Epiphyllum Ackermanni, is of a bright crimson colour, beautifully though delicately tinted with blue. —*J. M.*—The flower you send us of *Fuchsia Brockmannii* is very handsome, being particularly large, with the usual scarlet sepals, and pale blush petals. If the habit be compact, the variety is certainly a superior one, though it wants increased brightness in the colours of its blossoms. —*T. B.*'s specimens are *Cistus salviifolius*, and *Cytisus purpureus*. —*Delta.*—Your seed is the *Marvel of Peru*. —*Salopian.*—Your specimens are *Hardenbergia monophylla*, and a species of *Pedicularis*, probably *sylvatica*. —*J. T. Henley.*—No. 1 is *Genista canariensis*. No. 2 is, perhaps, a species of *Podocarpus*, but we cannot judge by the leaves alone. The admission fee to the Horticultural Society of London is 6 guineas; the annual subscription 4 guineas; and you must be proposed by a Fellow. —*G. H.*—We shall shortly insert an article on Pentstemons to meet your desires. —*A Subscriber.*—As your small and withered autumnal Figs would fall off naturally, it is as well to allow them to do so. —*S. C. K.*—Very sorry, but believe it impossible; we have not had a perfect set for sale for the last six months. —*Outis.*—We will answer you next week. —*J. M.*—*Bignonia Pandorae*. —*J. W. D.*—Your *Loasa* is probably new. We should like to see it.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE Budget of the Chancellor of the Exchequer, which was submitted to the House of Commons on Monday night, has been looked for with unusual interest. The leading fact of the financial year is the deficiency of the ordinary revenue by about two millions-and-a-half. The total expenditure for the year is 51,160,000*l.*; the total income is 48,740,000*l.*, showing an excess of expenditure of 2,420,000*l.* The Excise, which Sir R. Peel estimated at 13,700,000*l.* for the year, has produced only 12,500,000*l.*; the Customs, which he estimated at 21,500,000*l.* have produced only 20,750,000*l.*; the repeal of the timber duties, from which he calculated upon a loss of 600,000*l.*, has occasioned a loss of 676,000*l.* All the calculations have been wrong, except that of the Income-tax, which being estimated at 3,700,000*l.*, is likely to produce 5,100,000*l.*, though as yet the actual receipt has not been more than half that sum. The Post-office shows, as before, a steady and progressive increase. By the help of the amount expected from the Income-tax Mr. Goulburn estimates the income of the present year at 50,100,000*l.*, and the expenditure at 49,387,000*l.*, and he therefore expects to meet Parliament in April next, with a surplus on the year of 720,000*l.* In the expenditure, he promises a reduction of 900,000*l.*, consisting of a reduction of 645,000*l.* in the expenses of our establishments, and one of 257,000*l.* in the permanent charges connected with the public debt. He proposes no new taxes, and has no intention of remitting any taxes now in operation. He relies rather on the produce of the Income-tax, and on the prospects of a gradual revival of trade. Next in interest to these statements is the conversation in both Houses on Tuesday respecting the Repeal agitation in Ireland. The Duke of Wellington in the Lords declared that the Government were determined to maintain inviolate the integrity of the empire, and Sir R. Peel in the Commons announced that he was authorised by her Majesty to repeat the declaration made by the late King in favour of the Legislative Union, adding on the part of Ministers, that there was "no influence, no power, no authority, which the prerogatives of the Crown and the existing laws give to the Government, which should not be exercised for the purpose of maintaining the Union—the dissolution of which would involve, not merely the repeal of an Act of Parliament, but the dismemberment of the empire." On Tuesday Mr. Villiers brought forward his motion for the total abolition of the duties on corn. The debate has already lasted for four nights, and was last night again adjourned to Monday.

The news from India and China by the Overland Mail was in some measure anticipated by the telegraphic despatch noticed in our last. The details of the operations in Scinde are of course the leading features of this intelligence; the news from other parts of India, though comparatively unimportant, will be read with interest. From China we learn that a good understanding subsists between the British Plenipotentiary and the Imperial Commissioner, and that the arrangements for the commercial treaty will be resumed on the arrival of the treaty as ratified by Her Majesty.—The French Chambers have been occupied during the week with discussions on disputed elections, the interest of which is purely local.—In Spain the Regent has accepted the resignation of the Cabinet, and a Ministerial crisis has ensued, which promises to lead to a dissolution of the Cortes. The statesmen sent for by the Regent have failed in the attempt to form a new Ministry, and it is generally believed that in the present state of parties in both Chambers, the obstacles are too serious to be surmounted.

Home News.

COURT.—Her Majesty and the infant Princess continue to make favourable progress. Prince Albert, the Prince of Wales, and the Princess Royal are quite well. The Prince on Tuesday visited Windsor Castle, and inspected the alterations and improvements in the Park. His Royal Highness was attended during his visit by Mr. Ingram, Her Majesty's Head Gardener.—The Countess of Dunmore has succeeded the Countess of Gainsborough as the lady in waiting on the Queen, and the Hon. Misses Stanley

and Hamilton have succeeded the Hon. Misses Paget and Liddell as the maids of honour in waiting. Lord Rivers, and Admiral Sir Robert Othway have succeeded the Earl of Morton and Colonel Drummond as the lord and groom in waiting on her Majesty.

Death of Lord Fitzgerald.—We regret to record the death of Lord Fitzgerald, the President of the Board of Control, after an illness of a few days. The daily papers of Thursday announced that no hopes whatever remained of his ultimate recovery, and the fears then expressed that his Lordship would not survive the night were unfortunately realised by the result. The noble lord expired about two o'clock on Thursday morning, retaining his consciousness until a few minutes before his dissolution. It was evident to those who surrounded his bed, that he was approaching his death, from the exhaustion he experienced and the acute pain he suffered from the nature of his disorder. About five minutes before his death he fell into a morbid drowsiness, and shortly afterwards expired in the presence of Mr. Mahon, his Lordship's nephew, who attended him to the last. His Lordship is succeeded by his only brother, the Hon. and Very Rev. Dr. Henry Vesey Fitzgerald, Dean of Kilmore.

New Commission.—The Queen has been pleased to appoint the Duke of Buccleuch; the Earl of Lincoln; R. A. Slaney, Esq.; G. Graham, Esq.; Sir H. T. De la Beche, Knt.; Dr. Lyon Playfair; Dr. D. B. Reid; Professor Owen; Capt. W. T. Denison; J. R. Martin, Esq.; James Smith, of Deanston, Esq.; R. Stephenson, jun., Esq.; and William Cubitt, Esq.; to be Her Majesty's Commissioners for inquiring into the present state of large towns and populous districts in England and Wales, with reference to the causes of disease among the inhabitants. The Queen has also been pleased to appoint Henry Hobhouse, Esq., to be Secretary to this Commission.

Official Appointments.—It is announced that Mr. Wilder, the chief-clerk in the Colonial-office, has retired after a service in that department for about 40 years. Mr. Smith has succeeded Mr. Wilder as chief-clerk in the Colonial-office; and Mr. Barrow, son of Sir John Barrow, secretary of the Admiralty, has succeeded Mr. Smith. The commissioners for the navigation of the Mersey have appointed Capt. George Evans, R.N., Acting Conservator of the Mersey, in the room of Capt. Fitzroy, appointed Governor of New Zealand.

The Levee.—The Lord Chamberlain has given notice that the Levee intended to be held by Prince Albert, at St. James's Palace, on Wednesday, the 26th April, will take place on Wednesday next, the 17th inst., at 2 o'clock.

Income Tax.—A notice has issued from the office of Stamps and Taxes, that those holders of stock who have proved their exemption from Property-tax for the past year, on account of their income not amounting to 150*l.* per annum, will be allowed to receive their dividends for the present year free of any deduction, provided the stock belonging to them remain in every respect the same as when the deduction of the tax was made for the last year. Where any alteration has been made in the amount since the former deduction, the parties entitled thereto will be paid their dividends in full (provided their income has not increased to 150*l.* per annum), if on or before the 27th May they send to the office of Stamps and Taxes a statement of the amount and description of the stocks formerly and now held by them, in a form which may be obtained from the surveyor of the district in which they reside.

The Mint.—The following is the total amount of gold bullion and gold coin received at the Mint from the Bank of England and from private individuals, to be coined, from the 24th of June, 1842, to the 31st March, 1843:—Total weight, 204,592 lbs. 9 oz. 4 dwts. 14 grs. Total value, 9,559,597*l.* 2*s.* 8*d.* The total value returned to the Bank of England up to March 31, 1843, was 8,437,765*l.* 3*s.* 3*d.*; thus leaving in the Mint 886,295*l.* 17*s.* 8*d.* A Parliamentary return published this week, containing the expenses of the Mint for the year ending March 31, 1843, states the salaries of officers to have received 10,420*l.* 17*s.*; the wages and allowances paid weekly, 3,095*l.* 17*s.* 6*d.*; contingent charges and expenses, (such as materials for work, coals, charcoal, and rates and taxes,) 6,529*l.* 12*s.* 7*d.*; solicitor of the Mint for prosecutions, 14,529*l.* 12*s.* 7*d.*; gratuities to the officers for services on the China silver in 1842, 266*l.*; paid for assays of ingots for coinage, 1,014*l.* 2*s.*; and charges for melting, 12,312*l.* 18*s.* 11*d.*

Constabulary (Ireland).—The following is a statement of the amount and expenses of the Constabulary force employed in Ireland on the 1st January last:—1 inspector-general, 2 deputy inspectors-general, 2 provincial inspectors, 1 receiver, 1 surgeon, 1 veterinary-surgeon, 18 paymasters, 35 county inspectors, 216 sub-inspectors, 261 head-constables, 1,419 constables, 7,086 sub-constables, 304 horses, and 58 magistrates. The total expense of the establishment for the year 1842 was 441,605*l.* 5*s.* 11*d.*; of which amount 263,473*l.* 5*s.* 2*d.* was borne by the Consolidated Fund, and 178,132*l.* 0*s.* 9*d.* by the counties, cities, and towns of Ireland.

Foreign.

FRANCE.—There is no news of any moment in the Paris papers. All of them notice the opinion expressed in the House of Commons by Sir Robert Peel respecting the marriage of the Queen of Spain, as well as Lord Aberdeen's justification of the course the British Government has pursued regarding the late differences between Russia and Turkey. The journals of Sunday are almost wholly taken up with reports of and comments upon a debate in the Chamber of Deputies on the elections of Carpentras, Langres, and Embrun, which had already taken up two whole sittings, and had led to the annulment of the two former. There is nothing else worth noticing in the journals, save

that the committee on the budget have come to the resolution of recommending a reduction of 11,000 men in the effective force demanded by the Minister of War. A saving of 14,000*l.* would thereby be accomplished. The opening of the Paris and Rouen railway took place on the 1st inst., with great pomp and success. Commenced on the 1st May, 1841, and entirely finished on the 1st of May, 1843, the rapidity with which its works have been executed, and the punctuality with which the company have fulfilled their engagements, are topics of general surprise and praise with our Parisian contemporaries, who also advert to the powerful co-operation which British science, capital, and industry, have yielded on this occasion. A Toulon letter of the 6th inst. mentions the departure, on the 4th, of the *Uranie*, sixty gun frigate, Captain Bruat, for the Marquesas Islands, with one hundred and forty passengers, including a bishop, and several other ecclesiastics, as missionaries, a non-commissioned officer of the Municipal Guard of Paris, appointed to establish a company of these guards in the islands, and also a great many artisans, with a large quantity of stores. The crew amounts to 557 men. Two days previously to the sailing of the *Uranie*, an impressive ceremony took place on board. An altar was erected on the quarter-deck, upon which the Bishop of Amatha, assisted by a numerous body of clergy, performed an appropriate church service, administered the sacrament, and pronounced a benediction upon the ship and all on board.

SPAIN.—Advices from Madrid, to the 1st instant, announce that in the sitting of that day, the Minister of the Navy had informed the Senate that, in consequence of the majority which had declared against them in the Chamber of Deputies, the Regent had accepted the resignations which the Ministers had already tendered him on the 16th March. M. Cortina, who had been requested by the Regent to form a new Cabinet, had begged to be allowed twenty-four hours to reflect before he consented to undertake the task. If the French papers may be relied on, he found the obstacles too serious to be surmounted, and consequently relinquished the mission offered him. M. Olozaga, it is said, was then charged with the formation of a Cabinet.—In the sitting of the Senate of the 1st, the paragraph of the address respecting the foreign relations of Spain was again discussed, but with increasing gentleness. Count Almodovar urged that M. Guizot's speech had been prompted by no hostility to the Spanish people, and M. Olavarrieta condemned the marked animosity against France which the proposed paragraph imprudently expressed. The debate was then again adjourned. In the Congress, on the same day, M. Giraldo prayed that the Cortes of 1843 might prove like the sun, and pour light and life into the provinces, in the shape of an amnesty to all Spaniards implicated in the Barcelona or other occurrences.

BELGIUM.—A dreadful accident happened on the 3d on the railway. When the train which left Liege at half-past seven in the morning was near to Landen, two guards who were in a waggon carrying light goods, the second in the train, saw the carriage full of smoke. They removed the parcels in order to discover the cause of the fire, when the flames burst forth, on which they gave the signal to stop. Most of the passengers, hearing the sound of the whistle, looked out of the windows, when a violent flame, driven by the wind, seemed to touch the carriages. Two passengers and two guards preserving their presence of mind, held the doors fast, to prevent any person from getting out. In a few seconds the train stopped, the waggon that was on fire was detached, and all the passengers alighted. Fourteen passengers who had leaped out were more or less dangerously wounded. Four passengers and a guard were killed. Some linen was at hand, and the wounds were dressed as well as circumstances would allow. The most severely wounded were sent back in the carriage to Liege. Some were able to proceed on their journey. The cause of the fire is at present unknown, but the inconceivable rapidity with which the flame spread gives reason to suppose that some bottle or jar of highly inflammable spirit was broken, and that it communicated with the fire of the engine. It is remarkable that the sufferers by this disaster were victims to the first impulse of fear, for all those who kept their seats escaped without injury.

GERMANY.—His Royal Highness the Grand Duke has been pleased to decide that the Princess Maria Amelia Elizabeth Caroline of Baden, Marchioness of Douglas and Clydesdale, shall retain the title and rank of a Princess of Baden.—We hear from Vienna that the celebrated composer Lanner has just been carried to his last home, preceded by Strauss and his band, playing one of the deceased's best waltzes. We learn also that the Baron de Kubeck, President of the Supreme Chamber of Finance, to whom the King has entrusted the plans and other arrangements for the projected railway from Vienna to Trieste, has recently been over the line, for the purpose of ascertaining the best mode of constructing it, and the most economical way of working it when constructed. The line, when completed, will be one of the most gigantic works in Europe, not only on account of its length, which is 74 German (or about 350 English) miles, but also by the many obstacles of nature which are to be surmounted.—Count Valerian Krasinsky, author of the "History of the Reformation in Poland," long resident in London, has been honoured with an autograph letter from his Majesty the King of Prussia, who has kindly noticed the Count's literary occupation, and presented him with the golden medal of merit, which his Majesty has lately bestowed on a few men distinguished in literature, the arts and sciences.

ITALY.—A curious autograph of Napoleon was discovered recently at Perugia. It is an order for the army, and a bill of exchange for 2,000,000*l.*, addressed to

General Massena. This autograph has been detected in a five franc piece, which had been given in payment to an individual, who, thinking it a counterfeit piece, had it broken.

RUSSIA.—Letters from St. Petersburg, announce that Lieut. Ramstett, of the Imperial Navy, has made a most important invention. By means of an electro-galvanic apparatus, from which two platina wire-conductors descend to the bottom, Mr. Ramstett draws metallic masses of any weight from the bottom of the sea; and, by means of the same conductors, the spot is at the same time indicated where metal has been sunk. He tried his apparatus recently on the Neva, in presence of the Admiralty, and brought up into his boat, in less than twenty minutes, an anchor and chain cable upwards of one and a half tons weight, in seven fathoms water. The Emperor has granted him a patent for ten years.—The property left by Baron Stieglitz, the banker, who lately died at St. Petersburg, is estimated at the enormous amount of 50,000,000 rubles, (between 5,000,000*l.* and 6,000,000*l.* sterling). He was a native of Hanover, where his elder brother, one of the most celebrated physicians in Germany, died a few years ago.

TURKEY.—The German papers state, that the day for the election of a Prince of Servia had not yet been fixed; and, as Russia had declared that there existed no objection against the person of Prince Alexander, but that she merely insisted that the electoral formalities prescribed by the organic statutes of the year 1839 should be observed, the Porte was taking measures to procure the re-election of Prince Alexander. The Russian ambassador proposed that Hafiz Pasha, of Nezib, should be appointed Pasha of Belgrade.

INDIA AND CHINA.—The Overland Mail has brought accounts from Bombay to the 1st April, and from China to the 23d Feb. As stated in our last on the authority of the telegraphic despatch, the conquered territories of Scinde, except that portion belonging to the Chief of Khyrpore, have been annexed to the British dominions, and General Sir C. Napier appointed Governor. The acts for the suppression of the slave-trade have been declared to be in force in our new possessions; all kinds of transit duties are ordered to be abolished; and the navigation of the Indus is rendered free to all nations. To commemorate the bravery of the troops by whom the country has been won, and these satisfactory results ensured, the Governor-General has determined on having the unserviceable guns taken at Hyderabad cast into a triumphal column, on which are to be inscribed in English, and two native languages, the names of General Napier, and the European and native officers and men belonging to his force, whose gallantry was most conspicuous. On publishing the despatch of Sir C. Napier, relative to the battle of Meeanee, and Major Outram's narrative of his defence of the British residency, Lord Ellenborough published a notification, explanatory of the circumstances which had led to the war, and declaring his intentions with regard to the territories victory had placed at his disposal. The most important items of news from the scene of our recent conquest may be briefly summed up. Treasure to the amount of at least a million sterling was discovered shortly after the occupation of Hyderabad: it consisted chiefly of gold bars; and it is said Lord Ellenborough is desirous that it should be made over to the troops as prize money, but that the decision of the matter has been referred to the home authorities. General Napier has entrenched his troops at the Residency, which is three or four miles from the city, leaving the 12th Native Infantry to garrison the latter. On taking up his quarters in this new position, he sent to Sukkur for three additional regiments together with a troop of Horse Artillery. The first-named regiment left on the 1st March, and reached the camp in safety, but we have no intelligence of the arrival of the rest. Information reached Bombay on the 28th March, by the Semiramis steamer, that they had been attacked near Hyderabad on the 24th March by a body of Beloochees, but that Sir C. Napier had moved out to their rescue, and repulsed their assailants. The authenticity of this report, however, is questionable, the news having been derived by the authorities at Kurrachee from a native Cossid. Reinforcements have been sent to Gen. Napier from Bombay. The officers and men seriously wounded in the engagement at Meeanee, arrived in the *Sesostris* on the 12th March, and were all doing well. Captain Ennis, of the 21st, on proceeding down the river in company with a Parsee merchant, was murdered by the Beloochees; and another officer, Captain Godfrey, was attacked and robbed, and narrowly escaped with his life. There have been other reports of occurrences of the like nature, but these are the only ones that have been authenticated. The Beloochees are represented to have assembled to the extent of about 45,000 men, at a place called Meerpore; and if the rumour just alluded to, of an attack having been made on the force from Sukkur, be correct, the assailants must have come from this direction. It was supposed they intended to make an effort at recovering possession of Hyderabad, but their repulse by General Napier will no doubt have cooled their ardour. Among the official despatches conveyed by the present mail, is a narrative of a gallant and courageous defence made at Vikkur, on the Indus, by a small detachment of sepoys, against large numbers of Beloochees, who for three days and three nights obstinately assailed them. The sepoys were under a native leader, and behaved with unparalleled intrepidity. The Governor-General was at Agra, where he has taken up his residence in one of the palaces, and in which he held an investiture of the Order of the Bath. He has ordered the celebrated Somnauth gates to be locked up there, and the officers employed in escorting them have been sent back to regimental duty. The declaration of Sir Charles Napier, that the Indian

army is too scantily officered, has attracted attention, and has become the subject of general comment. The Bishop of Calcutta and Metropolitan of India arrived in Bombay on the 11th March, where he held his primary visitation, and presided at the founding of the Great Medical College. A magnificent comet was seen throughout India from the beginning of March, and engaged the attention of all the astronomers, one of whom actually declared it had become a satellite of the earth! Dwarkanauth Tagore has been excluded from his family caste, in consequence of his repeatedly eating with the "unclean Europeans." The captain of the Belvidere, which was burned some months ago at Singapore, was tried at Bombay for taking goods out of the ship while in harbour, and honourably acquitted. The most conflicting accounts were circulated respecting the state of Cabul. Akbar Khan is no longer popular there, and another was said to have seized the government. Dost Mahomed was going back from Lahore to Cabul, but it was not known how he would be received there. He wished to be aided by the Sikhs, but they did not seem inclined to give him any assistance.—The news from China extends to the 21st February. The latest was brought to Bombay by an American schooner, the Zephyr, which is now plying as an opium trader from Bombay to China, and is remarkable for her swift sailing. The Emperor has ordered an investigation into the murders of the crews of the Ann and Nerbudda at Formosa. Nothing had been done in the arrangements of the commercial treaty, for the British Plenipotentiary appeared to be waiting for the treaty as ratified by Her Majesty. The Chinese Commissioner and he were on good terms. Doubts are said to exist of the durability of any arrangement now entered into. The Chinese were busy in repairing all their forts and in strengthening their positions in the different places attacked last year. Trade was dull, but expected to revive speedily. At Canton some dissatisfaction still prevailed. An immature revolt at Manila had been put down, and the rebels executed. It had for its object to declare the islands independent of the Spanish yoke.

WEST INDIES.—The Royal mail steamer Avon arrived at Falmouth on Tuesday morning, bringing Mexican, Havannah, Jamaica, and other West India Island mails. Her dates of leaving are—from St. Thomas's, April 8, and Bermuda, April 20. Her Majesty's ship Warspite had proceeded to New York, for the purpose of taking home Sir Charles Bagot. Mr. Pakenham, late Minister at Mexico, came passenger from Vera Cruz by the Thames steamer, and landed at Bermuda, to await the arrival of the Dee, expected from England. The whole of the West India islands are reported to be unhealthy in consequence of the rains, and continued shocks of earthquakes were still felt. At Guadaloupe ten shocks had been experienced on the 3d, and one on the 5th, of April. General Santa Anna had been indisposed, but had recovered, and gone to the city of Mexico. On the 4th inst., near midnight, the Avon came in contact with the brig Eliza, of Swansea, with coals and machinery for Cuba. The concussion was so severe that the crew of the latter were obliged instantly to abandon their vessel, and get on board the steamer, and the Eliza is supposed to have sunk very shortly afterwards.

BRAZILS.—Her Majesty's packet Penguin has arrived from Rio with the Brazilian and Buenos Ayrean mails, having sailed therefrom on the 23d March, bringing 15 passengers, and on freight about 20,000*l.* in gold, silver, &c. She brings also a confirmation of the unsuccessful result of Mr. Ellis's special mission to the Court of Brazil, with a view of effecting a treaty between that empire and Great Britain, his proposals having been rejected and his final audience for formally taking leave being fixed for the 25th March, and soon after which it was expected he would embark in the Malabar for England.

Parliament.

HOUSE OF LORDS.

Monday.—The Marquess of CLANRICARDE moved for a select committee to consider the operation of the Irish Poor-law. After stating his grounds for the proposed inquiry, he said that it would not interfere with the progress of the bill at present in the House of Commons.—The Archbishop of DUBLIN seconded the motion, expressing his decided conviction of the necessity for an alteration of the Irish Poor-law. Mendicancy had increased in Ireland, while the law had been instrumental in drying up the sources of private charity. The Poor-law was not precisely an expedient for raising money on false pretences, but in passing through the Legislature it had been stripped of clauses which would have put a stop to mendicancy.—The Duke of WELLINGTON admitted that there were many defects in the Irish Poor-law, but contended that otherwise it was satisfactory, and only required amendment. He denied that there was an indisposition in the House of Lords to attend to measures relating to Ireland. As the law would be improved by the bill now in the Commons, he resisted the motion of the noble Marquess, whose object was to repeal the law.—The Earls of GLENGALL, MOUNTCASHEL, and ROSEN, and Lord COURTOWN, supported the motion, and the Marquess of LANSDOWNE admitted that a case for inquiry had been made out, though he thought that by the forthcoming bill the evils complained of might be rectified.—The Earl of WICKLOW and the Marquess of DOWNSHIRE opposed the motion.—The Marquess of CLANRICARDE would have withdrawn it, had any intimation been held out that the bill in the Commons would be referred to a committee up-stairs, on its reaching the Lords.—The Duke of WELLINGTON promised to consider the propriety of so doing, and the motion was withdrawn.

Tuesday.—The Earl of ROSEN called attention to the condition of Ireland, consequent on the agitation for the repeal of the Union, which was producing great mischief, except in the province of Ulster, where the people were still sound and loyal, and ready to do in 1843 what they had so effectually done in 1798.—The Duke of WELLINGTON said that the Irish Government were alive to the importance of the matter, and were aided by the supreme Government in the precautions which they were taking to ensure the public peace in Ireland. The Government were determined to maintain inviolate the integrity of the empire, and he was sure that Parliament would all them in so doing.—Lord BROUGHAM said that a severance of the empire; to prevent which this country would put forth its whole strength, moral and physical, on the first intimation of its necessity.—The Marquess of

LANSDOWNE said that the Government might rely with confidence upon the efforts of the House, in the maintenance of the integrity of the empire.—The Marquess of DOWNSHIRE said that it was highly requisite that attention should be directed to the present excited state of Ireland upon this question.—Lord CAMPBELL presented a petition, which again brought the Scotch Church question under discussion; and the Marquess of BRADALBANE asked Lord Aberdeen how the Government intended to deal with the subject?—Lord ABERDEEN said he had before stated the course which the Government would pursue, but he had no objection to repeat it. He should be very glad if he could prevent the disruption of the Church of Scotland, which it was said would follow the secession of some of its ablest ministers; but if the Church insisted on claims inconsistent with liberty, and with the recognised principles of law in this free Protestant country; if they contemplated establishing a tyranny, which it would be odious and derogatory to submit to, it was impossible to support them. The principle he was willing to recognise was the right of the people to object, and the right of the Presbytery to judge.—After a short conversation, in which the Duke of ARGYLL, Lord BROUGHAM, and Lord CAMPBELL joined, the petition was laid upon the table.

Thursday.—Lord BROUGHAM stated that Earl Spencer had authorized him to correct a misrepresentation respecting what he had formerly said as to the repeal of the Union. He had not, as represented, said that he would support the repeal of the Union if all the Irish Members did so; but that when all the Irish Members came round to its support it would be time enough for him to state his opinions on it.

Earl STANHOPE presented the petition of the farmers assembled at the Wallingford meeting, and in doing so, stated shortly his opinions relative to its prayer. The last harvest had not been more than an average one, and therefore the depression of prices was not attributable to it. The cause was the enormous importation of foreign corn, consequent on the act of last year, and which could not have taken place under the previous scale of duties. All the evils of the country might be cured by legislative measures, in the direction of protection, which could not be called monopoly when fairly extended to all interests.—The Duke of BUCKINGHAM affirmed that the recent alteration of the Corn-laws had been exceedingly prejudicial, and he hoped no further changes would be made. He wished to see the Government take the same tone with respect to the repeal of the Corn-laws as they had done on the subject of the repeal of the Union, and wished they would make a distinct declaration that they would resist all alteration.—Earl FITZWILLIAM admitted that the country ought not to be left in the dark as to the intentions of the Government.

—Lord WHARFCLIFFE said that the Government were not chargeable with creating any uncertainty, for they had declared their determination not to make any alteration in the law.—A brief conversational debate followed; after which the petition was ordered to be laid on the table.

Friday.—In reply to the Marquess of BRADALBANE, the Earl of ABERDEEN gave a similar answer as on former occasions, as to the intentions of the Government with respect to the Church of Scotland.—The report on the Registration of Voters' Bill was brought up, after some discussion; and some other routine business was transacted.

HOUSE OF COMMONS.

Monday.—The House went into a committee of Ways and Means, and the CHANCELLOR of the EXCHEQUER rose to open his Budget. He prefaced his financial statement by an enumeration of the difficulties that beset the Government, in their undertaking of last year, to equalise the revenue with the expenditure, at the same time that they reduced a large mass of duties; and particularly called attention to the fact, that while the operation on the revenue of the remission of duties was immediate, that of the imposition of taxes was remote. He then proceeded to his exposition of the actual revenue of the year ending the 5th April last, contrasting each item with the amounts anticipated last year by Sir Robert Peel. The Customs which had been calculated to produce 21,500,000*l.*, only realised 20,750,000*l.*, so that, on this branch of the revenue there was a deficiency of 750,000*l.* Of this deficiency 500,000*l.* arose on the article of wine, and 200,000*l.* on that of foreign spirits; caused, he said, by the uncertain negotiations, which had been pending with foreign Powers, and by increased habits of temperance amongst the lower orders. The Excise, which had been estimated to produce 13,700,000*l.* (inclusive of 250,000*l.* the additional duty on Irish spirits), only realised 12,500,000*l.*; leaving in this branch a deficiency of 1,200,000*l.* Of this defalcation 880,000*l.* was caused by the failure of the malt duties, which he attributed to the shortness or badness of the barley crop of 1840, and by the additional Irish spirit duty, which, instead of realising the anticipated 250,000*l.*, had only brought 56,000*l.* into the Exchequer. The Stamps, which had been estimated at 7,190,000*l.*, had produced 7,000,000*l.* The Taxes, which had been calculated at 4,400,000*l.*, had realised that sum. On the Post-office there was an increase upon the estimate of 110,000*l.* The Crown lands fell short of the estimate by 30,000*l.* The whole of the ordinary revenue, which had been estimated last year by Sir Robert Peel to produce 47,640,000*l.*, had only actually produced 45,600,000*l.*, thus leaving a deficiency on the entire ordinary revenue of 2,040,000*l.* In diminution of this, the 750,000*l.* received for the ransom of Canton being applied, the net deficiency on the ordinary revenue of the year remained at 1,290,000*l.* Under the Property-tax, which had been estimated to produce 3,700,000*l.*, the sum of 2,450,000*l.* had only been received up to the 5th of April; but the charges made under this tax in England and Scotland amounted to 5,500,000*l.*, so that, making allowance for reductions, the yearly revenue derivable from the Property-tax could not realise less than 5,100,000*l.* However, only 2,450,000*l.* came in aid of the revenue of the past year. The total expenses which had been calculated by Sir Robert Peel at 51,381,000*l.*, had been reduced by 222,000*l.*, and this left a deficiency of revenue to meet the expenditure at the end of the year of 2,420,000*l.* From this the sum of 262,000*l.*, provided to pay off the holders of Exchequer-bills, being deducted, the net deficiency of 2,100,000*l.*, the right hon. gentleman said he had no plan to propose but to leave it to be wiped away by the surpluses of successive revenues as they might arise. He then proceeded to announce his anticipations of the present year. He introduced this part of his Budget by stating that he left out of calculation the sums of 1,250,000*l.*, due to the opium merchants as compensation, and 800,000*l.* due to the East India Company for the expenses of operations in China, as he proposed to raise money for the liquidation of these sums by a vote of credit, reserving the money still to be received from China (which amounts to 3,150,000*l.*) for the repayment. The customs for the year he calculated at 19,000,000*l.*, excluding altogether the expectation of any duty from corn this year. The Excise, he thought, would produce 13,000,000*l.*, the Stamps 7,000,000*l.*, Taxes 4,200,000*l.*, the Post-Office 600,000*l.*, Crown lands 130,000*l.*, the ordinary miscellaneous revenues 250,000*l.*, money received from the Chinese Government, and which has been paid into the consolidated fund, 870,000*l.*, the Property-tax, 5,100,000*l.* Thus the total revenue of the year he anticipated would amount to 50,150,000*l.* The expenditure would be, for the Army, 6,619,000*l.*; for the Navy, 6,383,000*l.*; for the Ordnance, 1,850,000*l.*; for the miscellaneous votes, 3,000,000*l.* Total on these accounts, 17,852,000*l.*, being a reduction upon the estimates of last year of 645,000*l.* Then the charge on the funded debt would be 28,500,000*l.*, on Exchequer-bills 618,000*l.*, on the consolidated fund 2,357,000*l.* Total on these three charges, 31,535,000*l.*, being a reduction on the corresponding charges of last year of 257,000*l.*, and making, with the reduction before stated, a total reduction on the entire estimates of 902,000*l.* The result of these calculations was, that he anticipated the whole expense of the coming year to be 49,387,000*l.*, while the Income

he hoped for would amount to 50,150,000*l.*; thus leaving him 763,000*l.* of surplus to apply to the payment of the arrear of 2,100,000*l.*, with which he commenced the year. The right hon. gentleman concluded by expressing his confidence that the country was slowly recovering from its commercial and trading difficulties, and adduced what he considered to be proofs of it.—In reply to Viscount HOWICK, the CHANCELLOR of the EXCHEQUER added to his statement that no reduction of taxation was contemplated.—Mr. LABOUCHERE asked if there was to be no alteration in the sugar duties?—The CHANCELLOR of the EXCHEQUER said he had no such intention.—Mr. HUME commented on the statement of the Chancellor of the Exchequer, which had greatly disappointed him: The present Government had succeeded no better than the preceding; our difficulties had rather increased than diminished, and would do so until our system was entirely changed. He had been led to expect that the Chancellor of the Exchequer was about to propose something, such as the repeal of the malt-tax, and he was surprised if not disappointed to hear that nothing was to be done.—Mr. F. BARING also criticised the financial statement, which showed that the present Government, when in opposition, had proved to be false critics, as well as bad financiers. The revenue had produced by upwards of 2,000,000*l.* less than had been anticipated by a very sober calculation; what they had taken out of the pockets of the people by the income-tax, they had lost on the revenue derived from articles of consumption.—Sir R. PEEL quoted from the speech which he made last year, on introducing his financial statement, and contended that there had been such a reduction in the prices of the great articles of consumption, as would enable any economical and managing housekeeper to obtain that compensation for the income-tax which he had predicted. He had also predicted that a revival of commerce would follow the reductions of the new tariff; and though not wishing to speak too sanguinely, he thought that there were decided symptoms of a revival of manufacturing industry, though he regretted that some great branches, such as the iron and coal trades, were yet in a state of depression. He hoped the House would not rashly press upon the Ministry any reductions of duties; seeing that there was still a deficiency to provide for. Where would we be now, if the income-tax had not been imposed? Looking to the enormous accumulated deficiency of ten millions with which he had to deal at the commencement of 1842, no other measure could have been devised less objectionable or more effective to meet the difficulty; and though his anticipations of revenue from Customs and Excise had not been realised, and the period of the revival of trade had been postponed, he was satisfied that the great body of the owners of property would sustain him in resisting the repeal of the income-tax. He had been told last year, that the effects of that tax would be perceptible in the reduction of the amount of the assessed taxes. This prophecy had not been fulfilled, for the produce of the assessed taxes had been nearly what he had estimated. Considering the present state of the revenue, he had come to the conclusion, that for the present no reductions of duties could be proposed, which otherwise would have been most agreeable to him to propose.

Lord J. RUSSELL remarked that the budget of the late Government was proposed with a view to the benefit of trade and commerce, and would have had that effect if it had been adopted. But the financial measures of the present Government had preserved the entire amount of the deficiency for which they had to provide on entering office. He would not support any proposition which would permanently affect the revenue, but if trade and commerce were improving and we were blessed with a bountiful harvest next year, it afforded the desired opportunity for further amelioration of our import duties.—After some remarks from Mr. S. WORTLEY, Lord HOWICK alluded to the "change of performer" in making the annual statement; last year it was the First Lord of the Treasury, who, with a great flourish of trumpets, announced his scheme; this year, it was the Chancellor of the Exchequer, who spoke in humbler tone, confessing, as he was obliged to do, the failure of that scheme. He commented on the impolicy of the duty on the importation of coal; and after criticising the system of differential duties which had been adopted by the Government, called on the House boldly to adopt sound principles of commercial legislation, as the only means of restoring the country to a healthy condition. The present policy of the Government would entail the income-tax, not for three, but for ten years.—Mr. LIDDELL added his testimony to that of Lord HOWICK's, as to the pernicious effects of the duty on coal.—Mr. HURT asked if there was an intention to effect a reduction in the Three-and-a-half per Cents.—The CHANCELLOR of the EXCHEQUER replied that he must be guided by circumstances.—After some remarks from Mr. BELL, Mr. LABOUCHERE dwelt on the importance of an immediate adoption of a sound policy, which had only to be boldly acted on to bring general prosperity.—Sir R. FERGUSON and Mr. M. GIBSON followed, the latter intimating his fears that even the small duty on cotton could not be maintained with safety to the prosperity of our manufactures. He hoped Sir Robert Peel would boldly act on the principles which he had avowed, and he was sure the country gentlemen would not forsake him if he told them that the condition of the country required it.—Mr. WILLIAMS asked if the frauds at the Custom-house had been taken into account.—The CHANCELLOR of the EXCHEQUER had no means of ascertaining the amount of the frauds. The Report of the commission of inquiry had not yet been made, and would only refer to frauds actually discovered.—The CHANCELLOR of the EXCHEQUER in reply to Mr. HURT, stated that the Bank of England was instructed not to deduct the income-tax from the dividends of those whose income had been proved under 150*l.*—Mr. EWART asked if any propositions had been made to other countries, similar to those which had been made to Brazil.—Sir R. PEEL declined to give an answer, as it would be inconvenient. The discussion having been finished, the formal vote was agreed to, and the Speaker resumed the chair.

Tuesday.—Lord JOCELYN, before the House proceeded to the motions of the day, requested to know from Sir R. Peel the intentions of Government with respect to the maintenance of the Irish Union, now threatened by extensive agitation.

Sir R. PEEL, in a solemn and emphatic manner, declared himself authorized by her Majesty to repeat the language employed by the Crown on this subject, in a speech which was delivered from the throne during the administration of Earl Grey, and which expressed the most resolute determination to uphold the Union. The present Government, he said, would exercise for this purpose all the powers vested in them under the existing law; and though not desirous of disparaging the constitution by applying for new and extraordinary powers until those of the existing law should be found practically insufficient, they would not hesitate, should that insufficiency become apparent, to appeal to Parliament for such enactments as would effectually obviate the evil; for they were persuaded that the object attempted was not merely, as some called it, the repeal of a statute, but the dismemberment of the empire. The application to Parliament, should it come to be necessary, would be made, he was sure, with the greater success, in consequence of the forbearance of Ministers to make it until the necessity should have been manifested by experience of the inadequacy of the present law.—In reply to a question by Capt. Bernal, Sir R. PEEL said he did not recollect that Lord Althorp ever declared that, if all the Irish Members should be in favour of repeal, he would consider it his duty to accede to it. If Lord Althorp ever made such a declaration, Sir R. PEEL said he was not prepared to abide by it.

The SPEAKER called on Mr. Villiers to proceed with his motion on the Corn-laws, which was the signal for the presentation of a great number of petitions on the subject.—Mr. VILLIERS then rose to move "That this House will resolve itself into a committee for the purpose of considering the duties affecting the importation of foreign corn, with a view to their immediate abolition." The motion was similar to those which on various occasions he had urged on the House; and, though professing

his inability to do justice to the subject, he yet referred to his past exertions, at a period when the public mind was not alive to it, as the apology for doing so now, in preference to others who might be able to render it more justice. The subject might, indeed, be said to be exhausted, and so it ought to be, for the arguments used on former occasions were as weighty then as now. But a great change had now passed over public opinion on the question of the Corn-laws. Various circumstances had contributed to this. The Anti Corn-law League, however much underrated within the House, had largely contributed to enlighten the public mind, and their exertions would ere long be duly estimated, not only by this country, but by the world at large. Again, the distress of the country had compelled those to think who were usually averse to the consideration of public questions. All the old arguments by which a Corn-law had hitherto been supported were abandoned last year, when the law was altered, and another act was passed to keep corn between 54s. and 58s. the quarter, with the plea that it was mainly for the benefit of the agricultural labourer. The present condition of the corn-market was the reply to these fallacies; the law was condemned in public opinion, and its final abrogation but waited the sentence of the Legislature.—Mr. V. STUART seconded the motion.

Mr. GLADSTONE opposed the motion as one impolitic last year, and doubly impolitic this year. The Corn-law of last year was in the nature of a contract, and without a frank expression of error in having passed it, or a change of events producing a corresponding change in those results which were then thought to be ruinous, any alteration would be a breach of that contract. The Canadian Corn Bill was not an amendment of the law passed last session, but a part of the engagement then entered into. The operation of the present Corn Bill had not yet obtained a fair trial; and the effect of a total repeal of the corn duties would be to drain the country completely of its specie. The right hon. gentleman concluded a very long speech by declaring that the motion was one which it was impossible for the Government to entertain, or to hold out the hope of ever hereafter entertaining; that the existing law had quite fulfilled the expectation held out when it was proposed; and that should the Government assent to such a motion, they would convict themselves of the grossest imbecility, and, in the face of the world, declare themselves unworthy and incompetent to conduct the affairs of a great nation.—After some remarks by Mr. TAZELAND in favour of the motion, Mr. CHRISTOPHER opposed it, and denied the assertion that the farmers were inclined to a repeal. He said that in agreeing to the changes of last year, the Members of agricultural counties had accepted the proposition of the Government as the minimum of protection, and therefore, considering that so late a revision had taken place, and considering, also, that already large importations of foreign grain had been introduced at the reduced duty, he could not think of further alterations.—Mr. ROEBUCK, in a long speech advocating free-trade in everything, supported the motion.—The debate, on the motion of Mr. MILES, was then adjourned.

Wednesday.—The adjourned debate on the Corn-laws was resumed by Mr. MILES, who argued that the repeal of these laws would have the effect of changing arable land into pasture, and thereby cause great distress to those whose employment depended on agriculture. The independent members of the House were prepared to take their stand against farther concession; and the determination of the Government to maintain the present law gave him confidence.—Mr. WARD contended that under the state of things which would exist with a free trade in corn, the revenue would be easily raised, because the people would be able to command more comforts, and to consume more of those commodities from which the Customs and the Excise collected their duties. True, other countries were hostile in their tariffs, because we had delayed too long. Had we begun a system of free trade in 1815, we might have commanded the trade of Europe. In addition to general reasonings, the honourable member went into detail on the condition of Sheffield; and called upon the House to regain the confidence of the people by wise and timely concession.—Sir C. MAPPER, Sir G. STRICKLAND, Mr. GIBBONS, Lord HOWICK, and Mr. WALLACE, subsequently spoke in favour of the motion, and Mr. FITZMAURICE, and Mr. BAILLIE, against it.—Mr. COLQUHOUN denounced the system of free trade in corn, which had been described as a panacea for all the evils of the country, as one which would ruin the agriculturists, endanger the fundholder, reduce prices, and produce a confusion more universal than any which this country ever witnessed.—Lord HOWICK adhered to his opinion, that the best course was to impose on imported corn a small fixed duty; not because he was an advocate of protection to agriculture, but because he thought it would be the best compromise between conflicting opinions. Such a fixed duty would not sensibly affect prices, while it would materially benefit the revenue. But he was not the less prepared to support the motion; for if it were carried, it would be competent for any member of the House—and he was prepared, if no one else was—to propose a moderate fixed duty in lieu of the present sliding-scale. The course of Sir R. Peel had been marked by unwise concessions, because they were "a day too late;" and they might rest assured that the next bad harvest would compel another course on this question.—Mr. BLACKSTONE said that if he were to imitate Lord Howick, and to vote for the motion, it would be to go into committee, not to obtain a moderate fixed duty, but higher protection to agriculture than it at present receives. He was glad to learn from Mr. Gladstone's speech that the Government were now repudiating free-trade doctrines, and were prepared to support the agricultural interest, the depression of which was now acknowledged. He admitted that free-trade doctrines were spreading amongst the farmers, and he regretted it; but this was owing to the conduct of the Government, which led them rather to wish to see the end at once, than to die by inches. They were also deeply disappointed by being abandoned by the resident gentry, who had pledged themselves at the last general election to protect them. The farmers of the country were now beginning to act for themselves; and though the Government had silenced Sir Edward Knatchbull and the gentry, they would not long be able to control the yeomanry.—Mr. WALLACE praised the honesty of Mr. Blackstone's speech, the like of which he had never heard from the ministerial benches. For himself, he was a straight-forward repealer, and would be no party to any compromise of a fixed duty. The Corn-laws were doomed.—Mr. CAMPBELL affirmed that his constituents were all to a man coming round to the opinion that the new tariff was a wise and necessary measure, and that before it passed the price of butchers' meat was shamefully high, putting it out of the reach of the humbler classes. For himself he was not afraid even of a total repeal of the Corn-laws, if a little time were allowed; the slovenly agriculture of England would be cured, if the farmers were compelled to exert themselves more, in order to pay their rents.—The debate was again adjourned.

Thursday.—Mr. T. DUNCOMBE called attention to the petition of William Jones, the Chartist, who complained that he had been interrupted, on his trial, in an unconstitutional manner, by Mr. Baron Guiney, and that the learned judge had placed his case in the second class of misdemeanors, whereby he was subjected to a prison regimen insufficient to maintain health. Mr. Duncombe asked the House to address the Queen to take Jones's case into her merciful consideration.—Sir J. GRAHAM defended the conduct of Baron Guiney, and designated the hon. Member for Finsbury as "the Prosecutor-General and self-constituted Judge of Judges."—After some remarks from Mr. HUME, Mr. Sergeant MURPHY, and Mr. HAWES, the motion was withdrawn.

The adjourned debate on the Corn-laws was resumed by Mr. BOWTHWICK, who opposed the motion. While admitting that the constituencies of the country had been grossly deceived at the late general election by their present representatives, he absolved Sir R. Peel from all concurrence in that deception.—After some observations in favour of the motion from Mr. WRIGHTSON and Mr. MARSHALL, and against it from Mr. R.

PALMER and Mr. DARBY, Sir E. KNATCHBULL defended himself from the charge of having deserted the cause to which he had formerly stood pledged; and urged, as a sort of justification, that Lord J. Russell, Lord Melbourne, and Lord Fitzwilliam had changed their opinions on this subject.—Lord J. Russell, though still adhering to his fixed duty principle, refused to vote for the motion, which would pledge him to go into committee with the view of a total repeal.—The debate was again adjourned.

Friday.—The adjourned debate on the Corn-laws was begun by Mr. Brotherton, who spoke in favour of the motion. Mr. HUME and Mr. W. BLAKELEY also spoke in its favour, and Mr. HAMPDEN, Capt. GLADSTONE, Mr. BENNETT, Sir J. TYRELL, and Sir W. JAMES against it. After some remarks by Lord WORSLEY, Sir R. PEEL declared his opinion that the subject was exhausted. He stood by the principles on which the late changes had been framed; but in doing so, he had no concealed intention of repealing the Corn law, and he did not contemplate any immediate alteration. Beyond this decided declaration of no present intention to alter the law, he would not go, for he would not commit himself to any commercial law, or make declarations for the sake of conciliating political support.—The adjournment of the debate was then moved, and a very noisy scene ensued, which ended in a division giving a majority of 385 to 94 against the adjournment of the debate. Mr. W. O. STANLEY, however, repeated the motion, which was again negatived by 273 to 80. Mr. EWART then moved the adjournment of the debate, being the third motion to effect that object. Lord J. MANNERS moved the adjournment of the House, but after another stormy scene, it was ultimately agreed to adjourn the debate to Monday.

CITY.

Money Market, Friday.—Consols left off at 96½ to 1 for money, and 96½ for account; Three per Cents. Reduced, 95½ to ½; Three-and-half per Cents. Reduced, 101½ to ½; New Three-and-half per Cents. Annuities, 102½ to ½ Bank; Stock, 180 to 1; Exchequer Bills, 62s. to 64s.

Metropolis and its Vicinity.

British and Foreign Bible Society.—The annual meeting of this Society was held last week at Exeter Hall, Lord Bexley in the chair. On the platform were—the Bishops of Winchester and Chester, Lord Morpeth, Lord Teignmouth, Mr. Plumptre, M.P., and a large body of the clergy. The Rev. Andrew Brandram read the report, which was of great length, and gave a detailed account of the Society's operations. During the last 23 years no less than 1,600,000 copies of the Holy Scriptures had been distributed in France through the instrumentality of the Society, and within the last twelve months 135,841 had been circulated there. In Germany a very large distribution of the Scriptures had taken place. The progress made by the Society in that part of the world was highly satisfactory. In Wurtemberg the number of copies distributed last year was much greater than on any previous year. 20,000 copies had been granted for Hanover. 57,000 copies had been distributed in Italy. The report went on to state that very determined opposition had been given to the Society's friends in Belgium; notwithstanding which, 12,546 copies had been distributed in that country during the last year, being 3,000 copies more than in the previous year. In Prussia the Society was prospering. The committee had recently received a letter from Chevalier Bunsen, inclosing a remittance of 100*l.*, as a donation of his Majesty the King of Prussia, in addition to his annual subscription of 25*l.* 400*l.* had been received from Van Dieman's Land; and amongst the subscriptions was that of the Wesleyan Methodists' Society for 1,000*l.* In Stockholm, 19,935 copies had been distributed in the Swedish, French, and other languages. 15,970 copies had been sent to the Swedish Bible Society. From St. Petersburg a very large number of copies had been distributed in the various local languages; 40,000 families in Finland had received copies of the Bible. In Spain, considerable opposition had been experienced. In Greece, 8,428 copies had been distributed last year. In Mytilene, 4,470 copies. 60,000 copies had been forwarded to Calcutta during the year. The report adverted to the vast prospects which had been opened in China for the exertions of the Society, and proceeded to state that very urgent demands were made by the natives of New Zealand for the Holy Scriptures. 280*l.* had been received from Tahiti towards the funds of the Society. Three editions of the Scriptures had been printed in Mexico since 1837. A large number of copies had been distributed in the West Indies; and during the past year 100 new Bible Societies had been established. The total amount received during the year, applicable to the general objects of the Society, in subscriptions and donations, is 39,821*l.* 1*s.*; received from sales of Bibles and Testaments, 52,287*l.* 12*s.* 3*d.*; for drawbacks, 367*l.* 3*s.* 5*d.* Total amount received from all sources, 92,476*l.* 2*s.* 8*d.* The number of Bibles and Testaments issued from the depository at home have been 727,830, and from the depots abroad 254,230; total, 982,060. The total number of Bibles and Testaments issued since the commencement of the Society in 1804 was 15,020,994.

British and Foreign School Society.—The thirty-eighth annual meeting of this Society was held on Monday, at Exeter Hall, Lord John Russell in the chair. The hall was filled to overflowing with a large assemblage of both sexes. Amongst the company on the platform, were Earl Fitzwilliam, Lord Montagu, the Rev. Baptist Noel, Colonel Fox, M.P., Mr. Hindley, Esq., M.P., &c. In opening the business of the day, Lord J. Russell called the attention of the meeting to the death of the late Duke of Sussex, whom he warmly eulogised as a man who had rendered himself eminently useful in the promotion of every species of public improvement, and had also contributed much to the success of the Society by the countenance and support which he invariably yielded to it. He then went on to observe that this was a time when great principles were in jeopardy. There never was a time in which it was so desirable to stand by and support these principles as it was now. Looking back at times when it was thought dangerous to educate the poor, and when it was thought necessary that the teaching of Scripture should be accompanied with the teaching of the

church catechism and liturgy, he would congratulate the meeting that the present age was one of a more liberal cast—when men thought far differently upon these important points than they were wont to do. For himself, he thought that in teaching the Bible in schools, the Bible should be taught alone, leaving it altogether to the ministers of religion to expound its particular signification. This was a principle which rose superior to every other principle, both in its justice and liberality, and also in its applicability to the present condition of the people of England. He earnestly hoped the proceedings of the day would show that they were all determined to adhere to those principles bearing upon the important question of public instruction which would tend to render the rising generation good subjects while here, and fit them for the reward of goodness and virtue hereafter. The noble chairman was several times warmly greeted during his address, and sat down amidst great applause. The secretary then read the report, and entered into a detail of the financial affairs of the Society, which it appeared were favourable. It stated that the appearance of the schools throughout the country connected with the Society indicated improvement, and that the practicability and usefulness of the system on which these schools were founded were proved by continued experience. It also adverted to the educational measure introduced into Parliament by Sir James Graham, the spirit and tendency of which it condemned. The Society had watched for the past year, with anxiety, the movements of Government in respect to education; and whatever might ultimately be the nature of those movements, the committee trusted that no amount of aid which the Government might grant would ever induce the Society to compromise in the smallest degree the great principles which have regulated it from its institution. Several of the noblemen and gentlemen present then addressed the meeting, and resolutions in favour of the Society were unanimously carried.

London Society for promoting Christianity amongst the Jews.—The 34th annual meeting of this institution was held a few days ago at Exeter-hall. The attendance was very large, every available spot in the room being occupied. Sir T. Baring, Bart., presided, and was supported by Lord Ashley, M.P., the Marquis of Cholmondeley, Mr. Plumptre, M.P., the Dean of Salisbury, &c. The report stated that the number of conversions had been much greater during the past than any preceding year, and seven fresh missionaries had been appointed to foreign countries. The subscriptions and donations amounted to 25,066*l.*, being an increase of 366*l.* over those of the year preceding, and leaving an amount, after defraying all expenses, of 9,500*l.* vested in Exchequer-bills, and 2,456*l.* in the hands of the treasurer. The Society had issued during the year, 1,830 Hebrew Bibles, 2,056 Hebrew copies of the New Testament, 3,023 copies of the Book of Common Prayer, with large numbers of the Pentateuch and a variety of tracts. The Society's missions had been most successful in Jerusalem, Beyrout, Hebron, Smyrna, Poland, Cracow, Prussian Poland, Berlin, Königsberg, Frankfurt, Brussels, Holland, and Strasburg. Missionaries, however, are still required in Russia, Austria, Persia, the north coast of Africa, China, America, and New South Wales. The mission in London and the Hebrew College were likewise in a flourishing condition. The King of Prussia had presented the Society with a donation of 100*l.*, and had become an annual subscriber of 25*l.* The chairman alluded to Dr. Bowring's attack on the Bishop of Jerusalem, and said that the Society had received a donation of 50*l.* in consequence of that speech. On the motion of Lord Ashley, the motion was adopted, and several resolutions in accordance with the principles of the society were subsequently passed.

Colonial Church Society.—The annual general meeting of the members of this Society was held last week at Exeter-hall. The attendance almost filled the room. Captain Sir Edward Parry, upon taking the chair, said that in opening the proceedings it could not be necessary for him to urge upon an assembly like the present the value and importance of those objects which the Society was formed to promote. It appeared from the report that in Nova Scotia the Rev. Mr. Richards had, during the past year, visited many places where a minister had never before been seen, and held church services. The accounts from Prince Edward's Island were of an encouraging nature, Mr. Brooks, the agent, having distributed many tracts, and the churches being attended by large congregations. The Cape of Good Hope had not been forgotten by the Society; ministers were already there, and churches and chapels, each capable of accommodating 500 persons, were building. The colonists, it was confidently expected, would contribute liberally to their support, as the Society did not confine its beneficent labours to the Englishman, but gave them to the Dutch, Hottentots, and Malays. After alluding to the satisfactory state of affairs in other parts of the colonies, the report stated that Mr. Godfrey, the minister at Chantilly, had been withdrawn in consequence of the removal of the majority of the English residents since the death of the Duke of Orleans. Mr. Harding daily read prayers to the British and German residents at Lyons. In reference to the home proceedings, the committee stated that agents had visited the principal towns of England, Ireland, and Scotland, and had established many auxiliaries. The income during the year amounted to 3,225*l.* 16*s.* The Society paid particular attention to the selection of the persons they sent abroad. The Rev. C. Yorke moved, and the Rev. Hugh Stowell seconded, the adoption of the report, which was carried.

Royal Academy.—On Saturday the members of the Royal Academy gave their anniversary dinner at their apartments in Trafalgar-square, which was attended by a numerous assemblage of guests, among whom were several members of the Cabinet, the Foreign Ministers, and other

noble and official personages. The exhibition opened on Monday, a week later than usual, having been postponed in consequence of the death of the Duke of Sussex.

King's College.—On Thursday, the 4th inst., the annual distribution of the prizes to the medical students of the institution took place. His Grace the Archbishop of Canterbury in the chair, supported by the Earl of Dartmouth, the Bishop of Winchester, Sir R. Inglis, the Professors, &c. The seats in the theatre were crowded with the students and visitors. The Dean, Dr. Todd, introduced Mr. W. H. Parsey, the successful candidate for the medical scholarship, 40*l.* a-year, and for a certificate of honour, Mr. T. Hawksley. The other prizes and certificates were thus awarded:—Medicine, Surgery, and Midwifery—1st prize, Mr. Parsey; 2d prize, Mr. Steele. Certificates of Honour—Mr. A. B. Andrews, Mr. T. Hawksley, Mr. R. C. Golding, Mr. E. Thomas. Materia Medica and Physiology—1st prize, Mr. B. L. Jemmett; 2d prize, Mr. J. Duncan. Certificate of Honour—Mr. C. Roberts. Anatomy and Chemistry—1st prize, Mr. J. Ody; 2d prize, Mr. J. Duncan. Certificates of Honour—Mr. F. J. Hensley, Mr. H. G. Collett. Botany—Prize, Mr. J. H. Blount. Certificates of Honour—Mr. J. Darean, Mr. F. C. G. Ellerton. Forensic Medicine—Prize, Mr. M. Baines. Certificates of Honour—Mr. A. B. Andrews, Mr. R. C. Golding, Mr. J. H. Blount, Mr. R. Spitta, Mr. J. C. Grylls. Medical Society's Prize—Mr. B. L. Jemmett. The Principal introduced for the Warneford prizes—First gold medal, 10*l.*; books, 15*l.*—Mr. W. H. Parsey. Second gold medal, 5*l.*; books, 15*l.*—Mr. F. J. Hensley. For the Leathes prizes—1st prize, a Bible, Mr. B. L. Jemmett; 2d prize, a Prayer-book, Mr. W. G. Dalgairns. The presentations having terminated, the Earl of Dartmouth moved a vote of thanks to his Grace the Archbishop, which was seconded by the Bishop of Winchester, and carried unanimously.

Election of Chamberlain.—On Tuesday a Common Hall was held for the election of a Chamberlain in the room of Sir James Shaw, who has resigned in consequence of ill health. As there was no political excitement, the business of the day was transacted with great tranquillity. The two candidates, Sir John Pirie and Sir William Heygate, were received with cheers on their appearance on the hustings. The Recorder stated to the Livery that they had been assembled together for the purpose of receiving the resignation by Sir James Shaw of his office of Chamberlain, and of appointing a successor. He read the letter of Sir J. Shaw to the Corporation, and expressed a confident belief that the constituency would appoint a person in every respect qualified for the high office. The meeting then unanimously accepted the resignation of Sir James Shaw, and Sir William Heygate and Sir John Pirie were put in nomination. The Sheriff then put up the names of the candidates, and after having taken the show of hands twice, declared the majority to be in favour of Sir John Pirie. A poll was then demanded on the part of Sir W. Heygate, which continued until Thursday, when the majority in favour of Sir W. Heygate was so considerable that Sir John Pirie retired from the contest, and the former gentleman will in due course be declared duly elected.

The Literary Fund Dinner.—The anniversary dinner of this excellent Society which, during the last 54 years, has distributed upwards of 29,000*l.*, to men of genius and learning in all part of Europe, took place on Wednesday, in Freemasons' Hall. The Duke of Sutherland was in the chair, supported by the Russian, Prussian, United States, and Danish Ministers, the Bishops of Lincoln and St. Davids, Lord F. Egerton, the Earl of Arundel and Surrey, Archdeacon Hare, Mr. Gally Knight, and numerous literary men. The cause of the Society was eloquently pleaded in the course of the evening by the noble chairman, by the Bishop of Lincoln, Baron Brunow, Chevalier Bunsen, Mr. Everett, Mr. Lever (Harry Lorrequer), Mr. Hallam, Mr. Gally Knight, and Mr. Bell. The amount of subscriptions and donations announced was upwards of 800*l.*, including one of 1,000 silver roubles from the Emperor of Russia.

The late Special Commission in St. Pancras.—On Saturday the official report made by Mr. Alfred Austin, the assistant poor-law commissioner appointed by Government to investigate the alleged cruelty of St. Pancras towards the Creole pauper, John Jones, was transmitted by the commissioners to the Secretary of State. The case was fully noticed by us at the time. Our readers will recollect that Jones was taken before Mr. Combe, the magistrate, by the relieving officer of St. Pancras, for violent conduct in the workhouse, on the refusal of the guardians to permit him to see his wife, then lying in the London Fever Hospital, or to attend the funeral of his child, who was to be buried that day. The report, after going over the evidence, sums up as follows:—"It does not appear to me, from a consideration of all the facts of the case, as stated by the witnesses, that the committee acted in any other than a proper manner towards Jones, on the occasion of his application to them, on Friday the 7th ult. Nor do I perceive anything to blame in the behaviour of the beadle or other officer of the workhouse towards him on the occasion. It appears to me that the committee were justified in directing Jones to be taken before a magistrate for creating a disturbance in the workhouse; for if the violence of Jones had been overlooked, it would have given rise to the greatest difficulty, in keeping the requisite order and discipline in the establishment. I am inclined to think that a part of the excitement of Jones, whilst in the oakum room, is to be attributed to a mistake he was labouring under, with respect to the intention of the beadle and other persons to prevent his going to see his child buried. At the same time this mistake (if Jones were really labouring under it),

arose from circumstances produced by his own violence, and does not excuse his outrageous conduct towards the beadle and other persons present with them in the oakum room."

Mendicity Society.—On Saturday the twenty-fifth anniversary of this Society was held in Red Lion Square, the Earl of Grosvenor in the chair, supported by the Earl of Eldon, Marquis of Downshire, Lords Radstock, Teignmouth, Lovaine, and Skelmersdale, Sir Edward Cust, Sir John Boileau, Mr. G. Knight, M.P., &c. The statements annexed to the report showed that 38,853 cases of mendicants have been entertained and relieved at the Society's office during the year, a number greater than in any previous year, except 1841, when the severity of the weather occasioned unusual pressure. Besides other assistance, 128,914 meals were given during the year; 6,609 persons were employed in breaking stones, grinding corn, or picking oakum, and 4,773 letters were examined and reported on to the subscribers—a slight diminution in the number of begging-letters as compared with the preceding year, when they were 5,171—arising partly from the mildness of the weather, and in some degree, it is believed, from some of the subscribers to the Society having found it necessary, from the multitude of applications made to them by letter, to take means to discourage them. The report was adopted, and the officers for the ensuing year were then elected.

Metropolitan Improvements.—The following is the 27th clause of a bill recently introduced into the House of Commons by the Earl of Lincoln and Sir J. Graham, "for better regulating the Buildings of the Metropolitan Districts:—"And be it enacted, that as from the 1st day of January, 1844, it shall not be lawful to carry on, within the limits of this act, in any house or building, or vault, or in the open air, at a less distance than 40 feet from any public way, or than 50 feet from any other house or building, or ground not in the same possession or occupation therewith, any trade or business such as that of a soap-boiler, tallow-melter, slaughterer of cattle or horses, blood-boiler, bone-boiler, fellmonger, oil-cloth painter, manufacturer of gunpowder, detonating powder, lucifer matches or varnish, gas-works, chymical-works, fire-works, or any other trade or business which is, or which shall be considered by two of the justices of the peace to be, dangerous as regards fire, or dangerous or offensive, or obnoxious as regards all persons, more especially those persons living or passing in the vicinity thereof; nevertheless it shall be lawful for all such trades or businesses as shall have been already established to be continued to be carried on in their present situations for a term not exceeding 30 years from the passing of this act, provided the same be not contrary to any existing act of Parliament, nor otherwise contrary to law; and every person who shall be convicted before two justices of the peace of carrying on such dangerous or offensive trade, shall forfeit any sum not exceeding 50*l.*, as the said justices shall determine."

Failure of Messrs. Ackermann and Co.—The firm of Ackermann and Co., printsellers and engravers, in the Strand, and successors to the late Mr. Rudolph Ackermann, who have produced so many beautiful works of art, has stopped payment. Their transactions with some of the first houses in Europe and America have been very extensive, and their English creditors are also numerous. Their liabilities, it is reported, will not exceed 35,000*l.*, and there is every expectation of the creditors realising a considerable dividend.

Anti-Corn Law League.—A meeting of the merchants, bankers, and citizens of London took place on Monday afternoon, at the Hall of Commerce, Threadneedle-street, to consider the question of a repeal of the corn-laws. The spacious hall was crowded to overflowing. Mr. G. Wilson, chairman of the League, presided, and the meeting was addressed at great length by Mr. Bright and Mr. Cobden. Resolutions in favour of a total repeal were then unanimously carried.

Assam Company.—The annual meeting of the proprietors of this company, established to extend the cultivation of the tea plant in Assam, was held on Friday last, at the London Tavern, for the purpose of receiving a report relative to the operations for the past year, and to elect directors, &c. The chair was taken by Sir G. De H. Larpernt. It appeared from the report that the company continues to flourish, and that the produce of tea last season had not only come up to expectation, but had been 10,000 lbs. more. The price realised for the teas produced at the plantations of the company had been also larger than was anticipated, and thus the Assam tea had been established as an article of consumption in this country. The expectation of the produce for this season was about 200,000 lbs., and the increase must be progressive, so that, in 1847, when the plantations came into full bearing, the supply would be 1,500,000 lbs., worth at least 90,000*l.* The report was adopted, and a vote afterwards given to the directors.

Custom House.—It is understood that within the last few days, further frauds, to a considerable amount, have been discovered at the Custom House. Several official persons have been suspended in consequence.

Anti-Duelling Association.—An association has been just formed for the suppression of duelling. It consists of 326 members, including 21 noblemen, 13 sons of noblemen, 16 members of Parliament, 15 baronets, 30 admirals and generals, 44 captains, R.N., 23 colonels and lieutenant-colonels, 16 majors, 26 captains in the army, 20 lieutenants, R.N., and 24 barristers. They denounce duelling as sinful, irrational, and contrary to the laws of God and man. They also pledge themselves to discountenance the practice by influence and example. Captain Hope, R.N., and Mr. W. Dunmore, have become hon. secretaries to the association.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, April 29th—West districts, 125; North districts, 181; Central districts, 160; East districts, 211; South districts, 221. Total, 898 (489 males, 409 females). Weekly average for the last five years, 903 (461 males, 442 females), and for the last five springs, 854.

Provincial News.

Aylesbury.—The agricultural gentlemen of Buckinghamshire gave a dinner on Monday, in the County Hall of this town, to Earl Stanhope, for the purpose of testifying their respect for his character, and their high sense of the services he has rendered to the interests of the farmer, by his opposition to the principle of a free trade in corn. About 130 gentlemen sat down, and among those present were the High Sheriff of the county and most of the leading agriculturists of the neighbourhood. Mr. J. Rolfe, of Beaconsfield, presided; and on proposing the health of Lord Stanhope, described him as a kind friend to the landed interest and the industrial classes. It had been customary for the farmers of Buckinghamshire to look to the Duke of Buckingham as their champion; but he regretted to say, that that nobleman had not met with the support he had a right to expect, and he could not feel surprised if he had withdrawn from the contest disgusted. It must, however, be recollected that he had for many years stood forward as the farmers' friend; that he secured to the agriculturists a voice in the representation of his country; that he advocated the repeal of the malt-tax, in the belief that the reduction of the duty on that article would greatly benefit the British farmer; and on another occasion, after he had consented to take office under Sir R. Peel, when he made alterations in the laws affecting the agriculturist, and called on the Duke of Buckingham to assist him in carrying them through, that nobleman said he would never betray the interests of the British farmer. Lord Stanhope, in returning thanks, said he felt deeply grateful for the mark of respect with which they had honoured him, but he was not entitled to their thanks for any exertions in behalf of the agricultural interest. On the contrary, holding the opinions he had always done, had he acted differently, he should have grossly neglected his duty. It was necessary to persevere; for, deplorable and desperate as was the condition of the farmers at present, what must it be if the measure about to be introduced into the House of Commons should pass, allowing the importation of corn to an unlimited extent from the United States into Canada? He had the satisfaction of assuring the farmers present, that the measure would be opposed in the House of Lords, and he would himself undertake to prove that the arguments of those who sought to establish it were utterly destitute of foundation. The recent meeting in that county, over which he had the honour to preside, had been productive of good fruits—other counties were following the example. The farmers of Berkshire were about to meet during the ensuing week, and a requisition calling on the high sheriff to convene a meeting was in course of signature in Kent. The effect of the Canada Bill, if it passed so far as the fruitful provinces of America were concerned, would be equal to the total repeal of the corn-laws, and thus the little remnant of protection enjoyed by the farmer at present would be destroyed. He firmly believed that the Canadian Corn-bill was but the forerunner of a general system of free trade. He then proceeded to remark on the course pursued by the members of the Anti-corn-law League, and stated that he had been informed by a gentleman of undoubted veracity, that a member of the League had declared it to be their intention to force the landholders to sell their estates at a very low price, and with a House of Commons composed of their own friends re-enact the Corn-laws. Another gentleman had argued in the Bread-tax Circular, that the public had a right to sell the landed property throughout the country, and suggested the propriety of paying the present holders a per-centage of 1*s.* or 2*s.* in the pound for managing the estates for the benefit of the country. The agriculturists claimed nothing for themselves, but they asked protection for British industry. The noble lord concluded his address by calling on those present to exert every effort to secure a full, free, and effectual protection to British industry. Mr. Rolfe next proposed the health of Dr. Sleight, to whose exertions he believed their recent success was mainly attributable. Dr. Sleight, in returning thanks, stated that he should arraign her Majesty's ministers on three counts—first, that they had followed an unscientific and impolitic path since they had been placed in power; secondly, that they had acted with treachery towards the farmers; and thirdly, he charged them with mental imbecility. He then enlarged on each of the above points, and delivered a long address abounding in attacks on the Ministry, which was received with loud cheers, and other marks of approbation by the company. "Mr. Rolfe and the friends of British industry," and "The high sheriff," and other toasts, were then given.—On Saturday Mr. Cobden, and other members of the Anti-Corn-Law League held a meeting in the Town Hall, Lord Nugent in the chair. About 500 persons were present. Mr. Cobden spoke at great length in favour of the repeal of the Corn-laws, and several resolutions in favour of the League were carried.

Birmingham.—In consequence of representations made to Government of the injury which has been occasioned to the gun-stock trade from the employment of foreign walnut-tree wood, the Master-General of the Ordnance has determined that timber of home-growth shall alone be used in her Majesty's service.

Bristol.—The latest accounts state that Mr. Brunel is daily improving in health, and eats heartily, but little hope is entertained of a speedy dislodgement of the coin.

Kendal.—In reference to several paragraphs which appeared in the local journals, Lord Brougham's solicitors have written to the papers, stating that his Lordship is about to bring an action of trespass against Mr. Bird, the claimant, and other parties who were engaged in making the distress for rent upon Lord Brougham's farmers at Wethericks, and that Mr. Bird will then have an opportunity of showing whether or not he has a better title to Brougham Hall than its present owner. They state, that the best answer to the statement contained in one of the paragraphs, that Brougham Hall "was always called 'Bird's-nest,' until Lord Brougham came into possession," is the following extract from Bishop Nicolson's manuscript, written about 1670, and now in the Dean and Chapter's library at Carlisle:—"The great Roman way brings you to the Roman camp, having on the left Browham and Browham Hall, the seat of the Browhams; from this you have the prospect of Lowther Hall, Clifton Hall, likewise of Penrith, Penrith Castle, and Carleton Hall; likewise of Browham Hall and Chapel, and of Mr. Bird's house."

Leicester.—Tuesday, the 2d inst., being the usual day for depasturing the Freeman's Piece, alluded to in a former Number, considerable excitement prevailed in the town in consequence of a large majority (eleven to two) of the deputies recently elected having expressed their determination to resist any attempt that might be made by the anti-allotment party to turn cattle and horses upon the piece. Early in the morning large bodies of people congregated in front of the neatherd's house, and it was then found that all attempts to turn cattle, &c. into the piece were rendered abortive, by some persons having secured the gate with iron bands and spikes; on the other hand, the anti-allotment party showed an equal determination to oppose any attempt to break up the piece for gardening purposes; and to support this proceeding, the two deputies, who opposed the allotment of the ground, had obtained an injunction from the Lord Chancellor to stay such proceedings, under the powers of an act passed in the 44 Geo. 3, which provides that the right of common shall be limited to the "freemen resident within the precincts or liberties of the borough and their widows (during widowhood), to depasture two horses, mares or geldings, and two cows and a calf, from the 12th of September (if the crop of corn, &c., be got in) until the 13th of February." It being evident that this act limited the benefit of the common to those parties keeping a horse, cow, &c., and that the poor freemen received no advantage from the common, great dissatisfaction was expressed at the manner in which the piece had hitherto been managed; but the will of the testator being explicit as to the grazing of the common, no other remedy was left than to dispose of the produce to the best advantage; and this was stated to be by selling the produce of the crops and letting the common, thus extending the benefit to all classes of freemen. The old corporation party, however, resisted every attempt at innovation, till the late election of deputies, which ended in all but two of the opponents of the allotment system being thrown out. They therefore resolved to concede the point of letting the piece, and divide the proceeds among the freemen generally. The allotment party, however, would not give way, but, knowing that it would be useless to act in face of the injunction, they contented themselves with proposing resolutions expressive of their determination to carry out the allotment principle; and to effect this they announced that they would let the common and sell the crops, after which they would devote a portion of the funds to the obtaining of a new act to empower them to break up a portion of the piece for gardening purposes, each holder to pay 1s. per hundred per annum, which should be laid aside as a fund for erecting almshouses for the infirm or decayed freemen. Although upwards of 2,000 people were assembled, the greatest good humour prevailed, and not a single act of violence took place. In the evening a procession went round the town, headed by a banner and a band, proclaiming that the "cause of the people was triumphant."—A meeting was held here on Wednesday, and was attended by a large number of the creditors of Messrs. Clarke and Phillips, the Duke of Rutland in the chair. The meeting ended in resolutions to form a banking company, to take the business of Messrs. Clarke and Co., and in which concern the Duke announced he would take 100 shares. The old bank will not open again, but the public will not eventually be losers. Ten shillings in the pound, it is said, will be paid in a few days, and the other 10s., with interest, in a short time.

Liverpool.—On Saturday last, Wilnot Buckley, convicted at the last assizes of the wilful murder of his wife, at St. Helen's, and Betty Eccles, convicted at the same assizes of the wilful murder of her step-son at Bolton, underwent the extreme sentence of the law at the usual place of execution at Kirkdale Gaol.

Nottingham.—An advertisement has been published containing an address by the Vicar of St. Mary's, for the purpose of obtaining subscriptions for the repair and restoration of this church, and announcing that in consequence of the denial of a rate for the necessary repairs, it has at length been determined to make this appeal. It appears that all county meetings for charitable and religious objects are held within it, and that there is annexed to it a population of 32,000 souls, that hitherto it has accommodated a congregation of 2,000 persons, and that on these grounds alone it is highly desirable that it should be completely restored to the use of the parishioners.

Plymouth.—In consequence of Lord Ebrington and Mr. Gill, the Members for this borough, having replied to the requisition sent to them by some of the electors, that they should vote for a repeal of the corn-laws, by

intimating that they were in favour of a fixed duty, a meeting of a number of the electors took place on the 28th ult., and passed a resolution, pledging themselves to vote only for repeal candidates in future.

Portsmouth.—On Thursday week a serious accident happened to Dr. Quarrier of this town. It appears that he rose at an early hour, and proceeded to his study to examine some papers. Wishing to destroy several, and having no fire, he called for a taper, and lighted several of the letters and papers on the hearth. At this moment Dr. Quarrier was seized with a giddiness from stooping, and fell on the burning embers, and either from the giddiness, or the fall against the stove, or the effects of the smoke and flame, remained unconscious, so that the whole of his face and mouth were severely burnt. The servant, however, soon discovered Dr. Quarrier's perilous position. On being restored to his chair, he recovered his consciousness, but the swelling subsequently became so great as to obscure his vision, which is now, however, beginning to be restored, and great hopes are entertained by his medical attendants of his restoration to health.

Truro.—The mansion of Clowance, the seat of the Rev. J. M. St. Aubyn, has again been in a great measure destroyed by fire. On the morning of Thursday, the 20th ult., Mr. St. Aubyn was awoke by a smell of smoke, and the crackling of the burning timbers. He alarmed the domestics, who removed the books, pictures, and furniture, to a place of safety. The greatest part of the furniture and the best of the paintings have been preserved; among which are the celebrated cattle pieces of Cuypp, Wouvermans, Berghem, and Wilson. Several portraits by Reynolds, Kneller, and other masters, are also preserved; but a valuable series of fifteen crayon drawings, two by Sir Godfrey Kneller, another by Sir Peter Lely, with some other valuable paintings, have been consumed. All the plate, with the exception of a silver tea-urn, and a few smaller articles, has been preserved; but the most valuable part of the library has been destroyed. About 2000 volumes have been burnt; among which were many works not to be replaced, especially a rare and valuable collection of theological writings. The fire originated in a lintel let into the chimney of the dining-room.

Wolverhampton.—As the Red Rover coach, which runs from Ironbridge and Madeley to this town, was returning on Monday evening to Ironbridge, with ten passengers and a considerable quantity of luggage, when within half a mile of Madeley, the horses became unmanageable at a short and awkward turn of the road, and the vehicle being top-heavy, the coach was thrown over on its right side in the centre of the road, and the whole of the outside passengers precipitated into a ditch. One elderly gentleman, name not known, was killed on the spot; the coachman sustained a severe concussion of the brain, with fracture of the right leg, and dislocation of the ankle-joint; Mrs. Hardy, of Madeley Wood, sustained a fracture of the left leg; and Mrs. Grice, of Madeley, received a concussion of the brain. The others escaped with slight bruises.

Railways.—The following are the returns of the undermentioned Railways for the past week:—London and Birmingham, 18,459l.; Great Western, 14,631l.; South Western, 6028l.; South Eastern, 2008l.; Eastern Counties, 2297l.; North Midland, 4293l.; York and ditto, 1582l.; Greenwich, 806l.; Croydon, 278l.; Brighton, 3176l.; Blackwall, 812l.; Hull and Selby, 970l.; Grand Junction, 8708l.; Midland Counties, 2774l.—The further opening of the Bristol and Exeter Railway to Beambridge took place on Monday. The serious illness of Mr. Brunel, the engineer, prevented any exhibition of rejoicing, except such as the inhabitants of the district, who very naturally took a lively interest in the event, spontaneously offered. From London to the further terminus, the distance in use open is now 171 miles. It is expected that the line will be opened throughout to Exeter next year.—The Maryport and Carlisle Railway was opened from Wigton to Carlisle on Wednesday last; the distance is 11½ miles, and the day being remarkably fine the ceremony drew together very great numbers of people from all the towns and villages along the line.—A new railway is proposed to be constructed under the title of the Middlesex and Surrey Grand Junction, to commence at the Harrow Station of the London and Birmingham Railway, from thence to proceed southward through various places, over the Paddington Canal to Southall, where it will cross the Great Western. From this point it will pass the Grand-Junction Canal, sweep over the Hounslow-road, and proceed into Isleworth. Thence it will diverge, by a branch line, eastward, taking a circuit towards Twickenham Park, and terminating at Richmond. The main line will then continue its course from Isleworth, through Twickenham and Teddington, and after skirting Bushy Park and Hampton Court, cross the Thames below Kingston, and join the station of that name on the South-Western Railway. It will then run through Ewell and Epsom on to Gatton Park, where a tunnel of five-eighths of a mile in length will be required to carry it forward, and form a junction with the Brighton and South-Eastern Railways at Red Hill. Its communication with the metropolis will be formed by means of the Great-Western Railway terminus at Paddington.—On Saturday a special general meeting of the London Grand-Junction Company was held for the purpose of dissolving it. The undertaking was started during the railway mania, and was to have run from the Birmingham Railway at Camden-town through Battle-bridge, Pentonville, and Saffron-hill, to the Saracen's-head, by St. Sepulchre's church. The line, like the Greenwich and Blackwall Railways, was to have been built on arches—six of which, while the works were in abeyance, were for many years standing at the back of Gray's-Inn-road. The works not having been carried out

within the time specified by the Act, these arches were pulled down, and so much of the land as had been paid for reverted to the original owners. Two years ago an attempt was made to revive this project, when Mr. Rastrick, the engineer of the Brighton Railway, proposed to carry it out by a continuous tunnel from Farringdon-street to Primrose-hill, in the Regent's Park, but the proposition was rejected. No further steps have since been taken, and as the Act expires in July next, the meeting on Saturday was held to wind up the company's affairs, and to consider the steps to be taken for the disposal of the 3,000l. or 4,000l. in hand. A resolution was passed, authorizing the directors to dispose of it rateably among the proprietors.

IRELAND.

Dublin.—There was an extremely crowded meeting of the Repeal Association at the Corn Exchange on Monday. The stairs and passages, as well as the large room and gallery were thronged. Mr. O'Connell, who had returned from the Curragh of Kildare, entered the room amidst loud cheering. The sum of 100l. was announced as the result of the meeting at the Curragh on Sunday. The meeting was occupied for some hours with the receipt of money from various parts of the country. 574l. 12s. 5d. of "Repeal rent" was handed in. The *Dublin Mercantile Advertiser* says—"An official intimation has been received respecting the contemplated visit of the Queen and her illustrious consort to this country in the course of the ensuing summer. Orders for certain arrangements connected with the royal visit have been received at the castle."—Mr. Ross Cox, of the Head Police-office, has left Liverpool in the Caledonia mail-steamer, for Boston, armed with all the necessary powers for the arrest of Mr. Finn, the absconded treasurer of the corporation, and the seizure of all money and other property in his possession. Under the Ashburton treaty, increased facilities are given, through the co-operation of the authorities in the United States, for the capture of criminal fugitives and bankrupts.

King's County.—On the night of Thursday week, as John Gatchall, Esq., of Coolegegan, a magistrate of this county, was returning home from the Rev. Mr. Ridgway's, of Clonbullogue, where he had been dining, he was waylaid at Clonad, and murdered. His body was found next morning on the side of the road, with the ribs completely beaten in, and his throat cut and mangled in a shocking manner, by a discharge of ball and slugs. No clue has been obtained to the perpetrators of this crime.

Waterford.—The military and police, headed by the stipendiary magistrates, made another incursion into the barony of Gaultier, county of Waterford, last week. Some of the farmers paid the rate; but many others had their cattle under lock. Upon the latter notices were served that their places would be broken open if the rate was not paid within a week.

Fermanagh.—On Tuesday week there was a numerous meeting of the magistrates of this county, convened by the Lieutenant, the Earl of Erne, for the purpose of receiving from the Lord Lieutenant an answer to a former communication on the subject of the recent Repeal disturbances in Ulster. The magistrates had addressed a series of resolutions to the Government, deprecating the repeal agitation, and calling for the support of the executive in repressing the large masses of people assembled for the purpose of promoting it. The Lord Lieutenant in his answer states, that the question is receiving the most anxious consideration of the Government, which is determined to exercise every legal means at its disposal to maintain inviolate the legislative union between the two countries.

Kildare.—A great repeal demonstration took place on the Curragh of Kildare, on Sunday, Mr. Gerald Aylmer in the chair. The persons assembled were composed of farmers and labourers, together with a large number of the middle classes, who came from Dublin, Blackchurch, Naas, and Newbridge. Several resolutions were passed at the meeting declaring "the Act of Union to have been carried by fraud, bribery, and the unconstitutional employment of military force, wantonly and wickedly called into requisition by the then Government, for the unjustifiable purpose of dispersing meetings legally convened to petition Parliament against passing the iniquitous measure of the Union, which their fathers foresaw would be ruinous to Ireland, and the cruel and unjust operations of which had already injured the best interests of their common country; that it was not their object to seek a separation from Great Britain, and that nine millions of people could not be dragged at the feet of any other nation." A vote of confidence was then passed by acclamation to Mr. O'Connell, expressing the hope that he would never cease his exertions until he restored to Ireland her domestic Legislature; after which he addressed the meeting at great length, and concluded by calling upon the men of Kildare to rally round him, as those of the north, west, and south of Ireland had done, and no Government could refuse to grant them a restoration of their native Parliament.

SCOTLAND.

Glasgow.—General Sir T. Macdougald Brisbane, President of the Royal Society of Edinburgh, was on Monday elected Dean of Faculties in the University for the ensuing year, in the place of Lord Dunfermline, whose term of office has expired.—The Glasgow Anti-Corn-law petition was sent off on Tuesday, to Mr. Oswald, M.P., with 65,555 signatures. It is believed that this is the largest number of signatures ever attached to any petition emanating from the inhabitants of Glasgow.

Dumfries.—At the annual meeting of the Commissioners of Supply for this county, on Saturday, after a short discussion, some gentlemen proposed that the present rural police should be discontinued from the present date. All the officers in attendance were called in, and continued in their appointments for one month only.

A New Comet.—M. Mauvais, of the Royal Observatory at Paris, has just discovered a telescopic comet, within the limits of the constellations Cygnus and Pegasus. On Wednesday last, at 15 hours 10 min. 54 sec., mean time of Paris (10 min. 54 sec. past three o'clock in the morning), its right ascension was 326 deg. 33 min. 44 sec. and Boreal declination 29 deg. 34 min. 30 sec. In 24 hours, its right ascension increased 36 minutes of degree, and its declination diminished 1 minute. It had a feeble oval-shaped nebulosity, with a sensible condensation of light at the centre. Sir James South has published the following note on the subject in the *Times*, dated from Kensington Observatory, at 3 a.m. on Thursday. "At 17 hrs. 31 min., sidereal time, of May 10, I got a glimpse of the telescopic comet: its right ascension was about 22 hrs. 2 min. and 29 sec., and its north declination about 29 deg. 15 min. 30 sec.; but it was seen with so much difficulty with my five-feet equatorial, that the observations must be regarded with suspicion."

VICE-CHANCELLOR'S COURT.—(Before the Vice Chancellor of England).—*Attorney-General v. Shore*.—This celebrated case, which was argued at great length a little while ago, upon the application by the Attorney-General to confirm Lord Henley's report appointing trustees and sub-trustees of Lady Hewley's charity, in place of the ejected Unitarians, and by the relators to annul the report, because the Master had let in to the trusteeship members of dissenting congregations in connexion with the Scotch National Church and the Scotch Secession Church, as well as Independents of the relator's own class, now stood for judgment. His Honour delivered a very long but lucidly-written judgment, of which it will be sufficient to give an outline. His Honour commenced with an epitome of the original information, which stated that during the time of the religious persecutions in the seventeenth century, Lady Sarah Hewley stood forward as the protector and supporter in Yorkshire of the Nonconformists—that she founded the charity in question, several of the trustees of which, in her lifetime, were Nonconformists, and that she died in 1710; that it was very difficult not to ascertain to what particular class of orthodox dissenters she belonged; and that the Presbyterians, and Independents, and Baptists, differed only on articles of church government, but agreed on articles of faith and religious worship among themselves and the Church of England. But it was clear that Unitarians were not objects of her bounty, although they had, in course of time, under the name of Presbyterian Dissenters, obtained possession of the charity. Thus the information had a double object, exclusive as regarded the Unitarians, and inclusive as regarded the orthodox Dissenters. The decree, however, merely declared who were not fit to partake in the benefits of the charity, and it removed all the trustees and sub-trustees, who were, with the exception of one member of the Church of England, all Unitarians. His Honour had a distinct recollection, which was confirmed by Vice-Chancellor Knight Bruce, that the declaration was framed in that exclusive form, because the present Lord Chancellor of Ireland, who was the leading counsel for the relators, desired it should be so. However, it appeared with reasonable clearness what was the principle of the decree. It excluded those who were not proper objects of the charity, namely, Unitarians and members of the Church of England, but it left the question entirely open what parties should be included. His Honour then referred to Lord Lyndhurst's judgment in 1836, when his Lordship, assisted by some of the Judges, came to the conclusion, that the exclusive decree was right. Then followed Lord Cottenham's order in the same year, admitting Presbyterians of northern congregations in connexion with the Scotch Church and the United Secession Church to attend, with the relators who were Independents, before the Master, upon the appointment of trustees. His Lordship's order, as far as it goes, shows he did not think the two first classes could not partake of the charity. His Lordship's words, as they appeared on Mr. Sutton Sharpe's brief, were:—"Something must be done, otherwise this will become an independent charity, which was not the meaning of the decree." His Honour next referred to the appeal to the House of Lords, and the second question their Lordships put to the Judges—what persons were objects of the charity—and the answers of seven of the Judges. One was of opinion that Unitarians were comprehended, two that members of the Church of England were comprehended, six that it embraced Dissenters, but all the Judges thought that orthodox Dissenters were all included. And the observations of Lord Cottenham, in moving judgment, were most important—that the intention of Lady Hewley was to be judged of by the language and terms used in the deeds, and that no evidence of her feelings or prejudices can be regarded. It remains, therefore, to be decided by a decree on further directions, or in some other suit for the purpose, who were the objects of this charity. The petition of the relators asks that this question should be now decided. After the assent which the Attorney-General had given to Lord Cottenham's order in 1836, his Honour thought that order was not to be set aside for want of form. His Honour then stated the names of the seven trustees, and of the several sub-trustees, appointed by Lord Henley, and the objects of the four petitions now before the Court. And his Honour thought that the real question upon those four petitions, namely, whether proper persons were named, was overlooked, and confounded with another question, who are the persons entitled to participate in the charity. His Honour was of opinion that Lord Henley's report was right, and for this reason most especially, for unless the report were confirmed, he did not see how the other question could be decided. As the cause stood at present the other trustees had no interest in raising any question. It was objected that two of the new trustees were members of the Church of Scotland, and that two others even members of the Secession Church. Suppose they were; the decree has not said that such persons ought not to be trustees. But upon the affidavits his Honour did not understand that the facts were so. English Presbyterians do not cease to be English Presbyterians because they are in amity with the Church of Scotland or the Secession Church, and it appeared from the evidence that such persons had actually partaken of the charity. They hold the Westminster Confession of Faith, which substantially agrees with the Articles of the Church of England. It had been also objected that the Master had appointed two trustees out of each of the two other sets of claimants, and had given the Independents but three trustees. His Honour did not see how the Master could otherwise have divided the number seven. He had very properly given a preponderance to the larger body over the two others, but not an absolute majority to any. His Honour concluded in these words.—The real objection so strongly urged by the relators against the other petitioners, that the modern Independents are the only persons Lady Hewley intended to share in the benefit of the charity, cannot be decided upon these petitions. But it was fit there should be some person before the Court legally to argue the question with the relators, which should be judicially decided upon the words of the deeds, and not by conjecture as to what were Lady Hewley's private opinions. What she would think, if she were living, upon the questions which had been discussed before him it might be difficult to say; but, considering her piety and benevolence, it is probable that though an English Presbyterian she would have approved of the exertions which the Established Church of Scotland—more rigidly Presbyterian—had recently made in favour of the Jews, and the

would have been delighted to ponder upon the details of the interesting narrative which was lately published by Messrs. Bonne and MacCheyne, two of the missionaries from that Church. His Honour confirmed the Master's report, appointing trustees and sub trustees, and directed all parties to have their costs out of the estate; but the petitioners, other than the relators and the Attorney-General, were to have but one set of costs, as directed by Lord Cottenham's order. It was very proper that the question should be fully discussed, but the estate should be protected from unnecessary costs.

COURT OF COMMON PLEAS.—*Chesney v. Day*.—This was an action for a breach of contract under the following circumstances: the plaintiff is a Col. in the Artillery, and in the year 1838 undertook a survey of the river Euphrates, and on his return to the country he contracted with the defendants, who are lithographic printers, to furnish him with certain illustrations of a work which he proposed to write, descriptive of his survey. Owing to the illness of one of the defendants, the proposed illustrations were delayed, and the publication of the work was stopped until the defendants furnished the illustrations. Ultimately they were delivered, but not in time for the publication, until all interest was lost, in consequence of a parliamentary report which had been subsequently published. For the plaintiff several witnesses were examined, who all stated that the illustrations of the work were necessary to a profitable sale.—Mr. Serjeant Talfourd, for the defendants, contended that, did the plaintiff's work possess intrinsic interest, it would not have required the fictitious aid of lithographic illustration to recommend it to public notice.—His Lordship elaborately summed up the evidence; and the Jury, after half an hour's deliberation, found a verdict for the plaintiff.—*Damages, 100*l*.*

NEWMARKET SPRING MEETING.

FRIDAY.—*Hudicap Sweepstakes* of 10 sovs each. D.M. 6 subs. Won by Mr. Boyce's Coranna, 4 yrs, 8 st 2 lbs; beating Mr. Pettit's Ends and Odds, 4 yrs, 7 st 2 lbs; Lord Stradbroke's Jeremy Diddler, 4 yrs, 7 st 4 lbs; Mr. Batson's Rowland, 3 yrs, 6 st 2 lbs; Mr. Greville's f by Ishmael, out of Morella, 3 yrs, 5 st; and Lord Mililton's Birdeen, 3 yrs, 6 st 2 lbs, carried 6 st 4 lbs. Won by half a length.

The Newmarket Stakes of 50 sovs each, h ft, for 3 yr-old colts, 8 st 7 lbs; fillies, 8 st 2 lbs. D.M. 26 subs. Won by Lord Stradbroke's b c Evenus; beating Lord Exeter's Brother to Cesarewitch. Won by two lengths.

Matches.—100 sovs, h ft, 8 st 7 lbs each. D.M. Duke of Rutland's Allumette, 3 yrs; Duke of Portland's f by Beiram, out of Ruth, 3 yrs. A dead heat.—200 sovs, h ft. R.M. Lord Maidstone's The Caster, 3 yrs, 7 st, received forfeit from Mr. Rogers's Sir Fretful, 4 yrs, 8 st 7 lbs.—100 sovs, h ft. D.M. Duke of Rutland's Cowslip, 3 yrs, 8 st, 7 lbs, received forfeit from the Duke of Portland's f by Beiram, out of Souvenir, 3 yrs, 8 st 7 lbs.—100 sovs, h ft. T.Y.C. Lord Maidstone's Titania, 3 yrs, 6 st 12 lbs, received forfeit from the Duke of Beaufort's Rapture, 4 yrs, 8 st 7 lbs.—100 sovs, h ft. R.M. Lord W. Poulette's Nelly, 3 yrs, 8 st, received forfeit from Capt Rous's Lady Eleanor, 3 yrs, 8 st 7 lbs.

THURSDAY, DERBY.—11 to 5 agst Mr. Bowes's Cotherstone (take 5 to 2); 7 to 1 agst Mr. Blakelock's A British Yeoman, (taken freely); 16 to 1 agst Mr. T. Taylor's Gamecock (taken); 18 to 1 agst Mr. G. Heathcote's Amorino (taken); 18 to 1 agst Mr. Bel's Winesour; 20 to 1 agst Lord Chesterfield's Parthian; 20 to 1 agst Lord Eglington's Aristides (taken); 25 to 1 agst Major Yarburgh's Dampling; 25 to 1 agst Mr. Mostyn's General Pollock (taken); 30 to 1 agst Lord G. Bentinck's Gaper (taken); 30 to 1 agst Mr. Griffith's Newcourt (taken); 33 to 1 agst Mr. Bell's Blackdrop (taken); 40 to 1 agst Mr. Theobald's Highlander (taken); 40 to 1 agst Mr. Goodman's Maccabeus; 50 to 1 agst Lord Orford's Mercy colt (taken); 50 to 1 agst Lord G. Bentinck's Bramble (taken); 50 to 1 agst Mr. H. Combes's Fakeaway; 50 to 1 agst Lord Chesterfield's Progress c. (taken); 55 to 1 agst Mr. Gray's Gorhambury (Brocade c.) taken; 65 to 1 agst Lord Westminster's Languish c. (taken); 1000 to 15 agst all the mares (taken); 100 to 1 agst Mr. Mostyn's Earl of Richmond (taken); 100 to 1 agst Lord Exeter's Lucetta c. (taken); 100 to 1 agst Mr Thornhill's Elixir (taken).

OAKS.—7 to 1 agst Lord Westminster's Maria Day (taken freely); 12 to 1 agst Mr. Price's The Lily; 13 to 1 agst Lord Westminster's Laura filly; 15 to 1 agst Lord Lyndoch's Elegance filly (taken); 18 to 1 agst Lord Eglington's Egidia; 20 to 1 agst Duke of Rutland's Cowslip (taken).

MARK LANE, FRIDAY, May 12.—We have to report a fair supply of Wheat from Essex, Kent, and Suffolk; the condition was good, the demand being on the best White, we were enabled to establish an advance of 1s. on the best qualities, but this improvement did not apply to Red and secondary. In Foreign there was a fair business transacted during last week at an advance of 1s. per quarter, which was maintained to-day, but there was less doing. Barley remains at the same price, and last week's currency was supported for Peas and Beans. The Oat-trade is fully as dear as last week.

Glasgow, Glasgow, writer.—A. Hutchison, Cupar, merchant.

BIRTHS.—On the 6th inst., at Devon-port, the lady of Captain Maitland, of the 24th Regiment, of a daughter.—On the 7th inst., at Canterbury, the Hon. M. H. Tumor, of a daughter.—At the Deanery, Hereford, the lady of the Most Rev. the Dean of Hereford, of a daughter.—On the 9th inst., at Meanton View, Devon, the Right Hon. Lady Clinton, of a daughter.—On the 11th inst., at R. Hereford-street, Park-lane, the lady of S. Ram, Esq., of a son.

MARRIED.—At St. Margaret's Church, Westminster, Sir Valentine Blake, Bart. M. P., Menno Castle, county of Galway, to Julia Maria, daughter of the late R. MacDonnell, Esq., M. D.—On the 9th inst., at Marylebone Church, the Rev. W. Cureton, of the British Museum, to Harriett, eldest daughter of E. Blore, Esq., of Manchester-square.

DIED.—On the 10th inst., at 23 A, Lower Brook-street, R. J. Chambers, Esq., M. D., aged 68, magistrate in the Metropolis upwards of 80 years.—On the 8th inst., at Brompton, in the 84th year of her age, Mrs. Dayenport, late of Covent-garden Theatre.—On the 4th inst., at Breganz, on the Lake of Constance, General Lord Forbes.—On the 6th inst., at Gouray House, in the island of Jersey, General Sir Hilgrove Turner.

COMMERCIAL and GENERAL LIFE ASSUR-
ANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN
ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25*l*. to 500*l*., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of **FREDERICK LAWRENCE**, Resident Secretary, 112, Cheapside.

II HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by **DANIEL and EDWARD BAILEY, 272, HOLBORN.**

D. and E. BARRY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

A perspective drawing of a small, single-story building, possibly a garage or a small shop. It has a gabled roof with a small dormer window. The front facade features a porch supported by four square columns. There are large windows on either side of the porch entrance. The drawing is done in a simple, sketchy style with cross-hatching for shading.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-
place, King's-road, Chelsea, Hothouse-Builders and Hot-
water Apparatus Manufacturers, beg leave to inform the Nobility
and Gentry that their business, which has been extensive
throughout the country for many years, is entirely confined to
the BUILDING OF HORTICULTURAL ERECTIONS of every
description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of **BOTTOM-HEAT FOR PITTS**, by means of an open trough under the bed, is now being universally adopted. References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

PALMER, GREEN, & CO., No. 146, NORTH-STREET, BRIGHTON, respectfully invite the attention of Horticulturists, &c. to their **HOT-WATER APPARATUS**, which is admirably adapted for Conservatories, Vineries, and Forcing-Houses, of every description. The Apparatus here referred to is exceedingly simple in all its arrangements, and moderate in cost; efficient and economical in its operation, very easily managed, and not liable to be injured, over-heated, or put out of order by accidental neglect.

P., G., & Co. can also, with great confidence, (founded on experience,) recommend their HOT-WATER APPARATUS for warming and ventilating Churches and other Public Buildings, Shops, Warehouses, Factories, and Private Dwellings.

Further particulars will be promptly supplied on application as above, and reference given to most respectable persons on whose premises the Apparatus has been for many months in operation.

Other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87) renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4*l.* 4*s.* and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, &c. &c. Wire work Garden Implements &c. &c.

N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

of first quality, and in any quantity, direct from the bonded stores, either in Liverpool or London. Also, NITRATE of SODA. Apply to H. ROUNTHWAITE & Co., Merchants, 6, Cable-street, Liverpool.

put into carts or boats, at 20s. per ton, may be had of J. & E. STURGE, Chemists, 18, Wheelley's-lane, Birmingham.

BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

* * * POTTER'S Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

New Edition, improved, with nearly 1000 Engravings on Wood, One large Vol. 8vo, 50s. cloth.

NEW ZEALAND COMPANY.—Notice is hereby given, that the ANNUAL GENERAL COURT OF PROPRIETORS OF THE NEW ZEALAND COMPANY will be held on TUESDAY, the 30th day of MAY instant, at One o'Clock, precisely, at this House, for the Election of DIRECTORS, and other OFFICERS of the said Company; for the consideration of a DIVIDEND upon the Company's Stock; and for the transaction of other business. At the said Meeting, the following Directors will go out of Office, viz—

STEWART MARJORIBANKS, Esq., M.P.
CHARLES BULLER, Jun., Esq., M.P.
JOHN ARRL SMITH, Esq., M.P.
JOSEPH SOMES, Esq. (Governor.)
SIR RALPH HOWARD, Bart., M.P.
WILLIAM HUTT, Esq., M.P.

But being eligible for re-election, hereby offer themselves to be re-elected accordingly. By order, JOHN WARD, Secretary. New Zealand House, Broad-street Buildings, May 9, 1843.

BEE-HIVES.—GEORGE NEIGHBOUR and SON beg to inform their Apiarian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Bee-hives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and SON have also Glass Hives and other articles connected with Bee Management, at their Apiarian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps inclosed.

* * * "NUTT ON BEES" (5th Edition), now published.

SHADES FOR GREENHOUSES. J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

TO NURSERYMEN, HORTICULTURISTS, &c.

PROPAGATING GLASSES.—White, 1s. 2d. per lb., Green, 1s. per lb., or from 2s. 6d. to 24s. per doz. CUCUMBER-TUBES, all lengths, from 6d. to 4s. each; GRAPE-SHADES, with holes, from 2s. 6d. each; FISH-BOWLS, from 1s. 6d. each; Fish-bowls, for fountains, with hole in bottom, 2s. 6d. per lb.; at ASLEY PELLATT'S FALCON GLASS-WORKS, HOLLAND-STREET, BLACKFRIARS', where every description of Table-Glass and China is on sale. Days for viewing the Manufactory, Tuesday, Wednesday, and Thursday.

ROWLAND'S MACASSAR OIL.—Under the Special Patronage of Her Most Gracious Majesty the QUEEN, the Royal Family, and the several Courts of Europe. This Oil is universally acknowledged to be the ONLY ARTICLE that will effectually produce and restore Hair, prevent it from falling off or turning grey, free it from scurf and dandruff, and will render it delightfully soft and flexible. It will also preserve the coiffure in the heated atmosphere of crowded assemblies. CAUTION.—Much pernicious trash is now offered for sale as "MACASSAR OIL;" it is therefore of great importance to purchasers to see that the words "ROWLAND'S MACASSAR OIL" are engraven on the wrapper. All others are "GROSS IMPOSITIONS." The Proprietor's Signature is also engraven on the wrapper, thus:—A. ROWLAND & SON, 20, HATTON GARDEN, LONDON; Countersigned "ALEX. ROWLAND." Price 3s. 6d.—7s. Family Bottles (equal to four small), 10s. 6d., and double that size 21s. per bottle. Ask for "Rowland's Macassar Oil." Sold by them, and by Chemists and Perfumers.

ORNAMENTAL WIREWORK FOR THE GARDEN, 390, OXFORD-STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in FANCY WIREWORK, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hot-house Engines, Syringes, Fumigating Bellows, and other Horticultural Implements. G. B. THOMPSON'S Improved Waterpots, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

MECHI'S ELEGANCIES for PRESENTS and

USE.—The greatest variety for Ladies and Gentlemen, both in price and choice, is at MECCHI'S MANUFACTORY and EMPORIUM OF ELEGANCIES, No. 4, Leadenhall-street. Here may be suited the economist or the luxurious. Bagatelle tables, 3l. 10s. to 13l. 10s.; writing-desks, 10s. to 20l.; dressing-cases, 20s. to 100l.; work-boxes, 12s. to 20l.; leather writing-cases, with or without dressing-case, 18s. to 16l.; tea-chests, 7s. 6d. to 8l.; envelope-cases, 10s. to 10l.; inkstands, in wood, bronze, and papier-maché, 6s. to 6l. 6s.; splendid papier-maché work-tables, 10l. 10s.; sets of tea-trays, 8l. to 20l.; work and cake baskets, 25s. to 50s.; card-racks, 25s. to 40s.; hand-screens, 18s. to 48s.; netting-boxes, 25s. to 27s.; card-boxes, 2l. to 5l. 5s.; pole-screens, 4l. 10s. per pair; ladies' folios, richly painted, 30s. to 3l. 3s.; ladies' companions, or pocket work-boxes, in pearl, shell, paper, and leather, at all prices; ladies' scent and toilet bottles, 7s. 6d. to 3l. 3s.; ladies' card-cases, 10s. to 5l.; elegant chess-boards and ivory chessmen, various prices, to 16l. 16s.; watch-stands, 27s. each; gold and silver pencil-cases; elegant cases of seven-day razors, from 25s. to 10l. 10s.; ivory-handled and Scotch strops, in every variety; sporting knives, from 10s. to 3l.; splendid Wharfedale knives, ladies' scissors, 6s. to 50s. per pair; cases of plated and silver desserts, to 25l.; cases of splendid table cutlery, to 40l.; and a variety of other articles; of which catalogues may be had, gratis.—As MECCHI manufactures extensively on his own premises, the quality of every article is warranted.—Table Cutlery, Sheffield Plate, &c.

COMPOUND DECOCTION OF SARSAPARILLA.—Scurvy, Scrofula, Eruptions on the Face, Roughness of the Skin, Chronic Rheumatism, Indigestion, Chronic Liver Affections, General Debility, particularly when caused by excess; the effects of taking Mercury are among the numerous diseases and affections for which this invaluable alternative is almost a specific. To those effected with, or predisposed to, any of the above disorders, a course, spring and autumn, is generally recommended by the Faculty. The preparation of this Decoction is, however, difficult, and its dose somewhat large. All its virtues are possessed in a portable and pleasant form, by the Concentrated Compound Decoction of Sarsaparilla, prepared by BENJ. MOXON and SONS, Chemists, Hull.

Sold in Bottles, at 4s. 6d., 12s., and 22s. (equal to 6, 16, and 32 pints of the Decoction), by all respectable medicine venders.—London Agents: Barclay & Sons, Sutton, Edwards, Newberry, &c.; York, Dennis and Son; Dublin, at Butler's Medical Hall; Edinburgh, J. and R. Raines; Quebec, J. Musson.

TO THE PUBLIC.

HEALTH being paramount to every other earthly blessing, mankind are ever anxious to recover it when lost, and to preserve it when restored. The most prevailing complaint that afflicts society at large is confinement in the bowels, and most persons suffer more or less from its effects, which in some cases has been of that obstinate nature as to resist the power of medicine, and terminate existence. In consequence of the loss of a friend by the above obstinate complaint, and to obviate it in future, in the month of August, 1819, J. READ invented the well known Instrument called the "STOMACH and ENEMA PUMP" (vide the Life of Sir Astley Cooper, p. 301), which, with the blessing of Providence, has been the means of saving thousands of lives, and has been honoured by the sanction of the Royal Colleges of Physicians and Surgeons, and the most eminent Members of the Profession in the Kingdom, as well as on the continents of Europe, India, and America. J. R. begs to inform the Profession and the Public that he has taken out a new Patent for certain improvements, which surpass anything of the kind ever offered, inasmuch as they are more simple, portable, and durable; fitted with tubes that will stand the test of the hottest climates, and are not liable to be out of repair.

Manufactured only by the Patentee, 35, Regent Circus, Piccadilly; where they may be seen and proved.

* * * Observe the words "READ'S PATENT," without which none are genuine.

BOOKSELLERS' PROVIDENT RETREAT, 60, PATERNOSTER ROW.—Established April 6, 1843.

COMMITTEE.
JAMES NISBET, Esq., 21, Berners-street, Chairman.
THOMAS BROWN, Esq., 39, Paternoster-row, Treasurer.
COSMO ORME, Esq., 35, Fitzroy-square.
JAMES DUNCAN, Esq., 37, Paternoster-row.
ANT. K. NEWMAN, Esq., 33, Leadenhall-street.
EDM. HODGSON, Esq., 193, Fleet-street.
Mr. R. BALDOCK, 85, High Holborn.
Mr. JAS. BIGG, 53, Parliament-street.
Mr. G. COPLAND, 17, Paternoster-row.
Mr. H. FOSS, 81, Pall Mall.
Mr. C. D. LEFTLEY, 37, Soho-square.
Mr. S. LOW, 42, Lamb's Conduit street.
Mr. FRED. MALCOLM, 37, Paternoster-row.
Mr. THOS. RODD, 9, Great Newport-street.
Mr. W. SHARP, 39, Paternoster-row.
Mr. T. B. SHARPE, 187, Piccadilly.

Mr. S. IVES, 14, Paternoster-row, Hon. Secretary.

This Society has been established for the purpose of providing a comfortable habitation for the aged Members, and Widows of Members, of the BOOKSELLERS' PROVIDENT INSTITUTION, being in the Receipt of an annuity from that Institution, and who may require such a residence. Every person subscribing One Guinea a Year, or giving a Donation of Ten Guineas at one time, is entitled to one vote at all elections; and so in proportion for every additional Subscription of One Guinea a Year, or Donation of Ten Guineas; and is also eligible to become a Member of the Committee of Management. The very general approbation which has been given to the formation of this Society, and the liberal support it has already received, afford the most encouraging assurance that the sanguine anticipations of its benevolent projectors will be crowned with ultimate success. The present Contributions amount to 1500l.; and the Committee feel assured that they have only to make the object more extensively known, in order to secure the sum which is necessary to complete this desirable undertaking.

Subscriptions and Donations will be thankfully received by THOMAS BROWN, Esq., Treasurer, 39, Paternoster-row; by MESSRS. SMITH, PAYNE, and SMITH, Bankers, 1, Lombard-street, and by any Member of the Committee.

WANTED, a COTTAGE, or SMALL FARM, or SMALL DETACHED HOUSE, from 15 to 30 miles from London. It must contain at least one large or two good-sized Sitting-rooms, two good Bedrooms, with Servants' Rooms, Kitchen, &c., &c. There must be a good garden, well stocked with Fruit-trees, or an Orchard attached, and from five to five-and-twenty acres of land. Situation high, or at least dry; and if near a heath or common it would be preferred. The rent of the Cottage and Garden not to exceed 30l. per annum, the land at a price proportioned to its value. A long lease would be taken, or the Freehold purchased, nor would the Advertiser object to purchase, at a proportionate price, even if there be no House, or a mere labourer's Cottage on the property. Address (post-paid), to X.E., *Gardener's Chronicle Office*, 3, Charles-street, Covent Garden.

WANT PLACES.—All Letters to be post-paid.

TO NOBLEMEN and GENTLEMEN. **AS GARDENER, or GARDENER and BAILIFF,** a single Man, upwards of 30 years of age, who possesses a thorough knowledge of the profession in every department; has held some first-rate situations in England, where every branch of Horticulture has been carried on in an extensive way, and can be highly recommended from a family of note, with other references if required. Direct to Mr. BROWN, Gardener, at Lord Southampton's, Whittlebury, Towcester.

AS GARDENER, a respectable married Man, aged 30, who is a superior Grape Grower, and well skilled in the management of Pines; he perfectly understands Gardening in all its various departments. Can have an eight years' character from his last Situation, which he is leaving on account of the death of his late employer. Direct to J. S., Gardener, Elm Villa, Finchley, Middlesex.

AS GARDENER, a single Man, aged 30, who has a thorough practical knowledge of his business, and can be highly recommended. Direct to A.B., at Mr. J. FULLER'S, near Ottershaw Park, Chertsey, Surrey.

AS BAILIFF, or BAILIFF and FARMER, a respectable married Man, 35 years of age, (a native of Yorkshire), who fully understands the management of Arable, Meadow, and Pasture-land, the Rearing and Feeding of Stock, management of Plantations, &c.; can be highly recommended by one of the first Land-Agents in the country; has no objection to go into Ireland. Application to be made to Mr. MAY, Hope Nursery, Leeming-lane, Bedale, Yorkshire.

Printed by MESSRS. T. L. LANE, Lombard-street, Fleet-street, in the Precinct of Whitechapel, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, May 13, 1843.

ROYAL BOTANIC SOCIETY OF LONDON.
EXHIBITIONS for 1843, at the GARDENS, INNER CIRCLE, REGENT'S-PARK, WEDNESDAYS, May 24, June 28, July 19, from 2 o'clock until 7. The Prizes to be awarded are MEDALS and PLANTS, varying in value from 10s. to 15l., the total amount being 600l. for Plants and Flowers, and 10l. 10s. for Microscopes. Open to all Competitors.

Visitors will be admitted by Tickets to be obtained at the Gardens, and from 12 to 4 o'clock at 28, Regent-street, by Orders from Fellows and Members only. Price 6s.; and on the days of Exhibition, after 2 o'clock, 10s.

Schedules of Prizes, with the Regulations for the observance of Exhibitors, and all other particulars, may be had upon application at the Gardens, and at 28, Regent-street.

By Order of the Council, J. D. C. SOWERBY, Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The Anniversary Meeting will be held at the Society's House, No. 12, Hanover-square, London, on MONDAY next, the 22d of May, at 12 o'clock precisely.

London, May, 1843.—By order of the Council, JAS. HUDSON, Sec.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The Royal Agricultural Society of England is desirous of receiving Tenders from Innkeepers or others, to contract for any one or more of the following Supplies at the ensuing Annual Country Meeting of the Society, to be held at Derby in July:—

I. A Hot Dinner for 350 persons, with Dessert, and a bottle of Port or Sherry to each person, in the County Hall, Derby, on Wednesday, the 12th of July, 1843.

II. A Cold Dinner for 1500 persons, with a pint of Port or Sherry to each person, in the Pavilion of the Society, at Derby, on Thursday, the 13th of July.

III. Refreshments suitable for 300 Ladies in the Galleries of the Pavilion, on the same occasion.

Tenders to be forwarded on or before the 5th of June next, to the Secretary of the Society, No. 12, Hanover-square, London, where further particulars may be obtained: the Society not binding itself to accept the lowest tender. The particulars may also be obtained on reference to the Local Committee at Derby.

London, May 11, 1843.—By order of the Council, JAS. HUDSON, Sec.

GARDENERS' BENEVOLENT INSTITUTION.
—MR. CHAUNDY begs to remind the Subscribers to the above Institution who have kindly promised him their votes and interest in favour of WILLIAM WELLS (aged seventy-four years), that the election will be on THURSDAY, the 1st of June, at one o'clock, at the Crown and Anchor Tavern, Strand. He also respectfully solicits the Votes of the Subscribers who have not already promised them, assuring them that there cannot be a case more deserving their support.

In the Polling Papers WILLIAM WELLS is stated to be aged 64, which is an error, he being 74. Chislehurst in Surrey is also an error, it being Chislehurst in Kent.

N.B.—Voting Papers thankfully received by Mr. CHAUNDY, Nurseryman, Lewisham.

BENEVOLENT INSTITUTION for the RELIEF of AGED and INDIGENT GARDENERS and their WIDOWS.

Notice is hereby given, that a GENERAL MEETING of the Subscribers will be held on Thursday, 1st of June, at the Crown and Anchor Tavern, Strand, for the purpose of electing two persons out of the following Candidates to the annual Pension of this Charity:

No. 1. ANDERSON, JAMES, Gardener, London, aged 70. (Second application.)

2. SUFFELL, WILLIAM, Gardener, London, aged 67. (Second application.)

3. LYWARD, SAMUEL, Gardener, Camberwell, aged 64.

4. WELLS, WILLIAM, Gardener, Chislehurst, Kent, aged 64.

The poll will be taken at one o'clock, when the ballot will commence and close at three o'clock precisely.

By order, EDW. R. CUTLER, Secretary, 97, Farringdon-street.

Subscribers not having received their Polling Papers are requested to apply to the Secretary.

UNDER THE SPECIAL PATRONAGE OF HER ROYAL HIGHNESS THE DUCHESS OF GLOUCESTER, AND HIS ROYAL HIGHNESS THE DUKE OF CAMBRIDGE.

MESSERS. WATERER'S SPLENDID EXHIBITION OF AMERICAN PLANTS will open on THURSDAY, May 18, at the Nursery, King's Road, Chelsea. Admittance, 1s.

The Nurseries at Knab Hill and Bagshot are also now in perfection, and may be viewed gratis any day, except Sunday.

NEW WATHEREN EARLY BROCCOLI.

HURST AND MULLEN, SEEDSMEN, 6, Leadenhall Street, beg to offer a few Packets of the above splendid Vegetable at 2s. 6d. per Packet, the present time being very suitable for sowing.—New Bath Cos Lettuce (self-heating kind) 1s. per Packet.

A choice selection of Biennial and Perennial Flower Seeds, proper for sowing at the present season, 4d. and 6d. per Packet.

FUCHSIA ST. CLARE.—This splendid FUCHSIA, pronounced by Dr. LINDLEY as the "finest hybrid we have seen," is now being sent out by YOUELL and Co., Great Yarmouth Nursery, Norfolk, at 10s. 6d. per plant, free of postage, to any part of the United Kingdom.—Great Yarmouth, May 17, 1843.

14 To Mr. Beck, of the Slate Works, Isleworth, for 25 Roses in pots
15 To Mr. Catleugh, of Chelsea, for 25 Roses in pots
16 To Mr. W. Gunter, Gardener to Sir G. Larpent, Bart., F.H.S., for Dendrobium densiflorum
17 To Mr. W. Hardie, Gardener to J. Jarrett, Esq., F.H.S., for Doryanthes excelsa
18 To Messrs. Lucombe and Pince, of Exeter, for Acrophyllum venosum
19 To Mr. E. Davis, Gardener to Abel Smith, Esq., Woodhall, Ware, Herts, for Grapes
20 To Mr. Chapman, of South Lambeth, for Grapes
21 To Mr. J. Davis, of East Barnet, for Pine Apples

SILVER KNIGHTIAN MEDAL.

1 To Mr. Watt, Gardener to E. Neil, Esq., of Eccleston Bridge, Pimlico, for 12 Pelargoniums, in pots of 12 to the cast
2 To Mr. John Green, for 6 Herbaceous Calceolarias, in pots of 12 to the cast
3 To Mr. Catleugh, of Chelsea, for 6 Herbaceous Calceolarias, in pots of 12 to the cast
4 To Mr. Gaines, of Battersea, for Shrubby Calceolarias, in pots of 12 to the cast
5 To Mr. Catleugh, for a collection of 12 Fuchsias
6 To Mr. G. Clarke, Gardener to M. T. Smith, Esq., for 6 Stove and Greenhouse plants
7 To Mr. Bruce, Gardener to Boyd Miller, Esq., for 6 varieties of Cape Heaths
8 To Mr. Smith, of Norbiton, Surrey, for Rhododendron chrysoclectron
9 To Mr. Joseph Goode, for Tropæolum azureum
10 To G. Barker, Esq., F.H.S., for a specimen of Cynoches pentadactylon
11 To Mr. Thomas Ann, Gardener to J. H. Vivian, Esq., M.P., F.H.S., for Grapes
12 To Mr. Tillery, Gardener to His Grace the Duke of Portland, for Peaches and Nectarines
13 To Mr. S. Snow, Gardener to the Earl De Grey, for Strawberries (British Queen)
14 To Mr. Gadd, of Betchworth, near Dorking, for Cantaloupe Melons
15 To Mr. J. Catleugh, of Kemp Town, Brighton, for Grapes

SILVER BANKSIAN MEDAL.

1 To Mr. Bromley, Gardener to Miss Anderson, for 12 Pelargoniums, in pots of 12 to the cast
2 To Mr. Cockburn, F.H.S., Gardener to the Earl of Mansfield, for 6 Pelargoniums, in pots of 6 to the cast

3 To Mr. Beck, of the Slate Works, Isleworth, for 6 Herbaceous Calceolarias, in pots of 12 to the cast

4 To Mr. Catleugh, for 6 Shrubby Calceolarias, in pots of 12 to the cast

5 To Mr. Hogan, Gardener to H. Pownall, Esq., F.H.S., for a collection of 6 Stove and Greenhouse plants

6 To Mr. M. Clark, Gardener to W. Block, Esq., for a collection of 6 Stove and Greenhouse plants

7 To Mr. Joseph Goode, for a specimen of Gloxinia macrophylla variegata

8 To Mr. Joseph Goode, for a specimen of Begonia coccinea

9 To Mr. John Green, for a specimen of Siphocampylus betulifolius

10 To Mr. William Smith, of Norbiton, for a specimen of Rhododendron decorum

11 To Mr. G. Stanley, Gardener to H. Berens, Esq., F.H.S., for a specimen of Zichya inophylla

12 To Messrs. Lane and Co., for 50 varieties of Roses in pots

13 To Mr. W. Hardie, Gardener to J. Jarrett, Esq., F.H.S., for Melons

14 To Richard Brook, Esq., F.H.S., for a collection of 14 sorts of Apples and Pears

15 To Mr. W. Davis, of Isleworth, for Strawberries

16 To Mr. Baldwin, of Turnham Green, for a collection of Apples and Pears

17 To Mr. Hutchison, Gardener to E. J. Shirley, Esq., M.P., of Ealington Park, for Peaches and Nectarines.

THE CERTIFICATE OF MERIT.

1 To Mr. Clark, Gardener to W. Block, Esq., for Tall Cacti in flower

2 To Mr. J. Goode, for Tall Cacti in flower

3 To Mr. John Green, for Manettia bicolor

4 To Mr. James Hayes, Gardener to G. Hanson, Esq., of High Beech, for Aotus lanigera

5 To Mr. Kyle, Gardener to Robert Barclay, Esq., of Leyton, for a species of Bossiaea

6 To Mr. R. Jones, Gardener to Sir Moore Disney, F.H.S., for Acaia indica alba

7 To Mr. Gaines, for Ixias

8 To J. A. Nutt, Esq., F.H.S., for a specimen of Erica depressa

9 To Mr. Wood, of Norwood, for a collection of 12 Rock plants

10 To Mr. Beck, of Isleworth, for a Pelargonium susanna

11 To Mr. Beck, of Isleworth, for a Pelargonium (Zanzumim)

12 To Mr. Standish, of Bagshot, for 2 Calceolarias (Duchess of Gloucester and Surpize)

13 To Mr. I. Moss, Gardener to J. Taylor, Esq., F.H.S. for Citrons.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

BEAUTIFUL AND DISTINCT FUCHSIAS.

YOUELL & Co., in submitting their Catalogue of Fuchsias for 1843, (for which, see their Advertisement in this Paper of the 6th inst.), take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attend their mode of selecting last season collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. are desirous of calling attention to their peculiar method of executing orders for this tribe of plants; namely, that they will deliver them free of postage, on the receipt of a Post-office order, to any part of the United Kingdom, in collections, upon the following terms:

Twelve fine Show Varieties, 12s. Twelve extra fine and very superior . . . 21s.

The selection being left to YOUELL & Co.

Great Yarmouth Nursery, Norfolk, May 17, 1843.

MESSERS. VEITCH AND SON beg to offer the following New and Beautiful Plants, introduced by them through their Collector in South America:—

Alstroemeria nemorosa (See figures) Curtis's Bot. Mag., Aug. 1842,

Begonia coccinea " Curtis's Bot. Mag., Jan. 1843,

" " Curtis's Bot. Mag., May, 1843,

*Echites splendens " Paxton's Mag., March, 1843,

" " and Curtis's Bot. Mag., Nov., 1843

" atropurpurea " Edwards' Bot. Reg., May, 1843,

" " and Paxton's Magazine, Oct. 1842

" " Curtis's Bot. Mag., Feb., 1843,

" " Curtis's Bot. Mag., April, 1842

Gesneria Polyantha " Paxton's Magazine, March, 1843

Gloxinia macrophylla variegata " Curtis's Bot. Mag., April, 1843

Hypocyrta strigillosa " Curtis's Bot. Mag., Nov., 1842,

Manettia bicolor " Paxton's Magazine, March, 1843

Passiflora Actinia " Curtis's Bot. Mag., April, 1843

*Rondeletia longiflora " Curtis's Bot. Mag., Nov., 1842

and Paxton's Magazine, Nov., 1842

Stigmaphyllon ciliatum " Curtis's Bot. Mag., May, 1843

" heterophyllum " Curtis's Bot. Mag., May, 1843

Siphocampylus duplo-serratus " Edwards' Bot. Reg., Dec., 1842,

Tropæolum azureum " Curtis's Bot. Mag., Dec., 1842, and Paxton's Mag., Dec., 1842.

Messrs. VEITCH and SON having raised many thousands of Araucaria imbricata from seed, are enabled to offer them in quantity at a very low, moderate price.

N.B.—The Plants marked thus [*] will not be ready for delivery till the first week in June.—Exeter, May 18, 1843.

SUPERB SEEDLING CHRYSANTHEMUM THE "DUKE."

YOUELL AND CO. feel much pleasure in announcing

they have obtained the entire stock of an extremely beautiful seedling Chrysanthemum, from Mr. Wells, gardener to the Rev. J. Barrow, of Lingwood, I. Dec. No. 101k. This splendid variety, named "THE DUKE," was exhibited at the Norwich and Norfolk Horticultural Society's Exhibition, where it obtained the First Prize, as the best seedling; it also obtained First Prizes shown in the best standard; ditto ditto, 15; ditto ditto, 15; ditto ditto, 15; the judges pronounced it to be the best Chrysanthemum ever exhibited. The colour French white, changing to pale water petals, and ending in a richly incurved, turning a pale blue from its veins in water. It will be ready for sale at the first week in June, at 7s. 6d. per plant, free of postage, to any part of the United Kingdom. Great Yarmouth Nursery, May 17, 1843.

ARAUCARIA IMBRICATA SEED.

MESSERS. HURST AND MULLEN having had

12 sown to them a quantity of Seed of this splendid hardy tree, in good condition, can offer them at the following Price; viz., 5s. per 100 seeds (with 10 Seeds gratis on every 100, to make up 100, such as may not vegetate).

Early Orders are requested.—6, Leadenhall-street, May 18, 1843.

ROSES.

MESSRS. LANE AND SON beg to announce that they are in possession of all the New Roses of the season, most of which have fully sustained their character by indoor culture; but Messrs. LANE are aware of the fallacy of such criterion, have determined not to publish any List of them until they have proved their respective qualities by out-of-door cultivation, thus enabling Amateurs to select only such as will not fail to answer their expectations of possessing the most beautiful and desirable varieties; a full description of which will be given in their Catalogue of 1843-4, to be published in September next.

MESSRS. LANE and SON have on hand a large Stock of Bourbon, China, Tea-scented China, and Noisette Roses, which they are enabled to supply at from 9s. to 30s. per dozen, the selection being left to themselves. Nurseries, Great Berkhamsted, May, 1843.

THOMAS BROWN, NURSERYMAN, SEEDSMAN, and FLORIST, Slough, near Windsor, in submitting the following few select sorts of Dahlias, begs to direct attention to the **ESSEX TRIUMPH**, which is justly pronounced the most extraordinary flower ever produced, being a colour yet unseen in this beautiful and showy tribe of plants, and without which no stand hereafter can be considered complete. The Award of Prizes and Notices in the various Floricultural Publications given below will be the best proof of this unrivalled Dahlia's constancy and perfection.

1841. Chelmsford	Sept. 12.	1 Bloom.	1st Prize.
" Halstead	" 17.	" 1 "	" 1st Prize.
" Salt Hill	" 28.	" 1 "	(5/4 Cup) 1st Prize.
1842. Floricultural Society	" 6.	" 9 "	1st Class.
" South London	" 13.	" 4 "	1st Prize.
" Salt Hill	" 16.	" 4 "	2d Prize.
" Floricultural Society	" 20.	" 6 "	1st Prize.
" Do. (best Dark Dahlia)	" "	" 1 "	1st Prize.
" Sunbury	" 22.	" 3 "	1st Prize.
" Halstead	" "	" 1 "	1st Prize.
" Floricultural Society	" 27.	" 12 "	1st Class.
" Ditto	" 4.	" 6 "	1st Class.

The Floricultural Society of London described it as follows:—**ESSEX TRIUMPH.** Form, Good. Substance, good. Arrangement, good. Colour, dark maroon, good. Eyes, complete and good in every specimen. Depth, great and globular. Size, full. General Form, excellent. Class of Quality, FIRST RATE.

NOTICES OF THE PRESS.

From the GARDENERS' CHRONICLE.

Report of Seedlings shown at the South London Floricultural Exhibition, on the 13th September.

"The first prize was awarded to 'ESSEX TRIUMPH,' a fine and very deep maroon-coloured flower of first-rate properties, with petals of good form and substance, centre finely elevated, and general form perfect."

Salt Hill Show, on the 16th September.

"ESSEX TRIUMPH.—This noble flower is quite a model of perfection, fine in form, and deep in petals, with a centre high and finely developed. The colour is a very deep rich maroon, the petals are finely cupped, of good substance, and well arranged."

The Floricultural Society of London's Exhibition on the 22d Sept. "ESSEX TRIUMPH.—This fine flower was noticed last week in our report of the Salt Hill Show; it now occupies the post of honour, a situation it worthily filled, in addition to which it was placed first in class-showing, as the best dark flower. As a test of its constancy thirty-six blooms were exhibited in the room uniformly good. The general form of the flower is excellent, its size medium, with great depth of petals, the eye being perfect in all the specimens. To these fine properties we may add, that the petals are finely formed, of good substance, and well arranged; the colour is of the deepest rich maroon, and being very uniform throughout, gives great grandeur to the appearance of the flower."

From the GARDENERS' GAZETTE.

September 17.—"ESSEX TRIUMPH, the dark flower shown last week at the meeting of the Floricultural Society, is decidedly the best of the season, and obtained the first prize."

September 24.—"ESSEX TRIUMPH, a highly symmetrical dark variety, already successfully exhibited before this Society, as well as at Salt Hill, the South London Show, and elsewhere. Besides the stand for competition a large tray of blooms was sent by Mr. Thomas Brown, of Slough, who has purchased the stock, and they exhibited a remarkable constancy, every one of them keeping up their character."

October 1.—"ESSEX TRIUMPH. This flower, which has perhaps the finest formed petals of any yet seen, fully kept up its former character."

From the London Daily Papers.

"The most extraordinary novelty at this exhibition (the Surrey Zoological Gardens) was a Black Dahlia, called 'ESSEX TRIUMPH,' said to have been purchased by Mr. Brown, of Slough, near Windsor, at the large sum of 100 guineas: it was the admiration of crowds, which during the day thronged round the blooms, and made it most difficult to approach the tables near enough to get a sight of it. The Scientific and the Amateur appeared delighted with the boon that another season their gardens would be possessed of."

DAHLIAS.

Admiral Stopford (Trenfield) fine dark	4 feet—3 6	tained four other prizes at the principal open Shows	3 to 4 feet—10 6
Antagonist (Bragg), the finest white, very constant	4 to 5—10 6	Bedford Surprise (Sheppard), carmine purple, very fine and constant	5—3 6
Asmodeus (Davis), dark crimson, with a fine velvet petal, was classified by the Floricultural Society	5 to 6—10 6	Confidence (Cook), orange buff, fine petal, and novel Show-flower	4 to 5—7 6
Brown's Blue Bonnet, light violet purple, full and constant show-flower	5—7 6	Competitor (Hodges), rose, fine	3 to 4—5 0
Brown's Miranda, blush white, tipped with rose; gained 1st prize at York, August 4th; classed second at the Floricultural Society, and a prize at the Salt Hill Grand open Show, Sept. 16	3—7 6	Essex Triumph (Turville), the nearest possible approach to black, with a beautiful velvety gloss on the petal, form unrivalled, and is unquestionably the most novel and best Dahlia offered to the public	4—10 6
Brown's Marquess of Lansdowne, shaded salmon	5 to 6—2 6	[The usual allowance to the Trade on this flower, where a dozen are taken.]	
Brown's Perpetual Grand, bright crimson, fine broad cupped petals, well arranged, full and constant; was classed first at the Floricultural Society, and awarded five prizes at the principal open Shows	5—10 6	Mrs. Shelley (Mitchell), rose	4 to 5—3 6
Brown's Queen of Trumps, white, tipped with purple, petals of good substance and of great depth, classed second, on two occasions, by the Floricultural Society; also ob-		Phoenix (Hedley), best scarlet	3—2 6
		Princess Royal (Hudson), creamy buff, tipped with rose	4—2 6
		Prince of Wales (Dodd), yellow	2 to 3—2 6
		Surprise (Oakley), purple, singularly tipped with white, constant, and very showy	4 to 5—10 6
		Virgil (Mountjoy), dark crimson, fine Show-flower, and pronounced a first-class flower by the Floricultural Society of London	4—10 6

Strong and healthy plants are now ready. A general list may be had on application.

SUPERB CHRYSANTHEMUMS.

YOUELL AND CO., in offering their List of CHRYSANTHEMUMS (for which see their advertisement in this Paper of the 6th inst.), to the notice of amateurs, and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the list will be found highly satisfactory to those who may not only have the above object in view, but also to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants will be strong and healthy, and sent free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, in the first week in June, at the rate of 12s. per dozen.—Great Yarmouth Nursery, May 17, 1843.

SURREY-LANE, BATTERSEA.

N. GAINES begs to inform the Nobility, Gentry, and others, that his Collection of first-rate PELARGONIUMS, &c., are coming into flower; he therefore takes the liberty of reminding those that wish to improve their collection, that the present would be a favourable opportunity.—May 11, 1843.

NEW AND CHOICE PERPETUAL ROSES.

R. B. BIRCHAM, Hedenham Rosary, begs to offer the following select ROSES, well established in pots, fit for immediate transplanting—

Price per plant.—s. d.	Price per plant.—s. d.
*Auburnon . . . 3 6	Newton . . . 2 6
*Archie . . . 5 0	*Prince of Gales . . . 10 6

Mrs. Elliott . . . 3 6	Josephine Malton . . . 7 6

Those marked *, R. B. B. can supply wholesale orders at a fair trade price per dozen. Plants gratis, to compensate for distant carriage.

Hedenham Rosary is situated on the border of the county of Norfolk, and on the line of road leading from Norwich to Bungay, eleven miles from the former and three from the latter. Bungay is the nearest post town. A daily conveyance to the Eastern Counties Railway, thence to London.

NEW AND CHOICE ROSES.

A. PAUL & SON, NURSERYMEN, &c., Cheshunt, Herts, in offering the following Select List of ROSES, beg to remind Rose Amateurs that May is the best month for planting out beds of Dwarf Roses. The Plants now offered are in No. 60 pots, good and healthy, and if planted out this month will bloom in the approaching autumn.

Many persons preferring whole beds of Roses of one colour for the sake of effect, the following are well suited for that purpose, and grown in large quantities.

each—s. d.	per doz.
Hybrid Perpetual Auburnon, rose	3 6 or 30s.
Noisette Aine, lilac rose	1 0 " 10s.
" Euphrosyne, rose and yellow	2 0 " 18s.
Bourbon Queen, buff	1 6 " 15s.
" Armosa, pink	1 0 " 10s.
China, Fabvier, scarlet	1 0 " 10s.
" White	1 0 " 10s.
" Mrs. Bosanquet, flesh	1 6 " 15s.
Lawrenciana rubra, deep red	1 0 " 10s.

Also fine named varieties at the following prices, when the selection is left to A. P. & Son.

Hybrid Perpetual	24s. to 30s. per doz.
Noisette	12s. " 18s. "
China	12s. " 18s. "
Tea	18s. " 24s. "
Bourbon	18s. " 24s. "

For description of colours and further information, A. PAUL and SON beg to refer to their General Catalogue, which may be had on application at the Nurseries, inclosing 2 stamps for postage. Early orders are solicited, as many sorts are expected to be in great demand. A reference, or order on the post-office at Waltham Cross, will be required from unknown correspondents. Cheshunt Nurseries, May 6.

FUCHSIA TODDIANA, (the Flowers of which rival every other Hybrid in size, being nearly four inches in length,) is now being sent out at 10s. 6d. each, with the usual discount where six are taken.—THOS. CRIPPS, Tunbridge Wells Nursery.

Flowers of the above extraordinarily beautiful variety were transmitted to the office of this Paper in August last, for the opinion of the Editor, which was as follows:—"A. B.—your Fuchsia is one of considerable beauty, and differs in the great length of the division of the calyx from any which we have yet seen. Their colour is also bright, and not dimmed with that dirty tinge which usually prevails amongst this class of Flowers."

N. B.—Plants can also be had of Messrs. Lowe and Co., Clapton; or of Mr. CHARLWOOD, Seedsman, &c., Covent Garden, London.

DANE CROFT NURSERY, STOURMARKET, SUFFOLK.

S. GIRLING begs to inform his Friends and the Public in general, that he has commenced sending Dahlias out in Collections, to include a good Mixture of Colours: 12 Dahlias for 6s., 24 for 11s., 36 for 15s., 48 for 18s. To include a choice variety of Each Year's, in the proportion of one to each dozen plants; and a proportion of his much admired Fancy Border Varieties, peculiarly adapted for Border growing. If 100 are ordered, the price to decrease in the same proportion.

N. B.—Fine Plants of Fuchsias for bedding, at the same prices, up to 36 varieties. To save expensive carriage, they can now with safety be taken from the pots, and planted out, without hazard, immediately on receiving them.

JOHN MILNE begs respectfully to offer to the Nobility,

Gentry, and the Public, the following plants:—

A fine specimen of *Araucaria excelsa*, in pot, standing 8 ft. high, probably one of the finest in England, for sale, price 25l. Fine specimens of *Rhododendron hybridum* now in flower, from 7 to 10 feet high, each 7l. to 10l. 10s.

Fine specimens of <i>Camellia imbricata</i> , from 5 to 6 ft. high, 5l. 5s.	3 to 4 ft. each 3l.
" "	3 to 4 ft. each 2l. 2s.
" "	<i>Azalea Phoenicea</i> , 3 to 4 ft. ea. 7s. 6d. to 10s. 6d.
" "	<i>Danielsiana</i> , 2 to 3 ft. 7s. 6d. to 10s. 6d.
" "	<i>Clematis Sieboldii</i> , 10s. 6d.
" "	<i>Azalea grandiflora</i> , 10s. 6d. & 12s. 6d.
" "	<i>Cactus truncatus</i> , grftd., 2 & 3 ft. high, 20s. to 30s.

The above are fine specimens for furnishing Conservatories.

A fine collection of *Azalea sinensis*, *Camellias*, *Pelargoniums*, *Ericas*, *Epacris*, *Gesneras*, *Gloxinias*, *Achimenes*, &c. &c. Likewise a general collection of Greenhouse, Herbaceous, and Rock plants, too numerous to insert.

<i>Hovea Celsii</i> , per doz. 18s. to 24s.	<i>Mespylus Japonica</i> , 1 to 2 ft., each 2s. 6d. to 3s. 6d.
<i>Chorizema Henchmannii</i> , per doz., 18s. to 24s.	<i>Pinus lanceolata</i> , each 2s. 6d. to 3s. 6d.
<i>Daphne indica rubra</i> , per doz., 12s. to 18s.	<i>Pinus Morinda</i> , 2 ft. high, each 7s. 6d.
<i>Camellias</i> , 18 inches to 2 feet high, per doz. 2l. 2s.	<i>Correa Harrisii</i> , 1 ft., per doz. 18s.
<i>Camellia reticulata</i> , 1 to 2 ft. 5s. to 7s. 6d. each.	<i>Platylobium Murryanum</i> , each 3s. 6d. to 6s.
<i>Thea viridis</i> , or Green Tea, 18 inches to 2 ft., per doz. 18s. to 24s.	<i>Burtonia conferta</i> , each 1s. 6d. to 2s. 6d.
<i>Pimelea hispida</i> , per doz. 12s.	<i>Glycine Backhousiana</i> , each 5s. to 7s. 6d.

PLANTS FOR BEDDING OUT.

s. d.	s. d.
<i>Alstroemeria</i> , 6 varieties, each 1s. to 1 6	<i>Mimulus</i> , 6 fine varieties, per doz. 6s. and 9 0
<i>Aquilegia arctica</i> , each 1 0	<i>Nierembergia gracilis</i> , per doz. 9 0

<i>Honeysuckles</i> , in 6 vars. each 0 9	20 varieties of creeping Roses, large plants, each 1 6

Rosa Devoniensis, each 2s. 6d. *Lilium lancifolium album*, 5s.; *Do.* do. *punctatum*, 7s. 6d. each. The above plants are all in pots; and a general supply may be had throughout the season.

N. B.—Plants for Bedding or Creepers ordered to the amount of 20s. will be forwarded to any part of London carriage free; a reference or Post-office order will be required of unknown correspondents.—Albion Nursery, Stoke Newington, Middlesex.

SKIRVING'S IMPROVED SWEDEN TURNIP AND GUANO MANURE.

W. SKIRVING, SEEDSMAN, Queen Square, Liver-pool, begs to acquaint his Agricultural Friends and the Public, that the price for the present season of the GENUINE SEED of his IMPROVED SWEDEN TURNIP is 1s. 6d. per lb.; the sort warranted the same as that for which he received the premium of the Royal Agricultural Society of England.

GUANO of the best quality on the lowest terms. Orders, with a remittance or reference, will be punctually and faithfully executed.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. CANNELL, to subject to public competition, by auction, on the premises, Cambridge Road, Bethnal Green, near the Eastern Counties Railway Station, on TUESDAY, May 23, 1843, at 1 o'clock, A VERY RICH COLLECTION of TULIPS, comprising, among others, the following new and costly varieties, viz., Strong's Queen Byblo, Strong's King, Thalia, Byb, Sir R. Peel, Brulante Eclatante, Pompe Funebre, fine, Louis XVI. ex., ex., Sharp's Victory, Duke of Sussex, new, Violet Quarto, ex., Milo, Ponceau Brilliant, Acre's Camuse de Craze, Carter's Regulator, ex., Rose Brilliant, ex., Lawrence's Bolivar, ex., Duchess of Kent, &c.

May be viewed prior to Sale. Catalogues may be had on the Premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE & MORRIS will submit to public competition at the Auction Mart, Bartholomew Lane, on WEDNESDAY, May 24, 1843, and following day, at 12 o'clock, a Splendid Assortment of PELARGONIUMS, Choice DAHLIAS, New FUCHSIAS and VERBENAS, PANSIES, ROSES, and a variety of other plants for transplanting. May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE and ANNUITY COMPANY.

Capital £200,000, in 2,000 Shares.

DIRECTORS.

Edward Barnard, Esq., F.R.S.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, Jun., Esq.

C. E. Mangles, Esq.
J. B. Montefiore, Esq.
J. H. Ravenshaw, Esq.
William Walker, Esq.

BANKERS—Union Bank of London.

COLONIAL BANKERS—Bank of Australasia (Incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN—P. Fraser, Esq., M.D., 62, Guildford-st., Russell-sq.

SOLICITORS—Messrs. Swain, Stevens, & Co.

SECRETARY—Edw. Ryley, Esq.

The advantages offered to Emigrants to the Australasian Colonies by this Company are,—First, that no extra premium is charged for residence in any of the Australasian Colonies, except in New Zealand. Second, that no extra premium is charged, to those who assure for the whole term of life, for one voyage out to the Australasian Colonies, and for one return voyage; and that premiums may be paid and claims settled in those colonies. And to all persons who wish to assure their lives the Company offers unusually favourable rates of premium, participation in profits, and the guarantee of an ample subscribed capital.

Prospectuses and full particulars may be obtained at the Offices of the Company, 126, Bishopsgate-street.

HOT-WATER APPARATUS.

PALMER, GREEN, & CO., No. 146, NORTH-STREET, BRIGHTON, respectfully invite the attention of Horticulturists, &c. to their HOT-WATER APPARATUS, which is admirably adapted for Conservatories, Vineries, and Forcing-Houses, of every description. The Apparatus here referred to is exceedingly simple in all its arrangements, and moderate in cost; efficient and economical in its operation, very easily managed, and not liable to be injured, over-heated, or put out of order by accidental neglect.

P. G. & Co. can also, with great confidence, (founded on experience,) recommend their HOT-WATER APPARATUS for warming and ventilating Churches and other Public Buildings, Shops, Warehouses, Factories, and Private Dwellings.

Further particulars will be promptly supplied on application as above, and reference given to most respectable persons on whose premises the Apparatus has been for many months in operation.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS. CROSSKILL'S LIQUID MANURE CART, which received the Honorary Reward of the Roy. Agricultural Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price, delivered in Hull, 25/.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12/ 12s.

GUANO ON SALE BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of H. I. dersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 13 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

* * * POTTER'S Portable Farm-yard Manure, at 4/ 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth

New Edition, improved, with nearly 1000 Engravings on Wood, One large Vol. 8vo, 50s. cloth.

AN ENCYCLOPEDIA OF GARDENING.

By J. C. LONDON.

"No gardening book so comprehensive, and containing such an immense mass of matter, has ever been submitted to the public more free from errors of the pen or the press."—*Monthly Review*.

HORTUS BRITANNICUS; a Catalogue of all the Plants indigenous to or introduced into Britain. New Edition, 31s. 6d.

ENCYCLOPEDIA OF PLANTS. 8vo. 3l. 13s. 6d. cloth.

ENCYCLOPEDIA OF AGRICULTURE. 8vo. 2l. 10s.

ENCYCLOPEDIA OF TREES AND SHRUBS. 8vo. 2l. 10s.

AN ENCYCLOPEDIA OF COTTAGE, FARM, and VILLA ARCHITECTURE. 8vo. 3l. 3s. cloth.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Just Published,

A TREATISE ON "RENDLE'S TANK SYSTEM OF COMMUNICATING HEAT," by W. L. RENDLE, F.H.S., Plymouth, can now be obtained of all Booksellers, or from the Author, at 5s. 6d. (free by post.) Embellished with eight Wood Engravings.

LONGMAN, BROWN, GREEN, and LONGMANS.

ILLUSTRATIONS OF BRITISH GRASSES.

Just published, 4to. with 118 Plates, beautifully coloured, 3l. 16s., bds. **GRAMINA BRITANNICA**; or, Representations of the British Grasses: with Remarks and occasional Descriptions. By I. L. KNAPP, Esq., F.L.S. & A.S. Second Edition. London: LONGMAN, BROWN, and Co. Bristol: W. STRONG.

This Day, price 4s. 6d., The **PRACTICAL BEE-KEEPER**; or, Concise and Plain Instructions for the Management of BEES and HIVES. By JOHN MILTON. London: JOHN W. PARKER, West Strand.

Recently published, One large Vol. 8vo, with Six Copper-plates and numerous Wood Engravings, 18s. cloth.

INTRODUCTION TO BOTANY.

By Professor LINDLEY, Ph.D. of University College and the Royal Institution. 3d Edition, with Corrections and numerous Additions.

"We have no hesitation in pronouncing this 'Introduction to Botany' to be the most valuable and perfect in any language we are acquainted with."—*Medical Gazette*.

By the same Author,

THE THEORY OF HORTICULTURE; or an Exposition of the Physiological Principles on which the Operations of Gardening are conducted. 8vo. with numerous Illustrations on Wood. 12s. cloth.

"To all who delight in a garden, Dr. Lindley's charming volume will yield not only instruction, but endless amusement."—*Athenaeum*.

A NATURAL SYSTEM OF BOTANY. 8vo. 18s. cloth.

FLORA MEDICA. 8vo. 18s. cloth.

GUIDE TO THE ORCHARD AND KITCHEN GARDEN. 16s.

SYNOPSIS OF THE BRITISH FLORA. 12mo. 10s. 6d. cloth.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

On Wednesday next will be Published, in 12mo (a Volume for the Pocket),

A MANUAL OF BRITISH BOTANY, containing the Flowering Plants and Terms, arranged according to the Natural Orders. By CHARLES C. BABINGTON, M.A., F.L.S., F.G.S., &c.

JOHN VAN VOORST, Paternoster Row.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopaedias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

London: WHITTAKER and Co.

Handsomely bound in cloth, with Ninety-three Wood-Engravings, Price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt.

By W. C. TAYLOR, LL.D.

From the *British Magazine*.—"This is an elegant and well-executed little book, on a most interesting subject."

TILT and BOGUE, Fleet-street.

FAMILIAR ASTRONOMY.

By GEORGE DARLEY, A.B., Author of a System of Popular Geometry,—Companion to the Popular Geometry,—a System of Popular Algebra,—and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun*.

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

TO NURSERYMEN, HORTICULTURISTS, &c.

PROPAGATING GLASSES—White, 1s. 2d. per lb.,

Green, 1s. per lb., or from 2s. 6d. to 24s. per doz. CUCUMBER-TUBES, all lengths, from 6d. to 4s. each; GRAPE-SHADES, with holes, from 2s. 6d. each; FISH-BOWLS, from 1s. 6d. each; Fish-bowls, for fountains, with hole in bottom, 2s. 6d. per lb.; at ASPLEY PELLATT'S FALCON GLASS-WORKS, HOLLAND-STREET, BLACKFRIARS, where every description of Table-Glass and China is on sale. Days for viewing the Manufactory, Tuesday, Wednesday, and Thursday.

BEE-HIVES.

GEORGE NEIGHBOUR and Son beg to inform their Apian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, situated in the same street. Their selection of Bee-hives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and Son have also Glass Hives and other articles connected with Bee Management, at their Apian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have, Postage Stamps enclosed.

* * * "NUTT ON BEES" (5th Edition), now published.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

MECHI'S ELEGANCIES for PRESENTS and

USE.—The greatest variety for Ladies and Gentlemen, both in price and choice, is at MECHI'S MANUFACTORY and EXHIBITION OF ELEGANCIES, No. 4, Leadenhall-street. Here may be suited the economist or the luxurious. Bagatelle tables, 3l. 10s. to 13l. 10s.; writing-desks, 10s. to 20l.; dressing-cases, 20s. to 100l.; work-boxes, 12s. to 20l.; leather writing-cases, with or without dressing-case, 18s. to 16l.; tea-chests, 7s. 6d. to 8l.; envelope-cases, 10s. to 10l.; inkstands, in wood, bronze, and papier-maché, 6s. to 6l. 6s.; splendid papier-maché work-tables, 10l. 10s.; sets of tea-trays, 8l. to 20l.; work and cake baskets, 25s. to 50s.; card-racks, 26s. to 40s.; hand-screens, 18s. to 48s.; netting-boxes, 25s. to 27s.; card-boxes, 2l. to 5l. 5s.; pole-screens, 4l. 10s. per pair; ladies' folios, richly painted, 30s. to 3l. 3s.; ladies' companions, or pocket work-boxes, in pearl, shell, paper, and leather, at all prices; ladies' scent and toilet bottles, 7s. 6d. to 3l. 3s.; ladies' card-cases, 10s. to 5l.; elegant chess-boards and ivory chessmen, various prices, to 16l. 16s.; watch-stands, 27s. each; gold and silver pencil-cases; elegant cases of seven-day razors, from 25s. to 10l. 10s.; ivory-handled and Scotch strops, in every variety; sporting knives, from 10s. to 3l.; splendid Wharfedale knives; ladies' scissors, 5s. to 50s. per pair; cases of plated and silver desserts, to 25l.; cases of splendid table cutlery, to 40l.; and a variety of other articles; of which catalogues may be had, gratis.—As MECHI manufactures extensively on his own premises, the quality of every article is warranted.—Table Cutlery, Sheffield Plate, &c.

MOXON'S EFFERVESCENT MAGNESIAN APE-

RIENT may be had of all respectable medicine-vendors throughout Great Britain and Ireland, and nearly every part of the civilised world. In all parts it has met with the sanction of members of the medical profession, who recommend it to their patients as the best Family Purgative ever discovered. It is of eminent service in pains in the Head, casual or habitual costiveness, Bilious Affections, Nausea, Sickness, Heartburn, Indigestion, Gout, Piles, Fistula, and as an aperient saline draught in all febrile affections. It is an effectual remedy for derangement of the stomach and head, resulting from excess either in eating or drinking. It possesses all the medicinal powers of the most approved saline Apevents, without the disagreeable taste which distinguishes medicines of that class, and is so agreeable that even children can take it without dislike. Prepared only by BENJAMIN MOXON & SONS, Chemists, Hull. Sold in bottles, at 2s. 9d., 4s. 6d., and 11s. Observe—the genuine medicine has "MOXON & SMITH (then co-partners), Chemists, Hull," engraved on the Government stamp.—Wholesale Agents, BARCLAY and SONS, &c., London.

CAUTION.—Several Perfumers of apparent Respectability, for the sake of gaining a trifle more profit, basely attempt to impose their pernicious compounds upon the public as the real "MACASSAR OIL" for the Hair, and "KALYDOR" for the Complexion. They copy the bills and labels of the original articles, substituting either a fictitious name, or the word "GENUINE" in the place of "ROWLAND'S." To frustrate such imposition, it is necessary, on purchasing either article, to see that the word ROWLAND'S is on the wrapper, as follows, without which none are genuine. ROWLAND'S MACASSAR OIL, for the growth, and for Beautifying the Human Hair. Price 3s. 6d., 7s., or Family Bottles (containing four small) 10s. 6d.; and double that size, 21s. per bottle. ROWLAND'S KALYDOR, for the Skin and Complexion. Price 4s. 6d. and 8s. 6d. per bottle. A. ROWLAND and SON, 20, HATTON GARDEN, LONDON, is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraved on the Government Stamp affixed on the Kalydor. Be sure to ask for "ROWLAND'S" Articles, Sold by them and by respectable Chemists and Perfumers.

PINE PLANTS.—The Advertiser is desirous of exchanging from 200 to 300, or a less number, of good healthy Queen Pine Plants for Orange, Lemon, and Camellia Plants, from 2 to 5 ft. high.—Address A. B., Stedham, near Midhurst, Sussex.

MINIATURE GREENHOUSES of an IMPROVED

CONSTRUCTION. These beautiful Greenhouses can be had of any form and size; round, square, hexagon, octagon, &c., glazed, japanned, and completely fitted up, at a moderate expense.

ZINC FLOWER-POTS. These novel articles are more handsome and durable than the old red clay pots, and the plants flourish with increased vigour, owing to the current of Electricity generated by the Galvanic Circuit of Metal, Earth, and Water.

ZINC GARDEN LABELS in great variety. Garden Hand-frames, Cucumber-frames, &c., &c. All kinds of Horticultural Articles, suitable for Noblemen, Gentlemen, and Amateur Gardeners, on hand, or made to order, at HENRY HEWETSON'S Zinc Manufactory, 57, Cannon-street, London Bridge.

BUTTER MADE IN TEN MINUTES.

BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT.

ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES.

This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Zinc Pans for Churns to stand in, extra. N.B. Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, LEWES.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street.

WARM WEATHER.

Ease and Comfort for the Feet.—HALL & CO., Wellington-street, Strand, London, sole Patentees of the PANNUS CORIUM, or Leather Cloth Boots and Shoes. These articles have borne the test and received the approbation of all who have worn them. Such as are troubled with corns, bunions, gout, or tenderness of feet from any other cause, will find them the softest and most comfortable ever invented; they never draw the feet or get hard, and for warm climates they are found easier and more durable than any other kind of shoes; they resemble the finest leather, and are cleaned with common blacking. Their Elastic Spring Boots are worthy attention; they supersede lacing and buttoning, and effectually support the ankle. The material sold by the yard in any quantity. Any respectable boot and shoe maker may be appointed agent. The much-improved PATENT INDIAN-RUBBER GOLOSHES are Light, Durable, and Perfectly Waterproof.

HALL & CO.'S PORTABLE WATERPROOF DRESSES claim the attention of all who are exposed to the wet. Ladies' Cardinal Cloaks, with hoods, from 18s. Gentlemen's Dresses, comprising Cape, Overalls, and Hood, 21s. The whole can be carried with convenience in the pocket.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener, (Sundays excepted.)

MONEY FOUND.

THE Owner of some MONEY, found last Saturday in the Garden of the Horticultural Society, may have it upon application to 21, Regent-street, and describing it correctly, the expense of advertisements being deducted.

The Gardeners' Chronicle.

SATURDAY, MAY 20, 1843.

	Medico-Botanical	8 P.M.
Saturday, May 27	Royal Botanic (Garden Exhibition)	4 P.M.
Friday, June 2	Botanical	8 P.M.

In the Ratisbon "Flora, oder Botanische Zeitung," for 1843, p. 67, there is a short notice of a critique, by Dr. Hugo Mohl, of Tübingen, on Liebig's Theory of the Nutrition of Plants. It appears that this celebrated physiologist, as well as Schleiden, thinks himself bound to speak out on the subject, "seeing that Liebig's work, by means of his great reputation, and of the boldness with which he gives out his own views as settled truths, is calculated on the one hand to mislead those who are unfamiliar with vegetable physiology, and on the other, to confuse the reader by the opposition of many of his assertions to well-established facts, and also by the many contradictions observable in the work itself."

We have not yet seen Dr. Mohl's pamphlet, which is said to consist of about 60 pages; but we extract the following summary of his conclusions from p. 57 of the work above referred to.

It is the opinion of Professor Mohl, 1st—That Liebig has not used the means at his disposal as a Chemist to investigate the doubtful points in the theory of the nutrition of plants. 2ndly—That in a manner directly opposed to the true investigation of nature, he does not draw his conclusions from a deep research into individual cases, but from general and superficial observations, some of which are altogether uncertain, and from calculations founded upon the most arbitrary hypotheses, which are therefore for the most part deficient in scientific solidity. 3rdly—That his book, far from presenting a consistent theory considered in all points of view, is full of contradictions and inconsistencies. 4thly—That he does not possess even the most elementary knowledge of the organisation of plants. 5thly—That his assertion that vegetable physiologists consider humus as the chief food of plants is not true. 6thly—That his proposition that plants live entirely on inorganic matter is not new, but a disputed question, long since in discussion amongst physiologists. 7thly—That his assertion that all Botanists have considered it doubtful whether plants appropriate to themselves carbon by the decomposition of carbonic acid is untrue. 8thly—That his assertion that plants neither absorb nor assimilate organic substances rests entirely on theoretical speculations, and is wholly unsupported by proof. 9thly—That the whole account given by Liebig of the relation of plants to the atmosphere during darkness is in flagrant contradiction to facts. 10thly—That the assertion that nutritious substances, containing nitrogen, and those without that element, are absorbed in precisely determined proportions, is not confirmed by the chemical analysis of either the seed or plant. 11thly—That the whole theory of Rotation of crops is contrary to experience, and inconsequent in itself. 12thly—That the proposition that plants in summer derive their nourishment solely from the atmosphere is entirely incorrect.

On the other hand, Professor Mohl admits that Liebig has, 1st, In considering the nitrogen of plants as derived from the ammonia of the atmosphere, promulgated an idea which is an advance in science; and 2ndly—as regards the absorption of saline bases, has made it probable that the quantity of them is regulated by the capacity of saturation of the acids formed in plants.

As soon as we have been able to procure Professor Mohl's pamphlet, we shall state the arguments on which some of these conclusions are founded.

In another part of our Paper will be found a full Report of the magnificent Exhibition of Flowers and Fruit which took place last Saturday in the Garden of the Horticultural Society at Chiswick. To those acquainted with these floral gatherings it may appear impossible for cultivation to be carried further than it has been on former occasions; and yet the Chinese Azaleas from the garden of Lady Antrobus, and some of the greenhouse plants, particularly *Pimelea spectabilis*, from Mrs. Lawrence's garden, were superior to anything we have ever seen before.

The day was beautifully fine, the garden crowded with visitors of rank and fashion, and the arrangements for refreshments, under the direction of the successors to Mr. Gunter, everything that could be

desired. Medals to the amount of 250 were awarded, and well were they deserved by the successful exhibitors.

We have in some preceding articles endeavoured to show how the physical condition of our agricultural labourers might be improved by giving them useful and profitable employment. To those who consider the subject in a higher and more philanthropic view, and desire to see the moral condition of the lower orders of society raised in the same proportion as the arts and sciences have raised that of their superiors, it will not be sufficient that the labourer have the means of procuring the common necessities of life, if he have not likewise that moral and intellectual improvement which greatly enhances the value of existence. This must be effected by education and instruction.

The time is past when the fears and prejudices of narrow-minded men could counteract the desire of imparting useful knowledge to every class in society, from the highest to the lowest; and even if there were really any danger to society from a general diffusion of knowledge, it cannot now be avoided. The mass of the people are thirsting for knowledge, and it is in vain to attempt to lock up its sources, even if it were desirable to do so.

But it is of great importance to the welfare of society, as well as to the happiness of the lower orders, that the knowledge imparted to them should be suited to their moral and physical condition; that while they learn that which is really useful to them in their station, they should at the same time be taught those moral and religious principles by which they may steer their course through the storms and troubles of life.

There are few words in our language which are oftener misapplied than the word *education*; and when we speak of the education of the lower orders, scarcely two men attach the same idea to the word: hence many of the objections and scruples which would vanish, if men understood each other perfectly. We have, no doubt, our own peculiar notions respecting the education of the agricultural labourer, and if our readers will have patience with us while we endeavour to explain them, they may probably find in the end that they do not differ widely from us, whatever they may do at first sight.

By education we mean *training*. The French call the breaking-in of a young horse his education; the pointer is educated to show the sportsman where the game lurks by remaining immovable when his scent tells him that the game is before him. When the horse is obedient, and his paces are formed, and when the dog is staunch and steady, they are said to be well trained or educated; their nature and capacity allows of no considerable addition to this education. But with man it is very different: we often find amongst the lowest in the social scale, genius, which requires only to be developed to raise the individual to the highest rank amongst intellectual creatures, but which, for want of opportunity, is buried and lost to the world. It is not, however, to bring forward these rare gems that we advocate general education; it is to fit men of ordinary capacity for the duties which they are called upon to perform—to make the mechanic dexterous in his trade—to teach the labourer to do well whatever he may be called upon to do—to exercise his ingenuity in perfecting the operations he is engaged in, and to perform them with the least fatigue to himself. In those trades which require much skill and practice an apprenticeship is thought indispensable. In agriculture, one would imagine that everything was to be learned by instinct or imitation, and some well-meaning persons regret that boys, by going to school, are prevented from driving horses at plough, and thus in time learning to turn up the soil; as if the true principles of ploughing might not be learnt at school as well as forming crooked letters on a copy-book; or that a boy, become observant and intelligent by what he has learned, would not more readily become a good ploughman than the clodhopper.

We are almost ashamed to have dwelt so long on so self-evident a subject, but we would not be misunderstood; we do not want labourers to be philosophers nor mathematicians, much less controversialists in politics or religion; but we would teach them what is useful, what will enable them to earn an independent livelihood, and, perhaps, to raise themselves by honest industry, into a higher class in society; while at the same time we inculcated those sound principles of religion and morality, without which they can never expect to be happy within their own minds, or respected by their fellow-men.

On this principle we would that the schools established in agricultural districts were conducted, and that while children are taught to read and write, which, in our days, are essential preliminaries in all education, they should likewise be taught whatever may be useful to them, when they come to earn their bread by the labour of their hands. That this is not only practicable, even in the most retired parts of the country, but may even be made profitable to the masters who should voluntarily open such schools, we will endeavour to prove by actual facts; at all events,

such schools of industry, as well as learning, can be maintained at a much smaller cost than our national schools are at present; and, under proper regulations, be much more effective in training intelligent labourers and mechanics.—M.

SANDAL-WOOD, THE ALMUG OF SCRIPTURE.

In a former communication (Mar. 4, p. 132), having given some account of the Sandal-wood and tree, I promised on a future occasion to say something respecting its history. This is at all times a subject worthy of inquiry, not only on account of the interest felt respecting substances which we are in the habit of using, and seeing, or hearing talked about; but also because when a substance can be distinctly recognised, we may, by tracing it as an article of commerce, have it in our power to make our inferences respecting the course of commerce in ancient times, and also respecting the state of civilisation, both of the exporters and importers of articles of luxury.

Sandal-wood, though a produce of the Malabar coast, became early known in different and distant parts of India, and is therefore mentioned by early Sanscrit authors under the name of Chunduna. The common Indian name is Chundun, which the Arabs converted into Sundal, from which we have Sandal-wood. In the time of the Arabs the different kinds of Sandal-wood were well known, and distinguished by the names of red, white, and yellow Sandal-wood, all of which are probably the produce of the Peninsula of India; that is, if we suppose the yellow and the white to be produced by the same tree—*Santalum album*, and the red by *Pterocarpus santalinus* and *Adenanthera pavonina*.

Many substances, the produce of India, found their way, as is well known, to northern nations, at very early periods. Among these we may mention pepper, ginger, and spikenard. India was, in fact, the chief object of early commerce, being reached by caravans from the north, or its produce found its way by ships to the Persian gulf and the Red Sea. Hence we can account not only for the produce but some of the Indian names of the more remarkable substances reaching the Greeks. Among these Sandal-wood does not appear in ordinary authors. Actuarius mentions it apparently as if it was a well-known substance. At a still earlier period, however, that is, at the time of the Periplus of Arrian, who is supposed by Dr. Vincent to have been a merchant of the second century who visited the coast of Malabar, we find Sandal-wood mentioned by the name of Xylon Saggalinon, or Sangalinon, easily corrupted, as Dr. Vincent says, from Sandalinon, as an import at Omana, in Gadosia. Between this and Barogaza, that is Baroach, there has always been constant intercourse. Naqora, Tundia, and Muziris of the Periplus are supposed by Dr. Vincent to be the present Onoor, Borela, and Mangalore, the very places from which Sandal-wood is exported even in the present day, and from which it must have been carried north to Baroach and Omana. Seeing that it was an article of commerce at this early period, the only way in which we can account for its not being more distinctly mentioned is, that it may have been confounded with another fragrant wood, also obtained from India—that is, the Agila, or Aloe-wood. One cannot help thinking, that, growing so near the coast, and being possessed of such remarkable fragrance, it must have attracted attention as early as any other product of India. If we consider also the deficiency of timber both in Arabia and Egypt, and this, combined with the active commerce which seems to have existed at all times in the Red Sea, there must always have been a demand for timber, which must have been supplied from a variety of sources; indeed, in the very same list of imports in which Sandal-wood is mentioned, we find dokon, or squared timber. In the present day timber is exported from Bombay to the coast of Arabia. Forskal states that Saj, Abnoos, and Shishum were different kinds of timber imported from India in his time into Arabia. These are, Teak, Ebony, and Sissoo, the last of which is the wood of *Dalbergia Sissoo*. Teak, he also states, was taken to Egypt for making the keels of ships. That timber may have been imported by the Red Sea in former times seems far from improbable; indeed, in the sacred writings, we find that when Solomon held sway as far as the shores of the Red Sea, in conjunction with Hiram and the Phoenicians, "King Solomon made a navy of ships in Eziongaber, which is beside Elath, on the shore of the Red Sea, in the land of Edom: and they came to Ophir."—1 Kings, ix. 26. "And the navy also of Hiram, that brought gold from Ophir, brought in from Ophir great plenty of Almug-trees and precious stones."—1 Kings, x. 11. In the parallel passage of 2 Chronicles, ix. 21, "The king's ships went to Tarshish with the servants of Hiram: every three years once came the ships of Tarshish, bringing gold and silver, ivory, and apes and peacocks." If with these passages we compare 1 Kings, xxii. 48, and 2 Chron. xx. 35, 36, it is evident that the voyage to Ophir was commenced at the head of the Red Sea, and that the ships went to Tarshish, as well as to Ophir, in this voyage. Hence it is evident that there must have been a Tarshish distinct from the Atlantic Tartessus, and it must be sought for, as well as "Ophir, on either the African or Asiatic shores or islands of the Indian Ocean." Without attempting to enumerate the various conjectures which have been formed respecting the site of these places, if they were more than general expressions for rich and distant countries, it may be allowed to infer that, as a great variety of indubitable Indian products were known to the ancients, as Agila-wood, spikenard, cinnamon, pepper, and others; so it is evident that there must have been a commerce with India at very early times; and to it, therefore, we should look for the cargo of precious

stones, ivory, apes, and peacocks, as well as the gold and silver which they brought, as well as for the Almug, or Albug-trees. The parts of India which were reached at the earliest times were Crocala, now Curachee (at the mouth of the Indus), and Barugaza, now Baroach, in the Gulf of Cambay. These ports are very little distant from, and can easily communicate with, those on the coast of Malabar, and even with Ceylon; and thus we may account for precious stones, cinnamon of Ceylon, and pepper, forming such early articles of commerce. But the merchants who visited the Malabar coast for pepper must have touched at the very ports in the neighbourhood of which Sandal-wood grows, and from which, we have seen, it must long have been exported as an article of commerce. The Ophir and Tarshish of the above passages of Scripture must have been to the southward of the Red Sea, and one of them, at least, we conceive some part of India. From thence the whole of the above cargo might at any time have easily been obtained; it strikes us, therefore, that any wood or tree which formed a part of the cargo and was thought worthy of record, must have possessed some remarkable properties not common in the trees of the Mediterranean region. Sandal-wood forming a straight trunk, though not large, and being close-grained and possessed of such remarkable and agreeable fragrance, could not fail to attract the attention of any merchants visiting the coasts where it grew. As it was equally well fitted for making pillars or terraces, as for musical instruments, so we conceive that there is no other tree better entitled than the Sandal-wood, to be the Almug of Scripture,—“the king made of the Albug-trees terraces (pillars, 1 Kings, x. 12), to the house of the Lord, and to the king's palace, and harps and psalteries for singers; and there were none such seen before in the land of Judah,”—2 Chron. ix. 11. Sandal-wood, from its texture and agreeable odour when handled, is well calculated for making musical instruments. It is less used for such purposes in the present day, because, being expensive, and not very ornamental, its peculiar property, that of fragrance, is of little value, on account of the polish with which fashion requires that all instruments should now be covered. Though this does not amount to proof, yet probability is in favour of the Almug being Sandal-wood, as it has been supposed to be by Celsius and others. The principal difficulty with regard to its being so is from the name, Albug, occurring also in 2 Chron. ii. 8, when Solomon asks of Hiram, king of Tyre, to send him “also Cedar-trees, Fir-trees, and Albug-trees, out of Lebanon.” Hence it has been supposed to be a produce of that mountain. But Rosenmüller has justly remarked that in the parallel passage in 1 Kings, v. 6, 8, 10, there is no mention of Albug-trees, but only of Cedars and Firs; and he therefore infers that the addition of Albug-trees in the later passage, that is, in the book of Chronicles, appears to have been the interpolation of a transcriber.

ON VEGETABLE MANURES.

(Continued from page 284.)

Lime-Leaves.—100,000 parts of green air-dried Lime-leaves contain of mineral substances:—

260	parts of silica
4,786	“ lime
500	“ magnesia
1,552	“ potash
198	“ soda
48	“ alumina
162	“ oxide of iron and manganese
81	“ sulphuric acid
680	“ phosphoric acid
224	“ chlorine

8,491 parts of mineral substances.*

Although when the Lime-leaves are ripe, the greatest part of their potash, soda, and chlorine, have disappeared, or have been carried off by water; still lime, magnesia, and phosphoric acid, remain behind; on which account Lime-leaves are preferable to Oak or Beech-leaves, as litter. 1000 lbs. of green Lime-leaves contain (according to Boussingault), 32 lbs. of nitrogen, and, consequently, the ripe leaves must also contain a great amount of it.

Besides these three sorts of leaves, those of Elms, Birches, Ashes, Yoke-Elms, Poplars, and Willows, are used as litter. They all are more rich in lime, magnesia, and phosphoric and sulphuric acids, than the straw of the Corn-plants; and as they probably also contain more nitrogen, it follows that they are preferable for litter.

Fir-leaves.—Although most of the Fir and Pine-leaves drop in winter from the trees, they also fall to the ground in other seasons, especially during strong gales or heavy showers; which is to be taken into account when they are to be used as litter.

100,000 parts of green air-dried Fir-leaves contain of mineral substances:—

836	parts of silica
1,290	“ lime
78	“ magnesia
440	“ potash
196	“ soda
16	“ alumina
1	“ oxide of iron and manganese
74	“ sulphuric acid
192	“ phosphoric acid
27	“ chlorine

3,150 parts of mineral substances.

* The reader is requested to observe, that in former papers the proportions of parts, by the misuse of dots for commas, have been made to appear like decimal quantities instead of whole numbers. This requires correction through several previous articles.

Ripe Fir-leaves contain a greater proportional quantity of potash and soda than other dry leaves, because their resin protects them against the extracting power of water. The amount of nitrogen they contain is unknown, but is, probably, trifling.

A comparison of the mineral substances contained in the leaves of Coniferæ with those of other forest-trees shows that they are inferior to the latter as a litter; because if 3000 lbs. of Coniferous leaves are brought (mixed with dung) on one Magdeburg acre of land, it will derive from them only 39 lbs. of lime, 6 lbs. phosphoric acid, &c.

In some countries as, for instance, in the Tyrol, Styria, Corinthia, Franconia, Switzerland, and the Black Forest, the small twigs of Firs, with their green leaves, are used as litter for horned cattle. The manure thus produced, must possess some advantages over that obtained from dried leaves, as the green ones are richer in potash, soda, and chlorine, than the ripe ones.

Pine-leaves.—100,000 parts of green air-dried Pine-leaves contain of mineral substances:—

175	parts of silica
504	“ lime
120	“ magnesia
297	“ potash
264	“ soda
60	“ alumina
5	“ oxide of iron and manganese
49	“ sulphuric acid
240	“ phosphoric acid
30	“ chlorine

1,744 parts of mineral substances.

This small quantity of mineral substances found in Pine-leaves renders them a less valuable manure than Fir-leaves, even supposing them not to lose potash and soda in the course of ripening. Nevertheless, the litter of Pine-leaves is of the greatest agricultural importance in many sandy tracts of Germany. They supply the soil with all the substances required for vegetation; and by their quantity they make up for their bad quality. In those districts the farmers manure their land every two years with this sort of leaf-dung, and thus the arid soil is supplied with the requisite amount of humus. The quantity of nitrogen which Pine-leaves contain is not ascertained; it is probably greater than that of Rye-straw.

Fir, as well as Pine-leaves, decompose with great difficulty, owing to their woody texture and resinous quality. It is therefore necessary to let them lie (mixed with animal manure,) either in the stable or the dung-hill, until they are rotted. It is better still to put them, when moist, in large heaps, where they may heat and be partially decomposed; after which they may be used as litter. If this precaution is not taken, the leaves will remain two or three years in the soil without alteration; and this, probably, explains why, in some parts, a bad opinion is entertained of manure obtained from the leaves of Coniferæ.

It is asserted that the leaves of the Larch yield better manure than those of Firs or Pines, which I cannot decide, as I have never experimented upon them.

Amongst the vegetable substances or remains which are used for the absorption of animal excrements, or as litter, besides the above-named, many others are largely used in different countries; the principal are Heath, Turves*, the so-called forest-litter, the Whin and Black-berry, Ferns, Mosses, the refuse of Flax and Hemp, and Bull-rushes. Some of them yield a better, others a worse manure than straw, as will be seen by the following statements:—

1.—**Heath** (*Erica vulgaris*).—In some parts of Germany Heath is the only material used for litter; but a hundred years hence, it will scarcely be employed, now that heathlands are brought more into cultivation. It contains much wax and tannin, and as its texture is very woody, such manure will lie for years in the ground, if not properly prepared previous to being ploughed in. It therefore ought to remain for a long time either under the cattle or in the dung-hill.

100,000 parts of young air-dried Heath contain of mineral substances:—

582	parts of silica
518	“ lime
164	“ magnesia
94	“ potash
200	“ soda
45	“ alumina
53	“ oxide of iron
90	“ oxide of manganese
102	“ sulphuric acid
15	“ phosphoric acid
95	“ chlorine

1,958 parts of mineral substances.

Hence it follows, that, although Heath does not furnish the best litter, still it is preferable to the straw of Cerealia, as it is richer in lime, magnesia, potash, soda, and chlorine. Rye-straw used as litter acts the first year of its being used, as its decomposition is very quick; whilst Heath being woody, and decomposing slowly, affords a durable and protracted nourishment. The decomposition of Heath is retarded by its wax and resin, of which it contains 6 per cent. To destroy these substances, and to soften the woody texture, it is advisable, previous to being used as litter, to throw it into large heaps, where it may heat; by which means, the tannin (so very noxious to growing crops), of which Heaths contain perhaps from 4 to 5 per cent., will be destroyed.

Heath is preferable to Rye-straw, also, on account of its great quantity of nitrogen, which, although its amount has

* Name of a piece of green turf or Heath, cut out with a sharp iron instrument.

not yet been ascertained experimentally, will be greater than that of ripe Rye-straw, as the former is always cut green. Heath is especially valuable in sandy districts, where fodder is scarce and all straw is used for the food of cattle. Heath supplies the scanty sand with humus, thus maintaining it in a more humid state.

Heath is best sown as litter for sheep, for it will most easily decompose when the manure remains for a long time. But in such cases, straw should be frequently placed upon it, otherwise the wool may be injured.

The four-leaved Heath (*Erica tetralix*) is said not to be such good manure as the common Heath; this I cannot decide upon, not having analysed it. It is known that cattle will not eat it, but this does not prove it to be bad manure, because the Lupine is also rejected by cattle, although one of the best manures.

With Heath are also collected the Crowberry (*Empetrum nigrum*), the Sweet Gale (*Myrica Gale*), and the Andromeda polifolia; and it is probable that these three plants form even better manure than Heath itself.

(To be continued.)

'AMATEUR'S GARDEN.—No. XX.

Few plants are more generally attractive, or, when well cultivated, more deserving of a place in the greenhouse of the Amateur, than the *Hydrangea hortensis*; and it would be difficult to name a greenhouse-plant which at this season is so admirably adapted for a bed in the flower-garden. In its natural state, with delicate pink flowers, it is very beautiful; and when changed by art to the soft cerulean blue of a cloudless sky, it is still more lovely. Many of the readers of this Paper have seen and admired the noble specimens of this plant exhibited at the Horticultural Society's and other fêtes, and as a short detail of the treatment they receive may not be uninteresting, I subjoin it.

The cuttings are taken off the plants when about an inch long, which in plants forced into flower at this season is generally about the middle of February. They are taken off close to the old wood, and when trimmed and inserted in cutting-pots filled with light sandy soil, are immediately plunged in a close moist heat, in which they root with great freedom and rapidity. Being rooted, they are potted singly into small sixty-sized pots, in a rather strong turfy loam, using the turfy parts only; and as often as they require it, are re-potted into larger pots, until they reach 32s or 24s, in which they are left to flower.

From the time of potting up to the end of July they are kept under glass, but are regularly attended with water, (occasionally manure,) and as much exposed to the full influence of the light as possible; the objects being to keep the plants dwarf and to get as great a quantity of highly-elaborated sap deposited in the plant, and the flower well formed and the wood perfectly ripened before the winter season. After July, they are placed at the foot of a south wall, and exposed fully to the sun, gradually withholding water as the leaves begin to assume the autumnal tint, and keeping the soil only sufficiently moist, to prevent the roots being dried up after the leaves have fallen. By this season, if properly attended to, the terminal bud will be as thick as strong Asparagus; and the only care during the winter, will be to keep the buds free from damp, which may be effected by placing the plants on a dry airy shelf in the greenhouse, or in a dry shed, and covering them with kiln-dried fern, or straw.

This is the process of management the first season; in the second, the first plants should be introduced into the forcing-house in January; the second the middle of March, and the third be allowed to break naturally: this will give a succession of flowers from April until November, which may be used either for the decoration of the greenhouse or flower-garden.

After the first crop has flowered and the wood is pretty firm, say the middle of June, the plants are cut down to within two joints of the root, and the soil shaken from them; they are then repotted into small pots, and afterwards treated as in the first season; only observing to retain three or four branches instead of one, and to give the plants a 16 or 12-sized pot at the last shift; they may then be forced the third season, and will make splendid plants for the flower-garden.

It is singular that the *Hydrangea* never makes a root into fresh soil during the time it is in bloom, and it is from this reason that many are disappointed in obtaining blue flowers; because the plants have not any roots in the new soil, and therefore cannot extract the matter from the soil necessary to the chemical change which the juices undergo. I believe all fresh soil containing oxide of iron will produce blue flowers, providing the plants are grown in it from the cutting-pot, but the same soil will have little or no effect on old plants.—W. P. Ayres.

HOME CORRESPONDENCE.

ERRATUM.—Article on *Rose-budding*, p. 317 b, for “bast-bound” read “back-bound.”

Drainage.—In your last Paper, I perceive a letter signed “J. S. F.,” which speaks of an ineffectual principle of under-drainage, practised on the clay-lands of Gloucestershire, and in which he deprecates the use of any part of the retentive soil for covering in such drains. Having individually practised with unvarying benefit, for several years, the principle of Pearson's under-drainage, both on arable and pasture-land, to the extent of near six hundred acres; laying the Pearson plough-drains at half-rod distances apart, on the arable land, and varying the separation of the drains on pastures, according to circumstances, I take leave to recommend to “J. S. F.” and to all Gloucestershire clay-land owners and occupiers, to purchase a short pamphlet, written by Mr. Hodges, of

Hemstead, near Cranbrook, in Kent, and published by Messrs. Ridgway, Piccadilly, for that experienced cultivator (at the cost, to purchasers, of one shilling), being myself convinced that if the Gloucestershire clays are not infested with surface-stone, or materially commixed with veins of shrove and sand, that the Pearson drainage might prove of great advantage in that county, as well as in the wealds of West Kent, and of Sussex; in which latter I have put Mr. Hodge's opinions and recommendations into practice, and found them verified to the letter; and I am glad now, and not for the first time, to testify my thanks to that gentleman for the pains he has taken to benefit clay-land farmers, by making known the principles of Pearson's effectual, reasonable, and enduring Drainage (beyond calculation as to time); and in so saying, I feel it but justice to speak of Mr. Pearson and his invention in the highest terms, not forgetting his disinterestedness in letting the public have knowledge of it, without any patent obstruction. This has induced several liberal gentlemen of Kent, and some few of other districts, to subscribe towards making some slight remuneration to the inventor (a tenant of Lord Amherst,) and which, in justice, is an example that should not be lost upon other landowners, who may put the principle in practice successfully. I shall now add the following proofs, which have recently reached me, from an agricultural friend in Sussex, being dated May 12, 1843:—"We have been sadly wet under the South Downs; I was at my farm on Wednesday, and saw the land-drains run faster than any day during the winter; but I was pleased and surprised to see the Wheats look so well, where I followed your advice, and drained the clay well; it looked beautifully, and so does Mr. H—n's, at W—k, where it was under-drained." To say more, in fact, of the Pearson Plough Drainage in this address to you, or to the cultivator of land who may be open to practical information, is quite useless, after recommending Mr. Hodge's Pamphlet, wherein will be found full and clear instructions, with calculations of cost, &c. I differ only in one point with the pamphlet, viz., that I have found more main-drains (made with tiles,) and outfalls requisite to carry off the water from the plough-drains, to prevent their occasionally breaking up from too great accumulation of water during heavy rains—my mains being twenty rods apart in general; and it is well to observe, that the drain-tiles should be laid with the open part uppermost, laying a sole, or flat tile thereon, instead of in the common mode. In support of these statements I do not hesitate to give you my name, although declining to make it public.—*A Clay-Land Farmer.*

—Your correspondent signing himself "J. S. F." seems somewhat sceptical as to the efficacy of clay-draining, in removing the water from the surface of the soil. This system, so extensively practised in Gloucestershire, is not confined merely to localities requiring "the cutting through springs," but is used on all stiff pasture-land, where the water, from rain or snow, rests on the top. The object of draining is not to preserve the soil from moisture, so essential to all vegetation, but it is to prevent the fluid becoming stationary, and thus rendering the land cold and sour. Superficial furrow-draining may be very well where a better system cannot be acted upon, but it is a poor substitute for the usual method. Drains, to be of service, are recommended to be made three feet deep, in order that the ground should not be dried and parched during the summer months. In performing this work with tiles, we seldom see a layer of stones placed directly upon them, for two reasons: first, the great increase of expense, and secondly, it is not considered to be of sufficient advantage to justify the outlay. In five cases out of six, the tiles are laid on the smooth clay, the joints being secured with the same substance well pressed all round them, which has much the same effect as the clay drain, relative to its being impervious to water. In making the latter, it must be recollected that the trench is in the shape of a wedge, and that there are only about six inches of worked clay over the drain, forming an exceedingly strong arch; the lower part being smaller than the upper, and the remainder of the excavation being filled in loose. I am not surprised that "J. S. F." should be slow to believe in the benefit to be derived from clay-draining pastures; I was myself rather doubting, (although I was shown land on which the experiment had been made,) until I tried it on a patch where no under-ground spring existed; indeed, I should have been too happy to have found one for domestic purposes, and for the benefit of my garden; yet the surface was always wet and spongy after rain, from the impenetrable nature of the soil; but since I have clay-drained it, the herbage has improved and the pound become dry and sweet. Draining land is of incalculable advantage to the farmer and gardener, saving manure, and returning almost cent. per cent.; at the same time it may be overdone. It should always be borne in mind that the grand object in draining is not to take up the land, but to allow the superfluous water to subside; always keeping in view the moisture necessary to insure good and healthy crops. However strange it may appear to some of your readers, the fluid does, in a wet season, filter through the clay-drains in a copious manner, and they become perfectly dry when the summer is not rainy. No doubt there are many of your Gloucestershire readers, who have had an opportunity of witnessing the plan under discussion, and I trust some of them may be induced to give an opinion, from observation, on the matter: one practical remark is worth a dozen theoretical on a question of such importance.—*W. W.*

Elm-planks.—In your leader of May 13, you say "Elm is much less greasy than Fir." I beg to state that I have often seen Elm as well as Fir-planks used at the same time for wheeling upon. The least rain or frost always caused the Elm to be both greasy and slippery,

while the Fir ones were always preferred by the workmen, being the best in wet weather for keeping a secure footing upon.—*G. D.*

Manures.—The inquiry in your Paper respecting "sugar-bakers' scum" as a manure has brought to my recollection that many years ago a neighbour of mine (who is since dead) tried the "scrapings of a sugar-baker's floor" upon some grass-land, the effect of which was visible for several years after. The crop the first year was a very heavy one, but exceedingly coarse and rank, and of a very deep green colour. I should therefore advise, "J. O. U.," if he tries it, to do so sparingly.—*F. H. S.*

Scotch Farming.—For the information of "A Subscriber," at page 317, I beg to say that the nine quarters and a bushel of Wheat per acre, over a field of thirty acres, was realised in 1826, which was decidedly the best Wheat year in Scotland for a long period—say thirty or forty years. He must remember, also, that our acre is equivalent nearly to 1½ statute acre. Cambus is situated upon the north side of the Forth, five miles east from Stirling, and three west from Alloa. The soil is excellent Carse-soil, but not better than much hereabout. Mr. Mowbray was a distiller, and fed great numbers of cattle, whose urine he collected in a well, made for the purpose. He was also an active and intelligent farmer, who was in the front-rank of his class, and would have had good crops though he had not been a distiller, but being this, he turned everything to advantage. The number of times the field was watered with the liquid manure was twice; once about the end of March, and the other time before the middle of May. The same may be said of the field of Hay. It will be recollected that 1826 was a very dry year, so much so as to have obtained the name of the dry year; consequently, the liquid manure told with better effect. After the 1st of May, which was very snowy, followed with hard pinching frost at night, the Wheat crop never got a shower. With respect to the proportion, I cannot speak with perfect accuracy, but it may be guessed at from the nature of the cart: I believe it to have been liberal. The cart contained a large barrel, which was filled at the well; this barrel emptied itself into a long narrow box at the back end of the cart. The box, so far as I now remember, stretched across the cart as far as the outside of the wheels, and was pierced with holes in its bottom for the emission of the liquor. The horse went at an ordinary working pace. Mr. Mowbray died some years ago, but his son succeeded him, and, for anything I know to the contrary, is as enterprising and successful a cultivator as his father was.—*Not a Scotch Farmer.*

Bees.—I find that Mr. Wighton has either misread or misrepresented the statement of an experiment which was in my last communication. He says, "The experiment of putting a headless swarm into a hive to make the Bees create a queen by changing the gender, shows, I think, that 'Pettigrew' does not quite understand the subject he has taken up." I will not retaliate, but merely state here—I am constrained to do so—that I did not say anything about putting a headless swarm into a hive; and I dare say that most readers understood me to mean that the Bees were not to be left headless till the queen had laid eggs; that those eggs are destined to be 21 days in the cell; and that the Bees, as soon as they lose their queen, put around one, two, or more of them a gelatinous substance that metamorphoses them into queens in 14 days. Nor does this experiment differ from one which I, two years ago, asked Mr. W. to try, which he says he did in August with success. I shall now rectify two or three of Mr. Wighton's mistakes, that may lead inquirers astray. He says, "Bees' eggs are not hatched by incubation; the warmth of the hive alone brings the larvæ forth from the eggs." The warmth of the hive alone does not hatch eggs; nor yet does the warmth of the Bees hatch eggs that are not set upon. I shall give proof that will bear out my assertion, if Mr. W. desires me to do so. In another communication he says that "Queen Bees live four or more years, and common Bees one season." Queens, generally speaking, live four years, but never more: some prolific ones live but three years and two months. I say prolific ones, for there are good and bad ones, as we call them. No Bee-keeper ought to keep a three-year-old queen. Common Bees live nine months only. Hence it is necessary to select in autumn those as stock hives that have bred well in July and August. With a view to the writing a complete practical concise treatise on Bee-management (which I have not time to do at present) for the *Gardeners' Chronicle*, I wrote to the person who manages the apiary, in which I, when a lad, spent much of my time, for an accurate statement of what his Bees did in 1842. He says, in answer, "Our Bees did well last year. The best top (first) swarms gathered fifty pounds in the month of August alone. The produce of one swarm was 110 pounds of run-honey." Upon perusing these citations, some Bee-keeper may say, "This is an enormous quantity—my Bees do not produce so much. Wherein lies the secret?" Almost wholly in the size of the hives! The hives which are used in the apiary alluded to are three-fourths or four-fifths larger than the largest that is within 15 miles of London. I hesitate not to say that Bee-keeping will never be a profitable concern as long as Bees are in those small basin-sized hives. Mr. Wighton says, "Small hives produce early swarms." If we were to inquire what is the reason, he would answer, "Because they are more easily filled;" forgetting that large hives have Bees in proportion to their size, and are, indeed, as soon filled as small ones. Happily he neutralises his own assertion at the same place, by saying that he has "ample proof that Bees will throw swarms, whether their hives be full or not;" which, strange as it

may appear, is also gratuitous. I shall now point out a few advantages that may be derived from a knowledge of the transmutability of Bees' eggs. In doing so, we shall find that Mr. Wighton speaks with too much precipitation in saying that "the practical Bee-keeper may be assured that the knowledge of it will neither add to nor diminish the produce of his hives." As soon as the owner of the apiary of which I have spoken found that Bees could make queens at will when there were eggs in the hive, he invented a system of artificial swarming, which he practised for the space of 30 years with great success, having in one year realised nearly 100 pounds from his apiary—working from 6 in the morning till 6 in the evening elsewhere. The system may be thus stated:—As soon as the hive is pretty full, two-thirds of the Bees and the queen are taken away and put into an empty hive. The Bees that are left in the old hive make queens for themselves. Thus, swarms are prevented from flying away; Bees are prevented from lolling in clusters before swarming, which, when allowed, is an absolute loss; and the cottager can go to his work throughout the week with an easy mind, without hazarding any loss. By this system more second swarms are obtained than by the natural system; for after the Bees have lost their queen, they put eggs into two or more royal cells at one time. Those who keep small hives find it to be unprofitable to take more than one swarm in one year. The artificial system has many advantages over the natural system. One more I shall notice. Twenty-one days after the first swarm is taken off there are no brood in the old hives but a few drones, drones being 24 days in the cells. The Bees have bred queens; but queens are 10 days out of the cells before they commence to lay. Well, then all the Bees are taken from those hives that are above 40 pounds' weight, and put into empty hives. The honey is taken from the old hives, sent to market at an early season, and sold for a high price. In natural swarming the queens are set some time before the old ones go away, and are therefore laying before all the old brood is out.—*A. Pettigrew, Wrotham Park.*

Hawthorns.—I should be glad if you or any of your correspondents can explain the following circumstance, which has occurred in a garden about 2 miles from the city of Chester. Several Hawthorn-trees, which have hitherto borne most beautiful scarlet blossoms, are this year quite white. There are no Whitethorns near them, and the soil in which they grow is good black soil, upon a bed of sand.—*A. B.*

Parsley.—Parsley-seed, which generally lies long in the ground, is made to grow rapidly by sowing it in the following manner:—Dig a patch of ground, turning the soil over to the depth of twelve inches, break it well and level the top. Strew the seed thinly on the fresh earth and sift about half an inch thick of rich compost over the whole. In this manner Parsley will appear in the course of a fortnight or three weeks at the latest. I find that all seeds when treated in this manner vegetate quickly; and many of those which are supposed to require a hot-bed may be thus raised, with the advantage of not being drawn, having a more healthy appearance, and being more easily transplanted. It is a great mistake to sow any kind of seed too thickly, it is exceedingly injurious to the rising family, whose growth is sadly impeded for want of nourishment. Scarcity of food at an early period is too plainly shown in after life by a long unhealthy stem, producing yellowish-green leaves and stunted flowers. The effects of over-crowding is beautifully illustrated in the Mignonette: observe the difference between plants from seed sown in a pot or box and that luxuriating in a border; the former is thin, lank, and emaciated, whilst a single plant will in the latter case cover more than a foot square.—*W. W.*

On Boiling Vegetable Marrow.—The proof of the pudding is said to be in the eating. You recommended last week that this vegetable should be cut, cooked, and eaten, when not exceeding 3 inches in length. This, I submit, is a matter of taste. I have tried it 4 years, and prefer using it when 8 or 10 inches long, as it is then more mealy. Let your correspondents who are fond of the vegetable try my plan as well as yours:—Cut it when about the size I mention, peel off the rind, cut it down the centre in four pieces, take out all the seeds, boil it in the same way as Asparagus, and serve it up on toast, with white sauce instead of melted butter. My notion is that, at the above size, it is as superior to your "not exceeding 3 inches" as a good mealy Potato is to an early-forced soapy-flavoured one.—*Chemical Jack.*

On Preserving Apples.—I tasted some Apples on the 10th inst. as fresh as when picked off the tree; and found from my friend, at whose house I was dining, that he had preserved them in sand (not sea-sand) in boxes. They were carefully wiped before put in, and the sand was perfectly dry.—*A Tivy-side Subscriber.*

Clay-burning.—In the *Gardeners' Chronicle*, May 6, page 303, you give an account of the method of burning clay for manure, yet you make no comment on the most extraordinary part of the process, and one which is well worthy the attention of the chemist. I mean the marvellous appearance of combustion carried on without fuel. The small quantity of coal or brushwood used at first kindling of a kiln must of course be completely consumed in a few days or a few weeks; yet the fire continues unabated for months afterwards, with no addition except the lumps of pure brick clay which are thrown on the top of the kiln. Your informant expressly states that "after a kiln is fairly set a-going, no coal or wood or any kind of combustible is necessary, and it can only be extinguished by inattention." Here then is a marvellous paradox—a fire kept up month after month without fuel. How is it possible to account for this?—what can the

combustible matter be? I hope in an early Number to see an answer on this point, which I have no doubt must have puzzled many others besides myself, and of which I have never been able to obtain any explanation, though I have observed the process for years. It is to be observed that the clay itself seldom contains any carbonaceous matter, and that the sods are not thrown on the burning mass, but are exclusively used to form the walls of the kiln, so that the vegetable matters contained in them can in no degree be efficient as fuel.—*Phlogiston*. [We are unable to solve this problem, if, as our correspondent states, there is really no organic matters present in the clay; but we suspect there is, although they escape observation.]

Pronunciation.—My reason for mentioning "Anemone" was, that (as it is universally mispronounced) it affords a warning to modern nomenclators not to add to vulgar errors. Though the Professor, speaking *ex cathedra*, could not be charged with pedantry for calling it Anemōne, I yet doubt whether even he would ask a shopman, to whom he was not known, for a pound of double Anemōne roots. I was fully aware of the word being classical. Perhaps it is not generally known that "Dog-rose" is classical too—Theocritus, as my Gradus informs me, using it, at least the expression *κυνοσβατος*—in the very same line with *ανεμώνα*. It may be said that Dog-rose is not the strict equivalent, though it is with *κυνοσβατον*; but whether the latter word occurs in any respectable author, or has been coined for the Anglican market, you can perhaps inform.—*Salopian*.—[The earliest trace that we find of the latter word is in a Latin form. Valerius Cordus, a writer who flourished in the beginning of the 16th century, has a *Cynorrhodos*, which is said to have been the modern *Rosa arvensis*; but we do not know the word at all in a Greek dress.]

The Douglas Fir.—Among your answers to Querists in last Number of the *Chronicle*, is one to "H.E.B." on the fruiting of *Abies Douglasii*; in which you observe it is supposed to have fruited for the first time at Dropmore, about two years ago. I beg to state that there is at Ashted Park, the seat of the Hon. Colonel Howard, a seedling plant about 6in. high, from seed gathered from a plant growing there in 1840. At that time seed enough was obtained to sow a bed of about 4 square yards, and that solitary plant is all that vegetated. Early this spring Mr. Hislop sowed several seed-pans, with seed gathered last autumn, not one of which has yet appeared, though the seed looked good. At this moment the tree which was planted in 1835, and has grown vigorously, is full of young cones, and looks beautifully.—*Queous*.

On Keeping Apples.—I have at present some Apples in my store in a perfectly sound condition, although they are not of a kind reputed to be good keepers. On former occasions I have tried various plans to preserve this valuable fruit, but never succeeded so well as I have done the past season. In order that others may benefit by my experience, I take this opportunity of informing my brother amateurs of the system adopted. I hand-pick the fruit before it is quite ripe, and after rubbing it over with a towel, I deposit it on shelves in a large cupboard, with closed doors, constructed so as to exclude all light. The shelves, having a rim about 1 inch in height all round, to prevent the Apples tumbling off, are about 6 inches apart, and made to slide in and out for the convenience of sorting. The Apples are placed so as not to touch each other, and rest on the eye; I have sometimes left them a month in this way without looking at them, and although during that time one or two may have shown symptoms of decay, the contagion has not spread in the same manner that it does when they are packed in layers with straw in open frames, or exposed to the light without any covering. It would be very satisfactory if one or two of your readers would experiment on the foregoing plan, and report the result. Darkness, and protection from frost, appear to be the merits of the wooden press as a conservative.—*W. W.*

Asparagus.—The method of growing Asparagus by inverting a bottle over the head when it first appears from the ground—intended to produce a head something like a Cauliflower—was tried by myself with as little success as seemed to attend the experiment elsewhere. Bottom-heat is, I think, required; perhaps some of your correspondents have tried the plan in a frame over a hotbed, and can speak more definitely on this point. The circumstance connected with it that I wish to communicate is this:—Late last season, I cut the stalk, over which the bottle was inverted, and which had grown to such a size that it was impossible to move it without breaking the bottle. I thought no more of the matter; but am at this time surprised to find that the first head from the same crown is at least three times the size of any other on two large beds. What is the reason of this? As a correspondent lately inquired whether salt would injure the heads now growing, I beg to add that I have applied 2 stone of salt to a surface of 12 ft. by 4 ft.; especially selecting some young growing heads, and almost encasing them in salt. I applied it so lately that I see, and expected to see, no improvement in the size and quantity of the heads; but it assuredly did no injury to the growing ones, while it completely destroyed the weeds, of which the bed was full. It is evident that there is little to be feared from an over-application.—*Cepophilus*.

Verbenas.—Many persons, who have no greenhouse, complain of the difficulty of preserving the Scarlet Verbena (*Melindres major*) through the winter. Let them, in summer, take up a root with all its runners, (scarcely missed out of a large patch,) plant it in a pot, and train it upright against a twig of Elm, which throws out its lateral shoots so as to present a plain surface. This will form an elegant flowering plant till November

in the room; and from it (if still kept there) abundance of cuttings may be taken in the ensuing season, and afterwards the stalks may be laid on the ground horizontally, some mould sprinkled over, and a handlight superadded, which will strike in many places. I have tried this plan with a small plant this winter, and have about 34 from it at this time, besides the parent root.—*Cepophilus*.

Cucumbers.—The following system of growing early Cucumbers is practised by Mr. Barton, the gardener at Springfield, near Liverpool:—They are grown in a pit of forty-eight feet in length, by ten feet wide, heated by a common flue. A bark-bed of four feet wide is filled to two and-a-half feet with fresh tanners' bark; upon this a thin layer of rotten dung is placed, upon which is put a layer of the top spit of a piece of pasture-land, broken fine with the spade. This brings the surface of the bed to about two feet from the roof of the pit. The plants are fastened to stakes till they reach a trellis which is fixed six inches from the glass; upon this they are trained in a neat manner. Mr. Barton commences forcing the latter end of January, and very little air is given during the growth of the plants. If it is found requisite to admit air, it is done early in the fore part of the day. The temperature is made to range from 75° to 80°, as near as practicable; and the plants are syringed early in the morning and again in the afternoon. By this method fruit are cut by the first week in April. Mr. B. prefers the top spit of pasture-land a twelvemonth old, to the most richly-manured compost. The kind of Cucumber grown is the Kenyon. This sort is preferred by most of the gardeners in the vicinity of Liverpool, for early forcing.—*J. A.*

Figs.—Seeing that there are still a good many inquiries through the *Gardeners' Chronicle* about growing the Fig-tree, I send you my mode, which has succeeded quite to my satisfaction. I get small arches turned in the back-wall of a Peach-house, so that the roots have liberty to get into the border on the north side. I planted two trees, which were very small, about 4 years ago, and I got 60 well-ripened fruit last summer. I have at this moment 200 figs on the same trees, of a good size and colour, which I think are likely to do well. I give them the same treatment as I do the Peach-trees.—*J. M., a Gardener*.

State of Gardening.—Adam Smith's "Wealth of Nations" is generally looked upon as the text-book of political economists; but how far he is right in all that he has advanced, I will leave it for others to decide. In book 1st, chapter xi, he states that Gardening is not a profitable employment; he refers, I think, to market-gardening, and says, "The circumstances of gardeners, generally mean and always moderate, may satisfy us that their great ingenuity is not commonly over-recompensed. Their delightful art is practised by so many rich people for amusement, that little advantage is to be made by those who practise it for profit; because the persons who should naturally be their best customers, supply themselves with all their most precious productions." He goes as far back as the days of Democritus, to prove that it was not profitable to inclose a kitchen-garden; he also quotes from Columella and Palladius on the same subject. But from the account given of Garden Husbandry in the "Penny Cyclopædia," it would appear that it is not quite so bad as it is represented by Smith; but I do not know whether he referred to the kale-yards of Kirkcaldy or the gardens of the Metropolis. The author of the "Wealth of Nations," in another place, says, "In a hop-garden, a fruit-garden, a kitchen-garden, both the rent of the landlord and the profit of the farmer are generally greater than in a corn or grass field; but to bring the ground into this condition requires more expense." And from other statements that are made, one would be ready to conclude, that there is little difference between the profits of a grass-field and that of a kitchen-garden of the same size. In the "Cyclopædia" it is stated that "the profits of a garden near London, of the extent of ten or twelve acres, are as great as those of a farm of ten times the extent, cultivated in the best manner, without the help of purchased manure." In another part of the same article, it is said, "And many a man from a very small beginning has, with a moderate share of judgment and prudence, raised himself to independence, if not to affluence." From these statements surely we may believe that the condition of gardeners has improved since the time that the "Wealth of Nations" was written. Does it proceed from an increased knowledge in the cultivation of what the garden produces—or is there a greater demand for the articles cultivated?—*Peter Muckenzie*.

Kitchen Garden Economies, No. 2.—By cutting off Lettuces immediately above the life-knot instead of pulling them up by the roots, when wanted for table, a single or at most two sowings will suffice for the year. The root will soon send out a crop of shoots, which are just as good as those first taken; but they require to be used before they become large, as they are apt to run up and flower.—*Sprouts*.

Kitchen Garden Economies, No. 3.—Where room is scramp,—that is, where there is room for more, it is not a bad plan to mix Onion and Leek seed together, and sow broad-cast; then to thin out the Onions by taking up the Leeks and plunge them as deep as you please in a fresh bed prepared for them.—*Sprouts*.

Bees.—As a remedy against the effluvia arising from the dirt collected in Beehives, "W. W." states, in the *Chronicle* for April 29,—"Let a drawer be attached to the ordinary wooden hives about an inch in depth, which may be removed, when required, for the purpose of cleaning; to prevent the combs being cemented to the drawer, a light frame-work may be constructed and placed over it, with apertures about an inch square." This may appear a very good plan, but if the entrance is above the "frame-work," it would be a very unfit floor for the traffic of

the Bees; if otherwise, the frame would in some measure prevent the egress of the Bees, who seldom or never cement their structures to the floor of their dwelling, but leave a small space to afford free access to the divisions of combs. If the drawer was less than the space, say $\frac{1}{2}$ an inch, the frame might be dispensed with; but when we take into consideration the probability of the drawer not acting well, and crushing the Bees, I think it would be best let alone. The floors of common hives can be cleaned by lifting them up and sweeping off the dirt. Mr. Savage noticed this in a previous Paper. It is worthy of remark, that though the effluvia from dead Bees, &c. is very injurious, still it is not the primary cause of disease, and it is a well-known fact that healthy colonies always cleanse their dwellings from these accidental impurities.—*J. Wighton*.

Coniferae.—Observing in the *Chronicle* of May 13, an article on the cultivation of Coniferae in pots, I am induced to make a few remarks on the statements there made by Mr. Bishop. He recommends "that plants be raised in the spring, and potted off into 60-sized pots, and as soon as established to be shifted into 48s; and in six weeks another shift would be required into 24s; and at the approach of autumn to place them in 8s. The plants to remain in 8s, and in spring to be again removed into 2s. This (he observes) will complete a twelvemonths' growth; when, if due attention has been paid, the plants will be objects of wonder." In the first place, Mr. Bishop recommends the plants to be shifted from "48s into 24s," thus leaving out the intermediate size of 32s, which, I think, all gardeners will acknowledge is too large a shift for a Pinus, which does not form its roots so readily as many other plants—especially in six weeks. Mr. Bishop proceeds,—"At the approach of autumn place them in 8s," thus leaving out the intermediate sizes of 16s and 12s. I cannot agree with Mr. Bishop, by shifting into large pots in rapid succession. Supposing the Pinus to be shifted in autumn from a 24-pot into an 8-sized pot, at the very season of the year when the plant discontinues growing, in order to facilitate the ripening of the wood,—and the roots, of course, have almost done growing,—of what service to the plant can that enormous shift be at that advanced period of the year? It is my humble opinion, that if the plant were to be top-dressed, and remain in the 24-pot all the winter, and shifted into a 16-pot early in the spring, it would be more advantageous to it, and would enable the grower to shift into larger-sized pots in succession as required. Among the Pinus recommended by Mr. Bishop, are Pinus Devoniana and P. Russelliana, which are two of the slowest-growing Pines of all. We will suppose a plant of each potted from the seed-pot into small 60s in the spring, and as soon as established removed into a 48-pot, and, if necessary, removed into a 32 at the latter part of the summer. What would be the height of those plants the next spring, after a twelvemonths' growth? Why, not more than nine inches. At this period Mr. B. recommends their being shifted into 2s; consequently, we should have a plant nine inches high in a pot as large as a moderate-sized washing-tub; and what is to become of that plant after it is shifted into so large a pot? As a matter of course, it must there remain, and in the course of two or three years all the goodness of the soil would be exhausted; when, on the contrary, if it had been shifted from a 60-pot into a 48, and from thence into a 32, and so on in succession, shifting about twice a-year, the plant would have the advantage of new soils in its infancy; and I think, with frequent waterings, the growth of the plant would be promoted, and the treatment be more beneficial to the plants.—*S. Snipe*.

Yeast Plant.—I was surprised to see that your correspondent "John Abbott, Jun.," considers the Yeast-plant to be *Centaurea benedicta*, or the Blessed Thistle; but on looking into "Loudon's Encyclopædia of Plants," under *Centaurea*, I find that the leaves of some of the species of that genus bear a strong resemblance to those of the Yeast-plant; and I should be glad to know from Mr. Abbot how he happened to suppose it was the Blessed Thistle—if he has ever seen it cultivated, and if the same properties were ascribed to it as are in America to the Yeast-plant. The plant I have raised from the seed in question is of very vigorous growth, and although it does not yet show flower, I have no doubt you can form a tolerably correct idea to what it belongs from the cut I now send you, which is an exact representation of one of its largest leaves, natural size at present. The colour is dark green; the midrib of a paler colour, and tinged with red. The whole leaf is downy on both sides, but more particularly on the back

and towards the base. The young leaves that are forming at the heart are assuming a broader shape, and have the same number of indentations, but they are deeper and more pointed. The seed was sown in the open air on the 21st of February, and germinated in about a fortnight. Although a coarse-growing plant, the slugs are very fond of it, and I am obliged to watch it almost night and day.—*A Lady, and Constant Reader*.—[We can throw no light on this subject without seeing the plant. The evidence now supplied only shows, what was shown before, that it is of the Composite order.]

and a fine instance of superior culture: *Zichya dilatata*, three feet in height, very showy; *Zichya nophylla*, four feet high, splendid; *Hardenbergia monophylla*, on a cylindrical trellis, five feet above the pot, truly magnificent; *Echites suberecta*, unhealthy, and not blooming well; *Stephanotis floribunda*, very large, but the flowers only imperfectly developed; *Tropæolum tricolorum*, on an ornamental trellis covering the pot, healthy and beautiful; *Gompholobium polymorphum*, pretty good; an admirable plant of *Chorozema spectabile*, covering a convex kind of trellis, four feet in height, and with a prodigious quantity of flowers, and a new plant, seemingly allied to *Calceolae*, with bold upright racemes of very showy purple blossoms. Mr. Clark, gr. to T. Smith, Esq., Shirley Park, furnished another collection of climbers, among which were *Hardenbergia monophylla* and *longeracemosa*, in a magnificent flowering condition; *Manettia bicolor*, three feet high, and beautifully grown, having pleasing red and yellow flowers; *Kennedyia nigricans*, dwarf and handsome, with numerous racemes of its curious blackish and yellow blossoms; *Zichya glabrata*, four feet broad, unusually verdant and free-flowering; *Tropæolum tricolorum*, supported by a branching and bushy stick, without any training, and having a highly natural and delightful aspect. *Maurandia Barclayana*, on a narrow cylindrical trellis, which expands greatly at the top, where the flowers were abundant and large; and *Hoya carnosa*, trained to a barrel-shaped trellis, on which while in the healthiest possible state, it was producing many bunches of its sweet coat-like blossoms. *Zichya glabrata*, *Kennedyia prostrata*, and *Brachysema latifolium*, were from Mr. Clarke, gr. to W. Block, Esq., but in no way remarkable.

There was quite an average display, both in numbers and quality, of the charming tribe of Orchidaceae, and these obtained, as in former years, a considerable amount of the visitors' attention. Mr. Goode, gr. to Mr. Lawrence, contributed a variety of *Stanhopea tigrina*, probably *S. Devoniana*, with very dark blotches in the flower; a fine plant of the elegant *Oncidium divaricatum*; *O. luridum*, particularly healthy, and flowering liberally; *O. papilio*, the much-admired butterfly-plant, in high health; *Dendrobium cupreum*, an immense plant, with many noble racemes of its pale copper yellow-coloured flowers; *Blétia superba*, a species with large and remarkably rich purplish crimson blossoms; *Epidendrum crassifolium*, indicating how beautiful the species is when properly managed; *Chysis aurea*, perfectly healthy; a new species of *Epidendrum*, near *E. selligerum*; and the stately *Cyrtopogon Andersonii*, throwing up several strong spikes of showy yellow blossoms. *Maxillaria Deppii*, with nearly twenty of its interesting blossoms, which come up before the leaves; *M. aromatica*, flowering in its ordinary profusion, and shedding a delicious aromatic fragrance; *Cattleya intermedia*, with a good scape of bloom; a variety of *C. Mossii*, very splendid, with three flowers on one of the scapes; a species of *Catasetum*, with strange dingy brown flowers; *Oncidium pulchellum*, one of the prettiest of the genus; *O. stramineum*, small but pleasing; an apparently new species of *Epidendrum*, with dense and short upright spikes of whitish flowers; *E. macrochilum*, particularly robust; *E. primulinum*, with gracefully-spreading panicles of pretty blossoms; an enormous plant of *Acanthophippium bicolor*, the blossoms of which formed quite a bed on the surface of the pot and around the pseudo-bulbs; the delicate white-flowered *Burlingtonia venusta*; the brownish-flowered variety of *Vanda Roxburghii*; *Camarotis purpurea*, with its long racemes of deep pink blossom; and the strange *Coryanthes macrantha*, were from Mr. Mylam, gr. to S. Rucker, Esq., Wandsworth. Mr. Hunt, gr. to Mrs. Trill, supplied a nice plant of the lovely *Dendrobium pulchellum*, another of *D. Pierardii*, trained in an upright manner, to the shape of a cone, but not looking so well as when suffered to hang down naturally, and *Oncidium flexuosum*, fixed round a low trellis, which prevents it from rambling so much as it would otherwise do. *Brassia verrucosa*, a rather scarce species, with curious little warty substances on the lip of the flower, was sent, in a very verdant state, by Mr. Edmonds, gr. to the Duke of Devonshire, at Chiswick. *Dendrobium densiflorum*, bearing two racemes of flowers on one of its splendid stems, and one on another, came from Mr. Gunner, gr. to Sir G. Larpent, Bart. G. Barker, Esq., of Birmingham, furnished *Peristertia Humboldtii*, a new species, with long pendant scapes of yellowish flowers, which are much spotted and blotched with chocolate, and *Cynochos pentadactylon*, another new plant, having the flowers banded with dark brown like those of *C. maculatum*, but altogether larger and darker. Both these last are handsome plants, though their flowers are wanting in any very decided or showy colour.

A variety of valuable plants was exhibited as single specimens. *Doranthus excelsa* was shown in flower by Mr. Hardie, gr. to J. Jarrett, Esq. It had a tall flower-stem, 15 or 20 feet in height, surmounted by a large bunch of very dark red flowers. *Eriostemon buxifolium*, sent by Messrs. Vetch and Son, of Exeter, was a splendid specimen of appropriate culture; it was two feet in height, and so compact that the neat white flowers composed almost the only visible surface: it is one of the most deserving of dwarf greenhouse shrubs. From Mr. Frost, gr. to Lady Grenville, there was a specimen of *Oxalis cernua*, which has nodding flowers, of a very clear pale yellow tint. An excessively beautiful plant of the white Indian *Azalea*, about two feet in height, was from Mr. Jones, gr. to Sir Moore Disney. *Zichya pinnosa*, covering a flat trellis three feet high, was richly laden with flowers, from Mr. Stanley, gr. to H. Berens, Esq. A plant of *Azalea indica variegata*, not more than six inches high, yet a mass of blossom, and in the healthiest condition, came from Mr. Busby, gr. to J. Ricardo, Esq., of Sunning Hill. J. Allnut, Esq., produced a highly verdant and vigorous plant of *Erica sulphurea*, but it had few expanded flowers. Mr. Clarke, gr. to W. Block, Esq., exhibited a superior specimen of *Erica Hartnellii*. And Mr. Hughes, gr. to Mrs. Rogers, of Tooting, brought a plant of *Chorozema Henchmannii*, tolerably well bloomed, 4 feet in height, though somewhat ragged.

Of new or scarce plants, there were present *Siphocampylus betulifolius*, from Mr. Green, gr. to Sir E. Antrobus, Bart., in the highest order, and producing its scarlet and yellow blossoms very freely; *Manettia bicolor*, also from Mr. Green, 5 feet high, on a barrel-shaped trellis, and beautifully in flower. *Rhododendron chrysocladum grandiflorum*, a new variety, from Mr. Smith, of Norbiton, with large heads of brownish yellow flowers, which have numerous spots in the upper petals, and are very handsome. *R. Smithii decorum*, from the same individual, with pale and delicate pinkish blossoms, spotted in the upper petals, likewise good. *Cyrtoceras reflexa*, an elegant half-climbing plant, allied to *Hoya*, with noble foliage, and bunches of yellowish white drooping flowers, from Messrs. Lucombe, Pince, and Co., of Exeter. From the same firm a fine specimen of *Achimenes grandiflora*, bearing large pinkish crimson blossoms, almost equal in size to those of *A. longiflora*; and *Acrochylum venustum*, bearing plume-like spikes of white inflorescence. *Actus lanigera*, a neat little shrub, with a profusion of small yellow flowers sitting close to its stem; *Azalea superba*, with very dark blood-red blossoms, somewhat injured by travelling, from Mr. Davis, gr. to Lord Boston. *Statiche macrophylla*, a species with peculiarly broad and long leaves, though not in flower, from Mr. Forrest, nurseryman, of Kensington. A species of *Bossiaea*, with narrow and very regular alternate leaves, and rather superior yellowish flowers, from Mr. Kyle, of Leyton, Essex; *Begonia coccinea*, the showiest species of the genus, having scarlet flowers, which are disposed in panicles at the ends of all the shoots, from Mr. Goode, gr. to Mrs. Lawrence; *Tropæolum azureum*, further from Mr. Goode, and said to have been in bloom since September last; *Gloxinia macrophylla variegata*, another of Mr. Goode's plants, with broad white-veined leaves, and handsome purple flowers. And a *Leschenaultia*, probably *grandiflora*, from Mr. Falconer, gr. to A. Palmer, Esq., of Cheam. The last-named plant was much better than *L. biloba*, having larger and darker flowers; it may possibly rank among the finest things that were shown.

A collection of interesting little Alpine plants, grown in pots, was supplied by Mr. Wood, nurseryman, of Norwood. They

comprised some very pretty species, several of which were alluded to specifically in our report of the last meeting of the Horticultural Society, at Regent-street. Those which are most noticeable, and were not then pointed out, are, *Stachys corsica*, a beautiful lilac-flowered species; *Saxifraga granulata plena*, a plant that is often cultivated in flower-borders, and which is quite suitable for growing in pots; *Cheiranthus ochroleucus*, another favourite border plant, and equally adapted for pot culture; *Phlox setacea*, with showy dark pink flowers; *Pulmonaria davurica*, with bluish blossoms; and *Viola palmata*, bearing mottled flowers, of a blue and white tint. Of *Fuchsias* there was only one collection, from Mr. Catleugh, of Chelsea, the best varieties in which were—*Buistii*, a gracefully-growing plant, with very deep blue corollas to its rather small flowers; *rosea alba*, having nearly white blossoms; and *grandis*, which has good foliage, red sepals, and a rich crimson corolla; its flowers are large and showy. Messrs. Lane, of Berkhamstead, sent plants of their *F. Lanei*, which has immense blossoms, and appears to be in all respects a noble sort. Mr. Gaines, of Battersea, brought a basket of well-cultivated *IXIAS*, the varied and showy colours of which made an excellent display.

The *Pelargoniums* occupied a larger space than usual, and the quantity exceeded that of any former exhibition we have seen. The weather has for some time past been so unfavourable for the development of these plants, that greater heat than usual has been required to bring them forward; and the transition from heat to the cold air was apparent upon examination. The general display, however, was very imposing; and the cultivation, training, and management of the plants was highly creditable to the growers. The new class of *Pelargoniums* grown in pots of 24 to the cast proved highly interesting, as many seedlings and new varieties were introduced among them; and had the weather not been so unpropitious, this class would have numbered more competitors, as the size of the pots bring the cultivation of them within the management of a greater number of growers. The Gold Banksian Medal, offered by the Society in this class, was awarded to Mr. Beck, of Isleworth, a successful amateur, for 12 well-cultivated plants in fine health and condition; they were grown and exhibited in slate pots, and the state of the plants bore conclusive evidence that this anti-porous material is not injurious to the growth of these beautiful flowers. Some new and fine varieties were shown in this class also by Mr. Gaines and Mr. Catleugh. Among the growers of large plants, Mr. Cock's were conspicuously fine; nor can we imagine the cultivation of large specimens to be carried beyond the skill exercised by him; the Prince of Waterloo, Dido, Madeleine, Coronation, and Cyrus, excited unanimous delight from their fine colour and the extraordinary mass of bloom by which the plants were covered. Mr. Bell's collection was very creditable, and Mr. Catleugh's and Mr. Gaines's large plants were also generally admired.

The supply of seedling *Pelargoniums* was rather limited; the same ungenial weather had caused the seedlings generally to be late. Among those sent, two were selected by the Judges, to which certificates of merit were awarded; they were both from Mr. Beck, of Isleworth: *Susanna*, a white flower with a crimson spot in the upper petals; the general form of the flower is very good; and the petals being stiff, it retains its shape to the last; the habit of the flower is good, and its style of trussing very fine. *Zanzummin* is a large flower, having delicate pink under petals, with a rich crimson spot in the upper part of the flower, nearly covering the surface of the petals, leaving only a narrow border of rose-colour; this is a showy variety, and both flowers we imagine will improve as the weather becomes more favourable for the natural development of the flowers. The habit of the plant is good, short-jointed, and showing its trusses well. The advantages of showing the seedlings in pots must have been apparent to every one, as the nature of the foliage, mode of growth and trussing is seen, and supersedes the necessity of inquiry upon the subject; the regulation is an admirable one, and will prove advantageous both to purchasers and growers. The seedling *Calceolarias* were numerous, varying much in quality; but unless seedlings in this class possess decided novelty of colour or marking, or perfection of form, it is useless to single them out for reward, as the ease with which they are raised brings a tolerably good collection within the reach of every one possessed of a greenhouse. Two curious varieties from Mr. Standish's collection were selected for a certificate of merit; one named *Eclipse*, the other *Duchess of Gloucester*, the former having a buff ground, was covered with large maroon spots; the appearance of this variety is very peculiar, the latter had a lemon ground, covered with brown spots; they are perfectly distinct from those generally seen, and will no doubt be in request. The seedling *Cinerarias* were not sufficiently distinct to merit particular notice.

The following is a list of some of the winning Florists' Flowers. **PELARGONIUMS:** In collections of 12 varieties, in pots of 12 to the cast. (Amateurs).—Silver-gilt medal to Mr. Cock, for *Bertha*, *Amulet*, *Grand Monarch*, *Prince of Waterloo*, *Wonder*, *Mabel*, *Dido*, *Madeline*, *Coronation*, *Cyrus*, *Evadne*, *Jubilee*. Large silver medal to Mr. Beck, for *Comte de Paris*, *Bridesmaid*, *Una*, *Coronation*, *Climax*, *Joan of Arc*, *Florence*, *Erectum*, *Speculum*, *Rienzi*, *Eliza Superb*, *Jewess*. Silver Knightian medal to Mr. Watt, gr. to E. Snell, Esq., *Pimlico*, for *Comte de Paris*, *Clarissa*, *Acme*, *Eliza superb*, *Florence*, *Victory*, *Dowager Queen*, *Annette*, *Lord Mayor*, *Bridesmaid*, *Portia*, *Magnet*. (Nurserymen).—Silver-gilt medal to Mr. Catleugh, for *Comte de Paris*, *Sylph*, *Jubilee*, *Erectum*, *Coronation*, *Lady Mayoress*, *Jewess*, *Joan of Arc*, *Prince of Waterloo*, *Lord Mayor*, *Victory*, *Selina*. Large silver medal to Mr. Gaines, for *Victory*, *Jewess*, *Grand Duke*, *Sylph*, *Florence*, *Erectum*, *Joan of Arc*, *Emperor*, *Cyrus*, *Juba*, *Coronation*, *Mabel*. *Pelargoniums*, in collections of 12 new and first-rate varieties, in pots of 24 to the cast. (Amateurs).—Gold Banksian medal to Mr. Beck, for *Admiral*, *Evening Star*, *Meteor*, *Cleopatra*, *Leonora*, *Jessie*, *Martha*, *Matilda*, *Queen of the Fairies*, *Black Prince*, *Erectum*, *Susanna*. Large silver medal to Mr. Bell, Chelsea Hospital, for *Camilla*, *Sylph*, *Grand Duke*, *Comte de Paris*, *Van Amburgh*, *Flash*, *Enchantress*, *Queen of the Beauties*, *Jewess*, *Lord Mayor*, *Princess Queen*, *Bracema d.* (Nurserymen).—Silver-gilt medal to Mr. Catleugh, for *Mmerva*, *Eclipse*, *Mary Jane* (Bassett's), *Symmetry*, *Sir R. Peel*, *Charlotte*, *Matilda*, *Favourite*, *Jubilee*, *Great Western*, *Wizard*, *Enma* (Lumsden's). Large silver medal to Mr. Gaines, for *Prince of Wales*, *Caroline*, *Lydia*, *Euterpe*, *Sylph*, *Queen of Bourbons*, *Duke of Cornwall*, *Orange Perfection*, *Lady Prudhoe*, *Nymph*, *Vanguard*, *Amulet*. **HERBACEOUS CALCEOLARIAS:** In collections of 6 varieties, in pots of 12 to the cast. (Amateurs).—The Silver Knightian medal to Mr. Green, gr. to Sir E. Antrobus, Bart., for *Purpurea grandiflora*, *Alba coccinea maximum*, *Prince of Wales*, *Formosissima*, *Ne plus Ultra*, *Cordata*: the Silver Banksian medal to Mr. Beck, of Isleworth, for *Agnès* and *Lady Douglas* (seedlings), *Madonna*, *Adonis*, *Bertha*, *Pulchella superba*. The Silver Knightian medal to Mr. Catleugh, for *Green's Alba coccinea maxima*, *grandiflora*, *Fireking*, *Barnes' Reform*, *Prince of Wales*, *Jubilee*. **SERBURY CALCEOLARIAS:** In 6 varieties, in pots of 12 to the cast. (Amateurs).—The Large Silver medal to Mr. Beck, for *Lady of the Lake*, *King*, *Miss Antrobus*, *Standishii*, *Mirabilis*, *Climax*. (Nurserymen).—The Silver Knightian medal to Mr. Gaines, for *Gaines' Cyrus*, *Rising Sun*, *Golden Sovereign*, *Sunbeam*, *Dus y Miler*, *Magnifica grandiflora*. The Silver Banksian medal to Mr. Catleugh, for *Barnes' Amulet*, *Bridesmaid*, *Coronet*, *Commander-in-Chief*, *Green's Hero*, *Delicata*. The first prize, however, under this head was awarded to the *Calceolarias*, *Splendida*, *Village Maid*, *Prince of Wales*, *Superba*, *Painted Lady*, and *Picta*, from Mr. Stanley, gr. to H. Berens, Esq. As is common at the May show, the contests of the tent devoted to fruit were not very imposing. There were, however, some handsome Pine-apples, of various sorts, from Mr. Davis, gr. to Lord Boston, Mr. Burr, gr. to H. Preston, Esq., Mr. Davis, of East Barnet, and others. Black Hamburg Grapes were sent by Mr. Hall, gr. to W. B. Harcourt, Esq., St. Leonard's, Windsor,

Mr. Nicholson, gr. to the Earl of Orkney, Mr. Mitchell, of Brighton, Mr. Davis, of East Barnet, Mr. E. Davis, gr. to A. Smith, Esq., Woodhall Park, Mr. Davis, gr. to Lord Boston, Mr. Dods, gr. to Sir G. Warrenden, Bart., and Mr. Chapman, of Vauxhall: with a few White Sweetwater from some of the same growers, and from (?) the gardener to R. Gunter, Esq. Some fine Peaches and Nectarines came from Mr. Tillery, gr. to the Duke of Portland; and a dish of both, likewise, from Mr. Hutchison, gr. to E. J. Shirley, Esq. Mr. Jennings, gr. to the Earl of Derby, contributed some good Mayduke Cherries. A few pretty good Melons were exhibited; and some Strawberries. Among the last, Myatt's British Queen was from Mr. Snow, gr. to Earl de Grey. There were collections of Apples, including two or three kinds of Pears, in excellent preservation, from Mr. Baldwin, of Turnham-green, Mr. Fish, gr. to R. H. Oddie, Esq., and R. Brook, Esq., Pettistree Lodge. Three large Shadocks, with their blossoms, were furnished by Mr. Moss, gr. to J. Taylor, Esq.; and there were several brace of Cucumbers, from various parties. The prize-list will best explain the merits of all these articles.

The two main points that call for notice in the getting up of the exhibition are, first, that a considerable portion of the flowers had their names legibly and neatly written on cards, which were fastened to them in conspicuous positions; and, secondly, that many of the specimens had the soil in the pots covered with moss, which had a neat, finished appearance, and would tend materially to prevent the plants being injured by the abstraction of moisture by any currents of air to which they might happen to be exposed. Both practices, however, ought to be more universally adopted; and if the system of attaching names to the fruit were likewise pursued, it would add considerably to the interest with which they are contemplated by many an inquiring amateur.

May 18.—Mr. E. Solly, in his second lecture, briefly adverted to the importance of bearing in mind the facts, exemplified before, that the most extraordinary changes in matter may be produced by slight chemical differences of combination; that heat on one hand, light on another, and combination, will give rise to products of the most diversified character. He then proceeded to prove that the various forms of vegetable matter are mere forms of carbon, oxygen, hydrogen, and nitrogen. But in the first place he called attention to the large quantity of water that is found in all vegetables used for food, as was exemplified by the following Table of results obtained by himself, showing the relative quantity of water, organic, and inorganic matter in them.

COMPOSITION OF VEGETABLES.
Proportion in 10,000 parts of the Fresh Plant.

	Water.	Organic Matter.	Inorganic Matter.
Potato	7713	2173	114
Carrot	8727	1159	114
Turnip	9308	588	104
Parsnep	7920	1947	124
Red Beet	8501	1390	109
Bassano Beet	8730	1159	111
White Beet	8690	1198	112
Jerusalem Artichoke	7566	2298	136
Flag Leek	8611	1277	112
Shallot	9091	779	130
Garlic	8409	1338	153
Spring Radishes	9539	380	81
Endive	9290	619	91
Scotch Kale	8682	1173	145
Red Cabbage	8910	993	97
Savoy	8979	900	121
Seakale	9238	705	57
Young Cabbage	8693	1139	168
Spinach	8805	943	252
Lettuce	9350	555	95
French Beans	9317	619	64
Broccoli	8768	1186	96
Red Celery	9280	597	123
White Celery	9387	488	125
Giant Rhubarb	9447	492	62
Asparagus	9210	735	55
Watercress	9260	633	107
Sorrel	9207	703	91
Parsley	8430	1299	271
Fennel	8761	1048	191
Horseradish	6879	2945	176
Salsafy	7951	1929	120
Green Onion	8586	1325	62
Mustard	9462	436	102
Purple Sage	7515	2240	245
Cucumber	9589	352	59
Kohl Rabi	8646	1240	114

From this it appeared that the Cucumber contains as much as 95½ per cent. of water, the Cabbage 87, the Beet 86, and so on; this was further illustrated by a comparison between the fresh state of the Giant Rhubarb of Covent-garden, and the dried part of the same plant, the former being three feet long, and the latter about one-thirtieth of the size. Thus it appeared that plants consist of a small quantity of organic and inorganic matter, and of a large quantity of water. The organic products were then examined. Liebig's apparatus for the analysis of plants was introduced, and its application explained; and it was shown how it enables all the organic matter burnt away to be examined, and proved to consist of carbon, oxygen, hydrogen, and nitrogen. Then the characters of lignin, starch, sugar, gum, gluten, and albumen were pointed out. By a variety of tests their presence and distinctions were shown in the specimens of vegetable matter on the table, and also their conversion into carbon, oxygen, hydrogen, and nitrogen. In this part of the lecture some beautiful experiments were introduced, especially the decomposition of iodide of potassium by chlorine, and the liberation of the iodine, which before decomposition had no effect on starch, but afterwards attacked it, and gave it its usual blue colour. The carbonaceous nature of all these matters was elucidated by well-chosen experiments, and the lecture concluded by again referring to the active principles of plants, all the vegetable acids, and in short, everything organic in the vegetable structure, to peculiar combinations of the four great elements, oxygen, hydrogen, nitrogen, and carbon. Some allusion was at the same time made to the action and consequences of fermentation; but this was introduced at the end of the lecture, and was more insisted on than demonstrated; especially the fact that starch changes into sugar, sugar to spirit, spirit to vinegar, and vinegar to carbonic acid and water, which is the final result of all vegetable destruction.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A weekly council was held at the Society's House in Hanover-square, on the 10th of May, the Hon. R. H. Clive, M.P., in the chair. Viscount Torrington was elected a Governor, and 20 gentlemen Members of the Society. Mr. Davenport communicated the following results of trials made last year with guano on his farm at Capeshorne, in (Ceshire): *On Meadow*—One acre sown with 3 cwt. of guano and 3 cwt. of gypsum; crops, when ready to stack, 2 tons 18 cwt. One acre sown with 2 cwt. of guano and 2 cwt. of gypsum—2 tons 5 cwt. One acre sown with 2 cwt. of guano only—2 tons. *Turnips*—One acre of Turnips, 4 cwt. of guano and 4 cwt. of gypsum—30 tons produce. One acre of Turnips, 2 cwt. of guano and 2 cwt. of gypsum—27 tons. The difference between an unmanured acre and one manured with 3 cwt. of guano and the same quantity of gypsum was 27 cwt. of hay additional. Mr. Henry Wilson, of Stowlangtoft Hall, near Lxworth, Suffolk, presented to the Society a model of Rouse's Improved Plough. This plough is the invention of W. Rouse, a wheelwright, residing at Barton, near Bury St. Edmund's, and the principal points of advantage ascribed to it, as communicated by Mr. Wilson, are the following: "That the share may be deepened or *steepened* to or from the land in an

instant without stopping the horses or the ploughman's hand being taken off the plough; that it will go with or without a ground, with or without wheels, with a wood breast for Turnip and summer land, and with any shaped iron breast that may be required or preferred; that it requires no sledge for its removal from place to place; that the coulter may be moved six ways, by a movement effected in an instant, and so firm that no horse can move it; that the furrow can be taken any width, and any depth, up hill or down hill, with equal facility; that it will be less expensive to the farmer and more easy to the labourer than any plough yet made, the whole construction being so simple as to be kept in repair at less cost than other ploughs." The communication of Mr. Wilson stated that the plough had received the approbation of Mr. Allan Ramsome, and had undergone the test of practical trial on various kinds of land in Suffolk. Earl Spencer read the Report of the Committee appointed on the 3rd of May, and detailed the various advantages presented by each locality proposed for the next year's meeting, when Southampton was chosen as the place of the Annual Country Meeting of 1844. The Journal Committee reported the adjudication of the prize of ten sovereigns for the best Essay on the comparative advantages in the employment of Horses and Oxen in Farming-work, to James Cowie, of the Mains of Haulbrerton, Laurencekirk, Kincardineshire, Scotland; and the Prize of Twenty Sovereigns for the best explanation of the causes which appear to determine the production of fat and muscle respectively, according to the present state of our knowledge of Animal Physiology, to W. F. Karkeek, of Truro, Cornwall. Mr. Childers gave notice that he should move at the next monthly council, "that of the 25 Members of Council who go out by rotation, the 10 who have attended the fewest times during the year shall not be recommended by the Council for re-election."

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

May 17.—The second exhibition for the season came off at the Horns Tavern, Kennington. The quality of the productions shown was rather below the average, and the day being singularly unfavourable, the attendance of visitors was not so ample as usual. A band of wind-instruments performed during the afternoon. Among the plants and flowers present, we noticed a very fine specimen of *Hardenbergia monophylla*, trained on a conical-shaped trellis, about 4 ft. high, and flowering beautifully, from Mr. Townly; a splendid plant of *Erica* pregnant, about 18 inches in height, and from 2 to 3 ft. in diameter, quite a mass of bloom, from Mr. Dawson, of Brixton-hill; *Zichia inophylla*, attached to a large flat ornamental trellis, and magnificently in flower, from J. Allnutt, Esq.; *Pimelia spectabilis*, exquisitely bloomed, from Mr. Bruce; the beautiful *Nymphæa cærulea*, in a pan, and blooming, from Mr. Cox; a very handsome specimen of *Erica* propendens, laden with its lovely drooping pink flowers, from Mr. Dawson; *Aphelaxis humilis*, in the most perfect condition, from Mr. Bruce; a superb *Hydrangea*, dwarf, very luxuriant, with an immense head of flowers, which were individually very large, and of a bluish tint, from Mr. Dawson, gr. to T. Hawes, Esq.; *Lavender-hill*, *Ixora coccinea*, in the very highest health and beauty, from Mr. Bruce; and a *Cereus*, called "The Lawn Seedling," in the way of Jenkinson, but with paler flowers, and nearer speciosus in habit. In a collection of Alpines, from Mr. Wood, nurseryman, of Norwood, we observed, in addition to the plants shown at the Horticultural Society's Rooms and Gardens, a nice specimen of *Ranunculus pyrenaica*; it was unusually well grown, and is a most elegant little object. The collection of Heaths from Mr. Wilson, gr. to — Gillett, Esq., Clapham Park, had in it a very excellent plant of *G. odorata rosea*, and pretty good specimens of *E. sulphurea*, *mirabilis*, *Macbaniana*, *ampullacea* var. &c. From Mr. Hamp there were superb plants of *Gloxinia rubra*, maxima, and canescens, with *Ipomœa Horsfallia*, flowering on a cylindrical trellis in a very dwarf state, and a remarkably well-cultivated plant of the pretty *Stylidium fasciculatum*. Mr. Bruce exhibited a most noble specimen of *Polygala acuminata*, drooping with the weight of its showy blossoms, a fine *Azalea Gleasoniana*, and a particularly dense and rich plant of the admirable *Leschenaultia formosa*. *Chorozema Dicksoni* and *Henchmanni*, in a pleasingly dwarf and healthy condition; *Fabiana imbricata*; *Chorozema ilicifolia*, peculiarly excellent; *Eutaxia pungens*, compact, and finely-flowered; *Epacris cæresiflora*, throwing its flower-laden branches about rather tortuously and elegantly; a well-bloomed, though not very dense, *Boronia serrulata*, and a most extraordinary and meritorious specimen of *Plumbago capensis*, were sent by Mr. Wilson, gr. to — Gillett, Esq., Clapham Park. Mr. Fairbairn showed a neat plant of *Genista canariensis*, and a nearly allied variety, which has darker flowers, and is called *G. Atleana*; with charming little specimens of *Chorozema Henchmanni* and *Dicksoni*. A collection of *Cinerarias*, from Mr. Ivory, of Peckham, was brilliantly attractive, and contained most of the best varieties. We insert the names of the winning Tulips; their merits will be seen by reference to the prize-list. Mr. Lawrence's flowers were—*Aglaia*, *Polyphemus*, *Lawrence's Patty*, *Fabius*, *Holmes's King*, *Rose Brilliant*, *Captain White*, *Franciscus primis*, *Junius Brutus*, *Catalini*, *Madame Vestris*, and *Violet Imperial*. Mr. Brown's, which were recommended for a prize, were, *Triomphe Royale*, *Brown's Wallace*, *Polyphemus*, *Brulante eclatante*, *Salvator Rosa*, *Strong's King*, *Madame Vestris*, *Violet Rouge-atre*, *Brown's Ulysses*, *Daphne*, *Franciscus primis*, and *Clarence*. Mr. Townley's were, *Aglaia*, *Mentor*, *Austria*, *Platoff*, *Holmes's King*, *Triomphe Royale*, *Albion*, *Catalano*, *Gloria mundi*, *Optimus*, *Royal George*, and *Cérise belle forme*. Mr. Clark's were, *Triomphe Royale*, *La plus Belle*, *Darius*, *Rainbow*, *Clarence*, *Aglaia*, *Violet triumphant*, *Lord Brougham*, *Roscius*, *Mizraim*, *Fleur des Dames*, and *Rubens*. We remarked that the collections of plants were not generally distinguished from each other in the arrangement by any particular mark; while, in most cases, only the names of the exhibitors, and no other particulars about them were written on the cards attached to the plants. It would be an improvement to place something between the collections to separate them, and also to give the residence of the exhibitors, with the gentlemen to whom they are gardeners, when the latter are exhibiting. A list of the awards is subjoined:—**AMATEURS**.—The middle silver medal to Mr. Edmonds, for 24 varieties of Heartsease. The small silver to Mr. Munro, for do. The large silver to Mr. Townley, for 12 Tulips. The middle silver to Mr. C. Clark, for do. The middle silver to Mr. Massey, for 6 varieties of Calceolarias. The middle silver to Mr. Townley, for a collection of 12 miscellaneous plants. **GENTLEMEN'S GARDENERS**.—The large silver to Mr. Wilson, for a collection of 24 miscellaneous plants. The middle silver to Mr. Hamp, for do. The middle silver to Mr. Parsons, for 36 varieties of Heartsease. The large silver to Mr. Bruce, for eight varieties of Heaths. **NURSERYMEN, &c.**—The middle silver to Mr. Brown, for 36 varieties of Heartsease. The small silver to Mr. Henbrey, for do. The large silver to Mr. Catleugh, for 12 varieties of Pelargoniums. The large silver to Mr. Lawrence, for 12 Tulips. **ALL CLASSES**.—The middle silver to Mr. Bruce, for a specimen plant. The small silver to J. Allnutt, Esq., for do. The large silver to Mr. Bruce, for specimen plants of six distinct genera. The middle silver to do., for four specimens of *Orchidaceæ*. The small silver to Mr. Brown, for a seedling Tulip, *Brown's Ulysses*, a bizarre. The middle silver to Mr. R. J. Chapman, for four sorts of fruit. The middle silver to Mr. Chapman, for a basket of Grapes. The middle silver to Mr. Hamp, for a Pincapple. The middle silver to Mr. Martin, for four sorts of Vegetables. The small silver to Mr. J. Gaines, for do.

N.B. *Delight*: This Pansy is the most perfect specimen of form we have seen; the circle is complete, the flower lies quite flat, and the petals are in fine proportion to the size of the flower, the eye is fine, the upper petals are crimson purple, and the beeting which is somewhat irregular, is of the same colour. It was pronounced a 1st class flower, and was raised by Mr. J. S. Cook, of Longwick. 2d class prize was awarded to Bragg's *Elizabeth*,

a dark self of good substance. 1st class Tulip, *Ulysses*—bizarre, broke by Mr. Brown, of Slough, ground clear, feathering clean and decided, cup short.

COUNTRY SHOWS.

Armagh Horticultural Society, April 27.—The first Spring competition of this Society took place in the Market-house rooms, and, considering the early season of the year, was highly creditable to the competitors. The following specimens obtained prizes:—*Stove Plants*, 1, *Epiphyllum Jenkinsoni*, E. speciosum, *Thunbergia alata*, Mr. J. Lowrie, gr. to his Grace the Lord Primate; 2, *Epiphyllum Jenkinsoni*, *Hibiscus splendens*, *Aloe lineata*, Mr. J. Lowrie. *Greenhouse Plants*, 1, *Arbutus procera*, *Cianthus puniceus*, *Acacia armata*, *Hydrangea hortensis*, *Cytisus racemosus*, Mr. J. Lowrie; 2, *Fuchsia fulgens*, *Azalea indica alba*, *Siphocampylus bicolor*, *Clematis carulea*, *Genista canariensis*, Mr. J. Lowrie. *Auriculas*, 1, Cockup's Eclipse, Page's Champion, Harris's Blucher, green-edged; Kenyon's Ringleader, Hogg's Magnificent, Popplewell's Conqueror, grey-edged; Campbell's Robin Burns, Lee's Bright Venus, Cox's Pillar of Beauty, white-edged; Favourite Alpine, King of the Alps, Egyptian Queen, self or shaded, Mr. J. Lowrie; 2, Mr. S. Allen, gr. to E. Lucas, Esq. *Primroses*, Mr. J. Lowrie. *Polyanthuses*, Mr. S. Allen. *Hyacinths*, Nimrod, Lord Wellington, Lord Nelson, blue; Waterloo, Groot Vorst, Lord Wellington, red; Prince Van Waterloo, Grand Vaingueur, Hercules, white, Mr. J. Lowrie. *Pansies*, Turnbull's Dean Swift, Widdall's Helen, Fairbairn's Lavina, Lowrie's Queen, and 8 seedlings, Mr. J. Lowrie. *Calceolarias*, Laird o' Cockpen, Mrs. Hope, and Multiflora, Mr. J. Lowrie. *Cucurarius*, Queen Victoria, and 2 seedlings named Primate of Ireland and Miss Paton, Mr. J. Lowrie. *Bouquet of Flowers*, 1, a splendid figure of a pheasant, on a tasteful pedestal, from Penton & Skead's nurseries; 2, a splendid bouquet, composed of many rare and beautiful flowers, in the form of a Chinese grotto, Mr. J. Lowrie. *Apples*, Mr. G. Martin, gr. to J. Hatchell, Esq. *Cucumbers*, Mr. S. Allen. *Potatoes*, Mr. J. Lowrie. *Asparagus*, Mr. T. Corvan, gr. to Miss Waugh. *Beans*, Mr. J. Lowrie. *Onions*, Mr. J. Stoops, gr. to Capt. Algeo. *Mushrooms*, Mr. J. Lowrie. *Seakale*, Mr. T. Corvan. *Broccoli*, Mr. J. Stoops. *Lettuces*, Mr. J. Lowrie. *Leeks*, do. *Cabbage*, do. *Rhubarb*, do.—*Northern Whig*.

Birmingham and Midland Floral and Horticultural Society, April 27.—The first exhibition for the season was held in the town of Birmingham. The display of Fruit, Flowers, and Vegetables was remarkably fine for this period. A good collection of plants from Mr. Dickinson, Bristol Road, was generally admired; as were also the Pansies of Mr. Earl and Mr. Mellon. The following prizes were awarded: **AURICULAS**—Premier prize, Ne plus Ultra, Mr. S. Bunn. *Green*—1, Ne plus Ultra, Mr. Wallace; 2, Lovely Ann, H. Pope; 3, Clapton Hero, S. Bunn. *Grey*—1, Ne plus Ultra, S. Bunn; 2, Conqueror of Europe, S. Bunn; 3, Fletcher's Mary Ann, C. Fletcher. *White*—1, Pillar of Beauty, Mr. Wallace; 2, Lee's Bright Venus, Mr. Wallace; 3, Schol's Mrs. Clarke, H. Pope. *Selfs*—1, Lord Leigh, S. Bunn; 2, Lady Flora Hastings, Mr. Wallace; 3, Black Prince, Mr. Britten. *Alpine*—1, King of the Alps, J. Cowdry; 2, True Blue, Mr. Haines; 3, Lovely Ann, Mr. Haines. *Seedling*, 1, S. Bunn; 2, Mr. Downing. **POLYANTHUSES**—Premier prize, George the Fourth, J. Moore. *Dark*—1, Prince Regent, J. Moore; 2, Pearson's Alexander, J. Moore; 3, George the Fourth, C. Fletcher. *Red*—1, Lancer, J. Pope and Sons; 2, Sir Sydney Smith, Mr. Wallace; 3, Glory of England, J. Moore. *Seedling*—1, J. Pope and Sons. *Hyacinths*—1, R. Chinn; 2, R. Chinn. *Pansies*—Best collection of 12 blooms, 1, Mr. W. Earl; 2, Mr. J. Cowdry. *Pansies*—Best collection of 6 blooms, 1, Mr. W. Earl; 2, J. Cowdry. *Seedling* do.—1, Mr. Mellon; 2, E. Phillips. *Orchidaceæ*—1, *Cymbidium aloifolium*, A. Kenrick, Esq.; 2, *Maxillaria Harrisonii*, A. Kenrick, Esq. *Greenhouse Plants*—1, *Chorozema varium*, J. Pope and Sons; 2, *Correa speciosa*, J. Gough, Esq.; 3, *Epacris onosmodiflora*, J. Pope and Sons; 4, *Chorozema Henchmanni*, J. Pope and Sons. *Heaths*—1, Willmoreana, A. Kenrick, Esq.; 2, *Lactiflora*, J. Pope and Sons. *Camellias*—1, Double White, J. Moore; 2, *Pæoniiflora*, J. Moore. *Pelargoniums*—1, Joan of Arc, Mr. Bellis; 2, Foster's Alicia, R. L. Chance, Esq.; 3, *Splendissimum*, J. Cowdry. *Roses*—1, Yellow China, M. Kellett, Esq.; 2, White Moss, Mr. Bellis. *Hardy Shrubs*—1, *Rhododendron hybridum*, M. Kellett, Esq.; 2, *Rhododendron Russelianum*, J. Moore. *Frame Plants*—1, *Trillium grandiflorum*, J. Pope and Sons; 2, *Fumaria nobilis*, J. Moore. *Apples*—1, Scarlet Pearmain, R. L. Chance, Esq.; 2, Silk Apple, R. L. Chance, Esq. *Strauberies*—1, Keen's Seedling, R. L. Chance, Esq. *Beans*—1, R. L. Chance, Esq. *Peas*—1, Early Frame, R. L. Chance, Esq. *Asparagus*—1, Mr. Baker. *Seakale*—1, J. Mist; 2, J. Gough, Esq. *Broccoli*—1, R. Chinn; 2, Purple, R. L. Chance, Esq. *Cabbage*—1, Nonpareil, J. Rodway; 2, Early Dwarf, R. Chinn. *Rhubarb*—1, Myatt's Victoria, Mr. Baker; 2, Giant, J. Mist. *Lettuce*—1, Hardy Green, J. Rodway. *Groups of Flowers*—J. Cowdry.

Dundee Floral and Horticultural Society, May 10.—The first meeting of this Society for the season was held in the Caledonian Hall, Castle-street, when the tables were filled with the best specimens of each class which were ever exhibited in this town. The Auriculas were the principal attraction; but among the greenhouse plants were two or three stands, every plant of which was a perfect specimen. Among the articles sent in for the decoration of the room, were a very handsome group of greenhouse plants, from T. W. Miln, Esq. Greenhouse plants and Auriculas from the nurseries of Messrs. Urquhart and Sons, and Mr. W. Laird; and some splendid seedling Calceolarias, raised by Mr. Coucher, gr. at Saint Fort, which were much and deservedly admired, as well as three splendid Amaryllis, from Sir J. Ogilvy, Bart., and G. H. Newall, Esq. The judges had a difficult task to perform, and the result of their decision was—1, to C. Clark, Esq., for the best 3 green-edged Auriculas—Booth's Freedom, Laurie's Glory of Cheshunt, and Oliver's Lovely Ann; 2, to D. Martin, Esq., for Booth's Freedom, Lee's Colonel Taylor, and Wood's Lord Lascelles. Best 3 grey-edged, 1, to C. Clark, Esq., for Smith's Gen. Boliver, Waterhouse's Conqueror, and Morris's Liberty; 2, to Mr. J. Tait, for Alpine Shepherdess, Pearson's Liberty, and Taylor's Ploughboy. Best 3 white-edged, 1, to C. Clark, Esq., for Campbell's Robert Burns, Taylor's Glory, and Lee's Bright Venus; 2, to A. Eason, Esq., for Taylor's Glory, Wood's Delight, and Lee's Bright Venus. Best variety of var., 1, to Mr. James Jamison, for Oliver's Lovely Ann, Taylor's Ploughboy, Morris's Union, Taylor's Glory, Lee's Bright Venus, and a seedling; 2, to C. Clark, Esq., for Hedges' Britannia, Booth's Freedom, Jeffrey's Bonapart, Lee's Venus, Wood's Delight, and Smith's Mrs. Sim. Best 3 Selfs, 1, to Mr. J. Jamison, for Findlay's Purple of Tyre. Grimes's Grand Turk, and seedling; 2, to C. Clark, Esq., for Sims's Jessie Ann, Grimes's Flora's Flag, and Lowe's Ivanhoe. Best Alpine, to D. Martin, Esq. Best seedling Self, 1, to C. Clark, Esq.; 2, to D. Martin, Esq. Best-edged seedling, 1, to Mr. J. Tait; 2, to D. Martin, Esq. The premier prize given by Mr. Clark, for the best three Auriculas, was won by Mr. P. Brown, gr. to J. Sanderson, Esq., with Wood's Delight, Booth's Freedom, and Morris's Union, as well as the Sweepstakes, with Taylor's Glory, Smith's Gen. Boliver, and Howard's Lord Nelson. Best 3 Polyanthuses, 1, to Mr. J. Tait, for Collier's Princess Royal, Cox's Prince Regent; 2, to C. Clark, Esq., for Pearson's Alexander, Buck's George the Fourth, and Falkner's Black Prince. Best seedling Polyanthus, 1, to Mr. J. Tait; 2, to G. Fyfe, Esq. Best variety of double Primrose, 1, to Mr. P. Brown; 2, to Mr. J. Tait. Best specimen Bulbs, 1, to A. Eason, Esq., for Tropæolum pentaphyllum. Best variety of Bulbs (cut flowers), to C. Clark, Esq. Best 3 Calceolarias, 1, to C. Clark, Esq., for Picta coccinea, Maid of the Mill, and seedling; 2, to Mr. J. Hampton. Best variety of double Anemones, to Mr. P. Brown. Best 6 Pansies in pots, 1, to Mr. G. Simson, for Princess Royal, Haidée, Prince Albert (Silverlock's), Col. Dundas, Lady Flora Hastings, and Jupiter; 2, to S.

Thomson, Esq., for Miss Stainsforth, Diana Vernon, Haidée, Hope, Melon's Napoleon, and May's Complete. Best 6 Pansies (cut flowers), 1, to S. Thomson, Esq., for Henchman's Improvement, Silverlock's Prince Albert, Sylvia, Lord Howe, Queen of Whites, and Junior William; 2, to Mr. G. Simson, for Prince Albert, Col. Dundas, Sylvia, Ritchie's Rival, Defiance, and Isabella. Best 12 Pansies, 1, to S. Thomson, Esq., for Novelty, Earl of Ripon, Peter Dick, Miss Kemble, Success, Prince Albert, Enchantress, Laura superba, Sylvia, Napoleon, Miss Stainsforth, and Queen of Whites; 2, to Capt. Douglas, not named. Best Seedling, 1, to Capt. Douglas; 2, to W. Mason, Esq. Best 3 double Hyacinths, 1, to the Very Rev. Dean Horsley; 2, to G. Fyfe, Esq. Best 3 single, 1, to G. Fyfe, Esq.; 2, to Mr. W. Taylor, gr. to C. Chalmers, Esq. Best double Wallflowers, 1, to Mr. J. Tait; 2, to Mr. G. Sibbold. Best 6 single, 1, to Mr. W. Taylor; 2, to Mr. R. Ritchie, gr. to D. Miln, Esq. Best double Seedling, to Mr. P. Brown. Best variety of Greenhouse Blooms, cut, 1, to Mr. R. Ritchie; 2, to A. Eason, Esq. Best 6 Greenhouse Plants, 1, to A. Eason, Esq., for Pimelia linifolia and Hypericifolia, Azalea indica alba, and Phœnicea, Epacris cæresiflora, and Elchrysium superbum; 2, to Mr. R. Ritchie, for Ceanothus puniceus, Stratiola stricta, Hovea Celsi, Correa speciosa, Polygala speciosa, and Lotus Jac. bœa. Best pair of Epiphyllum, to Mr. J. Dick, for Jenkinsoni and speciosum. Best pair of Heaths, 1, to C. Clark, Esq., for Cerinthoides and Willmoreana; 2, to R. Gray, for hybrida and mammosa. Best Greenhouse Climber, 1, to A. Eason, Esq., for Zychia inophylla; 2, to Sir J. Ogilvy, for Kennedy's prostrata. Best Stove Climber, to C. Clark, Esq., for Thunbergia alata. Best specimen Plant (for beauty), 1, to Mr. Hampton, for Ceanothus puniceus; 2, to Mr. R. Ritchie, for Cytisus racemosus. Best (for rarity), to A. Eason, Esq., for Statice pseudo-armeria; 2, to C. Clark, Esq., for Gesnera faucialis. Best 6 Herbaceous Blooms, 1, to Mr. J. Dick; 2, to Mr. J. Tait. Best Bouquet, to Mr. H. Johnston, gr. to C. Clark, Esq. **VEGETABLES**—Best brace of Cucumbers, to Mr. J. Kid, gr. to Lord Kinnaird. Best two heads of Broccoli, 1, to Mr. G. Sibbold; 2, to G. Fyfe, Esq. Best two Lettuces, 1, to Mr. G. Sibbold; 2, to G. Fyfe, Esq. Best 4 Leeks, 1, to Mr. J. Hampden; 2, to Mr. G. Sibbold. Best 6 old Onions, 1, Mr. J. Kid; 2, Mr. J. Dick. Best 2 Early Cabbages, 1, to Mr. J. Hampden; 2, to D. Small, Esq. Best 12 heads of Asparagus, 1, to Mr. R. Ritchie; 2, to Mr. P. Brown. Best 6 table Apples, 1, to Mr. J. Dick; 2, to Capt. Douglas. Best variety of Apples, to Mr. J. Dick. Best 4 heads of Seakale, 1, to Sir J. Ogilvy, Bart.; 2, to Capt. Douglas. Best 6 stalks of Rhubarb, 1, to Mr. W. Taylor; 2, to Mr. J. Dick. Best basket of Vegetables, 1, to Mr. G. Sibbold; 2, to Mr. W. Taylor.

Cheetham Hill Cucumber Show, May 5.—This Exhibition was held at the Bird in Hand, Cheetham Hill. The money was divided between the dung-grown Fruit and those grown by fire-heat. Sixteen brace were brought for exhibition. The Ipswich Society's Standard was chosen. Besides the Members of the Society, many respectable Amateurs, Florists, and other gentlemen, sat down to an excellent dinner. The awards were as follows:

EXHIBITORS.	Sorts.	Mode of Growth.	Length.	Form.	Size.	Colour.	Neck.	Spine.	Rib.	Bloom.	Blossom.	Appearance.
1. Mr. J. Hamilton, gr. to F. A. Phillips, Esq.	Hamilton's Black Spine	Pine pit, heated by hot water.	27	Straight	Slender.	Very Dark.	Rather long.	Black.	Slight.	Very bloomy.	Fresh.	Handsome, young, and long.
2. Mr. F. Hamilton.	Hamilton's White Spine, not named.	Hot water pit.	24	Ditto.	Rather thick.	Very Dark.	Ditto.	Ditto.	Ditto.	Ditto.	Ditto.	Handsome.
3. Mr. P. Mothershead, gr. to — Bahams, Esq.	Ditto.	Pine pit, heated by hot water.	22	Ditto.	Rather thick.	Dark.	Ditto.	Ditto.	Ditto.	Ditto.	Ditto.	Good and young.
4. Mr. J. Kyle, gr. to — Thomson, Esq.	Walker's Pea Green, and fine pit.	Dung-heat.	20	Ditto.	Ditto.	Glossy.	Small.	Ditto.	Ditto.	Ditto.	Ditto.	Good, but rather damaged.
5. Mr. J. Worth.	Roman Emperor, Ditto.	Stove, heated by fire.	21	Crooked	Thick.	Faded.	Thick.	Ditto.	Ditto.	Ditto.	Ditto.	Old and stale.
6. Mr. E. Clegg, gr. to Mr. Lodge.	Walker's Fine Pit.	Fire Pit.	14	Straight	Small.	Dark.	Ditto.	Ditto.	Ditto.	Ditto.	Ditto.	Handsome, but small.

Six Prizes were also awarded to Dung-heat productions; their length was as follows: First, 15½ and 15 inches; Second, 20 and 18 do.; Third, 18 and 17 do.; Fourth, 16 and 15 do.; Fifth, 16 and 14 do.; Sixth, 17 and 15 do.

South Essex Horticultural Society, May 11.—The first exhibition for this season took place in Wanstead Park. The fineness of the day, with the attraction of the exhibition and the scenery of the Park, drew a great many of the Members and the resident gentry of the neighbourhood. The exhibition was the best that had ever taken place. The prizes were distributed thus:—**Large Collection of Plants, Nurserymen**, Mr. J. Fraser; **Small do.**, Mr. Pamplin. **Gardeners' Class**, 1, Mr. J. Kyle, gr. to R. Barclay, Esq.; 2, Mr. S. Gad, gr. to T. Lennox, Esq. **Small Collection**, 1, Mr. F. Croucher, gr. to J. Allcard, Esq.; 2, Mr. R. Forster, gr. to Rev. W. Wilson. **Amateurs' Class**, Mr. R. Poole. **12 Pelargoniums**, 1, Mr. J. Kyle; 2, Mr. S. Gad. 6 do., 1, Mr. Croucher; 2, Mr. R.

Waterhousiana, Hendersonii, hybrida-pulchella, King, splendens, and populifolia; a pretty variety, named Prince Albert, was in the collection of Mr. Charlton. The Pansies were excellent, and proved how much this old flower has been improved. There were several good collections of Heaths, and that to which the medal was given included well-grown plants of *E. Echiiflora*, *Andromedaeflora*, *rubra-calyx* *Linnæoides*, and *Linnæoides superba*. These were from Mr. Surtees' garden, as well as the prize collection of exotics, which consisted of good specimens of *Boronia serrulata*, *Epacris grandiflora*, a large plant, two varieties of *Chorozema Varium*, *Camellia Laena superba*, *Gesnera tubiflora*, *Begonia coccinea*, and *Maxillaria aromatica*. There were several other fine collections of plants; amongst them were pretty specimens of *Azara indica coccinea*, and of *Chorozema macrophyllum*. The single prize exotic was quite a gem; trained on a flat trellis, it was covered with hundreds of its beautiful flowers. Amongst the rare plants, besides the splendid one to which the prize was adjudged, there was a supposed new species of *Dendrobium*, with pure white flowers, recently imported from Western India, and *Epiphyllum Russellianum* from the same gardens. The bouquets were superb; the first prize was crowded with beautiful and rare flowers, *Pelargoniums*, *Carnations*, *Cinerarias*, *Cacti*, *Gnidiads*, *Salvias*, *Petunias*, *Verbenas*, *Roses*, including *Rosa Devonensis*, and many other forced flowers. In Mr. Reed's were also *Passion-flowers*, and hosts of things we are not accustomed to see in bloom for two months to come. The fine collection of plants sent by Mr. P'Anson and Finney from their nursery, included cut flowers of the scarlet *Rhododendron*, many new *Cinerarias*, such as *azurea*, *compacta*, *Pilot*, *Unique*, &c., *Fuchsia tricolor*, &c. &c. But the day was unfortunately so stormy and wet as any we have had this season. The determination of the Judges gave universal satisfaction. They awarded the medals as follows:—For the best dish of baking Apples, of sorts, the bronze medal to Mr. J. Clark, gr. to Mrs. Bewicke. The best dish of dessert Apples, of sorts, the second silver medal to Mr. J. Clark. The best dish of dessert Pears, of sorts, the second silver medal to Mr. J. Clark. The best collection of Cacti in flower, the second silver medal to Mr. G. Forman, gr. to Jos. Lamb, Esq. The best single specimen of a Cactus in flower, (Ackermannii), the bronze medal to Mr. G. Forman. The best variegated Auricula, (Metcalfe's Lancashire Hero), the second silver medal to J. Hetherington, Esq. The best variegated Auricula, (Privateer), the second silver medal to Mr. J. Watson, gr. to M. Anderson, Esq. The best variegated Auricula, (Stretcher's Empress Alexander), the bronze medal to J. Hetherington, Esq. The best dish of Early Potatoes, the second silver medal to Mr. G. Cook, gr. to E. James, Esq. The best brace of Cucumbers, the second silver medal to Mr. J. Watson. The best six double Hyacinths, from the open ground, the silver medal to Mr. W. Kelly, gr. to A. Doukin, Esq. The best double Hyacinth, from the open ground (Groot vorst), the second silver medal to Mrs. Surtees. The best double Hyacinth from the open ground, the bronze medal to Mr. J. Berry. The best six single Hyacinths from the open ground, the second silver medal to Mr. W. Kelly. The best single specimen of Hyacinth from the open ground, the second bronze medal to Mr. Wilson, florist. The best collection of Cinerarias, the second silver medal to Mr. J. Deans, gr. to Miss Cuthbert. The best Amaryllis, the second silver medal to Mr. W. Kelly. The second best Amaryllis, the second bronze medal to ditto. The best Rose, grown in a pot, (Smith's yellow odorata), the bronze medal to Mr. J. Cook, gr. to E. Collingwood, Esq. The best twenty-four Pansies, the bronze medal to Mr. J. Watson. The best collection of Ericas, the second silver medal to Mrs. Surtees. The best single specimen of Erica, (E. intermedia), the bronze medal to Mr. T. Charlton, gr. to Mrs. Atkinson. The best collection of forced hardy Shrubs, the second silver medal to Mrs. Surtees. The best Polyanthus, the bronze medal to J. Hetherington, Esq. The second best do., the second bronze medal to Mr. J. A. Craigie, Crawcrook. The best bouquet of Jonquills the second bronze medal to Mr. W. Kelly. The best collection of Exotic Plants, the silver medal to Mrs. Surtees. The best single specimen of an Exotic Plant, (*Tropæolum tricolorum*), the second silver medal to Mr. J. Deans. The best single specimen of a new or rare Exotic Plant, (*Cattleya Skinneri*), the second silver medal to G. Wailes, Esq. The best Seedling of any Florist's Flower, now exhibited for the first time, being a distinct and good variety: *Seedling Auricula*, (Dorman's John Buddle), the bronze medal to Mr. M. Dorman. The best bouquet of Flowers, the silver medal to Mr. J. Cook. The second best bouquet of Flowers, the bronze medal to Mr. J. Reid, gr. to W. Losh, Esq. A correspondent has favoured us with another report of the above, which differs in no material respect. He states that this Society has lately been remodelled on popular principles, and is therefore now more likely to advance its great object, that of proving for the innocent pleasure of the whole community.]

The North British Gardeners' Society, April 26.—The first meeting in the season was held in the Calton Convening Room. The show of flowers and vegetables was of a first-rate description, and worthy of the unceasing efforts of the various members of this flourishing Society. Prizes were awarded as under to the successful competitors:—For the 6 best *Auriculas*—Page's Ducks of Oldenburgh, Lawrie's Hertfordshire Hero, Taylor's Gior Hugh's Pillar of Beauty, Oliver's Lovely Ann, and Leigh's Talara—1, to Mr. J. Young, gr. to T. Oliver, Esq.; 2, to Mr. D. Fells, gr. to A. Blair, Esq. For the best 3 Self *Auriculas*—Kexos Grand Turk, Smith's Incomparable, and Oddy's Lady Midleton—1, to Mr. J. Young. For the best seedling *Polyanthus*, 1, to Mr. A. Forster, gr. to Capt. Falconer; 2, to Mr. P. Thomson, gr. to J. J. Vere, Esq. For the best seedling *Auricula*, 1, to Mr. D. J. J. Vere, Esq. For the best seedling *Polyanthus*, to Foul; 2, to Mr. J. Young. For the best double *Wallflowers*, 1, to Mr. J. Mr. Forrester. For the 3 best double *Wallflowers*, 1, to Mr. J. Dowie, gr. to Gen. Robertson; 2, to Mr. J. Addison, gr. to the Earl of Wemyss. For the 6 best *Hyanthus*, 1, to Mr. A. Foulis, gr. to Mr. P. Durham; 2, to Mr. J. Murray, gr. to Lord M'Kie. For the 3 best *Cinerarias*—Rival King, M'Nabiana, and Queen Victoria—1, to Mr. J. Young; 2, to Mr. J. Addison. For the best 3 *Ericas*—Hartnell, Linnæoides, and Vestita elegans—1, to Mr. J. Addison; 2, to Mr. D. Foulis. For the 3 best *Equis*—*pulchella*, *grandiflora*, and *ceræiflora*—1, to Mr. D. Foulis; 2, to Mr. A. Foulis. For the 3 best tender *Exotics*—*Epis*; 2, to Mr. A. Foulis. For the 3 best tender *Exotics*—*Calthe veratrifolia*, *Cymbidium aloefolium*, and *Pleroma hololeica*—1, to Mr. A. Foulis; 2, to Mr. G. Stirling, gr. to Viscount Melville. For the 3 best hardy *Herbaceous Plants*, 1, to Mrs. Forrester; 2, to Mr. J. Young. For the 4 best *Pears*, to Mr. W. Thom, gr. to Capt. Mitchell Innes. For the 6 best *Deer Apples*, three sorts—Ribston Pippin, Nonpareil, and Pal Ribston or Barcelona Pearmain—1, to Mr. J. Goodall, gr. to the New Abbey; 2, to Mr. W. Thom, gr. to St. Germain's. For the 4 best *Baking Apples*, two sorts—Fullwood and Yorkshire Green—1, to Mr. Thom; 2, to Mr. J. Goodall. For the best 12 heads of *paragus*, 1, to Mr. J. Goodall; 2, to Mr. Douglas, gr. to Sir T. Lauder, Bart. For the 2 best *Salads of Rhubarb*—Mr. Viori.—1, to Mr. Cubbertson, gr. to the Earl of Salisbury; 2, to Mr. G. Goodall. For the 2 best *Broccoli*, 1, to Mr. J. Addison; 2, to Mr. J. Douglas. The prize of one half-guinea, for the best variety, of *British Primroses*, 1, to Mr. Alexander Forrest; 2, to Mr. Thom. The following articles were sent for exhibition:—From Messrs. Handasyde, Musselburgh, a specimen in flower, of their new white *Ribes albidum*; also a collection of 22 named *Early Tulips*, from open border. From Alexander Tod, mt. gr., Leith, 12 stalks of Myatt's *Victoria*, or Pineapple flavoured *Rhubarb*, grown without artificial aid; this lot was greatly praised. From the gardens of Capt. Falconer, 3 new *Epimediums*, 18 distinct species of *Narcissus*, and 10 species of *Primula*. From Mr. Thomson, gr., Corstorphine-hill, 20 distinct varieties of seedling *Cineraria*, some of them really fine. A fine seedling *Pelargonium*, raised by Mr. J. Young, Newington Lodge, from Joan of Arc; considered by the judges to be a decided improvement on the parent plant.

Sherborne, Yeovil, and Weymouth Horticultural Society, April 26.—The first exhibition of this society for the season was held at the Town Hall. Though so early in the year, the room was exceedingly well filled with flowering plants, comprising many splendid varieties of Orchidaceæ, Azaleas, Rhododendrons, Cacti, Cinerarias, Calceolarias, Ericas, Auriculas, Roses, Hyacinths, Pansies, &c., &c. The principal object of attraction was a specimen of the Plantain Tree (*Musa Cavendishii*), the property of—Helyar, Esq. The contribution of R. Gordon, Esq., consisted of some remarkably fine specimens of Orchidaceous Plants, *Azaleas*, *Rhododendrons*, *Kalmias*, *Tropæolum tricolorum*, &c., &c. The other principal exhibitors were the Rev. W. H. Turner, R. Pattison, Esq., and J. A. Devenish, Esq., whose Pansies and Auriculas were much admired. From the nurseries of this and the adjoining towns the contributions were numerous and excellent; and the exhibition was altogether far superior to any that has taken place for many years. There was a numerous and highly respectable assemblage of visitors. The exhibition of Vegetables and Fruit was also good, and amongst the specimens deserving special notice may be mentioned the Cucumbers of R. Gordon, Esq., and Mr. Willmott; some extraordinary Pears from the gardens of B. Chandler, Esq., and T. Pooks, Esq., a fine sample of Myatt's Victoria Rhubarb, and some Asparagus exhibited by Mr. Devenish, together with a good assortment of Apples. The Prizes were awarded as follows:—To Mr. Spong, gr. to R. Gordon, Esq., for the second best Kitchen Apples, best Mushrooms, best Cucumbers, best collection of Orchidaceæ, best collection of Cacti, second best Greenhouse Plants, best specimen Greenhouse Plant, best collection of Cape Ericas, best collection of Hardy Plants (forced), best Hyacinths, best collection of Cinerarias, best Roses in pots, and extra for *Ixias* and Pinks. To Mr. Winzar, gr. to R. Pattison, Esq., for the best Lettuce, second best collection of Stove Plants, best collection of Greenhouse Plants, second best *Pelargoniums*, best *Calceolarias*, second best pair of *Auriculas*, second best collection of *Auriculas*, best Cut Roses, and extra for a specimen Greenhouse Plant. To Mr. Stevens, gr. to B. Chandler, Esq., for the best Dessert Pears, best Kitchen Pears, third best Cucumbers, and second best Broccoli. To J. R. Mayo, Esq., for best Dessert Apples, and best collection of Apples. To Mr. Andrews, gr. to H. C. Goodden, Esq., for the second best basket of Cut Flowers, and extra for Kitchen Pears. To Mr. Pottery, gr. to Mr. Goodford, for the second best collection of Apples, second best Dessert Apples, best Potatoes, and *Pelargoniums*. To Mr. Gould, gr. to the Rev. H. F. Yeatman, for the best Kitchen Apples. To Mr. Turner, for the best Pine-apple and Kidney Beans. To Mr. Pridham, gr. to W. H. Helyar, Esq., for the best Strawberries, best Stove Plants, best specimen Stove Plants, second best Orchidaceæ, and the best specimen Cape Ericas. To the Rev. R. G. Rogers, for the second best Asparagus. To Mrs. Parnell, for the third best Asparagus. To Mr. Cooper, gr. to Rev. W. H. Turner, for the second best Strawberries, third best Rhubarb, second best Kidney Beans, second best Lettuces, second best Seakale, second best Cacti, second best Hardy Plants, best Basket of Cut Flowers. To J. A. Devenish, Esq., for the best Asparagus, best Rhubarb, second best Cape Ericas, best Pansies, best pair of *Auriculas*, best *Polyanthuses*, best collection of *Auriculas*, second best collection of *Cinerarias*. To F. C. Steggall, Esq., for the second best Rhubarb, second best collection of Roses in pots. To Mr. Brewes, gr. to R. B. Sheridan, Esq., for the second best Mushrooms, second best Potatoes, best Carrots, best Cabbages, second best Pansies, the second best *Calceolarias*, third best basket of Cut Flowers, and best single *Anemones*. To Mr. Wilmot, for the second best Cucumbers. To Mr. Lucas, gr. to C. A. Moody, Esq., for the best Broccoli. To Mr. E. Watts, for the third best Broccoli. To Mr. Blake, gr. to the Rev. J. Blennerhassett, for the second best Cabbages, and best Seakale. To Mr. Melmoth, for the third best Cabbages. To Mr. Cabell, gr. to Mrs. West, for third best Pansies, second best Hyacinths, best double *Anemones*, and second best *Polyanthuses*. **COTTAGERS' PRIZES:** To T. Babslock, of Sherborne, for the best Cabbages, second best Broccoli, best Greens. To J. Samways, of Mudford, for the second best Cabbages, best Broccoli. To T. Miller, of Yeovil, for the third best Cabbages. To R. Cattle, of Clifton, for the third best Broccoli, third best Greens. To J. Jeffery, of Sherborne, for the second best Greens. The following plants were exhibited by Mr. J. Davison, of Sherborne: *Elichrysium proliferum*, *Epacris impressa*, *pulchella*, *nivalis*, *granadiflora*, *attenuata*; *Pimelea linifolia* and *hispida*; *Correae ventricosa*, *Mirbelia Baxterii*, *Boronia denticulata*, *Cytisus racemosus*, *Azalea Smithii*, *alba hybrida*, *phœnicea splendens*, *Anthocercis viscosa*, *Hovea Celsi*, *Clematis azurea*, *granadiflora*, and *montana*; a splendid collection of Hyacinths, *Ericas* *grandinosa*, *perspicua*, *persoluta*, *coccinea*, *australis*, *colorans verna*, *pubescens minor*, *Willmoreana*, *pyramidalis*, *transparens*, and others; with Pansies, Cinerarias, &c. From the nurseries also of Messrs. Pierce, of Yeovil, and Mr. Webber, of Crewkerne, the specimens were excellent and choice, but too numerous to particularize.

Wolstanton and Pottery Horticultural Society, May 4.—The first exhibition for the season took place in the Town Hall, Eurslem, (by the kind [permission of the trustees,) and afforded to the numerous visitors much gratification. The specimens of florists' flowers (Auriculas and Polyanthuses) were not so good as might have been expected; but the show of Stove and Green-house Plants was most excellent. The principal prizes were awarded to W. Davenport, Esq., E. Wood, Esq., W. Ward, Esq., Messrs. Burgess and Kent, Miller, Shufflebottom, Boon, Outram, and Heath. Messrs. Linter, Stubbs, King, and Hancock contributed much to the attraction of the meeting by their spirited performance of overtures, quadrilles, waltzes, &c.—*Staffordshire Advertiser.*

York Horticultural Society, April 19.—The Spring Show of the York Horticultural Society was held in the Guildhall of that city. A larger company than usual at this season visited the exhibition. The Council Chambers, which were set apart for fruit and vegetables, contained many specimens of a very fine quality, among which may be noticed a fine dish of Oranges, sent by J. Havel, Esq. A dish of Strawberries from Mr. Burnet, gr. to Sir R. Frankland, very fine, also attracted much attention. The chief attraction of the company was a most beautiful specimen of the Orchidaceous plant *Dendrobium densiflorum* (India), from Messrs. Backhouse. The judges awarded the following prizes:—**FLOWERS**.—*Glossa of Auricula*, 1, Mr. Hardman; 2, 3, Mr. Croshaw; 1, Mr. J. Jeff; 5, Messrs. Backhouse. *Grey-edged Anemone*, 1, Messrs. Backhouse; 2, Mr. Hardman; 3, Messrs. Backhouse; 4, Mr. Stevenson. *White-edged Auricula*, 1, 2, Messrs. Backhouse; 3, Mr. Theakston; 1, Messrs. Backhouse. *Self Anemone*, 1, Mr. Theakston; 2, Mr. J. Jeff; 3, Mr. Hardman. 1, Messrs. Backhouse; 5, J. Richardson, Esq. *Shaded Self Auricula*, 1, 2, 3, Mr. Theakston; 4, 5, Messrs. Backhouse. *Dark-laced Polyanthus*, 1, 2, 3, Mr. Outhwaite, gr. to S. Tate, Esq.; 4, Messrs. Backhouse; 5, Mr. Hardman. *Light-laced Polyanthus*, 1, Mr. Outhwaite; 2, Mr. Steward; 3, Mr. Outhwaite; 4, 5, Mr. Steward. *Polyanthus Narcissus*, 1, 2, 3, 4, 5, Mr. Outhwaite. *Hyacinth of any colour*, 1, Mr. Bell; 2, Messrs. Backhouse; 3, 4, Mr. Outhwaite; 5, Mr. Edward, Layerthorpe. *Tray of a Bloom of Hyacinths*, 1, 2, Messrs. Backhouse; 3, Mr. Outhwaite; 4, Messrs. Backhouse; 5, Mr. Hardman. **TRAY OF 24 PANSIES**, 1, Mr. Appleby for Amulet, Alarm, Bathoria, Beauty of Belton, British Queen, Christina, Col. Dundas, Fiana Vernon, Princess Royal, Miss Stainsford, Queen of the Whites, Royal Yellow, Salter's Seedling, Sir John Sebright, Signor Lablache, Victoria splendens, Wild Dutchman; 2, 3, Messrs. Backhouse. 1, *Tray of 12 Pansies*, 1, J. Richardson, Esq. **PLANTS**: *Cacti*, 1, Rev. D. R. Currier, Epiphyllum Ackermannii, var.; 2, C. Harris, Esq., for *Cereus speciosissimus*; 3, the Lord Mayor, for *Epiphyllum Ackermannii*. *Stove Plant*, 1, The Lord Mayor, for *Aschyl-*

nathanus parasiticus; 2, H. Harris, Esq., for Gesneria verticillata; 4, Messrs. Backhouse, for Aschyranthus parviflorus; 5, J. Roper, Esq., for Sinningia cerulea. *Orchidaceae* Plants, 1, Messrs. Backhouse, for Dendrobium densiflorum (India), 2, Messrs. Backhouse, for Gongora fulva, from Demerara; 3, C. Harris, Esq., for Cyripedium calceolus. *Pelargoniums*, 1, G. Hudson, Esq., for Foster's Nymph; 2, Rev. D. R. Carrer, for Synh.; 3, H. Baines, Esq., for Mastigophora; 4, J. Robertson, Esq.; 5, Messrs. Backhouse, for Mastigophora; 6, Messrs. Backhouse, for Elettaria; 7, Mr. Edward, for Zoronia serrulata; 8, Messrs. Backhouse, for Tropaeolum tricoloratum majus; 9, Mr. Appleby, for Epacris impressa; 4, J. Barber, Esq., for Tropaeolum coloratum minus; 5, Mr. Appleby, for Epacris grandiflora. *Azaleas*, 1, J. Roper, Esq., for Phacelia; 2, C. Harris, Esq., for indica alba; 3, Messrs. Backhouse, for Phacelia; 4, The Lord Mayor, for indica variegata; 5, Mr. Theakston, for indica alba. *Kalmius*, 1, Messrs. Backhouse, for Kalmius; 2, Messrs. Backhouse, for Kalmius; 3, 4, Mr. Appleby, Matilda, Malton; 5, Mr. Edward, for E. Hartnell; 6, Mr. Edward, for E. rubra calva; 7, The Lord Mayor, for E. Linnæoides; 8, Messrs. Backhouse, for E. Linnæoides; 9, Mr. Appleby, for Coluna; 10, Mr. Edward, for Coluna; 11, Mr. Appleby, for Coralina; 12, Mr. Edward, for Coralina; 13, Mr. Appleby, for Coralina; 14, J. Roper, Esq.; 15, Messrs. Backhouse; 16, Mr. Theakston. *Sedums*, 1, The Lord Mayor; 2, Mr. Theakston; 3, H. Baines, Esq. *Cactaceae*, 1, Mr. Appleby, for Lady Constantine; 2, Messrs. Backhouse. *Rose trees in pot*, 1, G. Hudson, Esq., for Yellow Noisette; 2, J. Barber, Esq.; 3, Mr. Theakston. *Banksias*, 1, Mr. Edward, for Berberis empetrifolia; 2, Messrs. Backhouse, for Berberis empetrifolia; 3, Messrs. Backhouse, for Berberis empetrifolia; 4, Messrs. Backhouse, for Berberis empetrifolia; 5, Messrs. Backhouse, for Berberis empetrifolia; 6, Messrs. Backhouse, for Berberis empetrifolia; 7, Messrs. Backhouse, for Berberis empetrifolia; 8, Messrs. Backhouse, for Berberis empetrifolia; 9, Messrs. Backhouse, for Berberis empetrifolia; 10, Messrs. Backhouse, for Berberis empetrifolia; 11, Messrs. Backhouse, for Berberis empetrifolia; 12, Messrs. Backhouse, for Berberis empetrifolia; 13, Messrs. Backhouse, for Berberis empetrifolia; 14, Messrs. Backhouse, for Berberis empetrifolia; 15, Messrs. Backhouse, for Berberis empetrifolia; 16, Messrs. Backhouse, for Berberis empetrifolia; 17, Messrs. Backhouse, for Berberis empetrifolia; 18, Messrs. Backhouse, for Berberis empetrifolia; 19, Messrs. Backhouse, for Berberis empetrifolia; 20, Messrs. Backhouse, for Berberis empetrifolia; 21, Messrs. Backhouse, for Berberis empetrifolia; 22, Messrs. Backhouse, for Berberis empetrifolia; 23, Messrs. Backhouse, for Berberis empetrifolia; 24, Messrs. Backhouse, for Berberis empetrifolia; 25, Messrs. Backhouse, for Berberis empetrifolia; 26, Messrs. Backhouse, for Berberis empetrifolia; 27, Messrs. Backhouse, for Berberis empetrifolia; 28, Messrs. Backhouse, for Berberis empetrifolia; 29, Messrs. Backhouse, for Berberis empetrifolia; 30, Messrs. Backhouse, for Berberis empetrifolia; 31, Messrs. Backhouse, for Berberis empetrifolia; 32, Messrs. Backhouse, for Berberis empetrifolia; 33, Messrs. Backhouse, for Berberis empetrifolia; 34, Messrs. Backhouse, for Berberis empetrifolia; 35, Messrs. Backhouse, for Berberis empetrifolia; 36, Messrs. Backhouse, for Berberis empetrifolia; 37, Messrs. Backhouse, for Berberis empetrifolia; 38, Messrs. Backhouse, for Berberis empetrifolia; 39, Messrs. Backhouse, for Berberis empetrifolia; 40, Messrs. Backhouse, for Berberis empetrifolia; 41, Messrs. Backhouse, for Berberis empetrifolia; 42, Messrs. Backhouse, for Berberis empetrifolia; 43, Messrs. Backhouse, for Berberis empetrifolia; 44, Messrs. Backhouse, for Berberis empetrifolia; 45, Messrs. Backhouse, for Berberis empetrifolia; 46, Messrs. Backhouse, for Berberis empetrifolia; 47, Messrs. Backhouse, for Berberis empetrifolia; 48, Messrs. Backhouse, for Berberis empetrifolia; 49, Messrs. Backhouse, for Berberis empetrifolia; 50, Messrs. Backhouse, for Berberis empetrifolia; 51, Messrs. Backhouse, for Berberis empetrifolia; 52, Messrs. Backhouse, for Berberis empetrifolia; 53, Messrs. Backhouse, for Berberis empetrifolia; 54, Messrs. Backhouse, for Berberis empetrifolia; 55, Messrs. Backhouse, for Berberis empetrifolia; 56, Messrs. Backhouse, for Berberis empetrifolia; 57, Messrs. Backhouse, for Berberis empetrifolia; 58, Messrs. Backhouse, for Berberis empetrifolia; 59, Messrs. Backhouse, for Berberis empetrifolia; 60, Messrs. Backhouse, for Berberis empetrifolia; 61, Messrs. Backhouse, for Berberis empetrifolia; 62, Messrs. Backhouse, for Berberis empetrifolia; 63, Messrs. Backhouse, for Berberis empetrifolia; 64, Messrs. Backhouse, for Berberis empetrifolia; 65, Messrs. Backhouse, for Berberis empetrifolia; 66, Messrs. Backhouse, for Berberis empetrifolia; 67, Messrs. Backhouse, for Berberis empetrifolia; 68, Messrs. Backhouse, for Berberis empetrifolia; 69, Messrs. Backhouse, for Berberis empetrifolia; 70, Messrs. Backhouse, for Berberis empetrifolia; 71, Messrs. Backhouse, for Berberis empetrifolia; 100, Messrs. Backhouse, for Berberis empetrifolia.

NOTICES OF NEW PLANTS WHICH ARE EITHER
USEFUL OR ORNAMENTAL.

CAMPANULA GRANDIS. Large Bell-flower. (*Half-hardy herbaceous plant.*) Campanulaceæ. Pentándria Monogýnia.—Introduced from St. Petersburgh under the above name. The habit of the plant is particularly strong and robust, and the flowers, which are usually $1\frac{1}{2}$ inches in diameter, appear in a terminal spike, like those of *C. pyramidalis*. It may either be cultivated in a pot and kept through the winter in a cold frame, to be turned out against a wall with a southerly aspect in spring; or it may be constantly grown in a pot and made to decorate the greenhouse. If increased in the spring by offsets or cuttings, plants of almost any size may be obtained for autumn flowering. Perhaps the best way of treating the species is to keep it always in a pot. *—Botanical Magazine of Botany.*

in a pot.—*Pastor's Magazine of Botany*.
LELIA ACUMINATA. Acuminate-lipped *Lælia*. (*Storæ Epiphyte*).
Orchidacæe. *Gynandria Monandria*.—This beautiful plant was
found by Mr. Hartweg, growing on the trunk of the Calabash
tree, at a place called Retatuben, in Guatemala. It is said to
form a fine corymb of eight flowers, and to be so beautiful that
the Guatemalenses give it the name of "Flor de Jesus." The
pseudo-bulbs are produced regularly and alternately, as well as
with great closeness, on the rachis, and are readily known by
being much flattened and wrinkled. The flowers, which are of
a delicate bluish tint, with the centre of the lip of a rich brownish-
purple, are borne in an erect scape. For cultivating it, nothing
is necessary but a suitable length of wood to support it; and
it can be kept in a warm moist house during spring and summer,
but may be taken to a colder one in winter. At no time, how-
ever, does it require a high temperature.—*Pastor's Magazine of*
Botany.

HÓVEA PUNGENS; var. major. Pointed-leaved Hóvea: large variety. (Greenhouse Shrub.) Leguminosæ. Diadelphia Decandria.—Very closely related to *Hóvea pungens*, but differing from it in the superior size of its leaves and flowers, and the greater robustness of its growth. It was reared by Mr. Low, of Clapton, from Swan River seeds, and flowered with them during the summer of 1841. If potted in the usual mixture of loam, heath-mould, and sand, it will grow vigorously, and it should be kept in a light and airy part of the greenhouse, and potted and watered with care. To render it bushy, the main shoot should be stopped when young, and the young laterals should also be shortened in an early stage of their advancement. There is no difficulty in causing cuttings to root, if they are potted in sandy earth, placed in very slight bottom-heat, and partially shaded. The spring is the best time for preparing them.—*Puxton's Magazine of Botany*

Oncidium microchilum. Small-lipped *Oncidium*. (Stone *Fp. phyt.*) Orchidaceæ. *Cynanchina Molandiana*. This most curious plant was introduced some years ago from Guatemala, by G. U. Skinner, Esq., and was afterwards found in the same country by Mr. Hartweg. Its real situation is near *O. deltoideum*. Although not a very splendid plant, it is far from being undeserving notice. Its very glaucous flower-stem, the snow-white lip and crimson petals, lying, as it were, in the middle of dusky-brown sepals, produce a singular and pleasing effect. It was figured from the garden of J. C. Harter, Esq., of Broughton, near Manchester, in September last. Mr. Wubem Ashton, the gardener to Mr. Harter, also deserves to be mentioned, as having succeeded in flowering the plant before any one else. Mr. Skinner, who discovered the species, has been so kind as to give us the following information on that subject. "The *Oncidium microchilum* I first found on the top of the 'Cuesta de Puente Azules,' some 13 leagues from Guatemala, and sent it to Mr. Bateman in 1833. It was growing on a bare rock, with a quantity of dead leaves and grasses about its bulbs, and its roots woven into the interstices of the rock and mould about it; very much exposed to the sun, except during the middle of the day, when a ledge of rock seemed to afford it a little shade. I afterwards found it in great abundance on the rocky banks of the river Michatayán, from whence the present one now flowered came, and was sent to Mr. Harter and Mr. Gowers in 1840, and arrived in June of that year. I never saw it except in such situations, generally exposed, and always among rocks. It is very fragrant; and in its native habitat I have always observed the sepals and petals darker and more marked than this now flowered here. The temperature generally of the above habitats are 68° to 70°; and, from being exposed, cold at nights." It may be potted in turfy heath-mould, mixed with a few pieces of small potsherds, which will cause superfluous water to pass off freely. The pot should be half filled with potsherds, broken smaller towards the top, and the soil considerably elevated above its brim. During the summer months, while the plant is in a growing state, plenty of water should be given, and the temperature allowed to rise to 80° by day, and fall to 68° by night—giving a slight shade in bright sunny weather. In the winter season very little water is required, and the temperature may be allowed to fall as low as 50° or 55°.—*Botanical Register*.

IPOMŒA CYMOSEA. The White-cluster Ipomœa. (*Stor Perennial*). Convolvulacæ. Pentandria Monogynia. — If all the names given by M. Choisy are really synonyms, it must be confessed that the botanists who have invented them have much to answer for. Thirteen different names for the same plant form rather an unusual supply of confusion even in the bewildering nomenclature of botanists. It is, however, to be said in justification, that at least a portion of the plant is variable in appearance, sometimes smooth, sometimes hairy; and that like other Ipomœas, it occasionally indulges in throwing out angles from its leaves. It appears to be wild all over the tropics of Asia; the Circars and the Moluccas, according to Roxburgh; Amboyna, according to Rumphius, and apparently Java, are its favourite countries. According to Rumphius, the flowers open about nine in the morning, and close at two in the afternoon. The same author tells us, that if the leaves are bruised they stain the skin a red colour, which can only be removed by scrubbing with sand and water. He adds, that the leaves are boiled and eaten as kitchen-garden stuff; and that they are applied to ulcers and tumours in the manner of poultices. It is a perennial, of great beauty, flowering most profusely in the stove. The specimens from which the drawing was made, and for which we are indebted to Mrs. Lawrence, were the most lovely one can imagine, in the month of December, when it is most difficult to procure such things, forming festoons of snow white yellow-green flowers resting upon a deep green shining foliage. — *Botanical Register.*

MISCELLANEOUS.

British Association.—Notice has been given that the thirteenth meeting of this institution will commence in Cork on Thursday, the 17th of August next, when the committees of sections will meet daily from Thursday the 17th to Wednesday the 23d, inclusive, at 10 A.M.; the sections will also meet daily from Thursday the 17th to Tuesday the 22d, inclusive, at 11 A.M.; and the general evening meetings will be held on Thursday the 17th, and Wednesday the 23d, at 8 P.M.

Agricultural Labourers.—About a dozen years ago, when I had somewhat more leisure than at present, I turned my attention much to this subject, and was the means of procuring the allotment, directly and indirectly, of some thousands of gardens to cottagers. I wrote a few observations, especially for those on my brother's estates, in which I mixed up a few hints useful to that class of persons, with directions for the cultivation of their gardens. On two or three occasions I have been applied to for permission to print this for sale at cost-price for distribution, to which I readily acceded. With the omission of the first paragraph, I believe it is applicable for distribution anywhere. I have only two or three copies left, and send one, which may be made any use of you may see fit. I have found, practically, that few will adopt the minutiae in the disposition of the allotment I have recommended; in other respects, the pamphlet has had a very decided effect in connexion with the gardens. At the time it was written I had very great difficulty in persuading any one to undertake the office of parish constable in the parishes I had under my immediate charge, the duty was so onerous in consequence of the loose and predatory habits of the population. At the Court immediately succeeding the first year's trial of this system, and the delivery of the little book to every cottager in two adjoining parishes, the constable of the preceding year offered no objection to re-election, upon which I expressed some surprise. He stated at the Court that he could have no objection, for he really had had nothing to do in his office during the past year, and I never afterwards experienced any difficulty. I lent money to buy pigs to those who required a loan: it was punctually repaid, and with one exception the rents have been regularly paid. The rents paid have been a trifle more than the farmer previously paid, to cover the rates, which are paid by the landlord. I had in the outset great difficulties with the farmers, who were almost universally opposed to the system; but I had the satisfaction of attending a meeting of a farmer's club very recently in this county, at which the subject for discussion was, the comparative advantage or disadvantage of the allotment garden system. There were some individuals who spoke against it, but a strong resolution in favour of it was carried by a very large majority of the meeting, consisting almost exclusively of rack-renters. — *Charles Lawrence.*

"TO THE LABOURERS IN THE PARISHES OF SYDE AND BRIMPSFIELD."

"On my brother's taking possession of the estates lately purchased by him, forming the principal part of the parishes in which you reside, the entire management of them necessarily devolved on myself, as he lives too far off to admit of his personal superintendence. With the knowledge I had of the interest he feels in the welfare of the labouring classes, I felt bound, as his representative, to make early inquiry into your condition; and had it under consideration, as you know, before the beginning of those disgraceful riots which have taken place about the country. These, for a time, put a stop to my proceedings. Your orderly and peaceable conduct, while these disturbances existed in this county, have increased your claims on our consideration. The other proprietors of land in the parish of Brimpsfield entertain the same feeling, and I hope you are sensible of their kind disposition towards you. I feel indebted to them for their liberal aid, and the readiness they have shown on every occasion to lend a helping hand towards carrying into effect any plans proposed for improving your condition. We have now set out allotments of land, to supply all of you with gardens. I have been guided as to quantity chiefly by the number of persons in each family; my intention has been to allot to each of you just as much land as I thought each family might be able to cultivate properly, without interfering with their regular labour for wages. You must always bear in mind that your best dependence is on the wages of labour, and that no member of your family who is able to work and can get work should lose wages even for a day. You must remember also that you have only those parts of the day to deal with that are not engaged in your master's service, and if the land allotted you requires

more time than this for its cultivation, you had better leave a portion of it uncultivated than lose wages. There are seasons at which two or three hours now and then may be of material consequence to you in the garden when they may not be so essential to your masters: there will be times at which two or three hours' extra service are very important to them, and not so material to you. There will be no difficulty in managing this between a good servant and a considerate master without loss of wages, and with much advantage to both parties. Your wants are few, but they are certain; they return every day, and the day's wages must be depended upon to supply them. Your crops may fail with all your pains, but your wages are sure; therefore they must be always your first object. If you stay away two or three days from your work for the sake of your garden, when Saturday night comes you must run in debt at the shop; and I shall by-and-by tell you what comes of this. Every man who has a garden must keep a pig, and consequently must have a sty. I shall have a good deal to say about the pig in another place. As a very large proportion of the cottages in Brimpsfield do not belong to my brother, I cannot help the tenants of those to styes. Such of you must get these ready as soon as possible. You must ask the owners of your cottages to find you materials—planks, slates, and walling-stone; get your masters to haul them for you, and do the rest yourselves. You must also try to get a shed put up against or near to your cottages, to keep your tools, your hog's-tub, and such of the produce of your gardens as you may want to stow away. You are fortunate in having good neighbours, who I am sure will feel disposed to afford you every reasonable assistance in providing yourselves with these conveniences, and who will not be backward in giving this or any other encouragement to the industrious and deserving. Now that you are in possession of your gardens, I think I cannot do you a greater service than by offering you some advice upon the cultivation and general management of them. I shall probably add a few hints on keeping pigs, and on some other matters. The cultivation of the garden is a subject upon which I am very anxious to fix your attention; it is of much greater consequence than you suppose;—indeed, whether the same piece of land be managed well or ill, will make the difference of one-half, or even more, in the quantity of nourishment that it will produce for your families.

"Manure."—The first thing you must do is to make a heap of manure; for unless this be regularly and constantly applied, all your industry and labour will be in vain. Every crop takes some virtue out of the land, and if this be not returned again, the soil will, sooner or later, be completely exhausted.

"Always taking out of the meal-tub, and putting nothing in, soon comes to the bottom."

For this purpose, your pig is the main friend you have to look to. Your heap must be formed as near as possible to the sty, and a little under the level of it, so that it may receive all the runnings. Dig a hole in the shape of a basin, about 3 feet deep in the middle, and about 8 feet over at the top; then puddle this very carefully, full 9 inches thick, and up to the level of the ground, with good clay, perfectly clean, and free from sand, grit, or mould, so that it shall be water-tight. If you can put some plank-stones at the bottom, and round the sides, so much the better, as you will not be so likely to disturb the clay, when moving the dung. This is to be kept in this hole until the heap gets 2 or 3 feet above ground. By these means you keep all the most valuable part of the manure in the heap, instead of leaving it to soak away to waste. Everything that the pig will not eat, all the dirt, and refuse of the house and privy, and even the old clothes, when quite worn out, must be carried to the dung-heap. No opportunity should be lost of collecting a barrow-full of dirt from the roads or other places, always taking care to do no harm to any one else, and not to obtain it improperly. Remember that 'every little makes a mickle.' When your dung wants moving from the hole, wheel it to the small portion of waste land left against each of your gardens for this and other such purposes. Lay it in a heap not more than 3 feet deep; shake it well to pieces as you lay it, and cover over the top with mould 3 or 4 inches deep; it will require once more turning before it is fit for use. When this is done take off the mould, and put it on again after the heap is turned. If I were to explain the use of this covering to you, you would not understand it; therefore, I need only tell you, that it very much increases the power of the manure, which is a great point to those who can make but little at best.

"Laying out the Garden."—Next to manure, the point I wish to urge particularly on your attention is the rotation of crops; by which is meant that you should lay out your gardens, and so forecast your crops, that they should stand on different parts of the ground, every succeeding year. This change does great good to the land in itself; and if it be very regularly followed up, year after year, another great advantage is, that, instead of putting a little manure all over your garden every year, you can bring the whole to bear on those crops which most need it, and every part will get regularly manured in its turn. As the method of laying out and cropping your garden is of the greatest consequence, I am very anxious that you should clearly understand my directions. I have, therefore, taken great pains to make the plan simple, and easily understood; and to render it more plain to you, I have laid down a quarter of an acre (which is the size of most of your gardens) to a scale. See accompanying Plan, where you will find the size of every bed shown in feet, and the number of perches each bed contains. When you have measured out eleven beds, of the sizes marked on the plan, and left an alley, about a foot wide, between

each, you will find that you have just disposed of your quarter of an acre of land, neither more nor less. I have Plan of a Garden, containing one quarter of an acre, or 40 perches or perches, for Three Years.

FIRST YEAR.			SECOND YEAR.			THIRD YEAR.		
1	2	3	4	5	6*	7		
							8	
		6*						9
4	5	6	7					
				8				
7			9				10

								6*
11			1	2	3	4	5	6

The two outer lines represent a walk three feet wide, stoned, round the garden, which incloses a quarter of an acre of tillable ground. The dotted lines represent alleys, one foot wide, not stoned, between the beds. The length of the garden within the walk is 69 yards within a few inches, and the width 17 yards. The following Table shows the exact measurement in feet, and the superficial contents in perches of every bed.

No. of Bed.	Width in feet.	Length in feet.	Surface in Perches.	No. of Bed.	Width in feet.	Length in feet.	Surface in Perches.
1	15	34	2	6*	15	6	$\frac{1}{2}$
2	19	34	2 $\frac{1}{2}$	7	25	21	2
3	15	34	2	8	25	43	4
4	15	34	2	9	25	21	2
5	19	34	2 $\frac{1}{2}$	10	51	46	9
6	15	27	1 $\frac{1}{2}$	11	51	46	9

drawn out the plan in the form you see, because that is the form in which most of your gardens are set out. Some of your gardens are in a different form; some contain less, and others more than a quarter of an acre; but this plan will be just as good a guide to them, as to the rest, if they will attend to the following direction:—To those whose gardens contain a quarter of an acre but are in point of form shorter and wider than the plan, I need only observe, that all the beds must still be made the same size as those on the plan; that is to say they must contain just the same number of feet of surface; that which is taken from the length of any bed must be added to the breadth. Those, whose gardens contain more or less than a quarter of an acre, must diminish or increase every bed in the same proportion as their whole garden exceeds or falls short of a quarter of an acre. If a garden contain 30 perches, instead of 40, every bed must be one-fourth smaller than those on the plan. If another contain 50 perches, every bed must be one-fourth larger than those on the plan, and so in proportion. Take care that you understand this perfectly before you lay out your gardens, otherwise you will get into confusion. I thought that if I gave you only one plan, and described the mode of cropping for 3 years, by reference to that, you might get confused, and make some mistake; therefore, I have drawn a separate plan for each of the first 3 years. At p. 10, I have given the cultivation and the crop for every bed. The numbers of the beds follow the crops; herefore, every number will be cultivated just the same and will have the same crop every year, but it will be in a different part of the garden. If you observe the situation of any crop in the plan for the first year, then mark its place in the plan for the second year; and then, in the third year, you will very readily understand the method I recommend you to follow. If you look to the alleys that go quite across the garden on the plan, you will see that the garden is divided into five principal compartments. The first year, the top compartment of the garden contains beds Nos. 1; 2, and 3; the second year, they are to be moved to the bottom of the garden, and the other crops all move one stage forward to make room for them. The second year, the top compartment will therefore contain Nos. 4, 5, and 6. These will be moved off to the bottom for the third year, and all the rest will be moved one stage forwards as before. The third year, the top compartment will contain Nos. 7, 8, and 9. These will be moved off to the bottom for the fourth year. The fourth year, the top compartment will be No. 10, which will be moved to the bottom for the fifth year. The fifth year, the top compartment will contain No. 11, which will be moved off to the bottom for the sixth year; and in the sixth year, every crop will occupy exactly the same place that it did in the first. If these compartments were of equal size, the same crops would not stand on any part of the same ground for 5 years, that is, till the year 1866. But this is not exactly the case as the plan is drawn; because rather more than one-fifth is required for the late Potatoes, and also for the Barley crop; therefore, a small part of the ground on which these two crops stand must

necessarily be the same as they occupied the year before; that is, to the extent of the difference between the length of these compartments and those in which the Peas, Beans, and Cabbages are; which will be found to be about 3 yards. I do not think this is of much consequence, as in the case of Potatoes, this extra quantity, though twice cropped, will be twice dunged, according to the directions after given; but, if you find by experience that you can make a smaller quantity of Barley and late Potatoes serve, you may divide the garden into five equal principal compartments. There is only one more observation which need be made in this place, which is, that the Early Potato bed and the Onion bed are to be manured, as you will see by-and-by, every year; and (see the plan) as they occupy one side of the garden only, when they have gone once round and come to the same place in 1836, they must be changed over to the opposite side. No. 8 must change places with Nos. 7 and 9, and No. 6 with No. 4.

"Crops.—When you come to this place read over again the last four pages, and examine the plans attentively; and by that time I hope all of you will be perfect in your lesson so far. Having taught you how to divide and lay out your gardens, I shall, in the next place, show you how and when to sow and plant the various crops, and where you may raise winter stuff in addition to the regular crops as shown upon the plan. You have hitherto been too much in the habit of planting any land you could get with Potatoes only, and you will perhaps be surprised at my setting out only about a third of your garden for this crop; I will therefore give you my reasons for this. The first is, that Potatoes yield much less nourishment for the body than many other crops; secondly, they exhaust the land more than any; yet they are so easily cultivated, so seldom fail, and are in many respects so useful, that I allow them, what I think, a large proportion of your garden. There are means by which men of science can find out the quantity of nourishing matter contained in the various produce of the earth. Several articles of food in common use have been examined by very careful and clever men, who have had great experience in performing nice experiments; and you may, therefore, be sure their report is nearly correct, however different it may be from the opinions you may happen to have. You must suppose that you have 100 pounds weight of each of the articles mentioned in the following list; the figures set opposite to each will show you the number of pounds of actual nourishment for the human body which each 100 pounds by weight contains; the remainder passes through the body without assisting in any way to its support.

100 lbs. of Lentiles contain	94 lbs. of nourishment.
Common Peas	93
French Beans (in grain),	92
Broad Beans	89
Bread	80
Butcher's meat, taking one sort with another	35
Potatoes	25
Carrots or Parsnips	14
Greens or Turnips	8

I do not recommend the cultivation of Lentiles (a kind of Pea), because they have a bitter disagreeable taste; but in the year 1555, when there was a great famine in this country, it is said that they saved thousands from perishing.

"Mode of Cultivation.—Having numbered every bed on the plan, I shall now direct the cultivation of each, in its order, for the first year—presuming that you have trenched all the ground before winter, as after directed. No. 1.—In the first week in February sow one row of Prussian Blue Peas, 4 feet from each side of this bed. These will stand 5 feet apart. The first week in April sow a row of Dwarf French Beans, within a foot of the edge on each side this bed, setting the seed 3 inches apart in the row. As soon as the Peas are gathered, dig over the bed, laying the haulm in the bottoms of the trenches as you go on, and plant out Savoys from the seed-bed (to be raised as after mentioned), in rows 18 inches apart; set the plants 16 inches from each other in the row. No. 2.—Dig over the last week in April. In the first week in May, plant out Early York Cabbage from the seed-bed; the rows 18 inches apart, the plants at 16 inches distance from each other in the row. These directions only apply to this first year, as you had not your gardens set out in time to crop this bed earlier. In future, the Cabbage plants, the seed of which is to be sown in August, as directed in No. 6, are to be planted out from the nursery-bed the middle of October, to stand the winter, and come in for spring Cabbage. (See directions as to No. 11, which this bed will always follow.) No. 3, Dig over, as soon as the Lettuce plants in the seed-bed are 2 or 3 inches high; plant out a row of them on each side of the bed, 1 foot from the edge. On the 13th May, or as near that day as possible, sow Kidney Beans (Scarlet Runners), 3 feet within each row of Lettuce plants; set the seeds 3 inches apart. As soon as they are 3 inches high earth them up, and in the course of two or three days after, stick them. No. 4.—Dig over the first week in April, and about the middle of the month sow Dwarf Imperial Peas for a second crop; one row at 3 feet from each edge of the bed, and one in the centre. The Peas I have recommended will do without sticks; but if you can easily get them your crops will be much more abundant. No. 5.—Dig over the end of January, and the first week in February sow 3 rows of Long Pod Beans, at 2 feet 6 inches apart. In the middle of April sow 3 rows more, at the like distance, to come in for a second crop. As soon as the first crop is gathered dig in the haulm deep, level over the ground, and plant out Scotch Kale from the seed-bed, in rows 2 feet apart, and 18 inches distant in the row. No. 6.—Lay about 3 barrows-full of manure over this bed the end of February, then dig it in about 2 or 3 inches under the mould. First week in March sow a row of Leeks round the border, 9 inches from the edge; and sow

Onion seed, broadcast, over the remainder of the bed. As soon as the Onions are taken up plant out York or Barnes Cabbage, at the same distance as the Savoys. No. 6*.—The end of February, level 1 yard square of this bed, and work the surface fine. First week in March sow seeds for Early York Cabbage; sow half another yard with Lettuce seed. In the middle of April, level and work in like manner 4 square yards more, and sow seeds of Savoys, Scotch Kale, Milan Kale, and Borecole, 1 yard of each. In June prepare another yard square, and sow seed of York or Barnes Cabbage. About the 12th of August prepare and sow another yard with Early York Cabbage seed. As soon as the plants in any of these seed-beds are fit to move, get ready a piece of ground on this bed, sufficiently large to take as many plants of the sort as you will want to plant out to stand, and then prick out the plants 3 inches apart every way. You must prick out rather more than will fill the bed in which they are to stand for a crop, as some may fail. This transplanting will make the plants much stronger, and produce finer heads, than would be the case if planted out at once from the seed-bed. Nos. 7 and 9.—Dig over in February; sow Carrot seed in one bed, and Parsnip seed in the other: these seeds to be sown in drills 1 foot apart, the Parsnip seed rather deeper than the Carrot. When the plants come up, thin them out to the distance of from 6 to 9 inches in the row, according to the depth and quality of the ground. The size of these crops will be much increased by loosening the earth to the depth of 3 or 4 inches between the drills occasionally, in dry weather, with a two-pronged hoe. No. 8. Lay eight barrows-full of dung in heaps on this bed in February. The first week in March, throw the bed up in ridges, just two feet apart, leaving your first trench, on each side the bed, 18 inches from the edge. When this is done, you will have 12 trenches. Lay your dung equally along the bottom of each trench: draw about four or five inches of mould down upon the dung, then plant Early Potatoes (the Frame, or Ash-Leaved Kidney,) three or four inches deep, and one foot from each other in the row. You are all apt to plant your Potatoes too near together, under a mistaken notion that, if you plant wide, you are losing ground; but I know, from practice, that you gain Potatoes by it. I plant my own Early Potatoes in rows three feet apart, and in deeper soil than yours. As soon as the plants appear above ground, hoe the whole over lightly; when about four inches high, earth up moderately; in a few days draw up the remaining earth to them. It is a bad plan to put by small Potatoes for seed; good sized, well-grown fruit should be selected for this purpose. If these Potatoes are not all dug for use by the 1st of August, the rest should be got up immediately. The haulm of Potatoes soon rots in the ground, and makes good manure; therefore, when you begin to take up your Potatoes, pick off the haulm of the first row, and lay it on the ground, next the edge of the bed, from which all the mould will have been drawn in earthing up the plants; and when this row of Potatoes is taken up, throw the mould back upon the haulm; proceed thus with every row, making the ground good and level as you go on, ready for the next crop; this will save digging all over again. Plant out Milan Kale, as fast as the first Potatoes are cleared off, to the extent of one half the bed, as this should be planted as early as possible. In the beginning of August, plant out from the seed-bed, Borecole, over the other half of this bed. Set the plants in rows two feet apart, and at 18 inches distance from each other in the row. These will be found very serviceable during the winter and spring. If you think I am providing you with more green food than is desirable, considering how little nourishment it affords, I must tell you that I am thinking of your good friend the pig, as well as of you; and that this ground would be lying idle from July till the middle of April, if it were not thus employed. No. 10. Lay on 12 or 14 barrows-full of manure the last week in April; throw up this bed in ridges, in the same manner as directed for No. 8, excepting that these trenches must be three feet apart. The first week in May, plant late Potatoes. Recollect what I have before said in selecting your seed; and treat this crop, throughout, as I have directed for No. 8; do not let any one persuade you to form the rows nearer than three feet, nor plant nearer in the row than one foot. If the sort of seed you use produces high and strong haulm, the rows should be four feet apart. You should not use seed grown on the same soil more than two years at any rate; it would be better to change your seed and the sort of Potato every year. As soon as the Potatoes are dug up, throw this bed up into ridges, three feet apart, in order that the ground may mellow, and work fine for the Barley crop, which will always follow the Potatoes. No. 11. This bed is intended for Barley, and ought to produce more than enough to fatten the pig thoroughly. I shall not pretend to offer you any advice about this crop, for I suspect you know much more about it than I do. As soon as the Barley is off, you should lay out beds Nos. 1, 2, and 3, for the next year's crop. Dig over the barley stubble, where the bed No. 2 will stand the next year, and get it ready for the Early York Cabbage, to be planted out in the middle of October. The other two beds may be ridged up to stand the winter. The farmers will give you good wheat straw in exchange for your barley straw, which will be more serviceable to you, to thatch your Potato heap, and to litter the pig. Having gone over every bed in the garden, the plans will be a sufficient guide to you for the cropping for the second and third years; you will then proceed with the same plan during the fourth and fifth years, moving every crop forward on the ground one compartment each year, and in the sixth, they will all come round to the same places they are to occupy in the first.

[We shall complete this at an early opportunity.]

GARDEN MEMORANDA.

Messrs. Loddiges', Hackney.—The Orchidaceous houses at this place are now shaded for the season; the material used being broad bands of straw, which are twisted loosely, and stretched across the roof, on the outside, at about a foot apart. They are kept on permanently, and the loose and straggling straws seem sufficient to shade the spaces between the bands. All the principal houses here are now heated by Rogers's conical boiler, which is found to answer admirably. In the Orchidaceous stoves there is at present in bloom *Oncidium bifolium*, one of the showiest and most interesting of the tribe for growing on blocks, and suspending. It has been flowering for several weeks. The delightful little *Mantisia saltatoria*, the column of whose flowers oscillates with the slightest touch, and which is called from this circumstance, as well as the gracefulness of its motion, "the dancing girl," is developing its purple and yellow blossoms very numerous. *Galeandra Devoniana*, a noble species, the superb *Vanda teres*, *Cammarotis purpurea*, a variety of the fine old *Maxillaria Harrisoniae*, with nearly pure white sepals and petals a large specimen of *Phaius bicolor*, *Cœlogyne undulata*, a rare but not very specious plant, *Dendrobium fimbriatum* and *densiflorum*, with their splendid orange blooms, and a new *Dendrobium*, from Manila, with tall stems, like those of *D. undulatum*, but not swollen at the base, and which has borne strong upright racemes of peculiar and elegant flowers for the last two or three months, are also flowering finely. There is likewise the pretty new *Eria longilabris*, with long racemes of white blossoms, which become reddish in the centre of the lip, and *Pleurothallis strupifolia*, a singular species, with interesting pink and brownish mottled flowers. In a cooler house, and exhibiting, by the richness of their colours, the desirableness of retarding the floral development of these plants, as well as the necessity of keeping them back, for succession, are *Dendrobium pulchellum*, in all its loveliness, *D. undulatum*, with its flowers stronger and darker than common, and several *Oncidia*. Placed in a corner of this erection is a gigantic specimen of *Tamias elephantipes*, or the Elephant's foot; its singular trunk, or stem, about two feet high and two feet six inches in diameter. It is now throwing out young shoots from its summit. The delicately white-flowered *Dendrobium Heyneanum*, and the curious little linguiforme, are blooming in the same house. The stove plants in blossom are, *Tillandsia xiphioides*, which is growing in the midst of a basket of some small *Dendrobiums*, and bearing white Iris-like flowers, which have a most delicious scent of Lemons. It is a delightful species for hanging up in a stove, as it will subsist entirely on air and water, without any soil. *Epidendrum selligerum*, one of the sweetest of Orchidaceous plants, and hardly inferior to *E. ionosmum* in fragrance, is blossoming near it. *Begonia manicata*, a new species, with singular frill-like appendages to the stalks of its leaves, is just passing out of flower, having been in a blooming state several months; it produces airy panicles of pretty whitish blossoms. *Cyrtoceras reflexa*, another plant which has been blooming since the winter, is still bearing its waxy inflorescence most abundantly. *Petræa Staplesi*, which has lately been most splendid, clothed with its fine drooping racemes of blue flowers, is just passing away. Proceeding to the greenhouses, we observed, among the bulbs, the lovely *Babiana bicolor*, with its ornamental blue and white flowers nicely open. *Boronia aemulaefolia* has been blossoming in extraordinary quantities this season, and is a valuable shrub for the greenhouse. We saw, too, a large stock of the scarce *Chorozema ovata*, in much superior health to that in which it is ordinarily met with. A widely-spreading specimen of *Berberis empetrifolia* was covered with its small golden flower-balls in one of the pits, and strongly recommends itself to notice. On the margin of an out-door cistern, was the double variety of *Caltha palustris*, an extremely beautiful plant, well adapted for either aquariums or any wet places. Messrs. Loddiges have commenced using charcoal pretty largely in the culture of their Orchidaceæ, and it seems to be admirably suitable. They also char the surface of the blocks of wood on which they suspend these plants, and by this means the wood is rendered more durable; there is no bark to peel off by decay and carry the plant along with it; a favourable surface is formed for the roots of the plants to cling to, and all the fungi which appear so numerous on common logs appear to be prevented from fastening on these.—E. K., May 11.

Reviews.

Remarks on the Management of Orchidaceous Plants, with a Catalogue of those in the Collection of J. C. Lyons, Ladiston. (Private Circulation.)

THIS little work has been gratuitously circulated, by J. C. Lyons, Esq., of Ladiston, Ireland, in order to remove out of the way of amateurs the difficulties which he himself experienced at first in the cultivation of the interesting tribe to which it relates. It is divided into a general essay on the Culture of the Orchidaceæ; a Calendar of Monthly Operations necessary in effecting the same, and a descriptive list of those which the Author possesses, with a few superior ones not in his collection. The last section includes a number of excellent hints adapted to the members of each genus separately. In the first, the subject is treated more in the abstract; and all the plans suggested are carefully based on the principles of science. The Epiphytal kinds, or those which grow on trees or other objects, from which they receive no nourishment, are arranged in four classes, as follows:—

"1st. Those species found in low dense woods, where scarcely any sun can penetrate. These, therefore, require shading from the rays of the sun, either from large plants in the house, or from creepers, or by some other means, and must have a hot and moist atmosphere. 2d. Those species found growing on trees, near to open brakes in the woods, where they receive a little sun, plenty of light, and a free but damp atmosphere. These should have a similar atmosphere, but will endure more sunshine than the last. The greatest part of the species come under this head. 3d. Those species found growing on single trees, in damp but exposed situations. These must also have a damp atmosphere and plenty of heat; but they thrive best if exposed to the sun, except just at mid-day, for although the sun in the tropics shines with great power, it must be remembered that the plants receive considerable shelter from the branches of the trees, (although standing single) on which they grow. 4th. Those species found growing on single trees, in elevated situations, where they are subjected to a drier air, and the burning rays of a tropical sun. These, therefore, require a lower temperature, less humidity, and nearly a full exposure to the rays of the sun."

Having spoken of the season of rest, the Author goes on to mention the growing period, and on this head he observes,—"About five o'clock, or as soon as the heat of the sun is rather on the decline, during the months of June, July, and August, it will be found of the greatest benefit to give the plants a thorough good syringing, with

water the same temperature nearly as the atmosphere of the house, after which it should be shut up close for the night; the temperature will increase frequently beyond 100 degrees, but I never have experienced any injury from that heat; in fact, as long as the atmosphere is saturated with moisture, the plants will not be injured by heat. When I use the term syringing, I wish it to be understood that I do not mean such a process as is generally performed on other plants, where the destruction and removal of the green-fly is the object. Epiphytes are not a species of plants much infested with them; I have never observed them on my plants, and although they may be frequently seen on the various creepers in the house, notwithstanding the great moisture, still they appear to avoid the Orchidaceæ. My mode of syringing, therefore, is in imitation of a plentiful, gentle shower of rain, let fall on the plants, not driven against them with an upsetting force."

Mr. Lyons likewise adopts the plan, of which he claims the origin, of introducing steam into the house, every evening during summer from the boiler. But the chief novelty in the work is the design for a stand for the Epiphytal species; it is called by the rather un-English term of the "Oniscamantic stand," and is thus directed to be made.

"Procure from the potter a pan generally known as a feeder, with a raised centre and a hole in it, into which the forked branch of a tree is to be made fast. In the forked part the plant is to be fastened with zinc or copper wire, and the roots covered with moss. The branches can be cut to any desired length, so as it does not overbalance the bottom. I have them from 12 to 36 inches long. The bottoms of the feeder should be made thick and heavy, which will cause it to stand steady and firm. They may be made of different sizes, and the branches cut to different lengths. Should the plant increase in size and weight so as to become unsteady, a larger bottom can easily be substituted. I have several plants of *Oncidium*, *Papilio*, *Stanhopea*, *Lælia*, and *Catasetum*, &c., growing in the forked branches, which succeed remarkably well; the foliage of all the plants so grown is much more luxuriant, and of a darker and richer green than those grown in lumps of peat, and at this moment (November) the branch of the tree is covered with the roots firmly attached to it, having in many instances penetrated the bark. They were, until the idea of the stand in their present state occurred to me, fixed in common pots, made steady with yellow clay pressed hard, but those in the stands are much preferable, as they contain a quantity of water in the feeder, which prevents the attacks of insects and also contributes to the moisture of the atmosphere by evaporation. I am strongly of opinion they will be found an excellent improvement on pots for almost every Epiphyte, and will not occupy more space, beside they have the advantage of allowing smaller plants to be placed between them."

Of this stand, again, it is remarked that it supplies "A natural material to grow on; a perfect drainage; a safeguard in a great measure against insects; it takes up less room in a house, is not more expensive than pots, and is far more pleasing to the eye; besides all which, it enables the growers to adopt a far more natural climate and system of treatment. The plants will be enabled to assume a more natural position of growth, which we know in many instances to be a downward position: this will prevent the wet from lodging in the young shoots and destroying them."

Mr. Lyons informs us that some cultivators have objected to it, because the bottom of the branch placed in it will necessarily decay. He states, however, that this may be easily remedied by cutting off the decayed portion, and inserting it afresh: others fear that it will become too heavy at the top and get overbalanced; but Mr. L. says that this never occurs with him, though he has large and heavy plants on the top of some of them, provided due care is taken in syringing. On the whole, the plan seems original, and likely to prove useful to cultivators, by dispensing, to a great extent, with all kinds of pots for the Epiphytal species. The work is, indeed, altogether calculated to be of service to inquirers, and the benevolent design of the Author must assuredly be appreciated.

CALENDAR OF OPERATIONS for the ensuing week.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—After this time many good gardeners do not put much stress on the bottom-heat, which must now be fast declining in the spring made beds. It is, however, a good plan to have the bottom-heat a few degrees higher than the average of the top-heat. There will soon be a good opportunity for adding a little fresh tan, when the young stock is being examined to ascertain which of them wants potting. Except those with ripe fruit, the whole should now have a very moist atmosphere.

VINERY.—Now is about the right time to determine what kind of grapes will best suit the family late in the autumn and the early part of winter. For private families who keep little company at that time, small bunches with fine large berries are the most economical; but for "parties," large bunches and berries should be produced, if only for appearance sake. To leave plenty of bunches is the way to have them small; and to thin out the bunches and the berries will cause both to be larger. The extent of thinning in either case must be left to him who knows the state of the Vines; the greatest fault with us all is leaving too much fruit to ripen.

PEACHES AND CHERRIES.—These houses must now be kept very dry till all the fruit is gathered.

FIGS.—These gross feeders will now require to have the soil constantly moist about their roots, whatever stage their fruit may be in.

MELONS.—There have been many very good hybrid varieties of these obtained within the last few years, by crossing our best old ones with the large Persian varieties. The rambling habit of the Persians is thus reduced, and the fruit partakes of an intermediate quality between both parents; still they are too large for private use, and might easily be reduced by crossing again with the old small green-fleshed sorts. Keep up a brisk heat and a moist atmosphere, with abundance of air while the fruit is swelling. For merely swelling the fruit a close atmosphere is best, but it injures the health of the plants, and a sickly plant never ripens a wholesome fruit.

RIDGE CUCUMBERS, TOMATOES, or any other of the half-hardy plants of this department not yet planted out, may now be done, and if the weather is windy or very dry, a few boughs or some other screen should be placed round them till they begin to root freely. Capsicums are generally the last of these to be planted out, and they will do by and by.

Out-door Department.

BROCCOLI AND CAULIFLOWER.—From the 20th to the 25th of May, the last sowing of autumn Broccoli and late Cauliflower should be got in. Former sowings of these should be carefully looked to; see that the plants are not too thick. Prick out some of them, and plant out the strongest.

TURNIPS AND SPINACH.—Here are two fastidious crops at this season. A few days of dry weather, and they are up in flower, unless well watered and well thinned; so that often, and a little at a time, is the best rule for them.

CARDUONS AND ENDIVE.—The last sowing of the first of these, and the first sowing of the other, may be now got in; almost everybody likes blanched Endive in salads, yet few people care much about Carduons; but if the cooks find out you have none, you will not forget sowing them again, if you should never see a Calendar.

CELERY.—A few plants, or, if you have plenty of ground, a good many plants of the most forward may now be put out; but many of them will run to seed.

SUMMER CROPS.—One of the best rules that can be given in a general way for sowing these, and also for planting out afterwards, is to do the work often and but little at a time; it is always better to have something to spare, if it goes to waste, than to run short of anything. Every dull, damp, or wet day, to the end of August, some things will have to be sown or planted, or pricked out and thinned.

EARLY POTATOES.—As these have been planted rather deeper than the main crops, I think it is better to keep the soil well stirred between the rows than to earth them up; and they will come in sooner that way.

ORCHARD.—Get soapsuds from the nearest laundry; it is the best nostrum of any that have been recommended for washing insects off trees; it is also a good liquid manure. Tobacco-water is better, if you do not mind the price; but then you must make it yourself. Nine-tenths of the tobaccoists, judging by their "liquor," belong to the anti-cruelty society. You can make good tobacco-water at the rate of sixpence a gallon by using the coarsest tobacco, and pouring boiling-water on it. See that all your Strawberries have some clean mulching, to prevent the soil splashing on them in showery weather. Many people have the good sense to thin all their wall-fruit as regularly as Grapes; and as the fruit set so thick this season, others would do well to follow their example.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—If you have propagated enough of these plants, the general management of an established collection is easy enough now; all are in active motion. The eye should have most of the work to do now; any one may water, shade, and give air, if you tell him how and when; but it requires more than this to see that plants are enjoying their existence—if you will allow the expression.

GREENHOUSE.—Get all your best specimens into the more favourable places, and see, by all means, that they are not too much crowded; half a dozen well-grown plants are better than a score of the ordinary run. If you have good plants of the Chinese Azaleas you might force some of them now to finish their growth and set their flower-heads; this would enable them to flower earlier next spring. Almost all sorts of plants require large portions of water now. Never allow the syringe to be used till every pot in the house is watered.

CONSERVATORY.—The advantage of two or three dozens of good stove plants will now be perceived in the conservatory, as these keep so much longer in flower through the summer here than if left in the stove, and are more at home than greenhouse plants. Let the plants here have a good deal more room now; it would be quite out of character to see this house crowded in summer, as if we had no flowers out-of-doors, even if plants were not injured by it. Keep the air as cool and moist as your means will allow, and do not turn out a fine specimen plant after passing out of flower if you have not a better place for it elsewhere.

PITS AND FRAMES.—These are applied to so many purposes from this time till next September, that no Calendar can anticipate the different treatment in all cases. Where plants are more an object than fruit, cold pits are the very best places for Heaths and all delicate greenhouse plants, and to such the summer directions will mainly apply.

Out-door Department.

Planting out the flower-beds engrosses all the time and attention of nine-tenths of the gardening world about this time. A good deal of the success depends on the manner of planting, simple though it be. If the beds are newly dug, as they ought to be, you must plant an inch or two deeper than the plants stood in the pots, to allow for the settling of the ground; and the whole should get a good watering before the surface is smoothed down. Mignonette, to flower late in the autumn, is always sown at the same time as the last spring sowing of Cauliflower in the kitchen-garden. *Nemophila insignis*, *Sanvitalia procumbens*, *Virginian Stock*, *Sweet Alyssum*, and a few other common low annuals, if sown now, and again three weeks hence, will flower till overtaken by the frost. Roses require particular attention now. Of all our plants in the open air, the Rose and the Peach suffer most from want of water when producing a good crop of flowers or fruit; both are also very fastidious about soils, and unless both are indulged with moist, friable loam, of a firm texture and on a dry bottom, they will require the greatest attention that can be paid to them about this time, and for some weeks yet, especially in keeping them free from insects and well supplied with water at the roots.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the Week ending May 18, 1843, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending May 19, 1843.

In consequence of the extreme coldness of the weather during the past week, the garden produce has not altered much since our last Report. Grapes, however, are greatly on the advance, and the market is exceedingly well stocked with them. The major portion of them, too, are very fine and well-coloured. Peaches are scarce and inferior; and there are only a very few Nectarines, which are small and poor. Forced Strawberries are beginning to decline. There are some extremely good Melons. A large supply of Apples is yet exhibited; Spring Carrots, Turnips, and Lettuce, improve but slowly, though the last are pretty numerous. There is now a great variety of culinary and medicinal herbs. We noticed some enormous stalks of Myatt's Giant Rhubarb. Of Cut Flowers, we observed *Erica hybrida*, *Hoya carnosa*, several kinds of Pinks, *Pergularia odoratissima*, some beautiful hybrid Rhododendrons, *Kalmia latifolia*, Tree Pæonies, *Crinum amabile*, *Astelma eximium*, Scarlet Pelargoniums, Carnations, and Heliotropes. There were potted plants of *Daphne cneorum*, *Epacris grandiflora*, *Fabiana imbricata*, Scarlet Pelargoniums, Pinks, and varieties of Rhododendron ponticum, that have not been previously named.

PRICES, SATURDAY, May 20, 1843.—FRUITS:—

Pine Apple, per lb. 6s to 10s	Lemons, per doz. 1s to 2s
Grapes, hothouse, per lb. 4s to 8s	— per 100. 5s to 12s
— Spanish, per lb. 1s to 1s 6d	Cucumbers, per brace, 1s to 3s
— Portugal, per lb. 1s to 3s	Walnuts, per bush., 12s to 18s
Apples, dessert, per bush., 8s to 16s	Chestnuts, per peck, 4s to 8s
— Kitchen, per bush., 6s to 10s	Almonds, per peck, 6s
Pears, dessert, per lb. 2s to 3s	Sweet Almonds, per pound, 8s
Strawberries, forced, per doz., 6d to 1s	Filberts, English, per 100 lbs. 50s to 55s
Gooseberries, per half-sieve, 5s to 7s	Cob Nuts, per 100 lbs. 60s to 70s
Currants, per pottle, 8d to 1s	Nuts, per bushel —
Apricots, per pottle, 1s 8d to 2s	— Brazil, 10s
Oranges, per doz., 1s to 2s 6d	— Spanish, 18s
— per 100, 6s to 18s	— Barcelona, 24s
— bitter, per 100, 6s to 20s	— Cob, 12s

VEGETABLES.

Cabbage-plants, per doz. 1s to 2s	Shallots, per lb., 1s to 1s 6d
Cabbages, per doz., 6d to 1s 6d	Asparagus, large, per hundred, 4s to 6s
Cauliflowers, per dozen, 6s to 14s	— Spruce, or Small, per bun. 1s 6d to 2s 6d
Broccoli, White, per bunch, 2s to 4s	Pears, forced, per bush., 20s
— Purple, do., 1s 3d to 2s	Lettuce, Cabb., p. hf.-sieve, 1s to 1s 6d
Beans, Kidney, forced, p. 100, 1s 6d to 3s 6d	— Cos, per score, 6d to 1s 6d
Potatoes, per ton, 80s to 100s	Endive, per score, 6d to 1s
— per cwt. 4s to 5s	Celery, p. bd., (12 to 15) 6d to 1s 6d
— per bushel, 2s to 2s 6d	Rhubarb Stalks, per bd., 4d to 1s 3d
— Kidney, p. bush., 2s to 2s 6d	Small Savais, per punnet, 3d to 3d
— Scotch, per bushel, 2s	Green Basil, per bunch, 6d to 1d
— New, per lb., 6d to 1s 6d	Watercress, per doz. sm. bun. 4d to 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Parsley, per half sieve, 6d to 1s
Turnips, per doz. bun., 3s to 5s	Tarragon, per doz. bunches, 2s to 3s
— Spring, per bunch, 6d to 2s	Fennel, per doz. bun., 2s to 3s
Red Beet, per dozen, 6d to 1s	Mint, per doz. bunches, 2s to 3s
Horse Radish, per bundle, 1s to 6s	Marjoram, green, per bunch 6d to 9d
Radish, spring, p. doz. hands, 6d to 1s	Majorana, per pottle, 6d to 1d
— Turnip, p. doz. bunch, 9d to 1s	Spinaich, per sieve, 1s to 1s 6d
Carrots, per doz. bunch, 6s to 8s	Leeks, per doz. bun., 5s to 6s
— Young Horn, per bun, 6d to 1s 6d	Onions, per bushel, 5s to 6s
— Spring per bunch, 6d to 1s 6d	— Spring per bunch, 3d to 6d
Paraneps, per dozen, 6d to 1s	— Pickling, per ht.-sv., 4s 6d to 5s
Garlic, per lb. 6d to 8d	— Green, p. doz. bun. 2s to 4s
	— Spanish, per doz. 2s to 4s

Notices to Correspondents.

SEEDLING FLORISTS' FLOWERS.—We beg our correspondents under this head will bear in mind that our opinions are public, for public purposes; and that we CANNOT GIVE PRIVATE OPINIONS; and also that in future all varieties must be named, or we cannot in future undertake to notice them. In the words of a correspondent, a favourable opinion from us gives a flower a certain value, and renders it immediately a marketable commodity; but it is possible that such opinions may be used for purposes of imposition. A name is some guard against this; we must therefore request that all flowers, before they come to us, may bear the name it is proposed they should eventually receive. If our judgment is favourable we will give the name at full length. If unfavourable, the initials only will be given. Numbers must in future be discontinued.

TO CORRESPONDENTS.—We must again mention that it is not in our power to spare time for naming collections of common flowers, ill selected, and worse packed; and we would beg our correspondents not to put themselves to the expense of sending, or us to the pain of neglecting them. It is unreasonable to expect us to give up valuable time to the examination of little fragments of common plants, whose names the inquirer can obtain of the first gardener in his neighbourhood. We are most ready to afford information on such points to a reasonable extent, but there must be a limit to such inquiries. We should say that one or two plants are as many as it can generally be necessary to send at a time. In future, when heaps of plants are sent us, we trust to be excused for not noticing them at all.

WHAT.—*B. A. B.*—Your Wheat has suffered from the cold nights, but it will probably soon recover. You may try some nitrate of soda as an experiment; but if there is a good plant on the ground, it may not be necessary. The nitrate cannot be too finely powdered; if it is dissolved in water its effect will be more certain. It is seldom expedient to sow Wheat on light land after Potatoes. *M.*

WOOD-PAYMENT.—*An Old Subscriber.*—We regard this as a branch of road-making, and not inapplicable to rural economy. We shall be happy to insert any communications on the subject.

MANURES.—*Corycius.*—There is no doubt that guano will greatly improve every kind of herbage, provided it be put on in rainy weather, or mixed with water as a liquid manure. In very hot weather it would probably burn the grass. You may safely put it on that part which had gypsum. This last is very uncertain in its effect; we have never found much benefit from it on grass land. *M.*—*Rural Chemistry.*—Waste grass may be put with stable dung, and made part of the manure heap, as recommended in the *Gardeners' Chronicle*, (vide April 1.) or it may be put into a heap of compost, consisting of the refuse of a yard with wood-ashes and other burnt rubbish; but it is much better first to reduce it with gas-water, which rots it speedily, and then to add it to compost-heaps. Ashes may be mixed with earth directly after they are made; but if they are exposed to the weather they are apt to be washed out again. They should be kept dry till wanted. No addition to a compost heap is more useful than the fluids that can be collected in a house, and they cost nothing. Our columns are already full of directions relating to these subjects.

LIQUID MANURE.—*T. A. N.*—It may be applied to Rose-trees throughout the spring and summer; it is of no consequence whether the weather is moist or not; only take care you do not overdo the Roses, and make them run too much to wood. **GARDENS.**—*Ovis.*—Your walls are low, but will do with good management; your difficulty will be with Pears. All precautions for keeping the cob dry are of little practical importance, so far as the trees are concerned. As to thatching it, your covering must not on any account extend more than 6 inches beyond the face of the wall. You will find in previous Numbers abundant information about forming your borders; the best rules are to give fresh soil, not too rich, or your trees will all run to wood. Good loamy turf and some stable-dung are enough. As to blood, and all those forcing substances, they are fit for nothing but Vines. Good leaf-mould is excellent; rotten grass, powdered charcoal, wood-ashes, and such matters are much better than azotised substances. Fruit-trees on walls are not of animal manure. *+*

SOILS.—*Quercus.*—We do not conceive that the soil in which an

old gigantic Walnut has grown for a couple of centuries would be exhausted of the nutriment required by Firs. At all events, if the Walnut-roots were grubbed up and burnt, and the ashes restored to the soil, any loss would be compensated for.

BOTTOM HEAT.—*T. A. N.*—We will give you some information on this subject shortly; in the meanwhile consult *Rendle's System of Tank-heating*, lately published.

VINES.—*E. S.*—We have never heard of the effect of Wine lees as a manure; but it is probable that they will be very useful. Do not, however, be rash, but try them on one or two plants first, and in small quantity at a time.

GRAPES.—*Vitis.*—You say that your Hamburgh Grapes are grown in a house heated by brick flues, and that from being placed in a very low situation, surrounded by water, the stone-holes are nearly all the year half-full of water; that the flues are now in a very filthy state, so that when heated they produce a very sooty smell. You add, that for 12 years you have had good crops from these houses, till the last three years, when the flues have got so bad. You ask us why your Grapes are attacked with rust? Be thankful that it is no worse. Immediately advise your master to pull down his flues, raise up his borders, apply a hot-water apparatus, and thus cure the evil at once. Your half-ripe bunch of Grapes shows you to be a good gardener; and it will be a real misfortune to both you and your employer if things are allowed to remain as they are.

VICTORIA VINE.—*N. B. G.*—It has been before explained in this Paper that the above is not a new variety, as you will find by referring to p. 787 of our 2d volume.

FERTILIZATION.—*D.*—When one plant is to be fertilised by another, you should proceed thus: From the plant to be fertilised, just before the flowers are ready to expand, cut out the little threads which produce the powder (or pollen), and leave untouched the pointed body (stigma) in the centre; then from a flower which is to fertilize take some of the powdery heads (anthers), and with them touch the stigma; then envelop the branch of the plant on which the operation has been performed with a piece of coarse muslin for a few days, so as to keep off insects. In general, you will find that the seedling is more like that from which the pollen is taken than the other. We hope these directions are sufficiently clear.

AMERICAN CRESS.—*F. G.*—This is, more properly, the *Belleisle Cress*, or *Barbarea praeox*. It can be sown thinly in drills, or broadcast on a small bed, and may be cut like the common or Curled Cress, but not too close to the ground.

AZALEA INDICA.—*N. P.*—This plant and its varieties are commonly placed out of doors in a rather shaded situation, after they have ceased flowering; but it is probably the better plan to keep them in the greenhouse tolerably well exposed to light, and not to water them too abundantly while they are ripening their wood. They must not, however, be suffered to flag from drought, as a repetition of this sometimes kills them.

PAUSONIA IMPERIALIS.—*D. C. L.*—We should certainly think this tree would be hardy in Dorsetshire, particularly if it be placed in a situation sheltered from cold winds, and at the same time duly open to the sun.

DAPHNES.—*Louisa.*—If your plant is the *D. odora*, you probably do not expose it enough to light in summer, and may keep it too cold in winter. Give it warmth and bright light when growing, and a good warm greenhouse in winter, and it will scarcely fail to flower.

RHODANTHE MANGLESII.—*Wellensis.*—The seeds of *Rhodanthe Manglesii* should be sown at two seasons: the first about the beginning of September; the second about the end of February. The soil the seeds are sown in should be rather strong, but not rich, for the first sowing; consisting of a mixture of sandy loam and leaf-mould: they should be sown in pots, and placed in a cold pit or frame, (if sown in the autumn,) which should be kept close until the plants are up. The young plants should be potted off when small, for if allowed to get large before potting they never do any good; put a single plant into a small 60-pot; they must then be returned to the pit or frame, and kept close until they recover the effects of the shift; afterwards harden them by admitting air. Then, when there is danger of frost, remove them to an airy part of the greenhouse for the winter, taking care that they are not over-watered; for much depends on the manner in which they are treated during the winter, as too much or too little water will destroy the healthiest plants in a short time. In the spring (February) repot them into a richer but light sandy soil, and place them in a warmer and moister situation, and pinch off all the first flowers as they appear. The spring-sown plants may be treated like other half-hardy annuals; only they must have plenty of air to keep them from being drawn up weakly.

CHRYSANTHEMUMS.—*Wellensis.*—Your young plants of *Chrysanthemums*, raised from pieces of the old stools, with a single stem, will be as good as those obtained from cuttings, if they were taken off when young. The old plants will not flower well unless you reduce the young shoots to three or four; and either reduce the old ball of roots and fresh pot them in rich soil, or freely supply the plants, when growing, with manure-water frequently during summer.

CLIANTHEUS PUNICEUS.—*F. G.*—You can easily propagate this species by cuttings, which, if now taken from the ends of the young shoots, will strike in any close frame or greenhouse, where they can be kept in a rather moist atmosphere and be duly shaded.

HALF-HARDY ANNUALS.—*T. A. N.*—Coxcombs, Balsams, &c., should be removed from the seed-pans and potted as soon as they have half developed the first leaf after the seed leaves. They should not be hardened previously to potting, nor until they are thoroughly rooted in the pots. Keep them in the hotbed-frame a few days after they are potted, and then harden them off gradually.

PANSIES.—*Curnation.*—If you refer to pp. 73 and 105, you will find lists of first-rate Pansies. *—*Oleida.*—A mixture of sandy loam and rotten manure, in the proportion of two-thirds of the former to one of the latter, is a good compost for these plants.

HEARTSEASE.—*H. B.*—We are unacquainted with the rules of the Heartsease Society.

WILD FLOWERS.—*Dried Plants.*—We do not conceive that collections of wild flowers are at all suitable for the Exhibitions at Chiswick; they come within the province of the Royal Botanical Society in the Regent's Park, who, we presume, would be glad to receive them next Wednesday. See their advertisement.

THE INDIGO PLANT.—Can any correspondent oblige the Editor with a few ounces of the leaves of the Indigo Plant, fresh or dried? the communication of them would be esteemed a great favour.

SEEDLING CACTUS.—*R. G.*—Your seedling is a very magnificent one, but a good deal like Conway's Giant Cactus, which we noticed last year. The flower has the character of *Ackermannii*, but is much larger, being fully 8 inches across, and its colour is a deeper red, with narrow petals, and a beautiful tint of blue in them. The stigma, unlike that of Conway's Giant, is nearly white. *—*Husler and Lumby.*—Your seedling it has really the habit of *C. flagelliformis*, is a fine thing, with rich scarlet and violet petals. It is nearest a seedling raised by Sir Philip Egerton, but distinct, and perhaps a finer colour. *—*T. Johnson.*—Your flower was too much shrivelled and crushed to enable us to form a just opinion of it. It seems much too like *C. speciosissimus*.

INSECTS.—*Coleoptera.*—The small brown beetle injuring your Raspberry trees by eating the young wood about half-way through, is the *Otiorynchus notatus*, a curculio of old authors, and the small green beetle which nearly stripped your Oriental Poplars of their leaves last year, is the *Chrysomela (Phaedon) Vitellina*. Good Entomological Pins can be obtained at J. Hill's, 22, Fish-street-hill, and at R. Plumpton's, 19, Newgate-street, S. *—*G. B.*—The beetle which has so much injured your Rose-trees is the *Otiorynchus* above-

mentioned. This troublesome insect hides under stones, clods of earth, dead leaves, &c. during the day, and in such places it might be advantageously sought after. We know of no better method of getting rid of such pests than by hand-picking during the night—their feeding time—which you already practise. S.

SCALE ON PINE PLANTS.—*Juder* is desirous of trying ammoniacal liquor for the destruction of the above pest, but is undecided as to the best method of applying it. He asks if it would be best to syringe the plants with it in a diluted state twice or thrice a week? or to soak the tan with it, in which state it would be given off by fermentation, as it is from fermenting dung? and whether a liberal sprinkling of the tan would not promote fermentation, and therefore be a good method of renewing the heat in exhausted beds? As we have no experience in this application of gas-water, we refer the question to our readers, some of whom may be able to answer it. We last week gave our reasons for doubting the advantage of using it with a syringe, and we equally fear that if ammonia enough to kill insects is introduced into the atmosphere of a house, it will be very likely to kill the foliage also. Experiments are much wanted on these subjects.

BOOKS.—*Dried Plants.*—George Don's edition of Miller's Dictionary is not of use to a gardener. There is no book in which all known plants are described; the most complete works of the kind are in Latin, and consist of many octavo volumes. Loudon's Encyclopedia of Plants, with the Supplement, is the best book for you. Your plant is *E. grandinosa*.—*R. E.*—The last is the best edition of McIntosh's Practical Gardener. *—*Hadafum.*—You can get Roberts's Treatise on the Vine through any bookseller. It is advertised at p. 586 of the 2d vol. of this Paper.

COTTAGERS' PRIZES.—*W. R. M.*—Your suggestion about giving plants, seeds, or books, to Cottagers for prizes at exhibitions, instead of money, is perfectly in accordance with recommendations that have more than once been given in this Paper. Doubtless the plan is a most desirable one.

MISCELLANEOUS.—*G. G.*'s specimens are, 1, *Polygala grandiflora*; and 2, *Gnidia simplex*.—*Y. Z.*—The leaves you have sent are those of *Pyrus torminalis*.—*Dee.*—Your plants are, 1, *Dillwynia juniperina*; 2, *Cliffortia tridentata*; 3, *Lavandula dentata*; 4, *Vestia lycioides*; 5, *Diosma uniflora*.—*C. E. G.*—Your Orchis is a light variety of *O. morio*.—*Holens.*—As the *Circæa* you have sent is not in flower, we cannot name it with precision, but it appears to be *C. luteana*.—*A Reader.*—1 is too much injured to be determined; 2 is *Ledum palustre*; 3 is *Cerastium lanatum*; 4 is *Ornithogalum umbellatum*.—*Tristis.*—We really cannot undertake to name heaps of fragments, crushed to pieces by the Post-office.

Tristis.—Your plant is apparently *Zephyranthes atamasco*, but so crushed, that it cannot be determined with certainty. *—*E. D. S.*—Some species of *Crataegus*, apparently *C. pyrifolia*, but too young for determination with certainty. *—*M. C.*—The disease of your *Acacia armata* is dirtiness; it swarms with white scale insects: we do not see anything the matter with your yellow China Roses; the green centre is what many of them are subject to, and there is no remedy for it: the plants are *Hardenbergia monophylla*, *Anemone Pulsatilla*, and *Ornithogalum umbellatum*; your *Camellia* seems right. *—*Original.*—The following are the names of such of your plants as are determinable; may we beg your attention to a paragraph at the head of these notices? 1, *Saxifraga hypnoides* var.; 2, *Geranum phaeum*; 3, *Fumaria lutea*; 4, *Vinca major*, variegated; 5, *Cytisus elongatus*; 6, *Hesperis matronalis*; 7, *Paeonia peregrina*; 8, *Paeonia double red officinalis*; 9, *Veronica gentianoides*.—*C. M.*—Carices are not Horticultural plants, nor economical, nor Agricultural. Besides, who can name Carices that are not in flower? No. 1, however, is *C. praeox*.—*M. W. K.*—Pierce your shells with a drill; you cannot soften them. *—*A Subscriber.*—We really cannot name tradesmen; there are many very respectable salesmen in Covent Garden-market. *—*J. K. L.*—*Cinnamomum* and *Myrtus* Pine Strawberry. *—*Perseus.*—We are unable to answer your question. *—*A Constant Reader.*—Your specimen is *Bauera rubrifolia*. *—*A Novice.*—You had better apply to the Secretary, 21, Regent-street. *—*J. H.*—Your *Alnus* is a very fine variety, of the *incana* breed, we detect, however, scarcely any of the musk scent. If this is as powerful as you represent it, the plant will certainly be a novelty. Your grubs will assuredly travel over your ground from a heap in the centre where they exist. If you have them all in that, your best plan will be to burn it. *—*An Unknown Intruder.*—Your plant, which is a parasite, is a species of *Cuscuta*, probably *chilensis*. We see no *Coccus* in your letter. *—*Oleida.*—We cannot advise you how to destroy water insects. *—*F. B.*—Your plants are, 2, *Rubus spectabilis*; 3, *Andrōmeda calyculata*; 4, *Cornus suecica*; 5, *Spiraea ulmifolia*; 6, *Andrōmeda acuminata*; 7, *Capriidolium sempervirens*; 8, *Helianthemum formosum*; 9, *Clématis montana*; 10, *Atragene austriaca*; 11, *Halæsis tetraptera*; 12, *Leipophyllum thymifolium*; 13, *Iberis sempervirens*; 14, *Ledum palustre*; 15, *Pernettya mucronata*; 16, *Vaccinium nitidum*; 17, *Fothergilla alnifolia*; 18, *Kalmia glauca*.—*H. W.*—Your *Stanhopea* looks as if it were a hybrid, between *S. oculata* and *S. insignis*; but it is evidently a dark and handsome variety of the former. *—*N. P.*—The blue flower is *Camassia esculenta*, the other *Hypocorympha robustum*.—*T. Ross.*—Your specimens are, *Gentiana acaulis* and *Tormentilla reptans*. The seed is that of the Water Melon.

SEEDLING FLORISTS' FLOWERS.

PANSIES.—*F. B.*—No. 3, will make a showy border variety; it is not good enough for a show-flower. No. 6, a flower of good form and substance, with a fine eye; the upper petals are too full, and prevent their lying flat; we object to the mottled appearance also, which will be uncertain; the petals are finely formed and in good proportion. No. 2, Yellow, with good eye, the petals are large and well formed; there appears a defect in the upper petals of this flower, from its having colour on the back, which showing through, makes it look like a stain. No. 4, Large and rather thin; this appears uncertain, as there is a slight tinge of blue on the upper part of the side petals, and the upper petals are stained and mottled; it wants substance, and is not so good in form as 2 and 6. *—*J. A.*—Your Pansy is a very fine one, round, flat, having well-proportioned petals, the yellow centre is pure and brilliant, eye fine, deep bronzy plum-coloured upper petals, with broad belt of the same colour surrounding the lower petals; a flower of good substance. *—*C. F.*—A large and well-formed seedling, eye fine and rich, the upper petals are of a deep rich blue purple, and a broad belt of the same colour surrounds the bottom petals; the ground colour of the lip is yellow, that of the side-petals a delicate lemon; this difference in the ground colour is the principal defect in the flower, which lies flat, is of good substance, and the petals are well-proportioned. *—*A. C.*—Your seedlings are worthless, they possess none of the qualities of good flowers. *—*J. and W. F.*—Your *Auricula*, in its present state, is pretty, but not of any value. The Pansy is a very good one in size, form, and substance; the belting is broad and fine, and the eye very good; the ground colour wants purity, it has streaks of yellow in it below the eye; and the belting is not sufficiently clean and abrupt where it joins the ground colour. *—*Tiny-Side Subscriber.*—We are not acquainted with the name of the Pansy upon which the experiments with Guano have been tried, and therefore cannot speak to the result; the specimen sent is worthless, from the running of the colour. *—*CINERARIAS.*—*R. Onkley.*—Your seedling *Cineraria* is a very good blue, but it does not differ from several already out. *—*CALCEOLARIAS.*—*S. B. W.*—Your *Calceolaria* is pretty, but too small; the properties constituting perfection in this class you will find in Vol. i. p. 844, of the *Gardeners' Chronicle*; you had better procure a few first-rate varieties from which to save seed. *

PELLARCONIUMS.—*F. P.*—In consequence of the seedlings being sent without names or numbers, it is impossible to give any but a general opinion of their merits. In some some are good, others deficient in this property, they are generally clear and fine in colour, a small one (*Pym's Favorite*?) is a very clear and brilliant flower, with the spot very dark and decided, but beautiful as the colour is, the flower is too small. In some, the petals are too thin, the best of them are good flowers, and will form ornamental objects for the greenhouse, but they are not sufficiently distinct from varieties already in cultivation to make them desirable to the general grower. *—*C. M. Thurtell, Capt. R. N.*—Your *Plato* is a rich, brilliant, and high-coloured variety. The flower is well formed, petals stiff and short; the upper petals are of a rich and brilliant scarlet, with a dark spot that terminates abruptly. The lower petals are of a deep rosy salmon colour, with a tinge of blue in the centre of the flower. This variety is rich, brilliant, and attractive. *—*Ceres.*—The upper petals are covered with a rich spot, lower petals delicate rose-colour; this variety does not appear to differ sufficiently from several we have seen to make it desirable; the petals had fallen. *—*A. C. Ariel.*—The lower petals of this seedling are too narrow, and the upper petals are thin on the edge and not even. *—*Phaenomenon.*—Fine showy flower in colour, but ill-formed; the petals are too long, narrow, and flimsy. This variety is not worth keeping. *—*Nina.*—The petals of this variety had fallen, they appear to be individually well-formed; they are, however, too full on the edge, which causes them to be puckered. The colour is common. *—*Miranda.*—Colour clear, spot intense, but the colour beyond the spot not so clear as it is in the *Sylph* or *Lady Douro*, which latter flower it resembles more than the *Sylph*. *—*Quorn.*—1. is a flower of good form, delicately coloured under petals; the upper ones are rather cloudy; 2, light lilac; the petals are thin and the form not good; 3, white with plum-coloured spot, rather small, but the form of the flower is very good; 4, bad form, under petals too thin and narrow; 5, in form tolerably good; it is no improvement upon *Florence*, which flower it much resembles; 6, bad form, petals too narrow and thin; 7, white, with plum-coloured spot, upper petals too long and thin on the margin; 8, pink, under petals flimsy. Nos. 1 and 3 are the best in the collection. *

Subscribers wishing to change their address, or remit money for the Paper, should send direct to the Newsmen who supplies them, as we do not execute country orders. The agent's name will generally be found on the cover of the Paper.

NEWS OF THE WEEK.

THE adjourned debate on the Corn-laws, which occupied the greater part of last week, was brought to a conclusion on Monday night, when Mr. Villiers' motion in favour of a total repeal was negatived by a majority of 256. On Tuesday Mr. Cumming Bruce moved for leave to bring in a bill to amend Lord Ashley's Act of last session, for regulating the employment of young persons in mines and collieries, so far as its provisions applied to Scotland. The object of the motion was to allow widows and unmarried females above 18 years of age to return to underground labour in the Scotch collieries. The motion was opposed by Lord Ashley and Sir J. Graham, and negatived on a division by a majority of 113. On Wednesday Mr. Sharman Crawford's motion for a bill, authorizing annual Parliaments, universal Suffrage, and other changes analogous to what are called "the five points of the Charter," was negatived by a majority of 69; and on the same night, Mr. Roebuck's resolution in favour of a system of education in which no attempt should be made to inculcate peculiar religious opinions, was negatived by a majority of 96. Last night Lord Stanley brought forward his resolutions relative to Canadian Corn, proposing that Canadian produce may be introduced at a fixed duty of 1s., which, with the addition of 3s. levied by the Canadian legislature, will enable the grain of the United States to be brought into this country, through Canada, at a fixed duty of 4s. These resolutions gave rise to a long debate, which was ultimately adjourned to Monday.

From France, our news is mostly of domestic interest, the Papers being occupied with an adjourned debate on a bill introduced by Ministers for abolishing the home manufacture of beet-root sugar in favour of the produce of the sugar-cane cultivated in French colonies. Another topic of national interest is a contest which has arisen between the clergy and the Professors of the University on the subject of Education, and which appears to have revived all the bitterness that characterized the religious controversies of the last century. From Spain, we learn that S. Lopez, the new Prime Minister, has submitted his programme to the Cortes. Among its professions and intentions the most important are the announcement of a general amnesty for all political offences, the prohibition of all future declarations of the state of siege, and various financial reforms, which will no doubt lead to strong party struggles. From Portugal we have accounts of the disastrous condition of the commercial and trading interests at Lisbon and Oporto, in consequence of the interruption of the tariff negotiations. The alarm produced by the general spread of distress throughout the wine districts had excited the attention of Government, and had induced the belief that the interrupted negotiations will very shortly be renewed with better prospects of success. By the Levant Mail we learn that a new complication has arisen in the Servian question, the reigning Prince having announced his resolution neither to resign his throne nor to submit to ejection: the grounds on which the Prince justifies this refusal are the alleged coercion of the Sultan by the Russian Cabinet, and the legality of his election in strict accordance with the Servian constitution, and with the sanction of the Porte. From the United States we have accounts to a recent date, but their interest is chiefly local. The expected retirement of Mr. Webster from the Cabinet, and the changes which his resignation would render

necessary are the principal topics of the papers. Some discussion had arisen on a reciprocal commercial treaty between the two countries, founded on a mutual diminution of duties, but the arrangement was considered to be scarcely practicable. The Canada papers mention the installation of Sir C. Metcalfe, at Kingston, with the usual ceremonies. The addresses of the Legislature and the replies are published; but His Excellency had given no indication of the line of policy he intended to pursue.

Home News.

COURT.—The ceremony of Churching the Queen took place yesterday in the Palace Chapel; the Archbishop of Canterbury officiated. Arrangements have been made for her Majesty and Prince Albert, accompanied by the Prince of Wales and the Princess Royal, to leave Buckingham Palace this afternoon for Claremont. It is expected that the Court will be absent from town about ten days or a fortnight, when her Majesty will return to Buckingham Palace, and remain in the metropolis till within a few days of Ascot Races.—H. R. H. Prince Albert held a levee by desire of her Majesty on Wednesday, at St. James's Palace. The Prince afterwards gave a dinner to the directors of the Ancient Concerts, of which his Royal Highness was the director for the evening.

Ministerial Changes.—The vacancy occasioned by Lord Fitzgerald's death has been filled up by Lord Ripon's moving to the Board of Control, and Mr. Gladstone has become President, instead of Vice-President, of the Board of Trade, with a seat in the Cabinet.

Foreign.

FRANCE.—The Paris journals are chiefly occupied with the important sugar question still under discussion in the Chamber of Deputies, with the new contest that has arisen between the Clergy and the University, and with the cruelties perpetrated in extending the French rule in Africa. The *Journal des Débats* devotes its columns to the religious question. The professors of the University are up in arms against the clergy, especially against the Bishop of Chartres, who has accused them of teaching every crime not even excepting murder. M. Michelet has thundered from his professor's chair in the Sorbonne against the declamation of the episcopal pulpit of Chartres. And, in return for the bishop's denunciation of the pantheism of the University, certain universitarians have published extracts from some volumes drawn up for the instruction of young priests in the duties of the confessional. The *Débats* gives extract from these books, calculated to cause a strong reaction against the clergy in France. The *Débats* says, that since 1830 the clergy have recovered from the unpopularity which their supposed connection with an oppressive Government up to that year entailed upon them, but the boldness with which they have now attacked the University and the administration of Public Instruction have awakened their old enemies, and it is feared that the French are recommencing the old circuit of the last century.—Judging from the accounts which the papers contain of the state of affairs in the north of Africa, the spring campaign, which has been long preparing on a formidable scale, has opened under no very favourable auspices. Abd-el-Kader, though pursued by several corps, has approached within a few miles of Oran, and, when the last advices left, the French were avenging themselves on some powerful tribes, whose allegiance the presence of the Emir had shaken. In the country bordering the road between Constantina and Philippeville, hostilities have been renewed with great fury, owing to the savage aggressions of the French, who had not only fired the Arab villages, but had armed the troops with axes, for the purpose of cutting down the fruit-trees, the orange and citron-trees, and the olive plantations, which constitute the principal wealth of the Sahel Kabyles.—A remarkable debate has taken place in the French Chamber of Peers, on the petition of certain Protestant parishes, on behalf of religious liberty. The Duc de Broglie stated the question in the most liberal and enlightened points of view, but the Chamber passed to the order of the day.—Baron Mounier expired at Passy on Thursday week, at the age of 58. He was a Member of the Chamber of Peers, Secretary of Napoleon's private Cabinet, and honoured afterwards with the confidence of the Bourbons, who had made him Councillor of State and Superintendent of the Crown buildings. Baron Mounier had refused office since the revolution of 1830, and confined himself to his duties in the Chamber of Peers.—From the remarks that have been made under this head on the subject of the salvage of the *Telemaque*, our readers will not be surprised to learn that the whole concern has broken down. The French Courts of Law have declared the Company bankrupts; Capt. Taylor is in prison for debt at Pont-Audemar, and the provisional committee have issued an announcement that the Company is dissolved, and that the shares are rendered valueless by the declaration of bankruptcy, no means existing by the constitution of the Company of making any call upon the shareholders, or of raising the sum required to pay off debts, and supersede the bankruptcy. It is somewhat extraordinary, that notwithstanding this failure, there is still an attempt made to revive the project, and propositions for that end are in circulation.

SPAIN.—The *Gazette* of the 10th inst. contains the decrees of the Regent, accepting the resignations of the former Ministers, with whose "devotion, patriotism, probity, and the distinguished manner in which they fulfilled their duties," the Regent declares himself highly satisfied. Those decrees are followed by others appointing

the new Administration, as follows:—M. Lopez, President of the Council and Minister of Justice; M. Aguilar, Minister for Foreign Affairs; General Serrano, Minister of War; M. Frias, Minister of Marine; M. Ayllon, Minister of Finance; M. Caballero, Minister of the Interior. Subsequent intelligence by telegraph to the 12th inst. informs us that Señor Lopez read on the 11th his programme to the Chamber. The following is a summary of its professions and intentions:—"Respect for the constitution, and a rigorous observance of the rights of the Cortes. Development of the national prosperity, and, as a consequence of such basis, the presentation, shortly, of a law on Ministerial responsibility, and of another one, whereby an amnesty is to be extended to all political offences posterior to the conclusion of the civil war. No influence to be exercised over the elections. No more state of siege to be proclaimed. A better organisation of the national militia to be effected. Order and reforms to be introduced into the finances. The sale of national property to be hastened. A good understanding to be kept up and increased with foreign countries, whilst upholding the dignity of Spain."

PORTUGAL.—We have advices from Lisbon to the 8th inst. The week's delay in the mail was occasioned by the loss of the Iberia's rudder outside of the bar of Lisbon, having been struck by a heavy sea, and the imperfect appliances of Lisbon consumed full ten days in supplying the deficiency. The utmost dismay pervaded the commercial and trading interests at Lisbon and Oporto, in consequence of the interruption of the tariff negotiations. Robberies were becoming of daily occurrence on the banks of the Douro. Six robberies, two of them sacrilegious, occurred on one day, and eight burglaries on another. The alarm was intense and universal. It was still thought that the Portuguese Government must soon give way, and in the highest quarters the belief prevailed that the negotiation would still be successful. It was held to be advisable in the British Government to fix the precise amount to which they desired the duties upon woollens to be reduced. A bill for reducing the duties on all foreign goods entering the island of Madeira had been laid on the table of the Deputies. This would operate chiefly in favour of British produce, and perhaps allow us to avail ourselves of the circumstance for a renewal of the negotiations. The Deputies were occupied with a measure of the Home Minister's for introducing a general system of education throughout the kingdom.

GERMANY.—Letters from Hanover state that if the King's health permit, His Majesty will set out for England on the 25th of this month. From Berlin we learn that the King of Prussia has presented a heavy gold medal, bearing on one side the King's medallion, and on the reverse an allegorical figure of music, with other embellishments, to Meyerbeer, for his composition of the chorus in praise of the house of Este, which was performed on the occasion of the masque, representing the Court of Ferrara in the sixteenth century, of which we gave a description some time ago.—A society has been formed at Berlin, chiefly consisting of ladies, to improve the condition of females in India!—A court for the decision of quarrels between literary men, publishers, &c. has been established at Stuttgart, and has succeeded so well, that the example is about to be followed in Leipzig.—From the Rhine we learn that on the road between Aix-la-Chapelle and Cologne, near the village of Weiden, a beautiful Roman tomb, probably that of a centurion of the highest rank, was dug up last week by some labourers making excavations for a new road. The sarcophagus contained some well-preserved gold coins of the reign of Vespasian, 70 years after Christ, and the whole is surrounded by four marble statues, which from their great beauty, must be considered to be of Grecian workmanship. As soon as the whole is cleared it will probably be sent to the Royal Museum at Berlin.—The letters of thanks which the city of Hamburg is about to present to the Sovereigns, who hastened to assist the inhabitants after the conflagration of last year, are to be written, or painted, upon tablets of Oak saved from the ancient city hall, and framed in bronze of the bells of the different churches that were destroyed. Each individual who contributed to the relief of the unfortunate sufferers is to be presented with a medal of the same material, and those foreigners who on the spot assisted in checking the progress of the calamity, are to be honoured with the freedom of the city. First-rate artists in England, France, and Germany, are to be entrusted with the execution of this plan.—Schelling, the celebrated German philosopher, arrived last week on a visit at Munich, his former residence, and was received at the gates of the city by a deputation of upwards of 300 noblemen, citizens, and students, who conducted him to the apartments prepared for him at the Royal Palace.

ITALY.—Letters from Rome mention that the Pope took his departure on the 1st inst., in order to inspect the maritime districts of his dominions. He is accompanied by a large number of high functionaries and engineers. His Holiness would first proceed to Anagni, Alatri, and Frosinone, and then continue his journey to Terracina. On his return he intended to examine the Pontine marshes, the partial draining of which the Government again intend to attempt. His absence would not exceed a fortnight.

RUSSIA.—The departure of Prince Paskiewitch from Warsaw for St. Petersburg, and the expected arrival of the Emperor in the Polish capital, are regarded as remarkable coincidences. The conference of the Emperor with the King of Prussia is expected to take place in Berlin, or more probably at Erdmendorf, in the beginning of June. Whether his Majesty will go from Warsaw to inspect the Army of the South is still uncertain, and will depend on what may then be the situation of the principalities of the Danube, whither several regiments of cavalry will shortly

be despatched. The progress of the railway is now totally suspended; but it is confidently expected that the Emperor, during his visit to Warsaw, will make arrangements for the continuance of the work, at the cost of the state.

GREECE.—Letters from Athens announce that King Otho has signed a convention with the Austrian Government, whereby the Austrian Lloyd's Company's steamers, which have for some years carried the mails and passengers between Trieste and Greece, twice a month, and *vice versa*, shall for the future be permitted to proceed from Patras, up the Gulf of Corinth to Leutraki, a port at the head of the gulf, from whence the mails and passengers will be conveyed across the Isthmus of Corinth (about seven miles), and re-embarked on board other steamers for Athens and the Levant ports. This new arrangement will not only save time, but does away with the necessity which has heretofore existed of this line of packets making the circuitous and often boisterous passage from Patras, round the whole of the Morea to Athens.

TURKEY.—The accounts by the Levant mail inform us that a new complication is likely to arise from the Servian question. It appears that the reigning Prince, upon being apprised by the Ottoman Government of its intention to submit to the demands of Russia, replied that he was resolved neither to resign nor submit to ejection; that his election had been strictly legal, in accordance with the constitution, and sanctioned by his lawful sovereign the Porte; and adding that as it was evident that the Sultan had been coerced, and was unable to protect his faithful Servian subjects, they were resolved to perform this sacred duty themselves, and that they would consequently resist all attempts at compulsion. The Bishop of Gibraltar arrived at Constantinople, in the Devastation steamer, on the 27th, and was to consecrate the new English Church, and administer the rite of confirmation. The accounts from Trebizond stated that Abdallah Pasha, governor of the province, was seriously indisposed. The new plenipotentiary of the Schah of Persia had not yet reached Erzeroum. The difference which had arisen between the Porte and Austria respecting the navigation of the steamers of the Danubian Company had been definitively adjusted. The Divan had given letters for all the Ottoman pashas and governors, enjoining them to extend to those steamers the assistance and protection granted to Ottoman vessels.

INDIA.—The following letter, giving an account of a survivor of the unfortunate 44th, has been published in the *Times*:—"Camp, Deesa, March 2.—A man belonging to No. 4 Company of her Majesty's 44th Regiment, whose name is James Edwards, being one of the few who escaped the sad massacre in Afghanistan, has made his way in safety through many difficulties to Deesa, and is now attached to No. 1 Company, of the 2d or Queen's. He appears a fine intelligent man, and no doubt his account could be rendered interesting. I hear that he travelled along from sunrise to sunset, keeping the east on his left, and at night often lay down both hungry and thirsty. With the exception of three days that he was ill and unable to move, he has been walking ever since the fatal catastrophe, to the 28th February, when he arrived in camp. I believe the first European he met was Lieutenant Simpson, of the 2d Cavalry, at Kassa, who did all that kindness could suggest to relieve the poor fellow from the plight that he was then in. He had no idea of the time that had elapsed, and knows not by what route he has made his way. I understand that 140 days ago he was obliged to leave his comrade, who fell sick, at some village. I have at present had no conversation with Edwards, but have seen him at a short distance, and have heard this much from those who gathered it at his mouth; and I mention it, as through the *Times* his safety may be made known to his friends, who must imagine him dead. Avoiding the large towns, he skirted the small villages, sometimes treated with much kindness, and occasionally with great indignity, the villagers sometimes seizing him by the hair, hooting him as a Feringee, and spitting in his face; he is much burnt and travel-worn—as might be expected; he has about two years' pay due to him, and may, perhaps, by the kindness of the Government and others, be enabled to set himself up comfortably in some little way in England, which may repay him for his last two years of misery. He was, I hear, a volunteer to the 44th, when that regiment went on service;—either the 3d or the 31st I believe he formerly belonged to."

UNITED STATES.—The royal mail steamer *Britannia* arrived at Liverpool on Saturday. She sailed from Boston on the afternoon of the 1st, and Halifax on the evening of the 3d inst., and has made the passage in 12 days and 12 hours. The new steam-ship *Hibernia*, which sailed from Liverpool on the 19th ult., was met within a few hours' sail of Boston, which she would reach on the morning of the 2d inst. The papers brought by the *Britannia* extend over a period of three weeks, from the 11th ult. to the 1st inst. Their contents are, however, unimportant, and not very interesting. The accounts from Washington relate exclusively to the expected retirement of Mr. Webster from the office of Secretary of State, and the changes in the Cabinet which that resignation would make necessary. One account states that he has actually resigned, whilst another says that he will not quit office until the pending negotiations between the United States and Great Britain shall have been brought to a close. There had been some discussion about a reciprocal commercial treaty between the two countries, the basis of which should be a mutual diminution of duties, but not much faith appeared to be felt in the States of the practicability of such an arrangement.—The Siamese twins were married at Wilks Co., North Carolina, by a Baptist minister, to the two daughters of a farmer named Yeates.—The Canada papers contain accounts of the

installation of Sir Charles Metcalfe, at Kingston. The addresses to his Excellency, on assuming the government, and his replies, are published in the papers. He had not developed the line of policy he intended to pursue. His predecessor, Sir Charles Bagot, had so far recovered as to be able to walk in-doors. He would return to England so soon as his health would permit. The Warspite, Lord John Hay, had arrived at New York to convey him home.—Accounts from St. John's, Newfoundland, to the 15th ult., communicate the distressing intelligence of the shipwreck of 28 vessels, with serious damage to 5 others, by the drifting of the ice from the Gulf of St. Lawrence. Although the craft were small, and the loss of capital less extensive in proportion, this great sacrifice of property will, it is feared, occasion much inconvenience to the trade of the colonists, especially to those engaged in the fisheries.—From Hayti we learn that the city of St. Domingo surrendered to the forces of the new Government on the 30th March, after a slight affair, in which 10 or 12 persons only were killed. Since the abdication of Boyer the administration of a Provisional Government had prevailed, as there had not been time for choosing a President.—From the West Indies we have the melancholy intelligence of the death of the Bishop of Jamaica, after a short illness, about the 10th of April.

CAPE OF GOOD HOPE.—We learn by the Cape papers received on Wednesday, that there is some reason to believe, upon the removal of the troops from Colesberg, that the Boers had again made hostile demonstrations. The news from Port Natal is alike unsatisfactory; for it seems that Major Smith requires a reinforcement of troops to suppress a similar feeling among the Boers in that neighbourhood. These accounts, however, are very vague; and, probably, are much exaggerated.

NEW SOUTH WALES AND NEW ZEALAND.—The Columbian from Sidney arrived at Liverpool on Wednesday, making the passage in 105 days. By this arrival we have Sydney papers to the 2d Feb., and New Zealand to the 11th January. There is no political news of importance from either colony. At the former, commercial matters appear to be in a very bad state. The *New Zealand Wellington Gazette* has the following passage: "In our last, under the head of Nelson news, we gave an account of Mr. Cottrell having proceeded upon an exploring expedition. The following extract from a letter of the 12th of December describes the result, and cannot fail to prove highly satisfactory. We think the fear about the deficiency of available land in New Zealand is now set at rest. Mr. Cottrell is just returned from an exploring expedition to the southward, which has turned out satisfactorily. He reached the mouth of the Wairoa, in Cloudy Bay, after about nine days' walking, for the last four days through an extensive grass valley containing about 250,000 acres, and, from his description, of very good land; he pronounces a road to be perfectly practicable from this into the plain, the pass through the hills being quite easy. A man who was with him, and a good bushman, undertakes to reach the valley in three days from the Waimea district; it appears also that there is an available district to the south-west. We hear nothing more from the flaxdressers; they have only just got their house up, and are beginning to cut the flax. They are still very sanguine of complete success."—At Sydney, the 55th anniversary of the foundation of the colony was celebrated with great pomp on the 26th Feb.; the weather was remarkably fine, and the whole proceedings of dinners, regattas, and other joyous demonstrations, passed off with the greatest satisfaction.

Parliament.

HOUSE OF LORDS.

Monday.—LORD WEAVERLIFFE, in reply to Lord Beaumont, denied the words attributed to him, "during the present session," when stating that no alterations were contemplated in the Corn-laws.—EARL POWIS laid upon the table of the House a bill to repeal the union of the sees of Bangor and St. Asaph.

The Marquess of CLANRICARDE moved the reprinting of the second report of the commissioners on railways in Ireland. He contended that means should be taken to give employment to the Irish people, which, in addition to the benefit which it would confer on the country, would also have the effect of stopping the agitation for the Repeal of the Union.—LORD BROUGHAM strongly censured the agitators and the agitation in Ireland, one effect of which was, that capital would not be invested in useful undertakings in that country.—A debate followed, in which the Marquess of LONDONDERRY urged the necessity of strong measures, and Lord CAMPBELL counselled moderation and forbearance.—The Duke of WELLINGTON declared his determination to do his duty to his Sovereign and his country, heedless of those accusations by which he was held up as an enemy to Ireland. He found himself in very good company, in the attacks made upon him by the Irish agitators.

Tuesday.—LORD BROUGHAM withdrew his Slave-Trade Abolition bill, and introduced another bill, containing some alterations. This amended bill was read a first time.

LORD BROUGHAM moved the second reading of the Townshend Peerage bill. After recapitulating the evidence as given at their Lordships' bar, he stated his intention to propose, after the second reading, that instead of the bill declaring the children of Lady Townshend illegitimate, it should merely declare them not to be the issue of the Marquis Townshend. And, moreover, he proposed to omit the name of one of the sons, because, being under age, he could not be legally summoned to appear at their Lordships' bar. Lord Brougham, on behalf of Lady Townshend, made a statement that she had been no voluntary party to any of these proceedings—that she had vehemently protested at the time against the change of name, the baptism, and the assumption of the titles by her children.—LORD COTTENHAM opposed the second reading. He contended that the case made out at the bar was so strong, that it was quite unnecessary for their Lordships to interfere by an extraordinary bill to enable the parties to obtain justice between themselves. The alterations proposed to be made in the bill by Lord Brougham were the most powerful reasons in themselves against their Lordships entertaining the Bill at all. It was a measure without precedent, and one which, if established, would be only the first of many painful cases. Redress by the ordinary course of law was open to the parties to this Bill; and, if their Lordships passed it, there was not one amongst them that would not live to repent it. He therefore moved that it be read that day six months.—LORD KENYON replied to Lord Cottenham, and

called on some other learned Peers to express their opinions.—LORD DENHAM declared, that if the Bill did not pass, public morality would suffer. He never more unhesitatingly gave a vote than he would to the second reading of this Bill.—LORD CAMPBELL gave his opinion that there was no other remedy but this Bill; and Lord LANGDALE said, that sooner than permit a great public scandal and private injury to go unredressed, the Bill ought to be passed.—Their Lordships divided, when the second reading was carried by 55 to 8.

Thursday.—The House went into committee on the Townshend Peerage Bill.—LORD BROUGHAM proposed the amendments of which he had given notice, viz., one which would go to make the Bill declare simply that the children of Lady Townshend were not the children of the Marquis Townshend, and the other that would leave one of the sons, Cecil Nina Bolivar, who is under age, out of the Bill altogether.—LORD MONTAGUE and the Earl of WICKLOW objected to the amendments and the Bill as unnecessary and mischievous.—The Marquess of CLANRICARDE suggested the propriety of calling the Marquis of Townshend to the bar, to answer for his conduct in bargaining for the sale of the rights of the Peerage for a pecuniary consideration.—The Earl of DEVON, notwithstanding the amendments, which he thought improvements, still considered the Bill most objectionable.—The amendments were finally agreed to, and the Bill passed through committee.

In reply to a question from Lord Campbell, the Lord CHANCELLOR stated that the Judges would be in attendance in the House on Thursday next to give their opinion respecting the law in cases of criminal lunacy. The Lord CHANCELLOR stated that Mr. Austen, the counsel employed for the Sudbury Disfranchisement Bill, had admitted his inability to prove a case of general corruption against the borough, and had therefore declared his intention of proceeding no further.—The Registration of Voters Bill was read a third time and passed.

Friday.—The order of the day for the second reading of the Sudbury Disfranchisement Bill was discharged. The Marquess of DOWNSHIRE adverted to the language of Dr. Higgins at the Mullingar meeting, and expressed his hope that the Duke of Wellington would continue the strong tone he had assumed on this question.—LORD BEAUMONT, on behalf of the Roman Catholic body, disavowed the sentiments attributed to Dr. Higgins, than which, in his opinion, nothing more disgraceful ever issued from the lips of a prelate.—The Earl of KENMARE also disclaimed any participation in the sentiments attributed to Dr. Higgins, and expressed his concurrence with Lord Beaumont's indignation.

HOUSE OF COMMONS.

Monday.—In answer to a question by Mr. Redington, Sir R. PEEL stated that he was authorized by the Queen to declare her Majesty's adherence to the declaration made by King William, in reply to the joint address of the two Houses of Parliament, in the year 1834, in reference to the repeal of the Union. And that royal reply having contained these words:—"I receive, with great satisfaction, your assurance that you will co-operate with me in my determination to preserve inviolable the legislative Union, and I shall feel it my duty to co-operate in the removal of any real grievances under which any portion of my subjects may be suffering." Her Majesty adhered to the latter as well as to the former part of it. With respect to what measures besides those before the House the Government proposed, in accordance with this royal pledge, to introduce in regard to Ireland, it would be inconvenient to announce them beforehand.—LORD CLEMENTS having asked under what head of amelioration the Government classed the Arms' Bill, Sir R. PEEL replied:—"I consider that a measure which is intended to protect the personal safety of residents in Ireland, and to prevent the commission of such terrible crimes as have been committed in some cases within the last two years, is one which may be expected to ameliorate the condition of that country."

The adjourned debate on the Corn-laws was resumed by Mr. W. O. STANLEY, who taunted the agricultural county members with forfeiting their pledges, and declared his opinion that the fixed duty of the late Government would have been a far more effectual security to the agriculturist, than the uncertain and conceding system of the present Government.—DR. BOWRING thought that the friends of free trade had great reason to congratulate themselves on the progress of the debate. Glimmerings of truth appeared in the twilight ignorance of the supporters of the Corn-laws, for half and whole admissions of the principles of free-trade dropt from various members, and in one case, that of Mr. Campbell, the member for Argyleshire, there was a hearty assent to them. The free-traders asked for the unqualified application of their principles; they repudiated exemptions in favour of any class whatever.—MR. EWART followed, appealing to the Conservative representatives of commercial towns, and contending that, in the course of the debate, the opponents of free trade had indulged in mis-statements and fallacies, such as that low prices would follow the repeal of the Corn-laws, and so forth. What was required was, such an extension of the commerce of the country as would increase the ability of the people to consume.

—MR. CHILDERS could not, in the present state of the country, and after the extensive changes of last year, vote for the immediate and total repeal of the Corn-laws, though he looked forward fearlessly to their ultimate removal, and was satisfied that the change would disappoint both opponents and supporters.—CAPTAIN LAYARD commented on the measures of the Government, especially the imposition of the Income-tax, and argued that the financial statement of the Chancellor of the Exchequer was not only a proof of their failure, but an additional argument for the further application of free-trade principles. He would vote for the motion because he condemned the Corn-laws, though on this point he feared he differed from some of his constituents who were interested in agriculture.—MR. E. BULLER discussed the subject of "peculiar burdens," and after showing that last year, by comparison with the previous one, was peculiarly favourable for disguising the mischiefs of a Corn-law, declared that in default of opportunity for supporting a fixed duty, he would give his vote in favour of the motion. The principle of the "sliding scale" could not be maintained, especially after the impetus given to free-trade principles by the Government, and the feeling of dissatisfaction and insecurity which their measures had communicated to the agricultural interest.—SIR C. BURRELL contended that landlord, farmer, and agricultural labourer, were all interested in the Corn-laws; even now, the recent changes had so affected the capital of the farmer, that if he were to sell off his stock he would lose one-half. He adduced various statements to show the necessity of fair protection to agriculture.—MR. FOULST SCROPE looked upon all indirect taxes on articles of consumption as savouring of protection. But as we had a great national establishment to maintain, we could not push the principles of free-trade to the extent of repealing all these taxes. What we should do, however, was to construct our financial system with a view to revenue, and not for protection, and above all, in that which constitutes the main article of subsistence for the people. There were only two arguments put forth in favour of the Corn-laws, peculiar burdens and prescriptive right; but the one was not proved, while if the other was to be pleaded in defence of an error, every additional year added to the prescriptive right only plunged us deeper in the mire. In his own opinion, there never was a more favourable time for the repeal of the Corn-laws; prices were already low, and he did not think they would descend much lower; while the benefit to the commercial community would be very great.—MR. THORNELY had visited the United States last Autumn, immediately after the passing of its high tariff. At Washington he had waited on the President, and urged the commercial reforms effected by Sir R. Peel as a reason for a more liberal policy, but Mr. Tyler had avowed his opinion—one which was largely shared in by American merchants—that our system of Corn-laws presented an almost insuperable bar to an extended trade between the two countries.—MR. STUART, speaking on behalf of the silk manufacture, denied that it required or sought protection, the demand of those interested in it being for equal

justice. The advocates of free trade were not disposed to legislate hastily or injuriously, or without due and previous inquiry into the nature of the alleged peculiar burdens borne by the agricultural interest. Sir R. Peel was bound to grant either inquiry, or the further extension of the commercial principles which he professed. As he did neither, he felt bound, in the circumstances of the country, to support the motion.—SIR H. DOUGLAS, as the free representative of the citizens of Liverpool, and not their pledged delegate, declared his determination to oppose the motion, which he considered as fatal in its object to the best interests of the empire, manufacturing, commercial, and agricultural. England was England's best customer; and to protect the small farmer was to protect the people; and confidence and steadiness in our legislation were essential to the employment of our superabundant capital.—MR. MUNTZ asked where the confidence was to come from—from a starving population, a diminishing trade, or a declining revenue? The Corn-laws caused the people of this country to pay fifty millions more for food than the range of the continental prices. It was not all lost to the country, but it was taken from industry and given to idleness. As a representative of a great, and enlightened, and a suffering community, he expressed his concern at the state of the revenue and the condition of the people, for which no ministry for the last twenty-five years had succeeded in providing an adequate remedy.—MR. COBDEN said there was no way of raising prices but by restricting supply. Could they justify themselves, therefore, in maintaining a law which restricted the amount of the supply of food for the people? He did not impute motives; but the condition of the agricultural labourer was the severest condition of the Corn-law which could be pronounced. He had been making some excursions into the agricultural regions; and he found pauperism and crime coincident, and was told that the return of the petty sessions was no criterion, for they were obliged to wink at crime, and to leave it unpunished. Even in Dorsetshire it was boasted, as an act of benevolence, that the poor labourer was permitted to gather up the sticks blown down from the crows' nests on the trees. Those landowners who were the best farmers denied that land would be thrown out of cultivation; that allegation was only made by those who came from the worst-farmed districts of the country, and who were, therefore, most rampant for protection. Long leases and good farming were to be found together, as in the Lothians and Northumberland; for himself, he would reckon it an insult to have a farm offered to him on which to spend money without the security of a lease. In fact, they did not know their own interests. Protection was alleged to have been diminished by the last Corn-law, but the landlords, instead of talking of reducing their rents, called on the farmers to bestir themselves, instead of sitting at their doors, smoking their pipes and drinking their ale. But the farmers were beginning to get sick of political landlords; they were jealous even of that small section who were trying to get up a friendship for the farmers on the ruins of the old friendships; they were suspicious of all who "promised" them anything; and they were coming round to the Anti-Corn law League, because the question was placed by them on its true merits, and promised them nothing.—COL. SMYTHORP made some warm remarks, excited by Mr. Cobden's allusions to Lincolnshire.—He was followed by MR. MILNER GIBSON, who represented the wishes of his constituency in favour of general Free Trade, making allowance, however, for the difficulties of Sir R. Peel, seeing that Liverpool was represented by so violent an opponent of Free Trade as Sir H. Douglas.—MR. VILLIERS replied, and on a division there appeared—For the motion, 125; Against it, 381. Majority, 256.

Tuesday.—The SPEAKER called attention to the circumstance of a bill (the Scottish Widows' Fund Bill) having received the royal assent, without the amendments of the Lords having been considered or agreed to by the Commons. Sir R. PEEL, seconded by Lord J. RUSSELL, moved the appointment of a select committee to inquire into the circumstances connected with the informality; which was carried.

MR. CUMMING BRUCE moved for leave to bring in a bill to amend Lord Ashley's act of last session, for regulating the employment of young persons in mines and collieries. He gave due credit to the motives by which Lord Ashley had been actuated, though the purity of his intentions was not a sufficient protection from error in judgment. The Mines and Collieries Act was a hasty and injudicious piece of legislation, and it had produced great distress in Scotland, by depriving individuals of employment for which they could obtain no substitute; and, though he did not wish to interfere with the Act so far as married females and young persons were concerned, he wished to amend it, by permitting widows and unmarried females, above eighteen years of age, to return to underground labour. The hon. member adduced a variety of documentary evidence in support of his motion, which he said he had brought forward on the express personal solicitations of the colliers themselves.

LORD ASHLEY did not think that a case had been made out for the interference of the House. Why was Scotland to enjoy a privilege not accorded to England, which was subjected to the same alleged inconveniences arising out of the operation of the Act? Already the results had been most beneficial in the emancipation of women, young girls, and children, from a slavish and degrading employment for which they were wholly unsuited, and the occupation of their places by men and boys—a change which was hailed with joy by the people themselves. The amelioration of their habits was evinced in striking instances, of which the noble Lord furnished proof from letters which had been addressed to him by individuals interested in the successful working of the act, especially by Lord F. Egerton; and amongst these testimonies were letters from Scotland, characterising the movement against the Mines and Collieries Act as proceeding from the selfish feelings of certain proprietors, who had coerced their work-people into a reluctant assent to the opposition. Of this latter fact he produced some evidence, tending to show the compulsory way in which petitions had been got up against the act. No doubt cases of hardship had arisen out of its operation; but it was the business of the proprietors to provide for the unhappy persons whose energies had been exhausted in their service, instead of coming to the House with a proposition to nullify a measure which had only come into operation last year, and was producing so much benefit. By negating the motion, the House would affirm that property had its duties as well as its rights.

SIR J. GRAMAM, considering the entire success of Lord Ashley's Act in England, and the great probability of its success in Scotland; and considering likewise the limited extent of the evil of which Mr. C. Bruce complained, concurred with Lord Ashley in resisting the motion.—MR. CURTIS and Lord F. EGERTON also opposed the motion.—A discussion followed, in which MR. ROZBUCK, LORD DUNGANNON, MR. P. STEWART, MR. FORBES, MR. BROTHERTON, MR. LOCKHART, MR. HINDLEY, and ALDERMAN THOMSON, took part; after which the House divided, when the numbers were—For the motion, 23; Against it, 136; Majority, 113.

SIR C. NAPIER moved an address, praying her Majesty to give directions to enable a certain number of old navy officers to retire with an increase of pay, for the purpose of bringing forward young and active officers. What he recommended was, that a hundred of the oldest post-captains on the list, being sixty years of age, should be allowed to retire with an increase of 100*l.* a year.—SIR R. PEEL objected to the motion as interfering with the prerogative of the Crown. He was not prepared to recommend the amount of this change, or to say that the plan proposed was a prudent one. He asked the House not to force the Government to adopt a proposition which they considered of very questionable utility.—LORD J. RUSSELL deprecated such propositions as injurious to the public service, and as a usurpation by the House of Commons of the functions of the Executive.—CAPT. BERNLEY recommended the withdrawal of the motion.—After some remarks by CAPTAINS PECHILL and PLUMMER, which were answered by MR. S. HERBERT, the motion was withdrawn.

Thursday.—Mr. SHARMAN CRAWFORD brought on his motion for leave to bring in a bill to secure the full representation of the people, and to shorten the duration of Parliaments. He supported his motion by historical precedent, admitted the great damage which had been done to the cause by the violent and imprudent conduct of the Chartists, alluded to the coincidence of his opinions with those which had been advocated by the Duke of Richmond upwards of 60 years ago; and pleaded that the changes which he sought constituted not revolution, but real reform, by restoring to the people their just rights, and giving them thereby effectual control over the abuses and extravagancies both of legislation and executive government. His plan is for annual Parliaments, extension of the suffrage to every sane man of 21 years of age, with other changes analogous to what are called the five or six points of the Charter.—Mr. T. DUNCOMBE and Gen. JOHNSON both rose to second the motion. Mr. CURTIS, Mr. FIELDEN, Mr. WARD, and Mr. ROSS followed.—Sir R. PEEL recapitulated the objections against the motion, and met it with a direct negative.—Mr. T. DUNCOMBE, Dr. BOWRING, Mr. MUNTZ, Mr. FERRAND, Mr. STANSFIELD, Lord J. MANNERS, Mr. TRELLAWNY, and Sir W. JAMES subsequently spoke, after which the House divided.—For the motion, 32; Against it, 101. Majority, 69.—Mr. ROEBUCK brought forward his resolution on the subject of national education: "That in no plan of education, maintained and enforced by the State, should any attempt be made to inculcate peculiar religious opinions; because, as such an attempt would be considered a plan for maintaining and strengthening an undue superiority of one sect over all others, the animosity and strife already existing among different religious denominations would thereby unhappily be greatly increased, and the cordial co-operation of all sects and denominations, which is absolutely necessary to insure the success of any plan of public education, rendered impossible."—Sir J. GRAHAM met the motion with a direct negative. He declared that he considered religion as the first and most important consideration in the question of education, and that he believed the country generally entertained the strong conviction that education, to be sound and safe, should be based on scriptural knowledge. He said it would be inexpedient to attempt practically to apply the principle of the resolution, yet he would not object to it on that ground, but because it was an abstract proposition fraught with consequences injurious and extravagant.—Mr. SHEIL dwelt on the great numbers of leopards, accomplices, and graceful mounds in the Church of England who now are persecuted to what he would call the "ancient faith," or, in other words, had adopted Puseyism, which was a natural and sufficient cause of alarm to the Dissenters. It was a monstrous thing that a Dissenter could be a Secretary of State or a Privy Counsellor, and yet be excluded from a miserable system of national education. If the Church were founded on a rock, what had it to fear?—Mr. M. MILNES, though a Churchman, would rather that the factory children were educated by any class of Dissenters than left as they now are. He regretted the dissensions which had been excited by the Factory Bill.—Mr. HAWES admitted that the Church of England, as the Church of the State, could claim superiority in some things; but in education the Dissenters claimed and had a right to perfect equality. But he saw no obstacle to a successful combined system of scriptural education, the importance and necessity of which he was sensible of, and should therefore oppose the motion.—Sir R. H. INGLES, who had been pointedly alluded to by Mr. Sheil, as to his opinions on the subject of Puseyism, claimed for himself freedom from interrogation on religious opinions. He gloried in the name of Protestant—reminding Mr. Sheil of the disputes between Jesuits and Jansenists, and Franciscans and Dominicans. Nothing deserved the name of education which did not bring out the highest qualities of man, with respect to his eternal welfare; and Sir J. Graham would as easily have carried a bill enabling the church to bestow a complete christian education on the people as the one now before the legislature, and which has excited such general abhorrence.—Mr. EWART was afraid that Sir J. Graham's speech would not allay the animosities which had been provoked by the Factory Bill.—Mr. ROEBUCK replied, and on a division there appeared—For the motion, 60; against it, 156.

Sir G. GRAY moved for the production of papers connected with the occupation of the island of Tahiti by the French. He bore testimony to the merits and services of the Protestant missionaries in this island, and expressed his anxiety that ample security should be obtained for them from the French Government.—Sir R. PEEL stated that he had received from the French Government, in writing, an assurance that they would be faithful to the three great principles—of perfect liberty of religious worship, the protection due to the subjects of a friendly power, and the favouring of labours undertaken for the purpose of extending the influence of Christianity.—After a few words from Lord PALMERSTON, the motion was agreed to.

Friday.—Lord STANLEY moved a committee of the whole House to consider the following resolutions, which he proposed to submit to it as the groundwork of the Canada Corn Bill. "Resolved—That on the 12th day of October, 1842, an Act was passed by the Legislative Council and Legislative Assembly of the province of Canada, and reserved by the Governor-General for the signature of her Majesty's pleasure, imposing a duty of 3s. sterling money of Great Britain on each imperial quarter of wheat imported into Canada, except from the United Kingdom, or any of her Majesty's possessions, and being the growth and produce thereof. That the said Act recites, that it was passed in the confident belief and expectation, that, upon the imposition of a duty upon foreign wheat imported into the province, her Majesty would be graciously pleased to recommend to Parliament the removal or reduction of wheat and wheat flour imported into the said United Kingdom from Canada. That, in consideration of the duty so imposed by the said Act of the Legislature of Canada, it is expedient to provide that, if her Majesty shall be pleased to give her sanction to the said Act, the duties imposed upon wheat flour imported into the United Kingdom from Canada should be reduced. That, during the continuance of the said duty, in lieu of the duties now payable upon wheat and flour imported into the United Kingdom from Canada, under an Act passed in the last session of Parliament, intitled, 'An Act to amend the Laws for the Importation of Corn,' there shall be levied and paid the duties following, viz.:—For every quarter of wheat, 1s. For every barrel of wheat, meal, or flour, being 196 lbs., a duty equal in amount to the duty payable on 34½ gallons of wheat.—Mr. LABOURER moved as an amendment to the motion, for the House to resolve itself into a committee: "That an humble address be presented to her Majesty, humbly praying her Majesty to withhold her assent from an Act passed in the last session of the Provincial Parliament of Canada, for the imposition of a duty on the importation of foreign corn." Mr. THORNELLY, Mr. BANKES, Mr. HASTINGS, Mr. MILES, and Lord HOWICK opposed the motion; Mr. LIDDELL, Mr. C. BULLER, and Mr. GLADSTONE supported it. On the motion of Mr. WOODHOUSE, the debate was then adjourned.

CITY.

Money Market, Friday.—Consols closed at 95 to ½ both for Money and Account; Bank Stock, 179½; Three per Cents. Reduced, 94 to ½; Three-and-half per Cents. Reduced, 100½; New Three-and-half per Cents., 101; Exchequer Bills at 1½d., 55s. to 57s. prem., and at 2d., 48s. to 51s. prem.

Metropolis and its Vicinity.

The Sussex Memorial.—It is understood that an influential meeting of noblemen and gentlemen will shortly be held at the Freemasons' Tavern, to adopt measures for calling a public meeting, for the purpose of erecting, by public subscription, a suitable memorial in remembrance of his late Royal Highness the Duke of Sussex. A provisional committee has already been formed, and measures were taken to originate the meeting so early as the 1st inst.

The Royal Hospitals.—The following is a Report of the number of children, and other poor people, maintained in the several Royal Hospitals of the City for the

year 1842: **Christ's Hospital**—185 children put apprentices and discharged from the hospital in the year last past, twelve whereof being instructed in mathematics and navigation were apprenticed to commanders of ships out of the mathematical school, founded by his Majesty Charles II.; 12 children buried during the last year; 1324 children now under the care and charge of the Hospital in London and at Hertford, and 181 to be admitted on presentations granted to this time. **St. Bartholomew's Hospital**: Patients cured and discharged during the last year, 4839. In-patients, 17,489; out-patients, and 17,252 casualty patients, most of whom were poor, sick, and lame persons, and many of them, being destitute of all relief, have been supplied with money, clothes, and other necessities, to enable them to return to their several habitations, amounting together to 39,580. **St. Thomas's Hospital**: There have been cured and discharged from this hospital in the last year, of sick, wounded, maimed, and diseased persons, 3,284 in-patients, and 30,711 medical and surgical out-patients, including casualties, some of whom have been relieved with money and necessities at their departure to accommodate and support them in their journeys to their several habitations; total, 33,995; buried from thence, after much charge in their sickness, 220; remaining under cure—in-patients, 397; out-patients and casualties, 917; so that there have been, during the last year, of poor objects under the care of the hospital, and destitute of other proper care, in all, 35,529. **Bridewell Hospital**: Received into this hospital during the last year, under commitments by the Lord Mayor and the Aldermen of the City, as criminal or disorderly persons, who have been kept to hard labour, or received correction, 1067. Apprentices sent by the Chamberlain for solitary confinement, 42; received during the same period sundry poor persons who have been committed for wandering abroad and begging in this city, 324; total, 1433. **Bethlem Hospital**: Remaining in the hospital on the 1st Jan., 1842, including those out on leave, 311; admitted in 1842, 344; total, 655. Discharged in various ways in 1842, 284: curables, 265; incurables, 9; criminals, 10. Remaining in the hospital, 31st December, 1842, including those out on leave, 371, viz., curables, 198; incurables, 88; criminals, 85.

Scottish Hospital.—The annual Spring Festival of the Scottish Hospital took place on Saturday evening at the Freemasons' Tavern. About 100 gentlemen sat down to dinner; the Duke of Sutherland, the President of the Corporation, took the chair; supported by Lord John Russell, the Hon. Leslie Melville, Mr. Mattheson, M.P., the Hon. William Fraser, of Saltoun, treasurer, &c. The noble Chairman gave the principal toast of the evening, "The Scottish Corporation, and may prosperity attend it." His Grace briefly alluded to the excellent object of the charity—namely, to afford relief to the poor, aged, and infirm Scottish residents in the metropolis; and to supply them with the means of returning, if required, to their native country. The charity, it appeared from the report, had been extensively useful. Lord J. Russell, in returning thanks for the House of Commons, said, perhaps some persons may be of opinion that members of Parliament were better employed, in the midst of hospitality and good cheer, in assisting the distresses of their fellow-creatures, and particularly of their fellow-countrymen, than in sitting up in the House of Commons until four in the morning, discussing the question of whether a debate shall go on or shall cease. I am very grateful for the honour you have done us, and I assure you that I feel most highly the benefits of institutions like this. The manner in which Scotchmen have come forward from generation to generation to the assistance of their poor fellow-countrymen, who have been overtaken by misfortune or distress, is, I must say, highly honourable to the national character. As I am not a Scotchman myself, I have the less difficulty in speaking of that character in the manner it deserves. It is said that it is the result of the best kind of education to enable a man to perform, justly and unanimously, all the offices of peace and war. Judging from the facts, certainly, I think the best education of all is to be found in Scotland; because, whether in the army or in the navy, or in civil services, Scotchmen are ever forward to defend the honour and interests of their country, and rise to the highest posts. Whether engaged in political achievements or political stations, they ever highly distinguish themselves; and, in fact, in all the other duties of civil life, I confess I know no nation in the world which is entitled to take rank before Scotland. It is becoming to such a people to continue, though unostentatiously, the exertions of such a charity as this, from which, for so long a series of years, the poor have found relief. I sincerely trust that a Society conferring such benefits may long prosper, and in every succeeding year be more and more successful. The Hon. William Fraser then gave "The Roof-tree of the House of Sutherland," which was responded to with Highland honours. The Duke of Sutherland acknowledged the compliment with deep feeling. The subscriptions announced during the evening exceeded 500l.

Meeting of West India Planters.—On Tuesday a general meeting of the West India body, consisting of planters, merchants, and others, was held, Mr. Alexander Grant in the chair, for the purpose of receiving and considering a series of resolutions recommended by the standing committee for the reconstruction of the West India body. The following noblemen and gentlemen were elected members of the committee:—The Earl of Harwood, Sir J. McDonald, Lord Holland, Lord Rivers, Sir Simon Clarke, Sir W. Codrington, Colonel D. Pennant, Dr. Barnet, Messrs. Fuller, M.P., Dickinson, Child, Russell Ellice, Torrens, Fullerton, Dalrymple, A. Crichton, Swaby, Sutton, Cohen, Barclay, Leary, Lesigne, Maize, Milligan, W. W. Chancey, Garraway, Hislop, Stewart,

Bosanquet, Natur, Anderson, and Davis. The secretary then read a series of resolutions, to the effect that a standing committee be held to represent the West India planters and merchants, with power to add to their number. The resolutions comprised also various matters of detail connected with the Colonial interests.

Anti-Corn-Law League.—On Tuesday, the various delegates assembled at Herbert's Hotel, Palace-yard, for the purpose of discussing the division on Mr. Villiers' motion in the House of Commons on the previous night, and passing certain resolutions relative to their future proceedings, prior to the dissolution of the Conference. Mr. P. A. Taylor, having been called to the chair, read a long address from the Conference to the Electors of Great Britain upon the vote passed on the motion of Mr. Villiers. Mr. Edwards moved the adoption of the address, which was carried unanimously; after which resolutions were put and carried that copies of the same should be forwarded to her Majesty's Ministers, and to the various members of the House of Lords and Commons. Mr. Harbottle moved "That this Conference feel the fullest satisfaction at the progress which free-trade principles are making in the public mind, as evidenced by the strong manifestation of opinion amongst the electors in different parts of the kingdom, particularly in the Agricultural districts, and which is confirmed by the increased numbers who voted in the minority in the division upon Mr. Villiers' motion." This motion having been carried, Mr. Villiers addressed the Conference at great length, and was followed by Mr. Hume and Mr. M. Philips; after which, Mr. Norris proposed the following resolution:—"That this Conference recommends the League forthwith to commence a registration of the electors of the kingdom, in order to be prepared at the earliest possible period to call upon the Queen's advisers, through the constitutional means of a humble memorial to her Majesty, to dissolve the present Parliament, and thus afford to the electors of the kingdom an opportunity of revising their late decision upon the question of the Corn-law." Mr. Craig seconded the motion, which was carried unanimously. Several other resolutions, expressive of thanks to the Members of the House of Commons who voted in the minority on his motion, having been put and carried, the Conference broke up.

The Temple Church.—The Queen Dowager, attended by her suite, paid a private visit to the Temple Church on Saturday afternoon. Her Majesty and suite were met on the terrace by Messrs. Burge, Spence, Whately, and the Hon. Mr. Talbot, Benchers. After spending half an hour in the Church, her Majesty and party proceeded to view the ancient halls of the Inner and Middle Temple. Her Majesty expressed herself highly gratified, having minutely examined all the curiosities of the building. A numerous concourse of persons greeted her Majesty as she left, a little after 5. At the meeting of the members in their hall, after the departure of the Queen, Sir C. Wetherall proposed her Majesty's health in an appropriate address, which was enthusiastically responded to by the barristers and students present. Her Majesty, previous to her departure, was pleased to express her satisfaction at this visit, which is the first the Temple has had the honour of receiving from a Queen since the days of Elizabeth.

The British Museum.—On Monday morning, workmen began pulling down the houses on the west side of the Museum, according to the orders of the Commissioners of Woods and Forests, the sale of the building materials having taken place on Friday last. The ground is purchased for the site of the new buildings of the Museum.

Festival of the Sons of the Clergy.—This anniversary festival was celebrated in the Cathedral of St. Paul's on Thursday the 11th inst., in the usual manner. There were present, besides many other persons of rank and influence and a great number of the clergy, his Royal Highness Prince George of Cambridge, the Archbishop of Canterbury; the Bishops of Chester, Bangor, Ripon, and Llandaff; Mr. Justice Cresswell, the Lord Mayor and Sheriffs, and many of the Aldermen and civic authorities. The collection at the doors exceeded the collection last year, and amounted to about 240l. Shortly after two o'clock the service was commenced by the *Dettingen Te Deum*, followed by other pieces of sacred music. The dinner in aid of the funds of the Society took place at Merchant Tailors' Hall, and was attended by most of the dignitaries who were present in the Cathedral, and by a large body of the clergy. The amount of the contributions was, as at the other part of the entertainment, exceedingly liberal.

Sale of the Colosseum.—This well-known building was last week brought to the hammer, at the Auction Mart, by Mr. George Robins. The event drew together an extremely numerous assemblage, among which the members of the legal profession constituted a large proportion. The biddings commenced at 10,000l., and after considerable time had elapsed in the progress of the successive advances, the property was knocked down to a gentleman of the name of Giraud, of Furnival's Inn, for 23,000 guineas. It was understood that Mr. Giraud acted in a professional capacity on the occasion, and that he was the representative, and not the principal.

New Church in St. Giles's.—The Rev. J. E. Tyler, Rector of St. Giles's-in-the-Fields, intends to raise a fund for the erection of a new church in this densely-populated parish. The site selected is in the line of the new street which will lead from Bedford-square to Waterloo-bridge. The plan has received the approbation of the Bishop of London; and at the last meeting of the Society for Promoting Christian Knowledge, the sum of 150l. was granted towards the erection of this church, which will be perfectly free.

Sale of Shakspeare's Autograph.—A very interesting sale took place on Wednesday, at Messrs. Evans's Rooms,

in Pall-mall, consisting of a valuable collection of autograph letters, &c., by the most celebrated literary and political characters of the last century. The chief object of attraction, however, was an autograph by Shakspeare, affixed to a deed of bargain and sale of a house in Blackfriars, purchased by him from Henry Walker, dated March 10, 1612, with the seals attached. The situation and boundaries of the tenement in question are fully described in the deed, and the interest is greatly enhanced by a detail of places in its immediate vicinity, and a list of persons who rented the adjacent property, as follows:—"All that dwelling-house or tenement, with the appurtenances, situate and being within the precinct, circuit, and compass of the late Blackfryers, London, sometymes in the tenure of James Gardiner, Esquier, and since that in the tenure of John Fortescue, Gent., and now or late being in the tenure or occupation of one William Ireland; abutting upon a streete leading down to Puddle Wharffe on the East part, right against the King's Maiesties wardrobe; part of which said tenement is erected over a great gate leading to a Capitul Mesuage, wch was sometime in the tenure of William Blackwell, Esquier, and since then in the occupation of the right honourable Henry, now Earle of Northumberland." The indenture is stated at the commencement to be "Betweene Henry Walker citizein and minstrell of London of the one partie, and William Shakspeare, of Stratford upon Avon, in the countie of Warwicke, gentleman, William Johnson, citizien and vintener of London, John Jackson and John Hemyng of London, gentlemen, of the other ptie;" the property being conveyed to all four; that Shakspeare himself is declared to have paid the consideration-money, amounting to 140*l*. The document, moreover, contains internal evidence, showing that Shakspeare was the sole purchaser of the premises, which he afterwards bequeathed in his will to his daughter Susanna Hall, in the following words:—"All that message or ten'te, wth th'app'tennes, lyeing and being in the blackfryers in London, nere the Wardrobe"—evidently the same house. On the back of the deed are the names of the attesting witnesses, "Sealed and delivered by the said William Shakspeare, William Johnson, and John Jackson, in the pnce of Will. Atkinson, Ed. Overy, Robert Andrewes, scrivener, and Henry Lawrence, servant to the same scrivener," whose seals it bears, with the initials "H. L." upon them. This important document was sold by Messrs. Evans about two years since, when it was purchased by a Mr. Poynder, of Christ's Hospital, for the sum of one hundred and sixty-five guineas. After a few preliminary observations from Mr. Evans, the relic was produced, Mr. Sainsbury, the proprietor of the Napoleon Museum putting it up at 100*l*. The bidding was carried on with considerable spirit between that gentleman and Mr. R. L. Jones for some minutes, the document being ultimately secured by the latter for one hundred and forty-five guineas. It was stated immediately after the sale, that Mr. Jones had purchased the relic for the City library at Guildhall. During the life of Shakspeare, the Lord Mayor and aldermen successfully resisted the performance of a single play by Shakspeare within their walls; and now they give 145*l*. for his signature! Nevertheless, the City-library is an appropriate depository for a document so interesting to the topographical antiquary of London.

Custom-House.—A seizure was made a few days since by the Custom-house officers of some foreign manufactured goods, supposed to bear the brands of British manufacturers. It appears that 400 bales of goods had arrived from Boston, in the Niagara, now lying in the St. Katherine-dock, addressed to the house of Baring, Brothers, and Co. The entry was passed, in the name of that firm, for warehousing the goods at the warehouses of Messrs. Taylor and Beil, at the Legal Quays, and 375 bales were in the course of removal in lighters belonging to the wharfingers in question. The discovery was made through the circumstance of 1 bale being landed on the quay of the dock in error; the officer on the station causing it to be opened, when each piece of goods was found to bear the brand of "Stark Mills, Manchester." The whole of the 400 bales were, in the first instance, detained by the Customs' officers; but they have since been given up, on the receipt of an explanation from Messrs. Baring, showing that the goods are totally different in texture and style from English manufactures, and that the "Manchester" on the brand is the town of that name in New Hampshire. Of the 400 bales, 200 are branded as being the fabrics of the "Lowell" mills (near Boston), 100 bales as those of the "Boott Cotton Mills" (America), and the remaining 100 bales as those of the "Stark Mills, Manchester, N.H." (New Hampshire). This explanation has been considered satisfactory, and the charge of deception alleged against the correspondents of Messrs. Baring has of course fallen to the ground.

Destruction of the Stone Pier at Greenwich.—On Tuesday morning, between nine and ten o'clock, the inhabitants in the vicinity of the stone pier at Greenwich were alarmed by a loud report like the explosion of a piece of artillery, succeeded within a few seconds by the announcement that the pier was falling. At the time several people were on the pier as it gave way, and others were on the barge which is moored in front. The damage extended to at least three-fifths of the entire length, which is 320 feet; and it is in depth, from the bottom of the piles, 80 feet. At about 11 o'clock on Tuesday night, just as the tide was rising, another crash was heard, which was at once attributed to the bursting of the piles in front of the pier. As soon as daylight appeared, boats put out to see the extent of the damage, and the appearance the pier then presented left not the slightest hope of saving any portion—pile after pile of ponderous timber, bound with iron, and fixed at the foundations in massive

plates of iron, had been split and shivered, some falling inwards and others outwards, whilst the parade gave way in every direction, the fissures extending nearly the whole length, and the plates of iron being shivered like glass. It is now, therefore, scarcely safe for any person to go on the pier, as the only remaining stairs leading to the floating-barges have been affected by the shock, and the whole of the frontage wall and iron railings must ultimately give way. The eastern end, near Ship Dock and the Royal Hospital, is opening in fissures, and is likely also to burst away in that direction. It is quite impossible to stay the damage, but the whole must be left to its fate, and be washed down by the tides, when the greater part of at least 10,000 tons of earth, &c., which had been laid in between the wall and the road to form the parade, will also be washed away. The present appearance of this extensive pier is that resembling an earthquake; the iron-work, masonry, and timbers are lying about or leaning in every direction. The cost of the pier was about 30,000*l*, and it was only completed about three years ago.

The National Society.—On Wednesday the annual general meeting of the National Society for Promoting the Education of the Poor in the Principles of the Established Church, was held in the Central School-rooms, Westminster. The Archbishop of Canterbury was in the chair, and a numerous assembly of clergymen and persons interested in the schools of the National Society and the cause of education filled the room, among whom were the Bishops of Winchester, St. David's, Chester, Ripon, Salisbury, and Bangor; Lords Kenyon, Radstock, Calthorpe, and Sandon, M.P. The proceedings commenced by an examination of the children of the Society's school, in Scripture knowledge and history, geography, grammar, arithmetic, and music. The Apostles' Creed and *Magnificat* were chanted with good effect by the boys and girls attending the schools in the course of the exhibition. The examination having been concluded, the report was read and adopted, and the meeting was addressed by the Bishops of St. David's, Bangor, and Chester, Lord Radstock, Lord Calthorpe, and other friends of the Society.

Inclosure of Hampstead Heath.—On Monday a numerous meeting of copyholders and inhabitants of Hampstead took place, for the purpose of considering a bill now before the House of Lords, entitled "The Wilson Inclosure Bill," the object of which is to empower the lord of the manor, Sir Thomas Maryon Wilson, to let land on building leases, form roads, squares, &c., and thus entirely to inclose and destroy that beautiful spot of recreation for the public of the metropolis, Hampstead Heath. Mr. Samuel Hoare, the banker, was called to the chair. The vestry-clerk read the copy of the Bill introduced into Parliament, which referred to Sir Thomas Maryon Wilson's estates in Middlesex, Essex, Kent, Suffolk, and Sussex, and gave him general powers of inclosure of such lands, and for the granting of leases for 99 years, making of squares, roads, &c. thereon, the inclosure of Blackheath as well as Hampstead-heath being a part and parcel of the Bill. Mr. White said he was one of the trustees of the fund raised to oppose a former attempt of the lord of the manor, in 1830, to inflict a similar injury on the copyholders and the public, by a Bill to inclose and destroy the beautiful prospect of Hampstead-heath. He had felt it his duty to come forward and oppose this Bill on public grounds, and deny the right of the lord of the manor to make roads and build houses for his own benefit, at the sacrifice of the rights and benefits of the public. Mr. Cooper observed that the lord of the manor had no right whatever to improve his property to the manifest injury of the public. Nothing was more clear than that no man was at liberty to build houses for his own advantage to the prejudice of the copyholders on such a manor. Most of the inhabitants of Hampstead were induced to reside there solely on account of its beautiful heath and the extensive views obtained therefrom of the surrounding country, as also the metropolis views of which could not be equalled within 40 miles of London. The character of the place, by the proposed measure, would be lost. There were numbers of houses at present untenanted; clearly showing that an increase was not needed. Houses held under copyhold powers had been built in various parts of Hampstead in the first style, under a belief that their prospects were not to be interfered with. This attempt would by no means be, if carried, a public improvement; on the contrary, it was an act of monstrous injustice to the public and to the copyholders, who he trusted would unite, and in every shape oppose this measure. They and the public had one common interest in the preservation of Hampstead-heath. The Rev. Dr. Burgh said he considered it was the duty of every inhabitant of Hampstead, whether a copyholder or not, to oppose this bill, and to defend their rights against that which he could only designate as an illegal assumption. On the former occasion, when a similar attempt was made, Lord Tenterden not only opposed, but gave a very strong opinion against the claim of the lord of the manor to have such powers granted to him. He (Dr. Burgh) considered that in accordance with the bill of the late Sir Thomas Wilson, the present lord of the manor had no right whatever to inclose the heath, or build thereon. If this bill were passed it would be ruin to the town of Hampstead, for the copyholders would get rid of their property, and he had understood that Lord Mansfield had declared his determination to leave Caen Wood, and dispose of his property there. The object of the copyholders in residing at Hampstead was its quietude, its retirement, and for the benefit of their health; and if they were to be deprived of all these, property would be completely annihilated. The public no doubt would look after their own rights and interests in this matter, but it was the duty of every copyholder to come forward boldly, and resist these encroachments on

the part of the lord of the manor. Mr. Riply concurred in the observations of the last speaker. He had on a former occasion, not only taken the opinion of Lord Tenterden as to the right of the lord of the manor to obtain such powers under an act of Parliament, but he had also obtained the opinion of Sir Charles Wetherall, Lord Abinger, when Attorney-General, Mr. Vernon Richards, and many other eminent lawyers, the whole of whom were adverse to such being a right vested in the lord of the manor.—Mr. Powell then moved a resolution, to the effect "That the proposed bill was highly injurious to the interests of the copyholders resident in Hampstead and its vicinity, and that it was their bounden duty, and they were resolved to oppose it, and endeavour by every means to prevent it being passed into a law."—The Rev. Dr. Burgh seconded the resolution, which was adopted unanimously.—Mr. Toller said that if the bill were carried, the whole of the eastern and south-western sides of the heath would be inclosed, and thus a view, in the latter instance, even as far as Windsor, would be obstructed. He had prepared a petition against the bill, which he would now read. It set forth that the petitioners would sustain irreparable injury if such a measure were passed; that previous attempts had been made in 1829 and 1830 to pass a similar measure, which was rejected. It therefore prayed to be heard by their counsel or agents against the passing of such bill. The petition having been unanimously adopted, a committee was appointed to watch the bill, and take all measures necessary for a determined opposition, for which purpose the sum of 200*l*. had been subscribed.

Hanwell Asylum.—On Wednesday a sale of fancy work, made by the female patients of the institution, was held at the Hanwell Lunatic Asylum, in aid of the Adelaide Fund for the Assistance of the Convalescent Patients upon their discharge. It was at first intended to hold the bazaar in the grounds of the asylum, and several marquees were already erected for the occasion, but from the unsettled state of the weather the committee found it necessary to alter that arrangement, and two of the long galleries on the west side were tastefully decorated with evergreens and flowers, in which the stalls were laid out, while two of the galleries, similarly decorated, were appropriated for the visitors to promenade in. The company were attended through the apartments by several of the visiting committee of justices. The band of the 13th Light Dragoons, from Hounslow barracks, were stationed at the basement of the principal circular staircase. Late in the afternoon, when, owing to the heavy rain, the company began to thin, several of the female patients were permitted to pass through the ornamented wards; and it was most pleasing to witness the order and quietness they manifested, and the delight and pleasure they expressed on recognising any of the medical officers, attendants, and magistrates acting on the committee. In the evening, after the stalls had been cleared, about 100 of the female patients were regaled with tea and cake in the ornamented wards, and passed apparently a pleasant hour in singing and other recreations.

The Royal Yacht.—The new steam-yacht *Victoria* and *Albert*, intended for the especial use of her Majesty, was hauled on Monday into the East India export-dock, and a great number of men were immediately set to work to complete her fittings, which will be finished in the most superb style. Her engines, which are of 650 horse-power, will be fixed by Messrs. Maudslay, and every exertion is making to get her ready in time for her Majesty's intended visit to Ireland in the course of the present summer.

Accidents.—We learn from a correspondent that Mr. Cook, of Brooklands, was thrown from his horse on Saturday, and sustained such severe injury as to leave very little hope of his recovery. He has been insensible ever since, and the physicians on Monday announced that if there were not a change for the better in a few hours all hope of recovery was vain. We are happy, however, to learn that the symptoms have taken a favourable turn, and that Mr. Cook is better.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, May 6th—West districts, 160; North districts, 159; Central districts, 190; East districts, 177; South districts, 193. Total, 879 (451 males, 428 females). Weekly average for the last five years, 903 (461 males, 442 females), and for the last five springs, 854.

Probucinal News.

Bridgend.—The adjourned inquiry into the double murder at Laleston terminated on Saturday. After the examination of several witnesses, and particularly of Mr. Herapath, the chemist, who deposed to the fact of arsenic being found in the bodies of the deceased persons, the jury returned a verdict of wilful murder against the sister and her husband. The magistrates, who believe that they shall discover some additional facts, have further adjourned their investigation. It is not, therefore, expected that the Coroner's warrant of committal will issue immediately, but that the prisoners will still remain in separate confinement at the county gaol.

Bristol.—Our readers who have taken an interest in the late accident to Mr. Brunel will be glad to learn that the coin was dislodged on Saturday last, in the presence of Sir B. Brodie, Mr. Aston Key, Mr. Hawkins, and Dr. Seth Thompson. On Sunday the patient was visited by the above-named gentlemen and Dr. Chambers, and was so much improved that he was allowed to go out for an hour. The following statement of the treatment adopted drawn up it is understood by Dr. Seth Thompson, has been published in the daily papers:—"The accident happened on the 3d of April. Sir B. Brodie was consulted on the 18th, and his opinion was, that the half-sovereign had passed into the windpipe. The following day Mr.

Brunel strengthened this opinion by a simple experiment. He bent his head and shoulders over a chair, and distinctly felt the coin drop towards the glottis; whilst raising himself a violent fit of coughing came on, which ceased after a few minutes; he repeated this a second time, with the same result. A consultation was held on the 22d, at which it was decided that conclusive evidence existed of the half-sovereign having passed into the windpipe, that it probably lodged at the bottom of the right bronchus, and that it was movable. It was determined that every effort should be made for its removal, and that for this purpose an apparatus should be constructed for inverting the body of the patient, in order that the weight of the coin might assist the natural effort to expel it by coughing. The first experiment was made on the 25th. The body of the patient being inverted, and the back gently struck with the hand between the shoulders, a violent cough came on, but of so convulsive and alarming a nature that danger was apprehended, and the experiment was discontinued. On this occasion the coin was again moved from its situation, and slipped towards the glottis. On the 27th tracheotomy was performed by Sir B. Brodie, assisted by Mr. Aston Key, with the intention of extracting the coin by the forceps, if possible; or, in the event of this failing, with the expectation that the opening of the windpipe would facilitate a repetition of the experiment of the 22d. On this occasion, and subsequently on the 2d of May, the introduction of the forceps was attended with so much irritation that it could not be persevered in without danger to life. On the 3d another consultation was held, when Mr. Lawrence and Mr. Stanley entirely confirmed the views of Sir B. Brodie and Mr. Key, and it was agreed that the experiment of inversion should be repeated as soon as Mr. Brunel had recovered sufficient strength, the incision in the windpipe being kept open. On Saturday, the 13th, Mr. Brunel was again placed on the apparatus, the body inverted, and the back gently struck. After two or three coughs he felt the coin quit its place on the right side of the chest, and in a few seconds it dropped from his mouth, without exciting, in its passage through the glottis, any distress or inconvenience, the opening in the windpipe preventing any spasmodic action of the glottis. In this remarkable case the following circumstances appear to be worthy of note:—That a piece of gold remained in the air-tube for six weeks, quite movable, and without exciting any inflammatory action, the breathing entirely undisturbed, and the only symptoms of its presence being occasional uneasiness on the right side of the chest, and frequent fits of coughing. That an accurate diagnosis was formed without being able to obtain any assistance from the stethoscope, although the chest was repeatedly and carefully examined, and also that a fair trial having been given to the forceps, the application of this instrument to the removal of a body of this peculiar form from the bottom of the bronchus was proved to be attended with great risk to life; while the cautious and well-considered plan of treatment above detailed was attended with complete success, and without risk."

Cambridge.—One or two attempts to annoy the Rev. Professor Whewell have been made during the period of his office, as Vice-Chancellor for the current academical year. The other day a more serious trick was played off against him, which must have been attended with great loss to many parties who were made victims in the hoax. Some gentlemen who had just left the University—Trinity men, it is supposed—having taken their B.A. degree, went round, on their arrival in town, to a number of London tradesmen, and gave orders for various quantities of their respective goods, to be sent, per waggon or coach, to Trinity Lodge, Cambridge, by a certain day. The orders were in all cases executed, and the Master's residence was accordingly beset on the day in question. Amongst the consignments, too numerous to mention, were a grand pianoforte, for the drawing-room; a cottage ditto, for a lower room; mechanical implements; complete sets of carpenters' and turners' tools; apparatus of an amateur forge; a child's cot, coral, and rocking-horse, &c. "Tailors," adds the *Cambridge Independent Press*, "have also arrived to measure the domestics for liveries, and jewellers to remodel the College plate, and one piece of goods has been forwarded under the charge of three men to fit it up in the Lodge."

Canterbury.—A sitting was held in the bankruptcy of Messrs. Baldock and Co. on Tuesday, for the declaration of a dividend under the joint estate, which has already paid 4s. in the pound to the creditors; the debts proved amount to 140,000*l.*, while the assets realised are 40,000*l.* The further dividend declared was 1s. 6*d.* in the pound, the period for the payment of which will be notified to the claimants through the official channel.

Carmarthen.—The Welch papers state that the offences committed by "Rebecca and her daughters" are daily growing more frightful, and not a single depredator has yet been discovered. On Friday Llanfihangel gate, near St. Clears, was demolished by a mob of men, disguised as usual in women's clothes, who were, however, disturbed in their operations by the passing of the Penbroke mail. They placed sentinels on each side of the road, and immediately the mail had passed, they finished their work of destruction. On Monday afternoon, the plantations of Mr. Powell, of Penycod, were set on fire, and the wind blowing freshly, before assistance could be obtained to extinguish the fire, four acres of valuable young trees were burnt. It fortunately happened that a great deal of furze had been cut from the plantation during the winter, otherwise nothing could have saved the whole 22 acres of plantation from being destroyed. On Monday night the gate in the town of St. Clears shared the fate of the others. Although a reward of 150*l.* and a free pardon has been offered by Government, not a single

accomplice has been taken, and the conduct of "Rebecca and her daughters" has grown daily more alarming.

Deal.—The new light on the tower that has just been completed at the South Foreland was exhibited for the first time last week, and is said to answer every purpose contemplated. On Friday night the deputy-master and a number of the elder brethren of the Trinity House went off in a yacht to view it from various points in the Channel, and were much pleased with the brilliancy of the light as well as with the improvements generally that have been effected on this important headland.

Eton.—The Newcastle scholarship, founded by his Grace the Duke of Newcastle in 1829, of the value of 50*l.* per annum, to be held for three years, open to competition for all boys in the sixth form and upper division of the fifth, and such of the middle division as should have arranged to leave the college before the next examination, was on Saturday last gained by Mr. Joynes, K.S., and the gold medal (given by his Grace to the boy who stood second in the examination for his scholarship), was awarded to Mr. Simpson. Mr. Joynes gained the medal last year, and Mr. Simpson, who was then his close competitor, had previously obtained the first Prince Albert's prize, presented annually by his Royal Highness for the promotion of the study of modern languages. Both of these young gentlemen are the sons of clergymen; Mr. Joynes being the son of the rector of Gravesend, in Kent; and Mr. Simpson, the son of the rector of Little Horsted, in Sussex. The number of pupils now at Eton is greater than ever before known; the entries of scholars at the termination of the Easter vacation amounting to upwards of 700. Since 1836 there has been a gradual and progressive increase in the number of scholars, as follows: In that year there were 444; in 1837, 475; in 1838, 522; in 1839, 560; in 1840, 593; in 1841, 636; in 1842, 659; and this year, at Easter, upwards of 700.

Exeter.—On Tuesday the 9th inst. the town-crier of Exeter announced that a public meeting would take place, and that Mrs. Fryer would deliver a lecture on the principles of total abstinence from spirituous liquors. The place selected for the meeting was a large attic loft, built about 50 years since for the purpose of drying serges, in East-street. At eight o'clock it is supposed there were about four hundred persons assembled to hear the lecture, consisting of men, women, and children; and while a gentleman was delivering an introductory address, a large portion of the flooring gave way, precipitating a great part of the audience to the middle floor, which contained several hundred bushels of oats, and fortunately prevented the breaking of many necks, as numbers of persons fell head foremost on the grain; and their additional weight coming so rapidly on this floor, caused it also to give way, and many persons were literally buried in oats and rubbish on the ground floor, having fallen from three stories high. The pressure of the falling beams, and the number of persons, burst out a window about ten feet in length on the ground floor, which formed an egress for those who were able to get out, and admitted many who came to the rescue of those who were injured. Fortunately, no lives were lost. That portion of the attic floor appropriated for the station of the lecturer, chairman, &c. did not give way, so that they remained affrighted spectators of the catastrophe.

Liverpool.—Another fire broke out on Saturday morning in Formby-street, in this town. This street, it will be remembered, was the scene of the memorable fire which occurred in Liverpool last September. At 10 o'clock on Saturday morning the policeman on duty in the neighbourhood discovered the fire on the premises belonging to Messrs. Ashton and Ginn, boat-builders, on the south side of the street, and adjoining the west wall of the fire-proof warehouses that were preserved from destruction by the great fire in September. The greatest activity was displayed by the authorities; but, from the start the fire had obtained, and from the nature of the premises, being the smithy, carpenters' shops, &c., surrounded by piles of dry planks, the fire had assumed an alarming appearance, and had almost completed the destruction of the premises wherein it originated before the engines could be got effectually into play. The windows and doors were burnt out, and the interior apparently gutted, and a quantity of wood destroyed, before a sufficiency of water could be obtained; but some hoses were passed through the dock wall, and planted in the dock with great alacrity, and in a few minutes after the engines got into full play its fury was considerably abated; and by 2 o'clock there was no longer any fear that it would extend beyond the premises it had at first taken possession of, and which were nearly demolished.—The Liverpool police-court was crowded by merchants and other respectable inhabitants of that town, on Tuesday last, for the purpose of hearing the investigation of a case of extensive embezzlement, alleged to have taken place in the Post-office. It appears that, in consequence of numerous robberies having of late taken place in the establishment, Mr. R. Lord was sent down from the General Post-office in London, to institute inquiries, and that certain suspicions having fallen upon J. Leeming, a clerk attached to the department of the Dead Letter-office, search was made, and evidence obtained of his being the party concerned. He was thereupon given into custody. The prisoner was charged with embezzling several letters containing bills of exchange to the amount of 4,939*l.*; also letters containing gold rings, beads, and other articles. The indictment was brought under the 1st of Victoria, cap. 26, which enacted that any person who should embezzle a letter going through the Post-office should be guilty of a felony, and render himself liable to be transported; and that if the letter so embezzled contained money or other valuables, he would render himself liable to be transported beyond the seas for life. Witnesses

were then called, whose evidence bore out every part of the charge, and the prisoner, who offered no defence, was committed for trial.

Manchester.—About eleven o'clock on Tuesday night an outrage of an alarming character was perpetrated in the immediate neighbourhood of this town, by a party of between 300 and 400 persons, chiefly brickmakers, armed with blunderbusses, guns, pistols, bludgeons, and almost every description of weapon, who forcibly entered the brick-croft of Messrs. Pauling and Henfrey, with the evident intention of destroying the property, and either murdering or maiming every one who might oppose their violence. After committing several acts of violence they retreated; but information was speedily conveyed to the Salford police-office, and a party of Officers were soon on the spot, by whose exertions some of the rioters were secured. On Wednesday seven prisoners were brought before the magistrates at the New Bailey, charged with having taken part in the attack, but were all remanded. The police are on the look-out for others of the turn-outs, many of whom, it is suspected, were wounded, and will be traced without much difficulty.

Portsmouth.—The Eurydice frigate, of 900 tons, built according to the plan of Rear-Admiral the Hon. George Elliot, was launched here on Tuesday. The ceremony of naming her was performed by a daughter of the Admiral. A numerous assemblage of persons had collected to witness the spectacle.

Windsor.—An order arrived here last week from the Commissioners of Woods and Forests, for the five dilapidated houses, the residences of that number of the Military Knights of Windsor, known as the lower foundation, situated in the lower ward of the Castle, to be immediately taken down, it having been deemed requisite, in consequence of their ruinous condition, that no delay should take place in their being razed to the ground, and a new row of houses for the Military Knights of the foundation of Sir Peter Le Maire constructed, with increased conveniences, in their stead. This foundation was endowed in the early part of the reign of James I., by Sir Peter Le Maire, with an estate of the then value of 230*l.* per annum.—An attempt to assassinate the Rev. Thomas Page, officiating minister of Christ Church, in the vicinity of Virginia Water, close to Windsor Great Park, was made a few nights ago, between eleven and 12 o'clock. The perpetrators of the outrage remain for the present undiscovered. Mr. Page resides, with his family, at the parsonage-house, which is a detached building situated a short distance from the church. A few nights ago, just as the Rev. Gentleman and his wife were retiring to rest, and at the moment Mr. Page (whose shadow was thrown upon the window) had approached the dressing-table, at the window of his bedroom, to extinguish the light, a loaded musket was discharged at him from the garden, and evidently at but a short distance from the house. Upon examining the window, a large slug, upwards of an inch in length, was discovered to have been lodged in the woodwork which divided the two sashes of the window, and in the precise direction of the spot where the Rev. Gentleman was standing. A portion of the glass was broken, and the shattered fragments scattered upon the dressing-table, but Mr. Page escaped unhurt.

Railways.—The railway receipts for the week have been as follows:—Birmingham and Derby, 1,141*l.*; Birmingham and Gloucester, 1,699*l.*; Edinburgh and Glasgow, 2,406*l.*; Eastern Counties, 2,186*l.*; Great North of England, 1,451*l.*; Great Western, 14,742*l.*; Hull and Selby, 979*l.*; London and Birmingham, 18,092*l.*; Blackwall, 715*l.*; Brighton, 3,081*l.*; Croydon, 256*l.*; Greenwich, 680*l.*; South Western, 5,976*l.*; Manchester and Leeds, 4,618*l.*; Midland Counties, 2,633*l.*; Northern and Eastern, 1,661*l.*; North Midland, 4,046*l.*; South Eastern and Dover, 2,021*l.*—The returns given in the report of the officers of the railway department, Board of Trade, show the average speed upon the various lines, exclusive of stoppage, as follows:—London and Birmingham, 27 miles per hour; Great Western, 33; Northern and Eastern, 36; North Midland, 29; Midland Counties, 28; Birmingham and Derby, 29; Manchester and Birmingham, 25; Newcastle and North Shields, 30; and Chester and Birkenhead, 28. The average speed on the Metropolitan lines, exclusive of stoppages, is about 22 miles an hour.—Arrangements have been entered into by the War Office for the conveyance of troops by the South Eastern and Chester and Birkenhead railways. The charge is to be the same as on other lines, viz., one penny per mile for every soldier, with the exception that, upon the Dover line, the officers are only to be allowed 1 cwt. of baggage.—The inhabitants of Stockport and neighbourhood, are, it seems, much dissatisfied at the Manchester and Birmingham Railway Company having raised the fares between the Stockport station and Manchester; and on Thursday, the 11th, a numerous meeting was held to take the subject into consideration. A number of speakers addressed the meeting, and expressed their disapprobation of the proceedings of the directors; and the meeting resolved, in consequence of their unaccommodating conduct, to establish a company to run coaches on the road between Stockport and Manchester. Several speakers promised to take shares in the intended company, and others promised to pay their fares to the intended company twice or thrice a week to and from Manchester, for six months to come. A committee was ultimately appointed to make arrangements for the formation of a company.—A meeting of the inhabitants of Brighton, convened by the high constable, was held at the Town-hall last week, for the purpose of considering the recent alterations in the table of fares and time adopted by the directors for the current month. The high constable presided. The speeches were all couched in the language of

complaint, the times of starting the trains being considered, in several points, very inconvenient, and the fares higher than on any other railway out of the metropolis, and nearly double those of the competing line, the South Eastern or Dover railway. The result was the appointment of a deputation to wait upon the directors, with a view of showing that the interests of the shareholders required a different policy to be adopted with regard to the fares, as well as the interests of Brighton, which the meeting considered to be injuriously affected by the high prices at present charged to passengers.

IRELAND.

Dublin.—The declarations of Ministers in both Houses of Parliament on Tuesday week have caused no ordinary sensation among all parties in Ireland, none of whom seem to have been prepared for the decisive step taken by the Government in relation to the question of repeal. At the meeting of the Repeal Association last week, Mr. O'Connell adverted to the proceedings in Parliament, and said that that was a great day for Ireland. He found in the London papers speeches attributed to Lord Roden and Jocelyn, and Wellington and Peel, and little "Spring Rice," as he was called in the south of Ireland. He rejoiced to find that their enemies had at length been reduced to the necessity of using Billingsgate in assailing the repealers. They could abuse them, but he defied them to accuse the repealers of a crime. A short time ago the English newspapers either took no notice at all of the repeal agitation, or put it off in a paragraph of five lines; but it was so no longer, and he was gratified to find that the repealers were now known and feared, but that they could not be subdued. He thanked the newspaper Duke of Wellington for that; he thanked the newspaper Lord Roden for it; he thanked the paltry Whig Lord Lansdowne of the newspaper for it, but above all he thanked that most despicable and contemptible of politicians—Henry Brougham. He was not worth their groaning. He was treacherous to his friends and cajoling to his enemies—a toad-eater of so foul a nature never disgraced the profession of the law. He had, to be sure, high talents; but no human being ever degraded his talents through selfish motives as he had done. There was no road to power too filthy for him to climb. Oh! it was delightful to find such a man against them, for they could not have a more contemptible enemy. He of course only spoke of the newspaper Lord Brougham. Mr. O'Connell then proceeded at considerable length, and said, that "if Peel extinguished their liberty, he should do so through the best blood of the Irish people." The Queen, he continued, was coming here; when she came to Ireland, they would get up petitions signed by a million of repealers, which some one would present to her in person, and then the Union was repealed. He hoped that every town and village through which her Majesty would pass would display its flags, on which should be written, "We pray your Majesty to repeal the Union." After some further observations, Mr. O'Connell concluded his speech by declaring that Ireland should be for the Irish, and the Irish for Ireland. Mr. Steele rose and said "Sir Robert Peel talks of civil war, let him try it if he dare." Here the meeting rose in great excitement, and cheered for several minutes. At the meeting on Monday last, Mr. O'Connell renewed the subject, and said there would be no civil war in Ireland as long as he lived. The people would keep at the legal side, and if others invaded them that was not a civil war, and he promised them that there was not a Wellingtonian of them all who would shrink less than he from that contest if it was forced upon them. Violating no law, the repealers would keep on constitutional grounds, as long as it was left to them; but if they throw them from that, *as victis* then, for the contending parties. The room was crowded to suffocation. The rent for the week exceeded 600*l.*—The Provincial papers are filled with details of meetings in connexion with the Repeal movement, and surpass, in violence of language, even the accredited organs of the Association in the capital. Government has sent a troop of Lancers to Enniskillen for the purpose of sustaining the police, should any necessity arise out of the Repeal movement. The papers announce that Father Mathew is expected to arrive in England in the course of a short time, on a visit to Cambridge, Wisbeach, Norwich, Ipswich, and other places.—The Atmospheric Railway between Dublin and Kingstown will be opened by the month of July.

Mullingar.—A great Repeal dinner has been given in this town to Mr. O'Connell, at which the Roman Catholic Bishop of Ardagh, Dr. Higgins, stated that every Catholic Bishop in Ireland, without an exception, is an ardent Repealer. "I know," he said, "that virtually you all have reason to believe that the Bishops of Ireland were Repealers; but I have now again formally to announce to you, that they have all declared themselves as such, and that from shore to shore we are now all Repealers." Mr. O'Connell interrupted the speech and declared that "it was the best news he ever heard."

Law.

COURT OF EXCHEQUER.—*The Attorney-General v. Hurel.*—*Custom-House Frauds.*—This was an information, filed at the suit of her Majesty's Attorney-General, to recover from the defendant, a glove importer, carrying on business at No. 8, Old Jewry, penalties to the amount of nearly 5,000*l.*, for illegally defrauding the Board of Customs of the duties payable upon 921 dozen pair of French gloves. The Attorney-General in opening the case to the jury, stated, that this information was founded on the 3d and 4th William IV., c. 52, an act which rendered any party liable to a penalty who should receive or conceal goods which had been illegally unshipped, and upon which the proper amount of duty had not been duly paid. The learned counsel, after having gone through a history of the case, proceeded to say that he thought the jury would have but little difficulty in arriving at the conclusion as to the guilt of the defendant when they should have heard

the nature of the evidence he should present to their notice. They would remark, as the case proceeded, that considerable ingenuity had been exercised in the transaction, and he regretted to say, that one of the chief instruments in the fraud was no longer within the jurisdiction of the English law. That person, whose name was Tye, had, as a partner of a Mr. Sherer, a gentleman whose conduct in the affair it was far from his intention to impugn, because it appeared that he had been altogether ignorant of the acts of his partner—it would seem acted as the Custom-house agent for a firm of the name of Vidil and Hurel, who carried on the business of glove-dealers and manufacturers at No. 8, Old Jewry. The partner Vidil, it would appear, resided at Grenoble, whilst the establishment in London was conducted by Mr. Hurel. That gentleman had employed the person Tye as his Custom-house agent, and the jury would hear from Mr. Sherer and the other witnesses a history of the manner in which the Custom-house business for that firm had been transacted. It was but right that he should state in the outset that one of the witnesses, and a most important witness too, whom he should put into the box, was one of the officers by whose connivance one of the frauds complained of had been effected. That officer would lay before them a full detail of the manner in which the fraud, with regard to the cases of goods which had reached this country by the Lady de Saumarez, had been accomplished. He did not mean to contend that the statement of such a witness was altogether calculated to induce them to place implicit reliance on his credit. All, therefore, that he asked was, that they should regard his testimony in the light of an explanation of the transaction, which it was impossible, for various reasons, to obtain through any other means. Its truth would be borne out by all the surrounding events which would be detailed by other witnesses. He simply, therefore, solicited that this man's evidence should be treated by the jury as an explanation of the affair. The witness Sherer, the partner of Tye, would prove that he had landed and examined the contents of the cases, of which he had taken an account, which had been passed by the witness Burnby, the tainted officer of the Customs, and it would be found that the variance between the account which he had taken, and that upon which the duty had been paid, was precisely the difference which was charged against the defendant by the information. The two offences which were charged on the present occasion had reference to cases landed from the Belfast and from the Lady de Saumarez, and if he fully made out the case, then the jury would have no difficulty in returning a verdict for the Crown, on whose behalf this information was now filed, not only for the protection of the revenue, but also for that of the fair traders, whose interests were compromised by transactions of this nature. Evidence was then adduced on the part of the Crown. Charles Sherer deposed as follows:—I am a Custom-house agent. In 1840 and 1841 I carried on business in partnership with a person of the name of Tye, under the firm of F. and J. Smith and Co. Messrs. Vidil and Hurel were Tye's customers. They were glove importers in the Old Jewry. Vidil lives at Grenoble, and Hurel carried on the business in London. We received instructions from him to pass goods at the Custom-house. The bill of lading was sent down to us, and if Tye was not there, I attended to the business. We received instructions in January, 1841, to pass goods brought by the ship Belfast from Boulogne. I obtained this "sight entry" in consequence. I examined three cases marked G S 529, E E 1,525, and C M No. 5. This is a sight entry for these cases. Edward Manico wrote the body of this entry. The goods were at the Custom-house-quay. The importer has the option of ordering the goods sent to him to any quay he chooses for the purpose of landing them, and he can previously ascertain what officer will be on duty there. Burnby was the landing water on this occasion. I knew an officer named Homersham; I believe he is now dead. I made an entry of the contents of the cases marked G S 529, which contained 152 dozen pairs of men's gloves, 213 dozen of habits, and 5 dozen of women's. The case marked E E 1,525, contained 240 dozen habits, 134 dozen men's and 16 dozen women's gloves, and C M 5 contained 145 dozen men's, 290 habits, and 10 dozen women's. I made this list from the inspection of the goods themselves. The course of business, on obtaining a sight entry, is this: a blue book is sent to the landing-water, who should therein enter the contents of the different cases. The agent of the importer attends the examination, and I did so on this occasion. The agent generally sees the landing-water enter the contents in the blue book, but sometimes the officers make an entry in another book first. After I had examined these goods they were repacked. These gloves were packed in the ordinary way. I gave the list of the contents to Tye, my then partner. This is a perfect entry of the goods, and it is in the handwriting of Tye. The amount of duty is entered. After the examination by the landing-water, the goods are repacked in the case. The agent then makes a perfect entry, with a view to the payment of the duty. William Burnby examined.—In the early part of 1841 I was one of the landing-waiters of the Customs. This blue book which has been put into my hand, was the blue book of the Lady de Saumarez. It was my duty to take an account of, and to inspect the cases on board of that vessel. I relieved Mr. Mason, another officer. The first part of this book is done by him. I attended the examination, and saw the goods. The whole of them were inspected in my presence, and I took an account in the book of the packages, and we compared them afterwards. I made a true account, and Sherer's account corresponded with mine. I made out a true account on some leaves which were formerly in this book, but those leaves are not here now. There is a leaf here which has been substituted for those taken away. The substitution took place at the Ship Tavern, in Water-lane, Tower-street. Homersham was present on the occasion of the alteration being made, and it was he, in fact, who had taken out the old leaf. The new leaf is in my writing. That leaf was obtained from a blank book. Blank books are very easily to be had. The seal was melted, and a counterfeit seal was then put on the book. Lord Abinger.—Then, in fact, you put a new seal on the book, or on the new leaf? Witness.—Yes; an artificial seal was made use of. We could not undo the book unless we broke the seal. Homersham had a counterfeit seal like the Custom-house seal. On my going to the Custom-house-quay that day, it was an understood thing that this business was to be done. The moment I went to the Custom-house to my duty that day the offer was made to me to pass three cases at considerably less than the proper duty. The arrangement was that these entries should be made in a book; but I made them in this book, and afterwards the leaf was torn out, and another leaf, with the artificial seal attached, was substituted. Lord Abinger.—And you, then, were to have some consideration for this act? Witness.—Yes, my Lord. Tye was to pay me a consideration. Mr. Erle, for the defence, said the jury were called upon to find a verdict for 5,000*l.* against the defendant, and by so doing, to implicate merchants of long standing and reputation in a conspiracy with two men acknowledged to be of infamous character. In a criminal proceeding of this nature he was justified in standing upon the principle, that if there should be the slightest doubt on the point in the minds of the jury, the defendant was entitled to that doubt. But, unless his mind much mislaid him, there was no evidence whatever to bring home guilt to the defendant. The count which was most relied upon was the illegal unshipping of goods which had come into the hands of the defendant, upon which duty had not been paid; but the essence of the case was, in truth, the knowledge or the no knowledge on the part of the defendant. The question did not turn upon whether these were legal remedies, for that was quite immaterial. As far as regarded this particular case, the point for the decision of the jury was one between man and man, whether they were satisfied that the defendant had received "uncustomed" goods, knowing that they had not been paid. Upon that point there seemed to him to be no evidence whatever. The defendant was a foreigner, and the man he had employed as agent, had been duly licensed to carry on the business of an agent at the Custom-house. A

merchant in obtaining goods from the Custom-house would therefore go to him to pass them. There was no personal interference whatever on the part of the defendant in passing the goods through the Custom-house. It was always done in the name of the agent. He paid the duty and the goods were then carted off to the merchant's warehouse. In this case F. and J. Smith were the only names used. There was nothing of a clandestine nature—nothing to induce the jury to say that the defendant had anything to do with the business. There were two persons who were acknowledged to be infamous villains, Burnby and Tye. They had, no doubt, defrauded the Government to a very great extent, but there was no evidence to show that any other conspirator was joined with them. The only ground upon which they went against the defendant was that of showing the amount of checks paid by him. It had been shown that 1,204 dozen pairs of gloves had got into the possession of the defendant, and only 389 were entered in the Custom-house book. It had been said that the defendant ought to show that he had paid for them, but it should have been proved, on the part of the Crown, that he had not paid for them. Certain sums of money had undoubtedly been paid by him about the time of receiving the goods much under the full amount, but there was no evidence to prove that he had not paid at a subsequent time. The only man who could show how the money was paid was Tye, and he was out of the jurisdiction of the Court. Much had been said about the injury done to the fair trader by such conduct as was imputed to the defendant. This was a common way of speaking of the subject, but it had all happened in January and February, 1841, and then upon certain limited transactions. Surely that was not to be urged for the purpose of setting the minds of the jury against the defendant. Every one well knew the disgraceful manner in which business had for a long time been carried on at the Custom-house, and it was greatly to be hoped that the commission appointed to examine into the abuses would fully investigate the whole system. Here the person really guilty was allowed to stalk abroad, while proceedings were taken against these highly respectable merchants.—No witnesses were called for the defence.—The Attorney-General, in his reply, commented strongly upon the absence of evidence, which the defendant, if really desirous of proving his innocence, might readily have produced. He might have produced the invoices and bills of lading, which came to him with the goods imported by him in the Belfast, and Lady de Saumarez; and if, as was insinuated, he really paid Tye the full amount of the duty, was not that fact easily proved? The defendant, however, did not appear at all desirous of freeing his character from guilt. He was apparently quite indifferent about the imputation upon his conduct, and had no desire to set himself right in the eyes of the world. All he wanted was, to throw a doubt upon his knowledge of the transactions. Then it was said a verdict could not be given against him. He, however, submitted, that in this, as in all other cases, the question was, what was the fair and reasonable construction to be put upon the transaction, and no one could doubt that the evidence entirely proved the case against the present defendant. Some of the persons concerned in this transaction had been called "detestable villains." Now he had no sympathy with men who betrayed the trust reposed in them; but it was for the jury to say, which was the most detestable villain, the Custom-house officer with a small salary, who had perhaps to support a family, and who gave way to the temptation of a bribe, and betrayed his duty, or the person holding up his head as a wealthy merchant, who offered a bribe upon one transaction, larger, perhaps, than the officer's whole annual income; and after he had thus corrupted the officer, and taken advantage of his treachery, instructed his counsel to complain of the baseness he had himself been instrumental in producing. Lord Abinger briefly adverted to the evidence, and left the question to the jury, whether they believed the defendant had received the goods in question, knowing they had not paid the full duty.—The jury, without hesitation, returned a verdict for the Crown; and the Attorney-General proposed that the verdict should be entered for 4,500*l.* penalties, which was something less than the Crown was entitled to.

Attorney-General v. Charles Candy.—The Attorney-General appeared for the Crown in this case, which, like the preceding one, arose out of the late Custom-house frauds. The information contained a variety of counts, framed under the provisions of the statutes 3 and 4 William IV., c. 52, and the first charged the defendant with treble penalties to the amount of 7,604*l.*, for unshipping 790 lbs. of foreign manufactured silks, and 2,100 ellis of the same stuff, of the estimated value of 2,534*l.*, without the payment of the legal duties thereon. Other counts respectively charged the defendant with similar penalties, for illegally harbouring, collecting, and removing from certain warehouses, the same silks under similar circumstances; and the last set of counts charged him with having the said goods in his possession, without the payment of duties, after such illegal removal. It clearly appeared, from the evidence of the witness produced on the part of the Crown, that the cases in question were consigned to the defendants, and arrived by the French steamer Phoenix from Havre. They were landed, in the first instance, at Galley-quay; and, after being duly examined by one of the Custom-house officers, were carted to the defendants' premises. The defendants employed, as their Custom-house agent, a person named Lumley, who had under him a clerk named Hunt, who attended to the Custom-house business, and in whose presence the goods in question were landed, weighed, and valued. It seemed that a practice had, for some time, existed at the Custom-house, of permitting the importers of silk goods, to take them from the control of the Customs officers before the duty was actually paid. The goods in question were delivered to the defendants in this way, before the amount of the duty was paid, but in a short time afterwards, the amount of the estimated duty was actually paid by the defendants. The only question therefore was, whether the defendants, in paying the estimated duty, had paid that amount to which the Crown was really entitled, or whether, by the connivance and fraud of the Revenue officers, the duty had not been estimated at a much smaller sum than the defendants were really bound to pay. In order to explain to the jury the precise manner in which it was supposed the alleged fraud had been effected, several witnesses in different departments of the Custom-house were called to prove the course of business in that establishment. Their evidence was generally to the same effect as that given by the witnesses in the case of "The Attorney-General v. Hurel." It appears that the landing-water has a blue book entrusted to him, the threads of which are secured by a Government seal, and each leaf stamped with a Government stamp; and in this book, when goods are landed, it is his duty, in the presence of the agents for consignor and consignee, to take an account of the weight, value, and description of the goods so landed, and to return the book nightly to the register's office. From the account thus entered the duty is afterwards ascertained, and a warrant made out for the delivery of the goods upon the payment of such duty. The blue books containing the landing-water's entries, relating to the cases imported by the defendants in July and August, 1840, were produced, and evidence given to show that leaves were substituted for those which the books originally contained, and which original leaves, it was suggested, contained correct entries of the quantities of the goods imported by the defendants. Witnesses acquainted with the silk trade were also examined to prove that they had made experiments as to the quantity of manufactured silk which boxes of certain cubic dimensions contained, according to the usual mode of packing goods of this description.—Sir T. Wilde addressed the jury for the defendant. He commenced by observing, that there were some questions of law in this case, but that, in his estimation, as well as that of his client, Mr. Candy, the questions of fact were far more important than the questions of law. He represented a British merchant, in extensive business, who was charged with a deliberate fraud on the revenue, in collusion with that man Burnby,

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The Royal Agricultural Society of England is desirous of receiving Tenders from Innkeepers or others, to contract for any one or more of the following Supplies at the ensuing Annual Country Meeting of the Society, to be held at Derby in July:—

- I. A Hot Dinner for 350 persons, with Dessert, and a bottle of Port or Sherry to each person, in the County Hall, Derby, on Wednesday, the 12th of July, 1843.
 - II. A Cold Dinner for 1800 persons, with a pint of Port or Sherry to each person, in the Pavilion of the Society, at Derby, on Thursday, the 13th of July.
 - III. Refreshments suitable for 300 Ladies in the Galleries of the Pavilion, on the same occasion.
- Tenders to be forwarded on or before the 5th of June next, to the Secretary of the Society, No. 12, Hanover-square, London, where further particulars may be obtained: the Society not binding itself to accept the lowest tender. The particulars may also be obtained on reference to the Local Committee at Derby.
- London, May 11, 1843.—By order of the Council, JAS. HUDSON, Sec.

SURREY FLORISTS' SOCIETY.—This Society held an Adjourned Meeting on WEDNESDAY, May 24, 1843, at the Hour Glass, Walworth Common, to take into consideration the conduct of one of their Members on the day of their last exhibition, and other business connected with the Society, when the following Resolutions were proposed, and unanimously adopted.

"That Mr. JOSEPH WAKELING be expelled this Society."

"That Mr. GEORGE GLENNY be excluded from every meeting of the Surrey Florists' Society, in consequence of an erroneous Report inserted in the *Gardener's Gazette*, of Saturday, May 20."

"That the Society do hold their Meetings at the Hour Glass, Walworth Common, instead of the Montpelier."

The Pink and Ranunculus Show will take place on MONDAY, June 19, 1843, at the Hour Glass, Walworth Common, to which the Friends of the Members will have free admission.—May 24.

BENEVOLENT INSTITUTION for the RELIEF of AGED and INDIGENT GARDENERS and their WIDOWS.

Notice is hereby given, that a GENERAL MEETING of the Subscribers will be held on THURSDAY, 1st of June, at the Crown and Anchor Tavern, Strand, for the purpose of electing two persons out of the following Candidates to the annual Pension of this Charity:—

No. 1. ANDERSON, JAMES, Gardener, London, aged 70. (Second application.)

2. SUFFELL, WILLIAM, Gardener, London, aged 67. (Second application.)

3. LYWARD, SAMUEL, Gardener, Camberwell, aged 64.

4. WELLS, WILLIAM, Gardener, Chislehurst, Kent, aged 74.

The chair will be taken at one o'clock, when the ballot will commence and close at three o'clock precisely.

By order, EDW. R. CUTLER, Secretary, 97, Farringdon-street.

Subscribers not having received their Polling Papers are requested to apply to the Secretary.

AMERICAN PLANTS.—WATERER'S SPLENDID EXHIBITION, King's Road, Chelsea, under the especial patronage of H.R.H. the Duchess of Gloucester and H.R.H. the Duke of Cambridge, is now in high perfection. Upwards of 10,000 plants, many 10 to 12 feet high, completely covered with flowers, producing one of the most brilliant scenes ever offered to public view.—Open daily, Sundays excepted. Admittance, One Shilling.

FUCHSIAS AND VERBENAS.

THOS. CRIPPS respectfully informs his Friends, the Amateur Florist, and others, that, in consequence of having a large stock of the above beautiful flowers, he is able to offer them at the following prices, viz.:—20 VERBENAS, by name, in 20 varieties, 10s.; 40 do. in 40 superb varieties, 30s. FUCHSIAS: 12 superb show varieties, including a plant of that highly-esteemed variety, P. Toddiana, 21s.

The above can be safely transmitted by post to any part.

N.B.—Catalogues of Fuchsias and other plants are now ready.

Tunbridge Wells Nursery.

ROYAL BOTANIC SOCIETY OF LONDON.—

List of MEDALS awarded at the EXHIBITION on WEDNESDAY, the 24th inst. The successful Candidates are requested to signify to the Secretary at the Gardens, within a fortnight, whether they will accept the prizes in Medals, Plate, or Cash, that a sufficient number of Medals may be struck.

For Collections of Fifty Stove and Greenhouse Plants.—First prize, value 15*l.*, to Mr. Goode, gr. to Mrs. Lawrence; second prize, value 10*l.*, to Mr. Green, gr. to Lady Antrobus; third prize, 5*l.*, to Mr. Hunt, gr. to Miss Traill; extra prize, 3*l.*, to Mr. Fraser, nurseryman, Lea-bridge Road.

For Collections of Twenty-five Stove and Greenhouse Plants.—First prize, 7*l.*, to Mr. Pawley, Bromley; second prize, 3*l.* 10*s.*, to Mr. G. Clarke, gr. to Wm. Smith, Esq., Shirley Park; third prize, 2*l.* 10*s.*, to Mr. Atlee, gr. to — Beaufay, Esq.; fourth prize, 1*l.*, to Mr. Redding, gr. to Mrs. Marryatt.

For Collections of Nine Stove and Greenhouse Plants.—First prize, 3*l.*, to Mr. Clarke, gr. to W. Block, Esq.; second prize, 2*l.*, to Mr. Jackson, nurseryman, Kingston.

For Collections of Six Stove and Greenhouse Climbers.—First prize, 4*l.*, to Mr. Pawley; second prize, 2*l.* 10*s.*, to Mr. G. Clarke, gr. to Wm. Smith, Esq.

For Collections of Nine Tall Growing Cacti.—First prize, 3*l.* 10*s.*, to Mr. Clarke, gr. to Wm. Block, Esq.; second prize, 1*l.* 15*s.*, to Mr. Cockburn, gr. to Earl Mansfield.

For Collections of Nine distinct kinds of Fuchsias.—First prize, 1*l.* 5*s.*, to Messrs. Lane and Son, nurserymen, Berkhamstead; second prize, 1*l.*, to Mr. Pawley.

For a Collection of Six Scarlet Pelargoniums.—First prize, 1*l.* 10*s.*, to Mr. Bayle.

For a Collection of Six Roses in Pots.—First prize, 2*l.*, to Messrs. Lane and Son.

For a Large Collection of Cut Blooms of Roses.—First prize, 1*l.* 10*s.*, to Messrs. Lane and Son.

For a Collection of Twelve British Ferns.—Second prize, 1*l.*, to Mr. G. Turner, gr. to the Hon. and Rev. Robert Wilson.

For a Collection of Agricultural Grasses.—First prize, 1*l.*, to Mr. Wm. Turner, gr. to Mrs. Holloway, near Reading.

For Collections of Twelve Pelargoniums in No. 24 pots, to Nurserymen.—First prize, 7*l.*, to Mr. Catleugh, Chelsea; second prize, 4*l.*, to Mr. Gaines, Battersea.

For Collections of Six Pelargoniums, in No. 24 pots, to Amateurs.—First prize, 3*l.*, to Mr. J. Dobson, gr. to — Beck, Esq., Isleworth; second prize, 1*l.* 5*s.*, to Mr. E. Bell, gr. at Chelsea Hospital.

For Collections of Twelve Pelargoniums, in No. 12 pots, to Nurserymen.—First prize, 4*l.*, to Mr. Catleugh; second prize, 1*l.* 15*s.*, to Mr. Gaines.

For Collections of Six Pelargoniums, in No. 12 pots, to Amateurs.—First prize, 3*l.*, to Mr. Watt, gr. to Wm. Snell, Esq., and Mr. Hunt, gr. to Miss Traill, equal; second prize, 1*l.* 5*s.*, to Mr. E. Bell, gr. at Chelsea Hospital; extra, 10*s.*, to Mr. Slowe, gr. to W. R. Baker, Esq., Bedfordbury.

For Collections of Four Pelargoniums, in No. 8 pots.—First prize, 2*l.* 10*s.*, to Mr. Hunt; second, 1*l.* 10*s.*, to Mr. E. Bell; third, 1*l.*, to Mr. G. Cockburn. Mr. Cock, of Chiswick, the most successful cultivator of Pelargoniums at the present time, most handsomely consented to waive his claim to enter his plants for competition.

For Collections of Six Herbaceous Calceolarias.—First prize, 2*l.*, to Mr. Dobson; second, 1*l.*, to Mr. Catleugh.

For Collections of Six Shubby Calceolarias.—First prize, 1*l.*, to Mr. Gaines; second, 1*l.*, to Mr. Dobson.

For Seedling Pelargoniums.—First prize, 1*l.* 10*s.*, to Mr. Dobson, for "Zanzumim;" second, 1*l.*, to Mr. Dobson, for "Theresa;" to Mr. Dobson, for "Susannah;" to Mr. Whomes, gr. to E. Forster, Esq., Clewer, for "Zanzumim;" to Mr. Whomes, for "Hybla."

For Collections of Seedling Calceolarias.—First prize, 1*l.*, to Mr. Green, for "Georgiana;" "Rosa magnifica;" "Imperial;" and "Ignea grandiflora;" second, 10*s.*, to Mr. J. Standish, nurseryman, Bagshot, for "Bagshot Beauty;" "Princess Mary," "Surprise," and "Duchess of Gloucester."

For a Seedling Cineraria.—First prize, 10*s.*, to Messrs. Lane and Son, for "Compacta."

For New or Rare Ornamental Plants.—Second prize, 2*l.* 10*s.*, to Mr. Forrest, nurseryman, Kensington, for "Static macrophylla;" third, 1*l.* 10*s.*, to Mr. Green, for "Manettia bicolor;" fourth, 1*l.*, to Mr. Hays, of High Beach, for "Aotus lanigera."

For Ornamental Specimen Plants.—First prize, 1*l.* 10*s.*, to Mr. May, gr. to E. Goodhart, Esq., for "Erica aristata major;" second, 1*l.*, to John Allnutt, Esq., for "Erica depressa;" third, 10*s.*, to Mr. Clarke, gr. to William Smith, Esq., for "Hardenbergia pregnant;" extra, 10*s.*, to Mr. May, for "Erica ventricosa."

For Collections of Five Orchidaceous Plants.—First prize, 7*l.*, to Mr. Hunt; second, 3*l.* 10*s.*, to Mr. Redding.

For a single Specimen of an Orchidaceous Plant.—Second prize, 2*l.*, to Mr. Greaves, gr. to Mrs. Cannon, Stratford, for "Oncidium humilium."

For a Collection of twenty kinds of Cape Heaths.—Second prize, 3*l.*, to Mr. Jackson, nurseryman, Kingston.

For a Collection of fifteen kinds of Cape Heaths.—First prize, 7*l.*, to Mr. May.

For Collections of six kinds of Cape Heaths.—First prize, 3*l.* 10*s.*, to Mr. Brazier, gr. to W. H. Storey, Esq., Isleworth; second, 2*l.*, to Mr. Green; third, 1*l.*, to Mr. Hunt; extra, 10*s.*, to Mr. Brazier, gr. to H. Storey, Esq., for Hybrid Heaths.

For a Collection of Eighteen Greenhouse Azaleas.—Second prize, 2*l.* 10*s.*, to Mr. Gaines.

Five Microscopes were exhibited, two of which were of a novel construction, and displayed new physiological facts in Botany. The prize will be awarded at the third meeting.

The following exhibitions, some of which were very beautiful, but for which the Society did not offer any prizes, were also contributed:—By Mr. Dobson, a miscellaneous collection. Mr. Wood, of Norwood, a collection of Alpine plants. Mr. Barney, nurseryman, Stratford, a large collection of globe Cacti. Mr. Ivory, nurseryman, Peckham, and Mr. Henderson, Pineapple-plant, collections of Cinerarias. Mr. Green, a seedling Azalea and three seedling Cacti. Mr. Mitchell, Mr. Bragg, of Slough, the Hon. and Rev. R. Wilson, Wymondham, Messrs. Lane and Son, and Mr. Thomson, of Iwer-boxes of Pansies. Mr. Brown, of Slough, a stand of Tulips. Mr. Rivers, nurseryman, Sawbridge-worth, cut flowers of Rhododendrons and Azaleas.

A graphic Telescope, for the delineation of plants at a distance, was shown by Mr. Cornelius Varley.

SUPERB CHRYSANTHEMUMS.

YOUELL AND CO., in offering their List of CHRYSANTHEMUMS (for which see their advertisement in this Paper of the 6th inst.), to the notice of amateurs, and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the list will be found highly satisfactory to those who may not only have the above object in view, but also to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants will be strong and healthy, and sent free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, in the first week in June, at the rate of 12*s.* per dozen.—Great Yarmouth Nursery, May 24, 1843.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

BEAUTIFUL AND DISTINCT FUCHSIAS.—

YOUELL & Co., in submitting their Catalogue of Fuchsias for 1843, take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties, and they would refer to the numerous testimonials of success which attended their mode of selecting last season collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. are desirous of calling attention to their peculiar method of executing orders for this tribe of plants; namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, in collections, upon the following terms:—

Twelve fine Show Varieties, 12*s.* Twelve extra fine and very Twelve extra fine ditto 16*s.* superior 21*s.*

The selection being left to YOUELL & Co.

DESCRIPTION OF FUCHSIA ST. CLARE.

This magnificent Fuchsia was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last, it was submitted to Dr. LINDLEY for his opinion, which will be found in the "*Gardener's Chronicle*" of the 14th of that month, as follows:—"Your Seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

As a proof of its being a most profuse bloomer, Y. & Co. had a plant in flower Sept. 15, 1842, on one branch of which were upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower-garden. Price 10*s.* 6d. per plant, sent free of postage to any part of the United Kingdom.

COUNTRY SHOW, Thursday, June 8, Hoddesdon Cottagers.

By an error in the printing-office, we were last week made to say (p. 333) that "medals to the amount of 250 were awarded" at the great Exhibition in the Horticultural Society's Garden. What should have been printed was, "medals to the amount of nearly 2500. were awarded."

We have received from a very intelligent person, Mr. W. Sherwood, Gardener to Mr. Mills, of Stamford-hill, a letter concerning the interests of Gardeners, which well expresses the opinions of all the best friends of Horticulture upon that very important subject.

After alluding to an appeal said to have been made to British Gardeners on behalf of some obscure and unworthy publication, upon the ground that the writer advocates their cause in what he calls a "bold" way, Mr. Sherwood proceeds thus:

"Now although I do not expect that this appeal will meet with the response anticipated, still there are some gardeners who entertain strange notions as to the manner in which a deliverance is to be wrought for them from the grievances under which they labour; and not a few who, instead of thinking for themselves, prefer others to think for them, and seem to consider that this power is vested in the 'press.' None can doubt but that a properly-conducted Horticultural paper subserves the interests of Gardening and Gardeners to an extent far surpassing any other channel of knowledge; but I do think, that so far from Gardeners being benefited by its interference in their arrangements with their employers, it is in fact diametrically opposed to the interests of both. And I believe that I speak the sentiments of the majority of Gardeners when I say that it is the duty of every well-wisher of his profession to discountenance a system so insulting to their employers and so degrading to themselves. The best advocate of a Gardener's interests is his own full appreciation of them. In order to feel our true position in society, and recognise our duty, we should remember that the progress of Horticulture and the increased demand upon our services consequent upon it has resulted solely from the intellectual refinement of society; and the degree in which Gardeners become sensible of this fact, and by it alive to the duties they are expected to perform, is the degree in which they become solicitous for the mental improvement of the whole fraternity of Gardeners. This is strikingly evinced in the sacrifices some have made for the formation of Mutual Instruction Societies in the neighbourhood of London, and the establishment of libraries in connexion with them. While the mass have been listening to scurrility heaped by one party upon respectable individuals, under the pretence of advocating the Gardeners' interests, and to another expatiating on the dissipation of men who bear (most unjustly) the name of Gardeners, these have been acting. They have not appealed to the prejudices and passions of man, but to his judgment; the tendency of their efforts has not been to make him dissatisfied with his situation, but with himself. The scores of young Gardeners who attend their meetings are not taught to support this or that person as being most favourable to their interest, but they are taught to think, and thereby led to see, that it is knowledge which confers a claim to public regard and promotion, and that a consistent deportment is the only means of enforcing it."

Nothing can be more just than these sentiments, in which we heartily concur. It is indeed to themselves that Gardeners should look, and to their own skill and knowledge that they should trust. They, like other men, will find that the surest road to higher wages and a better position in the world is through good conduct and augmented knowledge. They are becoming yearly more and more necessary to society; and if the sure result of that necessity is not by degrees the general improvement of their condition, it will be their own fault. They will, in the long run, find those their best friends who tell

them of their follies, and those their greatest enemies who teach them to be discontented with their situation, without pointing out any practicable means of improving it. As a body, Gardeners are more respectable and better informed than any class of servants; and the gentlemen of England are generally much more than ever alive to their importance; witness the numerous cases, daily becoming more frequent, where they are entrusted with the management of lands and plantations, with augmented pay. This has arisen out of their intelligence and good conduct. Their first great object should be to employ their natural good sense in holding fast the step thus gained; and one of the most efficient means of doing so is by encouraging the promotion of societies for instruction, discouraging everything which tends to throw a doubt upon the respectability of their profession, and holding themselves aloof from those low people who, Mr. Sherwood says, are mis-called Gardeners, and who are not only insensible to the force of arguments such as those he has so judiciously employed, but of any arguments whatsoever, even although they are backed by penury, contempt, and the workhouse.

We are obliged to "G. D." for his information concerning the relative slipperiness of Elm and Fir planks, which we have little doubt is correct. We do not, however, perceive that it touches the question at issue in our previous remarks. The slipperiness of a recently-wetted (and still less of a frozen) plank, worn only by men's shoes, has little resemblance to what we have called the unctuousness produced by violently beating into pulp a certain portion of woody fibre. Even in this respect we may possibly be wrong as regards the comparative merits of Elm and Fir. We cautiously said only that the one appeared to us less greasy than the other; and judging as well as we could from the specimen of Elm-capped paving near St. Giles's Church, we thought, and still think, that this is the case. Meanwhile the subject is very important, and we shall be glad if many will imitate the example set by "G. D.," of giving us actual facts, which cannot fail to be useful.

As a matter of speculation, it appears to us not improbable that Kyanizing, or Burnettizing, or some of the processes which are said to render wood incombustible, might to a certain extent diminish that greasiness which seems to belong in a remarkable degree to disintegrated resinous timber. On the other hand it may turn out that the greasiness is mainly due to foreign substances lying upon the surface of the wood, and that the superiority of the paving at St. Giles's is owing to the better preservation of the grooves by the toughness of the Elm. The question is altogether one of experiments, to which we must appeal, and for the publication of which, when properly authenticated, our columns shall be freely open.

THE education we would recommend for the children of agricultural labourers is such as can be afforded with the smallest assistance from the wealthier part of the community, if not entirely without it. There must be school-rooms and teachers. These may be provided at a very small expense: an old barn is readily converted into a school-room, and there are few parishes where there is not one or more such to spare. Small farms have been united in most places because they did not singly afford a livelihood to the occupiers, and spare buildings remain which may be readily fitted up as schools; a tithe barn, rendered useless by the commutation of tithes, may now become an excellent school-house. A retired gardener or head-ploughman, no longer capable of much labour, may have sufficient learning to teach children to read and write; and the labour of the children in a large garden, with a very small weekly payment, may be a sufficient remuneration for his trouble of teaching.

This plan has been tried in Sussex with full success, as the following report will show. It is the school-master himself who makes the statement.

REPLY OF THE MASTER TO INQUIRIES RESPECTING THIS SCHOOL.

"Willingdon, near East Bourne, Sussex.

"I have twenty scholars, to whom I teach reading, writing, and accounts, the church catechism, collects, and psalmody, on the national plan, with the approbation of the vicar, without any salary, for one penny per week from each boy, from nine to twelve o'clock; and from two till five in the afternoon, cultivating the land. I have not lost one from dissatisfaction, but I am glad to say that they willingly assist me. And the Rev. Julius Nouaille, of Pevensey, who recommended me, has applied to me for a master to take a school there of the same kind, for which he has obtained the bishop and vicar's consent, and a great farmer has willingly agreed to give up four acres of land for it. I am satisfied that I can keep two cows on the same quantity of ground, stall-fed, where I could keep but one if allowed to graze. I have no grass land, and all the first winter my cows had only straw, turnips, and mangel wurzel, till green food came on in the spring, and now my hay is the clover I sowed with the grain crop

last year. I have experienced a great deal of good from the liquid manure from the two tanks, one from the cows, and the other from the pigs. I have just killed a pig weighing 29 stone 7lbs., and one before about the same weight, which I have used in my family. I have a wife and four children, and a pupil of 13 years of age, come to learn the plan of stall-feeding cows and spade husbandry, paid for by Mrs. Parry, of the Cedars, Sunning Hill, Berkshire. It is allowed that my oats are the best sample in the parish. I tied my oats in sheaves, and set them up the same as wheat, which saves a great deal of shattering; this is the general practice in Cornwall and Scotland, and, I hear, in some parts of Kent, and is particularly useful for barley, to malt. I thrash my corn over the cow-house, as in Cornwall, Switzerland, &c., which keeps it perfectly dry, being off from the damp ground. I am entirely supplied with water by the rain which falls on the house preserved in a tank. The quantity of land I rent is five acres, on the side of the South Downs, at 3l. an acre; this with 10l. for my house, makes 25l., which I have paid for the year ending Michaelmas last, though I might have taken off my crops, and left rent free, but I preferred staying and teaching, though I have no salary, and so I think would many others. I have now three cows, a heifer, and calf, standing opposite to each other, with a road between their mangers for feeding these stall-fed cattle, which have never needed a farrier; and from skim-milk I have made cheese like the Dutch cheese, of which one vessel, the Ouze, last year imported so much, that the duty for it paid at Newhaven amounted to 4,000l.

"I remain, your obedient servant,

"April, 1842.

GEORGE CRUTTENDEN."

This statement may appear too favourable to be quite correct, but the fact is no less certain, that this man, paying a high rent, is enabled to raise from five acres of land sufficient produce for his comfortable maintenance, entirely by the labour of twenty boys, working three hours in the afternoon, while he teaches them three hours in the forenoon. The age of the boys is not stated; but supposing it to be from 8 to 14 years, or an average of 11, they would easily cultivate five acres of land by trenching, forking, hoeing, &c., on the system of the small Flemish farms. Whether Mr. Cruttenden's cheese, made from skim milk, be equal to the Dutch cheese usually imported, we will not stop to inquire; it is sufficient to have shown that a school may be supported without any external assistance. And it is evident, that, if the children made no progress, or were over-worked, their parents would soon take them away, and the master would lose his labourers, and consequently his means of living. Much of the success of the Willingdon school must be ascribed to the industry and judgment of the master, and also to the superintendence of the lady on whose property it is situated, and who takes a lively interest in its welfare. The children are early impressed with the importance of a minute attention to every operation in which they are engaged. They are the hands, while the master is the head; they see what the land can be made to produce, the profit which can be made on stock economically fed and properly attended to; and the lessons they learn at that early age they are not likely to forget.

Compare these children who may have worked two or three years under Cruttenden with an equal number taken from any national school—which are most advanced in those things which are practically useful? If some clever boy has outstepped his contemporaries, and can answer questions in arithmetic or geography which would puzzle our industrious scholars, how many will be found who, when placed with a gardener or a farmer, are of immediate use to their master, and can be entrusted with any kind of work? But this is not the question. What has it cost to teach a boy for four years at a national school, or one supported by subscriptions and benefactions? The smallest expense required for the maintenance of a school for 50 children, after a school-room and master's house have been erected, is at least 70l. per annum, or 1l. 8s. for each child; whereas if Cruttenden had 50 scholars he would only receive 4s. 4d. for each in the course of the year, supposing no holidays, and think himself amply paid. He could then cultivate 12 acres instead of 5, and his profits would be in proportion.

There may be some circumstances which favour this plan at Willingdon; but if Cruttenden pays a rent of 25l., there are many situations in the country where a cottage and school-room could be obtained from the proprietors without any rent, or a very small one, and it must be very rich land which would be worth 3l. an acre rent; so that if any proprietor of land should be desirous of making the experiment, and find another Cruttenden, he might confer a great benefit on the labourer's children by merely letting the master have a cottage and a few acres of land, and, if necessary, erecting a plain school-room. M.

THE ROSE-GARDEN.—No. V.

THE remaining group of Bourbon Roses comprises some fine varieties, remarkable for their dwarf and rigid habits. Of these, Augustine Lelieur is one of the oldest, and in its way, perhaps one of the most beautiful; its flowers are only semidouble, but they are so erect and so brilliant in colour, more particularly in autumn, that

it always attracts notice. *Latifolia* is so much like it, as scarcely to be distinguished except by its petals being a little crimped; Madame Nerard, Celimene, and Timocles, are also of the same rigid habit, with flowers of the palest silvery blush—a term which will perhaps convey that peculiar glossiness which seems to lay on the surface of the petals; Emile Courtier, Madame Margot, Ida Percot, and Madame Aude, are all beautiful rose-coloured varieties, of different shades; and last, but not least, the Queen of the Bourbons, which originated in a cross with some fawn-coloured tea-scented Rose, as it is slightly tinged with fawn—a colour quite foreign to this family, and has a slight "Odeur de Thé," as the French say. All the Roses here named have a uniform growth, and are admirably adapted for a bed, either as dwarfs on their own roots, or on short stems; they are not so well calculated for tall standards, as they do not form large heads, unless in very rich moist soils.

To some of these Bourbon Roses, which bear seed very freely, we owe a new race, now distinguished as hybrid Bourbons, blooming but once in the summer; but their season of blooming is prolonged, owing to their origin in part from Roses that continue to bloom till autumn. Most undoubtedly these will form the finest of all standards, as their habit is so remarkably robust; one variety in particular I anticipate will, if budded on large stocks of the Dog-rose, soon form a large umbrageous tree. This unique and splendid Rose was raised by Monsieur Laffay from Celine, and has been named by him, the Great Western—laughably spelt in some of the French catalogues "Grande Wistern," a name the origin of which I have no doubt has puzzled many a French gardener. This Rose has leaves and shoots of astonishing luxuriance, and flowers of a deep and peculiar red, rivalling the largest Peonies in size; a standard or a bush of this Rose, highly cultivated, will form one of the wonders of the Rosery. It should be budded on a very stout stock, otherwise the plant will soon become top-heavy: in mentioning this, I am reminded that cultivators often do not pay enough attention to the habits of their Roses when selecting stocks for them. Stout old stocks should always have some robust-growing varieties worked on them, for if a tea-scented or some delicate-growing Bourbon Rose is worked on a large stock, the sap is engendered faster than it can be taken away by the bud; many shoots are consequently repeatedly taken off; the producers of sap, the fibrous roots, then rot and die away; the sap-vessels close, and the plant, after languishing a season or two, also dies; therefore, on all large stocks the cultivator should bud the most luxuriant-growing varieties, such as the above and some of the following, which rival the Great Western in vigour of growth, and surpass most Roses in the beauty of their flowers. The first in beauty is Coupe d'Hébé, colour delicate glossy rose; form, perfection. This Rose has been called by a gentleman, a first-rate judge, "the most beautiful Rose in the world." Charles Duval is almost equally beautiful; in colour rather deeper. Capitaine Sisolat, Edward Delair, Paul Perras, Franklin, Lady Montgomery, and Henri Barbet, are all calculated to form standards of the largest size: there seems no limit to their growth. The following are of secondary luxuriance, but remarkable for the peculiar and brilliant red in their flowers; of these red Roses, Colonel Combes, Daphne, Ernest Ferray, La Esmeralda, and Dombrowski, are the most distinguished.

Of about the same range as regards habit are Riche-lieu (Duval), Belle de St. Cyr, Hortense Leroy, with rose-coloured flowers of the most perfect shape, Sylvain and Legouvé with flowers of brilliant crimson. Hortensia and Triptolème are remarkable for blooming in very large clusters, having a fine effect on standards. Lord John Russel, Brillante, and Miss Chauncey, the same for their rigid flower-stalks which keep their brilliant flowers erect, even in the heaviest showers. The above, and indeed all the Hybrid Bourbon Roses, form first-rate standards, their habits are so exceedingly luxuriant and yet peculiarly compact, quite different from that tendency to make long straggling shoots so remarkable in most of the hybrid Chinese Roses. The Great Western will undoubtedly prove valuable for stocks, as, like its parent Celine, it strikes freely from cuttings planted in a shady border in October. The cuttings should be made about nine inches long, eight of which should be in the ground, leaving one bud out; the following autumn they should be potted or bedded out, cutting off all roots but the tuft of fibres, which will be formed at the bottom of the cutting, and potting or planting them only from one to two inches deep, so that the bud may be inserted in the stem close to the ground. Exactly the same treatment may be applied to the Boursault stock, which will strike readily under the same treatment; this is more simple and requires much less trouble than some other modes recommended.—Z.

ENTOMOLOGY.—No. XLIV.

ACARUS GENICULATUS, Linn.; (the Bark Mite).—Fruit-trees are sometimes infested with a minute, red, shining Mite, which is gregarious, and congregates in the spring upon the bark at the base of the twigs, looking like a gummy exudation. These little animals are frequently found in prodigious quantities, and by extracting the sap they no doubt render the trees sickly, and in all probability reduce the size of the fruit. There were some thousands of them upon a small branch of a Plum-tree forwarded to me the beginning of May (fig. 1); they moved slowly, but were running over each other, and burrowing their heads under the rugosities of the bark: they varied in size, colour, and outline, some being pale red; others were of a deeper tint, with three brown spots towards the apex; and the older ones were still darker,

being of a deep chestnut colour, with the abdomen more globose. These mites appear to be separated from the Linnaean genus by Latreille, under the name of *Oribata geniculata*, and I imagine they have been described by De Geer as the *Acarus corticalis*. This distinguished naturalist found them from November to March constantly beneath the slightly-detached bark of an old Pear-tree, where they lived in society, remaining very quiet during the winter months; they also secrete themselves and breed under the lichen which often covers the trunks and branches of fruit-trees.

Acarus geniculatus appears to be horny, but it is tender and easily crushed, being filled with a pale rosy fluid; there are a few hairs scattered over the head and thorax, and the former is conical, with two strong bristles on the crown, and two incurved, articulated, and hairy palpi on each side of the mouth: the thorax has some transverse sutures, and the hinder portion forms a thickened semi-circular margin, which encompasses a great part of the abdomen; this is shagreened, often bearing a transverse brown spot in the centre, towards the apex, and a more circular one on each side. It has eight legs, not long but hairy, and of a dirty, ochreous colour; they are, apparently at least, five-jointed, the second joint being thickened, and the last produces a slender process, which is terminated by two (De Geer says by three) long, slender, curved claws, looking like one only in repose (fig. 3, magnified). These mites are about the size of a little grain of sand, or the finest gunpowder, and are larger than the *Acarus telarius* (fig. 2, the natural size).

On different parts of the bark I observed minute, globular, white egg-shells, from which no doubt the Acari had emerged; and as they grow they cast their skins, which were sticking in numbers where the mites had congregated, and with them were some smaller and more active Acari, of an oblong form; their colour was dirty yellowish white, with a dusky spot towards the apex: the vibrating palpi were very visible; they had eight legs, the anterior pair appearing to be the longest, the second pair the shortest. For what purpose this species attended upon the other is very uncertain; it might be for the purpose of feeding upon the eggs or the young, as soon as they are hatched. The *A. geniculatus* is very different to any other species that I have observed upon plants, which generally bear a greater resemblance to the mites of the Lime (vide *Gard. Chron.* vol. i., p. 164), it has more the appearance of a tick; its body is globular, it has some indication of a thorax, and the legs approach at their base.

The following methods of destroying the Red spider have been suggested by various writers upon gardening, and they are equally well adapted for the destruction of this *Acarus*. If the bark of the tree and the branches be well brushed over with a mixture of tobacco-liquor, sulphur, and a little turpentine, it will speedily kill the bark-mites and gas-tar, or ammoniacal liquor would, in all probability, answer the same purpose. The best period is when they leave their winter-quarters, and congregate on the tree, as shown at fig. 1. Salt and water seem to be also a good remedy; a tea-spoonful of common salt is to be dissolved in a gallon of water, with which the trunk may be washed, and the leaves syringed with safety, but it is recommended to wash the foliage of the tree with pure water a day or two after the application of the salt. It may be inferred from the economy of these mites, that keeping the trees clean must prove the best security against this and most other similar diseases. I have been astonished in the cider counties to see the trees in orchards laden with moss and lichens, which harbour these Acari and multitudes of injurious insects. I believe, also, that they assist in exhausting the trees and more speedily accelerating their destruction, by retaining moisture on the trunk and branches, which eventually rots the bark, induces decay, and renders them more likely to suffer from high winds and tempestuous weather. Woodpeckers and other birds are likewise attracted by the insects, and thus, probably, unwelcome agents are required to keep down an enemy which a little pains would relieve us from. I admit that an old Apple-tree clothed with rich green moss and grey lichens is a most picturesque object, and I always regret to see the trunks whitewashed and rendered hideous to the tasteful eye; the above application, however, after the extraneous clothing has been removed is not subject to this objection.—*Ruricola*.

AMATEUR'S GARDEN.—No. XXI.

Who is there that does not admire the Violet?—and yet how little care is taken of it after it is out of bloom! Every one complains, when it is impregnating the air with its delicious fragrance, that he has not half enough of it,

and notwithstanding at the proper season neglects to increase his stock.

How different is it with those who grow Violets for the supply of Covent Garden Market. They cultivate it—but private gardeners allow it to cultivate itself. Of the kinds grown for market, the Russian and Neapolitan are most cared for. The first, which is a single dark-blue variety, will produce flowers in abundance throughout the winter, even when the ground is covered with snow; and the Neapolitan will, if properly treated, produce flowers late in autumn and early in spring, but not through the winter, unless the season is very mild or it receives some little artificial assistance.

The proper way to manage both kinds is as follows:—About this time, having prepared a piece of ground—which should be rich and friable—by digging it over, and dividing it into plots one foot square, proceed to take up your old plants, shake the soil from the roots, and divide them into the number of plants required, taking care to retain as much root as possible to each plant, and to divest them of all their runners. They are then ready for planting, and may be placed, one strong plant or two weak ones, at the corner of each square. They must receive a copious watering to settle the soil about their roots; and if the weather is sunny, must be shaded for a few hours in the middle of each day. A rather shaded situation is proper for them through the summer, though a north aspect is not to be recommended.

Through the summer, the principal care will be to keep the ground free from weeds, to divest the plants of all runners as fast as they are produced, and to water them occasionally in dry weather. It is highly important that the runners be regularly removed. Mr. Knight, many years back, in regard to the preparation of Strawberries for forcing, asserted that the production of every runner was the loss of a bunch of flowers; and it is very probable that the same cause will produce the same effect in the management of the Violet. The great secret of preparing all plants for winter forcing and flowering is to get all the organisable matter possible deposited in the plant during the previous season's growth, and this can only be effected by having a healthy breadth of foliage, properly exposed to the light, and by preventing the plant from expending its energies in the production of useless branches: this is the theory of preparation, but there is another fact worth marking:—In the forcing season the excitation must be gradual and regular, or the matter which, under proper management, will be expended in flowers and fruit would, under warm, moist treatment, produce nothing but leaves and branches. This I have frequently experienced in the management of the Violet: from the same bed of plants, one set introduced into the forcing-house would produce nothing but leaves, while another in the comparatively dry air of the greenhouse would be all flowers. Flowers, it must be recollected, are but leaves or branches, in the state of metamorphosis; moderate growth is conducive to the production of flowers—luxuriant growth to the formation of leaves and branches.

In September such plants of the Neapolitan Violet as it is intended to force should be taken up with good balls, and potted in 48 or 32-sized pots, or planted on a very gentle hot-bed, under the protection of a frame. The best way to make the bed is to use old spent dry dung and leaves: it should be formed about three feet deep, and be covered with any light soil, such as leaf-mould and sandy loam, in which the plants may be plunged. During the winter the plants must have all the air possible in mild weather, but must be carefully protected from rain and frost, and a gentle lining must be applied to the bed when it is wished for the plants to bloom. After the number of plants required for pots or flowering in frames is prepared, the remainder, with the Russian kinds, may be planted under a south wall or in the borders of the flower-garden: this treatment is suitable for all the various kinds of Violet; but the two mentioned are the best adapted for winter flowering.—*W. P. Ayres*.

HOME CORRESPONDENCE.

ERRATA.—In the article on Draining, by "W. W.," at p. 335 a, for the "pound become," &c., read the "ground become."—For "not to take up," read "not to bake up."

Whence do Plants derive their Nitrogen?—It has been a matter of surprise to me that some able and enterprising Chemist has not undertaken to solve the following question, in a manner open to no objection on the score of accuracy—"Do plants derive the whole of their nitrogen from the ammonia of the atmosphere and the decomposing nitrogenous matters present in the soil? or have they not the power of appropriating the nitrogen which forms so large a constituent of the air? This question has often been proposed, and the opinions of scientific men have been expressed on either side; and it is certain that neither vegetable physiologists nor chemists are at the present time agreed on this point. The resolving of this question seems to me of great importance, as it would tend to throw much light on the functions of plants, and on their capability of inducing combinations not imitable by the most refined processes of art. The generally received opinion is that of Liebig—that plants cannot appropriate nitrogen unless it has previously assumed the form of ammonia, and the arguments he adduces in support of his views are, it must be confessed, novel, ingenious, and, to a certain extent, convincing. But why should we repose so trustfully on any mere opinion, how probable soever, when it is in our power to obtain positive proof? Is it because it is much easier to adopt an opinion, sanctioned it may be by a great name, than to enter upon a course of original and perhaps painful investigation to test its correctness? The human mind—accustomed to repose, and to

receive without effort its ideas, as the unbroken surface of a river the images of the trees and buildings which adorn its banks—is not stirred from this state of quiescence without some sense of uneasiness or pain. No one can attentively consider the operations of his own mind without being aware that to think long, connectedly, and deeply, on any subject, requires considerable exertion and is attended with much trouble. To this natural slothfulness of the intellect in the majority of men is to be ascribed the multitude of erroneous opinions on all subjects held by them; for it cannot be doubted, if they could be induced to think more, and to make active use of those powers which a bountiful Creator has denied to none but to fools and idiots, truth would take the place of error, and those few thinking men who now lead public opinion would, in order to preserve their proud pre-eminence, be compelled to think yet more profoundly, to observe more closely, and argue more conclusively. Thus all classes would have made an onward step towards that perfection which is "our being's end and aim." Asking pardon for this digression, which I fear will appear irrelevant, [not at all.] I return to the subject of this letter. That Liebig's views are not acceptable to the minds of others equally gifted with himself is proved by the fact that such men as Boussingault, Daubeny, Johnstone, Pereira, and others, dispute their correctness. It appears to me that this discordance of opinions amongst persons equally capable of judging arises from the want of appealing to actual experiment, which alone can settle the point at issue. The reason that this has not been done may be the difficulty of so arranging the conditions of the experiment as to supersede every possible objection. It is acknowledged that the difficulty exists, but it is submitted at the same time that it is not insuperable: and this being the case, it should, far from discouraging exertion, prove an effectual stimulus to it. It is indeed certain that nitrogen as it exists in the air, is wonderfully indisposed to combination; and the most energetic chemical action may take place in contact with it, and is, so to speak, shared by an unconcerned spectator. But this is only the general rule, and some exceptions can be pointed out (and they may be more numerous than we imagine). Why may not the action of plants be one of them? When the atmosphere is traversed by the lightning's flash, the track is pervaded by a chemical combination (nitric acid) of the nitrogen and the oxygen of the air. When pearlash, carbon, and iron, as in Thomson's process for making Prussian blue, are heated together strongly in an open vessel, and often stirred, the nitrogen of the air is absorbed by the mixture, and gives rise to the formation of cyanogen, which may be easily resolved into ammonia. Thus we see how, indirectly, ammonia itself may be formed from the atmosphere. If some of the most common chemical actions can thus withdraw and fix the nitrogen of the air, who shall say that the overruling and superior force of vitality is unable to effect the same? But to the proof: and first let us consider the necessary conditions of the experiment, and then the means of fulfilling them. If we sow a certain weight of seed, containing a known quantity of nitrogen in an artificial soil known to be destitute of that element; if we irrigate with pure water, and permit the atmosphere slowly to traverse an apparatus properly constructed for the purpose only after having been deprived of all its carbonate of ammonia (ever present in very small quantity), we shall, I apprehend, have secured all the necessary conditions of a very accurate experiment. After the plant has arrived at the greatest maturity possible under these circumstances, we have only again to recur to analysis, in order to ascertain whether or not the quantity of nitrogen has undergone any change. Should it be less than the seeds originally contained, then the plant must have imparted some nitrogenous compound either to the air or to the soil. If more, it will prove one of two things—either that the plant possesses the power of forming nitrogen out of some of the materials in contact with it, and therefore (what has been asserted by some) nitrogen is not an element, or it has absorbed it from the air and combined it with its own substance. I know of no other way of ascertaining which alternative is the truth, than by forming an artificial atmosphere in which the nitrogen is replaced by some other gas not containing it; or, by attaching another gasometer to the exit-tube to receive the air after it has passed through the apparatus, we may, by analysis, discover if any of the nitrogen has been abstracted. In making the experiment, two things arrest the attention—the form and arrangement of the apparatus, and the state of the materials employed. I suppose it will be reckoned necessary that the vegetating seed must be supplied with heat, light, water, and an atmosphere that can be constantly renewed. All this, I take it, may be accomplished by sowing the seed in a shallow glass vessel capable of being hermetically covered by a glass dome, having three apertures, into which should be secured, also hermetically, three tubes, one from a gasometer, one from the water-vessel, and one to serve as an exit-tube. The gasometer will contain common air and be slightly weighed in order to drive a current through the apparatus. Between this and the gasometer shall be two absorption-tubes, one containing solution of sugar of lead to stop the carbonic acid and the sulphuretted hydrogen; the other containing hydrochloric acid to absorb the ammonia. If these are properly arranged, we may be quite sure that neither carbonic acid nor ammonia can vitiate the air of the experiment. Care would be taken immediately after sowing the seed to displace the air in the apparatus by that from the gasometer. The water-vessel would be on the principle of the close filter, used for the liquid caustic alkali, in which the air necessary to replace the descending liquid is drawn from that part of the vessel into which it descends. Thus all contact with the general atmosphere

is completely avoided. The exit-tube may dip under the surface of mercury. We have thus provided an atmosphere destitute of ammonia, which can be renewed at each instant,—irrigation without admission of external air, and the means of light and heat. So much for the general description of form of apparatus—the details I leave to others; they will readily suggest themselves, and may be varied almost *ad infinitum*. The soil might consist either of pounded rock crystal, or white marble, according to the precise object of the experiment. Much attention should be paid to the purity of the water. I would recommend that it be twice distilled, rejecting each time the first half that comes over, for it almost always happens that all natural waters, whether spring or rain-water, particularly the latter, contains some ammonia, which, by taking the precaution pointed out, may be got rid of. It might be advisable before distilling, to fix the ammonia either by a few drops of sulphuric acid, or chloride of platinum.—*W. H. Potter, Chemical Works, Upper Fore-street, London.* [We do most earnestly hope that this very important matter, to which Mr. Potter has thus ably drawn attention, will be seriously and experimentally investigated. Profs. Daubeny and Johnston, Dr. Playfair, Mr. Edward Solly, Mr. Fownes, and other working chemists, should at once take it in hand, and their united experiments would settle the matter in six weeks.]

Draining.—I hope the remarks of your correspondent "J. S. F.," p. 318, will be well considered by those agriculturists who are disposed to afford their land this most valuable improvement. The greater cheapness of "plug-draining" is too often a temptation to its adoption (it is done in this neighbourhood for 4d. to 5d. per rod), but if the theory of Mr. Smith, of Deanston, as explained in his lecture at Bristol, that, as the soil becomes dried by the operation of the drains, it shrinks and becomes broken in a degree, to the depth of the drains, be true, it is reasonable to expect it will crumble down into the space left by the plug as a passage for the water, and eventually obstruct and close it. But if the work be properly done, and the clay well rammed down on the plug, it must act as a "puddling," and prevent any surface-water from arriving at the drain. If the soil be not so tenacious as to be consolidated by the rammer, moles will be very likely to get at the drains and therefore choke them. I would strongly recommend all who expect permanent improvement from draining to remember the old saying, "Once well done, is twice done."—*Lusor.* [See the observations of "A Clay-land Farmer," in our last.]

Asparagus.—I fear I am not singular in my disappointment from adopting the method of cultivating Asparagus, described in your *Chronicle* for 1842, p. 187; but with me it has been a failure. I took two beds, which had been made three years ago, with every precaution to ensure fertility. On the 29th of October, I covered them about four inches thick, with a mixture of one-third of fresh night-soil, with two-thirds of road-dust, swept from a limestone road; on the 23d of February this was forked in, dressed with a pound of salt to each yard, and the beds were covered about seven inches with leaves that had before covered the Seakale beds. My neighbours have been cutting for two or three weeks, but my grass seemed unwilling to make its appearance, till last week I observed a few heads, and on removing the leaves was able to get a few small, long, white shoots, much crooked in forcing through the leaves, but which, when cooked, were (as you observed) like "bleached timber," with half-an-inch of eatable Asparagus at the end. I have had the leaves removed, but the few buds that are now breaking through the surface are looking very weak and small. I expect to have lost the crop for this season at any rate. What the next will prove time will show.—*Lusor.* [The next will repay you for a temporary disappointment. Time is wanted for all these operations, and this year a miserable May has rendered time more necessary than ever.]

Fungus on Tan.—I would recommend your correspondent who complains of fungus growing on his bark-bed, to try the effect of soot sown moderately thick over its surface, as I have killed it several times by that means.—*J. R.*

Hedgehogs.—I consider these inoffensive animals as very useful inmates of a garden. I once had a very young one, and it was amusing, when he was rolled closely up, to throw a snail near him. It seemed as though he detected the proximity of the snail by smell; for he would soon begin to unfold himself with great caution, till he saw his prey, when he would suddenly dart upon it, and commence crushing the shell with great haste; as soon as the shell was removed, it ate the snail with much relish. I think the hedgehog would assist materially in the destruction of snails and insects in a garden.—*Lusor.*

Guano applied to Mangold Wurtzel.—In answer to the inquiries of "A Correspondent," at p. 216, respecting the application of genuine Guano to the Mangold Wurtzel crop, I beg leave to offer the following particulars of the method adopted by my gardener last spring:—Drills were drawn 6 inches in depth, and 2 feet apart, into which the Guano was strewn at the rate of 1lb. to 15 yards, and covered over with an inch of mould; above this the Mangold Wurtzel seed was afterwards sown. The produce of the seed thus treated was fully one-third more than of that which received a dressing of farm-yard manure; the average weight of the roots being from 8lbs. to 9lbs.—*E. S.*

Toads and Woodlice.—I am rather surprised to find that Mr. Beaton, at p. 176, doubts the fact of toads destroying woodlice; and yet he says he would not like to see his Cucumber and Melon pits *without one*. Now, if they do not destroy insects, why have them there? If they are not useful, they are certainly not ornamental. I have always considered them to be useful for the above

purpose, and have found that when one is put into a pot or frame where woodlice abound, the number of the latter soon decreases. But I never had an opportunity of seeing a toad in the act of devouring his prey until a day or two ago, when, on removing some Dahlia roots, several woodlice, disturbed by the operation, commenced running about in different directions. These, a toad, confined in the same frame, immediately approached and attacked. I at first thought that he opened his mouth and sucked the insect in; but, on a closer examination, I found that the toad possessed the property of being able to thrust out to a considerable extent his tongue, with which he seizes and conveys the insect into his mouth with such precision and rapidity, that to an inattentive observer it would appear that he only opens his mouth, when the insect immediately leaps down his throat. In the space of two or three minutes I witnessed upwards of 20 woodlice take the above leap. I have had the same toad for upwards of three years, and in the winter months, when his services were not required, a hole was dug in the earth, in the bottom of which a piece of slate was put, and on this he was placed, under an inverted flower-pot, and buried at about the depth of one foot from the surface.—*Tom Toad.*—Toads will keep frames quite clear from ants, beetles, and woodlice, and they are perfectly harmless. I have seen them eat thousands of ants and woodlice, and I always keep a number of them in my houses.—*Jemsheed.*

Pine-apple Strawberry.—Last year there was a good deal said about the difficulty of managing the "Pine-apple Strawberry," and very many persons are hence deterred from cultivating it; yet one of your correspondents asserted that it was as hardy, and as easily managed, with perfect success, as any other. As this is so delicious a Strawberry, it may not be out of place for me to press the same opinion. My soil is strong, yet I have not lost a single plant, either young or old, during the winter, and I have a good many. Their treatment is the same as the other kinds. I find, however, that the maggot of the Crane-fly is a great enemy to them. Would spirits of tar be as likely to drive them away as it does the wire-worm?—*Discipulus.* [The experiment is worth trying.]

Birds.—The other day a nest was found at Ashford Lodge, near Halstead, containing three blackbirds and one thrush, fully fledged. The nest was in a secluded place, and does not appear to have been in any way disturbed.—*J. Pagan.*

Keeping Apples.—There are many theories and plans for keeping Apples, but the following instance will show that they sometimes preserve themselves in a very unaccountable manner. Last week my gardener found two Apples—one a Tankard, the other a sound juicy Apple, which we call, in this part of the country, the Harvey—in the Box-edging of one of the walks, perfectly fresh and sound, although they had been exposed to all the frost, snow, and rain of the winter—the two former unusually severe. What makes it still more extraordinary is, that all the "Harveys" had disappeared from the fruit-room at least a month before the solitary one was found!—*E. F. L.*

Amaryllis reginae.—Surely "J. B.," p. 138, is mistaken when he states that he cultivates *Amaryllis reginae*, with *A. formosissima* and *vittata*, in the open air. The two last are greenhouse bulbs, and will do out of doors; but *A. reginae* is one of the tenderest of stove bulbs, as far as my experience goes, invariably suffering if left in the greenhouse late in autumn, and seldom flowering but in strong stove-heat; its constitution seems even to affect hybrids with more hardy species, for *A. aulica reginae* requires far more heat than *A. aulica*, so much so that the two will not flourish under the same treatment. Mr. Herbert doubts if *A. reginae* came from Mexico, on account of its tenderness. Is it not probable that it did come from the neighbourhood of Vera Cruz? We had little communication with Central Mexico and its *Tierra templada* in 1728, when *A. reginae* first flowered in England.—*J. R.*

Scotch and English Farmers.—I shall enter no further into controversy with your Stirling correspondent; for what truth can be established, or what right conclusions come to, with one who reiterates that a partial decline, although considerable, and a total giving up, are the same thing. Or that there is no difference between a simple statement of fact given on the authority of the Reports of the Great Agricultural Meetings at Liverpool and Bristol, and without the reasons being quoted; and reasons invented for the occasion by your correspondent, whilst the new matter introduced into his last letter, in reference to my first communication, is throughout a perversion of my meaning. I shall, therefore, wait for a clearer-headed adversary before I again address you on the subject of Scotch and English Farmers; only now remarking that your correspondent's manner of argument confirms the opinion now growing in public belief, that, by false statements, the character of Scotch Farmers has been attempted to be placed in a false position.—*Gosforth.*—[Here this controversy must cease, so far as the *Gardeners' Chronicle* is concerned.]

Bees.—J. A. Devonport, begs to submit, with every respectful deference, that the "Bar-and-frame Hive," of which a sketch was so kindly supplied in the last Number of the *Gardeners' Chronicle*, is not quite intelligible. Will "E. M. W." be so obliging as to describe the several parts, and letter them, in the next publication of the *Gardeners' Chronicle*. A key of this kind would remove all the difficulties from this ingenious and (I should hope also) useful Bee-box.

Apples.—I think I could show "A Tivy-side Subscriber" Apples in two months hence as good as he describes. We keep ours in what we call here half-penny (?) pots, or even in boxes. We always place them as they

grow, with the stalk uppermost. We never wipe them. I sent, a few days since, some hundreds, of a kind not over good for keeping, to a friend, and have now many hundreds more. We have kept them till the new crop came in. This year we do not consider a good year for their keeping.—J. B. H.

Charcoal.—As I consume a large quantity of Charcoal, I should be obliged if you, or any of your correspondents, would inform me of the manner of manufacturing it, as well as the cheapest, most simple, and most economical way, with as little immediate outlay as possible, or in a way which might be considered ultimately, and on a large scale, the best and the most economical by the outlay of capital for any particular construction of works or machinery.—J. K. [It must be ground into fine powder; that is the main point.]

Sash Bars.—In humid seasons I dare say many of your readers have had to deplore the loss of Melon-plants in dung-frames, by "damping off," caused by the drop from the astragals and side-bars of the lights, in consequence of bad glazing; together with the vapour arising from the vapour condensing on the under-surface of the glass, running down the astragals, &c., and falling from their lower edges on the plants. To obviate this evil, I had a

frame made and fitted up with astragals and side-bars, as shown in the above section, which requires no further explanation than that *aa* are grooves, which catch the rain-water which finds its way inside, and the condensed vapour, carrying it to the bottom of the lights, instead of dropping on the surface of the bed. *bb* are grooves to insert the ends of the glass on Mr. Read's excellent plan, which was published some years since in the Horticultural Transactions. I may observe, that vapour condenses sooner on glass than on wood; but seldom drops from it, but finds its way to the astragals—providing the pieces of glass are neither cut curvilinear, nor the under-sides convex, but flat, and cut rectangular; then the groove *a* will totally prevent dropping in the frame, and the evil consequences it induces, which I have proved this season. The frame above mentioned, was placed side by side on a dung-bed with another new one, of the common construction; the former is free from drop, the latter shows stripes of drops directly under the astragals, &c., all over the bed; and as the tank system of heating is likely to become general, as it well merits, I have no doubt the grooved astragal and bar will in some cases become useful.—J. Stevenson.

Wood-Paving.—In your leading article, May 13, you mention Messrs. Esdaile and Margrave's patent for capping the Fir-blocks with Elm. I would ask what advantage is contemplated from using two kinds of timber in preference to Elm alone? Elm is nearly the cheapest timber to be had, not being worth more than 1s. to 1s. 2d. per foot, and it is known to be very durable when constantly wet, and probably more so than Fir, when exposed to alternations of moisture and dryness.—Lusor.

FOREIGN CORRESPONDENCE.

Paris, May 15, 1843.—The annual exhibition of the Paris Horticultural Society was held in the Orangery of the Luxembourg Palace, on the 10th May and four following days. As heretofore, it consisted of a miscellaneous collection of flowers, fruit, vegetables, grains, paintings, tools, and other objects connected with horticultural pursuits. The weather was favourable each day, and nearly all the fashionables of Paris graced the room with their presence. Among the earliest visitors were the Duke and Duchess of Nemours. The show (with some few exceptions) was far from brilliant; and this cannot be wondered at—for what Amateur or Florist would subject a rare or fine specimen to the atmosphere of such a place for five successive days? But if there was not much to attract the notice of the connoisseur, there was enough to please the sight-gazers of Paris, who were daily seen thronging this temple, and offering their adorations to the vernal goddess. The best collection was decidedly that of M. Paillet, who obtained the first prize for Rhododendrons. His plants of *Atro-roseum*, *Comtesse de Vogüe*, *Glabrum*, *Triumphans*, *Grandiflorum*, *superbum*, *Comte de Rambuteau*, *Altacrerense*, *superbum*, *Lowenianum*, *Rubrum plenum grandiflorum*, *Morelianum*, and *album pictum*, were grand, and would have done credit to an English exhibition. Besides these he had several very distinct seedlings, one a dark crimson, and another a rose lilac, very deeply spotted. Unfortunately they were not numbered, and therefore it will be useless to describe them. In his stand was also a fine specimen of *Azalea indica coccinea grandiflora*, such as is seldom to be seen on this side of the water. The next most attractive collection was that of M. Margottin. This consisted of *Roses* in pots, and was awarded a first prize. The varieties were chiefly *Bengals*, *Teas*, and *Hybrids*, cultivated on standards, or half-standards, varying from 1 to 6 feet high. Most of the blooms were fine, and the plants in good health; but, to an English eye, the naked stems looked anything but appropriate in a public exhibition.

Among the best specimens were *Reine des Iles Bourbon*, *Clara Sylvain*, *Bougère*, *Comte de Paris*, *Princesse Hélène*, *Duchesse de la Vallière*, *Adam*, *Madame Breon*, *Fulgovie*, *Sulphurea* (old yellow), *Sisley*, *Emile Courtier*, *Lady Warrender*, *Triomphe du Luxembourg*, *Rose du Roi*, *Melanie Corneil*, *Paul Joseph*, *Niphotos*, and *Comte de Paris du Luxembourg*. The bright golden flowers of the old yellow Provence attracted universal admiration. M. M. Cels never fail to send a large collection;—in fact, without the assistance of their hot and greenhouses I know not what the Society would do on these occasions. At this time they furnished 500 or 600 plants, *Palms*, *Orchidaceæ*, *Cacti*, *Ericas*, *Azaleas*, *Rhododendrons*, *Coniferae*, and a multitude of other things, in and out of bloom, from all the four quarters of the globe. Their *Cacti* are the best in Paris; they pride themselves on their collection, and spare no expense in adding every thing rare. Very many of their specimens are large and fine, particularly *Echinocactus electracanthus*, *acuatus*, *macrodiscus*, *aulacogonus*, *piliferus*, *cornigerus*, *Echinopsis Zuccarini*, *multiplex*, and *Melocactus*, *nova species*, from Brazil. They also exhibited the beautiful *Mammillaria elephantidens*, which every collector of *Cacti* ought to possess. Among their *Orchidaceæ* were good plants of *Brassia Cavanii*, with its curiously-formed flowers, *Trichopilia tortilis*, *Oncidium carthaginense* and *ampliatum*, *Cyrtorchilus maculatum*, and *Phaius bicolor*; together with a fair specimen of *Azalea indica variegata*, an *Araucaria excelsa* and *imbricata*, 12 feet high, and *Cedrus deodara*. The gold medal, offered by the Duchess of Orleans, was awarded to M. Tripet Leblanc, for a collection of more than 700 cut Tulips; these were arranged in glasses, at regular distances, between which was moss or leaves, and the whole covered with light earth, in a raised bed about 50 feet long, neatly edged with turf. The illusion was so complete as to give them every appearance of being in their natural state of cultivation. The varieties were entirely confined to *Roses* and *Byblomens*, for *Bizarres* are altogether discarded here: even *Polyphemus* in all its beauty would not be tolerated. I must not scrutinize too closely the quality of the flowers; suffice it to say they were not cut to appear at Hampton; and therefore passed as a fine collection. M. Tripet Leblanc deserves credit for his zeal; for certainly few men beside himself, in France, would have made the sacrifice for the sake of the prize. M. Dufoy obtained the first prize for *Pelargoniums*, which he had grown for the markets: most of them were old varieties of little merit, save that of blooming freely. He also exhibited several very good *Verbenas*, and a dozen *Dahlias* in bloom. M. Chauvière obtained the second prize for *Pelargoniums*; among which were *Priory Queen*, *Mr. Garth*, *Flamingo*, *Onais*, *Sidonia*, and *Gauntlet*; and a prize for seedling *Calceolarias* and *Cinerarias*, which, however, would have passed unnoticed in London. M. Modeste was awarded the first prize for *Pæonies*; *Josephine Imperatrice*, *incarnata*, *Victoria*, *Hissiana*, *triumphans*, *splendidissima*, and *splendens*, were very fine, especially the latter, which has a fine round petal, although single. He also obtained the second prize for *Rhododendrons*: his plants of *Formosissimum*, *Lowell album*, *Lady Warrender*, and *Invincible*, were everything that could be wished. M. Soulange Bodin exhibited a large collection of hardy and Indian *Azaleas*, which fully deserved the prize awarded. *Versicolor*, *purpurea grandiflora*, *aurantiaca major*, *nobilissima*, *spectabilis*, *formosa*, *triumphans*, *coccinea maxima*, *bouquet parfait*, *tricolor perfecta*, *splendens*, *fulgens*, *picta*, *rubicunda superba*, *pontica alba*, *Danielsii*, and *variegata*, were conspicuous in beauty. M. Jacques, the King's gardener at Neuilly, exhibited several seedlings of herbaceous *Pæonies*, which were also awarded a prize: some of them are pretty and distinct, and will no doubt get into the trade. The amateurs contributed but little, and that hardly worth notice. M. Souchet obtained a prize for flowering plants which might have been purchased in any market for 100 francs. The fruit and vegetables were not at all worthy of a city like Paris. M. Gontier (the Wilmot of Paris) was awarded the prize for Grapes, Melons, Cucumbers, &c. M. Devilleneuve sent 40 varieties of Oranges and Lemons, in fruit and flower; this stand was always crowded with visitors. The specimens of *Pompelmouses*, *Bigaradier Grand Bourbon*, *doré*, *violet*, *Oranger à bois violet*, *Perrette de Florence*, and *Limonier Incomparable*, were very fine. There were two or three other prizes given, and three or four mentioned as honorables, but the subjects contained nothing worthy of particular attention. The entire exhibition was composed of about 2,500 plants, beside paintings, models, tools, &c.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

May 25.—Mr. Edward Solly, in his third lecture again adverted to the singular agencies which cause the conversion of such products as gum, sugar, starch, &c., one into the other. This was shown to be caused, in plants, by the presence of an azotised substance, called diastase, which, in germinating seeds, brings about with rapidity the same kind of alterations as the chemist produces artificially by means of inorganic substances. High heat, or sulphuric acid, or caustic potash will, in the presence of water, suddenly change insoluble starch into soluble gum; the germinating plant, although it has neither high heat, nor sulphuric acid, nor caustic potash to assist it, has diastase, which brings about the same result as those inorganic agents. Malting was adduced in illustration of this. Mr. Solly next directed attention to the inorganic matter that forms part of the constituents of vegetation, and referred to the table produced last week, in illustration of the quantity that is found to exist in plants. These inorganic substances remain in the form of ashes when plants are burnt, and then we are able to determine their nature: this was illustrated, in the case of ashes from the Beech-tree, by the performance of a chemical analysis; when *potash* was detected by tartaric acid, *chlorine* by nitrate of silver, *sulphuric acid* by baryta, *carbonic acid* by muriatic acid, *lime* by oxalate of ammonia, *magnesia* by phosphate of ammonia, *earthy phosphates* by ammonia, *silica* by its insolubility, and so on. All this showed that plants obtain their food either from the

air or the soil, which were next proved to be capable of yielding it. In addition to oxygen and nitrogen, which by their mixture form the atmosphere, it was shown that there is constantly suspended in it, water furnishing hydrogen, carbonic acid, and ammonia. The latter compound is not, however, discoverable, because it is dissolved in water as fast as it is formed, and therefore only occurs in the water precipitated from the atmosphere. But in addition to these gaseous matters, solid substances, in a state of minute division, are always floating in the air. The possibility of this was demonstrated by the following experiment: some potash was heated on a glass plate, in contact with a piece of wood; suddenly the mixture took fire, and the potash passed into the air in the form of a vapour that presently became invisible. That potash must remain suspended in the air: and in fact its presence may be detected for four hours after such an experiment. It is probable that soda is volatilized in a similar manner. The fact that it is so, was proved by an instance which Mr. Solly had obtained from the Horticultural Garden. Two plants of a *Catsetum* were taken, one growing in earth, the other in air. Their analysis gave the following curious result:—

	Growing in air.	Growing in earth.
Pseudo-bulbs	465 parts of solid matter.	488
Leaves	794	793

Now, it is to be inferred that in such a case the solid matter must have been supplied as abundantly by the air as by the soil. (This is a most curious, and in practice a most important fact.)

With regard to the soil, it must be evident that it is capable of supplying all earthy substances found in the composition of plants. The great difficulty of comprehending how such earthy substances get into plants consists in the supposition that they are insoluble. But their solubility was proved in the case of flint, or silica, by the condition of that earth (or acid) in combination with alkalies; silicate of potash, for instance, being shown to be perfectly soluble, and the flint in it being separated instantly when brought into contact with acids. The solubility of sulphate of lime (the earth called gypsum) was also demonstrated by a pretty experiment. Carbonate of lime was formed, by driving the carbonic acid of the breath through lime-water; this rendered the water turbid. A few drops of sulphuric acid were then added, which expelled the carbonic acid, and seized upon the lime, necessarily forming sulphate of lime, which, however, remained dissolved in the water. This experiment, and that of volatilising potash, were both capital.

Chiswick Show.—By accidental oversight the collections of *Roses* in pots were not noticed in our report of last week. It will be seen by the list of prizes then given that the judges did not award the principal one, it not being thought to be merited. The winners of other medals will also be found in that list. On account of the first prize not being given, we reserve all remark on the plants till the June show, when we intend referring to them amply.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY Council was held at the Society's House, in Hanover-square, on the 17th of May, the Marquis of Downshire in the chair. Nineteen gentlemen were elected Members of the Society. The Marquis of Downshire gave notice that he should call the attention of the Council at their next monthly meeting to the question of taking into consideration the propriety of the Society's recommending a course of public lectures to be given in London by Mr. Smith, of Deanston, on the subject of The rough-draining and Subsoil-ploughing, similar to those he had recently delivered with so much success in Ireland.—A letter was read from Mr. Kerr on the subject of grates tiles to prevent the entrance of vermin into drains; and a specimen of the mode of preparing tiles for a similar purpose suggested by Mr. Barton, of Threxton, was exhibited to the meeting.—Mr. Clive expressed his intention of exhibiting at the Derby meeting a cheap fire-engine of simple construction, throwing 25 gallons of water each minute. Mr. Davenport informed the Council that he had formed a fire-engine on Merewether's construction, very cheap and effective; and Col. Challoner stated that Mr. Sherborne, of Bedford, employed a single-acted engine with fly-wheel to prepare his manure with water in the summer.—The Marquis of Downshire presented the yearly Report of the Royal Agricultural Improvement Society of Ireland; and Mr. Buttsford, of Portland-place, a specimen of the Guinea-Grass from seed sown last spring at Hampton Lodge, near Farnham, Surrey, Mr. Buttsford stating that this grass in Jamaica grows to the height of five feet, and is considered as unrivalled for cattle.—Mr. Whitlaw offered some remarks on the distemper among stock.

FLORICULTURAL SOCIETY.

At the general meeting for the exhibition of Tulips and Heartsease, class-showing and seedlings, there were no Tulips from Amateurs, and the following is a list of the remainder:—Class-showing, *Heartsease*, Amateurs: a prize to Mr. Bragg for—Curion, edged; *Sulphurea elegans*, yellow; Bragg's White, white; Jewess superb, dark. *Tulips*, NURSERYMEN: Mr. Brown's Flamed Rose, 1st, *Triomphe Royale*; Orson's do., 2d, do. Mr. Brown's Feathered Byblomen, 1st, *Franciscus Primus*; Mr. Orson's do., 2d, do. Mr. Brown's Flamed Byblomen, 1st, *Salvator Rosa*; Mr. Orson's do., 2d, Rubens. Mr. Brown's Feathered Bizarre, 1st, *Ulysses*; Mr. Orson's do., 2d, Chadwick's Trafalgar. Mr. Brown's Flamed Bizarre, 1st, Strong's King; Mr. Orson's do., 2d, Platoff. *Heartsease*, Mr. Brown, yellow, *Sulphurea elegans*; edged, Curion; white, Brown's Maid of the Mill. Mr. Cook, Longwick, dark, Black Bess. Seedling Tulips, Mr. Brown's Ulysses, Feathered Bizarre, 1st class. *Heartsease*, Mr. Cook, Delight, 1843, 1 bloom, 1st class; Mr. Bragg, Elizabeth, 1843, 1 bloom, 2d class: these three flowers were noticed last week. Rejected—Mr. Cook's Paragon, Lady Jane, and Miss Betsy.

BOTANICAL SOCIETY OF LONDON.

May 19.—J. E. Gray, Esq., F.R.S., &c., President, in the chair. The following donations were announced.—A collection of plants from Western Australia, from Mr. John Turner: this collection comprises many duplicates. British plants from Mr. Edwin Lees, Mr. A. Henfrey, Mr. Freeman, and Miss Twining. Various donations to the library were also announced. Mr. A. Henfrey, A.L.S., exhibited specimens of *Leucocjum æstivum*, collected in Greenwich marshes. He also presented specimens of *Dentaria bulbifera*, collected at Harefield, Middlesex. Mr. William Andrews presented specimens of varieties of *Saxifraga geum*, in one of which the nectaries were thickly surrounding the ovary. The specimens were collected at the Great Blasket Island, coast of Kerry, Ireland. There was read a "Notice of the discovery of two species of Fungi, new to the British Flora, by Dr. Philip B. Ayres;" *Peziza corticalis*, found on Woodbine, between Stokenchurch, Oxfordshire, and Cadmore End, and *Hysterium rubrum*, found on Bean-stalks at Aston Rowant, and Tetsworth, Oxfordshire. Specimens of these new species were presented to the Society by Dr. Ayres. The commencement of a paper by Mr. Edwin Lees, F.L.S., "on the groups into which the British Fruticose Rubi are divisible" was also read. The paper was accompanied by drawings and specimens.

ROYAL BOTANIC SOCIETY OF LONDON.

May 24.—This Society held their first garden exhibition in the Inner Circle, Regent's Park. The morning of the day was extremely threatening, and the rains which fell so saturated the ground with moisture, that plants were obliged to be laid in some of the show-tents and on the turf for the company to walk upon; about 9 o'clock, however, the weather cleared, and the remainder of the day was all that could be desired. The exhibition, in many respects, was an echo of that of Chiswick, several exhibitors bringing the same plants. In one of two particular cases, such as *Orchidaceæ* and *Azaleas*, it was much below the last Chiswick gathering; but the collections of stove and greenhouse plants, and particularly the *Pelargoniums*, were abundant and splendid. As we fully reported the plants which were shown at Chiswick, we shall not repeat the description of those which were brought forward again on this occasion, confining our observa-

tions to such as were not then shown, or which displayed any peculiarity not before alluded to. Perhaps the specimen which had been cultivated to the greatest excellence, and which was altogether most novel, was *Acrophyllum venosum*, sent by Mr. Green, gr. to Sir E. Antrobus, Bt. This plant was in admirable health, and had large terminal feathery spikes of white blossom. Another good specimen of the same species was shown by Mr. Redding, gr. to Mrs. Marryatt, Wimbledon: but the flowers were not properly expanded. In the collection of Mr. Goode, gr. to Mrs. Lawrence, there was an immense and elegant plant of *Chorozema cordifolium*; *Gesneria latifolia*, very handsome, and finely grown; *Erica Cavendishii*, a rare yellow-flowered kind, in capital health; *E. ventricosa coccinea* minor, a plant not more than 9 inches high, but a mass of lovely pinkish flowers; *Anthocercis littorea*, extremely good; *Chorozema Henchmannii*, 4 feet high, excellent; *Oncidium flexuosum*, well grown; *Erica ampullacea* var., very fine; and a beautiful dwarf plant of *E. munda*. The collection of Mr. Green contained some splendid *Azaleas*, *Podolobium staurophyllum*, 3 feet high, well cultivated; *Pimelea rosea*, dwarf and beautiful; *Chorozema Dicksonii*, 18 inches high, admirable; *Pimelea hispida*, very broad, and laden with flowers; a variety of *Cactus*, like *Ackermannii*, but with blue in the blossoms; *Erica splendens*, handsome; *E. vestita alba*, very good; *Leschenaultia biloba*, brilliant; with a charming specimen of *Erica suaveolens*, and also of *E. Beaumontiana*. Mr. Pawley, of Bromley, exhibited *Erica propendens* in a lovely state; *Zichia coccinea*, very rich; *Chorozema Henchmannii*, magnificent, and in a condition which we have never seen excelled; *Erica hybrida*, a noble plant; *E. ventricosa carnea*, equally fine; *Gesneria bulbosa*, a splendid specimen; another plant of *Zichia coccinea*, on a trellis 4 feet across, and every inch of it covered with bloom; *Poiraea coccinea*, dwarf, and flowering liberally; and *Kennedyia nigricans*, in rich health, but wanting in showy colours. From Mr. Mill, Nurseryman, Stoke Newington, there were large plants of *Euthales macrophylla*, and the handsome *Hibiscus splendens*. Mr. Atlee, gr. to —Beaufoy, Esq., South Lambeth, showed, amongst a generally inferior collection, a *Verbena*, like *Chamaedrys*, on a low trellis, well managed; *Erica munda*, very small and close, blooming profusely; a large specimen of *Boronia pinnata*, and *Manettia cordifolia*, with good plants of *Boronia denticulata*, *Erica elegans*, and *Correa speciosa*. Mr. Clarke, gr. to W. Smith, Esq., Shirley Park, sent *Diplacus puniceus*, in a handsome condition; *Boronia denticulata*, extremely good; *Cereus speciosus*, grafted on *C. denticulatus*, and both flowering together; *Muralia Heisteria*, very dense and pretty; *Eutaxia myrtifolia*, dwarf, and in astonishing luxuriance; *Erica translucens*, and *Chorozema Dicksonii*, beautiful specimens. By Mr. Clark, gr. to W. Block, Esq., there was shown a favourable specimen of *Erica hybrida*, and a very close *Azalea lateritia*. The following plants came from Mr. Hunt, gr. to Miss Traill, Hayes' Place; *Dillwynia clavata*, remarkably well bloomed; *Erica odora rosea*, an excellent little plant; *E. ventricosa stellata*, particularly good; *Hovea Celsii*, 2 feet high, very compact and healthy; *Bossiaea rufa*, 3 feet in height, finely grown; *Pimelea decussata*, low and rich; *Tropæolum tricolorum grandiflorum*, superlatively beautiful; and *Boronia crenulata*, a showy specimen. The collection of Mr. Frazer, nurseryman, Lea Bridge Road, included, among many poor productions, *Zichia glabrata*, very elegant; *Leschenaultia Baxteri*, dwarf, with paler flowers than *L. biloba*; *Bossiaea linophylla*, 3 feet high, graceful; *Erica perspicua nana*, most attractive; and *Statice arborea*, a well-managed blooming plant. Of specimens there were *Erica depressa*, a large, close, and very verdant plant, from Mr. Joynes, of Totteridge; *E. ven-tricosa superba*, one of the most extraordinary specimens ever exhibited, from Mr. May, gr. to E. Goodhart, Esq.; *Erythrina crista-galli*, singularly excellent, from Mr. Watts, gr. to — Marshall, Esq.; and *Euphorbia grandiflora*, 5 feet high, a noble specimen, from Mr. Frazer, Lea Bridge Road. The *Orchidaceae*, which were of inferior quality generally, comprised a nice plant of *Oncidium pumilum*, on a block of wood, from Mr. Graves, gr. to Mrs. Cannon, Stratford Green; and a good variety of *Oncidium ampliatum*, from Mr. Redding. The group of tall *Cacti*, from Mr. Cockburn, gr. to the Earl of Mansfield, had fine plants in it of *C. speciosissimus*, *Jenkinsonii*, and *Ackermannii*, as had also that of Mr. Clarke, gr. to W. Smith, Esq., with *Jenkinsonii* grafted on *speciosissimus*, and both in flower, and a variety called *Scottii*, which resembles *Colvillei*. Both here and at Chiswick, the show of *Fuchsias* was by no means what might have been expected from the advertisements of growers. The *Venus victrix* was the most remarkable, and very pretty it certainly is; but as for the remainder, with the exception, perhaps, of *F. Laneii*, they are such as it would have been more prudent in the growers to have reserved until they were in a better condition, or better selected. There was a fine collection of shrubby *Calceolarias*, in slate tubs, from Mr. Beck, of Isleworth. The varieties were, *Luna*, *Climax*, *Lady of the Lake*, *Bleda*, *King*, *Standishii*, *Madonna*, *Lady Douglas*, *Maid of Honour*, *Standish's Beauty*, *Agnes*, and *Bertha*. *Calceolaria integrifolia*, elegant, and lanceolata, in an unusually large and rich state, were sent by Mr. Joynes, of Totteridge. Mr. Gaines's Shrubby *Calceolarias* were *Rising Sun*, *Dusty Miller*, *Favourite*, *Cyrus*, and *Sunbeam*. Mr. Catleugh's were *Commander-in-Chief*, *delicata*, *Reform*, *Commodore*, *Hero*, and *Caroline*. Mr. Catleugh's Herbaceous sorts were *Bridesmaid*, *Lady Sale*, *Van Amburgh*, *Lady of the Lake*, *Isabella*, and *Favourite*. Mr. Green had some new and striking seedling *Calceolarias*, as had Mr. Wakeling, gr. to W. Whitmore, Esq., Beckenham. Those from Mr. Standish, in the way of *C. Standishii*, and all very beautiful, were *Bagshot Beauty*, *Raphael*, *Surprise*, *Princess Mary*, *Reliance*, and *Duchess of Gloucester*. The best of Mr. Green's seedlings were *Rosa magniflora*, *Georgiana*, *Imperial*, and *Igneus multiflora*. We insert a list of the *Pelargoniums* exhibited, according as they received prizes. *PELARGONIUMS*.—Large collection from Mr. Cock, Chiswick, not for competition.—*Wonder*, *Cyrus*, *Dido*, *Mabel*, *Jubilee*, *Madeleine*, *Grand Monarch*, *Prince of Waterloo*, *Evadne*, *Coronation*, *Flamingo*, *Bertha*, *Cerule*, *Unit*, *Selma*, *Queen of the Fairies*, *Amnia*, *Wizard*. *PELARGONIUMS*, in collection of six varieties in 24-sized pots (*Amateurs*).—1, Mr. Dobson, gr. to E. Beck, Esq., Isleworth.—*Erectum*, *Susanna*, *Queen of the Fairies*, *Amnia*, *Cleopatra*, *Matilda*; 2, Mr. E. Bell, Chelsea Hospital.—Mrs. Stirling, Nymph, Camilla, Sylph, Eucantress, Lord Mayor. *Nurserymen*.—The number exhibited by Nurserymen in this class was doubled.—1, Mr. Catleugh, Emma, Luna, Lord Chancellor, Matilda, Favourite, Dido, Madeleine, Duchess of Sutherland, Grand Monarch, Echipse, Symmetry, Flash; 2, Mr. Gaines.—*Princess Royal*, *Rising Sun*, *Amaranth*, *Prince of Wales*, *Candidate*, Sylph, Caroline, Vanguard, Queen of Beauties, Nymph, Impericles, Euterpe. *PELARGONIUMS* in collection of six varieties in 21-sized pots (*Amateurs*).—1, Mr. Watt, gr. to —Snell, Esq., Pimlico.—*Acme*, *Annette*, *Dowager Queen*, *Florence*, *Lord Mayor*, *Bracemaid*; 2, Mr. Hunt, gr. to Miss Traill.—*Coronation*, *Prince Albert*, Sylph, Orange Boven, Bridesmaid, Matilda; 2, Mr. E. Bell, Chelsea Hospital.—*Simile*, *Vulcan*, *Rienzi*, *Coronation*, *Erectum*, *Una*; 3, Mr. Slove, gr. to R. Baker, Esq., Bayfordbury Park (no names). *Nurserymen* (numbers doubled).—1, Mr. Catleugh.—*Joan of Arc*, *Erectum*, Sylph, Flash, Comte de Paris, Victory, Idilia, Lifeguardsman, Ovid, Selma, Queen of Fairies, Coronation; 2, Mr. Gaines, Victory, *Erectum*, *Juba*, *Exquisite*, *Albina*, *Florence*, *Joan of Arc*, *Emperor*, *Cyrus*, *Grand Duke*, Sylph, *Mabel*. *PELARGONIUMS* in collection of four varieties in 8-sized pots.—1, Mr. Hunt, gr. to Miss Traill.—*Jehu*, *Alcina*, *Eliza*, *Superb*. *Lady Bridport*; 2, Mr. Bell, Chelsea Hospital.—*Bridesmaid*, *Climax*, *Joan of Arc*, *Florence*; 3, Mr. Cockburn, gr. to the Earl of Mansfield, *Climax*, *Perfection*, *Alexandrina*, *Joan of Arc*. *SEEDLING PELARGONIUMS*.—1, Zanzumum, Mr. Beck, Isleworth; 2, Theresa, Mr. Beck, Isleworth; *Susanna*, Mr. Beck, Isleworth; *Zanzumum*, Mr. Whomes, gr. to Mr. E. Foster, Esq., Clewer; *Hybla*, Mr. Whomes. There was a brilliant display of *Cinerarias*, and some good seedlings, especially from Mr. Ivory, of Peckham. A

collection of *Echinocacti*, &c., few of which were in flower, came from Mr. Bunney. A pretty whitish-flowered *Clintonia*, with broad pink edges to its blossoms, was sent by Messrs. Black and Green. There was the charming *Tree Violet* from Mr. M'Arthur, Edgeware Road. Other objects will have their merits indicated by the prize list. But we must notice two groups that seemed to us best to accord with the objects of the society. These were two collections of *Agricultural grasses*, from Mr. Joynes, of Totteridge, and Mr. Turner, gr. to Mrs. Holloway, near Reading, the former much too ripe, and falling to pieces; and a nice collection of *British Ferns*, from Mr. G. Turner, gr. to the Hon. and Rev. R. Wilson.

MISCELLANEOUS.

Tendency of Branches to direct themselves towards the Light.—Whenever a plant (the common Garden-Cress for example) is reared upon moistened cotton, in a room lighted by a single window, or in a box with a single aperture, the young stem, instead of rising perpendicularly from the soil, as if it were growing either in the open air or in complete darkness, inclines itself towards the light, preserving at the same time its straightness throughout, and forming an angle of a certain number of degrees with the ceiling. On the contrary, whenever a growing plant which has been raised either in darkness or in the open air, and has taken a vertical direction, is placed in either of the above conditions, the young stem first becomes bent and then inclines itself towards the light, in two distinct and successive phenomena: in the first, the lower part of the stem still retains its vertical direction, while the upper part is more or less horizontal; in the second, the upper portion being a little straightened and the lower slightly inclined, the whole of the stem becomes straightened, and finally points in the direction of the light. Although a plant thus inclines itself towards the side from whence the light proceeds, it is not necessary, as MM. de Candolle and Dutrochet appear to think, that the point of curvature should receive any portion of the rays of light. This bend does not remain in the young stems after the cause which produced it has been removed: the intensity of curve is, however, far from being the same when the young plants are placed under different circumstances; so that it may be laid down as a general rule that the tendency of the stems towards the light is much greater in proportion as the light is less intense, or the point from which it proceeds is low. The medium in which a plant is situated has no influence except upon the length of time in which the curve is produced; for both in water and in an atmosphere of hydrogen or nitrogen, the curve always terminates, though doubtless at different periods, by acquiring the same amount, provided all other conditions correspond. If instead of a case with one aperture the young plants were placed in a bag with two openings, and thus received the light in two directions, phenomena equally curious would be observed. These two apertures may be formed in the same side of the box, so that the rays of light which pass through them may form an angle more or less acute with each other; or the apertures may be situated on opposite sides. In the first instance, when the intensity of the two lights is equal, the stem bends in the direction of the resultant—that is to say, of the bisector of the angle formed by the two rays. But when the power of the two lights is unequal, either from the difference in the size of the apertures, or owing to one of them being partially shaded, the stem no longer curves in the direction of the resultant, but towards the strongest light. By the aid of a young plant, therefore, it may be ascertained which of two lights is the most intense—or which of two glasses is the most transparent; and, under certain circumstances, a plant may serve as a correct photometer. In the second instance, when the light is admitted on opposite sides of the box, provided the intensity of the rays is equal, the plant, equally balanced between both, neither leans to one nor the other. If, on the contrary, there is a difference in the power of the two lights, it inclines towards the most intense, unless it meets with a sufficiency of light from both sides; in which case it no longer grows curved, although the light should be more powerful on one side than on the other. In order to induce these phenomena, it is not necessary that all the rays of which light is composed should be present; for in all my experiments, either with the heliostadt or with coloured and analysed glasses, if I proceeded by elimination, the result was, that the plant, when exposed to the red, orange, yellow, and green rays, grew as if it were in complete darkness—that is to say, it never inclined to either side; whereas, under the blue and violet rays, it always acquired a curved form. This complete inaction under certain rays is not owing to the nature of the green or colouring matter. When two lights cross—the one a screen of water, the other a screen of spirits of turpentine—a plant inclines itself towards the bisector—that is to say, it grows as if the light were not obscured. As far, therefore, as the phenomenon of motion is concerned, the chemical rays of light possess no influence. As a plant situated between two luminous rays of unequal intensity always bends towards the most powerful, I could easily ascertain whether the blue or violet ray exerted the greatest influence; and it has always been in favour of the blue. Finally, as the stem always curves in proportion to the deficiency of light, I could easily, by means of plants placed in different parts of a dark chamber, ascertain whether the darkness were complete.—*J. Payer*, in the *Proceedings of the Academy of Sciences at Paris*.

Hopeton Oats.—In the *Cobourg Star*, an American paper, we find that a specimen of the Hopeton Oat, in the straw, was presented to the Editor of that journal, which, from the root to the top of the ear, measured upwards of 7 feet. The soil upon which it was grown was a heavy clay, on a retentive subsoil, which was three years since broken up from grass, and afterwards thoroughly tile-drained. The average height of the crop from which it was taken is said to have been 6 feet.

In cooking vegetables, the choice of water is very important, owing to the different effects produced in their texture by hard and soft water. Thus, green vegetables and pulse lose both their colour and consistence if boiled in soft water, whereas, if boiled in hard water, the colour is much better preserved, and the texture less altered. If, however, we wish water to act as a solvent, as, for instance, in making soap, and extracting the vegetable aroma, as well as the animal juices, the purest soft water will be by far the most suitable.—*Miss Zornlin's World of Waters*.

GARDEN MEMORANDA.

Newport, Salop.—There is now growing in Mr. Adams' Nursery a plant of the *Cianthus puniceus* that has survived the three last winters, and extends over from six to seven square feet of wall. It is at present covered with large clusters of blossom.—*May 20*.

Messrs. Waterer's Exhibition of American Plants, King's-road, Chelsea.—Considerable additions have been made to this splendid collection for the present season; and the plants are arranged in a more interesting manner, so as to give greater variety and effect. Some of them are already beautifully in flower, and the rest will open in two or three days. Besides an enormous mass of bloom, varying in the *Rhododendrons* from purplish to white, and comprising the orange and flame tints of the *Azaleas* with the delicate waxen-blossoms of *Kalmia latifolia*, the most prominent feature is the fine standard *Rhododendrons*; they are, within certain limits, of almost all sizes and heights, from a great, spreading tree, to a low, round-headed shrub. Some tall specimens, with comparatively small heads, would make admirable substitutes for Orange-trees in the Italian style of gardening; and others, of a larger description, with branches drooping down to the ground, would be magnificent objects on lawns. We noticed *R. hyacinthiflorum* blooming well as a standard, and several handsome hybrids between *R. ponticum* and *catawbiense*. The way in which the standards are produced is by grafting. The entire collection bears evidence of how well even the most delicate plants may be transplanted, if proper care is exercised in taking them up with large balls of earth to the roots. An immense standard specimen, which was brought to the same place two years back, has been removed there again this season, and is blooming magnificently, thereby showing that the finest plants are not injured by shifting. The plants will afford a decided treat to the admirers of showy flowers.—*E. K., May 23*.

Brown's Nursery, Slough.—Had there been no railroads, and we had been compelled, as in days of yore, to walk 20 miles on foot to visit our neighbour's garden, a sight of the Tulip-bed at this Nursery would more than compensate for all the labour. Grown under favourable circumstances, as to soil and air, the strength of growth and luxuriance of foliage are proportionably great, and the blooms are fuller of colour this year than the last. The plants are very healthy, and do not appear to have suffered, as has generally been the case in other places. *Lavina* is exceedingly good throughout the bed, although in various character; *Salvator Rosa* is also excellent, the colour of this flower is perhaps not quite so dark as in some others of the same class, but the symmetry of its form, the purity of its base, and the fine and decided character of its breaking, render it unquestionably one of the finest *Byblemens* in cultivation. *Wallace*, another *Byblemen*, broken by the late Mr. Charles Brown, is a large and noble flower, but not by any means equal to *Salvator Rosa*; *Ulysses*, broken also by Mr. C. Brown, is a first-row *Bizarre*, and although no doubt raised from *Polyphemus*, is different from that flower, or from *Albion*, to which latter it has been compared; for, independently of being only and constantly feathered, the shape is not exactly like either of those flowers, besides expanding less freely, which, during so cold a season as the present, is a manifest disadvantage. Mr. Brown has, however, broken many flowers similar to *Polyphemus*, some of them quite as good, and some inferior to it. One of them, a fourth-row flower, is nearly as large as *Lawrence's Sheet Anchor*, but it is not perhaps quite so close in shape; another, which for distinction is called *Brown's Polyphemus*, has an intensely dark and heavy feathering. *Hamlet* is not so good as last year. There is also a seedling from *Holmes's Pitt*, of which all that can be said is, that it is better than its parent; *Catalani*, *Madame Vestris*, *Austria*, *Strong's King*, and *Captain White*, are all remarkably good; whilst *Claudiana*, of which we had not seen a good bloom this year, is magnificent; *Siam*, *Desdemona*, *Catherine*, *Pompe funebre*, *Parmegiano*, and *Lac*, are generally heavy, and not by any means so good as last season. We missed a flower which is always good, and has been this year even better than usual, *Holmes's King*, and were rather astonished to find that it had never been grown by Mr. Brown. However, such will not be the case in future. Of *Tricolors*, such as they are, there were many fine specimens, particularly of *Lawrence's Black Duke*, and *Willmer's Duke of York*. As the blooms are now in full perfection, we should advise those of our readers who intend to pay this Nursery a visit (and it will well compensate them), to lose no time, inasmuch as one hot day would, in such a season as the present, in all probability cause the flowers to drop very rapidly.—*W.*

THE NATURALIST'S CORNER.—No. XII.

(Continued from page 304.)

44. Geography of Plants.—It is very remarkable that the Flora of Sicily produces scarcely any, if any, peculiar indigenous species, the plants being common, almost without exception, to Italy or Africa, or some of the countries surrounding the Mediterranean, whereas there are several indigenous plants in Corsica and some other Mediterranean islands. Mr. Lyell supposes the plants of Sicily to have migrated from pre-existing lands; and, as the remains of living species of shell-fish and zoophytes are found embedded in the strata at the summits of lofty mountains in the island, he brings us to this curious result, that the families of plants and animals of the *Val di Noto*, and some other mountainous regions of Sicily, are of higher antiquity than the country itself; that is, that these species flourished elsewhere before the island was raised from the depths of the sea, and even before the materials of its strata were deposited beneath the waters.

45. Palestine.—"A land flowing with milk and honey," is a proverbial expression, characterising a land exuberantly productive, not only in the necessities, but the luxuries of life. It includes more than it expresses; yet even as more strictly understood, it is particularly applicable to Palestine, the rich pastures of which secure an ample supply of very excellent milk, while for the superior quality of its honey it seems at all times to have enjoyed a high reputation. Milk and honey, in various preparations, occupy a prominent place in the dietary system of the people of Western Asia.

46. The Observation of Nature.—When *Anaxagoras*, the peculiar property of whose mind has been called "a certain high-wrought and fanciful sublimity," was asked why he came into the world, he answered, "To behold the sun, the moon, and the marvels of nature."

47. *Habits of the Lion*.—Pope makes a curious mistake about lions in his note to a passage respecting them in the Essay on Man. "The manner," says he, "of Lions hunting their prey in the deserts of Africa is this: at their first going out in the night-time, they set up a loud roar, and then listen to the noise made by the beasts in their flight, pursuing them by the ear, and not by the nostril." On the contrary, the lion hunts but little, is sluggish, and instead of pursuing by the ear, lurks, and springs on his prey by surprise.

48. *Uses of the Mesembryanthema*.—The common Ice-plant of the gardens, *Mesembryanthemum crystallinum*, so called because its cuticle is elevated in the form of multitudes of crystalline points, is burnt in the Canaries for the sake of its ashes, which the Spaniards import in large quantities for their glass-works, under the name of *Barilla Moradera*. Another species, the *M. nodiflorum*, is used in Egypt for the same purpose, and also in the manufacture of morocco leather. This and the other species are chiefly found in sandy, desert, arid places, where they flourish in the absence of other vegetation, and afford a grateful food to cattle, which browse upon them. *M. emarcidum*, according to Burnett, is fermented by the Hottentots, when it becomes narcotic, and is chewed by those people like Tobacco.

Reviews.

The Transactions of the Gardeners' and Stewards' Provident and Mutual Instruction Society. Dublin.

THE objects of the Society which issues the above little periodical are the creation of a Benefit Fund, and the diffusion of knowledge in farming and gardening among its members. It formerly published the "Irish Farmers' and Gardeners' Register," which is now discontinued, and the present work substituted for it.

Embracing two designs, which are both of a praiseworthy character, we cannot but wish it every success, and congratulate the members upon having a printed medium through which the more valuable of their communications may be handed about, and rendered more useful. In each of the three numbers for March, April, and May, which have been sent to us, there is an original paper, a few paragraphs containing good practical information, and a voluminous calendar of Garden Operations for the succeeding month. They appear to be sent out monthly.

No. I. contains an agricultural article on sowing grain-crops; and the writer concludes with the following advice about selecting the seed of all kinds of grain:—

"1st—Never retain the same kind of seed too long upon the land; at the end of three years it will generally deteriorate, and ought to be changed; change of seed always produces a change for the better in the crops. Heavy clay-lands will longest retain the seed pure; light loams and peat soils will sooner require the change.

"2d—In selecting seed it should be ascertained, if possible, where and on what kind of soil it grew; and select a soil of a different quality to that on which it is to be sown. Never select seed from a rich soil to sow it on a poor; but prefer that from a poor soil to sow it on a rich.

"3d—Always select seed well cleaned and pure, being strictly of the same kind; seed of different kinds will vegetate at different times, and ripen at different seasons, which occasions serious loss, and further deterioration of sample."

In No. II., for April, there is an excellent communication on the treatment of Mangold Wurzel. An article on the culture of the Potato occupies the principal part of No. III. We give an extract respecting the diseases to which the plant is subject:—

"The disorders to which the Potato is liable are, Dry Rot, Curl, and Scab. The first of these, which is the most dangerous, makes its ravages among our old mellow varieties, corroding them as a canker, commencing where some bruise, scab, or wound has effected an opening on the rind or skin of the tubers, and by admitting atmospheric air to mix with the saccharine and other juices of the Potato, causes gangrene to set in, and in a few months infect the whole tuber, and it becomes a brown putrid mass of dry rot. Old varieties of the Potato are not so liable to it, when grown on bog moor or mountain land. The Potato abounds in a starchy substance, and when cut or bruised there issues a portion of the liquid, and forms an incrustation on the wounded part, impenetrable to the atmosphere; but on the contrary, strong lands which retain ammoniacal salts, and that are remarkable for producing gluten, grow Potatoes destitute of the necessary quantity of starch, and so dry and mealy that their wounds and bruises remain porous and open to the influence of air, and to the baneful consequences of dry-rot.

"The Curl is a disease that a few harvest kinds are subject to, such as *Bangor*, *Red Nose Kidney*, and most of the kidney varieties. It is caused by allowing them to become too ripe before dug out; if taken up whilst in a growing state, before the stalks wither, and exposed to the influence of the sun until they turn green in the colour, the propensity to curl will be remedied.

"The Scab infects all Potatoes grown on lands void of fertility, that are worn out, or too long under the operation of the plough, and I would not advise a Potato crop in such soils. The farmer should endeavour to have his Potatoes for seed from moor or mountain soils, and if such cannot be procured, from mellow fresh ones; always avoiding seed from worn-out land."

CALENDAR OF OPERATIONS for the ensuing week.

Now that the busy time of sowing and planting is over, save with a few of the later flower-garden-plants, and the season hitherto being the most favourable we have had for many years, we shall have more leisure for the next three months to turn our attention

to the higher branches of gardening; and this is so far fortunate, because, whatever kinds of plants one cultivates, unless the greatest attention is paid to them while they are making their growth, so as to bring them into fine proportionate specimens, they will not be worth looking at, be they ever so rare. The window-gardening round London, now-a-days, can boast of better specimens of skill and attention than the general run of our best conservatories could do as late as fourteen years back. In the olden times, he whose collection numbered the most species was considered the fortunate king of spades. While this taste prevailed, gardeners were compelled to crowd their plants so much, that their naked stems looked more like fiddle-sticks than anything else. The very opposite of this system now prevails; no matter how rare a plant is, unless it yields so far to artificial treatment as to suit the views of the possessor, it is at once discarded for ever; and in this consists the grand secret of keeping up a selection of plants. At no former period were the advantages of growing plants into fine specimens more apparent than at the last show of the Horticultural Society, where almost every plant was a perfect specimen of its kind. The manner, also, in which the exhibitors placed their plants on the table was a lesson of itself worth going a hundred miles to see, and to learn. Instead of crowding them after the manner of the old school, every plant had a free scope all round, so that you could see the different modes of pruning, training, and staking, which the growers found most applicable to each kind; and let your experience be what it might, you could learn many useful hints from this arrangement. Any one, after witnessing this arrangement, who will allow his plants to be huddled up together at home, has paid too dear for his admission-ticket.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—About the beginning of June the succession and younger plants will want potting, and if they are in a healthy vigorous state, they will require plenty of room in the new pots, as, after Midsummer, when they are established in the new soil, they will grow faster than at any other period of the season.

VINERY.—These houses are now out of all sort of danger that I can think of, except what may be feared from too heavy a crop; and if you have any doubts on the subject, let the Vines have the benefit of them. See also that the bunches of the succession-crops are well thinned, and keep up a good growing atmosphere till the fruit begins to ripen.

PEACHES AND CHERRIES.—All that can be done to them is to guard the crop. The trees must put up with a little ill-treatment till the crops are gathered.

FIGS.—These must never suffer for want of water. Pinch off the tops of the young shoots always at the third or fourth joint, unless you want wood to fill up your space.

MELONS AND CUCUMBERS.—I saw the other day an original and very simple method of smoking these plants; or, indeed, any kind of plants in frames. It is this:—Dissolve a table-spoonful of saltpetre in a pint of water; take pieces of the coarsest brown paper, about six inches wide, and ten or twelve inches long; steep them in the liquid till they are all wet; dry them, and they are fit for use, and will keep I know not how long. When you want to smoke a frame, roll one or two of the pieces like a cigar, leaving a hollow in the middle from half-an-inch to an inch in diameter, and fill this up with tobacco; then twist one end, and stick it in the soil, and light the other end, and the thing will smoke away slowly for an hour or more, and kill all the flies. An innkeeper near this place hit upon the plan this season, and he uses the refuse tobacco of his smoking-room, or the odds and ends of cigars, and what is left in the pipes, &c.

Out-door Department.

The last three weeks have been the finest weather for gardening that we ever experienced in May. Insects have been as yet less general than usual, and all the crops of vegetables and fruits are now very promising indeed. Here we have had only two Gooseberry bushes infected with the caterpillar, and a little dose of the gas-liquor killed them instantly; the liquor was diluted as I have already stated.

ASPARAGUS.—This is the very best time in the whole year to apply salts and saline manures to this crop. The drainage of common sewers, of stables and cow-houses, laundries, or even pond-water made thick with soot, will all be now appropriated by these plants.

BROCCOLI for autumn may yet be sown. Grange's Early White is the best; but if you are fond of novelties, you can get them under half-a-dozen new names, all of which may be true enough for aught I know.

CALIFLOWER.—I should not like to sow this later than the beginning of this week for late autumn use. Sow very thin, as you can hardly expect to be able to prick out next month, so that the crop must stand on the seed-bed till fit to plant out permanently.

ENDIVE.—About the end of May or the beginning of June is the best time to sow this very wholesome salad for autumn use; and as you ought to sow some every three weeks till the middle of September, you need sow only a pinch of seeds each time; sow them also very thin.

SOWING SUMMER CROPS.—All summer crops, of whatever nature or kind, should be sown very thin indeed if any of the plants are to be afterwards transplanted. To be sure, you can thin out if they happen to be too thick; but if the weather is dry at the time, you may do a good deal of harm, and, on the whole, you had better sow thin in the first instance, and I have allowed you a new heading in the Calendar to remind you more particularly on this point. Lettuces, and the other succession-crops, you will, of course, not forget to sow, if you have only a penny almanac to say when.

ORCHARD.—One of the very best points of the old school is now-a-days not so much attended to as it ought to be—I mean the thinning-out and regulating the summer-growth of the Gooseberry, Currant, and Raspberry bushes. Though the kitchen-garden were full of weeds, the summer-pruning of these plants was never omitted in my younger days, and always about this time. In early situations, Peaches and Apricots may now be partially thinned, where a heavy crop is set. Cherries and Plums on the walls will also want thinning by-and-by. All the late Pears, either on walls or standards, are much improved by early thinning. It is hardly necessary to remind any one to keep down insects of all sorts on fruit-trees.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Very many of the free-growing plants will now want another shift into larger pots, and as they must occupy more room, you must remove some of the more hardy sorts to the greenhouse, or some other place. Now and in the middle of winter are the advantages of an intermediate house between a stove and greenhouse most apparent; this is the most useful house that can be about an establishment. Recollect that no plant is worth looking at until it is brought to a good specimen.

GREENHOUSE.—If you can by any possibility have access to spare frames or pits, all the Heaths, and most of the other hardier and more delicate greenhouse plants, will grow in them far better than in the best-constructed greenhouse; and in that case you can turn your greenhouse into an intermediate stove, or into a show-house where only plants in flower are to be kept for the summer.

PITS AND FRAMES.—When the finer plants are brought into these you may keep them a little closer, and probably many of the plants will want a little shading in the middle of the day at first. After the pots are all watered in the afternoon, give the whole a good sprinkling with the syringe; not, however, if it has been a dull cloudy day.

Out-door Department.

FLOWER-GARDEN.—This has been such a fine time for turning out flower-garden plants, for sowing or transplanting annuals, for mowing and rolling, and for the growth of weeds, that people are so much engaged in all this as to leave them little time to read Calendars.—*D. Beaton, Shrubland Park Gardens.*

State of the Weather near London for the Week ending May 26, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.		THERMOMETER.			Wind.	Rain.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending May 26, 1843.

The market this week is well stocked with garden produce of a better quality. Carrots and Turnips, of the present year, are now getting of a tolerable size; and there is a considerable quantity of Cauliflowers, offered at 6d. each. Grapes, Pines, Melons, and Cherries, are exceedingly good, particularly the first and the two last. Some hothouse Grapes are selling as low as 2s. a pound; but they are evidently very stale. Ordinary ones produce 4s. a pound. Gooseberries are much larger, and there are some Currants in a few of the stalls. Foreign Grapes and Oranges are many of them now rotting. Peaches are of a moderate size, though poorly coloured. The flowering plants in pots, that were fresh to us, were *Epacris heteronema*, *Erica mundula*, *E. vestita alba*, *E. cerinthoides*, a few wretched Balsams, *Lupinus polyphyllus* (both the blue and white varieties), *Cereus flagelliformis*, the Musk plant, some good *Mignonette*, the red-blossomed Hawthorn, *Boronia denticulata*, *Eutaxia myrtifolia*, and the Honeysuckle. Of cut specimens the principal were, *Fabiana imbricata*, varieties of *Erica ventricosa*, and *E. vestita*, *E. perspicua*, *Lupinus polyphyllus*, and various kinds of herbaceous *Pæonies*.

PRICES, SATURDAY, May 27, 1843.—FRUITS:—

Pine Apple, per lb. 6s to 10s	Oranges, bitter, per 100, 6s to 20s
Grapes, hothouse, per lb. 4s to 8s	Lemons, per doz. 1s to 2s
— Spanish, per lb. 1s to 1s 6d	— per 100, 5s to 14s
— Portugal, per lb. 1s to 3s	Cucumbers, per brace, 1s to 3s
Peaches, per dozen, 9s to 12s	Walnuts, per bush., 10s
Nectarines, per dozen, 8s to 12s	Chestnuts, per peck, 4s to 8s
Melons, 6s to 12s	Almonds, per peck, 6s
Apples, dessert, per bush., 8s to 22s	Sweet Almonds, per pound, 2s
— Kitchen, per bush. 6s to 10s	Filberts, English, per 100 lbs. 50s to 55s
Strawberries, forced, per doz., 6d to 1s	Old Nuts, per 100 lbs. 60s to 70s
Gooseberries, per half-sieve, 2s 6d to 6s	Nuts, per bushel —
Currants, per pot, 8d to 1s 10d	— Brazil, 16s
Apricots, per pot, 1s 3d to 2s	— Spanish, 18s
Oranges, per doz., 1s to 2s 6d	— Barceona, 22s
— per 100, 6s to 20s	— Cob, 12s

VEGETABLES.

Cabbage-plants, per doz. bunch., 1s to 3s	Shallots, green, per bunch, 3d to 6d
Cabbages, per doz., 6d to 1s 3d	Asparagus, large, per hundred, 4s to 7s
Cauliflowers, per dozen, 4s to 12s	— Spruce, or Small, p. bun. 1s 6d to 2s 6d
Beans, kidney, forced, p. 100, 2s to 4s 6d	Pears, forced, per half-sieve, 12s to 15s
Potatoes, per ton, 40s to 80s	Lettuce, Cabb., p. sieve, 3d to 1s
— per cwt. 4s to 5s	— Cos, per score, 6d to 1s 3d
— per bushel, 2s to 3s 6d	Celery, p. bd., (12 to 15) 6d to 1s 6d
— Kidney, p. bush., 1s 6d to 2s 2d	Rhubarb Stalks, per bundle, 4d to 1s 3d
— Scotch, per bushel, 2s	Small Nuts, per punnet, 2d to 3d
— New, per lb., 6d to 1s 6d	Green Basil, per bunch, 4d to 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Watercress, per doz. sm. bun. 4d to 6d
Artichokes, green, per doz., 3s to 6s	Parsley, per half-sieve, 3d to 1s
Turnips, Spring, per bunch, 3d to 1s 6d	Tarragon, per doz. bunches, 3s to 2s
Red Beet, per dozen, 8d to 1s	Fennel, per doz. bun., 2s to 3s
Horseradish, per bundle, 1s to 6s	Mint, per doz. bunches, 2s to 3s
Radish, Spring, p. doz. hands, 6d to 1s	Marjoram, green, per bunch 4d to 1s
— Turn p., p. doz. bunch, 6d to 1s	Mushrooms, per pot, 6d to 9d
Carrots, per doz. bunch, 7s to 9s	Spinach, per sieve, 6d to 1s
— Young Horn, per bun. 6d to 1s 6d	Leeks, per doz. bunch, 5s to 6s
— Spring per bunch, 6d to 1s 6d	Onions, per bushel, 5s to 8s
Parsnips, per dozen, 6d to 1s	— Spring per bunch, 2d to 6d
Garlic, per lb. 6d to 8d	— Pickling, per hf. sv., 4s 6d to 5s
Shallots, per lb., 1s to 1s 6d	— Green, p. doz. bun. 2s to 4s

Notices to Correspondents.

SALT.—*Dianthus*.—It was a sad error to listen to such foolish advice as that of salting your flower-beds. Three things may now be suggested:—1. To deluge the soil with water, in order to wash out the salt; but you will probably spoil the soil in the attempt, and may not succeed; 2. To remove all the soil; 3. To water the soil with nitric acid, which will decompose the salt and form nitrate of soda. We fear, however, the latter will be too costly a remedy. The best way will be to try a bushel of the soil first, and see what happens. The acid may be diluted largely with water, and the mass left for a fortnight, when it should be examined, to see if the soil is better. This may be ascertained by potting in it some spare Carnations, of no value.

MANURES.—*Guano*.—Use it at the rate of $\frac{1}{2}$ lb. to a gallon of water; it varies in strength. If you do not get effect enough repeat the dose.—*C. J. P.*—Apply gas-water to your heaps of weeds and peat, and you will find it speedily fit them for manure.

—*Graft*.—If you will take the trouble to refer back to our Notices to Correspondents for the last half-year, you will meet with all you desire on the subject.

PONDS.—*An Original Subscriber* can try powdered charcoal in clearing the water in his pond. It may possibly prove effectual; we cannot advise him as to any other plan.

GARDEN-FRAME.—Will the correspondent at Dewsbury, who, at page 211, described a garden-frame, favour us with some further information as to the manner of its construction?

BOTTOM-HEAT.—*J. M. H.*—You will get the information you want in a short time, in a leading article, probably next week. In the meanwhile we see no objection to your boiler; but why will not an old copper kettle, with holes cut for the flow and return pipes, do as well?

SPADES.—*Diggory*.—Foster's spades are not the same as Lyndon's patent spades. The former are manufactured at Stourbridge; the latter at Birmingham. Of this any dealer in such articles ought to have been able to inform you. If those in your neighbourhood do not choose either to supply them themselves, nor to give themselves the trouble of obtaining information respecting them from their London correspondents, you can certainly procure the article in question through the London nurserymen.

FRUIT-TREES.—*J. B. H.*—We hear of no complaints in this quarter, except such as are always made by grumblers against Providence.

PINE-APPLES.—Will Mr. Hamilton, who last year made some statements about his success in growing Pines, be so good as

oblige several correspondents with an account of his mode of management?

MELONS.—*Rus.*—You may remove all the female blossoms of your Melons, except about six or eight of the finest on each plant, which should be left to set for fruit. As a general rule, there should not be more than one fruit on each principal branch; though two may be allowed if it is very strong. The male blossoms may likewise be taken off after the fruit is thoroughly set.

PEACH-TREES.—*H. C. O.* sends last year's shoots from some large Peach-trees. Those received exhibit gum, and independent of this, a general mortification has taken place as regards all the last year's shoots. He attributes the evil to "the excessive heat of last summer, as the whole of the trees having a southern aspect are in the same state, whilst those having an eastern aspect, in the same garden, are in a healthy condition." When Peach-trees are too much dried up during a continuance of hot dry weather—which of course they are most liable to be against a south wall—they are apt to become diseased, in the manner above described, after the first heavy fall of rain. It would appear that more sap is then absorbed by the roots than the vessels of the tree can well receive. There is no remedy; but the preventive is obviously that of mulching and watering, in order to keep the trees in a free-growing state during the dry weather, so that when rain does come a full supply of moisture will be nothing more than what the trees have been accustomed to.

DRIED STRAWBERRIES.—*C. M.* begs Mr. Allen will kindly inform him how he continues to preserve his Strawberries, while drying in the sun, from dust. *C. M.* lives in London.

CUCUMBERS.—*Constant.*—The reason why your Cucumbers canker is for want of bottom-heat. The heat of your dung is exhausted, and the roots have a low temperature to grow in, while the tops are well supplied with the heat by the sun; watering will accelerate the evil. The best means for preventing canker, is by a slight lining of fresh dung to the bed before it gets exhausted, and not to suffer the water to go near the stems of your plants.

ASPARAGUS.—*J. M.*—The application of salt to your beds when the seeds were first sown would not have much effect; for in all probability it has long since been washed down into the soil, beyond the reach of the roots. You had better apply it now, dissolved in water. However, salt by itself is not enough; the plant wants a great deal of strong manure. No Asparagus near London has hitherto been, this year, as good as usual, owing to the long continuance of cold and wet weather. Are you well drained?

ORCHIDACEÆ.—*W. F. G. F.*, and *J. R. I.*—Our copy of Mr. Lyons's work was a presentation one; and Mr. L. has only distributed it among his private friends.

CAMELLIAS.—*F. A. P.*—The case to which you refer is probably that of some Camellia flowers produced near London, and exhibited a few weeks ago to the Horticultural Society. Those plants were trained to a north wall, in a well-drained border; in this all the secret of their success consists, as we believe. We should turn them out in such a place now, in a bed of peat, such as would be employed for Rhododendrons. The double white is one of the hardiest.

CACTI.—*T. White.*—The best way to bloom *C. speciosus* and *speciosissimus* is to grow them in an enriched soil, and keep them in a warm, light house while they are making their shoots, exposing them entirely during August and September. By the latter practice they will become brownish and unhealthy-looking for a time; though they will soon recover this.

CACTUS SEEDS.—*An Original Subscriber.*—The seeds of Cacti may be gathered and sown as soon as they are ripe. Being produced in a large pulpy berry, this never bursts of itself; but its appearance will tell you when it is mature. All the treatment they require, is to remove the pulpy matter from them; and this may be best done by washing.

ROSES.—*An Inquirer, Torquay.*—The appearance of green leaves in the centre of Roses is not uncommon. Some suppose it arises from the soil being too rich; if this be the cause the remedy is obvious. It is also caused by the early part of the season being dry, which, if followed by wet, induces fresh growth; for this we know of no remedy.

RHODODENDRONS.—*Rhodon.*—The variety called Mars is a good scarlet, and we believe it is hardy. To ensure a liberal display of flowers, treat your plants as recommended in Vol. i. p. 363; and also apply cow-dung to the roots. For information on American shrubs, you may consult Loudon's Arboretum Britannicum, and M'Nab on Evergreens.

CREEPERS.—*A Correspondent.*—Nothing grows faster than the American Creeper, Ivy, Clematis flammula and vitalba. It is possible that your place would suit some gardener; but it is necessary to advertise it.

PELARGONIUMS.—*Catherine.*—It is not advisable to syringe when the plants are in bloom, as it injures the flowers. *Catherine* and *An Inquirer at Torquay.*—We cannot suggest a remedy for the spotting of the leaves of Pelargoniums—the cause of which is at present unknown; the most experienced are subjected to have their plants injured by it, and whether it arises from any crudeness in the soil, or from the dampness of the house, or the larva of some minute insect, has never been ascertained. *F. A. P.*—If you want a rich compost for Pelargoniums, you may obtain it speedily by mixing two-thirds of fresh loam with one of well-decayed manure from an old hotbed. Add a little leaf-mould, and a small quantity of broken sand-stone, reduced as fine as possible, and you will not need silver sand. In the absence of stone, finely-broken potsherds, bricks or charcoal, will be useful. *The Rev. G. Bethune.*—It is not uncommon to see a single flower of a Pelargonium coming of a different colour, most probably indicating one of the parents of the flower, but that a whole branch should be so affected is very singular—these sports cannot be accounted for—the same thing takes place in the red Laburnum, in the Chrysanthemum, and is similar to a Nectarine occasionally coming on a Peach tree. *Dabbler.*—Your Seedling is a decided variety, pretty, but rather too faint in colour.

PANSIES.—*Pansie.*—Your method of proceeding appears correct, and the failure you experience in striking your Pansies proceeds most probably from the selection of the shoots for propagation. Prepare your ground by removing the soil to the depth of about four or five inches, and replace this with compost, which should be light and rich, consisting of equal parts of loam and leaf-mould, or well rotted cow manure, with a portion of sand; if the loam is stiff, this should be mixed well together and sifted: having prepared the bed, water it through a fine rose. Select your cuttings from the short jointed unbloomed shoots, taken from the centre or sides of the plants. The older shoots are hollow, and hard, and not fit for the purpose; take off the lower leaves, and cut close under a joint; for if a portion under the joint is left, it will decay and endanger the safety of the plant—insert the cuttings in the soil, and press the earth firmly round them, and when completed again water with a fine rose; shade from the sun, and pay attention to watering. When they begin to grow pinch off the tops of the shoots, to encourage their making strong and bushy plants. Some growers strike their cuttings under glasses, others do not, excepting in the early or late part of the season, when they require protection. Many strike their cuttings in pots, placing them round the edge, and covering with a hand-glass.

THE YEAST PLANT.—*Mr. Abbott* states in answer to *A Lady*, that he is not aware of the Blessed Thistle being used as a Yeast Plant, although employed medicinally; and he has sent a seed, which is certainly of *Cnicus Benedictus*. It does not, however, follow that because he has the Blessed Thistle, a lady's is the same; although the form of her leaf, and the general appearance of her seed, as far as the cuts explain them, are in favour of the supposition. We cannot spare more room

for this inquiry until it is ascertained that the plant in question will act like yeast, which is the only point of interest in the matter.

DOUBLE YELLOW ROSE.—*J. B.*—We are not aware whether this plant may be increased by grafting; but it will probably succeed by the ordinary mode, if grafted on stocks of the Austrian Briar.

RIBES SPECIOSUM.—*J. B.*—If your cuttings or slips of this plant will not root, you will perhaps gain your object by layering it.

DAHLIAS.—*A Subscriber* may prune his Dahlias, if he desires to have only a few very fine and perfect flowers on them. It should be done as soon as the shoots show themselves, and the lower ones alone should be removed. It is not well to take away the leader.

HYBRID PLANTS.—*Rosebud.*—In general it is necessary that when one plant is fertilised by another, they should both be of the same family, and even of the same genus. But we have some curious facts upon this matter, which will, before long, form the subject of a leading article.

SEEDLING CACTI.—*J. R.*—Your seedling is intermediate in the form and colour of its flowers, between *Jenkinsonii* and *speciosissimus*; it is quite as good as the latter, and has as much of blue in it; but unless it differs markedly in habit, it will not be distinct enough to bear a separate name.

SEEDLING HEATHS.—*A. T.*—Your seedling between *E. aristata* minor and *E. vestita* coccinea partakes of the character of both, as well in the habit and foliage as in the colour and form of the flowers; yet it is essentially different from either, and may be regarded as a very handsome and valuable production. The one raised from unimpregnated seeds of *E. perspicua* is not so peculiar; it has, however, very rich pink flowers, and is a beautiful thing. Could you furnish us with your address?

INSECTS.—*G. Imms.*—Your small white thread-like worms are the *Gordius aquaticus*; they abound in some places on the surface of the soil, in wet weather; their history appears to be but little understood. *S.*—*W. H. Rogers.*—The larva of a small moth belonging to the genus *Tinea* is creating the ravages you speak of to your carpets; three or four species of *Tinea* are known to create great destruction to woollen cloths, furs, silks, &c. The larva lives in a tube which it forms of the article it feeds upon; and when full grown turns into a chrysalis, and then becomes a small moth, the eggs of which produce the pest so much dreaded by yourself and other careful housekeepers. To destroy the moth is therefore of much importance, but this is a difficult matter, and instead attention should be chiefly devoted to the larva: to get rid of these, or at least to hinder them from doing important injury, all articles they feed upon should be frequently exposed to the light and fresh air, well brushing and beating them at the same time: in case of carpets being attacked, they should be frequently removed from the floors, well beaten, and the floors well washed with strong soap-suds, directing the scrubbing-brush into all cracks where the larvae are likely to hide. Attention to these particulars will do much to rid you of the nuisance you complain of; and if you will forward some of the small moths, which will soon make their appearance in your house, to us, the exact species of *Tinea* can be easily determined. *S.*—*A. E.*—The caterpillar destroying your Rose-bushes is probably that of a small moth called *Lozotenia Rosaria*; but as the specimen you forwarded to us was crushed before it reached our hands, we cannot speak positively: the eggs, which are laid in the summer or autumn, hatch with the opening leaves, and the little caterpillar begins at once to form a residence, by drawing two or more leaflets together, on which it feeds. This operation soon points out where the caterpillar is, and the best method which we know of getting rid of it is hand-picking, which should be practised as soon as the operations of the caterpillar become visible.

Your ground grub is that of a species of *Tipula*, probably that of *Tipula oleracea*, and is capable of doing much mischief. You should get rid of it if possible, but it is difficult to point out an effectual remedy for a garden; it will turn into what is commonly called a Daddy-long-legs, and when in this state it can be destroyed in a variety of ways, which will naturally suggest themselves, and no opportunity should be lost to clear your grounds of such a nuisance. *S.*—*S. D.*—White Hellebore powder, if fresh, is the best remedy for the Gooseberry caterpillar. *Grub.*—The grub infesting your garden to such a degree that you can hardly keep an herbaceous plant alive, is that above alluded to as probably the grub of *Tipula oleracea*, and in our answer to "A. E." you will find such information as will meet your inquiries. *S.*—*W. Elliott.*—Your insect is the Emperor moth—*Saturnia Pavonia* minor of entomologists. Its caterpillar feeds on Willow, Apple, and occasionally other trees, but is not known to do any serious injury to them. The middle of May and the beginning of August are the times when the moth appears. The caterpillar is found in the autumn. *S.*—*Z. K.*—If your ants are very troublesome, you had better pour boiling water on the hillocks; this will effectually destroy them.

BOOKS.—*S. F. J.*—The Linnean system of Botany is not worth learning, and we cannot do you the disservice of recommending you a book on the subject. *T. H.*—Martin Doyle's Cyclopædia can be procured by any bookseller who chooses to give himself the trouble to obtain it. If your bookseller won't get it, we advise you to change him. *R. E.*—The best work on British plants, with uncoloured plates, is Sowerby's small edition of English Botany.

MISCELLANEOUS.—*R. L. D.*—Your plant is *Hakea pugioniformis*; you will gain all the information you require from any catalogue. *M. W.*—The specimen sent is a variety of *Saxifraga hypnoides*.—*Clericus.*—We have no notes concerning the Apples and Pears that were exhibited at Chiswick. *M. C.*—We really cannot name your Rhododendrons. Nos. 9 and 15 are tolerably good flowers; but they are all too much like *R. ponticum*. *Luxor.*—The error arose through the printers having left out the word "bunches." You ought to read "per doz. bunches," as Cabbage-plants are made up in bunches containing from 8 to 10 plants each; the seedlings spoken of are sold for planting only. *S. Pitchford* and several others. See the Notices to Correspondents of last week, p. 844, the second paragraph. *M. E. S.*—*A. Fumariaceae* plant, and possibly *Adlumia cirrhosa*; but who can judge rightly of such a miserable specimen?—*Mr. Billington*, next week if possible. We wish to connect his remarks with some of our own. *J. M.*—Apparently an *Argyrea*, and perhaps *A. argentea*; if it is, as we suppose, a climber. *A. A.*—All plants may be raised from seeds, if seeds can be obtained. Mignonette, Buckwheat, and White Clover are favourite plants with bees. Liquid manure, if not applied in too large a quantity, suits most plants; but over-doses are often injurious, and independently of other mischief, may make plants run to leaf, instead of producing flowers. *Aith.*—Fruit-tree seeds cannot be bought. They are only saved by private individuals who intend to send them to friends abroad. Send out all "tender annuals" and Californian flower-seeds; the nurserymen understand these terms. *A Young Botanist's* specimens are, 1, *Spirea hypericifolia*; 2, *Cornus mascula*; 3, *Staphylea trifoliata*. You will easily ascertain their natural order from the catalogues. *W. Kirk.*—Your plant is the *Ipomœa bona-nox*, now called *Calonction speciosum*. *A. K.*—The specimens you have forwarded are *Pedia olitoria*, *Sherardia arvensis*, and *Veronica chamædrys*. *J. E.*—No. 1 is *Illicium floridanum*; 2, *Eutaxia myrtilifolia*; 3, *Aphelexis humilis*; 4, *Chorozema varium nanum*; 5, *Sálvia Grahami*; 6, *Bauera rubioides*. *A Subscriber* will find the names of the best Azaleas shown at Chiswick in our report of last week. In regard to the Roses, we refer him to a note in a subsequent page, under the head of "Chiswick Show." *Mabaviscus.*—3, *Lithospermum purpureo-cæruleum*; 5, *Ramonda pyrenaica*; others not recognisable. *M. W.*—*Silene quinquedentata*, and *Gaultheria shallon*. *C. E. G.*—1 *Orchis maculata*; 2, *O. latifolia*.—*Chermes.*—Most red

earths contain oxide of iron. If you want to make it, throw some old nails into water till a red mud is produced, and add it to soil. *L. J. F.*—There is no reason why your greenhouse should not face the east, it is a good enough exposure for greenhouses. *W. Maundrell.*—We are unacquainted with the correspondent at Dewsbury; but have asked the question. *Flora.*—Asparagus cannot be of better quality than yours.

An old Subscriber.—The seeds are the Stone Pine. *A. E.*—*Isia longiflora*. Bees cannot change the colour of flowers. Liquid manure prepared from cow-dung is excellent for Azaleas, and probably for Magnolias also. Young Melons fall off either because they are not fertilised or because the plant is not strong enough to bear them. Your Pear is apparently attacked by some mining insect; we are unable to suggest a remedy. *A Constant Reader.*—We have no means of obtaining the address of the Mr. Hamilton who won the prize at the Chesham-hill Cucumber show, and your letter, therefore, lies at our office. *R. R.*—Your Berberises are, 1, *B. ibérica*; 2, *Caroliniana*; 3, *cratægina*; 4, *sibirica*, var.; 5, *vulgaris*, var.; 6, *sibirica*; 7, *vulgaris*, var.; 8, *vulgaris*, var.; 9, *asiatica*; 10, *do.*; 11, *emarginata*; 12, *iberica*, var.; 13, *vulgaris*; 14, *siniensis*; 15, *aristata*. *A Subscriber.*—The Mr. Davis who obtained the prize for a miscellaneous collection of fruit at the Chiswick show, was Mr. E. Davis. *S. Smee.*—Your seedling Pæony is not distinct from *P. Moutan Banksiæ*, which varies very much in the filling-up of its flowers, and also in the shape and colour of the petals. *W. B.*—Your plant is some species of *Hymenocallis*. If you remove one flower-stem from your *Amaryllis blanda*, it will unquestionably improve it for the following season. *N. D. H. N.*—Your Apple is the Easter Pippin. *J. M.*—*Oncidium carthaginense*, var.; *Epidendrum aromaticum*; *Gesneria verticillata*.

One shilling each will be given for Nos. 7, 23, and 24, for 1842.

SEEDLING FLORISTS' FLOWERS.

PELARGONIUMS.—*W. J. E.*—Your seedling is a very ill-formed flower; the lower petals are too long and too narrow, and the upper ones are uneven on the edge. *Repeater.*—The lower petals are short and well-formed, but the flower altogether wants substance, and there is too much feathering seen below the spot.

PANSIES.—*H. H., Hampstead.*—Your seedling Pansy is a very good flower; flat, the petals in good proportion, with a well-marked eye; centre white, upper petals light purple, with a broad belt of the same colour round the lower petals; it is distinct in colour, a little deficient in substance. *W. C.*—*Bruce* is a large and fine flower, of good substance, weak in the eye, and no improvement upon many dark flowers already out. *G. M. W. Dublin.*—Your seedling Pansy wants roundness, and the eye more decided marking; the difference in the yellow of the ground-colour of the lip and side petals is a great drawback, and would be fatal in a better flower. *An Amateur.*—*A*—*r* is a round, flat, and well-formed variety, having the ground-colour of the lip yellow, and the side-petals white, which renders it of no use as a show-flower. *Jeannie Deans*, pure white ground, eye very dark and fine, upper petals of a deep rich and bright purple, with a broad margin of the same colour round the lower petals, a brilliant and beautiful flower. *Don Juan*, a clean and well-formed flower, yellow ground with rich mulberry upper petals, a broad border of the same colour surrounds the lower petals; the flower is flat, of good substance, but wants decided marking in the eye. *S. M.*—Pansies sent in a letter without any protection cannot arrive in a proper state to judge of their qualities; your seedling was quite dry and flat—it appears to be very thin, and of no use as a show-flower. *Ferox.*—No use as a show-flower, the ground-colour wants purity: it is small, with a notch in the lower petal. *J. H.*—Your Pansy is well formed, and the edges of the petals are remarkably smooth, but the flower wants size and substance.

CALCEOLARIAS.—*W. May.*—*Lady Charlotte* is a fine flower, well-formed, and singular in its marking, having a yellow ground covered with large brown spots. *Incomparable* is not so good in form, and we have seen many in the same way.

CINERARIA.—*Juvenis Cork*, quilled variety, pretty in colour, with the common fault of having the petals narrow and far apart.

FUCHSIAS.—*W. J. E.*—Your specimen does not appear to differ sufficiently from others we have seen. Besides which, the recent exhibitions have satisfied us that the quality of a Fuchsia cannot be well determined without seeing it on the bush. As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE long-expected secession from the Church of Scotland took place on Thursday, the 18th inst. The event, though remarkable in many of its details, presented few of the usual characters of a popular movement, and the expression of feeling on the occasion appears for the most part to have been confined to the galleries of the House of Assembly. The secession took place immediately after the General Assembly had been constituted, and before even the roll of members had been called over. The Moderator read the protest of the Non-Intrusion party, and walked out of the House, followed by 120 Ministers and 73 Elders; among whom were Dr. Chalmers, Dr. Candlish, and other well-known names. The seceding party then constituted a new assembly, by the name of the "Assembly of the Free Presbyterian Church of Scotland," of which Dr. Chalmers was elected Moderator. These events have of course excited general attention, and it will be seen by our Parliamentary Report that the Government are prepared to act by their recorded declarations, and will be guided by the proceedings of the General Assembly, as the recognised authority of the Scottish church, in any remedial measures they may propose for the relief of its present difficulties. The adjourned debate on the Canada Corn-bill in the House of Commons was concluded on Monday, when the motion for going into Committee was carried by a majority of 188. Mr. Christie's motion for leave to bring in a bill to abolish the oaths and subscriptions now required in the Universities of Oxford and Cambridge, and for admitting Dissenters to those Universities, was negatived on Thursday by a majority of 70. In the Lords on Tuesday, Lord Powis brought forward his bill to repeal so much of the Ecclesiastical Benefices Act as provides for the union of the sees of St. Asaph and Bangor. After an animated debate, in which several prelates took part, the bill was withdrawn for the present session.

From France we learn that the law adopting the amend-

ment for equalising the duty on colonial and beet-root sugar in five years, has passed the Chambers by a large majority.—From Spain we have the important intelligence of the resignation of the new Ministry. They asked not only for the dismissal of all the military friends of the Regent, but the immediate removal of the garrison of Madrid, to be replaced by such troops as Señor Lopez should select. The Regent refused to sign the dismissal of the Generals, and an immediate dissolution of the Cabinet was the result. Señor Becerra, President of the Senate, has been commissioned to form a new Ministry, and it is openly asserted that the demands of Señor Lopez were the precursors of a new Christino movement, which must have led to the overthrow of the Regent.—From the Levant we learn that the Servian Government has at length made its unconditional submission to the Porte. This unexpected change has been produced by the certainty that they would receive no support from France, England, or Austria; the Prince has therefore consented to resign, and a new election will take place without delay.

Home News.

COURT.—Her Majesty and Prince Albert, accompanied by the Princess Royal, left town on Saturday afternoon, for Claremont; where they still remain. The Prince of Wales and the Infant Princess, accompanied by the Dowager Lady Lyttelton, followed in another carriage. Wednesday being the Queen's birthday, was observed in London and at Claremont with the usual honours. Prince Albert came to town yesterday, to attend a meeting of the Fine Arts Commission, and returned to Claremont in the evening. The Royal suite at Claremont consists of the Countess of Dunmore, Lady in Waiting; Sir F. Storrie, Groom in Waiting; the Hon. Misses Stanley and Hamilton, Maids of Honour; the Dowager Lady Lyttelton; Cols. Grey and Wyld, Equerries in Waiting; and the Hon. C. A. Murray, Master of the Household.—It is understood that the King of Hanover has resolved not to undertake this year his journey to England.—Notice has been issued from the Lord Chamberlain's Office, that His Royal Highness Prince Albert will, by the desire of Her Majesty, hold a Levee at St. James's Palace, on behalf of Her Majesty, on Wednesday, the 21st of June next, at two o'clock; and that Her Majesty will hold Drawing Rooms at St. James's Palace on Thursday, the 29th June, and on Thursday, the 6th July, to celebrate Her Majesty's birthday.

Official Appointments.—The Earl of Dalhousie has been appointed Vice-President of the Board of Trade. The Queen has been pleased to direct letters patent to be passed under the Great Seal, granting unto his Royal Highness Prince Albert the offices of Governor and Constable of Windsor Castle, in the room of the late Duke of Sussex. The Queen has been pleased to appoint Lieutenant-General the Hon. Patrick Stuart to be Governor of Malta and its dependencies; Francis Burgess, Esq., to be Chief Police Magistrate in the Island of Van Diemen's Land; the Rev. George Giles to be chaplain of the Female Penitentiary in the Island of Van Diemen's Land; and W. Walter Raleigh Kerr, Esq., to be Assistant Auditor-General to the Government of the Island of Mauritius.

Establishment of the Prince of Wales.—The Queen has been pleased to direct letters patent to be passed under the Privy Seal of his Royal Highness the Prince of Wales, conferring the following appointments:—Thomas Pemberton Leigh, Esq., to be Chancellor and Keeper of the Great Seal to his Royal Highness; the Hon. John Chetwynd Talbot to be Attorney-General to his Royal Highness; George Edward Anson, Esq., to be Treasurer of the Household and Cofferer to his Royal Highness; James Robert Gardiner, Esq., to be Secretary and Clerk of the Council to his Royal Highness, Keeper of the Records of the Duchy of Cornwall, Secretary, Receiver-General, and Keeper of the Signet, for the Stewartry and Principality of Scotland; and Edward White, Esq., to be Auditor of the Duchy of Cornwall.

Parliamentary Movements.—Mr. Bagshaw, the late member for Sudbury, is once more a candidate for the representation of that borough, and has issued a preliminary address to the electors.

Order of St. Andrew.—The Marquis of Bute and Earl Mansfield have received the Green Ribands vacant by the deaths of the Duke of Sussex and the Earl of Abergavenny.

Foreign.

FRANCE.—The principal news in the Paris papers is that the law adopting M. Passy's amendment, equalising the sugar duties in five years, passed by 286 votes against 97. This amendment which altered completely the Ministerial bill by recognising the existence of a domestic sugar manufacture, and by subjecting colonial and home-grown sugar to the same duty, is considered by the papers as a victory over Ministers; but the fact that the question involved no political principle is successfully opposed by the partisans of the Cabinet to this assumption. We before alluded to the order of the Minister of Public Worship depriving the Protestants of the use of certain churches of Alsace, in which Catholic worship is also performed. These orders gave rise to some scandalous scenes, in one of which the curate of Bitschuelin committed some violent acts. Since then however the Minister has recalled the obnoxious part of his order, whilst the Archbishop of Strasburg, in a circular to his clergy, has enjoined them to pursue the ways of conciliation and peace. Much notice is taken by all the papers of the Repeal agitation in Ireland, and most of them view with satisfaction the prospect of the peace of the United Kingdom being disturbed. The *Gazette de France*, the organ of that por-

tion of the Legitimists and of the clergy who have placed their hopes on a popular or republican movement, is loud in its praises of the Irish Bishop of Ardagh, and is equally indignant with the pastoral letter of the Bishop of Strasburg. The *Globe* announces, on the authority of accounts from Goree, the arrest by a French cruiser belonging to the station on the western coast of Africa of an English vessel carrying slaves to the West Indies. This capture was made by the Vigie brig of war. The letters state that the vessel was English but was running for the Havannah with her slaves. For several days the Artesian well of Grenelle has thrown up small black fishes which have no apparent eyes. This phenomenon was observed last year at the same period. The Academy of Sciences had ordered a report to be made on this extraordinary fact.

SPAIN.—A telegraphic despatch from Madrid reached Paris on Monday, communicating the important intelligence that the Regent having refused to sign the dismissal of Generals Linage and Zurbano, the Lopez Ministry tendered their resignation, which was accepted. Señor Gomez Becerra, President of the Senate, immediately charged himself with the formation of a new Cabinet, in which the Ministry of Finance would be confided to M. Mendizabal. The Congress voted on the 19th an address to the Regent to recommend to him the Amnesty as well as thanks to the retiring Ministry. The Congress declared on the same day unanimously, with the exception of three voices, that the Ministers who had resigned had up to the last moment merited its confidence. Previous to this event, the Cabinet had taken various measures showing its hostility to the policy of the previous Ministry. At Barcelona, party feeling had run so high that the municipality on the 15th inst. published an address to the inhabitants, in which, after congratulating them on the part they had in the overthrow of the Rodil Administration and on the accession of their independent representative, Don Joaquin Maria Lopez, to the Presidency of the Council, they invited them to attend at a grand *Te Deum* which was to be chanted the next day in the Cathedral in commemoration of the event. This service was accordingly performed on the 16th. The garrison were under arms during the whole day, but no outbreak ensued.—The barque *Majestic*, arrived at Liverpool from Africa, reports that on the 21st March the Spanish brig-of-war *Nerrion* formally took possession of Fernando Po in the name of the Queen of Spain, whose colours were hoisted and a salute fired. The British took no part in the proceedings, but some of the natives showed a disposition to look upon the affair in a hostile light, although no disturbance took place.

PORTUGAL.—We have Lisbon news to the 15th inst. The Deputies had passed the bill for establishing a system of general education throughout the kingdom. It was very doubtful whether the Road-bill would pass into a law this session; and a strong opposition was expected to the reduction of the tariff as respects the island of Madeira. Prayers had been ordered to be offered up for the safe delivery of Queen Donna Maria, who has passed the sixth month of pregnancy. If the tariff negotiations were resumed by England, there was considerable probability of their being brought to a satisfactory close by a reasonable compromise of the disputed woollen duties. There was little likelihood of the Portuguese Government resuming these negotiations of their own motion. Great agitation prevailed at Oporto and throughout the wine districts, with reference to this subject.

GERMANY.—The Diet of the Prussian Rhenish provinces was opened at Düsseldorf on the 14th inst. Letters from Hamburg state that Hanover has determined not to join the Zollverein. The Saxon manufacturers are described as being in a state far from prosperous and as petitioning the Government for more protection, while Prussia, perceiving that the union is for the sole advantage of Saxony, is beginning to grow weary of it. The Leipzig fair has been more favourable than for some years, and food is said to be as dear in Saxony as in England. The Frankfort papers state that the house of Rothschild has given 100,000*l.* for the foundation of a hospital at Jerusalem, and is building, at its own expense, a synagogue at Frankfort. They also announce a discovery made by an Englishman, named Yardley, residing at Mannheim. It consists of a type-electro-magnetic telegraph; a machine by which news may be transmitted with the greatest rapidity from one place to another, and which at the same time fixes the impression on paper in the same manner as by a printing press and types.

ITALY.—The German papers publish a letter from Rome of the 6th inst., mentioning that an insurrectionary movement had taken place at Benevento, and that the delegate and authorities had been obliged to seek refuge in the citadel. Nothing is known of the motives of the movement, or the measures adopted by the Papal Government to repress it.

GREECE.—Letters from Athens state that King Otho has determined to apply the sliding-scale system, not only as regards a duty on corn grown out of Greece, but also to the reduction of public salaries. The King has accordingly imposed a duty which, at present prices, would amount to nearly 50 per cent. on foreign wheat, on which the inhabitants of the Archipelago almost entirely depend for support. A commission is now engaged in drawing up a new tariff of duties. It is to be on the prohibitory system, especially as respects English articles. A letter written by a Jew of Tricala, the chief town of the Sandjac in Thessaly, gives an account of an inundation by which between 4,000 and 5,000 persons perished. According to this statement many of the largest trees were broken down by the weight of the people who climbed up to their tops to escape from the flood. This account however requires confirmation.

RUSSIA.—The news of the Sultan having acceded to the Emperor's demands reached St. Petersburg on the 5th, and gave much satisfaction. M. de Boutenief has been intrusted by the Emperor with an extraordinary mission to Rome, for the purpose of settling the long-pending and intricate question respecting the appointment of Roman Catholic Bishops in the Russian empire. A new mail route to go twice weekly between St. Petersburg and Kjachta, the principal town on the Chinese frontiers, is to be put into operation immediately.

TURKEY.—Intelligence has been received from Belgrade that the Servian Government has at length submitted to the Porte. The Prince consents to resign, and another election will in all probability take place at Belgrade. The Ministers Petronowics and Woutschisek will repair immediately to Constantinople. This unexpected submission has been caused by the certainty which the Servian Government had obtained that they had no countenance or support to look for from France or England. Meerza Taka the Persian plenipotentiary arrived at Erzeroum on the 18th April, escorted by upwards of 100 armed Persians with a few field-pieces. Two Turkish regiments marched out of the town to meet the envoy. On the 2d of this month the Bishop of Gibraltar administered the rite of confirmation in the Turkish capital to 21 young persons of both sexes; and on the previous Sunday the Bishop preached in the chapel of the British Embassy. A Smyrna letter mentions the breaking out of a fire in the centre of the Bazaar at Magnesia on the 20th ult., which could not be extinguished until 2,000 shops had been destroyed. Fortunately the greatest part of the merchandise they contained was saved, but the loss is estimated at an enormous sum.

WEST INDIES.—The *Dee* steamer has brought a full supply of the West India journals, but although containing details of news from the several localities there is scarcely an item worth extract for English readers. The leading point in these papers is the statement of the inefficiency of the Royal mail packet line, and the request is strongly made for placing the old packets on the station. Respecting the condition of the crops little is reported. In Barbadoes, Demerara, Trinidad, and Jamaica, the manufacture of sugar had commenced, and was progressing according to these accounts favourably. Agricultural operations had not of late been successful from the general want of rain, but as within the three days prior to the departure of the mails the weather had altered to the wishes of the planters, they still expected to retrieve themselves. Fires had occurred at Demerara and Jamaica; the one in the former colony had been most destructive, but the amount of damage is not stated. Several of the islands were still unhealthy, and continued shocks of earthquake had been felt at Antigua, Guadeloupe, &c. At the latter place it was calculated that about one-third of the crop would be destroyed. A letter from M. Celoron, an inhabitant of Guadeloupe, dated March 7, giving an account of a phenomenon which appears to have been connected with the catastrophe of Feb. 8, has been published. It relates that between the eastern point of Marie Galante and Guadeloupe, and in the mid-channel, a column of water, black in colour and of large diameter, arose from the sea with great force. All around it to a considerable distance a quantity of vapour covered the sea. This appearance lasted about half an hour. M. Celoron adds that being well acquainted with waterspouts, he was certain that this was not one, as the column was too vertical and did not touch the clouds. No doubt was entertained by him of its being the effect of a submarine volcano.

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of several petitions, the Bishop of Exeter rose to present one on the subject of reform in the Ecclesiastical Courts; and proceeded to discuss the provisions of the bill now in progress through the Lower House. He was interrupted by the Earl of RADNOR, who rose to order, and remarked that it was contrary to rule to debate a bill not before their Lordships.—The Bishop of Exeter pleaded that the bill he was commenting on was not the bill now passing through the House of Commons, but a bill that he had bought for 5*l.*—The LORD CHANCELLOR said the Right Rev. Prelate was as irregular as possible. It was idle to discuss the paper if it did not correspond with the bill in the other House; and if it did correspond it was irregular to discuss it.—On the understanding that the Ecclesiastical Courts' Bill would not be pressed through their Lordships' House, should it come up too late in the session for discussion, and that it would not be debated during the necessary absence of the Prelates on their diocesan duties, the Bishop of Exeter withdrew his petition.—The Townshend Peerage Bill was read a third time and passed, after a protest by the Earl of DEVON against the expediency of the whole proceedings.

The Marquess of CLANRICARDE called the attention of the House to the recent transactions in Scinde, and asked certain questions as to the annexation of the territory, and the nature of the demands which had been made upon the Ameers.—The Duke of WELLINGTON said that the only authority for the annexation of the territory was mere rumour. Negotiations had been opened for a new treaty with the Ameers, which had been concluded on the 15th Feb., and on the following morning the political agent and his escort in Hyderabad had been treacherously attacked, and after an action of several hours had retired to their boats on the Indus. Sir C. Napier moved to their assistance, and on the 17th Feb. an action had been fought which brought about the capture of the Ameers, their cannon, and the city of Hyderabad. When the accounts in full should arrive of the whole of the transactions he would readily communicate the amplest information to the House. No instructions had been sent out relative to the occupation of Scinde.

In answer to Lord Campbell, the Earl of ABERDEEN said that with respect to the Scotch Church, nothing had happened to change the intentions already announced by Government.
Tuesday.—Lord CAMOYS introduced the subject of the Irish agitation for the purpose of exculpating Dr. Higgins from the charge of having used the inflammatory language attributed to him.—Lord BEAUMONT was surprised to see even one solitary Noble Peer come forward to defend Dr. Higgins. The Duke of WELLINGTON rose to put a stop to further observations on this matter, which had been irregularly introduced.—The Earl of POWIS moved the second reading of a bill to repeal so much of the Ecclesiastical Benefices Act as provides for the union of the

Sees of Bangor and St. Asaph. He had undertaken this task from a sense of duty to the Church, and was encouraged to proceed in it by the approbation of the two right reverend prelates now residing over the dioceses which are to be hereafter united. The creation of the bishopric of Manchester and the proposition for the union of these sees were simultaneous acts, and he therefore inferred that the one was subsidiary to the other. He entertained an objection to adding another bishop to the House of Lords; instead of giving the Bishop of Manchester a seat in the House, it would be better that he should succeed to the first vacancy in the sees of London, Durham, or Winchester. Instead, also, of applying the revenues of Bangor or St. Asaph to the endowment of the bishopric of Manchester, it would be better to adopt the suggestion of Sir R. Peel, and anticipate Queen Anne's bounty, at least until a vacancy should occur in the Archbishopric of York, when there would be ample funds for the purpose. The great revenues derived from Wales by several of the Oxford colleges, and by one or two bishoprics, as well as the revenues of the secular rectories now carried to the general purposes of the Ecclesiastical Commission, might have been more properly appropriated to the maintenance of the Welsh bishopric. He objected also to exchanging the deanery of St. Asaph for one unsuitable both in locality and population. The act for uniting the two sees would not, he felt confident, have passed, had Lord John Russell remained at the Home-office. All the difficulties which a bishop had to encounter in Wales were overlooked when double duties were imposed, which would be found incompatible with his pastoral functions. The junction of the sees made communication between the bishop and his diocese more inconvenient than it was at present. Another great objection was, that the whole patronage was exclusively vested in the bishop. The act was altogether a most unconstitutional measure; but he merely proposed to repeal that portion of it which would not come into operation until the death of the present bishops. He hoped, therefore, that their Lordships would listen to the wish of the Church, and preserve to the principality of Wales its bishoprics.

The Duke of Wellington recapitulated the circumstances connected with the origin and passing of the act. It had been founded on the recommendations of that Ecclesiastical Commission which had been appointed in the beginning of 1835, to inquire into the best means of increasing the utility of the Church. The commission, composed of the Lord Chancellor, the dignitaries of the Church, and many eminent statesmen, had recommended the union of the sees of Bristol and Gloucester, and of St. Asaph and Bangor, and the creation of a new bishopric at Manchester. The union of Bristol and Gloucester had taken place, and had been very beneficial in its results: that of St. Asaph and Bangor would no doubt be similarly productive when it took place. It was not so easy a matter to add a new bishop to the number already having seats in the House of Lords; public opinion had to be consulted, and it must not be forgotten that many persons objected altogether to the presence of the bishops in that House. The measure would, doubtless be attended with some inconveniences, but these were more than balanced by its advantages; and it had been accepted by the public as a proof of the real desire of those with whom the measure originated to reform the imperfections and increase the utility of the Church. He moved that the bill before their Lordships be read a second time that day six months.

The Bishop of Bangor supported the bill. He was as anxious as any man could be for the appointment of a Bishop for Manchester, but he did not think it was necessary to destroy an ancient diocese to effect that object.—The Archbishop of Canterbury defended the conduct of the Church Commissioners, of whom he was one. It was his opinion that no national damage would be done by the union of the two sees; and he did not think that, either in extent of territory, in population, or in the number of benefices, the united diocese would be such as to exceed the power of one man, and it was his intention to vote against the second reading of the bill.—The Bishop of Salisbury supported the bill, and pointed out the collegiate church of Manchester as an ample source from which sufficient funds for the endowment of the new bishopric could be derived, without the destruction of any existing bishopric.—The Bishop of London admitted that the source from whence the funds would be derived was obvious; but the difficulty was the creation of a new bishop, who would have a seat in their Lordships' House. To the suggestion that the new Bishop should remain without a seat in the House as long as there were 26 Bishops with seats, and that as soon as one should die the new prelate was to succeed—the Junior Bishop remaining out—the answer was, that Bishops sat there as temporal Barons, and to deprive one of his seat would be to deprive him of his baronial privileges. He opposed the motion.—The Bishop of Exeter, not wishing to postpone the appointment of a Bishop of Manchester until after the deaths of the present Prelates of Bangor and St. Asaph, would vote for the second reading of the bill.—The Bishop of St. David's objected that the overflows of Welsh poverty should be taken to supply the spiritual wants of wealthy Manchester. He also supported the bill before the House.—The Bishop of Lincoln and the Marquis of Salisbury opposed the Bill, which was supported by Earl Fitzwilliam, Lord Lyttleton, and the Bishop of Norwich.—On the suggestion of the Bishop of Exeter, Earl Powis withdrew his bill for the present session.—The Duke of Wellington then informed Lord Powis, that in case he brought forward this bill again, it would be necessary for him to have the Royal assent to its introduction, as the Queen had issued orders in Council for the carrying out of the Act authorizing the union of these sees.

Friday.—The Earl of Aberdeen, in reply to the Marquis of Breadalbane, said that he hoped to be able to introduce a measure next week for the purpose of regulating the settlement of the Church of Scotland question. The General Assembly, after the secession, had proceeded to repeal the Veto Act, and to replace the deposed ministers of the Presbytery of Strathgogie, and thus the law had been now obeyed. The Marquis of Londonderry having asked whether it was true that Mr. O'Connell, Lord Ffrench, and other Irish magistrates had been suspended for taking part in a Repeal agitation? The Duke of Wellington answered that he believed it was true; but he had no official information on the subject.

HOUSE OF COMMONS.

Monday.—Sir J. GRAHAM, in answer to Sir A. L. HAY, said he had received from the Lord High Commissioner the answer of the General Assembly of the Church of Scotland to her Majesty's letter. It was accompanied with an intimation that 93 endowed ministers, along with a considerable number of *quoad sacra* ministers, had seceded from the Assembly. The Government were prepared to act up to their recorded declarations, and would be guided by their observation of the proceedings of the General Assembly as to what remedial measures they would propose to the Legislature, in order to relieve the difficulties of the church. The adjourned debate on the Canada Corn Bill was resumed by Mr. WOODHOUSE, who expressed his regret that he should now be obliged to speak and vote against friends with whom he had acted cordially for the last 25 years. He foresaw that on the renewal of the charter of the Bank of England the subject of the currency must undergo general revision as a consequence of our Corn-law legislation. He deprecated perpetual meddling with the Corn-law question, which could have no other effect than to discourage British agriculture, and thus to leave this country at some peculiar juncture in an awkward position. He should, of course, oppose the Government, heedless of what company his opposition might throw him into.—Mr. ELLICE wished the amendment could have been so framed as to have enabled him to vote against the transit duties on American corn, and at the same time to retain the boon which the Bill proposed to grant to Canada. As it was, he should vote for the resolutions of the Government.—Mr. TROTTER, Mr. S. O'BRIEN, Lord SANDON, Mr. DABY, Mr. HUME, and Mr. CUMMING BRUCE, spoke in favour of the measure; Sir C. NAPIER, Mr. HAWES, Mr. BUCK, and Mr. F. BARRING, opposed them.

Sir R. PEELE said the immediate question before the House was not the merits of the Government measure, which might be fully discussed hereafter, but whether or not the House should adopt the unprecedented course of addressing the Crown to refuse the Royal assent to an act of a colonial legislature. The Canadian Legislature, assembled under novel and peculiar circumstances, had been invited by the responsible advisers of the Crown to pass this act; and he hoped that the House of Commons would not adopt the unusual course of asking for the interposition of a veto. Mr. Baring had said that Ministers had not contemplated this measure when they altered the Corn-law. But at that time the Government had given the subject an attentive consideration—in proof of which he read extracts from Lord Stanley's speeches during last session. The Canadians had no right, in passing their act, to anticipate that a formidable opposition would be raised by the members of the late Government against it. He did not deny the unfettered power of the House of Commons to refuse assent to the proposed resolutions, and thus to defeat the whole plan. But he asked them to consider such a step carefully. The speeches which had been made in the course of the debate had clearly shown that Ministers were not abandoning the principle of a sliding-scale, nor trifling with the agricultural interest; the measure was no diminution of the protection now enjoyed. No doubt, American corn brought through Canada would be subject to a fixed duty; but there was no alternative, for there was no system of averages in Canada by which to levy it in a different manner. It could not be denied that this measure would be a boon to Canada; the faith and honour of the executive Government were pledged to do what they could to carry it. The cost of suppressing the Canadian rebellion, and restoring peace to the province, could not be estimated at less than 3,500,000*l.*; the hazardous experiment of uniting the provinces had been tried; and under the irritating circumstances of our then intercourse with the United States it was of the utmost importance to conciliate the Canadians, without whose good-will and affection the colony would prove the weakest point in our whole empire. These considerations had moved the Government in proposing this measure, which was ardently desired by the Canadians, and was not calculated to affect home agriculture, either directly by large importations, or by smuggling, which, under the circumstances, could not reasonably be supposed to be carried on to any extent whatever. Let them, then, recollect the interests involved; if the House considered itself a better judge of colonial interests than the House of Assembly, why permit them to legislate? The spirit which actuated the amendment was similar to that which had proposed the extinction of the Jamaica Legislature; he could not deny their power to reject the measure, but let them beware of the consequences.

Lord J. RUSSELL rebuked Sir R. Peel for calling Canada the weakest point of the empire, and for asserting that the adoption of the amendment would be a mortification to the Crown. It might be a mortification to the Minister, but it was a perfectly constitutional resolution to adopt. He referred to Lord Stanley's declaration that "any man of sense would prefer a fixed duty to a sliding scale," and asked why was not New Brunswick included? and why Canada was treated as an English county. He considered the meaning of the resolutions to be to extend monopoly and restriction through the whole colonial empire. For three years he had seen nothing from the Government but deceptive statements upon the question, and there really seemed such a shuffling from one principle to another that he could not wonder at the want of confidence which had of late been exhibited at the Buckingham, Parks, and other county meetings. The Right Hon. Baronet said last year, in introducing his grand financial scheme, that his measure would be the means of bringing in a considerable quantity of foreign cattle, and by these means of reducing the price of meat in the English market. In the same speech he said that really there would not be, by his bill, any very considerable introduction of foreign cattle—that on that ground there was no cause for apprehension—that no one need think about it. Such were the contradictions made in the course of a single speech upon a single measure. In the debate on the budget—in talking about the Income-tax, the Vice-President of the Board of Trade said—"We have so lowered the price of living, that with moderate prudence any man may easily pay his Income-tax out of that reduction, such has been the effect of our measure!" That answered for the day. Presently there was a debate on the Corn Laws, and in recommending the House to vote against the repeal of those laws, he then told a very different story. Then it was that—"the reduction in the price of the various commodities had been caused by the distress of the manufacturers, who had ceased to produce, and who therefore had ceased to consume." When we heard such shifting what wonder was it that men's apprehensions should be excited. Could anything, he asked, more completely show that these Ministers—that these Conservative Ministers—were acting in the spirit of mere innovation—that they were changing for changing's sake—introducing alterations without the slightest prospect of benefit to the people of England, to the people of Canada, or to any mortal soul? "We are the men for change," they cried, "and we care not what its consequences may be."—The House then divided, when there were:—For going into committee, 344; for the amendment, 156; majority, 188.

Tuesday.—Mr. HUME complained of the verbal alteration which he found made by Lord Stanley in the Canada Bill resolutions. By the introduction of the words "produce of," the operation of the proposed law was confined to corn grown in Canada. He had voted for the resolutions under the impression that corn imported into Canada under the transit duty would be entitled to the privileges of colonial corn.—Lord STANLEY expressed his regret at having taken the benefit of the hon. Member's vote in consequence of a misunderstanding. He had stated distinctly that he intended to make no change with respect to American wheat.—In reply to Mr. Labouchere, Mr. GLADSTONE said he intended to move for the revival of the committee of 1831, on bubble insurance companies, and to bring in a bill for the perusal of members during the recess relative to the Merchant Seamen's Fund.—Mr. HAWES called the attention of the House to its former proceedings in reference to the Danish claims. He recapitulated the particulars of the case, and concluded with proposing a motion for an address to Her Majesty, to take into consideration the demands of the claimants.—The SPEAKER interposed a technical obstacle to the reception of the motion. Such a proposed address, involving a grant of public money, should be made in a committee of the whole House. Ultimately, after a conversation on the subject of precedent, the motion was withdrawn, with notice for a future day of one more in conformity with the forms of the House.

Mr. T. DUNCOMBE then submitted the case of the Rev. William Browne, late chaplain to the Knutsford House of Correction, who has been dismissed from his office by the magistrates of Chester, after giving evidence against the governor of the prison before the inspector of prisons, in the inquiry instituted under the authority of the Secretary of State for the Home Department. Whilst the chaplain had been dismissed, the governor, whose dismissal had been recommended by Sir J. Graham, was retained, with a declaration that he had not forfeited the confidence of the magistrates; and as the allegations against the governor involved not only himself, but the discipline and management of Knutsford House of Correction, and also the conduct of the Cheshire magistrates in resisting the wishes of Sir J. Graham, who had manfully done his duty, he moved for a select committee to inquire and report on all the circumstances.—Mr. TATTON ROBERTSON, as one of the Cheshire magistrates implicated, denied that the governor of the prison possessed his confidence, and expressed his regret at the course which they had adopted. But even admitting that they had erred in judgment, misled by feelings of attachment to an old and faithful servant, still a body of 34 gentlemen residing in and well acquainted with the locality,

must be better judges of all the circumstances than the House. The chaplain had attributed his dismissal to political motives, which was a libel on the magistrates, for a large portion of those who concurred in it were liberal in their political principles, and he had been treated leniently, considering his conduct. He opposed the motion.—Sir G. STRICKLAND and Mr. CURTIS supported the motion.—Sir J. GRAHAM, though objecting on principle to constituting the House a tribunal for judging the conduct of magistrates, would nevertheless support the motion for a committee of inquiry, if he thought it would be the means of bringing out any concealed facts. He regretted that the magistrates had not attended to his recommendations, but was bound to admit that the dismissal of the chaplain had been determined on by a large majority. Judging from his experience, he thought it would be for the public good if the Home Secretary were invested with a concurrent power, not in the appointment, but in the dismissal, of the officers of prisons, because, as a test, the Minister of the Crown, in exercise of that concurrent power, would be open to question within the House. As to the motion, he hoped it would be withdrawn.—Sir T. WILDE considered that a most overwhelming case had been made out for inquiry, but after what had fallen from Sir J. GRAHAM, he would join in the recommendation to withdraw the motion.—Some comments were made by other members, and Mr. T. Duncombe withdrew his motion.

Wednesday.—After the presentation of a great number of petitions against the education clauses of the Factories Bill, Mr. W. S. O'BRIEN inquired whether it was the intention of Government to submit a supplementary estimate to Parliament to provide for the expense of the increased forces recently ordered to Ireland?—The CHANCELLER of the EXCHEQUER said the transfer of troops from one part of the kingdom to another entailed no expense on the public. Should circumstances, however, require an expenditure beyond that in the estimate, the Government would of course propose it.—Sir R. PEELE, in reply to a question from Mr. BLEWITT, stated that joint representations had been made by France, Russia, and England to the Government of Greece, to induce it to take steps for the reimbursement to this and the other countries of the sums they had respectively advanced, and for providing in future for the regular payment of the interest on the loan. The representatives of the three powers had distinct instructions, should their recommendations fail, to take the means they would think most effectual for the purpose of procuring the reimbursement of what had been paid, and of preventing the possibility of the same liability being incurred in future by the guaranteeing Powers. To an application since made to this country to contract or guarantee a fresh loan, a refusal had been given.

Dr. NICHOLL, in reply to Mr. R. YORKE, stated that there was no intention to abandon the Ecclesiastical Courts Bill this session.—Sir G. GREY moved the second reading of the Charitable Trusts' Bill.—The ATTORNEY-GENERAL said that it was the wish of the Government to meet all the evils that belonged to the present system, and, if possible, correct them. It was most desirable that some scheme should be adopted by which charities might be visited and improved. He had hoped that the Government, ere this, would have been able to have introduced such a bill, and still trusted that before the present session expired such a measure would be brought forward. He hoped his hon. friend would not press the present measure.—Sir J. GRAHAM said the subject was one of great magnitude and importance, and had engaged the serious attention of the Government. He could not pledge himself that the Government would bring forward a measure on the subject, which would be passed into law during the present session. He hoped the measure would be sufficiently matured to be laid upon the table during the present session, but he could by no means pledge himself that the Government would be enabled to pass a law on the subject. He was anxious, however, to have it distinctly understood, that under no circumstances could he consent to the second reading of this bill.—After some further conversation, the motion for the second reading was withdrawn.—The Roman Catholic Oaths' Bill, after a short discussion, was read a second time, as was also the Pound Breach and Rescue Bill.

Thursday.—Mr. LABOUCHERE gave notice, on behalf of Lord J. Russell, that on Thursday, the 8th June, he would move that the House resolve itself into a committee of the whole House, for the purpose of considering the laws relating to the importation of foreign grain.—Sir R. PEELE gave notice to move the adjournment of the House for the Whitsun holidays, from its rising on Friday next till the following Thursday.

In reply to questions put by Sir R. Inglis, Sir R. PEELE stated that instructions had been sent out to India advising a discontinuance of all connexion between the officers of the East India Company and the ceremonies of the Heathen and Mahomedan worship; and also a cessation of all interference on the part of those officers with the management of the pagodas and mosque lands. These instructions had been, as far as practicable, acted upon. The attention of the Governor-General was also directed to the discontinuance of the annual pension of 60,000 rupees to the Temple of Juggernaut.

Lord STANLEY answered several questions respecting the Canada Corn Bill. He maintained that Canada could grow a surplus supply of grain, and affirmed that the decision of the Canadian Legislature, in passing their own act, was all but unanimous, in proof of which he said he would lay on the table of the House extracts from the journals of the House of Assembly. The Government have no intention of extending the principle of the Canadian Bill to other colonies.—Sir R. PEELE, in reply to Mr. W. O. STANLEY, who had a notice of a motion for a committee of the whole House on the subject of the union of the sees of St. Asaph and Bangor, declared his intention of upholding the decision of the Legislature. But he intimated his willingness to give early consideration to the means of increasing the efficiency of the establishment in North Wales.

Mr. CHRISTIE moved for leave to bring in a Bill to abolish certain oaths and subscriptions now required in the Universities of Oxford and Cambridge; and to provide for the extension of education in those Universities to persons not members of the Church of England.—The CHANCELLER of the EXCHEQUER opposed the motion. The founders intended that religion should be taught in those institutions, and that religion should be taught according to some particular form. The Dissenters were determined to substantial benefit from the nation, which, if granted, would create in the governing bodies of the Universities a constant agitation for the further advancement of dissent, and so the objects for which the Universities were founded would be defeated.—Mr. M. GIBSON denied that religion was at all taught at Cambridge. He demanded that the principles of civil and religious liberty already adopted should be carried out in the Universities.—Sir R. INGLIS declared that, having felt bound to resist this proposal when asked as a boon, he was doubly determined to resist it now that it was put forward as a claim. Religion now formed the basis of education in Cambridge, as it always had done in Oxford. The dissenters, instead of exhibiting a spirit of conciliation towards the Church, opposed it in every shape with the utmost animosity and virulence; and thus there was a very unfortunate time for them to ask for concessions from the Church. Whatever grievance might have existed was remedied by the establishment of the University of London.—Sir H. W. BARRON supported, and Mr. SHAW opposed the motion.—Lord STANLEY expressed his opinion that objections might justly be raised against the practice at Oxford of compelling under-graduates to sign the thirty-nine articles before matriculation, and that no danger would threaten the Church if Dissenters were admitted for the mere purpose of education. He opposed the Bill because the introduction of it would renew animosities and jealousies, and because it would not, unless carried much further, answer the purpose of the proposer.—Lord J. RUSSELL agreed that if it were to prevent persons from taking degrees in Oxford and Cambridge, the practice should be abolished; and that as there was a different rule at Oxford, at

Cambridge, and at the Dublin University, and as all could not be right, they should be made to conform. He cordially supported the motion.—Mr. WYSE, Mr. WYNN, Mr. REDINGTON, Mr. ROXBURGH, Lord SANDON, and Mr. R. YORKE, took part in the discussion that followed. On a division there were—for the motion, 105; against it, 175; majority against the motion, 70.

Sir V. BLAKE moved for leave to bring in "a Bill to apportion and regulate the overwhelming labour and business of Parliament in a manner calculated to allay discontent, and to preserve and maintain the inviolability of the United Empire upon a satisfactory and permanent foundation." The Bill not finding a seconder, fell to the ground.—Mr. G. W. WOOD obtained leave to bring in a bill to exempt scientific and literary institutions from the payment of parochial and municipal rates and taxes upon such parts of their buildings as are used exclusively for scientific and literary purposes.—On the motion of Sir R. PEEL, the Chaplain of the House was ordered to preach before the House on Monday next (Restoration of Charles II.).

Friday.—The Can bridge Election Committee reported that Mr. F. Kelly was duly elected; that there had been bribery, but that it was not known to him or his agents.—The House went into committee on the subject of the resolutions on the importation of Canadian wheat and flour. On the first resolution, embodying the fact of the passing of the Canadian Act, Lord J. RUSSELL moved to omit the words which made the legislation of this country dependent on the legislation of the Canadian Assembly. After some discussion the amendment was rejected on a division by 203 to 94. Lord WORSLEY then proposed another amendment declaratory of the inexpediency of any change in the duties on corn. On a division, there appeared, For Lord Worsley's amendment, 102; against it, 203. Majority, 101. Another division was taken on the resolutions, which were carried by 218 to 137.—Sir JAMES GRAHAM, in reply to Mr. M. J. O'CONNELL, said he had received an official communication from the Lord Chancellor of Ireland, intimating that Mr. O'Connell and Lord Ffrench had been removed from the commission of the peace, on account of taking part in meetings for the Repeal of the Union; and that the proceeding had the approbation of the superior Government.

CITY.

Money Market, Friday.—Consols for the Opening on the 18th of July, closed at 96 to $\frac{1}{2}$, and 95 $\frac{1}{2}$ to $\frac{1}{2}$ for Money; Three per Cents. Reduced, 95; Three-and-half per Cents. Reduced, 101 $\frac{1}{2}$; New Three-and-half per Cents., 102 $\frac{1}{2}$ to $\frac{1}{2}$; Bank Stock, 181; India Bonds, 55 to 59 prem.; Exchequer Bills, at 1 $\frac{1}{2}$ d., 52s. to 54s. prem.

Metropolis and its Vicinity.

City Improvements.—At the last meeting of the Common Council, the Improvement Committee submitted a report, from which the following are extracts:—"The Special Committee having examined carefully the plans which have been suggested to the Commissioners of Woods and Forests for a new thoroughfare, commencing in the neighbourhood of Leicester-square, through Lincoln's-Inn-Fields, into the City, crossing Farringdon-street by a viaduct, next considered the practicability of forming a street which would connect the end of Cheapside with such a thoroughfare at Lincoln's-Inn, and with a branch diverging into Holborn, which would effectually relieve the great pressure of the public traffic in the thoroughfares alluded to, and at the same time rendering a viaduct at Holborn-bridge unnecessary. They were of opinion that the formation of a street combining these desirable objects was decidedly practicable—the street to commence at the east end and continue along Paternoster-row, through Amen-corner, across Farringdon-street, to the south-west corner of Farringdon-market, in a straight line, the main line to continue across the middle of Fetter-lane to the City boundary, and a branch to diverge from the corner of the market to the end of Fetter-lane, at the summit of the hill in the wide part of Holborn. The Special Committee having had the levels in this proposed new line accurately taken, find that the greatest inclination of any part of it would not be more than about three feet in 100, and that only for the distance of 370 feet. It occurred to them, in pursuing the investigation, that this new line would be still greatly improved by the removal of the whole of the houses between the north side of St. Paul's-churchyard and Paternoster-row, from the end of Cheapside as far as Ave Maria-lane, which could be done for the additional sum of 150,000*l.* Should this be effected, that magnificent structure would terminate a vista of upwards of one-third of a mile, and the whole would, in addition to the increased facility and convenience which would be afforded to the growing commerce and traffic of the City, form one of the grandest improvements of an architectural character yet achieved in the metropolis. They also propose a new street from the north end of Dowgate-hill to the east end of St. Paul's-churchyard, thence to Earl-street, Blackfriars, through Tower-royal, Little and Great Distaff-lane, crossing the Old 'Change into St. Paul's-churchyard, about 1360 feet in length; and from the Old 'Change, through Knight Rider-court, Carter-lane, Godliman-street, Bell-yard, Addle-hill, to the east end of Earl-street, about 1,200 feet in length. Various other lines and removals of portions of streets to widen the thoroughfares are also recommended. The report then proceeds as follows:—"Having thus detailed those improvements, the Special Committee turned their attention to that part of the reference whereby we were directed to report our opinion as to the best means of accomplishing these objects, and having had under consideration the various improvements which have been carried out during the last twelve years, as connected with the avenues and approaches to London-bridge, ascertained that our expenditure in this respect has averaged about 150,000*l.* per annum, a sum which they apprehended, if the same could be provided for a few years, would enable all the proposed improvements to be carried into effect; and feeling that the Corporation have not the means at their disposal of effecting these improvements, however desirable the same may appear to be, the Special Committee are of opinion, as her Majesty has been graciously pleased to appoint a special commission for the purpose of considering of further Metropolitan improvements, which commission is now sitting, that a favourable opportunity exists for drawing the attention of the Government and the com-

mission, as to the best means to be adopted for raising the requisite funds for those purposes, and recommending that we should be empowered to confer with them upon this desirable object; and we agreeing with the special committee in the said report, submit the same to this honourable Court." The report was ordered to be printed, and to be taken into consideration in detail, at the next Court.—On Tuesday a deputation from the Metropolitan Improvement Society, consisting of Lord Robert Grosvenor, Mr. Hickson, Mr. Fowler, Mr. Godwin, and Mr. Austin, had an interview with the commissioners for improving the communications of the metropolis. The object of the deputation was a new line of roadway, partly running along an embankment on the north side of the Thames, to connect the great Essex-road with the west-end of London. A plan showing the projected line was submitted to the commissioners.

Court of Aldermen.—The committee appointed to investigate the charges against Alderman Thomas Wood, with respect to his transactions with the Talacre Coal Company, held a meeting on Saturday. The committee having stated that they had completed their investigations, Alderman T. Wood addressed them in a long speech, in which he explained various matters, and concluded with a solemn declaration that he had never been guilty of an unworthy action; all that he asked at the hands of the committee was even-handed justice. Sir M. Wood then said he had a resolution to propose, but before he did this, strangers were ordered to withdraw. It is understood that it was ultimately agreed to have the speech of Alderman T. Wood printed, and that the committee will give their decision on Saturday, June 17.

British and Foreign Temperance Society.—The annual meeting of this Society was held on Tuesday evening at the Music Hall, Store-street; Lord Teignmouth, in the absence of the Bishop of Norwich, in the chair. The report stated that, in 1832, the number of persons charged with drunkenness was 32,636; in 1842, it was 12,338; showing a decrease of 20,298. The decrease in the number of beer-shops in England and Wales, in 1843, as compared with the preceding year, was 2,499, and 8,839 as compared with 1839. The total quantity of malt converted into liquor in all the distilleries of the kingdom in the year 1840, was 3,947,000 quarters; in 1841, it was 3,796,000 quarters; showing a decrease of 150,000 quarters. The consumption of spirits in 1830 was not so much by 5,000,000 of gallons as in 1820; and in 1840, the decrease as compared with 1830 was 2,087,000 gallons. Illicit distillation had increased in Ireland; 143 persons had been charged with that crime in the quarter ending January, 1842; and 1,040 persons were similarly charged in the corresponding quarter of the present year. Sir Robert Sale, writing from Jellalabad upon the hardships to which the soldiers under his command were subjected, added—"I will not mention as a privation the European troops having been without spirits, because I believe that to be a circumstance tending to keep them in the highest health, and in the most admirable state of discipline; crime has been almost unknown, and a murmur is never heard, though they are deprived of their usual quantity of animal food." The principles of the Society were progressing in Gibraltar, Malta, Madras, Calcutta, China, Sweden, Denmark, Prussia, the Hanse Towns, Hanover, Russia, Switzerland, and elsewhere. The receipts during the past year amounted to only 473*l.* 18s. 6 $\frac{1}{2}$ d., and the expenditure to 451*l.* 3s. 2d. The Society was involved to the amount of 212*l.* 8s. 3 $\frac{1}{2}$ d. This report having been adopted, it was resolved that the grateful thanks of the meeting be expressed to her Majesty for the patronage with which she had been pleased to honour the Society. Their Majesties the King of Prussia and the King of Sweden were likewise included in the resolution.

Aborigines Protection Society.—On Tuesday the annual meeting of this Society took place at Crosby Hall, W. Aldam, Esq., M.P., in the chair. From the report, it appeared that the funds of the Society were inadequate to the large field of its operations for protecting the Aborigines of our various colonies. Statements of successful intervention on the part of the Society with the Government or local authorities were mentioned in the case of the Indians of British North America, the Hudson Bay Settlement, in the United States, Texas, South Africa, Australia, New Zealand, &c. The income of the past year was 259*l.* 1s. 2d., leaving a balance in hand of 15*l.* 4s. 9d., but there was a debt of 100*l.* owing by the Society. The meeting was addressed by the Rev. John Burnett, Dr. Yates, Dr. Hodgkin, and other gentlemen, and a subscription was raised as the meeting separated. Several foreigners were present, among whom were two natives of Dongola, and Upper Abyssinia, who had come to this country for the purpose of disposing of some giraffes to the proprietor of the Surrey Gardens; a Hottentot boy, and others.

Society for the Propagation of the Gospel in Foreign Parts.—On Friday the 142d anniversary meeting of this Society, incorporated by King William III., was held in St. Paul's Cathedral. There were present in the prebendal stalls, the Archbishops of Canterbury and Armagh, the Bishops of London, Durham, Winchester, Chester, Lincoln, Bangor, Ripon, Salisbury, and St. David's; Archdeacon Wilberforce, Archdeacon Hall, Dr. Russell, Dr. Hawker, Dr. Cuthbert, the Lord Mayor and sheriffs, and a large body of the metropolitan clergy. The Bishop of Norwich preached the anniversary sermon. The report, after alluding to the missionary efforts of the Society in British North America, the East and West Indies, British Guiana, Van Diemen's Land, New Zealand, and other places, stated that the expenditure for the general account for the past year had been 75,454*l.*; the income arising from the Queen's Letter had been 31,315*l.*; and from all other sources, 33,776*l.* Unless 30,000*l.* more were raised to defray the annual expenses, several promising missions

would have to be abandoned. The number of missionaries at present in connection with the Society in various places was upwards of 400. In the evening the Lord Mayor entertained the Bishops and clergy at dinner.

Library of the Duke of Sussex.—The Duke of Sussex's library is forthwith to be disposed of. It is stipulated in the will that it shall be in the first instance offered to the British Museum; and that, in the event of the trustees declining to purchase, it shall be sold in such manner as the executors may direct. Messrs. Evans have been called in to value it. The library, it appears, consists of upwards of 45,000 volumes, most of them in excellent condition, independently of MSS., consisting of early copies of different portions of the Holy Scriptures.

St. Saviour's, Southwark.—On Friday a numerous meeting of the rate-payers of this parish was held in the Ladye Chapel, for the purpose of nominating the candidates to the living of joint chaplain to the parish, vacant by the death of the Rev. W. Mann. After the nomination was concluded, the days when the several candidates are to preach their probationary sermons were fixed as follow:—Morning: May 28, the Rev. G. W. Cockerell; June 4, the Rev. Thomas Gibson; June 11, the Rev. J. T. Leet; June 18, the Rev. S. Rowe; June 25, the Rev. E. Thompson. Afternoon: May 28, the Rev. J. R. Barber; June 4, the Rev. S. Benson; June 11, the Rev. J. Williams; June 18, the Rev. P. Waller. A resolution was passed requesting that those gentlemen only who intended to go to the poll would preach their probationary sermons. The living is worth 700*l.* a year.

Artists' Benevolent Fund.—The anniversary dinner of this Society took place on Saturday at the Freemasons' Tavern. Lord J. Russell took the chair; supported by Mr. G. Knight, M.P.; Mr. Ewart, M.P.; Sir J. Guest, M.P.; &c. Lord John Russell advocated the claims of the Society in an eloquent speech, in which he pointed out the necessity of some society like this, to maintain, in such honourable independence as was due to the professors of the learned arts, those who, but for such means, might not have been enabled to provide against the casualties of life. The appeal was liberally responded to; and a long list of donations was read, including an annual benefaction of 100*l.* from her Majesty, and another of 10*l.* from the Queen Dowager. Mr. Gally Knight, in returning thanks for the Royal Commission of the Fine Arts, said that Prince Albert, who was at the head of the commission, was well qualified to judge of the merits of artists, as he had shared in the labour and delights of their profession. The demeanour of that Prince was such as to win all hearts, and he knew he took the deepest interest in the promotion of the arts in this country. The inquiries of the commission, as far as they had gone, led him to believe that there was a fund of talent in the country which would render it unnecessary to call in the aid of foreign artists.

Eton Festival.—The customary anniversary festival of the noblemen and gentlemen educated at Eton College was celebrated on Saturday evening, at the Thatched-house Tavern, under the presidency of Viscount Morpeth, supported by about 70 noblemen and gentlemen.

Accidents and Inquests.—An inquest was held at Hampstead on Monday on the body of the Hon. Lady Colville, relict of General the Hon. Sir Charles Colville, who died on Saturday morning, at Rosslyn House, from the effects of injuries received from her dress taking fire. It appears that on Friday morning her Ladyship, having finished writing a letter, rang the bell for a lighted taper for the purpose of sealing it. The taper was directly brought, and placed by her direction on the floor near the foot-stool. By some means her dress soon ignited, and when discovered by her attendants she was completely enveloped in flames. After some difficulty the servants succeeded in extinguishing the flames, but not before she was so dreadfully burned about the body and head, that she died on Saturday morning. The jury, after hearing the usual evidence, returned a verdict of Accidental Death.—On Tuesday an inquest was held on the body of Miss Sarah Jane Collins, who threw herself out of one of the windows of Hanwell Lunatic Asylum, where she was on a visit to her brother-in-law, Dr. Conolly, the physician of that establishment. It appeared from the evidence that the mind of the unfortunate lady had latterly been wandering on religious subjects, and at an early hour on Sunday morning she entered Dr. Conolly's room, saying that she thought it necessary that she should burn herself; and that she had been thinking of jumping out of the window. In order to quiet her, and to give him time to dress, Dr. Conolly asked her if she slept well; to which she replied that she had had a sweet sleep. He made a motion to get out of bed, on seeing which, the room-door being open, deceased ran away and went up stairs again. He slipped on his dressing-gown, and followed her to her room, the door of which he found shut. He called and knocked, but receiving no answer, he went in and found the window open, and deceased in the act of springing from it. He rushed towards her, and as she was falling, part of her dress caught some of the stonework of the building projecting from under the window-sill, and he succeeded in catching her by her left wrist, with his left hand. He continued to hold her by the wrist, although she struggled most violently for him to let her go, for upwards of 20 minutes, the whole time screaming and crying out at the top of his voice for assistance, but which was not afforded him, no one having heard his cries. From exhaustion and the violence of deceased's struggles, he was ultimately compelled to let go her wrist, and in an instant he heard her body fall into the area below, a depth of 50 feet, with a loud crash. He rushed down stairs, and found her lying on her side, completely doubled up, and quite dead. He had since her death heard that deceased declared, that had she destroyed herself on Palm Sunday her soul would be saved. Had

she been a patient in the asylum she would have been confined. He had no doubt of her insanity. The coroner remarked on the melancholy nature of the case, and the jury returned a verdict of "Temporary insanity."—An inquest has been held on the body of Mr. F. Tyrrell, the eminent surgeon and oculist, who died suddenly on Tuesday at the auction-mart. The sale of the freehold of Mr. Tyrrell's country residence at Acton, of which he held the lease, was advertised to take place by Mr. G. Robins, and Mr. Tyrrell intended to become the purchaser. About half-past two he entered the sale-room, and gave instructions to a gentleman, whom he had deputed to bid for the property. While he was conversing with his friend in a cheerful manner, he was suddenly attacked with illness, and left the room. He had scarcely reached the door when he was observed to stagger, and in attempting to lay hold of the bannisters, he fell. Several persons raised him from the ground, but long before any medical aid could be procured, Mr. Tyrrell was no more. He gasped twice after he fell, and died in less than two minutes. He was only 46 years of age, and had been for many years connected with St. Thomas's Hospital and the Ophthalmic Institution, and his practice was very extensive. The event created a great sensation in the auction-room, and the sale of the estate was, in consequence, postponed.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, May 13:—West districts, 142; North districts, 161; Central districts, 182; East districts, 178; South districts, 220. Total, 883—(437 males, 446 females).—Weekly average for the last five years, 903—(461 males, 442 females), and for the last five springs, 854.

Provincial News.

Incendiary Fires.—The *Police Gazette* contains the offer of a reward of 150*l.* for the discovery of the incendiary or incendiaries, who, on the night of the 1st inst., set fire to a stack of hay, standing on the estate of the Earl of Albemarle, at Quiddenham, Norfolk, by which it was wholly destroyed; and 50*l.* of the reward will be paid by Government, a like sum by the noble Earl, and the remainder by the Directors of the Suffolk Fire-office; and a free pardon is also offered to any accomplice giving the necessary information. Also a reward of 250*l.* for the discovery of the persons who, on the night of the 10th inst., set fire to certain buildings at Barningham, Suffolk, the property of Thomas Thornhill, Esq., in the occupation of Mr. Saxe, which were totally destroyed, together with a quantity of Corn and instruments of husbandry; 50*l.* of the reward will be paid by Government, who also offer a free pardon to any accomplice giving the requisite information, and the remainder by Mr. Thornhill. Likewise information that, on the night of the 13th inst., a stack of Wheat, the property of Mr. H. Farncombe, in the parish of Icklsham, Oxford, was wilfully set on fire and destroyed.

Aylesbury.—On Saturday, a special meeting of the Buckinghamshire Royal Agricultural Association was held in this town, the Duke of Buckingham in the chair. The meeting was summoned in order to discuss the bearings of the New Canada Wheat and Flour Bill upon the interests of the farmers, and was very numerously attended. After several gentlemen had addressed the meeting, a vote of thanks was given to Mr. G. G. Massell for a donation of 200 guineas to the Association. It was then resolved, "That it is the opinion of this meeting that the Canada Corn and Flour Bill introduced by Lord Stanley in Parliament on the 19th inst., is detrimental to the best interests of British agriculture—that in the event of such a bill being persisted in, our representatives in Parliament be requested to oppose it by every means in their power—and that this Association views with the deepest apprehension and alarm the unremitting exertions that are made by the Anti-Corn Law League to force upon the country the adoption of the principles of free trade." After the meeting the members of the Association and most of the farmers in town dined together, the Duke of Buckingham, as before, in the chair. The assemblage was one of the most numerous which had ever met in Aylesbury to consider an agricultural question, upwards of 200 gentlemen being present. After the usual loyal toasts, Mr. Horwood acknowledged the toast of "Prosperity to the Association." He said it was their duty to tell Sir Robert Peel plainly what their feelings were, and how much mischief his measures would produce; and he did not think that they should be told by him in reply, that if they did not submit to the measures which he thought fit to introduce, that he would leave them in the lurch. They did not, however, wish to rouse opposition towards the Government—the feeling of the farmers always had been and always would be in favour of good order and good-will; and if there was a misunderstanding between them and the Government, and between them and their members, as had unfortunately lately occurred, he hoped that it would not occur again; he hoped that henceforth they would understand each other, and that they would combine to form an association steadily looking after their own interests, and not interfering with the interests of others. Mr. Dupre, Mr. Murray, Sir S. Chetwode, and Mr. Clayton, returned thanks for the representatives of the county and boroughs. Mr. Dupre then proposed the health of the Duke of Buckingham. His Grace, in returning thanks, said he had, as they knew, taken a deep interest in all the questions affecting the Corn-laws, and when the important measures of last year came before them for consideration, he had formed an opinion with respect to them, which he had never yet seen occasion to change, but which, on the contrary, the events of every

day convinced him was the proper and correct view. He had opposed a fixed duty on corn upon the ground that he considered that it would be impossible to maintain it in times of scarcity, whereas the sliding-scale admitted corn in a manner at once safe to the producer, fair to the consumer, and most beneficial to the country at large. If, therefore, he had thought it proper on his own part to support the sliding-scale, how could he, maintaining that opinion, support a species of duty in the colonies which he did not think congenial to the interests of the mother country? Considering, therefore, that imposing a fixed duty on corn with respect to Canada would be giving rise to a dangerous precedent, as well as facilitating the smuggling of a large quantity of grain from the United States into this country, he could not give his vote in the House of Lords in favour of a measure which he considered to be so fraught with evil consequences. He was aware of the difficulties which surrounded the agriculturists, but in his conscience he believed that by firmly adhering to the law as it now stood with respect to protection, they would survive and triumph over their temporary difficulties. But this he also was sure of, that if the property of farmers was day after day, and month after month, and year after year, to be agitated and unsettled, the country would never be able to endure its burdens, and one common ruin awaited them all. They wanted peace; they wanted their interests to be left to the management of those who had a right peacefully to enjoy them; but if they were to be told on the one hand that free trade was their only salvation; if they were to be harassed upon the other by the supporters of a fixed duty; if they were told that the Canadian Corn Bill would not prove injurious to their interests, all this was keeping up an agitation with respect to the property of the farmer as injurious to himself as unsafe to the country. It was, therefore, upon these grounds that he told them that it was his intention, when the Canada Corn Bill came under the consideration of the House of Lords, to oppose it, he hoped as honestly as he had opposed the Government measures of last session. He would steadily adhere to that cause which he had always advocated; and, addressing them in that honourable name which he feared he did not sufficiently deserve—the Farmers' Friend—addressing them in that capacity, he could assure them that they never would be discarded by him—that they should never be addressed by one who forgot his duty to the Crown, to the people, and to the county of Buckingham.

Bath.—In consequence of the inability of the Bishop of Bath and Wells, from his extreme age and increasing infirmities, to perform his episcopal duties, the Bishop of Salisbury has undertaken the triennial visitation of the diocese. His Lordship will consecrate several new churches and chapels, and will hold a series of confirmations in the month of August.

Cambridge.—At the early hour of five o'clock on Tuesday morning, the election of the Master of Sidney Sussex College took place in the chapel of the College. The electors consisted of the ten fellows. At eight o'clock the result of the election was declared in favour of the Rev. Mr. Phelps, tutor of the College.

Carmarthen.—The Welch papers give the following account of the price of provisions in the Principality:—Fresh eggs are now selling at 7 for 2*d.*, or 42 for 1*s.*; salmon trout, 9 for 6*d.*; best fresh butter, retail, 10*d.* per pound; potatoes, 6*lbs.* for 1*d.*; a quarter of veal costs only 2*s.* 6*d.*. Rent is at the same low rate as living, and clothes of the native manufacture cost next to nothing.

Knutsford.—On Monday the general intermediate sessions for the county of Cheshire were held at the Court-house of this town, before Mr. Trafford Trafford, and upwards of 20 other Magistrates. After the Chairman had delivered his charge to the Grand Jury, the Magistrates retired to their private room, when the Chairman read a letter he had received from the Home Secretary, in reference to the affairs of Knutsford Gaol. In this letter, Sir J. Graham states—"It is matter of much concern to me that the Magistrates of the county have determined to retain in the office of keeper of the gaol one who has been proved to have so misconducted himself. The Magistrates are of opinion, upon the case to which I more especially called their attention (I refer to the case in which the keeper persisted in inflicting corporal punishment on a prisoner after the interposition of the Assistant-Surgeon and his desisting to forbear), that the reprimand of the Visiting Justices was sufficient punishment. It appears to me that such misconduct, as soon as made known to the Justices in quarter-sessions, should have been punished by immediate dismissal." He concludes by saying that—"The responsibility of these proceedings of the general quarter-sessions is upon those Magistrates who recommended and adopted such a decision; but I feel it to be a duty to declare my opinion that it is a decision not unlikely to lead to evil consequences, detrimental to the maintenance of good order in prisons, and calculated to lessen the confidence which Parliament has been disposed to impart to Magistrates in the superintendence and regulation of gaols." It was then suggested that no notice should be taken of the letter, but no motion was made on the subject, and the matter terminated.

Leicester.—A meeting of the creditors of the Leicester Bank was held on Thursday, at which it was stated that the liabilities are 600,000*l.*, and the assets 800,000*l.*. The concern is to be wound up under the direction of a committee, and a report of the exact state of the firm will be made to a meeting of creditors, fixed for the 31st inst.

Lincoln.—On Friday the 19th a meeting of the Lincolnshire farmers was held in this city, to receive Mr. Cobden and Mr. Bright as a deputation from the Anti-Corn-law League. About 3,000 persons were present. Mr. Bright and Mr. Cobden addressed the meeting at

considerable length, and a resolution, embodying a vote of thanks to those gentlemen, and condemnatory of the Corn-laws, was proposed to the meeting, followed by an amendment in their favour. After several speeches in support of the first resolution and the amendment, the chairman took the sense of the meeting, and declared the original motion carried by a large majority.

Liverpool.—Another fire broke out in this town on Thursday last. It occurred in Jackson's-lane, in a warehouse containing cotton and saltpetre, the latter of which caused a series of continued explosions. The warehouses on the opposite side of the lane caught fire, and four of them were almost entirely destroyed. Fortunately, no loss of human life occurred, but the amount of property destroyed is estimated at 45,000*l.*

Manchester.—We learn by the local papers that 23 bricklayers have been arrested at Manchester on suspicion of having been concerned in the late outrage on Messrs. Pauling and Henfry's croft, and after an investigation which lasted nearly four days, eight of them were committed on Monday, to take their trials at the next assizes. Six others have been remanded to afford time for further evidence to be obtained against them. The authorities are apprehensive lest another attack should be made upon the croft, but measures have been taken by them to secure the public peace in case of a similar outbreak. It appears that most of the persons arrested on this occasion belonged to the Brickmakers' Union, which held its meetings at Manchester every Saturday night.—On Tuesday evening this town became the scene of another outrage of a more alarming character than even that in which the brick-makers were engaged last week. The cotton-spinners have again turned out for an advance of wages, and during the past week have been parading before the mills and intimidating the workmen who are satisfied to work at the present prices from carrying on their lawful occupations. On Monday evening an outrage of an alarming character was perpetrated by the military, assisted by the mob. A wanton assault was made on two police-stations, the windows of which were completely destroyed, and several of the policemen were seriously, if not dangerously wounded. The police, however, succeeded in capturing some of the riotous soldiers, who were fined by the magistrates, and discharged from custody. It was hoped that this affray would have ended here, but it was only to be followed by still more lamentable outrages. The streets remained thronged during Tuesday morning, and in the afternoon Captain Willis received information that another attempt to demolish the station-houses in various parts of the town was contemplated. Arrangements were immediately entered into to defend the police against the aggressions of the military, but these arrangements were not completed in time to avert the danger. About five o'clock a mob of upwards of 2,000 persons, headed by 50 or 60 of the disorderly soldiers, surrounded the Oldham-road station, and commenced an attack upon the building. There were but five police-officers in it at the time, and they were therefore obliged to fasten the gates in order to keep out the mob, who, after having smashed a few of the windows, and fearing that there might be a strong force inside, retired, and in about half an hour after returned with about 200 soldiers and an immense mob. They at once renewed the attack upon the station, and demolished every window and several of the doors. The magistrates, however, and a strong detachment of police, followed by General Sir T. Arbuthnot, with two or three companies of soldiers, arrived in time to save the police. When the mob and the disorderly soldiers saw this force coming up, they turned and cheered, and were about to face them. At this moment the policemen rushed out of the station-house, attacked the mob in the rear, and by their united force they succeeded in apprehending several prisoners. The mob then dispersed, and re-assembled in other parts of the town, and beat the police whenever they could meet with them. The town, as may be imagined, is in a very disturbed state, and the troops are confined to barracks.

Oxford.—Great sensation was created here last week by a sermon delivered by Dr. Pusey, at Christchurch, in which the reverend professor avowed his faith in consubstantiation and the doctrine of the mass. This surprise has been increased by the announcement that a copy of the discourse has been demanded by the University authorities, with a view to examination and probable censure. It is stated that Dr. Pusey has, however, requested two days for consideration before complying with the request, and it is conjectured that he intends to plead the circumstance of the sermon having been preached in his own cathedral at Christchurch, of which, as professor of Hebrew, he is a canon, as a reason for exemption from the cognisance of the academical authorities.

Portsmouth.—An inquest was held a few days since at Little Green, near Gosport, on the body of Dr. Quarrier, who died on Wednesday night, from the severe burns he accidentally sustained thirteen days previously, and noticed in this Paper at the time. His death was caused by inflammation of the membrane of the brain, and also of the glottis, occasioned by the burns.

Reading.—A meeting, convened by the High Sheriff, upon the requisition of upwards of 800 of the farmers, freeholders, and agriculturists of Berkshire, was held on Saturday, in this town, to take into consideration the present depressed state of the agricultural interest, and to discuss the propriety of seeking for more ample protection for that interest from the Legislature. At eleven o'clock, the town-hall, the place appointed for the meeting, was nearly filled. Sir R. G. Throgmorton, Bart., high-sheriff, presided, and opened the business of the day with a short speech. Mr. Hippeley then moved the following resolutions:—"That this meeting views with the utmost anxiety and alarm the present depressed condition of all classes

of the agricultural community, caused, or greatly aggravated, by the operation of the new corn and tariff laws, which afford inadequate protection to the exercise of British industry, and to the employment of British capital in the cultivation of the soil. That under the extreme pressure of general taxation, and the local charges to which the land is exclusively liable, the home produce has a constitutional right to expect and demand from the Legislature ample protection against the otherwise ruinous competition of untaxed foreign capital and foreign labour."

Mr. Job Lousley, a farmer, seconded the motion in a long and animated address, during which he was loudly cheered. At the close of his speech, the numbers had so increased that it was necessary to adjourn to the Forbury, where hustings had been erected in anticipation of the event. The Earl of Radnor then spoke at great length in opposition to the previous motion, and concluded by moving an amendment the following resolutions:—"1. That the petitioners have been till lately impressed with the belief that laws regulating and restraining the importation of corn from abroad, are necessary for the protection of the British farmer; but that experience and more mature reflection have convinced them that such laws really afford him no protection, but that the best encouragement that can be given to those concerned in agriculture is that which is derived from the flourishing state of the industrious classes of the community. 2. That your petitioners believe that the time is fast approaching when all legislative protection will be abandoned. They have observed that all the measures lately adopted by the Legislature are in that direction, and that the principles advocated by the most eminent men of all parties lead to that result. 3. That your petitioners being for the most part connected with, and dependent for their support on agriculture, are now reduced to the most harassing and ruinous uncertainty with respect to their trade and future prospects. They conceive that any measures which do not bear the character of a final arrangement can only increase that uncertainty, and prolong its duration; and that it is for the interest of all parties that the question should be settled as speedily and as completely as possible. 4. That your petitioners, therefore, pray you to take steps for the total and immediate repeal of the Corn-laws." Mr. J. T. Norris, of Sutton Courtney, seconded the amendment. Mr. Walter, of Bearwood, then proposed, as a second amendment, the following resolutions:—"That this meeting is deeply sensible of the very depressed condition to which British agriculture is now reduced. But while it sincerely deplores so painful a state of things, it cannot but observe that every measure which has been introduced for many years past, for regulating the importation of foreign corn, has totally failed, as is proved by the frequent changes of the law on this subject. That this meeting, therefore, is of opinion that some fixed and stable plan is necessary, by which the fluctuations in the value of corn might be considerably lessened, the landlord and tenant might know what they had to expect, and foreign corn be subjected to a permanent duty of such an amount as might be most productive to the revenue, and so tend most effectually to diminish internal taxation." The Rev. Mr. Sloper seconded the motion. Mr. Allnutt, Mr. Blackstone, Mr. Palmer, Mr. Pusey, and Lord Barrington, followed in defence of the agricultural interest, and in support of Mr. Hippsley's motion. Several other gentlemen addressed the meeting, and the show of hands was then taken. The original proposition was carried by a considerable majority, only four or five hands being held up in favour of Mr. Walter's amendment. Petitions framed upon the resolutions were then adopted, that to the Lords to be presented by Earl Stanhope, that to the Commons by one of the county members.

Uxbridge.—On Thursday, the 19th, a meeting was held in this town, for the purpose of discussing the subject of the Corn-laws. Handbills were very generally circulated, announcing that Mr. Cobden, M.P., Mr. H. Pownall, and other gentlemen, would be present to argue the question. Mr. F. Sherborne, of Bedford, presided. The meeting was addressed by Mr. Cobden, Col. Wood, Mr. Hume, Mr. Byng, Mr. Pownall, and other gentlemen. A resolution was proposed by Mr. Wilkinson, and seconded by Mr. Hall, in favour of repeal of the Corn-laws, which was carried by a large majority, there being only about 40 hands held up against it. A petition to Parliament, in accordance with the resolution, was then submitted to the chairman to sign on behalf of the meeting; but he declined doing so, stating that he had not taken the chair with any such understanding, and that, moreover, he did not concur in the prayer of the petition. After some commotion, a vote of thanks to Mr. Sherborne was moved by Colonel Wood, and agreed to; and Mr. Hall was then called upon to succeed him, which he did, and signed the petition.

Railways.—The following are the receipts of Railways for the past week:—Birmingham and Derby, 1087*l.*; Birmingham and Gloucester, 1,627*l.*; Edinburgh and Glasgow, 2,314*l.*; Eastern Counties, 2,127*l.*; Great Western, 13,879*l.*; Hull and Selby, 1,079*l.*; Birmingham, 16,860*l.*; Blackwall, 783*l.*; Brighton, 3,034*l.*; Croydon, 286*l.*; South Western, 6,491*l.*; Midland Counties, 2,473*l.*; South Eastern, 2,030*l.*—The half-yearly general meeting of the South Eastern and Dover Company took place at the London Tavern last week. The report stated that the traffic on the line since the last opening from Headcorn to Ashford exhibited a gradual and steady increase. The railway would further be opened to Folkestone shortly after midsummer, and to the ultimate terminus at Dover within the present year. A scheme for making a communication between Paris and the South Eastern Railway, as prepared by Mr. Stephenson, had been approved of by the French Government, and would come before the Chamber

of Deputies for their sanction in the present session. The application to Parliament, concurrently with the London and Croydon Company, to extend the Railway by a branch line to the Bricklayers' Arms, had proved successful, notwithstanding the opposition of the Greenwich Company. Arrangements had been made with the principal carriers in Kent and Sussex for daily conveyance over the line, and a single line of branch railway to Maidstone, 10½ miles long, at a cost of 112,000*l.*, had been engaged to be constructed and opened by the contractors within 9 months after obtaining possession of the land. Branch lines to Canterbury and Hastings were likewise in contemplation. No accident had occurred upon the line to any individual. The balance, on the construction account, was 245,000*l.*, and that on the traffic account, 6,451*l.* Mr. Cubitt's report gave a detail of the progress of the works, and stated, amongst several other facts, that by the recent explosion at Roundown Cliff, land to the extent of 15 acres had been covered with soil at an average of 20 feet deep. The report of the directors was ultimately adopted by a large majority.—On Friday a special general meeting of the London and Croydon Company was held, at which the bill now before the House of Lords for making a branch railway from Corbett's-lane, where the Croydon and Greenwich railways join, to a point in Swan-street, near the Bricklayers' Arms, in the Old Kent Road, was unanimously approved of.—A special general meeting of the Taff Vale Company was held on Wednesday week at Bristol, to take into consideration the financial condition and late management of the company's affairs. The report of the committee of inquiry stated, that, from the investigations which had been made, the directors appeared to have been more mindful of their own interests than of those of the shareholders, and that the latter had been sacrificed to the former. They had further ascertained that some of the directors had contracted for the supply of articles to the company—had been allowed to carry their goods over the line at less than the ordinary rates—and had sold bad coke to the company at an increased rate. By this mismanagement the shareholders had become involved in a liability of 93,885*l.*, in addition to the capital required for the completion of the railway—a total liability of 754,000*l.* The meeting was finally adjourned.

IRELAND.

Dublin.—Notwithstanding the absence of Mr. O'Connell, the Corn Exchange, at the usual weekly meeting on Monday, was densely crowded, and there was fully as much excitement as at any previous meeting. The amount of rent was the largest weekly return yet announced, having been 709*l.* 18*s.* 6*d.* This included several English returns. The meeting did not terminate until nearly six o'clock, but the large room was crowded till the close. A new election for the office of treasurer to the corporation has taken place, and Mr. Costigin has been elected by a majority of five. The numbers were—For Mr. Guinness, 20; for Mr. Costigin, 25.

Cork.—The *Cork Examiner* contains a report, extending to 15 columns, of the proceedings in that city on the recent visit of Mr. O'Connell. It sets down the numbers congregated at the incredible figure of 500,000; but, even subtracting one-half from the calculation, there is no reason to believe that the demonstration was in any way inferior in point of physical force to the great gathering at Charleville a few days previous. There was but little novelty in the speeches at the Sunday meeting and banquet to call for even an abstract of the proceedings. It will, therefore, be sufficient to say, that Mr. O'Connell, Mr. Roche, M.P., Mr. Steele, and Mr. Callaghan, one of the city members, were the principal speakers. On the Monday another meeting took place in the Butter-weigh-house, at which, of course, Mr. O'Connell referred to the recent denunciations of repeal by Lords Beaumont and Kenmare, and attacked the Duke of Wellington and Lord Brougham in terms of unusual violence.—The *Virginia* packet-ship, from Liverpool to Boston, was totally lost off Kinsale, on Tuesday the 16th inst., but the crew and passengers were saved by a schooner which bore down to their assistance.

Charleville.—Another great repeal meeting has taken place in this town. If the concurrent accounts of the *Freeman's Journal*, *Limerick Reporter*, and *Nation* are to be relied on, the gathering was by far the most formidable, in point of numbers, of all the assemblages which had yet congregated together at the bidding of Mr. O'Connell. The two former papers state that 200,000 persons were present on the occasion; while the latter declares that 350,000 was under the mark. Some idea may be formed of the demonstration when it is stated, that, from Bruff, which is a distance of ten miles, to Charleville, Mr. O'Connell's carriage was obliged to proceed at a walking pace, so great was the cavalcade which accompanied it. A large platform was erected in the centre of the street opposite the market-house, in which were stationed a party of the 45th Light Infantry and a stipendiary magistrate. After considerable difficulty, the carriage arrived opposite the platform, but it was so crowded, and the streets so blocked up, that Mr. O'Connell found it was impossible to make his way, and accordingly determined to address the multitude from the dickey. He told them to insult no one, but be lively and merry at the prospects which were opening upon their country. He wanted liberty for old Ireland. He was travelling through the land, and would have the entire island with him before many months were over. Who would tell him, after that, a British statesman would refuse their just demands, and who would tell him he would not get a repeal of the legislative union? France knew that England was weak as long as Ireland was justly discontented—America knew it—Russia learned, and all

Europe was aware of it; and Heaven forbid she should be secure while Ireland was in chains.

Athlone.—Mr. O'Connell has been invited to a public meeting and dinner in this town. The invitation appears in the shape of a declaration, signed by Lord Ffrench, Dr. Higgins, Roman Catholic Bishop of Ardagh, Dr. Cantwell, Roman Catholic Bishop of Meath, Sir M. D. Bellew, Bart., and many others residing in the adjacent counties. In the declaration they say, "We are fully impressed with the conviction that nothing short of a repeal of the Union can be of any beneficial service to Ireland. This conviction is more firmly established by the threats said to be made use of by Wellington and Peel, and particularly by the declaration of the latter, who seems to entertain so thorough a contempt for the Irish people, that he says he will not consent to listen to the unanimous voice of her entire representatives. His threats of coercion we despise, and, as a proof of the little weight they have with us, beg to invite you, the father of repeal, to come amongst us, that we may show you, by the reception we shall give you, the measureless contempt we entertain both for him and his abettors."

SCOTLAND.

Edinburgh.—The long-repeated threat of secession from the Church of Scotland has at length been carried into effect by the Non-intrusion party coming voluntarily forward and declaring themselves no longer a portion of the church. This event took place on Thursday, the 18th, immediately after the meeting of the Assembly, and before even the roll of members was called over. Dr. Welsh, the late Moderator, on taking the chair, read a document containing a catalogue of alleged grievances—cases of interference on the part of the civil courts with matters spiritual. To this document 193 names were adhibited, comprising 120 ministers and 73 elders, who, immediately on the document being read, followed Dr. Welsh, and proceeded through the streets of Edinburgh in a body to a place of meeting prepared for their reception. It appears that on Thursday morning, after the levee in Holyrood Palace held by the Marquess of Bute, as her Majesty's Lord High Commissioner, his Grace proceeded to St. Andrew's church to open the General Assembly. After the usual sermon by the Moderator, Dr. Welsh, the Marquess of Bute ascended the throne, on which Dr. Welsh, having constituted the Assembly by a prayer, proceeded to read the protest of the non-intrusionist majority, which declared that "the Legislature has now, by its late proceedings, unequivocally, and for the first time, fixed the conditions of the church establishment in Scotland to be such as the civil courts have lately pronounced them—subversive, that is to say, of Church independence, as held by the seceders, and as believed by them to have been hitherto the law of the land, and more especially incompatible with the freedom of the Assembly itself; that any future Assembly to be held under these novel conditions is therefore no free or lawful Assembly; and, finally, that while firmly asserting the right and duty of the civil magistrate to maintain and support an establishment of religion in accordance with God's word, and reserving to themselves and their successors to strive by all lawful means, as opportunity shall in God's good providence be offered, to secure the performance of this duty, but acknowledging that they do not hold themselves at liberty to retain the benefit of the Establishment while they cannot comply with the conditions now to be deemed thereto attached, they protest their right to separate in an orderly way from an establishment which they loved and prized, and to organise themselves as shall seem expedient. On reading the protest, which was listened to with the utmost attention, the Moderator delivered it into the hands of Dr. Lee, the principal clerk, and immediately left the chair, and walked out of the House. He was followed by Dr. Chalmers, Dr. Gordon, Dr. M'Farlan, and the whole of the Non-intrusion party, all the benches usually occupied by them being emptied. The secession was hailed with loud acclamations in the gallery, but these soon subsided, and the party left the church with the utmost silence from those that remained. When they got outside the church, they were received with cheers and some hisses by the mass of people assembled. Having formed into order, they proceeded three abreast to Tanfield, Stockbridge; but along the line of procession, which was densely crowded, there were no expressions of applause or dissent. On their arrival at Tanfield the meeting was constituted by the name of the "Assembly of the Free Presbyterian Church of Scotland." Dr. Welsh then rose, and after saying that he felt assured "the eyes of every individual in that Assembly—the eyes of the whole Church and country—the eyes of all Christendom—were directed to one individual, whom to name was to pronounce his panegyric"—Dr. Chalmers, he proceeded to relinquish to him the chair of Moderator. Dr. Chalmers exhorted the Assembly. Dr. Candlish and others proposed measures for organising the new kirk, and for strengthening their own hands. Six committees were appointed to provide interim supplies of ordinances—means of education for their ministers—a church polity; to prepare an address to the adhering people, and letters to be addressed to corresponding churches at home and abroad. The meeting was then adjourned till the next day, when a deputation from the Presbyterian Church of Ireland came forward to the bar, with an address expressive of the sympathy and concurrence of that Church with the proceedings of those who now constituted the Free Presbyterian Church of Scotland. Several of the members of the deputation addressed the Assembly, warmly approving the course they had taken in vindicating their principles. Dr. Chalmers, in the name of the Assembly, thanked the Presbyterian Church of Ireland for their friendly sympathy and

HORTICULTURAL BUILDING and HEATING by HOT WATER

J WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hot-house-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

G U A N O N S A L E,
BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

Just Published,

A TREATISE ON "RENDLE'S TANK SYSTEM OF COMMUNICATING HEAT," by Wm. E. RENDLE, F.H.S., Plymouth, can now be obtained of all Booksellers, or from the Author, at 5s. 6d. (free by post.) Embellished with eight Wood Engravings.

LONGMAN, BROWN, GREEN, and LONGMANS.

ILLUSTRATIONS OF BRITISH GRASSES.

Just published, 4to. with 118 Plates, beautifully coloured, 3l. 10s., bds., **GRAMINA BRITANNICA**; or, Representations of the British Grasses; with Remarks and occasional Descriptions. By I. L. KNAPP, Esq., F.L.S. & A.S. Second Edition. London: LONGMAN, BROWN, and Co. Bristol: W. Strong.

This day is published, 8vo, price 6s.,

THE JOURNAL OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND. Vol. IV., Part I.

CONTENTS:

Mr. Grev, on Farm-Buildings—Tussac Grass in the Falkland Islands—Earl Lovelace, on Mangold Wurzel—Mr. Pusey, on Thorough-Draining, or Land-Ditching—Mr. Barugh Almack, on the Drill Husbandry of Turnips—Mr. Pusey, on Horse-hoeing Flat-drilled Turnips—Mr. Walsden, on Poughing up Down-Land—Lord Portman, on Shepherd's Corner Farm, Dorsetshire—Mr. Curtis, on Insects affecting Turnip Crops—Mr. Hyett, on the Nutritive Values of different Crops—Sanitary Effects of Land-Draining—Raising Turnips by means of Sulphuric Acid, &c.—Mr. Stace, on Rotations of Crops on Heavy Land—Mr. White, on Draining and Subsoil-Ploughing—Mr. Hannan, on Rape dust—Mr. Balmer, on Cropping in the South of Scotland—Mr. Johnston, Agricultural Tour in Denmark, Sweden, and Russia—Mr. Grey: Experiments with Guano, &c., on Turnips—Professor Playfair, on Rearing and Feeding Cattle.

MISCELLANEOUS.—Experiments on Manures—Prevention of Blight on Apples—Burning Clay—White Carrots—Experiments on different Manures for Carrots—Black Foxtail Grass—On Varieties of the Foxtail Grass—Pipe-Tiles—The Feeding Properties of Swedes and of Mangold-Wurzel—Nitrate of Soda—Bituminous Shale at Christian Malford, Wilts.—On Purifying the Air of Stables—Failure of Red Clover after Harvest.

JOHN MURRAY, Albemarle-street, Publisher to the Royal Agricultural Society of England.

JOHN READ, Sole Inventor and Patentee of the STOMACH AND ENEMA PUMPS, &c. (Vide the Life of Sir Astley Cooper.) Also the Improved GARDEN SYRINGE, for the invention of which the Royal Horticultural Society honoured him with their silver medal, as being the best instrument ever offered to their notice. Likewise HORTICULTURAL MACHINES of every description, which are so simple in operation, that they may be worked by a Lady with ease, dispersing water in form of a gentle shower or dewfall. Also Single and Double Action GARDEN and LOCAL FIRE ENGINES, so portable, as to pass through any common doorway, and may be kept in a House or public Building; will discharge 20 gallons per minute, a distance of 60 feet. The above may be worked by two men, and with four men may be continued for any length of time. These Engines are so constructed, that by shifting a single pin they may be worked by one Man with ease, for all Horticultural purposes. The Valves being of Solid Metal can never get out of repair, but are ready to act in an instant. May be seen and proved at 35, Regent Circus, Piccadilly. N.B.—None are genuine except stamped with the Patentee's Name.

MECHI'S ELEGANCIES for PRESENTS and USE.—The greatest variety for Ladies and Gentlemen, both in price and choice, is at MECHI'S MANUFACTORY and Export of ELEGANCIES, No. 4, Leadenhall-street. Here may be suited the economist or the luxurious. Bagatelle tables, 3l. 10s. to 13l. 10s.; writing-desks, 10s. to 20l.; dressing-cases, 20s. to 100l.; work-boxes, 12s. to 20l.; leather writing-cases, with or without dressing-case, 18s. to 16l.; tea-chests, 7s. 6d. to 8l.; envelope-cases, 10s. to 10l.; inkstands, in wood, bronze, and papier-maché, 6s. to 6l. 6s.; splendid papier-maché work tables, 10l. 10s. sets of tea-trays, 8l. to 20l.; work and cake baskets, 25s. to 50s.; card-racks, 16s. to 100s.; hand screens, 18s. to 48s.; netting-boxes, 25s. to 27s.; card boxes, 2l. to 5l. 5s.; pocket-screens, 4l. 10s. per pair; ladies' folios, richly painted, 30s. to 3l. 3s.; ladies' companions, or pocket work-boxes, in pearl, shell, paper, and leather, at all prices; ladies' scent and toilet bottles, 7s. 6d. to 3l. 3s.; ladies' card-cases, 10s. to 5l.; elegant chess-boards and ivory chessmen, various prices, to 16l. 16s.; watch-stands, 27s. each; gold and silver pencil-cases; elegant cases of seven-day razors, from 25s. to 10l. 10s.; ivory-handled and Scotch strops, in every variety; sporting knives, from 10s. to 3l.; splendid Wharfedale knives; ladies' scissors, 5s. to 50s. per pair; cases of plated and silver desserts, to 25l.; cases of splendid table cutlery, to 40l.; and a variety of other articles; of which catalogues may be had, gratis. As MECHI manufactures extensively on his own premises, the quality of every article is warranted.—Table Cutlery, Sheffield Plate, &c.

AERIAL NAVIGATION.—ROYAL POLYTECHNIC INSTITUTION.—A LECTURE on this subject, illustrated by MODELS of several kinds, which elevate themselves by MECHANICAL FORCE alone, is delivered at two o'clock daily, in addition to all the varied and instructive amusements of the Institution. Admission, One Shilling; Schools Half-price. Open Mornings and Evenings, except Saturday evening.

LUFF & CO.'s BOUDOIR PIANOFORTE, 25l., package included. LUFF & CO.'s COTTAGE PIANOFORTE, 27l., package included. For Tone, Touch, Durability, and Cheapness, never before offered; keeps well in Tune, and is prepared for extreme Climates. L. & Co.'s Patent Pianofortes equally cheap. Pianofortes for Hire, from 24l. Instruments taken in exchange. LUFF & Co., 103, Great Russell-street, Bloomsbury.

TO NURSERYMEN.
TO BE LET, on the Southern Coast, a desirable NURSERY-GARDEN, with House, Greenhouse, Hothouse, &c. Apply at the Office of Mr. WILLIAM BROMLEY, Solicitor, Gray's Inn Square.

MINIATURE GREENHOUSES of an IMPROVED CONSTRUCTION. These beautiful Greenhouses can be had of any form and size; round, square, hexagon, octagon, &c., glazed, japanned, and completely fitted up, at a moderate expense. **ZINC FLOWER POTS.** These novel articles are more handsome and durable than the old red clay pots, and the plants flourish with increased vigour, owing to the current of electricity generated by the Galvanic Circuit of Metal, Earth, and Water. **ZINC GARDEN LABELS** in great variety. Garden Hand-frames, Cucumber-frames, &c., &c. All kinds of Horticultural Articles, suitable for Noblemen, Gentlemen, and Amateur Gardeners, on hand, or made to order, at HENRY HEWETSON'S Zinc Manufactory, 87, Cannon-street, London Bridge.

BUTTER MADE IN TEN MINUTES.
BY THE NEWLY-INVENTED CHURN.
REGISTERED ACCORDING TO ACT OF PARLIAMENT.
ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES.
This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Zinc Pans for Churns to stand in, extra. N.B. Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, LEWES.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street.

BEE-HIVES.—GEORGE NEIGHBOUR and SON beg to inform their Apian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Bee-hives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and SON have also Glass Hives and other articles connected with Bee Management, at their Apian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps enclosed.

*** "NUTT ON BEES" (5th Edition), now published.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, Gloucester-place, Chelsea. BUILDERS, &c. The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

TO NURSERYMEN, HORTICULTURISTS, &c.
PROPAGATING GLASSES.—White, 1s. 2d. per lb., Green, 1s. per lb., or from 2s. 6d. to 24s. per doz. CUCUMBER-TUBES, all lengths, from 6d. to 4s. each; GRAPE-SHADES; with holes, from 2s. 6d. each; FISH-BOWLS, from 1s. 6d. each; Fish-bowls, for fountains, with hole in bottom, 2s. 6d. per lb.; at APSLEY PELLATT'S FALCON GLASS-WORKS, HOLLAND-STREET, BLACKFRIARS, where every description of Table-Glass and China is on sale. Days for viewing the Manufactory, Tuesday, Wednesday, and Thursday.

ROWLAND'S ODONTO, or PEARL DENTIFRICE.—A Vegetable White Powder, prepared from Oriental Herbs of the most Delicacious Odour and Sweetness, and free from any mineral or pernicious ingredient—it eradicates Tartar from the Teeth, removes decayed spots, preserves the Enamel, and fixes the Teeth firmly in their sockets, rendering them beautifully white. Being an anti-scurvitic, it eradicates Scurvy from the Gums; strengthens, braces, and renders them of a healthy red; it removes unpleasant tastes from the mouth, which often remain after fevers, taking medicine, &c., and imparts a delightful fragrance to the breath.—Price 2s. 9d. per box, duty included.

ROWLAND'S ALSANA EXTRACT immediately relieves the most violent Toothache, Gum-boils, Swelled Face, &c.; it is also an excellent Stomachic, in cases of Flatulency, Spasmodic Affections, &c., and gives instantaneous relief.—Price 2s. 9d., 4s. 6d., and 10s. 6d. per bottle.

NOTICE.—A. ROWLAND & SON, 20, HATTON-GARDEN, LONDON, is engraved on the Government Stamp, which is pasted on each article; also printed, in red, on the wrapper of the latter. Sold by them, and by Chemists and Perfumers.

[BY HER MAJESTY'S ROYAL LETTERS PATENT.]

TO NURSERYMEN, FLORISTS, GARDENERS, and OTHERS.

F. McNEILL & Co., Patentees of Improved Patent ASPHALTED FELT, beg to draw attention to their superior manufacture for ROOFING, which is now so extensively used in lieu of slates, tiles, thatch, &c., for Houses, Cottages, Out-buildings, Verandahs, Sheds, and, in fact, every description of building, and is particularly adapted, from its non-conducting qualities, as a covering and protection for plants, &c. This article is manufactured purposely for securing a perfectly tight roof against rain and snow, and for resisting the external heat of the sun, by its non-conducting qualities. It is impervious to wet, and not liable to crack with changes of temperature. The timber and woodwork may be extremely light, as the weight of the FELT is only 24 lbs. per 100 square feet; and thus, in timber alone, there is a saving of at least one-half; and the expense of the FELT, as compared with tiles, is considerably less than one-half; and with slating the difference is still greater. This article combines economy, durability, and neatness; it is manufactured 32 inches wide, and may be ordered for the length of any building, thereby preventing the necessity of many joinings; and any unpractised hand may roof a moderate-sized house in a few hours.—Parties sending to the manufactory, Lamb's-buildings, Bunhill-row, London, may have it immediately cut off from the machines, and furnished on the instant, so that they pay for no more than is actually required. The price of Roofing Felt is only 1d. per square foot.

*** Samples, with full directions as to its application, sent to any part of town or country, and orders by post immediately executed.

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row.

ORNAMENTAL WIREWORK FOR THE GARDEN,

390, OXFORD STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in FANCY WIREWORK, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hothouse Engines, Syringes, Fumigating Bellows, and other Horticultural Implements. G. B. THOMPSON'S Improved Waterpots, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

WANTED TO PURCHASE, An IRON VINERY, 13 feet high in back, 6 feet high in front, 15 feet wide, and about 35 or 40 feet long. Any one wishing to dispose of a Metal Vinery, of nearly those dimensions, of sound material, and strength sufficient to be taken down and conveyed to a considerable distance, may apply by letter, post-paid, giving full particulars—dimensions, price, and where it may be seen—to Mr. BOTHWELL, Dungannon Park, Ireland.

SEVENTH EMIGRANT SHIP.

FOR ALGOA BAY, Cape of Good Hope.—Last Shipping-day for Cargo, 30th June; sailing-day, 5th July. The very superior fast-sailing Coppered Ship ABBOTSFORD, A 1, burthen 550 tons, JAMES S. CHAMBERS, Commander, lying in the London Docks. This fine vessel has very superior accommodations for Cabin, Intermediate, and Steerage Passengers; her height between decks above six feet, and carries an experienced Surgeon. For Freight and Passage, apply to Mr. J. S. CHRISTOPHERS, East India Chambers, Leadenhall-street, London.

HATCHING APPARATUS.—Reduced Prices.—Messrs. TODD and SON, of Bury-street, Bloomsbury, beg to call the attention of the Public to their PORTABLE PATENT HATCHING AND REARING APPARATUS, being the original Manufacturers. This successful invention is capable of Hatching, at a trifling expense, any number of Game and Poultry Eggs of all sorts, from 50 to 200 at one time, and possesses the further recommendation of rearing the young birds at all seasons, and of furnishing Poultry for the table at a trifling cost, at all periods of the year. For further particulars, apply at the Manufacturers'. A Machine may be seen in use daily.

PARR'S LIFE PILLS.—The sale of this wonderful medicine has extended all over the world; and the benefit resulting by their use, is experienced by persons in all climes and countries. From the following extract it will be seen that, in British North America, PARR'S LIFE PILLS are producing their undoubted results—the restoration of the afflicted to health. Extract of a letter received by Messrs. A. Savage and Co., Montreal, from Mr. VARRY, a respectable Medical gentleman in Niagara, British North America:—"Enclosed I send you Cash, being the amount of first supply of PARR'S LIFE PILLS. I am now entirely out of the Pills, and could have sold many more on Saturday evening; as they are inquired for every day, and no small disappointment prevails in the town and neighbourhood in consequence of my supply being consumed. I have sold some few boxes to a country Merchant who has been afflicted with an affection of the Diaphragm and Liver, and he has found so much relief from the Pills that he has determined upon introducing them in his neighbourhood. I have been visited by persons who have travelled upwards of thirty miles to obtain them. The demand for them has exceeded my most sanguine expectations; several persons in this town have been cured of different disorders by their use:—one woman was confined to the house for six weeks, under one of our most skillful Physicians, with a liver complaint; and was told by him, that she would never recover. This gentleman cupped her, and said if the pain returned he must be sent for immediately. The pain did return, and she sent for PARR'S LIFE PILLS. This was on Thursday, and on the following Sabbath she was able, for the first time in six weeks, to attend at church. Her husband told me that his wife is now in better health than she has been for ten years. One case more before I close. An old woman living with my father for the last fifteen years, has, to my knowledge, been afflicted for that length of time with inflammation of the eye-lids—so bad at times as to deprive her of sight. She is upwards of 50 years of age; and for years could eat nothing but certain kinds of food. She has been taking PARR'S LIFE PILLS—her eyes are well, and she can eat anything, with a good appetite. This case of cure I have been an eye-witness to. (Signed) GEORGE VARRY, JUN." Sole Proprietors, T. Roberts and Co., Crane-court, Fleet-street, London; and sold wholesale by their appointment, by E. Edwards, 67, St. Paul's Churchyard; Barclay and Sons, Farringdon-street; Sutton and Co., Bow Churchyard; Mottershead and Co., Manchester; and J. and R. Raimes and Co., Lamburn; and retail by all respectable dealers in medicine in Town and Country. Price 1s. 1d., 2s. 9d., and family boxes, 11s. each. Full directions given with each box.

BEWARE OF IMITATIONS!

WANT PLACES.—All Letters to be post-paid.
AS GARDENER, a single Man from the country, aged 25, who has a Practical Knowledge of his business, and can be highly recommended from the Situation he is about to leave. Direct to R. P., Mr. Brown's Forcing-houses, Acton-green, Middlesex.

AS GARDENER, a married Man, aged 29, who understands the management of Greenhouse, Forcing, Flower, and Kitchen-Garden; he can have a good character from the family he has just left. Direct to A. R., Mr. Moore's, Grocer, Upper Clapton, Hackney.

TO GARDENERS.

AS FOREMAN or JOURNEYMAN in a good Establishment, a young Man who has had a good deal of practice, and will be found every way suitable; can give a satisfactory character.—Direct to A. P., Bedwell Park Gardens, Essendon, Herts.

AS GARDENER, ALEXANDER MACDONALD, Heaton Villa, near Stockport, will be at liberty on the 3d of June to engage with any Gentleman. He has devoted all his energies to his profession, on the most improved principles, particularly in the cultivation of Pines, Grapes, and every necessary in the Forcing, Kitchen, Fruit, and Flower Garden; is married, aged 34, can have a 9 years' unexceptionable character from the Situation he is now filling, and has a good knowledge of Scotch and English Farming, if required. Wages moderate.—After the 3d of June direct to Mr. J. HAMILTON, Gardener, F. A. Philips, Esq., Thornfield, Heaton Norris, near Stockport.

TO GENTLEMEN FARMING THEIR OWN ESTATES.
AS BAILIFF.—A young Man who has had experience in Agricultural business in all its branches wishes to obtain a Situation as above. Respectable references can be given, and he can be well recommended from his last Situation, where he lived several years. Has no objection to engage himself to a gentleman about to emigrate.—Address to W. F., Post-office, Canshalton, Surrey.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitehall, in the City of London, and Published by them at the OFFICE, 8, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, May 27, 1849.

TO BE SOLD, by Private Contract (the Proprietor going abroad), a small NURSERY, SEED-SHOP, GREEN-HOUSES, PITS, &c. &c., situated part at Camberwell and part at Peckham. May be viewed any day except Sunday, and immediate possession had if required.—Apply to JAS. KNIGHT, Seedsman, &c., Camberwell-terrace, Surrey, from whom every particular may be obtained.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25% to 500%, for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of FREDERICK LAWRENCE, Resident Secretary, 112, Cheapside.

ANNUITIES.—In the AUSTRALASIAN COLONIAL, and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of interest.

DIRECTORS.

Edward Barnard, Esq., F.R.S. C. E. Mangles, Esq.
Henry Buckle, Esq. J. B. Montefiore, Esq.
John Henry Capper, Esq. J. H. Ravenshaw, Esq.
Gideon Colquhoun, Jun., Esq. William Walker, Esq.

BANKERS—Union Bank of London.
COLONIAL BANKERS—Bank of Australasia (Incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN—P. Fraser, Esq., M.D., 62, Guildford-st., Russell-sq. Prospectuses, with Tables, Forms of Proposals for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Offices of the Company, No. 126, Bishopsgate-street, City.

EDWARD RILEY, Secretary.

COTTAM and HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch . . . 47 0s. 0d.
(Larger Sizes in proportion.)

Roger's Boiler, small size . . . 3 15 0
Ditto do. large do. . . 4 10 0

Hot Water Pipe, 4 inch diameter, 1s. 3d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 4s. 0d. each.

Strong do. do. do. 45 lbs. at 4 s. 0d. each.

Ox Hurdles, 4 feet high, do. 60 lbs. at 5 6

BEST WIRE FOR STRAINED WIRE FENCING at 1s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire work, &c.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7s.; 4 feet 6 in., 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

CAST IRON KUSTANDS, 2 feet inches 6 high, 5s. 9d. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations. Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87, renders it unnecessary to enter any remarks upon them beyond the following brief description.—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 16 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.

N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

THE CONICAL HOT-WATER BOILERS invented

by J. ROGERS, Esq., may be obtained of any size from JOHN SLEWEN, Ironfounder, &c., Sevenoaks, Kent.

J. SLEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements, suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery: they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

LIQUID MANURE.—PUMPS of a superior construction for Liquid Manure, portable and stationary. Garden Pumps, Hydraulic ditto, and for deep Wells; also for Ships, Barges, Tanners, Brewers, Soap-boilers, &c. Pumps kept for Hire, for Wells, and Excavations.—BENJAMIN FOWLER, late GEORGE TURNER, 63, Dorset-street, Fleet-street.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

*** POTTER'S Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE, as Imported, of first quality, and in any quantity, direct from the bonded stores, either in Liverpool or London. Also, NITRATE OF SODA. Apply to H. ROUNTHWAITE & Co., Merchants, 6, Cable-street, Liverpool.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

Published this Day, 4th Edit., greatly enlarged, 8vo., with nearly Two Hundred and Forty Illustrations on Wood. 21s. cloth, **ELEMENTS of PRACTICAL AGRICULTURE**, comprehending the Cultivation of Plants, the Husbandry of Domestic Animals, and the Economy of the Farm.

By DAVID LOW, Esq., F.R.S.E. Professor of Agriculture in the University of Edinburgh.

*** This Edition contains large and interesting additions on the chemical constitution and geological relations of soils; on the effects of climate and altitude; on the nature, uses, and cultivation of manures; on the principles of tillage and the success of crops; on the theory and practice of draining, &c.

Lately published, by PROFESSOR LOW, The BREEDS of the DOMESTICATED ANIMALS of the BRITISH ISLANDS. 2 vols. 4to., with 52 coloured Plates, 16 guineas, half-bound morocco.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

TWO HUNDRED FLOWERS AND PLANTS familiarly described; 80 interesting Papers on Practical Gardening, illustrated with 20 Engravings, are contained in Parts IX. and X. of THE GARDENER AND PRACTICAL FLORIST, published June 1; also Volume I., bound in cloth, price 7s. 6d. London: R. GROOMBRIDGE, 5, Paternoster-row, and all Booksellers.

Just published, price 3s., fcp. 8vo.

FLORA ODORATA; a characteristic Arrangement of the Sweet-scented Flowers and Shrubs cultivated in the Gardens of Great Britain. With directions for their Propagation, Management, &c. &c. By FREDERICK J. MOTTE.

London: C. A. BARTLETT, 60, Paternoster-row; ORR and Co., Paternoster-row. Leicester: BROWN and HEWITT.

Published this day, 12mo. price 9s.

A MANUAL OF BRITISH BOTANY. Containing the Flowering Plants and Ferns, arranged according to their Natural Orders. By CHARLES C. BABINGTON, M.A., F.L.S., F.G.S., &c. JOHN VAN VOORST, 1, Paternoster-row.

FAMILIAR ASTRONOMY. By GEORGE DARLEY, A.B., Author of a System of Popular Geometry, — Companion to the Popular Geometry, — a System of Popular Algebra, — and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—Sun.

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

LITHIC ANTI-CORROSION PAINT, from its Strength and Durability, forms an excellent coating for Greenhouses, Conservatories, and Outbuildings. Its antiseptic qualities particularly adapt it for the preservation of Wood and Iron Fences; and it may be advantageously employed upon good Brickwork, in place of stucco or other covering. Manufactured in stone and slate colours by JOHN BAZLEY WHITE & SONS, Roman and Keene's Cement Manufacturers, Millbank-street, Westminster.

WHITSUN HOLIDAYS.

AERIAL NAVIGATION.—ROYAL POLYTECHNIC INSTITUTION.—A LECTURE on this subject, illustrated by MODELS of several kinds, which elevate themselves by MECHANICAL FORCE alone, is delivered at Two o'clock daily, in addition to all the varied and instructive amusements of the Institution. Admission, One Shilling; Schools Half-price. Open Mornings and Evenings, except Saturday evening.

ROWLAND'S MACASSAR OIL.—Under the Special Patronage of Her Most Gracious Majesty the QUEEN, the Royal Family, and the several Courts of Europe. This Oil is universally acknowledged to be the ONLY ARTICLE that will effectually produce and restore Hair, prevent it from falling off or turning grey, free it from scurf and dandruff, and will render it delightfully soft and flexible. It will also preserve the coiffure in the heated atmosphere of crowded assemblies. CAUTION.—Much pernicious trash is now offered for sale as "MACASSAR OIL," it is therefore of great importance to purchasers to see that the words "ROWLAND'S MACASSAR OIL" are engraven on the wrapper. All others are "gross impositions." The Proprietor's Signature is also engraven on the wrapper, thus:—A. ROWLAND & SON, 20, HATTON GARDEN, LONDON; Countersigned "ALEX. ROWLAND." Price 3s. 6d.—7s. Family Bottles (equal to four small), 10s. 6d., and double that size 21s. per bottle. Ask for "Rowland's Macassar Oil." Sold by them, and by Chemists and Perfumers.

BULB CUCUMBER-GLASSES, for Watering by Evaporation during the growth of the Fruit, 2s. 6d. to 3s. 6d. each; GRAPE-GLASSES, with holes, 1s. 9d. to 2s. 6d. each; BEE-GLASSES, 1s. to 2s. 6d. each. Cylindrical CUCUMBER-TUBES, from 6d. to 4s. each; PROPAGATING-GLASSES, Green, 1s. per lb.; white, 1s. 2d. per lb.; or 2s. 6d. to 24s. per dozen; FISH BOWLS, from 1s. 6d. each; ditto, with hole in bottom for Fountains, 2s. 6d. per lb., at ASHLEY PETTLATT'S Falcon Glass Works, Holland-street, Blackfriars. Orders from the country, accompanied with a Post-office order, will meet with prompt attention.

DESIRABLE RESIDENCE for an HORTICULTURIST.—A Mansion-house, fit for the residence of a genteel family; Coach-house and Three-stall Stable; situated in the village of Fulford, one mile and a half from York. The House is surrounded by Three Acres of Garden Ground, soil deep and very productive: Orchard in full bearing; Wall-fruit, Hot-house, Melon-pits, and Tanks (well supplied with water); nearly Four Acres of Meadow-Land, with a stream running through it. To be Sold, or Let by the Year or on Lease; Rent, 80l. per annum. A good Cottage adjacent may be had for the additional rent of 6l. per annum. The premises may be seen by application to JOSHUA GRAY, Esq., solicitor, High Petergate, York.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTH, upon application to the Gardener.—Sundays excepted.

BUTTER MADE IN TEN MINUTES. BY THE NEWLY-INVENTED CHURN.

REGISTERED ACCORDING TO ACT OF PARLIAMENT. ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES. This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25s.	35s.	42s.

Zinc Pans for Churns to stand in, extra. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, Lewes.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIGBY'S Brush Warehouse, No. 80, Gracechurch street; LIVERMORE and SON, Ironmongers, No. 30, Oxford street.

PARR'S LIFE PILLS.—The sale of this wonderful medicine has extended all over the world; and the benefit resulting by their use is experienced by persons in all climes and countries. From the following extract it will be seen that, in British North America, PARR'S LIFE PILLS are producing their undoubted results—the restoration of the afflicted to health. Extract of a letter received by Messrs. A. Savage and Co., Montreal, from Mr. Varry, a respectable Medical gentleman in Niagara, British North America:—"Enclosed, I send you Cash, being the amount of first supply of PARR'S LIFE PILLS. SATURDAY, JUNE 3, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Monday, June 5 Entomological 8 p.m.
 Tuesday, June 6 Horticultural 8 p.m.
 Wednesday, June 7 London 8 p.m.
 Saturday, June 10 Royal Botanic 4 p.m.
 Tuesday, June 13, South London Floricultural, Surrey Zoological Gardens
 Wednesday, June 14 Medical Botanical 8 p.m.
 Saturday, June 17 Horticultural, (Chiswick Gardens).
 Country Show, Thursday, June 8, Hodgesdon Cottagers

We are happy to announce to the Fellows of the Horticultural Society, that the Council have directed the Garden at Chiswick to be kept open till 8 o'clock in the evening during the months of June and July, which it is hoped will be agreeable to those whose business keeps them in London during the afternoon. We would also direct the attention of visitors to some highly interesting experiments on manures which are now in progress in this establishment. Wheat, Potatoes, Turnips, and Peas, are the subject of examination in the Stove and Hothouse Department, under the direction of Mr. Edward Solly; and the influences of phosphate of ammonia, sulphate of ammonia, nitrate of soda, chloride of sodium, and other saline substances, are already becoming manifest in a highly instructive manner.

We would advise all who love flowers to visit the exhibition of American plants now on view at Messrs. Waterers, in the Kings-road; they will find themselves amply rewarded for their trouble. Under a large canvas roof is formed a temporary garden, with gravel walks, turf, and some thousands of American plants, as fresh as if they were still growing in the pure air of Bagshot. About 160 yards of winding walks are bordered by the most magnificent Rhododendrons one can imagine, intermixed with Azaleas of many colours, and the broad-leaved Kalmia. Of the former, we measured one specimen 18 ft. in circumference, about 9 ft. high, and loaded with about 600 clusters of beautiful pale violet blossoms. Others have stems from 4 ft. to 5 ft. high, and heads bending down with the weight of bloom. A broad-leaved Kalmia, 7 ft. high, and 6 ft. in diameter, will in a few days be a sheet of waxy blossoms.

Although these are perhaps the largest and finest plants in the collection, there are many others that approach them nearly, in all shades, of pink, rose-colour, white, blush, and lilac. We will not pretend to enumerate the varieties of Rhododendron to be found here, with the single exception of what is called Everestianum, a charming kind, whose corolla is very large, pale purple, half transparent, and delicately crumpled at the edges, but at once refer our readers to the collection itself, which, we may add, is now in all its beauty.

The following letter appeared in the *Church and State Gazette*, to which we would draw the attention of our clerical readers:—

EDUCATION OF THE AGRICULTURAL POOR.

To the Editor of the *Church and State Gazette*.

SIR,—One of the greatest difficulties the clergy of country parishes have to contend with in the education of their poorer parishioners, is the want of funds; and this difficulty (as it seems to me) is hardly to be overcome by any of the hitherto proposed schemes. There is no doubt but that the improvement in the standard of education which is supplied by our Diocesan Training Schools, will do much; but it will not do all that is necessary to relieve the country clergy of this difficulty; it may provide a more efficient master or mistress, and thereby excite a better desire than now exists on the part of the poor for the education of their children, but it will not provide funds adequate to the maintenance of such master or mistress. Under this persuasion I venture to beg a short space in your valuable and widely-circulated paper, to call the attention of the clergy to a plan which has been very successfully tried in this neighbourhood, and which promises to supply the almost universally-experienced difficulty I speak of in the way of funds. A landed proprietor has established what are termed "agricultural schools," upon a principle of uniting our present national and agricultural instruction; and by so doing, of making the labour of the little scholars, while under tuition in the art of husbandry in the afternoon, to compensate the master, in the way of salary, for the instruction they receive from him, in the usual course of our national education, in the morning. Schools have already been established upon this plan at the villages of East Dean and Willington, and they are attended with the happiest results. The usual quantity of land required for the purpose does not exceed five acres, and for this the master pays a rent, certainly equal to, and in most cases

beyond that of the adjoining land occupied by farmers. In the case of the Willington school, there is an appropriate house for which the master pays an additional rent. The only payment in money to the master is the usual penny a week from each scholar.

"Professor Daubeny lately visited these schools, and has approvingly noticed them in his article upon the 'Public Institutions for the Advancement of Agricultural Science,' in the last volume of the journals of the Royal Agricultural Society of England: saying, among other things, 'So far as the scholars are concerned, it would appear that a sufficient number of hours is allotted to impart to them an adequate knowledge of reading, writing, and arithmetic.' Dr. Mackenzie, of Kinellen, Dingwall, has also examined them, and noticed them in a little tract, called 'Britain's Danger and Safety.'

"Now surely, Sir, the clergy of small agricultural parishes would do well to consider whether they may not here find a means whereby a difficulty in the way of their educating the children of their poorer parishioners, at present apparently insuperable, may not be overcome. They have, for the most part, glebes at their disposal, and which if let on this understanding would produce to them quite as much rent as they could otherwise obtain, and provide at the same time their poorer neighbours with the means of a suitable education for their children. The extensive tithe-barns, now rendered unnecessary by the Tithe Commutation Act, would give them every facility, with but trifling alterations, for the establishment of a school-house. Nor can any reasonable objection be made to this plan on the ground of so employing the boys in the afternoon. The girls in our national schools are taught, and for the same number of hours, to work with the needle, the use of which, however, is not more important to them than is that of the spade and the hoe to the boys.

"But I have already occupied more space than I purposed in your columns, and therefore I will not at this time do more than add my earnest desire that the country clergy, whose parishes are otherwise without the means of supporting schools, will give my kind neighbour's suggestions a fair and sufficient trial.

"I remain, Sir, your obedient servant,

"Dec. 26, 1842.

"CLERICUS."

"P.S.—Any particulars respecting these schools may be obtained, by application to Mr. G. Cruttenden, Agricultural School, Willington, East Bourne."

Where schools are already established, and funds raised to maintain them, it would still be an improvement if the children were taught to work as well as to read and write. A national school was established at Winkfield, near Windsor, in 1835, patronised by the Royal family and the wealthy inhabitants of the Forest. Ample funds were raised to build a neat house for a master and mistress, and two school-rooms, one for boys and another for girls, with a workshop and sheds for tools. The garden was only two acres in extent until lately, when two acres more adjoining were purchased. The produce sold from two acres in 1842, amounted to upwards of 20*l.*, besides the vegetables used in the master's family, whose wife teaches the girls. The children learn to read, write, and cypher, four hours in the day, and work four hours (two hours in the morning and two in the afternoon). In wet weather the boys are employed making mats and baskets; in fine weather they work in the garden. The girls sow and knit stockings. The children pay twopence each per week, half of which, together with half the produce of the garden, is given in rewards once a year, chiefly in articles of clothing, in proportion to their attention and progress. The vicar of the parish, the Rev. W. L. Rham, directs the operations in the garden, and has the general superintendence. The plan has been found completely successful, and there are, or were lately, 45 boys and 37 girls taught in the school. The girls' work produces but little; but there is no doubt, that, with proper management, the 45 boys, paying 2*d.* a week and working on 5 or 6 acres of land, would indemnify a master who knew how to employ them to the best advantage.

Many improvements might be introduced in the mode of teaching the boys to work. The more advanced might be made to direct the work of the younger, and each having a responsibility, the work would be more systematically and profitably done. There are other schools where hours of working have been introduced; but in none besides that at Willington and another at East Dean has the system of entire self-support been tried, as far as we know. If this example could be followed successfully in various parts of the country, there would no longer be any obstacle to the education of every individual amongst the labouring population; uniting as much of letters as is useful to men in their station with those habits of industry which are so essential to their happiness and prosperity in life.—M.

PUBLIC opinion as to the manner of heating horticultural buildings has within the last 20 or 30 years undergone a remarkable change, which has by no means reached its end. When the application of hot water to this purpose was first proposed by the late Mr. Bacon, the flue-system was in almost exclusive use. The innovation of that gentleman was either looked upon coldly, or altogether opposed; it was pronounced costly, inefficient, and inapplicable; and

the owners of flues clung to them with tenacity, preferring the evils they were accustomed to, to advantages they knew nothing of. However, in this, as in other things, intelligence and common sense have at last triumphed over ignorance and prejudice; and we do not imagine there is a Gardener in the country who would think of heating any place with smoke flues if he could possibly get hot-water pipes.

Then came contrivances for moistening the atmosphere, and these too were opposed; syringing and watering being asserted to be all that a Gardener could want. However, some who were wiser than their neighbours adopted evaporating-pans: their crops were visibly improved, and evaporating-pans are rapidly coming into use.

Just now attention is directed to the possibility of expelling tan and fermenting stable-litter from a garden, and obtaining bottom-heat also by hot water. Mr. Rendle, of Plymouth, seems to have been the first to direct attention very strongly to the advantage of a method of doing this without the assistance of hot-water pipes; and in a pamphlet lately published by him* he has fully explained his manner of proceeding. While, however, we state this, we must add that the idea of causing water to circulate in troughs is by no means new; on the contrary, it is almost as old as the application of it to horticultural buildings, and even within this last few years has been much employed by Messrs. Corbett, Beaton, Davidson of Stackpole, we think Green, and others. What is most original in Mr. Rendle's plan is the establishment of a double current of water in the same tank, which also forms the foundation of the bed to be heated; but even this is not so new as we at one time supposed, as the following section and plans of a house at Oakley Park, the seat of the Hon. R. Clive, will abundantly prove:

- | | |
|---|---|
| 1 Lower Chamber | 8 Path inside the house |
| 2 Inside the house | 9 Pit full of leaves, to place the pots on |
| 3 End view | 10 Brick supports for flagging |
| 4 Boiler | 11 Evaporating tubes from the lower chamber |
| 5 Troughs, 14 in. wide, and 3 inches deep | 12 Cistern over the boiler |
| 6 Flue | |
| 7 Path in lower chamber | |

This house was erected about 12 years ago; it is 42 feet long, 9 feet high at the back, 3 feet high at the front, 11 feet wide. The lower chamber is 5 feet deep, and is covered by a flagging 3 feet square. It is heated by slack coals at 8*s.* per ton: one ton of coals is sufficient for 12 days in the severest frost, and keeps the thermometer at from 70 to 75 deg. In mild weather, about half the quantity of coals is sufficient to keep the thermometer to that degree. Making an average calculation, 6*d.* in the 24 hours would be the outside expense for coals.

We do not see that Mr. Rendle's plan differs from this in any essential particular, the trough (fig. 5) being in fact exactly the same as his tank, except that the flag-stones do not rest upon it.

We find, however, that, as usual, all sorts of objections are taken to this substitution of a steady, simple, manageable source of bottom-heat for the variable, troublesome, and often very expensive materials now in use. For the present, however, we shall merely refer to the success which has attended it for 12 years at Oakley, at Mr. Lee's of Hammersmith, and at other places. On a future occasion, we shall endeavour

* Treatise on the Tank System of Communicating Heat to Horticultural Structures. London. Longmans.

vour to answer such objections as we have heard of, to show in what way it seems likely to be most usefully applied, and to point out what the circumstances are which have occasionally led to its failure.

THE ANTIQUITIES OF GARDENING.

No. I.—Extracts from a M.S. on Gardening, in the possession of Sir Henry Bunbury, Bart., written by his Ancestor Sir Thomas Hanmer, 1660—1670.

Maracocs.—"The Maracoc is called in Latine Granadilla and Clematis trifolia, and Flos Passionis, the Passion-flower, because there are some parts of the flower which resemble a spear and three nayles, the instruments of the Passion. The flower consists of ten whitish leaves which stand round, and are covered with many crooked threads, of a kind of pale Peach colour, with a ring or circle of deeper Peach colour; out of the middle of the flower comes a pale whitish green head, spotted with red, with five crooked spotted horns, with broadish heads, from the midst of which rises another head, which bears three things like nailes, big above and smaller below. [Rapin, in his 'Poem of Gardens,' alludes to the representations which appear to have given rise to the name of Passion-flower, as follows:—

"In summer months will Granadilla show
Her bloom, which first in Amazona blew,
And graced the shore sent hither from Peru.
On lofty stems indented leaves adorn
The blossoms, which, with prickles, as the Thorn,
Our Saviour's Passion in their form declare,
Show all the barb'rous nails and bloody spear.
For from the midst a three-forked chive she rears,
And each bent grain like a crooked nail appears."]

Amaranthi.—"When Gerard wrote his Herbal, he knew only of two Purple Amaranthes, and one Scarlet, and that with the painted leaves; but of late years the English florists have raised above half a score of new varieties out of seed that came first from Surat, in Persia; many of which are very fine, and are of different scarlets, and other reds, or of lovely yellow; all the colours very orient and faire."

Roses.—"The Damaske Rose is very common with us, and the sweetest of all. The Variegated Damaske, or Yorke and Lancaster, which is the true Damaske, striped well with white; a fine rose when it marks rightly, sweet as the Damaske. Of Yellow Roses we have only one double, which is as big as a reasonable Provins, when it blows well, which it seldom does, either in England or other countries, being eaten up commonly with wormes in the bud. In Italy, they hold it likes best in a coole place. Wee know by experience that it loves to run up high and not to be cut at the tops. It is a lovely flower, being of a rich yellow colour. It blows very well in an open pure aire, near Hogmagog hills, not far from Cambridge, and a light soyle. In Italy, there hath been above these twenty years a fine Rose, the seed whereof came from the East Indies; it is called in Latin commonly Rosa sinensis, by the Indians [Chinese] Fuyo. It grows to a high tree for a Rose, hath a leaf like a Fig [this is doubtless the Hibiscus Rosa sinensis]. Ferrarius was the first raiser of it from seed in these parts of the world."

Christ's Thorn.—"In Latin Paliurus; it is a shrubby bush, with small roundish leaves and many sharp thorns. It grows plentifully in Palestine, and is called Christ's Thorn, because it is thought that the crown of thorns was of this tree."

The Cedar, usually called of Libanus—"No tree continues longer free from corruption than this. Wee have of late had some fine plants raised from seed which are yet very small, so that it is very rare in England as well as in the rest of Europe."

ON VEGETABLE MANURES.

(Continued from page 334.)

2. **Turves.**—In many parts of the north of Germany and Holland, heath-mould is cut into turves, called in German "plaggen." They are either used in stables, for litter, or placed alternately with straw dung, in heaps 4 to 5 ft. high (called Plaggenmist), and after they have become rotten, are used for manuring sandy soils. When long enough subjected to the action of dung (sheep or horse-dung is best, on account of the ammonia developed,) the crops will turn out very fine.

No doubt these turves, if properly mixed with dung, will form an efficient manure for dry, hot, sandy land, which they will supply with humus; and although the latter in the state of turves may be of a carbonaceous nature, yet the action of ammonia and the heating to which it is subjected will dissolve it, as it were, and convert it into vegetable nourishment. The coal of humus will then yield to the crops not only humic acid, but also lime, magnesia, sulphuric and phosphoric acid, alumina, &c. It is clear that the manuring action of turves will be considerably increased, if the heaps are also wetted with the drainage of dunghills, urine, &c., because in this case more ammonia will be generated to decompose the coal of humus. It is also advisable to add some lime, marl, &c., by which means good compost will be produced.

This sort of litter is best adapted for sheep, under whose influence the decomposition of the coal of humus and heaths will be most perfect; and the ammonia formed by the excrements of the sheep will be entirely absorbed by the humus of the turves; indeed the ammonia which is perspired by the sheep will not be lost, as may be ascertained by a simple experiment. If a vessel with humus is placed in a sheep or horse-stable, it will be found that humate of ammonia will be quickly formed. To prevent the wool of the sheep being injured by the turves, which are to be turned root upwards, a slight layer of straw is to be placed on the top.

This sort of manure will be much improved and made sooner available, if, like the leaves of trees, before being placed under the cattle, or mixed with straw, it is thrown

in high heaps and left to rot; by the heating thus produced, not only will the coal of humus (which is always alloyed with wax and resin), but also the heath and its roots, be subjected to a partial decomposition.

When turves are littered in stables, or placed there in some regular order, no sinks for fluid excrements will be required, because the earth of the turves will absorb them. They are to be left, if possible, four to six weeks under the cattle; then conveyed outside, and placed in heaps three to four feet high, for the purpose of heating, and if too dry, they are to be moistened with water. Under such circumstances, the ammonia cannot be lost, because it will be chemically absorbed by the earth of the turves as fast as it is formed.

It is said that turf manure will improve by remaining four or five days in small heaps in the field before it is spread, and it is stated that the air will extract the acid which it always contains. It, however, contains no volatile acid. If it is true that turf manure is improved by lying in small heaps, it can only be by forming more humic acid with the oxygen of the atmosphere, which acid cannot be generated in large heaps so extensively as in small ones, because the air has not free access; and if turves be ploughed in at once, the access of oxygen will be equally prevented.

Although it is well ascertained that making turf manure requires much manual labour and carriage, and that large tracts of land may be rendered still more barren by cutting the heath and its roots; on the other hand, we are to remember that fields of dry sandy soil are much improved by this manure, and it may be asserted that without it the soil would not even return the labour bestowed on it.

Instead of heath, common turf is also used as litter, the roots and the earth surrounding it being cut to a certain depth. This is a much better manure than peat turf, as it contains not only less carboniferous humus (saturated with resin), but the roots of grass are easier decomposed, and possess more manuring material than heath. If such turf is used as litter, the manure may be carried away and ploughed in in three or four weeks; whilst heath will not be reduced to the same perfect state in less than eight or ten weeks. It is seldom, however, that much use can be made of such turf, because this operation spoils whole tracts of land for a long time. It is only turf from roadsides, lanes, &c. that can be used.

(To be continued.)

AMATEUR'S GARDEN.—No. XXII.

Of all the various tribes of plants which we cultivate, there is not one so admirably adapted for blooming through the winter as the Cineraria; and what renders it still more valuable is the fact that any one having a common frame may grow the varieties in as great perfection as those possessing an extensive conservatory. This is the tribe upon which the Amateur must mainly depend for flowers to supply his drawing-room table through the winter. Those readers who possess the *Chronicle* for 1841 will there find my system of cultivating it; but as many do not, I shall here give a short abstract of my practice, which is simple, and has always been attended with very satisfactory results.

About this time the plants that have bloomed through the season must be cut down, turned out of their pots, and have at least half the old soil removed from their roots. This being done, a piece of ground in a sheltered part of the garden, which, if not already rich and friable, must be made so by adding leaf-mould or rotten dung and sand to it—must be prepared, and the plants planted out in rows 15 inches apart, and one foot apart in the row. In planting, the old ball must be kept at least one inch below the level of the surrounding soil, the object being to get the young shoots, as they spring through the soil, firmly rooted before they are removed from the old plant. Throughout the summer the plants must be copiously supplied with water, in dry weather, and be kept free from weeds, either by hand-picking or hoeing; but if the hoe is used care must be taken that the young plants are not injured, as they frequently protrude their offsets at some distance from the centre of the old plant.

By the middle of August the plants will be getting pretty strong; they must then be taken up and parted, retaining as much root as possible to each plant, and not rejecting any in consequence of their being small, as it is upon the various-sized plants that we must depend for a successful display of flowers; since the large plants will bloom in autumn, while the small ones will not flower before the following spring. At this removal the largest plants must be potted in pots proportionate to their size, and be placed in a cool close frame until they are established; after which they may be exposed until the approach of frost renders it necessary to protect them. The small plants, after the ground has been dug over, must be again planted at about one foot apart; they will require a little shading in sunny weather, and will make beautiful plants for potting in October.

The soil which I have found most suitable for Cinerarias is two parts of turfy loam, with one part each of leaf-mould and sandy-peat, mixed together and used as rough as possible; but they will grow in almost any light soil. Some of the old kinds, as Hendersonii, purpurea, elegans, Waterhousiana, and King, are the best adapted for early flowering, and a shrubby kind called Greenii, is also very splendid; but those who do not possess any plants at all may depend upon a tolerable good show of flowers from plants raised from seed. A friend of mine purchased a six-penny packet of seed at Carter's seed-shop in Holborn, 12 months back: from this he raised upwards of sixty plants, a number of them very distinct, and one a blue flower, superior to anything I have ever met with round London; so that the reader will see it is

not an expensive affair to procure a collection of Cinerarias.—W. P. Ayres.

HOME CORRESPONDENCE.

ERRATA.—In Mr. Potter's article on Nitrogen, p. 357, line 39 from the top, for "and is, so to speak, shared by an unconcerned spectator," read "and it, so to speak, stand by," &c. In the same page, line 15 from the bottom, for "slightly weighed," read "slightly weighted." Also, in the article on Apples, page 357, at the bottom of the third column, for "half-penny" read "half-piece," which our correspondent tells us is a mug used in Wales for containing milk, and holds about 28 quarts.

Garden-pots.—I have just made a good improvement on the common flower-pots, which deserves to be universally adopted. The shape, size, and expense are not altered. I have done away with the hole at the bottom altogether; and, instead of the flat bottom, the maker pushes in the centre of it, like the bottom of a common black bottle, only not with so sharp a turn inside, and the drainage-holes are round the sides at the bottom. From 2 to 6 holes, according to the size of the pot, will do all the business of drainage. The roots cannot get through the bottom, neither can the worms get in, and water cannot hang under the pot in winter, which, for Heaths, is the best part of the change.—D. Beaton.

Bees.—Having read in the *Gardeners' Chronicle* of May 20 some observations by Mr. J. Wighton on the plan suggested by "W. W." in the *Chronicle* for April 29, as a remedy against the effluvia arising from the dirt collected in Beehives, I beg to coincide in his opinion, but recommend one of the American floor-boards made by Mr. J. Milton, of No. 10, Great Marylebone-street, which, by its construction, will at once obviate the necessity of lifting up the hive to sweep off the dirt, or dead Bees, &c. As an inclined plane is made to extend the whole length of the centre of the American floor-board, it must of necessity be always clean, as nothing can remain upon it. The slight ascent forms no impediment to the Bees when returning home from their labours of collecting honey or pollen.—W. A. X.

Roses.—I have taken some pains to inquire, amongst private growers and nurserymen, what their opinion was as to the exhibition of Roses by Mr. Milne and my gardener at Chiswick on May 13, and without an exception I find them of the same opinion as myself—that they were highly creditable. I am glad my situation as second enables me to speak disinterestedly; and whilst I hold that we ought always to submit to the judgment of the judges, and give them the credit I do for honesty and impartiality, yet I think a little discussion may prevent the repetition of an error if one be committed, or satisfy the disappointed that the judgment was correct. In No. 5 of this year's *Chronicle* will be found a letter signed "Rosebud," in which I state my opinion as to the possibility of a fine exhibition in time to come, but that the production of 25 varieties in bloom would, from the shortness of the notice and the novelty of the thing altogether be attended with difficulty to the first exhibitors. Who will doubt their being exhibited better in June?—that is the Rose season. Why, the merit of the exhibition, in my view, was their appearing out of season. Now I ask any one of the judges, in the very best spirit—that of inquiry—did they ever produce such a collection as Mr. Milne's with such notice and at that time? If it be easy, how ashamed ought the nurserymen to be—the Rose-growing nurserymen—to let a gardener run them so close (I speak of my own) who had but 36 plants to get his 25 out of, and never grew a rose in a pot in his life before.—G. Beck. [We shall be happy to insert any short letter upon this subject, if rose-growers wish to take it up.]

Plants for a Suburban Garden.—A correspondent having solicited a tabular statement, in the annexed form, of about eight hardy trees, flowering shrubs, and herbaceous plants, that would thrive in three different soils, about 3 or 4 miles from St. Paul's, we insert the following, which may possibly be of more general use:—

SOILS.	TREES.	FLOWERING SHRUBS.	HERBACEOUS PLANTS.
Very poor chalky soil.	No trees will thrive in such a soil as this. It should be improved with a good dressing of cow-dung.	Probably a few Cistus, or Helianthemums.	Peonies, or lilies, may live in such a soil.
Ditto, but manured a little.	Acer macrophyllum, Alnus cordata, Taxodium distichum, Deodar Cedar, Tulip Tree, Silver Fir, Lombardy Poplar, Scarlet Oak.	Berberis aquifolium, Ribes sanguineum, Spiraea arifolia, Philadelphus, Germander, Arbutus unedo, Juniperus, Persian Lilac, Magnolia purpurea, Sweet Bay.	Pentstemon scutellari, Statice latifolia, Hottia japonica, Euphorbia grandiflorum, Geum montanum, Alyssum saxatile, Eriogonum speciosum, Delphinium grandiflorum (dble.)
Glazy retentive soil, and damp situation.	Alnus cordata, Taxodium distichum, Deodar Cedar, Tulip Tree, Silver Fir, Lombardy Poplar, Scarlet Oak.	Gaultheria, Spiraea salicifolia, Common Lilac, Ribes aureum, Ceanothus americanus, Hibiscus syriacus, Halesia tetrapetala, Magnolia glauca.	Campanula grandis, Coreopsis lanceolata, Lupinus polyphyllus, Lathyrus grandiflorus, Glycerhiza macrocarpa, Pentstemon ovatus, Potentilla atrosanguinea, Spiraea trifoliata.

Fumigation.—I observe in last week's *Chronicle* an article on "Smoking Melons and Cucumbers," which you suppose to be original; but if you will refer to Harrison's "Floricultural Cabinet" for 1840, p. 264, you will find the following: "Not having a house, I am obliged to winter my plants in a cold pit, which I have found a difficulty in fumigating, until I thought of the following plan: Take a piece of touch-paper, and lay it on a thin layer of tobacco; then roll it up and tie loosely. Light one end and place it in a flower-pan in the house or pit. I think half-an-ounce used in this way is equal to an ounce with the bellows; and it is not a tithe of the trouble, as it does not require any attention when lighted."

—**W. White.** [This plan, although similar to that referred to by Mr. Beaton, is sufficiently different to entitle him to regard the latter as original.]—In the *Chronicle* of last week, Mr. Beaton gives a receipt for a new method of fumigating plants, by steeping slips of brown paper in a solution of saltpetre, (one table-spoonful to one pint of water,) and then rolling up the paper like a cigar, but hollow, and filled with tobacco. Now, as I took this to be a very ready mode of smoking frames, &c. I thought I would try it, and accordingly steeped the paper in the solution as directed; I then rolled it up, both lengthwise and the shorter way, and also spirally; all these I filled with tobacco, but none of them would burn more than a few minutes. I finally soaked the tobacco in saltpetre and water considerably stronger than the former, and when dry it burnt freely by itself, but when rolled in paper it died out like the former. The ashes in each instance appeared to prevent its combustion longer. As I may not have applied it properly, perhaps Mr. B. will be kind enough to give some additional particulars, through the medium of your Paper.—**Junius.**

Testa di Quaglia.—A reader at Dorchester will be much obliged by some information respecting a plant indigenous to the Island of Malta, and called by the natives Testa di Quaglia, from the strong resemblance of the seed-vessels to a duck or quail's head. What is the true name of this plant?—what are its habits?—and how should it be cultivated?

Bees.—In answer to the inquiry of "W. R. M., Deptford," in the *Chronicle* of Saturday last, I beg to state that on the 1st of May one of my stocks of Bees in a common straw-hive swarmed, the wind being in the east; and on the 20th, this stock cast. It and the two young hives are at my garden at Walthamstow. On the 2d of May another stock, also in a common straw-hive, at my grounds in the Lea Bridge-road, swarmed; on the 14th, it cast, and again on the 20th. All of these, as well as those at Walthamstow, are strong, and whenever the weather is fair work well.—**J. Pamplin.**

Visiting Gardens.—Having had the privilege of making a short excursion into the country near me, to look into what is going on in the gardening world, I beg to lay before the public a few facts which may perhaps be acceptable; and in doing so, I would impress upon my brother-gardeners the great advantage arising from one gardener visiting another for their mutual benefit. Nothing tends so much to develop the mind as to witness in one's neighbour's proceedings effects produced by the most simple methods, while the observer has been perplexing himself for years to bring about the same end. Many instances of this nature have occurred to me during my short peregrinations, both as regards the growth of fruit and vegetables and plants. On calling at Studley Royal, the seat of Mrs. Lawrence, the garden of which is under the able management of Mr. Cuthbertson, I found all, where everything is done upon an extensive scale, in the first order. The Pines are abundant and very luxuriant, and promise well for large fruit and plenty of it. The Vines are also fine, and every house full of fruit and bloom, exhibiting great luxuriance. The kitchen-garden is filled with crops necessary for so large a family, all of which look well, although it is perhaps one of the worst naturally-situated gardens in the country so far as regards the soil, which is a cold, wet, stiff, barren clay, wholly brought to be productive by manual labour, dung, and artificial composts. Many laborious plans have to be adopted, such as being obliged to raise all the beds above the natural level, and adding various light and drying composts to every crop. Nothing can be grown without this precaution. Even for Strawberries, which are generally considered eligible for such situations, it is found necessary to have raised beds, which are in form of a half-cylinder, about 18 inches high in the centre and 4 feet across; they are filled with good soil, and the surface is covered with rough limestone, the plants being placed in the interstices, by which method they succeed to admiration; the fruit is always fine, and being so much exposed, is of the highest flavour and colour, as well as being always free from soil and insects: this hint may be useful to others who may be similarly situated. The ornamental part of the garden and grounds is all in the highest state of keeping, although the collection of plants for such a splendid place does not keep pace with the present improved taste in regard to cultivation. My next call was at Hope Nursery, where I was much surprised to find, in so comparatively isolated a neighbourhood, such a place. Hope Nursery is situated in Leeming Lane, one of the old Roman causeways, and in a very fertile district. This is comparatively a new place, the proprietor having, about ten years ago, removed his stock and business from Pickhill, which is about two miles distant. He has in that time erected numerous houses, pits, &c. for the growth of plants, to the extent of nearly 3000 square feet of glass, beneath which everything appears to be grown to admiration. I found general collections of all the fashionable plants in present cultivation, such as Calceolarias, Pelargoniums, Fuchsias, Australian and Cape plants, soft-wooded greenhouse

and stove plants, comprising most of the novelties in present cultivation; such as the new Achimenes, Gesnerias, Gloxinias, Camellias, Indian Azaleas, and indeed I may say (with the exception of Orchidaceae) by hundreds. What struck me as very beautiful was a plant of Rhododendron Smithii var. tigrinum; a good specimen, about 5 feet high, having several large trusses of flowers, the colour of which was a bright pinkish crimson, very much spotted with large black dots. This, I think, ought to be in every collection, particularly as it is said to be quite hardy. The hardy herbaceous collection appears to be very extensive. Several thousands are grown in pots for the convenience of being removed at any season, besides a large quantity in the open ground. The florist's department is well stocked with Pansies, Pinks, Carnations, &c., in large quantities, and of very select varieties. What gave me a good deal of pleasure was to find an arboretum formed into two divisions; one containing the dwarf deciduous flowering shrubs, which are all legibly labelled, to the number of about 300 species and varieties;—the next is composed of hardy ornamental and forest trees, including most of the new hardy Pinus, &c.; this division contains about 200 species and varieties, and to which I understand there is to be added a separate division of the hardy evergreens. When this is completed it will form a very valuable and useful appendage, both to purchasers and the nursery. The out-ground is occupied as a general nursery, and is upwards of 20 acres, as I learn from Mr. May; and in a very high state of keeping, as I scarcely saw a seed-weed on the ground. Mr. M. says he acts upon Mr. Loudon's principle—the "economic;" that is, by allowing no weeds to seed if possible to prevent it.—**T. P. S.**

Asparagus.—"Este" begs to say that his Asparagus-beds were treated with salt at the beginning of March, at the rate of 14 lbs. to all the beds but one, which had 10 lbs. The beds are 14 yards long by 1 broad. The produce has been greater this year than ever, and finer. The beds were manured as usual in November. He will feel obliged by being informed if the salt may be used again next year at the same time, or deferred till this time next year, as it is stated in last week's *Chronicle* that this is the best season for salting the beds. It has been a remarkable season for all seeds; they have lain a long time in the ground. The Seakale is improved by salt. [When the Asparagus is beginning to grow is the best season for applying salt. If used earlier much of it will be washed away from the roots by rains.]

Curculio lineatus.—I have at last ascertained beyond doubt that this insect feeds upon the leaf of the Bean. I had often watched them carefully, as I find them reposing amongst the young unfolded leaves; but they are so quicksighted and timid, that they run away and hide themselves as soon as one approaches near enough to see what they are doing. I have had presumptive evidence of their cutting the edges of the Bean-leaf for some time past; but this morning I detected one (a female) so busily at work, that I was able with caution to take the point of the leaf in my hand, and watch her operations for several minutes. Her position was on the edge of the leaf, which she embraced with her feet; she commenced eating on the edge, by cutting a small scollop; she then drew back the head, and began at the edge again, following the curve of the cut, till the head bent down so as nearly to touch the abdomen, and so continued till she had cut out a scollop of more than a tenth of an inch across. I used a powerful pair of spectacles, and am very sure I am not mistaken.—**Lusor.**

Bees.—Though it appears that my name as an apiarian has obtained a pretty extensive circulation, yet, with the single exception of the unwearied assistance which, for several years, I gave my much valued friend, Dr. Bevan, in the preparation of the 2d edition of "The Honey Bee," I have hitherto never addressed a line to any portion of the press. Among the many apiarian correspondents of the *Gardeners' Chronicle*, some of them, if they persevere in their apiarian researches, will see cause to modify certain premature opinions. There is no one whose general views so nearly accord with my own as those of Mr. Wighton. In your *Chronicle* of April 22, Mr. Wighton observes upon Mr. Rochet's observations on the fortifications of Bees, à la Huber, that, "however plausible this may be, I have no hesitation in saying it is founded in some mistake." To convince so ardent an apiarian as Mr. Wighton of his error, upon a matter in which, I am certain, none would feel more interested than himself, provided he could have conclusive evidence of this singular trait of his favourite insects, I will refer him to page 379 of "The Honey Bee," where he will find a simple detail of facts relative to the point upon which he is heterodox. In order to furnish Mr. W. with some internal evidence upon the matter at issue, I will add, that, receiving my early apiarian education in the school of Huist, it is not to be expected that I escaped imbibing some of his opinions—perhaps I might have said prejudices. Foremost among these was my ridicule of the fortifications of Huber; when, that I might not remain faithless but believing," the instance, as given in "The Honey Bee," occurred in my own apiary. Among my other apiarian whims was one to have a Polish hive. In this I have had combs nearly five feet in length, and in one of the entrances of this, about 2½ inches in length, was the fortification placed. Not being a conveniently-shaped hive to feed the Bees in, the family died, and why this is mentioned, is to give another singular fact, viz., that during the next spring, other Bees, when cleaning out the hive as a preparation for taking possession when swarming, actually destroyed the defensive curtain of their predecessors. To give Mr. W. an opportunity of atoning for his apiarian sin against our common father, Huber, I

will suggest that he come on pilgrimage—he may "boil his peas"—to Hunton, where we will endeavour to render his penance as light as is consistent with the heinousness of his offence.—**Robt. Golding, Hunton, near Maidstone.**

Scarlet Pelargoniums.—In noticing Mr. Diplock's article on this subject in No. 19, I would not recommend him or any other person to adopt any new method, however right it may appear, without first proving it on a small scale; but if he will, without prejudice, take six plants, and treat them precisely in the manner there laid down, and twice that number raised in autumn, and kept in sixty-sized pots until turned out, I have not the least hesitation in stating that they will cover more space and flower in greater profusion. It, perhaps, would be acceptable to some to know how to raise good plants from cuttings without bottom-heat and with little trouble. In July, a one or two-light frame is placed so as to face the north, and three inches of leaf-mould are placed in the bottom and watered well; on that is put three inches of sand, or sand and leaf-mould; this is then rendered firm and level; the cuttings are then planted in rows, and slightly watered to settle the soil about them, leaving off the lights to allow the leaves to become dry. They require neither shading, water, nor attention, farther than taking off any dead leaves that may happen to appear; and they will be firmly rooted in time to admit of being potted and rooted in the new soil, and hardened off before frost sets in. As Mr. Diplock never heard before of fresh green turf being used in the pot-culture of plants, I may state that I have read that the late Mr. Knight grew his large Cockscombs in a mixture of green turf and fresh dung; and Mr. Diplock would do well to turn back to a late Number of the *Gardeners' Chronicle*, and he will find an article on the effects of putrid vegetables on the growth of plants. Its beneficial influence is there plainly shown; and, along with other experiments, this has thoroughly convinced me that decomposing vegetables are more beneficial for the growth of plants than those which are decomposed. By perusing my article again, he will also find that the plants are first placed in very poor soil, and kept there until a sufficient number of spongioles is formed to absorb the nutriment contained therein. So confident am I in the belief that it is superior to turf laid up in heaps for any length of time, that I never use such when I can get it in a fresh state. Not only do Scarlet Pelargoniums grow luxuriantly in it, but any other plants with succulent roots will do the same. I have at present a Cineraria Waterhousiana thus treated, that in March was in a sixty-sized pot, now one foot and a half high and two feet in diameter, branching out in every direction, and not yet in flower. It does not require a single stake to support it. Various other plants in a like state of luxuriance are growing in green turf and dung, and that, too, on the one-shift system.—**Robert P. Drummond.**

The efficient but tedious and expensive method of raising Scarlet Pelargoniums prescribed by Mr. Drummond having elicited from others an account of their practice, none of which for economy can equal that of Mr. Halliday, I am likewise induced to send you my plan, which I first saw while serving in the gardens of the late Earl of Hardwicke, and have practised for nearly 20 years with success, without seeing any reason to change. I put the cuttings into small pots at once, which obviates any check they would receive when removing them, either from cutting-pots or the open ground. I do not much like the cuttings taken from the open border; they are generally too spongy, and as I am not in want of a great number, I make beds of mixed varieties, chiefly the old Graveolens, Fair Helen, Lady Essex, Emily, and Moore's Victory, which flower freely all the summer, and though not so gaudy as some, have a more delightful fragrance. A dozen or twenty pots which I reserve supply me with all I require. About the end of July, having removed all my Pelargoniums to the back of a north wall, I commence cutting them down, arranging the prunings, as I cut them off, as nearly as I can alphabetically, for the convenience of finding the sorts. When cut, I remove them into a shed; on the following morning I commence making them into cuttings. The scarlet ones I put into 60 or small 48 pots and place on a flue, which runs along the front of a Vinery, where they require no shading except what 18 inches of wall affords, and very little water, until they are struck, when I remove them to a cold frame, where I can give them plenty of air, and keep them there till the beginning of November, when I stow them away in a Vinery, which I intend to force about the beginning of February. At that time, or earlier if the weather will not admit of out-door work, I report them, and place them in another Vinery to be forced. By turning-out time, they are nice plants. The cuttings of my other sorts I put in smaller pots and plunge in sawdust on a gentle hotbed made of leaves, covered by a frame: I give a little water to settle the mould about the cutting. They require very little after, as their greatest enemy is damp. I frequently give a little air. They require scarcely any shading, unless the sun is very hot. After they are struck, they receive the same treatment as the scarlet ones, unless I sometimes give them a larger pot in the end of September or beginning of October.—**J. Murdoch.**

Agricultural Labourers.—I have on several occasions been highly gratified by your observations on the subject of employment for the poor, and would gladly lend my feeble aid to any effort that may be made in such a righteous cause. I fear, however, that the tenant-farmer, and especially the man who holds a strong clay farm, will not be able to carry out such plans of improvement as you—except the prospect before him should greatly improve—have often suggested; although it is quite certain that his own interests would be promoted by such a course. The real fact is, that such a person as I am here speaking

of is incapable of carrying on any extensive scheme of improvement, or, indeed, any improvement at all if it involve an immediate outlay. Clay farms, which most need improvement, are so dependent upon seasons, that those who occupy them can never raise themselves above the crippling effect of low prices, even if those prices should continue but for one season; and hence the first consequence of low prices upon all unimproved or but partially improved heavy soils, is, that the labourer is thrown out of work. The next effect, and which inevitably follows, is diminished produce, which is never compensated for to farmers of this class by a rise in price, for, if such rise really take place, it is generally just before harvest, when they are without a grain of corn of any kind for sale. It will be at once seen how this state of things is aggravated by the continuance of low prices if the unhappy tenant be left to his own resources; bad cultivation—and under such circumstances he has no spirit or means for anything better—must tell upon him so fearfully that he quickly becomes a pensioner either upon the poor-rate or the bounty of more fortunate friends. And as to the landlord, although he may, by means of the preference which the law allows him, have obtained the whole of his rent, I can have no difficulty in showing that under such circumstances as I have described he will have suffered his full share of loss.

—J. West, Newark.

Hibiscus cannabinus.—This plant is well known and very common in India, and is correctly described in Loudon's "Encyclopædia of Plants," in which the colour of the flower is stated to be yellow, or, as I would rather call it, yellowish buff. Some few years ago, while in India, I had some seeds given to me, which were said to have been brought from the Himalayan range by a gentleman who had been travelling in those regions; and among them there were the seeds of a plant, in which, on growing up, I was unable to discover any decided difference from the *Hibiscus cannabinus*, until it flowered; when, instead of the buff of the common country plant, it turned out of a rich deep crimson or lake colour. In all other respects it resembled the *Hibiscus cannabinus*, as nearly as it well could, in every stage of its growth: and of the various species of *Hibiscus* described in Loudon's work, there is none with which it coincides except the *cannabinus*. I can scarcely think it is altogether unknown in British collections of exotics; yet it has appeared strange to me, in that case, that so important a feature as the colour of the flower (differing by such marked characters from that of the species described) should not have been noted, if they are both of one species; or if a different species, that it should not have been more distinctly described in a work like Loudon's *Encyclopædia*. Should it turn out a variety of the *Hibiscus cannabinus* not hitherto introduced or recognised, it may be a useful acquisition. I beg also to offer it to notice as a handsome showy flower, of a hardy character, appearing to me capable of being easily acclimated to endure the open air of the southern parts of Britain. I have some young plants growing in pots, the seeds of which were sown in the middle of last month. Till they germinated they were kept in a room at a temperature of from 60° to 65°; but since then they have been placed in another, the general temperature of which is steadily about 55°, except during the height of a bright day, with the sun shining into the room, when it rises to about 60°; notwithstanding the plants continue in a vigorous state. The plant grows well in common garden mould, and is of rapid growth, taking not more than from 5 to 6 months from the sowing to the ripening of the seeds. Hence I conceive it might be acclimated in a few years to the ordinary outdoor temperature of an English summer, by a treatment progressively approximating to this condition, each succeeding generation becoming more hardy than its predecessor. The *Hibiscus cannabinus* is indicated in Loudon's "Encyclopædia" as a biennial. I consider it, however, as more strictly according with the character of an annual, the whole process in India, from the sowing to the ripening of the seeds, being comprised within the limits of one (the rainy) season, from June to November; and though the plants, if left in the ground, continue to vegetate a month or two longer, they die gradually off with the advance of the hot season.—J. H. H.

Gentianella.—"O. P." will run little risk in parting his *Gentianella* roots after they have flowered, provided the soil of his garden is not too light. The border into which they are transplanted must be fresh turned and broken small; the plants should be put into the ground immediately, well watered, and shaded with a mat for a few days, till they are established. I divided my *Gentianella* last year as above described, without any apparent injury; the only mistake I made was in separating the masses too much. Primroses, &c. I treat in the same manner after the bloom has disappeared; if left in the borders without moving, they increase so rapidly as to disfigure the parterres by their straggling leaves.—W. W. [We have seen this plant thriving in clay, rendered almost plastic by beating up with water, and consequently quite hard during summer, and we are also aware that it thrives admirably in peat, among *Rhododendrons*. It seems, therefore, indifferent to soil, and it is probable that the failure attending its management is chiefly connected with planting it when in flower, or when first growing, and not when the seeds have ripened and the plant is at rest.]

The best way of cultivating the *Gentian* is to plant it in a low damp situation in peat soil, and then let it grow wild, and on no other account to disturb it. It will throw out runners like the Strawberry, and bloom freely; and will soon fill the bed.—V. P.

Tulips.—I was present at the last grand Chiswick Flower-Show, and was delighted with the exhibition, with

one single exception; viz., the absence of any Tulips, which, in my opinion, detracted in no slight degree from the beauty of the exhibition. A hint to the above effect in your valuable Journal, I think, would have its due weight in the proper quarter, and I may probably be the cause of the introduction of the above valuable and beautiful flower into the exhibition next year. The competition would be proportionally great, no doubt, for such a magnificent description of flower, and especially so in the immediate neighbourhood of London.—A Subscriber.

Asparagus.—In answer to your correspondent "Cepophilus," I beg to inform him that I have this season tried to grow *Asparagus* in bottles over bottom-heat, but without success. The heads I placed the bottles over were six remarkably strong ones. I have also tried the bottle system upon *Asparagus* in the open ground, with no better result. It is my opinion that if *Asparagus* can be brought to the perfection to which it is said to be brought by simply inverting a glass bottle over it, the bottles should be much smaller ones than those generally used, which I believe are either wine or soda-water bottles. I mean to try bottles that will hold about a quarter of a pint, as the *Asparagus* will fill them in a much shorter time, and will be much more tender. I cannot account for "C's" head of *Asparagus* coming stronger this season; I do not believe it was because of any benefit derived from the inverted bottle last season, but more likely from the dressing of salt "C." had given it, it being a well-known fact that salt is an excellent dressing for *Asparagus*-beds.—E. Morse.

Netting for Wall-trees.—Early in the spring I placed a quantity of nets against some wall Fruit-trees, thinking it might be some protection against frost. I have not been disappointed in this respect; for now I find that the trees which were so protected are perfectly free from blight, while others, and even those immediately adjoining, for which I had no netting, are much injured by blight. The net was of twine, and used for preserving the fruit from birds when ripe.—Corycius. [By blight is, we presume, meant cold at night.]

Fabiana imbricata.—In glancing over the account of the Flower-shows in the *Chronicle* of May 6, I find it stated that *F. imbricata* is hardy. This I can confirm, for having had two plants of it in the greenhouse, both were put out in the open ground at the commencement of last winter, and have endured the inclemencies of the weather without the least injury, are quite healthy, and will soon flower. The Fahrenheit thermometer at its lowest was 17 deg., averaging upwards with the changes of the weather. This place is between seven and eight miles east from Perth, in Scotland, and is 200 ft. above the level of the sea.—Peter Long, Gardener.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.—The great length of the Report of the Royal Agricultural Society obliges us to defer till next week the insertion of a notice of Mr. E. Solly's fourth and concluding lecture.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.
The anniversary meeting was held on the 22d of May, Earl Spencer in the chair. The following elections were made unanimously:—PRESIDENT, Earl Spencer. TRUSTEES: Sir T. Acland, Bart., Hon. H. R. Clive, Marquis of Downshire, Duke of Grafton, Sir J. Graham, Bart., H. Handley, Sir F. Lawley, J. Neeld, Duke of Rutland, Earl Spencer, Duke of Sutherland. VICE-PRESIDENTS: Duke of Buckingham, Earl of Chichester, Earl of Ducie, Marquess of Exeter, Earl Fitzwilliam, Sir T. Gooch, Bart., Sir C. Morgan, Bart., Duke of Northumberland, Lord Portman, Earl Talbot, Duke of Wellington, Lord Worsley. GENERAL MEMBERS OF COUNCIL: I. Members remaining from last year's Council: D. Barclay, T. R. Barker, F. Burke, H. Blanshard, Hon. G. H. Cavendish, J. Ellman, S. Grantham, G. V. Hall, W. G. Hayter, C. Hillyard, W. F. Hobbs, Sir H. Hoskyns, Bart., S. Jonas, G. Kimberley, J. Kinder, Sir C. Lemon, Bart., W. W. Page, E. S. C. Pole, Professor Sewell, W. Shaw, Hon. Capt. Spencer, C. Stokes, H. S. Thompson, G. Wilbraham, Col. T. Wood. II. Members re-elected from last year's Council: Col. T. Austen, Hon. W. B. Baring, J. Bennett, T. W. Bramston, E. Buller, Col. Challoner, J. W. Childers, H. Gibbs, Sir J. V. B. Johnstone, Bart., W. Miles, E. W. W. Pendarves, Sir R. Price, Bart., P. Pusey, F. Pym, Rev. W. L. Rham, J. V. Shelley, T. H. S. Sotheron, W. R. C. Stansfield, H. Wilson. III. New Members of Council: S. Bennett, Beds.; E. Fellowes, Huntingdon; Lord Hatherton, Staffs.; W. H. Hyett, Glouc.; W. F. King, Hants.; E. A. Sanford, Somerset. REPORT OF THE COUNCIL.—The Council have the satisfaction of reporting to the Members, at their Fifth Anniversary Meeting, the uninterrupted progress of the Society in the accomplishment of the objects for which it was originally founded. The number of its Members now amounts to upwards of 7,000, no less than 1,436 having been elected during the past year. This extension of the Society, by the accession of new Members from every part of the kingdom, affords a striking proof of the interest with which its objects are regarded by the friends of agricultural improvement, and the increased amount of subscription has added considerably to the annual income of the Society. The Finance Committee have laid before the Council a highly satisfactory statement of the funds of the Society, and the result of their inquiry connected with the general receipt of subscription. Not only has every claim against the Society been discharged, and bills amounting to upwards of 1,000*l.* for the work executed by estimate and contract in preparing the present house for the reception of the Society and the transaction of business, been duly paid, but a further investment of capital has also been effected by the purchase of 1,000*l.* Stock in the New 3½ per Cents.; the total amount of the Society's funded property now amounting to 7,700*l.*, and the current cash balance in the Bankers' hands to 1,200*l.* The Council steadily maintain their firm conviction that the permanency and usefulness of the Society are dependent, in a great measure, upon the possession of such a fixed amount of reserved capital as will carry on, at all times, and under every circumstance, the current machinery of the establishment; and they therefore not only receive with great satisfaction the result of the Finance Committee's care and attention in thus husbanding the resources of the Society, and increasing annually its permanent investments, but they are also strongly convinced of the absolute necessity of abstaining from embarking the Society's funds in any doubtful speculations, and of strictly confining them to immediate objects of legitimate and undoubted importance. With respect to the best mode of collecting the subscriptions, the Council have confirmed the recommendation of the Finance Committee, that while those friends of the Society in various counties, who would undertake the trouble, should be requested to favour the Society with their inspection of the list of such subscriptions as might be outstanding and unpaid in their respective neighbourhoods, and communicate at their discretion with the parties whose names had been transmitted to them, the remittance of

subscriptions by means of Post-office orders should be generally recommended by the Society to its Members, as the most direct, practicable, and secure; this system of payment having been found perfectly successful and satisfactory to all parties who have adopted it, and each Member of the Society having been enabled by its means to remit to the Secretary, as it has become due, and from every part of the country, however remote, the subscription of the year, and to obtain by immediate return of post an official notification of the reception and registration of his money. It has been chiefly by this means that no less a sum than 1,097*l.* has been received since last Christmas on account of arrears alone. The Council have decided that in future all subscriptions due in advance on the 1st of January in each year, shall be considered as in arrear on the 1st of June ensuing. The Council, on mature deliberation, have resolved to strike out from the list of the Society the names of those Members who, previously to the date of the Charter, attended the early country meetings, and paid the subscription of the then current year, for the temporary purpose solely of enjoying the privileges of membership on those occasions, but without any intention of becoming continued Members, or being aware of their liability to be called upon for the subscriptions of subsequent years. The cancelling of these claims would greatly diminish the amount of what has hitherto been viewed in the light of arrears, while at the same time, no inconvenient precedent will be established. In the official department of the Society, the rapid increase in the amount of correspondence with so large a number of members, and the reception and accumulation of documents of every kind in the various branches of the current business of the Society, along with the multiplicity of accounts and numerous details requiring daily attention and great exactness, have rendered further aid indispensable to enable the Secretary to meet and discharge, satisfactorily to himself and to the members, the increasing duties and responsibilities of his office; and in consequence of the Finance Committee's report, the Council have made a permanent addition of two clerks to be placed under his control; suitable arrangements having also been effected in the convenient adaptation of the offices to the purposes of the daily transaction of business. The Council have obtained, on reasonable conditions, a lease of the Society's present house, for a term of 99 years, at an annual rent of 330*l.*, the counterpart of which has been duly executed, and the common seal of the Society affixed, in the presence of the Council, agreeably with the powers of the Charter. The Bristol Balance Sheet has been laid before the Council, and the sum of 573*l.* ordered to be paid out of the funds of the Society to meet the deficiency to that amount, occasioned by the excess of the expenditure over the receipts at that meeting. The General Derby Committee have nearly completed their arrangements for the meeting to be held at that town in July; and the Local Committee have reported the resolution of the Directors of the Midland Counties' Railway, to undertake the supply of any number of special trains that may be required on the occasion, liberally proposing to receive only half-fares for the conveyance of cattle and farming implements, and no advance on the usual fares for passengers. The Council have decided on Southampton as the place of the Annual Country Meeting of 1844; and have every reason to believe, that the selection they have thus made will be found advantageous both to the members of the Society at large, and to the Agricultural population residing within the district, in the amount of accommodation to visitors, which the town itself and its immediate neighbourhood are capable of affording, and in the facility of communication with every part of the kingdom. In order to diminish the expense attending the distribution of the Journal, the Council have confirmed the recommendation of the Journal Committee, that the publication shall in future take place in half-yearly parts, the first half-volume to appear in the spring, and the second in the autumn of each year; the whole volume for the year containing the same amount of matter as heretofore: and the first half-volume for the present year will accordingly be issued in a few days, agreeably with this new regulation. Dr. Playfair having resolved to devote his attention exclusively to the study and practice of Agricultural Chemistry, and to establish at the Royal Institution at Manchester a Laboratory for the pursuit and investigation of this subject, the Council have gladly availed themselves of the opportunity of appointing him the consulting chemist to the Society,—an honorary designation, in virtue of which the Society will at all times be favoured with Dr. Playfair's gratuitous opinion on any question in that science submitted to him by the Council, while members who wish to obtain analyses of soils, or other substances, may, at any time, by applying to the Secretary, obtain the scale of Dr. Playfair's charges. The Journal Committee have reported the following adjudications of Prizes for Essays:—To WILLIAM STACE, of Berwick, near Lewes, Sussex, the prize of 20 sovereigns, for the best essay on the rotations of crops suited for heavy lands. To THOMAS ARKELL, of Pen Hill Farm, near Cold Harbour, by Swindon, Wiltshire, the prize of 50 sovereigns for an account of the best mode of under-draining land, regard being had to variety of soil, subsoil, and other local circumstances. To JAMES COWIE, of the Mains of Haulkerton, Laurencekirk, Scotland, the prize of 10 sovereigns for the best Essay on the comparative advantages in the employment of horses and oxen in farming work. To W. F. KARREK, of Truro, Cornwall, the prize of 20 sovereigns for the best explanation of the causes which appear to determine the production of fat and muscle respectively, according to the present state of our knowledge of animal physiology. The Essays on the construction of Cottages, on the Management of Farm-yard Manure, and artificial Manures or Hand Tillages, are still under the consideration of the Judges. The Journal Committee have also reported the following prizes and subjects of the Essays, for 1844, the conditions of which will be given in the ensuing half-volume of the Journal. 1. For the best account of the comparative value of water-meadows and uplands generally, for cattle, sheep, and horses, but especially for milch cows, 20 sovereigns. 2. For the best Essay on the influence of climate upon cultivation within the limits of Great Britain and Ireland, 30 sovereigns. 3. For the best Essay on the indications which are practical guides in judging of the fertility or barrenness of the soil, 50 sovereigns. 4. For the best report of the present state of the agriculture of the county of Norfolk, 50 sovereigns. 5. For the best report of the present state of the agriculture of the county of Chester, 50 sovereigns. 6. For the best report of the present state of the agriculture of the county of Essex, 50 sovereigns. 7. For the best report of the present state of the agriculture of the county of Wilts, 50 sovereigns. 8. For the best account of improvements made by artificial deposits of soil from the sea or tide rivers, and the subsequent cultivation of the land, 20 sovereigns. 9. For the best account, both in cheapest way of keeping farm horses in good condition, both in winter and summer, 20 sovereigns. 10. For the best Essay on any agricultural subject, 20 sovereigns. Mr. R. Barker laid before the Meeting the following Census of Members, and abstract of Accounts:—Life Governors, 101; Annual Governors, 206; Life Members, 399; Annual Members, 6551; Honorary Members, 13; total 7270.

HALF-YEARLY ABSTRACT OF ACCOUNTS.		£	s.	d.

Colonel Challoner read the General Bristol Balance Sheet. This showed the total receipts of the meeting to have been £4,201. 14s. 5d., and the total payments 4775l. 1s. 8d.; a balance of 573l. 7s. 3d. being thus left chargeable on the funds of the Society, and which the Council had ordered to be paid. The Chairman announced that the preliminary prize-sheet for next year had been printed (in proof), for the inspection and suggestion of members prior to its consideration and adoption at the Council on the last Wednesday in June. In answer to Mr. Slaney, who wished to know whether the premium to be given for the Essays on the Counties would come out of the funds of the Society, the Chairman replied in the affirmative. Mr. Houghton wished to see the Society encouraging some practical measure to benefit the suffering population. His desire was that they should see if something could not be done with the waste lands of the country. He had had considerable experience with such lands, and had proved most satisfactorily that much could be done with them. For twenty years this matter had engaged his attention, and he would observe that he had occupied almost the largest quantity of land of any man in the kingdom. The plan that he would propose was that 3000 acres of waste land should be divided into thirty parts, and a premium given to him who should best prove the capabilities of the soil. He should be happy to contribute 50l. towards the expense of the experiment. A Weekly Council was held at the Society's House, in Hanover-square, on the 21st of May, the Right Hon. Earl Spencer in the chair. C. H. Turner, Esq., F.R.S., of Bruton-street, Berkeley-square, London, and Rook's Nest, near Godstone, Surrey, was elected a Governor, and fifty-one gentlemen Members of the Society. Mr. Bailey Denton, of Southampton, expressed his intention of exhibiting, at the Derby Meeting, a model three feet square, representing a map in relief of a district, with instruments, invented by himself, similar to the one in possession of the Society, and presented by him at a former Council. The model is constructed of plaster, or electrolysed in copper, to a true scale, any height or distance being obtained by the aid of an instrument accompanying it. Mr. Denton considered that the use of this invention as a complete guide to draining was evident; while the properties of an undulating surface were made apparent by pouring water upon the map thus modelled, which, flowing to the lowest levels, exhibited the mode in which the waters of the higher lands might be profitably applied. Mr. Read transmitted a plan for improvements in the making and burning of tiles. The Chairman of the Derby Committee announced, on the part of the Birmingham and Derby Railway, and the Midland Counties Company, in favour of exhibitors, that they would only require half-fares for Stock and Agricultural Implements, and the usual fares for passengers.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

The first summer exhibition and promenade took place on the 19th May, at the Society's Garden, Inverleith, Edinburgh. In the midst of much ungenial weather, the day fortunately proved tolerably good, and the company was numerous and respectable, including many strangers, whom the agitated state of the Scottish Church had drawn to Edinburgh. For the exotic shrubby plants prizes were offered to nurserymen and to private gardeners. In the former class the silver medal was voted to Messrs. J. Dickson and Sons, Inverleith Nurseries, for *Kennedya nophylla*, *Hovea pungens* var., *Leschenaultia biloba*, and *Brugmansia Weymaniana*; the last a very desirable novelty. In the latter class the silver medal was assigned to Mr. J. Young, gr. to T. Oliver, Esq., Newington Lodge, for *Elichrysum proliferum*, *Chorozema varium*, *Boronia serrulata*, and *Euphorbia splendens*; and the bronze medal, as second prize, to Mr. G. Stirling, gr. to Lord Melville, Melville Castle, for *Acacia cordata*, *Ulex capensis*, *Sphenogyne capitata*, and *Genista canariensis*. For *Fuchsias* of merit, a premium was voted to Mr. Young, Newington Lodge, for *F. insignis* and *F. tricolor*. The display of Cape Heaths was rich and beautiful. Premiums were awarded, first, to Mr. Stirling, Melville Castle, for *Erica grandinosa*, *elegans*, *suaveolens*, and *Beaumontiana*; second, to Mr. Young, Newington Lodge, for *E. vestita alba*, *vestita* var., *Beaumontiana*, and *gelida*; and third, an extra award, to Mr. J. Donald, Rose Park, for *E. vestita rosea*, *Blandfordiana*, *Wilmorea*, and *grandinosa*, he having been excluded from competing, on account of an informality. For Chinese Azaleas, the prize was voted to Mr. W. Findlay, gr. to the Hon. Mrs. Cochrane, Largo House, for *A. phœnicea* and *A. indica alba*. The show of specimens of *Trichoderm tricolorum*, trained in various forms, and densely clothed with brilliant flowers, was admirable. The silver medal, as first prize, was awarded to Mr. P. Thomson, gr. at Craigiehall, for a specimen trained in the balloon or globe shape; and a second premium to Mr. Findlay, Largo House, for a specimen trained in the form of an oval mirror. An extra award was made to Mr. R. Fenn, gr. at Fordel, for a very large specimen trained in the ladder shape, but which, from some informality, was not allowed to compete. The *Cinerarias* produced were very fine. Two premiums were awarded—the first to Mr. Young, Newington Lodge, for *Queen Victoria*, *Macnabiana*, *Rival King*, and *Imperial Blue*; and the next to Mr. J. Thomson, gr. to W. Keith, Esq., Corstorphine H.L. for *C. Keithi*, *fragrans*, *bicolor*, and *Thomsoni*. The *Cacti* were also beautiful, and two premiums were again voted—the first to Mr. Young, Newington Lodge, for *Cactus hybridus* and *Ackermannii* major; and the second to Mr. J. Gow, gr. to Count Flahault, Tulliallan, for *C. speciosus* and *Jehkinsonii* var. *Voyager* tropical *Orchidaceæ* appeared. The prize was awarded to Mr. Stirling, Melville Castle, for *Oncidium flexuosum* and *Calanthe veratrifolia*. A beautiful collection, containing the very remarkable *Oncidium papilio*, *Stanhopea oculata*, and *Pleurothallis racemiflora*, was sent by Mrs. R. Haig, View Park, but marked "not for competition." For specimens of the rich collection of species and varieties of *Rhododendron*, cultivated at Dysart House garden, an extra silver medal was voted to Mr. J. Blair, as a mark of approbation of his zeal and success with this fine genus. For a collection of 30 sorts of standard Apples, with the names affixed, and in excellent preservation, a premium was awarded to Mr. A. Cudde, gr. to G. Sligo, Esq., of Seacroft. Specimens of the *Baltimore Pippin*, of very large size, from the nursery garden of Messrs. Sang, Kirkcaldy, were much admired. A number of choice articles were sent for exhibition only. Among these the first place is due to some magnificent specimens from the Royal Botanic Garden; in particular, two noble *Bourbon Palms*, *Latania mauritiana*, *Ilaka dactyloides angustifolia*, *Callicoma serratifolia*, *Grevillea planifolia*, and *Epacris pulchella*—the last of very uncommon size. From the nurseries of Messrs. Dickson and Co., Leith Walk, there was a collection of greenhouse plants, and a rich show of *Calceolarias*, among which *C. Standishii* was pre-eminent. From the nurseries of Messrs. J. Dickson and Sons, Inverleith, there were also many beautiful specimens; and several fine plants were sent from Mr. Lawson's nursery-garden at Golden Acres. From Dr. Neill's garden at Canonmills, a large plant of *Azalea indica alba*, profusely covered with its snow-white blossoms, attracted much notice, as did also a Mandarin Orange-tree, in fruit, from the same place. A well-grown specimen of *Bossia linophylla*, several beautiful *Fuchsias*, and a seedling *Cactus*, from Mr. Wauchope's garden at Edmonds-

ton, were much admired. A hamper filled with named specimens of select stage *Auriculas*, from the collection of Mr. Oliver, Newington Lodge, excited much interest among the florists present, as did also a promising seedling *Auricula*, raised by Mr. Henry Gibb, Salisbury Green. Seedling *Pansies* of very considerable merit were exhibited by Mr. G. Logan, Mr. A. Symington, and Mr. J. Gow, Tulliallan, and some pretty seedling *Calceolarias*, from the garden of Sir T. G. Carmichael, at Castle Craig; while the attention of botanists was drawn to a number of curious and rare Alpine plants, sent from Melville Castle garden. A white-flowered *Rhododendron*, of large dimensions, was sent by Mr. Cushnie, Malta Green. The hothouses in the Society's own garden furnished several uncommon and lovely specimens, particularly *Epiphyllum speciosum*, of unusual size and studded with bloom; *Erica elegans*, very fine; *Euphorbia splendens* and *Cyrtopodium Andersonii*. Besides plants several other articles interesting to horticulturists were exhibited at this meeting. There was a tin box, with a contrivance for carrying cut flowers in safety to a distance, communicated by J. A. Mackenzie, Esq.; also, a portable case for preserving flowering plants from dust and smoke in dwelling-houses, by Mr. Arthur, 1, Waterloo-place. There was an extensive display of floricultural wire-work, fancy flower-stands and trellises for climbing plants, by Messrs. Smith and Son, High-street; revolving flower-stands, by Messrs. W. and C. Young, High-street; and light wire trees for slender climbers, by Mr. Mackinnon, Lothian-st.—P. N.

COUNTRY SHOWS.—We have the following in type:—Aberdeenshire, Bath, Devon and Cornwall, Lancaster, Cork, Birmingham, Hampshire, Cheltenham, Liverpool, Dorsetshire, Guernsey, Sandbach, East Lothian, Chesterfield Tulip Show, Warrington Tulip Show, and Walton Tulip Show; which we shall publish at the earliest possible opportunity.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

RHODODENDRON ROLLISSONII. Garden variety. (*Half-hardy Shrub*).—In many respects this very striking plant so much resembles *Rhododendron nobile*, the Ceylon variety of *R. arboreum*, especially in its deep-red flowers, and the closeness with which they are arranged, that we supposed it must be it. But upon comparing it with wild specimens from Ceylon we find that the *Rhododendron* of that island has leaves silvery underneath, while in the plant before us they are rusty. It is therefore clear that *R. Rollissonii* has had some other origin, but what that origin was we do not know. It is among the handsomest of the crowd of varieties, called hybrids, which tempt the buyer at every shop, and seems in colour to resemble most a plant called *Mars* by Mr. Lee, of Hammersmith, but its flowers are much more compact. There is a common belief that the Indian *Rhododendron* ought to be hardy, because it is found in Nepal. But Dr. Royle tells us (Illustrations, p. 258) that it is only found at the lowest elevations and in the most southern latitudes of the Himalaya. It is true that it sustains considerable cold in winter in these places, but the rise and fall in temperature are gradual, and better enable a plant to resist the climate. If the most northern stations for the *Rhododendrons* are thus comparatively mild, how much more so must those be to the southward, and how small the chance of acclimatizing *R. nobile*; notwithstanding that Mr. Walker assures us that the shoots of the *Rhododendron* are shrivelled up in Ceylon, as if they were scorched, in consequence of continued cold mornings, which blight everything. This variety is rather more tender, and requires a much warmer situation than the old *R. arboreum*. The plants, after flowering, should be kept in a warm pit, and rather close, to encourage the growth of the young shoots, afterwards they may be placed out of doors during the summer, and the pots should have a top-dressing of fresh cow-dung and plenty of water. It is increased by grafting in the same manner as *Camellias*.—*Botanical Register*.

ECHINUM PETRAEUM. The Rock Bugloss. (*Greenhouse Herbaceous Plant*). *Boraginaceæ*. *Pentandria Monogynia*.—This is a beautiful herbaceous plant, native of rocks in Dalmatia, where we believe it was first discovered by General Baron W. Velden. It is apparently a genuine *Echinum*, having an irregular corolla, with an erect limb, and perfectly even throat, without any appendages. Nevertheless Reichenbach, in his "Flora exaltata," not only refers to it as *Lithospermum*, but regards it as a synonym of his *L. rosmarinifolium*, which although apparently not the true plant of that name, is still a genuine *Lithospermum*. The plant from which the drawing was taken, was raised in the Garden of the Horticultural Society, from seeds presented by Baron Welden, and flowered beautifully in a cool greenhouse in May. At that time it was the gayest little plant possible, with its neat clean leaves, stiff stems, about nine inches high, and pale blue flowers, which are pink before they open. It is a pretty little hardy evergreen shrub, growing from one to two feet high. It succeeds best in a mixture of sandy loam and rough peat that is rather poor. It must be kept in a dry, airy situation, in a cold pit, where there is plenty of light at all times, but particularly during the winter. It flowers freely during the months of April and May, but is difficult to preserve through the winter, as it is very subject to damp off, even when the plants are old. It is increased by seed freely, or by cuttings of the young wood.—*Botanical Register*.

MISCELLANEOUS.

Treatment of *Amaryllis Belladonna* in Pots.—This is a plant of the easiest growth, generally blooming in September and October, and adding much at that season to the beauty of the greenhouse or parlour. The soil best suited to the bulb is composed of $\frac{1}{2}$ sandy loam, $\frac{1}{4}$ leaf-mould, and $\frac{1}{4}$ old hotbed manure, with sand in the proportion of nearly $\frac{1}{2}$ of the whole. The bulbs should be potted in August or September, and those with flower-buds will soon throw up a spike of elegant flowers. Give good drainage, with broken potsherds, coarse at the bottom and finer above, and fill the pots with the compost; place in the bulb, setting it down so as to leave about one-third of the top above the surface; finish with a good watering through a fine rose, or with a syringe, and place the pots in a frame or in the greenhouse, where the bulbs will speedily take root, and produce their flowers. But it is after this that the bulbs require the most attention, to make them bloom well another year; for upon the growth of the leaves, and the great quantity of sap stored up in the bulb, depends entirely its future excellence. As soon as the flowers have faded, the stem may be cut off just above the bulb; good supplies of water should be administered, and leaves will begin to put forth; in the course of two or three months they will have acquired their full size, and watering should then be gradually diminished until the foliage is completely dried up. During their growth the plants should be placed in a sunny situation, and as near the glass as convenient. When the bulbs have completed their growth, which will probably be in the month of February or March, they should be placed away on a dry shelf, turning the pots upon their sides, but not shaking out the bulbs. Here they may remain until August or September, when the operation of repotting should commence again.—*Hovey's Magazine of Horticulture*.

American Willows.—"In some few places a few miles up (Black and Poyer Rivers, Mosquito territory,) the land is low and swampy, and covered with Willow-trees. The importance of the Willow-tree has been acknowledged from time immemorial. Ropes and baskets made from Willow-twigs are of ancient date. In many parts of Europe, especially France, the leaves, in the green or dried state, are given to cows and horses, and are considered very good food. The bark is highly astringent, and may be used in tanning; and the leaves are also applied medicinally."—*Young's Mosquito Shore*.

Culture of the Vine in Bengal.—Mr. W. Storm, in his garden at Chamdane, near Ghirettee, has for some time past paid much attention to the growth of the Vine, and we had the gratification, a few days since, of seeing several of his Vines covered with luxuriant bunches of well-formed berries, and promising an abundant crop of fruit, which, from its early formation, will ripen long before the gales, the severe hot weather, or the rains can set in. Other Vines, too, at the same place are covered with blossom, others again just putting forth leaves; and, lastly, others under the course of pruning, so as to complete a course of succession fruit. Mr. Storm has secured this early fruiting by adopting a system of extensive pruning as the rains come to a close, when the first of his Vines were so treated; and then each successive week following up the course with other Vines, so as to continue it until the whole have passed under the knife. We look on the successful result of this experiment as opening a new era, as it were, in the fruit-garden; and we may with confidence recommend the system to those who may wish to cultivate the Grape. A few years ago it was a general belief that it was impossible to produce this delicious fruit in Bengal, but, as a rarity; it is now shown that we may shortly expect our tables to groan beneath a plentiful supply.—*Planter's Journal*.

Bermuda Potatoes.—By a late arrival from the Bermudas, a basket of Potatoes was sent by the governor, Colonel Reid, which for excellence of quality equalled anything known in Europe. This should encourage the West India Planters to turn their attention to the cultivation of Potatoes rather than Yams, which are not nearly so nutritive.

GARDEN MEMORANDA.

ERRATA.—p. 359, 3d col., in our notice of Brown's Tulips, in the 7th line and was placed instead of but; and in the 14th line from the bottom of the same report is should be omitted, and a capital M. should begin the next word.

Mr. Knight's, King's Road, Chelsea.—The "one-shift system" of potting has been adopted at this place, with a number of New Holland plants, of various genera, and though some of the specimens operated on were somewhat late of leaves and branches when the experiment was commenced, about three months back, they are rapidly assuming a better appearance, and in all cases the efficacy of the plan is very conspicuous. It may be mentioned, however, that the method has been practised with some slight modification; particularly large pots not having been used; and as only an open fibrous soil has been employed, and in large jumps of it, this is, doubtless, a prudent proceeding. In a border running one of the stoves, a plant of *Tabernaemontana* has stood exposed during the last winter, and is now trained against the wall, and blooming beautifully. *Physanthus albens*, *Pentstemon glaberrimus*, and some other half-hardy exotics, have likewise remained unprotected in a similar position, and are now growing with great freedom. *Lathyrus tomentosus*, a handsome blue flowering species, of recent introduction, has just been turned out into the same border. It is blooming profusely. There is an exceedingly fine collection of *Conifers* in pots, including most of the rarest species, with some seedlings which have not yet been named. The New Zealand kinds are unusually numerous and good; and among them are some elegant *Dacrydiums*, the singularly long and variegated-leaved New Zealand *Araucaria*, and some peculiar species of *Taxus* and *Podocarpus* in an excellent state of health. In the hardy department, a number of excellent hybrid *Rhododendrons* are coming into flower. There are several white blooming varieties, with copious dark spots in the upper petals. *R. multicaule* and *R. oculatum* are the best, and are quite hardy. *R. Wellsii* has lately bloomed, and has fine clusters of delicate pale blush-coloured flowers, of an admirable form, perfectly free from wrinkles, and lightly spotted. Two or three good seedling Azaleas have been flowered this season for the first time. The most distinct of them is to be called *A. exqu岸ita*, and is like variegata, with larger flowers, a much more decided crimson tint, and numerous spots. It is extremely beautiful. A new species of *Tropæolum*, with peculiarly strong stems, and a great quantity of glaucous foliage, which is composed of many leaflets, radiating regularly from the centre, is showing flower abundantly. It is from Valparaiso, and has orange-coloured blossoms, similar to those of *T. edule*. The original plant of *Lalage ovata* is now full of bloom. *Trymalium odoratissimum*, with elegant spikes of small white inflorescence, is blooming liberally, and has a fragrance like the sweet-scented *Woodroof*, *Asperula odorata*. Planted in an open border, where it is at present blossoming, is a species of *Violet*, from Van Diemen's Land. It is a small plant, with little purplish flowers, which have a white border, and are interesting. The glowing *Clerodendron splendens* is flowering magnificently in the stoves, even young plants producing large bunches of brilliant scarlet flowers. *Begonia coccinea* is also in blossom. A pretty plant, said to be of Japan origin, but called *Pentstemon Mexicanum*, is gay, with its pink and purple blossoms all the year. At present, it is particularly showy. The greenhouse plants are arranged in groups here, in an open area surrounded by houses, and placed so as to form clumps of various figures, intersected by paths. The surface on which they stand is made of coal-ashes.—E. K., May 23.

Reviews.

Flora odorata; or a characteristic Arrangement of sweet-scented Flowers and Shrubs, &c., (Orr and Co.), is an attempt, by a very young man, to gather into one volume useful particulars relating to the more fragrant of our cultivated plants. The idea was a happy one, and we dare say it will be some day worked out in greater detail. In the meanwhile this little book will be found useful and acceptable to many. It is, however, confined to hardy plants, and as the vegetation of northern countries is not so remarkable for fragrance as that of warmer latitudes, the list is not very extensive.

Milton's Practical Beekeeper (Parker) is another of those useful and entertaining contributions to the litera-

ture of Bees which the late few years have produced. Its most peculiar feature is a description, with figures, of a great many different sorts of hives, and a practical account of their respective merits. In this respect we regard Mr. Milton's book as peculiarly useful. It also contains many good instructions for the management of Bees, and a collection of passages from numerous writers on Bee-craft. We understand that Mr. Milton deals in the hives he describes, so that those who are ambitious of trying the various ways of management which Bee-authors have described, have an opportunity of doing so, in the most advantageous manner, by his assistance and that of his book.

A Calendar for Young Farmers. By Cuthbert Johnson, Esq. Ridgway.

A SIMPLE, plain, and practical work for the guidance of a young farmer is much wanted, and might be most extensively useful. When we received a copy of this work, we opened it with a high expectation of its merits, coming from the well-known prolific pen of the author. We must confess that, as is often the case where there are high expectations, we have been disappointed. The work before us consists of short questions and answers as to the operations on a farm for each month, intended no doubt to point out the most important objects of attention for that period. In this it resembles the headings of the months in most common almanacs. The most important part of the information is given in the notes, and consists of copious quotations from the "Farmer's Encyclopædia," by the same author, and of other works. Many things well suited for an Encyclopædia may not be so as a foundation for a practical system of farming, inculcated with confidence, and such as a young farmer can safely follow without danger of failure. Many of the recommendations in the notes are founded on facts and experiments, by no means certain and universally admitted; and some are directly contrary to the experience of many practical farmers. We will only give a very few instances. Salt is invariably recommended to be mixed with composts, or used directly on the land. We were startled at page 6, by a direction to add a bushel of salt to every cubic foot of earth, or pond mud, intended to be carried on the land: but we found afterwards that this was an error of the press, and that a cubic yard was meant, as in page 16. As a general rule, we cannot admit even this quantity on all kinds of soil: on gravel it would be soon washed out and lost; on clay it might do harm, if the weather was very dry, and its use is doubtful even in moist weather. Barley, (we presume Spring Barley, as Winter Barley is sown in October,) is recommended to be sown in January, as well as Oats; we think most practical farmers would not venture to do this with so tender a plant as Spring Barley, which a cold, wet February, such as we often have, would entirely destroy.

Fallows are to be broken up in March. We believe that this practice has been abandoned very nearly a century, and that all good farmers in heavy lands now break up their fallows before winter, and if they have an opportunity to do so early, give them a second ploughing or ridging up before Christmas: no notice is taken of this in October, November, and December.

A curious mistake, copied from the "Farmer's Almanac," is made as to the value of different fodder, (note, p. 14). As we could not understand this, we looked at the article in the "Journal of the Royal Agricultural Society of England," and found out the mistake. Instead of latter math bay being equal to 102, in nourishment, when good hay is 100, 102 lbs. of latter math hay are only equal to 100 lbs. good hay, and 90 lbs. of clover hay are of the same value, and so on—which is unintelligible: the richer the fodder, the less is required. A very young farmer might be puzzled by this table.

There is, no doubt, a great deal of good matter in the notes, which, if systematically arranged and put into the form of positive instructions, under the correcting hand of an experienced practical farmer, might be very useful. In its present shape we fear that no great assistance will be derived from it to the young and inexperienced. The most important directions with respect to ploughing, sowing, and reaping the crops are entirely omitted, or only incidentally alluded to.

It is with reluctance that we criticise the production of a meritorious author, who, with the assistance of those who have much experience, might have produced an excellent manual for young farmers. The work has been too hastily compiled.—M.

CALENDAR OF OPERATIONS for the ensuing week.

ALL the China, Tea-scented, and Bourbon Roses, that have been forced since last Christmas will now be on the decline, and should be well pruned back, and all the weaker shoots cut out entirely. There are many of them so fertile for blooming as to continue in flower yet for months; but it would be bad management to let them do so, as there will be no want of Roses for the next six weeks. If these plants were now repotted, shaking away the greater portion of the soil from their roots, and placed in a shady situation for about two months, pinching out what flower-buds they make during that time, they would be in a fine condition for autumn use in the conservatory. Large plants of Sweet Briars that have also been forced throughout the winter should now be entirely cut down to the surface of the pots, and placed in a shaded place. It will not answer to prune Briars, that have been forced, like other Roses. They get so hard in the wood by being constantly deprived of their foliage, that nothing short of cutting down will bring them about again; but by this system the same plants will do for years, and answer better than young ones. The very gayest bed on the lawn in autumn might be made by the following high-colored Roses, which are of nearly the same tints of scarlet and crimson. Suppose the bed to be a circle, place *Gloire de Rosamonde* in the centre, and tie it up to a stake, it being of a half-climbing nature. Then a circle of *Cramoisi* (*Chou-sante* and *C. superieure*); then *Henry the Vth* and *Saint-Pern*; the next circle of *Fabvier*; and the last, next the grass, *Psyche*, which is a Bourbon, but differs little from the rest in foliage. It is about the time to plant out these; and any Rose-grower can furnish a large bed of them for a few shillings, as they are all cheap ones. Indeed, their cheapness and high colours were my reason for pointing them out.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINKERY.—I once knew a good gardener who had three-fourths of his fruiting Pines fully swelled about this time of the year, and to all appearance likely to ripen at one time. He turned out half of them into a close, cold pit, and after three weeks he began to take back a few every week to the fruiting-house. He thus managed to make a long succession of them. After the succession and younger plants are potted, shade them a little in the middle of the day, and keep them close and in a moist atmosphere till they take freely to the new soil.

VINERY.—Keep thinning the berries and stopping the laterals as they advance; which, besides syringing and giving air, is the principal work now in Vineries.

PEACH-HOUSE AND CHERRIES.—These must take their chance for some weeks yet, till the fruit is all off. Keep the houses well ventilated and dry all night, and the glass as much down as possible through the day.

MELONS.—As your earliest plants ripen off their fruit, be ready with a stock of healthy, stout plants, to fill up the frames again; first taking the precaution to whitewash the sides of the pots. The rafters and woodwork should also be painted now, if they require it. A little of the surface-soil may be thrown away, and the rest stirred up, adding a portion of fresh soil. This is ten times better and easier than struggling away to get a second crop from the same plants. Keep your other plants thin at all times, and see that the fruit does not get hurt by lying too long in the same position. By no means let the bottom-heat decline, though the weather be ever so warm.

KIDNEY-BEANS.—If your first spring crop in the open air is come up thick, now is a good time to thin them, and plant the thinnings in pots for forcing, if you have not already succession enough on hand to supply you till they are ready in the open ground.

Out-door Department.

Never did the crops of fruit and vegetables look better at this time of year than in the present season. Peaches, Cherries, and Pears are in general so thick, that unless they are well thinned they will not be good for much besides exhausting the trees. Did you save a good heap of dung for the Celery trenches? If not, you must get some prepared. Have you netting enough to save your early Cherries? But, above all, are the kitchen-garden and the ships free from weeds? If not, it may be worth while to say that one good weeding is better than three hoeings and rakings. Indeed, except for covering seeds and gathering off stones, the rake should not be much used in a kitchen-garden.

ASPARAGUS will be much improved if the beds do not get dry till the berries begin to turn colour in the autumn. Recollect that this is the proper time to cultivate Asparagus, although half of the gardening world act as if they thought otherwise.

LEeks are a very useful vegetable in winter, and this is about the best time to plant them out from the seed-beds.

ONIONS are often injured by being left too thick in the rows. Thin, sow, and plant your succession crops as their different states indicate.

ORCHARD.—The wall-trees have hitherto been almost free from insects; but with the return of dry weather we may expect them, and must be prepared for their destruction. You cannot pay too much attention to thinning, stopping, and training the summer growths. See that none of the trees have more than a fair crop. The late rains were so favourable to the lawns that there is no want of short grass this season for the Strawberry-beds. The green Gooseberries are swelling fast now, and will soon be fit to gather.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Of all plants stove ones are the most easy to manage and to propagate; that is, in a general way. But they must have abundance of room for their roots, and not be too crowded in the heads. Large quantities of water they will always require in summer; and a strong moist heat, with the atmosphere kept sweet by free ventilation, is the life of these plants. In the great nurseries, they shade their stoves regularly in hot weather. It saves watering, and young plants grow with more freedom under partial shade; but for an established stock of specimen plants it is the worst possible plan to shade them.

GREENHOUSE.—There is nothing more general or more difficult to manage than attempts at growing and flowering these plants in the same house. But the thing cannot by any possibility be done to anything like perfection. House-plants, in our climate, must have large portions of water thrown over or among them, to keep up a moist atmosphere while they are growing, and flowers will not stand this with impunity.

CONSERVATORY.—Plants in flower here must be constantly shaded while the sun is strong on the glass. I have often heard ladies say, while viewing the large Pelargoniums at the Chiswick shows, how much they should like to have some of their own plants trained in the same way. Nothing is easier, if you have plenty of plants of each sort to be so trained. When the plants are just coming into flower, put four or five of them into one large pot, keeping the best side of the plants outwards, and, with a little training, you can at once make a specimen to any ordinary size; and if the soil is good, the plants will flower much longer in this way. I regularly adopt this plan, and find it very useful with many other plants, as well as with Pelargoniums. They are so many portable flower-beds on a small scale.

Out-door Department.

Flower-gardening for the next four months is the most pleasant of occupations, provided you have a good stock of succession plants, to fill up vacancies as they occur. This is a subject that requires a good deal of forethought; but in the largest places the flower-beds need show no want of flowers till the end of September. The routine of mowing, rolling, watering, and looking after insects, no one forgets.—D. Beaton, *Shrubland Park Gardens*.

State of the Weather near London for the Week ending June 1, 1848, as observed at the Horticultural Garden, Chiswick.

Average		29.815	20.608	25.211	63.7	46.5	54.6		.30

May 26. Flying clouds, with brisk S.W. wind; rain; clear.
27. Overcast; shower; clear and fine at night.
28. Showery; very heavy rain at 2 P.M.; thunder at 3; squally; sun-shine alternating with heavy showers, partly hail.
29. Slight drizzle in the morning; continued cold and heavy rain throughout the day; clear and cold at night.
30. Slight rain; very fine; overcast; showery.
31. Overcast; rain; cloudy and mild.

June 1. O. drizzle; cloudy; showers; very fine.
Mean temperature of the week 2.6° below the average.
The depth of rain in May of the present year was five inches and a quarter, a greater amount than has fallen in any month for at least the last 17 years.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending June 10, 1848.

Week ending June 15, 1881.						Prevailing Winds.						
June.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	N.	N.E.	E.	S.	S.W.	W.

The highest temperature during the above period occurred on the 10th, 1832, and 1835—thermometer 87°; and the lowest on the 9th, 1828, thermometer 36°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending June 3, 1848.

THE continued wetness of the season, and the greater warmth that has been lately experienced, have rendered all those articles which flourish in the open air far superior this week. This is particularly the case with Currants and Gooseberries, Peas, Lettuces, Cabbage, Turnips, &c., and the Carrots and New Potatoes are now getting fine. Artichokes are also now supplied, with good French Beans, fine autumn-sown Onions, immense Turnip Radishes, and very superior Cauliflowers. Pine-apples are unusually numerous and good. Cherries are excellent. Peaches and Nectarines are much improved. Grapes, likewise, are better, and most abundant; and Strawberries are exceedingly plentiful. The latter are principally Keen's Seedlings; but there are, besides, some handsome Myatt's British Queen. Phlox Drummondii, Genista triquetra, Polygala cordifolia, different kinds of Verbena, &c., are among the plants in pots; and Iris germanica, Lilium bulbiferum, Jasminum revolutum, the Yellow Banksian Rose, the Double-flowered Senecio elegans, Myosotis palustris, the Double Rocket, and the Double Red Hawthorn, are the chief of the cut-flowers.

PRICES, SATURDAY, June 3, 1848.—FRUITS:—

Pine Apple, per lb. 4s to 10s	Lemons, per doz. 1s to 2s
Grapes, hothouse, per lb. 2s to 5s	— per 100, 1s to 14s
— Spanish, per lb. 1s to 1s 6d	Citrus, per brace, 1s to 3s
— Portugal, per lb. 1s to 3s	Walnuts, per bush, 16s
Peaches, per dozen, 10s to 30s	Chestnuts, per peck, 4s to 8s
Nectarines, per dozen, 10s to 30s	Almonds, per peck, 6s
Melons, 6s to 12s each	Sweet Almonds, per pound, 3s
Apples, dessert, per bush, 8s to 22s	Filberts, English, per 100 lbs. 50s to 55s
— Kitchen, per bush, 8s to 10s	Cob Nuts, per 100 lbs. 60s to 70s
Strawberries, per half sieve, 2s 6d to 8s	Nuts, per bushel, —
Currants, per pottle, 8d to 1s 1d	— Brazil, 16s
Oranges, per doz., 1s to 2s 6d	— Spanish, 18s
— per 100, 6s to 20s	— Barcelona, 22s
— bitter, per 100, 6s to 20s	— Cob, 12s

VEGETABLES.

Cabbage-plants, per doz. bun. 1s to 2s 6d	Shallots, green, per bunch, 3d to 6d
Cabbages, per doz., 6d to 1s 3d	Asparagus, large, per hundred, 4s to 7s
Cauliflowers, per dozen, 2s to 8s	— Sprue, or Small, p. bun. 1s 6d to 2s 6d
Beans, Kidney, forced, p. 100, 2s to 4s 6d	Peas, forced, per half-sieve, 12s to 15s
Potatoes, per ton, 80s to 90s	Lettuce, Cabb., p. sieve, 8d to 1s
— per cwt. 4s to 5s	— Cos, per score, 6d to 1s 3d
— per bushel, 2s to 2s 6d	Celery, p. bd., (12 to 15) 4d to 1s 6d
— Kidney, p. bush, 1s 6d to 2s 3d	Rhubarb stalks, per bundle, 4d to 1s 3d
— Scotch, per bush, 2s	Small Spinach, per punnet, 2d to 3d
— New, per lb., 4d to 1s 8d	Green Basil, per bunch, 4d to 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Water-cress, per doz. am. bun. 4d to 6d
Artichokes, green, per doz., 3s to 8s	Parsley, per half-sieve, 9d to 1s
Turnips, Spring, per bunch, 3d to 1s 8d	Tarragon, per doz. bunches, 2s to 3s
Red Beet, per dozen, 9d to 1s	Fennel, per doz. bun., 2s to 3s
Horse Radish, per bundle, 1s to 6s	Mint, per doz. bunches, 2s to 3s
Radish, spring, p. doz. hands, 6d to 1s	Margarin, green, per bunch 4d to 6d
— Turnip, p. d. z. bunch, 6d to 1s	Mushrooms, per pottle, 6d to 9d
Carrots, Young Horn, p. bun., 6d to 1s 6d	Spinach, per sieve, 6d to 1s
— Spring per bunch, 4d to 1s 3d	Leeks, per doz. bun., 5s to 6s
Parsneps, per dozen, 6d to 1s	Onions, per bushel, 5s to 6s
Garlic, per lb., 6d to 8d	— Spring per bunch, 2d to 6d
Shallots, per lb., 1s to 1s 6d	— Pickling, per 45, 4s 6d to 6s
	— Green, p. doz. bun. 2s to 4s

Notices to Correspondents.

MANURES, &c.—J. S.—Bleaching-powder is chloride of lime. The best liquid manure for a small garden is Potter's guano mixed with water.

WEEDS.—A Young Farmer.—It is of small use to cut off the heads of Thistles close to the ground, unless you repeat the operation so frequently as to prevent them springing up again. By continual cutting they may be killed; but it is cheaper to grub them up, taking care at the same time that no plants are left here and there, as nest-eggs, to produce a fresh crop.

FOWLS.—G. Booth.—There is not a more common disease in fowls than the pip; for the remedy, see "The Penny Cyclopædia," or "Martin Doyle's Cyclopædia of Practical Husbandry," article, POULTRY. M.—Salop will likewise be answered by the foregoing.

TANK-HEATING.—P.—We will notice your plan; but not with approbation.

SEEDS.—A Young Gardener.—It is true that Peas ripened early in warm dry situations will produce an earlier crop than such as are raised late on cold heavy land. But whether under exactly equal circumstances seeds ripened in June will bring an earlier crop than seeds ripened in September we cannot say; probably they would. You had better consult Lindley's Theory of Horticulture.

PLANTS IN SHADE.—L. G.—They suffer from want of light and want of food. The branches that overhang them keep off the sun and rain; the roots that they must grow among rob them of their nourishment. All that you can do is to try and persuade Honeysuckles and Ayrshire Roses to make an attempt at growth; likewise you must assist by digging the ground well and manuring it. Laurels and Hollies will also do, but they are not climbers.

FRUIT-TREE BORDERS.—A Weekly Reader.—No vegetables of any description should be planted on fruit-borders within four feet from the bottom of the wall; and even beyond that distance, none but the lighter sorts of crops should be planted or sown. Peas should be excluded, because they are apt to breed mildew. Lettuces and such like dwarf crops will do no harm, provided the border be kept well manured.

Figs.—G. Jones.—The process of caprification is described in Vol. ii. p. 317, and is exactly the plan a clergyman in this neighbourhood practised last season, and saved all his crop, and ripened some very late in the autumn; which, he says, could not ripen if left to themselves. Loudon gives the practice in the French orchards from personal observation in the *Gardeners' Mag.*, Vol. vii. 263, and in some other of his works, but the former is the best account, and agrees with that in the *Chronicle* above alluded to. D. Beaton.

MELONS.—A Subscriber.—Presuming that all other circumstances are similar to those under which you formerly cultivated Melons with success, the cause of your plants damping off in the present season as soon as they have made their rough leaves is doubtless the unusually wet and cloudy weather lately experienced, together with a defect as regards bottom-heat. If the roots are kept in a proper temperature, Melon-plants will not be easily killed.

STRAWBERRIES.—An Old Subscriber.—The Russian Alpine Strawberry is the same as that cultivated around Paris for winter forcing. The seed can be procured from any Parisian seedsman. E. L. M.—The runners should be cut off at this time from Strawberry-plants in strong bloom, if you wish to make them very vigorous, and do not desire to multiply them in any way.—Deadleaf.—The error of your friend consists in supposing a wet season necessary to wash the pollen of Strawberries into the germen, whereas dry weather is undoubtedly desirable for all plants that are in flower, and Strawberries are benefited by wet only when the flower is properly fertilized. This subject was fully discussed in the 1st volume of our Paper.

POTATOES.—G.—The cultivation of Potatoes tends to loosen the soil; and if this is light already, however rich it may be, it is rendered unfit for Wheat, which likes a firm bottom, and is apt to be thrown out by the frosts in spring. On light soils there is no preparatory crop for Wheat, like broad Clover, as experience has fully proved, and for a heavy land-presser to follow the plough is of very great advantage to make a firm bottom to receive the seed. The following rotation on a very good light soil will be found among the best. First year—Winter Tares sown on the Wheat-stubble, and followed with Turnips, sown as soon as the Tares are cut for fodder; Potatoes, Carrots, Mangold Wurtzel, Swedes, and common Turnips. The proportion of each depends on circumstances and on the state of the land. Second year—Barley and Oats, half of it with

Clover. Third year.—Clover and Peas, on the Barley or Oat stubble. Fourth year.—Wheat. The same course may be repeated, provided Potatoes, Clover, and Peas recur only every eighth year, which is easily managed. All the crops except Clover and Tares must be drilled and well hoed. Nearly the same rotation will do for good heavy loams, Beans being substituted for Peas. Wheat may succeed Potatoes in heavy soils; but we still think Clover and Beans a better preparation. Where the land is not well suited to the growth of Barley, Oats are a better crop. Carrots will not succeed in very stiff soils. We cannot enter more fully on this important subject, which would require a volume, to be fully explained. *M.*

PETALOGONIUM.—*Ignoramus.*—The proper time for striking cuttings of Petalagonium is the month of June or July, when the old specimens have ceased blooming, and are cut back. The half-ripened shoots then removed may be used as cuttings, and if you have not the convenience of a hotbed frame, you can make up a small heap of fermenting manure, cover it over with rough turf, the grassy side downwards, place on it about three inches of sandy loam, and plant your cuttings in this, putting a handglass over them, and shading and watering them daily till they root. Pot them when they have formed roots, and keep them in a close frame for a time, repotting them when necessary. The way to make them bushy is to cut off the top of the cutting, or to remove the point of the shoot as soon as it begins to grow, and stop all the laterals again before winter commences. The probable cause of the leaves dying as yours have done, is the want of warmth, or their remaining too long in small pots. If kept through the winter in small pots, the plants should be shifted early, and before they begin to grow into larger ones, for they will not bear starving in spring. The sparing application of manure-water will be useful from March to May, inclusive. — *A. C. E.*—Your Petalagonium will need no special preparation for forcing, and they may be struck at the usual time. Plants raised in the summer should not be forced in the following winter, but may be used for this purpose in the one succeeding that. When cut down after flowering they should be kept rather warmer than usual, in order to develop their young wood rapidly, and they may then be ripened early by exposure. For the first bloom put them in the forcing-pit about the end of October, and treat them in the usual way; that is, keep the atmosphere warm and moist, but let it become gradually so till it reaches the desired point; and be careful to fumigate them if insects appear. *Alba floribunda* is one of those to be recommended for forcing.

CALECOLARIAS.—*An Old Subscriber.*—If you have previously prevented your half-shrubby and herbaceous Calceolarias from sending up flower-stems, and kept them growing vigorously, free from the effects of the green-fly, and in a cool situation, they will flower much later, but not so late as you state, nor so fine as if allowed to flower at their usual time. Continue to prevent them sending up flower-stems until the end of June; place the plants in a cool situation, and protect them from heavy rains and wind, in a cold frame, placed at the back of a north wall, where the lights can be put on in bad weather, but beware of the green-fly in such a situation. If the kinds are true shrubs, they will succeed much better if the flowers are constantly pinched off until the end of June. They will flower freely, particularly if planted in the open border, but not so fine as when allowed to flower at the ordinary time. Plants intended for late blooming should be retarded as much as possible in the spring, by keeping them in a very cool situation.

RHODODENDRONS.—*J. Florus.*—If you have a quantity of Rhododendron plants which you wish to propagate without going through the tedious process of raising young ones from seed, you can effect your object by layering them late in autumn. All that you have to do is to peg down each shoot into some light soil spread around the plant for the purpose, and they will make nice plants, fit for removal, in two years. It is just probable that picking off the blossoms of Rhododendrons in spring will induce them to flower again in the autumn, though they will do this spontaneously in wet seasons.

ROSES.—*J. Florus* will most likely get the information he seeks from Mr. Rivers's Rose Amateur's Garden. — *Ariel.*—We know of no means of curing mildewed Roses except by getting them into good health. Mildew is a fungus, and only attacks unhealthy plants. Your Roses look as if they had been growing in very rich soil, and exposed to cold nights. Some Roses are more tender and liable to the attacks of such fungi than others. Perhaps you had better cut back the young shoots to within a few inches of the old wood, and burn the leaves and parts cut off.

CINERARIAS.—*Survey.*—They can be exhibited at Chiswick among miscellaneous flowers. Your note is given to the Secretary of the Horticultural Society.

RANUNCULUS.—*Clemens.*—Ranunculus-roots in full growth cannot be removed at this time without injuring them for another year. The only thing to do is to take them up with large balls of earth.

SUMMER CLIMBERS.—*A Lancashire Flora.*—You may plant now against your south wall, for flowering this season, Lophospermum crubescens and scandens, Mamandya Barclayana, Eccremocarpus scaber, Tropaeolum peregrinum, and Rhodocotylon volubile.

AUTUMN FLOWERS.—*J. G. G.*—We here give you a short list of such plants as will flower in the autumn. You will find them all ornamental. *Stove-species.*—*S. lanum* Herbarium, *Colonna scandens* and *Schiedeania*, *Aschynanthus grandiflorus*, *Euphorbia splendens*, *Epiphyllum truncatum*, *Goldfussia glomerata*, and *Jatropha pandurifolia*. *Greenhouse species.*—*Brugmansia suaveolens* and *sanguinea*, *Luculia gratissima*, *Erica Bowleana*, *Massonia*, *Arclerina*, and *Irbyana*, any kind of *Fuchsia*, *Mirabeia Baxteri*, and *Crowea saligna*. *Climbers.*—*Allamanda cathartica*, *Ipomoea rubro-cerulea*, *Leardi*, and *ficiolia*, *Thunbergia*, *Tropaeolum peregrinum* and others, *Clematis Sieboldii*, and *Polevra coccinea*.

CHRYSAETHUMS.—*A. C. E.*—We cannot tell you how these plants could be bloomed all the winter. The only way of retarding them is by keeping them in a cool and rather shady place. It is impossible to state how many times they should be potted; this must be determined by their size and strength.

Ans. S.—If you wish to peg down these plants for propagation, it should have been done before; though you may do it now in a case of necessity. You have simply to bend down the shoots, and fasten them about an inch beneath the surface of the earth by small wooden pegs, with hooks at the upper end of them. These may be easily made with the twigs of old Birch-brooms. Cut off all the leaves that would be buried in the soil. If you desist merely to render the plants dwarf, proceed in the same way, but keep the whole of the shoots as near together as possible, or the specimens will be too rambling. Your other question shall be answered next week.

FUCHSIAS.—*Ignoramus* had better not rear his Fuchsia cuttings in a cucumber frame where there is much steam. A far cooler place will be preferable.

GLORIOSA SUPERBA.—*Garden Doubtler* will no doubt be able to get this plant of some of the great London nurserymen.

SEEDLING CACTI.—*T. Davies and Co.*—Your seedling between *C. grandiflorus* and *speciosissimus* is certainly a novelty. The flowers were entirely closed when we got them, but they have the appearance of those of *C. grandiflorus*, with a fine deep red tint. Doubtless it is worthy of being retained and cultivated, particularly as you state that some of the blossoms have been ten inches in diameter, and beautifully shaded with purple. The probable reason why your box was returned is that the carriage of it was not paid; nothing is received at our office on which there is any charge.

SLUGS.—*A Subscriber.*—You may destroy slugs by scattering powdered lime over them early in the morning. Or strew a few lettuce or cabbage leaves where they are most abundant, and they will invariably resort to them, when they can be picked off and killed.

INSECTS.—*A. Lawrence.*—The beetle which you complain of as so destructive to your stove and fruit-trees is the *Ausoplia floribunda*. It being a leaf-feeder, numbers may be taken by shaking the branches where they are feeding, over a cloth spread on the ground. From this cloth they may be easily collected and effectually destroyed by throwing them into boiling water. We should also recommend hand-picking, where practicable, as likely to be of much use in ridding your R. seedlings especially from such unpleasant visitors. — *A. K.*—The name of your moth is *Scoliopteryx libatrix*, Lin., or Herald Moth, and it is not of uncommon occurrence at this season of the year. *S.*

BOOKS.—*A Subscriber.*—The best work on the management of the Vine on open walls is Mr. Clement Moore's, published by Longman and Co. A useful one on forcing Vines is Mr. Roberts's Treatise, lately advertised in our columns.

CUCUMBER SHOWS.—Will the Mr. Hamilton who obtained a prize at the Cheetham Hill Cucumber Show favour us with his address?

MISCELLANEOUS.—*Apary.*—Your plants are, 1, *Dillwynia floribunda*, 2, *Oxyloium capitatum*. — *C. B. K.*—Your *Veronica* seemed a seedling variety of *V. triphylla*; but the specimen was accidentally lost. — *R. Lang.*—Your plant is the double-flowered *Belleisle Cress*, or *Barbarea praecox*. — *H. E. B.*—The Fern you send is *Polypodium pilosellides*. — *J. H.*—The flowers of your *Mimulus* were utterly withered when they reached us. — *J. R. J.*—Your plant is *Gymnogramma chaerophylla*, Desv. Kault. en. fil. p. 82. Spreng. syst. 4, p. 40, Hook. et Grev. in. fil. t. 45. Tropical America, West Indies, &c. An annual Fern, becoming a weed in stoves when once cultivated. — *Didymus.*—The *Myosotis* is *sylvatica*. It is impossible to say what your Willow is, from such a specimen. Some mature leaves should be sent in the autumn. — *J. Williams.*—Your *Fuchsia* is only a common form of *F. fulgens*. — *F. A. Hutton.* We are obliged by your offer, but have already so many contributions that we are compelled to decline it. — *Agricola.*—The plant sent is *Polygala amara*. — *T. Davies.* Seeds of the Tussock Grass from the Falklands have been occasionally introduced, but have never germinated. They are not now to be had. — *Ans. S.*—The specimen is apparently *Tournefortia lappacea*, but it was very much crushed. — *F. B.*—No. 1 is *Ageratum caelestinum*, 2, *Alonsoa incisifolia*, 3, *Polygala cordifolia*, 4, *Anthocercis viscosa*, 5, *Lotus Jacobaea*, 6, *Adenandra uniflora*. — *Indica.*—If you wish to become a gardener you must do three things. Get employment in some good garden for seven years; be steady, diligent, industrious, and well conducted; study vegetable physiology and practical botany, and learn as much more as your means will allow. — *A. B. C.*—We approve of the spirit of your letter, but do not think it would serve the good cause of gardeners. We will see whether we cannot ourselves apply the arguments more advantageously when we again return to the subject. — *A. Market Gardener* must seek for such information as he wants from the Statistical Society. We have no data. — *A Subscriber.* *Guerney.*—No. 1 is *Cotyledon umbilicus*, 2, *Arenaria maritima*, 3, *Silene maritima*, 4, *Critium maritimum*, 5, *Polygala vulgaris*, 6, *Genista anglica*. — *A. G. N.*—Your narrow leaved *Tropaeolum* is *T. edule*. The other is either a strong variety of *T. brachyceras*, or a new species; but we cannot decide which without seeing perfect flowers. — *An Irish Subscriber.*—You will meet with ample directions for drying flowers in former volumes of this Paper. Your plants are—1, *Ornithogalum umbellatum*, 2, *Veronica incana*, 3, *Potentilla atro-sanguinea*, 4, *Mimulus rivularis*, 5, *Spiraea hypericifolia*, 6, *Asphodelus albus*, 7, *Kennedia prostrata*, 8, *Pittosporum Tobira*. For this once we answer you; but it is too bad to send us such things. — *J. B.*—A Subscriber.—The Lemon-scented *Verbena* is *Aloysia citrifolia* (formerly *Verbena citrifolia*). It is impossible to name the Tulips from the leaves which were sent, the two long scented petals are from Parrot Tulips. — *D. B.*—The *Fuchsia* is a variety named *Monypenny*. — *E. A.*—Such Fuchsias as you have sent never had names; they are not good enough for border varieties. — *J. A.*—Name your flower "Harold," and send another bloom. — *Holcus.*—Apparently *Carex vesicaria*, but too young for positive determination. — *A. K.*—When a critical opinion is wanted, some explanation should be given of the object in sending specimens, otherwise, they are necessarily entrusted to assistants for determination. The *Veronica* is *V. montana*; the *Pedia* does not appear different from *P. olitoria*; it wants the toothed coronet of *dentata*. — *A Notice's* plant is *Bromus mollis*.

SEEDLING FLORISTS' FLOWERS.

ERRATUM.—At page 361, c, under the head of Calceolarias, for "Lady Charlotte" read Lady Constable.

PANSIES.—*R. S. M.*—*Desdemona*, eye bad, and petals want substance. No. 1, 43, too small, pretty, but no use as a show-flower; the ground colour of the lip differs from the side petals. The same objections apply to Lady Milner. — *J. H.*—Your Pansy is large and round, but it fails in substance for the size of the flower, the eye in the side and bottom petals runs into the purple belting, giving it a confused appearance; there is a notch in the lip, and the side petals do not meet well above the eye. — *R. S. M.*—*Bodiddor* is a flower of good form and substance, but the ground-colour of the lower petals being of a mixed or run character renders it of no use for showing. No. 322, good border variety, deficient in substance and form of petal to rank with show flowers. — *Bellefleur* is a fine variety in form, colour, and substance, the belting of deep blue is perfect round the lower petals, the upper petals have a tinge of purple in them; the eye is good, a little too much hidden in the bloom sent, by the height of the lip. This probably is not permanent, there is a stain of blue in the lip extending beyond the belting which if constant is a defect. — *W. B.*—Your Pansy is a neat and well-formed flower, fine eye, belting perfect, of a deep rich blue. The upper petals have a tinge of purple; it is rather thin, and the edges of the petals are rough; it is like many that we have, and is very sweet-scented.

TULIPS.—*Const's Letitia.*—This Tulip can only be admired for the indication it gives of a fine flame, as the bottom of the cup is stained, and the stamens are tinged with blue below the anthers; the petals are narrow and flat, and it wants shoulder to make it a well formed cup. — *Alexandrina Vulturina* has a finely-formed cup, good shoulder, petals individually of a good form, feather of a bright light brown, ground-colour yellow, rather waxy at the bottom of the cup, the flower is of a whitish buff outside, and when this is the case the yellow inside is seldom of an even tint.

CALECOLARIAS.—*W. C. Fife.*—Your seedlings are small but generally of a good form, the largest of them are small compared with the specimens which are grown in this part of the country. — *D. G.*—The form of your Calceolaria is not good, it is too narrow at the shoulder, and the bottom of the flower is uneven; it is common both in colour and making.

CINERARIAS.—*J. D. P.*—The best of your seedlings is No. 1, the petals are broad, and the flower is tolerably well filled up, the tip is also of a pretty colour. 2, is not a pure white, there is a slight tinge of purple in it. 3 and 4, are good in colour, but they have narrow petals, and none of them surpass the same kinds already in cultivation.

VERBENAS.—*D. B.*—We have examined your seedling *Verbenas* and compared them with the varieties grown, and although there are one or two pretty specimens, there is nothing sufficiently novel in colour to make them desirable; the colours, generally, are too faint and undecided. The white variety, No. 3, is the best.

PETALOGONIUMS.—*C. M. Thurtell, R.N.*—*Phosphorus* is a flower of great beauty of colour; the delicate tinge of blue in the centre imparts great brilliancy to the rich and fine rose-colour of the lower petals; the rosy crimson ground-colour of the upper petals is also very fine, although it is in a degree robbed

of its purity by the mottled way in which the blotch terminates; the lower petals are broad, but a little too long, which gives the flower too much squareness; and they appear to have an inclination to curl backwards at the edges, which takes from the flower that compact appearance which it ought to possess. In answer to your question about the other flower, we must add that our opinion is unchanged. There is a want of substance in the flower altogether; the upper petals are not flat, and they are uneven on the edge. — *T. T. H.*—Both your flowers are bold and showy varieties of good substance, but rather coarse. The upper petals in No. 1 are too large and uneven on the edges, and the under petals also are irregularly formed, which gives the flower a rough appearance. The same objections apply to No. 2, with the additional defect of the very under petals; the spot in the upper petal is rich and large, and runs far down the petals in both varieties, which is a good quality. — *A. P.*—*W. H. Chester.* The petals of your seedling are fine, and none of the flowers appear to keep their shape long; the colour which surrounds the spot is too faint and uncertain. The flower was too much blown. — *P. S. M.*—Your seedlings are all of the same character. Long-petalled flowers, they are showy market varieties, and are useful for planting in borders. — *A. M.*—The petals of your seedling are too thin; the under petals are well formed, and of a very delicate colour, but the upper ones are too crumpled and thin. — *H. P.*—Your seedling, *Sir Hugh Gough*, although it is a good substance, does not retain its form well, and the petals have an inclination to curl back, which deprives the flower of that compact form which it ought to possess. In colour it is bright and beautiful; in the upper petals the bright scarlet crimson predominates, in the lower petals the rosy crimson prevails; the spot is good, but the top petals would send some flowers. — *Lord Lovelock* is a pretty little flower, and bears some resemblance to the *Sylph*, and though a little more perfect in form, it wants the size, substance, beauty of colour, and intense spot of that fine variety. — *T. Clark.*—The upper petals of your seedling are very pretty from having a narrow rim of pure white round them, at the same time they are quite jagged and uneven at the edge; we cannot judge of the form of the flower, as the petals had fallen.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

The Christening of the infant Princess, by the names of Alice Maud Mary, took place yesterday in the Chapel Royal of Buckingham Palace, in the presence of various members of the Royal Family, and of the great Officers of State.—The debates in both Houses of Parliament during the week have related chiefly to questions connected with Ireland, which at present occupies so large a share of public attention. In the Lords, on Tuesday, the Duke of Wellington defended the proceedings of the Lord Chancellor of Ireland in dismissing Lord French and other magistrates who had presided at Repeal meetings, and stated that the Lord Chancellor, in the opinion of the Government, had only performed his duty in endeavouring to suppress agitation. Lord Aberdeen on Thursday brought in a bill relative to the admission of ministers to benefices in Scotland, and stated that he will move its second reading and explain its provisions when the House assembles after the Whitsun recess. In the Commons, the second reading of the Irish Arms Bill, after a debate of three nights, has been carried by a majority of 165. The Report on the resolutions on the importation of Canadian wheat and flour was brought up on Monday, when Mr. M. Gibson moved as an amendment that the reduction of the duty on the importation of Canadian wheat and flour into the United Kingdom should not be made contingent on the imposition or maintenance of a duty on the importation of foreign corn into Canada. This amendment was opposed by Ministers, and negatived on a division by 193 to 83. Leave was then given to bring in a bill founded on the resolutions, after a protest from Lord J. Russell against the Imperial legislature being restrained from altering or repealing it when other views prevailed on the subject of the Corn Laws. The motion for the second reading of the bill came on last night, when Lord Worsley moved as an amendment that it be read a second time that day six months. A long debate and a division ensued, when the second reading was carried by a majority of 109. The Repeal agitation continues to maintain a formidable character; the meetings in different parts of Ireland are increasing in frequency, and are everywhere attended by large and excited masses of the people. Troops have this week been despatched to Ireland in considerable numbers, and all the garrisons in the Irish provinces have been strengthened by fresh reinforcements.

A telegraphic despatch from Paris reached town yesterday, announcing the arrival of the India mail, with accounts from India to the 2d of May, and from China to the 12th of March. The affairs of Spain were tranquil, though some troubles had taken place at Sirhind, and a serious engagement had been fought at Lihytul. The death of Commissioner Elepo was the only news at Canton, but fresh attacks were expected on the Factories. On Major Malcolm's arrival, Sir H. Pottinger was to go to Canton with the ratification of the treaty, but nothing beyond this brief summary is at present known.—From Spain our intelligence continues to be highly interesting. The Cortes were dissolved on the 26th ult., and another general election will take place forthwith. The inhabitants of Arragon and Catalonia are represented to be in a state of great excitement, and the immediate suspension of the Regency is said to be the first object of the disaffected. The National Guard of Madrid, however, have openly declared their allegiance to the Regent, and it is hoped that the difficulties of the present crisis may be surmounted without an appeal to military interference.

Home News.

COURT.—The Queen and Prince Albert, accompanied by the Princess Royal, arrived in town on Tuesday afternoon, from Claremont. The Prince of Wales and the infant Princess, accompanied by the Dowager Lady Lyttelton, followed in another carriage. On Wednesday and Thursday her Majesty and Prince Albert took a drive in an open carriage and four. A grand dinner was given on Wednesday evening at Buckingham Palace, to the Queen Dowager, the Royal Family, and the directors of the Concerts of Ancient Music, of which Prince Albert had undertaken the direction, for the Earl of Westmoreland. After the dinner her Majesty and the Royal party attended the performance of the Concert; and on Thursday evening her Majesty and the Prince honoured the Italian Opera with their presence. On the same day Prince Albert laid the foundation stone of the Royal Naval School at Counter-hill, near Deptford. Her Majesty will leave town this day for Claremont, and remain there during the Whitsun holidays.—It is rumoured that, previous to the nuptials of the Princess Augusta of Cambridge with the Grand Duke of Mecklenburgh, an application will be made to Parliament, by Ministers, to settle an annuity on that princess of 3,000*l.* per annum. The ceremony is now understood to be fixed for the first week in July.—His Majesty the King of Hanover arrived in town yesterday, having finally determined to pay his long-expected visit to England, on the occasion of the Christening of the infant princess.—Their Royal Highnesses the Duke and Duchess of Cambridge, Prince George and the Princess Augusta, and the Hereditary Grand Duke of Mecklenburgh Strelitz, honoured the Duke of Devonshire with their company on Tuesday, at the public breakfast given by his Grace, at his residence, at Chiswick.—Colonel Buckley has relieved Colonel the Hon. Charles Grey in the duties of Equerry in Waiting on her Majesty, and Major-General Sir E. Bowater has relieved Colonel Wyld as Equerry in Waiting on Prince Albert.

Christening of the Infant Princess.—The second daughter of her Majesty and Prince Albert was yesterday admitted into the pale of the church. The Ambassadors, Cabinet Ministers, and others, who had been invited to the solemnity, assembled in the Old Dining-room at Buckingham Palace, at twelve o'clock, and upon their arrival were conducted to seats provided for them in the chapel. The Archbishops of Canterbury and York, the Bishops of London and Norwich, the Dean of Carlisle, the Hon. and Rev. C. L. Courtenay, Archdeacon Wilberforce, and Lord Wriothlesley Russell, Canon of Windsor, were the officiating clergy. The King of Hanover had not arrived at a quarter past 2 o'clock, consequently his Majesty, who was to have stood sponsor for the Royal infant, was represented by proxy. The Duchess of Kent appeared as proxy for the Princess of Hohenlohe Langenberg, and the Grand Duke of Mecklenburgh Strelitz appeared as proxy for the Hereditary Prince of Saxe Coburg and Gotha; who, with the Princess Sophia Matilda, were the sponsors. Her Majesty the Queen, Prince Albert, the Queen Dowager, and other Royal personages, took their seats in the Chapel Royal shortly after 12 o'clock, attended by the Great Officers of the Household, and the attendants forming the suites of the members of the Royal Family and visitors, who arranged themselves on either side of the chapel. The service commenced with the performance of sacred music. When the music had ceased the Lord Chamberlain, accompanied by the Groom of the Stole to his Royal Highness Prince Albert, conducted the infant Princess into the chapel; her Royal Highness was carried by the head nurse, attended by the Dowager Lady Lyttelton. Upon the conclusion of the Baptismal Service, her Royal Highness was reconducted from the chapel in the same way. As soon as the ceremony was concluded, her Majesty and Prince Albert, her Majesty the Queen Dowager, the Archbishops, the sponsors, and the other Royal personages, returned to the Queen's apartments in the same order as they entered the chapel. The visitors proceeded to the Long Gallery, to partake of a collation with her Majesty and the Royal Family. The Baptismal ceremony was performed by the Archbishop of Canterbury, and the Royal infant received the names of Alice Maud Mary.

Judges' Circuits.—The Judges sat on Thursday in the Exchequer Chamber, and selected their circuits during the approaching summer Assizes. The following is the arrangement:—Norfolk Circuit, Lord Denman and Baron Alderson; Home Circuit, Lord Chief Justice Tindal and Baron Parke; Midland Circuit, Lord Abinger and Justice Pattison; North Wales, Baron Gurney; South Wales, Baron Rolfe; Oxford Circuit, Justice Williams and Justice Maule; Western Circuit, Justice Coleridge and Justice Erskine; Northern Circuit, Justice Wightman and Justice Cresswell. Justice Colman remains in town.

Post Office.—The Post-office convention with France came into operation on Thursday. In the new regulations the former principle that the English charge a single rate for letters under half an ounce, while the French limit themselves to a single rate only when the letter is under one quarter of an ounce, is still preserved, but the English rate to France is reduced from 10*d.* to 5*d.*, the French rate being reduced to 5*d.* also; and the payment of these two rates will be all that is required for the conveyance of a letter to any part of France or Algeria. These letters must be left unpaid, or else they must be paid the whole rate to their destination. The transit-rate through France to other countries is likewise reduced to 5*d.*, a rate on letters under a quarter of an ounce; the other foreign rates varying according to the limit to which the letter is paid. To Turkey, the Levant, the Archipelago, Greece,

the Ionian Islands, Austria, Venetian Lombardy, Switzerland, Belgium, Germany, and Holland, letters may be sent by paying only the British rate of postage, if they are specially addressed *via* France; but to Spain and Portugal, Sardinia and Southern Italy, the French rates must be paid. To Alexandria, Constantinople, the Dardanelles, Greece, Malta, the States of the Church, the Sicilies, Smyrna, and Tuscany, the letters, when not sent by French packets *via* Marseilles, may be unpaid or paid to destination. English newspapers sent to France by packet will go free of postage, or by private ship on payment of a penny, while French newspapers sent here will pay a halfpenny. To and from other countries *via* France, the rates on newspapers will be a halfpenny from Spain, 1*d.* from Greece (by the French packets), 3*d.* from Malta, or any other place in the Mediterranean and the East Indies (by the monthly mail), and 2*d.* from other countries. It must be distinctly recollected, that on all letters a foreign rate is added to the lowest postage for every quarter of an ounce, while an English rate is only added for the half-ounce. The departure of the mail to India *via* Marseilles is postponed to Tuesday next, the 6th inst.

Foreign.

FRANCE.—There is little news this week in the Paris papers. The *Constitutionnel* states that the Government has received communications from China, announcing that the Emperor has decided upon immediately giving the French free access to his dominions upon the same footing as the English, and that in consequence of this intelligence a naval division is about to be sent into the Chinese Seas, under the command of a Rear-Admiral, and consequently it will be composed of several frigates and other ships-of-war.—The committee appointed by the Chamber of Deputies to examine the bill relative to foreign refugees in France, have terminated their labours. According to their report, the number of refugees amounts to about 16,000, of which 10,339 are Spaniards, 4,981 Poles, 790 Italians, and 333 Germans. The following telegraphic despatch from Gen. De Bar was received in Paris on Sunday:—"Algiers, May 23.—The Duc d'Aumale writes to me on the 20th May, from his camp at Chabounia:—"The smala of Abdel-Kader is captured, his treasure pillaged, and his regular infantry killed or dispersed. Four flags, a cannon, two ordnance carriages, immense booty, large tribes and flocks have fallen into our hands." The Prince must have arrived on the 22d at Boghar. His column will conduct the prizes into the Metidjah. The mother and sister of Abdel-Kader have—." The night interrupted the despatch at this important point, and the *Siécle* states that a ludicrous disappointment was experienced at the Tuileries when the result was known. The darkness having interrupted the communication, which ended with the words, "The mother and sister of Abdel-Kader have—." hopes were indulged till sunrise that the remainder of the despatch would announce the capture of the two Princesses. The anxiously-expected conclusion of the despatch did come up, but it was as follows:—"The mother and sister of Abdel-Kader have escaped." The *Journal des Débats* states that *smala* is the name given by the Arabs to the tents, family, domestics, and riches of a chieftain, and that this *coup de main* has probably been executed in the direction of Gougilat, an oasis of the minor desert, which Abdel-Kader had for some time past made his depot. The other despatches, though representing affairs as everywhere prosperous, detail but unimportant movements and skirmishes, amidst which we find Abdel-Kader still harassing his foes and escaping their grasp, and the French perpetrating *razzias* on such tribes as favour him. Another of these predatory expeditions is reported, which has yielded near two thousand captives of both sexes, three or four hundred horses, and twelve thousand head of cattle.

SPAIN.—A telegraphic despatch announces that the Spanish Cortes were dissolved on the 26th ult., and the new Cortes were summoned to assemble on the 27th of August. All was tranquil in the capital, but travellers from Saragossa and Barcelona state that a movement had broken out in those cities, and that the Municipal, National Guard, and troops had agreed to demand the restoration of the Lopez ministry. In Arragon and Catalonia it is said to be the intention to proclaim, with the aid of the Deputies who have quitted Madrid, the immediate suspension of the Regency, and the declaration of the Queen's majority. All the chief towns are agreed, and Saragossa, with the garrison, has already made a declaration of its intention. The Barcelona municipality is disposed to follow the movement, but will not commence. The sittings of the Cortes previous to the dissolution were very stormy. No sooner was it known that Señ. Lopez had finally resigned, than a message was sent to the Regent by the Chamber, praying him, indeed, to continue Regent till October, 1844, but on condition of his acting constitutionally. The Regent replied that his acceptance of Lopez's resignation was constitutional, and that he would act in the manner he deemed the most advantageous to the welfare of the country. On leaving the hall the new President of the Council, Gomez Becerra, and his colleague of the War Department, Gen. Hoyos, were insulted. A stone was thrown at the former, which, fortunately did not strike him, and an ill-dressed individual was arrested who had attempted to stab him. The two ministers succeeded in entering a carriage, and drove off amidst cries of "Fuera! Fuera!" "Down with the ministers and Anglo Ayacuchos!" "Viva la libertad!" The glass of M. Mendizabel's carriage was smashed on the same day, and it was believed that he would have incurred some personal danger had he

not prudently avoided attending the sitting of the Deputies. That of the Senate was far more pacific; the deputation entrusted with the presentation of the Address in reply to the speech from the throne succeeded in moving safely to and from the Regent's palace, though it included General Linage among its members. The troops were still kept in their barracks, and a part of the garrison was to remain under arms during the following night. The coalition journals published a number of most violent and almost revolutionary articles; one of them, in which the people were told that they were deceived, sacrificed, insulted, and sold, was believed to have been penned by M. Lopez himself. They failed, however, in creating the slightest agitation, and a bull-fight which took place on the next day passed off quietly. On the 21st, the nine regiments of the National Guards, to show how little they approved of the movement, ordered their bands to unite and give a serenade to the Regent. Most of the Guards themselves attended, as well as a multitude of people. After some music, the crowd shouted, "Long live the Regent," to which the latter replied by appearing on the balcony. He thus addressed those present—"Nationals! None have more than you comprehended my wishes, which are no other than your wishes, viz., defence of the constitution, of the throne of your innocent and young Queen, and the maintenance of national independence. Such are my aims. As Regent, as soldier, and as citizen, I will with you defend the constitution, national independence, and liberty." The Regent added, "Long live the Queen, the Constitution, the brave Nationals, and their valiant comrades of the army." The crowd replied by *vivas* for the Regent. Serenades were given by the same bands to the Ministers, Becerra and Mendizabel.—The official Gazette contains two important documents. By one of them, the Minister of Finance, Señ. Mendizabel, orders that the extraordinary contribution of 3,000,000 reals, raised at Barcelona in consequence of the late insurrection, shall be restored to that city. The other document is a circular letter of the Minister of the Interior, containing the promise of a general amnesty, by which all Spaniards sentenced for political crimes committed since Sept. 1, 1840, are set free, whether in prison, exiled, or transported. This excludes from the amnesty all the emigrants who have not undergone trial.

PORTUGAL.—We have accounts from Lisbon to the 22d ult. The arrival of the Princes of the Cobourg family, and the Princess Clementine, was daily expected at Lisbon. The Cortes were expected to remain open some weeks longer. The budget and other financial measures were coming under discussion. The ministerial Bill, reducing duties on foreign goods imported into Madeira to one-half, had passed the Deputies. Coal is admitted free, and the privilege was ordered to be extended to the Azores. The question of extending the whole Bill to those islands had been referred to a committee. At Lisbon business was generally complained of; but the export of wine from Oporto, and the amount of Customs duties received at the principal Custom-houses, had increased during the month of April, owing to negotiation having ceased, though some uncertainty still prevailed on the subject.

GERMANY.—The first debate in the Diet of the Prussian Rhenish provinces, opened at Dusseldorf on the 14th ult., was on the subject of giving complete and verbal publicity to the transactions of the Diet. The result was a petition to his Majesty, for the purpose of appointing an official reporter, whose notes should be published.—The Emperor of Austria opened the Hungarian Diet at Presburg on the 20th ult., by a Latin speech. Eight Royal propositions were afterwards submitted to the Assembly. One of them referred to the respective positions of the different religious worshipers, to the right of individuals not belonging to the nobility to purchase landed property, to the means of promoting trade, &c. The papers announce the death of the son of Count Sandor, and grandson of Prince Metternich, at Vienna, on the 14th ult., the day of the 70th anniversary of Prince Metternich's birth.—We learn from Munich, that a site has been selected for the house which the King of Bavaria has ordered to be built after the model of the ancient Romans, and for that purpose an architect and a painter have been sent to Naples to examine and to study all the particulars of the best preserved private buildings at Pompeii and Herculaneum. The extensive collection of ancient utensils and furniture which his Majesty at various times received as presents from the King of Naples will be sufficient to furnish the House.

ITALY.—The Pope's journey through the southern provinces of his dominions is described as a perfect triumph. The populations of the most distant villages meet him on his road, to offer him presents, and to receive his benediction. In one small town the corporation presented him with an equestrian statue of their patron saint cast of solid silver, and would almost with main force have placed this mark of their affection in the Pope's carriage, if he had not, with some difficulty, convinced them that its weight would break down the vehicle, and that it would be better for the saint to remain where he had been for so many centuries.

DENMARK.—It was announced in the French papers a few days ago, on the authority of a letter from Copenhagen, that a journalist of that city, charged with libel, had, in virtue of some obsolete law, been thrown into a dungeon, and kept on bread and water. By another letter, of the 17th ult., we learn that he has since been brought to trial and acquitted, and the crown has been condemned to the costs of the suit.

RUSSIA.—On the 8th ult., the Emperor of Russia addressed a ukase to the Minister of Finance, ordering that a loan should be made for the sum of 8,000,000 of

silver roubles, for the year 1844. This loan is intended to defray the expenses of constructing the railroad from St. Petersburg to Moscow.

TURKEY.—Constantinople letters of the 3d ult. mention that Sarim Effendi, Minister of Foreign Affairs, has been dismissed, and replaced by Rifaat Bey, Envoy at Vienna. Khosrew Pacha's accession to power was said to have been prevented by Sir Stratford Canning and M. Bourqueney, on the ground that he was too Russian. The funeral of one of the young Sultanas, daughter of his Highness, who died on the 30th April, took place with much pomp on the 1st ult., in presence of all the Ministers and principal functionaries of the empire. The Turks of Bosnia have broken out in insurrection, and made an attempt on the fortress of Ostroschatz. They were repulsed, but they besieged it and other fortresses, demanding that the Pacha and the Arnauts be sent away. There is no news from Servia.—One of the Dublin papers states that they have seen a letter from India, which contradicts the report of the murder of Capt. Connolly and Lieut. Stodhart, by the barbarians in Bokhara. The account comes *via* Meshid, and is grounded on letters received by certain Jewish houses in that place, but it is generally considered to require confirmation.

EGYPT.—Letters from Alexandria announce that Mehemet Ali still remained in that city. Ibrahim Pasha continued in a precarious state of health at Cairo, which gave rise to much speculation as to the consequences which might ensue should he die before his father, as Said Pasha, the second son, was considered incompetent to govern such a country as Egypt. The *Augsburg Gazette* publishes the following improbable story from a letter dated Cairo, 21st ult., stating that two ships laden with slaves, had been captured by British cruisers in the Red Sea, in the latitude of Sanaken, and that the captains of the ships had been hanged at the mainmast. The two slave ships were escorted (the bodies of the two captains still hanging from the mainmast) by the British cruiser, and the slaves set at liberty. This example is said to have intimidated the slave-merchants.

UNITED STATES.—The royal mail-steamer *Hibernia* arrived at Liverpool on Sunday. She sailed from Boston on the afternoon of the 16th ult., and Halifax on the evening of the 19th, and has made the passage in the remarkably short space of 11 days and 12 hours, the quickest ever made between Boston and Liverpool. The *Caledonia*, from Liverpool, for Boston and Halifax, was spoken about half way across the Atlantic. The *Great Western*, from Liverpool, arrived at New York on the 12th inst., after a passage of 12 days and 13 hours. Mr. Webster has resigned the office of Secretary of State. Mr. Everett having declined the mission to China, Mr. Cushing, the gentleman who was recently rejected by the Senate as Secretary of the Treasury, has been appointed by the President to fill the office. A cry for repudiation of the debt of Maryland had been raised; but the more honourable part of the community of that state was too strong for the democrats, and the doctrine was no sooner broached than effectually silenced. In the letter of a Philadelphia correspondent of the New York papers, dated May 15, is the following paragraph:—"The keeper of the lighthouse at Thatcher's Island, Cape Ann, saw a board at sea, which afterwards drifted ashore, having on it in printed letters, 'Steam-ship President.'" The last Kingston papers mention that Sir C. Bagot had somewhat improved in health, and that Mr. Cholmondeley, formerly on the staff, is on his way to New York, for the purpose of requesting Lord John Hay to take the *Wasp* to Quebec, as being a more convenient place than New York for Sir C. Bagot, in his present condition, to embark from. A vessel arrived at New York on the 15th April from Carthage, reports that the Grand Cayman, one of the three islands called Caymans, lying between Cuba and Jamaica, was sunk by an earthquake; but more recent advices, received by H.M.S. *Wasp*, state that there is no foundation for the rumour. Accounts have been received that the report of the intended canal across the Isthmus of Darien being nearly completed, is incorrect; and that the two years allowed the contractor to prepare and commence the undertaking have expired without any attempt whatever being made toward its fulfilment.

BRAZILS.—The *Malabar* has arrived from Rio, which she left on the 4th April. She has brought home the Hon. Henry Ellis, the British Envoy to the Brazilian Government, the failure of whose negotiations for the renewal of the commercial treaty has been known for some time. On the 18th ult., while in full sail, the island of Terceira being in sight, though at some distance, the *Malabar* appeared suddenly to have grazed a sunken rock. She was immediately brought to, but no bottom was found with 189 fathoms of line; and it might have been the effects of a submarine explosion, though this fact will be ascertained on her bottom being examined.

SANDWICH ISLANDS.—Accounts have been received at Liverpool, announcing that the Sandwich Islands were ceded to the British Crown on the 25th February, and were taken possession of by Lord George Paulet, of Her Majesty's Ship *Carysfort*, next day.—The New York papers mention the arrival of a small vessel at that port from Oahu, which had for part of her cargo 6,100 bags of sugar. "To import sugars," it adds, "from the most distant Pacific Islands into the United States is a remarkable feature in trade. The industry of the people of these islands is now very successfully employed in raising the cane, and they will shortly compete with the West Indies in supplying a part of the world, at least, with that great staple, sugar."

Parliament.

HOUSE OF LORDS.

Tuesday.—After a discussion and division on the Peterborough and Northampton Railway Bill, the second reading of which was

adjourned to Thursday, the Marquess of CLANRICARDE called attention to the official communication from the Lord Chancellor of Ireland to Lord Ffrench, and asked if any communication had been made to the Irish Government, so that they could be officially aware of the opinion of her Majesty on the subject of the Repeal of the Union.—The Duke of WELLINGTON said that general instructions had been given, that all the power and authority of the Lord Chancellor and the Irish Government should be exerted to discourage the Repeal agitation.—The Marquess of CLANRICARDE considered the letter of the Lord Chancellor most improper and unfortunate.—The Duke of WELLINGTON adverted to the anxiety caused by the agitation in Ireland, and stated that the Government had adopted measures to enable the Lord Lieutenant to preserve the peace, and to adopt all necessary measures to preserve the union inviolate. Magistrates were presiding over Repeal meetings, although her Majesty had declared her intention of preserving the Union. When it was well known to be the intention of the Government to preserve the inviolability of the Union, the Lord Chancellor had only performed his bounden duty in endeavouring to suppress agitation.—After a few remarks from Lord Glengall, Lord CAMPBELL condemned the Lord Chancellor's letter, and denied that Repeal meetings were necessarily illegal.—After some observations from the Earl of CHARLEVILLE and the Earl of WICKLOW, the Lord Chancellor upheld the course pursued by the Lord Chancellor of Ireland, and declared that had he acted otherwise he would have neglected the duty which he owed to his Sovereign and to his country.—Lord COTTENHAM charged the Government with a dereliction of duty in having permitted these assemblages, if illegal, to have continued so long unexpressed. If these meetings were illegal, the proclamation in the letter of Sir E. Sugden was most unfortunate, for in that document they were treated as perfectly legal.—The Marquess of LANSDOWN lamented the course pursued as most mischievous in its consequences, because it directed the attention of the people to the debates in Parliament as an authority, rather than to the law of the land.—Lord WHARFCLIFFE, although he admitted that the peace had not been broken at these meetings in Ireland, contended that the assemblage of 200,000 people must create terror, and should not be tolerated. He was quite willing to take his share of the responsibility attaching to the dismissal of Lord Ffrench, for any magistrate who attended such meetings was not fit to continue in the commission of the peace.—The Marquess of CLANRICARDE moved for the production of the letter of the Lord Chancellor of Ireland, which was agreed to.

Wednesday.—The Royal assent was given by commission to several Bills, the greater part of which were of local interest.

Thursday.—Lord BROUGHAM brought in a bill to introduce a form of procedure into the law of England, long known and practised in the Scotch law. "It was what was called in Scotland a declaratory action, a proceeding by means of which a person in possession, and dreading that his title might be disturbed when evidence in support of it might not be forthcoming—or by means of which a person not in possession and wishing to ascertain his rights, although no suit was pending between the parties—had the means of obtaining a declaratory decree of a court, either of law or equity, as the case might be."—On the motion of the Earl of CLARENDON, the Northampton and Peterborough Railway Bill was read a second time, after some opposition from Earl FITZWILLIAM, the Earl of HARDWICK, and others. The majority in favour of the bill was only 1.—The Marquess of LONDONDERRY inquired whether there was any prospect of the compensation to the Spanish Auxiliary Legion being soon paid, and was informed that the subject was now under discussion between the Government of this country and that of Spain.—Lord LORTON, on presenting a petition from a place in Ireland, in support of the Legislative Union, suggested that the best mode of restoring tranquillity to Ireland would be by calling out the yeomanry of the north, and some other places.—Lord CAMPBELL brought up the report of the committee on the subjects of defamation and libel. He stated at considerable length the recommendations of the committee, and added that it was his intention to introduce a bill founded on the recommendations of the committee. The report was ordered to be printed.—The Earl of ABERDEEN brought in a bill for removing doubts relative to the admission of ministers to benefices in Scotland; and stated that on Friday, the 9th inst., he would move the second reading of the bill, and explain its provisions.—Lord CAMPBELL said that, without knowing the provisions of the bill, he must protest against any bill which gave the Church Courts power to inquire into the grounds on which a congregation objected to a minister. The bill was read a first time, and the House then adjourned to Friday, the 9th inst.

HOUSE OF COMMONS.

Monday.—Sir G. CLERE, in answer to a question by Sir C. LEMON, stated that the Treasury had decided that the mails for the Peninsula, the Mediterranean, and the West Indies, should in future be despatched from Southampton instead of Falmouth, and that this arrangement would come into operation as soon as the Postmaster-General could make the necessary alterations for so doing.—Amongst the other preliminary business, there was a series of questions from Mr. RABINGTON, and other Irish members, as to the use of her Majesty's name on the subject of the repeal of the union and the dismissal of Lord Ffrench and other Irish magistrates.—Sir J. GRAHAM said that the Lord Chancellor of Ireland had received general directions to use all his official authority in order to discourage the agitation; and as to the use of her Majesty's name, it had been done under the direction of her responsible advisers.—Sir R. PEEL, amidst loud laughter from both sides of the House, moved the usual annual vote of thanks to their chaplain, for the sermon which he had that day preached to the House, in commemoration of the restoration of Charles II., and which was ordered to be printed. He said the laughter arose, he presumed, from the fact that only six or eight members were present in St. Margaret's, with the Speaker and the mace.

The report on the resolutions on the importation of Canadian wheat and flour was moved; and Mr. M. GIBSON then moved, as an amendment, that in reducing the duty on the importation of Canada wheat and flour into the United Kingdom, it is not expedient that such reduction should be made contingent on the imposition or maintenance of a duty on the importation of foreign corn into Canada.—The amendment was seconded by Dr. BOWRING.—Lord STANLEY declined re-opening the question, which had been so recently discussed, and affirmed by a majority of two to one. He, however, briefly replied to the speeches of the mover and seconder of the amendment.—Mr. THORNTON adverted to Lord Ashburton's declaration, that the tariff of the United States had been passed for revenue purposes only. His own experience, derived from a visit to America last autumn, enabled him to affirm that the current opinion of the Americans themselves was, that it was passed for protection, in order to foster American manufactures. He urged the importance of taking measures to induce the Americans to re-consider the tariff when Congress met next December.—Mr. VILLIERS pointed out the violation of all principle in the Canadian measure, which was, in fact, the creation of a Corn-law in Canada, and therefore an expedient to raise the price of food. We ought rather to present inducements to emigrants to settle in the colony, instead of adding to the temptation presented to them of proceeding to the United States.—On a division, the amendment was rejected by 195 to 83.—On the question, that leave be given to bring in a bill founded on the resolutions, Lord J. RUSSELL protested against the measure being considered in the light of a contract, or that the Imperial Legislature was to be restrained from altering or repealing it when sounder views prevailed. Leave was then given to bring in the bill.—Sir J. GRAHAM then moved the consideration of the Lords' amendments on the Registration of Voters Bill, which were agreed to.

The second reading of the Irish Arms Bill was next moved by Lord ELIOT, who briefly adverted to the past legislation on the subject of the importation of arms into Ireland and their regis-

tration. A bill, similar in its provisions to the present one, had been introduced into the House by Lord Morpeth in 1838. He did not deny that the restriction imposed by the bill was an infringement of the liberty of the subject, but the state of society must be taken into account. Colonel M'Gregor, the head of the Irish constabulary force, had strongly reported on the evils arising from the possession of unregistered arms, for which the law at present provided no effective remedy; in which he was corroborated by his second in command. These men were well qualified to judge of the state of the rural population in Ireland; but, as additional testimony, he cited various cases of violence and forcible entries into houses, of recent occurrence, as well as the number of murders committed, which he ascribed to the possession of fire-arms. The contrast between the number of criminal offences and amount of convictions in England and Wales and in Ireland further showed the necessity of the measure, the provisions of which placed Protestants and Roman Catholics on the same footing. All fire-arms, for whatever purpose, in the possession of individuals, are to be registered, and their owners licensed, under certain regulations, and with penalties for non-compliance; and with respect to the possession of unlawful arms, as pikes and daggers, some slight modification is to be made in the existing law, which leaves at present no alternative but transportation. In this matter a discretion is now to be given to the court which tries the convicted individual. Instead of the warrant of two Justices, in order to search districts for arms, which is required by the existing law, and which in practice has been found inconvenient, one Justice is to grant a search-warrant in which, however, the police to whom it is entrusted are to be named. Some other modifications are introduced into the present measure, which he believed to be necessary for the protection of property, and the maintenance of law and order.

Mr. S. CRAWFORD acknowledged that the bill was founded on precedents; but as he had never been a party to the precedents he moved the postponement of the second reading to that day six months.—Lord CLEMENTS seconded the motion, only regretting that it was not a direction to the Sergeant-at-Arms to kick the bill out of the House. He admitted that Lord Eliot, in dragging the "monster" before them, had stated the case fairly; but it was melancholy to see the Government bringing forward such a measure, instead of amending the laws relating to tolls and customs, which were the source of so much discontent. It was absurd to say worse outrages were committed in Ireland than in England: were not people shot at in the streets of London and Manchester? Nay, what was the character of the outrages on her Majesty? You call them mad, said the noble lord, and the theory seemed to be, that murders were committed by madmen in England, and by Roman Catholics in Ireland. He quoted the sentiments of Sir R. Peel, Lord Stanley, and Lord Glenelg, on former occasions, advocating the exercise of the ordinary powers of the law, rather than a resort to severe and coercive measures; and adduced a mass of documentary evidence relative to the past legislation of coercion, in order to prove the uselessness of the present measure, the provisions of which the magistracy of Ireland, as a body, would not enforce, though individuals might look to it as a means of oppression and revenge. If they were to legislate for Piccadilly as they did for Ireland, they would find the inhabitants of that quarter as discontented as the people of Ireland.—Mr. BARNES, though not approving of coercion, supported this bill, because it would prevent much mischief. The measure was only a preliminary one; when the patient was somewhat cooled down, he felt confident that the Government would undertake to cure the evils of Ireland.—Mr. SHELLE said if he were satisfied that such an Arms Bill would be effectual for the suppression of crime in Ireland, he would give it a reluctant but strenuous support. But he traced the discontents of the country to other causes, requiring other methods of cure. One was a great defect in the administration of justice—the mode of employing witnesses for the Crown, by which informers were bribed, and honest witnesses left wholly unprotected. Crown prosecutions were got up with injurious precipitation; and the power of challenging jurors was also exercised to the obstruction of justice. He objected to the Arms Bill, because it deprived the honest man of the means of defence, without taking from the ruffian the means of aggression; and, above all, because it established a distinction between England and Ireland. Mr. Canning had exclaimed, "Repeal the Union—restore the Heptarchy!" But they were teaching Ireland that with different legislation there ought to be different legislators. The bill was said not to be new; but it did contain some novelties in composition. The original Arms Bill had been introduced by Sir Arthur Wellesley in 1807, but the difference between Ireland in 1807 and 1843 was as great as between the Sir Arthur Wellesley of Dublin Castle, and the Duke of Wellington, whose fame filled the world. Sir Samuel Ronilly had denounced these efforts at coercion; and Sir R. Peel had himself joined in a similar denunciation, and had asked if such a state of things was to continue. It was said that Catholic Emancipation had not produced its desired results. But had it been conceded earlier—had it been granted in 1825, when they had agreed that the Catholic clergy should receive a salary from the State, and thus be connected by a "golden link"—he would not venture to say what would have been the result, but it would have been very different from the results of that measure, which was—he would not say extorted—but won, from the Government of the day. Sir R. Peel, on a recent occasion, had come down to the House of Commons with a prepared and sternly unconciliatory speech on the subject of the repeal of the union, and in that speech he had mixed up the name of our beloved Sovereign. What had been the course in 1837, on the accession of the Queen? On that occasion Lord John Russell, in officially confirming the Lord-Lieutenant in his office, had been commanded by her Majesty to express her satisfaction at the tranquillity of Ireland, and her wishes for its welfare. The young Queen had read the history of his country; she had felt that for great wrong there was great reparation due; and with all the warm feelings of her heart, had commanded her then Home Secretary to give utterance to those sentiments of gentleness and mercy by which she was animated. What was the condition of Ireland now?—what the difference between the Government of a Whig and Tory Administration? Why not treat Ireland as they had treated Canada? That colony had been governed as Ireland was still; but they now gave it a liberal governor, who did not even belong to their party, and they had called to the functions of office men who had been hunted to the death. Pursue a similar course in Ireland; carry out the Emancipation Bill; conciliate the clergy; strip the agitators of their three-fold panoply; and the whole past history of the world informed them what would be the result.

The ATTORNEY-GENERAL referred to the fact, that a similar measure had been introduced by Lord Morpeth in 1838, and afterwards in 1840, and though at that latter period, Mr. Shel. had been Vice President of the Board of Trade, neither he nor any Irish Member had raised a voice against what was now denounced as a violation of the constitution. He entered into statistical and other details, vindicating the necessity of the present measure, but admitted that the question of an Arms Bill for Ireland was one of some doubtfulness, and to be fitly considered by the House; and replied in detail to some of the arguments of Lord Clements and Mr. Shel. as to the remedial measures which they considered involved in "justice to Ireland."

Lord J. RUSSELL admitted that it was unquestionably true that the late Government had, in 1838 and 1840, brought in bills similar in their provisions to the present one. But the policy of that Government was wholly different from the present one. They had sought to inspire confidence in the law—to conciliate the people—a policy whose results required not a single act of the Legislature, but the continued operation of a wise policy. In this he, as Home Secretary, and Lord Normanby and Morpeth, had been well seconded by the late Sir Michael O'Loughlin, whose memory was now justly revered. They also had filled

offices with men in whom their countrymen had confidence, and the sympathies of the people of Ireland had been sought. But this course had not now been pursued; they had filled the bench of justice with individuals whose attachments were not with the majority, but the minority; and their treatment of the Irish magistrates was not calculated to maintain public tranquillity. Anxious for the maintenance of that tranquillity, he had early expressed his satisfaction on the appointment of Lord Eliot as Irish Secretary, and he was aware that much of the system of the late Government had been maintained. But, somehow or other, there was an essential departure from the spirit by which it had been actuated: would, for instance, such a man as Sir Michael O'Loughlin have been promoted by the present Government? He could not vote against the second reading of the Arms Bill; but he warned the Government against resting on such measures. As to the repeal of the Union, he felt that the arguments against it were so strong, that he should not dread any discussion in Parliament on the subject. But he reminded the Ministerial side of the House of the unfair manner in which they used to treat the late Government, laying every outrage at its door, and seemingly rejoicing at the intelligence of a fresh one, in order to use it for a party purpose. Now that no party purpose was to be served, let them pursue a course which had formerly and would again promote tranquillity in Ireland; he was not afraid of a civil war, but he felt the importance of a conciliatory policy.—The debate was adjourned; and after some routine business, the treatment of Ireland came once more under discussion, on a motion of Mr. SMITH O'BRIEN, for certain returns, to exhibit, amongst other matters, the "name, native country, and religious persuasion" of individuals appointed to offices, or dismissed from them, in Ireland, by the present Government. The object intended was to show that Irishmen were overlooked in the distribution of patronage. After some discussion the motion was modified, and agreed to.

Tuesday.—After a brief discussion as to whether notices of motion should have precedence of the adjourned debate on the Irish Arms Bill, Mr. COCHRANE allowed a motion, relative to our financial and diplomatic intercourse with Greece, to stand over; and some other motions having been either acceded to or waved, the adjourned debate on the Irish Arms Bill was proposed to be resumed; on which Lord PALMERSTON complained that the postponement of Mr. COCHRANE's motion prevented him from contradicting a statement of Sir R. Peel, who had said that the Greek Loan had been guaranteed by the late Government; whereas it was the Government of 1830, of which the Prime Minister was a leading member.

The adjourned debate was then resumed by Mr. ROSS, who said he was the last in the world to depreciate the act of emancipation, but it had been obtained at a great sacrifice, for it had prostrated the forty-shilling freeholders, and had practically put a stop to further ameliorating measures for Ireland. The Irish were naturally a loyal people, and it was an impeachment of their characteristic attachment to deprive them of arms in the way this bill proposed to do.—Mr. STAFFORD O'BRIEN acknowledged that Ireland had laboured under accumulated evils in past times, and that she had many wrongs still to redress. The condition of the country called for sympathy and redress; and though he admitted the necessity of the Arms Bill, he intended to propose amendments in order to mitigate its stringency, and hoped that when passed it would not hereafter be used for purposes of oppression and injustice.—Mr. REDINGTON criticised the provisions of the bill, which, though stated to be only a renewal and consolidation of the existing law, contained new and stringent enactments, as absurd as they were severe. There was nothing in the condition of Ireland requiring treatment different from that of England. The recent riots in the neighbourhood of Manchester were caused by men with arms in their hands, and the account of the outbreak not only surpassed anything which took place in Ireland, but outvied the accounts of the French exploits in Algeria. Yet no proposal was made to disarm these rioters, or to prevent them repeating their conduct. He cited returns to show that there was a remarkable diminution in the amount of crime in Ireland, and warned the House against exasperating the people of Ireland by coercive measures, such as the stringency as the necessity for them diminished. Colonel CONNOLLY added his experience as an Irish magistrate in favour of the necessity of the measure, and censured the agitators who disturbed the minds of the people by exaggerated statements both of evils endured, and of supposed benefits to be derived from the repeal of the Union.—Mr. CARRUTHERS contrasted the present condition of Ireland with its state when the Government came into office, and declared his opposition to the bill.—Lord BARNARD, on the contrary, thanked the Government for the bill, which all who had the welfare of Ireland at heart considered necessary.—Mr. SMITH O'BRIEN protested against the bill, for which no case had been made out. The best mode of repressing the outrages was by improving the condition of the country, and protecting the people from oppressive treatment on the part of the landlords. He warned the Government that the bill in its present shape would encounter a division on every clause.—Captain LAYARD bore testimony to the good qualities of the Irish people; and appealed to both English and Scotch members not to vote for a measure which was an outrage to their feelings and liberties.—Mr. WATSON, though an Englishman, yet, as an Irish representative, felt it his duty to protest against a bill which placed eight millions of our fellow-citizens beyond the pale of the constitution. Ireland required peace, but instead of peace, they gave her an Arms Bill. Was Ireland to be the victim of coercion, because when the late Government supported former measures of this kind, and were said to be bound in consistency to the present one? Let them put down the repeal agitation by an impartial administration of the law. Lord C. HAMILTON was deeply interested in the prosperity of Ireland, but drew, even from Mr. SHEIL's brilliant speech of the previous evening, arguments for the necessity of the Arms Bill. He viewed it not as a coercive measure, but as a protection to the innocent and well disposed.—Mr. C. BUTLER did not consider the bill itself a matter of much importance, seeing it was, on the whole, but a continuation of an old law which had been supported by both parties. But it was of importance when viewed in connection with the consideration of those who proposed it, and in connection with the consideration whether, or not they possessed the confidence of the Irish people. The accounts from Ireland were unquestionably calculated to create alarm; for such an organization in favour of a particular measure was almost unprecedented. It was unnecessary for any Englishman to give an opinion on the repeal of the Union, which ought to be deprecated more by the people of Ireland than by this country. But for the last two centuries the misgovernment of Ireland was the scandal of Christendom; while all Europe had been advancing, the condition of the people of that country had been deteriorating; while produce and rents were increasing, the physical state of the masses had become worse and worse. Ireland never been in Ireland, but he had had opportunities of judging of the strength of those anti-repeal forces which separated the different races. He contrasted the different policy pursued in Canada and in Ireland; and asked them to try in the one country the experiment which had been so successful in the other. The repeal of the Union would be a barbarous retrogression; but let them put their eyes in the condition of an Irish Roman Catholic, and view the question from his position. In a year and a half the new policy of the Government had raised an agitation, as dangerous as powerful. He counselled Sir R. Peel to adopt a larger and more liberal policy, and to accompany his Arms Bill with measures of anchorage, as otherwise he should give it his deplorable approval. Mr. SAUNDERS felt that Ireland was in a very unsatisfactory, if not alarming condition; never were the masses more excited, or all classes more dejected. This arose from a combination of causes. The depressed state of agriculture, arising from the new tariff, which was aggravated by the Canada Bill, was one cause; another, the temperance movement. Crime

had diminished one-third, as a consequence of Father Mathew's labours; but the blessing had been turned into a curse, because the movement had terminated in political combination. The Whigs boasted of the spirit in which they governed Ireland; but did they not appoint political partisans?—did they not even offer a high judicial situation to the individual who had now raised this repeal agitation? The Government, in their Irish appointments, had been actuated by the best disposition towards the people; and Lord Eliot, in particular, had manifested a disposition to please everybody. But unhappily the impression prevailed that the Irish Executive was feeble and controlled; the office of Lord-Lieutenant was an anomalous one in times of difficulty; and the organization of myriads by Mr. O'Connell, who had abandoned his functions in the House, had placed the country in a serious and alarming position. He cited some of the sentiments of the agitators, as affording evidence of their real sentiments and intentions; and described the agitation as an organization of the entire population, under the control of the Roman Catholic priesthood, against property and order. He affirmed that there was no portion of the community more alarmed than the respectable Roman Catholics; he was no friend of coercive measures, because he relied on the ordinary powers of the law to give security to the country.—Mr. M. J. O'CONNELL acknowledged that the Irish members had been somewhat remiss in their opposition to the Arms' Bills of the Whig Government. But then they were acting in support of a Government whose general policy was based on equity to Ireland, and who were opposed by the present Ministerialists in all their efforts to benefit the country. He strongly censured the bill, especially the "branding" and licensing clauses, and particularly that which requires the licensing of blacksmiths. The time at which the measure was brought forward was far more important than the measure itself; and he feared that the debate would strengthen the impression of the Irish people that they had nothing to hope from either of the great parties within the House, and that their dependence must be on themselves. The absent Irish members staid away because they did not feel it worth their while to attend the House, and, by so doing abandon other pursuits.—Mr. V. STUART could not conscientiously say that no measure was requisite for the registration of arms, and therefore supported the second reading of the bill, with a view to its amendment.—Sir H. W. BARRON proposed the adjournment of the debate; on which a discussion arose, and Lord CLEMENTS charged the majority with anxiety to go to Epsom Races, and therefore desirous of getting rid of an unpleasant subject.—After observations from different members, the adjournment of the debate was agreed to.

Wednesday.—Mr. MACKINNON, in reply to a question, stated that, in consequence of certain circumstances, he would not undertake the conduct of the Townshend Peerage Bill through the House.—Mr. HAWES reported from the Athlone Election Committee, that they had found J. Collett, Esq., to have been duly returned for that borough.

The adjourned debate on the Arms (Ireland) Bill was resumed by Mr. WYSE, who opposed the bill. Lord JOCELYN followed, and declared his intention to support it as the only measure likely to insure public tranquillity and prevent the danger of outrages and assassinations such as now prevailed. Mr. J. O'BRIEN, Captain BERNAL, the O'CONNOR DON, and Mr. HAWES opposed the second reading of the bill; which was supported by Mr. B. HOPE, Colonel VERNER, Mr. BORTHWICK, and Sir A. BROOKE. Lord SEYMOUR expressed his intention to vote for the second reading, but to oppose many of the details in committee.—Sir J. GRAHAM referred to the statements of crimes of a homicidal character committed in Ireland, far exceeding those committed in England, in proportion to the population of the two countries, as proofs of the necessity of continuing this or some similar bill. He quoted the admission made by Mr. SHEIL, that in the present state of society in Ireland there was no chance that the ordinary class of petty jurors would perform their duties, from very fear, and that it required a higher class of men, and better protected against outrage than at present, to perform the duties—as the strongest argument in favour of the necessity of this bill. The existing state of society in Ireland was not a new, but an old and long-continued one, and the enactments proposed were not new, but old enactments. He then entered into a history of the numerous Arms Bills and the Coercion Bills brought forward by the several Liberal Governments since 1805, and showed that, so far as Liberal precedents would go, he had plenty of them in support of the proposed measure. He claimed credit for the Government for having endeavoured to conciliate all parties in Ireland, and declared that it would be worse than madness—it would be cowardice and treachery—to refuse to pass the bill in the present state and circumstances of Ireland.—The Earl of LISTOWEL, Sir H. W. BARRON, and Sir D. ROOKE subsequently spoke against the second reading; and after some remarks by Mr. ROEBUCK, Sir R. PEEL concluded this long debate by charging those who now clamoured against the bill as a violation of the Bill of Rights and of the common law, and as an insult to Ireland, with having abandoned their Parliamentary duties when they supported a similar one in 1841, out of complaisance to the Government of the day. He repeated the assertion of Sir J. GRAHAM, that this measure was not introduced with any reference to the present state of things in Ireland, but in reference to a state of society long existent. The only question, then, to decide was, whether any bill was or was not necessary for the regulation of the possession of arms in Ireland. The necessity was fully proved by the admissions of Mr. SHEIL, and the hon. Members on his side of the House.—The House having divided, there were—for the second reading, 270; Against it, 105; Majority, 165.—On the motion for the Speaker to leave the chair, Mr. W. S. O'Brien moved as an amendment, that a select committee be appointed to inquire whether such a Bill was called for by the present state of Ireland, but withdrew it without going to a division.

Thursday.—The Speaker took the chair at the usual hour, but there being only fourteen Members present at 4 o'clock, the House adjourned.

Friday.—On the motion that the House at its rising adjourn to Thursday, a conversation took place on the state of Ireland. Lord J. RUSSELL explained that the late Government had offered not the Chief Baronship, but the Mastership of the Rolls to Mr. O'Connell. He considered that the great military preparations now taking place in Ireland, accompanied with dismissals of magistrates, were creating great alarm, giving an undue impetus to the Repeal agitation, and producing general embarrassment.—Sir ROBERT PEEL, in reply, deprecated all present discussion and said that Lord Fortescue had set the example of discouraging Repeal agitation. After a long and desultory discussion, the adjournment was carried without a division.—On the motion for the second reading of the Canada Wheat and Flour Bill, Lord WORSLEY moved that it be read that day six months. A long debate ensued, in which several members took part, and on a division the second reading was carried by 209 to 109.

CITY.

Money Market, Friday.—Consols have closed for the arrangement of the dividend. The last price was 92½ to 7 for the Opening. Three per Cent. Reduced, 92½ 4; Three-and-half per Cent. Reduced, 100½ to 1½; New Three-and-half per Cent. Annuities, 101 to 1½; Bank Stock, 178 to 9½; Exchequer Bills, 45s. to 50s. prem.

Metropolis and its Vicinity.

Despatch of Troops for Ireland.—Her Majesty's steam-frigate Cyclops was lying totally dismantled on Saturday last at Woolwich, and the engineers of the dock-yard had

disconnected part of her machinery for the purpose of repairing her. On Sunday morning at 4 o'clock, she was commissioned by Captain Austin, and the following day, by 4 P.M., she was completely rigged, had got her large guns on board, with ammunition and stores from the Arsenal, her provisions and tanks of water from Deptford, including 300 tons of coals, and was in every respect ready for sea within the short space of 36 hours. Lieut.-Colonel Burton, of the Royal Marines, embarked at a late hour on Monday evening, and the Cyclops sailed at 2 o'clock on Tuesday morning for Sheerness, to receive on board a large detachment of Marines from Chatham. The crew of the Cyclops is to consist of 175 men, but to make way for the great number of troops, 145 only will be taken from the guard-ship at Sheerness for the purpose of manning her. The Alban steam-vessel, Lieutenant Jeayes, has also sailed for Portsmouth, where it is expected she will be ordered to assist in conveying a part of the Marines intended to proceed to Ireland. We learn from Portsmouth that the Rhadamanthus steamer on Tuesday embarked Major Castieau, three Lieutenants, sixty gunners, four 6-pounders, and two howitzers, and sailed immediately for Dublin. The entire number of Marines, including officers and privates, embarked from that division, will be about 380. Rear-Admiral Bowles, it is said, will hoist his flag in the Malabar, and be stationed on the Irish coast.

Testimonial to Lord Morpeth.—The committee for completing the Morpeth Testimonial having determined to present the address to his Lordship without delay, the ceremony was performed on Tuesday at Stafford-house, the residence of his Grace the Duke of Sutherland. The presentation took place in the great hall of Stafford-house, and a considerable number of ladies were present in the gallery. Lord Morpeth acknowledged the compliment in a speech of great feeling, and declared that whatever may be the impressions produced by his recent travels in the western world, he has returned more than ever attached to the institutions of his own country.

Royal Naval School.—On Thursday, being the anniversary of Lord Howe's victory, the ceremony of laying the foundation-stone of this institution was performed by his Royal Highness Prince Albert. The Bishop of Rochester read prayers, after which the treasurers presented some coins in a vase which were deposited in a hollow place under the stone; the stone was lowered, and the Prince, with his mallet and trowel, completed the ceremony. Another salute was fired, and the band of the Royal Marines played "Rule Britannia," amidst the shouts and applause of upwards of 1,500 persons, who had obtained tickets of admission. The Bishop again offered up prayers, and one of the boys from the school delivered a brief address to his Royal Highness, thanking him for his kindness in endeavouring to promote the prosperity of the school. The mallet which was used by Prince Albert was made from one of the timbers of Lord Nelson's ship, the Victory.

New Zealand Company.—The half-yearly meeting of the directors and shareholders of this company was held on Tuesday, Mr. Soames in the chair. The report stated that the directors had received information of the arrival at Wellington in July last of numerous settlers from Sydney, with capital, and large importations of live stock had taken place. During the half-year ending Midsummer, 1842, the number of ships which entered Port Nicholson from England, Sydney, and other places, was 126, registering 16,842 tons; and the customs duties during the same period amounted to 8,000*l*. The population of the colony of Nelson already numbered 3,500 souls, and the number of ships arriving at that port in the half-year ending Midsummer, 1842, was 58; the customs revenue being 2,000*l*. Coal had been found on the river Mokaw, and limestone at Moturoa. Some differences had unfortunately arisen between the natives and settlers in the district of New Plymouth; but they had been entirely and satisfactorily adjusted at the date of the last despatches. Emigration had been carried on during the last season to a considerable extent, and the number of passengers conveyed to the several settlements in ships chartered by the company were, to Wellington, 4,431; Nelson, 3,335; New Plymouth, 1,030; total, 8,796. During the last year a ship had been despatched from Kelson, Hamburg, with a body of German settlers. The difficulties which had arisen with respect to title in the sale of lands in New Zealand were, it was hoped, satisfactorily settled; and the directors appreciate the favourable disposition evinced by the Home Government towards the company's settlers. The report then proceeded to give a financial statement of the company's affairs, from which it appeared that the total assets of the company amounted to 436,499*l*. 16s. 3d., and the liabilities to 306,278*l*. 10s. 4d., showing a surplus in favour of the company of 130,171*l*. 5s. 11d., which, with 150,000*l*., the estimated value of additional lands receivable from the Government in virtue of expenditure to the 5th of April of the present year, gave a total surplus of 280,171*l*. 5s. 11d. The report concluded by recommending a dividend of two-and-a-half per cent. upon the half-year. Mr. Lyall, M.P., moved the adoption of the report, that a dividend of two-and-a-half per cent. be declared for the half-year ending the 5th of April last, and that Viscount Courtenay, M.P., and Mr. E. Gibbon Wakefield, be elected directors in the place of Captain John Hine, deceased, and Sir W. Molesworth, who had retired. Mr. Emeritz seconded the motion, which was carried unanimously. On the motion of Mr. Russell Ellice the thanks of the proprietors were given to the governor, deputy-governor, and directors, for their general good management of the company's affairs.

Anti-Corn-Law League.—On Monday another large meeting of the Anti-Corn-law League was held in the Hall of Commerce, Threadneedle-street, Mr. G. Wilson in the

chair. The Chairman, in opening the proceedings, said he had great pleasure in again conferring with them on a subject of no secondary importance either to them or to the country at large. They were not met to discuss the merits of the two sliding-scales of 1828 and 1842; it was no part of their task to reconcile the different opinions of these in favour of a 10s., and those in favour of a 5s. fixed duty; nor did they care whether the old or the new Canadian Corn Bill was the more favourable for smuggling. They were here on the part of a numerous body who maintained their right to exchange their industry when and where they thought proper. All the interests of the community were represented on that platform—the agricultural by Lord Ducie, the professions by Mr. Moore, and Parliament by Mr. Cobden, M.P. He begged to draw their attention to the labours of the committee now in progress for enrolling members in the City of London. Three out of their four members had voted against the principles of free trade on a recent occasion, but such a circumstance would never happen again if a majority of the electors were enrolled as members of the Anti-Corn-Law League. The meeting was then addressed at great length by Lord Ducie, Mr. Moore, and Mr. Cobden.

Anti-Slavery Convention.—The committee of the British and Foreign Anti-Slavery Society have completed all the necessary arrangements previous to the holding of the Anti-Slavery Convention. The sittings will commence at ten o'clock on Tuesday morning, the 13th inst., at Freemasons' Hall; and Mr. Thomas Clarkson has consented to preside.

Anniversary Meeting of Charity Children at St. Paul's.—On Thursday the imposing assemblage of upwards of 6000 children educated at the parochial schools of the metropolitan parishes took place, according to annual custom, in St. Paul's Cathedral, and was, as usual, attended by a great number of the nobility and gentry, and by the Duke of Cambridge. The Sermon was preached by the Bishop of Salisbury. A very large subscription was made at the doors, which will be divided amongst the children of the several parishes.

Excise Seizures.—At the Excise Court on Thursday, James Walton, wholesale and retail tea-dealer, of 129, Bishopsgate-street-without, was charged with having in his possession dried and spent tea-leaves, dyed and fabricated as tea, and adulterated with carbonate of copper and gum-arabic. The penalties were laid at 1000*l.* under the Act 4 George II., c. 14, sec. 12, which imposed a penalty upon every pound of such tea of 10*l.* An officer of Excise stated that, on the 26th April, he went to the shop of the defendant, 129, Bishopsgate-street-without, and requested to examine his stock of tea. After a minute search, he discovered two bags, weighing 26*lbs.*, containing what appeared to him at first to be tea, but which, on inspection, he found to be nothing but tea-leaves that had been used and re-dried. Mr. G. Phillips, the chemist, stated that he had tested parcels of the tea, and that he found them adulterated with carbonate of lime, carbonate of copper, gum acacia, tan, and colouring matter. He found leaves which he believed to be sloe-leaves. The leaves were strongly impregnated with yellow and Dutch pinks. By the aid of acids and precipitates he had succeeded in reducing the copper to a metallic form. The leaves, on being immersed in water for some time, changed from green to their original colour, black. By damping the leaves and placing them upon paper, the colouring that had been used was clearly perceptible. A solicitor for the defendant said it would be fruitless to struggle against the charge, and he should confine himself to the question of mitigation. His client had never been charged before, although he had been in business for twenty years, and had a large family to support. The Court said that this was a most gross case, which had been fully proved, and their judgment was, that the defendant be fined in the penalty of 260*l.*—Charles White Cressy, tea-dealer, of 86, Kent-street, Southwark, was also charged with having in his possession 176*lbs.* of dried and coloured leaves, adulterated to represent tea. An officer proved finding four large bags concealed in defendant's shop, who said he purchased it as sea-damaged tea from a person named Johnson, of Bethnal-green, for 1*s.* 9*d.* per *lb.*, but had no bill of parcels or receipts, as he always paid ready money. It was adulterated with gum or some other glutinous matter. Mr. Phillips said he had tested it, and found the adulteration with gum varying from 25 to 18 per cent. The Court fined the defendant in the mitigated penalty of 250*l.*

The Temple Church.—On Sunday, their Royal Highnesses the Duke and Duchess and Prince George of Cambridge, the Duchess of Gloucester, and other members of the Royal Family, with the Duke and Duchess of Sutherland, the Greek Minister, Lords Brougham and Morpeth, attended divine service at the Temple Church. After service, their Royal Highnesses proceeded to the Hall of the Middle Temple, where they honoured the benchers of the Middle and Inner Temple by partaking of a *dejeuner*. The Duke of Cambridge, in reply to a short address of Lord Brougham, observed how happy he should feel, were he a younger man, in becoming a bencher of the Hon. Society; to which Mr. Thesiger replied. With the exception of the Queen Dowager, who visited the Church and Hall a few days since, these places have not been honoured by any member of the Royal Family since the days of Queen Elizabeth, by whom the beautiful screen wrought from some of the material that formed a part of the Spanish Armada, together with several spears, helmets, and firelocks, that now grace the gallery of the Hall, were presented.

Election of an Alderman.—The inhabitants of Coleman-street Ward on Wednesday elected Mr. William Hunter, Alderman of that Ward, in the place of Sir W.

Heygate, who had vacated his gown on being elected City Chamberlain.

Old London Wall.—At the meeting of the Institute of Architects on Monday night, Mr. G. Godwin, at the request of several members of the Society of Antiquaries, drew the attention of the institute to the threatened demolition of the remaining portion of old London wall, at the back of the houses in Trinity-square, Tower-hill, with the view of inducing their aid in favour of its preservation. He stated that this interesting remnant of antiquity bounds the western side of a plot of vacant ground in George-street, on which it is proposed to build a church and schools. The length of the wall is about 50 feet, and the height from 20 to 25 feet. It is faced with masonry in regular courses, and shows occasional layers of Roman bricks, especially in the lower part on the east side, recently exposed to view by the removal of some vaults and sheds, where they are seen to occur at regular intervals. At a period less eminent for the preservation of ancient monuments than the present day, the wall was strengthened at the northern angle and coped with brick-work, and is consequently in a tolerable state of repair. Lord Northampton, who was in the chair, suggested that the council should communicate with the Society of Antiquaries on the subject, and present a joint memorial, which he hoped might have the effect of saving the wall.

Thames Tunnel.—During the two months since the tunnel has been opened there have passed through, and paid toll, 675,640 persons.

Spitalfields' School of Design.—The second annual meeting of this School was held last week, at Crosby-hall, for the purpose of receiving the Committee's report of the proceedings of the School during the past year, and for the distribution of prizes to those pupils whose merit in the art of drawing and designing entitled them to the distinction. Lord R. Grosvenor presided, supported by Lord Colborne, Messrs. Cockerell, Dillon, Etty, James, Hanbury, &c. His Lordship congratulated the friends and supporters of the School on the progress which the School of Design was making in the public estimation. He directed attention to the distinction which France had attained in this respect; and observed that England, which had long been her rival in war, was now preparing to become her "rival"—though in a friendly way—in the more glorious arts of peace. He complimented the pupils on their progress, and having encouraged them to perseverance, observed that he believed there was talent sufficient in England to compete, if cultivated, with any other country in the world. From the report it appeared that there are now 180 pupils in the School, including the children of weavers, wood-carvers, cabinet-makers, &c., being an increase of 60 over those of last year. The income, from the establishment of the School up to the 25th March, amounted to 257*l.* 16*s.* 5*d.*, and the expenditure to 252*l.* 16*s.* The report further stated that the net proceeds of the ball at the Opera-house, under the patronage of her Majesty, was 1,185*l.* 7*s.* 6*d.*, which has been invested in Exchequer bills as a "building" fund. The prizes were then distributed, and the Committee and officers were elected for the ensuing year.

The Nelson Column.—The committee, consisting of the Duke of Northumberland, the Marquess of Northampton, Lords Colborne and Monteagle, and Sirs G. Cockburn, John Barrow, H. Inglis, and P. Laurie, and Messrs. C. Wood, Wilson Croker, and Sydney Herbert, met on Friday to consider whether the Corinthian capital should be gilt or bronzed. The committee agreed that it should be bronzed, as gilding would be inconsistent between a stone pillar and a stone statue. It was ascertained that 600*l.* more would be required of the public to enable the committee to complete the capital and statue.

St. Paul's Church, Knightsbridge.—The Bishop of London consecrated this church on Monday morning. A large number of the nobility and gentry of the neighbourhood were present at the ceremony. The church is capable of accommodating 2,000 persons, and has been erected at a cost of 11,000*l.* The Rev. W. J. Bennett, M.A., of Christ Church, Oxford, has been presented to the incumbency.

Miss Mitford's Subscription.—We are happy to find that the subscription raised for relieving the difficulties of Miss Mitford has been so far successful, that in a letter to the Rev. W. Kinsey she writes:—"You will, I know, be glad to hear that things are going on well, so far as the subscription is concerned. The debts are all paid, and there will be some hundreds surplus, which was what my friends wished in their kindness; for my own part, I was ever more set upon the payment of the debts, but now both parties are gratified."

The Parker Society.—On Tuesday the annual meeting of this Society, instituted for the publication of the works of the fathers and early writers of the English Church, took place at Freemasons' Hall, Lord Ashley in the chair. The report announced that the receipts for the past year showed a considerable increase over the preceding, and that the number of subscribers was between 6000 and 7000. Amongst the works which had recently been printed were the writings of Archdeacon Philpot, the remains of Archbishop Grindal, the Zurich Letters, and other interesting works. The subscriptions for the present year required an issue of 7,500 copies, and amongst the works which were intended to be issued were the early writings of Bishop Hooper, and part of the works of Archbishop Cranmer. These would be followed by reprints of the works of Jewell, Ridley, Coverdale, Latimer, and others.

Governesses Benevolent Institution.—A meeting was held last week, at the Hanover-square Rooms, for the purpose of passing a resolution and adopting measures to establish an institution for the relief and support of governesses while suffering from sickness, or when too

advanced in age to continue the exertions necessary for their own maintenance. His Royal Highness the Duke of Cambridge took the chair. The promoters have three objects in view:—"1. To afford assistance, privately and delicately (as in the Literary Fund) to English governesses in temporary distress. 2. When a sufficient sum shall have been accumulated, to grant annuities to governesses in their old age. 3. When a sufficient number of names shall have been furnished, to open a provident fund, by which governesses may, by their own subscriptions, secure annuities for themselves." The proceedings were of the most satisfactory character, and the sum subscribed in the room amounted to nearly 500*l.*

Fancy Fair at Greenwich.—The town of Greenwich on Thursday presented a lively and attractive appearance, in consequence of the crowd of visitors who attended the Fancy Fair held in the painted chamber of Greenwich Hospital in aid of the funds of the Shipwrecked Fishermen and Mariners' Benevolent Society. The articles exhibited for sale consisted of almost every variety of fancy goods, and among the lady patronesses of the society who officiated at the stalls were the Countess of Haddington, Lady Sarah Ingestre, Lady Caroline Legge, Lady Georgiana Bathurst, Lady Byron, Lady Aylmer, Lady Bloomfield, Lady Charlotte Berkeley, Lady Stafford, the Hon. Lady Stopford, Lady Seymour, and Lady Dymoke. The fair was again resumed yesterday, and with great benefit to the funds of the charity.

Accidents.—On Thursday afternoon, an accident of a very serious nature occurred to the Hon. John Thornton Leslie Melville. He had just arrived in Gracechurch-street, from his country seat at Roehampton, and whilst in the act of descending the steps of the vehicle, another omnibus came rapidly up, and before Mr. Melville could reach the pavement he was knocked down, and the wheels passed over him. He was taken up quite insensible, and conveyed to the banking-house of Messrs. Williams, Deacon, and Co., Birchin-lane, of which firm he is a partner, and was soon afterwards removed to Guy's Hospital. On examination, it was found that his left leg had been fractured in two places, his right leg much injured, an extensive lacerated wound across the forehead, besides several contusions on various parts of his body. The fractured limb was immediately set, and the hon. gentleman is going on as favourably as can be expected. Mr. Melville is between 50 and 60 years of age, and is one of the Governors of Guy's Hospital.—We learn by the Brighton papers that his Grace the Duke of Richmond met with an accident a few days ago. He was thrown from his pony, which started suddenly, and a bullet, which his Grace's medical attendants have never been able to extract, being slightly displaced, caused great pain and induced fainting. Assistance being soon procured, his Grace was conveyed to Goodwood-house, and is now doing well.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, May 20:—West districts, 139; North districts, 164; Central districts, 181; East districts, 192; South districts, 195. Total, 871—(472 males, 399 females.)—Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five springs, 854.

Provincial News.

Aylesbury.—After the lapse of two centuries since the death of John Hampden, a monument is about to be raised to his memory on Chalgrove-field, where he lost his life. The project of raising this memorial was suggested some time ago by Lord Nugent, and is now to be carried into effect by the efforts of his Lordship, assisted by the Duke of Bedford, the Marquess of Bredalbane, the Earl of Buckinghamshire, Lords Brougham, Denman, Lovelace, Leigh, Fortescue, and other gentlemen. The monument consists of a large block of Portland stone, 16 feet high, surmounted by a Ceppo Cap, and resting on a massive plinth of the same material. It is raised where the Oxford and Watlington road is crossed by the lane leading on one side to the village of Chalgrove, and on the other to Warpsgrove farm-house. It was here that Prince Rupert, in his retreat towards Oxford, having repulsed the main body of the Parliament troops under Gunter and Cross, was encountered by Hampden, who led a party of horse to the attack from the direction of Warpsgrove, and received his death-wounds shot by some of the musketeers of the Prince, who lined the hedge of the musketeers of the Prince, who lined the hedge which still incloses the south side of the lane. On the side of the monument facing Warpsgrove is his medal-lion portrait, in bold relief, by Scouler; on the opposite side are his arms; on the third the names of the subscribers by whom the monument is raised; and on the fourth is the following inscription from the pen of Lord Nugent:—"Here, in this field of Chalgrove, John Hampden, after an able and strenuous but unsuccessful resistance in Parliament, and before the judges of the land, to the measures of an arbitrary court, first took arms, assembling the levies of the associated counties of Buckingham and Oxford in 1642. And here, within a few paces of this spot, he received the wound of which he died while fighting in defence of the free monarchy and ancient liberties of England, June 18, 1643. In the two hundredth year from that day this stone was raised in reverence to his memory." A dinner will be given on Monday the 19th inst., on Chalgrove-field, Lord Nugent in the chair, in commemoration of the 200th anniversary of the fight.

Kendal.—The inmates of Brougham Hall, the seat of Lord Brougham, were on Tuesday week surprised by the appearance of Mr. Bird and his family, (lineal descendants of Mr. Bird, who sold the estate called "Bird's Nest" to

the father of Lord Brougham, subsequently named Brougham Hall,) who took possession of the premises. A few weeks ago some part of the family entered upon the estates contiguous, in the occupation of some of the tenants, but after three or four days' occupation withdrew, and returned home. For this trespass it appears Lord Brougham thought proper, through his solicitor, to serve each of the parties with a writ; to this the family of Bird put in an appearance, when it is stated Lord Brougham declined following up the matter, thinking the writ would effect an intimidation. The Birds have at length taken possession a second time, and entered upon the Hall, and now require to see by what authority the property is withheld, since they state they are satisfied the entail was never broken, and that their relative (Mr. Bird) had no power to sell, and that if such be the fact, no length of time will give a proper title. They remained on the premises until Friday last, when they were forcibly ejected, and are waiting at Penrith for further instructions from their solicitors how they are to proceed.

Liverpool.—It is only three weeks since we had to record the particulars of an alarming fire that occurred in the eastern wing of the Duke of Bridgewater's warehouses, situate between the Duke's and King's Docks. We have now again to describe another conflagration, which broke out on Saturday evening last, in the western wing of the same pile, and has proved little less extensive, while it has, perhaps, destroyed quite as large an amount of property. In the brief interval there have been two other destructive fires in this town, one in Formby-street, on Saturday fortnight, and one in Jackson's-lane on Friday week. The fire of Saturday evening was discovered shortly after the men had quitted work, when flames were seen issuing from the roofs of the second and third warehouses from the western end of the range. In spite of all the endeavours that were made, the fire descended to two rooms filled with cotton, on the fifth story of the second and third warehouses, where its further progress was arrested, the whole of the four stories below being saved. In consequence of the fire having broken out under very suspicious circumstances, the magistrates of the borough instituted a lengthened investigation into its origin on Monday. The inquiry was private, and was attended by an unusually large number of the authorities. It was adjourned for the purpose of affording time for further testimony to be obtained, but it is understood that several witnesses were examined, and that their evidence left no doubt upon the minds of the magistrates upon the main object of the inquiry, namely, that the fire was the work of an incendiary, at present unknown. The total amount of property destroyed is not less than from 10,000*l.* to 15,000*l.*, independently of the damage to the buildings.

Manchester.—On Friday the lengthened investigation into the conduct of the parties implicated in the late disturbances between the military and police was brought to a close, when nine soldiers and four of the town's people were ordered to find two sureties in 25*l.* each, for their appearance to answer the charge of riot and assault at the next Quarter Sessions. Four others were ordered to find sureties in 15*l.* each, to keep the peace for three months, and all the rest were discharged. On Monday a Military inquiry into the disturbance was commenced in the Regent-road Barracks, in consequence of an order issued from the Horse Guards. Lord Charles Wellesley, Colonel of the regiment, came down from London to attend the investigation, by direction of the Duke of Wellington. The inquiry was private. At nine o'clock the whole of the regiment was called out into the barrack-yard, and formed into a solid square by Lord C. Wellesley. His Lordship then addressed the officers and men, saying, that "it gave him great pleasure a fortnight ago to have received from the General commanding this district a very favourable account of the behaviour, discipline, order, and condition of this regiment. He regretted exceedingly that such pleasing intelligence should be followed by reports of so painful a nature. He had come to Manchester to investigate the accuracy of these reports; and it was his determination that such investigation should be conducted with the strictest impartiality and severity, and to punish all proved offenders to the utmost rigour of civil and military law. If any officer of the regiment should be proved to have participated in the outrage, he should not escape with impunity." The inquiry commenced at twelve o'clock, before General Sir William Warre, who presided; Mr. Kershaw, Mayor of Manchester, assisted by the Town-clerk, and the officers of the garrison. The examination of witnesses occupied upwards of six hours, and the inquiry was adjourned.

Nottingham.—Earl Manvers, as patron of the living of St. Mary's, in this town, has withheld his countenance to the subscription in progress for repairing the edifice, until the parish shall have conceded the principle of a church-rate. The sum required is 2,500*l.*, and 1000*l.* more to complete the pews, sittings, &c. of the church, which was rendered useless by a threatened fall of its massive towers last December.

Oxford.—The Margaret Professor of Divinity having called for a copy of the sermon preached by Dr. Pusey, on Sunday the 14th inst., the same has been transmitted to the Vice-Chancellor, by whom the following were appointed a board to examine and report upon its contents:—The Vice-Chancellor; Dr. Faussett, Margaret Professor of Divinity; Dr. Ogilvie, Regius Professor of Pastoral Theology; Dr. Hawkins, Provost of Oriel; Dr. Symons, Warden of Wadham, and Dr. Jelf, Canon of Christ Church. It is understood that the investigation terminated in the condemnation of the sermon, and that Dr. Pusey has been suspended from the office of preaching within the University for two years. The Rev. R. G. Macmullen, Fellow of Corpus, has

commenced an action of damages against the Regius Professor of Divinity for refusing to act as Moderator. At the performance of the Exercises for the degree of Bachelor of Divinity in the Divinity School, it has been customary for the Professor to assign the subjects for these Exercises, which he did; but Mr. Macmullen refused to adopt them, and tendered instead two theses of his own selection; and in consequence the Professor declined to act as Moderator. The two which Dr. Hampden appointed were:—1st. The Church of England does not teach, nor can it be proved from Scripture, that any change takes place in the elements in consecration at the Lord's Supper. 2d. It is a mode of expression calculated to give erroneous views of Divine Revelation, to speak of Scriptures and Catholic tradition as joint authorities in matters of Christian doctrine. The cause commenced last week in the Vice-Chancellor's Court, before Dr. Kenyon, and was adjourned to Friday.

Plymouth.—We learn from the *Plymouth Times* that a preliminary meeting of the Town Council was held on Friday evening, at which, it is believed, that the council came to the resolution of inviting Prince Albert to accept the office of Lord High Stewart of the borough, vacant by the death of the Duke of Sussex, the result of which will be communicated to the council at their next meeting, on the 6th of June.

Railways.—The following are the returns for the past week:—Greenwich, 687*l.*; Sheffield and Manchester, 408*l.*; Brighton, 3,078*l.*; Liverpool and Manchester, 4,018*l.*; Croydon, 267*l.*; Blackwall, 875*l.*; Eastern Counties, 2,278*l.*; Great North of England, 1,353*l.*; Hull and Selby, 1,134*l.*; Edinburgh and Glasgow, 2,576*l.*; Birmingham and Gloucester, 1,667*l.*; Birmingham and Derby, 1,200*l.*; Birmingham, 16,112*l.*; Great Western, 14,471*l.*; South-Western, 6,172*l.*; North-Midland, 3,922*l.*; Grand Junction, 7,137*l.*; Midland Counties, 2,414*l.*—The report of the Committee appointed to investigate the affairs of the Blackwall Railway has at last made its appearance; and though anxiously expected, its contents do not appear likely to be satisfactory to the shareholders. From the multiplicity of figures it is with some difficulty a correct view of the fact can be ascertained, though the result seems to be that, supposing all contingencies settled, 1,055,000*l.* will be the expense the proprietors are to bear for the completion of the undertaking. In this account there are many startling items. The act of incorporation, inclusive of all preliminary expenses, subsequent acts of Parliament, and attendant charges, figures at the large sum of 53,549*l.*, while solicitors' costs for professional advice and general business have absorbed as much as 42,986*l.*, of which 5,643*l.* remains unpaid. The engineering expenses have been more reasonable, 9,337*l.* having been the sum disbursed in that department. But there is another item which should be included in law charges—that of vendors' costs in conveyances, which is stated at 26,791*l.* There will be, according to the statement of the probable ultimate charges and receipts on account of capital, a balance of 11,030*l.* to the credit of the proprietors, when the whole of the amount to be subscribed of 1,066,572*l.* shall have been paid. The directors, by their dealings in shares on account of the company, appear to have made the small profit of 256*l.* 11*s.* 3*d.*, the gain on the issue of new shares having been 2,025*l.*, and the loss on the sale of the forfeited shares 1,768*l.* 8*s.* 9*d.* After giving a detail of the probable assets and liabilities of the concern, the committee proceeded to state that there is now no claim against it on which a greater interest than five per cent. is payable, and having done this, express themselves favourable to cheapness of conveyance, in accordance with which view the present rate of fares stand between London and Blackwall. The number of passengers carried from March to May, in 1842, was 382,929, and the money received, 7,352*l.* 11*s.* 8*d.*; while the number of passengers carried in the same period in 1843 was 398,687, and the money received 6,408*l.* 3*s.* 7*d.* On the future prospects of the undertaking, the committee are almost silent; they say they have cautiously avoided indulging in any speculations which might have a tendency to mislead; still in concluding their report they feel bound to express an earnest desire that the proprietors will co-operate in carrying out the measures which have been suggested for extending the steam-boat traffic in immediate connexion with the railway, as on the efficient completion of such an arrangement must mainly depend its future prosperity.—In a recent case for compensation on the Norwich and Yarmouth Railway, on which occasion Sir W. Follett was retained for the company, and Mr. Fitzroy Kelly for the defendant, who claimed upwards of 8,000*l.* for land, for which the jury returned a verdict for 1,500*l.*, Mr. Gurney, the banker, stated, on his cross-examination by the Solicitor-General, "that he had never travelled by rail; that he was an enemy to it; had opposed the Norwich Railway; and had left a sum of money in his will to oppose the extension of railways generally."

IRELAND.

Dublin.—We noticed in our Parliamentary intelligence of last week that Mr. O'Connell, and other magistrates who had taken part in the Repeal movement, had been struck out of the commission of the peace by Lord Chancellor Sugden. The following is a list of those who have been subsequently dismissed: Lord French, Mr. Daniel O'Connell, M.P., Mr. Maurice O'Connell, M.P., Mr. R. A. Fitzgerald, Mr. Nicholas Boylan, Mr. James Roe, Mr. J. P. Somers, M.P., Colonel Butler, Sir M. Dillon Bellew, Bart., of Galway; Mr. Alexander Sherlock, of Waterford; Mr. Pierse Somerset Butler, of Kilkenny; Mr. Daniel Clanchy, of Charleville; Mr. John Barter, of Cork; Mr. Caleb Powell, M.P., of Limerick; Mr.

John O'Hea, of Cork; Mr. Joseph Myles M'Donnell, of Doo Castle; Mr. Phillips, of Mayo; and Mr. Fitzgerald, of Muckridge, county of Cork. Mr. James Sinclair, of Donegal, and Mr. R. D. Browne, M.P., have addressed letters to the Lord Chancellor, resigning the commission, in order to enjoy the right of public discussion.—At the meeting of the Repeal Association on Monday, Sir Coleman O'Loughlen, Bart., (son of the late Master of the Rolls,) and ten other members of the Irish bar, several of them gentlemen of extensive practice, all of whom had heretofore kept aloof from the movement, gave in their adhesion to the Association. Mr. O'Connell handed in the sum of 1,224*l.* 7*s.* 4*d.* from the county of Tipperary. A considerable number of communications from various parts of the country were read, inclosing money to a large amount. At the close, Mr. O'Connell announced the week's rent to be 2,205*l.* 15*s.* 3*d.*, a much larger sum than had been received in any week during the agitation which led to Catholic emancipation. In connexion with the Repeal movement, the greatest activity prevails in various Government departments in sending off troops, arms, ammunition, and stores to Ireland; 25,000 stand of arms have been despatched from the Tower and Woolwich during the last five days, and barrack stores of every description, ammunition, &c. have been sent away for the same destination.

Cashel.—On Tuesday week the inhabitants of the South Riding of Tipperary assembled in this city to receive Mr. O'Connell. The procession extended five miles, and numbered, it is said, 300,000 persons. The meeting took place in the vicinity of the Rock of Cashel, Archdeacon Laffan in the chair. The amount contributed to the Repeal rent was 732*l.* 10*s.* A dinner took place in the evening, at which Mr. James Roe, of Roesborough, late member for Cashel, presided.

Nenagh.—The columns of the repeal papers are almost exclusively devoted to the proceedings of another demonstration of physical force, which took place on Thursday last at Nenagh, the capital town of the North Riding of Tipperary, at which 450,000 persons are stated to have been present, including many thousands who came a distance of 15 and 20 miles. The people of the King's and Queen's counties, of Limerick, Clare, and Galway, were present; and no less than 1000 boats filled with people, crowded the Shannon from the two last-mentioned counties. The platform was capable of containing 500 persons, and was crowded by at least that number. Mr. Patrick Fogarty, of Cabra Castle, was called to the chair amid the acclamations of the meeting, and resolutions in favour of Repeal were unanimously carried. The dinner took place in the evening in the Temperance hall. Nearly 250 persons sat down to dinner, and a gallery at one end, exclusively devoted to ladies, was densely thronged throughout the proceedings. Mr. O'Brien Dillon presided, supported by Mr. O'Connell, Mr. Caleb Powell, M.P., Mr. Steele, Mr. Hackett, mayor of Clonmel, the Right Rev. Dr. Kennedy, Mr. Lanigan, of Templemore, &c. Mr. O'Connell reviewed his labours for some weeks past, the brilliant success that followed his movements, from the meetings of Rathkeale and Limerick to those of Cashel and Nenagh, and remarked on the physical force displayed at each meeting, and how effectual it would be in the hands of another Napoleon, who had marched from Boulogne to the centre of Hungary with a much smaller effective force than surrounded him yesterday at the Rock of Cashel, and victory marked his progress, although he could not calculate on such an army of reserve as he then saw before him. He commented freely on the subject of Repeal, and afterwards spoke of the facility of getting it—contended that it was in the power of the Queen to grant it without the consent of Parliament, and then laid down his plan for the assembling of his 300 representatives in the Conciliation Hall of Ireland. The Right Rev. Dr. Kennedy in his speech said—"We have been ruled by England for forty-three years, and during that period her conduct to this country was a combination of the foulest crimes that ever disgraced a country calling itself Christian. This demand, the greatest statesman perhaps of England or Ireland prophesied should be one day made—it is now made—and, as I said before, we should urgently, but legally, constitutionally, and peaceably endeavour to carry out the object which we are told by a British Minister will never be effected, except, perhaps, at the awful test of a desolating civil war. Gentlemen, I believe there never was a more unwise threat than that—never did a more ill-judged one proceed from the lips of any statesman, and never was there such blind ignorance as that evinced by the anti-Irish truculent and dishonest legislators, who called forth that misplaced threat. Fellow-countrymen, it is impossible that those who threw out the threat had any knowledge of the present condition or feeling of the people of Ireland. You know that a great majority of our unhappy people at this moment are suffering such privations, that no war has any terrors for them. I say fearlessly, no war has any terrors for them, and least of all a war against their unnatural—their inveterate, and still unrelenting oppressors. I believe further, that except, perhaps, the restoration of a native Parliament, nothing would be more welcome in their present temper than such a war, whatever should be its issue." Several other toasts were given, and numerous speeches in favour of Repeal were delivered before the meeting broke up.

Longford.—A meeting of extraordinary magnitude took place here on Sunday, for the purpose of petitioning the Legislature for a repeal of the union. The requisition published on the occasion was addressed to the inhabitants of the county of Longford; but the great feature of the meeting was the dinner, at which Dr. Higgins, the Roman Catholic Bishop of Ardagh, presided. Dr. Higgins, in

the course of a long speech, said he had been accused of saying that there was no hope for Ireland but in repeal, and he now reiterated that assertion. He also reiterated that he had the most unbounded contempt and hate—not, as he had been reported to have said, for the aristocracy—but for their vices. By the immoral press of England he had been called something like a rebel. He was reported to have roused the priests of his diocese, and to have maddened the people to such a pitch that there was no safety either for life or property while such firebrands existed. He disclaimed such views, but he would at the same time let the people of England know, that if it was attempted to carry into execution the threats which had been held out lately against the people of this country, he would make every chapel in his diocese a repealing place, and would go into every sanctuary to proclaim repeal. With all the respect which every man of common sense and judgment must entertain for the aristocracy, when they are entitled to respect on account of virtues descended through a long line of ancestors, he still stood to the sentiments he had uttered in Mullingar, and, embodying the sentiments of his clergy and people, he defied them all to the death. He then proceeded to give the usual toasts. Mr. O'Connell's health was proposed, of course; and he responded at great length, but we cannot give even an outline of his address. Dr. Cantwell, Roman Catholic Bishop of Meath, in returning thanks for his health, stated that he concurred in all the sentiments put forward by Dr. Higgins that night. His opinion represented 150 Catholic clergymen and 250,000 of the people of his diocese; and that opinion was, that the union was a robbery, and that they could be respected by no man if they did not persevere in demanding a restoration of their rights.

Galway.—A repeal meeting was held at Caltra in this county on Sunday week, at which Lord Ffrench presided. The resolutions were proposed and seconded alternately by Roman Catholic priests and laymen, the latter class comprehending some of the leading gentry of the immediate district, such as the Hon. Thomas Ffrench, the Hon. Martin Ffrench, Mr. Dillon, of Caherhouse, &c. The resolutions embodied the following catalogue of the benefits to be derived from Repeal:—"1. Self-government, the making of our own laws, suited to the wants and wishes of our own people—the interpretation and administration of our own laws—the filling of all offices in the State with Irishmen.—2. The freedom of religion, and the extinction of a heavy and unjust impost by the total abolition of the tithe-rent charge, and all compulsory payments by one body of Christians to the teachers of the doctrines of any other persuasion.—3. The improvement of the condition of all occupiers of land by a well-considered plan of fixity of tenure, which, while it would secure to the landlord a moderate and adequate rent for his land, would at the same time ensure to the tenant the benefit of all his own labour and expenditure in permanent improvements.—4. The total abolition of the oppressive grand jury cess and the present iniquitous system of poor laws, and the substitution of well-regulated charitable institutions."

Dundalk.—The borough commissioners, on Tuesday last, adopted a petition for repeal without a dissentient voice. At a meeting of the Repeal Association on Sunday night, several new members were enrolled, amongst others, Captain M'Mahon, 13th Light Dragoons, paid 12. as a member.

SCOTLAND.

Edinburgh.—At the meeting of the General Assembly on Wednesday it was resolved in reference to the protest of the seceding party, that the ministers who attached their names to the protest have, by their own act, ceased to be ministers of this Church; that their parishes have become vacant, and that they are disqualified from receiving any presentation or appointment to a parochial or other spiritual charge in the Church as by law established, till reproved by the ecclesiastical judicatories—and that the subscribing elders are no longer elders in any of the parishes or sessions connected with the Establishment. The General Assembly have therefore instructed Presbyteries to intimate, without delay, the vacancies thus occasioned to the patrons, or to those entitled to present or to nominate persons, by whom, when found qualified, they may be supplied. They have also declared that the chapels and churches of the ministers who have since seceded, and adhered to the protest, are equally void. The number of clergymen who have seceded from the Church of Scotland is now 450; and there is little question that the number will soon be close on 500. This is nearly the half of the entire clergy, the number being under 1,200. About 240,000. have been raised in less than 10 weeks for the erection of the new churches, and no doubt that in a few weeks the amount will considerably exceed 300,000. Among the contributors are the Marquess of Breadalbane, 1,000. ; a Colonel in the army, 6,000. ; in three yearly instalments of 2,000. each; Mr. Paul, a private gentleman, 2,000. ; Mr. Nisbet, bookseller, London, 1,000. ; a Dissenter, 500. ; and there are various other subscribers of 2,000. and 1,000. each. It is also rumoured that the Marquess of Breadalbane, who has signified his adhesion to the "New Secession," has resolved to make a contribution of 10,000. to its funds. The Duke of Argyll has given ground as sites for such new churches as they may require in Campbelltown. Mr. Fox Maule is to build and endow a church at his own expense; Mr. A. Campbell, member for Argyllshire, is to do the same. In Elgin the inhabitants have raised 1,000. to build a church; and they will also liberally contribute for its support. So that

in many instances churches will be built and ministers provided for, solely by private munificence and local exertion, without requiring any aid from the general fund.

Law.

COURT OF EXCHEQUER.—(Sittings in Banco.)—*Custom-House Frauds.*—*The Attorney-General v. Hurel and Others.*—In this case, which our readers will recollect was tried before Lord Abinger at the last Nisi Prius sittings, Mr. Erie now moved to set aside the verdict entered for the Crown, and to enter the verdict for the defendant, upon a legal point reserved at the trial. The information was laid at the instance of the Crown against the defendant, an extensive importer of French gloves and other foreign goods, under 3d and 4th William IV., cap. 52 and 53, for having unlawfully unshipped goods upon which the duty had not been duly paid, or for having such goods in his possession, the duty not having been paid upon them. The learned counsel submitted that in this case the goods in question had been regularly landed, under what was called a "sight entry," an entry founded on the declaration that the importer was not acquainted with the nature and value of the goods. Subsequently, and after the goods had been examined by the Customs officers, a perfect entry was made, and after payment of the duty calculated on the perfect entry, the goods were delivered to the importer. In the present case the alleged fraud was in substituting a fabricated account of the quantity and value of the goods for the genuine account originally taken, by which means the goods were delivered upon payment of a much smaller amount of duty than the Crown was entitled to receive. All the proceedings were correct, fair, and regular, up to the period when the goods were examined, and the quantity ascertained. There was no pretence, therefore, for saying that the goods had been illegally unshipped, and yet every count in the information was founded on an illegal unshipment. The learned counsel said he had ventured to suggest this objection to the information at the trial, and the Attorney-General, on behalf of the Crown, suggested, by way of reply, that as the "perfect entry" on which the goods were delivered to the defendants was fraudulent, it related back to the landing of the goods, and rendered the goods delivered under it illegally unshipped within the meaning and intention of the acts of Parliament. No doubt the Smuggling Act (3 and 4 Wm. IV., c. 53, ss. 18, 44), declared that where goods were fraudulently landed under a sight entry, it was the same as if no entry had been made; but here the goods were properly landed under the "sight entry," and there was no reason to suppose that any fraud was contemplated until after the perfect entry was made. The Court was unanimously of opinion that the point raised by the learned counsel at the trial had been answered by the counsel for the Crown. Under the circumstances, it was as if the goods in question had been unshipped without any entry, and were therefore illegally unshipped. The Court, therefore, thought there was no ground for disturbing the verdict.—Rule refused.

The Attorney-General v. Candy.—In this case, which was tried before Baron Rolfe, and reported in this Paper when the trial took place, Sir Thomas Wilde now moved to set aside the verdict given for the Crown, and to obtain a new trial, on the ground that the verdict was against the evidence. The case against the defendant, who was an extensive importer of silk goods from France, was founded on the presumption, that in collusion with a landing-waiter named Homerton, since deceased, and of an informer named Burnby, he had contrived to falsify the entries of two parcels of goods, received from France in the months of July and August, 1840. The falsification of the entries, and the defendant's cognisance of the fraud, depended altogether on the evidence of Burnby. In his examination, Burnby stated that he was on habits of social intercourse with the defendant; that he had received large sums of money by way of gratuity from him, and that he had also borrowed money from the defendant, for which the defendant held his I.O.U.s. The witness Burnby's statements were more than ordinary evidence. Upon his own admission, he was a person of most disreputable character. He distinctly swore, however, that the defendant was in and out of the premises when the fraudulent entries contained in the Custom-house blue books were concocted, and upon his testimony the jury found for the Crown. In substituting the fraudulent entries it was necessary to use the Custom-house seal, which bound the threads of the blue book, and the witness Burnby said he had this seal made for Homerton, and saw Homerton use it in Mr. Candy's premises some time in the month of July, before the payment of the duty on the first parcel of goods, which formed the subject of the information. The goods were examined on the 8th, delivered on the 9th of July, and the duty paid on the 27th of July. Burnby swore that he saw the counterfeit seal used by Homerton in Candy's drawing-room in July, and the workman who prepared the counterfeit seal made an affidavit that it was not delivered until the month of August. Mr. Candy himself also made an affidavit, negating all the facts sworn to by Burnby, so far as he (Mr. Candy) was personally concerned. He swore that he had never given nor lent any money to Burnby, and never had any I.O.U. from him. He also denied that he had ever been on terms of social intercourse with Burnby; and that Burnby had come to his warehouse one day to make a purchase about dinner-time, and that it was usual in the business to ask customers to stay and dine; that Burnby had been so asked and stayed dinner, in company with a great number of other persons, which was the only occasion when he ever dined at the defendant's table. No doubt he could not rely on the defendant's affidavit alone as a ground for a new trial; but coupling it with all the facts of the case, he did submit that it was deserving of their Lordships' consideration.—Lord Abinger: No doubt, it was very proper the defendant should make an affidavit, but does he state that he paid, or believed he paid, the full amount of duty payable on the two parcels of goods, in respect of which the Crown has now proceeded against him?—Sir T. Wilde admitted that the defendant did not swear in express terms that he paid the full amount of duty—that might be impossible for him; but he distinctly swore that he was wholly ignorant of the frauds imputed to him, and did not participate in them, directly or indirectly.—Baron Gurney inquired if the defendant had set forth the invoices of the goods contained in the two packages on which it was alleged the duty had not been paid?—Sir T. Wilde replied that he had shown, at the trial, that from the course of trade it was impossible the defendant could show by his invoices what goods were in any package received three years ago.—Baron Gurney could hardly conceive how a merchant could receive goods without having some entry of the quantity or quality. At all events it must be known to the defendant's clerk.—Lord Abinger said the Court would look through Baron Rolfe's notes of the evidence taken on the trial, and announce in the course of a few days whether they should grant or refuse a new trial.

Saunders v. Wilkin.—This was an action tried before Mr. Justice Patteson at the late assizes for Essex, when a verdict was taken for the plaintiff for 56. 16s., subject to the opinion of the Court, on the following point:—The action was on a warranty, as to the soundness of a horse purchased by the plaintiff, who was a tailor, from the defendant, for 55. and a pair of trousers of the value of 1. 10s. The plaintiff, in his declaration, stated that he had purchased the horse at "the price or sum of 56. 16s." and upon its appearing that the contract was for 55. and a pair of trousers worth 1. 10s., the defendant's counsel insisted that there was a fatal variance between the contract as laid in the declaration, and that proved on the trial. The learned Judge who tried the cause overruled the objection, but gave the defendant's counsel leave to move the Court. A rule having been obtained accordingly last term, Mr. Thesiger now appeared to show cause against it, and cited a case of "Hunds v. Burt," reported in the 9th vol. East's Reports, in which it was held by Lord Ellenborough, that where a horse was sold for 16. in cash,

and another horse worth 14., it was properly stated in the declaration to have been sold for 30. Mr. Rodwell appeared to support the rule, but did not succeed in distinguishing the present case from that cited from East's Reports. The Court said there could be no doubt that the plaintiff was bound to prove the contract as he alleged it, but in the present case this had been done. The horse was, in fact, sold for 56. 16s. The rule for a new trial must therefore be discharged.

COURT OF QUEEN'S BENCH.—(Sittings in Banco.)—*The Chartists.*—*The Queen v. O'Connor and Others.*—The Attorney-General said he had to show cause against the rule obtained by his learned friends, calling upon the Crown to show cause why the judgment against Mr. O'Connor and others should not be arrested on the 4th and 5th counts. It was right he should state that, with respect to the remark that the 4th count did not charge conspiracy, the defendants were acquitted of the conspiracy, and they were entitled to the benefit of that acquittal. Under the direction of the learned Judge at the trial, as to the law of conspiracy, the jury acquitted the defendants of that charge. He did not complain either of the direction of the Judge or the finding of the jury. It was with a view to bring under the consideration of the jury, and also of this Court, whether the facts, indeed lately of conspiracy, constituted an offence, that those counts were prepared; and the learned Judge told the jury that, with reference to the facts stated in the 5th count, it was impossible for him to suggest anything by which the defendants could be acquitted. One objection was, that to the material averment there was no venue, but the count went on, "and, that afterwards, on the 1st day of August, in the year aforesaid, and on divers other days and times, between that day and the 1st day of October in the year aforesaid, in the parish aforesaid, in the county aforesaid, the said Feargus O'Connor, &c., together with divers other evil-disposed persons to the jurors aforesaid as yet unknown, did unlawfully." Here and here alone was the offence stated, and it was stated with a perfect venue—"and in that county aforesaid, aid, abet, assist, comfort, support, and encourage the said evil-disposed persons in this count first mentioned, to continue and persist in the said unlawful assemblings, threats, intimidations, and violence, and in the said impeding and stopping of the labour employed in the said trades, manufactures, and businesses, with intent thereby to cause terror and alarm in the minds of the peaceable subjects of this realm, and by the means of such terror and alarm violently and unlawfully to cause and procure certain great changes to be made in the constitution of this realm, as by law established, against the peace of our said Lady the Queen, her Crown and dignity." One of his friends had intimated, that it was not stated who the divers other persons were who had so assembled.—Lord Denman understood the objection to be that, the facts stated without a venue were facts which might have been committed anywhere, and would not be criminal in this country; and another objection was, that it was neither stated that the defendants were present when the offence charged was committed, nor that they knew any such offence was in point of fact committed, only that they were aiding and abetting.—Mr. Serjeant Murphy said there was no illegal offence charged.—Mr. Erie observed, that it was said that divers persons were assembled; the offence was an unlawful assembly, and it was essential that there should be three or more assembled, and it did not appear, except by the word "divers," what was the number assembled. Mr. Serjeant Murphy considered they ought to have been charged as principals. The Attorney-General said that the count charged, "that divers persons at divers places;" that would assume that there must have been two persons, which would have been sufficient. There was an offence committed by stopping labour with a view, by terror and intimidation, to change the constitution. There must have been two persons, and it was stated that there must have been three. It was said that the facts stated were facts which might have been committed anywhere, and would not be criminal in this country; and another objection was, that it was neither stated that the defendants were present when the offence charged was committed, nor that they knew any such offence was in point of fact committed, only that they were aiding and abetting.—Mr. Serjeant Murphy said there was no illegal offence charged.—Mr. Erie observed, that it was said that divers persons were assembled; the offence was an unlawful assembly, and it was essential that there should be three or more assembled, and it did not appear, except by the word "divers," what was the number assembled. Mr. Serjeant Murphy considered they ought to have been charged as principals. The Attorney-General said that the count charged, "that divers persons at divers places;" that would assume that there must have been two persons, which would have been sufficient. There was an offence committed by stopping labour with a view, by terror and intimidation, to change the constitution. There must have been two persons, and it was stated that there must have been three. It was said that the facts stated were facts which might have been committed anywhere, and would not be criminal in this country; and another objection was, that it was neither stated that the defendants were present when the offence charged was committed, nor that they knew any such offence was in point of fact committed, only that they were aiding and abetting.—Mr. Serjeant Murphy said there was no illegal offence charged.—Mr. Erie observed, that it was said that divers persons were assembled; the offence was an unlawful assembly, and it was essential that there should be three or more assembled, and it did not appear, except by the word "divers," what was the number assembled. Mr. Serjeant Murphy considered they ought to have been charged as principals. The Attorney-General said that the count charged, "that divers persons at divers places;" that would assume that there must have been two persons, which would have been sufficient. There was an offence committed by stopping labour with a view, by terror and intimidation, to change the constitution. There must have been two persons, and it was stated that there must have been three. It was said that the facts stated were facts which might have been committed anywhere, and would not be criminal in this country; and another objection was, that it was neither stated that the defendants were present when the offence charged was committed, nor that they knew any such offence was in point of fact committed, only that they were aiding and abetting.—Mr. Serjeant Murphy said there was no illegal offence charged.—Mr. Erie observed, that it was said that divers persons were assembled; the offence was an unlawful assembly, and it was essential that there should be three or more assembled, and it did not appear, except by the word "divers," what was the number assembled. the realm, and by means of such terror and alarm violently and unlawfully to cause and procure certain great changes to be made in the constitution of this realm as by law established." The Learned Counsel proceeded to argue the point at great length, and was followed by the Solicitor-General, who said that the offence with which the defendants were charged was this—that they did aid, abet, and assist the first-mentioned evil-disposed persons to continue and persist in the acts stated, and that they did so with a certain intent. The charge was not that the defendants were present, or taking part in the acts stated to have been done in the previous part of the indictment, but that they encouraged the parties who committed those acts to persist in the same conduct. There was a venue, therefore, laid in that part of the count which contained the charge against the defendants; and the question, therefore, now was, whether the allegation was also necessary in the previous part of the indictment. It certainly was not necessary at common law to introduce such an averment, and, even if it were, still according to the provisions of the 20th sect. of the statute of George IV., c. 64, if it appeared on the face of the count that the court had jurisdiction, the want of such an averment would be cured. He should maintain, however, that independent of the statute it was quite unnecessary, it was quite impossible for their Lordships to assume that the act charged took place out of the realm. Suppose the offence of tumultuously assembling and impeding labour had taken place in the county of Chester. The defendants were charged with aiding them in the county of Lancaster. If the evidence had proved that the aiding and abetting took place in Cheshire, might not the defendants have been found guilty on this indictment? It was not necessary to prove that it was done in Lancashire, and therefore it was unnecessary to introduce the averment. The fallacy, as pointed out, lay in not distinguishing between cases of felony and cases of misdemeanour. In cases of misdemeanour the offence might be made up of acts done in various places, and some acts might be done out of the realm, and some in it. Their Lordships would observe also, that the count contained the word "unlawfully." Now that must mean against the law of England. It also alleged that threats were made to the peaceable subjects of this realm. Why should the Court assume that the subjects of the realm were out of the realm? On the contrary, it must be assumed *prima facie*, that the grand jury were speaking of things which had taken place within the realm. It certainly would be a most violent presumption, after verdict, to say that what took place must have taken place out of the realm of England. At the close of the Solicitor-General's speech, the other counsel for the Crown stated that the case had been so fully argued that it was unnecessary for them to address the Court, and Lord Denman said he would appoint a day for hearing counsel on the opposite side.

SPORTING. EPSOM RACES.

MONDAY.—These popular races commenced this day, with the great trial race of the week, the *Craven Stakes* of 1000 sovs each, for 3-yr-olds, 6 st 8 lbs; 4 yrs, 8 st 10 lbs; 5 yrs, 9 st 4 lbs; 6 yrs and aged, 9 st 10 lbs. Craven Course. 10 subs. Lord G. Bentinck's *Discord*, 6 yrs (Rogers), beat Lord Chesterfield's *Knight of the Whistle*, 5 yrs. The following also started but were not placed:—Mr. Pannell's *Alce Hawthorn*, 5 yrs; Mr. Payne's *ch c by Emilius*, out of *Alcepede's dam*, 3 yrs; Mr. Shelley's *Nizza*, 3 yrs; Colonel Wyndham's *Tom Thumb*, 3 yrs; Sir G. Heathcote's *Moscow*, 3 yrs; Mr. D. Cooke's *What*, 3 yrs; and Mr. Balchin's *Epanette*, 4 yrs. Won by a neck.

The *Shirley Stakes* of 25 sovs each, for 2-yr-old colts, 8 st 7 lbs; and fillies, 8 st 4 lbs. One mile. 5 subs. Lord Strathbrooke's *Evenus* (Nat.) beat Mr. Smith's *Spiteful*, and Lord Exeter's *Wee Pet*. Won by half a length.

The *Woodcock Stakes* of 15 sovs, with 30 added, for 2-yr-old colts, 8 st 5 lbs; and fillies, 8 st 2 lbs. T.Y.C. 7 subs. Lord Albemarle's *Delaware*, by Bolero (Whitehouse), beat Sir G. Heathcote's *ch f by Velocipede*; Captain Dainton's *ch f by Liverpool*, Lord Exeter's *f by Beiram*, out of *Datura*; Mr. Hewitt's *The Midnight Star*; and Col. Wyndham's *ch by Liverpool*, d by Agreeable. Won by a length.

The *Minor Plate* of 50l.; 3-yr-olds, 6 st 10 lbs; 4 yrs, 8 st 7 lbs; 5 yrs, 8 st 12 lbs; 6 and aged, 9 st 1 lb; mares and geldings allowed 3 lbs. Winner to be sold for 300l., &c. Heats, 2 miles. General Sharpe's *Lara*, 5 yrs (J. Marston), beat Mr. Cowley's *Adrian*, aged; Mr. Booth's *Donnybrook*, 3 yrs; Mr. Kimber's *Viola*, 5 yrs; Mr. Bird's *Redcap*, 3 yrs; Mr. Brook's *Ima*, 5 yrs; Mr. Theobald's *f by Camel*, 3 yrs; and Mr. Bastard's *Sir Freiluf*, 4 yrs. Mr. Shepherd's *ch by Ascot*, 4 yrs; Mr. Werninck's *Patchwork*, 4 yrs; and Sir G. Heathcote's *Aurunzebe*, 3 yrs, were distanced early in the race. Won by half a length.

Match.—50l., 10 ft; 9 st each; mile and a half. Mr. Hewitt's *Stickler* (J. Day, jun.), beat Capt. Freeston's *Master May*.

WEDNESDAY.—THE DERBY STAKES of 50 sovs each, h ft, for 2-yr-old colts, 8 st 7 lbs; fillies, 8 st 2 lbs; mile and a half. The owner of the second horse to receive 100 sovs out of the stakes; and the winner to pay 100 sovs towards the expenses of the course. 156 subs. Mr. Bowes's *b c Cotherstone*, by Touchstone (Scott), beat Col. Charrille's *b c Gorbamby*, by Buzzard (Buckle). The following also started, but were not placed by the time Sir G. Heathcote's *b c Siricoll*, by Sheet Anchor; Lord G. Bentinck's *b c Gaper*, by Bay Middleton; Sir G. Heathcote's *ch c Khorassan*, by Samarcand; Mr. Bateman's *b c Chotornian*, by Camel; Mr. Combe's *b c Fakeaway*, by Freney; Mr. J. Brown and Mr. A. British Yeoman, by Liverpool; Mr. T. Taylor's *b c Gamecock*, by Jerred; Mr. Griffith's *b c Newcourt*, by Sir Hercules; Mr. Mostyn's *ch c General Pollock*, by Velocipede; Major Yarbrough's *b c Dumping*, by Muley Moloch; Lord Chesterfield's *b c Parthian*, by Jerred; Mr. Bell's *ch c Winchester*, by Velocipede; Lord Westminster's *b c by Touchstone*, out of Languish; Mr. Theobald's *ch c Humbly*, by Plenipo; Mr. Theobald's *br c Highlander*, by Rockingham; Mr. Baxter's *br c Magna Charta*, by Revolution; Col. Wyndham's *br c Murton Lordship*, by Muley Moloch; Lord Eglinton's *b c Aristides*, by Bay Middleton; Mr. Gratwick's *ch c Hopeful*, by Elias; Lord Orford's *ch c by St. Patrick*, out of Mercy; and Mr. T. Russell's *ch c Elvira*, by Enigma. Gayer took the lead at a strong pace, followed closely by Khorassan, Cotherstone and Gorbamby next, and went up with them Siricoll, Newcourt, a British Yeoman, Elexir, and two or three others; in the rear were Murton Lordship and Highlander, and there they remained to the end of the race. The leading horses maintained their positions till near the turn, where, so great had been the pace, the spectators looked in vain for Aristides, Newcourt, and Elexir—they had succumbed, and the crowd was composed of Chotornian, Fakeaway, and a British Yeoman, at neither with any chance. Gayer continued to lead a few strides over the road, and then, quite beaten, fell behind with Khorassan; Cotherstone immediately took up the running, followed by Gorbamby, Siricoll third, and in this order the race finished, Cotherstone increasing his lead from the stand, and winning in a common canter by two lengths. Gorbamby was three lengths before Siricoll, who beat Gaper about a length, the latter having a similar advantage over Khorassan. Three or four lengths behind were Fakeaway, Chotornian, and a British Yeoman, each claiming to be sixth. The pace from start to last was tremendous. Value of the stakes 12,277.

The *Epsom Stakes* of 5 sovs each, with 35 added; 3-yr-olds, 7 st 10 lbs; 4 yrs, 8 st 11 lbs; 5 yrs, 9 st 2 lbs; 6 and aged, 9 st 6 lbs; mares, &c. allowed 3 lbs; winner to be sold for 120l. One mile. 6 subs. Mr. Pannell's *Alce Hawthorn*, 5 yrs (Sly), beat Lord Albemarle's *Delaware*, 3 yrs; Mr. S. Heathcote's *ch f by Emilius*, out of *Alcepede's dam*, 3 yrs; Mr. D. Cooke's *What*, 3 yrs; and Mr. Balchin's *Dromedary*, 6 yrs. Won by a length.

The *Minor Stakes* of 5 sovs each, with 35 added; 3-yr-olds, 7 st 10 lbs; 4 yrs, 8 st 11 lbs; 5 yrs, 9 st 2 lbs; 6 and aged, 9 st 6 lbs; mares, &c. allowed 3 lbs; winner to be sold for 120l.

New T.Y.C. 8 subs. Mr. Taylor's *Sequidilla*, 5 yrs (Whitehouse), beat Mr. Skingsley's *Hawk's-eye*, 5 yrs; Mr. Osbaldeston's *Devil-among-the-Tailors*, 4 yrs; and 5 others who were not placed. *Sequidilla* won in a canter by four lengths, and was claimed.

The *Burgh Stakes* of 5 sovs each, with 35 added; 3-yr-olds, 8 st 2 lbs; 4 yrs, 8 st 11 lbs; 5 yrs, 9 st; 6 and aged, 9 st 4 lbs; mares, &c. allowed 3 lbs; winner to be sold for 80l. Last half mile. 16 subs. Mr. Beresford's *Henri Quatre*, 5 yrs (W. Boyce), beat Lord Dorchester's *John O'Gaunt*, 4 yrs; and 15 others who were not placed. A capital race with Henri Quatre, John O'Gaunt, and Victor, was won only by a neck; Victor a capital third, and Mongrel a moderate fourth.

THURSDAY.—*Sweepstakes* of 10 sovs each, h ft, if declared &c., with 50 added; mile and a quarter. 16 subs, of whom 7 declared. Mr. S. Herbert's *Teetotaler*, 4 yrs, 7 st (T. Day), beat Mr. D. Cooke's *What*, 3 yrs, 5 st 3 lbs; Duke of Richmond's *The Whaler*, 3 yrs, 5 st 3 lbs, and 6 others who were not placed. Won easily by a length.

Fifty Pounds, for 3 yrs, 6 st 10 lbs; 4 yrs, 8 st 7 lbs; 5 yrs, 8 st 12 lbs; 6 yrs and aged, 9 st 1 lb; mares and geldings allowed 3 lbs; winner to be sold for 200l. Heats, 1 mile. Sir G. Heathcote's *Hydaspes*, 4 yrs (A. Perren), beat Captain Dainton's *Mingo*, 3 yrs; Mr. Goodman's *Chummy*, 4 yrs; Mr. Balchin's *Dromedary*, 6 yrs; Mr. Werninck's *Patchwork*, 4 yrs; Mr. Clifton's *Vigo*, 4 yrs; and Mr. Jenkin's *Romulus*, 3 yrs. Won in a canter in the second heat.

Fifty Pounds, for 3-yr-olds, 6 st 10 lbs; 4 yrs, 8 st 7 lbs; 5 yrs, 8 st 12 lbs; 6 yrs and aged, 9 st 11 lbs; mares and geldings allowed 3 lbs. Winner to be sold for 150l., &c. Heats, 1 mile and a quarter. Lord Maidstone's *Titania*, 3 yrs (Simpson), beat Mr. Shelley's *Nizza*, 3 yrs; Mr. Hornsby's *Revoke*, aged; Mr. Werninck's *Patchwork*, 4 yrs; Mr. Bird's *Redcap*, 3 yrs; and Mr. Oldacre's *The Evening Star*, 4 yrs. Won in a canter in the third heat, and the winner claimed.

THE OAKS STAKES of 50 sovs each, h ft; 3-yr-old fillies, 8 st 7 lb; the second to receive 100 sovs out of the Stakes. Last mile and a half. Mr. Ford's *Poison* beat Mr. Thornhill's *Extremepore*, Mr. Payne's *Bessy Bedlam* filly, and 20 others who were not placed. Won cleverly by two lengths.

PRICES OF MANURES.

Agricultural Salt, per ton, 30s to 32s	Phosphate of Soda
Alexander's Compost, per bush, 1s 6d	Porter's do. infected Manure, per quarter, 18s 6d
Bleaching Powder, per cwt, 30s	— concentrated do., per qr., 80s
Bone-dust and half-bone, per quarter, 18s	Rape dust, according to quantity, per ton, 4s to 11s
Bramstone, per ton, 11l 10s	Rock Salt, per ton, 7l
Clarke's desiccated Compost, per bhd., 11 12s 6d	Saltpetre, per cwt, 25s 6d
Daniell's Bristol Manure, according to quantity, per bush, 1s 1d	Silicate of Potash (pure), per cwt., Soda Ash, per cwt., 14s to 16s
Guano (foreign), per cwt., 10s 6d to 12s 6d	Sulphate of Ammonia, per cwt., 18s
— Potter's English, according to quantity, per cwt., 14s to 16s	— of Iron, per ton,
Gypsum, according to quantity, per ton, 82s 6d to 45s	— of Soda, per ton, 7l 10s
Hunt's New Fertiliser, per bush, 1s 8d	Sulphur, per cwt., 10s
Muriate of Ammonia, per cwt., 24s	Sulphuric acid, according to strength, per lb., 1s 2d to 2s 2d
— Lime, per cwt., 12s	Trimmer's Composition for Clover, per cwt., 8s
Nitrate of Soda, according to quantity, duty paid, per cwt., 17s to 19s	Do. do. for Wheat, with Silicate of Potash, per cwt., 32s
Petre Salt, per ton, 34l 10s to 4l	Do. Compost for Turnips, per cwt., 8s
Phosphate of Ammonia, per lb., 1s 9d to 2s 6d	Urate, per ton, 5l
	Watson's Compost, per cwt., 10s, in quantity, 9l per ton

MARK LANE, FRIDAY, June 2.—We had a very small supply of Wheat from Essex, Kent, and Suffolk this morning, but there being several runs left over from Friday, there was a fair quantity offering; having a great deal of wet yesterday, and its continuing to rain, caused more eagerness on the part of the millers, and the stands were cleared at 1s. advance from last Monday. There was also an improved demand for Foreign, and 1s. more has been made of Polish Odesa and Dantzic; bonded is also improving in value. Barley is very scarce, and for the little at market of Malt quality, high prices are asked. Peas of all sorts are rather dearer, and Beans remain as last week. The Oat-trade is fully as dear, with a better sale.

BRITISH, PER IMPERIAL QUARTER.	S. S.	Red	S. S.

GAZETTE OF THE WEEK.

BANKRUPTCY SUPERSEDED.—E. Parr, New Inn-passage, Clare-mock 1, Insolvent.

BANKRUPTCY.—J. O. Palmer, Bold-street, Liverpool, music-seller.—H. W. B. Allen, Bradford, Yorkshire, woolstapler.—J. Gibbs, Saint Sidwell, Exeter, tailor.—J. Allen, G. Allen, and H. Allen, Birmingham, drapers.—C. Hobson, Shotley-bridge, Durham, miller.—T. Creeke, Cambridge, tailor.—G. Cantson, Basingstoke, ironmonger.—J. Webster, Sheffield, printer.—W. A. Whinfield, Newcastle-upon-Tyne, draper.—E. Dickin, Tarnock, Denbighshire, grocer.—J. J. Anston, Yorkshire, miller.—J. Jackson, Kingston-upon-Hull, grocer.—J. B. Atkinson, Caistor, Lincolnshire, wine-merchant.—L. Leyson, Carlisle, milliner and dress-maker.—J. Glass, Devoe, Wiltshire, coal-merchant.—R. Mansfield, Liverpool, coal-dealer.—H. S. Humphreys, Denbighshire, surgeon.

SCOTCH SEQUESTRATIONS.—M. Archibald, Stirling, timber-merchant.—J. and A. Reid, Glasgow, merchants.—J. and H. Ritchie, Saltcoats, merchants.—J. Moir and Co., Glasgow, piano-makers.—Major P. Cruikshank, Inverness-shire, banker.—J. Livingstone, Dundee, surgeon.—R. Brown, Glasgow, baker.

DECEASED.—On the 2nd inst., at Donore Glebe, county Kerry, Ireland, the Rev. Mr. P. J. O'Connell, of a son, late of Geneva, the lady of T. Butler, Esq., of Brimfield House, Northampton, and of a daughter, at King's Walden, Hertfordshire, the Rev. Mrs. P. J. O'Connell, of a son.—On the 27th ult., at Black Lea, the Hon. Mrs. A. Laguerre, of a daughter.—On the 28th ult., at Weymouth-street, Bath, and place, the Hon. Mrs. Penrose, of a son and heir.

MARRIAGE.—On the 1st inst., at St. George's, Hanover-square, J. A. Taylor, Esq., M.P. for Worcestershire, to Maria Theresa, second daughter of G. Rush, Esq., of St. Leonards, Essex, and Farninghoe Lodge, Northamptonshire.—On the 2nd inst., at St. Leonards, Essex, the Rev. S. Pope, M.A., Rector of St. Leonards, Essex, to Miss Harcourt, only daughter of the Rev. H. P. Pope, D.D., of St. Leonards, Essex.

DECEASED.—On the 28th inst., at his house, in Dorset-place, Vice-Admiral Keith St. John, of Leamington, on the 26th ult., A. M. Blackburne, eldest son of Sir A. Blackburne, Bart., M.P.—On the 26th ult., at Kilburn, the Rev. A. Taylor, B.D., Fellow of Magdalen College, Oxford, and for many years the Rector of St. Andrew's Church, in that place.—On the 28th inst., at her house in Hanover-street, Mary Lady Petre, relict of Robert Edward, tenth Lord Petre, and sister to Barnard Duke of Norfolk.—On the 28th ult., at Exeter, after a very protracted illness, Mary, wife of H. L. Grove, Esq.—On the 28th ult., at Syria, on his return from India, Capt. R. D. Werge, of Her Majesty's 39th Regiment, son of the late Lieutenant-Colonel Oswald Werge, aged 30.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of IN-VISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

BEE-HIVES.—GEORGE NEIGHBOUR and SON beg to inform their Apian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Bee-hives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and Son have also Glass Hives and other articles connected with Bee Management, at their Apian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps inclosed.

*** "NUTT ON BEES" (5th Edition), now published.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

TONIC MILK OF ORANGE, a DELICIOUS CORDIAL AND SWEETENER OF THE BREATH.—It warms and cheers the Stomach, creates an Appetite, Digests the Food, Strengthens the Lungs, Clears and Improves the Voice for Singing, enlivens the Spirits, dispels Nervous Debility, Clears the Blood, and thus removes Pimples and Eruptions, while it combines with these admirable properties the inestimable advantage of being the most efficacious agent offered to the Public, for Beautifying and Perfuming the Breath. It should be taken in the proportion of a wine-glass full twice a day, and is particularly recommended to GENTLEMEN on leaving home in the morning, or after smoking a Cigar, &c.; while to LADIES it will be equally grateful on going to a party or a ball, for its invigorating influence on the mind and spirits, and its purifying effect on the organs of the throat.

Mrs. GULLY respectfully announces to the Nobility, Gentry, and Public at large, that she has disposed of the Right, Title, and Recipe of the Tonic Milk of Orange to Messrs. A. ROWLAND and SONS, No. 20, HATTON GARDEN, LONDON; who have appointed Messrs. Barclays, Medicine Vendors, 95, Farringdon-street; Mr. Sanger, 150, Oxford-street; Mr. Johnston, 68, Cornhill; Mr. Prout, near Temple Bar; and Mr. Butler, 4, Cheapside, as Agents.—Half-pints 2s. 6d. Pints 4s. 6d. Quarts 9s. Stamp Duty inclosed.

HATCHING APPARATUS.—Reduced Prices.

From eight to sixteen Guineas.—Messrs. Todd and Son, of Bury-street, Bloomsbury, beg to call the attention of the Public to their PORTABLE PATENT HATCHING AND REARING APPARATUS, being the original Manufacturers. This successful invention is capable of Hatching, at a trifling expense, any number of Game and Poultry Eggs of all sorts, from 50 to 200 at one time, and possesses the further recommendation of rearing the young birds at all seasons, and of furnishing Poultry for the table at a trifling cost, at all periods of the year. For further particulars apply at the Manufacturers'. A Machine may be seen in use daily.

WANT PLACES.—All Letters to be post-paid.

TO NURSERYMEN, &c.

AS FOREMAN in a Nursery. A middle-aged Man, who has been many years in his last Situation, from which he can have an unexceptionable character. Direct to Mr. W. DEAN, Hill, Southampton.

AS GARDENER. A single Man, aged 27, who has a practical knowledge of his business in all its departments, and can have a good character from the Situation he is about leaving.—Direct to A. B., care of Mr. FRANKS, Post-office, Highgate, Middlesex. N.B. No single-handed place will be accepted. Wages, 30l. per annum.

AS GARDENER. A married Man, aged 30, who has a perfect knowledge of the Forcing departments of Grapes, Cucumbers, and Melons, likewise understands the arranging and laying out of Ornamental Flower Gardens. Satisfactory references can be had from the employer he is about leaving.—Direct to J. P., Post-office, Chislehurst, Kent.

AS GARDENER. A young Man, aged 27, who is perfectly conversant with the management of Pines, Vines, Stove and Greenhouse Plants, and Gardening in general, regarding which satisfactory references can be given. Wages, 25s. per week. Apply, by letter, to E. H., at YOBELL & Co.'s, Nurserymen, Great Yarmouth.

AS GARDENER. A respectable young Man, aged 28, married, without encumbrance, perfectly understands Horticulture, is desirous of meeting with a Situation in a gentleman's family. Can give every satisfaction as to abilities, sober habits, &c. from the gentleman he is now leaving, with whom he has been two years; likewise six years' previous character, if required; would have no objection to emigrate.—Direct to J. H., 65, Wickham-street, Vauxhall.

AS GARDENER, either single-handed, or where two or more are kept: a respectable married Man of true temperance principles, aged 37. Has a good practical knowledge of his business, and is particularly attached to the cultivation of Flowers. He is also practically acquainted with the new methods of Pot-culture, &c., as laid down in the *Gardeners' Chronicle*, to which excellent Paper he is a subscriber. Can have a good character of two years' standing from the gentleman he has just left.—Direct to W. HAYES, Low Leyton, Essex.

TO FARMERS AND LAND PROPRIETORS.

AS LAND STEWARD, or Manager of a Farm. A middle-aged Man, a native of Scotland, who has had great experience in Farming and Agricultural Pursuits all his lifetime. Some of the more finely-cultivated Counties of Scotland, and can produce the most flattering Testimonials from Gentlemen of the first respectability. References are kindly permitted to F. J. PATERSON, Esq., Balford Hall, near Rochdale; and to Messrs. JONES and CO., 11, Booksellers, Rochdale.

Printed by Messrs. BARNARD and FRANKS, Lombard-street, Fleet-street, in the Strand, at the Office of the *Gardeners' Chronicle*, and Published by them at the Office, 8, CHANCERY STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, June 3, 1843.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

PRICE 6d.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

NEW AND SUPERB PICTURES.

NEW FUCHSIAS OF 1943.

SUPERB SEEDLING CHRYSANTHEMUM THE "DUKE,"
YOUELL & Co. feel much pleasure in announcing they have obtained the entire stock of an extremely beautiful seedling (Chrysanthemum, from Mr. Wells, gardener to the Rev. J. Burroughes, of Lingwood Lodge, Norfolk. This splendid variety, named "THE DUKE," was exhibited at the Norwich and Norfolk Horticultural Society's Exhibition, where it obtained the First Prize, as the Best Seedling; it also obtained First Prizes shown in the best stand of 25; ditto ditto, 15; ditto ditto, 20; and the judges pronounced it to be the best Chrysanthemum ever exhibited. The colour French White, changing to pure white petals broad and beautifully incurved, forming a perfect ball of from 4 to 4½ inches in diameter. It is ready for sending out, at 7s. 6d. per plant, free of postage, to any part of the United Kingdom.—Great Yarmouth Nursery, June 6, 1843.

ORANGE, LEMON, and CITRON-TREES, and ITALIAN JASMINES.—The above have been imported, in excellent condition, by **TAYLOR & CRIGGON, Italian Warehousemen, 2, Suffolk-street, Pall Mall East,** who have also just received a few cases of choice Italian Wines, consisting of Alentico, Red and White Sparkling Asti, Cyprus, and Nice. Fresh Seltzer-water received every fortnight.

WARNER & WARNER, SEEDSMEN, 28, Cornhill,
 beg leave to offer the following choice SEEDS, which they
 can recommend with the greatest confidence:—

MILFORD NURSERY, NEAR GODALMING,
SURREY.—Twelve Thousand Greenhouse Plants, RUDDY-
BONEDIONS, CAMILLAS, ROSES, and other Hardy Plants in
buds; Four Well bred Cods, calculated for Hunters, a Pair of Hares,
and a handsome Brown Cob, to be Sold by Auction, by Mr.
WATKINS, on MONDAY, June the 12th, 1812, and following days, at
eleven o'clock, up on the Premises, MILFORD NURSERY, near Godalming.

Catalogues may be had one week previous to the Sale, upon the Premises, of Mr. ELWIN, Godalming; Messrs. NOBLE, No. 152, Fleet Street, London; and of Mr. WATERER, Auctioneer, Land and Timber Surveyor, Chertsey, Surrey, who will forward Catalogues by post upon application by letter pre-paid.

TO GENTLEMEN, FLOKISTS, AND OTHERS.
MESSRS. PROTHEROE & MORRIS will submit to
Public Competition, at the Auction Mart, Bartholomew-
lane, on THURSDAY, June 15th, 1871, and following day, at 12
o'clock, about 1,000 DAHLIAS, comprising all the new and leading
varieties, fine PEARSONIAN'S, the newest varieties of EUCHASIAS
and VERRENAS, HARTS CASE, &c. May be viewed the morning
of Sale; Catalogues may be had at the Mart, and of the Auc-
tioneers, American Nursery, Leytonstone.

Prospectuses containing every information may be obtained of the Agents of the "FARMERS' FIRE AND LIFE INSURANCE ASSURANCE," who are appointed in all the principal towns in the kingdom, or by letter, pre-paid, forwarded to W. SNAW, Esq., at the Offices, Wellington-street North, Strand, London.

A faint, sepia-toned architectural drawing of a large, symmetrical building. The structure features a central entrance with a prominent pediment supported by columns. On either side of the entrance are long, multi-story wings with numerous rectangular windows. The drawing is oriented horizontally, showing the front facade of the building. The style is that of a technical or architectural sketch, with fine lines and some shading to indicate depth and structure.

their improved plan of BOTANICAL and AGRICULTURAL gardens, of an open trough under the bed, is now being universally adopted. References may be had, and their works seen at the "The Nursery and Gentlemen's seats in the country, nearly to the whole of the London Nurseries, and a great variety of Horticultural Erections, and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

[illegible]

JOHN L. BAXTER, who the first to introduce the Galvanic Plant Protectors, and an agent for the same, is now ready to introduce to the public notice a new Trade Dress for the same, and other Houses where vapour is conducted, or at intervals required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS invented by J. ROBERTS, Esq., may be obtained of any size from JOHN HEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. Roberts having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, he is to offer it as most efficient and economical. It may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall, Messrs. Lea & Co's, Hackney, Messrs. Henderson's, Pine Apple Place, Mr. Knight's, 14, Grosvenor, Chelsea, Messrs. Veitch and Sons, Exeter, and at the Gardens of the Horticultural Society of London.

AMERICAN PLANTS.—WATERER'S SPLENDID
EXHIBITION, King's Road, Chelsea, under the especial
patronage of H.R.H. the Duchess of Gloucester and H.R.H. the
Duke of Cambridge, is now in high perfection. Upwards of
10,000 plants, many 10 to 12 feet high, completely covered with
flowers, producing one of the most brilliant scenes ever offered
to public view.—Open daily, Sundays excepted. Admittance,
One Shilling.

WINDSOR AND ETON ROYAL HORTICULTURAL SOCIETY.—NOTICE.—The Annual Grand Show of this Society for the Exhibition of **DAHLIAS** and other Flowers, Fruits, and Vegetables, will take place on **TUESDAY, Sept. 12, 1843.**—**WM. WRIGHT, Hon. Sec.** Windsor, June 9, 1843.

Y. OUELL & Co., in offering their **LIST of CHRYSANTHEMUMS** (for which, see their advertisement in this Paper of the 3rd inst.), to the notice of amateurs, and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the List will be found highly satisfactory to those who may not only have the above object in view, but also to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants will be strong and healthy, and sent free of postage (on the receipt of a Post-office order, to any part of the United Kingdom, at the rate of 12s. per dozen. - Great Yarmouth Nursery, June 8, 1843.

MESSRS. VEITCH AND SON beg to offer the following New and Beautiful Plants, introduced by them through their Collector in South America: -

<i>Memorosa</i> (See figures)	Curtis's Bot. Mag., Aug., 1842.
<i>Begonia coccinea</i>	" Curtis's Bot. Mag., Jan., 1843.
<i>Echites splendens</i>	" and Paxton's Mag., May, 1843.
"	" Paxton's Mag., March, 1844.
" <i>atropurpurea</i>	" and Curtis's Bot. Mag., Nov., 1842.
"	" Edwards' Bot. Reg., May, 1843.
"	" and Paxton's Magazine, Oct., 1842.
<i>Gesneria hirsuta</i>	" Curtis's Bot. Mag., Feb., 1843.
<i>G. oxonia macrophylla variegata</i>	" Curtis's Bot. Mag., Feb., 1843.
<i>Hypochoerita strigillosa</i>	" Curtis's Bot. Mag., April, 1842.
<i>Manettia bicolor</i>	" Paxton's Magazine, March, 1843.
<i>Passiflora Aetnina</i>	" Curtis's Bot. Mag., April, 1843.
<i>Rondeletia longiflora</i>	" Curtis's Bot. Mag., Nov., 1842.
"	" and Paxton's Magazine, Nov., 1842.
<i>Stigmaphyllon ciliatum</i>	

Sphenocampylus duplo-serratus Curtis's Bot. Mag., May, 1843.
Tricopodium azureum Edwards's Bot. Reg., Dec., 1842.
 Curtis's Bot. Mag., Dec., 1842, and Paxton's Mag., Dec., 1842.
 Messrs. VICKER and SON having raised many thousands of *Araucaria imbricata* from seed, are enabled to offer them in quantity at a very low, moderate price.—Exeter, June 3, 1843.

COTTAM AND HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.
HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.
HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch (Larger Sizes in proportion.) . . . £7 0s. 0d.
 Roger's Boiler, small size . . . 3 15 0
 Ditto do. large do. . . 4 10 0
 Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.
STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.
 Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 4s. 0d. each.
 Strong do. do. do. 45 lbs. at 4 4
 Ox Hurdles, 4 feet high, do. 60 lbs. at 5 6
BEST WIRE for STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire-work, &c.
GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.
HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.
CAST IRON FLOWER STAKES 4 feet long out of the ground, 7s.; 4 feet 6 in., 5 feet, 11s.; 6 feet, 11s.; 7 feet, 20s. per dozen.
CAST IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each.
 Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnot's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations. Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87) renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.
 N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS.
CROSSKILL'S LIQUID MANURE CART, which received the Honorary Reward of the Roy. Agricultural Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price, delivered in Hull, 25l.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12l. 12s.

BUDDING'S PATENT GRASS-MOWING MACHINE. This Machine, which has recently undergone some improvements, is admirably adapted for mowing Lawns and Pleasure-Grounds. It is so easy of management that it may readily be used by an unpractised hand; and while the work is much more rapidly performed than by the scythe, the effect is very superior, as it leaves no seam, and it may be used in all seasons, and best in dry weather, when the Grass is difficult to cut with the scythe.

Wholesale and Retail Agents to the Patentee—J. R. and A. Ransome, Ipswich.
 Agents in London—Thomas Wilkinson, 309, Oxford-street; Baker and Co., 65, Fore-street, Cripplegate; Cato and Sons, 89, Holborn Hill; Charles Smart, 369, Oxford-street.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

* * * POTTER'S Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE,
 BY THE IMPORTERS,
 ANTHONY GIBBS & SONS, LONDON;
 GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

Now ready, price 4s. 6d.,
RURAL CHEMISTRY.
 By EDWARD SOLLY, Esq., Jun., F.R.S.,
 Experimental Chemist to the Horticultural Society of London,
 Hon. Mem. of the Royal Agricultural Society, and Lecturer
 on Chemistry, at the Royal Institution.
 &c. &c. &c.

Extracts from the Introduction:—
 "A knowledge of the chemical composition of soils and the various substances employed as manures enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require, points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them: he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

Volume 1. is now ready, price 7s. 6d.
 London, R. GROOMBRIDGE, 5, Paternoster-row, and all Booksellers.

LYNDON'S PATENT SPADES.—These superior Spades, noticed in the *Gardeners' Chronicle*, Feb. 18, may be obtained by addressing a line to JOHN SHAWEN, Ironmonger, Sevenoaks. Prices 36s., 40s., and 44s. per dozen, delivered in London. A Post-office order is expected from unknown correspondents.

CAUTION.—Several Perfumers of apparent Respectability, for the sake of gaining a trifle more profit, basely attempt to impose their pernicious compounds upon the public as the real "MACASSAR OIL" for the Hair, and "KALYDOR" for the Complexion. They copy the bills and labels of the original articles, substituting either a fictitious name, or the word "GENUINE" in the place of "ROWLAND'S." To frustrate such imposition, it is necessary, on purchasing either article, to see that the word ROWLAND'S is on the wrapper, as follows, without which none are genuine. ROWLAND'S MACASSAR OIL, for the growth, and for Beautifying the Human Hair. Price 3s. 6d., 7s., or Family Bottles (containing four small) 10s. 6d.; and double that size, 21s. per bottle. ROWLAND'S KALYDOR, for the Skin and Complexion. Price 4s. 6d. and 8s. 6d. per bottle. A. ROWLAND AND SON, 20, HATTON GARDEN, LONDON, is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraved on the Government Stamp affixed on the Kalydor. Be sure to ask for "ROWLAND'S" Articles, Sold by them and by respectable Chemists and Perfumers.

HORTICULTURAL SOCIETY OF LONDON
EXHIBITIONS AT THE GARDEN.—The next Exhibition will take place on SATURDAY, June 17th; subjects for Exhibition must be at this office, on Friday the 16th of June, or at the Garden before half past eight o'clock, A.M., on the day of Exhibition. The gates will be opened at One, P.M. Tickets are issued to the Fellows at this office, price 5s. each; or at the Garden in the afternoon of the days of Exhibition at 7s. 6d. each; but only Orders from Fellows of the Society. N.B. No TICKETS WILL BE ISSUED IN REGENT-STREET ON THE DAY OF EXHIBITION.
21, Regent-street.

TO LET, in Regent-street, Three Rooms on the Second Floor, unfurnished, with the use of a large Meeting Room. They are suited for the purposes of a Society, and have for some years past been so occupied. Apply to the Porter, 21, Regent-st.

The Gardeners' Chronicle.

	Spilsby.	

THAT salt is extremely beneficial to Asparagus is undoubted; that this plant will take a great deal of it, and be much the better for it, is equally certain. The same is true of Seakale. Both are shore plants, and are abundantly fed with salt at all seasons. How much the largest quantity may be that they will endure is uncertain, but we have seen a pound of nitrate of soda given to one Seakale-plant without the slightest injury, and it would no doubt have found no inconvenience from as much common salt; nevertheless, there are those who are unable to discover the utility of salt as a manure for Asparagus. The reason of this is well pointed out by Mr. Beaton in a memorandum now before us.

"It is," he says, "a general rule to cut off all weak shoots while the Asparagus beds are in bearing, or at least up to the beginning of June. Under such treatment the plants cannot be much benefited by whatever dressings the beds received through the last winter or spring, till after this time, because all plants—the Asparagus among the rest—can only collect and digest their food, and store away the product for the next growth, while they are in a growing state; and in all herbaceous plants like the Asparagus this store is laid up in the roots. Now, whatever may have tended to improve Asparagus this season must have been stored before the end of last autumn; and salt given to beds last March must go through a wonderful process, along with other agents, in the course of this summer before it can be stored in the roots when the growing season is over, or tell upon the crop next May. These are simple facts, well known to the gardeners of the present day, but of which many of the last race of gardeners entertained strange notions—judging from their mode of loading their Asparagus-beds in winter with dungs and composts, a practice which is not yet got rid of, but which, compared with the improved system of feeding plants in summer, while they are in active growth, is a mere waste of time and materials;—not that winter-dressing is lost on the plants altogether, although the best part of it is, but that if the same amount were given in summer in a liquid form, when the plants could at once appropriate it, the benefit would be out of comparison in favour of summer manuring, not only to Asparagus, but also to Seakale and Rhubarb."

This is sound doctrine, and should never be neglected. We have a good deal to say upon the subject ourselves, but for the present we can do no more than beg our Gardening friends to act upon the principles laid down by Mr. Beaton, and not expect that a dressing of manure applied in winter is to produce some instantaneous magical effect; the processes of vegetation are slow, and cannot be hastened with advantage. Plants are like animals—they do not become fat the moment they swallow a good meal, but they must have a great many good meals before the effect of their nutritious diet tells visibly upon them. While we are speaking of the effect of salt upon Asparagus, we are glad to annex some excellent practical directions by Mr. Beaton for the general cultivation of this delicious vegetable:

"By far the best way of growing Asparagus is in single rows, 3 ft. apart, and 9 in. plant from plant; but if the ground is not deeper than 2 ft. or 30 in., or if room is scarce, the rows need not be more than 30 inches asunder. I have grown Asparagus this way for the last 15 years, and give them no dung in winter, merely clearing off the stalks and weeds in October, and pointing over the surface about 2 in. deep with a fork, and leaving it as rough as possible. Early in March, when the surface is quite dry, it is raked down, and about 2 in. of soil drawn over the crowns from each side of the rows, which gives the ground something of the appearance of a plot of Peas earthed up for the first time; when the gathering is

nearly over, the ground is stirred again to loosen the tramping made in gathering the crop. The hollow between the little ridges is then filled up with a powerful compost, consisting of equal portions of sandy soil, leaf-mould, and pigeons'-dung; the whole is then drenched with liquid manure from the stables, cow-houses, or laundry, and the foreman of the kitchen-garden gets *carte blanche* to water the Asparagus any day through the growing season when he can best spare his men, or, at all events, every fortnight, and always with liquid manure, if possible; as to the quantity of water, the only instruction he gets is that he cannot drown them. This is cultivating the Asparagus in summer. The plan is not at all a new one. I have seen it when a boy, 30 years ago, and I have never seen, heard, or read of a better plan since. In very dry seasons, like the last, it is of great advantage to mulch in between the rows with short grass, or any litter. Some have an idea that the frost should be kept from Asparagus, and go to some trouble to do so, but it is in reality as hardy as the Oak, or any other of our native plants."

WE have already expressed our decided opinion that the subdivision of farms into small occupations, although it may for a time give employment and maintenance to a greater number of families, tends in the end to impoverish a nation; and we would therefore not encourage to too great an extent the letting of small portions of land, together with a cottage and necessary outbuildings for the purpose of being cultivated entirely by manual labour, like the small farms in Flanders. No doubt it may be the means, in many instances, of raising poor, industrious men to a comparative state of comfort and independence; and if every circumstance were not taken into consideration, this would offer a very simple means of diminishing poverty and diffusing comfort through the class of Agricultural labourers, many of whom are distressed for want of employment. Nothing would be easier than to build cottages, with small barns and cow-stalls, to be let to industrious labourers, with four or five acres of land; and there is no doubt but the rent would pay a good interest for the outlay. The plan has been tried by the same lady who established the Willington self-supporting school, and a most interesting account has been published of a man, once a pauper, who, with a small advance of money to purchase a cow, and a few acres of land let to him at a full rent, has raised himself to a comparative independence. Such an example must have a most beneficial effect on all those who have the opportunity of following it, and, by stimulating industry, must reduce the number of those who are now dependent on private or public charity.

There is a great difference between a general subdivision of large farms and the introduction of a few of all intermediate sizes. We are inclined to think that the most natural and beneficial division of land is that which includes farms of all dimensions, from 50 to 1,000 acres. Less than 50 acres of arable land cannot well be profitably cultivated, according to the most improved system of husbandry, including the rearing and fattening of stock, and the raising of food for man. Great improvements cannot well be introduced where the capital is not large, and experiments cannot be made except where they form but a small proportion of the whole of the operations on a farm; but small farms produce many articles of consumption, such as poultry and dairy produce, which are below the attention of the large farmer. In them are brought up honest and industrious bailiffs and confidential servants—a class of men which is not numerous in our days, and which should be encouraged by every means in our power. In a small farm more attention is paid to details and economy, and a farmer who has successfully cultivated a farm of moderate dimensions and increased his capital may safely be promoted, as it were, to a larger. Be this as it may, the introduction of garden cultivation on a small scale may have its advantages, provided such occupations be let with caution and judgment, and the tenants be selected from the steadiest and most industrious labourers, as a reward for good conduct, and a solace in old age. The sight of a family consisting of a patriarchal father, who can no longer do much with his hands, but still directs his children by his experience, while in return they gratefully work for his support, is truly edifying; and we would such pictures were as common in Britain as they are in some other countries less rich and powerful, but not less happy.

It was once proposed in Parliament (by the late Mr. Whitbread, we believe) to provide cottages and gardens, as a reward in old age, for those who had never applied for parochial assistance, and who had brought up their families in industrious habits. As a public measure the thing was evidently impracticable, but the principle was good, and might be acted on by individuals in their own small circle. A few small occupations of four or five acres in extent, on which a family might live comfortably, let to men of known character, with a small advance of money, if required,

to be repaid by instalments, to purchase a cow, pigs, or a few sheep, would not only be a provision for a family, but have a salutary moral effect on the whole population. We will endeavour to develop this idea in a future article.—M.

AMONG the questions that naturally arise in the minds of the friends of the poor is, whether articles now rejected or neglected as food may not be sufficiently nutritious and palatable, to be suited for ordinary consumption. We all know how largely prejudice is mixed up with our feelings on the subject of food, and that even the Potato was at one time proscribed by the Puritans; a Middlesex peasant would not dream of cooking Nettles, and yet in Yorkshire and Lancashire, they are, when young, a common, and as we can testify, a good ingredient of broths; we also find that the French cottager will succeed in preparing good and wholesome food from substances which in this country are not thought of. Now, although we do not anticipate an English cottager's taking to frogs and snails, and "such small deer" for the supply of his table, yet we see no reason why he should not imitate the people of the Continent in the consumption of certain kinds of vegetable food unemployable among us.

Of these it is the Kidney Bean which promises best. We use it only in the young and tender state. The French employ the ripe seed, and when properly dressed, an excellent and agreeable food it proves to be. If instead of cutting the young pods, and thus wasting the produce of such plants, they were allowed to ripen their Beans, a saving of some importance would be effected in the economy of a cottager. We are led to these remarks by a letter from our correspondent Mr. Billington, who mentions the following case:—

"A very poor family in Shropshire being hardly pressed for food, the husband being unable to get employment, the wife bethought herself of some Kidney Beans she had by her, and put some in an earthen vessel containing a sufficient quantity of water, a few lumps of bacon, with a little seasoning of pepper and salt, and placed them in an oven to stew, two or three hours, till they became as tender as the best boiling Peas."

The peasants were agreeably surprised to find that the Beans, which they had fancied unfit even for the food of pigs, would thus furnish them with a nice mess; for they did not know that such seeds are served up at the tables of the wealthy in this country under the name of haricots, and are generally a favourite vegetable with continental nations. Hitherto it has been the universal custom in this country to throw away the dried beans of the Scarlet Runner, if not wanted for seed. We trust it will henceforth be remembered that excellent food may be had from one of those plants which now is made to scramble over the hedges and walls of a cottage garden, chiefly for the sake of ornament.

It must, however, be borne in mind that, although the Beans of the Scarlet Runner are good, the roots, which are fleshy and perennial, and look tempting enough to be eaten, are really poisonous, as was unfortunately proved last winter at Chelsea.

While we are upon this subject we may as well add, that, according to Mr. Daniell, the preparer of the manure of that name, horses, cows, sheep, and pigs, may be advantageously kept in part upon pulverised wood. In a pamphlet published a few months since* there is the following passage:—"About three years since I had occasion to send my cart-horses frequently through a piece of coppice-wood, and whenever it happened that they stopped within reach of the rods, they would greedily devour every bough they could come at. This I noticed many times. At last I was led to examine the rods on which I had seen them feeding, and found them completely stripped of their branches, some of which were of a very considerable thickness. This first led me to suppose that there must be some good qualities in the wood, and this consideration induced me to get some pulverized, and given to my cart-horses, which experiment was repeated at several different times, until I was fully satisfied that it had no injurious effect on them. After this I was led to give it to my gig-horses with their corn, and having ascertained that it did them no injury, I had machinery prepared for reducing the wood, for the purpose of food, and began to feed both cart and gig-horses, as also my cows and pigs, mixing a portion with all the food which was given them. This practice I have continued for the last ten months. Previously to feeding my horses in this way, they had each three-quarters of a peck of Oats and Beans given them per day, for which is now substituted three pints of Barley per day. They are in equally fine condition as when fed in the usual way, and more playful and free in their work. Soon after the wood was mixed with the fodder given to the cows, their milk, as well as their condition, was much improved. For several weeks past I have been feeding sheep with

* Address to the Agriculturists of the United Kingdom. Bath. Carrington.

the pulverized wood, together with crushed Swedish Turnips, and they also appear to improve by it. I have likewise fattened four pigs successively, mixing this food with Barley-meal, and the results have proved most satisfactory."

This statement, however strange it may sound, is not so startling when we remember that the woody matter of trees is, in its chemical nature, nearly allied to starch, and that it always contains some nitrogen; so that in reality it furnishes the ordinary materials of food in another form. We presume, however, that white-wooded trees, not resinous, are those which furnish Mr. Daniell's cattle with the sawdust they thrive so well upon.

A few weeks since we published a report of a lecture delivered before the Society of Arts by Mr. Fardon, in which the following passage occurs:—"He then detailed the result of 27 years' cultivation of two acres of land, alternately with Wheat and Potatoes. The cost of cultivation was 23*l.*, whilst the produce had been worth 93*l.*, thus leaving 70*l.* profit, subject to a drawback of 17*l.* for rates, rent, and parochial charges." One of our correspondents justly remarks, that these sums appear too large for average years, and that the statement requires explanation.

Upon writing to Mr. Fardon on the subject, he was so obliging as to furnish us with the following statement, from which it will be seen that although the quantity of land referred to as producing annually 70*l.* profit, less 17*l.* for rates, rent, &c., or 53*l.* net, was four acres, not two, yet that the result is still most interesting to the advocates of Spade-Husbandry.

"Samuel Bridge, of Stock Green, near Feckenham, in Worcestershire, has about four acres of stiff clay-land, on the blue lias formation. The land is naturally of inferior quality: he has occupied part of it for 27, and part for 15 years. He grows Wheat and Potatoes, and a small quantity of Beans. Leaving these out of the account, we may consider that he grows two acres of Wheat and two acres of Potatoes every year, the crop being shifted alternately from one division to the other.

"As soon as his Wheat crop is off he breast-ploughs his stubble ground, raking up and saving the stubble for litter: he then digs it over with a fork about 10 inches deep, and plants his Potatoes in the following spring; this crop is kept clean while growing, and the getting up of the Potatoes is made a complete cultivation for the planting of the Wheat.

"At first his neighbours ploughed his land for him gratis, but after about three years he took to digging it, and now prefers going to that expense rather than have it ploughed for nothing; and upon stiff land of that kind I do not doubt that his choice is a judicious one.

"He sells most of his produce, consuming a few of the Potatoes and the Beans in feeding a small quantity of bacon; the pigs are littered with his Potato-haulm and stubble. The manure from these, and from his house, with occasionally a little burnt clay out of his ditches, is all that is applied to the land.

"The cost of his manual wages per acre, including his own work, is as follows:—

Potatoes per Acre.	£	s.	d.
Breast-ploughing stubble	0	9	4½
Forking the land	1	8	1½
Planting Potatoes	1	17	6
Keeping them clean	0	4	0
Getting up and forking land for Wheat	2	16	3

Wheat per Acre.	£	s.	d.
Planting	0	4	0
Keeping clean	0	4	0
Reaping, &c.	0	8	0
Thrashing, at 6 <i>d.</i> per bushel	1	1	0

Two acres of Potatoes, at 6 <i>l.</i> 15 <i>s.</i> 3 <i>d.</i> —	13	10	6
Two acres of Wheat, at 1 17 0 —	3	14	0

Divided by the number of acres	4	17	4 6
--------------------------------	---	----	-----

Wages, at per acre per annum	£4	6	1½
------------------------------	----	---	----

"Leaving out of view the small quantity of Beans raised and of bacon fed, and supposing that he grew Wheat and Potatoes only, estimating the Wheat-crop at 40 bushels of grain and one ton of straw per acre; and the Potato crop at 12 tons per acre, which are what he obtains, valuing his Wheat at 7*s.* per bushel, his Potatoes and straw, at the price he obtains for them on the land, we shall have the following account:—

Sold annually:—	£	s.	d.
24 tons of Potatoes, at 50 <i>s.</i>	60	0	0
80 bushels of Wheat, at 7 <i>s.</i>	28	0	0
2 tons of Wheat-straw, at 50 <i>s.</i>	5	0	0

Deduct:—	£	s.	d.
Manual wages, at 4 <i>l.</i> 6 <i>s.</i> 1½ <i>d.</i> per acre	17	4	6
Seed Potatoes for 2 ½ acres, 25 bags, of 180 <i>lbs.</i> , at 4 <i>s.</i> per bag	5	0	0
Four bushels Seed-Wheat, at 7 <i>s.</i> 6 <i>d.</i>	1	10	0

Subject to rent and parochial payments .	£69	5	6
--	-----	---	---

"I may mention that the man has bought his land, and erected a cottage and out-buildings upon it.

"This is not the first instance that has occurred of large profits being made by the growth of Potatoes. I do not believe that these results could have been obtained on stiff and inferior land, under ordinary methods of culture: it is to fork-culture they are due.

"I believe it would be much better to consume all the Potatoes on the land in making pork and bacon, and that even more profitable results might thus be attained. The principle of selling so much produce is not admissible in farming, unless manure is bought. I published the particulars of this case in the *Mark Lane Express* some months since, and it occasioned a lengthened correspondence in that and in the *Worcester Journal*. I may observe that the cost of digging is much less when land has been dry for a long period, or for a few years, than when it is first broken up or put under spade or fork-culture."

We are continually hearing of sports, as they are called, when a branch of a red Thorn produces white flowers, or of a white Camellia red ones, or of a Peach-tree Nectarines, or of a red Plum white ones, and so on. These are accounted for upon the supposition that all artificial varieties are, on the one hand, prone to return to their original condition, and on the other, to deviate from it still further, the tendency to change having once been gained. Although it must be confessed that such explanations explain nothing, yet we are compelled, in the present state of our knowledge, to rest satisfied with them. We have now another case to record still more strange than those just adverted to.

Mr. Williams, of Pitmaston, a well-known, very skilful, and philosophical horticulturist, about 35 years ago planted a standard Mulberry tree; it did not begin to bear fruit till about 10 years afterwards, and for the following 10 years it produced no male blossoms, and the fruit had no seeds. But Mr. Williams being desirous of raising some seedling plants, and observing in a garden about a quarter of a mile distant a tree with some male blossoms on it, procured some, and applied the pollen to about half-a-dozen female flowers on his tree; these all set, and the seed produced plants. Two or three years after he had applied the pollen to a bough of the old tree, he observed on this particular branch, which was on the southwest side of the tree, many male blossoms; these have gradually extended over the whole tree, and it now scarcely bears any but male flowers, and this year nearly all the buds have proved males. The appearance of the tree was so remarkable, from the number of large blossom-buds, that two practical gardeners, who had asked leave to see his garden, could not at first view make out what tree it was.

Now to what are we to ascribe this? A tree that for many years produces nothing but females, as it becomes older changes its nature, and ends in producing nothing but males. We examined some branches sent to London by Mr. Williams, and their appearance was certainly very extraordinary. The old Gardening books say "that Mulberry-trees sometimes become barren;" and as those books were always written by men of great experience, it is probable that the fact is as they state—but why? Mr. Williams says that many other Mulberry-trees in his neighbourhood are also barren this year; and in the neighbourhood of London we have remarked several rather young Mulberry-trees covered with a profusion of male flowers only. But again we say—why? The occurrence is not common, and some branches of an exhausted old tree, as well as they, bear female flowers abundantly. Is it that males are a sign of vigour, and that the fine warm season of last year brought the Mulberry into a state of unnatural healthiness? Mr. Knight says, that the effect of an excessively high temperature is to cause, in unisexual plants, the production of male flowers only, while a very low temperature produces an opposite result. Cucumbers and Melons invariably produce male flowers only when the plants are young and very vigorous. Seedling Peaches and Apricots, as Mr. Williams remarks to us, in like manner form no pistils at first, that is to say when the plants are in great vigour. These facts look as if it might be the constitutional vigour given to the Mulberry in our hot and dry and bright summer of 1842 that produced the effect; but it is all uncertain, and we wish that our friends would consider whether anything within their knowledge goes to prove or disprove this conjecture.

ON THE APPLICATION OF GUANO.

a. It should never be given in contact with seeds, as it kills the embryo in germination. For this reason I am doubtful whether it might aid or hurt the first stage of growth, if the seed were previously steeped in a watery solution of guano. We know that carbonic acid and vinegar are given off by seeds in germination. These acids seem to attract ammonia so powerfully as to kill the germ. This effect will be most decided when the soil is very dry, but it is worth while to try with solutions of different strengths, whether water will take up azotized matter in a form capable of injuring tender seeds; I wish

to try it on Red Clover and Turnip seeds. The Peruvians irrigate immediately after the guano and crops are sown; the sandy character of their soil and their want of rain make this necessary. For the same reason they are said to give the manure in divided doses at different stages of growth; neither our soils nor situation admit of general irrigation, nor do many of our crops admit of repeated manuring on the large scale, but we have in mixtures a substitute more suited to our soils and climate than irrigation would be.

b. As the lumps are too strong the guano should be put through a fine sieve, and the lumps thus separated should be broken and put through the same sieve; this will be best done during the operation of mixing; but before proceeding to it I may mention a fact which farmers would do well to attend to. Guano rapidly absorbs moisture from the air, and this absorption increases both with the moisture of the air and the value of the manure. By drying two specimens of different values for an hour at 150°, I found the worst lost 15 per cent. between water and ammonia, and the best lost 22½ per cent.; and by again exposing these specimens to the open night air for an hour at 35°, the worst recovered nearly 6 per cent., and the best rather more than 8½ per cent. moisture. Inference 1.—Guano is constantly gaining weight. This would add much to the profit of retailers if it were not for the fact that part of this moisture (in mild weather) goes to aid the decomposition of the organic matter and its escape in gas. Hence, 2. Guano is constantly losing value; and this loss is proportioned both to the value of the article when imported, and to the warmth and humidity of the air in which it is kept. 3. Hence, the farmer will find his profit in purchasing that which has been recently imported (if valuable), and in mixing it as soon as possible: for, if too damp, it will not pass through a sieve; much will be lost; and if he attempt to dry it by heat, he will lose much more. If any has already become too damp for economical use, it may be mixed with at least its bulk of dry but cold mill-dust, bran, or tail oats well dried and ground in the mill. This will absorb much of its moisture, reduce it to a workable powdery state, and increase its value as a manure, without expelling its ammonia. 4. In comparative experiments, and indeed in fair trading, each bag ought to be weighed, and have its weight marked on it when imported; and this weight is all that the farmer ought to pay for, or regard in his experiments.

c. The objects of mixing guano are, 1. To partly disinfect it by absorbing its volatile products and diminishing its smell. 2. To separate its active particles, and thereby diminish their action on each other. 3. To present it to warm soils in a form in which its action will be less violent at first, but more protracted and steady than when given in an unmixed state. Of course, the colder the soil and the earlier the season when sown, the less quantity of mixture is needed, and conversely. But as a general rule: It should be mixed as equally as possible with four times its bulk of finely-sifted, moderately-dry black or brown-coloured earth, or peaty matter, sawdust, slightly-burnt clay, charred turf, coal or peat ashes, whichever of these substances can be most conveniently had. Perhaps newly-burnt charcoal, used as soon as cold, is the best matter that can be had for mixing; but as it can seldom be at the farmer's command, any of the above matters will answer in its stead. Where a considerable quantity of useless wood can be had, it might be piled up, surrounded and nearly covered with clayey or spratty turf, and burnt with little admission of air. When cold, the charcoal, clay, and charred turfy matter, if well broken with a spade, mixed, and put through a sieve, will make an excellent mixture for guano, especially for light, warm soils. Some have mixed guano with sand, and when for a cold clayey soil, this mixture seems very suitable; only sand need not be given in more than double its bulk, and should be put in the soil soon after mixing, whereas any of the other mixtures may, with advantage, stand beat up, under cover, for a week or more, according to the weather, character of the soil, and distance at which it is to be put below the seed, and also in proportion to the quantity of guano given to the acre. The colder and heavier the soil and the colder the weather, the more slightly the manure ought to be covered, and conversely. No rules can supersede experience in this. When either dung or bones are given as part of the manure, and when the soil is moderately moist or disposed to clay or peat, the guano should be put near the seed. Again, where the ground has just been limed, the guano ought both to be given in a large quantity of mixture and covered rather deeper than in ground not limed for a year or more. On light soils, lime should, if possible, be mixed some weeks before guano is given. As lime rapidly expels the ammonia from guano, it soon renders the manure inert. No farmer who understands the matter will mix either guano or dung or bones with either slaked lime or fully-burnt wood ashes, or burnt couch, unless the couch be well mixed with earth, and have stood some time in the heap after it is cold. Any of these substances, if in contact with guano, drive off its ammonia. Although guano slightly mixed may be sown above bones, yet bones and guano ought not to be mixed before they are sown, as they act on each other, if good, and the readiest part of the manure is thus dissipated before it reach the soil. A mixture of gypsum with guano can seldom do any hurt, and for Turnips or Clover on light soils it may often be advantageous. When our Turnip soils are very dry at sowing, it might be a great advantage if the top of the drills could be watered with a weak solution of guano. This might be done at no great expense, by a watering-pan having a very small rose, perforated with only three or four small holes so as to spread the liquid but little. A woman might go steadily along with this

pan, followed by another with a supply of liquid, a large barrel or tub standing at the upper end of the drills. If this be found beneficial, a machine might be made to carry a larger supply, and water two drills at once. It is likely that this watering would both disgust the turnip-fly, and quickly put the plants beyond its power.

From 60 to 70 per cent. of good guano are either dissolved or readily suspended in water. The solution may be tried of different strengths from $\frac{1}{2}$ cwt. to 1 cwt. per acre of the powder. This would require about 160 gallons of water, or 1 gallon per perch, or 40 $\frac{1}{2}$ yards length of a 27-inch drill. It may be difficult to make less liquid go over this length, and a larger quantity may be found inconvenient in practice. The undissolved parts of the guano may be mixed in sand or mould and used as a dressing over dung for later Turnips, or composted for after-use on grass.

Quantity of Guano per Acre.—This is not so easily determined as some gentlemen seem to think. The character and state of the soil, the locality where it is used, the period of the season when it is given, the kind of crop intended, the previous manure and system of cropping, the natural action and durability of guano as a fertilizer, the quality of the article used, and the amount of expectation contemplated, have all to be taken into account, and may vary the quantity from 2 cwt. to 8 or 9 cwt. per Scotch acre when given alone, and half the above quantities when a due proportion of dung, bones, or rape dust is given at the same time. When the soil is naturally warm and has been brought to a high state of fertility, and where the farmer's interest in the land extends over only four or five years, he will most economically promote it by giving merely enough of guano to start the plants with vigour, and, after a year or two, a light dressing of some suitable saline manure. If allowed, he may very cheaply "take his own out of the soil" in this way, and leave it as poor as he could wish. In our climate, all manures, except dung and partly-fermented vegetable matter, tend ultimately to exhaust the soil. Bones and guano, though in a much longer period, will in the end as effectually exhaust our soils as lime will.

We have heard much of the solar light enabling the leaf to decompose carbonic acid, and of plants receiving their carbon from the atmosphere. In hot and tropical climates, where sunshine is more abundant and steady, and where his rays are more direct and powerful, there is reason to believe that this is true to a considerable extent (the large size of leaves and blossoms, compared with ours; the comparative general deficiency of vegetable matter in tropical soils; the beneficial excess of saline matter there; and every other analogical fact, confirm this supposition)—but in our climate, where the heat is much less, and where the sun's rays are both more oblique and clouded during much of the season, little atmospheric carbon can be appropriated, except by our green crops, and therefore the supply must be chiefly afforded by the soil. Whatever, then, causes the evolution of more carbonic acid from the soil than it brings to the soil, gradually exhausts it, not only of carbonic acid, but also of the bases dissolved and carried from the soil by this acid. In the soil, any alkaline matter, as ammonia (from guano, dung, or bones), lime, and most of the salts, dispose the formation of carbonic acid, and commence a general fermentation, which extends to the dead vegetable matter in the soil and gradually reduces its quantity. Where the vegetable matter is in a very inert state and the soil is coarse, as in clayey land recently drained, either lime must be given in a previous fallow, (and when practicable, this ought to be done), or the manure must be good farm dung, not over fermented, or the guano must be given in a heavy dose (say 5 to 8 cwt., at least, per acre, put in, and covered moderately deep, some weeks or months, if practicable, before the seed); for in these soils, it requires much to begin fermentation so effectually as to act on the inert soil, and bring it into a fertile state. A good Turnip crop may be raised on such soils with less guano, but then the following white crop will show that the manure was wasted before the inertia of the soil was overcome. On the contrary, a soil which, by judicious culture, is already disposed to fermentation, may be made to yield crops for several years, by using repeated and varied small doses of ammoniacal and calcareous stimulants or salts, with occasionally a little dung, till the soil is reduced to ruinous barrenness. In warm light soils, it will require considerable management to give enough of good guano to carry through a rotation, without injuring the crop at first by its violence. Two or three cwt. per acre may be proper, if given alone; but much better give half dung or bones, and half guano, for such soils. Cold, high, clayey soils, even though under previous good management, will take 4 to 5 cwt. per Scotch acre, according to their exposure; and if (as is too often the case) lime or dung has been given them too sparingly, they may require more.—*P. Garden, Glenae, Dumfries. (Extracted from the Dumfries Herald, 30th March, 1843.)*

THE ANTIQUITIES OF GARDENING.

No. I.—Extracts from Sir Thomas Hanmer's * Manuscript on Gardening. (Continued.)

We have been favoured with an inspection of this manuscript by Sir Henry Edward Bunbury, Bart. It was commenced about 1660, at Bettisfield in Flintshire, and has evidently been written with great care and from much practical observation. It shows the attention that had been paid to Horticulture in our island nearly two centuries back, and that it had been prosecuted with a zeal scarcely surpassed by its numerous

* This Sir Thomas Hanmer was Member of Parliament for Flintshire; he was the grandfather of Sir Thomas Hanmer of Mildenhall, who was a Speaker of the House of Commons.

patrons among the nobility and gentry at the present day. The various kinds of flowers then in general cultivation are described, and instructions are given for their cultivation. Bulbous flowers were, it is stated, at that time in highest esteem, and accordingly the author gives full details respecting them. Of Tulips, in particular, he had an extensive collection of the finest varieties. Ornamental trees and Shrubs are treated of, and also forest trees. Many varieties of Fruit-trees were introduced by Sir Thomas from France to Bettisfield, and cuttings from these were distributed to various persons in the neighbourhood.

"The flowers in highest esteeme now amongst us are such as have those rootes wee call *Bulbous*, of which there are different kinds, both for the figure and greatness, but all of them resemble an Onion more or lesse, and are made up of white fleshy tunicles which enfold one another. Our chief *bulbous flowers* are these: the Tulipe, Narcissus, Iris, Crocus, Colchicum, Lilly, Crowne, Imperiall, Martagon, Gladiolus, Orchis, Ornithogalum, Dens caninus, Bulbous Violet, Moly, and Fritillary. Of *tuberous flowers* the most curious are those: Anemones, Irises, Cyclamens, Hyacinths, tuberous Irises, Satyriums, the Hollow roote, and Dragons. Of *fibrous Perennials* we have the Gilliflower, Stocke Gilliflower, Wallflower, Beare's eare, Hepatica, Lychnis, Trachelium of America, Lilly convally, Spiderwort, Valerian, Indian Candy Tufts, Maracox, or the Passion Flower, Everlasting Lupine, Melanthium, Moth, Mullein, Cortusa, Bellflower, Soapwort, Hesperis, Fibrous Ranunculus, Hollyhock, Cytisus, Aloes, Double Pellitory, Cowslips and Primroses, Double Featherfew, Ptarmica or Sneezewort, Orobis Venetus or Venetian Vetch, Hedysarum canadensis or the Suckling of Canada, Everlasting Pease, Limonium Rawolfii, Sedum arborescens or Tree Houseleek, Heleborine, the Italian or blew Marigold, Gnaphalium Americanum or Life Everlasting of America, Lagopus or Hartsfoot, Snappdragon, Nightshade Daisies, Double Lady Smocks, Marsh Marigold. Of *annuals* the best are: Adonis, the African Marsh Mellow or Alcea, Amaranthe, Scarlet Beane, Bastard Sopran, Convolvulus or Bindweed, Cornflower, French Honeysuckle, Goates beard, Hawkesweed Larkspur, Cresses, Mullein, Molucca odorata, Nigella, Pulsatilla, Scabious, Sonchus lanatus, Venus looking-glass, some sorts of Foxgloves, Coventry Bells, Sweet Sultan's flower, the Wonder of Peru. These above-mentioned flowers are all the sorts we have yet knowledge of in England, worthy to be received into our gardens, and more than were enjoyed by our ancestors, for many new kinds have within these last twenty years been brought hither out of foraine parts, especially our plantations and other countries of the West Indies, which were never seen here before, some whereof have required a manner of cultivating and ordering quite different from that of the old English flowers.

"Of Choosing Seed, and of Sowing and Ordering it. —The best seed is the most weighty, and is had from the lustiest and most vigorous stemms. Wee use to crop off flowers of such kinds as are many on a stalke, to make the other seed the better and have the more vertue, and such wee find usually in the lower seed-vessels of the stalkes. Bee not curious to keep the finest markt Tulipe or other rare flower for seed, unless the kind be strong, for better flowers are raised from a lusty flower of one colour, than from a curious stripped one of several colours that is but weak.

"Such seed as rises up with down, as Anemones and other sorts doe, must be watched and taken as soon as the down rises, which, when it is ripe, one hour of hot sunshine will make it doe, and if it be not gathered presently the least breath of aire will carry it away. Such as are dried with keeping long or hot weather, and others that are naturally more contumacious and stubborne, must be steeped in warm water or new milk before they be sown, or a little incision made with a penknife into them to help their germination—but hurt not the little spot or point of the seed, for then it dies."

"Earwigs hurt most Gilliflowers, and are taken best when these are newly podded (for they feed upon the young pods most) with sheepe's hooves and hollow Canes stuck upon sticks by the flowers, into which they creepe in the morning to hide themselves all day, and then you shall be sure of them every morning. Mice are easily taken with little traps baited with Nut kernels, pieces of Apples, and such things."

"Of Earths for Flowers.—Wee use two sorts of earths in our gardens, that is, natural and artificial. The natural are only the good rich blacke mold, which is the most generally good for all kinds, but best for the fibrous. The sandy fittest for bulbs; and loame, a kind of fat sand much used about London, good for most rootes. Clay and gravel, as well as marle, wee almost totally reject."

(To be continued.)

AMATEUR'S GARDEN.—No. XXIII.

ONE of the most troublesome diseases which Pelargonium growers have ever had to contend with is that which within the last two years has attacked the leaves of some collections, and imparted to the plants the appearance of having had the small-pox or measles. Many of the great growers in the vicinity of London have suffered to a very great extent, and I am informed that as early as February, Mr. Cock, of Chiswick, was obliged to destroy a number of his finest specimen plants to prevent the disease spreading through his whole collection. As several letters soliciting information relative to the cause and prevention of the disease have been put into my hands, I may state, (though I cannot speak positively, as the plants under my charge have hitherto escaped its ravages,) that I believe the spotted appearance to be caused by the grub

of some insect similar to the Tephritis Onopordinis, or Celery-fly, and I suspect it may be removed by the same means, viz., crushing the grub in the leaf, and by dressing the plant with something like spirits of tar, which, by imparting a noxious effluvia, will prevent the insects from depositing any more eggs on the plants.

Of course this remedy cannot be applied during the time the plants are blooming: at that time nothing more can be done than to divest the plants of the worst of their leaves, and give them a little extra heat to force them to make a few leaves to improve their appearance during the time they are in bloom. When the plants have done flowering, and are ready to cut down, every leaf should be removed from both the cuttings and old plant, and burned. The plants may then be dressed with tobacco-water, soft soap, and soot, made to the thickness of paint, and applied over the whole plant with a brush, which will destroy any eggs on the plants, and probably prevent the insects from depositing any more upon them.

As a further precautionary measure, the pots used should be well washed in warm water, the house properly cleaned and painted; and it would be well during the time the plants are in the open air to sprinkle the ground around them occasionally with a little spirits of tar. This is the system of management I should adopt if my plants were infected; but I have no hopes of clearing the plants this season, though every means should be employed by destroying the leaves to prevent the insect increasing in another one.

In several nurseries which I have lately visited, I find the disease making its appearance on the Fuchsia; collectors would therefore do well to keep a watchful eye upon new additions of soft-wooded plants to their collections; indeed, for my own part, I intend to make any additions to my stock perform a kind of quarantine in a house away from the other plants until I am satisfied they are clean. The above I trust will be a satisfactory answer to the Hon. and Rev. F. Curzon, and several other querists.

In a season when the blooming of American plants has been more than usually fine and abundant, I would direct particular attention to the importance of removing the flower-stems and seed-pods directly the bloom has fallen from the plants. In a garden containing several thousand Rhododendrons, part of them had the seed-pods removed about this time last year, and the difference both in quantity and quality of flower has been this season at least 50 per cent. in favour of the plants thus operated upon.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Testacella Maugei.—In a potfull of slugs, which my gardener was on the point of destroying a few weeks ago,

I happened to observe a species of *Testacella*, differing much in appearance from that which I had seen in the Oxford Garden; and on showing it to my friend, Mr. J. G. Jeffreys, he at once ascertained it to be the *T. Maugei* of Ferrusac. This species, though a native of Teneriffe, has for several years been completely naturalised in the nurseries at Durdham Down, near Bristol; and from thence has spread to become common in the gardens of this neighbourhood, and, most probably, of many other parts of the country, although from its habit of burrowing and rare appearance on the surface, it may often escape observation. To check the ravages committed by the larvae of the Crane-fly, I have long hoped that some natural enemy may be found to destroy them; and knowing that all the species of *Testacellæ* are carnivorous, I thought it not improbable that these "Horn-slugs," as they are hereabouts called, might be found to answer the purpose. In this,

however, I have been disappointed; for some experiments lead me to suspect that they would rather starve than touch the "leather jackets;" but as they live on earthworms and common slugs, they are still our benefactors, and ought not to share the fate, as they commonly do, of the phytivorous slugs. Great numbers of them have been destroyed by my gardeners, from a supposition that they rise to the surface in the night to eat the lettuces; but I am abundantly satisfied by a series of experiments and observations, that they never feed on these or any other vegetables. The *Testacella* may be at once known from other slugs, by a small flattish and rather ear-shaped shell at the posterior extremity; and I have sent you a drawing copied from Ferrusac's, that you may the better draw the attention of gardeners to the utility of these animals. *T. Maugei* appears to be at least equally hardy, and has to the full as strong a claim to be placed in the British Zoology as *T. haliotidea*.—*L. W. D., Sketty Hall.*

Accentuation.—I think that classical students, above all others in the world, should be the last to find fault with the pronunciation of scientific terms by gardeners: if with their learning they had removed difficulties and smoothed the road for the weak and the weary, they would have conferred a benefit on mankind; but instead of driving smoothly, as over wooden pavement, they have still left the road as rough as a newly-metalled Macadamised highway. With a total ignorance of the nature of the Latin and Greek accent, one party asserts that it should be placed on the radical part of the word, while another as stoutly affirms that it should be placed on the termination. Others say that the Greek accent should be somewhat like the Latin, when another party says that it

should differ; and so in the Latin antanaclasis we have the accent on the penultimate, and in the Greek *αντανάκλασις* we have the accent on the antepenultimate syllable. And what better again are our English Lexicographers, when treating of classical words? Take, as an example, the word "capillary;" and we find that Johnson, Kenrick, Nares, and Fenning, place the accent on the first syllable of the word; while Sheridan, Ash, Perry, Buchanan, Bailey, and Entick, place it on the second. Now, what can you expect from poor gardeners, when doctors differ so far? And when a bevy of students meet that have been taught at different universities, and attempt to read or speak in Greek or Latin, there will perhaps be found as great a difference in the pronunciation of some words as there will be among gardeners at horticultural exhibitions; and the person who has the misfortune to be in their company will have his mind somewhat dumfounded, and be like the boy who was sent to different teachers to learn English versification; he had committed to memory the following lines:—

"An Orpheus—an Orpheus—he works on the crowd;
He sways them with harmony merry and loud;
He fills with his power all their hearts to the brim;
Was aught ever heard like his fiddle and him?"

He was told by one of his teachers that it was iambic verse, and the accent must be placed on the second foot; another told him that it was trochaic verse, and the accent must be placed on the first foot; no, says a third, it is anapestic verse, and the accent must be on the third syllable; while a fourth as gravely informed him that it was a mixture of all the other three.—*Peter Mackenzie.*

The Squirrel.—The squirrel is sometimes blamed for destroying the young shoots of Spruce Firs; perhaps it may be guilty of doing so, but I believe it is of use sometimes in Spruce plantations. There is, I think, an aphid which is more destructive to these trees than the squirrel: their abodes have some resemblance to small cones; on an average they may contain a dozen cells, and in each cell there is commonly more than twenty of these insects. I have watched the squirrel devouring them very greedily. Now, suppose the squirrel took three meals a-day, and four of these cone-like substances to each meal, it will be found that more than 15,000 of these insects will be destroyed in one week by one squirrel; and perhaps it would be more for the benefit of woods if less powder and shot were expended upon these lively animals; for it is no uncommon thing to see the leading shoots of Larch, Spruce, and Scotch Fir, destroyed by those who delight in killing birds that perch upon the topmost boughs.—*Peter Mackenzie.*

Salvia patens.—Mr. Proctor, at p. 117, has stated that this plant damped off in winter under favourable treatment, proving thereby that it is not hardy. I do not, however, approve of cutting even the hardiest plants off close to the surface of the ground early in autumn, as was done to the plant in question; neither do I recommend leaf-mould as a dry covering, because, although it may protect the plant from frost, it will not preserve it from damp. I prefer coal-ashes, sawdust, very old lime-rubbish: the leaves of Scotch Pine may also be collected where the trees are thick, and they make a very dry covering. Mr. J. Henchman, of Edmonton, dug up during the winter of 1839 after severe frosts a plant which afterwards produced plenty of cuttings. Most likely there is something to be observed with regard to the state of the tubers of such plants besides their hardiness.—*John Ross, Holme, near Inverness.*

Tulips.—Having noticed a paragraph in your *Chronicle* of June 3rd, on the absence of Tulips from the exhibition at the Chiswick show, I would remind your correspondent that a collection was exhibited last year, of which very little notice was taken by the Judges. Could it therefore be supposed that any florist would ever make such a sacrifice again? I noticed, this year, a beautiful box of Carnations and Picotees exhibited, and for which no award was made. Can it then be a matter of wonder that florists are so backward in showing their productions at the Horticultural exhibitions?—*W. J. T.*

Rendle's System of Tank-heating.—I perceive by your leading article of June 3rd, that it is your intention to lend your assistance to the furtherance of the application of hot water for bottom-heat, for growing the Pine-apple and other exotic fruits. There is no doubt that even now, as you say, persons are to be found who object to the plan as brought forward by myself, but those who make these objections must be persons who have never seen the plan in operation, or at any rate could not have seen it efficiently in practice. Out of the many Horticulturists who have seen my new propagating house, I have not heard one say anything against it. The atmosphere is most genial and the plants flourish admirably. In the article alluded to I find you make mention of a plan used for twelve years at Oakley Park, which you consider similar to mine. Here I must, but respectfully, differ from you, as it appears by the plans and diagrams of the house at Oakley Park that the bottom-heat is obtained from a chamber, partly heated by hot water flowing in open gutters and partly by a fire flue, whereas my plan is merely a tank underneath the whole bed (as shewn in the accompanying sketch); and what I claim and consider of the greatest consequence in my plan, is, as I have stated in my Treatise, that "the large body of water contained in the tank or cistern when once heated remains so for a considerable time, by which the saving of fuel is immense." It is stated that a ton of coals will last for twelve days to heat the flues and gutters at Oakley Park, which at 8s. per ton is very reasonable. But then it must be borne in mind that coals cannot be procured in the neighbourhood of London, and at places distant from the collieries, at so cheap a rate; for 20s., 25s., and even 30s. per ton are no uncommon prices in

many parts of the country; whereas with my plan a ton of coals will be sufficient to keep the water heated in my

tank for more than twelve weeks for a house of similar dimensions to that shewn in the plate alluded to. From this it must be fairly inferred that the plan recommended by me is superior. I have been led to say thus much not by way of prejudice, my only object being to point out to Horticulturists the best plan for obtaining bottom-heat, and whether hot-air chambers, by either flues, pipes, or gutters, or my "tank-system," are the best mode, I leave for the public to judge.—*William E. Rendle, F.H.S.*

Clay-draining.—At p. 245 this is said to cost in Gloucestershire 1½d. per yard. I beg to say that the highest price I ever knew to have been paid for such work was 4d. per lug of six yards in length, but 3d. per lug is the common price. I have seen many acres clay-drained and rendered dry at a small cost, but the work requires to be very well executed, otherwise it will soon tell tales; indeed there is no description of draining that requires a more vigilant superintendence over the workmen than clay-draining does. Some workmen, if left to themselves, will take advantage of their employers. I once found, when measuring some clay-drains, that, for several feet in length the turf had only been taken off and replaced, with a few crumbs of earth added to give an appearance, no excavation having been made. Your correspondent "W. W." at page 385, says that "there are only about six inches of worked clay over the drain, and that the remainder is filled in loose." I beg to say that this is not the method practised in Gloucestershire. In this county the practice is to well ram the whole of the earth, beginning with the last portion taken out and ending with the turf. In fact, well ramming up to the surface, turf and all, is the principal criterion of good workmanship. A good clay-drainer will so ram his work that a very slight convexity will appear when his work is finished. When the land is in grass, the soil sufficiently adhesive, and the work properly executed, clay-draining will be found to be both cheap and efficient. The proper time for this kind of draining is the spring; it may however be done in winter if the weather be open; frost being found to be very injurious to the permanency of the work, no portion of the earth should ever be left out at night if there is the slightest prospect of frost. The mouths of the drains are formed of tiles; the branch drains should join the main at nearly right angles, and a very little fall is necessary. This sort of draining is not now much practised on arable land, and even on grass land it is falling into disuse, tile-draining being now more approved of, as being more permanent, but even this kind of draining is found in very stiff clay to be inefficient without some porous material being put over the tiles, which adds greatly to the expense, as in many places neither stones nor gravel can be found within several miles distance. A very intelligent member of the Gloucester Farmer's Club lately suggested the use of burnt clay for this purpose, thereby saving the expense of carting; and as, when land is effectually drained, there can be no occasion for leaving the ridges so high as they are now in many places, sufficient subsoil will always be found in the crowns of the ridges for the purpose of burning.—*Cultor.*

Bees.—If "Pettigrew" will look over his former communication, he will find I have neither misread nor misrepresented his words, viz.,—"putting a headless swarm into an empty hive, to make the Bees produce a Queen." I fear that it is "P." himself that misrepresents things; and until he become serious, I shall take no notice of what he says in relation to Bees, for his knowledge of them is beyond my "ken." On a second thought, I shall make a few observations on his remarks in the *Chronicle* of May 20th. "P." states, "I shall now rectify two or three of Mr. Wighton's mistakes, that might lead inquirers astray;" and observes I am wrong in saying Bees' eggs are not hatched by incubation, as the warmth of the hive alone brings the larvæ forth from the egg. But, as Bees do not hatch their eggs by incubation, I cannot see how I could express the thing in better words; however, I shall give "P.'s" version of it:—"The warmth of the hive alone does not hatch eggs; nor does the warmth of the Bees hatch eggs that are not set upon." This is beyond my comprehension; but "P." offers to give proof of it, therefore I must "wait a wee;" and notice that I mentioned that queen Bees lived 4 or more years, and common Bees one season. To this "P." replies, "Queens, generally speaking, live four or more years, but never more. Some unprolific ones live but three years and two months." The last part of this sentence appears to me as if "P." got his knowledge of it, as some do their accounts, by a Ready Reckoner. Authors, however, differ respecting the age of the head Bee, and "P." of course does not believe

the old notion that the queen Bee "never dies." May not this exemplify the old saying that "our King never dies?" I may observe that the age of a colony of Bees is a different thing to the life of the head Bee, though they seem by some to have been confounded. The oldest colony I have heard of was that under the leads of "Bees'-college, Oxford," (Corpus Christi is meant); it continued above 100 years. But I think it is doubtful if it were not often replenished by fresh swarms during that period; for Bees readily take possession of tenanted hives or cavities, though the combs they contain be very old. This fact is, of course, against the opinion that Bees' cells soon get coated with wax, or rather a film, from the brood, and become too small to rear strong Bees. For the sake of the reader who may be ignorant of this subject, I ought to state that there is a fresh or young queen left in possession of the hive every time a swarm leaves it, except the first one, which is led off by the old queen a few days before one is hatched, and in general she perishes in what is commonly called a "virgin swarm." I never heard of the quantity of honey obtained from the Cottage Bees just noticed; but I question if it was equal to that got from a hive on Pettigrew's artificial swarming plan, namely, "110 lbs. of run-honey." If this be not a mistake, it would certainly require "P.'s" large-sized hive to hold it. The size of hives being an important thing, I shall give an extract from a letter on the subject, from Dr. Clarkson, of Selkirk, who has kept Bees with success more than 20 years. "My hives are made of straw generally; but I have boxes also which I use occasionally. The straw ones are of the following dimensions: in height 10 inches, and flat at top; in diameter 11½ inches." How very near this comes to the size of the hive recommended by Mr. Payne of Bury, viz., "9 inches deep and 12 in diameter." Both those apiarians advocate the storifying plan, with straw hives, which is the simplest way after all. I question what either would say to "P.'s" statement,—"large hives have Bees in proportion to their size, and are indeed as soon filled as small ones." To me this appears strange indeed, and more so than my own assertion that small hives produce early swarms; also, that I have ample proof that Bees will sometimes throw swarms, whether their hives be full or not. "P." points this out as an incongruity, but I think that those who understand Bees will not see it as such. I have now only to notice "P.'s" artificial ways of making swarms. It is sufficient to say, that he professes to take the Queen and part of the Bees from an old stock, and put them into an empty hive; the headless Bees will create another Queen, and both colonies will go on prosperously, and more so than if left to swarm in their natural way. This may appear very well to those who are ignorant of the subject; but those who are otherwise must see that the thing is hardly practicable with safety to the Bees; but even if it were so, there is little necessity for such schemes, for Bees are prone to swarm; indeed this propensity acts against keeping them, especially on the depriving plan; for, how galling it is to have the number of Bees reduced, instead of having a box or bell glass of honey. This will happen in spite of ventilation plans. I must now leave it to the candid reader to decide whether my statements or "Pettigrew's" are the most likely "to lead the inquirer astray."—*J. Wighton.*

Roses.—One would have thought that, after the passing over of the Roses in your first notice of the last exhibition, it would have quite satisfied the exhibitors that the plants were, as a very good judge said, mere "make-shifts." This was apparent to any one of cool judgment; surely half-standards or quarter-standards, some with large, some with worked, and some with small stems, did not deserve or obtain much admiration. I, for one, thought that your omitting to notice them was intentional and admired your tact accordingly. I hope another time they will put in a better appearance and merit some praise. Allow me, now, to ask any one really a judge, if there was a single good specimen there? I have seen tea-scented Roses in large pots, from two to three feet high, covered with their large and fragrant flowers. Some approach to this I hoped to see at the last exhibition; instead of which, in one place were Roses on stems, the latter clumsy and ugly; in another, some plants, not by any means large, on their own roots, with from two to four blooms and buds on a plant, but not one specimen approaching even to perfection. I am a Rose grower, and yet not ashamed, as Mr. Beck says I ought to be; for, in common with many other growers, I generally pot standards and half-standards for forcing. Now, these give abundance of flowers and cuttings, but I should have been really ashamed if I had sent them for exhibition. I am inclined to think, however, that it will not be good policy in the large Rose-growers to exhibit plants in pots. For this purpose plants must have age, and consequently they must be established sorts. Nurserymen should show their customers the new sorts, and leave them to exhibit fine plants of the old ones. By reason of not being able to show the new Roses so readily as they have hitherto, I for one shall much regret when the Society ceases to admit cut blooms, for in that manner only can new Roses be exhibited.—*J. L. Y., a Rose Grower.*—[We must observe again, that the omission of the Roses in our first report was entirely accidental.]

Garden Frames.—I see you request me (in your Notices to Correspondents) to give you some further information respecting my communication inserted in your Paper at p. 211, on the subject of Garden Frames; and as I am ever ready to give to the cottager all the information which lays in my power, I send you as good a description as I can. In the first place, the soil is removed to a sufficient depth to allow of the top of the flues being on a level with the garden. The outside walls are then

built; afterwards the flues are built with bricks on edge, running about six inches from the front wall, and returning about the same distance from the back wall. After the flues are covered, the whole is chambered over with rough flags, resting on rough stones, a few inches above the flues, with the same inclination as the lights. The soil is then laid on the flags. The fireplace is built rather lower than the bottom of the flues; and the front may either be made straight with the front wall, or be put at the end, and covered very thick with stones and clay, to prevent the heat from escaping; or a light may be put over it, with a partition between it and the rest of the frame, as it will be too hot unless a loose brick be kept in the front and back walls, which may be taken out to cause a current of cold air to pass through the chamber. The fireplace is fitted up with a front, having an ordinary iron-door at the top and another beneath, with a ventilator for the ash-pit; and will only need attending to morning and evening, if the faces of the doors and frame are nicely ground or filed so as to fit each other exactly, and a dead plate three or four inches broad be placed between the grate and frame. A frame constructed on the above plan costs a mere trifle in fuel with us, as we can get the best coals delivered at 3½d. per cwt.; or we can get coke, which comes in fully as cheap and does not make so much smoke. I have a common brown ware bottle, which holds from two to three gallons, walled in by the side of my fire, with a tap to come to the outside of the wall; so that I have constantly hot water to mix with the water with which I water my frame. Any further information will be willingly given by—*A Cottager's Friend*.

Bees.—Will you allow me through the medium of the *Gardeners' Chronicle* to inform one of your correspondents, Mr. Devouport, that a pamphlet will be shortly published by Mr. R. Tyas, of No. 8, Paternoster Row, descriptive of the "bar and frame hive," invented by myself, a slight sketch of which appeared in the *Chronicle* of last May. You will thus relieve your correspondent "E. M. W." from the necessity of sending a lettered description of the "bar and frame hive," and much oblige *W. Augustus Munn*.

Bees.—Having seen a query in the *Gardeners' Chronicle* for May 20 respecting the early swarming of Bees this year, I beg to say that I bought a swarm on the 2d May, the weather being cool at the time. Would the writer of the article signed "A. Pettigrew, Wrotham Park," be kind enough to give the dimensions of the hives he recommends, and also state how he manages to take away two-thirds of the Bees with the queen, leaving the other third? I should also be glad to be informed what plan is to be pursued in one of Nutt's Bee-boxes, in which the Bees have been at work nearly three years, and the comb in the middle box is become very dark and thick. Is it recommended ever to remove it, or to change the queen, as hinted in the above-mentioned article? I find in our immediate neighbourhood, that one swarm was taken on the 29th April, and another on the 1st May.—*A Lady, Westbury, Wilts.*—I had a very strong healthy swarm of Bees sent to me on the 1st May last, which are doing very well, and I consider them an unusually strong swarm. I was also staying at a friend's in Nottinghamshire on the 3d May, and saw a hive preparing to swarm, and also heard a report of a swarm at Tisbury, about eight miles from here, as early as the 3d week in April.—*R. P. H., Ledbury.*

Guano.—The great object in the use of Guano seems to be to apply water to it shortly after it is employed. If it were mixed with a small proportion of some salt, having a tendency to deliquesce, or to attract moisture from the atmosphere, might it not be useful? such, perhaps, as Nitrate of Soda. Possibly a small quantity of common salt, or a portion of well-rotted dung, say 10 lbs. to 1 cwt. of Guano; or possibly a similar proportion of cow-dung would answer the purpose.—*J. Florus.*

Thawing Plants.—At p. 318, "J. M." admits the soundness of my argument, but seems to doubt my practice. All I can say is, that I have adopted it, and found it quite equal to my expectations; and I would also state, that I am deeply impressed with the utility of looking at Nature's laws for instruction, and would direct "J. M." to the same source instead of "submitting implicitly to my better judgment," which will be the more sensible course to pursue, because he will find his faith strengthened and his judgment improved. Suppose I were to tell him that sand had an affinity for the sun's rays—that heat is communicated by it to matter in contact with it—and rendered soluble for plants; and if in excess, nutritious, "J. M." would not believe it, because he did not see everything going on, though it is perfectly consistent with Nature's general laws. Surely "J. M." understands that water thrown upon ice will expand if at a temperature of 40°, and that the abstraction of frost from a plant is regulated by the heat at command. To expect more than this would be to expect impossibilities. The vagueness with which "J. M." expresses himself on my dulness of apprehension will in some degree account for my misunderstanding his remarks on Apricot-trees. But to follow up my previous statement, it is said, that it is a practice with some gardeners to put pans of water under trees on walls to counteract the heat; that is, as they think, to retard the blossom, but how far it has been useful is another question—perhaps "J. M." can decide?—*C.*

Drone Bees.—"A Shropshire Subscriber" may be assured that drones always appear previous to the first swarm, though in smaller numbers than before the after-swarms leave the hive. As to the time of their first appearing, much depends on the condition of the hive and the season, for the old queen that leads off the first swarm

is very cautious, and will not quit in stormy weather. This season the drones appeared in one of my hives 8 days before the swarm came forth. I do not think it is advisable to kill the drones, at least before the Bees begin to slaughter them; and even then it is of little consequence, for they will do it effectually—even the egg-grubs in the drone-cells do not escape their fury. Drones have appeared very early this season. The reason is obvious: the hives are in good condition, by the previous season being favourable for Bees. I think this remark is applicable to "W. R. M.'s" inquiry why his Bees swarmed on the 1st of May—the first I have heard of this season. Since then the weather has been unfavourable. The first swarms, however, will be stronger, and perhaps the after ones weaker, for during the delay more Bees were hatched to increase fresh colonies.—*J. Wighton.*

Hawthorns.—There is a Thorn-tree here full of dark pink (excepting one small tuft of pure white) blossom, on the same branch; the blossom is pink both above and below the white tuft, and no budding or grafting has been practised. Can any reason or cause be assigned for so unusual a circumstance? The land is cold and strong loam, with a clay bottom; the tree is growing about 100 yards from the Mersey.—*T. J.*

Fumigation.—I have tried various experiments for using Tobacco in frames, &c., and the particulars of the method I now adopt may assist your correspondent "Junius." For a 3-light frame used for Cucumbers or Melons—I place a piece of lighted candle, about 4 inches in length, in the mould in front of the bed, and put 3 small flower-pots round the candle, laying on the pots over the candle some wire-work, (the remains of an old garden-sieve,) about a foot square; I then lay on about 1½oz. of strong common Shag Tobacco, not damp, and in about 15 minutes the frame will be well charged with smoke, and the candle may then be removed. I find the above method to answer well, and to be safer than using burning embers amongst plants; it also requires far less trouble for small frames or pits.—*Jas. Drewett.*

—I have tried for some time past a similar plan to that lately given in the *Chronicle*, and have always succeeded. I have rolled the Tobacco in a cotton rag, and have suspended it by a string about 3 feet from the ground, and it has never failed to burn out well, and with good effect.—*J. L. B. J.*

Wrens.—It is a common belief in different parts of the country that a pair of Wrens in one season builds two nests, and only one of them is used. There are various reasons given by schoolboys and others for the Wrens acting in such a manner. Some assert that one of the nests is for the male Wren to sleep in; others that the one nest used for rearing the young is placed in a more exposed situation, to turn the attention from the habitation of the young ones; and persons who attend to birds' nesting give marks how to distinguish between the true nest and the false one before the eggs are laid. They say that in the nest where the family is intended to be reared there are always feathers in the bottom of it; the other nest is without them. Perhaps some of the readers of the *Chronicle* may be able to give some information on the subject, and oblige those who take pleasure in knowing the habits of the feathered tribe.—*Peter Mackenzie.*

The Khât Plant.—A correspondent has favoured us with the following extract from a letter, dated Yaush, in the dominion of Shoa, 29th Nov., 1842. "I have the satisfaction to forward you a few dried sprigs of the Abyssinian plant Khât, pronounced like our English word cart without the 'r' being heard. It comes from the neighbourhood of the town of Mástola Wárian, in Epabsie, and was obtained during my late visit to that place. I have not yet seen the tree to which they belong. I wished when at Mástola Wárian to visit the district where it grows, but I was told that at Mota, whither I was then proceeding, it was found in yet greater plenty, the inhabitants building their houses of the branches, it being in fact the only wood for that purpose. When I got to Mota, where I expected to remain a few days, I was obliged to return at once, unless I wished to lose the escort of a party of merchants across the mountains, where it is unsafe for a single traveller. I therefore postpone my personal inspection of it till I visit Damót, whither I am going as soon as I have despatched the messenger who carries this; and I did so with less reluctance, as I was told the Khât was not yet in blossom, and therefore I should not learn much more of it than I know at present. This plant is what in a former letter I mentioned as being Tea,—I cannot speak positively as to the correctness of the identification, but my impression is in favour of it, from my general recollection of the Tea Plant, and from the resemblance of these leaves to the Camellia sasanqua. Of the Khât, I learn there are two varieties, red and white, distinguished by the colour of the wood and young leaves; and, though I am not quite sure of this, the flower also. It appears to be a shrubby tree. Its size for building purposes need not be very large, as the houses are little more than wattles covered with mud. In Damót I shall make a point of becoming better acquainted with it. The Déjezmach told me that it grew in great quantities at Bútela about a day's journey from Gridera, his capital, and that there also the houses were built of its branches. It is made no other use of except by the Mahomedan merchants, who chew the leaves, and say that they prevent sleep. P.S.—I have just been putting a few of the loose leaves in my mouth, and if they are not Tea there never was anything more like it. Dec. 6th.—I have heard to-day just as I was closing this that the Mahomedan merchants have transported the Khât to the other side of the Obai, and that it now grows in great quantities in the country of the Yedjou Gallas. Still it is not used as an article of

trade." [This plant is not Tea, but the *Catha edulis* of Forskahl, now called *Celastrus edulis*. According to that author it is the Kat or Gat of the Arabs, by whom it is cultivated in Yemen along with Coffee. They eat the green leaves with greediness, believing them to have the power of causing extreme watchfulness, so that a man may stand sentry all night long without drowsiness. They also regard it as an antidote to the plague, and assert that a person wearing a twig of it in his bosom, may go among the infected with impunity; they even believe that the plague cannot appear in places where the tree is cultivated. "Nevertheless," says Forskahl, "the taste of the leaves does not seem to indicate such virtues." Bové found it in the Pasha's garden, cultivated under the name of Kaff. The accompanying woodcut is taken from one of his specimens. "But," says a learned friend, "Bové probably misread the Arabic name of the plant, and hence,

كاف Kâff, for كات Kât (كاف, كات). The leaves gathered when the plant is 3 years old, are sold as Kât mubarreh, or inferior Kât. The following year the young shoots are gathered, and fetch a higher price. They taste like a fresh filbert. The Kât, when quite fresh, is very intoxicating, (Botta, Voyage dans l'Yemen, p. 99); but its ordinary effect is to exhilarate the spirits, to promote good humour and vivacity of mind." We have tried the quality of the infusion in hot water, but are unable to say anything in its favour.]

Bees.—A curious case concerning Bees has come under my observation. On the 9th of March, 1842, an old Abele was blown down from the western side of a hill. It had long been thought that Bees hived in its hollow, and so it proved. The top of the tree, containing a large stock of Bees, (surmounted by a shattered nest and much rubbish) was carefully removed to a neighbouring kitchen-garden, where they worked merrily all the summer, and in July threw off a swarm, which has thriven well. Before winter, the hollow of the tree, above the comb, was well cleaned out and plastered up, and the place of exit and entry which the Bees had made for themselves, through a hole where once had grown a branch, was reduced with mortar and lead plates, and the tree placed in a sheltered place. Till March, the Bees were observed occasionally working about their home, and they seemed pretty strong. Then they were missed suddenly, and on splitting open the tree, no live ones, and hardly a dozen dead bodies were found. There was a great deal of comb—some very ancient, and 10lbs. of honey. Intermixed with this was all manner of dirt, and two owls' eggs, quite surrounded by the comb. These eggs were brought into the neighbouring house, and were not of unpleasant odour at first, but in a short time were extremely offensive, and on being opened, a young owl was found, that once must have been quite ready to peck the shell. A few days after the Bees left their tree, there was observed in the house (in which Bees are known to be in the roof) a very large number of Bees, dead and dying. Now, I would ask the following questions:—Why did the Bees go, and where? Had their departure any connection with dead Bees in the neighbouring house? When were the owls' eggs laid?—by whom hatched, or rather sat upon? Were they kept from decomposition by the comb stopping out outward air?—*Tizy.*

Daphne cneorum.—I beg to inform your correspondent that the most successful way of cultivating the above fragrant hardy Daphne is to plant it in an exposed airy dry situation, in peat and road-sand. If the ground is naturally low and wet, a barrowful of broken tiles, stones, &c. must be put into the hole, and on the top of them

pieces of turf be placed, the grass side downwards. Then put on the compost, chopped fine, but not sifted. Under this treatment every shoot will send out roots and bloom freely.—*J. Rogers.*

Rapidity of Vegetation in India.—When Lieut. Eyre, the author of the interesting account of the Cabul insurrection, left Meerut for Afghanistan, two years ago, he had commenced a Botanical Garden at the Horse Artillery mess-house, and had planted a number of choice trees. On his return lately to his old quarters, he was astonished to find the trees grown so high, that he could sit under their shade at noonday, many of them being 20ft. high.

Agricultural Education.—"Tizy" begs to suggest on the subject on which "M." writes to the Editor of the *Gardeners' Chronicle*, that the schools which have been some time established and are now in full force in the neighbourhood of Eastbourne and East Dean, Sussex, are believed to carry out the combination of agricultural with religious and literary instruction.

Wagtails.—It is pleasant enough at times to notice the situations where birds will take up their abode for a time, to rear their young. The Wagtail will sometimes descend into a crevice in the side of a coal-pit, where persons are ascending and descending daily, and machines working above them. A pair this season built theirs in a heap of coals, but the coals had to be removed, and the nest was shifted from place to place, but the old ones still followed the nest, and reared their young. Some years ago, some of my children brought home a Wagtail's nest, with young ones in it; like the one already noticed, the nest required to be removed, the old birds followed them home, and a shelf was fitted up in a pigsty, which was inhabited by a pig at the time. The nest was placed upon the shelf, and the young ones were brought up by their parents until they were able to fly and shift for themselves, and the children were well pleased that they had saved the young birds from destruction.—*Peter Mackenzie.*

FOREIGN CORRESPONDENCE.

Eboe, Aug. 28, 1841.—The town of Eboe is situated on the left bank of the Niger, and is approached by a narrow stream about a mile in length; it is one of the great marts of African commerce. In the stream we met with many canoes, of all sizes, belonging to tribes from different parts higher up the river. Many of the people live in these canoes upon the water, so that the entrance of the town assumes a very lively appearance. Some of the larger canoes are adorned with flags, having the most grotesque figures of animals, birds, and implements of warfare, worked upon them. During our sojourn at Eboe, several of us paid a visit to the palace of King Obie; in proceeding to which we had to turn out of the main creek into a side one, about two hundred yards long. After walking through mud and water up to our knees for a quarter of a mile, we arrived at the seat of Royalty, which consisted of a quantity of mud-huts huddled together, without the least appearance of order. We were ushered into a square yard, with an open shed on three sides; on the other was the building which contained the sable beauties belonging to the mighty monarch of Eboe. Some of these dark ladies assumed a modesty that might vie with the most accomplished coquette of more civilised countries, by peeping from the entrance of their hut with all the curiosity inherent to the female portion of society, and showing their beautiful white teeth; darting away, however, the instant that they saw our eyes were fixed upon them. Others joined us, bringing little curiosities of their own manufacture in exchange for cotton, needles, rings, &c., which we took with us to barter. The greater part of their garments are of Manchester manufacture, obtained from merchants who trade to the coast; one of the principal ornaments of both sexes consists of large ivory rings, worn round the arms and legs. Some of the men have obtained small bells, which they fasten round the legs, and seem to be highly pleased with the tinkling which they produce in walking. During our stay at the palace, some of the native musicians attended with their instruments, most of which produced a most horrible noise. After quitting the royal residence, and bidding farewell to the ladies of the court, we took a survey of the town, which covers a large extent of land; the huts lie rather distant from each other, and are generally surrounded by a plot of ground, in which Cocoa-nuts, Bananas, Plantains, &c., are grown. The town is intersected by small streams, which at this time were full of water; so that to get from one part to the other, you are obliged to wade up to the middle in mud and water. I was informed, however, that during hot weather these creeks are dried up. As we paraded through the town, a great number of the inhabitants followed us, who were greatly surprised when they saw the effects of our fire-arms upon the small birds. They seemed to fancy that we were possessed with supernatural powers, and afterwards paid us the greatest attention; even carrying a seat about after us, so that we might rest ourselves at our leisure; and the day being showery, they even held mats over us during the rain. Their objects of worship are numerous, nearly each dwelling having its *ge-ge*, or charm; some of these were the rude figure of a man cut out of wood, others are some utensil of common use among the people, or the skulls and bones of birds and beasts; all of which are protected by a small shed erected over them. Among the articles manufactured by the people are the wooden figures of different beasts; but whether they represent any beasts found about that part, or are formed from the imagination, I could not ascertain. I think the estimates of the population of this city, as formed by recent travellers, are far too high; as the huts lie detached, it is a difficult undertaking, during a visit of a few hours only, to give an estimate near the truth. Certainly, a great number of individuals

live in canoes upon the stream, which runs from the town to the Niger; but they are chiefly traders from various parts of the country, so that they cannot well be considered to belong to the population. Polygamy is allowed, and a man is considered rich in proportion to the number of wives which he possesses; though slaves would be a more appropriate term, as the females do all the laborious work—such as cultivating Yams, taking them to market, &c. Upon asking one of the traders to take us to the vessel lying in the river, he evinced as much sagacity in striking a bargain as could be expected from a merchant of Europe; and, as a preface, informed us that he had traded with the white people at Bonny, a place frequented by the Palm-oil merchants. King Obie came on board the Wilberforce twice during the time we were staying in his territories. He appeared to be about 60 years of age, though from the early decay of the African constitution it is probable that he might not be so old. He seemed very proud of forming an acquaintance with the white men. His eldest son is a tall young man, of prepossessing appearance, and apparently about 20 years old; he was persuaded to dine on board during one of his visits, in which he did not deviate from the custom so universal among all the Africans, *i.e.*, of refusing to partake of wine before the person presenting it had previously tasted it. Upon the second visit of Obie to the vessels he brought with him two of his wives, who, by order of the Captain, were each provided with an European dress. This scene was very interesting, as after being clothed they were each provided with a looking-glass; their pantomimics on this occasion were truly ridiculous, as they turned about in every direction—first looking in the glass, and then upon the dress: Obie himself seemed no less pleased than they did. The highest degree of heat observed at this place was 85°; the greatest difference between the wet and dry bulb of the hygrometer was 78° and 83°; the lowest temperature was 76°.—*J. A.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

June 6.—Sir Oswald Mosley, Bart., in the chair. Viscount Howick, M.P., Lord Farnham, C. F. Bamford, Esq., W. Purling, Esq., H. M'Kellar, Esq., and Mr. Glendinning, were elected fellows of the Society. A communication from Captain Hall, Berwick-upon-Tweed, was read, relating to a new vegetable, which it is considered easy to acclimate in the Southern parts of England, and for which the climate of Britain is thought peculiarly suitable. The plant is a variety of some species of *Amaranthus*, possibly *oleraceus*, and is markedly distinguished by the milk white appearance of its stem, branches, and leaf-stalks. As its excellence depends on the succulence and tenderness of its nature, it requires to be grown rapidly, so as to be fit for use at the age of a month or so; and this is effected by a rich light soil, abundance of moisture, and a high temperature; the latter may be carried occasionally as high as 90° in the day, and regulated at from 70° to 75° at night. It is rather impatient of much light. In India, it is grown to the greatest perfection during the rainy season, towards the end of June. A common melon frame is recommended to grow it in; and the plants grow from a foot to a foot and a half high. The seeds should be sown in rather shallow rich earth, and the part of the fermenting materials beneath the soil should be in a partially decomposed state, that the roots may penetrate into them. The plants may be pricked out when young at six inches apart, and require a slight shading in bright weather. The early part of the year is preferred for growing it. It is used as a vegetable in two ways. 1st, The leaves are plucked, and dressed like Spinach, when they are considered not inferior to those of any similar plant. 2nd, The stems and side branches, being the white parts of the plant, are separated from each other, cut into proper lengths, boiled, and placed on toast, like Asparagus, and eaten with meat, either with butter, sauce, or gravy. They are very like Asparagus or Sea-kale. Messrs. Loddiges obtained the Knightian medal for specimens of *Cirrhopetalum Cumingii* and *Cypripedium barbatum*, two elegant and rare Orchidaceous plants. The former has flat feathery heads of rich purplish crimson blossoms, which have each an oscillating labellum; and the latter has prettily striped flowers, with little warty substances topped by hairs which surround the sepals and petals. A Knightian medal was also given to Mr. Low, of Clifton, for cut flowers of *Hydrangea japonica*, this being the first time any of the numerous species existing in that part of the world have been flowered in Britain. The flowers, which are pinkish, have a long stalk, and are radiating at the circumference. It is likely to prove quite a rarity, and an interesting shrub. *Claytonia pulchella*, from the Swan River, Colony, and a more singular than beautiful, was also from Mr. Low. To Mr. Brazier, gr. to W. H. Storey, Esq., a Banksian medal was adjudged for a seedling variety of *Erica verticillata*, called *grandiflora alba*; with which there was a collection of seedlings from the same species, a number of beautiful plants, varieties of *E. ventricosa*, with *E. Cavendishiana*, and a lovely specimen of *E. perspicua nana*. A certificate was awarded to Messrs. Chandler and Sons, of Vauxhall, for a *Verbena*, named *atrosanguinea*, of a bold strong habit, and with large dark scarlet flowers; with another for *Lilium eximium*, a noble white-flowered species, well bloomed in a pot. Messrs. Chandler sent besides some flowers of seedling *Pelargoniums*, and a seedling *Papaver*, between bracteatum and orientale, with handsome flowers. Mr. Errington, gr. to Sir P. G. Egerton, Bart., obtained a certificate for a cut specimen of the charming *Aerides crispum*, which bears long branching racemes of whitish blossoms, with a crimson lip, and a fragrance equal to that of *A. odoratum*. With this, there were cut flowers of *Dendrobium calceolaria*, a variety of *Cattleya Mossiae*, *Maxillaria tenuifolia*, richly mottled, and a plant of the graceful *Oncidium flexuosum*. From G. Sandeman, Esq., of Highbury, there were two unusually close and fine specimens of *Diosma cricoides*, which commonly grows in a rambling manner. These received a certificate. A yellow-flowered new species of *Sempervivum*, like *S. arboreum*, was sent by Mr. Young, of the Milford Nursery, Godalming. C. B. Warner, Esq., sent a fine plant of *Cattleya Mossiae*, with thirteen flowers, and a good specimen of the beautiful *Saccolabium guttatum*; the flowers of both were ruined by the negligence of the Railway people. From Mr. Rivers, of Sawbridgeworth, there was a collection of *Azaleas* and *Rhododendrons*, among which a large variety of *R. maximum*, with very numerous and dark spottings, was most noticeable. Some good Royal George Peaches and Elruge Nectarines were communicated by Mr. Henderson, gr. to Sir G. Beaumont, Bart., and a basket of fine Black Hamburg Grapes, each bunch weighing from 1½ to 2 lbs., by Mr. Atlee, gr. to H. Beaufoy, Esq., South Lambeth. The plants from the gardens of the Society were *Oncidium flexuosum*, *Wentworthianum*, and *leucochilum*, *Epidendrum radiatum*, specimens of the interesting little *Echeveria secunda*, a very fine *Campanula grandis*, the elegant *Pernettia angustifolia*, the sweet-scented *Aquilegia fragrans*, *Begonia Dregii*, dwarf and pretty, *Manettia cordifolia*, and *Pelargonium tricolor* in a handsome state, *Gloxinia caulescens*, and a curious Orchidaceous plant, *Serapias longipetala*. C. B. Warner, Esq., exhibited an ornamental wire basket, made of iron, and coated with zinc by the electro process.

The object is to avoid paint, which soon peels off in hothouses and to prevent rust. The cost of zincing is said to be about equal to four coats of paint. Specimens of the Horn Slug, of which a notice will be found in another page, were shown to the meeting. It was stated that the next meeting of this Society would be held on the 4th of July.

June 1.—Mr. E. Solly in his concluding lecture commenced by adverting to the facility with which nitrogen in the nascent state combines with hydrogen to form ammonia. This was shown by decomposing Nitric acid by tin, when an oxide of tin was formed and the nascent nitrogen combined immediately with hydrogen to form ammonia; the absorbent power of various substances in relation to ammonia was also shown, and especially of charcoal, road-scrappings, water, and oxide of iron. The production of nitrates by the combination of nitrogen, and oxygen in the presence of bases, nitrate of potash near putrifying matter, and nitrate of lime in mortar, was explained. Mr. Solly next proceeded to consider the nature of humus and humic acid. He professed his reception of the doctrine of the English school, and adopted by Liebig, that the true office of humus is to furnish carbonic acid by combining with oxygen; humic acid, he observed, does not exist of itself in the soil, but is an artificial product obtained by the action of alkalies on humus; he did not consider that there was any good reason for saying that humic acid has anything to do with the nutrition of plants. From this he passed to the consideration of the mechanical texture of soils, and here stated that he had found the capacity of retaining moisture in a soil singularly increased by the addition of murate of lime, in very minute quantities. After showing that all plants contain ammonia, and producing it from the Potato, he proceeded to the consideration of its organic matter, and observed that the value of a plant for food was not to be judged of by the quantity of its solid organic contents; for Horse Radish contains 29.45; while the Kidney Bean contains 10.00; it was the azotised substances alone which, are directly assimilated by animals. In speaking of electricity, he stated that his remarks led him to believe that the vital actions of plants and electrical forces were intimately connected; that the latter would probably be one day found of great importance in agriculture, and that they probably assisted in a high degree in maintaining the electrical equilibrium of the atmosphere. In speaking of the food of plants phosphoric acid was particularly alluded to, and the reasonable expectation that the compounds of phosphorus would prove of more service as manures than any other substances. In conclusion, he directed attention to the important office executed by plants as purifiers of the atmosphere, not merely by absorbing carbonic acid and extricating oxygen, but by decomposing poisonous miasmata, and he mentioned a case where a Bean had retained its health in an atmosphere containing so large a proportion as 1/100 of sulphuretted hydrogen. The innocence of this gaseous compound had already been indicated by the luxuriant vegetation described by Humboldt as surrounding the fetid lakes of South America, and was now, by this and other experiments, placed beyond all doubt.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A WEEKLY Council was held at the Society's House, Hanover-square, on the 31st of May, Thomas Raymond Barker, Esq., in the chair. G. R. Smith, Esq., of Great Cumberland Place, London, and Seisdon, near Croydon, Surrey, was elected a Governor, and 34 gentlemen Members of the Society. Mr. Read attended the Council for the purpose of explaining the construction and adaptation of his pipe-tiles, and of laying before the meeting the following letter on the same subject, addressed to him by Mr. T. Hammond, of Penshurst, in Kent:—"As you wish to be informed of the expenses of draining with cylindrical tiles, and my opinion of their effects, I have troubled you with this letter. Porous soils, the drains 3 feet deep, placed at the distance of two rods in parallel lines up the field, and afterwards subsoil-ploughed, will be completely drained at the following expense per acre:—

1350 tiles, at 21s. per thousand	£1	8s.	6d.
Cutting drains, and laying the tiles, at 4d. per rod	1	6	8

I have not included the expense of fetching the tiles, as that depends on the distance; but they are made so light that we can carry off 7,000 with a single waggon. I am at this time draining on a stiff clay soil, the drains 2 feet deep, with 24 feet between the drains; expense as follows:—

1850 tiles, at 21s. per thousand	£1	16s.	9d.
Cutting drains, and laying tiles, at 3d. per rod	1	7	6

I have this last winter drained about 10 acres with the round tiles, and am quite satisfied they act better than any others yet made, as they are not liable to be disturbed by moles, or any other vermin (which the other sort admit), and can be laid with greater nicety in the drains than tiles of any other shape. I have now had 20 years' experience of the effects of draining, and am quite satisfied that no expenditure on the land will make so good a return. The soil being, by its means, relieved of stagnant water to the depth of 3 feet, immediately admits the atmosphere into its pores, and accordingly what was before *inert* at once becomes *active* soil; allowing the roots of plants to penetrate it, and the rain, which was previously injurious, to pass through the soil into the drains with beneficial effect. I am opinion that the size of the tile may be still further reduced, with an equally good result, so as to reduce the cost of making and carriage 15 per cent. below the price of those I have already sent you, which were made by order for me, being smaller than any the manufacturers had made before."

An interesting communication was read on bone-dust applied as a manure on different kinds of soil and compared with guano, with indications of considerable practical improvements in the use and more economical expenditure of bones. The further consideration of this paper was deferred until a more exact detail of the facts from which the results were derived had been obtained from the writer. Messrs. T. Gibbs and Co. presented fresh specimens of Comfrey, Bokhara Clover, and Siberian Cow Parsnip, for soiling cattle; and of the Winter and Chevalier Barley, coming into ear. Mr. H. Gibbs stated, that since the Winter Barley had come into ear he had found that it had purged the horses very much, and wish to know whether any Member of the Council had witnessed similar effects from it; he added, that the horses had been fed regularly with it, but while only in the blade no such effect had appeared. Professor Sewell undertook to try such effect had appeared. Professor Sewell undertook to try some of the horses under his care with similar green Barley which Mr. Gibbs would supply. The Siberian Cow Parsnip produced an immense crop of green food, and the cows appeared to take it readily. Professor Sewell reported that he had with great pleasure sent direct replies to all the Members of the Society whose cases of epidemic among their stock had been referred to him by the Council. He regretted that the nature of the present form of the disorder was such as to preclude the possibility of the predominant symptoms at any given stage of the complaint being the only guide to a safe administration of remedies, a general prescription of great benefit in one case perhaps proving fatal in another, according to the peculiar condition of the animal and the nature of the attack. He was, however, happy to state that pupils of the Veterinary College, well grounded in the knowledge of the diseases of cattle, as well as in those of the horse, were now sent out duly qualified, not only to almost every district in the kingdom, but to Australia, Egypt, and South America, as well as to Berlin and other parts of Germany, where a similar disorder prevailed among the cattle. He had visited the continental establishments for veterinary instruction, but he gave a decided preference to the school-practice of our own country. Mr. Shaw gave notice that he should move, at the next Monthly Council, on the 7th of June, "that a sum be subscribed from the funds of the Society in aid of the funds of the Cowfold Agricultural

Society in Sussex." Mr. Smart, of Rainham, presented a model of his Turnwest plough; Mr. Lukis, a sample of fresh Guernsey butter (churned in that island on the 19th of May, from cream poured off from milk which had been allowed to sour), the price in Guernsey market being a shilling per pound of 15 ounces, and the butter thus made having the advantage of retaining its freshness for a longer time than ordinary butter.

LENNYAN SOCIETY.

June 6.—Edward Forster, Esq., in the chair. T. Turner, Esq., and J. Tullock, Esq., were elected Fellows of the Society. A pair of live Cameleons were exhibited by Dr. J. Brown. A paper was read on the Ophiuridae, a family of Star-fishes, from Prof. Edward Forbes. A paper was read from George Gardner, Esq., on a new genus of plants called Pentaphyllum. This genus was made by Mr. Gardner for a little plant which he found on the Organ Mountains, and which is allied in many of its characters to the genus Triuris, which had been found in the same district by Mr. Miers. It differs from Triuris in its perigonium, having six lobes instead of three. The author had only obtained female specimens at present. Mr. Miers had referred his Triuris to the orders Juncaginaceae or Fluviales; but the author placed that genus and Pentaphyllum near Smilacaceae, and proposed to form the two genera into a new order, Triuraceae. He considered that this order would hold the same relation to Lindley's division of Dictyogens that Menispermaceae did to the division Homogens of the same author.

AGRI-HORTICULTURAL SOCIETY OF INDIA.

April 17.—On this occasion a letter was read which had been addressed to the Government by the President of the Society, pointing out the great loss that would be sustained by the Society by the withdrawal of the privilege of free postage, which was formerly allowed. The reply from Government to this letter was also read, and contained a laconic refusal of the request. Another Government letter was read containing an extract from a recent despatch of the Court of Directors, in which the usefulness of the Society is favourably noticed, and a promise made of future assistance, with regard to the transmission of seeds to the Society from England. A communication was read, containing favourable accounts of the prosperous condition of the Lucknow Garden. The report of the Cattle Committee on the expediency of discontinuing the premiums hitherto granted by the Society for improving the breed of Cattle was read to the Society. The Committee were of opinion that these premiums should not continue, on the ground that the results were not sufficiently important to render such outlay necessary. They further suggested that a year hence would be the best time for withdrawing such premiums, as the Society's existing engagements extend to that time. The report drew the attention of the Members to another subject of importance; namely, granting premiums for improving the wool produced in this country. The subject was referred back to the Committee for them to furnish a schedule and scale of the premiums they propose, together with the different qualities of wool for which competition ought to be encouraged. The second meeting of the Fruit and Kitchen Garden Committee having been held, the result of their proceedings was brought forward for consideration. This was a schedule enumerating the fruits for which premiums are proposed to be held out, the amount and distribution of those premiums and other details to carry out the proposed object, which was referred to the Finance Committee's Report. The following Prospectus of the Calcutta Horticultural Society was distributed:—The exertions of the Horticultural Society having now fully established the vegetables of Europe in India, affords opportunity to cultivate the less useful but more engaging portion of vegetable production—Flowers. Of those perhaps few more beautiful can be found than what are indigenous to this country; yet a familiarity with them has still to be developed, some being yet unknown beyond their native woods or natural jungles, and others merely found cultivated amongst a few private persons, who have been at the pains to transplant them to their own gardens, where in too many instances they have flourished for a year or two, and then, in the frequent changes of society, between station and station, have fallen into the hands of new possessors, and been lost or neglected. Again, how numberless are the natural beauties of Europe and other parts of the world which might be made to flourish in an Indian soil; some of them bringing to the mind recollections of the homestead of youth, and the goal of hopes long cherished; others gorgeous in beauty, and fitted to adorn even a paradise. Individual exertion alone, it can hardly be expected, should effect these objects, however desirable it must be acknowledged they are; it is combination that must accomplish them; and however it may, at a first glance, appear within the province of the Agricultural and Horticultural Society to direct attention to the attainment also of horticultural excellence, a short reflection will, it is conceived, convince that it may be more successfully accomplished by other means. As a society for the improvement of Agriculture, this institution has higher, and nobler, and more important objects, requiring all its energies, and more than all its present means, to accomplish; these, therefore, must tend, as indeed they ought, to divert attention from what, however it may serve to refine the taste and recreate the mind, is after all of little use to the community at large. But what appears perhaps the stronger and more obvious grounds for seeking to establish a separate society for the improvement of our Flower Gardens is, that in this country above most others, men are so occupied in professional and other pursuits, that they have little leisure to spare for the ornamental; independently of which, the cultivation of flowers, from their natural affinity in beauty, and delicacy is more peculiarly the province of the fairer portion of the creation. As a mere branch of the Agri-Horticultural Society the active co-operation of the ladies, therefore, would be wanting; whilst, in a separate society, there is little doubt that they would, on the contrary, take a leading part. The objects to be sought by such a Society would be the importation of flower-seeds, bulbs, &c. from Europe; the interchange of plants, seeds, &c. among various parts of India; and eventually the establishment, as the funds increased, of a nursery, for the purpose of raising plants and seeds for distribution, in greater abundance and more economically than could be done from importation. Meetings shall be held monthly at fixed days in each month, at which any paper shall be read that may appear interesting, and the general business of the Society shall be transacted. Shows of flowers shall take place twice in the year, the management of these to be under the special care of the ladies' Committee, at which premiums and medals shall be given. An annual volume shall be published of such papers as may be selected, as containing peculiar interest, and Ladies shall be invited to contribute, for its decoration, drawings of favourite flowers to be lithographed. Ladies of members to be considered members of the Society, without any additional subscription; their attendance shall be particularly requested at the meetings of the Society, and their assistance solicited in carrying out its objects. All members shall be entitled to a share of the seeds, bulbs, or plants imported by or presented to the Society, also to a copy of the annual volume of Transactions, and when the nursery shall be established to a share of the plants, &c. distributable therefrom.—*Planter's Journal*.

COUNTRY SHOWS.

Aberdeenshire Horticultural Society, May 10.—The first competition for the season took place in the Banqueting Hall of the County Rooms. The attendance was very numerous and fashionable; and the show, whether we regard the beauty or the great number of specimens presented for competition, was fully equal to that of any other. The whole arrangements of the Committee gave the most satisfaction to the visitors, and a most efficient band was in attendance, which added much to the pleasure of the scene. The prizes were awarded as follows:—*Seedling Auriculas*, 1, to T. Milne, Sunnyside; 2, C. Runcy, Esq., of Millbank. *Stage Auriculas*, 1 and 2, D. Cairns, gr. Glenbervie; 3, T. Milne, Sunnyside; 4, D. Cairns. *Seedling Polyanthus*, 1, 2, and 3, T. Milne. *Stage Polyanthus*, 1 and 2, T. Milne; 3, C. Runcy, Esq. *Hyacinths*, 1 and 2, A. Mackie, gr. Arbuthnot; 3, A. Forbes, Esq., Kingsland Place. *Anemones*, 1 and 2, N. Glennie, gr. Pinray. *Stems*, 1 and 2, J. Mayer, gr. Ferryhill; 3, F. Deans, gr. Union Grove. *Forced Strawberries*, 1 and 2, R. Donald, gr. Woodside. *Asparagus*, 1 and 2, N. Glennie; 3, A. Mackie, Arbuthnot. *Broccoli*, (white), 1, W. Davidson, gr. Lunatic Asylum; 2, T. Robertson, gr. Hardgate. *Broccoli*, (other sorts), 1, W. Aitchison, gr. Huntly Lodge; 2, W. Davidson; 3, W. Aitchison. *Sea-Kale*, 1, W. Barron, gr. Crathes; 2, J. Wood, gr. Logie; 3, N. Glennie. *Leeks*, 1, F. Deans; 2, G. Rae, gr. Banner Mill; 3, F. Deans; 4, G. Anderson, gr. Gooseberrybank. *Rhubarb*, 1, A. Mackie; 2, J. Roy, jun., gr. Aberdeen; 3, A. Mackie. *Potatoes*, 1, J. Wood; 2, R. Farquhar; 3, J. Wood. *Greenhouse Plants*, 1, T. Darling, gr. to Lady Grant, Woodhill; 2, W. Joss, gr. Banchoy House. *Greenhouse Plants*, 1, R. Farquhar; 2, G. Cardno, gr. Cornhill; 3, W. Gallow, gr. Scotstown. *Best Ornamental Border Flower*, J. Mathewson, gr. Links. An Extra Prize was awarded to C. Runcy, Esq., for a superb specimen of *Echeveria gibbiflora*, in full flower.—*Aberdeen Journal*.

side; 4, D. Cairns. *Seedling Polyanthus*, 1, 2, and 3, T. Milne. *Stage Polyanthus*, 1 and 2, T. Milne; 3, C. Runcy, Esq. *Hyacinths*, 1 and 2, A. Mackie, gr. Arbuthnot; 3, A. Forbes, Esq., Kingsland Place. *Anemones*, 1 and 2, N. Glennie, gr. Pinray. *Stems*, 1 and 2, J. Mayer, gr. Ferryhill; 3, F. Deans, gr. Union Grove. *Forced Strawberries*, 1 and 2, R. Donald, gr. Woodside. *Asparagus*, 1 and 2, N. Glennie; 3, A. Mackie, Arbuthnot. *Broccoli*, (white), 1, W. Davidson, gr. Lunatic Asylum; 2, T. Robertson, gr. Hardgate. *Broccoli*, (other sorts), 1, W. Aitchison, gr. Huntly Lodge; 2, W. Davidson; 3, W. Aitchison. *Sea-Kale*, 1, W. Barron, gr. Crathes; 2, J. Wood, gr. Logie; 3, N. Glennie. *Leeks*, 1, F. Deans; 2, G. Rae, gr. Banner Mill; 3, F. Deans; 4, G. Anderson, gr. Gooseberrybank. *Rhubarb*, 1, A. Mackie; 2, J. Roy, jun., gr. Aberdeen; 3, A. Mackie. *Potatoes*, 1, J. Wood; 2, R. Farquhar; 3, J. Wood. *Greenhouse Plants*, 1, T. Darling, gr. to Lady Grant, Woodhill; 2, W. Joss, gr. Banchoy House. *Greenhouse Plants*, 1, R. Farquhar; 2, G. Cardno, gr. Cornhill; 3, W. Gallow, gr. Scotstown. *Best Ornamental Border Flower*, J. Mathewson, gr. Links. An Extra Prize was awarded to C. Runcy, Esq., for a superb specimen of *Echeveria gibbiflora*, in full flower.—*Aberdeen Journal*.

Bath Royal Horticultural Society, May 19.—The second exhibition for the season of this Society took place in Sydney Gardens. The weather proved dry and favourable. The company was numerous and fashionable, falling little short of 2,000, and the appearance of the Gardens, some of the paths being newly gravelled, more cheerful than on some former occasions. The brass band of the North Somerset Yeomanry Cavalry, dressed in their uniform, were in attendance; and their spirited performances contributed largely to the enjoyments of the day. The supply of plants and flowers from numerous amateur and professional cultivators was on a very liberal scale, and in their combined arrangement presented a highly-gratifying spectacle. The Grand Octagon Rustic Pavilion was profusely filled with flowers. The central stand was principally occupied by ornamental baskets, got up with much ingenuity and taste. One of immense magnitude was sent by Mr. Shaw, containing a large variety of choice and beautiful plants; another was supplied by Miss Bayly, comprising a fine collection, splendidly varied; and a third, from J. M. Yeeles, Esq., was not less worthy of notice. Mr. Yeeles had also an excellent collection of hardy plants on this stand. A handsome basket, comprising fine Calceolarias, Roses, Pelargoniums, &c., contributed by Miss Todd, likewise attracted great attention. This stand was also graced with baskets of Pelargoniums, one by Y. Sturge, Esq., and another from Mr. Gready. Among the single specimens was a magnificent plant of *Rhododendron*, in full bloom. It belonged to Mr. Salter. The side-stands of the Octagon Tent were variously ornamented. The exhibitors were General Andrews, J. M. Yeeles, Esq., and Mr. Shaw. A noble specimen of the *Doryanthus excelsa*, a New Holland plant in full bloom, was sent by J. Jarrett, Esq. Another object worthy of notice was a fine Coffee-tree, exhibited by Mr. Bennett, standing ten feet high, and bearing clusters of fruit of considerable size. The following is a list of the prizes awarded:—**Flowers' Flowers and Cut Flowers**.—*Tulips*, best 9, different names, 1, Mr. Martin; 2, Mr. Cole; 3, Mr. Sealey. *Anemones*, best 24 blooms, different names, Mr. Kitley. *Pansies*, best 24 varieties, 1, Mr. Bryant; 2, A. J. Maule, Esq. *Ornamental Collection of Cut Flowers*, 1, Mr. Wheeler; 2, Mr. E. Carpenter. *Collection of Cut Flowers*, 1 and 2, J. M. Yeeles, Esq. *Tulips*, single specimens, Byblomen, Miss Bayly; *Rose*, R. Godfrey, Esq.; *Bizarre*, R. Godfrey, Esq. *Best 6 different names*, 1, Miss Bayly; 2, Mr. Rogers. *Anemones*, 1, A. Lawrence, Esq.; 2, Miss Bayly. *Ranunculuses* (Turban of any sort, best 18), 1, Mr. Gerrish; 2, Mr. H. Simson. *Pansies*, best 18 varieties, 1, J. M. Yeeles, Esq.; 2, Mr. Salter. *Best 12*, 1, Mr. Salter; 2, Miss Bayly. *Brompton Stocks*, best 4 flowers, 2 red and 2 white, Rev. C. Paul. *Collection of Cut Flowers*, 1, T. Emerson, Esq.; 2, Mr. Pyatt; 3, Mr. G. Shaw. **Plant Prizes for Tulips**, 1, Miss Bayly; 2, Mr. Lockstone. **FLOWERING PLANTS IN POTS, NURSEYMEN**.—*Stone Plants*, best 6, Mr. Salter. *Greenhouse Plants*, best 9, 1, Mr. Salter; 2, Mr. Drummond. *Cape Ericas*, 1 and 2, Mr. Salter. *Pelargoniums*, 1, Mr. Gready; 2, Mr. E. Carpenter. *Calceolarias*, Shrubby or half Shrubby, best 6, 1, Mr. Wheeler; *Herbaceous*, 1, Mr. Salter. *Hardy Plants*, best 8 varieties, 1, Mr. Salter. *American Plants*, best 4, 1, Mr. Salter; 2, Mr. Wheeler. *Fuchsias*, best 6 varieties, 1, Mr. Salter. *Roses*, best 20 varieties, 1, Mr. Salter; 2, Mr. E. Carpenter. *Cinerarias*, best 6 varieties, 1, Mr. E. Carpenter; 2, Mr. Salter. *Ornamental Basket of Plants*, 1, Mr. Salter; 2, Mr. E. Carpenter; 3, Mr. Lidiard. **AMATEURS**.—*Orchidaceous Plants*, best 3, 1, J. Jarrett, Esq.; single specimen, 1, J. Jarrett, Esq. *Stone Plants*, best 5, 1, J. Jarrett, Esq.; single specimen, 1, J. Jarrett, Esq.; 2, Mr. Bennett. *Greenhouse Plants*, best 6, 1, J. M. Yeeles, Esq.; 2, J. Jarrett, Esq.; best 4, 1, J. M. Yeeles, Esq.; 2, G. C. Tugwell, Esq.; single specimen, 1, J. Jarrett, Esq. *Cape Ericas*, best 4, different varieties, 1, G. C. Tugwell, Esq.; 2, J. M. Yeeles, Esq.; best 2, 1, J. M. Yeeles, Esq. *Pelargoniums*, single specimens, Light, 1, Dr. Kay; 2, J. M. Yeeles, Esq.; *Rose*, 1, J. M. Yeeles, Esq.; 2, Dr. Kay; Red, 1 and 2, J. M. Yeeles, Esq.; Dark, or Mottled, 1, J. Jarrett, Esq.; best 12, 1, Dr. Kay; 2, G. C. Tugwell, Esq. *Calceolarias*, Shrubby or Half-Shrubby, 1, J. M. Yeeles, Esq.; *Herbaceous*, 1, J. Jarrett, Esq. *Hardy Plants*, best 4, 1, J. M. Yeeles, Esq. *American Plant*, best specimen, 1, J. M. Yeeles, Esq. *Amargyllis*, best 3, 1, Mr. G. Shaw. *Cape Bulbs*, best collection, 1, Mr. G. Shaw. *Cinerarias*, best 4, 1, J. Jarrett, Esq. *Roses*, best collection, 1, Miss Bayly. *Ornamental Basket of Plants*, 1, J. M. Yeeles, Esq.; 2, Miss Bayly; 3, Mr. G. Shaw. **MR. G. SHAW'S PRIZE FOR PELARGONIUMS**.—Best collection, 9, different names, Mr. Carpenter; 2, Mr. Shaw; 3, Mr. Walters. **FRUIT**.—*Pineapples* (Queen), 1, Mr. Murray, gr. to the Marquis of Bath; (Black, of any sort) 1, Mr. Spencer, gr. to the Marquis of Lansdowne. *Grapes* (Black), 1, Mr. Spencer; (White) 1, Mr. Spencer. *Melons*, 1, J. Jarrett, Esq. *Figs*, 1, Miss Whitehead. *Strawberries*, 1, G. Yeeles, Esq.; 2, Mr. Lidiard; 3, Mr. Murray. *Cherries*, 1, Mr. Kitley. **VEGETABLES**.—*Best Collection of Green Peas*, *Cauliflowers*, *Potatoes*, and *Cabbage*, 1, Mr. Lidiard. *Best Collection of Kidney Beans*, *Asparagus*, *Cucumbers*, and *Lettuces*, 1, Mr. Lidiard; 2, G. C. Tugwell, Esq.; 3, Mr. Pyatt. *Salad*, 1, Mr. Cooke; 2, Mr. Cooper. **COTTAGERS' PRIZES**.—(For Cottagers residing within four miles of the Guildhall, Bath).—*Cabbages*, 1, J. Drewett; 2, P. Fisher. *Potatoes*, 1, J. Drewett; 2, P. Fisher. *Lettuces*, 1 and 2, J. Drewett. *Apples*, 1, J. Drewett. *Nosegay*, 1, J. Drewett. (For Cottagers residing beyond four miles)—*Cabbages*, 1, J. Chivers; 2, J. Webb. *Lettuces*, 1 and 2, J. Webb. *Apples*, 1, J. Webb. *Nosegay*, 1, J. Chivers. **EXTRA PRIZES**.—*Collection of Cut Flowers*, Mr. Salter. *British Plants* (given by Dr. Kay), Mr. Kitley. *Seedling Pansy*, Mr. Kitley. *Seedling Pansies*, T. Emerson, Esq. *Seedling Pansies*, J. M. Yeeles, Esq. *Basket of Pelargoniums*, Mr. Gready. *Collection of Fuchsias*, Mr. Drummond. *Collection of Plants*, Mr. E. Carpenter. *Seedling Pelargonium*, Mr. Gready. *Seedling Calceolaria*, Gen. Andrews. *Stone Plant*, Miss Whitehead. *Seedling Pelargonium*, Mr. Brown, gr. to the Countess of Pembroke. *Cinerarias*, J. M. Yeeles, Esq. *Seedling Calceolarias*, Mr. Kay. *Tulips*, Miss Bayly. *Do.*, Mr. Lockstone. *Apples*, Mr. E. Carpenter. *Potatoes*, T. Emerson, Esq. *Do.*, Mr. Cooke.—*Bath Herald*.

Birmingham Horticultural Society, May 11.—The first Exhibition for the season took place at the Gardens, at Edgbaston. The afternoon was fine, and the company numerous and select. The exhibition was good, and appeared to give general satisfaction. The Gardens were in excellent order; and the numerous plants in the house and in different parts of the gardens afforded much gratification to the visitors. Mr. Barker, as usual, sent a large collection of Orchidaceous and other plants; Mr. Willmore, a miscellaneous collection of house plants; and Messrs. Pope and Sons a larger assortment than usual. Mr. J. Moore, J. F. Ledsam, Esq., Mr. T. W. Belles, and other gentlemen, liberally contri-

buted to the exhibition. Mr. W. Earl had two stands of remarkably fine Pansies, in the culture of which he excels. Mr. F. Dickinson and Mrs. Willmore each sent a number of fine plants, but not for competition. The list of prizes awarded is as follows:—*Exotic Orchidaceous*, 1, *Dendrobium Crumenatum*, 2, *Vanda Roxburghii*, 3, *Epidendrum raniferum*, 4, *Cattleya Mossiae*, Mr. Insley, gr. to G. Barker, Esq.; *Do.*, six plants, 1, *Cattleya intermedia*, *Oncidium maculatum*, *Stanhopea grandiflora*, *Oncidium ampliatum major*, *Oncidium divaricatum*, and *Maxillaria aureo-fulva*, 2, *Maxillaria Deppelii*, *Acanthophippium bicolor*, *Huntleya violacea*, *Maxillaria macrophylla*, *Epidendrum macrochilum*, and *Calanthe veratrifolia*, Mr. Insley, gr. to G. Barker, Esq. *Stone Plants*, 1, *Ceropegia elegans*, Mr. T. Williams, gr. to J. Willmore, Esq.; 2, *Gesnera Douglasii*, Mr. T. Bartlet, gr. to D. Houghton, Esq.; 3, *Strophanthus dichotomus*, 4, *Francisca Hopeana*, J. Willmore, Esq. *Greenhouse Plants*, 1, *Myrtaceae*, unknown, Messrs. Pope and Sons; 2, *Bosissia cordata*, J. Willmore, Esq.; 3, *Pimelea decussata*, Mr. J. Perdu, gr. to T. Small, Esq.; 4, *Oxylobium Pultenae*, J. Willmore, Esq. *Do.* six plants, 1, J. Willmore, Esq.; 2, Messrs. Pope and Sons. *Ericas*, 1, *Linnaeoides*, T. Kenrick, Esq.; 2, *Sulphurea*, 3, *Walkerii*, Mr. S. Harrison, gr. to J. Y. Bedford, Esq.; 4, *vestita alba*, Messrs. Pope and Sons. *Do.* six plants, Messrs. Pope and Sons. *Pelargoniums*, 1, *Dennis's Perfection*, 2, *Garth's Perfection*, 3, *Garth's Victory*, Mr. F. Brewer, gr. to T. W. Belles, Esq.; 4, *Splendidissimum*, T. Small, Esq. *Cacti in flower*, 1, *Jenkinsonii major*, Mr. R. Gallier, gr. to A. Kenrick, Esq.; 2, *Jenkinsonii*, D. Houghton, Esq.; 3, *Speciosissimus*, A. Kenrick, Esq. *Melocacti*, six plants, 1 and 2, G. Barker, Esq. *Narcissi in pots*, six plants, 1, Mr. J. Moore; 2, Messrs. Pope and Sons. *Alpine Plants in pots*, six plants, 1, Messrs. Pope and Sons; 2, Mr. J. Moore; 3, Messrs. Pope and Sons. *Herbaceous Plants in pots*, six plants, Mr. J. Moore. *Paeonies*, 1, Moutan, Messrs. Pope and Sons; 2, unnamed, Mr. J. Moore. *Auriculas*, 1, *Warne's Union*, Messrs. Pope and Sons; 2, *Franklin's Colonel*, Messrs. Pope and Sons; 3, seedling, Messrs. Pope and Sons. *Polyanthuses*, six sorts, 1, Mr. J. Moore; 2, Messrs. Pope and Sons. *Ferns*, six plants, 1, Mr. J. Moore; 2, Messrs. Pope and Sons. *Coffee Tree*, in fruit, (upwards of ten feet high), D. Houghton, Esq. *Orange Tree*, in fruit, 1, Mr. J. Moore; 2, Mr. J. Kendrick, gr. to J. F. Ledsam, Esq. *Twenty-four Pansies* (Gardeners and Amateurs), 1, J. Willmore, Esq.; 2, Mr. W. Fennimore, *Do.* (Nurserymen), 1, consisting of Thompson's Eclipse, Cook's Mulberry Superb, Pearson's Hinda, Lord Francis Egerton, Thomson's Regulator, Grand Duke, Roi de Mulberry, Jehu, Imogene, Hector, Earl Clarendon, Earl's Werner, Victoria Superb, Laura Superb, Azura, Pearson's Zellica, Lane's Calypso, Earl's Marsala, Amulet, Thomson's Rufus, and four seedlings, Mr. W. Earl; 2, consisting of Thomson's Jehu, Grand Duke, Imogene, Lane's Diana, Earl's Lalla Rookh, Hector, Thomson's Regulator, Victoria Splendens, Earl's Werner, Duchess of Richmond, Mulberry Superb, Pearson's Magnath, Silverlock's Prince Albert, Earl's Maid of Milan, Curion alba maculata, Lane's Diana, Vivid Superb, Thomson's Duchess of Sutherland, Lady Lucy, Thomson's Eclipse, Azura, Thomson's Cyclops, and two seedlings, Mr. W. Earl. *Roses in pots*, 1, *Ruga*, Mr. G. Fisher, gr. to W. Anderton, Esq.; 2, *Yellow Noisette*, Mr. T. Morris, gr. to J. W. Whateley, Esq. *Rhododendrons in pots*, 1, *Splendidissimum*, Messrs. Pope and Sons; 2, *Hybridum*, G. Barker, Esq. *Azaleas in pots*, 1, no name, J. Y. Bedford, Esq.; 2, *Phoenicea*, G. Barker, Esq.; 3, *Pope's seedling*, T. Kenrick, Esq.; 4, *Early Pink*, Mr. J. Moore. *Camellias*, 1, *Elegans*, Mr. J. Moore; 2, *Corallina*, Mr. J. Moore. *Pines*, 1, *Havannah*, Mr. W. Carpenter, gr. to J. Taylor, Esq.; 2, *Queen*, Mr. T. Taylor, gr. to T. Upfall, Esq. *Apples*, 1, *Scarlet Nonpareil*, J. F. Ledsam, Esq.; 2, *French Pearmain*, J. F. Ledsam, Esq. *Rhubarb*, 1, *Myatt's Victoria*, Mr. J. Moore; 2, *Giant*, J. Y. Bedford, Esq. *Brace of Cucumbers*, 1, *Improved Manchester*, J. F. Ledsam, Esq.; 2, *Manchester*, J. Y. Bedford, Esq. *Do.*, *Draper's frame*, D. Houghton, Esq.; 4, *Early frame*, J. F. Ledsam, Esq. *Brussels*, 1, *White Brussels*, Mr. E. Ryaston, gr. to S. Dawes, Esq.; 2, Mr. E. Ryaston. *Do* purple, Mr. E. Ryaston. *Kidney Beans*, Mr. E. Ryaston. *Forced Potatoes*, *Ash-leaved Kidney*, Mr. E. Ryaston. *Seakale*, 1, Mr. E. Ryaston; 2, J. Taylor, Esq.; 3, *E. Arnfield*, Esq. *Lettuce*, 1, *Bath Cos*, S. Dawes, Esq.; 2, *Hardy Green*, W. Anderton, Esq. *Extra Prizes*.—*Vine in fruit*, in a pot, D. Houghton, Esq.; *Calceolaria*, Grand Duke, E. Cresswell, Esq.; *Calanthe densiflora*, J. Willmore, Esq.; *Gnidia tomentosa*, J. F. Ledsam, Esq.; *Pimelea decussata*, J. W. Belles, Esq.; a collection of twenty named British plants, Mr. J. Cole; group of flowers, Mr. J. Cole; ditto, J. F. Ledsam, Esq.; *Cactus Ackermannii major*, W. H. Rogers, Esq.; *Seedling Cactus*, A. Kenrick, Esq.

Cheltenham Horticultural and Floral Society, May 23.—The second exhibition of this society took place at the Rotunda, Pittville, and was one of the most successful since its foundation. The shrubberies and lawns appeared to great advantage, nature being admirably seconded by art, and extreme order and neatness everywhere observable. The noble room of the rotunda was converted into a conservatory, and filled with exotics. The show of plants, if not so large as on former occasions, made up for the deficiency by being of more than usual excellence. Amongst the contributors the name of Mr. Hodges was, as usual, conspicuous. The exhibition of Fruits, Salads, and Vegetables, was all that could be desired in the present state of the season, and the entire arrangements appeared to give general satisfaction. Below is the award of prizes: **AMATEURS**.—*Tulips* (12 blooms), 1, Mrs. Eyston; 2, Mr. Bailey. *Do.* (5 blooms), 1, Mrs. Eyston; 2, Mr. Bailey. *Double Anemones* (5 blooms), 1, Lady Saynds. *Pansies*, 1, Dr. Irving. *Stone or Greenhouse Plants*, 1, Miss Tunno; 2, *Stalice arborea*, W. J. Agg, Esq. *Ericas*, 1, Miss Tunno. *Pelargoniums* (best 6), 1, Bruegroom, Joan of Arc, Jewess, Florence, Bridesmaid, not known, Dr. Irving; 2, *Speculum mundi*, London's Perfection, Deny's Perfection, Foster's Eliza, *Speculum mundi*, W. J. Agg, Esq. *Do.* (one), 1, Coronation, Miss Tunno; 2, *Alexandrina Victoria*, Sir R. Wolseley, Bart. *Hardy Shrubs*, 1, *Rhododendron ponticum*, Miss Tunno. *Hardy Herbaceous Plants*, 1, *Dodecatheon elegans*, Dr. Irving; 2, *Ranunculus polyanthus*, W. J. Agg, Esq. *Plants* (Collection of 6), 1, Miss Tunno; 2, Sir R. Wolseley, Bart. *Plants* (Ornamental Basket), 1, Dr. Irving; 2, Miss Tunno. *Wild Flowers*, 1, C. T. Cooke, Esq. *Pineapples*, 1, Queen, J. Taylor, Esq. *Grapes* (Dark), 1, Black Hamburg, J. Taylor, Esq. *Do.* Light, 1, Dutch Sweetwater, Sir R. Wolseley, Bart. *Potatoes* (Forced), 1, Mr. Churchill; 2, *Ash leaf kidney*, Mr. J. Yarsley. *Asparagus*, 1, J. Taylor, Esq.; 2, Lady Saynds. *Cauliflowers*, 1, Mr. J. Yarsley. *Cucumbers*, 1, Walker's Cucumber, Mr. J. Yarsley; 2, *Manchester Hero*, Mrs. Blackman. *Turnips*, 1, Mr. Churchill. *Cabbage*, 1, Nonpareil, J. Taylor, Esq.; 2, Mr. J. Yarsley. *Rhubarb*, 1, *Giant*, Mrs. Blackman; 2, *Goliath*, Mr. J. Yarsley. *Salad*, 1, Mr. J. Yarsley. **EXTRA PRIZES**.—*Collection of Plants*, Miss Wallace; *Citrons*, J. Taylor, Esq.; *Strawberries*, J. Taylor, Esq.; *Fuchsias*, Dr. Irving. **HONORARY PRIZE**, D. R. McDonel, Esq. **SECRETARY'S OPEN PRIZES**.—*Pelargoniums* (5), 1, *Gaines's King*, Garth's Victory, *Gaines's Masterpiece*, Priory Queen, *Bridesmaid*, Miss Tunno; 2, *Joan of Arc*, *Masterpiece*, Priory Queen, *Ancia*, *Nymph*—Dr. Irving. **NURSEYMEN AND COMMERCIAL GARDENERS' PRIZES**.—*Tulips* (12 blooms), 1, Mr. Hodges. *Pansies*, 1, Mr. Hopwood. *Plants* (Collection of 6), 1, Pimelea decussata, *Stalice arborea*, *Boronia crenulata*, *Tropaeolum tricolorum*, *Euphorbia splendens*, *Chorozema varium*—Mr. Hodges; 2, Mr. Hopwood. *Pelargoniums* (Collection of 12), 1, Mr. Hodges; 2, Mr. Hurston. *Do.* (Collection of 6), 1, Mr. Hodges; 2, Mr. Hurston. *Cinerarias* (Collection of 12), 1, Mr. Hodges. *Ornamental Basket of Flowers*, 1, Mr. Hodges; 2, Mr. Hurston. *Single Plants*, 1, *Seedling Pimelea*, Mr. Hodges; 2, *Clematis bicolor*, Mr. Hurston; 3, *Fuchsia corymbiflora*, Mr. Clarke. *Potatoes* (Forced), 1, *Ash-leaf Kidney*, Mr. Middlemiss; 2, *Ash-leaf Kidney*, Mr. Dale. *Asparagus*, 1, *Giant*, Mr. Dovey; 2, *Giant*, Mr. Middlemiss. *Peas*, 1, *Double Blossom*, Mr. Dovey. *Cauliflowers*, 1, Mr. Dovey; 2, *Early Dutch*, Mr. Middlemiss. *Carrots*, 1, *Early*

by showing him how to increase his produce from year to year, and thus expedite, more perhaps than by any other proceeding, the return to Agricultural prosperity generally. Whilst it would proportionately benefit the country by the increase of produce of its own soil, and practically refute the taunting argument that "the land cannot feed the population."—*J. Prideaux. (Extracted from the Plymouth Herald.)*

Agricultural Labourers.—[The following is the conclusion of Mr. Lawrence's Pamphlet, from p. 343.]

"General Directions.—I must now give you a few general directions. Be very particular in keeping your garden free from weeds; do not put off hoeing till weeds become a crop, for then rain may come, and you cannot get rid of them. When the weather is dry, hoe as often as any weeds appear above ground; you can go over the whole of your garden in a very short time in this way, and you will find, by following this up in April and May, your ground will be clean all the summer, and with much less labour than is required when weeds are once let get ahead. You should have a tool to use between your crops, like the common hoe, but with two prongs instead of the cutting edge; the prongs should be a little larger than those of a dung-fork, six inches long, and about four inches apart. You will find it very beneficial to your crops to loosen the earth with this occasionally, between the rows of plants. In November and December, throw up every bed, not under crop, in ridges, as I have suggested for the bed intended for Barley; this gets the mould in nice working order, and renders it much more fruitful. I wish also to press on your attention, with respect to all crops, that which I have hinted at in the case of Potatoes: namely, that much is lost by planting too closely, let the ground be ever so good. This is a mistake you are all apt to fall into, for want of knowing something of that which is called the physiology or principles of vegetation. A free exposure to air is absolutely necessary to the support both of animal and vegetable life. The blood of animals, after being forced from one part of the heart, through the vessels called arteries, all over the body, returns by another set of vessels called veins, to a different part of the heart, in a very impure state; from thence it passes into the lungs, or lights as you would call them, where it is exposed to the action of the air we breathe; this purifies it, and renders it, with some additions, again fit for circulation. It then returns to the heart again, and is again sent round the body as before: and thus it circulates, regularly undergoing purification in the lungs every turn. Nature performs a like process in some respects in vegetation. Plants derive their nourishment partly from air, and in part from water, or earth combined with water, and the earth derives all its fertility from the air. The leaves are the lungs of vegetables; their juices also circulate through one set of vessels, from the roots to the leaves, where they absorb the main principle of their support, and return by another set of vessels, and deposit the materials which cause the growth of plants. Your vegetables would not grow without air and light in the richest soil that ever was made. It follows, therefore, that the earth about your plants should be freely exposed to the atmosphere or air, that it may absorb the necessary moisture for the nourishment of the roots; and that the leaves should all be freely exposed, in order that the fluids circulating through them may also absorb from the air the materials necessary for the support of the plant. I hope you now understand that, what you call making the most of your ground, by planting close, is, in truth, making the least of it; that is to say, when the plants are so near to each other as to prevent the exposure of the roots and leaves of all to a free circulation of air. You have all planted rows of Potatoes so near together that the haulms of the rows, when high and strong, met; and you have probably observed, in this case, nearly all the under leaves yellow and decayed. Nature intended every one of these to increase your crop, but you have frustrated her kind intentions, which I hope you will avoid in future. You must make a hole on the waste, near each of your gardens, to take decayed leaves of all sorts, Cabbage-stems, weeds, &c., for these will rot in time, and make good manure."

Pigs.—I have a word or two to say about your pigs, as I expect every one of you to keep one. In the first place, it is very material that the pig be kept quite dry; you must therefore always be attentive to the roof of the sty, and see that it does not let wet. The open part of the sty, where the pig feeds and exercises, should be planked, and sloped sufficiently from the covered part or bed for all wet to drain away to the dunghoop. The sty must be kept clean; it should be cleansed every day. Dry leaves and fern, collected in the autumn, are good substitutes for straw for the bed, when straw is scarce. I would recommend you not to buy in your pig before May, as you would have some difficulty in finding sufficient food for him earlier without going to expense; he should then be not less than six or seven months old. As there is very little common or waste on which your pigs could be turned to graze, you must treasure up all the refuse Cabbage-leaves, pods of Peas, and Beans, &c. to supply them with sufficient food in the sty during the summer. One hog tub you must have, and as soon as you can afford it you should get another, that one may be filling while the other is being emptied; moreover, it is an advantage not to give the wash while it is fresh, for pigs are found to thrive better on it when stale. Let the Potatoes and Carrots intended for the pigs be boiled, and then mashed up with the wash. As soon as the Acorns and Beechnuts are ripe, set the children to collect them, as they are very nourishing food for pigs. In the beginning of October you must prepare for fattening, by giving less green food, and more Potatoes and Carrots, which you will then have in abundance. A pig will require about two bushels of

Potatoes, and one of Carrots or Parsnips boiled, and mixed with the wash every week during this month; but as the appetites of pigs will vary, you must watch them when feeding, and give a little more or less at a meal, taking care not to give at one feed more than they eat up clean. They should be fed three times a day at the least, I should say four times during November and December, while fattening. During the last week of October, mix about half a peck of Barley-meal with the allowance of wash for the week; each of the two first weeks in November, one peck; each of the two last weeks, a peck and a half; the two first weeks in December, two pecks each; the third week, three pecks; and the fourth week, four pecks. It is necessary to be careful in increasing the Barley-meal; this must be done gradually in order to prevent surfeit, which will throw the pig back. If your crops of Peas should be very abundant, and produce more than you want as vegetable food, let them ripen well, and put them by for fattening the pigs to save meal. By the end of December, if you have managed the pig well, he will be fat; if he be not, you must give him a little more time, for he ought to be thoroughly fat before he is killed. I cannot dispose of the pig, when killed and burned, better than in the words of the Author of "Cottage Economy." He proceeds as follows: "The inwards are next taken out, and if the wife be not a slattern, here, in the mere offal, in the mere garbage, there is food, and delicate food too, for a large family for a week, and hog's puddings for the children, &c." "The butcher the next day cuts the hog up, and then the house is filled with meat—souse, griskins, blade-bones, thigh-bones, spare-ribs, chines, belly pieces, cheeks, all coming into use one after the other, and the last of the latter not before the end of about four or five weeks." "All the other parts taken away, the two sides that remain, and that are called flitches, are to be cured for bacon. They are first rubbed with salt on their insides or flesh sides, then placed one on the other, the flesh sides uppermost, in a salting-trough, which has a gutter round its edges to drain away the brine; for to have sweet and fine bacon the flitches must not lie sopping in brine, which gives it a bad taste. Every one knows how different is the taste of fresh dry salt from that of salt in a dissolved state; the one is savoury the other nauseous; therefore, change the salt often—once in four or five days; let it melt, and sink in, but not lie too long; change the flitches; put that at bottom which was first put on the top; do this a couple of times. As to the time required for making the flitches sufficiently salt, it depends on circumstances—the thickness of the flitch, the state of the weather, the place where the salting is going on. It takes a longer time for a thick than a thin flitch; it takes longer in dry than in damp weather; it takes longer in a dry than a damp place. But, for flitches of a hog of twelve score, in weather not very dry nor very damp, about six weeks may do; and as yours is to be fat, which receives little injury from over salting, give time enough, for you are to have bacon till Christmas comes again. The place for salting should be cool, and where there is a free circulation of air. Confined air, though cool, will taint meat sooner than the mid-day sun accompanied by a breeze." The Author then directs that the bacon should be smoked, and not dried, that the flitches should be hung up in a chimney where no rain could fall upon them, and not so near the fire as to melt; that the smoke should proceed from wood fires, not coal. If there be a fire constantly by day, a month would be long enough for the flitches to remain in the chimney; but if not, rather more time must be given, taking care not to leave them long enough to get rusty; that the flitches should be dried to the hardness of a board, but yet not quite dry; that before the bacon is hung up in the chimney it should be laid on the floor, powdered over pretty thickly with bran, that this should be rubbed on the flesh and patted well down upon it. The lard must be taken care of and put away in bladders, mixing a little salt with it will make it keep good for a longer time. I have been very desirous of collecting for you all the knowledge I could about the pig, for he will furnish you with a great number of good, hearty, and nourishing meals after your day's toil, throughout the year; and I hope you will not only attend to all I have written, but pick up all the information you can as to the best plan of feeding and management. Never regard a little additional trouble, for "there are no gains without pains."

"Cleanliness, Neatness, Regularity, and Order.—Strict attention to these qualities is of the utmost importance to your welfare. Make them the habits of your household; they will prove a blessing to your children, and a great advantage to them through life. Cleanliness is said to be next to godliness: on the latter it is unnecessary for me to say anything more than to urge your regular attendance at your church on a Sunday, where you will be taught the vast importance of this virtue to your condition, here and hereafter, by your good minister, who, I know, takes a deep interest in your well-being in all respects. Cleanliness contributes greatly to your health, as well as comfort and appearance. Neatness carries with it its own reward, it is always pleasing to behold, and particularly where it is least expected, in the dwellings of the poor. It shows a disposition to make the most of the little advantages you may have; it is an encouragement to those who have done something to serve you to do more. Order and regularity in all things are well worth your attention; they will save you both time and money; have a place for everything, and everything in its place. The wife should have a regular time, every day, allotted for the performance of her various household duties; and should so arrange them as to devote as much time as possible, of the most favourable part of the day, to the garden; but she

must never lose a day's work when she can get paid for one, unless prevented by illness, or the necessary care of young children. As every day brings its own occupations, never put off to to-morrow that which can be done to-day. There is some truth in the old proverb, "One to-day is worth two to-morrows." Regularity in your payments is a most important consideration; without the strictest attention to this, neither your own labour, nor any advantages that may be offered to you, will long mend your condition, or save you from wretchedness. While you pay ready money you can go to the best market, buy the best articles, and at the cheapest rate; you are independent, and have nothing to fear. If you once get in debt you have no chance of paying off old scores, for your wants and your means continue to bear the same proportion to one another. For fear of offending those in whose power you have thus placed yourself, you must continue dealing with them; you must be content to take those articles, of inferior quality, which others who go with money in their hands, have refused; and you must pay the best price, nevertheless, to cover the risk the shopkeeper runs in trusting you. You become dependent, your spirit becomes broken by difficulties, you become careless and negligent, and are lost men. If you are thrown behind hand by any chance accident, borrow of your masters, who will always help a good servant in these cases; but do not run in debt at the shop; do not even resort to this if you can possibly avoid it, for "he that goes a borrowing goes a sorrowing." Cleanliness, neatness, regularity, and order, must be enforced on your children, both by your advice and example. They will all have to get their livelihood in one kind of service or other; most of them will look for places in families, and the possession of these qualities makes nearly all the difference between a valuable and a worthless servant. I have seen many cases in which really industrious servants, who were never idle, but who were always in a muddle, and had never done their work, merely for want of method and regularity, replaced by others who have performed all the same duties, with ease to themselves, with time to spare for their own purposes, and with satisfaction to their employers."

"Service.—The few last observations have suggested to my mind some reflections on the subject of service in general, which I think may be useful to you, and with which I shall close my observations. I have always heard very general complaints by servants, both agricultural and domestic, of the treatment and conduct of their masters and mistresses; sometimes, no doubt, with good reason, for we are all erring mortals. But the number of the satisfied bear a very small proportion to the number of the dissatisfied; and truth compels me to say, that I have generally found those who were contented with their situations happened to be the best of servants. Again I have known some servants give a man the worst of characters as a master, and others give the very same man a character just the reverse. How come these things to pass? I will tell you. Careful, industrious, and faithful servants generally make good masters; and there are very few exceptions to this. Good men make good masters to such servants from a natural feeling and sense of justice. Bad men, in other respects, often make good masters for their own interest only. Every man, be his character what it may, feels that good servants are necessary to his own peace and comfort; and to keep them, he knows he must, at any rate, treat them well, or they will leave him. I know this to be the feeling of every master and mistress I have ever talked with on this subject. I never find any one who is not sensible of the value of a really good servant, in any situation; or, who is not ready and willing to make any reasonable sacrifice to keep such a servant. When, therefore, I find servants complain of neglect or ill-treatment—though such complaints are, I am aware, too often well founded—I am sure that in nine cases out of ten it arises from their own inattention or misconduct, in some way or other; and as the same causes will lead to the same consequences, wherever they go, as soon as they feel from their master's conduct towards them, that they are losing his esteem and consideration, let me advise them, at once, instead of leaving a master and abusing him, to look carefully back upon, and examine their own conduct, and see if they have been, upon all occasions, faithful, just, and obedient to him. If they do this sincerely and honestly, I suspect they will seldom fail to find the cause of any alteration in their master's conduct towards them. If, upon reflection, they find that they have failed in their duty, they must exert themselves to repair the mischief, and regain lost ground. If they feel they have done their duty, they should respectfully inquire whether their employer has any complaint to make, and tell him, at the same time, the cause of their inquiry. This would oftentimes prevent a separation, and lead to a good understanding in future. You are always too ready to change your masters, on very slight grounds, without recollecting that you must meet with difficulties and something you may not like in every situation; and that in changing, you are probably flying from one evil merely to run into another, perhaps a greater. Neither you, nor your sons and daughters in service, appear to me to be aware how material it is to your interest to continue as long as possible in the same place. After long service, a servant becomes acquainted with all his master's views, wants, and habits, and knows how to serve and please him better than any one else. This gives an old servant a great advantage that he cannot have in a new place. As the period of service increases, so does the attachment of the master; and from this naturally spring acts of consideration and kindness; it leads to numerous little privileges and advantages, which a servant, continually on the move, can never know. Should death, or any other circumstance render it neces-

sary for a servant to look out for another place, long service with the late master is the best recommendation he can take. Such a person is sure to have a choice of the most desirable situations; and, in old age or sickness, he will have a claim that will not be resisted, upon those whom he may have served long and faithfully. Poor Richard says:—

"I never saw an oft-removed tree,
Nor yet an oft-removed family,
That thrive as well as those that settled be."

And this is true as to servants. I have been induced to offer these observations to you, and through you to your children, in consequence of the complaints I hear in almost every family of the habits and conduct of servants now, as compared to what they used to be. Whatever may be said of the situation of agricultural servants, (and I am fully aware that they have not had those comforts they are fairly entitled to,) this is very far from being the case with domestic servants. Within the last few years, their wages have been greatly increased: their only necessary expense, namely, clothing, has been very greatly diminished; they have become extremely particular, both as to the quantity and kind of work they would perform; and equally so as to the quality of their fare. I want to have strict justice done on all sides. I wish most anxiously to see the labourer and his children engaged in other services, well housed, well fed, well clothed, and treated with kindness and consideration. But I must tell you and them, that all these advantages are due only to those who strive to perform their various duties to the utmost of their ability; to those who are honest, civil, obliging, ready to do the work justly required of them, industrious and careful in the execution of it; faithful guardians of the property entrusted to their care, and ever watchful of their master's interest. I will give you one caution at parting, though I hope and believe it is not necessary. Many persons have objected to the plan of supplying labourers with gardens, and to their keeping pigs, &c.; because they think that having a garden to cultivate, will induce a man to come late to his work—to return early from it—and to steal away from it when his master's absence may afford him an opportunity. The same persons think that having a pig will be a temptation to a poor man to pilfer all he can for its support; corn, grain, straw, &c. I do not believe a word of this; for, making due allowances for the different advantages of different stations amongst mankind, I believe the poor to be full as honest as the rich; but I mention these objections to you in order that you may be particularly careful to avoid every act that might give any persons the least ground for supposing they were sufferers by any advantage given to you. Take nothing that does not belong to you; neither goods nor time. For, if you rob your master of time which he pays you for, it is the same thing, in substance, as robbing him of his money. When you lay down your heads to rest at night, employ, if it be only a few minutes, in looking back and reflecting upon your conduct through the day. Judge yourselves, as you may rest assured you will hereafter be judged by Him "to whom all hearts are open, and all desires known, and from whom no secrets are hid;" and your feelings, on composing yourselves to sleep, will be a sure and safe guide for the conduct of the morrow. I shall add nothing more at present, but that I hope, ere long, to see you baking your own bread, and brewing your own beer. This must be deferred till you can save a trifle to buy two or three tubs and small casks. You will have your hands pretty full now, and will want every farthing you can save for some time to come, to supply yourselves with garden-tools, the hog-tubs, &c. I shall come amongst you as often as I can find time to go so far. I shall watch your proceedings with great interest, and shall hope to find you have attended to all my directions, or be able to give me a good reason for not having done so. The deserving may be sure of encouragement. If they are at any time in want of further information or advice, or of any assistance in my power to afford them, it shall be always at their service. With every wish for your increased comforts and happiness, which after all will mainly depend on your own industry and general good conduct, I remain, your faithful servant, CHARLES LAWRENCE."

GARDEN MEMORANDA.

Highele, the Earl of Caernarvon's.—There was lately blooming most splendidly at this place, which has always been celebrated for its American plants, a quantity of seedling Rhododendrons, some of which are of the most novel and magnificent character. Several of them are of the richest and most vivid vermilion tint, splendidly spotted with nearly black spots on the upper petals. The parents of the purplish-flowering kinds are *R. altaclerense* and *R. ponticum*; and those of the redder and pale pink sorts, *R. altaclerense* and *R. maximum*. In both cases the *R. altaclerense* is the male parent; they are remarkable for having immense trusses of flowers, many of which are likewise individually large and beautifully formed. This is especially the case with a light purple one, which might easily be mistaken for *Azalea pontica*, were it not altogether larger. There are also two or three very deep purple ones, which are quite peculiar and are generally considered showy; but the colour is rather too dull. One of a brownish purple tint is very singular, but too dingy. Perhaps the best of all is a pale vermilion-coloured one, in the way of *R. maximum*, splendidly spotted, with bold trusses and flowers almost equal in figure to *Azalea indica atrata*. A very fine one, of a delicate rose tint, is further particularly noticeable. The great merit of the whole is that they are particularly hardy.

Mr. Goldham, Islington.—This has been a most unfavourable season for Tulips; great losses have been sustained by most of the fanciers in the neighbourhood of London, but to these losses so generally complained of, Mr. Goldham has happily been a stranger, scarcely a failure has occurred in his extensive collection. What has been wanted here has been sun, but though he has scarcely shone upon the bed since the flowers have shown any colour, the condition of the flowers was beyond what we anticipated under these disadvantages, and very superior to the state of the bed last year; the flowers generally have less colour, and are more true to their character; there are exceptions to this which we noticed, particularly with *Polyphemus*—these were

generally surcharged with colour, excepting in those instances where they had run back and been rebroken, when their constancy is more to be depended on. Among the *Roses Goldham's* Queen was conspicuous with its singularly bold and fine flame, and his *Ellen*, which has the same character of flame as *Pandora*, and the same formed cup as that beautiful variety. *Goldham's Maria* is this season in great purity of ground, with the feather and flame most delicately pencilled. The *Gem* is also in its true character with its high and rich colour, but wanting sun to bleach the ground colour. *Triomphe Royale*, *Aglaia*, and *Fleur des Dames* were in fine character. The Duchess of Sutherland among the Byblomens claimed particular attention, not alone for the beauty of the flower, but for its constancy also; every bloom was true to its character, pure in the white, and rich and decided in the markings. *Pandora*, a rosy purple, was not so fine as it was last season, the outer petals had evidently been cramped by the untoward state of the weather. *Musidora* was in great perfection. The *Louis* were on the decline, but enough remained to show they had been of a superior strain. *Fanny Kemble* and *John Kemble* were fine. *Napoleon*, a flower with a bold dark flame, forms a valuable addition to a bed, from it being so decidedly different from others. *Lord Nelson*, *Holmes' King* (an old favourite), and *Franklin's Superb* were also fine. In *Bizarres*, *Polyphemus* was heavy and bad, excepting in two or three instances before alluded to. *Milton* not good; on the contrary, the *Garricks* were fine throughout the bed. *Strong's Duke of Bedford*, a feathered bizarre, a fine middle-row flower, and *Davy's Comet*, good. *Apelles* and *Strong's King* were both fine. *Shakespeare* and the *Sultan* also. Dr. Lindley, a bizarre broken last season comes fine, and is peculiar for the deepness of the yellow and the intense black of the flame and feather; the few we have noticed were either old varieties in very fine condition, or flowers not generally found in collections. It was evident upon examining the flowers that they had wanted sun and warmth to expand the blooms more kindly. A few have broken into colour this season; we noticed a bizarre which promises to be a great acquisition; in its present state it bids fair to surpass *Strong's King*, the yellow and scarlet are fine and clear, the cup short and well-formed, petals firm and waxy, the colour is distributed in a deep rich feather, alike in all the petals; it is to be named *Goldham's King*. Another bizarre, a seedling from *Polyphemus*, having a clear ground, with a delicately-pencilled feather, to be called *Perfection*, with a rose just opening, and promising well, were the elite of the newly-broken flowers.—May 29.

Rebriebs.

Manual of British Botany; containing the Flowering Plants and Ferns, arranged according to the Natural Orders. By C. C. Babington, M.A. Small 8vo. Van Voorst.

MR. BABINGTON has long been known as a most diligent and critical investigator of our wild plants, and we are glad to find that he has made public the result of his researches, in the work before us. The statement which he makes in the preface explains what it was that led him to consider this kind of investigation worth the pursuit.

"From the attention which has long been paid to the elucidation of the Flora of Britain and the numerous excellent botanists who have, since the time of the justly celebrated Ray (not to go further back) employed their talents upon an endeavour to determine the indigenous products of these kingdoms, the Author, in common it is believed with most English botanists, did not suppose that much remained to be done in British botany; for he could not expect that after the labours of such men as Smith, Hooker, Lindley, and others, and the publication of so invaluable and unrivalled a collection of figures as is contained in the *English Botany*, there could still be many questions concerning the nomenclature, or any considerable number of unascertained species, the determination of which would fall to his lot. He had not however advanced far in the critical examination of our native plants before he found that a careful comparison of indigenous specimens with the works of eminent continental authors, and with plants obtained from other parts of Europe, must necessarily be made, for it appeared that in very many cases the nomenclature employed in England was different from that used in other countries, that often plants considered as varieties here were held to be distinct species abroad, that several of our species were only looked upon as varieties by them, and also that the mode of grouping into genera was frequently essentially different.

"The discovery of these facts produced considerable astonishment, and the author was led to consider what could have been the causes of so remarkable a discrepancy. The following appears to be the most probable explanation. It is well known that at the close of the last century Sir J. E. Smith became the fortunate possessor of the Herbarium of Linnæus, and was thus enabled to ascertain, with very considerable accuracy, the British species which were known to that distinguished man, and to publish, in the most improved form that he had given to his system, a remarkably complete and excellent Flora of Britain. Then followed the long-continued separation of this country from France, and indeed from most of the European nations, by which we were almost completely prevented from observing the progress which botanical science was making in other countries, and at the same time our own Flora was continually receiving accessions of new plants which it was nearly impossible to identify with the species detected and published in France and Germany. At the conclusion of the War we had become so wedded to the system of Linnæus, and it may even perhaps be allowable to add, so well satisfied with our own proficiency, that, with the honourable exception of Mr. Brown, there was at that time scarcely a botanist in Britain who took any interest or paid the least attention to the classification by Natural Orders which had been adopted in France, and to the more minute and accurate examination of plants which was caused by the employment of that philosophical arrangement.

"The publication of so complete and valuable a Linnæan work as the *English Flora* greatly contributed to the permanency of this feeling, and accordingly we find that at a very recent period working English botanists were unacquainted with any of the more modern continental floras, and indeed even now many of those

works are only known by name to the great mass of the cultivators of British botany."

Upon looking through Mr. Babington's pages we find many novelties. But whether or not all his new species will bear the test of examination will probably be for some time a matter of dispute. This however is certain, that he deserves credit for calling attention to circumstances which have been very generally overlooked. For ourselves we are far more inclined to reduce than to increase the number of species in books; and to regard the distinctions which many Botanists suppose to be permanent, merely as trifling deviations from ordinary structure, analogous to those which occur in so much more marked a manner in the animal kingdom, without however leading zoologists into the error of confounding them with species. When we see the extraordinary creations which are now springing up in gardens; when we know that plants with almost all the characters of *Azalea pontica*, for instance, have been bred out of capsules of the common *Rhododendron*; and when we consider the very unexpected discoveries lately made experimentally by the Dean of Manchester among *Narcissi*, we cannot but pause before we recognise as of specific importance such characters as those by which Mr. Babington separates *G. intermedium* from *G. urbanum*, *Dryas depressa* from *D. octopetala*, or *Thesium humile* from *T. linophyllum*.

However this may be, there is no doubt that Mr. Babington's is a very valuable contribution to our knowledge of British plants, full of original information and good critical remarks. It has also an excellent feature, in the adoption of Koch's method of marking in italics those points in the specific characters of difficult genera, to which attention is most particularly demanded.

Theorie der Gärtnerei, von John Lindley (Lindley's Theory of Horticulture).—8vo. Vienna. 1842.

THIS is a translation into German of the well-known English work, with some valuable notes and observations by the translator. As it may interest our readers to know the opinion of well-educated foreigners upon the importance of correct theory to Gardeners, we select a few passages explanatory of the translator's views.

In the preface, after some complimentary matter, which need not be extracted, the text proceeds thus: "The art of gardening has hitherto consisted of a mere medley of isolated or ill-arranged rules, and the individuals engaged in it usually received nothing more than a tradesman-like and superficial education, principally dependent on the capacities of their masters or employers. Such a degree of instruction may have been formerly considered satisfactory, but it is a question whether this is so at the present moment—a question not difficult of solution, when we listen to the complaints either of garden proprietors or of gardeners, who often find themselves foiled in the culture of most important plants for want of some sound principles of action. Much fame, indeed, has already been earned by gardening, but it will be more and more merited the more its doctrines are based on well considered principles and scientific views.

"The most profitable and useful appropriation of the soil forms the most solid prosperity of all countries. It is therefore the chief problem of our art, for the proper solution of which we have only to interrogate our great teacher, Nature. If our questions are well put, we are sure to receive in all cases the same answer, because nature remains invariably the same, and is never subjected to either inconsistency or contradiction. If we perceive the forms of her manifestations to be different, this should only be a stimulus prompting us to unceasing activity and to renewed and more careful observations.

"If once a theory is constructed on a sound basis, like that of our Author, it is impossible that those who apply themselves to horticulture should be easily led astray in their endeavour after improvement. To the young gardener it is invaluable, because it contains a long series of principles, the soundness of which has been proved by experiment, and which therefore deserve the entire confidence of the beginner."

Among the notes which the translator has added to the Author's text, the following will be found among the more interesting. We have prefixed to these the number of the paragraphs in the English edition—or the pages—for the convenience of those who may possess it.

Par. 30.—"Every leaf-bud, either on the branches or the stem, has a connexion with the root by means of very simple organs. It is the continued life of these organs of a branch or a bud, after its separation from the original plant, which, in our opinion, is the main condition of the formation of roots in any part of a plant.

Par. 30.—"The young roots of some genera live for a very considerable time without the cotyledons exercising any function. So we find that the seeds of the *Pæony* which are sown in January, will have formed roots in September, but the cotyledons will not be visible for four or five months later, viz., in January or February of the next year.

Par. 32.—"As summer advances leaves are nearly all formed, and they then perform the function of nourishing a plant; because, if the root remains ever so long without moisture the plant will not cease to live so long as its atmospheric parts can absorb the moisture of the air, the dews, and rain.

Par. 35.—"Of the continually-absorbing power of the roots, the simile of a wick of a candle is certainly one of the most appropriate. The wick (as well as the spongioles of the root) by its hygrometric quality continually conducts fluids to the flame, only the spongioles, being continually renewed by their constant formation onwards, are permanent.

Par. 35.—“In many cases the rejection of certain substances by the roots of plants may be caused by a want of chemical affinity. Liebig says, ‘Nature herself shows us what a plant requires for its youngest fibres at the first period of development. Becquerel has proved that the seeds of Graminaceæ, Leguminosæ, Coniferæ, Chicoracæ, Umbelliferæ, Coniferæ, and Cucurbitacæ excrete acetic acid during germination. A plant sprouting forth from the soil, a leaf protruding from its bud, contain a portion of ashes, which are in general as much saturated with alkaline salts as at any other period of vegetation (Saussure). Becquerel’s experiments tell us how and by what means these alkaline salts reach the plants. The acetic acid, when formed, spreads in the humid soil, becomes saturated with alkaline matter, lime, and magnesia, and is again taken back by the fibres of roots in the form of neutral salts.’”

Par. 37.—“The curious phenomenon that poisons fatal to animals are also destructive of plants must be considered as a wise provision of the Creator, because if such poisons did not kill plants the latter could not be the chief nourishment of men and animals, whose existence would then be the most difficult thing imaginable.”

Par. 38.—“The analysis of Liebig has proved that rain-water contains nitrogen in the form of ammonia, and that of Struve, that most mineral matter contains carbonic acid. Before this, no one could explain whence the amount of nitrogen contained in the plants was derived. This riddle is now solved, and the culture of plants has been thereby advanced to an incalculable degree, although some may still not sufficiently appreciate the discovery.”

Par. 42.—“In the same way as the cotyledons exist for the nourishing of the young stem, so also the leaf which is beneath a bud is there for nourishing the latter. But is leaf in the axil of which is no bud has another function.”

Par. 49.—“In all perennial plants, in shrubs, fruit and forest trees, a new and particular vegetative process follows the perfect maturation of the fruit; whilst in annuals from this period the stems become lignified, and the leaves change their colour into yellow; on the other hand, the leaves of trees and shrubs remain in activity until the beginning of winter. The formation of the woody rings proceeds, wood becomes more solid and hard, and from August onwards leaves produce no more wood; all carbonic acid which they receive and assimilate is used in the preparing of nutritious substances for the next year; instead of ligneous fibre, starch is formed, and spread in the form of August juice through all parts of the plant, (Hartwig in Liebig’s Organic Chemistry.)”

Par. 67.—“The common belief that it is only the direct rays of the sun which can operate the decomposition of the carbonic acid in leaves, and that the reflected rays (the common light of day) do not possess that quality, is a great fallacy, because in many plants just the same substances are formed, whether they are struck by the rays of the sun or grow in the shade; they require light, and the light of the sun; but it is indifferent to them whether they receive the solar rays directly or indirectly; their functions will merely go on with more energy and rapidity if growing in the sun than in the diffused light of day, or in the shade; and there cannot be any other difference in this case than what is exercised by light on chemical compounds, and this difference will consist merely in a more or less accelerated process. Thus chlorine and hydrogen unite into chloric acid, but this combination only takes place after some hours, if merely influenced by the light of day, while in the sun’s rays it is sudden, and accompanied by an explosion, and in the dark not the least change will be observed.—Most physiologists have connected the exhalation of carbonic acid during night with the absorption of oxygen from the atmosphere, and consider this function as the real respiration of plants, which (as we know) produces in animals a decarbonization of the blood. There is scarcely an opinion which rests on such a feeble basis. The water received by roots contains carbonic acid, which is not decomposed on the absence of light, but remains dissolved in the sap which pervades all parts of a plant; and every moment, along with the water evaporating through the leaves is a proportionate amount of carbonic acid expelled. Soil in which plants vegetate luxuriantly contains a certain quantity of moisture (an indispensable condition of their life), and such a soil is never deficient in carbonic acid, either derived from the atmosphere or from the putrefaction of vegetable matter. No water, either rain or that of springs, is free from carbonic acid; and at no period of the life of a plant does the capability of its roots to absorb moisture, and consequently air and carbonic acid, altogether cease. Can it therefore surprise us that carbonic acid, conjointly with the evaporating water of the plant, is returned to the atmosphere, when the cause of the fixation of carbon, viz., light, is deficient? That exhalation of carbonic acid is as unconnected with the process of assimilation and with the life of a plant as the absorption of oxygen. They do not bear the least relation to each other; the one is a purely mechanical, the other a chemical process. A wick of cotton shut up in a lamp which contains a fluid impregnated with carbonic acid will be in just the same position as a living plant in darkness. Water and carbonic acid are absorbed by the power of capillary attraction, and both evaporate again on the surface of the wick.—Liebig’s Organic Chemistry, 1840.

(To be continued.)

CALENDAR OF OPERATIONS for the ensuing week.
I must apologise for ploughing with another man’s heifer; I see, plainly enough, that the “Floricultural Cabinet” has a better claim to originality for smoking frames with touch-paper than my friend the publican; and we must cover our retreat in the words of the adage, which says, “a good tale is not the worse for

being twice told.” I can only account for “Junius’s” failure by supposing his Tobacco to be too moist. One of my men tried two papers, and both burnt down to the sockets. The “Cabinet’s” plan of putting a thin layer of Tobacco on the paper, and then rolling it up loosely, is better than having all the Tobacco in the centre. I have just heard that Mr. Henderson, of Pine-Apple-place, has proved the Polygala Chamæbuxus to be a good plant for winter forcing. No doubt many of the greenhouse Polygalas might be so managed (with a little pruning about this time, and keeping them in-doors through the summer) as to come into flower early in January. Try also Goodia latifolia, and some of the Crotalaria, in the same way. Perhaps there are some who are not aware that all the Conifers, treated after this fashion, —that is, kept in vigorous growth in the greenhouse all the summer,—will begin to flower late in the autumn, and continue on through the whole winter, supplying the place of the Fuchsias; and this puts me in mind of the Mexican Fuchsia splendens, which is a late spring flowerer; but if you treat it for the next three or four months, as you would your forcing Fuchsias, that is, cramped at the roots and allowed no more water than will just keep it alive, then give it a good shift and force it along with the Roses, and you will have it in flower by the end of February. I treated my plants thus last year, and they were much admired in the conservatory last spring. I have also, the year before last, crossed this Fuchsia with the pollen of fulgens and corymbiflora; and I like the seedlings better than either of their parents.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If the young stock of plants have all been looked over and potted, nothing requiring particular notice will be wanted for some time, except the common routine of watering and syringing, giving air, and perhaps shading if the plants do not stand the sun well.

VINERY.—The houses where fruit is ripe, or about ripening, must be kept dry with a free current of air, but as soon as the crop is reduced to a fortnight’s consumption, you had better cut all the bunches and hang them in a cool, airy room. This would be a great relief to the Vines, as you can syringe them freely, and yet give them as much air as the house will allow. Those in the late houses, or in greenhouses, will want abundance of moisture, both at the roots and over the foliage, to encourage them to swell a fine crop of fruit.

PEACHES.—The last of these cannot well be managed like the Grapes, as they do not keep well any length of time after they are ripe, and are never better than when just gathered off the trees. You must therefore have patience, and keep the air in this house dry till after the fruit is gathered for use, when you will, of course, give the trees and all parts of the house a thorough good washing down with the engine or a powerful syringe. The Cherry-trees may also be treated in the same manner.

MELONS AND CUCUMBERS.—In nine cases out of ten, Melons, in the hands of a young beginner, either come in when they are not wanted, or altogether at one time, just as Pines often do; but, unlike the Pine, you cannot keep them for any length of time after they are ripe. The only expedient that I know of to meet such a case is to gather some of the fruit a short time before they are quite ripe, or as soon as the flavour of the first Melon indicates its approach to maturity, to place these on a shelf in a cool fruit-room or dry cellar, where they will keep for a week or ten days; and if you serve them as you would winter Pears, by exposing them for a day or two to a dry heat in the kitchen, or under glass in the sun, they will eat as mellow and with as good flavour as if they had ripened on the plant. Indeed, I am not sure if very early or very late Melons might not be improved in this way. See that the ridge Cucumbers do not get too thick at their first starting; and those that have been in bearing for a long time will now want large portions of water, as their roots must occupy all the bed, and have exhausted the soil a good deal by this time.

Out-door Department.

The weather still keeps dripping. How different from this time last year, when nothing was thought of in the kitchen-garden but the watering-pot, and no short grass or hardly any kind of herbage could be had for mowing crops, &c. All the crops are now weekly improving in strength and appearance. In two or three more weeks we shall have the turn of the season; the nights will then begin to lengthen and the dews will become regular, to sustain vegetation in case of dry weather succeeding this wet.

ASPARAGUS.—Except for some very particular occasion, Asparagus should not be cut after this time in private gardens.

BROCCOLI AND CABBAGES.—Plant out a few young Cabbage-plants and autumn Broccoli once a fortnight, to keep up a supply of young heads in the autumn; and see that the seed-beds of these do not get too much crowded, as they will soon do this moist season.

CAULIFLOWERS.—A few young plants of these from the spring-sown beds had better also be transplanted, at short intervals, rather than a large breadth at a time. If those now coming into use are likely to be more abundant than is required for the daily consumption, some of them should be checked, to keep them back, if only by pushing in the spade on one side, to cut half their roots.

CELERY.—A short row of this may be put out and well watered, to carry on the early succession; and the young plants for the main crops will require a regular supply of water, if the rain does not get to their roots.

SUCCESSION CROPS OF LETTUCES, PEAS, KIDNEY-BEANS, &c.—You will go on with these according to the state of the last sowings; and see that the hoe is always in motion among crops in rows, whether there are weeds or not. There is one kind of work which is hardly ever thought of in summer; I mean trenching vacant pieces of ground as they fall in; but I know of no method of improving heavy soils equal to trenching it when perfectly dry in summer.

ORCHARD.—I suppose the Tomatoes planted out against the walls must be dignified with a notice as an orchard fruit, if only to say that, like the ridged Cucumbers, they are often left to get too much crowded at the first setting off; the first high wind will then shake them about in all directions. Two-thirds of their shoots must be cut out, to make room for the rest. This check throws them back ten days more; and after all this mismanagement people will say, next October, the season was too cold to ripen them, or get some other excuse equally groundless. Continue pinching, pruning, and nailing-in the summer wood; and if insects make their appearance on any part of the walls, or on bushes or standard trees, give them no rest till they are destroyed, and let all your walls and borders have a neat appearance. Anti-I dislike more than any insect. Boiling water is the shortest way of dealing with them when you find their nests.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—The Hecyclus, Clerodendrons, Vincas, and other stove-plants mentioned last spring as useful auxiliaries for flowering in the conservatory in the summer, should now be in good condition for flowering, and have large portions of air to insure them to the change. Clerodendron squamatum bids fair to turn the C. speciosissimum out of cultivation. In habit, foliage, and inflorescence, both plants are very much alike, but the speciosissimum has an unfortunate way of throwing out glandular secretions on the undersides of the leaves; and unless these are wiped off with a dry sponge on their first appearance, they soon dry up into black, rusty spots, giving the plant a filthy appearance. Doubts were entertained last year about the new Clerodendron splendens being a free flowerer; but these have now vanished, and no plant better deserves a place in a select collection. The stoves require more air now; but still keep up a strong, moist heat, and let the plants stand clear of each other.

GREENHOUSE.—Dwarf plants intended for specimens should

have the best places along the front stages, unless there are pits or frames which can be spared for them. When the advantages of growing plants in pits through the summer shall be better understood, our greenhouses will be turned to better account during that time than they are at present. Some will use them for growing Grapes, others for intermediate houses for the hardier stove-plants, while the majority will turn them into regular summer conservatories, where nothing but plants in flower will be admitted.

COLD PITS.—Camellias, Chinese Azaleas, and the finer hybrid Rhododendrons, have been kept in heat since they flowered, ought now to be turned into these pits for three weeks or a month before the time of their coming into flower, as they will be nearer the glass and will have more of the season’s light and warmth than if they were started in the open air. The best time of the year for starting them is in the autumn, and the three families will take by grafting as freely as the Apple or Pear. Gardenias that have been forced often look sadly after the first year or two, but they may be forced for a man’s life-time, and look well, if properly managed. The best plan is to allow a frame for them about this time, to turn them on of the pits, and good loam made light with leaf-mould, and a little peat, to water them well at the roots, and to close down till they begin to grow freely; and all the time never to let their leaves be dry for any lengthened period, by a free use of the syringe or a fine rose watering-pot. After that begin to give air by degrees, till, by the middle or end of July, you can expose them to the heavy night-dews, putting on the glass in the morning; and if you see the sun is too strong for them, throw a slight shade over the glass. Dwarf plants of Luculia gratissima, Rondeletia speciosa, Francisca Hopeana (but not F. latifolia), and a host of other plants of the same stamp, will make finer plants, and bloom better, when thus treated, than by any other method that I know of. In October they must all be potted and kept close in the same frame till they recover the check. I have no room to name a tithe of the greenhouse and frame plants that ought to be now turned out into warm borders.

Out-door Department.

After all the Dahlias are staked, the Rosery requires the greatest attention now. I fear we shall have another bad Rose season. The plants, being too luxuriant, begin to throw up green centres already.—D. Beaton, Shrubland Park Gardens.

State of the Weather near London for the Week ending June 8, 1843, as observed at the Horticultural Garden, Chiswick.

	BAROMETER.		THERMOMETER.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
June 2	30.0	28.0	64	51	57.5	S.W.	0.8
3	29.5	27.5	62	49	55.5	S.W.	0.2
4	29.0	27.0	61	48	54.5	S.	0.2
5	29.0	27.0	61	48	54.5	S.	0.2
6	29.0	27.0	61	48	54.5	S.	0.2
7	29.0	27.0	61	48	54.5	S.W.	0.2
8	29.0	27.0	61	48	54.5	S.W.	0.2

Mean temperature of the week 2.8° below the average.
The highest temperature during the above period occurred on the 12th and 13th, 1842—thermometer 90°; and the lowest on the 15th, 1841, thermometer 36°.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending June 17, 1843.

1842	72.1	51.1	61.6	11	0.9	1	1	1	1	1	1	1	1
1843	72.1	51.1	61.6	11	0.9	1	1	1	1	1	1	1	1

The highest temperature during the above period occurred on the 12th and 13th, 1842—thermometer 90°; and the lowest on the 15th, 1841, thermometer 36°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending June 9, 1843.

From the continued wet weather, Vegetables and all out-door productions have gone on advancing with great rapidity, and are now for the most part large and good. Gooseberries and Currants have almost attained their full size. Cauliflowers are very superior; Artichokes are as large as it is desirable to have them; Turnips and Carrots are in an excellent state; New Potatoes are very numerous, and of first-rate appearance; Peas, too, are more general, and of an excellent quality. Lettuces, small Salad, &c. abound at present. Of forced Fruits, the Grapes are now admirable, and the deep rich colouring of the black sorts is especially beautiful; Peaches and Nectarines are also superior. There are a few Plums, with a quantity of noble Melons; and Cherries, which, of moderate quality, are selling at 1s. per pound. Some cut flowers of different kinds of Iris, varieties of Erica ventricosa, Gloriosa, Boronia serrulata, Asperula odorata, Collinsia bicolor, Aconitum napellus, the double flowered Myrtle, Amaryllis Johnsoni, Gladiolus pudibundus, Epacris grandiflora, and Tropæolum Moritzianum, are exhibited; with plants in pots of several varieties of Erica ventricosa, Diosma ericoides, Saxifraga granulata plena, and others that have before been pointed out.

PRICES, SATURDAY, June 10, 1843.—FRUITS:—

Pine Apple, per lb. 4s to 10s	Cherries, forced, per lb. 10s to 15s
Grapes, hothouse, per lb. 2s to 5s	— French per lb. 10s to 15s
— Spanish, per lb. 1s to 1s 6d	Lemons, per doz. 1s to 2s
— Portugal, per lb. 1s to 3s	— per 100, 5s to 10s
Peach, per doz. 1s to 2s	Cucumbers, per brace, 1s to 2s
Nectarines, per doz. 1s to 2s	Walnuts, per bush, 10s
Melons, 6s to 10s each	Chestnuts, per peck, 4s to 5s
Apples, dessert, 1s to 2s each	Almonds, per peck, 6s
— per doz. 1s to 2s	Sweet almonds, per pound, 3s
Strawberries, per doz. 1s to 2s	— per 100 lbs. 50s to 55s
Gooseberries, per doz. 1s to 2s	Citrus Nuts, per 100 lbs. 60s to 70s
Currants, per doz. 1s to 2s	Nuts, per bushel —
Oranges, per doz. 1s to 2s	— Brazil, 1s
— per 100, 10s to 12s	— Siam, 1s
— per 100, 10s to 12s	— Hardeyana, 2s
— per 100, 10s to 12s	— Cob, 1s

VEGETABLES.

Callage, 1st quality, per ton 100s to 110s	— Spruce, or Small, per bush 1s to 2s
— 2nd quality, per ton 80s to 90s	Lettuces, Cabb., per sieve, 6d to 1s
— 3rd quality, per ton 60s to 70s	— Cos, per score, 4d to 1s
Beans, Kidney, forced, per lb. 1s to 2s 6d	— (12 to 15) 6d to 1s 6d
Potatoes, per ton, 60s to 90s	— (12 to 15) 6d to 1s 6d
— per cwt. 4s to 5s	— (12 to 15) 6d to 1s 6d
— per bushel, 2s to 3s	— (12 to 15) 6d to 1s 6d
— Kidney, per bushel, 1s 6d to 2s	— (12 to 15) 6d to 1s 6d
— Scotch, per bushel, 2s	— (12 to 15) 6d to 1s 6d
— New, per lb. 3d to 1s	— (12 to 15) 6d to 1s 6d
Artichokes, green, per doz. 3s to 6s	— (12 to 15) 6d to 1s 6d
Turnips, Spring, per bunch, 3d to 1s	— (12 to 15) 6d to 1s 6d
Red Beet, per dozen, 8d to 1s	— (12 to 15) 6d to 1s 6d
Horseradish, per bundle, 1s to 6s	— (12 to 15) 6d to 1s 6d
Radish, Spring, per doz. hands, 6d to 1s	— (12 to 15) 6d to 1s 6d
— per doz. 1s to 2s	— (12 to 15) 6d to 1s 6d
Carrots, Young Horn, per doz. 1s to 2s	— (12 to 15) 6d to 1s 6d
— Spring per bunch, 4d to 1s 3d	— (12 to 15) 6d to 1s 6d
Garlic, per lb. 6d to 8d	— (12 to 15) 6d to 1s 6d
Shallots, per lb. 1s to 1s 6d	— (12 to 15) 6d to 1s 6d
— Green, per bunch, 3d to 6d	— (12 to 15) 6d to 1s 6d
Peas, per bushel-sieve, 1s to 2s	— (12 to 15) 6d to 1s 6d

Notices to Correspondents.

MANURES.—A Constant Reader.—A couple of pounds of oil of vitriol will, we conceive, be enough to fix all the ammonia likely to be found in a load of farmyard-manure, and it ought

must stand well above the foliage; at the same time they are rather rough, and deficient in that compactness of formation which would make them available as show flowers. No. 1 wants precision on the edges of the shield, and the petals are considerably crimped at the edges; 2 is a very fine colour; 4 is not sufficiently steady, either in the colour or marking. They are fine and very ornamental varieties.*

CALCEOLARIAS.—*Alonso.*—Your seedlings are very pretty varieties, but they are not new. Mr. Standish, of Bagshot, has raised several with both flowers and spots larger.—*Dobson's Isleworth Delight*, herb-buff ground with a large bright crimson maroon blotch; this flower is rather too flat in front, but it is very large and attractive, measuring $1\frac{1}{2}$ inch in diameter.—*Othello*, ha. sh.—A very large self, of a deep rich velvety maroon, the best of the kind which has come under our notice; it is not flat but projects well in front, the outline is too much indented at the bottom, in size it is nearly equal to *Delight*.—*W. P.*—The best of your seedling Calceolarias are *Grand Monarch*, *Amato*, *Meteor*, *Simile*, *Rival*, and *Princess*; they are better in form and more distinct in the marking than the remainder, some of which are small, others bad in form, and several too common or indistinct in colour: the best of your collection are good flowers, but not equal to the finer sorts in cultivation.*

CINERARIAS.—*R. H. Bellas.*—*Wizard of the North*, this variety is beautiful in colour, but the petals are too narrow.*

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE despatches by the Overland Mail of the 1st May bring detailed particulars of Sir C. Napier's decisive victory on the 24th March. This hard-fought battle, which is scarcely less important in its consequences than those which took place during the late events in Afghanistan, was fought on the river Fullahie, about four miles from Hyderabad. The Beloochees, commanded by the Ameers, numbered 20,000 men, while the British force was only 5,000. Notwithstanding this disparity of numbers, the enemy were defeated and dispersed after a hand-to-hand fight of three hours, in which a large number of their guns and standards were captured; 1,000 men killed; 4,000 wounded, and all their leaders, with one exception, made prisoners. The towns of Meerpore and Oomercote were immediately taken; and thus the power of the Ameers, who for more than half a century have ruled the fertile districts along the Indus, has been utterly overthrown. These achievements were not accomplished without a considerable loss on our part, in killed and wounded; and the despatches are filled with accounts of personal gallantry which may be classed among the most remarkable exploits of our army. Scinde, as before announced, has been annexed to the British territory, and Sir C. Napier is actively engaged in arranging measures for the government of the conquered districts. From China our news comes down to the 12th March. It states that in consequence of the sudden death of the Imperial Commissioner, a considerable delay in the settlement of the treaty and commercial tariff was anticipated. Many of the difficulties which had arisen were supposed to be occasioned by the intrigues of the Hong merchants at Canton, who are jealous of the opening of the other ports.—From France we learn that the Committee on the Budget for the ensuing year have proposed considerable reductions on the Ministerial estimates; several grants have been altogether rejected, and others are expected to become the subject of party struggles, which may seriously embarrass the Cabinet and possibly endanger its existence.—The news from Spain announces a succession of insurrectionary movements which have taken place in different towns of Catalonia; but the prompt measures of the military authorities, by preventing their becoming general, have deprived them, in a great measure, of their importance. Attempts have been made to excite similar movements in the northern provinces, but hitherto without success; and it is hoped that the decided steps adopted by the Government will effectually prevent any general outbreak.—From the United States we learn that Sir Charles Bagot, notwithstanding the apparent improvement in the last reports, expired on the 19th ult., after a long illness attended with considerable suffering. The Canada papers advert to the fact that the changes he introduced into the constitution of the colony will hereafter be regarded as the most important events in its political history: and even those who were most opposed to the policy of his measures unite in paying a cordial tribute of respect to his memory and to the excellence of his personal character.

At home, in the absence of the usual excitement of Parliament, there is little to record. The proceedings in the Court of Queen's Bench in the case of Mr. Feargus O'Connor have terminated in the admission of the alleged defect in the indictment, the Judges having unanimously decided that the omission of the venue in the fifth count renders it absolutely void. As Mr. O'Connor was only found guilty on that count, the decision of the Judges amounts of course to an acquittal, and Mr. O'Connor is consequently at large. The Repeal agitation continues in full force, and money to the amount of many hundreds of pounds is still contributed to the weekly rent. Fresh dismissals of magistrates have led to the resignation of the commission by other gentlemen who disapprove of the proceedings of the Irish Chancellor, and in the meantime the Government are making

extensive military and naval preparations to suppress any outbreak of rebellion.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses, left town on Saturday for Claremont, and returned to Buckingham Palace on Thursday in excellent health. On Monday her Majesty and the Prince drove from Claremont to Windsor. The Queen did not visit the Castle, but remained at Adelaide Lodge while his Royal Highness walked to the Castle through the Park. His Royal Highness was met on the north terrace by the Clerk of the Works, who reported the progress made in the various alterations and improvements going forward at the Castle since his Royal Highness's last visit. The Prince did not go over the Castle, but returned to the Lodge through the new walks, attended by Mr. Ingram, her Majesty's head gardener. The Earl of Warwick has succeeded the Earl of Hardwicke as the Lord-in-Waiting on the Queen.—The King of Hanover arrived, as we announced in our last, on Friday evening, and took up his residence at St. James's Palace. His Majesty immediately visited the Queen, the Queen Dowager, and other branches of the Royal family. On Monday, being his Majesty's birthday, the event was celebrated with the usual honours at Kew, and the principal members of the nobility in town paid visits of congratulation to his Majesty. In the evening the Queen Dowager gave a state dinner to his Majesty and other members of the Royal family, in commemoration of the day. On Monday the King honoured Sir R. Peel with a visit, and on Tuesday dined with the Duchess of Gloucester. On Thursday the King honoured Mr. and Mrs. Laurence with a visit at Ealing Park, and dined in the evening with the Marquis and Marchioness of Londonderry.—Her Majesty the Queen Dowager, attended by the Prince of Saxe Weimar and her suite, left town on Wednesday by the London and Birmingham Railway, to pay a visit to Croome Court, the seat of the Coventry family in Worcestershire, which, should her Majesty approve of the situation, will, in all probability, be taken as her winter residence. After inspecting the Hall and going over a portion of the grounds, her Majesty departed by Upton to Malvern to dine and pass the night previous to her return to town.

Gazette Announcements.—The Queen has been pleased to nominate his Royal Highness Prince Albert to be the First and Principal Knight Grand Cross of the Order of the Bath, and to appoint his Royal Highness Acting Grand Master of the Order, in the room of his late Royal Highness the Duke of Sussex. The Queen has been pleased to direct letters patent to be passed under the Great Seal, granting to his Royal Highness the Duke of Cambridge the offices of Chief Ranger and Keeper of Hyde Park and St. James's Park, in the room of his late Royal Highness the Duke of Sussex.

The Army.—The Ministerial papers announce that Government last week entered into a contract with Messrs. Learmouth, the principal army accoutrement makers, for 10,000 sets of accoutrements, to be supplied forthwith. This order confirms the general impression that the army is about to be considerably increased.

Parliamentary Movements.—The Nottingham Election Committee have reported that Mr. Gisborne was duly elected member for that Borough. The Lord Advocate of Scotland is to offer himself for the county of Argyle in the room of Mr. Campbell, of Monzie, who has retired. It is not expected that there will be any opposition.

Royal Commission of Fine Arts.—Her Majesty's commissioners have given notice:—1. That whereas various statues in bronze and in marble, of British Sovereigns and illustrious personages, will be required for the decoration of the New Palace at Westminster, artists are invited to send models to be exhibited, for the purpose of assisting the commissioners in the selection of sculptors to be employed. 2. The models are to be sent in the course of the first week in June, 1844, to a place of exhibition hereafter to be appointed. 3. The specimen, or specimens not exceeding two in number, to be sent by each artist, may be either prepared for the occasion, or selected from works already executed by him within five years prior to the date of this notice. 4. The works may be ideal or portrait statues, or groups, but not relievi. The subjects are left to the choice of the artists. The materials are to be such as are commonly used for models and casts. The dimensions are to be on the scale of an erect human figure, not less than three nor more than six feet. 5. The invitation to send works for the proposed exhibition is confined to British artists, including foreigners who may have resided ten years or upwards in the United Kingdom. 6. Artists who propose to exhibit are required to signify their intention to the Secretary, on or before the 15th of March, 1844.

Post-Office.—A pamphlet has just been published by Mr. Rowland Hill on the subject of Post-office reform, in which he points out several defects in the existing system, and suggests various remedies for the purpose of affording additional convenience to the public. On the defects which still exist Mr. Hill observes that—"Of the 2,100 registrars' districts, comprised in England and Wales, about 400, containing a million and a half of inhabitants, have no post-offices whatever. The average extent of these 400 districts is nearly 20 square miles each, the average population about 4,000. The average population of the chief place of the district about 1,400, and the average distance of such chief place from the nearest post-office between four and five miles. In one instance (in Lincolnshire) the chief place of the district, containing nearly 1,000 inhabitants, is as much as 16 miles from the

nearest post-office, and in some parts of Wales the distances are even greater than this. But striking as these facts are, they by no means indicate the full extent of the evil. An inspection of the Post-office maps will show that even in England, where the ramifications of the Post-office distribution are more minute than in any other part of the kingdom, there are districts considerably larger than the county of Middlesex into which the postman never enters." Mr. Hill adverts to the lateness of the morning general-post delivery in London as a point of great importance to mercantile men. In some parts of the town it is generally ten or eleven o'clock, and in the immediate suburbs eleven or twelve o'clock. Occasionally it happens that all the letters are detained by the late arrival of a single mail; and Mr. Hill says, generally "the time occupied in sorting and delivering a letter frequently exceeds that required in bringing it from Bristol." It happens, in many cases, that an early delivery is of the greatest importance, and in order to secure it letters are sent as parcels by the very trains which convey the mails. To meet these defects, Mr. Hill proposes the following remedies:—"By uniting the letter-carriers of both the general and district posts in one corps, the force employed in the delivery under consideration might be doubled; and as there are very few district-post letters at this early hour (not a twelfth of the combined numbers), this first general delivery, by far the most important of the day, would be accomplished in about half the present time. A similar union of the two corps of sorters, with some other improvements, would effect a similar saving of time in the preparation of the letters for delivery; and there is no doubt that under the combined operations of these improvements, with little or no additional expenditure, and without increasing the labour of the men, the delivery might be completed, even in the remote parts of London, by nine o'clock. The striking advantages of this union are abundantly manifest when it is known that in addition to the fact of the district-post letters being the least numerous when the general-post letters are most so, the time of greatest pressure in the district department is precisely that at which the general-post department is closed for the day. Nor does this union involve any serious innovation; since the present division is peculiar to London, not extending even to the suburbs, and is for certain purposes already set aside every day. With hourly deliveries the present general detention of the letters, in case of a single mail arriving late, would be obviously unnecessary." In regard to the London district-post, formerly the twopenny-post, it is well known that the interchange of letters by this post is now so slow that special messengers are frequently employed by the public. "The time," says Mr. Hill, "ordinarily required to send and receive a reply between one part of London and another, is between seven and eight hours, and between London and the suburbs ten or eleven hours, even when night does not intervene." When night intervenes the time between sending a letter and receiving an answer is greater, amounting, in some cases, to 21 hours. Mr. Hill's remedies are these:—"In London make the collection and delivery of letters once an hour, instead of once in two hours; and establish district offices, so as to avoid the necessity of making all letters, as at present, pass through St. Martin's-le-Grand. In the principal suburbs make some increase in the frequency of delivery of letters, and much more in their receipt and transmission to London, where comparative frequency of delivery is already provided for. As regards the compact parts of those suburbs which can be reached by the night mails, say by a quarter before nine o'clock, effect a delivery the same night, instead of the following morning, as at present. This would be much more convenient to the public than the additional delivery recently established, and would cost nothing (except perhaps a trifling increase of salary to the letter-carriers), whereas the recent additional delivery costs 4,000*l.* per annum." Mr. Hill calculates that these arrangements would reduce, by one-half, the time necessary for an interchange of letters; and the improvement if combined with others, might be effected with little or no additional expense, and without adding to the labour of the men. The postage in the London district on packets exceeding an ounce is now higher than before the general reduction, and checks the transmission of larger packets which formerly went through the Twopenny post. The higher rate of postage in this case was no part of Mr. Hill's original plan. He recommended that the rate for all district posts should be fixed at 1*d.* for two ounces, and 2*d.* for four ounces; and he now repeats the same proposal, with the additional reasons in its favour furnished by experience of the existing system.

Foreign.

FRANCE.—The Paris papers are mostly taken up with extracts from the London journals relative to the progress of the agitation in Ireland, and with the report of the committee of the Chamber of Deputies on the budget of 1843. This voluminous document, which contains 335 quarto pages, gives anything but a favourable picture of the state of the finances. By the Government plan the ordinary expenses were estimated at 1 milliard, 281,013,710 francs. The committee proposes to reduce this sum to 1 milliard, 262,064,633*f.* Economy indeed appears to be the order of the day in the resolutions of the Chamber. On Monday and Tuesday it refused some augmentation in the expenses of the French establishment at Pondicherry, which no longer pays its expenses. The Minister asked for 8,000*l.* for the charitable part of the *jétes* of July, which, in consequence of the melancholy fate of the late Duc d'Orleans, are to be solemnised this year merely by alms and funeral services. Grants to the Italian opera and to other theatres have been rejected by the commis-

sion, with a hint that so fashionably attended a place of amusement ought, at least, to pay its expenses. Increased grants to the clergy have been also rejected. Four millions of francs demanded for works on the Strasbourg and Paris railroad line have been rejected, on the ground that the company has offered to take the line when completed. The commission also objected to Government holding and working any railroad, even the small lines joining Lille and Valenciennes to the Belgian frontier. But all these reductions and questions will come before the Chamber during the discussion of the budget. —The announcement in the English papers last week to the effect that the Sandwich Islands had been taken possession of in the name of her Majesty, caused a great sensation in Paris on Thursday, and produced a letter from Messrs. Timoteo Haalilio and William Richards, calling themselves Envoys of his Majesty King Kamehameha III. to his Majesty the King of the French, who protested against this wanton aggression of England, and threaten her with the consequences! They state that the Sandwich Islands are civilized, Christian, and independent, and that their independence was acknowledged by the United States on the 19th December, 1842, and by the British Government itself on the 1st of April last. —A letter from Tarbes, in the *Mémorial Bordelais* of the 28th ult., contains the following strange account:—"On Tuesday last, at 6 in the evening, a luminous meteor, having its direction from east to west, passed through the village of St. Martin, on the road to Bagneres. In an instant all the houses, with the exception of three, were entirely destroyed, and the materials were scattered over the fields. Fortunately, no person was killed, but several were injured. After having levelled houses, barns, &c., and torn up immense trees, the meteor, carried onwards by an impetuous wind, took its course towards the villages of Bernac-Debat, Barbagan-Debat, and Angos, destroying everything on its passage." The *Abeille des Hautes Pyrénées* gives the following additional particulars of the whirlwind. The storm lasted about ten minutes, and was unaccompanied by any rain. At St. Martin 50 houses were overturned, and a part of the roof of the church taken off. A windmill near the village was totally destroyed. At Bernac-de-Bois 3 houses were blown down, and 12 more or less injured. At Allier nearly every house was unroofed; and at Angos, not only were several houses much injured, but, for a distance of 2 miles, almost every tree was pulled up or shattered. Oaks of great age, which had hitherto escaped unhurt in all attacks of the elements, were uprooted. The crops were much injured, and large hailstones of a flat form, with chesnut leaves in their centre, were found in some places.

SPAIN.—The Madrid journals of the 29th ult. contain details of an attempted insurrection at Malaga. On the arrival on the 23d of the news of the resignation of the Lopez Cabinet, the National Guard and Municipality assembled, and a Junta was formed, which forthwith issued a proclamation, urging the inhabitants not to acknowledge the Regent's Government until the restoration of the Lopez Administration, and the accomplishment of their programme. This movement was fortunately checked by a reaction which took place on the 26th, when the Junta was dissolved, and the authorities recovered their ascendancy. A movement took place in the morning of the 30th, at Reuss, a considerable town in Catalonia, where the deputies, Colonel Prym and Capt. Milans, published a proclamation calling upon the people to take arms in defence of "the innocent Isabella," who was in the parricidal hands of those who had violated the constitution, and who maintained themselves in power by means of money received from an ally who coveted the possession of Cuba and the Philippine Islands," meaning, of course, Great Britain. Letters from Barcelona state that Colonel Prym had presented himself at the head of 3,000 militia and volunteers before Tarragona, but that the gates having been closed, he was obliged to retrace his steps. The Captain-General had detached from the garrison of Barcelona, in the direction of Tarragona, a regiment of infantry, with some cavalry, and ordered General Zurbano to organize a second brigade, and take command of the forces sent against the insurgents. The garrison of Montjoui had been relieved, and replaced by the Regiment del Principe. It was reported that the tocsin had been sounded in the villages adjoining Barcelona, and that the insurrection had spread all over the province. Barcelona, however, was tranquil. Letters from Bayonne of the 3d inst. state that the news of an alleged outbreak at Grenada, and the formation of a Junta presided over by Captain-General Santa Cruz, had filled with hopes the Christiano refugees residing along the Spanish frontier. All their attempts, however, to create insurrectionary movements at Bilbao, and in the northern provinces, had hitherto proved unavailing. The *Gazette* of the 30th contains an order from M. Mendizabal directing the chief of the Treasury to forward in bills on London 50,000*l.* out of the proceeds of the third instalment paid by the house of Rothschild on account of the quicksilver contract, to be applied to the payment of the half-yearly interest of the Three per Cent. Stock, coming due on the 30th inst.

PORTUGAL.—We have Lisbon news to the 29th of May. It had been determined at a Ministerial Council to keep the Cortes assembled for a full month longer, the object being to give full discussion to the Finance Minister's important measures. The Deputies had at length addressed themselves to the budget, and had passed the item raising the Custom House emoluments for the foreign dividends from 6 to 10 per cent. They had likewise passed, in substance, the tax on fresh fish for the same purpose. A bill had passed the Deputies for the re-erection of the lately burnt College of Nobles. There was no intimation as yet of any proposition for

renewing the tariff negotiations. The law reducing by one-half the Customs' duties at the Island of Madeira had passed both Chambers. There was no appearance of the Pluton with the Princess Clementine of Orleans and the family of Saxe-Cobourg, but they were hourly expected. The Grande Antille, *alias* Gloria, a Spanish slave-vessel, taken under Portuguese colours at Mosambique, about which so much dispute has prevailed, had been amicably disposed of to the Spanish Government, who pay the fine and liabilities, and make her a vessel of war. She had taken her Spanish crew on board and sailed for Cadiz.

BELGIUM.—We learn from Brussels that Mr. Gachard, keeper of the Royal archives in that city, and Mr. Hanssen, first clerk of the Home Department, have gone to Spain, by command of King Leopold, for the purpose of examining the archives there, and to procure copies of all important documents which can throw new light upon Belgian history. The Spanish Government having granted all possible facilities, this mission promises highly interesting and important historical results.

HOLLAND.—Letters from Utrecht of the 3d, mention that on the evening of the previous day, about 8 o'clock, a meteoric stone fell in the commune of Blaauwkapel, about a league from the city. After a violent explosion, repeated three or four times, resembling a discharge of artillery, a whistling and howling noise was heard, which excited much anxiety and alarm among the villagers. The servant of a farmer, who was bringing some horses home from the field, saw at a short distance a heavy body fall to the ground with such violence that the sand was raised to a considerable height in the air. Having procured a spade, he returned to the place, and found the stone at the depth of 3 feet in the stratum of sand which extends below the clay. It weighs seven pounds, is of a longish irregular shape, and covered with the black crust peculiar to these bodies, which is broken off only in one place, where the internal grey matter of the stone appears.

GERMANY.—Accounts from Vienna mention the return of the Imperial family, with Prince Metternich, from Presburg. Among the *Postulates* submitted by the Hungarian Diet, just opened by the Emperor in person, are the following important bills:—To limit the Royal veto, so far as to give the force of law to any measure twice adopted by the two Chambers; to incorporate Transylvania with Hungary; to give additional securities for liberty of speech and liberty of the press; to establish an official Gazette for registering the proceedings of the Diet; to incorporate Galicia with Hungary; to exclude all persons not Hungarians from the Hungarian army, and to direct that the Hungarian regiments, except under extraordinary circumstances, shall not be required to quit their own country; to abolish entailments of property; and to promote and encourage the native Hungarian language. The Royal propositions or Government bills, on the other hand, are eight in number, and aim chiefly at an improved criminal code, the prevention of the excesses that have so frequently occurred at the elections of deputies, to redress the grievances complained of by the constituencies of cities, and several bills of a financial character. Among the bills remaining from former sessions, and likely to be again brought forward, are—one to confer on individuals, not of noble birth, the power of holding landed property;—and another intended to place the different religious professions on a footing of greater equality.—The Prussian papers mention that considerable improvements have been introduced in the steam navigation between Hamburg and Magdeburg. The boats now leave each city twice a week, and perform the voyage up the Elbe in 32 hours, and down in 16. The consequence is, that even persons going from Hamburg up the river and taking the railroad from Magdeburg, are able to arrive at Berlin in several hours less time than by the *Schnellpost*, or mail diligence. The steamers have also been altered so as to draw much less water than formerly, and the company express a confident belief that even in the driest summers the navigation on the Upper Elbe will not in future be interrupted. The King of Prussia left Berlin on the 30th ult. for Stettin, and probably for Königsberg and Dantzic. His journey will take several weeks, and her Majesty the Queen intends to pay a visit during this period to her Royal sister at Dresden.

ITALY.—Letters from Rome under date of the 20th ult. mention the arrival in that city of the Marquess of Douglas with his bride, the Princess Mary of Baden. They also state that the Pope has given authority to a Company of the Duchy of Modena, to construct a railroad from Rome to Civita Vecchia. We lately noticed the excitement produced at Rome by the appearance of Lord Chesterfield's foxhounds on the Campagna. We now learn that the Roman citizens have been no less astonished by a match of cricket, played on the 22d ult., by a party of English gentlemen, who, having indulged themselves in a short practice at this truly English game, made a match for 500 scudi aside—Oxford and Cambridge against all the world. The match was played in the ground of the Borghese Villa, in the presence of an immense concourse of spectators. Letters from Naples of the 28th ult. announce the arrival in that harbour of the Brazilian squadron, sent under the command of Rear-Admiral Porpeire to convey the future Empress of the Brazils to Rio Janeiro. The squadron made the passage from Rio to Naples in 75 days.

GREECE.—Letters from Athens of the 20th ult. state that the poverty of the country had never been so great, that property was every day falling in value, and that specie being scarce, trade was carried on by barter, even around the capital. The Government had commenced disbanding some of the Greek troops, and reduced the pay of others, whilst the Bavarians were left in the enjoyment of their larger salaries. Strange rumours had cir-

culated for some days in that capital. A successor for King Otho was talked of, as if the latter had abdicated, and three candidates for the throne were mentioned—1st, the Duke of Leuchtenberg, son-in-law of the Emperor of Russia; 2d, the Duke of Cambridge; and 3d, Prince Augustus of Saxe Coburg, who lately married Princess Clementine, of Orleans. It is added that the agents of Russia are the authors of these reports. They assert that King Otho will never consent to give the country a representative Government, and that he will be compelled to abdicate.—A statue larger than life, and executed in the Egyptian style, has been found near Marathon, and brought to the Museum of Athens. The figure has an iron disc in each hand. Some assert that it is a representation of Antinous; others consider it an Apollo.

TURKEY.—Accounts received by way of Vienna announce the complete pacification of Bosnia. The insurrection was, however, only put down by the Pacha's yielding to the demands of the insurgents, sending away the Arnauts, and placing the contributions on the old footing. They also state that Prince Alexander of Serbia had succeeded in procuring 30,000 signatures to a petition in his favour, which has been forwarded to Constantinople, and it was generally believed that he would be re-elected. —Reschid Pacha, former Ambassador at Paris, is appointed Governor of Adrianople.

EGYPT.—Letters from Alexandria of the 17th ult. announce that the mortality amongst the oxen still prevailed throughout Egypt. Of those imported from Sennaar more than 5000 had died. The plague likewise had broken out at the Sharkie, at Mansura, and at Damietta; and at Alexandria a few cases had appeared. They also speak in very sanguine terms of the probability of a junction between the Red Sea and the Mediterranean, by means of a canal cut through the Isthmus of Suez. The Pasha has recently had an interview with the Consuls of the European nations to discourse with them on the subject. The Austrian Consul has been especially charged by Prince Metternich to sound the feeling of the Consuls; and the general belief in Egypt is that some project for accomplishing the work will soon be adopted.—Among the miscellaneous cargo carried out to Egypt last week by the Great Liverpool, was a case of six salmon, caught in the river Tert, near Southampton. They were well packed in ice, and there is little doubt of their arriving at their destination in good condition. As this description of fish has never yet been seen in Egypt, it will indeed be a rarity.

INDIA.—The despatches by the Overland Mail of the 1st of May have arrived this week. They bring the important details of the victory gained by Sir Charles Napier, on the 24th March, near the River Fullahie, in which their last effort was made by the Ameers, who during 60 years have ruled the fertile districts along the Indus. These details are of high interest, and the military portion of them will be found in the extracts from the despatches under our Miscellaneous paragraph. It appears that Sir C. Napier, having learned that the enemy had taken up a strong position on the River Fullahie, four miles from Hyderabad, moved out on the 24th March to attack them. His force consisted of about 5,000 men, with 17 guns and howitzers. He was for three hours closely engaged in a hand-to-hand fight with a body of 20,000 Beloochees, and after a gallant and severe struggle defeated and dispersed them; 11 guns and 19 standards were captured, and 1,000 men are supposed to have been killed: probably 4,000 more were wounded. Shere Mahomed, the leader of the force, escaped. Our loss amounted to 39 killed, and 231 wounded; amongst the former are Captain Garrett, of the Bengal 9th Cavalry, and Lieut. Smith, of the Bombay Horse Artillery; Lieut. F. Burr, 21st Native Infantry, has since died of his wounds. The town of the Meerpore was soon taken, and its Ameer, Shere Mahomed, who made this last attempt at resistance, fled to the desert. Oomercote, another important position, in the direction of the British territories around Deesa, was taken on the 4th April by the bold enterprise of Lieut. Brown, Aide-de-Camp to Sir C. Napier. The conduct of this officer has called forth universal praise. Sir C. Napier, who was employed in regulating the conquered districts, considers Scinde as completely subdued for the present. The Beloochees of the mountains will, it is thought, make some attempt at the termination of the monsoon to assail the British, but there is nothing serious apprehended. The Ameers of Scinde arrived at Bombay on the 19th April, where they were received with distinction, and sent to reside under a strong guard at Malabar-point, Government-house. One of them, who is represented as a dangerous character, and who had gained notoriety from his being implicated in the murder of Captain Ennis, and in the attack on the British Envoy, was confined in Fort George. The place of their ultimate confinement was not known; Phoolshair, an old palace of the Peishwa, 17 miles from Poonah, was spoken of. Of 200 ladies, composing their Zenana, only 30 have volunteered to follow the future fortunes of their masters.—The insurrectionary movement at Sirhind, noticed in the announcement which we published last week, appears to have been of some importance. The territory of Khytul being about to lapse to the British Government by the death of the chief, the widow resolved to keep possession for herself, and raised the country. Two companies of the 72d Native Infantry, stationed at Khytul, were attacked in this quarter, and compelled to retreat rapidly on Kurnaul, with the loss of 30 or 40 men. Lieutenants Whistler and Farre were severely wounded. Heavy reinforcements were immediately sent out, and the insurrection, it is supposed, will be suppressed without difficulty.—In the interior of India tranquillity prevails; the mountainous districts of Bundelkund form the only exception; but the attention of the Government was directed

to the necessity of establishing peace there. The news from Afghanistan represents Akbar Khan as having lost much of his popularity. He had come about the middle of March to Jellalabad to meet his father, Dost Mahomed, who was going from Peshawur towards Cabul.—The remains of the late Sir W. Macnaghten have been recovered by his widow. The body had been recognised by the absence of the head and the arm, which had been cut off by his assassins. The body is now on its way to Calcutta for interment, having been recovered, by the payment of a large price, from the well into which it had been cast. Several smart shocks of an earthquake have been felt in the Deccan, but attended with nothing serious. The Governor-General continues at Agra, and has expressed a wish to visit Hyderabad, the capital of Scinde. His Lordship, who was said to have received notice of his elevation to an earldom, had become a favourite with the army. His rule in India had become remarkable for the abolition of slavery in every part of this country within the British rule. The following paragraph relating to Col. Stoddart and Capt. Connolly is given on the authority of a Loodianah letter, and though it certainly forms a striking contrast to the information sent home by Government some months ago, on the authority of our Persian Envoy, to the friends of these unfortunate gentlemen, still too much reliance is not placed on it by the Indian papers. It corresponds, however, in a remarkable manner with the account quoted by us from the Dublin papers last week:—"Loodianah, March 23, 1843.—The report last month was, that Col. Stoddart and Capt. Connolly had been murdered, but there is a Jew here who declares that they are still alive, and that he heard from a brother of his at Bokhara, who told him a Greek interpreter and a slave, who had been for months confined in the same well with them, were taken out and executed, and the populace made to believe that they were Colonel Stoddart and Captain Connolly. The man has very good testimonials of character, and has offered (without reward) to convey a chit to them, and bring back an answer in the course of five months."

CHINA.—The news from China, which comes down to the 12th March, states that, in consequence of the sudden death of Elepoo, the Imperial Commissioner, after a feast at Canton, apprehensions were entertained of the settlement of the treaty and commercial tariff being considerably delayed. The most singular stories were afloat among the Chinese regarding the death of the Commissioner. According to some he had been poisoned, and others even said that so onerous were the duties of his office, that in a moment of disgust he broke his own head with his inkstone—the stone on which the Chinese prepare their ink. Keying, a cousin of the Emperor, was spoken of as likely to take the place of the Commissioner; and Sir H. Pottinger had declared his intention to proceed to the northern ports, in order to carry on the negotiation there. Many of the difficulties that interpose in the arrangement of the business are supposed to arise from the intrigues of the Hong merchants at Canton, who do not wish that the other ports should be opened. At all the other places the inhabitants showed the most friendly feelings towards the British. The Vixen steamer, with Colonel Malcolm on board, was expected at Hong-Kong about the middle of March.

CAPE OF GOOD HOPE.—The expedition against the rebellious Boers has at length terminated without bloodshed, and the Lieutenant-Governor has returned with the greater part of the troops, leaving a garrison of about 300 men at Colesberg, which may protect the native inhabitants against ill-treatment on the part of the Boers. With respect to the port and country of Natal, the rumours are that the British Government will take full possession either as a separate Government or a dependency of the Cape. The colony has been desolated by immense swarms of locusts, which left their eggs in the earth; and now these are hatched, the whole country swarms with them, hopping about for several weeks until they get wings, and destroying every blade of grass. It is said to be impossible to form an idea of the enormous quantity without seeing them. It is, however, hoped they may leave as soon as they can fly, but others would probably supply their places. If the locusts were away, there would be a chance of grass for the winter, but it was feared that they will destroy everything.

UNITED STATES.—The Great Western steam-ship arrived at Liverpool on Thursday morning, after a rough voyage, which has occupied thirteen days and a half, during a great part of which she experienced strong head winds and squally weather. She has brought 128 passengers. Sir Charles Bagot died at Kingston on the 19th ult.; his sufferings from disease had been severely protracted, but although a martyr to bodily ailment, his mental faculties remained clear and unclouded to the last. A public dinner was given to Mr. Webster at Baltimore on the 19th ult., at which he delivered a speech which has excited very considerable attention, as it is supposed to denote the future policy of the American Government as regards Great Britain. He is in favour of a considerable reduction of duties in the American tariff, and expresses a strong wish to see a low scale of fixed duties adopted by this country for the admission of the agricultural produce of the United States. As regards wheat and flour, he seems to think it futile to expect that that principle will be carried out at present by the British Ministry; but he urges a reduction of duties on rice, tobacco, and Indian corn—more especially the latter, which is produced in enormous quantities in most of the wheat-growing States, and which is little known and less used in England. This speech has naturally excited great interest—the result of Mr. Webster's late official position, and the high rank on the score of talent and character

which he holds amongst his countrymen. Although no longer connected with the Cabinet he is believed to speak not only the sentiments of President Tyler himself, but also the feelings of the wealthy manufacturers and merchants of the New England States. The American embassy to China is to consist of Mr. Cushing, "Grand Commissioner;" Mr. D. F. Webster, "Grand Secretary;" Mr. John Tyler, jun., Private Secretary; and Mr. J. R. Peters, jun., as Agent of the American Institute. A number of attachés are also spoken of as likely to join the missions connected with the principal families and leading public institutions of the United States. The Mexican forces, amounting to 2,000, had been captured by the Yucatanans, whom they went to invade, near Morida. The want of provisions is stated to have been the cause of the surrender. An action at sea between a Mexican steamer and the Yucatanese, ended in the defeat of the former and the capture of the steamer. By the articles of capitulation the Mexican force was to embark for Tampico within eight days, leaving their arms behind. Mr. Louis Bourbon, who was one of the Canadian patriots of 1839 sent into exile in New South Wales, made his escape from that place, and arrived in New York on Monday by the brig Russian, from Rio Janeiro. He declines to state the manner of his escape, as it might possibly implicate other persons concerned. During the first two years of his exile he acted in the capacity of clerk to the Government, closely confined, however; but at the end of that time he was permitted to enjoy the freedom of the colony. He proceeds immediately to the frontier, where he expects to meet his family, from whom he has been absent about four years, after which he goes to France. Mr. Bourbon is son-in-law of Speaker Papineau, so well known in Canada.—The project of transporting the cotton from the upper settlements on the Brazos to the mouth of the river, by means of gum-elastic bags or floaters, has proved entirely successful. The *Planters' Gazette* notices the arrival at Columbia of between 400 and 500 bales, the greater part of which was floated down the river in gum-elastic bags. Cotton can be conveyed by means of these bags from any point where 6 inches of water can be found, and the cost is not greater than if it were transported on flat or keel boats.—Intelligence has been received of the loss of the fine packet-ship the *Great Britain* on her late outward passage to New York, together with the whole of her cargo. She was frigate-rigged, of 404 tons burden, and was built at Quebec in 1839. On the 30th March she experienced a terrific hurricane, carried away her foremast, and sprung a leak, which the greatest exertions could not keep under. The leak increased so fast that all hands abandoned all hopes of being saved; happily, however, the ship Philadelphia, bound to Boston, hove in sight just before the packet sank, and was the means of saving the lives of both crew and passengers.

Parliament.

HOUSE OF LORDS.

Friday.—Their Lordships met this day for the first time after the Whitsun holidays.—The LORD CHANCELLOR communicated to the House a message from the Crown, containing her Majesty's gracious permission to the nuptials of the Princess Augusta and the Hereditary Grand Duke of Mecklenburgh-Strelitz, and trusting to their Lordships taking into consideration the propriety of making a suitable provision for the illustrious Princess. On the motion of the Duke of WELLINGTON, the message was ordered to be taken into consideration on Tuesday.—The Duke of WELLINGTON, in answer to observations by the Marquis of CLANRICARDE, said that the Lord Chancellor of Ireland had given his opinion in writing that the meetings held in Ireland for a repeal of the Union had a tendency to outrage, and might be dangerous to the State. It appeared obvious to him (the Duke of Wellington) that outrage and bloodshed might be the result of such meetings; and it was equally clear that Lords Lieutenants of counties attending such meetings were not the persons for the Government of Ireland to confide in; consequently the Lord Chancellor had taken steps to remove certain parties from the commission of the peace. There could be no objection to meetings for the repeal of an Act of Parliament, but the peace of the country could not be permitted to be broken.

HOUSE OF COMMONS.

Thursday.—The Commons assembled this day, pursuant to adjournment, but, forty Members not being present when the Speaker took the chair, a "House" could not be made.

Friday.—Mr. BERNAL, in the absence of Mr. C. Wood, chairman of the Nottingham Election Committee, reported to the House that the committee had resolved that Thomas Gisborne, the younger, Esq., had been duly elected to serve in the present Parliament for the town and county of Nottingham.—In answer to questions by Sir A. L. HAY, Sir J. GRAHAM said that it was the intention of her Majesty's Government to bring forward a measure relating to the Church of Scotland, but it was not intended to propose any grant of public money.—Sir R. PERL appeared at the bar, and announced a message from her Majesty. The message having been brought up, it was read by the Speaker, and in effect was, that her Majesty informed her faithful Commons that she had given her Royal Assent to the marriage of her Royal Highness the Princess Augusta of Cambridge with his Royal Highness the Prince of Mecklenburgh-Strelitz; and from the many proofs of attachment which had been manifested toward the Crown, she had no doubt but that a suitable provision would be made for her Royal Highness on her nuptials.—Sir ROBERT PERL then moved that her Majesty's Message be taken into consideration on Monday next.—In reply to a question by Mr. EWART as to what numbers constituted an illegal meeting, Sir J. GRAHAM said he did not think that the question was one which any individual Member of Parliament would be justified in answering. The hon. Member himself belonged to the legal profession, and therefore ought to know the law himself. He (Sir J. Graham) did not say that numbers constituted illegal meetings, but he considered that numbers was a most important ingredient. He did not say that any number, however great, made a meeting illegal; but it formed a subject, under some circumstances, for important consideration.—Mr. EWART asked the hon. Bart. the Member for Oxford whether it was the intention of the authorities at Oxford to publish the decision relating to Dr. Pusey.—Sir R. INGLIS protested against the hon. Member asking him such a question. He might as well ask the hon. Member whether Dr. Macfarlane, or any other member, had seceded from the Church of Scotland. He had no control over the authorities at Oxford.—Mr. R. YORKE asked if it was the intention of Government to bring in a new bill relating to the Poor-laws during the present session?—Sir J. GRAHAM said he should ask leave, next week, to introduce some new clauses into the present Poor-law Act, but it was not his intention to introduce a new or extended measure.

CITY.

Money Market, Friday.—Consols for the Account closed at 92½. Three per Cent. Reduced, 93½ to ½; Three-

and-half per Cent. Reduced, 100½ to ½; Bank Stock, 179; Exchequer Bills, 51s. to 53s. prem.

Metropolis and its Vicinity.

Visit of Her Majesty to Scott's Stables, near Leatherhead.—On Monday week, the day before the court left Claremont for Buckingham Palace, her Majesty proceeded in an open landau, attended by the Countess of Mount Edgcombe, to Scott's stables, near Leatherhead, for the purpose of witnessing the gallops of Cotherstone, the Derby favourite, and the other horses engaged in the race. Prince Albert accompanied her Majesty on horseback, attended by the Earl of Hardwicke, the Hon. Colonel Grey, and Colonel Wyld. Immediately after the unexpected arrival of her Majesty, the whole of the horses entered for the Derby in the stables were taken to Leatherhead Downs, where they performed their gallops, Cotherstone taking the lead. The horses having returned to the stables, her Majesty and the Prince passed through and inspected the extensive training establishment of Mr. Scott, and afterwards took their departure for Claremont. Her Majesty and his Royal Highness left a handsome present for the grooms and others connected with the stables.

Court of Aldermen.—On Saturday the Committee of Aldermen assembled, for the purpose, it was understood, of bringing to a close the long-protracted inquiry relative to Alderman T. Wood and the Talacre Coal and Iron Company. Mr. Alderman Brown read a report relative to the whole of the proceedings relative to Alderman Wood and his connection with the Talacre Coal and Iron Company, which in a great measure went to re-open the case, being founded principally on the affidavits exhibited in the Court of Queen's Bench relative to the Brinn mines. Alderman T. Wood complained of the manner in which the report had been drawn up, and requested to be allowed a copy of it, for the purpose of correcting the errors which it contained, before it was sent round, which was agreed to. An angry discussion, partaking, in a great measure, of a personal nature, ensued, and was terminated by the postponement of the business for a fortnight; the announcement of which created some surprise, as the proceedings had already extended over a period of eight months.

The Polish Ball.—On Monday night a grand fancy and full-dress ball for the relief of the distressed Polish refugees resident in this country was given at Willis's Rooms, and was very numerous attended. The costumes of the Duchess of Sutherland and the Ladies Gower, the Duchess of Bedford, Lady Seymour, Marchioness of Aylesbury, &c., were among the most splendid; being the same as were worn at the Queen's masque last year. The ball was very well sustained, and complete sets of quadrilles were danced in the national costume of Poland. The proceeds of the ball have not been announced, but there is no doubt that they were considerable.

The Derby Lotteries.—On Saturday an information was laid before the Croydon police-court against Mrs. Thrale, landlady of the King's Arms Inn, in that town, for having a Derby club at her house. The information was stated to be laid by William Kerrod, soda-water manufacturer, St. John's, Fulham. The information, which extended to considerable length, charged the defendant with having set up a certain mischievous and unlawful game, under the denomination of "The King's Arms Derby Club," and, in furtherance thereof, made and published a certain proposal and scheme for advancing small sums of money by several persons, amounting in the whole to a large sum, to be divided and shared among the winners at such mischievous and unlawful game, and that certain tickets were delivered out, entitling parties to a share of such money so advanced according to the said proposal and scheme, against the form of the statute in such cases made and provided, and for which offence she had forfeited the sum of 200l. A clerk from the office of Mr. Kirke, of London, applied on behalf of the informer for the postponement of the case, on the ground that counsel had been engaged, but could not be present that day. Mr. Russell, of Croydon, as counsel for the defendant, objected to the postponement of the case. The magistrates having refused to postpone the case, the information being read the informer was called, but did not appear. Half-an-hour was allowed for the purpose of making his appearance, when, not answering to his name, the case was dismissed. The informer shortly afterwards entered the court, but the magistrates refused to allow the case to be re-opened. The informer was consequently liable for the costs.

The Whitsun Holidays.—The usual Whitsun festivities of Greenwich fair, Hampton Court, Wandsworth, and other places in the suburbs, drew large crowds of holiday folks from the metropolis on Monday. Notwithstanding these attractions, the town exhibitions were generally thronged. At the British Museum the number of visitors was 13,140, which was nearly 3,000 less than those who attended last year, when the numbers were 16,329. The decrease on Monday was chiefly attributable to the unfavourable state of the day. The visitors were perfectly well behaved, and only one person was refused admission on the ground of intoxication. The number of visitors on Boxing Day was 28,225, on last Easter Monday 18,432, and the Easter Monday of last year 14,320. The Museum remained open all the week till Friday inclusive. The National Gallery was visited by 1200 visitors on Monday. Last week 38,478 persons paid toll to pass through the Thames Tunnel, and on Sunday alone there were 17,513 visitors. But the most numerous display on Monday was that of the teatotalers, who met on Hampstead Heath. The number of persons who took part in the cavalcade could not have been less than 15,000, and the line extended completely across the heath, a distance of more than one mile and a half.

The Southwark Park.—A numerous meeting of the inhabitants of Southwark was held this week in the vestry room of the church of St. George the Martyr, to take into consideration a requisition addressed to the churchwardens for petitioning Parliament and the Government for a grant of a suitable piece of ground for the formation of a park for the southern districts of the metropolis. The churchwarden submitted a resolution, stating that it was of the first importance to the moral and physical condition of the people that they should have open walks for healthful recreation, which would tend to prevent or at least alleviate disease. He mentioned a very eligible site for the projected park, a large plot of ground near Walpole-place, Kent-road, which extends all the way to New-cross, and which would be very soon built upon if it were not secured in time for such an object. Several letters were read from a great number of Peers and Members of the House of Commons, all promising their co-operation to effect this object. The resolution was passed unanimously.

The Enclosure of Hampstead Heath.—The excitement created throughout Hampstead and the northern suburbs of the Metropolis at the projected enclosure of Hampstead Heath by the bill now before Parliament, introduced at the instigation of the Lord of the Manor, Sir T. M. Wilson, and entitled the "Wilson Estate Bill," still continues to increase, and petitions against it are preparing in every quarter. On Thursday the objections to the bill, a copy of which it is intended to place in the hands of every Member of the Legislature, were finally arranged on the part of the copyholders, and it is their intention also to call upon the public generally for their assistance to preserve to the Metropolis this favourite place of recreation.

Kensington.—At a meeting of the rate-payers of St. Mary Abbots' on Monday, after a long discussion respecting Col. Fox's recent diversion of the north end of the Addison-road, it was resolved that the churchwardens be requested and authorized to take the necessary and proper measures for the restoration of the road. Col. Fox having offered, as a compensation, £200 towards the paving of the road, Mr. Percival moved, as an amendment,—"That a committee be appointed by this vestry to inform Col. Fox that the vestry are willing to accept the indemnification he offers for the alteration of the line of the church path in the Addison-road, if Col. Fox will take the proper steps to make such an agreement a legal one, and binding upon the parish." Mr. Mills seconded the amendment. Only two hands, those of the mover and seconder, were held up for the amendment; and the original motion was carried with acclamation.

Hampton Court.—On Friday, at the Feltham petty sessions, a young man, named William Bennet Watkins, who stated himself to be gardener to Mr. B. Watkins, of Hammersmith, was brought before Messrs. Devon and Carpenter, the sitting magistrates, charged by a police constable with having stolen a quantity of plants and cuttings from the Royal Gardens at Hampton Court Palace. The charge having been clearly proved, he was convicted and sentenced by the magistrates to one month's hard labour in the House of Correction.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, May 27:—West districts, 155; North districts, 156; Central districts, 163; East districts, 175; South districts, 210. Total, 859—(457 males, 402 females.)—Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five springs, 854.

Provincial News.

Incendiary Fires.—The provincial papers give accounts of incendiary fires in different parts of the agricultural districts. The Maidstone papers state that as two gentlemen were riding last week past Tyland-farm, on the Rochester-road, they saw a sainfoin stack burst into flames, and a man run away from it, up a lane leading to the Warren. They immediately galloped in pursuit, and overtaking the man, apprehended him. He proved to be a stranger in the district, knowing nothing whatever of Mr. Hills, the owner of the stack. He confessed that he had done it from a desire to be sent out of the country, as he was starving, and could not obtain employment. He was taken to Boxley cage, where he is now in custody. His name is George Brown, a gardener, from Bradford, Essex. The stack was entirely consumed, but was insured.

Alnwick.—The following account of the Draining-plough is extracted from the *Newcastle Journal*:—"An interesting trial of the power of the draining-plough, 'Green's Patent,' was made at Alnwick on Saturday last, in a field called Stamp's-close, adjoining Alnwick-moor, belonging to his Grace the Duke of Northumberland. The draining took place on the market-day, to give the farmers and neighbouring gentry an opportunity of forming a practical opinion as to its merits. The field consists of about 8 acres. The drain lines had been laid out, and the turf thrown aside by the common plough on the previous day. The draining-plough commenced operations at the usual hour on Saturday morning, and the whole of the drains, one between each ridge, to the depth of 18 inches, were completed by the evening. The plough was drawn by 8 horses, attended by 4 men. Mr. Patten, his Grace's park and farm steward, superintended the work. One decided advantage that the draining-plough has is, that it can be used when the farmer has little or nothing else to do. The work was unanimously approved of; and, among other suggestions that were thrown out by the gentlemen and farmers on the ground, the following may not be unworthy of consideration, viz.,—that a township or parish might purchase a plough for their common

use, or one might be kept in each bailiwick for the use of the tenantry. It was also observed that, in proportion as the soil was more impregnated with clay, the draining was more perfectly done. This would indicate its superior applicability to the soils of Northumberland."

Birmingham.—Last week the western neighbourhood of Birmingham was considerably alarmed by rumours of disturbances amongst the turn-out nailors of Bromsgrove and the adjoining mining districts of Cradley, Stourbridge, &c. For some years past various reductions have taken place in the manufacture of nails, amounting in the aggregate to 20 per cent.; and about a fortnight ago a further reduction was attempted. A good workman, upon the average, could, under the old prices some years ago, earn about 20s. per week; but since the reduction first took place, the price has reduced the rate of remuneration to 16s. The attempt recently made would reduce it still further to 14s. The strike became general last week, in consequence of these reductions. The magistrates endeavoured to effect a compromise between the operatives and their masters, but the men refused to return to their work without an increase of wages. A public meeting was also held, without effecting any satisfactory settlement. The following statistics will show the poverty of Bromsgrove and its neighbourhood:—The population of the parish is 9,671; the number of houses assessed to the poor 2,016—of these 1,763 are under 10L. per annum, and 1,391 under 5L. About 180 occupations are void, and the tenants of 619 are from poverty excused paying rates. The number of permanent paupers receiving regular relief is about 1,000; and on Friday week, in addition, 360 heads of families, comprising about 1,500 people, received temporary assistance at the Union workhouse.

Bristol.—A determined burglary and attempt at murder was committed on Saturday night at Conham, a small retired village on the banks of the Avon, about six miles from this city. Three men called Watkins, an uncle and two nephews, broke into the cottage of an old woman named Hunt, who had amassed a considerable sum of money; after robbing it of all the property they could carry, they stabbed Mrs. Hunt, and left her, as they supposed, dead, having covered her with a bed and a heavy box for the purpose of suffocating her. She succeeded however in releasing herself, and is likely to recover. The prisoners have been apprehended, and committed to take their trials.

Cardmarthen.—The outrages of "Rebecca and her Daughters" have reached such a height as to excite apprehension that the magistracy of this and the adjoining counties of Pembroke and Cardigan will be obliged to place the whole district under military surveillance. From attacking and destroying turnpike gates in remote and unfrequented parts of the country, they have proceeded to exploits of greater daring, and on Saturday morning last, attacked and completely destroyed one of the gates of the county town, Cardmarthen. It appears by the statement of the toll-collector, that at about one o'clock on Saturday morning, nearly 300 persons arrived at the gate, and immediately placed sentinels in Water-street, and about Greenhall, the residence of Capt. Davies, a borough magistrate. Their leader, "Rebecca, who is easily distinguished by his extraordinary stature, was attired in female clothing, and proceeded with a sort of body-guard to enter the toll-house. He then gave directions "to smash the windows and unroof the house." The windows were instantly beaten down, and they were proceeding to unroof the house, when the wife of the toll-collector rushed forward to this mysterious leader of the band, and entreated him to spare the house for the sake of her dying child, who lay ill up stairs. The man seemed moved by this appeal, and proceeded to the bedside of the invalid, when finding the statement of the mother to be correct, he gave orders "to stay proceedings," as far as the toll-house was concerned, but they destroyed the gates, and fired several volleys of musketry. They also stated their determination to raze the Cardmarthen workhouse to the ground in August next.

Liverpool.—The many fires which have occurred recently in this town have drawn the attention of the magistrates seriously to the subject, and several meetings of the justices have been held during the week. It is understood that several witnesses were examined, and that the result of the investigation was a strong suspicion that the recent fires, and particularly those at the Duke's warehouses, have been produced by incendiaries. The evidence was transmitted to the Secretary of State, and the Home-office has determined to co-operate with the magistrates and corporation of the town in the endeavour to discover the delinquents. Placards were posted throughout the town and suburbs on Saturday, offering 500L. reward, namely, 300L. by the council of the borough, and 200L. by insurance offices, for the discovery of the offenders, and announcing that a free pardon would be granted to any accomplice, who will give such information as shall lead to the discovery of the actual offenders.

Manchester.—A fatal accident, occasioned by the explosion of a boiler, occurred last week, at Medlockvale Dyeworks, the property of Messrs. Hulme and Sons, situate in the township of Failsworth, about five miles from this town. The accident occurred when the works were in full operation, and it is remarkable that it did not prove more extensively fatal. One man was killed on the spot, and others are so severely injured as to render their recovery a matter of great doubt. The explosion filled the whole of the dyehouse and narrow passages around with a dense volume of steam and dust, and so great was the expansive power of the steam that the whole of the roof was blown from the dyehouse, the windows shattered, and a portion of the front wall thrown down.—The inquiries into the origin of the late outrage between the

military and police are still in progress, and are not likely to be concluded for some days.

Oxford.—We announced last week that Dr. Pusey, the Regius Professor of Hebrew, had been suspended from preaching in the University for two years. The subjoined recapitulation of the case will not be uninteresting:—On the fifth Sunday after Easter, Dr. Pusey being called on to preach before the University in the Cathedral of Christ Church, took for his subject the doctrine of the Eucharist. An impression was made on some of his audience that the doctrine of Transubstantiation and of the Mass were advanced and defended in a tone altogether dissonant from that of the standards of the Church of England, and the result was that an official demand was made on the Vice-Chancellor to appoint a board to examine the sermon. In compliance with this call, a board was constituted of the six Members of Convocation mentioned in our last. Each of these divines sent in a separate report, as three of them are said to have found little fault with the sermon; but the Vice-Chancellor thought proper to suspend the Regius Professor of Hebrew from preaching within the precincts of the University for two years. Against this sentence Dr. Pusey has addressed a protest to the Vice-Chancellor, from which the following is an extract:—"I have stated to you, on different occasions, as opportunity offered, that I was at a loss to conceive what in my sermon could be construed into discordance with the Formularies of our Church; I have requested you to adopt that alternative in the Statutes, which allows the accused a hearing; I have again and again requested that definite propositions, which were thought to be at variance with our Formularies, should, according to the alternative in the Statute, be proposed to me; I have declared repeatedly my entire assent *ex animo* to all the doctrinal statements of our Church on this subject, and have, as far as I had opportunity, declared my sincere and entire consent to them individually; I have ground to think, that, as no propositions out of my sermon have been exhibited to me as at variance with the doctrine of our Church, so neither can they, but that I have been condemned either on a mistaken construction of my words, founded upon the doctrinal opinions of my judges, or on grounds distinct from the Formularies of our Church. Under these circumstances, since the Statute manifestly contemplates certain grave and definite instances of contrariety or discordance from the Formularies of our Church, I feel it my duty to protest against the late sentence against me as unstatutable as well as unjust."

Portsmouth.—The Victoria and Albert royal steam yacht will be brought round here next month, as it is expected she will be fully equipped and ready for sea in about six weeks. Whatever intention Her Majesty might have had of visiting Ireland in the course of the summer, there is now no probability of such a visit taking place, at least until that country is in a more settled state. It is understood to be Her Majesty's intention to take repeated excursions to sea during the season, and to visit some of the principal ports along the coast, and among others that of Plymouth, to inspect the dockyard and other public works there. It is stated that the Prince of Wales and the Princesses will be brought down to the coast during the summer for the benefit of the sea breeze.

Southampton.—On Friday morning, about half-past ten o'clock, smoke was seen to issue from the hold of the brig Tartar, lying in the new docks at this place, and laden with a quantity of war stores, consisting of a large number of Congreve rockets and above twelve hundred shells. The crew, who had only arrived from London on the previous night, immediately left the vessel to her fate, it being currently reported she had fifty tons of gunpowder on board. This fortunately was not the case, or great mischief must have happened to the railway terminus and that part of the town situated near the docks. The smoke still continued to issue, but in very small quantities, until a few minutes past eleven o'clock, when it burst out into flames. It now became quite apparent that any attempt to scuttle her would be unavailing, from the danger of her situation. At twelve o'clock a party of Sappers and Miners arrived, and with the aid of six horses brought one of the large guns from the platform into the dockyard, where six shots were fired into her bottom, but without effect, and in an instant a tremendous explosion took place, rockets and shells flying in all directions. The scene at this time was very grand; the whole deck was in a blaze, and at intervals of every three or four minutes fresh explosions took place, which lasted until past two o'clock, when it was thought the whole of the combustible parts of the cargo had entirely exploded. Preparations were then made to obtain one of the small Isle of Wight steamers to haul the burning vessel to the mud banks, as it was quite certain she must soon sink; but the wind, which had been previously very high, suddenly abated, when the flames took another direction, and in a moment another series of explosions took place, which continued for about twenty minutes, when the vessel went down head foremost. She had twenty long brass cannons and their carriages, destined, with the war stores, for the Mexican government. The value of the cargo was 25,000L. The consternation in the town was so great, from the report that there was a large quantity of gunpowder on board, that all the inhabitants in the streets near the Docks shut up their houses and shops, and left the town; even in the High Street, many families left their dwellings, and proceeded to the country. Porters with the luggage of passengers, and passengers who were on their way to the railway station, might be seen returning in all directions to get out of the town. An examination of the crew took place before the magistrates on Saturday morning, but nothing was elicited to show how the fire originated. The magistrates said it was an extra-

ordinary affair, but they could proceed no further in their investigation unless the captain had other witnesses to produce.

Railways.—The following are the returns for the past week:—London and Birmingham, 16,162 $\frac{1}{2}$; Great Western, 13,701 $\frac{1}{2}$; South Western, 5,877 $\frac{1}{2}$; South Eastern, 2,101 $\frac{1}{2}$; Eastern Counties, 2,152 $\frac{1}{2}$; North Midland, 3,957 $\frac{1}{2}$; York and ditto, 1,503 $\frac{1}{2}$; Greenwich, 778 $\frac{1}{2}$; Croydon, 300 $\frac{1}{2}$; Brighton, 3,127 $\frac{1}{2}$; Blackwall, 768 $\frac{1}{2}$; Hull and Selby, 1,110 $\frac{1}{2}$; Grand Junction, 7,024 $\frac{1}{2}$; Midland Counties, 2,427 $\frac{1}{2}$.—A special general meeting of the Sheffield and Manchester Company was held last week at Manchester, Mr. Parker, M.P. for Sheffield, in the chair, when ten new directors were appointed for the future management of the company's affairs, and the forfeiture of certain unpaid shares was formally confirmed. It was announced that the works were proceeding rapidly, and that the line would be opened from end to end by the beginning of 1845.—The inhabitants of Liverpool came up in large numbers on Thursday week from Lancashire by the annual cheap train. By this conveyance the fare is only 30s. from Liverpool and Manchester to the metropolis and back. There was another excursion of the same kind on Monday last. Upwards of 1,000 persons have availed themselves of this opportunity of visiting London at a moderate rate.—A few days ago the mail-train from Bristol to London conveyed an unusual cargo of passengers, in the shape of a hive of bees, which had swarmed that day at Clifton, where they were safely domiciled in a wooden hive, made partly transparent by glass windows. Thus secured they arrived at their destination in perfect safety.—It has been computed that the amount obtained by the Government in the shape of Income-tax from the various railway companies throughout the country will very nearly reach 100,000 $\frac{1}{2}$ per annum; and it is expected that before the Income and Property-Tax Act expires, it will, by the now gradual extension of the several lines, considerably exceed that amount. It was stated by Mr. Saunders, the secretary to the Great Western Company, in his examination lately at the Oxford sessions (in an appeal by the company against its being assessed to the poor at 3,000 $\frac{1}{2}$ for the two miles the railway passed through the parish of Goring), that the amount of income-tax paid by that company alone was 10,450 $\frac{1}{2}$ for one year, ending Apr. 5, 1842. The inhabitants of many small parishes through which the lines of railway pass have been materially relieved by the various companies being assessed to the relief of the poor, according to the estimated profit upon those portions of railways lying within their respective boundaries. In the comparatively small agricultural parish of Goring, the Great Western Railway Company have now to pay upon each shilling rate made in the course of the year the sum of 118 $\frac{1}{2}$ 18s., thus relieving the ratepayers some three or four times a year to this large amount.

IRELAND.

Dublin.—The following magistrates have been dismissed since our last, for taking part in the Repeal agitation:—The Hon. M. J. French, the Hon. Thomas French, Mr. De Vernon, and Mr. Roche, M.P. and Deputy-Lieutenant for the County of Cork. The following gentlemen have resigned their commissions:—Mr. Maurice Power of Ringacoutig, Cork, Mr. Charles O'Connell, Mr. Kean Mahony, Mr. John Maher, late Member for the County of Wexford, and Deputy-Lieutenant, Mr. Patrick Ternan, Mr. J. Mathews, and Mr. T. Ennis, magistrates for the County of Louth; and Mr. J. H. Talbot, of Wexford.—Rear-Admiral Bowles hoisted his flag on Sunday at Kingston, on board H.M.'s steamer Lightning, under the usual salutes. On the previous day the Rhadamanthus, steam-frigate, landed at the Pigeon-house 6000 stand of arms and one million rounds of ball cartridge. She left soon afterwards for Waterford, with 6000 stand of arms, and four companies of the 61st Regiment. Two frigates have also been sent to Waterford, one to cruise along the coast, the other to be stationed at Dunmore.—The weekly meeting of the Repeal Association took place on Monday. Various sums from the provinces were handed in, and numerous members were admitted. Notwithstanding the absence of Mr. O'Connell, the meeting was densely crowded from the opening to the close of the proceedings, when the amount of Repeal rent was announced to be 904 $\frac{1}{2}$ 11s. 4d. With the exception of the last week, when the extraordinary contributions from the North and South Ridings of Tipperary were included, this is much the largest weekly return yet received. The previous week's return, on Monday fortnight, which was considered so very large an amount, was 709 $\frac{1}{2}$, nearly 200 $\frac{1}{2}$ less than the rent announced on Monday.

Dungannon.—A serious conflict between the Repealers and the Protestants took place last week in the village of Carland, near this town. A meeting of Anti-Repealers had assembled, and were passing in procession through the town, to meet some of their party on the Carland road, when they received intelligence that about 18 Protestants had been attacked by the Roman Catholic Repealers, on passing through the village of Carland, and that several of them had been severely maltreated. Upon receipt of this information, the procession moved on in the direction of Carland, but as its progress was comparatively slow, a large number ran forward at full speed towards the village. Arriving there, and finding that the Repealers had fled, they commenced the wrecking of the Repealers' houses. When the work of destruction was going on, a local magistrate arrived at the place with a party of police, and dispersed the rioters, but not until 45 houses were wrecked, and their entire furniture destroyed. The Lord-Lieutenant has offered 100 $\frac{1}{2}$ for the apprehension of the persons concerned in this outrage.

SCOTLAND.

Edinburgh.—On Tuesday week the Moderator proceeded to deliver his address on the close of the assembly, characterising it as one that would be long memorable in the history of the country; and alluded to the various important measures they had passed. His Grace the Commissioner spoke as follows:—"Right Reverend and Right Honourable, I enter into the feelings under which you will return to your homes from this Assembly. You will be cheered, however, by the happy reflection that you have attended faithfully to the many matters of momentous and oft-painful interest which came before you, and you will obtain, I am sure, the gratitude of your Sovereign and of your country. I congratulate you upon the measures which you have taken to sustain the admirable schemes of your church, and to provide for the efficient supply of those charges which have been vacated by your seceding brethren; and I shall humbly pray with you that the Spirit of your Great Master, the God of peace and love, may guide and strengthen you." The Assembly was then dissolved, and the next meeting appointed for Thursday, the 16th of May, 1844. In the Free Presbyterian Assembly on the same day, Dr. M'Farlan, of Greenock, moved an address to the Queen, explaining the grounds on which they separated from the Established Church, and took occasion to go over the grounds of difference which existed between them and the general assembly. Dr. Buchanan, in seconding the motion, remarked that by the recent decisions of the Civil Courts, an impassable wall of separation had been raised up between this church and the State, and that the Residuary Assembly by their decisions had raised up a still more impassable wall of separation between the two. It might be possible, from the return to sound principles by the legislature, to reunite themselves with the State; but they never could be again incorporated with an Erastian establishment. Dr. Candlish read a lengthened report from the committee for interim supplies, furnishing details of the proceedings they were to pursue, the number of labourers at their command, and the number that would be required. He enforced the views of the committee in a lengthened speech, in which, towards the close, he adverted to a question that had more than once been put to him—how far a person located in a district where there was no church of the Free Assembly, nor of any other which the Assembly would cordially acknowledge—how far it would be the duty of such a person to attend the Established Church? In his judgment, the Assembly of the Established Church had decided the question for them, by reverting to the old anti-Christian law of 1799 against ministerial communion, and thus had virtually excommunicated all Christendom. He doubted if such a body could be called a Church of Christ, and it was clear that none of their members ought to attend its ministrations. Mr. Sheriff Monteath and Dr. Welsh expressed some doubts respecting this doctrine; but the general feeling was evidently with Dr. Candlish. A considerable amount of routine business was gone through; and it was agreed to hold another Assembly in Glasgow on the 17th of October of this year, when they would probably sit for eight days. Dr. Chalmers then addressed the Assembly in a speech of great length. Among other topics, he adverted to the position which they were to hold with reference to the Establishment, and spoke of its downfall as a probable result of their labours. That must not deter them from going forward. If their principles were worth sacrificing their place in the Establishment for, they were worth the Establishment itself. They had no ill-will towards those who remained, and would have no pleasure in seeing them lose their stipends; but if the assertion of their principles caused them to lose their own livings, surely they would not now give up those principles simply because it risked the loss of the livings of others. That would be to love their neighbours—not as, but a great deal better than themselves. After many exhortations to zeal, and a fervent recommendation to them to abound in prayer, he dissolved the Assembly.

Perth.—On Thursday evening last week the streets of Perth presented a scene of complete insubordination and riot. About 6 o'clock some soldiers belonging to the 68th Regiment, which has been stationed here for some time, left the barracks and paraded about the streets. Their object appeared to be to pick a quarrel with the town's lads; but, seeing that the civilians were likely to be too many for them, they hurried back to the barracks, and soon after sallied forth with greatly increased numbers. Upwards of 100 men, armed with bludgeons, rushed in a body through the principal streets, maltreating and knocking down, without regard to age or sex, a number of individuals, and threatening all who came in their way. The greatest confusion and alarm prevailed for a short time; but the magistrates were promptly at their posts. The civic body marched up to the soldiers, and after the provost had read the Riot Act, they set to work to disperse the rioters. A contest ensued, and a number of individuals were severely injured; but the citizens ultimately prevailed, taking 10 or 12 prisoners, and putting the rest of the soldiers to flight. Next forenoon an attempt was made on the part of the military to make a second assault upon the citizens. A number had got outside the barracks armed with firelocks and bayonets, but they were repressed and turned back by their Officers. The magistrates, on Friday, despatched an express to Sir Neil Douglas, Commander of the Forces in Scotland, making him aware of what had taken place, and by midnight the bearer of the express returned, bearing Sir Neil's orders, that the 68th Regiment should be removed from Perth to Stirling on Monday morning.

THEATRICALS.

DRURY-LANE.—The season at this theatre, according to the public advertisements, will terminate on Wednes-

day next; on which night Mr. Macready will relinquish the management, and make his last appearance before a London audience for a very considerable period. The Queen has signified her pleasure to command a performance at this theatre on Monday next, the first state visit since Mr. Macready has been the lessee. A communication to that effect was forwarded to the theatre from the office of the Lord Chamberlain on Thursday, and a list of pieces was sent for her Majesty's selection. The appearance of the Sovereign at the theatre will, it is expected, have a beneficial effect on the fallen fortunes of Drury-Lane, and cause an additional number of nights to be added to the season.

HAYMARKET.—An advertisement has appeared in the daily papers, in which Mr. Webster, the lessee of this theatre, offers 500 $\frac{1}{2}$, besides other advantages, to the author of the best modern comedy illustrative of British manners and customs. The question of merit is to be decided by a committee of dramatic authors and critics next January.

Miscellaneous.

The Harvest.—The anxiety prevailing throughout England on the subject of the harvest appears to be felt almost equally in France and Spain, where the continued rains give rise to serious apprehensions. "Observing," says the Paris correspondent of the *Times*, "that some uneasiness is felt in England for the corn and other crops, I have consulted the highest authority on the Continent of Europe on the subject, I mean M. Millot. His opinion is, that extensive injury has not yet been done to the crops by the wet and cold of the month just expired, but that an unsatisfactory predisposition was beginning to manifest itself. The rain and cold during last month were general throughout Europe. The south and the north—Spain, France, Germany, and England, are alike menaced. If, however, the weather take up, and become warm, the harvest will be magnificent; and it is consoling to observe, that from the moment when the new moon came in (last Monday morning), to this, the weather has been improving, and the temperature rising. This is as fine a day, with 80 degrees of Fahrenheit, as could possibly be desired. I am obliged to add, however, that the meteorological observations and deductions made by those who study that science are said to lead to the expectation that this summer will be moist and stormy. There are upon an average 11 days of rain in May. This month there were 28 or 29. Still it would be unfair to anticipate from this fact that we shall have a wet summer; for in the month of May in the deplorable year 1816, there were only 18 wet days. It results, therefore, that the superabundance of rain in last month does not justify unfavourable speculation, although it has actually produced a predisposition to injury, and a consequent increase in the price of wheat and flour."

The Victory in Scinde.—The following is an extract from an article in the *Bombay Times*, giving, from the official despatches, an account of the recent operations and victory in Scinde:—"General Napier having learned that the Beloochees had posted themselves in a strong position four and a half miles from Hyderabad, with a view of attacking or annoying him, moved out from his intrenched camp on the Indus at daybreak on the 24th of March, in order to engage them. About half-past 8 o'clock they descried the enemy's force, above 20,000 strong, under the immediate command of Shere Mahomed. They were posted in nearly a straight line behind one of the large nullahs, or dry water-courses, with which the country abounds. This was formed by two parallel ditches, one 8 feet deep by 20 wide—the other 17 by 42 wide. These had for a long distance been freshly scarped, and a banquette raised behind expressly for the occasion. The village of Dubba was immediately in their rear, and the Fullalee itself, with jungle on its further bank, on their extreme right. A stronger or better selected position could hardly have been desired. Our troops, when within 1,200 yards of the enemy, were halted and formed in order of battle, and then advanced in echelon of regiments, at distances of about 20 yards. After a further advance of 400 yards they again paused for a little, to permit a slight change of arrangements. The Scindians' guns, 11 in number, had some time before this begun to fire on the irregular horse sent forward to reconnoitre before the main body came up. An heroic exploit of three officers of the force excited the admiration of the whole army. Just before the commencement of the action, Major Waddington of the Engineers, with Lieutenants Brown and Hill of the Artillery, galloped from end to end of the enemy's line, on purpose to draw on themselves the fire of the guns and matchlocks, and so ascertain their strength, while they looked out for accessible or undefended portions where the nullah might be crossed. Though bullets and round shot whistled around them, they escaped unharmed. The left of the enemy's force appeared to be unsatisfactorily defined, being concealed by the brushwood of a shikargah; but, perceiving that in this direction he was outflanked by the British troops, he commenced moving from the right, so weakening the best-defended portion of his position which was desired to be attacked. Major Leslie's troop of Horse Artillery was ordered forward to endeavour to rake the nullah; the 9th Cavalry and Poonah Horse advancing to the left of the Artillery, which was supported on the right by her Majesty's 22d, retired considerably at first, so as to admit of the oblique fire of the guns. About 9 o'clock the whole of our guns opened, and the British line advanced from the left of the 22d. This brave battalion marched up the nullah under a heavy fire of matchlocks without returning a shot till within 40 yards of the intrenchment, when they stormed the work like British soldiers. General Napier at this time rode in amongst the

showed a sufficient allegation of time and place.—Mr. Justice Patterson: Is there any authority for showing that a man must be charged as an accessory before the fact, when there is no allegation of the fact having been committed? It is very possible to charge a man with inciting others to commit a crime, and that would be an offence though the crime had never been committed. But that is not the case here.—Mr. Erie: It would be impossible to charge a man as accessory before a fact, if that fact never was committed. The absence of any allegation of time and place could not be cured by verdict. There was no such allegation here, and the indictment was therefore bad.—Mr. Justice Coleridge: You assume that the omission of a venue to one essential fact is an omission to the whole.—Mr. Erie: That was so. The act of the defendant was certainly alleged within the jurisdiction of the court: but the offence, if any, was not so alleged. The marginal venue now was merely the venue for the caption of the indictment, sufficient, not for the offence presented, but only for the jurors who present. In the Oxford case the marginal venue was Oxford. The court held that it must be considered as Oxford county, and not Oxford city. But that was contradicted by the allegation in the body of the indictment, which showed that the offence was committed in the city. All these cases showed the necessity of having a proper venue properly laid. Now here, in the fourth count, there was a defective allegation of venue, and in the fifth count there was no allegation of venue at all. It was impossible to import into the body of the indictment the venue stated in the margin. Every material fact ought to be alleged with a proper venue, and if not so alleged the indictment could not be supported.—Mr. Dundas, on the same side, submitted that the marginal venue could not be imported into the body of the indictment. For this he cited a great many authorities. In one case, in an indictment for bigamy, there was a venue in the margin, but the different parts were all alleged in blanks. The prisoner was convicted, but judgment against her was arrested, on the ground that it did not appear on the face of the indictment that the jury had jurisdiction. The *King v. Fraser*, at the Old Bailey, in September sessions, 1833, before Sergeant Arabin, and reserved for the judges, was the case which he referred to.—Mr. Justice Coleridge: There was ample ground there for arresting the judgment without its supporting your proposition.—Mr. Dundas: It certainly supported the proposition that the venue in the margin could not be imported into the body of the indictment. If so, then the fifth count was clearly bad, and the judgment must be arrested.—Mr. Baines, on the same side relied on the objection that the introduction of a venue distinctly alleging the place where any material fact constituting the offence was alleged to be committed, was absolutely necessary to the validity of the indictment. Without such preciseness, it was impossible for a defendant to know what were the charges against him, or how he was to meet them. Here the material part of the fourth count was without any allegation of venue. The whole of the fifth count was without any venue, and as it was necessary that every material allegation should have a venue, this indictment could not be supported.—Mr. Sergeant Murphy, who was on the same side, having inquired the intention of the court in now confining the argument to the question of the venue, Lord Denman said that the court wished the case to be argued now upon the question of venue, as if no other objection existed to the indictment. If it should be necessary afterwards to hear the learned counsel on the other point, due notice of their being called on to argue it would be given them. Mr. Sergeant Murphy then addressed the court, and contended that no criminal charge could be supported without a good allegation of venue. If there was an indictment against a person for harbouring a thief, but without an allegation of time and place, the indictment would be bad. If so, the case of the "*King v. Stott*" which was relied on by the other side, could not be supported. And there was every reason to believe that that case had been misapprehended; for it was against the ordinary experience of pleaders to say that any material fact could be well alleged, if alleged without a sufficient venue. The object of the venue was twofold: first, to warrant the jury in trying the case; and next, to enable the defendant to know what the charge against him was, so that he might be able to meet it. If no venue or a defective venue were given, both these objects were defeated. Here there was no proper allegation of venue in the fourth count, so as to show that the court had jurisdiction in the matter, while in the fifth count there was no allegation of venue at all, and for aught that appeared there, the alleged offence might have been committed in any remote part of the world. That count, therefore, did not even make a show of giving a jurisdiction to the court, and consequently did not enable the other side to call in and the 7 Geo. IV.; for, according to that statute, the objection of defective venue could only be remedied in cases where the court clearly had jurisdiction.—Mr. Baskin and Mr. Atterton followed on the same side, and again went through all the authorities to show that the counts in question were defective and were not aided by the statute. On the whole, they submitted that it was quite clear that the rule for arresting the judgment must be absolute. Lord Denman said that the court would in a few days intimate to the parties its intentions with respect to this case.—Accordingly on Wednesday he delivered the following judgment: The Court has considered the case of the *Queen v. O'Connor* and others, with reference to the objections arising upon the point of venue. None is stated in the fifth count, and it is plain that at common law the count is for that reason bad. Every material fact must be stated, with time and place, in order that it may appear that the grand jury had jurisdiction to find the bill, and also that it may be known whence the petty jurymen are to come who are to try the case. This is laid down in all the books and authorities cited at the bar. Indeed it was hardly contended, on the part of the Crown, that the count could be supported at common law, as it contains no venue in itself, nor any words of reference to the venue in the margin, to which many facts stated in the fifth count cannot be referred, according to the distinction hereafter to be mentioned. Recourse is then had to the statute of the 7 George IV., c. 64, sec. 20, which enacts that "no judgment after verdict, or confession, or default, shall be stayed for want of a proper or perfect venue, provided it shall appear by the indictment that the court had jurisdiction over the offence." Now, whether a total omission of venue can be considered as cured by these words, or whether the statute must be confined to cases where some venue is stated, though improperly or imperfectly, in either case the condition on which that remedy for defect is given by the 7 Geo. IV. is, that it shall appear by the indictment that the court had jurisdiction over the offence. If this means local jurisdiction, the fifth count does not show it, for no place is mentioned in the body of it; and we cannot, as already stated, import into it for that purpose the county noted in the margin, as has been done in civil actions. To hold this would be to say, as was indeed said by the Solicitor-General, that whenever the grand jury of any county whatever has found a bill of indictment for a crime cognizable under the commission, a trial which takes place upon it in that county must be good after verdict, though the indictment does not show the court to have had any jurisdiction over the offence, on which condition alone the defect is cured by the statute. The argument drawn from the 16th and 17th of Charles II., c. 8, and 4th Anne c. 16, was that, as in civil actions, the total omission of venue is cured by the first of these Acts under the words "for want of a right venue;" so the total omission of venue in criminal cases may be cured under the 7 Geo. IV., which uses the words "for want of a proper or perfect venue;" but the defect cured in civil actions is not the total omission of the venue, but the introduction of an improper or imperfect venue, and it is even then only cured by the statute of Charles, if the case is tried by a jury of the proper county in which the action is laid. Now the action in every civil case is laid in the county stated in the margin, and if the trial take place in that county, the condition is fulfilled. By the 4th of Anne, the remedy is extended to the case of judgment by default; all the defects which would have been cured by the statute of Jeoffails, in case the verdict of twelve men had been given in such action, being expressly cured by the 2d section of that statute. To avoid any analogy to these statutes, the 7 Geo. IV. should have cured the defects of venue where the cause was tried by a jury of the county in which the indictment was preferred. The venue in the margin may show this, but certainly does not make the indictment show that the court had jurisdiction to try the offence, unless specifically referred to in the body of the indictment. The distinction between

COURT OF QUEEN'S BENCH.—(Sittings in Banco).—*The Queen v. O'Connor and Others.*—The arguments in this case were resumed on Monday. The court having given notice to the counsel for defendants to confine themselves to the simple question whether the defective venue in the fourth count, and the want of venue in the fifth count must, or need not be fatal to indictments, the arguments resolved themselves into a merely technical discussion. Mr. Erie first addressed the court in support of the rule to arrest the judgment. In order the more fully to explain the ground on which, as he contended, the want of venue was fatal to the indictment, he must first explain the nature of the charge, as it was made in the fourth count of the indictment. That count charged that divers persons, on divers days, between the 1st of August and the 1st of October, at divers places, tumultuously assembled together, and by violence impeded labour, and thereby caused terror and alarm. Having alleged this offence to have been committed by divers persons, it then went on to charge the defendants with what in a case of felony would be the offence of being accessories. It alleged that the defendants in Lancashire did aid, abet, and comfort these persons to continue and persist in the said unlawful assembling. Under this mode of charging

criminal and civil cases in this respect is found to be taken in the King v. Knollys, 2 Lord Raymond; Lenthall's case, Croke, Elizabeth; the King v. Budridge, 3 P. Williams; and the King v. Fawcett, there cited, and numerous other cases quoted at the bar. It has been established in such a variety of cases, that it is impossible for this court to overlook them. It follows, therefore, that as the court cannot connect the venue in the body of the indictment with the venue in the margin, for want of such special reference, it does not appear by the indictment that the court where the indictment was found had jurisdiction, and that defect was not cured by the statute of 7 George IV. The court had considered whether the statute of 7 Geo. IV. may not admit of a different or wider meaning, namely, that the offence should appear to be of such a nature that the court has authority to try it, and a strong argument in favour of that construction arises from the apparent impossibility of giving effect to the words in any other manner. But we are satisfied such is not the case, and we are convinced that the defects in the venue are not intended to be cured, unless the jurisdiction of the court in respect of locality is made to appear. One consideration, indeed, is decisive of that. Persons accused might otherwise be punished for offences committed in another realm, if the quality of the offence alone give jurisdiction. This clearly was not intended. Mr Dundas referred to a case reported not quite correctly, in the last edition of Burn's Justice, and also in 1 Moody, Crown Cases. We have before us the very case, in which the opinion of all the judges was taken, and also a copy of the indictment. The prisoner was tried for bigamy at the Old Bailey, in 1833. The first marriage was alleged to have been contracted in Kent, and the second in Surrey; and the pursuer was alleged to have been apprehended on a day named, but of the place or county where he was apprehended no mention was made. The conviction was held bad, because the witnesses proved the offence in Surrey, though the venue in the margin was Middlesex; but no one suggested that Middlesex could be drawn from the margin into the body of the indictment, though that would, unquestionably, have cured the defect, nor was it suggested that the court appeared by the indictment to have jurisdiction over the offence of bigamy, which would have cured the defect, if the reference had been to the quality of the offence, and not to the place where the offence was committed, or the prisoner apprehended. An objection on the score of omitting the local venue is not merely technical, but real and important, for the allegation of material facts as occurring in a particular county is not only that which authorizes the grand jury to find any bill of indictment, but is also a warrant to the sheriff to summon the petty jury, which must pass judgment on those facts between the Crown and the prisoner. The trial of witnesses for perjury might be embarrassed, and justice defeated, if the jurymen were to be empanelled without authority. To make the act of trying to confer the right to try would be a charge so violent that we cannot believe it to have been intended by the Legislature. Upon the whole, we are of opinion that the judgment upon the fifth count must be arrested. An objection was also taken to the fourth count, on the score of venue, a material fact being alleged without place. Stott's case, in 2 East's Pleas of the Crown, was thought to bear directly on this doctrine, and was not successfully distinguished by the defendants' counsel. But the Master of the Crown-office has found the paper books in that case, on which Mr. Justice Ashurst wrote his note of the argument offered by Lord Abinger on the one side, and the late Mr. Justice Vaughan on the other, in Michaelmas term, 1798, and the endorsement of the learned judge intimates that the case stood for further argument. The prisoner was convicted in April, and was sentenced to twelve months' imprisonment, more than all of which had expired before the argument, and there is every reason to believe that Sir Edward East was mistaken in reporting that case as decided. Indeed, he himself intimates that, if there was an error in the sentence, it might possibly have been amended by being changed to transportation for fourteen years, a strong reason for not pressing the arguments founded upon that case further. We think, however, that here the statute 7 George IV. applies a remedy, as the conduct imputed to the defendants is criminal, and is stated with the venue. The count states the fact of unlawful assemblies having taken place at divers places, without naming them, though that statement is introductory to the charge, which is a charge of aiding and assisting persons to continue the said assemblies, and the aiding and assisting is stated to have been in the county of Lancaster. The count, therefore, has a venue, though an imperfect one, because, though the material facts in the early part of it are without place, the part which charges the defendants with the offence has a venue, and refers to a former part of the count, which former part therefore may be considered an imperfect statement of a venue; and as the offence itself is laid with a proper venue, it appears by the count that the court had jurisdiction, and that is the very case contemplated by the statute. We, therefore, think it necessary to hear the argument on the validity of the mode of stating the charge in that count, and we appoint Friday morning for that purpose.—Mr. O'Connor was convicted only on the fifth count, the effect of the above judgment is therefore to entirely acquit him.

POLICE.—The particulars connected with the attack upon Mr. Alexander Chisholm, the surgeon, have already appeared in this Paper, and it will be remembered that Mr. Stratford, by whom the assault was committed, was liberated on Saturday, the 27th ult., upon his personal recognizance in 500*l.* and two sureties in 250*l.* each, for his being forthcoming at this Court on Wednesday last, to answer the charge of Mr. Chisholm, who, on the day the bail was entered into, was pronounced by his medical attendants to be out of danger. On Wednesday Mr. Stratford appeared accordingly, when Mr. Chisholm's legal adviser announced that he had no intention of pressing the charge further, being satisfied that Mr. Stratford could have no vindictive feeling towards him. A public apology was then made on behalf of Mr. Stratford, who was immediately discharged.

On Wednesday evening, after the closing of Bow-street Office, a great bustle was observed, the cause of which was involved in mystery. It was, however, understood that an order had been made by the Secretary of State to Mr. Twyford, the sitting magistrate, to issue a warrant for the apprehension of Samuel Mayer, who had written a letter to Sir J. Graham, offering to assassinate Mr. O'Connell. The person deputed to give the information, finding the court closed, went in search of the magistrate, and ultimately found him at the Athenaeum Club. Having accompanied the magistrate to the court to have the document made out, they were subsequently joined by other persons connected with Government, for the purpose of completing the deposition. The whole of the night was spent in deliberating on the subject, and on Thursday morning, before five o'clock, several official personages arrived at the court, where they remained until eight o'clock, in close consultation. The proceedings were conducted with the greatest secrecy, but in the course of yesterday it transpired that the writer of the letter, who has been apprehended, resides at Gloucester, where he holds a situation in the Custom-house. He admitted to the magistrates that he wrote the letter, and did so under the excitement of having taken too much wine; he stated that he regretted it as soon as he posted it, and communicated his folly to his friends, suggesting the propriety of his writing another letter to Sir J. Graham in explanation, but they thought it so ridiculous that no notice would be taken of it. After consideration, Mr. Hall told the prisoner that the charge against him was one of a most serious and important character, and that no Minister of State could have passed it by without public notice. It had, however, been determined to admit him to bail, himself in the sum of 400*l.*, and two sureties in the sums of 200*l.* each, to appear at the next July Sessions of the Central Criminal Court, to answer any charge that might be preferred against him. The prisoner then gave in the names of Mr. Jones, a shipowner at Gloucester, and a gentleman named Watkins, as his bail.

SPORTING.

FESOM RACES, FRIDAY.—THE OAKS.—The following are the details of this race, the result of which we announced briefly in our last. The most remarkable features were the extraordinary number that ran, and the defeat of all the favourites by a mare that was not even mentioned in the betting. In 1831, when Oxygen won, 21 started; in 1832, Galata's year, 19; in 1833, Vespa's, 19; and in 1841, Ghuznee's year, 22; these are the largest fields on record for

the Oaks, and the best of them falls short by one of that on Friday. But if the number was so unusual, there was nothing extraordinary in the quality of the animals, except their badness. A worse lot never went to the post; and the best proof of it is, that up to Wednesday, so feeble were the public pretensions of the favourites (Maria Day, who was not in her form, excepted), that 8 to 1 was currently offered on the field; and it was only after Cotherstone's victory that the Bessy Bedlam filly and Decisive came so strongly into the market. The new rule for starting did not prove so successful in this race as for the Derby; three or four false starts, and the real one such a bungling affair that two jockies had their horses' heads turned the wrong way when the word was given, and were left behind. For the first quarter of a mile the pace was good, Carillon, Sister to Jeffy, the Bessy Bedlam filly, Decisive, and the Elegance filly lying in front so close together that it was impossible to say which had the lead; Sister to Jeffy then took up the running at greatly-diminished speed, followed by Decisive, Bessy Bedlam next, and the rug at their heels. This order was observable to the mile-post, where, as the pace was, Utica, Judith Hutter, Carillon, and Lord Westminster's two were tailed off; the others went on in a cluster to the turn, round which Sister to Jeffy went two lengths in advance, attended as before, reached the last road, where Extempore, Fanny Callaghan, the Bessy Bedlam, Elegance, and Rococo fillies closed with her, and for a few strides they were "all of a heap." Extempore then went in front, followed by Poison, Bessy Bedlam filly third, in which rotation they ran half way up the distance. Poison then shot ahead of Extempore, and, imitating Cotherstone, passed the chair by two lengths. Extempore beat the Bessy Bedlam filly half a length, Messalina was a length from the latter and half a length before Decisive, who was not quite a length before the Rococo filly. Value of the stakes, 2,600*l.* On coming to scale, a formal objection was made to the start; but the stewards, after hearing evidence, decided that it was valid. Maria Day broke down in the race, and the Laura filly pulled up lame. The rider of the latter was fined 5*l.* for starting twice without the signal.

The Members' Plate of 50*l.* for 3-yr-olds, 6st. 7lbs.; 4-yr-olds, 9lbs.; 5-yr-olds, 8st. 13lbs.; 6 yrs and aged, 9st. 2lbs.; mares, &c. allowed 3 lbs. Winner to be sold for 200*l.*, &c. Heats, 2 miles.—Mr. Cowley's Adrian aged (Calloway) beat Mr. Bainbridge's Lady Mary, 5 yrs, Col. Charlie's The Knight, aged, and seven others.

The Derby and Oaks Stakes, of 5 sovs. each, with 25 added; three years, 7st. 4lbs.; four, 8st 9lbs; five, 9st; six and aged, 9st 2lbs; mares, &c. allowed 3lbs; horses that have started once at this meeting and not won, allowed 3lbs, twice 5lbs. The winner to be sold for 120*l.*, but if entered as to be sold for 80*l.* allowed 7lbs over and above all other allowances; the second to save his stake. Heats, one mile. (18 subs.) Mr. Bastard's Teapot, 4 yrs (Nat), beat Mr. Kling's Dahlia, 6 yrs; Mr. Gray's Jim Crow, aged; and 11 others.

STATISTICS OF THE DERBY.—The last was the 63d anniversary of this celebrated race, it having been established in 1780, when it was won by Sir C. Banbury's Diomed, beating 8 others. On that occasion there were but 36 entries, while this year they amounted to 161, being 22 less than last year. It would appear that it was some years before this race became popular with the patrons of the turf, for during the first seven years of its existence the entries dwindled from 36 to 29, and from that period until the present year they have been gradually increasing. The lowest number of horses that ever started was in 1794, when Lord Grosvenor won with Dædalus, 4 only coming to the post; and the highest number when Coronation carried off the prize, 29 starting. During the last 16 years the average number of horses that have started is 23. Eight years after the race was established the Prince of Wales won the stakes with Sir Thomas. The Duke of York was a winner twice—in 1816 with Prince Leopold, and in 1822 with Moses. Sir F. Standish was the first gentleman who won the race two years in succession, in 1795 with Spread Eagle, and the following year with Didcot. The Duke of Grafton and Lord Egremont were also winners two successive years—the former in 1809 with Pope, and the next year with Whalebone; the latter in 1804 with Hannibal, and in 1805 with Cardinal Beaufort. The Duke of Grafton was a winner of four, and Lord Egremont of five races. The former nobleman was the last winner of the Derby two years successively. The Duke of Bedford was a winner on three occasions—in 1789 with Skyscraper, 1791 with Eager, and 1797 with a colt by Fidget. Lord Grosvenor also won three races—in 1790 with Rhadamanthus, 1792 with John Bull and 1794 with Dædalus. The Dukes of Rutland and Portland were not so fortunate, being winners of only one Derby each, the former in 1828 with Cadland, and the latter in 1819 with Tiresias. Lord Jersey was a winner of three races—in 1825 with Middleton, 1827 with Mameluke, and in 1836 with Bay Middleton. Mr. O'Kelly, the owner of the celebrated Eclipse, was a winner in 1781 (the second year of the race) with Young Eclipse, and in 1784 with Sergeant, Eclipse being the sire of both horses. The only horse that ever won the Derby and St. Leger in one year (1800) was Champion, the property of the late Mr. Wilson.

MARK LANE, FRIDAY, June 9.—This morning being unsettled the Factors asked higher prices for free Foreign and English Wheat, but the Market was not brisk, and there was great difficulty in making 1*s.* advance, although it was accomplished in many instances; the bonded is withdrawn from the Market, or held at an advance. Barley continues to sell at the same prices, but the supply is short. Peas are held higher in consequence of some unfavourable account of the crop. Beans are unaltered in value. The prices of Oats are fully maintained.

GAZETTE OF THE WEEK.

BANKRUPTCY, SUPERSEDED.—W. Eden, Queen-street, Cheapside, printer.
BANKRUPTS.—J. Whitmore, Stockport, Cheshire, pawnbroker.—J. Ryan, Stockport, Cheshire, surgeon.—T. Stripling, Colchester, Essex, coachmaker.—T. Waller, Preston, brewer.—J. N. George, Upper Berkeley-street, Marylebone, bookseller.—J. W. Carleton, Upper George-street, Bryanston-square, bookseller.—G. Tattersall, Noble-street, London, hosier.—P. Singleton, Kingston, Jamaica, merchant.—W. Slade, Bridport, Dorsetshire, boot and shoemaker.—W. Danson, Bath, Somersetshire, tailor.—W. Reynolds and J. T. Fairbank, Sheffield, Yorkshire, builders.—J. M. Mallan, Ludgate-hill, dentist.—J. Greave, Nicholas-lane, Lombard street, engraver.—J. Deane, Oxford, bookseller.—J. Clarke, R. Mitchell, J. Phillips, and T. Smith, Leicester, bankers.—W. Musgrave, Leeds, dyer.—J. Breasley, Leeds, victualler.—W. Deacy, Manchester, snuffaker.—J. Marrian, Sheffield, brewer.
SCOTCH SEQUESTRATIONS.—W. Hutton, South Queensferry, Linlithgow, baker.—P. Bryce, Glasgow, victualler.—J. Hunter, near Midcalder, wood-merchant.

BIRTHS.—On the 30th ult., at Fernay, the lady of the Hon. E. A. Lambert, of a son.—On the 1st inst., at 50, Wilton-crescent, the lady of T. Milner Gibson, Esq., of a daughter.—On the 5th inst., in Dover-street, the Lady Harriet Milner, of a son and heir.
MARRIED.—On the 6th inst., at Dryburgh Abbey, the Hon. and Rev. Scourie Hay, youngest brother of the Earl of Erroll, to the Lady Alicia Erskine, third daughter of the Earl of Buchan.—On the 7th inst., at St. Mary's, Marylebone, the Hon. W. Godolphin Osborne, second son of Lord Godolphin, to the Hon. Caroline Montagu, daughter of the late, and sister of the present, Lord Rothesay.
DIED.—On Thursday, the 1st inst., Mr. John Milne, Nurseryman, of Stoke Newington.—On the 6th inst., at Lewisham, John Fenn, Esq., civil engineer.—On the 8th inst., at his residence, Cottage-grove, Mile-end road, the Rev. J. Fletcher, D.D., of Stepney, aged 98.—On the 8th inst., at the official residence of the Chancellor of the Exchequer, H. Goulburn, Esq., Jun., aged 31.

HATCHING APPARATUS.—Reduced Prices.—From eight to sixteen Guineas.—Messrs. Todd and Son, of Bury-street, Bloomsbury, beg to call the attention of the Public to their PORTABLE PATENT HATCHING AND REARING APPARATUS, being the original Manufacturers. This successful invention is capable of Hatching, at a trifling expense, any number of Game and Poultry Eggs of all sorts, from 50 to 200 at one time, and possesses the further recommendation of rearing the young birds at all seasons, and of furnishing Poultry for the table at a trifling cost, at all periods of the year. For further particulars apply at the Manufacturers'. A Machine may be seen in use daily.

CORNS, BUNIONS, &c.

THE PROPRIETOR OF THE ANTI-CALLOSITY, or RUSSIAN CORN AND BUNION PLAISTER, feels great confidence in recommending it as the most certain cure for all Callous Swellings on the Feet that has ever yet been invented. By the use of this Plaister immediate benefit will be found, and in a short time a Radical Cure will be effected by gradually dispersing the Hard or Soft Corn, and entirely removing those painful throbblings so severely felt at every change of weather. Sold, with full directions for use, in boxes, 1*s.* 1*d.* and 2*s.*, at SANGER'S Medicine Warehouse, 150, Oxford-street; and all Medicine Vendors throughout the country. Remember—"THE RUSSIAN CORN AND BUNION PLAISTER."

HORTICULTURAL SOCIETY'S SHOW, CHISWICK.—Noblemen and Gentlemen desirous of seeing Stephenson's Improved Conical Boiler in operation, are respectfully solicited to inspect one recently fixed in the above Gardens, heating a Melonry upon the much-approved plan of water circulating in open troughs. Prospectuses and drawings may be obtained at STEPHENSON'S & Co.'s Warehouses, 61, Gracechurch-street, where also may be seen a variety of Patterns of ornamental Iron Fencing, Hurdles, Wire-work, Flower-Rods, and Horticultural implements.

BRITISH ORCHIDACEÆ.

A LADY who has some fine specimens of the broad and narrow-leaved Helleborum, the Fly Orchis, the Bird's Nest, and others soon about to blossom, is anxious to obtain a purchaser for them. Her family has lately met with a sad reverse of fortune, which has reduced them to a state of wretchedness, and she would be truly grateful to those who would assist her in relieving a few of their wants. Address, J. E. S. Post-office, Chichester.

MECHI'S Superb Tea Trays, in papier maché, (manufactory, 4, Leadenhall-street, London) are unrivalled specimens of japan work, infinitely surpassing the Chinese. The prices vary from a very low figure up to twenty guineas the set. They comprise some brilliant specimens of Art, in Figures, Landscapes, Flowers, and Birds, with burl and gold. The same manufacture is applied in Work-boxes, Dressing-cases, Envelope-cases, Netting-boxes, Glove-boxes, Playing Card boxes, and Ladies' Visiting Card-Cases, Hand-screens, Pole-screens, Card-racks, Inkstands, Ladies' Work-tables, Chess-tables, Portfolios, Note and Cake Baskets, Ladies' desks, Letter-boxes, &c. The foregoing are all in papier maché, and very cheap, say from 13*s.* up to 20*l.*, and Mechi can confidently assert that his establishment for these articles surpasses in price, quality, and extent of Stock any similar concern in the United Kingdom. Mechi is sole inventor of the MECHAN Dressing-cases, the Patent Castellated Tooth-brushes, 9*d.* each, the Cushioned Bagatelle-tables, the Magic Razor-strop, and peculiar Steel-razor. A visit to his Establishment will gratify those who are desirous of seeing the most perfect manufactures of this country displayed in the most attractive form.

AGRICULTURAL CHEMISTRY.

THE Committee of Management of the AGRICULTURAL CHEMISTRY ASSOCIATION OF SCOTLAND hereby request such persons as have intimated their intention to be Candidates for the Office of CHEMIST, and such as intend being so, to transmit their proposals to Mr. COVENTRY, 28, Moray-place, on or before the 18th instant, as the Election is to take place on WEDNESDAY the 21st.

ALL DISEASES of the KIDNEYS and BLADDER speedily and effectually cured by DR. YOUNG'S MIXTURE. The efficacy of this Medicine in the above Complaints has been long proved by its unparalleled success in a practice of many years' standing, and has induced the present proprietor to make it more generally known.

Sold in Bottles, 2*s.* 9*d.* each, by the Proprietor's Agent, J. SANGER, 150, Oxford-street, London; also by Johnson, 68, Cornhill; Prout, 229, Strand; Mr. King, 232, Blackfriars Road; and all Medicine Vendors throughout the country.

TONIC MILK of ORANGE, a DELICIOUS CORDIAL and SWEETENER of the BREATH.—It warms and cheers the Stomach, creates an Appetite, Digests the Food, Strengthens the Lungs, Clears and Improves the Voice for Singing, enlivens the Spirits, dispels Nervous Debility, Clears the Blood, and thus removes Pimples and Eruptions, while it combines with these admirable properties the inestimable advantage of being the most efficacious agent offered to the Public for Beautifying and Perfuming the Breath. It should be taken in the proportion of a wine-glass full twice a day, and is particularly recommended to GENTLEMEN on leaving home in the morning, or after smoking a Cigar, &c.; while to LADIES it will be equally grateful on going to a party or a ball, for its invigorating influence on the mind and spirits, and its purifying effect on the organs of the health.

Mrs. GULLY respectfully announces to the Nobility, Gentry, and Public at large, that she has disposed of the Right, Title, and Recipe of the TONIC MILK of ORANGE to Messrs. A. ROWLAND and SONS, No. 20, HATTON GARDEN, LONDON; who have appointed Messrs. Barclays, Medicine Vendors, 95, Farringdon-street; Mr. Sanger, 150, Oxford-street; Mr. Johnson, 68, Cornhill; Mr. Prout, near Temple Bar; and Mr. Butler, 4, Cheapside, as Agents.—Half-pints, 2*s.* 9*d.*; Pints, 4*s.* 6*d.*; Quarts, 9*s.*; Stamp Duty included.

BUTTER MADE IN TEN MINUTES. BY THE NEWLY-INVENTED CHURN. REGISTERED ACCORDING TO ACT OF PARLIAMENT. ATTWOOD, WIMBLE, & WARNER, MANUFACTURERS, LEWES. This CHURN being made entirely of Block Tin, the necessary degree of temperature can be given to the cream, by placing it in a pan of cold or hot water, which ensures the butter coming in 10 or 12 minutes. The simplicity of its construction, and the facility with which it may be cleaned, are no inconsiderable advantages over those now in common use.

Sizes	No. 1	2	and 3
Churn from	7 to 8 lbs.	13 to 15 lbs.	26 to 28 lbs.
Price, carriage paid to London.	25 <i>s.</i>	35 <i>s.</i>	42 <i>s.</i>

Zinc Pans for Churns to stand in, extra. N.B.—Thermometers and Butter Prints supplied. May be obtained through any respectable ironmonger in town or country, and from the Manufacturers, Lewes.

To be seen in London, at WRIGHT'S Range Warehouse, No. 3, Arthur-street, near the Monument; RIEB'S Brush Warehouse, No. 80, Gracechurch-street; LIVERMORE and SON, Ironmongers, No. 30, Oxford-street.

NEW AND IMPROVED CHURCH AND CHAMBER ORGAN,

MANUFACTURED BY H. C. LINCOLN,

Organ Builder to Her Majesty The Queen,
And to their late Majesties George the Fourth and William the Fourth;

AND BUILDER OF THE ORGANS IN

HER MAJESTY'S CHAPEL ROYAL, BRIGHTON.

HER MAJESTY'S PALACE, THE PAVILION, BRIGHTON.

HER MAJESTY'S CHAPEL, DEVONPORT.

Mr. LINCOLN has just had the honour to receive the following testimonial from the Rev. W. F. H. HOOPER,
Incumbent of Withington:—

"Withington, Manchester, March 27, 1843.

"Mr. LINCOLN has just completed an Organ for my Church, which was opened by Dr. GAUNTLETT on Friday the 17th, and Sunday the 19th of this month. The Instrument has given the most complete satisfaction to me and to all who have felt an interest in its erection. The best judges both amongst my own people and of persons unconnected with the Church have pronounced it perfect—unsurpassed in its softness, richness, and variety of tone. I have pleasure in adding that Mr. LINCOLN has treated us with considerable liberality, has acted with openness and uprightness, and as becomes a tradesman of the highest respectability—has spared neither labour nor (I may add) expense in fulfilling his contract to the utmost, and has devoted himself strenuously, not to say enthusiastically, to the work of turning out an Instrument that should give perfect satisfaction to the Committee of gentlemen concerned in its erection. In this he has completely succeeded; and I shall be happy if my recommendation secures him further patronage.

W. F. H. HOOPER, Incumbent of Withington."

ORGAN MANUFACTORY, 196, HIGH HOLBORN.

Mr. LINCOLN solicits the attention of the Nobility, Clergy, and the Professors and Amateurs of Church Vocal and Instrumental Music, to the peculiarities and advantages of the great and numerous improvements he has recently adopted in the construction of the Church and Chamber Organ. These alterations have been made with a view of affording an increased efficacy to the Organ, in rendering its support to a large congregation, and in the performance of Church Instrumental Music. The effect gained is such as to combine the breadth and variety which distinguish the Continental Organ, with the universally recognised sweet and silvery tones produced by the English mode of voicing and finishing the pipes.

The advantages gained by the adoption of the new mode of construction are unquestionable:—

1st. The Organ has a more weighty and solemn character of tone, which is gained by the introduction of the new Stops, called the Bourdon, Tenoroon, and Quint.

2d. It has a more brilliant and silvery character, from the new mode of arranging the Sesquialteras, Mixtures, and by the use of a new Stop, called the Doublette.

3d. It has a more soft and varied character, from the circumstance that instead of the Instrument only possessing one Flute, it has three, four, or even six, all of which combine with the new Stops in producing an entirely new quality of tone to the Organ, and which is admirably adapted to the purposes of Psalmody. These Flutes are called the Claribel-Flute, the Oboe-Flute, the Wald-Flute, the Suabe-Flute, the Piccolo, and the Flageolet.

Mr. LINCOLN begs to refer to the following Organs, as examples of the new manner of combining great power and variety at a small expense.

THE NEW ORGAN IN THE CHURCH OF ST. THOMAS, THE ROLLS, CHANCERY-LANE,
(Opened in November);

THE NEW ORGAN IN CROSBY-HALL, BISHOPSGATE-STREET (Opened in December);

THE ORGAN AT THE NEW CHURCH, WITHINGTON, MANCHESTER (Opened in March);

THE NEW GRAND ORGAN NOW ERECTING AT THE CATHEDRAL CHURCH OF ST. DAVID.

Mr. LINCOLN submits the following TESTIMONIALS from the late Dr. Clarke Whitfield, Mr. Attwood, Mr. Thomas Adams, Dr. Gauntlett, and Mr. Purkis, as to the Character of his style of Organ Building:—

From Dr. J. CLARKE WHITFIELD, Professor of Music to the University, Cambridge.

I have employed Mr. LINCOLN at Trinity and St. John's Colleges during my residence at Cambridge, and therefore can vouch for the superiority and durability of his work, as well as for his moderate charges. It is my opinion that the Diapasons of Mr. LINCOLN possess more of the sweetness of the celebrated "Father Schmidt" than those of any other Organ Builder of the present day.

From Mr. ATTWOOD, Organist of St. Paul's Cathedral, and Composer to the King.

I have the pleasure to inform you that I think the Organ built by Mr. LINCOLN an instrument possessing a fine quality of tone, great power, and very complete in all its parts.

Testimonial from the New Church Committee, Newington, and Mr. PURKIS, Organist.

The undersigned feel highly gratified in expressing their opinion upon the Organ built by Mr. LINCOLN for the said Church; and testifying to the great satisfaction he has given therein, not only with respect to its internal construction, mechanism, and powers, but also to the very fine and superior quality of tone it so eminently possesses, and of which it is scarcely possible to convey a sufficiently just and adequate idea.

(Signed) A. CYRIL ONSLOW, Rector.
GILBERT ELLIOTT, Minister.
JOHN PURKIS, Organist.
(And all the Committee.)

Testimonial from the New Church Committee, Camberwell, and Mr. THOMAS ADAMS, Organist.

The undersigned deem it only common justice to Mr. LINCOLN to express the very high and general satisfaction which he has given in the erection of an Organ in such new Church without any written contract, he completed, within the time stipulated, all, and even more than in his tender he had engaged to perform, without claiming a single extra. Of the appearance of the Organ, of its internal mechanism and workmanship, and above all, of its powerful yet mellow and most beautiful tone, it is scarcely possible to convey a just idea of the praise which has been bestowed upon it by all who have seen and heard it.

(Signed) JOHN GEORGE STORIE, Vicar.
JOHN VANE, Minister.
THOS. ADAMS, Organist.
(And all the Committee.)

Testimonial from Dr. GAUNTLETT, Organist of Christ Church, Newgate-street, London, and of St. Olave's, Southwark.

Mr. HENRY C. LINCOLN has erected two Organs on my new plan, and has two others in progress. I have much pleasure in recording my opinion of his merits. In the contracts which he has executed under my superintendence, I have ever found him, although exceedingly moderate in his price, yet very desirous to give his employers every advantage. The internal mechanism and the outward decoration of his work have been finished in the best style. The metal and manufacture of his pipes have been of high excellence; and every portion of his instrument has been completed with the same uniform attention to its durability and due effect.

Mr. LINCOLN has the honour to announce

A NEW AND IMPROVED CHURCH BARREL-ORGAN;

ALSO,

THE CONCERT-ORGAN FOR THE SALOON OR DRAWING-ROOM;

AND

THE APOLLONICON, OR SELF-ACTING ORGAN;

For the Mechanical Performance of Symphonies, Overtures, Choruses, &c.

Mr. LINCOLN continues to manufacture the OLD ENGLISH UNISON and GG CHURCH-ORGAN, to which he gives some new Characteristics, by means of his newly-invented Flute, Reed, and Diapason Stops. He also reconstructs the Old Instruments upon the New Plan.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of IN-VISIBLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bording, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

BEE-HIVES.—GEORGE NEIGHBOUR and Son beg to inform their Apiarian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Bee-hives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and Son have also Glass Hives and other articles connected with Bee Management, at their Apiarian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps inclosed.

* * * "NUTT ON BEES" (5th Edition), now published.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

ORNAMENTAL WIREWORK FOR THE GARDEN, 390, OXFORD STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in FANCY WIREWORK, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hothouse Engines, Syringes, Fumigating Bellows, and other Horticultural Implements. G. B. Thompson's Improved Waterpots, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

BULB CUCUMBER-GLASSES, for Watering by Evaporation during the growth of the Fruit, 2s. 6d. to 3s. 6d. each; GRAPE-GLASSES, with holes, 1s. 9d. to 2s. 6d. each; BEE-GLASSES, 1s. to 2s. 6d. each. Cylindrical CUCUMBER-TUBES, from 6d. to 4s. each; PROPAGATING-GLASSES, Green, 1s. per lb.; white, 1s. 2d. per lb.; or 2s. 6d. to 24s. per dozen; FISH-BOWLS, from 1s. 6d. each; ditto, with hole in bottom for Fountains, 2s. 6d. per lb., at ASPLEY PELLATT'S Falcon Glass Works, Holland-street, Blackfriars. Orders from the country, accompanied with a Post-office order, will meet with prompt attention.

LITHIC ANTI-CORROSION PAINT, from its Strength and Durability, forms an excellent coating for Greenhouses, Conservatories, and Outbuildings. Its antiseptic qualities particularly adapt it for the preservation of Wood and Iron Fences; and it may be advantageously employed upon good Brickwork, in place of stucco or other covering. Manufactured in stone and slate colours by JOHN BAZLEY WHITE & SONS, Roman and Keene's Cement Manufacturers, Millbank-street, Westminster.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER in a Nobleman or Gentleman's Family. He is competent to the Management of the whole routine of Gardening in every branch, with Woods and Plantations; has lived in his last Situation nearly twenty years; is a married man, 44 years old. Can give unexceptionable references as to character. Direct to N. B., at Messrs. T. and J. BACKHOUS, Nurserymen, York.

AS GARDENER OR BAILIFF. A middle-aged, married Man, without incumbrance, of very extensive practice, whose ability and character will bear the strictest investigation. Wages no object. Direct to A. B., at 2, Strong's Cottages, Brook-green, Hammersmith.

AS GARDENER. A married Man, who has no objection to the care of Cows, or to take charge of a Horse and Chaise; can have an excellent character from his last employer. The country not objected to.—Direct to W. CLARK, at Mr. Lockhart's, Wood street, Walthamstow, Essex.

AS GARDENER, or GARDENER and FORESTER. A single Man, aged 39 years, who has a thorough practical knowledge of Pines, Grapes, Greenhouse Frames, and all branches connected with his profession. He had in his last Situation the Management of the Woods and Plantations, and left it in consequence of the death of his late employer. Highly respectable reference can be given. Direct to Mr. BLAKE, 22, Upper Berkeley-street West, Hyde Park Square, London.

AS GARDENER. A single Man, aged 25, who has been from his earliest youth engaged in his business, and thoroughly understands the most approved methods of Fencing, and can be highly recommended. Direct to C. S., at Mr. MILTON'S Apiarian Repository, 10, Great Marlborough-st., Wimpole-street.

TO THE NOBILITY, LANDED PROPRIETORS, &c. THE Advertiser, a Scotchman, 40 years of age, and married, wishes to meet with an eligible Situation. He is competent to undertake the management of extensive Forests, Woods, Plantations, Nurseries, and Kitchen Gardens, laying out Carriage drives, plain and ornamental Walks, &c. For the last 16 years he has been in the employ of a Nobleman in the County of Salop, and formerly was engaged for a period of several years, under the late celebrated Mr. John Hay, Planner, of Edinburgh, in which several capacities he has been enabled to obtain a thorough knowledge of his business in all the above branches, including the most modern methods of Fencing, Harvesting, Bark, &c. The most unexceptionable references can be given. Address, Mr. LACHLAN, Richmond, Walcot, near Ludlow.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet street, in the Precinct of Whitechapel, in the County of London, and Published by them at the Office, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, June 10, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 24—1843.

SATURDAY, JUNE 17.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Aberdeenshire Horticultural Society, its exhibition	383 a	Hawthorn, curious variation in the blossoms of a	291 b
Abutilon striatum, culture of	400 b	Hedera, new seedling Rhododendrons at	398 a

Hampshire Horticultural Society, show of the	395 a	Wood, its use in feeding cattle, when it is pulverised	387 c
Harlequin Horticultural Society, its exhibition	396 a	Wrens, habits of	391 b

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

NEW AND SUPERB FUCHSIAS.

YOUELL & Co. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their select List of the above elegant tribe of plants, which appeared on the front advertising page of this Paper of the 27th ult. They are now ready to be sent out per post, free, (on the receipt of a post-office order,) to any part of the United Kingdom, upon the following terms:—
12 fine show varieties, . . . 12s. 12 extra fine and very superior
12 extra fine ditto . . . 16s. rior . . . 21s.
The selection being left to YOUELL & Co.
Great Yarmouth Nursery, Norfolk, June 14, 1843.

TO PANSY GROWERS.

J. PEARSON, having a fine Stock of his BLACK PRINCE PANSY, will, on receipt of a Post-office order for 5s., send it to any part of the Kingdom in a tin-box, post-free.—Chilwell Nurseries, near Nottingham.

MAGNIFICENT NEW FUCHSIA, "FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised from seed in the Exeter Nursery, and which they have no hesitation in saying is decidedly the finest variety ever produced; indeed, it is at once admitted to be so by all who see it, who are struck with admiration of its noble appearance. The flowers are exceedingly large, being longer as well as broader than those of any other Fuchsia, and are of very firm, thick, waxy substance. The tube and sepals are of a rich scarlet-crimson colour, opening freely and well displaying the corolla, which is widely-expanded and of a fine violet-blue colour, differing greatly from all other hybrid Fuchsias. The whole habit of the plant is exceedingly good; the leaves are thick, glossy, and of a Laurel-like texture; it blooms abundantly, and the flowers hanging gracefully upon long peduncles, clear and distinct from the foliage, appear to great advantage; it flowers well in the open border, and is quite hardy. The original Seedling Plant is now flowering in the Exeter Nursery, and may be seen by any person who calls there, and will also be shown at the next great Exhibition of the London Horticultural Society, on the 17th inst.—Strong, healthy plants will be ready for delivery on the 10th of August next, at 10s. 6d. each, and will be sent by post, carefully packed in tin cases. Orders will be executed strictly according to the priority of their reception. The usual discount to the Trade if six plants are ordered.

N.B.—This seedling Fuchsia was raised last summer, has been fully proved, and will give satisfaction to all who purchase it.—Exeter Nursery, June 1, 1843.

SUPERB CHRYSANTHEMUMS.

YOUELL & Co., in offering their LIST of CHRYSANTHEMUMS (for which, see their advertisement in this Paper of the 3rd inst.), to the notice of amateurs, and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the list will be found highly satisfactory to those who may not only have the above object in view, but also to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants will be strong and healthy, and sent free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, at the rate of 12s. per dozen.—Great Yarmouth Nursery, June 15, 1843.

MESSRS. VEITCH AND SON beg to offer the following New and Beautiful Plants, introduced by them through their Collector in South America:—

Alstromeria nemorosa (See figures)	Curtis's Bot. Mag., Aug. 1842,
Begonia coccinea	Curtis's Bot. Mag., Jan. 1843,
Echites splendens	and Paxton's Mag., May, 1843,
atropurpurea	Paxton's Mag., March, 1843,
hirsuta	and Curtis's Bot. Mag., Nov., 1842,
Gesneria polyantha	Edwards' Bot. Reg., May, 1843,
Gloxinia macrophylla variegata	and Paxton's Magazine, Oct., 1842,
Hypocyrta strigilosa	Curtis's Bot. Mag., Feb., 1843,
Manettia bicolor	Curtis's Bot. Mag., Feb., 1843,
Passiflora Actinia	Curtis's Bot. Mag., April, 1843,
Rondeletia longiflora	Curtis's Bot. Mag., Nov., 1842,
	and Paxton's Magazine, Nov., 1842,

Stigmaphyllon ciliatum	Curtis's Bot. Mag., May, 1843
heterophyllum	
Siphocampylus duplo-serratus	Edwards' Bot. Reg., Dec., 1842,
Tropaeolum azureum	Curtis's Bot. Mag., Dec., 1842, and Paxton's Mag., Dec., 1842.

Messrs. VEITCH and SON having raised many thousands of Araucaria imbricata from seed, are enabled to offer them in quantity at a very low, moderate price.—Exeter, June 3, 1843.

NEW AND SUPERB FUCHSIA ST. CLARE.

THIS magnificent FUCHSIA, pronounced by Dr. LINDLEY as "the finest hybrid we have seen," is now ready for sending out by YOUELL & Co., upon the following terms, viz.:—One St. Clare, with eleven other finest Show varieties for 21s.; the set delivered free of postage, (on the receipt of a post-office order) to any part of the United Kingdom.—Great Yarmouth Nursery, June 14, 1843.

ROSES.

T. RIVERS, JUN., respectfully informs his Friends and the Public that his Collection of ROSES will be in full bloom about the 28th inst. To those inclined, a day may be spent among Roses, as the collection is now much larger than it has ever yet been. The Nurseries, although very extensive, are connected. Down trains per Northern and Eastern Railway, Shoreditch, run as follows, calling at Harlow and Sawbridge-worth stations alternately, each one mile from the Nursery: Morning—eight, half-past nine, half-past eleven o'clock; Afternoon—half-past one, half-past four, quarter-past six, and half-past eight o'clock.—Sawbridge-worth, June 15, 1843.

FUCHSIA TODDIANA. Fine strong Plants of this charming variety, Ten Inches to One Foot in Height, are now being sent out at 10s. 6d. each, or small, in Thumb Pots, 5s., together with small Plants of every New variety in Cultivation at half the Spring Prices.

Catalogues of FUCHSIAS, VERBENAS, &c., can be had on prepaid application. THOMAS CRIPPS, Tunbridge Wells Nursery.

NEW FUCHSIAS OF 1843.

W. MILLER has a limited Number of all the new FUCHSIAS at half their advertised prices; as Epssii, 5s.; St. Clare, 5s.; Brockmania, 3s. 6d.; Balloonii, 3s. 6d.; Lancii, 3s. 6d.; Rogersiana, 3s. 6d.; Toddiana, 5s.; Enchantress, 5s.; Pulcherrima, 3s. 6d.; Ivoryana, 3s. 6d.; Transparens, 2s. 6d.; King, 3s. 6d.; Gem, 3s. 6d.; Dermisiana, 2s. 6d.; also the best of the older varieties, at 10s. 6d., &c., &c. Likewise all the new VERBENAS at half-price; to include case and postage to any part of the United Kingdom. Orders accompanied by a remittance executed in rotation.

Providence Nursery, Ramsgate, Kent.

ROSES.

E. DENYER begs to inform the Nobility, Gentry, and his Friends in general, that his superb collection of ROSES will be in bloom about the 26th of June. The Standard and Dwarf Roses are planted on each side of a walk 660 feet long, and consist of 500 varieties. Orders taken for the plants when in bloom, and delivered in November next. Admittance gratis. Nursery within three miles of London, Loughborough-road, North Brixton.

SPLENDID NEW PELARGONIUM—"THURTELL'S PLUTO."

LUCOMBE, PINCE, & Co., are happy to inform the Public that they have made arrangements with Capt. Thurtell for the sole possession of the Stock of this unrivalled Flower, and shall be able to execute orders for it early in October next.

The following Opinion, given by Dr. LINDLEY, of this fine Pelargonium, in the *Gardeners' Chronicle* of the 20th May last, renders it quite unnecessary for them to say more than that it is a most distinct variety—a decided step in that peculiar class indispensable in all good collections, and will give satisfaction to those who purchase it.—"C. M. Thurtell, Capt., R.N.—Your 'Pluto' is a rich, brilliant, and high-coloured variety. The flower is well-formed, petals stiff and short; the upper petals are of a rich and brilliant scarlet, with a dark spot that terminates abruptly; the lower petals are of a deep rosy salmon colour, with a tinge of blue in the centre of the flower. This variety is rich, brilliant, and attractive."

L., P., & Co., have also arranged with Capt. Thurtell for the sole disposal of all his fine SEEDLING PELARGONIUMS, a list of which will be published in a future Advertisement, when the price of "Pluto" will be stated.—Exeter Nursery, June 12, 1843.

SUPERB SEEDLING CHRYSANTHEMUM THE "DUKE."

YOUELL & Co. feel much pleasure in announcing they have obtained the entire stock of an extremely beautiful seedling Chrysanthemum, from Mr. Wells, gardener to the Rev. J. Burroughes, of Lingwood Lodge, Norfolk. This splendid variety, named "THE DUKE," was exhibited at the Norfolk and Norwich Horticultural Society's Exhibition, where it obtained the First Prize, as the Best Seedling; it also obtained First Prizes shown in the best stand of 25; ditto ditto, 15; ditto ditto, 20; and the judges pronounced it to be the best Chrysanthemum ever exhibited. The colour French White, changing to pure white: petals broad and beautifully incurved, forming a perfect ball of from 4 to 4½ inches in diameter. It is ready for sending out, at 7s. 6d. per plant, free of postage, to any part of the United Kingdom.—Great Yarmouth Nursery, June 17, 1843.

WARNER & WARNER, SEEDSMEN, 28, Cornhill, beg leave to offer the following choice SEEDS, which they can recommend with the greatest confidence:—

	Per paper—s. d.
PRIMULA SINENSIS FIMBRIATA, crimson shaded, saved from the most splendid flowers	1 0
CALCEOLARIA, shrubby and herbaceous, from the finest flowers	1 0
New Double CANTERBURY BELLS, blue and white	1 0
PAPAVER ORIENTALIS (very beautiful)	0 6
LYCHNIS FULGENS	1 0
New WHITE WALCHEREN BROCCOLI (true)	1 0
CHAPPELL'S NEW CREAM DO.	1 0
WHITE DO.	1 0

N.B.—The present season is the most suitable for sowing the above seeds.

SUPERB BLUE CINERARIA SEED, furnishing to

the Greenhouse throughout the Winter months a varied, lively, and brilliant continuance of elegant bloom. MICHAEL BREWER, Sen., Nursery, London Road, Cambridge, respectfully invites notice to his extensive collection of the most esteemed named kinds as well as to his own new and beautiful Seedlings now in bloom, comprising every shade of deep, rich, and light Blue, and to observe, that as the present is the best season to sow for Autumn, Winter, and early Spring Flowering, he is induced to offer Seed of the same warranted as newly-gathered from the best selected and set-apart varieties from amongst his numerous stock, in packets, mixed, at 3s. 6d., 7s., and 10s. Prepaid applications, inclosing Post-office orders, will be immediately executed, post-free.

WINDING-UP SALE for the season of DAHLIAS, PELARGONIUMS, FUCHSIAS, VERBENAS, &c., by PROTHORPE and MORRIS, at the Auction-Mart, on THURSDAY, June 22d, at 12 o'clock, being the last sale this season.

BRITANNIA LIFE ASSURANCE COMPANY, 1, PRINCES STREET, BANK, LONDON.

This Institution is empowered by Special Act of Parliament, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestably, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others.

The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of 30, who by the payment of 5l. 3s. 4d. to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000l., subject only to the condition of his continuing the same payment quarterly during the remainder of his life,—a condition which may be fulfilled by the mere saving of EIGHT SHILLINGS weekly in his expenditure. Thus, by the exertion of a very slight degree of economy—such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000l., which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director. A Board of Directors attend daily at 2 o'clock, for the despatch of business.

ROYAL BOTANIC SOCIETY OF LONDON.—

Exhibitions of Plants and Flowers, for 1843, Inner Circle, Regent's Park, WEDNESDAYS, June 28 and July 19, from 2 o'clock until 7.

The Prizes to be awarded are MEDALS and PLATE, varying in value from 10s. to 100l., the total amount being 600l. for Plants and Flowers, and 10l. 10s. for Microscopes. Open to all Competitors. Fellows, Members, and Bearers of Ivory Tickets will be admitted upon entering their names or numbers in the Gate Book.

Visitors will be admitted by Tickets to be obtained at the Gardens, and between 12 and 4 o'clock at No. 28, Regent-street, by Orders from Fellows and Members only. Price 6s.; and on the days of Exhibition after 2 o'clock, 10s.

Schedules of Prizes, with the Regulations for the observance of Exhibitors, and all other particulars, may be had on application at the Gardens, or at 28, Regent-street, as above.

By Order of the Council, J. D. C. SOWERBY, Secretary.

FLORICULTURAL SOCIETY OF LONDON.—

The Meeting on TUESDAY, the 20th inst., will take place at 3 o'clock, when Prizes will be awarded for Seedling Pinks, Pansies, and Pelargoniums, together with first and second Prizes for the best specimens of Pinks in class showing. The seedling Pelargoniums to be exhibited on the plant. Communications to be addressed to the Secretary, to whom any specimens may be forwarded by Members or otherwise, carriage-paid.

Members may introduce their friends, by written orders, or otherwise.—T. C. WILDMAN, Hon. Sec.

Crown and Anchor Tavern, Strand, June 13, 1843.

SLOUGH PINK AND HEARTSEASE SOCIETY.—

POSTPONEMENT OF SHOW.—At a Meeting of the Committee, held this day, it was unanimously resolved to POSTPONE THE SHOW from June 26th to July 3rd, in consequence of the lateness of the Season. All entries to be made on or before June 27th, after which time it will be double. Schedules of Prizes, &c. may be had on prepaid application.

J. S. WATTS, Hon. Sec.

Crown Hotel, Slough, June 15, 1843.

AMERICAN PLANTS.—WATERER'S SPLENDID

EXHIBITION, King's Road, Chelsea, under the especial patronage of H.R.H. the Duchess of Gloucester and H.R.H. the Duke of Cambridge, is now in high perfection. Upwards of 10,000 plants, many 10 to 12 feet high, completely covered with flowers, producing one of the most brilliant scenes ever offered to public view.—Open daily, Sundays excepted. Admittance, One Shilling.

YOUELL & Co.'s Nursery, Great Yarmouth, a

splendid Specimen of their FUCHSIA ST. CLARE, upwards of Nine Feet in Circumference, literally covered with bloom, to which they respectfully invite admirers of this elegant tribe of Plants to inspect. June 15, 1843.

YELLOW RHODODENDRON.

LUCOMBE, PINCE, & Co., have now a few plants for sale of this rare and beautiful RHODODENDRON, and as they purchased from Mr. SMITH, who raised it, the original Plant, which was exhibited in Flower by him at Chiswick, and gained the Large Silver Medal, and have propagated stock from it, their plants may be depended upon as being the true "RHODODENDRON AUREUM," or Smith's Yellow Rhododendron.—Exeter Nursery, June 12.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25*l*. to 500*l*., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of FREDERICK LAWRENCE, Resident Secretary, 112, Cheapside.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87) renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4*l*. 4*s*. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.

N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

COTTAM and HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch . . . 27 0*s*. 0*d*.

(Larger Sizes in proportion.)

Roger's Boiler, small size . . . 3 15 0

Ditto do. large do. . . 4 10 0

Hot-water Pipe, 4 inch diameter, 1*s*. 3*d*. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 35 lbs., 3*s*. 6*d*. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 1*s*. 4*d*. each.

Strong do. do. do. 45 lbs. at 4*d*. "

Ox Hurdles, 4 feet high, do. 60 lbs. at 5*d*. "

BEST WIRE FOR STRAINED WIRE FENCING at 8*s*. per bundle of 150 yards each. Uprights for ditto, 7*d*. each. The Improved continued, and every other kind of Fencing, Fancy Wire work, &c.

GARDEN ROLLERS 18 inches long. 3*s*.; 20, 4*s*.; 22, 5*s*.; 24 inches, 6*s*.; 26, 7*s*.; 28, 8*s*.; 30, 10*s*. each.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3*s*. 6*d*.; 20 inches, 4*s*. 6*d*.; 22 inches, 5*s*. 6*d*. each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7*s*.; 4 feet 6 in., 5*s*. 11*s*.; 6 feet, 1*s*. 7*d*.; 20*s*. per dozen.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5*s*. 9*d*. each.

Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations. Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

IMPROVED SYSTEM OF HEATING GREENHOUSES, MELON, PINE, AND CUCUMBER-BEDS, &c.

CALDWELL, PARKER, & Co., IRON-FOUNDERS, Scotland Road, Warrington, Lancashire, most respectfully solicit the attention of the Nobility, Gentry, Seedsmen, Gardeners, &c. to the improvement which they have made in the system of HEATING HOTHOUSES by Water—a system which supercedes all others in producing the most healthy Plants in the shortest time, for which they can produce the most undeniable reference.

The improved system prevents the scorching of plants, so common to flues, and keeps the house in one regular temperature, with a saving of fuel and labour; and the Improvers warrant their system to be superior to any other, and ultimately, far less expensive.

THE RIGHT HON. the Earl of Derby, Founder.

THE RIGHT HON. the Mar. of Serton, Patron.

The Right Hon. Lord F. Egerton, Patron.

A. L. Gower, Esq., Castle Malpas.

L. B. Hesketh, Esq., Gwyrch Castle.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

BUDDING'S PATENT GRASS-MOWING MACHINE.—This Machine, which has recently undergone some improvements, is admirably adapted for mowing Lawns and Pleasure-Grounds. It is so easy of management that it may readily be used by an unpractised hand; and while the work is much more rapidly performed than by the scythe, the effect is very superior, as it leaves no seam, and it may be used in all seasons, and best in dry weather, when the Grass is difficult to cut with the scythe.

Wholesale and Retail Agents to the Patentee—J. R. and A. Ransome, Ipswich.

Agents in London—Thomas Wilkinson, 309, Oxford-street; Baker and Co., 65, Fore-street, Cripplegate; Cato and Sons, 89, Holborn Hill; Charles Smart, 369, Oxford-street.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of 114 of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

* * * POTTER'S Portable Farm-yard Manure, at 4*l*. 15*s*. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

GUANO ON SALE, as Imported, of first quality, and in any quantity, direct from the bonded stores, either in Liverpool or London. Also, NITRATE OF SODA. Apply to H. ROUNTHWAITE & Co., Merchants, 6, Cable-street, Liverpool.

ILLUSTRATIONS OF BRITISH GRASSES. Just published, Quarto, with 118 Plates, beautifully coloured, 3*l*. 16*s*., boards.

GRAMINA BRITANNICA; or, Representations of the BRITISH GRASSES: with Remarks and occasional Descriptions. By I. L. KNAPP, Esq., F.L.S., and A.S. Second Edition. London: LONGMAN, BROWN, and Co. Bristol: W. STRONG.

REV. WILLIAM BENNETT'S WORKS. Third Edition of

DISTINCTIVE ERRORS OF ROMANISM.—A Series of Lecture Sermons, preached during Lent. By the Rev. WILLIAM J. E. BENNETT, M.A., late Student of Christ Church, Oxford, and Minister of Portman Chapel, St. Marylebone. One Vol. 8vo, cloth, price 1*s*. Each Lecture sold separately, price 8*d*.

SERMONS ON MISCELLANEOUS SUBJECTS, with Introductions, Notes, &c. 2 Vols., demy 12mo, price 1*s*. 4*s*. boards; or separately, Vol. I., 6*s*. 6*d*.; Vol. II., 7*s*. 6*d*.

A GUIDE TO THE HOLY EUCHARIST, forming in the Second Volume a Companion to the Altar. 2 Vols. 18mo, 8*s*. cloth.

THREE SERMONS, explaining the New Marriage Act with regard to Churchmen and Dissenters. 12mo, price 6*d*. and 1*s*.

"IF ANY PROVIDE NOT FOR HIS OWN." A Sermon preached in All Souls' Church, St. Marylebone, on Sunday, the 22d of March, 1840. 6*d*.

LETTERS TO MY CHILDREN ON CHURCH SUBJECTS, Vol. I., cloth boards, now ready.

CYMRU.

Now publishing in Numbers,

THE ECCLESIASTICAL ANTIQUITIES OF THE CYMRU, or the Ancient British Church; its History, Doctrine, and Rites. By the Rev. JOHN WILLIAMS, M.A., Perpetual Curate of Nerpur, Flintshire, and Vice-President of the Institut d'Afrique de Paris.

1. Bardism, 2*s*.—2. Introduction of Christianity, 6*d*.—3. National Establishment of the Church, 6*d*.—4. Councils of Arles, Sardica, and Ariminum, 8*d*.—5. Rise and Suppression of Pelagianism, 8*d*.—6. Defenders of the Faith, 8*d*.—7. Trial of the Church, 8*d*.

BIRD'S LENT LECTURES. (2d Edition.) In foolscap 8vo, price 3*s*. 6*d*. cloth. Second Edition of **TWELVE LECTURES ON THE CHURCH CATECHISM,** by the Rev. CHARLES SMITH BIRD, M.A., late Fellow of Trinity College, Cambridge.

THORNDIKE'S ARMOUR FOR CHURCHMEN.

A DISCOURSE OF THE RIGHT OF THE CHURCH IN A CHRISTIAN STATE. By HERBERT THORNDIKE, B.D., formerly Prebendary of Westminster. A New Edition, with Appendix, Table of Scriptural References, General Index, &c., and a Preface, by the Rev. J. S. BREWER, M.A., of Queen's College, Oxford. 1 Vol. 12mo, cloth, price 8*s*. 6*d*.

"To have read and studied Hooker will not furnish a dispensation from the expediency, we may almost say necessity, of reading and studying Thorndike."—*Church Intelligencer*.

MELBOURNE CHURCH.

Now ready, 1 Vol. in demy 8vo, cloth, with plates, price 5*s*. **THE HISTORY AND ANTIQUITIES OF MELBOURNE CHURCH, DERBYSHIRE.** This Church is believed to have been erected originally by King Ethelred about the year 700. Edited by the Rev. JOSEPH DEANS, Vicar of Melbourne, Perpetual Curate of Chellaston, Derbyshire, and Domestic Chaplain to the Right Hon. the Earl of Beverley.

W. J. CLEAVER, Baker-street, Portman-square.

Just published, price 1*s*. 8vo., sewed.
AN INAUGURAL LECTURE ON BOTANY CONSIDERED AS A SCIENCE, AND AS A BRANCH OF MEDICAL EDUCATION. Read in King's College, London, May 8, 1843. By EDWARD FORBES, F.L.S., F.B.S., Vice-President of the Wernerian Natural History Society, &c., Professor of Botany in King's College, London.
JOHN VAN VOORST, 1, Paternoster-row.

Just published, in 8vo, price 21*s*. cloth, with Four Maps, **A CYCLOPEDIA OF COMMERCE, MERCANTILE LAW, FINANCE, and COMMERCIAL GEOGRAPHY:** comprising Descriptive and Statistical Accounts of Commodities, with Customs and Excise Regulations, Duties, &c.—Commercial Statistics of the different Countries of the World, including their Physical Character, Productions, Trade, Seaports, Monies, Measures, Finances, &c.—Colonies, Shipping, Public Companies, Railways, Roads, Docks, Post-office, &c.—Summary of the Principles of Commerce, Finance, and Banking, with Historical and Statistical Illustrations of these subjects—Digest of Commercial Law, including Insurance, Partnership, Principal and Agent, Bills of Exchange, Sale, Guaranty, Bankruptcy, Shipping and Navigation, and Contracts and Obligations in general—Commercial Arithmetic and Accounts, Exchanges, Coins, Measures and Weights, Public Funds, Interest, Annuities, and Assurances, with numerous Tables—Explanation of Mercantile Terms and Usages, besides a variety of Miscellaneous Information. By WM. WATERSTON, Accountant. The Law Articles contributed by JOHN HILL BURTON, Advocate.

Parts I. to VI. may also be had separately, price 3*s*. 6*d*. each. OLIVER & BOYD, Edinburgh; SIMPKIN, MARSHALL, & Co., London.

In small 8vo, price 3*s*. 6*d*. **PRODUCTIVE FARMING;** or a Familiar Digest of the Recent Discoveries of LIEBIG, DAVY, and other celebrated Writers on VEGETABLE CHEMISTRY; showing how the results of English Tillage might be greatly augmented. By JOSEPH A. SMITH.

WILLIAM TAIT, Edinburgh; SIMPKIN, MARSHALL, & Co., London.

Second Edition. Will be ready shortly. **A TREATISE ON "RENDLE'S TANK SYSTEM** OF COMMUNICATING HEAT." By WM. E. RENDLE, F.H.S., Plymouth, can be ordered of all Booksellers, or of the Author, 5*s*., or 5*s*. 6*d*., free by post.
LONGMAN, BROWN, GREEN, and LONGMAN.

In one small volume, price 1*s*. **PAXTON'S POCKET BOTANICAL DICTIONARY.**

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

Handsomely bound in cloth, with Ninety-three Wood-Engravings. Price 6*s*. 6*d*.

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.
From the *British Magazine*.—"This is an elegant and well-executed little book, on a most interesting subject."
TILT and BOGUE, Fleet-street.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5*s*. 6*d*.

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published." London: WHITTAKER and Co.

A LUXURY FOR WARM OR WET WEATHER.

BERDOE'S SUMMER VENTILATING WATER-PROOF FROCK and LIGHT SUMMER COAT.—These novel and gentlemanly garments have already been adopted by a long list of the Nobility, Gentry, Professional Gentlemen, &c., and will prove well deserving the attention of all who regard a respectable and gentlemanly appearance, in opposition to slang, vulgarity, and meanness. Made to measure in the first style; but a large assortment always ready, of which an inspection is confidently invited. (Warranted Waterproof, without confining Perspiration.)

Made only by W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill, (eight doors from Bishopsgate-street).

SUN-BURNS, FRECKLES, TAN, and other disfigurements of the Skin, are pleasingly eradicated by that unique preparation ROWLAND'S KALYDOR, a balmy odoriferous liquid, and now universally admired for its sovereign virtues in completely removing all cutaneous eruptions, and in rendering the complexion delicately clear and fair. It is invaluable as a renovating and refreshing wash during travelling, or exposure to the sun, dust, or harsh winds, and after the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving, in allaying the smarting pain.

CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR."—it is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper, and "A. ROWLAND & SON, 20, HATTON-GARDEN," engraved on the Government stamp affixed to each bottle. Price 4*s*. 6*d*. and 8*s*. 6*d*. per bottle, duty included.

Ask for ROWLAND'S KALYDOR.—Sold by them, and by Chemists and Perfumers.

WANTED TO PURCHASE.—A BOAT, (short, very broad, and deep) for a small pond; a Large Cabinet for Minerals; some Iron Hurdles; Pheasants' Cages; Two or Three Melon Frames, and a Greenhouse, or the Glazed Sashes only. Melon Condition not material so that the Price is very low. Direct (stating exact dimensions, with lowest prices) to A. B., at Mr. MANICORN'S, Baker, South Molton-street, Oxford-street.

ROYAL BOTANIC SOCIETY OF LONDON.—The next PROMENADE of this Society will take place at their Gardens in the REGENT'S PARK, on WEDNESDAY, JUNE 21, from 4 to 7 o'clock, if the weather prove fair. Fellows, Members, their Friends, and the Bearers of Ivory Tickets alone can be admitted. Ample provision is made against sudden showers of rain. By Order of the Council, J. D. C. SOWERBY, Secretary.

The Gardeners' Chronicle.

SATURDAY, JUNE 17, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, June 20	Linnæan 8 P.M.
	Floricultural 8 P.M.
	(Crown & Anchor). 3 P.M.
Wednesday, June 21	Microscopical 8 P.M.
	Geological 8 P.M.
Saturday, June 24	Royal Botanic 4 P.M.
Tuesday, June 27	Zoological 8 P.M.
Wednesday, June 28	Royal Botanic, Garden Exhibition. Medico-Botanical 8 P.M.
Country Shows, Friday, June 23,	Liverpool Spilsby.

MR. CLEMENT HOARE, in his excellent treatise on the cultivation of the Vine on open walls, remarks that a prevailing idea, that the more wood there is in a Vine the more Grapes it will produce, is precisely the reverse of the fact; that to permit a Vine to make a great quantity of wood under the idea of thereby getting a great quantity of Grapes, is grasping at the substance and catching the shadow; that in order to keep a plant in good bearing condition the pruning-knife should be used to a far greater extent than on any other kind of fruit-tree; and finally, that the most severe manner in which that instrument is applied to other trees is as nothing when compared with that required by the Vine. These statements are not confined to winter pruning, but applied to the Vine at all seasons; and upon the assumption that they are correct, Mr. Hoare founds his mode of "long-rod" pruning. It has always occurred to us that a little discussion would be advantageously applied to this subject, and we therefore invite the attention of Grape-growers to the following considerations:—

Mr. Hoare's theory, as we understand it, may be briefly expressed thus: The quantity of Grapes which a Vine is capable of producing is not in proportion to the quantity of its foliage, therefore an abundance of foliage is disadvantageous to the Vine, and should be removed. In support of this proposition Mr. Hoare refers to the practice in vineyard countries, and to his own experiments. It is stated that the proprietors of vineyards insert in their leases covenants to regulate the number of shoots to be left on each stool, and the number of eyes to which a branch is to be shortened, because, in the absence of such covenants, the vine-farmer would exhaust the Vines, and gradually ruin the quality of the wine. Upon turning to Chaptal's standard work on the cultivation of the Vine in France we find this idea confirmed. He attributes the indifferent quality of the Grapes obtained from the Vines that are allowed to scramble over trees and to hang from them in festoons, as is the case in Provence, to the watery quality of the sap consequent upon the superabundance of leaves (vol. i. p. 293); and in another place (vol. i. p. 296) he says that in the French vineyards Vines are pruned in order "to hinder the dispersion of the sap, and the formation of an infinite quantity of shoots, branches, twigs, and leaves, which would push in crowds from the buds, would extend the surface of the stool in an immoderate degree, and increase beyond all bounds its powers of sucking up fluids from the soil (*aspiration*). But in depriving it of what is called superfluous wood, the sap is concentrated in a part of those shoots which are considered best suited to produce fine, good, ripe fruit."

Mr. Hoare's own experiment is stated to be this:—"To describe the results, which, with little variation, were the same in all, one Vine may be advantageously selected. This was a White Muscadine, in the eighth year of its age, and, like all the rest, in the highest bearing condition possible. It produced in the following spring an abundant supply of vigorous bearing shoots, and shewed 78 bunches of fine Grapes, the produce of 29 buds, retained on two horizontal right and left shoots. As the season advanced the shoots extended themselves rapidly, the bunches of fruit increased in size, and the Vine thrived as well as usual, seemingly quite unconscious of the task it shortly had to perform. Blossoming being over, and the fruit set, the trial of strength commenced. On the 1st of July many of the bunches measured 11 inches from the shoulders to the extremities, and when matured would have weighed a pound and a half each. They hung close together, forming, as far as they extended on the wall, an entire and compact mass of Grapes, the weight of which, if ripened, would have exceeded 60 pounds. The middle of that month arrived and the berries had only reached the size of small Peas, while those on other Vines, not subjected to any such trial, were full grown, and had commenced the stoning process. On the 1st of

August no perceptible increase of size in the berries had taken place, and the Vine began to show strong symptoms of exhaustion. About the middle of that month the foliage assumed a withering appearance, and on the 1st of September the vegetation of the plant was almost at a stand; the shoots ceased to grow, the fruit and foliage were in a prostrate condition, and the vital energies of the Vine appeared quite unable to supply the daily increasing demand for nourishment. Throughout that month it continued in a pitiable condition, and though a valuable plant, it was nevertheless suffered to take its course as well as all the others, in order that the trial might be decisive. About the 1st of October, the greater part of the berries having grown as large as middling-sized Peas, those on the shoulders of some of the bunches began to show symptoms of ripening by becoming a little transparent, and at the same time the berries at the extremities of the bunches began to shrivel. As the month advanced, the ripening process proceeded slowly, but the shrivelling increased rapidly. Towards the latter end of October the trial was over, and the experiment complete; on many entire bunches every berry had shrivelled, and in no bunch had the process of maturation proceeded farther down than the shoulders. The whole crop was gathered about the 1st of November, and the ripened portions being put together, weighed 9½ pounds. Not one of these ripened berries, however, was more than half the usual size, and in point of flavour not to be compared to others of the same sort ripened at least six weeks previously."

This is, no doubt, a very instructive experiment in some respects, and well worth the attentive consideration of Gardeners; but there is a somewhat important omission in the circumstances relating to it, so far as the question now before us is concerned—namely, how this Vine had been treated previously, and in what manner it was pruned during the progress of the experiment. All that we learn is, that in the previous years the Vine had been remarkably vigorous, and had been closely pruned.

It may perhaps appear that, at all events, this sort of evidence is conclusive as to the correctness of Mr. Hoare's theory, and shows that close pruning is advantageous to Vines. We must, however, confess that it does not carry conviction to our mind. Mr. Hoare's experiment seems to us to amount merely to this,—that if you leave on a Vine more bunches than it can support, those bunches will shrivel and not ripen. But there still remains behind the question, why it cannot support its own produce? and that is not answered by the experiment. Mr. Hoare, indeed, may say the bunches did not swell "because the quantity of Grapes which a Vine is capable of producing is not in proportion to its foliage." But might it not with equal justice be inferred that they did not swell because the quantity of leaves to nourish the branches was insufficient?—insufficient both during the year of the experiment and in the previous season. We think the language which the Vine spoke on this occasion not only might, but should be thus interpreted:

Mr. Knight long since showed that the Melon, when young, and before its organizable matter is formed in sufficient abundance, is incapable of supporting its fruit; that if fruit is set on very young Melon-plants, it either turns yellow and drops off, or remains small and of bad quality; and that the true principle of obtaining finely-grown and richly-flavoured Melons is to prevent their bearing till their organizable matter is abundantly stored up. Now this appears to us explanatory of the shrivelling of Mr. Hoare's Grapes. In the first place, the Vine had been previously close-pruned, which would diminish the amount of organizable matter prepared in its branches during the season previous to the experiment; for it is the constant rule that the quantity of organizable matter in a plant is in proportion to the quantity of its healthy leaves; and secondly, it is to be inferred that the same system of close-pruning was observed during the experiment, which in that case would further deprive the bunches of matter whereon to feed.

With regard to the evidence afforded by the French Vineyard practice, it has not necessarily that connexion with close pruning which it at first sight appears to have. The French landlord limits the quantity of bunches to be borne by his Vine-stools, and directs the removal of branches, in order to insure the perfect ripening of the fruit; for, as Chaptal observes in another place (vol. i. p. 294), "the nearer the Grapes are to the surface of the ground (provided they do not touch it, which ruins them) the more they are exposed to the heat reverberated from the soil;" but of course that reverberation would not take place at all if the ground were covered over with an entangled mass of branches and leaves. In this country Grapes are not placed in such circumstances as they are in the French Vineyards, where the Vines cover the ground from a foot-and-a-half to two yards apart, like the plants in our Gooseberry-grounds.

It is true that Chaptal mentions repeatedly the watery quality of sap consequent upon a superabun-

dance of leaves, but this sort of physiological reasoning is inadmissible. Sap is not watery because of a superabundance of foliage, but because of an undue supply of water by the roots, or an insufficient exposure of leaves to the influence of light; indeed, Chaptal's own instances in support of his interpretation may be used against it; for, while he refers the bad quality of the Tree-Grapes of Provence and of the rampant Vineyards of Poitou to a superabundance of leaves, he admits that the higher temperature of Italy, where the Vines are also allowed to scramble among trees, will occasionally produce good Grapes; although he adds, this is only in some places, for the wines of Italy are of poor quality, and will not keep. We should rather say that the bad quality of the Tree-Grapes, &c. is owing to their leaves being shaded by the branches among which they grow, and that the indifferent quality of Italian wine is due partly to the same cause, and partly to the careless way in which it is made.

Upon the whole, we cannot say that the system of close pruning and frequent abstraction of leaves is satisfactory to us; and we would in particular express our doubt whether it does not materially retard the ripening of Grapes out of doors. But as this is a matter of very considerable importance, and there are many points connected with it which we have no room to enter upon to-day, we must reserve our further observations. In the meanwhile, we shall be extremely glad of the experience and opinion of practical Grape-growers upon the subject, observing only, in addition, that all the foregoing remarks apply to summer pruning only.

KEEPING in view the principles we laid down in our last Number respecting the letting small portions of land for garden cultivation, and distinguishing such garden-farms from the allotments or gardens, let to the labourers working on a farm, we will endeavour to explain our meaning by a reference to such occupations in other countries which we have had an opportunity of visiting, principally in Flanders, France, and Switzerland. Although the general state of agriculture, on a large scale, is very different in these countries, being most perfect in Flanders, next in Switzerland, and the least so in France, there is much less difference in the management of the very small occupations cultivated principally by the spade. Except in a small orchard—a most useful appendage to a cottage garden—no part of the ground is in permanent grass; and the stock, of whatever kind it may be, is kept in the stalls or sties all the year round. This may be considered as the foundation of the whole system, without which so small portions of land could not be profitably cultivated. Where there is no stock there is no manure; the land, instead of improving in fertility, is soon exhausted, and no labour can restore it. Where there is a cow, and a calf to succeed her, food must be raised for them—artificial grasses and other green food in summer, and roots and straw in winter. Experience soon shows what quantity of land must be devoted to this purpose. Those who are not acquainted with this system will scarcely believe that two acres of arable land will feed two small cows and a heifer, and two or three acres more suffice to raise corn and pulse to feed a family and carry some to market; that poultry and pigs are kept on the refuse, and a sheep is often fatted in the same shed or stall with the cows. It is not so much by the abundance of each crop, as by the rapid succession in which they are raised, that this is done. But as facts are always more convincing than arguments, we will here extract a short account of a small farm in Belgium from the *Outlines of Flemish Husbandry*, p. 90, which we have every reason to believe is correctly stated.

"Near Alost we met with one of the smallest farms which will maintain a family without other work—it was barely five acres. The house was much larger than such an occupation warranted; but it was an old farm-house, and the land had been divided into small holdings, leaving only five acres to go with the house. There was a small orchard of about a quarter of an acre, in which there were some thriving Apple and Plum trees. The grass under these was good, and the only cow which the man had was led by the wife in a halter to graze there for a short time every day—apparently more to give her exercise than for the food she could pick up. The grass seemed to have been cut for her in another part. This cow had cost eight pounds, and the man regretted that he had not had the means to purchase a second, as he could have maintained two very well. Half of the land was in Wheat, the other half in Clover, Flax, and Potatoes; so that the Clover did not recur sooner than every sixth year, the Flax and Potatoes in nine. As soon as the Wheat was reaped he began to hack the stubble about four inches deep with a heavy harrow, and as fast as he got a piece done it was sown with Turnips, after having had some of the contents of his urine tank poured over it—for, small as the farm was, it had its reservoir for this precious manure. Thus a considerable portion of the

Wheat stubble was soon covered with young Turnips of a quick-growing sort, which, if sown in the beginning or middle of August, were fit to pull in November and December, and were stored in the cellar for winter use. There was a small patch of *Cameline*, which was sown less for the seed than for the stems, of which he made brooms in his leisure hours in winter. But these hours could be but few, and only when snow covered the ground, and prevented him from digging and trenching, which was a constant operation; for the whole five acres had to be dug in the course of the year, and as much of it as possible had to be trenched, the soil being a stiff loam of a good depth, which was much improved by stirring and trenching. The milk and Potatoes, with a little salt pork, fed the family—for a pig was fed on the refuse of the food given to the cow and a little corn. Most of the Wheat, and all the Flax, were sold, and more than paid the rent, which was not high—about 10*l.* a year, without any rates, tithes, or taxes.* Incessant labour kept the man in good health, and his wife was not idle. They had two or three young children, one at the breast; but, except the wish for another cow, there seemed no great dissatisfaction with their lot, nor any great fears for the future. They had no parish fund to fall back upon—not even a union-house; but had they come to want by unforeseen accidents they would have found the hand of private charity ready to help them."

This interesting account shows what may be done by cheerful industry. No time must be lost; no gossiping of the wife or tippling of the husband, but both striving to assist each other. A man who works for himself always works harder and more cheerfully than he that works for wages; his children are brought up in industrious habits; honesty is inculcated by precept and example; and, as there are few temptations where there is no idleness, there are fewer examples of vice.—*M.*

THORNS.

As there is no genus more ornamental than *Cratægus*, although some of the species are not desirable, the following list will, we hope, be found useful to such of our correspondents as have expressed a desire to possess a select collection. They may be planted next each other in the order in which they stand.

1. *Cratægus heterophylla*, has small red fruit in great profusion.
2. *C. Aronia*, has very large, yellow fruit, rather late in the autumn.
3. *C. Douglassii*, has rather large, black fruit, very early in the season.
4. *C. oxyacantha rosea superba*, the most beautiful of all the Thorns when in bloom, with deep crimson flowers and small red fruit.
5. *C. coccinea*, the large scarlet fruited Thorne.
6. *C. odoratissima*, the Sweet-scented Thorn, with very large, pale-red fruit.
7. *C. punctata flava*, the large yellow-fruited Thorn.
8. *C. Leeana*, the large Tansy-leaved Thorn, with large, pale-red fruit.
9. *C. macracantha*, the very long-spined Thorn, with very small bright-red fruit in great profusion.
10. *C. Oliveriana*, the small black-fruited Thorn, very profuse but late.
11. *C. prunifolia*, the entire-leaved Thorn, with a profusion of bright-red fruit, very late.
12. *C. oxyacantha*; the new double scarlet; a most beautiful double variety of No. 4 in this list.—*J.*

ON THE BOKHARA TREE CLOVER.

(*Melilotus leucantha major*.)

THE Bokhara Clover claims a place in every flower-garden for its beauty. It is very striking to look upon an herbaceous plant, 10 or 12 feet in height, covered with spikes of white Pea blossoms, which also shed a sweet perfume.

I esteem its value in Agriculture of greater importance. The objections to its cultivation are, that cattle give a preference to other green food, and that the stem contains too much woody fibre. The plant, however, is new to Britain, and we know that man and animals frequently require successive trials of new food before taste is acquired for it. As a proof of this, I understand that some cattle are getting very fond of this Clover; and we know that the tissue of plants in general is changed more and more into woody fibre as they progress towards maturity. Nature increases the woody fibre of this Clover for support as it elongates its gigantic stem. If, however, it is cut for cattle, when about two feet in height, it will be found nearly as succulent as the common Red Clover.

I exhibited plants of it at the Highland Society's Show last September, 9 feet in height, being the second crop of it that season from poor sandy land. I know no plant whatever that will produce so much weight of vegetable matter in equal time and space; and were it only for the production of vegetable manure, it is a boon to the Agricultural world. In my experiments with it last summer, as a manure for new varieties of Alsike(?) Clover, I found it the very best and cheapest manure.

In the economical formation of manure, it might be liberally supplied with other food throughout the summer to young cattle and pigs, in an open straw-yard profusely

* It must be recollected that this is in a country where the average price of Wheat is about 3*6s.* the quarter, and where labour is about 1*s.* a day.

bedded over with layers of turf, peat-earth, whins, broom, brushwood, ferns, straw, weeds, &c., and thus save much outlay on the purchase of foreign manures.

The Bokhara Clover may be sown at any time throughout the growing season; but the most profitable time to sow it is immediately after a crop of early Potatoes, or even after Grass, Barley, Wheat, &c. The land being well manured, ploughed over, and harrowed smooth, it may be sown in shallow drills, 18 inches apart; being cut once in autumn, it will produce a much earlier spring crop than Tares, Italian Ryegrass, &c. It should always be cut very close to the ground, as the shoots produced from beneath the surface are the most luxuriant, and it will thus stand a severe winter much better than when its vitality is exposed on long stubble. Treated in this way with me, it stood two successive winters, and acquired all the characteristics of a perennial root. I have no doubt of its continuing perennial and more vigorous with the age of the plants, if only cut close in autumn, and top-dressed with rich compost.

I saw a remarkable result at Oxenford Castle the other day, which Mr. Gardener pointed out to me in the garden. Mr. Gardener sowed the Bokhara Clover last May, and cut part of it several times for use, leaving a part which produced ripe seed. The latter is now considerably more luxuriant than the former.

Might not this Clover be advantageously introduced thinly over the dry pastures of Australia? The seeds would vegetate if sown during the rainy season, while the plants might afford shelter and shade to the surrounding Grass, and even food, when other vegetation lies scorched beneath a tropical sun.—*Robert Arthur, 1, Waterloo Place, Edinburgh.*

FAMILIAR BOTANY.—No. XVI.

The Water Dropwort.—Some of a neighbour's children were amusing themselves by the side of a ditch whose sides had been worn away by the heavy rains that have lately deluged the country, when they spied some nice tender roots, white inside, and looking like little Parsneps. Such a prize was not to be neglected, and in a trice a good parcel of them were pulled up, brought home and eaten. Alas! in a short time the children all became ill, then they went raving mad, and in three hours two of the party died in strong convulsions. I am not sure that the others will recover.

This sad calamity was caused by a pernicious plant, called by the English herbalists the *Water Dropwort*, by the Kentish people *Bendock*, by Botanists *Enanthe crocata*, by the Irish peasantry, who often suffer from it, *Dahou*. It is one of our most poisonous weeds, and is every year the parent of frightful mischief. The books tell us that during the last war "eleven French prisoners had the liberty of walking in and about the town of Pembroke. Three of them being in the fields a little before noon, dug up a large quantity of this plant, which they took to be wild Celery, to eat with their bread and butter for dinner. After washing it, they all three ate, or rather tasted of the roots. As they were entering the town, without any previous notice of sickness at the stomach or disorder of the head, one of them was seized with convulsions. The other two ran home, and sent a

surgeon to him. The surgeon endeavoured first to bleed, and then to vomit him; but those endeavours were fruitless, and he died presently. Ignorant of the cause of their comrade's death, and of their own danger, they gave of these roots to the other eight prisoners, who ate of them with their dinner. A few minutes afterwards the remaining two who gathered the plants were seized in the same manner as the first, of whom one died; the other was bled, and an emetic with great difficulty forced down, on

account of his jaws being, as it were, locked together. This operated, and he recovered, but was some time affected with dizziness in his head, though not sick, or the least disordered in the stomach. The other eight, being bled and vomited immediately, were soon well."

Sometimes the hair and nails are said to come off; cows and horses perish when they feed upon it, as they will do if they find it in their pastures; dogs are also affected by it in a dangerous degree. In short, it is a fearful poison. Luckily, however, it is easily known.

Its roots are produced in thick fangs, like those of a Dahlia, but are smaller; they have been frequently sold during the winter by knavish gardeners to silly customers as the roots of that plant. In the autumn and winter they contain a yellow strong-smelling juice, but in the spring this disappears. The leaves are dark green, perfectly smooth, as is the stem, which grows 4 or 5 ft. high. They are divided in a bipinnate way into numerous leaflets, which are somewhat of a lozenge form, but are deeply and bluntly gashed. The flowers are white, and in compound umbels; they are of the Umbelliferous order, and have a visibly five-toothed calyx, with two stiff upright styles. The fruit (vulgarly called the seed) is oblong, ribbed, pressed closely together, and terminated by the two stiffened and almost spiny styles.

By these marks it is easily known from all our wild umbelliferous plants. Not a hair is upon it—its leaves are of the deepest green—and if you draw a line all round the leaflets without regarding the incisions, you will find that it will generally describe the figure of a lozenge more or less accurately: a good practical mark which will hardly deceive you. Lest, however, you should not be able to recognise your enemy by this description, I add his portrait, and I beg you to hunt him down, and root him up wherever he can be found.—*R. E.*

THE ANTIQUITIES OF GARDENING.

No. I.—Extracts from Sir Thomas Hanmer's Manuscript on Gardening. (Continued.)

"Artificial earths are either simple or compounded, and are much better than the natural, both for seeds and roots. The uncompounded are—1. Willow earth, which is found in the trunks or bodies of old Willows, and is the very substance of the tree rotted with moisture into an earth, but soe light and fine as none exceeds it for the bringing up of tender seeds or roots. 2. Dung, especially of coves, but so well rotted that it will pass through a reasonable fine sieve, and this is absolutely necessary, either alone, as for Beare's Eares and other fibrous flowers, or mixt, as shall be hereafter directed, for almost all flowers. 3. Rotted leaves and sprigs of trees, and sweepings of houses and streets, all which are good for most sorts of flowers.

"The compounded earths are made up of some parts of the natural and some parts of the simple artificial well mixt together, which, being skilfully done according to the natures of several plants, will cause admirable effects, as Tulips prosper wonderfully in a compounded earth of a little sand, some dry black mould, and the rest Willow earth; Cyclamens and Anemones in sifted dung and black mould."

[It appears from the above extract that Willow earth has been long highly esteemed for florists' flowers. Some still continue to use it.]

"In such earths as these your Tulipes will flourish; but every two or three years at most you must bring in fresh, for they delight in change thereof, as well as of the ayre. I know in Paris one of the ablest florists there, who had got a great deal of money by Tulipes, and he assured me that he changed his habitation purposely every third or fourth year in Paris, because of his Tulipes, which he found infinitely bettered by varyeties of ayre as well as of earth.

"The beds ought to lye a little higher in the middle than the sides, that all the flowers may be seen the better, and especially that no wet may lye too long about the rootes, which would putrify them, as the touching of new hot dung will do these and all other bulbs; yet some digg in such deep under the earth the rootes stand in, the hot fume whereof comforts, as they say, and not destroys them; but I should be cautious of using it, unless you desire to have your flowers blow richly one year, and never see them blow any more.

"When your Tulipes are past flowering, crop off the stalks of your choice stript ones, that they may not seed, for thereby they are much weakened."

(To be continued.)

AMATEUR'S GARDEN.—No. XXIV.

In addition to the plants before recommended, the Amateur who is thinking of having a few pots of flowers for his window or drawing-room table through the winter, must put in a first sowing of annuals for autumn blooming in pots. It is almost needless to name the kinds best adapted for this purpose, as in every garden they may now be seen in bloom; but as some may not know those kinds which are most suitable for winter-flowering, I will enumerate a few. First, then, among the tribe of beauties are *Nemophila insignis*, *Phacelia oides*, *atomaria*, and *Pawleyi*, a kind raised by Mr. Pawley, of Bromley, which has black flowers, beautifully margined with white. It is a variety raised from *N. atomaria*, and as it comes pure from seed may be considered a permanent kind. Next may be named *Collinsia bicolor* and *grandiflora*, *Clarkia pulchella* and *p. alba*, *Schizanthus pinnatus*, *p. humilis*, *Priestii*, and *Hookeri*; and lastly, *Erysimum Perofskianum*, *Ageratum mexicanum*, and the various kinds of *Salpiglossis* and *Petunia*. The last, however, are best raised from cuttings taken from

the old plants in August, and if potted off singly as soon as rooted, will flower in a warm room up to Christmas.

As most annuals transplant indifferently, it will be advisable to sow them at once in the pots in which they are intended to bloom; and in draining these it will be well to follow the advice given in a leading article twelve months back, viz., place an oyster-shell in the bottom, and fill the pots half full of moss before any soil is put into them. The moss will be found advantageous through the summer, as it will retain moisture, and if the pots could be plunged in it it would be greatly in favour of the plants. The seed must be sown very thinly, and as soon as the plants are up they must be thinned, retaining only the proper quantity in each pot. This, it must be recollected, is the first supply; but a second for later flowering must be sown about six weeks hence. Those who admire Stocks in pots, may sow some of the ten week kinds; and the Mignonette will of course not be forgotten.

Of plants before spoken of, the scarlet and other Pelargoniums, the propagation of which was recommended, will require to be potted off. If they are well rooted they may be placed at once in their blooming pots, in rough soil; but if they are not, give them pots in proportion. They must be stopped to make them bushy, and no flowers must be left on the plant till after the middle of August. The first sowing of *Primula sinensis* will now be fit to pot off; they must be put, two plants in a large 60-sized pot, in loam, peat, and leaf-mould; and it will be advantageous if they can be kept under glass in showery or dull cold weather. A second sowing must now be got in for the main winter and spring supply.

If strong plants of *Salvias* are desired for blooming in pots, no time must be lost in preparing them; but as small ones are preferable, the blooming points taken off the old plants at the end of August, and rooted in heat, will be quite early enough. Propagate Chinese and other Roses as fast as you can procure cuttings; as, if you get the plants strong by autumn they will, with very little forcing, bloom all through the winter. I have now I think said sufficient respecting plants for blooming in the drawing-room, and it will be the Amateur's fault if he have not a supply of them next winter.—*W. P. Ayres.*

HOME CORRESPONDENCE.

New Manure.—I have seen in your columns some valuable statements respecting the different manures now in use, and though many foolish and expensive theories have been advanced, I think the subject one of vast importance, and that much good may ultimately be derived to the public. I have tried guano and nitrate of soda on a small scale—the latter has answered my purpose much better than the former. I have also tried another manure for several years, of which I have seen no mention (perhaps from its not being generally known,)—namely, sizing dregs or the refuse of the skins of animals prepared in lime-pits. This is a material extensively used in this neighbourhood in preparing worsted warps for the loom. The produce from this is about three times as great as any manure I have yet tried, and the expense, where it can be got in sufficient quantities, is only about half as much as common farm-yard dung.—*I. G. H., Bradford, Yorkshire.*

Potatoes.—About a third of my crop of early Potatoes not appearing, I was induced to examine if the tubers had decayed, but to my surprise found them solid as the inclosed sample, with young Potatoes attached, but no appearance of vegetation above ground. This is the second year of cropping part of the land they were set upon, no manure being used, but a considerable portion of burnt soil (burnt six or eight years ago); the other portion is a stiff loam, and only brought into cultivation three years ago; both are well drained. Would you favour me and your other readers with the probable cause of my crop thus failing?—*R. R. R., Chester.* [We regret to be unable to solve our correspondent's difficulty. The tuber he sent is sound, and the young one, when exposed to the air, soon began to turn green—a sign that vitality is active. The diseases of the Potato are not at all understood by anybody. Possibly the cold wet weather may have some concern in the mischief; if so, warm weather will remedy it.]

Roses.—In reference to a paragraph in last week's *Chronicle*, signed "I. L. Y.," I should be glad to know from him, how long the "tea-scented Roses in large pots, from two to three feet high, covered with large and fragrant flowers," had been growing in the said large pots? Had they been growing therein only since the notice of the new system of showing in pots has been promulgated, about six months? If so, were there 25 varieties? And if, as might be supposed to have been the case, "I. L. Y." was in possession of something far transcending the "make-shifts," I can only regret, in common with other disappointed visitors to the garden, that he should have withheld his very interesting display. My opinion is—and it was formed before I saw what Mr. Beck says in the *Chronicle* of the 3d inst.—that the plants exhibited on the occasion alluded to were splendidly grown, considering the shortness of the time. The great object which the Horticultural Society profess to have in view, is the rewarding skilful gardening: now the skill displayed on this occasion by all who exhibited was considered meritorious, or the prizes would not have been awarded. I doubt whether "I. L. Y." had at the time in his possession any one Rose, potted since the new system was given out, that could have borne comparison with the new ones—Paul Joseph, Cornice de Seine et Marne, and others—exhibited by Messrs. Lane and Son, of Great Berkhampstead. I recollect on former occasions, when Rose exhibiting was in its infancy, that a single box of Scotch

Roses, half-blown and surrounded by a few buds, was awarded a prize; indeed I have seen such sorry "make-shifts," that many a cottage-gardener of the present day would blush to acknowledge that he had no better. Yet these were the best of the time, and were meritorious, because no one else had had the spirit to attempt to excel them. "I. L. Y." must know that new Roses imported into this country since Michaelmas last could not, by any possibility, be grown to a height of three feet on their own roots, and be "covered with large and fragrant flowers."

—*Alpha.* [We have struck out some passages which our correspondent will, upon consideration, perceive were better omitted. And we think it necessary to observe, that the decision of the judges, whether right or wrong, could not be influenced by the novelty of the sorts exhibited. They could only regard them as specimens of cultivation, and in that view they gave them such a reward as they considered them entitled to.]

The Oniscamantic Epiphyte Stand.—I am extremely sorry that the name which I have given to my new Epiphyte Stand has not met with approbation. I am at the same time, however, much gratified that it has been the name only which is disapproved of, while the principle has been invariably admitted to be good, new, and well calculated for the growth of tropical Orchidaceæ. I do not consider that the name is by any means an inappropriate appellation; and in this I am inclined to hope that many, on consideration, will agree with me. It expresses in the fullest possible manner the use for which it is intended. The name is a compound word, derived from the Greek *ὄνισκος*, a wood-louse, and *ἐπιφυτικός*, defensive, or used in defence against; and by dropping the terminations, we have the name *ὄνισκαμντικός*, or, in the English character, *Oniscamantic*. I do not think, that by selecting the above expressive Greek words, I have been guilty of any innovation, when I recollect how very many of the generic names given to Epiphytes are derived from that language,—*Dendrobium*, *Epidendrum*, *Oncidium*, *Ischilus*, *Cyrtopodium*, *Peristeria*, &c. &c. The growers of Epiphytes are at liberty to call it by whatever name they wish; I only beg of them to give it a fair trial, and then judge if it has been misnamed.—*J. Lyons.* [It is only to persons unacquainted with the meaning of words that such as Mr. Lyons has contrived are offensive. New things require new names, and we would beg those who object to the Greek compounds, necessarily used in Natural History, to show us how they would construct better out of Saxon or Latin; recollecting that a few dozens are of no use. We must be provided with at least 10,000 to begin with.]

Roses at Exhibitions.—The concluding remark of your correspondent "I. L. Y.," in your last Number, attracted my notice. After some remarks on the Roses brought forward at the Hort. Soc. Exhibition in May, he concludes thus—"I for one shall much regret when the Society ceases to admit cut blooms, for in that manner only can new Roses be exhibited." Deprecating as much as possible the now-exploded mode of exhibiting these lovely flowers—in bunches strangled in moss, I yet venture to think it worth some consideration, whether cut flowers of the above genera not continue to be admitted under the express restrictions or conditions:—That they be attached to a sufficient length of stem to bear them up, at least six inches or more above the tubes and moss in which they are inserted, so as in some degree to show their habit and mode of flowering, and in no case to be tied in bunches. Single branches, or at most two in a tube of water, would induce "I. L. Y." and other "Rose-growers" to bring forward their new species or varieties; and I hope be no detriment, but a pleasing feature in the exhibition. I ventured to suggest something of the sort in the *Gardeners' Chronicle* two years ago—before the pot-system was agitated—and now I think it only admissible for the purpose of getting new sorts into earlier notice. But I leave the subject to wiser heads.—*Quercus.*

Squirrels.—A very remarkable fact in natural history has just occurred at Swarthdale House, six miles from Lancaster, the residence of James Clarke, Esq., jun. A month or two since, some wood was felled in Kellet-wood, and with the fall of one tree came down a squirrel's nest with three young ones in it. The little creatures were carefully carried to Swarthdale House, and as a cat in the house had just kittens, they were handed over to her care. Strange to say, she took to the young strangers most kindly, and in fact completely reared them, just as if they had been her own kittens. The little rogues are now fairly out of the nursery. In the day-time, they betake themselves to the woods, and at night regularly return to the house. They are perfectly domiciled, and are treated with all imaginable freedom by every member of the family.—*Facile.*

Gorteria rigens.—Is it not an unusual circumstance to have a tuft of the *Gorteria rigens* in the open air, having survived several winters, and now with seventeen or more blossoms ready to expand when the sun shines strong upon them? This is the case in my garden at this time, situated not far from the southern coast.—*J. P. S. S.* [Yes. Very unusual.]

Bees.—It is with great reluctance that I answer Mr. Wighton's letter, and show my disapprobation of his conduct in answering mine. If I use the language of reprehension, I hope I shall be forgiven. I shall avoid all unprofitable repetition. He still pretends to say that I recommend "putting a headless swarm into a hive," and so on. I said, take away the Queen, after the swarm had been a certain time in the hive, as he himself very well knows; but he will not argue fairly. He goes on in this manner—"I fear that Pettigrew misrepresents things; and until he become serious, I shall take no notice of what he says, for his knowledge of Bees is beyond my

ken." I am sorry to find Mr. Wighton so uncourteous and uncharitable. Two years ago he, in a discussion, told me that my articles were "complete hoaxes, carrying their own denial," &c.; and as soon as I had relapsed into silence he began to teach, and is now teaching, those hoaxes. "To interpret the present thoroughly, we must understand and unfold the past," says Channing. In this present discussion Mr. Wighton is loth to confess, and unable to conceal, his lack of ability to meet me on fair grounds, and therefore very unseasonably tries to efface my facts, and tear himself away; finding shelter, or seeking retreat, by saying that I am not serious. Philosophers tell us that "doing a thing imperfectly is often worse than letting it alone." Therefore I ask Mr. W. and the gentleman who first put the question, whether we have or have not proved that Bees'-eggs are transmutable? I think we have; but if they think otherwise, I shall prove it to their satisfaction; for I think this is the most important point in the history of the Honey-Bee, and that I am as competent to prove that Bees'-eggs are transmutable as that 4 and 4 do not equal 9. I shall be anxious for an answer. Mr. Wighton seems to doubt that 110 pounds of honey were produced by one swarm in 1842. If any other individual doubts it, I will give the address of the person who squeezed the honey out of the combs before he weighed it. I said Queen-Bees, generally speaking, live four years; some prolific (not unprolific) ones live but three years and two months. "It appears to me," says Mr. W., "as if he got his knowledge from a Ready Reckoner." I take leave to inform Mr. W., that I was taught all I know of Bees by experience; hence it is that not one jot of my writings has been disproved. That those Queens that do not live four years die ten months sooner, is a beautiful provision of nature. Almost all Queens are bred in June and July; and if they were to die later in the year than August, the Bees would be nonplussed, for they have no eggs to be metamorphosed into Queens. The Bees themselves seem to be aware of the danger of having old Queens. I have known a swarm set a Queen, and then throw the old one out alive. She crept in four times, and met with the same fate. Mr. Wighton says, that "Bees do not hatch their young by incubation; the warmth of the hive alone brings the larvæ forth." I did not ask Mr. W. to prove this, for I knew it was out of his power. I shall attempt to prove that Bees'-eggs are hatched by incubation. If we from ignorance, or by way of experiment, feed a swarm night and morning in January, we find that the Bees swell a little; that is, cover more comb, and the Queen begins to lay. Well, if cold ensue, the Bees draw together—leaving a semicircle of brood uncovered, which dies notwithstanding the warmth of the hives. When warm weather comes, the Bees spread again, and eggs are placed around this brood; but before they are half hatched, the unpleasant odour of the back-gone brood becomes unendurable, and the Bees are obliged to leave them uncovered, which is leaving them to perish. Thus, this back-gone brood increases all the summer. Sometimes the stench of the brood compels the whole swarm to forsake the hive. Some hives have back-gone brood, and yet the swarms never

New Fuchsia.—I think that you will be pleased with our "Fuchsia Exoniensis," and we have to thank you for the hint afforded us in your notice of *Fuchsia cordifolia* in the Botanical Register, stating that it would be a fine species to raise hybrids from. I immediately availed myself of this suggestion, and impregnated "F. cordifolia" with "F. globosa," and this out of many hundred seedlings has been the result, proving the correctness of your assertion.—*R. T. Pince, Exeter Nursery.*

Public Suburban Gardens.—It has often been a matter of surprise to me that in England, and at any rate in many parts in the vicinity of London, there are no planted promenades, like the Alamedas in Spain, laid out as gardens in some commanding spot, where those who cannot afford or cannot obtain a house with a large garden, may be able, not only to walk themselves, but to send their children to gain health and fresh air among the refreshing green shrubberies, grass, and flowers. My mind has been more particularly directed to this matter by the fact of what is about to happen at Camberwell just now, which, when I first knew it, was a pretty village with plenty of green fields and lanes, where you might ramble about and fancy yourself miles from the metropolis; but now with the increase of population and modes of conveyance, every spot of available ground is covered with houses, and it is only with the old-established dwellings that gardens can be found. I was one of those who dignified with the name of garden a few yards square of ground rather larger than a good-sized bed on a gentleman's lawn; while for air and exercise my little ones, in common with hundreds and hundreds of others, were compelled to trudge along the hot dusty roads in momentary dread of tradesmen's cart-horses, and along paths, which those who know Camberwell, agree give much employment to shoemakers from the grinding pointed loose material of which they are formed; and then all air and view in that vicinity are blocked out by the intervening walls, palings, and houses, of the more lucky dwellers upon Champion, Denmark, and Herne hills. A good-sized piece of ground, well laid out in walks, shrubberies, and flower-beds, and which might be kept in order by a small annual subscription by those who used them, and be kept private by a lodge at the entrance, would be a real boon to the whole neighbourhood. A plot of ground now offers itself commanding delightful views of the surrounding country, and well known doubtless to yourself and other lovers of Horticulture, as I believe, planned and arranged by the celebrated Dr. Lettsom, Grove-hill, and, until now, in the occupation of Charles Baldwin, Esq., but which in this

month comes into the hands of Mr. Chadwick, the builder. New roads, streets, &c. &c. are talked of, but I am sure were you to see the place as it now is, with beautiful groups of the finest trees—Cedars, I should think, two centuries old, and shrubberies, all in the utmost vigor, you would agree with me in thinking that to doom so sweet a place to bricks and mortar, and level to the ground the growth of centuries, must amount to a sin almost, and I beg of you to raise your powerful voice in behalf of hundreds, to induce the possessor to appropriate the principal part of these beautifully laid-out and situated grounds to the purpose I have mentioned; in fact, for a large garden for the gardenless families. A little taste would of course be required in the laying out of more flower-beds and shrubberies where so much grass now exists, and the plantations might be added to, but could scarcely be improved by being taken from. The grounds are all well inclosed; there is a lodge at the gate. The rules as to who should be admitted, and how the place managed, might be an after-thought. The adjoining grounds once belonging to Mr. J. Jackson, are alike doomed, and would be a valuable addition, but I must not be too exorbitant. You have only to see the place and know the facts to enlist us on your side. May I beg of you to plead for us? so you would help to preserve the beauty of a place long celebrated and with many pleasing associations, and would confer a lasting benefit on the inhabitants of Camberwell, and an especial favour on one who with most of his neighbours breathes the smoky air of Babylon all day as—*A Merchant*. [We know the place well, and should quite deplore the loss of Dr. Lettsom's grounds and noble trees. But it rests with the inhabitants of Camberwell to prevent the destruction of the place. If they will subscribe a fund for the maintenance of the grounds equal to their value for ground-rents, we should think Mr. Chadwick would be only too happy to assist them in their preservation.]

The Training of Flowering Plants in pots is at present much attended to by gardeners and others, but there are some plants growing in the flower-garden that would be greatly improved by a little more care being taken of them. The *Daphne Cneorum*, or Garland Flower, is one that repays well with a little trouble bestowed upon it; its appearance is beautiful, and its smell delightful. When left without any notice being taken of it, most of the flowers will be produced at the extremities of the plant, and sometimes it will be found brushing the ground when the wind is high, and many of the branches worn half-way through: such a plant as the Garland flower, breathing ambrosia that fills the gales of May with delight, and clothes with glory the ground on which it grows, deserves better treatment. If carefully trained, it may be made to cover much more ground than is commonly allowed for it, and produce greater abundance of flowers; by making the branches radiate from the centre of the plant, every flower has room to flourish freely, and a plant of it covered with flowers from the centre to the circumference is really a beautiful object. I have one trained in such a manner; its diameter is five feet. Such a plant in a May morning, with the beauty of the flowers and the fragrance which pervades the air, drives through the soul a stream of pleasure which is impossible to describe.—*Peter Mackenzie*.

The Pelargonium Spot.—I shall be obliged by your correcting the statement made by Mr. Ayres in last Saturday's *Chronicle*, that as early as February Mr. Cock, of Chiswick, was obliged to destroy a number of his finest specimen plants to prevent this disease spreading through his whole collection. The truth is, the whole of my plants were affected with it last August (before they were removed to the greenhouse), but with a little care and attention they soon recovered their usual health, and have continued so ever since; and I hereby declare that I never lost a plant through it in my life.—*W. Cock, Chiswick*.

Bees Swarming.—In answer to your correspondent as to time of Bees swarming, the earliest swarm was on 5th of May, and that from that time to the 11th swarms were very common.—*A. J., Willingham Rectory*.

Vines.—I have five Vines, which I planted three years ago, in a new house built entirely for Grapes. A border was made in front of the house, at the same time, which consists of as good soil as can be got, and the border is well drained. The depth of the border at the back is 3 feet, and 2 feet at the front. The Vines were planted in April, and made some very good wood the same year. This I cut down to two eyes the first time of pruning; and the next spring I commenced forcing them in the early part of February. To my great surprise they made much weaker wood than the previous year; but what is more astonishing to me, about the end of March they began losing their leaves, and continued doing so until every leaf was gone. Beginning about 3 feet from the bottom of the house, I lose about 2 or 3 leaves every day from each Vine if the sun shines upon them. There is not the least appearance of the leaves coming off until the sun has shone about an hour, then they scorch up as if they had been burnt, and may be rubbed to powder. I keep the heat of the house by night about 65°, and by day 70° to 75°. I train one Vine up each rafter. Last winter I cut them down to about 4 feet from the front, and this spring they were so very weak that I could scarcely get them to break at all. I thought as this is the third year, I should get a bunch or two off each Vine; but instead of bunches, I believe I must be content if I can keep the Vine. The leading shoot of this year is quite yellow, about a foot from last year's, and the leaves are scorching up in the same place as before. It does not matter where on the Vine the leaves are situated; for if they are shaded by other leaves they will scorch the same.—*S. Querill, Park Villa*. [We submit this letter to the

consideration of our practical readers, some of whom may possibly be able to account for so singular a failure.]

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

At a Monthly Council held at the Society's house in Hanover Square, on the 7th of June, the Earl of Hardwicke, President, in the chair, 18 gentlemen were elected Members of the Society. Mr. R. Barker presented the monthly report of the state of the funds of the Society on the 31st of May, from which it appeared that the receipts during that month had been 783*l.*, and the payments 545*l.*, with a transfer of credit of 500*l.* on account of the Derby Meeting, leaving a current cash balance in the banker's hands of 933*l.* The Council directed that, agreeably with the recommendation of the Committee, the names of 17 defaulters should be struck out of the list of the Society, while the names of three other parties should be retained for the purpose of further communication with them on the subject of their arrears. The Duke of Richmond presented the report of the progress of the works at Derby and the arrangements for the Meeting; and agreeably with the recommendation of the Committee, the Council unanimously resolved that the land in the occupation of Mr. White at Mickleover, originally selected for the trial of implements, and offered to the Society by the owner, Mr. Chandos Pole, of Radborne Hall, should be retained for that purpose. The Council then appointed the General Southampton Committee, for the purpose of taking steps, immediately after the termination of the ensuing Derby Meeting, for the arrangements to be made in advance for that occasion; the Duke of Richmond is chairman. The Council having taken into their consideration Mr. Shaw's motion on the subject of a grant of money, as solicited, from the funds of the Society, by the Cowfold Agricultural Association, decided that each local association throughout the kingdom had an equal claim on their bounty, and resolved, accordingly, "That when the Society should be in a condition to aid other Societies, that question would be considered." Mr. Barclay, M.P., communicated plans, by Messrs. Bonomi and Cory, of Durham, of the Earl of Zetland's farm buildings, at Upleatham, in Yorkshire; Mr. Houghton, of Sunninghill, his plan for the establishment of model farms, and the creating of Honorary Directors or Governors; and Mr. Joseph Crompton, of Shrewsbury, copies of his Account and Commercial Pocket Book.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

The first summer meeting was held in the Hall in the Society's Garden, on Thursday, 1st June; but seldom has there been a more ungenial 1st of June. The principal prizes were offered for Florists' Flowers. Pansies and Calceolarias were good; Tulips indifferent, and, owing to the backwardness of the season, no Pinks, nor Ranunculuses, nor Mimuluses were produced in competition. There was, however, a fine display of shrubby and herbaceous exotics. For the best 24 Pansies or Heartsease, the silver medal was awarded to Mr. John Finlayson, Kincardine, the names of the flowers being Queen Margaret, Rhodora Dhu, Sir Andrew Wyke, Jeanie Deans, Prince of Wales, Marmion, Flora Macdonald, Lady Keith, Black-Eyed Susan, Daniel Defoe, Volney, Laird O'Logan, Lass of Brechin, Seedling of 1843, Gipsy, Prince Charlie, the preceding 16 being all raised by Mr. Finlayson himself. Henchman's La Superbe, Diogenes, Victory, Beauty of Hitchens, Arago, Dr. Johnson, Widal's Decora, and Brown's Countess of Orkney. The bronze medal, or second prize for Pansies, was voted to Mr. John Young, gardener to T. Oliver, Esq., Newington Lodge. For the best 24 Tulips, the silver medal was awarded to Mr. Young, Newington Lodge, for Louis XVI. (bloom much inferior to that of former years.) Ambassadeur d'Hollande, Holmes' King, Hector Magnus, Africanus, Duchess of Wellington, Albion Byblomene, Beaufort, Mignonne, Sublime, Light Triumph Royal, Dark Triumph Royal, Duc de Bronte (Roses); Waterloo, Duke of York, General Blucher, Lord Duncan, Gloria Mundi, Bonaparte, and Adamant Rainbow, Bizarres. The second prize was voted to Mr. Alex. Forrester, gr. to Captain Falconer, of Carloune. For the best six double stock Gilliflowers, three red and three white, the medal was assigned to Mr. Robert Fairbairn, Portobello. The prize of two Nurseries, "through the medium of the Society," to be competed for by practical gardeners, for the six finest varieties or hybrids of the Calceolaria of Chili or Peru, was awarded to Mr. John Young, gr. to Mrs. Hamilton Nisbet Ferguson, of Archerfield, the kinds being named Reliance, Stella, Paragon, Reid's Medium, Barnes' Hope, and Lass of Richmond Hill. For another collection, consisting wholly of seedlings raised by the competitor, and named Purity, Mrs. Stewart, Gloriosa, Eclipse, Nymph, and Sunbeam, the Committee voted an extra premium from the Society's funds to Mr. William Connacher, gr. to H. Stewart, Esq., of St. Fort, Fife. A similar premium of two guineas had been offered by Messrs. J. Dickson and Sons, Inverleith, for the best six stage Pelargoniums; but, owing to the inclemency of the season, there was no proper competition, only one collection having been sent in. This collection was, however, considered very good, meritorious consisting of Garth's Flash, New Coronation, Foster's Prince Albert, Queen Dowager, Foster's Nymph, and Erectum, and an extra premium was awarded for it from the Society's funds; while the awarding of the prize offered by Messrs. J. Dickson and Sons was delayed till the meeting of the 23d June current. One of the most meritorious productions of the day consisted of a superb collection of seedling Calceolarias, raised at Maryfield, by Isaac Anderson, Esq., his greenhouse and pits being managed wholly by himself. Among several of great beauty, the varieties named Duchess of Buccleuch and Miss Walker were pre-eminent. The Society's silver medal was voted to Mr. Anderson, as a mark of approbation. In a large square tray there was a tasteful and instructive display of the flower and leaf of some of the newest and finest Pelargoniums, (the truss of flowers being placed in front of the leaf of each sort respectively,) including, among others, the Queen of Faries, Duchess of Sutherland, Lady Sale, Topaz, Flash, Captivation, and Mabel. This display was from the Inverleith Nurseries of Messrs. J. Dickson and Sons. A specimen of *Arum crinitum*, in full flower, from the Botanical Nursery Garden of Mr. Cunningham, Comely Bank, attracted much notice on account of its singularly curious appearance. It is believed the plant was never before seen in flower at Edinburgh. The hall was further adorned with many fine shrubby and herbaceous exotics sent for exhibition; particularly a choice collection of greenhouse plants, including several exquisite Cape Heaths, remarkable for dwarfness of habit and free flowering, from Messrs. Dickson and Co., Leith Walk; a rich general collection of greenhouse plants from Messrs. J. Dickson and Sons, Inverleith; a number of beautiful greenhouse specimens from Mr. Syme's garden, at Trinity Cottage; a lovely series of Pansies from Messrs. Handasyde, Fish-errow; with some very pretty seedling Pansies from Mr. Robert Hall, Rosebank, an amateur cultivator. Some select specimens from the greenhouse and stoves of the Experimental Garden itself received deserved commendation, as exhibiting the perfection of culture. Several interesting communications, chiefly from professional gardeners, were read to the meeting, and gave rise to useful discussion. A brief account of these we must reserve for another opportunity. A rich collection of Epiphyllal plants and bulbs, and curious seeds, procured from the interior of Brazil, was presented to the Garden in the most handsome manner by the representatives of the late Sir John Robison. Twenty-nine new Members were on this occasion added to the Society, as honorary Members, and four as corresponding. It was intended that an evening promenade should have taken place, but the state of the weather totally precluded it.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

The third show of this Society for the season took place at the Surrey Zoological Gardens on Tuesday, the 13th. A north-east

wind, and a day of incessant drizzling rain, prevented more than a very few visitors from attending, while the exhibition itself was in no degree remarkable. On looking over some of the collections, we could not discover a single specimen deserving of notice. Others, however, contained much more meritorious objects, and a few comprised beautiful and finely-grown plants. The lovely *Phalenopsis amabilis* was about the rarest and most valuable plant shown. This was from Mr. Cox. *Gloxinia macrophylla variegata*, a handsome variety, with broad leaves which have white ribs and rich purple flowers, was in a collection sent by Mr. Wilson, gr. to — Gilliat, Esq., Clapham Park; as was also a very large specimen of *Gloxinia rubra*, the showy *Gladolus insignis*, and *Tillandsia amnena*, finely in flower. In a collection from Mr. G. Young, there was the pretty *Achimenes rosea*, fine plants of *Mimulus Macleanianus*, a dark-flowered variety of *Lilium bulbiferum*, and a beautiful plant of *Epacris heteronema*. A collection from Mr. Fairbairn, of Clapham, comprised a number of small but very pleasing and nicely-cultivated specimens, among which were varieties of *Erica ventricosa*, with *E. tetralix*, and *Boronia serrulata* and *viminea*. Mr. Halley, of Blackheath, showed, besides commoner things, *Dilwynia speciosa*, an excellent plant of *Cineraria splendida*, *Prostranthera lasiantha*, an old but interesting species, a pretty plant of *Hibbertia Cunninghamii*, and *Verbena Halleyi* lacinia, which has the habit of *tenuicoides*, but with flatter heads of lilac flowers. Of *Orchidaceae*, there were *Oncidium flexuosum*, flowering well, *Leptotes bicolor*, very beautiful, and the curious *Coryanthes speciosa*, from Mr. Bruce, gr. to B. Miller, Esq., Mitcham; with *Cattleya intermedia* and *Forbesii*, two varieties of *Gongora*, and *Vanda multiflora*, from Mr. Cox. The plants which appeared to be cultivated most perfectly were *Leschenaultia formosa*, a splendid little specimen, *Coleonema pulchra*, extremely compact, and a red-flowered *Alstromeria*, brought by Mr. Bruce, gr. to B. Miller, Esq. The Heaths were by no means fine; still the collection of Mr. Halley, of Blackheath, was made up of beautiful though small plants. It included *E. propendens*, odorata alba, and several varieties of *E. ventricosa*. Those produced by Mr. Bruce were likewise tolerably good. *E. tricolor*, *eximia*, *Cavendishii*, and some varieties of *ventricosa*, were the best of these. There was a tolerably extensive display of Pelargoniums, with little, however, of novelty in their appearance. We give the names of those which received prizes. Mr. Gaines's plants were Joan of Arc, Lady Elizabeth Bullock, Juba, Beatrice, Raphael, Louis Quatorze, Lady Douglass, Perfection, Albina, Exquisite, Grand Duke, and Victory. Lady Paget's collection had in it Joan of Arc, Eliza superb, Florence, Coronation, Erectum, and Victory. That of Mr. Welsh, gr. to G. Edmonds, Esq., Wandsworth, contained Joan of Arc, Bridesmaid, Orange Boven, Victory, Matilda, Priory Queen, Grand Duke, and Prince Albert. Mr. Pamplin's comprised Ajax, Maid of Saragossa, Assassin, Sir R. Peel, Camilla, Perfection, Vesta, Enchantress, Sir Walter Scott, Hesperus, and Superb. Mr. Bourne, gr. to Sir E. Paget, Chelsea Hospital, showed Orange Boven, Fanny Garth, Erectum, Lady H. Paget, Bridesmaid, Comte de Paris, and Mabel. In Mr. Edmund's group, there were Jewess, Victory, Nymph, and Comte de Paris. The relative merits of these will be seen by the list of awards. Mr. Gaines's Calceolarias were in good condition. They were Rival, King, Argo, Favorite, Lanis, Golden Sovereign, Attila, Queen of England, Lass of Richmond Hill, grandiflora, magniflora, Incomparable, and Sunbeam. *Rosa devoniensis* was exhibited in pots by Mr. Halley, of Blackheath. There was a quantity of cut Roses, several general collections of cut flowers, pretty good Pansies, some excellent Ranunculuses, and a stand of seedling do., with a few Pinks. Some well-coloured Black Hamburg Grapes were shown by Mr. Chapman, of Vauxhall, and Mr. R. J. Chapman, of Clapham; Myatt's British Queen Strawberries, growing in the pots, by Mr. Rawlins, and a variety of really fine vegetables, among which the Cauliflowers and Cardoons were perhaps the most noticeable. The judges distributed the prizes thus: AMATEURS.—Twenty-four Heartsease, 1, Mr. Edmonds; 2, Mr. Pyffe; 3, Mr. Bridges. *Six Pelargoniums*, 1, Lady Paget; 2, Mr. Edmonds. *Six Calceolarias*, 1, Mr. Edmonds. *Twelve Pinks*, Mr. Trevers. *Twelve Ranunculuses*, 1, Mr. Trevers; 2, Mr. Burrup. *Cut flowers*, Mr. Rawlins. *Collection of plants*, Mr. Schroder. GENTLEMEN'S GARDENERS.—*Collection of plants*, Mr. C. Young; 2, Mr. Wilson, gr. to — Gilliat, Esq., Clapham Park. *Twenty-four Heartsease*, 1, Mr. Welsh; 2, Mr. Parsons. *Eight Ericas*, 1, Mr. Bruce, gr. to B. Miller, Esq.; 2, Mr. Wilson. *Eight Pelargoniums*, 1, Mr. Welsh; 2, Mr. Bourne. *Eight Calceolarias*, Mr. Welsh. *Eighteen Roses*, in bunches, Mr. Bruce. *Cut flowers*, 1, Mr. Bruce; 2, Mr. Parsons. *Nurserymen, Florists, &c.*—*Collection of plants*, 1, Mr. Halley, Blackheath; 2, Mr. Fairbairn, Clapham. *Thirty six Heartsease*, 1, Mr. King; 2, Mr. Cook. *Twelve Pelargoniums*, 1, Mr. Gaines. *Batteusea*; 2, Mr. Pamplin. *Twelve Ericas*, Mr. Halley. *Twelve Calceolarias*, Mr. Gaines. *Twenty-four Ranunculuses*, 1, Mr. Tyso, Wallingford; 2, Mr. Lockhart, Chapside. *Twelve Pinks*, Mr. Norman. *Collection of Roses*, in bunches, Mr. Dennis, Chelsea. ALL CLASSES.—*Specimen plant*, 1, Mr. Cox; 2, Mr. Bruce. *Specimen plants of six Genera*, 1, Mr. Bruce; 2, Mr. Cox. *Four Orchidaceous plants*, Mr. Cox. *Seedling Heartsease*, Mr. Edmonds. *Collection of fruit*, 1, Mr. R. J. Chapman, Clapham; 2, Mr. Rawlins. *Black Grapes*, Mr. Chapman, Vauxhall. *Collection of Vegetables*, 1, Mr. Martin, Thames Bank; 2, Mr. J. Gaines. EXTRA.—*Alpine plants*, Mr. Wood, nurseryman, Norwood.

MISCELLANEOUS.

Vegetation of Swan River.—A file of papers from Swan River having reached us, we extract the following observations on the Vegetation of the Colony, by Mr. James Drummond:—"The natural order Santalaceae contains with us two genera, of which we have interesting species. The Nut-tree of the York district is a species of *Santalum*; the Nuts are sometimes eaten by the settlers, but they have very little flavour; the natives use the Nuts for greasing themselves; they appear to contain a large portion of a pure vegetable oil, which might perhaps be turned to account in seasons when they are abundant. I have observed a very narrow-leaved species of *Santalum* among the ironstone hills near the Beaufort River. The *Exocarpus*, the *Van-Diemen's-Land Cherry*, belongs to this order; we have several species, the largest and showiest is the *Exocarpus cupressiformis*, which appears to be found all over this vast island. Of the natural order *Thymelaeae* we have many fine species; of *Pimelea*, the *decussata* and *rosea* are both common, from the Swan to King George's Sound, in the vicinity of the coast; a large yellow-flowered species is common among the hills; it is so fragrant, that in a dull cloudy day, or in the evening, it is delightful to travel among the hills when this plant is in flower. We have many rather pretty plants of this genus; the *Pimelea spectabilis*, a remarkably fine one, grows on the tops of the hills between the Helena and Canning rivers. The natural order *Proteaceae*, at Swan River; almost peculiar to Australia, abounds at Swan River; our list now amounts to upwards of 250 species. The first two genera described by Mr. Brown—*Petrophila* and *Isopogon*, Dr. Lindley justly remarks, were better united;

and our Swan River species confirm his views in that respect. The species of the two genera are so much alike, and run so much into each other, that I have long given up trying to distinguish them. One of Fraser's species, the *Petrophila linearis*, is common on the sandy ground about Perth; in size and shape the flowers resemble the English Honeysuckle. Another fine species, the *Petrophila biloba* of Fraser, grows among the rocks near the foot of the hills. Dr. Lindley remarks of *Petrophila brevifolia*,—a species which he describes from Swan River,—that it has flowers which, when infused in hot water, give out so brilliant a yellow, that it is worth examination as a probable source of a dyeing material; the species is common in the sandy country to the east of the Toodyay district. The finest *Petrophila* I have seen, with heads of flowers as large as some of the round-flowered *Banksias*, and very fragrant, grows on sandy ground near the Beaufort River; it belongs to Mr. Brown's first division of the genus. Of the genus *Adenanthos*, Dr. Lindley remarks that the only beauty is in the leaves, which almost hide the flowers; but we have several species to which that character does not apply. A pretty red-flowered, box-leaved species, grows on the road-side between Perth and Guildford; and another, with red leaves, which, from its being almost always in flower, I have named *semperflorens*, grows on the tops of the hills. There is also a beautiful rose-coloured species, which covers the ground as with a carpet of that colour, found on the sandy land to the south of the Beaufort River. Of the genus *Conospermum* we have many interesting species at Swan River; Dr. Lindley remarks of it, that no one would suspect the genus at Swan River to belong to the order at all, until after a minute examination; for while the majority of the species, with their long woolly, paniced, irregular flowers, have altogether a peculiar aspect, a *Conospermum acerosum* might be mistaken for a *Colletia*—and *Conospermum glumaceum* has altogether the appearance of some *Bupleurum*, with great membranous bracts. The *C. acerosum* grows between the Guildford lakes and the foot of the Darling Range, and *C. glumaceum*, which is very fragrant, grows on the Toodyay road-side, close to the foot of the hills. Dr. Lindley remarks of the genus *Synaphea* from Swan River, that they are in many cases ragged-looking plants, whose leaves seem as if they were intended to be larger, but starved into hard dry lobes. *Synaphea decorticans* is a strange oak-leaved plant, whose bark is thrown off in numerous thin brown layers. *S. brachystachya* seems clothed with the leaves of an *Eryngium*, and *S. pinnata* has large regularly pinnate leaves, glaucous on the under side. Besides these species described by Dr. Lindley, we have his *gracillima*, and several of Dr. Brown's species of this curious genus. The *Franklandia fucifolia* is common about King George's Sound, and I observed it in travelling to the south, soon after passing the Capel River. The curious plant so common in the woods about Perth, which grows about 3 feet high, with panicles of brownish yellow flowers, and divided strap-shaped leaves, is a species of *Symphionema*, and we have several others, one of which, growing about 2 feet high, has golden yellow flowers, is the finest. Of *Agastachys*, we have two species, distinct from the odorata of Brown; one of them is found to the south of the Capel River, and both among the hills to the south of the Vasse Inlet; they are both beautiful fragrant plants. The *Persoonias*, Dr. Lindley observes, are plants of little beauty; *Frazeri*, which is common about Perth and near the coast, is, as he states, the handsomest. *Persoonia macrostachya*, like *Petrophila brevifolia*, seems to possess dyeing properties, which deserve investigation. The *Persoonia laureola* is a small bushy tree, not uncommon in our woods, with leaves like Laurel, from which it takes the name; and *P. Drummondii*, described by Dr. Lindley from specimens collected among the hills between the Helena and Canning rivers,—the plant being common in the woods throughout the Leschenault district,—forms sometimes rather a handsome small tree; its long green falcate leaves and drooping branches being ornamental; its bark, formed of numerous layers of cuticle of a red colour, is very characteristic. The *Anadenias* consist of plants whose leaves are their chief ornament, the flowers being small and in-are their chief ornament, the flowers being small and inconspicuous. *A. flexuosa* is a most curious species with remarkable zigzag reflexed leaves; it is found on the top of Toodyay Catta. *A. aquifolium*, when not in flower, of Toodyay Catta. *A. aquifolium*, when not in flower, bears a great resemblance to a Holly; and *A. Hakeoides* has broad-toothed reticulated leaves, so much like those of *Hakea undulata*, that it might be taken for that plant if it were not for the absence of the hypogynous gland. Of *Grevillea* we have many species; the *Grevillea Thielmanniana*, a splendid scarlet-flowering species, grows on the ironstone-gravel formation on the top of the Darling range of hills. *G. eriostachya* bears long spikes of yellow flowers; bipinnate and quercifolia are fine species. A remarkable black-flowered *Grevillea*, not yet named, grows on the banks of the Salt River; it grows in a pyramidal form, with bifarious branches, to the height of 10 or 12 feet. Of *Manglesia*, a new genus lately separated from *Grevillea*, we have 7 or 8 species; I believe all the known species of the genus are from Swan River; the finest of them, the *G. tridentifera*, now in full flower in the York and Toodyay districts, is called by the settlers the Swan River Hawthorn, as from the number of its snow-white flowers, and the size and shape of the plant, it bears some resemblance at a distance to the favourite English Hawthorn. Of the genus *Hakea* I have collected over 50 species in the colony; I shall only notice a few of the most striking species. The *H. glabella* of Fraser, common about every settlement, produces a large quan-

tity of a beautifully transparent gum; it forms a low bushy tree, with leaves bearing some resemblance to Holly. The *H. mixta* of Lindley is remarkable for bearing simple filiform leaves, also trifid filiform leaves and entire oval leaves on the same plant. It varies as much in height and habit as it does in the form of its leaves: in the Swan River district to the west of the Darling Range, it forms a shrub from 4 to 6 feet high, with white downy flowers; on the top of the ironstone hills to the east of the Darling Range it has long spreading branches, and bears yellow flowers; in the Kojonup district, it is a tree 30 feet high, with the habit of the Evergreen Cypress. I can find no difference between the leaves and seed-vessels of these plants by which I can distinguish them as species. The *H. Baxteri*, a remarkable species, with fan-shaped leaves, and seed-vessels as large as a common Russet Apple, grows to the south of the Beaufort River, and it has lately been found near the Moore River. A yellow-flowered species, with round prickly leaves, grows in strong clay on the banks of the Avon. In drying this plant for specimens the leaves all drop off; on that account I think the species is not yet named, although it well deserves to be known; it is, when in flower, one of the finest species; it grows to the size of a small tree. We have also a beautiful crimson-flowered *Hakea*, which I think is not yet named; it grows in such abundance on some parts of the hills, that they appear, when the plant is in flower, of a crimson colour, from its numerous blossoms; it is a small prostrate-growing species, with ovate acuminate glaucous leaves, which end in sharp points; the plant is abundant near the Mission-house on the Swan. We have a curious species of *Hakea*, with filiform sulcate leaves, 9 inches long, and a very remarkable one, with round-pointed leaves, and large pear-shaped seed-vessels, found abundantly on the banks of the Salt River, about 20 miles to the east of Mr. Morrell's residence. *Lambertia multiflora* of Lindley grows on both sides of the Toodyay road near the foot of the hills, and it is particularly abundant to the left of the road. Since Dr. Lindley wrote on the Botany of the Swan River colony, I have found in it four additional species of *Lambertia*; two of these are described in the supplement to Dr. Brown's Prodrum, and a third, with beautiful silvery obovate leaves and straw-coloured flowers, found to the south of the Gordon River, agrees with Mr. Brown's formosa in the number of its blossoms. In my late journey to the south of the Vasse I found a species of *Lambertia* growing 30 feet high, with a trunk 3 feet in circumference, which, although sometimes bearing twin-flowers, is no doubt properly referable to the one-flowered section of the genus. In my journey to King George's Sound, about two years ago, I found what I considered a new genus, nearly allied to *Lambertia*, and like it, bearing the leaves in threes; in that plant the flowers are very numerous, borne in whorls in the axils of the leaves; it grows on hills to the north of the Beaufort River. *Xylomelum occidentale*, found by Frazer on the shores of Geographe Bay, is plentiful throughout the Leschenault district, and may be seen in flower and fruit every season on the banks of the Swan, a little above Mr. Joseph Hardy's house. I have found the hills to the south of the spring called Bibachgoin by the natives. Of the genus *Banksia*, I have gathered 24 species in our colony. The finest of the whole genus, the *B. grandis* of Linnaeus, we may well call the pride of the Swan, where it is very common, and grows sometimes 30 feet high, with a trunk two feet in diameter. As reported by Frazer, in healthy young trees the foliage is beautiful, and the flower-spikes from 14 to 16 inches long; it is the native Mangite, and when the natives are left to their own resources, men, women, and children live for weeks together principally on the honey which they suck from the flowers of this fine tree. *Banksia Caleyi* and *B. Menziesii* are both abundant, and form the principal firewood used in the town of Perth. *Verticillata* is common in our swamps, and grows to a large size; I have observed it on the banks of the Murray river with shorter, broader, and nearly entire leaves. The *Banksia aquifolium* of Lindley, common about Perth, which produces flowers like a *Hakea*, at first yellow, but soon turning red, appears very distinct from the *ilicifolia*, as it is found at King George's Sound; but observations which I made in my late journey to the south convince me that these plants are the same species, and not even varieties. There is as much difference between *B. Caleyi* and *B. grandis*, as they appear here and at the Sound. Cunningham observes that *B. coccinea* and *B. grandis* are the pride of King George's Sound; there the *B. grandis* is a mere shrub compared to what it grows to at Swan River, but the *coccinea* which they use for firewood there, is a splendid plant. I found a fine new red-flowering species on the banks of swampy brooks between the Sound and Mount Barker. Since Dr. Lindley wrote, I have found at least 10 new species of *Dryandra*, some of them I think finer than any before described. The *D. favosa* makes our best substitute for the Holly in making hedges; *D. nobilis* grows on the right hand side of the old Toodyay-road, just before beginning to descend into the valley of the Avon, and also near St. Ronan's Well, on the York road; *proteoides* is found a little to the south of the Toodyay road, about half a mile before travelling so far to the east as the grove of *D. nobilis* before mentioned. The natives suck honey from the flowers of *Grevillea eriostachya*, and *G. bipinnata*; from several *Dryandras*, and from *Banksia Caleyi*, *Menziesii*, and *verticillata*. It is worthy of remark that no genus of *Proteaceae* with more than two seeds in the capsule has yet been discovered in Western Australia. The celebrated Warrata of Sydney, *Telopea speciosissima* of Dr. Brown, and his genera *Lomatia* and *Stenocarpus*, have many-seeded capsules.

GARDEN MEMORANDA.

W. Leaf, Esq., Streatham.—This is one of the few places in which a small garden, as compared with the size of the house, has been made to command and appear to inclose a large tract of interesting country, by taking advantage of natural circumstances, and by the use of artificial means; while, in planting it, no expense has been spared for the purchase of trees and shrubs of the most varied and ornamental character. In fact, by far the larger portion of the best of our pleasure garden plants, with the exception of *Coniferæ*, have here been brought together, and produce at all seasons a very rich effect. Situated on a considerable eminence, the house is fronted by a lawn, which slopes part of the way down the hill, and then conducts the eye over an exceedingly rich woodland scene to Wimbledon Park, and the surrounding country. In this broad valley the trees, though appearing to form a wood, are actually much scattered, and hence occasion an unusual and enchanting variety of surface. A view from another part of the garden includes the whole of the Metropolis, with the fine hills to the north and north-west; and another, southwards, takes in those of Addington, a great deal of the Surrey range, and part of Kent; so that, on three sides, there are prospects of an extremely diversified character, for 15 or 20 miles. A plantation bounds the pleasure grounds on the south and south-west, excluding the public road, a large house adjacent, and an open foot path. Thoroughly to shut out the latter, the soil has been much raised, and is supported by a wall of turf. On the principal lawn there is a small lake, with an island in the centre; which last is entirely covered with the *Cornus alba*, forming a broad drooping mass of foliage and flowers at the present time; and in winter being very attractive by the redness and regularity of its shoots. Although so high, the ground, from having a very clayey substratum, requires much draining, and is apt to get swampy in wet weather. In a spacious conservatory, immense plants of *Acacia pubescens* and *oxycedrus*, the yellow *Banksian* Rose, and *Berberis fascicularis* have just ceased blooming; while an enormous *Polygala grandiflora* and a *Bignonia capreolata* are just in perfection. The mode of treating the plants in this conservatory is to allow a few specimens to grow as large as they will; or, in fact, to run almost wild: they thus occupy a considerable space, and are particularly splendid when in bloom; but kill all the slower-growing species. The open portion beneath them, when they get so tall and bare at the bottom, is filled up temporarily with a succession of flowering plants in pots, such as *Pelargoniums*, tall annuals, *Rhododendrons*, &c., which will receive no injury from being placed there merely while they are blossoming. There are other greenhouses, a stove, and some frames, for the culture of flowering plants; and in one of these *Gesnera Cooperi*, and some varieties of *Gloxinia*, are admirably grown. The secret in managing them so cleverly seems to be giving them a rich soil, and a pretty large pot, keeping them in a moist atmosphere, and giving them plenty of water, (occasionally enriched with manure), while they are advancing. Fine-apples, forced Strawberries, &c. are abundant, and good. Two large Vineries, containing old Vines, have lately been altered, and the Vines replanted. One was done in March, 1842, and the other last winter. The object of the change has been to contract the width of the houses, (which are high), so as to render their pitch rather steep in front; and also to renew the borders, and plant the Vines nearer the top. On account of the trees being formerly too deeply rooted, the Grapes did not ripen well. In the house which was done in March of last year, the Vines have now quite recovered from the shift, and are bearing freely. Those which were removed in the past winter are making rather weakly shoots at present; though they promise even better than the others did at the same period after shifting. By thus retaining the old Vines, and not planting fresh ones, several years have been gained in regard to the crop, which appears likely to be excellent in future. Where the old plants were not worth preserving, and young ones are growing up, some specimens in pots have been introduced between these, and are now ripening their produce well. The Grapes are not much inferior to those on strong planted out Vines.—*E. K., June 5.*

THE NATURALIST'S CORNER.—No. XIII.

(Continued from page 360.)

the seeds of the *Bixa Orellana*, is produced the substance known in commerce by the name of *Arnotto*. Dyers form with it the colour called aurora, and when mixed with Lemon-juice and a gum it makes a crimson paint, with which the Indians adorn their persons. By the Spaniards it is used for the purpose of adding to the colour and flavour of chocolate and soups. In Gloucestershire and other counties it is employed to colour cheese, and in Holland butter is dyed with it. The bark of the tree is made into ropes in the West Indies, and the wood is used for the purpose of procuring fire by friction.

50. *The Weeping Willow* (*Salix Babylonica*) is said to have been introduced into England by the poet Pope, who, being with Lady Suffolk when she received a parcel from Spain bound with withes, which appeared alive, took one, and planted it in his garden. It grew up, and afterwards became so well known as Pope's Willow, at Twickenham. This tree is one of the greatest favourites in China, as may be inferred from its constant introduction into Chinese pictures. Growing on the banks of its native Euphrates, near Babylon (whence its name), it was the Willow on which the weeping daughters of Zion "hung their harps."

51. *The Elder*.—Sir James Smith, speaking of the *Sambucus nigra*, or common Elder, which is found abundantly in this country, says that our uncertain summer is established by the time that it is in full flower, and entirely gone when its berries are ripe.

(To be continued.)

Reviews.

Theorie der Gärtnerei, von John Lindley. (Lindley's Theory of Horticulture).—8vo. Vienna. 1842.

(Continued from page 399.)

Par. 76.—"It is easy to determine beforehand," by examining the different component parts of leaves, which of them will absorb, in its living state, most oxygen in darkness. The leaves and green parts of all plants, which contain volatile oils, that is, aromatic volatile constituent parts, which are converted into resin by the absorption of oxygen, will take up more oxygen than such as are deficient in those substances. Others again, in the sap of which tannin and gallic acid occur, or which contain highly-azotised substances, will absorb more oxygen than plants in which those substances are deficient. The experiments of Saussure are decisive proofs of this. Whilst the *Agave Americana*, with its succulent, scentless, tasteless leaves, will only receive 0.3 parts of its volume of oxygen in 24 hours if placed in darkness, those plants

which are rich in gallic acid, like *Quercus robur*, will absorb ten times, and the leaves of *Populus alba* (full of a volatile oil easily convertible into resin) twenty-one times their volume of oxygen. This chemical action of the leaves is very evident in *Cotyledon calycina*, *Cacalia ficoides*, and some others, which in the morning are sour, like Sorrel, at midday tasteless and in the evening bitter. It is therefore clear that during night an acidifying and oxidizing process takes place in the day and evening; on the other hand, disoxidation takes its turn; the acid becomes converted into substances which contain oxygen and hydrogen in the same proportion as water, as in all tasteless and bitter substances.—*Liebig's Org. Chem.*

"Those leaves which remain longer green than others will receive in the same period less oxygen than those whose substances go through a speedy state of change."

Par. 78.—"The five leaflets of a pinnated Rose-leaf yield, under proper culture, five little plants."

Par. 85.—"The food which the young plant can receive from the air in the form of carbonic acid and ammonia is confined within certain limits; it cannot assimilate more than the air contains. If, therefore, in the beginning of its development the number of shoots, leaves, &c. has exceeded these limits in consequence of a superabundance of nutritious substance derived from the soil, and if it therefore requires for the completion of its development into flowers and fruit more nutritious substances than the air can yield, it will not be able to reach the formation of flowers and fruit. In many cases this food only suffices for that full development of leaves, culms, and twigs. It will therefore be the same as if ornamental plants are transplanted into larger pots, and allowed to increase and multiply their roots. In such a case, all the food will be consumed in multiplying roots and leaves, which will shoot into mere herbage, and not produce flowers. With dwarf fruit-trees the case is reversed; we abstract, as it were, a part of their branches, and consequently of their leaves; we prevent the development of new branches; a superabundance of nourishment is artificially created, which is then used by the plant for multiplying flowers and increasing the size of the fruit. The pruning of the Vine has a similar aim.—*Liebig's Organic Chemistry.*

Par. 96.—"If the ripening of fruit take place in the dark, oxygen is absorbed, and the green of the leaves (resinous, and replete with resinous matter) is changed; red and yellow pigments are formed; vinous, citric, and tannic acids vanish, and in their stead are found sugar, starch, and gum.—*Liebig's Organic Chemistry.*

Par. 98.—"The fruit of the Fig-tree is eatable, but, as has been lately proved, not nourishing."

Par. 99.—"The formation of acid is accompanied by the slightest excretion of oxygen; it increases in the so-called neutral substances of the ligneous fibre, sugar and starch; and it reaches its maximum in oils. The effects of the light of the sun and the influence of heat in the ripening of fruits is somewhat represented by the numbers, which express the quantity of the secreted oxygen of organic compounds in determined proportions.—*Liebig's Organic Chemistry.*

Note, p. 83.—"If the temperature is somewhat lower, and moisture considerable, most of the Pelargonium either will yield no pollen at all, or some very imperfect; whilst under different circumstances, some even of those considered sterile hybrids will yield—if not the normal number of anthers—at least a sufficient quantity of perfect pollen, to be capable of fertilization, and yielding good seeds."

P. 87, note 67.—"This (the supposed cause of the Double Yellow Rose not flowering) is contradicted by an experiment of our own. We know two places where the Double Yellow Rose produces every year perfect flowers, they are distant from each other one league. The situation is a particular one, and in both places there is scarcely any difference. The one plant grows close to the wall of a high building, around which there is on one side a wet ditch, up to which the extremities of the roots must reach; in the other place a canal is close to the roots. If in both these cases the roots do not actually reach the water, they are at all events continually in a soil moistened by water. As the one building, near which the Rose stands, has a projecting roof, and the other consists of a high wall, which keeps off westerly winds, the leaves are constantly protected from moisture, whilst the roots have as constant a supply of it."

Par. 119.—"The statements as to the temperature of Vienna cannot afford gardeners any certain data, because the observations are made in the middle of the city, where the number of chimneys, the warmth of houses, stables, and dung-hills, which where horses are kept can never be entirely emptied, radiate a considerable amount of caloric, which must diminish the cold. The vapours, which are seen floating above the town in chilly mornings and evenings still more corroborate this assertion."

(To be continued.)

CALENDAR OF OPERATIONS for the ensuing week.

ABOUT the beginning of June is generally the time for budding Roses that are wanted to push out into heads this season; such as we call monthly Roses. But already we are in the middle of the month, and hardly a bud can be got in yet; the wood of both bud and stock being so green and soft, owing to the continual rains of the last six weeks. I used also to begin to put in cuttings of all the China and climbing Roses about this time; taking the young, stubby shoots which flower along the main branches, and are about four or five inches long. These are now about ready for making into cuttings; and, simple as this process is, there are many who do not know it. It was only the other day I walked with a nice party over these gardens, and found some of the young ladies very anxious to know, among other things, what was the right time to grow Roses from "slips;" and then how the slips were prepared for planting, what quantity

of water they required, and how often should they have it, with a great many more questions about them. After answering them, we went to make cuttings, took the short flowering shoots, cut them off from the boughs so close that we had to pare off a little of the bark round the bottom of the cuttings; then cut away the two lower sets of leaves, and pinched off the tops of the cuttings, because they had flower-buds on them. They were now ready for planting; some with only two sets of leaves, and some with three, which were all left on. I then showed them how they should plant them, about an inch and a half deep, pressing the soil very tight to them; and told them if they could pull them up with a gentle pull, they were not firm enough in the ground. There are scores of plants of which cuttings may be made now in the same way; and if they are planted in a shady place, they will soon make roots. All the Pelargoniums will, for instance; but if one had a handglass to put over them they would root in a much shorter time, only there is more trouble when a handglass is used; as, if the cuttings are not regularly looked over every other day, some of them may damp off by the confinement. About a pint of water through a fine rose watering-pot will be enough to water all the cuttings under one handglass at first; and half that quantity every other day afterwards, unless the weather is very dry, when they must have it every day, and always the first thing after breakfast. I thought I should have room to tell young gentlemen just come home for the summer holidays how the gardeners make the plants to grow from buds; but as budding can be done any day through the holidays, next week will be time enough to tell them all about it; only, in the meantime, see that your penknives are very sharp, and have some stout worsted, such as is used to make shooting stockings, for tying on the buds; this is better than matting.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If you give the plants plenty of room, plenty of heat and moisture, and some liquid manure occasionally, there are no plants less troublesome than Pines; and on the table it is the king of fruits. When the tank system of bottom-heat comes to be understood, and the French mode of growing them without pots adopted, we shall have them from the coal districts all over the country as cheap as Melons.

VINERY.—I expect we shall have a very dry summer yet, after these rains are over. There seems to be a complete cycle of drenchings and droughts going on in our latitude. But what has this to do with the Vineries? Nothing, but that the late heavy rains have washed down all the goodness from the surface of the borders, where the most active roots are; and when the dry weather sets in they will have nothing to feed on, unless you give them slight waterings with liquid manure, and cover them with a thin layer of short grass, to keep down evaporation.

PEACH-HOUSE.—This has been a bad season for ripe Peaches. They could neither get sun nor air sufficient to give them a good flavour; and so with Grapes and Melons; since the middle of May, all that could be done was giving air by the doors and front ventilators, while the roof sashes were obliged to be kept down, as if they were fixed.

MELONS.—The succession plants will require large portions of water at the roots when they are swelling their fruit; and also a smart bottom-heat. Keep turning over the fruit which is ripening, lest it get damaged on the under-side, by being too long in one position; and if you can get the stalk end downwards, it is the thickest part of the Melon to bear the weight. Let all the young plants be kept thin of shoots.

Out-door Department.

On dry soils the wet has done no harm yet; but crops are in a sad plight on the heavy, wet lands, and a change to dry weather is wished for by everybody. In the Kitchen-Garden, some of the tender crops have come to a stand-still, and the fly has made several attempts on the fruit-trees; but the dashing rains keep it under yet. Peas are growing out of all proportion to their stakes, and Beans are so top-heavy, that the first high wind will break down many of them. The Strawberries are late; but there seems to be a good crop of them. In some places many of the Cherries and Pears have dropped; but the Gooseberries, Currants, and Raspberries never looked more promising at this time.

ONIONS.—These have grown so fast lately, that unless they are well thinned out they will injure each other.

Hardy seedlings this season, they soon crowd each other on the seed-beds. Do the same with Cauliflower and Cabbage plants.

BEANS AND PEAS.—Except for the earliest crops of these, people seldom think of stopping them, but they should all be stopped this season, if only to keep them within reasonable bounds.

STRAWBERRIES.—Those plants that have been turned out from the forcing-houses since the middle of May have had such a fine time to finish off their growth without any check, that many of them will do to force next year. I have never forced Strawberry plants the second time; but one of the best gardeners in Suffolk told me the other day he always does, and the advantage is a larger crop from the same sized pots. After they finish their growth, about this time, he lets them get dry in the pots, as they do with the Pelargoniums after cutting them, for a fortnight or three weeks, then shakes the dry mould from their roots, and repots them in fresh soil, planting them deeper than they stood before. I had previously read of the plan, but was not aware of the advantages of it. See that enough small pots are at hand to get in the runners by and by for the next forcing plants.

ENDIVES.—Plant out a few of these for the first supply, and a few more ten days hence, after which they will enter your regular succession-crops.

ORCHARD.—This is about the best time to scarify the branches or stems of hide-bound trees; a good old practice, which has fallen into disuse, probably from being performed in winter, when it did more harm than good by opening up wounds which could not be healed till the return of the sap next summer. But, if performed now, the incision will be filled up in two or three weeks with a layer of soft matter from top to bottom, along which the returning sap will find a ready channel to the roots. Just try a branch or two this way, if only for experiment. I am satisfied, from long experience, it is a safe and useful plan to invigorate stunted branches; but it must be done at the right time.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—The weather has been so dull lately that we could hardly give sufficient air to the stoves, and the young growths are too weak in consequence; so that shading must be resorted to on the first return to clear weather, till the plants are hardened by degrees with abundance of air. Keep an eye after insects, which multiply fast at this time, if not disturbed; and see that none of the plants suffer for want of larger pots.

GREENHOUSE.—The general routine of watering and training the plants, with attention to cleanliness, are all that you can do now, unless some of the plants may want another shift. It might be worth while to mark such plants as flower from April to June, and are getting too large or straggling, or are not in good health, and keep them in a warm, sheltered place; and when you begin winter forcing, to bring them in by way of experiment, to see how early in spring you could flower them. If they should not answer, you could get good cuttings of them before you throw them away. Depend upon it, whoever gets the most plants to flower in the dead of winter, will, in a few years, be thought the best gardener; and, like everything else, a little forethought and judgment will go a long way in such matters.

CONSERVATORY.—The late dull weather was more favourable to plants in flower in this house than to any department of gardening; no sun or dry hot air to fade the blooms, and no shade to hurt the foliage. In very many cases plants in flower do not require so much water as when they are in more active growth; but the strong conservatory climbers planted out in the borders can hardly have too much water just now. It is of no use giving

hints about cleanliness, as this house is always kept like a drawing-room.

PITS.—Cold turf pits are just as useful in summer as they are in winter; and if they are only covered with the thinnest calico, stretched on frames, hundreds of plants will live and thrive in them better than anywhere else. Some of them should have a thin layer of soil, to plant out young seedlings in, or newly-rooted plants, and for young, tender Roses, &c. All sorts of flower-garden plants may be propagated in them for the next three months, either in pots, or what is better, planted out in a bed of light soil, covered over with an inch of sand. Many other uses for them will occur in practice. Any country labourer can put up such pits; and their size should correspond with that of the Melon-pits in the same establishment, so that the frames may do for either.

Out-door Department.

Too much rain is as hurtful to young half-hardy plants as too little. Yet I never saw the plants take so freely to the soil as they have done this season. Flower-gardening is of such a routine nature that one hardly knows what to say about it; as every one minds to keep their flowers in order, by tying them up and thinning them, sweeping, mowing, rolling, and all such kind of work.—*D. Beaton, Shrubland Park Gardens.*

State of the Weather near London for the Week ending June 15, 1843, as observed at the Horticultural Garden, Chiswick.

June.		BAROMETER.		THERMOMETER.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.

The highest temperature during the above period occurred on the 21st, 1834—thermometer 81°; and the lowest on the 22d, 1830, thermometer 39°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending June 16, 1843.

The market is now very abundantly supplied with Gooseberries, Currants (which are beginning to colour), Peas, Lettuce of the finest quality, very excellent Cauliflowers, Spring Turnips, Carrots, Onions, Potatoes, Mustard and Cress, Asparagus, French Beans, Cucumbers, &c. Among the Fruits, Cherries can be had as low as 1s. 3d. and 1s. 6d. a pound, while there are some of the Bigarreau kind. A most remarkable improvement is perceptible in the Peaches and Nectarines, particularly the former, which are unusually large and handsome. Melons are fine, and profusely supplied. There is a larger quantity of Grapes than usual, and more of the White Sweetwater than we have before seen this year; but a number of the black ones are very poorly coloured. Pine Apples are more than commonly numerous. Strawberries are falling off, probably on account of the advancement of the out-door crops. The most conspicuous novelties in flowers are cut specimens of *Lilium eximium*, most of the common annuals, appearing to have been grown in a swamp with rich soil, and Pinks and Moss Roses in the greatest profusion. We saw nothing fresh in the collections of potted plants.

PRICES, SATURDAY, JUNE 17, 1843.—FRUITS:—

Pine Apple, per lb. 4s to 10s	Cherries, French, per 12 lbs. 7s to 10s
Grapes, per bush, per lb. 1s to 5s	Lemons, per doz. 1s to 2s
Spanish, per lb. 1s to 1s 6d	per 100, 5s to 14s
Portugal, per lb. 1s to 3s	Cucumbers, per brace, 1s to 1s 6d
Peaches, per dozen, 10s to 30s	Walnuts, per bush, 10s
Nectarines, per dozen, 10s to 30s	Chestnuts, per bush, 4s to 8s
Melons, 4s to 8s each	Almonds, per peck, 12s
Apples, dessert, per bush, 8s to 16s	Sweet Almonds, per pound, 3s
Kitchen, per bush, 6s to 12s	Filberts, English, per 100 lbs. 60s to 55s
Strawberries, forced, per oz., 3d to 1s	C. b Nuts, per 100 lbs. 60s
Gooseberries, p. h. sieve, 3s 6d to 4s 6d	Nuts, per bushel —
Currants, per half-sieve, 3s 6d to 4s 6d	— Brazil, 16s
Oranges, per doz., 1s to 3s	— Spanish, 18s
— per 100, 6s to 12s	— Barcelona, 22s
— bitter, per 100, 6s to 20s	— Cob, 12s

VEGETABLES.

Cabbage-plants, per doz. bun., 1s to 2s 6d	Peas, per sack, 12s to 14s
Cabbages, per doz., 6d to 1s 6d	Asparagus, large, per 100, 2s 6d to 6s
Cauliflowers, per dozen, 2s to 6s	— Sprue, or Small, p. bun. 1s to 2s
Beans, Kidney, forced, p. 100, 2s to 5s 6d	Lettuce, Cabb., p. sieve, 6d to 1s
Potatoes, per ton, 60s to 100s	Celery, p. bd. (12 to 15) 6d to 1s 6d
— per bushel, 1s 6d to 3s	Rhubarb Stalks, per bble, 4d to 1s
— Kidney, p. bush., 1s 6d to 2s 6d	Small Salads, per punnet, 2d to 3d
— Scotch, per bushel, 2s	Green Basil, per bunch, 4d to 6d
— New, per lb., 3d to 1s	Watercress, per doz. am. bun. 4d to 6d
Artichokes, green, per doz., 2s to 3s	Parley, per 12 bunches, 1s 6d to 3s
Turnips, Spring, per bunch, 3d to 1s	Tarragon, per doz. bunches, 2s to 3s
Red Beet, per dozen, 9d to 1s	Fennel, per doz. bun., 2s to 3s
Horseradish, per bundle, 1s to 6s	Mint, per doz. bunches, 1s 6d to 3s
Radish, spring, p. doz. heads, 6d to 1s	Marjoram, green, per bunch 4d to 6d
— Turnip, p. doz. bunch, 6d to 1s	Mushrooms, per pottle, 3d to 2s
Carrots, Young Horn, p. bun., 6d to 1s 6d	Spinach, per sieve, 1s to 1s 6d
— Spring per bunch, 4d to 1s 6d	Leeks, per doz. bun., 5s to 6s
Garlic, per lb., 6d to 8d	Onions, per half-sieve, 4s to 6s
Shallots, per lb., 1s to 1s 6d	— Spring per bunch, 2d to 6d
— green, per bunch, 3d to 6d	— Pickling, per hf. v., 4s 6d to 5s
Peas, per sieve, 4s to 5s	— Large, per bun., 4d to 10d
— per half-sieve, 2s 6d to 3s	

Notices to Correspondents.

MANURE.—A. F.—Liquid manure should be weak, and applied often, if that is practicable. When plants are beginning to grow, till they are in full growth, is the period when it should be used. It is of little use at other times. Yours should be very good; if it is offensive add a little bleaching powder. No Asparagus has done well this year, in consequence of the cold and wet season. Neither manure nor salt can supply the place of the light and warmth of the sun. Salt certainly does improve the flavour of Asparagus. We are glad to hear that the manure-heap made as we directed a short time ago has produced you such enormous crops; it could not be otherwise.—*Anthony.*—If chalk is of use to your land, independent of manure, it may be added to your dunghill; but if your land does not require chalk it is useless to add it to the dunghill. In any case you had better apply it to the land separately.—*M. W. K.*—No doubt your manure is too strong, and perhaps you have used too much sulphuric acid. The rule is to add the latter till the effervescence begins to cease, and no longer. Instead of three quarts of water to one quart of the fluid it would have been right to have used at least 10 quarts. In all cases liquid manure is best applied very weak and often. It is impossible to give directions for the proportions to be borne by oil of vitriol and cloacine; that can only be learnt by experience; a little will go a long way.

SPENT HOPS.—*Thuro.*—We have certainly answered you, and if the reply has not been printed it has been lost. All vegetable matter that is capable of entering into fermentation, whether hops or leaves, may be used as a source of manure, only it must be in the first place rotted; that is the indispensable condition. Gas-water will accelerate the rotting process. We do not understand the question about Boursault Roses.

DECAYED WOOD.—*Persona.*—Although many kinds of wood when decayed are excellent for plants to grow in, that is not the case with such as contain tannin, a mixture of what chemists call tannic acid and foreign matters, and abundant in Oak and Larch. This substance is excessively astringent, and precipitates the azotised substances called vegetable albumen and gluten, the free action of which is necessary to vegetable life; hence its noxious action on young roots and the mischief it does to plants growing in it. It is a peculiar compound of carbon, oxygen, and hydrogen, but when it is decomposed loses all its peculiar characters. At that time then it may be employed; but its decomposition is difficult, and requires a long time. We fear you will find that it has done harm wherever wood containing it has been applied.

COWS.—*Cambricus.*—We are not acquainted with any short compendium on the diseases of cows, which we could recommend. Most of the books on the subject contain a variety of receipts of very dubious utility. We would recommend care in the prevention of disease. Air and moderate exercise will keep cattle in health. A pound of Glauber or Epsom salts, with two ounces of powdered ginger, given in time, will often prevent disease; and it is almost the only remedy which can be administered with safety by a cowman. In serious cases an experienced veterinarian must be consulted. In Mr. Youatt's work on Cattle many useful observations may be found on this subject. *M.*

BAD WATER.—*K. L.*—It is difficult to imagine anything worse than to use water from a pond, into which the drainage from a farm-yard finds its way for the purpose of filling hot-water pipes. We are not surprised that the steam from the expansion-box should have nearly destroyed your Vines, or that although you have frequently emptied the pipes and filled them with pure water, and have also put powdered charcoal into them, you should be unable to purify them properly; as when you enter the house in the morning there is always an unpleasant smell, and many plants when put into the house lose their leaves, it is possible that chloride of lime would remedy the evil; but as we do not know the exact cause, it is impossible to point out an exact remedy.

VINES.—*J. G. N.*—Nothing can be more injudicious than to strip off the leaves from Vines and Peaches under the idea of thus ripening the fruit. See more observations to-day in a leading article. *D. R.*—The Muscat Muscadine, which is the same as the Seeding, so called, to which you refer, is the Chasselas Musqué of the Horticultural Society's Catalogue of Fruits, 3rd edition. The Muscat Escholata is a synonym of the White Muscat of Alexandria. The Escholata superba is probably the same as the Black Morocco. We shall be glad to receive specimens of the Grape you received under the name of Dulzetta, when ripe. The dead patches on the green berries of your Vines are occasioned by drafts of cold air. *Vitis* has some affected in a similar manner, especially near where air is admitted by sliding down the sashes. Instances of such disease have frequently been observed in the case of Vines trained under the glass of a lobby, and exposed sometimes to cold external air, and occasionally to hot air, when the door of the stove was set open for ventilation.

GRAPES.—*A. F.*—We fear there is no chance of Grapes ripening out-of-doors this year. Too much time has been already lost. If you could fix bell-glasses over your six bunches, that would assist you more than anything else.

PINES.—*Ignoramus.*—If you grow Pines in a bottom-heat of from 90° to 95°, you will not only start them all, as you have done, but produce all sorts of monsters. The bottom-heat should never exceed 84°. With this excessive stimulus, the rich manure and warm water you have been using increased the mischief.

MELONS.—*J. H. S.*—We would be glad if any Melon-grower will state, in the *Chronicle*, how far Melons should be kept from the glass, and how far from the glass could they be ripened.

FRUIT-TREES.—*Persona.*—The application of salts to fruit-trees is hazardous. Common salt, for instance, will certainly kill them; nitre has, however, been applied in moderate quantity with rather a beneficial effect. This you may use in the meantime as a manure for your Apricot-trees, at the rate of 2 lbs. to each, distributed in solution equally over the border, instead of nitrate of soda, until the effects of the latter substance on fruit-trees have been fully ascertained.

STRAWBERRIES.—*Persona.*—There ought to be no flowerless plants in Strawberry-beds, not even amongst those of the Hautbois varieties. In some soils too much dung occasions great luxuriance of foliage, with little or no fruit. In such cases a top-dressing of fresh soil, different in its nature from that in which the plants are growing, is preferable to rich manure.

ASPARAGUS.—*Guichenet.*—If in cutting your Asparagus you take every shoot, whether strong or weak, there can be no reason at the end of the season, say the 1st of June, to prevent your laying on a good coat of dung, and forking it in. Indeed, you cannot have a better time to manure the beds under the above circumstances. There could be no objection to putting on a coating of salt, before laying on the dung, and forking them both in together.

TRUFFLES.—*Persona.*—What you have sent is an extremely good Truffle, but not one which can be used for propagating this plant. You must get some friend who lives in a Truffle country to find you some that are naturally soft, black, and putrid. At that time their seeds are ripe. All else is uncertain. Your plan seems feasible. Of course you know that no one has ever in this country succeeded in obtaining them artificially, though it has been certainly done in Prussia.

CABBAGES.—*An Isle of Man Subscriber.*—The Vanack Cabbage is the finest variety for use early in the season. Sow in the end of July or beginning of August, and transplant in October. The most dwarf variety of Potato for forcing is Knight's Early Kidney; if you cannot readily obtain this, you can keep the Ash-leaved Kidney dwarf by a limited supply of water.

RAMPION.—*Persona.*—Rampion sown now ought to be fit for use in November, and throughout the winter. In sowing you have been deceived by the extraordinary minuteness of the seeds, and unless you thin directly, the roots will not acquire an average size. In future, sow in the tract made by pressing the edge of a rod on the soil. You can part the seed by mixing it with fine sand.

SUCCULENTS.—*Ignoramus.*—Any succulent plant will live for a long time suspended in the air, and will flower in that state; other plants will not. The reason is, that the skin of succulents is thick and tough, and will not allow the fluids contained in the plant to be evaporated; other plants have not such a skin, but soon lose their juice and perish. You will find some statements about the directions taken by the parts of plants in a late Number, p. 359. We cannot answer the question as to colour. Flowers do no harm in a bedroom, if they are not strong-scented; the powerful odour of some plants affects the nerves of some people. Violets, for instance, produce fainting in some constitutions.

CACTI.—*M. W. K.*—The plant which you have under the name of fulgidus is of little value, being but slightly distinguishable from *C. Jenkinsonii* in the flower. *James Kitley*—Your seedling Cactus resembles *C. speciosus*, but is very superior in colour and size to that variety.

FUCHSIAS.—*A Lady* will find the best new Fuchsias named at p. 321, the second column. *Venus victrix* appears the most distinct and remarkable of the existing novelties. *O. P. Q.*—Your Fuchsias appear to be, 1, insignis; 2, pendula splendens;

3, a very young bloom of Blanda. The difference between the flowers of some of the varieties is so trifling that it is difficult to determine the particular sorts without the foliage.

ROSES.—*A Lady.*—Lists of different kinds of Roses have been given in previous Numbers; and you will probably get an account of such as you desire in the "Rose-garden," which has appeared in our pages.

PELARGONIUMS.—*Herbert.*—It is quite possible that your seed may produce one or more desirable novelties. *W. B.*—You will find some answers to inquiries like your own in last week's paper. We cannot ascertain the cause of the spots. The author of the "Amateur's Garden" ascribes it to insects; some to the punctures of Aphides. We see no proof of this, and doubt it. Most likely it is something in the soil. Sea-sand may be substituted for white sand, if it is thoroughly deprived of its salt by repeated washing.

VERBENAS.—*Herbert.*—You can only prick out your seedlings about three or four inches apart, in a rich compost, and let them take their natural course. They may possibly flower late in the autumn.

CORREA SCANDENS.—*Rus in Urbe.*—It appears most probable that your plant has suffered from the lowness of the temperature, and the general dullness of the weather this season, and that a change in these will restore it. For a small climber to occupy the lower part of your trellis, you can employ *Maurandya Barclayana*.

TREE PRUNING.—*M. W. K.*—If you grow these in pots, they should be repotted early in the month of March, just as they are beginning to grow. Any light, loamy soil will suit them; and you may add a little decayed manure for those you wish to be particularly fine.

SEEDLING THUNBERGIA.—*J. Fryer* has sent us a seedling which has the colour of the flowers of *T. aurantiaca*, but with a whitish centre instead of a dark one. This feature renders it distinct.

FAST-GROWING TREES.—*E. S.*—The fastest growing trees you can have for the neighbourhood of London are Ashes, Limes, Horse-chestnuts, Canadian Poplars, Cærulean Willows, Black Walnuts, and the *Ailanthus glandulosa*.

BOOKS.—*Wm. Blood.*—We presume that Dr. Mackenzie's tract may be obtained of the Edinburgh booksellers. The article by Professor Daubeny cannot be had separate from the volume in which it is published that we are aware of. *J. A. J.*—Mr. Lyons's book is not sold, but given away to his friends. We answered this before. *R. N.*—"Chambers' Educational Course" is admirably adapted for young men who wish to study without masters. Any of the parts may be had separately. The last was Etymology, and very instructive it is. *William Jameson.*—We recommend you the volume on Horology and Astronomy in the Popular Encyclopedia of Natural Science if you wish to study such matters; it is well written, well illustrated, and brief. *Alice.*—"Chambers' Cyclopædia of English Literature," of which six parts have now appeared, is the best book we know of to supply the place of the old "Elegant Extracts;" it is well suited for schools, as well as to those whose means will not allow them to buy many books on literature. The selections are judicious, and the work may be safely put into the hands of the young. *Herbert.*—"London's Encyclopedia of Plants" is an excellent work for your purpose.

A Journeyman.—We never before heard of the "Pictorial Flora." For the habits of British plants, the best work is "Watson's Botanist's Guide." "Lindley's Introduction to Botany" and "Theory of Horticulture" both give you the state of vegetable physiology at the time they were published. *Philadelphos.*—The best book on Forest-trees is "Selby's British Forest-trees," in which you will find all the information you want. It is useless to medicate Acorns, nor did we ever hear of its being done. Beech is exclusively propagated by sowing the mast. *C. C.*—Paxton's Botanical Dictionary is an excellent Gardener's Catalogue. For Vegetable Physiology, read "Lindley's Theory of Horticulture;" for Practical Botany, the same author's "Elements" will be useful.

INSECTS.—*A. F.*—We know of no remedy except hand-picking, unless fresh white Hellebore-powder would kill them; but it is difficult to apply this to caterpillars on Nut-bushes. *R. B.*—Your grubs, as far as we are able to judge from the specimens you sent, which were terribly crushed, appear to be those of a Tipula, or Crane-fly, as you suppose. If you do not find the remedy proposed by "Discipulus" answer, try the effect of lime and gas-water, as recommended in *Gardeners' Chronicle* for 1841, page 612, in the article on the Crane-fly. *S.*

T. P. H. W.—The blight on your Pyracantha is one of the Scale Insects, *Coccus* of Entomologists, and probably the *Coccus Oxyacanthæ*. It is very injurious to the plant on which it feeds, and you should try and get rid of it in the way mentioned in the *Gardeners' Chronicle* for 1841, p. 131, under the article "Mealy Bug and Scale Insect." *S.*—*Entom.*—The blight which has so much injured your Wyck Elm-tree by raising bag-shaped excrescences on almost every leaf, is an Aphis, or Plant-louse, of the genus *Eriosoma*, bearing the specific name of *Alni*. If you open one of the bags, you will find it full of the insects in various stages of growth. *S.*

WOODLICES.—*A. M.*—We must refer you to the information given in former Numbers, to which we have nothing new to add. You may destroy worms by watering the ground containing them with lime-water.

MISCELLANEOUS.—*A Reader's* plants are *Enonymus europæus* and the broad-leaved variety of *Kalmia angustifolia*. *P. R. W.*—Your Rose is *R. spinosissima*. *S. T. P.*—Apply to the secretary to Sir W. Burnett's patent, Castle-court, Cornhill. *R. D.*—*Pedicularis palustris*. *H. E. B.*—We do not perceive the difference between your Azalea raised from *A. lateritia* and the variegated Azalea indica. *A Young Gardener.*—*Iris pumila*, *Cerastium strictum*. *Sarah*—*Aquilegia glandulosa*, *Iris variegata*, *Pæonia peregrina*. *A Constant Reader.*—*Salix pentandra*, the Sweet Willow. *H. C.*—Varieties of the Rhododendron have no settled names except in a very few cases. Your grandiflorum is a pure Ponticum, and hybridum roseum is a pure Catawbiense; that is to say, are mere varieties of those species, unchanged by muling. Azalea cuprea splendens is a deep orange. *Erinus.* Ferns can only be had through the nurserymen, any of whom can either supply or procure such as are "in the trade." *Potentilla.*—The "excrescences" are the roots of the Vine formed in the air; they do more good than harm, and need not trouble you. It is the strength of your Vine and the dampness of your atmosphere that causes their appearance. *J. C. L.*—We would advise you, if you reprint your little treatise, to sell it. A noble sells his land—A Scott his novels—a barrister his law—a soldier his liberty—we our botany and gardening—a doctor his physic; why should you not also sell your commodity? *W. D.*—Your specimen is *Scleranthus perennis*. *C. B.*'s plant is *Scleranthus perennis*. *J. G.*'s *Stanhopea* appears to be a natural hybrid between *S. insignis* and *S. grandiflora*. It is a variety of the former. *C. P. E.*—Your specimens are—1, *Aquilegia canadensis*; 2, some species of *Erigeron*; 3, *Orobolus tuberosus*; 4, the double variety of *Pyrethrum Parthenium*; 5, the double-flowered *Dianthus collinus*; 6, apparently *Leptospermum Thea*; *Coleonema gracilis*. *O. Jersey.*—Your flowers are smashed to pieces from being ill packed. The *Salvia* could not be distinguished from *S. patens*. The *Fuchsias* are evidently too like the varieties now common to be of any value. *J. P. S. S.*—*Arabis alpina*. Melons will bear a temperature of 50° at night without injury. *Pill Garlic.*—*Begonia Dregeana*; we do not know the *Mesembryanthemum*. *Sarah.*—*Iris variegata* and *Aquilegia glandulosa*. *A. E.*—We really cannot undertake to name seeds. Your other question is answered elsewhere. *N. M.*'s seedling *Mimulus* has a very large and handsome flower, but it is not remarkable, nor sufficiently different from some existing varieties. *A. F.*—The Pear raised by Mr. Knight from crossing the Jargonelle and Autumn Bergamot

is called the Tillington. *J. C. L.*—*Oncidium crispum*; a pretty variety, so far as can be ascertained from the flower, which was very much crushed. *Amateur.*—The charge would be about 6s. *A Lieut., R.N.*—Your *Hydrangea* is *H. quercifolia*.

SEEDLING FLORISTS' FLOWERS.

PELARGONIUMS.—*R. C.*—*Semiravis* is a large coarse flower, not worth preserving. *Ninus*, lower petals short and well formed, but inferior to many we have in the same way. *H. W. H.*—*Princess Alice Maud*, too thin in texture, the jagged edges to the petals is a great defect. *Cabira*, of no use, the lower petals are too long and narrow. *N. B.*—No. 1, a large flower, bad shape, the petals being too long. No. 2, lower petals too narrow, and the upper petals too thin and cramped on the edge: *Thurtell's, R.N.* *Fairy Queen*, broad under petals, slightly veined and tinged with delicate pink, top petals covered with a dark spot, having an edge of pink; the petals want firmness, and they appear disposed to curl back. *Lord Haddington*, a flower of good substance, with broad under petals, rat or too long, white centre, with rosy pink terminations to the bottom petals, dark spot surrounded with rosy crimson; the flower altogether has a crumpled appearance, petals curled back too much; they are both second-rate flowers. *Blackford, Jersey.*

—Your flowers were neither numbered nor named; this was an omission difficult to rectify: the best of the three is a large flower, with rosy salmon under petals, white centre, petals broad and of good substance, dark spot dies away evenly to the edge, petals are remarkably even on their surface, and smooth at the edge. The flower with a white edge to the upper petals cups too much, the lower petals are too narrow, if the flower opened more there would be divisions between them, the other flower is the best formed, but is too crumpled on the edge of the upper petals. These flowers have good substance, the petals are very smooth on the surface, and even on the edge.

—*O. P. Q.*—*Aricia*, the petals of this flower had fallen, but it appears to be your best; the lower petals are small. *Monarch*, a showy variety, wanting a little more substance; the upper petals are too long and pointed. *John Bull* is very rough and deficient both in form and substance. *Colo.*—Your seedling is a very ill-formed flower, petals all too long and narrow. *R. C.*—The seedling named Mrs. Cooke, from being badly packed, did not arrive in a proper state to judge of; the petals appear to be well formed; it is, however, very thin, and we have many varieties of the same character very superior to it.

—*J. Kitley.*—Your flower is too thin, the upper petals are bad, thin at the edges, and mottled in colour; in varieties of this colour we have many very superior flowers. *J. Grundy.*—Your seedling is a well-formed and very pretty flower, of good substance; its principal defect is the thinness of the edge of the upper petals; the lower ones are a little too veiny also.

—*J. Cowan.*—Your three seedlings are well formed, and good flowers. No. 2 is decidedly the best; it is the cleanest flower, retains its form well, and has but little feathering visible in the centre; it resembles *Cyprus*, but we consider it an improvement upon that flower. No. 1 resembles 2 very closely, but is a shade darker both in the upper and lower petals. No. 3, with more pink in its colour, is a coarser variety.

PANSIES.—*N. B.*—No. 1, yellow, not the same in all the petals, and the edging imperfect. No. 2, good eye and pretty colours; the flower wants substance, and the ground-colour of the upper petals appears to be stained. 3, stained yellow under petal, the flower altogether is thin. *F. B.*—*Cléo* wants the eye, and the ground-colour differs in the petals. *Tugthorn* is a very pretty border variety, the yellow lip disqualifying it as a show-flower. *Village Maid*, fine eye, wanting a little more substance and size. *Eclipse*, yellow, with fine eye, slight indication of light blue in the top petals; yellow is rather stronger in the bottom petal than in the rest of the flower; large, flat, and well formed.

—*Duke of Norfolk*, large well-formed flower, with a fine eye, primrose ground, with a pencilled edging of delicate blue round the petals, a few spots of purple in the top petals; the two latter promise to be good show-flowers. *R. R. D.*—Your Pansies are too small, and of no use; we have several splendid sets in the same way.

VERBENA.—*R. R. D.*—We cannot tell the exact tint of your seedling, from its having been so much pressed; we cannot imagine it to surpass the varieties at present grown; it being sweet-scented must be its principal recommendation. *O. P. Q.*—Your seedling *Queen Superb* is a very pure white when it first opens, but it soon changes to a dirty lilac pink; it is, however, sweet-scented, and forms a good truss.

FUCHSIAS.—*Nowbray.*—We have examined your seedling *Fuchsias* and compared them with many of the finest varieties at present in cultivation; your specimens possess more substance in the sepals and the tubes are higher-coloured than any of the large-blossomed hybrids we have seen. *Princess Royal* resembles *Chandlerii*, with a longer tube, sepals not quite so light but tipped with green; this is quite equal if not superior to that fine variety. *Alice Maud Mary* wants colour. We regard this only as a botanical curiosity; the petals are long, separated, quilled, and each is furnished with an anther. There are four perfect stamens also; the style is very long, flower light rosy vermillion. *Rudolphus*, red purple petals, deep rosy vermillion tube and sepals, stout in substance, and rich in colour. *Magnificent*, tube rather longer, and flower higher-coloured. *Magnificus*, do. These three are remarkably fine, bearing a strong resemblance to each other. *Fairy Queen*, long, rough, rich-coloured tube and sepals; petals stout, without purple, remarkably fine. *Prince of Wales*, tube very long, and rich in colour; petals stout, with a slight tinge of purple very fine variety.

CINERARIAS.—*G. Walker.*—The blue of your seedling is very beautiful and bright, but the flowers are very small we have the same colour in larger flowers. *L. and M.*—The colour of your seedling is a clear and bright blue, and the largest flower of its colour we have seen, measuring 1½ inches across. The petals are narrow for the size of the flower.

CALCEOLARIA.—*B. & K. P.*—Your seedling is a very pretty variety, good in its form, colour, and marking.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE proposal of Ministers, granting to her Royal Highness the Princess Augusta of Cambridge an annuity of 3,000*l.* a year, to commence on her father's death, as a dowry on her marriage with the Hereditary Grand Duke of Mecklenburg Strelitz, was submitted to the House of Commons on Monday. An address in reply to the Queen's message on the subject was first brought forward as a matter of form, when Mr. Hume proposed an addition to the address expressive of the consideration of the House for the present unsatisfactory state of the country. This amendment was rejected on a division by 276 votes to 52, and a desultory discussion on the proposed grant took place, which ended in an adjournment. The subject was resumed on Wednesday in a committee of supply, when Mr. Hume moved another amendment, declaring the opinion of the committee that the allowance so long enjoyed by the Duke of Cambridge should have enabled him to make provision for his children,

and that it was neither wise nor just in the present state of the country to propose any grant by way of dowry to the Princess Augusta. Sir R. Peel justified the grant on the ground that the Duke of Cambridge has to transmit a dukedom to his successor with the means of keeping up its dignity, and adduced various precedents for the vote. A division ensued, when the motion was carried by 223 to 57 votes. Another division took place last night on the second reading of the bill, Mr. Hume having moved that it be read a second time that day six months; but this amendment was negatived, and the second reading carried by a majority of 104. On Monday, Lord Howick's motion for a repeal of the coal duty imposed last year was negatived by a majority of 63; and on Tuesday, Lord J. Russell's motion for a Committee to consider the present state of the Corn-laws, with a view to the adoption of a compromise in the form of a moderate fixed duty, was negatived by a majority of 99. On Thursday, Sir J. Graham announced the intention of Government to abandon the Educational clauses of the Factories' Bill, and promised to explain on Monday the course which the Government would adopt in regard to the remaining clauses. The third reading of the Canada Corn Bill was opposed by Col. Sibthorp, who moved its third reading on that day six months, but the House on a division passed the Bill by a majority of 150 to 75. The Irish Arms Bill was then brought forward, and a long debate ensued, which has not yet come to a division. In the Lords, on Tuesday, Lord Aberdeen brought forward his Bill for regulating the affairs of the Church of Scotland: considerable opposition was offered to its details, but it was ultimately read a second time, on the understanding that many of its alleged defects could be remedied in committee. The accounts from the Provinces within the last few days give gratifying reports of a favourable change in the weather, which for some weeks past had given rise to great anxiety. It is now hoped that the occurrence of more genial weather will be lasting, and that the result will show that little permanent injury has been done to the crops by the long continuance of rain.

From France we have accounts of renewed discussions in the Chambers on various measures of Finance, in which the Ministers have been again defeated. The interest of these questions is chiefly local, and the only political character they possess is their possible influence on the stability of the Ministry.—In Spain the apprehensions expressed last week for the tranquillity of the provinces, are fully confirmed; four regiments in Catalonia have deserted to the insurgents, and the Barcelonense Junta has declared itself independent of the Government of Madrid. An understanding is said to exist between the party of Queen Christina and the insurgents; and it is even rumoured that the Regent intends to remove the young Queen from Spain, and place her under British protection, unless the movement can be speedily suppressed.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princesses continue at Buckingham palace, and are quite well. The Queen held a Court and Privy Council on Saturday, at which Lord Dalhousie, Sir Edward Ryan, and Mr. Pemberton Leigh took their oaths and seats as Privy Counsellors. In the evening, her Majesty and Prince Albert honoured the Italian Opera with their presence, and on Monday went in state to the Theatre-Royal, Drury-lane. On Tuesday, the Queen held a Chapter of the Order of the Thistle, at which the Marquess of Bute and the Earl of Mansfield were elected Knights of the Order. The Queen and Prince attended the performances at the Italian Opera in the evening. On Wednesday the Queen gave a dinner and concert to the King of Hanover, the Queen Dowager, and other members of the Royal Family. Prince Albert visited Mr. Waterer's exhibition of American Plants, King's-road, Chelsea, on Wednesday, and was pleased to express his satisfaction at the exhibition. The Prince will hold a levee on Wednesday by desire of her Majesty. It is expected that the Queen and Court will pay a visit to Walmer Castle early in the summer, and that her Majesty's first trip in the royal steam-yacht will be to Plymouth, where the seat of the Earl of Mount Edgcombe will be prepared for her reception.—The Princess Clementine of Orleans and her consort, the Prince of Saxe Coburg-Kohary, at present spending the honeymoon with the Queen of Portugal, are expected to arrive in England in the early part of July, on a visit to her Majesty.—The King of Hanover left town on Saturday for Kew, and returned to St. James's Palace on Monday. Previous to his departure his Majesty held a levee for the reception of the Foreign Diplomatic Corps. His Majesty occupied his seat in the House of Lords on Friday night as Duke of Cumberland; he took his seat between the Duke of Wellington and Lord Aberdeen on the Ministerial benches, and was dressed in deep mourning.—The marriage of the Princess Augusta of Cambridge with the Hereditary Grand Duke of Mecklenburgh Strelitz is understood to be finally arranged to take place on Wednesday next.

Foreign.

FRANCE.—The papers are for the most part taken up with the debates in the Chambers on the French settlements in the Pacific, and the repeated defeats experienced

by Ministers on this and other financial measures, although not directly of a political character, had induced some misgiving respecting the power to maintain themselves in office. A trifling decline in the funds took place on Monday, solely caused by this impression. The discussion on the credit of 5,987,000 francs, required for the establishment of the colonies in Oceania, recommenced on Monday. M. Billault moved a reduction of 243,500 francs in the first item, which led to a long discussion, after which M. Guizot proposed a reduction of 678,000f. He offered to reduce the money on the effective of troops by 397,000f., instead of 325,000f., taking from the pay of marines at home that destined to the force employed abroad. In addition to this, M. Guizot proposed a further reduction, striking off 100,000f. from the 300,000f. left at the disposal of the Government. The Chamber was satisfied with the proposal, and passed the grant by 220 to 140 votes. In the course of his speech, M. Guizot declared that the opening of a canal through the isthmus of Panama was perfectly practicable, that a company had been formed for the purpose, and that the expense would not be so great as imagined by the adversaries of the project.—The papers publish some particulars of a banquet given at Maçon to M. de Lamartine, and a report of his very remarkable speech on the occasion, in which he exhorts the people to "endeavour to recall the Government to the principles which placed the present king on the throne; but that, should the Government persist obstinately in the course it has hitherto pursued, the people must not accompany them in it." According to the figurative reasoning of M. de Lamartine, "the monarchy imagined and decreed in 1830, and which it was then understood was to be that of King Louis Philippe, was the work of reason and of necessity, —a monarchy not enveloped in the mysteries of English metaphysics, concealing its origin in heaven, but the monarchy of broad daylight, examined by everybody, agreed to by everybody, belonging to everybody. Less than that would be the *ancien régime*—more than that would be the republic." He concluded by giving as a toast—"The regular and peaceable accomplishment of the destinies of democracy." In a word, M. de Lamartine shows that the two monarchies tried by France since 1789—the military monarchy of Napoleon and the divine-right monarchy of the restoration, endured for only 15 years each; that the present experiment of the monarchy has existed for now nearly 13 years, and may be expected to expire in a couple more; that then the existing monarchy having been, though a work of necessity, a masterpiece of reason, and having failed in its object, France should have no more to do with monarchies of any kind or description.—The official journals announce that the Prince de Joinville, on his arrival at Rio de Janeiro, demanded of the Emperor of the Brazils, with the consent of the King his father, the hand of her Imperial Highness the Princess Frances of Braganza, which was accorded to him. The marriage was to be celebrated at Rio on the 1st May. The Prince de Joinville is now on his way back to France, in the frigate Belle Poule, with his young bride, and is expected to arrive in the course of next month.—The weather had begun to improve in Paris. The journals of the departments of Saone and Loire, of the Aine and of the Rhone, announced that the Saone had overflowed its banks, and caused much injury. Letters from Grenoble mention that the country in that direction had been inundated by the overflow of the Isere. The journals of Maçon state that the floods caused by the continued rains had occasioned serious disasters, and great fears are entertained for the crops. Letters from the south of France announce the all but total failure of the vintage in that quarter. Early in the season the vine gave promise of a harvest equal to that of 1834, but, so great is the damage caused by hailstorms of unusual violence, that what is made will, it is stated, be converted almost entirely into spirit.—The Cour Royale of Orleans was occupied during the whole of the 5th, 6th, and 7th of this month in considering the appeal lodged by our countryman, Mr. Conaty, against the judgments which had been pronounced against him by the Tribunal of Tours and the Cour Royale of Blois for playing with marked cards. After hearing the pleadings on both sides, the Court fully acquitted Mr. Conaty, and ordered him to be immediately discharged. It is said, however, that the discharge has been opposed by the Advocate-General, on the ground of his having lodged an appeal against the judgment of the court.

SPAIN.—The accounts from Spain received by the French telegraph are very unsatisfactory, and are considered to be the forerunners of the downfall of the Regent, unless some decided change should speedily take place. They announce the passing over of four regiments in Catalonia from the Regent to the insurgent force organized by Colonel Prim, and state that an understanding exists between the Christians and the party now in opposition to the Regent. This union will not be avowed until the downfall of Espartero, which the movement calculates on effecting. No doubt exists as to the violence of the excitement which prevails in many parts of Catalonia, and it is said that the crew and captain of the Government steamer at Barcelona have been bought over by the insurgents. Colonel Prim is master of the south of the province, and intercepts all the Government despatches. The vanguard of General Zurbano, who was marching against the Colonel, deserted, and the General was obliged to retreat. The Barcelonense Junta at Sabadell, which suddenly found itself in possession of sufficient funds to corrupt the whole province, has declared its separation from the Government at Madrid. Previous to these events, General Zurbano, who had marched towards Tarragona, had returned to Barcelona for his baggage. He

was discovered in the streets, hustled, and with difficulty escaped to his hotel. The crowd gathered round the hotel, and he was obliged to get an escort. This escort refused to attack the people, but the General dealt about some sabre strokes, and some of the horse police fired, and wounded two persons. The baggage was flung into the sea. The Captain-General then was about to proclaim martial law, but the provincial deputation and the civic authorities begged him not, and he recalled his decree. From Bayonne we learn that Ciudad Rodrigo had revolted, and that Valladolid and Valencia were disposed to follow its example. Much excitement prevailed at Burgos on the 8th, and it was said that a battalion of the provincial regiment of Lerida, which had marched for Ciudad Rodrigo a few days before had deserted to the insurgents. Fears were also entertained for Santander. Navarre and the Basque Provinces were quiet. It was not known what resolve the Regent would take, but it was feared that it was too late for him even to accept a Lopez cabinet. It was currently reported in the Opposition circles of Madrid that the Regent intends to quit Spain with the young Queen, to proceed to Lisbon, and place her Majesty under British protection. This is, however, indignantly denied by the official journals, and the tranquillity of the capital has not been disturbed.

PORTUGAL.—We have Lisbon news to the 5th instant. The Duke of Saxe Coburg and his family had arrived at Lisbon on the 30th ult., in the French steamer Pluton. The Duke had been waited upon by the diplomatic corps, and the officers of the garrison, at the palace of Necessidades. The court was expected to leave shortly for Cintra. The Duchess of Braganza was expected to leave on the 8th, in the Duke of Cambridge steamer, for Holland. The session of the Chambers had been again continued for another month, and the financial projects were under debate. A bill imposing an increased legacy duty had passed the Chamber of Deputies, after a prolonged discussion. The Ministry had been left in a minority on two clauses, which led to reports of their retiring; but, at a subsequent meeting of their supporters, it was apparent that the great majority of the Chamber was staunch to the Government, and a motion of Costa Cabral's, the next day, was carried by 62 against 29 votes.

GERMANY.—The King of Prussia has returned an answer to the Diet now in session at Dusseldorf, with respect to giving full publicity to the debates and transactions of that body, from which it appears that his Majesty intends to make some modifications in the law concerning the regulations of the press. The King had appointed M. Grube Prussian Consul-General to China, who is immediately to proceed there by land for the purpose of informing himself, on his way, in what manner the interests of Prussian commerce may best be promoted. The upper part of the spire of the cathedral at Königsberg fell down last week, and crushed several of the surrounding houses. No life was lost, but a considerable number of persons were severely injured, and as it was feared that the remainder of the structure, 160 feet high, would give way, all the inhabitants of that neighbourhood had deserted their houses. The Cologne papers announce that the long-pending negotiations between Belgium and Prussia relative to a reduction in the tariffs are on the point of being concluded in a satisfactory manner.—The *Journal de Frankfort* states, from Vienna, that the steam-boat Vienna, which plied between that city and Presburg, had run on a bank and been sunk. Several of the passengers were drowned, and a large quantity of merchandize was lost.

ITALY.—The *Augsburg Gazette* quotes a letter from Rome, stating that swarms of grasshoppers had suddenly made their appearance in the country adjoining Palo, and on the western coast, and laid the fields completely waste. Thence they extended their ravages to the plains of the Campagna. The means adopted for their destruction having proved unavailable, the Pope ordered processions and prayers in all the churches to implore Divine protection against the scourge.—The foundation of the Lombardo-Venetian railroad, a work of great importance for the commerce of Austria and the Italian States, was laid on the 1st inst. by the Archduke Viceroy in front of the Porta Tosa. An immense multitude witnessed the ceremony.—The marriage of the Princess Terese with the Emperor of Brazil was solemnised by proxy at Naples on the 31st ult.

RUSSIA.—The Emperor has taken active measures to build an Imperial residence on an extensive scale in the southern part of the Crimea, called the "Italy of Russia." This was a favourite plan of the late Emperor Alexander, who purchased for that purpose, a short time before his death, a large estate not far from Taganrok, and which is said to be one of the most beautiful and picturesque spots in the empire. The celebrated Bavarian architect, M. von Klenze, had arrived at St. Petersburg, by special invitation of the Emperor, who is anxious to consult him about the designs of several new public buildings that are to adorn the capital of the Czars.

DENMARK.—We learn by the French papers that Thorwaldsen, the celebrated sculptor, on the 1st of June, opened his collection of pictures and marbles to the view of the public at Copenhagen. The pictures, particularly, are said to be of great value, and he has declared his intention to leave the whole after his death, upon certain conditions, to the city.

TURKEY.—Letters from Constantinople of the 24th ult., state that the appointment of Redschid Pasha to the government of Adrianople was considered to be a sort of exile. Being no longer in the diplomatic service of the Porte, he had, by accepting an office in the military department, become ineligible for ever from holding the place of Minister for Foreign Affairs. It was said that the Turkish Government had received intelligence from

Belgrade of the voluntary retirement of Prince Alexander from the government of Servia. The death of Princess Lubicza, who for years has been the principal cause and instigator of the disturbances in the Turkish provinces on the Danube, took place at Neisatz on the 26th ult.

UNITED STATES.—Another of those extraordinary passages for which the British and North American steamers are so celebrated has just been accomplished by the Caledonia, which arrived at Liverpool on Tuesday, after a passage of nine-and-a-half days, from Halifax. The Caledonia brings an account of the arrival of the Acadia at Boston under twelve days, having left Liverpool on the 19th ult. and reached Boston at midnight on the 31st, stopping eight hours at Halifax to land and take in the mails. The political news by this arrival is unimportant. The remains of Sir Charles Bagot had arrived on board the Warspite, and the lady and family of the late Governor-General had reached New York, and would embark in the same ship on the 1st, and proceed to England. The commercial accounts from the United States are favourable. Great excitement prevailed in the money markets of New York, Boston, and Philadelphia, and during the ten days previous to the departure of the Caledonia, several descriptions of American stock advanced from 15 to 20 per cent., and up to the close of the mails for the steamer a large amount of business was transacted.—Dr. Noah Webster, the author of the well-known Dictionary of the English language, died at New Haven on the 28th May, in his 85th year.

BRAZILS.—By H.M.'s packet Swift we have news from Rio to the 23d April, but it contains few facts of political interest. It was expected that the marriage of the Prince de Joinville with the Princess Donna Francisca would be solemnized on the 1st of May, and the 10th was fixed for their departure in the Belle Poule for France. The dowry of the Princess was to be upwards of 200,000*l.*, of which 20,000*l.* was to be paid in cash, and the remainder in local stock, at 70. The dates from the River Plate are to the 16th April, whereby we learn that the Buenos Ayrean blockading fleet before Monte Video had been ordered away from there by Commodore Purvis, of Her Majesty's ship Alfred.

SANDWICH ISLANDS.—We lately announced the occupation of these islands by a British squadron, but it now appears, by the Ministerial papers, that the Home Government refuse to sanction the proceeding. It appears that certain claims having been preferred against the Government of the Sandwich Islands on behalf of British subjects, and by the British Admiral, the sovereign of those islands professed his inability to meet the demands in question, but offered to divest himself of the sovereignty of his dominions in favour of the Queen of England. The British Admiral accepted the cession of these territories conditionally, but acknowledged at the same time that he was acting without instructions, and the arrangement was to be regarded as provisional until it should be ratified and approved by her Majesty's Government. The view which has been taken of this treaty of cession in this country is not favourable to its confirmation. Although no blame is laid on Admiral Poulett for his share in the transaction, it is understood that the Sandwich Islands are not to be annexed to the dominions of the British Crown, but to be restored to the independent authority of the native sovereign.

Parliament.

HOUSE OF LORDS.

Monday.—Earl STANHOPE gave notice that on Friday he would present the petitions agreed to at the county meetings of Berks and Kent, on the subject of the Corn laws.—The Millbank Penitentiary Bill was read a second time, on the motion of Lord WHARFOLFE, and was ordered to be committed on Thursday.

Tuesday.—The Duke of WELLINGTON moved an address to her Majesty, thanking her for her gracious communication respecting the Princess Augusta of Cambridge, and professing the willingness of the House to entertain any proposition which might be submitted to them.—Earl FORTESCUE took occasion to call attention to the fact, that the two children of the Duke of Sussex had been left unprotected. He stated his belief that, after the payment of his late Royal Highness's debts, nothing would remain either for the Duchess of Inverness, or the children of Lady Augusta Murray; and professed to state these facts, not for the purpose of taking from the entire unanimity of their Lordships on the present auspicious vote, but with the intention of recalling the circumstance to the consideration of the Government.—The Duke of WELLINGTON, while paying a tribute of personal respect to his late Royal Highness, declined to enter into any discussion on the topics irregularly introduced by Lord Fortescue. He could not, he said, consider the marriages of the Duke of Sussex as legal or political marriages, though they might, in a moral point of view, be marriages. He said that the facts were only known to him as they were known to all the world; but at all events, their case could not be considered in connection with the present subject.—Lord BROUGHAM added his testimony to the many excellent qualities of the Duke of Sussex, after which the address was agreed to.

The Earl of ABERDEEN moved the second reading of the bill for Regulating the Admission of Ministers to benefices in the Church of Scotland. He argued, at considerable length, that the seceders had acted illegally, because the principles of the Church of Scotland were those of Calvin, Knox, Beza, &c., and declared his opinion, that rather than accede to their demands, it would be preferable to abolish the Church of Scotland altogether.—The Earl of ROSEBURY, in a speech in which he censured the conduct both of the General Assembly and of the seceders, moved, as an amendment, that the bill be read a second time that day six months. It did not meet the present emergency, and contained principles of which he did not approve.—Lord BROUGHAM, admitting the sincerity of the seceders, was convinced that when zeal cooled, they would, with the exception of a few popular preachers, discover the injudiciousness of their conduct in the difficulty of maintaining themselves and families. He disapproved of the bill, because, though it would not conciliate the seceders, it would gratify what remained of the Church, by giving them rights and privileges which he did not think ought to be conceded.—The Earl of HADDINGTON supported the bill.—Lord COTTENHAM, at some length, argued that the bill conferred powers on the Church of Scotland which it had never yet possessed, but for which it had often struggled in vain.—The Lord CHANCELLOR advised the second reading of the bill, on the ground that its defects could be remedied in committee.—Lord CAMPBELL assented to this, but declared his deter-

mination to oppose the bill in all its subsequent stages, unless it were materially amended.—Lord ABERDEEN replied; after which the bill was read a second time.

Thursday.—The Scotch Church Bill was postponed until Thursday next.—Lord MONTAGUE adverted to the union of the archdeaconry of Raphoe with another extensive parish, in opposition to the recommendation of the Ecclesiastical Commissioners. The parishes were large, and contained a large number of Protestants, and ought to have a resident clergyman in each; he therefore moved for papers on the subject.—The Duke of WELLINGTON had no objection to the production of the papers, but said that the revenues of the archdeaconry were 1,700*l.* at the time the Ecclesiastical Commissioners made their recommendation, but since then those revenues had fallen off one-half, and under such circumstances the recommendation was not applicable.—The Marquess of LANSDOWNE strongly condemned the union of the parishes on principle. After a short discussion, the papers were ordered. The Canada Corn-Bill was brought up from the Commons, and read a first time.

Friday.—After some conversation on the late negotiations with the Brazils, Lord WHARFOLFE fixed Thursday next for the second reading of the Canada Corn-bill. Earl STANHOPE presented the two petitions lately agreed to at the county meetings of Berks and Kent, and said that the farmers believed that their capital was wasting, their property exhausted, their skill and industry thrown away, and they were now in that state of disgust which was easily converted into despair. The Duke of RICHMOND presented petitions to the same effect, and expressed his concurrence in the opinions they conveyed.

HOUSE OF COMMONS.

Monday.—The preliminary business included a variety of questions relative to various topics—the acquisition of Scinde, the number of benefices in the Scotch Church vacant by the secession, with some other matters of inquiry relative to Ireland, &c. The first public business was the consideration of the Queen's message, relative to the marriage of the Princess Augusta of Cambridge.—Sir R. PEEL proposed, first, to vote an address to the Queen, thanking her for her gracious communication; and when that was passed he intended that the House should go into committee, in order to enable him to state the nature of the provision intended for her Royal Highness, on her marriage. Accordingly he moved the address to her Majesty.—Mr. HUME was willing to agree to the address, provided an addition were made to it, expressive of the due consideration of the House for the present unsatisfactory state of the financial, commercial, and physical condition of the country.—Mr. WILLIAMS seconded the amendment.—Sir R. PEEL said the address would not commit any member to the subsequent proceedings, and begged Mr. Hume not to interpose any obstacle to his going into committee, when he would make a statement which would convince the House that the Government were not indifferent to the present state of the country.—Lord HOWICK pressed on Sir R. Peel the propriety of not asking the House to agree to a grant of money without giving time for consideration, thereby following the precedent adopted in the case of Prince Albert.—Sir R. PEEL was not disposed to resist postponement, if it were the general feeling of the House; but still thought that his statement, if suffered to be made, would prove satisfactory.—Lord J. RUSSELL considered that it would be more respectful to the Crown to go into committee, in order to hear the proposal of the Government.—Mr. HUME declared his determination to divide on his amendment, being resolved, so far as he was concerned, that the truth should be conveyed to her Majesty.—A division accordingly took place, when Mr. Hume's proposed addition to the address was rejected by 276 to 52.—Mr. HUME called on Sir R. Peel to make his statement before going into committee; but after a few words from Sir R. Peel, he withdrew his opposition. The House then went into committee, and Sir R. PEEL said that the Government, in proposing a provision for her Royal Highness, did not intend to make any immediate addition to the burdens of the country. Briefly alluding to precedents, he said that it was intended by the Duke of Cambridge to make provision for his daughter during his own lifetime, and the resolution he now proposed was to enable her Majesty to grant an annuity of 3,000*l.* to the Princess, to commence on her father's death.—Mr. MACKINNON proposed an amendment, that the annuity should be reduced to 2,000*l.*, to be granted from the day of the marriage. He entered into some calculations to prove the superiority of his proposition to that of the Government, but he was greatly interrupted by the impatience of the House.—Sir R. PEEL said that the amendment, though ostensibly a reduction, was really a proposition for an increased grant, inasmuch as it was to take effect from the day of the marriage. He therefore submitted that the committee could not entertain the proposition.—After some discussion on the point of form, Mr. MACKINNON withdrew his amendment. Mr. WILLIAMS commented on the income and appointments enjoyed by the Duke of Cambridge, and remarked that there was a Duke of Mecklenburg—the grandfather or father of the intended husband of the Princess—who was already a pensioner on this country, and had been so for the last 45 years. The sums paid to those German Princes and Princesses who had formed alliances with our Royal Family now amounted to 200,000*l.* annually. This fact, coupled with the heavy load of general taxation which had to be borne by a distressed and impoverished country, justified him in opposing the grant.—Sir H. DOUGLAS would not hesitate to support this grant to the grand-daughter of that illustrious Monarch who had voluntarily surrendered the immense patrimony of the Crown to the control of Parliament, greatly to the advantage of the public.—Mr. HUME pressed on Sir R. Peel the propriety of postponing the consideration of the subject.—Sir R. PEEL could not now think of doing so, seeing that discussion had been raised.—Lord HOWICK thought he ought to do so, in conformity with former precedent.—Lord J. RUSSELL, on the contrary, was of opinion that as discussion had begun, it ought to go on.—Sir R. PEEL, however, yielded, on condition of the committee being resumed the next day, provided Lord John Russell would give way with his motion on the Corn-laws.—Lord J. RUSSELL was reluctant to lose his only opportunity of discussing so important a subject.—After some further conversation, it was settled that the discussion be adjourned until Wednesday.

Col. RUSHBROOK moved for a new writ for the election of two Members for the borough of Sudbury.—Mr. C. W. WYNN, after referring to the extraordinary difference in the amount of evidence given at the bar of the House of Lords and that given to the House of Commons in this case, moved the appointment of a select committee to compare the evidence, as given before the two Houses of Parliament in the case of the Sudbury Disfranchisement Bill, and to report thereon.—This amendment was supported by Sir R. PEEL and Lord J. RUSSELL, and agreed to.

On the motion for going into a committee of ways and means to consider the sugar duties, Viscount HOWICK moved as an amendment, that the House should resolve itself into a committee to consider the propriety of repealing the coal duty imposed last year, and of re-establishing the duty on the footing on which it formerly stood. The noble Lord contended that the increased duty of last year had greatly injured the coal trade, as well as a large portion of the shipping interests. It had indirectly damaged other trades, and had totally failed as an item of revenue. Besides, it was contrary to the announced Ministerial dogma—that it was contrary to sound principles of legislation to impose burthens on British manufactures.—Mr. GLADSTONE would not contradict the numerous philosophic principles uttered by Lord Howick in the course of his speech, but simply defended the present duties on the ground of revenue. The duty would realise on the year about 114,000*l.*, and that sum could not be relinquished in the existing state of the finances. He quoted figures to prove that the duty had not operated violently on the trade either at home or abroad, nor on the freights; and that the coal trade might increase under the duty now levied. Lord

H. VANE, Mr. BELL, Mr. LABOUCHERE, and Mr. LIDDELL, supported the amendment of Lord Howick, which was opposed by Sir G. CLEAVE and Sir R. PEEL, who objected to the proposition, on the grounds that the House had not sufficient experience of the operation of last year's duty, and that the injurious effects of the tax upon trade had not been demonstrated. He warned the House, that if they consented to the repeal of the present duty, they would have a combination of other small interests calling for the repeal of the duty on wool and other articles producing only about the same amount of revenue. He asked that majority who were desirous of upholding the public credit of the country, to support the Government against such combinations of particular interests, and to maintain this tax until it should be proved to be a bad one. On a division there were—For Lord Howick's amendment, 121; against it, 187; majority, 66.

Tuesday.—In reply to Lord R. GROSVENOR, Sir J. GRAHAM said the Government had directed their anxious attention to the subject of interments within the precincts of towns, and a very elaborate report had been prepared on the subject, but he could not say that any measure was sufficiently matured to be introduced.—Sir E. KNATCHBULL presented the petition agreed upon at the county meeting lately held on Penenden Heath, praying for full protection for domestic industry, and stating that the petitioners viewed with the greatest alarm the progress of the Canada Bill. He said he agreed in the prayer of the petition, but that he dissented from the petitioners' views with respect to the Canada Corn-bill.

Lord J. RUSSELL moved that the House resolve itself into a committee, for the purpose of considering the present state of the law regulating the importation of foreign corn. The noble Lord contended that neither the manufacturing, the commercial, nor agricultural interests were satisfied with the present state of the Corn-law; and said that his object was to propose, not a total abolition, but a moderate fixed duty. He would not state what amount of duty he would propose until the House resolved to go into committee with him, for then only could he explain what he considered a compromise likely to be satisfactory to the parties in the House and to the country. The history of the abolition of slavery, and of Catholic emancipation, exhibited periods when the adoption of a compromise would have been as wise as expedient. Nor did he anticipate the continuance of the agitation of the Anti-Corn-law League after the adoption of an equitable system. Many of the individuals engaged in that agitation were concerned in trade and manufactures, whose time was precious to them, and who would not be disposed to continue their exertions after the settlement of the question by the adoption of a fair compromise. He was still of opinion that in a time of general scarcity there should be power given to the executive to suspend the operation of a fixed duty—an opinion to which he was led, not on any grounds of political economy, but as a measure of expediency, to be ready for a contingency, the probability of the occurrence of which, under a fixed duty, could only be regarded as remote. In urging the change which he now advocated, the party with which he acted claimed no monopoly of the merit, or the right to effect it; the statute book bore witness to their past exertions on behalf of civil and religious liberty, and enabled them without grudging to give the credit of the adoption of a fixed duty to any administration that would undertake it. It was impossible to avoid change, or to maintain the present system; and he therefore urged them to accede to his motion.

Mr. GLADSTONE, notwithstanding that he assented to many of the principles laid down by Lord J. Russell, saw a gross injustice to those parties who had embarked their capital and labour under the existing law, in the proposition of now making a further change to a fixed duty, the permanency of which Lord J. Russell himself could not guarantee. The decision of last year in this law was a solemn one, and the noble Lord was now lending his aid to the unsettlement of the question, adding to the uncertainty which, it was urged, prevailed throughout the country.—Mr. LABOUCHERE was prepared to go into committee with Lord J. Russell, and to treat the Corn-laws on commercial principles, by trying the experiment of a moderate fixed duty.—Mr. HUME, considering a fixed duty preferable to a sliding scale, and yet believing it to be a fixed justice, was ready to give it his vote.—Sir W. CLAY, Mr. AGLONY, Mr. EWART, and Mr. VILLIERS, subsequently supported the motion, and Col. Wood and Mr. WODEHOUSE opposed it.

Sir R. PEEL taunted Lord J. Russell for his concealment of the moderate fixed duty that he would propose, but accounted for that concealment by hinting that a sudden and very inconvenient explosion would follow the divulging of the noble Lord's secret. He also ridiculed the idea of a fixed duty, which even the proposer could not help unfixing at particular times. He avowed his determination to adhere to the present law, until convinced by facts and evidence that it ought to be departed from. The Corn-law of last year was a compromise between conflicting interests, and it had been assented to by the agriculturists on the understanding that it was to be maintained. It had worked well, for though there had been a fall of prices after it was passed, mainly caused by the unexpected good harvest of last year, there had been great steadiness in the range of prices; and seeing no chance of any successful settlement of the question from the proposition of Lord J. Russell, he declared his determination to maintain the existing law.—Lord JOHN RUSSELL was not discouraged by the circumstance of being in a minority. Past experience assured him of the ultimate triumph of truth and reason; other questions had surmounted more formidable opposition. He vindicated his proposition of a moderate fixed duty.—After a few words of explanation from Sir R. PEEL the House went to a division; there appeared—for Lord J. Russell's motion, 145; against it, 244; majority, 99.

Wednesday.—After the presentation of a great number of petitions against the educational clauses of Sir James Graham's Factories Bill, Mr. M. GRISON put various questions to Sir R. Peel on the state of public business, more particularly as regarded the intentions of Government with respect to the Factories Bill, the Ecclesiastical Courts Bill, and the Local Courts Bill.—Sir R. PEEL replied that Sir J. Graham would on Thursday state to the House the course which he meant to take with the Factories Bill. With regard to the delays which had taken place in other measures before the House, Ministers had given notice of certain measures, some to make important reforms in the administration of justice, others to make some provision for the education of the people, but it was impossible for them to specify the exact period at which any bill would come on. There had been constantly adjourned debates; he did not wish to make any complaint of these adjournments, which were necessary to give honourable gentlemen a full opportunity of expressing their opinions, but when they took place for four or five nights in succession, of course they interfered with the arrangements made for getting through the business. He never had moved an adjournment at twelve o'clock; but was ready, on the contrary, at all times to devote ten or twelve hours, instead of eight or nine, to the disposing of the public business; but it was quite impossible for him to control the deliberations of the House, or hasten a particular measure being brought forward at a given time.—Mr. AGLONY hoped that Sir J. Graham would also state the intention of Government with respect to the Ecclesiastical Courts Bill; and Sir GEORGE GARY announced that he would not persist in his motion for referring the bill to a select committee, as considering the lateness of the session, it was hopeless to expect a select committee, and still more hopeless to expect a committee of the whole House. He should therefore substitute a notice that the Committee on the Bill be postponed for three months—not because he objected to the bill, but because he thought it quite impossible to get through it in the course of the present session.—Mr. HINDLEY inquired if Government had investigated the circumstances attending the introduction of 100 barrels of American manufactures into this country, consigned to Messrs. Baring, Brothers, and Co. He trusted there would be an opportunity of getting at the real facts of the case.—Sir R. PEEL said

his right hon. friend the President of the Board of Trade would probably answer the question on Thursday.

The House then went into committee of supply. On the proposed annuity of 3000*l.* a year to the Princess Augusta of Cambridge being moved, Mr. HUME opposed the grant. He disclaimed any intention to reflect on the character of the Duke of Cambridge; he reflected only on Ministers who could propose such a grant. He denied that there was any principle or precedent upon which the country was called upon to support the children of Royal Dukes. If there were, it might extend as fairly to their grandchildren, and what was the limit to which these grants might not extend? He asked why should the children of the Duke of Cambridge be treated differently from those of the Duke of Sussex; and with reference to the grant immediately under consideration, referred to a grant of 2,000*l.* a year which was already enjoyed by a relation of the Prince of Strelitz, under an Irish act of Parliament, of 38 George III., under which he calculated that 335,000*l.* had been paid to that personage. He put it to the Government whether such grants did not impair the position of the Crown in the affections of the people. What would be said now if it was proposed to the House to grant 335,000*l.* to the nephew of Queen Charlotte? The proposed grant, considering that the Royal Family were long-lived, he calculated might in 45 years amount to 500,000*l.*; and he denied that there was any sufficient ground for such a grant. After some further observations, in which he took a review of the civil list, he concluded by moving an amendment—"That in the opinion of the committee, the ample allowance so long enjoyed by his Royal Highness the Duke of Cambridge should have enabled him to make provision for his children; and it is neither wise nor just, especially in the present state of the country, and the deplorable destitution of the labouring classes, to propose any grant by way of dowry for the Princess Augusta Caroline of Cambridge."—Mr. LIDDELL, amidst general symptoms of impatience, protested against the amendment.—Sir R. H. INGLES opposed the amendment, and contended that the proposed grant to the Princess Augusta was not worth one-tenth part of the sum Mr. Hume had calculated.—Mr. F. BARRING suggested that the grant to the Princess Augusta should not take effect till the decease of the Duke of Mecklenberg Strelitz, who at present enjoyed a pension from this country.—Colonel WOOD contended that the grant proposed fell far below the deserts of the Duke of Cambridge, whose name was at the head of all the charities in this country, and who never refused to preside at dinners for charitable purposes.—Mr. WARD thought the Duke of Cambridge should provide for his own daughter's marriage, as any other nobleman or gentleman did. Considering the distressed state of the country, he put it to the House whether it was fit thus to add to the tinsel of royalty.—Sir R. PEEL urged that the Duke of Cambridge, though he had undoubtedly received a large income, had to transmit a Dukedom to his successor, with the means of keeping up its dignity. The proposed grant was not to take effect till the death of the Duke of Cambridge. Mr. Hume having disputed the right, on the ground of precedent, for such a vote, he would remind the House that all the daughters of George III. were allowed 16,000*l.* a year, and the Princess Sophia of Gloucester, who was not so nearly allied to her Majesty as the Princess Augusta, received 7,000*l.* a year. The grant to the Duke of Strelitz, already existing, was made in consequence of territorial sacrifices to which he had had to submit during the French Revolution. He abstained from entering into details of calculation, but he thought that the House, with all regard to the distressing circumstances of the country, would be fully justified in making such a grant as that proposed.—On a division the motion was carried by 223 against 57.

Thursday.—Sir J. GRAHAM announced that the Government had come to the resolution to withdraw the Education clauses of the Factories Bill, and that the other clauses of the bill having been framed with reference to the Education clauses, the Government required time to determine whether or not they would press the factories regulations portion. He promised to state his final resolve on Monday, and likewise whether or not the Education clauses were definitively or only temporarily withdrawn.—Sir R. PEEL moved the reception of the report of the resolution granting the annuity to the Princess Augusta of Cambridge, on her marriage.—Mr. HUME opposed the reception of the report, and complained of ridicule cast on him and his calculations by the Premier.—After some remarks from Sir R. PEEL, Sir R. H. INGLES, and Mr. WILLIAMS, the report was received without a division, and a bill founded on it was introduced.

The third reading of the Canada Corn Bill having been moved, Colonel STURTEVANT moved the third reading that day six months. After a short discussion, the House divided, when there were—For the third reading, 150; for the amendment, 75: Majority, 75. The bill was read a third time and passed. On the motion to go into committee on the Irish Arms Bill, Mr. WYSE moved that the bill be referred to a select committee, to inquire how far it was just or politic to restrict the people of Ireland in their undoubted constitutional rights to possess and carry arms. A long discussion ensued, in which Lord ELIOR and several other members took part, when, on the motion of Mr. S. CRAWFORD the debate was adjourned.—The report on the Church Endowment Bill was brought up, and a clause, including in its operation the Channel Islands, was added by Sir R. PEEL.

Friday.—The Princess Augusta's Annuity Bill was proposed for a second reading, on which Lord HOWICK suggested the propriety of making some provision for the family of his late Royal Highness the Duke of Sussex. He did not expect any present answer to his proposition, and none was given.—Mr. HUME then said that he should take a division on the second reading of the bill. A division accordingly took place, when there appeared—For the second reading, 141; against it, 37; majority, 104. The adjourned debate on the Irish Arms Bill was resumed by Mr. SHARMAN CRAWFORD, and the House was addressed by Mr. B. WALL, Sergeant Murphy, Mr. ROEBUCK, Lord J. RUSSELL, and Mr. M. O'FERRALL against the measure, and by Sir R. PEEL, Mr. ESCOTT, Sir J. GRAHAM, and Lord STANLEY, in its favour. An adjournment was moved by Sir C. NAPIER, and negatived by a majority of 168, but after some further discussion, the debate was adjourned.

CITY.

Money Market, Friday.—Consols closed at 93½ for the opening; Bank Stock, 179½; Three per Cent. Reduced, 94½ to ¼; Three-and-half per Cent. Reduced, 101½; Exchequer Bills, 54s. to 56s. prem.

Metropolis and its Vicinity.

The Catholic Institute.—The annual meeting of the Catholic Institute of Great Britain took place on Tuesday in Freemasons' Hall. Lord CAMOYS presided, and said that it was gratifying to find the Catholic Institute supported this year by so much more numerous a meeting than the last, and this, too, notwithstanding the absence of that distinguished individual (Mr. O'Connell,) who had fostered the institution from the period of its formation, and who was only prevented from attending the present annual meeting of its supporters, for the purpose, as he (Lord Camoys) hoped, of bringing to some satisfactory conclusion the unfortunate destinies of his distracted country. (His Lordship was here interrupted by tremendous cheering, and waving of hats and handkerchiefs.) He proceeded, amidst continued applause, to show how much remained to be done by the Institute. "Look,"

he said, "at the controversy now going on in the Established Church, especially at Oxford. There was one Regius Professor (Dr. Pusey) just condemned and suspended for having advocated the doctrine of the real presence in the Eucharist; whilst another Regius Professor of the same University (Dr. Hampden) had been subjected to an action for damages for his maintenance of an entirely opposite doctrine. Now, if the action were to terminate against Dr. Hampden, he thought that the University of Oxford would be in what the Americans were accustomed to call a "fix!" He had heard at one of the meetings of that Institute a hope expressed that they (the Roman Catholics) might live to see the day when high mass would be celebrated in Westminster Abbey. He knew not how probable such an event might be, but this they knew, that the doctrine of the mass had been preached in the Cathedral of the University of Oxford; and it had been authoritatively declared, that if Dr. Pusey's sermon had not been condemned, six or seven colleges of Oxford University were ready to have mass said directly. There was indeed a very slender barrier between Puseyism and the Church of Rome; and what a field was now presented for the Roman Catholics to demolish that slender barrier at once, and to restore this great country to that Catholic union which was so exceedingly desirable!"—The secretary then read the report, which stated that seven new publications had been printed during the past year, of which there had been printed 45,000 copies, including a tract in the Italian language, for the instruction of the Maltese and other inhabitants of the islands in the Mediterranean Sea; that 116,000 tracts had been printed, of which 104,923 had been circulated. The receipts amounted to 1,117*l.*, being a falling off of 137*l.* 8s. 2d. since the year 1842. Auxiliary branches had been formed at Berbice, Madras, Brompton, Sheerness, Burton-park, Hereford, Middlesborough, and other places. The Hon. C. Langdale moved the adoption of the report in a speech of some length, wherein he expressed his disappointment at the declining state of the Institute, a resolution moved by Mr. O'Connell last year having, as well as other measures, proved a complete failure. Without organization no good could be done, and he hoped that if the Catholic Institute did expire, something would arise, phoenix-like, out of its ashes, from which greater benefits would accrue to the interests of Catholicity generally. The Rev. Mr. O'Neal seconded the resolution for the adoption of the report in a long speech, in which he strongly expressed his dislike of the measure now before Parliament, and his disapprobation of the manner in which the poorer classes were treated in this country. In alluding to the Puseyite doctrines, and the principles of religion inculcated by the Oxford divines of that school, he would tell them for a fact, that one of those Oxford divines of the new school, speaking to a Roman Catholic clergyman the other day, who reproached him for his sluggishness in not at once boldly joining the Church of Rome, to which he was already very favourably disposed, told him (the Catholic priest) that he already believed in the doctrines of the real presence, the absolution of priests, the invocation of saints, purgatory, and in every other point of the Catholic doctrine; but that he (the Oxford divine) believed the time for joining the Church of Rome was not yet arrived, but that he hoped it soon would! The Hon. Sir E. Vavasour moved a resolution that the committee be instructed to use their utmost power to obtain for the Romish priesthood free access to gaols and workhouses, for the purpose of visiting the Roman Catholic inmates of such establishments. The Hon. E. PETRE, after a strong speech against the Factory Education Bill now before the legislature, moved a resolution condemnatory of the amended clauses of that measure, and of the bill generally, which was carried unanimously, and a petition against the bill ordered to be prepared for presentation to Parliament.

Institute of the Fine Arts.—A numerous meeting of gentlemen connected with the Fine Arts took place last week at the Freemasons' Tavern, for the purpose of establishing an association to be called the "Institute of Fine Arts." Mr. WYSE, M.P., presided. Mr. WYON, as provisional secretary, proceeded to read to the meeting the conditions upon which it was proposed to found the Institute—which were, to facilitate a general intercourse of the members of the profession, to cultivate a pure taste and a just appreciation of the importance of art, to prevent the encroachment of injurious influences, to take cognizance of scientific questions connected with art, and to be a channel through which the opinion of the profession generally may be expressed. Amongst its objects, it was proposed to embrace the formation of a library and reading-room, and the collection of works of art, and all other matters which may afford the artist increased facility in his studies; appointing stated times for hearing of original papers, for the inspection of works of art and antiquities, and for general communications of importance to art, science, and literature. It was hoped by the formation of the Institute, entirely unconnected with any exhibition or school of instruction in art, to bring their professional brethren to one common centre, and thus, by an enlarged communication one with the other giving and receiving that information which mutual intercourse alone can procure, and which in every station of life was one of the greatest means of improvement. The committee recommended that the Institute be founded on the principle of strict neutrality, and laid down a code of laws for its general government. Various resolutions were then passed adopting the preceding conditions, and the Institute was declared to be established. The names of upwards of 100 gentlemen who had enrolled themselves members of the

Institute were then read over, and 18 gentlemen were selected on a ballot to act as a council.

British and Foreign Anti-Slavery Society.—The General Anti-Slavery Convention commenced their sittings on Tuesday, at Freemasons' Hall. The large room was nearly full, and among the audience was a great number of ladies and gentlemen belonging to the Society of Friends. Mr. Gurney was unanimously appointed chairman. The Rev. Mr. Morgan read the report of the Society's proceedings during the past year, which was listened to with much attention. The council have since continued their sittings daily, and have had the following subjects under their consideration: The Slave-trade Abolition Act of 1834—the present state of the Abolition question in various nations on the Continent—the present state of the African Slave-trade—and the results of emancipation in the British Colonies.

Middle Temple.—The *Times* of Wednesday states that a young man of colour, almost of the pure negro race, is now keeping his terms for the bar, at the Middle Temple. "What a proud example," it says, "for our brethren on the other side of the Atlantic, to see this young man dining in the ancient hall, with so numerous an assemblage of white men (among whom are not only some of the most talented, but also the most noble of England's sons,) and by whom he is treated with the same courtesy and respect as if he were one of themselves. We hope this instance of the manner in which a man of colour is treated in the fatherland will not be without advantage to the much-persecuted negro race and their descendants in the United States."

Merchant Tailors' Company.—On Saturday the annual examination of the "Monitors" of Merchant Tailors' School took place, preparatory to filling up the vacant scholarships at St. John's College, Oxford, pursuant to the foundation and statutes of that establishment. The examination was conducted by the Rev. Dr. Wynter, Vice-Chancellor of Oxford, and President of St. John's; and the two Senior Fellows of that body, in the presence of the Master, Wardens, and Court of Assistants of the Company. There were this year two vacancies to be filled up, and Messrs. Thornton and Palin, the senior monitors, having passed through their examination in a manner to prove their title to the advancement, were elected. Some University exhibitions were also bestowed upon meritorious scholars, whose approaching period of superannuation precluded the hope of their succeeding to the more ample and secure provision of a fellowship. Immediately after the completion of this business the usual exercises were recited by the eight monitors, in the public schoolroom, before the Vice-Chancellor of Oxford, the Master and Wardens of the Company, and a numerous assembly. In the evening the annual dinner took place, at which Prince George of Cambridge, Sir R. Peel, and other Members of the Cabinet were present.

Exhibition of Cartoons.—The cartoons which have for so long a period occupied the attention of the artists who compete for the prizes offered by the Fine Arts' Commission, have been exhibited to the Commissioners this week, in Westminster Hall. It is rumoured that the favourite subjects among the artists are, Boadicea, the Landing of Cæsar, and Caractacus.

Monument to Milton.—Considerable curiosity was created on Monday in Watling-street, by the erection of a large tablet on the walls of Allhallows Church, to the memory of Milton. It bears as an inscription the following well-known lines:—

"Three poets in three distant ages born,
Greece, Italy, and England did adorn,
The first in loftiness of thought surpassed;
The next in majesty—in both, the last,
The force of nature could no further go,
To make a third she joined the former two."

"John Milton was born in Bread-street, the 9th day of December, 1608, and was baptized in the parish church of Allhallows, Bread-street, on Tuesday, the 20th day of December, 1608."

St. James's Park.—During the last few days several workmen have been employed, under the order of the Commissioners of Woods and Forests, in forming a new bank to the sides of the canal in the ornamental inclosure of St. James's Park. The plan will be followed out which is adopted on the banks adjoining the house erected by the Zoological Society, where the surface of the banks is covered with flint-stone cemented with lime, the underground being composed of bricks. It is intended to form both sides of the canal, and those of the various islands, in the same solid manner; and it is expected that the banks so constructed will last many years. The effect will add greatly to the beauty of the ornamental inclosure.

St. Saviour's, Southwark.—On Tuesday, the nomination of candidates for the office of morning chaplain of St. Saviour's, vacant by the death of the Rev. S. Mann, took place in the vestry-room. Originally there were 12 candidates, but in consequence of a resolution of the vestry by which it was resolved that all ministers be requested to withdraw their pretensions who did not intend to proceed to the poll, the number was reduced to two only. The Rev. S. Benson, who for upwards of 20 years has been curate of the parish, was first named—the other candidate was the Rev. W. S. Rowe; but upon a show of hands being made, the presiding officer declared for Mr. Benson, 65; for Mr. Rowe, 2. A poll was demanded on behalf of the Rev. W. S. Rowe, which terminated in Mr. Benson's election by 156 votes to 3. There are 1,200 voters who have the right of voting, though not more than 700 have been ever known, in such cases, to vote. The salary is 400*l.* per annum, with surplice fees, which average above 200*l.* a year.

British Museum.—The number of visitors during the last week was 32,159, and with all this large concourse,

but one person was removed from the rooms on the grounds of intoxication, whilst no single case of theft occurred. The numbers of visitors were on Monday, 13,410, Tuesday, 2,439, Wednesday, 10,061, Thursday, 1,386, and Friday, 4,843.

Thames Tunnel.—The number of passengers through the Tunnel last week was 66,175, and the amount of toll was 275l.

Queen's Prison.—The well-known privileges attached to the "Rules of the Queen's Bench" ceased on Saturday week, when the Marshal sent his officers to call the rulers within the walls. The privileges of rulers have thus terminated, after an existence of many centuries. Captain Hudson, R.N., has been appointed keeper of the prison. The salary is 800l. per annum.

Inquests.—An inquest was held at Camden Town on Tuesday, by Mr. Wakley, on the body of the Rev. Samuel Kidd, Professor of Oriental Literature in University College, whose death took place under the following circumstances:—The servant in deceased's family deposed that the last time she saw him alive was on Sunday night, at prayers, before the family retired to rest. He then appeared better, and more cheerful than usual. On Monday morning, she was alarmed by hearing a loud scream, such as was usually uttered by deceased prior to going into fits of epilepsy, to which he was subject. She found deceased lying on the floor, black in the face. She raised an alarm, but he was discovered dead. Mr. George deposed that he had, with Dr. Taylor, made a *post mortem* examination of the body, and found great congestion of the lungs. When he first saw deceased, he was in such a position as to stop the circulation of the blood. He had no doubt that he died from congestion of the lungs, produced from want of circulation of the blood, whilst in a fit of epilepsy. The Jury returned a verdict to that effect.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, June 3:—West districts, 130; North districts, 161; Central districts, 194; East districts, 187; South districts, 203. Total, 875—(445 males, 430 females).—Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five springs, 854.

Provincial News.

Birmingham.—In reference to the recent strike of the nailors at Bromsgrove, the Birmingham papers state that most of the workmen having returned to their work, and tranquillity being restored, the troops returned to Birmingham on Saturday, and the additional police force is also withdrawn.

Bristol.—The Bishop of Gloucester and Bristol has pronounced sentence in the case of the Rev. G. M. D'Arcy Irvine, stipendiary curate of Redcliffe Church, in this city, who was charged under the Church Discipline Act with having celebrated an illegal marriage on the 29th January last, between two persons of the parish of Nailsea, Somerset, knowing at the time, from credible information, that such parties were neither of them resident in the parish of St. Mary Redcliffe, and also that they were within the prohibited degrees of affinity. The Bishop, after stating the facts of the case at some length, suspends Mr. Irvine from all the functions of his office in the diocese for the space of one year, condemns him in the payment of 5l. towards the expenses of the proceedings, and revokes the licenses granted to him as curate of St. Mary Redcliffe and as stipendiary chaplain of the Bristol House of Correction.—It is understood that his Royal Highness Prince Albert has fixed Wednesday, the 19th July, for his visit to this city, to witness the launch of the Great Britain, sister ship to the Great Western.

Carmarthen.—The Welsh papers this week give fresh accounts of "Rebecca and her Daughters." It appears that warrants of distress had been issued against the parties fined for defrauding Water-street gate, and the constables were proceeding towards Talog for the purpose of executing them, when they heard the sound of a horn, and immediately between 200 and 300 persons assembled together, with their faces blackened, some dressed in women's caps, and others with their coats turned, so as to be completely disguised, armed with scythes, crowbars, and all manner of destructive weapons; and, after cheering the constables, defied them to do their duty. The constables had no alternative but to return to town without executing the warrants. The women were seen running in all directions to alarm their neighbours; and it is supposed that some hundreds were concealing themselves behind the hedges, and did not intend to make their appearance unless their services were required. The magistrates met at the Town-hall to take the matter into consideration, and it is supposed that some active measures to suppress the movement will be forthwith adopted.

Gloucester.—In the House of Commons on Tuesday, Captain Berkeley said he had heard that Mr. Mayer, the person who wrote the letter to the Secretary of State referring to Mr. O'Connell, had been dismissed from his situation in the Customs at Gloucester. If this was not true, he wished to ask if it was intended to keep him in that employment? Sir T. Fremantle said that Mr. Mayer had been appointed as a temporary or extra clerk in the Custom-house, during the absence of one of the clerks. After his examination before Mr. Hall, by whom he was admitted to bail on the charge of misdemeanour, directions were sent to the Custom-house at Gloucester, that his services would in future be dispensed with.

Liverpool.—Another fire broke out in this town on Wednesday morning in the extensive soap manufactory of Messrs. Croft, in Comus-street. The building, which was nearly new, was entirely destroyed. The damage is estimated from 14,000l. to 18,000l. Meetings have been held during the week, at which resolutions in favour of a

petition to Parliament on the subject of the frequent fires in the town were unanimously carried.

Maidstone.—On Friday last the great meeting of the county of Kent, called for the purpose of taking into consideration the depressed state of agriculture, and of all other branches of British industry, was held on Penenden Heath. The weather was extremely unpropitious; the wind blew with great violence, and incessant torrents of rain poured down throughout the day. Yet, in spite of the weather and the exposed situation, from 1,000 to 1,500 persons kept their position from the beginning to the end of the meeting, which lasted nearly five hours. The High Sheriff briefly opened the business of the meeting, by adverting to the subjects mentioned in the requisition, and requested a fair and impartial hearing for all who might address them. Earl Stanhope then came forward and said that they had met there for the express purpose of considering the causes of the grievous distress which afflicted the country, and which pressed so heavily and severely, not upon the agricultural classes alone, but also on every productive class in the country. Since the passing of the New Corn-law of last year, and the adoption of the new Tariff system of the present Government, a fearful and lamentable change had visibly come over the fortunes and prospects of the country, and its present situation was anything but an encouraging one. But not to deal altogether in general assertions, he would call their attention to the fact, that since these measures came into operation there had been a decline in the price of corn and cattle to an extent of from 25 to 30 per cent. Now, the annual produce of Great Britain in grain alone amounted to about three hundred millions sterling, and taking the loss to the country at only 25 per cent., it appeared that, under the operation of the new Corn-law and Tariff, it has been already plundered to the amount of seventy-five millions. This fearful calculation of loss was upon grain and other products of the soil, and did not include the loss which had likewise accrued to the agricultural interests from the decline in the prices of cattle. This was enough, he contended, to show that their situation was a bad one, and he warned them to bear in mind that, bad and gloomy though it might be now, it might become still worse. In some districts of the country rents were at present paid by farmers, not from the profits of their farms, but by drawing upon their capital; whilst in others, farms, in many instances, have been altogether abandoned, the occupiers of them being unwilling to take others after leaving them, and not caring even to inquire at what rents others could be procured. Such was but a partial exposition of the disastrous effects produced by the present discouraging prospects of the agricultural producers. But the evil did not confine itself to the farmers alone—it extended also to another class of the community, who have a right to look to the Government for that protection to their industry to which they were entitled. Farmers could not be discouraged and suffering without labourers being, as a natural consequence, depressed. The labourers felt the pressure as well as the farmers, and were now working on all hands at diminished wages. In some places their wages had been reduced from 9s. per week to 7s. But what was worse than all, there were many who could not procure work for themselves at any price, and great numbers were thereby deprived of employment, who were both able and willing to provide themselves with subsistence. The measure which the Government had provided and carried into effect had driven hundreds of them from their employment into prisons and union workhouses, where he was sorry to say their poverty was punished as a crime. The stagnation of industry was general. The great majority of the interests of the country were suffering, and capital could, with the utmost difficulty, find for itself a profitable investment. Ruin and revolution were advancing upon them with rapid strides, and the evils, of which the country had already but too much reason to complain, were aggravated by the recent proposition of the Government—the new Canada Corn-law. Farmers had been taunted with last year swallowing a camel, and now straining at a gnat. The reason was, perhaps, that their stomachs were so full with swallowing the camel, that there was now no room for the gnat. But had they followed his advice, they would have swallowed neither camel nor gnat. His advice to them was, that they should not trust to the present Ministers, who by their conduct had proved themselves utterly unworthy of confidence. He had also advised them not to trust to Members of Parliament, who were sometimes but too ready to forget their promises to their constituents. The noble Earl did not appeal to the landlords. It was his duty to defend, and he was anxious to defend, the rights of the farmers, and also the rights of the labourers, the most numerous and meritorious class of society, and most valuable and important to the state. The times were critical, and we might expect convulsions, in which neither life nor property would be safe. He would, therefore, recommend a close and cordial union among all the productive classes of the community for their mutual defence. The noble Earl in concluding moved that a petition be presented to both Houses of Parliament, and that the High Sheriff be requested to sign the same in the name of the meeting. He then read the petition, the prayer of which demanded full and adequate protection to all branches of industry. Mr. James Ellis seconded the resolution. Mr. George Beaton then moved as an amendment, that the Corn-laws were injurious to the community at large, without being beneficial to farmers, and that a petition be presented to Parliament, praying for the abolition of all protection; and suggested an amended petition to the effect that the Corn-laws were contrary to common sense, common humanity, common justice, and common Christianity; that they were of no advantage to the producers of food,

as they rendered farmers more liable to panics than they would otherwise be, and praying for the abolition of the bread-tax and all commercial monopolies. The Earl of Radnor observed, that the proposition made by the last speaker was perhaps not worded as he himself should have worded it; but as to the substance of both the petition and resolution, he cordially agreed with them. Though not worded altogether to his taste, he yet had no objection to second them—for the proposition made to them by the previous speaker was in substance an opposition to all monopolies. Had this opposition been confined to the Corn-laws he should have willingly concurred in it, but he was all the more willing to do so now, as it embraced a wider field. It was futile to expect to secure prosperity to farmers by legislative enactment. Produce a general prosperity throughout the country, and the farmers must necessarily partake largely of it, with the other classes. On the grounds he had now stated, he begged to dissent from the proposition of the noble lord. With respect to the Canada Bill, they need care but very little about it. It would produce little or no effect in lowering the price of corn. Canadian corn would not come into the country without being called for. Its corn was needed, and therefore its lands would be cultivated. Men would emigrate to the colony, and capital would be sent out to keep them in employment. The demand for food was increasing in this country every year, at the rate of about 1,000 fresh mouths every day. We could not in this country produce sufficient additional food to supply this constantly increasing demand; and why should agriculturists be afraid of importing corn from abroad? They have always received the largest prices when the largest importations were made, and the lowest prices when importation was limited. For the last 170 years Parliament had passed, he believed, upwards of 140 laws for the protection of agriculture—each more stringent than its predecessors, either putting a higher duty on corn, or the price at which corn would be admitted at a higher rate. The two last attempts might certainly be regarded as an exception. Experience had taught them that none of these expedients had succeeded. The plan of restricting the importation of corn had been tried over and over again. It was now time that we tried the other course. They must be satisfied, however, that it was foolish to interfere by legislation. He would again repeat his cordial concurrence with the sentiment of the resolution, which he seconded, and with the prayer of the amended petition for the repeal of the Corn-laws and all monopolies.—Sir Edward Knatchbull fully concurred with the noble Earl that the general fall in prices was not to be attributed to the new Corn-law or the new tariff. The farmers had received no injury from those measures. They were salutary measures, and their ultimate result would be to place the interests of this country on a safer and more secure basis than hitherto. At all events, they have not been productive of the present low prices and wages. These could be properly accounted for. The noble Lord (Stanhope) had told them, that on the eve of the last harvest, two millions of quarters of wheat were imported into this country. Reckless speculation had placed this corn in bond in expectation of a bad harvest. It was, however, an abundant one, and they were then compelled to pour their corn into market at a loss to themselves and to the injury of the farmer. These were the causes of the present low prices and wages. He was sorry to see that confidence did not at present prevail to any great extent among the agriculturists. He was anxious to re-establish this confidence. The want of it arose from an erroneous supposition on the part of the agriculturists. They supposed that the late corn-law was passed only as preparatory to greater changes yet in store. He believed no such changes were meditated. The noble Lord (Stanhope) did not believe that such was the case. He himself gave his assent to that measure, because he firmly believed it would be a lasting and permanent one; and it was his settled conviction, that when the late corn-law was contemplated and carried into effect, the Government no more thought of further change than it did of a total abrogation of the corn-laws. He would advise the farmers, if they valued and wished to maintain the principle of protection, to adhere to the law as it now is; but if they agreed with the noble Lord, let them use their influence to abolish it; let them guard the law as it now stands, for in that only consisted their safety. If they were only as firm and as vigorous as the advocates for corn-law repeal, they would be able triumphantly to sustain it. In regard to the Canada Bill, the agriculturists had nothing to fear from it. Instead of injuring their interests, it was, in his belief, an additional protection to them. He would explain to them the grounds on which such a belief might be made to rest. In the first place, such was the opinion of free traders themselves, and they had thus openly expressed themselves, both in and out of Parliament; and in the next place, it established the principle of protection in Canada, and England and Canada would mutually assist each other in maintaining the necessary protection. The farmers would therefore see that this bill gave them greater protection than before. As the law now stood with the duty varying from 1s. to 5s., the average duty paid for some time back had been about 2s. The amount in the way of protection would now be 4s. per quarter,—1s. paid by the Canadian exporter to this country, and 3s. paid to Canada. We should not, it was true, get the 3s. paid by the American on importing his wheat into the colony, but the loss would be inconsiderable. Mr. Plumptre followed amidst much confusion in justification of the vote he had given in favour of the Canada Bill. Mr. Hodges, formerly Member for the county, then proposed a third resolution, affirming the advantages of a fixed duty of 12s. over a

sliding-scale. He remarked that should the Canada bill pass, a large quantity of American corn would be imported into this country, to the prejudice of the English agriculturist, and adverted to several prominent points in the public life of Sir R. Peel, to show that the right hon. Baronet was altogether unworthy of confidence, and wondered how Sir E. Knatchbull could continue to repose any confidence in his ministerial colleague. He believed that the Prime Minister was at this moment preparing in his own breast measures of a very different character from those with which he was now feeling the public pulse. Lord Stanhope briefly replied, after which the different resolutions were presented to the meeting. For Mr. Hodges' resolution for a fixed duty, the show of hands was very feeble. Mr. Beaton's motion, in favour of total abolition, very nearly divided the meeting with Lord Stanhope's resolution. This last, however, appeared to have the majority, and the meeting immediately adjourned.

Oxford.—The daily papers announce that the Rev. T. E. Morris, of Christ Church, has been admonished by the Vice-Chancellor, for the sermon preached by him before the University on Ascension Day. The sermon has since been published, and it is understood the following is the passage which drew down the admonition:—"Laud, the martyred archbishop, who, let us trust, still intercedes for this Church, whose enemies he resisted unto death—and for this ancient seat of prayer and holy contemplation, for which he did so much while yet with us, has placed among his private devotions the Apostles' Creed, and a more expanded form of it, and also a yet more concise statement of the principal mysteries in the economy of Redemption, by which they may be called to mind at any moment: 'Caro factus et conceptus est; Natus; Passus; Crucifixus; Mortuus; Sepultus; Descendit; Resurrexit; Ascendit; Assedit; Revertetur; Retribuet.'"

Plymouth.—A meeting of the council of this borough was held at the Guildhall on the 7th inst., for the purpose of electing a Lord High Steward in the room of the late Duke of Sussex. Mr. Whiteford, a Conservative, moved that his Royal Highness Prince Albert be elected to fill the vacant office. This was seconded by Mr. Soltan, a Whig, and unanimously agreed to. The common seal of the corporation was then affixed to the patent appointing his Royal Highness to the office, after which the royal standard was hoisted at the Guildhall, and the church bells rang merry peals on the occasion.

Rye.—On Saturday, a meeting took place in this town for the purpose of hearing an address from Mr. Cobden on the agricultural working of the corn-laws. The meeting first assembled in the Town-hall, which was found to be so small that it afterwards adjourned to the cattle market. Mr. Cobden addressed the meeting at great length. He said that some persons perhaps would contend that without some protection the farmer could not compete with the foreigner. Why not? The land was as good here as abroad, and labour, taking into account what an Englishman did, as cheap. Why, then, could not the English farmer compete with the foreign farmer? The manufacturers paid taxes and did without protection; then why not the farmer? He might be told that the land was peculiarly burdened. This was not true. On the contrary, the landowning legislators had taken care to ease themselves of their fair portion of taxation. If this were not so, why did they oppose the motions that were made from time to time for an inquiry into those exclusive burdens which it was said the land bore? He had spoken of the ostensible reason alleged for protection; in private the landlords talked in a very different way, and sometimes one of their number, not over sharp, let out the whole secret. Sir Edward Knatchbull, for instance, stated the other night that without the corn-laws the marriage settlements could not be paid, and Lord Mountcashel that they could not pay the interest on their mortgages. It was said by some that the corn-laws were for the benefit of the farm labourer, but his experience enabled him to state most positively that agricultural labourers received the lowest wages of all, and that the very lowest wages were received in purely agricultural districts, the wages of agricultural labourers increasing in proportion to their proximity to manufacturing towns. He had generally found also that the best farmers were advocates for free trade. He was for free trade in everything; but he attacked the corn-laws as being the keystone of all monopolies, being perfectly satisfied that the corn-law being destroyed, the landlords would not permit the existence of any other. A reduction of the corn-tax would not do, for the part that remained would be adduced as a plea for the continuance of other monopolies. He then moved, "That in the opinion of this meeting the corn-law has proved injurious to the interests and the independence of the tenant farmer and the farm labourer, and that it ought to be totally and immediately repealed." Major Curteis thereupon moved, "That in order to prevent the depreciation of the property of the tenant farmer, which must ensue from an immediate abolition of the corn-law, a fixed duty on corn is desirable." The amendment, which was seconded by Mr. Selmes, was supported by about a dozen hands; and Mr. Cobden's motion was carried by a large majority.

Windsor.—Captain Cumming, who succeeded to the Governorship of the Military Knights of Windsor on the decease of the late governor, Colonel Basset, in January, 1842, expired at his residence, the Governor's house, in the lower ward of the Castle, on Sunday morning, after a long illness, in the 56th year of his age. The vacant Governorship is in the gift of her Majesty, upon the recommendation of the Dean and Canons of Windsor. The appointment may be said to be merely an honorary one, the Governor receiving only between 3*l.* and 4*l.* per

annum beyond the yearly stipend of the other military knights.

Woodstock.—The annual meeting and dinner of the Oxfordshire Agricultural Society took place in this town last week, Mr. Ashurst, the President, in the chair. The toast of the "Members for the county" was responded to by Lord Norreys, Mr. Harcourt, and Mr. Henley. Mr. Harcourt thought the English system of farming extravagant, and recommended that the system of farming and improved mode of cultivation adopted in the Netherlands should be pursued by the farmers of this country. By the system of manuring pursued in the Netherlands a much greater produce was obtained from the soil, and by that means the farmers were enabled to pay higher rents for their lands. It was no common thing to see farms of 100 acres cultivated in such a manner as to enable the farmer to live well, while farms of the same size in this country were regarded as insignificant, and at the same time the farmers were paying there as high often as 7*l.* per acre for their land. He also highly eulogised the Scotch system of farming. Mr. Henley said that he held opinions very contrary to those of his hon. colleague who had just sat down. He thought it would be ridiculous in the English farmer to adopt the foreign system of cultivation, so widely different was the soil, the climate, and the character of the farmers of this country from those abroad. The taxation also of this country was much larger. Mr. Harcourt had spoken of Scotch farming. He wished to know if ever there was an instance of a Scotch farmer coming into that county to farm without putting his hands into other's breeches-pockets. The Scotchmen were too cautious and "canny" to pursue their system in Oxfordshire at their own expense; and whenever a Scotch farmer was found, he was always in the position of a bailiff. He never knew but one instance of a Scotch farmer having embarked in farming on his own account in Oxfordshire. Mr. Blackstone, M.P., acknowledged the toast of "the newly-elected Members of the Society." He quite agreed in the agricultural principles announced by his friend Mr. Henley; and he hoped that, as English farmers, they would continue to be distinguished by their own system of farming. So long as he had the happiness of having the confidence of his constituency, and at present he might say he had the confidence of two-thirds of them, he should never desert those principles which he had expressed in Parliament. The President then read the awards of the prizes, which were distributed in the presence of the meeting.

Railways.—The returns of traffic for the week, by the principal lines, have been as follows:—Great Western, 14,370*l.*; Northern and Eastern, 1,727*l.*; London and Birmingham, 18,023*l.*; South Eastern and Dover, 2,282*l.*; South Western, 7,277*l.*; North Midland, 3,967*l.*; Grand Junction, 8,304*l.*; Midland Counties, 2,493*l.*; Blackwall, 982*l.*; Brighton, 3,538*l.*; Greenwich, 1,030*l.*; Eastern Counties, 2,483*l.*; Croydon, 415*l.*; Great North of England, 1,362*l.*; Hull and Selby, 1,172*l.*—The Llanelly Railway and Dock Company does not yet pay a dividend to the proprietary. According to the accounts presented at the meeting in the early part of the week, the gross expenditure is, 7,500*l.* per annum, and the gross receipts, 7,800*l.*—The traffic on the Greenwich line during the fair was as follows:—Whit Sunday, 9,650 passengers, 297*l.*; Whit Monday, 23,237 passengers, 691*l.*; Whit Tuesday, 11,190 passengers, 330*l.*; Whit Wednesday, 6,986 passengers, 208*l.*; making a total of passengers for the four days of 51,063; and a gross receipt of 1,527*l.*—A full meeting of the Blackwall Company was held last week for the purpose of receiving the report of the committee of inquiry, appointed on the 28th Feb. The report being of extreme length, and in print, was not read to the meeting. The suggestions of the committee, as already noticed in this Paper, were chiefly in relation to steam-boat navigation, which they recommended to be concentrated as far as practicable at Blackwall. The accounts had been found in order as far as the committee had inquired, but they thought it requisite that they should be reported on by a public accountant. The shortness of the period to make the inquiry had prevented the committee going into the past transactions of the company to the extent they would have desired. After a long detail of their operations, the committee thought by the zealous exertions of the directors, and some plan for connecting steam navigation with the Brunswick-wharf, that the affairs of the company might be relieved from their present state of depression. Dr. Bowring entered into an explanation, and said that every information had been given by the directors. Mr. Sergeant Gazelee went through the report, and maintained that the committee had not told them anything but what they knew before, besides not going into the past transactions of the company, which was one of the principal reasons of the committee being nominated. He concluded by moving an amendment, "that in the opinion of this meeting the committee have mistaken their duties in not inquiring into the past management of the railway, and therefore the report is of no service to the proprietors." Mr. Bigg seconded it. Mr. Daniell, one of the committee, entered into a long explanation, and said that they had not been in any way influenced by the directors. Mr. D. Salomons and the chairman also explained. The amendment was lost, and the report was received.

IRELAND.

Dublin.—The Irish papers continue to announce the resignation and dismissal of Magistrates. Mr. John Power, of Gurteen; Mr. W. F. Finn, of Kilkenny; Mr. W. S. O'Brien, M.P., magistrate for Clare and Limerick, and Mr. Henry Grattan, M.P., have resigned the commission of the peace. Mr. F. Comyn, of Galway; Capt.

Mockler, of Meath, and Mr. Blake, of Galway, have been dismissed. Mr. Delaney, of Kilkenny, has been reinstated, his resignation having been sent in without his knowledge or authority. The usual meeting of the Repeal association took place on Monday. The amount of rent for the week was 1,717*l.* 11*s.* 10*d.* The enthusiasm is said to have been beyond description, the immense crowd outside the building joining in the cheers from the inside. Previous to the adjournment, the chair was taken by the Rev. Mr. Lowry, a Presbyterian clergyman of the north of Ireland, whose appearance at the meeting was hailed with great applause. Mr. O'Connell has issued a long manifesto to the Irish people on the subject of Repeal. It enters at great length into the various questions arising out of the proposed Repeal of the Union; but our space allows us only to advert to the more prominent topics it discusses. Mr. O'Connell proposes a Local Parliament for Ireland, consisting of the Sovereign, the House of Lords, and the House of Commons. The restoration of an Irish House of Lords presents, he says, no serious difficulties, and any modification of the Peerage, in consequence of creations since the Union may be safely left to the decision of the House of Peers itself. All Irish questions of litigation would be decided, he says, in Irish tribunals, without any species of appeal to British tribunals. He does not expressly say that the final appeal would be to the Irish House of Lords, but he suggests no other final appeal. As to the Commons, he admits there must be a reform of the old system, and says he would invite all that is wise, steady, and unrevolutionary, to discuss the principle and detail of a reform plan. He insists that nothing like the ascendancy of Romanism is intended by Repealers or the persecution of Protestants, or the confiscation of any vested interests in Church property. He would have every religion severed from the State. He would take away no man's income during his lifetime, but as each ecclesiastical benefice fell in, the ecclesiastical state revenues should be gradually and at length entirely appropriated to purposes of public charity and general education, but should not be appropriated, in whole or in the smallest part, to any other Church whatsoever.

Mallow.—A Repeal demonstration took place in this town on Sunday, at which 400,000 persons are said to have been present. A dinner was given in the evening, the Rev. Dr. Collins in the chair, at which Mr. O'Connell addressed about 600 persons on the prospects of the Agitation. "The Repealers," he said, "were peaceable, loyal, and attached, affectionately attached to the Queen, and determined to stand between her and her enemies. If they assailed us to-morrow and that we conquered them, as conquer them we will one day, the first use of that victory which we would make would be to place the sceptre in the hands of her who has ever showed us favour, and whose conduct has ever been full of sympathy and emotion for our sufferings. What I want you and them to understand is that we are sensible of the position in which we are placed, that we have our apprehensions—by apprehensions I do not mean fears—but they are threatening us Irishmen, peaceful and tranquil, and for what offence? An act of Parliament binding two countries together is insisted to be repealed by the Irish people. I have thrown my whole heart and soul before you, and I wish you all to understand your state, that I might frighten Wellington and Peel from their attempt to trample on the liberties of Ireland. I tell them we will keep within the law and commit no crime, that we will stand within the constitution, and let them not dare attempt to try our patience beyond what it will endure, for it is not safe to drive even cowards to madness; and oh, it is much less safe to drive those who are not cowards. I feel it now my duty to warn you against these Saxons; perhaps a few days will tell us what they mean to do; but recollect old buccaneering Wellington, and the maniac disposition of Stanley, and the bigoted prejudices and disposition of Sir J. Graham are in operation in the Cabinet, and the result may be adverse to us. If so, be prepared, I tell you, for the worst. Take care, of all things, to listen to the communications that will be made to you—for if they do not gag my mouth and manacle my hands you will hear me pointing out the course of conduct most wise to be adopted, and though that course may not strike you as being the most wise, yet I hope you will give me credit for my intention. I hope my dream of conflict will never be realised, that it is an empty vision, but let none of us be to blame; let us stand shoulder to shoulder on the constitution, and let not Ireland be abandoned to her foes by the folly, the passions, or the treachery of her children."

Kilkenny.—A Repeal-meeting took place in this city on Thursday of last week, at which no less than 300,000 persons are said to have been present. Mr. P. S. Butler, who has recently been dismissed from the magistracy, presided. Mr. O'Connell commenced the proceedings by directing the music to play "God save the Queen," which was done by more than a dozen bands, the whole of the vast multitude remaining uncovered. He then addressed the meeting at great length on the various topics connected with Repeal. A dinner took place in the evening, at which 500 persons were present.

Dungannon.—After two days of minute investigation, the inquiry into the riots at Carland has closed. The magistrates have decided on taking informations against seventeen of the Protestants and nine of the opposite party; against the first for riot and attack upon houses, or as it is termed "wrecking;" against the others for riot and assault. All the cases have been returned to the assizes, the trials to take place at Omagh.

Tipperary.—The murderers of Mr. Scully, of Kilkenny, are all in custody, and four of them, now in

Clonmel gaol, will be tried at the ensuing assizes for this county. It appears that there were five persons concerned in the murder of the ill-fated gentleman, and that one of them has become an approver. They were all hired assassins. The man who fired the shot followed Mr. Scully, without his shoes, until he came close to his back, into which he discharged the contents of his gun, which took instant effect. The only cause that has been assigned for the homicide was a proposal made by Mr. Scully to a tenant, to exchange the farm which he occupied for another equally good and eligible. The murderers were neither the tenants of, nor in any way connected with the property of the unfortunate gentleman.

Monaghan.—A fatal affray between the country people and the police took place on the 5th inst., on the estates of Mr. Shirley, at Maheracloon, in which one of the rioters was shot. On Thursday the jury returned a verdict that the deceased came by his death by a gun-shot wound from a party of 28 policemen, commanded by Major Wilcox and Sub-Inspector Barry; that the police have not produced sufficient evidence to show that they were in imminent danger of their lives at the time they fired on the people; and that there was not proof as to the identical person who fired the shot. The local papers state that this verdict has rather increased than allayed the excitement of the peasantry, and that the people have imbibed the notion that they should have a fixed tenure, at their own rent, and that their landlords by demanding their rights are persecuting them.

SCOTLAND.

Edinburgh.—The number of ministers who have signed and adhered to the protest given in to the General Assembly on the 18th ult. is stated in the *Witness* of Tuesday, 23d, to be about 444. On a careful examination of all the names that have been hitherto printed in the *Witness*, it appears, however, that the number of ministers is only 395, of whom are: Parish ministers, 214; *Quoad sacra* ditto, 144; Professors, 3; Assistants and successors, 14; Ordained assistants, missionaries, and others having no cure, 20; in all, 395. The number of parish ministers in all is, 947; deducting from which the above 214, there remain 733. The number of ministers of Parliamentary churches and chapels of ease is about 246; deducting from which the above 144, there remain 102; making together, 835. It thus appears that there are 733 parish ministers, besides 102 ministers of chapels, who have not retired from the Establishment.

THEATRICALS.

DRURY-LANE.—Her Majesty and Prince Albert paid a state visit to this theatre on Monday night, and on no occasion of a royal visit to a national theatre was the Sovereign received with a more enthusiastic welcome. As early as three o'clock the doors were invested by crowds anxious to obtain admittance, and the rush to secure places was so general that in a few moments every tenable position became eagerly occupied, with the exception of the reserved seats. The dress-circle was very quickly filled, and the house altogether presented a splendid appearance. At ten minutes before seven her Majesty left the Palace, preceded by seven royal carriages, in which were the attendants on the Queen and Prince Albert, guarded by an escort of the Horse Guards. In the carriage with her Majesty and Prince Albert were the Earl of Jersey, Master of the Horse, and the Duchess of Buccleuch, the Mistress of the Robes. Throughout the progress from the Palace to the theatre the most loyal demonstrations were exhibited. Her Majesty arrived at the theatre between five and ten minutes after seven o'clock, and was conducted to the Royal box by Mr. Macready and Mr. Serle. For some time after her arrival the enthusiasm of the audience could not be restrained, and the warmth of their feelings continued to pour itself out, cheer after cheer, and peal after peal, in the midst of which the curtain rose, and the National Anthem was sung by the whole company. The performances commanded on this occasion were Shakespeare's play of "As You Like It," with the farce of the "Thumping Legacy." In both instances it is sufficient to say that the cast was excellent. Her Majesty and Prince Albert appeared to enjoy the performances very much, a circumstance which they indicated as well by remaining until the termination of the farce, as by frequently indulging in laughter at Mr. Keeley's drollery in the afterpiece. At the conclusion of the performances the audience again called for the National Anthem, which was immediately acceded to, and it was repeated by the whole strength of the company, the audience meanwhile standing. The Royal party left at a little after eleven, and the rising of her Majesty to depart was the signal for a renewed manifestation of the feelings of the audience.—The season at this theatre closed on Wednesday night, when Mr. Macready delivered his farewell address to a house crowded in every part. The character he selected for his last performance was *Macbeth*, and at the fall of the curtain he appeared at the call of one of the most enthusiastic audiences ever collected together at Drury Lane. The ladies stood up and waved their handkerchiefs, the masses in the pit and galleries waved their hats; bouquets of gigantic dimensions were hurled down from all quarters, and in an instant the stage presented the appearance of a flower-show. At length order was restored, and Mr. Macready, who was evidently much affected by the warmth of his reception, came forward and addressed the audience. After stating that his resignation of the theatre was not caused by the want of public encouragement, or by low nightly receipts, but by the heavy expenses incurred in restoring the various departments of the establishment itself from decay and ruin to its present state, he gave

a history of his connection with the two large theatres. He then passed to the circumstances of dramatic patents and disclaimed all intention of imputing blame to the proprietors of the theatres or to individuals, but declared his conviction that "against the law, which gives to persons totally unacquainted with the drama and with all appertaining to the dramatic art, an irresponsible power over it, every impartial voice should be lifted up." "The principal performers," he said, "have testified their confidence in my system, by deliberately consenting to hazard one-third of their incomes in its support; and I have volunteered myself still further sacrifices towards perfecting what is so far advanced; but as I cannot subject myself to the liabilities required of me, I have reluctantly and with deep regret resigned my charge. The consequence is, both these large theatres are now untenanted. The holders of their patents are unable themselves to present the glorious works of Shakspeare to an English audience, and yet are armed by the law with power to forbid their representation elsewhere. For were I now, after all I have given and endured to maintain the drama in these theatres—were I excluded by circumstances as I now am from them—to attempt in a theatre lately licensed by the Lord Chamberlain for the performances of brutes and brute-tamers, were I to attempt there the acting a legitimate play, the law, 'with all their might to urge it on,' would be put in force to prevent, or to punish me. May I not ask for what public benefit such a law is framed, or for what one good purpose it is persisted in? In regard to the proprietors of this theatre, let me once again, and emphatically, disclaim all intention of imputing blame individually—for many of them I entertain the highest respect and esteem—it is the law under which they act that I complain of, and condemn as the drama's worst enemy. In conclusion let me merely add, that I have endeavoured to redeem, throughout my management, every pledge of my introductory address:—I have endeavoured to make your national theatre worthy of Shakspeare and of our country. In this attempt I hope I have not entirely failed. I have at least striven my utmost, and the encouragement I have received from you would have been sufficient to sustain me in the struggle, if, as should have been the case, this theatre had been adequately appointed. For that encouragement, ladies and gentlemen, I return you my warmest acknowledgements. To the respectable portion of the public press I am anxious to offer the expression of my gratitude for its sympathy and aid; and with my own, with the performer's thanks, let me indulge the hope that time may bring about a better state of things, and that I may yet again, under happier auspices, be honoured with your favour and approval. With a feeling of sorrow, but no desponding, ladies and gentlemen, I respectfully and most gratefully take my leave." Mr. Macready retired amidst loud and continued cheering.

Law.

COURT OF QUEEN'S BENCH.—(Sittings in Banco.)—**THE CHARTISTS.**—*The Queen v. McDouall.*—Mr. Erle had to support the rule for arresting the judgment on the fourth count of this indictment, and before drawing the attention of the Court particularly to the count itself, he would pray their Lordships would bear in mind what this indictment did not charge. There were nine counts in this indictment, of which several were framed for known offences of conspiracy, and several in respect of riotous and tumultuous assemblies; but this count was neither for conspiracy nor tumultuous assembling. The third count was identical with the fourth, with the exception that, instead of charging the mere aiding and abetting, it charged that the defendants did conspire to aid and abet. The fourth count was not framed for any offence that had a name in respect of which any precedent was to be found. He need not draw attention to the right the defendants had to insist upon the prosecutor putting forward a charge of a known crime to which the defendants were accessory. The indictment was framed upon the principle of charging in the earlier part that some other persons as principal offenders were guilty of a principal offence whereof the defendants were accessories before the fact by aiding and abetting. He was to submit that, dividing this indictment into two parts, there was no offence charged in the first branch of the indictment; and the latter branch of the indictment, imputing that the defendants were accessories, was not sufficient to establish that offence. The first part of the indictment charged no principal offence; it was not a charge of conspiracy, nor was there a charge of riotously assembling. The description given was, "that divers evil-disposed persons unlawfully and tumultuously assembled together." If that did not constitute an indictable offence, he was at a loss to know how the introducing several steps in the indictment could form an offence. The defendants could not be found guilty of riotously assembling. It was essential that three or more should be charged, because the essence of the offence was, numbers should be assembled. (Co. Litt., 175; 1 Ventris, 251; Salkeid, 934.) It was essential that the purpose of the assembling was to disturb the peace, or that the indictment should have gone on to show some act, done in common by the parties assembled, which in itself would constitute a riot, or breaking the peace; but it was consistent with the present indictment that they might have assembled for the purpose of festivity or electioneering, which were legal assemblies, and the mere adding the word "unlawful" would not make the indictment good. The first step, therefore, did not show that the assembling was for the purpose of breaking the peace. The second step was, that by violence, threats, and intimidation, divers other persons, being peaceable subjects of the realm, were incited to leave their occupations and employments, and thereby labour was impeded. Was there to be found in that statement anything which, taken by itself, would constitute an indictable offence? The result was no part of the offence. The mere impeding labour was not an indictable offence. The nearest offence to this would be that of assault; but it would be idle to say that a party could be convicted of an assault by circumlocution, such as was to be found in this indictment.—Mr. Justice Williams.—If persons assembled together, and by acts of violence impeded labour, that would be an indictable offence, would it not?—Mr. Erle said his Lordship had introduced acts of violence; the count did not charge acts of violence. The prosecutors had abstained from charging that the divers persons so assembled had done an act which would have brought them within the reach of the criminal law. The residue of the first branch clearly did not constitute an indictable offence by saying that they thereby impeded labour, because that was merely the result. They ought to have been charged with an offence of a known name. Those who made the charge ought to have kept within the known principles of the criminal law. The count was bad on the ground that it did not appear where these divers persons were assembled. There was

a point of a mir or description, which was that the divers persons who were the principal offenders were neither named nor stated to be unknown; and in support of this argument the learned counsel cited the case of "The King v. Caspar," 2 Moody's Criminal Cases, 101. If the party was not known, it should have been so stated in the indictment. With respect to the accessories not being properly charged, it was said they were accessories after the fact, but it did not appear that they were present, nor that they knew what was going on, but it was consistent with the indictment that they might merely have subscribed money for the support of parties during the time they ceased to labour. Unless the parties were shown to have been present, it ought to be shown that they had a knowledge of what was going on. In the 31st vol. of the State Trials, page 1, the parties were alleged to have aided persons who were unknown. Another objection was, that if the parties were charged with being accessories before the fact, there would appear to be a substantial offence, but then they would be charged with being accessories to an offence which did not appear to have ever existed. They were charged with aiding and abetting the divers evil-disposed persons to continue and persist in the said unlawful assemblies. He was dealing with the case upon the supposition that it was intended to say that divers persons had been guilty of an offence, and that the defendants were accessories. Then the indictment contained no charge that the crime of the principal offender ever was committed.—Mr. Justice Patteson said, it was difficult to think how a man could aid and assist in doing a thing unless it was done, but it might be aiding to do a thing which was intended to be done.—Mr. Erle said, a person might supply gunpowder to a ship when no gun was fired. Where there were known offences, these offences ought to be stated. It was not aiding and abetting in an attempt to commit a misdemeanour. Where an attempt was charged, there must be an act done by the defendants which would be part of the offence, supposing it should be committed. Supposing a pistol to be charged by a person who intended to commit a murder, but afterwards changed his mind, the loading the pistol would not be an offence, because there was no breach of the law; the intention alone was not criminal.—Mr. Justice Patteson said there was a case some years ago, where a man went to an engraver in the Strand, and wished him to make a plate for the purpose of committing a forgery on the Norwegian Government; it was held that the man was indicted for soliciting.—Mr. Erle replied, that here the case was different; the defendants were not indicted for soliciting, nor was it an indictment for an attempt to commit a misdemeanour. The indictment did not show that they took any part in impeding labour; there was no act done by the defendants. He submitted that the generality of this indictment made it bad; it was too indefinite; it was so devoid of all particulars, that the defendants had not that reasonable information as to what they were called upon to answer, to which all indicted persons were by the law of England entitled. There never was an indictment more bare in specifying any particulars; the words were "divers persons, at divers times, at divers places." To what part of England could the attention of the parties be directed? who were the principal offenders? where were they? what was the time? what was the offence? Every elector in every day-assembly, every festive meeting, might come under the denomination of tumultuous assembling. The defendants were not supposed to be jointly guilty of any one of the acts charged, for these had been laid in the indictment as several and distinct, yet this only furnished an additional reason why the count now sought to be overturned should have been rendered more accurate and specific in its language. Among many other cases upon conspiracies, those of "The Queen v. Toulis," 5 Carr. and Payne, and "the King v. Seaworth," 1 Adolphus and Ellis, were authorities to show the inflexibility of the Courts in regarding "generality" as fatal to an indictment. Upon these authorities, as well as upon the loose and vague wording of the count, he contended that it was opposed to the spirit and rules of the law with reference to indictments, and must therefore be held by their Lordships to be void and bad.—Mr. Denman, Mr. Baile, Mr. Sergeant Murphy, Mr. Bodkin, and Mr. Atherstone, followed on the same side, after which, Lord Denman said the Court would take time to consider the matter.

POLICE.—The Aldermen at Guildhall have been this week occupied with a charge of forgery preferred against Lady Ricketts, the widow of the Admiral who died recently at Cheltenham. The charge was preferred by Mr. Newton, her ladyship's son-in-law, who alleged that she had forged the signature of her late husband for the purpose of receiving his pension. Our readers will recollect that a similar charge was brought against the lady by Mr. Newton a few months since at Cheltenham, when the magistrates, after full investigation, dismissed the case. The hearing of the evidence occupied the court during three adjourned sittings, and on each occasion the hall was crowded. Mr. Newton conducted his own case, and Mr. Humphrey appeared for Lady Ricketts. Alderman Musgrove objected to Mr. Newton conducting his own case, and decided that all questions should be put through him. Mr. Price, from the Audit-office; Mr. Pike, senior clerk in the Paymaster-General's Office; and Mr. Defaur, the Navy Agent, were examined at great length. Mrs. Newton was then examined, and distinctly stated that the signature to one of the documents was not in the handwriting of her late father. This statement created an extraordinary sensation, but it afterwards appeared that she had not seen her father write for fifteen years. Two servants, who formerly lived in the service of the late Sir T. Ricketts, swore positively that he was quite childish, and unable to write his name. On the other side, an unmarried daughter of the accused swore that the signatures to the three alleged forged certificates were in her father's handwriting. Mr. Humphrey made a powerful speech on behalf of Lady Ricketts, and the presiding Alderman said, it was the opinion of himself and brother Aldermen that no case had been made out to sustain the charge of forgery, and therefore the case must be dismissed. The result was received with loud cheers.

SPORTING.

ASCOT RACES, TUESDAY.—These races commenced this day under very unfavourable circumstances. The rain set in early, and continued without ceasing throughout the day; the approaches to the course were ankle-deep in mud, and the course itself in a state that has rarely been equalled. The assemblage was in keeping; the Grand Stand contained only the inveterate lovers of the turf whom nothing could deter; the minor stands were almost tenantless, and the whole display was disheartening. The jockies suffered severely; their jackets presented any colours but "colours of the riders," their persons were drenched to the skin, and their features on returning to scale, were so bespattered that not a feature was distinguishable.

The Trial Stakes of 5 sovs. each, w.t.l. 50 added for two yr olds, feather, three, 7st 4lbs; four, 8st 13lbs; five and upward, 9st 4lbs. New mile. 14 subs. Mr. Pidd's Poison, by Plumpo, 3 yrs. Bell, beat Duke of Bedford's John o'Gaunt, 5 yrs. Mr. Oliver's Grace Darling, 3 yrs. and 8 others which were not placed. Won easily by two lengths.

The St. James's Palace Stakes of 100 sovs. each, h. ft; for three-yr-old colts, 8st 7lbs; fillies, 8st 4lbs. Old mile. 4 subs. Lord Westminster's c by Touchstone out of Languish (Templeman), beat Lord Exeter's c by Beiram out of Marnello; Lord Bruce's c by Elis out of Rosalie; and Lord Jersey's c by Slane out of Cobweb. Won by two lengths.

The Ascot Derby Stakes of 50 sovs. each for three-yr-old colts, Swinley course. 9 subs. Sir G. Heathcote's Amorino (Chapple), beat Mr. Thornhill's Elixir; General Wyndham's c by Velocipede—Guerdon; Lord Exeter's Czar; and Lord Exeter's Antidote.

The Ascot Stakes of 25 sovs. each, 15ft, and only 5, &c., with 100 added; the second to receive 50 sovs. out of the stakes; the winner of any handicap after the weights were declared 7lbs extra; two miles and a half, 37 subs., 18 of whom declared.

to the Editor.—Saturday, June 17, 1913.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 25—1843.

SATURDAY, JUNE 24.

Price 6d.

ROYAL BOTANIC SOCIETY OF LONDON.

Exhibitions of Plants and Flowers, for 1843, Inner Circle, Regent's Park, WEDNESDAYS, June 28 and July 19, from 2 o'clock until 7.

The Prizes to be awarded are MEDALS and PLATE, varying in value from 10s. to 15l., the total amount being 600l. for Plants and Flowers, and 10l. 10s. for Microscopes. Open to all Competitors. Fellows, Members, and Bearers of Ivory Tickets will be admitted upon entering their names or numbers in the Gate Book.

Visitors will be admitted by Tickets to be obtained at the Gardens, and between 12 and 4 o'clock at No. 28, Regent-street, by Orders from Fellows and Members only. Price 6s.; and on the days of Exhibition after 2 o'clock, 10s.

Schedules of Prizes, with the Regulations for the observance of Exhibitors, and all other particulars, may be had on application at the Gardens, or at 28, Regent-street, as above.

By Order of the Council, J. D. C. SOWERBY, Secretary.

AMERICAN PLANTS.—WATERER'S SPLENDID

EXHIBITION, King's Road, Chelsea, under the especial patronage of H.R.H. the Duchess of Gloucester and H.R.H. the Duke of Cambridge, is now in high perfection. Upwards of 10,000 plants, many 10 to 12 feet high, completely covered with flowers, producing one of the most brilliant scenes ever offered to public view.—Open daily, Sundays excepted. Admittance, One Shilling.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

NEW AND SUPERB FUCHSIAS.

YOUELL & Co. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their select List of the above elegant tribe of plants, which appeared on the front advertising page of this Paper of the 27th ult. They are now ready to be sent out per post, free, (on the receipt of a post-office order,) to any part of the United Kingdom, upon the following terms: 12 fine show varieties, 12s. 12 extra fine and very superior 12 extra fine ditto, 16s. prior 21s.

The selection being left to YOUELL & Co.

Great Yarmouth Nursery, Norfolk, June 21, 1843.

VICTORIA REGIA.—Those Parties who purchased

Seeds of the above fine Aquatic Plant, in the spring of 1841, many of which failed to germinate, will now receive an equal number of fresh Seeds, gratis. These Seeds were collected so recently as the month of March, 1843; it is therefore confidently hoped that the purchasers will not be subjected to the same disappointment as before. There remain yet a few more of the Seeds for disposal; but an early application for them is recommended, a small number only having been just received (June 20) by Mr. SONNENBURG's agent from Pirara.—Apply at No. 45, Frith-street, Soho-square, London.

ANAGALLIS (BREWERI), AND SUPERB BLUE CINERARIA SEED.

MICHAEL BREWER, SEN., NURSERYMAN, London Road, Cambridge, begs to offer strong plants of his Splendid deep blue, full and complete round-petaled Seedling Anagallis (Breweri), being of a strong, green, and vigorous habit, and the flower equal in size to a half crown. It is now ready for sending out, at 5s. per plant, postage free, to any part of the Kingdom. (See "Notices to Correspondents" in the *Gardeners' Chronicle* of June 10.) Also, packets of his Brilliant CINERARIA SEED, comprising every shade of Dark and Light Blue tint; and as the present is the best time for sowing for Autumn, Winter, and early Spring flowering, he is induced to offer Seed, warranted as newly gathered, in packets at 3s. 6d., 7s., and 10s. Applications, inclosing post-office orders, will be immediately executed.

SUPERB SEEDLING CHRYSANTHEMUM THE "DUKE."

YOUELL & Co. feel much pleasure in announcing they have obtained the entire stock of an extremely beautiful seedling Chrysanthemum, from Mr. Wells, gardener to the Rev. J. Burroughes, of Lingwood Lodge, Norfolk. This splendid variety, named "THE DUKE," was exhibited at the Norwich and Norfolk Horticultural Society's Exhibition, where it obtained the First Prize, as the Best Seedling; it also obtained First Prizes shown in the best stand of 25; ditto ditto, 15; ditto ditto, 20; and the judges pronounced it to be the best Chrysanthemum ever exhibited. The colour French White, changing to pure white; petals broad and beautifully incurved, forming a perfect ball of from 4 to 4½ inches in diameter. It is ready for sending out, at 7s. 6d. per plant, free of postage, to any part of the United Kingdom.—Great Yarmouth Nursery, June 22, 1843.

ARAUCARIA IMBRICATA PLANTS.

MESSRS. VEITCH & SON having raised a considerable number of this Splendid Hardy Ornamental Tree, are enabled to offer fine healthy plants, from 4 to 6 inches in height, at the following moderate prices, viz:—

10l. per 100;—5l. 10s. for 50;—and 30s. per dozen. For the convenience of some purchasers, Messrs. V. & Son have appointed, as their London agent, Messrs. HURST and M. MULLEN, Seedsman, No. 6, Leadenhall-street, N.B.—A remittance or reference required from unknown correspondents.—Exeter, June 19, 1843.

HORTICULTURAL SOCIETY OF LONDON.—AWARD OF THE JUDGES AT THE EXHIBITION AT THE GARDEN OF THE HORTICULTURAL SOCIETY, JUNE 17, 1843.

GOLD KNIGHTIAN MEDAL.—1 To Mr. John Green, Gardener to Sir Edm. Antrobus, Bart., F.H.S., for 40 Stove and Greenhouse Plants. 2 To Mr. J. Goode, Gardener to Mrs. Lawrence, F.H.S., for 40 Stove and Greenhouse Plants. 3 To Mr. Paxton, Gardener to His Grace the Duke of Devonshire, K.G., for Exotic Orchidaceae. 4 To Mr. Mylam, Gardener to S. Rucker, Esq., F.H.S., for Exotic Orchidaceae. 5 To Mr. Moffatt, Gardener to His Grace the Duke of Newcastle, for a miscellaneous collection of Fruit.

GOLD BANKSIAN MEDAL.—1 To Mr. John Dobson, Gardener to Mr. Beck, of Isleworth, F.H.S., for 12 varieties of Pelargonium, in pots of 24 to the cast. 2 To Mr. Catleugh, of Hans-street, Chelsea, for 12 varieties of Pelargonium in pots of 24 to the cast. 3 To Mr. J. Goode, for 20 varieties of Cape Heaths. 4 To the same, for Exotic Orchidaceae. 5 To Messrs. Lane, of Great Berkhamstead, for 25 Roses in pots. 6 To Messrs. Lucombe and Pince, of Exeter, for 21 Seedling Heaths. 7 To Messrs. Rolleston, of Tooting, for Exotic Orchidaceae. 8 To Mr. Spencer, Gardener to the Marquess of Lansdowne, for a miscellaneous collection of Fruit. 9 To Mr. J. Davis, of East Barnet, for a miscellaneous collection of Fruit.

SILVER GILT MEDAL.—1 To Mr. Gaines, of Battersea, for 12 varieties of Pelargonium in pots of 24 to the cast. 2 To Mr. I. Parker, Gardener to J. H. Oughton, Esq., Rochester, for 12 varieties of Pelargonium in pots of 12 to the cast. 3 To Mr. Catleugh, of Hans street, Chelsea, for 12 varieties of Pelargonium in pots of 12 to the cast. 4 To Mr. Redding, Gardener to Mrs. Marryatt, F.H.S., for 40 Stove and Greenhouse Plants. 5 To Mr. Pawley, of the White Hart Inn, Bromley, Kent, for 20 Stove and Greenhouse Plants. 6 To Mr. Hunt, Gardener to Miss Traill, F.H.S., for 6 Stove and Greenhouse Plants. 7 To the same, for 6 species of Cape Heaths. 8 To Mr. Joseph Goode, for Stove and Greenhouse Climbers. 9 To Mr. John Green, for 20 species of Cape Heaths. 10 To Mr. Brazier, Gardener to W. H. Story, Esq., F.H.S., for 6 species of Cape Heaths. 11 To Mr. J. Smith, Gardener at the Royal Bot. Garden, Kew, for Achimenes multiflora. 12 To Mr. Mylam, Gardener to S. Rucker, Esq., F.H.S., for Nepenthes ampullacea. 13 To the same, for Aroides odoratum. 14 To Mr. John Brewster, Gardener to Mrs. Wray, F.H.S., for Barkeria spectabilis. 15 To Mr. T. Insley, Gardener to G. Barker, Esq., F.H.S., for Exotic Orchidaceae. 16 To Mr. R. Atlee, Gardener to H. Beaufoy, Esq., South Lambeth, for Grapes. 17 To Mr. J. Davis, of E. Barnet, for Grapes. 18 To Mr. I. Wharton, Gardener to Miss Whitehead, of Bath, for Pine Apples.

LARGE SILVER MEDAL.—1 To Mr. Gaines, of Battersea, for 12 varieties of Pelargonium in pots of 12 to the cast. 2 To Mr. Hunt, Gardener to Miss Traill, F.H.S., for 12 varieties of Pelargonium in pots of 12 to the cast. 3 To Mr. W. Bourne, Gardener to the Hon. Sir E. Paget, Chelsea Hospital, for 6 varieties of Pelargonium in pots of 8 to the cast. 4 To Mr. Dobson, Gardener to Mr. Beck of the Slate Works, Isleworth, F.H.S., for 6 Shrubby Calceolarias in pots of 12 to the cast. 5 To Mr. Gaines, for 6 Shrubby Calceolarias in pots of 12 to the cast. 6 To Messrs. Lane and Son, for 12 varieties of Fuchsia. 7 To Mr. Falconer, Gardener to Archdale Palmer, Esq., for 6 species of Stove and Greenhouse Plants. 8 To Mr. Bruce, Gardener to Boyd Miller, Esq., for 6 species of Stove and Greenhouse Plants. 9 To Messrs. Lucombe and Pince, of Exeter, for Statice macrophylla. 10 To the same, for Luxemburgia ciliolata. 11 To Mr. W. Redding, for Acrophyllum venosum. 12 To Mr. J. Smith, for Luxemburgia ciliolata. 13 To Mr. T. Jackson, F.H.S., for 20 varieties of Cape Heaths. 14 To Mr. F. Fraser, of Leyton, Essex, for 20 varieties of Cape Heaths. 15 To Mr. G. Clark, Gardener to Mr. T. Smith, Esq., F.H.S., for 6 varieties of Cape Heaths. 16 To Mr. James Falconer, for Tall Cacti in flower. 17 To Mr. A. Milne, Gardener to C. S. Chauncey, Esq., F.H.S., for a collection of Roses in 50 varieties. 18 To Messrs. Paul and Son, of Cheshunt, for a collection of Roses in 50 varieties. 19 To Messrs. Veitch and Son, of Exeter, for Oncidium Lanceanum. 20 To Mr. M. Henderson, Gardener to Sir Geo. Beaumont, Bart., for a miscellaneous collection of Fruit. 21 To the same, for Pine-apples. 22 To Mr. Bruin, Gardener to R. Gunter, Esq., F.H.S., for a miscellaneous collection of Fruit. 23 To Mr. E. Davis, Gardener to Abel Smith, Esq., F.H.S., for Grapes. 24 To the same, for Pine Apples. 25 To Mr. Chapman, of South Lambeth, for Grapes. 26 To J. G. Fuller, Esq., F.H.S., for Pine-apples.

SILVER KNIGHTIAN MEDAL.—1 To Mr. Hunt, Gardener to Miss Traill, F.H.S., for 12 varieties of Pelargonium in pots of 24 to the cast. 2 To Mr. Catleugh, for 6 Herbaceous Calceolarias, in pots of 12 to the cast. 3 To the same, for 6 Shrubby Calceolarias in pots of 12 to the cast. 4 To Mr. G. Stanly, Gardener to H. Berens, Esq., F.H.S., for 6 Shrubby Calceolarias in pots of 12 to the cast. 5 To Mr. John Trevers, of East-lane, Walworth, for 24 varieties of Pinks. 6 To Mr. Norman, of Woolwich, for 24 varieties of Pinks. 7 To Mr. Catleugh, for 12 varieties of Fuchsia. 8 To E. Foster, Esq., Clewer, near Windsor, for a seedling Pelargonium (Phaon). 9 To Mr. G. Clarke, for a collection of 6 species of Stove and Greenhouse Plants. 10 To Mr. John Green, for Stigmaphyllon ciliatum. 11 To Mr. James Dawson, Brixton-hill, for Erica pulverulenta. 12 To Messrs. Beck and Co., 67, Strand, for Martynia fragrans. 13 To Mr. Pawley, of Bromley, for 6 species of Cape Heaths. 14 To Mr. Bruce, for 6 species of Cape Heaths. 15 To the same, for a Collection of Tall Cacti in flower. 16 To A. Rowland, Esq., F.H.S., for 50 varieties of Roses. 17 To Mr. H. Cobbett, of Horsell, near Woking, for 50 varieties of Roses. 18 To Messrs. Lucombe and Pince, of Exeter, for Vanda teres. 19 To F. G. Cox, Esq., of Cedar Lodge, Stockwell, for Phalaenopsis amabilis. 20 To Mr. R. Poole, Leyton, Essex, for Pimelea decussata. 21 To Messrs. Lockhart and Co., for a Collection of Ranunculuses. 22 To Mr. Brazier, Gardener to W. H. Story, Esq., F.H.S., for 8 Hybrid Heaths. 23 To Mr. Joseph Davey, Gardener to George Smith, Esq., F.H.S., for Grapes. 24 To Mr. J. Fish, Gardener to H. Oddie, Esq., for Pine-apples. 25 To Mr. H. M'Onach, Gardener to E. Vines, Esq., F.H.S., for Pine-apples. 26 To Mr. Spencer, Gardener to the Marquess of Lansdowne, for Nectarines. 27 To Mr. Fish, Gardener to Colonel Sowerby, Putteridgebury, Luton, for Peaches. 28 To Mr. S. M. Carson, Gardener to W. F. G. Farmer, Esq., F.H.S., for two Melons (Olivier's Greenflesh).

SILVER BANKSIAN MEDAL.—1 To Mr. Bell, of Chelsea Hospital, for 6 varieties of Pelargonium in pots of 12 to the cast. 2 To Mr. Gaines, of Battersea, for 6 Herbaceous Calceolarias in pots of 12 to the cast. 3 To Mr. John Neville, of Peckham, for 24 varieties of Pinks. 4 To Mr. R. Henbrey, of Croydon, for 24 varieties of Pinks. 5 To E. Foster, Esq., of Clewer, near Windsor, for a seedling Pelargonium (Duke of Devonshire). 6 To Mr. Fraser for a second seedling Pelargonium (Robustum). 7 To Mr. Brazier for Erica splendens. 8 To Mr. Lee, F.H.S., for Aquilegia Skinneri. 9 To Messrs. Lucombe and Pince, of Exeter, for Siphocampylus betulaefolius. 10 To the same, for Ozothamnus thrysoides. 11 To Messrs. Rolleston, of Tooting, for Kalmia latifolia buxifolia. 12 To Mr. W. Dennis, of King's Road, Chelsea, for 50 varieties of Roses. 13 To Mr. Laing, of Twickenham, for 50 varieties of Roses. 14 To Mr. Insley, Gardener to G. Barker, Esq., F.H.S., for Mormodes luxatum. 15 To Messrs. Tyso, of Wallingford, for

Ranunculuses. 16 To Mr. H. Baile, of Covent Garden, for Globe Scarlet Pelargoniums. 17 To Mr. W. Salter, Gardener to J. M. Yeates, Esq., of Bath, for Erica tricolor. 18 To Mr. R. Mountj y, F.H.S., for Stalidum fasciculatum. 19 To Mr. F. Fraser, for Epacris grandiflora. 20 To Mr. G. Wortley, Gardener to I. F. Maubert, Esq., F.H.S., for Grapes. 21 To Mr. Roberts, Gardener to M. Wilson, Esq., Salton, for Grapes. 22 To Mr. Mitchell, Gardener to Lord Vernon, for Peaches and Nectarines. 23 To Mr. Pedrick, Gardener to H. Pownall, Esq., F.H.S., for Peaches and Nectarines. 24 To Mr. Feggo, Gardener to the Marquess of Abercorn, for Peaches. 25 To Mr. H. Bance, Gardener to Dr. Tarleton, of Chelsfield, Kent, for 6 Melons.

THE CERTIFICATE OF MERIT.—1 To Mr. Ingram, of Southampton, for a Pelargonium (Corinthian). 2 To Mr. John Standish, of Bagshot, for a Calceolaria (Illuminator). 3 To Mr. J. Neville, of Peckham, for a Pink (Brilliant). 4 To Mr. G. Piper, Gardener to R. Whitley, Esq., of Blackheath Park, for a Cineraria (Princess Royal). 5 To Mr. E. P. Lyne, of Plymouth, for a Pelargonium (Princess Alice). 6 To Messrs. Lee and Co., for a species of Lathyrus, from Texas. 7 To Messrs. Lucombe and Pince, for Gompholobium polymorphum. 8 To Mr. Joseph Goode, for Helichrysum retortum. 9 To the same, for Gloxinia maxima alba. 10 To Mr. Edmonds, for Peristeria pendula. 11 To Mr. Hopgood, of Bayswater, for Soliya linearis. 12 To Mr. John Trevers, of East Lane, Walworth, for Ranunculuses. 13 To Mr. J. Bruce, for Aphelexis sesamoides. 14 To Mr. Hunt, for Oncidium microchilum.

LYNE'S PELARGONIUMS.

WM. E. RENDLE has procured the Stock of Seedling PELARGONIUMS raised by P. E. Lyne, Esq., and informs Amateurs and others who took notes of them at the "Chiswick Fête" on Saturday last, that Lists and Descriptions of the Seedlings coming out this season will be shortly published, and will be sent by post on application.—Union-road Nursery, Plymouth, June 20.

NEW AND SUPERB FUCHSIA ST. CLARE.

THIS magnificent FUCHSIA, pronounced by Dr. LINDLEY as "the finest hybrid we have seen," is now ready for sending out by YOUELL & Co., upon the following terms, viz:—One St. Clare, with eleven other finest Show varieties for 21s.; the set delivered free of postage, (on the receipt of a post-office order) to any part of the United Kingdom.—Great Yarmouth Nursery, June 21, 1843.

MAGNIFICENT NEW FUCHSIA, "FUCHSIA EXONIENSIS."

LUCOMBE, PINCE, & Co., beg leave to call the attention of the Public to a very superb New Fuchsia, which has been raised from seed in the Exeter Nursery, and which they have no hesitation in saying is decidedly the finest variety ever produced; indeed, it is at once admitted to be so by all who see it, who are struck with admiration of its noble appearance. The flowers are exceedingly large, being longer as well as broader than those of any other Fuchsia, and are of a very firm, thick, waxy substance, with the corolla of a fine violet blue colour. Plants will be ready for delivery on the 10th of August next, at 10s. 6d. each, and will be sent by post, carefully packed in tin cases. The usual discount to the trade if six plants are taken. For a full description of this Fuchsia, see Advertisement in the *Gardeners' Chronicle* of the 17th inst.

ROSES.

E. DENYER begs to inform the Nobility, Gentry, and his Friends in general, that his superb collection of ROSES will be in bloom about the 26th of June. The Standard and Dwarf Roses are planted on each side of a walk 660 feet long, and consist of 500 varieties. Orders taken for the plants when in bloom, and delivered in November next. Admittance gratis. Nursery within three miles of London, Loughborough-road, North Brixton.

TO PANSY GROWERS.

J. PEARSON, having a fine Stock of his BLACK PRINCE PANSY, will, on receipt of a Post-office order for 5s., send it to any part of the Kingdom in a tin-box, post-free.—Chilwell Nurseries, near Nottingham.

ROSES.

T. RIVERS, JUN., respectfully informs his Friends and the Public that his Collection of ROSES will be in full bloom about the 28th inst. To those inclined, a day may be spent among Roses, as the collection is now much larger than it has ever yet been. The Nurseries, although very extensive, are connected. Down trains per Northern and Eastern Railway, Shoreditch, run as follows, calling at Haring and Sawbridge-worth stations alternately, each one mile from the Nursery: Morning—eight, half-past nine, half-past eleven o'clock; Afternoon—half-past one, half-past four, quarter past six, and half-past eight o'clock.—Sawbridge-worth, June 15, 1843.

YELLOW RHODODENDRON.

LUCOMBE, PINCE, & Co., have now a few plants for sale of this rare and beautiful RHODODENDRON: and as they purchased from Mr. SMITH, who raised it, the original Plant, which was exhibited in Flower by him at Chiswick, and gained the Large Silver Medal, and have propagated stock from it, their plants may be depended upon as being the true "RHODODENDRON AUREUM," or Smith's Yellow Rhododendron.—Exeter Nursery, June 12.

ROSES.

A. PAUL and SON beg to announce to their Customers and admirers of Roses in general, that their ROSES are now in FULL BLOOM. The Collection, which last season consisted of upwards of One Thousand Varieties, has received considerable additions from the Continent, and comprises all the newest and most interesting varieties in cultivation. The present is a favourable opportunity to such as wish to form or add to their collection, as the varieties they approve of can be selected, and the Plants will be delivered in November.

The Nurseries are near the Waltham Cross Station on the Northern and Eastern Railway, which distance from London is accomplished in the short space of half-an-hour; trains leaving Shoreditch—morning, at 8, half-past 9, and half-past 11 o'clock; afternoon, half-past 1, half-past 3, and half-past 4 o'clock.—Cheshunt Nurseries, near Waltham Cross, Herts.

FUCHSIA LANEII.

MESSRS. LANE & SON, of GREAT BERKHAMSTEAD, Herts, beg to announce that they have STRONG PLANTS of the above New Seedling, which has stood the test of the present season as well as the last, it having been exhibited at both the Horticultural Society's Shows at Chiswick, and the Royal Botanic Society's Exhibition at Regent's Park, this year, at each of which prizes were awarded to it. The size of bloom and general habit of this plant eminently qualify it for a place in every collection. Sent by post to any part of the Kingdom, on receipt of Post office order or cash from unknown correspondents. Price 7s. 6d., with the usual discount to the Trade when not less than 6 Plants are taken.—June 22, 1843.

THOMAS CRIPPS, Florist, Tunbridge Wells, has a few Plants of that singularly beautiful Annual, *NEMOPHILA*, "DISCOWALES" (which was figured in the "Floricultural Cabinet" for the present month) to offer. The flowers of this fine variety are a beautiful rich velvety black, margined with white. Plants 2s. 6d. each, or, if requested, will be sent per post, without additional expense, on the receipt of 3d. postage stamps.

NURSERIES, GREAT BERKHAMPTON, HERTS. ROSES.

MESSRS. LANE and SON beg to inform their Friends and the Public generally that their immense Stock of Standard and Dwarf ROSES will be in FULL BLOOM on and after the 29th inst., and must be seen to warrant an opinion of their great extent and beauty. The Nurseries are within Six Minutes' Walk of the Berkhampton Station of the London and Birmingham Railway, trains stopping at which leave Euston square at 7 and 8 o'clock every morning, and at 1, 3, and 6 o'clock every evening (Sundays excepted). Up-trains leave the Berkhampton Station for London every day (Sundays excepted) at 49 minutes past 7, 4 mins. past 9, and at 16 mins. past 41 mins. past 11 in the morning, and at 25 mins. past 4, and 22 mins. past 8 o'clock in the evening.—June 22, 1843.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WM. WOOD & SON have much pleasure to inform Rose Amateurs and their Friends, that their extensive Collection of ROSES is now coming into Flower, and will continue in splendid bloom during the season.—Woodlands, June 22.

ORANGE, LEMON, CITRON, SHADDOCK, and FORBIDDEN FRUIT TREES.—J. BUTLER invites the attention of the Nobility and Gentry to his last importation of these TREES, just arrived from Genoa. They are remarkably fine, the price from 6s. and upwards. To be seen at J. BUTLER'S Italian Warehouse, 155, Regent street, London. Genuine Seltzer Water, fresh from the Rhine, price 8s. per dozen bottles.

DUNSTABLE, BEDFORDSHIRE.

TO AMATEURS, HORTICULTURISTS, AND SPORTING GENTLEMEN.

MR. W. W. SIMPSON has received instructions from **EDWARD BURR, Esq.**, to sell by Auction at the Crown Inn, on **WEDNESDAY** next, July 26, 1843, a superior detached Family Residence, situated in the pleasantest part of the town, in excellent repair, and possessing every convenience. Communicating with the house is a beautiful Conservatory, with Fountain therein, a large Forcing House, containing Vines in full bearing, (both heated by one cast-iron Hot-water Apparatus); together with a large Pleasure Garden, very tastefully laid out, and abundantly stocked with choice Shrubs and Flowers; a Kitchen-Garden in the rear, divided by a lofty brick wall, with Pine-pits and Melon-frames therein. The House contains capital Cellarage, a set of excellent Rooms on the ground-floor, and large Hall, 9 Bedrooms, Dressing-rooms, and Water-closets. The Out-Buildings consist of double and single Coach-houses, Stalled Stables for four Horses, with Harness-room attached and Loft over, Laundry, Coal-house, Piggeries, and Dung-pit. On the opposite side of the street, lying in front of the house, will be included a piece of Pleasure-ground, inclosed by an ornamental iron-fence, and held on lease for an unexpired term of 47 years from Michaelmas next. On the same day will also be sold 290 acres of Pasture and Arable Land adjoining. The above property is well situated for any Gentleman fond of hunting, being within reach of four packs of hounds.—For further particulars apply to Mr. W. W. SIMPSON, No. 13, Bucklersbury, London.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & Others, TWO THOUSAND CAMELLIAS, FINE VARIETIES OF AZALEA INDICA, GREENHOUSE AND OTHER EXOTIC PLANTS.

MESSRS. PROTHEROE & MORRIS are instructed to submit to public competition, by Auction, on the premises, Kingsland Nursery, Ball's-Pond-road, about the middle of July, by order of the Proprietor, in consequence of removing to Stratford, about 2,000 DOUBLE & SINGLE CAMELLIAS, consisting of all the approved kinds, in a high state of cultivation. A choice assortment of AZALEA INDICA; also a collection of STOVE and GREENHOUSE PLANTS, consisting of ARAUCARIA EXCELSA, CLIVIA NOBILIS, BONAPARTIA JUNCIFOLIA, &c. May be viewed a week prior to Sale. Catalogues may be had on the premises; of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

BRITANNIA LIFE ASSURANCE COMPANY, 1, PRINCES STREET, BANK, LONDON.

This Institution is empowered by *Special Act of Parliament*, (4 Vict. cap. 9), and is so constituted as to afford the benefits of Life Assurance in their fullest extent to Policy-Holders, and to present greater facilities and accommodation than are usually offered by other Companies. The decided superiority of its plan, and its claim to public preference and support, have been proved incontestably, by its extraordinary and unprecedented success.

Assurances may either be effected by Parties on their own Lives, or by Parties interested therein on the Lives of others. The effect of an Assurance on a person's own life is to create at once a property in reversion, which can by no other means be realized. Take, for instance, the case of a person at the age of 30, who by the payment of 5l. 3s. 4d. to the Britannia Life Assurance Company, can become at once possessed of a bequeathable property, amounting to 1000l., subject only to the condition of his continuing the same payment quarterly during the remainder of his life, a condition which may be fulfilled by the mere saving of eight shillings weekly in his expenditure. Thus, by the exertion of a very slight degree of economy—such, indeed, as can scarcely be felt as an inconvenience, he may at once realize a capital of 1000l., which he can bequeath or dispose of in any way he may think proper.

Detailed Prospectuses, and every requisite information as to the mode of effecting Assurances, may be obtained at the Office.

PETER MORRISON, Resident Director.

A Board of Directors attend daily at 2 o'clock, for the despatch of business.

NATIONAL LOAN FUND LIFE ASSURANCE, ANNUITY, and DEFERRED ANNUITY SOCIETY, 26, Cornhill, London.

Capital, 500,000l.—Empowered by Parliament.

DIRECTORS.

T. Lamie Murray, Esq., Chairman.
John Elliotson, M.D., F.R.S. George Langley, Esq.
John Griffith Frith, Esq. John Rawson, Esq.
H. Gordon, Esq. Clement Tabor, Esq.

AUDITORS.—Professor Wheatstone, F.R.S.
Professor Graves, A.M., F.R.S.

ACTUARY.—W. S. B. Woolhouse, Esq., F.R.A.S.

The superior advantages to those Assured with this Society will be best understood by a comparison of its principles and a reference to the last Annual Bonus declared on Policies of five years' standing, viz.:

Entry	Policy No.	Age.	Sum.	Annual Premium	Bonus added.	Cash Bonus.	Prem. reduced
1837	39	59	1,000	£ 7 8 4	£ 132 14 6	£ 58 19 9	£ 8 19 4
1838	114	56	3,000	£ 175 15 0	£ 296 9 7	£ 123 0 6	£ 16 9 7

Policies now entered upon entitled to participation in next Annual Division. Two-thirds of all premiums paid can be borrowed by the Assured without loss of Policy.

F. FERGUSON CAMROUX, SECRETARY.

THE FARMERS' AND GARDENERS' HAIL-STORM INSURANCE COMPANY.—Offices, 4, Wellington-street North, Strand, London.

This is a subject which deeply affects the interests of both landlord and tenant, the destruction by Hail-storms being equally fearful and frequently more extensive than damage by fire.

Wheat, Barley, Oats, Beans, Peas, and Tares, insured at 4s. per cent., inclusive of the stamp, subject to the conditions contained in the policy. The Stamp on the Policy is paid by the Office.

All claims settled in the month of November in each year, and should any disputes arise, to be referred to arbitration.

Glass in hothouses, greenhouses, &c., insured at 15s. per cent., subject to certain conditions.

Prospectuses containing every information may be obtained of the Agents of the "FARMERS' FIRE AND LIFE INSURANCE INSTITUTION," who are appointed in all the principal towns in the kingdom, or by letter, pre-paid, forwarded to W. SHAW, Esq., at the Offices, Wellington-street North, Strand, London.

COTTAM and HALLEN, ENGINEERS, IRON-FOUNDERS, &c., &c., No. 2, WINSLEY STREET, OXFORD STREET, LONDON, and at CORNWALL ROAD, LAMBETH.

GARDEN ROLLERS 18 inches long, 34s.; 20, 44s.; 22, 50s.; 24 inches, 60s.; 26, 75s.; 28, 84s.; 30, 105s. each.

CAST IRON RICKSTANDS, 2 feet 6 inches high, 5s. 9d. each. Garden Engines, Mowing Machines, Garden Chairs, Superior Garden Tools of all kinds, Garden Vases and Pedestals in great variety, and every description of Horticultural Articles, Agricultural Implements, and Furnishing Ironmongery; Dr. Arnott's Stoves, Anglo-Belgian Cooking Stoves; Broiling Stoves. The above low prices being on account of the depression in the Iron Trade, are subject to future alterations.

HOTHOUSES, CONSERVATORIES, &c., made upon the most improved principle, either of iron or of iron and wood combined, which can be fixed complete in any part of the Kingdom, at very low prices, in consequence of the present depressed state of the Iron Trade.

HOT-WATER APPARATUS for heating Hothouses, Conservatories, and Greenhouses; Churches, Public or Private Buildings, &c., with COTTAM'S PATENT, or ROGER'S BOILERS. After 15 years experience, and having fixed upwards of 1500 Apparatuses for the above-mentioned purposes, and by various improvements which they have made during that time, C. and H. can with confidence undertake the erection of similar Apparatus upon the most extensive scale. For the convenience of those who wish to fix their own Apparatus, they have affixed the following low prices:

Cottam's Patent Boiler, 24 inch 47 0s. 0d.

(Larger Sizes in proportion.)

Roger's Boiler, small size 3 15 0

Ditto do. large do. 4 10 0

Hot-water Pipe, 4 inch diameter, 1s. 3d. per Foot.

STRONG IRON HURDLES, 3 ft. high, out of the ground, 6 ft. long, with five horizontal bars, weighing about 36 lbs., 3s. 6d. each.

Light Cattle Hurdles, 3 ft. 6 in. high, weighing 42 lbs. at 4s. 0d. each.

Strong do. do. do. 45 lbs. at 4 4 "

Ox Hurdles, 4 feet high, do. 60 lbs. at 5 6 "

BEST WIRE FOR STRAINED WIRE FENCING at 8s. per bundle of 150 yards each. Uprights for ditto, 7d. each. The Improved continued, and every other kind of Fencing, Fancy Wire work, &c.

HAND-GLASS FRAMES for Cucumbers, &c., 18 inches square, 3s. 6d.; 20 inches, 4s. 6d.; 22 inches, 5s. 6d. each.

CAST IRON FLOWER STAKES 4 feet long out of the ground, 7s.; 4 feet 6, 9s.; 5 feet, 11s.; 6 feet, 15s.; 7 feet, 20s. per dozen.

Show-Rooms at the Manufactory, No. 2, WINSLEY STREET, where every information may be obtained.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of INVARIABLE WIRE-FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasants, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

RENDLE'S TANK SYSTEM OF HEATING.

STEPHENSON AND CO., 61, Gracechurch-street, London, Inventors of the IMPROVED CONICAL and DOUBLE CYLINDRICAL BOILERS, having been much engaged in heating buildings upon the above system with Tanks of various materials, solicit the attention of scientific Horticulturists to an Iron Tank now fitting up on their premises, which offers most decided advantages over every other article hitherto employed for the same purpose. These tanks which are ornamental in appearance can be made from 10 to 100 feet long and of any width and depth, and can be connected or disconnected by any working Gardener without the slightest difficulty, thus affording the opportunity to persons in remote districts of employing this much approved method of heating without the assistance of Engineers. The Tanks can be applied to Boilers and Pipes already fixed, and from the present low price of Iron will be found cheaper than of any other material. Mr. RENDLE, of Plymouth, has kindly undertaken to receive orders and furnish information to any persons in his neighbourhood, and prices for any size will be forwarded upon application to S. and Co.

HORTICULTURAL BUILDING & HEATING by HOT-WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hot-house-Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry, that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

BUDDING'S PATENT GRASS-MOWING MACHINE—This Machine, which has recently undergone some improvements, is admirably adapted for mowing Lawns and Pleasure-Grounds. It is so easy of management that it may readily be used by an unpractised hand; and while the work is much more rapidly performed than by the scythe, the effect is very superior, as it leaves no seam, and it may be used in all seasons, and best in dry weather, when the Grass is difficult to cut with the scythe.

Wholesale and Retail Agents to the Patentee—J. R. and A. Ransome, Ipswich.

Agents in London—Thomas Wilkinson, 309, Oxford-street; Baker and Co., 65, Fore-street, Cripplegate; Cato and Sons, 89, Holborn Hill; Charles Smart, 369, Oxford-street.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

POTTER'S Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL and BRISTOL.

M'Intosh's New Edition of the PRACTICAL GARDENER, in ONE VOLUME, containing the latest and most approved modes of Management of KITCHEN, FRUIT, and FLOWER-GARDENS, GREEN-HOUSE, HOTHOUSE, CONSERVATORY, &c.; comprising numerous explanatory Woodcuts and Steel Engravings. In one large 8vo. vol. (976 pages), 21s. cloth letter; coloured plates, 26s.; and may be had in 10 Parts, at 2s. plain, or 2s. 6d. coloured. By CHARLES M'INTOSH, C.M.C.H.S., Head Gardener to the Duke of Buccleuch, Dalkeith. "The labour and experience of a life devoted to the science of Horticulture we now present to the public."—*Author's Preface.*

London: THOMAS KELLY, Paternoster-Row; SIMPKIN and MARSHALL, and all Booksellers.

FOR AUTHORS PUBLISHING.

Now ready, Fourth Edition, price 2s. 6d., cloth gilt, or 3s. post-free.

THE AUTHOR'S PRINTING and PUBLISHING ASSISTANT: A Guide to the Printing, Correcting and Publishing New Works: Comprising—Explanations of the Process of Printing—Preparation and Calculation of Manuscripts—Choice of Paper, Type, Binding—Illustrations—Publishing—Advertising—Estimates of Cost for large or small Editions—Editions for Private Circulation, &c. With an Exemplification and Description of the Typographical Marks used in the Correction of the Press.

"Every one who has written, or who may write for the press, should possess this work."—*Metropolitan.*

SAUNDERS & OTLEY, Publishers, Conduit-street.

*** AUTHORS and PUBLISHERS desirous of having their Works reviewed in THE METROPOLITAN MAGAZINE are requested to direct copies to be forwarded to the Editor, at the Publishers', Messrs. SAUNDERS & OTLEY, Conduit-street, before the 15th of each month. The ability and impartiality displayed in this department of THE METROPOLITAN are well known, and its Reviews constantly quoted as of the first critical authority.

Just Published,

THE TEMPERATURE OF ENGLAND; Specifying the Mean Daily Variations of Heat in the soil through the year. By J. C. DAVID, author of the "Paradise of Land Proprietors." These Statical Tables are practically useful to Land Proprietors, Surveyors, Architects, & Engineers, Botanists, Florists, Farmers, and all amateurs of the productive glories of the soil. For sale by SHERWOOD, GILBERT, and PIPER, Paternoster-row; RINGWAY, 169, Piccadilly, and all respectable Booksellers. Price 1s. 6d.

NOW ON SHOW, AT
YOUELL & Co.'s Nursery, Great Yarmouth, a splendid Specimen of their **FUCHSIA ST. CLARE**, upwards of Nine Feet in Circumference, literally covered with bloom, to which they respectfully invite admirers of this elegant tribe of Plants to inspect. — June 22, 1843.

The Gardeners' Chronicle.

Tuesday, July 4 . . . Horticultural . . . 3 P.M.
 Friday, July 7 Botanical . . . 3 P.M.

COUNTRY SHOW, Monday, July 3 . . . Slough Pink and Heartsease.

THE Potato crop has of late years been seriously affected by a disease which consists in the production of tubers, instead of stems, when growth first commences after planting, and in the loss of all further power of vegetation consequent upon this malformation. We have examined several specimens of the disease without succeeding in discovering the smallest trace of organic injury, and we feel satisfied that there is nothing in the visible formation of the Potato which will account for it. All the tubers, young and old, seem perfect.

It is therefore probable that Chemistry must be called upon to explain the source of the mischief, and that some deficiency or excess of the proximate principles lodged in the tuber will be found connected with it. Although we have nothing positive to state in confirmation of this suggestion, yet there are some facts which may possibly lead to the discovery. We all know that the Potato-shoots, when first produced, are fed by the matter lodged in the tuber from which the shoots proceed. That matter consists largely of starch; an insoluble substance, which only becomes capable of nourishing a young shoot by changing into gum or sugar. Chemists tell us that such change is effected by a form of matter which they name diastase, in which nitrogen is an element. Since we know that the quantity of azotised matter* found in a Potato varies very considerably, it is probable that the quantity of diastase also varies, and that in some cases it may be altogether insufficient to render the starch soluble, except to a small extent. If that were so, the bud, when it springs from a tuber, would be unable to grow into a shoot bearing leaves, but would develop itself in an imperfect way, and remain as a little tuber, without any power of growing further.

This may be the history of the disease in the Potato now under consideration; and if so, it would perhaps be removed by adding azotised manure; for the latter, when decomposing in the soil, may furnish the nitrogen that is required. It is true that diastase is a peculiar compound, and that we have no authority for supposing diastase itself likely to be formed in a Potato by the addition of azotised matter to soil. On the other hand, we know so little of nitrogen, and its action in vegetation, except that its influence is most important, that it is a fair subject of speculation. If leaves cannot decompose carbonic acid, except in the presence of nitrogen, it may very well be that starch also cannot change into sugar or gum except in its presence, and that in any nascent state it may act just as well as if produced by the decomposition of diastase.

We would recommend then those whose Potatoes are thus affected to manure them at once with water containing ammonia. This can do no harm, and may do good. Experiment, too, is somewhat favourable to the trial; for lately, in the Garden of the Horticultural Society, some Potatoes which had not made their appearance above ground at the time when others planted at the same time were in full vegetation, were, at the desire of Mr. Edward Solly, watered with a weak solution of muriate of ammonia; when in a few days the leaves and stems came up, and are now the most vigorous of all.

THE important effect of the stimulus incessantly applied to Horticulture by the Horticultural Society was never more conspicuously manifested than on Saturday last, as many of our readers can bear witness. The cultivation of some of the plants was quite wonderful, nor was the total absence of bad gardening much less surprising. In former years, the exhibitions of the Society have been what those of the Royal Academy still are—a few noble specimens of art, many good ones, and a great number that reflected no credit on the senders. But the latter class is now fairly eradicated, and it would have been difficult to find on the late occasion a plant really discreditable to the grower, with the exception of one exhibition of Roses.

For this result, the Horticultural Society have an undoubted right to claim credit. It has arisen entirely

* Matter containing nitrogen.

out of their determined perseverance in refusing rewards to ill-grown plants, and in applying their ample funds to the encouragement of good cultivation instead of mere collecting. By setting their faces steadily against all attempts at obtaining prizes for plants merely because they were new, they have raised the standard of British Gardening a thousand per cent., and placed it in a position from which nothing can now make it descend. Complaints have indeed been made of the operation of this system, and a few gardeners have withdrawn from competition at Chiswick; but in doing so, they only proclaimed their unskilfulness by tacitly declaring that the standard of cultivation fixed by the Society's Judges was too high for their abilities. In the meanwhile their places have been taken by better men, who have had the talent to appreciate the true principles of cultivation, and to apply them more skilfully than has ever been done before to practical operations. The miserable Kalmias and wretched forced Roses, whose just condemnation a few years ago by the Judges produced so much discontent, have disappeared; and he would be a bold man who would now venture to produce them; for bad as was one of the exhibitions of Roses in pots on Saturday last, it was better than those to which we allude, and it was the only instance of really bad gardening which met our eye.

We would ask any unprejudiced person whether this improvement would have taken place if the Judges had been weak enough to allow themselves to be intimidated into awarding high medals for low skill, merely because high medals were offered, and none but bad specimens produced. To have done this would have been not only to offer a premium for apathy, but absolutely to discourage exertion; because if exhibitors had discovered that the prizes were awarded under all or any circumstances, they would have had no motive to cultivate their plants better than ordinary. Their great object would have been to ascertain what plants in their own possession were not likely to be produced or exhibited by others, and then by sending them to the Garden they would have easily secured a most unmerited and unwise reward. But the Judges stopped this promptly by declaring that they would not award prizes, whatever might be offered, unless the objects produced were really worthy of the distinction; while, at the same time, they often marked their sense of really good gardening by increasing the medals promised by the Society.

Among the beautiful species that graced the tables, Orchidaceous plants commanded the greatest admiration. A deep bank of the rarest, the gayest, the sweetest, and the most graceful of these charming flowers, a hundred feet in length, formed a spectacle such as has never before been seen in Europe. Some *Heaths*, from *Lucombe* and *Pince*, of *Exeter*, exhibited among miscellaneous subjects, obtained a Gold Banksian Medal, although nothing higher had been offered in that class than the Silver Knightian. The large collections of *Stove* and *Greenhouse* plants from *Lady Antrobus* and *Mrs. Lawrence* were each so good in their way, that they both received the highest prize; and no fewer than seventeen medals, altogether of the value of 25*l.*, were assigned to single specimens of new or rare ornamental plants. Such circumstances sufficiently indicate what this Exhibition was.

We were sorry to see some instances of exhibitors entering their plants in wrong classes, for all such instances are necessarily passed over by the Judges. Some persons, too, could not reach the garden in time, and were excluded altogether. We trust that they will be more exact on a future occasion.

On Wednesday, the 12th of July, the last of these Exhibitions for the present year will take place; and it gives us great pleasure to announce the intention of the Duke of Devonshire, on that occasion, to open his beautiful gardens and grounds to all the visitors to the Society's Exhibition. Few, except the personal friends of his Grace, know anything of this delicious residence, and the permission to stroll through so charming a retreat will, we are sure, be regarded by the visitors as an act of the greatest kindness on the part of the noble President of the Society.

THERE are many clergymen, retired merchants, and tradesmen, who take pleasure in rural occupations, but who would be afraid to embark in the precarious speculation of farming. A neat house or villa, with a good garden, and a few acres of land, naturally suit the *otium cum dignitate* of those who have been long engaged in the active pursuits of life and are now come to the age of repose, while they still want some stimulus to exertion, without much care or fatigue. From the questions which are repeatedly asked us on very simple subjects of practical husbandry, we presume that some general practical instructions as to the useful, if not profitable management of a few acres of land may be interesting to many of our readers, and useful to another class, whom we consider as peculiarly our scholars; we mean young

gardeners, who may often be intrusted with the management of such parcels of land in addition to that of a garden. We will therefore, in a few short articles, give some hints derived from actual practice, which may be useful to those who take pleasure in the occupations of the country, and who may not have leisure to read books on Agriculture, or to study minutely the best practices of improved husbandry. If our observations may appear trivial and our directions minute, we repeat that we do not write for experienced farmers, nor pretend to develop all the *arcana* of modern scientific Agriculture, with its references to physiology, chemistry, mineralogy, and meteorology, but simply to tell those who do not already know it how they may improve their grass-fields, and make the most of any arable land they may occupy, without being led into unnecessary expense or ruinous experiments.

To begin, we shall take a view of the best management of ten, twenty, or thirty acres of grass-land, more or less rich in its nature, where there is no arable land attached to it, and this will probably be the case with the *rus* of many of our readers.

There is no family so small but what will produce manure sufficient for several acres of land: garden refuse and pot-liquor with very little bran or pollard will feed a sow or two; and as there is generally at least one horse kept for use and a couple of cows, a portion of grass-land for pasture and to make hay is a great convenience. The stable-dung will probably be mostly used by the gardener for hot-beds, and if he be not restrained, the whole will be afterwards dug into the garden. There is no necessity for this when the soil of the garden is good and has been kept in tolerable heart; besides, much sweeter vegetables, if not so large, are raised where more vegetable than animal manure is used. Parings of grass where it grows rank and weedy, and sods taken from grips made to let off the surface water from clay soils, laid for a time in a heap and moistened with a little liquid manure and then turned over, will make the best compost for a kitchen-garden or to dig in around the roots of fruit-trees and shrubs: this every good gardener knows well. What we would now inculcate is the economy of manure, so as to have enough for the garden, and also for the grass-land.

The stable and cow-house and the pig-sty are generally looked to as the great sources of manure—so they are on a farm; but where there are only a few acres of grass-land and no great quantity of stock can be kept, it is the house which is the real producer of manure, and that it may be so, there must be an arrangement of drains and tanks so that nothing shall run to waste. If a new house is erecting, the plan of it should always take in a general *cloaca*, that is, a common sink with a proper barrelled drain, by which all refuse liquor is carried to some convenient spot out of sight, where there is a copious well-cemented tank, arched over, with an opening or door through which it may be occasionally emptied and cleaned out. It should be divided by a water-tight partition into two chambers, so that one may be emptied gradually while the other is filling. Into this tank should be brought all the liquid parts of the dung of the animals, and all the water from water-closets, soap-suds, &c.; in short, it should be a universal receptacle for all waste liquids. Close to the tank should be a square pit walled round, to receive all the litter from the stables, and the solid refuse of house and garden, excepting that which the pigs will eat. Into this pit should be collected the mowings of the lawn, the sweepings of the gravel-walks, and all the leaves which can be collected. If the heap is moist it will be in a constant state of decomposition, which may be artificially assisted where there is an opportunity, by occasionally adding some liquor from gas-works, or guano, merely to excite fermentation; but this is not essential, if the tank-liquor be occasionally pumped over it; sods and earth may be added if the decomposition appears to go on very rapidly. The whole may be turned over now and then to accelerate the fermentation, or be trod close to check it. In this way a sufficient heap of rich compost may be obtained which will manure several acres of land. If there is a large tank the liquid should be pumped into a large cask set on wheels, and let out through a hole in the lowest part of the cask, so as to flow on a board set slanting under it, to spread it over a certain space as the vehicle moves on slowly; a bung or valve keeps the liquor in till it arrives at the place which is to be manured. This may be done in spring and after hay-making, choosing rainy weather in preference. No one who had not seen this plan in operation would imagine that from a moderate family and only one horse, a couple of cows, and a few pigs, ten acres of grass-land could be manured every year, and thus twenty or thirty acres kept constantly in good heart. The first expense is not great. The common drain carrying off all refuse liquids to some distance from the house contributes to its salubrity. The effluvia of a well-managed dung-heap are always kept down and absorbed by earth, so as never to offend the senses, besides being out of

sight. In short, this arrangement is the basis of all further proceedings, and the money expended upon it is a capital which will pay a most excellent interest ever after.—*M.*

Our readers will remember the extraordinary aquatic plant, named after her present Majesty, and the anxious desire which has been felt to procure it in a living state. A year or two ago, a small number of seeds reached England, and were dispersed among a few gardens, but they invariably failed. We are therefore most happy to direct attention to an advertisement in this day's Paper, announcing the arrival of a fresh supply, from Mr. Schomburgk, who has also directed that all the purchasers of the seeds formerly sold shall be supplied with other seeds without charge. Thus we hope this magnificent flower will be at last secured to our gardens.

REMARKS UPON THE CULTIVATION OF TERRESTRIAL ORCHIDACEÆ.

By FREDERICK OTTO.—(From the *Gartenzeitung*.)

It is well known that the Orchises of the north of Europe seldom thrive in gardens. The principal cause of this failure is no doubt the neglect of the rule, that all plants should be transplanted when they have arrived at the greatest perfection and have completed their gay flowers. The inexperienced eye cannot distinguish a large part of these plants before they are in blossom, nor afterwards, when they wither and are hardly visible above-ground; so that it would seem as if it were indispensable that they should be transplanted when in their tenderest state, if they are to be had in gardens at all. Nevertheless, all cultivators agree as to this time being the most unseasonable of any. It is, however, possible to transplant them when in flower, if they are taken up with a ball of earth at their roots, so that neither the roots nor flower-stalks are injured; and this is tolerably easy, because a great part of the Orchises grow in damp meadows, where the earth which surrounds the roots does not readily fall off; and in such cases the plant may be removed without its growth being injured. But in the absence of this precaution, it is idle to transplant Orchises during their time of growth. Their roots would never recover the injury caused by such disturbance, and we should wait in vain for their re-appearance the next year.

The best time for transplanting Orchises is really in autumn, when the plants are in a state of rest; and the cultivator must devise the means of finding them, although they are almost withered upon the ground. There can be no doubt that this is the proper time for transplanting; and I find that our species brought from the Tyrol, Switzerland, and Italy, where their tubercles have been properly preserved, will unfold in the following spring, and produce strong blossoms, although they are cultivated and kept in pots.

But this is not all that must be attended to. When our native species are transplanted into gardens great care should be taken as to their situation and soil. I have often remarked that they grow much better if placed between other plants, as they there find themselves in their natural situation. And this is an additional reason for the opinion I have already mentioned, viz., they should be brought into the garden not only with the whole of their ball of earth, but also with all the sorts of plants belonging to it. Experience has taught me that whatever attention we may pay to our Orchises, and however exactly their natural soil is imitated, yet if they are cultivated in neatly-kept beds, they never thrive so well as if they stood among the other plants which naturally surround them—a peculiar quality which appears to be well worth attention.

It would be well to find out whether this species retain this habit in other gardens. Experience has taught that the greater part of the Swiss and Tyrolean Alpine Orchises, as well as those from the south of Europe, are best cultivated in pots; but in this situation the plants weaken from year to year, until the tubercles at last disappear. If we would retain them longer in our gardens, particular attention must be paid to the soil in which they grow; and it would probably be best to cultivate them in boxes which may be covered during the winter months.

In conclusion, it may be useful to those who would collect the northern species and introduce them into gardens to know the situation and soil in which they naturally grow. With this view I submit the following list:—

- Malaxis paludosa*, upon very wet peat earth, among Sphagnum.
- Corallorrhiza innata*, upon stumps of roots in wooded peaty marshes.
- Liparis Loeselii*, in peat meadows, among Sphagnum.
- Orchis morio*, in meadows and pastures.
- „ *palustris*, in damp meadows, often half under water.
- „ *mascula*, in meadows and pastures.
- „ *pallens*, upon chalk in mountain meadows.
- „ *variegata*, in loamy mountain-pastures.
- „ *militaris*, in meadows.
- „ *fusca*, upon chalk in mountain meadows.
- „ *coriophora*, in meadows.
- „ *ustulata*, in meadows.
- „ *globosa*, in meadows.
- „ *sambucina*, in meadows.
- „ *maculata*, in very dry meadows.
- „ *latifolia*, in meadows.
- Anacamptis pyramidalis*, in meadows.
- Gymnadenia conopsea*, in meadows.
- „ *densiflora*, in meadows.
- Platanthera bifolia*, in dry meadows, on mountains, and in forests.

- Herminium Monorchis*, in meadows.
- Ophrys Myodes*, in shady forests, particularly upon chalk.
- „ *arachnites*, in meadows, also upon limestone.
- „ *apifera*, upon limestone hills.
- Epipogium Gmelini*, upon mouldering roots of trees, in mountainous woods.
- Spiranthes autumnalis*, in meadows.
- Neottia Nidus avis*, growing upon roots of trees in woods.
- Listera ovata*, in damp places in common woods.
- „ *cordata*, in mountain meadows and woods.
- Epipactis latifolia*, in forests.
- „ *atrorubens*, in mountain woods, particularly upon limestone.
- „ *viridiflora*, in shady places.
- „ *palustris*, in meadows.
- Goodyera repens*, in Fir woods among moss.
- Cephalanthera rubra*, in shady woods.
- „ *ensifolia*, in shady forests.
- Cypripedium calceolus*, in shady woods.

TRELLIS FOR CLIMBERS.

ON RENDERING VINES PRODUCTIVE.

SEEING some remarks by "Mr. R. Errington," at page 211, also by "A Grape Grower," at page 286, on "Mr. Roberts's Treatise on the Vine," reviewed by you at pp. 103 and 119, has induced me to forward the following, which is merely a copy of a short communication given to Mr. R. Thompson, of the Horticultural Society's Garden, at the meeting of the 13th June, 1840, when I received the thanks of the Society for forwarding my Grapes.

The Grapes forwarded along with that communication were of the third crop, from Vines planted in the beginning of May, 1837.

The object in view when planted having been obtained—viz., a plentiful supply of fruit in as short a time as possible,—I forward the account of the mode of treatment adopted, for the benefit of those who may be similarly situated.

Two Vineries were erected at Hawkstone, Salop, (the seat of the Right Hon. Viscount Hill,) in the spring of 1837—the one for an early, the other for a late House. The borders were thrown out three feet deep and thirty wide; and after taking every precaution necessary for preventing a stagnation of water, they were filled up with the following mixture, viz.:—

To every six loads of turfy loam were added—one load of well-rotted manure, one load of leaf-mould, half a load of sand, and a quarter of a load of bone-dust. The whole being well incorporated and slightly trodden, the Vines were planted in the following manner:—

Having selected them principally of one year's growth from the bud, with from three to six feet of well-ripened wood, after removing all the buds except the leading one, and having slit them under every other bud (previously removed) and placed a small piece of decayed wood to keep it open, for the purpose of making them root more freely in the following compost—one-third leaf-mould, one-third decayed tan, one-third sand,—part of the above compost was laid on the surface of the prepared borders, when the Vines were laid on it, and entirely covered (except the leading bud) with the same mixture.

That year they were allowed to grow without stopping the leading shoots, many of them exceeding 20 feet in length, and when pruned there was left from 10 to 15 feet of well-ripened wood, thicker than many which I have seen of three and four years' planted Vines.

On commencing to force the early Vinery, in March, 1838, by proper attention to heat and moisture, there were few buds that missed; the result was a supply of Grapes from July, 1838, to February, 1839.

In 1839, the forcing commenced in February, the Vines being previously pruned on the close-spur system, the supply of Grapes lasting from June, 1839, to March, 1840, the last being cut on the 8th of that month.

In the year 1840, the early Vinery was commenced in January, the Grapes accompanying my communication to the Society being part of the produce.

To this I may add that, after the drains were laid and filled in with stones, the border was perhaps not more than two feet deep. But planting the Vines is nothing to

the means you must use for bringing them on afterwards, as without attention to their daily wants you cannot be certain of success, though you may, by chance, hit the mark. As facts are not easily disputed, and as your *Chronicle* is widely circulated in this and the surrounding counties, I beg to inform your readers that I have this season re-laid on a similar plan two Vineries, which I shall feel a pleasure in showing to any who "labour in the Vineyard," or other respectable persons who may feel an interest in scrutinising the effects produced.—*James Macdonald, Mount Shannon, Castle Connell, Ireland.*

AMATEUR'S GARDEN.—No. XXV.

I AM sorry to find that the remarks I made relative to the spot on Mr. Cock's Pelargoniums have given offence, for in referring to them I merely wished to show that the Amateur could not be surprised at his plants being attacked, since the best cultivator in the country had not been able to avert the disease; and I regret it the more because, as Mr. Cock has publicly denied the statement, he has compelled me, in justice to myself, in the same manner to prove that if I was in error, that error originated with Mr. Cock himself.

The facts are these: in looking over the grounds of the Duke of Devonshire, at Chiswick, early in February, I noticed to Mr. Edmonds that his Pelargoniums had the disease, and the conversation turning upon the subject, he stated that Mr. Cock was in trouble about it, and a short time before had destroyed some of his plants, alleging that if he did not it would spread through the whole collection. I mentioned the subject again to Mr. Edmonds on Saturday last, and he assured me he perfectly recollected, to use his own words, "the earnest manner in which Mr. C. spoke of it."

Had Mr. Cock addressed me privately in this matter I would with pleasure have modified or withdrawn the statement; but as he did not he must not now blame me for clearing myself, though it be at his expense. As, however, it appears Mr. C. experienced no difficulty in ridding his plants of the disease, I am sure he will be conferring a great favour on a number of the readers of the *Gardeners' Chronicle*, both amateurs and practical gardeners, if he states the particulars of the treatment to which his diseased plants were subjected.

The learned President of the Microscopical Society assures me there is no trace of insects in the leaf of the diseased plants, and therefore I suppose all my former speculations are worthless. Indeed, no person, with the exception of Mr. Cock, appears to understand the disease, as one attributes it to cold, a second to deleterious particles in the soil, a third to damp, and so on; almost every person ascribing it to a different cause. But let its origin be what it may, it is pretty certain that it is a contagious disease, and that neither heat nor cold, nor drought nor moisture, will prevent it for any length of time; but if the infected part be merely pricked with the point of a pen-knife when first perceptible, the disease will not spread any further in that part, as I have satisfactorily proved within the last fortnight; I therefore still say, prevent its spreading as far as possible, and in every available manner.

Never, in the whole course of my practice, had we such an unfavourable season for flower-gardening, for in thousands of instances half-hardy plants are not so large as they were six weeks back; and now, instead of drenching rain, we have parching days, and cold dewless nights. But what is to be done? Why, in many cases, tender spring-propagated plants must be taken up again, and the beds planted with something more hardy; and those that are left must have the soil well stirred about them to the depth of two inches, to make a light surface and prevent the evaporation of moisture. Peg the plants down as they require it, and train them so as to cover the ground as quickly as possible. One thing, however, this season has taught me, and that is, that in this uncertain climate there is no dependance to be placed in spring-propagated plants for bedding out. Circumstances have compelled me, to plant out about ten thousand plants, propagated since March, and in almost every instance they will be a month later before they are in bloom than those propagated in the autumn. I can therefore with confidence say to the inexperienced,—if any one tells you that spring is the best time to propagate plants for bedding out, do not believe him.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Heating Apparatus.—I observe at p. 345 of the *Gardeners' Chronicle* a second inquiry respecting bottom-heat by tan, similar to the inquiry at p. 305 by "Amateur." The following plan may be relied on as having been fairly proved at Fortan Cottage, near Lancaster, the residence of R. Tanguy, Esq., and it has far exceeded his expectations for raising seedlings and keeping plants in winter. By a slight inspection of the figure it will be easily understood.

An inclosure is made of stone, about 12 ft. long, 5 ft. wide, and 2 ft. high, and is covered over with stone flags. Then there are placed thereon two hot-bed frames, and a quantity of sand is placed in them for the seed-pans and pots to stand upon. A fire is made in the inclosure, of turf, the ashes of which will keep hot for a long

time,—that is, after a quantity has been got into the inclosure,—so that, at night, a turf is laid on the hot ashes, and will keep burning all night and maintaining the heat in the inclosure; and if the day is fine and sunny, there needs no turf putting to the ashes, but if the day be wet and cold, then turf may be applied, and the heat will be kept to what is required. To supply moisture in the frames it only requires the sand to be watered. At one end of the inclosure there is a small door for supplying the fire. Where turf is not to be had it may be done with wood or sawdust; the whole is a very trifling expense, and may be made to any size. I have taken away part of the inclosure and the frame for the purpose of showing the inside of both.—*M. Saul, Garstang.*

Wheelbarrows.—In filling earth into a wheelbarrow with a spade, it is no uncommon thing for the spade to strike the end of one of the wheelbarrow handles, and take part of it away; what remains is generally smoothed with a knife to prevent the hand of the person from being injured, and by repeated strokes of the spade, and repeated paring with the knife, the ends of the hands of the wheelbarrow will have the appearance of pointed sticks, and are very unpleasant to work with. By way of experiment, some years ago, I had the ends of one protected with shields of iron, which have answered all that was required of them. The iron used was about as thick as a halfpenny, and made to fit the ends of the handles, which is commonly of an oval shape. Two holes were made in each shield, and were fastened to the barrow with small screws. The spade and the shield have come sometimes in contact, but the shields have preserved the wood from being injured.—*Peter Mackenzie.*

Excavation of Trees by Birds.—The Parus, or, as it is called by some, the Titmouse or the Blue-mope, does much mischief in gardens and orchards by picking off the tender buds of trees. Thirty-one species are scattered over the globe, of which 8 are common to our own country. It is a very fertile tribe, laying from 10 to 20 eggs at one hatch. They feed on seeds, fruit, and insects, and a few on flesh. Most of them are fond of the brains of other birds, which they get at by cleaving the skull of such as they find dead. They are restless, bold, and cruel to birds less than themselves, and will attack such as are three times their own size. My attention has been drawn for some time past to a pair of those birds, which have built their nest in a tree by the side of a road along which I have to pass. A description may be of interest to others. The tree is an Elder. It is about 4 feet high, and 10½ inches in diameter; and an Ivy plant has grown upon it, which gives it a most beautiful effect—the top having been cut off some years ago. The first time my attention was drawn to this tree was by observing a bird peeping from one of its cavities. On examining the tree, I found the entrance no larger than I could put the end of my finger in, and I should not have supposed that there was such a thing in the tree if the birds had not come out at the time I was passing. I was therefore induced, at different times, to watch their movements; as it is now quite clear that when I first observed them, they were just commencing to excavate the interior of the tree for another apartment; and as the one picked off the wood in the new apartment, the other brought it out and dropped it at a distance from the tree, in the road; I suppose for fear of their place being discovered. But on the 12th of May last it was found by a lad who was passing by, as a bird was coming out of the tree at the time. The lad then commenced breaking into the tree to get at the nest, which he found contained 8 eggs. It so happened that I shortly after had to pass the place, when I saw what had occurred, and examined the wonderful work that those two birds had achieved. There is a passage between the two apartments. The first apartment, it is quite clear, had been made last year, as there was an old nest which the birds had not discovered. The first had been made last year, the other in the present year. The entrance from the old one was from the back, and the entrance was a small round hole which was just above the side of the nest. The wood of the tree was scooped out about 4 inches by 3 inches, being an oval-shaped cavity, and about 2 inches deep in the centre, and which was lined with a little fine moss. The wood was picked, and formed as finely as if it had been done by the hands of man. An engraving, representing this singular circumstance, has appeared in a work entitled "The Builder," but it is very incorrect. I have since met with another of these nests in the stump of an old Sycamore tree, and which I have no doubt has been occupied several years by a pair of those birds. There is only one apartment in this tree, which has but just been found out, on account, I suppose, of its requiring a carpenter's axe and much labour to come at it.—*M. Saul, Garstang.*

Bees.—"A Lady" has requested me to state how swarms are to be taken off artificially, and to give the dimensions of the hives I recommend; if I induce a few apiarians to keep large hives, and adopt the artificial system of swarming, I shall do some good; and I am fully aware that Mr. Nutt and his disciples, with Mr. Wighton and his, are pursuing phantoms. Mr. Wighton says, in his answer to my last letter, "The propensity of Bees to swarm acts against keeping them. How galling it is to have the number of Bees reduced instead of having a bellglass of honey!" What! does the swarming of Bees reduce their number? No, it increases the number two or threefold. Three or four Queens are breeding instead of one. All systems that prevent Bees from swarming are not profitable. If Bees in a good locality are managed properly, two swarms will be taken from every stock every year; and if the year be propitious, one or two bellglasses of honey may be got from the first swarm. But I must tell the cottager, whose paramount object is profit, that Bees,

when kept in one apartment, gather a third more than when kept in two. Therefore, he will find it more lucrative to raise the hive by ekeing, than putting a box on the top, unless he can sell the comb in the box at about double the price of run honey. The hives of which "A Lady" wishes me to give the dimensions are from 20 to 24 inches diameter, and from 12 to 15 inches deep, for first swarms; and a little less, and deeper in proportion to size, for second swarms. Shallow hives are not good for winter stocks, though Bees can put more honey into them than into deep ones. We take off swarms thus:—Blow a little smoke from cotton rags (rolled up in the shape of a candle) into the hive, which stupefies the Bees; lift the hive off the board, and place it a few yards from the stool with its crown on the ground; place an empty hive of the same size on it, and tie a cloth round the joining of the hives to keep in the Bees; place the hive that the young colony is about to be put into, on the board, then rap or drum gently on the old hive for about the space of ten minutes to make the Bees run into the empty one (the warmer the night the faster they run); take off the topmost hive, and place it on the ground with its mouth up—spreading the cloth over the old one; and then look for the Queen in the swarm. She is easily known; as soon as she is seen shake the swarm into the hive that is on the board, and all is finished in less than 20 minutes. Two-thirds are about the usual number that go with the first swarm, but this must not be the rule; for there must be as many left in the old hive as will cover and bring out the brood. If there are not enough taken from the old hive, the cloth must be removed for a few minutes; if too many, place it on the board for a few minutes. The old stock place a yard to the right, the colony a yard to the left of the old stool. I have been very verbose on this subject, for we have found artificial swarming to be very profitable indeed. How galling it is to stand for days beside a hive, and see the Bees loitering away their time! What an absence of knowledge and poverty of genius is exhibited in doing so! What an incalculable loss!—*A. Pettigrew, Wrotham Park.*

Chloride of Lime for Worms, &c.—As I have frequently seen in the *Chronicle* Limewater recommended for destroying worms, and by one correspondent Corrosive Sublimate, both of which I admit are very good—but the latter, I should think, from its very poisonous nature, will never be generally used, while the former is not easily procured by some—and as I was very much annoyed by the worms getting into the pots, of which I have five or six hundred, and not a place where I can set them in the summer season, excepting round the edge of the grass-plot, I have used for this last three years Chloride of Lime, and I have found it quite to my wishes. The quantity that I use is about an ounce to eight gallons of water, and I have never found it to hurt or discolour a leaf, as I have frequently watered the beds, plants, and grass-plot all over. It kills the moss on the latter; but what I find it the most useful for is about every month to water round the pots, that it may run underneath, which it quickly does, the garden being on the descent; and by making the water a little stronger, and applying the brush gently to cause it to go over every part at the same time, it effectually destroys all the green on the flagstones. Lime in a powdered state is a most excellent thing (but this is going from gardening) for destroying the small bugs that fowls are infested with. All fowls are not troubled with them, but where they are, they are a great pest; so much so that scarcely a hen will sit its time, and if she should, she is in general so weak as not to be able to bring the chickens up. By throwing a few handfuls on the roost now and then it keeps the place quite free from them. They are very small, and like the red spider, only white-brown. I only know that they are very busy little gentlemen, and should they chance to get in your head, they will make full employment for both hands.—*W. P.*

The Lily of the Field.—Some time since (vol. ii. p. 744) we ventured to express our confident belief that the Lily to which our Saviour referred in His Sermon on the Mount, was not, as is commonly supposed, the White Lily. And we grounded our opinion upon the absence of all evidence of that plant being found in the Holy Land. A kind correspondent has just put into our hands a letter from a gentleman resident at Aleppo, who completely confirms our conjecture. He says: "Although I have resided long in Syria, I am imperfectly acquainted with the botany of Aleppo and Antioch only. All I can say is, that I never saw the White Lily in a wild state, nor have I heard of its being so in Syria. It is cultivated here on the roofs of the houses in pots as an exotic bulb, like the Daffodil."

Mulberry Trees.—About 11 years ago I put a very small Mulberry tree into my garden. It has grown very nicely, and looks healthy. For three years—say from 1839 to 1841—it produced a good deal of fruit. In 1842, however, I had scarcely any fruit: the tree was full of blossom, but it was all false blossom, and fell off. This year it is loaded with bloom, but it is all false, and I fear I shall have no fruit. The soil is a black common soil; near the tree I have Strawberries—they are producing nothing this year. May I beg to inquire how I had better treat the tree in order that it may produce fruit?—*J. M.* [See a leading article a week or two ago.]

Autumn Sowing of Annuals.—I beg to call the attention of some of your numerous readers, more particularly the amateur, to a subject which undoubtedly deserves to be in more general practice—I mean that of sowing hardy Annuals to stand over winter for early summer flowering. Although there is perhaps little original in the practice followed here, I will describe my method for the benefit of the amateur, who generally is anxious to make his little parterre as attractive as possible. About the first week of October I sow my seed, on a fine day, in beds,

in a situation that is sheltered from cutting winds, but freely exposed to the influence of the sun and air, treading the beds moderately firm with the feet, as the young plants are not so liable to be thrown out by frost on a firm as on a soft bed, and finishing off with the rake. Nothing more is necessary, except keeping free of weeds, until the following April, when I prepare beds or borders where I intend the plants to flower. I then transplant them in beds, in rows 9 inches apart, and at the same time sow seed of the same sort with them on the same bed. By this method I have two crops on the bed the same summer, and a brilliant show of Annuals from the 1st of May throughout the summer and autumn months; I also follow the same practice in planting patches in the mixed border by dropping in seeds of the same sorts. The sorts I treat as above are *Plectoitis congesta*, *Collinsia bicolor* and *grandiflora*, *Clarkia pulchella*, *Gilia tricolor*, *Eutoca viscida* and *E. Manglesii*. The *Nemophila insignis* and *atomaria* are both very hardy to stand the winter, but I prefer sowing them where they are to flower. The above will all withstand the severest frost if the beds are firm, moderately sheltered, and on a dry bottom. And I believe as many more might be added equally hardy, but these present a sufficient variety to be interesting.—*G. W. G. L.*

Wrens.—"Peter Mackenzie's" paragraph, in your Number of June 10, reminds me that in Gloucestershire it is a common traditional persuasion that the male Wren is the sole tenant of a nest which he occupies in single blessedness. I well remember, as a bird-nesting boy, to have met with these nests, and to have been told contemptuously, "Oh! it's only a bachelor Wren's nest." There is mostly some foundation for these articles of the popular faith.—*G. W. S.*

Melons.—If "I. H. S." will grow his Melons about eight or ten inches from the glass, he will find them answer very well. I have grown them so for four years in two light frames, and have invariably ripened eight in each light, the produce of three plants. I have them now eighteen inches in circumference.—*Cummins.* [We hope to hear again from this correspondent.]

Asparagus.—Perhaps at this time of day you will scarcely believe that the great proportion of practical gardeners disbelieve the method which you recommend for raising Asparagus, chiefly because it does not accord with the practice they have been used to, and therefore they cling to the old lazy fashion of trusting to covering them up with manure before winter, and cutting only a shoot here and there in spring, allowing of course the pith and essence of the plants to be wasted as heretofore in weak shoots, which they permit to spindle up from the first, and especially the weakly ones. In your last Number, June 10, there are very good hints given on this subject, but they are not specific enough, as I venture to think, to cause uninitiated beginners to adopt your suggestions, and far less to induce the old gardener to abandon his prejudices, especially that class which is in service, and has the ear of the master or mistress, who are in general themselves ignorant of kitchen gardening, and permit themselves to be overruled by men who are too often most distinguished by their obstinate resistance to everything new which they themselves do not suggest. There are few things that old-fashioned gardeners swagger more about than the produce and management of the very three things which you have treated of so well and so rationally in your last Number. I mean Sea-kale, Asparagus, and Rhubarb. I myself believe that the cultivation of the Potato itself is not more simple and commonplace than is that of these three most excellent vegetables. But will this be admitted and acted on by those who, having served a routine apprenticeship in order to befit themselves for managing gentlemen's gardens, devote their attention much more to the treatment of the forcing-house, the conservatory, or the Melon and Cucumber-frames, than to the more useful products of the kitchen-garden? I fear not. In this conviction it is that I apply to you to instruct us how to cultivate successfully the classes of vegetables which require several years to bring them to perfection. Asparagus being a great favourite—I should say the greatest of these—and the present being the proper season for carrying into execution the excellent views which are expressed in general terms in your last Number, I would suggest to you the advantages which would accrue from a set of general rules being immediately promulgated as to its cultivation during summer, now that the season for cutting is over. It is but justice to you to say here, that on reading the first paragraph in the *Chronicle* which I noticed this spring on the cultivation of Asparagus, I caused my Asparagus beds to be cut clean over as with a scythe, then I had a considerable portion of them dressed with guano, at the rate of four cwt. to an acre of land; and from that day to this I have not allowed a single shoot to run up, not caring whether they were fit for table use or not, but cutting everything off the beds whether small or large—and I have had far better Asparagus as well as much more of it than ever before. Has my practice in this squared with the advice which I understood you laid down? Next let me ask, should every shoot, whether small or large, be allowed to run to seed now that cutting for table-use is at an end? If not, say how these should be selected, restricted, and regulated, for this point is one of great importance with the uninitiated, when contending for a better system with those who can boast of having served an apprenticeship to the craft. Your recommendation of summer dressing and manuring Asparagus, being new in these parts, will probably be stoutly disputed, unless you shall fortify your recommendation from authority.—*Robert Wallace, Kelly.* [We are sorry to hear so unfavourable an account of the gardeners in our correspondent's neighbourhood. That

persons are to be found who refuse to alter any part of their practice, however defective, is no doubt true; but this occurs with others quite as much as with gardeners, and is the inevitable consequence of bad education and a want of intercourse with the world. We must say, however, that the really respectable of modern gardeners are not open to the complaints of our correspondent. With regard to the treatment of Asparagus and the necessity of improving the usual way of growing it, no other evidence is required than the quality of it in Covent-Garden market. There are few better kitchen-gardeners than those round London, and yet their Asparagus seems intended to form timber rather than a tender and delicate esculent. If we can find leisure we will comply with our correspondent's wishes, by putting directions for its cultivation into a specific form. In the meanwhile we can only say that so far as its summer management goes, all that is necessary is to water it with liquid manure and common salt, very often and not strong, while the plants are growing; to preserve all the shoots, weak and strong, and to let them die a natural death. Nothing can be worse than the practice of some people to cut off the stems early in the autumn, before they begin to die naturally. If it were possible to prevent the formation of the berries it would be so much the better; but as that can only be done by hand-picking the operation will probably be found too tedious.]

Tile-Draining.—In your last Number you have quoted largely from a correspondent in Kent (Mr. Hammond), on Tile-draining, with cylindrical tiles of a very light description and small size—so much so as to admit of seven thousand being drawn on a waggon; this to us in Scotland, who find three to four hundred enough to draw with one horse over common country roads, is something astounding; and your correspondent would do a great favour, were he to state the size in length, breadth, and thickness of the Tiles he alludes to, and their weight by the thousand. I shall offer no apology for making this communication, considering it to be a duty to ask for and give information on any subject in which the comfort or prosperity of the people are concerned; and that such knowledge is very much required to remove antiquated customs, and to overrule prejudices of long standing.—Robert Wallace, Kelly.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

June 17.—Nothing could be more brilliant or attractive than the second grand exhibition of this Society at their gardens, Chiswick. The day was exceedingly fine, but not oppressively warm; the lawns dry, yet beautifully green; all vegetation, owing to the late rains, most richly luxuriant; the company unusually numerous and splendid; the gardens in the best keeping; and the show, both of flowers and fruit, so excellent throughout, that there was scarcely a class in which a remarkable superiority was not manifest. Indeed, it seems to have been generally considered that this fête was altogether unequalled by any of the previous ones. More than 11,000 visitors were present. We learn, however, that, by not conforming to the rules of the Society, which stipulate that the objects for exhibition shall be in the garden by a given time, Mr. Gaines, of Battersea, had part of his collection of Pelargoniums excluded, and that other exhibitors were similarly shut out.

As the Orchidaceæ, from their numbers and beauty, constituted the point of greatest attraction, we shall speak of them first. Of specimens, there was the exquisitely fragrant *Aérides odoratum*, shown by Mr. Mylam, gr. to S. Rucker, Esq., Wandsworth. It was in a wonderfully healthy state, and covered with its drooping racemes of lovely flowers, some of which, however, were not expanded. Next was the charming *Barkéria spectabilis*, from Mr. Brewster, gr. to Mrs. Wray, of Cheltenham. This was a magnificent specimen, and most superbly in bloom; it is cultivated in an open wire basket, with scarcely any soil, and that of the most and most for its description. Further, there was *Oncidium lanceanum*, exhibited by Messrs. Veitch and Son, of Exeter, in an astonishingly fine state of health, a very large specimen, and blooming admirably. The breadth and deep verdure of the leaves of this plant were very peculiar. A small specimen of the elegant *Phalænopsis amabilis* was contributed by F. G. Cox, Esq., of Stockwell. Mr. Hunt, gr. to Miss Traill, Hayes Place, near Bromley, sent a very handsome plant of *Epidendrum macrochilum*. It was the white-lipped variety, and beautifully grown. A noble specimen of *Peristeria pendula*, with singularly large pseudo-bulbs, and clusters of prettily spotted flowers, came from Mr. Edmonds, gr. to his Grace the Duke of Devonshire, Chiswick. *Mormodes luxatum*, a curious greenish-yellow flowered plant, was from Mr. Insley, gr. to G. Barker, Esq., Birmingham. Of collections, that from Mr. Mylam, gr. to S. Rucker, Esq., contained a particularly beautiful little specimen of *Phalænopsis amabilis*, the flowers of which had quite a snowy whiteness; *Aérides affine*, with long streaming racemes of white and crimson blossoms; *Saccolabium praeorsum* and *guttatum*, exquisitely cultivated and flowered; the large variety of *Oncidium ampliatum*, the singular and pretty *Oncidium pubes*; a handsome plant of *Oncidium leucocolum*; *Epidendrum primulinum*, with a very rich and free-flowering spike; *Vanda teres*, tolerably well bloomed; a healthy *Maxillaria purpurea*; the strange *Coryanthes maculata*; *Zygopetalum cochleatum*, with an immense flower, the petals and sepals of which had been strangely united; very fine plants of *Epidendrum alatum* and *E. cinnabarinum*, the latter particularly showy; a new species of *Epidendrum*, not much unlike *E. alatum*, though having a larger and prettier lip; the novel *Peristeria Humboldtii*, blooming profusely; *Cynoches chlorochilon*, with its enormous yellowish-green blossoms; *Brassia Wrayæ*, having rather stiff racemes of flowers; the splendidly mottled *Oncidium luridum* *guttatum*; *Epidendrum macrochilum* *roseum*, with its handsome crimson labellum; *Stanhopea Barkeri*, a very pale-flowered species; and magnificent specimens of *Aérides odoratum* and *Maxillaria cristata*. Of the *Aérides* it may be remarked that, from having so many strong roots, it did not seem to flower quite so abundantly as it has done; while the *Maxillaria cristata*, which few persons can cultivate well, had two unusually long racemes of expanded flowers, and several others in a state of progression. The last-named species was decidedly the most meritorious in the collection, as regards culture. In the group furnished by Mr. Paxton, gr. to his Grace the Duke of Devonshire, Chatsworth, the principal plants were *Dendrobium cærulescens*, a gorgeous specimen, with more than 400 blossoms, and having a plant of *D. Wallichianum* in the midst of it; *D. nobile*, not much less beautiful than the preceding; and *D. intermedium*, apparently between *D. nobile* and *cærulescens*, a lovely plant. These specimens were just in that condition when the species flowers most liberally; for, unlike some other *Dendrobium*, after they get old they never bloom so well. They had been kept back to the present somewhat unnatural season by being placed in a cool house and shaded. Another striking object was *Phalænopsis amabilis*, the leaves of which are so large as to resemble those of a Palm, while the flower-stems are seven or eight feet in height. It requires growing in a large pot, and is then one of the most

stately and ornamental of the tribe. There were specimens, besides, of the interesting *Cattleya citrina*, the flowers of which are deep yellow, pendulous, and often solitary; *Maxillaria ochroleuca*, a mass of small yellowish blossoms, which are so profuse that they almost hide the pseudo-bulbs; *M. tenuifolia*, with very narrow leaves and richly-marked flowers; *M. vitellina*, a rather showy and neat-growing species; *M. Xanthina*, with the habit of *M. stapelioides*, and lively yellow blossoms; a very good plant of *Peristeria cerina*; *Oncidium sphacelatum*; *O. pulchellum*, remarkable for its elegance; *O. divaricatum*, another graceful species; *Epidendrum variegatum*, finely grown; a plant of *Renanthera coccinea*, the flowers of which are more deeply coloured this season than usual; the minute but pleasing *Saccolabium gemmatum*; *Burlingtonia venusta*, full of its charming white blossoms; and a new species of *Dendrobium*, with slender drooping stems, and delicate pinkish flowers, which are darker in the bottom of the lip, and are borne numerous on the older stems. Messrs. Rolleston, of Tooting, exhibited *Stanhopea oculata*, richly laden with its beautiful and odorous blossoms; *S. saccata*, a very nice little species, and excellently grown; a pale-flowered variety of *S. Wardii*; a good plant of *Aérides odoratum*; *Renanthera coccinea*, with very splendid blossoms, like that before mentioned; a luxuriant plant of *Maxillaria tetragona*; *Cattleya Mossie*; an extremely fine *Aérides affine*, and *Vanda teres*. From Mr. Insley, gr. to G. Barker, Esq., of Birmingham, there were a noble *Peristeria Humboldtii*; a species of *Cymbidium*, with foliage like that of *C. aloifolium*, but larger and different flowers; *Cyrtocentrum stellatum*, blossoming abundantly; *Phalænopsis amabilis*, *Cynoches chlorochilon*, *Maxillaria Xanthina*, *Oncidium pubes*, a good light-flowered variety of *Stanhopea Wardii*, and *Mormodes citrina*. The collection from Mr. Goode, gr. to Mrs. Lawrence, Ealing Park, included a highly meritorious *Oncidium flexuosum*; *Epidendrum crassifolium*, in the best of health; some gigantic *Gongoras*; a small *Aérides odoratum*; *Acropera Loddigesii*, with its aromatic scent, in good condition; *Cattleya Mossie*; *Bletia Shepherdii*, peculiarly handsome and well-cultivated; *Maxillaria stapelioides*, uncommonly strong; a large plant of *Dendrobium calceolare*, but with only a few flowers opened; a good *Mormodes citrina*; *Aérides affine*, finely bloomed; *Stanhopea quadricornis*, *S. oculata*, and a very dark variety of *S. tigrina*, all in capital flower; with *Dendrobium secundum*, a specimen that was in better condition, and had more ample racemes of flowers, than is generally to be met with. On looking over these plants, we observed that some of the species with pendulous racemes, especially the *Stanhopeas*, required a green background to throw out their pale blossoms to advantage; and to supply this defect Cabbage-leaves had been employed in one or two instances, presenting a mean and slovenly appearance. In such cases, however, it would be advisable for exhibitors to cover the pots with moss, or even green gauze, or anything of the kind that would not be conspicuous. We also noticed that a few of the species which were growing on logs of wood had these inserted in flower-pots. *Cattleya Mossie*, thus treated, had a good effect. Most of the exhibitors, too, had hung cards to their specimens, with the names of the plants legibly written on them; and though, perhaps, a green card would be preferable to a white one, on account of not drawing the eye so much away from the specimen itself, it is most desirable that this practice should be carried out universally, as it is with Pelargoniums, &c.

After the Orchidaceæ, the plants most meriting attention for their showiness and the superiority of their culture, were in the smaller collections of stove and greenhouse species. Of these, Mr. Hunt's, gr. to Miss Traill, came first, and comprised *Boronia serrulata*, a very admirable specimen, so full of branches that there was scarcely a vacant space of two inches on any part of its surface; *Oncidium flexuosum*, wonderfully large, healthy, and compact, and showing that Orchidaceæ, as well as other plants, may be subjected successfully to artificial training and management, for the plant, though only two feet in height, and as broad as it was high, had no appearance of having been operated upon by art; *Dendrobium nobile*, in the most perfect health, and with very large flowers; a fine *Ixora coccinea*; a spreading, dense, and well-flowered *Pimélea decussata*; and a magnificent *Leschenaultia formosa*. Mr. Falconer, gr. to A. Palmer, Esq., Cheam, and Mr. Bruce, gr. to B. Miller, Esq., Colliers' Wood, had collections of equal merit. That of the first was composed of *Leschenaultia formosa*, precisely in the shape of a bee-hive, and more thoroughly covered with flower than any plant we have ever before witnessed; a healthy *Oncidium altissimum*; a most magnificent *Polygala cordifolia*, four feet above the pot, and the same in width, surpassed by none in beauty; *Ixora coccinea*, four feet high, yet having none of that bareness at the bottom which is common to tall plants of the species, and being handsomely flowered as well; with *Epiphyllum speciosum*, grafted on *Cereus speciosissimus*, and trained so as to form a gorgeous front of inflorescence. Mr. Bruce's plants were a noble *Epiphyllum speciosum*, treated as that just specified in respect to grafting, but trained into a smaller compass, so as to exhibit the same aspect on every side, and exhibiting great skill in its management; *Coleonema gracilis*, particularly good; a fine *Oncidium flexuosum*; *Aphelexis humilis*, in the most perfect flowering condition; and a favourable specimen of *Leschenaultia formosa*. Mr. Clarke, gr. to T. Smith, Esq., Shirley Park, showed a collection which, in respect to the healthiness of the plants, was of the highest excellence. It had in it a glorious specimen of *Leschenaultia formosa*; *Boronia denticulata*, magnificently cultivated; *Polygala oppositifolia*, and *Pimélea decussata*, peculiar for the richness of their foliage, and the size as well as deep colour of their flowers; with *Chorozeina Dicksonii* and *Eutaxia pungens*, which were as close and well-blown as if this were their ordinary habit. In the last collection belonging to this class, contributed by Mr. Frazer, nurseryman, of Leyton, the best plants were one of *Pimélea decussata*, and another of *Epacris grandiflora*. The *Epacris* was about three feet high, and in every respect perfect. As instances of cleverness in culture, most of the specimens thus enumerated, though not excelling others in the exhibition, were of the very highest order of merit. Straggling tendencies had been overcome, compactness of growth attained, the disposition to bloom increased, the largest plants had been kept luxuriant and free from bareness at the lower part of their stems; while all the while their aspect was generally natural, and such that at least none of the machinery of art was discernible. They were chiefly in large pots, free from stakes except to the main stem, and these entirely hidden by the branches, with the shoots regularly disposed on all sides, the flowers all standing out well, so as not to be concealed by the leaves, conspicuous for breadth rather than height, and almost as full of flowers at the sides, down to the very rim of the pot, as at the summit.

Of the largest collections, there were two of which the qualities were so delicately balanced that the judges awarded them both a first prize. They were produced by Mr. Green, gr. to Sir E. Antrobus, Bart., and Mr. Goode, gr. to Mrs. Lawrence. We shall specify the principal objects in each, beginning with Mr. Green, who had three singularly interesting plants.—*Azalea indica variegata*, lateritia, and *Gledstanesii*, which, though not so grand as some of his other specimens, were deserving of the highest praise. They were about six or nine inches high, very full of healthy leaves and fine flowers; and one of them, *A. Gledstanesii*, almost hid the pot in which it was growing. They appeared to have been raised from cuttings, and not grafted; and indicated strongly the superiority of this more natural system of cultivation. There was a superlatively grand plant of *Coleonema gracilis*, like a little tree, yet with the branches down to the pot, and nearly as wide as high; *Siphocampylus betulifolius*, grown so as to appear like a large herbaceous plant, with numbers of radical shoots, though it is a decided shrub. This specimen, while only a foot in height, was almost three feet across, and quite overspread with flowers. *Calanthe veratrifolia*, in a very large pot, exhibited a strength of foliage and of flower-spikes which was really amazing; *Chorozeina ovata*, on a conical trellis, was covered with its brilliant flowers; of *Leschenaultia biloba* there

was a magnificent specimen, proving that the species may be rendered of a close habit by proper attention; *Acrophyllum venosum* was good, but fading; *Epiphyllum speciosum* and *Ackermanii* were transcendently splendid; *Ixora coccinea*, gorgeous; *Cytisus racemosus*, five feet in height, prodigiously laden with bloom; *Eutaxia pungens*, tolerably well managed; *Rondeletia speciosa*, in a large and small state, splendid; a well-covered trellis of *Tropæolum tricolorum*, on which there was not an inch of space without flowers; *Boronia serrulata*, dense and dwarf; a large *Leschenaultia formosa*; *Azalea Danielsiana*, and *Hibbertia Cunninghamii* in good order; a handsome *Leschenaultia Baxteri*; and a glowing *Clerodendron*, called *fulgens*, which is very like *C. speciosissimum*. In Mr. Goode's collection there was a pot of *Achimenes longiflora*, which is the best that has yet been exhibited, and was of a first-rate character; a beautifully cultivated specimen of *Stylidium fasciculatum*; remarkably vigorous and richly flowered plants of *Clerodendron squamatum*; three *Polygala cordifolia* in the finest condition; several *Pimélea decussata* of a great size, one of which was losing its flowers; *Leschenaultia biloba grandiflora*, a charming plant, with dazzling blue inflorescence; a gigantic *Stephanotis floribunda*, clothed abundantly with both leaves and blossoms, the latter lovely and fragrant in the extreme; *Aphelexis sesamoides*, very excellent; *Leschenaultia Baxteri*, good; a standard *Azalea lateritia*, with a very close head of bloom; very splendid plants of *Epiphyllum speciosum*, and *Cereus speciosissimus* and *Jenkinsonii*, three pretty specimens of *Pimélea rosea*; *Pavetta cæffra*, twelve feet high; *Acacia alata*, ten feet in height, extremely graceful; *A. pulchella*, a standard, exquisitely beautiful; *Erythrina Crista-galli*, in good bloom; and *Chorozeina varium*, trained on a globular trellis, from which the branches all stand out and give a rather natural aspect, while extreme denseness is attained. A third great collection by Mr. Redding, gr. to Mrs. Marryatt, Wimbledon, was excessively meagre. The only plants worthy of note in it were *Aspasia epidendroides*; a dwarf *Gardénia radicans*; *Maxillaria aromatica*, flowering in profusion; a healthy *Brassia caudata*; large specimens of *Cereus speciosissimus* and *Pimélea decussata*; *Marica cærulea*, and *Cattleya Mossie*. A small group brought by Mr. Pawley, of Bromley, had in it a nice dwarf *Rondeletia speciosa*; a similar *Ixora coccinea*; *Mahérnia incisa*, a pleasing cone of pretty red flowers; a large plant of a species of *Sinningia*, probably *velutina*; *Azalea Danielsiana*, in a healthy dwarf state; *Acropera Loddigesii*, surrounded with pendulous flower-scapes; *Pimélea decussata*, fine; and the graceful *Scyphanthus elegans*. In a limited miscellaneous collection by Mr. Hogan, gr. to H. Pownall, Esq., were a good specimen of *Pimélea decussata*; an excellent plant of *Sollya heterophylla*; and *Fuchsia fulgens*, of an immense size, but more noticeable for foliage than for bloom.

There were many exhibitors of Heaths, and in some of the collections we noticed plants of the rarest and most exquisite beauty. Perhaps the most conspicuous group was one from Messrs. Locombe, Pince, and Co., of Exeter, made up of twenty-one varieties of *E. ventricosa*. As a whole, this collection produced a most enchanting effect, and the individual specimens were each from 18 inches to two feet in height, broad, compact, and splendidly adorned with blossom. There was a somewhat similar contribution from Mr. Brazier, gr. to W. H. Storey, Esq., Isleworth, consisting of 8 seedling varieties of *E. vestita*. Judging by the well-known difficulty of growing these plants perfectly, the specimens were of the first excellence, and some of the varieties were distinct. A more general collection, exhibited by Mr. Goode, gr. to Mrs. Lawrence, comprised excellent plants of *E. perspicua*, *vestita coccinea* (particularly fine), *inflata*, an extremely tall specimen, with few flowers; *Cavendishii*, well grown; *intermedia*, something like *E. Bowiana*, dwarf and good; *perspicua nana*, exceedingly pretty; *fragrans*, very dense; *gemmifera*, a good plant; *ventricosa tenuiflora*, very low and close; *Westphalingia*, finely managed; and the curious and well-grown *gnaphalioides*. Mr. Green had *E. jasminoides*, a small plant; *Beaumontiana*, handsome; *perspicua*, remarkably meritorious; *splendens*, excellent; a very fine *propendens*; *ventricosa superba*, in a magnificent state; and some other rich specimens of the varieties of *ventricosa*. From Mr. Brazier, gr. to W. H. Storey, Esq., were a superb *E. Cavendishii*; *Humelii*, fine; *Westphalingia*, very healthy; *gelida*, extremely good; and some excellent *ventricosas*. Mr. Clarke, gr. to T. Smith, Esq., Shirley Park, produced *E. translucens*, four feet high, a glorious specimen; *tricolor*, fine and dense; *perspicua nana*, exceedingly lovely; and splendid varieties of *ventricosa*. *E. tricolor*, *perspicua*, *Westphalingia*, and several of the *ventricosas* were particularly fine, from Mr. Hunt, gr. to Miss Traill. Mr. Bruce, gr. to B. Miller, Esq., brought a noble *E. tricolor*, an excellent *E. Cavendishii*, and a few admirable *ventricosas*. Mr. Jackson, nurseryman, of Kingston, sent a small and good *E. tricolor*, a pretty *odorata*, a gigantic *jubata*, which was only partially in flower; a very spreading, rather bare *E. tricolor*; a capital *Cavendishii*; *Daphneflora*, large and dense; and a pretty specimen of *baccans*. Some fine varieties of *ventricosa*; a beautiful little *tricolor*; *propendens*, in a pleasing state; *spuria*, three feet high, excellent; with elegans, small and compact, were from Mr. Frazer, nurseryman, of Leyton, Essex. From Mr. Pawley, of Bromley, we noted a fine *E. Cavendishii*, and some large *ventricosas*. Shown as single specimens, there was *E. Cavendishii*, excessively rich, and with an extraordinary mass of flowers, from Mr. Goode, gr. to Mrs. Lawrence; *E. splendens*, a superb plant, from Mr. Brazier, gr. to W. H. Storey, Esq.; *E. tricolor*, transcendently broad and good, from Mr. Salter, gr. to J. M. Yeates, Esq., of Bath; and a new species, called *E. pulverulenta*, of a curious upright habit, like a small Cypress, with neat dark pink blossoms. The leaves seem to be covered with a whitish powder; this was from Mr. Dawson, of Brixton Hill.

The climbing plants were not generally conspicuous, and there was but one collection, from Mr. Goode, gr. to Mrs. Lawrence. In this we remarked *Stigmaphyllon ciliatum*, with somewhat heart-shaped leaves, which have slender hairs round the edge, and clusters of yellow flowers, which have curled petals, and look like those of some *Oncidia*. It seems likely to be an ornamental plant. There are likewise a species of *Cyclogyne*, with handsome purple flowers; *Marianthus cæruleo-punctatus*, well cultivated, though only just beginning to bloom; *Tropæolum edule*, exceedingly showy; *T. pentaphyllum*, pretty good; *Poirrea coccinea*, excellent; *Ipomœa tyrianthina*, splendid, but the flowers closing in the afternoon; a large *Echites suberecta*; a capital conical plant of *Hardenbergia monophylla*, *Aristolochia ciliosa*, a nicely-grown *Manettia bicolor*, and the brilliant blue-flowered *Clitoria ternatea*.

Two collections of Cacti were brought by Mr. Falconer, gr. to A. Palmer, Esq., and Mr. Bruce, gr. to B. Miller, Esq. In that of the former there were magnificent specimens of *Ackermanii*, one a low standard, and of *Jenkinsonii*. That of Mr. Bruce contained splendid specimens of *Ackermanii* and *speciosissimus*, a large variety of *speciosum*, and *Mallisonii*, trained spirally on a conical trellis, and covered with flowers. The main point that we noted in these collections was that all the other species are grafted on *speciosissimus*, thus giving them greater strength and richness, and enabling the grower more easily to have them of any desired form, as standards or dwarf bushes. The last are obtained by twisting the stems of the stock round a small trellis, and covering them with scions of the required species. Beyond the plants thus mentioned, one specimen of *speciosissimus* was exhibited by Mr. Goode.

We shall now turn to the specimen plants, of which there was a great variety, comprising some magnificent things, and several plants that were new to these shows. As instances of cultivation, the *Pimélea decussata*, more than four feet in diameter shown by Mr. Poole, of Leyton, Essex; *Stylidium fasciculatum*, probably the most remarkable plant at the exhibition, by Mr. Mountjoy, Ealing; *Siphocampylus betulifolius*, equal to that of Mr. Green, before described, by Messrs. Locombe, Pince, and Co.; and by the same gentlemen, *Ozothamnus thrysoide*

four feet in height, with branches extending to the same breadth, sheeted over with small white blossoms, and stated to be evergreen and hardy; with an *Epacris grandiflora*, four feet high, of a most superb description, by Mr. Frazer, of Leyton; and *Acrophyllum venosum*, in the highest perfection, by Mr. Redding, gr. to Mrs. Marryatt; were among the most extraordinary, and could hardly be surpassed. Of new plants, or such as have not been long introduced, there were *Nepenthes ampullacea*, a novel species of Pitcher-plant, with beautifully mottled and fringed pitchers, by Mr. Mylam, gr. to S. Rucker, Esq.; *Luxemburgia ciliosa*, a fine plant, with ciliated leaves, and showy terminal spikes of clear yellow flowers, by Messrs. Lacombe, Pince, and Co., of Exeter, and Mr. Smith, of the Royal Botanic Garden, Kew; *Achimenes multiflora*, with deep lilac flowers, which have a slightly fringed margin, also from Mr. Smith; *Statice macrophylla*, having peculiarly large leaves, and flowers resembling those of *S. arborea*, by Messrs. Lacombe, Pince, and Co., of Exeter; a species of *Lathyrus*, with ornamental reddish crimson blossoms, by Messrs. Lee, of Hammersmith; *Aquilegia Skinneri*, not well coloured, likewise by Messrs. Lee. *Martynia fragrans*, in a superb condition, by Mr. Crees, gr. to Messrs. Beck, Henderson, and Co., Strand; *Tropæolum edule*, small but good, by Mr. Jackson, of Kingston; and *Stigmaphyllon ciliatum*, by Mr. Green, gr. to Sir E. Anthon, Bart. The more common species included a *Kalmia latifolia*, on which almost all the flowers were so close as to touch each other before they opened. This was from Messrs. Rollison, Tooting, and excited much notice; *Hotia japonica*, extremely well managed, and profusely decked with its white feathery spikes of flowers, from Mr. Redding, gr. to Mrs. Marryatt; *Gompholobium polymorphum* major, trained to a kind of pillar, and very beautiful, from Messrs. Lacombe, Pince, and Co.; a fine species of *Gesnera*, of which the plant was both large and handsome, from Mr. Hunt, gr. to Miss Traill; *Oncidium crispum*, from the same firm; a pretty plant of *Manettia bicolor*, also from Mr. Hunt; *Sollya linearis*, conspicuous for its deep blue flowers, a good specimen, from Mr. Hopgood, nurseryman, Bayswater; *Elichrysium sesamoides*, handsomely grown, from Mr. Bruce, gr. to B. Miller, Esq.; *Achimenes longiflora*, not remarkable, from Mr. Stanley, gr. to H. Berens, Esq.; *Vanda teres*, very pale, from Messrs. Lacombe, Pince, and Co.; *Oncidium microchilum*, from Mr. Hunt, gr. to Miss Traill; *Euthales macrophylla*, a good but rather straggling plant, from Mr. Hayes, High Beech, Essex; a pale blue flowered *Leschenaultia*, from Mr. Goode; and from the same, *Elichrysium retortum*, well treated and singular, *Fuchsia corymbiflora*, handsome, with a very rich specimen of *Gloxinia maxima*.

For the prize offered for *Fuchsias* there were two competitors, Messrs. Lane and Son, of Berkhamstead, and Mr. Catleugh, of Hans-street, Chelsea. In the last-named collection, the finest sorts were—*Venus vitrix*, a beautiful and very distinct kind; *conspicua arborea*, resembling *Chandlerii*, but having a more erect rigid habit, and brighter scarlet corollas; *arborea*, from which the previous one is only slightly different; *magnifica*, with extremely short and spreading flowers—a good variety; *Salter's splendens*, a large flower, though deficient in colour; and *Buistii*, a small-flowered kind, like *formosa elegans*, only rather more slender. Messrs. Lane's contribution included *Laneii*, very compact in habit, a free bloomer, and having handsome flowers; *tricolor*, with a pale bluish-coloured calyx, of which the tips are tinged with green, and a deep crimson corolla—a very pretty variety; *formosa elegans*, the habit of which is very graceful, while the corollas are of the richest purple; *Grenvillei*, which is near *Laneii*, only it has a somewhat wider tube, and more purplish corolla to its blossoms; *Mony-pennii*, which flowers with astonishing freedom, and is a tolerably good sort; with *Prostii*, which has large flowers, slightly wanting in colour. The remainder of these collections seemed unworthy of record, in respect to the varieties; but the specimens were pretty well cultivated. By themselves there were *F. Eppii*, from Mr. Pawley, of Bromley, and *F. Exoniensis*, from Messrs. Lacombe, Pince, and Co., of Exeter. *Eppii* has unusually great blossoms, but the specimen shown indicated the most rampant growth, though we understood it had been somewhat forced, and that the natural character of the plant is compact enough. *Exoniensis*, too, seems a tall-growing plant, with very long crimson calyxes, and purplish corollas. The flowers appear hardly to expand sufficiently; though we are informed that this circumstance, and the comparatively loose character of the specimen, were owing to its having been forced forward in a warm house, on which account also it was much injured in appearance by its exposure.

In regard to the *Roses* in pots, there were but two collections, and one of these was of quite an inferior character, having in it tall straggling and standard specimens, by no means pleasing to the eye or well-grown; this was from Mr. Dennis, of Chelsea, and the Duchess of Buccleuch was the finest plant in it. The other, from Messrs. Lane and Son, of Berkhamstead, was much better; still the plants in it were rather pretty little specimens than fine and highly-cultivated objects. What is desired in this class of plants is strong specimens, whether bushes or dwarf standards, bearing from 20 to 30 expanded flowers, and upwards; whereas those which have been shown are young plants, with from three or four to eight or nine expanded flowers, and only producing a good effect by being grouped together, not as separate objects. Some of Messrs. Lane's plants were, however, very good, considering the sorts; though decidedly the most desirable plan of preparing these subjects is to take the well-grown specimens from the open borders, and pot them for the purpose, as is done with those intended for forcing. The best specimens we saw were, *Aiba Blanchefleur*, *Triomphe de Brabant*, *Tea Triomphe de Flore*, *Tea Caroline*, *Bouquet Queen*, and *Bouquet Phoenix*. Several good collections of cut *Roses* were exhibited, and, as usual, attracted much of the company by their fragrance. They presented no particularly novel feature, and the names of the successful exhibitors will be found in the Prize List. A stand of cut *Roses* was shown by Mr. Gaines, of Battersea, and twelve good plants of the *Globe* scarlet compactum *Pelargonium*, which is a handsome variety for either pots or beds, by Mr. Baile, florist, of Hammer-smith.

CALCEOLARIAS.—In Herbaceous Calceolarias in 6es there was no competition in the Amateurs' Class, and the Large Silver was given to Mr. Dobson, gr. to Mr. E. Beck, of Isleworth, for finely-bloomed varieties, grown in slate pots corresponding in size to pots of 12 to the cast; the sorts were Holmes's Queen Adelaide, Madonna, Maid of Hanover, Speciosissima, Holmes's Prince of Wales, and Laura. In the Nurserymen's Class the Silver Knightian was awarded to Mr. Catleugh, for *Stansbury*, *Selma*, *Gazelle*, *Maria*, *Willmoreana*, *Golconda*; Silver Banksian to Mr. Gaines, for *Argo*, *Rival King*, *Lass of Richmond Hill*, (names were lost to the three others). For Shrubby Calceolarias in 6 varieties, 12 pots of 12 to the cast, Mr. Dobson obtained the Large Silver; these were also grown in slate pots, with a profusion of bloom; the sorts were, *Coppersmith*, *Hamburg Scarlet*, *Gem*, *Spectabilis*, *Lady of the Lake*, *Alice*. And the Silver Knightian was awarded to Mr. Stanley, gr. to H. Berens, Esq., for *Lady of the Lake*, *Duke of Cornwall*, *Magniflora grandiflora*, *Sr R. Peel*, *Ariel*, *Com-paca*. Nurserymen. Large Silver to Mr. Gaines, for *Favonite*, *Sunbeam*, *Incomparable*, *Attila*, *Una*, *Magniflora grandiflora*, and the Silver Knightian to Mr. Catleugh, for *Commodore*, *Lanceolot*, *Perfection*, *Bridesmaid*, *Reform*, *Anulet*. A collection of 12 Seedlings was also exhibited by Mr. Standish, of Bagshot, these consisted of his fine spotted and mottled varieties, and comprised *Cometor*, *Elysium*, *Princess Mary*, *Sir D. Wilkie*, *Pilot*, *Vanavelde*, *Boz*, *Adventurer*, *Surprise*, *Delicata*, *Exciter*, and *Iaphael*.

The *PELARGONIUMS* were in much finer condition than at the previous exhibition, the flowers were well developed, the colour fine, and the plants vigorous and healthy; and there was less difference between the appearance of the various collections than ever we remember to have seen. The only one that was far behind its competitor was that placed next to Mr. Dobson's, whose plants

were uniform in appearance, and well managed. Mr. Gaines in his small collection exhibited *Nymph* in fine order, and with a greater head of bloom than we remember to have seen upon this variety. The *Sylph* also among Mr. Catleugh's large plants was a fine object. The flowers in Mr. Hunt's plants (in the larger collection) were remarkable for their size, but this experiment we thought carried a little too far, as some of the flowers lost character. The way in which Mr. Parker exhibited his 12 large plants was very creditable. Mr. Bourn and Mr. Bell also showed finely grown plants among their large specimens. 1. *PELARGONIUMS*, in collections of 12, new and first-rate varieties, in pots of 24 to the cast. The Gold Banksian was awarded to—Dobson, gr. to Mr. Beck, of Isleworth; these plants were well cultivated, uniform in size and in their head of bloom, containing the following varieties: *Lucy*, *Leonora*, *Erectum*, *Susanna*, *Martha*, *Scarlet*, *Cleopatra*, *Evening Star*, *Meteor*, *Lord Chancellor*, *Geraldine*, *Luna*; the other collection to which the silver Knightian was given was from Mr. Hunt, gr. to Miss Traill. These flowers had no names attached, and from their receiving the smallest medal offered by the Society, it is evident the judges did not consider them cultivated with the skill and perfection expected in this class. Mr. Catleugh and Mr. Gaines contended for the gold medal in this class as nurserymen; their collections were both fine and well-cultivated: Mr. Catleugh's was decided to be the better of the two, his plants were—*Paris*, *Hannah*, *Gipsy*, *Priory King*, *Hebe*, *Madame Taglioni*, *Jubilee*, *Troubadour*, *Queen of the Fairies*, *Unit*, *Madelina*, and *Queen of Beauties*. Silver-gilt to Mr. Gaines, whose collection contained *Lady Sale*, *Rising Sun*, *Duchess of Sutherland*, *Nymph*, *Lady Prudhoe*, *Comte de Paris*, *Jubilee*, *Madelina*, *Eximia*, *Euterpe*, *Gipsy*, and *Orange Perfection*. In collections of 12 varieties in pots of 12 to the cast, in the Amateurs' Class, the silver medal was obtained by Mr. Parker, gr. to—Oughton, Esq., of Roehampton, for *Priory Queen*, *Wildfire*, *Mrs. Stirling*, *Lord Mayor*, *Victory*, *Grand Duke*, *Ovide*, *Acme*, *Erebus*, *Bleda*, *Jubilee*, and *Annette*; these plants were large, finely grown, and well bloomed. The large silver was awarded to Mr. Hunt, gr. to Miss Traill, for *Jubilee*, *Comte de Paris*, *Corona*, *Sylph*, *Victory*, *Nymph*, *Mrs. Stirling*, *Matilda*, *Louis Quatorze*, *Ovid*, *Orange Boven*, and *Prince of Waterloo*. In this class, among Nurserymen, the silver gilt was awarded to Mr. Catleugh; his collection contained *Comte de Paris*, *Prince Albert*, *Master Humphrey*, *Selma*, *Victory*, *Annette*, *Gipsy*, *Coronation*, *Luna*, *Sr R. Peel*, and *Madonna*; and the large silver to Mr. Gaines, for *Sylph*, *Exquisite*, *Erectum*, *Raphael*, *Mabel*, *Juba*, *Grand Duke*, *Lady E. Bulteel*, *Lady J. Douglass*, *Alba perfecta*, *Matilda*, and *Prince Albert*. In collections of six varieties in pots of eight to the cast, the collection from Mr. Bourn, gr. to Sir E. Paget, obtained the large silver medal, for *Victory*, *Erectum*, *Eliza Superb*, *Florence*, *Fanny Garth*, and *Mabel*; and the silver Banksian was awarded to Mr. E. Bell, of Chelsea Hospital, for *Joan of Arc*, *Comte de Paris*, *Coronation*, *Climax*, *Bridesmaid*, and *Roseum elegans*.

The tent set apart for Seedlings was, as on former occasions, an object of much interest; this interest was in no degree abated on the present occasion, for it was literally crowded with spectators till the close of the gardens. There was a large quantity of Seedling *Pelargoniums* from numerous growers, but the number of really fine flowers, of those which contribute to carry on this beautiful class towards greater perfection, was very limited, and few were considered by the judges as fulfilling this desirable end. The specimens from E. Foster, Esq., of Clewer Manor, claimed, for novelty of colour and sterling properties, superiority above all others. This will appear from the three principal prizes having been awarded to three out of his collection of five, and another variety (*Phæton*) was considered by the judges as not sufficiently expanded to be a fair subject for examination. In the selection of the Seedlings for the prizes the Silver Knightian was awarded to Mr. Whomes, gr. to E. Foster, Esq., for *Phæton*, a noble flower. The under petals are of a light rosy salmon colour, and the dark maroon blotch in the upper petals nearly covers their surface, leaving the edge of a light rosy maroon. The flower is large, of a fine cupped form; the petals are stiff, broad, and even on the edge. Mr. Whomes also received a Silver Banksian for the *Duke of Devonshire*, a flower characterized by extraordinary richness of colour, white centre, the lower petals terminating in a rich purplish rose, veined of a deeper colour; the upper petals are deep and fine in colour, velvety in texture; the blotch is very dark, changing to a rich crimson carmine to the edge; the flower has great substance, the petals being thick to the edge and perfectly even. A second Silver Banksian was also awarded to Mr. Whomes for *Robustum*. This variety has rosy purple under petals, broad and finely formed, and so perfectly even on the edge, as to have the appearance of being cut by a sharp instrument; a slight tinge of crimson surrounds the blotch, and the petals have a rosy purple tinge at the edge. There is a slight unevenness in the upper petals. A certificate was awarded to C. P. Lyne, Esq., for a seedling named *Princess Alice*, bright salmon pink under petals; the blotch in the top petals is large and dark changing to bright crimson, leaving a narrow margin of rosy vermilion round the edge. This is a remarkably clear and bright flower, of good form, and finely cupped; the edges of the upper petals are slightly serrated. A certificate was also given to Mr. Ingram, of Southampton, for *Corinthian*, a pretty flower, of good properties; it is of a good form, and cups well; the centre is white, with the remainder of the under petals of a purplish pink; upper petals dark and even. In addition to the seedlings in pots, there were cut blooms from Mr. Pamplin, and also a collection from Mr. Rendle, containing several of the new Devonshire flowers. We also noticed in a collection (we believe from Lacombe, Pince, & Co.), a single flower of a seedling named *Defiance*, which promises well. The seedling *Calceolarias* were not numerous; there were some curious varieties, but not an advance upon some previously exhibited; one only was selected by the judges, from Mr. John Standish, of Bagshot, called *Illuminator*, good in form, and novel in marking; the ground-colour is yellow, and the flower is covered with brown spots, leaving but small portions of the ground-colour seen, which have a lively appearance. A certificate was awarded to Mr. Neville, for a seedling *Pink named Brilliant*, a very pretty and compact flower; and to Mr. G. Piper, for a seedling *Cineraria* named *Princess Royal*, white tipped with purple, with a scent like that of the *Heliotrope*; a flower of good properties and habit of blooming. There were two fine collections of *Ranunculuses*, from the Messrs. Lockhart, of Parson's-green, and from Messrs. Tyso and Son, Wallingford; these were much admired for their beauty and delicacy; many of the edged varieties were exceedingly beautiful. A Silver Banksian medal was awarded to Messrs. Tyso & Sons; their collection consisted of *Naxara*, *Rosa Montana*, *Temeraire*, *Grand Romana*, *Sophia*, or *Ma de Luce*, *Tippoo Saib*, *Louissette*, *Galtzin*, *Costoe's Coronation*, *Bouquet*, *Sanspareil*, *Comble de Gloire*, *Apollo*, *Glacia*, *Fête Nocturne*, *Hercules*, *Navarino*, *Philoles*, *Queen Victoria*, *Melpomene*, *Lesbos*, *Jaune en Pompadour*, *Coronax*, *Carnes*, and the following seedling varieties of their own raising: *Edgar*, *Felix*, *Alexis Gippus*, *Attractor*, *Amasis*, *Flaminus*, *Basilia*, *Champion*, *Comphollis*, *Creon*, *Ebrington*, *Edwin*, *Innocent*, *Jubal*, *Leureate*, *Saladin*, *Vendome*, *Paxas*, *Pasca*, *Paulini*, *Onisippus*, *Dr. Horner*, *Delectus*, *Dictator*, *Imbert*, *Meander*, *Nymphus*, *Orlando*, *Exquisite*, *Menelaus*, *Minos*, *Exemplar*, and two or three unnamed seedlings. Messrs. Lockhart's flowers were—*Lady Leveson Gower*, *Lady Sale*, *Golconda*, *Hebe*, *Roderick*, *Duc de Nemours*, *Electra*, *Lady Sondes*, *Otway*, *Almaraz*, *Fingal*, *Columbia*, *Deuil Noir*, *Euler*, *Oudney*, *Sir W. Raleigh*, *Miaulis*, *Sully*, *Pirate*, *Numa*, *Mary Stuart*, *Lord Byron*, *Hamlet*, *Thomas Pringle*, *Pearl*, *Parisina*, *Wilberforce*, *Victor Hugo*, *Olinthus*, *Ten-Pounder*, *Lictor*, *Duchess of Kent*, *Triton*, *Nusta*, *Quintilian*, *Prince Albert*, *Parody*, *Duchess of Kent*, *Triton*, *Sadi*, *Annetta*, *Major Laing*, *Pliny*, *Commodore Napier*, *Magellan*, *Vanguard*, *Constantia*, *Diogenes*, *Waterman*, *Brightness*, *Dr. Leyden*, *Europa*, *No Proxy*, *Minstrel*, *Harlequin*, *Busaco*, *Barbour*, *Omega*, *Bienheim*, *Laurestinus*, *Admetus*, *Sappho*, *Scoresby*,

Memorial, Mars, Lady Barrington, Masterpiece, Margent General Gibbs, Charybdis, Eumenes, Nydia, De Buffon, Dollond. In consequence of the lateness of the season the collections of *Pinks* were not numerous, but they were as good as could be expected from the unfavourable state of the weather; the lacing in many was imperfect, and rough edges were common—but the weather for this flower has been most unpropitious. Mr. Norman showed as good a stand as it was possible, and some fine specimens were amongst them; they consisted of *Bunkel*, *Queen Victoria*, *Eclipse*, *Lord Brougham*, *Wilmers' Unique*, *Prince of Wales*, *Garrett's Alpha*, *Kirtlan's Clarissa*, *Burchett's Young John*, *Dagh's Lady Sherbourne*, *Legg's Prince Albert*, *Hopkins' One in the Ring*, *Unsworth's Omega*, *Lady Flora Hastings*, *Norman's Henry*, *Holmes's Coronation*, *Stevens's Sir G. Cook*, *Cousin's Coronation*, *Hodges's Gem*, *Brown's Acme*, with three seedlings.

The Heartsease were not particularly remarkable, nor were the seedlings of any note, excepting one, named *Belle Forme*, from Mr. Mountjoy, which promises to be a good flower.

The Fruit-tent was much better filled than on the last occasion, and some really admirable things were exhibited in it, especially *Pineapples*, *Peaches* and *Nectarines*, *Melons*, and a *Cucumber*. The last was by Mr. Mills, of Gunnersbury, not for competition, 32 inches long, very straight, and unusually thick, though a trifle too old. It was of the sort called the *Champion*. The best *Queen Pines* were contributed by Mr. J. Wharton, gr. to Miss Whitehead, Bath, and were truly excellent, as were some of the *Providence* kind, by Mr. Moffatt, gr. to the Duke of Newcastle. There were also fine ones from other persons, and a *Blood Pine* from Mr. Davis, of East Barnet. The exhibitors of the finest *Black Grapes* were Mr. Henderson, gr. to Sir G. Beaumont, Bart., whose *Grapes* were remarkably handsome; Mr. Chapman, South Lambeth, well coloured; Mr. Dodds, gr. to Sir G. Warrender, Bart., Mr. Davy, gr. to E. Smith, Esq., Colney Hatch; Mr. Davis, gr. to A. Smith, Esq.; Mr. Davis, of East Barnet; Mr. Spencer, gr. to the Marquess of Lansdowne; Mr. Brewin, gr. to R. Gunter, Esq.; and Mr. Atlee, gr. to H. Beaufoy, Esq. *White Sweetwater* or *Muscat Grapes* were sent by Mr. Dodds, gr. to Sir G. Warrender, Bart.; Mr. Frost, gr. to the Countess of Grenville, Mr. J. Davis, East Barnet; Mr. Spencer, gr. to the Marquess of Lansdowne; and Mr. Jones, gr. to Sir M. Disney, Bart. The principal contributors of *Peaches* and *Nectarines* were, Mr. Fish, gr. to Colonel Sowerby; Mr. Spencer, gr. to the Marquess of Lansdowne; Mr. Moffatt, gr. to the Duke of Newcastle; Mr. Henderson, gr. to Sir G. Beaumont, Bart.; Mr. Dodds, gr. to Sir G. Warrender, Bart.; Mr. Tillery, gr. to the Duke of Portland; Mr. Mitchell, gr. to Lord Vernon; Mr. Penrick, gr. to H. Pownall, Esq.; and Mr. Fogg, gr. to the Marquess of Abercorn. Of *Melons*, the most remarkable were, *Oliver's Green-flesh*, from Mr. Carson, gr. to F. G. Farmer, Esq.; *Nonesuch*, very large, likewise from Mr. Carson; and a great *Cantaloupe*, from Mr. Evans, of Baywater, Mr. Dodds, gr. to Sir G. Warrender, Bart., showed some good *Mayduke Cherries*, with excellent *White Dutch Currants*, and fine *Strawberries*. Other *Strawberries*, in pots, were sent by Mr. Jones, gr. to Sir M. Disney, Bart.; and Myatt's *British Queen*, by Mr. Spencer, gr. to the Marquess of Lansdowne. Some excellent *Figs* were brought by Mr. Jones, gr. to Sir M. Disney, Bart.; and a few *Apples*, by Mr. Fish, gr. to H. H. Oddie, Esq.

[The excessive length of this report compels us to defer all others till next week.]

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

MEDINILLA ERYTHROPHYLLA. Reddish-leaved *Medinilla*. (*Greenhouse Shrub*.) Melastomaceæ. Decandria Monogynia. —For the introduction of this handsome shrub our cultivators are indebted to his Grace the Duke of Devonshire, whose collector, Mr. J. Gibson, found it on the Khosea hills, which constitute a part of the Himalayan range in the East Indies, and brought it to Chatsworth in 1837. It flowered there in the following season. Being a free-growing plant, which is readily multiplied, it has been so distributed since that period that it is now in most of the principal nurseries, and in many private gardens. Its chief characteristics are an extreme healthiness of aspect, very ample and finely-formed foliage, an abundant production of flowers, a considerable robustness of habit, and a capacity of thriving well either in a greenhouse or stove. The blossoms are borne about the months of June or July, and last a very long time. They appear in clusters on the lower and naked portions of the stem or branches, and are not much unlike those of the Peach, but less spreading or cup-shaped, and with differently-arranged stamens, which stand out rather prominently, and have curved filaments. When young the leaves have a reddish tinge, from which the specific name is derived. Afterwards they become purely, though pale, green. Noticing it in the miscellaneous matter of the "Botanical Register," Dr. Lindley says that "it is apparently very near *M. rubicunda*, a Sumatran plant, with the leaves obtuse at the base. One of the principal features in the genus *Medinilla*, namely, the spur at the back of the anther, is so nearly wanting here, that it only appears in the form of a very small lobe, quite at the base of the anther, opposite the anterior auricles. The species is quite a *Medinilla* in habit." It is a plant of easy culture, growing freely in a mixture of turfy loam and heath-mould, with some pieces of broken freestone or potsherds interspersed throughout the soil. A large pot appears to be unnecessary for it, as it does not throw out many fibrous roots, drawing a great part of its nourishment from the large tuber-like callosities which form at the base of the stem. These, in its wild state, become nearly drained of moisture and shrivel up in the dry season, recruiting themselves again during the rains. Cuttings of almost any size will easily root in loam and sand, if covered with a glass. Although it succeeds in either a greenhouse or stove heat, it flourishes best when treated as a greenhouse plant throughout the summer, and kept, during winter, in a house with a temperature intermediate between that of the stove and the greenhouse. It should be watered rather profusely in the warmer months. —*Paxton's Magazine of Botany*.

CYMBIDIUM DEVONIANUM. The Duke of Devonshire's *Cymbidium*. (*Stove Epiphyte*.) Orchidaceæ. Gynandria Monandria. This very beautiful addition to the genus *Cymbidium*, which is named after his Grace the Duke of Devonshire, was found by his Grace's collector, Mr. Gibson, on the Khosea hills, in India, and introduced to Chatsworth in 1837. It bloomed there in the months of March and April of the present year. Mr. Gibson gathered it from the trunks of decayed trees, or from the hollows or cavities of those old specimens which had become filled up with vegetable mould. In England it grows very freely on any half-decayed block of wood, suspended at a good distance from the glass. The species has reniform pseudo-bulbs, and throws from them fine racemes of bloom, from a foot to eighteen inches in length, which hang down after the manner of *C. aloifolium*. It is not much unlike the latter plant in the hue of its sepals and petals, which appear to be of a brownish cream colour, but the lip, which is their most conspicuous feature, is of a beautiful purplish crimson tint, and very rich. A specimen which was exhibited in April at the Horticultural Society's Rooms had been in flower two or three weeks; and as the colour of the lip like that of some species of *Calanthe*, changes and fades after the flowers have been open for some time, it was then of a dull brownish shade, which is by no means pleasing. In its earlier stages, however, it is very showy and brilliant; and this circumstance will place it before any of the other species. —*Paxton's Magazine of Botany*.

MISCELLANEOUS.

Cultivation of Water-Cresses.—M. Faussier, of Senlis, who has brought the artificial culture of *Water-Cresses* to

great perfection, treats them in the following manner: The depth of the trenches in which they are grown being entirely dependent upon that of the springs by which they are supplied with water, the former are so prepared that, as nearly as possible, a regular depth of three or four inches can be kept up. These trenches are three yards broad, and eighty-seven yards long; and whenever one is to be planted, the bottom is made quite firm and slightly sloping, so that the water which flows in at one end may run out at the other. If the bottom of the trench is not sufficiently moist, a small body of water is allowed to enter to soften it. The Cresses are then taken and divided into small sets or cuttings, with roots attached to them; and these are thrown over the bottom of the trench at the distance of 3 or 4 inches from each other. The Cress soon attaches itself to the damp earth; in three or four days the shoots straighten and begin to strike root. At the end of five or six days, a slight dressing of well-decomposed cow-dung is spread over all the plants, and this is pressed down by means of a heavy board, to which a long handle is obliquely fixed. The water is then raised to the depth of 2 or 3 inches and never higher. Each trench is thus replanted annually, and furnishes twelve crops during the season. In the summer, the Cresses are gathered every 15 or 20 days, but less frequently during winter. Care is taken that, at each gathering, at least a third part of the bed is left untouched, so that neither the roots may be exhausted, nor the succeeding gathering delayed. After every cutting, a little decayed cow-dung, in the proportion of two large barrowfuls to each trench, is spread over the naked plants, and this is beaten down by means of the rammer above mentioned. After the Water-Cresses have been thus treated for a twelvemonth, the manure forms a tolerably thick layer at the bottom of the trench, and tends to raise its level. To restore it to its original level, all the refuse should be thrown out upon the borders which separate the trenches from each other. These borders may be planted with Artichokes, Cabbages, or Cauliflowers, which will here attain a great size. Cress-grounds should always be at a distance from trees, on account of the leaves which otherwise drive amongst the plants and require much time to pick out. There are two weeds which, even in the cleanest Cress-grounds, can scarcely be kept under; these are the Duckweed and Zannichellia palustris, which both multiply so quickly, that unless carefully rooted out, they do great injury to the Cresses. The Zannichellia may be kept under by careful handweeding, and the Duckweed by raising the water so as to make it float above the Cress-plants, when it may be skimmed off with a besom. —*Bon Jardinier.*

A new Tree Pæony.—We understand that Mr. Van Houtte, of Ghent, has in his possession a new Tree Pæony, called the "Triumph of Malines," which is remarkable for its beauty. Its flower is said to have the appearance of a cluster of Rhododendrons, forming a pyramid almost as large at the summit as the base. Its colour is described to be deep Amaranth. We presume the variety will soon be in the trade.

Seedling Cactus.—We have received from Messrs. Davies & Co., of Wavertree, specimens of seedlings, raised between *C. speciosissimus* and *C. grandiflorus*, having flowers which share the form of the latter and the red colour of the former. Two fine varieties are before us; the one with large blossoms, very like those of *C. grandiflorus*, of a pale red and rather dull colour, and the other somewhat less like *C. grandiflorus*, of a richer hue, more resembling *C. speciosissimus*. There is much of novelty in them, and the blooms, unlike those of *C. grandiflorus*, are said to remain perfect for two days. We have also received from Mr. J. F. Wood, a flower of a seedling which grows in the way of the creeping *Cereus*, and which was obtained from *speciosissimus*, which is supposed to have been accidentally fertilized. Its flowers are in the way of Ackermannii, and exhibit very slight traces of the beautiful purple of *speciosissimus*. They are however handsome, and the plant, with the pendulous habit of the creeping *Cereus*, must have a striking appearance.

Ceylon.—We have much satisfaction in announcing the appointment of Professor Gardner to the charge of the Botanic Garden of Ceylon, vacant in consequence of the death of Mr. Normansell. The zeal and Botanical knowledge of Mr. Gardner, and the practical acquaintance with tropical vegetation gained by him in his long travels in Brazil, render him peculiarly fitted for such an appointment, which cannot fail to be a gain to the colony.

GARDEN MEMORANDA.

J. Moss, Esq., Otterspool, near Liverpool.—This place is pleasantly situated on the banks of the Mersey, and has a beautiful undulation of surface. The kitchen and fruit-gardens are well conducted, and are kept very clean. In the forcing department we observed an excellent crop of Grapes and some good Pines. In one of the plant-houses are some very large healthy bulbs of the most esteemed sorts of *Amaryllis*; we also noticed some remarkably fine plants of the *Gloxinia maculata*, which were obtained by leaving only one stem to form a plant. In the house devoted to the cultivation of *Orchidaceae* plants is a very large specimen of *Cattleya Mossiae*, it is the original plant imported by the liberal proprietor of this place, and from which the figure was taken for the Botanical Magazine. At the time of our visit it had twelve spikes of flowers, and was really a magnificent object. We were informed by the intelligent gardener, Mr. James, that it has not flowered since the figure was taken till the present year. Among the others in flower, we observed *Cattleya Forbesii*, *Oncidium ampliatum*, *O. lanceanum*, *O. pumilum*, and a fine plant of *O. papilio*, with eight flower-spikes, *Maxillaria aromatica*, *Broughtonia sanguinea*, *Calanthe veratrifolia*, &c. The flower-garden contains some well-arranged beds, and has a pretty appearance, it has an elevated walk on three sides from which you get some splendid views of the Mersey and the county of Cheshire, with the Welsh mountains in the back ground. —*J. A.*

Reviews.

Prize Essay of the Wetherby Agricultural Association, on the Application of Rape-Dust and other Hand Tillages. By John Hannam. Longman. pp. 35.

We have perused this Prize Essay of Mr. Hannam's with great satisfaction, and do not hesitate to pronounce it to be a most useful treatise on the theory and practice of manuring. He does not confine himself to the ostensible subject of Rape-dust and similar artificial helps to vegetation; but he gives a very clear and concise view of the theories of modern chemists and physiologists on the nutrition of plants, and endeavours to show that the practice of the best farmers is in perfect accordance with the latest discoveries of eminent chemists in the composition of vegetable productions. The whole is clearly stated, and we can safely recommend it to the attentive consideration of practical farmers. —*M.*

CALENDAR OF OPERATIONS for the ensuing week.

THE flower-gardens at Shrubland Park are open to the public every Friday, while the family is passing the gay season in London. Among other parties, we had three schools over the grounds lately; and I found many of the young people very anxious to learn how gardeners managed to grow and propagate their plants; how deep seeds should be sown; and as many more such questions as would fill the Calendar; and I must say more or fewer parties never entered any garden; not a flower was picked or broken down, nor a foot put on any of the dug beds. They all kept on the gravel walks, or ran along the lawns, more orderly than grown-up people often do. They were particularly interested when I told them how we made the standard Roses by budding; and as this may interest other young people, now home for the summer holidays, I shall tell them, as I promised last week, how we gardeners bud Roses and other plants. But the best way to learn this, or anything else which gardeners do, is to see one do it. Now, if you have a sharp penknife, and a little ball of worsted to tie the buds with, we may begin by cutting off a branch of this year's growth from a fine Rose-bush; then cut off all the leaves from this branch. There is a bud at the bottom of each leaf on the upper side, and every one of these buds would make a branch next year, if left to themselves; and they will do so if you take them off the mother plant, and insert them within the rind of another Rose-shoot or branch; and this is called budding. When you make a pen you begin by taking off a slice of the quill, and buds are taken off just in the same way. You take off a slice of bark, and a little of the wood, about an inch long, and the bud in the middle of the slice; then make a cut in the bark, where you want to put in the bud, as long as the slice, and at the upper end of the cut make another cut across, and the two cuts will form the letter T. Now open the bark a little on both sides of the first cut with your penknife, and put in the slice, keeping the point of the bud upwards, as it was before; and when the slice is nearly all in, cut the top of it square with the cross cut, and it will lie in close. Then you tie the loose bark over the slice with your worsted, and turn it round and round till you cover all the cut, only leaving the little bud in the centre free, for fear of smothering it. Now the work is finished; and all buds are put in in the same way by almost everybody. I sometimes, however, practise a different mode, which I want to disclose, for the consideration of established practitioners. It is this: when a friend sends you a Rose-shoot in a letter, ten to one if the buds on it are half developed, and of course you throw the shoot away as useless. But if you take out the incipient buds, with half the thickness of the shoot, along with them, the top part slanted off, wedge fashion, and the bottom squared, you can take out a similar piece of the stock, and work in your bud after the manner of side-grafting, and not one out of a score of them will fail; and this is the surest way to work them in spring and autumn, when the bark does not rise freely.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINES.—Now that we are in the heart of their growing season, let us supply them abundantly with the usual stimuli of liquid manure and a strong, moist heat, shutting them up early in the afternoon, with their leaves all dripping from the use of the syringe; for this treatment suits the fruiters also at this time till the fruit is full swelled, when the over-moisture must be given up by degrees.

VINERY. The bunches of the latest Vines are now in most places in a forward state for being thinned; and as these are to stand over the dull months of the year—November and December—they ought to be well thinned of their berries. You may also push them on with a strong moist heat until they are swelled to their utmost stretch, you will then have more of the season before you to let them colour slowly, in a fine current of fresh air. It is the worst possible management to let them go on slowly now, and to have to push them in the autumn to colour them.

PEACH-HOUSE.—Many of these houses are now cleared of the fruit, the trees and all parts of the house being well washed down with the engine. If you end this growth as you began it last December; that is, letting it finish gradually in a gentle moist heat, with plenty of air, the trees should be in a good condition for the next crop.

FIGS. The second crop of these is now in a forward state; the trees want abundance of moisture at all periods of their growth, and more particularly when swelling their fruit. Let them have a free current of air, and syringe them frequently over-head.

MELONS.—A thrifty, strong plant, in a fresh, rich soil, will teach a beginner more about Melons than a whole season's Calendars; as, if such a plant has not been kept thin of shoots from the beginning, these are now crowded in inextricable confusion, and the more you prune them after this the sooner they will canker, or die altogether perhaps.

CUCUMBERS on the ridges are now growing away with great freedom. If they do not cover the space allotted to them, regularly pinch out the tops of the main branches, but keep them thin of shoots near the bottom, otherwise they will soon get into confusion. It is a good plan to put a layer of clean straw under them, to keep them clean; and they will require less water if the beds are covered.

Out-door Department.

About the end of June and beginning of July, as the early Peas and Beans are cleared off the ground, is the usual time of planting out Broccoli, Brussels Sprouts, Savoys, &c.; but if room is scarce, many of these may be planted out between standing rows of other crops that are expected to come off soon. No one ever thinks of planting any of the Cabbage tribe without first manuring the ground.

COLEWORTS are much sought after in some places, but in some families they are never used. This is about the time to get in the first sowing of them; and in many late situations it is high time to sow early Cabbages to come in betimes next spring; but in good situations a fortnight hence will be time enough.

PEAS AND BEANS.—The earliest varieties of these should now be sown for the last time; but some Early Frames may be sown as late as the second week in July; and if we have fine weather in October they will afford some dishes, when they will come in very acceptable.

CELERY.—Another trench or two may be planted out, but a fortnight hence will be time enough for the main crop in most places. There is much difference of opinion among gardeners on this simple point; the seasons principally, however, determine the right time.

ORCHARD.—If the tops of shoots of Currants or Gooseberries should become infested with insects, as they often do about this time, the best way is to cut off the tops at once, which will do no harm to the bushes so late as this in the season. A good washing with the engine occasionally will be of service to the wall-trees, and unless they are attacked by insects, clean water is as good for this purpose as any mixture. See that the Vines never get loose, or grow too long, before they are tied in, and so with all your wall-trees.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Plants in this house have got so much hardened in their young wood that they may have large portions of air given them daily. There is hardly a week till the beginning of August but some plants will want a shift into larger pots.

GREENHOUSE.—All the coarser plants being now removed out-of-doors, more attention must be paid to the watering of the more delicate plants, which are kept in through the season; train out and stake them till you get them into handsome shapes.

PITS.—I find my improvement on the flower-pots particularly useful in these cold pits, as we can now keep the bottom of the pits as damp as we please, which imparts a refreshing coolness to all around, and this without any danger from worms entering the pots. We syringe all the plants here late in the afternoon, and we are now beginning to leave off the lights at night, where the hardier plants are, and only put them on about breakfast-time. Most pot-plants require to be somewhat screened from the sun, out-of-doors, for a few weeks, till the nights lengthen out a little more, when the dews will in a great measure counteract the effects of strong sun.

FLOWER-GARDEN.—Everywhere in the flower-garden the greatest order and neatness should prevail; not a dead or fading flower should be seen, not even in the wildest corner of the shrubberies. No plant requiring support should be a day without a neat stake. Many of the annuals may be prolonged if their seeds are cut off as they begin to form: some, again, would do better if the strongest shoots were cut back, to show a uniform growth all over the bed or row. Never let the *Salvia patens* come up with a centre stem; pinch this off close to the bottom, and half-a-dozen shoots will spring up for one, which is better than thick planting. Some people treat their Hollyhocks in the same way, and by that means get great masses of late-flowering shoots. —*D. Benton, Shrubland Park Gardens.*

State of the Weather near London for the Week ending June 22, 1843, as observed at the Horticultural Garden, Chiswick.

June.		BAROMETER.		THERMOMETER.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday 16		29.960	29.981	71	46	58.5	N.E.	
Saturday 17		29.979	29.972	75	50	62.5	N.E.

Tuesday 20		30.180	29.953	63	59	61.0	N.E.	
Wednesday 21		30.128	29.984	73	51	62.0	S.W.	
Thursday 22		30.045	29.984	70	40	55.0	N.E.	
Average		30.023	29.955	68.5	47.8	58.2		.02

June 16. Very fine, with scattered white clouds; clear at night.
17. Clear; overcast; very fine, with a few light clouds; cloudy and fine at night.
18. Slight dry haze; overcast and fine.
19. Uniformly overcast; cloudy and cold.
20. Densely clouded; overcast; cold and clear at night.
21. Very fine throughout.
22. Clear; very fine with light clouds; clear at night.
Mean temperature of the week 3.3° below the average.

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending July 1, 1843.

June and July.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sun. 25	71.7	61.0	61.8	9	0.73 in.	—	1	5	1	2	8	3	2

The highest temperature during the above period occurred on the 28th, in 1836—thermometer 91°; and the lowest on the 1st July, in 1837, thermometer 37°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending June 23, 1843.

THE chief new feature in the market this week is a large quantity of Cherries and Strawberries from the open garden. The former are almost entirely of the Mayduke sort, and those of good quality range upwards from 8d per lb., though many are to be had at a lower rate. The Strawberries are of various kinds, but the Keen's seedlings are most abundant, and good ones may be obtained at 8d per pottle. Grapes, Pines, Peaches, and Nectarines, are particularly splendid this week, and have reached a very high degree of perfection. All the more common kinds of Fruits and Vegetables are tolerably good, and the Cauliflowers are of the most superior description. Cucumbers are now very numerous, yet there are comparatively few that are straight and well-grown. The collections of Cut Flowers include a vast number of hardy things, and annuals in great profusion. The more uncommon flowers are *Fuchsia tricolor*, *Pimelea decussata*, many beautiful Roses and Irises, and a prodigious quantity of Moss Roses and Pinks. Among potted plants are *Fuchsia tricolor* and *Standishii*, many varieties of *Erica ventricosa*, various Cacti, and *Pimelea rosea*.

PRICES, SATURDAY, June 24, 1843.—FRUITS:—

Pine Apple, per lb. 4s to 10s	Cherries, English, 1s to 5s
Grapes, hothouse, per lb. 2s to 5s	Lemons, per doz. 1s to 2s
— Spanish, per lb. 1s to 1s 6d	— per 100, 6s to 14s
— Portugal, per lb. 1s to 3s	Cucumbers, per brace, 1s to 1s 6d
Peaches, per dozen, 10s to 30s	Walnuts, per bush, 10s
Nectarines, per dozen, 10s to 30s	Chestnuts, per peck, 4s to 8s
Melons, 4s to 8s each	Almonds, per peck, 6s
Apples, Kitchen, per bush, 6s to 12s	Sweet Almonds, per pound, 2s
Strawberries, per qt. pottle, 6d to 2s	Filberts, English, per 100 lbs. 50s to 55s
Gooseberries, p. half-sieve, 1s 6d to 3s 6d	Cob Nuts, per 100 lbs. 60s
Currants, per half-sieve, 2s to 3s	Nuts, per bushel
Raspberries, per sm. bask., 10d to 1s 3d	— Brazil, 16s
Oranges, per doz., 1s to 2s 6d	— Spanish, 12s
— per 100, 6s to 12s	— Barcelona, 22s to 24s
Cherries, French, per 12 lbs., 4s to 8s	— Cob, 12s

VEGETABLES.

Cabbage-plants, per doz. bun., 1s to 2s 6d	Peas, per sack, 9s to 12s
Cabbages, per doz., 6d to 2s	Asparagus, large, per 100, 2s to 5s
Cauliflowers, per dozen, 2s to 6s	— Spruce, or Small, p. bun. 1s to 2s
Beans, Kidney, forced, p. 100, 2s to 3s	Lettuce, Cabb., p. sieve, 6d to 1s
Potatoes, per ton, 60s to 120s	— One, per score, 4d to 1s
— per cwt. 4s to 6s	Calery, p. bd., (12 to 15) 6d to 1s
— per bushel, 2s to 3s 6d	Rhubarb Stalks, per bdle, 4d to 1s
Kidney, p. bush., 2s to 3s	Small Salad, per punnet, 2d to 3d
Scotch, per bushel, 2s	Green Basil, per bunch, 4d to 6d
New, per lb., 4d to 1s	Watercress, per doz. sm. bun. 4d to 6d
Artichokes, green, per doz., 1s to 5s	Parsley, per 12 bunches, 1s 6d to 3s
Turnips, Spring, per bunch, 3d to 1s	Tarragon, per doz. bunches, 2s to 3s
Red Beet, per dozen, 9d to 1s	Fennel, per doz. bunch, 2s to 3s
Horse Radish, per bundle, 1s to 6s	Mint, per doz. bunches, 1s 6d to 3s
Radish, spring, p. doz. hands, 6d to 1s	Marjoram, green, per bunch 4d to 6d
— Turnip, p. doz. bunch, 6d to 1s	Mushrooms, per pottle, 2s to 4s 6d
Carrots, Young Horn, p. bunch, 6d to 1s	Spinach, per sieve, 1s to 1s 6d
— Spring per bunch, 4d to 1s	Leeks, per doz. bun., 5s to 6s
Garlic, per lb. 6d to 8d	Onions, per half sieve, 4s to 6s
Shallots, per lb., 1s to 1s 6d	— Spring per bunch, 2d to 6d
— green, per bunch, 3d to 6d	— Large, per bun., 6d to 1s
Peas, per sieve, 3s to 4s 6d	

Notices to Correspondents.

MANURE.—*Pontederulais*.—Salt is sometimes advantageous, if used in minute quantities; but its action is sure to be enervating if in excess, and it is better let alone, unless it has been mixed for some months with lime, when its nature is entirely changed, and it becomes suited for light lands that burn. —*Kent.*—Mix all your dry materials, and make them into heap, watering it, as you proceed in making it up, with the fluid you mention. Let it lie three months, and it will be fit for use. Do not, however, permit anything to soak away, but if any fluid drains off, let it be thrown back on the heap every day. If your fluid is putrid, as it should be before using, throw in 3 lbs. of sulphate of iron (green vitriol), and let it dissolve before adding to the heap.

SALT.—*Dianthus*.—It is impossible to say how much nitric acid is required to decompose your salt, for there is no knowing how much is left in the soil, or within reach of the acid. Perhaps half an ounce per superficial foot will be enough to remove the mischief; but you should dig the bed over before applying it, and then allow it to remain two or three weeks before it is replanted. Then sow on it some common annual—a little Mustard, for instance—and see whether that is healthy or not; if it is you will probably be safe.

ALLOTMENTS.—*R. W. B.* can easily make rules for his allotment tenants according to circumstances, if he will look at those given in page 243, as adopted at Eastbourn, or by Sir Charles Bunbury. When labourers are anxious to have allotments few rules are required. It would be difficult to draw up a code of rules to suit all circumstances. *M.*

PINES.—*Ignoramus*.—If Blue suckers were taken off in August last, and subjected to a bottom-heat of 100° for two months, (and afterwards placed in a bottom-heat of 80°), the excessive heat at that time would cause them to start into fruit at this season.

VINES.—*W. H.*—Your Vine-leaves can scarcely be called diseased, although they are in an unusual state, because nothing can well be more healthy than they are. The appearance of warts on their underside is most probably caused by the damp atmosphere and rich soil in which they are growing, and may be conceived to arise thus: The water which the leaves derive from the stem and absorb from the atmosphere is unable to escape again, in consequence of the air that surrounds them being continually loaded with moisture; the result of this is that the water accumulates in the interior of the leaves, and swells them up in the form of warts. The presence of the latter on the under side only, is owing to perspiration from the Vine taking place principally by that surface, which is moreover much softer and looser in texture than the upper surface. If the volumes of aqueous vapour discharged into this Vinery through the *manhole* of the boiler were cut off, the affection would not now disappear, but in all probability would cease to come on new leaves. The coarser habits of the Black Hamburgh will account for its being affected, while the more delicate Frontignan escapes.

PACKING FRUIT.—*X. Y. Z.* will find some information respecting the best method of packing fruit to go by railway, at p. 485 of the first volume of this Paper. The main point to be attended to is to have the box containing the fruit enclosed in another box, leaving an interspace of two or three inches all round, which must be filled up tightly with hay, moss, or other soft material of a like character.

SEA KALE.—*Oriola*.—No doubt you have used your salt too strong. In the article referred to by you it was expressly stated that we did not know how much was the greatest quantity Sea-kale would bear. Although a plant may take one pound of nitrate of soda with impunity, it does not follow that it will also take one pound of muriate of soda (common salt). Wait till the autumn; and if your plants recover let them alone; if they do not you must replant them; but you may use the same bed.

ASPARAGUS.—*S. S.*—We do not know what the greatest depth is that Asparagus may be buried: five or six inches are enough. The deeper it is buried the later it will be in appearing. The crowns never rise nearer the surface. While growing, a fluid consisting of soap-suds and the drainings from a water-closet fermented in an under-ground cistern will suit it well. If you apply it in a weak state, and only while the Asparagus is growing, you cannot well *verdo* it by a weekly drenching. Your last question is answered in a leading article of June 10. —*Libanon*.—If you will read a leading article of June 10, you will find your question nearly answered. Common salt should be used: and the best strength is weaker than seawater; we can only repeat, what has been so very often mentioned before, that the rule to be observed in applying saline manure, and indeed all manures, is to administer them weak, and often, and while the plant is in rapid growth.

POTATOES.—*F. B.*—We are convinced that nothing is gained by planting whole Potatoes, and that sets will produce quite as good results. It is not at all necessary to place Potatoes in a warm place previous to planting; and it may do harm. Transplanting is not a good plan. For other answers see a leading article of to-day. —*H. L., Berberis, Quoad*.—See a leading article of to-day.

MOWING MACHINE.—*F. J.*—This instrument is well known to us, and we do not think it comparable with a good mower. Its principal use is where men cannot mow neatly, or when the weather is so dry that the edge of the scythe will not bite. It cannot be employed in wet weather. Stones break its knife-edges; and it is troublesome. In very small places, where there is no regular gardener, it is most useful.

SEEDS.—*Pontedericus*.—Sow Crocus and Narcissus seeds as soon as ripe in pans of light earth, in a cold frame; get them up as soon as you can; give them all possible light while growing; gradually dry them off when their leaves turn yellow, and keep them in their earth during the succeeding winter, very slightly damp.

POTTING.—*Pontedericus*.—We do not advise you to make a rule of putting rotten dung at the bottom of the roots of plants in pots. It will make them run to leaf. A rich light loose compost for them to grow in, and plenty of drainage at the bottom, is what most plants like.

VERANDAS.—*Pontedericus*.—Evergreen and Japan Honeysuckles, Pyracantha, Ivy, Banksian Roses, White Jasmine, will suit you, unless your situation be very bleak.

THE CEDAR OF LIBANON is propagated by seeds, which are obtained by splitting the cones, among whose scales they are lodged. Some articles on Coniferous plants in former volumes explain the mode of raising them.

DRYING FLOWERS.—*H. Carter* may preserve the petals of his *Pelargonium* flowers by simply placing them between clean smooth paper, beneath a book, or something that will press them out flatly.

PELAGONIUMS.—*G. W.*—Discard the following sorts:—Beauty of Ware, Admiral Napier, Masterpiece, Gem, Bleda, Priam, Cunningham's Clarissa, William the Conqueror, Queen of Scots, Brightonensis, Beatrice, Ranceanum, and replace these with Mahda, Queen of the Fairies, Lyne's Duke of Cornwall, Cyrus, Grand Duke, Comte de Paris, Garth's Witch, Wonder, Prince of Waterloo, Hodge's Emperor, Madeline, Beck's Hebe.

FUCHSIAS.—*Eclipse*.—Among the Fuchsias named *Formosa elegans* is our favourite; when well grown with the deep purple colour of the petals well developed, it is an elegant and beautiful object. —*Youell and Co.*—From the specimen received, *St. Clare* appears to be a prolific bloomer and fine variety, we have never seen the colour so fine in any specimen grown near London.

BOOKS.—*C. J.*—The latest work on the Vine is Mr. Robert's Treatise, recently noticed in our columns. Mr. Mearns's Essay also gives instructions about coiling the stems, and otherwise growing Vines, in pots. —*A Subscriber*.—We cannot advertise the prices of books or where they are to be had; that is the business of Booksellers. —*L. J. W. and others*.—We have no intention of reprinting Mr. Lawrence's useful pamphlet; nor could we do so without that gentleman's permission.

MICROSCOPES.—*Y. Z.*—If you have not more than 10s. to spare, you had better buy a good common pocket lens, with an inch focus; it should not cost above 3s., and it will do all that a more expensive kind will. If, upon going to the shop, you find it does not magnify enough, you can easily have a second in the same case, with a shorter focus and higher magnifying power. The Stanhope lenses are powerful, but of little use for practical Botany, in consequence of the smallness of their field.

INDIAN ARMY.—*G.*—We cannot discuss questions that do not concern the professed objects of this Paper. The grievances of the Indian Medical Officers are stated in a pamphlet published by Simpkin and Marshall, to which we must refer you.

NAMES.—*Probe*.—The *i* is short—thus, Abutilon; it is a change of the word inutilis.

DESTRUCTION OF INSECTS.—*W. C. A.*—Gas-tar has a very unpleasant smell, and rather an unsightly appearance on a garden wall; however, there is no doubt it will prove noxious to most insects. It will not injure vegetation if the latter is not brought in contact with such time as the gas-tar is dry. The heat of the wall, on an average, will not be increased by the dark colour. The Meetings of the Horticultural Society are always announced at the head of our leading article.

ANTS.—*R. S.*—We wish most sincerely we could tell you how to get rid of Black Ants but we have tried or mentioned all the plans that have been proposed, and nothing seems effectual. We have recommended a solution of corrosive sublimate and common treacle, covered with paper pierced full of holes, so that the ants may run upon the surface without sticking in it; but we do not as yet know how it will answer.
