other toasts were then drunk, during which the Prussian and United States Ministers returned thanks on behalf of the ambassadors. The company then adjourned to the open air to witness the great ceremony of the day, which can scarcely be termed a launch, as the steamer was merely floated from the dock in which she was built. As she passed slowly into the outer basin, the Prince broke a bottle of wine upon her bow, and named her the "Great Britain," with the usual ceremonies. The Prince immediately took his departure for town, and left the terminus at

Bristol at 4 o'clock by a special train. The burthen of the Great Britain, which is built entirely of iron, is 3,600 tons register. For the sake of contrast it may be well to mention that the tonnage of the Great Western is 1,600 tons. The Great Britain will carry double the quantity of the Great Western, and be light afterwards. She will be propelled by engines of 1,000 horse-power combined: the length from figure-head to taffrel is 322 feet; length of keel 289 feet, extreme width 50 feet 6 inches: she has four decks, the upper deck is flush, and is 308 feet long; the second deck consists of two promenade saloons, the aft or first 110 feet six inches by 22 feet, and the forward or second class, 67 feet by 21 feet 9 inches. The third deck consists of the dining saloons, the grand saloon measuring 96 feet 6 inches by 30 feet, and the second class 61 feet by 21 feet 9 inches. The whole of the saloons are 8 feet 3 inches high, and surrounded by sleeping berths, of which there are 26, with single beds, and 113 containing two, giving 232 berths. This large number is exclusive of the accommodation which could be prepared on the numerous sofas. The fourth deck is appropriated for the reception of cargo, of which 1,200 tons will be carried, in addition to 1,000 tons of coal. The engines and boilers occupy a space of 80 feet, in the middle portion of the vessel. The engine-room and the cooking establishment are situated in this part of the ship. There are three boilers; these are heated by 21 fires, and will contain 260 tons of water. There are four engines, of 150 horse-power each, the cylinders of which are 7 feet 4 inches in diameter. The chimney is 39 feet high, and 8 feet diameter. She is fitted with six masts, the highest of which is 74 feet above deck. The quantity of canvas carried will be about 1,700 square yards, she will be fitted with the patent wire rigging, the hull is divided into four watertight compartments, and the quantity of coal consumed will be about 60 tons per day; upwards of 1,500 tons of iron have been used in her construction and that of the engines and boilers, the draught of water when laden, will be 16 feet, and the displacement about 3,200 tons, in addition to which she will be propelled by the screw instead of paddles; so that the whole vessel may be regarded as a great experiment of iron v. wood—screw v. paddle; and immense v. moderate length. She will also be fitted with very powerful pumps, which can throw off seven thousand gallons of water per minute. It is estimated that her total cost will be about 100,000*l.*

—The Trinity-house surveying steamer, *Argus*, arrived at Cumberland-basin on Saturday morning with the remains of Captains Drew and Jenkin Jones, two elder brethren of the Trinity-house, who were unfortunately drowned on the previous morning off Trevoise Head, Padstow. Several of the elder brethren had been surveying the light houses in the Channel, and on Friday morning, five of them, with four of the crew, attempted to land at Trevoise Head: but in consequence of there being a heavy sea, it was considered unsafe to attempt a landing, and they returned to the steamer. On nearing her, the engines were stopped, and, in attempting to cross her bows, the boat came in contact with the steamer while she was heavily pitching, and she was cut in two; all were immediately immersed in the sea, and Captains Drew and Jones were drowned. The other seven were saved. The bodies of the deceased were secured, and every means adopted to restore animation, but all proved ineffectual. A coroner's inquest has been held, and a verdict of accidental death returned.

Carmarthen.—In consequence of the unsettled state of South Wales, owing to the determination of Rebecca and her daughters to destroy the turnpike gates, orders were received at Woolwich at an early hour on Sunday morning to have in readiness a six-pounder field-gun and twelve-pounder howitzer, which were sent off on the same day, with the usual number of men of the Royal Artillery, required for their service in the field. The orders were to proceed to Bristol by the Great Western Railway, and from Bristol to Carmarthen with the least possible delay, in case their presence might be required to put a stop to the destruction of property in that quarter. The gates destroyed since our last are the following:—The Pontnewydd Gate and Toll-house, about five miles from Carmarthen, in the afternoon of Friday week (to which the Dragoons were called out, and, after scouring the country for about fourteen miles, returned without even having seen a suspicious character); the New Inn Gate, near Llandilo; the Gwarallt Gate, near Lampeter, and a toll-bar near it, on Monday week; two gates near Cardigan; the Pontwely Gate, between Rhydfach and Llandysil, on Friday; the Pumpaint Gate, near Dolecothy, on Thursday; and the Bronfelen Gate, five miles from Llandovery, on the road leading to Llandwrtyd, on Saturday. The magistrates have caused several persons to be apprehended on suspicion of destroying this gate, and are busily employed in investigating the affair. Such was the difficulty of obtaining a person to receive the tolls at the Bronfelen Gate, that fourpence was allowed to the collector for every shilling he received. Sixteen gates, toll-houses, and bars, have been destroyed in the Three Commot's District. It is a rather singular fact that not a single gate has been destroyed on a Sunday.—The Grand Jury have found true bills against the parties concerned in the recent attack on the workhouse; but the trials will not take place at these assizes, having been removed by *certiorari* into the Court of Queen's Bench.

Eton.—The great east window of the College chapel has just been fully exposed to view by the removal of the woodwork on either side, which was accomplished during the recent repairs and alterations within the interior of the edifice. Considerable anxiety has been manifested, for some time past, to have the present plain glass of this window, which ranks amongst the finest church windows

in the kingdom, entirely removed, and replaced with stained glass, containing Scriptural devices and emblems. The Upper boys have applied to the authorities of the College for permission to carry this intention into effect, and to defray the whole of the expense from their own pockets. In this undertaking there is no doubt that very material assistance will be rendered by many old Etonians. Mr. Eastlake, the Royal Academician, has been applied to on the subject, and has consented to furnish a design.

Leeds.—During Father Mathew's visit to this town, on Sunday and Monday week, he administered the pledge to 6,000 persons. In Bradford, on Tuesday, it is said he administered the pledge to 7,000. In Huddersfield, on Wednesday, his visit is also said to have been attended with success, and in York he gave the pledge to 2,000.

Lewes.—Mr. Cobden paid a visit to this town on Tuesday for the purpose of addressing the Sussex farmers on the subject of the Corn-laws. The meeting first assembled in the County Hall, but afterwards increased so much that it was necessary to adjourn to the Friars' Field, where about 1500 or 1600 persons assembled. Mr. Curteis, M.P. for Rye, presided. After a long address from Mr. Cobden followed by Mr. Elphinstone, M.P. for this borough, Mr. H. Brown moved, "That in the opinion of this meeting, protection to one class at the expense of other classes is injurious to the community at large, and, therefore, all laws professing to protect either the agricultural, colonial, or manufacturing interest, ought to be forthwith abolished." The chairman then spoke in favour of a fixed duty, after which he put Mr. Brown's resolution to the meeting, and every hand appeared to be raised in its favour; he remarked that it became his duty to declare it carried, only two hands having been held up against it, and both of them belonging to one person.

Liverpool.—A discovery in connexion with the recent fires at this port was made last week, from which there is reason to apprehend that the incendiaries are desirous of perpetrating additional mischief. It seems that as one of the police was going his rounds about 8 o'clock in the evening, he found a large heavy piece of pitch intermixed with fresh cotton, lying under the weatherboard of a cellar in Greenock-street, situated under an immense pile of warehouses, extensively filled with cotton and other valuable property. The pitch and cotton were immediately removed to the office of the Commissioner of Police, where it has been inspected and found to be in a highly combustible state, only requiring the slightest application of a lighted match to set it in a blaze. It was most fortunate that the discovery was made at so early a period of the night, or the consequences might have been very serious. No clue has yet been obtained to lead to the apprehension of the offenders.

Southampton.—A deputation from the council of the Royal Agricultural Society held their first meeting in this town on Monday, for the purpose of making preliminary arrangements as regards site and buildings for the general annual meeting of 1844. The deputation arrived by railway, and were met by the mayor and corporation, with whom they proceeded to the Audit-house; and, after partaking of a collation provided by the mayor, proceeded to examine the various plans suggested as fit for the show, pavilion, and ploughing-matches, &c. The committee expressed themselves pleased with the excellent accommodation this town and neighbourhood is capable of affording them, and will make their report to the next general meeting of the council in London.

Sheerness.—We regret to state that the accident on board H.M.S. *Camperdown* last week has proved more serious than was at first anticipated, and that a seaman and Miss Yerker, one of the ladies who were on board, have died of the injuries they sustained by the explosion. Inquests have been held on the bodies, at which it was proved that, whilst the ship was firing a royal salute as the King and Queen of the Belgians were passing, a portable magazine, called the saltbox, was placed on the main deck, about three feet from the after-gun, before the bulkhead, which was used for saluting cartridges, so as to obviate the frequent opening of the magazine. The box, at the time of the explosion, contained ten cartridges of three pounds each. There were also four rockets hung against the beam over the saltbox, two of them one pound rockets, and the other two half-pound. After the Royal salute had been fired, another gun went off, and then the saltbox exploded, and a short time afterwards a discharged rocket was found lying about midships. The saltbox was placed in its proper place, between the two knees on the side, that being the most secure part of the side. The box has been in the same place for more than two years. It is the custom in the Navy to have the box so placed, and is under the charge of the sentry on the half-deck, who stated that the ammunition and the lids of the boxes were perfectly secure during the firing of the Royal salute. It is also customary to keep, for present use, rockets hung on the beam of line-of-battle ships, under the half-deck. The rockets on board the *Camperdown* were placed in a similar position. It is also usual to fire the guns with port-fires, as is adopted on board her Majesty's ship *Excellent*, at Portsmouth. The ship's crew were firing with Finmore's tubes for priming, and it has been known that the quill part of the tube, and part of the worsted, have been thrown from the gun in an ignited state. Several gunners were examined, who proved that the salt-box was placed in the most secure part of the vessel; and Commander Finling, of the *Camperdown*, stated that he and his Officers had used every means to discover the real cause of the explosion, but they had not been able to satisfy themselves. In the case of the seaman, the jury returned a verdict of Accidental Death, at the same time expressing their opinion that all proper care and diligence had been

taken by the Commanding Officer of the ship; while in the case of Miss Yerker, the jury returned the following special verdict—"That the deceased was accidentally killed by the explosion of a portable magazine on board her Majesty's ship *Camperdown*, but how that explosion occurred there is no evidence to show; but the jury are of opinion that it partially arose from the reprehensible practice of keeping so large a quantity of powder out of the magazine, and the jury do recommend for the future that the proper authorities will cause their recommendation to be carried into effect."

Winchester.—A meeting, convened by Mr. Cobden and Mr. Bright, took place in this city on Saturday, for the purpose of considering the "agricultural working of the Corn-laws, and the true cause of the present depressed condition of the farm tenantry." The hour fixed for commencing the proceedings was 2 o'clock, but there were then not more than 100 persons present. Shortly before 3, however, they increased considerably, the number being then estimated at 600; and Mr. Cobden, with his friends, having taken up their position upon the platform, which was erected upon two waggons at the rear of the Corn Exchange, the business was proceeded with; Mr. Etwall, M.P. for Andover, in the chair. Mr. Bright addressed the meeting on the various topics connected with the Corn-laws, and said he wished it to be known that the League did not advocate low prices, but natural prices. They were desirous of those prices which the produce of men's industry would fetch if it had not been interfered with by legislation. The League was an association which had nothing to do with politics; they never supported the Whigs or their fixed duty, and had with equal energy opposed the present Ministry with its sliding-scale; they would continue their exertions to the last by the most determined opposition to all Ministers, of whatever politics they might be, or however influential, if they interfered in the slightest degree with the furtherance of the principles of free trade. Mr. Cobden next addressed the meeting, and commented for an hour and a half upon the evil effects of restrictions of any description upon trade. He reiterated the opinion he had promulgated in Bedford, Norfolk, Essex, Kent, and elsewhere, that the Corn-laws as a "protection" to tenant farmers was a rank delusion. He contended, at great length, that the price of Corn principally depended upon the home industry of this country, and that the laws regulating the importation of foreign productions put a fetter upon industry, and stopped the stream of commerce. He then referred to the act passed in 1815, and repeated the arguments which he urged at Colchester in opposition to the continuance of the Corn-laws. He said he had spoken feelingly upon the subject, being a farmer's son, and knowing the effect of the operation of those enactments upon the condition of persons in that class. He attributed the ruin which had come upon the farmers of England for the last 28 years to nothing else but the Corn-laws. He then dwelt at great length upon various topics in opposition to the Corn-laws, and in conclusion observed that he did not expect any advantage whatever personally from the part he had taken in the question. He regarded the principles of free trade as just, and of importance for the establishment of peace between the people of all parts of the world. There were so many moral and social advantages likely to grow from it, he had supported it with all the power of which he was capable, and the only reward he expected was that he should be considered a faithful and zealous advocate for the accomplishment of those principles of free and unrestricted trade all over the world. Mr. R. Owen next presented himself, but in consequence of a row it was impossible for him to proceed. Mr. Hoskins, M.P., also attempted to address the meeting, but was scarcely audible in consequence of the general riot and confusion which continued among the crowd. He was understood to deny that the farmers of Dorset and Somerset were favourable to a repeal of the Corn-laws. Mr. Jones, a practical farmer, and Mr. Marsh, a solicitor, then addressed the meeting, the latter expressing his dissent from Mr. Cobden's views. Mr. Monday, a farmer proposed a resolution condemnatory of the Corn-laws as injurious to all classes of the community, and stating that the adoption of free-trade principles would be advantageous to the country in general. The resolution was seconded, and adopted by a large majority.

Railways.—The following are the receipts for the past week:—Croydon, 360*l.*; Sheffield and Manchester, 436*l.*; Greenwich, 785*l.*; Birmingham and Derby, 1,220*l.*; Blackwall, 1,148*l.*; Great North of England, 1,325*l.*; York and North Midland, 1,725*l.*; Northern and Eastern, 1,849*l.*; Birmingham and Gloucester, 2,127*l.*; Edinburgh and Glasgow, 2,159*l.*; Midland Counties, 2,585*l.*; Manchester and Birmingham, 2,654*l.*; Eastern Counties, 2,937*l.*; South Eastern and Dover, 3,298*l.*; North Midland, 4,417*l.*; Manchester and Leeds, 5,176*l.*; South-Western, 7,137*l.*; Grand Junction, 8,637*l.*; Great Western, 15,268*l.*; Birmingham, 17,797*l.*

IRELAND.

Dublin.—Mr. Maurice O'Connell has been superseded since our last, for attending Repeal meetings. The daily papers state that the money transmitted to the Repeal Association is periodically invested in the Government securities. Last week the sum of 6,000*l.* was invested, in the New Three-and-a-half per Cents., by the broker of the Association. A Repeal demonstration took place on Sunday, at Swords, a village about seven miles from Dublin. The place was decorated with triumphal arches, and an immense quantity of green boughs. The attendance was very numerous, amounting to several thousands, and Mr. J. O'Connell, M.P., addressed the meeting.—The weekly meeting of the Repeal Association took place on Monday.

Mr. O'Connell alluded to the proposed subscription of the French Republicans, and to the promised visit of M. Odillon Barrot, as noticed in our Foreign News. He said the French sympathisers "need only write to Mr. Ray, and the gentleman who proposed to come over could, instead of taking that trouble, write to him (Mr. O'Connell), or to the secretary. But with reference to any communications with ulterior objects, he would distinctly say that they would receive no such communications. When, the other day, they were threatened with civil war, they declared that they would not strike the first blow; and he now could tell them that there would be no second blow at all. In sympathy for civil and religious liberty, in sympathy for freedom of conscience, and in sympathy for those in France who wish to strike down the iron yoke of monarchical domination, where it pressed upon popular freedom, they heartily united; but whatever would throw the slightest taint on their allegiance, shake the connexion between these countries, or disturb the golden link of the Crown by which the empire was united, had no sympathy whatever from them." Mr. O'Connell then announced the rent for the week as 1,464*l.* 1*9s.* 7½*d.*

Tullamore.—The King's County repeal demonstration took place in this town on Sunday, and was attended by between 40,000 and 50,000 persons, while some thousands more lined the main avenues of the town, finding it impossible to get within hearing distance of the platform. The walls, the windows of all the houses and storehouses commanding a view of the speakers, their roof-tops, and even chimney-tops, all found ready and patient spectators; but certainly not listeners, for they could not have heard anything beyond the cheering, in which they sometimes assisted. Dr. O'Rafferty, the parish priest of Tullamore, presided; and after several resolutions had been passed, Mr. O'Connell addressed the meeting at great length. He said, "The present Administration had proclaimed, trumpet-tongued, that the progress of repeal was irresistible; while they stood with their arms folded, like the fool who waited at the river's side for the water to pass by that he might walk across. Notwithstanding their declared preference of civil war to repeal—supported as that declaration was, at the time it was made, by Brougham, the most despicable of statesmen, and by a creature named Beaumont, who called himself a Catholic, —not one of those Ministers, during the recent debate of six nights, dared to talk of coercion, or of civil war, or, indeed, of any plan whatever for crushing the question of repeal—they just came to the magnanimous decision of doing nothing; thereby admitting the legality of the people's conduct and their undoubted right to look for the repeal of an atrocious act of Parliament. But they admitted more,—they admitted that the temporalities of the Irish Church could not long be continued. Under heaven there was no greater wrong than compelling the people of Ireland to pay a set of parsons for preaching doctrines to which they did not subscribe. A greater wrong, both to Presbyterians and Catholics, was never inflicted on a country than transferring those temporalities to the church of the minority—a minority of one in ten of the population; and that wrong every one, blessed be Heaven, was now admitting. The first great benefit of repeal would be the allocation of those funds to the purposes of charity and education, and the British Parliament already threatened to give them up without repeal." The dinner to Mr. O'Connell (which was attended by about 500 persons, consisting principally of shopkeepers from Tullamore, Athlone, Birr, Portlinton, Edenderry, and other towns, and farmers of the county,) took place in the evening. The decorations were few, but the inscriptions were numerous, and consisted chiefly of quotations from speeches in favour of and against repeal. Over the chair (which was filled by Dr. Cantwell, the titular bishop of the diocese,) was Sir R. Peel's opinion that civil war was preferable to repeal, followed by Mr. O'Connell's defiance to him to commence such a strife in Ireland; Dr. Higgins' defiance to all the Ministers of England to put down repeal in the diocese of Ardagh; and Mr. Steele's defiance of "let him try it if he dare." Mr. O'Connell spoke at length on repeal and other topics connected with Ireland. Referring to the decision of the twelve judges in England on the subject of Presbyterian marriages, he declared that a more indefensible or wicked decision he had never seen in the annals of judicial folly. He thought that there was an overweening respect paid in this country to my lords the judges. When at the bar he fought them, and now that he was from the bar he would say that a worse set of men were not, he believed, in the community. As a member of Parliament he was ready to forego every other pursuit, and repair to the House of Commons the moment the Presbyterians required it, to assist in passing a law to remedy this grievance, and reverse a decision which went to say that the ministers of their church were not clergymen at all. Alluding again to England's weakness, he said that she dared not hold out a single threat either to France, America, or Spain, until she did justice to Ireland. But what sort of propositions were made in the British Parliament under that pretence? One said, "Abolish the laws"—there were no such laws—"which prevent your sending an ambassador to the Pope." Another said, "Give the Roman Catholic bishops, whom the Irish people so much venerate, their titles." Dr. Cantwell here interrupted him and said, "We should despise them, coming from a British Parliament." Mr. O'Connell—"You would, my Lord, and yet that Parliament denies you the privilege of signing yourself 'Bishop of Meath,' or my right rev. friend of writing himself down Bishop of Ardagh." Dr. Higgins—"I am the bishop, though." Mr. O'Connell—"Yes; you are the Bishop of Ardagh, in unbroken succession from the days of St. Patrick, a succession that shall last to the second coming of the Redeemer. But

what an absurdity to suppose, that, because the people of Ireland venerate you, you would allow them to be conciliated if the British Parliament conferred upon you titles which you already possess!" He then touched upon the questions of the Irish church, landlord and tenant, unjust taxation, fiscal robbery, diminished franchise, limited municipal reform bill, &c., and observed that the British Parliament admitted them to be grievances, but did not promise to redress them. He, however, would not take their promise. What cared he, then, for their admissions? In January next, or, at farthest, in May, he would have a Parliament in Ireland, as surely as the rising of the sun, unless the Irish people were untrue to themselves. The second step towards repeal was coming. A few more of these meetings, and he should be ready to proclaim the meeting of 300 gentry in the city of Dublin. He concluded by proposing the health of "The Right Rev. Dr. Cantwell, Bishop of Meath;" who in returning thanks, challenged Lord Eliot to point out a single appointment by the grand jury of Westmeath, a county in which the Roman Catholics were 11 to 1, of a single Roman Catholic to any place, however humble, of profit, trust, or emolument. The Irish people were starving in the midst of plenty; the produce of their honest industry and toil was made to minister to the comforts and luxuries of men who resided in another country, and that was a state of things which he could not suppose it to be the will of Providence to continue. In conclusion, he gave the "Irish Hierarchy, and one of its brightest ornaments, the Bishop of Ardagh." Dr. Higgins, in reply, adverted to the proposed remedies for Irish grievances. As to the Ambassador to Rome, he said, he would be regarded and called an English spy. Let the ambassador be Protestant or Catholic, he cared not which if the Catholic were an Englishman, it would become the duty of the Irish bishops to select one from amongst themselves whom they would send to Rome as the real ambassador to watch the spy of the intriguers. He, for one, would look upon it as the first step towards the downfall of his religion, if any man, selected by the present Cabinet of England, were to be sent as ambassador to the court of the holy father, as his purpose would obviously be to bring the political weight of that detestable Government to bear upon the pure and simple character of their sacred religion. The other proposition was, to give them titles and revenues. The titles, thank God, they already had from a higher source—they were of God, not man; and as to the revenues, he believed he spoke the sentiments of every Roman Catholic bishop in Ireland, when he said that the moment those revenues were forced upon them, they would—be, for one, at least, would—go before the holy father and say, "Give me some means of escaping this pollution, or receive from my hands my crosier and my mitre." They knew what pollution there was in the connexion of church and state, and the day it was attempted with the Catholic Church in Ireland would be a day of agitation more frightful even than the present. He could not sit down without alluding to the gross ingratitude of the English nation towards the Catholic bishops of Ireland, whom they had called a demon priesthood, surplined ruffians, and almost rebels, for taking part in the present peaceful agitation. But did they know that when the Catholic bishops of Ireland joined for repeal, instead of the aristocracy asking what they would do with the people, the people were asking what they would do with the aristocracy? or that before they joined for repeal nothing was more familiar amongst the exasperated inhabitants of the country than the notion of beginning an agitation against rents, and measuring the rights of landlords by the law of nature? Instead of encouraging that notion, the Catholic bishops of Ireland turned the feelings of the people into a peaceful agitation for repeal; and if that repeal were long withheld, he was not the man to prevent an agitation against rents, which once begun would soon shake the empire to its very centre. The die was cast; onward they would move in peaceful agitation, and he had now only to hope that the stupidity and cupidity of England would not drive the people to that other agitation to which he had adverted." After some other toasts, the company separated.

Ennisclorthy.—A melancholy case of assassination is just reported from the county of Wexford, a district hitherto so tranquil. Mr. Fayle, who was postmaster, and also collector of county cess, has been assassinated. It appears that latterly a spirit of resistance to the payment of rates having arisen in certain quarters, Mr. Fayle was obliged in his public capacity to make seizures. The result of this was, that he received some threatening letters, and for his protection was obliged to carry fire-arms. On Wednesday he slept at Newtownbarry, driving there in his gig, and at five on the following morning, he was found lying in a ditch, within five miles of his home, and the horse grazing near him. Mr. Fayle was not dead when discovered, and he was enabled to state, that on passing a plantation on the road side, a shot, fired from behind, gave him an alarm, but the slugs passed through his hat without doing any injury. Three men then leaped out of the wood, and he could not say what occurred after. The fatal wound is from a ball in the front of his forehead, and Mr. Fayle's pistol was found on the road discharged; but whether he fired off, or it had been used by one of his assailants, cannot be ascertained at present. The object of the assassins had nothing to do with plunder, for his money was found on his person. It is said that there are no hopes of his recovery.

SCOTLAND.

Edinburgh.—The general education committee of the Free Protestant Church, at a meeting held in Edinburgh

on Tuesday week, in the exercise of powers conferred upon it by the Free General Assembly, made the following appointments to the chairs of the college established in connexion with the church: Dr. Chalmers, to be Principal and Primarius Professor of Divinity; Dr. Welsh, Professor of Divinity and Church History; Dr. Cunningham, Professor of Divinity; Dr. Duncan, Professor of Hebrew and Oriental Languages. Dr. Cunningham does not commence his duties till the session of 1844, and the committee have requested him to proceed in the meantime to America, in order to become acquainted with the system of theological instruction followed in some of the most eminent American universities. The committee also agreed that teachers belonging to other evangelical communions should be eligible to officiate as masters of schools, aided by or in connexion with the committee.

Flaw.

ASSIZE INTELLIGENCE.—(OXFORD CIRCUIT, OXFORD.)—*Cripps v. Hills.*—This was an action brought by a confecturer of this city to recover the amount of a bill for articles supplied to the defendant during his residence at the University, between Hilary term, 1840 and 1842, the total amount of which was 4*9l.* 10*s.* 2*d.* To the declaration three pleas had been pleaded,—1st, except as to 2*0l.* never indebted; 2d, except as to the same, infancy; 3d, as to the 2*5l.* payment into Court. The fact that the goods were furnished having been proved, Mr. Serjeant Talfourd addressed the jury for defendant, and said, the history of the young man, the defendant in this action, was the history of too many others who were sent to this noble University, not so much for the purposes of advancing the cultivation of their minds, as in order to acquire habits of right living and just feeling, and to form acquaintances that should be of advantage to them in future life. The defendant was the only son of a gentleman of fortune, who granted his son a handsome and most liberal allowance, on coming to the University, amply sufficient to defray all reasonable expenses consistent with his station in life. His father, on one occasion, visited him, with his family, while there; he saw his mode of living, and found nothing requiring either reprobation or censure; but to his regret and astonishment discovered that although at the time little more than 19 years of age, he had in two years and a half, of which only about 18 months would be spent in Oxford, incurred debts to the amount of 1,600*l.*, besides running through the whole of the money given him by his father, thus creating, through thoughtlessness and want of ordinary prudence, an embarrassment and annoyance which would in all probability endure for years. It must, therefore, be a source of deep and painful reflection, that the tradesmen of this city should be instrumental in causing the misery and pain of which this was by no means a solitary instance, and heavy indeed was the responsibility which they incurred in inviting youths to extravagance, and leading them by most falacious promises to incur heavy responsibilities, wholly inconsistent in many instances with their position in life. In this case the first question for consideration was, whether the defendant were a minor while resident at college; the second, whether, if he were so, the articles supplied were necessities or not. This was not one of those cases where the plaintiff's demand had been altogether resisted; for 2*5l.* had already been paid, and he must say that he highly commended the course pursued by the defendant; and the moral courage he had shown in setting up the defence which he had done deserved the praise of every man similarly situated, and more especially of every father who had a son either at this or the sister University. The allowance to the defendant having been proved, and evidence having been given of his position in life, &c., Mr. Wateley, Q.C., replied, observing that he perfectly coincided with his learned friend as to the degree of courage requisite to put the present defence upon the record, for the defendant had by payment of 2*5l.* admitted to a certain extent his liability; the question, therefore, for the consideration of the Jury, would resolve itself merely into one of amount, and they would only have to say whether the articles sent to the defendant were or were not paid for by the 2*5l.* already alluded to. The establishment of friendships was not one of the least advantages to be derived from a University education; and how, he would ask, were opportunities to be afforded for social intercourse and the mutual interchange of kindly offices, if young men at College were debarred from entertaining each other at their rooms? Could it, therefore, be said that the articles supplied on such occasions were not necessities, or that any good end would result from their prohibition? The learned counsel commented at some length upon the topics adverted to by Mr. Serjeant Talfourd; after which, Mr. Justice Maule, in summing up, remarked that he did not think the Jury could draw any inference from the 2*5l.* already paid into Court, but that, unless they were of opinion that the goods supplied exceeded in value 2*5l.*, their verdict must pass for the defendant. With regard to the term "necessaries," he would not say that they ought to construe the word in a strictly metaphysical sense, or say that nothing was necessary which a man could do without, as a learned Judge had once observed, that nothing was unnatural which happened, because if, accurately speaking, it were unnatural, it could not occur. Assuming it necessary that a man should live, he must have that to subsist upon which accorded with his condition of life, and his expenses must be proportioned to that condition. He could not give his assent to the proposition laid down by Mr. Wateley, that it was necessary for a young man sent to the University to give entertainments to his friends; nor did he by any means deem it necessary that he should incur expenses, while at College, exceeding 300*l.* a year. His Lordship was aware that, to a certain extent, the less a man spent the more he would get at either University for his money, and any one who recollected aught of University career, must know this full well. He did not think, in the present instance, any blame whatever was attached to the defendant, or his father, who had supplied his son with a very ample income, and whose conduct must be considered most exemplary and praiseworthy. The learned Judge then explained the state of the law relating to the infancy and power of infants to bind themselves by contracts, when the Jury returned a verdict for 2*4l.* 10*s.*

SOUTH WALES CIRCUIT.—*CARDIFF.*—*The Llaleston Murders.*—The trial of Edward Thomas and his wife, Mary Thomas, for the double murder of her brother, Mr. William Howells, of Pantrossylla, and Jane Harry, his servant, commenced on Wednesday week, and from an early hour every avenue to the court was densely crowded. The prisoners pleaded "Not Guilty." The particulars of this case were noticed in this Paper at the time, and it will therefore be necessary to notice only the evidence of the principal witnesses. Anne Thomas deposed, that she was housekeeper to the late Mr. Howells, the brother of the female prisoner. He was a respectable farmer and freeholder, residing at Pantrossylla, near Llaleston. She had been in his service for some years, and remained in it up to the period of his death, which happened the morning after Good Friday last. Mr. Howells was a bachelor of about 53 years of age, and had no other near relative but the female prisoner, who was his only sister; the only persons residing in his house were the deceased, two boys, who were farm servants, and the witness, his housekeeper. The family were in the habit of drinking beer occasionally with their dinner, generally homebrewed, but when out of that, Mr. Howells used to send a gallon jar to Llaleston to a Mrs. Lewis for beer, she being a maltster and brewer. Mr. Howells was on terms of considerable intimacy with Mrs. Lewis, and often declared his intention of marrying her. In the house they had a stone jar, which was kept for the purpose of fetching the beer. On Good

Friday last the deceased and his servants sat down to dinner in the same room but at different tables; they had salt beef and pork and brocoli for dinner. Her master was then in health, and ate his dinner rather more heartily than usual. After dinner, as they were out of beer, her master took down the jar, which she had washed out the day previously, and asked her to go to Llaleston to fetch some. As, however, she was busy about the farm, and could not well go, he went out to look for a little boy named John Morgan, the son of one of his tenants, living in a cottage close by, and he sent him to fetch the beer. Witness was present when the deceased gave the little boy the jar to fetch the beer, and when the little boy brought it, and placed the jar with it on the table. Mr. Howells told the boy to go to Mrs. Lewis's for it, and to return with it as quickly as he could, and it was about half-past 4 o'clock when the boy came with it. Witness then went out to milk the cows, and on her return she felt poorly, and her master desired her to take some tea. Mr. Howells took the jar with the beer into the dairy, and witness afterwards partook of the beer; she took about an eggcup full of it, but had not drunk it many minutes before she felt a burning sensation in her mouth and throat, a fullness, and was seized with a vomiting and brought up blood, and she felt as if she could hardly see. About 6 o'clock her master, Mr. Howells, was also taken ill. Witness could not assist her master, being so ill herself that she was obliged to crawl up stairs to bed, and remained there ill until Sunday afternoon. She never saw the jar afterwards until she saw it broken in pieces in a field near the house. She also saw several pieces of broken bottles—the policeman was gathering them up, and witness identified the jar by the handle, which she knew perfectly. Witness was the only woman living in Mr. Howells's house, and there was nothing locked up from her in the house except the money. This circumstance enabled her to state that there was no poison in the house, nor had there ever been anything of the kind. Mr. Pritchard, the surgeon, deposed to the fact of deceased's illness, and to the post-mortem examination of the body, which was exhumed in consequence of the suspicions excited by the conduct of the prisoners. Mr. Herapath, the chemist, of Bristol, proved that the bodies on being analysed contained arsenic. The case for the prosecution being closed, Mr. Chilton addressed the Jury in a speech of three hours' and upwards duration for the prisoners, in which he threw doubts upon various points in the evidence, and concluded by appealing, in powerful language, to the well-known religious prejudices of the Welsh people against capital punishments.—Mr. Justice Maule, in summing up, arranged the evidence in chronological order, and commented upon the whole of it. He also took occasion to observe that he thought it exceedingly dangerous that juries should be addressed as they had been by Mr. Chilton at the conclusion of his speech, for if the evidence was sufficient to cause them to entertain no reasonable doubt of the guilt of the parties upon their trial, they must fearlessly pronounce such a verdict, and without looking to ulterior consequences; and if, having done so, it should afterwards be shown, as had been said by Mr. Chilton, that they were innocent, he saw no reason why the jurors should not sleep tranquilly upon their pillows, because they had come to their conclusion upon the evidence offered them conscientiously and to the best of their judgments. The Jury having retired, after being locked up for an hour and a half, came into court, and pronounced a verdict of Not Guilty, upon both the prisoners. The verdict appeared to be received with the utmost astonishment, not only by his Lordship, but by every one in the court, which was crowded almost to suffocation. The prisoners were on Friday morning arraigned for the murder of Jane Harry and on the coroner's inquisition. No evidence was, however, offered, and they were discharged. They were reconveyed to the gaol for safety, followed by an excited multitude, yelling at them and threatening vengeance.

SPORTING.

TATTERSALL'S.—THURSDAY.—Goodwood Cup.—4 to 1 agst Col. Charrille's Gorhambury (taken), 7 to 1 agst Sir G. Heathcote's Siriol (taken), 10 to 1 agst Mr. Lichtwald's Hyllus (taken), 11 to 1 agst Lord Eglinton's Pompey (taken), 15 to 1 agst Mr. Gully's Baronet, 17 to 1 agst Mr. Johnstone's Charles XII., 20 to 1 agst Mr. Meiklan's Agreeable colt.

MARK LANE, FRIDAY, JULY 21.—There have been a few arrivals of English Wheat since Monday, which were sold at 2s. per qr. beyond that day's currency. Foreign Wheat is also 2s. dearer; but bonded does not advance in proportion to the free. Barley Peas, and Beans, are fully as dear, and Oats are 6d. to 1s. higher.

George Ross Lindsay Crawford, Earl of Glasgow.—On the 14th inst., accidentally drowned, while engaged on a survey in the Bristol Channel, Captain Richard Drew, F.R.S., and Captain Jenkin Jones, R.N., Elder Brethren of the Trinity House.

FUN FOR THE FIRESIDE!

Bound in cloth, price 5s. 6d.

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: WHITTAKER and Co.

SUN-BURNS, FRECKLES, TAN, and other disfigurements of the Skin, are pleasingly eradicated by that unique preparation ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR."—It is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper, and "A. ROWLAND & SON, 20, HATTON-GARDEN," engraved on the Government stamp affixed to each bottle. Price 4s. 6d. and 8s. 6d. per bottle, duty included.

Ask for ROWLAND'S KALYDOR.—Sold by them, and by Chemists and Perfumers.

COUNTRY HOUSE WANTED, Unfurnished, for a term of years.—A Gentlemanly Residence, detached, in perfect order, between 30 and 50 miles of London. The situation must be elevated and healthy, free from the neighbourhood of stagnant water or marsh land, on a light or gravelly soil, with southern aspect. The house must contain 3 or 4 best bedrooms, nurseries, 3 servants' rooms; dining and drawing rooms, not less than 21 ft. by 15 ft.; good morning room, usual domestic offices, well supplied with water; 4-stall stable; good pleasure-grounds, flower and kitchen gardens, with from 14 to 20 acres of meadow land; and within a mile of a church and a village, and 3 or 4 of a good town. The house must stand in its own grounds, and a lodge-entrance for the gardener would be preferred. Full particulars to be addressed to Messrs. HEDDER, Land-Agents, 10, New Bond-street, opposite the Clarendon,—at whose Offices Cosmographic drawings of properties may be seen.

ELECTRO-PLATED and GILT ARTICLES.—ELKINGTON & Co., Patentees, beg to announce that, to meet the increasing demand for this manufacture, they have opened an establishment at No. 22, REGENT-STREET, (CORNER OF JERMYN-STREET,) where every variety of articles for the Side-board, Dinner, Dessert, and Breakfast Tables may be inspected.

They have also a similar assortment at their City Establishment, No. 45, MOORGATE-STREET, where they have a MANUFACTORY for PLATING and GILDING, RE-PLATING and RE-GILDING ARTICLES of every description, and of ALL METALS.

With reference to articles of their manufacture, the Patentees beg to state that they differ from all goods hitherto offered as "Plated Goods" or "Substitutes for Silver," being made in the same manner as SOLID SILVER, from which they cannot be known, and being also composed of a hard white metal, strongly coated with silver by the Electro process.

Silver Articles of every kind or pattern exactly copied.

Every article made by the Patentees bears their stamp (E. & Co. beneath a Crown.)

AGRICULTURAL EDUCATION.—The Proprietor of a respectable Academy, some distance from town, who is also connected with Farming, has a VACANCY for two Pupils, between the ages of 8 and 15, who will devote a part of the day to Scholastic pursuits, and the other to those of Agriculture, the practice of which is conducted upon the improved system. English, French, Latin, Greek, Drawing, and the Mathematics, are the principal branches of literature that will be taught.—For terms, &c., apply by letter to X. Y., 6, Old Cavendish-street, Oxford-street.

CHEAP STATIONERY, CUTLERY, WORK-BOX, WRITING-DESK, and DRESSING-CASE MANUFACTURER.—Sloper's Embossed Postage Envelopes, without Advertisements, 1s. per dozen to purchasers of other articles; fine Bath-post, 3d. per Quire, 5s. per Ream; ditto Note, 2d. per Quire, 3s. per Ream; Queen's Size (Note), 2s. per Ream; very superior Foolscap, 8d. per Quire, 12s. 6d. per Ream; Envelopes, 6d. per 100; Copy Books, 4d. each, 3s. 6d. per dozen; good Pens, 1s. 6d. per 100; Embossed Blotting Books, 6d. each; superior Bibles, gilt edges, 1s. 10d. each; ditto Prayer Books, 1s. 6d. each; good Pen-knives, 6d. each; Rosewood Work-boxes, 2s.; Rosewood and Mahogany superior Desks, 7s. 6d.; superior Pocket-books, 6d. each, &c., &c. Goods exchanged, or Money returned if not approved of. A nameplate engraved, and 100 best Cards printed for 4s. 6d. Bookbinding, Printing, and Engraving, at the lowest terms; 10 per cent. off new Books and Music. Parcels of 2l. value forwarded 100 miles free of carriage; of 10s., 5 miles from London, and any amount in town. Lists of Prices, and samples of Paper, sent on the receipt of two postage-stamps, from SLOPER'S Stationery Warehouse, 20, George-street, Portman-square, London.

BUTTER MADE IN TEN MINUTES

BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT.

ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Metal Pans for Churns to stand in, 4s. 6d., 6s., and 7s. Larger sizes made to order. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, LEWES.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & Co., 109, Fenchurch-street.

ALL DISEASES OF THE KIDNEYS and BLADDER

speedily and effectually cured by DR. YOUNG'S MIXTURE. The efficacy of this Medicine in the above Complaints has been long proved by its unparalleled success in a practice of many years' standing, and has induced the present proprietor to make it more generally known.

Sold in Bottles, 2s. 9d. each, by the Proprietor's Agent, J. SANGER, 150, Oxford-street, London; also by Johnson, 68, Cornhill; Prout, 229, Strand; Mr. King, 232, Blackfriars Road; and all Medicine Vendors throughout the country.

CORN, BUNIONS, &c.

THE PROPRIETOR of the ANTI-CALLOSITY, or RUSSIAN CORN and BUNION PLAISTER, feels great confidence in recommending it as the most certain cure for all Callous Swellings on the Feet that has ever yet been invented. By the use of this Plaister immediate benefit will be found, and in a short time a Radical Cure will be effected by gradually dispersing the Hard or Soft Corn, and entirely removing those painful throbblings so severely felt at every change of weather. Sold, with full directions for use, in boxes, 1s. 1d. and 2s., at SANGER'S Medicine Warehouse, 150, Oxford-street; and all Medicine Vendors throughout the country. Remember—"THE RUSSIAN CORN and BUNION PLAISTER."

FOR THE PUBLIC GOOD.

DR. ROBERTS'S CELEBRATED OINTMENT, called the POOR MAN'S FRIEND, is confidently recommended to the public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs, if of 20 years' standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, cancerous humours, &c., and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1s. 1d. and 2s. 9d. each. Also his

PILULE ANTISCROPHULÆ.

confirmed by more than 40 years' experience to be, without exception, one of the best alterative medicines ever compounded for purifying the blood and assisting nature in all her operations; hence they are useful in scrofula, scorbutic complaints, glandular swellings, particularly those of the neck, &c. They are efficacious also in rheumatism, and form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1s. 1d., 2s. 9d., 4s. 6d., 11s., and 22s. each. To those who cannot take pills, the proprietors would strongly recommend Dr. Roberts's

ANTISCROBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic complaints; they strengthen the constitution, purify the blood, and promote a circulation of the fluids; are gentle in their operation, and do not require cessation from business. In bottles at 2s. 9d. each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT (who have been confidently entrusted with the preparation of his medicine for many years past), are left joint proprietors of the "Poor Man's Friend," "Pilule Antiscrophulæ," "Larwell's Pills," "Medicated Gingerbread Nuts," and "Antiscrobutic Drops," with the exclusive right, power, and authority to prepare and vend the same.

The still increasing demand for the above medicines, from all ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER.—A respectable middle-aged married Man, who perfectly understands the management of the Hothouse and Greenhouse, likewise Early Forcing, and every department in general; and who can have a good character from the Situation he has just left.—For particulars apply to Messrs. WM. WOON & SON, Maresfield, near Uckfield, Sussex.

AS GARDENER.—A married Man, aged 42, who has had the general practice of a Kitchen-Garden and Pleasure Grounds of a large Establishment. Would not object to take charge of Pasture Land, if required. Can have a reference from the employer he is now leaving.—Direct to V. K., Holly-hill Lodge, Erith, Kent.

AS GARDENER, where another is kept, or a single-handed place.—A respectable young Man, aged 26, who understands the management of cows, and has no objection to make himself generally useful. Can have a good character from his last Situation.—Direct to W. H., at Mr. UDELL'S, Tea-dealer and Grocer, Royal Hill, Greenwich, Kent.

AS GARDENER.—A respectable young married Man, aged 26, without incumbency; can have a good character from his last Situation; no objection to a single-handed place.—Direct to W. C., at Mr. CUTHILL'S, Florist, No. 4, Denmark-hill, Camberwell.

AS GARDENER.—A respectable married Man, aged 37, who is perfect master of every branch of his Profession, is capable of taking the management of Pines, Grapes, Greenhouses, Hothouses, Wall trees, Kitchen and Flower Garden, and every variety of Early and Late Forcing, with the care of Meadow-land and Cattle. His wife is an excellent Laundress, and would take the entire management of the House in the Family's absence, with Poultry or small Dairy. Can obtain most trust-worthy characters. No in-door place will be accepted.—Direct to S. C., 8, Peel's-place, Kensington Gravel Pits.

AS GARDENER.—A single young Man, aged 28, who understands the propagation and general management of Stove and Greenhouse plants, the Kitchen and Flower garden. Can give satisfactory reference as to character and ability. Salary, 22 guineas with board and lodging, or 1l. a week if out of the house.—Direct, E. K., at Messrs. LONDRES'S Nursery, Hackney.

AS GARDENER.—A young Man, who is perfectly conversant with the management of Orchidaceous, Stove, and Greenhouse Plants, &c. Also has a general knowledge of Forcing and Gardening in all its branches, having lived in some of the principal places in the neighbourhood of London. Satisfactory testimonials can be given by the head Gardener with whom he is still living.—Direct to A. B., at Mr. RONALD'S, Nurseryman, Brentford.

AS GARDENER.—A married Man, without incumbency, 33 years of age, who is well acquainted with Horticulture and Floriculture in all their various branches, and can have a Character of four years and a half from his last Situation. If desired, his wife can act as Housekeeper and Cook.—Direct to A. Z., at Messrs. RONALD'S and SONS, New Brentford, or Messrs. FLANAGAN and Co., 9, Mansion House Street, London.

AS GARDENER.—A respectable single Man, aged 34, who perfectly understands the management of Hothouses, Greenhouses, Early Forcing, and Kitchen Garden, with the Management of Meadow-land. Can have four years' character from the gentleman he has just left.—Direct to A. B., Albion Coffee-house, 122, Houndsditch.

TO NOBLEMEN and GENTLEMEN.

AS FARM BAILIFF, in any county in England.—A young Man, a native of Cumberland, who can give respectable references, and produce sufficient testimonials as to character, capabilities, &c.—Direct to A. L., Post-office, Brampton, Cumberland.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Printshop of Whitefriars, in the City of London, and Published by them at the Office, 8, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 22, 1844.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 30—1843.

SATURDAY, JULY 29.

Price 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Agricultural Society, remarks on the show at Derby	499 a	Grass land, good seeds for	504 c
Alonsoa grandiflora, treatment of	505 a	Guano, notice of	504 c
Amateur's Garden	501 a	Heating apparatus, Watson's, described	500 b
American Agriculturist, rev.	504 a	Leaf-mould, to prepare	504 c
Antiquities of gardening	500 a	Lee's Botany of the Malvern Hills, rev.	508 b
Bees, queries respecting	501 c	Nerves, as purifiers of the blood	505 b
Bees, remarks on the amount of honey collected by	501 b	Orchidaceous plants, sale of	508 b
Bureau Society, exhibition of	512 a	Pear tree, double, notice of	508 a
Botanists, description of the water Brit. Soc. plants by	511 a	Pear trees, to check the blistering of their leaves	505 a
Broom, as a medicine	511 a	Pelargoniums, scarlet, to pot in autumn	505 a
Cacti, remarks on	511 a	— their treatment	501 a
Companionship, as a means of treatment	511 a	— to bloom in succession	500 l
Cats, destroying (cock) flies	511 a	Cession	500 l
Chambers, evergreen	515 a	Pine-apples, remarks on the deformity of	507 a
Corn, as a food for stock	515 a	Pits, hints on building	505 b
Cotton-wool, as a manure	510 a	Raspberry, Fastolf, merits of	512 a
Countryside, the necessity of stating the cause of winning flowers at	499 a	Red spider, to destroy	505 b
Cucumbers, to cure mildew on	505 a	Rendle's tank system of heating, remarks on	501 a
Falkner's Muck Manual, rev.	504 a	Rhubarb-stalks, to preserve	505 b
Fire, queries respecting disease in	505 a	Roots and leaves, medical properties of	508 b
— to check the ravages of insects on	505 b	Roses, to obtain autumn-blooming	504 a

Flax, refuse, as a manure	500 a	Sticks, their treatment	505 a
Forster, as a manure	500 a	Strawberries, benefited by removing the leaves	502 a
Glass, the utility of sheet over other kinds for horticultural purposes	499 a	Van Diemen's Land, meteorological observations at	503 b
Good, as a manure	503 b	Veronica's Nursery, notice of	503 c
Grass, as a manure	503 b	Wet, in plants in the open air, remarks on	499 a
Grass, as a manure, supposed cause of putting in	505 a	Wrens, habits of	501 c

TO LET, in Regent-street, THREE Rooms on the Second Floor, Unfurnished, with the use of a Large Meeting-Room. They are suited for the purposes of a Society, and have for some years past been so occupied. Apply to the Porter, 21, Regent-street.

TO FLORISTS, NURSERYMEN, and Others.
THE WEST LONDON FLORICULTURAL EXHIBITION will take place in the grounds of the Almshouses of the BUTCHERS' CHARITABLE INSTITUTION, at Walham-Green, Fulham, on TUESDAY, the 8th, and WEDNESDAY the 9th of August, 1843; when Prizes of Silver Cups and Medals will be awarded. A List of the Prizes and the Regulations of the Show may be obtained of Mr. J. T. NEVILLE, Ebenezer House, Peckham.

KINGSTON ROYAL HORTICULTURAL EXHIBITION, SEPTEMBER 14, 1843.
For particulars apply to J. JACKSON, Hon. Sec.

GRAND FLORICULTURAL and HORTICULTURAL EXHIBITION.—The Annual Floricultural and Horticultural Exhibition in the GROUNDS of the YORKSHIRE PHILOSOPHICAL SOCIETY will be held on SATURDAY, the 26th day of August next, under the Patronage of the principal Nobility and Gentry of the County, and upon the same scale as on former years.

The Grounds will be open at Twelve o'clock, Admission, 3s. each; at One o'clock, 2s. each; and after Three, until Five o'clock, 1s. each. Children under 14 years of age, and schools, half-price. The Exhibition will close at Five o'clock.

The Schedule of Prizes may be had after the 1st day of August, on application to Mr. SOTHERAN, Bookseller, Coney-street, York, or to the Committee of Management, or to Mr. BAINES, at the Museum.—Museum, York, July 27, 1843.

MEETING OF THE HIGHLAND SOCIETY AT DUNDEE, on the 8th, 9th, and 10th of August.
Noblemen and Gentlemen who may be at Dundee at the above Meeting, are respectfully invited to inspect the Stock of Seedling and Transplanted Forest Trees, &c., in the Nurseries of WILLIAM URQUHART and SONS.

SHOW OF FUCHSIAS.—A splendid collection of the above beautiful tribe of plants may be seen in bloom, containing all the new varieties of the present season; also the best of the older sorts,—at WILLIAM MILLER'S, Providence Nursery, Ramsgate. Sundays excepted.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

NEW AND SUPERB FUCHSIAS.

YOUELL & Co. respectfully refer the readers of the *Gardeners' Chronicle* to their select List of the above elegant tribe of plants, which appeared on the front advertising page of this Paper of the 27th ult. They are now ready to be sent out per post, free, (on the receipt of a post-office order,) to any part of the United Kingdom, upon the following terms:

12 fine show varieties, 12s. 12 extra fine and very superior, 16s. 12 extra fine ditto, 21s.

The selection being left to YOUELL & Co.

Great Yarmouth Nursery, Norfolk, July 26, 1843.

FUCHSIA ST. CLARE.—A Specimen of this magnificent FUCHSIA has been again submitted to Dr. LINDLEY. YOUELL & Co. have therefore much pleasure in referring the readers of the *Gardeners' Chronicle* to the remarks made, and which will be found amongst the "Notices to Correspondents" in this Paper of the 24th ult., as follows:—"YOUELL & Co.—From the specimen received, St. Clare appears to be a prolific bloomer and fine variety; we have never seen the colour so fine in any specimen grown near London."

YOUELL & Co. can supply a limited number of fine strong Plants, 15 inches high, in 48-sized pots, at 10s. 6d. each; or one smaller St. Clare, with 11 other fine show varieties at 21s., per post, free, on the receipt of a post-office order.—Great Yarmouth Nursery, July 26, 1843.

SUPERB CHRYSANTHEMUMS.

YOUELL & Co. in offering their List of CHRYSANTHEMUMS (for which see their advertisement in this Paper of the 1st inst.), to the notice of Amateurs and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the List will be found highly satisfactory to those who may not only have the above object in view, but also to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants are strong and healthy, and sent free of postage (on the receipt of a Post-office order) to any part of the United Kingdom, at the rate of 12s. per dozen.

Great Yarmouth Nursery, July 26, 1843.

EAST NORFOLK GRAND CARNATION AND PICOTEE SHOW.

YOUELL and CO. beg respectfully to inform their Friends that their Annual Exhibition of the above will commence on the 1st of August, and will continue for three weeks. Their Collection now amounts to UPWARDS OF NINE HUNDRED OF THE FINEST VARIETIES IN CULTIVATION, and the present Exhibition will be found to surpass anything of its kind in the kingdom. THREE THOUSAND POTS WILL BE STAGED.—ADMITTANCE GRATIS.
Great Yarmouth Nursery, Norfolk, July 26, 1843.

HORTICULTURAL SOCIETY OF LONDON.—LIST OF PRIZES offered at the Exhibitions in the Garden, in 1844:—

MEDALS AND REWARDS.—The Society distributes the following Medals and Rewards; namely,

	value	£	s.	d.
C. The Certificate		0	10	0
SB. Silver Banksian Medal		1	0	0
SK. Silver Knightian Do.		1	5	0
LS. Large Silver Do.		1	15	0
SG. Large Silver Gilt Do.		4	0	0
GB. Gold Banksian Do.		7	0	0
GK. Gold Knightian Do.		10	0	0
LG. Large Gold Do.		20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. In case an Exhibitor shall receive a First Prize in any one Letter, he shall not be entitled to receive any other Medal in the same Letter, except in CC, DD, and EE.

CLASS I.—FLOWERS; for which Nurserymen and Private Growers exhibit independently of each other.

A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast. GB—SG—LS—SK.

B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast. SG—LS—SK.

N.B. Persons exhibiting in B cannot also exhibit in C.

C. Pelargoniums, in collections of 6 varieties, in pots of 8 to a cast. LS—SB.

D. Rhododendrons, in pots; not fewer than 6 plants in 6 varieties. LS—SK—SB.

E. Roses, in pots; Amateurs to show in collections of 12, Nurserymen in collections of 25, distinct varieties. GB—SG—LS.

N.B. It is the wish of the Society, in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.

F. Moss Roses in loose bunches, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties. SK—SB—C.

G. Other Roses, exhibited as in the last letter, and in 50 varieties. LS—SK—SB—C.

N.B. No one who exhibits in this letter can also compete for the following.

H. Other Roses, exhibited as in the letter F, and in 25 varieties. SK—SB—C.

N.B. Higher medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

I. Cape Heaths, in collections of 20 distinct varieties. GB—SG—LS.

N.B. It is expected that the same plant shall not be exhibited on more than one occasion.

K. Cape Heaths, in collections of 6 distinct varieties. SG—LS—SK.

N.B. No person who shows in I will be allowed to exhibit also in K.

L. Calceolarias, in sixes; in pots of 12 to the cast. LS—SK—SB.

M. Carnations, in pans of 24 distinct varieties. LS—SK—SB.

N. Picotees, in pans of 24 distinct varieties. LS—SK—SB.

O. Pinks, in pans of 24 distinct varieties. SK—SB.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition.

P. Stove or Greenhouse plants, in collections of 30 plants. GK—GB—SG—LS.

N.B. Heaths, Calceolarias, Fuchsias, Greenhouse Azaleas, Rhododendrons, Orchidaceae, Cacti, and Pelargoniums, to be excluded from P, Q, and R.

Q. Stove or Greenhouse plants, in collections of 15 plants. GB—SG—LS.

N.B. Persons exhibiting in P not to compete in Q also.

R. Stove or Greenhouse plants, in collections of 6 distinct species. SG—LS—SK.

N.B. Persons exhibiting in P or Q will not be allowed to compete in R also.

S. Greenhouse Azaleas, in 12 distinct varieties. GB—SG—LS.

T. Greenhouse Azaleas, in 6 distinct varieties. SG—LS.

N.B. No one can show in both classes of Azaleas.

U. Stove or Greenhouse climbers, in collections of 6 species. SG—SK.

V. Exotic Orchidaceae, in collections of not fewer than 20 species. LG—GK—GB.

N.B. Exhibitors cannot shew in more than one of the classes, V, W, and X.

W. Exotic Orchidaceae, in collections of not fewer than 6 species. GK—GB—SG.

X. Exotic Orchidaceae, in single specimens. SG—LS—SK.

Y. Plants in glass cases, grown on Mr. Ward's plan. SG—LS—SK.

N.B. It is highly desirable that these cases be made with a movable door, so as to prevent the condensation of the water on the inner face of the glass during the time of exhibition.

Z. Distinct varieties of Tall Cacti in flower. GB—SG—LS.

N.B. The GB and SG Medals are not to be given if fewer than six varieties are exhibited.

AA. Fuchsias in collections of 12 distinct varieties. LS—SK.

BB. Cinerarias, in pots, in collections of 12 distinct varieties. SK—SB.

CC. Single Specimens of new or extremely rare ornamental plants. SG—LS—SK—SB—C.

N.B. These Medals will be awarded by the Society's Officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this letter. Nothing will be regarded as new which has been exhibited in the Garden in a previous season.

DD. Miscellaneous subjects. SK—SB—C.

N.B. Cockscombs, Heartsease, Hydrangeas, and cut flowers are altogether excluded from exhibition. Exhibitors under this head will not be thereby entitled to a pass ticket.

EE. Seedling Florist's flowers. SK—SB—C.

N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to

be shown in pots, and not in a cut state. No person will be allowed to exhibit more than five seedlings at each meeting. Exhibitors under this head will not be thereby entitled to a pass ticket.

IN ADDITION to any medals assigned to the classes I, P, Q, and W, the SK and SB medals are offered for the two collections in those classes which shall be best named by the Exhibitor.

N.B. The Society's officers, who will make this award, will be guided in their judgment by a consideration not only of the correctness of the names, but of the accuracy of the spelling, and the neatness of the writing.

CLASS III.—FRUIT; for which Market Gardeners, Fruiterers, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.

N.B. All fruit must be FULLY ripe and WELL-COLOURED; if the contrary it will be disqualified.

FF. Miscellaneous collections of fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind. GK—GB—LS.

N.B. Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

GG. Grapes. SG—LS—SK—SB.

HH. Pine Apples. SG—LS—SK—SB.

II. Peaches or Nectarines, in dishes of six specimens. SK—SB.

KK. Other kinds of fruit. SK—SB—C.

JUDGES.—The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings, being not so much to encourage the collector as to reward the skilful Gardener; they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition might obtain a prize, merely because there is no better exhibition of the same class to oppose it.

Copies of the above list may be obtained at 21, Regent-street, upon application to the Secretary.

SPLENDID NEW CARNATION,—"APPLEBY'S PRINCE OF WALES," (Scarlet Bizarre), blooms of which may be seen at Messrs. HURST & McMILLAN'S, Seedsmen, 6, Leadenhall-street, London, on the 29th of July. For description see "Gardeners' Almanac" for 1843. Plants, 10s. 6d. per pair, ready in October.

MAGNIFICENT NEW FUCHSIA,—"FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co. beg leave to call the attention of the Public to a very superior New Fuchsia, which has been raised in the Exeter Nursery, and which is decidedly the finest variety ever produced. Flowers of it were submitted to Dr. LINDLEY, who, in the *Gardeners' Chronicle* of the 8th inst., thus expresses himself:—

"Lucombe, Pince, and Co.—The blooms sent of Fuchsia Exoniensis prove it to be a very splendid variety; it is a flower of great substance throughout, seed-vessels dark, tube and sepals of a rich crimson carmine; the sepals are long, they expand freely, and disclose the rich crimson-purple corolla, which is very large, and of a peculiar denseness of texture."

The Plant was also exhibited at the last great meeting of the London Horticultural Society on the 12th inst., and obtained the Society's Certificate of Merit.

Strong Plants will be ready for delivery on the 10th of August next, at 10s. 6d. each, and will be sent, free of all other charge, by the post, carefully packed in stout tin cases. The usual discount to the trade if six plants are ordered. For a full description, see Advertisement in the *Gardeners' Chronicle* of the 17th ult.

N.B.—This Seedling Fuchsia has been fully proved, and will give satisfaction to those who purchase it.

HUGH LOW and Co. have the following PLANTS for SALE:—

	£	s.	d.
Tropaeolum azureum, fine flowering roots, in a dry state	3	3	0
Do. Do. strong	5	5	0
Do. Do. a few; very large	7	7	0
Hydrangea japonica	11	5	0
Habrothamnus fasciculatus (see description in the "Botanical Register" for the present month)	1	1	0
Paulownia imperialis, strong	0	7	6
Salix japonica, new hardy tree	0	7	6
Podostylis spherica	1	1	0
Chorozema ericoides	2	2	0
Fuchsia Stanwelliana, very fine	0	5	0
Phlox Van Houttei	0	7	6

A remittance or reference required from unknown correspondents. No allowance on the Tropaeolum unless more than one is ordered. Clapton Nursery, London, July 20, 1843.

ANAGALLIS BREWERII AND SUPERB BLUE CINERARIA SEED.

MICHAEL BREWER, SEN., NURSERYMAN, &c., London Road, Cambridge, begs to offer strong plants of his Splendid deep blue, full and complete round-petaled Seedling ANAGALLIS BREWERII, being of a strong green and vigorous habit, and remarkably well-adapted for bedding. It is now ready for sending out, at 5s. per plant, postage free, to any part of the Kingdom. Flowers have been submitted for the inspection of Dr. LINDLEY, of which he gives the following description in the *Notices to Correspondents* in the *Gardeners' Chronicle*, June 10:—"Anagallis, Breweri, M. Brewer, Sen.—The flowers of your Anagallis are very large, and of a brilliant deep blue tint. It, as you say, is of a green and vigorous habit, it will be a very desirable plant." The Messrs. HENDERSON, Nurserymen, &c., Pineapple Place, Edgware Road, London, with several other eminent Florists, gave orders for it, on the ground of seeing the flower previous. Flowers will be forwarded to any applicant on receipt of two postage stamps.

Also, packets of his Brilliant CINERARIA SEED, comprising every shade of Dark and Light Blue tint; and as the present is the best time for sowing for Winter, and early Spring flowering, he is induced to offer Seed, warranted as newly gathered, in packets at 3s. 6d., 7s., and 10s. Applications, inclosing post-office orders, will be immediately executed.

THOMAS CRIPPS, Florist, &c., Tunbridge Wells, respectfully begs to offer the following entirely new FUCHSIAS, viz., St. Clare, 3s. 6d.; Eppsii, 3s. 6d.; Brockmanii, 3s. 6d.; Stanwelliana, (very fine), 5s.; Gem, 3s. 6d.; Iveryana, 3s. 6d.; Toddiana, (extra fine), 3s. 6d.; Enchantress, 3s. 6d.; Rogersiana, 3s. 6d.; or the set, 25s. Twelve Superb and Distinct varieties, the selection being left to T. C., 12s. On the receipt of Post-office order, for any quantity not less than three, the above will be forwarded post-free.

ARAUCHARIA IMBRICATA PLANTS.

MESSRS. VEITCH & SON having raised a considerable number of this Splendid Hardy Ornamental Tree, are enabled to offer fine healthy plants, from 4 to 6 inches in height, at the following moderate prices, viz.:—

10/2. per 100;—5/1. 10s. for 50;—and 30s. per dozen. For the convenience of some purchasers, Messrs. V. & Son have appointed, as their London agent, Messrs. HURST and M'MULLEN, Seedsmen, No. 6, Leadenhall-street, N.B.—A remittance or reference required from unknown correspondents.—Exeter, June 19, 1843.

B. SAUNDERS, NURSERYMAN, Florist, &c., Island of Jersey, begs to inform Amateurs of Cape and other Bulbs that he has the following varieties to dispose of in August and September next, many of which are for the first time offered to the public. Orders will be executed in rotation as received, and cash or reference required from unknown correspondents; and as the stock of many of the varieties is very limited, early orders are requested.

P.S.—As many as from four to six dozen of Ixias or Sparaxis can be sent by post, at the moderate charge of from 1s. 4d. to 1s. 6d.—Cesarean Nursery, Island of Jersey, July 10.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. AND W. MYATT intend sending out, by the middle of August, their NEW STRAWBERRY, the DEPTFORD PINE, fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2/1. 10s.; British Queen, 1/1, and Eliza, 10s. per 100.—Manor Farm, Deptford, July 22, 1843.

THE QUEEN CABBAGE.

J. & S. SHILLING beg to acquaint the Public generally that they will do well to possess themselves of the above CABBAGE for sowing at this season of the year, which will be found superior for earliness and certainty of Cabbaging to any other. Packets, containing half-an-ounce of seed, will be forwarded by post free, on the receipt of 2s. 6d. in letter-stamps, or a Post-office order. From the great difficulty in getting this sort to bear seed, it will be always scarce, and should be taken care of; it is also very superior in every other respect.—Nursery, North Warnbro', near Odiham, Hants.—July, 1843.

TO NOBLEMEN, GENTLEMEN, FLORISTS, and Others. Two Thousand CAMELLIAS, fine varieties of AZALEA INDICA, Large RHODODENDRONS, ARBOREUM HYBRIDUM, GREENHOUSE and EXOTIC PLANTS, CACTI from Mexico, &c. &c.

MESSRS. PROTHEROE & MORRIS are instructed to submit to Public Competition by Auction, on the premises, Kingsland Nursery, Ball's Pond-road, on WEDNESDAY, August 2d, 1843, and following days, at 12 o'clock, by order of the Proprietor, in consequence of removing to Stratford, about 2,000 Double and Single CAMELLIAS, consisting of all the approved kinds, in a high state of cultivation, a choice assortment of AZALEA INDICA, STOVE and GREENHOUSE PLANTS, consisting of ARAUCARIA EXCELSA, CLIVIA NOBILIS, BUONAPARTIA, JUNCUS, &c. May be viewed three days prior to Sale, and Catalogues had on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

ALBION ROAD NURSERY, STOKE NEWINGTON.

MESSRS. PROTHEROE & MORRIS respectfully announce they are instructed by the Executrix of the late Mr. JOHN MILNE, to offer for public competition, in August next, the splendid and choice Stock of GREENHOUSE, EXOTIC, and other PLANTS, of which Catalogues will be duly published.

IMPORTATION OF PLANTS FROM MEXICO.

MESSRS. J. C. & S. STEVENS beg to announce they will sell by Auction, at their Great Room, 38, King-street, Covent-garden, on TUESDAY, 1st August, at 12 o'clock, a Collection of PALM, ORCHIDACEA, and CACTI, from the temperate and cold climates of Mexico; containing many specimens of great rarity, and some quite new; all in a very fine healthy state. May be viewed on Monday and morning of sale, and Catalogues had of the Auctioneers, 38, King-st., Covent-garden.

MR. J. FURBER will sell by Auction on the premises, No. 10, CHURCH STREET, HACKNEY, on THURSDAY, August 3, 1843, at 12 o'clock, by order of the Proprietor, EXCELLENT HOUSEHOLD FURNITURE of the customary description, together with the remaining Stock in Trade of a SEEDSMAN, consisting of about 60 FINE BLOOMING CAMELLIAS, and a quantity of other Plants; 7 Light Wood Frames, a Set of 81 Seed Drawers, and smaller ditto, 3-partition Corn Bin, 5 Bushels of Lynn's Dwarf Superb Wrinkle Marrow Pea, Flower Stages, Garden Implements, Seeds, &c. May be viewed on Wednesday the 2d, and Catalogues had upon the Premises, or of Mr. J. FURBER, Auctioneer, &c., No. 18, Duke-street, Manchester-sq.

TO THE NOBILITY, FLORISTS, and Others.

TO BE SOLD, a large quantity of PEAT-MOULD, of very superior quality, well adapted for the Cultivation of Roses, American Plants, Bulbous Roots, &c. &c. It can be delivered in London at a very moderate expense. Samples and Particulars of price may be had at F. CHATWIN'S Seed Warehouse, 6, Hungerford Market, Strand, and the Bulk may be viewed on applying to Mr. DAVIS, Powis-street, Woolwich.

NATIONAL LOAN FUND LIFE ASSURANCE ANNUITY, and DEFERRED ANNUITY SOCIETY,

26, Cornhill, London.

Capital, 500,000l.—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
John Elliottson, M.D., F.R.S. George Langley, Esq.
John Griffith Frith, Esq. John Rawson, Esq.
H. Gordon, Esq. Clement Tabor, Esq.

Joseph Thompson, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:—

Entry	Policy No.	Age.	Sum.	Annual Premium.	Bonus added.	Cash Bonus.	Prem. reduced.
1837	39	59	1,000	67 8 4	132 14 6	58 19 9	8 19 4
1838	114	56	3,000	175 15 0	296 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

HAIL-STORMS.

THE DEVASTATION caused by the late destructive HAIL-STORMS proves the necessity of Persons protecting themselves against such losses. Prospectuses containing the Rates of Insurance for Crops and Glass may be obtained on application to W. SHAW, Esq., at the Hail-Storm Insurance Company's Office, Wellington-street North, Strand, London.

CHEAP CABIN PASSAGES to NEW ZEALAND.—The COURT of DIRECTORS of the NEW ZEALAND COMPANY hereby give Notice, that arrangements have been made, whereby intending Colonists may reach their final destination in New Zealand, going as Cabin Passengers, for the sum of 35 Guineas for each Adult Passenger, and Children in proportion. For further information apply personally, or by letter, to the Secretary at the New Zealand House, Broad-street Buildings, London.

By order of the Court, T. C. HARRINGTON, Sec.
New Zealand House, London.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch . . . £7 0s. 0d.
(Larger Sizes in proportion.)
Roger's Boiler, small size . . . 3 15 0
Ditto do. large do. . . 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.
STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.
Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4s. 0d. each.
Strong do. do. . . 45 lbs. at 4 4
Ox Hurdles, 4 feet high, . . . 60 lbs. at 5 6

BEST WIRE for STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.
GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.
Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each.
Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations. Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

HOT-WATER APPARATUS.—Buildings of every kind heated in a superior manner. The trade supplied with Boilers, Furnace-doors, Bars, Dampers, Pipes, Cisterns, and every requisite for heating. BENJ. FOWLER, 68, Dorset-st., Fleet-st., London.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

IMPROVED SYSTEM OF HEATING GREENHOUSES, MELON, PINE, AND CUCUMBER-BEDS, &c.

CALDWELL, PARKER, & Co., IRON-FOUNDERS, Scotland Road, Warrington, Lancashire, most respectfully solicit the attention of the Nobility, Gentry, Seedsmen, Gardeners, &c. to the improvement which they have made in the system of HEATING HOTHOUSES by Water—a system which supersedes all others in producing the most healthy Plants in the shortest time, for which they can produce the most undeniable reference.

The improved system prevents the scorching of plants, so common to flues, and keeps the house in one regular temperature, with a saving of fuel and labour; and the Improvers warrant their system to be superior to any other, and ultimately, far less expensive.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HOTHOUSES, CONSERVATORIES, &c., made and fixed complete in all parts of the Kingdom. One two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1/1. 8s. Garden-Lights made and glazed from 1s. per foot, at JAS. WATTS, Sash Manufactory, Claremont-place, Old Kent-road. *** Reference given.

HENRY HUNT'S PATENT GARDEN POTS and STANDS, for effecting improved Drainage and draught of Air, of which highly favourable notices have appeared in *Paxton's Magazine* for May, *Gardeners' Magazine* for June, *Practical Florist*, No. 23, and *Gardeners' Gazette*, May 6. Sold Wholesale and Retail at No. 29, Queen's-row, Pimlico; and No. 17, Great Ryder-street, St. James's. N.B.—Nurserymen wanted as Agents for the above in many of the provincial towns.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4s. 6d. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4s. 6d. per bushel.

POTTER'S GUANO.—TURNIPS, MANGEL-WURZEL, &c. By the use of the above Manure, at 4/1. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL and BRISTOL.

RURAL CHEMISTRY.
By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London,
Hon. Mem. of the Royal Agricultural Society, and Lecturer
on Chemistry, at the Royal Institution.
&c. &c. &c.

Now ready, price 4s. 6d.,

Extracts from the Introduction:—
"A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them. He will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

Index of Contents.

Acclimatizing	Cherry-tree gum	Growth of plants
Acid, benzoic	Chloride of sodium	Gum
Acid, carbonic	Chlorine	Gum arabic
Acid, humic	Cider	Gum, cherry-tree
Acid, lactic	Citric acid	Gum, resin

London: 3, Charles-street, Covent-Garden; and may be ordered of all Booksellers.

THE VINE IN AUSTRALIA.—THE CULTURE
of the GRAPE-VINE and the ORANGE in AUSTRALIA
and NEW ZEALAND comprising Historical Notices, Instruc-
tions for Planting and Cultivation; with Accounts, from personal
Observation of the Vineyards of France and the Rhine, and
Extracts concerning all the most celebrated Wines, from the
Work of M. JULIEN. By GEORGE SUTTON, Esq., F.L.S.
London: SMITH, ELDER, AND CO., 65, Cornhill.

JOSEPH HAMILTON'S PRACTICE; or, A New
Era in the Cultivation of the Pine-apple; showing, in Opposi-
tion to all other Authors, its real Habits. Also, a Recipe, by which
he has destroyed both the Cotton Bug and White Scale by one
application. It is herein proved to demonstration that by his
practice 250 lbs. of fruit can be cut annually out of one Pit,
20 ft. by 7½ ft., independently of any succession-houses. The
Author claims the discovery entirely to himself. The Work will
be ready whenever a sufficient number of Subscribers come
forward. The manifold advantages accruing from the adoption
of this system are the following:—1st, No room is wanted for
succession-plants, which have hitherto occupied more room than
the fruiters; 2dly, The insuring of one and frequently two fruits
from one plant annually; 3dly, Larger and better flavoured
fruit; 4thly, Any gentleman or Amateur who has hitherto been
deprived of such a luxury may now cultivate Pines at a com-
paratively trifling expense.—Thornfield, near Stockport.

No. VIII. will be published on the 1st of August, and will be con-
tinued, at Sixpence a Month, of the

GARDENERS' EDITION OF THE BOTANIC
GARDEN; with numerous Additions and Engravings of Plants.
By B. MAUND, F.L.S. It contains Coloured Engravings of the
most Ornamental Plants, suited to the open Garden, with Descrip-
tions, Cultivation, &c., for the assistance of Gardeners and Ama-
teurs. Also a FLORAL REGISTER, with Woodcuts and Descrip-
tions of handsome Plants, newly introduced from Foreign Countries.
Also AN AUCTIONEER, containing Miscellaneous Information on
Gardening Affairs. Also a portion of Professor HENSLOW'S
BOTANICAL DICTIONARY of 5,000 Words, and 200 Cuts,
descriptive of the Vegetable World; a complete Book of Reference
on Subjects connected with the description of Plants. Thus, it will
be seen, that this Work, although sold at so very moderate a price,
comprehends a greater variety of Botanical and Gardening Informa-
tion than any Publication extant.—London: R. GROOMBRIDGE,
Paternoster-row.

Handsomely bound in cloth, with Ninety-three Wood-Engravings.
Price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CON-
FIRMATIONS OF SACRED HISTORY, from the Monu-
ments of Egypt. By W. C. TAYLOR, LL.D.
From the British Magazine.—"This is an elegant and well-
executed little book, on a most interesting subject."
BOGUE, Fleet-street.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopedias, when the compres-
sion of a great variety of information into one volume, in order to
bring it within the means of persons of all ranks, is so universally
sought, it is evidently desirable that the Gardener, and those con-
nected with his profession, should be as well accommodated as other
classes in this particular. No such work existing, however, prior
to the issue of the present publication, its value will be at once
apparent; since it combines the more essential features of a Botanical
Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially
adapted for the Amateur and Floriculturist; who may, by carrying
it in his pocket, examine all the plants that are at any time submitted
to his inspection, and immediately derive every intelligence respect-
ing the peculiarities or affinities of particular species which could
reasonably be wished for. This is an advantage that can only be
sufficiently estimated by those who have felt the want of such an
assistant; and to all such individuals, as well as to every agent or
friend of Horticulture, the Pocket Botanical Dictionary is decidedly
indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

FAMILIAR ASTRONOMY. By GEORGE DARLEY,
A.B., Author of a System of Popular Geometry, —Companion
to the Popular Geometry, —a System of Popular Algebra, —and a
System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth
lettered.

"There is a vast deal of astronomical information conveyed in a
most winning and unassuming manner in this delightful little volume,
which, not less for the novelty of its plan than the extent of its in-
telligence, reflects infinite credit on the taste and talents of its pro-
jector and editor, Mr. Darley."—*Sun*.

TAYLOR and WALTON, Booksellers and Publishers to University
College, 28, Upper Gower-street.

FUN FOR THE FIRESIDE!

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions
and alterations only having been made as were required by the
greater delicacy observed in modern conversation; but, that the
volume might have some substance, and be a good table or tra-
velling book, copious additions have been made from other old
volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that
everybody presumes that he himself and everybody else are perfectly
familiar with its contents . . . and yet, if the reader will ask his
acquaintance, it will appear that not one in five hundred ever set eyes
on a copy. It is in consequence of like questions that this edition is
published." London: WHITTAKER and Co.

WANTED.—A MANSION AND MANOR TO

RENT, Furnished, in a healthy and desirable neighbour-
hood, not far distant from a Railway station, and within 80
miles of town. It must be adapted for a Family of Fortune,
with a good and extensive right of Sporting attached.—Particulars
to be forwarded to Messrs. HEDDER, Land Agents, 10, New Bond-
street, opposite the Clarendon, at whose Offices Cosmographic
drawings of properties may be viewed.

GROWTH OF PLANTS.—HUMPHREYS'

INODOROUS SOLUBLE COMPOUND, to Promote the
Growth of Plants. Dissolved in water, this valuable Preparation
may be used with great advantage either in the Drawing-room
or in the Conservatory. A single Bottle is equal in fertilizing
force to some hundred weight of rich Compost; and by its use,
not only common plants are improved by increased brilliancy of
flower and deeper verdure, but valuable exotics are so strength-
ened, as to resist the usual alternations of temperature, and may
be preserved without a Greenhouse. Sold in Bottles, 1s. 6d.
each, with full Instructions for Use, by the leading Chemists,
Druggists, &c. in Town and Country. Wholesale Agents, DAVY,
MACMURDO, & Co., 100, Thames-street, London.

OLD GILDING, LACQUER, AND BRONZE, how-

ever dirty, faded, or tarnished, rendered equal to New by
UPTON'S PARISIAN DETERGENT. The effect is sudden, aston-
ishing, and lasting; trouble—merely sponging the surface; and
expense—only a few pence for the largest Gilt Frame. Fly-
spots are at once removed—no necessity, therefore, to cover
from the Fly. GOLD DETERGENT, 2s. 6d. per bottle; Lacquer
and Bronze, 1s. 6d.; Lamp (interior), 1s. 4d. All are innocuous
and inoffensive. Sold by Upton & Co., Lamp Manufacturers,
33, George-street, Hanover-square, and 66, Basinghall-street,
City. N.B.—A trial free of charge. The trade supplied.

AGRICULTURAL EDUCATION.—The Proprietor

of a respectable Academy, some distance from town, who is
also connected with Farming, has a VACANCY for two Pupils,
between the ages of 8 and 15, who will devote a part of the day to
Scholastic pursuits, and the other to those of Agriculture, the
practice of which is conducted upon the improved system.
English, French, Latin, Greek, Drawing, and the Mathematics,
are the principal branches of literature that will be taught.—For
terms, &c., apply by letter to X. Y., 6, Old Cavendish-street,
Oxford-street.

ELECTRO-PLATED AND GILT ARTICLES.—

ELKINGTON & Co., Patentees, beg to announce that, to
meet the increasing demand for this manufacture, they have
opened an Establishment at No. 22, REGENT-STREET,
(CORNER of JERMYN-STREET,) where every variety of articles
for the Side-board, Dinner, Dessert, and Breakfast Tables may be
inspected.

They have also a similar assortment at their City Establishment,
No. 45, MOORGATE-STREET, where they have a MANUFAC-
TORY for PLATING and GILDING, RE-PLATING and RE-
GILDING ARTICLES of every description, and of ALL METALS.

With reference to articles of their manufacture, the Patentees
beg to state that they differ from all goods hitherto offered as
"Plated Goods" or "Substitutes for Silver," being made in the
same manner as SOLID SILVER, from which they cannot be
known, and being also composed of a hard white metal, strongly
coated with silver by the Electro process.

Silver Articles of every kind or pattern exactly copied.

Every article made by the Patentees bears their stamp (E. & Co.
beneath a Crown.)

CHEAP STATIONERY, CUTLERY, WORK-

BOX, WRITING-DESK, AND PRESSING-CASE MANU-
FACTURER.—Sloper's Embossed Postage Envelopes, without
Advertisements, 1s. per dozen to purchasers of other articles; fine
Bath-post, 3d. per Quire, 5s. per Ream; ditto Note, 2d. per Quire,
3s. per Ream; Queen's Size (Note), 2s. per Ream; very superior
Foolscap, 8d. per Quire, 12s. 6d. per Ream; Envelopes, 6d. per 100;
Copy Books, 4d. each, 3s. 6d. per dozen; good Pens, 1s. 6d. per 100;
Embossed Blotting Books, 6d. each; superior Bibles, gilt edges,
1s. 10d. each; ditto Prayer Books, 1s. 6d. each; good Pen-knives, 6d.
each; Rosewood Work-boxes, 2s.; Rosewood and Mahogany super-
ior Desks, 7s. 6d.; superior Pocket-books, 6d. each, &c., &c.
Goods exchanged, or Money returned if not approved of. A name-
plate engraved, and 100 best Cards printed for 1s. 6d. Bookbinding,
Printing, and Engraving, at the lowest terms; 10 per cent. off new
Books and Music. Parcels of 2l. value forwarded 100 miles free of
carriage; of 10s., 5 miles from London, and any amount in town.
Lists of Prices, and samples of Paper, sent on the receipt of two
postage-stamps, from SLOPER'S Stationery Warehouse, 20, George-
street, Portman-square, London.

NEW AND IMPROVED CHURCH AND CHAMBER ORGAN, MANUFACTURED BY H. C. LINCOLN,

*Organ Builder to Her Majesty The Queen,
And to their late Majesties George the Fourth and William the Fourth;*

AND BUILDER OF THE ORGANS IN

HER MAJESTY'S CHAPEL ROYAL, BRIGHTON.
HER MAJESTY'S PALACE, THE PAVILION, BRIGHTON.
HER MAJESTY'S CHAPEL, DEVONPORT.

Mr. LINCOLN has just had the honour to receive the following testimonial from the Rev. W. F. H. HOOPER, Incumbent of Withington:—

"Withington, Manchester, March 27, 1843.

"Mr. LINCOLN has just completed an Organ for my Church, which was opened by Dr. GAUNTLETT on Friday the 17th, and Sunday the 19th of this month. The Instrument has given the most complete satisfaction to me and to all who have felt an interest in its erection. The best judges both amongst my own people and of persons unconnected with the Church have pronounced it perfect—unsurpassed in its softness, richness, and variety of tone. I have pleasure in adding that Mr. LINCOLN has treated us with considerable liberality, has acted with openness and uprightness, and as becomes a tradesman of the highest respectability—has spared neither labour nor (I may add) expense in fulfilling his contract to the utmost, and has devoted himself strenuously, not to say enthusiastically, to the work of turning out an Instrument that should give perfect satisfaction to the Committee of gentlemen concerned in its erection. In this he has completely succeeded; and I shall be happy if my recommendation secures him further patronage.

W. F. H. HOOPER, Incumbent of Withington."

ORGAN MANUFACTORY, 195, HIGH HOLBORN.

Mr. LINCOLN solicits the attention of the Nobility, Clergy, and the Professors and Amateurs of Church Vocal and Instrumental Music, to the peculiarities and advantages of the great and numerous improvements he has recently adopted in the construction of the Church and Chamber Organ. These alterations have been made with a view of affording an increased efficacy to the Organ, in rendering its support to a large congregation, and in the performance of Church Instrumental Music. The effect gained is such as to combine the breadth and variety which distinguish the Continental Organ, with the universally recognised sweet and silvery tones produced by the English mode of voicing and finishing the pipes.

The advantages gained by the adoption of the new mode of construction are unquestionable:—

1st. The Organ has a more weighty and solemn character of tone, which is gained by the introduction of the new Stops, called the Bourdon, Tenoroon, and Quint.

2d. It has a more brilliant and silvery character, from the new mode of arranging the Sesquialteras, Mixtures, and by the use of a new Stop, called the Doublette.

3d. It has a more soft and varied character, from the circumstance that instead of the Instrument only possessing one Flute, it has three, four, or even six, all of which combine with the new Stops in producing an entirely new quality of tone to the Organ, and which is admirably adapted to the purposes of Psalmody. These Flutes are called the Claribel-Flute, the Oboe-Flute, the Wald-Flute, the Suabe-Flute, the Piccolo, and the Flageolet.

4th. It has more breadth and body of tone, from the adoption of a new method of manufacturing the Reed Stops. These are made to speak, so as to combine the weight of a Diapason with the fullest tone which it is possible to give to a Reed Pipe. The new Reed Stops are called the Posaune, the Trombone, the Cornopean, the Soft Horn, the Corno-Flute, the Clarinet, the Trumpet, the Clarion, the Oboe, and the Octave Clarion.

5th. A distant, subdued, and piano effect, combined with brilliancy sufficiently prominent to keep up the voices, is gained by the Tenoroon Dulciana, a new Reedy-toned Dulciana, and the Echo Dulciana Cornet, a Stop of Five Ranks of Pipes, which has been copied from one in the celebrated Organ of Cologne Cathedral.

6th. More Pipes are obtained to each Key than has yet been attained, and at a less expense; and it must be evident the greater number of Pipes of differing qualities of tone that can be brought to bear upon each Key the greater must be the musical resources of the Instrument.

7th. The Sound-boards are made to contain nearly double the work of the ordinary sound-boards, and the wind-chests nearly double the quantity of wind.

8th. No money is thrown away upon useless mechanism, but the greatest attention is paid to create music in every possible variety and combination.

9th. Although the compass of the Keys is apparently contracted to CC, in effect the Organ extends to CCC, as every Key on the Manual has with its Unisons, the Octave below; thus, in fact, the Instrument has the same compass as the Organ in St. Paul's Cathedral, without the disadvantages attending the old compass.

Mr. LINCOLN begs to refer to the following Organs, as examples of the new manner of combining great power and variety at a small expense.

THE NEW ORGAN IN THE CHURCH OF ST. THOMAS, THE ROLLS, CHANCERY-LANE,
(Opened in November);

THE NEW ORGAN IN CROSBY HALL, BISHOPSGATE-STREET (Opened in December);

THE ORGAN AT THE NEW CHURCH, WITHINGTON, MANCHESTER (Opened in March);

THE NEW GRAND ORGAN NOW ERECTING AT THE CATHEDRAL CHURCH OF ST. DAVID.

Mr. LINCOLN submits the following TESTIMONIALS from the late Dr. Clarke Whitfield, Mr. Attwood, Mr. Thomas Adams, Dr. Gauntlett, and Mr. Purkis, as to the Character of his style of Organ Building:—

From Dr. J. CLARKE WHITFIELD, Professor of Music to the University, Cambridge.

I have employed Mr. LINCOLN at Trinity and St. John's Colleges during my residence at Cambridge, and therefore can vouch for the superiority and durability of his work, as well as for his moderate charges. It is my opinion that the Diapasons of Mr. LINCOLN possess more of the sweetness of the celebrated "Father Schmidt" than those of any other Organ Builder of the present day.

From Mr. ATTWOOD, Organist of St. Paul's Cathedral, and Composer to the King.

I have the pleasure to inform you that I think the Organ built by Mr. LINCOLN an instrument possessing a fine quality of tone, great power, and very complete in all its parts.

Testimonial from the NEW CHURCH COMMITTEE, Newington, and Mr. PURKIS, Organist.

The undersigned feel highly gratified in expressing their opinion upon the Organ built by Mr. LINCOLN for the said Church; and testifying to the great satisfaction he has given therein, not only with respect to its internal construction, mechanism, and powers, but also to the very fine and superior quality of tone it so eminently possesses, and of which it is scarcely possible to convey a sufficiently just and adequate idea.

(Signed) A. CYRIL ONSLOW, Rector.
GILBERT ELLIOTT, Minister.
JOHN PURKIS, Organist.
(And all the Committee.)

Testimonial from the NEW CHURCH COMMITTEE, Camberwell, and Mr. THOMAS ADAMS, Organist.

The undersigned deem it only common justice to Mr. LINCOLN to express the very high and general satisfaction which he has given in the erection of an Organ in such new Church: without any written contract, he completed, within the time stipulated, all, and even more than in his tender he had engaged to perform, without claiming a single extra. Of the appearance of the Organ, of its internal mechanism and workmanship, and above all, of its powerful yet mellow and most beautiful tone, it is scarcely possible to convey a just idea of the praise which has been bestowed upon it by all who have seen and heard it.

(Signed) JOHN GEORGE STORIE, Vicar.
JOHN VANE, Minister.
THOS. ADAMS, Organist.
(And all the Committee.)

Testimonial from Dr. GAUNTLETT, Organist of Christ Church, Newgate-street, London, and of St. Olave's, Southwark.

Mr. HENRY C. LINCOLN has erected two Organs on my new plan, and has two others in progress. I have much pleasure in recording my opinion of his merits. In the contracts which he has executed under my superintendence, I have ever found him, although exceedingly moderate in his price, yet very desirous to give his employers every advantage. The internal mechanism and the outward decoration of his work have been finished in the best style. The metal and manufacture of his pipes have been of high excellence; and every portion of his instrument has been completed with the same uniform attention to its durability and due effect.

Mr. LINCOLN has the honour to announce

A NEW AND IMPROVED CHURCH BARREL-ORGAN;

ALSO,

THE CONCERT-ORGAN FOR THE SALOON OR DRAWING-ROOM;

AND

THE APOLLONICON, OR SELF-ACTING ORGAN;

For the Mechanical Performance of Symphonies, Overtures, Choruses, &c.

Mr. LINCOLN continues to manufacture the OLD ENGLISH UNISON and GG CHURCH-ORGAN, to which he gives some new Characteristics, by means of his newly-invented Flute, Reed, and Diapason Stops. He also reconstructs the Old Instruments upon the New Plan.

IMPORTANT TO LADIES.

KEARSLEY'S ORIGINAL WIDOW WELCH'S FEMALE PILLS, so long and justly celebrated for their peculiar virtues, are strongly recommended to the notice of every lady, having obtained the sanction and approbation of most gentlemen of the Medical Profession, as a safe and valuable Medicine in effectually removing obstructions, and relieving all other inconveniences to which the female frame is liable, especially those which, at an early period of life, frequently arise from want of exercise and general debility of the system: they create an appetite, correct indigestion, remove giddiness and nervous headache, and are eminently useful in windy disorders, pains in the stomach, shortness of breath, and palpitation of the heart: being perfectly innocent, may be safely used in all seasons and climates.

. It is necessary, owing to the numerous imitations, to inform the Public that KEARSLEY'S is the only ORIGINAL and GENUINE MEDICINE of this description ever made, and has been prepared by them for more than FIFTY YEARS!! Purchasers are particularly requested to remark, that as a testimony of authenticity, each Bill of Directions contains an affidavit, and bears the signature of "C. KEARSLEY," in writing, and each box is wrapped in white paper. Price 2s. 9d.

Sold, Wholesale and Retail, by J. SANGER, 150, Oxford-street, London; and all respectable Medicine Vendors throughout the country.

SCURVY and IMPURE BLOOD.—Another most EXTRAORDINARY CURE, by means of HALSE'S SCORBUTIC DROPS.—The following case has excited so much interest, that the Guardians of the Parish of Brent, Devon, have considered it their duty to sign their names to the accompanying important declaration. It is well worthy the notice of the public:—"We, the undersigned, solemnly declare, that before Thomas Robins Rolins, one of our parishioners, commenced taking Halse's Scorbatic Drops, he was literally covered with large running wounds (some of them so large that a person might have laid his fist in them): that before he had finished the first bottle he noticed an improvement, and that by continuing them for some time, he got completely restored to health, after everything else had failed. He had tried various sorts of medicines before taking Halse's Scorbatic Drops, and had prescriptions from the most celebrated physicians in this county without deriving the least benefit. Halse's Scorbatic Drops have completely cured him, and he is now enabled to attend to his labour as well as any man in our parish. From other cures also made in this part, we strongly recommend Halse's Scorbatic Drops to the notice of the public. Signed by JOHN ELLIOTT, Sen. (Lord of the Manor), John Manning, Henry Gnodman, William Pearse, Arthur Langworthy.—June 21, 1843."

Any Medicine Vendor will procure it on application. Wholesale Agents for London:—Barclay and Sons, Farringdon-street; Hallett, 83, High Holborn; Prout, 229, Strand; King, 232, Blackfriars-road; Schulze, 58, King William-street; and Sanger, 50, Oxford-street.

CORNS AND BUNIONS.

Patronised by the Royal Family and Nobility.

PAUL'S EVERY MAN'S FRIEND is a sure and speedy cure for those severe annoyances, without causing the least pain or inconvenience. Unlike all other remedies for Corns, its operation is such as to render the cutting of Corns unnecessary, (indeed, we may say the practice of cutting Corns is at all times highly dangerous, and has been frequently attended with lamentable consequences, besides its liability to increase their growth), and being prepared on the softest kid leather, it adheres with the most gentle pressure, producing an instant and delightful relief from torture, and, with perseverance in its application, entirely eradicates the most inveterate Corns and Bunions.

Prepared only by JOHN FOX, in boxes at 1s. 14d. each, or three small boxes in one for 2s. 9d.; and to be had, with full directions for use, of C. KING, 232, Blackfriars Road, directly facing Christ Church, London; and of all respectable Chemists and Medicine Vendors throughout the United Kingdom. A 2s. 9d. box cures the most obdurate Corns.

. A-k for "Paul's Every Man's Friend."

BRITISH FERNS and GRASSES to be SOLD.—Upwards of 20 varieties of British Ferns, about 150 Dried Specimens of British Grasses, and likewise about 20 varieties of the British Orchidaceous Plants Orchis and Ophrys, &c. All very fine plants.—Direct to G. S. T., 47, Cochrane-terrace, Portland Town, Regent's-park.

ROWLAND'S ODONTO, or PEARL DENTIFRICE.—A Vegetable White Powder, prepared from Oriental Herbs of the most Delicacious Odour and Sweetness, and free from any of the most Delicacious Odour and Sweetness, and free from any of the mineral or pernicious ingredient—it eradicates Tartar from the Teeth, removes decayed spots, preserves the Enamel, and fixes the Teeth firmly in their sockets, rendering them beautifully white. Being an anti-scorbutic, it eradicates Scurvy from the gums; strengthens, braces, and renders them of a healthy red; it removes unpleasant tastes from the mouth, which often remain after fevers, taking medicine, &c., and imparts a delightful fragrance to the breath.—Price 2s. 9d. per box, duty included.

ROWLAND'S ALSANA EXTRACT immediately relieves the most violent Toothach, Gum-boils, Swelled Face, &c.; it is also an excellent Stomachic, in cases of Flatulency, Spasmodic Affections, &c., and gives instantaneous relief.—Price 2s. 9d., 4s. 6d., and 10s. 6d. per bottle.

NOTICE.—A. ROWLAND & SON, 20, HATTON-GARDEN, LONDON, is engraved on the Government Stamp, which is pasted on each article; also printed, in red, on the wrapper of the latter. Sold by them, and by Chemists and Perfumers.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTH, upon application to the Gardener.—Sundays excepted.

BUTTER MADE IN TEN MINUTES
BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT.
ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Metal Pans for Churns to stand in, 4s. 6d., 6s., and 7s. Larger sizes made to order. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, Lewes.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BENHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & CO., 109, Fenchurch-street.

ARAUCHARIA IMBRICATA, or SIR JOSEPH BANKS'S PINE.

YOUELL & Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust, 3 year-old plants, 8 to 9 inches high, 10l. per 100, or 30s. per dozen.—Great Yarmouth Nursery, July 26, 1843.

The Gardeners' Chronicle.

SATURDAY, JULY 29, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Aug. 1	Horticultural	3 p.m.
Friday, Aug. 4	Floricultural	7 p.m.
Tuesday, Aug. 8	Botanical	4 p.m.
Wednesday, Aug. 9	West London Floricultural, Walham Green.	

COUNTRY SHOWS.—Wednesday, Aug. 2. Doncaster.

In another column will be found a statement of the prizes which the Horticultural Society of London offers to exhibitors at the Garden for the year 1844. It seems desirable to mention some of the more important particulars in which the plan which has been observed this year is to be departed from.

In the first place, the number required for large collections of Stove and Greenhouse plants is reduced from 40 and 20 to 30 and 15; but it is to be observed that neither Greenhouse Azaleas, Rhododendrons, Cacti, Orchidaceæ, Pelargoniums, Heaths, Calceolarias, or Fuchsias, will be allowed to form a part of those large collections. This will have the effect of making the latter more strictly than they have been, collections of miscellaneous plants, and of confining the excluded plants to the classes in which they are separately shown.

On the other hand, the medals are increased for some of the plants belonging to the excluded classes. For example—a new class of Azaleas in sixes is opened; the medals for Cacti are increased from a Large Silver to a Gold Banksian, or, in other words, from 35s. to 7l.; and the number of Rhododendrons to be shown is reduced from twelve to six. Then a new class of Orchidaceæ is added to the old ones. It is now decided that a large gold medal, value 20l.; a Gold Knightian, value 10l.; and a Gold Banksian, value 7l., shall be given for the best three sets of Exotic Orchidaceæ shown in collections of not fewer than 20 species. This will, it is expected, produce the important effect of inducing the very great growers of these wonderful plants to contend with each other, and consequently of giving an increased chance of success to those whose means are less ample.

In Roses, the prizes offered for specimens in pots remain as before; but Amateurs are not required to show more than twelve plants. This will, we trust, secure the appearance of many rivals in what we regard as one of the most interesting branches of cultivation. It will be remembered that we last year offered an additional prize of Five Guineas to the gentleman's gardener who should first obtain the principal medal for Roses in pots. No gentleman's gardener having succeeded in doing so, we paid it to Messrs. Lane, of Berkhamstead, to whom the Gold Banksian Medal was assigned by the Judges at the June meeting. We now offer the same sum, in two prizes of Three Guineas and Two, to the best and second best collections of Roses in pots, exhibited by gentlemen's gardeners at the meeting in May next year, provided they have not been previously exhibited elsewhere.

Among minor changes is the reduction in the number of Stove and Greenhouse Climbers from 12 to 6, and a corresponding diminution of the value of medals offered for them; the union of Shrubby and Herbaceous Calceolarias in one class, there being no longer any limit between them; the exclusion of Heartsease from exhibition, and the admission of Fruiteers as exhibitors of fruit in the same class with market gardeners.

As new subjects for exhibition, Cinerarias in twelves and plants grown in Ward's cases are now, for the first time, specifically admitted. Upon the latter subject we have a few observations to make. There seems no reason to doubt that the plan of cultivating plants in close-glazed boxes, first proposed by the gentleman whose name they bear, is one which will enable all persons, whether enjoying the blessing of country air or not, to manage plants successfully; and that a ready means of indulging in one of the most pleasant and unfatiguing of all recreations is thus afforded even to the poor invalid who is unable to quit her room. Yet Ward's cases are seldom seen. This arises from certain practical difficulties attendant upon the treatment of plants in them, and we now trust that the offer of medals for them will have a twofold effect—that of causing skilful gardeners to turn their attention to the details of their management, and manufacturers to the art of making them of more elegant forms than any we have yet seen. If this is accomplished, we may, without exposing ourselves to the charge of enthusiasm, express our confident

expectation that Ward's cases will become as common everywhere as bird-cages are now.

A VERY sensible letter appeared in the *Mark-lane Express* of the 17th on the improvement of waste lands, or rather on the necessity and advantage of such improvements. There can be no doubt that there are at this moment immense tracts of absolutely waste land in Great Britain or Ireland, or of land producing so little in scanty pasture as to be nearly waste; and our attention has been long directed to the means by which such lands might be rendered productive, without any great risk or sacrifice. The suggestion in the letter alluded to,—to establish Joint Stock Companies for this purpose,—appears to us to be made without much reflection on the nature of such companies and the mode of their management. There is no difficulty in finding capital for any rational enterprise, provided it be clearly shown that there is a fair prospect of its being secure and affording a reasonable interest; but before you can raise money by mortgage on waste lands, something more than the mere soil must appear as a security. This is labour, judiciously applied, and buildings. The first thing is to get houses erected for the cultivators, with other necessary farm-buildings, of such dimensions as may induce men with slender means to lay out their labour on the land. There is no mode of bringing poor land into cultivation like a garden-system—the spade must begin the work. Trenching and clearing of large stones are essential preliminaries to future production. This can only be done with the spade and pickaxe; but when it is done there is already a value added to the land. If extensive draining, such as that of bogs, is necessary, the proprietor must do this himself, or grant such length of lease as will indemnify the lessee; and there is no want of enterprising men who would risk 10,000l. or 20,000l., if there was a fair prospect of profit. This is seen every day in Scotland. One good directing head, who has a large sum of money at stake, will be worth a whole board of directors paid for their services, and only risking little of their own compared to the whole capital of a company. But whatever be the capital of the improver, he cannot insure success without the help of inferior agents, who must be stimulated by a similar motive of self-interest. An industrious man with a family may undertake ten, fifteen, or twenty acres of waste land, and will in time bring it into cultivation. The land in its present state is worth little—little rent, therefore, must satisfy the proprietor; and a lease of twenty-one years will appear to the tenant as a kind of perpetuity. The expense of the buildings, if built by the proprietor of the soil, should pay a fair interest, clear of repairs, half of which should be done by the landlord and the other half by the tenant. If the tenant can build a house, it should be done according to a regular plan given by the proprietor, who may furnish materials or not, according to circumstances. The tenant, in general, has little except labour to give; but this is exactly what is most required. No paid labour will ever equal that which is voluntary, and of which the immediate profit is the labourer's. Experience fully proves this. Intelligence, diligence, and sobriety, which are the fruits of a judicious education, are essential to success. In Scotland and Prussia, where the labourers are well educated, great tracts of poor land have been brought into excellent cultivation by being let out in small portions on lease; and when the term is out the tenant has thriven, and the landlord's rent is vastly increased. Then several of the small holdings may be thrown into a farm; more extensive buildings erected, and the most industrious and intelligent of the smaller occupiers made regular farmers. But what is to become of those who are turned out at the end of the lease? If they have shown sufficient intelligence and industry, another portion of waste land may be let to them on advantageous terms, and they will go on improving land with all the advantage of their former experience. If they have not satisfied the expectations of the proprietor, and have not been so successful as others, they had better return to the condition of day-labourers.

A great part of Flanders has been changed from a barren sandy heath into fertile fields by the industry of small occupiers, and land which was of little or no value in its waste state now pays a rent of from 20s. to 30s. per acre; while the tenants have, in many instances, saved as much as to buy the land they had improved, at 30, and even 40 years purchase.

In Prussia, and different parts of the North of Germany, the same system has had the same result; and we know of a large tract of black peaty soil in the North of Scotland where Heath alone was seen, and where stones and rocks of all sizes appeared through the soil, completely reclaimed by being let on lease in small portions to industrious labourers, who, having materials allowed them, built small houses and sheds, according to a regular plan laid down, and gradually brought the whole into cultivation. In the 10th Vol. of the Prize Essays and Transactions of the High-

land and Agricultural Society of Scotland, there are no less than 17 Reports on the Improvement of Waste Lands by the proprietors or lessees, the expense in each case being accurately stated. In these instances the waste land was already attached to farms in cultivation, and consequently required few additional buildings; but the results show that in most cases the capital laid out was amply repaid; and these reports afford much useful information to those who would embark in such undertakings.

Why should the strength and sinews of the nation be expended in distant lands, which scarcely acknowledge a common interest with the mother-country, while there are yet so many wastes affording ample scope for industry, even within a few hours' walk of the metropolis? A foreigner is struck with the light heaths and commons near London, and is apt to exclaim—Where is all the superfluous capital, which can scarcely find profitable employment, and suggests uncertain expeditions to the Antipodes in hopes of profit, when the bosom of the earth is open, and would gratefully and amply repay what is judiciously confided to it? One great cause of the fear of embarking in a losing Agricultural speculation is a want of confidence in the steadiness and sobriety of the labouring classes in England. They cannot always be trusted to their own guidance; they are not sufficiently educated to feel the importance of industry and sobriety. Whenever they are not under the eye of the master the temptations to idleness are too strong to be resisted. The activity of the mind having no proper direction—the desire of information not being satisfied, for want of early habits of reading and reflection—company is the only relaxation, and the company of idle men leads to idleness and intemperance when there is no substance in the thoughts or conversation. When the waste of the mind shall have been cultivated, there will be no difficulty in reclaiming that of the land.

The well-educated labourer is in a far superior position; he can find relaxation from the toils of the day in reading and study; where his own experience fails, he can have access in books to the experience of past generations. The examples of those who have risen to affluence, and even power, from the lowest ranks in life, stimulate his exertions; he dreams of advancement, and every nerve is strained to improve his situation in life, which he knows can only be secured by honest and persevering industry. How important, then, to the prosperity of a nation is a proper attention to the education of the people!—M.

We mentioned some time since (p. 603. 1842) that Count Hompesch, a Belgian gentleman, had ascertained that the bituminous shale of Portland could be profitably worked as a source of manure, in consequence of its becoming, when carbonised and deprived of the bituminous matter, a powerful disinfecting material, resembling animal charcoal in that respect.

We now find that the facts connected with this project have been collected into a small pamphlet*, in which the advantages expected from the preparation of the shale are explained. For ourselves, we can only state that it is certainly a most energetic remover of putrid smells, and express our belief in its being a material extremely well worth examination. We have no personal experience in its manuring quality, but we understand that when united with decayed animal matter, it has proved highly valuable in gardens. Among some papers before us, we find the following memoranda relating to this matter:—"Three sick Orange-trees, in a very bad state, with a few yellow leaves, and which had not flowered for two years, were top-dressed two inches deep with the prepared powder on the 15th of March. In two months they were covered with leaves of a deep green, and flowers were appearing abundantly. Similar effects on the Camellia were obtained by similar means,—the flowers became larger and more double."

Count Hompesch tells us that he has always found it best to use the material as a top-dressing, and to water with it frequently in small doses; and that when the material has been mixed with the soil, he has not found the same beneficial effects. "This," he observes, "I attribute to the disinfecting powder of the bituminous shale having the property of retaining the carbonate of ammonia in its pores, and to the water that passes through being charged with just the dose which vegetation requires; so that absorption is slow and uniform, instead of being unequal and rapid, as happens when the material is mixed with soil."

We may add that an interesting account of the important fertilising powers of some bituminous shale, at Christian Malford, in Wiltshire, is given by Mr. Gowen in the last Number of the Royal Agricultural Society's Journal.

ENTOMOLOGY.—No. XLVI.

COCCUS PATELLEFORMIS (Curtis). *The Brown Limpet scale*. This also belongs to the last section, and is a * Notice on the Necessity and Means for founding an Establishment for the Manufacture, on an Extensive Scale, of New and Powerful Manure." Brussels: Meline & Co.

true Coccus. It is nearly allied to the Orange-scale, called by Linnaeus *C. hesperidum*, but it is longer and larger. From the strong resemblance it bears to some of the delicate limpets which inhabit our sea-coasts, I have distinguished it by the specific name of *Patellaeformis*. The brown limpet-scales, which are the females, are distributed along the stems and branches of the twigs, with their heads downward, and vary considerably in size and form, some being oval (fig. 2), whilst others are more elliptical and slightly curved (fig. 3). The outline, however, is apparently never symmetrical; they are very convex, somewhat semi-cylindrical, shining, and of an ochreous colour, variegated with bright and dark brown. The edge is thin and membranous, and at the hinder extremity is a suture, furcate at the base (fig. 4, greatly magnified). The under-side is very concave in the adult females, the skin lying close to the back of the scale, and the portion towards the tail is blackish. They have six small legs; but in the specimens I examined, I observed neither eyes, proboscis, nor antennae, but no doubt they exist in an earlier stage of their lives. There are two white cottony lines on each side of the scale: the first pair at the middle, and the other pair towards the anterior extremity. These lines are common to the scale insects, and appear to be the parts of contact which fix them securely to the plant (fig. 5). On removing the scales, a cottony substance remained on the stalk with some young ones, very similar to those of the black scale, and not larger, but rather broader in proportion, and less active; there were but few, and no eggs nor exuviae accompanied them. With the large scales were smaller ones (fig. 6), which I believe to be of the same species at an earlier stage of growth; indeed, they had every appearance of the young ones which had settled there imbibing the sap and forming a scale over themselves, until the males hatched, when they would become fertile, rapidly increase in size, lay their eggs, and die without ever moving from the spot where they first pierced the bark with their fine syphons. They were yellow and oval; the minute black eyes were visible, and the back was rayed with bright brown streaks.

I have never seen the brown limpet-scale abound to any great extent, as many of the other scale insects do, yet they are sometimes very troublesome, and being the largest, I believe, of the hothouse scales, they must greatly weaken the plants which they attack. I regret that the males of this species are unknown to me, but they are, no doubt, minute animals and winged; indeed, little is known of this very curious tribe of insects, not less interesting to the gardener from the injury the various species do to his choicest plants, than to the merchant to whom many species are of vast importance as articles of commerce, as will be readily admitted when we state, that the annual value of the Cochineal alone imported into Great Britain is estimated at not much less than half a million sterling; besides which other species of Coccus furnish shell-lac, employed in the making of sealing-wax, of varnishes in japanning, &c. It will therefore afford me infinite pleasure should these sketches of their economy lead those who have constant access to hothouses, and better opportunities than myself, to study their histories and give the result of their investigations to the public, with accurate figures of the eggs, larvæ, pupæ, and the male and female adult insects. A good example has been set by Bouché, who in his "Garten-Insecten," and "Naturgeschichte der Insecten," has done a good deal towards a better knowledge of the Coccoi, injurious to the gardens at Berlin, by relating their economy and describing many new species; but unfortunately these works are written in German, which renders them almost sealed books to the majority of English readers. I find from a passage in the latter volume, that a species of ant attends the scale insect, as many others do the Aphides or Plant-lice. As it is an interesting fact, I will endeavour to translate the paragraph. "The Shield-lice," he says, "is very much sought after by ants in hothouses, especially by the *Formica marginata*, on account of the sweetness of its excrement; they are nourished by it, and the ants frequently squeeze the Shield-lice to obtain their evacuations, in such a manner, that they die from it. This fate particularly happens to the weak males, which consequently seldom arrive at maturity."

To exterminate these insects seems to be very difficult: the true Coccoi being large and prominent species may be scraped off the bark with a wooden knife, or a stiff brush will remove them; but as multitudes of the eggs and young ones may escape injury from their minuteness, it will be necessary to wash the trunks, &c. immediately with some mixture of soap, tobacco, and water; whether the addition of sulphur be useful, I am unable to determine: the great object, however, in extirpating them, must be to ascertain the period when the young issue from the eggs, and then apply the remedies proposed, as at that time they are undefended, and the slightest application will kill them. As scrubbing the leaves is impracticable, such plants as have the foliage infested to any extent, ought, if possible, to be immersed in some medicated liquor, as, for instance, lib.

of soap mixed with 4 gallons of soft water, adding half-a-pound of tobacco and one pound of flour of sulphur; then boil the whole until it is reduced to 3 gallons; when cool, immerse the plants infested after the roots and leaves are trimmed for potting, and they may in a day or two be washed clean with pure water: this mixture is said to be too strong for delicate exotic plants, and if used for watering, it must be diluted by three parts of water.—*Ruricola*.

ON THE CULTIVATION OF THE CHERIMOYER. (ANONA CHERIMOLIA.)

It is a matter of surprise to me that so few tropical fruits should be cultivated in England, almost the only one being the Pine-apple, which, if it is to be estimated by the value set upon it where it has to withstand a comparison with other natives of hot climates, is a very poor fruit indeed. It is perfectly well known that the Pine is thought one of the poorest of fruits in those countries where it grows in the open air. There are many tropical fruits which might be cultivated without much difficulty in England, if proper means were employed; but if people expect to get fruit from any stove plant without bestowing at least as much pains and money on its cultivation as is bestowed on that of the Pine, they will most assuredly be disappointed.

The tropical fruit which I think would be cultivated most easily in England is the Cherimoyer (*Anona Cherimolia*); it is often mentioned as one of the finest fruits in the world, and is the only one which I have tasted that I think worthy of comparison with a first-rate Peach, properly ripened. The Cherimoyer is a fruit of considerable size, fine specimens often weighing four pounds, or even more; it is of an irregular heart-shape, and pale greenish-yellow colour; the skin is very thin, and covered with obsolete impressions of scales, which I have observed are less apparent in the finer varieties of the fruit than in the common ones. The eatable part is a white pulpy matter about the consistence of custard, which forms nearly the entire mass of the fruit. The seeds are contained in the cells of the pulp; they are quite smooth, few in number, and are separated without difficulty; so that, although of considerable size, their presence is no drawback to the pleasure of eating.

I have no doubt that the Cherimoyer might be cultivated with as great success, and with as small an outlay, as the Peach (I am not talking of out-door Peaches), because I have grown it to perfection in a climate where the Peach thrives perfectly well. The course of treatment I would advise would be, to build a house like a Peach-house, and in it to plant the Cherimoyer. The only difference between the requirements of the two plants would be in the duration of heat necessary for ripening. The heat of the Peach-house would be quite sufficient, but it must be kept up at least two months longer than is required to ripen Peaches. The winter-heat should be only just enough to keep the plant from being frozen; it will then lose its leaves almost entirely, and when the spring comes, and heat is applied, the flowers will appear abundantly on the old wood. They will require artificial impregnation, or the fruit will be few, ill-shaped, and small; indeed it is more than probable that without great attention to this part of the cultivation no fruit would ever be set in this country; although, if pains were taken, the crop would, I believe, be abundant.

The Cherimoyer is a large, straggling bush; one of 10 feet high would spread 20 feet, if left to itself, which I have found to be the best way of getting fruit. A plant five feet high will bear fruit, if it be not a seedling, and will bear a succession of its curious, half open, sweet-scented flowers for about three months; so that by a little management ripe fruit may be obtained during an equal period of time, or even longer, for I have seen late fruit hang on the tree during a whole winter, and ripen in the spring. The Cherimoyer is a native of a very dry climate, but it likes a good supply of water during the flowering season, or it will not set fruit. It seems to thrive best in sandy soil, which need not be rich; it is altogether a very hardy plant, not easily injured by heat or drought, and I hope it may some time procure from English Horticulturists the attention which its merits deserve.—*J. O. B.*

AMATEUR'S GARDEN.—No. XXX.

HAD I not recently become acquainted with Mr. Beaton, I should almost feel disposed to pick a quarrel with him for forestalling me with his article on the improvement of Rose garlands, in the introductory remarks to the Calendar of last week; but on a second thought I think I ought rather to congratulate myself that so interesting a subject has met with such an able advocate. The introduction of a number of kinds on one plant on pillars, garlands, or walls, or even single standards, has long been a favourite idea of mine; and I have long thought that if ever I should have the charge of a tolerably good surface of Rose wall, I would try whether an unique and rather novel feature in flower-garden scenery could not be produced, by grouping the kinds in masses, according to their complementary colours (as far as these could be obtained), or at any rate, so that no dark group should be so placed as not to have a light colour close by, to enhance, by comparison, its brilliancy; but as I shall not have an opportunity of carrying this idea into execution for a year or two, I throw it out with the hope that some amateur reader may be induced to carry it into practice.

Climbing Roses, though very beautiful when viewed en masse, are in a floristical sense but poor things, as many of them are little more than semidouble, with thin, flimsy petals, and therefore but ill suited for that close examination which is the prevailing fashion of the present day. It is consequently worth consideration whether

their cultivation ought not to be, to some extent, discontinued, and their places filled up by better things. This may be readily effected by budding the choice sorts at various heights on the climbing kinds at the present time, taking care to give the delicate-growing varieties the most elevated position on the branch, and placing the strong-growing ones towards the bottom. This method I have practised for some years past, and I can only say, that a pillar covered with six or eight kinds of the best of the French and Hybrid China Roses, has a far more imposing appearance than when covered with a few flimsy flowers of the climbing kinds. In the coming season I am about to plant a number of arches of 30 feet square with Roses, and I there intend to introduce none but the most rampant growing Ayrshire kinds, and then bud them as they advance with a general collection of the more choice varieties. It is surprising with what vigour the French and Hybrid China varieties grow when budded on the climbing kinds. The French *Aglaia* Adanson, *Boula de Nanteuil*, *Nelly*, *Franklin*, *Pharericus*, *Rouge éblouissante*, and several others I have had make wood from 4 to 8 feet long the season after budding, when worked on the old wood of a Banksian Rose, and I have no doubt but that the Bourbon, China, Tea-scented, and other perpetual Roses, if worked in the same way, would grow with corresponding vigour; and if so, we have reason to expect that many of the delicate-growing kinds would bloom much stronger in consequence. The experiment, however, is worth trying, and I earnestly recommend it to the consideration of the Amateur.

As the busy season of propagation preparatory to another year is at hand, the Amateur, if he has still to get his heat by the antiquated and uncertain plan of fermenting material, must lose no time in forming a slight hot-bed for cuttings of *Pelargoniums*, *Verbenas*, and other grouping plants. As only a very slight degree of heat will be required, an old lining from the Melon and Cucumber frames will be the best material to use; to which, to excite fermentation afresh, a small quantity of short grass may be added, the whole to be sprinkled as the bed is formed with ammoniacal liquor, diluted with ten times its quantity of water. The bed will not be fit for the cuttings for a fortnight to come, and by that time I shall offer some remarks on the plants to which attention is first required.—*W. P. Ayres*.

HOME CORRESPONDENCE.

Bees.—At p. 445, I perceive that "Apis" has observed the controversy between "A. Pettigrew" and myself, relating to Bees, and that he has left little for me to notice. However, as "P." says that I do not argue fairly, I shall offer a few remarks on my own behalf. He speaks of "my disciples;" I know of none; but supposing that I have any, if his charge be true I should soon lose them. "P." founds it on what I called his own words, viz., "putting a queenless swarm into an empty hive to make them produce a queen." To clear this up I shall give his own version of it at p. 209 more fully. "When from one of the first two swarms we take away the queen, the day after they are put into empty hives we find that the queenless swarm, after searching one, two, or three days, begins to make royal cells, by adding wax to common cells." The term empty hives renders this sentence rather obscure. I said that "the cell in which it (the queen) was reared differed a little from the usual form of queen-cells, being less pear-shaped, and not so deep." "P." denies this, without seeing the cell in question. He says I "erred in saying that they are not so deep as royal cells generally are." Does this show that "P." argues fairly? I question if ever he kept Bees on the depriving plan, otherwise he would not have demurred at my statement, viz., "how galling it is to have a hive weakened by swarming instead of having a bell-glass full of honey." I now notice "P.'s" plan of making artificial swarms. It is useless to repeat what has been said on this subject; suffice it to say that it is intended, in a great measure, to obviate the loss by Bees clustering on the outside of their hive. This being an important point, I shall offer a few remarks upon it. Why do Bees become idle, especially before the first swarm quits the hive? Want of room makes them turn outside of it, but when this is not the case, idleness prevails in a great degree inside. The fact is, that Bees are more bent upon leaving the hive than the queen is willing to lead them off. She will not leave in bad weather, nor before her successors are in some degree matured in their cells. The question then is, what is gained by premature separation? If done in bad weather there is none—perhaps an injury; for what use would Bees be in an empty hive at such a time? If the weather were good, a few days might sometimes be gained; but when the unnatural disturbance of the hive by smoke and the uncertainty of success are taken into consideration, I think the scheme is best let alone. "P." may urge that success is sure, but why does he not take the precaution to remove the treasureless Bees to a distance and confine them, say 24 hours, otherwise they might return to their old home? "P." may demur at this, but my experience accords with that of a writer (I think Riems) who says—"Bees deprived of their queen ought to be confined 24 hours, with a due admission of air; without this precaution they would soon search for their queen, and infallibly find her out." It may be alleged that this is hardly applicable to the Bees in question, for the queen is with them in the empty hive, whilst those in the full one are nearly in the same condition as Bees usually are after the first swarm is gone; that is, a few days without a queen, until one is hatched. The danger is, lest the queen and all the Bees return to their stored home. I may mention a more simple plan than that just noticed, related by Sir

W. Jardine. At present I cannot give his own words; the following will, however, explain his meaning:—
 'When Bees hang in a cluster outside the hive, sweep them into an empty one containing a bit of brood-comb, and place it immediately where they stood; then carry the full one to another part of the garden; the returning Bees will enter and remain, though with surprise, in the treasureless hive.' There can be no necessity for either plans after the first swarm, although Sir W. J. experimented after the first swarm; but it is a rare occurrence for Bees to cluster before the second swarm. When it does happen it is better to give more room, than to force away part of the Bees; for as soon as the queens come forth, repeated swarming may happen, and the stock will thus be reduced to weakness, or what Sir W. J. calls "puny stock hives, which give much trouble, and cost a great deal more than they are worth."
 "P." mentions that "Bees have no eggs later than August." If he were to ask his friend that squeezed the 110 lbs. produce from one hive, perhaps he would tell him that not only eggs but much brood is often squeezed out amongst honey in October. As the drones are in general destroyed before August, he probably believes in the old notion, that the drones sit upon the eggs; hence they are called sitters. But it may be asked, where are the sitters in the winter, at the time that "P." notices "Bees drawing together and leaving a semicircle of brood uncovered, which dies, notwithstanding the warmth of the hive, the stench of which compels Bees to forsake their hive?" He observes also, "that this back-gone brood increases all the summer." Without a proper degree of heat, the brood of course must die, and would soon become dry and crisp without stench, and cleared out before other eggs were deposited in the cells, in a way similar to that by which drones' cells are cleared of brood at the time their slaughter begins.—*J. Wighton.* [Our readers will agree with us that this is enough of argument. Mr. Pettigrew intends shortly to state, without argumentation, his own views of Bee management.]

Bees.—The diversity in the temper of Bees mentioned by "Omicron" at p. 501, is owing simply to traffic in the apiary. If the most ferocious Bees were placed in a public thoroughfare for the space of a fortnight, they would become very mild-tempered; and if peaceable, unoffending Bees were not to see men or cattle for the same space of time in summer, no person could approach their hives without danger. The most peaceable Bees will wage war with a person if there be any visible perspiration on him. No Bee-keeper ought to attempt to hive a swarm when he is perspiring. It were better to shade the swarm, and sit in a cool place for a few minutes. I knew a man who, after having run a mile,—though he was or should have been conscious of the danger,—nevertheless attempted to take a swarm from a hedge or bush, but was stung so severely that he was carried from the scene in a highly sick and dangerous state.—*A. Pettigrew.*
 I think that "A. J. S." is right in the opinion that he was deceived in the condition of his two stocks of Bees at the time of purchasing them. As regards the weak stock having deserted the hive in June, it is rather an unusual occurrence. However, I think it might be owing to scout bees, from a colony about to swarm, having taken possession and destroyed the rightful owners. The drones would, of course, share the same fate, or perhaps the dead ones at the front of the hive were slaughtered from the other stock. In general, scout bees remain only during the day, clearing out old or deserted hives. This may account for none being found in "A. J. S.'s" stock, when it was examined in the evening. It may be alleged that fresh swarms only enter deserted hives. This, however, is not always the case. A swarm of mine lately took possession of a weak stock's abode, under the leads on a tower, about a quarter of a mile from their old home. As the combs in "A. J. S.'s" hive are fresh, they would be of great use, especially to a weak swarm, without "taking out every other comb." If what I have said is wrong respecting the desertion of the weak hive, I may safely observe that poverty was the cause of its failure.—*J. Wighton.*
 In answer to an inquiry from "Apis" at p. 505, I beg leave to state that a few years back, as I was passing through a field in which grew a great number of trees, my attention was attracted by the humming of Bees around a Whitethorn. On examination, I discovered what I thought to be a Fungus, but on closer inspection I found to my astonishment a great number of Bees as busily employed as though they had been in a hive. On cutting down the combs, I found both honey and young Bees in the maggot state. How long they might have taken up their abode there I cannot venture to say; it was then the month of August.—*A Bath Subscriber.* [But where were the Bees? in the ground—in a Whitethorn—or in a Fungus?]

Heating.—These being the days of moral reform, when we brewers will soon be compelled to relinquish our calling for one of more innoxious character, the idea occurred to me that some of the casks might be turned to another purpose—that of heating Vineries, &c., by having a number of them placed end to end, with short pipes connecting them, so as to maintain a healthy circulation of their uninebriating contents. If this theoretical adaptation be at all practicable, it may probably be of use to some of your readers.—*F. Y.* [In order to render this system serviceable, the pipes connecting the barrels must be of metal, and of considerable length; otherwise, wood being a bad conductor of heat, but little warmth will be thrown into the surrounding atmosphere.]

Ringling.—In the spring I performed the operation of "ringling" on two plants, a Gooseberry-bush and a Pomegranate. Now, whilst the shoots above the incision exhibit no difference in appearance from the rest on the

plant, the shoot (in both cases) next below the incision has grown with astonishing rapidity and vigour; so much so, that these shoots, besides being of very much greater length are of more than twice the thickness of any other of the same age. Is this consistent with the notion that "ringling" confines the sap above the incision by checking its descent?—*L. B.* [No. But the probability is that the ringling has checked the current of sap upwards; in what way this has taken place could only be determined by inspecting the specimens.]

Mulberries.—Among the many edifying articles in the *Chronicle*, I have not seen any notice respecting the growth of Mulberries in pots; and I am surprised that no gardener has given any information on this subject. I have five small plants from 18 to 30 inches high; and such a tree in miniature, with a hundred ripe fruit on it, would, if of no other value, be pretty to set on the table with the dessert, for the ladies to pick their own fruit from. A plant may be brought into a bearing state in five or six years, and will bear forcing in a high temperature, having fruit nearly ripe by the time that their leaves open in a natural state out of doors.—*W. S. D., Coventry.*

Plants for Edgings.—Amongst the plants which have been mentioned in the *Chronicle* as suitable for edgings in shady situations, *Cotyledon umbilicus* has not been mentioned. I never met with this plant abundantly anywhere except in this part of the country. It looks remarkably well when grown in patches.—*Thomas Sellers, Pennoyre.* [It will only thrive, we believe, in the damp, mild climate of the West and South of England.]

Strawberries.—I perceive at p. 502, that you are still of opinion that mowing off the leaves of Strawberries is a bad practice. I should feel obliged to you, or any practical reader of the *Chronicle*, that will inform me of any new plan that would be likely to succeed better; until then I shall not be easily persuaded to forsake my present system. What I before stated are facts, not easily contradicted. I have found, after the leaves have been taken off, that, with the assistance of manure, the beds have been well feathered with foliage, which is, I consider, a great protection, and the only means of insuring a good crop the following season. But as I grow six different sorts, viz., Downton, Keen's Seedling, Royal Sovereign, Myatt's Pine, Elton, and Alpine,—which last two sorts do not cease from bearing before the latter end of September or beginning of October,—you nearly agree with me as to the time when the manure should be laid on, as I mow off the leaves as soon as the fruit is gathered.—*D. Z.*

Chamomile.—At p. 479 I observe that "J. W. T." asks why his Chamomile produces single flowers. If he will plant it on poor sandy ground, well trodden, so that every part is as hard as a gravel walk, he will find that his Chamomile will bloom double and abundantly.—*E. C., St. Peter's-street, Cambridge.*

Improved Garden Pots.—I herewith send you drawings of two garden-pots which I consider will be found valuable;—the one for growing specimen plants in, the other for striking cuttings in. When Mr. Brown's pots were first announced, I was much pleased with the invention, and considered that they would be of great service to plant-growers in the cultivation of specimen plants, Heaths, New Holland plants, &c., as affording shelter to the roots from the scorching heat of the sun's rays; but although it appeared so desirable an improvement to me, I nevertheless considered that a pot constructed as here represented, would be of greater importance, and make Mr. Brown's invention more perfect, as it would afford a complete drainage as well as preserve the roots from the sun; I think it would be found valuable in forwarding the growth of specimen plants, as must be obvious to any plant-grower, who will immediately see the utility of it, as the roots of the plants would be kept cool, and an excellent drainage secured. The propagating pot, No. 2, will be found of great value to nurserymen or others in the propagation of tender cuttings, &c. This could be made with or without Mr. Brown's improvement, but I think it would be preferable with it. What I consider the chief superiority of this plan over the common pot is this: that when the pot is plunged in heated materials, the barrel of the pot would form a hot-air chamber, thereby always imparting a genial glow of warmth to the sides of the pot, and thus stimulating or quickening the vegetative powers of the cuttings placed therein.—*William E. Rendle, F.H.S., Plymouth.*

Moss Rose.—I have a standard White Moss Rose on its own bottom, which grew last year nearly eight feet high. The top has been foreshortened about 18 inches, and the standard is now about 6½ feet high, literally covered with upwards of 30 well-formed buds, and not one yet expanded. No one can imagine the beautiful appearance

which the plant has, by being supported on its own stem. Do any of your readers remember to have seen the White Moss growing similar to the one I have described?—*J. E., Rotherham.*

Potatoes.—In answer to "S. H.'s" inquiry, p. 445, I beg to state that my Potatoes were planted about the 20th of March, and are Ash-leaved Kidneys. I procured them, about four years since, from Nottinghamshire, where they are known as Aldbury Kidneys.—*R. R. R.*

New Budding Knife.—Thinking that any little improvement tending to facilitate the operation of budding would be interesting to some of your readers,—I send you the pattern of a Budding-knife made after my own shape, and which, from the rapidity which it allows of being turned in the hand, and its ready application to the bark, enables the operator to insert a bud nearly half as fast again as he would with the old straight-handled Budding-knife. The knives are well made by Plum, of Bristol.—*Henry Curtis, Moorend and West of England Rose Nursery, Bristol.* [This is the neatest Budding-knife we have seen. The ivory handle is shaped like the blade of a curved pen-knife, is sharp and turned up at the point, and is evidently extremely well contrived for the purpose it is intended for.]

Composition for Watercourses.—Though I am very much pleased with "A. B.'s" remarks, p. 462, that all who communicate ought to be particular; still, I am sorry to say I cannot be so. In regard to salt with Asparagus, I am of opinion, and am not inclined to alter that opinion, that you cannot err, either in time or quantity. You say "the best food for cows next to Grass is a few Beans soaked in water for 24 hours." Now, a few Beans, I should say, "A. B." would not think explicit enough, and it would indeed be valuable to know a little more about it. Would any of your correspondents answer me this question? I have a watercourse laid in bricks and terrace mortar; it remains good during the summer months, but a frost causes great leaking. Is there any composition that will resist the frost under water and between wind and water? It would save me pounds, and more than oblige *J. B. H.*

Peat Drains.—Mr. Smith, at p. 492, states that a stone or tile-drain would last for twenty years, and would be in as good a condition at the end of that time as when first constructed. "Peat-drains," he says, "would, on the contrary, scarcely endure as many months." I have no doubt if Mr. Smith had an opportunity of examining some Peat-drains on the Natebey-hall estate, near Garstang, that he would find them in nearly as good a condition as they were when first made, which is now twenty years ago. The Duke of Hamilton has been adopting this plan to a very great extent for some years, although he has got plenty of good stone upon the place; and I could also name many other landowners who are adopting Peat in preference to stone-draining.—*M. Saul.*

Muriate of Ammonia.—Observing at p. 477 your remarks on the destructive power of ammonia on animal life, it reminded me of what I saw practised upwards of twenty years ago, by a gardener under whom I then served, viz., placing muriate of ammonia and sulphur in shallow pans in the Melon frames exposed to the sun, with the belief that the effluvia then arising from the pans was effective in keeping away insects, and he was a very successful cultivator. I should be glad to know, supposing it had the desired effect, of what use the sulphur was;—did it act in any way on the ammonia?—*A. C.* [We apprehend that the muriate of ammonia had nothing to do with the effect. It is not likely that the sulphur had any action on the muriate; it is probable that the sulphur alone was of use in keeping away insects.]

The Cuckoo.—I heard the Cuckoo singing clearly and distinctly on the last day of June, which I never noticed before the present season. Does the above circumstance betoken a fine summer? I never heard it in full note after the 15th of the above month. There is a friend of mine who has in his possession a young Cuckoo, which he took out of a nest on a down, which nest he thought was a Whinchat's. He watched the nest constantly, and one morning he found only one egg left, which proved to be the Cuckoo's, all the rest having been ejected, and found broken immediately under the nest. He hopes to keep the young Cuckoo through the winter.—*A Subscriber.*

The Titmouse.—In June last the gardener to Mrs. Chorley, of Bolton-le-Sands, near Lancaster, observed a pair of these birds frequenting an ornamented bottle which was standing upon the garden-wall, and he was therefore induced to examine it. To his great surprise, he found that they had made their nest and laid eggs in the bottom of the bottle, and he was at a loss to know how the young would find their way out, as the passage was only two inches deep by three quarters of an inch in diameter,—the distance from this passage, or neck, to the bottom of the bottle, being thirteen inches; he therefore resolved to give them a fair chance, by allowing the bottle to remain, and in due time ten young birds were produced, and found their way in and out of the neck of the bottle, in the same manner as the old birds had done. This is a further proof of the boldness of the Titmouse as described in p. 429.—*Facile.*

FOREIGN CORRESPONDENCE.

Paris, July, 1843.—The fruit-growers of England will not have much reason to dread foreign competition this season, at least not from France, for we have had miserable weather for the last two or three months. Such a summer has scarcely, if ever, been known; cold winds, hail, rain, or storms have had complete mastery, and a really fine day is almost as great a rarity as at Christmas. Paris, which in general is so gay with flowers in May, and so well furnished with summer fruits in June, has been this year but scantily supplied with either. The flowers in the

No. 2.

No. 1.

markets looked crippled, the blossoms neither opened freely nor emitted their usual odour; Strawberries and Raspberries are without flavour, and later crops present unfavourable appearances; a bad season is certain. The primary cause of all this is, no doubt, the severe weather which visited us in the middle of April, when for three successive nights the thermometer stood at 24°, 22°, and 26°, of Fahr.; this destroyed all the young Vines, just then coming into full leaf, as well as most of the Peaches, Apricots, Nectarines, Almonds, Walnuts, and Pears; and the subsequent cold and rain have completed the disaster. Even so late as the 30th of June a white frost was perceptible in many places round Paris. All this will be severely felt in a country like France, where the Vineyards are one of the chief sources of wealth, and fruit (together with bread) almost the sole subsistence of the labouring classes during the summer and autumn. On the 13th July, 1842, I cut ripe Grapes from a south wall, to send to a friend in England: on the same day this year they were just coming into blossom. The bunches are large and numerous, but the greater part of the buds are evidently chilled, and fall off upon the least touch. The open ground Vines in this neighbourhood are not even in bloom, and anything like a crop from one or the other is quite out of the question, except we should be favoured with a long and hot autumn. The poor fruit-growers of Montreuil, Bagnolet, Charonne, and the neighbouring hamlets, will be nearly ruined; there is not sufficient fruit to pay the expense of training. You may walk along entire walls without seeing scarcely a Peach or Nectarine; unfortunately, there is not only a season's fruit lost, but the trees are everywhere in an unhealthy condition, the branches covered with gum, and appearing as if struck by lightning. Apricots, Plums, and Pears have not suffered to the same extent, but there is nothing like an average crop, and in exposed situations you see no fruit at all. Walnuts will be very scarce. Cherries are selling at from 3d. to 6d. per lb.; English Blackhearts and Montmorencies readily fetch this, or even more; last year they were from 2d. to 4d. The Cider crop has also suffered. I have examined whole rows of trees without seeing a single Apple; I speak of those near and within 15 or 20 miles of Paris; but I understand the same may be said both of Normandy and Picardy. As to Agricultural prospects, I cannot pretend to give an opinion: but I would remark, *en passant*, that the corn-fields looked in good condition last month. During the last fortnight, however, the Wheat has been much laid by the heavy rains. Haymaking is not yet finished. Most black clouds have, however, a silver border; and so, in this instance, there is a small contra-balance in the unusual abundance of all kinds of vegetables. New Potatoes have never been known so fine, nor Peas so cheap; 40 to 50 sous (1s. 6d. to 2s.) a sack has been the market price, and this cannot pay the expense of gathering. The retail price of fine young Marlies (a kind of marrowfat) shelled, is at this time only threehalfpence a litre, or English quart; Cauliflowers, Cabbages, Artichokes, and, in fact, all Vegetables, are equally abundant. I may almost say the same of Currants. I now turn to Floriculture, and while still upon the bright side, would remark that the Roses have been splendid. I have resided in, or been in the habit of visiting, France for the last fifteen years, but never remember to have seen the blooms so large or perfect before. In ordinary seasons the petals are either burnt or drop in a day or two. It has not been so this year; they have had full time to expand; and Gallicas, Centfeilles, Moss, &c., with their hybrids, have been literally covered with flowers for two months. The China, Bourbon, and Hybrids, are also now in great perfection, and remind me of the noble blooms I have so often admired in England, when visiting the collections of Messrs. Rivers, Hooker, Wood, Lane, or Paul; for however fragrant the Rose may be in France, and more southern districts, it is in eight seasons out of ten larger and more perfect to the eye in England, Holland, and Belgium. Greenhouse plants have not done well; the cold nights in May and June (frequently as low as 42 and 44 deg. Fahr.) seriously checked the Pelargoniums, which have not been more than two-thirds of their usual size; moreover, oftentimes ill-formed and quite out of character. A kind of thrips has also committed almost as great havoc as the green-fly; it has also attacked Calceolarias and many other plants. Annuals have been a decided failure, no doubt from the torrents of rain. The sudden changes have been no less extraordinary; yesterday the thermometer was at 82 deg. Fahr. in the shade, to-day it is at 50 deg.; and last week the fluctuations were even greater: in fact, we might almost suppose ourselves to be in the month of September rather than July.

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

July 5.—At a Monthly Council held at the Society's house in Hanover square, Mr. W. Draycot presented a specimen of English Cotton, with the following account of it:—"The inclosed Cotton was grown, not in the interior of Mexico, but in the interior of the county of Nottingham. The tree has long been very interesting to me, and this is not my first effort to bring it into notice. I do so now in consequence of having read the report of the proceedings of the Council of the 21st of June, in which it is stated that Mr. Colman, the Agricultural Commissioner from the United States, exhibited some specimens of Silk, Silk-cotton, and Cotton, this last the produce of a large tree. The specimen I send is also the produce of a large tree, growing upon the estate of the Earl of Mansfield, at Edwinstowe. With the Cotton I send some foot stalks, and also some leaves. I am much inclined to think it a pure specimen of the one described by Mr. Colman. I regret I did not attend to it sooner, as I then should have been enabled to procure some Cotton in a better state, as well as finer foot-stalks, with the capsules more perfect. The seed is about twice the size of the germin in Wheat; some will be found amongst the wool; I think they are emitted immediately on the opening of the capsules. It is desirable that an effort

should be made to grow Cotton in this country, if only for the purpose of making down pillows." Mr. Cherry's paper on prizes for horses was referred, with several others, to the Journal Committee. The Marquess of Downshire presented a specimen of Irish Flax of the growth of 1843, from a field, averaging 3½ feet in height. Mr. Dean submitted plans prepared by his son, Mr. Alex. Dean (civil engineer to the Haarlem Drainage Commissioners), of his proposed drainage of the Metropolis. Mr. Shaw exhibited paintings of a boar and sow belonging to Mr. Nutt, of York; and Mr. Easton transmitted a specimen of an unknown plant, which had yielded him a luxuriant crop.

July 10.—At a Council held at Derby, the Duke of Richmond in the chair, 36 gentlemen were elected Members.

July 19.—The Marquess of Downshire in the chair. 20 gentlemen were elected Members. Mr. Denison, M.P., stated the great disappointment he had experienced in attending the Derby Meeting, at not finding on the Implements exhibited in the show-yard, such information as would lead the Members and the public at large to profit by the decision of the Judges, and be enabled to draw just conclusions on the comparative merits of implements belonging to the same class. Mr. D. stated that he had gone to the meeting with twenty of his tenants, and an implement-maker of the village, the great object of the party being to select such implements as appeared best suited to their land. They found a splendid show of implements, but hardly any assistance from the Judges to guide them in their purpose selection; and even in cases where prizes were awarded no explanation was given of the grounds of the award; and thus the journey of the party, as far as its main object was concerned, proved entirely fruitless. Mr. Denison then applied to parties whom he thought most capable of giving him advice in the choice of two or three of the most important implements he wished to purchase, but he found to his further perplexity that each recommended different implements. Considering that in such a state of things nothing could be more unsatisfactory to a member, or less likely to tend to the formation of a just decision, and that while the Society invites competition and expends its money in awarding prizes, the members who provide that money have a right to be put in possession of the results, carefully examined and deliberately judged, he thought it a great reproach to the Society that the omission had occurred. He would venture to suggest that a much larger number of Judges should be appointed, that their labours should be subdivided—one set of them for ploughs, another for drills, another for threshing-machines and chaff-cutters, and so on. He thought that in this way something really useful might be done, and decisions of some value obtained. The noble chairman thanked Mr. Denison for the statement; and so desirous were the Council to remove every just cause of complaint, that he would himself second any motion which Mr. Denison would propose. The latter gentleman then gave notice that he would move, at the next monthly council, "That at future country meetings, on or before the morning on which the show of implements is opened to the public, the award of the Judges should be known, with all necessary information to guide the public in the selection and purchase of implements." Mr. Shaw gave notice that he should move, "That a committee of three persons, to consist of one member of the council, one practical farmer of the district, and one implement manufacturer, be appointed to take land, get it prepared, and make the necessary arrangements for the trial of implements at the Southampton meeting: That the trial of implements shall take place in the week preceding the meeting, and that an exhibition of implements at work, and not a trial of their merits, shall take place on some day during the meeting: That the number of Judges of implements be increased, and that there be one or more practical farmers among them: That it be imperative on every exhibitor of an implement for a prize, to state to the best of his ability the name of the inventor (if known), the time when invented, the particular points of merit or improvement (if the claim be for improvement), and in what district it has been and is used." Prof. Owen having been informed that the Council were desirous of transmitting to the Royal Academy of Sciences at Munich, replies to various inquiries made by that learned body on the subject of the Alpaca, undertook to obtain the required information; in the meantime he inclosed specimens of the four varieties of wool, of the value of which he had long been impressed with a favourable opinion. He feared that the humidity of our mountain districts would prevent the growth of wool of the same beautiful quality as that developed in the Andes, if even the Alpacas could stand the climate; but he thought the experiment would be worth the trial. Mr. Beman communicated the mode of his trial of different varieties of Wheat; Mr. Bennett, his remarks on the advantages of the Tweeddale tile machine; the Rev. T. J. Powell, his mode of registering (as an Honorary Distributor), the distribution of the Society's Journal; and Mr. Baker, a communication on Friendly Institutions, which were referred to the Journal Committee. Mr. Pusey, M.P., transmitted specimens of pipe-tiles and draining tools; and Messrs. Robertson, specimens of their new grating pipes for drains. A large collection of specimens of plants and minerals was received from Dr. Daubeny, from Spain, and was ordered to be reserved for the Monthly Council.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

July 25.—The fourth meeting for the present season was held in the Surrey Zoological Gardens. The weather was favourable for the occasion, and the exhibition, so far as flowers were concerned, surpassed anything of the kind which we have hitherto seen in this place. The miscellaneous collections of plants exhibited by amateurs were deficient; but those brought by gentlemen's gardeners and nurserymen were highly creditable. In the former class the first prize, a large Silver Medal, was awarded to Mr. Townley, whose collection comprised *Hoya carnosa*, flowering in great luxuriance; a fair specimen of *Thunbergia alata*; *Clethra arborea*, with neat white bell-shaped flowers, particularly fine; *Jasminum gracile*, and *Lantana aculeata*. In the collection of Mr. Cox, of Stockwell, there was also a fine plant of *Clethra arborea*; the delicate *Campánula pumila alba*; a fair specimen of *Achimenes longiflora*; a well-bloomed *Calceolaria*, like *Standishii*, and *Columnea splendens*: for these a Middle Silver Medal was awarded. Amongst gentlemen's gardeners, Mr. Bruce, gr. to B. Miller, Esq., obtained the Gold Medal; his collection contained particularly handsome specimens of *Achimenes rosea* and *longiflora*; *Leschenaultia formosa*, quite concealing the pot, and loaded with bloom; a small plant of *Státice arborea*; *Aphelexis humilis*, in good condition; *Erythrina crista galli*, very vigorous; *Erica ampullacea*, beautifully bloomed; a good plant of *Phymatanthus tricolor*, with several pretty *Ericas*. The large Silver Medal was obtained by Mr. G. Young, in whose collection were *Lilium Thunbergianum*, in excellent health; *Mirabilis undulata*, with prickly leaves and light purple flowers; the dark variety of *Achimenes longiflora*, blooming freely in a large pan; *A. grandiflora*, equally fine; *Maurandya Barclayana alba*, trained on a circular horizontal trellis; *Siphocampylus betulifolius*, in excellent health; with *Lilium eximium*, *Erica Boweiana*, &c. The third prize (middle Silver Medal) was awarded to Mr. Wilson, gr. to — Gilliat, Esq., of Clapham Park, whose collection contained a lovely plant of *Allamanda cathartica*, not more than two feet high, yet having eight branches, each bearing at the tip several of its gorgeous trumpet-shaped flowers; *Erica reflexa* and *Massoni*, well bloomed, but slightly on the decline; a pretty specimen of *E. Savilleana*; one marked *McNab's* seedling, and *E. Aitoniana*, in fine health, but not fully in bloom. Mr. Hamp, gr. to Jas. Thorne, Esq., of South Lambeth, received the fourth prize (small Silver Medal); he exhibited *Campánula fragilis*, trained on a small upright trellis, and having a pretty effect; a fine specimen of *Gesnera splendens*; a small plant of *Besleria puchella*, and several good *Fuchsias*. Small collections, from Mr. Bragg and Mr. Schroder, were also recommended for a prize. Mr. Jackson, of Kingston, amongst nurserymen, obtained the Gold Medal, the principal plants in his collection being Heaths; there

were, nevertheless, well-grown specimens of *Achimenes longiflora*, several *Gloxinias*, *Státice mucronata*, sinuata, and pseudo-arméria. The second prize in this class (large Silver Medal) was awarded to Mr. Halley, who exhibited fine plants of *Fuchsia Iveryana*, *Cormackii*, *formosa elegans*, and *Monceppennil*; *Státice arborea*, blooming freely; *Erica eximia* and *tricolor elegans*, beautifully flowered; and *Lilium eximium*. In Mr. Fairbairn's collection, which received the middle Silver Medal, were pretty specimens of *Erica eximia*, *ampullacea*, *princeps*, and *Aitoniana*; *Primula sinensis*, double white and red, in great perfection; the brilliant *Crassula coccinea*; *Lilium eximium*, and a dwarf plant of *L. Thunbergianum*. For Heaths the large Silver Medal was awarded to Mr. Jackson, for an extremely large specimen of *Erica jubata*, and well-grown plants of *E. ampullacea major*, *princeps* var., *cruenta curviflora*, a flesh-coloured seedling, *Jacksonii*, *tricolor elegans*, *viridiflora*, *jasminiflora alba*, and a seedling from Shannoni. Mr. Fairbairn, of Clapham, received the middle Silver Medal for small but very compact and well-bloomed plants of *Erica Savilleana*, *ampullacea*, *Irbyana*, *Hartnellii*, *obovata umbellata*, *eximia*, *Massoni*, *ampullacea rubra*, *jasminiflora alba*, and several varieties of *tricolor*. Mr. Catleugh, of Chelsea, exhibited the only collection of Pelargoniums; they were exceedingly well grown, and obtained the large Silver Medal; consisting of *Beauty*, *Nestor*, *Queen of the Fairies*, *Priory Queen*, *Selina*, *Duenna*, *Erectum*, *Witch*, *Mrs. Stirling*, *Madonna*, *Lord Mayor*, and *Victory*. A good collection of the scarlet Pelargonium compactum was brought by Mr. Baile, of Hammersmith. Mr. Bragg received the middle Silver Medal for a collection of *Fuchsias*; amongst them were fine plants of the old *formosa elegans* and *globosa major*. Mr. Catleugh exhibited *F. arborea*, *Lancei*, *splendens*, *Stewartii*, *sanguinea*, *Dalstoni*, *decora*, *Devonia*, *insignis*, *magnifica*, *Una*, and *Cormackii*, beautifully bloomed; but a prize was not awarded in this class. Mr. Gaines also sent a good collection, containing *Loudoni*, *magnifica*, *grandis*, *Gem*, *aurantia*, *fulgens*, *multiflora*, *ilicifolia* (very elegant), *Venus*, *vitrix*, *Couperi*, *Meteor*, *conspicua*, *fulgens globosa*, *Iveryana*, *Salter's splendens*, *Lancei*, and *exelsa*. The middle Silver Medal was awarded to Mr. Conolly, of Acre-lane, Brixton, for a dozen dwarf and well-grown Cockscombs. Mr. Doran, gr. to W. Hawes, Esq., exhibited another creditable collection. From the latter person there were also 12 healthy Balsams, for which the middle Silver Medal was given. Messrs. Paul & Son, of Cheshunt, obtained the large Silver Medal for a very beautiful collection of cut Roses. Of the prizes given to gentlemen's Gardeners for collections of Rose-blossoms, the middle Silver Medal was awarded to Mr. Parsons, of Enfield, and the small Silver to Mr. Mason. Of the extra prizes given by Mr. Denyer, for the best 12 single trusses of Rose-blossoms, the first was awarded to the Rev. H. A. Mathews, for *Heureuse Surprise*, *Cabbage Provence*, *Bouquet de Flore*, *Coupe d'Hebe*, *Boule de Nanteuil*, *Queen of the Bourbons*, *William Jesse*, *Common Moss*, *Madame Hardy*, *La Séduisante*, *Great Western*, and *Duc de Bassano*—and the second to Mr. Young. Amongst miscellaneous single specimens, Mr. Cox received the large and middle Silver Medals for *Oncidium bifolium*, and *Cycnoches chlorochilum*. The small Silver Medal was awarded to Mr. Jackson, for a beautifully-bloomed plant of *Erica Savilleana*. Of Amateurs, Mr. Bragg received the middle Silver, and Mr. Cox the small Silver Medal for cut Flowers. A small Silver was likewise awarded to Mr. Townley, for the same. Mr. Bruce and Mr. Parsons obtained the first and second prizes, amongst gentlemen's Gardeners; and Messrs. Fairbairn and R. J. Chapman, the first and second amongst Nurserymen, for collections of Cut Flowers. Extra prizes were given to W. T. Hiff, Esq., and Mr. Bragg, for the same. Mr. Garty, of Camberwell, likewise received a middle Silver Medal for Cut Flowers. The first prize for Pansies was awarded to Mr. Edmonds, and the second to Mr. G. Young. Mr. Henbrey also obtained a prize for the same. A good collection of *Verbenas* was exhibited by Mr. Catleugh, and several fine *Ericas* by Mr. Dawson, of Brixton Hill. The Gold Medal was awarded to Mr. Newhall, amongst Amateurs, for his collection of Carnations, consisting of *Willmer's Conquering Hero*, *Brook's Flora's Garland*, *Franklin's Dr. Franklin*, *Puxley's Queen*, and *Prince Albert*, *Sealey's Princess Royal*, *Headley's William Cobbet*, *Smith's Mrs. Bett*, *Ely's Bright Venus*, *Martin's Conterder*, *Mansley's Beauty of Woodhouse*, and *Don John*. Mr. Dowler received the second, and Mr. Wildman the third prize for the same. For the best 12 white-ground Picotees, the Gold Medal was awarded to Mr. Edmonds, who exhibited beautiful blooms of *Orson's Adelaide*, *Annesley's Sanspareil*, *Wain's Victoria*, *Musson's Charlotte*, *Wilson's Prince Royal*, *Barrard's Bride*, *Heath's Superb*, *Miss Desborough*, *Purple Perfection*, *Nulli secundus*, *Barrard's Borderer*, and *Brinkler's Hope*. Mr. Newhall received the large Silver Medal for *Willmer's Miss Brown*, *Brook's Miss Brook*, *Martin's Prince George*, *Garret's Lady Dacre*, *Huften's Miss Willoughby*, *Sharpe's Duke of Wellington*, *Wilson's Fanny Kirby*, *Wilson's Pluperfect*, *Brinkler's Purple Perfection*, *Wain's Queen Victoria*, *Joan's Prince Albert*, and *Crask's Queen Victoria*. The third prize was awarded to Mr. Burrup, and the fourth to Mr. Alleway. The extra prize (middle Silver Medal) given by J. S. Proctor for the best 12 white-ground Picotees, was won by G. Edmonds, Esq., with *Jessup's Sir W. Middleton*, *Wain's Victoria*, *Orson's Adelaide*, *Sharpe's Invincible*, *Barrard's Bride*, *Brinkler's Conductor*, *Barrard's Borderer*, *Willmer's Prince Royal*, *Ely's Grace Darling*, *Purple Perfection*, *Nulli secundus*, and *Wain's Queen*. The Silver Cup, value 5 guineas, offered by Messrs. Dickson to Amateurs, for the best 12 white-ground Picotees, was gained by the Rev. H. A. Mathews, with *Mathews's Cynthia*, *Wood's Mrs. Veasey*, *Mathews's Eclipse*, *Dickson's Trip to Cambridge*, *Dearlove's Favourite*, *Giddens's Vespasian*, *Giddens's Sir Robert Peel*, *Brinkler's Lady Althorpe*, *Willmer's Prince Royal*, *Brinkler's Lady Chesterfield*, *Brinkler's Masterpiece*, *John's Prince Albert*. The first prize amongst gentlemen's Gardeners for white-ground Picotees was obtained by Mr. Welsh, gr. to G. Edmonds, Esq., with *Dickson's Trip to Cambridge*, *Wain's Victoria*, *Woollet's Prince*, *Lady Flower*, *Sharpe's Invincible*, *Orson's Adelaide*, *Sylph*, *Musson's Charlotte*, *Nulli secundus*, *Heath's Superb*, *Giddens's Sir R. Peel* and *Purple Perfection*. The 2nd prize was gained by Mr. Smith. The 1st and 2nd prizes for Carnations were given to Mr. Embleton, gr. to J. Barnard, Esq. Amongst Nurserymen, Mr. Norman obtained the 1st prize for white-ground Picotees, with *Barnard's Lady Dacre*, *Crask's Queen Victoria*, *Twitche's Fair Rosamond*, *Musson's Charlotte*, *Sharpe's Invincible*, *Willmer's Agnes*, *Barrard's Miss Jane*, *Fellowes's Purplea elegans*, *Garret's Lady Dacre*, *Brinkler's Masterpiece*, *John's Prince Albert*, and *Sharpe's Hector*. The 2nd prize was awarded to Mr. Franklin, of the City Road, and the 3rd to Mr. Hughes. Mr. Norman also stood first for Carnations, exhibiting fine blooms of *Brook's Flora's Garland*, *Ely's Lord Milton*, *Jones's Brilliant*, *Puxley's Prince Albert*, *Mansley's Beauty of Woodhouse*, *Headley's William Cobbet*, *Ely's John Wright*, *Twitche's Don John*, *Cartwright's Rainbow*, *Ely's Lady Ely*, and *Duke of Bedford*. Amongst the seedling Carnations, single bloom, (open to all classes), the first prize was awarded to Mr. Wildman, the second to Mr. Franklin, and the third to Mr. Schroder. For a seedling white ground Picotee, the Rev. H. A. Mathews obtained the first prize with one called *Regina*, and the third prize with one called *Cynthia*, and Mr. E. Clark the second. The extra-prizes of 1 guinea each offered by G. Edmonds, Esq., for the best bizarre and like Carnations, were won by Mr. Norman, with *Brook's Flora's Garland*, and *Mansley's Robert Burns*. Prizes of the same value offered by T. Barnard, Esq., for the best light and heavy-edged Picotee were won, the former by Mr. Franklin, and the latter by Mr. Norman, with *Sharpe's Wellington*. The Silver Medal offered by W. T. Hiff, Esq., for the best collection of Indigenous Plants, was awarded to Mr. Riddle. The Grapes exhibited were fine, particularly those from Mr. Allee, gr. to H. Beaufoy, Esq., and Mr. Chapman, of Vauxhall, each of whom obtained a middle Silver

Medal. Mr. Parsons, of Enfield, received the first prize for four varieties of fruit, viz., a Queen Pine, black and white Grapes, exceedingly large Gooseberries, and Elton Pine Strawberries. A second prize was awarded to Mr. Bruce for a fine Melon, Grapes, Plums, and Apples. Mr. Bushell also received a prize for a collection of fruit. Amongst nurserymen, Mr. Martin's collection of Vegetables was particularly good, and received the first prize; the second was awarded to Mr. Gaines, of Battersea. Mr. Parsons received the first prize for a collection of vegetables, and Mr. Allerton the second, amongst gentlemen's gardeners.

BOTANICAL SOCIETY OF EDINBURGH.

July 20.—This Society held its last meeting for the season, at the Botanic Garden. The President, Dr. Neill, in the Chair. After a delightful walk through the Gardens, during which Prof. Graham pointed out the objects most worthy of notice, the meeting assembled in the class-room for business. Donations to the library were presented from E. Lees, Esq., Worcester, and Prof. Forbes, of London,—and several valuable parcels of British and foreign plants were announced. The papers read, which were mostly of a technical character, were:—1. On the Genera Gomphonema, and Méridion. By Mr. J. Ralfs, Penzance. 2. On four new species of British Jungermanniæ. By T. Taylor, M.D., Dunkerron. 3. On a species of Fungus, found imbedded in peat, near Stirling. Communicated by Mr. P. Mackenzie, West Plain. The attention of botanists has recently been directed to the importance of studying the vegetable remains imbedded in peat-mosses, as calculated to throw light on the early vegetation of the country, and the successive changes it has undergone. For this object, communications like that from Mr. Mackenzie are much to be desired. A letter was also read from Dr. J. Dickson, St. Helier's, Jersey, mentioning some interesting additions to the Flora of that island, which he had lately discovered; and remarking that he felt convinced it contains many other species still unknown to botanists.

COUNTRY SHOWS.

Adam's Lodge of Free Gardeners, July 10.—The members of Adam's Lodge of Ancient Free Gardeners in this town held their annual show of *Ranunculuses* on Monday evening, at the house of Brother Cloughton, in Crow-tree-lane. The prizes were awarded as follows:—For the best, second best, best three, best six, and best twelve, to Mr. T. Hull, florist, Sunderland. The 2nd best three, Mr. J. Walker; 2nd best six, Mr. R. Cloughton; 2nd best twelve, Mr. R. Thompson. There were also some other choice florists' flowers shown, for which prizes were given. Best three, and best six Pinks, Mr. T. Hull; 2, Mr. R. Thompson. Best twelve Pansies, Mr. T. Hull. Best six Irises, Mr. R. Cloughton.—Sunderland Times.

Bebington Horticultural Society, June 30.—The first meeting of this interesting Society, of which Sir W. M. Stanley, Bart., is the president, and the lady of the Rev. R. M. Feilden, the lady patroness, was held in the Rock Ferry Hotel Pleasure Grounds, for the exhibition of plants, flowers, fruits, and vegetables, and was eminently successful, being, in fact, little, if at all inferior to the recent exhibition at the Liverpool Botanic Gardens. The exhibition itself had a magnificent appearance, some Orchidaceæ, sent by Sir W. M. Stanley, Bart., and H. Winch, Esq., were very beautiful; one, belonging to the latter gentleman, "the Butterfly Plant," attracted great attention. The collection of Greenhouse plants, comprising Verbenas, Fuchsias, &c., belonging to the Rev. Mr. Mainwaring, was much admired, as was also the collection of T. Winch, Esq., which consisted chiefly of Pelargoniums. A Cactus speciosissimus, belonging to Mr. Gott, was an elegant plant. Some beautiful Pansies were exhibited by J. B. Amey, Esq. There was a capital show of vegetables, especially of Cauliflowers, Cucumbers, and Cabbages. The show of fruits was not so good, being deficient in quantity, though the quality was superior, especially of Cherries, Gooseberries, White Currants, &c. The prizes were awarded as follows. PREMIER PRIZES.—Best Orchidaceæ, Sir W. M. Stanley, Bart.; 2, H. Winch, Esq. Stove Plant, 1, Rev. Mr. Mainwaring. Best Greenhouse Plant, Mr. Gott; 2, H. Littledale, Esq. Best Collection of Greenhouse Plants, Rev. Mr. Mainwaring; 2, Sir W. M. Stanley, Bart. Best Pelargoniums, H. Winch, Esq.; 2, Sylph, Queen Dowager, Joan of Arc, Alexandrina, H. Littledale, Esq. Best Pelargonium, Sylph, H. Winch, Esq.; 2, Masterpiece, H. Littledale, Esq. Best Collection of Roses in bunches of three blooms, not less than six varieties, 1, Sir W. M. Stanley, Bart.; 2, not less than four varieties, Mrs. King. Extra prize for do., — Walsh, Esq. Best Collection of Fuchsias, not less than 6 varieties, Invincible, insignis, eximia, Chandleri, Standishii, racemiflora, grandis, &c., &c., J. T. Raynes, Esq. Best Collection of four magniflora, conspicua, Magnificence, Donaldsonii, H. Winch, Esq. The best Fuchsia, 1, multiflora, H. Winch, Esq.; 2, globo-a major, Rev. Mr. Mainwaring. Best Collection of Verbenas, Rev. Mr. Mainwaring. Best Herbaceous Plant, 1, Rev. R. M. Feilden; 2, G. J. Wainwright, Esq. Best Basket of Greenhouse Plants, 1, Sir W. M. Stanley, Bart.; 2, H. Winch, Esq.; 3, J. T. Raynes, Esq. Best Cut Flowers, 1, Sir W. M. Stanley, Bart.; 2, W. Sharp, Esq. Best Bunch of Cucumbers, 1, H. Hill, Esq.; 2, Mrs. King. Best Pines and Melons, Sir W. M. Stanley, Bart. Best Plate of Black Currants, Mrs. King. Best of White, do., Rev. R. M. Feilden. Best of Red do., Rev. R. M. Feilden. Best of Cherries, Rev. R. M. Feilden. Best of Apples, H. Hill, Esq. Best of Gooseberries, Rev. Mr. Mainwaring. Best Autumn-sown Onions, Mrs. King. Best Spring do., Rev. Mr. Mainwaring. Best Cauliflowers, 1, Rev. Mr. Mainwaring; 2, Sir P. De M. G. Egerton, Bart., M.P. Lettices and Cabbages, Mrs. King. Curled Parsley, R. W. Barton, Esq. Peas, Sir W. M. Stanley, Bart. EXTRA PRIZES, W. Sharp, Esq. Turnips, 1, Sir W. M. Stanley, Bart.; 2, Rev. R. M. Feilden. Extra Prize for Mushrooms, Sir W. M. Stanley, Bart. Rhubarb, S. Needham, Esq. Carrots, Rev. Mr. Mainwaring.—Liverpool Mail.

Beeston and Chilwell Florists' Society, June 27.—This society held its third show at Mr. Flewitt's, Chequers Inn, Chilwell, when the following prizes were awarded for *Ranunculuses*:—Premier prizes—1st class dark selfs, Voslin Ox, Mr. Wheatley. 2nd class dark grey, Prittar, Mr. Spray. 2nd class striped, Peter the Great, Mr. Wheatley. 4th class, spotted, —, Mr. Wheatley. 5th class, mottled, Rose Imperial, Mr. Spray. 6th class, edged, Orissa, Mr. Spray. 7th class, dark selfs, Henrietta, Mr. Spray. 8th class, light selfs, Plato, Mr. Wheatley. 9th class, olive, Socrates, Mr. Wheatley.

Chichester Horticultural Society, June 24.—The first Exhibition was held at the Council Chamber, and the large room in which the plants, &c. were arranged was well filled during the afternoon with company, most of the gentry of the town and neighbourhood being present. The collections that most excited admiration were very well-grown Greenhouse and Stove Plants, exhibited by Mr. Webster, gr to Mrs. Haskisson, of Earham; and a well-cultivated collection of 12 varieties, shewn by Mr. Graham, gr to Mrs. Smith, of Bersted Lodge. Mr. Carmichael, gr to Mrs. Hawkins, of Bignor Park, exhibited some beautiful Ericas, in excellent condition; they were grown in pits without any fire-heat. Mr. Carmichael again took the first prize for the Green Flesh Melon. Mr. Toogood, gr to Mrs. Pilkington, had a very pretty collection of cut Roses, &c. Mr. White, gr to Mrs. Dorrien, of Lavant House, exhibited amongst other plants, a fine Oncidium. From the nursery of Mr. Silverlock, there was a large collection, consisting of Greenhouse Plants, New Holland Ferns, and new and striking kinds of Fuchsias, some very fine Heartsease, &c., a very good collection of Pelargoniums, &c. These plants

were not for competition, neither were those from Messrs. Newman, who exhibited some Pelargoniums, Stove Plants, Calceolarias, a very fine tray of Iris Blooms, Roses, &c. Mr. Webb also exhibited some fine Seedling Calceolarias, and a large collection of Roses. The prizes were awarded as follows:—To Mr. Webster, 1, for 12 Greenhouse Plants, 6 Stove, 3 Cacti, 6 Roses in pots, specimen plant (Cactus); and 2, for 12 cut bouquets of Roses. Mr. Graham, gr to Mrs. Smith, of Bignor, 1, for 12 Pelargoniums, 12 varieties of Roses in bouquets, Peaches, Strawberries, and Cherries; 2, for 3 Cacti. Mr. Toogood, 1, for a collection of Cut Flowers; 2, for Pelargoniums, Roses in bouquets, 6 Stove Plants; and a prize for a Seedling Verbena. Mr. Carmichael, 1, for Green Flesh Melon; 2, for 12 Greenhouse Plants. Mr. McEwen, gr to Col. Wyndham, of Petworth House, 1, for Pine; 2, for Green Flesh Melon. Mr. Holmes, gr to the Bishop of Chichester, 1, for a collection of Vegetables; and a prize for Strawberries. Mr. Goldring, gr to G. P. Gruggen, Esq., 2, for a Specimen Plant, *Fuchsia corymbiflora*. Mr. White, gr to Mrs. Dorrien, 2, for a collection of Vegetables, and a prize for the *Oncidium*. Mr. Evans, gr to J. B. Freeland, Esq., 1, for 12 cut varieties of Roses.

Dorset Horticultural Society, July 5. The second exhibition took place at the Assembly Rooms, Blandford, and was as well attended as could be expected from the unfavourable state of the weather. The various articles produced were excellent, and fully sustained the character of the former shows. The prizes were awarded as follows: *Orchidaceæ*, 1, Mr. Winsor, gr to R. Patison, Esq., *Cattleya Forbesii*; 2, Mr. Noble, gr to J. J. Farquharson, Esq., *Epidendrum ciliare*. Best Specimen Plant, J. J. Farquharson, Esq., *Gloxinia maxima*; 2, Cactus speciosissimus. Best Collection, R. Patison, Esq., *Polypogon latifolia*, *Angelonia coccinea*, *Fuchsia excelsa*, &c.; 2, J. J. Farquharson, Esq., *Clématis Sieboldii*, *Thunbergia alata*, *Valloia purpurea*, *Polypogon latifolia*, *Sollya salicifolia*, *Thunbergia aurantiaca*, *Campanula grandis*, *Thunbergia leucantha*. Greenhouse Plants, 1, R. Patison, Esq., *Leschenaultia formosa*, *obolata*, *Epacris grandiflora*; 2, J. J. Farquharson, Esq., *Mandevilla suaveolens*, *Helichrysum proflerum*, *Leschenaultia formosa*. Stove Plant, 1, R. Patison, Esq.; 2, Rev. H. Austen. Pelargoniums, 1, J. J. Farquharson, Esq., *Jupiter*, *Joan of Arc*, *Coronation*, *Sylph*, *Victory*, *Spleen*; 2, R. Patison, Esq., *Ericas*, 1, E. O. Spooner, Esq., *ventricosa tricolor*, *vent. tenuiflora*, *mammosa pallida*, *ventricosa coccinea minor*; 2, R. Patison, Esq. Cockscombs, 1, Mr. M. Fisher; 2, Mr. Furmidge, gr to Sir J. Smith, Bart. Calceolarias, 1, R. Patison, Esq. Annuals, 1 and 2, Sir J. W. Smith. Best Ornamental Device, J. J. Farquharson, Esq. Best Basket of Cut Flowers, Sir J. W. Smith, Bart. Best Nosegay, Rev. G. Seymour. Best Cut Roses, E. Doughty, Esq.; 2, J. J. Farquharson, Esq. Pine, 1, 2, and 3, J. J. Farquharson, Esq. Best Melon, G. Harris, Esq.; 2, E. Doughty, Esq. Best Black Grapes, J. J. Farquharson, Esq.; 2, G. Harris, Esq. Best White Grapes, Mr. Saunders, gr to Sir R. Glyn, Bart. Best Strawberries, best Cauliflower, Mrs. Michel. Best Currants, best Raspberries, second best White Grapes, Capt. Garland. Best Keeping Apples, B. Linthorn, Esq. Best Figs, Mr. Newton, gr to H. C. Sturt, Esq., M.P. Best Cherries, Mr. M. Fisher. The cottagers, as usual, have again earned their well-deserved meed of praise, their productions still keeping pace with their former exhibitions, and gaining for them much approbation.

Exhibition of Roses, Birmingham, July 13.—This took place at the Athenæum Rooms, Temple Row, Birmingham. There was a large collection of cut specimens, including a number of very fine flowers, but the season has evidently been most unfavourable; in fact, some of the collections of the principal growers were only partially in bloom. The show excited considerable interest among the admirers of this flower, and it will no doubt have the effect of exciting still greater attention to the cultivation of the Rose. There were a few specimens in pots, including a very fine plant of the White Bath (Moss), sent by Mr. Flindell, which attracted much attention. Mr. Coudrey, of the Edgborough Nursery, contributed an excellent collection of Pinks, amongst which his seedlings, Lord Calthorpe, Lord Lytton, and Venus, were conspicuous. Mr. Milson had also some stands of Pansies, and a fine collection of seedling *Ranunculuses*. The following is a list of the prizes awarded for Roses:—24 Blooms, 1, Fulgens, Blush Moss, Violet Blue, Brennus, Duchesse d'Angoulême, Duke of Wellington, Coupe d'Amour, Coutarde, La Tourterelle, Blush Provence, Venus, Medora, Queen of Denmark, Unique, Morning Star, Titus, Attelaine de Bourbon, Carmine Feu, Village Maid, Catalina, George the Fourth, Maria des Dames, Rosa Ruga, Emma; Mr. Coudrey, 2, Royal Purple, Capitaine Sissolet, Globe White Hip, Thornless Violet, Yellow China, General Lamarque, George the Fourth, Morning Star, La Grande, Miralba, La Seduisante, Moss, Aglaia Adanson, Great Royal, General Valmore, Armosa, Aspasie, Pope's Fulgens, Philippine, Madame Hardy, Fulgens, Madame Dubarry, Neubienis; Messrs. Pope and Sons, 3, Henri Quatre, Globe Hip, Jaques, Great Royal, Prolific Moss, Crimson Damask, Duke of Devonshire, Provence Moss, George the Fourth, Stadtholder, Rosa Mundi, La Tourterelle, Village Maid, Madame Dubarry, Queen of Beauty, Blush Hip, Wellington, Lady Stuart, Amadis, Bouquet Royal, Ruga, Elegans, Fulgens, Lady of the Lake; Mr. E. Phillips, 12 Blooms, 1, La Tourterelle, Unique, Climbing Provence, Wellington, Globe Hip, Violet Blue, Madame Dubarry, Provence Moss, Duke of Devonshire, Fulgens, Jaques, L'Ombre Agrée; Mr. E. Phillips, 2, La Tourterelle, Brennus, Rosa Mundi, Venus, Duke of Wellington, Bella Ellen, Duchesse d'Angoulême, Leyden, Morning Star, Rosa Ruga, Village Maid, Coupe d'Amour; Mr. J. Coudrey, 3, Bequet, Fulgens, Violet Blue, Capitaine Sissolet, Globe White Hip, General Lamarque, Miralba, Madame Dubarry, Yellow China, Moss, Royal Purple, La Grande Therese; Messrs. Pope and Sons, 6 Blooms, 1, La Tourterelle, Ruga, Thornless Violet, Fulgens, Violet Blue, Capitaine Sissolet; Messrs. Pope and Sons, 2, Duchesse d'Angoulême, Madame Hardy, Las Casas, Fulgens, La Tourterelle, Brennus; Mr. J. Coudrey, 3, George the Fourth, White Globe Hip, Las Casas, Ruga, Valeur Episcopal, Fulgens; Mr. J. Moore, *Pot Roses*, 1, White Bath Moss; Mr. F. B. S. Flindell, 2, Louis Philippe d'Angiers; Messrs. Pope and Sons, 3, Fimbriata tea scented; Messrs. Pope and Sons, 4, Princess Helena, Messrs. Pope and Sons, 5, White China; Mr. F. B. S. Flindell, 6, Yellow China; Mr. F. B. S. Flindell. Cut Specimens. Premier. Coutarde; Mr. J. Moore. Moss, 1, Moss Provence; Mr. J. Moore. 2, White Bath; Mr. T. B. Wright. 3, Crimson Moss; Mr. J. Coudrey. 4, Duc de Luxembourg; Mr. J. Moore. 5, Moss Provence; Mr. J. Moore. 6, Moss de Meaux; Mr. J. Moore. White, 1, White China; Mr. E. Phillips. 2, Rose Unique; Mr. E. Phillips. 3, White Globe Hip; Mr. J. Coudrey. 4, White Provence; Mr. J. Coudrey. 5, White Globe Hip; Mr. J. Coudrey. 6, Ruga; Mr. J. Moore. Yellow or Sulphur, 1, Yellow China; Messrs. Pope and Sons. 2, Queen of Bourbons; Mr. F. B. S. Flindell. 3, Yellow Noisette; Mr. J. Coudrey. 4, Princess Heloise; Messrs. Pope and Sons. Blush, 1, Duchesse d'Angoulême; Mr. J. Coudrey. 2, La Seduisante; Messrs. Pope and Sons. 3, Starholder; Mr. J. Moore. 4, Cabbage Provence; Mr. J. Moore. 5, Reine des Belges; Mr. J. Moore. 6, Morning Star; Messrs. Pope and Sons. Red, 1, Attelaine; Mr. J. Moore. 2, Coupe d'Amour; Mr. J. Coudrey. 3, Brennus; Mr. T. B. Wright. 4, Wellington; Mr. J. Coudrey. 5, Fulgens; Messrs. Pope and Sons. 6, Columbrienne; Mr. T. B. Wright. Purple, 1, Aurora; Messrs. Pope and Sons. 2, Princess; Mr. J. Coudrey. 3, La Tourterelle; Mr. E. Phillips. 4, Royal Purple; Mr. J. Moore. 5, Waterloo; Mr. J. Moore. 6, Wellington; Messrs. Pope and Sons. Dark, 1, Fulgens; Mr. J. Moore. 2, Bequet; Messrs. Pope and Sons. 3, George the Fourth; Mr. J. Moore. 4, Grand Purple; Mr. E. Phillips. 5, Mottled Velvet; Messrs. Pope and Sons. 6, Violet Blue; Mr. J. Moore. Striped or Mottled, 1, Duke of Devon; Mr. J. Moore. 2, Aglaia Adanson; Messrs. Pope and Sons. 3, Village Maid; Mr. J. Coudrey. 4, Athelin; Mr. E. Phillips. 5, African Black; Mr. E. Phillips. 6, Bizarre Mirabeau;

Mr. E. Phillips. Noisette or Cluster, 1, Carmosette Carne; Mr. J. Moore. 2, Ruga; Messrs. Pope and Sons. 3, Bourbon; Mr. E. Phillips. 4, Fulgens; Mr. J. Coudrey. 5, Madame Desprez; Messrs. Pope and Sons. 6, Venus; Mr. J. Coudrey.

Hampshire Horticultural Society, June 29.—The Third Exhibition was held at the Corn Exchange, Winchester, at which an excellent display of good flowers was made. The Calceolarias were magnificent, and attracted the attention of every one; the gardener was rewarded, by desire of the Judges, with an extra medal of the first class, in addition to his other medals, for his skilful treatment of them. The Roses were numerous and fine from the gardens of the Misses Garnier, the Dean of Winchester, and Sir Thomas Baring. A splendid Pine Apple (brown Antigua) and some beautiful seedling Heartsease were exhibited by Mr. Silverlock, nurseryman, Chichester. The following seedling Pelargoniums—Rival, Sir Charles Napier, Captain, Snowdrop, and Prince of Wales, were by Mr. Ingram, nurseryman, Southampton. A dish of a new Strawberry, to be called the Deptford Pine, of large size and exquisite flavour, was sent by Mr. Myatt, the grower. Mr. Sheppard, of Winchester, exhibited a good collection of Pelargoniums. The judges on the occasion awarded the prizes as follows:—*Orchidaceæ* plant, 1, *Oncidium flexuosum*, Miss Garnier; 2, J. Fleming, Esq. Stove plant, Rev. G. C. Rashleigh. Collection of do., Rev. G. C. Rashleigh. Greenhouse plants, Rev. F. Beadon. Climbers, Rev. F. Beadon. Twelve Pelargoniums, 1, Mr. W. Barnes; 2, not given, the exhibitor, Mr. Barnes, having gained the first prize in this class; collection of do., Col. Wall. Twelve *Ranunculuses*, R. Taylor, Esq. Four Shrubby Calceolarias, W. J. Campion, Esq. Four Herbaceous do., W. J. Campion, Esq.; collection of do. mixed, W. J. Campion, Esq. Do. of *Salpiglossis*, Col. Wall. Twelve Hardy Herbaceous plants, Rev. the Warden. Twelve Roses, 1, Miss Garnier; 2, Rev. the Warden; collection of do., Miss Garnier. Twelve Pinks, Rev. the Warden; collection of do., W. J. Campion, Esq. Twelve Heartsease, W. J. Campion, Esq.; collection of do., W. J. Campion, Esq. Four Fuchsias, 1, Rev. Mr. Henville; 2, Rev. Mr. Henville. Collection of Iris, Rev. G. C. Rashleigh. Six Cockscombs, Rev. Mr. Henville. Six Balsams, Rev. Mr. Henville. Collection of Annuals, Rev. the Warden. Do. Cut Flowers, Rev. the Dean of Winchester. Dence in do., J. Leigh, Esq. Bouquet, Sir T. Baring, Bart. Collection of plants, C. Seagrim, Esq. Extras—Pinks, W. J. Campion, Esq. *Achimenes longiflora*, Rev. F. Beadon. Collection of Cut Flowers, Sir T. Baring, Bart. Ten Herbaceous plants, Col. Wall. FRUITS.—Pine Apple, H. Holloway, Esq. Black Grapes, C. Seagrim, Esq. Best Melon, Rev. Mr. Henville. Best Strawberries, 1, W. J. Campion, Esq.; 2, H. Holloway, Esq. Vegetables.—Peas, H. Holloway, Esq. Best Broad Beans, Rev. the Warden. Best Cauliflowers, Mr. Stride. Best Potatoes, 1, Rev. Dr. Moberly; 2, H. Holloway, Esq. Best Cucumbers, Mr. Stride. Best Turnips, Col. Wall. Best Carrots, Rev. the Warden. COTTAGERS' PRIZES.—Three best Cabbages and second best Nosegay, E. Bevis. Two best Cabbages, second best Potatoes, and best Nosegay, J. Taplin. Best Potatoes, J. Southwell.

Harleston Horticultural Society, July 4.—At the Second Exhibition, notwithstanding the cold winds of the preceding month, the Fruits and Flowers did credit to the exhibitors. Mr. Bircham, of Hedenham, exhibited a choice collection of Roses, comprising most of the new Perpetual and other sorts. Prizes were awarded as follows:—Best Melons, 2nd do., Roses, best Peas, Cherries, and Lettices, Mr. J. Wilteton, gr to the Rev. N. White. 2nd Melons, 1 and 2 Kidney Beans, best Cauliflowers, Greenhouse Plants, Designs, and Cut Flowers, Rev. Archdeacon Oldershaw. 3 Strawberries, 2 Potatoes, Lettices, Calceolarias, best 6 Pelargoniums, R. Priest, Esq. Best Strawberries, 24 Roses, Calceolarias, Cut Flowers, 12 Pansies, J. Jeffes, Esq. 2nd Strawberries, best 12 Roses, T. L. Taylor, Esq. 2nd Cherries, best Potatoes, W. Norman, Esq. 2nd Cauliflowers, Peas, B. C. Etheridge, Esq. 2nd Greenhouse Plants, Mrs. Abel. 6 Cut Roses, best 12 Pinks, 2nd stand of Cut Flowers, 2nd *Ranunculuses*, Mr. J. Francis. 2nd half-dozen Cut Roses, G. Carthew, Esq. Best 18 dissimilar Cut Roses, W. Bunn, Esq. 3rd Cut Flowers, C. Etheridge, Esq. Best 12 *Ranunculuses*, and half-dozen Roses, Rev. W. P. Spencer. 2nd 12 Pansies, best 6 do., Mr. T. Adams. 2nd 6 Pelargoniums, Messrs. Smith and Buck. 3 Pelargoniums, extra prize, Mr. T. Aldous. Collection of Greenhouse Plants, Rev. W. A. Bouverie.

Kendal Horticultural Society, June 23.—The following were the prizes awarded at this show:—PELARGONIUMS, Six Varieties, 1, Miss Wakefield, Sedgwick House, for Gaines's Prince Albert, Rollisson's Beauty, Grand Monarch, Amethyst, Concert, and Madeline; 2, Mr. Rennie, gr to J. Gandy, Esq., Bank House, for Sylph, Garth's Conservative, Lowndes's Perfection, Gaines's King, Lord Sandon, and Foster's Alicia; *Single Specimen*, 1, Mr. Rennie, for Sylph; 2, Mr. Wilkinson, gr to James Machell, Esq., for Life-guardian. FUCHSIAS, Six Varieties, 1, Mr. Townley, for Chandleri, Invincible, Venus vitreæ, inflata fulgida, tricolor, and conspicua; 2, Mr. Rennie, for maxima, seedling, Loudonii, conspicua arborea, Standishii, and Macabianana; *Single Specimen*, 1, Mr. Rennie, for fulgens; 2, Mr. Townley, for Elchattress; CALCEOLARIAS, Six Varieties, Mr. I. Whitwell, for Lady Constable, Sultana, Sir Robert Peel, Plant's Queen, Plant's delicatissima, and Plant's formosissima; *Three Varieties*, Mr. Townley, for Lady Constable, Nymph, and Argus; *Seedling*, Mr. J. Gold, for a very pretty seedling named Alice Maud Mary. CACTI, *Three Varieties*, Mr. Rennie, for speciosissimus, *Epidyllum splendens*, and Ackermannii. BALSAMS, Mr. W. Line. PETUNIAS, 1, Mr. W. Hogg, gr at Green Bank, for Nixon, formosa, and Village Maid; 2, Mr. Rennie, for Queen Victoria, Birt's Boy, and magna rosea. GREENHOUSE CREEPERS, Mr. Rennie, for *Petunia tripartita*, *Triæolum pentaphyllum*, and *Clenatis Sieboldii*; *Single Specimen*, Mr. Rennie, for *Hoya carnosa*. BASKET OF GREENHOUSE PLANTS, Miss Wakefield, for a beautiful collection of plants, one of which (*Gesnera Cooperi*) was much admired; *Collection of ditto*, Mr. Rennie, containing among other plants worthy of notice, two well-bloomed specimens of *Puelea hispida*, and *P. decussata*. *RANUNCULUSES*, 1, Mr. Rendon; 2, Mr. Rennie. PANSIES, 1, Mr. R. Carter, for Pacha of Egypt, Queen of the Lakes, Mountjoy's Victoria, Modesta, Mar. of Orleans, Joseph, Beauty of Kendal, Thompson's Grand Duke, Grace Darling, Grand Duke of Russia, Victoria superba, and Beauty of Westmoreland; 2, Miss A. Yeates, Mint Cottage, for Thompson's Jehu, Thompson's Eclipse, Thompson's Dowager, Thompson's Mogul, Silverlock's Black Knight, Silverlock's Prince Albert, Goode's Roi de Mulberry, Goode's Waltham Abbey, Howe's Mirac, Henchman's Success, King's Great Western, and Climax; *Seedling ditto*, 1, Mr. W. Hogg; 2, Mr. J. Hargreaves. CUT ROSES, Twelve Varieties, Mr. D. Bailey, gr to J. Branker, Esq., Ambleside; Four Varieties, Mr. D. Bailey. PINKS, 1, Mr. Rendon; 2, Mr. D. Bailey. PAONIES, 1, Mr. Airey, gr to C. Wilson, Esq., Ridmaden Park; 2, Mr. D. Bailey. ANEMONES, 1, Rev. G. Wilson, Grayrigg; 2, Mr. J. Phillips. VERONAS, 1, Mr. Rennie, for Queen, Triumph, rosea odorata, mirabilis, melindres latifolia, and Neill; 2, Mr. D. Bailey; *Single Specimen*, Mr. J. Newby, gr to Professor Wilson, at Kheray, for Princess Royal. Bouquet (Greenhouse), Mr. Bannister, gr to R. Moser, Esq.; Bouquet (Hardy), 1, Miss Wakefield; 2, Mr. Sanderson, gr to J. Gandy, Esq. Designs, 1, Mr. Wm. Hogg; 2, Mr. Purvis. Collection of Six Pot-plants, Nurserymen, Mr. Carden, Burton-in-Kendal, for Calceolaria Standishii and Lady Constable, Fuchsia Brockmannii and Balconii, and Pelargoniums Enchantress and Gipsy. Gooseberries, Mr. J. Bateman, for Companions. Peas, Mr. J. Newby. Carrots, Mr. D. Bailey, for Early Horn. Cabbages, Mr. J. Newby. Turnips, Mr. R. Carter. Cauliflowers, Mr. J. Newby. Lettices, Mr. Peden, gr to R. Potherg, Esq., Bridge House. Potatoes, Mr. J. Newby. Rhubarb, Mr. Gutz, gr to E. Swinburne, Esq., Calgarth, for Myatt's Victoria. Cucumbers, Mr. Purvis, for Walker's new Improved. Onions, Mr. J. Newby, for White Lisbon. EXTRA PRIZES, Mr. J. Hargreaves, for Rosa Devonensis; Mr. Townley, for a finely-grown specimen of Cal-

Royal Horticultural Society of Cornwall, July 11.—The second exhibition for the season took place in the Polytechnic Hall, Falmouth. There was a good attendance of company from different parts of the county, and a fair display of plants and flowers, fruit and vegetables, though choice plants were not quite so numerous as usual. The nurserymen occupied the spacious gallery, and their beautiful specimens contributed much to the splendour and interest of the exhibition. In the group of Stove plants which obtained the first prize, there was a beautiful *Achimenes longiflora*, large, and finely in flower. There was also another fine specimen of the same flower in the hall, with beautiful plants of *Gesneria Suttoni*, *Cattleya Loddigesii*, *Achimenes pedunculata*, and *Oncidium pulvinatum*. There were a fine collection of Greenhouse Plants from Grove Hill, and a good display of *Fuchsias* of different kinds, among which was a magnificent *F. corymbiflora* from Enys. The *Fuchsia Victoria* which obtained the second prize was well grown. The *Pelargoniums* were much more numerous than at the first exhibition, and very good for the season. They comprised some choice seedlings raised by different growers. The first prize was obtained by Mr. C. W. Fox, of Truro, for a seedling named "Sir Hugh Gough;" in colour it was brilliant and attractive, the upper petals being of a bright scarlet crimson with a large spot, and the lower petals rosy crimson; it is a very free bloomer, and bears large bunches of flowers, from 8 to 10 on a truss. With it were exhibited two very beautiful seedlings, also raised by Mr. Fox; one in particular, called sanguineum, had a very high colour, being of a rich and brilliant scarlet. Some persons considered this superior to "Sir Hugh Gough." A group of *Roses* in pots was good, and in ex-

ship the Sulphur, by whom it was found in California in great abundance, and forming a most conspicuous object.—*Botanical Register*.

PITCAIRNIA MICRANTHA. Small-flowered Pitcairnia. (*Stove perennial*.) Bromeliaceae. Hexandria Monogynia. This singular little species was found among some Orchidaceous plants imported from Rio, in December, 1841, by Lieut. Christopher Smith, of H.M.'s Packet "Star," and presented to Sir Charles Lemon, Bart., M.P. It flowered at Carclew in March, 1843, and proves to be very distinct from any other of the genus to which it belongs, as well as the smallest that has yet come under our notice. It requires the constant heat of a damp stove; and thrives very well either in loose vegetable matter, or on the decayed branch of a tree. The leaves are numerous, flat, undulated at the margin, flaccid, spreading and recurved, linear-lanceolate acute, from nine inches to a foot long, and about an inch wide; of a deep green above, and a pale glaucous green beneath, without any spines at the edges. The scape is erect, nine inches long, issuing from the centre of the plant, of a brownish green, remarkably slender, round and downy, with several linear bracts along the stem, which is half its length, covered with flowers; while the flowers are white, not exceeding a quarter of an inch across, drooping and opening one or two at a time in succession, from the base upward.—*Botanical Register*.

MISCELLANEOUS.

Myatt's Pine Strawberry.—It is a very singular fact, to which we have alluded on a former occasion, that Myatt's Pine Strawberry, one of the best of all kinds, should be so entirely uncultivable by most persons, and yet should flourish with the greatest luxuriance here and there. We last year mentioned the fact, that in Mrs. Marryat's garden, at Wimbledon, the sort succeeds abundantly, and proves most prolific. This year it has continued to preserve all its vigour and fertility; and yet plants from Wimbledon, transported to the garden of the Horticultural Society, are just as unmanageable as ever; scarcely growing, and bearing little or nothing. We must, then, again beg to inquire among our correspondents whether, since last year, their experience enables them to point out how this most valuable sort can be grown with certainty.

The British Association.—We find it announced that the next meeting of this body will take place at Cork, on Thursday, the 17th August next. The circulars just issued state that there will be arranged in the rooms of the Agricultural Museum, open daily to members and ladies provided with tickets, an exhibition of philosophical apparatus, models, machinery, collections of natural history, and manufactured products; and that an exhibition of flowers, fruits, and vegetables, open to members of the Association and ladies provided with tickets, will take place, in honour of the Association, on Tuesday, the 22d August, at 2 P.M., in the large room of the Corn Exchange.

Mr. Hartweg.—We have great pleasure in announcing the safe return of Mr. Hartweg to this country, after his long travels in equatorial America, in the service of the Horticultural Society. During nearly seven years he has been ransacking Mexico, Guatemala, Guayaquil, Popayan, and New Granada, and the large number of fine plants obtained during that period bears witness to the zeal with which his researches have been prosecuted.

Cotton Seed for Cows.—It is stated in the *American Agriculturist*, that if cows are fed upon boiled cotton seed, with a little chopped corn added, it gives the butter a rich flavour and fine yellow colour, and doubles the quantity. The cotton seed must be well cooked, which a few minutes boiling will do.

Disease in Potatoes.—We learn from the local papers that at a late meeting of the Probus Farmers' Club, the prevalent disease of the Potato crop was brought under consideration. It appears that Sir Charles Lemon has for some time past directed his attention to this subject, and with a view of eliciting the opinions of the members of the club, and stimulating them and others to institute experiments which might determine the very frequent cause of failure in the Potato crop, he furnished them with the following paper, confessing at the same time that he had obtained as yet no satisfactory result. The symptoms of the disease, says Sir Charles, are as follows:—The sets appear to sprout as they ought, and as others which surround them in the same field have done; but they are stopped short before they reach the surface, and no leaves are formed. Large patches in the field are thus left bare; and when the ridges are dug up, it is found that these abortive sets have formed each a little button, about two or three inches from the surface, and, as it were, gone to rest after the effort. The disease produced no very sensible effects on the crops till about four or five years ago; but I have been informed by a farmer of this neighbourhood, that he recollects a few instances in which these little dwarfs, called by the country people "Bobbin Joans," were noticed as long ago as 30 years. In the neighbourhood of Penzance, a great Potato country, the failure of crops from this cause has been more general and more destructive than in this part of the county, in some instances destroying one-third of the produce. This information I derive from a gentleman residing there, on whose accuracy I place great confidence. Without dwelling on the name, then, let us inquire as to the thing, unde derivatur "Bobbin Joan?" The form in which the question first presents itself, is, whether the defect is owing to the soil or the seed? Whether, in fact, some principle necessary to the growth of perfect Potatoes is either naturally wanting in the soil, or has been, by excessive culture, extracted? And, again, whether the Potato may not have contracted some disease, or perhaps have exhausted that vitality which we know will last only a limited time after the creation of a new plant from blossom seed, though its produce may be extended over an unlimited surface by the propagation of its offspring. And this latter supposition is that adopted by the gentleman to whom I have before alluded; who says that the Potatoes in his neighbourhood "have degenerated, are

degenerating, and ought to be regenerated." I shall presently state reasons why I do not agree with him; but first let me give the history of some of his experiments. He first took some Potato sets from a field which was much infested with "Bobbin Joans," and planted them in new ground; in the crop which was produced, there were some, but not very many of these abortions. He then planted sets of a fresh sort in the ground previously supposed to be infected, and the crop was entirely free from the deformity. At my suggestion, a farmer in this neighbourhood has made the same experiments; and though the result agreed with that obtained near Penzance only in this, that good sets produced perfect Potatoes in ground which had previously produced "Bobbin Joans," I think it is enough to prove that the condition of the soil is not the true cause of the complaint. The point in which the issue of the experiments made here differed from that arrived at near Penzance, related to the reproduction of imperfect Potatoes from diseased sets. Here none such appeared; but there was a good and healthy crop. Moreover, I have planted in garden-ground, the very "Bobbin Joans" themselves, in which, if anywhere, the disease must have prevailed; and in due time, I dug up an abundant return of Potatoes, every one of which was sound and of full size. From the foregoing experiments, it appears to be clear that the condition of the ground is not the sufficient cause of the effect, and there is also a reasonable presumption that disease or constitutional debility in the plant, arising from the decrepitude of age computed from the original sowing, does not explain the loss of energy in the plant which was so easily revived by renewed planting. Then, I think, we must look about for other causes to account for the stunted growth described; and the mode of planting the sets suggests itself as the most natural. There is some analogy between the effects thus produced and the habit which may frequently be observed in the growth of certain bulbous plants. The common autumnal Colchicum, for instance, if planted too deep, will make a shoot which stops short of the surface, and then forms a bulb in the position most favourable for its growth in the ensuing year; and I have even seen cases when the plant has been accidentally buried very deep, where three or four of these bulbs have been formed at nearly equal distances from each other—thus, as it were, making its journey to the surface by stages. Therefore, planting too deep, I have no doubt, may in some cases be the cause of the production of "Bobbin Joans." The root may not have strength to reach the surface; and so transfers its substance to a more favourable position. But this is a very imperfect solution of the difficulty; for in a field where the culture has been equal, and apparently there has been no variation in the depth of the plants in different parts, "Bobbin Joans" have occurred in one place, and been entirely wanting in every other. This same remark is applicable to the idea which suggested itself to me, that insufficiency of nourishment and the absence of light might account for the imperfect growth of the set; as described in the third volume of the Horticultural Society's Transactions, page 48. It is there stated that Potatoes covered with sand, and placed in a cellar, will produce small tubers, exactly resembling "Bobbin Joans." The author thus explains the phenomenon. "The Potato, from the abundant nourishment which the tuber affords to the embryo plant, has an extraordinary disposition to vegetate; and it seems to be possible to place it in such a situation that the vegetating power, being prevented from exerting itself upwards so as to form stem and leaves, should be employed in throwing out roots only with their appendages." But I do not see how this cause can exist in the open field, or what is to prevent the vegetating power from exerting itself upwards; and I believe we must look in another direction for the natural history of "Bobbin Joans." The following circumstances seem to point to that direction; and I submit them to the growers of Potatoes as leading to a conjecture to be verified or contradicted by their experience:—From a heap of Potatoes lately turned, some of which had shot out to a considerable length, two or three examples have been brought to me in which the shoot had been suddenly stopped by a small tuber. On cutting open the Potato, I found that the inner substance had entirely decayed away, and not more than half an inch remained of the interior substance. This, however, appeared to be perfectly sound. Furthermore, on referring again to the farmer from whose field I first got the "Bobbin Joans," and who had suffered severely in his crop in the season before last, I learnt that the Potatoes from which he had taken the sets which produce the defective crop, had been drawn in very wet weather, and stowed away without being properly dried. They had remained in that state; and I have no doubt that incipient decay, though unperceived when the Potatoes were cut, had produced some change in the substance unfavourable to the growth of the set. Heating by fermentation, or from any other cause, and perhaps frost, may produce the same sort of disorganization; and I think it is not difficult to conceive that the starch of the Potato, being prematurely changed into sugar, and dissipated before the young plant is in a condition to absorb it, the set may be rendered unable to afford the nourishment requisite for healthy growth. What remains of the original substance may be simply transferred to the little tuber, as the substance of the cotyledons of a bean are transferred to the root-leaves, before those leaves have begun to perform their functions, and attract from the atmosphere the proper nourishment for the infant shoot. The reasoning which I have thus indulged in I confess is not conclusive, but it may point the way to some useful and practical conclusions, and I offer it in the hope that

the subject may be taken up by a more experienced agriculturist. In my hands the result pretends to no more than to be conjectural; and my surmises are as follows:—1st. That a chemical change may occur in the internal substance of a Potato which the eye cannot discern; but which may render it unfit to afford nourishment to a young plant in the first season of its growth. 2d. That this incipient decomposition may be produced by dampness, by heating, or by bruises. 3d. That the utmost care is requisite to preserve that portion of a crop which it is intended to plant again in the most perfect state of health and integrity.—*Carclew, April 18, 1843.* P.S.—Since writing the above, a circumstance has been related to me, which at first appeared to be entirely inexplicable, according to the view which I have taken; but, on reconsideration, I think it is not at variance with my conjecture:—A large quantity of Potatoes were cut for seed. Some of these were planted in the morning, and some in the evening of the same day. Those which were planted in the morning grew well; those planted in the evening produced dwarfs, and ended in a failing crop. Now, I think we have only to suppose that incipient fermentation had taken place in the heap of cut Potatoes, and the result may be thus explained. The sets which were at the top of the heap were sown first; and these would be less affected by the exclusion of air and the pressure of the heap. Those sown in the evening were at the bottom of the heap, and may have been bruised by the weight of the mass above them,—at all events, fermentation would commence there; and therefore the chemical change of substance which would end in fermentation, would commence there also.—At the conclusion of the paper, a rather long and interesting discussion ensued between the members of the Club, as to the cause of the disease in question. Its destructive effects were acknowledged by all, but so completely were the opinions of the members at variance, as to the cause, that it was recommended that experiments be instituted forthwith, and we recommend others to do so also, so that we may now hope, as the subject is fairly brought before the public, that it will be thoroughly investigated.

GARDEN MEMORANDA.

Miss Trail's, Hayes, near Bromley, Kent.—Although the season at which this place is seen to the greatest advantage is somewhat past, there is, nevertheless, much to engage the attention of those who take an interest in well-grown plants. The Pelargonium-house, a pretty span-roofed edifice, is filled with good middle-sized specimens of the best varieties in cultivation, which, although slightly on the decline, still exhibit evident traces of the skillful manner in which they have been bloomed. This house also contains some choice Heaths; for example, two remarkably healthy plants of *Erica Massoni*, each is nearly six feet high, one bearing dense trusses of its beautiful light-green and crimson flowers; *E. ovata*, a noble variety with extremely large waxy, flask-shaped blossoms, and of robust habit; with finely-formed specimens of *E. retorta*, *ampullacea*, *Savilleana*, and the rare infundibuliformis, each of which will shortly be one mass of bloom, two feet in diameter and the same in height. Here also we saw a young plant of *Fuchsia Eppsii*—a strong growing variety, with flowers of a large size, the sepals of which are bright carmine, the petals, being, however, deficient in that depth of purple which is so desirable; it is, moreover, stated to be a shy bloomer. In the open air, but sheltered from the sun by one end of the Pelargonium-house, are two magnificent specimens of *Boronia serrulata*, trained to hemispherical trellises, and literally covered with their bright rosy flowers; with a healthy plant of *Gompholobium polymorphum*. Fronting this house is a small lawn, neatly laid out in beds of various forms, planted with Roses, Pinks, and half-hardy border plants; and on the right of this, against the north side of a wall, a large collection of Heaths and other hard-wooded plants are arranged. Those in flower consist of a very handsome specimen of *Erica tricolor* superba, a remarkably large-blooming variety; *tricolor elegans*, at least three feet in diameter, but not more than two in height; *densa*, bearing clusters of pretty white flowers throughout the whole length of the stems; two lovely specimens of the beautiful *E. eximia*, and several varieties of *E. ventricosa*. A well-grown plant of *Polygala cordifolia*, scarcely two feet high, exhibits one unbroken mass of bright purple flowers, together with *Mirabilis undulata* and several species of *Pimelea*. In the conservatory, and planted in the border at one end of the house, which it completely covers, is a magnificent plant of *Brugmansia sanguinea*, loaded with a profusion of drooping red and orange-coloured flowers. The showy *Clerodendron squamatum*, the pretty *Manettia bicolor*, *Eriostemon buxifolium*, with neat star-like flowers, *Crœwea saligna*, and various species of *Polygala* and *Pimelea* ornament the stages. In the border a fine old plant of *Acacia affinis* is growing, having a stem fully nine inches in diameter; its head has, however, been partly removed, to keep it within the limits of the house. The plant-stove joins the conservatory, and contains excellent specimens of *Ixora coccinea*, *Clerodendron paniculatum*, *Rondeletia speciosa*, forming quite a shrub, with here and there a cluster of rich orange and scarlet flowers, and *Euphorbia Bronnii*, so dense that its stems touch each other. The Orchidaceous house is not particularly gay, on account of the plants being required, when in bloom, to decorate the drawing-room; it is situated between two Vineries, in one of which the Grapes have already attained maturity; those in the other, consisting entirely of Black Hamburgs, are rapidly changing colour, and promise to be extremely fine.—*R. A., July 3.*

Heligan, near St. Austle, Cornwall, the seat of J. H. Tremaine, Esq.—Some fine specimens of the *Benthämia fragifera* are beautifully in blossom here. They are, doubtless, the finest in this country, as the plant was first introduced by the proprietor of this extensive and beautiful domain. One of the specimens is twenty feet in height, and is covered with a mass of delicate cream-coloured blossoms, many of the blooms measuring as much as four inches in diameter. This shrub has a magnificent appearance, and ought to be generally grown.—*W. E. R.*

Reviews.

The Journal of Agriculture, and Transactions of the Highland and Agricultural Society of Scotland. New Series, No. I. Blackwood. THE appearance of this excellent periodical is always welcome, and we are glad to find that the commencement of a new series furnishes those who are only now turning their attention to the science of Agriculture with the opportunity of becoming subscribers to it. As usual, the papers of the Highland Society demand the greatest share of attention, but in the Journal itself are several articles well worth perusal.

In the first article, Professor Johnston takes advantage

of the recent subscription in Scotland for securing the services of a chemical adviser in the farming interest, to point out in what way he considers such an officer would be most useful. Among other things, he recommends Lectures as an efficient means of diffusing modern views of agricultural science.

"If, for political purposes, oral addresses are considered the most effectual means of influencing the popular mind—and if, for religious and other benevolent ends, a peripatetic agency is found the most effective—why should not the same means be useful in the dissemination of agricultural knowledge? It is in vain to publish books when men refuse to read, or to reason upon paper to those who are unaccustomed to think of what they read; but there is something in the fervour of the living voice which the dormant spirit cannot withstand, and in personal appeals to the understanding which even those unaccustomed to think will scarcely be able to resist. In the proposed peripatetic character of the chemical officer, I see the ready means of accomplishing, in part at least, this great good. Stored with all the available knowledge which geology, chemistry, physiology, and botany have yet supplied, he will, as a part of his regular duties, visit now in this and now in that district of the country. He will lecture in public, and converse and instruct in private; and thus, by inoculating a few here and a few there, will form so many smaller centres from which knowledge shall gradually circulate among all. And if much time must elapse before all parts of Scotland can in this way be visited, yet the volunteers and deputies I have supposed to accompany him will lessen in part this unavoidable difficulty, by carrying the advantages of each address to the more distant parts of the country. Can it be doubted that by such means sound knowledge may be diffused among the agricultural classes more rapidly than by any method ever hitherto tried? It is true that lectures upon science are occasionally given in the provinces; but why leave them to the chance of a stray visitor, or to that of imbibing wrong notions from a half-instructed lecturer? Even were such instruction generally provided in our universities, why should those be debarred from sharing in it whose circumstances do not permit them to repair to those distant fountains! Why, especially, should this be the case in reference to a subject so important as the culture of the land, and in the case of a body of men so invaluable to the State as those to whom this culture is entrusted? It will not be considered as an unimportant consequence that the association itself will be supported and strengthened by it—the objects it has in view more fully brought out and appreciated—and its influence for the benefit of agriculture extended even beyond the limits of the country in which it has taken its rise. Is the half of Scotland yet awakened to the connection between science and agriculture?—to the benefits which the former already has conferred, and promises in future still more to confer, upon the latter? Will they soon awaken to it, or will they awaken of themselves? I know of nothing so likely to rouse them as the sound of the living voice."

There are those who believe that the analysis of soils will lay the foundation of good cultivation. We believe that the value of this operation has been over-estimated, and that it is to the analysis of manures and of crops, rather than of soil, that we must look for chemical assistance. Mr. Johnston states that 30 or 40 rigorous analyses of soils are as much as a good chemist can perform in a year, and we believe this to be near the truth; and if so, it is more than doubtful whether the advantages to be derived from such analyses, in practical agriculture, can be equal to the necessary expense of obtaining them. We are glad to see that Mr. Johnston looks at this subject in the same way as ourselves. We quote his observations at length:—

"An apparently very simple method of improving the soil, and one which at first sight seems strongly to recommend the prosecution of refined analyses, is founded upon the following mode of reasoning. Take two soils, one fertile, one more or less unproductive: analyse the former, and you see what a fertile soil contains; analyse the latter, and you see in what it is deficient; add these defective substances to the unfertile soil, and, making the two soils alike, you will make them equally productive. But supposing that, when thus mixed, the two soils would prove equally productive—which is by no means a necessary consequence—there are so many causes of diversity in the samples of soils which may be collected, that the result of an analysis can rarely be trusted to as indicating what the soil is actually in want of. In different parts of the same field samples so different may sometimes be unconsciously gathered, that a rigorous analysis of any one will fail to exhibit the general constitution of a whole field, while, if the expedient be adopted of mixing a variety of samples, the analysis of the mixture will give the composition of no part of the field whatever. Soil gathered from the same spot also is liable to such diversities, that, if collected at one season, analysis may say it abounds in a given substance, while at another it may find the same substance wholly wanting. In summer when the hot sun draws up the moisture from the soil, it rises from beneath, bringing with it whatever soluble substances it holds in solution. But when it reaches the surface, it evaporates, and leaves these behind it; and upon some spots these substances accumulate so much, in a hot summer, as actually to form a white saline crust upon the surface of the soil. Collect the soil at this period, and the chemist will pronounce it to abound in a remarkable degree with sulphate of soda, or sulphate of magnesia, or sulphate of lime, or sulphate of iron, or sulphate of alumina, or common salt, or chloride of calcium; and whatever bad qualities the soil was known to possess, he may ascribe to the excess of these or other soluble substances he has found it to con-

tain. On the other hand, collect it after a season of washing rains, and—especially if the soil be light—scarcely a trace of the same soluble substances may be found in it; and thus chemistry might bid the practical man to add to his land what it already abundantly contained. Such difficulties lying in the way of collecting soils which can be considered as average samples of a whole field, and at every season of the year, it is obvious that much uncertainty must attach to the results of analysis, both in regard to the constitution of fertile and unfertile soils; and that he who founds upon this basis alone his prescriptions for improving the condition of the land may often form erroneous opinions himself, and may induce practical men to incur expense which can lead to no sensible good, and may actually diminish the amount of his crops. Yet the analysis of soils, in a certain sense, and with a view to certain special objects, is neither worthless nor deserving of neglect. One soil, by an easy examination, is found to be deficient in organic matter, and the advice may be—try the ploughing in of a green crop; another may contain much vegetable matter in what is called an inert state—try upon that a dressing of hot lime; a third may contain sulphate of iron or alumina—drain, deep plough, lime, (or marl,) and summer-fallow such land, and you take the shortest road towards a cure. Again, one may ask—Why does lime not benefit my land? An easy analysis will reply, because it abounds in lime already, and must have a season of rest from liming; or because it is poor in organic matter, and requires more liberal supplies of manure; or, if neither of these is the case, because your land requires draining. So the subsoil may be yellow and noxious when brought to the surface, or it may kill the roots of plants when they descend to it. Then a simple examination may prescribe draining and subsoiling, that the noxious matter may be washed out by the rains, and the whole mellowed by the admission of the air. Or it may be rich in lime, which has sunk from the surface, and, after frequent limings, has produced a real marl bed beneath, affording a congenial harbour to the pestiferous coltsfoot; and here the chemist may say, plough your land deep, and bring up the marl, and you will both save the cost of lime for a season, and will rid yourself of a troublesome weed."

In another place, in the same paper, the statements of Liebig are taken to illustrate the utility, or rather necessity, to farmers, of some sound chemical adviser, if they are not to be led into expensive errors by false theoretical views.

"Observe, by one or two examples, into what practical errors the propagation of a mere theoretical opinion may lead. It has been long known that the stems of the Corn crops—their straw—contain much silica; and it has been believed, nearly as long, that it is by means of potash or soda, and chiefly the former, that silica is enabled to enter into the plant. Upon this opinion, Liebig—whose name has recently become so familiar in connection with scientific agriculture—based an explanation of the benefit of naked and green-crop fallows. He broadly announced that Wheat grows well in this soil because it contains much potash—refuses to grow in that because potash is wanting, and that the efficacy of a fallow consists in its allowing the potash of decaying minerals to accumulate in the soil, and thus to provide a sufficiency for an after-crop of corn. What was this, but to say that, by adding potash to the soil, you may grow Wheat after Wheat for an unknown period? How important, and yet how simple, a discovery this! No wonder that it attracted the attention, and excited the hopes, even of the more instructed farmers, and that a kind of potash monomania should have spread among the distressed agriculturists from one end of the island to the other. Then was the flood-gate opened for new varieties of quackery, and every large town speedily produced its own chemical-manure manufactory. But a very slight examination showed the unsoundness of this opinion of Liebig. A green crop favours, he says, the after-crop of corn, by allowing the potash to accumulate; and yet, according to the best analysis we yet possess, the two green crops in a four years' rotation, carry off from the soil ten times as much potash and soda as the two corn crops. Where is the possibility, then, of accumulation? what becomes of the theory? what of the quack manures? what of the hopes of corn crops in succession? It may produce some ultimate benefit thus to unsettle men's minds; because it will lead some to think, to inquire, and, at last, to make considerable approaches towards the truth; but it causes an immediate pecuniary loss to many, and disgusts more with the applications of science, and leads them naturally to distrust even its best-founded prognostications."

"Again, in another case, Liebig reasons as follows:—Wheat straw contains about 16 per cent. of inorganic matter, which it leaves, when burned, in the form of ash; barley straw, 8 per cent., and oat straw 4 per cent.—therefore, "upon the same field which will yield only one crop of wheat, two crops of barley and four of oats may be grown." From this opinion naturally followed the practical rules—add to the soil those substances contained in the straw, and, if you wish a crop of barley, add twice, or of wheat, four times as much as you would add for one of oats. How simple also these rules and practice! What an easy thing to farm land upon chemical principles! Yet the facts from which Liebig's opinion and the practical rules are both deduced are incorrect. There is seldom any striking difference between the quantity of ash left by the three kinds of straw in question, when grown upon the same soil. They all vary, leaving, in general, from 4 to 8 per cent. of their weight. There is nothing then to reason from. How easy, with a little precise information, to remove all foundation for such unsound opinions!"

In an article by Mr. Main, on the Means of supplying Air to the Roots of Plants, are some observations upon

Draining, which deserve the attention of many practical men. "It is surprising to those who know but little of the nature of the various strata of the earth's surface, how easy it is in some cases to get rid of surface-water. For instance, if there be wet and dry places on the same field, the owner may be assured that a bed of clay, or other kind of earth impervious to water, lies beneath the wet, and a porous subsoil beneath the dry places. A drain of sufficient depth opened (and filled nearly to the surface with stones or loose gravel) from the wet to the dry places, will certainly render the whole dry. In my own practice, and acting on this principle, I have been in many cases very successful in laying arable fields dry. Two cases I may mention as examples:—A field of eleven acres, of a fine loam, suitable for wheat, beans, or indeed any other crop, had a hollow near one of the ends, which was every winter filled with water, and ruinous to wheat or grass, very frequently to the extent of between two and three acres. This I resolved to drain. A neighbouring farmer predicted that the attempt would be a failure; because his father, when tenant, sunk a shaft to the depth of above seventy feet in the lowest dip of the hollow, and filled it with stones, excepting that this would form a *swallow* for all the rain and melted snow retained by the hollow. But this expectation was not realised; the water first filled the pit, and then flowed over the land as before. The cause was easily comprehended: the pit did not reach to the chalk-rock, nor did it pierce through any porous stratum; its loamy sides and bottom were perfectly water-tight, so that little or none could escape. My plan was different. I saw marks in an adjacent field of where chalk had been drawn at some former time; thither I opened a stone-filled drain below the ploughshare, from the lowest dip of the hollow; and, when the water had accumulated, it ran towards the old chalk-pit, but totally disappeared long before arriving at the place, and thus was a valuable field laid dry. Another arable field contained a pond, which very often overflowed its boundaries. Lower ground was at the distance of half-a-mile; and the expense of forming so long a drain prevented all attempts to get rid of the annoyance. I advised the tenant to dig a deep drain from the pond up into a high bank of gravel, into which the water oozed away immediately; and ever after carried off all excess. By this simple expedient a large piece of excellent land was reclaimed and brought into a regular course of culture at a very trifling expense."

Among the papers furnished by the Highland Society is one by Professor Traill, on the Production of Butter, which will be read with interest, but of which we can only give the conclusions, which are as follows:—

"1. That the addition of some cold water during churning facilitates the process, or the separation of the butter, especially when the cream is thick and the weather hot. 2. That cream alone is more easily churned than a mixture of cream and milk. 3. That butter produced from sweet cream has the finest flavour when fresh, and appears to keep longest without acquiring rancidity; but that the buttermilk so obtained is poor and small in quantity. 4. That scalding of the cream according to the Devonshire method yields the largest quantity of butter, which, if intended for immediate use, is agreeable to the palate and readily saleable, but if intended to be salted, is most liable to acquire, by keeping, a rancid flavour. The process of scalding is troublesome; and the milk, after the removal of the cream, is poor, and often would be unsaleable from the taste it has acquired from the heating. 5. That churning the milk and cream together, after they have become slightly acid, seems to be the most economical process on the whole; because it yields a large quantity of excellent butter, and the buttermilk is of a good quality—a point of some importance when buttermilk is largely used as an article of diet, as it is in Lancashire. 6. That the keeping of butter in a sound state appears to depend on its being obtained as free from uncombined albumen, or caseine, and water, as it can be, by means of washing and working the butter when taken from the churn."

There is also an instructive report upon the Use of Manures, by Mr. Maclean, of Braidwood.

"Mr. Maclean states 'that the severe drought of the season has been rather unfavourable for the full development of most of the fertilising qualities of the great proportion of the applications experimented upon. The farm, however, is situated in a mountainous district of country, at an elevation of between 800 and 900 feet above the level of the sea, and, consequently, in a humid climate, where the copious dews, falling nightly upon the grass, would, in some degree, assist in rendering the manures into a more soluble condition than could have been expected to take place in a climate more genial and dry. From the great benefit the whole of the applications derived from the genial showers which fell from the 28th June to the 10th July, it is evident that the fertilising qualities of artificial manure are brought more completely into action in a moist season than in a dry, and all crops appear to improve in damp weather; but the seedling grasses and clover plants seem to receive a stimulus which no condition the land could be put into by the most liberal application of farm-yard manure could convey to them. Plants as well as animals are benefited by a change of food; they get satiated, as it were, upon a continuance of the same kind, and none more so than the grass and clover plants, which circumstance often draws from intelligent and experienced agriculturists, the common remark, 'that the land is tired of producing them.' The experimenter, therefore, trusts that the following tables will afford ample illustration of the benefits which grass crops may derive from surface applications of the various manures experimented upon, and as nothing tends more

to keep up the fertility of the ground than a luxuriant herbage, the ultimate profit to be derived from the application of these manures must not be regarded as limited to the grass crop alone. It will be observed from the tables that luxuriance in crops does not always imply a proportionate degree of weight; for example, that portion dressed with salt was always inferior in its appearance, and yet the weight of the produce is ample."

"It is also somewhat curious that the weight of dried hay per acre from the portion dressed with soot is only 200 stone, while with a mixture of sand No. 2, it is 202 stone; with No. 3, peat-ashes and soot, it is 217 stone—No. 4, clay-ashes and soot, 220 stone—No. 7, subsoil

and soot, 230 stone; and with No. 8, compost and soot, 202 stone. These various substances being mixed with the soot, may, perhaps, give a more full development to the ammonia, which principally constitutes the fertilising qualities of soot. The subsoil of No. 7, was of a rather rich quality, having a marly texture; the whole of the substances were in mixture with the soot about forty-eight hours, and were in a dried state before being mixed. The great produce and weight of dried hay, and the ultimate profit per acre, from the application of guano, No. 6; saltpetre, No. 11; and nitrate of soda, No. 12, give the most striking evidence of their value as top-dressing manures for seedling grass crops."

EXPERIMENTS with various Manures, Simple and Compound, as a Top-Dressing upon Grass for Hay, in 1842; the Dressings were applied 7th May, Grass cut 24th June, and Win Hay weighed 5th July, and Stacked.

"Mr. Maclean also transmitted to the Society a Table, showing the relative weight and value of a Turnip crop grown with and without artificial manures. This Table is also appended. The field which formed the subject of experiment, Mr. Maclean states to be of the poorest description, "quite proverbial for producing inferior crops." In the year 1836, he top-dressed it with lime and earth, and kept it in pasture until 1841, when it was sown with Oats, and produced a middling crop. The soil is thin blackish muir—subsoil, a muirband pan, nearly impenetrable. It was tolerably well drained; though by no means furrow-drained; still he was enabled to have it ploughed to a depth that had not been previously practicable. It will be observed, from an inspection of the tables, that the varieties of Turnips experimented on were the Yellow and Globe—thirty cart-loads of good farm-yard dung being applied alone, and one-half that quantity, or fifteen cart-loads, being applied in combination with each of the fertilizing substances.

TABLE showing the Relative Weight and Value of Turnips with and without Artificial Manures, in 1842.

No. of Portions.	Quantity of Dung and application of Manures per Imperial Acre.	Expense of Manure per Acre.	Weight of Yellow Turnips per Imperial Acre.	Weight of Globe Turnips per Imperial Acre.	Value of Yellow per Acre at 8d. per cwt.	Value of Globe per Acre at 6d. per cwt.	Total Value per Acre after deducting Manures	Gain by Application.	Loss by Application.

But we must not allow our readers to suppose that this Number is wholly agricultural; on the contrary, we find a paper on the Plantations formed on the Sutherland estates, and another by Mr. Pearson, of Bewdley, on the Canker and Gum in Fruit Trees, from the last of which we must make an extract.

Mr. Pearson says that, "In 1841 the Peach trees here suffered severely by gum or canker. Some old trees had to be replaced by young ones. I have tried various soils here for the Peach, some in shallow borders, others in deep ones; some thoroughly drained, others not drained at all—as the subsoil is dry—in all of which the roots are

perfectly healthy, while their branches suffer by canker in all the different soils, and in all the different forms of border. These experiments inclined me to the belief that the root of the disease did not rest in the soil, any further than that a soil for any kind of tree to grow in should be of such a composition as to produce a tree sufficiently vigorous for the purpose intended. No matter whether it is intended for timber, fruit, or flowers only. I have stated that, if the Peach trees here were covered with glass, it would eradicate or prevent the disease. In this I might, in one sense, have been mistaken to a certain extent. I have stated, however, in another place, that I

would engage to have two peach-houses, everything as to soil and situation being the same, and I would almost destroy the trees in one house by artificial gum or canker, and the trees in the other house should be nearly, if not altogether, free from it. This, I admit, is a very bold assertion; but the following experiment enables me to make it with some degree of confidence:—I had a small Peach tree growing (or rather dying) against a south wall, which was so affected with disease, that it had only two living buds on it. I potted it, and set it in the peach-house, to see if I could restore it to anything like a healthy state. One of the buds was knocked off by accident; the other bud grew, and did pretty well. The second year I planted it against the west end of the house—its aspect being east. Having, as I fancied, traced the disease to external causes, I disbudded, as we gardeners term it, two buds on the little tree in question. The one bud was pinched off, leaving one small leaf to it; the other was pinched off without leaving a leaf, but leaving the nucleus or base of the bud; and, as is well known to practical cultivators of the Peach, buds treated in the latter mode never put forth again. Over these denuded buds I fixed an open vessel of clear rain-water, in which I placed a wetted worsted thread, one end of it hanging over the side of the vessel in a perpendicular line with the buds. By the well-known law of attraction in this case, the thread dripped its regular supply of water on the denuded buds, which were allowed to be kept moist, by this means, for two or three days at a time. Then the thread was removed, and the buds allowed to be dry for a day or two, when the water was again applied; and thus we proceeded with those alternations for a short time, occasionally examining the buds. On the first examination I could not perceive anything remarkable in their appearance; but, by and by, I fancied I saw a slight discoloration of the outward bark, extending about an inch below each bud. Soon after this, fancy became certainty, by the bark becoming darker in colour, and small globules of gum, as clear as drops of rain in the sunbeam, exuding from the bark, about an inch below each bud. After keeping them dry for a few days, the water was again applied, and in a short time the gum took its well-known dark amber colour, and the bark its well-known brown. Thus the disease was fully established artificially; and here the branch is on the tree for any person to see—many of my neighbours having already seen it. At the present time there is gum hanging on the said branch; and any stranger would take it for the disease in its natural way, as there is no discernible difference in it. In fact, I do not think that the branch will live much longer, as the disease has almost extended round it. I had, for years, felt pretty certain that by far the greater number of cases of the disease made their first appearance at or near the buds in the Peach tree, but never could decide exactly how the dawn of its existence took place, till I had the satisfaction of witnessing it in the above simple experiment.

"In Peach trees, generally speaking, and probably in many other trees, natives of warmer climates than ours, there are always more or less of what gardeners term abortive buds, both of wood buds and blossom buds. This abortiveness establishes itself earlier or later in the autumn, or probably from the vicissitudes of a severe winter, such as the last winter, for instance; when in the latter part of January we had here April-like weather, but on the 15th, 16th, and 17th of February, the thermometer sunk to 17 deg. below freezing, which rendered all the blossom-buds on four Apricot trees abortive, notwithstanding their growing against a south wall. The abortive wood-buds are more numerous in those trees which are rather declining in vigour, or in those branches of a young tree which has been robbed of its portion of nourishment by its more robust neighbours, or, which is often the case, on branches which have borne too much fruit. It matters little, however, in this case, how these abortive buds are established; the fact is, they are established, and there the disease commences its silent but certain and destructive operations. When the buds are dead, they, like all dead vegetable matter, become powerful absorbents of water, whether of the finely-divided vapours of the atmosphere, or the more condensed form of rain water—hence, after rain, they become gorged with water. So long as these dead buds rest on the trees, there is little or no cicatrization between the dead buds and the branches which they rest on; or, at all events, not before they have been saturated with moisture, which first saturation, after death has taken place, enters into the most incipient fermentation with the sap of the plant, at the connection between the dead bud and the living branch. By the alternations of wintry weather, from wet to dry, and wet to frost, and frost to hot sunshine, as spring approaches, the frost, freezing the water in the dead buds, enlarges their capacity for holding the destructive element, which assists in carrying on the fermentation between the album and the bark. In this infant stage of the disease, it is not discernible by ordinary observation, as the bark does not change its colour for some time after the disease has entered the system of the plant; and, if dry weather follow the recent establishment of it, its ravages are arrested for a time, but which, nevertheless, progress as the sap attenuates, when the disease manifests itself to the eyes of every beholder, but to none more than to the eyes of the gardener, who has carefully prepared his well-drained border, as a preventive or cure of the pest in question, and who finds, as I have found, that the whole 'root doctrine,' as a cure of canker on the head of the tree, is next to a fallacy, save, as I have above stated, that a soil should possess ingredients which will produce a tree sufficiently vigorous for the purpose intended, avoiding that state of exuberance which prevents it.

July 21. Cloudy and fine; overcast.
 22. Lightly overcast and fine; slight rain; cloudy; rain at night.
 23. Cloudy; squally, with heavy showers; densely clouded; cold rain at night.
 24. Clear; cloudy and fine; clear at night.

July 25. Overcast and fine; clear.
26. Overcast; slight rain; cloudy and mild; rain at night.
27. Rain; showery; cloudy and fine.
Mean temperature of the week 57°; be. w. the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing week ending August 5, 1884.

July.	Aver. Temp.	Aver. Low Temp.	Aver. High Temp.	No. of Rain Days.	Quantity of Rain.	Days of Frost.	Days of Snow.	Days of Hail.

Dec.	85	75	95	1	2.2	1	1	1

The highest temperature during the above period occurred on the 1st, 1884, thermometer 80°; and the lowest on the 1st, 1877, thermometer 12°.

REPORT ON COVENT-GARDEN MARKET. For the Week ending July 28, 1884.

In consequence of the late rains, the market continues to be well supplied with vegetables of good quality. Fruit of all kinds in season is abundant. Pines consist principally of Queens, with a few Monticenis, Envoies, and Provencens. Of Hothouse Grapes there is a fair supply. Peaches and Nectarines are remarkably good, and there are also some tolerable Apricots of foreign growth. Dessert Plums are becoming more plentiful, consisting of the Orleans, with a few Greengages. Cherries and Strawberries are less abundant, although they may still be obtained at a low price. Raspberries, Currants, and Gooseberries, are offered in large quantities, but they are still very small. Cucumbers from the open ground are plentiful, and there are some fine specimens of frame growth. Peas continue to be brought in great abundance. Windsor and Long-pod Beans are plentiful and cheap. French Beans have much improved, and are now supplied in large quantities. Early Horn Carrots have nearly obtained their full size, and, with Turnips, continue excellent. Good Cauliflowers may still be met with, and Cabbages abound. A small quantity of Asparagus is offered. Artichokes, Vegetable Marrows, &c. are not scarce. Mushrooms are rare, and fetch a good price. The show of Picotees and Carnations, amongst Cut Flowers, has been exceedingly fine: with them we noticed a great variety of Roses and Pinks, with Alstromerias, Jasmine, Sweet Peas, Scarlet Pelargoniums, Honeysuckles, Orange-flowers, Japan Lilies, Aconitum versicolor, and flowers of the Tulip-tree.

PRICES, SATURDAY, July 29, 1884.—FRUITS:—

Pine Apples, per lb., 1s to 1s 6d	Cherries, Wall, per lb., 1s to 1s 4d
Grapes, per lb., 1s to 1s 2d	Apples, new, per half-sieve, 1s 6d to 3s
Peaches, per dozen, 12s to 21s	Oranges, per dozen, 1s to 4s
Nectarines, per dozen, 12s to 21s	Lemons, per dozen, 1s to 3s
Apricots, per dozen, 12s to 21s	Lemons, per 100, 6s to 14s
Plums, per dozen, 12s to 21s	Cucumbers, per brace, 6d to 2s
Strawberries, per pot, 6d to 1s 6d	Almonds, per bushel, 6s
Gooseberries, per lb., 1s to 1s 6d	Sweet Almonds, per pound, 3s
Currants, per half-sieve, 1s to 3d	Nuts, per bushel, 1s
— Black, 2d to 3d	— Brazil, 1s
— Red, for wine, 1s 6d to 4s 6d	— Raw, 1s 2d
Raspberries, per gallon, 1s 6d to 2s	— Cob, 12s
Cherries, English, per 2 lbs., 1s 6d to 3s 6d	

VEGETABLES.

Cabbages, per doz., 6d to 1s 6d	Peas, per doz. 1 lb., 3s to 4s
Carrots, per doz., 6d to 1s 6d	Onions, per doz. 1 lb., 1s 6d to 3s
Beans, per doz. 1 lb., 1s to 5s	— Large, per doz. 1 lb., 1s to 6s
— Windsor, per doz. 1 lb., 1s 6d to 3s	— Small, per doz. 1 lb., 1s to 6d
Potatoes, per doz. 1 lb., 1s to 10s	— Kidney, per doz. 1 lb., 1s to 6d
— New, per doz. 1 lb., 2s to 4s	— Peas, per bushel, 1s to 2s
— Peruvian, per doz. 1 lb., 1s to 6d	— Lettuce, per doz. 1 lb., 1s to 6d
— Kidney, per doz. 1 lb., 1s to 6d	— Cabbage, per doz. 1 lb., 1s to 6d
— Scotch, per doz. 1 lb., 1s to 6d	— Celery, per doz. 1 lb., 1s to 6d
Artichokes, green, per doz. 1 lb., 1s to 6d	— Small, per doz. 1 lb., 1s to 6d
Vegetable Marrows, per doz. 1 lb., 1s to 6d	— Sweet, per doz. 1 lb., 1s to 6d
Tomatoes, per doz. 1 lb., 1s to 6d	— Water, per doz. 1 lb., 1s to 6d
Red Beet, per doz. 1 lb., 1s to 6d	— Parsnips, per doz. 1 lb., 1s to 6d
Horseradish, per doz. 1 lb., 1s to 6d	— Turnips, per doz. 1 lb., 1s to 6d
Radish, per doz. 1 lb., 1s to 6d	— Carrots, per doz. 1 lb., 1s to 6d
— Turnip, per doz. 1 lb., 1s to 6d	— Asparagus, per doz. 1 lb., 1s to 6d
Carrots, per doz. 1 lb., 1s to 6d	— Mint, per doz. 1 lb., 1s to 6d
Shallots, per doz. 1 lb., 1s to 6d	— Parsnips, per doz. 1 lb., 1s to 6d
Spinach, per doz. 1 lb., 1s to 6d	— Walnut, per doz. 1 lb., 1s to 6d

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—We are so often applied for particular Numbers of the *Gardeners' Chronicle*, to complete sets, and so many are now out of print, that we think it will save all parties trouble if we publish a list of the Numbers which may still be had. Any Subscriber who will forward to our publisher Post-office stamps, equivalent in value to as many Numbers as are required, shall have them sent. Those Subscribers who are very anxious to complete their sets should write at once, as we have very few copies of some of the Numbers.

1841:—1, 6, 8, 13, 15, 16, 17, 18, 20, 22, 23, 24, 25, 27, 28, 29, 30, 31, 32, 33, 34.
1842: 4, 6, 8, 10, 11, 12, 16, 18, 30, 42, 50, 51, 52.
1843: 1, 5, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27.

AGRICULTURE.—*Anthony.*—Mangel Wurzel and Carrots are very apt to run to seed if very dry weather comes on before they have sufficient roots. It may also be owing to the seed having been gathered from plants which ran to seed the first year. There was very little good Carrot seed last year. The subject of pating and hurring has been a controversy for ages amongst Agricultural writers, and the arguments for and against it are so plausible that no final decision can be given in all cases. Much depends on circumstances. The chief advantage of burning consists in destroying the seeds of weeds, and the insects which infest the soil. If a good crop of Turnips can be raised with ashes, and these fed off by folding sheep on them, the organic matter destroyed and evaporated will be replaced. Wherever there is old lerbage and a loamy soil, burning may be recommended: light soils are deteriorated by it. Care should be taken not to let the heaps burn too fast. *M.* We know of no experiments with coal-gas as a manure. Although employed as an ingredient in Daniel's manure, it is doubtful whether it has any other effect than that of driving away insects, and enabling the manure to stick to the light land where it is used. However, it is a subject that ought to be further investigated.

MANURES.—*S. H.*—Use common manure for your grass-land, as long as it lasts. Guano is an excellent material for the same purpose, but it must be mixed well with six times its bulk of ashes, or peat, or soil, of some sort; and must be applied in wet weather or it will burn the grass. We never heard of cows refusing grass from land manured with guano. *—The Editor.* Thanks for the seeds. Gas-water is the ammonia liquor through which gas passes in the process of purification.

LIQUID MANURE.—*S. R. S.*—An economical plan for saving liquid manure is described at p. 51 of this year's *Chronicle*. **LEAF-MOULD.**—*Anonymous.*—We are informed that the Melon-bred made of leaf-soil, spoken of in "Paxton's Magazine of Botany" for July, was made thus:—A leaf-bed, from the rakes of shrubbery, coppice, or park, in autumn, and devoted as a medium of bottom-heat to the Pine-apple at the winter, was amply prepared to receive Melon-plants early in the following July. It contained masses of semi-decayed leaves, fragments of sticks, twigs, and bark, with some fibres of Grass.

The roots of the Melon penetrate freely, and luxuriate in the interstices of the masses, the foliage is large and perfectly healthy, and 17 fruit, each weighing 2 lbs. at the least, were in one year produced by a single plant so treated. *K.*

PLANTING.—*Anonymous.*—In a contract for planting trees of a certain size, say Larch, 18 in. to 24 in. length is to be measured from the tip of the shoot to the ground line, after the trees are properly planted. Is it possible that any one fancies the roots to be included in the measurement?

HEATING.—*Guichenot.*—Your letter is forwarded to Mr. B.—*S. C. D.*—At p. 348 of 1842, is some information upon tank-heating. We have some matter in hand upon this subject, which will be as speedily published as we can ascertain what is the best means of constructing the apparatus. At present, we see no objection to gutters lined with cement and covered with flat tiles or slates, being substituted for iron pipes, and placed in the same situation.

HEATING LITS.—*S. R. S.*—You cannot do better than procure one of the boilers you describe, and erect an apparatus similar to that described at p. 348 of the *Chronicle* for 1842.

VINES.—*P. Nicholson.*—For a small Vinery we would recommend you to obtain, 1 Royal Muscadine and 1 Chasselas Musqué—white Grapes; the remainder may consist of Black Hamburgs.

S. R. S.—If your newly-planted Vine is strong, you may let it run up the whole length of the rafter, or even bend it along the top of the house before you stop it; but if it is weak, it will be better not to allow it to become so long. By stopping it, two or three of the buds at the extremity may be thrown into growth; but this will be of no consequence, as that portion of the stem will be removed at the winter pruning.

MIGNONETTE.—*S. H.*—The cause of your Mignonette becoming drawn and straggling, may be ascribed either to its being grown in a shady situation, or to its having been allowed to become too crowded. Tree Mignonette is obtained by selecting and putting a vigorous young plant, the flowers of which are to be pinched off as often as they appear during the first season. It must be repotted as occasion may require; the lower shoots must be removed in autumn, and the plant must be kept during winter in a room or greenhouse above the freezing point. The second season it may be treated in a similar manner; and the next year it may be allowed to bloom, which, with care, it will continue to do for several years.

LAI RETS.—*Ignoramus.*—These shrubs will not thrive upon wet retentive land. A light rich soil suits them best.

THE YEAST PLANT.—*A Lady.*—The plant is *Cnicus benedictus*. The bread is very like heavy bread made with bad yeast, but by no means so good as unleavened bread. Would not any other plant produce the same effect?

SALVIA PATENS.—We have received several more communications on this subject, but, as we have already stated, we can find no more room for them. Quite enough has already been stated for all reasonable purposes.

ANAGALLIS.—*Vestal.*—We ourselves measured Flora's Anagallis, and it was really the size of a five shilling piece. *J. L.*

FIRS.—*J. G.*—The best time for transplanting Firs is the month of November. You can do nothing to aid the growth of those which you removed a fortnight since, except to keep the soil constantly puddled about the roots.

GRASSES.—*E. Evergreen.*—The genera *Carex* and *Scirpus* belong to the Cyperaceous Order, and Junco to the Juncaceae. The number of grasses usually acknowledged as British is 123.

HEATHS.—*G. Pile.*—We are making experiments upon the effect of manure-water upon Heaths, and will report the result in due time.

PETUNIAS.—*J. Ross.*—These are not florists' flowers, and no rules have yet been laid down for judging them.

ORCHIDACEOUS PLANTS.—*S. R. S.*—For growing in a pit heated by hot water, we recommend the following: *Cattleya crispata* or *violacea*, *Oncidium papilio*, *flexuosum*, or *guttatum*, *Odonoglossum grande*, *Maxillaria Deppii*, and *Epidendrum aromaticum*.

WINDOW PLANTS.—*Annie.*—The following are inexpensive plants, suitable for a window in winter:—*Chrysanthemums*, *Pelargoniums*, *Myrtles*, *Fuchsias*, *Heliotropes*, *Aloes*, and *Lysimachia nummularia*.

ROSES.—*Ignoramus.*—The fact that your Ayrshire and Perpetual Roses make very vigorous growth, but do not bloom, is easily accounted for by their being planted against a wall with a north-west aspect. In such a situation, and especially where the soil is retentive of moisture, they do not receive much benefit from the sun; the wood is only partially ripened, and long watery shoots, instead of flowers, are the consequence.

C. D. B.—You had better deter the removal of your Crimson Perpetual Rose until the autumn. If care is taken to injure the roots as little as possible, it may then be transplanted without danger. We cannot undertake to name Roses.

FUCHSIAS.—*Hibernicus.*—If the seedling has always all the parts of the flower in sevens it will be a curiosity, but we fear it is not handsome enough to become a good show-flower.

STRAWBERRIES.—*W. W. J.*—Mr. Silverlock informs us that the Victoria Strawberry is a large late kind, a profuse bearer, of good flavour, though not so high as that of Myatt's Queen, and much esteemed for preserving. He introduced it some years ago, and has since improved it from seed—a fine dish of fruit having been exhibited on the 12th at Chiswick as the 'Chichester Pine.'

INSECTS.—*Dundee.*—Your Melon leaves are infested by the Red Spider. To check it, keep your pits damp for a few days, or try the effects of gas-water, set in pans to evaporate. *G. L.*—Your insects are the *Cossus ligniperda*, or Goat Moth, which is not rare in several parts of England. In the larva state it bores into the trunks of trees, and commits much havoc amongst Oaks, Ashes, Willows, and Poplars.

Crinum.—The beetle you discovered under a garden-pot which was standing in some decayed vegetable mould, belongs to the genus *Cilibe* of Latreille, all the individuals of which are confined in their geographical distribution to our Australasian colonies. The present specimen was probably imported in the larva state from those distant parts of the world. Under these circumstances, we know not where to recommend you to search for another specimen in this country, except in the same locality where you obtained the last. As it is interesting to trace the way in which foreign insects become imported into this country, if you have any other observations to offer in elucidation of this subject, we should be obliged if you would favour us with them.

S. C. Noble.—Your moth is the Tortrix (*Orthotenia*) *Turionella*. It is not peculiar to the *Pinus insignis* in its attacks, as it has been known to do great injury to the Scotch Fir, particularly on the Continent. *S.*

ANTS.—*T. Keen.*—We cannot advise you in your case. Watering the earth where ants abound is a good plan for driving them away; but were you to do so, it would most likely cause your Melon-plants to canker.

RED-SPIDER.—*J. J. G.*—There are no means of removing Red-Spider except by damp or by the fumes of sulphur, unless the vapour of ammonia should do it; but that has to be ascertained experimentally.

BUGS.—*A. B.*—Mix corrosive sublimate and soft soap into a paste, and plaster well the joints of the furniture. No bugs will stand that. If they show a swarm stip on all the paper hangings and burn them; and if all crevices in the plaster with corrosive sublimate and Plaster of Paris; and, moreover, point all the fissures in wood-work, or the spaces between the flooring boards with the sublimate and soap. You will see no more of your enemy; and we trust you will not send any further supply to us, as London is sufficiently stocked already;—not that we received the lively specimens you speak of. They had fortunately escaped into the letter-bags, for the benefit of somebody else.

POTATOES.—*Mark.*—The curl in Potatoes, according to Mr.

Knight, proceeds from the highly inspissated state of the sap in dry and farinaceous varieties. The same authority asserts that it may be prevented by taking up the tubers before they are nearly full grown. That the disease is thus originated is rendered more probable by its appearing after the late hot summer, although you had never observed it until this season for the last 16 years.

BUDDING.—*R. A. T.*—It is better to remove the piece of wood which remains in the bud after being sliced off the twig; but a union will often take place even if it is not removed. Evergreens are not budded, but they might be at this season if there were any use in doing so.

TRANSPLANTING.—*J. J. G.*—Evergreens may be transplanted at this season, and sometimes they succeed remarkably well. All the Holly hedges in the Horticultural Garden, and the bank of Evergreens at the back of the new stables at Windsor Castle, were transplanted at Midsummer. But a much more certain season is November.

FERTILIZATION OF PLANTS.—*T. Keen.*—If you fertilize a flower with the pollen of another of a different species, the seedlings, supposing that the pollen takes effect, will be mules.

LAW OF GARDENS.—*J. M.*—You had better consult your solicitor. We believe that if a person's trees overhang your garden and hedge to a great extent, and to their injury, and the owner of the trees will not cut them back as far as your hedge, you can do it yourself, if you stand on your own property. But neighbours should not so act to each other. It is far better to prune by consent.

GLAZING.—*Husticus.*—If it is a Greenhouse you are building, you need not putty the laps; for what your glazier says is true, the putty will in time come out. No doubt it is more expensive to use sheet glass than crown-glass, especially in squares of 6 ft. 6 in. But what is the difference between large squares of sheet and small ones of crown? A good deal is saved in the expense of glazing and making frames when the squares are large.

WOOD-PAVING.—*C. C.*—Mr. Stead's paper upon wood-paving, alluded to at p. 315, appeared in No. 32 of last year's *Chronicle*.

MISCELLANEOUS.—*F. B.*—1, *Malope trifida*; 2, *Lantana mixta*; 3, *Cynoglossum glochidiatum*; 4, *Salvia splendens*; 5, *Clarkia pulchella*; 6, *Salvia Grahami*.—*Holcus*.—1, *Rosa stylosa*; 2, *R. canina*; 3, *Rubus fruticosus*; 4, *Salvia Horminum*.—*J. W. F.*—1, *Phlox suaveolens*, *P. suaveolens variegata*; 3, *P. maculata*; 4, *P. crassifolia*; 5, *Potentilla*; 6, *Hedysarum apinum*.

A. C.—We do not apprehend that the removal of the terminal bud of *Spathodea campanulata* would retard its blooming. *Maia*.—*Trifolium rubens*; we are not aware that it has been used for fodder. *A Reader*.—*Butomus umbellatus*.—*S. C.*—*Blitum chenopodioides*, or Strawberry blite.

Ramsgate.—*Statice mucronata*; *R. W.*—*Statice mucronata* and *Escallonia rubra*.—*A Regular Subscriber*.—White Hellebore, either *Veratrum album* or *nigrum*; but we cannot determine which from a leaf. *Y. N. D.*—Some species of *Tremella*.—*W. B.*—*Hippeastrum aulicum*, not a bit like *Amarrillia blanda*.—*R. E.*—*Elaeocarpus cyaneus*.—*G. P.* can have No. 33, 1842, for one shilling. *Omego*.—*Impatiens glandulifera*. The grass is *Agrostis stolonifera*, or *Florm*, and is of little value in Agriculture.

SEEDLING FLORISTS' FLOWERS.

FUCHSIAS.—*S. Girling.*—Your seven seedlings are so much alike in colour, that, were it not for a slight difference in form and in the length of the foot-stalk, no difference would be discernible. The vermilion colour of the petals is particularly bright, and the purple of the petals, though pale, is clear. No. 1, in our opinion, is the best. *R. C.*—Your seedling is too much like several varieties already out to make it desirable. *M.*—Your seedling is neither remarkable for firm, size, nor brightness of colour, and consequently cannot be recommended.

VERBENAS.—*S. Girling.*—The best of your seedlings is No. 92, with smooth, flesh-coloured flowers, fading to white. In 90 the flowers are crumpled, and few in number. 83 resembles many others already out.

PETUNIAS.—*H. W.*—Both your seedlings are very large and fine flowers, measuring more than three inches in diameter; they are of a good colour, (a bright light purple,) and better in form than any large specimens we have seen, being less indented in the outline.

PANSIES.—*A Subscriber.*—None of your flowers are worth keeping; they have neither size, substance, nor other good qualities to recommend them. *N.*—The Pansy you propose to name "Hope" is quite a second-rate flower; the top petals are too small; the edges of the petals generally want smoothness, and the flower altogether a little more substance. *H. K.*—Your Pansy is round, well proportioned, and of good substance, the yellow ground colour bright and clear, eye good; the colour of the top petals and the broad belting of the lower ones are of a uniform bright golden brown; the flower is rather small.

PICOTEES.—*Thos. Allport.*—Your Picotee is of no use as a show-flower; it is too deficient in petals. *E. S. C.*—Your seedlings can only be regarded as border varieties.

CARNATIONS.—*R. Orson.*—Your seedling scarlet bizarre Candidate promises to be a good flower; the guard-leaves are good, and the petals altogether are of a good size, form, and substance, but a little too much serrated on the edge, the striping is bold, clear, and distinct, through rather too heavy in the bloom sent, and the white a little poncey; pod fair. It much resembles Walmsley's William IV.

PELARGONIUMS.—*W. G.*, a Subscriber from the Commencement. The colour beyond the spot in your seedling, *General Pollock*, is too much mottled, and wants either a white or rose-coloured edge; the petals had fallen, so that we could not judge with certainty of its form, but we imagine from the shape of the petals that there is a division between the upper and lower petals when the flower is fully open, it is common in colour, and not equal to several varieties we have in the same way.

R. R. R.—Your seedling is deficient in form and substance and will not improve sufficiently by cultivation to make it desirable. *H. Marshall.*—No. 1.—A showy variety, good size, clean top petals, but rather crumpled at the edges; it will make a good greenhouse variety; 2, broad round under petals, of good substance; plum-coloured spot in the top petals, veiny beyond; the ground-colour instead of being white is tinged with lilac throughout; 3, petals long and rough on the edges, not worth preserving; 4, white, with plum-coloured spot, which is rather large, with lines extending beyond, under petals pure, somewhat like but not so good as the *Hutch*.

J. Clewley.—No. 1, is a large and well formed flower, with broad petals, light centre, with clear pink under petals; there appears to be a slight inclination in the petals to turn back; in other respects it is superior to many of the cultivated sorts—it will prove a showy greenhouse variety; 2, This flower is of a bad colour, and deficient in form and substance. *L. D. Penney.*—*M. nana*, white, with small plum-coloured spot, is a flower of fair substance and good form. *Chito*, a pretty flower of good substance, colour clear, somewhat like *Erectum*, but not quite so good. *Helen* is a well shaped flower, having the petals short and broad; the upper petals are too much curled at the edge, and there is a slight indication of the same defect in the lower ones. No. 100, under petals long and narrow, very inferior to *Helen*.

R. W.—The darker variety is bad in form, the petals being too long; it is also thin and flimsy in texture and not worth preserving. The lighter flower is better in every respect; the petals are firm, and it keeps its form well, but the petals want breadth, and the colour is too mottled.

Sand-rork.—Your seedling is a large and showy flower, clear in colour, dark spot, and of good substance, it is better than many of the varieties we see exhibited. Still it wants firmness and compactness; it opens too flat, and appears to have an

inclination to turn back: this shows that the under petals are rather too long for a finely-proportioned flower.*
As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE accounts from Spain announce the surrender of Madrid to the insurgents, after a brief engagement, in which the troops of the Regent under Generals Seoane and Zurbano went over to the insurgent army. Gen. Narvaez is therefore master of the capital, after a succession of marches and counter-marches, manœuvres and tactics, which have, perhaps, no parallel in military history. The triumph of the insurrection and the defection of the troops have been so sudden and complete, that the most important events have been accomplished by other means than an appeal to force, and Spain has thereby been spared from the renewed calamities of civil war. The movements of the Regent are still involved in uncertainty, and are explained only by the supposition that he had no confidence in his troops. According to the last accounts, he was in the neighbourhood of Cordova, apparently retiring within the frontier of Portugal. The future policy of the insurgents is of course the object of great anxiety, more especially in reference to the proceedings of the Christino party in Paris. Their avowed exultation at the present crisis of affairs leaves little doubt that the recent movement originated in the French capital, where the plan of future operations is already talked of without reserve. According to these rumours, the restoration of the Lopez ministry, the declaration of the Queen's majority, and the choice of the Duc d'Aumale as the husband for her Majesty, are likely to be the first measures of the party now in power.—From France, we learn that the Repeal agitation, set on foot by the Republicans of the capital, has made but little progress, and is indeed discountenanced by the leading papers. Mr. O'Connell's speech, repudiating the necessity of interference, has had considerable influence in producing this result; and there is some doubt whether M. Ledru-Rollin, the Repeal delegate, will now visit Dublin. The Chamber of Peers on Saturday voted the Ministerial Budget by a large majority, but postponed the Government bill for the Tours and Orleans railroad to next session. The two Chambers were formally prorogued on Monday by Royal ordonnance.—From Italy, we learn that the long-pending treaty of commerce between Great Britain and Naples has been signed and forwarded to London for ratification; and from Turkey we have the confirmation of the statement that Prince Alexander Georgewitch has been unanimously elected Sovereign of Servia.—From the United States we regret to learn that the Columbia steamer, which we announced last week as having run on shore at Seal Island, has been totally lost. The crew and passengers were all saved, and have arrived at Liverpool; and a great deal of the property on board has also been secured. For the details of the accident, which appears to have been altogether unavoidable, we refer our readers to our Foreign news.

At home, however, another steam-boat accident, more calamitous in its consequences, is reported under our Provincial intelligence. The Pegasus steamer, from Hull to Leith, has been lost on the Fern Islands, near the scene of the well-known wreck of the Forfarshire steamer, and all her crew and passengers, with the exception of six persons, have perished. The particulars are fully given in another part of our Paper, and will be read with melancholy interest. In Parliament, during the week, the proceedings have been mostly of that routine character which always indicates the approach of the close of the Session. The Irish Arms Bill and Lord Lyndhurst's Bill for legalising Irish Marriages have been passed in the Commons, and several other measures mentioned in our Report have been advanced in their respective stages. It is generally expected that Parliament will be prorogued early in August.

Home News.

COURT.—Her Majesty and Prince Albert, the Duke Ferdinand, Prince Augustus and Princess Clementine, and Prince Leopold of Saxe Coburg Gotha, honoured the Italian Opera-house with their presence on Saturday evening. The Queen and Prince Albert, and the Duke Ferdinand of Saxe Coburg Gotha, attended divine service on Sunday morning in the Chapel Royal, Buckingham Palace. On Monday the Prince Augustus and the Princess Clementine, the Duke Ferdinand and Prince Leopold, inspected the suite of state rooms in St. James's Palace; after which they went to St. Paul's, the Tower, and the British Museum, and spent a considerable time in that institution. Their Royal and Serene Highnesses and suite also went to the Reform Club, and were conducted through the establishment. In the evening of the same day the Queen gave a state ball at Buckingham Palace, which was attended by the King of Hanover, the other members of the Royal family, and most of the nobility and gentry now in town. The Queen opened the ball in a quadrille with Prince George of Cambridge, having as a vis-à-vis the Princess Clementine and Prince Albert. On Tuesday her Majesty and the Princess Clementine visited the Zoological Gardens in the Regent's-park. Prince

Albert, the Duke Ferdinand, and the Princes Augustus and Leopold, accompanied the Queen and Princess on horseback. Her Majesty and Prince Albert, the Duke Ferdinand, and Prince Leopold, honoured the Italian Opera with their presence in the evening. On Wednesday, Prince Augustus and Princess Clementine, the Duke Ferdinand and Prince Leopold, visited the British Institution, the Exhibition of the Society of British Artists in Suffolk-street, the National Gallery, and Whitehall Chapel; they afterwards accompanied her Majesty and Prince Albert to the Thames Tunnel. On Thursday, her Majesty and her Royal guests visited Claremont and Bushy-house; returning to Buckingham Palace in the evening.—The King of Hanover honoured the members of the Carlton Club with his company at dinner on Saturday evening, and afterwards left town for Kew. His Majesty visited the Queen Dowager at Bushy-park on Sunday afternoon, and gave a dinner-party in the evening. His Majesty came to town on Monday, and honoured the Marquess and Marchioness of Ely with his company at dinner, and afterwards went to the Queen's state ball. On Wednesday, his Majesty honoured his Excellency Count Kielmansegg, his Minister at this Court, with his company at dinner, and remained for the evening party. The Duke of Cambridge also honoured his Excellency with his company at dinner. On Thursday, the King dined with the Duchess of Gloucester, and in the evening honoured the Countess of Haddington with his company.—The Prince and Princess of Oldenberg and family, and a numerous suite, quitted Brighton on Monday for Worthing. His Serene Highness left Worthing for Goodwood on Tuesday morning, but returned in the evening. His Highness has visited the races each day.

Representative Peer.—The election of a Scottish Representative Peer, in the room of the late General Lord Forbes, took place on Tuesday week in the Palace of Holyrood, when Lord Polwarth was unanimously elected.

Parliamentary Movements.—Mr. Bright, the member of the Anti-Corn Law League, has been returned for Durham by a majority of 78. The numbers at the close of the poll were as follows:—Mr. Bright, 488; Mr. Purvis, 410: majority for Mr. Bright, 78.

Duchy of Cornwall.—The gross revenues of the Duchy for the year ending December 31, 1842, were 32,935*l.* 13*s.* 4*d.*; salaries and expenses 12,833*l.* 13*s.* 4*d.*, leaving 20,102*l.* for the Prince of Wales.

The Royal Navy.—The navy at the present moment consists of 230 vessels of all descriptions, mounting 3,471 guns, viz.: 3 yachts, 14 sea-going line-of-battle ships, 31 frigates, 35 sloops of war, 34 smaller vessels, 68 steam-vessels, 25 surveying-vessels (including 9 steamers), 9 troop-ships, 1 hospital ship, and 10 stationary guard ships. Our force at home consists of 780 guns; Mediterranean, 653; Brazil, 451; East Indies, 566; Cape and Coast of Africa, 293; North America and West Indies, 315; Particular service, 232; Surveying, 120; Troop-ships, 58; Lakes, 3; Total, 3,471 guns. This is an augmentation of 8 vessels, but a reduction of 384 guns, since the commencement of the year.

Royal Parks.—From a return of the public money expended upon each of the Royal parks during the year 1842, and just published by order of the House of Commons, it appears that, upon Hyde, St. James's, and the Green Parks, there has been expended 16,680*l.*; on Regent's Park, 5,150*l.*; on Greenwich Park, 1,316*l.*; Richmond, 6,155*l.*; Hampton and Bushy, 4,059*l.*; Windsor Great Park, 16,342*l.*; Windsor Home Park, 863*l.*; Ascot Royal Stand, stables, and kennel for stag-hounds, 266*l.*; and on the Phoenix Park, Dublin, 8,647*l.*; making a gross total of 59,478*l.*

Post-Office.—For some time past the Postmaster-General has been negotiating with the directors of the different railways for extending the delivery of the Post-office twice a day by the morning and evening railway-trains, to many parts where there is only one delivery daily, and even every other day. With respect to the mails to Scotland, the north and west of England, and Ireland, arrangements are nearly completed that will be highly beneficial to the public by an expeditious delivery of their letters and newspapers. The following towns have been added to the list of the morning mails within the last few days: Andover-road, Bishop's Stortford, Cambridge, Folkstone, Gateshead, Newcastle, Northumberland, North Shields, Rickmansworth, Ryde, Saffron Walden, South Shields, Sunderland, and Ware.

British Museum.—The returns just published by order of the House of Commons relative to the financial condition and recent improvements in this establishment, show that the total receipts during the past year, including the Government grant of 30,000*l.*, amounted to 37,263*l.*, and that the total actual expenditure for the same period stood at 34,032*l.*, leaving a surplus sum in the treasurer's hands of 3,230*l.* The receipts on account of the Bridgewater and Farnborough funds amounted to 517*l.*, and the estimated amount of Parliamentary grant required for the services of the current year was 32,576*l.*, a considerable portion of which would be required for the new buildings and improvements. The number of persons admitted to view the general collections during the past year amounted to 547,718, being an increase over the previous year of 228,344, and the number of visits made to the reading-rooms for the purpose of study or research, was 71,706, being an increase over the corresponding year of 2,403. The number of visits by artists and students to the galleries of sculpture had been 5,627, and the number of visits to the print-room 8,781. The average number of readers is 245 a day, the number of deliveries of MS. to whom, exclusive of illuminated volumes, amounting during the last year to 19,727. The Parliamentary grant proposed to be voted for the present year is 32,576*l.*

Church Preferment.—The Queen has been pleased to make the following appointments to benefices vacant by the late Secession in the Scotch Church:—The Rev. Hugh M'Diarmid, M.A., to the church and parish of Callander, Perth, in the room of the Rev. P. Robertson; the Rev. W. Mearns, to the united churches and parishes of Kineff and Caterline, Kincardine, in the room of the Rev. T. Brown; the Rev. R. W. Fraser, to the church and parish of Burntisland, Fife, in the room of the Rev. D. Couper; the Rev. C. Smith Adie, to the church and parish of Edzel, Kincardine, in the room of the Rev. R. Inglis; the Rev. G. Ritchie, M.A., to the church and parish of Jedburgh, Roxburgh, in the room of the Rev. J. Purves; the Rev. G. Blair, to the church and parish of Monzie, Perth, in the room of the Rev. J. R. Omond; the Rev. J. G. Wood, to the church and parish of Renfrew, in the room of the Rev. D. M'Farlane; the Rev. A. R. Bonar, to the church and parish of Fogo, Berwick, in the room of the Rev. J. Baillie; the Rev. D. Martin, to the church and parish of Dunnichen, Forfar, in the room of the Rev. D. Ferguson; the Rev. A. Cunningham, to the church and parish of Crailing, Roxburgh, in the room of the Rev. A. Milroy; the Rev. R. W. Watson, to the church and parish of Logie, Fife, in the room of the Rev. A. Melville; the Rev. W. Carrick, to the church and parish of East Kilbride, Lanark, in the room of the Rev. H. Moncrieff; the Rev. G. Murray, to the church and parish of Girthon, Kirkcudbright, in the room of the Rev. R. Jeffrey; and the Rev. W. Reid, to the church and parish of Borge, Kirkcudbright, in the room of the Rev. S. Smith.

Colonial Bishoprics.—The second report of the archbishops and bishops forming the committee appointed to act in concert with Government for the erection and endowment of additional bishoprics in the colonies, gives the following statement of receipts and expenditure to the end of June, 1843:—Special fund: donations and subscriptions for New Brunswick, Ceylon, Cape of Good Hope, South Australia, China, New Zealand, Tasmania, and Gibraltar, 4,935*l.* 14*s.* 1*d.* General fund: 60,249*l.* 13*s.* 4*d.* The expenditure, including 32,500*l.* invested in Exchequer Bills and other Government Securities, has been 53,590*l.* 18*s.* The report states that two of the bishops consecrated for sees newly founded have now been for some time on their respective spheres of labour. The Bishop of New Zealand (Dr. Selwyn) had completed the first visitation of his diocese, and reports favourably of the progress of religion in these settlements. The Bishop of Gibraltar, having resided some weeks at the metropolis of his see, and for a considerably longer period at Malta, and, having nominated an archdeacon for the general superintendence of ecclesiastical affairs in each of those places, is now engaged in visiting the several cities in which the English congregations have been gathered together in the islands and on the coasts of the Mediterranean. Already he has exercised the functions of his office at Athens, Smyrna, and Constantinople, where, although there are considerable congregations in communion with the Church, no Anglican bishop had ever before been seen. The Bishop of Tasmania (Van Diemen's Land), who sailed for his diocese at the end of February last, undertook to remain for a few days at the Cape of Good Hope, in order to administer the rite of confirmation. The committee have determined on appropriating a large portion of the fund remaining at their disposal, namely, the sum of 20,000*l.*, towards the endowment of a bishopric in New Brunswick. The contributions from New Brunswick, in aid of this object, amounted, at the date of the last despatches, to 2,150*l.* The Bishop of Australia, though lately relieved from the care of New Zealand and Van Diemen's Land, is still charged with the administration of a diocese too large for his effectual superintendence, and he has, in a recent communication, pleaded earnestly for the erection of a distinct bishopric in the thriving settlement of Port Philip. The Bishop of Calcutta has also recommended the subdivision of his own enormous diocese, by the erection of a bishopric for the northern provinces of India. The committee intend, in the first place, to recommend to her Majesty's Government, as soon as the adequate endowment shall have been secured, the erection of a separate bishopric for the province of New Brunswick; afterwards for the other important colonial settlements, in the order suggested by the joint considerations of their intrinsic claims, the offers of assistance, and the probability of success.

The Chinese Expedition.—A parliamentary return just published shows that the sums paid or to be paid on account of the war with China, amount to 2,879,873*l.*, of which sum 804,964*l.* are required to be voted in 1843-44, as balance due to the East India Company. Another return states that 1,281,211*l.* 13*s.* 5*d.* will be required to make good to certain holders of opium surrendered in China in March, 1839, the amount of compensation due to them under Art. 4 of the treaty of peace. The above amount, however, includes a sum of 29,289*l.* 11*s.* 9*d.* as a claim by two Parsee firms, the settlement of which depends on further explanation.

Foreign.

FRANCE.—The great subject of remark in the French papers is Mr. O'Connell's comments on the radical meeting at which M. Ledru-Rollin was deputed to visit Dublin. All of them concur in throwing additional ridicule on the proceedings in Paris (now so decidedly repudiated by the Repeal Association), and recommend the matter to be allowed to die quietly away. The *National* publishes a third list of subscriptions in France in favour of the repeal agitation in Ireland; this list amounts to 412*l.* 50*s.*, making the total amount subscribed 1,137*l.* 50*s.*—The Chamber of Peers sat on Friday, and, despite the efforts of the

Minister of Public Works, postponed to next session the ministerial bill for the construction of a railroad between Tours and Orleans. Immediately after, the bill for enabling the Government to pay the interest due on the part of the Greek loan guaranteed by France came under discussion, and passed by a majority of 96 to 4. On Saturday the Chamber voted the budget of receipts by a majority of 98 to 4. The two Chambers were formally closed on Monday by Royal ordonnance. The attendance in both houses was exceedingly small, and the whole ceremony, which terminated with shouts of *Vive le Roi*, did not last five minutes.—As had for some time been expected, the *Moniteur* publishes a Royal ordonnance appointing Vice-Admiral Baron de Mackaw Minister of the Navy and Colonies, in lieu of Admiral Baron Roussin, who has resigned.—The domestic intelligence in the papers presents but few points of interest. A telegraphic despatch from Brest announced, on Sunday, the arrival of the Prince de Joinville and his young bride from the Brazils. They are expected immediately in Paris. The appeal of the celebrated Vidocq against the sentence of the Tribunal of Correctional Police, which condemned him to five years' imprisonment and five years' *surveillance*, came on before the Cour Royal on Saturday. After the speech of the Advocate-General, the Court, without even hearing Vidocq's counsel, reversed the sentence. Vidocq was immediately set at liberty, and was warmly congratulated by his friends. General Alava, Aide-de-Camp of the Duke of Wellington in the Peninsular war, and afterwards Spanish Ambassador of Queen Christina at Paris, has just died at Bareges, aged sixty-four.—The Palais Royal, so famous some years back, is now every day losing favour with the public, and the numerous passages in the neighbourhood threaten it with complete decay; 18 or 20 arcades are now to let; 22 others are occupied by the vendors of ready-made clothes; and some of the principal cafés and restaurants, the goodwill of which used to be worth 300,000 f., have been closed because they did not clear their expenses.—At the first Chamber of the Civil Tribunal of the Seine on Wednesday week, the cause of "the Marquis of Hertford against Nicholas Suisse," valet de chambre of the late Marquis, having been called on, M. Philip Dupin stated the case for the Marquis, who sought to recover the value of 30,000 f. French *rentes*, which had been placed in the hands of MM. Cailliez and Debague, bankers in Paris, by Nicholas Suisse. M. Dupin, in a long pleading, recapitulated all the facts as given in evidence on the trial of Suisse at the Old Bailey, and dwelt with much severity on the refusal of M. Cailliez to appear as a witness on that occasion, in consequence of which refusal he contended Suisse was acquitted. After an authenticated report of the trial of Nicholas Suisse before Mr. Justice Williams at the Old Bailey, had been read to the Court, the cause was adjourned for eight days to hear the counsel for the defence.—A Toulon paper publishes the following letter from Mascara, July 5:—"Abd-el-Kader has again escaped the pursuit of our soldiers by an almost miraculous flight, thanks to the simplicity of his costume. The Spahis, who thought only of plunder, abandoned the principal personage to strip the Emir's physician, a Frenchman, who was richly dressed, and rode a horse splendidly caparisoned, and yet this person pointed with his finger to the Emir, who was only ten paces off, tightening the girths of his horse. The day before yesterday the Emir in person was attacking tribes under the cannon of Mascara." The *Journal du Havre* states that Messrs. Dean and Edwards, who have been employed to explore the cargo of the *Télémaque*, at Quillebeuf, are proceeding actively, but hitherto without much success. They have brought up thirty-one pieces of timber and some fragments of the hull, and have made attempts to raise some of the barrels, which were found partly imbedded in the sand, but they came to pieces on applying the tackle to them. Their contents were merely whale or palm-oil. A considerable number of casks still remain to be examined, and it is believed that there are in the vessel several large cases bound with iron.

SPAIN.—A telegraphic despatch from Madrid, dated July 23d, announces that the troops of Gens. Narvaez and Seoane encountered each other on the previous day, at Torrejon, and after an engagement of about a quarter of an hour, the soldiers of both armies fraternised. Gen. Seoane and the son of Zurbano were taken prisoners. Zurbano made his escape, and concealed himself in Madrid. The municipality was going out at the moment when the telegraph was despatched, to surrender Madrid unconditionally to the insurgent army. The Militia of Madrid were returning to their homes, and the troops of Brigadier Enna, which pronounced themselves, are in possession of the posts. It was expected that Gen. Narvaez or Gen. Aspiroz would enter Madrid at 5 o'clock with his division. This despatch may be regarded as the close of the first act of the eventful drama, whose result must now be regarded with the greatest anxiety. The triumph of military anarchy has been so sudden and complete, that it has effected at least one important object, in sparing Spain from the renewed calamities of a long civil war. In the singular contest we have had occasion to record during the last three weeks, in which, until now, no battle has been fought, in which an army has been driven out of Catalonia, and a place like Lerida captured without a shot being fired, in which everything has been done by marches and counter-marches, manœuvres and tactics, the observer has been astonished at finding important results accomplished daily by other means than those of force. What has lately been passing around Madrid and on the Saragossa road was truly curious. Several columns of both parties seemed to be closely following each other, and apparently mingled in

an inextricable manner. The marching of these columns, dovetailed, as it were, one with the other, presented for some days one of the rarest and most interesting phenomena in the history of modern warfare. The protracted absence of the Regent from the scene where his political existence was at stake, is still altogether unaccountable; and it is now announced that he is retiring into Portugal. The army under Zurbano and Seoane, which appears to have "fraternised" with the corps under the insurgent generals who are now the masters of Madrid after a single exchange of shots, are said to have doubted of the cause in which they were engaged, when they learnt that the Regent himself was retiring in the gorges of the Sierra Morena, at a moment when the capital, the Queen, his friends, his fame, and the safety of his supporters, all depended on his presence. His cause is now irretrievable, and the more because the change which has been effected in the destinies of the Peninsula is emphatically a military revolution; for it has been accomplished by unbounded corruption in the army, and by the energy of military adventurers. If there were ever any doubt that the movement originated in Paris, it would now be removed, by an announcement in the French papers of Tuesday, the significance of which is increased by the fact that the Duc d'Aumale has long been mentioned as a candidate for the hand of Queen Isabella. "Queen Christina," they state, "held a grand levee in the Hotel de Courcelles on Monday, on the occasion of her birthday. The King, Queen, the Duc d'Aumale, the Duke and Duchess of Nemours, and Madame Adelaide, successively visited the ex-Regent, and M. Guizot and Marshal Soult presented their homage to Her Majesty." "The Duc d'Aumale," observes the *Commerce*, "was most gracious to all the Spaniards present in the salon of the mother of Isabel II., and even spoke to them in their native language."—The daily papers give the following account of the manner in which the above intelligence from Madrid was received in Paris. As soon as the despatch reached the Government, M. Guizot went immediately to the Hotel de Courcelles, that he himself might have the pleasure of announcing the news to Queen Christina. Immediately afterwards an express was sent off with the news to King Louis Philippe, who was at the Chateau de Bizy. In the evening the ex-Regent threw open her saloons, and all the courtiers of her party, both French and Spanish, pressed forward to offer their congratulations. Next morning a council was held at her hotel, at which MM. Toreno, Zea, Castillo, Grimaldi, and several others, assisted. It is said that it was determined by the council that they should despatch a courier to Madrid with instructions for General Narvaez and for M. Martinez de la Rosa, who left Paris a few days ago, for Spain. Queen Christina and her councillors will wait the course of events before they leave Paris. It appears to be their intention to proclaim the Lopez ministry, with all its members, as a Provisional Government, charged to convoke the Cortes, and to cause the majority of Queen Isabella II. to be proclaimed, although her Majesty is only 12 years and 9 months old.

PORTUGAL.—By the Royal Tar steamer we have news from Lisbon to the 17th inst., where all was tranquil. Dissensions still prevail in the Cabinet respecting the measures to be employed for the prevention of any popular outbreak, on which subject M. Costa Cabral and the Duke de Palmella are at issue. The Excise revenues are to be farmed out by public auction for three years, at the end of the present month.

GERMANY.—We learn from Berlin that Prince Augustus of Prussia, uncle of the King, died rather suddenly at Brandenburg, on the 19th inst. The Prussian Government, induced by feelings of interest for the commerce and industry within the boundaries of the Customs Union, intends to send a commissioner to China, for the purpose of obtaining authentic information upon commercial matters, and also to establish a Prussian Consulate at Canton for the whole Chinese empire. M. Grube, of Dusseldorf, who is to be the Consul, was formerly employed in the office of the Minister of State, the President of the Government at Dusseldorf. He is to have a salary of 3,000 dollars per annum, but he must remain three years at his post. After that, on his leaving, he or his family are to have a pension of 1,600 rix-dollars.—Madame Caroline Pichler, one of the most popular novel writers of the age, died at Vienna last week, at the advanced age of 74. Several of her works have successfully been introduced into our literature.—A letter from Presburg, of July 7, states that the Emperor of Austria, in his quality of King of Hungary, has just decided the long-disputed question of the religion of children sprung from mixed marriages. In answer to a petition from the last Diet, praying that parents of different religions might be freed from the obligation of bringing up their children exclusively in the Catholic religion, his Majesty has ordered that children may be brought up as Protestants or Catholics, as may seem fit to the parents; and, in case they cannot agree, the children are to follow the religion of the father. This resolution, the letter states, caused great satisfaction in the city, and in the evening of the intelligence the houses were illuminated.—The Grand Duke Michael of Russia passed through Bamberg on the 21st inst., on his way to the waters of Kissengen. He would thence proceed to England.

ITALY.—Recent letters from Naples announce that the Treaty of Commerce between Great Britain and Naples was signed on the 26th ult., and forwarded to London for ratification.

TURKEY.—Accounts from Constantinople of the 7th inst. state that a squadron of nine sail-of-the-line were on the point of putting to sea under the command of the Capitan Pasha, for the purpose, it was supposed, of

making a demonstration on the coast of Greece and the European provinces of Turkey. Rifaat Pasha, the new Minister for Foreign Affairs, and M. de Titoff, the Minister of Russia, arrived on the 1st, by the Russian steamer Meteor. Namik Pasha, who had just returned from Bagdad, had been appointed President of the Council of War at Adrianople. Redschid Pasha was rapidly recovering from his recent attack of apoplexy. According to advices from Teheran of the 7th June, the troops of the Khan of Bokhara had routed those of the Khan of Khiva, and taken possession of the town. Through the same channel we have reports similar to those received from India with respect to the fate of Colonel Stoddart and Captain Conolly, who, it is confidently asserted, are both alive to this day. The Constantinople news announces the termination of the Servian question, of which we had previous accounts through Germany. They confirm the statement that Prince Alexander Cara Georgewitch has been re-elected unanimously, and that his Ministers, Petroniewitch and Wutschitch, whose banishment was so emphatically demanded by Russia, have been permitted to remain in Servia.

EGYPT.—Letters from Alexandria, of the 6th inst., state that the Pacha is still in that city, and apparently in better health, riding out every day in the environs, while Ibrahim Pacha remains apparently taking no interest whatever in what is going on, allowing Abbas Pacha, who for the last week has been there, to assume the pomp and circumstance of first aide-de-camp, or wakeel, to his Highness. A new light has, however, been thrown upon this matter, perfectly consonant with the policy of these countries. Abbas Pacha has been for some time past intriguing and attaching to himself in Cairo, a large and influential body, the Oulemas, at once men of the law and ministers of religion, and consequently a powerful organ with a fanatic population; before these intrigues reached a point dangerous to the government and intended line of succession it was necessary to put a stop to them. It is said that Mehemet Ali and Ibrahim decided in concert that Abbas, under the immediate *surveillance* and surrounded by the spies of his grandfather, would be far less likely to do mischief than if left to himself in Cairo, and it is for that reason that he is brought to Alexandria, and will be kept there with the highest honorary title the Pacha has to bestow, with far less ability to do mischief than he had before, and with just as much real power as the Pacha may think it prudent to allow him.

UNITED STATES.—We regret to learn by the arrival of the Margaret steamer at Liverpool, on Sunday, under command of Captain Shannon, late of the Columbia, and bearing the mails and passengers of that unfortunate vessel, that she has been totally lost; fortunately every soul was saved, as well as much of the property on board the vessel. The following are the particulars:—The Columbia went ashore on the 2d, about one o'clock, upon the Devil's Limb (a solid rock), a mile and a quarter from land, and one-and-a-half from the lighthouse on Seal Island. From the thickness of the fog, nothing at a distance was discernible, and consequently it was impossible to form any accurate judgment as to their particular situation. For three hours, in this perilous predicament, their ultimate fate was a matter of most anxious solicitude, and their impending danger continued to assume a more hopeless aspect. During all this time every exertion was making to lighten the vessel by throwing the coal, &c. into the sea: and with her engines, and every available means, a continued perseverance was made to get her off, but without success. Alarm-guns were constantly fired, but unfortunately—from the ignorance of their position—at the side of the ship from the shore. About four o'clock, to their no little delight, a boat from the island made its appearance, and very quickly explained to them their position. The ladies were all immediately sent on shore; most of the other passengers remained until the next morning with the crew on board, for the purpose of rendering whatever assistance they could toward saving the ship from destruction. At every flood-tide the engine was put in operation with a view of backing her, but the impracticability of moving her may be perceived from the fact that she was so far up upon the rock as to draw at her bows five feet of water less than usual. On the 4th she broke her back, and when the Margaret left she was swinging by the bows, and certain, from the least violent commotion of the wind and waves, to become utterly destroyed. All the movables on board have been saved. The crew of the Columbia have been left at the wreck, and 'hopes are entertained that they will be able to remove a great part of the engines before she goes to pieces.—The Great Western and Hibernia have since arrived, the latter after a passage made within the almost incredible space of nine days. They bring accounts that the chief portion of Fall River was burned down on the 1st inst. It is computed that the loss of property amounts to 250,000 dollars, at least. Fall River is well known by our coasters, for many vessels freighted with coal from Pictou and Cape Breton have disposed of their cargoes there. An angry feeling between the native and Irish citizens of the Union is arising from the Repeal question. Mr. O'Connell's denunciations of the slave-holders, and threatened interference with them, when the opportunity arrives, have so excited the ire of the anti-abolitionists of Baltimore and Philadelphia, that they have resolved to suppress, if they can, the agitation of the complaints of Ireland in the States. At Charleston the Repeal Association have held a special meeting, at which several "indignation speeches" were pronounced against Mr. O'Connell, and then the Association dissolved finally, distributing its funds to two Catholic charitable societies. The lovers of literature and admirers of one of its greatest living ornaments,

will be gratified to learn that Mr. Washington Irving has succeeded to a large fortune, which has been bequeathed to him by one of the Society of Friends, to whom the distinguished American author was personally unknown. Mr. Irving, in consequence, intends immediately to relinquish his appointment as United States Minister at Madrid, where, it is said, his health has suffered materially since his recent residence in that capital.

AUSTRALASIA.—Sydney papers to April 2d, and Hobart-town to April 8th, have arrived this week. In the *Morning Herald*, (a Sydney journal,) the affairs of the Bank of Australia are referred to in a manner little calculated to revive confidence in the administration of those establishments in the colonies. Alluding to something which had transpired the day previous, it is observed on March the 31st:—"The 'untoward' disclosures of the mismanagement of the Bank of Australia have naturally caused the greatest excitement in the city. In fact, with the exception of the recent discoveries of the frauds committed on the Bank of Manchester, we know of nothing equal to them, and the latter only exceed the former from the circumstance of the cashier, the day before the discovery became inevitable, having quietly swept out some 15,000*l.*, being the balance in the iron chest, and absconded to America. The affairs are even blacker than we represented them yesterday. The firm that was stated to have obtained 108,000*l.* is liable for upwards of 50,000*l.* in addition, or 160,000*l.* in the whole. The director who was said to have had 60,000*l.* has had 80,000*l.*, and another director has had 40,000*l.*; besides which there are various trifling debts of 15,000*l.*, 20,000*l.*, &c. There is but one opinion of the conduct of the directors." Things were still very depressed in Van Diemen's Land, and the colonists were speculating on the causes and remedies for such a state of affairs. There is no news from this part of Australasia.

CAPE OF GOOD HOPE.—Advices from the Cape of the 6th May, contain the copy of a minute laid before the Legislative Council of the colony by the Governor, respecting Port Natal, and announcing that her Majesty's Government had decided upon taking the emigrant farmers under the protection of the British Crown, of recognising their district, of adopting it as a British colony, and of establishing such institutions, under British authority, as her Majesty may deem necessary. The Governor adds that, having adverted to the objections he had adduced against the incorporation of Port Natal with the Cape colony, her Majesty's Government had felt disposed to admit their validity, and to consider the best means by which due provision might be made for establishing a colonial government at Port Natal, distinct from, if not independent of the government of the Cape of Good Hope. Meanwhile the Commissioner is to recognise the amnesty granted by Lieut.-Colonel Cloete. Grants or sales of land in the district are, however, prohibited till the will of her Majesty is known; and it also appears to be decided that the Governor of the colony, under whatever denomination, is to be appointed by her Majesty, and that no laws to be passed in the colony shall be valid without his consent. H.M.S. *Cleopatra* arrived at Port Elizabeth on the 27th April, having captured off Quillemaine, on the 12th, the Brazilian brigantine *Progresso*, with 440 slaves on board. The crew, with 50 of the negroes, were removed to the *Cleopatra*, and the remainder sent forward with a prize-master to Simon's-bay.

Parliament.

HOUSE OF LORDS.

Monday.—Lord BROUGHAM stated that, having received an ample apology from the printer of the *Kendal Gazette* for the calumnious remarks made in that paper, of which he had lately complained, it was not his intention to persist in his motion to have the said printer called to their Lordships' bar.—On the motion of the Earl of Devon, the Scientific Societies Bill was read a third time and passed.

Tuesday.—Lord BROUGHAM took occasion to caution all artists who feel disposed to send in plans, drawings, and models, for the ornamenting of the new Houses of Parliament, pursuant to the advertisement issued by the Fine Arts Commission, that they must do so at their own risk. He thought it an act of charity to such artists to give them fair notice that it was not certain they would have employment, for the wisdom of Parliament might refuse to have their wishes carried out in the manner they would propose.—The Earl of ABERDEEN laid on the table several returns relating to slavery and the slave trade.—The Marquess of LANSDOWNE moved for the correspondence which took place between the Government here and that of France relative to the apprehension of offenders.—The Earl of ABERDEEN begged to decline producing the correspondence asked for, for the reason that no such correspondence existed.—The motion was withdrawn.

On the motion of Lord MONTAGUE, a return of the balance-sheet of the income and expenditure of the country up to the 5th July was ordered.—The Earl of GLENCAIRN brought forward the question of the Irish Deep Sea Fisheries, for the purpose of inducing the Government to do something to carry the Act of last year effectually into operation. He suggested the granting of 15,000*l.* or 18,000*l.* in the shape of loans or bounties, and the reconstruction of the old fishery board, as the best means of encouraging the fisheries.—Lord CARRERY, the Marquess of CLANRICARDE, and Lord MONTAGUE, also urged on the Government the necessity of supporting the fishermen in their trade, and extending their operations.—The Duke of WELLINGTON said he would take care that the attention of the Government in the proper quarter should be turned to the subject.

Thursday.—The Libel and Defamation Bill was read a third time. On the motion that it do pass, Lord BROUGHAM proposed an amendment in the sixth clause—that which inflicts the punishment of imprisonment, with hard labour, for a term not exceeding three years on persons guilty of extorting money by threats of the publication of libels—which he thought necessary to render it practically effectual. He moved the insertion of these words:—"If any person shall threaten to publish any matter or thing, with intent to extort money, or any security for money, or any valuable thing," &c.—The Lord CHANCELLOR considered some alteration absolutely necessary to render the clause operative; but he feared the words proposed went too far. The debate on the motion was adjourned to Monday to allow of due consideration, and to obtain the opinion of Lord Denman on the effect of the words proposed.

Friday.—The Royal Assent was given by commission to the following bills:—The Charities Bill, the Punishment of Offenders Bill,

the Privy Council Bill, the Marriages (Ireland) Bill, the Salmon Fisheries Bill, the Parochial Rates Bill, the Scottish Schoolmasters' Widows' Fund Bill, the Norfolk Island Bill, the Tay Fences Bill, the Dundee Harbour Bill, the Bolton Waterworks Bill, the Liverpool Improvement Bill, the Paisley Corporation Bill, the Cockerhough Free Grammar School Bill, the Northampton Improvement Bill, the Londonderry Bridge Bill, the Great North of England Junction Railway Bill, the Walton-on-the-Hill Rectory Bill, the Marquis of Abercorn's Estate Bill, the Earl of Waldegrave's Estate Bill, Jackson's Divorce Bill, and several Road Bills.—On the motion of Lord WHARNCIFFE, the Bill for the Regulation of Cathedral Churches in Wales was read a second time; as were also the Loan Societies Bill, the Controverted Elections Bill, the Slave-Trade Suppression Continuance Bill, the Bills of Exchange Bill, and others.

HOUSE OF COMMONS.

Monday.—The early portion of the sitting was occupied with the remaining clauses of the Arms Bill. The main discussion was on the question of the period of the duration of the bill. The original proposition of the Government was for five years; but, after discussion and two divisions, it was decided that it should last for two years, and to the end of the then next session of Parliament, or practically for three years. The whole of the clauses, including those which had been postponed for further consideration, having been gone through, the long-protracted committee on this bill was terminated, the report to be brought up on Thursday.

The report of the committee on the Excise duties, recommending the reduction of the additional duty on Irish spirits was then brought up, on which Sir R. FERGUSON moved the re-committal of the resolution, for the purpose of proposing a still further reduction on the duty on Irish spirits of *id.* a gallon.—Mr. BARRING and the CHANCELLOR of the EXCHEQUER having spoken against the amendment, Sir R. FERGUSON withdrew it, and the report was received.—The Admiralty Lands Bill which stood for committee was objected to by Mr. BARNARD and Mr. HURR, defended by Mr. SINNEY HERBERT, the Secretary to the Admiralty, and after some discussion, during which the main objection urged against the bill was, that it conferred an arbitrary and unlimited power on the Admiralty to appropriate land "for naval purposes," Sir J. GRAHAM explained that sufficient check and control would still remain to the House, inasmuch as all sums to be expended on the purchase of lands would have to be included in the estimates, which would be liable to question and scrutiny.—A division took place, when the bill was passed into committee by a majority of 59 to 28. But in committee it encountered further opposition, though ultimately it was carried through this stage.

The Marriages (Ireland) Bill was read a second time, and the standing orders having been suspended, was committed and reported.—The Public Works (Ireland) Bill, and the Court of Exchequer (Ireland) Bill were respectively read a third time and passed.—Lord ASHLEY obtained leave to bring in a bill to establish, regulate, and protect societies for the improvement of the industrious classes, by extending the allotment or field-garden system, and the more general establishment of loan funds in England and Wales.

Tuesday.—Mr. CHRISTOPHER complained of the way in which the Customs Acts Bill had been read, out of course, on Monday night, and called attention to a clause introduced into that bill which bore materially on the interests of British agriculture, as allowing the agricultural produce of the State of Maine to be admitted into this country at the colonial duty. He asked the Government if that were their intention in passing this clause.—Mr. GLADSTONE could only give a limited answer. The intention of the clause was neither more nor less than to give legal effect in this country to the third article of the treaty of Washington. With respect to the effect of the clause in admitting foreign produce, he could not then well explain the matter, but he would, in a future stage of the bill, take an opportunity of giving an explanation.—Mr. WILLIAMS also complained of the introduction of a clause into this bill which made a very great alteration in the watch trade.

In reply to a question from Sir H. W. BARRON, Sir R. PEEL said that he would not make any immediate appointment to the Judgeship of the Admiralty Court in Ireland, and that it should be made subject to any arrangement the Government might hereafter think fit to make respecting the union of the offices of Judges of the Prerogative and Admiralty Courts.—Sir G. CLERK gave notice that on Friday he would lay before the House the remaining estimates; among them those of the expenses of the war in China, and of the compensation money for the opium.

Mr. HUME moved for leave to bring in a bill for the establishment of schools to promote a sound education for the rising generation of the United Kingdom at the public expense, without wounding the feelings or injuring the rights of any sect or class of the community, but confining the business of the schoolmaster to the secular and moral training of the children, and leaving all religious instruction to religious teachers distinct from the school; to the end that general instruction and a spirit of Christian brotherhood and good-will may be disseminated amongst all classes and denominations.—Mr. EWART followed in support of the motion, but the House was counted out at a quarter past 8.

Wednesday.—The Controverted Elections Bill was read a third time and passed.—Lord ASHLEY withdrew the Industrious Classes Bill for the present session, giving notice to introduce it again early in the next.—Mr. GIBSON complained of an interpretation put upon the excise laws, by which individuals making cash advances on the consignment of excisable goods, were held liable to have the goods so consigned seized for the duty owing by the manufacturer. Mr. GIBSON instanced the case of Messrs. Truman, who, having advanced a large sum on the security of malt, were held by the Court of Exchequer liable to have this malt seized for duty left unpaid by the maltster, not on this, but on other malt.—The CHANCELLOR of the EXCHEQUER did not think it would be just or advisable, with respect to the collection of the revenue, to permit dealers to put articles into the hands of a factor, and thereby relieve the articles from the payment of duty. With respect to the case of the Messrs. Truman they were only held liable to a sum of money after a trial and adjudication by a court of law.—In answer to a question from Capt. BERKELEY, Mr. SINNEY HERBERT said an inquiry had been made into the cause of the late explosion on board the *Camperdown*, and that orders had been given to prevent the continuance of the practice of keeping large quantities of powder on the deck of vessels during the firing of salutes.—Sir J. GRAHAM, in reply to a question from Mr. BANNERMAN, declined to say whether it was the intention of the Government to remove from the Professorships of the Universities of Scotland those gentlemen who had adhered to the Free Presbyterian Church. The memorial received from certain members of the University of St. Andrews was under the consideration of the Law Officers of the Crown.

The House went into committee on the Coroners Bill.—On the clause allowing travelling expenses to the coroners at the rate of 1*s.* 6*d.* a mile, Mr. WILLIAMS moved the substitution of 1*s.* a mile. On a division there were—For the original mileage, 59; for the amendment, 48. Majority, 11. The other clauses were agreed to.

The Municipal Corporations (No. 2) Bill was read a third time and passed.—Sir J. GRAHAM obtained leave to bring in a bill for the regulation of theatres. He said it was a bill in lieu of one which had been proposed by Mr. T. Duncombe.—On the motion of Mr. F. MAULE, a return of the names of the different corps of Yeomanry Cavalry, which have been, or are likely to be, re-established on permanent pay, under the estimate of the present year, was ordered.

Thursday.—The Marriages (Ireland) Bill was read a third time and passed.—Mr. W. S. O'BRIEN gave notice that, on the motion for committing the Episcopal Functions Bill, he would move its committal that day three months.—Mr. S. CRAWFORD brought in a bill to amend the law of landlord and tenant in Ireland, which was read a first time, and ordered for second reading on the 22d August.—The further consideration of the report on the Irish Arms Bill raised another debate, there being clauses proposed to be added,

both by the Government and members of the Opposition. After Lord CLEMENTS had spoken shortly on the propriety of proceeding with some other business, Mr. S. CRAWFORD proposed the following amendment:—"That the unrestricted power of having, carrying, and using arms, for all legal purposes, is a right enjoyed by Englishmen and Scotchmen, and is one of the essential safeguards of freedom. That to limit or withhold this privilege, as regards Irishmen, creates an unjust, impolitic, and insulting distinction, and is a violation of that equality of rights which can be the only safe and just basis of Imperial legislation. That, therefore, it is the duty of this House to reject any measure which would impose or continue such restriction."—This was seconded by Mr. ROSS; and on a division was rejected by 99 to 44. Lord J. RUSSELL proposed certain clauses, one of which had for its object to confine the operation of the more stringent provisions of the bill, especially the search for arms, to such disturbed districts as had previously been proclaimed by the Lord Lieutenant, following in this respect the precedent of the English Arms Bill of 1819. He had heard with much pleasure the creditable sentiments uttered by Irish Conservative Members, when they expressed their willingness to share with their humbler fellow countrymen in the inconveniences to which they would be subjected by the Bill. But it should be borne in mind that the power to search for arms given to magistrates would practically be only enforced against the lower classes.

Lord ELIOT censured the inconsistency of Lord J. Russell, who had expressed his willingness to renew a bill which contained these powers of search, unaccompanied by the modifications and checks of the present bill. No search for arms could take place by night, without the presence of a magistrate; nor by day, without the presence either of a magistrate or of a sub-inspector of police. Districts were only proclaimed when in actual insurrection; but the present bill was a preventive measure, to repress outrages, and those agrarian disturbances which rendered life and property insecure.—After a short discussion, in which Mr. M. J. O'CONNELL, Mr. ROSS, Mr. EWART, the O'CONNOR DON, Lord CLEMENTS, and Mr. LEBOY took part, the House divided, when Lord John Russell's clause was rejected, by 109 to 65. Several additional and postponed clauses having been added, Mr. M. J. O'CONNELL moved the omission of clause 8, the "branding clause." Lord ELIOT maintained its necessity, and on a division it was retained by 74 to 37.—The bill having received all its amendments and alterations, was ordered to be engrossed and read a third time on Friday.

The next order of the day was the committee on the Irish Poor-law Amendment Bill, and eight clauses out of twenty-six, of which the Bill is composed, were agreed to, the seventh being postponed.—The Prison Discipline Bill, the Ecclesiastical Jurisdiction Bill, the West India Islands Relief Bill, the Excise Bill, and the Loan Societies Bill were read a second time.—The House went into committee on the Slave-trade Bounties, and, on the motion of the CHANCELLOR of the EXCHEQUER, resolutions were agreed to and ordered to be reported.—The Stamp Acts Bill, the Law of Evidence Bill, and the Episcopal Functions Bill passed through committee.

Friday.—Mr. BRIGGS made the Quakers' affirmation, and took his seat as Member for Durham.—On the motion of Mr. V. SMITH the Slave-trade Suppression Bill was read a first time.—The House then resolved itself into a committee of supply, and Lord JOHN RUSSELL proceeded to state his views on the present state of public business, which led to a general discussion on the Ministerial measures of the present Session.

CITY.

Money Market, Friday.—Consols for account closed at 93½ to 94; Three per Cent. Reduced, 94½ to 95; Three-and-half per Cents., 101½ to 102; New Three-and-half per Cents. 101½ to 102; Bank Stock, 180½; Exchequer Bills 55*s.* to 57*s.*, and 53*s.* to 55*s.* prem.

Metropolis and its Vicinity.

Royal Visit to the Thames Tunnel.—On Wednesday the Queen, Prince Albert, the Prince of Saxe Gotha, the Princess Clementine, and other distinguished personages, now on a visit to her Majesty, honoured the Thames Tunnel with a visit. From the shortness of the notice but few preparations could be made. Indeed, most of the directors were out of town. Even Sir Isambert Brunel, the engineer under whose auspices the works were commenced and completed, was too far from town for a communication to reach him in time to be present. At about half-past 3, there was a numerous attendance of visitors, the fact having transpired that her Majesty was about to visit the works. The flags were hoisted at the Tunnel works, and from various other places in the vicinity, and a scene of animation presented itself in all quarters. Precisely at the hour stated, the royal barge arrived off the Tunnel pier, and her Majesty was received by Mr. B. Hawes, jun., M.P., Sir A. Crichton, and three of the directors. The Queen was welcomed by the people who had collected with great acclamation, and, preceded by the secretary and the assistant-engineer, her Majesty descended the Rotherhithe shaft, Lord Byron being in immediate attendance on her Majesty. Having proceeded through such a work as never a Queen before had traversed, the royal party returned, and as they re-ascended, "God save the Queen" was struck up, and loudly joined in by the assembled multitude. On arriving at the entrance-room, her Majesty was pleased to express her gratification at being enabled to witness the completion of the Tunnel, and her regret that Sir I. Brunel was not present. The arrangements, though hurried, were well carried out, and her Majesty entered the royal barge amid the cheers of thousands, the bells of the churches in the vicinity ringing at the same time a merry peal. Her Majesty, when Princess Victoria, we believe, once viewed the works, which were then not half completed.

The Custom-house Frauds.—The report of the Commissioners of Revenue inquiry on Custom-house frauds has just been published; but the evidence on which it is founded has not yet been made public. The report shows that a well-organised system of fraud has been going on for several years past; and the same system of public plunder might, in all probability, have now been flourishing in full impunity and success, if remorse had not touched the conscience of Mr. Burnby, one of the delinquents, who, in the autumn of 1841, inculpated no less than 21 landing-waiters, who had been selected for employment on the silk and baggage import duty, on account of their supposed zeal in the service of the Revenue. Mr. Burnby's disclosures were not at first credited by the Custom-house authorities, who desired, as a proper measure of precaution, to wait for corroboration; and this was obtained through the instrumentality of Mr. Homersham, another criminal, now deceased, and a landing-waiter of the first class, at a salary of 400*l.* per

annum, who speedily made a disclosure of the fraudulent transactions in which he and others were implicated, and which are classed in the Report under the eight following heads:—"1. The granting of false certificates by the export officers, whose duty it is to ascertain what goods are shipped. 2. By granting a false certificate of the quality, or of the existence of goods for exportation, to obtain an amount of drawback of duty far exceeding what is legally due, or a drawback for an imaginary exportation of articles. 3. The *dummy* system, or the substitution of a package of low duty goods for a package of high duty goods. Passing cigars, for instance, under the denomination of marble. 4. By the negligent or wilful undervaluation of goods where they are subjected to *ad valorem* duties, and the dishonest or careless and faulty enumeration of the goods when their amount is to be stated. 5. By the improper computation of the tares of packages. 6. An under valuation and under account of goods, so that an under duty is paid, by means of making a proper entry in the rough book on examining the goods, and obliterating that entry so soon as they were safe in the warehouse of the importer, substituting in place of the proper entry a false and insufficient entry of the goods, denoting a low duty, which was paid instead of the proper duty to the Crown. 7. The fraudulent entries of goods by the substitution of fresh leaves for the original leaves in the landing-waiter's 'Blue Books,' with imitations of the handwriting of the registrar's clerks, with false entries and with false seals. 8. The obliteration of the entry in the 'Blue Book,' by a chemical process, and the substitution of a false for the real account in it." The last six heads of fraud above enumerated are attributed by the Commissioners to the allowance of "sight entries," and the delivery of goods to importers on credit, and to the maintenance of high duties, the evasion of which frequently places within the reach of the revenue officer, by one fraudulent transaction, as much money in one day as his salary amounts to in one year. The Commissioners state "That it is of more importance, even with a view to the protection of our own manufactures, that duties should be low, but be fairly and fully levied, than that there should be nominally high rates of duty acting as an encouragement to the fraudulent, and a discouragement to the honourable merchant, but which are unequally exacted, and most irregularly and partially enforced." They refer particularly to the evidence given by Mr. Porter, of the Board of Trade, before the Committee on the Import Duties, respecting the evasion of the silk duties, and append to their Report the completion of his statement from that time to the present, taken from a comparison of the accounts of the French Custom-house of silks exported, and from those of our Custom-house entries of imports, by which the fact is established, that less than one-half of the silk goods exported from France to England pay duty on their importation in this country.

Sale of the late Duke of Sussex's Property.—The following is the amount realised by the property of his late Royal Highness at the recent sale:—Plate and plated articles, 20,752*l.* 15*s.* 5*d.*; decorative furniture, 3,981*l.* 1*s.* 6*d.*; trinkets, rings, and seals, 2,473*l.* 2*s.*; snuff-boxes and bonbonnières, 2,238*l.* 12*s.* 6*d.*; clocks and watches, 1,924*l.* 5*s.*; swords, pistols, and sticks, 1,092*l.* 1*s.* 6*d.*; pipes, tobacco, and cigars, 3,617*l.* 9*s.* 6*d.*; bijouterie, 802*l.* 1*s.* 6*d.*; miniatures and pictures, 759*l.* 1*s.*; so that the total exceeds 38,000*l.* In reference to the statement that the King of Naples has made an offer for the late Duke's books and manuscripts now in process of valuation, it appears that the report is entirely destitute of foundation, no such offer having been either received or anticipated. It is also stated that there is little reason to suppose that the books will be purchased by Government for the British Museum, as that library already contains duplicates and triplicates of some of the most valuable works in the late Duke's collection.

The late Duel.—At the Marylebone Police-court on Monday, Mr. Humphreys, the solicitor of Mr. Gulliver, informed the magistrate, that since the last examination he had been before Mr. Justice Coltman, at the Judge's chambers, Chancery-lane, accompanied by Mr. Fell, the chief clerk of the Court, Mr. Mills, the coroner's clerk, and the police-inspector; and that the Judge had taken bail for Mr. Gulliver's appearance to answer the charge at the next sessions of the Central Criminal Court, himself in 1,000*l.* and four sureties in 500*l.* each. The witnesses were then bound over in 40*l.* for their appearance at the trial. On Tuesday, the coroner's jury reassembled for the fifth time, and signed the inquisition. In consequence of the Judge's order admitting Mr. Gulliver to bail, the coroner did not issue his warrant for his committal to Newgate; but after a long conversation with Mr. Humphreys, he expressed his opinion that the other accused parties would surrender at the same time with Mr. Gulliver to take their trial on the verdict of the jury. The police-inspector was then bound over in 100*l.* to prefer a bill of indictment on the part of the coroner against all the parties implicated by the verdict.

Peace Convention.—A deputation of this Society had the honour of an audience of the King of the French, at the Palace of Neuilly, on Friday, for the purpose of presenting to his Majesty the "Memorial to the Governments of the Civilized World," adopted by the General Peace Convention recently held in this metropolis, on the importance of inserting in treaties between nations a clause binding the parties to refer their disputes to the arbitration of one or more friendly Powers mutually chosen, and thus prevent the necessity of having recourse to arms. His Majesty gave the deputation a very gracious reception, assured them of his cordial interest in the object of their mission, and expressed himself in terms highly gratifying to the deputation.

New Catholic Cemetery.—On Monday a new Roman Catholic Cemetery, situated in the centre of Commercial-road East, was consecrated by the Right Rev. Dr. Griffiths, after the forms of the Roman Catholic ritual. The ceremony derived its novelty and interest from the circumstance of its being the first instance in this country of its revival from desuetude, after a period of 350 years.

The Nelson Monument.—The construction of the Nelson Monument, in Trafalgar-square, the progress of which was interrupted in consequence of the Corinthian capital not being completed, has, after a suspension of some months, been again proceeded with. On Monday the workmen began fixing the leaves and volutes of the capital, which were cast at Woolwich dockyard, and which have been upon the ground in Trafalgar-square some days. Some of the leaves and volutes, which have taken between two and three years for their execution, weigh two or three tons. The statue is nearly finished and will shortly be raised; and it is expected that the monument will be completed by the end of the year.

Victoria Park.—The line of a new road from London Fields, and extending from thence to Dalston, Kingsland, Stoke Newington, &c., called King Edward's Road, has been laid out from a place opposite the Triangle, at Hackney, continuous with one of the chief carriage entrances of the new park. The sewerage of the road, which is about 50 feet wide, has been completed, and several eligible building sites, on and near it, were sold at the Auction Mart last week. It is called King Edward's Road, from the circumstance that a great deal of the property about there belongs to Christ's Hospital, of which that monarch was the founder. Nearly opposite there stood, a few years since, a portion of an ancient building, which rumour assigned as part of a former palace of John of Gaunt, Duke of Lancaster. Great anxiety is felt in the surrounding vicinities for the commencement of operations in the park, which is expected to take place next month.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, July 15:—West districts, 131; North districts, 136; Central districts, 158; East districts, 160; South districts, 172. Total, 757—(423 males, 334 females.) Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five summers, 846.

Provincial News.

Carmarthen.—Mr. Hall, chief magistrate of Bow-street police-office, left town on Monday by direction of Government, for the purpose of instituting a rigid and searching inquiry into all the circumstances connected with the "Rebecca riots" and disturbances in this part of the kingdom. It is understood that Mr. Hall is accompanied by one or more legal gentlemen to assist in the inquiry. A body of the Metropolitan Police has also been sent down to assist the local authorities. Although the Dragoons are in the saddle every night, scouring the country here and there, they happen to be always in the wrong place, and the work of outrage continues not only undiminished, but with increased and increasing audacity. In the coal districts near Pontyberem, on Friday night, a scene was perpetrated that has seldom been equalled in any civilized country. The troop of the 4th Light Dragoons stationed at Carmarthen, were led out by Colonel Trevor, Vice-Lieutenant of the county, who, in consequence of information of an intended meeting, deemed it advisable to be present to check any tendency to outrage. Accordingly, with Colonel Love, commandant of the district and Major Parlbay, the Colonel and the troops left Carmarthen about half-past five in the evening, proceeded through Porthyrhyd and Llanddarog, nearly to Llanon, and returned to Carmarthen, through Pontyberem and Llangendeirne. During the whole line of march, not the slightest indication was manifested of a disposition to break the peace, although it was evident that the whole country was in an extremely well organised condition for mischief. Before the Dragoons had got two miles from Carmarthen, a shot was fired from a high hill by the road side, known as Cystanog Wood Hill, which was immediately answered from other hills, and which plainly proved that a system of signals was successfully established throughout the whole country. The Dragoons, after their 30 miles ride, came back to Carmarthen, literally as wise as they went. The following morning, however, the news reached Carmarthen, that within an hour after they had passed through Bethanie gate, situated near the Tumble, on the Llanon road, the Rebeccaites were assembled by the firing of rockets to the number of about 1000, and they instantly proceeded to break the gate into pieces, which they accomplished in a very short time. During the progress of their work they testified the fulness of their triumph by beating drums, firing guns, blowing horns, &c. They were not disguised as heretofore in women's clothes, but being principally colliers, and their faces being already blackened, they needed no further disguise than their occupation had already endowed them with. Bonfires were lighted on all the adjacent hills, and after destroying two other toll-bars on a by-road, they disappeared in the same mysterious manner as they had appeared. On Sunday morning a man named Jones, of Cefn-bythyn, went to Swansea and gave information to the Mayor, Dr. Bird, and the other magistrates, that he was himself at the destruction of Bolgoed bar, and would inform against 40 others. Their names having been taken, in the course of the night Captain Napier, with the Superintendent of the Glamorganshire police, took a fly, and having posted over to the parish of Llanedy, in Carmarthenshire, succeeded in apprehending two of the rioters. On Monday morning a company of foot-soldiers

left Swansea, accompanied by a division of the rural police, in four-horse coaches and other vehicles, and proceeded to Llangafelach, for the purpose of apprehending some more of the parties, against whom information had been laid. They had no sooner arrived on the spot than a large mob assembled, and evinced every disposition to resist any attempt at arresting the men suspected. A farmer's wife, Mrs. Morgan, threw a saucepan of boiling water over Capt. Napier, which scalded his shoulder, and then attacked him with the saucepan, with which she beat him about the head; and her son, John Morgan, a powerful young man, having seized a sickle, also attacked Captain Napier with it, and wounded him on the head; a desperate struggle ensued, and Captain Napier drew one of his pistols, which, however, fortunately was not cocked, the hammer being down, for Morgan immediately grasped his wrist, and turning the muzzle of the pistol to Capt. Napier's breast, pulled the trigger, but without effect. Finding his life in danger, Capt. Napier immediately drew his other pistol, and fired, and shot the young man, the ball entering the abdomen; after, however, having recoiled and felt the wound, he immediately renewed the struggle with increased desperation, but the noise of the pistol having alarmed the policemen outside, they rushed into the house, where they found Capt. Napier covered with blood, and succeeded in rescuing him and securing the prisoner, who was brought into Swansea and conveyed to the infirmary in the gaol, where he was examined by Dr. Bird, who found that the ball had lodged in the back, from which Dr. Bird succeeded in extracting it. Upon seeing their companion fall the mob dispersed, but not before ten prisoners had been secured, among whom are the postmaster of Pontydowlais, and several farmers. The wounded man was conveyed to the Swansea Infirmary, where he is doing well. The scene of these depredations, it will be observed, has now been quite changed; the disturbances having originated in the rural districts on the borders of Pembrokeshire and Carmarthenshire, but now having entirely removed from that quarter, and the state of affairs being clearly more and more desperate in the southern parts of Carmarthenshire, in the mining and manufacturing districts. On Tuesday night, at 12 o'clock, the Rebeccaites assembled in great numbers, and demolished the Crossilwyd gate and toll-house, within a mile of Carmarthen, on the high road to Swansea, and did it in the most daring manner. The magistrates have since met, and resolved on the establishment of a rural police.

Croydon.—Pursuant to public advertisement, a meeting was held on Saturday, at Croydon, for the purpose of giving Mr. Cobden an opportunity of addressing the farmers and labourers of that neighbourhood upon the subject of the Corn Laws. The meeting assembled at the Town-hall, and afterwards adjourned to the open air, notwithstanding the inclemency of the weather. Mr. Alcock presided. After Mr. Cobden had spoken at some length in favour of a total repeal, Mr. Fife came forward, and expressed his opinion that the proposed measure would be ruinous to the country. He was proceeding to develop his views in opposition to free trade, but the meeting would not hear him. Mr. Grace, of Reigate, a farmer, then moved that it was expedient to have a total repeal of the Corn Laws. Colonel Thompson having spoken upon the resolution, three persons, whose names appeared to be unknown, attempted to put forth the doctrines of the charter, but the meeting refused to listen to them. An amendment, however, in favour of the charter was proposed and seconded. The amendment was put, and six hands only were held up in favour of it; the original resolution was then put and carried.

Hull.—We regret to have occasion this week to record another addition to those deplorable losses of life and property, by the wreck of steam-vessels, which have of late years invested with such melancholy interest the Farne group of islands on the east coast of Northumberland. The present wreck is one of the most painful events that has occurred on that part of the coast since the destruction of the Forfarshire steamer, in which Grace Darling acquired such celebrity. It is, in fact, a similar catastrophe, and took place within a very short distance of the spot where that vessel became a sacrifice to the storm. On Thursday, the 20th, the steam-boat Pegasus struck upon a rock near Holy Island, and in a short time became a total loss. Nearly the whole of the unfortunate persons on board met with a watery grave. The Pegasus, which has plied between Leith and Hull for several years, left Leith harbour on Wednesday evening a little before six o'clock, having on board, it is supposed, nearly 70 individuals, reckoning both passengers and crew. She was commanded by Captain Miller, formerly well-known on this coast as the master of one of the Leith smacks. The evening was calm, the surface of the water being scarcely even agitated, and the vessel bore on its usual course for some hours, till about 12 o'clock, when it reached the neighbourhood of the Fern Islands. The tide being almost at ebb, and the water consequently shallow, the vessel, when passing the inner Fern Island, struck upon a sunken reef near what is called the Goldstone Rock with great force. When the vessel struck, the captain was standing on the bridge, in the centre of the vessel, and seeing the danger, he immediately ordered the boats to be lowered, lest the vessel should go down whenever she was moved from the rock. All the passengers by this time were on deck, several who had been in bed having, of course, been instantaneously roused; and the extreme of distress and agitation was manifested. The Rev. Mr. McKenzie, from Glasgow, engaged in prayer upon the deck; and in a few minutes afterwards the mass of them were launched into eternity. The captain, having thought that if the vessel were brought off the rock, he could

run her on shore, which was about a mile and a half distant, ordered the steam to be let on, for the purpose of backing her off. This accordingly was done, and the vessel proceeded heavily in the direction of the shore, but had not gone above two hundred and fifty yards, when the water, rushing in at the fissure which the rock had made in the bow, instantly extinguished the fires, and, of course, stopped the working of the engine. A few seconds served to complete the catastrophe. The passengers, seeing that the vessel was rapidly going down, and would very soon be submerged, made a rush towards the boats, which had been previously lowered, the effect of which movement was, that both being overloaded, were swamped; and those who had thus attempted to escape were involved in the same destruction, and almost simultaneously, with those on board the steamer. The scene which ensued does not admit of description. The shrieks of the drowning women are described as terrific. Several of them were high upon the masts; but as the vessel gradually sank, they were either washed into the water, or perished on the rigging. Six lives, however, were saved,—those of two passengers and four of the crew, who were picked up by the Martello steamer, a vessel belonging to the same company, which was on its way from Hull, and by the same course. Between 5 and 6 o'clock in the morning, when this vessel passed the Fern Islands, the wreck of the Pegasus was discovered, the topmast being about five feet above water. Immediately before a boat came drifting past, containing one of the passengers still living, who was picked up, but being quite unable to utter a word, they were not by him made aware of the catastrophe. A dead body, however, next floated past, and this told something of the sad story, which they soon understood too well, when, looking round, they discovered at some distance the topmast of the Pegasus, with two individuals clinging to it. They immediately proceeded toward them, and having picked them up, tacked about for some time, and succeeded in picking up other three individuals, who had been clinging to various supports, thus saving altogether six persons. The passengers saved were—a person named Baillie, who belongs to Hull, whither he was returning along with a gentleman in a weak state of mind, who was lost; and a Mr. Hillyard, also belonging to Hull. Baillie was saved by keeping his place in one of the boats, which, though all but filled with water, was quite sufficient to sustain one individual; and Hillyard was one of those on the top of the rigging. Those of the crew saved were, the mate, the engineer, the carpenter, and a fireman. The Martello remained in the vicinity of the wreck for about three hours, and picked up six of the bodies, two of which, it is said, (those of the second engineer and of a young lad named David Scott, from Paisley,) gave signs of life after being brought on board, but could not be effectually restored. Three of the other bodies were those of females; the first, that of a middle-aged married lady, since claimed as a Mrs. Alexander, from Paisley; the second an elderly woman, who had evidently been aroused from her bed, and who still lies unclaimed in South Leith Church, where all the bodies were carried upon the arrival of the Martello at Leith. The third has been claimed as Miss Barton, a young lady who had just left Miss Banks's boarding-school in Edinburgh to return to her friends in Lincolnshire. When found she had firmly clasped in her arms a little boy, apparently about four years old, the brother of a young lady on board, also a pupil of the same school, whom it is supposed she had seized with a hope to save. Another body claimed is that of Mr. Jas. Martin, son of Mr. Martin, cabinet-maker, Great Russell-street, Covent Garden, who is also lost. The names of all the sufferers, or even of most of them, are as yet unknown; and as the steerage passengers were not booked, many will, in all probability, never be ascertained. The cabin passengers booked at Leith were—Mrs. Edington, from Edinburgh; Miss Hopetoun, Miss Floors, Miss Briggs, Mrs. McLeod, Mr. McLeod; Mr. Torry, from Hull; Mr. Elton, the well-known actor, who appeared last week at the Edinburgh Adelphi Theatre, and has left seven orphan children; Mr. Hodgson, son of Mr. Hodgson, printer, Edinburgh, and assistant secretary of the Leeds Mechanics' Institute; Rev. Mr. Mackenzie, from Glasgow, tutor in the Independent Seminary, and editor of the "Congregational Magazine;" Mr. Banks; Mr. Elliot and son, thought to be from Dundee; Mr. Moxham, Mr. Milne. Besides these, it is understood that there were on board the following gentlemen:—Mr. David Whimster, of Edinburgh, who was on his way to Sheffield to receive license in connexion with the Wesleyan Methodist body; Mr. James Hunter, son of Mr. Hunter, ironmonger, 15, Howe-street; Mr. Martin, of Great Russell-street, Covent Garden, London, and son; Mr. George Aird, son of Mr. Aird, grocer, Hanover-street, who was on his way to London to see a little of mercantile life before setting up in business. Some troops belonging to the 56th regiment were also on board.

Hythe.—We have to record another fatal steam-boat accident, which occurred on Monday morning, off Dungeness. The following facts have been gathered from the crews of both vessels. The Pluton, a first-rate war-steamer, belonging to the French government, after landing at Southampton, the Duke Ferdinand, the Princess Clementine, and other illustrious personages, now on a visit to her Majesty, was ordered to proceed round the coast to Woolwich, to await their return to the continent. On her passage to the Thames, when off Dungeness, while going at full speed, she ran into the Jane of Sunderland, from Newcastle, bound to Rouen, with coals. Such was the force of the collision, that the steamer tore away the chains, rigging, and everything within reach of her bows. The mate of the schooner was crushed to death between

the main chains and the steamer's bows, and his body carried overboard. The master, and the rest of the crew, jumped into the boat at the schooner's stern, which went down by the head almost at the same moment as the painter was cut. After rowing for some time, they came up with the Pluton, which, at the moment after the collision took place, put her helm hard a-port, and proceeded on her passage, until she was compelled to bring to, to clear away her bowsprit and head, which had gone overboard and impeded her progress. They were taken on board, and on being landed yesterday morning at Woolwich, received 3s. to pay their passage to London. The pilot states that he saw the schooner, and heard the shouts of her crew, and called to the engineer to stop her, and the men at the wheel to put her helm over; but the crew of the Pluton (120), being foreigners, and not understanding English, his commands were not obeyed.

Liverpool.—An extraordinary case of robbery has recently come to light in this town. It appears that on the 3d inst., Mr. Hayter Blackmore, M.P. for Wells, had three Bank of England notes, each of the value of 1000*l.*, stolen from his pocket between the bank of Messrs. Masterman and Co., in London, and his residence in Regent-street. On Monday week Mr. Taylor Jennings, a clerk in the branch Bank of England in this town, was apprehended on a charge of having had one of the 1000*l.* notes so stolen in his possession. He was brought before Mr. Rushton on Tuesday morning, and discharged for want of evidence. On the same day John Anderson, a notorious character was placed at the bar, charged with having knowingly received the above note. The evidence ran to a good length, and consisted chiefly of the depositions of Mr. Jennings. It appeared that the prisoner, from peculiar and disreputable circumstances, had got Jennings in his power, and had first induced him to substitute seven 100*l.* notes stolen at the Preston Guild (the particulars of which were fully noticed at the time), for seven other 100*l.* notes deposited in the bank by several customers. For each note so changed Mr. Jennings received 7*l.* 10*s.* as his share of the spoil. On the 7th inst. the prisoner Anderson requested Jennings to get a note for 1000*l.* changed for him, for which service he promised him 200*l.* Jennings took the note and delivered it to Mr. Wood, who keeps a public-house in Windsor-street, in which street the former lodged. He requested Wood to get it changed for him, and borrowed from the latter 20*l.* Mr. Wood took the note to Messrs. Barnes, and those gentlemen having heard an honest statement from Mr. Wood of how he came by it, had suspicions that all was not right, and stopped it. The circumstances were subsequently detailed by Mr. Wood to the conductors of the branch bank, and information having been given to the police, it was discovered that the 1000*l.* note was one of those lost on the 3d inst. by Mr. Hayter Blackmore. Jennings was immediately apprehended, and this led to the subsequent apprehension of Anderson, as above stated. In the course of his evidence Mr. Jennings said that he asked Anderson how he came by those notes. He told him that a person brought them down to Liverpool from London. He said two friends of his in London got them from a person who was riding in an omnibus. He said they saw him come from a house, but he had forgotten whether he said a banking-house or what. They watched him and saw him get into an omnibus, and they got in with him, and when he got out at some street they got out too. While he was in the omnibus they saw him keep his hand on his right pocket. When they got out they followed close to him, and one of them took the notes out of his pocket as he got out. One immediately set off for Liverpool, and the other watched the gentleman about where he went to. They saw him go back to the place where they first saw him, and the people that he told would not believe him. Anderson said the one who had started to Liverpool with the money gave him this 1000*l.* note. These facts were confirmed by several witnesses, who, after two examinations, were bound over to prosecute at the assizes, and the prisoner was ordered to be remanded for a week.—Mr. Henderson has been appointed the new Recorder of Liverpool. The salary is fixed at 500 guineas a year, to be paid out of the borough fund, although the patronage is in the Secretary of State.

Manchester.—A Chartist, named John Bailey, who has been regarded as one of the leaders of the party in this neighbourhood, and who always occupied a conspicuous position in those periodical displays of Chartist strength and feeling got up in honour of Mr. O'Connor, on the occasion of his visits to Manchester, was brought before the borough magistrates on Tuesday, on a serious charge of felony. It appeared that the prisoner had been on terms of intimacy with a Mrs. Consterdine, residing in Portugal-street, Oldham-road, and that, taking advantage of her absence from home, he entered the house by forcing open the back-door, broke open a box, and took therefrom a purse containing a considerable amount of gold and silver. He was seen in the house, moving about in an apparently stealthy manner, by a neighbour, who stated what she had seen when Bailey was apprehended, and a crooked sixpence found in his possession was identified as a part of the stolen money. In the course of the examination it transpired that the prosecutrix had been robbed a short time previously of 8*l.* or 10*l.*, and that on that occasion the prisoner evinced extraordinary sympathy for her loss. He made minute inquiries as to where she kept her money, under the pretext of obtaining some clue which might enable him to reach the guilty parties, but in reality, as it now appears, for the purpose of following their example. He was committed for trial at the next Sessions.—The Rev. Father Mathew arrived in this town on Wednesday last, and since that period has been occupied upwards of nine hours a-day in administer-

ing the pledge of total abstinence to the people of Manchester. He was assisted by the united efforts of the Protestant and Catholic teetotallers of Manchester, who merged, for the occasion, their religious differences, in the desire to promote the object in which they were agreed. Many of those who received the pledge at the hands of the rev. gentleman had previously been total abstainers; but as some notions of peculiar sanctity are held respecting the person of Father Mathew, the pledge was renewed in order to ensure the reception of his benediction. Up to Saturday evening 18,000 persons took the pledge. On Sunday it was administered to 30,000, and on Monday and Tuesday to 32,000, making in all a total of 80,000 pledged teetotallers in Manchester. Of these there are 4,500 infants, 3,000 of whom belong to the St. Patrick's district, a part of Manchester principally inhabited by the Irish.

Portsmouth.—The Lords of the Admiralty have decided upon building a new class of brigs, of 12 guns, which will supersede the old 10-gun brigs, so long known as the "floating coffins." The new 12-gun brigs are to be armed with ten 25 cwt. 32-pounders, and two 18-pounders. It is stated that Mr. White, of Cowes, is to give a design for a brig of the new class, and that Mr. Fincham, of Chatham, is also to give a design. Mr. White is the builder of the Waterwitch, formerly a yacht belonging to the Earl of Belfast, and which was brought into the service, and since noted for its powers of sailing, and consequent successes on the coast of Africa in the capture of slaves. Mr. Fincham is the builder at Chatham Dockyard. It is also understood that the Surveyor of the Navy, Sir W. Symonds, will furnish a design.

Sheerness.—On Monday another jury was empanelled in the Royal Dockyard on the body of Miss Barton, 22 years of age, the daughter of a clergyman residing on the Isle of Sheppy, another of the unfortunate sufferers who received such severe injuries from the explosion of the portable magazine on board H.M.S. Camperdown, that she died on Saturday evening. The deceased is the third sufferer who has died from the effects of this occurrence. The evidence adduced before the jury was similar to that given at the inquest on the body of Miss Yerker last week, upon which occasion the jury returned a special verdict with respect to keeping so large a quantity of powder out of the magazine, and hoped that the authorities would cause so dangerous a practice to be discontinued. The jury returned a verdict of Accidental Death, at the same time expressing their hope that the authorities would act up to the recommendation of the previous jury.

Railways.—The following are the receipts for the past week:—Croydon, 372*l.*; Greenwich, 847*l.*; Blackwall, 1185*l.*; Newcastle and Carlisle, 1475*l.*; York and North Midland, 2023*l.*; North Eastern, 1757*l.*; Birmingham and Gloucester, 2163*l.*; Edinburgh and Glasgow, 2515*l.*; Eastern Counties, 2008*l.*; South-Eastern and Dover, 3153*l.*; Liverpool and Manchester, 3341*l.*; Brighton, 4112*l.*; Midland Counties, 4669*l.*; Manchester and Leeds, 5113*l.*; North Midland, 5669*l.*; South Western, 8033*l.*; Great Western, 15,233*l.*; Birmingham, 19,105*l.*—On Monday a special meeting of the London and Dover company was held for the purpose of taking into consideration the expediency of making a branch railway to Maidstone, and another to the Bricklayers' Arms in the Old Kent-road, and further to consider the propriety of raising further capital for the purposes of the undertaking. The chairman stated that the amount required by the directors was 177,777*l.*, which they proposed to raise either by means of loan notes, or by debentures for the Bricklayers' Arms branch. A resolution to this effect was then proposed, and after some discussion as to the terms upon which the money was to be borrowed, passed with but three dissentients. The next business was the consideration of the construction of the Maidstone branch, which underwent much discussion. The chairman stated that the proposed line had been surveyed by the engineers, Messrs. Stephenson and Bidder; that its distance from the main line would be about ten miles; the total estimated number of passengers 77,000*l.* per annum, and the total net income 24,215*l.* The proposition met with opposition from a few of the proprietors, but ultimately, on being put to the vote, was carried by a large majority. The other requisite resolutions having been agreed to, the chairman in the course of the discussion stated that within ten days steamboats would be plying between Folkestone and Boulogne, which would enable passengers to accomplish the distance from London to Boulogne in little more than six hours and a half. The system of low fares lately adopted had done much to benefit the railway. He believed that the whole line would be opened to Dover before December, and that the branch line to Maidstone would be completed within twelve months after obtaining possession of the land. This statement was followed by a resolution that the directors should be empowered to borrow on loan-notes or mortgage the sum of 266,600*l.*, which was carried unanimously.—A special meeting of the Croydon Company was held this week for the purpose of giving the directors authority to raise 70,000*l.* by an issue of new shares, to enable them to complete their portion of the Bricklayers' Arms extension line, the shares to be nominally 20*l.* value, at 10*l.* each, payable in four instalments of 2*l.* 10*s.* An issue of shares was preferred to an increase of the bonded debt, which already amounted to 230,000*l.* Resolutions to this effect were agreed to.—On Monday a meeting, convened by the high constable, was held at the Town-hall, Brighton, to receive the report of the deputation appointed to confer with the directors of the Brighton Railway. The chief feature in the report was the communication from the directors, that after the 1st August the prices of the first, second, and

third-class passengers by mixed or slow trains would respectively be 12s., 8s., and 5s. The report was received. —On Monday-week the two o'clock mixed train of carriages on the Dundee and Arbroath Railway-line took fire. The carriages started from Dundee at the usual hour, and were midway on the line to Broughty Ferry, when the fire was discovered by some labourers who were working at the road. Immediately behind the engine were four waggons loaded with flax, and one of miscellaneous goods, consisting of flannels, cloths, laces, and similar articles; and lastly, another tier of flax waggons, ending with those conveying passengers. The fire originated in some of the ashes being blown among the flax, which readily ignited, as the day was very stormy; and in the course of a few seconds the first two waggons were in a blaze, and were rapidly communicating to those behind. The damage done amounts to 300*l.* or 400*l.*—The special train on Thursday-week from Southampton to London, engaged for the conveyance of the Duke of Saxe Coburg and his relatives, performed the journey, 77 miles, in one hour and 39 minutes.

IRELAND.

Dublin.—Sir Edward Sugden has left town for England, to join his family at Boyle Farm. The Master of the Rolls, Mr. Justice Burton, and Baron Lefroy are appointed Keepers of the Great Seal in the absence of the Chancellor. His Lordship, previous to his departure, appointed three gentlemen to the commission of the peace—viz., Mr. George Ruxton, for the county of Louth; Mr. Charles Webber, for the county of Sligo; and Mr. Edward Crips Villiers, for the county of Limerick. The following is Lord Lyndhurst's Act for legalising Presbyterian Marriages, the whole being comprised in the following words:—"Whereas marriages have in divers instances been had and celebrated in Ireland, by Presbyterian and other Protestant and Dissenting Ministers or Teachers, or those who at the time of such marriages had been such, between persons being of the same or different religious persuasions, and it is expedient to confirm such marriages; Be it therefore enacted by the Queen's Most Excellent Majesty, by and with the advice and consent of the Lords Spiritual and Temporal and Commons in this present Parliament assembled, and by the authority of the same, that all marriages heretofore had and celebrated in Ireland by Presbyterian or other Protestant Dissenting Ministers or Teachers, or those who at the time of such marriages had been such, shall be, and shall be adjudged and taken to have been and to be, of the same force and effect in law as if such marriages had been had and solemnised by clergymen of the said United Church of England and Ireland, and of no other force nor effect whatsoever."—The Grand Jury of Armagh have published a declaration condemning the Repeal agitation, and expressing an anxious hope "that her Majesty's Government will make use of those powers which the laws and constitution afford them, for speedily putting an end to proceedings so fraught with mischief to the best interests of our country, and of every individual of its community." This declaration is signed by the whole of the Grand Jury, and countersigned by the High Sheriff, the Duke of Manchester, and several other gentlemen.—A meeting in opposition to Repeal has also been held at Belfast, and attended by the Duke of Manchester, the Marquis of Donegal, Earl O'Neill, Earl of Roden, the Earl of Erne, Sir R. Bateson, &c. Bishop Hughes, of New York, who recently arrived in Dublin in company with several of his episcopal brethren from the far west, on business of a religious nature, has addressed to a friend a letter on the wrongs of his native land, in the course of which he observes:—"Repeal the Government will not grant till the last extremity, and nothing short of repeal will satisfy the Irish people. But there is one melancholy consolation, that, until it be granted, Ireland will continue in the eyes of all nations England's weakness and shame. The Parliament and the leading journals (he writes from London) speak of nothing else, and yet the question seems to make but little impression on the iron-hearted people here. But the truth is, the Irish must depend upon themselves. It had been my plan to visit Ireland after I had transacted my business on the Continent; this I may still do; but my feelings got so much excited by the poverty and oppression, the patriotism, the indifference, and the perfidy which I witnessed in that lovely land, that it is a relief to escape from the spectacle."—One of the murderers of the herdsman to Mr. James Scully was found guilty at Clonmel Assizes on Friday.—At the meeting of the Repeal Association on Monday, Mr. O'Connell gave an account of the Tuam demonstration. He said that "all the Bishops of that province had declared themselves repealers. One thing only had tarnished this bright prospect; it was the gross misconduct of the people of Abascragh. It was melancholy that the people should be ignorant of their paramount duty to keep the peace. The people at Abascragh had erected a triumphal arch—and they were ordered to take it down. Now everybody knew that no matter what outrage might be committed against them, it was the duty of the people to obey the authorities. If anything illegal be done against them, we can vindicate the law and punish the aggressors; but there must be no assaults, no riots. In this instance there were but seven policemen, and they did no more than obey the orders of their superiors. Yet the people pelted them with stones, and drove them into their barracks, wounding one man seriously. Such conduct he declared was treason to Ireland. The persons who were guilty of it were traitors. They would have broken up the Connaught meeting altogether, but for the profound respect he felt for his venerated friend 'John Tuam.' Yes, he would have returned to Dublin, and let the meeting be abortive, to

mark his contempt of the people guilty of such an outrage. The poor policemen were but doing their duty, and it was barbarous to attack them. He now moved that Abascragh should be blotted out of the map of Ireland, and that the name of every one belonging to it should be struck out of the roll of the association; nay, more; he moved that no inhabitant of that town should be admitted among them." This motion was deliberately moved, seconded, and carried. A financial statement was read to the meeting, from which it appeared that in 1842 the sums received in the quarter ending 4th July amounted to but 999*l.* 9s. 7*d.*, while the total received in the corresponding quarter of this year amounted to 15,798*l.* 11s. 3*d.*, being an increase on the quarter of 14,799*l.* 1s. 8*d.* Mr. O'Connell announced that he would have 10,000*l.* invested in the public funds to the credit of the association. He had to acknowledge various sums from the county of Wexford, 34*l.*, 51*l.*, 21*l.*, and other large sums, amounting in the whole to 621*l.* 11s. Next came acknowledgments of money from America—31*l.* from New York, 100*l.* from Providence, Rhode Island, 20*l.* from St. John's, New Brunswick, from Albany, 100*l.* From Connaught, 265*l.*, from Ulster, 80*l.*, handed in by Mr. Duffy. From England, 72*l.* The total amount of rent for the week was 2,198*l.* 18s. 6½*d.*

Tuam.—The Repeal demonstration in this district took place here on Sunday. It was looked to with peculiar interest, from the circumstance of the requisition convening the meeting having been signed by Dr. M'Hale, titular Archbishop of Tuam, and the entire body of this division of his diocese. The procession, in which was Dr. M'Hale, Mr. Bodkin, M.P., and Mr. R. D. Browne, M.P., met Mr. O'Connell about five miles from the town. The place fixed for the proceedings of the day was the Gurrane racecourse, two miles from the town, on the side opposite to that by which the procession had to return—and in consequence of the vast multitude who thronged the road, it was half-past six before Mr. O'Connell and his friends reached the platform erected in the middle of the race-course. The immense number of persons collected it would be impossible accurately to estimate. They covered an area of about seven acres, besides forming a continuous line from the place of meeting to the town. In the outward circle, however, were horsemen and several cars with females. On the platform they seemed disposed to fix the number present at above 100,000. There were no military at this meeting, but a large body of police were in the town, brought in from the neighbouring stations. Mr. Bodkin presided. Lord Ffrench moved the first resolution, deprecating the Legislative Union, and pledging them to persevere in unremitting exertions to obtain the restitution of their national parliament. Mr. M. Blake, of Frenchfort, seconded the resolution, which was carried with acclamation. Mr. R. D. Browne moved a resolution of gratitude to Mr. O'Connell, and pledging them to co-operate with him in his struggle to obtain complete national regeneration. Mr. T. Bodkin seconded the resolution, which was carried amidst loud cheering. Mr. O'Connell then addressed the meeting, and said they would get Repeal if they would act by him as he desired. They would get Repeal without a blow. Did they not know the advantages Repeal would give, to induce them to assist him in the way he requested? By Repeal they would be protected from English oppression; they would be freed from the slavery of paying the clergy of a church in which they did not believe. If he got Repeal his first step would be to put an end to the poor-houses; and with the 800,000*l.* from the church temporalities, he would build hospitals and houses of refuge for the poor. They would next abolish the grand jury cess. The government should pay for the roads, bridges, and rails, and the land be relieved from the grand jury cess. Then every householder and every married man should have a vote, and should be protected in the exercise of that vote by the ballot. Every year nine millions of pounds sterling were obtained out of Ireland. Give him Repeal, and next year these nine millions would be spent in Ireland. There was another evil. The rack-rent landlords were grinding the people to powder. The tyranny of the landlords was worse than all the other evils put together. He proposed that there should be no shorter lease than twenty-one years. It might be as much longer as the landlord pleased, but no lease no rent. To prevent the exaction of too high rent, he would give an appeal to the assistant-barrister, from him to the judge of assize, and from him to a jury, to ascertain the value of the land—nay, more, every tenant who laid out money in the improvement of the land, might register the amount he expended every year in the Crown-office; and, if his lease were not renewed, his landlord should repay him what he laid out. He then alluded to the condition of England, and her points of weakness, to show that she could no longer resist Repeal. A resolution, expressive of sympathy with the superseded magistrates, and of a determination to resort to the arbitrators in all cases of difference, was then proposed, and carried; after which the meeting adjourned. The dinner took place in a large room attached to the Mitre Hotel, in which two galleries were fitted up which accommodated three hundred ladies. Mr. O'Connell spoke at great length, and Dr. M'Hale adverted to the late discussions on the Catholic priesthood. He said, the object for which they were met might require that the sentiments of the Catholic clergy, so far he might be deemed their humble organ, should not be misunderstood. A strange change seemed to be coming over the minds of some of their rulers. They proposed to throw open to the Catholic clergy the sanctuary of the British Treasury, nay, even to open to their hierarchy high places in the British Legislature, if they would but bow down and

worship Saxon ascendancy. But the virtue of the Catholic clergy was proof against the treacherous ordeal of their carresses. It would be a dangerous day for the liberty of Ireland, if the Catholic clergy entered into any arrangement which would withdraw them from the confidence of a suffering people. And he would tell the Government that until justice was done to the people, the clergy were the last persons for whose provision they ought to feel the least anxiety. Was it not time that the Government made the necessary concessions to them? The people suffered under many grievances. Was it just that the accumulated treasures of ancient piety should be monopolized, in a country entirely Catholic, by a few persons of another creed? They were told of the concession of Emancipation. No thanks to them for that concession; but what did it amount to? What boon was it that the poor people should be grateful for because, out of some sixty or eighty places, an individual, perhaps a nominal Catholic was put into one of them as a bribe, perhaps for political apostasy from his principles. They must go to the fountain of the evil, and dry up that misery which was the source of the vengeance of the people. Why not try the principle of coercion to the heartless landlords, who were destroying the tenantry of the country? As the Parliament were unwilling to give a perpetuity of tenure to the poor, the people of Ireland had no alternative but a Repeal of the Union. Upon the principles of jurisprudence, as well as of Catholic theology, which held that for every wrong atonement would be made—a wrong having been inflicted upon Ireland by the Union, they would never rest satisfied until they compelled the English Government, by the institution of the Irish Parliament, to make full and adequate reparation to Ireland. The Chairman proposed the health of the Right Rev. Dr. Browne, titular Bishop of Galway. Dr. Browne returned thanks, and expressed his strong concurrence in the efforts made to procure the Repeal of the Union.

Enniscorthy.—The Repeal demonstration in this town took place on Thursday, and was attended by thousands of persons from all parts of the surrounding county. Mr. J. H. Talbot presided; and Mr. O'Connell, Dr. Keatinge, the titular bishop of Ferns, and others, addressed the meeting at great length on the prospects of Repeal. At the dinner in the evening, the Rev. Mr. Synnott acknowledged the toast of the Catholic Priesthood of Ireland. He said that the Catholic clergy rejoice that they have no hope but in the Repeal of the Union. "If we had other hopes our minds would be distracted in the pursuit of those other objects—our minds by that distraction would be weakened—one set of men would encourage one measure of relief, and another set of men would encourage another; but now all our energies, and hopes, and determination, are concentrated upon this point, and by that powerful concentration we must succeed in carrying out one object—the Repeal of the Legislative Union. The Catholic clergy have taken that position at your head, and I am confident that you will not disown their leadership. They will not do any discredit to the sacred character they bear, for while they are your leaders the political triumph will bear likewise a sacred character. That sacred character they do not forget—that sacred character they are invested with, and it is that character which guarantees to you that their advice, their exertions in co-operating with you, must be essentially directed to a legitimate object, and to attain a national end."

Miscellaneous.

A Nobleman's Country Seat.—"Take a lord, now, and visit him to his country seat, and I'll tell you what you will find—a sort of Washington State-house place. It is either a rail old castle of the genuine kind, or a gingerbread crinkum-crankum imitation of a thing that only existed in fancy, but never was seen afore—a thing that's made modern for use, and in ancient style for show; or else it is a great, cold, formal slice of a London terrace, stuck on a hill in a wood. Well, there is lawn, park, artificial pond called a lake, deer that's fashionablised and civilised, and as little natur in 'em as the humans have. Kennel and hounds for parscutin' foxes—presarves (not what we call presarves, quinces and apple sarce, and greengages done in sugar, but presarves for breedin' tame partridges and peasants to shoot at), h'aviaries, hive-eries, h'yew-veries, hot-houses, and so on; for they put an "h" before every word do these critters, and then tell us Yankees we don't speak English."—*Sam Slick in England.*

Opening of a Roman Tumulus.—A most interesting discovery, illustrative of the funeral customs of the Anglo-Romans, has been made in the parish of Rougham, on the estate of Mr. Philip Bennet. At the corner of the two roads leading to Hessel and Bradfield Manger, and within a few feet of the highway, stands the half of a hill, called Eastlow-hill, and a slight distance therefrom were two semicircular mounds, about 50 or 60 feet in diameter, covered with herbage and shrubs. The men belonging to Mr. Levett's farm were engaged in clearing away one of these mounds, to lay the soil upon the land, when, on Friday week, having come to the centre, the pick of the workmen broke into an oven-shaped cist or cavern, containing sepulchral remains. A hole, between three and four feet square, appears to have been first dug about three feet below the general level of the country. Four rows of red hollow tile bricks, each 11 inches long, about six inches wide, and seven inches deep, and nearly an inch thick, and having a circular hole in the middle of each end, were then placed on the soil, and covered over with large flat tiles. The whole was arched over with tiles, forming a chamber of about 2½ feet square and two feet deep; open at one end. Each tile was ornamented with two striated bands, placed diagonally from angle to angle, and crossing in the centre. In this chamber was a large

square canister-shaped urn of emerald green glass, with a handle on one side. It was nearly 16 inches high, and eight inches wide; and was about half full of burnt bones. By the side of the urn was a large plain iron lamp, of the accustomed form in length, from the wick-chamber to the handle nearly a foot. Unfortunately, from the ignorance of the man who made the discovery, the cist was opened so carelessly, that the fine and curious urn was broken. This part of the country must have been extensively occupied by the Romans, for pateræ, and pieces of pottery, swords, spurs, and other articles of iron, have been frequently and for many years discovered within two feet of the surface in this part of Rougham, and within the adjoining parish of Whelnetham. The land was common till within the last 30 years; and so many human bones were found, it is said, on removing part of the Eastlow-hill, that the then owner of the estate (Mr. Kedington) refused to permit any more of the hill to be cleared. Adjoining to the tumulus which has been opened is another, as yet quite undisturbed; and near to them are the pits or trenches, whence it is probable the soil was procured to heap up these simple and long-enduring resting-places.—*Suffolk Herald*.

A Contrast.—The change of times and manners cannot be more strikingly illustrated than in contrasting the account of Prince Albert's visit to Bristol, as inserted by us last week, with the following curious particulars of a visit paid to that city in the reign of Queen Anne by her Royal Consort, Prince George. In "Corry and Evans's History of Bristol," vol. ii. page 423, is the following:—"Extract from an old Bristol newspaper, relative to Sir J. Duddelstone.—Prince George of Denmark, consort of Queen Anne, in passing through this city, appeared on the Exchange, attended only by one gentleman, a military officer, and remained there till the merchants had pretty generally withdrawn; not one of them having sufficient resolution to speak to him, as perhaps they might not be prepared to ask such a guest to their houses. But this was not the case with all who saw him; for a person whose name was John Duddelstone, a bodice-maker, who lived in Corn-street (probably the house now occupied by Norton and Son, booksellers, which is very ancient), went up to him and asked him 'If he was not the husband of the Queen?' who informed him, 'he was.' John Duddelstone told him he had observed with a good deal of concern that none of the merchants had invited him home to dinner, telling him he did not apprehend it was for want of love to the Queen or to him, but because they did not consider themselves prepared to entertain so great a man; but he was ashamed to think of his dining at an inn, and requested him to go and dine with him, and to bring the gentleman along with him, informing him that he had a piece of good beef and a plum-pudding, and ale of his dame's own brewing. The Prince admired the loyalty of the man, and, though he had bespoke a dinner at the White Lion, went with him. When they got to the house, Duddelstone called his wife, who was up stairs, desiring her to put on a clean apron and come down, for the Queen's husband and another gentleman were come to dine with them. She accordingly came with a clean blue apron, and was immediately saluted by the Prince. In the course of the dinner the Prince asked him if he ever went to London? He said, that since the ladies had worn stays, instead of bodices, he sometimes went to buy whalebone; whereupon the Prince desired him to take his wife with him when he went again, at the same time giving him a card to facilitate his introduction to Court. In the course of a little time he took his wife behind him to London, and, with the assistance of the card, he found easy admittance to the Prince, and by him they were introduced to the Queen, who invited them to an approaching public dinner, informing them they must have new clothes for the occasion. So they each chose purple velvet, such as the Prince had then on, and in that dress they were introduced by the Queen herself as the most loyal persons in the city of Bristol, and the only ones in that city who had invited the Prince her husband to their house. After the entertainment, the Queen desiring him to kneel down, laid a sword on his head, and (to use Lady Duddelstone's own words) said to him, 'Ston up, Sir Jan.' He was offered money, or a place under Government; but he did not choose to accept of either, informing the Queen that he had 50*l.* out at use, and he apprehended that the number of people he saw about her must be very expensive. The Queen, however, made Lady Duddelstone a present of a gold watch, which my lady considered as no small ornament when she went to market, suspended over a blue apron. Sir John Duddelstone, with his lady, lie buried in All Saints' Church, Bristol, on the right side of the entrance from the north door."

The Comet.—A letter from Villeneuve-sur-Lot (Lot-et-Garonne), 17th inst., says:—"Last night, at about ten o'clock, we again saw the famous comet, as it appeared in the month of March. It occupied an immense space in the heavens. In a very elevated position above the horizon, to the south-east, it had a slight oblique direction with respect to the Milky-way. Its form has not changed, but it appeared much more brilliant in our southern sky than it did at Paris. After the rising of the moon the light of the comet became feeble, and at a quarter past ten it was no longer visible."—Extract from a letter, dated Sydney, New South Wales, March 6, 1843: "We are all exceedingly interested in the course of a prodigiously-fine comet which surprised us a few days ago. I saw it on Thursday, March 2d, just at sunset, and since then it has arisen higher every night. It infinitely surpasses everything I have ever thought of in a comet. The tail was 40 degrees, of a perfect white, and as straight as a line."

China.—A Berlin correspondent of the *Débats* writes,

on the 11th inst.: "We have received letters from our fellow-countryman, the missionary Gutzlaff, in China, stating that he had ascertained that the art of constructing buildings of cast iron, of which the English pretend to have lately been the first discoverers, has been practised for centuries in the Chinese empire. M. Gutzlaff has found on the top of a hill, near the town of Tsing Kiang Fou, in the province of Kiang Nan, a pagoda entirely composed of cast iron. It is covered with bas-reliefs and inscriptions, which, from their forms, characters, and dates, show that they are as old as the dynasty of Tang, which was on the throne as far back as from the 5th to the 10th century of the Christian era. It is in the shape of an octagon pyramid, is 40 ft. in height, and 8 ft. in diameter at the base. It has seven stories, each containing extremely curious historical pictures. M. Gutzlaff represents this monument as being strikingly elegant, and surpassing in this respect everything of the kind he had previously seen in China."

Steam in France.—On the 1st January, 1842, there were in France 5,605 steam-boilers and 2,807 steam-engines, besides 169 locomotives. Of these 5,605 boilers, 4,857 were of French manufacture; 1,747 of them furnished steam for various uses, and the remaining 3,858 supplied the 2,807 engines. Of the 2,807 engines, 584 were low pressure, equalling 11,114 horse-power, and 2,223 high pressure, equalling 26,182 horse-power, making together 37,296 horse-power; that is, the force of 121,888 draught horses, replacing the strength of 783,000 men of labour. These amounts, as compared with the year 1840, present on one side a reduction of 40 boilers, not used for steam-engines; and, on the other, an increase of 285 boilers for steam-engines, of which last 216 were fixed and 27 locomotive. This increase gives an equivalent to 2,946 horse-power, or 8,836 draught horses, or 62,000 men. In 1841 steam-engines in France did the labour of 155,061 draught horses, or 1,085,427 men.

French Finance.—The national debt of France, which in 1572, under Charles IX., was only 17,000,000*fr.*, was in 1832, 5,417,495,016*fr.* At the present time it is almost 7,000,000,000*fr.* France has already been bankrupt six times, viz.:—Under Sully, who deducted the interest formerly paid on the capital; at the end of Louis XIV.'s reign, under Desmaret, who paid neither capital nor interest; at the fall of the "système Law," under Lepelletier; under the Abbe Terrai, who did not pay the assignments; during the revolution after the creation of 45,000,000 of mortgages; lastly in 1799, by the reduction of two thirds of the debt.

Kills.—"I shall be off to the highlands this fall; but they haate got no woods there; nothin' but heather, and that's only high enough to tear your clothes. That's the reason the Scotch don't wear no breeches, they don't like to get 'em ragged up that way for everlastin', they can't afford it; so they let 'em scratch and tear their skin, for that will grow agin, and trousers won't."—*Sam Slick in England*.

Law.

COURT OF CHANCERY.—(Before Sir J. Wigram.)—*Reeve v. Attorney-General.*—The testator, the Rev. Thomas Meyrick, amongst other charitable legacies, gave 1,000*l.* to the Society for Promoting Christian Knowledge, to be applied solely in the principal of Wales, and he gave the income of the residue of his personal estate to the same society, being, as the testator stated, probably about 200*l.* a-year, upon trust, to pay the same annually to one orthodox learned and popular preacher who in the Lord Bishops of the society shall license and appoint to preach in London and in their respective dioceses successively one course of sermons in towns containing not less than 3,000 souls, which he, and all succeeding him in this ministry, shall publish for their own benefit, being dedicated to the Archbishops and Bishops, and being written in a plain style and solely in defence and illustration of the liturgy and of the 39 articles of the Church of England against the errors of the Church of Rome, of John Calvin, John Wesley, and all other heresiarchs. The Society for Promoting Christian Knowledge declined to take the legacy on these trusts. Mr. Wray, for the Attorney-General, said that in these circumstances the course was to leave the application of the charitable legacy to the Crown, by sign manual. Mr. Wetherell, for the executor, made no objection to this direction. The legacy was ordered to be applied in such manner as her Majesty, under her royal sign manual, shall direct.

VICÉ-CHANCELLOR'S COURT.—(Before Sir J. K. Bruce.)—*Richardson v. Lupton.*—The bill in this suit was filed by six persons, alleging themselves to be shareholders of the British Iron Company on behalf of themselves and all other the Shareholders, Proprietors, and Members of the company, except the defendants, against the Directors, Trustees, and Secretary, alleging various acts of irregularity and mismanagement on the part of the defendants, and praying general accounts of the whole concern, that the management of the affairs might be put an end to, but no dissolution, in terms, was prayed. It appeared that some of the shareholders not made parties had paid 75*l.* per share, while the plaintiffs had only paid 50*l.* per share, alleging that the call for the additional 25*l.* per share ought never to have been made, and was not justified by the resolutions that had been come to by the great body of the shareholders.—Mr. Russell, Mr. Wigram, and Mr. Palmer, argued that all the shareholders ought to have been made parties; Mr. Simpkinson and Mr. Shapter contended for the contrary proposition.—His Honour said it was a very important case relating to a trading company, part of the partners of which took one view of the point disputed, and another division of the partners a contrary one. The number of either class was so great as to render it substantially impracticable to make that class parties to the suit. The bill was filed, perhaps, properly so far as the plaintiffs represented themselves, and all others who took a similar view to themselves of the question in dispute. None, however, of those who dissented from their views were on the record except the Directors, who were in the situation of Trustees, as well for the plaintiffs themselves as the shareholders who dissented from them. They could not therefore freely, and in an unfettered manner, contest the point for those who had paid the 75*l.* per share, as those parties could if they were on the record. These Directors had duties towards both classes of disputants beyond the mere duties subsisting between partner and partner. There were two points involved in the suit—one, the time, manner, and circumstances of a dissolution; the other, whether the capital of the company had been rightly increased—that is, whether the plaintiffs could be rightly compelled to pay more than a certain specified amount of capital. One object of the bill, although not specified, was a dissolution; another was to exempt the plaintiff from the liability to contribute any further capital; and the large

body who object to this exemption are those who had contributed the increased amount of capital. They were not before the Court, and they plainly had an interest that the plaintiff should pay equally with themselves. It was too much to say that such a question would be agitated, discussed, and disposed of without the presence of an adequate number to sustain the argument over and above the persons who were trustees for both contending parties. His Honour therefore thought, that assuming, for the purposes of the argument, and for those purposes alone, that the answer was true, he must hold that the suit was defective for want of parties. His present impression was, that when a dissolution was prayed, it was not universally necessary that all parties must be before the Court; so Judge who had decided any case meant to go that length. Such a rule would render redress in many cases quite impracticable. The law would never recognise the legality of a partnership, and yet not afford the means of redress on breach of the contract between the parties. He must declare that on the present state of the pleadings, and on the assumption that the answer was true, he must hold that the suit was defective for want of parties. With such a declaration, he should direct the matter to stand over to the hearing of the cause, without prejudice to any question, and without prejudice to the right of the plaintiff to amend his bill, and all costs must be reserved, and each party to have liberty to apply.

ASSIZE INTELLIGENCE.—(NORFOLK CIRCUIT, BEDFORD.)—*The Wrestlingworth Murder.*—Sarah Dazley, aged 28, pleaded not guilty to an indictment, charging her with the wilful murder of William Dazley, her husband, by arsenic, on the 29th of October last. This case, which has for some months excited great interest in this county and the adjoining parts, was noticed by this Paper at the time. The avenues leading to the Court and the seats therein appropriated to the public were densely crowded at an early hour. The jury having been sworn, the counsel for the prosecution proceeded to detail the almost unparalleled circumstances under which the prisoner became involved in this accusation; and from this statement, corroborated by the testimony of various witnesses, it appeared that the prisoner, who pursued the trade of a milliner and dressmaker among the lower orders of society, after having buried her first husband, one Henry Mead, married William Dazley, the subject of the present inquiry, in October, 1840. For some time they continued to live together happily, but it would seem that their domestic circle was latterly marred by discord, for not many weeks before his death, which took place on Sunday, the 29th October, 1842, they were known to have had a serious quarrel, which ended in the exchange of blows. Notwithstanding this, the deceased enjoyed among his neighbours the character of a good husband, and having fallen sick about a fortnight before his death, it certainly appeared that his wife was unremitting in her attention to his wants, though his mother lived in the house, and that she made a point of administering to him all his medicine and food. On the Tuesday before his death he became worse, and a professional gentleman, Sandell by name, happening to ride through their village, Mrs. Dazley called him in to prescribe for her husband. The condition of his patient not appearing very pressing or serious, Mr. Sandell told the prisoner to come over to his residence at Polton and get some medicine. This she did, being accompanied by one Mary Carver, to whom on their way home she said "she should not give her husband the pills which he had got from the doctor, but some others which she had got from a Mrs. Gurry, a woman who sold drugs in Polton, and knew quite as well as Mr. Sandell what to order for sick folks." Saying this, she opened the box, threw away its contents, and inserted in their place three other pills, which she produced from her pocket in a piece of newspaper. On her arrival at home she told her husband to take the pills which Mr. Sandell had prescribed for him, and quitted the house. During her absence the deceased took one, but not without great demur, so much so, indeed, that a girl who was in attendance was obliged to take one first. This circumstance, when made known to the prisoner, appeared greatly to excite her anger, while both her husband and the girl Mary Bull became very sick, hot, and thirsty, in about an hour and a half afterwards. This attack, however, soon subsided, and the sick man began to mend till the Saturday, when the prisoner said she was going again to Mr. Sandell for some more medicine. This she accordingly did, and having returned, in the evening, she, in the presence of the two brothers of the deceased and Mary Bull, emptied a white powder into a cup, and gave it to her husband, after having mixed it with water from a teapot, saying, that "Mr. Sandell had sent it, and said that if it operated right it would cure him, and if not, it would kill him." Although this would to ordinary minds appear to be anything but a recommendation, yet the man yielded to it, and swallowed the draught so prescribed to him by his wife. This was about half-past nine, and at first the mixture seemed to benefit him, for he was easier than before for about an hour, but at the expiration of that period he became dreadfully sick at the stomach again, and continued to evince all the symptoms of having taken some strong irritating drug, till five o'clock in the morning, when he gradually sank. The illness of the man being well known, as well as the attendance of a regular surgeon, no suspicion of unfair play was at first excited; and about Christmas the widow entered into a third matrimonial engagement with a young man named Waldoch, their banns being once asked in church. About this time, however, in consequence of the unexpected death of the prisoner's first husband, and her son by him, people began to say openly that she had poisoned all three; and these reports having come to the ears of Waldoch, with an intimation that if he married her he would incur the scandal of having been a party to those crimes, he at once declined to go further in the matter, and himself forbade the banns; after which the prisoner quitted Wrestlingworth suddenly, under the pretence of going to Balooch to her lawyer, and took up her residence in the parlours of London, where she was discovered by the police, and taken before the Lord Mayor. An investigation having been instituted before him, she was handed over to the provincial authorities, on suspicion of having poisoned all the individuals above mentioned. The first thing done was the exhumation of the bodies for the purpose of medical inspection; and though great difficulty interposed by the length of time which had occurred since the death of Mr. Mead, even his body gave some indications of the presence of arsenic, but in the case of William Dazley, and the boy Mead, and especially in the former, the tests to which the intestines were subjected, elicited unequivocal proof of their death having been caused by arsenic. In consequence of this a Coroner's Jury returned a verdict of "Wilful Murder" in each case, and the prisoner was finally committed to take her trial at these Assizes. The Grand Jury, however, having thrown out the bill in the case of the son, the prisoner was now arraigned solely on the charge involved in the death of her husband. In order to bring home this charge, a vast body of evidence, chiefly circumstantial, was adduced, but, without going into all the minute details, after having given the above outline of the main facts, it may suffice to state that Mr. Burnham, a chemist at Polton, and his apprentice, deposed to the fact that the prisoner bought some arsenic at their shop on some Saturday between July and Christmas last year, while Mr. Sandell expressly swore that he had never given her any powder at all for her husband; and it further appeared that she was seen to make up some pills early in the week, which she put up into a piece of newspaper before she went with Mary Carver for the first medicine from Polton. Besides this, many declarations of supposed hostility and malice towards her husband were put forward as indicative and explanatory of her unnatural conduct—such as, that she was "determined to have seven husbands in ten years;" "that she never would allow any man to strike her without doing for him;" and "that though her husband was a good one she wished him dead, and would gladly follow him to the grave." After she was taken into custody, when sleeping at Biggleswade, on her way to Polton, she entered into a long conversation with the women appointed to sit up with her, in which, after inquiring whether "the Judges hanged much now," she

at the Office, 8, CHARLES-STREET, COVENT GARDEN, LONDON, W., where all Advertisements and Communications are to be addressed to the Editor.—Saturday, July 29, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 31—1843.

SATURDAY, AUGUST 5.

PRICE 6d.

burning	528 a	Yeast plant	528 b

MAGNIFICENT NEW FUCHSIA,

"FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised in the Exeter Nursery, and which is decidedly the finest variety ever produced. Flowers of it were submitted to Dr. LINDLEY, who, in the *Gardeners' Chronicle* of the 8th ult., thus expresses himself:—

"*Lucombe, Pince, and Co.*—The blooms sent of *Fuchsia Exoniensis* prove it to be a very splendid variety; it is a flower of great substance throughout, seed-vessels dark, tube and sepals of a rich crimson carmine; the sepals are long, they expand freely, and disclose the rich crimson-purple corolla, which is very large, and of a peculiar denseness of texture."

The Plant was also exhibited at the last great meeting of the London Horticultural Society on the 12th ult., and obtained the Society's Certificate of Merit.

Strong Plants will be ready for delivery on the 10th inst., at 10s. 6d. each, and will be sent, free of all other charge, by the post, carefully packed in stout tin cases. The usual discount to the trade if six plants are ordered. For a full description, see Advertisement in the *Gardeners' Chronicle* of the 17th June.

N.B.—This Seedling Fuchsia has been fully proved, and will give satisfaction to those who purchase it.

ARAUCARIA IMBRICATA, or SIR JOSEPH BANKS'S PINE.

YOUELL & Co., possessing the most extensive stock in the country of the above Splendid Hardy Ornamental Tree, beg to offer them on the following advantageous terms:—Fine robust, 3 year-old plants, 8 to 9 inches high, 10l. per 100, or 30s. per dozen.—Great Yarmouth Nursery, August 3, 1843.

THUNBERGIA FRYERII.

J. FRYER has much pleasure in being able to comply with the request of his numerous friends, by sending out at an earlier date than already specified the above delicate and very desirable new variety of *Thunbergia*. Strong, healthy plants will be sent out the last week in August, by post, prepaid, carefully packed in tin cases, at 7s. 6d. each, with the usual allowance to the Trade. Blooms are exhibited daily, and orders received at Mr. NUTTING'S, Seedsman, 40, Cheapside; and blooms will be sent by post, on application, containing two postage stamps. N.B.—A splendid Collection of PANSIES, for autumn blooming, can now be supplied at moderate prices, and all the new FUCHSIAS, &c.—Clarendon Nursery, Camberwell, Aug. 3, 1843.

SUPERB FUCHSIAS AND CHRYSANTHEMUMS.

YOUELL & Co. beg respectfully to refer the readers of the *Gardeners' Chronicle* to their Advertisement of the above, which appeared in this Paper of last week. Great Yarmouth Nursery, August 3, 1843.

J. YOUNG, NURSERYMAN, Taunton, begs to offer to the lovers of HARDY FERNS collections of 25 varieties of the better British and Hardy American sorts for 1l. 10s.

J. Y. is now taking up a large collection of IXIAS, which have been grown in the open ground, without protection, during the past winter, and begs to offer to his Friends and the Public collections consisting of 16 or more sorts, at 4s. per dozen, in quantities of not less than six of each; they may be sent by post at a very small expense. J. Y. will furnish names of Ferns and Ixias, if desired. Aug. 2, 1843.

ARAUCARIA IMBRICATA PLANTS.

MESSRS. VEITCH & SON having raised a considerable number of this Splendid Hardy Ornamental Tree, are enabled to offer fine healthy plants, from 4 to 6 inches in height, at the following moderate prices, viz:—

10l. per 100;—5l. 10s. for 50;—and 30s. per dozen. For the convenience of some purchasers, Messrs. V. & Son have appointed, as their London agent, Messrs. HURST and M'MULLEN, Seedsman, No. 6, Leadenhall-street. N.B.—A remittance or reference required from unknown correspondents.—Exeter, June 19, 1843.

MYATT'S NEW SEEDLING STRAWBERRIES.

J. AND W. MYATT intend sending out, by the middle of August, their NEW STRAWBERRY, the DEPTFORD PINE, fruit of which has been exhibited at the London Horticultural Society, and a Banksian Medal awarded. It has also been submitted to Professor LINDLEY, for whose opinion see *Gardeners' Chronicle*, No. 26, p. 447. It is a most prolific bearer, exhibiting at the same time a profusion of fine fruit and bloom on the same truss. Price, Deptford Pine, 2l. 10s.; British Queen, 1l., and Eliza, 10s. per 100.—Manor Farm, Deptford, July 22, 1843.

EAST NORFOLK GRAND CARNATION AND PICOTEE SHOW.

YOUELL AND CO. beg respectfully to inform their Friends that their Annual Exhibition of the above commenced on the 1st of August, and will continue for three weeks. Their Collection now amounts to UPWARDS OF NINE HUNDRED OF THE FINEST VARIETIES IN CULTIVATION, and the present Exhibition will be found to surpass anything of its kind in the kingdom. THREE THOUSAND POTS WILL BE STAGED.—ADMITTANCE GRATIS. Great Yarmouth Nursery, Norfolk, August 3, 1843.

THE QUEEN CABBAGE.

J. AND S. SHILLING beg to acquaint the Public generally that they will do well to possess themselves of the above CABBAGE for sowing at this season of the year, which will be found superior for earliness and certainty of Cabbaging to any other. Packets, containing half-an-ounce of seed, will be forwarded by post free, on the receipt of 2s. 6d. in letter stamps, or a Post-office order. From the great difficulty in getting this sort to bear seed, it will be always scarce, and should be taken care of; it is also very superior in every other respect. Nursery, North Warnbro', near Odiham, Hants.—August, 1843.

ALBION ROAD NURSERY, STOKE NEWINGTON.

MESSRS. PROTHEROE & MORRIS respectfully announce they are instructed by the Executrix of the late Mr. JOHN MILNE, to offer for public competition, this month, the splendid and choice Stock of GREENHOUSE, EXOTIC, and other PLANTS, of which Catalogues will be duly published. Leytonstone, August 3, 1843.

NATIONAL LOAN FUND LIFE ASSURANCE ANNUITY, and DEFERRED ANNUITY SOCIETY,

25, Cornhill, London.

Capital, 500,000l.—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
John Elliottson, M.D., F.R.S. George Langley, Esq.
John Griffith Frith, Esq. John Rawson, Esq.
H. Gordon, Esq. Clement Tabor, Esq.

Joseph Thompson, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.

Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz:—

Entry	Policy No.	Age.	Sum.	Annual Premium.	Bonus added.	Cash Bonus.	Prem reduced.
1837	39	59	1,000	£ s. d. 67 8 4	£ s. d. 132 14 6	£ s. d. 58 19 9	£ s. d. 8 19 4
1838	114	50	3,000	175 15 0	295 9 7	123 0 6	16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

ANNUITIES.—In the AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the PROFITS of the Company, and receive a rate of Annuity much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its funds at a high rate of interest.

DIRECTORS.

Edward Barnard, Esq., F.R.S. C. E. Mangles, Esq.
Henry Buckle, Esq. J. B. Montefiore, Esq.
John Henry Capper, Esq. Richard Onslow, Esq.
Gideon Colquhoun, Esq. William Walker, Esq.

BANKERS—The Union Bank of London.

COLONIAL BANKERS—The Bank of Australasia (Incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN—P. Fraser, Esq., M.D., No. 62, Guildford-street, Russell Square.

SOLICITORS—Messrs. Swain, Stevens, & Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity, or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, corner of Cornhill.

EDWARD RILEY, SECRETARY.

HAIL-STORMS.

THE DEVASTATION caused by the late destructive HAIL-STORMS proves the necessity of Persons protecting themselves against such losses. Prospectuses containing the Rates of Insurance for Crops and Glass may be obtained on application to W. SHAW, Esq., at the Hail-Storm Insurance Company's Office, Wellington-street North, Strand, London.

THE CONICAL HOT-WATER BOILERS, invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Messrs. Veitch and Son's, Exeter; Mr. Pontey's, Plymouth; the Royal Botanical Society's Gardens, Regent's Park; and at the Gardens of the Horticultural Society of London. Considerable improvements have been effected since last season; particulars of which are in course of preparation.

NEW AND USEFUL INVENTIONS.

EDWARD WEEKS, Sen., HORTICULTURAL ARCHITECT, Hortulan-place, King's-road, Chelsea, original and sole Patentee for HEATING by HOT-WATER, respectfully begs to inform the Nobility, Gentry, and all Patrons of Horticulture—amateur as well as practical—that he has invented and brought to perfection several essentially-necessary improvements in the fitting up and construction of Forcing-frames and Hothouses, Greenhouses, Conservatories of whatever size or construction, namely, 1, a very powerful and effectual BOILER, at present unequalled; instantaneous in action, economical in fuel, and lasting in heat; not possible to corrode or to be out of order; 2d, a very simple STEAMING APPARATUS, by which the body of air in the house is kept in constant motion; and lastly, a very simple contrivance by which fresh air can be admitted or excluded at pleasure, even by the hand of a child, either within or without; either a single or double r.f. SHUTTERS also on a very simple principle. E. WEEKS begs further to state that as his inventions have been shamefully pirated and unfairly imitated, by which he has suffered seriously, both in purse and reputation, he is now under the necessity of not allowing the inspection of his new inventions or his Factory, except by employers or their accredited agents or gardeners.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hot-house-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted. References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGERS'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch £7 0s. 0d.
(Larger Sizes in proportion.)
Rogers's Boiler, small size 3 15 0
Ditto do. large do. 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs., at 4s. 0d. each.

Strong do. do. 45 lbs. at 4 4 "

Ox Hurdles, 4 feet high, 60 lbs. at 5 6 "

BEST WIRE for STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s., 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations. Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS.

CROSSKILL'S LIQUID MANURE CART, which

received the Honorary Reward of the Roy. Agricul. Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A. The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B. Patent Iron Pump, which cannot possibly choke or get out of order. E. The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price, delivered in Hull, 25*l*.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12*l*, 12*s*.

HENRY HUNT'S PATENT GARDEN POTS and STANDS, for effecting improved Drainage and draught of Air, of which highly favourable notices have appeared in *Paston's Magazine* for May, *Gardeners' Magazine* for June, *Practical Florist*, No. 23, and *Gardeners' Gazette*, May 6. Sold Wholesale and Retail at No. 29, Queen's-row, Piccadilly; and No. 17, Great Ryder-street, St. James's. N.B.—Nurserymen wanted as Agents for the above in many of the provincial towns.

J. B. LAWES'S PATENT MANURES, composed of Super Phosphate of Lime, Phosphate of Ammonia, Silicate of Potash, &c., are now for sale at his Factory, Deptford-creek, London, price 4*s*. 6*d*. per bushel. These substances can be had separately; the Super Phosphate of Lime alone is recommended for fixing the Ammonia of Dung-heaps, Cesspools, Gas Liquor, &c. Price 4*s*. 6*d*. per bushel.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & CO., LIVERPOOL AND BRISTOL.

POTTER'S GUANO.—TURNIPS, MANGEL-WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of Potter's Guano.

*** POTTER'S Portable Farm-yard Manure, at 4*l*. 15*s*. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

LIQUID MANURE. PUMPS of a Superior Construction, fixed and portable, for Liquid Manure. Garden Pumps, Hydraulic ditto, and Pumps for deep wells. Also Pumps for Ships, Barges, Tanners, Soap Boilers, Brewers, &c. Well-Digging and Boring executed.—BENJAMIN FOWLER, (late George Turner,) 63, Dorset-street, Fleet street.

PUBLISHING MONTHLY. LARGE, 1*s*. 6*d*.; SMALL 1*s*.; GARDENERS' EDITION, 6*d*. THE BOTANIC GARDEN; OR, MAGAZINE OF FLOWERING PLANTS. WITH MANY IMPORTANT AND USEFUL ADDITIONS. By B. MAUND, F.L.S.

Each Number contains BEAUTIFULLY-COLOURED FIGURES OF ORNAMENTAL PLANTS, both herbaceous and shrubby; suitable for the Flower Garden or Pleasure Ground. With the derivations of names; classes; orders; height of the plants; time of flowering; native country; history; qualities; most approved modes of propagation and culture; and other information, interesting to every lover of a Garden. Annexed to each Number, is the FLORAL REGISTER.

With Wood-cuts of admired Flowering Plants, mostly such as have been newly imported into this country; with the necessary information respecting them. Also,

THE AUCTARIUM, in which are given, improved methods of cultivation and preservation of vegetables, fruits, and flowers; new discoveries connected with gardening; and miscellaneous information. Also, in each Number, till complete, commencing with the new volume, on the 1st of January, 1843, a portion of Professor Henslow's

BOTANICAL DICTIONARY, Written expressly for the Author, there being so great a want of such a Work: thus, the BOTANIC GARDEN contains four distinct Works, proceeding together, at a trifling cost, once a month.

The Volumes already completed of this Standard Botanical Work, can be had at the following Prices:—

	LARGE.	SMALL.
Hf.-bd., green mor. backs, gilt edges, each 2	2 0 0	1 10 0
Cloth gilt, beautifully embellished	2 0 0	0 0 0
Drab boards	1 17 0	1 5 0

The Gardeners' Edition at 6*d*., with partially coloured plates, commenced in January, 1843, with No. 1. The portions of the FLORAL REGISTER and AUCTARIUM, already published, contain nearly Twelve Hundred Engravings, forming one handsome volume, which will be delivered GRATIS to the purchaser of four volumes of the BOTANIC GARDEN.

GROOMBRIDGE, Paternoster-row.

BOTANICAL BOOKS.

THE FOLLOWING WORKS ARE NOW TO BE HAD OF WILLIAM PAMPLIN, BOTANICAL BOOKSELLER, 45, FRITH STREET, SOHO SQUARE, LONDON.

TRANSACTIONS OF THE HORTICULTURAL SOCIETY OF LONDON. Seven Volumes. 4to. That is—the First Series complete, half calf, gilt, 7*l*. 7*s*.

TRANSACTIONS OF THE LINNEAN SOCIETY OF LONDON. Eighteen Volumes. 4to. That is—all that have yet been published. Vols. I. to XII. are neatly half-bound, and the remaining six are in Parts, as published, 17*l*. 17*s*.

TRANSACTIONS OF THE HORTICULTURAL SOCIETY OF PRUSSIA. Fourteen Volumes. 4to. A fine Copy, half-calf, gilt. Berlin, 1824-1840. 12*l*. 12*s*.

TRANSACTIONS OF THE IMPERIAL ACADEMY OF NATURAL HISTORY OF BONN. 4to. A quantity of separate Volumes, Parts, and Papers from this and several other similar Continental Works can always be supplied.

Of the following Books, copies are always to be found at W. PAMPLIN'S.

DE CANDOLLE.—PRODROMUS SYSTEMATIS REGNI VEGETABILIS. Seven Volumes. The eighth volume of this Work will be published in a few weeks; those persons who wish to receive it on the day of publication are requested to forward their names to the Advertiser at once, in order that they may be supplied without disappointment.

BUEK.—GENERA, SPECIES, ET SYNONYMA CANDOLLEANA, seu INDEX GENERALIS ET SPECIALIS AD DE CANDOLLE PRODRUM SYSTEMATIS NATURALIS REGNI VEGETABILIS. Pars I. et II. Berlin, 1842. 18*s*.

WALPERS.—REPERTORIUM BOTANICES SYSTEMATICÆ. Of this Valuable Work, the 8th Part, or Part III. of the second Volume, has just appeared. Price of each Part, 4*s*.

ENDLICHER.—GENERA PLANTARUM. Vienna, 1840. 4*l*.; or handsomely bound in two volumes, half-calf extra, 4*l*. 8*s*. 6*d*.

ENDLICHER.—MANTISSA BOTANICA. Vienna, 1842. 6*s*.

ENDLICHER.—ICONOGRAPHIA GENERUM PLANTARUM. Handsomely bound, half-calf extra. Vienna, 1838. 3*l*. 10*s*.

POEPPIG ET ENDLICHER.—NOVA GENERA AC SPECIES PLANTARUM QUAS IN REGNO CHILENSI PERUVIANO ET IN TERRA AMAZONICA, &c. Two Volumes, fol. Various copies, bound or unbound, from 4*l*. 14*s*. 6*d*. and upwards, according to binding and condition. The Parts of Volume the Third which have appeared, as well as most of the former Parts, can still be had separately.

PERSOON.—SYNOPSIS PLANTARUM. Two Volumes. Various copies, neatly bound or half-bound, from 18*s*., and upwards.

KUNTH.—ENUMERATIO PLANTARUM OMNIUM HUCUSQUE COGNITARUM, &c. Several of the Volumes may be had separately. 14*s*. each.

AUGUSTE ST. HILAIRE.—FLORA BRAZILIÆ MERIDIONALIS.—ADJUT. JUSSIEU ET CAMBESSEDES. Volumes I. and II., neatly half-bound, and remainder in Parts. Paris, 1824, &c. 7*l*. 7*s*.

MIKAN.—DELECTUS FLORÆ ET FAUNÆ BRAZILIENSIS, &c. Several odd Parts of this Magnificent Work, each, 15*s*.

FLORA.—ODER BOTANISCHE ZEITUNG. Complete from the beginning.

LINNEÆ, EIN JOURNAL FÜR DIE BOTANIK. Complete from the beginning.

GERARDE'S HERBAL, OR HISTORY OF PLANTS. Various Copies of both the Editions, from 18*s*. and upwards, according to condition.

PARKINSON'S HERBAL. Various Copies, from 18*s*. and upwards, according to condition.

LINNEÆ SPECIES PLANTARUM CURA WILDENOW. Various Copies, from One to Three Guineas, according to condition.

LINNEÆ SYSTEMA VEGETABILIIUM CURA SPRENGEL. Various Copies, from Two Guineas and a half to Three Guineas.

EKART SYNOPSIS JUNGERMANNIARUM IN GERMANIA, &c. Numerous Plates. 4to. Various Copies from 10*s*. 6*d*. to 12*s*.

WIGHT'S ICONES PLANTARUM INDIE ORIENTALIS, or Figures with Descriptions of East Indian Plants. This is allowed to be the very best and cheapest Work upon Indian Botany. The Third Part of the Second Volume has just been received from Madras; the Price of this Part is 1*l*. 5*s*.

WIGHT AND ARNOTT.—PRODRUMUS FLORÆ INDIE ORIENTALIS. Volume the First being all that has yet appeared. 16*s*.

*** N.B.—W. PAMPLIN has a good collection of British and Foreign Books upon FERNS.

In small 8vo, price 3*s*. 6*d*.,

PRODUCTIVE FARMING; or, a Familiar Digest of the recent Discoveries of LIEBIG, DAVY, and other celebrated writers on VEGETABLE CHEMISTRY; showing how the results of English Tillage might be greatly augmented. By JOSEPH A. SMITH.

WILLIAM TAIT, Edinburgh; SIMPKIN, MARSHALL, & Co., London.

This day is published, 12mo, Price 9*s*.

A MANUAL OF BRITISH BOTANY. Containing the Flowering Plants and Ferns arranged according to the Natural Orders.

By CHARLES C. BABINGTON, M.A., F.L.S., F.G.S., &c. "Mr. Babington's is a very valuable contribution to our knowledge of British plants; full of original observations and good critical remarks."—*Gardeners' Chronicle*, June 10.

JOHN VAN VOORST, Paternoster-row.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of A System of Popular Geometry.—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5*s*. cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun*.

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

FUN FOR THE FIRESIDE!

Bound in cloth, price 5*s*. 6*d*.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: WHITTAKER and Co.

CORNS, BUNIONS, &c.

THE PROPRIETOR OF THE ANTI-CALLOSITY, or RUSSIAN CORN AND BUNION PLAISTER, feels great confidence in recommending it as the most certain cure for all Callous Swellings on the Feet that has ever yet been invented. By the use of this Plaister immediate benefit will be found, and in a short time a Radical Cure will be effected by gradually dispersing the Hard or Soft Corn, and entirely removing those painful throbblings so severely felt at every change of weather.

Sold, with full directions for use, in boxes, 1*s*. 1*d*. and 2*s*., at SANGER'S Medicine Warehouse, 150, Oxford-street; and all Medicine Vendors throughout the country.

Remember—"THE RUSSIAN CORN AND BUNION PLAISTER."

ALL DISEASES of the KIDNEYS and BLADDER speedily and effectually cured by DR. YOUNG'S MIXTURE.

—The efficacy of this Medicine in the above Complaints has been long proved by its unparalleled success in a practice of many years' standing, and has induced the present proprietor to make it more generally known.

Sold in Bottles, 2*s*. 9*d*. each, by the Proprietor's Agent, J. SANGER, 150, Oxford-street, London; also by Johnson, 68, Cornhill; Prout, 229, Strand; Mr. King, 232, Blackfriars Road; and all Medicine Vendors throughout the country.

SUN-BURNS, FRECKLES, TAN, and other disfigurements of the Skin, are pleasingly eradicated by that unique preparation ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR."—It is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper, and "A. ROWLAND & SON, 20, HATTON-GARDEN," engraved on the Government stamp affixed to each bottle. Price 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

Ask for ROWLAND'S KALYDOR.—Sold by them, and by Chemists and Perfumers.

ONLY TO BE KNOWN TO BE VALUED.

DR. ROBERTS'S CELEBRATED OINTMENT,

called the POOR MAN'S FRIEND, is confidently recommended to the public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs, it cures years' standing, cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, cancerous humours, &c., and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots, at 1*s*. 1*d*. and 2*s*. 9*d*. each. Also his

PILULÆ ANTISCROPHULÆ,

confirmed by more than 40 years' experience to be, without exception, one of the best alternative medicines ever compounded for purifying the blood and assisting nature in all her operations; hence they are useful in scrofula, scorbutic complaints, glandular swellings, particularly those of the neck, &c. They are efficacious also in rheumatism, and form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes, at 1*s*. 1*d*., 2*s*. 9*d*., 4*s*. 6*d*., 11*s*., and 22*s*. each.

To those who cannot take pills, the proprietors would strongly recommend Dr. Roberts's

ANTISCORBUTIC DROPS,

for the cure of the scurvy, scrofula, leprosy, and all scorbutic complaints; they strengthen the constitution, purify the blood, and promote a circulation of the fluids; are gentle in their operation, and do not require cessation from business. In bottles at 2*s*. 9*d*. each.

By the late Dr. Roberts's will Messrs. BEACH & BARNICOTT (who have been confidently entrusted with the preparation of his medicine for many years past), are left joint proprietors of the "Poor Man's Friend," "Pilulæ Antiscrophulæ," "Larwell's Pills," "Medicated Gingerbread Nuts," and "Antiscorbutic Drops," with the exclusive right, power, and authority to prepare and vend the same.

The still increasing demand for the above medicines, from all ranks, is the best and most substantial proof of their utility.

Observe.—No medicine sold under the above names can possibly be genuine, unless "Beach and Barnicott, late Dr. Roberts, Bridport," is engraved and printed on the stamp affixed to each package.

BUTTER MADE IN TEN MINUTES

BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT. ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES, SUSSEX.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25 <i>s</i> .	35 <i>s</i> .	42 <i>s</i> .

Metal Pans for Churns to stand in, 4*s*. 6*d*., 6*s*., and 7*s*. Larger sizes made to order. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, Lewes.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street; BRINHAM, 19, Wigmore-street, Cavendish-square. Export Agents, BARNES & Co., 109, Fenchurch-street.

CURTIS'S BUDDING-KNIFE.—"This is the neatest Budding-knife we have seen. The ivory handle is shaped like the blade of a curved pen-knife, sharp, and turned up at the point, and is evidently extremely well contrived for the purpose it is intended."—Opinion of Professor LINDLEY, in the *Gardeners' Chronicle*, July 29, 1843.

GEORGE PLUM, Surgical Instrument Maker and Cutler, No. 3, Dolphin-street, Bristol, and at No. 262, Strand, London, begs to call the attention of the Public to the above new and desirable article, manufactured solely by him. Sent free to any part of the kingdom, on receipt of 38 penny postage stamps, or a post-office order for 3*s*. 2*d*.

Now ready, price 4s. 6d.,
RURAL CHEMISTRY.
 By EDWARD SOLLY, Esq., Jun. F.R.S.,
 Experimental Chemist to the Horticultural Society of London,
 Hon. Mem. of the Royal Agricultural Society, and Lecturer
 on Chemistry at the Royal Institution.
 London: 3, Charles-street, Covent Garden.

The Gardeners' Chronicle.

SATURDAY, AUGUST 5, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Aug. 8. } West London Floricultural, Walham Green.
 Wednesday, Aug. 9.

Tuesday, August 15. . . . Horticultural. . . . 8 P.M.

THE new aids which recent observers have been suggesting to gardeners will doubtless prove to them as beneficial as modern potent medicines have become to physicians. What mercury and calomel, with all the poisonous brood of Hellebore, Aconite, and Henbane, are now to the latter, ammonia, with the nitrates, sulphates, muriates, and phosphates, will soon be to the gardener. But in both cases, a knowledge of the true and beneficial application of them will be arrived at through many accidents and errors. If this has been the case with medicines for man, it will be much more so with appliances to plants; for those who have to administer the latter are unskilled in delicate operations, and the death of their patients involves but little responsibility. Nevertheless, as a good deal of inconvenience and some serious loss may attend the unskilful administration to plants of the most beneficial substances, we cannot do better than offer some observations upon the manner in which, as a general principle, agents of unknown force ought to be applied.

The common error of all those who are experimenting is to imagine that because a substance is undoubtedly beneficial to one plant, under one set of circumstances, it will necessarily be so to all plants, and under all other circumstances. A man is apt to believe that he cannot have too much of a good thing; and, applying that idea to his plants, to suppose that if a little of anything is useful to them, a good deal must be still better. It was some years ago ascertained that if a little muriatic acid was mixed with a great deal of water, the plants in the neighbourhood of the vessel from which this fluid was evaporating became excessively vigorous; immediately after this discovery, a zealous gardener placed pans of pure muriatic acid in his greenhouse, and, of course, killed everything within reach of the fumes. Nitrate of soda has been proved incontestably to exercise a highly-beneficial action upon most plants, if used in very small quantities; yet how many hundred plants have perished under the infliction of this agent in excess! Nothing can be more important to healthy vegetation than ammonia; yet, because we suggested the probability of its proving advantageous to plants in Vine-ries, and similar buildings, if allowed to mingle with the air, a gardener of our acquaintance placed pans of the strong London gas-liquor among the leaves of his Melon plants, and, of course, a couple of hours put an end to the experiment by destroying half his foliage.

The truth is, that all agents of this sort should be applied in what it is now the fashion to call homœopathic doses, that is to say, in quantities so small as to be inappreciable by our senses. It is thus that nature administers them, and we never can do better than follow her closely. Naturally, ammonia is conveyed to plants in rain-water, but in quantities so very small at each dose, that chemists could not for a long time discover its presence at all. In thunderstorms the quantity may be doubled, and we all know with what beneficial effects; yet even then it is undiscoverable by our ordinary senses. Salt is in like manner given to plants by the atmosphere, yet who can taste salt in the air of even the sea-coast, unless in stormy weather? Now these things are not the result of mere chance, but form a most important part of the system of unerring Wisdom observable in the universe. The organs of plants are not capable of sudden and violent action; they have not, like the stomach of animals, a rapid power of decomposing and assimilating what is presented to them; but their digestion is sluggish and incapable of being much quickened without danger to their lives. To that danger nature does not expose them—why should man?

The more we see of the action of alkaline and other agents upon plants, the more we are convinced that the true way of administering them is in extremely small quantities at a time, and that although they may sometimes bear larger doses with impunity, yet that risk always attends their administration in quantity. For example, suppose that it was desirable to give garden plants gas-water at the rate of one gallon a rod,—instead of applying it all at once, however diluted, it would be infinitely better to give it at ten different times, and each time greatly diluted. It would be better, instead of mixing it with fifty gallons of water, and applying it all at once, to mix it with

five hundred gallons of water, and to apply it on ten successive occasions. We are extremely anxious that this should be clearly understood, because we foresee that if it is not attended to, all that powerful assistance which artificial agents are capable of giving to plants will be lost, and that gardeners, dismayed by the bad consequences of over-doses, will leave off using them at all. And yet their own experience gives them a better warning than we can of the great importance of attending to these matters.

Every gardener knows that when a hot-bed is first made up, the atmosphere of it is one in which plants cannot live; although when it "sweetens," as they say, it becomes more grateful to plants than any other which is known. Now what is it that renders the atmosphere of a hot-bed fatal at first, and salubrious afterwards? Its temperature?—hardly that, for it is easily moderated, and rarely is more than plants can well bear. The quantity of water that is suspended in it?—certainly not; for a damp atmosphere is incapable of producing such sudden death as seizes plants in the vapour of a fresh and rank hot-bed. It is the ammonia that flies off, which, when abundant, as at first, is fatal, and which, when in moderate quantity, as afterwards, is so grateful to plants. We have here a case of poisoning at first by an over-dose of that which afterwards, in proper quantity, is the carrier of health and vigour.

These are most important considerations, in every point of view, and more especially now that the tank-system of furnishing bottom-heat is so rapidly driving stable-litter out of the field. We fully anticipate disappointment in the effect of the tank-system, as compared with the old hot-beds, unless some means are taken of throwing a proper quantity of ammonia into the air. We have no doubt that in using this substance a good many gardeners will kill their plants outright; but we are also persuaded that it will be easy to apply, and that there is not the shadow of a necessity for any such unfavourable result. The maxim must be, "A very very little, very very often." We should begin by pouring a wine-glass-full of gas-liquor for every ten sashes into the tanks or water-troughs once a day, when about to steam the pits, and if we found this a safe quantity we should double it; and go no further, except with extreme caution.

SOME general directions as to the mode of cultivating the small portion of arable land which we recommended to be occupied with the Grass-land attached to a country-house or villa may be acceptable even to those who have ample means of information, from their own observations, or from Agricultural works. This land must be considered as something intermediate between a garden and a farm; it should be cultivated as a garden, but cropped like part of a farm. The tillage should be as perfect as possible; and the great object, whatever be the nature of the soil, to bring it to the highest state of fertility of which it is capable. If the soil be originally poor, a judicious outlay in labour and manure will gradually improve it; but a certain system must be followed to avoid a useless expenditure of capital. In all cases it should be trenched all over at least two feet deep. If the subsoil is of so barren a nature as to be unfit for being brought to the surface, and only a small depth of good soil lies over it, the improvement will be slow. The subsoil must be stirred to a small depth at first, and earths mixed with it to improve it. Suppose a very coarse gravel mixed with sand and yellow oxide of iron within six inches of the surface, where the soil is a poor light sandy loam—we can scarcely suppose a worse soil. We have chosen it on purpose; for it is frequently met with in Surrey and Hampshire, and particularly on Bagshot-heath; yet such a soil has been improved and rendered fertile by poor cottagers, who were allowed to build a hut and inclose a garden on the heath, the land being of no value. A person with a command of capital would improve such a spot in much less time.

In the first place, the iron is to be neutralized, which may be done by exposure to the air, when moist, with the addition of lime, or chalk, and peat-ashes. The protoxide will gradually be washed out, or changed into peroxide. Clay or marl mixed with the sand and gravel will consolidate it, and animal or vegetable manure will make it produce something. Potatoes are often among the first crops. Buckwheat and Rye are the only kind of grain which will succeed as yet. Continued tillage and abundant manuring soon produce an improved top soil, which, from being of a yellow colour, becomes brown by the addition of humus. There is often a hard thin crust at a small depth below the surface of such a soil, which is known by the name of the *pan*, or *moor-hand*. This is formed by the iron deposited from water which runs through the light soil, and meeting a more impervious loam, crystallizes or forms a kind of hard cement with the fine siliceous sand. This is impervious to water, and until it be removed or broken through, no improvement can take place. Deep trenching is therefore indispensable, and is

repaid by the loam which is found under the *pan*, and which, although impregnated with iron, improves the texture of the loose top sand.

By great expense or indefatigable industry many acres of such a soil, which the law declares to be *suapte natura sterilis*, or absolutely barren, so as to be exempt from tithes for seven years after cultivation, under the old laws, have been brought to a comparative state of productiveness. We would not recommend such land while better is to be had, but we take an extreme case as an example.

The other extreme is a wet stiff yellow clay, which it is impossible to work upon in its wet state, and which becomes a perfect rock for hardness when dry. Yet this soil is more readily rendered fertile than the last. It must first of all be laid dry by numerous drains two-and-a-half feet deep, and very close to each other, the tiles in the drains being covered with six inches of *small gravel*, and the whole ground trenched two feet deep, laid in ridges before winter, and not touched again till moderately dry and mellowed in spring. Manures chiefly in a long undecomposed state may be dug in, and Potatoes planted, laying the ground as loose as possible over them; or Beans may be dibbled in rows, two feet apart. If lime or chalk can be obtained, it will greatly improve the soil, and may be put on to almost any extent. Twenty cart-loads of chalk, forty bushels each, will not be too much; or 300 bushels of lime per acre. Coal-ashes likewise will greatly improve the land, by preventing its running into clods. However unpromising this soil may be at first, it will be more easily improved than the poor sand impregnated with iron.

We do not suppose that many spots will be chosen for cultivation where the soil is so unpropitious; but many partake of the one or the other extreme, and with a little pains may be converted into very useful land. Patience and perseverance overcome many difficulties. This may be considered as a digression, as few of our readers we hope have such soils to bring into cultivation; but by giving extreme examples we shall better instruct those who have little experience. We have ourselves land in cultivation, once very nearly as unpromising, and our description is not taken from mere imagination.

The spade, the pickaxe, the fork, and the heavy hoe are the instruments of tillage which alone can bring ungrateful soils to a productive state. Tillage is the great improver. The old man in the fable, who told his sons when he was on his death-bed that a treasure lay buried in their field, gave the great secret of fertility. Dig deep, stir it well, expose it to the air, and the treasure will be found in the crop.—M.

TREATMENT OF FUCHSIA CORYMBIFLORA.

BEING aware that the robust growth of *Fuchsia corymbiflora* had often been complained of, on account of its attaining to a size altogether unsuited for small buildings, I was, last summer, induced to endeavour to flower this plant in as dwarf a state as possible, but having it at the same time in good health. As I have succeeded beyond my expectations, and as an account of its treatment may be of service to others, I communicate it to you, that you may make it known through the medium of the *Chronicle*. The leading shoot of a young plant was last summer pinched off, so as to leave two healthy joints, to produce shoots from the axils of the leaves. When these shoots were about a foot in height, the strongest of them were bent down and trained horizontally, for the double purpose of allowing the weaker ones to overtake them in growth, by remaining erect; and likewise to cause other young shoots to spring from those parts of the stem that were growing horizontally: this they will do, upon the principle, that the sap in general has a tendency to ascend.

From those shoots that pushed, nine of the strongest were selected, the remainder being rubbed off. Six of them were arranged to form the outside, the other three composed the centre. The tops of the shoots were kept nearly upon a level at first; but as the central shoots had the benefit of receiving more of the ascending sap, they soon took the lead of those forming the circumference, which brought the plant to the most suitable shape for rendering its floral beauty attractive. This spring, when it was scarcely two feet in diameter, and about the same in height, it developed its gaudy corymbs from the summit of each shoot. The plant has been a very conspicuous object for a long time, attracting the eye of the visitor immediately on entering the greenhouse. It was reported before the commencement of winter, when, I gave it a good shift, and used very rich soil. It has not been reported since, being allowed to bloom in the same soil in which it grew through the winter. As it is a gross feeder, I occasionally give it liquid manure.—H. H. Cantley.

ON THE TRANSMISSION OF CUTTINGS TO INDIA.

ABOUT the first fortnight in August is the right time for taking the first steps for preparing grafts or cuttings of fruit-trees, &c. destined to go by the overland mail, next November, to India or China, or to any other of our distant possessions. For the manner of preparing such grafts see the remarks at the head of the *Calendar to-day*, and others on the same subject, which I made this time last year, vol. ii., p. 558, which have met the approbation of a gentleman of high physiological acquirements, who takes an active interest in all subjects tending to the general improvement of our East Indian territories; see also vol. ii., p. 539, and Number 14 of the current volume,

p. 228; to which I may add that I have the sanction of my worthy employers to prepare grafts here after the manner I suggest, and that I shall be glad to send them, carriage free, to London next October, in time to be packed for the November overland mail. I may further add, that I once unpacked a case of plants that had been lying seven months in a hot warehouse at Vera Cruz, and that some of the woody plants packed in saw-dust were still alive, after being packed full nine months; and I have little doubt but grafts of two years old wood, if packed after the manner of those sent to India by the overland route, and placed in a large case of dry saw-dust, or in a bale of cotton, might be sent to India or China, round the Cape of Good Hope, in the bottom of a merchant vessel; and if care were taken not to excite them too much at first, there would be little danger of their success. In Dr. Gibson's letter of the 27th April, 1842, (vol. ii., p. 539), he says, "All the cuttings of the Jargonelle, &c. have rooted, and till the beginning of the hot season were flourishing. Since then they have drooped much and I fear they will die." Now, it was natural enough to suppose that these cuttings were rooted, when they broke forth into leaf, but the chances are that none of them formed any roots at all. Indeed, from their arrival till the date of Dr. Gibson's letter, there was hardly sufficient time for their rooting, even in the climate of Bombay or Calabar, supposing they had arrived in as good a state as when they were packed in London. We have all of us seen analogous cases at home; the Elm and other deciduous trees, after being felled in the spring, break into leaf on the approach of summer, and keep green for five or six weeks, or till the leaves exhaust all the available sources of the parent tree, and then fade away, just as the above cuttings are reported to have done, after going through the same process; and in all probability the fate of the two Golden Pippin and one Duchesse d'Angoulême cuttings, which reached Calcutta safe, will be reported by Dr. Griffith to have been the same, unless better precautions had been taken to insure their success than were used towards those in the nearer stations of Calabar or Bombay; and if so, something further must be done for the safety of future trials. If one might suggest a gardening hint to our distant friends in the East, it would be this:—Plant the cuttings 4 inches deep, in very light soil, and press it about them so close, that you could not pull them up without a good effort. The sun should not shine on your cuttings at any hour of the day; if this shaded situation is naturally dry so much the better in your hot climate, but you must keep the soil always moist by watering after the rainy season. As soon as signs of vegetation begin, place a wooden box over the cuttings about 15 inches high with the bottom taken out of it, and glass or strong white paper, oiled, used instead; this will give them light enough at this stage. In England, we would place a hand-glass over them, but the wooden-box is preferable in your climate, being a powerful non-conductor of heat, which is just what your cuttings require. If you see the least dampness within the box, remove it, scrape away a little of the surface-soil all round, and sprinkle some dry earth or wood-ashes in its place, wipe the box dry, and turn it over them again. As soon as the young shoots are from 4 to 6 in. long, begin to let in air by placing a piece of wood under one corner of the box sufficient to raise it up 3 in.: but this is a critical period. If you see the leaves drop in the least you must let down the box again for another week, and afterwards begin with opening only one inch, which you will increase by degrees, as your tenderlings gain strength; but I should think you cannot dispense with the box altogether for five or six months, although you may take off the glass or paper top as soon as the leaves will endure a 6-inch opening under the box. Unless you have a good gardener, you should never plant your cuttings in pots, as they are liable to get either too dry or too moist—the natural moisture of the soil is more uniform and congenial for them.

That I might speak with more confidence on this sub-

ject I began to make the same experiments here about this time last year, by preparing cuttings of Apples and Pears, which I planted in two aspects last November, on an east and north aspect—those on the north aspect are now a month in advance of the others. I did not think hand-glasses would be necessary in our cool moist climate. By the end of last May they began to leaf, and by the end of June you would have supposed by their appearance that they were well furnished with roots, but not a fibre was made at that time, and now they are only beginning to put out roots, and I shall send one of them along with this to show the state they are in. Now, if this summer had been as hot and dry as the last, all my cuttings would have perished last June, unless I kept a cool moist atmosphere round them under a hand-glass.

The English reader will excuse me for going this length with a subject that might be privately reported to the parties interested, but as there may be others engaged in the same pursuit in other distant parts of the world to whom any suggestions of this nature may be acceptable, the pages of this widely-circulated Journal seem the best channel for the purpose.—D. Beaton.

PLAN OF THE PROPAGATING-HOUSE AT MESSRS. VEITCH'S, EXETER.

The accompanying are plans and sections of our new Propagating House, which has now been erected and in

full work for several months, during which time it has more than answered our most sanguine expectations. It is divided, as will be seen by the plan, into two compartments, which are entered from the back through a lobby or small potting-room. One division we devote to propagation in general, and the other to the raising of newly-imported seeds; and it is at this time completely filled with supposed novelties from all quarters of the world, especially from South America, whence we have received them, through our collector, Mr. William Lobb. The house is built in the middle of a piece of ground containing a quarter of an acre, and is inclosed with walls and hornbeam hedges, being so situated as not to be seen by visitors. It is surrounded with pits, frames, hand-glasses, &c., in which the young plants raised and propagated within the house are hardened off, and in which the increase of such plants as do not require the aid of a house or bottom-heat is also carried on, the whole forming a complete propagating department. The house is heated on Rendle's tank system. The tank is formed of brick arches worked in cement, with brick sides, the whole being well coated with cement. The top is of slate, cemented down. The sides of the bed are also formed of brick-work. The material used for plunging in is a clean sharp sand, which we find retains the heat for a considerable time. In one part of the bed we have put soil, and the cuttings planted out in it have rooted most rapidly. We would draw your

attention particularly to the simple and yet efficient manner in which we regulate the heated water by means of the apertures D. By this contrivance we can heat only one division of the house at a time, or only half of either or both divisions; and while all can be heated at one time, yet each bed may be regulated to a different degree of heat, thus forming four distinct beds to be heated as circumstances may require. These apertures are formed with short pieces of 4-inch iron pipe, cemented into the brick-work, and the circulation is regulated by having plugs to fit the pipes. This plan, though simple, we believe to be new, and the advantages arising from it must be apparent to every one. Steam, if required, may at any time be obtained by opening the doors at which access is procured to the apertures for increasing or diminishing the circulation of the water. Mr. Rendle has seen the house, and joins in the opinion expressed by every other person who has inspected it, that it is the most complete house of the kind which he has ever seen, and he also considers his tank system of heating to have been here most fully and efficiently carried out. From the trial already given, we unhesitatingly say that, as a medium for obtaining bottom-heat, it is most admirable, and ere long will entirely supersede the use of Tan, and all other fermenting materials.—J. Veitch and Son.

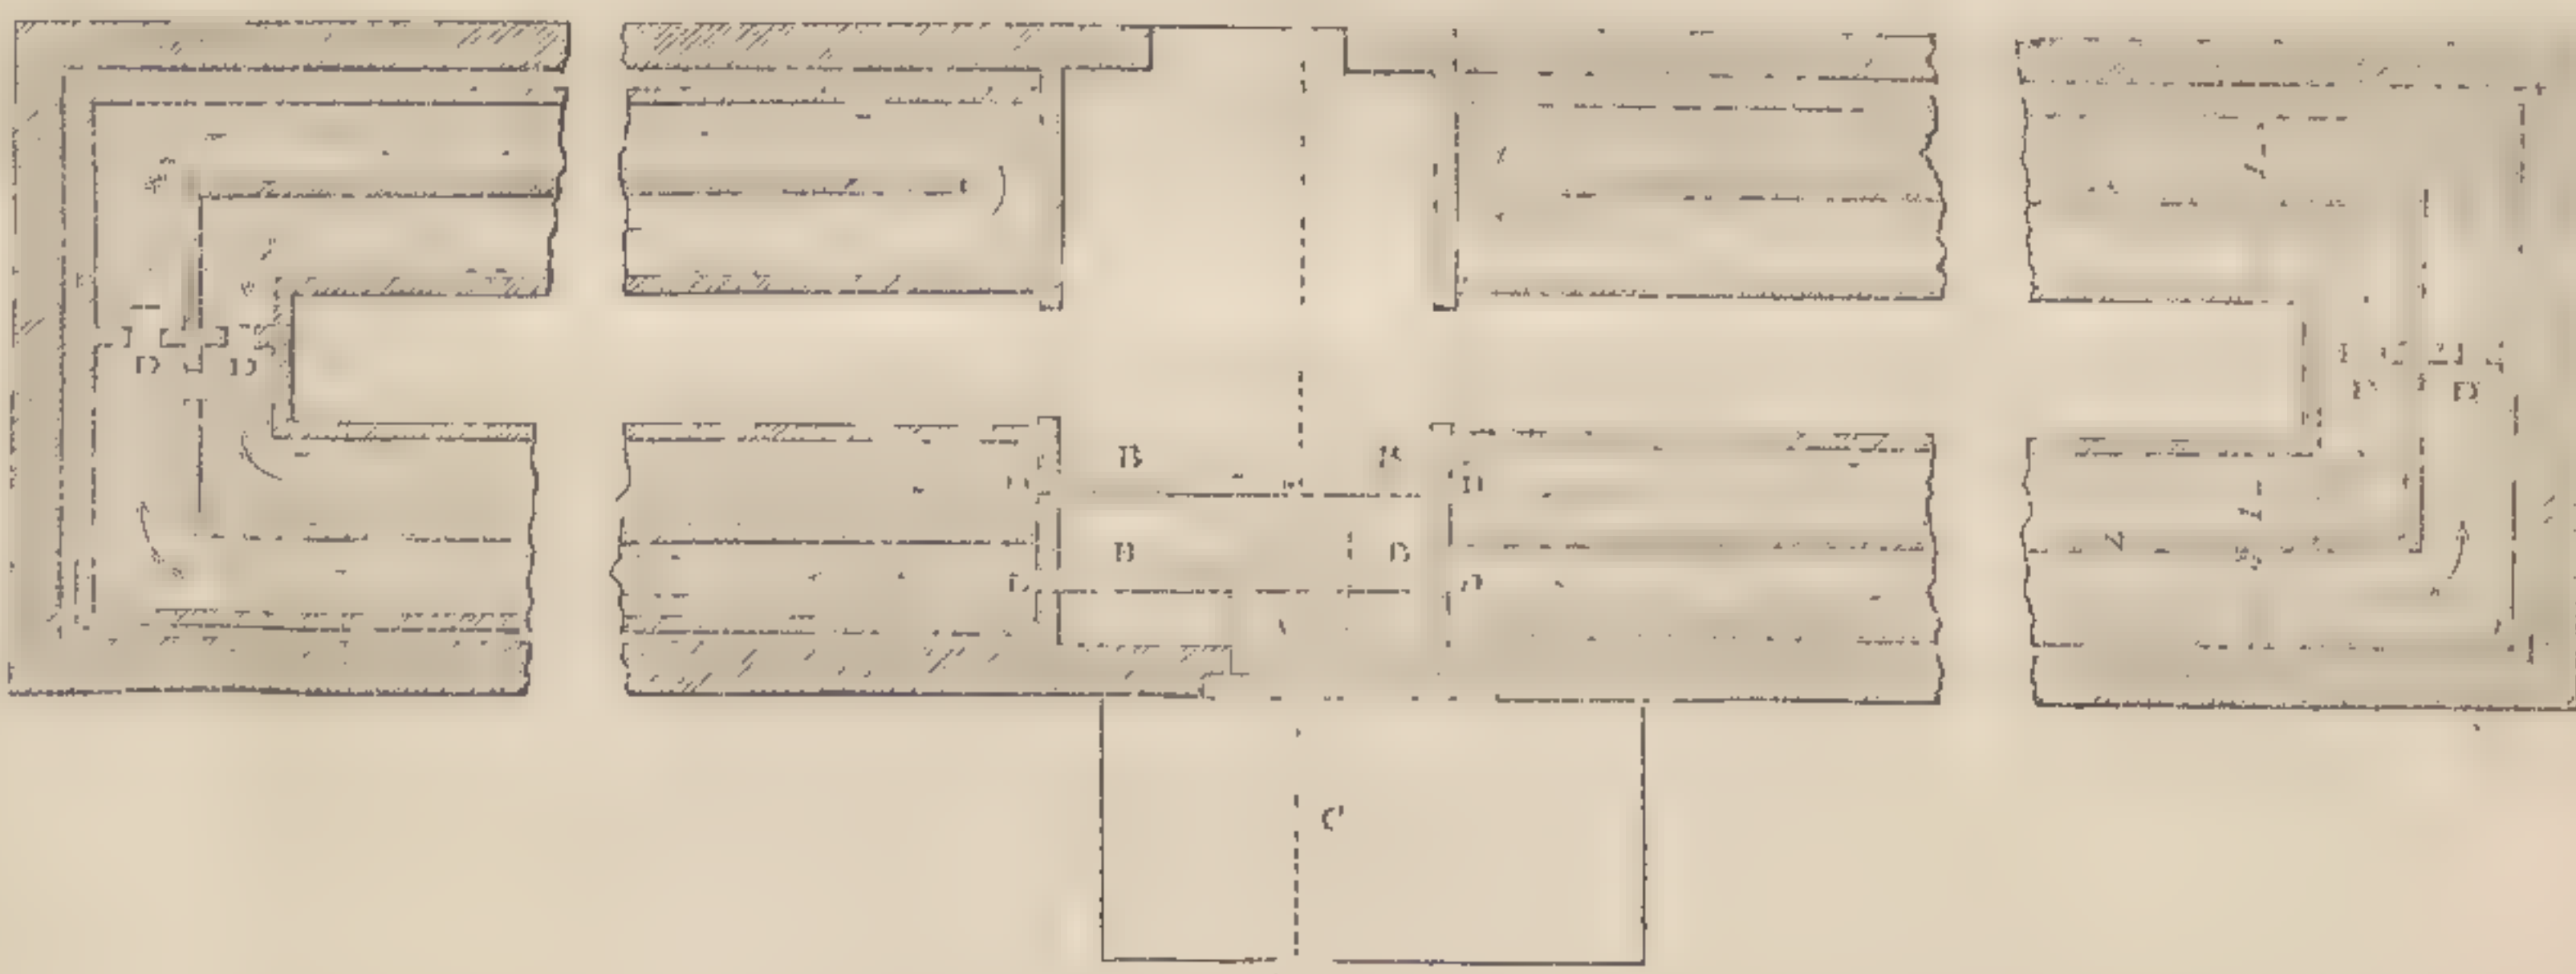

Section from Y to Z.

Transverse Section.

A represents the Boiler, &c.
B Flow and return-pipes.
C Stoke-hole.
D Plug-holes for stopping the circulation of hot water, if bottom-heat is required

only for one house or for part of one house.
E Doors for getting access to the plug-holes, and also available for steaming the House when required.
H Potting-benches.

Plan showing the Circulation of Water.

Plan of Construction.

AMATEUR'S GARDEN.—No. XXXI.

The first step towards ensuring an effective display of flowers in the coming year is to make the arrangement at the present time, when it can be determined with the greatest accuracy what kinds of plants will look best in certain situations; for, let it be remembered, that, however well the plants may be known, the exact—I may say peculiar—tint of the flowers, cannot be carried in the eye, and therefore no correct arrangement can be made at the

time the plants are out of bloom. In making the arrangement, the best way to proceed is to take a quantity of sand and spread it on a table or potting-bench, of sufficient size to admit of a correct representation of the flower-garden being formed upon it. If your garden is on gravel, form your beds, and proceed to fill them with flowers of the most admired colours, and if the first arrangement does not please you, re-arrange until you get it to your satisfaction. When the garden is on grass, strew the spaces between the beds with short grass, as it is indispensable

that you have the colour of the spaces between the beds, or you cannot determine what colours will look best in them. After the arrangement is completed the beds must be numbered on a plan, and the names of the flowers entered in the "Garden Catalogue," with the number of plants requisite to stock the beds properly—always allowing a few of each kind for deaths, or for giving or exchanging with any friend that may be disposed to barter with you. Where there is more than one flower-garden, the plants for each should be kept separate throughout the winter, and in spring, when they are potted off, it is easy to put in a few pots of cuttings to make up any loss that may have occurred, which, where a great quantity is required, is almost inevitable.

At this place we have four distinct flower-gardens, which, with their circumferential borders require, to stock them properly, about 10,000 plants, and we require nearly the same quantity to fill up the vases, rustic baskets, borders and beds scattered about the lawn. In the coming season, I intend these four gardens—three of which are on grass, and the fourth (will be) on gravel—to be representative of four distinct styles of grouping; while in the vases and baskets I shall endeavour to introduce those flowers of a drooping habit which are best seen on a level, with, or rather above the level of the eye, as for instance the whole tribe of Fuchsias and many Pentstemons, &c. In one garden the flowers will be arranged in masses of one colour in each bed;—in the second each colour margined with its complementary one, as blue with orange, purple with yellow, scarlet with white, and so on,—in the third three or four colours in each bed, with probably a specimen greenhouse plant in the centre,—and the fourth, which will be on gravel, principally with cold colours, as blue, purple, and their numerous shades, which cannot be properly shown on grass, which is a cold colour. In this way I hope to do away with the sameness which must otherwise exist among the gardens, and afford visitors something to think about, and an opportunity of examining which is the most effective style of gardening.—This is, I think, a new idea, and I hope I shall not be charged with egotism for throwing it out and giving others an opportunity of applying it to practice.

The layering of Chrysanthemums, if not already commenced, should be no longer delayed. The way to proceed is to make an incision in the under side of the shoots, about six inches from the tip, and sink it into the ground, placing a little fresh sandy compost round it, and either pegging the shoot down, or securing it by placing a stone or half brick over the compost. The young plants will be ready to take off towards the end of September, and will make beautiful dwarf flowering specimens.

The middle of August is the best time to sow Ten-week Stocks to be preserved through the winter in pots, and planted out in April for spring blooming. One of the best growers for the supply of Covent Garden Market makes it a rule to sow on the 11th and 16th of August, and the plants generally commence blooming about the end of March.—*W. P. Ayres.*

ROSES IN POTS.—No. I.

THE Rose, which has been justly designated the "Queen of Flowers," has, perhaps, never attained to a higher degree of popularity in England than at the present time. The improvement in this beautiful genus, by the introduction of new varieties, has been greater within the last few years than the most sanguine Rose cultivators could have anticipated; and the improvement in the cultivation here has been quite equal to the success in originating fine varieties abroad. The adoption of a class for the exhibition of "Roses in Pots" by the Horticultural Society of London appears to have awakened attention to this mode of culture. Exhibitors during the past season have been few, because there were many misgivings on the point, which want of experience and knowledge of the varieties best suited for the purpose tended to confirm. Those, however, who have grown Roses in pots during this season, appear convinced that the difficulties advanced are imaginary, and are looking forward to another year to produce handsome plants, with more perfect flowers. Roses in pots form highly interesting objects among the French; and why should they not do the same here, since it is allowed that our general cultivation of Roses in the open ground is quite equal to theirs?

One great advantage in exhibiting Roses in pots is, that their true character becomes apparent; we see the Rose as it would appear growing in our gardens, and can refer it to its proper class. On the other hand, the greatest difficulty is to obtain a sufficient number of plants clothed with flowers, and in perfection, at a stated period. This, however, (which only affects exhibitors,) may in a great measure be remedied, by growing the freest bloomers and shifting the plants to a sunny or cool situation, as their state may require. Where twelve plants are wanted for exhibition at different seasons, not less than one hundred plants should be grown, and the greater portion of these should be Autumnal Roses.

But before advertizing to their culture, the question may arise, what varieties are best suited for the purpose? It is probable that most varieties would succeed, but the following, many of which are established favourites, may be selected without fear, a great portion having been proved suitable in the nurseries here during the present season.

The varieties from the sections Moss, Provence, Gallica, Damask, Perpetual, and a portion of the Hybrids, I would advise to be grown as worked plants, on stems from six inches to two feet in height; the others may be grown on their own roots, or at the option of the cultivator. In very many cases, however, worked plants produce a

greater quantity of flowers, and of larger size than such as are grown on their own roots.

Among the PROVENCE we may mention—
a Adeline, bright red
a Blush
a Cabbage, rose
a Crested, or Cristata, rose
a Angers, bright rose
a La Fiancée, flesh
a Queen of Roses, bluish lilac
a Emmerance, sulphur
a Sylvain, brilliant rose
a Wilberforce, deep crimson

MOSS.

Blush
a Celina, rich crimson, spotted with purple
a Eclatante, bright even red
a Gracilis, rose
a Pomponne feu, bright rosy crimson
a Unique, pure white
a White Bath, pure white
a De Metz, bright rosy purple

DAMASK PERPETUAL.

a Rose du Roi, or Crimson
a La Mienne, deep rose
a Josephine Antoinette, bluish
a Emilie Duval, pale rose
a Isaac Lablée, bright pink
a Bernard, salmon rose
a Antinous, rosy purple
a D'Angers, rosy pink
a Belle Faber, deep rose
a Royale, light rose

HYBRID PERPETUAL.

a Aubernon, bright rose, changing to red
a Clementine Duval, rose and lilac
a Comte de Paris, purple and crimson
a Coquette de Montmorency, fine deep cherry
a Dr. Marx, brilliant carmine
a Duc d'Aumale, superb deep crimson
a Duchess of Sutherland, fine pale rose
a Edward Jesse, dark purple, shaded with crimson
a Fulgorie, rosy carmine
a General Merlin, light rose shaded
a Lady Alice Peel, deep pink
a Louis Bonaparte, vermilion
a Madame Laffay, brilliant rose
a Mrs. Elliot, rose, shaded with purple
a Prince of Wales
a Prudence Rösser, pale rose, with a whitish cast
a Princesse Hélène, bright rosy purple
a Queen Victoria, rose, carmine centre
a Rivers, bright crimson

HYBRIDS OF CHINESE AND BOURBON.

a Aurora, crimson, shaded with violet
a Camuzet carnée, beautiful peach
a Charles Duval, superb deep pink
a Col. Combes, bright crimson, spotted with lilac
a Comtesse Lacépède, clear flesh
a Coupe d'Amour, bright deep rose
a Coupe d'Hébé, superb deep pink
a General Allard, large globular rose
a General Kleber, crimson, changing to violet
a Great Western, crimson and purple, very large
a Henri Barbet, bright deep rose
a Hortense Leroy, bright pale rose
a Lady Stuart, fine clear blush
a Legouvé, rosy crimson
a Lord John Russell, brilliant rose
a Madame Plantier, pure white
a Madame Rameau, purplish crimson
a Madeleine, flesh, edged with crimson
a Marie de Nerœa, pink blush
a Micaela, bluish rose
a New Globe Hip, pure white
a Princess Augusta, bright crimson and purple, shot
a Pomponne bicolor, purple and crimson shaded
a Richelieu, rose
a Velours épiscopal, violet, velvety
a Volney, very bright rose
a William Jesse, crimson; tinged with lilac

GALLICA.

a Adèle Prevost, silvery blush
a Blanchefleur, flesh and white

Those marked 'a' are large full Roses, the others are desirable on account of their fine habit, distinct colour, or showy appearance.

Roses trained as climbers would form very beautiful objects in pots. If allowed to grow to the height of three or four feet and then stopped, I imagine they would throw out lateral shoots, and become covered with foliage and flowers, from the top to the edge of the pot. For this purpose I should select in preference to the Ayrshire, Boursault and Sempervirens, some of the Hybrid China, Hybrid Perpetual, Noisette, Bourbon, and even some of the Gallicas that are most vigorous in growth; the flowers of the former being mostly small, or semi-double. Notwithstanding this, they are, perhaps, unequalled when

a Boula de Nanteuil, dark crimson purple
a Cicero, bright crimson
a Daguessau, deep bright crimson
a Daubenton, fine bright rose
a Duc de Nemours, violet and crimson, marbled
a Duchesse d'Abrantes, pale rose
a Docteur Dielthim, dark shaded rose
a Fleur d'Amour, bright crimson purple
a Grandpapa, shaded crimson
a Grandissima, purplish crimson
a Jeanne d'Urfé, rose and lilac
a Julie d'Etanges, pale rose
a La Calasienne, finely-shaded rose
a Louis Philippe, superb dark rose
a Nero, violet crimson spotted
a Phœnix, bright rosy crimson

NOISETTE.

a Aimée Vibert, pure white
a Clara Wendel, pale yellow
a Comtesse de Tolosante, white, sometimes flesh
a Du Luxembourg, lilac rose, deep red centre
a Euphrosyne, pale rose and yellow, very sweet
a Fellenberg, fine bright crimson
a La Victorieuse, white, shaded with rose
a Madame de Chalonge, yellow
a Miss Glegg, pure white
a Yellow, or Smithii

BOURBON.

a Armosa, bright pink
a Augustine Lelieur, vivid even rose
a Bouquet de Flore, light carmine
a Célimène, fine clear blush
a Ceres, deep rose
a Comice de Seine et Maine, vivid scarlet
a Emilie Courtier, fine rosy crimson
a Enfant d'Ajaccio, purplish crimson
a Julie Deloynes, white
a Le Grand Capitaine, fiery crimson
a Madame Ande, clear lilac rose
a Madame Nerard, silvery blush pink
a Paul Joseph, deep velvety crimson
a Proserpine, dark crimson
a Queen, buff, rose and salmon

CHINESE.

a Augustine Hersent, deep pink
a Belle Isidore, pale rose changing to crimson
a Lady Warrender, white, creamy centre
a Louis Philippe, carmine purp.
a Madame Bréon, beautiful light rose
a Madame Bureau, pure white
a Madame Desprez, pale lemon, very sweet
a Marjolain, dark crimson
a Mrs. Bosanquet, pale flesh
a Napoleon, bright pink
a Prince Eugene, crimson purp.

TEA-SCENTED.

a Adam, clear light rose
a Archduchess Thérèse, creamy white and yellow
a Barbot, yellow, edged with rose
a Belle Archinto, flesh, shaded
a Bougère, deep rosy bronze
a Bride of Abydos, creamy white, edged with rose
a Caroline, bluish pink, centre rose
a Comte de Paris, flesh-coloured rose
a Devoniensis, pale yellow
a Don Carlos, pale buff & salmon
a Eliza Sauvage, pale yellow, orange centre
a Eugène Desgaches, fine rose
a Fragolotta, bright rose
a Goubault, rose, buff centre
a Haman, rose and buff, changing to crimson
a Julie Mansai, pure white
a Madame Roussel, white, flesh centre
a Josephine Malton, large, creamy white
a Moiret, yellowish bronze
a Niphotos, large sulphur white
a Nina, clear blush rose
a Pictolus, fine yellow
a Prince d'Esterhazy, large rich rose
a Safranot, buff and yellow
a Tagliont, creamy white, centre buff.

grown as pillar-Roses in the open ground. Their growth is rapid and graceful, and their large corymbs of flowers render them a mass of beauty. Such plants as are not kept in pots should be removed from the ground early in autumn, as soon as the shoots are sufficiently ripened, which they generally are by the middle of September.

It potting, the sized pots best adapted are Nos. 12, 16, 24, and 32, according to the size and habit of the plant; and these should be well drained. The soil used should consist of equal parts of turfy loam that has laid by and become mellow, and manure (the remains of a hotbed) so far decomposed, as to have the appearance of black mould. If the loam be of a hard or binding nature, a mixture of sand will be necessary. Having selected the plant, cut off close to the stock any wild suckers, and shorten in the roots tolerably freely. In potting, the soil should be pressed down firm, and afterwards watered through a fine rose. The plants may then be removed to a sheltered situation, and plunged up to the rims of the pots in old tan or cinder-ashes. Under this treatment, if turned out of the pots in November, young fibrous roots will be seen forming in abundance; they will appear to have quite recovered from their removal, and will bloom well the following summer.

With regard to such plants as are always kept in pots, they may be shifted at different seasons of the year, as their growth may require. Supposing them to be in small 60 pots in the spring, they may then be shifted into 48s, keeping all flower-buds nipped off, and afterwards into 24s, which will generally be found sufficient for their growth during the first season.—*W. Paul, Nurseries, Cheshunt, Herts.*

HOME CORRESPONDENCE.

Experiments with Artificial Manures.—I have been much interested in the Table of the action of Manures by Mr. Maclean, published in the *Chronicle* of July 29th, and I have no doubt but that most of your numerous readers will join me in thanking you for bringing before their notice, from time to time, results fraught with so much importance to the Agricultural community. If thanks are due to you for thus noticing the labours of others, of how much greater praise is he deserving who contrived and carried through such a mass of experimental investigation? It is from data such as those afforded by this tabular record, that we can alone hope to deduce principles for our sure guidance in the scientific improvement of agriculture. In my opinion, that man is more entitled to our gratitude, in a national point of view, who carefully compiles such a table as Mr. Maclean's,—being the result of his own experiments, and guarded as much as possible from sources of error, than he who writes volumes of speculative theories. It is by such labours that the practical farmer may render indispensable service to the man of science, who, without it, must infallibly grope as it were in the dark in search of truth, and be liable to be misled by every ignis fatuus which flings its uncertain ray across his benighted path. May I indulge a hope that you will, whenever practicable, present your readers with similar tabulated results; they will not prove of passing interest only, but tend to confer an increased value on your esteemed periodical when bound up as a book of reference. But I will not dismiss these remarks without pointing out what must surely be an error in the table referred to, and which must tend to bring into disrepute a manure which almost every one agrees in setting a high value upon—I mean the Sulphate of Ammonia. In the Table, this substance is valued at 80s. per cwt., while every one knows it may be purchased for 18s.; so that in the experiments on Turnips it appears that an absolute loss was caused by its application, and is the only instance in which such loss occurs. It seems that $\frac{1}{2}$ cwt. of sulphate of Ammonia can, under the circumstances of the experiment, replace about 15 cart-loads of farm-yard Manure; the produce being nearly the same with the mixture as with 30 cart-loads of muck used alone. The Table gives the expense of the mixture exactly the same as the unmixed manure, viz., 6l. each per acre. Even in this point of view it might be useful to know, when farm-yard muck runs short, that it may be made to do double duty by the addition of sulphate of Ammonia; but the real cost of the mixture is only 3l. 4s. 6d., and not 6l.; and I submit that this must most materially alter our opinion, as deduced from the Table, of the economical application of the salt in question. A similar alteration requires to be made in the 28th experiment on Grass. I may also point out that the cost of Guano in experiments on Grass, Nos. 6 and 15, is put at nearly double its present price. This reduction will, of course, very much enhance its value as an economical Manure, and will place it at once at the top of the tree. These remarks may serve to point out how necessary correctness is in every element of such a Table, and without it nothing will be easier than to convert that which should be the grand test of truth into the parent of error.—*W. H. Potter, Upper Fore-street.*

Pelargoniums.—Will you allow me to suggest the trial of a diluted solution of the nitro-muriatic acid to Pelargoniums for root-watering, where that peculiar disease in the leaf exists. I took one out of its pot, trimmed the roots, and watered it with the acid. It seems quite recovered; a second, similarly treated in its roots, was put into the same soil, but watered only with pond-water; it will go off again; both were cut down to 3 eyes.—*T. Ingle, M.D., La Hague, St. Peter's, Jersey.*

Alum useful in fixing Ammonia.—I named to you the other day that Alum was overlooked as an agent for fixing the Ammonia in liquid manures, &c. and you seemed to doubt its efficiency. I have since proved it, and you will find upon trial how completely it acts, and how speedily it removes from a stable the strong ammoniacal foetor,

(where there is not free ventilation,) by the using a pailful of water with about half a pound of Alum dissolved in it. Upon adding the two solutions of Carbonate of Ammonia and Sulphate of Alum together, immediate effervescence ensues, the alumina is deposited, and the ammonia fixed. Now the alumina deposited (if the sulphate is used in tanks) can be employed or not, but why not?—it will be in all probability a subsulphate, and in some cases as good as gypsum; but a little lime thrown upon the deposit at the bottom of the tank, where alum is used, would soon fix any acid which was free there, and I think the combination of the two earths would have no bad tendency, but the reverse, in some soils.—*Thomas Ingle, M.D., La Hague, St. Peter's, Jersey.*

Watering Out-door Plants.—I quite coincide with "J. L." that the two acknowledged agents in the vigorous growth of plants are heat and moisture; but I cannot comprehend how he should wish it to be understood, as a general rule to go by, that the morning is preferable to the evening for watering plants out of doors. "J. L." states that evaporation is in proportion to the dryness of the air,—might it not have been as well for him to have said at the same time, that the air is never so dry as when ice is forming on the surface of the earth? but I dare say "J. L." saw that this was the turning point in his argument, and conceived it the wiser plan to leave it out. However, that is no reason why it should remain so in so important a discussion. It is a well-known fact that the sun's rays impart no heat to the air in their transmission to the earth; but any sensible effect produced by them is in proportion to the extent they are reflected or absorbed, and since the general practice is to give water after the sun has passed the horizon, very little evaporation takes place beyond the power which the heat has given to the air to carry moisture previous to watering, and this moisture so carried up will soon again be deposited in the form of dew. This last circumstance, with the water thrown on, will retard radiation—(or why is it that a clear night is more favourable to radiation than a cloudy one?)—until both water and dew are capable of rising in the form of vapour. Now, I think these statements in some degree remove "J. L.'s" objections to watering in the evening, for I have shown that moisture and heat are not removed so far from the plant as he imagined; and also that evaporation by evening watering is limited indeed. "J. L." recommends watering to be done, "about or soon after sun-rise." Who would disturb the silent dew? "J. L." does not say he would; but how different in its effects is his system of watering to that calm quiescent state in which plants delight to dwell, compared with which "J. L.'s" morning watering is a state of atmosphere in motion,—anything but conducive to the growth of vegetation.—*C.*

Watering Out-door Plants.—You require an answer fræ practical men as to whether it is better to water out-door plants in the morning or at night. I have had a gude share of both planting and watering in my life-time, and I have come to the conclusion (for I think I have na been blind atehether to the effects of water upon plants that has been applied to them by the hand o' man in the morning, at midday, and the gloamin), that gardeners in general are great gowks for watering sae muckle as they do. Such a statement may not please some o' them, for I ken that there are some gay full chaps belonging to the profession, and, according as the advertisements read, have a perfect knowledge o' their business in every department. I canna mak ony sic asseverations, for I ken fu' weel there is mony a thing I would need to be instructed in, and that o' watering among the rest; I have been like mony more in the world that have watered and watered and better watered, and the crops made little progress for it a'; and ae day, when I was unco tired at the wark, I sat down on the edge o' the water-barrow, and looked up to the cluds, and I may say prayed for rain, but I thought again that the age o' miracles was gane by, and I remembered that man had a rational soul within him, and if he would just exercise the faculties that his Maker had given him, he might be a great deal better off, for we often act as if we were animals o' instinct, and as if we had nae reason to guide us; and when I say that I intend to water a great deal less than I have done, you are not to imagine that I live in, or even in the neighbourhood of the parish of Dreep-daily, where Andrew Fairservice served his time, and learned to grow Green Kale beneath glass, and forced Nettles for early Greens. I will not be able to explain my meaning perhaps in Natural Philosophy terms, for I am no sae weel acquainted wi' radiation, absorption, evaporation, latent heat, and mony mae words that are used noo-a-days as I would like to be; but I get wonderfu' help fræ that wonderfu' book "Brande's Dictionary," where aye will get a' the kittle words explained that lie between Abaciscus and Zygophyllaceæ, and every gardener should try and be able to lay his hand upon aye as soon as he can. And as I was saying before, when I was resting upon the water-barrow, with my elbow upon my knee and my head upon my lap, a thought came into my head, that something else might do far better for growing crops than watering them; I thought if something like a mackintosh could be had for summer crops, it would be a great benefit to them,—something ye ken that would keep in the heat and the moisture, and no interfere greatly with the working o' nature, and after trying various substances that did not answer so weel as I would like, they were soon laid aside, but I mak mysel' believe that I have succeeded at last, but the stuff is so common and so cheap, and so muckle despised, that I maybe shouldna tell ye what it is until it be better proved; at any rate it has been as a sheet-anchor to some of my crops this season. I am thinking we all had our share of cold and wet in the spring months of this year; then, came June with hirstering heat,

which rent the earth about the roots of our crops, and although hoeing and pulverising were practised among some vegetable crops, and water besides, they appeared to be dying in the spring of their days; then was the time that I spread the mantle over their roots,—it appeared as refreshing to them as the shadow of the Gourd was to Jonah in the land of Assyria. They improved every hour after it was put on, and those that were left without it have made but a sorry appearance. What I have said will perhaps not please you for an answer to your questions, but I think you will be ready to admit that it would be a great improvement in gardening if crops could be made to thrive weel in hot weather without water being applied to them by the aid of the gardener; some may be so wedded to the water-tub and the watering-pot, that they will not easily part with them. For my part, I am heartily tired of them, and intend to use them as seldom as possible.—*A Moorland Gardener.*

Maturation of Fruit without being in immediate connexion with Leaves.—In corroboration of Mr. J. Murdoch's statement, at p. 479, that Peaches and Plums will come to maturity without leaves being in immediate connexion with them to draw and mature the sap, allow me to mention that the same fact has several times come under my observation. At the present time I have both Peaches and Plums, without a single leaf in connexion with them, swelling as fast as those that have all the appendages necessary to bring them to perfection. Some years ago I accidentally broke the leader at the same joint from which a fine Fruit proceeded. Although not expecting the latter to swell any farther, I determined to give it a fair chance by bringing the leaves of the nearest branches over it, to shade it from the sun. The Fruit swelled off and ripened to all appearance in a sound state. In such cases, does nature make up the deficiency from the leaves nearest to the fruit? or, admitting the doctrine that Fruit originates from metamorphosed leaves or wood, is it not possible that the whole of the matter necessary for the formation of Fruit is deposited in the stem or branch previously to the swelling of the Fruit, and that the leaves only exercise their proper function with a view to the formation of more wood, without any peculiar provision for the Fruit?—*Dee.* [We apprehend that in those instances the Fruit was not at the end of leafless branches, but of leafless spurs, which makes a great difference. It is also to be presumed that in the first instance mentioned the Fruit was already swelling, and able to attract food to itself, independently of the leader that was broken off. No doubt, after fruit has acquired a certain size, it becomes more independent of neighbouring leaves than when it is younger.]

Strawberries.—Although I agree with you in most things, I beg to differ with you respecting the cutting off the leaves of Strawberries at this season; and although I do not cut quite so close as "D. Z.," I am sure, from considerable experience, that the principle is good. In point of neatness there is no comparison; the beautiful green and feathered foliage of the mowed beds being pleasant objects in autumn, and affording quite sufficient covering for them in winter; in fact, they may be compared to birds after moulting. And to observe the fine plump buds of those which have been cut over when they have made a few new leaves, the difference is at once manifest; and if done in time and with judgment, the result will be a plentiful crop of fine and large fruit the following season.—*C. W. T.*

Forcing Strawberries.—Perhaps it may be thought invidious to object to anything proceeding from so high an authority as Mr. Paxton, particularly as the object was to satisfy the inquiries of "A Subscriber," as to the best manner of preparing Strawberry-plants for forcing. I have long known and practised (but it was before the days of Keen's seedling, when there was more occasion for it) a similar plan to that recommended at p. 480, viz., to take runners of the previous season and transplant three of them into 32-sized pots, at the end of April or the beginning of May, plunging the pots in an open piece of ground, removing the runners, &c. during the summer, and repotting them into pots a size larger in August or September. They become fine robust plants; but I do not think it commensurate with the extra trouble, though by one circumstance as Mr. Paxton, who has merely to say "Do," and it is done, it would be worth trying. I generally strike some runners in small pots and repot them again, but I am mostly satisfied with the best runners I can find in the month of August, when I plant three of them in 24 or 32-sized pots, according to the size of the plants. I prefer wet days to take the runners up, as the mould adheres best to them; but I like to cut off the tips of the roots, as it causes them to produce twice the quantity of fresh fibres. After I have potted them I place them, if it should be hot weather, behind a north wall for eight or ten days, after which I plunge them in an open part of the garden, in the common soil, up to the rims of the pots. A friend of mine, long gardener to Sir William Folke, a successful forced-Strawberry-grower, used to recommend taking the small runners in the month of September and potting them, as he frequently found the earliest ones had a disposition to come into bloom in the autumn; and the best crop I ever remember to have had was on an occasion when the want of pots compelled me to put off potting the runners till the first week in October; when, fearful that they would not have time to make many roots before the season was over, I filled a frame with fresh horse-droppings, and plunged the pots therein, but without covering them with lights. This was the usual custom of the late Mr. Press, long gardener to Mr. Gray, of Hornsey, who, besides supplying the wants of his master's family, (I have heard,) could send a great many to market; and the chief place he had for growing

them in was upon some shelves in front of a Peach-house. I believe the chief cause of failure in forced Strawberries arises from their being introduced into too warm a place. I always find those which I place in my vineries when I begin forcing do a great deal better than those introduced later.—*John Murdoch.*

Prizes for Seedling Pelargoniums.—In the *Chronicle* of July 15 you gave a list of the prizes awarded at the last exhibition of the Horticultural Society, in which I observe two Silver Knightian and two Silver Banksian Medals were given for Cherries, and a Certificate of Merit for a seedling Pelargonium, named Psyche. It was the opinion of one of the most experienced growers of seedling Pelargoniums that Psyche was the best ever exhibited in this or any other year. Of its merit, therefore, I conclude there can be no doubt. It is equally clear that one of the objects of the Society in offering prizes is to encourage merit, and to proportion the value of the prizes to the degree of skill exercised in producing the object exhibited. I take the liberty, therefore, of asking, whether there is not at least as much merit in producing a beautiful seedling Pelargonium as in exhibiting a good dish of Cherries? A tolerably good soil and favourable season will produce fine Cherries without exercising the skill of the gardener, but to raise a seedling Pelargonium fit for competition in the present day requires considerable judgment in selecting the parent plants, and some experience in the management of them. In this view I am confirmed by the awards of the judges at the exhibition at Chiswick in June, when they gave one Silver Knightian and two Silver Banksian Medals to three seedling Pelargoniums. With the parties who exhibited on those two occasions I have no connexion, but as a Fellow of the Horticultural Society of more than 20 years' standing, I feel most anxious that its character for fairness and consistency should be maintained.—*F. H. S.* [We have no doubt that some one of the judges will answer this next week.]

Rot in Larch.—I observe in your answer lately to a question on a subject of great importance—the heart-rot in Larches, that you suggest the probability of its arising from too much moisture about the roots. My experience would lead me to a precisely contrary conclusion, namely, that the disease is caused by a deficiency rather than by an excess of moisture. At least, I know that the disease is prevalent in the dry sandy heaths, till lately so common in Cheshire and the neighbouring counties, and I am told does not occur among Larches planted on the sides of slaty mountains, where moisture is very abundant. It is much to be regretted that by far the greater part of the Larch plantations in this part of England have been made upon thin, dry, sandy soils, which are by no means suitable to the tree, so that we are not likely to form a true notion of its real value as a timber tree in situations where the soil will allow it to flourish.—[We have stated that the subject is exceedingly obscure, and we should be very glad to hear what the experience of others is on the subject. Our own impression is, that the published evidence leans towards a wet subsoil being the cause of the mischief; but our correspondent's evidence seems, in this instance, to point the other way. Is he, however, sure that the subsoil is dry?]

Bees.—In answer to your inquiry at p. 519, I beg to state that the Bees were in the comb, which hung from one of the branches of the Whitethorn.—*A Bath Subscriber.*—No one is less anxious to prolong this discussion than I am; but as Mr. Wighton seems to say that my meaning in one place is not clearly understood, I beg to clear away all ambiguities. Before a first swarm is 24 hours in a hive two or three bits of comb are made, and eggs are placed therein. Then, if the queen be taken away, the Bees add wax to one or more cells, which may be called bent royal cells, for common bee cells are horizontal, and queen cells vertical. The wax added to the common cells is put in a vertical form. Mr. W. saw this part of the cell only, and therefore says that I argue unfairly, because I was not at Cossey Hall to see it. I have seen many like it.—I thank Mr. W. for pointing out a discrepancy in my article: viz., that Bees have no eggs later than August. Absolutely speaking, this is wrong; but, generally speaking, it is right. I assure Mr. W. that when brood goes back before it is ten days' old it never becomes dry. When speaking of artificial swarming he stands on very slippery ground; but I forbear to make another remark.—*A. Pettigrew.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

August 1.—R. W. Barchard, Esq., in the chair. G. Banks, C. R. Colville, J. G. Dyne, P. P. Fitzpatrick, T. L. Hodges, R. N. Hunt, W. Shaw, E. Steer, and J. Tatham, Esqrs., were elected Fellows. A communication from the Comte Lelieur respecting Strawberries was read; it stated, that, in addition to the usual distinctive characters by which Strawberries are recognised, several others might be added, viz., 1, the age at which each variety, raised from a runner, bears fruit; 2, The age at which each kind arrives at the maximum of its production; 3, How many years the same plant will continue in good bearing; and, 4, What varieties will bear two crops in the same season; thus, for instance, Keen's Seedling and the British Queen will, if planted in the open border after being forced, grow luxuriantly, and produce a second crop more abundant than the first; whilst the Elton, under similar treatment, throws out nothing but runners; although these three sorts, after being forced, make extraordinary growth towards the end of the season, and bear a prodigious quantity of fine fruit for several succeeding years. Comte Lelieur was of opinion that it would be useful to select a certain number of plants of each of the best varieties after forcing, and to plant them in the open border to ascertain which kinds will produce a second crop; and that it was a good plan, before turning them out of the pots, to withhold water entirely for a short time, in order that they might be excited into new growth by repeated waterings. The writer also observed that the temperature of Pine-stoves was too warm for Strawberries, when first placed in heat to bring them forward; that the flowers of these plants, particularly of those kinds which throw out an abundance of foliage before blooming, should be brought on gradually.

Thus, for instance, the Elton is barren, while Keen's Seedling succeeds in a rather high temperature, provided the house is kept cool until the fruit is set. A paper from Mr. Dunsford, of Capethorne Gardens, near Congleton, Cheshire, upon the cultivation of the Pine Apple, was also read. This was accompanied by the plan of a pit now in use there, differing but slightly in external appearance from M'Phan's. The interior of the pit within the inner walls is filled up with brick-rubbish, so as to form a solid mass; and when level, the whole is covered with flat tiles or slates, upon which 9-inch draining-tiles are laid across the bed, commencing just above the front flue, and these are in their turn covered with flat tiles. The draining-tiles convey the heat over the whole surface of the bed, so that a regular bottom-heat of 95 deg. can be maintained. The depth of the pit from the glass to the tiles is 4 ft. at the back and 1 ft. in front. In such a construction, and cultivated upon the system recommended at p. 171 of the *Chronicle*, the writer states, that, by the aid of dung-heat, every amateur and gardener may grow Pines with as little trouble and expense as Cucumbers or Melons. A Providence Pine, weighing 7 lbs. 1 oz., grown under similar treatment, also accompanied the communication. Mr. Goode, gr. to Mrs. Lawrence, exhibited a collection of plants, containing most beautiful specimens of the flesh-coloured *Erica infundibuliformis*, and the brilliant *E. parmentieri*; *Stanhopea grandiflora*, bearing three fine scapes of powerfully-scented flowers; a good specimen of *St. insignis*; *Sophranitis pterocarpa*, a minute plant, with several delicate purple flowers, growing on a log of wood; *Oncidium crispum*, chocolate and yellow; *Achimenes grandiflora*, with bright purple blooms, having a white centre; *A. multiflora*, with flowers of pale purple, fringed on the margin; and *Cattleya Mössiae*, in good condition: a Knightian medal was awarded for the four first-mentioned plants. From Mr. S. Gad, gr. to T. J. Lenox, Esq., of Plaistow, Essex, was a magnificent specimen of *Gloriosa superba*, having more than twenty of its singular orange and vermilion flowers expanded at one time: for this a Knightian medal was also awarded. Messrs. Youell, of Great Yarmouth, exhibited cut blooms of nineteen varieties of *Fuchsia*, some of them particularly fine, especially those of *St. Clare*, with long drooping flowers, of a light vermilion colour, having petals of pale crimson purple; *Bruceana*, small but an extremely free-bloomer, with short tube and sepals of dark vermilion, and petals of deep purple, having the stamens and pistil much exerted: a seedling called *Lindleyana*, with a somewhat inflated tube, which, with the sepals, is of good substance, and of a dark vermilion tint; the petals differ little from them in colour, and are slightly tinged with crimson; *Magnifica*, a prolific bloomer, with reflexed sepals of light rosy purple, and only wanting in contrast of colour; *Gem*, with a thick, short tube, and sepals of a bright rosy vermilion colour; petals crimson purple; and *insignis*, with rich crimson vermilion tube, and sepals of good substance; petals purplish crimson, its foliage bearing some resemblance to that of *F. corymbiflora*: the remaining ones exhibited were—*F. princeps*, *carnea*, *Money-penny*, *tricolor*, *stylis maxima*, and *Venus victrix*. Messrs. Youell also sent exceedingly fine specimens of the Fastolf Raspberry, which were greatly admired, and received a certificate. From Messrs. Chandler, of Vauxhall, was a well-grown plant of *Fuchsia Chaudleri*, forming quite a pyramid of bloom, *F. Brewsteri*, a highly-coloured and elegant variety, apparently the same as *Bruceana*, in Messrs. Youell's collection; *St. Clare* in good condition, proving this to be a free-blooming and very fine variety when properly treated; *Verbena Fowleana*, with pretty lavender-coloured flowers; and cut blooms of Marygold and several fine varieties of *Verbena*: for *Fuchsia St. Clare* a certificate was awarded. From Alex. Rowland, Esq., were two boxes of cut Rose blooms, comprising some fine varieties. From Mr. Cathul, of Cambewell, an exceedingly well-grown plant of *Lisianthus Russellianus*, a basket of flowers of a clove-scented seedling *Carnation*, called the Prince of Denmark, and a Beechwood Melon. From Mr. Mountjoy, of Ealing, a very pretty hybrid *Gloxinia*, said to have originated between *Sinningia guttata* and *Gloxinia rubra*; the flowers are of a clear flesh-colour, having a pale primrose throat; the foliage is dark green: a certificate was awarded for it. Mr. Smith, of Dalston, exhibited four pretty seedling *Fuchsias*, one called *venusta*, with flowers of the colour of *Venus victrix*, but of a more globose form and larger, and with curiously dentated leaves; *Vesta*, with tube and sepals of a pale flesh-colour, tipped with green, and of good substance, opening well, and displaying the petals, which are vermilion tinged with crimson; *gigantea*, an extremely large variety, with dark vermilion tube and reflexed sepals; petals purplish crimson; the other variety was somewhat similar to the last, but smaller. From Messrs. Goode, of Pottery End, was a small plant of *Erica Massoni*. From Mr. Hally, of Blackheath, a small plant of *Gaultheria hispida*, bearing its conspicuous white berries in abundance, which contrast well with the dark green foliage, and render it a valuable plant either for the conservatory or for turning out in the open air in summer;—a certificate was awarded for it. From Mr. Spencer, gr. to the Marquess of Lansdowne, was a most handsome Queen Pine Apple, weighing 5 lbs. 12 oz.; for which a Banksian Medal was awarded. Mr. Jones, gr. to Baron Dimsdale, brought a fine specimen of the Cayenne Pine Apple upon the plant, for which a certificate was awarded. Some tolerably good White Frontignan and Black Hamburg Grapes were exhibited by Mr. Jones, gr. to S. M. Disney; the latter were, however, deficient in colour. An extremely fine specimen of the Housaine Melon, weighing 10 lbs., came from Mr. Fleming, gr. to his Grace the Duke of Sutherland; it had been grown upon a plant situated in a fig-house, being planted in a small pit to keep it from interfering with the roots of the Figs: a Banksian Medal was awarded. From Mr. Bruce, gr. to B. Miller, Esq., was a Syon Hybrid Cucumber, exhibiting a natural graft, formed by the adhesion of the leaf-talk to the side of the fruit: this kind is stated to be invaluable as a ridge Cucumber in a cold, wet season like the present, producing abundance of fine clean fruit, whereas the common bumpy ridge sort, on the same bed, has been so much affected with canker as to be entirely useless. Mr. Haseldine Pepps exhibited two Lupines, one planted on the 26th of April, when weighing 2½ grains, in soil composed (in 100 parts) of silica, 75; alumina, 15; and carbonate of lime, 10; it was then watered with 30z. 5drs. of distilled water, and afterwards with 30z. of the same, every day; on the 30th of July it was in a dying state, and weighed 42½ grains. The other, planted on the 8th of May, in peat and loam, and weighing 2½ grains, was watered in the usual way, and weighed, on the 30th of July, 192½ grains. Both plants were grown in glass pots. The experiment was made to ascertain how far it is possible to make plants grow without those elementary substances usually considered as forming their food. From the garden of the Society were handsome specimens of *Achimenes longiflora*, *rosea* and *multiflora*; *Pentstemon curviflorus*, said to have originated between *P. gentianoides* and *campanulatus*, but scarcely differing from the old *P. atropurpureus*; *Isomeris arborea*, a new hardy shrub, from California, having the ovary projecting in a singular manner from the mouth of the flowers; *Bouvardia splendens*, of a much richer scarlet than the old *B. tri-phylla*; *Huntleya violacea*, bearing two of its curious dull violet-coloured flowers; the beautiful *Pharos albus*; and four plants of the common *Hydrangea*, each of which had been treated in a different manner, to find out, if possible, what ingredient it is in the soil that changed the flowers from pink to blue—No. 1, treated in the usual way, was by far the most healthy plant, and bore pink flowers; 2, to which 3 oz. of phosphate of iron had been administered, was evidently in an unhealthy condition, the flowers being pink, small, and having, with the leaves, a yellowish tint; 3, treated with ½ oz. of caustic potash, bore small and pale pink flowers; while 4, to which ½ oz. of alum had been given, produced blue flowers—the dose had, however, been too strong, as was shown by the weak condition of the plant and the small size of the flowers; nevertheless, it proved to a certainty that alum will produce the desired effect. Cut flowers of *Ceanothus*

azarens, a pale variety of the same, and *C. pallidus*,—all capable of standing the winter, except in very severe seasons,—with a collection of *Verbenas*, also came from the Society's garden.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
July 26.—Right Hon. Lord Portman in the chair. Five gentlemen were elected Members. The Hon. W. R. Rous transmitted a statement of the comparative consumption and expense of fattening twelve bullocks, half of which were fed on native produce (a "compound" of linseed, &c.), and half on foreign oilcake. The result was in favour of the former. The Rev. D. Gwilt stated the injury which his Lucerne and Flax crops had sustained from the presence of a parasitical weed, a specimen of which was transmitted to Mr. Paxton, gr. to his Grace the Duke of Devonshire, for determination. Mr. Clive recommended the adoption of his Classification of "short-wooled Sheep, not qualified to compete as South-downs;" Mr. Bames, an analysis of milk in the dairy districts; Mr. Harrison, his manure powder to the notice of the Council; and Mr. Walsford stated his discovery of a mode of destroying animal life without injury to plants.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.
ERRATA.—The 3rd prize for Picotees was awarded to Mr. Orson, and not to Mr. Hughes, as stated in our report of last week; and for Carnations, Mr. Orson received the 2nd, and Mr. Hughes the 3rd prize.

MISCELLANEOUS.

Watering Plants in the Ionian Islands.—Where gardens are cultivated, as in the neighbourhood of the towns of Zante and Corfu, two methods of watering are employed, viz., by hand and by gutters. The gardener carries a jar with a large mouth under one arm, and pouring the water from it, with the other hand he scatters it over the thirsty plants. The gutters are little channels made in the soil; closed at one end, and supplied with water from a well by means of a lever and bucket, till the ground is thoroughly saturated. The time of watering is evening, usually after sunset. In the process the foot is often employed, the naked foot, for the purpose of closing one channel, or breaking down a little embankment to turn the course of the water into different beds,—bringing to recollection the Scripture expression of watering the seed "with the foot, as in a garden of herbs." By the villagers, who are fond of flowers—and it is a prevalent taste, particularly in Corfu, where they pride themselves upon their fine Carnations—another method of watering is used, which probably has been found by experience to have a better effect. The florist takes the water into his mouth and spurs it on his plants. The slightly raised temperature of the water may be beneficial, and also the small quantity of saliva mixed with it, which may act as a manure.—*Davy's Notes on the Ionian Islands.*

New Mode of employing Creosote for the Preservation of Butchers' Meat and Fish.—Creosote, so named from its great antiseptic power, which exceeds, perhaps, that of any other substance, has been long employed to preserve animal matters from decay. The only two ways in which creosote is usually applied for this purpose, consist either in exposing the meat which we wish to preserve to the smoke of burning wood, of which creosote is the effective constituent, or else in immersing it for a short time in water containing a few drops of creosote. Articles of food prepared by either of these methods may, as is well known, be kept for a long time without spoiling; but both these modes of using the creosote are attended with the inconvenience that the food necessarily acquires the taste and smell peculiar to smoked meat, which is by no means agreeable to every one. By the method now proposed, this inconvenience is entirely avoided. During the past summer, which was so unusually hot, in common with most persons, I experienced considerable difficulty in preserving fresh meat even for a few days. It struck me at length, however, that perhaps the vapours of creosote might be found useful for this purpose, and the method adopted was the following very simple one. I placed a small plate containing a little creosote immediately under each piece of meat as it hung suspended in the larder, and covered both over with a cloth. The creosote soon gave off vapours which formed an antiseptic atmosphere around the meat, and kept it quite fresh three or four days longer than it would otherwise have been. If the plate is gently heated before the creosote is put into it, the vapours rise more quickly, and if the additional precaution is also taken of suspending the meat in a wooden box or earthen jar which can be closed with a lid, the beneficial effect is still more discernible. I have tried this process during the greater part of last summer with invariable success, and, a butcher, who also tried it on a larger scale in his stall, was equally convinced of its efficacy. The meat, when cooked, has not the slightest smell or taste of creosote. There is also another advantage attending the use of creosote. Its smell is so disagreeable to flies that it effectually frees a larder from the presence of these noxious insects. The same quantity of creosote may be used for several weeks, but on being long exposed to the air it loses most of its smell, and is partly changed into a species of resin.—*Dr. Stenhouse, in Proceedings of the Philosophical Society of Glasgow.*

GARDEN MEMORANDA.

Messrs. Norman, Woolwich.—Those who have not visited this little spot during the Carnation and Picotee season (now nearly over in this neighbourhood) have lost a treat. We never saw plants in better condition, or the blooms finer, both as regards size and brilliancy of colour. Too much credit cannot be given to the Messrs. Norman for their perseverance and skill; their ordinary occupation abstracting much of their attention from their favourite pursuit, and their garden being so limited in extent, as to render the complete success which has attended their exertions quite astonishing. Their mode of propagation is principally by piping, which, although attended with more uncertainty than that of layering, affords ample repayment in the health and soundness of the plants produced. The proper plan is to pipe early, before the grass becomes hard and woody. This may easily be managed with the Pink or Picotee, which are not so sportive; but with the Carnation, on account of its disposition to run, the process is attended with much more trouble; it being necessary to mark the pipings from each plant, in order that when the plant from which they were taken comes into bloom, and is discovered to be run, they may be identified and

thrown away. Unless this precaution is taken, it is better to postpone the work till blooming time, but then it is comparatively late, and less likely to be successful, particularly with reference to the shorter period allowed for the growth of the plants after they are established. Complaints have been made for some time past of the deficiency in Purple and in Rose flakes; this can no longer be done with justice, as we noticed several that would vie successfully, as regards properties, with the best flowers of any of the other classes: for instance, amongst the Purples, Mansley's Beauty of Woodhouse, a full-sized flower, with fine white and good purple, the only defect being an inclination in the petals to reflex, and also to lie too close together; Pollard's First-rate, a better shaped flower, though not so large, nor with white so pure, but highly deserving its name; Ely's John Wright, a noble flower, as large, and deeper in colour than Beauty of Woodhouse, but not so constant; also Mansley's Bonny Bess; Milwood's Premier, though the white is not good; Nix's Lady Chetwynde, large and bold, but the colour not generally uniform; and Willmer's Solander, distinct, and occasionally very good, but this season too deficient in colour. In Rose flakes, Ely's Lady Ely, Ely's Mrs. Gardner, Low's Marchioness of Westminster the right one, Wilson's Blarney, and that peculiarly coloured rose, Brooks's Flora's Garland, are all first rate, as well as Hoyle's Beeswing. There is more room for good Scarlet flakes, the white in most of them not being pure; Chadwick's Brilliant is probably as good as any in this respect—the flower, however, is rather too thin, in which point Jones's Brilliant (a very desirable flower) has the advantage. One of the finest Scarlets in point of colour is Ivan's Marchioness of Westminster, the colour not being so red, but light, and unusually bright; the white is, however, not good, and the edge of the petal rough, with a tendency to curl. Harris's Beauty of Cradley is also good in colour, but the white is impure, and the flower too thin. In Ely's Mrs. Granger the white is also inclined to be pinky, but the edge of the petal is remarkably smooth, and the shape of the flower good; in Weldon's Earl of Lichfield the white is fine, and the petal good. Amongst Scarlet Bizarres the following will be found to possess the finest colours:—Hedley's William Cobbett, Ely's Duke of Devonshire, Ely's Lord Pollington, in which the colours are brilliant, although the flower is not so good this year as last; Ely's Regular, (with regard to the darker colour, the scarlet being dull, and the white only tolerable); Rainforth's Game Boy, Twitchett's Don John, Martin's Splendid (in which the petal is excellent, but the colours not so bright as in Don John), and Hutton's Patriarch, in which the colour is intense; the flower is, however, much too thin, and the dark stripe not sufficiently deep. In the class of crimson Bizarres there are many very beautiful varieties. Cartwright's Rainbow, not well standing its soft and curly petals; Paxley's Prince Albert, Higgin's President, though deficient in bizarre; Ely's Lord Milton, and Duke of Bedford, with their beautiful colours; and Mansley's Robert Burns. The Picotees were remarkably fine, and notwithstanding the advances made in this beautiful class, there still remains something to be accomplished, the edges of the petals being for the most part not so smooth as the Carnations. One manifest advantage, however, the Picotee possesses over its rival is in the greater substance of its petal. Sharp's Duke of Wellington at present stands unrivalled amongst the heavy red-edged flowers, notwithstanding the smoothness of the petal and peculiarity of colour. Wildman's Isabella, Sharp's Criterion and Gem are also excellent. Brinkler's Duchess of Sutherland and Masterpiece (better than Giddens's Teaser), Burroughes's Fair Ellen and Miss Osborne, Willmer's Princess Royal, the best and smoothest of the Rose-edges, with Tolworthy's Isabella, a first-rate flower. In Purples, Heath's Superb, Vespasian, Dickson's Trip to Cambridge, and that lovely petalled flower, Nix's Lady Chetwynde, John's Prince Albert, and Ely's Grace Darling; Sharp's Invincible, and Luff's Seedling; Bond's Countess of Winton, a small but good flower, with Brinkler's Purple Perfection; and though last mentioned, not least esteemed, we noticed a small but very beautiful flower of Barnard's Mrs. Barnard, fuller of petals than any bloom we had previously seen.—*July 29.*

Yard House, near Taunton, the seat of the Rev. E. T. Halliday.—A specimen of the *Cereus serpentinus* has lately bloomed here. The flower was four inches in circumference, and possessed a strong rose-scented perfume. The plant is 12 feet 9 inches in height, and about four inches in circumference. It swelled altogether four buds, one of which, as above mentioned, attained maturity, and the others promise an early development.

Reviews.

Dr. Justus Liebig in his Relation to Vegetable Physiology. By Dr. Hugo Mohl. (Dr. Justus Liebig's Verhältniss zur Pflanzen-Physiologie.) Tübingen. Fries. 1843.

THIS is the pamphlet of Dr. Mohl to which we referred in a leading article of May the 20th, and which consists of a critique on the work of Dr. Liebig, so well known in this country under the title of "Chemistry, in its applications to Agriculture and Physiology." Dr. Mohl says that work was anxiously looked for by botanists both on account of the reputation of Liebig as a chemist, and from a knowledge of the fact that they had much to look for from the aid of Chemistry in their investigation of the phenomena of the nutrition of plants. But Dr. Mohl observes that throughout the whole work there is a want of original experiment, which is the more wonderful, since it is written by the greatest experimenter of his day, and the possessor of one of the largest laboratories in Europe. Nevertheless Liebig everywhere insists on the importance of experiments, and is continually appealing to those of Theodore De Saussure. Under these circumstances the work can only be looked upon as an attempt to construct a theory from data already known to the world.

The next general remark by Dr. Mohl refers to the style in which the book is written. If not always correct, it is energetic and clear; the thoughts are propounded in short determinate propositions, and there is not the slightest indication of doubt or uncertainty about anything; the author seems to know everything for certain, and says it boldly out. This sort of style is apt to mislead the uninitiated, and frequently leads the author himself into positive contradictions; in fact, a thing is stated to be black or white according as it suits the author's purpose. For instance, in one place (p. 22)* he says that leaves do not decompose carbonic acid in the shade, (in which he is wrong,) and in another place (p. 121) he says the leaves do decompose carbonic acid in the shade, (in which he is right). Such contradictions are frequent, and prove that the author is neither well-grounded in the subjects on which he has undertaken to write, nor has fully considered them. The manner in which Liebig attributes erroneous views, entertained perhaps by individual botanists, to "vegetable physiologists" and "botanists" in general, is objectionable and liable to mis-

* These numbers refer probably to one of the German editions

lead. Thus he says (p. 6) that "vegetable physiologists" consider humus as the principal food of plants. Now this is not true: vegetable physiologists have no sacred books in which their code of laws is contained, and if any individuals have maintained such a view, the great body has not. In fact, Ingenhousz, Senebier, Curt Sprengel, Link, and De Candolle, have all either denied it or taken other views. The doctrine of humus is altogether a chemical one, and has only been supported by chemists. Again, Liebig says (p. 24) that "all botanists and vegetable physiologists have doubted the assimilation of the carbon of the atmosphere by plants." Yet all books on vegetable physiology contradict such a statement; and the absorption of carbonic acid from the atmosphere is so generally admitted that Adolphe Brongniart, in the 13th volume of the "Annales des Sciences," has even proposed to account for the excessive vegetation of the primitive world upon the supposition, that the atmosphere at the period those plants were growing contained a larger amount of carbonic acid in its composition than it now does. This might have been considered misrepresentation, had not Liebig in many other instances displayed an equal amount of ignorance of botanical literature and facts. As, for example, when he says (p. 91) that the woody fibre of lichens may be replaced by oxalate of lime, and that in Equisetum and the Bamboo silica assumes the form and functions of the woody bundles, and (p. 36) that a leaf secreting oil of lemons or oil of turpentine has a different structure from one secreting oxalic acid.

An instance of Liebig's misrepresentation of facts occurs in his rejecting the theory of the respiration of plants. It is well known that plants absorb oxygen in the dark, and give out carbonic acid; and this has been attributed by botanists to a true process of respiration. This, Liebig thinks, betrays great ignorance on the part of botanists. He believes the giving out of the carbonic acid to be merely a mechanical process, and the absorption of oxygen to be a chemical one. He says all leaves, dead or living, absorb oxygen, and the more oil or tannic acid they possess, the more oxygen they absorb. He endeavours to prove this position by comparing, from tables made by De Saussure, the quantity of oxygen absorbed by the leaves of Pinus abies, Quercus robur, and Populus alba, as compared with the quantity absorbed by the Agave americana. Mohl remarks on this statement, that, in the first place, the quantity of oxygen absorbed by the Agave is put down at 0.3, when it ought to have been at 0.8, so as to affect the calculations very considerably; and that, in the second place, those plants in De Saussure's table which contain neither oil nor tannic acid in any quantity, as the Triticum aestivum and Robinia pseudacacia, are altogether omitted, although they absorbed more oxygen than those mentioned by Liebig; whilst the oily Juniper and Rue, which are also omitted, absorbed less.

Again, Liebig states on this point, that the absorption of oxygen has nothing at all to do with the processes of life. How is it, then, asks Mohl, that plants begin to be blighted when oxygen is withdrawn; that seeds will not germinate; that leaves lose their irritability; that the motions of leaves and flowers cease; that leaf-buds and flower-buds will not open when brought into an atmosphere without oxygen? But the way to settle the question of respiration would appear to be to determine whether the asserted relation between the quantity of oxygen absorbed and the quantity of carbonic acid given out was wrong. In De Saussure's experiments, there was found to be an exact relation in all cases. This would not be the case, were Liebig's theory of the origin of the carbonic acid correct.

These few general remarks, observes Dr. Mohl, will serve to indicate the claim of Liebig to become a reformer of botanical science.

(To be continued.)

CALENDAR OF OPERATIONS for the ensuing week.

THE Hawthornden and other Codling Apples grow free enough from cuttings planted under a north wall in November, and no doubt many Pears will do the same. I have sometimes heard people express a wish that they could rear sufficient of these cuttings to plant in a kitchen-garden, to see if they would be more dwarf, and to ascertain if the flavour of the fruit would be different from that of grafted trees. There is nothing in particular to recommend in this experiment; but there are points connected with it that may be of more general application which are not usually acted on, if indeed, they are rightly understood. Anyone who intends to put in cuttings in November of fruit-trees, or indeed of any hardy tree that is difficult to strike, ought to begin to prepare the cuttings before the middle of this month, by shortening the shoots to one-half or one-third of their length. The passage of the ascending sap being thus cut off, it will so accumulate in the remaining portion of the shoots as to be ready to burst their buds into another growth. Now, gardeners know very well that when we get the eyes of any plant in this prominent state in the autumn they will shoot with greater vigour in the spring, and there is no reason to doubt but the same effect, to a certain extent, will take place if these shoots are used as cuttings. It follows, then, that all cuttings of deciduous trees are benefited by being stopped before the growing season is over. When cuttings of exotic plants that are difficult to strike, or that take a long time about it, are first put in, they are kept in a close, cool place till they form a callosity at the bottom, whence the roots issue; they are then put into bottom-heat, to facilitate the emission of roots. It seems, therefore, that the most eventful period in the life of a cutting is that at which the callosity takes place, and, fortunately, we can assist its progress long before the shoots are separated from the tree. This is effected either by taking off a ring of the bark at the bottom of the shoots, or, what is better, but much more troublesome, to separate the shoots partly from the main branch, and keeping the parts separated with a small wedge, till the end of the growing season, when it will be found in both cases that the descending sap has formed a ring of granular woody matter on the upper side of the incision, which will be ready to emit roots on the first stimulus being applied. Although there are some who affect to disbelieve the doctrine of sap descending, this does not prevent Nature from furnishing your cuttings just as I have stated, and I have little doubt but cuttings of any hardy tree might be so prepared as to produce roots; and this is the time to make such preparation. One thing must be particularly guarded against in this experiment, and that is, not to submit the cuttings to heat in water, or if you should be tempted to do so in the spring, to have their tops secured from the atmosphere as much as possible, as, by the above process, they are so full of excretable matter that leaves would be pro-

duced long before roots, and those leaves might draw off all the juices before the roots were in existence to supply more, as was the case with some cuttings lately sent to India, which arrived safe, but in that warm climate the tops began to grow too soon, and before roots could be formed the cuttings were exhausted of their scanty stock of nourishment, and soon died.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—After the beds have been remodelled for the reception of the fresh-potted plants it will be necessary to watch them closely, to see that the bottom-heat does not increase too much for the roots. After the first watering, to settle the new soil, they will not require much more for the next three weeks, more especially as the atmosphere about them is kept more moist and close than before, in order to force them a little, that they may root the sooner in the fresh soil.

VINERY.—The Vines now in bearing have large portions of air daily, to keep up a dry, sweet atmosphere round the ripe fruit; and the late ones, now fast attaining their full size, are being kept a little more dry, so as to insure them gradually to the dry state in which it will be necessary to have them by-and-by. This would be a good time to give a coat of paint to the inside of all the houses. It will hardly be necessary to remind you to keep the bunches free from damp berries, and the shoots clear of such growths as interfere with the bearing branches for next year; but I ought to say that the borders of the late houses should once more receive a good dose of liquid manure before the final swelling of the fruit, when no more of such stimulus need be given for the rest of the season.

PEACH-HOUSE.—If any of the young trees, not yet subdued to their ordinary strength, have been threatening to overrun their space, this would be a good time to fork down to their roots, and to cut off a few of the larger ones. The cut stumps have time enough yet to make fresh roots to meet the demands of next season, and this seasonable check would affect the strength of the trees at once; otherwise, as they are now cleared of their crop, they will find themselves in the condition of Phœbus' horses under the guidance of Phaeton, and may run away at a rambling pace, seeing that the borders are so full of moisture. Keep them cool and clean by all means.

MELONS.—Perhaps the frames stand in more need of attention by this time than the plants within them; as soon, therefore, as a crop is cleared out, see that the painting and glazing are all right. There can be no plea in favour of putting this off till winter, when, in all probability, the lights will be as much needed as at present. Besides, winter painting is half the labour lost, and as to Melons, the late crops should stand thinner on the shoots than the summer ones, and should have a strong heat, with large portions of air, to keep them in a healthy, growing state.

TOMATOES.—There is every prospect of these being scarce and dear this season; prune them close, and be content with an under-crop rather than run the risk of a large one, that will not be half-ripened at the proper time. Thin out the Capsicums, also, for the same reason. Lose no time in gathering the leaves of your Tobacco as soon as they are full-sized, and pull off the flower-stalks on their first appearance, except from those which you want for seed.

Out-door Department.

In the kitchen-garden men are now busy potting young Strawberry-plants for forcing, clearing the ground of crops and weeds, guarding their fruit from birds and insects, laying down plans for future operations, and descending freely on the merits of seeds and seedsmen. Some of the latter are roughly handled, without ceremony; those who supply packets of new seeds for trial come in for a good share of this, while more than the usual average of the new samples turn out to be discarded old sorts. Among the new Peas, Prince Albert and the British Queen have found a place; the former is an early dwarf Pea, not quite so good as the Warwick, and the latter is of the Knightian Tall Marrow breed, and six weeks later than Prince Albert, with a very heavy crop of good Peas: only fit for those near the woods, who can get poles to support them. Packets of the Early Frame Pea, with printed labels marked "true," inclosed the "true" Semitar Pea.

ONIONS.—Lose no time in laying down the tops of these; they look as if they would grow on till Christmas. Sow a good bed or two to transplant next spring, and to be pulled before the spring-sown ones are fit to draw. Sow these next to the Spinach, as the two crops come off about the same time next May, when you will have a good breadth of ground at command. It is always a good plan to sow or plant such crops by the side of each other as may be expected to be ready at the same time, even if this should interfere with the "rotation."

ENDIVE.—Sow a large bed of this, for the last time this season; and if you keep them over winter they will help the salads till the spring-sown Lettuces come in.

TURNSIPS.—If you have no access to field-grown Turnips, which are always preferable to the garden ones, you had better sow a large breadth of them in some light portion of the garden, for winter use.

CABBAGES.—In late situations it would be advisable to sow a bed of the earlier sorts, for transplanting about the beginning of next March. The 22d of August used to be the appointed day for this sowing in my younger days, but this is too late for many places. See that the former-sown beds are not too much crowded with plants.

ORCHARD.—I have not seen a single wasp since I stopped paying for them last May. Large flies and hornets are nearly as scarce, and I expect we shall not be troubled much with these this season. Wall crops appear to be much later than usual. Keep a good eye upon the Alpine Strawberries, and mark the largest and best bearers. It has been the fashion for some years to raise these annually from seeds, but they sport as much as Calceolarias. Now is a good time to make a new bed of Strawberries, if not already done. If the fly has attacked any of the fruit-trees or bushes it will not hurt them now to pinch off the tops of the shoots. See that all Vines and other trees are well nailed before the autumn winds set in. Let no crops of vegetables remain on the fruit-tree borders, and have them well stirred up with forks. The trees require all the assistance you can give them this cold season.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—If you see any of the woody plants still disposed to grow freely you ought to check them, but not suddenly, by removing them to a cooler house, or near the door, giving them less water. On the other hand, such plants as flower late in autumn should now be encouraged a little. A few plants of Gesnera elongata might now be brought to the stove for the first succession, unless you have kept some there all summer. Graft the delicate and annual Ipomœas on the hardier sorts, to stand the winter; also the different varieties of Thunbergia alata on the roots of T. coccinea or grandiflora. They will make strong, healthy plants before next spring, and produce a good crop of seeds next June.

GREENHOUSE.—The fading of Pelargoniums, and their removal from this house have left a wide blank here in many places; so much the better if Vines are on the rafters, as you can keep the house more for their use and treatment, which should now be a regular forcing, in order to get the fruit ripe in time.

PITS AND FRAMES.—We are now on the eve of a busy time for pits and frames. Mignonette is to be sown immediately for winter use. Large quantities of the best China Roses are to be struck without loss of time, to bed out next May. All sorts of tender annuals that are usually sown in the autumn must be got in early, for we can always keep them back if they grow too fast. Seeds of Calceolarias and Pelargoniums ought also to be sown as gathered after this time. Cuttings of the bedding Mesembryanthemums should be put in among the very first, as they do not flower well or early from late autumn cuttings, and hardly at all from those taken in spring. Every cutting you can spare of the bedding Pelargoniums should be in the cutting-pot or bed as soon as it is ready to take off, till you have a full supply; and recollect in this, as in all the other tribes for the flower-garden, that you will require a great many more plants next May than you had at last planting time.

FLOWER-GARDEN.—Every flower-garden in the country is now as clean and sweet as possible, but a cheerless time will soon be here, and unless we are prepared for it, what is to become of us next year? This is a good time to make a great quantity of turf pits, to store away the winter stock; and this is the first and most essential step

towards having a fine display in the flower-garden; as, if you have not winter room, and plenty too, how are you to expect to shine like your neighbours who have no lack of these things?—D. Beaton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the week ending Aug. 3, 1843, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 10th, 1842, thermometer 90°; and the lowest on the 6th, 1833, thermometer 36°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending August 4, 1843.

NOTWITHSTANDING the late heavy rains the supplies are amply sufficient to meet the demand. Pines of excellent quality are brought, and amongst them are some good Providences and Montserrat. Black Hamburg Grapes are well coloured in general, and with them are bunches of the Muscat and Sweetwater. Peaches and Nectarines do not appear to be so abundant. Apricots, Greengage and Orleans Plums are becoming more plentiful. A few Figs have been offered during the week, from 3s. to 6s. per dozen. Strawberries and Cherries are on the decline; of the latter there are a few samples of the Bigarreau, from 5s. to 10s., and of the Turkey Heart, from 3s. to 5s. per doz. lbs. Currants and Gooseberries abound; the former from 2s. 6d. to 4s., the latter from 1s. 6d. to 2s. 6d. per half-sieve. Raspberries are plentiful, but, as is the case with all tender out-door fruit, they are much bruised with the heavy rains. Green Walnuts for pickling fetch about 3s. 6d. per half-sieve. Amongst Pears, there are the Citron des Carmes, from 2s. 6d. to 3s. per half sieve; the Lammas, at 4s. per bushel, and a few Jargonelles. Apples consist of Juncations, from 1s. 6d. to 2s. 6d. per half-sieve, and a few Hawthorn deans. We observed also some New Town Pippins of 1842 in good preservation, from 2s. to 3s. per dozen. There has been little variation in the price of Vegetables during the week. The late rains have favoured the growth of Peas, and they continue to be well supplied, although not so abundantly as a few weeks back. Cauliflowers are particularly fine; Potatoes, Turnips, and Carrots, are remarkably clean and good. French Beans are abundant. Celery is excellent at this early period of the season; Salading and Herbs of every description are plentiful. Cut Flowers comprise Swainsonia galegifolia, Lilium cæmulum, Bixnônia venusta, Alstromeria pælegrina, Ceanothus azaricus, Orange-flowers, Gladioli, Pelargoniums, and Geraniums; with Roses, Pinks, Picotees, and Pansies, in great variety.

PRICES, SATURDAY, AUGUST 5, 1843.—FRUITS—

Pine Apple, per lb., 3s. to 6s.	Raspberries, per gallon, 5d. to 1s.
Grapes, hothouse, per lb., 2s. to 3s.	Cherries, English, p. 12 lbs., 1s. 6d. to 2s. 6d.
Peaches, per dozen, 12s. to 21s.	Cherries, Wall, per lb., 1s. to 2s.
Nectarines, per dozen, 12s. to 21s.	Apples, new, per hf. sv., 1s. 6d. to 2s. 6d.
Apricots, per doz., 1s. to 4s.	Oranges, per dozen, 1s. 6d. to 4s.
Figs, per doz., 6s.	— per 100, 10s. to 30s.
Melons, 2s. to 6s. each	Lemons, per doz., 1s. to 2s.
Plums, per punnet, 2s.	— per 100, 7s. to 16s.
— Gage, per punnet, 2s.	Cucumbers, per brace, 6d. to 2s.
Strawberries, per punnet, 6d. to 1s.	Almonds, per quart, 5s.
Gooseberries, p. 14 sv., 1s. 6d. to 2s. 6d.	Sweet Almonds, per pound, 3s.
Currants, per half-sieve, 2s. to 3s. 6d.	Nuts, per bushel —
— Black, 2s. 6d. to 3s.	— Brazil, 16s.
— Red, for wine, per sieve, 4s. to 5s.	— Baracenia, 24s.
— for dessert, p. hf. sv., 3s. to 4s. 6d.	— Cob, 12s.

VEGETABLES.

Cabbages, per doz., 9d. to 1s. 3d.	Leeks, per doz. bun., 3s. to 4s.
Cauliflowers, per dozen, 1s. to 5s.	Onions, Spring p. doz. bch., 1s. 6d. to 3s.
Beans, Kidney, per hf. sieve, 2s. to 3s. 6d.	— Large, per doz. bch., 2s. to 6s.
— Scarlet, per hf. sv., 1s. 6d. to 2s. 6d.	Garlic, per lb., 6d. to 1s.
— Windsor, per sieve, 1s. to 1s. 6d.	Chilis, per 100, 1s. to 2s.
Potatoes, old, per ton, 10s. to 20s.	Peas, per bushel, 1s. to 3s.
— new, per cwt., 2s. to 5s.	— per sack, 2s. to 5s.
— per bushel, 1s. to 3s.	Lettuce, Cabb., p. score, 9d. to 1s.
— Kidney, p. bush., 3s. to 4s. 6d.	— Cos, per score, 1d. to 1s. 6d.
Artichokes, green, per doz., 1s. to 5s.	Celery, p. bd., (12 to 15) 6d. to 1s. 6d.
Vegetable Marrows, per doz., 6d. to 1s.	Small Salads, per punnet, 2d. to 3d.
Turnips, per doz. bun. bch., 3s. to 5s.	Sweet Bun. l., per doz. 1 bun. 6d., 2s. to 4s.
Red Beet, per dozen, 9d. to 1s.	Watercress, per doz. bun. 4d. to 6d.
Horseradish, per bundle, 1s. to 6s.	Farsley, per half sieve, 1s.
Radish, spring, p. doz. hands, 6d. to 1s.	Tarragon, per doz. bunches, 2s. to 3s.
Turnip, p. doz. bunch, 6d. to 1s.	Fennel, per doz. bunch, 2s. to 3s.
Carrots, Horn, p. doz. bunches, 3s. to 6s.	Mint, per doz. bunches, 1s. 6d. to 3s.
— Long, per doz. bunches, 4s. to 7s.	Marjoram, green, per bunch, 2d. to 4d.
Shallots, per lb., 1s.	Mushrooms, per punnet, 1s. to 2s.
— green, per bunch, 4d.	Wallnuts, Green, per bushel, 7s. to 9s.
Spinach, per sieve, 1s. 8d. to 2s.	

Notices to Correspondents.

BOTTOM-HEAT.—*Proteus*.—Three inches are sufficient depth of water for gutters, but we doubt whether four inches in width will be sufficient to communicate the requisite heat to a cucumber-bed. We should say that six inches are the smallest space which it is safe to employ, especially where the water is shallow. In the Horticultural Garden the earth is thrown at once upon the hot-water gutters in order to save chambering, and it seems to answer perfectly well. In this system, it will be a great point to maintain a steady heat rather than a strong one.

M'PHAIL'S PITS.—C. D. B.—If circumstances render it advisable to use hot litter as a fermenting material, then M'Phail's pits are as good a contrivance for Melons as any other.

VINES.—An Amateur.—There is no necessity for applying fire-heat to a Vinery at this time of the year, unless continued damp weather prevails; nor earlier in the season, when the Grapes are set, if a temperature of 55 deg. can be maintained without it. When Grapes are ripened, the young wood is in a great measure matured also, and it will not injure the Vines to remove all laterals formed after that period.

THE HOLLY.—Hex.—You will find no better account of this plant than in "Selby's British Forest-trees." Whether or not it grows fast depends more on the soil than anything else. Rich loams are what suit it best. It should not be overshadowed by other trees, and if the land is manured for it so much the better. As to pruning it, with a view to making it grow fast, the less you do of that the better; all that is necessary is to encourage the leader, if necessary, by stopping any laterals that try to interfere with it. In the nurseries, when Hollies are stunted and bushy-headed, they are headed down, with a view to obtaining a clean, straight shoot; but they should not be allowed to become stunted, and then there would be no need to cut them back. In Hollies, and all other things, stop where necessary, but prune not at all, if you can help it.

PERENNIALS.—Anglo-Indian.—The following kinds will answer

your purpose. *Alyssum saxatile*, yellow; *Chryseis crocea*, orange; *Delphinium grandiflorum*, double var., deep blue; *Dodecatheon Meadia*, light rose; *Erythronium dens canis*, both white and red varieties; *Gentianaseptemfida*, blue; *Geranium lancastriense*, reddish-purple; *Lobelia fulgens*, scarlet; *L. speciosa*, purple; *Lysimachia ciliata*, yellow; *Mimulus moschatatus*, yellow; *Erica herbacea*, rose; *Omphalodes verna*, blue; *Pentstemon gentianoides*, coccinea, scarlet; *P. ovatus*, blue; *Phlox ommiflora*, white; *P. stolonifera*, rose; *P. setacea*, light rose; *Polemonium caeruleum*, blue; *Potentilla Hopwoodiana*, rose and white; *P. Russelliana*, dark chocolate; *Saxifraga granulata plena*, white; *Stactis Gmelini*, blue; *S. tatarica*, red and white; *Tournefortia heliotropioides*, lavender; *Trillium europaeum*, yellow. 1

TULIP-TREE.—*Mathetes*.—This is increased either by layers or from seeds procured from its native country. There is no necessity for pruning it further than to cut out any dead wood which may occur in old trees. If you are desirous of rendering your plant more vigorous, the best plan will be to water it occasionally when in full growth with liquid manure. 1

SALVIA PATENS.—*Mary*.—As you state your case, we presume that your plant was in some way injured when first tried up, and is now recovering. This, and perhaps cold at the root, may have been the cause of the flowers falling off.

CUTTINGS.—*K.*—Honeysuckles, Jasmines, and similar climbers, will strike readily from cuttings after this time. A little bottom-heat will forward the production of roots, and establish them better before the approach of winter. 1

CYCLAMEN.—*Clericus*.—The sweet-scented Persian Cyclamen may be obtained of any nurseryman. We can say nothing respecting the price. 1

EXOTIC PLANTS.—*J. L.*—We conceive it is possible to keep plants from a warmer climate too hot at night in this country, occasionally, even though freely exposed to the atmosphere. We doubt whether morning watering, unless it is a deluge in quantity, will afford as adequate a supply of moisture as the ordinary watering in an evening.

ROSES.—*Wellensis* and *Others*.—It is early yet for putting in cuttings of Roses; the latter end of this month or the beginning of next will be quite soon enough. By that time the young wood will be properly matured, the want of this is the cause of your present failures. 1

FUCHSIAS.—*G. Tolmase*.—No one who knows anything of the new seedlings of this genus can be ignorant that St. Clare is one of the finest varieties we have. At the meeting in Regent-street, last Tuesday, this was proved by the specimens exhibited. It is true that it is a loose grower, and requires good management to be obtained in perfection; and it is possible enough that some gardeners may not be able to grow it well; but that only shows their want of skill. Some people cannot grow *F. corymbiflora*, and say that too is a bad sort; but who attends to such assertions?—*Rosa*.—We recommend you the following Fuchsias, which, for variety and beauty, we think will meet your wishes.—Thompson's formosa elegans, Venus victrix, conspicua arborea, robusta, splendens, Curtisii, Cornmaki, Pontey's tricolor, Paragon, pulcherrima, Dalstonii, Brewsteri. *

PELAGONIUMS.—*An Economist* is recommended to procure the following kinds for his collection.—Sir Robert Peel, Hodge's Commodore, Madeleine, Lynes's Duke of Cornwall, Games's Rising Sun, Erectum, Sylph, Matilda, Nestor, Rhoda, Wonder, Coronation, Prince of Waterloo, Grand Monarch, Garth's Witch, Queen of the Fairies, Leila, Annette, Cyrus, Sapphire, Unit, Luna, and Wonder. —The following Pelargoniums will improve *A Subscriber's* collection.—Foster's Sir R. Peel, Favourite, Garth's Witch, Lynes's Duke of Cornwall, Rhoda, Hodge's Emperor, Amyntor, Priory Queen, Unit, and Selina, which, though deficient in form, is brilliant in colour, and makes a fine variety in a collection. —*Rosa*.—The following list contains the best Pelargoniums we are acquainted with in their different classes. This list may also be referred to by *A Lover of the First Class*, for those flowers not in his collection. *Purple*: Forster's Sir R. Peel, Conservative, and Creole. *Crimson*: Grand Duke, Games's King, Hodge's Commodore, Sapphire, and Madeleine. *Orange*: Lynes's Duke of Cornwall, Games's Rising Sun, Erectum, Eclipse, Lord Chancellor, Wizard, and Comte de Paris. *Rose*: Favourite, Nestor, Rhoda, Wonder, Grand Monarch. *Rose with white centre*: Amyntor, Unit, Luna, Symmetry, Constellation. *Pink*: Sylph, Matilda, Maid of Honour. *White*: Queen of the Fairies, Garth's Witch, Leila, and Annette. Selina, and two or three other varieties mentioned in this list, though not flowers of good form, are useful in a collection, on account of their brilliant tints, and cannot be dispensed with until better flowers appear of their respective colours. *

PINKS.—*R. H.*—The following 24 Pinks are flowers of first-rate properties.—Acre's Lord Brougham; Brown's Garland, Eclipse, Acme, and 134; Bunkell's Eclipse; Barrett's Conqueror, Churell's Rosana, Creed's President, Dawson's Gauntlet, Garrat's Alpha, Headley's Duke of Northumberland, Hodges' 166 and Gem, Jeff's Mary Anne, Kean's Ne plus Ultra, Ibbet's Triumph, Legg's Prince Albert; Norman's Henry, Defiance, and Duke of Wellington; Walmer's Prince of Wales, Unworth's Omega, White's Warden. *

AMARYLLIS FORMOSISSIMA.—*An Amateur*.—To throw this plant into bloom, we would advise you to diminish the supply of water gradually, and to keep it in a warm and dry situation during the winter. Rejoice it in spring; place it near the glass, and water it freely when it begins to grow. 1

CHERIMOVER.—*J. S.* can procure this of such nurserymen as Messrs. Loddiges; its cultivation is well worth attempting in earnest.

MELONS.—*Finbroensis*.—We can account for your Melons, which were turned out in the first week in April, not having yet shown fruit, if, as you say, they were kept in a temperature seldom below 80°. That temperature suits them in the day, but is 20° too high by night, and has caused the production of nothing but male flowers, as it always does.

RASPBERRIES.—*H. D.* may increase his favourite Raspberries by means of the suckers which spring up around the base of the old stools. 1

STRAWBERRIES.—*H. D.* has this year had Strawberries in the highest perfection and of immense size—some of the Downton sort having measured four inches round; the beds were made two seasons since, and he asks whether it would be advisable to manure the beds this autumn or not, they having up to this time yielded from the natural soil, which is a deep rich earth, famous for the growth of Carrots? Manure can do no harm, but it seems unnecessary for the present, under the circumstances stated.

MULBERRIES.—If *W. S. D.* would be so kind as to say how he keeps his Mulberries dwarf it would be a great kindness to "Anonymous."

VEGETABLES.—*D. Z.*—The White Versailles Lettuce should be sown in April and May in rich well manured soil, where the plants may be thinned out to 12 or 15 inches apart, or transplanted when young to that distance. It is an excellent summer Lettuce. 1

INSECTS.—*Ignoramus*.—The insects which you find upon your Rose-bushes adhering to the leaves, are the pupae of the common two-spotted Lady-bird (*Coccinella dispar*). As this insect, in the larva state, lives upon Plant-lice, Aphides, &c. you should not attempt to destroy, but do all you can to encourage, it.—*Ruth, a Subscriber*.—Your Thorn-hedge is attacked by a very destructive little moth, called the Small Ermine, *Yponomeuta padella*. It will do no harm in your house, being a vegetable feeder. Gas-liquor is to be obtained at gas-works, and is produced from coal during the manufacture of gas. When the caterpillars of the Small Ermine first begin to congregate, this liquor and water would probably kill or drive the caterpillars away, if the hedge were well syringed with the

mixture.—*G. S. Wintle, Gloucester*.—The Beetles you forwarded to us are the Autumnal Chalcid, *Rhizotrogus scitialis*. They are very common in some parts of this country. We cannot account for the appearance of this insect so abundantly with you this season, while for the last ten years you have not observed it. The periodical appearance of certain insects has been frequently noticed, but never satisfactorily accounted for.

—*Angus*.—The insect which you suppose to have done so much injury to the leaves of the Oak trees in Forfarshire, by covering them with round brown desiccated spots, is what is commonly called a Frog-hopper, in the immature state. It probably belongs to the genus *Tettigonia*. Insects nearly allied to the one in question are known to do much injury to vegetation, and the round spots on the Oak-leaves (having an evident puncture in the centre) in all probability result from the attacks of the insects you have forwarded. 1

BEES.—*M. B.*—Your Bees, which have established themselves under the roof of your Apple-house, are like many others when left to their own guidance; and, provided the situation is suitable, they will do best if left to their own will. Hence you cannot do better than leave them in their present situation, and take the swarms which they may throw off. Placing a hive near them, either with or without comb, would have no effect whatever in enticing them from their favourite abode. 1

APHIDES.—*Dulwick*.—We have never observed the Aphis to which you allude upon any specimens of *Abies morinda* which have come under our notice. We recommend you to syringe your plants with ammoniacal liquor, diluted with twenty times its bulk of water. —*D.*—You will not kill them with gas-water, unless you use the syringe.

MONSTERS.—*Ulkwater*.—Your Rose is one of those instances of malformation which explain the true nature of the floral organs, and contribute to prove the truth of the doctrine of "Morphology," a curious branch of botanical science, to which some well-meaning, but very ignorant, persons are opposed, under the most absurd idea that it is Atheistical, and so forth; whereas it is, in fact, the very reverse. Some of these days we shall treat the whole subject formally in our columns, for which purpose we are collecting materials. In the meanwhile we are obliged for your specimen, which is, however, common. It is a case where the carpels of the Rose are returning to the condition of leaves, and with that return are resuming the power of forming buds in their axil, a power which they lose if they are absolutely in their carpellary condition. —*Kilmarnock*.—We quite agree with you, and think that your reasoning is sound. The instance you give of the origin of the Willow-leaved varieties, so common in nurseries, is quite new to us, and exceedingly curious. Although you do not wish your letter to be printed, we trust that we may make use of it some day, when we take up the subject of Morphology.

SNOWS.—*F. G. S.*—A collection of yellow-ground Picotees would not rank, nor could they compete, with white-ground flowers.

EXHIBITIONS.—*A Subscriber*.—All fruit intended for exhibition at the meetings of the Horticultural Society should be sent to 21, Regent-street. 1

MAW-SHED.—*A. T. J. H.*—This is nothing more than Poppy-seed stained blue.

LABRIS.—*J. H. W.*—We do not know where brick labels, similar to those used in the Arboretum at Derby, can be purchased. 1

ELDER WINE.—*Mtd-o-Wood* will find the best directions that can be given on this subject in Macculloch's little treatise on Wine-making.

COPYRIGHT.—*Anglo-Indian*.—We must decline giving an opinion on a matter in which a solicitor should be consulted. We believe, however, that corporate rights override individual rights; and we do not advise you to try the question with a rich or powerful Society. It seems to us improbable that the law would allow an individual, B, to convert to his private gain that which is the joint property of the corporate body of which B is a fragment; and we presume that if the law did permit this, it would also permit all co-partners in the corporate body to sue B for a share of his profit.

MISCELLANEOUS.—*E. S.*—Your *Rubus* is the *R. hispidus* of Linnaeus, but not of Willdenow and some others. It was called *R. obovatus* by Michaux and Pursh. The *Rubus hispidus* of Willdenow is the *R. trivialis* of Michaux. All this is extremely well made out in Gray and Torrey's excellent Flora. —*Didymus*.—*Asplenium adiantum nigrum* 1. —*Clericus*.—Both numbers are out of print. —*Mary*.—*Sutherlandia frutescens*, a well-known Cape plant, usually treated as a tender annual. It blooms abundantly, and seeds in the open ground during the autumn. —*R. B.*—The old *Agrostemma* (now *Lycnis*) *Cochi* rosa. —*S. W. G. S.*—*Cornus coccinea* —*X. Y. Z.*—The White Currant, which you may have obtained as a new seedling, does not appear to be different from the White Dutch. The Early Potato received along with the above cannot be distinguished from the Early Manly. 1 —*Snob*.—1, *Evénia promastri*; 2, *Ranalisia fastigiata*; 3, *Cetraria glauca*. —*H. H.*—1, *Rubus cæsius*; 2, *R. corylifolius*; 3, *R. plicatus*; 4, *R. carpinifolius*. —*D. R.*—The Grape you received under the name of Dulzetta is the Blue Frontignan. It is quite distinct from the Black Frontignan, with which it has been confused. The foot-stalks of the berries become purple as the fruit ripens, and the juice of this variety is of a deep purple tinge, with only a weak Muscat flavour. The Pig appears to be the White Marseilles. —*W. Scorgie*.—1, *Draba verna*; 2, *Thymus serpyllum*; 3, *Sedum villosum*; 4, *Asplenium rata muraria*; 5, *A. Adiantum nigrum*; 6, *Fedia chloria*; 7, *Mitella diptylla*; 8, *Marchantia hemisphaerica*; 9, *Lycopodium selaginoides*; 10, *Aspidium Lönchitis*; 11, *Corydalis fasciculata*. —*Reverend*.—*Sturtia pentagyna*. 1. —*Dido*.—*Plumbago capensis*. 1. —*M. D.*—*Ptelea trifoliata*. 1. —*Sarah*.—*Pentstemon atropurpureus*, *Negundo fraxinifolia*, *Monarda fistulosa*, and *Actaea spicata*. The *Calandrinias* are all alike, and are *C. speciosa*. 1. —*F. H. R.*—*Mahernia incisa*. 1. —*A. S.*—*Agrostis alba*. 1. —*A Constant Reader*.—Your Pea is the Auvergne. 1. —*Weekly Subscriber*.—1, *Brachycome iberidifolia*; 2, *Campánula spéculum*; 3, *Lobelia gracilis*; 4, *Ceanothus pallidus*; 5, *Godetia Lindleyana*; 6, *Lotus Jacobæus*; 7, *Agératum Mexicanum*; 8, *Oenothera tetralopha*; 11, *Escallonia rubra*; 12, *Jasminum fraticans*; 15, *Coronilla glauca*; 14, *Salvia chamædrifolia*; 21, *Lantana Sellowii*. —*C. W. T.*—Your remarks will be acceptable. 1. —*W. B.*—Your plant is *Hippeastrum aulicum*. Its irregularity in flowering is some accident. —*J. C.*—*Zephyranthes rosea*. —*Rev. J. H.*—*Allanthus glandulosus*. —*G. Walker*.—*Veronica spicata*. 1. —*B.*—We apprehend that your *Stanleyas* are spotted by being kept too cold and damp. Your *Cattleya* shall be named next week. —*J. D. P.*—There is nothing remarkable in the *Eschscholtzia*, neither are the *Petunias* better than many others now cultivated. 1. —*A Regular Subscriber*.—Your report of the Gooseberry shows shall appear as soon as we can find room for them. 1

SEEDLING FLORISTS' FLOWERS.

VERBENAS.—*S. Goring*.—The best of your seedlings is 91, a very brilliant scarlet, having a rich velvety appearance; 50, white, tinged with purple, and having a purple centre, is pretty; but 93, something similar to it, with larger flowers of a richer colour, is much superior: 89 resembles one sent on a former occasion. There is nothing remarkable in your *Phlox*; it differs from *P. suavis* only in having light purple tubes. 1

PELAGONIUMS.—*J. L. Douglas*.—*Edith*, white, with small plum-coloured spot, is not good in form; the lower petals are too narrow. *Hebe*, bad form, under petals too narrow, and the flower altogether thin and flimsy. *Rival King* had fallen to pieces, but from the form and substance of the petals it appeared to be the best which you have sent; the colour is good, but the spot is too feathery, and the upper petals are a little too high. *Mary Martin* altogether wants substance and form. —*L. S. E.*—Your seedlings from being badly packed

had fallen to pieces; from the form and colour of the petals of the Queen of Sarum, it appears to be a pretty flower, and well shaped, but deficient in substance. The other variety is not so good. —*S. B. D.*—No. 1, a seedling of good form and substance, white centre, with bright rose termination to the lower petals; fine deep spot, rosy crimson beyond; a clear and brilliant flower. 2, Maroon spot, with rosy crimson margin, lower petals purplish rose, a good deal veined, and this is also visible in the top petals; a flower of good form, substance, and colour. 3, A flower of good form and substance, deep maroon spots, mottled rosy maroon, softening to the edge; inner petals delicate purple rose, good form, edges of the bottom petals remarkably even. 4, Maroon spot, mottled and veined to the edge; very delicate rosy purple under-petals; a flower of good form and substance. 5, Crimson maroon spot, veined and softening to the edge; very delicate pink under-petals. These flowers are all rather small, well formed with short round under petals of good substance, clear and bright in colour, and may be regarded as very pretty second-class flowers. —*X. Y. Z.*—We know nothing of your flowers; but this we know, that if they have been delivered at our office they have been punctually noticed; for nobody's questions are neglected. Your insinuation is unworthy of you.

PICOTEES.—*Evan Hirst*.—Your Picotee is a stout flower with well-formed petals, but the white is bad, the edges of the petals serrated, and the heavy edging very irregular: it will not do for a show-flower, but will be very ornamental in the border. —*W. B.*—The principal defect in your purple Picotee is, that the guard-leaves do not project sufficiently beyond the next row of petals, and the edges are a little serrated. The white is good: the petals are well formed and fine in texture; colour and edging good, and with no disposition to bar—it promises well. —*Yonell and Co.*—Light-edged rose Picotee; the edges of the petals are too serrated. If this defect is permanent it is fatal to it as a show-flower; the petals are well formed, of a good size, white fine, and the flower opens well: if the edges would come smooth, it would be a very desirable flower. The colour is confined to the edging. *

CALCULARIAS.—*Seedlings* (without a name).—These were very pretty varieties, spotted and blotched; 6 and 7 were the best in the collection, but they are all too small for the taste of the present time. —*S. B. D.*—Your seedling with yellow ground, entirely covered with brown spots, is a very good variety, but inferior to *Standishii*. *

PANSIES.—*T. Cross*.—*Conqueror*, a dark flower, of good form and substance; the upper petals and a broad margin round the lower petals are of a deep velvety mulberry colour; the shield in the centre, which is generally white or yellow, is just distinguishable by being more of a blue colour than the margin, which gives it a novel appearance. *Tim Bobbin* wants substance, and *Curious* is deficient in the eye, and in the purity of the white ground. —*J. S. Hulme*.—*Emily* is a very pretty flower, of good properties, but too small to rank with show flowers. The *Anquary* it is impossible to give an opinion of, as it was quite shrivelled up; the colours are good. *

FUCHSIAS.—*G. W.*—Your seedling, with pink tube and sepals, each an inch in length, and dark vermilion petals, from which the stigma protrudes an inch and a half, is one of the largest flowers of this character which we have seen. The colour of the sepals is rather pale, but that may improve in a further summer than the present. If its habit is good it will be well worth cultivating. —*J. L. Douglas*.—Your seedling *P. undulata* is a very bright and rich-coloured flower, of moderate size, but not superior to some of the older varieties. —*T. Cripps*.—The flowers of your seedling are very large, of a pale rose-colour, the corolla being a little darker, with a slight tinge of purple; the sepals are very long; for so large a flower it appears to be deficient in colour and substance. —*W. Rogers & Son*.—Your seedling is a flower of good substance; tube and sepals of a bright rosy red; corolla, purple vermilion; pistil, very long and stout; a very large and showy variety. —*J. W. Tordella*.—*Winters*, tube long and smooth, of a rosy crimson; sepals open very wide, with the points slightly tipped with green; corolla short, of a rosy vermilion; a fine variety. *Magnificent*, tube smooth, bright rose; corolla large, of a crimson purple; a fine and showy flower. *Maria*, tube and sepals smooth and rose-coloured; corolla large, of a fine bright blue purple; an elegant variety. *Queen*, large flower, of good colour, but the corolla is too crumpled. *Florence*, tube smooth, sepals spreading, rosy in colour, with the points slightly tipped with green; corolla, rosy purple; a very pretty flower. All these seedlings are good in form, bright in colour, and smooth in texture. —*S. B. D.*—Your seedling Fuchsia is rather small, but fine in colour; bright red tube and sepals, with large violet purple corolla; it is an elegant flower, but rather too much like some of the older varieties. *

As usual, a host of letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE Overland Mail has arrived this week with news from Bombay to the 19th June, and from China to the 16th April. The details are not of much importance, with the exception of those which relate to Scinde. Sir C. Napier has made terms with most of the chiefs of that fertile country, and there is little doubt that its complete pacification will shortly be effected. Dost Mahomed has reached Cabul and has resumed the government, but the Afghan chiefs are far from being united in their allegiance to him. Lord Ellenborough left Agra on the 30th May for Calcutta, to join his council. In China, Sir H. Pottinger was waiting the arrival of the new Imperial Commissioner Ke-Ying, who was expected at Canton about the beginning of June. Smuggling was openly carried on, in spite of the efforts made to arrest its progress; and opium and British goods were selling at high prices. — From Spain, we learn that the insurgent Generals entered Madrid on the 24th, and that the Lopez Cabinet was reconstituted on that day. The Ministers immediately proceeded to the Palace, and were received most graciously by the young Queen. The Regent, on the other hand, has effected a junction with Gen. Van Halen, and commenced the bombardment of Seville; one of the suburbs of that fine city is already reduced to ashes, and the last accounts state that the firing is still continued. The new Madrid Government has despatched a division against the Regent, who is said to be in a condition to offer effectual resistance. The bombardment of Seville is severely censured by the French papers, but it is stated that the Regent could not have been aware of the fall of Madrid when he commenced operations. — In France, the affairs of Spain still occupy attention, and rumours are current that the Northern Powers have intimated their determination to oppose a marriage between Queen Isabella and the son of Louis Philippe. Some alarm pre-

vails in Paris respecting the Turkish expedition against Tunis, and a squadron has been despatched from Toulon to watch the movements of the Ottoman fleet. From the Levant, we learn that this fleet left the Dardanelles on the 16th, under the command of the Capitan Pacha, and there was little doubt that it was intended to act against Tunis. The Sultan is also concentrating a large military force at Adrianople, and in the neighbourhood of the capital; and there is reason to suppose that the Schah of Persia meditates some act of aggression on the Turkish frontier.

In the House of Commons, on Monday, the motion for the second reading of the Church of Scotland Benefices Bill, sent down from the House of Lords, gave rise to a long and animated discussion on the affairs of the Scotch Church, and the second reading was only carried by a majority of 18. On Tuesday, Lord John Manners brought forward a motion for repealing the laws of Mortmain, as imposing restrictions on private charity, suggesting at the same time the re-establishment of religious houses and of monastic institutions. Sir J. Graham opposed the motion, which was ultimately withdrawn without a division. Mr. Ward then brought on his motion for effecting a new settlement of the revenues of the Irish Church, by distributing them among the members of the Establishment, the Roman Catholics, and the Presbyterians, according to the numbers of each denomination. Lord Eliot opposed the motion, and after a long sitting the debate was adjourned to Wednesday, when the House was counted out, and the motion consequently fell to the ground.

Home News.

Court.—Her Majesty and Prince Albert, with the Prince of Wales and the Princesses, accompanied by the Duke Ferdinand and the Prince and Princess of Saxe Coburg Gotha, left town on Thursday for Windsor Castle, where they will remain till Tuesday. During the week the Royal visitors have inspected Hampton Court Palace, the exhibition of Cartoons, Westminster Abbey, Greenwich Hospital, the East India House, the West India Docks, the Athenæum Club, and Guildhall. Her Majesty and Prince Albert accompanied them to the new Houses of Parliament on Saturday, to the Exhibition of the Royal Academy on Monday, and to Stafford-house, the residence of the Duke of Sutherland, on Tuesday. The Queen had a state ball on Monday, and a dinner party on Wednesday. Prince Albert presided at a meeting of the Fine Arts Commission on Friday, and transacted business at the office of the Duchy of Cornwall on Tuesday. The Duchess of Norfolk has succeeded Lady Portman as the Lady in Waiting on the Queen; Lord Rivers and Colonel Drummond have succeeded Lord Byron and Sir F. Stovin as the Lord and Groom in Waiting on Her Majesty. Colonel Arbuthnot has relieved Major-Gen. Wemyss as Equerry in Waiting on the Queen, and Colonel Wylde has relieved Colonel Bouverie as Equerry in Waiting on Prince Albert.—The King of Hanover left town on Saturday for Kew, and gave a dinner on Sunday to the Duchess of Gloucester, the Duke of Wellington, and a numerous party. The King came to town on Monday, and was present at Her Majesty's Ball. On Tuesday His Majesty dined with the Earl of Jersey, and on Wednesday with the Earl of Shaftesbury, attending the Duke of Wellington's concert in the evening. On Thursday His Majesty dined with the Duke of Sutherland.—The Queen Dowager will leave town in a few days for Witley Court, Worcestershire, which Her Majesty has taken on lease for three years.—The Crown Prince of Wurtemberg has arrived in town from a tour of several weeks in Scotland, the north of England, and part of Ireland.

Royal Commission of Fine Arts.—The Commissioners have issued an invitation to artists to send in specimens of fresco painting, for the decoration of the new houses of Parliament. They have also issued similar invitations for arabesque paintings and heraldic decorations for the enrichment of panels, friezes, &c. in colour and gold, as well as for designs for ornamental metal work for screens, railings, gates, &c., and for ornamental pavement.

The National Society.—The National Society for promoting the Education of the Poor in the principles of the Established Church has just circulated a paper on the subject of additional schools in the mining and manufacturing districts. The object of the circular is to effect the purpose aimed at by the Educational clauses of the Factories Bill, by means of private subscriptions, and in connection with the Established Church. Amongst the subscribers are the Queen, 1,000*l.*; Prince Albert, 500*l.*; the Queen Dowager, 500*l.*; the Duke of Northumberland, 1,000*l.*; the Duke of Portland, 1,000*l.*; Sir R. Peel, 1,000*l.*; the Archbishop of Canterbury, 500*l.*; the Archbishop of York, 500*l.*; the Bishop of London, 500*l.*; the Earl of Harrowby, 500*l.*; the Dean and Chapter of Durham, 500*l.*; the Duke of Buccleuch, 500*l.*; Lord F. Egerton, 500*l.*; the Hon. Sidney Herbert, 500*l.*; Mr. Abel Smith, M.P., 500*l.*; Mr. Holford, 500*l.*, &c. The total amount at present subscribed is nearly 33,000*l.*

Foreign.

FRANCE.—Considerable alarm prevails in Paris respecting the reported Turkish expedition against Tunis, and two ships of the line and a steamer sailed from Toulon for that destination on the 26th. The Marseilles papers of the 28th announce, that in the evening of the 25th the maritime prefect was instructed by telegraphic despatch to send out immediately all the vessels of war which had their provisions on board, and early in the morning of the

26th two ships of the line and a steamer put to sea, for Tunis. It was supposed that the Government had received some important information from the Regency of Tunis, and that its last despatches from Constantinople had apprised it of the intention of the Ottoman Government to make another attempt against that Regency. Some even stated that the Turkish fleet was already before Tunis. A steamer, returning from Bona on the 19th, descried a fleet of nine sail off Cape Gattes, apparently steering towards Gibraltar. This naval force, at first mistaken for an English fleet, is now believed to be the Ottoman squadron, which was to have put to sea on the 5th for the Archipelago.—The anniversary of the revolution was not celebrated by fêtes this year in Paris. The King and the Royal Family returned on Saturday evening to Neuilly from the Château of Bizy. The Duke and Duchess de Nemours are making a tour of Normandy and Brittany, where they have been enthusiastically received. The Toulon papers mention a report that Admiral Parseval Deschenes has been called from Smyrna to take the command of the Mediterranean squadron, and that Admiral le Ray is to hoist his flag in the Inflexible, as Commander of the Levant station.—The *National* of Tuesday publishes its ninth list of subscriptions in favour of agitation in Ireland. It amounts to 230 francs, making the total amount subscribed 2,836 francs.—During the entire week there have been innumerable conferences at the Hotel de Courcelles (the Paris residence of the ex-Queen Regent of Spain), at which assisted the whole of Her Majesty's Council, the Austrian Ambassador, the Prussian Minister, the Chargé d'Affaires of Russia, and M. Guizot, who came in from Auteuil express for the purpose. The result has not transpired, but it is reported that the northern Courts, at least, are determined to oppose a marriage between Queen Isabella and the son of Louis Philippe.—The *Moniteur* publishes a Royal ordinance, promoting the Prince de Joinville to the rank of Rear-Admiral. This ordinance is followed by the Marriage Act of the Prince with the Princess of Brazils, which was signed on the 31st, in the Palace of Neuilly, in presence of the Royal family, Marshal Soult, M. Guizot, the Minister of Brazils, Baron Pasquier (Chancellor of France), and the Duke de Cazes (Grand Referendary of the Chamber of Peers), acting as the civil officers. The *Journal des Débats* states that the Princess of Brazils brought to her husband for her dower:—1st, 1,000,000*fr.* in specie; 2d, a revenue of 180,000*fr.* arising from Brazilian 6 per Cent. Stock; 3d, 25 leagues of territory in the province of Santa Catharina, at the choice of the Prince; 4th, the Princess possesses in her own right, a yearly income of 26,000*fr.*, together with diamonds and jewels to an amount of 200,000*fr.*; 5th, the Emperor of Brazils made a present to his sister of 300,000*fr.* for her outfit. Besides these, "the right of succession to the throne of Brazils is expressly reserved to the Princess de Joinville. She is to become Empress of Brazils, to the exclusion even of her eldest sister, the Queen of Portugal, if the Emperor Don Pedro II. and the Princess Januaria, the presumptive heiress of the throne, die without issue. This clause has been inserted in the Marriage Act of the Princess."

SPAIN.—We learn from Madrid that on the 23d the barricades were removed from the streets of the capital, as well as the cannon, which had been stationed in various quarters, and the National Guard dispersed and returned to their homes. In the afternoon Gen. Aspiroz made his entry, his vanguard consisting of the engineers and artillery, who had recently joined them. Aspiroz was escorted by a numerous staff and followed by the people, who uttered mingled *Vivas!* and *Mueras!* Gen. Narvaez entered on the 24th. On that day also Col. Prim entered, a Catalan battalion forming his vanguard. On the 25th the people had resumed their good humour and gaiety, and the National Guard were disarmed without any resistance. The Ayuntamiento and Provincial Deputation were also dissolved. M. Gomez Becerra, the head of the fallen cabinet, was said to be seriously ill. M. Mendizabal was believed to have sought refuge at the English Legation, which was granted, and General Seoane had retired to France. Madame Mina and M. Arguelles had tendered their resignations, and the Duke de Baylen had been appointed temporary guardian of the Queen. MM. Ayllon and Caballero arrived at Madrid on the 24th, and thus completed the Lopez cabinet, which was reconstituted on that day. The Ministers immediately proceeded with General Narvaez to the Palace, where the Queen received them most cordially, and gave Gen. Narvaez a reception the more gracious, as he was enabled to afford her tidings of her mother, Queen Christina. In the evening the young Queen drove out, and was everywhere enthusiastically cheered. It is said that, previous to his departure from Madrid, Gen. Zurbano had an interview with Mr. Aston, who, on being told by him that he would endeavour to join the Regent, recommended him to advise the latter to abdicate. We learn, however, by telegraphic despatch that the Regent and Gen. Van Halen have effected a junction, and that, at the moment when all his hopes of success were over, the Regent commenced the bombardment of Seville, and reduced one of its suburbs to ashes. The bombardment was continued to the 22d ult., and the Paris papers state that on the morning of the 23d, the people having sent out a deputation to request the Regent to cease firing, a negotiation was entered into, but without effect, and the bombardment was renewed on the 25th. The French papers dwell with great severity on this attack, which they pronounce an act of cruel revenge, or a means of extorting a large sum from the wealthy capital of Andalusia. As there is a four days' march from Seville to Cadiz, the *Journal des Débats* anticipates that if the Regent should

remain but two days before the former city, and only leave it on the 24th, in order to be at Cadiz on the 27th, he will find that the news of the defeat of Seoane and Zurbano has already arrived thither, when Cadiz may very possibly have joined in the general movement, and shut its gates on him. Desperate, however, as his position appears to be, there is reason to believe that he has still the means of protracting the struggle. His junction with Van Halen and attack on Seville show that he is not precipitately flying, as was recently supposed. The new Madrid Government have hastened to despatch a division against him, and another against his partisan, Gen. Ricafort, in Estramadura; whilst his cause must still be upheld in Galicia, since a brigade has also been sent to that quarter. *La Siècle* affirms, on what it considers excellent authority, that the united forces of Espartero, Van Halen, and Ricafort, amount to 12,000 men, and that the soldiers are beginning to repent their defection. The Municipality of Saragossa, upon the news of the entrance of Narvaez into Madrid, sent a deputation to Brigadier Amettler, for the purpose of announcing to him that the city recognised the new Government. Letters from Perpignan, of the 26th ult., state, that on the previous day the Governor of Montjuich had written to the foreign consuls to inform them that he had demanded 25,000 francs from the authorities of Barcelona, to provide for the wants of the garrison of the fort, and that if his request was not attended to, he would fire upon the city. The consuls had protested against that determination and had succeeded in prevailing on the Governor not to fire upon the city, but await the instructions of the new Government of Madrid.

PORTUGAL.—We have advices from Lisbon to the 28th ult., announcing that on Friday, the 21st instant, the Queen was safely delivered of a Princess. This event having taken place rather unexpectedly, the usual preparations and ceremonies were rendered unnecessary. Salutes were fired from the batteries and ships at anchor, and a partial illumination was observed for three nights throughout the city. The public mind was occupied with other matters, which appear to have withdrawn, in a great measure, the attention which might otherwise have been bestowed upon the Sovereign. For the last week several regiments had been kept under arms, as the greatest anxiety continues to prevail regarding the fortunes of Spain. The infant Princess is the first daughter her Majesty has yet had, and the probability that, if she lives, she may become the future Queen of the French, is already talked of—the Count of Paris, heir apparent to the French throne, is now three years old, and the alliance, therefore, in point of age, will be very suitable. It is considered to be made more probable by the fact that the heir to the French throne must marry a Roman Catholic Princess of the first rank, and the contingency was spoken of at Court before the Princess Clementine left Lisbon.

GERMANY.—The Diet of the Rhenish provinces closed its session at Dusseldorf on the 20th ult., prior to which it resolved, by a majority of 46 to 26, to address his Majesty to abrogate the laws interfering with the liberty of the press, and to introduce a law to abolish the existing censorship. The *Gothenburg Gazette* states that the interview which took place at Straalsund between the King of Prussia and the King of Denmark included, amongst other objects, the marriage of Prince Frederick of Hesse, nephew of Christian VIII., with a Grand Duchess of Russia. Prince Frederick is presumptive heir of the electorate of Hesse and of the kingdom of Denmark.—At a recent meeting of the committee charged to superintend the completion of the cathedral of Cologne, the archbishop stated that he had received two communications, which he considered of importance. One was a letter from the King of Bavaria, announcing that he had directed his representative at the Germanic Diet to present a proposition to the other members, calling on each to engage to pay some certain sum each year until the edifice was completely finished. Should this proposition, as he hoped, be acceded to, the King undertook to contribute 10,000 florins a year from his privy purse during his lifetime, and he had no doubt that his successor would continue the same contribution. The second document was a copy of the King's address to the Germanic Diet on the same subject.

TURKEY.—Constantinople letters of the 17th ult. state that a Cabinet courier arrived there on the 11th from St. Petersburg, and the next day an important communication was made to the Porte by the Russian Minister. The Emperor, he informed it, refuses to sanction the late proceedings in Servia, and still insists on the banishment of M.M. Wustschish and Petronowics. While these chiefs remain at the head of affairs in that principality, his Majesty is of opinion that nothing can be established on a satisfactory basis; and if the Porte has not the power to render its authority respected, he will himself take measures for the restoration of order and obedience. Since the receipt of the above despatches, the Porte has again issued orders for armaments on the scale originally contemplated. The camps formed at Adrianople and Constantinople each consist of 60,000. The latest intelligence from Persia is also of a very dubious character, there being reason to suppose that the Persian Government meditates some act of aggression, by way of reprisal for the attack upon Kerbela. The Shah left Teheran on the 22nd June with a small division of his army, accompanied by thirty field pieces. He had made no previous communication to the diplomatic body as to his route and destination. The Sultan had paid a visit of ceremony to the Capitan Pacha, on board his flag-ship the Mahmoudieh, previous to his departure for the Mediterranean. The fleet got under weigh on the 16th, and consisted of two ships of the line, four frigates, and some corvettes and cutters. There was

little doubt that it was intended to act against Tunis. Admiral Walker commanded one of the vessels.

INDIA.—The overland mail has arrived with dates from Calcutta to June 7; Bombay, June 19; Alexandria, July 20. The dates from China are of the 16th of April. The news is not of much interest this month, except that relative to the state of the newly-acquired province of Scinde. That fertile district, which under a good government and properly cultivated will become a garden, is now nearly pacified by the measures adopted by Sir C. Napier. He has made terms with most of the Chiefs, and even Meer Shere Mahomed is stated to have offered to make his submission provided he could have his private property secured to him. There is no doubt that within a short time the complete pacification of the country will be effected. Sickness prevailed very much in the camp at Hyderabad. Several officers died. Sir C. Napier had an attack of fever, but had recovered. The ex-Ameers had been removed from Bombay to Sassoor, near Poonah. The most dangerous of them was a prisoner in the Castle of Surat, where he was well guarded. The news from Lahore is that the alarm caused by the rumoured sickness of Shere Singh had ceased. That monarch was employed in traversing the north-east part of his dominions, and in examining his fortresses. The sons and brother of Shah Soojah were dependents on the bounty of the Sikh Monarch. Dost Mahomed, who was in very bad health, had reached Cabul, where he is said to have resumed the government, but the Afghan Chiefs are represented as very far from being united in their allegiance to him. In the interior of India tranquillity prevails. There were some disturbances at the capital of the late Scindiah's dominions, where the Minister appointed to govern during the minority of the child chosen to succeed him, was attacked and dispossessed of his power. The British had not interfered, but it was generally supposed that they would soon be obliged to send troops to protect the young Sovereign himself. Lord Ellenborough left Agra on the 30th May for Cawnpore and Allahabad, en route for Calcutta. Rumour asserts that strict orders had arrived from home ordering him to join his council. Prior to his departure from Agra he named Mr. Clark Governor of the North-western Provinces. This gentleman was latterly Envoy at the Court of Lahore, which office has been abolished. The beginning of the monsoon was felt through India. The mercury fell very much. A gale came on and expended its fury in the Bay of Bengal. Several ships were lost on the Coromandel coast. A dreadful hurricane was felt at the Mauritius towards the end of April, and caused severe losses. In Bombay, the burning of teak-ships was resumed on the 6th June, when a fine ship, the Thomas Grenville, was consumed. The insurance-offices have declined granting heavy policies on native ships with Lascar crews. The heat in Bombay was felt very much in the commencement of June, but the monsoon had broken on the night of the 18th, and had cooled the atmosphere. The wing of the 78th Highlanders had suffered from a sort of brain fever, which was attributed to their caps, and exposure to the sun, as well as to their careless mode of living in the tropics.
