INDEX OF CONTENTS

TO

THE VOLUME FOR 1843.

A

ABACA, described, 140
 Abies Douglasii, 321; first flowering of, 336
 Acacias for a greenhouse, 216; spectabilis, 759; armata, 881
 Acarus geniculatus, described, 356
 Accentuation, remarks on, 389
 Achimenes hirsuta, 807; pedunculata, 806; grandiflora, 633; hirsuta, adv., Henderson, 658; longiflora, its treatment, 41, 73, 174; producing bulbs at the axils of the leaves, 105; grandiflora, adv., 369; multiflora 140; treatment of the genus, 178
 Acorns, American, adv., Whalley, 114
 Adhesive paper for dried plants, 777
 Aechmea fulgens, 695
 Aecidium laceratum, described, 678
 Aerides virens, 523
 Afghanistan, plants of, 53, 116; variation of its climate, 67, 116
 African Marygold, luminous appearances in, 691; oil, 845; guano islands, 864; Kidney-beans, 862
 Agapanthus, its treatment, 9; umbellatus, var. maximus, 175
 Agarics, remarks on, 559
 Agave Americana, its treatment, 321
 Agricultural works, adv., 128; remarks on, 571; chemistry, association of Scotland, adv., 407; education, adv., 517; experiments, remarks on, 155; labourers, to employ, 299, 315, 373; Mr. Lawrence's letters to, 342, 396; means of improving their condition, 333, 387, 411; to educate their children, 355, 371; labour, ancient price of, 445; *Agricultural Gazette* announced, 837
 Agriculture, its improvement, 318; hints on, 427, 443, 477, 517, 539, 555; of Ceylon, 845
 Agricultural Gazette, preparations for, 907
 Ailanthus, 807
 Alhagi of the Desert, 87
 Allcard, (Mr.) his garden noticed, 559
 Allotments, remarks on, 187, 206, 227, 243, 387, 411, 863; to prepare and let, 243; succession of crops for, 262
 Almanacs of Farming and Gardening, rev., 847
 Almug of Scripture, 333
 Alonsoa, its treatment, 505
 Alstroemeria lineatiflora, 844
 Althæa frutex, 72
 Alum useful in fixing Ammonia, 541; in turning Hydrangeas blue, 543
 Amaryllis Belladonna, its treatment, 22, 85, 102, 137; in pots, 302, 375; speciosissima, its treatment, 157; Josephineæ, described, 645; longifolia, 305; reginæ, habits of, 357; formosissima, to bloom, 545
 America, N.W., collector for, 231; Willows of, 375
 American plants, soil suitable for, 721
 American Agriculturist, rev., 504
 Ammonia, its value in Horticulture, 539; to apply, 539; fixed by Alum, 541; to fix in Manure, 665; 449, 697; its effects on vegetation, 692, 710; phosphate of, 40; its effects on grass, 3; test for, 9; sulphate of, 40; Dr. Daubeny's letter respecting, 99; per acre, 9; its value for destroying insects, 477; turmeric as a test for, 88; muriate of, to destroy insects, 519; on Cucumbers, 556; Potter's remarks on fixing, 229, 245; with blue vitriol, 229; with salt and lime, 230; with gypsum, 117, 144, 135, 177, 777; to fix, 9, 115, 117, 189, 191, 248; with salt, 115, 245; Mr. Henslow's letter on, 135
 Ammoniacal liquor to kill weeds, 806; its effect on grass, 3, 22, 191, 209, 461; on bark, 286; to convert into manure, 72, 216; formation of carbonate of soda from, 245
 Ammocharis falcata, its treatment, 283, 301
 Amphicome arguta, 232
 Anagallis Brewerii, 400; adv., 425; grandiflora, 461
 Analysis of soils, 625
 Anæctochilus setaceus, 711
 Ancients, opinion of, respecting animals, 142
 Anemones, to protect, 25; adv., 33; to grow in boxes, 248; treatment of, 809, 881
 Anger, in the island of Java, produce of that part, 738
 Angle, measuring, directions for, 721
 Animals, source of fat in, 71; anatomy of, 303
 Anisoplia horticola, 190; to destroy, 377
 Annals, treatment of, 655; early, 25, 116; advantage of sowing in autumn, 429; to protect, 38; list of, 209; for autumn blooming, 412; greenhouse, to sow, 69, 116; for autumn sowing, 560; select, 105; fragrant, 248; tender, their treatment, 305; their seeds will generally grow the second year, 305
 Anomatheca cruenta, 144
 Anona Cherimolia, its treatment, 518
 Antirrhinum majus, var. quadricolor, 774
 Antiquities of Gardening—green Peas, 71; Lemons, 119; Market Gardeners and Pigs, 157—372, 389, 412, 500; fruit-trees, orchards, and Vines, 840
 Ants, to destroy, 105, 361, 433; to drive from Pine-pits, 122; from pots, 249
 Aphis, to destroy, 321, 449; on Roses, 449; on Firs, 545; on Peach-trees, 697
 Apples, for succession, 809; select, 57; of 1842 sold at Preston, 574; stocks for, 73, 144; to gather the fruit of, 649; to graft on Pears, 105; late kinds, 105; instance of twice blooming in one season, 758; Sturmer Pippin, adv., 154; of Sodom, 73; moss on, to destroy, 158, 216; caterpillars injurious to, to destroy, 105; singular preservation of, 357; to preserve, 305, 336, 357, 777; in sand, 335; late flowering of, 773
 Apple-trees, to prune, 881
 Apricots, good, 121; trees, to move, 305
 Aquilegia Skinneri, 775
 Arable land, to crop, 477
 Araceae order, described, 140
 Areca sapida, 142
 Araucaria imbricata, Youell's adv., 817; treatment of seeds, 232, 465, 862; seeds, adv., 329; plants, 425, 862
 Arbutus, to remove, 69
 Architecture, good works on, 400; of birds, 303
 Arnott, whence procured, 415
 Aromatic plants, effect produced by, 559; on approaching Ceylon, 609, 646
 Arrowroot Pudding and Mange, to make, 447; potato starch in, 141; price of, 479
 Artisan, a new periodical, reviewed, 742
 Ascension Island, growth of plants in, 230
 Asclepias, gigantic, 69; curassavica, hardy, 789
 Ash-tree, toad discovered in, 737; to confine the roots of, 809; variety of, 878
 Asparagus, use of trenches between the beds, 697; to cut down, 792; salt for, 9, 44, 249, 387, 444, 462, 488, 629; nitrate of soda

for, 41; beds, to plant, 75, 249, 387, 464; to grow in bottles, 102, 138, 336, 374; hints on manuring, 305, 433, 479; on manuring, 357, 361, 373, 387, 417, 697; remarks on, 633; its treatment, 387, 429, 464, 865; in wet soils, 649; hardness of, 445; to apply sea-water to, 577; superiority of Austrian, 589
 Asphalte, adv., Farrel, 2; Croggon, 440; for covering, 488
 Aspidiotus proteus, or small brown scale, described, 676; conchiformis, or Apple-tree Mussel Scale, described, 735; Nerii, or small white-scale, described, 588; ostreiformis, or Pear-tree oyster-scale, described, 805
 Assam Tea, 39
 Atmosphere, to retain moist, 272; of hothouses, 772, 803, 821, 788, 839
 Atropis pulsatorius, described, 116
 Aucuba, a Cornaceous plant, 161; remarks on, 211; description of the fruit, 286
 Auriculas, canker in, 842 860; adv., 33; select, 321; seed of, to sow, 89; their treatment, 100; treatment of seedlings, 121; adv., Dickson, 130; Groom, 129
 Australian plants, their treatment, 400
 Autumn flowers, 377
 Avenues, advocated, 57
 Aviaries, their construction, 101
 Azaleas, to propagate, 761; seed, to sow, 71; Herberti, to grow, 289; Indian, treatment of after blooming, 845

B

BABINGTON'S Manual of British Botany, rev., 398
 Backhouse's Visit to the Australian Colonies, reviewed, 142
 Bacon, to preserve, 23
 Balsams, treatment of, 345
 Baloot Oak, 85
 Bamford Hall, Pine-stoves at, 139
 Baobab-tree, 463
 Baptisia australis, 216
 Barkmite, described, 356
 Bark, to strip from trees, 85; mite, 556
 Barkeria spectabilis, 741
 Barley-corn, prolific, 69; bulbous-rooted, 103; straw as a manure, 208
 Barnadesia rosea, 463
 Barton, near Bury St. Edmunds, young trees noticed at, 647
 Barringtonia speciosa, 863
 Baxter's British Pæonogamous Botany, reviewed, 560
 Bay Lily, 807
 Beans, Kidney, a profitable vegetable for the poor, 387; manure for, 57; French, to cure red spider on, 57; early, 89; good kinds, 105; straw as a manure, 244
 Beck, Mr., his tank-house, 820; his potting-shed, *ib.*
 Becium bicolor, 268
 Beds, dwarf-plants for, 272
 Beech-trees, disease in, 593; Beech, evergreen, its introduction, 231; hedges, to form, 272; to retain their leaves, 913
 Bees, controversy respecting their swarming, 578, 542; cause of their deserting their hive, 519; on a White-thorn, 519, 542; under tiles, to manage, 545, 824; hive of, on a log of wood, 775; to preserve during winter, 677; instance of sagacity in, 695, 822; singular fact connected with, 391, 433; to take off swarms artificially, 429; prolific hive of, 694; remarks on the weight of honey collected by, hive great weight of comb and honey in 501; on the temper of 501, 519, 737; profitable management of, 646; their treatment, in winter, 6, 52, 69, 85, 101; fecundity of, 574; in Zante, 271; on by Wighton, 85, 138, 210, 265, 336, 390, 400, 445, 590; habits of, 101, 373, 413; to dislodge, 210; remarks on, 445, 480, 542, 758, 861, 864; Wighton's work on, adv., 112; swarm of in Hawthorn-hedge, their comb containing brood, 589; query respecting the transmutation of eggs, 139; answered, 158, 209, 286; treatment of, 173, 629; in spring, 246; Dahlia, injurious to, 230, 301; to manage in straw hives without destroying them, 265; mode of clearing their hives, 286, 372; hints respecting them, 335; early swarming of, 357, 373, 391, 414; in New Zealand, 881; and Wasps, 822; observations on, 909
 Beehives, Nutt's, Strictures on, 139; work on, adv., Milton, 151; Lady's Safety, 177; adv., Neighbour, 224; should not be painted inside, 286; straw, to plaister, 246, 53; patent bar and frame, 317; cottage, adv., 328
 Beet, adv., Whyte, 49
 Beetle, Fern-shaw, destruction caused by, 190
 Begonia coccinea, 118, 396; Evansiana, hardy, 758
 Beil, gardens at, noticed, 760
 Bell's subscription, 857
 Belgian Carrots, to sow, 73, 86, 89
 Benthamia fragifera, at Heligan, 524
 Berberis glumacea, 89; aquifolium, adv., Kendle, 170; to sow seeds of, 561; trifoliata, 216; dulcis, 232, 695
 Berberry, mildew on leaves of; its effect upon corn, 738; to sow, 913
 Berlin Botanic Garden, circular respecting, 258
 Bermuda, growth of Potatoes in, 375; coffee, 863
 Bicke's Art of Cultivating the Ground without Manure, 8; remarks on, 35; by Mr. King, 70; test of, 70; failure of, 775
 Bifrenaria inodora, 559
 Bignonia venusta, to prune, 777; greenhouse kinds, 41; picta, 591
 Bilberry leaves, as manure, 478
 Birch, its value, 23
 Birds, to frighten, 272; bad effects of destroying, 677; architecture of, 303; singular association of, 357; benefits derived from, 557, 742; nests, plants propagated in, 694
 Birkenhead, new public parks at, 742
 Bixa prellana, 415
 Blackbird, remarkable, 70
 Blackberry Jelly, receipt for, 774, 789
 Bleaching powder, a disinfecting agent, 192
 Bletting, its derivation, 21
 Blight, killed by pilchard-oil, 861
 Blue Bell, to extirpate, 248
 Blue-flowering plants for the Conservatory, 265
 Boar, wild, 142
 Bobbin Joans, 589
 Bog-earth for manure, 177
 Boilers, Stephenson's double cylindrical, 87; Burbidge and Healy's, adv., 732; description of those used at Veitch's Nursery, 556
 Bokhara clover, 246, 289; notice of, 412; treatment of, 758
 Bolbophyllum adenopetalum, 23
 Bombyx Neustria, described, 244

Bombazine dust for manure, 46
 Bonatea speciosa, singular property of, 247
 Bones as a manure, 5; adulteration in detected, 50; their effect on Wheat, 189; boiled superior to unboiled, 318; digested in sulphuric acid, 761
 Books, on farming, 25; adv., 96, 259; for gardeners, 25; on plans and ornaments, 73; land surveying, 89; Botany, 144, 216, 238, 417; Geology, 216; Conchology, 216; for travellers on the Continent, 239; on the treatment of forest-trees, 721; new Botanical, 911
 Book of the Farm, No. 16, rev., 792; observations on, 792
 Border-plants, good, 245; for a wall, to form, 344
 Boronia Fraseri, 823
 Botanic Garden at Kew, improvements in, 675; of University of Copenhagen, 775; of Ceylon, 432
 Botany, adv., 332; remarks on, 744, 761; of the Himalayan mountains, adv., Allee, 2; works on, 25, 41, 488, 864; adv., Pamplin, 538; new, 103; lectures on, adv., 201, 410; familiar, 99, 188, 207, 228, 412, 735
 Botanical terms, remarks on, 299; works lately published, 775; books, new, 879, 911
 Botanists, destruction amongst rare British plants, committed by, 501, 557
 Bottom-heat, remarks on, 68, 449, 488, 606, 661, 803; hotwater gutters for, 544, 659; hotwater recommended for, 305; observations on different systems of, 643
 Boucherie's (Dr.) his method of improving the appearance and quality of wood, 911
 Bouquets, adv., Harding, 1
 Bowling-green, to make, 761
 Boxley Abbey, a fine specimen of Clanthus puniceus in bloom there, 303
 Brachycome, its treatment, 71
 Branches, their tendency to stretch towards the light, 359
 Brande's (Prof.) lectures, 877
 Bravoa geminiflora, treatment of, 697
 Bread, its nutritive power in various countries, 559
 Brewers' grains, as a manure, 105, 136, 177
 British Association, meeting of, announced, 342, 524
 Broccoli, sprouts, to boil, 7; seed, adv., Hammond, 49; leaves, to cure scalds, 70; good kinds, 105, 848; Walcheren, adv., 314
 Brocklehurst, Mr., his garden noticed, 271
 Broughton Hall gardens, noticed, 759
 Brown's Nursery, noticed, 359
 Bruchus granarius, described, 188
 Brugmansia, adv., T. Bridgford, 786
 Brunsvigia Josephinae, its treatment, 248, 283; multiflora, 283
 Buck-wheat, as a green manure, 4; straw, as a manure, 229
 Buds, their development, 228
 Budding, plan of, 317, 432, 528; improved knife for, 519; adv., 538
 Bulb Cucumbers-glasses, adv., 370
 Bulbs, treatment of, 809; growth of, 38; adv., Saunders, 478; Cape, their treatment, 73, 245, 248, 283, 681, 761, 774; adv., 553; 910
 Bugs, to get rid of, 528; mealy, to destroy, 561
 Butler, effect of sheep on, when pastured with cows, 103, 209; to produce, 525

C

CABBAGES, Conve Tronchuda, &c., 809; large size of, 806, 823; early, 41; club to prevent in, 57, 825; leaf, curious form of, 628; Chinese, its treatment, 73; Portuguese, 216; good kinds, 105, 138, 417; Cow, 161; singular instance of sporting in, 561; grub, to kill on, 445; to plant crowns of, 822; large, 909
 Cactus, Conway's Giant, adv., 154; new varieties, noticed, 247, 345, 361, 377, 432, 417, 465, 505
 Cacti, their treatment, 105, 361; from seed, 216, 361; adv., 240, 441, 457
 Cabul, remarks on its vegetation, 69
 Calandra granaria, 907
 Calceolarias, adv., Dickson, 1; May, 14; select, 144, 561, 777; to bloom late, 377; treatment of, 478
 Calcutta, Botanic Garden noticed, 287
 Caledonian Hort. Soc. Gardens noticed, 103
 Calendar, remarks on, 54; alteration in, 907
 Calla, its treatment, 232
 Callis'emon salignum in flower at, 447
 Calypso borealis, 272
 Camel, account of, 142
 Camelina sativa, described, 633; seed of, disagreeing with cattle, 678
 Camellias, to water with Nitrate of Soda, 41; remarks on, 697; their treatment, 56, 57, 102, 117, 177, 633; in the open air, 118, 174, 361; soil for, 216; to graft, 189; adv., Hally, 186; new variety noticed, 247; good kinds, 272
 Campanula Lædingii, 268; grandis, 341, 505
 Canada Kale, 41
 Candollea tetrandra, 844
 Canker, to eradicate, 89; cause of, 526; in Cucumbers, 361; in Melons, 777; Auriculas, 842, 860
 Canvas for frames, to prepare, 139, 157
 Caoutchouc, remarks on, 463
 Cape Bulbs, remarks on, 245; their treatment, 248, 681; Jasmine, 449; Iridaceæ, 761; culture of, 774; 910
 Cape Palmas, its vegetation, 22
 Cape Gooseberry, its treatment, 305, 400
 Carbon, adv., 151
 Carbonic acid, its relation to plants, 875
 Carbonate of Soda, from gas-liquor, 245
 Caroons, to cook, 119
 Carex paniculata, large size of, 161
 Carnations, select, 26, 543, 681, 761, 809; Appleby's Prince of Wales, adv., 515; their treatment, 100, 216; soil for, 649; exhibition at Youell's, adv., 537; adv., Youell, 114; Groom, 129; Holland, 129; Dickson, 130; Ely, 154; Ansell, 226; Wood's description of, 134, 155, 206; to fertilize, 792, 861; Mr. Orson's Paper on the Properties of, 91; remarks on, 230, 266; catalogue of, 857; manure for, 848; autumn, 842; late flowering, 909; kind of abundant, in pollen, 909
 Carrots, remarks on the Altringham, Large Surrey, and Long Horn, 249; Belgian, to sow, 73, 86, 89; cause of their running to seed, 528; yield best when sown thickly, 86; seed adv., Gordon, 204; Yellow Belgian, adv., Clarke, 204
 Castor Oil Plant, its treatment, 177
 Catalogue of Roses, Rivers's, rev., 643; Paul's, rev., 742; Lane's, rev., 776
 Caterpillars on Apple-trees, to destroy, 105; on Gooseberries, 272, 480, 503, 761
 Catasctum planiceps, 175; experiments with, 358

Cattle, good work on, 105; feeding, remarks on, 697
 Ceanothus divaricatus, 523
 Cedars, to prune, 793
 Celery, to destroy maggots on, 697; its culture in beds, 4, 20; adv., Lane, 17; to cook, 39; soon cools when brought to table, 54; to earth up, 105; effect of Potter's Guano on, 266; remarks on, 881
 Cellar for roots, to prepare, &c., 245, 266; for plants, 825
 Cement, adv., Austin, 128; hydraulic, 609; Roman, to apply, 630; observations on, 646
 Centradenia rosea, 319; culture of, 876
 Cerbera fruticosa, 9
 Cereale papaver, 7
 Cereus serpentinus, blooming at Yard House, 543
 Cesspool, contents of, as a manure, 72; to disinfect, 192
 Ceylon, Botanic Garden of, 432; Cinnamon plants described, 679
 Chalk, to apply to land, 416
 Chambers' Cyclopædia of English Literature, remarks on, 417
 Chamomile, curious sporting of, 479; to prevent, 519
 Chandler's Nursery, noticed, 159, 824
 Chara, as a green manure, 84
 Charcoal, a preventive to the Onion-maggot, 54, 161; growth of plants in, 55; to prepare, 358, 478; to mix with soil in potting, 177; to mix with manures, 248; made from refuse cuttings, 191; to use advantageously, 216, 248; food for plants, 875; Mr. Rigg's experiment with, 875; its effects on plants, 907
 Chemistry, made Easy, adv., 498; Rural, adv., 51; lectures on, 318, 338, 358, 392; striking discoveries in, effects of, 733
 Cherimoyer, its treatment, 518; where procured, 545
 Cherries, for espaliers, 25; Mayduke, remarks on, 57; on walls, their treatment, 305; to destroy insects on, 433
 Chervil, bulbous-rooted, 159
 Chickweed, to destroy, 9
 Chicory, to cultivate, 289
 Child's "Every Man his own Brewer," rev., 160
 Chimonanthus, hardy, 72, 192; its treatment, 232
 China, collection for, 7; flower-gardens in, 39; Cabbage of, its treatment, 73; seeds from, to raise, 121; Mr. Fortune's mission to, 140
 Chinese Egg-plant, 142; Iris, its treatment, 177; method of sowing seeds, 247
 Chionanthus, to flower, 144
 Chloride of lime, a remedy for worms, 429
 Chlorine, to disinfect manure, 4
 Chorozema spartioides, 630
 Chrysanthemums, their treatment, 229, 345, 736; list of, 681; adv., 281; the Duke, adv., 329; list of, adv., Youell, 441; to bloom in winter, 377; to render bushy, 377; pamphlet on, adv., 442; to layer, 541; Chinese, 876
 Churns, Atwood's, noticed, 593
 Cider, to make, 864
 Cinerarias, their treatment, 289, 372; good kinds, 289; to sow seeds of, 720; seed, adv., 385
 Cinnamon plant, described, 679
 Cirrhopetalum auratum, 911
 Civil history, 24
 Clarke's Ladies' Hand-Book, adv., 112
 Clay, directions for burning, 303, 335; land, to improve, 539; hungry, to ameliorate, 793
 Clematis Hendersonii, 561
 Clianthus puniceus, its treatment, 9, 121; to propagate, 345; specimen at Newport in the open air, 359
 Climbers, trellis for, 4, 68, 84, 156, 173, 263, 300, 428; for a S.E. wall, 57; for a shaded trellis, 72; for a rough wall, 72; for a N. aspect, 89; for a Conservatory, 89; hardy, to strike cuttings of, 545; for a rough-cast wall, 105; for a summer-house, 121; for verandahs, 433; greenhouse, 305; annual, 209, 272; to bloom, 216; summer, 377; evergreen, 505
 Climate, in the N. of Scotland, 211; in United States, 807
 Cloacine explained, 72; to save, 144, 216, 247; to disinfect, 216, 247
 Clover, cause of its failure, 99; Alsike, 158; seed, doctored, test for, 231; Bokhara, 246, 289, 412; soil for, 289; red, as a green manure, 35; white, 35
 Clover Rape, &c., remarks on, 645
 Clover Dodder, its habits described, 627; to destroy, 627, 758; pernicious effects of, 607, 629; list of plants attacked by it, 644; seed of, said to be imported from Khehat, 662; its effect on Lucerne, 678; described, 710; origin of, 806; remarks on, 737; introduced from Afghanistan with Lucerne seed, 694; to separate the seeds of, from those of Lucerne, 771; seeds of, 802, 909
 Clowesia rosea, 741
 Club in Cabbages, to prevent, 87, 825
 Coal-ashes, as a protection to the roots of plants, 272
 Cobæa scandens, 192
 Cockscombs, culture of, 788; their treatment, 345
 Cockroaches, to destroy, 396, 505
 Coccus testudo, described, 443, 444; patellaformis, 517, 518; Cocoa-nuts, for manure, 909, 862
 Coffee plant, 842
 Coltsfoot, to extirpate, 248
 Colours, arrangement of, in flower-beds, 173, 316, 540
 Columnea splendens, 211
 Colours of flowers, remarks on changing, 577
 Comarostaphylis arbutoides, 463
 Commelina cælestis, its treatment, 443
 Corn, cheaper to buy than flour, 22; Indian, remarkable crop of, 38; its treatment, 400; stubble as a manure, 133; new kind of, 647; transmutation of, 661
 Corn Weevil, 907
 Comparettia rosea, 140
 Compost heap, to prepare, 720
 Conservatory, plants for, 88, 104, 884; described, 629; climbers, 89; new mode of treatment suggested, 588, 607; blue-flowering plants for, 265; time for planting, 400; remarks on planting, 761
 Coriaria, manures injurious to, 89; adv., P. Lawson, 786; treatment when young, 105; of seeds, 232; cultivation of, in pots, 315, 336
 Convolvulus, Swan River, described, 719
 Contrivance in the creation, 23
 Cookery, problem in, 22, 38; No. 2, 190
 Coppice wood, its treatment, 101
 Copyright, remarks on, 545
 Coral tree in the open ground, 172
 Coriaria myrtifolia, poisoning by, 319
 Cork tree, not hardy, 89
 Correspondents, notice to, respecting naming plants, 344
 Corrosive sublimate, to destroy worms, 37, 70, 86, 216, 449
 Cosson's Introduction to the Flora of Paris, noticed, 39
 Costus speciosus, its treatment, 56
 Cottage Bee-hive, adv., 329
 Cottagers, cheap way for them to prepare manure, 83; books, as prizes for, 345; Gardens, in Scotland, suggestions for improvement of, 660
 Cotton's My Bee Book, adv., 200
 Cotton, of English growth, 520; coverings of, for frames, to prepare, 301, 557; seed of, for cows, 624
 Cotoneaster, berries of, not poisonous, 505
 Curculio lineatus, feeds on the Bean, 373
 Cotyledon umbilicus, for edgings, 519
 Couch-grass, to destroy, 103, 825
 Covering for flowers, 557; for stacks, 558
 Cow-grass, to lay down land with, 232
 Cows, to cure warts on their teats, 177; good kinds, 443; food for, 825; dung of, a good manure for American borders, 321; cotton seed, as food for, 524; works upon, 417; effect of vegetable refuse on their milk, 157
 Cranberries, as manure, 478; to cultivate, 844
 Crabs, ornamental, 41
 Crataegus, ornamental kinds of, 412

Creasote, for preserving meat, 543
 Creepers for a N. aspect, 89; for a bank, 192; quick growing, 361; adv., Milne, 258; hardy, list of, and time of flowering, 633; list of, 881
 Cress, American, to sow, 345
 Crickets, to destroy, 561
 Crinum longifolium, treatment of, 825
 Crocuses, to protect from mice, 9; adv., Lockhart, 170; to sow seeds of, 433
 Cropping, remarks on, 720; succession for allotments, 262
 Crowfoot, as a green manure, 84; to destroy, 192, 216
 Cryptogamic plants, adv., Gardiner, 170
 Cuckoo, habits of, 519, 557; account of one surviving two winters in England, 574; to keep in winter, 862
 Cucumbers, treatment of, 848; adv., Cuthill, 1; Carter, 170; remarks on, 19, 22; qualifications of, 19; cause of canker in, 361; boxes, adv., Watt's, 2; good kinds, 53, 216; pit for, 25; nitrate of soda for, 192; to prepare a hotbed for, 53; their treatment at Southill, 118; early, to cultivate, 336; bed, to mix gypsum with, 232; to cure mildew on, 505; benefited by muriate of ammonia, 556; bitterness in, 561
 Currants, to train, 506; trees, 909
 Currant, Vine, its treatment in the Ionian islands, 70; largefruit of, 175; to raise from seed, 319
 Cuscuta trifoli, 710, 756; Europæa, 710
 Custom House officers, plants plundered by, 115
 Custard Apple, 233
 Cuttings, peculiar method of striking, 102; when to gather, reason for retaining a leaf on, 709; to prepare, 104, 300; of the Apple, treatment of, 116, 300; not likely to root in a Potato, 272; half-hardy in spring, 189; autumn-struck, preferable to spring, 428; pit for, 189; to transmit to India, 228, 539, 544
 Cyclopædia of Science, rev., 791
 Cyclamens, their treatment, 460; varieties described, 660
 Cynoches, 775; pentadactylon, 319
 Cydonia japonica, for a north wall, 69; edible, 240
 Cymbidium Devonianum, 431
 Cypress tree, its durability, 87
 Cyrtanthus, its treatment, 248, 488
 Cytisus Weldenii, 647

D

DARLIAS, select, 761; to cut down the stems of, 777; adv., Whale, 1; Mitchell, 1; Newton, 17; Edwards, 33; Malroy, 26; Headland, 49; Mountjoy, 65; Bushell, 65; Heale, 65; Smith, 81; Keynes, 82; Bragg's, 82; Gaines, 97; King, 130; Langeller, 154; Low, 201; seed, to sow, 41; to save, 87; of 1842, exhibited near London, 289; Mr. Wildman's remarks on, 86, 102; properties of, 86, 102; select, 231, 233, 305, 593; to prune, 361; Asmodeus, adv., 170; Virgil, 185; Uxbridge Rival, 282; Imogene, 282; Queen of the Isles, 298; Essex Triumph, 330; blooming of, with open centres, 711; list of winning flowers, 231; effect of nitrate of soda on, 191; to keep through the winter, 744; adv., Brown, 226; Sutton, 257; Atwell, 258; at exhibitions, should be named, 499; coccinea, double, 879; remarks on, 877
 Daisy, a guard against wireworm, 693
 Dalkeith Palace Gardens, noticed, 176
 Dandelions, to destroy, 216
 Daniell's manure, good for Turnips, 22
 Daphne, to graft, 9; soil for, 216; Cneorum, soil for, 321, 391; to train, 414; odora, to bloom, 345
 Date tree, 845
 Dates, remarks on, 449
 Daubeny's sulphate of ammonia, letter respecting, 99
 David's Temperature of the Soils, adv., 426; reviewed, 464
 Davis's Injury and Waste of Corn from Thick Sowing, rev., 576
 Davy's Agricultural Chemistry, adv., 328
 Deciduous shrubs, list of, 825
 Dendrobium sanguinolentum, 118; rhombeum, 268; Ruckeri, 319; taurinum, 447; cucumerinum, 575; list of, 761; aqueum, 823
 Denyer's nursery, noticed, 487
 Devonshire, mildness of, 159
 Derby, remarks on the Agricultural Society's meetings at, 499; show, adv., 257; account of, 481, 502; remarks on, 492; anniversary meeting, 374; Southampton meeting, adv., 834
 Digging land, cost of, 9; shrubberies, 805, 843, 860, 861
 Diocletian's answer to Maximilian, 87
 Diospyros virginiana, 844
 Diseases of vegetables, remarks on, 131; in Potatoes, Sir C. Lemon on, 524; in Firs, 37; in Larch, 458, 661; in Pansies, 573, 646, 809; cure for, 589; in Pinus, 319
 Dock-mud, as a manure, 614
 Doctored Clover seed, test for, 231
 Dodder, pernicious effects of, on Clover, 607; its habits, 627; to destroy, 627, 758; plants attacked by it, 644; seed imported from Khehat, 672; its effect on Lucerne, 678; described, 710; origin of, 806; remarks on, 737; introduced from Afghanistan with Lucerne seeds, 691; to separate seeds of, from those of Lucerne, 771; seeds of, 802, 909
 Dodd's Annual Biography, adv., 80
 Doxat's Meteorological Ephemeris, rev., 807
 Doyle's Cyclopædia of Husbandry, rev., 39, 87; of Practical Agriculture, rev., 176; Kitchen Garden, adv., 184
 Drainage Act, remarks on, 19, 51, 86, 116, 187; works on, rev., 143; remarks on Mr. Pusey's Bill for, 283, 300
 Draining, remarks on, 3, 21, 35, 51, 232, 248, 334, 356, 525; manner in which it may be carried out universally, 3, 51, 261; observations on, and directions for, 264, 318, 643; its beneficial effects on the Weald of Kent, 68; on forming companies for, 115; fields, 232; with clay, 245, 390; cylindrical tiles, 392, 480; on different kinds of subsoils, process of making pipes for, 659; plan of, 606; and subsoil ploughing, remarks on, 587; directions for, 506, 627; with peat, durability of, 519, 627
 Drain-water, its application to useful purposes, 51
 Drawing, works on, for beginners, 465
 Drejer, death of, 775
 Droke, remarks on, 571
 Drying plants, easy method of, 488
 Drone Bees, time of their appearance, 391
 Dropmore, Pinuses at, 808
 Duckweed, as a green manure, 84
 Dühring's Art of Living, 627
 Duvaua longifolia, 823
 Dyer's wood, for manure, 121

E

EARTHS, artificial, 412
 Earthen pipes, to joint, 842, 862, 878; for heating, 737, 693
 Earwigs, to destroy, 102
 Eboe, description of, 392
 Echites splendens, 319
 Echium petraeum, 375
 Edgings, plants for, 825; Cotyledon umbilicus for, 519; Fairy Roses for, 527; Saxifraga hypnoides for, 285
 Edinburgh Botanic Garden, noticed, 119
 Edington, Apple-trees at, 879
 Education of Gardeners, letters on, 210; in Germany, 775
 Eel, large, 806
 Egg, large size of, 736, 773; plant, Chinese, 142
 Eggs, effect of food on, 159, 175, 230; to preserve, 190
 Egyptian seeds, to raise, 41; silk plant, 69, 121
 Eleagnus reflexa, hardy evergreen, 6, 41; parvifolia, 759
 Elder, 415
 Electrotyping, remarks on, 459, 463
 Elements of Agricultural Chemistry, adv., 442
 Eleutheria anomala, 844
 Elm planks, slipperiness of, 335, 355
 Emigrant's Hand-Book of Facts, rev., 192
 Employment of labourers, 187, 206, 227, 299, 315
 Engines, forcing, adv., Read, 168; Jones, 204
 English and Scotch Farmers, remarks on, 209, 265, 301, 357

Enormities, Horticultural, 53
 Entomology, 52, 116, 156, 186, 244, 356, 443, 588, 676, 735; works on, adv., 112; 907
 Epicurus, remarks respecting, 912
 Epidendrum arbusculum, 523; Schomburgkii, 631; remarks on habits of, 744
 Epiphyllum Russellianum, 911
 Epiphytes, stand for, 413; house at Broughton-hall, 908
 Equisetum, to destroy, 400
 Eranthemum pulchellum, 909
 Erythronium Braziliensis, 775
 Erythrina, to flower, 144; in the open air, 172; to propagate, 400
 Espaliers, material for, 806; for fruit-trees, 865
 Essenden Place, Pinus insignis blooming at, 319
 Eucalyptus robusta, 842
 Eucalypti, their decortication in Australia, 137; hardy kinds, 862
 Euphorbia jacquiniiflora, its treatment, 160, 210, 267
 Evergreens, to remove, 9, 528; Gray's adv., 873
 Excrescences of Oak-timber, 908
 Exhibitions of the Horticultural Society, single plants for, 25; to show Pelargoniums at, 44; remarks on naming plants at, 52; remarks on, 89
 Exotic plants may be kept too warm at night, 545
 Experimenting with manures, remarks on, 171; results of, 526
 Experimental co-operation, 861; farming, dialogue respecting, 213
 Eyre's Journal of an Afghanistan prisoner, rev., 39

F

FABIANA imbricata, hardy, 374
 Fairbairn's Nursery, noticed, 214, 760
 Falkner's Muck Manual, adv., 475; rev., 504
 Fall of the leaf, its cause, 188
 Familiar Botany, 99, 188, 207, 228, 412, 735
 Farmers, advice to, 155; laws of, 266; English and Scotch remarks on, 209, 265, 301, 316, 357
 Farming, experimental, dialogue respecting, 213; Scotch remarks on, 335; treatise on, adv., 410; on a small scale, hints on, 427, 443, 447; remarks on, 709, 733, 777
 Pastoff Raspberry, Youell's, adv., 817
 Fat in Animals, source of, 71
 Fences, to renovate, 862
 Fermentation, remarks on, 84
 Ferns, where procurable, 449; to sow the seed of, 577; remarks on, 461; as manure, 478; British, adv., 518; adv., Young, 537
 Fern-shaw Beetle, destruction caused by, 190
 Fertilisation of plants, 345, 528
 Fielding's, &c., Sertum Plantarum, rev., 834
 Fig, to observe in flower, 73; caprifigation of, 376; remarks on the fruit falling, 192, 400; to grow in Vineries, 230, 266; treatment of, 300, 336, 744, 820; best soil for, 249; to graft on a Vine, absurdity of, 633; for back wall of a Vinery, 593; best kind for forcing, 121; directions for, 633
 Figwort, described, 207; remarks on, 249
 Filberts, to preserve, 119; to train, 89; treatment of, 305
 Fire, caused by the friction of Cane-stalks in the forests of Ke-moon, 304
 Firs, Scotch, disease in, 37; time to stop, 488; when full grown, 73; remarks on its varieties, 161; plants that will grow under, 37; best time to remove, 528; leaves of, as manure, 334; query respecting disease in, 505; to destroy insects on, 46
 Fish, John Dory, 773; pond at Logan, 790; gold and silver, their treatment, 6, 54, 85, 101, 138, 188, 272, 285; where purchased, 73, 192; best time to remove, 192; Jack, food for, 216; questions respecting, 301; answered, 461; tameness of, 805
 Fleas, to kill on dogs, 606, 822; in stables, to destroy, 649
 Flies, their utility, 7
 Flint, calcined, to prepare, 144
 Flora odorata, rev., 375
 Floral fancies, rev., 55
 Florence Court, Fir-trees at, noticed, 696
 Florist's Journal, adv., 200; rev., 824
 Florist's flowers, Humphrey's compound for, 842
 Floricultural Society, management of, 317; statement in Proceedings contradicted, 913
 Floors, to prepare, 249
 Flour, its nutritive power in various countries, 559
 Flowers, notice respecting, 289; remarks on, 317; to keep up a supply by small means, 156; natives, at exhibitions, 345; on the pronunciation of their names, 210, 336; winter, 400; for autumn, 377; vagaries of, 775; night smelling, supposed cause of, 400; remarks on, 445; to hybridise, 444; sweet-scented, 449; double, to fertilize, 633; their origin, 628
 Flower-garden, plans for, 758; grouping plants in, 662; in China, 39; borders, to dig, 68; arrangement of plants for, 316, 540; pots, sizes of, 233; arguments in favour of glazed ones, 285
 Flower-seeds, adv., Lucombe and Co., 82; Brown, 98; Aphelium and Eichel, 98; Sutton, 114; Cooper, 114; Black, 130; Rendle 153; Hurst, 154; Warner, 169; Sang, 226
 Flowering-plants for forcing, 736, 798
 Flower-pots, improvements in, 372, 519, 557; Hunt's patent, adv., 498
 Flax, growth of, in Ireland, 175
 Flute-grafting, how performed, 321
 Food of plants, 5; its effect on eggs, 175; for cows, 825
 Forbes's Inaugural Lecture on Botany, rev., 447
 Forcing, remarks on, 35, 40, 54, 67, 577; Roses, Rivers' method, 210; plants for, 247, 736; houses, new plan of adjusting lights for, 230
 Fork, for leaves, 38
 Forest-trees, to prune, 37, 842, 758, 789, 910; to train, 136, 843; outline of Gavin Cree's system of pruning of, 691; adv., Rogers, 116; best work on, 417; directions for, 644; observations on, and table expressing the girths at different heights, 645; remarks on size of, at Nerguis, Flintshire; also Dr. Thackeray's method of pruning of, 676
 Fortune, Mr., letter from, announced, 719; his mission to China, 741
 Foster, Mr., his garden, noticed, 487
 Fountain, adv., Wyatt, 184
 Fox-hunters, crops injured by, 130
 Frames, canvas for, remarks on, 680; sheet-glass for, 792; two-light, to keep up a succession of flowers in, 156; cheap mode of glazing, 211, 390; cotton coverings for, 301; for protecting annuals, 38; for growing Vines in, 54; to prepare canvas for, 139, 158
 Frankfurt, notice of Prince Salm's garden at, 287
 French Beans, effects of spirits of tar on, 737
 Frogmore Gardens, noticed, 39
 Fruit, to keep from wasps, 662; to preserve, 5; with water, 38; maturation of, without leaves, 542, 589, 677, 711; when wet, 246; to pack, 433, 561
 Fruit-trees, to prune, 649; in gravel, remarks on, 711; heavy crops of late fruit on, consequences resulting from; reason of, 709; hucks of, as a manure, 133; to transplant, 5, 665; select, 9, 25, 41, 57, 825; adv., Forrest's, 817; for south wall, 25; to pave below, 822; borders, to drain, &c., 632; moss on, to destroy, 633; to protect in flower, 73, 161; to train, 41, 73; stocks for, 73; to eradicate lichen from, 158; adv., Corsten, 186; borders, distance to plant vegetables on, 376; salt for, 417; remarks on the prizes awarded by the Horticultural Society for, 556; for a north aspect, 865; espaliers, distance between, 73; suitable for trees, 865; effect of gas tar on stems of, 909
 Fuchsias, to keep in winter, 721; list of, 721, 761; to sow the seeds of, 649; treatment of, and corymbiflora, to sow seeds of, 681; splendens, 7, 57; Exoniensis, 663, 862; Standish's seedlings, described, 674; corymbiflora, 761; to grow in the open air, 73; in a dwarf state, 539; Brockmania, adv., 33; Toddiana, 97; Eppsi, 154; Miller, 65; Deana, 82; Youell, 97; Smith, 186; Ivery, 201; Cormackii, 268; Smith, 314; at Logan House, 790; kinds for the open ground, 89, 144; new, 413, 446; select, 144, 321, 431, 433, 446, 481, 543, 545, 681; St. Clare, 433; good sorts,

545; Queen Victoria, 446; Rogersiana, adv., 169; majestica multiflora, 298; Deansia, 314; Exoniensis, 360; Prince Albert, 553; Lowryi, 553; treatment of, 821; Cripps, 353; Bell, 553; to propagate, 116; affinis, to flower, 633; discolor, rapid growth of, 631; Constellation, habit of, 761; fine specimen in the open air at Logan, 557; Exoniensis, 878
Fumigation, easy method of, 189; hints respecting, 373, 391; Patent Blower for, adv., 456
Fungi, said to possess phosphorescent properties, 691; as a green manure, 116; on tan, to destroy, 357, 578
Furnace, Jukes' patent, 39
Furze, to raise, for a cover, 57

G

GARDENERS' and Farmers' Almanacks, rev., 847
Gardeners' Benevolent Society, remarks on, 99; Association—plan for establishing a garden for those out of employment, suggested, 677, 909
Gardeners, dissolute, remarks on, 19, 21, 41, 54; Societies, 19, 21, 73; remarks on their character and interests, 355; discussions, 189; letters on their education, 210; Associations, 822; Benevolent Institution, adv., 240, 329; lament, 608
Gardener and Practical Florist, adv., 2
Gardening, antiquities of, 71, 119, 157, 372, 389, 412, 500; state of, 336, 840
Garden-engine, cost of, 321; Rollers, adv., 426; pots, Rendle's improved, 519; pots, best form of, 771
Gardens, management of, 249; new trees and shrubs for, 577; remarks on visiting, 373; walks, formation of, 593; forming a public one at Camberwell, 413; law of, 528; scenery, remarks on, 789; produce, query respecting, 117; answered, 139; frame, to construct cheaply, 211, 390; walks, remarks on edgings of, 710
Garrya, its treatment, 25
Gas, to heat conservatories, 133; lime, as a manure, 57, 88, 218; its effect on the eggs of fowls, 159; water, as a manure, 72; for destroying insects, 477; quantity to apply, 177, 321; for grass, 191, 209, 301, 461; how produced, 528; not likely to destroy insects, 321; lime, its effects on grass, 232; tar, noxious to insects, 433; as a manure, 528
Gas tar, its effect on the stems of fruit-trees, 909
Genista canariensis, nearly hardy, 305
Gentiana amarella, &c., noticed, 628
Gentianella, its treatment, 317, 321, 374
Geography of plants, 359
Germany, wild flowers of, 266
Gesnera lateritia, 38; elegans, flowering of, out doors, 789; elongata, its treatment, 56; zebina, 121
Gesneras, treatment of, 865
Ginger, to have a second crop of, 557; information regarding its culture requested, 590; cultivation of, 608, 630
Gladolus communis, found in the New Forest, 479; splendens, 559; to sow the seed of, 665
Glass, superiority of sheet over other kinds, 499
Glazed frames, substitute for, 55, 557; useless, 139
Glazing, remarks on, 464, 488, 499, 528
Gloxinias, to bloom in a greenhouse, 161, 305; digitaliflora, 759; treatment of, 825
Glycine sinensis, cause of its not growing, 193
Goldham, Mr., his Tulips noticed, 398
Gongora truncata, 523
Gooseberry, best flavoured, 121; weights of, 774; growing on Willows, 267; caterpillars, to destroy, 272, 480, 488, 503, 761; Cape, to raise from seed, 400; its treatment, 305; to train, 806
Gorse, French, remarks on, 192
Gourd, largest, 192; good sort, 216; remarks on, 909
Grafting Vines, 37, 208, 216, 230; Camellias, 189; as practised by the ancients, 84; remarks on, 105, 144, 249; clay, recommended for, 121, 249; wax, mode of applying, 286; flute, how performed, 321; Rhododendrons, 809, 825
Grain, Bruchus, described, 188
Grammatophyllum multiflorum, 7
Grapes, large bunch of, 825; Mr. Crawshaw's, remarks on, 3; cause of rust on, 5, 37, 189, 461; for a greenhouse, 25; remarks on forcing, 35, 40, 54, 67; to keep late, 3, 37; out-of-door, to ripen, 417; remarks on various kinds, 89; cause of shanking, 120, 230, 265; black Muscat, 232; Chasselas Musqué, 848; Malmsey, 321; dark-juiced kinds, 248; temperature which they require when ripening, 459; on open walls, 580; Muscat, supposed cause of their spotting, 505; remarks on, 721; shrivelling, principal cause of, 709
Grass field, to destroy slugs in, 697; gas-lime for, 191, 232, 301
Grass, roots of, as a green manure, 36; to extirpate from walks, 73; seeds for pasture, 88, 216; Couch, to destroy, 103; to convert into manure, 344; tree, 105; seeds, to sow Barley with, 121; Tussack, described, 131; seeds of, adv., Sutton, 168; Italian Rye, to sow, 232; British, adv., 516; effect of gas-liquor on, 3, 22, 191, 209, 461; land, hints on treating, 289, 459; to stock in summer, 465
Gray's Flora of N. America noticed, 215
Grecian sugar-plant, 69
Green-fly, see Aphid
Green manure, seeds to sow for, 881
Greenhouse, to protect from frost in winter, 680; to heat, 793; in Canada, glass for, 777; plants, select, 7; Vines for, 25; annuals, to sow, 69; shades for, adv., Weekes, 224; to fumigate, 246; miniature, adv., Hewetson, 260; remarks on the erection of, 400, 464
Greg's Scotch Farming in England, rev., 160
Grey Wagtail, anecdote respecting, 737
Groom's Nursery, noticed, 214, 319
Grotto Pea, Shilling's adv., 835
Grubs, to destroy, 445, 465
Guano, query respecting its application to Vines, 318; notice of, 504; experiments with, 845; to apply, 848; its effect on vegetation, 692; effect on Turnips, 737; adv., Myers, 1; Fothergill, 34; Skirving, 259; Whalley, &c., Rounthwaite, 369; its effect on grass, 3, 5; adulteration of, 824; on flowers, 23; on Cauliflowers, 479; on Wheat, 189; on Potatoes, 227, 286; on cattle, 866; on Mangel Wurzel, 367; on Peas, 444; on various crops, &c.; Potter's artificial, its effects, 3; on Celery, 266; adv., 204; Cotton, 312; liquid, for meadows, 177; to prepare, 248; garden, on its application, 388; experiments with, 5, 7, 189, 444; for grass, 40; quantity per acre, 161, 389; to apply, 40, 192, 305, 360; to Turnips, 144; to meadows, &c., 528; with saline substances, 391; to sow with seeds, 216, 272; native, remarks on, 51, 80, 264; curious incrustation caused by, 230; M. Teschemacher's experiments with, 141; as applied in S. America, 175; versus bones, 877, 909
Guards, for trees, 6, 118
Guernsey, Camellias in the open air, there, 39
Guide to Service, The Farm Bailiff, rev., 648
Gum in trees, cause of, 526
Gutters, hot-water, for bottom-heat, 544, in Horticultural Society's Garden, 659; plan to prevent dampness from, 876
Gypsum, to fix ammonia, 83, 117, 135, 141, 177, 777; to conduct experiments with, 83, 157, 212; to analyse, 157; how to use, 177; its effect on Potatoes, 280; as manure, quantity per acre, 325; adv., Sturge, 312

H

HAGGERSTONE Castle Gardens, a fine plant of Doryanthes excelsa blooming in, 303
Hamerton, J., Esq., his pamphlet on Arboriculture, rev., 696
Handlights, material for, 761
Hannam's prize essay of the Wetherby Agricultural Association, rev., 432
Hardenbergia macrophylla, its treatment, 137
Hare, black, 301
Harrison's Garden Almanack, adv., 112
Hartwegia purpurea, 558
Hartweg (Mr.), advices from, 392; his return announced, 524; seeds collected by, adv., 555

Harvest mouse, curious situation of its nest, 711
Hawk, capture of, 823
Hawthorn, changing the colour of its flowers, 335, 391, 445; fungus on, 678; berries, to prepare for sowing, 792
Hay, musty, not hurtful to cattle, 118; to render palatable, 175, 245; to steam, 245; after-math, 761
Heartsease, see Pansy
Heath-mould, quality of, 889
Heaths, to kill mildew on, 777; shifting of, 792; their treatment, 206, 228; at Berlin, 24; scab and mildew on, 593; good kinds, 73; hardy, 248; price per 100, 697; as a manure, 334; seedlings noticed, 361, 461; hybrid, 461; MacNab's treatise on, 561
Heating, remarks on, on different systems of, 643, 720; apparatus, adv., Stephenson, 1; Bailey, 1; Shewen, 1; Hill, 1; Weeks, 17, 200, 537; Palmer, 312; Caldwell, 312; Fowler, 516; for frames, 428; upon a new plan, adv., Thomson, 112; treatise on, adv., Rendle, 200; remarks on, 19, 40, 57, 66, 68, 449, 488, 528, 561, 661, 680; earthen pipes described, 737; Rendle's tank-system, 19, 609; described, 36, 57, 390; bad effects of using, open tanks, 643; by steam, 38; by gas, 133; by means of casks, 519; dwelling-houses, 40; tank system, 305; cost of apparatus, 144, 161; zinc pipes unfit for, 144; apparatus at Oakley Park, 371; at Lancaster, 428; Huyshe's system, 460, 479; Watson's, 500; remarks on, 593, 616; open tanks, 606; remarks on, 697; with earthen pipes, 693; boilers for, 865; killogie, a substitute for fermenting materials in hotbeds, 607, 628; boilers, remarks on, 632; hot-water tanks, 803; hot-water gutters for, 544; as used in the Horticultural Society's garden, 659; new apparatus for, 806; a greenhouse, 793; observations on, 771; apparatus, Saul's, 428, 823; with brick-flues, 908; observations on, 909
Heat, brick flues for, 878; water, a non-conductor of, 774; peat, a non-conductor of, 629
Hedgehog, to keep in a garden, 321, 357
Hedychium, their treatment, 72
Hedysarum albae, 87
Heliotropium, &c., winter treatment of, 744
Hemlock Spruce, 192
Hemp, its cultivation in the north of India, 55
Henderson's nursery, noticed, 39, 447, 742
Hen-roost, manure from, to use, 272
Henslow, Prof., his Letters on Fixing Ammonia, 135; announcement of their separate publication, 231, 315
Hera, valley of, its productions, 23
Herbaceous plants, Jackson's adv., 857
Hewell, near Bromsgrove, gardens noticed, 663
Hibbertia perfoliata, 911
Hibiscus Lindleyi, 216; cannabinus, character and treatment of, 374; Wraye, 488; Surattensis, 809
Hierro, sacred tree of, 304
Highclere, notice of, 398
Highland Journal of Agriculture, rev., 524
Himalayan mountains, botany of, adv., Allen, 2
Hobart Town, vegetation of, 142
Hollies, to sow the seed of, 649; their treatment when newly planted, 105; to clip, 144; to transplant, 249; to prune, 544; best kinds of, 541
Hollyhock, time of sowing, 289; gigantic size of, 759
Holme gardens, near Laverne, noticed, 695
Hompesch, Count, remarks on his new fertilizer, 517
Honeysuckle, French, as a field plant, 305
Hooker's British Flora, 9; Dr. Joseph, his return to England announced, 647
Hopeton Oats, gigantic, 359
Hops, male and female on the same plant, 758
Hop refuse, a substitute for stable dung, 158; as a manure, 216, 417; poles, treatment of plantations intended for, 270; to cultivate in Wales, 649; improvement in cultivation of, 647
Hornwort as a green manure, 84
Horse-radish, to extirpate, 9; to plant, 216
Horsetail, to destroy, 400
Horse-Chesnuts for pigs, 6; food for sheep, 737
Horticultural Essays of the Regent's Park Mutual Instruction Society, rev., 247; enormities, 53; buildings, to heat by gas, 133; Society's garden noticed, 191, 576; alteration in the time of closing, 371; in the exhibition list, 517; statement of the weather on the days of exhibition, 556
Hotbed, to prepare, 53; substitute for glazed frames for, 55; for raising annuals, 289
Hothouses, advantage in their being span-roofed, 261
Hot-water apparatus, Bailey, adv., 857; pipes, to set, 248; hard water for, 445; boilers, adv., Cottam and Hallen, 537
Hovea racemulosa, 103; pungens, 341; splendens, 447
Humphrey's inodorous compound, adv., 552; its effects upon plants, 711
Humus, remarks on, 99; adv., Lance, 151
Hyacinths, adv., Youell, 553; list of, 681; for forcing, necessity of procuring them early, 576; remarks on, 697; their treatment, 36; in water, 105
Hybrid plants, hints respecting, 361, 461; to produce, 444, 460
Hydrangea, effect of ferruginous peat on colour of, 646; its treatment, 334; turned blue with alum, 543; remarks on, 909
Hylurgus piniperda, to destroy, 721
Hypocalymma robustum, 175

I

Ice, effect of straw in packing, 73; plant, its treatment, 121; to preserve, 881
Icones Plantarum, Hooker's, rev., 632
Ilex Paraguayensis, 118; hints on transplanting, 321
Implements of spade husbandry, 88
India, to prepare cuttings for, 228, 539, 544; rapidity of vegetation in, 392
Indian corn, remarkable crop of, 38; its treatment, 400, 823; Agri-Horticultural Society, 39, 103, 191, 393; establishment of a new one in the N.W. provinces, 392
Indigofera stachyoides, 212
Indigo, black, discovered, 879
Inorganic substances found in plants, 358
Insects, to kill, 73; effects of powerful smells on, 22, 264, 477; to kill for the cabinet, 69, 138, 174, 265, 305; remarks on killing, 101, 138, 174, 433; on Firs, to kill, 505, 721; on Larch, 806; on Cherries, to drive away, 249; in malt, to destroy, 433; from Roses, 465; from walls, 249; from furniture, 249, 361; influence of tar, &c., in destroying, 285; on Roses, to kill, 361, 488; in cupboards, to extirpate, 577
Ionian Islands, treatment of the Vine there, 70; manner of watering plants there, 543
Ipomoea, to plant, 105; in the open air, 232; rubro-caerulea, its treatment, 71, 192; Learii, 161, 616; cymosa, 342; tynanthina, 321; caerulea, &c., remarks on flowering of, 744
Ipomopsis elegans, 848; splendens, to protect from frost, 697
Ipswich Cucumber show, remarks on, 157, 174; prize Cucumbers at, 480
Ireland, remarks on planting in, 267
Iris, Chinese, its treatment, 177; select, 825
Iron labels, 105
Italian fire-fly, discovered in a greenhouse in Norfolk, 718, 860; to naturalise, 862
Ivy, as a covering for houses, 89; stem, roots of, remarks on, 721 to cover a new wall with, 910
Ixias, adv., Young, 537; treatment of, 721

J

JACKSON'S Nursery noticed, 288, 807
Japan, Flora of, 288
Jasmines, adv., Cobbett, 98; Arabian, require artificial heat, 321; Cape, treatment of, 449
Jealous wild flowers, 55
Jesse's Gleanings in Natural History, reviewed, 192
John Dory, 773
Johnson's Calendar for Young Farmers, reviewed, 376; Lectures

on Agricultural Chemistry, adv., 442; Every Lady her own Flower Gardener, adv., 50; Guano as a Fertilizer, reviewed, 191; Agricultural Chemistry for Young Farmers, reviewed, 215
Joining earthen pipes, 842, 862
Journal, to form, 73; of the Royal Agricultural Society, adv., 368; of Agriculture, and Transactions of the Highland Society, reviewed, 524, 742
Jukes' patent furnace, 39

K

KENNEDIAS, their treatment, 105; splendens, 877
Kensington Gardens, noticed, 695; improvements in, 214; pillaging of plants in, 771
Kew Botanic Garden, notes on, 247
Khât plant, account of, 391
Kidney Beans, a profitable vegetable for the poor, 387; remarks on, 721; good kinds, 105
Kieri, valley of, 319
Kilravock Gardens, noticed, 791
Killogie, 628; a substitute for fermenting materials in hotbeds, 607
King of Hanover, false reports concerning, 675
King wood, whence procured, 9
Kitchen gardening, 865
Kitchen garden, how to prepare soil in, 649; economics, 246, 336
Knapp's Illustrations of the British Grasses, adv., 368
Knife, for budding, improved, 519; adv., 538
Knight's Nursery, noticed, 375
Kunth's, (Prof.) Enumeratio Plantarum, reviewed, 807
Kydia, derivation of the word, 463

L

LABELS, iron, 105; zinc, to write on with common pencils, 911
Labichea bipunctata, 663
Labourers, employment of, 187, 206, 227, 299, 315, 373; means of improving their condition, 333, 387; to educate their children, 355; Mr. Lawrence's letters to, 342, 397
Labour, agricultural, ancient price of, 445
Lachenalias, their treatment, 159
Lackey Moth, described, 244
Laelia acuminata, 341
Lambertian herbarium, Don's account of, adv., 128
Lament, Gardener's, 608
Lane's Nursery, noticed, 463
Lane's manures, Treatise on, rev., 143
Land, to support a family, 821; with a clayey subsoil, its treatment, 9; marshy, to reclaim, 9; beneficial results of pulverizing, 87; clover sick, 99; remarks on paring and burning, 528; grass, to crop and manure, 105; to crop after Potatoes, 105; advantage of inclosing from the sea, 175, 209; heavy, to reclaim, 121, 539; profits derived from its improvement, 245; light, rotation of crops for, 376, arable, to crop, 477; waste, to improve, 517, 539, 555; sandy, to improve, 539; grass seeds for, 504
Larch, disease in, 661; adv., Dickson, 49; Urquhart, 66; remarks on, 216; diseased, 488; a light moist soil good for growth of, 630; cause of, 542; cause of decay in, 572; insects on, 862; rot in, 942
Larmiers in the heads of deer, 142
Launceston (Van Dieman's Land), Botanical Garden, 7
Laurel, leaves to destroy insects, 73; eaten by slugs, 272; Portugal, to prune, 57
Law of Gardens, 528; 881
Laws, to kill moss on, manures for, 721, 761; soot, a good manure for, 73; grass-seeds for, 177, 233, 616, 400, 405; their treatment, 305; manure-water for, 105; to improve, 121, 233; grass-seeds for, 681; leaves for pits, 25; fork for, 38; when to apply gas-water to, 720; to apply soot to, 865
Lawson's Treatise on the cultivated Grasses, rev., 143
Lea-land, to crop and manure, 105
Leaf (Mr.), his garden noticed, 415
Leaf-mould to prepare, 232, 504; to grow Melons in, 528
Leaf-cutter Bee, 843
Leaves, impropriety of removing them from Vines, &c., 443; respiration of, 463; bad effects of mowing them from Strawberry-beds, 555
Leeks, to boil, 23
Lee's Botany of the Malvern Hills, adv., 456; rev., 503
Leianthus nigrescens, 790
Lelieur (Comte), his remarks on Strawberries, 542
Leonotis leonurus, its treatment, 41, 56
Letter to the Farmers of England, adv., 50
Lettuce, Artichoke-leaved, 89; good kinds, 105; white Versailles, its treatment, 545; kinds to stand the winter and time of sowing, 593
Lichens, fragrant, 22; on fruit-trees to eradicate, 158; on lawns, 321
Liebig's Agricultural Chemistry, new edition, by Playfair, adv., 690; his letters on, rev., 776; his Chemistry, rev., 846
Light land, rotation of crops for, 376
Light, its effects on plants, 54, 73; tendency of branches to seek, 359; its effect on plants, 819
Lilies, treatment of, 848
Lilium lancifolium, adv., 33; testaceum, 175; isabellinum, 807
Lily, of the Valley, to transplant, 9, 25, 232; to flower in autumn, 272; of Scripture, 429, 465
Lime-tree, leaves of, as a manure, 334
Lime, its effect on Wheat, 232; to kill worms, 809
Lime-water, to prepare, 54, 57; not effectual in killing worms, 157
Lindley's (Prof.), Theory of Horticulture, rev., 847
Linnaea borealis, 711
Linnaeus, remarks of, 87
Lion, habits of, 360
Lisianthus Russellianus, Cuthill's adv., 857; to raise from seed, 161; treatment of, 804
Lissochilus roseus, 319
Losa lucida, adv., 553
Lobelia gracilis, to propagate, 773; to sow seed of, 248; fulgens, treatment of, 633; erinus, var. grandiflora, 396
Locomotion of plants, 57, 89
Loddiges' Nursery, noticed, 343, 879 1
London, account of a Vinery on the eads of a house in, 462
London and Edinburgh Journal, adv., 80

Magnolia fuscata, attraction of, for blackbirds, &c., 646; to sow seeds of, 761
 Main's Landscape Gardening, adv., 128
 Maize, constituents of, 845; sugar extracted from, 139; analysis of, 633; its treatment in America, 176
 Malacca, correspondence from, 267
 Malaria of cesspools, to destroy, 25
 Malloo, account of, 319
 Maltese cross, blue, yellow, white, and scarlet plants for, 272
 Malt, to destroy insects in, 433; dust, as a manure, 133; comb, as a manure, 177
 Manchester, new Society for judging florists' flowers, adv., 260; remarks on, 262
 Manettia bicolor, 319; glabra, 848; cordifolia, treatment of, 825
 Mangel Wurzel, as food for cattle, 105; to salt, 216; cause of its running to seed, 528; leaves, to salt, 821
 Manures, for Turnips, 314, 845; refuse lime from gas-works; gas tar as a, 528, 865; saline, experiment with, on Oats, &c., 677; gypsum, quantity per acre, 825; on experimenting with, 171; sulphate refuse for ley, 11; their use, 67, 205; to fix ammonia in, 697; speculative, prussiate of potash, remarks on, 737; their treatment, 9, 25, 40, 144, 205; strong kinds, 464; Count Hompesch's, 517; experiments with, 5, 22, 189, 526; vegetable matter for, in a fresh state, 771; to disinfect, 4; brewers' grains, 105, 136, 177; Potter's remarks on experiments with artificial, 541; liquid, cart, adv., Crosskill, 1; for Onions, 25; for flower-clumps, 117; Mr. Potter's remarks on, 157; principles to be observed in preparing, 205, 317; green, 34, 20, 35, 52, 58, 81, 116; their effect on insects, 264; to save, 427; artificial, their weight per bushel, 231; their effect on Turnips, 526; Daniell's, good for Turnips, 22; not destructive to insects, 267; home, their management, 226, 427; gas-lime, as a, 57, 88, 218; water as, 72; dyers' wood, 121; pigs' wash, 321; vegetable, 133, 207, 229, 244, 262, 284, 334, 372, 478, 500; how taken up by plants, 67; cheap way for cottagers to prepare, 83, 117, 121, 144, 172, 448; tank for preparing, 83, 427; waste of, 83, 189; works on, adv., 128; remarks on, 67, 83, 99, 115, 172, 243, 317; manner in which they enrich the earth, 99; animal and vegetable, their application, 115; efficacy of mixed over simple kinds, 243; heap, to prepare, 205; liquid, to apply to plants, 121, 416, 464; pumps for, adv., Fowler, 204; to fix ammonia in, 248, 448; adv., Fothergill, 151; Lance, 151; Skirving, 259; for Carnations, 848; Lawe's, 442; for a stiff soil on yellow clay, 720; bog earth for, 177; bombazine dust for, 46; bones, boiled superior to unboiled, for, 318; contents of cesspools as a, 72; to disinfect, 192; Cocoa-nuts for, 862; Cranberries for, 478; Hen-roost, manure from, 272; Hop-refuse a substitute for stable-dung, 158; as a, 216, 417; experiments with, 576; pigeon-dung for vines, 881; for clayey soil, 913
 Maple, to propagate, 881
 Marcetia excoriata, 463
 Marcet (Mrs.), her works, adv., 260
 Marriages, early and improvident, bad effects of, 676; in Prussia, *ib.*
 Marshy land, to reclaim, 9; salt, to drain, 302
 Martagon, its derivation, 6, 166
 Martin's Thames and Metropolis Improvement Plan, rev., 176
 Masters' nursery, noticed, 7
 Maund's Botanic Garden, adv., 538
 Maw-seed, 272, 545
 May's nursery, remarks on, 373
 McIntosh's Practical Gardener, adv., 128
 McNab's testimonial, 790
 Meadow-land, its treatment, 56, 459; hints on manuring, 459
 Meadows, containing peaty-soil, to improve, 633
 Mealy Bug, to destroy, 649, 721
 Mearn's Treatise on the Vine in pots, adv., 128; rev., 159
 Meat preserved by Creasote, 543
 Medlars, to propagate, 9, 25
 Melocactus communis, treatment of, 777
 Melons, cause of canker in, 777; to grow under oiled canvas, 744; muddy state of soil good for growth of, 644; Persian, to grow in baskets of earth, in an open tank, experiment with, 643; Pigeon-dung used for, in Persia, 645; remarks on, 697; superiority of, 571; one from Syria described, 589; adv., White, 707; young, cause of fruit being small on, 709; effect produced when deprived of foliage, 709; seeds, to test the quality of, 737; adv., Cuthill, 1, Carter, 170; Hardy's Cantaloupe, 37; to grow in leaf-mould, 528; Beech-wood, a good sort, 89; distance of the fruit from the glass, 429; seeds, remarkable instances of vitality in, 102; ancient directions for planting, 231; Persian, their culture, 284, 315, 321; directions for leaving fruit, 361; for gathering, 489; cause of failure, 376, 545; pit for, 461; manure for, 842; seeds, Spivey's adv., 835, 873
 Mesembryanthemum, uses of, 360
 Meteorological Ephemeris, H. Doxat's, rev., 807
 Meteors, 910
 Mice, to destroy, 5
 Microscope, for botanical purposes, 144, 433
 Mignonette, treatment of, in winter, 720; cause of its losing its fragrance, 72; tree, to grow, 528; to bloom in pots, 556
 Mildew, doubts about its origin, 823; to cure, 144, 377; on Peas, 633; on Cucumbers, 605; on Roses, 377
 Milford Nursery, sale at, 369
 Mill's improved pit, 37
 Miller's Gardeners' Dictionary, best edition of, 249; Don's edition, 345
 Milton Lodge gardens, noticed, 776
 Milton's Practical Bookkeeper, rev., 378
 Miltonia Clowesii, 23
 Mimuli, good sorts, 121
 Mistletoe, trees on which it is found, 105
 Mock Scorpion, to destroy, 649
 Mohl (Prof.) his critique on Liebig's Theory of the Nutrition of Plants, noticed, 333, 543, 559, 576, 591, 614, 631, 647, 664, 679
 Moisture in stoves, injuries arising from excess of, 155
 Monstrous flowers, remarks on, 488, 545
 Moredun, noticed, 87
 Mormodes luxatum, 575; aromaticum, 844
 Morphology, remarks on, 861
 Moss (Mr.), his garden, noticed, 432
 Moss, to preserve, 843; to destroy on lawns, 761; to destroy on gravel, 845; adv., Gardiner, 96; from fruit-trees, to eradicate, 158, 216
 Moth, small ermine, to destroy, 545; yellow underwing, to destroy, 681
 Mott's Flora odorata, adv., 370
 Mount Edgecumbe gardens, noticed, 672
 Mowing, remarks on, 233; machine, value of, 433; adv., 410
 Mud from ponds, for manure, 105
 Mugwort, as a green manure, 52
 Mulberry, treatment of, 677, 777; to propagate, 9, 573; effect of pruning, 105, 633; to graft, 305; to grow in pots, 519, 557; rapid growth of, 590; singular instance of sporting in, 388
 Mules, remarks on, 577
 Mummy Wheat, 805, 787; produce of, 822; to sow, 881
 Murate of lime, for fixing ammonia, 248; of ammonia, to destroy insects, 519; beneficial to Cucumbers, 556
 Murray's New Chemical Fertilizers, adv., 170; Trials and Effects of New Chemical Fertilizers, rev., 231
 Musa Cavendishii, its treatment, 73; adv., 457
 Mushrooms, as a green manure, 116; large, 574, 694; to grow in the open air, 272; properties of in different countries, 559; to prepare a bed for, 561; culture of, 591; remarks on growth of, 614
 Myrtle, remarks on, 142; to keep in winter, 825, 792

N

NAMINO plants in the Parks, strictures on, 317
 Names of plants, remarks on, 299

Narcissus, to sow seed of, 483
 Narcissi, to force, 865
 Nasturtium, luminous appearance in, 691; officinale, iodine in, 769
 Nature, remark of Anaxagoras on the observation of, 359
 Natural History, works on, adv., 128; a Branch of School Education, reviewed, 696
 Naturalist's Corner, 864, 847, 7, 23, 87, 142, 760, 830
 Neapolitan Violet, to force, 788
 Nectarine tree, singular instance of one shedding its fruit, 561; list of, 665
 Neill, Dr., his garden noticed, 71; testimonial to, 103, 447
 Nelumbium speciosum in Astracan, 559
 Nemophila discoidalis, adv., 426; black variety, remarks on its origin, 445
 Nepenthes distillatoria, treatment of, 665
 Nerine, its treatment, 249
 Nettles, as purifiers of the blood, 505
 Nets, to preserve, 57; adv., Richardson, 50; woollen, injurious to the setting of fruit, 192; hints to purchasers of, 301; of no use in the prevention of blight on Wall trees, 374
 New Plymouth, letter from, 318
 New Zealand, emigration to, advocated, 25; letters from, 190, 318; remarks on, 192; to send plants to, 793; plants for, to pack, 247, 790; plants, adv., Stevens, 457; as an Agricultural colony, remarks on, 478, 605; extracts from letters respecting, 605, 606; remarks on soil of, 627; burning, best mode of clearing Fern, &c. on, 628; climate of, 663; Flax, remarks on, 697
 Niger, vegetation at the confluence of, 7, 286
 Night scented flowers, remarks on, 445, 488
 Niphaea oblonga, treatment of, 697
 Nitric acid, as manure, 448
 Nitro-muriatic acid, for checking the spot in Pelargoniums, 541
 Nitrogen of plants, whence is it derived? 356
 Nitrate of soda, experiments with, 22, 191; quantity to apply in the kitchen garden, 22, 72; its effect on Pinus Webbiana, 25; on Beans, 72; on a Rhododendron, 119; Roses, 191; on Potatoes, 227; on Onions, 461; on various flowers, 191; for Camellias, 41; Asparagus, 41; Strawberries, 121; garden crops, 192; Firs, *ib.*; Cucumbers, *ib.*; for various plants 216; for Wheat, 314; to destroy Grubs, 445; adv., Rounthwaite, 369; of Potash, for Pelargoniums, 248
 Norfolk Island, Cabbage, palm of, 142
 Norman's Picotees and Carnations, noticed, 543
 Notices to Correspondents, remarks on, 243
 Nuphar minima, query respecting, 301
 Nuthatches, habits of, 337
 Nuts, to preserve, 721

O

Oak, leaves, for pits, 25; stools, to renovate, 40; great age of, 823; Fulham, 41; evergreen, to prune, 41, 89; soil for, 73; spangles, described, 52; Turkey, its value for timber, 67; extraordinary growth of, 67; Baloot, 85; tender kinds, 89; to plant, 321; timber, excrescence of, 908; new hardy, 911
 Oats, Tulip root in, 773; straw as a manure, 229; Hopeton, gigantic, 359; consequence of stacking, when wet, 560
 Odontoglossum citrosimum, 38
 Oil-cake, as a manure, 133
 Oil-cloth, to prepare, 36
 Oleanders, treatment of, 681
 Olive, how grafted by the ancients, 81
 Ombrological Almanack, reviewed, 24
 Oniscumyctic Epiphyte stand, 413
 Onnanthe crocata, described, 412
 Oncidium bicallosum, 212; suave, 212; microchilum, 341; uniflorum, 647
 Onions, great weight of, 773; productiveness of, 806; Tripoli, its treatment, 9; liquid manure for, 25; remarks on, 670; globe, to sow, 249; maggot, to destroy, 22, 102, 233; by charcoal, 54, 161; by rolling, 102; by nitrate of soda, 461; by soot, 608; good kinds, 105, 144; nitrate of soda for 272; disease in, 649
 Orange Lily, luminous appearance in, 691
 Orange trees, adv., Cobbett, 98; Taylor, 369; Marsano, 298; Flanagan, 298; Butler, 426; cause of leaves dropping, 192; seedlings to graft, 216; improved by a top-dressing of rotten fruit, 248; their treatment in France during the last three centuries, 263; soil for, 321; temperature for in winter, 649
 Organisable substance, explanation of the term, 681; history of, 709; organic matter, origin of, effect of on soils, 755; in water, 845
 Oxylolium obovatum, 575
 Orchard, heavy crops of late fruit in, consequences resulting from, reason of, 709
 Orchidaceae, some kinds delight in a low temperature, 39; treatment of, 777; Lyons' remarks on their management, rev., 343; adv., Stevens, 240, 258; sale of, 503; Holmes', 441, 457; British, adv. for exchange, 407; terrestrial, their treatment, 428; new stand for, 413; for a pit, 528; support for, 557; of Mexico and Guatemala, by J. Bateman, Esq., rev. 719; of Quito, 911
 Otiorynchus notatus, to destroy, 345
 Owen's Lectures on Anatomy, rev., 879
 Owl, useful in gardens, 118; eggs of, found amongst the comb of bees, 391, 433
 Oxalis Bowel, its treatment, 89
 Oxylolium capitatum, 268

P

Packing flowers, 792; plants, for New Zealand, 247, 790; fruit, 433
 Paint, made of Potatoes, 86; for pits, 233
 Palestine, productiveness of, 359
 Palm-house of the King of Prussia, 69
 Palms, adv., 457
 Palmetto root, 845
 Pansies, select, 73, 105, 777; manure for, 57; disease in, 573, 646, 809; cure for disease in, 589; soil for, 345; adv., Henchman, 113; Earl, 154; Hart, 202; Pearson, 425; double, 505; properties of, 301; to strike cuttings of, 361; treatise on, rev., 104
 Paeonies, remarks on, 23; tree, to propagate, 289; new variety of, 432; to grow in pots, 417
 Paper, adhesive, for dried plants, 777
 Paradise stocks, remarks on, 249
 Paraguay Tea, 233
 Parchment labels, 823
 Paris, Royal parks and gardens of, 113; correspondence from, 302, 368, 519; weather near, 519
 Parks, strictures on naming plants in the, 317; diagrams of, 371
 Parsley, to grow fine, 335
 Passiflora Fieldii, adv., 553
 Pasture, old, for Potatoes, 144, 161
 Paulownia imperialis, adv., Smith, 81; noticed, 212; to propagate, 285; hardy, 345, 825
 Paving below fruit-trees, 822
 Peach-trees, list of, 665; cause of leaves blistering on, 697; aphid on, to destroy, 697; to shed their flowers, cause of, 726; to train a few inches from the wall, 121; to train, 144; cause of bloom not setting, 144; Smith's treatise on, adv., 260; to force, 267; remarks on the diseases of their leaves, 289; their treatment in dry weather, 361, 400; cause of disease in, 400, 526; Walburton Admirable, adv., 553; border to crop, 865; to root-prune, 593; old trees, objection to budding of, 649; to apply fire-heat to, 681
 Peat-bogs, gardening on, 757
 Peat, to convert into manure, 40, 72; analyses of, 583; to obtain, 678; substitute for, 216; good annuals to grow in, 272; drains, durability of, 519, 841; non-conducting properties of, 629
 Pears, for a N.W. aspect, 721; coreless, described, 737; Vicar of Winkfield, described, 20; Jargonelle, as a standard, 744; desert, good keeping kinds, 665; select, 25, 57, 144, 177, 305, 713; Lewis, 192; Barnadiston, 192; for standards, 89, 681; late for a south wall, 25, 177; varieties to come in between

Christmas and Easter, 744; for espalliers, 25; to summer-prune, 37; to prepare cuttings, 544; to prune, 121, 189; on Corbett's plan, 285; to preserve on horsehair, 119; stocks for, 144; large tree, 191; qualities of a few, 318; to check the blistering of the leaves, 505; will not force, 557; to transplant in lime, effect of, 635; training result of, 841; Louise Bonne (of Jersey) described, 660; Van Mons Leon le Clerc, 877; for a south aspect, 913
 Peas, adv., Cormack, 1; Prince Albert, 574; Farnes' Early, remarks on, 630; mildew on, origin of, 633; Prince Albert, rapid growth of, 645; Woodford Marrow, 216; Early, 809; remarks on, 806; to keep mice from, 805; early taste for, in France, 71; not influenced by a chalky soil, 72; the largest, 89; remarks on Cormack's Prince Albert, 559; Early May, 662; Farnes' Early, 662; spirits of tar, to preserve from pheasants, 737; straw of, as a manure, 244
 Pelargoniums, list of, to preserve during winter, 681, 711; select, 25, 233, 433, 465, 545, 777, 849; for bedding out, 572, 736; manure for, 25; soil for, 161, 361; prizes for seedlings, remarks on, 542, 556, 573; mode of exhibiting seedlings, 41; Lyne's seedlings, 773, 790; as standards, 773; for forcing, 25, 377; to propagate, 377; to obtain a succession, 500; treatment of, 84, 465, 500, 501, 590, 855; to stop the shoots of, 121; treatment of seedlings, 161; of scarlet, 262, 317, 337, 373, 505; good scarlet, 556; to keep in winter, 793; characters of various kinds, 190, 447; new, *ib.*; nitrate of potash for, 248; liquid manure for, 321; Queen Victoria, 805; hints on exhibiting, 286; cause of leaves spotting, 616; to prevent the leaves spotting, 361, 389, 400, 417, 428, 541; with nitro-muriatic acid, 541; Mayday, adv., 314; Lynes', 425; Pluto, 409; to move to a distance, 633; adv., Hodges, 33; Gaines, 97; Catleugh, 113; Groom, 129; Ash, 186; Masters, 201; Hancock, 297; White, 473
 Penang, the great tree of China, 55
 Pentstemons, observations on, 809
 Pepps (Mr. H.), his experiments on Lupines, 543
 Perennials, good, 73, 105, 245, 248, 544; for pot-culture, 89
 Peristerias, remarks on habits of, 744; elata, its treatment, 57; Humboldt, 268
 Petunias, seedlings of different colours raised from one called scarlet without hybridisation, 678; adv., Cattell, 258
 Phaius albus, 103
 Pheasants, to drive from seeds, 38
 Philibertia grandiflora, 212
 Philosophy, practical, 157
 Phlox, Van Houtte's, 55; adv., 457; suaveolens var., 679; Drummond, to sow the seed of, 744; an annual, 121; its treatment, 244; adv., Wood, 130
 Phormium tenax, fine plant of, at Woodville, 487
 Physalis edulis, its treatment, 305
 Physianthus albicans, 190
 Picotees, select, 25, 545, 616, 809; adv., Groom, 33; Youell, 114; Dickson, 130; Ely, 154; Johns, 553; their treatment, 100; Wood's description of, 134, 155, 266, 243; Mr. Orson's paper on the properties of, 191; remarks on, 230; to fertilize, 878
 Picture-cleaning, directions for, 593
 Pigs, to feed with Horse-chests, 6; wash of, as manure, 321; feeding of, 825
 Piqua plant, 233
 Pilchard oil, to kill blight, 861
 Pine-apples, at Bicton, 787, 842; culture of, 837, 861; size and weight of, 759, 789, 803; cultivation of, 788, 803, 819, 908; effects of allowing gills to remain on, 697; Mammoth, weight of, 807; weights of, 118, 806; to cure scale on, 7, 449, 616; remarks on their cockcombing, 505; to fruit the same plants for several years, 100; adv., Rosling, 114; to exchange, 332, 354; adv., Trinder, 457; Dungate, 568; mode of growing, 773; Hamilton's treatise on, adv., 517; culture of, in France, 174; cause of leaves spotting, 192; imported from the West Indies, 575; soot, as a manure for, 209, 266; suckers, cause of fruiting, 417, 433; number to put in a bed, 26 feet by 8, 616; remarks on, 877; bottom-heat for, 881
 Pine-pit, at Hewell, described, 772
 Pine-stoves, at Bamford Hall, described, 139
 Pinks, to have in bloom nearly all the year through, 72; to propagate, 460; to fertilize, 809; select, 545
 Pinus, laricio, destroyed by rabbits, 211; seedling, shrinking of, 649; to plant out, 809; Mexican species of, nearly hardy, 190; cones at Ockham Park, 575; Douglasii, producing seeds of, adv., 354; remarks on, 913
 Pip, in fowls, to cure, 876
 Pipes, earthen, for heating, 737, 693; to joint, 842, 862
 Pipings of Carnations, treatment of, 543
 Pits, peat walls for, 793; to construct, 849; for flower-garden plants in winter, 693; to protect from frost, 4, 20; M'Phail's recommended, 544; Mills' improved, 22, 37; for cuttings, 189; remarks on covering, 633; height of, 192; ridge and furrow, 208; for Melons, 461; hints on building, 505; at Capesthorpe, 543; with peat walls, 633; ridge and furrow, 208; at Hewell, 772
 Pitcairnia macrantha, 524
 Planks, Elm, slipperiness of, 335, 355; to kyanise, as a preventive, 355
 Plantains, dried, a confection, 55; or rib-grass, to destroy, 232
 Plantations, young, their treatment, 25
 Planting, remarks on, 84, 136, 736; to transplant, 819; precipitous places, 161; Rejuvenescence of, being a Key to explaining their Growth, Flowering, &c., with Practical Application to Culture, by Dr. C. H. Schultz, rev., 614
 Plants, vegetable monster, 140; trailing evergreen for rockwork, list of, 616; importance of knowing the structure and natural habits of, 755; luminous appearances in, 691, 711, 758; in pots to apply liquid manure to, growth of, 771; for a south wall, 777; winterflowering, 805; Prof. Henslow's remarks on their respiration, 269; whence do they derive their nitrogen? 356; for a suburban garden, 372; on potting, 135, 171, 187, 205, 263, 283, 433, 444; to hybridise, 444, 460; out-door, to water, 478, 499, 542, 555, 557; on their decomposing carbonic acid, 543; on their absorbing oxygen, 544; delicate time to propagate, 556; shade for, 557; to grow in large pots, 691; emission of carbonic acid by their roots, 5; food of, 5, 272; for forcing, 247, 399; to fertilize, 345, 528; kinds to flower in winter, 681; greenhouse, select, 7; herbaceous, 681; for flower-beds, 681; not eaten by rabbits, 9; to preserve in pits, 20, 36; in cellars, 465; to pack, 247; out-door, to protect, 23, 84; light necessary to, 36, 54, 73; to tie, 36; stages for, 41; to dry, 488; to keep green in drying, 41; of Afghanistan, 53, 116; herbaceous, 57, 245; yellow, 216, 248; white, 248; for growing under Fir-trees, 57, 89, 376; locomotion of, 57, 89; to winter, 400; action of manure on, 67; frozen, to recover, 84, 113, 137, 210, 285, 317, 399; stove, select, 88, 272; perennial for pot-culture, 89; conservatory, 89, 104, 216; two essentially distinct parts in, of importance for gardeners to consider, 709; in-door, 105; for windows, 144; hardening of their texture, 99; packages of, plundered at the Custom-house, 115; sulphur in, 159; to propagate, 116, 487; border, 245; to apply liquid manure to, 121, 144; to send abroad, 121; protection for, 789; remarks on potting, 135, 171, 187, 205, 245; tropical, their treatment, 155; for clumps in summer, 161; composition of, 875; remarks on, 907
 Plant-guards, 908
 Platylolium Murrayanum, 289
 Pleasures and advantages of rural life, 912
 Pleurothallis Smithiana, 679
 Plums, for espalliers, 25; good kinds, 89; cause of cracking, 665; new disease in 319; wild, remarks on, 462
 Pocket Almanack, rev., 24
 Polyanthus, treatment in pots, 100; of seed, 233
 Polyanthus Narcissus (yellow), cause of its not flowering, 289
 Polianthes tuberosa, its treatment, 121, 449
 Polytechnic Review, rev., 24; adv., 96
 Pomegranate, its treatment, 73, 89; to bloom, 192; to preserve in winter, 793

- Pond, to form a bottom to, 305; to clear the water in, 360; to keep down weeds in, 721; weeds in, 910
- Poor, to employ, 187, 206
- Popular Flowers, adv., 112; The Geranium, rev., 71; The Pansy, rev., 104
- Portulaca splendens, 631; to raise seeds of, 272
- Potatoes, great crop of, 464, 864; probable cause of their forming tubers, instead of leaves, 413, 427, 445; great produce of, 774; extraordinary tenacity of life in, 590; to store up, cellar described, 629; manures for, 9, 25, 227, 913; to obtain young ones early in winter, 593; good early, 9, 105; in Bermuda, 375; weight of, 806; their treatment, 25; alternate with Wheat, 338; remarks on failure of, 694; haulm of, for manure, 25, 263; sets, remarks on, 57, 144, 433; effects of guano on, 72, 227, 286; paint from, 86; Sir C. Lemon's letter on the disease of, 524; singular instance of their deterioration, 117; its cause, 190; to plant, 144; cause of curl in, 528; new, in the open ground in March, 159; effect of various manures on, 227, 243, 286; to preserve from sprouting, 697; Mr. Fleming's experiments with mixed manures upon, 243; good kinds for clayey soils, 272; top-dressing for, 321
- Potato-starch, detected in Rice and Arrowroot, by hydrochloric acid, 141; query respecting, 462
- Potter's Guano, 773; quantity to apply to an acre for garden-purposes, 648; its effects on grass, 3, 645; on Celery, 266; on Asparagus and other kitchen-garden crops, 587; season to apply to Asparagus, &c., 632; good, for liquid manure, 376; for small gardens, 560; effect on Wheat, 677; effects of, 873
- Potting plants, remarks on, 135, 433, 414, 479, 590; on the "one-shift system," remarks on, 171, 187, 205, 263, 283, 692, 709, 733, 756, 758, 822; material for, 862; one-shift system of, 876
- Potting-shed, Mr. Beck's, 820
- Pots, Rendle's improved, 519, 557; sizes of, 233; drainage for, 806
- Pot-plants, management of, 907
- Poultry, good kinds, 6, 38, 55; works on, 233
- Prejudices; covering for kitchen crops, 662; against slate pots, 69; against naming plants, 102; in showing plants, 139; against growing soft and hard-wooded plants together, 190

- Strawberries, to dig between the rows of, 755; nitrate of soda for, 121; to prepare ground for, list of productive kinds, 744; to prepare for forcing, 480, 542; benefitted by mowing off the leaves, 502, 519, 542; remarks on, 555; treatment of, 589, 793; Elton, remarks on, 616; Haig's scarlet Pine, adv., 168; plants, to prepare for forcing, 573, 589; Princess Alice Maude, adv., Fisher, 441; noticed, 464; Victoria, 528; good kinds for succession, 177, 665; Russian Alpine, 376; delicious character of, 188; to distinguish male from female flowers, 272; dried, to prepare, 302; Myatt's Pine, easily cultivated, 357; to strengthen, 376, 417, 464; effect of dry weather on, 376; cause of unfruitfulness, 400; Myatt's New Deptford Pine, 447; Hautbois, 464; Myatt's Pine, 524; remarks on culture of, 587, 608; application of guano-water to, 661; Comte Lelieur's remarks on, 542; Myatt's Pine, remarks on, 711; Keen's seedling, to produce a second crop, treatment of, 711; one-shift system for, 711; to dig between, 720; in autumn, bad practice of, reason explained, 700

Strachan's Agricultural Tables, rev., 880
 Stages for plants, 41
 Stove-plants, select, 88, 272
 Streitzia regina, 272; to sow seed of, 321
 Studley Gardens, remarks on, 373
 Substitute for glass, 861; for wood, 861
 Suburban garden, plants for, 373
 Succulents will bloom if suspended in the air, 417
 Sugar, extracted from a Grecian plant, 41, 69; an Asphodel, 69; bakers' scum, good for Turnips, 321; for grass, 335
 Suggestions for Experiments in Practical Agriculture, adv., 442
 Sulphate of Ammonia, per acre, 9, 218; sulphate refuse as a manure, 711; of iron, best material for fixing Ammonia in manure, 577; of lime, to fix Ammonia, 83; and nitrate of soda, their effect on Potatoes, 227
 Sulphur in plants, 159
 Sulphuric acid, quantity to use, 105, 416; to mix with liquid manure, 192
 Summer chambers, 377
 Sutton's Culture of the Vine in Australia, adv., 456; rev., 464
 Swallows, to prevent from building under eaves of houses, 738, 823
 Swan River Colony, botanical excursion in, 212; vegetation of, 414, 719, 759
 Sweeps, remarks on, 70
 Swan River Vegetation, 845

T

TALINUM teretifolium, 38
 Tan, to convert into manure, 72, 88, 177, 488, 561; fungus, to destroy, 249, 357, 561
 Tank-house, at Doneraile Gardens, description of, 757; hot water, 774, 803. Mr. Beck's, 820
 Tanks, porous material for, remarks on, 649; for a green-house, 793; covering for, 861
 Tank-heating, Rendle's system of, 390, 500; Huyshe's system, 460, 479, not applicable to Pines, 500; remarks on, 691; to render water-tight, 736
 Tansy, as a green manure, 52, 86
 Tar, spirits of, to destroy wireworms, &c.; to apply, 216
 Tares, disease of, 573
 Tecoma jasminoides, 248
 Temperature, in forcing, 35, 40, 54
 Tents, adv., Richardson, 476
 Testa di Quaglia, 373, 608
 Testacella Mangel, described, 389
 Testimonial presented to Dr. Mills, remarks on, 447
 Tetranema Mexicanum, 844
 Texture of plants, hardening of, 99
 Thawing plants, remarks on, 84, 118, 137, 210, 285, 317, 391
 Theorie der Gärtnerei, von John Lindley (Lindley's Theory of Horticulture), notice of, 398, 415, 457, 742, 912
 Thistles, Bannatic Globe, as a green manure, 68; to eradicate, 376, 913, in by-ways, bad effects of allowing them to seed, 691
 Thorns, ornamental kinds, 412
 Thrips, to destroy, on Cucumbers, 649
 Thrush, singular instance of parental affection in, 318
 Thuja articulata, 9
 Thunbergias, their treatment, 161; new seedling, 417; Fryeri, adv., 457
 Tigridias, to keep in winter, 736
 Tillage, remarks on, 232, 555
 Tilandsia, its treatment, 9
 Tilley's Agricultural Chemistry rendered simple, rev., 285
 Timber, to strip the bark from, 85
 Tinca sarsicola, described, 156; to destroy, 361; vestianella, species of moth, to destroy, 393
 Tipula oleracea, to destroy, 361
 Tissue, vegetable, to prepare for minute examination, 777
 Titmouse, building in a bottle, 519
 Toads destroy woodlice, 210, 357; in an Ash tree, 737
 Tobacco, number of plants allowed to cultivate in Great Britain and Ireland, 630; as manure, 761
 Tobacco Rhubarb, remarks on, 138, 161, 881; adv., Youell, 834
 Tomatoes, habits of, 429, 519
 Topham's Chemistry made Easy, adv., 498; rev., 560
 Torbrön's Treatise on Pine-apples, rev., 824; observations respecting, 913
 Tortoise, to keep in winter, 877
 Traill, Miss, her garden noticed, 524
 Translating, quenouille, explained, 25; forest-trees, 136
 Transplanting, remarks on, 136, 321; observations on, 678, 712
 Transactions of the Prussian Horticultural Society, rev., 24; of the Dublin Gardeners' Provident and Mutual Instruction Society, rev., 360; of the Highland Agricultural Society, adv., 442
 Trays for Flowers, adv., Hewetson, 456
 Trees, in hedge-rows, their effects on Corn, 691; guards for, 6, 118; to strip the bark from, 85; ornamental, 105; for marshes, 177; fast growing, 417; to protect from hares, 118; excavation of, by birds, 429; absence of, in the North American prairies, 173; adv., Willmer, 130; fruit, cause of gum and canker in, 526; measure of, in planting, 528; petrified, discovered in a stone-quarry, near St. Helen's, 678; Pæonies, to propagate, 289; new var., 432; to grow in pots, 417; list of, 881
 Trellis, for climbers, 4, 68, 84, 156, 178, 263, 300, 428; for China Roses, 192
 Trevirana, its culture, 173
 Trilliums, their culture, 209
 Trimmer's Science with Practice, rev., 191
 Trollius acaulis, 523
 Tropæolum peregrinum, its beauty, 573; azureum, 23; pentaphyllum, its treatment, 400; Moritzianum, its culture, 73;

polyphyllum, 741; tuberosum, to flower, 121, 210, 805; pentaphyllum, 806
 Tropical Orchidaceæ, 838
 Troschel, Dr., his mission to California, 775
 Truffles, 590; to propagate, 233, 417; cultivated in France, 71
 Tuberoses, adv., Cobbett, 33, treatment of, 449; to keep during winter, 681
 Tuckermania maritima, 175
 Tulip-root, a disease in Oats, 773
 Tulip-tree, to propagate, 545
 Tulips, Florentine, 57; to protect, 73; absence of, at the Chiswick Exhibition, 374, 390
 Turf, under trees, 805; as a green manure, 36, 372; to prepare for potting, 305
 Turkey, observations on, 840
 Turmeric, as a test for ammonia, 9, 88
 Turnip-tops, as a green manure, 20; seed, adv., Haig, 168; fly, to keep away, 318; effect of various manures on, 526; to fold sheep on, 132, sprouts, to prepare, 246
 Turnips, specimen, grown with guano and salt, 737; saw-fly, 620
 Turtle-doves, disease in, 773
 Turtle Scale, black, described, 443
 Tussack Grass, 57; account of, 131, 190
 Tyas' Sentiment of Flowers, adv., 442

U

UNDER-DRAINING, beneficial effects of, 68
 University College, Botanical prizemen at, 559
 Urine and vegetable refuse, as a manure for plants, 68; to save, 144, 216, 247, 289

V

VALIOTA purpurea, its treatment,
 Van Diemen's Land, meteorological observations at, 503
 Varnish for cotton-frames, 55; useless, 139
 Vegetable manures, 207, 229; physiology, importance of, 733
 Vegetable marrow, to boil, 319, 335; different kinds of, 633; cause of fruit falling off, 662; treatment of, 681
 Vegetable tissue, to prepare, for minute examination, 777; irritability, 822
 Vegetables, discovery of a way to preserve them, 574; food from, 24; refuse, for manure, 25, 102, 117; putrid, their effect on the growth of plants, 68; diseases of, 131; importance of good water in cooking, 359; select kinds, 105; for shady ground, 161; their composition, 338; seeds of, adv., May, 114; hardy, 505; to procure good seeds of, 157; from the Rhine, 192; new variety, 392; vagaries, 878
 Vegetable irritability, 911
 Vegetation in India, rapidity of, 392; of Swan River, 414; Vegetable matter, to apply as manure in a fresh state, 771
 Veitch's Nursery, noticed, 503; propagating-house, 540
 Ventilation, remarks on, 440
 Verandahs, chambers for, 433
 Verbenas, their treatment, 41, 73; adv. Miller, 65; Wood, 130; Hally, 186; May, 225; Miller, adv., 834; Veronica speciosa, 363; good kinds, 144, 272, 447; soil for, 248; formosa elegans, adv., 258; list of, 272; to preserve in winter, 336; to stand over winter, 773; remarks on raising hybrids from, 693; winter, treatment of, 744
 Vetch, as a green manure, 3; straw, as manure, 262
 Victoria regia, seed, adv., 426; remarks on, 428, 561
 Vines, to fruit in succession, 720; for a late vinery, 697; selection for a crop, 697; culture of, in Bengal, 375; good works on, 377, to render productive, 428; cause of warts on the leaves, 433; strictures on pruning, 411; singular failure of the leaves upon, 414; supposed cause of, 445, 461, 479; impropriety of removing leaves from, 413; questioned, 479; advantage of removing the buds from the lower part of the stem, in planting, 488; Black Hamburgh, remarks on colouring of, 678; and Peaches, to grow together, 681; system of pruning deduced from Scripture, 678; remarks on culture of, 711; management of, 676; query respecting a system of pruning, 615; boroer, to make, 825; to apply guano to, 619; to graft, directions for, 744; adv., Hoare, 1; remarks on stopping, 272, 616; to graft, 37, 208, 216; remarks on management, 619, 230; to cure scale on, 40; temperature in forcing, 35, 40, 54, 67, 105, 120; power of vegetation in, 51; to grow in frames, &c.; in pots, 232, 665; to steam, 57; their treatment in the Ionian islands, 70; necessity of watering when grown within the house, 72; young, to prune, 89, 120, 528; affected by frost, to recover, 102; Roberts's treatise on, rev., 103, 119; to remove, 248; remarks on some kinds, 417; their treatment, 103, 119, 266, 316; border for, 103; Errington's remarks on, 211; to inarch, 192, 232; for a Vinery, 528; to propagate, 119; to disbud, 120; remarks on pruning, 573; flowers destroyed without affecting the leaves, 121; great produce of, 573; wash for, 144; to protect the stems, 161; rust of, remarks on, 132, 189; Portugal, to train, 161; in pots, to train, 177; to raise from eyes, &c.; Verdelho, 192; for a greenhouse, 216; to stop their bleeding, 265; remarks on, 847; to graft, 230, 844; border for, 103; Errington on, 211; Roberts on, 230; covering for, 266; hints for improving, 300; manure for, 881; to graft, 881
 Vineries, treatment of Figs in, 300; on roofs in cities, 462; temperature to be maintained in summer, 459
 Violets, Neapolitan, cause of their failure, 73; their treatment, 356; tree, its culture, 73, 89; Russian, their treatment, 356; list of good kinds, 616
 Viscaria oculata, 823; Backhouse, adv., 857
 Vitriol, green, to apply, 88; quantity to use, 105, 416; oil of, to fix ammonia, 230, 399
 Vriesia psittacina, 140
 Vulgar errors, 511; blight on corn from the Barberry, explanation of, 694; refuted, &c.

W

WAGTAILS, habits of, 392
 Walks, to extirpate grass from, 73; remarks on edgings of, 710
 Walls for trees, remarks on, 232; north, unfit for Peaches, 289; to prepare borders for, 344; new, to cover with Ivy, 910
 Walnut-trees, to transplant, 136; to graft, 177
 Ward's Cases, 847; plants for, 89; grown in, 574; for sending plants out in, 121; remarks on, 577; prizes for, at exhibitions, 517
 Wash for fruit-trees, 848; for Vines, 144
 Wasps, observations on, 629; numerous about Bristol, &c., 645; remarks on, nest in Currant-bush described, 661; plentiful in Shropshire, 661; remarks on killing, 301, 556; nest, 878; and Rats, 909
 Waste land, to improve, 517
 Water, a non-conductor of heat, 774, 806; danger of using bad for hot-water pipes, 417; greatest heat of, in open gutters, 561
 Watering out-door plants, 478, 499, 542, 555, 557; in the Ionian Islands, 543
 Water-flannel described, 735
 Water Dropwort, described, 412
 Waterer's exhibition of plants, adv., 313; noticed, 359, 371
 Watercourses, query respecting composition for, 519
 Watercresses, treatment of, 431, 444
 Water Lily, to multiply, 292, 289
 Watson's granulated manure, 248
 Weasel sportsman, 823
 Weather, remarks on, 396
 Weeds, to prepare for manure, 649; to boil for manure, 9; heaps of, to decompose, 360; to destroy, on gravel-walks, 616; in ponds, to destroy, 737, 758, 806, 842, 847; observations on, 774; to destroy by ammoniacal liquor, 806, 819; in ponds, 910
 Weekes (Mr.), his annual dinner, 71
 Weights of fine Horticultural productions, 608
 Wells, to remedy their impurity, 70, 86
 Wellington, New Zealand, letter from, 190
 West's Agricultural Tract for the Times, rev., 288
 West Indian cultivation, account of, 269
 Wheat-splitting, 837; observations on, 838; Egyptian, adv., Staunton and Sons, Strand, 658; experiments with manures on, 189; propagation of, by division of its roots, amount of saving by, 65; straw, as a manure, 208; to dibble in, 571; gluten contained in, 633; nitrate of soda as a manure for, 344; alternate with Potatoes, 388; tillering of, 646; possibility of obtaining 30 quarters per acre, 396; year after year on some land, 772; splitting, opinions of practical workmen concerning tables showing expenses of, 734; to transplant, by division of its roots, experiment on, 695; to sow, quantity per acre, 720; preparation of the ground, and manure for, 720; Australian, 864
 Wheelbarrows, to preserve the handles of, 429
 Whitethorn, plants for grafting in, 216
 Whitney's substitute for glass, 819
 Wighton on Bees, adv., 112
 Willow, carulean, remarks on, 6; new American, adv., Rivers, 130; peelings for bottom-heat, 272; American, 375; weeping, 415
 Window plants, 105, 144, 528
 Windsor, progress of the Royal Gardens at, 227; Gardens at Frogmore, noticed, 647
 Wine, to make from common Bramble, 614; raisin, to make, 26; Grape, to make, 645; receipt for making, 647; Black Currant, to make, 663; British Champagne, to make, 695; British, remarks on, 57; best work on, 449; ginger, receipt for making, 679; lees of, as a manure, 345; Elder, best work on, 545
 Winter gardening, 822, 862; 878
 Wire, for walls, 793
 Wireworm, to destroy, 233, 272, 301, 305, 318, 744
 Wirework, adv., Baker, 90; Gidney, 224; Thompson, &c.; coated with zinc, 392
 Woodlouse, death-watch, described, 116; to destroy, 649
 Woodlice, to destroy, 57, 102, 177, 465; destroyed by toads, 210, 357
 Wood, Punch's critique on, 71; pulverised, as food for cattle and horses, 387; decayed, as manure for plants, 417
 Wood-paving, remarks on, 315, 528; advantage of using Elm in, 358; improvement in, 738
 Wood-ashes, for manure, 25; as a top-dressing for plants, 57
 Woolen Moth, white-shouldered, described, 156
 Woolen rags, to arrest ammonia during fermentation of, 744; rags to apply as a manure, 665
 Woodville, fine plant of Phormium tenax at, 487
 Worms, to destroy, 5, 37, 70, 809, 825, 865, 881; by limewater, 54, 70, 192, 216; by corrosive sublimate, 37, 70, 86, 216, 449; by salt, 70; with chloride of lime, 429; their use, 103
 Wrens, query respecting, 391; answered, 429, 501; their nests noticed, 590; nest, 910

X

XYLOCOPA figured, 791; nest of, 791

Y

YEAR-BOOK of Facts, rev., 143
 Yeast, as a manure, 216; plant, 246; described, 336, 361, 528
 Yew, poisonous nature of, 807; Irish, where raised, 9; to cut down, 101
 Yucca, species of, 144; soil for, 216; gloriosa, treatment of after flowering, 633

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 1—1843.

SATURDAY, JANUARY 7.

Price 6d.

FLORICULTURAL SOCIETY OF LONDON.—The GENERAL MEETING for the Election of the Committee and Officers will be held, at 1 o'clock on Thursday next the 12th inst., at the Crown and Anchor Tavern, Strand; on which day the ANNUAL DINNER OF FLORISTS and AMATEURS, in conjunction with the Patrons and Members of the Gardeners' Benevolent Institution has been appointed to take place, at 5 o'clock. —H. WILDMAN, Hon. Sec. Tickets, 12s. 6d. each, (including a Bottle of Wine), may be had, on application, addressed to the Secretaries of the above Societies, at the Crown and Anchor Tavern.

SEEDLING DAHLIAS.—W. R. WHALE begs to announce to Dahlia-growers generally, that he intends sending out HERO of STONEHENGE Dahlia, in strong Plants, early in May; it not being in his power to accommodate his numerous friends with Ground Roots, having received orders for 24 roots. This Dahlia needs not the usual puffing; suffice to say, it is a gem of the first water; and, if it do not give satisfaction, the cash will be returned. Colour, a dark Mulberry, with fine cupped petals of great substance, symmetrical form, splendid habit, flowers standing erect above the foliage, perfectly constant the whole season, closes when young, pronounced to be a decided improvement on Rival Sussex at Stone Henge Show, by Messrs. Keynes, Spary, Dodds, &c. &c. Awarded the following prizes: viz.—1st. at Stonehenge, on Salisbury Plain, supposed to be the premier Show of the season, (calculated to have been 10,000 persons present)—2d. at Devon and Exeter; 3d. at Marlborough; and in a winning stand of 12—prize at Salt Hill, and at several of the Metropolitan exhibitions, the only places exhibited at. Price 10s. 6d., the usual discount where a dozen plants are ordered—height 4 to 5 feet. NOVELTY, ruby ground, tipped, and striped with buff, quite new in colour, full-sized flower, fine clear petals, symmetrical form, an every day's flower, perfectly constant—height 2 to 3 feet, 10s. 6d. APPLAUSE, a pale orange, fine clear cupped petals, a round and full-sized flower, it looks beautiful in a stand, rather flat, but comes up in water, like many other stiff petal flowers—height 4 to 5 feet, 10s. 6d. Only 4 roots of this variety.—Elcot, Newbury, Berks, Jan. 4, 1843.

MITCHELL'S Unrivalled Variegated DAHLIAS, viz.—The BEAUTY OF SUSSEX and BLANCHE SHELLEY. JAMES MITCHELL begs to announce his intention of sending out in May the above seedling Dahlias; which he can recommend with confidence to the most limited grower; they have been justly pronounced both by foreign and English growers to be the most beautiful, and the most valuable acquisition ever offered to the Public. J. M. will also have fine plants of Mrs. SHELLEY, which is first-rate and very scarce. The BEAUTY OF SUSSEX, —This Dahlia has been placed before any other two coloured flower, at all the principal Shows in England: viz.—the Salt Hill, the Floricultural, the South London, Maidstone, and Tunbridge wells Shows. Colour, delicate pink, strongly edged with Cherry—the petals are cupped, of firm texture, and well arranged, never confused; the general form is excellent, and rising well in the centre; a constant show-flower—4 feet, 10s. 6d. BLANCHE SHELLEY, white, delicately tipped with purple, beautifully cupped petals, superior form, and of great depth: a constant show-flower—5 feet, 10s. 6d. Mrs. SHELLEY, delicate rosy pink, cupped petals, a constant show-flower—4 feet, 5s. —The usual allowance to the trade, where a dozen plants are ordered.—Pitdown Nursery, Maresfield, Uckfield, Sussex.

JAMES DICKSON & SONS, NURSERYMEN, SEEDSMEN, and FLORISTS, have much pleasure in announcing that they have succeeded in making a valuable addition to their extensive stock of CALCEOLARIAS, by the purchase of the entire stock of those richly-spotted varieties raised by Isaac Anderson, Esq., which took the first prize for seedlings at the Royal Caledonian Horticultural Society's meeting of the 15th July last, and were justly described as being the finest varieties yet exhibited. There are six distinct varieties, named as follows—George Heriot, Graham, Greigiana, Ariadne, Margaret, Neillii. These will be sent out in rotation of order, early in April next, at 30s. per set, or 7s. 6d. each. Early orders will oblige, and meet with prompt attention; but as the stock of some of the varieties is very limited, early application can only be guaranteed execution. Seed Warehouse, 32, South Hanover-street, Edinburgh; Nurseries, Inverleith, and Broughton Park.

Note.—Messrs. J. D. & Sons are now sending out plants of that beautiful and distinct variety of Epiphyllum truncatum, called Epiphyllum truncatum elegans, which attracted so much notice at the Horticultural Society's Show.

HARDING, MARCHAND DE BOUQUETS, No. 1, CLIFFORD STREET, OLD BOND STREET.—BOUQUETS of all kinds made to order, and carefully packed for the country. A liberal price will be given to Growers and others in the Isle of Wight, Devonshire, &c. for forced and other Cut Flowers—Orange, Rose, Pelargonium, Clove, and Carnation blooms most in demand. On Sale, various Works on the Language of Flowers, Ornamental Flower Pots, Vases, Stands for Plants, Fancy Baskets, &c.—Apply post-paid.

FUCHSIA ST. CLARE. **YOUELL & CO.** have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this Paper of the 24th Dec., together with their two new Verbenas. Great Yarmouth Nursery, Jan. 5, 1842.

PATRONIZED BY HIS GRACE THE DUKE OF RUTLAND AND MANY OF THE NOBILITY,

THE FASTOLFF RASPBERRY.—For many years past there has been cultivated in the neighbourhood of Yarmouth, adjacent to the ancient Castle of Sir John Fastolff, a red Raspberry of a most extraordinary size and rich flavour. The Nobility who visit the sea-coast here have invariably expressed their astonishment at the exceeding fineness of the fruit of this variety, and until lately YOUELL and Co. have not been enabled to obtain a sufficient stock of it to bring it into public notice; but having now obtained a supply (although limited) of fine Canes, beg to offer them on the following terms, and they can be sent with safety to any part of the United Kingdom, on the receipt of a Post-office order.

Packages containing 50 Canes, 25s.—Packages containing 25 Canes, 14s.—Package included.

The few to whom YOUELL and Co. have sent it, have expressed their high admiration of its superiority over other varieties; and a letter just received from a Gentleman in Derbyshire, to whom this variety was sent, states that it invariably takes prizes at the Hort. Shows in his neighbourhood. In conclusion, YOUELL and Co. beg to state that they have not, or do they intend to recommend any article but that which they can do with confidence; and in this instance they feel fully assured of its giving the most entire satisfaction.—Great Yarmouth Nursery, Norfolk, Jan. 5, 1842.

SHIRLEY VINEYARD, NEAR SOUTHAMPTON,—NURSERY DEPARTMENT.

CLEMENT HOARE respectfully announces that he has now on sale an extensive collection of Grape Vine Plants of superior growth, and of the most approved sorts in general cultivation, varying in price from 2s. 6d. to 7s. 6d. each.

Lately Published, **A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS.** By CLEMENT HOARE. 3d edition. 8vo, 7s. 6d. boards. LONGMAN & Co., London. Sold by all Booksellers, and at the Vineyard, at Shirley.

J. CUTHILL begs to recommend his **EARLY MELON** as the most prolific and easy of culture. His Black Spine and Snow's Cucumbers, the best in cultivation, may be seen growing to the amount of 300 plants, in pits heated by Stephenson's Wrought Iron Boiler, heating nearly 500 feet of large piping. Also Seed of the True Lion-House Cucumber for houses, &c. Lisianthus Russellianus, New Spotted Digitalis, Phlox Drummondii very fine. The above, each per packet 2s. 6d., sent free on the receipt of an order. Direct, J. CUTHILL's Flower and Forcing Grounds, Denmark Hill, Camberwell, London. Fine Plants of the Lisianthus Russellianus from 5s. to 10s. each. N.B.—Wanted an Active Lad, aged 17; Wages, 2s. per week, with Board and Lodging.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, begs respectfully to inform the Nobility, Gentry, and others of Manchester and its Vicinity that they can be supplied with the following new and early articles:—Cormack's Prince Albert and early Kent Peas, British Queen ditto; Taylor's new improved Windsor, and Johnson's Wonderful Beans; Manchester and Giant red and pink Celery; Hamilton's White Spine and Walker's Prize-fighter Cucumbers; Incomparable Cos Lettuce, together with every other variety of Horticultural, Agricultural, and Floricultural Seeds, at his Wholesale and Retail Warehouse, 106, Deangate, Manchester. Agent for Sir James Murray's Patent Fertilising and Guano Manures.

CHARLES FARNES, No. 128, ST. JOHN-STREET, LONDON, respectfully informs the Public that his Collection of New KITCHEN-GARDEN AND FLOWER-SEEDS are now ready to send out. Catalogues with prices will be forwarded on application.

Farnes' Superior First Early Peas, height, 1½ to 2 ft.

Lord VISCOUNT CAMPDEN
And Seventy-two other Members of Parliament and Gentlemen.
COUNTY DIRECTORS.—Upwards of 170 Gentlemen, Landed Proprietors, or otherwise connected with Agriculture, holders of 50 Shares, have been appointed County Directors.—FARMING STOCK insured without the Average Clause at 1s. 9d. per cent., no duty.—COMMON INSURANCE at the usual moderate rates.—INSURANCE OF LIVES on an equitable scale of charge. Endowments of all kinds for future or existing children. The usual commission to Solicitors. Agents are appointed in all the principal Towns in the kingdom. W. SHAW, Managing Director.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV. LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16l. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31l. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5l. 5s. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Beasts, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE's New Patent Land-presses and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., upon the above system, which has (at an immense cost to the inventor), been brought to great perfection, and heats the same by HOT-WATER APPARATUS, with improved Tube or Conical Boilers. W. HILL also adapts DR. ARNOTT'S NEW BALANCED REGULATOR to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. PENN'S SYSTEM only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, is a perfect and rapid Circulation, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer-heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. HILL would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. HILL, Builder and Surveyor, Lewisham.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS. **CROSSKILL'S LIQUID MANURE CART,** which received the Honorary Reward of the Roy. Agricultural Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price delivered in Hull, 25l.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12l. 12s.

THE GENUINE GUANO ON SALE AT LIVERPOOL. Any quantity of this celebrated and valuable natural Manure can be obtained from the Queen's Bonded Stores, either in Liverpool or in London. Apply to Messrs. Wm. Jos. MYRNS & Co., Importers, Liverpool; Messrs. COTESWORTH, POWELL, & PRIOR, Great St. Helen's, London; or Messrs. EDWARDS, DAWSON, & Co., Brokers, Liverpool.

ENCYCLOPÆDIA OF FLOWERS.

On Saturday, January 7, will appear the first portion of this valuable guide to the Florist and Amateur—being **THE COMPLETE HISTORY AND CULTURE OF THE HEARTSEASE**, for the Border and for Exhibition; forming a leading feature in the First Number for 1843 of the **GARDENER AND PRACTICAL FLORIST**, price THREEPENCE. Published every Saturday by R. GROOMBRIDGE, 5, PATERNOSTER-ROW, where all advertisements that can interest the nobility and gentry who have gardens, must be forwarded. The charge is 5s. for six lines, and 6d. every additional line.

VALUABLE WORKS ON INDIA. PUBLISHED BY WILLIAM H. ALLEN & Co., 7, LEADENHALL-STREET.

BOTANY OF THE HIMALAYAN MOUNTAINS. Illustrations of the Botany and other branches of the Natural History of the Himalayan Mountains, and of the Flora of Cashmere. By J. FORBES ROYLE, M.D., V.P.R.S., F.L.S. and G.S., M.R.A.S., &c. &c. &c. Now complete, in 2 Vols. Imp. 4to, with Coloured Plates, half morocco extra, price 11l. 11s.

THE PRODUCTIVE RESOURCES OF INDIA. By J. FORBES ROYLE, M.D., F.R.S., &c., Late of the Medical Staff of the Bengal Army, and Superintendent of the Hon. E. I. Company's Botanic Garden at Saharanpore, and Author of "Illustrations of the Botany and other Branches of the Natural History of the Himalayan Mountains."

"In respect to Dr. Royle's object to point out the latent agricultural wealth of India, he has brought a large store of knowledge, accumulated from local observation, practical experience, and scientific studies, to bear upon the subject, which he has elucidated with much ability."—*Times*.

THE EAST INDIA GAZETTEER; containing particular Descriptions of the Empires, Kingdoms, Principalities, Provinces, Cities, &c. &c. of Hindoostan and the adjacent Countries, India beyond the Ganges, and the Eastern Archipelago; together with Sketches of the Manners, Customs, Institutions, Agriculture, Commerce, Manufactures, Revenues, Population, Castes, Religion, History, &c., of their various Inhabitants. By the late WALTER HAMILTON. In 2 vols. 8vo, price 12. 12s. boards.

THE HISTORY, ANTIQUITIES, TOPOGRAPHY, and STATISTICS OF EASTERN INDIA; comprising the districts of Behar, Shahabad, Bhagalpore, Gorukpore, Dinajpore, Purnia, Rungpore, and Assam, in relation to their Geology, Mineralogy, Botany, Agriculture, Commerce, &c. &c. Surveyed under the orders of the Supreme Government, and collated from the original documents at the East India House. By MONTGOMERY MARTIN. Complete in 3 vols. 8vo, with numerous Plates, 2l. 2s. cloth boards, lettered.

"This work is now concluded, and we can only repeat our previous opinion, that it is one of the most valuable additions to the literature of the present day."—*Literary Gazette*.

TRAVELS IN WESTERN INDIA, embracing a Visit to the Sacred Mountains of the Jains; and the most celebrated Shrines of the Hindoo Faith, between Rajpootana and the Indus; and an account of the ancient City of Nehrwalla. By the late Lieutenant-Colonel JAMES TOD, Author of "Annals of Rajasthan." Royal 4to, cloth. Price 3l. 15s. 6d.

"* * * This work is embellished with Nine Plates and Vignettes, beautifully engraved from Sketches by Mrs. Hunter Blair."

"A work which must be regarded as the most important, the most full, and the most interesting that has ever appeared upon Western India."—*Atlas*.

MAPS AND CHARTS OF INDIA, &c., Published by W. H. ALLEN & Co.

MAP OF CHINA AND THE ADJACENT COUNTRIES, drawn from the latest Surveys and other Authentic Documents; containing all the Geographical Information relating to that Country and adjacent Tracts, up to the present time. By JOHN WALKER. On one large sheet, coloured, 8s.; on cloth, in a case, 11s.; on cloth, with rollers, 12s. 6d.

CHART OF THE CANTON RIVER, folded in case, 2s. 6d.

GENERAL CHART FROM ENGLAND TO CHINA, including the India Seas; inscribed to James Horsburgh, F.R.S., &c. &c. On one large sheet, price 7s. 6d.; or on cloth, bound, 10s. 6d.

A MAP OF INDIA, from the latest Surveys of the best authorities, and corrected to the present time. On six sheets of Atlas, 2l. 12s. 6d.; on cloth, in a case, 3l. 13s. 6d.; or on cloth, with rollers, varnished, 4l. 4s.

A SMALLER MAP OF INDIA, compiled from the latest Documents. On one large sheet, 18s.; or on cloth, in a case, or on rollers, 1l. 5s.; or with rollers, varnished, 1l. 9s.

London: W. H. ALLEN & Co., 7, Leadenhall-street.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates. Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY. The Number for December, 1842, contains highly-finished drawings of *Cattleya superba* (Superb-flowered Cattleya), *Correa bicolor* (Two-flowered Correa), *Loasa Herbertii* (Mr. Herbert's Loasa), *Salvia bicolor* (Two-coloured Sage), *Floriculturna*—*Gloxinia discolor*.—*Gongora*?—*Maurandya*?—*Niphaea oblonga*.—*Oncidium Lemonianum*.—*Oncidium microchilum*.—*Oncidium volubile*.—*Scutella splendens*.—*Tropæolum aztecum*. Operations for January—Index—Dedication—Advertisement—Latin Index to Coloured Figures of Plants—English Index to Coloured Figures of Plants—Woodcut and Coloured Illustrations.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That the drawings are of the highest order, and are done by one artist, whose names are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, but sometimes far handsomer, old species; the majority of which may be cultivated by every one possessing a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the first Number, the present Volume is a valuable opportunity for those who wish to become subscribers.

London: W. S. ORR and Co., Paternoster-Row.

FUN FOR THE FIRE-SIDE!!

JOE MILLER'S JEST-BOOK.

A Pleasant and Useful Book, containing a selection of the most amusing and original jokes, puns, and anecdotes, as were required by the great and witty Joe Miller in his modern conversation; but, that the volume is of great substance, and is a good table or travelling companion. The illustrations have been made from other old volumes.

"An anecdote connected with this work is, that every body who has read it and everybody else are perfectly familiar with its contents. . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."—*London: WHITTAKER and Co.*

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Public at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4s. 6d. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4s. 6d. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4s. 6d. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3s. 6d. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."

—*Library of Useful Knowledge, Article "Mechanics."*

TAYLOR and WALTON, Booksellers and Publishers to University College, 28, Upper Gower-street.

HORTICULTURAL AGENCY, 65, Lower Thames Street.—N. SYLVESTER informs his Friends and the Public that he gives particular attention to this branch of his business. Gentlemen sending orders to the Continent for Trees, Plants, Bulbs, &c., should have the packages consigned to N. S., who will clear and forward them within a few hours after arrival in London. All kinds of Goods received for shipment or cleared from the Docks.—N. SYLVESTER, Custom-house Agent, Licensed by the Commissioners of Her Majesty's Customs. N. S. will forward Orders to the Continent free of Postage.

CUCUMBER and MELON BOXES and LIGHTS.—For SALE, one, two, and three Light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two Light Boxes and Lights complete, from 1l. 8s. Garden Lights made, glazed and painted, from 1s. per foot. Sashes and Frames made, glazed, and hung complete, 1s. 8d. per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road.

* * * An Apprentice wanted.

THE ANNUAL DINNER of the SUBSCRIBERS to, and FRIENDS of, the GARDENERS' BENEVOLENT INSTITUTION, the MEMBERS of the FLORICULTURAL SOCIETY OF LONDON, and the NURSERYMEN, GARDENERS, and AMATEUR FLORISTS of GREAT BRITAIN, will take place at the CROWN and ANCHOR TAVERN, STRAND, on THURSDAY, the 12th of JANUARY, 1843, at Five o'Clock. PROFESSIONAL SINGERS WILL ATTEND.

THE GENERAL MEETING of the GARDENERS' BENEVOLENT INSTITUTION, the FLORICULTURAL SOCIETY OF LONDON, and ANNUAL MEETING of the TRADE, at One o'clock the same day.

Dinner Tickets, 12s. 6d. each (including a bottle of wine), may be obtained of the following members of the Committee:—

Messrs. BEATON, Shrublands, near Ipswich; BRISTOW, Knightsbridge; CHANDLER, Vauxhall; CHARLWOOD, Covent Garden; GAYNES, Little St. Gregory, Cirencester; HENDERSON, Pine-apple-place; LOW, Clapton; MOUNTJOY, Ealing; NOBLE, Fleet-street; OSBORNE, Fulham; ROGERS, Eaton-square; SMITH, gardener to Lord Lenterden, Hendon; THOMSON, Iver; TOWARD, gardener to H.R.H. the Duchess of Gloucester, Bagshot Park; WARNER and WARNER, Cornhill; WATERER, Knapp-hill, Bagshot. Of Messrs. ATKINS, Northampton; DAY, Oxford; DICKSON, Acton; DUNTON, Flanagan, Mansion House-street; GARRAWAY and Co., Bristol; GIBLING, Stowmarket; MACKAY, Badminton; N. TING, 45, Cheapside; OGDEN, Coventry; ORSON, Old Kent-road; WOOD and SONS, Maresfield; at the GARDENERS' BENEVOLENT INSTITUTION, Mr. WILDMAN, Hon. Secy., 1, The Strand; and Mr. BOWLER, Hon. Secy., of the Benevolent Institution, 13, Kent-road.

EXTENSION OF THE PRINCIPLE OF ART-UNIONS.

THE Public are now respectfully invited to inspect some of the FINISHED ETCHINGS illustrative of the SONGS OF SHAKESPEARE by the ETCHING CLUB. The whole Series will be ready in the third week of this month for every Subscriber to the ROYAL POLYTECHNIC UNION of LONDON for the year 1843. The prizes will be drawn on the 25th of April, 1843. Two most material points should be perfectly understood by the prize-holders:—First.—That they are to select for themselves the prizes adapted to their taste from the PRINCIPAL EXHIBITIONS IN LONDON. Secondly.—That the COMMITTEE is honourably and wholely devoted to the exclusively devoted to the promotion of the work of Art or science (advertisements and notices alone excepted). The specimens are to be sent at 5, Cavendish-square; they will also be shown by the Honorary Secretary at the ROYAL POLYTECHNIC INSTITUTION, of whom the prospectus may be had, and to whom subscriptions may be paid.

HODGSON and ABBOTT'S PALE ALE.—The above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from B. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.—City Office, 98, Gracechurch-st.

WANTED, as GARDENER, an unmarried Man, who writes a fair hand, knows something of Botany, has a competent knowledge of every part of his profession, including the cultivation of Orchideous plants, and a desire to improve. Wages, 40l. a year, with board and lodging in the house. Two under-gardeners are kept, one of whom will probably be wanted. Apply by letter, post-paid, to G. F., 3, Charles-street, Covent-garden. Any recommendations not requiring to be returned may be sent at the same time.

WANTED, a GARDENER and his WIFE, the former to undertake the management of a small Greenhouse and Forcing-house. He must possess a good knowledge of Flowers. There is no Kitchen-garden; he would, therefore, be required to make himself occasionally useful in the house. The wife as Cook and general servant; there is one other Maid-servant kept. Wages 40l. a year, with other perquisites, that will be explained. Apply any morning before 10, at No. 6, Barnsbury Park, Liverpool-road, Islington.

WANTED, by a respectable single YOUNG MAN, a SITUATION as UNDER-GARDENER; he can have a 4 years' good character from the place he has just left, and perfectly understands the management of Greenhouse and Forcing-house. The Country would be preferred. Direct to C. I. K., 14, Duke-street, Lisson Grove; if by letter, post-paid.

WANTS a SITUATION as GARDENER, (or as GARDENER and FORESTER), an Active, Middle-aged, Married Man, who perfectly understands the management of Vines, Grapes, Peaches, Stoves, and Greenhouse Plants, and the cultivation of all Florist's Flowers; can have an undeniable character from his last situation, where he has lived Twenty years. Direct to A. B., at Mr. Cock's, Chiswick.

WANTS a SITUATION.—A Man and his Wife, without incumbrance; the Man as Gardener, the Woman as Cook, or to look after a Dairy or Lodge. Can have a 3 years' good character from their last place. Direct A. B., at Mr. ROWLAND'S, No. 8, St. Mary Axe.—All letters, Post-paid.

A YOUNG MARRIED MAN, about 30, is desirous of engaging himself with any Nobleman or Gentleman, as GARDENER. His last situation was in one of the first families in Warwickshire, and he previously lived in some of the principal establishments of the country. Having also a considerable knowledge of the principal systems of Agriculture, a situation where the management of a small Farm came under his charge would be preferred, and an unexceptionable recommendation, as to abilities, &c. will be obtained. Direct, G. J. P., Post office, Oxon.

TO NURSERYMEN.—The Advertiser is desirous of entering into an arrangement with any respectable Nurseryman, who may feel disposed, either now, or within a limited period, of disposing of his business. The neighbourhood of London would be preferred. Application to be by principals only. Address, T. F. C., No. 28, St. Paul's Place, Ball's Pond, Islington, London.

TO NOBLEMEN and GENTLEMEN.—WANTS a SITUATION as GARDENER, a Married Man without any Family, age 37 years; a person with a practical knowledge of his business in all its departments. The advertiser will receive a good character from James Alexander, Esq., Somerhill, Tonbridge, Kent, where he has served in the above capacity for several years. He will be disengaged the 1st day of March, 1843. Address, James Massey, Gardener to James Alexander, Esq., Somerhill, Tonbridge, Kent. No single-handed place need apply.

PATRONISED by all the principal Architects and Builders in this Country and Abroad.—SEYSSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, never cracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet), was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with details of the work may be obtained on application to J. FARRELL, Secretary.

Seyssel Asphalte Company's Depot, Stangate, London. Note.—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

TO LADIES.
ROWLAND'S KALYDOR.—Under the special Patronage of Her Most Gracious Majesty the QUEEN, and the Royal Family.—This elegant and delicate preparation thoroughly eradicates all Pimples, Spots, Redness, Tan, Freckles, and other Defects of the Skin; heals Chilblains, and renders a chapped and rough skin, pleasantly soft and smooth. It imparts a youthful roseate hue to the Complexion, and renders the Arms, Hands, and Neck delicately fair and soft. CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR";—it is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper.—All others are "GROSS IMITATIONS." * * * To protect the Public from Fraud, The Commissioners of Stamps have authorized the following signature to be engraved on the Government Stamp, thus—"A. ROWLAND and SONS, 20, Hatton Garden," which is affixed to each bottle. Price 4s. 6d. and 8s. 6d. per bottle, duty included. Ask for ROWLAND'S KALYDOR. Sold by them, and by Chemists and Perfumers.

HORTICULTURAL SOCIETY OF LONDON.
This Day is published, Price 3s. 6d. to Fellows of the Society, and 5s. to Others.

A CATALOGUE OF THE FRUITS Cultivated in the Garden of the Horticultural Society of London. Third Edition. Sold at the House of the Society, 21, Regent-street; and also by Longman and Co., Paternoster-Row; J. Hatchard, Piccadilly; Ridgway, Piccadilly; Rivingtons, Water-loo-place; and by the principal Booksellers in all parts of the Empire.—N.B. A few Copies of the 2nd Edition may be had at the reduced Price of 1s. 6d. each.

The Gardeners' Chronicle.

SATURDAY, JANUARY 7, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.		
Monday, Jan. 10	Zoological	8 1/2 p.m.
Wednesday, Jan. 11	Medico-Botanical	8 p.m.
Saturday, Jan. 14	Royal Botanic	3 1/2 p.m.
Tuesday, Jan. 17	Horticultural	2 p.m.
	Linnean	8 p.m.
	Floricultural	6 1/2 p.m.
Wednesday, Jan. 18	Geological	8 1/2 p.m.
Friday, Jan. 20	Microscopical	8 p.m.
	Botanical	8 p.m.

WE some time since mentioned Mr. George Crawshaw's late Grapes, produced without fire, at Colney Hatch (1842, p. 608). At the meetings of the Horticultural Society in November and December they were exhibited, and were allowed by all the Grape-growers present to be as good as Black Hamburgs can be, and much better than they often are. We had the good fortune to receive bunches of these Grapes again on the 1st of the present month, and they were still as fresh, as plump, as sweet, and in all respects as excellent, as they were two months before; not shrivelled, not decaying; but firm, covered with bloom, their fruit-stalks green, and in quality all that a Grape can be.

Mr. Crawshaw says, that, to preserve Grapes thus long on the Vines, and in such perfection, nothing more is required than a dry, well-exposed house, and plenty of fresh air. To excess of heat during the spring and summer, particularly during the month of May, when the shoots are tender, and to an insufficiency of air, if the weather is damp or cold during the months of October, November, and December, he attributes the general failure of the late Grape crop. These are important facts for the Grape-grower to bear in mind.

Let us return to the all-important subject of employing the poor in the work of drainage; for every week is adding to the inmates of the Unions.

Draining, whether considered as a means of profit, or as a national benefit, is of the highest interest and of the most urgent necessity. It is in actual evidence that by the mere removal of stagnant water, without further outlay, land which had grown two or two-and-a-half quarters of Wheat per acre, has at once produced three-and-a-half and four quarters. This well-ascertained fact renders all reasoning as to causes superfluous in a practical point of view. The necessity of doing something is, in fact, admitted; the difficulty consists in setting about it. It is plain that if any one takes to drainage independent of his neighbours, the acts of one man, or his inaction, may render other proceedings ineffectual. What we trust will be done is the passing of some general Drainage Act, which shall give consistency and union to one general operation all through the country. Upon this point, Mr. Bailey Denton's views appear to us extremely well worth the consideration of Government, which, we most earnestly hope, will take the initiative in the ensuing session of Parliament.

Let us, however, not be misunderstood: we do not desire a measure which shall compel everybody to drain their fields and gardens, whether they choose to do so or not; all that we wish for—all, indeed, that it would be prudent to propose—is some general enactment, which shall facilitate the effectual drainage of such lands as the owners may desire so to improve. Any proposition to compel drainage would, of course, be met by a direct negative from the landed interest; but we know from experience, that, so long as the operation is wholly dependent on individual exertions, there will be no such progress made in it as the nation will feel. Look, for instance, at Mr. Pusey's Act of 1840, which enables the owners of settled estates to borrow money by way of mortgage to drain their lands. Do any of our readers know a single case in which this very valuable measure has been taken advantage of? We know of none; and from this fact we are compelled to infer that there is wanting some legislative measure which shall induce, not compel, the gradual and complete drainage of our heavy lands. Among the suggestions that have been offered with a view to secure a general system of drainage without encroaching on private rights, that of Mr. Denton seems the most practicable. This gentleman recommends that means should be immediately taken to provide ready and complete outlets for all the waters which now stagnate on the surface, during floods, and in wet seasons; and he is of opinion, that if this were once effected, under-draining of neighbouring lands

would certainly follow; for the effect produced by the one would render obvious the advantage and ease of accomplishing the other.

To do this with the greatest benefit to the country, it would be necessary to clear and improve all the more important of the watercourses which now intersect those valleys where, in consequence of some barrier, or the insufficiency of size in the channel of such streams, the accumulating waters overflow, and, becoming stagnant, sour the adjoining pastures, and destroy the autumn-sown corn. In these valleys where there are no natural watercourses, and where the waters collect on the surface, producing even worse effects, open public drains would have to be made, connecting such valleys with some natural stream. All these watercourses would become so many public mains, and would form over all the country a general network of ready-formed outlets for the use of the cultivators of the lands through which they pass at any time when the price of labour and pecuniary means may induce them to undertake such work. This would be a prodigious advantage, and might be economically obtained. There would then be no cases in which a want of outfall, or the ill-feeling of a neighbour, would stand in the way of draining. It could not happen that one person's land would be deluged by the refuse waters of his neighbours. An enterprising, sensible, market-gardener could not then be inundated by the unwillingness of a man on a different land, who refuses to join in the work of drainage. But in this undulating country such instances must continually occur, if nature, unassisted by art, is to guide descending waters to their natural outlet. Our readers have only to turn to Mr. Chadwick's Sanatory Report, p. 305, (where he relates a case that may be taken as the type of many) to find evidence of these evils. They are however so common, that few will read these remarks without feeling their application to some instances with which they are personally acquainted.

Difficulties like these would cease if the principle, that every landowner, large and small, should have outfall for injurious water, were made the basis of an Act of Parliament. The amount of compulsion involved in such a measure would be merely the authorized entry of scientific officers to direct, and of labourers to construct, the main drains, which, with few exceptions, would be confined to the valleys; those exceptions being along the junction of the out-cropping of particular strata. For instance, in districts where the clay overlies the chalk, a drain along the junction would intercept the water running off the clay, which water would otherwise drop down into the chalk until it reached the subterranean level of the water in that formation; and, *vice versa*, where the alluvium of the valleys outcrops along hill-sides upon porous strata, the springs which exude at the junction would be caught in a receiving drain for *after application*.

The present state of the country bears ample testimony to the necessity of a preliminary public measure for the improvement and preservation of outfalls and watercourses upon the three fundamental principles of drainage laid down by Sir John Rennie in his vindication of the plans of his father, of Smeaton, Telford, Milne, and others in the Middlefen drainage, viz., "The improvement of the outfalls and channels of rivers; the judicious construction of inferior drains for low-land waters; and catch-water drains for high-land waters." When this great engineer used these expressions, he was alluding, indeed, to the great work of fen-drainage, which, as requiring great engineering talent to carry out effectually, has ever been considered as a distinct matter from the drainage of heavy uplands; but we think the present season, and indeed all previous winters, must have convinced the most sceptical that there exists some analogy with the two works; and that with all the under-draining in the world, the valley lands will not become as profitable as they are capable of becoming, so long as the waters of the higher lands may stagnate on the lower lands.

The worst pastures are the lowest lands; and since all evidence goes to prove that there is not an acre of land in this country which has not, or may not, command a ready outfall for its superfluous water, and which consequently is not susceptible of thorough draining, a fresh field for the employment of the poor opens itself to the view of agriculturists.

Let us suppose that by a general measure for the improvement of outfalls the landlords and tenants became united in an earnest wish to make the most of an advantage which would then be readily attainable, and that they set about underdraining in good earnest: the immediate effect would be to convert into arable land all those low, inferior pastures which are now overflowed; the tillage of these would create a large instant demand for labour, and a wide extent of land peculiarly fitted for the growth of Wheat would be gained to the nation. These are points in themselves of no small magnitude. In addition, we may with certainty anticipate that, as, in the case of parish and turnpike roads, employment for some few surplus

hands is found, so would the parish drains, if under skilful management, create a like demand.

We cannot but think that, with such security and assistance as the measure we thus advocate would afford, the landed interest would be aroused into action; companies would be formed to find capital, and to superintend great works of under-draining; and the Unions would be relieved of the present excess of inmates; while the cost to the country would be repaid by the profits on the uses to which the waters thus obtained might be applied, if made the vehicle of carriage for the refuse of towns for irrigation, and as a moving power; thus turning a present evil into a future benefit. To these points we shall again advert.

When, about a twelvemonth ago, we noticed an account by Mr. Potter of his Artificial Guano, we expressed an opinion that it ought to be a very powerful manure, and recommended our readers to try it.

We have now before us some returns which show that our expectations were not unfounded. Mr. Cotton, of Hildersham Hall, near Cambridge, used it for Barley, and obtained 6 quarters per acre; on Grass land the ordinary produce of Hay was doubled. On Orange Mangel Wurzel the result was still more striking: a square yard dressed with common farm-yard manure produced 27 lbs., another, dressed with Potter's Guano, 40 lbs.; the heaviest root of the latter weighed 15 1/2 lbs., others 12 lbs. and 13 lbs. The soil was light, with chalk close to the surface. The following was also the result of an experiment on rich old meadow land, resting on limestone-rock, at Aske, the property of the Earl of Zetland:—

"Five separate plots of land, a quarter of an acre each, were staked out in the same field; adjoining these plots another piece was staked off, containing 150 square yards. They were treated as under:—

	1st plot, 1/4 of an acre, No manure.	2d Do. 10 bushels soot, and 6 stones salt.	3d Do. 40 gallons Am. liquor, & 120 gallons water.	4th Do. 4 stones Guano mixed with fine soil.	5th Do. 12 stones Am. phosphate mixed with do.	6th 150 sq. yards 7 lbs. Potter's Manure mixed with charcoal ashes.

		cwt. qr. lb.	Rate per acre, ton cwt. qr.	Increase, cwt. qr.
No Manure		7 1 1/4	1 9 2	
Soot and Salt		9 1 0	1 17 0	7 2
Ammoniacal Liquor		8 3 0	1 15 0	5 2
Guano		9 2 0	1 18 0	8 2
Am. Phosphate		8 0 0	1 12 0	2 2
Potter's Manure		1 2 0	2 8 0	18 2 1/2

These are very remarkable results. At the rate of weight obtained by Mr. Cotton, 87 tons an acre of Mangel Wurzel were produced, which is more than double the usual maximum. And the quantity of Hay in Lord Zetland's experiment was sufficiently great to show that this substance may be employed on Grass lands with very decided advantage.

ON MANURING WITH GREEN CROPS.—No. IV. (By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 868 of 1842.)

3. *The Vetch* (*Vicia sativa*).—This plant is also sown for green manure, especially in the south-west of Germany. But, considering that this is best accomplished by plants yielding an abundant herbage, it is advisable to select that sort which is a hybrid between the Pea and the Vetch, and which yields a far more abundant herbage than the common Vetch, especially if the land has been manured with gypsum.

If the common Vetch is not sown too late, the Magdeburg acre will yield, on an average, 6500 or 7000 lb.; whilst the hybrid Vetch will yield 8000 lb. and more, herbage and roots taken together.

1000 lb. of green Vetch consist of

750.0	"	water in fluid state.	
4.3	"	nitrogen (contained in the vegetable substance).	
3.4	"	potash.	
0.3	"	soda.	
4.0	"	lime.	
0.8	"	magnesia.	
1.0	"	sulphuric acid.	
3.0	"	phosphoric acid.	
0.5	"	chlorine.	
126.0	"	carbon.	
106.7	"	hydrogen, oxygen, silica, magnesia, alumina, manganese, and oxide of iron.	

1000.0 lb.

If then green Vetches, ploughed in on one acre of land, will weigh 7000 lb., the furrow-slice will obtain about 30 lb. nitrogen, 23 lb. potash, 1 1/2 lb. soda, 28 lb. lime, 5 1/2 lb. magnesia, 7 lb. sulphuric acid, 21 lb. phosphorus, 2 lb. chlorine, and 875 lb. carbon. That this manure is not equal to that of the Lupine is seen at once from the above, and is confirmed by experience.

If Vetches are to yield any considerable quantity of fodder, the soil must be pretty fertile. In the Rhenish Pfalz (where agriculture most flourishes) the farmers sow it for green manure in autumn amongst the stubble of Wheat, Rye, and Spelt, and it is not ploughed in till late in autumn, when bitten by frost, because in this case it decomposes better and quicker. In the following spring Barley is sown, and this green manure is considered equal to a small dressing of dung. The soil of this province consists of a fine humous loam. Before ploughing in, the field is harrowed lengthways, so that the plant may be well buried. It will not be advisable in northern coun-

tries to sow Vetches as a fallow crop, because they require, even in the midst of summer, 10 or 11 weeks' time to come into blossom. If they are sown in the beginning of April, they can be ploughed in by the middle of June, and the land can be followed by a second crop of Vetches, or, still better, of the larger sort of Spurry. The objections to sowing Vetches are, that they often fail; that their roots do not reach deep; that they suffer from wire-worm, and that the seed is expensive. I do not much recommend them, and there are other plants preferable for green manure. At times they are sown with Beans, when a greater mass of herbage will be obtained; the latter, however, require a yet stronger soil than Vetches. Beans, however, have this advantage, that their roots reach 6 or 7 inches deeper, and they thus loosen heavy land better. The seed of Beans, however, is still dearer.

4. *Buck Wheat*.—Buck Wheat has been often praised as a superior plant for green manure, but I have much reason to doubt it. In the first place, its success is too precarious; it yields little herbage, and that is very watery. If it succeeds well, one Magdeburg acre of land will yield on an average 4800 or 5000lb. green herbage and roots. 1000lb. green consist of

820.0lb. of water.	
2.0 "	nitrogen (contained in the substance of [the plant].)
1.5 "	potassa.
0.5 "	soda.
1.5 "	lime.
2.0 "	magnesia.
0.5 "	sulphuric acid.
0.7 "	phosphoric acid.
0.3 "	chlorine.
100.0 "	carbon.
71.0 "	hydrogen, oxygen, silica, alumina, man- ganese, and iron.

1000lb.

If, then, an acre yields 5,000 lbs., the furrow-slice will receive 10 lbs. nitrogen, $7\frac{1}{2}$ lbs. potass, $7\frac{1}{2}$ lbs. lime, 10 lbs. magnesia, $2\frac{1}{2}$ lbs. sulphuric acid, 4 lbs. phosphoric acid, and 500 lbs. carbon, &c., which small quantities cannot produce any great result. Whenever I have used Buck Wheat for green manure, I have always returned to my former resolution, not to do so again, the result being constantly very trifling. Spurry is at any rate to be preferred, for the seed is less expensive, and its roots penetrate quite as deep into the ground. In heath-soil, however, Buck Wheat will succeed better than Spurry. I have often found by experiment that manuring it with gypsum will not improve the former, because it obtains the small amount of sulphuric acid required for its chemical constitution from rain-water. It generally requires only the atmosphere for its growth, and can support a great deal of heat and drought; on the other hand, it is more susceptible of wet and cold than most other cultivated plants. It never suffers from wire-worm or caterpillar; in short, it is a plant which, notwithstanding its disadvantages, has also some good qualities. If it grows luxuriantly, it will destroy all Couch-grass, and generally clean the land well; but if weak, the land will become so foul, as even to injure the subsequent crop. The latter must on no account be forgotten, if Buck Wheat is used as green manure; and if its failure seems certain, it should be at once ploughed in. This is, in fact, a rule which ought to be observed with regard to all plants grown for green manure. Nitrogen, potass, and magnesia, seem to be the most important agents in growing Buck Wheat. If it is manured with any nitrate, it vegetates most luxuriantly, which proves that, notwithstanding its broad leaves, it does not receive much nitrogen from the air.

In the middle and south of Germany it is sown in autumn in Corn stubble, and ploughed in after having attained $1\frac{1}{2}$ to 2 feet in length. In the north, however, this is impossible. It only acts during one season, which is explained by the small quantity of its chemical constituents. As it branches a good deal, it need not be sown thick; 55 to 60 lbs. of seed per Magdeburg acre will suffice. Before it is ploughed in, it must be harrowed over, and a few days afterwards the crop can be sown.

(To be continued.)

CULTURE OF CELERY IN BEDS, AND THE ROTATION OF CROPS.

In an extract from *Hovey's Magazine of Horticulture*, and also in the notice of the garden at Putteridgebury, allusion has been made to the cultivation of Celery in beds. As my system of growing that vegetable in beds differs a little from that generally practised, in so far as I make the beds available for various purposes prior to planting the Celery, it may not be without interest to some of your readers if I give a short detail of it.

In the autumn, after the crops are cleared, the ground which is intended for Celery the following season is marked out in beds, 4 ft. wide, running from north to south, and the mould in every alternate bed is excavated to the depth of 14 inches, being placed so as to form a ridge between the beds. This ridge is then planted with Endive or Winter Lettuce, which may be considered the first crop. During the winter, as the leaves and weeds are cleared from the pleasure-ground and garden, they are wheeled into the trenches to the depth of, when pretty solid, one foot; and are occasionally turned so as to get the various ingredients equally commingled. In February the leaves in each trench are collected into two or three heaps, and sufficient hot dung is added to each to excite by gradual admixture fermentation in the whole mass. This, after it has attained a proper heat, is levelled equally over the bed; and, if the heat is not too violent, is covered 4 inches thick with mould from the sides of the ridges,

which mould is afterwards protected with 5 or 6 inches of Fern or dry litter.

At the time the fermentation of the leaves and dung commences, a sufficient quantity of Ash-leaved Kidney Potatoes to plant the beds are placed on the floor of a forcing-house, and covered to the depth of 1 inch with leaf-mould, or any other light soil; or where there is not the convenience of a forcing-house, a slight hotbed must be made up for the purpose of starting the Potatoes. About the middle of March, all things being favourable, the Potatoes may be planted in rows, 1 foot apart and 3 inches deep, in the soil before alluded to; making choice of the crown of the Potato only, and reserving the lower parts to plant in a bed by themselves, or in the natural ground; for it is a fact worth knowing, that in Potatoes planted on the same day there will be a fortnight's difference in favour of the crown over sets taken from any other part of the Potato, by the time the produce will be ready for table. After the planting is finished, it is necessary to rake the surface of the beds smooth and fine, to prevent as far as possible the heated air confined between the interstices of the soil from escaping, and to prepare the ground for a crop of Radishes.

When the Radishes are sown, the Fern or litter may be returned to the bed, and need not be removed again until the Radishes are up; after which, it must be removed in a morning and returned in the evening, until the Potatoes are so high as to require some more effective protection. For this purpose, common sheep-hurdles covered with straw or reed, and made to rest on the ridges on each side, are an excellent covering; but where these are not available, the less effective, though more expensive, method of hoops and mats may be resorted to. The Potatoes will require little or no earthing up, and will be ready for table in April and May. If the sets throw up more than three stems, it will be well to reduce them to that number, as there is no advantage in having more leaves than can be properly exposed to the light.

These form the second and third crops. In the end of February a row of Knight's Dwarf Marrow Peas may be sown along the centre of each ridge; and if the Endive is removed to a house or frame to blanch, a row of autumn-sown Lettuce may be planted on each side of the Peas, which will form the fourth and fifth crops. In June, after the Potatoes are used, the beds must be dug over, the soil being thoroughly mixed with the dung; they will then be ready for the sixth and last crop, which will be the Celery. If Celery of superior quality and unusual dimensions is desired, it will be best to replace the soil that the Potatoes were grown in by a layer of compost, six inches thick, consisting of good mellow loam and peat-earth. This must be mixed in equal quantities with the leaf-mould; and it would be advisable before planting to give the whole a thorough soaking of ammoniacal liquor, or some other rich liquid manure. A mixture of vegetable matter of this kind, in a half-decomposed state, I have invariably found superior to the best spit dung for growing Celery: it is not superior in flavour only, but also in size and texture. For my first crop of Celery to be ready for table in August, I sow in shallow pans or boxes about the middle of February, and place the pans in heat until the plants are half-an-inch high; I then remove them to a moderately warm frame, to harden. They are pricked out on a gentle hotbed, in leaf-mould, at about three inches apart, in April.—*Judea*.

TRELLIS FOR CLIMBERS.

AMATEURS' GARDEN, No. I.

In commencing this part of the *Gardeners' Chronicle* for the ensuing year, I shall endeavour to the utmost to render it as instructive and interesting as possible. For this purpose, in the kitchen-garden department, I shall give directions for sowing just such a number of crops of each vegetable, as will be indispensable to the regular supply of a small family; the flower-garden and greenhouse I shall endeavour to make gay at all seasons; the management of what are designated florists' flowers will

be occasionally noticed; and the exposition of the principles upon which the practice of gardening is founded will not be lost sight of. The province of the Amateur ought to be to cultivate selections rather than collections of plants; for, as a small garden, well managed, affords more pleasure than a large one half cultivated, so is a small collection of plants, properly treated, calculated to give more satisfaction than an extensive assortment of mere botanical curiosities. I shall, therefore, as I proceed, point out such new or old, but comparatively neglected plants, as I consider adapted to answer the purposes of the Amateur.

From present appearances it is likely that we shall be visited by some rather severe weather; and as the late mild season has induced many tender plants in the open air to grow with nearly the vigour of spring, some slight protection will be indispensably necessary. Many plants, such as Noisette, Tea-scented China, and the more tender of the Hybrid China and Bourbon Roses, are pushing even at the lowermost buds; therefore a slight frost on the young shoots, if they are unprotected, will be sufficient to do them irreparable injury. It is not cold that plants suffer from, so much as sudden changes in temperature; for it is well known that a plant will brave considerable cold on a northern exposure, while a similar one on a warm south border, if not protected from the sun, will be killed. Hence the utility of the plan recommended by Mr. Rivers, viz., to take up tender Roses, place them under a northern wall, and protect them with a mat in frosty weather; but as plants—for the first two or three years at least, until a considerable quantity of fibrous roots are formed—sustain a severe check by this treatment, it will be found better to tie the shoots loosely together, cover them thinly with dry fern or straw, and then to envelop the whole in a water-proof covering of some kind, such as calico saturated with oil, and a very small proportion of white-lead, or even with oiled paper. This covering must not be permanent, but merely put on in case of frost; and the fern or straw should be sufficiently loose to admit of a current of air passing through it; the object being not to protect a plant, but to retard its growth.

If the outer walls of pits or frames containing half-hardy plants are not already rendered frost-proof, place dry straw or waste hay round them, to the thickness of one foot, and thatch it securely with straight straw; which, by throwing the wet off, will be found a much better protection than fermenting materials.

Greenhouses containing flowering plants of Camélias, Epacris, Cinerarias, Heaths, &c., should not be allowed to fall much below 40° in temperature. Flowering plants require rather more water than those in a dormant state, especially when fire heat is used; but be cautious, and if you err, let it be on the side of moderation.

W. P. Ayres.

HOME CORRESPONDENCE.

Disinfection.—I am glad to observe that you have taken up that most important subject, the sanitary condition of the labouring population. Few inquiries are more worthy of consideration, as it strikes at once at the root of disease, misery, and vice. My attention has been strongly drawn to this subject, in consequence of some investigations recently made by order of that enlightened sovereign, the King of Prussia; and my inquiries have led me to conclusions very similar to some of those you have advanced. I shall say nothing of the effect of miasms and putrid vapours on health, for I conceive that every one must be alive to them, although not aware how much evil they produce. The question now is, not as to the effects thus produced, but as to the best method of remedying them. Houses, streets, and whole towns, are rendered unwholesome from the want of attention to cleanliness. Refuse of all kinds is left to putrefy in the vicinity of dwellings, or within their walls; and in populous places, where buildings are crowded together, it is frequently found that no means are taken to prevent those evils which are sure to arise when human beings live in an atmosphere loaded with putrid exhalations; probably the most effectual remedy for this is a thorough system of drainage; but then what is to become of the matters thus removed? Complete drains may be made to ensure the immediate removal of putrefying matters, from the places where their presence might do injury, into rivers or the sea; or proper receptacles might be formed to receive these matters, and some of the disinfecting processes, which the discoveries of chemists have brought to light, might be adopted to destroy putrid effluvia, and thus prevent all evil effects. The latter must be allowed to be preferable. The value of the manure annually lost by drainage is enormous; our sewers carry away matters which would fertilise thousands of acres, the whole of which might be saved at a comparatively small expense. No doubt there is a great difficulty to overcome in the prejudice which exists against the use of faecal manure, but it must in time give way before the necessity of employing it, or some costly substitute. In disinfecting refuse animal matter there are three points to be attended to—first, to destroy the offensive smell; secondly, to preserve the volatile products of decomposition; and lastly, to render it portable if to be used at a distance. It is of the first importance that the process adopted to destroy smell shall not at the same time cause the loss of those substances which constitute the chief value of manure. Chlorine, the most powerful known disinfecting agent, might be prepared at a very small cost; it would not in any way injure the manure, and it would effectually destroy putrid vapours. Other cheap substances might also be employed with advantage; but it is at present unnecessary to examine which is the best method of converting refuse matters into ma-

nure, my object is merely to assist in drawing attention to this most important subject.—*Edward Solly, jun., 38, Bedford Row.*

To destroy Worms.—Your correspondent "R. S. V. P.," in last week's *Chronicle*, says he has found lime-water of little or no value in destroying worm-casts in lawns. All I can say is, that about a fortnight since I tried it, as recommended in the *Chronicle*, by putting quick-lime into a barrel with water, and allowing it to stand a day before using it; and it appears to have effectually removed the worm-casts.—*J. R. W.*

Spirits of Tar.—"A Rosshire Gardener" has in a late Number added his testimony to the utility of spirits of tar, in preserving Carrots from wire-worm. Although an old practitioner, I have never until within the last two years had any complaint to make against the wire-worm, so far as Carrots are concerned. However, another natural enemy, by name *Scolopendra electrica*, as well as several under the generic denomination of *Julus* or ring-worm, often create great devastation amongst the Carrot-crops; these are formidable enemies to contend with in addition to the *Elatér obscurus*, or wire-worm. Your Rosshire friend may, however, rest assured that spirits of tar will keep them at defiance; but I would advise him, as these pests will in all probability take shelter at a great depth under the surface of the ground, to give a good dressing to his Carrot-beds in autumn, by digging in the spirits of tar; and also to give a repetition of the dose in spring, as he purposes. He says he has made use of it more than once; may I ask him how long he has practised this remedy? I would not have alluded to this had I not found spirits of tar a useful remedy in more ways than one in the Horticultural world; but I have no pecuniary or selfish interest in the matter. Spirit of tar is so offensive to insects, that they avoid it as much as possible; consequently, if buried in the ground in autumn, they retreat to the surface, where they are either killed by the frost, or eaten up by their natural enemies. If applied only in spring and near the surface, they commit their depredations underground, as the roots of the Carrot descend; whereas, if applied in autumn, and committed to the ground with the manure, it drives them to the surface, when they either die of want, or are eaten up by the birds, &c. Many persons may perhaps think that spirits of tar are of a volatile nature, like ether, ammonia, and others of the same class, and that they will, if applied in autumn, lose their volatile parts ere spring brings forth the tap-rooted Carrot to be destroyed. I should have thought so too, had I not of late been taught differently. A neighbour of mine craved my assistance in ascertaining the cause of failure in a field of Turnips, containing 24 acres, which upon examination I found to be infested with wire-worm in great numbers. I told my friend that the season for applying spirits of tar was passed, as the plants were six inches high; but he was anxious to try my nostrum. I therefore procured a sufficient quantity, and we set to work. During the process of preparing the sand and spirits of tar, a small quantity of the latter was spilt upon my coat; the consequence is, that up to this date, if I appear in public with that coat on, I am avoided, because I smell of something offensive. If man, therefore, shuns me for having only a small patch of my coat besmeared with spirits of tar, and which, after a period of six months smells as disagreeable as ever, what must insects experience when this is brought in contact with them? Amongst the uses to which I would direct your numerous readers to apply this simple remedy are the following—I do not, however, pledge myself that I am in each case quite correct:—1st. Mixing it with the soil as a security against all underground enemies.—2d. Sowing it, when mixed with sand, with Peas and Beans in autumn, to secure them from mice; and also in spring and summer in situations where pheasants, rooks, or jackdaws attack them.—3d. Sowing it on the surface where any of the Brassica tribe is sown, as these are frequently devoured by birds.—4th. Saturating shreds used in nailing wall-trees.—5th. Pouring a table-spoonful of it into the burrows of rats, mice, and moles; also in the entrance to wasp-nests.—6th. Painting very slightly the branches of Apple-trees infested with American blight; also various species of *Doccus* or scaly insect. This operation must be performed during winter, as it would be fatal to the foliage; it might be as well to reduce the strength of the spirits, by mixing them with sand.—7th. Saturating pieces of sponge or woollen-rags with them, and placing them in barns amongst grain, and in seed-rooms amongst seeds. Hanging them amongst the branches of trees and plants infested with aphides; also near fine fruit when ripe, such as Peaches, Figs, &c., &c.—8th. Slightly painting the stems of fruit-trees in autumn, as a preventive against hares and rabbits.—9th. Sprinkling on gravel-walks subject to worm-casts.—10th. Sowing on the surface of the ground with Turnips, as a preventive against the fly.—11th. Washing walls against which fruit-trees have been growing, when they have been injured by insects.—12. Steeping nets in, used for a fence against hares and rabbits. Spirits of tar have also been applied by medical men as a remedy in inveterate cases of ring-worm in the human head, when the ordinary means have proved unavailing.—*C. McIn.*

To destroy Mice.—Fry a sheet of brown paper (the coarser the better) in any grease; this the mice will eat, and it will destroy them. This is safer, cheaper, and easier than any trap.—*Senex.*

Experiments with Guano.—Having read and heard so much of "Guano" as a manure, I was last spring induced to make trial of it, and I have found it in many instances answer remarkably well, as the following testimonies will shew. J. Lowe, Esq., of Brent, tried Guano last year, [and had a large crop of Barley and

Oats. He also sowed Clover with the Barley, which is likewise looking well. This proves it to be a lasting manure, and not like nitrate of soda, only visible just after the first application. Mr. C. Spear, Colebrook Farm, near Plymouth, states, that he applied Guano mixed with earth, and drilled it in with the seeds of Swedish Turnips; but having used it too strong, a great part of the seed was killed; but those which came up were of immense size, and were on the 10th of December very green, when compared with the other part of the field, (manured with Bone-dust) and as heavy per acre. He is, therefore, perfectly satisfied with its superior fertilizing qualities. This gentleman fell into the same error as many other of my friends, some of whom drilled in the clean Guano with the seed; consequently, it was so powerful, that as soon as the seed burst, the vegetative powers were destroyed. We find the best way of applying it is to mix 4 lbs. of Guano with a bushel of ashes or earth. Mr. Shepherd, of Sutton, South Milton, says: "I sowed 100 lbs. of Guano, on a piece of land for Turnips, in a direct line through the middle of the field, and manured the other part of the field with the best rotten dung I could procure; but the difference in the appearance of the crops was so great, that the country people at large could not help making remarks about it. The part that was manured with the Guano could be seen at a great distance." Mr. T. Moore, Kingsbridge, sowed 50 lbs. on 40 yds. of Grass-land; the remainder of the field was dressed with good rotten compost; but that sown with Guano was by far the best, and the cattle liked the herbage much better. It is now as green as the finest meadow. Mr. W. Moore, Kingsbridge, sowed a small quantity on a lawn for trial; the part sown with the Guano was covered with moss, and looked very badly. Before the other parts, that were not manured, required cutting, this portion of the lawn was obliged to be cut twice; the moss was quite killed, and the herbage looked very fine." These are facts from highly respectable men, who are well known in the South of Devon. I have found it useful as a liquid manure, by mixing 4 lbs. in about 8 gallons of water.—*W. E. Rendle, Plymouth.*

Experiments with Manures.—The following is an account of three experiments made on the growth of Swedes, with different manures:—

Pre-paring Crop.	Character and quality of Manures per acre.	Cost of Manures per acre.	Time Sowing.	How often sown, and what quantity of seed.	How often sown, and what quantity of seed.	When Pulled.	Ground Sown.	Weight per acre after being topped and tailed.	Cost of Manure per ton of net produce.	Remarks.
Oats.	32 bushels of Bones.	Bones at 25s. per quarter. £4 12 0	May.	Once, 2½ lbs. per acre.	Once, 2½ lbs. per acre.	From the 10th to the 16th Nov.	0 0 39 15 17 2 9	2s. 1d.	Guano compost, laid in rows, covered with the plough, and seed drilled in upon it.	
Wheat.	20 tons stable-dung per ton. £5 0 0		May.	Once, 2½ lbs. per acre. Some of the rows deficient, and made up from plants on the guano piece.	Once, 2½ lbs. per acre.	From the 10th to the 16th Nov.	0 3 20 16 18 1 1	2s. 1d.		
Wheat.	2 cwt. 2 0 23 lbs. Guano. 2 0 23 Mould. 1 0 11 Charcoal.	Guano, at 14s. per cwt. £2 10 0 Charcoal, at 10s. per cwt. £2 0 0 Pounding, &c. £0 5 0 £1 15 10	May.	Once, 2½ lbs. per acre.	Once, 2½ lbs. per acre.	From the 10th to the 16th Nov.	0 3 20 16 18 1 1	2s. 1d.		

—*Hortulanus, Wrexham, Somerset.*

Food of Plants.—A fortnight since we published a short account of a discovery by Messrs. Wiegmann and

Polsdorff, that the roots of plants emit carbonic acid, and that this agent has the power of decomposing siliceous substances. Our correspondent, Mr. Murray, has written to claim the originality of this. He says that he made the discovery in 1818, having proved the fact experimentally by growing in distilled water the bulbs of Hyacinths, Persian Iris, &c.; that he communicated the circumstance to Mr. Edward Rudge, and announced the discovery in his lectures at the Surrey Institution in that year. He adds, that he then published the details in the Transactions of the Wernerian Society, as well as in two distinct works of his own, several years ago; and before the Natural History Section of the British Association at Edinburgh, in 1834, Dr. Graham in the chair, he publicly announced the circumstance, in reference to some remarks made by Dr. Daubeny. He moreover alleges, that nearly 20 years ago, Dr. Wiegmann, in the German Journals of Science, ridiculed and impugned his announcement of the fact he now announces as his own discovery. In conclusion, Mr. Murray says, "I am possessed of a very remarkable specimen proving that the carbonic acid gas secreted by the roots of the Lichen does decompose the silicated alkali of glass. It is a piece of old glass from a window at St. Cross, near Winchester. When put into my hands, it was beautifully mantled with a brilliant Lichen; which being removed, discovered the surface of the glass beneath, corroded and completely grooved or wormed." While we are quite ready to assist Mr. Murray in claiming what he regards as his own, we must be permitted to add, that he seems to have rather misunderstood the object of Wiegmann and Polsdorff's paper. They do not seem to lay much stress upon the secretion of carbonic acid by roots; it is to the decomposition of silicates by this agent that their experiments are principally directed; and we do not gather from Mr. Murray that he has published anything on that subject, until now, when he mentions the highly curious and interesting fact of glass being corroded by a Lichen.

Rust on Grapes.—I certainly do not wish to encourage any Gardener, while thinning his Grapes, to handle them, however clean his hands may be, or to rub them with his head, however dry his hair may be; but I cannot allow that his doing either or both would produce what is called Rust. Grapes may be thinned, either by handling the end berry only, which may be afterwards cut off, or by means of a small deal stick, not larger than a crow's quill; this will render it almost unnecessary to touch the berries at all with the fingers. I quite agree with Mr. Bromley, p. 853, as to the cause of the disease and its cure; but I do not see why in explaining his method of eradicating it, he should mix up his mode of pruning the Vines, which even if 50 years old and trained on the spur system, can be easily cured of Thrip. Such a statement is liable to mislead others, and induce them to think that the old stems of Vines cannot be cleaned.—*G. C. Colney.*

Preserving Fruit.—Observing in one of your late numbers a paragraph on preserving fruit, I beg to state, that gooseberries, currants, cherries, &c. may be successfully preserved in the following manner: Procure as many clean, dry wide-mouthed bottles as will be required, and fill them with the gooseberries or cherries, the stalks of which have been previously removed; currants should be held by the stalk over the mouth of the bottle, and the berries should be cut off singly with sharp scissors, as the less they are handled the better. The fruit must of course be perfectly dry before being put into the bottles, which should be well corked, and covered with rosin to prevent the air from getting in. A dry corner of the garden should be selected, where they should be buried with their necks undermost, two or three feet below the surface. The earth should be well packed round them, taking care however that the bottles are not broken. Those who have no garden may bury them in a dry cellar. In this manner, green as well as ripe fruit may be preserved for a length of time.—*Geo. M. J.*

Transplanting Fruit-trees.—Your correspondent "Totty," at page 809, requests information for transplanting large Walnut-trees. The following is the system which I have adopted with success in removing large fruit-trees:—Having in the autumn of 1840 determined on removing a row of large standard Apple and Pear-trees, I commenced by reducing the heads of the Apple-trees considerably; I then opened around each tree, at 2 feet 6 inches distance from the stem, a trench 2 feet wide, and deep enough to cut through the surface-roots; these trenches were then filled with leaves and left for the present. The Pears, which were handsome standards of the same size as the Apples, and from 14 to 16 feet high, with stems 8 feet high and 5 inches in diameter, were headed down to within 18 inches of the top of the stem, and were trenched round in the same manner as the Apples. About the beginning of March in the ensuing spring they were crown-grafted, and grew rapidly; some of the weaker sorts, such as the Marie Louise, inclined downwards; the others were tied down, to make them assume a pendent habit, and to induce them to become fruitful. In the following winter, 1841, after holes, 6 feet in diameter and 2 feet deep, had been prepared for their reception, with the top spit turned in with the turf downwards, thus leaving the holes only a foot deep, and after the balls had been sufficiently frozen to insure their being lifted with safety, the trees were removed to their new situation with from 14 to 16 hundred weight of earth about their roots. They all succeeded admirably, and some of the Apples bore fruit. This season the Pears have formed fruit-buds throughout the whole length of the preceding year's wood, and promise well for an abundant crop next season. I have never removed large Walnut-trees; but I have no doubt that if the above plan be pursued, they will succeed quite as well as Apples or

Pears.—*M. Busby, Gardener to S. Ricardo, Esq., Tit-ness Park.*

Elæagnus reflexa, a new hardy Evergreen.—I possess a shrub from Japan, which MM. Decaisne and Morren have named *Elæagnus reflexa*, and characterize as follows. "E. foliis oblongis acuminatis coriaceis supra glaberrimis subtus lepidoto-ferrugineis, perianthii segmentis subrectis." It is well deserving of cultivation, since, of all the species which have proved hardy in this climate, (of London,) it is the only evergreen. The large and elegant shaped leaves (4 inches long by 1½ broad, average size) with the upper surface of a dark shining green, contrasting beautifully with the bright silvery scales of the under side, would alone secure it a distinguished place amongst the hardy evergreens belonging to other genera. But this shrub recommends itself besides, by its ample panicles of small yellow flowers diffusing around the fragrance of the Violet and Pink combined. It was introduced into the Jardin du Roi, at Paris, in 1834, from the Botanic Garden of the University of Ghent. At the first of these places I have known it to flower freely 12 ft. high, in a bed of heath soil, exposition N. E. In my garden in Suffolk, it grows vigorously in a mixture of loam and heath mould, and would probably succeed in any open soil.—C. W. [We are unacquainted with this plant. No such name is to be found in books, nor does the plant occur in that part of Siebold and Zuccarinis' Flora Japonica which has reached us. The leaves resemble those of E. conferta. Can you let us have a plant?]

Tree Guards.—Of the various contrivances for protecting newly-planted trees from being barked, or otherwise injured by horses or cattle, &c., perhaps there are none so simple, and at the same time so perfectly effectual, as the one invented some years ago by C. Lawrence, Esq., of Cirencester, of which a sketch and description are given in the "Gardener's Magazine," vol. xiii, p. 166. As many of your readers, however, may not possess that work, I will transcribe Mr. Lawrence's account of his invention, as I believe its merits are such as to render it deserving of being better known. I have had ample proof within the last five years of its utility, and am therefore enabled to recommend it as one of the best protectors of young trees that can possibly be employed. Besides its cheapness and durability, which are not the least of its recommendations, it has altogether a much neater appearance than those which are so frequently seen fixed around trees near a gentleman's residence, and which in too many instances only disfigure and render unsightly the trees that were planted for ornament. From the following description and sketch, any labourer may soon understand the way of constructing the tree-guards, that have led to these remarks. Procure stakes of Ash, or Larch, on thinning young plantations, or cutting down coppices, 6 feet in length, or more if requisite, and about two inches in diameter; and bore holes through the tops and bottoms, about one foot from each end. Get a similar hole drilled up the centre of a stake, and saw it off in lengths of two inches, or rather less; pass a strong wire or thick tarred string through one stake, by the holes, at the top and at the bottom; then pass it through the hole made in one of the two-inch pieces at each end, and then through another stake; separating each stake at top and bottom by a piece of wood, until you have enough to surround the tree loosely, leaving plenty of space for growth. Place it round the tree, and fasten the ends of the wire or string. This guard is much the same as the

cradle put round the neck of a blistered horse, to prevent his gnawing the irritated part. The stakes merely rest on the ground, and should be cut quite flat at the bottom, to prevent their sticking into the ground. At the upper end they should have a sharp slanting cut with a bill-hook, and threaded with the slope towards the tree. The motion of the tree will not in any degree be impeded; and the bark cannot be injured, let the wind blow as it may, for the guard moves freely with the tree in every direction. *a* represents the tree; *b* the small stakes which form the cradle; *c* the pieces which are placed between the stakes at top and bottom.—M. E. H. [Although this method of protecting trees differs but slightly from that recommended by Mr. Bowers, at p. 365, of the *Chronicle* for 1841, we have, nevertheless, inserted it, as the accompanying drawing will render it more intelligible.]

Cerulean Willow.—In the climate of England, few trees grow with equal rapidity to the Cerulean Willow, which is supposed to be a variety of *Salix alba*. Some of these trees were planted eighteen years ago, on the New Walk, by the side of the River Ouse, at York. Their

tops have twice been cut to prevent them from being blown over by high winds, attended by the flooding of the river. Several of these trees exceed five feet in circumference, at five feet from the ground; one of them is five feet six inches, and contains thirty-four cubic feet of timber.—J. B.

Mildness of the Season.—From the garden at Orwell Hall, Suffolk, the following flowers were gathered on the 1st of January, 1843. *Salvia fulgens*, *Verbena Thompsonia*, *V. Tweediana*, *V. Aubletia*, *V. Sabina*, *Fuchsia globosa major*, *F. Virgata*, *Tropæolum peregrinum*, *Oxalis versicolor*, *Cineraria cruenta*, *Senecio elegans*, *Pentstemon gentianoides*, *Phlox Drummondii*, *Erysimum Perofskianum*, *Silene pendula*, *Lupinus luteus*, *Antirrhinum majus*, *A. caryophyllum*, *Saponaria ocymoides*, *Chimonanthus fragrans*, *Mignonette*, purple and white Stocks, Ten-week Stocks, Russian Violets, Wall-flowers, *Pelargoniums*, and *China Roses*.—A. C.

Martagon.—This inquiry has been left at p. 790 of your *Chronicle*, by yourself and your intelligent correspondent, with the question "Why was the Philosopher's Stone called Martagon?" In the absence of more positive information, I venture to offer the following conjecture:—It seems that with our older gardeners and botanists, Martagon was the generic name of a group of liliaceous plants, one of which in particular was called by Lobel and others, *Lilium chemicarum* or *chemistarum*, and Martagon because of the golden hue of its bulb. This appearance, when the wits of all the world were turned toward the acquisition of the "great secret," naturally suggested the association with the object of every man's desire. Gardeners were always full of the "conceits" of nomenclature, and are so still, as evinced by our Golden-drops, Pheasant's Eyes, Bishop's Thumbs, Flemish Beauties, Lady's Fingers, Délices des Dames, Œil de Jour, Glout Morceau, Cuisse-Mesdames, &c., &c.—an innocent indulgence of the poetic fancy, from which men of graver sciences are not always exempt. Not having it in my power to refer to the systematic writers on Alchemy, I looked into Ben Jonson's well-known drama, thinking that so grandiloquent a word would certainly find a place in the jargon he puts into the mouth of his pretended adept; but I do not find it there. Unless, therefore, it can be shown to come directly from the Arabic, I think that Martagon must be one of the mystifications of Paracelsus, the inventor of much of the jargon of the alchemy of the 15th century, or of some other fanatic of that time. It seems not unlikely that the above-mentioned worthy coined it out of Magisterium or Magisterion, the real unadulterated red-precipitate-philosopher's-stone powder. Or, it may have been used as a convenient contraction of Magisterion; and if any of your readers find it difficult to trace the similitude, I recommend to their notice, to help their vision, the following exemplary case of our excellent friend Jonathan Oldbuck:—"I am clear we should read Salmon-length for Shalthmont's-length; Shalthmont, Salmont. You see the close alliance of the sounds; dropping out two h's and a t, and assuming an l, makes the whole difference."—P. P. [We have taken the trouble to look through the old folios of Paracelsus, and the collection of alchemical books formed by Salmon, without finding anywhere this word Martagon. We are, however, reminded by them that iron was called by the alchemists Mars, and it is not impossible that the word Martagon may come from ago, to act on anything, and that it may really refer to the hoped-for power of the Philosopher's Stone in acting upon iron so as to change it into gold.]

Shakspeare's "Pale Primroses."—Your Correspondents "Florizel" and a "Foreigner" have been, perhaps, more successful in pointing out the distinction between the Poet and the Physiologist than in explaining the passage in question. The very general and remote resemblance which may be fancied between a young damsel and the pale Primrose seems quite insufficient to demand the specific words, "A malady most incident to maids." The matter is, however, not worth pursuing, or at all events had better wait for some new light. Your Correspondents, as is now the fashion, reject with indignation the idea that Shakspeare could possibly step beyond the proper boundaries of his own art. This is an excess of idolatry, which must be injurious rather than otherwise to Shakspeare's fame, and will, eventually, cure itself. Shakspeare's reputation can well afford to concede quite as much fallibility as can be fairly urged against it; and probably his most vulnerable place will be found in an occasional tendency to a minuteness, more than is consistent with true poetry, though it may not always be good physiology. One instance at this moment occurs to me, though I cannot refer to it with precision. He talks somewhere of the "gnarled and unwedgeable oak." Now, though gnarledness is an allowable poetical character, unwedgeableness is, I think, quite the reverse; because it is a quality not discoverable by any inspection of the Oak in the landscape, and becomes evident only to him who follows the tree to the faggot-shed, and watches its conversion into logs of fire-wood.—M.

Bees.—Having some pretensions to a knowledge of the management of bees, I will endeavour to solve the difficulties of your fair correspondent, who writes at p. 837 of your last volume. Her first complaint that her bees made but little honey in the summer of 1841 is an unreasonable one; since in consequence of the unfavourable season it was quite impossible for bees to make much honey. There was no great error, I imagine, in not feeding them during the autumn, as they probably made enough honey for their own sustenance. Upon this point I would remark, that when bees require to be fed, it ought to be done at once, at the rate of 2lbs. or 3lbs. per day for a week or ten days together in fine weather, during the month of October; after which, they should not be dis-

turbed, as unnecessary interference with them always does mischief. The bees will increase in weight according as they are fed. 1lb. of honey or good sugar mixed with 1lb. of boiling water will answer well. It is a mistake to suppose that bees in boxes always die in winter from cold, especially when constructed as Nutt's and Taylor's are. That your correspondent erred in wrapping hers up in mats is pretty evident, from the bees having in December been as strong and brisk as they would have been in June. It is desirable, for obvious reasons, to have the inmates of a bee-hive torpid rather than brisk in December. Instead of stopping the mouth of the hive with a piece of perforated zinc when the frost begins, I prefer darkening the front with a piece of board, so placed, as entirely to exclude the sun-beams, or even the rays of light. The sad condition of her bees in January appears to have arisen from too much anxiety to secure their comfort. The bees were thus (artificially it may be said), rendered so brisk in January, that it was most proper to feed them if they required it; but, probably, that would not have been necessary, had no extraordinary efforts been made to prevent their torpidity (the natural state in this climate) in winter. The high temperature of the hive complained of might have been prevented by giving air to the side-boxes, and by removing and cleaning the tubes daily. There is no reason for believing that clustering about the foot-board always precedes swarming. The bees of your correspondent finding themselves uncomfortable from the high temperature of the hive, and their crowded condition, naturally took a sudden and unceremonious leave of their kind and over-anxious patroness. I have only to add further, that if "a Despairing Beekeeper" will make another attempt, and attend to the hints I have given for her guidance, she will not find her bees ungrateful. In conclusion, I beg to mention that from a box constructed on Nutt's plan, I last year obtained two side-boxes, and two glasses of honey; one of the boxes weighed 46½lbs. net; the other 35lbs.; and the two glasses 10lbs.; total, 91½lbs.; which was allowed to be equal to any that Italy ever produced. For the former I received an honorary medal from the Exeter Horticultural Society. If your correspondent wishes to have a glass filled with honey, she may easily accomplish that object by cutting a hole two or three inches in circumference in the top of a common straw-hive, and by placing over it a glass in April; in that way I took one this year which weighed 13½ lbs., and got a fine swarm also.—C. S., Beacon House.

Gold and Silver Fish.—I beg to inform a Correspondent that the following plan of preserving Gold and Silver Fish has been pursued with success. Two years ago, I lost all my Gold Fish, which were Dutch, although I was very particular in breaking the ice every day around the basin. I afterwards procured a quantity from Montrose, where they are bred in the reservoirs attached as condensers to the large engine of the Flax Mills; and instead of breaking the ice all round, I broke three small holes about 9 inches in diameter, which were covered with old bee-hives or boxes to keep them from freezing up. As soon as the ice was sufficiently firm, I baled out the water through these apertures until a large bubble of air appeared beneath the ice; continuing to do so until I had in fact formed a frozen shutter, which covered the pond and preserved the fish in good health. The bottom of mine is formed of mud, originally puddled with clay and cow-dung; it is 4ft. 6in. deep, with a cemented rim 2ft. wide, and 18in. deep. Its diameter is 18ft., with a small fountain in the centre, which requires about a hogshead per day to keep it playing. I have found that large Fish will never travel nor bear handling; they are also essentially a pond-fish, and require but little change of water. The temperature of the reservoirs where they breed in such numbers, averages, I am told, from 60 to 70 degrees. I would advise your Correspondent to return his fishes into the pond, and endeavour by all means to keep up the temperature of the water, and to allow plenty of air beneath the ice if the pond should become frozen.—J. G., St. John's.

Gold Fish.—In the county of Somerset, Gold and Silver Fish live and thrive in ponds, without any other care being taken of them, than to break the ice so frequently, as not to permit the pond to be entirely covered with ice for many hours.—H. D.

Poultry.—Seeing in last week's *Chronicle*, an inquiry as to which is the best sort of Poultry, I have, after the experience of 4 years, no hesitation in recommending the half-bred Malay, as being beyond all comparison the best, both for the table and as good layers. They are, perhaps, rather careless sitters, being large and heavy, but as sitters, they may be termed tolerable, and one must not expect to find perfection even in a Hen. Though an enthusiastic amateur gardener, I am also very fond of my Poultry, and by the system I pursue in their management, I always succeed in obtaining a superabundance of eggs and very fine Chickens. Between January and December, 1841, I obtained from 25 Hens, 3,894 eggs; and a Chick hatched in March, weighed in September, when trussed fit for table, 4 lbs. My secret, is to keep the Hen-house at a regular temperate heat, by means of a small Dutch Stove kept burning for about 2 hours in the afternoon, and to give my Hens a warm breakfast of boiled Potatoes the first thing in the morning. By this means, I get plenty of eggs during the whole winter, and indeed, throughout the year; my Hens cease to lay only for about 6 weeks in the autumn. A mixture of Malay with Spanish or Dorking, I consider the best.—A. F. S.

Horse-Chesnuts for Pigs.—If "A. P., Cheam," who tried to feed his pigs on pounded Horse-Chesnuts, had steeped the latter in lime-water without pounding, they would have been eaten voraciously, nor would the lime-water have prevented them from vegetating. The farina of Horse-chesnuts, prepared like Potato-flour, is equally

good for the purpose of starch. If it were deprived of its bitter by lime water, would it be an unwholesome article of food?—*M. E.* [Probably it would still be unfit for the use of man.]

FOREIGN CORRESPONDENCE.

Confluence of the Chadda and Niger.—We made this part of the river on the 17th of September, and landed at the late town of Pandiaki. This town was in a very flourishing state at the time the Liverpool expedition visited this river; but since that period it has been destroyed by the Felatas, and the inhabitants have been obliged to take refuge on the opposite side of the Niger. The soil, upon examination, was not found to answer the expectations previously entertained of its fertility; and Stirling Hill, situated about two miles further up the river, was decided upon as the site for the model farm. Operations were immediately commenced in clearing land, building houses, &c.; and several of the natives came and assisted to prepare the ground for planting Cotton. With regard to extensive cultivation, I think this will not be found to answer the expectations of the African Agricultural Society, as the parts capable of tillage are confined to a few narrow valleys, the greater part of which are cultivated by the natives. From what I have seen of the African disposition, I do not think they will be inclined to give up the whole of their good land to a stranger, whether black or white. The soil is of a poor sandy description, the only vegetation flourishing being a species of *Tephrosia*, nearly related to *T. toxicaria*, which covers acres of land about Pandiaki and the Confluence. This plant is used by the natives to give the beautiful blue dye to their cloth. Indigo is also found, but not plentifully, neither does it seem to be taken notice of by the people. Cotton of a good quality is frequently met with in a wild as well as a cultivated state. I have no doubt but the soil is better adapted for cultivation at a short distance from the banks of the stream, as I have always found it to improve the farther I proceeded from the river. The utmost distance, however, which I was enabled to go from the settlement, was six miles, having been taken with the fever two days after the Albert proceeded up the river, and consequently incapacitated from prosecuting my researches any farther. Macgregor states, that at the junction of the Shary (Chadda) with the Niger, it is covered with majestic trees; but this part is now the least wooded of any met with after entering the Nun. The only large trees to be seen at the present time are a few specimens of the *Adansonia digitata*. The Flora is very similar to that on the coast, except that Palms and *Orchidaceae* are more rare at this place. In the former tribe there are a few specimens of a species of *Areca*, and at a short distance in the interior is found the *Elais guineensis*; but it is rare. The lovely *Spathodea campanulata* is plentiful in the moist valleys, and at this season they were covered with its large scarlet flowers. On the banks of the river were also two species of *Combretum*, and a beautiful *Clerodendrum*. The natives prepare a red dye from some tree which they find at a distance from the Confluence; but I was unfortunately prevented from seeing it, by being taken ill, previously to the time which I had appointed to accompany one of the chiefs of the village to the place at which it was found. The natives cultivate Yams, Dhourra, Ground Nuts, Capsicums, Gourds, Tobacco, Papaws, Bananas, Limes, and a small yellow fruit—a species of *Chrysobalanus*. They brought also to the settlement, for sale, goats, fowls, Guinea fowls, eggs, and honey. The manner of dyeing their cloth is as follows:—a number of deep, narrow jars are buried in the earth, so that the tops remain a few inches above the surface. A quantity of the *Tephrosia* is then gathered, and the leaves, with the young shoots, after being bruised, are mixed with a certain quantity of water in those jars. After remaining for a few days, to get the liquid to the proper degree of colour, the cloth is immersed, the tops of the jars are covered over, and they are left in this state for about two days; after which, the cloth is taken out and dried. If the colour is not deep enough, it is subjected to another immersion. I have no hesitation in saying, that the natives live nearly, if not totally, upon a vegetable diet. I could never see the goat used as food; and the Guinea-fowl is either thrown away, or offered as a sacrifice; but why offered as a sacrifice, I cannot say, except that it is a terrible enemy to the crops of Ground Nuts and Dhourra. Some of the largest trees of *Adansonia* are also objects of superstitious regard; those so distinguished having their trunks stuck full of the barbed heads of arrows and spears, with the skulls of birds and animals. They have also a superstition with regard to Stirling Hill, and say that it belongs to an evil spirit, that will not let any one live upon it. A day or two after the Albert had proceeded up the river, a village about two miles from us was ransacked by the Felatas, and most of the inhabitants carried away. I could not see that any blood had been shed, but many of the huts were burned to the ground. The markets are conducted by the women, who are very just in their dealings; they are also very expert in numbers, soon counting over several thousands of cowries. This operation is performed by reckoning three at a time. I may also state, that I think Lander was labouring under a mistake when he said that the Delta of the Niger produces Cedar, as, upon the closest inspection, I could not see anything approaching to the *Coniferae*. He probably meant some plant allied to *Cedrela*.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

FUCHSIA SPLENDENS. Splendid Fuchsia. (*Greenhouse Shrub*). *Onagraceae*. *Octandria Monogynia*. Fine a plant as *F. fulgens* is, we regard this as being still more beautiful, because of the

vividness of the scarlet and pale green colour with which it is adorned. In habit it much resembles it, and, in fact, is composed at one time to be the same species, but it eventually differs in many important circumstances. It will probably be the hardiest of its race, for it was found by Mr. Hartweg on the mountain called Totontepeque, at the height of ten thousand feet above the sea, or little more than 5,500 feet lower than the frozen summit of Mont Blanc. This species should neither be cultivated in very rich soil nor in a large pot, for both these circumstances have a tendency to prevent its flowering freely. It will grow well enough in any free soil, and flowers abundantly in the early part of the season. Young plants are easily struck from cuttings of the young shoots, when planted in sand and treated in the usual way. Like other Mexican and Peruvian species, it is not sufficiently hardy to stand a severe winter out of doors about London.—*Bot. Reg.*

GRAMMATOPHYLLUM MULTIFLORUM, var. *tigrinum*. The Tiger-spotted Letter-leaf. (*Stove Orchidaceous Plant*). *Orchidaceae*. *Vandiceae*. *Gynandria Monandria*. This species varies a good deal in the markings of its flowers, which sometimes present almost as rich a colouring as those of *Oncidium papilio*. It is a stove-plant, and succeeds easily in the hot damp *Orchidaceous* house. It may either be grown in turfy peat, in a pot, or suspended from the rafters; if cultivated as an air plant, the roots should be surrounded with some substance, such as sphagnum, or peat, and liberally supplied with water. When well managed it flowers regularly every year, and continues in flower longer than any plant of its race with which I am acquainted. It is propagated in the usual manner.—*Bot. Reg.*

ZICHYA VILLOSA. Villous Zichya. (*Greenhouse Climber*). *Papilionaceae*. *Diadelphia Decandria*. This plant was raised from Swan River seeds by Mr. Standish, Nurseryman, Bagshot. It is a free-growing greenhouse climber, well suited for either training round some ornamental wirework, fastened to a pot, or to the pillars or rafters of a greenhouse. The plant grows freely in a mixture of loam and sandy peat, when not broken very fine, if the pots are well drained. It is easily increased by cuttings, or by seeds, which are produced freely when the plants get large. It flowers the greater part of summer, if properly treated, and placed where it has plenty of light and air; but it should never be placed out of doors during summer (as is frequently done), as the plants are generally injured in such a situation by either the rain or wind. They do best when kept all summer in a cold frame, with the back turned to the sun, but with the lights off during fine weather.—*Bot. Reg.*

MISCELLANEOUS.

Pruning.—In order to secure the regular bursting of buds, along the branches of a tree, "the leading shoots should be left for shortening in the spring, just before the opening of the leaf; when the sap, then becoming active, and each bud left—being equally matured, will rapidly distribute its impulse over the whole. On the other hand, if shortened early in winter, the sap, whilst deficient of energy to produce any apparent effect, will gradually ascend to the ends of the branches, become there deposited, and in the spring, being roused into quick action, impel the terminating buds into rapid growth, which will rob all below them of that stimulating fluid of which they themselves have become the greedy consumers."—*Maunder's Bot. Gard.*

Botanical Garden, Launceston, New South Wales.—We learn from the Launceston papers, that arrangements are being made for establishing a Botanical Garden in that town, the local government having granted to the inhabitants 7 acres of land for that purpose. At a meeting held on the 6th of July, it was resolved that the management of the Garden should be placed in the hands of the Committee of the Horticultural Society, amongst whom we observe the names of the Rev. J. Bishton, Rev. R. H. Davies, R. C. Gunn, C. S. and W. Henty, Esqrs.

Greenhouse Plants.—The following is a list of choice plants for Greenhouse cultivation:—*Boronia pinnata*, *B. serrulata*, and *B. anemonefolia*, *Polygala oppositifolia* and *P. cortusifolia*, *Gardouia Hookeri*, *Rocella ciliata*, *Hovea celsi*, and *H. pungens*; *Chorizema viridum*, *C. Dicksoni*, and *C. Henchmanni*; *Mirbela floribunda*, *Swainsonia galegifolia* and *S. gal. alba*, *Sollya heterophylla*, *Helichrysum proliferum* and *H. spectabile*; *Pimelea hispidula*, *P. decussata*, and *P. spectabilis*; *Bossiaea linophylla*, *Eutaxia myrtifolia*, *Dillwynia floribunda*, *Genista canariensis*, *Cytisus rhodopneus*, *Erythrina*, *Cristagalli*; *Acacia vestita*, *A. armata*, *A. hybrida*, and *A. pulchella*; *Lechenaultia formosa* and *L. bifida*, *Coleonema tenuifolia*; *Correa Cavendishii*, *C. Lindleyana*, and *C. speciosa*; *Styphelia tubiflora*, *Sprengelia incarnata*, *Crœwea saligna*, *Luculia gratissima*, *Gardonia florida* and *G. radicans*; with *Ericas*, *Euphorbias*, *Fuchsiae*, *Camellias*, *Oranges*, and *Indian Azaleas*. Climbing plants may consist of *Sollya linearis*, *Gompholobium polymorphum*, *Kennedyia Marryattae*, *Hardenbergia monophylla* and *H. macrophylla*; *Zichya glabrata*, *Z. villosa*, and *Z. inophylla*; *Tropaeolum tricolor*, *T. azureum*, and *T. brachyceras*; *Mandevilla suaveolens*, *Ipomœa Lealii*; *Thunbergia alata*, *T. alata alba*, and *aurantiaca*.

Guano.—From a tabular statement, published in the *Bristol Gazette*, relative to the effects of this manure, we extract the following results:—The experiment was made with Turnips, and three species of manure were used. Five cwt. of guano produced a crop weighing 17 tons per acre, at a cost (for manure) of 2s. 1d. per ton of produce. Twenty tons of stable-dung produced a crop of 16 tons weight, at an expense of 5s. 11d. per ton; and 32 bushels of bones produced a crop of 15 tons weight, at a cost of 5s. 9d.

China.—We understand that a collector (Mr. Thomas Lobb) is about to proceed to Java and China, in the *Samarang*, Capt. Belcher, and that his mission is on account of the Royal Botanic Garden, Kew. His objects will, we presume, be purely botanical.

To cure the Scale on Pines.—The following is a receipt of the late Mr. Runciman's, who was a good Pine-grower, for destroying the Scale-insects which infest that plant: Boil gently together, in 4 gallons of soft water, 1 lb. of tobacco, 1 lb. of sulphur, 1 lb. of soft soap, and ½ lb. of nuxvomica, until the quantity is reduced to 3 gallons. In this the crowns and suckers should be steeped for a quarter of an hour; after which, they should be well rinsed in a tub of clean water. They should be turned bottom upwards until the wet is drained from them; and

after being potted, they should be kept in a strong, moist heat. Where it is requisite to dress large plants, great care should be taken to drain the water from them thoroughly, and not to wash too near the hearts.

The Italian Way of Cooking Broccoli Sprouts.—Boil them in salt and water; let them cool; when cold, dredge them with flour, fry them brown in butter, and sprinkle a little salt over them. This wholesome and pleasant dish is to be met with at the first tables on the Continent, and is much superior to the very primitive mode in which Broccoli is usually presented at ours.—*Muscipula*.

THE NATURALIST'S CORNER.—No. VII.

(Continued from page 340.)

23. *Cereale Papaver.*—Many are the reasons assigned by commentators for the epithet *Cereale* being applied by Virgil (*Georg. lib. i. 212*) to *Papaver* (the Poppy). Jervius assigns the following:—either because it is eaten like corn, or because Ceres made use of Poppies to forget her grief, and was thrown thereby into a sleep, when she had watched a long time on account of the abduction of Proserpine; or because Mycon, the Athenian, who was beloved by Ceres, was transformed into a Poppy; or because it was sprinkled upon bread. La Cerda quotes the authority of Eusebius, in his third book, "*De Præparatione Evangelica*," that Ceres was accounted the inventress of Poppies. Rudus has the same quotation. La Cerda gives another reason: that Ceres relieved her hunger with Poppies, as appears from the fourth book of Ovid's "*Fasti*." We are there told, that when Cereus invited Ceres to refresh herself in his cottage, his little boy was sick, and could get no rest; upon which Ceres gathered some Poppies to cure him, and tasted them herself unawares. La Cerda also quotes Brodæus for another reason: that Poppies were sown amongst the Corn for the sacrifices of Ceres. Again he quotes Brodæus and also Turnebus, who observe that the statues of that goddess are frequently adorned with Poppies. Lastly, he cites a reason, assigned by Mancinellus, that there is a sort of Poppy, called *bulgaricus*, of which a wholesome sort of bread may be made. The reason assigned by Probus, that Poppies are common amongst the Corn, which is under the protection of Ceres, cannot be right; because the Poppy heads, which are so common on the statues of Ceres, plainly belong to the cultivated sort, not to that which grows amongst the Corn. Rudus thinks the best reason is, because it appears from Pliny that the seeds of white Poppies were frequently eaten by the ancients: this, indeed, shows why Virgil called the Poppy *Vesum papaver*, but does not seem to explain the epithet *Cereale*. It is certain that Poppies were consecrated by the ancients to Ceres, and that most of her statues are adorned with them.

24. *Utility of Flies.*—It may appear surprising how a Being perfectly good should have created animals which seem to serve no end but to spread desolation wherever they go. But let us be cautious in suspecting any imperfection in the Father of the Universe. What at first sight may seem only productive of mischief, will, upon mature deliberation, be found worthy of that Wisdom which planned the most beautiful parts of the world. Many poisons are valuable medicines; the storms are beneficial; and diseases often promote life. The common flies are regarded by mankind in general as noxious, and at best as useless beings in the creation: but this is certainly far from being the case. There are not probably in all nature animals of more importance; and it would not be difficult to prove that we should feel the want of one or two species of large quadrupeds, much less than of one or two species of these despicable-looking insects. Mankind in general are sensible that nothing is more disagreeable or more pestiferous than putrid substances; and it is apparent to all who have made observation, that these little insects contribute more to the quick dissolution and dispersion of putrescent matter than any other. They are so necessary in all hot climates, that, even in the open fields, a dead animal, or small putrid substance, cannot be laid upon the ground two minutes before it will be covered with flies and their maggots, which, instantly entering, quickly devour one part, and perforating the rest in various directions, expose the whole to be much sooner dissipated by the elements.—*Smeathman, Philos. Trans.*, 1781.

GARDEN MEMORANDA.

Exotic Nursery, Canterbury.—As the widely-circulated columns of the *Gardeners' Chronicle* often contain accounts of provincial gardens not in the immediate vicinity of the metropolis, we were induced to make notes, which were most kindly handed over to the editor of the *Chronicle* at Canterbury. Nothing surprised us more, after proceeding down the London street of the ancient city, and walking through Mr. Masters' house, than being immediately ushered, at its back, into a garden filled with a great variety of both hardy and tender plants, which, though crowded, were well arranged, and, from their healthy appearance, gave proofs of skilful cultivation. One portion of the grounds had out in an arched room, in which the arrangement of the plants had been followed in planting the various groups. The specimens were necessarily kept small, in consequence of the space being limited, but the habit of the different species are striking as well as their notes of growth. The direct and nearly straight homely growing of plants, nearly all in structure, but which are yet distinguished from and contrasted with one another, in consequence of the varying forms and shades of their leaves, is well calculated to recommend the scientific instead of the usual ornamental arrangement of hardy plants in shrubberies. This was exemplified in the groups of *Horse-Chesnuts* and *Pavies*, the *Asies*, *Maples*, *Hollies*, *Thornes*, *Gleditschias*, &c. Among the *P. pinnatis*, *P. paucifloras*, being placed with *P. græca*, contrasted well, from their difference in habit, as well as in the form and colour of their foliage. Among single specimens, *Corylus avicula*, which had attained to nearly 7 feet in height, looked very healthy, and was so dense as to become a fine object, from the perfect form and colour of its numerous catkins, which made it so desirable to those who seek for new forms of interior into their shrubberies. *Beris fasciculata* was seen about 2½ feet high against a wall, while *Lagerstræmia indica*,

which one would hardly expect to succeed, had stood out of doors for several winters, and had this year produced a rich show of its gay inflorescence. The collection of Pines contains, with the more common ones, most of those which have been lately introduced. The in-door arrangements of the establishment seem to be complete, as there are houses for succulents, Orchidaceae, Pelargoniums, Camellias, Oranges, Australian and Cape plants, as well as a small stove. The two most remarkable specimens seen were *Pandanus spiralis* and *Sabal Blackburniana*; the former is perfect in form, elegant in appearance, and just beginning to show its spiral growth; the latter is also a fine specimen. There are several large *Rhododendrons*, with a fine tree of *R. arboreum*; all giving rich promise of bloom for the coming season. The chambers within doors were also remarkably beautiful; *Passiflora Loudoni* having covered a large portion of the roof of the Orchidaceous house, and having produced during the season several thousands of flowers. *Tecoma jasminoides* has also blossomed freely, as well as the scarlet *Passion-flower* (*P. racemosa*). The latter was said not to have been a single day without flowers for the previous 18 months. Among the Orchidaceae in flower, we observed the singular and beautiful *Trichopilia tortilis*, *Ixia oblonga*, a *Dendrobium*, imported from Chu. &c. The elegant tribe of Ferns had not been neglected. *Polypodium aureum*, *Adiantum pubescens* and *tenerum*, with *Asplenium coriaceum*, were in excellent condition. The house devoted to succulents contains a considerable number of those singular-looking plants; amongst them are large specimens of *Cactus abnormis*, *Echinocactus Eyrésii*, and *erinaeus*, several *Opuntias*, with many old *Aloes* and *Euphorbias*. Among the hothouse-plants there is a *Bauhinia*, received from Dr. Wallich as *B. piperifolia*, the binate leaves of which, when in a young state, are pink-coloured. *Besleria elegans*, several species of *Hibiscus*, and among them *H. Cameroni*, blooming abundantly in a young state, were particularly conspicuous. The bark-pit in the stove was occupied by *Musae*, *Hedychiums*, and *Palms*. The handsomest of the *Musae* was *M. discolor*, the underside of its leaves being of a rich brownish purple colour, and contrasting well with the light-green foliage of *M. rosacea* and *coccinea*. The *Heaths* are grown here with some difficulty, in consequence of the lowness of the situation rendering them liable to damp off; still there were some handsome specimens of *E. vestita* and its varieties, as well as of *E. Hartnelli*. A great variety of *Camellias* (not less than 150, we were told) are cultivated; all looked healthy, and even the small plants were set for bloom. In the *Camellia-house* there was a large *Psidium Cattleianum*, with an abundant crop of fruit, as well as several *Orange-trees*. It is, perhaps, going beyond the province of this article, but we cannot help observing that nothing was more delightful to observe in this establishment than the attention paid to science in connection with its application to practice. This was also conspicuous in the Museum of Natural History in the town, in which there is an excellent Herbarium of the plants growing in the neighbourhood of Canterbury.—R.

Cupesthorpe Hall, near Conington.—At this place a crimson hybrid *Rhododendron* is now flowering in the open air without any protection. The plant has 91 trusses of bloom upon it, and it is remarkable, that, if the season is ever so severe, it has invariably produced its flowers within a week of the same period. Several other plants of the same variety will be in bloom in a few weeks.—W.P.D.

Mittheilung über die Erfindung den Boden ohne Dünger anzubauen. (Communication on the Art of Cultivating the Ground without Manure.) By F. H. Bickes, Frankfurt-on-the-Maine, 1842, 8vo, pp. 31.

WONDERS WILL NEVER CEASE! While our agriculturists are eagerly discussing the comparative advantages of particular soils, and studying the theory of manures as propounded by Sprengel and Liebig, a countryman of these distinguished professors comes forward to proclaim that their labours are vain; for, if we are to believe him, he has discovered the art of growing luxuriant crops on the poorest land, and without any manure whatsoever; and the cost of the process is so trifling, that for the acre of Wheat or Maize, it does not exceed fivepence sterling; and for Rape, Cabbage, &c., amounts to only about half that sum! At first we were disposed to consider such extraordinary pretensions as an effusion of quackery, and entitled to little or no credit; but our incredulity has been somewhat shaken by the numerous and respectable attestations which the author has appended to his pamphlet, and which tend to prove that his method has been practised with success, during the last 12 years, in various parts of Germany and Holland. Thus the certificates from Vienna, dated in 1829 and 1830, declare that Mr. Bickes's process, which would seem to consist in some preparation of the seed, "renders all dunging unnecessary, is applicable to the poorest soils, and to all sorts of plants, and imparts to them a wonderful degree of vegetation and fulness;" and they give the results of the experiments in the Imperial Garden of the Château, from which it appears that Wheat raised from seed sown by Mr. B. had larger ears and more grains than that produced from unprepared seed; that the Barley showed ears with four rows and a larger number of grains, while that from unprepared seed had only two rows and a smaller proportion of grains on each stalk; and the Indian Corn exhibited a larger number of much stronger and thicker heads. At Offenbach, in unmanured and light sandy soil, the prepared Wheat produced 10-15 stems from a single grain, with larger and fuller ears; Rye and Barley presented the same vigorous growth, and Flax had stronger stems, with heavier and more numerous capsules, and was of a dark green colour; while the plants from unprepared seed had become yellow. Potatoes had seldom fewer than ten shoots from a single tuber, and some as many as 12, 15, and even 17 strong stems; while the green crops, viz. Grass, Clover, Beet, White Cabbage, Savoy, &c. were equal, if not superior, to those raised in gardens. At Büdingen, again, some plants of the Sunflower, treated according to Mr. B.'s method, grew to the height of 10 to 11 feet, with woody stems of 8½ to 9 inches in circumference. Ten or twelve Potato-plants, of a large yellow sort, called Marburger, yielded each, on the average, 30 good-sized tubers, with stem and branches seven feet long; and Maize, which grew partly singly and partly in rows, had from two to five, and in some instances, as many as eight and nine heads. These crops were obtained in the garden of Count Isenburg; and we are further assured by the certificate, to which are attached the signatures of two burgomasters, the Court Gardener, a grand-ducal councillor, and other official persons, that they were raised in ground but partially

dressed, and in the midst of tall weeds! The trials of this method in Holland, made in the summer of 1834, were attended with results not less astonishing: prepared Wheat and Rye, though sown thick, gave from 50 to 60, and even 80 stalks from one grain; and a plant of Barley bore eight large ears. Buck-Wheat rose to 4½ and 5 feet; Flax had 4 and 5 stems from one seed, and Indian Corn grew from 9 to 10 feet in height with 4 or 5 stems, and 4 to 5 heads from a single corn. The green crops were equally luxuriant. Red and White Clover and Lucerne grew 3 feet high; from two Tobacco-plants, 541 seed capsules and 200 large and small leaves were cut; and a second blossoming yielded 742 fresh capsules, and of larger size; the seed from the whole weighing 2 hectograms, or upwards of 6 ozs. At the date of the report (Oct. 30), these plants were budding anew; and all this, if we read the description aright, was effected in the shifting sand (Flugsande) of the downs of Holland!

The method of preparing the seed is a secret.

CALENDAR OF OPERATIONS for the ensuing week.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If the tan was in a good working condition when the fruiting-plants were plunged for the winter, it should now give a steady bottom-heat of from 80° to 90°. If it even gives 75° at the bottom of the pots it is quite enough at this dull season. The mean bottom-heat provided by Nature to the roots of plants in all parts of the world is well known to be higher by some degrees than that by which they are surrounded on the surface, and much less liable to variations. However far we may deviate with impunity from this simple rule in our management of other stove plants, we must strictly adhere to it to insure success in the cultivation of this fruit. While the thermometer out-of-doors keeps above 18° or 20°, that in the fruiting-house may range up to 70°, and as the weather gets colder let it fall gradually to 60°. The roots of the succession-plants, being younger and more active than those of the fruiters, are therefore more easily stimulated, and on that account should be kept from 5° to 10° lower. A humid atmosphere is at all times essential to these plants, but especially in the early stages of their growth.

VINERY.—I began forcing my earliest Vinery on the 1st of last month, in the good old-fashioned way, by introducing as much fresh horse-dung as we could find room for in the house, having first removed all plants in leaf, to save them from the ammoniacal vapour of the dung. Not to lose the benefit of such a powerful agent in the destruction of insect life, I ordered all the Fig, Peach, and Apricot trees in pots to be removed into this house, with all other plants that were suspected of harbouring enemies, such as *Roses*, *Neriums*, *Brugmansias*, &c., which had previously been pruned or headed down on purpose to undergo this general purification. The result I shall not fail to tell you. This is the first time that this house has been forced, therefore the artificial heat has not yet exceeded 60°. Plants that have been already accustomed to this early forcing may now be kept at 65°, with all the moisture that can be applied to them. Giving air is of less consequence at this stage; just enough to keep down the sun-heat to 70° is sufficient. The borders inside the house were thoroughly watered with tepid water, and the outside border has been covered a yard deep with one-half leaves and one-half fresh dung in a state of fermentation.

PEACH-HOUSE.—My earliest Peach-house is divided from the above Vinery by a glass partition, and is heated by the same boiler—one of Rogers's best conical ones. I began to force it on the same day as the Vinery; the weather was so favourable during the last month, that little or no artificial heat was applied, the house being closed up early in the afternoon. I have it now about 50° in the day, and about 40° at night; the flower-buds are already much swollen. The trees were treated in the manner described in Mr. Errington's paper in vol. i., p. 7. The borders inside were well watered with tepid water, that on the outside being protected by a layer of warm dung, but not so hot as that over the Vine-roots. No air will be admitted by the front lights in either house when the weather is frosty.

CUCUMBERS. Suffolk is the cradle of Cucumber-growing. The pedigree and "points" of a Cucumber are as keenly canvassed here as those of the horse elsewhere. The aim of the best growers is to have the temperature as nearly 75° as possible in the mornings; to get all the leaves dry once every day; and to admit as much fresh air at all times as circumstances will permit.

ASPARAGUS.—This is the easiest of all plants to force; yet unless strong, healthy roots are to be had at this early period, success need not be expected. The beds in bearing ought to have constant air, and a bottom heat of from 60° to 70°.

SEAKALE AND RHUBARB.—All the plants of these that are intended for forcing this spring should be forthwith mulched over with litter of some sort; if warm dung, all the better. The spent linings from pits at work will do very well. In adding more dung now to keep up the heat in the Seakale beds, take care that it is not overdone; where there are plenty of plants and a scarcity of dung, the former had better be forced in some of the houses at work.

STRAWBERRIES.—The Peach House is the best place to introduce the first crop of these. Clear off all dead leaves, stir the surface of the pots, and add a little fresh soil. This, and all such work as is not imperatively called for, should be deferred till rainy or stormy days.

MUSHROOMS.—Lose no opportunity of separating the horse-droppings from the litter, as it is received from the stables, and place them in some dry shed till wanted.

MISCELLANEOUS.—The Carrots sown on a warm border last August, to come into use before the spring-forced ones are ready, will now require a slight protection. Make active preparations for sowing Radishes, Carrots, and other light crops requiring slight hot-beds. The dung cannot be too well prepared and sweetened for this purpose. A stock of dry soils of different textures should always be at hand in open sheds ready for use. Any new brickwork about the framing ground should be protected from frost with as much care as half-hardy plants. All pumps and water-pipes that are in the least exposed should also be covered with litter.

Out-door Department.

Plants of every description have never been in a worse condition to resist frost than they are this season. Broccoli, Endive, Celery, and Lettuces will all require slight protection now. Cardoons and blanched Celery might be removed into sheds, with a little moist sand put round their roots. Horse radish may be treated in the same manner, but never more at one time than is sufficient for three weeks' consumption. The last month has been so mild as to have excited all plants and roots into growth. Care must be taken of Onions, Carrots, Beet, &c., perhaps they have also been deceived by the season. Manuring, digging, and trenching should now be pushed forward with all speed.

ORCHARD.—All newly-planted trees and bushes should be mulched with the lightest portion of rotten dung or spent linings. Unnail the Fig-trees on the walls, and gather their branches together in the centre; and after tying them together fasten a few of the strongest to the wall, and thatch the whole over with straw. After pruning see that all the trees are divested of Lichen, Moss, rough dead bark, &c. It is a capital plan to wash over the stems and main branches with a paint of fresh slacked lime and a little soot.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Let the temperature here be kept very steady at this time; not higher with fire-heat than 60°, even in the warm Orchidaceous house. This is a good time to prune and regulate the heads of the specimen plants. Many, such as *Justicia*, *Poinsettias*, *Aphelandras*, &c., had better now be cut down altogether, and kept dry for a few weeks. If you have a good stock of *Euphorbia jacquiniiflora*, cut down some of them also; this will enable them to make an

earlier growth, and come into flower three weeks sooner next winter. This treatment applies with equal effect to *Justicia speciosa* and the old *Justicia*, now *Branthemum pulchellum*, and no doubt to all our winter-flowering plants. The circumstances of their not being allowed to exhaust themselves by flowering this season will enable them to do so with increased vigour next year. Look at the *Gloxinias* and *Gesneras* on the dry shelves, and set a few roots of each into growth, to create a succession of flowers. As soon as the *Dendrobiums* and others of this tribe, that have been kept dry lately, show signs of growth, give them a little moisture. If you have at command sufficient humidity for the atmosphere of this house, very few Orchidaceae will require much water at this season. They are all so accommodating that they may be potted at any time; but the present, and early in the autumn, are the best seasons for so doing. All sorts of insects are fond of them, particularly woodlice, and the smaller shell-snails; these must be constantly watched and destroyed.

GREENHOUSE AND CONSERVATORY.—If the liberty I have taken above in introducing my own practice in the Vinery and Peach-house will be acceptable to the reader, I shall in future speak of these two houses separately; in practice I treat them very differently. Our greenhouses here are constantly ventilated day and night, except during frost. The conservatory, on the contrary, gets only a little air in the middle of fine days, from September to May; and the temperature averages from 40° to 50° during the dullest weather.

PITS AND FRAMES.—Of all our plant-structures these are become of late years the most important—they are the omnibuses of our gardens: everything, from the finest Heath to the humblest Alpine plants, finds a ready asylum here during these hard times. They require the utmost attention at the present season. A slimy green pot, a speck of mouldiness on the surface, or even a decayed leaf, if not instantly removed, may be the ruin of the most favourite plant. Very little watering will be required here for some time yet; see that ample covering is ready for the long cold nights.

Out-door Department.

Now that the first sharp frost has settled the worms for the winter, get all the lawn well rolled at the first opportunity; prune, plant, or transplant, all sorts of shrubs and trees; protect all tender ones. All the tender *Roses* must also be protected. Mr. Rivers proved last winter that good liquid manure is as good for *Roses* as rotten dung; this is of the greatest advantage, as we are always short of the latter. No doubt but other shrubs would be much benefited by a dressing of this sort.

NURSERY AND FOREST DEPARTMENT.

FOREST AND COPPICE WOODS.—It is no use finding fault with the farmers for not employing the idle labourers, when one can hardly ride ten miles across the country without seeing scores of acres of the finest plantations running to ruin, for want of thinning, pruning, and draining. Coppice Woods are like old Raspberry stools, with only this difference, that a chance shoot here and there has got the lead, depriving all the rest of their due nourishment; this should not be so.

NURSERY.—Nursery grounds are, or ought to be, managed like the kitchen-garden, at least as far as rotation of crops, manuring, digging, and trenching, are concerned. The Acorn-beds, if sown last November, will now be visited by mice, which must be destroyed. The stool-ground should now be cleared and cleaned of all weeds, weak shoots, spurs, &c., so as to be ready for layering a fresh stock of shoots next month. Now is the best time to cut all shoots for grafting in the spring; gather all these to one convenient place, and stick them in the ground with their proper number-sticks. Nothing is more slovenly than to see the foreman running himself out of breath at grafting-time in hunting after the different sorts, while the grafter is kept idle half his time in waiting for them.—D. Beaton, Shrubland Park Gardens.

State of the Weather near London for the Week ending Jan. 5, 1843, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 8th, in 1827—thermometer 53°; and the lowest on the 8th, in 1841—thermometer 6°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending Jan. 7, 1843.

[The Half-sieve contains]	3½ imperial gallons.
The Sieve	7 "
The Bushel Sieve	10½ "
The Bushel Basket	1 imperial bushel.
Pannets for Seakale are	7½ in. wide and 2 in. deep.
" Radishes	8 "
" Mushrooms	7 "
" Salad	5 "

The supplies have been well kept up during the past week; prices have varied but little, and trade remains much the same. **Fruit:** Pines are tolerably abundant, from 4s. to 6s. per lb. The hothouse Grapes are of superior quality to those which have been offered for several preceding weeks. Pomegranates appear to be over. A few of the dessert Pears have made a slight advance in price; the Old Colmar fetching 10s.; Nelis d'Hiver, 12s.; Beurré Rance, 8s.; Easter Beurré, 5s.; and Passe Colmar, 6s. per 4 sieve. Baking Pears may be procured from 3s. to 3s. 6d. per bushel. Amongst the dessert Apples are the New town Pippin, from 2s. to 3s. per doz.; the American Lady, or Pomme d'Api, a beautifully high coloured Apple, from 6d. to 1s. per doz.; Ribstone Pippin, from 5s. to 7s. per bushel; Golden Pippin, from 8s. to 10s.; and Nonpareil, from 10s. to 12s. per bushel. The Russet and Wellington, for Kitchen Apples, are excellent; the former, from 3s. 6d. to 4s.; the latter, from 4s. to 5s. per bushel. **Vegetables:** The best bunches of Asparagus are a trifle dearer than in our last Report. Seakale may be obtained of almost any quality, and at almost any price, as it ranges from 9d. to 2s. 6d. per punnet. The supply of Broccoli, Brussels' Sprouts, &c., is good; White Broccoli fetching from 1s. 6d. to 3s. per bunch; and the Purple ditto, from 9d. to 1s. 6d. per bunch. A few forced French Beans are offered, from 2s. to 3s. per 100. Cabbage Lettuces are small, and fetch from 4d. to 8d. per score; the Cos are much better, and are selling from 9d. to 1s. 6d. per score. Celery sells from 6d. to 1s. 6d. per bundle; but a great portion of it is of inferior quality. Mushrooms are even cheaper than they were last week, being plentiful from 4d. to 9d. per pottle. **Flowers:** A great variety of cut flowers are exhibited: comprising *Poinsettia pulcherrima*, *Euphorbia jacquiniiflora*, *Rondeletia speciosa*, *Lachenalia tricolor*, *Camellias*, *Cinerarias*, *Amaryllises*, *Rhododendrons*, *Daphnes*, *Kalmias*, *Oranges*, flowers, &c.

PRICES, SATURDAY, JAN. 7, 1843.—FRUITS.

Pine Apple, per lb. 4s to 6s	Lemons, per doz. 1s to 2s
Grapes, Hothouse, per lb. 8s	— per 100, 6s to 14s
— Spanish, 9d to 1s	Almonds, per peck, 6s to 7s
— Portugal, 1s to 1s 6d	Sweet Almonds, per pound, 2s 6d to 3s
Apples, dessert, per bush, 2s 6d to 3s	Walnuts, per bush, 12s to 16s
— Kitchen, 2s to 3s	Elberta, English, per 100 lbs. 60s to 65s
Pears, dessert, per hf. sieve, 2s to 10s	Citrus Nuts, per 100 lbs., 70s to 80s
Melons, Spanish, 2s to 4s	Nuts, per bushel—
Oranges, per doz., 9d to 2s	— Brazil, 16s to 20s
— per 100, 5s to 14s	— Spanish, 18s
— bitter, per 100, 10s to 12s	— Barcelona, 24s
Chestnuts, per peck, 3s to 6s	— Cob, 14s

VEGETABLES.

Savoy, per doz. 6d to 1s	Spinach, per sieve, 1s 6d to 2s
Cabbage, per doz. 6d to 1s	Leeks, per doz. bun., 1s 6d to 2s
— plants, per doz. 1s 6d to 2s	Onions, per bushel, 4s 6d to 6s 1
— Red, for pickling, 1s 6d to 4s	— Pickling, per hf. sv., 3s to 4s 6d
Brussels Sprouts, per hf. sv., 1s 3d to 2s	— Green, p. doz. bun., 3s to 4s
Broccoli, White, per bunch, 1s 6d to 3s	— Spanish, per doz. 1s 6d to 4s
— Purple, 9d to 1s 6d	Garlic, per lb. 6d to 8d
Beans, Kidney, forced, per 100, 2s to 3s	Shallots, per lb., 1s
Potatoes, per ton, 40s to 75s	Asparagus, large, per 100, 3s to 10s
— per cwt. 2s to 4s	— Second, 2s 6d to 3s 6d
— per bushel, 1s 3d to 2s	— Spruce or Small, 2s to 3s 6d
— Kidney, per bu., 1s 6d to 2s	Sea-kale, per punnet, 9d to 2s 6d
— New Autumn, per lb., 6d to 9d	Lettuce, Cab. p. sv., 4d to 8d
Jerusalem Artichokes, per half-sieve, 9d to 1s 6d	— Cos, 6d to 1s 6d
Turnips, per doz. bun., 1s 6d to 2s 6d	Endive, per score, 9d to 1s 6d
Red Beet, per dozen, 9d to 1s	Celery, p. bd., (12 to 15) 6d to 1s 6d
Scorzonera, per bundle, 1s 3d to 1s 6d	Rhubarb Stalks, per hble, 1s to 1s 3d
Salsify, per bundle, 1s 3d to 1s 6d	Small Salads, per punnet, 9d to 1s 6d
Cardoons, each, 1s 6d to 2s	Corn Salads, per hf. sieve, 9d to 1s
Horse Radish, per bundle, 1s 6d to 4s 6d	Watercress, per doz. sn. bun., 4d to 6d
Radish, per doz. hands (24 to 30 each) 9d to 1s	Parsley, per dozen bunches, 1s 6d to 2s
— Turnip, p. doz. bch., 1s to 1s 6d	Tarragon, per doz. bun., 2s to 3s
Carrots, per doz. bunch, 3s to 5s	Sage, per doz. bunches, 1s 6d to 2s
Parsneps, per dozen, 6d to 1s	Mint, per doz. bunches, 2s to 3s
	Mushrooms, per pottle, 4d to 6d

Notices to Correspondents.

SOIL.—A Constant Reader's house is situated on the North Chalk Downs; the adjoining land and garden consist of from 8 to 15 ins. of mould, overlying and passing into a bed from 3 or 4 ft. to 6 or 8 ft. in thickness, of bright, red clay, full of large chalk flints, and without a particle of free lime. In ploughed fields this clay is brought to the surface, and the water lodges there; but in his meadow-land, which has been laid down many years, and in his garden, the rain-water drains away immediately. Under these circumstances, he inquires to what depth we would recommend him to dig or trench for planting trees, and for his crops in his garden. His gardener asserts that if he trenches, the clay (as in the ploughed fields) will be brought to the surface, the good soil buried, and the garden will be spoiled. On the other hand, all horticultural books seem to recommend trenching under all circumstances. We apprehend the gardener to be right. It would never do to bring to the surface a tenacious clay which will not drain; for a free and full escape of surface-water is indispensable in a garden, and must be secured. We say, then, act in such a manner that you are sure of the water percolating freely. In planting both forest and orchard-trees, the land should be well turned over; if for orchard-trees, the hole should be manured 6 feet in diameter at least; but for small forest-trees it is needless to do more than open a hole, a foot or so wide, so as to admit the roots without doubling up. The use of paving the bottom of a hole in which a fruit-tree is planted, is to prevent the roots getting into soil they do not like; if your subsoil is of that description, pave by all means, if you have the materials.

MANURES.—A. H.—In fixing the ammonia of cloacine by the application of chloride of lime, no danger is to be apprehended from an excess of the chloride; but as the substance is dear, no more than is indispensable should be employed. If every day all the dung from the pigs, the horses, and the cows of your farm is carried to a shed protected from sun and rain, but exposed to currents of air, and dried with ashes, you will be furnished with abundance of manure in the spring to drill with green crops; but in this way you will be a loser, by preventing the fermentation which takes place on the dunghill. Why can you not ferment them first and dry them afterwards? Muriate of soda is of no use whatever for fixing ammonia. Soda has a much stronger affinity for muriatic acid than ammonia has; and, in consequence, when caustic soda, or its carbonate, are added to muriate of ammonia, the latter is decomposed, common salt is formed, and ammonia is set free, either caustic or in the state of carbonate. E.—H. L.—In testing for free ammonia by the method recommended last week, p. 868, it is not of much importance what sort of turmeric is employed, provided it be of a tolerably good yellow colour. Inferior turmeric may be used when good is not to be had, because even the former is reddened by ammonia. The difference in colour between that so reddened, and a portion of turmeric merely moistened with water, indicates the quantity of free ammonia. We are obliged for your offer, but cannot find room at present. E.—Mr. Chadwell.—The best method of converting vegetable refuse into manure has already been stated at p. 745 of the *Chronicle* of last year. M.—You will find as much as we know about sea-weed upon referring to the Index of last year. Some difference of opinion exists as to whether it should be applied fresh or not; we, however, entertain no doubt that the best way is to rot it with any animal matter; refuse fish would no doubt be a good substance to add to the fermenting mass. Stultus.—We cannot venture to foretell what the effect would be of oil-cake used as manure to a Vine-border. It is probably a very good material. Your Vines will hardly suffer from the border being too rich in such kinds of manure, provided it is well drained. W. C. A.—We have at present little information about the action of sulphate of ammonia. It is expected to turn out the best form of ammonia. Only, care must be taken to apply it in wet weather, or first dissolved in water. Now is a good time to try it. We should use 1½ or 2 cwt. an acre.

MARSH LAND.—R. B.—To reclaim your land, ruined by surface-water, and overrun with rushes, you should thoroughly under-drain it, clean it by ploughing up the rushes, burn them, and scatter the ashes on the land. The parts not collected by the workmen will die of themselves, when the soil is thoroughly drained and well tilled. Don't burn the soil, however. If you act thus your land will no doubt bring you heavy crops of Wheat under good management.

DIGGING.—W. C. A.—We are certainly of opinion that 4s. 10s. an acre is enough for double digging land.

HEATING.—S. C.—We cannot undertake to settle the cost of erecting a heating apparatus; that will be best learned by application to the dealers in it; many of whom, and most respectable persons, advertise in our columns. There is no reason why a boiler should not be employed to heat a Melon-pit, and to boil weeds, &c., if it is desirable. A common brewing boiler would do, provided the pipes are on a level and large enough. For this, however, a plan would have to be prepared on purpose. No doubt by boiling the roots and stems of weeds, &c., the greatest bulk of manure may be obtained, as well as the most rapid and most certain decomposition. By burning, the bulk is very much diminished; to decompose them in a heap takes some time, even if gas water is employed. But if boiled for 5 or 6 minutes, most seeds and all weeds will entirely lose their vitality. But then comes the question, of whether the expense of fuel is not greater than the value of the manure? Besides, it is evident that this operation could only be performed on a small scale, in small gardens.

PRUNING VINES.—Judea.—Many men, many minds. We prefer the spur to the rod-system of training Vines, because we have been more accustomed to it, and because, with ordinary care, we have always seen its adoption attended with success. Good forced Grapes may no doubt be produced by the rod-method; but why the spur-system should be more "unnatural and unphilosophical" than the rod-system of training Vines, or the plan of pruning a Gooseberry-bush in the form of a bell-glass, we are at a loss to determine.

CONFERRA.—A. B.—Good practical directions for raising *Arcaëria imbricata*, and other Coniferous plants, from seed, will be found at p. 83 of the *Chronicle* for last year.

LILY OF THE VALLEY.—H. M.—The proper season for transplanting these is the autumn; they will, however, succeed in spring, if carefully moved.

EVERGREENS.—T. R. W.—Your case is entirely different from that

of "T. S. P." When you want to remove large Hollies, or other evergreens from hedgerows and similar rough places, where it is difficult to preserve the roots, you cannot do better than remove them with balls when their earth is firmly frozen; but for transplanting in open places, where almost every root may with care be traced out, open weather is to be preferred.

PLANTS.—A. H.—*Thuja articulata* is not hardy; *Juniperus Bermudiana* is not capable of cultivation in this climate; *Cupressus expansa*, of the Horticultural Society's Gardens, is the horizontalis of some of the trade; *Gymnocladus Canadensis* is a very slow grower, and nothing will accelerate its rate much; your plant would, however, be the better for manure. Cuttings that strike unwillingly will strike more readily under Ward's cases. Whether *Rhododendron*, *Azalea*, and *Rhodora* are three genera or not, is a matter of opinion. We say yes. The Irish Yew is a seedling, raised at Florence Court, in Ireland.

WEEDS.—T. H. S.—Your plant is certainly Chickweed, but is only an annual. We never heard of its being troublesome. If, however, it does take possession of land, it can only be destroyed either by carefully following or by smothering it by strong crops. We fear your Clover is in bad condition to be affected by such a plant as Chickweed.

CHLANTHUS PUNICEUS.—H. M.—Your plant appears to have suffered from insufficient drainage. If you grow it near the light in rich loam, allow it plenty of pot-room, and give it plenty of air on all favourable occasions, you can hardly fail to flower it.

TROPAEOLUM TRICOLOR.—H. M.—You will not injure your plant by nipping off the early blossoms; but you must take care to train down fresh shoots over the parts thus treated, otherwise that portion of your trellis will be destitute of bloom.

CERRERA FRUTICOSA.—H. M.—This plant will not succeed in a conservatory; when practicable, it should be planted out in the border of a stove.

HIBISCUS CAMERONI.—H. M.—It is very doubtful whether this plant would thrive in the low temperature of a conservatory.

TILLANDSIA.—Mr. H. G.—Of *Bromelia humilis* we know but little. *Tillandsia amensis* is a handsome plant, with which we are better acquainted. All plants of this description require to be kept quite dry at one season of the year, and to be grown in a strong and moist heat during the remainder. With such treatment you will no doubt induce your plants to flower.

AGAPANTHUS UMBELLATUS.—G. Walker.—This plant is also called the Blue African Lily. It should be grown in a rich loamy soil, with plenty of pot-room, and should be abundantly watered during the growing season. In winter it requires the protection either of a greenhouse or frame.

PRIMULA SINENSIS.—H. B. R.—Your monsters are of the same nature as those often seen in the *Polyanthus*. We shall be glad to make use of them as soon as we can find room to take up Morphology again.

DAPHNE.—Coryncus.—*Daphne laureola* is the best stock upon which to work any of the smaller kinds of *Daphne*. When the plants are grafted, they should be placed in a cold pit or frame, which is kept close and rather moist; but in which no artificial heat is used. It is doubtful whether they would succeed if placed in a dung frame or out of doors, after being grafted. When only a few plants are wanted, they will do very well under a large hand-glass, which is kept close and well shaded.

PANSIES.—W. W. wishes to be informed whether any of the artificial manures have been tried upon Pansies; and, if so, the result.

ROSES.—Thomas.—The stock on which Roses are budded is called indifferently the Wild Rose, Dog Rose, and common Hedge Briar. It is the common Hedge Rose with upright shoots; and is collected in hedge-rows by the peasants, who bring it for sale to the nurserymen. No doubt, as the hedge-roses consist of several different species, some are better for stocks than others; but they are not distinguished in practice. The Sweet Briar is a bad stock.

CROCUSES.—E. S.—There is no means of driving mice away from Crocus-roots, unless spirits of tar will do it. If your water-trap is like that mentioned at p. 126 of last year's *Chronicle*, we fear you do not place it in the runs of the mice; if you do so place it, you can hardly fail to reduce the numbers of your little enemies.

MULBERRIES.—Bombicis amator.—These trees may be propagated both by seeds and layers.

QUINCES.—Thomas.—These are layered in the autumn, when the young wood is firm and half ripe.

MEDLARS.—Thomas.—These are grafted at the same time as Pears and Apples.

FRUIT-TREES.—Pyrrus.—The fruit of a Pear-tree which has been worked upon the Quince will not prove gritty in consequence, provided the tree is in a thriving condition; but should the Quince stock dislike the soil, or if the stock and variety worked upon it are unsuitable, the fruit will then become stunted and gritty, from the want of sufficient nourishment. Re-grafting with the same variety will do no good in this case. J. M.—The Paradise stock is a dwarf variety of Apple, the roots of which are more fibrous and are produced nearer the surface than those of the Crab-stock. It is easily propagated from suckers. A Constant Reader.—Six good varieties of Kitchen Apples, as regards both quantity and quality, and which will afford a supply from the present time till August, are the Royal Russet, Dumelow's Seedling, Bedfordshire Foundling, Alfriston, Northern Greening, Gooseberry Pippin, and Easter Pippin or French Crab. Bigarreau.—Kitchen fruits are in general to be preferred for planting against a North wall. The Morello and Kentish Cherries, and the Orleans Plum, would have succeeded better than the varieties you have planted.

CURRENTS.—Vicarius.—The sorts you mention can be had of London nurserymen. The country nurserymen should obtain them from their London correspondents.

ONIONS.—T. B. H.—You cannot do better than let your Tripoli Onions, which were sown in August, stand as they are, until the middle of February, when, if the weather permit, they may be planted out 6 inches apart into other beds. You must not, however, depend upon them for winter use, as this kind does not keep long after being drawn.

ASPARAGUS.—Thomas.—Put as much salt on your Asparagus-beds as will make them quite white. They will take a great deal.

POTATOES.—A. H.—You cannot well plant your Potatoes earlier than the beginning of April, on stiff clay. If you use with them guano, mix it with ten or twelve parts ashes, or mould, or some substance that will mechanically divide its particles, and place it in the drills or holes when your sets are planted. If sulphate of ammonia, apply it mixed with water as soon as the Potatoes are beginning to show their leaves. Epsom salts are certainly a good manure for Potatoes; we should use 1½ cwt. per acre alone; but we are not sure that cloacine will improve their action; it may be too strong. We are unacquainted with the effect of Bran. Where does Liebig recommend those substances? A Constant Reader.—You cannot procure a better kind for early forcing than the Ash-leaved Kidney Potato. You may obtain a crop of Radishes in the same frame by sowing them as soon as the Potatoes are planted.

HORSE RADISH.—Radix.—This is only to be extirpated by constantly destroying the leaves as they appear. If you persevere in doing so, it must die. Fork up as much of it as you can in addition.

RABBITS.—Mid-o-wood.—The plants least likely to fall a prey to the raving appetites of Rabbits are the different species of the *Christma's* Rose, Monkshood, and Foxglove, with *Rhododendrons*, *Azaleas*, *Andræmedas*, hardy Heaths, *Daphnes*, *Laurustinas*, *Virginian Tobacco*, *Petunias*, and *Columbines*.

INSECTS.—Mr. J. Rogers's twigs of a Ribes may be affected by insects; but if that be the case, it must have been early last spring, as the excrescences are woody, and partake more of the nature of the conglomerated masses often disfiguring the branches of the Birch-tree than of Galls. Having never observed any Galls upon the Ribes, we should be glad of specimens if fresh excrescences be formed in the ensuing spring. R.—A. B. or E. F.—It is only the young of certain species of spiders which have the power of sailing through the air, and it is well attested by naturalists, that the gossamer spiders have the property attributed to them, of being able to shoot forth threads of web from their bodies. The rotatory motion observed was occasioned by the spider collecting its web into a ball between its legs. The subject is amusingly discussed in Kirby and Spence's *Introd. to Ent.*, recently published, vide vol. II, p. 269.—R.

BOOKS.—A. X. Z.—The price of the new edition of Hooker's British Flora is 11. 18s. for the two volumes. The natural arrangement adopted in that work is that of De Candolle. G. B.—The *Pomological Magazine* has long since been terminated with the 3rd volume.

EXPORTING PLANTS.—J. M.—We do not remember to what you allude; you should always give a reference to the page of an opinion you criticise; we cannot spare time to hunt for such things.

WOODS.—H. D.—King-wood is said to be produced by a leguminous tree, called *Baphia nitida*—figured in Loddiges's Botanical Cabinet, t. 367. Rose-wood is the timber of a species of *Jacaranda* found in Brazil; the French call it *bois de palixandre*. It is not the produce of a *Rhododendron*.

THE RIDDLE.—W. H., and Others.—Much obliged, but we have not room for the poetical answers. It is evidently the Rose.

POPULATION OF GREAT BRITAIN.—A Constant Reader.—The information you require will be found at page 47 of our volume for last year.—B.

MISCELLANEOUS.—J. R. J.—The Fern is *Polypodium vulgare*.

Julius.—Chemicals may be obtained of Messrs. Garden & Co., Oxford-street.—J. C. L.—Your plant is *Pitcairnia suavelens*. We have written to Mr. J. Hamilton for an explanation of the manner in which he treats his Pine-Apple plants, but we have not yet received any satisfactory answer. We sent a letter to our correspondent R. D. F., *Findrassie House*; if he has not received it, we must request him to send us a more explicit address.

G. F. Ashgrove.—A great deal respecting the treatment of *Lucilia gratissima* has already been stated in the earlier Numbers of the *Gardeners' Chronicle*. In an *Occasional Reader* may easily discover the contents of a "drying room" by re-perusing the article to which he refers.

F. H. S.—Judging from the leaf sent, your *Chanthus* appears to be in perfect health; the spots are evidently occasioned by some insect, probably by some of the miners. H. will find an answer in his book of *Arithmetic*. Rumer.—Your Pear is the *Beurré Rance*. The price of Quince seed is 1s. per oz. J. M.—No 1 of your flowers is *Zygopetalum crinitum*; 2 is *Z. intermedium*. G. P.—You can have Nos. 11, 12, and 42; 33 is out of print.

S. H., *Whitechurch*.—The Numbers you write for are both out of print. J. W.—Mr. Westwood being the Secretary of the Entomological Society, he will be able to furnish the information required, if a letter be addressed to him at 17, Old Bond-street. *Ruricola* would be happy to answer the questions, but he is not a member.

Mr. Major.—We do not print circulars. J. A.—Your letter contains useful criticisms; but it is evident that such matters are oversights which correct themselves. A. B. C.—We are not acquainted with the history of the man eaten by rats. Mr. Scott.—We are obliged by your letter; and will take an opportunity of examining the facts.

A. R.—Your plant is *Senecio tussilaginis*. T. D.—The subscription to the *Gardeners' Chronicle* is 6s. 6d. per quarter if paid in advance. C. Bolton.—Your parcel has not been received.

J. White.—Your Clydesdale Apple is not known. In form, size, and colour, it resembles the Margil; to which it is not inferior in flavour. A Canny Scotchman.—We are not aware that we have ever received such a communication as you mention.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE official returns of the public revenue, of which we give an abstract in another column, afford by no means a cheering prospect for the commencement of the New Year. The deficiency in the last quarter's revenue amounts to more than nine hundred and forty thousand pounds, and the deficiency on the year just ended, as compared with that which ended on the 5th January of last year, is not far short of the same amount, although the Income-tax has been two quarters in operation. The details of the returns furnish matter for serious consideration; in the four main branches of revenue—the Customs, the Excise, the Stamps, and Taxes, the deficit on the year amounts to the immense sum of 2,425,554l. The greatest falling off is under the head of Excise; the deficiency in that branch for the year being 1,173,614l., and for the quarter, 717,262l. The Customs also exhibit a similar depression; on the year the deficiency in their returns is 824,275l.; on the quarter, 581,185l. The only compensating fact is the increase in the Post-Office for the year, of 150,000l., and for the quarter of 14,000l. If it were not for the new branch of revenue created by the Income-tax, the deficit for the past year would have amounted to nearly 1,500,000l. The returns for the quarter are more serious than those for the year, since they mark the progressive increase of distress. The falling off in the Excise and Customs' duties shows an alarming decrease in the consumption of articles from which those duties are derived; and if the decrease continues, there will be next year a deficiency of 3,000,000l. in the Excise alone. These are melancholy facts. They prove, by evidence which all parties must admit, that the prosperity of the country has sustained a serious check, and that the most important interests have suffered from the prevailing pressure. It is not difficult to conjecture upon what class these privations have more immediately fallen; but, at the same time, it is impossible not to perceive in the simultaneous decline of two such branches of revenue as the Customs and Excise, how many in the middle classes of society must have curtailed their habitual expenses and enjoyments. These considerations will naturally direct attention to the approaching session of Parliament; and the public will no doubt look forward with unusual interest to the measures which will be brought forward for the relief of our financial difficulties.

From France we have accounts of the addresses presented to the King on New Year's Day, with his Majesty's replies. The address of the Ambassadors expressed satisfaction at the continuance of peace, and declared that it was consolidating itself by its very duration, for its blessings are every day better appreciated. The King cordially concurred in this remark, and said, that everything gave him confidence that Providence will continue to bless their common endeavours to prevent the repose of the world from being disturbed, and to insure the maintenance of the general peace which now so happily prevails. The King will open the Chambers, in person, on Monday next,

with a speech from the throne; the Opposition are expected to press for the Abolition of the Slave Trade treaties of 1831 and 1833, but the Ministry are strong enough to defeat the movement, and have no apprehension for their stability. — From Spain, we have accounts of the Regent's progress on his return to Madrid; he has everywhere been received with respect and sympathy, and his government has evidently gained additional influence by the result of the recent insurrection. — Our advices from the Levant confirm the news already announced in regard to Syria. The Sultan has acceded to the wishes of the Allied Powers by appointing two native Governors for the Lebanon, and has determined to conciliate the people by the withdrawal of the Turkish garrisons. These accounts also mention the recall of Redschid Pacha, the Ottoman Ambassador at Paris; this measure was unexpected both in Paris and Constantinople, and it is supposed to have reference to some important changes in the Turkish Ministry.

Home News.

Court.—Her Majesty and Prince Albert left Windsor on Thursday for Claremont, accompanied by the Duchess of Norfolk, the Marquess of Ormonde, Major-General Wemyss, the Hon. C. A. Murray, and Mr. Anson, who are the only members of the Royal household who will be in attendance at Claremont. The Princess Royal, with her French governess, left for Claremont in the forenoon. The Prince of Wales remains at the Castle under the care of Lady Lyttelton. It is expected that her Majesty's visit to Claremont will not be prolonged beyond Thursday next, the 12th inst. On Monday morning the Queen and Prince Albert walked for some time in the Home Park, after which his Royal Highness hunted with his harriers at Ritchings Park. On Tuesday her Majesty and the Prince walked in the Park both in the morning and afternoon; and the Prince enjoyed several hours' shooting over the preserves at Cumberland Lodge. On Wednesday at 3 o'clock the Queen held a Privy Council at Windsor, the summonses for which were only issued at noon on the same day. It was attended by several Ministers, for whom a special train was ordered on the Great Western Railway. At the Council, an Order in Council was passed for making Vice-Admiralty and other Courts at Hong-Kong, in China, which have hitherto been held at Canton. The Duchess of Norfolk has succeeded Viscountess Canning as Lady in Waiting on her Majesty. Mr. O. Gore has succeeded Captain Meynell as the Groom in Waiting. Major-Gen. Wemyss has relieved the Hon. Colonel Grey as Equerry in Waiting on the Queen; and Colonel Bouveris has relieved Major-Gen. Sir E. Bowater as Equerry in Waiting on Prince Albert.

The Revenue.—The official returns of the revenue for the year and quarter which ended on the 5th inst., have just been published. They exhibit a considerable falling off as compared with the returns of the last year and quarter. The total ordinary income for the year ended Jan. 5, 1842, was 45,252,495*l.*; that for the year just completed, was 44,329,865*l.*, showing a decrease on the year of 922,630*l.* The total ordinary revenue for the quarter, ended Jan. 5, 1842, was 12,426,169*l.*; while that of the quarter just ended was 11,486,107*l.*, showing a decrease on the quarter of 940,062*l.* The following are the details:—The returns for the *Year* exhibit an increase in the Post-office of 150,000*l.*; Income-tax, 571,056*l.*; Miscellaneous, 481,673*l.*, to which must be added Imprest and other moneys, 157,283*l.*; Repayment of Advances, 171,912*l.*; making the total increase, 1,531,924*l.* There is a decrease in the Customs of 824,275*l.*; Excise, 1,173,611*l.*; Stamps, 213,416*l.*; Taxes, 209,319*l.*; and in the Crown-lands, 29,400*l.*; making the total decrease, 2,454,551*l.*, from which deducting the above increase of 1,531,924*l.*, we have, as stated above, a decrease on the year's accounts of 922,630*l.* The returns for the *Quarter* are still more unsatisfactory. In the Customs there is a decrease of 591,145*l.*; in the Excise, 717,262*l.*; Stamps, 56,763*l.*; Taxes, 23,547*l.*; Crown-lands, 9000*l.*, making a total decrease of 1,388,057*l.* There is an increase in the Post-office of 14,000*l.*; Miscellaneous, 6,185*l.*; Income-tax, 257,212*l.*, to which must be added Imprest and other moneys, 80,910*l.*; Repayment of Advances, 89,388*l.*; making a total increase of 447,995*l.*, which being deducted from the above decrease of 1,388,057*l.*, shows a deficiency on the quarter's accounts of 940,062*l.* If the Imprest-money and repayment of advances be excluded from the calculation, the deficiency on the ordinary sources of revenue will be for the year 1,251,825*l.*; and for the quarter, no less than 1,110,860*l.*

Naval Promotions.—With reference to the *Gazette* of the 23d inst., the following additional promotion has taken place, in consequence of the recent war in China:—Lieutenant to be Commander—Mr. Thomas Francis Birch.

The Navy.—The Navy at the present moment consists of 234 vessels of all classes, mounting in the whole 3,890 guns, which is about 670 guns less than last New Year's Day, and consequently there are about 7,000 seamen less in employ. It appears that there are 18 sea-going line-of-battle ships, being 7 less than last year; 32 frigates, being 5 less than last year; 39 sloops, 1 less; 36 smaller vessels, 19 less than last year; 64 steamers, 4 additional; 21 surveying vessels; 10 troop-ships; and 10 receiving ships. Our force at home comprises 604 guns; packets, 46; Mediterranean, 1,035; Brazils, 403; East Indies, 886; North America and West Indies, 476; Cape and Coast of Africa, 309; surveying, 93; troop-ships, 56.

Foreign.

FRANCE.—The Paris Papers are principally occupied with the addresses delivered to Louis Philippe on New-Year's Day, and with his Majesty's replies. The Marquis de Brignole Sale, the Sardinian Minister, as senior member of the Corps Diplomatique, presented to the King the address of that body, and availed himself of the opportunity to assure his Majesty of the pacific disposition of Europe towards his Government. He then added—“Peace, which so fortunately subsists, and the maintenance of which is the object of the endeavours of all the Cabinets, is consolidating itself by its very duration, for every day its blessings are better appreciated. May it continue to be the lot of Europe and France to enjoy it many years under the reign of your Majesty.” The King replied—“I have been deeply affected by the share which all the Sovereigns whom you represent have taken in the immense loss I have sustained, and I seize this opportunity of again declaring how much I have valued the testimonies they offered to me. Could my family or myself receive any consolation, we should find it in the manifestations with which we have been surrounded by all France, and the universal sentiment which was everywhere evinced as to the necessity of providing against the future consequences to be feared from our great calamity. Everything gives me confidence that Providence will continue to bless our common endeavours to prevent the repose of the world from being disturbed, and to insure the maintenance of the general peace, by a continuation of that good harmony which so happily subsists between all the powers.” His Majesty's reply to the Peers was received with loud acclamations, particularly when he characterised their demonstrations as “at once the support of his courage and the hope of the future that remains to him.” When the applause had subsided, the King continued—“This future you know is entirely consecrated to France. The blow which has struck me was of a nature to inspire grave anxiety. Your wisdom, the fidelity of the Chambers to monarchical principles, the support which I have found in them, and the national ardour so openly expressed for myself and my family, have removed even the dread of the evils which this immense calamity might have drawn upon France.”—Public attention is now directed to the opening of the Chambers on the 9th; it is officially announced that they will be opened by the King in person, and consequently there will be a speech from the throne. Although it is certain that M. Guizot will be materially strengthened by this circumstance, rumours of a change of Ministry were still in circulation in Paris, founded on the determination of the Opposition to press Ministers to abrogate the treaties of 1831 and 1833. Upon this subject there is no doubt that, if the attempt be made, it will certainly be defeated by the Ministry, who entertain no feeling of apprehension for their stability.—The Government papers contain an additional article to the Post-office conventions entered into between France and Holland, and in virtue of which a direct and mutual correspondence is to be opened, through Belgium, between Lille and Breda.—The fortifications of Paris are beginning to excite the apprehensions of the inhabitants; and the *Commerce* infers, from the eagerness with which the Government is prosecuting the expropriation of the ground on which the new detached forts are to be erected, and the rapidity with which these operations are conducted, that the Ministry are afraid that the Chamber would not sanction the enormous expenses occasioned by those stupendous works. The citadel of Mont Valerien, composed of five bastions, is to be shortly closed. It contains already two barracks, four powder-magazines, and several other buildings.—A letter from Toulon states that the ship *Maria Annetta*, sailing under the Sardinian flag, and whose crew was composed of Spaniards, had been captured by the French corvette *Blonde*, Captain Trehouart, off the island Mayotta, being accused of acts of piracy and slave-trading. This vessel and her crew had arrived at Toulon, where she has been placed under sequestration. The seamen have been committed to prison to wait their trial.—M. Cussy, ex-president of the insurrectionary junta of Barcelona, published in the *Semaphore de Marseilles* of the 27th ult. a vindication of his conduct whilst he headed the revolt. He particularly directs himself against a charge of dishonesty, adduced against him by a London journal, in having “made away with no less a sum than 16,000,000 reals.” He then proceeds to exonerate the French Consul from the accusation of undue interference, and declares that “he was the providence of the refugees, and that all, without any distinction of party, found at his hands the same hospitality, including even the families of Van Halen, Gutierrez, and Zavala.” The best possible understanding was believed, in Paris, to exist between the English and French Cabinets respecting Spanish affairs; it was even stated that our Minister in Madrid has been instructed to recommend to the Spanish Ministry acquiescence in the demand for satisfaction addressed by M. Guizot to the Regent's Government. It was also rumoured that after the settlement of this difference France would accredit an ambassador to the Spanish Court, and that the choice of the Government would either fall on M. de Pontois, or M. de Bourqueney.—The trial of Jacques Besson, for the murder of M. de Marcellange, has been brought to a close after nine days' sitting. After remaining about an hour in deliberation, the jury brought a verdict of guilty against the prisoner, without finding any extenuating circumstances. He was accordingly sentenced to death, and to be executed on the public square of Puy. It is said, however, that a point made by the prisoner's counsel would induce the Court of Cassation to annul the finding, and order a new trial.—Major Lelievre, whose name has frequently been before the public in connexion with the defence of Mazagan,

arrived at Malesherbes on the 22d December. The inhabitants of this town, his native place, had prepared a banquet in his honour, which was presided over by M. Hutteau, Mayor of Malesherbes, and an old soldier of the empire, supported by 82 guests. Above the chair of M. Lelievre were placed, as a trophy, the three swords of honour offered to him by the towns of Angers, Strasburg, and Peronne. Many toasts were drunk—to “The defenders of Mazagan;” to “The Army of Africa;” to “Lelievre, our brave countryman,” &c. Major Lelievre, in a simple speech, expressed the gratitude which he experienced at those testimonies of esteem and attachment.—The line of French mail-packets to cross the Atlantic is expected to commence running next June. The packets will be 14 in number; they are built to carry 40 guns each, and will belong to the French Government. The port selected for the packet station is Cherbourg. Four of the steamers will run to and from New York; and the rest will convey mails and passengers to and from France and the West Indies, Brazils, and the Gulf of Mexico. The fares for passengers will be considerably less than the charges of the English West India Mail Steam-packet Company. The whole of the postage paid to the English Government for the correspondence between France and the southern United States and the French West Indies will be lost to this country after the French Atlantic steamers have commenced running. A vessel has already been despatched to make the necessary arrangements at the various stations and routes selected for the packets.—At the last meeting of the Institute, Mr. Wright, the Anglo-Saxon scholar, who has contributed so largely to our knowledge of middle-age literature, was elected English corresponding member in the room of the late Earl of Munster. There were two other candidates for the office, viz., Mr. Hamilton, vice-president of the Society of Antiquaries, and Sir Gardner Wilkinson. Out of 34 members present on the occasion, Mr. Wright had 25 votes. M. Guizot is said to have exerted himself strenuously for Mr. Wright.

SPAIN.—We have accounts from Barcelona to the 27th. General Seoane has joined to his functions of Captain-General those of the political chief. Señor Gutierrez, before his retirement, annulled the municipal elections; and the Military Commission has set at liberty Señor Gibert, who was arrested on suspicion of being concerned in the late outbreak. Several villages on the French frontier had been disarmed. The Ayuntamiento had issued a notice, informing the inhabitants that it was the will of the Captain-General, Seoane, that the war contribution of 12,000,000 reals should be paid within three days, and inviting them to comply with that exigency. The Regent slept at Tarragona on the 23d, and proceeded on the next day to Vinaroz. He was everywhere received with demonstrations of respect and sympathy by the people and the National Guard. The Regent was to reach Valencia on the 25th, to stop there on the 26th and 27th, and then set out for Madrid, which he expected to enter on the 1st January. The preparations for his reception in Valencia were on a most triumphant scale. The citizens and National Guard of that province are said to have felt the necessity of proclaiming their adhesion to the existing Government, in opposition to the attempts of the Republicans and Christinites.—The official journal of Madrid contradicts the assertion that Gen. Van Halen has been displaced in consequence of any demand of France, or from obsequiousness to that power. The papers are much occupied with the letter written by Gen. Pastor, giving an account of the surrender of the Atarazanas, which he surrounded, and distinctly stating that the French Consul went twice to that fort, accompanied by two members of the Junta. It also contradicts the assertions of the Christino organs, that the English ships of war off Barcelona had given projectiles to the fort of Monjuich for the bombardment. It was believed in Madrid that M. Gutierrez, late Political Chief of Barcelona, would be removed in the same capacity to Granada.—The conduct of Mr. Penleaze, the British Consul at Barcelona, in refusing to compromise his Government by any overt act in allowing Spaniards to take refuge on board our ships of war during the bombardment, has been much censured by the French papers. It appears, from a letter addressed by the Consul to his relatives in England, that when the city was threatened with bombardment, he was requested by Capt. Maunsell of the *Rodney*, to go on board, with his family; but as he had some Spaniards under his protection who had been threatened with assassination, he determined not to desert them, and they remained during the whole bombardment, which Mrs. Penleaze bore with great courage and calmness. But on Sunday morning, when everything was over, Capt. Maunsell sent to say that Espartero had complained that the Consul impeded his operations, and urging him as a point of duty to go on board. Mr. Penleaze could no longer resist; and taking his wife out of a sick bed, and going out in a heavy sea to the ship in the roadstead, proved too much for her shattered constitution; and she sunk under it. It appears more than probable that, if he had retired on board the *Rodney* when first requested to do so, the life of Mrs. Penleaze would have been preserved.

PORTUGAL.—We have received Lisbon news to the 26th ult. Nothing definitive had been done respecting the tariff question, but it was expected to be decided in one way or the other, as far as the plenipotentiaries are concerned, in the course of a few days. The Suffren French line-of-battle ship, bearing the flag of Adm. Cazez, had arrived at Lisbon, where the French have also a corvette and a brig-of-war; it was said that two other vessels were expected; and there was a report that a French squadron under the command of an admiral was to be stationed at Lisbon for some time. There are now three vessels in the

Tagus; the Relampago, the Gloria, and the Cabo Verde, all of which were seized by General Marinho during his government of Mozambique, for their notorious design to take in cargoes of slaves; the general has published a letter, written by Senhor Vincente to M. Bataille, the French slaving agent at Mozambique, which leaves no doubt whatever of the illegal intention. The Gloria, although professing to be bound on a peaceful voyage to the coast of Africa for ivory and palm oil, was found at Mozambique to have a crew of 70 men armed to the teeth, carrying 6 pieces of artillery, besides a long 24-pound swivel gun, and having on board all the apparatus of fetters, cauldrons, and other accompaniments of a slaver. —The economies now completed by the Government in the various departments of the public service amount to the large sum of 65,000*l.* per annum. In addition to those which have been already announced, the Duke of Terceira has accomplished one of great importance, which no one, less popular, could have attempted. It is a retrenchment in the expenditure connected with the supplying of uniforms to the Army of Portugal, to the very large extent of 99½ contos per annum (22,400*l.*). The military force is to be henceforth maintained on the footing of 21,000 infantry and 3,000 cavalry; of whom 6,000 are with registered license—leaving an actual subsisting force, drawing pay and receiving food and clothing, of 18,000 men. There is at once a diminution of number, and an increase in the duties and efficiency of the force. There seems to be no doubt that these retrenchments have done more than any other acts to strengthen and consolidate the power of the present Administration.

BELGIUM.—Letters from Brussels of the 26th ult., state that General Joly, president of the Belgian commission for running the boundary line between Belgium and Holland, has arrived at Maestricht, where the Dutch commission has likewise assembled. It may, therefore, be supposed that the treaty on the subject of the boundary line will be shortly carried into effect. It is stated that the general receipt on all the railroads in the kingdom will amount this year to about 7,500,000*f.*

HOLLAND.—On the 29th ult., a general meeting of the shareholders of the Dutch Railway Company was held at Amsterdam. M. Conrad, the engineer, gave an account of the state of the work, and, among other things, announced that it was expected that the road from Leyden to the Hague would be completed in the spring. He declared that there was no truth in the reports that the roads had sunk down in some places between Amsterdam and Haarlem. Dr. Siebold, the well-known author of works relative to Japan, has communicated to the *Journal de la Haye*, "A notice of an inedited narrative of a voyage of Duco, made in 1639 in the Great Ocean to the east of Japan, undertaken by order of the East India Company, by Commodore Mathew Quast and Abel Jansan Tasman, and of authentic documents, which prove the Bonin Isles, of which the English took possession in 1827, and in which they have probably since planted a colony, were discovered and described by those two illustrious Dutch navigators." It seems that Dr. Siebold, being led to entertain some idea that the Bonin Islands had been discovered in the beginning of the 17th century by some Dutch navigator, he, therefore, made search in the archives of the Dutch East India Company, when he was so fortunate as to find last month several documents signed by Quast and Tasman, and a journal of the voyage, with a map, indisputably confirming his expectations, and giving additional honour to the navigators who were the first to explore those dangerous and then unknown seas.

GERMANY.—The *Augsburg Gazette* states that the Prussian Ambassador at St. Petersburg has received orders to state to the Russian Cabinet, with respect to the facilities granted to the Prussian commerce by a late ukase, that the Prussian Government is anxious that all the States of the German Customs Union should be admitted to enjoy the same advantages, inasmuch as its intention is not to act for itself, but for the general interest of the Union. A Berlin letter of the 25th ult., states that the Hereditary Prince of Prussia, being out a few days before a boar hunt, wounded one of these animals of unusually large size. The beast, which was not disabled, turned upon the Prince, threw him down, and in all probability would have killed him, had not one of his suite fortunately come to his rescue, and shot the boar, which fell instantly lifeless. His Royal Highness did not receive the slightest injury. Another letter from Berlin states, that the King of Prussia has ordered an architect of that city to construct at Sans-Souci a Greek theatre, where the masterpieces of the ancient Greek tragedians are to be represented in the open air in the fine season.—It is said to be the intention of the Austrian Government to abolish the transit duty, in order to facilitate commercial communication between the German Customs Union and the provinces of the Danube. The construction of railways in Austria is proceeding rapidly; a convention has just been concluded with the government of Saxony for the construction of a railway from Prague to Dresden; and letters from Vienna of the 24th ult. announce a sudden rise in the price of the Vienna and Milan Railroad shares, which had reached 92, with every prospect of a further improvement, in consequence of an Imperial decree ordaining that this railroad should be completed as quickly as possible, and that the Government would undertake any part of the line which the company was unable or unwilling to execute. Thus the Adriatic will soon be connected with the German Ocean by means of a railroad passing through the Austrian provinces.—The restoration of Hamburg is making rapid progress on the plans chiefly of Mr. William Lindley, an English engineer, whose services in checking the progress of the conflagra-

tion were acknowledged by the authorities. The streets are to be wider and straighter than those of the old town, and in addition to these improvements, the Government has decided on constructing a lock and other works for opening a navigable canal between the rivers Elbe and Alster. A complete system of sewers also, upon the large scale of those in London, will be established; and one of the main lines is already in progress of execution. A Hamburg paper of the 30th ult. states that the preparations for the marriage of the Crown Prince of Hanover are in great forwardness; nothing is known respecting the time when it will take place, but from the active manner in which the preparations are executing, it seems probable that it will be in a short period, perhaps before the end of January.

SWEDEN.—Letters from Stockholm of the 23d ult. mention that the King had been so much indisposed, that it was necessary to put off the Council for two days, but at the date of the last accounts his Majesty had somewhat recovered, and no serious apprehensions were entertained. These accounts notice the failure of the house of Gesthof and Co., of Stockholm. The liabilities of the insolvents are estimated at 400,000 thalers banco, or from 50,000*l.* to 60,000*l.* sterling. A considerable quantity of old Roman silver coins of several Emperors have been dug up in the Island of Gothland.

MALTA.—Accounts from Malta mention the narrow escape of H.M. steam-ship Geyser from shipwreck on the banks off Cephalonia, on the 3d ult. She struck on the Guardiana bank while on her passage from Malta to Corfu with the Ionian mails, but was fortunately got off, after throwing her heavy guns overboard, and succeeded in reaching the port of Argostoli before night. Her escape is the more remarkable, as a gale of wind came on during the night, and nothing could have saved the vessel had the machinery sustained injury.

RUSSIA.—The fête-day of the Emperor, on the 19th ult., was celebrated with the usual demonstrations at St. Petersburg. In the morning a grand mass was performed in the chapel of the Winter Palace, at which the Emperor and Empress, with the Imperial Family and the Court, attended. After the mass the Emperor received the diplomatic corps in the throne-room, and the ladies were admitted into the apartments of the Emperor to perform the ceremony of kissing hands. In the evening the whole city was brilliantly illuminated; and on the evening of the 20th there was a grand ball at Court.—The Report for 1841 of the Foundling Hospitals of St. Petersburg and Moscow, which has just been published, furnishes a serious picture of the mortality to which the inmates of those magnificent establishments are subject. At the end of 1840, the children under the care of the two great houses were in number 47,811. In the year 1841, the children deposited in the institution amounted to 46,572; and the number of deaths was no less than 10,155. During the same year, 6,749 of the children were either returned to their parents, or dismissed from the institution. Among the latter were 75 who were sent to study at one or other of the universities; 14 were placed in the schools of medicine, 88 in the schools for land-surveying, nearly 500 were sent to the several imperial manufactories, and 1068 were apprenticed to different trades.—Private letters from St. Petersburg of the 17th ult. state that the Minister of the Interior has communicated to all the governors of the provinces the following imperial order:—"Upon my report of the arrest of an incendiary, his Imperial Majesty has been pleased to order, if this criminal is convicted, he is immediately to be punished by running the gauntlet six times before 1,000 soldiers, at noon, and on the very spot where he committed the crime, and with all possible publicity and ceremony; if he survives the punishment, he is to be conveyed to the Siberian mines, to suffer 21 years' hard labour. It is his Majesty's wish that this punishment shall be applied in such cases when incendiaries are taken and convicted of such crimes. In cases of incendiaries who are not of age, a report shall be made to his Majesty before they are punished."

TURKEY.—Letters from Constantinople of the 18th ult. confirm the news already announced in regard to Syria, and the Minister for Foreign Affairs had announced officially to the representatives of the five great Powers, that the Sultan, in order to conform to the wishes of those Powers, had determined to intrust the administration of the Lebanon to two governors, one a Maronite and another a Druse. These two governors are to be appointed by the Pacha of Saida, to whom they will be subordinate. The Sultan has also determined to withdraw the Turkish garrisons. In regard to Servia, the *Augsburg Gazette* says that the French Ambassador M. de Bourqueney, has declared that Louis Philippe is not opposed to the protectorate of Russia over the Danubian provinces, and consequently not opposed to the restoration of the Milosch family. The *Carlsruhe Gazette* of the 31st ult. also states, that it is the determination of the great Powers to insist upon the restoration of Prince Michael to the throne of Servia, having resolved to defend legitimate right against the spirit of revolt. Letters from Paris announce the sudden recall of Redschid Pacha, the Turkish ambassador, at the Court of France. The immediate object of the measure was not known; but it was supposed that he would immediately succeed to some high office.

EGYPT.—Advices from Alexandria of the 16th ult. state that the Pacha has left Mansourah for Cairo, and that after staying there a few days, he will go on to Suez, where Boghos Bey, his Prime Minister, expects that he will give orders to have the canal, so long talked of, between Suez and Cairo immediately begun. Private letters state that an experiment of some importance in the improvement of the transit of passengers has just been made to try the capability of dromedaries for draught. "One of the new

carriages lately sent out by the Oriental Company was brought over here from Cairo with some difficulty, four horses being found scarcely sufficient to draw it on the heavier or sandy part of the road. It was here determined to try two dromedaries in it, and although the experiment was made under considerable disadvantage for want of proper harness, breastplates, &c., it proved completely successful, showing that the dromedary is much more valuable for draught than the horse in this country. Drawn by dromedaries properly harnessed, these new carriages will form a vast improvement, being far more commodious and easy than the clumsy vans hitherto used." We may also mention here that a small steam-vessel has been constructed for the Peninsular and Oriental Company with engines and patent propellers, intended to ply on the Mahmoudieh canal from Alexandria to Atfeh. The propellers consist of two small instruments in the form of the sails of a windmill, working in the run under each quarter of the vessel, and by means of multiplying-wheels are turned with great velocity; their action on the water propelling the vessel either forwards or backwards, according to the direction in which they are turned. The boat has been tried on the river, and went at a speed of eleven miles an hour without causing any perceptible agitation of the water. She has been since shipped at Southampton, on board the Oriental, for Alexandria.

CHINA.—The Great Seal of England was on Saturday affixed to the treaty recently ratified between this country and China, at the residence of the Lord Chancellor, in George-street, Hanover-square, after which it was transmitted to the War-office, for the purpose of being forwarded to the Celestial Empire, under the care of Major Malcolm. The seal is inclosed in a silver box, similar to that used for the patent of his Royal Highness the Prince of Wales, and, together with the important document to which it is appended, is inclosed in a case covered with crimson velvet. Of the seal itself, it is expected that no trace of the impression of Mr. Wyon's beautiful design will exist when the case reaches its destination, on account of the yielding nature of the materials of which it is composed; indeed, on former occasions, it has been discovered that during the comparatively short journey between Scotland and London, the design has been completely obliterated. Lieut.-Col. Malcolm left London with the Treaty on his return to China on Thursday last.

WEST INDIES.—The West India steam-ship *Thames* arrived on Sunday with West Indian, Mexican, and other mails, having left Demerara on the 3d of December, Barbadoes the 5th, St. Thomas's the 10th, and Bermuda the 16th. The papers received by her come down to the beginning of December, but they afford little information for the general reader. The dates from Jamaica are to the 3d ult., and the accounts from that island state the legislative proceedings as working in the most harmonious manner. The Assembly had under consideration laws for the better administration of bankrupt and insolvent estates, which, it would appear, were strongly called for, from the flagrant cases of fraud which had occurred under the present system. The Customs revenue for the year 1842 was 80,748*l.*, which, as compared with former returns, proved a favourable increase in the commerce of the island. Fears prior to the late rains had been entertained for the support of the crops against the drought threatened by the continued heat; but there was every prospect of suitable weather following, and the hopes of the planters were therefore revived. The advices from Demerara, Trinidad, and Barbadoes also speak of the favourable state of the weather for the crops, and the improvement trade was experiencing; but beyond these facts there is not a line worth extract in the papers, which are for the most part occupied with dissertations upon the evidence lately taken before the committee of the House of Commons, on the condition and prospects of the West Indies. According to the estimates made of the return of the crops, in all instances an increase is expected.

CITY.

Money Market, Friday.—The unfavourable state of the revenue has produced a decline in the price of Stock. Consols closed at 94½ to ½ for the Opening, ex div.; Three per Cents. Red., 95½; Three-and-half per Cents. Red., 102; Exchequer Bills, 59s. to 61s. prem.; Bank Stock, 172 to 3; India Stock, 261½ to 3.

Metropolis and its Vicinity.

The Weather.—A seasonable change took place in the weather on New Year's Day, and continued for two days, with every appearance of frost having at length set in. The whole of Sunday was one of the finest New Years' Days remembered for many years, the sun shining brilliantly. On Monday and Tuesday the frost continued with unabated intensity. All the smaller ponds in the vicinity of the metropolis were completely frozen up, and in many of the more exposed situations the ice exceeded one inch and a half in thickness, affording abundant employment to the itinerant vendors, who at this season of the year supply the pastrycooks and fishmongers with that necessary article. The larger sheets of water in the parks were partially frozen over, but the gates were not thrown open, as the ice was not capable of bearing. The brightness of the weather caused a very numerous attendance in the parks, which were crowded until dusk, notwithstanding the intensity of the cold. The Humane Society also made their arrangements for the prevention of fatal accidents during the prevalence of the frost. On Wednesday morning, however, the weather again changed; the wind suddenly shifted to S.W., accompanied by rain, by which the ice in the Parks was almost entirely broken up; another change occurred at night, and a north wind set in with a hard frost. On

Thursday and yesterday the weather continued extremely variable, presenting alternations of thaw and frost during the 24 hours, and completely at variance with the predictions of many of the weather prophets.

Income Tax in the City.—The committee appointed at a late public meeting of the inhabitants of the ward of Tower, to memorialise the Commissioners for General Purposes, on the subject of the improper increase which had been made upon the Income-tax returns of that district, had an interview on Saturday with the Chancellor of the Exchequer. They were accompanied by Mr. Masterman, one of the city Members. The deputation presented a memorial, stating that the Government surveyor had admitted, in a letter to the chairman of the meeting, that in the assessments for income alone, no fewer than 556 persons out of 1,542 had had their incomes estimated by the ward assessors, it having been alleged by the officers that these persons did not make returns; that upon inquiry he had found this to be partially untrue, inasmuch as some of the returns appeared to have been lost or mislaid; moreover, that the increases under schedules A and D had in almost every instance been made upon the suggestion of the ward assessors; that the ward assessor had presented himself at the meeting, and publicly denied this, and had charged his superior officer with having compelled him to make the increases. That the meeting, upon this evidence, had nominated the deputation then present as a committee to confer with the Commissioners for General Purposes, to whom a memorial was immediately prepared and presented, in which the illegality of an assessment, estimated or increased upon grounds such as those mentioned by the government surveyor, without the intervention of the additional commissioners, as required by the act of Parliament, was strongly represented; and that as no deliberation could have been bestowed upon the different cases, or discrimination exercised by the proper authorities, and, moreover, as it was quite apparent that neither the spirit nor the letter of the Act had been complied with, the memorialists prayed that the commissioners would be pleased to cause a re-assessment of the ward, according to the original returns, to be made; that the commissioners, in answer to this memorial, had said that the district represented by the deputation had certainly some reason to complain, but while they made this acknowledgement, they lamented it was out of their power to grant the relief which was prayed for. That the assessment-books having been signed by the additional commissioners, they were thus legalised, and that they have, therefore, no power to cause a re-assessment of the district. The abstract went on to say that the deputation had been compelled to bring the case before the government in the shape of the present memorial. That in doing so they had been actuated by no political or party feeling. That the district from which this complaint emanated had ever been remarkable for its loyal acceptance of all constitutional measures, and that the inhabitants, though they did not shrink from bearing their fair share of any public burden, felt confident the Government did not desire that they should be forced to contribute more than by law could be required. The Chancellor of the Exchequer, after hearing these statements, said that the individual who had been most in fault was the district assessor; and that officer not having been appointed by the Government, it was clear the Government had no control over him. A remedy for his defects lay rather in the hands of the inhabitants of the district themselves. If a case were made out against an officer who had his appointment under the Government, the Government could then interfere. Several members of the deputation then entered into details, and mentioned many instances which had come under their personal observation. Mr. Piper stated, on the authority of the assessor, that while that officer was at the chambers of the commissioners, going over the returns for the Ward of Tower, a junior clerk called out, from a remote corner of the room, "Have you come to So-and-so's return yet?" adding, "I know them well; they ought to make a wapping return! Put 500% on to them at least." Mr. Hunt, a member of the deputation, informed the Chancellor of the Exchequer that it was his case to which Mr. Piper had alluded, and offered to put the very document in his hands on which the addition was made. At the close of the interview, the Chancellor of the Exchequer said he felt obliged to the deputation for the statements they had made; the information which he had obtained would not be thrown away; and over and above, he would look into the case, as regards the legality of the assessment.

Sunday Trading.—For some time past, the inhabitants of St. Pancras have complained of the traffic allowed to be carried on, not only on the Sunday morning, but throughout the entire day. During the last few days, the various paving boards have taken the subject into consideration, and have issued printed notices, that any person opening shop on Sunday for the sale of any articles will be proceeded against with the utmost rigour of the law. The itinerants who sell articles in the streets have likewise been cautioned not to offend, as proceedings will be taken against them.

Metropolitan Churches.—The directions contained in the recent charge of the Bishop of London are complied with by a large number of the metropolitan clergy. On Sunday morning the Rev. Dr. Spry, rector of Marylebone, preached for the first time in his surplice. The Bishop, it will be remembered, recommended that the clergy should preach in their surplices in the morning, and in their academical gowns in the afternoon and evening. At the close of the communion service Dr. Spry ascended the pulpit, and proceeded to the delivery of his sermon without the introduction of the usual hymn or psalm, for which no provision is made in the Rubric or canons. At Trinity Church,

in the same parish, notice was given on Sunday morning, that in future the recommendations of the Bishop on the subject of preaching would be adopted—that all notices would be read by the clergyman from the reading-desk, instead of by the clerk as heretofore; that the sacrament of baptism would be administered immediately after the second lesson in the afternoon, and that the church would be opened for Divine service every morning during the week at ten o'clock, and every afternoon at four. The rectors of the remaining district churches in the parish are expected to follow the example of the rector. In St. George's, Hanover Square, however, and some other churches at the west-end of the town, the clergy have refused to comply with the proposed alterations. In the City the incumbents have held a meeting at Sion College, at which a deputation was appointed to obtain an interview with the Bishop of London. They expressed the apprehension of the clergy, that the alterations pointed out for their adoption would give great offence to the laity, but at the same time stated that if the bishop would order them to adopt them, they would obey. The bishop replied, he would not order, but it was his charge; the City clergy have, therefore, with few exceptions, made no alteration.

Hall of Commerce.—On Monday the opening of this very handsome building, recently erected by Mr. Moxhay in Threadneedle-street, was celebrated by a *déjeuner*, under the auspices of the Lord Mayor, several of the aldermen, and sheriffs. The interior of the establishment, which is at once spacious and elegant, consists of a hall of meeting, with every accommodation for the transaction of business connected with the general commerce of the kingdom; a reading-room, supplied with British and foreign newspapers; private apartments, to which parties meeting in the hall may retire to conduct negotiations of a confidential character; sample and deposit rooms, with iron safes, a register-office, &c. The Lord Mayor presided, supported by the chairman of the East India Company and the principal merchants of the City. Lord John Russell arrived some time after the commencement of the proceedings, and was received with loud cheers. The Lord Mayor, after giving, with all the honours, the usual routine toasts, proposed "Prosperity to the Hall of Commerce." He referred to the fact that the magnificent building under whose roof they were assembled had been erected by the unaided means of one man, at a cost of more than 60,000% ; and he felt confident that every one who had looked into its arrangements would agree with him, that such an institution was calculated greatly to increase the facilities and promote the interests of all who were engaged in commerce. Lord John Russell returned thanks as one of the representatives of the City of London, for the honour which had been done them by drinking their healths. He was sure they were all actuated by one cordial feeling of admiration of the public spirit and enterprise which had prompted Mr. Moxhay to undertake the building of that great and splendid hall, and they all wished him the fullest and most complete success. He hoped the undertaking would be successful for Mr. Moxhay's own sake, but he felt persuaded it would be a higher reward to him to find that his efforts had conducted in any way to promote the commerce and prosperity of that great city. This was not an occasion on which political matters should be introduced, but he trusted they were all anxious for the promotion of the prosperity of the City and of the country to which they belonged, whose prosperity, he might say, was so intimately connected and bound up with that of the City of London, that the City could not prosper without the country participating in the benefits to be derived from it. In conclusion, therefore, he would beg to give as a toast, "Prosperity to the City of London and the trade thereof." Mr. Moxhay and several other gentlemen addressed the meeting before it broke up. Among the embellishments of this institution, a statue by Mr. Carew, placed at the grand entrance, attracted general admiration. It is executed in Malta stone, and represents Whittington, the size of life, seated on the mile-stone, tired and dejected, at the moment when the merry sound of Bow bells strikes upon his ear.

The Great Northern Steam Ship.—This vessel arrived in the East India Docks last week from Ireland, and was visited on Monday by a number of Naval officers, including Capt. Sir Edward Parry, Mr. Lloyd, chief engineer of the Woolwich dockyard, &c. The Great Northern is fitted with Mr. Smith's Archimedean screw, and is one of the largest vessels to which that principle has hitherto been applied. She was built at Londonderry by Mr. W. Coppin, and laid down about 18 months since. The following are her dimensions:—Extreme length, 247 feet; extreme breadth, 37 feet; depth in hold, 26 feet; draft of water, 16 feet; with a dead weight of 1,300 tons, consisting of coals, ballast, machinery, &c. The diameter of the cylinder is 68 inches, the length of stroke 4 feet 6 inches, and the number of strokes per minute 17; the diameter of the propelling screw is not less than 11 feet. The Great Northern is frigate-built, pierced on her upper deck for 44 guns, and fully rigged as an ordinary sailing vessel. The mainmast is 90 feet high, and its diameter 33 inches. The length of mainyard 76 feet, and the diameter 22½ inches. When in full sail she spreads no less than 6,700 yards of canvas. Her speed under steam-power only was accurately tested before she left Ireland, on Loch Foyle, where she made 8½ knots per hour, equal to 9½ statute miles; and in her voyage to England she ran, under sails only, from the Ower's light, near Portsmouth, to Dungeness, a distance of 66 nautical miles, in five hours. The position of her machinery is near the stern, leaving the hold entirely free for mercantile purposes; and the boilers and furnaces are all placed below the water-line. The machinery occupies about 1-6th of the tonnage of the

vessel. The consumption of fuel is about one ton per hour; and the extraordinary capacity of the ship may be judged from the fact, that, with 600 tons of coal on board, she will still take in 1,000 tons of measurement goods, and afford accommodation between decks for no less than 800 troops. Her destination is not at present known, but there is said to be little doubt that she will be engaged in the India trade. Thirteen large vessels are at present fitting with the Archimedean screw, among which may be mentioned the Great Britain, now building at Bristol—a vessel of more than 3,000 tons burthen; the Rattler, Government frigate; and three French ships of war.

The Scottish Monument.—On Friday the workmen commenced the clearing of the ground in Regent Circus, which the Marylebone Vestry have granted to Mr. Hume, as the site of the proposed monument to the Scottish Reformers of 1793; and a long pole, showing its intended height, was placed in the centre. On Saturday morning, to the astonishment of the inhabitants and the public, the pole was found to be surmounted by a cap of liberty. Information was forwarded to the parochial authorities, who declined to mix themselves up in the matter. Some gentleman resident on the spot, it is stated, lost no time in conveying information of the occurrence to the Commissioners of Woods and Forests. The result was, that the red cap and pole were speedily struck down. At 11 o'clock the vestry assembled to consider a motion of which Mr. Gomm had given notice,—“That the safety and protection of the persons and property of the members of the board of vestry may be duly considered, the parish solicitor be instructed to submit his opinion in writing to the following question—‘Can any proceedings, and of what nature, be adopted, and by whom, against the board of vestry, or any or either of its members, for a recent grant of a portion of the parish land to Mr. Joseph Hume, M.P., to erect a column to the alleged Scottish martyrs?’” After an angry discussion, during which several vestrymen addressed the meeting for and against the motion, a show of hands took place, when the motion was declared to be negatived by a large majority. Mr. Gomm then demanded a division, upon which an extraordinary scene of confusion ensued. The moment Mr. Gomm mentioned a division, those who voted in the majority were seen rushing from their seats in all directions, making their exit as fast as possible in defiance of the authority of the chairman, who continued to use his hammer for some minutes to no purpose, the vestry at the time being in a state of the greatest uproar. The opponents of the monumental column insisted on the division, when the motion proposed by Mr. Gomm was carried by a majority of nine to eight. It was stated that the reason for the course adopted by those who left the vestry was to prevent their names being recorded in the event of legal proceedings being taken.

Fires in the Metropolis.—On Monday Mr. Braidwood, the superintendent of the Brigade Force, at the meeting of the Directors forming the Committee of the London Fire Establishment, made his annual report of the fires that occurred during the past year within the limits of the Metropolis. The report commences by stating that fires were on the increase in London, the number of last year exceeding by 73 those of the preceding 12 months, and being 213 over the average of the last nine years, though they have not been so extensive in magnitude. The following are the number of fires that have taken place since the Brigade was formed, ten years ago: In 1833, there were 458 fires, destroying 31 houses totally, and damaging 427 other buildings. In 1834, 482 fires; 28 houses burned down, and 454 damaged. In 1835, 471 fires; 31 houses burned down, and 440 damaged. In 1836, 564 fires; 33 houses burned down, and 531 damaged. In 1837, 501 fires; 22 houses burned down, and 479 damaged. In 1838, 568 fires; 33 houses burned down, and 535 damaged. In 1839, 584 fires; 17 houses burned down, and 567 damaged. In 1840, 681 fires; 26 houses burned down, and 655 damaged. In 1841, 696 fires; 24 houses burned down, 672 damaged; and in 1842, 769 fires; 24 houses burned down, and 743 damaged: making a total of 5,774 fires within the last ten years; including 269 houses totally burned down, 1,611 partially consumed, and 3,894 slightly damaged. The number of lives lost by houses taking fire during the period is as follows: In 1833, 12; 1834, 3; 1835, 11; 1836, 14; 1837, 13; 1838, 24; 1839, 25; 1840, 25; 1841, 11; 1842, 20—total, 158. These are the lives lost where the firemen were called, but many others have occurred through clothes taking fire, &c., of which no notice has been received. The chief portion of the fires broke out in the undermentioned trades: At booksellers', bookbinders', and stationers', 79; bakers', 140; brokers', 48; cabinet-makers', 84; carpenters', 245; chandlers', 48; chemists', 40; drapers' (woollen and linen) and mercers', 107; grocers', 59; hat-makers', 57; lodging-houses, 440; private dwellings, 1,935; public-houses, 318; oil and colour-shops, 87; lucifer-match-makers, 63; stables, 113; and sale-shops of different descriptions, 325. A great number have been proved to be wilful, and the offenders escaped punishment on account of the want of a prosecutor.

Fire at Somerset House.—On Thursday evening, about half-past 6, a fire occurred in the office of the Commissioners of Stamps and Taxes, in the south-east corner of the quadrangle of Somerset-house. It originated in one of the apartments on the basement floor, and was occasioned by a large fire having been lighted on the hearth (no stove being in the fire-place), which becoming overheated, communicated to the bond-timber underneath. Several engines were speedily in attendance, but the flames were subdued before they reached the spot, and very little damage was sustained.

Metropolitan Amusements.—The sums of money spent

in theatrical amusements on Monday, the 26th Dec., at the fourteen theatres now open in the metropolis have been calculated as follows:—Covent Garden 350*l.*; Drury Lane 350*l.*; Haymarket 220*l.*; Adelphi 120*l.*; Olympic 80*l.*; the Princess's 200*l.*; the Royal Marylebone 100*l.*; the Surrey 140*l.*; the Victoria 120*l.*; Sadler's Wells 80*l.*; the Queen's 75*l.*; the Norton-Folgate 90*l.*; the Pavilion 75*l.*; the Garrick 60*l.*—Total, 2000*l.* The following sums were taken at the popular saloons licensed to perform musical entertainments:—Grecian Saloon 150*l.*; Albert Saloon 100*l.*; the Bower 50*l.*; the Yorkshire Stingo 40*l.*;—making a total of 2,400*l.* taken at the doors of the various places of theatrical and musical entertainment.

Public Meetings.—On Tuesday, the half-yearly meeting of the London Dock Company was held, for the purpose of declaring a dividend for the half-year ending the 31st ult., and for the election of directors; Mr. John Cattley, in the chair. From the report, it appeared that during the half-year ending the 30th November last, the tonnage of vessels entered into the Docks was 149,452 tons, against 131,893 tons in the corresponding period of 1841, being an increase of 17,559 tons. The earnings of the company for the six months of last year, ending with the 30th November, were 182,655*l.* 4*s.* 3*d.*; and those of November, 1841, 186,878*l.* 15*s.* 6*d.*, or a decrease of 4,223*l.* 11*s.* 3*d.* The expenditure for the last six months was 105,482*l.* 19*s.* 9*d.*; and during the period ending the 30th November, 1841, 105,288*l.* 17*s.* 8*d.*, or an increase of 194*l.* 2*s.* 1*d.* The directors recommended a dividend at the rate of 1*l.* 17*s.* 6*d.* per cent., being more by 2*s.* 6*d.* than that agreed upon at the meeting in July last. The chairman, in explanation of the leading items of the report, observed that the Docks were progressing favourably, and that there was a balance of 191,429*l.* in favour of the company. There had been no new works erected in the last half-year. Although there was an increase in the tonnage since the last meeting, it would be seen there was no augmentation in the revenue. This arose from the greater number of corn-laden vessels that had arrived, the cargoes of which were not warehoused in the London Docks. The report was then adopted, and the dividend declared as proposed by the directors.—The half-yearly meeting of the Canada Company took place on the 29th ult. Mr. Ambrose Humphrys was elected a director, and a dividend at the rate of 6 per cent. on the capital paid up was declared. The Governor said that the sales in the crown reserves, up to the 24th November last, had been 33,963 acres, whereas in the same period in the previous year there were but 22,538 acres, showing an increase of 10,425 acres. In the Huron tract, up to the end of October last, the sales had been 25,605 acres, and in the same period of last year 6,367 acres only. There had been also 25,000 acres of the company's land in the Huron tract sold upon a new plan of receiving payment in twelve instead of six annual instalments. It was anticipated that the total sales of land in 1842 would amount to 100,000 acres, accounts having been already received of the sale of 85,000 acres. The receipts of the company had been satisfactory, being above those of last year, and the last instalment due to Government for the purchase of these lands had been paid.—The half-yearly meeting of the Imperial Slate Mining Company took place on Monday, Mr. W. R. Collett, M.P., in the chair. The report stated, that the company had recently become lessees of the whole of the slate mines, twenty square miles in extent, situated in the districts of Curraghally and Killaloe, in the county of Tipperary. The quarries had been surveyed by Mr. Cubitt, the engineer, and all the liabilities connected with the purchase of the railways, machinery, and property paid off. The sales at the quarries and different depots during the past year showed a considerable increase over those of the preceding year. One thousand men were now employed in the principal quarries, which produced upon an average 10,000 tons of slate per annum. The profit upon the workings for the past year, after payment of expenses, showed a balance of 2,775*l.*, applicable to the payment of a dividend at the rate of 6 per cent. per annum.—The half-yearly meeting of the proprietors of the Colonial Bank was held on Monday, Mr. Colville, M.P., in the chair. From the report, it appeared that the losses the bank had sustained beyond the reserved fund, were calculated at about 50,000*l.* The profit made during the half-year left an available balance of 14,361*l.* 1*s.* 5*d.*, from which the directors proposed to declare a dividend of 2 per cent. for the half-year, being at the rate of 4 per cent. on the paid-up capital. A motion for postponing the declaration of a dividend, and another for reducing the salaries of the directors from 3,500*l.* to 1,500*l.* per annum, were negatived by a large majority, and the report of the directors was adopted.—On Wednesday the half-yearly meeting of the Royal Santiago Mining Company was held. From the report it appeared that the produce of the six months ending the 31st August was, 5,683 tons of copper, which fetched at Swansea 55,008*l.* 9*s.* 11*d.*, which the balance of last account increased to 56,365*l.* 19*s.* 2*d.* A diminution in the proceeds of the mine had occurred since the previous half-year, which had caused the receipts to be less 5,000*l.*, and had been paid as import duty under the new tariff. The expenses for the same period, including the Income-tax, amounted to 31,513*l.* 11*s.* 6*d.*, being an increase of about 3,000*l.* over those of last year; but it was accounted for by the erection of new buildings and machinery for the more extensive working of the mine. The net profit on the half-year was 24,852*l.* 7*s.* 8*d.*, from which the directors declared a dividend of 3*l.* 9*s.* per share. After some remarks from Sir Samuel Scott, Bart., Mr. Thornton, Sir Isaac L. Goldsmid, Bart., the Hon. Leslie Melville, and other proprietors, the report

was adopted.—The Quarterly Court of the South Sea Company was held on Thursday. A long discussion arose on the prospects of the Company and the management of its affairs; after which it was resolved that a dividend of one and three quarters per cent. be declared on the Company's stock for the last half-year, and that the dividend warrants be paid on the same day as the Government Annuities. The Chairman said there was not sufficient money to make up the dividend, and that the deficiency would, as usual, be made good by Government.

Southwark.—It was announced, about a fortnight since, that the Bishop of Winchester had interdicted the performance of a concert for a charitable purpose in St. Saviour's Church, on the ground that no such performance ought to take place in a sacred edifice. On Friday, the *Standard* and other papers announced that his Lordship immediately wrote to the committee to ascertain what they calculated as the amount likely to be realised by the performance; and on receiving their reply that, on a rough estimate, they expected to have received between 150*l.* and 200*l.*, after paying the expenses, the bishop transmitted a cheque on his bankers for the larger sum, with a letter, stating that he would not allow the cause of charity to suffer by his conscientious scruples. Since the above statement appeared in the daily papers, Mr. Sturmy, on behalf of the Committee for conducting the proposed performance, has addressed a letter to the *Morning Chronicle*, stating that no such donation has ever been received, and consequently giving a total denial to the statement as to the Bishop of Winchester's alleged gift of 200*l.* to the schools; the fact being, that the Committee have not received one shilling towards the expenses incurred by them.

Hanwell Lunatic Asylum.—On Christmas Eve, the matron gave her annual musical entertainment to the female lunatics in this asylum. Nearly 300 patients were present, with a large number of visitors, among whom were two of the visiting magistrates and Mr. Mainzer, who added to the interest of the festival by singing two or three melodies in the course of the evening. After the patients had partaken of tea and cake, they danced with the attendants, and were then amused by listening to several simple ballads sung by the matron and others. At half-past eight, refreshments were distributed to each patient; after which the Evening Hymn was sung, and at nine o'clock they all retired in the most orderly manner. These entertainments to the insane, simple as they are in themselves, are found to have permanently beneficial effects. For five years the experience of the officers at Hanwell has proved them to be powerful moral agents for the good government of lunatic asylums, and for the improvement, comfort, and happiness of their unfortunate inmates.

Woolwich.—On Saturday last a meeting of the inhabitants was held for the purpose of making a rate for the repairs of the church, and other disbursements of the churchwardens. The probable expenses of the ensuing year having been submitted to the vestry, it was moved by the churchwardens, that a vote of twopence in the pound be granted; on which an amendment was moved by Mr. Colquhoun, that the churchwardens be empowered to pave the path leading from Church-street through the church-yard to High-street, and that a rate of threepence in the pound be granted, to enable them to carry this improvement into effect. The churchwardens stated, in reference to the last rate, that many had not paid it on account of poverty, and only two or three had objected on principle. The rate of 3*d.* was then carried, only one hand being held up against it.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, Dec. 24, 1842, was 833:—males 395; females 438. Weekly average, 1838-9-40-41—males 467; females 445. The occurrence of this mortality in the different districts was as follows:—West Districts 128; North 144; Central 149; East 205; South 207.

Provincial News.

Incendiary Fires.—On Sunday week, about 11 at night, the rick-yard of Mr. Hine, of Newnham, near Baldock, in Hertfordshire, was fired, and the whole produce of the farm, with the exception of some hay, was entirely consumed, consisting of five ricks of wheat, two of oats, two of barley, and one of clover seed. The damage is estimated at upwards of 2,000*l.* In Derbyshire, on the same night, the stack-yard of Mr. Naylor, of Pleasley, was fired; and before any assistance could be given, a barn, containing about 40 loads of wheat, and 5 stacks in the yard, were destroyed. In Lincolnshire, on the previous Friday, three stacks of straw, from which the corn had been threshed out in the course of the day, were burnt on the farm of the Rev. T. H. Rawnsley, at Halton. A stack of hay and some straw were fired, on Monday week, on the farm of Mr. Brackenbury, at Aswardby, in the same county. In Suffolk, on Wednesday week, the Red Barn, at Polstead, near Hayland, was fired and destroyed. This barn obtained notoriety about eighteen years ago by the murder of Maria Marten by William Corder. The amount of property burnt is calculated at about 300*l.*, and the authorities of the district have offered a reward for the apprehension of the incendiary.—On Saturday night a fire broke out at Tingewick, Bucks. Farm and other property to a considerable extent was destroyed. The Duke of Buckingham attended from Stowe, and exerted himself in arresting the flames; his grace's engine and fire-brigade were also on the spot. The flames were visible for miles round. A few weeks ago two incendiary fires took place at Steeple Claydon, a few miles from Tingewick.

Ashburton.—The fifteenth annual distribution of the Christmas bounty of the late Wm. Gifford, the translator of Juvenal, was made by the appointed trustees to the

poor of the parish, on Christmas-day, immediately after morning service. Twenty poor aged persons, 10 men and 10 women, were presented with 50*s.* each, and 200 shilling loaves of bread were given to as many poor persons: thus providing a seasonable relief to 220 poor families every year "for ever."

Aylesbury.—The *Aylesbury News* of Saturday states that the assessments of the Income-tax in that neighbourhood have caused much dissatisfaction, and have given a great deal of unnecessary trouble. "Parties from all the surrounding villages (some of them labourers, earning but 10*s.* or 12*s.* per week), were compelled to attend at the Court-house on Monday, and were kept waiting two or three days, thus losing their time, and being put to expense and inconvenience. In many cases the costs of the appeal amounted to more than three years' payment of the tax sought to be imposed."

Birmingham.—The National Conference held their last sitting on Friday. In the morning of that day they negatived a motion rendering the Clergy and dissenting Ministers ineligible to sit in Parliament; and after a long discussion of the details, adopted the "People's Bill" without a division. In the evening, they resolved that Mr. Sharman Crawford be requested to move in the House of Commons, at the earliest possible period, for leave to bring in the bill adopted at this Conference, with an understanding that he will consider himself pledged to all those details of the measure which are necessary to secure the just representation of the whole male adult population of the United Kingdom; such details to include equal electoral districts—vote by ballot, no property qualification, payment of members, and annual Parliaments. Another resolution was passed, requesting Mr. Duncombe to support the Bill. A plan was then adopted for the future operations of the Conference, which included public meetings in the various towns of the country, for the purpose of circulating addresses to the electors, and entreating them to vote only for such candidates for seats in Parliament as may advocate complete suffrage. The plan included a form of address, setting forth the grounds of making the appeal, and urging considerations to induce electors to pledge themselves to the course proposed. A form of pledge was also given, and suggestions for bringing it into public favour. The general object of the plan was to address the electors, obtain pledges from them, and by this means to obtain a register of the friends of complete suffrage, and consolidate the movement.—On the same day, the Chartists held the last meeting of their Conference. The conduct of the complete suffrage party in separating from the Chartist members of the Conference, was strongly condemned by Mr. Feargus O'Connor and other speakers, who characterised it as a "want of good faith," and endeavoured to pass a resolution to that effect. After a long discussion, this resolution was withdrawn and another adopted, in which the words "want of good taste" were substituted. The "People's Charter" was then considered in its several clauses, and it was resolved to keep pace with the complete suffrage agitation, by promoting in all parts of the country an agitation in favour of the charter.—On Monday, the Anti-Corn Law League had a festival at the Town-hall, at which from 1200 to 1400 persons were present. Mr. Scholefield, M.P., presided, supported by Mr. Cobden, Mr. Bright, and other active members of the League. Mr. Sturge also made his appearance, but took no part in the proceedings. The meeting was addressed at some length by the Chairman, by Mr. Bright, Mr. Cobden, and other gentlemen, and a subscription was commenced, at which about 200*l.* were collected.

Brighton.—The last sale of the property of Messrs. Wigney, the bankers, of this town, took place last week. The property being fully mortgaged, realised but little beyond the sums lent upon it, although the amount came up to the expectations of the assignees. The competition was spirited, but very few of the particulars have any general interest. One item among the shares is curious, as a proof of the little value of American speculations. It consisted of "Four certificates of Shares in the Missouri and Arkansas Clamorgan Land Association, United States, for 366*l.* each." For this lot there were six competitors, and the selling price was 6*l.*

Bury.—On Saturday last the Rev. Jonathan Ackroyd was brought before the Petty Sessions of this town, on two charges—first, for being a rogue and vagabond under the Vagrant Act—and, secondly, for having obtained money under false pretences. It appears from the evidence that the prisoner had levied contributions in various quarters, by representing that he was the incumbent of a church or chapel at Skircoat, near Halifax; that the church was in debt upwards of 2,000*l.*, owing on a mortgage; and that he was obtaining contributions to liquidate the debt. He further stated that he had performed the church duties and services there for a period of ten years gratuitously, and that the building was still in connexion with the Church of England. The police, on receiving intimation of these proceedings, conferred with the Archdeacon, who said that he had received upwards of 300 communications regarding the prisoner; and from these and other circumstances, it appeared that he had been receiving great numbers of contributions in the neighbourhood of Bolton and Bury. The Archdeacon further said, that not a penny of the contributions had been paid to the funds of the church, and that the prisoner had received a large amount not in the books. When he was apprehended, a book was found in his possession, entitled, "A list of the names of minor contributions towards the liquidation of a debt upon Christ Church, Skircoat, Halifax, Yorkshire, amounting to upwards of 2,300*l.*" The amount received by the prisoner, as stated in this book, was 792*l.* 11*s.* 6*d.*; but other books and letters, also found in his possession,

stated the aggregate receipt to be 2,249l. 19s. 8d. Other evidence was adduced to show that he had been previously in custody at Manchester, for obtaining goods by means of a false bill of Exchange. After a long inquiry, the Chairman said the Bench had a painful duty to perform, but they were compelled to execute it, inasmuch as the prisoner had not lately alone been going about in the manner described, but had been doing so for many years. It was time, therefore, to put a stop to such deeds. The Bench were unanimously of opinion that he should be imprisoned in the House of Correction at Salford, and there kept to hard labour, for three calendar months on the first charge, and that he should be committed to the Sessions for trial on the second.

Car-marthen.—We learn by the local papers that the marble statue of Diana, executed for the King of Prussia by German artists resident at Rome, and which was on board the galliot stranded about a fortnight since on the Cefn Sidan sandbank, has been recovered from the wreck. It appears, from the letter of a correspondent of the *Car-marthen Journal*, that it had a narrow escape from mutilation. The wooden case, part of which was four inches in thickness, had, in consequence of the top being off, become nearly filled with sand. This, added to its own weight, had made it so ponderous, that, not being able to raise it from the hold with the tackle then in the vessel, orders had been given to pull the statue from its case, a process which would certainly have broken it into fragments. Ropes had been actually placed for that purpose under its legs and arms, when Mr. Rees, of Kilmaenllwyd, arrived at the wreck; after consulting with Mr. Mansfield, of Llanelly, as to the possibility of its being raised entire, he gave him directions to let the statue remain for that day, and to bring on the following day the tackle, &c. necessary for raising it in the case. Accordingly, Mr. Kierhan, of Purry Port, sent on the next day his powerful tackle and screw-pump; and, under the directions of Mr. Mansfield, the statue was hauled by horses out of the hold, placed upon two pair of wheels, and conveyed to the storehouse at Pembrey, with the loss of part of a finger only. In addition to this the vessel was freighted with numerous cases of marbles of smaller size, all of which have been recovered without much injury.

Cheltenham.—Mr. Newton, the son-in-law of the late Sir Robert Ricketts, who recently brought himself prominently before the public by charging Lady Ricketts and other parties with compassing the death of the deceased baronet, has again made his appearance before the borough magistrates. On the former occasion, his case completely broke down, and not one of his charges was substantiated. He has now caused the valet of the late baronet to be apprehended on the charge of being a party to the alleged poisoning. The accused was brought before the bench last week, when the information was read over, and the chairman asked who was the complainant? No answer was returned, though the question was repeated three times, and the prisoner was thereupon ordered to be discharged. Mr. Newton then rose, and said he was the complainant in this case, and demanded that it should be proceeded with. The magistrates said he ought to have stated this before; and as the man had been discharged, Mr. Newton must procure a fresh information if he intended to proceed further in the matter.

Chichester.—The affairs of the Chichester Old Bank have been again brought before the public by the application of Messrs. Charles and William Ridge, the two senior partners, to the Court of Bankruptcy for their certificates. The application was opposed by Mr. Chambers, in behalf of the assignees, on the grounds that the failure was caused by the fraudulent trading of the bankrupts, in deceiving the customers by the fallacious manner in which they kept the accounts of the bank, and holding out their affairs to the world as profitable and prosperous, when they must have well known they were deeply involved in difficulties, and insolvent; by their extravagant mode of living after they were aware of the insolvency of their business, and also by the fraudulent disposition of the monies of their customers, under pretence of administering to their father's will, by which means they paid large legacies to their own family out of the funds deposited in the bank. These allegations were supported by a minute history of the affairs of the bank, in which it was stated that at the death of their father in 1829, the partners who now applied, without ascertaining how their affairs stood, paid legacies to their relatives to the amount of 12,500l., and drew out 3,000l. each for themselves, showing a total of 30,500l. they had taken from their customers' funds; and, according to the examination of Mr. Charles Ridge, it appeared that all this was done without ascertaining whether the father was indebted to the bank or not. Their annual balances were never properly ascertained; and, as a principle of bookkeeping they carried their bad debts, including the 48,000l. owing by Messrs. Fry and Chapman, their London agents, to the profit side of their accounts, and charged interest and compound interest on those bad debts from year to year. No distinction was made between good and bad debts, and by this system of bookkeeping it would, of course, to the casual observer, appear that they were transacting a profitable business. It was also stated that Mr. Charles Ridge had lived at the rate of 1,500l. per annum for years, when the bank was insolvent. A statement prepared from the accounts of the establishment put before the Court of Review gave the actual deficiency for each year since 1828. From this it appeared that in 1829 the deficiency was 51,400l.; in 1830, 51,900l.; in 1831, 50,000l.; in 1832, 47,000l.; in 1833, 42,000l.; in 1834, 40,000l.; in 1835, 52,000l.; in 1836, 59,000l.; in 1837, 62,000l.; in 1838, 74,000l.; in 1839, 79,000l.; in 1840, 80,000l.; and in 1841, the year in which the firm

stopped payment, the deficiency was 83,000l., and yet it was found that they had drawn out large sums of money from time to time. Under their fiat no less than 1,100 persons proved debts, many of whom were sufferers to the extent of the whole savings of a hard-worked and frugal life. Mr. Missing, for the bankrupts, replied to these charges, and contended that the bankrupts having made a true statement of their affairs, were entitled to their certificates. Although fraud had been alleged against them, no such motive had been discovered upon reading the examinations which had taken place. The erroneous method of keeping the accounts did not involve fraud, neither could it be said that the world had been deceived by them, since their books were never open to the inspection of the customers or the public. It was error of judgment, and not of the fallacious system of making the accounts, the payment of the legacies was made. In conclusion, he argued that the bankrupts were innocent of any intended fraud, believing, up to the period of their stoppage, that they were solvent, and as they had made a full discovery of their estate and effects, they were in his opinion entitled to their certificates. Mr. Commissioner Fane took time to consider his judgment. He should, he said, before he gave his decision, carefully read over the examinations referred to in the speeches of counsel on either side.

Coventry.—The papers have lately noticed the measures taken by the Bishop of Norwich for the removal of pews in churches, and for the restoration of the ancient custom of fitting-up the body of the building with open benches. We now find that similar efforts are making by the Bishop of Worcester, and that his lordship, in conjunction with the Archdeacon, has stated to the churchwardens of Trinity Church in this town, that the parish church is equally the property of all the parishioners; that any charge for pews or sittings is decidedly illegal; and a practice which the bishop, as the Ordinary, cannot sanction. In consequence of this communication, the wardens have allotted the pews and sittings indiscriminately to the parishioners on application, and free of any charge.

Durham.—A petition has been forwarded from the Bannockburn Colliery to the Marquess of Londonderry, for presentation to the House of Lords, praying for an alteration in the Collieries' Bill of last session. In acknowledging the receipt of this petition, Lord Londonderry recommends "that efforts should be made by all the other collieries in Scotland; and that petitions should be prepared in like manner by each of them, disapproving of the late bill." He also states that, in order to effect their purpose, "the petitions should be very numerous, and active exertions should be made by all colliers." From this it is evident that an attempt will be made in the ensuing session of Parliament, on the part of the owners of collieries, to procure a repeal, or an alteration in Lord Ashley's Act.

Halifax.—An extensive system of forgery on the provincial banks of the Midland counties, and also on the Bank of England, has recently been discovered in this town. Eight persons were apprehended as the principal parties in the confederacy, and the most important witness was one of their accomplices, who had been in custody at Nottingham on three charges of uttering false notes, and who now appeared to give evidence against them. The notes which were forged were those of the Wirkworth and Ashbourne Bank, and those of the Halifax and Huddersfield Bank. There appears to be no doubt that the system has been carried on for a considerable time, and to a large amount. Seven of the prisoners have been committed to York to take their trial at the next assizes.

Harwich.—The corporation and inhabitants of this town have addressed a memorial to the Lords of the Treasury, representing the rapid changes which are daily taking place in the harbour, caused by the fall of the cliff called the Beacon-hill, on the western entrance of the harbour; and stating that further and more extensive changes are daily taking place in the southern point of the beach, below Landguard-fort, the point having encroached so far into what was formerly the deep-water channel, that the lights erected but a few years since, at a great expense, are no longer found to be a safe leading-mark into the harbour. They express their belief that these changes arise principally from the removal of stone from the Ordnance shore for the purpose of making cement, many thousand tons being annually removed and converted, with the consent of the Board of Ordnance; so that, in a few years, unless a stop is put to such proceedings, Harwich must inevitably become an island; and the harbour, if not entirely destroyed, will be so much deteriorated and blocked up, as to render it, in a great measure, useless as a harbour of refuge, to the injury and danger of a numerous class of vessels which now resort to it for shelter. They conclude by praying for an inquiry into the statements of their memorial, in order that Government may adopt measures for preventing the results to which they refer.

Hertford.—The General Quarter Sessions for this county commenced on Tuesday, the Marquis of Salisbury in the Chair. The principal topic of discussion related to the county expenditure for the maintenance of the rural police. It appeared from the Parliamentary documents, which were quoted by several of the magistrates, that the cost of maintaining the police force in the county of Hertford greatly exceeded that of other counties in England. Durham, with 80 police constables, cost the county 750l. less than Hertford with only 70. In Suffolk, which had 67 constables, the cost of the rural police was 2,000l. less than that of Herts; and in Worcestershire, where there were also 64 constables, the cost was 1,750l. less. Two or three cases were brought under the consideration of the Court during the day, where members of the Rural

Police had made offers to offenders to compromise, for trifling pecuniary returns, charges which had been preferred against them. In the opinion of the chairman, it was the bounden duty of the county to prosecute with rigour all such cases. After some discussion, with reference to the sale by auction of the Berkhamstead and Hitchin Bridewells, and the proceedings advisable to be taken to obtain a more equal assessment of the county rate, the sessions were adjourned.

Jersey.—We learn by the *Jersey News* that the Mayor of Weymouth has addressed letters to the Chamber of Commerce in Guernsey and Jersey, intimating that Government are about to allow the mails to and from the Channel Islands to be conveyed by contract from Southampton, and that the vessels now running between that port and the islands had been surveyed and approved, in consequence of which he requested their influence to prevent the removal of the packet station. The Chamber of Commerce in Guernsey having already voted in favour of Weymouth, decline any further interference, but that in Jersey have decided in favour of Southampton by a majority of 7; the numbers being, for Weymouth, 18, and Southampton, 25.

Liverpool.—The Liverpool papers mention, as a proof of newspaper despatch, that the President's Message, brought by the Independence, was received in that port on the afternoon of Sunday the 25th, at three o'clock. A copy of it was forwarded, at a quarter past four, by an express engine to Birmingham—the distance from the Edge-hill station of the Grand Junction Railway to that town (97 miles) having been performed, including the stoppages to take in coal and water, in two hours and 30 minutes. From Birmingham, it was forwarded by a second express engine to London. There it was set up, and copies of the *Times* containing it were received in Liverpool at a quarter to four o'clock on Monday afternoon—just 24 hours from the time it left Liverpool, and after having travelled, up and down, 420 miles.—On Thursday evening this city was the scene of another extensive fire. It broke out suddenly about half-past five, in the workshops of Messrs. Foster and Stewart, the extensive joiners and builders, in Lawton-street. The yard in which the workshops stood extends from Lawton-street to Newington, and is 112 yards in length by 60 in breadth. The shop was filled with timber and new work, all of which, with the building, were destroyed; the flames having spread with great rapidity, the strong north-west wind which was blowing at the time fanning them in an extraordinary manner. The buildings on the same site were completely destroyed about nine years ago by a similar calamity.

Norwich.—The local papers inform us that the number of presents sent by the different coaches from Norwich to London during the Christmas week, amounted—by the Ipswich mail to about 400; by the Newmarket mail, 400; Phenomenon, 250; Telegraph, 346; Magnet, 1,400; Mack's Van, 280. Total, 3,076.—They also state that the amount already subscribed to the public monument to the memory of the late Earl of Leicester, is 4,440l. 6s. 6d.

Pembroke.—The Naval papers mention that the Admiralty have given orders that the Royal steam-yacht now building at this dockyard for the use of her Majesty be entered in the Navy List, under the title of "The Victoria and Albert Yacht." She will cost, it is said, little short of 100,000l., and is expected to be ready for sea in the course of the ensuing spring.

Portsmouth.—On Sunday morning Admiral Sir Charles Rowley hoisted his flag (white at the main) as the Commander-in-Chief at this port, on board the St. Vincent, under the customary salutes. His predecessor, Sir Edward Codrington, hauled down his flag on Saturday evening at sunset, having in the course of the day mustered the ship's company and taken his leave of them. On quitting the ship, the men gave him three cheers; and as he passed the Victory, the crew of that ship manned the rigging and cheered him.—The Archduke Frederick of Austria, whose frigate, the *Bellona*, has been lying at Spithead for about a fortnight, detained by the strong westerly winds, has at length been enabled to take his departure, the wind having shifted to the northward. His Imperial Highness had only landed once since he left the harbour on Thursday fortnight.

Reading.—Early in the ensuing spring, a new church will be erected at Sonning, near this town, on a piece of ground given by Lord Sidmouth for the purpose. The estimated cost of its erection is 2,000l., and nearly that amount has been already subscribed. Mr. R. Palmer, one of the members for the county, has presented the sum of 200l. in aid of the undertaking. The population of Sonning very nearly approaches 3,000, and it is intended that the new edifice shall afford accommodation for about one-fourth of that number.

Southampton.—The annual festival of the Gipsies of the New Forest was held on the 28th ult. on the Rev. Mr. Crabb's grounds, about a mile from this town. On these grounds the families and tribes of the gipsies of the forest were invited, according to the yearly custom, to partake of a dinner, and to receive various articles of winter clothing. These presents are furnished by means of subscriptions of the residents in all parts of the county. At two o'clock, nearly 200 gipsies, consisting of men, women, and children, sat down to a dinner of roast beef and plum pudding; and were waited on by the gentry of the neighbourhood, who assembled in large numbers to witness the scene.—On Monday, the 26th ult., a party of labourers from Lea and Romsey assembled at a shooting-match at Toothill, near the latter place. In the course of the evening a fight ensued between the people of the two villages, during which an old man named Savage, 70 years of age, was so seriously wounded, that he died in about 36

hours. An inquest has been held, and a verdict of Manslaughter returned against 14 persons, who have been committed to Winchester gaol to take their trials at the next assizes.

St. Asaph.—Public attention has lately been directed to the state of the Welsh bishoprics, by the contemplated union of the two dioceses of North Wales. It appears that the net value of the diocese of St. Asaph is 6,301*l.*; the net value of the diocese of Bangor is 4,464*l.* In the former see are 143 parishes, in the latter 131 parishes—making together 274 parishes, which is far below the average number of parishes in any English diocese, while in respect of population the inferiority is yet more striking. In the diocese of St. Asaph there are 52 livings under 200*l.*, in the diocese of Bangor there are 61 livings under 200*l.*—of the former, 38, and of the latter, 26 are in the gift of the respective bishops, who are in many cases the impropriators of the great tithes. In the diocese of St. Asaph, the bishop is the impropriator of 13 livings, the total revenue of which is 4,668*l.*, and in the diocese of Bangor, the bishop is the impropriator of 7 livings, the total revenue of which is 1,120*l.* From the former see, therefore, is required 932*l.*, and from the latter 280*l.*, to raise the value of these livings to 200*l.* each.

Warwick.—The excitement produced in the Western Districts of Warwickshire by the melancholy occurrence at Sperrall, of which we gave the particulars in our last, has not subsided. At the inquest last week the evidence adduced merely substantiated the facts already published, and proved that the father of the young man, a respectable farmer at Sperrall, was the person against whom his anger was principally directed; that the deceased was acting as a special constable for the protection of Mr. Crowley, and that while deceased was approaching for the purpose of apprehending the son, the young man shot him dead in the presence of several witnesses, and in open day. The jury returned a verdict of Wilful Murder against James Crowley, and a reward has since been offered for his apprehension.

Winchester.—The Quarter Sessions of the county commenced in this city on Tuesday, and were more numerous attended than on any former occasion, no less than 124 magistrates being present. The cause of this attendance was the election of a chief constable of the county police in the room of Capt. Robins, who had resigned. At the close of the poll the numbers were—for Capt. Harris, 64; for Capt. Morant, 57. The former gentleman was then declared duly elected.

Windsor.—The last stone of the spire of the new Military Church, of which Prince Albert laid the foundation in April last, was fixed on Friday, and the arrangement of the interior is now in progress. The body of the church will be fitted up with open benches, without pews. In addition to the accommodation afforded to the Military, there will be about 1,000 sittings for the inhabitants of Windsor and Clewer. The principal feature of this church is the tower, nearly 100 feet high, and surmounted by a spire, of Bath-stone, rising 48 feet. The cost of the building will be about 10,000*l.*, nearly one half of which is already subscribed, Her Majesty and Prince Albert being large contributors. The building is designed by Mr. Blore, and when complete will form a striking object from the Castle and surrounding neighbourhood.

Worcester.—The County Sessions commenced in this city on Monday, Mr. Pakington, M.P., in the chair. For some time past considerable disapprobation has been manifested throughout the county, on account of the alleged expense and general inefficiency of the Rural Police, but more especially on account of the great burdens imposed on the agricultural districts, as compared with those of the manufacturing towns of the county. At the present meeting, a committee appointed at the last sessions delivered their report on the propriety of re-organising the county police. The report stated that the committee had made inquiries as to the population of each parish in the county, and the number of paid constables appointed under the Parish Constables' Act, commonly called Sir James Graham's Act, that they were not prepared to deny that some improvement had taken place, but they thought it vain to expect that the main objects of a constabulary force would be secured by the operation of that act. The committee recommended that no reduction be made in the present constabulary force. Several gentlemen then addressed the meeting on the subject, contending that the Parish Constables' Act, if carried out with energy, would fully answer the purposes which the present Government contemplated by the introduction of that measure. After a long and desultory discussion, it was resolved that the report be received, and that a committee be appointed to obtain information with regard to the probable effect of the New Parish Constables' Act, and to see how far it could be efficiently carried out in the county of Worcester. It is generally considered that the report of this committee will be preliminary to the abolition of the Rural Police force in July next.

York.—A meeting of the shareholders of the Yorkshire Agricultural and Commercial Bank was held in this city, on Thursday, the 29th ult. Mr. Blanshard, the chairman, stated that the whole of the original capital had been lost, and that the liabilities of the bank amounted to upwards of 179,000*l.* After a very stormy meeting, during which several shareholders declared that they had embarked the whole of their fortunes in the company, and that they were now ruined, it was resolved that a call of 1*l.* per share, in addition to the two calls of 1*l.* each lately granted, should be made for the purpose of meeting the deficiency, and that the affairs of the company should be wound up as soon as possible. The greatest distress prevails in this city and neighbourhood upon the subject; and the details which have been made public show a case

even worse than that of the Bank of Manchester. It appears that the Bank was projected in 1836, and started with a paid-up capital of 70,000*l.* for the towns of York, Whitby, Driffield, Malton, Hull, Leeds, and Pocklington. The amounts since added make up a total capital of 211,000*l.*, all of which has been lost, and a heavy amount of liabilities remains to be met by the shareholders in addition to their present loss. At the outset an error was committed which was enough to shake the stability of any provincial bank. The directors took the business of the Northern and Central Bank at Leeds, paid them 6,000*l.* for the good-will, and took accounts to the amount of 80,000*l.*, for which they paid down Bank of England notes. On this 80,000*l.* there has been a loss of about one-half. All the dividends, which have been regularly declared, are now said to have been paid out of capital, when in fact there was no dividend to declare. The effects of the failure will be severely felt by the agriculturists; and the *Leeds Mercury* observes that it is a painful feature of the case that many of the shareholders are widows and persons of small means, who, tempted by the success of two other banks in York, invested their money in this undertaking, and have lost everything.

Railways.—The following are the returns of the principal railways for the past week: Newcastle and Carlisle 1,340*l.*; Liverpool and Manchester 3,698*l.*; Great Western 13,691*l.*; South Western 5,516*l.*; Birmingham and Derby 1,322*l.*; Birmingham and Gloucester 1,719*l.*; Hull and Selby 882*l.*; Grand Junction 7,741*l.*; Great North of England 1,332*l.*; Midland Counties 2,718*l.*; Manchester and Birmingham 2,477*l.*; Manchester and Leeds 3,966*l.*; North Midland 4,330*l.*; York and North Midland 1,706*l.*; Blackwall 569*l.*; Croydon 222*l.*; Brighton 3,379*l.*; Eastern Counties 947*l.*; Greenwich 825*l.*; Northern and Eastern 1,331*l.*; London and Birmingham 16,886*l.*—The engine-driver and firemen on the North Midland line struck work on Saturday, the 24th ult., in consequence of a regulation by the directors, that the men should in future be paid only for the days on which they work, as is the practice on the Manchester and Leeds Railway. The directors took immediate steps to procure fresh hands, and a sufficient number of drivers from other lines have been engaged, so that the trains have continued to run without interruption.—On Sunday evening, an accident happened to the train on the Glasgow and Edinburgh railway. When near the Polmont station, being the first west from Falkirk, the engine was obstructed by an empty truck, which some malicious person had drawn across the line. The collision shattered the truck to pieces, and threw the engine off the rails, upon some soft ground, into which it entered without sustaining any damage. The carriages, 5 or 6 in number, and containing from 25 to 30 passengers, kept the rails, and although the shock was severe, the passengers escaped without injury.—A young lad was brought before the Mayor of Reading last week, charged with having wilfully placed a piece of iron on one of the rails of the Great Western Railway, for the purpose of throwing the train off the line. The policeman on duty discovered the obstruction only a few moments before the passing of the train. If it had not been removed in time, the engine would probably have been thrown down an embankment, 22 feet in depth. The prisoner, a farmer's labourer, pleaded guilty to the charge, and was fined 5*l.*, and in default of payment committed for 3 months.—We are informed by a correspondent that a serious accident occurred on Tuesday at North Shields, at the works now in progress for the formation of a street from the river to the terminus of the Shields and Newcastle Railway. Whilst the workmen were employed in excavating the new road, a large body of earth unexpectedly fell from the face of the cutting, and buried five of the workmen, who were loading the carts. The men were soon dug out, when three of them were found to be quite dead; while two others were seriously bruised, but hopes are entertained of their recovery. The foreman of the works was on the spot at the time, and narrowly escaped with his life.

IRELAND.

Dublin.—The proceedings of the Lord Chancellor in regard to the Irish magistracy, by removing from the commission those whom he considers to show unfitness for the bench, continues to attract great attention. Since the removal of Lord Lucan and Mr. O'Mally, the Chancellor has superseded Mr. Hugh Lawton in the commission of the peace, in consequence of his having, in strong and ungarded terms, entered a protest against the decision of two of his brother magistrates, in a case in which one of them was plaintiff. This led to a long recriminatory correspondence, which was submitted to the Lord Chancellor, who has ordered Mr. Lawton to be superseded, and an inquiry to be held into the conduct of Mr. Townsend.—A Mr. Egan, of Moate, formerly a director of the National Bank, has been charged with having conveyed away a parcel belonging to the company, which contained cash and securities to the amount of 3,000*l.* He affirms that the charge is the result of a conspiracy, and was only intended to draw away attention from the real delinquents. He will, however, have to take his trial upon the accusation. The following letter has been received by the managers of the National Bank, containing part of the stolen property, consisting of securities to the amount of 1,200*l.*; bank post bills to the amount of 500*l.*; and letters of credit to the amount of 450*l.*; leaving the amount of cash retained by the thief, 1,770*l.* The letter ran thus:—"You have enclosed who I sent by a person I met here; do not blame any person; I left one in place of it.—Liverpool, Tuesday."—A requisition has been published in the Dublin papers convening a meeting, to be held in the Theatre Royal, on Thursday, the 26th inst., for the purpose of taking steps to erect an "enduring

testimonial" of the esteem in which the labours of the Rev. Mr. Mathew are held by all classes of the community. This document is signed by 2 dukes, 4 marquesses, 11 earls, 3 viscounts, 4 barons, and by nearly 200 other names; comprising the leading gentry, merchants, and several clergymen of all religious persuasions.

Limerick.—The temperance movement continues to meet with great success in all parts of the country. The *Limerick Chronicle* says—"We are exceedingly happy to announce the gratifying fact of not a single drunken person being taken up by the police in the streets during the Christmas week—an occurrence unprecedented in the annals of Limerick, and of which the friends of temperance should feel truly proud." We learn also by the Cork papers that seven non-commissioned officers and three hundred privates of the 45th Regiment accepted the pledge of total abstinence last week from the Rev. T. Mathew, at his residence in that city. The Belfast papers also mention a circumstance of the same kind. On Sunday last, being New Year's Day, about 90 soldiers of the 54th Regiment, at present stationed in that town, adopted the total abstinence principle. Among these were several sergeants and corporals, who have determined, with about 400 of their comrades who have already taken the pledge, to commence the new year by abstaining entirely from all intoxicating drinks.

Galway.—The inquest on the sufferers by the late melancholy accident in the Catholic chapel of this town was brought to a close on Friday, after a very long and minute investigation. The coroner, in summing up, said the evidence might be compressed into a very narrow compass. The same facts were detailed by the several witnesses examined, and, with few exceptions, they corroborated each other, and established beyond doubt that the cry of the gallery's falling originated in the body of the chapel, under a gallery where it happened considerable confusion arose from the pressure occasioned by a vast crowd of persons collected on it. Some of those underneath the gallery, through timidity and nervousness, dreaded an accident; for which, it appears, there was no ground for apprehension, and labouring under that impression, innocently raised the cry—immediately caught up and echoed through the building—that the gallery was falling. He was glad that the case was so publicly investigated—reports were set afloat and circulated, without the shadow of foundation, deeply affecting the character of a few individuals, differing in religion from the congregation assembled in the chapel on Christmas morning. It was but justice to the individuals alluded to by the reports to state, that it appeared in evidence, that their demeanour, while in the chapel, before the alarm was spread, was not only decorous, but that their conduct afterwards was praiseworthy. The jury returned a verdict, that the deaths of the persons killed on Christmas morning last were caused by the rush of the congregation to gain egress, on a cry being groundlessly raised, by some person or persons unknown, that the galleries were falling—and that the alarm was created without any malicious intent. Since the first accounts were published, four more persons have died; making a total of 37, who perished by the catastrophe.

SCOTLAND.

Edinburgh.—Among the projected improvements upon the Palace and Park of Holyrood, public attention is now directed to the re-edification of the Chapel Royal, as a matter of the first consequence. Independently of its value as an example of Gothic architecture, this venerable ruin possesses a higher interest as the depository of the relics of the ancient Scottish monarchs; and the Edinburgh papers state that it has long been a reflection upon the country, that a structure devoted to such a purpose should be left in a state of neglect and desolation. They state that the late Government incurred some expense in procuring plans for its restoration, and that it would be most gratifying to the national feeling that these or similar plans should be carried out, as a sequel to her Majesty's late visit to Scotland.—In the High Court of Justiciary, on Saturday last, Alexander Mackenzie, cattle-dealer and farmer, at Drumhead, Forfarshire, was indicted on a charge of assault, by means of loaded fire-arms, with intent to kill Mr. James Duff, a grazier, at Whitefield, Perthshire. The prisoner pleaded guilty, and threw himself on the mercy of the court. Sir James Ramsay, of Banff, stated that he had been his tenant for 20 years, and had the highest opinion of him previous to this event. The Rev. James Watt, and other respectable witnesses, gave similar testimony. The Lord Advocate said, on the part of Government, that the statute had given him power to restrict the libel; and, after the greatest consideration which the law-advisers of the Crown could give to the case, they had come at last to the opinion, that it was consistent with their duty that the prisoner should not be allowed to receive a capital sentence, but that, as Her Majesty's Advocate, he should interpose the plea which the statute has given him, and spare the prisoner the ultimate sentence of the law. Lord Mackenzie, in reply, said:—"This is certainly a most noble and generous sentiment, said:—We have here standing at the bar a man who has lived a respectable situation as a Scotch farmer—a man of religious, moral, and steady habits—a man who seems to have been kind to his relations, and just in his previous dealings; and yet he has done that which has brought him to stand at this bar to answer to a charge which, I am sorry to say, is one of the most atrocious that have ever been compelled to listen to. He confesses—It is impossible to take his confession lower than that, I think the words of the indictment, and the nature of the case, show plainly that no lower confession could or would be taken off his hands; he confesses, that from motives, if not of a malignant, yet of a wretched and sordid

nature—from regard to some pecuniary advantage—he formed the purpose of assassinating his friend; and that he, as far as he had the power, executed his purpose; that he waylaid him, and fired at him with intent to kill him. As Her Majesty's Advocate had found it consistent with his duty to restrict the libel, the court had not to execute the capital sentence; and he therefore proposed that the prisoner should be transported for life. Lord Medwyn and the Lord Justice Clerk coincided in this view, and the prisoner was sentenced accordingly. The prisoner, whose mental suffering had been apparent throughout, was then removed. He is described as being between 50 and 60 years of age, of tall stature, which anguish had bent almost double; and every feature in his countenance betrayed the misery which for the last few months he had undergone. When the Rev. Mr. Watt and Sir James Ramsay gave their testimony, his tears flowed unrestrained, and during the time the judges were speaking, his feelings were equally apparent. His pitiable condition is said to have moved the compassion of every one in the court, which was crowded to excess throughout the whole trial.

Glasgow.—On Friday night, about nine o'clock, the embankment or breast of Glanderston Dam, near Barrhead, gave way, and the contents of the reservoir rushed down the channel of the burn with irresistible velocity. The first place which suffered from the flood was the Print Works of Springfield, occupied by Messrs. Hardie, Stark, and Co., where three entire houses and a young lad employed on the premises were swept off. The works of Springfield are entirely suspended by this occurrence; the whole of the machinery, the goods in course of finishing, and the vessels and stock of printing materials, including about 3000 worth of indigo, were all carried away by the current, inflicting serious loss on the owners. The next place which suffered from the flood was the Print Works of South Arthurlie, occupied by Messrs. Hays and Sons, and situated about a quarter of a mile below Springfield. Here the destruction of property was not so great as at Springfield, but the loss of life was much more serious. Two dwelling-houses, a large out-shed, and a byre, with all their contents, were instantly carried away, and with one of the houses, the entire family of occupants were drowned and buried in the ruins. With the exception of the husband, the other family shared the same fate as their neighbours; and nine persons have perished in the two houses. Besides this damage the current also swept down a portion of the garden-wall at Arthurlie House, the property of Mr. Lowndes. At two farm steadings further down, a good deal of property was likewise carried off, and the bridge at Darley was destroyed.

THEATRICALS.

COVENT GARDEN.—Miss Rainforth made her first appearance in *Semiramide* on Monday night, and though perhaps deficient in physical capability for the part, she won the good opinion of the audience, and established her claim to a high rank both as a vocalist and an actress. The part of *Semiramide* requires no ordinary qualifications, and Miss Rainforth displayed an energy in overcoming its difficulties which was hardly expected even by those who have long appreciated her merits as a very accomplished singer. At the conclusion of the opera she was loudly called for, and was cordially applauded by a house full in every part.—A new farce called the *Highwayman* was produced at this theatre on Wednesday. It is not remarkable for any novelty, being manufactured out of old and well-used materials; but it is, nevertheless, full of incident and absurdity; the audience are kept alive by a succession of ridiculous scenes; and the object of producing a laugh is attained. As the piece is made up with mere conventionalities, there is no plot worth unravelling,—but we may state that Mr. Bartley personates an old country *Squire Jolly Boy*, and that the other principal characters are sustained by Mr. Harley, Mr. Meadows, and Mrs. Humby.

Miscellaneous.

Winter at St. Petersburg.—The following account appeared lately in one of the Paris papers:—"Winter is more variable at St. Petersburg than at Moscow, that is, the cold does not reign there with such continued severity. Thus, for instance, it is said not to be a rare circumstance at Moscow to find a fruit-peeling, or any other matter, thrown by chance from a window, catch on the balcony, and, becoming immediately frozen, remain there suspended for the rest of the winter. Such a case could not occur at St. Petersburg, where, although the thermometer often descends to 30 degrees of Reaumur below zero (35° below zero of Fahrenheit), the neighbourhood of the sea combats the icy winds of Siberia, and unexpectedly brings on the most strange changes in the temperature. It has never rained, in the memory of man, at Moscow, during the months of December and January. At St. Petersburg, on the contrary, rain frequently falls during these two months, and at that period it has been constantly the custom to replace carriages by sledges. This latter kind of vehicle, which no person gives up, becomes the most inconvenient in the world, being driven in the midst of snow and mud. The winter at St. Petersburg, on account of these sudden transitions, so unexpected and so rapid, is far more formidable than at Moscow, and to strangers who have not experienced its effects is particularly serious. To defend one's self from the weather the most constant and minute precautions are required. In October the Russians, and all who have been long in the country, assume fur clothes, and keep them in continual wear until the month of April, after the ice has broken up on the Neva. Stoves are lit everywhere, and each family lays in a stock of birchwood, the braise of which

is more abundant than of any other wood. There is a servant specially appointed to attend to the stoves, and his duty is to keep up, as much as possible, an equal heat throughout the house. The best stove-keepers, whose fame procures them a high salary, are generally from Moscow. Twenty degrees of cold do not appear astonishing to an inhabitant of St. Petersburg, though he then casts a curious look at the thermometer. At 23 or 24 degrees, constant rounds are made during the night to prevent the police and sentinels from falling asleep on their posts. Should the cold bring on drowsiness, and the sufferer not be able to prevent himself from yielding to its influence, he must perish, as he can only wake from his sleep in the other world. At 25 degrees, the theatres are closed, and all those who are obliged to go out on foot, hurry along with their utmost speed, most anxiously looking at the noses of all those whom they meet in the street. If a sudden paleness—of which no intimation is given by any physical feeling—should appear on that part of the face, the passer-by rushes forward, and commences rubbing the afflicted feature of the alarmed passenger with snow, to produce animation. The same thing may occur to the operator himself before the hour is over. At 30 degrees of cold, the populace alone go out of doors; entire families shut themselves up; and not a single sledge of any appearance of fashion is seen in the streets. Yet even then the military reviews are not interrupted, and the highest dignitaries, up to the Emperor himself, repair to them without a cloak. It must be evident that, with cold of such intensity, the sufferings of the poor must be dreadful; yet it may be affirmed without exaggeration, that the lower classes, in winter, suffer less in Russia than in France. There are placed in the various quarters of every large town of the empire public establishments, heated by large stoves, where every person that pleases may take refuge."

Law.

COURT OF CHANCERY.—*In re Hartley.*—This was a petition to discharge an order of the Vice-Chancellor, by which certain Cornish miners were to stand committed for a trespass on the land of which a Mrs. Hartley is the receiver. It appeared that there is a custom in the Stannaries of Devon and Cornwall, under which men may stream or board for tin, or open a waste land, or on land which has been already streamed. The ground in the parish of Wendron, on which the alleged trespass took place, was supposed to have been already streamed by a defunct company called the Royal Duchy Mining, but this was denied. The Lord Chancellor, after hearing the circumstances of the case, was of opinion, that the order for commitment, as against the petitioners, ought to be discharged. There was no pretence for charging them with any intention to commit a trespass. It was clear that the object of the parties who employed them was to try a right, and it was against them that proceedings might be had.

In re Shore.—In this matter of the Lady Hewley's charity, a reference to the Master was ordered by Lord Cottenham, for the appointment of new trustees. Those trustees have been appointed, and a petition presented to the Vice-Chancellor to confirm the Master's report. A petition has also been presented against the confirmation of the report, on the ground that the selection of the trustees from so many different classes of dissenters is highly objectionable. A third petition is before the Lord Chancellor to get rid of the original order of reference made by Lord Cottenham, and a petition was now heard to obtain the consent of his lordship to the hearing of all the petitions before the Vice-Chancellor on the ground of the expense and loss of time which must ensue if the Vice-Chancellor heard and made orders on the first two petitions, and the Lord Chancellor afterwards heard the third petition, and rendered all the proceedings nugatory by discharging the original order of reference. His Lordship, after hearing counsel on both sides, directed the hearing of all the petitions before the Vice-Chancellor in the same manner as if one of them had not been a petition of appeal.

VICE-CHANCELLOR'S COURT.—(Before Sir L. Shadwell.)—*Imray v. Tegg.*—Mr. Bethell moved, on behalf of Mr. Tegg, the bookseller in Cheapside, to dissolve a special injunction granted *ex parte* on the 19th November last, restraining him from continuing to publish a treatise, called "The Cyclopædia of Domestic Medicine, intended for Popular Use," which was alleged by Keith Imray, M.D., of the Royal College of Physicians, Edinburgh, to be a piracy of a work bearing a similar title written by him. It was proved that Mr. Tegg had purchased the copyright of the work at the bankruptcy sale of Messrs. Arnold and Ball. His Honour said it was simply a question whether a man should be permitted to sell what he had purchased. It was quite impossible to support the injunction, which must be dissolved with costs.

CENTRAL CRIMINAL COURT.—The third Session of the present Mayoralty commenced on Monday, before the Lord Mayor, Recorder, Sheriffs, and other city authorities. The only point in the Recorder's charge to the Grand Jury which offers any interest for our readers, is his exposition of the law in reference to a charge of cutting a holly-tree, which involves a charge of felony under the statute. He said, that, with respect to the law as bearing on the case of robbing trees from gardens, pleasure-grounds, or orchards, it appeared in the present instance that the damage to the tree was laid at 50s. By the act 7 and 8 Geo. IV. c. 29, it was provided that any person cutting, injuring, or stealing trees from parks, gardens, pleasure-grounds, or orchards, where the injury exceeds in amount the sum of 20s., the case became one of felony, but it was provided that when the damage was done in some place neither park, garden, pleasure-ground, nor orchard, the damage should exceed in amount the sum of 50s., to come within the provision of the statute. The Grand Jury returned a true bill on this charge.—William Ewerton and James Brooks were then indicted for feloniously cutting a certain holly-tree, the property of Mr. Brown, and thereby doing damage to the tree above the value of 20s. A second count alleged the damage to be done to the owner of the tree, Mr. Brown. A policeman stated, that on the night of the 19th December, he was on his beat, near the village of Wanstead, in Essex, when his attention was called by the violent barking of a dog. He went in the direction of the noise, and when he had reached the spot he heard another noise, as if some person was breaking down trees. He climbed up the wall which went round the grounds of Mr. Brown, and saw Brooks, apparently on the watch. Directly he saw witness he ran away. Witness then went to a tree which he saw shaking, and saw Ewerton in it, cutting some branches. Witness desired him to come down, which he did. Witness then attempted to take him into custody, but the prisoner resisted violently. After 10 minutes violent scuffling, witness told him he might as well go at once to Mr. Brown's house, as he was so well known that he must be taken the next day. The prisoner then went quietly up to the house, where he was given up to the gardener. He made a violent resistance while at the house, but was at last secured. There was as much holly cut off the tree as two men could carry. The gardener stated that he was alarmed on the night of the 19th by the barking of the dog. Soon afterwards

the policeman came up with Ewerton in his custody. Witness, after assisting the constable to handcuff him, locked him up. Witness estimates the damage done at 25. 10s. Mr. Brown stated, that he occupies a house and grounds at the village of Wanstead, in Essex. The tree in question was a very valuable one. It stood nearly 20 feet high, and had several descriptions of variegated holly grafted on it. It could not be replaced under 20 guineas. For the defence, Mr. Doane submitted to the Court that there was no case for the jury, as there was no decisive proof that the intrinsic value of the tree was above 20s. The tree was not the property of the prosecutor; he had only the control over it for the time being, and could not himself remove it from the garden. Mr. Commissioner Bullock said, that in his opinion there was a case for the jury to consider, as the value of the tree had been distinctly stated to be above the sum required by the act. Mr. Doane then addressed the jury at some length, and argued that the gardener had not valued the tree properly. Upon his own admission he knew very little of gardening. As to the statement of the prosecutor, that he would not take 20 guineas for the tree, that amounted to nothing; as the value he might place upon it, as a man of taste, might be, and was, very considerably above its real value. The Commissioner having summed up, the jury returned a verdict of Guilty against both prisoners. Mr. Commissioner Bullock said, that the offence of which the prisoners had been convicted was worse than an ordinary felony, for, besides the actual theft, there was much wanton mischief done. The sentence of the Court was that they each be imprisoned 18 months, and kept to hard labour.

Michael Meaghan was placed at the bar, charged with the wilful murder of Thomas Leary. This case, which has been already noticed, arose out of a drunken quarrel on Christmas Day, caused, it is supposed, by jealousy. The evidence was not of any public interest, and Mr. Baron Gurney, in summing up, observed that it was the opinion of himself and Mr. Justice Wightman that the evidence carried the charge no further than manslaughter. The jury brought in a verdict accordingly; and Baron Gurney, after an impressive address pointing out the melancholy effects of drink, sentenced the prisoner to imprisonment, with hard labour, for 18 calendar months.

SPORTING.

TATTERSALL'S, THURSDAY.—There was a small attendance and a very dull performance. The business, however, deserves a brief record. **THE DERBY.**—7 to 1 agst. Mr. Blakelock's A British Yeoman (taken to 1300, and afterwards offered); 25 to agst. Col. Peel's Murat (taken); 1000 to 45 agst. Lord Eglinton's Aristides (taken); 1000 to 30 agst. Mr. Bell's Winesour (taken); 1000 to 15 agst. Mr. Theobald's Highlander (offers to take 1000 to 10); 1000 to 15 agst. Sir G. Heathcote's Khorassan (offers to take 1000 to 10); 1000 to 15 agst. Duke of Richmond's Clara colt (taken); 2000 to 30 agst. Major Yarbrough's Dumping (taken); 500 to 5 agst. Mr. H. Combes' Fakeaway (taken); 1000 to 10 agst. Mr. Wagstaff's The Brewer (taken); 500 even between Aristides and Murat, 500 even between Amorino and Sirkol. **OAKS.**—1000 to 35 agst. Mr. F. Price's The Lily (taken); 300 to 10 agst. Lord Westminster's Laura filly (taken); 300 to 10 agst. Lord Eglinton's Egida (taken).

MARK LANE, FRIDAY, JAN. 6.—There have been a few cargoes of North Country Wheat on the Market to-day, which have been sold at an advance of 1s. per qr.; of Essex and Kent there has been none on sale. On Wednesday there was a lively demand for Foreign at 1s. advance, which improvement has been maintained this morning, but the sales have been to a limited extent only.—In Bonded there was not much doing. The supply of Barley has been pretty well cleared off, and fine qualities are improving in value. There were not so many Peas and Beans offered on sale, and Monday's currency was supported. The Oat Trade was quite equal to Monday.

GAZETTE OF THE WEEK.

BANKRUPTS.—J. S. Eiffe, 48, Lombard-street, and 1, South-crescent, Bedford-square, chronometer-maker—W. Paine, Stony Stratford, Buckinghamshire, baker—W. Cook, Bungay, Suffolk, grocer—J. Mayer, New City-chambers, Bishopsgate-street, London, and late of Foley, Staffordshire, earthenware-manufacturer—J. Hodson, Reading, Berkshire, druggist—J. Lockwood, Lepton, Yorkshire, manufacturer of fancy waistcoating—J. Wilson, Manchester, warehouseman—G. Foster, Newcastle-upon-Tyne, butcher—J. Cowher, Huddersfield, Yorkshire, corn-miller—J. Ray, Leeds, porter-merch—J. Taylor and J. Butterworth, Rochdale, Lancashire, painters—G. Pile and W. J. B. Staunton, Bishopsgate-street, wine-merchants—T. Mann, 11, High-street, Camden Town, grocer—H. White, Topham, Devonshire-lodger—J. Swallow, senr., J. Swallow, junr., and J. Swallow, Skircoat, Halifax, corn millers—R. T. Hall, and J. Hall, Leeds, flax-spinners—M. Willott, Huddersfield, merchant—W. Gawthorpe, Huddersfield, plumber—G. C. Harrell, Bristol, auctioneer.

SCOTCH REGISTRATIONS.—W. Ballantine, Shilva, Dumfriesshire—J. Connel, Senr. Andrew's, draper—P. Reid, Ballinluig, or Tullimet, Perthshire, merchant—J. Waud, Dundee, grocer.

BIRTHS.—On the 2d inst., in St. James Gardens, Hyde Park, the Lady of R. B. Dunlop, Esq., of Drumhead, near Gairloch, Dumfriesshire, of a son.—On the 2d inst., at the Castle, Portonstone, Ireland, the Countess of Rosse, of a daughter.—At Fleurs Castle, on the 1st ult., the Duchess of Roxburgh, of a son.—On the 3d inst., at Chesham, Bucks, Camberwell, Mrs. Henry Law, of a son, still born.—On the 29th ult., at 25, Sussex-square, the Hon. Mrs. John Gellibrand and Hubbard, of a son.—On the 29th ult., the lady of W. Grant, Esq., barrister-at-law, of a son.—On the 31st ult., at New Brook-house, Lancashire, the lady of W. P. Hulton, Esq., of a daughter.

MARRIAGES.—On the 3d inst., at All Souls, Langham-place, R. J. Griffiths, Esq., of Newcourt, Hereford, to Harriet Anne Lambell, only daughter of the late Fowler Price, Esq., of Huntingdon Court, in the same county.—On the 4th inst., at St. George's, Hanover-square, Griffiths, Jenkins, Esq., Lieut. in the Indian Navy, to Jane, youngest daughter of John Jones, Esq., of Crosswood, Montgomeryshire.—On the 31st ult., at Easton, John Bennett Lawes, Esq., of Rotherhampton, to Caroline, daughter of the late Andrew P. M. Esq., of Northall, Norfolk.

DEATHS.—On the 31st ult., at his residence, in the Royal Arsenal, Woolwich, Maj. General Drummond, C.B., Director General of the Royal Artillery.—On the 1st inst., at Doddington Castle, Gloucestershire, the Hon. Lady Codrington.—On the 2d inst., at York Lodge, Mary, the wife of the Rev. Thomas Gibson, rector of Ditcham, aged 82.—On the 23d ult., Henry (Jett) Berners, the son of George Berners, Esq., of Watlington, Oxfordshire.—On the 24th ult., John Milward, Esq., of Lacey-house, near Stratford-on-Avon, aged 72.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Parish of St. Andrew Undershaft, in the City of London, and published by them at the Office of the CHRONICLE, GARDENERS' CHRONICLE, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, January 7, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 2—1843.

SATURDAY, JANUARY 14.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Evergreens, to remove . . .	9b	Rabbits, plants not eaten by . . .	9b
Fish, gold and silver, to keep in . . .	6c	Roses, stocks for . . .	9b
winter . . .	6c	Scale on Pines, to cure . . .	7b
Fruit, to preserve . . .	6c	Season, mildness of . . .	6b
— trees, to transplant . . .	6c	Sea weed, to convert into manure . . .	9b
Fuchsia splendens . . .	7a	Shakespeare's pale Primroses . . .	9b
Grafting Pears, remarks on . . .	9b	Spiders, peculiar properties of . . .	9b
Grammatophyllum multiflorum . . .	7b	some kinds . . .	9b
var. tigrinum . . .	7b	Spirits of Tar, offensive to ver- . . .	5a
Grapes, cause of rust on . . .	5c	min . . .	5a
— Mr. Crawshaw's, remarks on . . .	9a	Tillandsia, its treatment . . .	9b
Greenhouse plants, select . . .	7b	Trees, guard for, described . . .	6a
Guano, beneficial effects of . . .	7b	Trellis for creepers . . .	4b
— experiments with . . .	6a	Vetch, analysis of . . .	9a
Heating, remarks on . . .	9a	Vines, remarks on pruning . . .	9a
Horse-chestnuts, as food for pigs . . .	6c	Weeds, to boil for manure . . .	9a
Horse-radish, to extirpate . . .	9b	Willow, cerelean, remarks on . . .	6a
King-wood, its origin . . .	8c	Worms, to destroy . . .	7b
		Zichya villosa . . .	7b

JAMES DICKSON & SONS, NURSERYMEN, SEEDSMEN, AND FLORISTS, have much pleasure in announcing that they have succeeded in making a valuable addition to their extensive stock of **CALCEOLARIAS**, by the purchase of the entire stock of those richly-spotted varieties raised by Isaac Anderson, Esq., which took the first prize for seedlings at the Royal Caledonian Horticultural Society's meeting of the 15th July last, and were justly described as being the finest varieties yet exhibited. There are six distinct varieties, named as follows—George Heriot, Graham, Greigiana, Ariadne, Margaret, Neillii. These will be sent out in rotation of order, early in April next, at 30s. per set, or 7s. 6d. each. Early orders will oblige, and meet with prompt attention; but as the stock of some of the varieties is very limited, early application can only be guaranteed execution. Seed Warehouse, 32, South Hanover-street, Edinburgh; Nurseries, Inverleith, and Broughton Park.

Note.—Messrs. J. D. & Sons are now sending out plants of that beautiful and distinct variety of *Epiphyllum truncatum*, called *Epiphyllum truncatum elegans*, which attracted so much notice at the Horticultural Society's Show.

FUCHSIA ST. CLARE.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this Paper of the 24th Dec., together with their two new Verbenas. Great Yarmouth Nursery, Jan. 5, 1843.

MITCHELL'S Unrivalled Variegated DAHLIAS, viz.—The **BEAUTY OF SUSSEX** and **BLANCHE SHELLEY**. **JAMES MITCHELL** begs to announce his intention of sending out in May the above seedling Dahlias; which he can recommend with confidence to the most limited grower; they have been justly pronounced both by foreign and English growers to be the most beautiful, and the most valuable acquisition ever offered to the public. J. M. will also have fine plants of **Mrs. SHELLEY**, which is first-rate and very scarce. The **BEAUTY OF SUSSEX**,—This Dahlia has been placed before any other two-coloured flower, at all the principal Shows in England: viz.—the Salt Hill, the Floricultural, the South London, Maidstone, and Tonbridge-wells Shows. Colour, delicate pink, strongly edged with cherry—the petals are cupped, of firm texture, and well arranged, never confused; the general form is excellent, and rising well in the centre; a constant show-flower—4 feet, 10s. 6d. **BLANCHE SHELLEY**, white, delicately tipped with purple, beautifully cupped petals, superior form, and of great depth: a constant show-flower—5 feet, 10s. 6d. **Mrs. SHELLEY**, delicate rosy pink, cupped petals, a constant show-flower—4 feet, 5s. —The usual allowance to the trade, where a dozen plants are ordered.—Pitdown Nursery, Maresfield, Uckfield, Sussex.

SEEDLING DAHLIAS.—**W. R. WHALE** begs to announce to Dahlia-growers generally, that he intends sending out **HERO OF STONEHENGE** Dahlia, in strong plants, early in May; it not being in his power to accommodate his numerous friends with Ground Roots, having received orders for 24 roots. This Dahlia needs not the usual puffing; suffice to say, it is a gem of the first water; and, if it do not give satisfaction, the cash will be returned. Colour, a dark Mulberry, with fine cupped petals of great substance, symmetrical form, splendid habit, flowers standing erect above the foliage, perfectly constant the whole season, closes when young, pronounced to be a decided improvement on Rival Sussex at Stone Henge Show, by Messrs. Keynes, Spary, Dodds, &c. &c. Awarded the following prizes: viz.—1st. at Stonehenge, on Salisbury Plain, supposed to be the premier Show of the season, (calculated to have been 10,000 persons present)—2d. at Devon and Exeter; 3d. at Marlborough; and in a winning stand of 12—prize at Salt Hill, and at several of the Metropolitan exhibitions, the only places exhibited at. Price 10s. 6d., the usual discount where a dozen plants are ordered—height 4 to 5 feet. **NOVELTY**, ruby ground, tipped, and striped with buff, quite new in colour, full-sized flower, fine clear petals, symmetrical form, an every day's flower perfectly constant—height 2 to 3 feet, 10s. 6d. **APPLAUSE**, a pale orange, fine clear cupped petals, a round and full-sized flower; it looks beautiful in a stand, rather flat, but comes up in water, like many other stiff petal flowers—height 4 to 5 feet, 10s. 6d. Only 4 roots of this variety.—Elcot, Newbury, Berks, Jan. 4, 1843.

SEYMOUR'S SUPERB WHITE CELERY.

MESSRS. LANE AND SON beg again to offer to the Public the above superior Celery Seed (at 1s. 6d. per packet) the qualities of which are so well known as to require no eulogium here, although it may be advisable to state, by way of caution, that there is an old variety of Seymour's White Celery offering for sale, which is very inferior to the above.—Also the **BLACK-SEDED BATH COS LETTUCE**, at from 1s. to 5s. per packet.—Either or both can be sent by post, on the receipt of postage stamps or post-office order from unknown correspondents.—Nurseries, Great Berkhamstead, Dec. 26, 1842.

RANUNCULUSES.

*100 Different superb named sorts, one root of each. £5 0 0

*100 Splendid Seedling varieties, Ditto Ditto 10 0 0

MESSRS. TYSO & SON, WALLINGFORD, BERKS, invite the attention of their Floral Friends and the Public to their extensive Collection of Named Ranunculuses, and particularly to their unrivalled Seedlings, to which they have recently added some splendid new varieties. They have received during the past season, by reports in newspapers, as well as by private letters, numerous testimonials to the superior character of the Flowers raised by them, and of the Prizes obtained by their Seedlings at many of the principal horticultural exhibitions in the kingdom. The Seedling varieties are of vigorous growth, and will yield a profusion of bloom. An early application is recommended, to ensure all the sorts.

The articles marked * can now be transmitted by post, and will be sent, securely packed and prepaid, without additional charge, to gentlemen forwarding the cash with the order.

Messrs. T. & Son's General Descriptive Priced Catalogue for 1843 may be had Gratis, and will be sent prepaid to applicants enclosing a twopenny postage label.

SEEDLING DAHLIA.—DEWAR'S IMOGENE.

A beautiful bright lilac; fine cupped petals, good outline and rises well in the centre, a most abundant bloomer, and very constant; flowers well above the foliage on stiff foot-stalks, height from 3 to 4 feet. It took a Seedling Prize at the following shows: 1st. at the Great North of England, 8th Sept., 1841; First Class Prize at Hexham, 3 blooms, 13th Sept., 1842; First Class do. at the North of England, 12 blooms, 21st Sept.; First Prize at Durham, 21st Sept.; First Prize at Morpeth, 9 blooms, 22d Sept. It also obtained a Prize at York, 28th Sept. In class showing, it was placed first at Hexham and the North of England shows as being the best lilac. It was also placed as a First Class Flower by the Board of the Hexham Floral Society, on the 7th Sept. Will be sent out in strong plants the last week of April, at 10s. 6d. each, and may be had of Mr. HENRY NEWTON, Nurseryman, Newcastle; Messrs. WARNER, Seedsmen, London; Messrs. RONALDS, Nurserymen, Brentford; Mr. J. HARRISON, York; and H. DEWAR, Jesmond, near Newcastle-on-Tyne.

THE FASTOLFF RASPBERRY, patronised by his Grace the Duke of Rutland and many of the Nobility. For particulars of the superior merits of the above highly valuable Raspberry, **YOUSSE & Co.** beg to refer the readers of the *Gardeners' Chronicle* to their Advertisement of last week. Great Yarmouth Nursery, Jan. 13, 1843.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, begs respectfully to inform the Nobility, Gentry, and others of Manchester and its Vicinity that they can be supplied with the following new and early articles:—Cormack's Prince Albert and early Kent Peas, British Queen ditto; Taylor's new improved Windsor, and Johnson's Wonderful Beans; Manchester and Giant red and pink Celery; Hamilton's White Spine and Walker's Prize-fighter Cucumbers; Incomparable Cos Lettuce, together with every other variety of Horticultural, Agricultural, and Floricultural Seeds, at his Wholesale and Retail Warehouse, 105, Deangate, Manchester. Agent for Sir James Murray's Patent Fertilising and Guano Manures.

POTTED VINES.—WANTED, a few strong, bearing VINES IN POTS, for early forcing.—Address, H. G. B., at the Office of the *Chronicle*, stating sorts and price. N.B. The nearer Cheshire the better.

SHIRLEY VINEYARD, NEAR SOUTHAMPTON,—NURSERY DEPARTMENT.

CLEMENT HOARE respectfully announces that he has now on sale an extensive collection of Grape Vine Plants of superior growth, and of the most approved sorts in general cultivation, varying in price from 2s. 6d. to 7s. 6d. each.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & OTHERS. Two newly-erected Greenhouses, several Two-light Boxes and Cap-glasses, Rockwork, sundry Utensils, &c.

MESSRS. PROTHEROE & MORRIS are instructed to submit to public competition, by Auction, on the Premises, Cotham-road, near Bristol, on Wednesday, Jan. 25th, 1843, and following day, at 11 o'clock, by order of the Trustees of Mr. John Miller, under a deed of assignment, the whole of the valuable Nursery Stock, consisting of Fruit and Forest-trees, Evergreens and Shrubs, Hothouse, Greenhouse, and Herbaceous Plants, a choice Collection of Carnations, Picotees, Auriculas, &c. May be viewed prior to sale. Catalogues may be had of Mr. Price, Solicitor, No. 1, Stephen-street, Bristol; Mr. T. P. Willcox, Builder, Bristol; of the principal Seedsmen in London; on the Premises; and of the Auctioneers, American Nursery, Leytonstone.

HORTICULTURAL BUILDING and HEATING by HOT WATER

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted. References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—**STEPHENSON and Co.**, Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5l. 5s. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WATTS'S New Patent Land-presses and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by **DANIEL and EDWARD BAILEY, 272, HOLBORN.**

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., &c., upon the above system, which has (at an immense cost to the inventor), been brought to great perfection, and heats the same by HOT-WATER APPARATUS, with improved Tube or Conical Boilers. W. HILL also adapts DR. ARNOTT'S NEW BALANCED REGULATOR to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. PENN'S SYSTEM only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, is a perfect and rapid Circulation, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer-heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. HILL would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. HILL, Builder and Surveyor, Lewisham.

HOTHOUSES, CONSERVATORIES, &c., Made and Fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1l. 8s. Garden-Lights Made and Glazed, 1s. per foot, at JAS. WATT'S, Sash Manufactory, Claremont-place, Old Kent-road. Reference given.

THE GENUINE GUANO ON SALE AT LIVERPOOL.—Any quantity of this celebrated and valuable NATURAL MANURE can be obtained from the Queen's Bonded Stores, either in Liverpool or in London. Apply to Messrs. WILLIAM JOSEPH MYERS and Co., Importers, Liverpool; Messrs. COTESWORTH, POWELL, and PRYOR, Great St. Helen's, London; or Messrs. EDWARDS, DANSON, and Co., Brokers, Liverpool.

Just published, 12mo, price 9d., **OBSERVATIONS ON THOROUGH DRAINAGE** as the Basis of Agricultural Prosperity. By OWEN OWEN ROBERTS, Author of "Hints to Agriculturists," "Facts for Farmers," and "Church Revenues Revealed." London: Published by Messrs. SIMPKIN & MARSHALL.

NEW ZEALAND AND THE SOUTH SEA ISLANDS. Pictorial 8vo, with a Map, &c., 5s. cloth, **POLYNESIA**: or, an Historical Account of the Principal Islands in the South Sea, including New Zealand; the Introduction of Christianity, and the actual Condition of the Inhabitants in regard to Civilization, Commerce, and the Arts of Social Life. By the Right Rev. M. RUSSELL, LL.D. and D.C.L. (of St. John's College, Oxford).

By the same Author, uniformly printed, with Maps and numerous Engravings:

I. PALESTINE, or the HOLY LAND. 4th Edit., 5s.
II. ANCIENT and MODERN EGYPT, with an Outline of its Natural History. 4th Edit., 5s.
III. NUBIA and ABYSSINIA: comprehending their Civil History, Antiquities, Arts, Religion, Literature, and Natural History. 2d Edit., 5s.
IV. HISTORY and PRESENT CONDITION of the BARBARY STATES. 2d Edit., 5s.
OLIVER & BOYD, Edinburgh; SIMPKIN, MARSHALL, & Co., London.

In Monthly Nos., 8vo, with Four beautifully-coloured Plates.
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY.

The Number for December, 1842, contains highly-finished drawings of *Cattleya superba* (Superb-flowered Cattleya), *Correa bicolor* (Two-flowered Correa), *Loasa Herbertii* (Mr. Herbert's Loasa), *Salvia bicolor* (Two-coloured Sage). Floricultural Notices—*Gloxinia discolor*.—*Gongora*.—*Maurandya*.—*Niphæa oblonga*.—*Oncidium Lemonianum*.—*Oncidium microchilum*.—*Oncidium volubile*.—*Scutellaria splendens*.—*Tropæolum azureum*. Operations for January—Index—Dedication—Advertisement—Latin Index to Coloured Figures of Plants—English Index to Coloured Figures of Plants—Woodcut and Coloured Illustrations.

This work comprises, monthly, four admirably-coloured plates, and twenty four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. ORR and Co., Paternoster-row.

FAMILIAR ASTRONOMY. By GEORGE DARLEY,

A.B., Author of a System of Popular Geometry.—Companion to the Popular Geometry.—a System of Popular Algebra.—and a System of Popular Trigonometry. 12mo, with Engravings, 5s. cloth, lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun*.

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

One Volume, price 7s. 6d.,

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository*.

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator*.

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette*.

"The publication of this work is well timed . . . The Life of Rienzi is to us full of interest."—*Athenæum*.

"Those that wish to become acquainted with the true history of a man who was, in some sort, the Napoleon of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tail's Magazine*.

London: WHITTAKER and Co.

HAND-BOOKS FOR THE PEOPLE.

THE HAND-BOOK OF GARDENING; expressly intended for Persons possessing and fond of cultivating a Garden of moderate size. Price 2s. cloth, a New and Enlarged Edition.

THE HAND-BOOK OF BOTANY; Or Linnæan Lessons on Common Plants, for Field and Garden Practice. Price 2s.

THE HAND-BOOK OF AGRICULTURE; Chiefly for the use of those interested in the Allotment System. Price 1s. 3d.

THE HAND-BOOK OF COOKERY; Intended for the use of the Middle Classes. Price 2s. cloth.

THE HAND-BOOK OF THE TOILETTE; Having in view the union of Bodily Health with Beauty of Person. Price 2s. cloth.

THE HAND-BOOK OF THE LAUNDRY; Expressly intended for those who "wash at home." Price 1s. 9d.

THE HAND-BOOK OF MEDICINE; Forming a Useful Manual in time of Need, when Professional Aid cannot readily be procured. Price 2s. cloth.

THE HAND-BOOK OF NATURAL PHILOSOPHY. Price 1s. 9d.

London: W. S. ORR & Co.; and W. and R. CHAMBERS, Edinburgh.

Just published, price 6s., cloth,

THE HAND-BOOK OF CHEMISTRY; with a

complete Index of Reference. By G. H. CAUNTER, Esq.
London: W. S. ORR and Co.; and W. and R. CHAMBERS, Edinburgh.

DARLEY'S SCIENTIFIC LIBRARY, for the Use

of Schools, Private Students, Artists, and Mechanics. It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the Poor at large. To youth of either sex at public and private schools, to persons whose education has been neglected, or whose attention has not been directed in early life to such studies, and to Artists and Mechanics, these little Works will be found particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced, not only to their simplest, but to their shortest form.

1. A SYSTEM OF POPULAR GEOMETRY. Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. Fourth Edition, 4s. 6d. cloth.

2. COMPANION TO THE POPULAR GEOMETRY, in which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. (A Second Edition is now ready.) 4s. 6d. cloth.

3. A SYSTEM OF POPULAR ALGEBRA, with a Section on Proportions and Progressions. Third Edition. 4s. 6d. cloth.

4. A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical, with Popular Treatises on Logarithms, and the application of Algebra to Geometry. Second Edition, 3s. 6d. cl.

"For students who only seek this limited knowledge of these sciences, there are perhaps no treatises which can be read with more advantage than Darley's Popular Geometry and Algebra."—*Library of Useful Knowledge, Article "Mechanics"*

Taylor and Walton, Booksellers and Publishers to University College, 28, Upper Gower-street.

Handsomely bound in cloth, with Ninety-three Wood-Engravings, Price 6s. 6d.

ILLUSTRATIONS OF THE BIBLE, AND CON-

FIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt By W. C. TAYLOR, LL.D.

From the *British Magazine*.—"This is an elegant and well-executed little book, on a most interesting subject." Tilt and Boock, Fleet-street.

FUN FOR THE FIRESIDE!!

Bound in cloth, price 5s. 6d.,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation; but, that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiae.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself and everybody else are perfectly familiar with its contents . . . and yet, if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published." London: WHITTAKER and Co.

In one small volume, price 15s.

PAXTON'S POCKET BOTANICAL

DICTIONARY.

In what may be called an age of Cyclopaedias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, a Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur and Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of Horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. ANDREWS, Bond-street; ORR & Co., Paternoster-row.

Price 7s., illustrated with Wood-cuts of Birds, Cages, &c.,

A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their

Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"A very delightful book of its kind. . . . It seems to us an indispensable book for the bird-fancier."—*Spectator*.

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes, and, in fact, rivals the beauty of the *Annals*."—*Weekly Dispatch*.

London: W. S. ORR and Co.; W. and R. CHAMBERS, Edinburgh.

This day is published, price 3d.,

PUNCH'S ALMANACK FOR 1843, Brimful of Fun and Jokes, and containing upwards of One Hundred humorous Cuts. Also,

PUNCH'S LETTERS TO HIS SON. Revised and corrected from the original MSS. in the Bloomsbury Library, by DOUGLAS JERROLD. With 24 Illustrations by KENNEY MEADOWS. Price 5s.

PUNCH'S PANTOMIME; or, HARLEQUIN KING JOHN, AND MAGNA CHARTA; as now performing at the Theatre Royal, Covent Garden. Price 1s.

PUNCH; or, the LONDON CHARIVARI. Volume the THIRD. Price 8s. Published every Saturday, price 3d., and in Monthly Parts.

PUNCH'S POCKET-BOOK is now on sale, price 3s. 6d., roan tuck.

OFFICE, 13, Wellington-street; and sold by all Booksellers.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS OF EUCLID,

With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared."—*Athenæum*.

"Cannot be easily surpassed."—*Dublin University Magazine*.

COOLEY'S GEOMETRICAL PROPOSITIONS: a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES OF EUCLID, with Enunciations. Price 1s. 6d.

London: WHITTAKER and Co.; sold by all Booksellers.

TO GARDENERS, SEEDSMEN, and OTHERS.—

To be LET, the House and Premises of a Nursery and Seedsmen, consisting of a double-fronted Conservatory, Shop with Two Counters, Window-fittings, Drawers, Shelves, and sundry Plants; in a good situation, and capable of great improvement. None need apply who cannot command the sum of 60l. Immediate possession may be had. Apply, on the premises, 44, Hercules-buildings, Westminster-road, Lambeth.

BLUE GLASS FOR HOTHOUSES, in the opinion

of many eminent British and Foreign Philosophers and Horticulturists, admits the chemical rays which have the power of accelerating germination, while it has the tendency to exclude the red rays that are injurious to vegetation. May be had at a moderate price per foot, of APSLEY PELLIATT, Falcon Glass Works, Holland-street, Blackfriars road; also Striking Shades, Grape Shades, Cucumber Glasses, &c. &c.

EXTENSION OF THE PRINCIPLE OF ART-UNIONS.

THE Public are now respectfully invited to inspect some of the FINISHED ETCHINGS illustrative of the SONGS OF SHAKESPEARE by the ETCHING CLUB. The whole Series will be ready in the third week of January next for every Subscriber to the ROYAL POLYTECHNIC UNION OF LONDON for the year 1843. The prizes will be drawn on the 25th of April, 1843. Two most material points should be perfectly understood by the prize-holders: First.—That they are to select for themselves the prizes adapted to their taste from the PRINCIPAL EXHIBITIONS IN LONDON: Secondly.—That as the Committee is honorary, the whole subscription fund is exclusively devoted to the produce of the work of Art or Science (advertisements and correspondence alone excepted). The specimens are to be seen at 5, Cavendish-square; they will also be shown by the Honorary Secretary at the ROYAL POLYTECHNIC INSTITUTION, of whom the prospectus may be had, and to whom subscriptions may be paid.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTH, upon application to the gardener.—*Sundays excepted*.

HODGSON and ABBOTT'S PALE ALE.—The

above celebrated Beer, so strongly recommended by the Faculty, is to be procured only from E. ABBOTT, Brewery, Bow, Middlesex. The Trade not being supplied, the Pale Ale cannot be genuine if procured elsewhere.—City Office, 98, Gracechurch-st.

WANTS a SITUATION, an experienced GARDENER; he is a married man, with one child. Wages expected, 60l. a year, with a cottage. The Advertiser has given entire satisfaction to gentlemen whom he has served, and to whom he will refer. A Line, describing the nature of the service required, will save trouble, and have immediate attention.—Direct to J. M., *Gardeners' Chronicle* Office.

WANTS a SITUATION, as GARDENER, a married Man, aged 29, who understands Hothouse, Greenhouse, Early Forcing, and Propagation of Plants, Kitchen-Garden, and Meadow-land, and Cattle if required; just from the country, leaving on account of the place being let; character unexceptionable. Terms in his last place, a guinea per week—cottage, and fuel.—Address, T. D., at Mr. TOWN'S, Cheesemonger, Camberwell-green.

WANTS a SITUATION as GARDENER, a Married Man (no family), aged 33 years, a native of Scotland, has a perfect knowledge of gardening in all its various branches upon the most improved and scientific principles; can have an undeniable character from the gentleman he has just left. Salary about 70l. per annum. Address to H. H., 57, Paddington-street, Marylebone.

WANT SITUATIONS, a middle-aged Man and his Wife (without family). The Man is a first-rate GARDENER and FLORIST; is well acquainted with new ground work, the building of Rockwork, making Ferneries, collecting British Plants, &c.; also understands managing Land, Cattle, &c., if required. The Wife as COOK or GENERAL SERVANT; can manage the Dairy, &c.—Letters to be addressed to FEMINA, Dennis's Nursery, King's-road, Chelsea.

A YOUNG MARRIED MAN, about 30, is desirous of engaging himself with any Nobleman or Gentleman, as GARDENER. His last situation was in one of the first families in Warwickshire, and he previously lived in some of the principal establishments of the country. Having also a considerable knowledge of the principal systems of Agriculture, a situation where the management of a small Farm came under his charge would be preferred, and an unexceptionable recommendation, as to abilities, &c. will be obtained. Direct, G. J. P., Post-office, Banbury, Oxon.

TO NOBLEMEN and GENTLEMEN.—HENRY MITCHELL, late GARDENER to Mrs. Sampson, of Tullimaar, near Truro, will be happy to engage with any Nobleman or Gentleman who may be in want of an experienced GARDENER, or GARDENER and FORESTER. The Advertiser is 30 years of age, married, and without a family.—Address, until the 30th inst., H.M., Slapton, near Dartmouth, Devon.

SEED-TRADE.—WANTED IMMEDIATELY (for a London House), an ACTIVE SHOPMAN, accustomed to the Trade. Address A. B. C., Mr. LANGDON'S, Stationer, Newgate-st.

TO GARDENERS, NURSERYMEN, &c.—In the vicinity of Staines, about six miles from Windsor and Hampton Court, to be LET, by the year or on lease, an extensive well-arranged GARDEN, surrounded by excellent high walls, 300 feet long and 90 feet wide, with large Grapery, Melon-pits, Mushroom-house, Pump, &c., together with a convenient six-roomed detached Cottage, Piggery, Tool-house, &c. For particulars apply to Mr. TAYLOR, Bricklayer, Staines, or Mr. COOKE, Gardener, 4, Ladbroke-grove, Notting-hill.

PATRONISED by all the principal Architects and Builders in this Country and Abroad.—SEYSSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, never cracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. FARRELL, Secretary.

Seyssel Asphalte Company's Depot, Stangate, London.
Note.—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

ROWLANDS' ODONTO, or PEARL DENTRIFICE.—

A Vegetable White Powder, prepared from Oriental Herbs of the most Delicious Odour and Sweetness, and free from any mineral or pernicious ingredient—it eradicates Tartar from the Teeth, removes decayed spots, preserves the Enamel, and fixes the Teeth firmly in their sockets, rendering them beautifully white. Being an anti-scorbutic, it eradicates Scurvy from the Gums, strengthens, braces, and renders them of a healthy red; it removes unpleasant tastes from the mouth, which often remain after fevers, taking medicine, &c., and imparts a delightful fragrance to the breath.—Price 2s. 9d. per box, duty included.

ROWLANDS' ALSANA EXTRACT immediately relieves the most violent Toothache, Gum-boils, Swelled Face, &c., it is also an excellent Stomachic, in cases of Flatulency, Spasmodic Affections, &c., and gives instantaneous relief.—Price 2s. 9d., 4s. 6d., and 10s. 6d. per bottle.

Notice.—A. ROWLAND & SON, 20, HATTON-GARDEN, LONDON, is engraved on the Government Stamp, which is pasted on each article; also printed, in red, on the wrapper of the latter. Sold by them, and by Chemists and Perfumers.

ARCHITECTURE.—LECTURES at the ROYAL ACADEMY.—The attention which is now so generally directed to this subject, and the interest awakened by the brief and casual notices which appeared last year in *The Athenæum*, of the Lectures of Prof. C. R. COCKERELL, at the Royal Academy, have induced the Proprietors to make such arrangements as will insure a full and accurate Report of each of the Six Lectures about to be delivered. The first will appear in *The Athenæum* of Saturday, January the 14th.

The Gardeners' Chronicle.

Saturday, Jan. 28	{ Royal Botanic 8½ P. M.

WE are reminded by a correspondent that the principle of giving every landowner an outfall from his land, which we advocated last week, has already occupied the attention of Mr. Pusey, to whom the country is already so much indebted for his exertions in the important work of drainage. In fact, notice of a committee was given by that gentleman last session, and evidence on the subject was prepared; but the discussion on the Tariff frustrated his intentions. We have reason to believe that Mr. Pusey intends to renew his notice in the ensuing session, with a view to some general legislative enactment; and we most sincerely trust he will receive the support of the whole landed interest. The two chief difficulties are—1st, the existence of old corporations of sewers, and of local acts; and 2ndly, the want of a competent board to which appeal might be made. The latter would have to be provided: and we cannot but suppose that where measures of such paramount importance are concerned, the former difficulty would be easily removed.

SINCE the cultivation of the Cucumber has become a matter of such general interest, that societies have been established for the sole purpose of testing its merits, it is desirable that there should be laid down some reasonable and fixed rules from which an universal standard may be formed for judging of the qualities of this vegetable. This is the more necessary, since the standard of almost every society at present formed differs in some respect from that of its neighbour.

In all these, the superiority of the fruit is made to depend upon its length, combined with certain other qualities, some of which indeed are of importance, while others, in our opinion, are of little or no consequence; and one, which requires a fruit to be ribbed, is most absurd. Why a ribbed Cucumber should be preferred to one with an even surface, we cannot imagine. In peeling such a fruit, the portion of it beneath the rind must necessarily be cut away; and consequently great waste, as well as a loss of the best part of the fruit, is occasioned. It is equally incomprehensible why a black-spined Cucumber should be peremptorily declared to be superior to one with white spines. Qualities such as these are perfectly arbitrary, add nothing to the appearance of a Cucumber on the dinner-table, and have no relation to its good quality as a salad.

Then we must have Cucumbers grown to an enormous length; everybody wants to have his fruit longer than his neighbour's; and if it is so long that no dish can be found to hold it, so much the better. But is there any common sense in this? Of what earthly use are these long fruits, except to make people stare? Are they better flavoured—better bearers—better seeders? Quite the contrary: they are simply longer. They are too long to be placed on a dinner-table, too long to be eaten by a small party, too coarse to suit a cultivated palate, and are, in fact, fit for nothing, except to excite the admiration of the servants' hall. If such things must be had to stare at, why not cultivate the Patagonian Cucumber, or the Snake Gourd, at once? The fact is, that a Cucumber 10 or 12 inches long is much better in all respects, only it is not so extraordinary, and will not make folks stare so much.

Let a Cucumber be a foot long, straight, of even thickness, with a flower still fresh upon its point; let it moreover be shortnecked, firm, brittle, and a free bearer, and you have nearly all that it is possible to desire. If of the old prickly race, bloom—natural, not artificial—should be insisted on; because it ensures carefulness on the part of the grower, and the fruit looks better; but as Cucumbers of the Smyrna and Turkish breed have no bloom, and they are among the best for the table, to require bloom as a *sine qua non* would be to exclude some of the most useful sorts in cultivation. Finally, no Cucumber-show should be held later than June. In proportion as the season advances does the difficulty of growing this vegetable diminish; and it must be some very extraordinary

circumstance indeed that can render any Cucumber worth a prize after June, in a society especially instituted for its cultivation.

We have been led to make these remarks by having received from Mr. James Reid, gardener at Bretton Hall, near Wakefield, some very handsome Cucumbers, of the Sion House kind, accompanied by a brace of seedlings from the same sort, with a request that we would give our opinion respecting them. The latter were certainly more uniform in size, and superior in outward appearance to the former; but, allowing for the extra care which most persons bestow upon sorts of their own raising, we do not think that the seedlings are preferable to the old variety.

WE understand it to be the intention of Mr. Crawshaw to exhibit specimens of his Grapes on Tuesday next, at the meeting of the Horticultural Society in Regent-street. This will give our readers an opportunity of judging for themselves as to their quality.

SOME time since we recommended the members of the Hammersmith Mutual Instruction Gardeners' Society to alter their rules, by substituting, for fines, expulsion in case of drunkenness; whereupon our good friend Peter Mackenzie, himself a gardener, and well acquainted with the brethren of the gentle craft, made some general observations, directed at nobody in particular, which we thought very proper; but which, it seems, people have been wise enough to apply to themselves: at least, so we gather from a letter addressed to us by Mr. W. L., of Hammersmith, who seems to have taken Mr. Peter's letter in dudgeon, calling it scurrilous, and so forth.

We are not sorry that Mr. L. has addressed himself to us, because it gives us an opportunity of speaking our mind about certain things, concerning which we might otherwise have been silent. On the other hand, we do regret that it should be necessary to animadvert upon the letter of a man who seems to be well-intentioned, and, in some respects, right minded.

It is evident that the great offence that we and Mr. Peter have been so unfortunate as to give to the Hammersmith Gardeners' Mutual Instruction Society consists in our recommending the expulsion of members who get drunk; and it is the more surprising that these good people should have proved so sensitive, because other Societies of the same kind have thanked us for the advice. How is it then that the members of this Hammersmith Society are so tender upon this point? Is it because it touched them home? We hope not. Mr. L. says, "It does not follow because you meet with a drunken man in company that you are to become a drunkard also; a man that would suffer himself to be led away must be a person of very weak intellect—of very little self-command. I would rather allow him to remain, that by seeing the actions of the good man, and the success that attends his exertions, the drunkard may be induced to amend his former errors, and for the future walk in the paths of industry and sobriety." This is all very fine; but, good Mr. L., "fine words butter no parsneps." If, indeed, these drunkards were likely to be amended by your plan, we would have it tried—not by sitting night after night with your sot, but by expelling him, and putting him on his good behaviour. If he mends, it is easy to readmit him; if he remains in your society, it is not so easy for raw young men to avoid imitating his example. The truth is, that tippling is the bane of gardeners, as it is of so many other classes; and no measures short of the most stringent are at all likely to cure it.

We say nothing of the members of the Hammersmith Gardeners' Mutual Instruction Society, and we are bound to believe all that is good of them, for we know nothing to the contrary. It is, in fact, because we wished them to remain respectable that we gave them that advice, at which Mr. L. has taken huff. But he knows quite as well as we do, that there exists among gardeners a set of low fellows, who spend their evenings in pothouses, and their days in cheating their employers. These persons, the dregs of the craft, may be known by a swaggering demeanour, which the simple mistake for knowledge. They are men of assertions, talking down the really well-informed gardener with loud words, slang and braggadocio. In the morning you will see them dirty and unshaven; by noon they are muddled, and may be found at the nearest public-house, laying down the law to the sots around them: in the evening they are drunk. At the meetings of gardeners, they appear in greasy clothes, foul linen, hats and shoes, like their hair, unacquainted with the luxury of a brush; and they strut about, the very Pariahs of Horticulture. On such occasions you may observe them in clusters, perplexing their scanty brains by foolish arguments about nothing. By way of showing their importance, they jostle the ladies who may have the misfortune to be near them at Horticultural Shows, and eventually are consigned to the police, or are threatened with it, when their insolence is quieted, and they sneak away

to their more congenial tap-rooms. Would our Hammersmith correspondent keep these in his Society?

Experience has brought us acquainted with many of this sort. They are at once a nuisance and a disgrace to gardeners, and should be unceremoniously expelled from all decent associations; for gardeners, as a body, are the reverse of this description; and for their own sake they should not allow their credit to be compromised, or their society to be contaminated, by the admission of such people. No one knows better than we do the excellence of character which is found in the great body of gardeners; their painful efforts to improve themselves with most inadequate means, their self-denial, their struggles against difficulties, and the patience with which they bear the sad reverses to which they are too often exposed; and, let us add, the strictly honourable conduct that marks their lives. To virtues such as these we bear our willing testimony; and because we know of them and honour them, we are the more anxious to draw a broad line of distinction between gardeners of respectability and the people just described.

It happened, not long since, that a very worthy young man was induced to join a party of gardeners in arranging some meetings for mutual instruction, and for other purposes connected with their profession. An object of this kind, one would have thought, would have met with approbation, if not assistance, from every gardener who deserved the name. But no; Timothy Cackle, one of the low fellows we allude to, was present, who ridiculed every proposition that was made, bullied everybody, and, by mere force of impudence, contrived to upset the business of the meeting. In doing so, Mr. Timothy Cackle no doubt thought himself a fine fellow; but his master did not estimate him so highly when he knew of his proceedings. Would Mr. L. keep this man in his Society?

A second case was reported in the *Times* a short time since. It appears, that, among other ruffians apprehended for torturing a bull, was one Isaac Ransom, a gardener of Sudbury. It was proved that this worthy had been among the most active in setting dogs on the bull, and that the animal was tormented about an hour, during which language of the most filthy and disgusting description was indulged in. The magistrate very properly sentenced Mr. Isaac Ransom to imprisonment with hard labour in the House of Correction for two months. Is this man the sort of person Mr. L. would keep in his Mutual Instruction Society?

Now we affirm that these men, Cackle and Ransom, are only a type of the class which we shall continue to call low gardeners; that such occurrences, or others very similar, are by no means uncommon among them; and that their brutal habits can, in fact, lead to no other results. Nevertheless, well-meaning men, like Mr. L., are apt to regard such conduct as of no consequence to themselves; and to think that, so long as their own acts are unimpeachable, they have nothing to do with those of others. We can assure them that in this they commit an error seriously prejudicial to themselves. It is the interest of all gardeners to watch over their profession; not by their own conduct alone, but also by influencing and controlling that of others beneath them. If they do this effectually, the character of gardeners is raised; and, as their importance advances, remuneration will keep pace with it. On the other hand, if no means are taken to eradicate the evil portion, it, like weeds upon a dunghill, will grow rank, and flourish, and choke the good seeds that are sown among them. Cure the Cackles and Ransoms, good Mr. L., by the most gentle of measures, by remonstrance, by showing them your own good example, by persuasion, by kindness, by any other tender and affectionate process, *if you can*. But, in the meanwhile, remove them from your Society: that is our advice.

We are no enemies to conviviality. We should be the last to require gardeners to lead a life of total abstinence. All we contend for is the necessity of sobriety; a man may be happy without getting drunk; and gardeners, above all men in the world, require to be proof against this vice; for the charge entrusted to their care is great and will not bear neglect. However, we have said enough upon the subject for the present; or, if we have not, we shall surrender it into the hands of a correspondent, who signs himself "A Gardener," and whose experience in these matters will be found in another column.

HEATING.

OUR attention has lately been called by Mr. Beck, of Isleworth, to a somewhat novel method of heating by hot water, which appears worthy of being more generally known. The apparatus now in use at that gentleman's residence is upon a very small scale; but the principle upon which it acts is capable of being carried out to any extent, and is at once so simple and economical, that we shall attempt to describe it briefly to our readers.

The originality of this invention lies with Mr. Rendle, of the Plymouth Nursery, who, in June last, forwarded to the Horticultural Society a paper upon the subject, which was read at one of their meetings, and of which an ab-

stract was given at p. 422 of the *Chronicle* of last year. The main point in which it differs from other methods is, that the hot water, instead of circulating round the house in pipes or open gutters, is contained in the centre of the building in a wooden tank, upon the lid of which is a layer of bark or saw-dust, raised 3 or 4 feet above the floor, for the reception of pots of cuttings, plants, &c. This tank is divided lengthways by a partition in the centre, with the exception of about two inches, which are left open at one end to allow the water to circulate; its opposite extremity is connected with a small boiler by means of a pipe. The water upon becoming heated in the boiler flows through the pipe into the tank, and after passing round the latter returns to the boiler by another pipe; in this manner the circulation of the water is kept up.

The tank in Mr. Beck's house is about 11 inches deep; but he is satisfied that 6 or 8 inches in depth would be amply sufficient. Its lower part is formed of wood and the upper of slate, one portion of which is covered with tan for plunging in cuttings, &c; the remaining part is left bare, so that on sprinkling it with water a copious vapour is obtainable. The waste of water in the tank is trifling; when, however, it requires to be replenished, it is easily effected by means of a small orifice left for that purpose in the slate covering.

The boiler, by which this comparatively large body of water is heated, is of diminutive size, and, perhaps, we cannot give a better idea of it than by supposing one of Rogers's to be divided crossways into two; the lower portion, hermetically closed, will then represent the boiler in question. As in Rogers's, the fire is contained in the centre, and is supplied with fuel from the top. It stands upon a grating raised a few inches from the floor, and is surrounded at the distance of two or three inches by an iron case, from one side of which the smoke makes its escape through a small chimney. This outer case or covering is almost double the height of the boiler; and the more effectually to prevent the radiation of heat from its sides, an iron cylinder slides down through the opening by which the fire is fed, and fits exactly within the top of the boiler. This answers the double purpose of containing a body of fuel, which settles down and supplies the fire during the night; and, when the lid is placed upon the outer case, of checking the draught of the fire, which is only continued through some small passages cut in the sides of the cylinder. A small opening also communicates with the fire from the outside, through which the former can be stirred when necessary.

In a boiler of this kind, many improvements could, doubtless, be suggested. Mr. Beck is of opinion that a great advantage would be derived by having the boiler, as in Rogers's improved, in the form of a dome above the fire, and by having the latter fed on one side by means of a shelving hopper, covered in, and placed as nearly as convenient to the top of the apparatus.

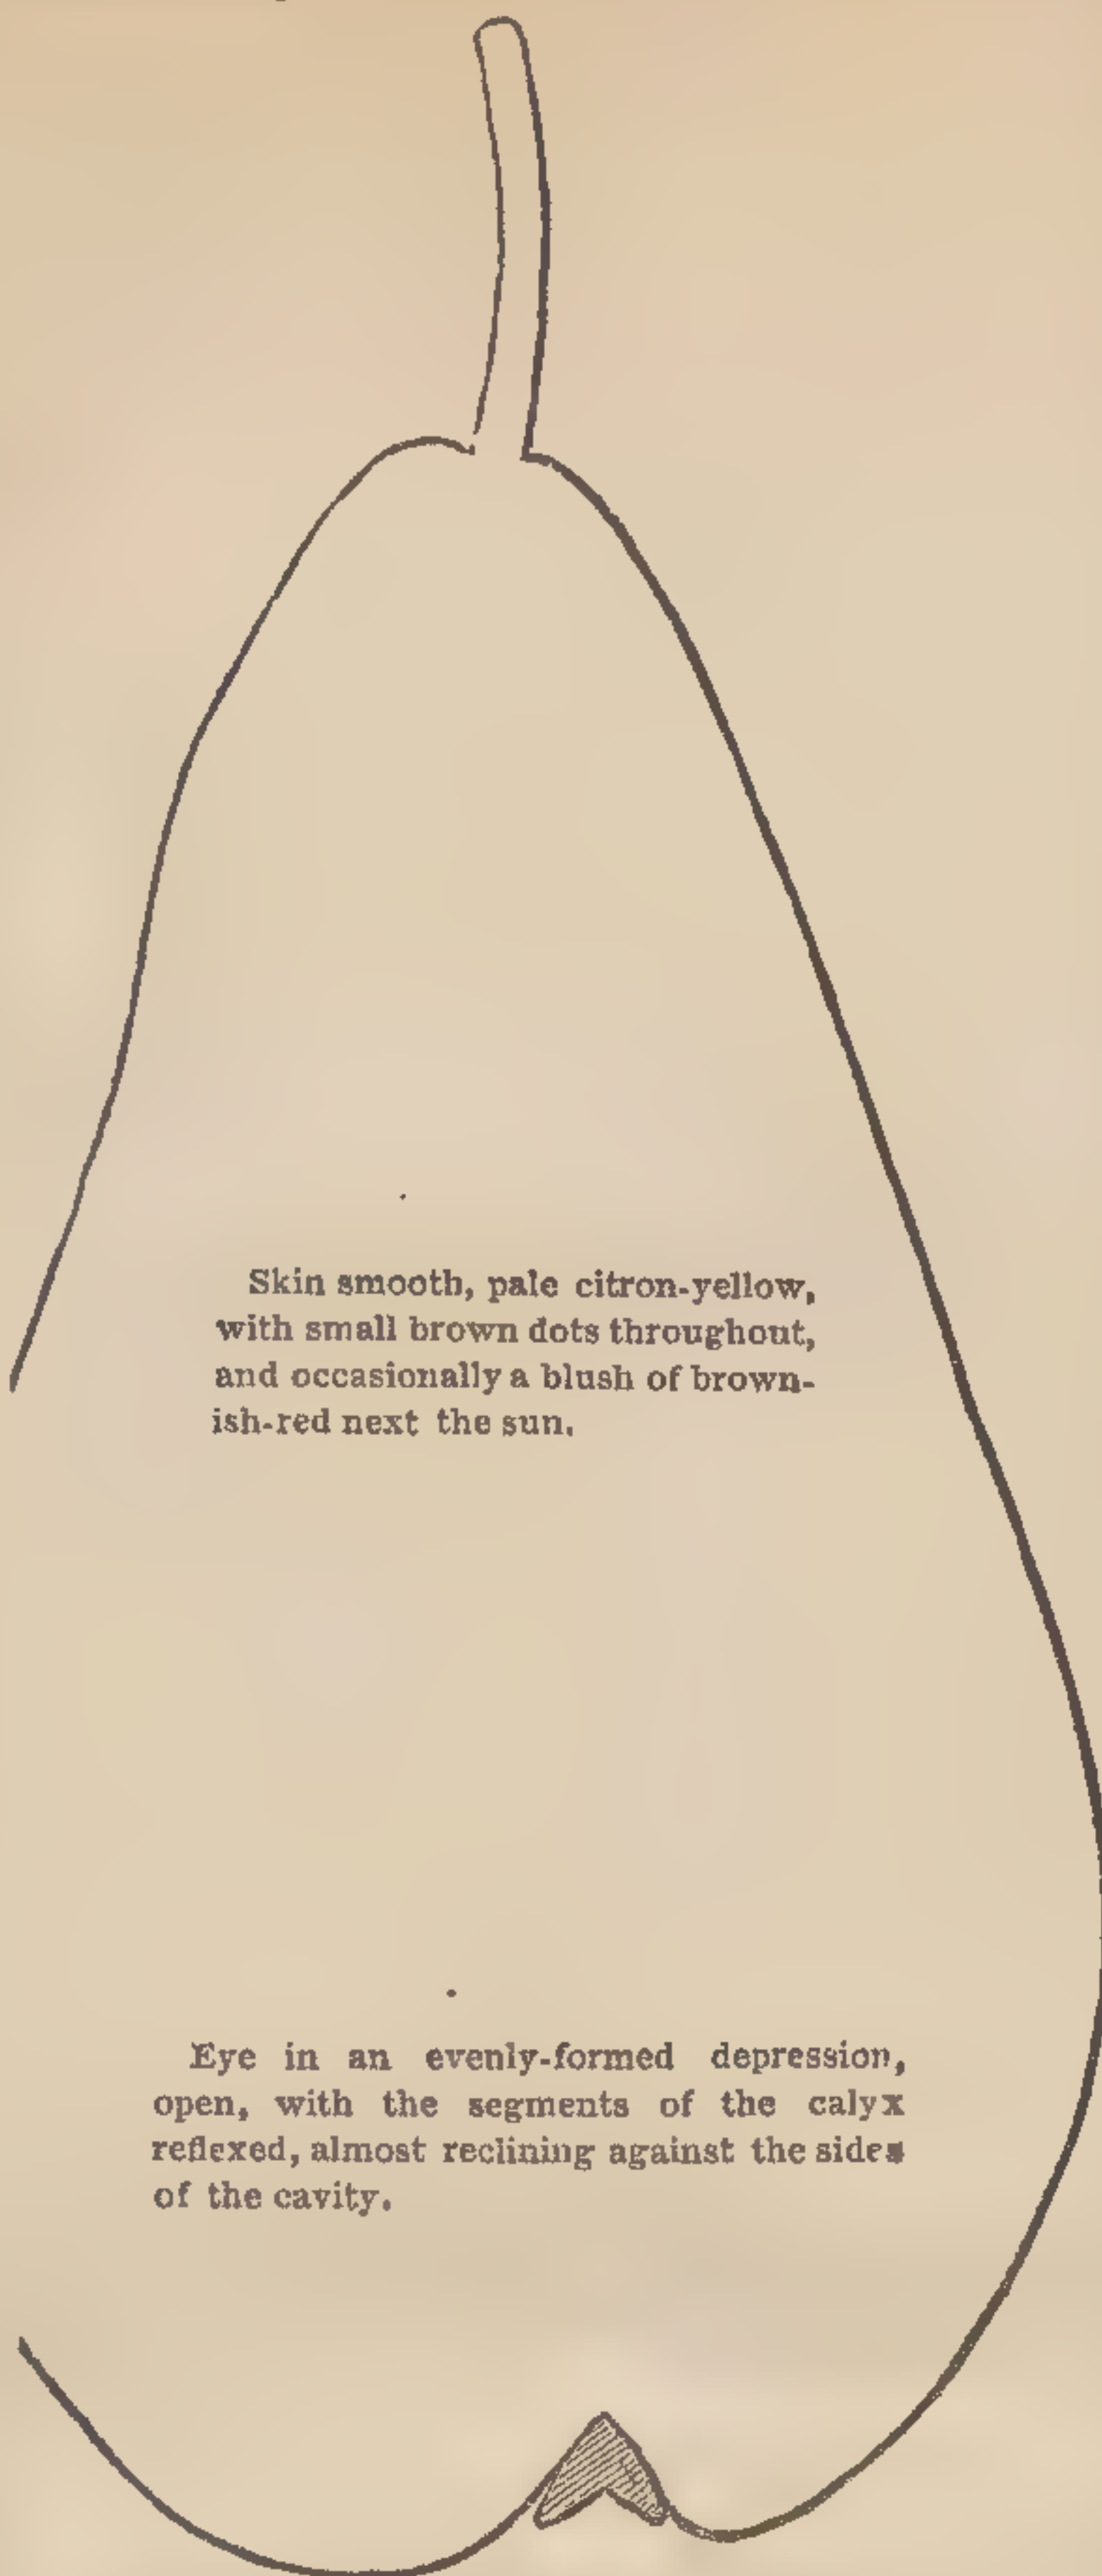

During the time in which this system has been in working, the water has never been within many degrees of the boiling temperature, yet the thermometer within the house has seldom, on the coldest nights, fallen below 60° or 65°. Its great advantages are, that the tank in which the water circulates, will, with such modifications as circumstances may require, serve as a stage for plants, either in the centre or round the sides of a house, by which the expense of hot water-pipes will be dispensed with; and its extreme simplicity, which is such that any person situated at a distance from engineers might, with a little ingenuity and the assistance of a carpenter and blacksmith, erect an apparatus of his own; since any boiler which would create a circulation of water would answer as well as the one above described, although it might not be equally economical. We may also state that the atmosphere of the house, in which this system is adopted, is remarkably pure.

VICAR OF WINKFIELD PEAR.

Synonyms. *Le Curé, Monsieur le Curé, Clion, Dumas.*

THE following account will, it is presumed, clear up the confusion which has existed respecting this Pear, of which the accompanying is an outline from a specimen forwarded by the Rev. W. L. Rham. It was found growing wild in a wood by M. Clion, a French curate, and hence obtained the name of *Monsieur le Curé*. Subsequently, by French authors, it was erroneously made synonymous with the Saint Lezin, which it resembles only in external appearance; the Saint Lezin being a firm-fleshed stewing pear. Trees under both names were obtained from France by the Horticultural Society; the Saint Lezin was correct; but that under the name of *Monsieur le Curé* proved false, being a small round pear. The difference between the two was in consequence not ascertained till 1832, when M. Vilmoren sent specimens on purpose. With these, fruit from a tree then in bearing in the Society's garden, under the name of *Dumas*, was found to agree. In the mean time, a tree of the sort in question had been imported from France by Mr. Rham, to his garden at Winkfield, Berkshire; and some cultivators having obtained cuttings from this importation, the variety was propagated in the neighbourhood of London under the name of the Vicar of Winkfield. For this, the familiar appellation of Vicar of Wakefield has been sometimes substituted. Fruit very large, oblong, or of a somewhat truncated pyramidal form; **NEW SHAPED** in length, obliquely inserted; flesh buttery, and melting in all seasons, and rich in such as are favourable. In point of flavour it cannot compete with many autumn varieties; but as it keeps till January, when there are few good sorts, it deserves cultivation on that account. The tree grows very vigorously, and requires to be kept thin of branches; it is hardy, and

bears as a standard. The leaves are large, roundish, shortly acuminate. Flowers large with roundish petals.—*Robert Thompson.*

Skin smooth, pale citron-yellow, with small brown dots throughout, and occasionally a blush of brownish-red next the sun.

Eye in an evenly-formed depression, open, with the segments of the calyx reflexed, almost reclining against the sides of the cavity.

ON MANURING WITH GREEN CROPS.—No. V. (By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 4.)

5. *Rape*.—*Rape* may be used as a green manure on all soils which are strong enough; but on a poor soil it yields so little herbage as scarcely to be worth ploughing in. It is valuable because the seed is cheap, and it grows both late and early, and consequently feeds on the atmosphere, which costs nothing: its roots, moreover, penetrate to some depth, and bring substances out of the subsoil; its woody roots and stems will loosen heavy land. In the Elsass it is planted for green manure after early Peas and early Potatoes, even on very sandy soils, and is followed by Rye or Wheat, which then succeed exceedingly well. If, when sown after these two crops, it does not yield any great amount of herbage, it still, nevertheless, is better than nothing; to which must be added, that the soil, if left unsown, will uselessly lose its humus—a circumstance of great importance in green manuring; because, even if grown immediately after other crops, it cannot be made use of either as fodder or dry: it still, if ploughed in, will give the soil a considerable quantity of carbon and nitrogen. If *Rape* is sown in autumn, it is left till the spring; after which the field is planted with Peas, Potatoes, &c. The amount of herbage and roots which an acre will yield, may be stated at 7,000 or 8,000lbs.; but if left till it is in flower, it will yield twice as much.

1000lbs. of green Rape consist of	
770-0	water in a fluid form. [stances.]
3-5	nitrogen (contained in the organic sub-
4-0	potassa.
1-0	soda.
4-0	lime.
0-4	magnesia.
1-6	sulphuric acid.
1-0	phosphoric acid.
1-5	chlorine.
140-0	carbon. [of iron, and manganese.
73-0	hydrogen, oxygen, silica, alumina, oxide

1000.0 lbs.

If, therefore, the acre yields 8,000lbs. of green leaves and roots, the furrow-slice will receive 28lb. nitrogen, 32lb. potassa, 13lb. sulphuric acid, 8lb. phosphoric acid, 1120lb. carbon, &c., from which (especially from nitrogen and carbon) a good effect may be anticipated. In localities where wireworms occur, *Rape* is best sown with Oats, when 8 inches high, and between the rows, because the

Rape will then grow in the shade of the Oats, and be better protected. If not too high it is rolled down before being ploughed in, otherwise it is mown and drawn into the furrow; 10 to 15lb. seed are used per acre.

6. *Rye*.—Professor Giabert, at Turin, some years since, recommended *Rye* for green manure. New things are mostly overrated—and so it was with *Rye*, some even believing that it would supersede manure altogether. But although *Rye* will not effect all which has been expected from it, still it possesses many good qualities as a green manure; it will succeed on very indifferent land, and is one of the earliest plants in spring. On the other hand, its roots do not reach deep, and consequently do not much enrich the furrow-slice, except with a little nitrogen and carbon; the seed, moreover, is expensive. The amount of manuring substances contained in green *Rye* will be equal to the ripe *Rye*, straw, and ripe grain taken together. It is, therefore, easy to calculate how much it will better the soil. A small quantity of potash, soda, sulphuric acid, and common salt must, however, be added, because *Rye* in ripening loses a portion of these substances. When *Rye* is used for green manure, choice should be made of fields which are quite clean, and where a good deal of *Rye* has been lost at the harvest; for in this case, if the *Rye*-stubble is lightly ploughed in immediately after harvest, less seed will be required. After the *Rye* has been ploughed in, late Barley is planted, or the field may be manured and planted with Potatoes; otherwise, the practice is the same as with other green plants ploughed in.

7. *Turnip-tops and tails*.—These are used in some of the light soils of England (Norfolk) for green manure, after the parts above ground have been eaten during autumn and winter by sheep. Barley is sown afterwards; which, of course, will succeed the better if dung has also been used. But Turnips may as well be sown amongst the stubble of manured *Rye*, and then it may be succeeded by Barley or Oats. 1000 lbs. of Turnips consist of

900-0	lbs. of water in a fluid state.
2-2	nitrogen.
0-8	potash.
1-0	soda.
1-3	lime.
0-3	magnesia.
0-4	sulphuric acid.
0-8	phosphoric acid.
0-3	chlorine.
50-0	carbon.
42-9	hydrogen, oxygen, alumina, silica, oxide [of manganese and iron.

1000.0 lbs.

If, therefore, 10,000 lbs. of the tops and tails of Turnips are left on one Magdeburg acre of land, the soil will receive 22 lbs. of nitrogen, 500 lbs. of carbon, &c. To this are to be added the excrements of the sheep, which are at least worth a quarter as much as the Turnips.

In the Palatinate and the Elsass the leaves of White Turnips are used as manure, being a very indifferent food. After the harvest they are scattered over the field and ploughed in, like the leaves of Mangel Wurzel.

(To be continued.)

CULTURE OF CELERY IN BEDS, AND THE ROTATION OF CROPS.

(Continued from page 4.)

I do not approve of nursing early Celery plants in pots, as I have invariably found them more apt to run prematurely to seed than those pricked out in the usual manner; and this I attribute to the alternations of drought and moisture to which they are necessarily exposed, and to the spiral direction given to the roots by their confinement in the pots, which induces a stunted habit of growth, ill suited to luxuriant vegetation. For the main crop, I sow in a warm sheltered situation in the open air, in the beginning of February; and for late crops, about the end of March; pricking out the plants, when about inch-high, six inches apart, on a well-prepared border of leaf soil and good garden mould: they are removed to the trenches with a good ball to each when six inches high. My early crop I plant in the beds early in June, my main crop in July, and successional crops at intervals of three weeks, until the middle of September. For the early and main crops I plant three rows in each bed, placing the rows at one foot apart, and nine inches between the plants in the rows; for I find that I can grow a greater weight of Celery with plants at that distance, than if a greater number of plants were planted in the same space; but for late crops four or even five rows will not be too thick. To the early crops I apply water very copiously, at least once a week in dry weather, making use of pond water, if I can procure it, and, if not, of spring water mixed with soapsuds or liquid manure. I give sufficient to soak the beds thoroughly, and then on the following day, as soon as the leaves are clear of moisture, I place an inch of dry mould over the beds, to prevent as far as possible the water from being carried off by evaporation.

I am no advocate for earthing Celery a little at a time; I never earth up until the plants are at least a foot in height, and I then tie each plant loosely with matting, removing the suckers and small leaves at the same time, and applying four or six inches of mould at once. I find this the safest plan; as in earthing a "little and often" the soil is very likely to get into the heart of the Celery plants, and they are then useless. Where a great quantity of Celery is required, and it is not necessary to occupy all the beds with Potatoes, they may be planted with early Lettuce, Cauliflowers, or French Beans, or sown with Turnips, Carrots, or any other crop that is required so soon as it can be produced.

The advantages of this system are—first, there is no space lost, as the ridges are useful for Salad plants, and

the beds for early crops; secondly, a greater quantity of Celery can be produced, as single rows require to be grown 4 ft. apart, while three rows are by this plan grown in 8 ft.; thirdly, the Celery having a greater quantity of healthy pabulum for the roots to work in than it would have in single trenches, attains a larger size, and is much superior in quality; fourthly, the mass of vegetable matter added to the soil prepares it admirably for tap-rooted vegetables in the following seasons; and fifthly, by the manure for the Celery being prepared in the beds, the nuisance of wheeling manure on the walks after they are turned for the season is avoided. Indeed, by proper management, no garden ought to require dung to be wheeled into it from the time the walks are turned until the following winter.

I generally sow my Celery ground in the second year with Carrots, Parsneps, Beet, and other edible-rooted plants without manure; in the third year, Cabbage well manured; in the fourth year, Onions without manure, but manured for Coleworts in the autumn; in the fifth year, early Peas and Broccoli; and in the sixth year, Potatoes. Thus by dividing a certain portion of the garden into six equal compartments, the rotation of crops is reduced to a regular system, and each crop is six years before it again comes to the same place. By a little management of this kind, the crowding of two or three crops together, now too general, may be wholly avoided; and we need hear no more of the complaint that "ground will not grow Celery." It is not to be expected that it will, unless it be properly prepared. In conclusion, I may state that, in my opinion, Seymour's Superb White is the best Celery in cultivation.—*Judex*.

AMATEURS' GARDEN, No. II.

The principal requisite in preserving tender plants in cold pits or frames through the winter is, to keep them dormant from the end of October until the end of February; for as the growth of a plant depends more upon heat and moisture than upon other agents of healthful existence, it is obvious that the more cool and dry plants are kept, provided they do not suffer from an excess of either cold or drought, the more likely are we to be successful in their preservation. For this reason both the plants and pits should be kept dry, by placing the pots on some material, such as dry ashes, that will absorb moisture, and by admitting all the air possible in favourable weather. I give air at all times when the exterior temperature is a few degrees above the freezing point, and I remove the sashes entirely on dry mild days. Water I never apply, unless the plants are flagging, and then only in sufficient quantity to recruit their strength. Plants thus treated will scarcely be injured by the same amount of frost that would kill them in a growing state; provided they are kept closely covered until they are thoroughly but gradually thawed.

In protecting cold pits, the covering should never touch the glass, because, if it does, it absorbs the heat from the pit, and gives it off again to the atmosphere; but if it is raised 1 inch above the glass, it repels the radiant heat, and thus a stratum of confined air is generated, which forms an excellent protecting medium. For this reason, wooden shutters, frames thatched with straw, waterproof canvass, or tarpauling, are superior to mats; and hence the necessity, when extra covering is required, of placing it above and not between the usual covering and the glass.

Plants in rooms should only receive water when in actual need of it, but they must be kept as near the glass as possible. Pelargoniums that are not so bushy as may be desired must have the point of each shoot pinched out, and the same may be done with other plants of loose habit. Should the nights become very severe, it will be a good plan to place the plants under a table, surrounded to the ground by a large woollen cloth; and as a further precaution, when necessary, a stone jar or two of hot water may be placed amongst them at the time of retiring for the night.

In the kitchen-garden proceed with digging and trenching, except in snowy or frosty weather. The pruning and nailing of hardy fruit-trees must be concluded as quickly as possible; but Peaches and Apricots will be best if left until the end of February. If the Peas and Beans sown in November appear above ground, a second crop of each must be put in at the first favourable opportunity; but if none were sown at that time a crop of each must be got in without delay. A small crop of Early Frame Radish may be sown on any dry warm border sloping to the south, and may be protected by haulm or litter until the plants are up. Prepare dung, or dung and leaves, where the latter are plentiful, by frequent turnings, for beds for forcing Cucumbers and other vegetables. Where these materials are dry they should be watered when turned over.—*W. P. Ayres*.

HOME CORRESPONDENCE.

Drainage.—In furtherance of your views respecting a general drainage of the country, permit me to direct your attention to one of the provisions of the General Highway Act (5 and 6 Wm. IV., ch. 50, sec. 51), by which all the surveyors of the kingdom are directed to take the materials required for the repair of the highways from the brooks and rivers within their respective districts. This is now seldom or never done: the consequence is that these channels or outlets for the conveyance of water from the land are choked and obstructed by the accumulation of stones and sand brought into them by the winter floods; and the free passage of the water is by these means prevented. By the 13th Geo. III., ch. 78, surveyors were prohibited from taking materials from enclosed grounds, unless they could show that there were none to

be procured from wastes, rivers, and brooks. This provision appears to be omitted in the 5th and 6th Wm. IV., ch. 50; but might, I think, be re-enacted with advantage; and, if vigorously enforced, would tend much to remove what is now generally admitted to be the greatest impediment to the agricultural improvement of the country.—*An Old Subscriber*.—With reference to your suggestion of a General Drainage Act, in a leading article, which advocates a measure of the highest importance and public utility, I beg leave to observe that it would be of much consequence to many were some steps taken to prevent the use of mills, or the making pond-heads to work mills, when the stream is so sluggish or its fall so little as to make that necessary; because this cannot and never is done without great injury to the land adjoining and above the pond-head; such preventing its proper drainage by the natural stream adjoining. How the means are to be procured to buy up the interest of those now having mills on such streams, and the right to the use of the water thereof, is more than I can suggest; but I cannot help thinking that it would be a fit subject for the consideration of any one who would give his attention to a General Drainage Act, as suggested by you; inasmuch as by wind, or by steam, the wheels of some such mills might be worked, or substitutes for them, instead of by running water; and in such cases as I have alluded to above, the mills in use at present necessarily occasion injury to other property.—*B. C. H.*

Gardeners' Societies.—As these are institutions which, when properly conducted, are calculated to be of inestimable advantage to the rising generation of gardeners, I am happy to find that two new institutions are springing up in the neighbourhood of London, and in parts where, if the gardeners are so disposed, they may be well supported. If, however, there is one thing more than another calculated to militate against the prosperity and respectability of such gatherings, it is the practice of holding the meetings in public-houses; for no matter whether liquor be prohibited or not during the hours of meeting, it is sure to be indulged in afterwards, and when members become pot-vallant they are apt to ridicule or jeer at statements which in the room they had not the courage to combat. The consequence is, it creates ill-feeling and jealousy, deters young members from taking any part in future debates, and not unfrequently leads to those bickerings which are anything but creditable to either individuals or societies. Thus, on mentioning to the gardener of a nobleman that there was a Gardeners' Society at the Thatched House Tavern, at Hammersmith, he replied, "If you said a convivial society you would be nearer the truth;" and certainly the rule inserted at page 713, as formed against "intoxication," is strong evidence that such is the case. Far be it from my wish to raise a prejudice against the society; but this I will say, and I speak from no very limited experience, that the respectability and utility of all societies of this kind will be much augmented if the meetings are wholly unconnected with public-houses. So convinced were the projectors of the "West London Gardeners' Association" of this, that at its commencement, and during the whole of the time its meetings were held at Hammersmith, they paid seven shillings per night for a private room, though they could have had one at any of the public-houses free of expense; and I believe to this principally, and to the untiring assiduity of the leading members, may be attributed the respectable standing which that institution has attained among the societies of the metropolis. Rules as to the conduct of members and conducting the discussions are far best left out; for if members do not feel sufficient interest in the prosperity and respectability of their institutions to conduct themselves with courtesy towards each other, and if the chairman of the evening does not possess sufficient influence to check any ebullition of feeling, there is but little hope for the prosperity of the society, or the intellectual advancement of its members. Fines are of no use; to tax a man's pocket, is not to convince his reason that he has done wrong; and unless his reason is convinced, it is not very likely that he will amend his ways. In the excitement of debate uncivil expressions will escape even from the most guarded; but one rebuke from the chairman or an influential member will do more towards checking such conduct in future than fifty fines. I can speak feelingly on this subject; for I once experienced such a rebuke for an improper expression, that I would willingly have given my whole week's wages to have escaped. While I fully accord with Mr. Peter Mackenzie in what he has advanced respecting the "dissipation of gardeners," and would avoid a drunken one as much as I would a contagious disease, I cannot agree with him, that they should be thrown on the world as outcasts, or monsters which ought to be avoided. No; the spirit of philanthropy and benevolence, on which all societies for mutual instruction ought to be founded, forbids it. We ought not to say to poor erring humanity, "Go and beg your bread from door to door as a vagabond upon the face of the earth;" but, on the contrary, our exhortation should be, "In your sober moments come among us, and we will endeavour, by the force of our example and good counsel, to convince you of the error of your ways, and by making you taste of the sweets of intellectual pleasures, make you a good and useful member of society." Few unfortunately are there who have not at some time or other stepped beyond the line of sobriety, and therefore common charity should prompt us to pardon it, and as much as possible prevent it in others. The gatherings which generally take place before a young man goes to a situation, and yclept "foys," are, to say the least of them, very foolish and irrational assemblages, where a man spends several pounds (which in the majority of cases he cannot afford) for the purpose of seeing his

friends and acquaintances make beasts of themselves. The piece of harlequinism called "Making a Gardener," without which a man is not allowed to wear an apron in some of the nurseries, is only "the perpetuation of the disgusting relics of a barbarous age."—*A Gardener*.

Flooring.—An Infant School is now erecting in this neighbourhood, to which a play-ground of considerable declivity is attached. It is a question how this area, 102 by 42 feet, can be best and most economically prepared, to obtain the advantages of a dry, firm, and smooth footing. Perhaps some of your correspondents would kindly answer this question, and give the probable amount of cost.—*Anne, Carisbrooke*.

Bletting.—Although a prolonged discussion of this subject promises to partake more of the philological than of the horticultural or botanical character, your readers will probably not be sorry, as the Scotch proverb says, to "hunt the mawkin doon;" and so I make no apology for replying to the observations of your correspondent "F." in a late *Chronicle*. "F.'s" lively communication has given a new turn to the inquiry respecting the meaning of the word bletting; or rather the subject divides itself into two branches:—one seeks to explain the nature of the change taking place in the maturation of the rosaceous fruits, and the application of the word to express the idea of that change:—the other the derivation of the word itself. The first of these was the prime object I had in view when I preferred the question; and you have in part answered it most satisfactorily. You say that you follow De Candolle in the adoption of a word popular in France, to express over-ripeness, meanness, or the intermediate stage between ripe and rotten;—the druxiness, droxiness, or drossiness of the Sussex people. The word answers very well, and is not likely to be mistaken or misapplied; though I still think that the ripeness of the Medlar (taken as the exemplar of the tribe) in chemical nature, as well as in taste and flavour, differs as much from rottenness, as the melting condition or perfect ripeness of a Noblesse Peach does. Nevertheless, "precision and copiousness," as "F." says, are valuable qualities in a language, and it is very convenient to say that,—whilst a Peach ripens, a Medlar blets. To follow out the other branch of the inquiry, the etymology of "blette," will, perhaps, lead me out of my depth; but I will endeavour to reply to some of the observations of my fellow-correspondent. He supposes that there has been a misprint in my quotation from the old "Thresor de la langue Françoise," of *pourrée* for *poirée*; and goes on to say:—"This is not unimportant, for the word is derived from the Latin *blitum* (Greek *bliton*) beet; in French *poirée*, i. e. white beet. It is found in our language, as the name of what is, I believe, called Strawberry-spinach." I think that "F." will find in the sequel that the matter is not quite so easily settled. On referring again to my author, I find that the spelling is correct, although I have erred as to the signification of the word. I find on looking further, that he does not use the word *blette* adjectively, and that by "Espèce de *pourrée*" he does not mean "de *pourriture*," as I took it, and answering to the *trop-mûre* of later Dictionaries, but a potherb, the *blitum* or *blète* of our older herbalists. *Pourrée* is afterwards spelt *porrée* and "*porrée-rouge*,"—*blitum* (*Blitte* effilée, or Strawberry-blite of the present day.) You, Mr. Editor say, at p. 838, *βλῖτον* is supposed to have been the plant now called *Amaranthus blitum*, still used in France as a bad sort of spinach. Now, in Jaume St Hilaire's "Plantes de la France," I find two blites beautifully figured, *La Blitte effilée*, *Blitum virgatum*, to which he appropriates the English name of Strawberry-blite; and the *Amaranthus blitte*, *Amaranthus blitum* of Linneus. The clustered scarlet axillary inflorescence of the former of these, shews it to be the true Strawberry-blite, and no Beet at all. If we come back to the English herbalists, we find in Gerard a whole host of "Blites;" including almost all the Chenopodiaceæ, with the Orach and Atriplices; and the following quotation from "Booth's Analytical Dictionary of the English Language" (p. 235) will shew that several wild and cultivated herbs were anciently associated under this name. "The generic name *Chenopodium* (Greek *χην*, a goose, and *πους*, a foot) was given on account of the form of the leaves of the early included species; of those, the best known are the *Bonus Henrius*, wild spinach, or all-good, the leaves of which are often eaten as greens; the *arbitum*, or upright Blite; the *album*, common orach, or Frost-blite; the *viride*, Green-blite; the *vulvaria* (*olidum*) Stinking-orach, or Stinking-blite; the *polyspermum*, or Allseed; and the *maritimum*, Sea-blite, or white Glass-wort. Most of the species of Goosefoot grow on waste ground, or among rubbish; and the name Blite is from the Greek *βλῖτον*, fit only to be cast away, worthless. The genus "*BLITUM*" includes some foreign species, or, it may be, varieties of one species known in this country by the names *Strawberry-blite*, *Strawberry-spinach*, *Bloody-spinach*, and *Berry-bearing orach*. A species of *Amaranthus* (*polygonoides*) which grows amongst rubbish by the roadsides in tropical countries, is by some Botanists called the *Amaranthus blitum*. The well-known culinary herb Spinage or Spinach (for it is written both ways), the *Spinacia oleracea*, was formerly included amongst the blites." Gerard includes the Beet amongst the blites; and the French seem to have done the same, sometimes using the word "Blette" (genus pro specie) for their *Betrée*. The other name of *Poirée* or *Pourrée* must have been given it from its pear-shaped, or perhaps, leek-like root; for I strongly suspect that the derivation of this word is from *Poireau* or *Poireau* (v. Boyer) a Leek, and "Poirée-rouge" red-Leek:—and thus comes "espèce de *pourrée*" ("Thresor" loc. cit.) a species of Leek. But our speculations on the parentage of *Betrée*, and of all the Blites (the *Amaranthus blitum* included) in the Greek

Bliton, are at once set at nought by Paxton, who tells us that Beet is from the Celtic *Bet*, red. Here then a new light breaks in upon us, and we find another instance of the imperfect knowledge of the Etymologists of the last century, who traced everything up to the Latin, Greek, or Hebrew tongues, forgetful of their cognate, congeneric dialects. To say that Beet, Blitte, or Blite come from *Bliton*, is as much aside the truth as to say that *Vater* and *Mutter* come from *Pater* and *Mater* or *πατήρ* and *μήτηρ*. Again, it would be as unreasonable to suppose that the plant or plants, by the Greeks called *Bliton* (whether *Chenopodium* or *Amaranth*), one of which our ancestors called *Allgood*, another, the true *Strawberry-blite*, an elegant plant, and several of which were potherbs (it is reasonable to suppose) in the time of Theophrastus, were so called because they were worthless and only fit to be thrown, "as men would serve a cucumber," to the dunghill. While we thus dispose of the French and English *blitte* and *blite* as substantives, we are still in the dark as to the use of these words (the former of them, at least) adjectively. "I. K. S." another of your correspondents, quotes a "Vocabulaire Etymologique" for "*Blette*, s. f. (*βαίτον*, espèce de légume insipide),—plante. Adj.: *Poire blette*,—molle et presque pourrie." As the author of this *Vocabulaire* has not given the derivation of the adjective, you are left to suppose that it is the substantive word used adjectively. "F." has probably hit on the right soil, and I hope he will continue to dig in it. His "*Glossaire de la Langue Romane*" informs us that *blet*, *blitte*, *bleque*, &c., signify "soft." We must look for some other origin, therefore, for the adjective, than the *blitte* of the Greek *bliton*, or of the Celtic *bet*. The softness and mealiness of some of the *Chenopodia* help the conjecture of a figurative application of the term. But the speculations of the etymologists are a byword and a jest, and we must wait for further information. Having already occupied so much of your space on what will appear to some a rather "droxy" subject, I must only briefly notice some other of my fellow correspondent's remarks. "F." says that "blight" comes from the Anglo-Saxon *blæcþa*, which he translates "scurf, leprosy." On what authority does he rest, beside the affinity of sound? Lye defines this word by *vittilio*, which, I believe, is not leprosy nor a scurfy disease. "Scurf" exists entire in the Anglo-Saxon; and for "leprosy," Lye introduces the Gothic (quoting St. Matthew) *thrush* or *thrustfil*—literally, "breaking-out." *Blæcþa* comes nearer to "blain" or "blotch." If "blight" be Saxon, it is most probably from "*blæstan*—insufflare, to blast;" and this will agree with the inveterate popular idea of blight from atmospheric causes. My fellow correspondent concludes his remarks with a "*amaa nota bene*" on the use of the verb "swerve" in a passive sense. I dare say he is quite right; and I shall not look for authorities to gainsay his dictum: for if "swerve" is not a transitive verb, it deserves to be made so, and the sooner it is done the better, for the sake of the "copiousness and precision" of our language. In the foregoing quotation from Booth's *Analyt. Dict.* it will be observed that he spells the Greek name with an *η* instead of an *ι*—evidently with an eye to the root *βαλλειν*, to cast, or fling.—P. P.

Rooting.—I have two Hyacinths in flower-glasses, one of which is a common clear glass, the other is coloured dark blue; the root in the latter has grown more than double the other in strength and height, and is showing a fine flower, which its companion is not yet doing. Is this by accident, or is it caused by the dark colour of the glass, excluding the light?—A Young Lady. [Roots are formed with more difficulty when exposed to light than when in darkness. The first effort made by a young plant when it begins to grow is to force its rootlets downwards into the soil, and although this may be prevented by art, yet a plant will never form its roots so willingly under the influence of light as if buried in darkness.]

Amaryllis Belladonna.—I am not surprised at all that so few persons should cultivate this plant (a very great favourite of mine), as it is such an uncertain bloomer in the open ground. It has been in the garden here many years, but scarcely ever flowered till I got Dr. Herbert's book on this class of bulbs; since then, I have had the pleasure of seeing its delicate and fragrant blooms every autumn. It is thus described at p. 275 of Dr. H.'s work: "They are exceedingly hardy, but two things are necessary to their flowering,—a strong growth of the leaves, and absolute rest from Midsummer until their period of flowering in September. If the leaves sprout early, and are so much damaged by severe frosts that a vigorous growth does not ensue in spring, or if they are preserved green by a wet summer after the period of rest, or if they have not moisture in September to promote the blossoming, it will fail."—"A strong previous growth of the leaf seems necessary to its formation by the return of the sap from the leaf at the time of their decay; the seasonable drying up of the leaf seems to be the requisite circumstance, if followed by a sufficiently high temperature. In a pot it is very easy to regulate the points above stated; in the open ground, it can only be done by putting a glass covering or awning over the bulbs, so as to keep off the rain in a wet summer." "A south wall promotes the drying of the roots; they very seldom flower with me in the middle of the garden." In pursuance of these physiological principles, most of the bulbs here are now kept in large pots or boxes; and they well repay the trouble by their delightful flowers. Probably the reason of their not being oftener met with is the frequent failure of the bloom for want of attention to their nature.—C. D., Sussex. [Plant them at the foot of a warm south wall, well drained, and leave them to themselves. There will be no failure of bloom, we will warrant.]

The Season.—I have in my possession a Cowslip in full bloom, lately dug up in this parish. It is no starveling,

but a fine fellow, with a fat, tall flower-stalk, and some twenty flowers upon it; and treading, quite as nearly as nature will allow a Cowslip to do, on the heels of its elder brother, Oxlip. My parishioners, who have spent their lives in the fields, seem to think this a very remarkable proof of the mildness of the winter. C. W. Bingham, *Sydney Vicarage, Dorset*.—[We think so too; but we also have a Cowslip now before us in full flower in the cold London clay: which is still more remarkable.]

Cucumbers.—About 12 months ago, I paid a visit to Mr. Mills, at Gunnersbury; where I saw the best Cucumbers that had ever come under my notice at that season of the year. I may now state that the benefits of his system have reached this neighbourhood. A few days since, I saw the Cucumbers at Woolverstone Park, which are grown by Mr. Stannard, in the manner recommended in Mills' treatise. There were six lights of various sorts, both black and white spined, all looking well; that is to say, they are young, strong, healthy clean plants, with leaves from 14 to 18 inches wide, dark green, and bearing the appearance of spring rather than winter; with an abundance of fruit, in every stage of growth up to 16 inches in length. Some complaints have been made of the expense; but as it is well known that Cucumbers cannot be had at this season without (and very frequently not with) expense, I say, until some more economical and equally certain method can be devised, follow Mills' system.—Thomas Wild, 3, Tavern-street, Ipswich.

Economical Pumps in Hothouses.—Having been at considerable labour in carrying water to the plant-house at Holme Gardens, our employer had a pump, occupying only six square inches, placed in the corner of the bark-pit. Both in summer and winter water is abundantly supplied from the rivers, even when our highland pumps are frozen. If the ornamental head of such a pump is objectionable, it might be covered with a creeper, such as *Hoya carnosa*, a *Kennédya*, or some such plant. The water may be rendered tepid by constructing a concealed cistern beneath the bark or leaves; and it may be conveyed by means of pipes to any of the adjoining houses. Where the latter are heated by hot water, such a pump will be found still more advantageous. The expense of its erection is 5*l.*, which is soon repaid; as two men in one hour could easily do more watering in the summer season than could formerly be performed by three men in double that space of time.—Snowdrop.

The Onion Maggot.—Notwithstanding the great failure of the Onion crop in various parts, I have adopted the following remedy for the last five years with perfect success:—Immediately on the appearance of the maggot in my Onions, I take advantage of a dull or rainy day, and, with a watering-can and rose, I saturate the beds well with strong soap-suds. I then pull up all those which are infected, and I seldom find another die off afterwards. I am surprised to find that your valuable correspondent (Peter Mackenzie) states that the salts contained in the suds keep the maggot from the seed, when it is well known that it does not originate in the seed.—W. B. T.

Problem in Cookery.—What is the reason that fruit and liquors become, when heated, more acid, and, on cooling, are restored to their natural sweetness? A solution of this seeming mystery will oblige a subscriber and occasional contributor.—K.

Experiments with Manures.—Impelled by your observations last spring, I tried many experiments with various kinds of manure as a top-dressing to Grass land upon a tenacious clay subsoil. Among these were the ammoniacal gas-liquor from the gas-works, sulphate of soda, nitrate of soda, common salt, sulphuric acid, and chloride of lime. They were all applied in the beginning of May, but, except in the case of the gas liquor, without any perceptible effect. Wherever the water-cart passed with the ammoniacal water, its course could be traced by the dark green of the Grass; but at the Hay harvest, the produce did not much differ from the average quantity yielded by other parts. I likewise tried the mixture recommended so strongly for Potatoes by Prof. Johnstone, consisting of sulphate of soda and nitrate of soda; but the ridges so manured were very inferior to the ridges on which no manure had been used: I cannot help attributing this universal failure in the application of these manures to the continued drought from which we (in Dorsetshire) suffered so much. I experimented also with Daniell's manure for Turnips, and where it was sown broadcast it yielded an excellent crop of Swedes; but where it was drilled in with the seeds, the Turnips never came up; between the drills there was, however, a most luxuriant crop of weeds. I also succeeded in getting a capital crop of Swedes from cloacine dried with coal-ashes, according to the directions which you were so good as to give in reply to some former queries of mine.—A. H.

Effects of powerful Smells upon different Insects.—The wasp appears to be sooner affected by pungent scents than some other insects, since the fumes arising from Cayenne pepper thrown on hot iron will kill them in less than a minute; while the aphid, though infinitely more delicate, can bear them in a closed box with impunity for an hour. The fumes arising from burnt sulphur do not affect the white scale. I submitted some Pine-suckers, which were covered with scale, to these fumes in a close box not a foot square; and I found that neither the plant nor the insect were affected, although half an ounce of sulphur was burnt.—Flora.

Spirits of Tar.—In the article on spirits of tar at p. 5 of this year's *Chronicle*, I perceive that your correspondent recommends that it be mixed with sand, and sown with Peas and Beans, to preserve them from the attacks of mice and pheasants. The mice I can deal with, but I have never

been able to preserve my Peas and Beans from those beautiful adjuncts to a gentleman's mansion, the pheasants. I have been so often baffled by them, that I have caught at the idea, as a drowning man would at a straw; *Hic est, aut nusquam, quod quarimus*, said I: I am determined to try the experiment. My object in writing is to ask how much spirits of tar will be necessary, mixed with sand, to sow with 12 quarts of Peas? Can I overdose them? will it prevent the pheasants from picking them off after they are up?—J. W. C.—[Mr. McIntosh uses a gallon to 60 or 70 square yards; and we apprehend the best plan will be to water the soil where the Peas are sown, if pheasants are to be thus driven away. If sand is employed, we presume it must be well wetted. The tar will not hurt the crop; probably it will act as a manure. We, however, have no idea whether the plan will be effectual. May we beg our correspondent to report the result of his experiment when he has tried it?]

Experiments with Nitrate of Soda.—The following are the results of a few carefully-conducted experiments with Nitrate of Soda: On Keen's Seedling Strawberries, sown in the spring, the effects were not visible; Carrots, sown in the spring, large increase in size; Seakale, great increase in size and prominence of bud for this year's forcing; cut on Christmas-day. Brassicas of all kinds, deep luxuriant colour and vigorous growth; Asparagus produced the most extraordinary effects, as compared with other things; I cut 50 stalks, which weighed nearly all 4 oz. each, and took the first prize at a local show; the tops were of a very dark green, and kept growing late into the autumn. Onions in 1841 kept growing too late; they were very large, but did not harvest; in 1842 there was no perceptible difference. Conifers, increased depth of green, and vigorous growth. Turnips, sown with the seed, which came up with unusual rapidity, and continued to grow fast until they arrived at maturity; they were tender, juicy, and mild in flavour, with a perceptible improvement in the following crops. The soil is a remarkably friable sandy loam, on a substratum of loam and brickearth, much spotted with gravel, having a great tendency to burn in dry summers. The quantity of nitrate used was at the rate of 1½ lb. to the rod. In the case of the Asparagus, the whole of the land was measured, but no nitrate was put in the alleys. In every instance, except the Turnips, where it was harrowed in with the seed, it was applied when the plants were in a growing state, being strewn on the ground and allowed to be washed in. It appears to me that, wherever discrepancies arise as to its action, it must either be attributable to the sort of plants to which it is applied, or to the time and mode of using it. I, of course, mean on the same soils.—J. G., St. John's.

Lichens.—In the Travels of the Abbé La Lande, who visited Italy 1765, I find an observation, of which I add the following free translation:—"There is a manufacture at Rome of a powder called *Cyprio*, because the secret of making it was derived from the island of Cyprus. It is perfumed by a Lichen, or Moss, very common upon trees, which, by maceration in water, acquires a very delicious scent." Is it at all known to what kind of Lichen he alludes?—R. E. K. [We do not find any account of this Lichen; but there are many which are fragrant. *Lecidea aromatica* is very sweet-scented when bruised; some *Collema*s become fragrant when moistened, and *Parmelia fragrans* has a similar quality.]

Advantage of Buying Corn.—I am enabled to confirm Mr. Loudon's statement respecting the benefit to be derived by the labourer from the purchase of corn instead of flour, or bread; having made inquiries of parties, who at the present time adopt the system. The following fact, however, speaks for itself. A quarter of wheat will produce 130 four-lb. loaves: that at 40*s.* the quarter is, within the smallest fraction, 3*q.*d. a loaf. Wheat at the figure quoted, is better than that of which cheap bread is made; the general price of bread in the metropolis is from 5½*d.* to 7½*d.*—C. K.

FOREIGN CORRESPONDENCE.

Cape Palmas.—We reached this settlement on the 18th of July. For neatness of houses, &c., this must rank next to Sierra Leone. During our short stay at this place, I was so fortunate as to meet with Mr. Minor, an American missionary, who assisted me greatly in my researches. In a ramble through the bush we met with a fine species of *Smeathmannia*, growing to the height of 20 feet, and producing abundance of large white flowers, with some noble specimens of the Butter and Tallow tree (*Pentadesmis butyracea*), which is very ornamental, with large, entire, shining, coriaceous leaves, and pendulous fruit. Upon being wounded, a viscid yellow juice exudes from it; this tree grows to the height of 30 or 40 feet; the fruit is known to the natives of this part of the coast by the name of *Lapanee*. The order *Anonaceæ* is very abundant; one species was growing about the settlement, and is sought after by the people for its delicious fruit—the appellation given to it is *Lapaumee*. The dried fruit of a species brought from the interior was given to me by Mr. Wilson, of Fair Hope, Cape Palmas. One of the Fan Palm is found at a short distance from the beach; the leaves of this, when cut into narrow slips, are plaited by the natives, and are then converted into hats, or sold to the seamen visiting this port: this is known to them by the name of *Sennite*. The Oil Palm is also plentiful, but is not taken much notice of by the settlers. I may also mention *Habzélia aromatica*, another plant of the *Anonaceæ* order, the dried seeds of which are known in the shops of this country as the Piper *æthiopicum*. The seeds are used at Cape Palmas; but in the interior, at the confluence of the Chadha and Niger, it is not taken any notice of by the natives, though

growing on the banks of the river in great abundance. A beautiful Cinchonaceous plant is found about Fair Hope, which possesses a climbing habit, and bears large corymbs of light pink flowers. A species of Coffee, introduced from Prince's Island, has taken possession of the soil, and flourishes exceedingly. In the more open places are found a *Cardiospermum*, and a *Violaceous* plant, with small white flowers, and a species of *Jonidium*. The order *Capparidaceæ* is plentiful, especially in the genus *Cleome*; the *Commelinaceæ* are abundant in the genus *Tradescantia* and *Aneilema*; and *Euphorbiaceæ* in the genus *Phyllanthus*. The tribe of *Ficus* is plentiful, but the fruit of none of them is sought after. The species of *Napoleona*, found by Dr. Vogel, is growing in the lands about the settlement that have been cleared some years back, and upon which a young vegetation is springing up, but I was not able to obtain any specimens in flower; it is a plant of no beauty, the colour being of a brick red. A lovely species of *Loranthus* is very plentiful, the flowers of which are of a rich scarlet and purple colour. In wet situations are two species of *Lycopodium*; one possessing a creeping habit, the other growing upright. I only met with four kinds of Ferns; a climbing one is plentiful, as well as a species of *Polypodium*, but the other species are rare. A plant of the *Araceæ* order is growing abundantly in the marshes; so also are several *Cyperaceæ*. The stagnant waters produce a *Nymphaea*, which, I was informed, bears beautiful yellow flowers. Amongst the cultivated plants, the settlers have Cotton, Coffee, Indigo (found growing also in a wild state), the Sugar-cane, Cassava, Yams, &c. The fruits consist of Cocoa-nuts, Bananas, Plantains, Papaws, Oranges, Limes, Guavas, Sweet and Sour Sop, Pine-apples, Vines, and Mulberries. The Vines do not thrive; but the Mulberries are doing well—the species is *Morus multicaulis*. In the garden of a missionary, a very pretty *Amaranthus* was cultivated, which was obtained from the interior. A small quantity of Camwood is imported from this settlement—that and Palm oil being the principal articles of commerce. This was the only place in this part of Africa where I saw bees kept in hives for the sake of their honey, as they can be found so readily by other means. The thermometer stood at 80° at noon; the wet bulb hygrometer indicating 6° of dryness.—J. A.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BOLBOHYLLUM ADENOPHYTUM. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria. A native of Singapore, whence it was received by Messrs. Loddiges. The flowers are yellowish and slightly sweet-scented. It resembles *B. coccineum*, from which its want of a pseudo-bulb, or at most its extremely small one, and its petals, not serrated but glandular on the inside, readily distinguish it.—*Bot. Reg.*

TROPEOLUM AZUREUM. Blue Nasturtium. (*Greenhouse Climber*). Balsaminaceæ, Tropæoleæ. Octandria Monogynia.—This is a most remarkable plant, lately introduced by Messrs. Veitch and Son; it is much deeper coloured in a wild state than it has yet been in cultivation, but it is a very valuable acquisition for gardens. This pretty species makes a beautiful object when trained on some ornamental wirework, fastened to the pot, and requires the same kind of treatment as *Tropeolum tricolorum*. The soil in which it is potted should consist of some good rich sandy loam and leaf-mould, or fibrous peat, with a good portion of sand. The mixture should not be sifted fine, but left rather coarse. When the bulbs begin to grow (which generally happens in August or September), pot them in the above mixture, covering the bulb in the soil about half an inch, and well drain the pots. The latter should then be placed in a sheltered but not in a confined or shaded situation, out of doors. They will then grow rapidly, and much stronger than if kept in the greenhouse or pits; but when the nights get cold or wet they must be removed to the greenhouse for the winter, out of the reach of the frost; they must be placed in an airy and rather dry situation, where there is plenty of light. Thus treated they will flower freely during the spring and part of the summer. If there are several bulbs, some may be retained in a dry state until the spring before they are potted, by which means they will flower much later. When the plants have done flowering withhold water gradually, and place the pots in a dry situation. The bulbs do best when allowed to remain in the pots all summer to rest. It is increased by cuttings taken off before the plant begins to flower. The young plants when struck should not be either potted off, or have the tops tied up, but should be allowed to grow and hang down over the pot, otherwise they seldom form bulbs.—*Bot. Reg.*

COBURGIA VERRICOLOR. Changeable Coburgia. (*Half-hardy Bulb*). Amaryllidaceæ. Hexandria Monogynia.—This beautiful plant is the produce of the excursions of J. Maclean, Esq., over the Peruvian Andes from Lima, where he did not see it in flower, and the exact place of its growth is not noted. The large species of *Coburgia* are found deeply imbedded in rich alluvial soil, in the clefts or on the summit of rocks, and on the edge of precipices. They flower sparingly in their native land, and much difficulty has been found in making them bloom in Europe. Those who cultivate the bulbs for sale may plant them in the open ground, taking them up to lie dry during the winter; but, on the mountains where they grow, the temperature varies less than with us, and the principal division of season is dry and wet. There the *Coburgia* preserves its leaf often the whole year, and flowers in the heat of December and January, which answer to our June and July, and that period has been preceded by the free growth of the leaf. In order, therefore, to make the old bulbs flower, we ought to obtain a vigorous state of growth before midsummer, and at that time, if bloom does not appear, place them in a hotter situation. They like strong soil, mixed with perfectly rotten and pulverised dung or leaves, the neck being kept above ground if they are in pots.—*Bot. Reg.*

MILTONIA CLOWESII. Mr. Clowes's *Miltonia*. (*Stove Epiphyte*). Orchidaceæ. Gynandria Monandria.—This very beautiful species approaches nearest to *M. candida*, which it resembles in several prominent characteristics. Its pseudo-bulbs and leaves are somewhat similar, except that the former are rather more tapering towards the summit, and mostly a trifle greener. The flowers are, moreover, exceedingly like those of *M. candida* in general conformation, being only a very little smaller; but the structure of the lip is altogether different, and its hues are quite peculiar. It is considerably compressed in the middle, by the folding back of the edges; and this construction almost gives it the appearance of being composed of two parts. The point, besides, is greatly attenuated. At first it is said to be perfectly white; but it afterwards acquires, towards the base, a pleasing violet and pinkish tint. It is one of the most desirable of *Orchidaceæ*, on account of its blooming through the dull months of October, November, and December. It may be cultivated like the pseudo-bulbous class of *Oncidium*, by being potted in turfy heath-mould and potsherds, well mixed and efficiently drained. A very slight depth of soil is needed, and the pot can be principally filled by

placing a smaller one in its centre in an inverted position. It does not require a great heat, and but a scanty supply of water in winter. It is a native of Brazil.—*Paxton's Mag. of Botany.*

MISCELLANEOUS.

Contrivance in the Creation a Demonstration of the Existence of the Deity.—One of the most irresistible arguments by which we demonstrate the existence of a God, as well as the character of many of his attributes, is that which we gather from a minute investigation of his works. The region of Nature is full of God; and the deeper our researches are into its wonders, the fuller and the stronger does the conviction become that all its parts have had their origin and arrangement from a Power—a Power altogether independent in its own being of the various objects over which it presides, and a Power which in all its operations has followed a specific plan, purpose, and design. The marks of contrivance which meet us all through Creation declare unanswerably a Contriving Mind. This arrangement of matter cannot come of chance. The fortuitous concurrence of atoms, of which ancient sages pitifully philosophized, could never have organised such mechanism as the whole Universe develops; and he who, with that mechanism before him, owns no God, is, we affirm, but a melancholy witness of the truth of that saying—that no man is so credulous as an infidel. I pass by a throng of facts which, in answer to such a question, seem to rush forth from above us, and beneath us, and around us, to fix on one particular class of evidences of Designing Power which pre-eminently claims attention: it is that class which so plainly contemplates the condition of this our world, and especially of our own species—not as God made them at the first, but as we now see them—subject to suffering, disease, and pain. Now that our race, in common with all animal existence, has become liable to physical suffering—and that suffering of so various and often opposite kinds—we look into the resources of Creation, and what do we discover? We discover the fact, that all this state of things has been foreseen, anticipated, and provided for; inasmuch as here are stores laid up in all the vast repositories of the mineral and vegetable kingdoms—yes, and even in the secret properties of animal substances also—stores of every kind, exactly adapted to meet the wants, and ease the pains, and often altogether to remove the diseases that our "flesh is heir to." So that here is design and contrivance shown in the most affecting manner. God our Maker has been under the necessity—a necessity imposed by his creatures' sin—of inflicting certain sufferings upon us. Yet how do these provisions of nature exhibit Him before us? Even while, as it were, with the one hand He wounds, with the other He ministers, if not the cure, at least the mitigation of the pain. Here are ills existing all around us; and, all around, here are the antidotes to those ills already prepared. Now we ask—Is this chance? Comes it of chance that the world should prove one great depository of medicines for its own maladies? No, we reply: here is intention—here is foreknowledge of special circumstances—here is preparation to meet those circumstances. And the contemplation of such a coincidence between the world's physical woes, and the world's medicinal stores—the one so corresponding to the other—enforces the recognition of a Mind that has foreseen, and anticipated, and determined to provide for, a condition of suffering existence such as earth now exhibits.—*From a Sermon preached before the Apothecaries' Society, by the Rev. John Harding.*

Productions of the Valley of Herat.—The winter at Herat is not so severe as that of England, although snow lies on the ground for a few days during the months of December and January, and occasional frost occurs until early in March. The summer months are much hotter than in England, but cooler than in India, in consequence of a very high wind which blows steadily from the North during the months of June, July, August, and September. Little rain falls except in winter and early spring, the cultivation of the valley being carried on by means of canals cut from the river. The climate may certainly be considered as a very dry one. The principal trees in the valley are the Elm, Ash, Fir, Plane, Poplar, Willow, and Cypress. Of fruit trees there are the Pear, Apple, Quince, Peach, Apricot, Plum, Cherry (sour), Mulberry (red and white), Pomegranate, Walnut, Filbert, Berberry, and the Fig; the Pistachio flourishes in the district immediately north of the valley. Of Melons and Grapes there is every variety in perfection. The vegetables are Cucumbers, Beet, Onions, Lettuce, Brinjals, Carrots, Turnips, Spinach, Khol-Kohl, and Beans; all, except the three first, of very indifferent quality. The garden flowers are few in number: the Rose, red, white, and yellow, the Jessamine and a species of Lilac, the common Red Tulip, the Narcissus, Blue Iris, Pink and Marigold; the Sunflower, Hollyhock, and Cockscomb, are common. Amongst the wild flowers, are the Butter-cup, Dandelion, Cornflower, Nettle, Clove, Forget-me-not, and Poppy.—*Transactions of the Agri-Horticultural Society of India.*

Conversion of Starch into Gum and Sugar.—During germination, a great change has taken place in the chemical composition of the seed; a notable quantity of its starch has passed into the condition of Grape-sugar, and become soluble, while the gluten, or azotised portion, has undergone partial decomposition, giving rise to a certain quantity of a most extraordinary substance called "diastase," which possesses the power of inducing the conversion of starch into Grape-sugar. The simplest experiment for illustrating the specific property of this curious body is to add to a quantity of warm thick gelatinous starch, a little infusion of common malt made with tepid water, and then maintain the whole at a temperature which does not much exceed 160° Fahr. In the course of a very few minutes,

the starch, before so thick that the vessel might be inverted without spilling any, becomes as limpid and thin as water. It is now "dextrin" or starch-gum, a state intermediate between ordinary starch and sugar. If the temperature be still kept up, in the course of some hours, depending upon the quantity of malt-infusion used, the liquor will have acquired a sweet taste, and have become, in fact, a solution of Grape-sugar. This is the principle of the first step towards the manufacture of beer, and which is called "mashing;" its object is to get a saccharine liquid susceptible of fermentation. The practice is as follows:—The malt, roughly ground, or rather crushed, between rollers, is placed in a spacious wooden vessel or "mash-tun," furnished with a false bottom pierced with small holes, like a colander, and raised a little space above the true bottom. A stop-cock, placed between the two, communicates with an exit-pipe. The due proportion of water, regulated of course by the quality of the liquor required, which has meanwhile been heating to the proper temperature in a large copper boiler close at hand, is now let on, and the mixture in the tun, after due agitation, either by machinery or by hand, is closely covered up to prevent loss of heat, and suffered to remain during a space of time varying from two to four hours. In this interval the greater part of the starch of the grain, which had escaped unaltered during the malting, is, by the action of the diastase before mentioned, converted into soluble mucilaginous matter and sugar; the liquid, or "wort," acquiring a degree of sweetness incomparably greater than could have been communicated by the sugar actually contained in the malt itself.—*Fownes, in the Pharmaceutical Journal.*

Protecting Plants.—At the last sitting of the Paris Horticultural Society, M. Victor Paquet made an interesting communication relative to a mode of protecting, on the open ground, delicate plants from the frost in winter. The branches are to be tied together, and, if necessary, two sticks are to be fixed in the ground as supporters. Some litter is to be spread over the ground round the plant, and a sack or other covering is to be placed over the whole. This covering is to be made thoroughly wet, so that it may be frozen at the first frost. The frozen surface not admitting within the interior a cold so intense as itself, the plant is in a comparatively warm temperature.

Guano.—The superintendent of the hardy department reported that he had tried several experiments with guano upon plants in pots. In loam, containing one-fiftieth part of this substance, *Verbenas* and *Sálvias* became luxuriant in about the same degree as if potted in rotten dung. The same plants also flourished exceedingly in sand containing a similar proportion of guano. The same effect, or even a more beneficial action, was produced upon them when peat was substituted for sand. But when rich garden soil was employed with the same proportion of guano, the plants became languid and died. It was therefore inferred that the value of guano as a manure, will depend upon the soil with which it is employed, and that a quantity which would be highly beneficial in poor soil will become deleterious upon land previously rich and well manured.—*Proceedings of the Hort. Soc., No. 17.*

Bacon.—As it is of some importance to cottagers to know how best to preserve their bacon, we have borrowed the following receipts from an old lady whose bacon is never rusty. For the bacon of a large pig take 14 lbs. of common salt, 1 lb. saltpetre, and $\frac{1}{2}$ lb. bay salt; with this mixture rub the bacon thoroughly, and then put it down tightly into a tub kept expressly for the purpose, having a lid to fit tightly on, and also an inner cover, which rests on the bacon, and presses it down as it diminishes. Before the salt is used it should be damped with a quart of cold boiled water. If these precautions are attended to, the bacon will preserve its colour and good flavour for 18 or 20 months. As soon as the weather becomes hot, the brine should be poured carefully out of the tub, be boiled and well skimmed, and when cold be again poured over the bacon.

To boil Leeks.—For the Cottager Leeks make a delicate, economical dish, and are very beneficial in case of colds. In boiling these vegetables, it may be well to state that they are much improved by changing the water when half boiled. It is commonly supposed that Leeks are stronger in flavour than Onions: this, however, is an erroneous opinion; they are, on the contrary, much milder.

Mildness of the Weather.—We learn from the *Londonderry Journal*, that, as a proof of the mildness of the weather in that neighbourhood, some ripe Strawberries were, a few days ago, gathered in the garden of Mr. R. Stewart, of Altrest, near Donemana, which lies in rather an exposed situation. In various parts of the country thrushes have also been singing, and sparrows have commenced to build their nests.

THE NATURALIST'S CORNER.—No. VIII.

(Continued from page 7.)

25. The *Pæonias*, a very conspicuous genus of herbaceous and suffrutescent plants, were highly esteemed by the ancient Greek physicians, but their praises are too extravagant for sober repetition. Modern times, however, are not altogether free from some remnants of absurdity. "The anodyne necklaces," says Burnett, "still sold to prevent convulsions in children, and to ease dentition, are made of beads turned from the root of the common *Pæony*."

26. The great utility of the bark of the *Birch-tree* in North America is very remarkable. Not only are the canoes in which the Indians trust themselves on lakes sufficiently boisterous, some miles from the shore, made of it, but also all sorts of small cups and dishes. Besides, it burns like pitch; splits into threads which serve for twine; and the filmy part, near the outside, may be written upon in

pencil, making no bad substitute for paper.—*Head's Forest Scenes.*

27. Dr. Cheyne remarks, in his Philosophical Conjectures on the preference of *Vegetable food*, that he believes a good natural philosopher might show, with great reason and probability, that there is scarcely a beast, bird, reptile, or insect, that does not, in each particular climate, instruct and admonish mankind of some necessary truth for their happiness, either in body or mind.

28. In *Civil History* records are consulted, medals examined, and antique inscriptions decyphered, in order to determine the epochs of human revolutions, and verify modern events; so in *Natural History* we must search the archives of the world; draw from the bowels of the earth the monuments of former times; collect the fragments, and gather into one body of proofs all the indices of physical changes, which may enable us to retrace the different ages of nature. It is thus only that we can fix some points in the immensity of space, and mark the progressive stages in the eternal march of time.—*Jameson's Geological Illustrations.*

Reviews.

Verhandlungen des Vereins zur Beförderung des Gartenbaues in den Königlich Preussischen Staaten. Transactions of the Royal Prussian Horticultural Society at Berlin. Vol. XVI., Part II.

THE greater portion of this Part is taken up by a very detailed article on the culture of Heaths, by Mr. E. Regel, Inspector of the Botanic Garden at Zurich, followed by a description of the species and most remarkable hybrids in cultivation. The first portion, occupying 54 quarto pages, is devoted to the cultivation of this beautiful tribe of plants, and appears to be the result of long practical experience and careful comparison of the directions given by previous writers, especially of those contained in Mr. McNab's treatise, with the practice of the principal Heath-growers in Germany, as well as of those of this country, as far as Mr. Regel has been able to ascertain them. After devoting the first chapter to the soil, a long one follows on propagation; this is closed by an enumeration of species classed according to the length of time and difficulty of striking cuttings under various modifications of soil and temperature. In the third chapter, on transplanting, the English practice, recommended by McNab and others, of filling the bottom of the pots for large specimens with stones, brickbats, cinders, or bits of wood, is contrasted with the opinion of Jannack and most German growers, that this practice is not only unnecessary, but prejudicial. Mr. Regel advocates the German practice, but admits that the greater humidity of the British climate may require a different treatment. The fourth chapter contains directions for pruning; the fifth for watering; and the sixth, long details as to Heath-houses or stages for summer, with reference to aspect, temperature, light, and ventilation. The directions in this chapter are drawn up chiefly for the climate of Germany, where the long drought of summer has more to be guarded against than the continued damp of our climate, which it is McNab's chief object to counteract. With regard to the Heath-houses for winter, detailed plans for which accompany the paper, Mr. Regel warmly advocates heating by hot water. He also strongly protests against iron sashes, or any iron work in contact at once with the outer and inner air. For, as the internal temperature should not be kept in winter above 3 deg. Reaum. (39 Fahren.), if the external cold descends only to 5 Reaum. (21 Fahren.) the internal vapour condenses and cools so rapidly on the iron sashes as to fall in the form of snow. Mr. Regel cautions also very particularly against any cold draught being allowed to pass over the Heath-plants. He recommends that all light should come from above, and not from the sides; that the plants be as near as possible to the light; and that the inclination of the roof be very small. At the close of the chapter, the Heaths in cultivation are again enumerated, and classed according to their relative hardiness to bear cold in winter. The seventh and last chapter is devoted to the diseases which attach to cultivated Heaths, and which are chiefly attributed to defects in cultivation, with the exception of the Fungus named by Klotzsch *Clavicularia destruens*, which, if not stopped in time, will soon overrun whole plants; and, if it does not destroy them, will reappear regularly every year. Mr. Regel considers powdered sulphur, either alone or mixed with slaked lime, to be the best remedy.

The second division of the paper occupies 130 quarto pages, and contains detailed descriptions of all the species in cultivation. In their classification, Mr. Regel adopts the four subgenera established by Bentham in *De Candolle's Prodrum*, and many of the sections of Klotzsch, or of Bentham, with others, either entirely new or modified, with special reference to the facility of determining cultivated species. The number enumerated is 335, besides varieties; but Mr. Regel includes as species many of the garden hybrids, which are now multiplied almost indefinitely, so as to render almost fruitless any attempt at describing them on paper. Of two hybrid seedlings raised from the same parents, one will often have more of the character of one of the hybrids in cultivation would have to include a separate account of almost every individual raised. It appears to us that it would have been better, even for garden purposes, to have enumerated as species only such permanent ones as are really so in a Botanical sense; and after each species to have referred to the hybrids which either are known to have that species as one of their parents, or have such an affinity to it as to make that probable.—*E. M.*

The Naturalist's Pocket Almanack is an attempt to

render this sort of book useful to those who are more interested in Natural than in Political History; the plan is good, and we wish the work success.

The Ombrological Almanack is, Mr. Legh, its author, informs us, founded partly on admitted principles, and partly upon observations and discoveries recently made on the influence of the planet Jupiter and his satellites on our atmosphere. We cannot congratulate the author upon the success of his weather predictions, as far as the present year has gone. We are now writing with the country covered with snow; but the Almanack, which says nothing of that, tell us the weather will be fair and cloudy; while the 3d of the month, which was one of the loveliest of bright sunny days, was announced to be frosty, sleety, and cloudy.

The Polytechnic Review. No. I.—If we notice this new periodical, it is certainly not for any merit that we discover in it. It professes to treat, among other things, of Agriculture; and the editor assures his readers that he has, in that department, "facilities at his disposal which have not yet been possessed by any similar periodical;" and then, as if he could not say enough upon this point, he repeats that "in this department unusual facilities and assistance are at his command." Upon looking to the nature of these unusual facilities, we find they are derived from plunder of the "Gardeners' Chronicle," and from nothing else. All the Agriculture that is produced consists of Dr. Playfair's first lecture on the Animal Chemistry of Farming, misprints included, purloined without acknowledgment, from our columns. It is fortunate that the worthy gentleman who rejoices in the name of editor of this abortion has hoisted the black flag thus early; for otherwise, we might, in our simplicity, have fancied that his trumpet-tongued announcement of prodigious facilities and peculiar advantages really possessed some meaning.

CALENDAR OF OPERATIONS for the ensuing week.

THE sudden disappearance of the first hard frost of the new year, and the changeable nature of the weather since the first new moon of the season, coupled with the fact that the wind blew from the south-west on the last shortest day, are held by our weather prophets here as sure indications of a mild open winter. Good news this, if true. We must not, however, on this account, relax our vigilance; for although the last two months of the year may be said to be the most trying for all kinds of house-plants, yet the next six weeks are by no means free from trials of a different cast. The large fires necessary to meet sudden depressions of temperature, and the heat of the sun on frosty days, are sure to bring on vegetation too quickly, and, if not guarded against, will as surely bring disappointment at a future period. Thick coverings at night, as little firing as is consistent with the safety of the plants, and judicious ventilation, are the proper remedies. Besides the routine business of the season, such as wheeling dung, digging, pruning, sweeping and rolling grass, gathering leaves and materials for composts, I had lately some of the best hands on the pleasure-grounds doing work which is often neglected in many places, and sometimes never thought of at all. They were examining the roots of all our finer trees and shrubs planted on the grass or elsewhere within the last dozen years, forking over the original composts in which these were planted, tracing out and bringing nearer to the surface such roots as went too deep; others that rambled too wide were cut back to different lengths, and after removing a portion of the old compost, and adding fresh in its place, a zone of good soil, about a foot or eighteen inches wide, was placed round the outside, care being taken to have an inch or two of poor soil on the top to prevent the roots of the grass from penetrating into the new compost. This sort of work wants much looking after, from the palace to the smallest garden.

The early forcing of flowers is becoming more and more general every year, and is now a regular and profitable branch of business at many of the nurseries round London. There is an excellent paper on this subject, by Mr. Green, in Vol. I., p. 148, with a good list of plants suitable for the purpose. The early Tulips and Narcissuses have never been stronger with me than they have been this season; the earliest Hyacinths, on the other hand, are not so strong as usual; perhaps the general drought overtook them last season before their leaves had finished their office. The whole race of tea-scented Roses ought to be forced, or otherwise encouraged to bloom early, in order to enjoy their delicate fragrance, as in summer they can hardly be said to be sweet. The Spang's Provence is the earliest and best forcer of the old Roses; but to come in at Christmas the hybrid Perpetuals are by far the best and sweetest, providing they are on their own roots or worked upon the Boursault—the latter is so easily excited into growth, whereas our native Rose stocks are entirely unfit for forcing purposes.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Continue the top and bottom heat, especially by fire, as steady as possible for some time to come. Pines and Orchidææ suffer less from confined air than other stove plants; but the air in Pine-stoves, being always more or less charged with exhalations from the fermenting materials, must be changed as often as the state of the weather will permit. When the quantity of hot-water pipes in any of the houses is barely sufficient to keep up the requisite temperature, they must always be kept very hot; and thus, besides drying up the moisture, they deteriorate the air in a manner not yet sufficiently explained.

VINERY.—If the stems of the Vines have been painted with any composition for destroying the eggs of insects, &c., the longer it remains on, the more effectual it will prove. When I use this kind of paint, I always dredge it over, while moist, with fine sand; this forms a hard crust, and prevents the paint from scaling off until it is cracked by the growth of the tree—of course I never allow it to be washed off by the syringe. Vineries that are to be forced next month should now be shut up, and the outside borders well mulched with fermenting materials. Those now in forcing must be constantly kept moist, with a temperature of from 50° to 60°, according to their states of forwardness.

PEACH HOUSE.—During this changeable weather some nicety is required to watch the temperature of this house. Whether you are beginning to force it, or your trees are coming into blossom, keep it rather below the mark than otherwise; abundance of air and moisture are the main points to be attended to until the blossoms open, when moisture must be withheld.

CHERRY HOUSE.—The trees here are so forward this season, with merely the shelter of the house, that it would be dangerous to leave them now exposed to frost. Very little forcing is required for the Cherry at any time; but they are even more susceptible of sudden changes than the Peach, and also more liable to the attacks of insects. Any Cherry-trees in pots may be brought into the coldest end of the Peach-house. Trees of this sort are always more manageable in pots or boxes; and, being liable to failures not easily accounted for, a good stock should be kept on hand to replace accidents of any kind.

FIG HOUSE.—I would never plant a house with figs; they answer so much better in pots, which can readily be brought into any house at work and in succession. Before they come into leaf they can stand in any out-of-the-way corner: they delight in a mild moist atmosphere.

CUCUMBERS.—Those in a bearing state require a constant, brisk heat, and plenty of air, especially if they are surrounded by fermenting materials. The dung for seed-beds, or for planting out upon, should be thoroughly sweetened before the beds are made; but few people think of beginning so early with this troublesome system.

MELONS.—For a very early crop, seeds should now be sown in any of the pits or houses at work.

MUSHROOMS.—Keep the bearing beds free from woodlice, and continue to collect droppings for succession beds.

ASPARAGUS.—Where a constant supply of this useful vegetable is wanted, a few single rows ought to be sown every year to meet the demand, without encroaching on the permanent beds. Celery trenches will be found the best for raising this supply, and I advert to it thus early that room may be left in disposing of the ground for future crops.

KIDNEY BEANS.—For winter use, these should always be sown in the pots in which they are to fruit, as transplanting them will materially check their growth. Later in the season they may be sown in boxes and transplanted with safety. Pots of 32's are large enough for the early crops; the soil, if well drained, can hardly be too rich for them.

MISCELLANEOUS.—Early Radishes, Potatoes, Onions, Lettuces, Herbs, and small salading, may now be forwarded on slight hot-beds. I always pot the earliest crop of Potatoes in 48 pots, place them anywhere in the stoves till they are well up, then remove them to a cold vinery to harden, and afterwards turn them out in turf pits, covered with reeds and with a little hot dung under them.

Out-door Department.

All the early crops of Peas, Beans, Radishes, and Lettuces, may now be safely sown on dry, warm borders, and well guarded from mice, birds, slugs, &c. An excellent list of the best sorts of these and other vegetables has been recently given by Mr. Wintling. There has been no want of time this season to protect all crops that require it; neither has there ever been a finer time for pruning and nailing, planting, and getting forward with the routine business of this department.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—Many of the Orchidææ are now enjoying a comfortable repose, while others, less fortunate, have to struggle on against our long nights and comparatively dull days. Assist this last class by giving them as much light as you can, and do not excite them to too rapid growth. Another portion which have just returned from the drawing-room, where they have been showing off their beauties, will, in all probability, be in want of a refreshing draught; look to them, and take care that the water is not too cold for them; a little attention will soon bring them to their regular habits. Look also over the *Hedychium*s now piled under the stages or on shelves, and start a few roots into growth to prolong their season. No plants are more fragrant or more suitable for the conservatory, when in flower, than *H. maximum*, *coronarium*, and *Gardnerianum*; but the latter is unfortunately of short duration, so that a great number of plants would be required to keep up a succession of flowers for any length of time. Out of 16 species of this genus which I have flowered, these three are all that I can recommend for general purposes. If the plants are clean, there is very little work in the stoves at present. All sorts of foreign stove-seeds, or of any other description from abroad, may now be sown with safety. This is the best time to sow seeds of fine *Rhododendrons*, *Azaleas*, *Kalmias*, &c.

GREENHOUSE.—Keep the temperature as low as possible on fine days by giving abundance of air. Nothing is better after all than the old flue for heating a common greenhouse; this has been lately very apparent.

CONSERVATORY.—This should now be in a blaze with early forced flowers and stove plants, including a few *Orchidææ*. Orange-trees, forced last spring in the late vineries, are just coming into blossom. I sowed a quantity of lemon-seeds this time last year; they are now about the size of my penholder, and in a smart heat, ready to be grafted on the first wet day. I intend to have scores of these in 48 pots for forcing all the year round. The heat in this house is not lower than 40° at night, and as much as the sun can raise it to in the day, with a little air for an hour or two every fine day.

PITS AND FRAMES.—There is a little breathing room here now; many of the plants having been removed for forcing and propagation, such as Pinks, Roses, *Hydrangeas*, *Gardenias*, *Fuchsias*, &c., and a host of Dutch bulbs, which have been here for a few weeks to improve their foliage, after coming from under the leaf mould where they have been since they were potted. This puts me in mind of a resolution which I meant some time since to put to all Gardeners and Amateurs, namely, that we must in future get over these Dutch bulbs one month sooner than the usual time. To do justice to a *Hyacinth*, it ought to be potted on the 1st of September, if it is desirable to have it in flower on Christmas day.

Out-door Department.

FOREST AND COPPICE WOOD.—The weather this month is always too uncertain for planting. Pit, trench, and drain the land first, and plant it afterwards; thin by all means, especially in the middle of the plantation, and do not use above one half of the number of nurse plants that your predecessor used to do. To make amends for the poles you would expect some dozen years hence, crop the ground with potatoes, carrots, or any other crop that suits the land best, until the trees begin to meet.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the Week ending Jan. 12, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.		THERMOMETER.				Wind.	Rain.

The highest temperature during the above period occurred on the 15th, in 1834—thermometer 56°; and the lowest on the night of the 19th and morning of the 20th, in 1838—thermometer 42° below zero.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Jan. 13, 1843.

[The Half-sieve contains]	3½ imperial gallons.
The Sieve	7 " "
The Bushel Sieve	104 " "
The Bushel Basket	1 imperial bushel.
Punnets for Seakale are	7½ in. wide and 2 in. deep.
" Radishes	8 " "
" Mushrooms	7 " "
" Salad	5 " "

The market has been well supplied with both fruit and vegetables during the past week; but the demand has not been great. *Fruit:* The supply of Pines is not large. A few hothouse Grapes of fair quality are offered from 5s. to 8s. per lb. Amongst the dessert Pears the Ne Plus Meuris and St. Germain's have appeared; the former at 8s., and the latter at 6s. per half-sieve. Good samples of the Old Colmar at 10s., and of the Beurre Rance at 6s., are also offered. The prices of dessert Apples remain nearly the same as in our last Report. The demand for Nonpareils has been upon the increase, and their price has therefore advanced a little. Excellent Cockle Pippins may also be had, at 5s. per bushel. Pummeloos, or Forbiden Fruit, have made their appearance, from 6d. to 1s. each. *Vegetables:* The quality of Asparagus has of late somewhat improved; the best bunches continue to fetch from 8s. to 10s. each; the inferior ones are from 2s. to 3s. 6d. each. Seakale is abundantly supplied, and is a little cheaper than in our last Report. The price of White Broccoli has also fallen; good samples being obtainable from 9d. to 2s. per bunch. Turnips are excellent, from 1s. 6d. to 2s. 6d. per dozen bunches. We noticed some young autumn-sown Horn Carrots, from 4d. to 6d. per bunch. Rhubarb is very little in demand, and may be procured from 9d. to 1s. 6d. per bunch. Of Celery there is a fair supply; the White fetching from 6d. to 1s. 3d., and the Red from 9d. to 2s. per bundle. Mushrooms are still plentiful, from 4d. to 9d. per pottle. *Flowers:* Amongst the cut flowers are Hyacinths, Tulips, Narcissuses, Cyclamens, Gardénias, Amaryllises, Cinerárias, Azalæas, Abutilon striatum, Pyrus japonica, the Chinese Primrose, &c.; and in pots are some good forced Hyacinths and Tulips.

PRICES, SATURDAY, JAN. 14, 1843.—FRUITS:—

Pine Apple, per lb. 4s. to 6s.	Lemons, per doz. 1s. to 2s.
Grapes, Hothouse, 5s. to per lb. 8s.	Almonds, per peck, 6s. to 7s.
— Spanish, 1s. to 1s. 6d.	Sweet Almonds, per pound, 2s.
— Portuguese, 1s. to 1s. 6d.	Walnuts, per bush. 12s. to 16s.
Apples, dessert, per bush. 8s. to 7s.	Chestnuts, per peck, 3s. to 4s.
— Kitchen, 2s. 6d. to 6s.	Filberts, Eng. isl., per 100 lbs. 60s. to 65s.
Pears, dessert, per hf. sieve, 2s. to 10s.	Cob Nuts, per peck, 3s. 6d.
Pummeloos, each, 6d. to 1s.	Nuts, per bushel—
Melons, Spanish, 2s. to 3s.	— Brazil, 16s. to 20s.
Oranges, per doz., 8d. to 2s.	— Spanish, 18s. to 20s.
— per 100, 5s. to 10s.	— Barcelona, 24s.
— bitter, per 100, 10s. to 12s.	

VEGETABLES:—

Savoy, per doz. 6d. to 1s.	Paraspe, per dozen. 6d. to 1s.
Cabbage, per doz. 6d. to 1s.	Spinach, per sieve, 1s. 6d. to 2s.
— plants, per doz. 1s. 6d. to 2s.	Leeks, per doz. bun. 1s. 6d. to 2s.
— Red, for pickling, 1s. 6d. to 4s.	Onions, per bushel, 4s. 6d. to 6s.
Brussels Sprouts, per hf. sv. 1s. to 2s.	— Pickling, per hf. sv. 3s. to 4s.
Broccoli, White, per bunch, 1s. to 2s.	— Green, p. doz. bun. 3s. to 4s. 6d.
— Purple, 8d. to 1s. 3d.	— Spanish, per doz. 1s. 6d. to 3s.
Beans, Kidney, forced, per 100, 2s. to 3s.	Garlic, per lb. 6d. to 8d.
Potatoes, per ton, 50s. to 70s.	Shallots, per lb., 1s.
— per cwt. 2s. 6d. to 3s. 6d.	Asparagus, large, per 100, 8s. to 10s.
— per bushel, 1s. 6d. to 2s. 6d.	— Second, 2s. 6d. to 3s. 6d.
— Kidney, per bu., 1s. 6d. to 2s. 6d.	— Spruce or Small, 2s. to 2s. 6d.
— Scotch, per bushel, 1s. 6d.	Sea-kale, per punnet, 6d. to 1s.
— New Autumn, per lb., 4d. to 8d.	Lettuce, Cab. p. ac. 1d. to 8d.
Jerusalem Artichokes, per half-sieve, 8d. to 1s. 6d.	— Cos, 1s. to 1s. 6d.
Turnips, per doz. bun., 1s. 6d. to 2s. 6d.	Endive, per score, 6d. to 1s. 6d.
Red Beet, per dozen, 6d. to 1s.	Celery, p. bd., (12 to 15) 6d. to 1s.
Scorzonera, per bundle, 1s. 6d. to 1s. 6d.	Rhubarb Stalks, per bd., 9d. to 1s. 6d.
Salsify, per bundle, 1s. 6d. to 1s. 6d.	Small Salads, per punnet, 8d. to 1s.
Horse Radish, per bundle, 1s. 6d. to 4s. 6d.	Corn Salads, per hf. sieve, 6d. to 1s.
Radish, per doz. hands (24 to 30 each) 8d. to 1s.	Watercress, per doz. sm. bun. 4d. to 6d.
— Turnip, p. doz. bch., 1s. to 1s. 6d.	Parley, per half-sieve, 1s. to 1s. 6d.
Carrots, per doz. bunch. 3s. to 5s.	Parsnips, per doz. bun., 2s. to 3s.
— Young Horn, per bun., 4d. to 6d.	Sage, per doz. bunches, 2s.
	Mint, per doz. bunches, 2s. to 3s.
	Mushrooms, per pottle, 4d. to 9d.

Notices to Correspondents.

MANURES.—Little Skill.—We do not advise you to apply your liquid manure till your seeds are sown; if you delay till they have germinated so much the better. **Theta.**—Woodashes are among the best of all manures for anything. Mix them with dry earth, and top-dress with them; or add them to a heap of manure; they will greatly improve its quality. **A. R.**—Brine, which is salt and water mixed with a little animal matter, can only be used as a manure in small quantities. The best way of applying it is to pour it on lime, and allow the soaked mass to remain in a heap for three months. At the end of that time an excellent manure for light lands that are apt to burn, will have been formed. **Querist.** We are sorry to say we have no information respecting Mr. Bicke's doings beyond what we have stated. **M.**—Fresh vegetables are an excellent manure, and he must be a very ignorant person who thinks that they breed slugs. If they do not benefit the land, it is either because it does not want manure, or there is not enough of them. The best way, however, to use refuse vegetables is to throw them in a heap, to moisten them with gas-water, or fermenting urine, and to leave them to rot, which they will soon do. Such heaps should always be well covered over with earth. **A Sub-scriber.**—Soot is an excellent manure mixed or unmixed. The best way, however, to apply it, is as a material to work up the fermenting matters of cesspools and similar places. **A. H.**—We should have thought that nothing would have been more easy than for a bailiff to carry a few leaves of turmeric paper in his pocket to be used occasionally. We fear that no means will be found of contriving an easier test for ammonia. As to the length of time that manure heaps will lie before fermentation begins, that is so entirely dependent upon the temperature of the air and the nature of the materials, that we are at a loss what directions to give. Examination alone will show the extent of their putridity. If the heat of fermentation has attained the amount of 50°–60° for two or three weeks, it will in general have carried decomposition far enough; but the more complete the decomposition the better, provided the ammonia formed in the process is not lost. If heaps of decaying materials are just moistened with gas-water, or if waste yeast can be added to them, decomposition will be greatly accelerated. We had forgotten the statement made by Liebig, that Epsom Salts mixed with cloacine formed a powerful manure for Potatoes, and the index to his book is so bad as to be almost useless. We conceive that as the object in applying this agent is chiefly to restore to Potato-land the magnesia it has lost, ½ cwt. an acre would be an ample supply. If you determine what quantity of cloacine you mean to use per acre, you can easily calculate in what proportion to add Epsom salts to it. Remember always that 1 ton of cloacine, without Epsom salts, is equal to 6 tons of the best farmyard manure. **Liquid Manure.**—**W. P. K.**—We would not recommend you to apply liquid manure now to land which you intend for Onions. It will be of more service if you water the Onions with it weekly, after their first thinning. **Malaria of Cesspools.**—**Theta.**—The best means you can use to destroy the malaria, and prevent the unpleasant smell arising from a cesspool, is to use a small quantity of bleaching-powder mixed with water. **Plantations.**—**T. S. P.**—If you have plantations five or six years' old, you cannot do better than dig between the trees, in order to destroy the grass which has grown there. The digging must, however, be shallow, so as not to interfere much with the roots. In making a fresh plantation, it is as well to grow Potatoes between the young trees for two or three years, provided the ground is manured; for it keeps the ground clean, and stable manure is very advantageous to forest-trees in general, with the exception of the Fir tribe. We have not received the copy of the *Chronicle* you are so good as to speak of. **Grapes.**—**Amateur.**—Either the Royal Muscadine or the Black Hamburgh are suitable Vines for growing in a Greenhouse, where abundance of air, with little fire-heat, is given. **Peach-trees.**—**A. Walker.**—The best paper which has come under

our notice upon the culture of the Peach under glass is one from Mr. Errington, which was published a few years since in the Horticultural Society's Transactions, and of which an extract was given at p. 7 of the *Chronicle* of 1841. **Anemones.**—**S. F. C.**—An easy way of protecting Anemones and Ranunculuses is to bend across the beds wooden or iron hoops, securely fixed in the ground; upon these mats can be thrown in cases of frost or snow, but care must be taken that they are firmly secured to the hoops by pegs. **Garrya elliptica.**—**A. A.**—This plant does not require to be pruned. It succeeds best in peat, but will thrive in almost any soil or situation. **Christmas Rose.**—**A. A.**—The Christmas Rose will grow in peat, but it prefers a heavy, wet soil. **Pinus Webbiana.**—**A. Salopian.**—It is probable that this plant casts its old leaves after having been watered with nitrate of soda as an effort of reviving nature, and that it has not yet had time to renew them. The leaves will not appear again on the denuded branches, but in all probability the buds will burst vigorously this spring. **Ferns.**—**Mercator.**—Any nurseryman can supply you with these plants. Some you may find in old walls, in hedge-rows, and other wild places. **Roses.**—**T. B.**—Liquid manure, not applied too strong, will be beneficial to Roses which are just coming into bloom. **Doe Roses.**—**A Young Lady.**—It is not too late to transplant wild Roses from the hedges for the purposes of budding. It may be proceeded with whenever the weather is open. **Lily of the Valley.**—**A Young Lady.**—When it is desirable to transplant Lilies of the Valley at the present season, they will not be injured, providing that it is carefully done. The autumn is, however, the best time for removing them. **Flower-seeds.**—**S. F. G.**—It is too soon yet for sowing any kind of flower seeds in the open border. If you want any for blooming early, you had better sow in a slight hotbed such things as Collinsia bicolor, Nemophila insignis, Kaulfussia amelloides, Schizanthus pinnatus, Clarkia pulchella and elegans, Godetia Lindleyana, Glitia tricolor, and the Rocket Larkspur. You will be quite early enough, however, if you do this six weeks hence. **Pelargoniums.**—**An Original Subscriber.**—The following sorts are the best for forcing:—Admiral Napier, General Washington, Isidorium, Diadematum rubescens, Alba multiflora, King Rufus, Hodge's Emperor, Madeleine, Prince of Waterloo. **Amateur.**—Well-rotted cow manure, 3 years old, is much better than leaf-mould for Pelargoniums in pots. **Picotees.**—**J. H.**—The following Carnations and Picotees are early bloomers, and will probably suit your situation:—**Picotees:** Garratt's Lady Dacre, Hufton's Will Stukeley, Martin's Prince George, Wood's Talisman, Lee's Mary Ann, Jean's Moonraker, Gidden's Emma, Wood's Joan of Arc, Willmer's Maid of the Mill, Hogg's Ensign, Norman's Vesuvius, Cox's Clarence. **Carnations:** Ely's Duke of Sussex and Earl Fitzwilliam, Snooks' Defiance, Cartwright's Rainbow, Ely's Duke of Bedford, Hogg's Epaminondas, Addenbrook's Lydia, Orson's Rob Roy, Hogg's Blue Ribbon, Lascelles' Queen of Sheba, Hogg's Duchess of Kent and Queen of Roses. **Pears.**—**Little Skill.**—Hacon's Incomparable Pear would probably bear in three or four years, if grafted on the limb of a tree in full bearing. **Training.**—**W. W.**—Quenouille training is explained at p. 705, Vol. I. It consists in training one upright central shoot in summer, and shortening it down to 15 inches at the winter pruning, in order that it may at that height produce branches forming a tier, to be trained in the first instance horizontally. The shoot produced by the uppermost bud is, however, trained as upright as possible during the summer, and is cut back so as to produce another tier 15 inches above the first, and so on, until the tree has reached the desired height. In this climate it is necessary to train the shoots downwards, which is easily done by tying those of the first tier to short stakes, those of each successive tier being fastened to the branches below them. When the shoots are thus arched downwards at full length, or nearly so, they soon come into a bearing state; but, in this climate, if cut short, as the French do, they only send up a number of shoots annually. This plan answers very well where it can be at all times properly attended to; but if this cannot be guaranteed, the ordinary form of dwarfs is preferable. Quenouilles require more time to be devoted to them than Espaliers do. **Fruit-trees.**—**A. A.**—Standard Pear and all other kinds of fruit-trees require pruning more or less, at some time or other. **A. W.**—The following Pears are suitable for Espalier rails in a northern district:—Dunmore, Hacon's Incomparable, Louise Bonne (of Jersey), Thompson's, Winter Nells, Passe Colmar, Knight's Monarch, Beurre Rance. **Plums:** Royale Hâtive, Green Gage, Purple Gage, Fotheringham, Ickworth Imperatrice. **Cherries:** May Duke, Elton, Downton, Royal Duke. **J. Hagercroft.**—The number of good Pears that will be fit for dessert from February to April is very limited. It will be advisable to plant the space you have allotted against a south wall for Pears of this late description, with the Easter Beurre, Ne plus Meuris, and Beurre Rance. **Medlar Seeds.**—**M. H. G.**—The seeds of Medlars grown in this country do not germinate readily. They should not be allowed to dry before they are sown. By attending to this, you will probably be more successful than by following the artificial mode of subjecting the seeds to the action of boiling water; which, however, has been advantageously practised in softening the skins of some seeds imported from hot climates. **Cucumbers.**—**W. P. K.**—When it is not intended to force Cucumbers early there will be no advantage derived by having the walls of your pit so high as they are represented in Mr. Mills' Treatise. If the cavity which is to contain the lining around the pit is two feet deep instead of three, it will be quite sufficient. You will find no material so good as turf for covering the faggots inside; but where that cannot be procured, small branches may be substituted. They must, however, be laid very close and regular, otherwise the soil in which the Cucumbers are growing will settle through. **Rhubarb.**—If a *Young Gardener* will forward his address to Messrs. Youell and Co., of Great Yarmouth, they will give him every information which he may require respecting the Tobolsk Rhubarb, and if he wishes for positive proof of its superiority it is at his service, as Messrs. Youell have been cutting an abundance of it for some time past. **Potatoes.**—**A. H.**—If you find the haulm of Potatoes unwilling to decay, throw it in heaps, moisten it with gas-water, cover the heaps with mould, and you will soon find it reduced; or burn it, and return the ashes to the land; you will lose nothing but carbon and water by the operation. On no account cut off the leaves of the Potato at any period; if you do, you will ruin your crop. The removal of the flowers is quite another thing; they contribute nothing to the formation of tubers; but, on the contrary, take from them. Leaves, on the other hand, provide all the materials out of which the Potato is formed. The rankness of Potatoes in India is quite different from any kind of growth they are likely to furnish in a cold country like England. **Books.**—**Mercator.**—Doyle's "Cyclopædia of Practical Husbandry," or, Stephen's "Book of the Farm" are what we recommend to you. **Inquirer.**—Take "Macintosh's Practical Gardener." **J. L. S.**—You will find "Paxton's Botanical Dictionary" an useful book of reference. We cannot recommend anything to you at the price you mention; you had better be content with the *Gardener's Chronicle*. Your other question will be answered shortly. **Oak-leaves.**—**T. C. Y.**—When these are required for filling pits, linings, &c. an opportunity should be taken of raking them together during fine weather, when they are dry. If not wanted directly, they should be heaped up in an open shed, or some other situation where they would be protected from rain and snow. They require no preparation, except that of being thrown lightly into the pits, over which they should be equally distributed, and of being firmly trodden down, so that they may not settle too much when they begin to heat, which, if the leaves are in good condition, may be expected to take place in eight or ten days. **Planning.**—**Mercator.**—It is hardly in our power to give directions for laying out Flower-gardens; that can only be done on paper.

In so small a piece of ground as yours, the best effect would probably be attained by two or three ovals judiciously disposed. Two small ones might run parallel with the fence, and another be placed in the centre of the remaining space. **Exhibitions.**—**T. K.**—If one person exhibits at the Horticultural Society's Exhibitions, two plants, one of which is new, and the other old and rare, he will be allowed prizes for each, provided they are both deemed sufficiently deserving, and are shown under the proper letters. **New Zealand.**—**T.**—We have repeatedly expressed our favourable opinion of this colony for emigrants, provided they do not go to Auckland. We have no space to discuss the question further just now, and therefore can only add, that if we intended to emigrate, we should go there ourselves, like the editor of the New Zealand Journal, who after three years' inquiry into the prospects of the colony, and the most ample means of acquiring information, is about to proceed thither with his family and property. **Technical Words.**—**A Subscriber.**—Imbricated signifies arranged like the tiles on a house, and is applied to the relative position of flowers. **Figs.**—**A Cottager** will find an answer in another column.

Miscellaneous.—**A. B. Z.**—We never heard of such a thing as a blue Rhodanthé. **T. Wilcox.**—Lindley's Elements of Botany:—**A Cabbage.**—Your plants are, 1, Bérberis glumacea; 2, B. aristata; 3, B. asiatica; 4, Jasminum fruticans; 5, Coronilla émerus. **Theta.**—Your plant is Peltidea canina, so called because it has been recommended as a cure for the bite of a mad dog; its virtues are, however, considered to be imaginary. **C. E.** had better consult his solicitor. We should suppose that if he were to mutilate that which the law will not allow him to remove, he would be very likely to get into a scrape. **Bucks.**—We are afraid to advise you, so much depends on the condition of the land. If it is in very good heart the plan might succeed, but not otherwise. Should you carry it into execution you had better sow the Norfolk White Turnip. **A. B. C.**—We cannot interfere between you and advertisers. We are in no way responsible for their conduct. **W. P. K.**—Your Pear is the Gilgil. **W. B. B.**—Your pretty little orchidaceous plant is Sophronitis violacea. **A Reader and Subscriber.**—The Dahlia you enquire about was sent on two occasions to the Floricultural Society; at one meeting it was pronounced first-rate, and second-rate on the other. From these decisions it is fair to conclude that it is uncertain. It is a good exhibition flower when in perfection. **Errata.**—In the Naturalists' Corner of last week, at p. 7, column c, line from the top 17 and 26, for Jervius read Servius, and for Rudus, read Ruæus.

As usual many letters have arrived too late for answers this week. **MR. PAXTON'S COTTAGER'S CALENDAR** is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenantry may have them delivered in any part of London by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies required.

NEWS OF THE WEEK.

THE news received by the Overland Mail gives a detailed account of the closing events of the campaign in Afghanistan, and of the return of the British troops through the Khyber Pass, which was successfully accomplished on the 7th November. From the date of our last advices to the evacuation of Cabul, the troops were employed in demolishing the principal towns, and in leaving behind them an enduring mark of vengeance. After destroying Istalif, they razed to the ground the celebrated Bazaar of Cabul, and spared no portion of the city except the quarter inhabited by the Kuzzilbashs. The Bala Hissar was left standing for the purpose of affording to Shah Poora, a younger son of Shah Soojah, who had mounted the throne, a means of defending himself against the attacks of the Afghans after the departure of the troops. On leaving Cabul, the Army laid waste the country on their line of march, burning the villages and forts, and showing, as the Indian papers tell us, no mercy either to friend or foe. They destroyed Jellalabad, with its fortifications and gardens, and arrived at Peshawur on the 6th November, having passed through the most difficult defiles in Asia without the occurrence of any important casualty. They were to commence their march to the British provinces on the 6th, and on their arrival Dost Mahomed and all the Afghan prisoners who have fallen into our hands since 1839 were to be restored. Lord Ellenborough had issued a proclamation, couched in the pompous language of the East, announcing to "his brothers and friends" the native princes of India, that the sandal-wood gates of the Temple of Somnauth have been recovered after a captivity of 800 years, and that they will be restored with great ceremony and pomp to the Juggernaut temple, to which they originally belonged. The policy of this measure is much questioned by the Indian papers, and it is expected to give great offence to the Mahometan population. From China we have accounts to the 13th Oct.; nothing of great importance had occurred since the date of the last advices, and the progress of affairs was suspended until the ratification of the treaty had been received from England. The monopoly of the Hong merchants was completely at an end, and samples of tea had been sent to Hong Kong direct from Nankin. The captured junks had been restored, and trading on a small scale had already commenced between the English and Chinese, who were daily becoming more sensible of the value of commercial intercourse. Our European news begins to assume a more important character. In France, the Chambers were opened on Monday by a speech from the throne. The King, after alluding to his recent bereavement, refers with satisfaction to the prosperity of the country as attested by the rapid increase of the revenue. He alludes to the pacific relations of foreign powers, and to the harmony prevailing among them in regard to the settlement of the Syrian question. His Majesty deprecates the disturbances which have recently agitated Spain, and declares that in his relations with the Spanish Monarchy his sole object has been

to protect the legitimate interests of France. The speech touches lightly on the occupation of the Marquesas Islands, and on the negotiations now in progress for improving the trade and industry of the kingdom by commercial treaties with Foreign Powers. The question of the Right of Search is not mentioned, but it is said to be the main point upon which the Opposition will make their attack on Ministers in the debate on the Address.—From Spain we have accounts of the return of the Regent to Madrid, and of the dissolution of the Cortes. The Regent's reception by the people was cold, and little enthusiasm was manifested by the troops or National Guards. The dissolution of the Cortes was not unexpected, as it had become evident that the Ministry could not hold office while the Chambers remained so hostile to its measures. The new Cortes will not assemble until the 3d of April.—From Lisbon we learn that the Portuguese Cortes were opened on the 2d by the Queen in person. The speech mentions with satisfaction the arrival of the Ambassadors of the Great Powers of the North, and the anxiety of the Government to give additional development to its foreign relations by means of treaties of commerce and navigation. The necessity of equalising the receipts and expenditure of the State is again adverted to, and the negotiations with the Pope are described as advancing towards a favourable settlement.—From the United States we have no political news, public attention being exclusively absorbed by the details of an attempted mutiny on board one of the ships of the American Navy. The object of the conspiracy was to convert the ship into a piratical cruiser, and intercept all vessels passing between Europe and New York. It was headed by the son of the Secretary at War, who was summarily tried and hung at the yard-arm as soon as the conspiracy was discovered. If it had succeeded, the packet-ships from London and Liverpool might for some time have been the scenes of fearful atrocities. The accounts from Canada describe the health of Sir Charles Bagot as much worse, and give slight hopes of his Excellency's recovery.

Home News.

Court.—Her Majesty, Prince Albert, and the Princess Royal continue at Claremont, and are quite well. The Prince of Wales is at Windsor Castle, and is still suffering from the effects of teething, but in other respects is in good health. During the week her Majesty and Prince Albert have taken their usual walks in Claremont-park, and the Prince has shot over the preserves at Ox-shott Common and at Stoke whenever the weather has permitted. The Court is expected to return to Windsor on Monday next.

Parliamentary Movements.—A circular has been sent by Sir R. Peel to all the supporters of his Government, informing them that the meeting of Parliament having been fixed for Thursday, the 2d of February, public business of importance will be brought forward without delay, and expressing an earnest hope that it may be consistent with their convenience to be in attendance at the opening of the session.—A rumour has been current during the week that Mr. Barnard is about to retire from the representation of Greenwich, but there is no foundation for the report, and Mr. Barnard has given it an unqualified contradiction.—The election for North Shropshire will take place on Monday; the only candidate is Viscount Clive, who will be returned without opposition.

National Debt.—The Lords of the Treasury having certified to the Commissioners for the Reduction of the National Debt that the actual expenditure of the United Kingdom exceeded the actual revenue for the year ended the 10th October last by the sum of 2,523,823*l.* 13*s.* 11*d.*, the Commissioners for the Reduction of the National Debt have given notice that no sum will be applied by them on account of the Sinking Fund, under the provisions of the Act, between the 7th Jan. and the 5th April in the present year.

Foreign.

FRANCE.—The opening of the Session of the French Chambers, to which the political circles have for some time looked forward with unusual interest, took place on Monday with a speech from the throne. The streets were lined with troops, who loudly cheered his Majesty in his progress from the Tuileries. The King was accompanied by the Queen, the Princess Clementine, Mademoiselle Adelaide, the Duke de Nemours, and the Duke de Montpensier. The Chamber was very fully attended by Peers and Deputies, and by all the members of the Corps Diplomatique in full costume. The reception of the King was very cordial; the whole House rose to welcome him with loud and repeated cries of "Vive le Roi." The King seemed much affected, and after a few minutes' pause delivered the following speech:—"Gentlemen, Peers, and Deputies.—The affection and the sympathy of the French nation have sustained my courage. My heart, ever suffering from grief, but full of confidence in your devotedness in calling you myself together to resume the course of your labours, I wished to conclude to-day what my grief had compelled me to leave incomplete at the opening of your session. You have already achieved much for the security and future prosperity of France; I thank you in her name. Whatever may be our trials, I and my family will devote to her service whatever strength and life the Almighty shall grant us. Thanks to the maintenance of public order and peace, the national prosperity, attested

by the rapid increase in the public revenue, manifests itself beyond our most sanguine hopes. The solid empire of the laws is the best security for the well-being of all, as it is for the power of the state; and the conviction everywhere established, that the laws will be religiously executed, renders less frequent the enforcement of their penalties. I congratulate myself on our having obtained those happy results. I feel confident that our prosperity will pursue its course without either interruption or obstacle. My relations with foreign Powers continue to be pacific and amicable. The good harmony prevailing amongst the Powers has strengthened the repose of the East, and procured in Syria for the Christian population the establishment of an administration conformable to their religious faith and their wishes. I deplore the disturbances which have recently agitated Spain. In my relations with the Spanish monarchy my sole object has been to protect our legitimate interests, to preserve for Queen Isabella II. a faithful amity, and to testify for the rights of humanity that respect and protection which honour the name of France. By the occupation of the Marquesas Islands I have secured to our navigators in those distant seas a protection and refuge, of which the necessity had been long felt. Thanks to the persevering efforts of our brave army, our dominion in Algeria becomes everywhere stable and respected. The vigilance and regularity of the administration will complete the work so gloriously prosecuted by the courage of our soldiers. I have opened with several states negotiations which will have the effect of imparting to our agriculture, our commerce, and manufactures more active development, and to procure for our national interests additional facilities. Laws of finance, and various bills intended to introduce into our legislation and administration important improvements, shall be immediately presented to you. Gentlemen, the world is at peace! France is free, active, and happy! My object has been, and ever shall be, until my last breath, to secure those blessings for my country. It is with your constant and loyal co-operation that I have succeeded. You will aid me in maintaining and in consummating the work which we have commenced in common. This will be for all the most worthy recompense: and for me the only consolation that I can hereafter hope for." The paragraph referring to the Spanish question was slightly applauded, but the cheering was more animated at the conclusion. The King looked well, but seemed to have a cough, which impeded his free reading of the discourse. His voice faltered at the first and last paragraphs, but by an effort he regained his composure. After the usual forms, the Minister of the Interior declared the session opened, and the King retired amidst the acclamations of the assemblage. The Chambers have since been occupied with the usual routine business. In the formation of the *bureaux*, or monthly standing committees, the Ministers have obtained a signal triumph, not only over the Opposition, but over the party of Count Molé. Only one member of Opposition, M. Barrot, has been appointed; all the others are of M. Guizot's opinions. The Sugar Bill and the Budget were then presented.—We learn that the King has made a proposition to sell Versailles to the state for 18,000,000*fr.*, stipulating to employ the money, and more than the money, in the completion of the Louvre, which will require, it is said, a million sterling.—The opening of the Chambers is of course an event of so much importance that it occupies almost exclusively the attention of the Journals. The affairs of England, however, and particularly the retreat from Afghanistan, afford them additional matter for comment. They contrast the state of the public revenue in Great Britain with that of France, and observe, that whilst the former shows an alarming deficit, the latter has improved during the year 1842 to the amount of 60,000,000*fr.* In regard to Indian news, they all unanimously declare that the evacuation of Afghanistan, or rather the mode of evacuation, is more disgraceful to the English name and to English honour, than any event of the present century. The *Ministerial Journal des Debats* contrasts the conduct of Gen. Pollock with that of the French generals in Algeria, who have, it states, the consoling expectation that, by adopting measures of extreme rigour, they are rescuing the country from barbarism, and laying the foundation of future civilization, while Gen. Pollock has had no other object than the gratification of mere revenge. "What," it asks, "had Jellalabad done to deserve the fate it suffered, a city which opened its gates to Sir R. Sale and gave him provisions? Near 100,000 inhabitants have thus been left without habitations in a climate almost as cold as that of Russia. It is frightful!—but what is most odious is, that the English have avenged themselves upon the inhabitants of the towns, instead of doing so on the tribes who destroyed Gen. Elphinstone's army in 1841. In Afghanistan, as well as in Algeria, the warlike part of the population is that which wanders with its flocks in search of pasture. The towns are only inhabited by Jews, Armenians, Hindoos, Cashmeerians, Tadjiks, slaves, merchants—that is, by strangers and peaceable people, who have never taken up a gun since the beginning of the war. These are the people who are to support the weight of the revenge of the English. Those whom they ought to have pursued were the Ghilzies, the Afridis, the Channaris, the Mohmeeds, the Othman Kails—all those whom General Pollock has taken care not to go and seek in their mountains. General Pollock has done what a French general would do, who, having to punish a revolt of the Flittas, or the Beni-Amer, would go and burn Mostaganem or Mascara. He has committed inexcusable cruelties. Public opinion, however, has already pronounced itself in India against these excesses; and we do not doubt that in England also, they will raise the indignation of all gener-

ous hearts."—The official *Moniteur* states that the Hon. Capt. Grey has arrived at Toulon, in H. M.'s frigate *Belvidera*, to convey to Vice-Admiral Baron Hugon the expression of the gratitude of Admiral Sir E. Owen, Commander-in-Chief of the British naval forces in the Mediterranean, for efficient assistance given on the 30th November last, to her Majesty's ship-of-the-line *Formidable*, by the vessels of the French station at Barcelona.

SPAIN.—We have accounts from Madrid to the 4th inst., bringing the important intelligence of the dissolution of the Cortes, and of the return of the Regent from Barcelona. The Regent entered the capital on horseback on the 1st, accompanied by the civil and military authorities, who had gone out to meet him. The assemblage of people was very numerous, and the staff extremely brilliant. Among the latter were Generals Rodil, Grases, Ferraz, Iriarte, and many others. Two squadrons of the cavalry of the National Guard constituted the escort of the Regent, who proceeded straight to the palace of the Queen. The troops afterwards defiled before her Majesty and the Regent, who had taken their station on one of the balconies of the palace. At 3 o'clock, the Regent, who was suffering from fatigue and indisposition, repaired to his residence of Buena Vista. His reception by the people was cold, and little or no enthusiasm was manifested by the troops or national guards. In the evening, the city was but partially illuminated. At 4 o'clock, the members of the new municipality took the oath of office in presence of the Political Chief, by whom they were formally installed. In regard to the progress of the Regent through the different towns on his line of march, his reception appears to have been everywhere satisfactory. In every town and village he passed through, the corporations, provincial deputations, national guards, and even the clergy, vied in demonstrations of respect and adhesion to his regency and government. He was waited upon on his arrival in the confines of Valencia by the Political Chief and the provincial deputation. At Almanza he took his seat in a carriage, drawn by six mules richly harnessed, which conveyed him to Valencia, escorted by the National Guard. He entered the city under a triumphal arch, and proceeded to the hotel prepared for his reception, amidst two lines of National Guards, and saluted by the enthusiastic acclamations of the multitude. A telegraphic despatch from Barcelona, dated the 2d inst., announces that General Seoane, on the 29th, annulled the division of the forced war contribution which had been made by the municipality, because it weighed too heavily on the Moderados, who were not engaged in the outbreak. The commercial classes are to pay one-half, and the tax-payers the remainder. The first payment was to be made on the 5th inst. The decree of the Regent dissolving the Cortes is dated on the 3d; it announces that the new Cortes will be convoked on the 3d April. The projected treaty of commerce with England still excites great interest in Barcelona and in Madrid. In the latter city the editors of the Opposition papers drew up and signed on the 3d a strong declaration against the conclusion of the treaty.

PORTUGAL.—We have advices from Lisbon to the 2d inst. The new year was ushered in with the opening of the Chambers, and the recommencement of the legislative business of the kingdom. Her Majesty opened the Cortes in person, with the following speech from the throne:—"Honourable Peers of the Kingdom, and Deputies of the Portuguese Nation.—It is always an object of high satisfaction to me to see the representatives of the nation united in this respectable place. I congratulate myself with you on this solemn act, and trust that, animated with the most decided desires to employ all your solicitude in the honourable effort to consolidate the representative system, you will adopt for this purpose all the means and provisions that your wisdom may suggest. With the arrival at this court of the ministers of Austria and Prussia, and with that which has lately taken place of the representative of his Imperial Majesty the Emperor of Russia, the diplomatic relations of this country with the great powers of the north are completely restored; and I have the satisfaction of being able to communicate to you, that I continue to receive from all the friendly and allied nations the most decided proofs of friendship and harmony. My government seeks with anxiety to maintain these political relations, and to give greater development to the commercial ones, by means of treaties of commerce and navigation, with which it is unceasingly occupied. I trust that it will not be long ere the opportune occasion arrives to make known to you the result of the negotiations between my government and that of his Holiness; and that, without any breach of the prerogatives of the Crown, the necessities of the Lusitanian Church may be attended to. The budget for the future economical year will be presented so you, and I ought especially to call your attention to the urgent necessity of equalizing the receipts and expenditure of the state. My Ministers will give you an account of the measures which they judged urgent to adopt in the absence of the legislative body, and will present to you the proposals which experience suggests respecting the different branches of the public service." The arrival of the Suffren French line-of-battle ship, and the reports that other vessels were ordered there, had excited suspicions that the French Government had some sinister designs to carry into effect at Lisbon, which were increased by the absence of all explanation on the part of the French Minister there. The Rodney British line-of-battle ship arrived at Lisbon on the 26th ult., and was expected to remain there for the present. The negotiations still continued on the tariff question, without anything further having been settled.

BELGIUM.—The Government papers have published a Royal ordonnance, dated 6th January, approving the

definitive convention between the State and the City of Brussels for the purchase, by the Government, of the real property, and of the museum, with the library, the gallery of ancient and modern paintings, the collections of natural history, the cabinet of medals, &c., belonging to the city. They have also published a list of honorary members of the Royal Academy of Medicine at Brussels, approved by the King. The following are the English physicians and surgeons in this list: Dr. Abercrombie, Dr. Bright, Sir James Clark, and Dr. Marshall Hall; Messrs. Samuel Cooper, Guthrie, Travers, and Lawrence. The Belgian Colonisation Company intend to fit out an expedition which will be shortly sent to found its first settlement in Central America.

GERMANY.—The Prussian papers announce the death of the Archbishop of Posen and Gnesen, M. Martin de Dunin; he died on the 26th ult., aged 69.—Letters from Berlin mention the expected arrival of the Countess de Rossi and her husband, late Sardinian Ambassador at St. Petersburg, who has been appointed to fill the same post at Berlin, the Countess having been unable to endure the climate of Russia. The Countess de Rossi, once the favourite singer, Madame Sontag, will now revisit the scene of her early fortune and artistic fame, and be received as an Ambassador in those saloons in which she gained the first triumphs of her profession.—It is rumoured that the Directors of the Asylum Life Assurance Company in London are likely to establish branches of that institution in Berlin and other parts of the Prussian dominions; this report is confirmed by the announcement of the daily papers that Sir James Law Lushington and Mr. Farren, two of the directors, have had an interview with Chev. Bunsen on the subject.—Letters from Trieste state that the English Commissioners for inquiring into the practicability of conveying the Indian mail through Germany, have made a favourable report, and have ascertained that the journey from London to that place by Ostend, Cologne, Frankfurt, Munich, Augsburg, Innsbruck, &c., may be performed in 135 hours and 25 minutes. This would enable the correspondence to be forwarded from Alexandria to London in 11½ to 12 days; but when the railroads, now in construction, shall have been finished, a considerable additional saving of time will be possible.—On the 21st ult. the St. Pauli sailed from Hamburg with 120 German emigrants, bound for New Zealand. Of these 100 may be said to belong to the labouring classes; the remainder consist of a physician, some missionaries, and the numerous family of the agent. This is said to be only the commencement of an extensive system of emigration, which is likely to be organised in Germany, under the auspices of the New Zealand Company.

ITALY.—Letters from Milan announce that the railroad from Venice to that city has been opened as far as Padua, and that the event has excited the greatest interest in the north of Italy.—From Rome we learn that the Pope has determined to send a Vicar apostolic to China, in compliance with the wishes of the Roman Catholics resident in that country.—Letters from Catania mention that the eruption of Mount Etna continues with more or less violence, and that all the towns at the foot of the mountain are full of company attracted from all parts of Italy by the imposing spectacle. The lava continues to flow in a broad stream in the direction of the Val del Bove, and there is some reason to apprehend that it will take the direction of Milo, in which case it will make a descent on Zafferano, and probably destroy Giarre and Mascali on the sea coast, north of Aci Reale. Up to the present time there is no reason to fear for the safety of Catania, which has so often been destroyed by previous eruptions.

RUSSIA.—The last official census of Russia gives the following as the populations of the chief towns of the empire:—St. Petersburg, 470,202 souls; Moscow, 349,068; Odessa, 60,055; Cronstadt, 54,717; Wilna, 54,499; Toula, 51,735; Kiev, 47,424; Astracan, 45,938; Casan, 41,304; Sebastopol, 31,155; Darpat, 12,203; Abo, 13,050; Helsingfors, 12,725; Warsaw, 140,571.

EGYPT.—Private letters from Alexandria state that the murrain still continues among the cattle, and that the Pacha has dismounted all his cavalry and artillery, and sent their horses to the plough. A plan is now being prepared by a French engineer here for the construction of a Barrage across the Nile, at the head of the Delta, which will be forwarded in a short time to the Academy of Sciences at Paris for inspection. Should their opinion as to its feasibility and usefulness be favourable, there is every probability that the Pacha may decide on carrying this great undertaking into execution very soon. The probable cost is estimated at about 250,000*l.* sterling, and the great advantage anticipated is a constant supply of water, by means of canals, to all parts of the country, even during the lowest periods of the Nile—thus allowing a great portion of the present waste though rich land, to be brought into cultivation almost as easily as the fields on the banks of the Nile. This work has been in contemplation for years, but it is said his Highness now thinks seriously of commencing it, although nothing will certainly be done until the present plan has been approved of by able engineers in Europe.

INDIA.—The Overland Mail arrived on Saturday with accounts from India to the 1st December. The return of all the British troops through the Khyber Pass was fully completed on the 7th November. The first division, under General Pollock, succeeded in effecting their march without much difficulty. The second, commanded by General M'Caskill, was not equally fortunate, in consequence of the neglect of crowning the heights over a most dangerous part of the defile. The mountaineers were on the watch, and, finding this division embarrassed in its movements near Ali Musjid, during the night of the 3d, they made an attack on the baggage, a considerable quantity of which is

said to have fallen into their hands. During the skirmishing two officers, Lieut. Christie, of the Artillery, and Ensign Nicholson, of the 30th Bengal Native Infantry, were killed; upwards of 100 Sepoys were killed and wounded, besides a number of camp-followers. Two cannon were also taken by them, but one of the guns was taken on the following morning. With this exception, nothing of consequence appears to have occurred in the return of the troops from Jellalabad to Peshawur through the most difficult defiles in Asia. The third division, under General Nott, which formed the last one of the army, arrived at Jumrood, the frontier station of the Sikh territory, on the 6th, and it was intended to commence the march to the British provinces on the 10th Nov. From the date of our advices by the last mail, to the evacuation of Cabul, the troops appear to have been employed in demolishing the principal towns, in order to leave behind them an enduring mark of vengeance. After the capture of Istalif, General M'Caskill's brigade burnt and destroyed it, giving it over to pillage, during which neither armed nor unarmed men were spared, and no quarter given. They treated the women with respect, but every other living being was put to the sword. They returned to Cabul on the 7th October, and General Pollock having received from Lord Ellenborough positive instructions to leave the country without delay, preparations were immediately made for carrying out the work of destruction which it had been determined should be performed previous to their retirement. Indeed, from the fact of snow having made its appearance on the hills, and ice in the camp, it was evident that, unless they resolved to pass the winter in Cabul, a longer stay could not be made with safety. The 12th, therefore, was fixed as the day for departure; and on the 9th, a party of sappers and miners, under Captain Abbott, the chief engineer, protected by a brigade commanded by Colonel Richmond, was marched into the city for the purpose of effecting its destruction, together with the Chah Chatta, or Grand Bazaar, a splendid structure, 600 feet long, and containing nearly 2,000 shops, erected so far back as the reign of Aurungzebe, by the celebrated Ali Murdan Khan. Two days were occupied in conducting these operations, and by the morning of the 11th the whole of the houses, with the exception of those in the Kuzzilbash quarter of the city, were laid in ruins, while the bazaar was utterly demolished, and a mosque which adjoined it levelled with the ground. This act of vengeance is much censured by the Indian papers, and it is said that the parties who will suffer by it are not Affghans, but the merchants of Hindostan, who thought themselves safe in our protection. The Bala Hissar, or citadel, was spared, Shah Poora, a younger son of Shah Soojah, having mounted the throne of Cabul, and taken possession of this place, and it being considered advisable to leave him with the means of defending himself against any forces that might be brought against him on the departure of the troops. Great efforts are said to have been made to secure Mahomed Akhbar Khan, and directions to hang him, if captured, had been received by General Pollock; but the Sirdar effectually eluded the vigilance of his pursuers, and has now, it is reported, succeeded in reaching Balkh. The troops marched between the 12th and 15th, and had all reached Jellalabad by the 26th October. They had ravaged the country, burned the villages and forts, and spread havoc and devastation everywhere along the line of march. The *Bombay Times* states that no mercy was shown; that "impartial slaughter was dealt on friend and foe, on those who sued for pardon as well as those who bade us defiance; armed and unarmed, professed allies and open enemies, were alike destroyed." The rear-guard was attacked, and five officers wounded, with about eighty sepoy killed and wounded, near Gundamuck. They were employed on the 25th and 26th in destroying Jellalabad; and having blown up the fortifications, burnt the houses, and destroyed the gardens and vineyards of the inhabitants, they proceeded in the direction of Dhakka, reached Jumrood, below the mountains, on the 2d November, and arrived at Peshawur, as stated above, on the 6th. Fulteh Jung, with many hundreds of friendly Affghans from Cabul, and multitudes of women, accompanied the army to take shelter in the British provinces, from the fearful drama which may now be looked for at Cabul. Some apprehension appeared to have been entertained of a collision between the Sikhs and the British troops near Peshawur, and positive orders had been issued to prevent any British soldier or camp follower from entering any village near the camp, and from going to Peshawur. The Governor-General has issued a proclamation, intimating that so soon as the British troops return to India, Dost Mahomed, and the whole of the Affghan prisoners who have come into our hands since 1839, will be restored in safety, but requiring that, prior to their obtaining permission to return to their own country, they should attend his Lordship's Levee at Ferozepore, which is intended to rival in magnificence any display ever made by the Great Mogul. This order contains also the remarkable statement that Akhbar Khan, prior to the late advance of the British armies, had refused the offer of the Governor-General to exchange the British prisoners in his custody even for his father and his own family. The political agencies established in Scinde, appointed by Lord Auckland, had been abruptly terminated by an order of Lord Ellenborough, who has placed the whole management of those districts under the care of General Sir Charles Napier, now commanding the Bombay army stationed there. There had, according to rumour, been some further stipulations urged upon the Ameer of Hyderabad, to which they seemed unwilling to assent. Great activity prevailed in the communications between that General and the Government of Bombay. A notification has been

published to the effect, that troops will be maintained on a line of posts from Kurrachee, by Sukkur on the Indus, to the Murkunda in Sinhind; that war and other steamers will continue to ply on the rivers; and that a lighthouse will be constructed at Kurrachee. In announcing this fact the proclamation states, that "As late as the time of Aurungzebe, the Indus is known to have been navigated by large vessels drawing very little water, adapted to the convenient conveyance of merchants and their goods; and the Right Hon. the Governor-General will be disappointed indeed, if the British Government, with all the skill and science of modern times, cannot at least restore the commerce which existed upon this river in the time of the Mahometan Emperors." A proclamation has also been issued by the Gov.-Gen. "to all the Princes and Chiefs and people of India," expressing his gratitude to Providence for the late events, and announcing that the sandal-wood gates of the Temple of Somnauth have been recovered, by which the insult of 800 years is at last avenged, and that the gates are to be replaced in the Juggernaut temple of Somnauth with every circumstance of pomp and ceremony. The gates are to be escorted by 100 men, and a proportion of Europeans from Gen. Nott's division, to which will be added 25 troopers from the Governor's body-guard, under Captain Herries, the Aide-de-Camp. The men forming the escort are to have double batta while employed on this duty; the procession is to be received with every demonstration of respect in the various States through which it may pass en route to Guzerat, when they are to be again fixed to the temple, from which they were removed 800 years ago. Her Majesty's 41st regiment was about to embark for Europe from Kurrachee, for which purpose transports had been ordered from Bombay.—It was rumoured that six of the officers who were in the hands of Akhbar Khan are to be tried by Court Martial; they are Gen. Shelton, Col. Palmer, Capt. Waller, Eyre, Boyd, and Anderson. Madras was visited by a severe thunderstorm on the 24th Oct., no less than five vessels having been totally wrecked. There had been a heavy fall of rain at Bombay on the 15th Nov., which unusual and unseasonable event had caused the cholera to rage among the natives for several days. The health of the island was restored when the mail was despatched. The accounts from Burmah show the ravages which the cholera was making among its population. Whole villages have become desolate, the inhabitants being driven to seek shelter by flying up the country, or cut off by this dreadful malady. At Amoenapoor alone 10,000 had died of it. From Singapore we learn that the ship *Belvidera*, which left Bombay for that port with a precious cargo of pearls, cotton, opium, &c., had been completely destroyed by fire in the roads there. The police had received intimation that she was one of the five ships doomed to destruction within the last few months. It was believed that the parties concerned in the destruction of this vessel were native dealers of Bombay, who had shipped goods in her, and succeeded in effecting fraudulent insurances. From the evidence which has been elicited there is every reason to think that the charge will be brought home to several of the delinquents. In the interior of India tranquillity prevailed, with the exception of the mountainous districts of Bundelkund, to quiet which there was a considerable force collecting in that direction.

CHINA.—The news from China comes down to the 13th Oct. It was said that a clipper had brought news to a later date of that month, that everything was in its usual state while waiting for the ratification of the treaty by the Queen, and that opium had risen in price. The news in regard to commercial affairs opens a cheering prospect to British interests in China, and is calculated to give confidence to our merchants at home, in regard to their future operations. The Hong merchants' monopoly is at an end, and samples of tea from Nankin have been forwarded to Hong Kong by her Majesty's plenipotentiary; the price is moderate, and the report on their quality generally favourable. The imperial commissioners have offered to accompany her Majesty's plenipotentiary to the newly-opened ports of trade. The captured junks have been restored, and trading between the English and Chinese has commenced in the Yang-tze-keang. The imperial commissioners have published a manifesto in regard to the treaty of Nankin. It is a singular document in many respects, and not the least so as recognising the liability of the Chinese Government for the opium they had so unceremoniously obtained possession of, and for which they state that the six millions paid after the capture of Canton was intended to compensate. The capture of Canton was intended to the English "barbarians;" and missionaries still call the Emperor the importance of while pointing out to the Emperor the importance of obtaining the withdrawal of the fleet, they declare that they have "examined and found what are the unwarrantable demands of the said barbarians, which they so imputably urge, and they are deserving of the utmost portunately urge, and they are deserving of the utmost hatred." They state that the Shewei, an officer of the Emperor's body-guard, and his colleagues, who conducted the negotiations with Sir H. Pottinger, "again authoritatively questioned him as to the difficulties, but the said barbarian only stared at him indignantly; the Shewei was not listened to." After stating with remarkable clearness the advantages of coming to terms with the English, they show that the sums which will be received from our merchants in payment of duties will meet the expenditure of the Imperial family; they admit also that "comparing one year's expenses of the army with the sum paid to the English it is as three to ten; and as there is only the name of fighting, without the hope of victory, it is better to adopt plans in accordance with circumstances, and put an everlasting stop to war." They then detail the efforts made to induce the "said barbarian" to reduce the number of places which he demanded as ports of trade, and

say—"If we again prepare our armies to maintain those places, it is a difficult matter to engage with them on the waters. Though near to each other we have been idle (there has not been any fighting) for many days; and as to those places which they have taken and keep possession of, will it not be allowed them to return to us our territory, and allow them to trade, since they are willing respectfully to pay the duties? Just now they are sensible, and repent of their errors, and are as obedient as if driven by the wind, and when again united in mutual friendship, benevolence, and truth, all things will go on well. And since they will guard their own market, and surround and protect the sea boundaries, there will not be any necessity for recourse to our interference, which will be to the advantage of our country." The commissioners conclude by declaring that they have "examined, and found, that with reference to equal official intercourse, it may be unreservedly granted; and as the affairs with the foreigners are finished (the war ended), the prisoners may also be released, by which harmony and good understanding will be strengthened; for a state of peace will bring repose and gladness, and overthrow factious parties."

UNITED STATES.—The packet-ship *New York*, which sailed from New York on the 19th ult., arrived at Liverpool on Wednesday. The papers brought by this conveyance are four days later than those received by the mail steamer. There is no political or commercial news of moment; public attention in New York is almost exclusively engrossed by the news brought by the United States brig-of-war *Somers*, just arrived from the coast of Africa, of an attempted mutiny on board that vessel, the object of the mutineers being to overpower and murder the officers, and convert the *Somers* into a piratical cruiser between Europe and New York. At the head of the conspiracy was a midshipman, Mr. Philip Spencer, son of the American Secretary-at-War, who, with two of his most active confederates, were summarily tried at the drum-head and hanged from the yard-arm of the brig, as soon as the conspiracy was discovered. The details of the plot given in the *New York* papers are of the most atrocious kind; they were to board every vessel off the harbour, and no one was to be left to tell any tales. They were to proceed to the Isle of Pines to meet a confederate, so that the conspiracy must have been a long time in embryo, and the confederate has yet to be arrested. The *Somers* is stated to be the fastest sailer in the American navy, well manned, and carrying 10 guns; and had not the design been so fortunately frustrated, frightful crimes might for some time have been perpetrated on board the English and American packets.—We regret to state, that the latest accounts received at New York from Kingston describe the health of Sir Charles Bagot as much worse. Only slight hopes, it is added, were entertained of his Excellency's recovery. The immense ship canal, which connects the St. Lawrence with the upper lakes, is at length completed; and on the 30th Nov. the inhabitants of Kingston were surprised by the arrival from Cornwall of the steam-boat *Highlander*, the first vessel that had passed through the canal. Although one of the largest steam-boats on the river, the *Highlander* met with no difficulty in passing through the locks. She left the mouth of the canal on the previous day, and ascended the rapids between that and Prescott with the greatest ease.

CITY.

Money Market, Friday.—Consols for money and the account closed at $94\frac{1}{2}$ to $\frac{1}{2}$; Exchequer Bills, 61s. to 63s. premium; Bank Stock, 171 to 173; India Stock, 261 to 263; Three per Cents. Reduced, 95; Three-and-half per Cents., $101\frac{1}{2}$ to $\frac{3}{4}$; New Three-and-half per Cents., 101.

Metropolis and its Vicinity.

The Weather.—The weather still continues exceedingly changeable, alternations of frost and thaw daily following each other. During Monday night the wind blew with great violence from the S.W., which continued up to about 8 o'clock on Tuesday morning, when there was a fall of snow, which lasted only half-an-hour, and during which the wind suddenly shifted to N. The after part of the day was extremely fine, although the wind was keen and cold. At midnight the thermometer stood at the freezing point, and the mercury in the course of the night fell considerably lower, so that by day-break on Wednesday morning ice nearly half an inch thick had formed; yet at 8 o'clock the thermometer again stood no lower than 32°. The frost, however, continued through the forenoon; but between 1 and 2, P.M., a rapid thaw took place. The wind also shifted to nearly due S., yet blew very cold, and at 6 o'clock a fall of snow commenced, which by about 7, in the outskirts of the town, had covered the ground to the depth of 3 or 4 inches. Throughout the last 12 hours the wind has blown a perfect hurricane; it commenced yesterday afternoon, and continued during the whole night without intermission. Several fine trees in St. James's and Hyde Parks, Kensington Gardens, Chiswick Park, Zion Park, and at other places near town, have been torn up by the roots, and several barges and small craft have been sunk on the river. From accounts received this morning, the storm appears to have extended as far as Brighton; and we shall no doubt hear of its effects in other parts of the country.

The Houses of Parliament.—A number of workmen are employed, under the Woods and Forests, in preparing both houses for the approaching meeting of Parliament on the 2d of next month. The men have this week been engaged in painting and otherwise renovating the body of the houses, and the libraries, committee-rooms, lobbies, &c. No material alterations are to be made in the interior of the houses.

The City Sewers.—A report has been published by the City Commissioners of Sewers, containing the result of the Surveyor's examination of the main lines of sewers in the

City of London. The report of the Poor Law Commissioners on the inquiry into the sanitary condition of the labouring population of Great Britain, contained several severe animadversions on the present Commissioners of Sewers. The system of operation, the fitness of the commissioners for their situation, and the works that had been accomplished, were alike the objects of uncompromising blame. The surveyor's report is made in obedience to an order of the Commissioners of Sewers made on the 4th of last October, and it is to furnish these commissioners with an opportunity of exonerating themselves from the charges which the Poor Law Commissioners have brought against them, that the facts in this report have been collected. The following extract contains some curious historical information on the subject:—"Previous to the great fire of London, all kinds of drainage appear to have been superficial and fortuitous; at that time the main sewers being the Fleet-dike, the Walbrook, and the Tower-ditch, the highest point of which was at Aldersgate. It was not till after this event that the construction of sewers became an object of solicitude; but it not being deemed that there was sufficient authority to levy rates for making new lines of sewers, 'adventurers' were permitted to undertake this task, the commission taking charge of their cleansing and maintenance, and suffering no one to extend or communicate with them without compensation to the first builders. The first common sewer was built by the Dean and Chapter of St. Paul's, down Ludgate-street and hill, but its exact date has not been recorded. In 1668, that of Fleet-street was constructed, and for a century afterwards sewers still continued to be laid down through the enterprise of private individuals, among whom was Sir Christopher Wren. It was not until the appointment, in 1768, of Mr. George Wyatt, as surveyor of sewers, that the management of the old, and the formation of new, sewers was carried on in a workmanlike and efficient manner. This gentleman executed with great boldness a main line of sewer, five feet high, and three feet wide, as an auxiliary to the Walbrook—the waters pouring into the latter having so increased that it had become overcharged, and the foundations of the wharf at its mouth were undermined and washed away. It was built at a level, very close to, and below the church tower of St. Stephen's, Walbrook, and extended to the end of Beech-lane, where it obtained a depth of 14 feet, being 4 feet 6 inches high, and 2 feet 9 inches wide at the head. In 1775, the same year this sewer was completed, another main line, 5 feet high and 3 wide, was commenced along Bishopsgate-street without, and was extended to Nortonfalgate in 1778. A sewer of the same dimensions was also built in 1777 from near Moorgate to the city boundary in Ropemaker-street, which, in 1779, was continued along Finsbury-road to Tindal's burial-ground. The increase of buildings in the county, and the additional quantities of water poured into the city sewers, rendered it necessary that some more capacious outlet should be formed, and the Walbrook sewer was accordingly enlarged to an average of 7 feet 10 inches, by 4 feet. This was, however, only a palliation of the evil, which was not effectually combated until, at the building of the present London-bridge, Mr. Samuel Acton, the then surveyor, proposed that advantage should be taken of it, and then was commenced the London-bridge sewer—a work which has contributed more than any other to the health and welfare of the City and the Finsbury division. This work was, through the resignation of Mr. Acton, intrusted to the present surveyor, and it was therefore incumbent upon him to enter into a defence of his operations, which he has done at great length, showing that the line so formed actually replaces the old Walbrook, the original bed of which it intersects in several places. Within the last 13 years, (that is, since an outlet at London-bridge was obtained,) sewers have been built in 168 different streets and places; and the map of the city sewers shows the following sewerage lines as complete in that district:—From the Temple gates along the river side to Tower-hill; from Temple-bar nearly to Tower-hill; from Holborn-bars to Whitechapel-bars; from Aldersgate, in an irregular line, to Tower-hill; and from the Thames nearly to Holborn-bars; from the Thames to Aldersgate-bars; from Dowgate-dock to Golden-lane and Beech-lane, and Ropemaker-street; from London-bridge to Finsbury; from the Thames to Nortonfalgate." The Report adds that, "Although it cannot yet be said that not a street, or court, or alley in the whole City is without adequate drainage, there is fair ground for hope that but few years will elapse before so desirable a statement can with truth be made."

The Fleet Prison.—It has been recently stated, that a New Central Criminal Court would probably be erected on the spacious site where the untenanted prison of the Fleet now stands. The matter has for some time been under the consideration of the civil authorities, and the daily papers state that it is not unlikely that the improvement will be realised.

City Antiquities.—Among the most important works now in progress in the city, connected with its improvement, is the extension of the sewerage through Lad-lane, connected with the main leading sewer in Prince's-street. The excavations, which are from 18 to 20 feet deep, have during the last week exhibited some interesting facts relative to the early history of the City. Some coins, principally of Antoninus, and a few interesting fragments of Roman and Samian pottery, with household utensils, have been found; but the chief objects of interest have been the discovery of some vestiges of the foundation walls of some old Roman buildings. The most extensive of these was found last week opposite the Swan-with-two-Necks, where the excavators arrived at a wall composed of flints, about 18 feet below the surface, which was between 5 and 6 feet

in thickness, and through which they had some difficulty to penetrate. A contiguous line of wall was also found in the excavations for laying the foundations for the warehouses of Messrs. Pickfords, which are adjacent, and others have been found in other excavations in the neighbourhood, which lead to the idea that on this spot there formerly stood a castle or other extensive building. A passage was also found running in a parallel line between this and Cateaton-street, about 12 feet wide. At the lower depth there was a fine stratum of vegetable mould, apparently belonging to an ancient garden site, which supposition is strengthened by the appearance of gravel, probably used in the formation of garden-walks, as it is only found in thin layers, and in detached portions. Above this was found the site of the foundation of the old houses destroyed by the fire of London, the rubbish of which, without the aid of concrete, formed the foundation of the more modern buildings. Opposite to the church-walls in Cateaton-street, at the depth of about 18 feet, a large quantity of human bones was found, showing that there existed here a place of sepulture, which must have been coeval with the time of the Romans.

The Wellington Statue.—The committee of the subscribers to the city equestrian statue of the Duke of Wellington, begun by Sir F. Chantrey, and completed since his death by Mr. Weekes, met last week at the studio, to inspect the progress of the work. The horse is already cast in bronze, and the figure of the Duke, in clay, was placed upon it, in order to judge of its effect before it is also cast. The head of the horse is very spirited, with the ears pricked forward; he is standing on all four legs, and is not in action. The Duke is seated in an erect position, with the head uncovered, his left hand holding the bridle, and the right holding the marshal's baton. The costume is very simple, the whole body, from the waist to the toe, being clothed in one unbroken pantaloons, whilst a short cloak covers the shoulders, and is skillfully draped over the back, and partially down each side. The entire height is rather more than 12 feet, and the executors of Sir Francis Chantrey stated that it will be ready next June.

The Model Prison.—The first criminal inmates of the new prison at Pentonville were 16 convicts, who were drafted from Newgate about a fortnight ago, six of whom are under sentence of ten years' transportation, and the other ten of seven. The number of inmates has been considerably increased since the late sitting of the Central Criminal Court, and during the present week numbers have arrived under sentences from the Epiphany Quarter Sessions throughout the country.

Public Meetings.—On Tuesday, a meeting of the holders of the Portuguese Bonds, issued for a loan raised in 1836, was held to adopt measures for obtaining their rights, in respect to the advances made to the Government at Lisbon, on the collateral security of the debt due from Brazil to Portugal. The meeting was convened by the contractors in consequence of recent communications received from the Portuguese Government. The chair was taken by Sir Isaac Lyon Goldsmid, who said he had taken some pains to ascertain the feelings of the bondholders as to the last offer made by the Government at Lisbon for the arrangement of their claims under the loan raised in 1836, and the major part of them had agreed to the proposition he had now to submit to the meeting. It would, however, be important if the bondholders were unanimous. He then read a long letter addressed by him to Baron De Tojal, which, after going through a statement of the various financial transactions between the Portuguese Government and the British bondholders, contained a proposal accepting the terms offered by Portugal for the settlement of their claims, with this exception, that the reply proposed that the Brazilian stock to be placed in the hands of the bondholders should be reckoned at 75 instead of 85 per cent. Several of the bondholders addressed the meeting in support of the view of Sir Isaac and his friends, who hold about 600,000*l.* of the bonds now circulating, among whom was Mr. Tasker, who gave it as his opinion, that in this instance the exertions made to get from Portugal what she really owed her creditors, would prove to other foreign states that British interests were not so inclined to have their debts cut down as they appeared to imagine. Mr. Thornton seemed to think that the bondholders were "driving too hard a bargain" with Portugal; and, therefore, moved that the terms of the proposal should be accepted. He endeavoured to show that the interest of the other class of creditors of Portugal would be interfered with, if the terms contained in Sir Isaac's proposal were pressed. He said that he represented holders of between ten and eleven millions of money, having himself nearly 900,000*l.* of the bonds of Portugal; and he was glad to be enabled to state that, as respected the security of Brazil offered, Mr. Ellis, the British Minister at Rio, was negotiating a treaty to admit Brazilian sugar and coffee into this country, at a moderate rate of duty. The meeting, however, was nearly unanimous; and the result, when the question came to the vote, was, that the mover, and his nephew Mr. T. Thornton, were found to be the only supporters of the view he had taken. The proposal of Sir I. L. Goldsmid will be forthwith forwarded to the Finance Minister, Baron de Tojal, and every hope is entertained that the terms it contains will meet with the sanction of the Cabinet, especially as Baron Lagos, who was present, expressed himself in favour of the fair and candid manner in which the whole question had been treated by the majority.—A special general meeting of the Anglo-Mexican Mint Company was held on Thursday week for the purpose of taking into consideration the propriety of raising additional capital. The directors in their report announced to the meeting that, in consequence of having entered into a contract with the Government of Mexico for working the Mint of Zacatecas for a period of

fourteen years, they had, agreeably to the powers vested in them, determined on the creation of 10,000 half-shares of 5*l.* each, to be appropriated preferably to the proprietors. Resolutions were then passed, empowering the directors to make a further issue of shares to that extent. —The general meeting of the shareholders in the London Joint Stock Bank was held on Wednesday. The report stated that the affairs of the bank for the half-year ending the 31st ult. showed a net profit for that period of 19,189*l.* 5*s.* 11*d.*, of which sum the directors proposed to apply 18,000*l.* to the payment of the usual dividend of 6*l.* per cent. on the paid-up capital of the company, and to carry the remainder to the credit of the guarantee fund. The guarantee fund would then amount to 94,403*l.* 17*s.* 2*d.* The statement of the account of liabilities and assets was on the debtor side, to capital paid up, viz. 60,000 shares, at 10*l.* each, 600,000*l.* To amount due by the bank, 1,771,739*l.* 18*s.* 7*d.* To amount of the guarantee fund, 93,214*l.* 11*s.* 3*d.*, and amount carried to profit and loss account, 38,154*l.* 2*s.* 11*d.*; making a total of 2,503,108*l.* 11*s.* 10*d.* On the credit side, by Exchequer-bills and India Bonds, 246,013*l.* 14*s.* 6*d.*; by bills discounted, loans, and cash, 2,222,469*l.* 17*s.* 4*d.*; by building, furniture, &c., in Prince's-street, 23,000*l.*, and building, &c., in Pall-mall, making a total the same as the other side, of 2,503,108*l.* 11*s.* 10*d.* The report and statement of the accounts were agreed to unanimously, and a vote of thanks given to the directors.

Anti-Corn-law Meetings.—On Tuesday a meeting of electors of the borough of Marylebone took place, for the purpose of completing the formation of a Central Borough Anti-Corn-Law Association, to carry out the objects of the great League Fund. Mr. Bagshaw presided, and was supported by Gen. Sir De Lacy Evans, Mr. Ewart, M.P. and other gentlemen. The meeting was addressed by Mr. Henry Weymouth, Dr. W. C. Taylor, Mr. Ivey, and others; and resolutions for the formation of the proposed Association were adopted. It was also decided to hold a public Meeting at the Colosseum on Thursday, the 26th inst. for the general purpose of the League. On Wednesday evening a meeting of the sixth district of the Metropolitan Association, comprising the division of St. Luke, Islington, and Clerkenwell, was held, Mr. P. A. Taylor in the chair. The meeting was addressed by Mr. T. M. Gibson, M.P., Mr. Ewart, M.P., Dr. Bowring, M.P., Mr. Martineau, Mr. Buckingham, and other gentlemen connected with the district; after which resolutions were adopted in favour of the League Fund.

Church Pastoral Aid Society.—On Tuesday evening a meeting of the members of the Bloomsbury branch of this society was held, the Hon. and Rev. Montagu Villiers in the chair. The report stated that the society by its grants now maintained 243 incumbents, having under their care and pastoral superintendence a population of 1,832,552 souls. The charge to the society for these incumbents, 129 of whom were without parsonage-houses, was 21,110*l.* In addition to this number, 194 clergymen and 31 lay assistants were supported in their labours by the funds at an annual charge of 17,705*l.* It was expected that after the ordinations to be held during the present and ensuing months, 15 more curates would be appointed to occupy grants now vacant, requiring a further sum of 1,300*l.* The contributions recently received amounted to nearly 2,000*l.*, to which was to be added 70*l.* 6*s.* received by the Branch Association. After addresses by the Rev. Dr. Dibdin, Rev. Mr. Hughes, and others, resolutions were passed in support of the objects of the society.

Royal Humane Society.—The half-yearly meeting of this Society took place on Tuesday, Mr. Baron Gurney in the chair. Among those present were Lord John Russell and several other influential members of the society. The report stated that during the preceding six months 85 cases had been brought under the notice of the committee; of these 78 were successful, and 7 beyond recovery; 14 were attempts at suicide, and six had been referred to the present Court; 13 cases had occurred in Hyde-park, and of these 11 were successful, 2 beyond recovery, and 3 attempts at suicide. 21 silver medals, 18 bronze medals, and three votes of thanks engrossed on vellum had been awarded, and 156 persons had received pecuniary rewards. On the motion of Lord John Russell, a vote of thanks was passed to the Duke of Northumberland for his liberal support of the charity, and his Grace was re-elected President. The subscriptions for the current year amounted to 3,489*l.* 1*s.* 7*d.*, and the balance from last year 136*l.* 2*s.* 4*d.* The general expenses for the year were 1,752*l.* 1*s.* 3*d.*, and those of Hyde-park alone 561*l.* 3*s.* 4*d.* Stock to the amount of 1,236*l.* had been purchased, and the balance in hand was 5*l.* 4*s.* 1*d.* Medals were then awarded in the cases above alluded to.

Asylum for the Deaf and Dumb.—On Monday the half-yearly general meeting of this institution, established in 1793 for the support and education of indigent deaf and dumb children, was held at the London Tavern. The report stated that during the last 50 years of the Society's operations, 1,800 deaf and dumb children had been taught to read, write, and cipher, to correspond with others by means of signs, and to understand the truths of the Christian religion. During the last 12 months 70 children had been received into the asylum, and the committee now proposed that 30 more, from a list of 93 candidates, should be elected, believing that the necessary funds to maintain and clothe them would be afforded. Nearly 300 children were now being instructed in the school, and clothed and maintained by the charity. The list of candidates showed that instances of three and four children having been born deaf and dumb in one family were not of unfrequent occurrence. In one family containing seven children, there were four born deaf and dumb; in another family, containing six, there were three; and in another, contain-

ing five, there were three. The receipts arising from subscriptions, legacies, dividends, &c., during the past year, amounted to 11,575*l.*; the disbursements to 10,772*l.*; leaving a balance in hand of 802*l.*

Election of Chief Rabbi.—We learn by the daily papers that the Presidents of the various Jewish synagogues in Great Britain have been requested to proceed immediately to appoint delegates from their congregations, and to report their names to the secretary of the Great Synagogue, preparatory to their assembling in London to elect a Chief Rabbi of the Jews of the British empire, in the room of the late Dr. Hirschel. Several eminent men are said to be mentioned as candidates for the office.

The Scottish Monument.—We noticed in our last the proceedings of the Marylebone Vestry on the 31st ult., in adopting a resolution to ascertain how far their grant of a spot of ground in Regent's Circus for the erection of this monument might expose the Vestry to legal proceedings. On Saturday last there was an exceedingly full attendance of the Vestry for the purpose of deciding on the confirmation of this resolution. Mr. Clapp moved the non-confirmation of the minute. He contended that the Vestry had just as much right to erect this monument to the Scottish Reformers as they would have to erect one to Lord Castlereagh, Mr. Pitt, or any deceased Tory nobleman. Mr. Gomm thought the Vestry would find out that the course they had pursued was no joke. In the first place, the Vestry had no right to give the land for such a purpose at all; and, secondly, they had no right to allow the parish to be disgraced by a monument to such characters. Mr. Hodgkinson denied the character given of those men, and declared (amidst great confusion) that they were Jacobins, and justly-convicted traitors. Mr. Walpole Eyre thought it a disgrace to the parish, and little credit to the memory of these men, to put up a monument to them under the pretence of its being a lamp-post. Mr. Hume denied that there was any wish to erect this under the pretence of its being a "lamp-post;" he should indeed consider himself, and the Reformers whose memory it was to commemorate, disgraced by the erection of a lamp-post. He asked for its erection as an ornament to the parish; and thought there was but little credit attached to those who now sought to set that erection on one side. He was sorry he had ever brought the subject before the Vestry, as it had created a party spirit he had not anticipated. He had already been at great expense in the contract for digging out the foundation, and he wished the Vestry to decide at once whether they could proceed or not. After considerable discussion a division was demanded, when there appeared—For non-confirmation, 35; for confirmation, 14; majority in favour of proceeding with the monument, 21. The surveyor announced that the foundation already dug came in contact with a manhole belonging to a sewer, and the Commissioners of Woods and Forests dared them to build over it. The architect of the monument, therefore, desired to move the foundation four or five feet more northward. An angry discussion again ensued, but the application of the architect was complied with.

Hoxton.—On Saturday night a murder and suicide, committed under circumstances of a distressing nature, caused much excitement amongst the inhabitants of Huntingdon-street, Hoxton Old Town, and its neighbourhood. This double crime was committed by a man named Giles, a maker of hooks and eyes, who had resided some time in that street. Pulmonary consumption in an aggravated form had lately rendered him so weak and infirm that he could not continue at his work; and the result was, that after parting with almost every article of furniture, and everything wherewith he could raise money to purchase food for his family, he became very much distressed. On Saturday evening, in the absence of his wife, he cut the throats of his two younger children, and then destroyed himself. One of the children was found to be still alive, and some hopes are entertained of her recovery. An inquest was held on Monday, when the jury returned a verdict of "Temporary Insanity."

Woolwich.—The 16 gentlemen cadets belonging to the first class of students at the Royal Military Academy who have been detained at their studies beyond the usual period as a mark of disapprobation of their conduct in joining in some street disturbance a few months back, were examined on Tuesday, and the extra duties having been considered sufficient punishment, and a warning to others not to follow a similar course, they have obtained leave of absence, and will be immediately appointed to commissions.

Hanwell Lunatic Asylum.—We noticed in our last the entertainment given on New Year's eve to the female lunatics in this asylum. A similar festival was given on Twelfth Night to the male patients, and with the same satisfactory results. The scene of the *fête* was one of the long galleries on the male side of the house which open into the great central tower, and the circular gallery on the same floor within the tower. These galleries were tastefully decorated with festoons of evergreens, interspersed with drawings and numerous mottoes in ornamental borderings. The greater part of these decorations were the work of patients; the paintings and the mottoes, some of which were in Latin, were exclusively their performance. As on the previous occasion, Mr. Mainzer was present, and added to the interest of the scene by occasionally presiding at the piano, selecting a sufficient number of the patients to form the chorus. A band of music, composed partly of patients and partly of the servants of the house, filled up the intervals between the singing and the dances, which were kept up with great spirit and frequently renewed. After "God save the Queen" had been sung in good style, the whole party joining in the chorus, they sat down to supper, which was followed by pipes and tobacco. After this, the music and

the dancing were renewed until nine o'clock, when the party broke up, the patients being evidently as much delighted with their holiday as the visitors, who assembled in large numbers to witness this interesting festival.

Mortality of the Metropolis.—The number of deaths registered in the week ending Dec. 31 was 1004: males, 523; females, 481. Weekly average, 1838-9-40-1—males, 467; females, 445. The occurrence of this mortality in the different districts was as follows—West districts, 129; North, 190; Central, 194; East 222; South, 269.

Provincial News.

Incendiary Fires.—The following fires have been reported this week:—In Surrey, two barns filled with wheat and barley, and the stables on the farm of Mr. Woodward of Thorpe, were totally destroyed on Saturday evening. In Lincolnshire, on the 4th inst., several corn-ricks on the farm of Mr. Peacock at Thorpe Tilney, 10 miles from Sleaford, were consumed. On Saturday last a great part of the farming-stock of Mr. Rusher at Heckington, was fired and destroyed; and on Sunday, 7 stacks of wheat, 2 of barley, and one of hay, were burnt to the ground on the farm of Mr. E. Cooper at Ramsby. In Cheshire, on Thursday week, the stacks in the farm-yard of Mr. R. W. Barton, and 1,100 feet of timber, valued at 1,000*l.*, were entirely consumed. A labourer residing in the neighbourhood of the farm has been apprehended as the supposed incendiary, and committed to take his trial.

Caernarvon.—On Saturday last the Monk steamer was totally lost on Caernarvon Bar, and 24 persons drowned. The vessel was on her voyage from Portlinnlaen to Liverpool, and struck on the north bank of the bar about 6 p.m., on Saturday, when the engine became immediately disabled. She soon stuck fast on the sands, as it was then within an hour of low water. The master, being in hopes she would float off with the flood tide, endeavoured to pacify the passengers to await the event, but made signals to the life-boat station, by exhibiting lights and burning a tar barrel, in hopes they would come off. The boat, however, could not be made available, as she was in such a position that she could make no way against a strong tide and head wind, and consequently no assistance could be rendered. The vessel went to pieces during the night, and only four of the crew succeeded in saving themselves in a small punt, after much danger and exertion; they were once capsized on approaching the bank, but, fortunately securing the boat, they hauled her on the bank, and launched her a considerable distance over it, to get into the channel between it and the main, which they were enabled to reach by the use of the bottom boards, having lost the oars when she capsized. As day came on, a life-boat from Llanddwyn was able to reach the fragment of wreck which still remained on the sands, and found two other persons, who were brought away in safety. The body of the captain has been washed ashore; and, so far as can at present be ascertained, the number of lives lost is not less than twenty-four.

Carmarthen.—The local papers observe that the state of society in Wales may surprise some of their English readers, when they acquaint them with the fact that there has been for some months past in the neighbourhood of St. Clears, a mob of depredators amounting to about 600, who assemble nightly for the purpose of destroying the turnpike-gates on the various lines of roads. They are headed by a very tall man, dressed for disguise as a female, and known by the name of Rebecca; and as many of his associates are likewise dressed as females, the whole gang have been christened "Rebecca and her daughters." These men are nearly all of them ably mounted, and are the terror of the neighbouring country. The Pwlltrap gate has been destroyed several times, and as frequently replaced by the trustees of the road; but immediately after its re-erection, the confederates have invariably assembled in greater force than before, and levelled it to the ground. They are well organised, for although so numerous a body they disperse immediately afterwards in different directions, and completely elude the vigilance of the local police. Rewards have been offered for their apprehension, and some of the London police have been sent down to assist the constabulary in discovering the parties, but hitherto they have been entirely unsuccessful.

Ipswich.—We noticed last week the proceedings of the church authorities of Coventry in abolishing pews in churches, and adopting the ancient custom of open benches. As this improvement commenced with St. Margaret's, Ipswich, it may not be uninteresting to our readers if we give the following letter addressed to Mr. Fonnereau of that town by the Bishop of Norwich, who has done so much to introduce the ancient praying benches in other parts of his diocese:—"Palace, Norwich, Dec. 16.—Dear Sir,—Agreeing with you, as I entirely do, upon the injustice and evil tendency of pews, by which the benefits of our church services are, comparatively speaking, confined to the higher and wealthier classes, to the exclusion of the poor, I sincerely hope your appeal to the inhabitants of Ipswich may be successful, and that they may be amongst the first to express, as a collective body, their disapprobation of a system so adverse, in my opinion, to the true interests of our national church, which professes to have so much at heart the spiritual welfare of the poorer and humbler classes of our population. I am persuaded, indeed, that one of the prominent causes of dissent, as well as utter disregard and indifference to religion, manifested by too many of these classes, is attributable, in a great degree, to that exclusive system of pews which has for so many years prevailed. If you have not yet seen a charge delivered, Nov. 1842, by Archdeacon Samuel Wilberforce, I would recommend it to your notice, as containing much valuable information and able remarks

pon so important a subject. I remain, yours respectfully, E. NORWICH.

Liverpool.—On Saturday last the Collegiate Institution in this town, of which the foundation-stone was laid by Lord Stanley about two years since, was opened with unusual ceremonies. This building, which is of great extent, and one of the finest specimens of architecture in Liverpool, has been erected by the private subscriptions of the inhabitants at a cost of 24,000*l*. The great hall was crowded with visitors, among whom were the Bishop of Chester, the Right Hon. W. E. Gladstone, several Members of Parliament, and a large number of the local clergy. In the absence of Lord Stanley, Mr. Gladstone, Vice-President of the Board of Trade, delivered the inaugural address. He said—"At the opening of an institution intended mainly for the benefit of the middle classes of society, he, who was himself sprung from that middle class, and with his family still claimed to belong to that middle class—felt that he might be expected to entertain some sympathy with the principal object of this institution; that he might desire to open and smooth the way for those who might be inclined to enter in the path of honourable advancement, and that upon this account, if not upon personal qualifications, he might with sincerity and earnestness address them on the question which had assembled them together. He said that there was no class of men who ought to take a livelier interest in the progress of all schemes connected with public education than that class which was connected with political office. What was the condition of the institutions of this country? He should now speak of facts not open to dispute. He rejoiced they were here removed from the arena of party discussion; but it was admitted on all hands that we had arrived at a state in the progress of society in which we must give a broad basis to public institutions, in which we must feel interest in them, and challenge for them the approbation and support of the mass of the intelligent community. It was his opinion, that those who were appointed to watch over the laws and institutions of the country ought to know best of all men—that inasmuch as we must look to the great masses of the intelligent community for the means of upholding our institutions—of supporting the throne and the aristocracy—of supporting the church—of supporting all which some men deemed to be relics of dark ages, but which others believed to be sound in their principles and deeply rooted in the affections of the people—they ought, he said, to know best the necessity of training the minds of the population in sound and useful knowledge—in knowledge which would bear the criterion of a searching examination, and not in that which too often passed for sound and useful knowledge—with pretensions to the substance, and not to the reality. It was, therefore, acting on those convictions that, so far from desiring to see education restricted in the country, he trusted that every year that passed over our heads might, on the contrary, witness its freer and freer diffusion on sound and true principles. Did we not live in an age when everything was made subject to question and doubt? when men's minds were stimulated into an activity which was salutary, no doubt, in many respects, but which required the guide both of sound Scriptural principles and enlarged habits of thought? It was a critical period in the history of nations when men began to question themselves with respect to things about them—when doubts were suggested before the means of solving those doubts were at hand—when there was a great disposition to question the merits of this and that institution, and when there was not the same power to examine the merits on which such institutions might depend. This was eminently an age of criticism, and, in that sense, of scepticism. Did we hold it desirable to check that spirit of inquiry? No such thing. It was a certain state which belonged to our condition and circumstances—it came upon us as a dispensation of Providence that everything should be subjected to discussion. Let that discussion be continued; but let it be fairly and fully felt as approaches to a right understanding, not under delusion or haste, not under prejudices and party feelings, but with all those aids and appliances of sound knowledge and of right habits, and, above all, with all those reliances on a higher power, which Christianity alone could give. With those advantages let us meet discussion, and we need not fear for its issue. And here he came to that great question, that question of questions—what was an education? What was an education, if it was indeed to vindicate for itself that title for a being like man, who had faculties, who had hopes, who had temptations, and who had dangers? There were two systems which were irreconcilably divided, and the audience were the adherents of one of them. They did not come to disparage the efforts of those who thought differently on the subject of education, and the ends to which it should be directed; but they were ready, he trusted, to do justice to their benevolence and their zeal; ready to acknowledge that in many cases we might take a lesson from that zeal; and that men of sounder views might profit in practice by the example of persons who, though they possessed less light, yet seemed to make a more sincere and earnest use of the light which they possessed. He paid great respect, then, to the persons and motives of those who took other views on this vital question; still he felt that there were two systems irreconcilably divided. There were those who thought—and he admitted the opinion to be a plausible one to men at first sight, and that many would say it was the true one—there were those who thought that the first object of education was to give to a man such information as should serve the purposes of his temporal advancement—as should enable him to pursue with efficiency and success the calling to which he

might be about to devote himself; and if they had that view of the nature of education—if they felt that education was merely designed to put tools into the hands of a man, which tools he might employ in order to shape all the materials which earth afforded—if they held such a belief as this, the natural consequence was, that they could not see the necessity of founding education on the definite basis of religion. They said we were unhappily perplexed by religious divisions, and they were led to add, 'Let us avoid all those difficulties, let us found our public education upon the communication of a description of knowledge about the utility of which there is no doubt, and let us leave religion to be dealt with by other men according to their will and pleasure.' He hoped this was not an unfair view of the question. He hoped this was not an unfair version of the view which many were led to take, and he was bound to say, under the influence, as he thought, of a most unfortunate delusion; but still from motives which we were bound to respect, and by no means implying an indifference on the part of such individuals to the importance and value of religion itself. He firmly believed that religion should be included in the matter of education, and not only that religion should be one item among many, one head in the long catalogue of accomplishments, but that it should be the ruling and pervading principle, the principle to which all others were to be subordinate, and with respect to which all the foundations of an institution were to be regulated, and all its ends directed and arranged. It was a great truth, that education to be valuable and to deserve the name, must be a religious education, and to be religious must be founded on the definite revelation of God. He believed that if they could erect a system which should present to mankind all branches of knowledge save the one that was essential, they would only be building up a Tower of Babel, which, when they had completed, would be the more signal in its fall, and which would bury those who raised it in its ruins. He believed that if they could take a human being in his youth, and make him an accomplished man in natural philosophy, in mathematics, or in the knowledge necessary for the profession of a merchant, a lawyer, or a physician,—that if with any or all of those endowments they could store his mind,—if they could endow him with the science and power of a Newton, and if they had concealed from him, or rather if they had not given him a knowledge and love of the Christian faith, he would go forth into the world destitute of everything that constituted the true and sovereign purpose of our existence." The Rev. J. Conybeare, the Principal of the Institution, here briefly explained the principles upon which it would be conducted; after which the bishop closed the proceedings by pronouncing the apostolical benediction. In the evening the Mayor entertained a large party of the principal supporters of the undertaking at dinner in the Town-hall.—The *Liverpool Chronicle* mentions as a remarkable fact, that Capt. Nye, of the packet-ship *Independence*, which arrived at that port on Sunday-week, in 16 days from New York, states, that though he has crossed the Atlantic above a hundred times, the last was the only voyage he did not see a solitary sail the whole distance from New York to Liverpool.

Manchester.—The weekly meeting of the League was held on Friday, and was attended by an unusually large number of members. The chairman, Mr. Geo. Wilson, stated, that large subscriptions had been received during the week from several important towns; that on the previous night meetings had been held at Warrington and Bolton; that 300*l*. was subscribed at the former place, and upwards of 700*l*. in the latter, before they quitted the room. He also stated, that the town-council of Glasgow and Edinburgh had conferred the freedom of those cities on Mr. Cobden, for his exertions in promoting the cause of the Anti-Corn-law League. The secretary then read a long list of places from which contributions had been received, after which the meeting was addressed at great length by the Hon. C. P. Villiers, M.P., Mr. M. Philips, Mr. Cobden, Mr. Brotherton, the Rev. Dr. Hewlett of Coventry, and other gentlemen. It was announced that arrangements had been entered into for holding a meeting on every evening up to the 30th inst. all of which would be attended and addressed by deputations of the council of the League, including the most influential members.

Plymouth.—We learn by the *Plymouth Journal* that the arrangements and surveys for the formation of a line of telegraphs along the coast, from the Lizard to Portsmouth, are in a forward state, and it is expected that the signal stations will be completed and in operation in the spring. The stations, as far as practicable, will be along the coasts of Cornwall, Devon, Dorset, and Hants, to Portsmouth, whence the telegraphic communications will be made to the Admiralty as heretofore. In consequence of the stations of the preventive service being generally so situated that each commands a view of an extensive line of coast, and being under the superintendence of lieutenants in the navy, it is intended to have a number of them fitted with telegraphs, as was the case on the coast of Kent and Sussex, when Admiral Sir H. Pigot commanded the coast blockade. By this mode the expense of the line will be comparatively trifling, as an addition of only one man to each station will be required.

Reading.—We learn by the Reading papers that Aldermaston House, the fine old mansion of Mr. W. Congreve, was totally destroyed by fire on Saturday morning last. The fire broke out in the morning between 4 and 5, in an attic over the drawing-room, and though soon discovered it had gained such head that it was impossible to suppress it. The plate, however, and a large portion of the furniture, were saved. At 7 o'clock the whole building was enveloped in flames, which were seen at Newbury and

other places for many miles round; the roof fell soon afterwards, and for some minutes completely smothered the flames. The engines from Reading reached the Hall soon after 8, and before noon the flames were in some measure subdued; but the principal rooms, the hall, and by far the greater part of the building, were totally destroyed.

Wigan.—Intelligence arrived in this town on Wednesday week that Whitley-hall, the residence of Mr. A. F. Halliburton, was on fire. The report caused a great sensation, as the hall is one of the finest mansions in the neighbourhood of Wigan. The fire was occasioned by some lighted coals falling from the grate in the study down a back flue constructed for the purpose of increasing the draught in the chimney from the cellar. Some straw in the cellar underneath the study caught fire, and, had a timely discovery not been made, it is more than probable that the mansion would soon have been destroyed from its elevated situation and the strong breeze which was blowing at the time. The flames were soon subdued, and very little damage was sustained.

Windsor.—A military funeral took place in this town last week, when the body of Lieut. De Winton of the 2d Life Guards, who died at the cavalry barracks on the 31st ult., was buried in St. George's Chapel with the usual military honours. The aisles of the chapel were lined with troops, and a large number of officers of high rank took part in the imposing ceremony.—The daily papers announce that forms of proposals for a contract have just been issued from the Office of Woods and Forests, for the immediate erection, in that portion of the Home-park, near Adelaide-lodge, situate between her Majesty's private dog-kennel and the dairy, opposite Frogmore-lodge, of a small picturesque brick-building, to be appropriated exclusively for keeping the varied and peculiar breeds of domestic poultry belonging to her Majesty.

Wrexham.—A case of embezzlement, somewhat similar to that which occurred at Richmond a few weeks since, has been made public in this town, Mr. B. Dillon, the actuary of the Savings-Bank, having been found to be a defaulter to the amount of above 570*l*. A meeting of the trustees has been held, at which all the particulars were disclosed; and the result has been the apprehension of the delinquent. It appears that Mr. Dillon was formerly a wine merchant in Wrexham, and failed for a large amount. Being a good accountant he has filled several offices of trust, and was actuary to the Savings-Bank and auditor to the Union. His occupation of accountant brought him a considerable income, sufficient to place him above the reach of temptation. The depositors will sustain no loss by the defalcation, as he gave a bond, signed by two sureties, for a part of his liabilities, and the remainder will fall upon the trustees.

York.—The Yorkshire Papers still dwell on the recent failure of the Agricultural and Commercial Joint Stock bank, of which we gave the particulars in our last, and state that the effects will be severely felt in York and in the surrounding districts. Not only has the paid-up capital of 211,000*l*. been totally lost, but the shareholders have now to meet a call of 3*l*. per share, in order to wind up the concern, which will make another loss of 162,000*l*. It appears also that litigation in a business of this sort is hardly to be avoided, so that the ultimate loss of the shareholders has yet to be determined, nor is it pretended that the affairs can be wound up in less than a year and a half. The list privately distributed of the proprietary who are, during this long interval, to be kept in suspense, contains the names of 562 shareholders, a large proportion of whom, exclusive of those resident in York, are landowners and farmers.

Railways.—The following are the returns of the principal railways for the past week:—London and Birmingham, 11,559*l*.; Great Western, 10,081*l*.; Northern and Eastern, 1,155*l*.; South-Western, 4,803*l*.; Birmingham and Derby, 1,248*l*.; Hull and Selby, 671*l*.; Grand Junction, 5,546*l*.; Edinburgh and Glasgow, 1,604*l*.; Midland Counties, 2,212*l*.; Blackwall, 551*l*.; Great North of England, 995*l*.; Sheffield and Manchester, 379*l*.; North Midland, 3,400*l*.; Brighton, 3,662*l*.; Greenwich, 830*l*.; Eastern Counties, 376*l*. It is stated in the *Railway Magazine* that the Great Western Company have determined to make the Box tunnel an open cutting, and that the contract for carrying this important improvement into effect has been already taken. A meeting of the inhabitants of Carlisle, in aid of the proposed railway from that city to Lancaster, was held last week. Mr. Errington, one of the engineers of the line, stated that there are no engineering difficulties; and that with respect to gradients, the obstacles were not so great as had been overcome upon the Newcastle and Carlisle Railway, and upon several others now in successful operation. From Carlisle to Penrith, and from Lancaster to Kendal, it is proposed to make the line double; but the middle distance, that is, from Penrith to Kendal, a single line only will be laid down in the first instance. The distance from Carlisle to Lancaster will be 69 miles; and Mr. Errington stated that he had no doubt that the railway could be laid down, stations built, carriages supplied, and the whole put in working order for one million sterling. The plan proposed for raising this sum is this:—The different railway companies, that is, the London and Birmingham, the Grand Junction, the North Union, and the Preston and Lancaster, will take shares at once to the amount of half a million. The value of the land required is calculated at 90,000*l*., and it is stipulated that the landowners shall take shares to this amount. It is then proposed to raise, in 50*l*. shares, among the inhabitants along the line, the sum of 160,000*l*. A capital of 750,000*l*. will thus be provided, and this being three-fourths of the whole estimated cost, it is believed that Parliament will at once grant a bill. The remaining portion of the money will be raised

either by the sale of shares in the usual way, or by loan. —On Thursday morning a fatal accident occurred on the North Midland Railway. From the official report it appears that while the train which left Leeds for Derby at 5 o'clock was waiting at the Barnesley station, it was run into by a goods train, by which a Mr. Harvey, a traveller for the house of Finlay & Co., of Glasgow, was killed on the spot. Fortunately he was the only passenger, or the results would have been more serious, as the engine and carriages were smashed to pieces.

IRELAND.

Dublin.—The Lord Lieutenant and Council, upon the recommendation of the Ecclesiastical Commissioners for Ireland, have suspended the appointment of a Provost to the Cathedral of Tuam, vacant by the death of the Hon. G. D. Beresford. This was the only remaining instance of the existence of the office of Provost in a Cathedral church. There were no duties of any sort connected with the office. The income of the Provost of Tuam, amounting to about 300*l.* a-year, has been transferred to the Ecclesiastical Commissioners; but memorials, signed by the clergymen of the parishes out of which a part of that sum, amounting to 180*l.* a-year, is derived in rent-charges, have been presented to the Privy Council and the commissioners, praying for the distribution of this sum in augmentation of their incomes.—A great sensation has been produced in legal circles, by the appearance of a general order from the Lord Chancellor, requiring the names, ages, duties, attendance, or non-attendance, as the case may be, of officers of all classes deriving salaries or emoluments in the Court of Chancery. It is said in explanation of this order that there are some officers, with very high salaries, who seldom appear personally, and that others have been absent, from illness or other causes, during a whole year. It is added that serious apprehensions prevail in the other equity and common law courts, that a similar order will be immediately issued, with a view to important modifications in the whole system.—The extensive establishment of Mr. Busby, the distiller, has stopped payment. The amount of the liabilities does not exceed 26,000*l.*, and the failure is attributed, in a great measure, to the temperance movement, which is said to have produced the ruin of three-fourths of the spirit retailers in Ireland.—Mr. Geo. Cornwell Lewis, the second of the three Poor-Law Commissioners, has succeeded Mr. Nichols as resident commissioner in Dublin.—At the weekly meeting of the Repeal Association, a long letter was read from Mr. O'Connell, in which he announces five measures as the basis upon which he seeks to combine all Irishmen in the struggle for the Repeal of the Union. They constitute, he says, the great national compact upon which he calls upon Irishmen of every persuasion to rally together, in order to obtain national independence and prosperity for their native land. The following are the measures:—1. The total abolition of the tithe rent-charge.—2. Fixity of tenure for the occupying tenants.—3. The encouragement and perfecting of Irish manufactures.—4. Complete suffrage and vote by ballot.—5. Abolition of the present poor-law, and augmentation of well-regulated charitable institutions. Such, he says, is the basis of their repeal agitation for the year 1843. The rent for the week was 142*l.* 14*s.* The *Morning Register* newspaper, one of the leading organs of the Repeal party, has been discontinued, and is henceforth to be incorporated with the *Freeman's Journal*.

Tyrone.—A requisition, signed by peers, deputy-lieutenants, and magistrates, has been forwarded to the High Sheriff of Tyrone, calling on him to convene a meeting to take into consideration the working of the Irish Poor-law, which, they allege, is found to be cumbrous, expensive, and ill-suited to the wants of the destitute. A similar requisition to the High Sheriff of Fermanagh is in course of signature. The union of Tuam has also been convened to petition "for the utter repeal of the present unwise, cruel, and oppressive enactment, denominated 'A Law for the Relief of the Poor,' and the substitution of a benevolent measure, which would have the effect of diminishing pauperism, by developing the rich resources of the country, making, at the same time, a special provision for the relief of the aged and infirm members of the community, in accordance with the true interests and habits of the Irish people." Such is the wording of the requisition, which is signed by Dr. M'Hale, the Roman Catholic Archbishop, Mr. Bodkin, one of the Members for Galway county, and by several magistrates and Poor-law Guardians.

Belfast.—The extraordinary meeting of the General Assembly of the Irish Presbyterian Church continues to occupy the attention of the local Presbyteries. In addition to other districts, resolutions have been adopted by the Presbyteries of Newry and Down, requesting the Moderator of the General Assembly to convene a meeting of the body, in order to express their sympathy with the Presbyterian churches of Scotland and Ireland, and to assist them in their present struggles. There is now little doubt that a meeting of the Assembly will take place early in the ensuing month.

Galway.—On Wednesday week, a fire broke out in the mill of Mr. Fitzgerald, at the Nun's Island, and soon extended to the next mill, belonging to Messrs. Rush and Palmer. The military were quickly on the spot, and the police and the officers and men of the Raven cutter rendered the most effective aid in checking the progress of the flames. The two mills, however, were totally consumed, with the large property in grain and oatmeal they contained, chiefly belonging to poor mealmongers, whose cries and lamentations are described as heartrending. There was no fire-engine, and it was with the greatest difficulty the extensive mills of Mr. Regan adjoining were saved. The local papers state that the poor mealmongers are completely ruined.

SCOTLAND.

Edinburgh.—We learn by the *Edinburgh Observer* that it was announced in that city on Monday last, that the Moderator had received an answer from Government to his recent communications, announcing that her Majesty's ministers had no intention, by admitting the claim of right, recognising the convocation, or acceding to its demands, or those from the last meeting of commission, to interfere with the existing law as regards the church; and that they do not purpose to introduce any measure into Parliament affecting the Church of Scotland, as by law established. It appears that this reply is in the form of a state paper, bearing the signature of Sir J. Graham, as adopted at a meeting of the Cabinet Council, presided over by the Queen herself.

Dundee.—On Saturday last, indictments were served upon the Chartist preacher, John Duncan, and five other individuals, operatives in this town, to take their trial before the High Court of Justiciary at Edinburgh, on the 16th inst., for having taken an active part at the meeting of the 16th August last, when a general strike or cessation from labour was proposed, and the people recommended to "help themselves." Indictments were also left at the houses of four other Chartists, who absconded immediately after the meeting referred to, and have not since been heard of.

Glasgow.—The first ship from Scotland to China since the new treaty, the James Campbell, sailed last week from the Broomielaw for Hong-Kong, one of the ports opened to the merchants of Great Britain by the treaty. The vessel is said to be completely full, having as much merchandise on board as she can carry.

THEATRICALS.

DRURY LANE.—An English version of Rossini's opera of "La Gazza Ladra" was produced at this theatre on Saturday. The object of this performance was to introduce to the public two young ladies, whose names were not given in the bills, in the characters of *Annette* and *Pippo*, which latter character is in this version called *Felix*. The lady who played *Annette*, and who was called in the bills "a pupil of the Chevalier Micheroux," is Miss S. Novello, whose style has evidently been formed by a good musical education. Her execution was on the whole very pleasing, and she elicited much applause during her performance. The other young lady who played *Pippo*, is a contralto; she acted with remarkable confidence and power for a first appearance, and gave promise of future excellence. At the close of the opera they were loudly called for, and were greeted with reiterated plaudits. The new version of "La Gazza Ladra," not only abridges that fine opera, and reduces it to the character of a melo-dramatic spectacle, but is in all respects the most feeble attempt which has ever been made to adapt the Italian opera to the English stage. In scenery and dress it was unexceptionable, but this was a poor compensation for the mutilation of Rossini's music.

COVENT GARDEN.—The well-known opera of "Gustavus" has been reproduced at this theatre, but without the brilliancy for which it was celebrated 10 years ago. Some of the popular choruses were given with their ancient effect, and the ball scene was deservedly successful; but the general result was not so satisfactory as had been anticipated. It was, however, announced for repetition three times a week. On Thursday Colman's "Bluebeard" was revived at this theatre, and was received with great satisfaction by the juvenile audience which generally crowds the house at this holiday season.

Miscellaneous.

The Cabul Prisoners.—The gallant advance of Sir Richmond Shakespear from Cabul, by forced marches of 90 miles a day, for the purpose of assisting in the release of the prisoners, has been already noticed in our paper. We find in the Indian intelligence received this week the following interesting correspondence on the subject, which we reprint without abridgment, as it gives the names of those who were so providentially released from captivity. "To Sir Richmond Shakespear, Military Secretary, &c.:—Dear Sir—Rescued as we have so lately been from a state of prolonged and cheerless captivity, which threatened soon to terminate in hopeless slavery in a land where the laws of humanity are unknown and unacknowledged; restored by a wonderful interposition of Providence to country, friends, and all that renders life desirable,—it would ill become us, in the midst of our rejoicings, to forget those friends through whose agency this happy change in our prospects has been effected. To you we are bound to express our heartfelt thanks for the promptitude with which you led a body of Kuzilbash horsemen to our assistance at a most critical period, to whose timely arrival amongst us at Kaloo, it may be chiefly attributed that our flight from Bameean was not intercepted. To thank you adequately in words for so signal a service would be impossible, but we trust you will accept of this as a token of the gratitude we feel, and with every good wish for your happiness and prosperity, we subscribe ourselves yours very faithfully, Fanny Macnaghten, Florentia Sale, Alexandrina Sturt, Jean Boyd, F. Boyd, A. Waller, R. Waller, G. Mein, Emily Eyre, Vincent Eyre, C. Mackenzie, Eldred Pottinger, Edward Webb, B. Melville, Georgiana Mainwaring, H. Johnson, G. St. P. Lawrence, C. Harris, C. Griffiths, T. Palmer, J. S. Alston, T. Thomson, J. Macgrath, J. Nicholson, —Airy, —Souter, John Shelton, J. C. Hampton, —Evans, T. P. Walsh, R. Warburton, H. Drummond, R. L. Burnett, H. M. Williams, A. Crawford. Camp Cabool, Sept. 24." To this letter Sir R. Shakespear returned the following reply:—"To Lady Macnaghten, Lady Sale, &c., Gen. Shelton, and Major Pottinger. Dear Ladies and Gentlemen—I

was this morning greatly gratified by receiving a very kind and flattering letter, signed by the ladies and officers who were lately prisoners at Bameean, and I hasten to request that you will express to them my sincere thanks for the very handsome terms in which they have spoken of my poor services. I shall ever consider it one of the happiest events of my life, that I should have had the good fortune to have been in any way instrumental in effecting your escape from Afghanistan. I remain, dear Ladies and Gentlemen, your obedient servant, R. C. SHAKESPEAR. Camp, Jellalabad, Oct. 26, 1842."

The Three Sovereigns.—The following anecdote, according to the Paris Papers, has often been told by the Emperor Alexander, and is amongst the traditions of the Russian Court:—In 1814, during the period when the Allies were masters of Paris, the Czar, who resided in the hotel of M. de Talleyrand, was in the daily habit of taking a walk (in strict incognito) every morning in the gardens of the Tuileries, and thence to the Palais Royal. He one day met two other sovereigns, and the three were returning arm-in-arm to breakfast in the Rue St. Florentin, when, on their way thither, they encountered a provincial, evidently freshly imported to Paris, and who had lost his way. "Gentlemen," said he, "can you tell me which is the Tuileries?" "Yes," replied Alexander; "follow us, we are going that way, and will show you." Thanks on the part of the countryman led them soon into conversation. A few minutes sufficed to arrive at the palace; and, as here their routes lay in opposite directions, they bade each other reciprocally adieu. "Parbleu!" cried all at once the provincial, "I should be glad to know the names of persons so amiable and complaisant as you are?" "My name?" said the first—"Oh, certainly; you have, perhaps, heard of me; I am the Emperor Alexander!" "A capital joke," exclaimed the Gascon; "an Emperor!—and you," addressing the second individual, "who may you be?" "I?" replied he; "why, probably I am not wholly unknown to you, at least by name—I am the King of Prussia!" "Better and better," said the man; "and you, what are you, then?" looking at the third person. "I am the Emperor of Austria!" "Perfect, perfect!" exclaimed the provincial, laughing with all his might. "But you, monsieur," said the Emperor Alexander, "surely you will also let us know whom we have the honour to speak to?" "To be sure," replied the man, quitting them with an important strut, "I am the Great Mogul!"

The Human Voice Automaton.—The Paris *Constitutionnel* states that a mechanician of a little town in Bohemia has constructed an automaton which imitates perfectly the human voice, particularly the soprano notes. It sings several difficult airs with the greatest accuracy. Shakes, runs, and chromatic scales, are all executed with surprising precision. This automaton, in singing, even pronounces certain words, so as to be easily understood. The inventor hopes to arrive at such a point of perfection as to bring his machine to pronounce all the words of the best operas. He intends shortly making a journey to Prague and Vienna, to give concerts, and from thence to Paris and the other cities of Europe.

Statistics of Marriage in Paris.—The following account of the married women in Paris has just been published in the French papers, although the facts were collected from the registry books of the 18 years from 1813 to 1830 by our countryman Mr. Francis Corboux, and published in his work on Life Assurance. Of 121,625 marriages, there were 814 between 12 and 15 years old; at 16 years, 1,190; at 17 years, 3,959; at 18 years, 5,816; at 19 years, 6,957; at 20 years, 7,610; at 21 years, 8,047; at 22 or 23, between 7,000 and 8,000; at 24 or 25, upwards of 6,000; but at 26, 27, and 28, they scarcely exceed 5,000. This decreasing progression goes on, so that up to 31 years there were only 3,651; thence to 41 years, 1,798; at 42 years, 1,015; at 48 years, 586; at 56 years, 226; at 60 years, 126; and during the 18 years there were 578 marriages of women aged 61 years and upwards. Another account shows that out of 1,000,000 married in Paris, 521,365, being more than one half, were married before the commencement of their 26th year.

The Porcelain Tower of Nankin.—The following extract from a letter describing one of the greatest curiosities in China, is taken from the *Bombay Spectator*:—"Numerous, as you may conceive, have been the pilgrimages made to the far-famed 'Porcelain Tower.' For the first time in inspecting any of the monuments of this country, no disappointment has been experienced, while comparing what they actually are with what the legends of the book-makers in China describe them to be. It is, indeed, a most elegant and singular structure, as remarkable for its correct proportions as for the rare material of which it is partially composed. I say partially, because the mass of building is not of porcelain, but is composed of common brick, with a facing and lining of beautiful white glazed porcelain bricks or slabs, fixed into the masonry by means of deep keys or shoulders, cast like a half T, on the brick. Its form is octagonal, and running up each of the angles is a moulding of large lites of very fine clay, glazed and coloured red and green alternately; round each story runs a light balustrade formed of green porcelain, upon which four arched doorways open, set to the four cardinal points, the arches being elegantly turned with large glazed tiles, cast in all imaginable fancies of design and variegation of colour, representing wild beasts, demons, deities, monsters, &c. It appears to be a 'sight' among the Chinese themselves, for there are priests or bonzes attached to the building to keep it in order, who earn their consideration by distributing to the visitors lithographed elevations of the tower, with descriptions attached, and who seem to have the duty entrusted to them of illuminating it on gala occasions. This is effected by means of lanterns made

of thin oyster shells, used in lieu of window glass by the Chinese, which are placed at each of the eight angles on every story, and the effect of whose subdued light on the highly reflective surface of the tower must be most striking and beautiful. The walls of Nankin are more remarkable for their extraordinary height and great extent than for the strength which has been given to them by the builders; in some places they are not less than 70 feet in height, and at very few points along an *enceinte* of fully 20 miles in extent, are they less than 50. There are, however, several points at which they are open to escalade with 26 feet ladders; the Chinese engineers, though they have evidently bestowed extensive repairs upon the fortifications this year, having, as usual, forgotten to raise their ramparts where the undulations of the ground alter the levels of their foundations. From the peculiar features of the country adjoining the town, and from the situation of the Tartar city or citadel, which is separated from the great straggling mass of the town by open fields and gardens, it appears evident that the place could at any time be readily carried by a comparatively small force, and retained against a very large one of undisciplined troops, as long as they had the means of procuring supplies, which, in consequence of the goodness of the road and its inconsiderable length, could always be obtained from the river. The Chinese, I think, must have wisdom enough to know that our stay here, and our examinations of their city from the heights and from the summit of the Porcelain Tower, have taught us this secret; and it may therefore be considered as an additional reason to the many that exist, why they should not too soon again tempt the "devil's children," as they call us, to measure strength with their bravos. Three to four thousand seasoned troops, with a few guns, some powder bags, mining tools and scaling ladders, would have Nankin under their command in a week from Woo-sung, with four or five steamers, and a dozen junks or decked boats to be towed up by them against the stream; and from the important discovery of coal of decent quality in large quantities here, we may always reckon upon being able to keep steamers constantly employed in bringing in supplies from all points on the river, whither they can be drawn."

Law.

JUDICIAL COMMITTEE OF THE PRIVY COUNCIL.—*Keelley v. Carson*.—Their Lordships met this morning for the purpose of giving judgment in this case, which had been twice argued. Mr. Baron Parke gave judgment as follows:—The great importance of the principal question in this case induced those of their Lordships who heard the first argument to request that a second might take place before themselves and other members of the Judicial Committee. The case has been again argued before the Lord (hancellor, Lords Brougham, Deunam, Abinger, Cottenham, and Campbell, the Vice-Chancellor of England, the Lord Chief Justice of the Common Pleas, Mr. Justice Erskine, Dr. Lushington, and myself, and I have been instructed by their Lordships to state the reasons for the advice which they will give to Her Majesty to reverse the judgment of the Court below. That judgment was given in favour of the defendant, upon a demurrer to several special pleas to an action of trespass for false imprisonment, by which the acts complained of were justified by the defendant Carson as Speaker of the House of Assembly of Newfoundland, by other defendants as members of that house, and by one as messenger in aid of the Serjeant-at-Arms, upon an arrest and commitment for an alleged breach of privilege of the House. Several objections were taken of a formal nature to these pleas, which it is unnecessary to state, as the opinion of their Lordships is not founded upon any of those objections. The main question raised by the pleadings, and applying equally to the case of all the defendants was, whether the house of Assembly had the power to arrest and bring before them, with a view to punishment, a person charged by one of its members with having used insolent language to him out of the doors of the house, in reference to his conduct as a member of the Assembly—in other words, whether the house had the power, such as is possessed by both Houses of Parliament in England, to adjudicate upon a complaint of contempt or breach of privilege. It is, indeed, stated in the plea of the defendant Carson, and that of the other defendants, members of the House, that something occurred which might amount to a contempt committed in the face of the Assembly, by the use of violent and threatening words to one of the members then present in his place; but each plea also justifies the original arrest of the plaintiff below upon a warrant issued by the Speaker, founded on the complaint of a breach of privilege committed out of the House; and if the House of Assembly had not a power to issue that warrant, this part of such plea is bad; and as each plea is entire, the whole is bad. The question, therefore, whether the House of Assembly could commit, by way of punishment, for a contempt in the face of it, does not arise in this case. Their Lordships are of opinion that the House of Assembly did not possess the power of arrest, with a view to adjudication on a complaint of contempt committed out of its doors, and consequently that the judgment of the Court below must be reversed. In order to determine this question, and to ascertain what the legal powers of the Assembly were, it is proper to consider, first, under what circumstances it was constituted, and what was the legal origin of its powers. Newfoundland is a settled, not a conquered colony, and to such colony there is no doubt that the settlers from the mother country carried with them such portion of its common and statute law as was applicable to their new situation, and also the rights and immunities of British subjects. Their descendants have, on the one hand, the same laws and the same rights (unless they have been altered by Parliament; and, on the other hand, the Crown possesses the same prerogative and the same powers of government that it does over its other subjects; nor has it been disputed in the argument before us, and therefore we consider it as conceded, that the Sovereign had not merely the right of appointing such magistrates, and establishing such corporations and courts of justice, as he might do by the common law at home, but also that of creating a local legislative assembly, with authority, subordinate, indeed, to that of Parliament, but supreme within the limits of the colony, for the government of its inhabitants. This latter power was exercised by the Crown in favour of the inhabitants of Newfoundland in the year 1832, by a commission under the Great Seal, with accompanying instructions from the Secretary of State for the Colonial Department; and the whole question resolves itself into this—whether this power of adjudication upon, and committing for a contempt, was by virtue of the commission, and the instructions legally given to the new legislative assembly of Newfoundland, for under these alone can it have any existence, there being no usage or custom to support the exercise of any power whatever. In order to determine this question, we must first consider whether the Crown did in this case invest the local legislature with such a privilege. If it did, a further question would arise—whether it had power to do so by

law. If that power was incident as an essential attribute to a legislative assembly of a dependency of the British Crown, the concession on both sides that the Crown had a right to establish such an assembly, puts an end to the case; but if it is not a legal incident, then it was not conferred on the Colonial Assembly, unless the Crown had authority to give such a power, and actually did give it. Their Lordships gave no opinion upon the important question, whether, in a settled country, such as Newfoundland, the Crown could, by its prerogative, besides creating the Legislative Assembly, expressly bestow upon it an authority not incidental to it, of committing for a contempt—an authority materially interfering with the liberty of the subject, and much liable to abuse. They do not enter upon that question, because they are of opinion, upon the construction of the commission and of its accompanying document, that no such authority was meant to be communicated to the Legislative Assembly of Newfoundland; and if it did not pass as an incident by the creation of such a body, it was not granted at all. This appears to be clear from the consideration of the instruments. By the commission for the establishing the Legislative Assembly, dated the 26th of July, 1832, his late Majesty William IV. authorised the Governor, with the advice and consent of the Council of the Island, from time to time to summon and call general assemblies of the freeholders and householders within the island, in such manner and form and according to such powers, instructions, and authorities, as were granted or appointed by the general instructions accompanying the commission, or according to such further powers, instructions, or authorities, as should at any time thereafter be granted or appointed under his Majesty's sign manual and signet, or order in Council, and that the persons thereupon duly elected should take the oaths, and should be called and deemed the General Assembly of the Island of Newfoundland; and the Governor, with the advice and consent of the Council and Assembly, or the major part of them, respectively, should have full power to make, constitute, and ordain laws, statutes, and ordinances for the public peace, welfare, and good government of the island and its dependencies, and the people and inhabitants thereof, and such other as should resort thereto; which laws, &c., were to be as near as might be to the laws and statutes of the United Kingdom, and subject to the approbation of his Majesty, and to the negative voice of the Governor. Accompanying this commission was a despatch from Viscount Goderich (now Earl of Ripon) containing instructions to the Governor for the regulation of his conduct, upon which some reliance was placed in the argument at the bar, as affording evidence of the intention of the Crown to confer the power in question upon the House of Assembly. The Commission itself, where such an authority would naturally be expected to be found, if the Crown had intended to confer it, is entirely silent upon this subject, nor does it grant any of the privileges of the British Parliament; and the terms used by the Earl of Ripon's letter have probably reference to the mode of conducting business, and the forms of procedure, which are to be assimilated to those of the British House of Commons; at all events, terms so vague and general could never have been used with the intention of giving the powers of commitment, and other privileges of so important a nature, if the authority of the Crown was required to bestow them by a special grant. The whole question, then, is reduced to this—whether by law the power of committing for a contempt not in the presence of the Assembly is incident to every local legislature. The statute law on this subject being silent, the common law is to govern it, and what is the common law depends upon principle and precedent. Their Lordships see no reason to think that on the principle of the common law any other powers are given than such as are necessary to the existence of such a body, and the proper exercise of the functions which it is intended to execute. These powers are granted by the very act of its establishment—an act which, on both sides it is admitted, it was competent for the Crown to perform. This is the principle which governs all legal incidents—"Quando lex aliquid concedit, concedere videtur et idem singulis quoque ipsa esse non potest." In conformity to this principle, we feel no doubt that such an assembly has the right of protecting itself from all impediments to the due course of its proceedings. To the full extent of every measure which it may be really necessary to adopt to secure the free exercise of their legislative functions, they are justified in acting by the principle of the common law. But the power of punishing any one for past misconduct as a contempt of its authority, and adjudicating upon the fact of such contempt, and the measure of punishment, as a judicial body irresponsible to the party accused, whatever the real facts may be, are of a very different character, and by no means essentially necessary for the exercise of its functions by a local legislature, whether representative or not; all these functions may be well performed without this extraordinary power, and with the aid of the ordinary tribunals to investigate and punish contemptuous insults and interruptions. These powers certainly do not exist in corporate or other bodies assembled with authority to make by-laws for the government of particular trades or limited numbers of individuals. The functions of a colonial legislature are of a higher character, and it is engaged in more important objects; but still there is no reason why it should possess the power in question. It is said, however, that this power belongs to the House of Commons in England; and this, it is contended, affords an authority for holding that it belongs as a legal incident by the common law to an assembly with analogous functions. But the reason why the House of Commons has this power, is not because it is a representative body with legislative functions, but by virtue of ancient usage and prescription, the *Lex et Consuetudo Parliamenti*, which forms a part of the common law of the land, and according to which the High Court of Parliament, before its division, and the Houses of Lords and Commons since, are invested with many peculiar privileges—that of punishing for a contempt being one. And besides, this argument from analogy would prove too much, since it would be equally available in favour of the assumption by the council of the island of the power of commitment exercised by the House of Lords, as well as in support of the right of impeachment by the Assembly—a claim for which there is not any colour of foundation. Nor can this power be said to be incident to the Legislative Assembly by analogy to the English Courts of Record, which possess it. This Assembly is no Court of Record, nor has it any judicial functions whatever; and it is to be remarked, that all those bodies which possess the power of adjudication upon, and punishing in a summary manner, contempts of their authority, have judicial functions, and exercise this as incident to those which they possess, except only the House of Commons, whose authority in this respect rests upon ancient usage. Their lordships, therefore, are of opinion, that the principle of the common law, that things necessary pass as incident, does not give the power contended for by the respondents as an incident to, and included in, the grant of a subordinate legislature. It was, however, argued that in other colonies the Legislative Assemblies exercise the power of committing for breach of privilege without objection, and that the usage in this respect was good evidence that such power was an incident attached by the common law, though not on the ground of necessity; and no doubt this argument would have had much weight if there had been many Legislatures situate precisely as this is, and the usage to exercise the power of commitment for breach of privilege had been frequent, and the acquiescence in its exercise long and universal, and that usage could have been explained only on the ground that the power was a legal incident. But no such usage has been proved, and the constitution and practice of different colonies, and the prerogative of the Crown with reference to other cases, differ so much that there is very little analogy between them, and no inference can safely be deduced from the law as understood in one to guide us with respect to another. In some the very exercise of the power, with the sanction of the tribunals, and the acquiescence of the public for a long period of time, may raise a presumption that the power has been duly communicated by law. But in

this case we have the simple question to decide, without any usage, any acquiescence, or any sanction of the courts of law, except in the very case in which we are now called upon to affirm or reverse the judgment of the court below. It remains to be considered how the question stands on express authority, and unless there be some satisfactory authority expressly in favour of the power, we must hold that the common law does not confer it. There is no decision of a court of justice nor other authority in favour of the right, except that of the case of "*Palmer v. Barrett*," decided by the Judicial Committee, the members present being Lord Brougham, Mr. Justice Bosanquet, Mr. Justice Erskine, and myself. Their Lordships do not consider that case as one by which they ought to be bound in deciding the present question; the opinion of their lordships, delivered by myself immediately after the argument was closed, though clearly expressed, that the power was incidental to every Legislative Assembly, was not the only ground on which the judgment was rested; and therefore was in some degree extra-judicial; but, besides, it was stated to be, and was founded entirely on, the *dictum* of Lord Ellenborough in "*Burdett v. Abbott*," which *dictum* we all think cannot be taken as an authority for the abstract proposition that every legislative body has the power of committing for contempt. The observation was made by his Lordship with reference to the peculiar powers of Parliament, and ought not, we all think, to be extended any further. We all, therefore, think, that the opinion expressed by myself, in the case of "*Palmer v. Barrett*" ought not to affect our decision in the present case; and there being no other authority on the subject, we decide according to the principle of the common law, that the House of Assembly have not the power contended for. They are a local Legislature, with every power reasonably necessary for the proper exercise of their functions and duties; but they have not what they have erroneously supposed themselves to possess, the same exclusive privileges which the ancient law of England has annexed to the Houses of Parliament. The judgment, therefore, will be reversed, and there must be a writ of inquiry of damages, unless the parties can agree amongst themselves. They ought to consider it as a mere question of right to be tried, and therefore not a case for damages.

SPORTING.

TATTERSALL'S, THURSDAY.—The betting was just enough to permit a quotation against most of the leading Derby favourites, the first excepted, but was too flat to claim any other notice. The **DERBY**.—19 to 1 agst. Lord Eglington's Aristides (taken to a pony); 20 to 1 agst. Colonel Peel's Murat (taken to 50*l.*); 35 to 1 agst. Mr. Bell's Winesour (taken to 10*l.*); 40 to 1 agst. Col. Anson's Napier (taken to a pony and aft. off*d.*); 40 to 1 agst. Sir G. Heathcote's Siricol (taken 45 to 1); 45 to 1 agst. Sir G. Heathcote's Amorino (taken to 40*l.*); 45 to 1 agst. Mr. Griffiths's Newcourt (taken to 40*l.*); 50 to 1 agst. Mr. Bowes's Cotherstone (taken to 35*l.*); 50 to 1 agst. Mr. H. Coombe's Fakeaway (taken to 50*l.*); 50 to 1 agst. Lord Chesterfield's Progress colt; 1000 to 15 agst. Lord Exeter's Lucetta colt (taken and afterwards offered); 1000 to 15 agst. Lord Westminster's Languish c (taken); 2000 to 25 agst. Col. Peel's St. Valentine (taken); 1500 to 15 agst. Mr. D. Cook's Trueboy (taken and aft. off*d.*); 2000 to 20 agst. Mr. Wreford's Monimia c. (taken and aft. off*d.*); 500 even Amorino agst. Siricol; 300 to 20 agst. Sir G. Heathcote's lot (taken); 425 to 25 agst. Col. Peel's lot (taken.)

MARK LANE, FRIDAY, JAN. 13.—The Wheat Trade is exceedingly flat, the Millers not having confidence to follow up the advance established on Monday, and prefer waiting the result of next week's supply.—Foreign is held at Monday's prices, and the sales have been to a limited extent.—There was no inquiry for bonded. The supply of Barley is small, and fine quality is in demand at full prices. Peas and Beans are a dull sale at our quotations, and there is no life in the Oat Trade.

Bleeding, its derivation	21 c	Old-leaves for pits, to prepare	25 b
Bolophyllum adenopetalum	23 a	Ombrological Almanack, rev.	24 b
Books for gardeners	25 b	Onion maggots, to destroy	25 b
Bone as a manure	25 b	Onions, to apply liquid manure to	25 a
Cape P. lymas, its vegetation	23 c	Pear, remarks on	24 c
Carnations, select	25 b	Pear, Vicar of Winkfield, described	25 a
Celery, its culture in beds	20 c	Pelargoniums, good forcing kinds	25 b
Civil History, remarks on	25 a	Picotees, select	25 b
Coburgiana versicolor	25 b	Plantations, young, treatment of	25 a
Contraception in the Creation	25 b	Plants in the open ground, to protect	23 c
Cookery, problem in	25 b	— to preserve in winter	23 a
Corn, advantage of buying instead of flour	22 c	Polytechnic Review, rev.	24 b
Cowslip, early bloom of	22 a	Potato-tubers, to convert into manure	25 b
Cucumber, good properties of	19 a	Pumps for hothouses, economical	25 b
Cucumber pit, remarks on	25 b	Queenouille trailing explained	25 b
Drainage act, remarks on	19 a	Rape as a green manure	20 b
Exhibitions of single plants	25 a	Roots, effect of light on	20 c
Fruit-trees, select	25 b	Rye as a green manure	20 c
Gardeners, effects of dissipation on	19 b	Sage as a manure	25 a
— societies, remarks	19 b	Scotch as a manure	25 a
Guano, experiments with	23 c	Spirit of tar, to prevent the attacks of mice and pheasants	22 b
Heating by hot-water, at Mr. Beck's	19 c	Starch, its conversion into gum and sugar	25 b
Herat, valley of, its productions	23 b	Transactions of the Prussian Hort. Soc. at Berlin, rev.	24 a
Insects, effect of powerful smells on	22 b	Tropæolum azureum	25 a
Leeks, to boil	23 c	Turnip-tops as a green manure	20 c
Lichens, fragrant	23 c	Vegetable refuse as a manure	25 a
Malaria of cesspools, to destroy	25 a	Wood-ashes, a good manure	25 a
Manures, experiments with	25 b		
— to prepare	25 a		

ROYAL BOTANIC SOCIETY OF LONDON. GARDENS, INNER CIRCLE, REGENT'S PARK.—The Exhibitions for the year 1843 will take place in these Gardens on the following days, viz.:

Wednesday, May 24;
Wednesday, June 28; and
Wednesday, July 19.—From 2 till 7 o'clock.

By Order of the Council,
JAMES DE CARLE SOWERBY, Secretary.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON, and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842.—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—From the *Gardeners' Chronicle and Gazette*.

Also obtained the following prizes:—No. of Blooms Exhibited.
1st prize at Hull, Aug. 30th 12
1st prize at Beverly, Sept. 7th 2
Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th 4
1st prize at Leeds, Sept. 21st 12
1st prize at Newcastle, Sept. 21st 6
1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th 6
1st prize at the York Floral and Horticultural Society, Sept. 29th 18
1st prize at the York Floricultural Society, Oct. 1st 12
1st prize in its class as the best white or blush, ditto.
Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10s. 6d.

All orders addressed J. EDWARDS, Florist, Layorthorpe, Nursery or Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec. 1, 1842.

FUCHSIA BROCKMANIA.—This splendid FUCHSIA was raised by P. PADDEN, Gardener to the Rev. William Brockman, of Beachborough, Kent. It has been justly admired by all who have seen it, and repeatedly noticed by the Editor of the *Gardeners' Gazette* as a superb variety, "distinguished by firmness of texture, large size, and diversity of colour between the sepals and petals." (See "P. P., Notices to Correspondents," August 13, 1842). It bears remarkably fine foliage, is of vigorous habit, and a most profuse bloomer; therefore confidently recommended as desirable in any collection, and indispensable to the exhibitor. Strong Plants will be sent out early in spring (carriage-free to any part of the kingdom) upon the receipt of a post-office order for 7s. 6d. As the Plants (so far as the limited stock will allow) will be sent according to priority of order, early notice is requested. To Nurserymen ordering Six Plants, the usual allowance.—Direct to Mr. PADDEN, Gardener, Beachborough, Hythe, Kent.—Dec. 1, 1842.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTÉES, AND LILIUM LANCIFOLIUM.

H. GROOM, CLAPHAM-RISE, NEAR LONDON, (removed from Walworth), By APPOINTMENT, FLORIST TO HER MAJESTY, respectfully informs the Nobility, Gentry, and Public, that this is the best season for planting the above Flowers, and that he can supply them of first-rate quality at the following prices:—

RANUNCULUSES, 100 roots in 100 superfine sorts £4 4 0
Superfine mixtures from 5s. to 21s. per 100.
ANEMONES, 100 roots in 100 superfine sorts 3 0 0
Superfine mixtures from 7s. 6d. to 21s. per 100.
AURICULAS, 25 superfine sorts, 1 plant of each 3 13 6
CARNATIONS, 25 superfine sorts, 1 pair of each 3 10 0
PICOTÉES, 25 superfine sorts, 1 pair of each 2 10 0
YELLOW PICOTÉES, 12 superfine sorts, 1 pair of each 2 2 0
LILIUM LANCIFOLIUM ALBUM, from 5s. to 42s. each.
" **PUNCTATUM**, from 10s. 6d. to 42s. each.
" **SPECIOSUM**, small bulbs, at 63s. each.
H. G. also begs to say that he has a few Trees of his **PRINCESS-ROYAL PEAR** for sale, at 5s. each.—The Trade supplied.

FUCHSIA ST. CLARE.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this Paper of the 24th Dec., together with their two new Verbenas.
Great Yarmouth Nursery, Jan. 19, 1843.

TO DAHLIA GROWERS.—For Sale at **L. JACOB MALROY'S**, Horticulturist, Liège, Belgium, the beautiful Dahlia **INDISPENSABLE**, (semis 1841, de rassart) from 4 to 5 feet high, abundant bloomer, of an admirable form, leaving nothing to be desired; the colour as white as snow. As to dimensions, those of its smallest flower far surpass the largest of the Virgin Queen. This truly remarkable Dahlia, which may justly be called the King of the Whites, has obtained the medals of honour at the last exhibitions of Lille and Rouen, and is considered far superior to Lady Prudhoe, Blanche, Bianca, and other new whites of high reputation; in short, all the amateurs who have seen it, unanimously agree that it is impossible to procure a more perfect white. The conditions of the sale are as follows:—64. or 150/s. per good root, if there are 20 ordered before the end of the present month, January; if not, the sale of them will be postponed until autumn.

DOUBLE ITALIAN TUBEROSE ROOTS, 4s. per dozen.—The Annual Importation of these delightful and fragrant BULBS has just been received at **ARTHUR CORBETT'S**, late Mr. C. BARRON'S, Italian Warehouse, 18, Pall Mall. Where also may be seen a Choice Collection of Orange, Lemon, Citron, Lime, and Cypress Trees, Catalonian and Arabian Jasmines, &c., just arrived from Italy.—N.B. Importer of choice Honeycomb, Parmesan and Gruyere Cheese, New Salad Oil, and other Foreign Produce, &c. Lists, with Prices, may be had.

IMPERIAL NURSERY, CHELTENHAM.

SAMUEL HODGES begs respectfully to inform the admirers of the Pelargonium, that he has a few more strong plants left of his unique Seedling, Oberon, at 42s. each. Those that have not seen Oberon, will find the following a faithful description. It has the habit and size of bloom of Foster's Alicia; in the upper petal is a large dark spot, with a clear and distinct white margin about the eighth of an inch wide; the lower petal is as brilliant a white as the upper margin, and forms a beautiful cup without crumple or serrature.

PATRONS BY HIS GRACE THE DUKE OF RUTLAND, THE LORD BISHOP OF LONDON, THE EARL OF HARRINGTON, AND MANY OF THE NOBILITY.

THE FASTOLFF RASPBERRY.—For many years past there has been cultivated in the neighbourhood of Yarmouth, adjacent to the ancient Castle of Sir John Fastolff, a red Raspberry of a most extraordinary size and rich flavour. The Nobility who visit the sea-coast here have invariably expressed their astonishment at the exceeding fineness of the fruit of this variety, and until lately **YOUELL & CO.** have not been enabled to obtain a sufficient stock of it to bring it into public notice; but having now obtained a supply (although limited) of fine Canes, beg to offer them on the following terms, and they can be sent with safety to any part of the United Kingdom, on the receipt of a Post-office order.

Packages containing 50 Canes, 25s.—Packages containing 25 Canes, 14s.—Package included.

The few to whom **YOUELL & CO.** have sent it, have expressed their high admiration of its superiority over other varieties; and a letter just received from a Gentleman in Derbyshire, to whom this variety was sent, states that it invariably takes prizes at the Hort. Shows in his neighbourhood. In conclusion, **YOUELL & CO.** beg to state that they have not, or do they intend to recommend any article but that which they can do with confidence; and in this instance they feel fully assured of its giving the most entire satisfaction.—Great Yarmouth Nursery, Norfolk, Jan. 19, 1843.

EARLY PEAS, &c.—HENRY D. CORMACK, SEEDSMAN, begs respectfully to inform the Nobility, Gentry, and others, of Manchester and its Vicinity that they can be supplied with the following new and early articles:—Cormack's Prince Albert and early Kent Peas, British Queen ditto; Taylor's New Improved Windsor, and Johnson's Wonderful Beans; Manchester and Giant red and pink Celery; Hamilton's White Spine and Walker's Prize-fighter Cucumbers; Incomparable Cos Lettuce, together with every other variety of Horticultural, Agricultural, and Floricultural Seeds, at his Wholesale and Retail Warehouse, 106, Deangate, Manchester. Agent for Sir James Murray's Patent Fertilising and Guano Manures.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, & OTHERS. Two newly-erected Greenhouses, several Two-light Boxes and Cap glasses, Rockwork, sundry Utensils, &c.

MESSES. PROTHEROE & MORRIS are instructed to submit to public competition, by Auction, on the Premises, Cotham-road, near Bristol, on Wednesday, Jan. 25th, 1843, and following day, at 11 o'clock, by order of the Trustees of Mr. John Miller, under a deed of assignment, the whole of the valuable Nursery Stock, consisting of Fruit and Forest-trees, Evergreens and Shrubs, Hothouse, Greenhouse, and Herbaceous Plants, a choice Collection of Carnations, Picotees, Auriculas, &c. May be viewed prior to sale. Catalogues may be had of Mr. Price, Solicitor, No. 1, Stephen-street, Bristol; Mr. T. P. Wilcox, Builder, Bristol; or of the principal Seedsmen in London; on the Premises; and of the Auctioneers, American Nursery, Leytonstone.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 161. per cent. on the premiums then paid; and in 1839 a second Bonus was awarded, amounting on the average to 311. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Losses are granted to go to any part of the world, on terms proportionate to the risks.

Losses on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.
By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

COUNTY FIRE-OFFICE, AND PROVIDENT LIFE OFFICE, 50, REGENT-STREET, PICCADILLY. Established 1807.

His Grace the Duke of Rutland, K.G.
The Marquess of Northampton
The Rt. Hon. Lord Northwick
The Earl of Macclesfield
Sir Wm. Earle Welby, Bart.
Sir John Osborn, Bart.
Sir R. Duckworth King, Bart.
Sir Henry Pynn
Sir Frederick A. Roe, Bart.
Alex. Henderson, Esq., M.D.
John Edward Conant, Esq.
Andrew Macleay, Esq.
Frederick Squire, Esq.
George Pryme, Esq.
Glynne Earle Welby, Esq., M.P.
&c. &c. &c.

The advantages offered to the public by the above Offices are such as result from a course of uninterrupted prosperity, the fruits of a prudent and economical management for a period of thirty-five years.

At the present time so many establishments exist, vying with each other in the profession of benefits to the public, which numerous failures and consequent ruin to thousands of industrious families have proved to be fallacious, that the Directors think they will best discharge their duty to the Proprietors and to the Public by a simple statement of the advantages which have been realised by these Offices.

The **COUNTY FIRE OFFICE** has not only settled all claims with promptitude and liberality, but has, from its first establishment, made large returns to the Insured. These amount at the present time to 125,000l.

The **PROVIDENT LIFE OFFICE** has at each septennial period divided the whole of the profits, subject to a deduction of about a twentieth part only, among the Insured. The benefits actually secured to lives insured in this Office may be judged of by the following Table:—

No. of Policy	Age	Bonus in 1813 & 1820	Bonus in 1827 & 1834	Bonus in 1841.	Total of Bonuses.	Sum Insured
		£. s. d.	£. s. d.	£. s. d.	£. s. d.	£.
109	37	221 11 2	387 11 10	304 0 4	1213 3 4	2500
430	38	90 3 11	159 3 0	148 6 4	497 13 3	1000
435	38	257 2 1	506 19 6	144 19 6	1509 1 1	3000
492	46	106 15 9	197 16 2	99 15 11	604 7 10	1000
515	31	72 13 1	134 13 7	94 1 1	411 7 9	1000

JOHN A. BRAUNTON, Managing Director.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—**STEPHENSON & Co.**, Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 51. 5s. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chantler's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket pipes.

N.B.—WATTS'S New Patent Land-presses and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by **DANIEL and EDWARD BAILEY**, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., upon the above system, which has (at an immense cost to the inventor), been brought to great perfection, and heats the same by HOT-WATER APPARATUS, with improved Tube or Conical Boilers. W. HILL also adapts **DR. ARNOTT'S NEW BALANCED REGULATOR** to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. **PENN'S SYSTEM** only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, is a perfect and rapid Circulation, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer-heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. HILL would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. HILL, Builder and Surveyor, Lewisham.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at The Gardens of the Horticultural Society of London.

HOUSES, CONSERVATORIES, &c., Made and Fixed Complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 11. 8s. Garden-Lights Made and Glazed, 1s. per foot, at JAS. WATT'S, Sash Manufactory, Claremont-place, Old Kent-road. Reference given.

THE GENUINE GUANO ON SALE AT LIVERPOOL.—Any quantity of this celebrated and valuable NATURAL MANURE can be obtained from the Queen's Bonded Stores, either in Liverpool or in London. Apply to Messrs. WILKINSON JOSEPH MYERS and Co., Importers, Liverpool; Messrs. COTTESWORTH, POWELL, and PRYOR, Great St. Helen's, London; or Messrs. EDWARDS, DANSON, and Co., Brokers, Liverpool.

MANURES.—MARK FOTHERGILL, 40, Upper Thames-street, begs to offer the following Fertilizers to the Dealer, Experimental Farmer, and the Horticulturist:—viz. Guano, Nitrates, Soda and Potash, Daniel's Bristol Manure, Alexander's Compost, Clarke's dessicated do., Sulphate of Ammonia, Silicate of Potash, Sulphate of Soda, Also Petre Salt, Rock, and Agricultural Salt.

M. F. being appointed Sole Agent in London for Potter's English Guano, begs particularly to call attention to it, as being equal in value, in its component parts, with the Foreign Guano; and having this further recommendation, that it is also strictly uniform in its composition.

Full particulars of quantity to be used and mode of application of the above Manures; also Mr. C. Johnston's Pamphlets on Nitrates of Soda, and Potash, and Gypsum—and Mr. TRIMMER'S ON GUANO—to be had at 40, Upper Thames-street. The last named to be had also (by appointment) of Mr. PATTITT, Bookseller, No 1, Old Compton-street, Soho.

GUANO ON SALE BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

HORTICULTURAL SOCIETY OF LONDON. This Day is published, Price 3s. 6d. to Fellows of the Society, and 5s. to Others,

A CATALOGUE OF THE FRUITS Cultivated in the Garden of the Horticultural Society of London. Third Edition. Sold at the House of the Society, 21, Regent-street; and also by Longman and Co., Paternoster-row; J. Hatchard, Piccadilly; Ridgway, Piccadilly; Rivingtons, Water-loo-place; and by the principal Booksellers in all parts of the Empire.—N.B. A few Copies of the 2nd Edition may be had at the reduced Price of 1s. 6d. each.

ARCHITECTURE.—LECTURES at the ROYAL ACADEMY.—The attention which is now so generally directed to this subject, and the interest awakened by the brief and casual notices which appeared last year in *The Athenæum*, of the Lectures of Prof. C. R. COCKERELL, at the Royal Academy, have induced the Proprietors to make such arrangements as will insure a full and accurate Report of each of the Six Lectures about to be delivered. The first appeared in *The Athenæum* of Saturday, January the 14th.

Also, this day, with Title-page and Index, bound in cloth, price 11. the VOLUME for 1842 of

THE ATHENÆUM (1,152 large 4to. pages). It contains a complete History of the Literature of the period, and of the proceedings of the Learned and Scientific Societies; and is an invaluable present to friends residing in the Colonies, or in foreign countries.

Publishing Weekly, Price Three-pence, and in Monthly Parts, with numerous illustrations.

PUNCH; or THE LONDON CHARIVARI. "The career of this little Publication, from its outset till now, has been one of unflinching success; week after week it has sustained itself with astonishing constancy, and shown that its authors are inexhaustible in their resources. Ministers of Momus, they reign over the kingdoms of satire and burlesque with unlimited sway. There is one thing, in addition to the cleverness of 'Punch,' which has not a little contributed to its success, and that is, the unvarying good humour and propriety which prevail in it, and the total exclusion from its pages of all that is gross, low, or coarsely personal—a discipline, the absence of which has swamped many previous attempts of the same kind."—*Times*.

* * * Also, a STAMPED EDITION, Price 4d., to go Free by Post. OFFICE, 12, WELLINGTON-STREET, STRAND.

Rev. LEONARD JENYNS, M.A., F.L.S. &c.

THE NATURAL HISTORY OF SELBORNE. By the Rev. GILBERT WHITE. A new edition, in foolscap 8vo., price 7s. 6d., with 25 Illustrations: and Notes by the Rev. LEONARD JENYNS, M.A., F.L.S., &c., Author of "A Manual of British Vertebrate Animals." "Everybody knows that the History of Selborne has gone through many editions; no one, however, has, to our mind, so fully entered into the feelings of the author as Mr. Jenyns. His notes are judicious and apposite, neither too many nor too few."—*Gardeners' Chronicle*, Dec. 24th, 1842.—JOHN VAN VOORST, 1, Paternoster-row.

SCHOOL BOOKS by WILLIAM BUTLER.—1. CHRONOLOGICAL, BIOGRAPHICAL, HISTORICAL, and MISCELLANEOUS EXERCISES, on a New Plan, designed for daily use. 11th Edition; Enlarged by THOMAS BOURN. 12mo. 7s. 6d. bd.

2. ARITHMETICAL QUESTIONS, on a New Plan. 12th Edition, with Additions by GEORGE FROST. 12mo. 6s. bd.

3. EXERCISES on the GLOBES and MAPS, interspersed with some Historical, Biographical, Chronological, Mythological, and Miscellaneous Information, on a New Plan. To which are added QUESTIONS FOR EXAMINATION. With an Appendix, in which the Constellations may be easily known. By THOMAS BOURN. 11th Edition. 12mo. 6s. bd.

4. A KEY to the EXERCISES on the GLOBES. 2s. 6d.

5. MISCELLANEOUS QUESTIONS IN ENGLISH HISTORY and BIOGRAPHY. 4th Edition. Enlarged by THOMAS BOURN. 12mo. 1s. 6d.

6. GEOGRAPHICAL EXERCISES on the NEW TESTAMENT, with Maps. 5th Edition, Enlarged by THOMAS BOURN. 12mo. 5s. 6d. bd.

7. ARITHMETICAL TABLES. 19th Edition, with Additions, by THOMAS BOURN. Price 8d. sewed.

Sold by J. HARRIS; DARTON and HARVEY; and SIMPKIN, MARSHALL, and Co.

HARRISON'S FLORICULTURAL CABINET, is published on the 1st of every Month. Each Number contains coloured figures of the newest and best Flowers, and 24 pages of letter-press, on the management of flowers, descriptions of new ones, with wood engravings, &c., price 6d. The January Number contains a coloured plate of the handsome new BLUE NASTURTIUM. Published by Messrs. WHITTAKER and Co., Ave Maria-lane, London, and may be had of any Bookseller.

S. GIRLING'S CATALOGUE OF ENGLISH AND FOREIGN DAHLIAS can now be had on prepaid application; it contains as well, a List of Fuchsias, Pelargoniums, Pansies, and Verbenas, any of which S. G. will be happy to receive orders for; and pledges himself to supply early plants correct to name, and on liberal terms where a quantity is wanted; the trade liberally supplied.

Deane Croft Nursery, Stowmarket, Suffolk.

In commencing the SECOND VOLUME, the Conductors announce that they have INCREASED the Size, without additional charge, to SIXTEEN FOLIO PAGES.

Published every FRIDAY, Price FIVEPENCE, **THE CHURCH AND STATE GAZETTE.**—Newspaper Stamp Returns for April, May, and June. (Ordered by the House of Commons, August 12).

CHURCH AND STATE GAZETTE 70,000.

Church Intelligencer	18,000	Nonconformist	85,250
Conservative Journal	11,000	Patriot (twice a week)	70,000
Ecclesiastical Gazette	86,750	Record (twice a week)	101,000
John Bull	45,000	Watchman	51,500

In professing a desire to maintain the union of Church and State, we exclude all principles and views hostile to the Established Institutions of the Empire. We have no sympathy either with the Adversaries of the Reformation, or with the Champions of the Reformation in opposition to Primitive Truth. We war against all doctrines, the tendencies whereof are on the one hand to Popery, and on the other hand to Dissent and Sectarianism. We support the State as the Nursing Parent of the Church—and the Church as the Guide and Counsellor of the State. We believe that the Empire has prospered, under Divine Providence, in proportion as Church and State have understood and fulfilled these their respective functions—in proportion as they have appreciated the design of their union—in proportion as each has strengthened each—and especially in proportion as the State has become religious. Believing, moreover, that the vast majority of the reflecting, the educated, and the pious people of this country, concur in these views, of which we do not perceive in the Public Press any adequate Representative, we have entered the field and established our Newspaper.

We challenge no opposition and profess no rivalry, but simply desire to supply a defect through which false views have obtained an unsuspected and unwarrantable currency. Had we doubted of the expediency of the course we have adopted, the violence of Party spirit, at the present moment, and the lamentable misapprehensions to which that violence has given rise on most solemn and important topics, left us no alternative, and justified our decision.

Truth, like air, is useful only in circulation. To circulate truth has been and is our one object—to be useful will be our reward. Cautiously, therefore, we avoid each extreme of Party, and fearlessly address ourselves to the correction of every error. We expect as much the disfavour of all violent partisans, as the countenance of moderate men and sound thinkers.

We rely for support not only upon the Nobility and Gentry, who, from high birth and station, may be considered hereditary patrons of Church and State principles, but also upon the thoughtful Middle Classes, who, in the gradual formation of right convictions, require both a guide and an interpreter. It is scarcely necessary to say, that in politics we are CONSERVATIVE; as willing to improve as we are unwilling to impair—reverencing the hoarded wisdom and rich experience of the past, as the best guides in principle for the conduct of the details both of the present and the future.

It becomes us not to speak of the talent and abilities with which our Publication is supported. The public, indeed, have a right to require at our hands, industry, thoughtfulness, and candour—a holy and reverent love for all things sacred and venerable—an unswerving maintenance of all things true—an impartial judgment upon all things doubtful. Without these, talent is mischievous, and our object would be unattainable.

The GAZETTE contains Original Articles on Matters affecting the Church, and on the Leading Topics of the Day—on Dissenting Tactics—Foreign and Home Correspondence—a Weekly Resumé of Foreign News—Original Reviews of Books of Interest—Ecclesiastical and University Intelligence, and all the news interesting to the Clergy and Laity of the Church—the Proceedings of Charitable and Religious Societies—Naval and Military Intelligence—Court and Fashion—Finances, Markets, and Funds—and a Miscellaneous Department replete with the most interesting facts of each week.

SCALE FOR ADVERTISEMENTS. Advertisers are respectfully informed that a further reduction has been made in the Scale of Prices for Advertisements, viz.:—

Seven lines and under	£0 5 0	Half a Column	£1 7 0
Per line after	0 0 6	Column	2 10 0
Quarter of a Column	0 15 0	Page	6 10 0

(A line to average ten words.)

Advertisements received until 12 o'clock on Friday morning, at the Publishing Office, 342, Strand. Annual Subscription, 22s. (if paid in advance, 20s.), may be transmitted by Post-office Orders, payable to Mr. WILLIAM EDWARD PAINTER, 342, Strand; where all communications for the Editor, and Advertisements, will be received.

DOMESTIC COMFORTS.—READ'S PATENT INSTRUMENTS for removing poisons from the stomach, alleviating costiveness, and other complaints of the stomach and bowels, were first patronised by Sir Astley Cooper, Sir H. Alford, Mr. Abernethy, and the most eminent members of the profession, and sanctioned by the Royal College of Surgeons. This distinguished patronage induced some unprincipled adventurers to palm upon the public spurious imitations as improvements on, and superior to, READ'S patent instruments. J. R. has, to oblige his friends and agents, repaired all kinds of instruments sent to him for that purpose, and has discovered more than 20 of different makers, many of which have been sold as READ'S patent, although the public have been repeatedly cautioned against purchasing machines that have not the Royal Arms and the patentee's name. That the public may no longer be imposed upon, J. R. will forward a single instrument to any part of the kingdom on receipt of a Post-office order. Price of the enema syringe, 11. 13s.; improved enema fountain, 21. 2s.; ditto with reservoirs, 21. 5s. May be seen and proved at 35, Regent-circus, Piccadilly.

IMPORTANT TO ALL. "I CAN say of the WATERPROOF COAT I purchased of you, that I never had anything so pleasant in wear, or so efficient as a 'Waterproof,' and therefore, in every respect superior to a 'Mackintosh.' It is a very pleasant garment, too, for moderate warmth when the weather is dry. As a medical man, and having much daily riding, I have fully proved what is above stated, and you are welcome to use this 'as the testimony of one much and constantly exposed to the weather, as it may be useful to yourself and others, &c.—' THOMAS WARNER, Surgeon, Cirencester, Jan. 4, 1843." The Garment referred to is BERDOE'S well known VENTILATING WATERPROOF FROCK, and the above testimony is entirely unsolicited, nor has W. B. ever seen the party who gives it. Made only by WALTER BERDOE, Tailor, Waterproof, &c., 69, Cornhill (eight doors from Bishopsgate-street.)

WANTS a SITUATION as GARDENER and FLORIST, a respectable Single Young Man, about 30 years of age, who has a good knowledge of British Plants, Ferns, &c., with an unobjectionable reference. Wages 30l. per annum. Direct, pre-paid, to WILLIAM TURNER, at Mr. Knight's, King's-road, Chelsea.

WANTED, a FOREMAN, who has a thorough knowledge of Early Forcing and Framing, both of Flowers and Fruits.—Apply, by letter or otherwise, to the GARDENER, St. Margaret's, Isleworth, Middlesex.

WANTS a SITUATION as CLERK, or CLERK and SHOPMAN, in the Nursery and Seed Business, a steady Married Man, Aged 40 years; writes an excellent hand, and has always been accustomed to the Trade. Character unexceptionable. Direct W.S., care of Messrs. Beck, Henderson, and Co., Seedsmen, 67, Strand, London.

WANTS a SITUATION as GARDENER, an active respectable Young Man, aged 31, who has a practical knowledge of his business in all its branches; would not object to take charge of Grass or Meadow Land, and to make himself otherwise useful. Can have a character from his last situation, which he has just left, that will give general satisfaction. Direct to A. Z., 11, Barne-street, Stoke Newington.

SEED TRADE.—WANTS a SITUATION, a young Man of good education and experience in the Seed Trade, as Assistant in a Shop or Counting-house. Satisfactory references will be given. Address "P.P.," at the Office of this Paper.

A YOUNG MARRIED MAN, about 30, is desirous of engaging himself with any Nobleman or Gentleman, as GARDENER. His last situation was in one of the first families in Warwickshire, and he previously lived in some of the principal establishments of the country. Having also a considerable knowledge of the principal systems of Agriculture, a situation where the management of a small Farm came under his charge would be preferred, and an unexceptionable recommendation, as to abilities, &c. will be obtained. Direct, G. J. P., Post-office, Banbury, Oxon.

MESSRS. MARNOCK AND MANLEY beg to inform their Friends and the Public, that they have published their Catalogue of Flower Seeds, &c., for 1843, which will be forwarded free by Post, on application. Their Importation of German and Prussian Seeds have arrived in fine condition, to which they beg to call their attention. Nursery, Hackney, Jan. 12, 1843.

THE Occupier of a Large Farm in Essex, has an opportunity of RECEIVING into his family, a GENTLEMAN'S SON, to learn Farming, where he will be treated in every respect as one of the family. Address to HENRY FLOWER, Esq., 14, North-buildings, Finsbury-circus.

GARDENERS' ENTERTAINMENT. J. WEEK'S, Jun., Annual Improved Plan of [H]EAT-ING, will take place at his Horticultural Manufactory, Gloucester-place, King's-road, Chelsea, on Thursday the 2nd of February. Such professional Gardeners who are his friends and supporters, and who will honour him with their company, are requested to favour him with a line, by Post, without delay.

PATRONIZED by all the principal Architects and Builders in this Country and Abroad.—SEYSSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, for the purpose of securing the use of the genuine article, to insert in their specifications "The Seyssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seyssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, never cracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Black wall, and other Railways; at the Joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. FARRELL, Secretary.

Seyssel Asphalte Company's Depot, Stangate, London. Note.—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

ROWLAND'S MACASSAR OIL.—Under the Special Patronage of Her Most Gracious Majesty the QUEEN, the Royal Family, and the several Courts of Europe. This Oil is universally acknowledged to be the ONLY ARTICLE that will effectually produce and restore Hair, prevent it from falling off or turning grey, free it from scurf and dandruff, and will render it delightfully soft and flexible. It will also preserve the coiffure in the heated atmosphere of crowded assemblies. CAUTION.—Much pernicious trash is now offered for sale as "MACASSAR OIL;" it is therefore of great importance to purchasers to see that the words "ROWLAND'S MACASSAR OIL" are engraved on the wrapper. All others are "GROSS IMITATIONS." The Proprietor's Signature is also engraved on the wrapper, thus:—A. ROWLAND & SON, 20, HATTON GARDEN, LONDON; Countersigned "ALEX. ROWLAND." Price 3s. 6d.—7s. Family Bottles (equal to four small), 10s. 6d., and double that size 21s. per bottle. Ask for "Rowland's Macassar Oil." Sold by them, and by Chemists and Perfumers.

TO LANGUAGE TEACHERS.—Wanted, a Teacher, or Teachers, of French and German, for two Young Ladies, within 5 miles of Hyde Park-corner. One who can teach both Languages would be preferred. Address to S., at No. 5, Maiden-lane, Covent Garden, stating terms per lesson, twice a week.

The Gardeners' Chronicle.

SATURDAY, JANUARY 21, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
 Tuesday, Jan. 24 Entomological 8 P.M.
 Wednesday, Jan. 25 Zoological 8½ P.M.
 Wednesday, Jan. 25 Medico-Botanical 8 P.M.
 Saturday, Jan. 28 Royal Botanic 8½ P.M.
 Wednesday, Feb. 1 Geological 8½ P.M.
 Friday, Feb. 3 Botanical 8 P.M.

THERE are some points in forcing which are perfectly consistent with theory, and undoubtedly advantageous in practice. There are others which the custom of good gardeners sanctions, and which appear to lead to advantageous results, but of which theory offers a less satisfactory explanation. And there is not a few which are at variance with theory, the best practice, and common sense. We shall now proceed, week by week, to touch gently upon some of these.

As we are bound to believe that all created things have been stationed by the Almighty in those places for which their habits render them best suited, the first object of a gardener, in his artificial processes, should be, to imitate as nearly as he can the natural conditions to which the plant to be forced is exposed in the countries where it thrives the best. If this were skilfully attended to, and we knew each circumstance to which a given plant is naturally exposed, we have the power of exactly imitating all of them, except light. We can secure any amount of temperature—we can apply moisture with the greatest exactness—and we may compose artificially every sort of soil. Thus, heat, food, and moisture, the more essential of the conditions of vegetable life, are wholly under our control; and light, which is beyond our imitation, is naturally furnished in sufficient abundance to maintain the health of plants, if not to secure the greatest possible amount of those secretions which constitute flavour.

But although we thus possess so large an amount of power, we fear that it is very often most unwisely applied; and hence it is, that, while one gardener never fails with his early Grapes and Strawberries, or with his Peaches, and Apricots, or Raspberries, others can hardly ensure a crop of the former, regard the latter as almost unattainable, and would be ruined outright if the condition of holding their places was the production of forced Apples, or Currants, or Gooseberries.

Among the many causes of failure, the foremost, we apprehend, is a mismanagement of temperature by maintaining forcing-houses as warm at night as by day, and an idea that, provided a certain number of degrees on the thermometer is not exceeded, any temperature below the standard will do. Mr. Knight long since pointed out this fatal error: "Few gardeners," he says, (*Horticultural Papers*, p. 213), "if any, have ever believed plants to be at all endued with powers of sensation and perception similar to those of animals, or to be in any degree susceptible of pleasure or pain; and yet it is very questionable whether there has ever been a single gardener, who, in the management of Fruit-trees in a forcing-house, did not in some respects err by treating his trees as he would have done if he had supposed them to possess such powers. Being fully sensible of the comforts of a warm bed in a cold night, and of fresh air in a hot day, the gardener generally treats his plants as he would wish to be treated himself; and, consequently, though the aggregate temperature of his house be nearly what it ought to be, its temperature during the night, relatively to that of the day, is almost always much too high. The consequences of this excess of heat during the night are, I have reason to believe, in all cases highly injurious to the Fruit-trees of temperate climates; for the temperature of these is, in many instances, low during the night. In Jamaica, and other mountainous islands of the West Indies, the air upon the mountains becomes, soon after sunset, chilled and condensed; and, in consequence of its superior gravity, descends and displaces the warm air of the valleys; yet the sugar-canes are so far from being injured by this sudden decrease of temperature, that the sugars of Jamaica take a higher price in the market than those of the less elevated islands, of which the temperature of the day and night is subject to much less variation."

But it is not merely in the West Indies that this great diminution of temperature at night takes place; it is universally the case in all climates whence our Fruit-trees have been derived. When we consider how clear the sky is in the lands of the East, it is impossible that there should not be a great amount of nocturnal radiation, the effect of which will necessarily be to cool down the air to a very considerable extent, especially in the spring; and when we look at the registers of temperature kept in such places, that which was before a matter of inference becomes established

by direct evidence. Take Malta as an example: in the month of January, according to Dr. Davy, the thermometer reaches 60° in the day, but falls to 42° at night; and even in July, the difference between the day and night amounts to 16°. In the Ionian Islands, Zante, Corfu, Cephalonia, fine Grape countries, the difference is not less considerable. Now we hardly dare inquire how many gardeners, when they begin forcing early Grapes, venture to maintain a low night temperature. We know that with some it is a maxim to keep the thermometer above 60° at night. But what does nature do where the Vine thrives best? In Zante, whence come the Currants, or Corinth Grapes of the shops, the Vine pushes in March; and it is a common saying there, "that after the 10th March (Old Style), not even a dog without a tail should be allowed to enter a Vineyard," (*Davy's Ionian Islands*, ii., 345) because of the risk of his breaking off the young and tender shoots. Now the average temperature of Corfu, at 8 A.M., in the month of March, we learn from the same authority, is only 51°; and of course it must have been some degrees lower during the night; in April it is not more than 57°; and it does not reach 61° till May, when, since the Grapes are ripe in August, the berries must be set. There can be no doubt, then, that 48° is quite high enough at night for Grapes in the first month of their growth, and 54° in the second.

The reason why a low temperature at night is desirable, seems to be this: If much heat and moisture are applied to a plant in vegetation, it must of necessity grow in proportion to the amount of those agents; now it is in daylight only that plants can digest their food and harden their texture; and the amount of digestion, and consequent hardening, will be in proportion to the intensity of the light they receive. If, then, they are compelled to grow in the dark, they are filled with undigested sap, and their wood becomes watery and soft. Even where they can be excited each day by very powerful light, it would seem that nature exposes them to no such risks—although one might suppose that beneath a southern sun the mischief caused at night might be repaired during the day. How much more, then, in these dull, northern regions, where we never behold the sun in all his brightness, and for weeks together in the spring only as he struggles through clouds, how much more ought we to avoid that nightly growth for which our daylight can bring no help!

We have now before us a letter, dated last October, from a Gardener, complaining that his early Grapes would not colour, and that most of them shrank off; a circumstance that he thought very surprising, because the other half of his house, which was not forced, coloured well, and did not shank. To be sure, he says, he could never get his house warmer at night than 60°, and he fancied that if he could have commanded more heat he might have been more successful. Now it is perfectly clear that, in this case, it was to nothing but his unwise striving after a temperature that his Vines could not bear at night, that he owed his failure, and his master the loss of his crop. By keeping his Vines growing fast all day and all night, there was no elaboration of sap; nothing was stored up for a supply of the materials of colouring or filling the berries; but most of the organisable materials intended for those purposes were consumed in foliage and bad or useless wood. Then, when the time came for the Grapes to draw upon the stems for nourishment, there was none for them, and they necessarily withered, or, as they say, shrank off; and still later, when the few that escaped from this starvation required colouring matter, that too was absent, and entire failure was the result.

We would, at this season of the year, recommend Gardeners to consider these things well, and in addition to study carefully the chapter on temperature in the *Theory of Horticulture*; more especially the following paragraph:—

"The effect of cold is, as has been seen, to diminish excitability; of heat, to stimulate it: but, if the latter stimulus were constantly equal, it may be conceived that the excitability would soon become impaired or expended. Nature has, however, provided against this result, not only by the fluctuations of temperature that occur at different periods of the day, but more particularly by the periodical fall of temperature at night, and its rise during the day: an arrangement intimately connected with all the vital actions of vegetation. In the day, when light is strongest, and its evaporating and decomposing powers most energetic, temperature rises, and stimulates the vitality of plants, so as to meet the demand thus made upon them; then, as light diminishes, and with it the necessity for excessive stimulus, temperature falls, and reaches its minimum at night, the time when there is the least demand upon the vital forces of vegetation; so that plants, like animals, have their diurnal seasons of action and repose. During the day, the system of a plant is exhausted of fluid by the aqueous exhalations that take place under the influence of sun-light; at night, when little or no perspiration occurs, the waste

of the day is made good by the attraction of the roots, and by morning the system is again filled with liquid matter, ready to meet the demand to be made upon it on the ensuing day. No plants will remain in a healthy state unless these conditions be observed."

We hope our readers will not think that we have finished our observations on Drainage. Our remarks are only interrupted by other things, and will be continued next week. In the meanwhile, we shall be thankful for information and suggestions upon a matter which must occupy the attention of Parliament very soon. We have already received many communications on the subject, some of which, we regret to say, represent the obstinacy or selfishness of individuals to be a greater bar to the carrying a good bill through Parliament than we could have anticipated.

We trust to be able to show, that, if a judicious distribution of the waters to be obtained by drainage is effected, we shall secure, at least, an equivalent for the mills on rivers, and for the weirs and dams across streams, which now impede the natural drainage of low districts. The after-application of water is just as important in one way as the removal of water is in another.

SINCE the notice of Mr. Bickes's alleged "Discovery of the Art of Cultivating the Ground without the Aid of Manure" appeared in our Paper (p. 8), a German friend, who has lately arrived in this country, informs us that he has inspected the crops raised by Mr. Bickes at Kastel on the Rhine, where he resides, and has found them to possess all the luxuriance ascribed to them in the Pamphlet. We have also been favoured with the perusal of a MS. letter from Mr. B., in which he mentions, that last year, notwithstanding the great drought of the summer, his method was equally successful as in former years. If these statements are to be relied on (and the manifold testimony in their favour will not allow us to reject them hastily), they would seem to afford stronger proofs than ever of the position of Liebig, viz., that a large proportion of the solid matter of plants is derived from the atmosphere.

We trust that some of our readers who are in communication with Frankfurt will endeavour to gain some further information relating to Mr. Bickes's extraordinary statements. We presume that his prepared seeds may be procured, although the method of preparing them is kept a secret.

ON MANURING WITH GREEN CROPS.—No. VI.
(By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 20.)

8. *Red Clover.*—In some countries (for instance, in the Rhenish Palatinate) Red Clover is only used as a green manure, ploughed in before it has begun to blossom. 1000 lbs. of Red Clover dried, contain—

17 lbs.	of nitrogen.
20	" potash.
5	" soda.
28	" lime.
37	" magnesia.
47	" sulphuric acid.
67	" phosphoric acid.
37	" chlorine.
550	" carbon.

Silica, iron, alumine, manganese, oxygen, and hydrogen, make up the remainder.

When Green, it contains 79 per cent. of water, 12 per cent. of carbon. It cannot be doubted that Red Clover is a very valuable plant for green manure, as its roots reach, even the first year, two to two and a-half feet in the subsoil, and may weigh perhaps one-third as much as the leaves and stems taken together. If, therefore, the Magdeburg acre will yield 9000 lbs. of the latter, the whole amount of manuring substance would be 12,000 lbs. The herbage of Green Clover is most commonly employed, and is allowed to be 8 inches high before it is ploughed in. If the Clover is luxuriant, the succeeding crop will, in the main, be equally rich; which may be perhaps explained by the land being rich, then clean, and containing a great mass of Clover roots, which amount at times to the half of the leaves and stems, possessing probably the same constituents as the herbage.

9. *White Clover.*—This plant also is grown in some places (for instance, Westphalia) for green manure. It does not, however, yield more than one-third as much as Red Clover, to which it is otherwise inferior, in consequence of its roots not penetrating more than 12 or 15 inches in the ground. It is mostly used as manure after having been pastured for two, three, or four years.

1000 lbs. of Green Clover contain—

810.0 lbs.	of water in the fluid state.
3.5	" nitrogen.
6.0	" potash.
1.0	" soda.
4.5	" lime.
0.5	" magnesia.
0.7	" sulphuric acid.
1.0	" phosphoric acid.
0.4	" chlorine.
110.0	" carbon.
62.4	" hydrogen, oxygen, alumine, silica, oxide of iron, and of manganese.

1000.0 lbs.

[If 4000 lbs. of White Clover, with the roots, are ploughed

in on one Magdeburg acre of land, the soil will receive 14 lbs. nitrogen, 440 lbs. carbon, &c.; whence we might conclude (even if experience did not prove it) that crops cannot be as good as after Red Clover. If, however, they do prove good after this sort of green manure, it may be owing partly to the excrements of cattle, and partly to the rest which the soil has received.

10. *Roots of Lucerne and Saintfoin.*—Both these plants act on the fields where they have been ploughed in by their roots, which are sometimes 20 years old; and their strong effects may be judged of by the luxuriant state of several crops grown after them. We must, however, take into account that the soil has been also manured by the leaves which have fallen during that long time. It would perhaps be possible to bring to the surface a large part of the deep roots, which are of no use to the subsequent crops, by means of such instruments as are applied in England to draw the roots of Thistles and Coltsfoot. It however remains to be seen whether the roots thus obtained would repay the labour. At any rate, idle hands might be employed about it.

11. *Roots of Grasses (turf manure).*—When an old pasture is broken up, the soil is manured by the sward, which soon decomposes, and whose effect will last the longer the older the sward is; because, in that case, it forms a close mat of roots, in which the strength of the furrow-slice has been collected as well as that of the subsoil, if such deep-rooted plants as Dandelions, Plantain, Milfoil, and Thistles, are in the turf. An old sward of Grass is, moreover, a very superior manure, because it keeps the soil (especially if light and dry) in a moist and cool condition. Such soil, therefore, if laid down with a mixture of Grasses, White Clover, &c., although used for several years as a pasture, when ploughed is followed by 3, 4, 5, crops of grain, which (after the decay of the Grasses) will grow as luxuriantly as after a full manuring; provided, however, the soil, when originally laid down, was in tolerably good condition; otherwise these very Grasses which were intended to manure the soil, will grow ill and form anything but a dense turf. It may be assumed that the roots of a pasture 4 to 5 years old, contain as much manuring substances as the roots of Red Clover two years old.

To the plants already mentioned may be added the stubble of Spurry cut green, Vetches, and other vegetables used as fodder, the weeds that grow on fallows or in stubble. The latter are most useful when their roots reach deep in the subsoil, and so bring substances to the surface of which the furrow-slice is deficient. The green stems of Tobacco are very valuable, as they are rich in alkali and nitrogen. The stubble of plants mown green should be ploughed in as quickly as possible, in order that the humus formed by the leaves that have dropped may not be dissipated.

(To be continued).

FLOWERING HYACINTHS FOR SHOWING.

HAVING seen in the *Chronicle* several modes of cultivating Hyacinths, I am induced to send you the method which I adopt for obtaining a fine spring bloom for the purpose of exhibition; a point on which none of your other correspondents have remarked.

In the first place, it is important that a proper selection be made in the choice of bulbs, which ought to indicate great strength; for as the best sorts sometimes make poor flowers, such only should be chosen as show the greatest substance. The soil which I make use of consists of good free loam and well-rotted cow-dung, with a small portion of sand; yet I would remark that this is not of great importance, as the matter to be developed is the secretion of the previous season, and therefore only requires to be placed in favourable circumstances to forward its proper development.

The bulbs being planted in 32s (proper Hyacinth pots being of the same width as those, although much deeper), I place them in a cold pit or frame, with a dry flooring, and cover the whole over with dry saw-dust, at least six inches deep, above the pots. This material being kept perfectly dry, the bulbs are secure from frost, and likewise from premature excitement. When spring arrives and the leaves begin to push, I raise the pots above the saw-dust to prevent that blanched appearance which this tribe often present when brought from the old tan-heap, which is but too often their abode until wanted for forcing. As soon as the plants begin to grow I expose them as much as possible, merely protecting them from frost and rain.

When nearly in flower, I remove them to a shaded place, and fix over them hand-lights, elevated upon inverted flower-pots under the corners, for the twofold purpose of making room for their tops and giving them all the air possible. When the day is fine and calm, remove the top of the light entirely. In such a situation, they will develop themselves in their greatest perfection, and may be preserved in full beauty for double the time which they would be if exposed to the sun.—A. Dawson.

A MACHINE FOR PREPARING OIL-CLOTH.

THIS design represents a small machine for manufacturing oil-cloth, which will be found essential by those who have much glass to cover. I need not enter into any details respecting the economy in using oil-cloth in preference to garden-mats; enough has already been stated in the *Chronicle* upon that subject.

My opinion is, that oil-cloth is an excellent covering for various purposes. If a light triangular frame was made, and covered with this cloth to any required length, it would answer for covering early Peas or Potatoes during frosty nights. After the danger of spring frosts was past, it would serve for placing over any newly-transplanted Cauliflowers, Celery-plants, &c., provided the weather

was unfavourable when they were removed. It would also be serviceable for sheltering Celery during the winter from frost and rain; and would assist in preventing the Celery from becoming rotten.

Frames of a conical form, covered with oil-cloth, might be made of strong wire, with the ends fixed into a round hoop of wood, to stand upon the ground. These would answer for covering Gooseberry and Currant bushes, and, if placed over them sufficiently soon, would keep them from breaking too early in spring. These frames, with proper ventilation, would also serve for protecting the fruit in autumn from birds and heavy rains.

The following machine has been contrived by me for preparing this substance:—

Fig. A.

Fig. B.

A is a side view of the machine: the frame and the three rollers are made of wood; the latter are 6 inches in diameter. The frame is of wood, 2½ inches square, and morticed together, as represented in B. The whole machine, exclusive of 10 inches for the boiler and frame, will not occupy more than 2 feet 6 inches square. The boiler, of block tin, is 3 feet 3 inches in length, 9 inches deep, and 9 inches in width; or made in length according to the width of the cloth to be prepared. The boiler and fire-place are fitted within an iron frame screwed to the bottom sill at C. An iron supporter is screwed to one of the uprights under each end of the double rollers at D, and secured also to the top of the iron frame in which the boiler is fixed.

Two rollers, one on each side of the boiler (fig. 1), are fixed upon the iron frame; these are intended for the cloth to be rolled upon, previous to its passing through the machine. 2 is a small tin roller fixed in the bottom of the boiler, so as to cause the cloth to be saturated by descending from roller 1 and ascending from 2 to 3. The cloth passes over the roller 3, and then between the double rollers. At each end of the roller (fig. 3), a flange is fixed so as to direct the cloth between the two rollers; it is requisite that the double rollers should be covered with cloth. The post, to which the top roller is fixed, is to be made so that the axle will rise and fall according to the thickness of the cloth prepared.

When the cloth has been conducted between the double rollers, it is placed upon the single roller and turned round by the windlass. The passage of the cloth is shown by the dotted arrows. 4 is a fire-place under the boiler, made either of bricks or cast-iron, heated by charcoal, with a small tube at the extremity to allow the gas from the charcoal to escape and cause combustion. 5 is a box drawer made of sheet-iron, with a round handle in front to push in and out when required. This will answer as a ventilator, and will be much safer than if left open, as the sparks of charcoal are liable to fly about. 6 is a tin dish, placed under the bottom roller to prevent the oil from being wasted by falling upon the floor.

To every gallon of cold-drawn linseed oil one pound of bees' wax may be added; these should be placed in the boiler till the liquid becomes quite thin from the heat of the fire; it will then be fit for use. When a sufficient quantity of cloth has been prepared, it may be conveyed to some convenient place to dry, and may be stitched together as required.—Thomas Sellers, Pennoyre.

RENDLE'S TANK SYSTEM OF HEATING.

I READ with pleasure your notes at page 19 of the *Chronicle*, respecting a "new plan of heating," observed at Mr. Beck's, of Isleworth; and also that you do me the justice to ascribe the originality of its invention to me. As you have now brought it prominently before the public, perhaps a few observations from myself may prove acceptable.

It is a plan which can scarcely be recommended too strongly; for not only is it adapted for the smallest propagating-house, but also for plant structures of the largest size. You have clearly explained the principle of the apparatus to your readers; therefore, description from me would be superfluous. My tank or cistern is about 20 ft. long, and 5 ft. broad; it is situated in the centre of a house, and except at the end where the boiler is fixed, is

surrounded by a walk. The boiler is one of Rogers's, and acts admirably. The depth of the tank is only 6 inches, and this is quite sufficient. On the top I have placed large slate slabs, cemented to each other to prevent a superfluity of steam from escaping into the house.

When first I thought of this excellent mode, I imagined that to keep up a sufficient heat in the house, I should be obliged to retain a constant fire; but such is not the case. If the fire is lighted for two hours in the morning and evening it is quite sufficient to maintain a steady and genial bottom-heat, as the large body of water in the reservoir, when once heated, remains warm for a considerable length of time. The thermometer is generally on an average at 65°.

In a small house this principle can be adopted for less than 5*l.*; and in larger ones, at a cost at least one-half less than that of hot-water pipes. As you justly remark, a common blacksmith and carpenter are all that are required to put it up. I doubt not but before many years it will be universally adopted by all those who grow Pine-Apple, Melon, Cucumber, or even stove and Orchidaceous plants, when we shall find dung, leaves, and other fermenting materials excluded from the Pinery and Stove, and used only for manures. Even I, who can procure tan and dung at a very low rate, am a saver of at least 20*l.* a year by this discovery; therefore the saving must be very great in a larger establishment, where hundreds of loads of dung, tan, and leaves, are consumed annually.

On the 28th of December last, the apparatus was set at work, and my foreman commenced propagating Dahlias, which are potted and placed on the top of the slates, and surrounded by sawdust. They are now breaking luxuriantly; hundreds of cuttings are already taken off, and plunged in sawdust in another part of the tank. I have used the apparatus for more than 8 months, and have been highly successful in striking some thousands of plants. It is certainly the most complete plan that possibly can be adopted for a propagating-house.—W. C. Rendle, Plymouth Nursery.

AMATEURS' GARDEN, No. III.

As the present weather is not inviting for out-door operations, advantage should be taken of it to regulate the greenhouse and frame plants previously to their commencing their spring growth. That the health of plants, as well as of animals, is materially influenced by cleanliness is evident, from the difference between the growth of the same species in the country, and in the smoky atmosphere of large towns. In the country, plants grow with vigour; whereas, in the town, although enjoying the same advantages as to soil and water, they only drag out a miserable existence. This is caused by the respiratory organs becoming choked by the accumulation of dust on the foliage, and as the plant is thus unable to breathe, some derangement of its system must be the result. In the constituent parts of the atmosphere, the most delicate analysis has failed to detect any material difference between that of densely populated towns and open places; but that it is less transparent is obvious to those who have ever observed it from an eminence. There is no doubt, therefore, that the want of light and the dirty state of the foliage are the principal reasons why plants do not thrive in towns; but the success that has attended their cultivation in Ward's cases proves that they can be grown in such situations, provided they are kept clean, have all the light that can be procured, and are not parched up by an arid atmosphere; for it is to keeping plants free from dirt, and to supplying them with an atmosphere containing moisture proportionate with the temperature of their habitations, that we may attribute their successful cultivation in glazed cases. From the above observations the window-gardener will see the necessity of keeping his plants clean, especially in dull weather; and the possessors of frames and greenhouses the propriety of washing the glass frequently.

In regulating the plants, it will be well to wash the foliage of Oranges, Camélias, and other smooth-leaved plants, with a sponge and clean water; and the dust may be removed from Pelargoniums, and other woolly-leaved plants, by brushing them lightly with a soft brush. After the plants are cleaned, the pots should be washed, and the surface of each replaced with fresh soil; and if they require it, they should be neatly tied to fresh stakes. It is not an uncommon occurrence to see a stick as thick as a man's thumb supporting the delicate stem of a Calceolária, or forming part of a trellis for a fragile and elegant climber. This is bad taste; and it should be recollected that, as a support of this kind is only a necessary evil, the more slender the sticks are the better, provided they are strong enough to sustain the plant. Stout green thread, or painted twine are good substitutes for matting.

Carnations, Picotees, Aurículas, and Polyanthuses in frames, should have all the air possible in mild weather; but they must be protected from wet. It is a good plan to have the frame raised upon a brick, placed beneath each corner, with movable boards to fit around it, so that they may be let down in mild weather, to admit a current of air among the pots, and be replaced in case of frost. Remove all decaying matter, so as to keep the atmosphere within as pure as possible, and prevent the attack of mildew on the plants.—W. P. Ayres.

HOME CORRESPONDENCE.

Salt as a Manure.—I am one of those who consider a little fact worth a great deal of theory; consequently I feel no hesitation in relinquishing my theoretical opinions concerning salt as a manure, after the statements made by Mr. Brewis in a late Number. I may state, however, that one of my objects was to bring out facts, if such could be

produced. The bearing of the quotations from the sacred books led me to infer that an article so often chosen to indicate sterility and desolation could not be a fertilizer of the soil; this was merely a theoretical inference, having never tried it by experiment. Now as Mr. Brewis has stated the beneficial effect of salt on a "damp soil," I should feel obliged if he will inform us, through your columns, whether his ground is of a clayey, adhesive quality—or what is usually understood by a "strong" or "heavy" soil; what proportion of salt he uses to a given breadth, and how frequently applied? Mr. B. says I seem "to plume myself on my acquaintance with Scripture." If such was apparent in my remarks, I am sorry for it, for it is not true. He moreover asks me the meaning of salt having "lost its savour," to which I offer the following solution. In Palestine are salt rocks, the cliff-like parts or peaks of which, from long exposure to a hot sun and atmospheric influence on their exposed surfaces, lose that property which, when applied to the palate, we call saltiness, otherwise "its savour." It is then used for foot-paths, or walks, as we use *dehritus* or gravel; hence it is "trodden under foot of man." These saline rocks, their effect, use, &c., were doubtless present to the view of Christ, and those whom he taught by so apt an allusion. I have heard that our culinary salt may be deprived of "its savour" by a similar process, but I cannot vouch for the truth. As to the practice of the Northumbrian farmers in manuring with "Wrack" (Fuci), as it is called, I was not only aware of it, but have been engaged in doing it, though not in Northumberland. It is, however, worthy of notice, that it consists of a mass of vegetable matter besides salt; and that its *entire* efficacy is not derived exclusively from its saline particles. Mr. Brewis rather triumphantly inquires, whether a land of lime, guano, &c., would not be equally uninhabitable with a "salt land?" I answer, undoubtedly; but we never find the articles spoken of symbolically to denote sterility and desolation, by the sacred or any other writers with whose works I am acquainted. As your correspondent is versed in northern practices, he may also be acquainted with northern words. Suppose, then, he were to relish or try to flavour his porridge with the long-exposed *dehritus* of a salt rock; on tasting he would probably find it was still "Wersh," (a northern term that has no equivalent in English, but the negative saltless); it would have "lost its savour."—*Quercus*.—At p. 806 of the *Chronicle*, there is an article upon Salt by "Quercus," who appears to have formed an unfavourable opinion of it as a manure; and I think some of his texts have been somewhat strained to support his views. If we take a glance at the geological history of common Salt, we shall find it occur in almost every formation of rocks; so that nearly every particle of earth must at one period or another have been moistened with brine. According to Mr. Featherstonehaugh, salt is found in America in the old transition slate rock; we are also informed that in the English coal-mines, there are Salt-springs; and the rock-salt of Cheshire is situated in the new red sandstone. In Wurtemberg, it is said to exist in the upper members of the same series, called the Muschelkalk. According to Buckland, it is found in the lias of Switzerland. Sedgwick and Murchison have shown that it occurs in the Oolites in the Austrian Alps; and at Wieliczka, near Cracow, it is found in the tertiary series. Any-one would be led to suppose that such a wide-spread article must have been intended for the good of organised beings, whether vegetable or animal. Of late, many portions of alluvial soil have been taken from the dominion of the sea, which for ages have been steeped in salt-water; but I will only notice one spot, which frequently came under my observation. It was formerly a small bay, near the town of Kincardine, on the Firth of Forth. For an account of its embankment and cultivation, I would refer your readers to the 6th vol. of the "Prize Essays and Transactions of the Highland and Agricultural Society of Scotland," where a report of it is given by Mr. Menzies. It appears from the report that the first vegetation which appeared to take possession of the mud after the tide was shut out, was the *Poa maritima* and *Aster tripolium*, with *Agrostis stolonifera* and *alba*, along the course of the fresh-water runs. The abundance of salt which the mud contained appears to have prevented Corn-crops from growing well at first; but it is stated in the report, "Commencing with Grass seems to be by much the cheapest and best method for extracting salt from lands thus reclaimed from the sea; the over-quantity of which seemed to be the cause of barrenness at first, as it became productive in proportion as the salt was extracted from it. Sheep and cattle thrived uncommonly well on these fields while they were in pasture, and both the grass and *bestial* pastured thereon improved as the fields advanced in age." It is probable that the salt was taken from the soil by means of the crop that grew upon it; and, when received into the stomachs of the cattle would produce the effect lately pointed out by Dr. Playfair in his lectures; namely, "The Chlorine of the salt goes to form the gastric juice, which is so important an agent in digestion, and the Soda forms the bile, which is a compound of soda." In America, the salt licks which herds of buffaloes and deer frequent are commonly referred to, when salt is recommended as a condiment in the food of cattle. To point out the beneficial effect of salt upon vegetation in general, when properly applied, would extend the present article to an undue length; but I may state, in conclusion, that the quality of grain is greatly improved, and that Potatoes and Clover-grass have been often greatly benefited by its application.—*Peter Mackenzie*. [No doubt salt, judiciously applied, is as good a manure as saltpetre or nitrate of soda. There is plenty of evidence of this.]

Destroying Worms on Grass.—Of the many methods

which have been recommended for destroying worms on Grass, I have found corrosive sublimate the most efficacious. By means of it I cleared a piece of Grass, from which it seemed almost impossible to eradicate the worms, the surface being always covered with casts, and presenting the most slovenly appearance; but for nearly a year and a half after this was applied, there was scarcely a single cast to be seen. I mix it at the rate of one ounce of corrosive sublimate to about 40 gallons of water, the sublimate being first beat quite small, and dissolved in some hot water. The requisite proportion of each being prepared, the whole should be well stirred together, and commencing at one end of the lawn with a watering-pot without a rose, let the surface be entirely flooded. If any part of the ground is missed, the worm-casts will soon be as bad as ever. Directly after the sublimate and water is applied, the worms will make their appearance, which I have always picked up. The dose may be made sufficiently strong to kill them on the surface, or even in the ground; but this is attended with danger to the grass, particularly on light soils. I therefore consider picking them up to be the best. If possible, the ground should be gone over a second time after an interval of three or four days. Attention should also be paid to the state of the ground, which should neither be soaked with rain nor parched with drought, but in a medium state. Great care is at all times necessary in using this deadly poison. I applied it last spring with much greater success than time for destroying slugs on young Peas.—*A. Dawson*. [No doubt it offers one of the readiest and best means of destroying worms.]

Pruning Forest Trees.—Allow me to thank Mr. Billington for his answer to my request at p. 789, which other avocations have hitherto prevented me from noticing. Mr. B. says I have "raised doubts and misconceptions of his system of Pruning," &c. The latter is probable; but my object in taking up the subject has been not to "raise doubts" only, but to bring proprietors and managers of plantations, where *timber* is the object, to a rational consideration of the injury which they commit by following those pernicious systems which have been laid down by theorists; and followed in too many instances, with a confiding pertinacity which is truly astonishing. Mr. B. also tells us, "I still maintain what I have proved in my former publication, that the increase of timber in trees is in proportion to the number and healthiness of the branches and leaves." And again, "hence the greater number of branches with healthy leaves is the true cause of the increase of timber in trees." Now this is precisely my opinion, and what I have contended for from the first; so that, after all, we are like the two wiseacres that contended about the colour of the camelion—and were reproved by the animal thus:—

"As things in different lights you see,
They'll every one resemble me."

Mr. B. sees fine timber flourishing through the medium of his "system," and I see it as good or superior without any (pruning) system at all. The intervening sentence between those above extracted from Mr. B. is precisely an amplification of what I mean by "reciprocity"—a term which he seems to dislike, although he does not furnish one more expressive. I also wish to say a few words upon the seeming discrepancy in my friend's remarks, and I shall put them in the form of a query. How is Pruning by any "system" likely to increase the timber of a tree, if that increase depend on, and is produced by, the number of branches and leaves? I cannot think of any "system" of Pruning that does not counteract the intention. Mr. B. is mistaken in thinking I am an advocate for the "Prune-not-at-all system." Pruning in many cases is beneficial; but in pruning forest-trees systematically, with the view to an increase of timber, the means will certainly retard and not accelerate the end. I am for employing both "labour, reflection, and expense," whenever and wherever it can be done with beneficial results; but not in curtailing the heads of trees with a view to increase their stems. When Mr. Billington presents his proposed Essay to the Royal Agricultural Society, I hope it will correct the crude notions respecting trees which were promulgated in one of their late reports, not long since reviewed by you. After all Mr. B.'s enlightened views and long experience, I fear, however, that there is still some latent clinging in his mind to the old notion, that what is taken from the head is necessarily laid on the stem; for he remarks, "My system of training is simply to regulate those parts according to Science, so as to aid those properties in accelerating the elongation and regular increase of timber in the stem, and not to 'expend itself in making useless branches.'" How can branches be "useless" if the increase of the stem depend on their number and healthiness? Mr. Falconer, also, at p. 588, says, that he is no convert to this no-pruning system,—and what are his reasons? Because, on looking over the Park or Forest, he sees that trees even of the same species do not grow all alike, some producing fine timber, and others wasting their energies in producing "spray, faggot, and firewood." How picturesque our parks and forests would look, if the trees were denuded of all spray, faggot, and firewood. Mr. F. must learn from Mr. Billington that the increase of timber in trees is in "proportion to the number, &c. of branches and leaves." This is beyond all contradiction.—*Quercus*.

Summer Pruning Pear-Trees.—In common with others, I tried the breaking or rather, half-breaking, the luxuriant shoots of my young Pears and Apples, which were not sufficiently root-pruned. I do not think that the buds below the fracture are larger, fuller, or more ripened than on the unbroken branches; but the buds on the parts above the fracture appear full and large. This would, I conceive, be the natural consequence of the returning sap being kept in the upper part of the shoot;

there being more leaves at the top than on the lower part. In many cases the fracture has healed over, and I mean to leave the pendent shoots unpruned.—*Tolly*.

Disease in Scotch Firs.—In a late Number of the *Chronicle*, the Rev. R. W. B. requested information respecting the unusual decay and weakly appearance of Scotch Fir-trees on his grounds. At West Plean there are Scotch Fir-trees of the same age and having the same unhealthy appearance as those mentioned by your correspondent. After examining them, I have every reason to believe that their decay is occasioned by the *Hylurgus piniperda*.—*Peter Mackenzie*.

Grafting Vines.—In your answer at p. 824, to a correspondent, who has an Escholata Grape of which he does not approve, you advise him to plant another in its stead; but when the ease with which an inferior Vine can be grafted with another sort, is considered, I think it a waste of time to plant one to supply its place; a far better way is to select a shoot, as low as possible on the old Vine, and to inarch it with another kind either from a pot or from a neighbouring plant; this however should be done when the vines are in full growth. In six weeks they will have become sufficiently united, so that the engrafted shoot may be severed from the parent plant; and if allowed plenty of light and air, it will mature its wood sufficiently to take the place of the old bearing stem, which may be cut away the following season: or if the graft is not thought strong enough, it may be cut down and allowed another year's growth, whilst the original stem may be retained; I have treated several Vines so, and it appears to have the effect of hastening or retarding the ripening of the same Grape, accordingly as the stock may be of a late or early kind. I had two Vines, the names of which I do not know; one was a very late Grape with bunches and berries shaped like a Black Portugal, but of a grizzly colour; the other which is called the Sicilian, was a round early white Grape, about the size of a Dutch sweet-water, and hollowed at the end like an Orange, very sweet, but having a disagreeable thick skin. These I inarched from a neighbouring Black Hamburgh; the fruit from the early stem ripened first, and the leaves dropped off some time ago; whereas, on the late stem, the leaves are still green; their parent is in an intermediate state.—*Vitis*.

Rust on Grapes.—The disease mentioned by "W. Bromley" was evidently caused by insects, and was quite different from what I suppose to be meant by rust; which, in my opinion, is an induration of the cuticle of the fruit at an early stage of its growth, and is caused by the house being overheated, and by the fruit being afterwards too suddenly subjected to a current of cold air. During a period of more than twenty years' experience in Grape growing, the only sort I ever found affected was, the Black Hamburgh, and that but slightly. Although I am certain that the less and the more carefully they are handled the better, still I think he goes beyond experience when he states that, after being touched by the hair of the head, they will cease to grow.—*A. C.*

Preserving late Grapes.—A correspondent from Cork informs us that the method recommended by Mr. Crawshaw for preserving late Grapes has been practised with great success by Mr. Haycroft, at Lord Doneraile's, in that county. At Christmas, there were in one Vinery nearly 200 bunches in good condition.

Hardy's Cantaloupe Melon.—I have grown Hardy's Cantaloupe Melon, and I find it to be a good and early kind. The latter point I tested by growing it with one of my earliest sorts. In order to give them both a fair trial, I prepared a two-light pit for their reception; and after paying to both of them every attention, six fruits were set upon the Cantaloupe before my own sort showed any inclination to do so. The result was, that I cut fruit 23 days earlier from the former, and obtained three crops from the same plant. Both the flavour and size of the fruit are good; the first which I cut weighed 4½ lbs. I intend to grow it this season upon a much larger scale.—*R. Whitaker, Gardener to Major Savage, Midsummer Norton, Bath*.

Rhubarb.—If my experience of the superiority of early Rhubarb is of any service to a "Young Gardener," I beg to state that I grow the Tobolsk, and another sort called Dully's Scarlet Admirable. Both kinds have been treated in the usual way, and I have been using the Scarlet Admirable since the middle of last month. On uncovering the Tobolsk, I find it to be only just sprouting. The Scarlet Admirable may also now be met with in abundance in Covent Garden Market.—*S. G., St. John's Wood*.

Mills' Improved Cucumber Pit.—Last autumn I had a range of Mills' pits erected here, but too late in the season to avail myself of ridging out the plants for winter-forcing at the time mentioned in his treatise. Being anxious, however, to test the heating power, and to keep the frost from the brick-work, I lined one of the pits on Nov. 25th; in three days after, the heat was 95°. The seed was then sown, and from that time to the present the pit has never been without air night or day, although without covering of any kind. The lining was made with dung and leaves, having been turned, and a little fresh dung added every ten days as the old sank. The plants are healthy, and the thermometer ranges from 70° to 75°, with one inch of air left on at the back all night. I was surprised on the 2d of this month, when we had 12° of frost, to find the thermometer in the pit standing at 73°; proving the superiority of the improved pit over the old system with double mats and hay. The saving of dung is also great; and the cavities in which the linings are made preserve them from the changes of the weather, which those more exposed are liable to. The pit which I am working has hardly had a fair trial, as it is filled up with soil above the loose material to the top of the air-flue; much less of the

heated chamber is thus left for warming the pit; but being obliged to use it for a seed-bed, I was compelled to keep the plants near the glass. It is, I think, of great importance to have some boards on the lining at this season of the year, as they afford protection against heavy rains. I have also a gutter for the front water to pass away without dropping on the lining.—G. Bond, Gardener to the Earl of Powis, Walcot.

Fork for Leaves.—I send you a sketch of a simple and useful leaf-fork which has been used here for some years; I have neither seen it in use anywhere else nor yet mentioned in any publication; but I am certain that it only requires to be known to be generally adopted wherever there is any great quantity of leaves to be collected. One person with this implement will take up with greater facility more leaves than two persons could do with any other tool which I have seen used for that purpose. It is simply a large four-tined fork, made of wood, shod with iron; the tines are 18 inches long, and are morticed into a head about 17 inches long and 1½ inch by 2½ inches thick. The tines are 1 inch in width and 1½ inch in depth at the head, gradually tapering to a point with a curve or bend upwards (fig. 2). The wood of which they are formed ought to be hard and tough; either Oak or Ash will do, but the Robinia Pseud-Acacia is preferable to either. The head should be made of Ash, with a T handle of the same, and should be two feet four inches long (fig. 1). Its recommendations are its size and lightness; the leaves also do not hang upon it as on a common fork, the large size of the tines tearing them asunder.—Andw. Toward, Bagshot Park.

Light Frame for Protecting Annuals, &c.—I could not help being much struck the other day at what I at first attributed to the ingenuity of a little boy, who, in derision of a clumsy brick trap which had been set for catching sparrows, collected a number of pieces of wood, of which he constructed a kind of frame-work, having the appearance of a square roof; with the sticks so disposed as to admit sufficient light, and yet so near together as to answer the purpose of a trap. This little fabric being raised on one end, similar to the sieve when applied to the same purpose, falls down upon displacing a small piece of wood, and entraps its unfortunate victim, which is easily taken out by inserting the hand through an opening at the top. This lattice-work, at once so light and easily constructed that a dozen of them might be procured for a few pence, I find so admirably adapted for protecting annuals, the forcing of Seakale, Rhubarb, &c., that I hope a few words as to its construction will be acceptable. To lay the foundation, procure four pieces of Hazel, or any other kind of wood, of the same length, say about 14 inches, and half an inch thick; tie them together, at right angles, so as to form a square, two pieces only touching the ground, the other two being laid upon them. Upon this base place four other pieces about an inch shorter than the first layer, shortening and laying the bars in succession, until you have reached the apex of the miniature roof within about five or six inches, according to the size intended; cover the aperture that remains with a piece of deal or tile, and you have the figure in the form of a pyramidal frustrum. I cannot better explain the manner in which the pieces are secured together than by stating that my little friend, cutting the string of his bow, bending the bow itself across the frame-work, and then tying the ends of the same to the middle of the two parallel pieces that were first laid down, as described above, gave to the whole the desired tension and firmness. The obvious utility of such a contrivance as a screen from excessive rain, and the protection it would afford, with the advantage of light and air, to the smaller kinds of flower seeds, united with its neat appearance and simplicity of contrivance, will, I trust, recommend its adoption.—Adam Keys, Plum's House, Whiston.

Salvia patens.—In Holme Gardens, near Inverness, a specimen of the above plant survived last winter in the open ground. It flowered from the 1st of June until November, and was only 3 ft. high, and 4 ft. in diameter, being densely covered with flowers. The crowns of the tubers were 3 in. beneath the surface of the ground. I think it will prove quite hardy in any dry situation; I have left one plant out this winter by way of experiment—the result I will communicate hereafter.—J. Ross.

Growth of Bulbs.—Having more Cape bulbs last autumn than I wanted, I cut open several, to observe their mode of growth, and I found that the buds are formed at the first shooting of the leaves. In a plant of Brunsvigia Josephinae, which had just flowered, and whose leaves were about three or four inches long, there was a well-formed bud at the base, and in the centre of the new leaves, about three quarters of an inch high. I discovered buds likewise in bulbs of B. multiflora and in Nerine. I am induced to mention this, as Mr. Herbert suggests in his work on bulbous plants, page 276, that the bud is probably formed at the drying off of the leaves, and it will account for growers being so often disappointed by the non-appearance of any

flower-bud, after a vigorous growth of leaves in the preceding year. To obtain flowers from these difficult Cape bulbs, the plants must not only be well grown during the preceding season, but also in the year before that, to induce the formation of a flower-bud. Amongst your Notices to Correspondents in a late Chronicle, "Bulbosus" asks for information respecting his bulb of B. Josephinae. If he examines his plant he will probably find the roots decayed; such effects as he describes often arise from this cause. Should this not be the case, his plant must have been kept in too moist a house, without a due circulation of air. Where a proper circulation of air is kept up, I feel satisfied that bulbs may be grown without either rotting or being buried. "Bulbosus" may pull off the decayed outer coats, but with caution, or he will cause the bulb to bleed. Cyrtanthus obliquus I find to flower more freely in the conservatory than in the stove, which is probably too close for it.—J. H.

Indian Corn.—In March last I sowed some seeds of the tall Indian Corn separately in small 60-pots, and kept them in a cold frame until May, when I planted them out 2 ft. apart, plant from plant, and 3 ft. between the rows. Each plant produced on an average 3 fine ears, and the average weight of each ear when divested of leaves, was 1 lb. I gathered the crop in October; thus, from 12 plants I got 36 lbs. of fine Corn—a far greater increase than I believe could have been obtained upon the same space of ground from any other Corn crop.—Charltoniensis.

Problem in Cookery.—Sir, I think I am philosopher enough to answer the question proposed by "K." in reference to the diminished sweetness of hot fruits and other things. The true statement I believe to be, not that the sweetness is diminished, but that most other flavours are increased by heating, and thus the sweetness is overpowered. As a general rule all odours and savours are developed by warming the matters from which they proceed, and this increased development by temperature is great in proportion to the volatility of the substance. Thus, most dilute acids being more volatile than syrup, are by heating rendered disproportionately prominent to the palate, and hence the apparently inferior sweetness of hot plum tart. The effect in question is most strikingly shewn in the case of sweetened grog, if your readers know what that is. A glass of sweetish rum-and-water taken hot, will appear to have a full flavour of the spirit; let it cool, and the taste of the sugar will so completely prevail over that of the rum, that it would not be thought to be the same mixture. I need scarcely point out that alcohol and syrup being at opposite ends of the scale in regard to volatility, this instance is more decisive than that of the plum-tart. I have thus endeavoured, according to my humble abilities, to acknowledge the kindness with which you received the inquiries in a somewhat similar matter of *An Old Lady*.

To Preserve Fruit with Water only.—Fill your bottles with fruit; place them in a convenient vessel up to their necks in cold water; put them on a brisk fire, and heat the water to 160°; keep it at that temperature for half an hour, and have some boiling water ready with which to fill your bottles to the neck; afterwards cork them down tight. Peas will neither keep good when done in this manner, nor as stated by "No Mystery" at p. 821 of last year's Chronicle.—W. P. K. [The samples of cherries, currants, and gooseberries which accompanied this were most excellent.]—Last autumn I preserved Gooseberries, Currants, Cherries, &c., in the same manner as that recommended by "Geo. M. I." at p. 5; as well as some Peas, which continue green, and are at this season an acceptable dish.—W. S., Moss Grove, Manchester.

To Expel Rats.—Rub some tar about all the holes and places where the Rats resort. To this they have a great aversion, because it sticks to their fur, from which they are not able to remove it. This is a sure and cheap way of driving them from buildings in which they are troublesome.—Facile.—A Rat-trap is described at p. 853, of last year's Chronicle. If, instead of a wooden top, your correspondent were to cover the cask with a sheep-skin, or some old parchment well wetted, and drawn tight; and after it had become dry, and the Rats had been induced to feed upon it, if a few triangular cuts were made in it, sufficiently large to allow the Rats to fall through, I think it would be an improvement. A friend of mine has captured them in that way.—R. G.

Pheasants.—Being much troubled with pheasants, which destroy my early crops of Peas and Beans, I usually place Pea-sticks on the rows directly after the seeds are sown; these baffle the birds until the plants are up, when the sticks require to be removed. I have afterwards placed bowed sticks down the rows, with a net running along the top; but this is too much trouble. I have therefore ordered at the basket-maker's some twig cradles, to be made in the shape of a half-moon, 17 inches in width, and 9 inches in height. These I intend to have tarred over, and I have no doubt that they will last six or seven years. They should be made of different lengths, so as to fit close together when stowed away in a dry shed.—W. Brown, Merevale.

Poultry.—I should feel obliged if "A. E. S." would inform me whether the Malay Hens are white or coloured, and in what part of the country they are common, as they are not known under the above name here. I should be glad to procure a pair of them. "A. E. S." does not mention whether the Dorking Hens recommended are the white or the grey variety. The latter are generally found to grow more plump and large, whilst the former are preferable from their uniform white colour at table. Perhaps, some correspondent can also give me some further information regarding the best breed of Ducks, and where they can be obtained.—A Subscriber, Renfrewshire.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

LYCASTE PLANA. (*Stove Epiphyte*). Orchidaceae. Gynandria Monandria. This plant is nearly allied to the *Maxillaria*, or *Lycaste*, macrophylla, of which it has quite the habit. It differs in the petals being quite even, not undulated, and in the lateral sepals being much more exactly oblong; the tubercle on the lip is also much more obtuse. In colour too they are different. *L. macrophylla* has olive green sepals, and petals almost colourless; *L. plana* has the sepals of a deep rich madder red inside, and the petals are richly tipped with crimson.—*Botanical Register*.

GESNERA LATERITIA. Brick-red-flowered Gesnera. (*Stove Herbaceous Plant*). Gesneraceae. Didynamia Angiospermia.—With the most ample and noble foliage, and particularly brilliant flowers, this plant combines unusual dwarfness and compactness. It was introduced from Brazil eight or nine years ago. Cuttings should be taken from the young shoots as soon as they are two or three inches long, in the same way as Dahlias; only not removing the base, but leaving it attached to the old tuber, that fresh stems may be generated. If struck rapidly in a brisk heat, they will form excellent blooming plants in the following season, and will probably flower the same year. The plant demands a rather generous treatment in regard to soil and atmospheric moisture. The compost in which it is potted should be enriched with leaf-mould or decayed manure; and it must not be stinted for pot-room. To retain around it a congenial humidity, it should be plunged in fermenting bark, or some such material, so that the supply of moisture may not depend on variable sources. The tubers should be well preserved from damp during the resting period.—*Paxton's Magazine of Botany*.

TALINUM TERRETI-FOLIUM. Slender-leaved Talinum. (*Green-house Herbaceous Plant*). Portulacaceae. Polyandria Monogynia.—A pretty little herbaceous plant, seldom seen in cultivation. It inhabits various parts of North America, from Texas as far north as Pennsylvania, trailing over naked rocks, its favourite place of resort. In our gardens it is treated as a greenhouse plant, and then it forms pretty patches of lively purple flowers. It is, however, seldom seen.—*Botanical Register*.

ODONTOGLOSSUM CITROSUM. Lemon-scented Odontoglossum. (*Stove Epiphyte*). Orchidaceae. Vandeeae. Gynandria Monandria.—This plant was imported by Geo. Barker, Esq., of Birmingham, from Mexico, and given to T. Brocklehurst, Esq., of the Fence, near Macclesfield, by whose gardener it was exhibited at one of the great meetings of the Horticultural Society at Chiswick, in 1842. It has large snow-white and rose-coloured flowers, of great beauty, exhaling a delicate smell of Lemons.—*Botanical Register*.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Jan. 17.—R. H. Solly, Esq., in the chair. Miss Horrocks, J. French, Esq., and Mr. Robt. Cooper were elected fellows. A paper upon a method of heating Hothouses by steam was read, from Mr. P. Walker, gr. to R. W. Grenfell, Esq., Maisteg, near Swansea. Instead of heating water in large pipes by means of smaller ones conveying steam and traversing their longitudinally, it was proposed to introduce the end only of a steam-pipe into that of a larger water-pipe, which is continued round the house. The steam is generated in a boiler, and can thus, by pressure, be made to heat the water in the pipes to any required temperature: it may also be thrown into the atmosphere in any quantity by means of a small perforated pipe running along the top of the water-pipe. To prevent abstraction of heat, the steam-pipe is to be isolated on wooden sleepers, and to be inclosed in a tunnel of the same material. Mr. Goode, gr. to Mrs. Lawrence, exhibited a large collection of Orchidaceae and other plants, including a magnificent specimen of *Dendrobium nobile*, covered with its beautiful white and violet purple flowers; *Laelia albida*, white, having the centre of the labellum marked with yellow, surrounded with a slight stain of purple; *Cyrtorchilus maculatum*, bearing 3 fine panicles of its prettily-spotted flowers; *Peristertia guttata*, producing its singular cup-like blossoms in clusters upon the surface of the pot; a fine plant of the recently-introduced *Manettia bicolor*, whose red and yellow tubular flowers, although rather scantily produced, had a pretty effect; *Clerodendrum splendens*, a handsome species lately brought from Sierra Leone, and bearing panicles of rich scarlet; with *Laelia anceps*, and cut blooms of *Spermatocyon azuleum* and *Astrapea Wallkii*; the latter a largestove plant, with immense leaves resembling those of the Mulberry, and producing freely at this season of the year its drooping clusters of light carmine flowers: a Knightian medal was awarded for the *Dendrobium*. From Mr. Green, gr. to Sir E. Antrobus, were an exceedingly well cultivated specimen of *Euphorbia jacquiniiflora*, having each of its drooping branches terminated by a raceme of vivid scarlet flowers; fine plants of the showy *Epiphyllum truncatum*, and the scarcely less beautiful *Epacris impressa*; *Gesnera zebrina*, which, although past its best, still exhibited a multitude of its bright yellow and vermilion blossoms, with *Gesnera longifolia*, *Correa longiflora*, and *Erica Westcottii*: a Banksian medal was awarded for the *Euphorbia*. Messrs. Lucombe and Pince exhibited a pretty little Melastomaceous plant, of recent introduction from Mexico; it is somewhat similar in habit to *Saponaria ocymoides*, and thrives well in a moderately warm greenhouse, where it produces its rosy lilac flowers in great profusion: a Banksian medal was awarded for it. From G. Loddiges, Esq., a cut specimen of *Episcandrum densiflorum*, a species nearly allied to *E. nians*, and possessing, when in the hot-house, the desirable property of diffusing an agreeable fragrance: for this a Banksian medal was also awarded. A large collection of cut Orchidaceous flowers were sent by Mr. Appleby, gr. to T. Brocklehurst, Esq.; amongst them were a fine dark variety of the singular *Stanhopea Wardii*; a beautiful bloom of *Laelia anceps*; *Myanthus cristatus*, having the labellum covered with long white excrecences, resembling hairs; *Dendrobium tetragonum*, a curious species with the segments of the perianth of a light primrose colour, margined with reddish brown, and not unlike the extended limbs of a large spider, a Certificate was awarded to the *Stanhopea*. From E. Johnstone, Esq., were a pretty collection of cut Camellias, with specimens of *Garrya elliptica*, a hardy evergreen shrub, bearing catkins of great length, similar to those of the Hazel, and *Acacia pubescens*. Mr. Mountjoy also exhibited a specimen of *Garrya elliptica*. From Mr. Halley, of Blackheath, a seedling Camellia, named C. Halleyi, a pretty variety, but not superior to C. imbricata, to which it bore some resemblance. From Mr. Clarke, gr. to W. Block, Esq., a very large flower of Camellia Donckelaeri; its great size appeared to have arisen from its having been grafted upon a stock of some strong-growing variety. Mr. Goodbrand, gr. to Geo. Crawshaw, Esq., exhibited 25 bunches of excellent Black Hamburg Grapes, cut from the same Vines as those brought forward at the two previous meetings: it is unnecessary to say more in their praise than that they were equally good upon this as upon former occasions, and that to bring them to this perfection, not quite 2 sacks of house-cinders had been consumed; the fire not having been lighted more than 20 or 25 times during the season, and then only for the purpose of excluding frost or excessive damp. From Mr. J. Hammond, of Jersey, were some very good Seedling Apples, which are stated "to unite the properties of the Golden Pippin and Nonpareil, like the former, they may be eaten as soon as gathered, and they will keep as long, or nearly as long, as the latter, some of the fruit of 1841 having continued sound until the following May." The flesh is yellowish, crisp, juicy, and rich. From J. Moorman, Esq., handsome specimens of the Easter Beurre, Beurre d'Arreberg, Jean de Witte, Nelis d'Hiver, Passe Colmar, and Glout Morceau Pears, 6 very good varieties for late keeping: a Certificate was awarded for them. From the Garden of the Society were two fine specimens of *Amaryllis adica*; a plant of the true Olympian Hellebore, which will probably prove hardy in this country, the petals of which are of a beautiful, clear, greenish white; *Acacia verniciflua*, a handsome, compact-growing,

species, with orange-coloured flowers, well adapted for growing in small greenhouses; *Hoitzia Mexicana*, a plant with pale flesh-coloured flowers, of great beauty in its native country, but although introduced many years since, it is not so generally cultivated as it deserves; cut flowers of the deliciously scented *Chimonanthus fragrans* and *grandiflora*, hardy shrubs, requiring only to be protected while in bloom from wet, and worthy of a place in every garden; with a branch of *Garrya elliptica*, were also exhibited. The fruit from the Garden consisted of the following Pears: Rouse Lench, a great bearer and hardy; Ne Plus Meuris, not handsome, but of good quality; Beurré Rance, Easter Beurré, and Poire d'Austrasie. Amongst the Apples were the Pomme Royale, a kind of Russet, of good quality; Boston Russet, well-flavoured; New Rock Pippin, a small, but firm and rich fruit; Pennington's Seedling, rich, but higher flavoured after moister summers than that of 1842; and the Cockle Pippin, a good desert Apple, and an excellent keeper. A model was exhibited of Jucke's Patent Furnace. In this the fire-bars form an endless chain passing over two drums, one at each end of the furnace, and are kept in constant motion, at the rate of about 8 feet per hour, either by hand or by a strap connected with a steam-engine. The consumption of fuel is regulated by a door in front, which can be raised to any desired level. The air is constantly passing through the fire-bars, and the clinkers are carried along by the revolving bars, and fall over into an iron box at the extremity of the grate. The whole of the apparatus can be removed from beneath the boiler, when necessary. The smoke is said to be entirely consumed.

LINNEAN SOCIETY.

Jan. 17.—E. Forster, Esq., in the chair. Mr. Wm. Taylor exhibited specimens of *Camelina sativa*, a cruciferous plant, with siliqueous fruit. The seeds of this plant are used on the Continent for the purpose of obtaining oil, which they yield in abundance. The produce of the plant is large, being 40 or 50 bushels of seed per acre. Specimens of the seeds, as well as of the oil, and the cake after the expression of the oil, were also exhibited. A paper was read from W. Griffiths, Esq., of the Hon. East India Company's Service, on the development of the embryonal sac in the ovules of *Santalum*, *Loranthus*, and *Viscum*. In this paper, the author corrected some previous statements which he had made, and entered fully into the nature of the changes he had observed in the growth, structure, and relative position of the embryonal sac, nucleus, and pollen tubes in two species of plants belonging to the natural order Santalaceae. Mr. R. H. Solly exhibited, with the aid of Mr. Powell's microscope, specimens of the curious wood of *Phytocrene*. Mr. Hassall exhibited specimens of various species of *Conserve*. Messrs. W. Osborne, Neesom, and D. Rush, were elected Fellows.

FLORICULTURAL SOCIETY.

Jan. 17.—Mr. Wrench in the chair. Mr. Turville was elected a member. It was announced that at the ensuing meetings, the discussions upon florists' flowers would be renewed; the first to take place on Feb. 7, when Mr. Wildman will bring forward a paper upon the Dahlia.

MISCELLANEOUS.

Chinese Flower Gardens.—The Chinese gardens are of a peculiar character, and differ altogether from ours in their arrangements; while the care bestowed on them by their possessors exceeds anything of which we could have formed an idea. To each branch, often even to each leaf of a tree or a shrub, the utmost pains are taken to give the appropriate turn, and the gardeners may be seen sitting constantly beside the plants, and employed in binding and pruning them, in order to accomplish the desired form. The production of the greatest variety and contrast of colours is the chief object of the Chinese flower-gardeners. Strangers to refinement and the tender emotions, the Chinese have no taste for the pure and tranquil enjoyment which the perfumes of sweet-scented flowers yield. It is only in gaudy colours, and by a marvellous skill in developing singular growths, that the Chinese gardener excels. Long and straight alleys run directly through their gardens, and are bordered by low trees of one and the same species. We visited these gardens [in one and the same species] in the month of November, and remarked the following objects: close to the entrance were large masses of *Chrysanthemums*, the blossoms of which had attained an extraordinary size. Then followed whole plots of Citrons and Shaddocks, which were raised in pots, and loaded with fruit; and it was remarkable that all these fruits were divided into segments, and thus formed permanent monstrosities, which were further propagated by grafts. It is by such mis-growth that they acquire a finger-shaped appearance, which occurs also occasionally in our conservatories. In China these fruits are cultivated assiduously, not only for the adornment of the gardens, but also for the sake of the well-known Chinese preserved Citron, of which large quantities come to us by commerce. For this purpose they use chiefly the smaller fruits, 3 or 4 inches long, which are boiled in refined sugar. The larger fruits of monstrous shape are of the Shaddock kind, and often from 10 to 11 inches long, while the several segments extend singly in all directions. In the gardens these odd-shaped fruits, as well as the sweet Oranges, with which whole plots are planted, have a neat appearance, as they do not allow any trunk to form, but force them at once to spread into branches. Large borders are to be seen planted with *Camellia japonica*, and others with Cockscombs, some with white, others with yellow or red flowers; the yellow-flowered plants had shot particularly high, and they were so arranged that all the plants in a bed were of one and the same colour. We also saw in the gardens a species of *Scilla*, very like *Sc. maritima*, which showed the same sort of monstrosity as the Cockscomb. We observed Bamboos in pots, the stems of which were 2 or 3 feet high, and were wound into a spiral form from below upwards. Among the trees were the Lee-chee, Banana, *Averrhoa carambola*, and various Palms, on the stems of which *Epidendrum*s were trained. The ponds of these gardens, some of which were very large, contain beautiful fish, which are fed by a disgusting but common method among the Chinese, which is said to render them very plump. The stools in the pleasure-houses are, for the most part, of a coarse sort of porcelain, or they are formed of large flat stones supported by wooden frames; which, by their coolness in summer, must be very agreeable to sit upon, when one is accustomed to them. Single borders are frequently edged with a small-leaved Box-tree; and the long walks are bounded by hedges of *Averrhoa*, *Olea fragrans*, and other plants, which were new to us. On the whole, we must allow that the planting in regular masses of the large-flowered *Chry-*

santhemums, with Oranges, *Camellias*, *Kalmias*, and tall Cockscombs, is not altogether devoid of beauty; but a stranger can hardly reconcile himself to an arrangement which must appear to him so contrary to the rules of good taste. Hydrangeas and Asters seemed at this time to be out of fashion, for we saw very few of them.—*Dr. Meyen's Reise um die Erde.*

Orchidaceous Plants.—The collection of Orchidaceous plants in the garden has been much increased of late years by the introduction of many rare and beautiful species from the high lands of Mexico and Guatemala. When these were sent home, Mr. Hartweg informed us in his letters, that the thermometer was sometimes near the freezing point where many of them grew; and this was confirmed by the quantity of small mosses, which we found growing upon some of the branches to which the plants had attached themselves. I, therefore, about two years ago, removed many of them into a house, which is kept cooler than the Orchidaceous stove, and they have succeeded much better than others of the same kinds which were allowed to remain in a high temperature. Many of those which are most unmanageable in the Orchidaceous house succeed here without any trouble; it is evidently the most natural place for them, as in other circumstances they are over excited, growing sickly and languid, forming smaller pseudo-bulbs and leaves every year, and finally perishing.—Mr. Loddiges, and, I believe, Mr. Bateman, have both experienced the same results; it is, therefore, a circumstance which cannot be too well known, because many persons have been deterred from growing Orchidaceous plants, by believing that they require such a high temperature. The house in the Garden where they are grown has no artificial heat during the greater part of the summer, and in winter it is kept at about 55 degrees. The air, however, is always kept more moist than in a common greenhouse.—*Mr. Fortune, in the Proceedings of the Hort. Soc., No. XVII.*

Assam Tea.—The *Planters' Journal* (an Indian newspaper) notices favourably some Gunpowder Tea that had been produced in the hilly country of Assam. The specimen is declared to have a strong, high flavour, and other qualities that will recommend the article strongly to consumers in England, where it can be delivered at a cheap rate. We learn from the same source that the shares in the Assam Company that were lately offered for sale at auction met hardly any bidders, and that the prices offered were very inadequate to the amount already paid up. The Company are making another call on their shareholders of 3l. 10s. each share, divided into portions of rs. 17 8.

Agri-Horticultural Society of India.—We learn from the *Planters' Journal* that the Secretaryship of this important institution was not filled up at the departure of the last mail, and that, in addition to the other candidates, Mr. Griffiths had offered himself for the situation.

To Cook Celery.—Celery stewed in plain water till tender, and sent up to table with a toast and melted butter, exactly like Seakale, is an admirable auxiliary to a mutton-chop, &c., and for those who cannot masticate it in a raw state.—*Muscipula.*

GARDEN MEMORANDA.

Henderson's Nursery, Pine-Apple-Place.—The show-house is already becoming gay with forced flowers, amongst which the delicate blue corymbs of *Rhodora canadensis* are very conspicuous. Another humble but interesting object, and one which appears to be well suited for early forcing, is *Cyclamen coum*, the rich rosy colour of its drooping flowers contrasting well with the dark green of its foliage. *Camellias*, *Narcissuses*, and *Hyacinths* are blooming freely; of the latter, few are better adapted for this early period than *Waterloo*, a dark rose-coloured flower. A large plant of *Siphocampylus betulifolius* also promises an abundant bloom: in appearance it does not differ greatly from *S. bicolor*; if anything, its habit is stronger. In the stove we noticed several handsome plants of *Begonia insignis*; its clear pink flowers, which are abundantly produced, and its elegant drooping mode of growth, render it worthy of being more generally cultivated. *Begonia parviflora*, with small white flowers and of compact habit, is another pretty species which is extensively grown at this nursery. It is found that this genus thrives best in a soil not too retentive of moisture; and that it is beneficial during the growing season to let the mould in the pots sometimes become well dried before the plants are again watered. This treatment tends to make them more bushy, and this habit may be increased by occasionally nipping out the tips of the young shoots. *Eranthemum strictum*, an old and neglected plant, deserves a place in every collection; at this season, the deep blue colour of its flowers form a striking contrast with the scarlet panicles of *Gesnera elongata* and the more vivid tints of the terminal leaves of *Poinsettia pulcherrima*. Several plants of *Jacaranda mimosæfolia* were pointed out to us; its elegant foliage renders it at all times a handsome object. It is said to succeed best when treated like *Erythrina Crista galli*; namely, by being cut down annually, and by allowing the whole strength of the plant each season to be confined to one or two shoots. *Catesbea parviflora*, a small prickly shrub, with white flowers, is also blooming freely in this house. Amongst the plants which enliven the Heath-house are *Erica Westcottia*, a pretty variety, somewhat in the style of *E. Linnaea*, but not quite so highly coloured; *E. Lambertiana rosea*, a free-blooming winter variety; *E. exurgens coccinea*, another good winter variety, with much of the habit of *E. vestita*; *E. scabriuscula*, crowded with dense heads of white flowers; with the delicate little *E. hyemalis*, and many others. A new climbing species of *Clerodendrum* has lately bloomed in the Orchidaceous house. The colour of the petals is said to be a French-white, while that of the centre inclines to pink. *Dendrobium moniliforme* is here producing its lovely violet and purple flowers in great perfection, and scarcely less beautiful are the delicate tints of *Laelia anceps*. Many others equally worthy of notice are also in flower; amongst which we may name *Oncidium ampliatum*, with panicles of bright yellow, spotted with brown; *Cymbidium sinense* and *Rodriguezia crispata*, both very fragrant; *Dendrobium cucullatum*, its drooping branches loaded with delicate primrose and blush coloured flowers; *Pharus Woodfordii*, light yellow, having the labellum prettily curled and marked with orange; the beautiful *Zygopetalum Mackayi*; *Laelia acuminata*, white, slightly stained with purple—having a tinge of sulphur upon the labellum, and the throat strongly marked with purple.—*R. A., Jan. 16.*

New Royal Gardens, Frogmore.—We understand that the extensive works which are going on in these Gardens are progressing rapidly. Already is the west wing of the noble range of horticultural buildings, now putting up by Mr. Clark, of Birmingham, nearly completed; and the frame-work of the other wing begins

to indicate the extraordinary length to which the entire range of buildings will extend, and which we learn will be little short of one thousand feet. A neat and elegant structure, in the Elizabethan style, occupies the centre of the range, and is intended for the residence of the Royal Gardener, whose time and talents are almost exclusively devoted to superintending the formation of the new and very spacious garden, upon which some scores of workmen have long been most actively employed. The chief feature of the place, however, will be the long range of horticultural buildings already mentioned, and which, from their present appearance, bid fair to surpass any existing structure of the kind with which we are acquainted. We hope to be enabled to give our readers a more detailed description of these buildings when the range is completed.

Beau Séjour, Guernsey.—A plant of the variegated *Camellia Japonica* is now flowering in this garden in full perfection, being clothed with from 1500 to 2000 blossoms. It has attained the summit of a wall which is 11 feet in height, and is fully 40 feet in breadth. Several kinds of *Camellias* are thriving, with equal luxuriance, at Mr. Dobrée's; amongst these is a double white, which extends about 50 feet, the blossoms of which are about to make their appearance in countless numbers. What more striking proof can be given of the mildness of our climate?—*Guernsey Star.*

Reviews.

Journal of an Afghan Prisoner. By Lieut. Eyre. 12mo. Murray.

If as literary critics we had to pronounce an opinion upon this book, we should describe it as one of the most interesting that it is possible to conceive, and infinitely beyond the fictions of romance in the extraordinary tales which it unfolds. We, however, regard it merely with respect to its natural history, of which there are scraps here and there.

Frequent mention is made of a plant called the Holly Oak. In the valley of Jugdulluk, a formidable defile through which the troops had to struggle on their way to Jellalabad, the road was obstructed by two strong barriers, formed of branches of this prickly Holly Oak, stretching completely across the defile. The same plant is mentioned elsewhere as growing on the hills.

At the Pass of Udrak-budruk, the author gathered "quantities of a curious herbaceous plant, the under surface of whose leaves was covered with a beautiful crimson dewy-looking substance, which the Afghan ladies use as rouge." In one of the branches of the Tezeen valley, yellow Dog-Roses and white Tulips are mentioned, and the travellers in the heat of the day refreshed themselves in shady bowers formed of Juniper. On the hills near Cabul, the Gum-ammoniac plant is spoken of with the young flowers clustered together not unlike a small Cauliflower. It is described as an umbelliferous plant, growing to the height of six feet, and in its general appearance and mode of growth, resembling an *Heracleum*. In the same place, that is the captives' prison, in the valley of Cabul, the climate was delightfully cool and pleasant, and the cultivation luxuriant. The common trees were the Poplar, Willow, Mulberry, and *Elaeagnus*, whose yellow flowers scattered a powerful and delicious perfume through the surrounding air. Purple *Centaureas* adorned the Cornfields, and a handsome *Hedysarum*, with a Lupine-like flower, enlivened the border of every field and water-course; while a delicate kind of *Tamarisk* ornamented the banks of the neighbouring river; and in the garden was found a very beautiful *Orobanché*, growing parasitically from the roots of the Melon.

Can any of our readers tell us what the Holly Oak and the Afghan Rouge plant are?

Introduction à une Flore Analytique et Descriptive des Environs de Paris, par M. M. Cosson, Germain, and Weddell, is a little list of the plants found about Paris, with short occasional notes. It consists of 153 duodecimo pages, and gives the localities in which the species occur.

The new Number of *Martin Doyle's Cyclopædia of Practical Husbandry* begins with Manures, and ends with Paring and Burning. As usual, it is full of good, useful, practical information, of which the following is not a bad specimen.—"Lord Meadowbank's mode of rendering Peat a profitable manure is by far the best. His suggestion is to form a layer of peat which had been previously in a dry state, a little longer than the intended midden, six inches thick; and on this to lay fresh dung and peat in alternate courses, diminishing each layer of dung from 10 inches in thickness until the compost is three or four feet high, when it should be covered from the ends (which should be formed to overlap for the purpose) and the sides with peat. His lordship's proportion is, one load of dung to three of peat, in mild or warm, and a little more dung in cold weather, so as to produce a full and general fermentation, which in summer will be so rapid and violent as to require an additional application of peat. The heap should be turned upside down and thoroughly mixed, and all the lumps broken a few weeks before using, after which it ferments moderately a second time, and then presents the appearance of garden-mould, and equals farm-yard manure in strength."

CALENDAR OF OPERATIONS for the ensuing week.

We have always at command and under control, for early forcing, three of the principal agents which govern the growth of plants—heat, air, and moisture. With heat and moisture alone we can stimulate almost any plant to growth in the depth of winter. If we merely wished to enlarge the growth of our plants without reference to their flowers and fruit, we might thus succeed without any great violence to nature, and early forcing would indeed become a simple process. But having no control over light, which is the most important agent in the growth of plants, we must so apply heat and moisture as to accord with the quantity of solar light which our dull winters afford. Practice alone can determine what degree of heat and moisture may safely be applied to certain families of plants under a given quantity of light. Hence it is, on this point at least, that the observations of men in daily practice are of more importance to the amateur and young gardener than those of men of science. Hence, also, the great caution insisted on, of late years in the application of artificial heat in the comparative absence of light. The daily

range of the thermometer, however, is of much less moment as a guide in forcing, than the mean temperature of certain periods or stages in the growth of plants. At one time or other, I have forced every plant which comes under this title, from the Mango to the Early Frame Pea; and I know of none which may not have a range of from 5° to 10°, or even more in the daytime, during any stage of their progress; yet I know there are opposite and most absurd notions entertained on this point. I have even known young gardeners threatened with the loss of their situations, because they could not or would not keep their thermometers to the exact degree specified in a book or calendar. I wish it, therefore, to be always understood, that when I mention in this calendar any particular degree of heat, that I intend it to represent the mean temperature for that week; also, unless otherwise specified, that I would never go above that degree by fire-heat, and that I put little stress on a rise or fall of 10°, influenced by the weather. I would therefore recommend young men attending the forcing-houses, to hang up a piece of slate near the thermometer, with the days of the week written on it, to mark opposite to each the temperature at 8 or 10 o'clock, A.M., and at 8 or 10 P.M.; then to add all up weekly, and take the average or mean for their memorandum-books: afterwards, the average of certain stages, say from the time of commencing fires to the appearance of leaves in the vinery or the flowers in the peach-house, and so on, in all the houses, pits, or frames. This will afterwards prove much more valuable to them than a record of the daily range of the mercury.

1.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PIVINY.—The temperature here must still be kept low and steady. Tepid water only should be used for such plants as require watering; nothing is more injurious to plants in general than lowering the temperature of the soil in which they grow by the use of cold water. It is now considered in building new houses or altering old ones, that a provision for a regular supply of tepid water is indispensable.

VINERY.—There are Vines now in all stages of growth, from those whose fruit is barely set or setting, down to those whose sap is just beginning to move. Different temperatures to suit these different stages will of course be necessary; say from 45° to 50° at first, and then up to 60° as the Vine breaks into leaf, and gradually up to 70° when the Vines are in flower. The Black Hamburgh, Black Prince, White Muscadine, and other free-setting kinds will set their fruit even at this dull season in a moist atmosphere, just as well as in a dry stove; but the Sweetwater and Muscats, being deficient in pollen, require a drier atmosphere when in flower.

PEACH-HOUSE.—Should the trees be at all weak, if one-sixth part of their blossom-buds are rubbed off, it will materially assist them in setting their fruit; if, on the other hand, they are young or rather vigorous, let all their flowers remain. Keep a dry atmosphere with plenty of air; from 45° to 50° is high enough at night while the trees are in blossom.

CHERRY-HOUSE.—If you guard against frost it will be sufficient for this house at present.

CUCUMBERS AND MELONS.—Heat and moisture are the life of these plants at this early period. Several sowings of both should be made, to have a constant supply in case of accidents or failures. In a practical point of view, I fully agree with what is said about Cucumbers in the last *Chronicle*. My object has always been to endeavour to have plenty of them when wanted. The Anna Boleyn Pink and double yellow Tulip, are, in my eyes, the best in their classes: but in point of utility, the Van Thol Tulip has no rival with me. Just so with a Cucumber 12 inches long; but if an amateur chooses to have them 40 inches long, ribbed, smooth, or powdered, why not have them so if he pays for it? The extravagance of the thing is no more than for one man to grow Pelargoniums, so that twelve of them would be large enough to fill a house, in which another man could find room for two hundred smaller plants of the same sorts. If I could tell an amateur how to add 6 inches to his 3-foot Cucumber, I should not mind writing a long calendar on the subject. At any rate, cold water will not do for Cucumbers thus early.

MUSHROOMS.—When a sufficient quantity of droppings is ready, new beds for spring use may be made on a wet day, when the men can do little else.

Out-door and Orchard.

The work here is still of the common routine character. Whenever the surface-soil is dry, stir up the earth between all young crops in rows, such as Cabbages, Carrots, Onions, Lettuces, &c. Cauliflowers under hand-glasses require good attention during this changeable weather; let them have plenty of air, and take the glasses off during fine days. Place boards or some litter between the rows, for walking on. Pruning and nailing should now be nearly completed, except in the case of Peaches and Apricots, which had better be delayed till next month.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Now that many of the Orchidææ are beginning to grow, great attention must be paid to the young and tender shoots, to see that no moisture lodges in their centres, or inside the sheathy envelopes which cover the buds at the bottom of the stems or bulbs. These coverings, being now of no use, had better carefully be cut off, but not torn off, for fear of displacing any of the buds. Keep the plants always clean, and water only such as are growing, and those but sparingly. Some of the *Cyrtopodiums* might now be shaken out of their pots, the bulbs cleared of all the dry remains of the last foliage, repotted in very rich turfy loam, and plunged in a mild bottom-heat among the Pines, or any frames at work. The same treatment suits the *Phaius*, or old *Blétia* Tankerville, after the flowering is over; only, as it is of an evergreen nature, it requires to be watered all the year round. It is a most useful plant, to come in at this time, among forced flowers for the rooms or conservatory. Any scarce stove-plant may now be removed into more heat, for the purpose of increase; and cuttings of any woody plants which take a long time to strike, may now be put in and placed in a close frame or pit.

GREENHOUSE.—Abundance of air should be given at all times when the weather permits. I have seen plants die about this time in this house from want of water, when the surface of the pots were, if anything, too moist. Water often and a little at a time, as I was first taught, is the cause of nine-tenths of the failures in this way. Try the opposite, water very seldom; but when you do, mind to have every particle of soil in the pot wetted.

CONSERVATORY.—Having once got this house gay for the new year, never slacken your endeavours to keep it so till next Christmas; but to do this, you must have plenty of plants, and room to grow and force them.

PITS AND FRAMES.—When the weather will not permit the lights to be taken off, you can improve and sweeten them very much by turning them during the day; that is, let two men take hold of the light, one at top and one at bottom, and then turn it over. The inside will thus be exposed to the air, which will dry the inner surface of the glass. All sorts of pits, whether for hardy plants or for forcing, should occasionally have the lights turned through the season, particularly in winter and spring.

COLD VINERY.—Here many plants too tall for the pits are lodged; with others too soft to be entrusted there, and some from the intermediate stove, resting for a few months. Of this last class I shall this week speak of *Russelia juncæa*; a lady having lately asked how to manage it. Four or five years ago, several specimens of this plant were exhibited at the shows at Chiswick, but they have since fallen off. I treat it exactly like the Vine, pruned on the spur system. I rest it for three or four months in winter, in a cool Vinery, where the frost is excluded. If I wanted it to be in flower by next May, I should now prune it by cutting out the whole of the drooping slender shoots, made last year, to the last eye next the principal shoots; and I would cut off two-thirds of the *last growth* of the principal shoots. I would remove it to the Peach-house, or any place kept

at 50°, till it began to grow, when I would shake off all the mould from its roots, and repot it in as small a pot as I could get the roots into without crowding them; using rich turfy soil. It should then have more heat, and by the time all the eyes pushed a few inches, it would require as much heat as any of the stoves could afford. Never allow rampant suckers to rise from the bottom, unless wanted for principal main shoots. By this treatment they do beautifully for three or four months in the conservatory, when in flower. The old *Lagerstræmia indica* I treat exactly in the same way; only the spurs are left three or four inches long. What a pity it is that this fine plant should be so seldom seen!

Out-door Department.

Vegetation is now happily arrested without any great violence, and half-hardy plants are in much better condition to stand a smart frost than they were on New Year's Day. Soils and gravel should now be carted, and laid in convenient places, to be at hand for the beds and walks next spring. Keep a constant eye on neatness along the walks and grass; see also that alterations and improvements are got forward, so as not to interfere with the great business of spring.

NURSERY AND FOREST DEPARTMENT.

PLANTATIONS AND COPPICE.—See that the shoots left on coppice stools are not more numerous than the roots can maintain in vigour, and so arranged as to have an equal share of light and air. Cut back to a shoot any of the side branches which contend with the leading shoots, if you wish for long, straight poles. Clear out the drains or watercourses as carefully as you would the spouts around your buildings.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the Week ending Jan. 19, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.		THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 23d, in 1834—thermometer 58°; and the lowest on the 27th in 1827—thermometer 17°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending Jan. 20, 1843.

[The Half-sieve contains 3½ imperial gallons.	
The Sieve 7	
The Bushel Sieve 10½	
The Bushel Basket 1 imperial bushel.	
Punnets for Seakale are 7½ in. wide and 2 in. deep.	
„ Radishes 8	
„ Mushrooms 7	
„ Salad 5	

In consequence of the mild state of the weather, most kinds of vegetables are unusually abundant; foreign fruits, and many sorts of native growth, are also well supplied. *Fruit.*—Few Pines are offered, and there is a trifling advance in their price. The supply of Hothouse Grapes is becoming limited; foreign samples are very good, the Spanish Grapes fetching from 9d. to 1s., and the Lisbon, from 1s. to 1s. 6d. per lb. Good dessert Pears are less abundant, and an advanced price is consequently demanded; fair samples of the Beurré Rance and the Ne Plus Meuris are selling from 7s. to 10s. per half-sieve; the Easter Beurré from 5s. to 7s.; and the Glout Moreau, at 10s. per half-sieve. In the price of dessert Apples there is also a trifling advance; Nonpareil, fetching from 12s. to 15s. per bushel; Ribstone Pippins, from 6s. to 8s.; and Golden Knobs, 5s. per bushel. The best Kitchen Apples are the Blenheim Orange, from 4s. to 5s.; with the Royal Russet and Winter Queening, from 3s. 6d. to 4s. 6d. per bushel. Pummeloos are abundant, from 9s. to 12s. per dozen. *Vegetables.* The supply of Asparagus continues on the increase, and there is a slight diminution in its price. Seakale is equally plentiful, and of excellent quality. The best punnets are from 1s. 6d. to 2s. each. A few French Beans may be obtained, from 3s. to 3s. 6d. per 100. Rhubarb is pretty generally offered, from 6d. to 1s. per bundle. Carrots are dearer than in our last Report, having risen to 4s. and 6s. per doz. bunches. Young Horn Carrots fetch from 4d. to 6d. per bunch. Other kinds of Vegetables remain the same as quoted last week. *Flowers.* There is a great variety amongst the cut *Camellia* blooms. *Hyacinths* are becoming more general. We noticed some very clear flowers of the white *Cydonia japonica*, with *Abutilon striatum*, *Acacia pubescens*, *Cypripedium venustum*, *Azaleas*, *Gardenias*, and the Tree *Pæony*.

PRICES, SATURDAY, JAN. 21, 1843.—FRUITS:—

Pine Apple, per lb. 4s to 7s	Chestnuts, per peck, 3s to 6s
Grapes, Hothouse, per lb. 6s to 8s	Walnuts, per bush., 12s to 16s
„ Spanish, 9d to 1s	Almonds, per peck, 6s to 7s
„ Portugal, 1s to 1s 6d	Sweet Almonds, per pound, 3s
Apples, dessert, per bush., 2s 6d to 8s	Filberts, English, per 100 lbs. 60s to 65s
„ Kitchen, 2s to 3s	Cob Nuts, per 100 lbs., 70s. to 80s.
Pears, dessert, per half-sieve, 2s to 12s	Nuts, per bush., 1s to 1s 6d
Oranges, per doz., 9d to 2s	„ Brazil, 16s to 20s
„ per 100, 4s to 14s	„ Spanish, 20s
„ bitter, per 100, 10s to 12s	„ Barcelona, 24s
Lemons, per doz., 1s to 2s	„ Cob, 14s.
„ per 100, 5s to 12s	

VEGETABLES.

Savoy, per doz. 6d to 1s	Spinach, per sieve, 1s 6d to 2s
Cabbage, per doz. 6d to 1s	Leeks, per doz. bun., 1s 6d to 2s 6d
„ plants, per doz. 1s 6d to 2s 6d	Onions, per bushel, 4s 6d to 6s
„ Red, for pickling, 1s 6d to 4s 6d	„ Pickling, per half-sieve, 3s 6d to 4s 6d
Brussels Sprouts, per half-sieve, 1s to 2s	„ Green, per doz. bun., 2s to 4s
Broccoli, White, per bunch, 9d to 2s	„ Spanish, per doz. 2s to 5s
„ Purple, 8d to 1s 3d	Garlic, per lb. 6d to 8d
Beans, Kidney, forced, per 100, 3s to 3s 6d	Shallots, per lb., 1s
Potatoes, per ton, 40s to 70s	Asparagus, large, per 100, 7s to 9s
„ per cwt. 2s to 4s	„ Second, 2s 6d to 3s 6d
„ per bushel, 1s 2d to 2s	„ Romaine or Small, 2s to 2s 6d
„ Kidney, per bush., 1s 6d to 2s	Sea-kale, per punnet, 6d to 1s
„ New, per lb., 4d to 8d	Lettuces, Cab., per doz., 4d to 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	„ Cos, 1s to 1s 6d
Turnips, per doz. bun., 1s 6d to 2s	Endive, per score, 6d to 1s 6d
Red Beet, per dozen, 9d to 1s	Calary, p. hd., (12 to 15) 6d to 1s
Sprouts, per bundle, 1s 3d to 1s 6d	Rhubarb Stalks, per doz., 6d to 1s
Salsify, per bundle, 1s 3d to 1s 6d	„ Small, 1s to 1s 6d
Horse Radish, per bundle, 1s 6d to 4s	Corn Salads, per half-sieve, 9d to 1s
Radish, per doz. hands (24 to 30 each) 8d to 1s	Watercress, per doz. sm. bun. 4d to 6d
„ Turnip, p. doz. bch., 1s to 1s 6d	Parsley, per half-sieve, 1s to 1s 6d
Carrots, per doz. bunch. 4s to 6s	Tarragon, per doz. bun., 2s to 2s 6d
„ Horn, per bunch, 4d to 6d	Sage, per doz. bunches, 2s to 2s 6d
Parsneps, per dozen, 9d to 1s	Mint, per doz. bunches, 2s to 2s 6d
	Mushrooms, per pottle, 4d to 5d

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—We are so often applied to for particular Numbers of the *Gardeners' Chronicle*, to complete sets, and so many are now out of print, that we think it will save all parties trouble if we publish a list of the Numbers which may still be had. Any subscriber who will forward to our Publisher post-office stamps equivalent in value to as many Numbers as are required, shall have them sent. If parties find that they have any duplicates we shall be glad to exchange them. Those subscribers who are very anxious to complete their sets should write at once, as we have very few copies of some of the Numbers.

1811: 1, 2, 4, 5, 6, 7, 8, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 41, 46, 47.

1842: 1, 3, 4, 5, 6, 8, 9, 10, 11, 12, 16, 18, 19, 22, 23, 24, 39, 41, 42, 50, 51, 52, 53.

TO AGRICULTURAL CORRESPONDENTS.—As this class of Correspondents is increasing, we beg to say that we are endeavouring to find some one thoroughly conversant with the details of agriculture, to whom such inquiries can be referred; and we hope in a week or two to be able to discharge all our arrears under this head, in a manner satisfactory to ourselves as well as our Correspondents.

MANURES.—Agricola.—It is much cheaper to buy gypsum than to make sulphate of lime. The latter is, however, a refuse in the manufactory of patent candles, and may be bought of the makers of them.—*An Original Subscriber.*—It is stated that a compost consisting of three parts peat and one stable manure is equal to its bulk of stable dung, and more permanent in its effects. (*Liebig, Amer. edit. p. 372.*) If you can add pearl-ashes or wood-ashes to your peat, it will become a valuable fertilising material, without any stable manure at all. Ammonia will be largely absorbed by the peaty matter. Mr. Rennie's book is no authority whatever. When fermenting materials are covered over with mould, it is not to prevent the escape of carbonic acid, but of ammonia, which by degrees is partly absorbed by the substances it is in contact with, and to keep up the heat of fermentation. This we trust is an answer to all your questions. If not, you must blame yourself; for who but a young lady can read crossed writing, one-half of which is obliterated by the other half.—*J. Wollaston.*—1½ or 2 cwt. of guano will be a sufficient annual dressing for an acre of Grass land.—*H. M.*—Since you want to use your manure immediately, you had better fix the ammonia with very weak sulphuric acid. Guano must be used in mixture with 3 or 4 times its bulk of peat, ashes, cinder-siftings, gypsum, or some such material; not lime. It is too strong in its pure state; old tan is a bad material. The guano is best applied to Grass-land when the grass is beginning to grow, and in damp weather; 1½ cwt. an acre is enough. We shall be infinitely obliged for the result of your experiments.—*J. B.*—3½ render sawdust fit for manure it must be rotted; the best means of effecting which is to mix it with other substances in a state of fermentation. It then becomes valuable, not only as a source of carbon and saline matters, but as a medium for condensing the volatile matters around it. Cloacine is a good material to mix with it. We do not anticipate advantage from mixing it with gas lime, which, however, is a good manure in itself. It is absurd to say that sawdust creates wire-worms. The dust produced by singeing bombazens ought to be a good manure: acting like animal charcoal, and excellent as a disinfecting agent. But we never heard of its being so employed. Its value has to be determined by experiment.—*B. F.*—We do not find phosphate of ammonia quoted among the articles sold by dealers in manures; it must therefore be obtained of the wholesale manufacturing chemists. Sulphate of ammonia is sold by all the dealers in manure; and will no doubt become a most important substance.

TIMBER.—*A Cantab* writes thus:—“About 70 years ago a small wood of Oaks was cut down from a dry bank in the county of Cumberland. The shoots from the old roots grew up very thickly, and were repeatedly thinned, but not sufficiently, as the trees springing from them grew straight, tall, and thin, with hardly any top. For the last 20 years they were observed to increase very little in size, and by the advice of those on the spot I cut the whole down again in the spring of 1839. The first year's shoots were generally spoiled in getting away the timber, and by the last two years' growth they have become bushes of about 3 feet high, of all shapes and forms, the tops having died off in many cases for a few inches during the winter of 1841. May I ask your opinion as to their future management? Ought they next spring to be thinned out, leaving only two or three of the best shoots at each root; or should they be suffered to take their own course for one, two, or three years longer? I saw them in August last, and was much disappointed to find that none of the shoots seemed to take the lead of the rest; each old root had formed a regular bush.” The best advice we can give is, that the bushes should be immediately cleared to two or three principal shoots, and kept cleared; that the laterals of these shoots should be stopped, and the event of a season waited. If they, next autumn, appear to be getting on, we would go on for a second year in the same way, until the leading growth was decidedly established. But if, after the first year, they still continue scrubby, we should cut them down once more, and take care to watch the young shoots carefully, allowing only two to spring from each stock; and as soon as one of these has fairly taken the lead of the other, we should remove the latter.

HEATING.—A Sufferer.—The joint at the extremity of a pipe may be made water-tight at its point of junction with a brick or slate tank by what is called an “union joint.” A series of such tanks as are described at p. 19 might be connected by means of short pipes, but then the pipes must be large, and the last tank only must have an incomplete partition. We can, however, see no advantage in such an arrangement. White lead and oil are used for rendering a slate tank water-tight.—*T. S. P.*—It would lead us away from our objects if we were to admit much discussion as to the method of heating dwelling-houses. Nevertheless, we may refer you to the account of Mrs. Tysson's stove, at p. 723, of last year's volume; and state in addition that another excellent method of obtaining heat is from small water-pipes connected with a boiler at the back of the kitchen fire. The cost of your “cockle” is too great.—*Amateur.*—Joyce's stove is a very imperfect contrivance, and we can hardly recommend it. Nevertheless, if you adapt a pipe to the upper draft hole, and convey that pipe out of a pane of glass, you may possibly find it answer your purpose.

VINES.—F. Lamb.—We cannot recommend you a better recipe for destroying the scale on Vines than a mixture of clay, lime, soft-soap, sulphur, and urine, made into the consistency of thick paint. This must be applied over all parts of the Vines, after the rough bark has been removed from them. The steam of fermenting dung might assist in the destruction of the insects, but as you say the roots of your Vines are in the house, and near the surface, it would be dangerous to place a large body of fermenting material above them. Should the heat of the dung raise the temperature of the soil beneath higher than 45° or 50°, it would be highly prejudicial to the Vines at this early period, and would cause them to break very weak.—*J. D.*—There are two ways, and two ways only, in which a Yew hedge will injure a Vine border. One is by rooting into it, the other by shading it from the sun. The former, you say, is guarded against; but you make no mention of the latter. If the Yew hedge does not shade the border, it can do the Vines no harm, and the bad quality of your Grapes must be referred to some other cause.

PINES.—A Subscriber will find at p. 7 of the *Chronicle* of this year a remedy for the scale which infests Pine plants. There is such a Pine as Anson's Queen, but it is not a sort of much excellence.

PEACH-TREES.—Amygdalus.—It is impossible that your Peach-

trees should have been injured in the manner you describe, by the application of a mixture of soft soap, tobacco water, lime, and Scotch snuff. From the appearance of the shoots sent, we should judge that the trees were attacked by canker, from the roots having penetrated into a cold and unfavourable sub-soil.

FULHAM OAK.—*M. B.*—The specimen sent is the Fulham and not the Locomotive Oak; the latter has much smaller leaves, and is more evergreen. The deciduous Oak of which you speak is probably the common Turkey Oak. The Locomotive Oak is said to have been an accidental seedling, detected about 50 years since amongst a bed of seedlings in the Exeter Nursery; where five or six other distinct and handsome varieties are cultivated.

EVERGREEN OAKS.—*Georgiana.*—These trees should be pruned just at the time when they are beginning to make a fresh growth. The remarks upon pruning the Common Laurel which were made at p. 467 of last year's *Chronicle* are equally applicable to the Evergreen Oak.

ELÆAGNUS REFLEXA.—*M. H.*—You will, we presume, be able to procure this plant by inquiring for it of the London nurserymen; it came originally from Belgium.

BIGNONIAS.—*A Subscriber.*—The best of this tribe for greenhouse cultivation are *Bignonia jasminoides*, *grandiflora*, and *Pandora*, with *Tecoma capensis*.

CAMELIAS.—*A Subscriber.*—If your plants are in good condition you had better not run the risk of watering them with nitrate of soda before they flower. If applied at all, it should be given when the plants are in full growth, and then only in very small quantities.

SPHOCAMPYLUS RETULIFOLIUS.—*J. R.*—This plant succeeds best in an intermediate stove, potted in a mixture of turfy loam and heath-mould. It should regularly be shifted into a larger pot when necessary, and, if well drained, will require to be freely supplied with water. There is little doubt but it will prove sufficiently hardy to bear the treatment of ordinary greenhouse plants, and to be turned out into the flower-garden in summer.

VERBENAS.—*Verbena-Killer.*—If, as you say, the Verbena cuttings which you have placed in a small greenhouse, and which keep dying off in spite of all your attention, are well rooted, it is probable that you have given them too much water, and not sufficient air. Place them in a light and airy part of the greenhouse, and water them during this dull weather only when they really want it. If you were to procure some good Verbena-seed, you might perhaps raise some handsome varieties. The seed should be sown towards the end of February in shallow feeders, which should be placed in a gentle heat. The seedlings might be planted out, in summer, in a warm part of the garden, where they would probably flower in the autumn.

LEONOTIS LEONURUS.—*J. R.*—This plant requires to be grown in a rich loamy soil, well drained, and to be kept in an airy part of the greenhouse. It should be allowed plenty of pot-room, and be freely watered. When all danger of spring frosts is over, the pots should be plunged up to the rim in a south border, where they should be plentifully watered, and occasionally with liquid manure. They may remain in that situation until the end of September, when they may be removed to the greenhouse to bloom.

ACHIMENES LONGIFLORA.—*J. R.*—The bulbs of this plant should be started in a warm cucumber frame, towards the end of February. Each plant when it has formed a few leaves, should then be potted off separately into small pots; or, what is preferable, several may be planted together in a shallow box, after which they may be treated in the same manner as the old *Trevirana coccinea*. The temperature of a warm greenhouse suits them admirably. *A Subscriber.*—We cannot account for your plants of *Achimenes longiflora* dying down without producing bulbs. Such a thing does not usually occur. The bulbs are small; therefore you must be careful lest you overlook them.

EGYPTIAN SEEDS.—*A Student.*—All that you have to do, in order to raise them, is to place them in a hotbed, and to treat them in all respects like tender annuals. Egyptian plants will not do well in this country unless kept in frames in very warm and dry places. Any light soil will suit them.

DAHLIAS.—*C. S.*—Your communication is an advertisement. We cannot in any other form publish accounts of seedlings, of which we have no personal knowledge.

DAHLIA SEED.—*T. Wollaston.*—We cannot recommend one seedsman in preference to another. Every respectable nurseryman ought to be able to supply you with good Dahlia seed. This should be sown in a hotbed about the latter end of February, and as soon as the plants are large enough they should be pricked thinly out into wide-mouthed pots, or feeders. When all danger of frost is over, they may be transferred to the open ground.

HYACINTHS.—*Hibernia.*—We apprehend the case you mention is merely accidental. The colour in this case cannot have any influence over the rooting.

QUINCE.—*An Original Subscriber.*—The Quince seeds which are bought at the shops will germinate, if treated as recommended at p. 745, of the *Chronicle* of last year. They may be procured at the best shops in Covent Garden Market.

STRAWBERRIES.—*D. M. C.*—The drainings from dunghills form as good liquid manure for Strawberry plants in pots as any other which you can prepare. You must not, however, apply it to the plants until they begin to grow freely.

TRAINING FRUIT TREES.—*H. J. S.*—Apple and Pear-trees against walls are best trained horizontally; for Plums the fan method is preferable. In balloon-training, an upright stem is allowed to grow to the height of 6 ft.; at this height branches are encouraged, and must be trained horizontally till they are 3 ft. from the stem. They are then curved downwards by pieces of string attached to their extremities and affixed to a hoop or small stakes at the base of the tree; the top will thus assume the form of a balloon. It is necessary to train the branches horizontally in the first instance, in order that they may form a wide curve at top when they become a little bent in tying down.

FRUIT TREES.—*Clericus.*—The following is a selection of Fruit-trees which will probably succeed in your garden, situated half a degree north of Edinburgh: For your South wall, the Acacia, Royal Scot, Royal George, Malta, Noblesse, and Barrington Peaches; and the Elrige and Violette Hâtive Nectarines; these would require a little assistance from fire-heat in ordinary seasons; you might also have the May-Duke Cherry, Greengage Plum, and Moorpark Apricot. For your East aspect, the Jargonelle, Marie Louise, Beurré Bosc, 3 Hacon's Incomparable, Thompson's, 2 Winter Nellis Pears, and the Ribstone Pippin, Old Nonpareil, and Herefordshire Pearmain Apples. For your West aspect, the Breda, Moorpark, and Royal Apricots; May-Duke, Royal Duke, Elton, Downton, and Knight's Early Black Cherries, the Royale Hâtive, Greengage, Purple Gage, Kirke's Coe's Golden Drop, and Washington Plums; and the Beurré Rance Pear. Apples for Espaliers may consist of the Wormsley Pippin, Golden Reinette, Blenheim Pippin, Court of Wick, Pearson's Plate, Pitmaston Nonpareil, Court pendu Plat, Reinette du Canada, Boston Russet, and Sturmer Pippin. The extent of each aspect, divided by the number of trees as above respectively appropriated, will give the distance at which the trees should be planted. For Apples on espaliers, 15 ft. between each tree will be sufficient. The permanent trees should be dwarfs. Riders may be planted between; and if so tall as to admit of being trained downwards, they will bear the sooner.

ORNAMENTAL CRABS.—*M. N.*—The Siberian Crab, Cherry Crab, Supreme Crab, and Biggs' Everlasting Crab, are ornamental, both when in flower and fruit. Biggs' Everlasting Crab, if protected from birds, will retain its fruit all the winter.

ASPARAGUS.—*F. Lamb.*—Salt acts very beneficially upon the

growth of Asparagus; and, to give some idea of the proportion in which it should be applied, we recommended that it should be spread over the surface of the beds until they were white. *Hibernia.*—Nitrate of soda may be applied to Asparagus beds at the rate of 2 cwt. per acre; salt may be used at the rate of 2 lbs. per square yard.

CANADA KALE.—*A Shropshire Subscriber.*—The true kind is like the common "Scotch Kale" or "German Greens," but of a dwarf habit; its heads should now be in perfection, affording an abundance of sprouts in spring. It was recommended for a small garden, because of its small size, allowing more plants to be grown, and consequently more sprouts, on an equal plot of ground. We presume seeds of some spurious kind must have been procured; the true sort is excellent in quality at this season.

CABBAGE.—*An Original Subscriber.*—The Early Russian is one of the best of early Cabbages; but it is now seldom met with.

ONIONS.—*An Original Subscriber.*—The seeds of the White Spanish Onion which are sold by the London Seedsmen are chiefly imported.

SCALE ON PLANTS.—*An Amateur* says that—having seen in the *Chronicle*, at p. 805, a communication from Mr. Mallison, stating that he had destroyed the white scale on his Camellias, by having them syringed three times with Chamomile water, he procured a quantity of Chamomile-flowers, which he infused in the proportion of half-a-pound of flowers to three gallons of boiling-water, with which his plants, which were infested with the scale, have been syringed every favourable morning since the appearance of Mr. M.'s paragraph, up to the present time; he cannot, however, perceive that it has any tendency whatever to destroy the scale. But he may be in error, as he applied the mixture cold, while perhaps it should have been warm; or possibly Mr. M. forgot to mention some particulars as to the time and mode of doing it. Would Mr. M. favour him with an account of his method of applying it? *D. M.*—To judge from the leaf sent, your plants must be terribly infested with the scale insects. Your best plan will be to cut off and burn all the shoots which you can spare from the plants infested; then with gum-water to brush over the remaining branches. All that escape this process should be afterwards scrubbed off with a stiff brush. It is stated that syringing the plants with Chamomile-water has proved effectual in removing them; but doubts are entertained as to its efficacy.

BOOKS.—*A Young Student.*—Lindley's Natural System and Introduction to Botany will be your next steps. If you read French, De Candolle's *Physiologie Végétale* may also be taken. For species you must study De Candolle's *Prodromus* and Kunth's *Enumeratio*, Endlicher's *Genera Plantarum*, and Meisner's *Tabulæ Botanicae*. There are scarcely any charts of Botanical Geography, except one of Palms and another of Amarantaceae by Von Martius. None of the Numbers you mention can be had at present. *A. B.*—The only books, likely to be met with in a circulating library, which give any account of the vegetation of Himalaya and Nepal, are Royle's *Illustrations of the Himalayan Mountains*, Loudon's *Arboretum Britannicum*, and Vigne's *Travels in Kashmir*.

EXHIBITIONS.—*C. H.*—The mode, adopted by the Horticultural Society, of showing seedling Pelargoniums, embraces those points which it is desirable to ascertain in all new varieties. Cultivation (which it is always desirable to see) does not form the subject for examination in this class; it is the properties of the flower, and the general habit of the plant, that the judges are called upon to investigate and decide upon. Therefore a fine flower moderately cultivated would be successful against one of inferior qualities with the highest cultivation. Seedling Pelargoniums frequently become deteriorated in the second season; and we have known seedlings of first-rate character, to which prizes have been awarded, discarded in the second year as worthless. This renders the system of showing in trusses unsatisfactory, besides its being open to other objections. By the present arrangements the habit of the new variety (an essential point), as well as the qualities of the flower, will be at once seen: an advantage impossible to be gained by the former mode of showing. The disadvantage of living at a great distance from the place of exhibition is not increased by this new regulation; it is the same whether you exhibit in trusses or in pots.

GARDENERS.—*A. B. C.*—There are good and bad gardeners and bad and good masters. Some gardeners are well paid, others ill paid; some get much more than they deserve, others much less than they ought to have. But we cannot settle these things; it would do gardeners no good if we were to attempt it. Let them help themselves by discouraging ill-conduct in their brethren, and persevering in good conduct themselves. Thus shall they raise the character of their profession, and with that character will rise their wages. For our own parts, we can truly say that many gardeners, or persons who call themselves so, are not worth labourers' wages, and utterly ruin the credit of really good and deserving men.

HERBARIUM.—*Freshman.*—Very few leaves will keep their greenness more than two or three years; they all become brown eventually. If plants are not succulent, and are dried very quickly without artificial heat, they are the most likely to remain fresh-looking. Some one recommends the use of pads filled with muriate of lime for this purpose; but we have no experience in that practice.

GREENHOUSE.—*L. T. F.*—In a greenhouse which is only eight ft. wide, we cannot recommend you anything which will be more convenient, or contain a larger number of plants than a rising stage. As the height of your house is 6½ ft. in front, there will also be room for a shelf for small plants above the pathway. If you were to build a pit in the centre of the house, the number of plants which it would contain would be very small.

PLANT STAGES.—*Laurestinu.*—It is almost impossible to give advice in a newspaper as to the manner of laying out gardens, or, which is the same thing, disposing the plants in a greenhouse. In your case, we regret to say that the difficulty is increased by the imperfect information you have given us. Nothing is said of the roof, nor of the aspect, nor of the height, nor of the situation of the heating apparatus. Supposing, however, that it has a sloping roof facing the south or thereabouts, you seem to have no means of placing plant-stands except in the form of a stage resting with its back against the back wall, and turning again at the brick wall. In addition to which you may have a shelf or two in front, and a walk to separate these from the main stage. All such matters are, however, only to be settled well by actual inspection.

EXCHANGES.—*C. P.*—We are very sorry to be obliged to say that we cannot undertake to effect exchanges. All such transactions can only be arranged by means of advertisement. We may, however, congratulate you on the success you must have with your Cape bulbs. Few persons, if any, can rival you in this respect.

SLATE BOXES.—*W. B.*—Nothing can answer better than slate boxes for growing Orange-trees in.

PAINT.—*A Constant Reader.*—Wash the pipes with bleaching-powder and water.

WALKS.—*B. H.*—You will find full directions for making asphalt walks at p. 379 of last year. Burnt clay will no doubt assist you in improving your walks; but the asphalt is better.

SUGAR.—*J. E. M.* asks about a plant indigenous to Greece, from the root of which it is intended to extract sugar; he thinks it is some species of *Narthecium*, but is not certain; and believes that a company is about to be formed for conducting the operation. Can any one give him information upon this subject? We know of no *Narthecium* to which this inquiry can have relation.

MISCELLANEOUS.—*Medicus.*—Did you pay the postage of your letter? If not, that will account for our not receiving the first, as

unpaid letters are refused.—*B. T. W.*—You must inquire among your Botanical friends for the Grasses you want; they are not to be bought that we know of.—*A Well-Wisher.*—Your question is not Horticultural. The word has no meaning, but was used, we believe, as a piece of nonsense in the burlesque of Tom Thumb.—*J. R., Woolwich.*—We do not recognise the leaf sent.—*Robin.*—There is no such plant as *Pomerania splendissima*.—*Vitis.*—We cannot make a point of inserting articles in the *Chronicle* as soon as they are received. Many communications must necessarily stand over for want of room. Yours has been in type for several weeks, and will probably appear either to-day or in our next Number.—*J. Hill.*—We have no recollection of the question to which you allude.—*J. L. Wood.*—We cannot inform you what your packages would cost. The only means of obtaining packages of plants from Belgium and Paris is by the Diligence, or ordinary conveyance. We shall be obliged.—*R. G.*—You must watch amongst our advertisements, where the first volume of the *Chronicle* is occasionally advertised. There is no chance of its being reprinted.—*An Amateur.*—Your plant is *Clématis balcanica*, and is also known as *C. calycina*.—*A. S.*—We cannot answer such questions; they should be addressed to the nurserymen.—*A Subscriber* may obtain the Index of 1841 by enclosing Post-office labels to the amount.—*Gulielmus* will see by the list at the head of "Notices to Correspondents" the Numbers we have. For any Numbers not in that list we are willing to give 6d. each.—*A Nursery Foreman.*—The last Number for July is out of print.—*S. H.*—We really cannot help you. Our letters, when addressed like yours, do not miscarry.—*J. M.*—We cannot read your writing, and do not know what you mean. What are "Sinetines of National Scots Fir Tree shones?"—*Gulielmus.*—On your Pear-tree covering a north gable you may graft the Jargonelle, Hacon's Incomparable, Flemish Beauty, Marie Louise, Thompson's, and Knight's Monarch Pears.—*Amateur.*—Cobbett's Apple is the Reinette Blanche d'Espagne, which had been taken out, probably by French emigrants, to America, whence Mr. Cobbett obtained it. The Mother Apple, (of some, is the Burr-Knot. The Kentish Fill-basket is a large Apple for kitchen use; and the Hawthornden has the character of being an early and very abundant bearer.—*Curmel.*—The Apple, which you state has been cultivated in your neighbourhood for nearly a century, is the Court-pendu Plat.—*A. C.*—Your Apple is undoubtedly Coe's Golden Drop. You will observe that the fruit of this variety is, in general, peculiarly marked with rust-coloured specks.—*R. B.*—Your Pears are the Gilgil.—*A. E. S.*—The Pea you describe as having been received originally in your part of the country from the Horticultural Society, and answering well both early and late in the season, is doubtless Knight's Tall Marrow. The disease you mention is caused by a fungus, and is not peculiar to the Auvergne Pea. Its attack is induced by such conditions as are unfavourable to the growth of the plant.—*C. C. B. P.*—You will find a list of Potatoes at p. 841, Vol. II. A typographical error occurs from a transposition of the figures referring to the above, at p. 857.

ERRATA.—In Mr. W. R. Whale's Advertisement of Seedling Dahlias, inserted Jan. 14th,—for 2nd prize at Devon and Exeter, read 1st; and for 3rd at Marlborough, read 2nd. As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE discussions in the French Chambers during the past week afford a good insight into the state of parties and the opinions of their leaders. Although the debates were merely introductory to the appointment of the Commission on the Address, although no definite question was before the House, men of the most opposite shades of opinion seemed eager to seize the opportunity for denouncing the Right of Search. The extreme party contended for the immediate abrogation of the Slave Trade Treaties of 1831 and 1833; while others, feeling that such a course would lead to an immediate rupture with England, proposed a negotiation for their gradual abolition. It was contended, on one hand, that the last Chambers having compelled the Government to refuse the ratification of the treaty of 1841, it was impossible for the present Chambers to sanction any other treaties which were almost identical with it in principle; while M. Guizot declared that the treaties, though merely temporary, and contingent on the suppression of the Slave Trade, were nevertheless in force, and ought, therefore, to be legally executed. The result of this excitement will probably be the introduction of a passage into the Address, recommending increased vigilance in the execution of the treaties. Their abrogation by a legislative vote would not only be subversive of all the principles of diplomacy, but, by the admission of all parties, would amount to a declaration of war with England. It is not supposed that the Opposition party is strong enough in the Chambers to effect this object; but the course they have taken thus early in the session may be received as a significant indication of French feelings on this important subject.—From Spain we have accounts of the enthusiastic interview between the Regent and the National Guard of Madrid, and of the rumoured negotiations between the King of the French and the Austrian Cabinet for effecting a marriage between Queen Isabella and the eldest son of Don Carlos. Letters from Barcelona state that, although the time for the forced contribution has been again extended, a very small proportion has yet been collected, and that many of the inhabitants are leaving the city to escape the operation of the decree.—From Portugal there is nothing new; the Chambers have been occupied with routine business, and with a consideration of the measures adopted by Ministers during the recess, with a view to a bill of indemnity.—In Prussia, public attention is entirely occupied by the recent proceedings of the Government against the freedom of the press. One of the leading journals of Leipzig had lately published a letter addressed to the King of Prussia by the poet Herwegh, whose recent interview with his Majesty will be in the recollection of our readers. The language in which this letter was couched is admitted on all hands to have been indecorous and dis-

respectful; but the offence was considered so serious by the Government, that they have prohibited the circulation of the Paper in every part of the Prussian States, and have thus virtually crushed it. The affair has caused great excitement throughout Germany; more particularly as so harsh a measure was not expected from a Government which had apparently identified itself with the progress of free institutions.—The affairs of the Levant are again unsettled. The amicable relations between Turkey and Greece have sustained another check, and the interference of Russia is likely to produce additional complications in the Servian question. The election of the new Hospodar of Wallachia has terminated in the triumph of the Russian candidate, and thus one of the most important provinces of the Danube will continue subject to her control.

At home, we have received from all parts of the country distressing accounts of the recent storms. The great extent over which they prevailed had in some measure prepared the public for this intelligence, but the disasters on the coast, which every day of the past week has made public, have perhaps been unparalleled in their amount. Our Paper contains the particulars of many of these calamities, and there is, unhappily, no doubt that a great number have occurred of which we have received no tidings. The shipping-interest has not for many years sustained so severe an injury, and the unusual loss of life has added to the general depression which these disasters have produced in all classes of society.

Home News.

Court.—Her Majesty, Prince Albert, and the Princess Royal returned to Windsor Castle from Claremont on Monday last, and are quite well. The health of the Prince of Wales has considerably improved within the last few days. Prince Albert, attended by the Duke of Buccleuch and the gentlemen of his suite, came to town yesterday, and transacted business at the office of the Duchy of Cornwall.—The Earl of Morton has succeeded Lord Rivers as the Lord in Waiting; and Colonel Drummond, of the Scots Fusilier Guards, has succeeded Mr. R. Ormsby Gore as the Groom in Waiting on her Majesty. The Duchess of Norfolk, who has been in attendance on her Majesty as Lady in Waiting, left the Castle on Thursday for Town, in consequence of the continued indisposition of the Duke of Norfolk, who had for several days been expected at the Castle. The Viscountess Canning has arrived at Windsor to take the duties of the Duchess of Norfolk as Lady in Waiting on her Majesty.

Parliamentary Movements.—Lord Clive was on Monday elected without opposition member for North Shropshire, in the room of the present Lord Hill, elevated to the Peerage by the death of the late Commander-in-Chief. The sudden death of Col. Clements creates a vacancy for the County of Cavan; the Hon. Somerset Maxwell has issued an address to the electors, soliciting their votes in favour of the Hon. Capt. James Maxwell, of the 59th Regiment, and third brother of Lord Farnham, who is at present at Jersey with the depot of his regiment.—An official summons has been issued by Lord John Russell, as leader of the Opposition, informing the Members of Opposition that questions of importance affecting the state of the country will be brought forward at the commencement of the session.—Sir R. Peel gave his first Cabinet dinner on Tuesday, and has issued cards for the usual full-dress Parliamentary dinner on the 1st Feb., the day previous to the meeting of Parliament.

Foreign.

FRANCE.—The news from Paris is almost exclusively devoted to the discussion of the Right of Search, and to speculations both on the address and on the divisions to which it will give rise hereafter. The debates introductory to the Commission on the address, the members of which were nominated favourably to Ministers, are peculiarly interesting to English readers, since it is generally considered that the abrogation of the Slave-trade treaties of 1831 and 1833 would be a declaration of war between France and England. The arguments employed against the maintenance of the treaties of 1831 and 1833 are various. The extreme party would abolish them, from pure hostility to England. Others, like the members for the great seaports, oppose them, because they are the pretexts by which England secures her domination of the seas; and the mildest foes of the treaties would abrogate them, because they threaten to produce collisions. The chief speakers against the treaties in the debate on the Commission were M. Barrot and M. Dupin. M. Barrot denied that the refusal to sign the treaty of 1841 was enough. The amendment voted by the last Chamber complained of the principle of the treaties of 1831 and 1833, and the present Chamber could not sanction those treaties. He did not want to abrogate those treaties at once, or break with England; he merely wished for negotiation. M. Dupin held the same language, and advised the Government to imitate the United States. M. Lanyer, a follower of Count Molé, went farther, and argued that England had broken the treaty of 1831. The 9th article of that treaty obliged her to make efforts to induce all countries to join in the right of search. Instead of acting up to this article, Lord Ashburton abandoned it, and waived all such pretensions in his treaty with America. France was, therefore, doubly entitled to imitate not merely the United States, but England herself, which abandoned the principle of the treaty whenever she found it

impracticable. M. Lacave Laplagne, Finance Minister, declared he had been against the treaty of 1841, and would gladly see that of 1831 repealed. But it could not be done unconstitutionally or unfairly. France herself had pressed the negotiation of the treaties. They had been ten years in course of execution before she complained, although the acts complained of had long taken place. There were seven instances of abuse complained of, and the way in which the English Government listened to and received those complaints, left no cause for saying that the spirit of the treaties would not be respected. M. Duchatel pleaded that the Government had done much in refusing to ratify the treaty of 1841, without bringing about any interruption of harmony between the powers. Their exertions had been confined to this. They had entered upon no negotiation with regard to the treaties of 1831 and 1833. M. Guizot said that the treaties existed. They were not perpetual in their nature, as they related to what was temporary, viz., the Slave trade. When this has been suppressed, the treaties will cease of themselves. At present they exist, and ought to be legally executed. He admitted that certain regulations, tending to prevent abuse, had been neglected. One of these was the annual convention, fixing the number of cruisers. This regulation would again be put in force. It was the subject of pending negotiation, which would prevent any abuse of the right of search.—This debate will show what is the prominent topic of French politics at this moment. There is no doubt that the Commission will introduce a paragraph, either suggesting an increased vigilance in the execution of the treaties, or expressive of the wish of the Chamber that the abrogation of the right of search principle may be accomplished by the means of negotiations. All the leading parties, however, disavow the notion of wishing a rupture with England by a demand for annulling the treaties of 1831 and 1833; but the feeling is strong and universal for some arrangement similar to that concluded with the United States. Count Molé has declared that he is intimately convinced of the value and importance of the alliance between England and France; and that, although opposed in principle to the right of search, as he was when formerly Minister of Marine, still that he would religiously observe and execute all existing treaties. M. Thiers, also, although cautious in his language, manifests the desire that no attempt may be made to come into contact with European diplomacy by the attempt to break up solemn treaties by the expression of a legislative vote.—It appears that the Sugar Duties Bill will be the field of a serious attack upon the Government. The Chamber of Commerce of Paris has declared against the ministerial project, and adopted a report against the subject. It deprecates, as does the *Journal des Débats*, the suppression of the beet-root article, and insists on the equalization of duties at 40 francs on both sugars. M. Thiers will be the opponent of Ministers on this question, which, when the Right of Search is got rid of, will be the prominent topic of the ensuing session.—The Minister of Finance has laid before the Chamber of Deputies a comparative statement, showing the difference existing between the estimates of 1843 and the last budget voted under the restoration. According to that document, the increase in the receipts rose during the last 12 years to 361,576,999f., and the diminution to 60,190,774f., leaving an augmentation of 301,386,225f. The augmentation in the expenditure, during the same period, has been 498,638,012f., and the diminution 116,216,514f., which leaves a net increase of upwards of 380,421,498f. The administration of Customs has also presented to the Chambers the general returns of the coasting trade during the year 1841. This trade occupied 79,483 vessels, navigated by 315,809 men, and measuring 2,424,246 tons. The returns of the Excise taxes for 1842 amounted to 751,257,000f. (30,000,000l.) As compared with those of 1840, they exhibit an increase of 68,622,000f. (2,720,000l.), and exceed those of 1841 by 35,584,000f. (1,440,000l.)—The Miscellaneous news may almost be disposed of in a single paragraph. It is rumoured that M. Lacave Laplagne, Minister of Finance, intends to retire because he is hostile to the treaties of 1831 and 1833, and that the Minister of Marine has been authorized to establish armed factories on the coast of the Gambia. The Toulon papers state that the crew of H.M.'s frigate Belvidera, Hon. Capt. Grey, were beaten in a rowing match in that harbour a few days since by the crew of the French line-of-battle ship Friedland. The statue voted by the Council-General of the Tarn to the memory of La Proust has been cast at the foundry of M. St. Denis, with complete success. It is to be erected at Alby, the birthplace of the celebrated navigator. The struggle between Calais and Boulogne, as to which of the two towns should form the point of communication of the coast with the north line of rail-road, is said to have been decided by the Ponts et Chaussées in favour of Boulogne.

SPAIN.—We have accounts from Madrid to the 9th inst. They state that the deputies of different political opinions had held frequent meetings in that capital for the purpose, no doubt, of preparing for the electoral contests which were to commence on the 10th March. The solemnity of Twelfth-day had attracted a large concourse of the nobility, ambassadors, and visitors to the Palace of Buena Vista, where the Regent received them on that day. Since the time of Ferdinand VII. no reception at Court had been attended with so much éclat. The Regent replied to the address presented to him on the occasion by General Ferras, in the name of the National Guard, that his only desire was to promote the well-being of the nation, and that he had no other interest than that of defending liberty, the constitution of 1837, the throne of the Queen, and the independence of his country. After praising the patriotism displayed by the militia of Madrid

in October, 1841, the Regent added:—"I am the chief of the State, the Regent of the kingdom, during the minority of our august Queen. In the course of twenty-two months her Majesty will have attained her majority, and my heart tells me that I shall then be able to say, 'Madam, on me devolves the glorious mission of committing to your hands the destinies of a great and independent nation; so great, Madam, that not only is it respected, but dreaded, by foreign nations.' My heart, I am sure, will not deceive me. This object once achieved, I will retire into private life, amidst my fellow-countrymen: I have no other ambition. But if, when seated by my family fireside, I see the throne shaken, and the constitution we have sworn to maintain exposed to danger, I will again fly to their defence, offer my breast once more to our enemies, and sacrifice my life, if necessary, in order to save liberty, the throne of Isabel II., and the constitution." The Regent was interrupted here by the enthusiastic applause of the National Guards. He then resumed:—"Nationals! Such are the sentiments of a true Spaniard. Should the enemies of our glory and our liberty attempt to tarnish the honour of that soldier, of the Spaniard who now addresses you, I authorize you to tell them that they are *villanos* and traitors, and that you have read the heart of a man who knows no deceit. Time passes over rapidly: time will show the sincerity of that citizen-soldier, of that old Spaniard, who desires nothing beyond the glory of his country." This speech was received with the most deafening *vivas*, and the chief of battalion of the artillery of the National Guard, M. Villabriga, having stepped forward, protested, in the name of his comrades, that if there existed men so insane as to meditate projects against his life, he might depend on all the National Guards of Madrid sacrificing their lives in defence of his person. Since this took place, the officers of the National Guard have presented an address to Government, praying for the adoption of measures against the calumnies of the daily press against the Regent. The National Guard of Madrid are its citizens; its officers are elected by those citizens, and hence this document is virtually a protest of all the citizens of the capital against the journals of the same city. In State affairs there is nothing new, except the daily increasing conviction that the French Court is busily engaged in secret negotiations respecting Spain. It is believed that Louis Philippe and Queen Christina are at this moment negotiating, at Vienna, the marriage of Queen Isabella with the eldest son of Don Carlos, and that Prince Metternich is disposed to give his sanction to the scheme.—Letters from Barcelona of the 8th inst. state, that the greatest effervescence prevailed in that city in consequence of the *bando* issued by the municipality at the desire of the new Captain-General. Not more than 27 citizens had, in compliance with the General's injunction, presented themselves to pay their quota of the extraordinary contribution, of which only about 8,000l. had as yet been collected, leaving no less than 112,000l. to be paid up. Many of the inhabitants were determined to leave the city rather than obey the orders of the authorities; and others had resolved on opposing passive resistance, and allowing their property to be seized, sooner than submit to the exaction. The rebuilding of the citadel was proceeding very rapidly, and so desirous were the military authorities to accelerate its completion, that the works were not even interrupted on Sundays and other holidays, which is very unusual in Spain, where the Sabbath is strictly observed.

PORTUGAL.—We have advices from Lisbon to the 9th January, and letters and journals from Madeira by the same packet to the 23d December. The Chambers at Lisbon had been occupied with routine business and the verification of the late elections. The Ministers were submitting to the Chambers a statement of the various measures adopted by them during the recess, preparatory to the proposition of a bill of indemnity, and the Queen's speech had not yet been taken into consideration. The French and English line-of-battle ships still remained watching each other. Commodore Sir Charles Napier returned to England by this packet.—The brig-of-war Don Pedro had arrived from Madeira at Lisbon with the report of the commission on the subject of tariff reductions, which the Government was expected to adopt. Were it not for the unusually large number of 400 English invalids and strangers now wintering at Funchal, and spending large sums of money, the shops, and even the Custom-house, would be closed, and the island literally ruined. The weather had fortunately continued fine.

GERMANY.—From Berlin we learn that the King of Hanover arrived there on the 10th, from Dessau. On the previous day the Crown Prince set out for Altenburg to spend a short time with his bride; and it is expected that the King will join him there before his return to Hanover. The Prussian Government lately issued an ordinance against the Leipzig *Allgemeine Zeitung*, not only prohibiting its circulation in Prussia, but at the same time prohibiting the forwarding of the Paper through any Prussian post-office. The number of subscribers in Prussia is estimated at 2,400, in addition to which all the subscribers in Mecklenburg, Hamburg, Hanover, Frankfurt, &c., who were accustomed to receive the paper through the Prussian Post-office, will henceforth be prevented from receiving it. Under these circumstances the decree will have the effect of completely extinguishing the paper. The reason which drew down upon it so severe a measure of anger, was the publication of a letter from the poet Herwegh to the King of Prussia, a letter which is spoken of on all sides as having been couched in highly indecorous language, but which Herr Herwegh himself declares was published without his consent, and contrary to his wish. It seems that he is a young man, a

native of Zurich in Switzerland, and consequently by birth a citizen of a republic. He has acquired a good deal of celebrity in Germany as the author of political lyrics. He had been connected with the *Leipsic Gazette*, although he resided at Berlin, and he was about to undertake the management of an Opposition paper at Königsberg. A report was current that this new paper would be the organ of extreme opinions. The Prussian Government, therefore, prohibited its appearance, and thus called forth the letter which has produced all this excitement. Our readers are already acquainted with the interview between the poet and the King of Prussia a few weeks since, which this affair is likely to make famous throughout Germany. A letter from Leipsic says—"Our town presents a striking proof of the advance in public prosperity caused by the introduction of railroads. Since the completion of those between our town and Dresden, Berlin, and Altenburg, the population, which was before only 43,000, has increased to 55,000, or a quarter more. The business of the fairs here, which five years ago amounted to 40 millions of thalers (144 millions of francs a-year), at present has reached the sum of 70 millions of thalers (252 millions of francs) per annum."

TURKEY.—Accounts received by way of Vienna from Constantinople, dated the 21st ult., announce a fresh rupture between the Ottoman and Greek Governments; and it was feared that the Turkish Minister at Athens would demand his passports. The election for Hospodar of Wallachia took place at Bucharest on the 1st inst. The national Wallachian party brought forward Styr Bey as their candidate, but the Russian party triumphed; their candidate, M. Bibesco, having succeeded in obtaining the absolute majority, and was declared duly elected Hospodar of Wallachia. A rumour was current at Constantinople that Col. Stoddart, formerly attached to the mission in Persia, and Capt. Conolly, who wrote an interesting account of his travels in Central Asia, and who was at Constantinople in 1837 or 1838, have been beheaded in Bokhara. It is said that they were seized by the authorities of Bokhara as spies, and could have got away through the favour of the Russian political agent, but refused his assistance; and after a number of trials and sufferings, they were at last taken from prison to the market-place, where Colonel Stoddart was first beheaded. That when this was done, Capt. Conolly could still have saved himself had he consented to embrace Islamism; but firmly rejected the offer, and also immediately fell under the headsman's knife. Such is the account as given in letters from Constantinople, but it is hoped that it may prove unfounded. —Advices from Tunis, of the 20th ult., announce that the Bey had, of his own free will, proclaimed the freedom of the children of slaves hereafter born in the Regency.

CAPE OF GOOD HOPE.—We have advices this week from the Cape of Good Hope of the 26th Nov. brought by the unfortunate East Indiaman *Conqueror*. The papers dwell at some length upon a declaration of war, or at least a denunciation of the British government, and a renunciation of allegiance, by an assembly of Boers in the vicinity of the Orange River, close upon our border, in the presence of Mr. Justice Menzies, chief puisne judge of the colony, and other authorities. They also made overtures to the Griqua chief of Philippolis to unite with them in the revolt. The Judge had taken formal possession of the district on account of the English government; but this act had been repudiated by the Governor as unnecessary, the whole territory belonging already to the Crown. The affair, however, is treated in a very serious light by the Cape press, which laments that the government had for some time past been "letting down its authority;" and says that the natural result of this behaviour "has been open rebellion, bloodshed, devastation, and plunder, and is now a more extensive rebellion than has ever been known in South Africa under either the Dutch or British government. The *South African Advertiser* declares that mischief has been done that will require thousands of soldiers to repress, and at an expense of not less than a million of money. The country about Graham's Town, and to a long distance in the interior, is represented as having been in a deplorable state from a protracted drought. Many farmers had been obliged to quit their farms by the entire failure of water. Both the Fish and Sunday Rivers had ceased to flow; many springs had dried up, the pasturage had disappeared, and even the hardy karoo bushes presented nothing but thin, dry, and blackened branches. The rains, however, had at last commenced; and it was hoped that many of the crops, which were rapidly failing for want of moisture, would be partially secured.

BRAZILS.—By the Express packet, which left Rio on the 27th Nov., we have intelligence that the Right Hon. H. Ellis, the Special Envoy from her Majesty, had been most favourably received by the Emperor and his court, and though there was a good deal of opposition to the tariff proposed by England, yet the predominant feeling was in its favour, and it is fully anticipated that the Envoy will be able to come to such an issue as will improve the intercourse between England and the Brazils. Mr. Ellis arrived in H.M.S. *Salamander* on the 11th inst., and delivered a long address to the Emperor in French; to which his Imperial Majesty replied as follows—"You may assure your august Sovereign, that this additional proof of her friendship is very gratifying, and highly esteemed by me."

UNITED STATES AND CANADA.—The mail-steamer *Britannia* arrived at Liverpool on Sunday night. She encountered dreadful weather during the passage, and felt the full effects of the hurricane on Friday. She has, notwithstanding, made the voyage in less than 14 days from port to port, and brings papers from New York to 31st ult., from Boston to 1st, and from Halifax to 3d inst.—The proceedings in Congress were of the ordinary kind.

The subjects before it were purely domestic, though allusion had been made to the Oregon territory, on a motion being made for papers concerning it. The Government seemed to be blamed for having passed the subject over in the negotiations between them and Lord Ashburton. The news of the recent successes in China, and the retrieval of the British arms in India from the disastrous campaign in Afghanistan, had excited lively feelings of astonishment, mixed up with a portion of jealousy, on the part of the American commercial classes. The inquiry into the circumstances of the mutiny on board the *Somers*, the details of which are already before our readers, was sitting at Brooklyn, opposite New York, on board the *North Carolina*, and was exciting the very greatest interest. The court consisted of three of the oldest commanders in the service, and of the Hon. Ogden Hoffman, the Judge Advocate. The three days' proceedings before the court are reported at considerable length in the New York papers. The inquiry had not terminated on the 31st; but, as far as it had progressed, the belief was general that the commander and officers had performed a perfectly justifiable act in condemning and hanging the chief parties implicated in the conspiracy.—Letters from Canada give a more favourable account of the Governor-General's health, indeed much more so than was anticipated. There is not the slightest doubt that he will return to this country as soon as possible, and his medical attendants are of opinion that by the change of climate his health will be thoroughly re-established.

CITY.

Money Market, Friday.—Consols for the Account closed at 94½, and the same for money; Three per Cents. Reduced, 95½ to 1; Three-and-half per Cents. Reduced, 101½ to 2; New Three-and-half per Cents., 100½ to 1; Bank Stock, 172½; India Stock, 261½; Exchequer Bills, 63s. to 65s. prem.

Metropolis and its Vicinity.

Attempt to Assassinate Sir R. Peel's Secretary.—We are concerned to announce that an attempt was made yesterday afternoon, in open day, and in a crowded thoroughfare, to assassinate Mr. Edward Drummond, the private secretary of Sir Robert Peel. Very few particulars have as yet transpired, the assassin having refused to give his name, or explain his motive. It has, however, been ascertained that he is called Daniel M'Naughten—a native, it is supposed, of Glasgow. The crime was perpetrated in front of the Salopian Coffee-house, close to Charing-cross. It appears that Mr. Drummond had left Sir R. Peel at the Council-office, and had been at his brother's bank at Charing-cross. He was returning to Downing-street, in company with a friend, when M'Naughten came behind him and discharged two pistols almost simultaneously into his back. One missed fire, but the bullet from the other entered in a slanting direction, and passed into the right thigh. The assassin was immediately seized by the bystanders, and the wounded gentleman was supported into Messrs. Drummond's Bank. On the arrival of a surgeon, Mr. Drummond was removed to his own house, in Grosvenor-street. The ball has since been extracted by Mr. Bransby Cooper and Mr. Guthrie, and although a portion of the linen which was forced into the wound still remains there, the surgeons have declared that no vital part is injured, and that they have every reason to believe that Mr. Drummond is doing well. It has been discovered that M'Naughten had been seen lurking about the residence of the Prime Minister for several days past, and there is, therefore, reason to suppose that Sir Robert Peel was the destined object of this attack. It seems impossible to imagine any personal motive for the commission of a crime hitherto so un-English in its character. In private life no man could have been more generally esteemed than Mr. Drummond, and his kindness and courtesy had so completely gained him the respect of all who were brought into communication with him in his official capacity, that all suspicion of the assassin having been actuated by private vengeance is at once removed. The man's dress and appearance resembled that of a gentleman's valet. He was immediately apprehended, and remains of course in the custody of the police.

The late Hurricane.—The daily papers have given long accounts of the damage done in the neighbourhood of town by the hurricane of Friday night. The streets of the Metropolis and the suburbs were strewn on Saturday morning with fragments of broken chimneys, pots, tiles, slates, &c.; while, out of town, trees, palings, &c., have been blown down in all directions. In St. James's and Hyde Parks the promenades were covered with branches of trees. In Kensington-gardens, an ancient elm, on the border of the Black Pond, which had for scores of years been the pride of the spot, was torn up by the roots. On the Bayswater side of the gardens a lofty lime shared the same fate, and an oak in the long avenue was blown down, while all parts of the ground were covered with branches of trees. On the Palace-green, at Kensington, opposite the apartments of the Duke of Sussex, a large tree was also torn up by the roots. At Brompton-row, in the Fulham-road, two ash-trees, which have for years formed part of a row skirting the edge of the footpath, were torn up by the roots; fortunately, though numerous persons and vehicles were passing along at the moment, no accident occurred. At Hackney, Islington, and Kingsland, many trees were blown down, and several walls and fences were destroyed. At Notting-hill, Shepherd's Bush, and other elevated and open parts, nearly every house suffered more or less. In Holland Park much damage was done to the trees; and in the Addison-road a green-house, on the premises of Mr. Jackson, was

blown down. Up the river, about Chelsea, Fulham, Putney, Wandsworth, Hammersmith, Richmond, &c., several barges, some heavily laden, with boats of every description, were drifted from their moorings, and although the greater part of them ran on shore, several were sunk. Along the shore on each side, the walls and palings and some fine trees, were blown down, and considerable damage was done to many of the market-gardens by the influx of the tide. In Chiswick Park, the seat of the Duke of Devonshire; Ealing Park, the seat of Lady Carr; Zion Park, Duke of Northumberland's; Osterly Park, Earl Jersey's; Hanworth Park, Mr. Perkins; and Stanwell Park, Sir J. Gibbons; several fine trees were uprooted, and limbs and branches torn off; while the roofs of sheds, outhouses, and stacks were blown off in other quarters. In the course of Saturday alone, intelligence was received at Lloyd's of the loss of 22 vessels, and 56 other losses were reported on Monday, exclusive of partial injuries. It would fill a large portion of our Paper if we gave even a catalogue of these disasters, and of the others which have since occurred. The loss of the *Conqueror* East-Indiaman is detailed below, and the most important of the other wrecks on the English coast are noticed under our Provincial News. The hurricane was succeeded by heavy falls of snow at intervals during Saturday, which was followed by a slight frost on Sunday morning. The weather in the early part of the week was extremely changeable, and has continued to present alternations of rain and frost.

Loss of the "Conqueror" East Indiaman.—In our brief notice in our last of the destructive hurricane which visited the Metropolis on Friday night, we expressed our fears that accounts of serious disasters would be received from various parts of the country. The great extent over which the storm prevailed has in some degree prepared the public for the intelligence of wrecks from all quarters; and we regret to say that the most gloomy apprehensions have been more than realised. A list of disasters, perhaps unparalleled in their extent, has been already received; and there is reason to fear that the catalogue will even yet be greatly augmented by subsequent arrivals. Only six weeks have elapsed since the attention of the country was painfully excited by the loss of the *Reliance* off Boulogne, when nearly all the passengers and crew were lost. Another East Indiaman has now to be added to the melancholy list of wrecks on that coast. The *Conqueror*, a fine vessel of 800 tons, belonging to Messrs. Wigram and Green, bound from Calcutta to London, and commanded by Capt. Duggan, after beating about in the Channel during the heavy gale on Friday night, was driven on shore off Lornel, a small town on the French coast, only six miles distant from Merlimont (where the *Reliance* struck), at about half-past 10 o'clock, and almost immediately went to pieces, every soul on board being lost, with the exception of a boy, named Henry Abchurch, one of the cuddy servants. The crew consisted of about 50 seamen and officers, and the vessel had no less than 17 cabin passengers, viz., Mrs. Thompson, and four children—one girl and three boys; Mrs. Major Johnstone, with one girl and three boys; Capt. Milner, 39th B. N. I.; Lieut. and Mr. Marshall; Miss Turton, daughter of a judge at Calcutta; Master Blake; Master Reeves; and Mr. Stephens, in command of a detachment of the 91st from St. Helena. About the same period a Swedish vessel was wrecked near the spot, and all hands perished; as also an English fruit-vessel, with the whole of her crew. Three other vessels were also wrecked: among them was a large three-masted Russian, off Etaples, in which every soul perished. From the details given by the poor boy, mentioned above as the only survivor of the *Conqueror*, it appears that she struck at half-past 10 on Thursday night, off Lornel, near the entrance of the Canche, where the sandbanks extend a considerable distance from the shore. During the whole night blue-lights, rockets, and signals of distress were fired without intermission. The wreck was observed by the inhabitants on the coast, but such was the boisterous state of the weather at the time, that it is stated to have been impossible to render any assistance. The vessel held together nearly twelve hours, and went to pieces about nine on Friday morning. The sea was at this time running very high, and although many persons were on the shore, no attempt seems to have been made to save the crew, and out of seventy persons believed to have been on board, the boy Abchurch was the only one who reached the shore for a considerable period. He had been lashed to a spar, and was in a most exhausted state. Restoratives were immediately applied, and he slowly regained consciousness. Before ten o'clock Mrs. Thompson was washed on the beach, with one of her children. The unfortunate lady, who was in daily expectation of being confined, was not quite dead, but survived only a few moments. The wind continued to blow strongly from the N.W. during the whole day, and several bodies came on shore, including Mrs. Jenkins, five children, two sailors, and two soldiers. Information was immediately forwarded to Boulogne, and Mr. Hamilton, the consul, arrived at Lornel on Friday afternoon, and claimed 13 boxes of despatches which had come on shore. Portions of the wreck and cargo were washed on shore during the day, and taken possession of on behalf of the underwriters. Mr. Hamilton directed a number of coffins to be prepared for the bodies, and made arrangements for the proper performance of the funeral service. Although the weather has very much moderated since Saturday, strong gales have prevailed, in consequence of which many bodies drifted ashore during Sunday and Monday, and it is generally believed that nearly the whole of the crew have been recovered. There is a remarkable similarity in the circumstances attending the loss of the *Conqueror* to that of the *Reliance* on the same shore, which

we had so recently occasion to record. A letter, addressed by one of the seamen to his father and mother, on Thursday week, when the ship was off Torbay, shows that the Conqueror was all well at that time, and running up the Channel with a fair wind. The coincidence between this case and that of Captain Green, of the Reliance, who addressed his brother under similar circumstances from the Lizard, cannot fail to be remarked. The ship which brought the letter from the Conqueror was the American liner Westminster, which was in company with her during the greater part of the Thursday, both vessels continually tacking on each other's course. The latter ship arrived in the Downs on Sunday last. The Conqueror left Bengal on the 18th September, 1842. No advices had been received by her owner from the Cape, but it is conjectured that she had made a very favourable passage from the early period of her arrival in the Channel.

Wreck of the "Jessie Logan" East Indiaman.—On Tuesday, information was received in the City that another East Indiaman had been added to the melancholy catalogue of losses occasioned by the late gales. The vessel was the Jessie Logan, the property of Mr. Logan, a merchant at Liverpool, from which port she traded with Calcutta. She was 850 tons burden, and commanded by Capt. Major. On Monday last, this vessel, being on her homeward voyage, and apparently making for Boscastle or Bude Brys, on the Cornish coast, became unmanageable, and was driven aground off Boscastle, about 17 miles from Launceston. Blue lights and other signals of distress were made; but such was the fury of the gale and the violence of the surf, that none would venture to her assistance. At length she drifted on the rocks, and soon became a total wreck. She had evidently been abandoned by the crew and passengers; but, from the long-boat having been washed on shore, there is no doubt that they have all perished, as, up to the present time, no information has been obtained respecting them. She was a North American-built vessel. Her cargo, consisting of rum, sugar, spices, and general East India produce, has been washed ashore on the coast; but no despatches or papers of any kind have been recovered. In addition to this and the other calamities recorded in other parts of our Paper, 20 other vessels have been reported as wrecked on other parts of the Western coast, and we regret to say with great loss of life.

Court of Aldermen.—A Court was held on Tuesday, at which the question of wood-pavement was discussed, with a view to its applicability to the City thoroughfares. Sir P. Laurie, in bringing the question forward, stated, that he agreed with the observations of Alderman Copeland, who said that the shopkeepers would find out their mistake in advocating the substitution of wooden for stone pavement, as few persons would allow their carriages and horses to be placed in such imminent danger, and that he was in the habit of going out of his way himself because he did not wish to risk his own or his horses' life. He trusted that the authorities would interfere to prevent the further extension of the new plan of paving. Very lately, three women had been killed in consequence of the difficulty of checking the horses of omnibuses, and two drivers had been tried and acquitted, the jury having agreed that it was impossible to exercise any control over horses travelling over such a perilous surface. On Sunday morning he had witnessed a curious sight. As the Blues were returning from the Horse Guards to their barracks they all dismounted in Argyll-street, in which the wooden pavement is laid down, and led their horses until they reached Portland-street, where the stone pavement recommenced, and, upon making inquiry, he learned that the extraordinary action of dismounting was occasioned by the severe fall of a soldier upon the wooden pavement, upon which a horse of any spirit could scarcely stand. He was on the bench when a driver of an omnibus was tried by Lord Denman for having run over a man in Coventry-street, in which the wooden pavement was laid down, and the prisoner was acquitted, proof having been given that it was impossible for the driver of an omnibus to pull up on such a surface. At the last sessions, a cabman was acquitted before Baron Gurney upon similar grounds; and Mr. Payne had recently held an inquest upon a young female who was killed in the Poultry. In his opinion the magistrates of London were bound to do all in their power to prevent such consequences as seemed to result inevitably from the use of the wooden pavement. Alderman Gibbs said, that, although as chairman of the Sewers' Commissioners, he was decidedly opposed to the introduction of wooden pavements, he was outvoted on the question by those who admired it. He wished that the inhabitants would present petitions to the commissioners against the substitution of the new plan for the old one, and he would give them all the support in his power. He was sorry to inform the Court that there was a mania in favour of wooden pavements, and that, on that very day, a petition had been presented to the commissioners for the introduction of a specimen. His objections were not without foundation: independently of his own experience, he had been informed by medical authority, that, since the wooden pavements had come into fashion, accidents had increased one-third. Alderman Wilson declared that he would not risk his carriage and horses in the streets into which the wooden pavements had been introduced. The shopkeepers would soon find that West-end customers would be very cautious of hazarding the safety of their own persons, and the lives of their horses, on the wooden pavements of the City; and they would also find that the wooden pavements would be much more expensive than that to which they had been accustomed. Alderman Copeland repeated what he had mentioned in the Guildhall on Saturday, and said he was frequently put to great inconvenience in con-

sequence of his reluctance to run the hazard of driving in the City. Sir Peter Laurie hoped that the inhabitants would maturely deliberate upon the subject, which he, as a magistrate of the City, considered it to be his duty to bring forward in order to rouse them to exertion.

The Scottish Monument.—At the meeting of the Marylebone Vestry on Saturday, in reference to this monument, the proceedings were suddenly stopped by an announcement from the vestry clerk that he had that instant received a document from the Commissioners of Woods and Forests with reference to the Scottish monument, which demanded the immediate attention of the vestry. The document was signed by Messrs. Pemberton, Crawley, and Gardner, Solicitors to the Board of Woods and Forests. It stated, that having ascertained that the excavation lately made in the Regent-circus had been made by the vestrymen, or under their assumed authority, for the purpose of laying the foundations of a monument, her Majesty's Commissioners had directed their solicitors to give notice to the vestry that the soil and freehold of the Regent-circus are vested in her Majesty, and that the limited jurisdiction which the vestrymen possess over it, for the purposes of paving, cleansing, and lighting, does not extend to authorize the erection of a structure which is not designed for any of those purposes. That her Majesty's Commissioners consider the erection of the intended monument upon the property of the Crown to be objectionable, and that they have instructed their solicitors to file an information and bill for injunction in the Court of Chancery, for the purpose of preventing it. A long and angry discussion ensued, the opponents of the monument expressing their satisfaction at the result, and its supporters contending that the Commissioners had no legal power over the ground. Mr. Joseph suggested that the vestry should at once, as wise men, retrace their steps; and moved a resolution, "That orders be forthwith issued by the vestry to suspend all further proceedings relating to the erection of the Scottish monument in the Regent-circus, and that notice be immediately given to the architect to that effect." Sir R. P. Jodrell seconded the motion, which was carried without a division.

Missionaries to China.—One of the largest meetings, perhaps, which was ever held in Exeter-hall, took place on Tuesday evening, being convened by the London Missionary Society, to consider the means of extending and promoting Christianity in China. The doors were opened at five o'clock, and by six the hall was so full that policemen were stationed at the various entrances to prevent others entering. Mr. W. T. Blair, of Bath, presided. Dr. Leifchild moved the first resolution, expressive of thanksgiving to God for the termination of the war between China and Great Britain, and for the greatly enlarged facilities secured, by the treaty of peace, for the introduction of Christianity into that empire. This resolution was seconded by the Rev. Dr. Alder, and was carried unanimously. Several other resolutions were likewise passed, one of which, moved by the Hon. and Rev. B. Noel, stated that the Anglo-Chinese College was to be removed from Malacca to Hong-Kong, and that the Missionary labours were to be specially directed to that island. The meeting did not separate till a late hour, and collections were made at the doors.

Fires.—One of the most destructive fires which has visited the Metropolis for many years broke out on Monday evening, about seven o'clock, on the extensive floor-cloth manufactory of Mr. Rolls, situated within a few hundred yards of the canal-bridge on the Old Kent-road. The premises occupied a commanding situation, fronting the main road, and were well known to all persons acquainted with the Greenwich and Dover-road. They are surrounded on the west by the Marlborough-road, and on the east by some private dwellings, known as Ranger-place, at the extremity of which stood the still more extensive factory of Mr. Goulston, also a floor-cloth manufacturer and japanner. In less than ten minutes after the fire was first discovered, Mr. Rolls' premises were in flames as high as the upper windows, being chiefly built of wood, and filled, of course, with combustible materials. Notwithstanding the efforts of the fire-brigade, assisted by several engines, the fire continued almost uninterruptedly until the whole factory, consisting of painting-rooms, drying-houses, store-rooms, warehouses, and the other appendages to a floor-cloth manufactory, were consumed. Some private dwelling-houses at the side were also destroyed, together with property to a large amount. The fire next spread to the floor-cloth factory of Messrs. Goulston, adjoining the private houses, which, being built chiefly of wood, was soon in flames, and burning with great fury. In a quarter of an hour all was destroyed. The heat from the burning buildings was at this time so great that water had to be thrown on the houses opposite, to prevent them from catching. The fire was at length subdued for a few moments, by the falling of the roofs; but, being composed principally of beams of wood, they soon ignited again, and were destroyed. By nine o'clock the surrounding buildings were out of danger. The Kent-road was completely stopped, and no vehicles were allowed to pass. When the Dover mail came up it was found impossible to get the horses by, until their eyes were bandaged, when the coachman with some difficulty succeeded. The damage is roughly estimated at little short of 20,000*l.*, but all the property is insured.

Accidents.—On Sunday afternoon, during the performance of divine service, an accident occurred in the chapel in Queen-street, Lambeth. At half-past three, whilst the annual sermon preached on behalf of the Sunday schools in connexion with the chapel was being delivered to a numerous congregation, a temporary gallery, erected for the accommodation of the children

instructed in the schools, fell, carrying all who were in it to the ground. About fifty children were seated in it at the time, and many of them were seriously injured.

Westminster.—A special meeting of the Court of Sewers for the city and liberty of Westminster was held last week, "to consider the steps to be taken with reference to the report of the Poor Law Commissioners on the sanitary condition of the poorer classes, presented by Royal command to both Houses of Parliament during the last session." A court was held on the 23d ult., when the proceedings were almost wholly confined to the hearing an address from the chairman, Mr. Donaldson, in reply to certain charges and imputations contained in the published report of Mr. Chadwick, secretary to the Poor Law Commissioners. After several gentlemen had expressed their disapproval of the reports, Mr. Leslie suggested the following resolution:—"That the Court requests an investigation under the authority of Her Majesty's Secretary of State for the Home Department into the charges brought against the Westminster Commissioners of Sewers in the report of the Poor Law Commissioners on the sanitary condition of the poorer classes, and to ascertain the best means of cleansing the streets and roads by aid of sewers, and also the most advantageous form of sewers for the public interests." This resolution was carried by a majority of 17 to 1, the only dissident being Mr. Hawkes, who approved the suggestion for an inquiry, but opposed the present motion, because, in his opinion, it attached too much importance to the Poor Law Report.

Southwark.—The inhabitants of St. Saviour's, Southwark, held a meeting on Friday, to take into consideration "the cause of the abandonment of the recently-proposed performance of sacred music in the church; to consider the power of the bishop and clergy to prevent such performance, and the statement in the bishop's letter as to the wardens having no power to grant the use of the church." The requisition calling the meeting had been signed by upwards of 100 persons, and 103 were said to be present. The statement in the Bishop of Winchester's letter, referred to in the notice, was as follows:—"With the minister alone, subject, of course, to his responsibility to the ordinary, is the right of exercising his discretion as to the allowing the use of the church for any meeting except for the customary meetings of vestry for parochial business. The minister has a perfect right to refuse the use of the church for such a performance as advertised; and I may add that he has not only a right so to do, but it is his bounden duty. The churchwardens have no power to grant the use of the church." Resolutions were now passed expressing the regret of the parishioners at the bishop's interference, referring to the precedents for performances of sacred music afforded by the annual rehearsals at St. Paul's, and the musical festivals in the provinces; and declaring that the chaplains of St. Saviour's have no right, as the bishop imagines, to interfere in the management of that parish. From the facts stated in the resolution it appears that neither of the ministers is rector of the parish. The rectory, with all its rights, privileges, and appurtenances, was granted upon purchase, by letters patent from James I., to certain inhabitants in trust for the wardens, who for the time are the rectors, and are authorized to exercise all the powers of rectors, and, among other things, to provide for the school, and two chaplains, or preachers, for the church; and further, the wardens are to be under the control of the Bishop of Winchester only in such matters as those over which he has legal control. In regard to the schools, for whose benefit the performance was intended, it was stated that the professional singers engaged for the occasion had voluntarily resigned their claims for compensation; and the rumour that the bishop had contributed 200*l.* to the charity was officially contradicted.

Hammersmith.—On Monday a numerous meeting of the ratepayers of Hammersmith was held in the vestry-room of the church, in pursuance of a requisition to the churchwardens, for the purpose of taking into consideration "the vexatious and oppressive nature of the Income-tax, and of the machinery—alike unequal, unfair, and inquisitorial, by which this odious impost is inflicted upon a too generous and too confiding public; and also, the expediency of adopting petitions to the Houses of Legislature for its immediate repeal." The churchwarden was voted to the chair, when, in consequence of the vestry-room being incapable to hold the large number of inhabitants present, an adjournment took place into the body of the church. After a long discussion, the following resolutions were adopted, and ordered to be embodied in petitions to both Houses of Parliament:—
1. "That the object, the principle, and the extent of all taxation ought to be limited to the promotion of the prosperity of the commonwealth, and the equal protection and security of every individual member of the community."
2. "That this vestry meeting would regard a tax upon property as a legitimate impost, were each individual called upon to contribute towards the charge for protection a fair share of the burthen, honestly commensurate with the extent and value of his interests and possessions."
3. "That a tax upon income appears, on the contrary, to be a tax upon individuals, in very many cases distinct from all property, unjustly extorting from the honest earnings of labourers and unremitting exertions of individuals for the support of their families, an equal load of burthen to that assessed upon the more fortunate possessor of funded wealth and hereditary property." An amendment was moved in the course of the proceedings, "That the parishioners are of opinion, that direct taxation is better than indirect taxation, and that it is therefore inexpedient to petition Parliament against the Income-tax;" but on being put to a show of hands, three only were held up for

it, and the original resolutions were finally carried without a dissentient voice.

Mortality of the Metropolis.—The number of deaths registered in the week ending Saturday, the 7th inst., was 869 (451 males, and 418 females). This mortality occurred in the five districts in the following proportion, to which, being the first return for the year, we shall add the parishes included in each district. West districts, including Kensington, Chelsea, St. George's, Hanover-square, Westminster, St. Martin's-in-the-Fields, and St. James's, Piccadilly, 130; north districts, including St. Marylebone, St. Pancras, Islington, and Hackney, 151; central districts, including St. Giles's, and St. George's, Strand, Holborn, Clerkenwell, St. Luke's, East London, West London, and City of London, 164; east districts, including Shoreditch, Bethnal-green, Whitechapel, St. George's-in-the-East, Stepney, and Poplar, 213; south districts, including St. Saviour's, St. Olave's, Bermondsey, St. George's (Southwark), Newington, Lambeth, Camberwell, Rotherhithe, and Greenwich, 211. The weekly average for the five previous years was 903 (461 males, and 442 females); and for the five previous winters, 1,004. Population in 1841, 1,870,727.

Provincial News.

Bristol.—The late storm, which appears to have affected almost every portion of the kingdom, in its progress visited Bristol and the neighbourhood, and raged on Thursday and Friday with the utmost fury. During the night the wind blew with great violence, producing the usual effects of chimneys blown down, windows broken, and houses partly unroofed. Among other accidents the Gothic window of St. Nicholas Church, in the clock-tower, was torn completely out of its framework and dashed in. The vane of St. Philip's church also was torn off. From St. Werberg's Church several copingstones of large size were blown down. At the West of England Stay Factory the entire stack of chimneys was blown down, and, falling on the roof, dashed it in, and the whole mass forced its way through the ceiling of a room in which upwards of 50 girls were at work, causing, of course, the utmost consternation, but no serious injury to the inmates. Several vessels in the Severn were driven on shore, and some foundered at the mouth of the river.

Brighton.—The storm was severely felt here during the whole of Friday. Some of the old fishermen declare that they never saw the waves rise so high; they occasionally covered the chain-pier, which rocked very much, but has escaped uninjured. The wind brought the Shoreham train on the railway to a stand-still. The Defiance, Portsmouth coach, which left at 4 o'clock, was blown over near Shoreham, and the passengers so much injured that they were obliged to be conveyed back to Brighton. A boat lying on the beach at Shoreham was blown into a field, and smashed to pieces. At Kemp-Town all the fences and boardings were levelled with the ground. The houses on the cliffs have received great injury; the Bedford Hotel presents the appearance of an attack by rioters, almost every window in that fine building being broken. A great portion of the roof of the theatre was carried away. Mr. Rogers, a florist in the Western road, had half the covering of his green-house blown off and smashed to pieces, damaging many of the plants. The tall chimneys in the town rocked to and fro, and many of the inhabitants took refuge in the lower parts of their houses, in the greatest state of alarm from the roofs being beat in. From the falling stacks scarcely a roof in an exposed situation has escaped injury. The fishing craft on the coast sustained much damage, and many lives were lost.

Claremont.—The gales during the past week, which have been generally destructive throughout the country, have done considerable damage in the neighbourhood of Claremont and Esher. Several trees have been blown down in the park, and the plantations and shrubberies in the vicinity have been injured to a great extent. Nearly in front of the mansion at Claremont are two fine cedar trees, supposed to be upwards of a century old, and at least 40 feet high. Between these trees formerly stood the old mansion, previously to the erection of the present edifice. During the height of the gale, on the night of Thursday, the top of one of them was blown down, the wind snapping the stem in twain about 25 feet from the ground. The other tree was also shorn of many of its branches; and the beauty of both is materially injured. In the course of Friday the royal standard hoisted on the steeple of Esher church, in honour of her Majesty's visit, was blown into shreds. At Ditton, Hook, Chessington, and Hampton, the severity of the storm was equally experienced, and considerable damage has been done to numerous buildings in all situations exposed to its fury.

Liverpool.—The observers of the barometer were astonished, on Friday morning, on inspecting their instruments, to find that an extraordinary fall of the mercury had taken place during the night, from 28.92 to 28.05. This unusual phenomenon was the general topic of conversation during the day. The barometers in the public rooms were under constant inspection, and the minutest movement of the mercury was watched and noted from morning till night. Some said that the phenomenon denoted an earthquake, for the great earthquake at Lisbon had been preceded by an extraordinary fall of the mercury. Others maintained that it was the precursor of a storm, and that as the wind was blowing smartly from the westward, that was the probable direction from which the hurricane would come. All agreed that some severe visitation was impending, but whether a convulsion of the earth or merely of the atmosphere, nobody could tell. As the day advanced, however, the wind increased, showing that the predictors of the storm were the true prophets.

Towards evening it had changed from a gale to a storm, and from 6 o'clock on Friday night till 4 on Saturday morning it blew a hurricane, causing serious damage and loss at sea as well as on land. The hurricane was at its height between 2 and 3 o'clock. It was, with short pauses, terrific. People who were exposed to its fury had not the slightest doubt that it was as violent as the memorable storm on the night of the 6th January, 1839. The river, even at low water, about 3 o'clock in the morning, was one sheet of foam, the waves running as high as if it had been a full tide in calm weather. Hundreds of families, especially those who reside in situations exposed to the sweep of westerly winds, never ventured to bed during the night. They sat up in the lower apartments of their houses. With one exception, however, where a roof fell in and buried a whole family in the ruins, the damage done to the buildings by the tempest has not been serious. This accident occurred in the London road, but the inmates were all rescued alive. Several vessels were wrecked and many lives lost in the harbour and off Holyhead.

Manchester.—The storm of Friday was anticipated in this town by the remarkable depression of the barometer observed by Dr. Dalton and other meteorologists. The fall was so rapid and so low as to produce a general impression that it was connected with some sudden convulsion of the atmosphere. Dr. Dalton states that on Thursday, at 6 o'clock p.m., the mercury began to descend in the barometer, and in five hours sank .12 of an inch, when it stood at 29.05 inches. On Friday morning at 8 o'clock it stood 28.15 inches, and gradually descended until 2 p.m., when it was observed at 28.02, being lower by .16 of an inch than he ever observed it at Manchester. The only depression which he has found in his journal of observations made in Manchester for upwards of 49 years, that approaches the nearest to the present, occurred on 23d Nov., 1824, when the mercury stood at 28.18 inches. The mean height of the barometer, as adduced from his observations for the last 49 years, is 26.885, being 1.865 inch higher than the height it stood at on Friday. At 4 p.m. it was 28.10; at 8 p.m. it was 28.20; at 9 p.m. it was 28.27. As to the wheel barometers, some of them actually went round the dial to "very dry."

Plymouth.—During the greater part of Thursday night it blew a heavy gale in this harbour, and between six and ten on Friday morning it was a perfect hurricane from W.S.W., during which several vessels drove from their anchors in the Sound, and were stranded on the rocks in Batten Bay. The Southampton, from London to Gibraltar, went ashore, and lies apparently bilged; the General Brock, from London to Africa, drove at nine o'clock, and went ashore; the Seawitch, from London to Africa, struck soon after. They are all expected to be got off should the weather moderate, and the greater part of their cargoes will probably be saved. The Bragilla, of Falmouth, was lost in Bovisand Bay, but the crew saved. The Belle, of this port, ran ashore on the rocks in Cat-water, and a trawl sloop ran on the rocks under Teats-hill. The Thunderer, 84, the Euphrates East Indiaman, and numerous other vessels, rode out the gale in safety under shelter of the Breakwater. The position of the Euphrates was at one time very perilous; she dragged her anchors, and hatchets were kept ready to cut away her masts; she is bound to Calcutta, and it is stated that she has specie to the value of 150,000*l.* aboard, and 50 tons of Congreve rockets. The Royal Adelaide, 120, during the gale, parted one of her mooring chains. She drove some distance, but brought up by letting go an anchor. The Confiance steam-tug went to her assistance, and she was soon put in a position of safety. So great was the force of the wind, that lead weighing nearly a ton was peeled off one of the sheds in her Majesty's Dock-yard, where other effects of its strength have been manifested. In the citadel the slates were blown from the roof of the barracks to the ramparts, and the lead on the chapel was turned up like paper. Many chimneys were blown down in Devonport, Stonehouse, and Stoke, and in some cases the inmates were compelled to escape through the windows. The roof of Saltram House, the seat of Earl Morley, has sustained considerable damage. The officer employed in the Dock-yard to record the movements of the barometer for a period of seven years, states that in all that time it was never so low as on Thursday night on the approach of the gale, but that on Friday morning, during the worst of the weather, it was still lower, and that there was no means left of indicating the force of the storm.

Portsmouth.—The gale of Friday was severely felt in this harbour. The William the Fourth, from Cowes to London, ran ashore in Stokes Bay, but has been got off; the Moore, from Southampton to Sunderland, went ashore on the beach, but is expected off if the weather moderates; the Two Brothers, from Weymouth to Langston, went ashore on South Sea beach, but has since been got off; a brigantine ran ashore on the Woolsnars, crew supposed to be saved. A sloop and a two-masted vessel were observed in the morning riding heavily, two miles S.S.W. of Cumberland Port; they both sank shortly afterwards, and it is feared all hands have perished. The mast-heads of the two-masted vessel are visible above water. Several houses at Southsea are much damaged in roofs, chimneys, and windows. Many of the large dockyard buildings are, also slightly damaged; and Lord Ashburton's new marine villa, in Stokes Bay, is severely injured. At Cowes the streets were flooded, and great damage has been done to the quay and wharfs. At Southampton, a number of boats and small craft were driven on shore. Several unfinished houses were blown down in the neighbourhood of the railway terminus, which sustained some damage by the falling of a stack of chimneys, and some breakage of skylights. On the south side of the Isle of Wight, a large brig from Sunderland to Grenada was driven on shore, and the master and mate drowned.

Ramsgate and Margate.—Several wrecks occurred along this coast, and in the neighbourhood of Ramsgate and Dover—the oldest man in the Coast-Guard declares that he never witnessed such a scene. Seven ships and four schooners were lost on the North Sand; the Diana was driven on the Knock Sand, full of water. At Deal a number of vessels have arrived more or less damaged, and there is little doubt that many have foundered in the channel. At Sheerness the hurricane was severely felt; in fact, it was impossible to stand against it in any exposed situation. The oldest inhabitant has no recollection of so awful a gale. During the night no less than four ships drove on shore on the Maplin Sand, where it is expected they will become wrecks. The fine American packet, Samarang, reported to be 600 tons burthen, was lost on the Brake shoal, close to the Goodwin Sands. The ship was laden with a cargo of turpentine, oil, and other goods, and arrived in the Downs from Quebec on Friday morning, and was on her way to Hull, when overtaken by the storm. The crew of 21 men were rescued by the Duke of York Cutter, of Ramsgate, which went off in the height of the gale to their assistance. A delay of half-an-hour would have been fatal, for the ship went to pieces immediately after they left her.

Tynemouth Castle.—The storm has produced very serious damage on this coast. On Thursday the Percy steam-vessel was totally wrecked about 10 miles north of the Castle. She belonged to North Shields, and had left this harbour on the evening previous, to look out for vessels in distress, when she was overtaken by the storm. Owing to her pitching heavily, the engines soon became unmanageable, and the commander, in order to save her, brought her head down upon the shore; but unfortunately she drove upon a mass of rocks, where she subsequently became a total wreck. All the crew, excepting a boy 15 years of age, who was drowned, saved themselves by swimming ashore. Between the place where the Percy went ashore and Dunbar, five vessels are reported to have been driven upon the beach, and there is said to be no chance of getting them off. Other vessels have been lost on different parts of the coast, and it is said that so awful a storm has not been experienced since 1824.

Windsor and Eton.—The storm of Friday night has done considerable damage in this neighbourhood. The wind blew a complete hurricane, several trees were uprooted in the park, many portions of which were strewn with the branches, which the poor of the neighbourhood were permitted to carry away. Public attention has been directed by several correspondents of the *Times* to Dorney Church, in this neighbourhood. It was stated that two antique statues of Bacchus and Ceres, recently imported from Italy, had been placed over the altar, in the room of the Lord's Prayer and Creed; that a pew built like a conservatory glazed at the sides, with a glass roof, and fitted up with a stove, was recently erected in the church, and that pewter vessels have been substituted for the communion plate. These charges have called forth replies from Mr. Palmer, the patron of the living, and from Mr. Carter, the rural dean. Mr. Palmer says that the statues were not those of Bacchus and Ceres, and denies that his pew is now covered with a glass roof; the rural dean states that the statues were removed by his direction last summer, when he recommended the Tables to be replaced, and that the Bishop of the diocese fully approved of the order he had given.

Bath.—A meeting of the Town Council took place last week for the purpose of agreeing to petitions to both Houses of Parliament, at the commencement of the ensuing session, for a repeal of the Corn-laws; the subject was brought forward by Admiral Gordon, and supported by several aldermen and other members, in a discussion which lasted upwards of two hours, when it was unanimously agreed that petitions should be presented, and a committee was appointed to draw them up and submit them to the council for adoption.

Bridgewater.—An inquiry has been going on in this town respecting the death of an orphan girl, who was said to have been starved to death by her mistress. It appeared on the inquest that many bruises and marks of blows on the head with some instrument were perceptible. Several witnesses gave evidence of frequent complaints by the girl of a want of food, and the statement of the medical gentleman tended to confirm the alleged ill-treatment of the girl by her mistress. The prisoner, who is the wife of a tradesman in the town, was committed to Taunton jail to take her trial for manslaughter.

Caermarthen.—We noticed in our last the extraordinary proceedings of a party of rioters in this part of Wales, who have obtained notoriety under the name of "Rebecca and her daughters." We now learn that a detachment of Royal Marines, stationed at Milford, was despatched on Thursday morning, in carriages, from that place, under the orders of Captain Wilson, to suppress the warfare against turnpike-gates, which has caused so much excitement at St. Clare's. It is supposed, that as the farmers have refused to be sworn in as constables, they are encouraging their labourers in their acts of destruction. It is said that the rioters are armed with muskets, pistols, and scythes, and fancy that they will be able to effect the demolition of every turnpike-gate in this way, and then attack the Union at Neorheth, to which they have a great antipathy.

Cambridge.—The approaching election to the office of the Regius Professor of Divinity, vacant by the promotion of Dr. Turton to the Deanery of Westminster, is creating great interest in the university. At the last meeting of the Electors, the following divines declared themselves candidates:—1. The Rev. W. H. Mill, D.D., Christian Advocate, Chaplain to the Archbishop of Canterbury, and formerly Principal of Bishop's College, Cal-

cutta. 2. The Rev. Alfred Ollivant, D.D., late Vice-Principal and Professor at St. David's College, Lampeter. 3. The Rev. Christopher Wordsworth, jun., D.D., Head Master of Harrow, late Public Orator. It was the intention of Dr. Graham, Master of Christ's College, to have offered himself as a candidate, but has withdrawn in consequence of one of the electors having entered a protest as to his eligibility, on account of holding the Mastership of a college. Tuesday, the 31st inst., is fixed for hearing the exercises of the candidates; and it is understood that the election will take place on the same day.

Ilford.—On Sunday morning, while the inhabitants of Little Ilford were assembling to hear Divine service, the roof of the church was discovered to be on fire. The supply of water was abundant, and the flames were subdued before much mischief had been done. The fire was occasioned by a part of the flue, which carried away the smoke, being in so decayed a state as to allow sparks to pass through it and rest on the timbers supporting the roof. It was fortunate, however, that the morning was so calm, for had there been the slightest wind the building must have been destroyed.

Leeds.—The local papers mention the following proofs of the physical and moral degradation of the manufacturing population afforded by the registration of births and deaths in the Leeds districts for the last quarter. They state, that whilst the marriages at the register-office and dissenting chapels have not increased in number, those at the parish church, in 1842, are less by between 200 and 300 than in the year 1841. In the number of births registered during the last quarter a decrease of a fifth or sixth will be manifest, as compared with the corresponding quarter of 1841, while the number of illegitimate children born have been trebled in some, if not in all the districts.

Nottingham.—We lately noticed the dilapidated condition of the tower of St. Mary's Church in this town; and the opinion of Mr. Cottingham, the architect, who had surveyed the building, and pronounced it to be unsafe in its present state. Last week the parishioners were convened for the purpose of raising a rate to defray the expenses of the necessary repairs. The meeting took place in the church, but was so fully attended, in consequence of a rate not having been levied for many years, that it was adjourned to the Town-hall. An amendment condemning church-rates as unjust, and deferring the consideration of the question for 12 months, was proposed and carried by a large majority. A poll was then demanded by the churchwardens, which lasted for two days; and gave 145 for the rate, and 929 against it.

Oxford.—For some days past the University has been occupied with the rumoured conversion to the Roman Catholic faith of another Fellow of Magdalen College, the Rev. Bernard Smith. The local papers had contradicted the statement, but all doubt has now been dissipated by a letter from the reverend gentleman himself, addressed to the Vice-President of his College, admitting the fact, which took place on Christmas-day in last year. Mr. Smith at present holds the valuable preferment of Leadenham, in Lincolnshire, and which he only retains till his brother, who will succeed him, is able to receive the appointment.

Sheffield.—The old-established banking-house of Messrs. Parker, Shore, and Co., have, it is understood, been obliged to suspend their payments. The house is one of long standing, but it is not thought that its liabilities are heavy, as the business of the firm has been much reduced of late years. The principal of the establishment, Mr. John Parker, was one of the Lords of the Treasury under the late Administration, and is a sitting member of the present House of Commons. The failure of the bank is attributed to the depressed condition of trade in Sheffield, which is so bad that the merchants, manufacturers, and traders, are unable to realise their debts, and the bank has been led into advances, which the parties indebted to them have been unable to meet.

Shepton Mallet.—On Tuesday, the 10th, a fire broke out at the crape and silk factory of Messrs. Hardisty, of Dasshill, situated between this town and Wells. In about three hours and a half the whole of the premises were burnt down. The walls and roof fell in; the flames were so powerful that no assistance could be rendered. It is supposed there is 40,000*l.* damage done; but the property is understood to be insured. The premises are between 60 and 70 yards in length, and seven stories high, and it is one of the largest factories in this part of the country. It is supposed that it will throw 600 hands out of employ, and the fire broke out with such rapidity, that the poor girls and boys were obliged to run for their lives, leaving their clothes behind; it is said that out of nearly 400, there are few who have not lost something of small value.

York.—A Meeting of Shareholders of the Yorkshire Agricultural and Commercial Bank was held in this city on Tuesday. After a stormy discussion, the propositions brought forward and adopted at a previous meeting were confirmed, as being, in the present condition of the concern, the best that could be acted upon. The affairs of the bank are to be wound up as speedily as possible, and a call of 3*l.* per share is to be made forthwith, in order that its liabilities may be discharged.

Railways.—The following are the returns of the undermentioned railways for the past week:—London and Birmingham, 12,120*l.*; Great Western, 9,687*l.*; South Western, 4,379*l.*; South Eastern, 1,405*l.*; Eastern Counties, 804*l.*; North Midland, 3,407*l.*; York and North Midland, 1,194*l.*; Greenwich, 713*l.*; Croydon, 314*l.*; Brighton, 2,479*l.*; Blackwall, 478*l.*; Hull and Selby, 632*l.*; Grand Junction, 6,000*l.*; Midland Counties, 2,144*l.*—On Monday a special general meeting of the London and Birmingham company was held at the Euston

station, for the purpose of authorizing the directors to apply to Parliament in the ensuing session to make a branch line from the Blisworth-station, Northampton, to the city of Peterborough. Mr. G. C. Glyn having taken the chair, pointed out the eligibility of the proposed line, which would embrace in its route the towns of Northampton, Thrapston, Oundle, Peterborough, Boston, and Lynn, and a great part of the county of Lincoln. All the large landholders were in favour of the line, which would be 48 miles in extent, and cost, according to the engineering estimates, 500,000*l.* The Duke of Grafton had placed at the disposal of the company land sufficient to form a station at Gayton, and had also engaged to make the necessary roads in connexion with it. The estimated traffic for passengers, parcels, and contingent traffic, amounted to 22,971*l.*; for goods and cattle, 9,100*l.*; making a total of 30,500*l.* per annum. The locomotive power of the Birmingham Railway would be applied to the traffic of the branch line, the expense of working which was estimated at between 10,000*l.* and 12,000*l.* per annum. A series of resolutions was then passed, empowering the directors to raise the required sum, which was intended to form an integral portion of the capital of the main line in a certain amount of shares to be divided rateably and at par amongst the proprietors. The chairman, in reply to questions from a proprietor, who took occasion to allude to the recent disasters on the North Midland Railway, in connexion with the reductions in the expenditure of that establishment, said it was not the intention of the directors of the Birmingham Railway to reduce their establishment; and he believed that the adoption of such false systems of economy was fraught with consequences the most dangerous, both to the undertakings themselves and to the interests of the public.

—On Friday, an inquest was held on the body of Mr. Robert Harvey, the gentleman who was killed by the late accident on the North Midland Railway. After a long examination of witnesses, who proved that the luggage-train which caused the accident neither used the whistle nor regarded the signal; the jury returned a verdict of "Manslaughter" against Edward Jenkins, the engine-driver, who was accordingly committed to York Castle for trial at the next assizes. The foreman, addressing some of the directors who were present, said, "We think the railroad company are very highly to blame for employing such inefficient men, and not having a sufficient number to attend the stations. We think the accident might possibly have been prevented if there had been a sufficient number of men at the Barnsley station to get off the passenger-train in due time." On Saturday night, two coke trains on the same line came in collision near Derby, and one of the engines and several carriages were smashed. It appears that the first coke engine, owing to some defect, could not get along; the consequence was, that a second train overtook it, and notwithstanding the guard of the first train exhibited the signals, the second train ran into them, and a collision occurred. The guard of the first train sprang off just as the second came upon them, and the engine was smashed to pieces. On Monday, as a Nottingham train was leaving the station, a North Midland luggage-train came up from the north, and nothing but the presence of mind of an attendant prevented a collision. Seeing the danger, he reversed the point, and sent the passenger-train on another line just as the luggage-train came up to the junction. Had a collision taken place, the passenger-train must have gone over the embankment—perhaps into the river.—On Tuesday last, a Sheriff's Court was held at Reading, for the purpose of assessing damages caused by the Great Western Railway in making a "spoil bank" on land adjoining the Sonning cutting, at Early Court farm, the property of Lord Sidmouth, and in the occupation of Mr. W. Shackell; and also for the alleged occupation and use of land, contrary to agreement. The evidence was given on both sides at great length, but it has no general interest for the public. The total claims were 1009*l.*, and the jury made the following award:—To Lord Sidmouth for permanent injury to Pit-field, 419*l.*; to Mr. W. Shackell for temporary injury to Pit-field, 58*l.*; to Lord Sidmouth, for temporary injury to Mutton-meadow and Breach's-meadow, 63*l.* 10*s.*—A table of the fluctuations in the value of railway shares has been published by Messrs. Watson, the share-brokers of Leeds, embracing the condition of the market for the past year. Taking a general view of the returns, it appears that a depreciation has occurred in all except the Birmingham, Great-Western, Bristol and Exeter, York and North Midland, and Manchester and Leeds shares, which have shown symptoms of advance in public opinion. Another circular of the same description gives the following as the total receipts of the undermentioned lines, in the half-years ending the 31st December, for the three last years:—Birmingham and Derby, 1840, 25,713*l.*; 1841, 31,335*l.*; 1842, 35,353*l.*—Birmingham and Gloucester, 1840, 21,791*l.*; 1841, 48,730*l.*; 1842, 49,281*l.*—Eastern Counties, 1840, 14,753*l.*; 1841, 21,815*l.*; 1842, 25,828*l.*—Grand Junction, 1840, 228,249*l.*; 1841, 236,987*l.*; 1842, 201,570*l.*—Great Western, 1840, 150,925*l.*; 1841, 336,028*l.*; 1842, 353,928*l.*—Hull and Selby, 1840, 17,066*l.*; 1841, 24,083*l.*; 1842, 27,180*l.*—Liverpool and Manchester, 1840, 134,969*l.*; 1841, 131,541*l.*; 1842, 114,387*l.*—London and Birmingham, 1840, 403,395*l.*; 1841, 428,777*l.*; 1842, 419,471*l.*—South Western, 1840, 138,650*l.*; 1841, 149,071*l.*; 1842, 167,574*l.*—Manchester, Bolton, and Bury, 1840, 14,176*l.*; 1841, 15,626*l.*; 1842, 14,537*l.*—Midland Counties, 1840, 43,662*l.*; 1841, 70,244*l.*; 1842, 70,809*l.*—North Midland, 1840, 72,895*l.*; 1841, 114,316*l.*; 1842, 114,526*l.*—York and North Midland, 1840, 22,701*l.*; 1841, 43,744*l.*; 1842, 45,482*l.*—A special Meeting of the Great Western Com-

pany was held on Thursday, to consider a plan of the directors, for purchasing the Cheltenham and Great Western Railway. One of the proprietors having moved, as an amendment, to lease the line, the decision between the purchase and leasing of the line was referred to the ballot of an adjourned meeting, appointed to be held on Thursday next.

IRELAND.

Dublin.—The National Bank robbery and the trial of Mr. Egan, of Moate, on suspicion of being the party implicated, has been the exclusive topic of attention during the week. The evidence has been given at great length, but the details would have little interest for our readers. A number of coach-office clerks, and persons usually employed about such establishments, were examined; but the most material evidence was that of the guard of the coach, who swore positively that the false parcel left in the coach-office, in lieu of the bank one, was the parcel handed to him by Mr. Egan. This and other evidence established a case of presumption against the prisoner; but, on the other hand, nothing was alleged absolutely incapable of being refuted. No part of the stolen property was found upon him; he did not avoid pursuit or inquiry; on the contrary, his conduct subsequent to the charge appears to have been candid and unembarrassed, and such as would be expected from an innocent person. The most respectable witnesses were examined as to the character of the prisoner, including Mr. Tuite, member for Westmeath, and Mr. Ellis, assistant-barrister for that county, who spoke of Mr. Egan in the highest terms. A letter from Lord Castlemaine was read, stating his readiness to give evidence as to the character of Mr. Egan, but he was under the necessity of leaving town; and he regretted this the less on account of the favourable turn of the case, as appeared from the evidence. Mr. M'Donogh addressed the jury on the part of the prisoner at considerable length. He contended that the evidence adduced for the prosecution was altogether circumstantial—very little of which left grounds for suspicion against Mr. Egan; much of which was favourable to him—much equivocal; and many circumstances appeared that pointed to the real thief. He asked the jury, Was it likely that a man capable of stealing a parcel of money would, as had been done in the present case, return to the bank a bill for 71*l.*, for which he was liable? Had Mr. Egan stolen the money, would he not have thrown that security into the fire, and thus terminate his liability for a large amount? The trial occupied the Commission Court from Thursday the 12th, and closed on Tuesday. Mr. Justice Jackson commenced his charge to the jury at the sitting of the court, and did not conclude until half-past two o'clock. The jury remained half an hour in deliberation, and returned a verdict of "Not Guilty." The prisoner, on the announcement of the verdict, leaned his face upon his hand and wept audibly. There was a very general expression of applause in the body of the court, which was echoed by the crowd outside.

Cork.—As a contrast to the accounts which we have given in our recent Numbers respecting the management of Hanwell Lunatic Asylum, we may cite the following observations of the Lord Chancellor of Ireland in relation to the case of a Mr. Speed. His Lordship, in giving judgment, said, "I could hardly have believed that such an outrage on humanity as is disclosed by the affidavits in this case could have been perpetrated at the present day. A gentleman of a highly respectable family, who is afflicted with insanity, was put under the care of a committee of his person. Afterwards one of his brothers was appointed committee, and he placed the lunatic in a house in Cork. This unfortunate lunatic was found by two gentlemen, who are magistrates in the county, and they immediately exerted themselves on his behalf. The lunatic was found by those gentlemen in an outhouse belonging to the man with whom he had been placed, and from the state of the roof there was access for the weather and the rain; and, though it was in the latter part of the year, he was stark naked, his legs chained and clenched together, and fastened in a chain not more than two feet in length, without even straw, and not able, on account of his chains, to lie down in such a way as to rest himself, and without power to move beyond the limit of the narrow circle which the chain would describe. Such were the circumstances in which, through the inattention, to say the least of it, of his brother, the lunatic lived. This is a case upon which, naturally, I have felt great pain on account of the family; but I felt bound to have it fully investigated and exposed, because I am afraid the evil exists to a considerable extent." His Lordship then announced that it was his intention to carry into execution a series of arrangements which he thought would tend to secure to this unhappy class of persons much more care and attention than, in too many instances, they have heretofore experienced.

Tipperary.—Another murder has been committed in this county. The victim was the herdsman of Mr. Scully, who was so recently assassinated in the same district. He was waylaid and murdered by two men, who assaulted him with stones, and broke in the left side of his skull. An inquest was held on the body on Friday, and a verdict of Wilful Murder returned.

Belfast.—The atmospheric phenomena which preceded the late storm, and were noticed in many parts of England, were observed also in this town. The tide of Friday morning was at its height at twenty-six minutes past 8, and rose to 11 feet 3 inches, being 2 feet 3 above the previous tide—a remarkable difference when the very low state of the barometer is taken into consideration. In addition to these phenomena, the storm-glasses were the whole day in a remarkably unsettled state:—the

index of the wheel barometers, in all parts of the town, went round the circle, passing over the lowest marks, and rising the reverse way, to beyond "fair;" afterwards, the index came back the way it traversed, and then remained at the lowest point, "very stormy." The marine barometers were affected in exactly a similar way. Indications of this kind took place about the 6th of January, 1839—the period of one of the severest storms ever experienced in Ireland.

Newry.—At the Newry quarter sessions last week, Mr. Jones, the assistant barrister, in his charge to the grand jury, gave the following account of the increase of litigation resulting from the protracted and still existing distress of the farmers:—"At the sessions for the present quarter he had heard 3,000 civil bills; 2,000 at Newtownards, and 1,000 at Hillsborough. There would probably be another 1,000 at these sessions, making altogether 4,000 civil bill entries. This was a larger number of entries than he had ever known to be brought before him at the sessions for a single quarter. Since he first came to this county there was a positive increase of one-fourth in the number of civil bill entries. The extraordinary increase on the present occasion he attributed to the depressed state of the lower classes. Though the last harvest was a most luxuriant and bountiful one, yet still, in consequence of the low prices, it did not afford an adequate remuneration to the farmer."

Downshire.—In the storm of Friday, a melancholy calamity happened on the coast of this county. The morning was so fine that almost all the boats from Newcastle to Analong went out to their fishing in the bay, where they had an unusually good take. About noon it came on to blow with snow. Two of those nearest the shore succeeded in returning, but nine boats were swamped, together with another which went out to attempt a rescue. The men were all from the fishing village of Analong, and the pretty watering-place of Newcastle; 27 belonging to Analong, and 47 belonging to Newcastle, have been drowned. By this sad event no less than 26 families have been left destitute.

SCOTLAND.

Edinburgh.—The letter of Sir James Graham conveying the answer of her Majesty's Government to the memorial transmitted to Sir Robert Peel, and the other members of the Administration, by the General Assembly, has been published since our last. It is in every respect an important document. After minutely recounting the leading facts of the questions at issue, it states, that when the Government consider the nature and extent of their demands, they find them to be no less than the reversal of the solemn judgments of the supreme courts of law; the repeal of the statute under which for a period of 130 years patronage has been administered in Scotland; and the concession of privileges, not such as are ascertained and defined by constitutional law, or the recorded decisions of competent tribunals, but privileges such as "the Church considers to belong to her." It states, that the wish of the Government to heal these unhappy divisions, and to close this unseemly spectacle of a Church in connexion with the State openly violating the law, remains unabated and sincere. "We are convinced," says Sir J. Graham, "that the Church established by law in Scotland has produced the best practical effects on the morals and religious character of the people. It has well fulfilled, and it continues to fulfil, the important purposes for which it was founded; and any shock which might endanger this great national establishment would be regarded by her Majesty's servants as a fearful calamity. But in resisting the abolition of patronage, her Majesty's servants believe that they are maintaining a right which is conducive to the welfare and stability of the Church itself. It cannot be denied that the right of presentation in the Crown is a bond of amity, which intimately connects the Church of Scotland with the head of the State; and patronage in the hands of laymen has also its effect in securing to the Presbyterian establishment the co-operation and support of powerful interests, where hostility might otherwise be apprehended, and could not fail to be injurious to the Church. The Assembly submitted the question at issue to the judgment of the Court of Session. They were dissatisfied with the decision—they had their legal remedy—they used it. They carried the judgment by appeal to the bar of the House of Lords; and in the last resort the judgment of the Scotch Court was confirmed, and the Veto Act was pronounced to be illegal. This solemn decision fixed the principle of law which rules all the minor cases which have since arisen. The judgment in the second Auchterarder case, which found the patron and presentee entitled to redress in the form of pecuniary compensation for a civil wrong, was a legal sequence of the former judgment; and here again the Assembly was content to plead before the Civil tribunal, and again the Assembly refuses to submit to the compulsion of an adverse decision. I am also compelled reluctantly to remark that the Church, not content with disobeying the decrees of the Civil Courts, has inflicted the severities of her discipline, as in the case of the Strathbogie Presbytery, on ministers whose only crime has been obedience to what has been declared to be the law of the land. All the other cases complained of in the memorial and declaration of right which relate to the settlement of ministers have arisen in the determination of the Church to enforce the Veto Act in defiance of law. The acts of the General Assembly (the claim, declaration, and protest, the address against patronage, the demand of the repeal of the statute of Anne), have unhappily diminished, so far at least as the Church is concerned, the hopes of arrangement; and her Majesty's Ministers, now understanding that nothing less than the total abrogation

of the rights of the Crown, and of other patrons, will satisfy the Church, are bound with firmness to declare that they cannot advise her Majesty to consent to the grant of any such demand."—A meeting of the special commission of the Assembly was held on Thursday, when they agreed to a minute, in reply to the above letter, on the subjects which at present agitate the Church. The minute argues at great length the right claimed by the Church for exclusive jurisdiction in ecclesiastical matters, and contends that the power assumed by the Civil Court is a power not conferred by the State. It then alludes to the other questions referred to in the letter from Government, and assuming that Ministers are not inclined to grant any redress of the grievances complained of, it states that "the Legislature will have an alternative submitted to them, namely, whether to force on a disruption of the established Church of Scotland, with all its attendant evils, or to restore the Church to the state in which she was between 1834 and 1838, when the Veto Act had not been declared illegal, the power to admit *quoad sacra* ministers had not been challenged, and the jurisdiction of the Civil Courts, which has since been so largely exercised, had not been claimed." The special commission are of opinion that the claim of right should be laid before Parliament, and that the Commission of Assembly should petition both Houses, calling the attention of the Legislature to the grievances and applications for redress set forth in the Church's claim. A meeting on the subject is convened for the 31st inst.

Glasgow.—On Wednesday of last week, the town council met for the purpose of presenting Mr. Cobden with the freedom of the city. The Lord Provost, Sir James Campbell, in presenting this honour stated, that it was conferred on him in testimony of the esteem which the town council entertain of the ability, zeal, and untiring efforts with which he has advocated the principles of free-trade, not only in his private capacity, but on various arenas of public life—and especially in the House of Commons, as the representative of one of the most rising manufacturing communities in England. Mr. Cobden in the course of his reply, said: He hoped that this compliment had been paid without any regard to his political views. He believed that the gentlemen who proposed it had done so solely on account of his personal services in the cause of free-trade. As such, he accepted it. If there was one thing which he desired more than another, it was that this question should be considered apart from political partisanship, or the time-serving purpose of mere politicians. The Free Trade banquet took place in the evening, Mr. J. Oswald, M.P., in the chair, supported by Mr. Cobden, Col. Thompson, and Mr. Bright, who addressed the meeting at great length. It is calculated that nearly 2000 persons were present.

Perth.—The local papers state that last week, smoke was observed to issue from the armoury-room at Lynedoch Cottage, on which the servants broke open the door to discover the cause, and found the room in flames and several articles burning. In a short time the fire was got under; after which, on examining the damage sustained, it was found that the coat which Lord Lynedoch wore at the battle of Barossa was consumed. His lordship would permit no one to enter the room but himself and one servant, and always kept it locked. The fire was caused by the over-heating of a flue which runs beneath the floor of the room.

Miscellaneous.

The March from Cabul.—The following letter giving a succinct account of the march between Cabul and Jellalabad has been communicated to the "Agra Ukhbar" by one of the officers of the Staff. It contains a good deal of information respecting the Afghan Passes, which will no doubt interest our readers. "Camp, Jellalabad, Oct. 26, 1842. On the 12th inst. the whole British force then encamped in the neighbourhood of the city, marched to Boodkhak, accompanied by the Shabzada Futteh Jung, and most of the Hindoos late resident of Cabul. Here arrangements were made for dividing the troops into two columns, by taking the 2d and 16th Regiment Native Infantry, with Captain Blood's battery of 9-pounders, from the force under Major-General Nott, and attaching them to that with Major-General Pollock, who moved forward with his divisions through the Khoord Cabul Pass the following morning. Major-General Sale had taken a route by the (Gost Pundurrah) Pass to the right of the Khoord Cabul with his light brigade the day previous, so as to turn the Khoord Cabul Pass, and crown the heights from the further side, where they were more accessible. This route (Gost Pundurrah) can only be adopted by troops in light marching order, with yabooks, being impracticable for camels or heavily laden animals, and if the Afghans had made any disposition to oppose our passage through the Khoord Cabul, the detour taken by the 1st brigade would have been of material advantage; as it was, however, not a shot was fired, nor enemy seen, and we all encamped at Khoord Cabul on the 13th, some arriving there rather late, from the delay in getting our immense train of baggage through the narrow pass. On the 14th we passed over the Huft Kotul (the scene of our former glorious fight), and through the Tezeen Pass, encamping in the valley. The 4th brigade, under Brigadier Monteat, C.B., formed the rear-guard, and did not effect their march as scatheless as yesterday. Owing to the badness of the bullocks yoked to the captured guns, very great delay was occasioned, and finally the bullocks were taken out, and the soldiers of Her Majesty's 31st Regiment supplied their place; the labour was excessive, and they did not arrive at the narrow pass leading to the Tezeen valley until dark. The enemy, taking advantage of this, commenced a sharp fire into the column, and

masses of baggage collected there, causing great confusion amongst the latter. Parties were immediately sent up to the heights on the right to dislodge these marauders, the brigadiers, staff-officers, leading the party; but owing to the darkness little could be done beyond checking their descents into the pass; nothing but the flash of their juzzais could be seen. Finding themselves checked on the right, they tried the left and rear of the column, and annoyed them much, killing some six, and wounding an officer, and about 11 men. However, the guns were safely deposited in camp at a quarter past 10 o'clock, and all the baggage, with the exception of that destroyed when the cattle fell on the march. The advance guard had burnt the fort of Koorderbux Khas, the Tezeen chief, during the day; and the two 18-pounders received from Major-General Nott were burst, thus affording more cattle for the transport of the other guns; indeed, but for this the captured guns could not have been taken on the following day. On the 15th, the 1st division, consisting of the 1st and 2d brigades, under Major-General Pollock, marched to Kutturgung, two marches, whilst the 2d division, consisting of the 4th brigade with that portion of Major-General Nott's force before mentioned under Major-General M'Caskill marched, at a late hour to Leh Baba (one march), thus separating the two divisions by one day's march, and General Nott's column took up their ground at Tezeen the same day, having suffered in the pass rather more than the 4th brigade, caused in a great measure, I fancy, by their being unacquainted with the country, and neglect in crowning the heights soon enough. The marches to Leh Baba, Kutturgung, and Jugdulluk, on the 15th, 16th, and 17th, were accomplished with but little annoyance. The enemy followed up the rear-guard each day, and made several attempts upon the baggage of the 2d division, but without success. The first division marched through the Jugdulluk Pass on the 17th without firing a shot. On the 18th, however, when the 2d division attempted it, the most decided attack yet evinced was sustained by them; rarely have the Afghans shown more courage or daring than was displayed by the Ghilzies on that day. Sword in hand they more than once rushed towards our retiring parties, when recalled from the heights by the rear-guard, but each time a shell or shot thrown from the guns, placed in a position most judiciously by Brigadier Monteat at the top of the pass, sent the Ghilzies to the right-about, and saved our men. Notwithstanding their obstinate attacks, and their following close upon the rear-guard for five or six miles beyond the pass, I am happy to say that the Ghilzies had their labour in vain, not a particle of baggage falling into their hands, whilst their loss must have been considerable; for, besides many that fell from our skirmishing parties, several round-shot dashed directly through the Gungahs, behind which they were ensconced, killing numbers,—and our shell scattered many a group who little calculated on such unwelcome visitors. Their attack upon Major-General Nott the following day was much tamer from their thrashing on the 18th; but they managed to annoy his force greatly, showing them the wide difference between the Kandahar and Peshawar routes to Cabul. Every day from this to Gundamuk, where the three divisions arrived on the 19th, 20th, and 21st successively, our rear was followed pretty closely by the Afghans—chiefly in expectation of plunder, which, I am glad to say, they were disappointed in. The divisions halted each one day at Gundamuk, and arrived at Jellalabad without any occurrence (beyond Nott's forces having made an example of some men in the Nemla valley) on the 22d, 23d, and 25th. We march hence on the 27th as far as Alli Baghan—that is, the whole of General Pollock's force, that under General Nott moving the following day. As yet nothing is known of the manner in which way we are to cross the Punjaub, but we trust it will be in brigades; for great inconvenience ensues from moving large bodies at a time. Very severe loss has been sustained by officers and men from the falling of baggage cattle since leaving Cabul. I have myself lost four private camels, besides property; others even more; so that our promised batta will not positively recompense us for actual losses. The medal, however, will be highly prized, though indeed dearly earned. The privations endured by officers and men of the force that advanced from Jellalabad have been beyond description, but particularly by the soldiery, being tentless and bedless; from camels falling and their loads destroyed on the road, and often, too, rations as they have been sent, on arriving at the encamping ground, up to the heights, there to remain until the next day; all this they have borne with cheerfulness, and both Europeans and Sepoys have done their duty well."

Law.

COURT OF CHANCERY.—*Blundell v. Gladstone.*—This was a rehearing by way of appeal from a decision of the Vice-Chancellor, declaring that the plaintiff, Thomas Weld, who has taken the name of Blundell, is the devisee under the will of the late Mr. Blundell, of Inch Blundell. By the will, made in 1834, the testator gave his estates to the second son of Edward Weld, of Lulworth, in the county of Dorset. Mr. Weld, of Lulworth, is however, named Joseph, and his eldest brother, who was named Joseph Edward, is dead. The plaintiff, Thomas, the second son of Mr. Weld, filed the bill against Mr. Gladstone and the other executors to establish his title to the property, and the Vice-Chancellor directed an issue, which was tried at the Lancaster assizes in 1840, and the result of which was a verdict in favour of the plaintiff, and a decree of the Vice-Chancellor, declaring him to be the devisee named in the will. The rehearing before the Lord Chancellor, assisted by Mr. Justice Patteson and Mr. Justice Maule, was at the instance of Lord Camoys and his sister, Lady Strouton, who claimed as heirs-at-law if the title of the plaintiff failed. If the will could be held void for uncertainty. The case, which derived an importance from the estates being of the value of more than 8,000*l.* a-year, was argued before the vacation. Mr. Justice Patteson, on the part of Mr. Justice Maule and himself, now delivered the opinion they had formed on the construction of the will, and that opinion was in favour of the

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 4—1843.

SATURDAY, JANUARY 28.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Achimenes longiflora, its treatment	41 a	Hyacinths, their treatment in pots	36 a
Amateur's Garden	36 c	In 18, Agri-horticultural Society	39 b
Asparagus, salt for	41 a	Indian Corn, remarkable produce of	38 b
Assam Tea, remarks on	39 b	Leonotis Leonurus, its treatment	41 a
Bulbs, art of cultivating the ground without manure	35 c	Lucerne, as a green manure	36 a
Bignonia for the greenhouse	41 a	Lycaste plans	38 c
Books, botanical	41 b	Manuring with green crops	35 c
— on Himalayan vegetation	41 b	Melon, Hardy's Cantaloupe, a good kind	37 c
Bulbs, growth of	39 a	Mill's improved pit, remarks on	37 c
Canada Kale	41 b	Oak, Fulham	41 a
Celery, to cook	39 b	— evergreen, to prune	40 c
China, flower-gardens in	39 a	Oak-stools, to renovate	39 c
Clover as a green manure	35 c	Odontoglossum citrosimum	39 c
Cookery, solution of problem in	38 b	Orchids, some kinds delight in a cool atmosphere	39 b
Cosy's Introduction to an Flore des Environs de Paris, noticed	39 c	Pear-trees, summer pruning of	37 b
Crabs, ornamental	41 a	Peat, to convert into manure	40 c
Dahlia seed, to sow	41 a	Pelargoniums, on exhibiting	41 c
Doyle's Cyclopaedia of Husbandry, rev.	39 c	Pheasants, to drive from seeds	38 b
Drainage, remarks on	35 c	Poultry, good kinds	38 b
Eyre's Journal of an Afghanistan Prisoner, rev.	39 c	Pruning forest trees	37 b
Flrs, Scotch, disease in	37 c	Rats, to expel	38 b
Forcing, remarks on	35 a	Rendle's system of heating	39 c
Fork for leaves	39 a	Rhubarb, an early sort	37 c
Frame for protecting annuals	39 b	Russelia juncea, its treatment	40 a
Frogmore Royal Gardens, noticed	39 b	Salt as a manure	39 c
Fruit, to preserve in water	38 b	Salvia patens, hardy	39 a
Fruit trees, select	41 a	Sawdust, for manure	40 c
— to train	41 a	Scales, to cure	40 c
Furnace, Jucke's patent	39 a	Seeds, Egyptian, their treatment	41 a
Gardeners, remarks on	41 b	Siphocampylus betulifolius, its treatment	41 a
Gesnera lateritia	38 c	Stages for plants	41 b
Grapes, cause of rust on	37 c	Sugar, extracted from a Grecian plant	41 b
— to keep late	37 c	Takuma tetrafolium	41 b
Guano, to apply	40 c	Turf as a green manure	39 c
Guernsey, Camellias in the open air there	39 c	Verbena, their treatment in winter	41 a
Heating by steam, Walker's plan	39 c	Vines, to graft	37 c
— Rendle's System	39 c	Worms on Grass, to destroy	37 a
Heating dwelling-houses	39 c		
Henderson's Nursery, noticed	39 b		

JOSEPH HEADLAND, FLORIST, &c., LONDON

ROAD, CAMBRIDGE, begs to offer Fine GROUND ROOTS of the undernamed DAHLIAS, in fine condition, and warranted true to Name:—	s. d.	Indispensable, (Girling)	3 6
Admirable (Spary)	3 6	Inverton, (Hodges)	5 0
Aethusa (Union)	5 0	Lady Glentworth, (Carter)	5 0
Beauty of Wakefield (Barrett)	10 0	Marquess of Lansdowne, (Brown)	10 0
Beeswing (Headly)	7 0	Majestic, (Widnall)	7 0
Chancellor, (Whale)	10 0	Marchioness of Exeter, (Widnall)	10 0
Conqueror of the Plain, (Spary)	5 0	Oriental Pearl, (Union)	5 0
Dowager Lady Cowper, (Jackson)	3 6	Oscar	3 6
Duke of Richmond, (Edwards)	5 0	Phoenix, (Headly)	10 0
Eclipse, (Cattellagh)	5 0	Princess Royal, (Hudson)	15 6
— (Widnall)	3 6	Satirist, (Headly)	7 0
Exquisite, (Holmes)	3 6	Stanley, (Jones)	7 0
Frederic the Great, (Atwell)	5 0	Twyford Perfection	8 0
		Unique (Walters)	3 0
		Westbury Rival	10 0

DOUBLE ITALIAN TUBEROSE ROOTS, 4s. per dozen.—The Annual Importation of these delightful and fragrant BULBS has just been received at Arthur Cobbett's, late Mr. C. BARRON'S, Italian Warehouse, 18, Pall Mall. Where also may be seen a Choice Collection of Orange, Lemon, Citron, Lime, and Cypress Trees, Catalonian and Arabian Jasmines, &c., just arrived from Italy.—N.B. Importer of choice Honeycomb, Parmesan and Gruyere Cheese, New Salad Oil, and other Foreign Produce, &c. Lists, with Prices, may be had.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEEES, AND LILUM LANCIFOLIUM.

H. GROOM, CLAPHAM-RISE, NEAR LONDON, (removed from Walworth), By APPOINTMENT, FLORIST to HER MAJESTY, respectfully informs the Nobility, Gentry, and Public, that this is the best season for planting the above Flowers, and that he can supply them of first-rate quality at the following prices:—

RANUNCULUSES, 100 roots in 100 superfine sorts	£4 4 0
Superfine mixtures from 5s. to 21s. per 100.	
ANEMONES, 100 roots in 100 superfine sorts	3 0 0
Superfine mixtures from 7s. 6d. to 21s. per 100.	
AURICULAS, 25 superfine sorts, 1 plant of each	3 13 6
CARNATIONS, 25 superfine sorts, 1 pair of each	3 10 0
PICOTEEES, 25 superfine sorts, 1 pair of each	2 10 0
YELLOW PICOTEEES, 12 superfine sorts, 1 pair of each	2 2 0
LILUM LANCIFOLIUM ALBUM, from 5s. to 42s. each.	
PUNCTATUM, from 10s. 6d. to 42s. each.	
" SPECIOSUM, small bulbs, at 63s. each.	

H. G. also begs to say that he has a few Trees of his PRINCESS-ROYAL PEAR for sale, at 5s. each.—The Trade supplied.

IMPERIAL NURSERY, CHELTENHAM.

SAMUEL HODGES begs respectfully to inform the admirers of the Pelargonium, that he has a few more strong plants left of his unique Seedling, Oberon, at 42s. each. Those that have not seen Oberon, will find the following a faithful description. It has the habit and size of bloom of Foster's Alicia; in the upper petal is a large dark spot, with a clear and distinct white margin about the eighth of an inch wide; the lower petal is as brilliant a white as the upper margin, and forms a beautiful cup without crumple or serrature.

FUCHSIA BROCKMANIA.—This splendid FUCHSIA was raised by P. PADDEN, Gardener to the Rev. William Brockman, of Beachborough, Kent. It has been justly admired by all who have seen it, and repeatedly noticed by the Editor of the *Gardeners' Gazette* as a superb variety, "distinguished by firmness of texture, large size, and diversity of colour between the sepals and petals."—(See "P. P., Notices to Correspondents," August 13, 1843). It bears remarkably fine foliage, is of vigorous habit, and a most profuse bloomer; therefore confidently recommended as desirable in any collection, and indispensable to the exhibitor. Strong Plants will be sent out early in spring (carriage-free to any part of the kingdom) upon the receipt of a post-office order for 7s. 6d. As the Plants, so far as the limited stock will allow) will be sent according to priority of order, early notice is requested. To Nurserymen ordering Six Plants, the usual allowance.—Direct to Mr. PADDEN, Gardener, Beachborough, Hythe, Kent.—Dec. 1, 1843.

FUCHSIA ST. CLARE.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this Paper of the 24th Dec., together with their two new Verbenas. Great Yarmouth Nursery, Jan. 26, 1843.

TO GENTLEMEN AND AMATEUR FLORISTS.

The time of year is now fast approaching for planting that delightful flower, the Ranunculus; a few hundred roots to be parted with at 42s. per hundred, (with names); planting time, February and March. Apply (pre-paid) to Mr. EYRE, Farnham, Surrey; where may be seen, in the blooming season, in Mr. EYRE'S Collection of Pelargoniums, "a few Seedlings," broken into flower in July last, 1842, with many of this year, 1843. Some possessing striking foliage, cultivated and grown in small pots, "in their true and natural state, without that pernicious aid," chemical watering, which can only serve to raise and drive "colorem contra naturam," for a short period.—Farnham, January 23, 1843.

DAHLIAS.—An AMATEUR has a Collection of about

Sixty good ground Roots at his disposal, being Show Varieties, many first-rate sorts, and in good condition. For full particulars apply by letter, Post-paid, to F. H., Post-office, Maidenhead, Berks.

SEEDLING LARCHES.—Several Hundred Thousands

of Two and Three Years' old Seedling Larches, of first-rate quality, and at very moderate prices, are for sale by DICKSON and TURNBULL, Nurserymen, &c., Brechin. N.B. Will be put free on board a vessel at Montrose, from which port there is a regular trader once a week to London, &c.

CAMELLIAS.—WANTED, about a dozen good,

strong, growing Plants, of the hardy and common Sorts, standing not less than from 5 to 6 feet high from the pot, and well covered with foliage. Any person having the above to dispose of is requested to apply by letter, stating lowest price, to Mr. BENJAMIN HEATH, Gardener, Highfield, near Southampton. The Plants are not wanted until out of flower.

PATRONIZED BY HIS GRACE THE DUKE OF RUTLAND, THE LORD BISHOP OF LONDON, THE EARL OF HARRINGTON, AND MANY OF THE NOBILITY.

THE FASTOLFF RASPBERRY.—For many years

past there has been cultivated in the neighbourhood of Yarmouth, adjacent to the ancient Castle of Sir John Fastolf, a red Raspberry of a most extraordinary size and rich flavour. The Nobility who visit the sea-coast here have invariably expressed their astonishment at the exceeding fineness of the fruit of this variety, and until lately YOUELL and Co. have not been enabled to obtain a sufficient stock of it to bring it into public notice; but having now obtained a supply (although limited) of fine Canes, beg to offer them on the following terms, and they can be sent with safety to any part of the United Kingdom, on the receipt of a Post-office order.

Packages containing 50 Canes, 25s.—Packages containing 25 Canes, 14s.—Package included.

The few to whom YOUELL and Co. have sent it, have expressed their high admiration of its superiority over other varieties; and a letter just received from a Gentleman in Derbyshire, to whom this variety was sent, states that it invariably takes prizes at the Hort. Shows in his neighbourhood. In conclusion, YOUELL and Co. beg to state that they have not, nor do they intend to recommend any article but that which they can do with confidence; and in this instance they feel fully assured of its giving the most entire satisfaction.—Great Yarmouth Nursery, Norfolk, Jan. 26, 1843.

WHYTE'S SUPERIOR DARK AND DELICIOUS

BEEF-ROOT in sealed Packets of 5s.; each packet containing 1 oz. To be had of Mr. KNIGHT, Nurseryman, Kings-road, Chelsea, and of the Grower, J. WHYTE, Rails Head, Isleworth. As this Beet requires peculiar culture, directions will accompany each packet.

SEYMOUR'S SUPERB WHITE CELERY.

MESSRS. LANE and SON beg again to offer to the Public the above superior Celery Seed (at 1s. 6d. per packet), the qualities of which are so well known as to require no eulogium here, although it may be advisable to state, by way of caution, that there is an old variety of Seymour's White Celery offering for sale, which is very inferior to the above.—Also the BLACK-SEEDED BATH COS LETTUCE, at from 1s. to 5s. per packet.—Either or both can be sent by post, on the receipt of postage stamps or post-office order from unknown correspondents.—Nurseries, Great Berkhamstead, Dec. 26, 1842.

EARLY PEAS, &c.—HENRY D. CORMACK,

SEEDSMAN, begs respectfully to inform the Nobility, Gentry, and others, of Manchester and its Vicinity that they can be supplied with the following new and early articles:—Cormack's Prince Albert and early Kent Peas, British Queen ditto; Taylor's New Improved Windsor, and Johnson's Wonderful Beans; Manchester and Giant red and pink Celery; Hamilton's White Spine and Walker's Prize-fighter Cucumbers; Incomparable Cos Lettuce, together with every other variety of Horticultural, Agricultural, and Floricultural Seeds, at his Wholesale and Retail Warehouse, 106, Deangate, Manchester. Agent for Sir James Murray's Patent Fertilising and Guano Manures.

HOME-GROWN SEEDS.

MESSRS. SUTTON and SONS respectfully acquaint those readers of the *Gardeners' Chronicle* who have not yet hitherto honoured them with their commands, that their grounds, being situated at considerable distances from each other, and of different soils, they are enabled by strict attention to grow Garden-Seed true to their kinds, and can supply their Customers with Seeds which they know to be new, thereby preventing disappointment in the crops. The Annual Seed Catalogue is now published, and may be had gratis on application.

The following articles are particularly recommended:—£ s. d.
100 Ranunculuses, in 50 fine varieties by name . . . 1 5 0
50 do., in 50 do. . . 0 15 0

The most approved kinds of Kitchen Garden Seeds, in a complete collection for a Nobleman's or Gentleman's family . . . 2 2 0

Ditto, ditto, for a smaller Establishment . . . 1 1 0

Ditto, ditto, of Flower-Seeds, containing all the new kinds worthy of recommendation; together with the best of the old sorts, with instructions enclosed . . . 1 10 0

Ditto, in smaller collection, equally choice . . . 1 1 0

Ditto, ditto, ditto . . . 0 10 6

Double Italian Tuberoses, fresh imported, per dozen . . . 0 4 0

J. S. and Sons, having a stock of all the new kinds of Kitchen Garden and Flower-Seeds, they will be included in the above collections; or they may be obtained separate, according to order, at moderate prices.

N.B.—Parcels delivered free to the Railway-station, or any part of London.—Reading Nursery, Berkshire, Jan. 28th.

HENRY HAMMOND, NURSERY AND SEEDSMAN,

Mundford, near Brandon, Suffolk, respectfully announces to the Nobility, Gentry, and the Public generally, that the late fine season for preserving his admired WHITE CAPE BROCCOLI enables him to offer it at 3s. 6d. a packet, which will contain half an ounce. The many orders already received from those who were purchasers last year justify H. H. in again offering it to the public. The flavour is not only equal to any Cauliflower, but it is as hardy as any of the Cabbage tribe. By sowing in March, the end of May, and August, a supply may be had nearly all the year. If any gentleman wishes for information respecting its quality, a reference to the undermentioned Gardeners will meet with an immediate reply:—Mr. Wylie, His Grace the Duke of Grafton, Euston Hall; Mr. Piper, Right Hon. Lord Walsingham, Merton Hall; Mr. Hammond, Sir Richard Sutton, Bart., Lynford Hall; Mr. Brownly, John Angerstein's, Esq., Weeting Hall. Messrs. Flanagan, Seedsmen, Mansion-house-street, London, who can warrant the stock, and will carefully execute any orders entrusted to them.—A good PROPAGATOR in the Out-door Department is wanted.—Mundford, Jan. 19, 1843.

COUNTY FIRE-OFFICE, AND PROVIDENT

LIFE OFFICE, 50, REGENT-STREET, PICCADILLY. Established 1807.

TRUSTEES.	
His Grace the Duke of Rutland, K.G.	Sir Henry Pynn
The Marquess of Northampton	Sir Frederick A. Roe, Bart.
The Rt. Hon. Lord Northwick	Alex. Henderson, Esq., M.D.
The Earl of Macclesfield	John Edward Conant, Esq.
Sir Wm. Earle Welby, Bart.	Andrew Macleay, Esq.
Sir John Osborn, Bart.	Frederick Squire, Esq.
Sir R. Duckworth King, Bart.	George Pryme, Esq.
	Glynne Earle Welby, Esq., M.P.

&c. &c. &c.
The advantages offered to the public by the above Offices are such as result from a course of uninterrupted prosperity, the fruits of a prudent and economical management for a period of thirty-five years.

At the present time so many establishments exist, vying with each other in the *profession of benefits* to the public, which numerous failures and consequent ruin to thousands of industrious families have proved to be fallacious, that the Directors think they will best discharge their duty to the Proprietors and to the Public by a simple statement of the advantages which have been realised by these Offices.

The COUNTY FIRE OFFICE has not only settled all claims with promptitude and liberality, but has, from its first establishment, made large returns to the Insured. These amount at the present time to 125,000l.

The PROVIDENT LIFE OFFICE has at each septennial period divided the whole of the profits, subject to a deduction of about a twentieth part only, among the Insured. The benefits actually secured to lives insured in this Office may be judged of by the following Table:—

No. of Policy	Age	Bonus in 1813 & 1820	Bonus in 1827 & 1834	Bonus in 1841.	Total of Bonuses.	Sum Insured
		£. s. d.	£. s. d.	£. s. d.	£. s. d.	£.
109	37	221 11 2	387 11 10	504 0 4	1213 3 4	2500

JOHN A. BEAUMONT, Managing Director.

HOT-WATER APPARATUS FOR HEATING

HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM PERFECTED.—FOR OBTAINING A FREE

CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., &c., upon the above system, which has (at an immense cost to the inventor), been brought to great perfection, and heats the same by HOT-WATER APPARATUS, with improved Tube or Conical Boilers. W. Hill also adapts Dr. ARNOTT'S NEW BALANCED REGULATOR to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. PENN'S SYSTEM only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, is a perfect and rapid Circulation, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer-heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. Hill would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. Hill, Builder and Surveyor, Lewisham.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 57. 5s. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WAYTE'S New Patent Land-presses and Drills.

HORTICULTURAL BUILDING and HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHLSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

RENDLE'S TANK SYSTEM OF HEATING.

WILLIAM E. RENDLE having received several communications from various parts of the country, concerning his "Tank System of Heating," which will ultimately become universally adopted in all forcing establishments where bottom-heat is required, begs to announce to those Gentlemen, as well as to others who wish for information respecting it, that it is W. E. R.'s intention to publish a well-executed Engraving, with a Treatise appended, which will contain every information requisite to set up or adapt the Apparatus for Houses of various sizes, with the cost of materials, fixing, &c.

Every Pit in the kingdom ought to be fitted up on this principle.

W. E. R. is induced thus to bring this system prominently before the public, knowing that it will be of the greatest utility, and of immense importance to Horticulturists. The cost of the Treatise will be regulated according to the number of subscribers.

Union Road Nursery, Plymouth, Jan. 23, 1843.

THE GENUINE GUANO ON SALE AT LIVERPOOL.—Any quantity of this celebrated and valuable NATURAL MANURE can be obtained from the Queen's Bonded Stores, either in Liverpool or in London. Apply to Messrs. WILLIAM JOSEPH MYERS and Co., Importers, Liverpool; Messrs. COTESWORTH, POWELL, and PRYOR, Great St. Helen's, London; or Messrs. EDWARDS, DANSON, and Co., Brokers, Liverpool.

BONE MANURE. ADULTERATION DETECTED. The extent to which Bone Manure is adulterated is so great as to render it imperative upon the Farmer to ascertain, by chemical analysis, the quantity of PURE BONE it contains.

W. H. POTTER undertakes to examine any Sample that may be submitted to him, and within two days after the receipt thereof, to return the correct percentage of PURE BONE. Mr. Potter's charge is 5s., which should be enclosed with an average sample, say 1 lb., and sent (carriage paid), to the Artificial Guano Works, 28, Upper Fore-street, Lambeth, where Unadulterated Bone may be had, either in dust or 2-in. pieces.

*** Mr. POTTER examines every species of Artificial Manure, and reports upon them at the above charge. Soils very carefully analysed.

GUANO ON SALE BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

In small 8vo., Price 2s. Cloth. The Fifth Edition of **EVERY LADY HER OWN FLOWER-GARDENER**, By LOUISA JOHNSON. With a Chapter on Window Gardening, by Mr. MACINTOSH, and a Description of WARD'S Domestic Greenhouse. Preparing for Publication, uniform with the above, price 2s., **EVERY LADY'S COMPANION TO THE KITCHEN-GARDEN**, by A LADY. London: W. S. ORR, and Co., Amen Corner, Paternoster-row.

THE QUEEN'S SPEECH, specially Reported and Illustrated, will appear in next Saturday's Number of "PUNCH, OR THE LONDON CHARIVARI," price 3d.

A STAMPED EDITION to go free by Post, price 4d. Vol. I. is just published, and Vols. I. and II. are, as well as all back Numbers, constantly on sale.—Office, 13, WELLINGTON-STREET, and Sold by all Booksellers and Newsmen.

Just published, price Sixpence, **A LETTER to the FARMERS OF ENGLAND**, on the RELATIONSHIP OF AGRICULTURE and MANUFACTURES. With a representation of Ploughs and Ploughing in Buckinghamshire and the Lothians. By ONE WHO HAS WHISTLED AT THE PLOUGH; Author of Letters under that signature in the *Morning Chronicle*. London: RIDGWAY, Piccadilly.

MESSES. MARNOCK AND MANLEY beg to inform their Friends and the Public, that they have published their Catalogue of Flower Seeds, &c., for 1843, which will be forwarded free by Post, on application. Their Importation of German and Prussian Seeds have arrived in fine condition, to which they beg to call their attention. Nursery, Hackney, Jan. 12, 1843.

S. GIRLING'S CATALOGUE OF ENGLISH AND FOREIGN DAHLIAS can now be had on prepaid application; it contains as well, a List of Fuchsias, Pelargoniums, Pansies, and Verbenas, any of which S. G. will be happy to receive on order, and pledges himself to supply early plants correct to name, and on liberal terms where a quantity is wanted. The trade liberally supplied.

Dane Croft Nursery, Stowmarket, Suffolk.

SION NURSERY, CROYDON.

ROBERT COOPER begs to inform the Public that he has just published his CATALOGUE of CHOICE FLOWER SEEDS, &c. &c. for 1843, which will be forwarded by Post on application.—Jan. 25, 1843.

EXTENSION OF THE PRINCIPLE OF ART-UNIONS.

THE ROYAL POLYTECHNIC UNION of LONDON.—Subscribers and the Public are respectfully informed that the ETCHINGS illustrative of the SONGS of SHAKESPEARE by the ETCHING CLUB are now ready for inspection. By the liberality of the Members of the Club, the Subscribers will receive Seventeen Etchings instead of the promised number of Thirteen.—Subscriptions received by the Honorary Secretary, at 309, Regent-street, and 5, Cavendish-square.

WILLIAM LYNN, NURSERYMAN, SEEDSMAN, and FLORIST, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a GARDEN TOOL WAREHOUSE, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. W. L. begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit-Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which, he trusts, with industry, punctuality, and attention, will secure to him general patronage.

W. L. solicits particular attention to his new PEA, LYNN'S DWARF WRINKLED MARROW, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn Pea ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, enclosing a postage-stamp.

TO NURSERYMEN.—To be DISPOSED OF, an Old-established NURSERY, in the immediate vicinity of London, containing 11 Acres of Land, in the best state of cultivation, partly stocked with Fruit-trees, Standard and Dwarf Roses, Evergreens, and other Ornamental Shrubs and Trees, principally inclosed with good walls. There are 4,000 feet of Glass, well stocked with Greenhouse and other Plants. There are also on the premises a commodious Dwelling-House, and Seed-Shop attached, Stabling, Sheds, &c., all in excellent repair. Rent and Taxes moderate, and 25 years of the Lease unexpired. The above is situated on one of the leading thoroughfares out of London, and may be entered upon on or before 25th March next. For particulars, application to be made, by letter only, prepaid, to Messrs. NOBLE, Seedsmen, &c., 152, Fleet-street, London. Part of the purchase-money may remain, if required, on approved security. The proprietor is retiring from business in consequence of ill-health.

THE GARDENER at ST. MARGARET'S informs those parties who have addressed letters to him upon the subject of a Second Gardener's place, that the Advertisement was inserted without his knowledge, he being perfectly satisfied with his present Foreman, whom he considers strictly honest, sober, industrious, and trustworthy, and things under his charge bear testimony of his attention to his business. St. Margaret's, Jan. 23, 1843.

CUMBER and MELON BOXES and LIGHTS.—For SALE, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two-light Boxes and Lights complete, from 17. 8s. Garden Lights made, glazed and painted, from 1s. per foot. Sashes and Frames made, glazed, and hung complete, 1s. 8d. per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road. *** An Apprentice wanted.

GARDENERS' ENTERTAINMENT.

J. WEEK'S, Jun., Annual Improved Plan of [H]EATING, will take place at his Horticultural Manufactory, Gloucester-place, King's-road, Chelsea, on Thursday the 2nd of February. Such professional Gardeners who are his friends and supporters, and who will honour him with their company, are requested to favour him with a line, by Post, without delay.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener (Sundays excepted).

PATRONIZED by all the principal Architects and Builders in this Country and Abroad.—SEYSSSEL ASPHALTE.—In consequence of the daily attempts made to imitate this valuable mineral production, and of the name of "Asphalte" being given to most of the spurious and "cheap" materials, the Directors of this Company particularly recommend Architects, Builders, and others, (for the purpose of securing the use of the genuine article,) to insert in their specifications "The Seysssel Asphalte, Claridge's Patent," and not merely "Asphalte" or "Bitumen," as, in many cases where these terms have been used, gas-tar and other worthless and offensive compositions have been introduced. For the information of those residing at a distance from London, and of those who, having employed the spurious composition, may, from its failure, have become prejudiced against the use of Asphalte, the following are mentioned as some of the distinguishing qualities of the genuine material. The Asphalte of Seysssel is of a light colour, closely resembling Yorkshire stone, has a smooth surface (without being slippery), and joints almost imperceptible; it is also free from smell, is not acted upon by change of temperature, and is at all times dry and warm, and remarkably pleasant to walk upon, and, from its elasticity, never cracks. The fictitious material, on the contrary, has a dark and dirty-looking appearance, presents a rough and coarse surface, and, from its brittleness, is liable to crack, particularly in frosty weather. In consequence of the above qualities, the genuine material (being perfectly impervious to wet) has been used with great advantage for roofing; it can be laid down to any extent, presenting one uniform surface, and is far superior to lead, as it is not liable to expansion or contraction in consequence of any change in the temperature. For covering of arches, (to prevent the percolation of wet,) it is invaluable, the Greenwich Railway Company alone having covered upwards of 400,000 superficial feet; it has also been used on the Great Western, Birmingham, Midland Counties, South Western, Brighton, Blackwall, and other Railways; at the joint Stations, London-bridge, and at the South Metropolitan, Highgate, and Nunhead Cemeteries. As proof of the great durability of the genuine Asphalte, it need only be mentioned that the first work executed in this Country with this material, (amounting to 3,952 feet,) was at Whitehall, opposite the Horse Guards, in the month of April, 1838, and which, although only half an inch in thickness, has remained up to this time (a period of four years and eight months) in the most perfect condition. Books of Testimonials with scale of prices may be obtained on application to J. FARRELL, Secretary.

Seysssel Asphalte Company's Depot, Stangate, London. Note.—Neither the pavement in Parliament Street, London, nor the works at the Model Prison, at the Abney-park Cemetery (which from its failure has since been removed), or at the Hotel at the Slough station of the Great Western Railway, were executed by this Company.

WANTS a SITUATION as GARDENER, a respectable young Man, aged 30, who has a practical knowledge of his business in all its branches, and can be well recommended from the situation he is about to leave. Address, A.B., at Mr. BELL's, Bookseller, Richmond, York.

WANTED, a steady, active, middle-aged Man, who has some knowledge of Greenhouse Plants, Cultivation of Roses, Training Fruit-trees, &c., and would have no objection to go out Jobbing occasionally. None need apply who cannot have a good character from their last situation. Further particulars may be had by applying by letter, post-paid, to J. COLE, Nurseryman, Rugby, Warwickshire.—Jan. 23, 1843.

WANTS a SITUATION as GARDENER, a middle-aged married Man without encumbrance; who understands the management of Pines, early Forcing, and Gardening in general; he would prefer living on the premises, can have a good character from his last place, where he lived upwards of 10 years. Direct to A.B., No. 9, Great Orchard-row, High-street, Camberwell.

WANTED, immediately, an active and steady MAN, to take charge of a provincial Nursery of recent establishment. He must have a thorough knowledge of the Nursery Business, and be a good propagator of Greenhouse Plants, &c. Satisfactory references will be required. Application to be made, stating Wages, to Messrs. HANDCOCK and SON, Nursery Seedsmen and Florists, 218, Giltgate, Durham.

WANTS a SITUATION, a single young Man of respectable connexions, as Under Gardener, where his employment would be principally in the Houses. Has been as Under Gardener for seven years, and can have a good character from the gentleman's Gardener he is now living with. Direct to J. A., Post-office, Aveley, Essex.—All letters post-paid.

TO SEEDSMEN.

WANTS a SITUATION, a respectable young Man (who has been engaged for the last three years in the Seed Business, in a large concern in the country), either in a Seed-shop or Warehouse, where he could make himself generally useful. Salary not so much an object as immediate employment. For particulars, please to apply (post-paid) to Messrs. W. and J. NOBLE, Seedsmen, No. 152, Fleet-street, London.

WANTS a SITUATION as GARDENER, a respectable Man, age 46, who thoroughly understands his Business, and all kinds of Forcing, Pleasure-grounds, and Kitchen-gardens; and can have an unexceptionable reference from the gentleman he has just left, with 13 years' character; either to live in the house or not. Direct to A.B., Mrs. CARRY'S, No. 8, Providence-row, Islington-green.

WANTS a SITUATION as GARDENER, or GARDENER and BAILIFF, a single young Man, aged 32, who has a thorough knowledge of his business, and can have a good character from his last place.—Address to H. H., Post-office, Tonbridge Wells.

WANTS a SITUATION as GARDENER, a respectable, young, unmarried Man, who has been 12 years at the business, and has a competent knowledge of his profession in all its branches; has been in some of the first-rate situations as Gardener in the North; and can have an undeniable character from the place he is now in, where he has lived above two years.—Direct, I. B., Mr. PETER FAIR'S, Bookseller, Bishop-Auckland.

TO NOBLEMEN, GENTLEMEN, FARMERS, & GRAZERS.—WANTED by a Young Man (a native of Cumberland) a SITUATION as FARM BAILIFF, in any County in England. The Advertiser has been brought up in Cumberland to Farming and Grazing; and is acquainted with thorough Drainage system, Subsoil and Trench Plowing, and with most of the modern improvements in Agriculture; and would be able to give respectable references, and produce sufficient testimonials as to character, and capabilities, &c. Address, A.L., Post-office, Brampton, Cumberland.

NOTICE.—All persons having a CLAIM upon the ESTATE of the late Mr. MICHAEL WATERER, Nurseryman, Knaphill, Herts, Surrey, are requested to send in their Accounts without delay; and all persons indebted to the said Estate are requested to pay the same to HOSIA WATERER, Knaphill, or to JAMES WATERER, Chertsey, Executors to the deceased.

GARDEN NET.—New Garden Net, viz., Herring Net, one-inch mesh, made with machinery, 1½d. per yard in any length or width. Old Fishing Net, properly mended up, in lengths 30 or 40 yards, 8 and 10 feet deep, 3d. per yard square. Woollen and Worsted Net, fine Blossom and Wasp Net, made from Hemp, Bunting, Screens, &c. &c. Woollen Tie for Flowers. Also Sheep-folding Nets, Fishing Nets, Rabbit and Hare Nets. Nets for Fences against Rabbits, Dogs, Poultry, &c., 2d. per yard; also for covering in Poultry yards, Pheasants, &c., 2d. per yard. Superior expanding Tents for Lawns, &c., 5s., 36 feet round. Tarpaulins for Wagon and Stack Covers, Garden Frames, &c., 2s. per square yard made up.

ROB. RICHARDSON, Net and Tent Makers, 21, Tonbridge Place, New Road, near Euston Square, London.

N.B.—1000 London Policemen's Capes for Farmers' Servants, 1s. 9d., 2s., and 2s. 6d. each.

IMPORTANT TO ALL.

"I CAN say of the WATERPROOF COAT I purchased of you, that I never had anything so pleasant in wear, or so efficient as a 'Waterproof,' and therefore, in every respect superior to a 'Mackintosh.' It is a very pleasant garment, too, for moderate warmth when the weather is dry. As a medical man, and having much daily riding, I have fully proved what is above stated, and you are welcome to use this as the testimony of one much and constantly exposed to the weather, as it may be useful to yourself and others, &c.—"THOMAS WARNER, Surgeon, Cirencester, Jan. 4, 1843." The Garment referred to is BERDOE'S well-known VENTILATING WATERPROOF FROCK, and the above testimony is entirely unsolicited, nor has W. B. ever seen the party who gives it. Made only by WALTER BERDOE, Tailor, Waterproofer, &c., 9, Cornhill (eight doors from Bishopsgate-street.)

CAUTION.—Several Perfumers of apparent Respectability, for the sake of gaining a trifle more profit, basely attempt to impose their pernicious compounds upon the public as the real "MACASSAR OIL" for the Hair, and "KALYDOR" for the Complexion. They copy the bills and labels of the original articles, substituting either a fictitious name, or the word "GENUINE" in the place of "ROWLAND'S." To frustrate such imposition, it is necessary, on purchasing either article, to see that the word ROWLAND'S is on the wrapper, as follows, without which none are genuine. ROWLAND'S MACASSAR OIL, for the growth, and for Beautifying the Human Hair. Price 3s. 6d., 7s., or Family Bottles (containing four small) 10s. 6d.; and double that size, 21s. per bottle. ROWLAND'S KALYDOR, for the Skin and Complexion. Price 4s. 6d. and 8s. 6d. per bottle. A. ROWLAND AND SON, 20, HATTON GARDEN, LONDON, is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraven on the Government Stamp affixed on the Kalydor. Be sure to ask for "ROWLAND'S" Articles, Sold by them and by respectable Chemists and Perfumers.

In the Press, and will be published in a few days, in one small vol. 12mo,

RURAL CHEMISTRY.
By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London.

The Gardeners' Chronicle.

SATURDAY, JANUARY 28, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.	
Wednesday, Feb. 1	Geological 8½ a.m.
Friday, Feb. 3	Botanical 8 p.m.
Monday, Feb. 6	Entomological 8 p.m.
	Horticultural 2 p.m.
Tuesday, Feb. 7	Linnean 8 p.m.
	Floricultural 6½ p.m.
Wednesday, Feb. 8	Medico-Botanical 8 p.m.
Saturday, Feb. 11	Royal Botanic 8½ p.m.

WE have already stated that during the last session of Parliament Mr. Pusey gave notice for a committee to inquire into the subject of Drainage; and we believe that evidence was prepared to establish and show the necessity of enforcing the universal clearance and maintenance of the outfalls now existing, so that underdraining might hereafter become a less difficult and costly operation. We are, however, not aware that there was an intention of making the measure universally compulsory, and placing it under scientific administration; nor do we understand that the after-application of drain-water had attracted the attention of those agricultural Members of Parliament, who are generally interested in such matters. Indeed, it is chiefly in the pamphlet of Mr. Bailey Denton, already referred to, that the subject has been examined: and as we agree with that gentleman in believing that even more ultimate profit may be derived to the country from beneficial after-uses of drain-water than from the mere eradication of existing evils, we shall now proceed to consider that topic.

If a profitable distribution of the drain-water, which now is so injurious from its stagnation, be practicable, it must be secured by uniformity in arranging the receiving watercourses; and although that uniformity can only be worked out in districts, still it is essential that those districts should be allotted in relation to the whole country, and without regard to the interests of private individuals. This systematising of the mains or receivers is the amount of compulsion to which we alluded in our former notice of the subject; and we are of opinion that, in the absence of such compulsion, the nation will never be made to feel a great and important change, but will be brought, by the desultory plans of separate individuals, into the same condition as London, so far as regards systematic arrangement of the mains, and the application of the valuable matter to be derived from them.

The dislocation of the Metropolitan sewers is a matter of common complaint; they have been planned without reference to each other, and now they will not work together; but had all the London works of this kind been formed upon one well-considered, preconcerted plan, not only would the drainage of London and its suburbs have been more effectual but the water of the Thames would still be as pure as it was originally: and instead of being corrupted by the refuse of the town, the valuable contents of the sewers might have been directed to the large increase of agricultural wealth. By some such uniformity of arrangement as would have secured to London advantages of which we can now only regret the loss, the waters of the higher lands may, in many cases, conduce to the fertility of the lower lands. But this uniformity can never be secured if we allow the opportunity to pass without incorporating with the regulations of a General Drainage Act stringent provisions for regulating the dispersion of the water to be gained by its operation. There is no apparent reason why the measure which renders clay lands dry enough for improved cultivation should not also make light lands moist in all cases where a transfer of surplus water can be effected advantageously; though such opportunities would not be general, they certainly would occur.

England cannot indeed be called, in strict agricultural terms, an irrigating country; but, nevertheless, cases may be found in Wiltshire, Bedfordshire, and many parts of Scotland, where the benefit to be derived from such an use of water is distinctly shown. By combining the measure we are now advocating with that for the sewerage of towns, land-waters would be exchanged, where localities are favourable, for urban refuse. Where towns are situated in valleys, on the one hand, the waters from the hills above would be collected (as at Greenock), and conveyed into the towns for cleansing the streets, flushing the sewers, and furnishing a supply for domestic purposes; and, on the other, the refuse substances would be conveyed to the land, either in mixture with the water that had served for cleansing the town, or, after being raised into flat-bottomed vessels, like the boats used by the Germans for the same purpose, it would be floated along the connecting watercourses into the country for use as solid manure. Near Edinburgh, in the Holyrood meadows, we have a well-known

proof of the value of irrigating with the contents of sewers; for there, sandy, inferior land has become worth as much as 57l. an acre, annual rent; not that we are at all disposed to advocate the manner in which the sewerage is used in this instance; on the contrary, we agree with Mr. Bailey Denton in regarding such a selfish use of the sewerage in the light of an abuse. We would rather turn to Mr. Roe's very recent Report on the Drainage of Eton*, because the improvements suggested by him afford a better illustration of this part of the subject. That gentleman (whose great practical experience entitles his observations to the most careful consideration) particularly directs attention to the importance of the contents of sewers for irrigating meadow land, and turning them to profitable account as a means of supplying an abundance of rich manure. We have already seen, in the report of the Poor-law Commissioners, that the contents of the ditches at Eton have been found to kill the Grass; a circumstance which plainly shows the ignorance of some farmers, and the value of sewerage when sufficiently diluted and judiciously applied.

With regard to the application of drain-water as a moving power, there can be no doubt that this may be effected in many places at a cost quite trifling when compared to steam; for there must be at this moment numberless springs gushing from hill-sides, having a flow of water sufficient to drive a 10, 20, or 30-foot wheel, and therefore capable of being instantly turned to profitable account. Upon this point we would particularly refer to Mr. Bailey Denton's pamphlet. If the supply from springs were augmented by water brought together by main-drains, we should confidently look for this branch of its application being carried to a great extent. Indeed it is only necessary to turn to the instance afforded by Lord Hatherton at Teddesley, and to the mines and works in Wales, in Cornwall, Devon, and Ireland, to gain assurance of its paramount economy. Besides, as we cursorily remarked last week, the quantity of water to be accumulated by judicious management would afford means for compensating millowners and others who may be aggrieved by the removal of their mills, weirs, and dams.

We think every one will agree with Mr. Denton, that, if the after-application of drainage water should form part of any legislative measure, not only would the direction of the system be more skilful in itself, but the obligation on the part of individuals to keep their watercourses clear, would produce a result more beneficial to thorough drainage than could arise from any measure devoted to that object alone.

In recommending to Parliament the propriety of uniting the distribution of drain-water and of the refuse of towns with the improvement of outfalls and watercourses, we do not advocate the execution of expensive works, like the aqueducts and reservoirs of Lombardy, Spain, and India; these, in a country like England, would not repay their cost. All we ask for, is, such as may be constructed economically and profitably, and which in their maintenance and repair would create a continued and paying demand for labour in winter.

But it may be asked whence all this water is to come? Upon this point we shall content ourselves with referring to Mr. Denton's pamphlet, where it is shown, by fair calculation, that the force of surface-water alone is equal to 2,000,000 horse-power, the whole of which might, by skilful engineers, be turned to the useful purposes we have mentioned.

These considerations must, we think, be felt by every one to be of great importance to the country; they demonstrate how enormous are the annual losses of national wealth by neglect, supineness, or unskilfulness; they point out a new and immense field for the employment of labour profitably; and we do trust they will lead Parliament to give the whole question the most careful consideration without further loss of time.

As we anticipated, the determination of the Horticultural Society to exclude from the best prizes at the Garden Exhibitions, Roses that are cut, and to encourage the cultivation of those plants in pots, has excited a good deal of interest, and produced a fair crop of opinions, a tolerable sample of which has already reached us. One man congratulates the Society upon the decision at which they have arrived; another doubts the possibility of cultivating Roses thus with any sort of success; a third says he can't do it, abusing us for advocating it, and his master for insisting upon his making the attempt. We are perfectly aware that the plan will not suit the "stand stills;" and we can easily understand that those Gardeners who have no notion of the reason why they do a thing, may be aghast at the very thought of having to grow a Rose as well as a Pelargonium; but we also know that the thing may be done, and well done too, and that the really intelligent gardener

will have no serious difficulty in the matter. Indeed, a better test of the metal that a man is made of could scarcely have been hit upon; and the only persons who have any just grounds for complaint, are the Pelargonium growers, who now stand a good chance of being eclipsed. If Roses are as well grown, and as well got up, as Pelargoniums, the tide of fashion will be very likely to take a turn, for, after all, there is nothing like a Rose. We cannot conceive anything more perfectly enchanting, in the way of flowers, than a sitting-room decorated with Banksian and Chinese Roses, gracefully arranged upon the trellises of flower-pots.

That there are difficulties in the way we freely admit, that many of the first attempts will be failures we cannot doubt; but perseverance is sure to triumph—and in what cause, let us ask, can perseverance be more worthily employed? One of the first stumbling-blocks will be uncertainty as to the manner of preparing plants for cultivation in pots. One man will perhaps grow them "on their own bottoms," others will use stocks, and then will come a question as to the kind of stock that had best be employed. Upon that point, and some others, we have a welcome communication from Mr. Robert Reid, gardener at Noble Thorpe, near Barnsley. Mr. Reid, in the spring and summer of 1838, was living in Philadelphia, U. S., where the culture of Roses in pots is carried on to a great extent, both in nurseries and private gardens, and where, at the monthly exhibitions of the Philadelphia Horticultural Society, they form a leading feature. Nothing, he says, could exceed the beauty of some of the collections. There were not many climbing Roses, except the double white Banksian Rose, which, being so very sweet, is a great favourite there; and of this he saw plants in large pots (16's or 12's), coiled neatly round three or four sticks, covered with Roses down to the pot, and forced early in the spring, which it bears exceedingly well. He justly observes, that, as the Banksian is, perhaps, one of the most difficult Roses to flower in a pot, many other of our beautiful climbing varieties would succeed in the same way.

The manner in which these Roses are prepared is stated by Mr. Reid to be as follows:—

"The Boursault Rose, being for pot-culture superior as a stock to any other kind, should be planted in good rich soil in a sheltered situation; and, if cut down to form stools for the purpose of producing layers, it will in the second year be strong enough to produce abundance of fine shoots, the earliest of which will make such rapid growth, that they may be layered the same season. If this operation is carefully performed, and if the end of the layer is tied up neatly to a stick, it will in a few weeks be sufficiently high to allow one bud to be inserted in the stem. It is a safe plan to cut the tongue on the upper side of the layer, whereby all danger of breaking the shoot is prevented. It is, however, advisable to insert a piece of clay, or a small stone, in the opening, to prevent it from adhering before roots are formed.

"About the end of October, these early layers will have made sufficient roots to admit of their being taken up and potted; and it will thus be seen how quickly a fine and vigorous collection of Roses may be propagated.

"The reason why only one bud should be inserted upon each stock is obvious: the latter, when headed down, furnishes its whole strength to the bud, which soon forms as fine a head as a Maiden Peach, and a much more handsome plant than if the supply had been divided between several buds.

"All the unbudded shoots which remain upon the stools can be layered in the following spring, and may be budded in the course of the summer. By the adoption of this plan, a whole year is saved; instead of a crop of layers to be taken off for planting out in nursery rows, to be budded in the succeeding summer, here is a crop of fine young plants ready for being potted the same season. Many sorts, such as Bourbon, Noisette, China, and Tea-scented Roses, will, if well managed through the winter, flower beautifully during the following spring and summer.

"In this manner, plants of much greater strength can be raised, and in a much shorter time than from cuttings. For the Amateur, they will make excellent window-plants; and to the Gardener they will be invaluable for the greenhouse and conservatory during winter and spring; and for planting out during summer in the flower-garden, from whence, after blooming throughout the autumn, they must be again taken up and repotted for spring flowering. There is little doubt but that the market florist would find a ready sale for well-grown Roses in pots, as the taste for them is common amongst all classes; and a long bed planted and shaded after the manner of Tulips would be a beautiful sight for summer visitors."

A STIRLING correspondent strongly urges us to call attention to a new source of manure, which he thinks must exist in our own country. He says that every year seems to be proving more and more conclusively that guano is one of the best of our manures, and

* Report on the State of the Drainage of Eton College, &c., in a Letter to Dr. Hawtrey.

that it therefore would be very important to find it nearer home than the Islands of the Pacific, whence it is now imported. As it is the deposit of sea-fowl, he supposes that we must have an abundance of it on many parts of our own coast, especially in the Western Isles of Scotland, which are the resort of great flocks of sea-fowl, and in the Orkney and Shetland Islands; and he thinks the collection of it would be a profitable employment for the very poor inhabitants of those places. He recommends the Agricultural Society of England and the Highland Society to offer premiums to individuals for obtaining it, in order to stimulate them to exertion.

We hardly know what to say to this proposition. If, indeed, the substance were really to be found in the places mentioned, there is no doubt that it would be very valuable, and afford a far more ample remuneration for collecting it than the premiums of societies. But it is generally understood that their wet climate and the storms to which those islands are exposed, are perpetually washing the material into the sea as fast as it is formed; a circumstance which does not happen in the dry climate whence the foreign guano is brought. Perhaps some one may be able to say what the fact really is respecting the presence of guano in our northern islets.

If it should turn out that, as we suppose, it is lost as fast as it is produced, we are by no means sure that it might not be saved artificially, if a little pains were taken to do so. In Persia, the great manure is pigeons'-dung; small dove-cotes are built in the plains, in the form of towers, in the upper parts of which the birds inhabit, and in the lower of which the manure is collected. Access to these towers is secured by a door at their foot, which can be opened for the purpose of clearing out the interior; and thus the extensive Melon grounds are richly manured. Could not means be taken to induce the sea-fowl to frequent particular spots, where, by means of a little contrivance of the Persian kind, the effects of rain might be prevented? It is to be remembered, that if this substance could be thus collected, it would be more powerful than guano; because it would be, or might be, free from sand and other impurities, which greatly diminish the value of the imported guano. It is for our Scotch friends to consider how far such a project is feasible.

ENTOMOLOGY.—No. XXXIX.

OAK-SPANGLES AND SILK-BUTTON-GALLS.—There are several different kinds of these singular and pretty objects which are formed upon the Oak-leaves. In some seasons they are exceedingly abundant, as in the autumns of 1840 and 1841, and at other times it is difficult to find any of them; such was the case, generally speaking, last year. A casual observer might mistake the brown globose Button-galls (fig. 2) for the eggs of a large moth (especially of a *Lasiocampa*), the rosy spangles (7) looking like the same expanded; and not a few persons have supposed them to be fungi. They are, however, galls, formed by minute hymenopterous insects called *Cynipoidea*.

These galls are attached to the under-side of the Oak-leaves by a short pedicle, as represented in fig. 5; and the same is shown in the centre of fig. 4, which is the under-side of one of the globular spangles magnified, fig. 3 being the upper-side. These galls are produced upon the under-side of the leaves, and generally on the south side of the tree. After the succession of heavy showers we had in September and October, 1841, I found the Oak-leaves covered with spangles in Suffolk, when they were larger than I had ever before observed them; this induced me to examine some carefully, and on opening one I found a live shining fat maggot (fig. 6), with a bright yellow patch on its back, curled up and lying in a small cavity close to the pedicle of the gall. I opened several others with similar success, but could not find any of them in the pupa state; and although I placed the leaves in a pot with damp moss, which I kept until the following year, I could not rear them, or if I did, they escaped through the fine gauze which was tied over the pot. I was, however, fully convinced that the Oak-spangles were the work of a Gall-fly; and upon referring to the "Encyclopédie Méthodique," I found the following short description of the insect which causes these pretty objects. It is a true *Cynips*,* but it is called by the French naturalists *Diplolepis lenticularis*:—"The antennæ are blackish, a little longer than the thorax; the whole of the body is black and shining; the legs are yellow." The Oak-spangles are equally common in France, and M. Danthoine says that in Provence "they are sometimes so abundant that, in autumn, when any one shakes the Oaks, they fall like rain; this little gall detaches itself from the leaves in the month of October, and remains buried during winter either in the earth or in the snow. Each lentic (the appellation by which he distinguishes the little gall) contains rarely more than one larva, which comes forth a perfect insect towards the first fine days of spring."

These spangles, or buttons, are beautiful objects when examined under a lens, being covered with fine fibres shining like silk, and varying from a greenish to a brown colour, with a pit, or deep circular impression on the crown. The other galls, which often accompany them, are larger, flatter, and something like a saucer or a

depressed Chinese hat, generally of a crimson colour, the outer margin a little reflexed, and the centre slightly elevated; these likewise arrive at their full size in October and November; but in July they are very minute; at that time the centre is ochreous, and the ring deep red and velvety. I have also detected in the thickened central part of these a gelatinous maggot, but it is generally entirely dried up. I can find no account of the species of *Cynips* which infest these galls, and am therefore unable at present to describe it, or to give it a name.

I have observed a third variety of gall, in November, upon the Oak-leaves, which was more fleshy, and larger than usual: some were green and others brown; they were the shape of a deep cup; the top was open, with a minute tubercle in the centre. These also contained minute maggots, which I was unable to rear. In June, 1841, a fourth variety of gall was sent to me from the same Oak-tree which had furnished a constant supply of the Oak-spangles: some of the leaves exhibited as many as three of the galls, but most of them only one; they were variously placed, projected but slightly from the surface, and differed from all the foregoing in being equally visible on both sides. Upon examining the under-side of the leaf, the galls appeared to form a circular leathery spot, of a dull ochreous colour, surrounded by a thickened green ring, about a line in diameter; this ring was wrinkled, and the colour of the leaf; on the upper-side the spot was similar, with the addition of a little tubercle in the centre; and there was sometimes a conspicuous hole, from whence the perfect insect had escaped. On opening one which, by holding the leaf up to the light, I saw contained some opaque object, I detected a shining piceous *Cynips*, with long brown antennæ, a little clavate; the legs were ochreous and the nervures of the wings deeply coloured; by its side I saw a parasitic maggot of a grey colour, which had seized the *Cynips*, and, to my great annoyance, soon ate out the body, and mutilated the other parts. If this species be not described, I propose calling it *Cynips Quercus tiaræ*, from the resemblance of the gall to a turban.—*Ruricola*.

ON MANURING WITH GREEN CROPS.—No. VII. (By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 36.)

It cannot be doubted that many plants, not yet used, will yield good green manure, because they combine all essential properties in a high degree. The following are some with which I have made successful experiments.

1. *Tansy* (*Tanacetum vulgare*).—This plant, which is common in a wild state, and on account of its pungent smell and taste (owing to some ethereal oil) is not eaten by cattle, has hitherto been only used medicinally. If it is only used as a green manure, its not being relished by cattle is of no consequence, and is a case similar to that of the Lupine. The qualities which recommend Tansy are of much importance, viz., its roots reach 2 to 3 feet in the soil, and thereby bring to the surface important mineral substances, such as potash, sulphuric acid, phosphoric acid, etc. It is a perennial, and does not suffer from drought, wet, or cold, is never attacked by vermin, grows from the earliest spring, and yields a great mass of herbage, viz., 29,000 to 30,000 lbs. per Magdeburg acre; whilst Lupine, under the most favourable circumstances, will not yield more than 16,000 lbs. I have not yet analysed the Tansy, and am, therefore, unable to state with accuracy how much manuring substances are added to the soil by 1000 lbs.; but some comparative experiments gave such a favourable result, that I may say that Tansy is in no way inferior to Lupines. At the end of May, 1837, I carted the first cut of Tansy on a small piece of ground, which was of the same size as that on which the Tansy had been grown; I ploughed it in five inches deep, and 8 days afterwards sowed Barley, which, from the first to the last, grew as luxuriantly as if it had been manured with dung; nay, it might be even distinguished by every one from an adjacent piece of Barley, which had been dressed with dung. In 1838, I sowed both plots with Oats; and here also that manured with Tansy stood much better than where none has been applied.

If we then remember that one acre of Tansy yields manure for at least two acres of other land, that it is a plant most easy of propagation, as it seeds by itself, and even becomes a weed; that on proper soils it will grow for 10 years most luxuriantly, and that during that time it does not occasion any expense of labour or outlay for seed, it will be obvious that it is worth while trying expe-

riments on a large scale with this plant. If they be successful (as I have no reason to doubt), 200 acres of bad land would not only be improved by 50 acres of Tansy, but also kept in such heart, that a dressing with Tansy would only be required every second year. The only objection to this sort of green manure is, that it cannot be ploughed in on the spot where it is grown, but must be conveyed to the field. Although our native Tansy is a valuable green manure, yet the *Tanacetum boreale*, a native of Siberia, seems to be still better, as it attains the height of 7 or 8 feet, whilst ours grows only 4 or 5 feet.

2. *Mugwort* (*Artemisia vulgaris*).—This plant, which grows wild near roads and hedges, might be used advantageously as a green manure, as its roots reach 3 to 4 feet in the subsoil, and thus bring substances to the surface (especially a large amount of potash), which are valuable fertilizers. It yields, even on poor loamy soils, as considerable a mass of herbage as the Lupine, as it can be mown twice a year; it lasts several years, is not attacked by vermin, nor injured by weather, and it grows from the earliest to the latest part of the year. Still, Mugwort, like Tansy, requires for its success a subsoil which contains (at least in some degree) all the substances required for vegetation, such as potash, common salt, lime, gypsum, and the phosphates. When either of these plants goes off, it is evident that the subsoil is exhausted, at least for the present, and they are then to be sown on other fields. I have not made any experiments to show how crops will grow after the green herbage of Mugwort has been ploughed in, still analogy leads me to suppose that its effects will be the same as those of Tansy. Perhaps it would be best to sow Mugwort and Tansy together, as both are often growing so in their wild state. This culture is at any rate very useful, as mineral substances are thus obtained at a cheap rate; which, although amongst the indispensable nourishment of crops, cannot be applied in large quantities on account of their high price; for instance, potash, common salt, phosphate of lime, and gypsum. No doubt, besides Tansy and Mugwort, several other wild plants may be used for the same purpose, the roots of which reach deep in the soil; for instance, Mullein (*Verbascum*) for dry sandy soils, which yields a great mass of herbage, and is very hardy; whilst some species of Cow Parsnep (*Heracleum*), would be more adapted for clayey soils.

(To be continued.)

GARDEN EXHIBITIONS OF THE HORTICULTURAL SOCIETY OF LONDON.

WITH many of the Exhibitors and Friends of the Horticultural Society, I must congratulate the Prize Committee upon the important and useful alterations which they have introduced to the circular which has appeared amongst your advertisements. There is one thing, however, which I am anxious to bring under their notice; and I cannot do it better than by asking you to print the suggestion in the *Gardeners' Chronicle*.

You are aware that the exhibitions are less interesting than they might be, owing to the difficulty which is felt by visitors in getting acquainted with the names of the plants. I have frequently heard them making anxious inquiries of those who were supposed to be Gardeners or Exhibitors, and in many instances getting names which were either erroneous, or garbled and unintelligible. Last year it was reported that this defect was to be remedied, by the Society's officers putting correct names to all the specimens; but as this was not done, I suppose it was found impossible, for want of time. I would therefore propose that the plants should be named by the Exhibitors themselves, and in order to encourage them the Society might offer a Banksian Medal, or Certificate, for the best-named collections. Florists' flowers are generally named by the Exhibitors, and single specimens of ornamental plants have their names written upon the entry cards by the Clerks at the Garden; so that it is only the "Collections" about which there is any difficulty, and for which rewards would have to be offered.

Suppose, then, that a Banksian Medal was offered for the best-named collection of 40 stove and greenhouse plants; certificates for the best-named smaller collections, and for Heaths and Azaleas. The names would have to be legibly written and correctly spelt, as well as placed upon the plants in situations where they would be easily read by the visitors. I have little doubt that by these means the visitors would be more interested than they can be by the sight of a splendid flower without a name; for, how much soever they may admire it, they have no means of asking it from a Nurseryman, or of making him comprehend what it is they wish to add to their collection. And I also think that a prize of this kind would not only be highly honourable to those Gardeners who might be successful competitors, but it would have a tendency to improve them in the art of writing and spelling botanical names.—*Criticus*.

BEES.

If there is anything more calculated than another to induce man to undertake a task, it is the appeal of a member of the fair sex for assistance when in distress. I have written many thousands of pages for the press, but never two lines about Bees. Although very fond of Bees, I have never yet written anything concerning them; I have now, however, out of sympathy to a "Despairing Bee-keeper," drawn up the following account of my experience with these insects during the last season only, as my avocations have previously prevented me from keeping Bees.

In the month of June last, I purchased a swarm of Bees, which had been secured in a common straw hive, and the season being favourable, they appeared to be active and industrious on every occasion when the weather permitted them to go abroad. From the quantity of pollen

* Curtis's Guide, Gen. 564, ii. 29 b.

which I observed them carry into the hive, I judged about the end of August that it must be nearly full; especially as the Bees, even in very fine weather, clustered at the entrance, and did not appear to proceed to the fields in such numbers as they had hitherto done. In order to afford them more room, I made a box 10 inches square, outside, of wood, 1 inch in thickness. At the bottom of the front side, I cut a hole 2½ inches long, by ½-inch in depth, exactly similar in dimensions to the entrance to the straw hive. In the side of the straw hive I cut a hole 2½ inches long, by 1 inch in depth, and having made a tube of zinc, for the sake of neatness, I fixed it to the box, and joined the straw hive and box together; the zinc entering about half an inch beyond the straw of the hive.

I left the hole in front of the side box open; and the Bees on the following day recommenced operations with all their former activity; thousands departing through the medium or outlet of the box, but all entering the straw hive on their return laden with their floral treasures. In the evening, from curiosity, I separated the side box, and to my astonishment, several of the Bees came along with it, intent on absorbing with their proboscis the condensed steam from the heat of the hive, which had formed like dew-drops on the zinc. It occurred to me, that this liquid might prove injurious to the Bees, and I therefore immediately made a communication of wood to join the box to the straw hive. I am now glad that I did so; as I feel convinced that the white powder, in appearance like arsenic, which always forms on zinc, after it has been wetted even with the purest rain-water, is of a poisonous nature, and is the principal cause of the destruction of Bees hived within wooden boxes, or in straw hives, when they are fed from zinc troughs, or have their entrances contracted by the same metal.

When the weather became frosty in the early part of November, being desirous that every care should be taken of my Bees, I closed the aperture in the side box, which I had found of great use in warm weather, as, on all occasions, it proved an effectual safety-valve. I at the same time covered the entrance of the straw hive with a piece of perforated zinc; but in a few minutes afterwards the Bees became unsettled and crowded to the entrance, evidently oppressed by the alteration I had made, and appearing to absorb the condensed air on the zinc, which induced me to remove it altogether. Shortly afterwards, I attempted to contract the entrance by inserting a piece of wood one inch long by half an inch thick, leaving about one and a half inch open. The wood had not been applied many minutes when two of the Bees came and examined it, with the object of removing it, as they fixed their hind legs to it and pulled with all their strength; but failing in their endeavours, they, with several others which subsequently joined them, ran about the entrance and appeared to be very uneasy. As I could not bear to see them uncomfortable, I withdrew the piece of wood, upon which two of them immediately occupied the position where it had been placed, and continued fanning for nearly ten minutes, as if it had been the warmest day in June.

This satisfied me it would be best to let the Bees take their natural course, as my contracting the entrance would only create foul air and cause their destruction. In this I have not been disappointed, as up to Dec. 26 I only witnessed three dead Bees from my hive, there being no drones to kill. Two of the Bees must have been strangers or unruly members of the community, as they were brought out of the hive by other Bees, assisted by one on each side as guards, thrown down in front of the hive and stung to death; the executioners returning to the hive immediately afterwards with apparently as great satisfaction as if a praiseworthy action had been performed. These deaths occurred in August; but the third took place towards the end of December, as I found the body of the Bee in the side box lying near the body of an earwig; both having evidently been killed by stinging, as the Bee appeared quite glazed and free from disease; it is, therefore, probable that it had been fighting.

I almost every day examine the bottom of the straw-hive, which I can easily do by the aid of a lighted candle held in front of the entrance. It is remarkably clean, only a few crumbs of wax about the size of pins' heads appearing on it. I consider this to be the covering which falls from the combs on their being opened to supply the winter stores, which appear amply sufficient for their subsistence; although the hive is very crowded, being, as nearly as I can guess, from 40 to 50 lbs. in weight. My Bees appear in excellent health; on tapping at the entrance, they come to ascertain the cause of the noise; and on the 13th, 14th, and 15th Dec., when the wind blew soft and warm from the S.W., they left the hive in such numbers that I was obliged to open the hole in the side-box during the time the sun was near the meridian. It is worthy of remark that many of them came home as laden with pollen as would have been the case in May; and on these days they carried out of the hive every crumb of wax which had previously fallen, leaving the bottom board as clean as if it had been scoured.

From the observations which I have made, I am of opinion that Bees will thrive best if left to their own natural instinct. It is bad policy to lift the hive from the board, after the season is past when they can collect propolis to fill up the parts which they wish to close, to prevent their being injured by contrary currents in the hive in inclement weather; as it is impossible to replace it in the same position in which they had secured it, and they cannot go abroad to procure the material to remedy the evil.

Some apirians recommend the use of tobacco-smoke, but I question if the Bees ever recover fully from the effects of being fumigated. I have constructed a Bee-hive to obviate any necessity for, in the slightest degree, injuring these useful and truly valuable insects. It com-

bines the advantage possessed by the common cottage straw hives, as a winter residence, with that of boxes of wood attached to work any quantity of honey, or to separate stocks, without allowing them to swarm, or to join stocks on the approach of winter, or to make experiments of any kind with the Bees, as the boxes have windows to permit a full view of all their operations. I send you a sketch to show that it has a pleasing appearance, and that it requires no other protection whatever. Considerable taste might be displayed in making hives in which all these advantages are combined; although in the present I have studied economy in order to satisfy myself that they can be made at a moderate price, so as to be within the reach of all classes; and I shall be happy to show it to the "Despairing Bee-keeper," or any other respectable reader of the *Gardeners' Chronicle*, should they pay me a visit.

The boxes are made of wood one inch in thickness; and as your "Despairing Bee-keeper" has stated that Bees kept in boxes generally die during the winter, I have lined the inside of my boxes with India matting, similar in texture to the straw hives. The interiors remind me of the tapestried halls of our ancestors, and must prove a luxury to the Bees. The dotted lines in the plan of the base show the thickness of the wood, and that there are pillars supporting a portico extending three inches, and the roof six inches over the straw portion of the hive, to protect it from rain and the meridian summer sun. The whole roof lifts off at once with the greatest ease, and is so constructed that bell-glasses could be worked on the head of the straw hive, or on either of the boxes.—*John Grant, Editor of the "Army and Navy Register," Woolwich.*

AMATEUR'S GARDEN.—No. IV.

As some readers may have dung sufficiently fermented to be made into a bed for the growth of the Cucumber, I will offer a few remarks on the most simple method of managing it. Presuming that a common frame is to be employed, the first thing will be to excavate the ground where the bed is to be formed, to the depth of 3 feet, and 4 feet wider and longer than the frame to be used. In the centre place a layer of faggots or waste wood, 2 feet thick, of the size of the frame, and upon this foundation lay the fermented dung; taking care to make the mass firm as you proceed, until the bed is 4 feet high in front, and 4½ feet at the back. If the dung is not well fermented or dry, it will be advisable to sprinkle it with tepid water as you proceed. The bed being formed, the frame must be placed upon it, and as soon as the mass begins to heat, the dung inside the frame should be forked over twice or thrice a week until it is quite sweet; that is, until the steam evolved is inoffensive to the smell. At that time the frame must be lifted off, and the dung from the centre of the bed formed into a wall 6 or 8 in. wide all round the sides of the bed. On this wall place some boards 6 in. wide, so that their outer edge will be even with the outside of the frame, and then plaster the inside all round with mortar or tempered clay, which will prevent the entrance of steam, and deprive the woodlice of a favourite retreat. Should the dung be very hot, some strong pieces of wood may be placed across the bed, with some boards and thin turf above them, on which the soil for the plants must be put. A hot-air chamber is thus formed between the dung and the soil, by which every part of the latter is at all times equally heated, and all risk of burning the roots is removed. The heat from this air-chamber may also be brought in to warm the atmosphere of the frame in a case of emergency.

It is of little importance what kind of soil is used, so that it is not of an adhesive nature. Peat-earth is good, because it is porous, and its pooriness is remedied on dung-beds by the carbonic acid and ammoniacal gas which pass

through and enrich it from the fermenting dung; but I have found sandy turfy loam and leaf-mould in about equal quantities, used in a rough state, superior to it. The soil should be placed in a narrow ridge along the back of the frame, but not so as to rest against the wood-work; in this position it gets rather more sun, and the young plants have the advantage of the light reflected from the back of the frame.

In planting, place two plants under each sash and within eight inches of the glass; pinch the top from one of them as soon as it has made three rough leaves; train the laterals along the back of the frame, and stop them above every leaf until they show fruit. These plants will produce a few early fruit; but the others, which are to be trained towards the front, must not be allowed to bear fruit until they have acquired strength, as they must be depended upon for the main supply.

It is not necessary that the temperature of the frame should exceed 65° with air by night, but by day with sun and air it should range from 70° to 85° or 90°. Sprinkle the plants about 2 o'clock in the afternoon of every sunny day with tepid water, and shut the sashes close down; but give a little air at the time the frame is covered up for the night. Unless the weather is very bright, water at the root will not be required more than once a week, until the middle of March; but after that time the plants will stand in need of it more frequently. Keep the temperature steady at 65°, by occasionally turning or renewing the linings; do not allow the bed to become crowded with useless vine; keep the glass clean, and success is certain.

For early use, there is no Cucumber equal to the old Southgate for a frame; next to that, the Syon House and Roman Emperor are the best. If, however, long fruit is wanted, Young's Champion and Dreadnought, two white-spined varieties, may be procured; which, in addition to producing fruit of extraordinary length, are of a hardy constitution, and bear profusely. In my opinion, the white-spined varieties are invariably superior to the black kinds, both in precocity, prolificacy, and hardihood.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Affghan Plants.—The nearest wooded part of the Sufaid Koh (i. e., White Mountain) to Cabul is Taizeen. The forests of the Sufaid Koh consist of various kinds of Fir, among which the Deodar is abundant; the Cheel, or *Pinus longifolia*, is also believed to occur, as well as the Chilgozeh, which, from the abundance of the seeds exposed for sale, must be common. These appear exactly to resemble those of the *Pinus Gerardiana*, a native of Kunawur, on the northern face of the Himalaya Mountains. These forests likewise contain the Baloot, a species of Oak; the Zaitoon, a species of Olive; the Schne, one of the most celebrated plants in the country for its aromatic and stimulant properties, and which may perhaps be a species of *Balsamodendron*. This seems especially in the Kojuck range. The only forests with which Mr. Griffiths expresses himself acquainted are those about Olipone, in which direction the mountains assume the Himalayan features. The principal trees of these mountains are the Deodar, or Nokhtur; the Zaitoon, and the Baloot. There is, perhaps, another species of Oak; but, so far as known to Mr. G., no other Fir-tree. On the Kafir Mountains other forest-trees occur, as the Horse-Chesnut, and a beautiful *Abies* or Spruce Fir, apparently allied to the *Morinda* or *Khutrow* of the Himalayas. At Cabul, the demand for timber is supplied almost exclusively by the Poplars. The great majority of the cultivated trees are fruit-trees; and the bulk of the vegetable fuel is supplied by the low bushes, chiefly species of *Artemisia*. From Taizeen, supplies of Baloot branches are brought to Cabul, as well as a good deal of charcoal prepared from it and the Deodar. The transition from the absolute barrenness of the Hindoo Khoosh to the finely-clothed Himalayas certainly takes place somewhere to the north of Pusheel, or between it and Jugdulluck. It would appear almost sudden, both Firs and the Zaitoon ceasing abruptly; the Baloot only straggling as far as Jugdulluck, about which it is a stunted tree, very much like a Holly. This, no doubt, is the prickly Hollyoak, with which stockades were made by the Affghans in the Cabul Passes; but as Mr. Griffiths has not given it a specific name, we are unable to get more precise information. But both his collection and that of Dr. Falconer, no doubt, contain specimens which will hereafter enable the species to be ascertained.—*R.*

Enormities.—People who regard Horticulture as a tranquil, peaceful recreation or employment will startle at such a heading, and wonder what must be the sequel to so electrifying an announcement. But the fact is, that, as one of the readers of your *Chronicle*, I beg to thank you for staying, by your late strictures on monstrosities, the present rage for "horticultural enormities"—enormous Celery, enormous Carrots, enormous Cucumbers, and enormous Grapes. Any production now, to be orthodox, must be in its way enormous. It generally happens, however, that flavour is herein sacrificed to appearance, and I must think, and do find, that Celery grown in well-digested compost to a moderate size, is far superior to heads big enough for neat stock to graze on. Carrots should rather be remarkable for saccharine and tender substance, than for making two in a dish a full complement for dinner. Cucumbers grown on a single stem against a south wall in summer are crisper and more saccharine than others, and should be, in my opinion, of the black and white spine old-fashioned sort, just as you describe them. These will be relished by the cognoscenti in gastronomy far beyond the Patagonian monsters of the present day. As for Grapes, if they are produced out of

a dry gently-manured compost of lime-rubbish and loam, although not so big in berry as a Muscle Plum, yet 1lb. of Grapes so grown will be worth a stone of the "enormity breed," provided palate and not eye is to form the canon for supremacy of excellence.—*W. Mason.*

Dissipation of Gardeners.—Your judicious remarks, at p. 18, respecting the dissipation of Gardeners, and the excellent letter of "A Gardener" upon the same subject, must be cordially approved by every right-thinking person of that valuable class who wishes to see his profession elevated above the degrading vice of intemperance. The objects and associations of Horticulture are so pure and uncontaminated, and afford such a pleasing variety of food for the imagination, that it is difficult to conceive how men who have once entered upon its pursuit can degrade themselves so far as to seek, in the vice of drinking, for that gratification of their inferior senses for which, in their intervals of sobriety, they must despise themselves. I trust that this important matter will call forth an abler pen than mine amongst my brother Gardeners, that such mistaken characters may see in what estimation they are held by those who desire to see their profession elevated to that degree of respectability which it deserves. I wish it not to be understood that I am inimical to a judicious enjoyment of the gifts of a bounteous Providence. We all require a certain portion for the support of Nature, and perhaps a hard-working Gardener may need more than some other classes; but it is the abuse of those gifts that I would deprecate. I would raise my voice against the frequenter of pothouses—who pours down his throat glass after glass of liquid fire, for no other purpose apparent than to deprive himself of that reason which was given him for the noblest of purposes, but which he converts to the most debasing. Such men should be made aware that they are considered by all respectable Gardeners as the weeds of the profession, and, as such, deserve to be rooted out "pro bono publico."—*J. W. C.*

Calendar.—I am much struck with the familiar and comprehensive style in which Mr. Beaton has written his second "Calendar of Operations," which every gardener I think must be pleased with. I am, however, induced to ask him, through the medium of the *Chronicle*, to enlarge a little on his remarks on "The Conservatory," by begging him to name some of the stove plants and Orchidææ, calculated to create the "blaze" of which he speaks. I always fancied that stove plants would, if moved from their own edifice at this season of the year, instantly droop, unless a higher temperature was maintained than is safe for Caméllias, Kennédias, Acacias, &c., growing in the beds. Of course I am mistaken, and I think that a series of papers on the management and decorations of conservatories in a more full detail would be generally acceptable. Greenhouses of this description are now become common; but few present that constant succession of flowers which their character demands: this deficiency a series of papers would remedy. Will he also kindly say how Hedychiums should be managed? I am induced further to trespass on your or his kindness by asking how to raise Rhododendron, Indian, or Ghent Azalea seed, both in pots and the open ground. I have raised seed-pans full, but they always perished before putting out their second leaf.—*An Inquirer.*

Effect of Light upon Plants.—I can fully confirm the statement of Mr. Beaton at p. 39, "that Light is the most important agent in the growth of plants." I have two houses of nearly the same dimensions; one facing the North, the other with a South aspect; the former has been heated artificially since Nov. 30th, the temperature ranging from 39° to 69°. The latter has never had artificial heat applied to it, except when very hard frost was expected at night, perhaps not half-a-dozen times during that period. Both houses are filled with Roses, and I have gathered the greatest quantity from the Southern house, which of course caught every beam of sunshine that was to be had in this dreary season.—*Oikos.*

Night Temperature of Vines.—If my experience in confirmation of your remarks at p. 35, regarding the temperature of forcing-houses at night, will be of any use in assisting to convince those who are still sceptical on this important point, they are at your service. When I began to force Vines some years ago, I was sanguine of success, and believed that a strong heat was all that was necessary to ensure it. I commenced with 50° night temperature, that of the day of course fluctuating according to the state of the weather, for the first fortnight or three weeks; at the end of the month I raised the temperature at night to 60°, gradually increasing it to 75°, which I made my standard, allowing myself a range of 3° above and 3° below that point. The result of this treatment was the development of weak long-jointed wood; fruitful certainly, but the fruit, like the wood, was weak; the branches were long and straggling; the berries small, and when ripe very imperfectly coloured, and in many cases shanking off. I was grievously disappointed, for I calculated upon having large, compact, black bunches, covered with bloom; instead of which, I had bunches that I was almost ashamed to send to table. I was at first inclined to attribute it to the border; but when I reflected that I had taken the greatest care to have it thoroughly well drained, I concluded that this could not be in fault, and that the error must lie elsewhere. I mentioned my disappointment to a brother Gardener, a clever practical man, who, on observing the state of my Vines, (the fruit was then on the point of changing colour) inquired what temperature I was in the habit of keeping at night. Upon detailing my practice to him, he shook his head and said, "Ah! I see how it is, you have kept too high a temperature in the earlier stages of forcing; you have given your Vines more food than they can properly assimilate, and have thus weakened their digestive func-

tions." Much more to the same purpose passed, which it is needless to recapitulate, as you have so clearly explained the principle in last week's *Chronicle*, and in the Theory of Horticulture. In summing up, he said, "Begin with a lower temperature, increase it more gradually, and always let it at night sink at least 10° lower than what you consider necessary in the day." By following this advice, the second season after commencing the new treatment I succeeded in obtaining from the same trees strong, short-jointed wood, and close compact finely-coloured bunches, all of which I owe to this timely advice.—*I. W. C.*

The Grape Vine.—An extraordinary instance of the power of vegetation in the Vine is, I think, deserving a place in the *Gardeners' Chronicle*. About ten years since, it was deemed requisite to enlarge a school-room in this town which had a Vine growing at the eastern end; but so unwilling was the proprietor to destroy it, that he ventured to lay the branches under the new flooring to the extent of 15 feet; and, to his surprise and gratification, it has continued to produce fruit, notwithstanding a great portion of it is in continual darkness, and consequently deprived of atmospheric excitement, except by the termination of its flexible branches and annual foliation.—*N. S. Hodson, Bury St. Edmund's.*

Growing Vines in Frames.—The following system of growing the Vine in frames, which is well adapted for gardens where the quantity of glass is limited, is practised by Mr. Dawson, gardener to Lord Ducie, at the Hoo, Hertfordshire. About the first week in April, a bed of partly decayed dung, to which a small quantity of raw material is added, so as to produce a slight heat, is made at about 18 inches from the wall in front of the selected Vines. This bed is built sufficiently deep to admit of its being about 3 ft. high after settling. The frame used by Mr. Dawson separates into two portions, so that the lower part can be first placed upon the bed. It contains a trellis upon which the Vines are trained, fixed about a foot above the surface of the dung. The upper portion of the frame can be afterwards put on and secured to the lower by small brackets. The advantage of having the frames constructed in this way is the ease and safety with which the Vine can be taken in; since, in introducing the shoots of a Vine through a hole cut in the back of a frame of ordinary construction, the buds would be liable to be rubbed off. No more care is required, except in stopping, thinning, &c. Air is given freely, but no linings to the bed are required, Mr. Dawson having failed in a crop upon which he tried this experiment. In severe weather a covering is put on, but this is not generally resorted to. By pursuing the above method, fruit of good quality has been cut by the latter end of August; for which Mr. Dawson has obtained several prizes at local Horticultural exhibitions.—*J. A., Liverpool.*

Double Yellow Rose.—In a leading article at p. 811, of the *Chronicle* of 1841, you have mentioned different localities in Britain, where the Double Yellow Rose has blossomed; the most northern of which appears to be Biel, in East Lothian. As this Rose is undoubtedly a native of a warm climate, I am of opinion that, where practicable, it should be grown against a wall with a southern aspect. A specimen, from 10 to 11 feet high and 7 or 8 feet in diameter, is planted here in a similar situation, and in connection with a greenhouse. The soil in which it grows is of a light nature; and, although so far north, two very beautiful Roses were last year gathered from this plant, and were exhibited at the Gardens of the Horticultural Society of Edinburgh, where they were greatly admired.—*W. Procter, Gardener at Tarbat House Rosshire.*

Celery.—The mode of cooking Celery in last *Chronicle* I have almost daily experience of, but I am desirous of having the following problem solved. Though the Celery is brought to table as hot as several other vegetables in daily use, it becomes cold much more rapidly; indeed, after the cover is removed it is with difficulty that it can be served round the table. Why is this?—*M. C.* [No doubt there is something in the texture of the Celery which renders it a good conductor of heat, and therefore it cools down rapidly. Probably this is connected with the many large open cavities which it contains. We cannot, however, say that we have found it cool inconveniently fast, if covered with good melted butter.]

Charcoal a Preventive to the Onion Maggot.—At p. 165 of the *Chronicle* for 1841, "A. H., Nottingham," states that, half-an-inch of Charcoal dust spread over the soil and mixed with it just before Onion-seed is sown, will be found a sure preventive against the grub, mouldiness, &c. He also states that it is a remedy for the club in the roots of Cabbages and Cauliflowers. May I ask your Correspondent "as a young practitioner" the exegetical reasons why he applied the Charcoal to such a purpose, if he knew the philosophy of its results, or if done in a hap-chance manner? It is assuredly a simple and not less easy way of destroying these pests; and when once fully convinced of the philosophy of its nature, I will try the remedy, and the result shall afterwards be reported.—*A Rosshire Gardener.*

Salt as a Manure.—I can bear testimony to the beneficial effects of Salt as a manure when judiciously employed. My garden, when I came to it, was so infested with slugs as to render it almost impossible to preserve a vegetable from their ravages, more especially from those of a large species, half as long as a man's thumb, provincially termed the herring-back slug. By the advice of a neighbour, I procured a quantity of Salt, which I kept in a dry shed; and when a quarter of the land was cleared of its crop, I sprinkled it all over with Salt, and allowed it to remain for a day or two before it was dug in. I likewise on moist evenings, when the slugs were most active, went carefully over the garden and gave it a slight

sprinkling with Salt, even amongst the growing crops. This effectually destroyed those pests, without injuring the vegetables; and my garden is now comparatively free from them. The Salt I use is a coarse sort, which I purchased at Scovill's Wharf, in Tooley Street, for about 18s. per ton. It is that in which hides are imported from South America; and is consequently enriched by matters which it extracts from the skins. I think if your Correspondent "Quercus" will refer to the xvth Chapter of Luke, verses 34 and 35, he will there be led to infer that Salt, which had not lost its savour, was formerly considered beneficial for dressing land. I have used Salt with equal success on heavy and light land; and the crops flourish amazingly from its good effects.—*C. Wood, Clapham.*

Lime Water.—Several Correspondents have recommended Corrosive Sublimate for destroying worms on Lawns, &c.; at the same time cautioning persons against its dangerous nature. Why then do they not use the more safe, simple, and efficacious substitute—quick-lime? The idea of using Lime-water for this purpose was introduced about 25 years ago, (I believe for the first time) by a gardener named McDougal, who travelled over a great part of the kingdom collecting subscriptions of 10s. 6d. each. When he had collected as many as he could, he divulged the secret to his subscribers, and to myself amongst the number. His secret was merely to put some quick-lime into a tub of water, to stir it up well, and when the lime had subsided, to water the lawn, &c., with the clear liquor. This is an infallible remedy, although some of your Correspondents have stated otherwise; but I apprehend that their failure has arisen from their having made use of stale or slack lime; that is, lime that had been slacked either from having had water poured over it, or from having imbibed atmospheric moisture. A bushel of quick-lime is sufficient for an acre of ground.—*F. H. S.*

To destroy Rats.—At page 853 of the *Chronicle* of last year, there is a description, by J. Parks, of a trap for catching rats, to which I beg to offer the following improvement. Instead of the hole being left open in the lid, a light tin trap-door should be fitted to it, and this should be fixed with a very weak wire spring, just strong enough to raise the door to its proper place whenever a rat drops into the hogshead. This door must, for a few days at first, be fastened up with a button, during which time some food should be placed upon it, to induce the rats to frequent it. Afterwards, the bait should be secured to the trap-door, so that it may not fall off when the rat drops into the water.—*D. M. C.*

Gold Fish.—At p. 857 of last year's *Chronicle* a correspondent inquires as to the best way to keep Gold Fish alive through the winter. I therefore take the liberty of making a few remarks on the subject. Your correspondent appears to bestow much unnecessary trouble upon the Fish; for I consider once in a week, or a fortnight, is quite often enough to change the water; for which purpose pond water is preferable to rain, which, when taken from a tub or tank, supplied from the roofs of buildings where there are chimneys, must contain particles of soot, and these are no doubt injurious to the Fish. The reason why they so often die when kept in glass globes is owing to the change of water from warm to cold. The globes are commonly placed close to a window, where the heat of the sun in summer and of the fires in winter must make the water warm, and I believe the general practice is to change it about once in a week. As the temperature of the fresh water must therefore be a great deal lower than that removed, it is no wonder that persons so often fail in keeping their Fishes alive. It would be a better plan to raise the water to the same temperature as that which it is to replace. I am not aware whether it is generally known that there are two varieties of Gold Fish; one the Chub Headed or Dutch, the other of a brighter colour, and more tapering shape. The latter is bred by several persons in this neighbourhood, who keep them in ponds during the winter. Perhaps the Dutch Fishes are more tender than the other variety, as a correspondent at p. 6 says, that he lost all his which were of that kind. My pond is rather singularly situated; being in the highest part of my garden, which has a steep slope towards the north-east. It is, therefore, one of the coldest aspects that can be; particularly as this part of the country is very elevated. The depth of the pond at this season is about three feet, and its dimensions 14 by 12 feet; the waste water being carried off by a drain. It is formed out of the solid clay, and is supplied entirely by the rain, which filters through the clay, and which being impregnated with iron, is very hard; since the sun scarcely ever shines upon its surface for two or three months in the winter. About four years ago I stocked it with twenty brace of Gold fish, of various sizes. I have never since fed or removed them; all that I do in frosty weather is, to break the ice every morning, or, if very severe, twice during the day. I have only lost three, and that was from my neglecting to break the ice one day when the frost was very intense. The ice does not require to be broken more than three or four feet square in one place, unless the pond is of a large size; it should also be thrown out, in order that it may not again congeal together. I ought to mention that my pond is formed in the centre of a hollow space, having a narrow path round its margin, and a sloping bank five feet wide, which prevents its being dried up in the summer. There is a white Water-Lily in the centre, and the Fish are very fond of collecting under the shade of its beautiful round leaves in hot weather. My Fish are at this time from two to nine inches in length; and, of various colours, from the brown to the finest gold and scarlet: and in a summer's day, they are one of the prettiest objects in a garden. They thrive well thus treated, and breed every season. Your

Correspondent is advised to replace his Fish in the pond, but I consider that it would not be safe at this time. It would be better to keep them as they are for a month or two longer.—*I. F., Sudbury, Harrow on the Hill.*

Poultry.—In answer to your Renfrewshire correspondent, I beg to state that the Malay Hens are usually of a reddish brown colour, long in the leg, with a peculiar round-shouldered look in the form of the back. Mine were originally given to me by a friend from India; but they are to be procured in abundance at Baker's, or indeed of any of the poultry-dealers in Leadenhall market. My Dorking hens are coloured, as I prefer those to the white sorts. I have never found anything to complain of in the colour of their flesh.—*A. E. S.*

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

STENOMESON VITELLINUM. Yolk of Egg Stenomeson. (*Steve Bulb.*) Amaryllidaceæ. Hexandria Monogynia.—A bulbous plant from Lima, whence it was sent by J. Maclean, Esq., to the Horticultural Society, with whom it flowered in February, 1842. It is essentially distinguished from other known species by its broad leaves, depressed bulbs, and the intermediate teeth of the cup being obtuse and undivided. The plant flowered in a cool stove, where it had been kept warm and moist while growing, but cooler and drier while at rest. It is among the prettiest of the Western American bulbs; but is at present extremely rare.—*Botanical Register.*

VAN HOUTTE'S PHLOX. Garden Variety.—For a knowledge of this remarkable plant we are indebted to M. Louis Van Houtte, Nurseryman, of Ghent, who sent it to us in October last, in full flower, but without any account of its origin. It is a variety of remarkable beauty, looking as if *P. suaveolens* had been crossed with *P. caroliniana*, leaving on a white ground a crimson evidence of its paternity. The appearance of the plant is beautiful, far beyond anything yet seen in the genus *Phlox*; and we were almost going to say, beyond anything among the hardy perennials in cultivation. An approach to it was exhibited last year by Mr. Mountjoy, nurseryman, of Ealing, but it was only an approach, with a much paler stain on the corolla: that, however, was very pretty, and well worth the acquisition of the lovers of gay flowers.—*Botanical Register.*

MISCELLANEOUS.

Dried Plantains as a Confection.—Dr. Wallich exhibited at a meeting of the Agri-Horticultural Society of India, in May 1840, a bottle containing dried Plantains, which had been prepared at Kornegalle in Ceylon simply by solar heat, without any admixture of sugar. The mode of their preparation is as follows: the fruit is gathered when fully ripe, and is laid on light cane-frames exposed to the sun. When it begins to shrivel, the outer skin is stripped off (the stripping off the skin is a very essential part of the process, as it acquires an unpleasant flavour by drying), and then the drying is completed. During the process it becomes covered with a white mealy effluence of sugar, as the Fig does under similar circumstances. It is evident that the fruit in this state bears precisely the same relation to the fresh Plantain that the dried Fig and Raisin do to the fruits from which they are prepared, and may be expected to keep good as long as either of them. Some samples, which were two years old, were sufficiently moist, of a consistence and flavour between the Date and Fig, and very sweet without acidity. There are no seeds, the whole of the fruit being eatable.—*Transactions of the Agri-Horticultural Society of India.*

Cultivation of Hemp, as practised in the North of India.—The seed is sown in the hills about the middle of May, and when the plants spring up they are thinned to about four or five inches apart, and the ground is kept clear of long Grass during the period of their growth. Hemp flourishes best on the northern side of the hills, and in a soil rich from the decomposition of vegetable matter. The plant ripens about the end of September or the beginning of October: it is then cut down and dried in the sun, being afterwards steeped in a pond or stream for eight days; the fibre is then stripped off from the thick end of the stem, and when put together in small parcels is beaten a little with a piece of wood or tappee, and is made up into twists like yarns of cotton. There is another plant, called the Large Nettle Plant, that grows in the interior of the hills, which makes even stronger ropes than the Hemp. It frequently grows to the height of 14 or 15 feet. The Hill people, in preparing ropes from it, steep it for three days only, and then strip off the fibre; this is done in a contrary manner to that of stripping Hemp—i.e., the top of the Nettle is broken off, and the fibre is pulled down from the thin end. Strong ropes are also made from a creeper, called in the Hills, Malloo. For suspension bridges, this plant has been found stronger than Hemp.—*Transactions of the Agri-Horticultural Society of India.*

Charcoal.—During the past year, various experiments have been in progress to ascertain what effects would be produced upon plants by potting, or striking them from cuttings in charcoal; or by mixing it in various proportions in the soil in which they were to be grown. From what had been published on this subject in "Liebig's Organic Chemistry" and elsewhere, I had been led to expect some very decided results; but after varying the experiments in many different ways, nothing has happened which proves charcoal to be useful as a chemical agent in the growth of plants. When pounded and used by itself, it is very apt to get too dry, and then runs together and sets very hard. Some Orchidaceous plants, Gloxinias, and Cacti, were potted in it, but they did not succeed, evidently from the causes above mentioned. When mixed with soil, in the proportion of two-thirds of charcoal to one-third of soil, and also in smaller quantities, such plants as Oranges, *Ipomoea scabra*, *Gesnera*, and Cacti, grew very well in the mixture, but not better than others which were treated in the common way. Cuttings of the common Caper, *Ficus elastica*, *Euphorbia jacquiniiflora*, *Ipomoea*, and various other kinds, were

planted both in pounded charcoal, and in different proportions mixed with sand; but the results were not more favourable to the charcoal than to the common sand usually employed for that purpose. The Caper rooted freely in both ways, but the others did best in the sand. Many cuttings, when planted in pure charcoal, or even where that formed a principal part of the mixture, threw off their leaves in a short time and rotted at the base. From what has come under my observation during these experiments, I would not recommend this substance to be used by itself for the growth of plants or for striking cuttings; and if it does produce any good chemical effects when mixed with soil, these will probably depend in a great degree upon the constitution of the soil, in the same way as lime and chalk are only good manures for certain lands. But it is very possible that these effects are only mechanical, tending to keep the ground open, in the manner which renders ashes so very beneficial to stiff soils.—*Robert Fortune, in the Proceedings of the Hort. Soc., No. 17.*

Penang—"The Great Tree." A day or two after, I visited the Great Tree. It is on the slope of a hill, so we had no great ascent to make. I recognised it as the Great Tree directly I saw it; though I had been told that even at a little distance it would not look so large as it is. It is believed to be a species of *Dammar* tree. The natives call it the Milk-tree; because, when bruised with a stick, a milky or rather creamy substance, very white, soft, and somewhat glutinous, makes its appearance. It is said to be 30 feet round the base (I think it is more), 110 feet up to the first branch, and at that height still 21 feet round. It has not many branches left, and it is said to be dangerous to stand under the tree in windy weather. The trunk is very straight, like a huge mainmast. It is decidedly worth going to see, though seven miles from the harbour.—*From the "Last Year in China, by a Field Officer."*—[The tree here mentioned is no doubt some kind of Fig: and not a *Dammar*, which is resinous, not milky.]

Substitute for Glazed Frames in Hot-Beds.—In the *Rheinländische Gartenzeitung* a substitute for the glazed frames of hot-beds and green-houses is described. Instead of glass, the frames are covered with a fine white cotton-cloth. In order to render this more transparent, and enable it to resist moisture, it is covered with a preparation, the ingredients of which are 4 oz. of pulverised dry white cheese, 2 oz. of white slack lime, and 4 oz. of boiled linseed oil. These three ingredients having been mixed with each other, 4 oz. of the white of eggs, and as much of the yolk, are added, and the mixture is then made liquid by heating. The oil combines easily with the other ingredients, and the varnish remains pliable and quite transparent. The expense of a forcing-bed arranged in this manner is inconsiderable, and it yields at the same time many other advantages. Such a hot-bed needs not the anxious attention required by the ordinary ones covered with glazed frames. During the strongest rays of the mid-day sun, they do not require any particular covering or shade; the atmosphere therein preserves a nearly equable temperature almost the whole day, and requires only to be changed from time to time, according to circumstances.—*Annals of Chemistry.*

GARDEN MEMORANDA.

Low's Nursery, Clapton.—In the show-house Hyacinths and Tulips are just beginning to create a gay appearance. The principal object, however, is a large specimen of *Acacia platyphylla*, a winged-stemmed species, somewhat resembling *A. alata*, but with considerably darker flowers, almost approaching to orange. We were informed that the present plant is the one originally introduced into this country, and that it has been in blossom for several months. *Epacris mutabilis*, a pleasing variety with white campanulate flowers tipped with rose, is here blooming freely; it has the merit of flowering earlier than most other varieties. A large plant of the beautiful *Camellia tricolor* will also be in bloom shortly. In this house we noticed *Banksia Hugelinii*, an elegant species of recent introduction, with singularly sporting foliage; the most common form of the leaves is, however, oblong-lanceolate, with the margins deeply laciniated; the rare *Dacrydium cupressinum*, a coniferous plant, with a graceful drooping habit, and another species of more erect growth, probably *D. latum*, which throws out, at regular intervals, side-branches having a drooping tendency. Should the latter prove hardy, it will be a valuable addition to this tribe of plants. In the extensive Heathery, but few specimens are in flower, and these chiefly consist of *Erica tenella*, a profuse bloomer, with small rosy-purple flowers; *E. ardens*, reddish orange; *E. Témpleyi*, a beautiful rose-coloured variety, with a large inflated corolla; and the old *E. mutabilis*, with light-purple tubes, gradually changing to crimson. One pit is entirely taken up with *Araucaria imbricata*, the seeds of which are sown separately in small-sized 60 pots; they are germinating rapidly, and the house is kept constantly shaded, to accelerate this process. In another house were pointed out to us two plants of *Statice platyphylla*, a species lately introduced from the Canary Islands; the leaves are larger, and have shorter petioles than those of *St. arborea*, with which the flowers are said to agree in colour, although produced in larger trusses. *Thunbergia Hawtayneana* is just expanding its delicate flowers in one of the stoves, with several strong specimens of *Gesnera lateritia* and *mollis*. An adjoining house contains numerous plants of *Scyphanthus elegans*, a handsome greenhouse creeper, with yellow blossoms, nearly allied to *Loasa*, but not possessing its stinging properties. In a small house, which is used for grafting and similar purposes, there is a good contrivance for maintaining any required degree of moisture in the atmosphere. This is effected by the two 4-inch iron pipes which warm the house, being seated in an iron trough, capable of being filled with water to any requisite depth. When a moderately damp atmosphere is necessary, the lower pipe only is partially immersed in water; but when a greater degree of moisture is demanded, the water in the trough is brought in contact with the upper pipe also. The trough can be emptied by means of a stopcock at one extremity.—*R. A., Jan. 23.*

Reviews.

Floral Fancies and Morals from Flowers. 12mo.: Tilt and Co.

ONE of the most pleasing little books we know is Carové's "Story without an End," charmingly translated by Mrs. Austin. Some, perhaps, think it too fanciful and

flowery; but we, who have far too much of the real world for our liking, confess to our love for the sweet visions of Dreamland; and especially for such as those of "The Child." The little work before us seems to have been intended as an imitation of Carové's style, and we may add is in many respects a successful one. It is a series of fables, intended, we are told, in part, to convey information concerning the economy and habits of some of the most beautiful or singular productions of the vegetable kingdom, and partly to illustrate moral truths by analogies drawn from the same source. Instead of criticising the book, we shall content ourselves with an extract, as a specimen of the author's agreeable style. The subject is

THE JEALOUS WILD FLOWERS.

"On the first introduction of exotics into our gardens and conservatories, many native plants grew envious of the universal preference shown to these foreign intruders. It may seem strange how the secluded dwellers in wood and wild could ever have learned what was going on in the fashionable world; but they derived this dangerous information from a vile garden outcast, who, having travelled all the way from London in a dung-cart, chanced to grow up among our simple rustics, and poisoned their heads with news and notions never before dreamed of. For a while, however, the malcontent flowers only pined in silent jealousy, till one fine summer's day, a large body of them met together, and consulted how they might best assert the national rights they considered so shamefully invaded. A spirited Viper's Buglos first addressed the assembly. 'I move,' said he, 'that a chosen party of us should forthwith go up to London, and make a determined stand against the insolent pretensions of these contemptible foreigners. Once fairly matched against theirs, our superior merits cannot fail to be acknowledged; and if any should dare to dispute them—by the name of Flora!!' Here the vegetable orator concluded with an abrupt pause, as the most emphatic expression of implied threatening, and wound up all by shaking his formidable spike, and raising his azure crest, with the bold bearing of an old English knight, eager to challenge all competitors. His heroic resolution was warmly applauded, and, in the violent clapping of leaves which immediately ensued, the opposition of two only dissentient flowers, the retiring Violet and the modest Daisy, was completely drowned. Several of the Buglos party rose to second their leader's proposal, and branched out into fine flourishes about their patriotic desire to uphold the honour of their native soil. Nothing else, they declared, would have induced them to undertake the danger and trouble of the projected expedition. Perhaps, however, if these flowers of eloquence could have been thoroughly investigated, a few grains of personal vanity might have been found clinging to their roots. Several of the individuals who were to accompany Sir Viper Buglos had, indeed, long panted for a wider field wherein to display their respective attractions. The pheasant-like eye of the handsome Adonis, weary of gazing at the rustic beauties of the Corn-field, flashed fire at thoughts of conquest over fair and graceful foreigners. The lovely *Nymphaea alba* daily viewed her image in her liquid mirror, and with pardonable pride, felt herself a Queen of Waters; while the poetical Narcissus, like his ancestor of old, was more than satisfied with his own appearance. Then, what dress of 'purple and pall' could bear comparison with the Lady's Mantle of silvery satin, unsullied as the snow of her native mountains? Others, again, of appearance less striking, prided themselves on their personal accomplishments. The Shaking Grass was a most light and graceful dancer on the breeze; and the musical powers of the Reed had been acknowledged from the days of Pan, though his waving plumes had never been half sufficiently admired. How the floral party travelled is a matter of uncertainty, though clearly not, as in modern days, by post or railroad; suffice it that they arrived in town, or its vicinity, and the day afterwards made their appearance at a grand exhibition of exotics, to which they gained admission through the interest of some relations, who as yet continued to hold high places in the flower-garden. But, alas! for our native candidates, when their merits came to be weighed (how fairly we attempt not to determine) against the foreign pretensions they had so imprudently challenged. Then, blighted in the bud were all their aspirations, even like the hopes of many a sanguine son of Igenius, who, having left his native shades for metropolitan celebrity, is overlooked in the crowd, or shoved aside by more confident competitors.

"Oppressed by the impure and heated atmosphere of a crowded show-room, and withered by the neglect or scornful comparisons of nearly all the spectators, how did our disappointed aspirants droop for the refreshing air of their quiet glades! Even their bold leader, Sir Viper Buglos, was compelled to lower his azure spike before the emerald lance of an African *Gladiolus*. The fiery eye of the handsome Adonis sunk, for the first time, before the bright blue orbs of the Peacock Iris. The pure classic beauty of the *Nymphaea alba* was completely eclipsed by the dazzling charms of an Amazonian Queen of Indian waters. The white satin sheen of the Lady's Mantle found but few admirers, contrasted with the velvet robes of crimson and purple which glowed around. The graceful evolutions of the Shaking Grass could not even be displayed for want of air to move his slender footsteps. As for the tuneful Reed, he soon discovered that the breeze was no less a necessary agent in his instrumental performance; and, could even his wolian strains have been awakened, the prevailing taste for foreign airs, as well as foreign flowers, would have caused his silvery tones to have fallen unheeded on fashionable ears.

"Thus terminated the wild flowers' silly attempt to obtain distinction by abandoning the stations wherein nature had placed them, and to which, convinced of their

folly, they were glad enough to return. They have ever since bloomed contentedly within their native recesses, thinking it no hardship to 'waste their sweetness on the desert air.' But in the most secluded spot, where foot of man has never trodden, why should the wild flower be said to waste its fragrance?—for, even there, may not its very perfume minister to the enjoyment of millions of sentient beings, from the bird and the butterfly down to those tiny existences which dance in every mote of the summer sunbeam, and sport in every drop of teeming water?"

We have only to add that the little book is embellished with 70 fanciful illustrations, some in lithography, and others cut in wood, the latter of which are much the best.

CALENDAR OF OPERATIONS for the ensuing week.

As these weekly Calendars are addressed more particularly to Amateurs, I shall this week glance at a subject in which a large portion of them are much interested; namely, the paddock, or meadow-land round the house, where a few cows, horses, or sheep, are kept, according to the taste of the occupier. In no part of the world are hay-making and the management of meadow-land better understood than in Middlesex. While in that county I had to forego many of my previous notions of the Scotch system of managing Grass lands. Where the paddock is grazed all the year round, the land stands less in need of assistance from manures than where the economic Dutch system of stall-feeding is pursued. In either case, however, it is a point of good management to keep the land always in good heart; and as there is a natural prejudice against breaking up such land for permanent improvement, recourse must be had to top-dressing it with rotten dung, rich humous composts, or, what is better than either, with good liquid manure from cesspools. The end of January, or beginning of February, are the best periods of the year for this work, as, if done later, its effects are, in a great measure, lost by evaporation, which becomes more powerful as the season advances; and if applied earlier, the winter rains and melting snow will carry off the best portion of the dung into the drains and ditches. Strong clayey lands are more liable to this kind of waste than porous loams. Light soils are also subject to waste, though in a less degree; and the best portion of the manure will be carried down too deep, by winter rains, to be of benefit to the more tender Grasses, which, from the long-rooted Clovers having more than their share, will thus be overpowered. It may, therefore, be laid down as a general rule, that the end of this or the beginning of next month are the best periods for manuring Grass-land; that Grasses are more benefited at this time by stimulants which give immediate effect than by such as are of a permanent nature; and hence, liquid manure is preferable to rotten dung. Before the land is rolled, after this dressing, it would be of essential service if the whole could be sprinkled over with a suitable compost; that is, light soil with a portion of rotten dung for heavy lands, and clay with dung for light soils; the small siftings from coal-ashes are also excellent for Grass on any soil. An Amateur who does not know the nature of soils, and may have taken up the current topic of draining, would do well to get advice from the nearest gardener, or intelligent farmer, on the spot, previous to any undertaking of this nature; he may thus save both his land and his purse from useless drainage. There are thousands of acres in this country that might easily be ruined by drainage; such as, for example, light sandy soils lying on loose chalk or gravel, or, indeed, on any porous substratum. Instead of draining such land, he ought rather to have recourse to substances that will retain the natural moisture, such as clay and cooling manures, or salts and nitrates, which possess the property of attracting moisture from the atmosphere. This does not, of course, imply that drainage, where wanted, is not the grand fundamental source for the permanent improvement of all our lands. At present, however, I fear we must be content with the less efficient mode of surface-draining in a general way, till the stimulus under the auspices of our great Agricultural Societies and the wants of our population will lead us to adopt the Scotch system of long leases, when drainage on a sound basis, and other improvements, will follow as a matter of course. The cheapest mode of draining heavy Grass land is the open-drain system prevalent on the clayey lands in Middlesex. The open drains there are from 9 to 15 inches deep, according to the inclination of the ground and the depth of the receiving ditches, and from 12 to 18 inches wide. The width of all open drains must necessarily be determined by their lengths, and by the fall of the ground. Many fields and paddocks might be greatly improved by this partial system, at no great expense; their after-management will only be to have them cleaned and cleared out annually after harvest. The roller is as essential to Grass land as dung; two or three rollings when the ground is in a half-dry state will greatly improve it. If any rough compost has been spread on the land, a bush-harrow should be run over it, to scatter the lumps more equally, previous to rolling it.

In our anxiety with early forcing, which at present requires our principal attention, we must not lose sight of those plants which are to come into flower next autumn and winter. This class comprises more names than I can mention this week, but I will continue them occasionally throughout the season. A prospective Calendar is, indeed, a great desideratum in our garden literature; but no individual, however extensive his practice, will be able to do justice to this subject. Mr. Whiting has given an excellent hint in a late Number on this point, where he says that the day of the month on which any crop is sown or planted should be marked on the tally indicating the name of the crop. I have adopted this plan for many years, but did not attend sufficiently to the times when the crops came into use to enable me to construct a regular prospective Calendar. The subject, however, deserves our best attention. Gesnera elongata is an excellent winter flower, which may be had from October to April, with a little management. When this has done flowering it should be kept rather dry until it is pruned; and this should be done in succession till the end of spring. Those pruned now should flower next October. Prune the young shoots close to the main branches, and keep them in the stove with but little water till all the eyes are beginning to grow, then shake the mould from their roots and repot them in a light rich compost, and force them gently for three months. After resting in the greenhouse through the summer, they should be again potted in August, or in succession through the autumn, and returned into heat; they will then begin a fresh growth, and will continue to flower for a long time. Leonotis leonurus treated thus, only being turned out of doors in summer, may be had in flower from August to the end of November. There are two species of a half Orchidaceous genus, from the Brazils, which thrive exceedingly well in the conservatory in July, August, and September, if now set growing in a smart bottom-heat and very rich soil. These are Dichorizandra thyrsiflora and gracilis, both with beautiful light-blue spikes of flowers. The old Costus speciosus, by the same treatment, will come in very useful late in the autumn. As these plants, like the Gloxinias, require to be dry in winter, and may be kept where nothing else would grow, they are useful where room is scarce, and I believe that is the case everywhere in our days.

KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINES.—In all probability the bottom-heat will have to be renewed by the additional supply of tan or leaves. See that the increased heat does not exceed 90° or 95°. Those called Black Pines, such as the Black Jamaica, Montserrat, &c., require very little water at this time; and all that are wanted for early fruiting had better be kept dry for a week or two. This check

will throw them into fruit with more certainty. If the warmest end of the house is so treated, and the other end rather encouraged to grow, with a little water and gentle syringing, the succession of fruit may be prolonged.

VINEY.—Many people make a point of beginning to force Grapes on the 1st of March; but the first week or ten days of February are much better for that purpose, and the expense need not be greater. By beginning thus early, you can bring on the plants more imperceptibly, by using only a little fire in the day-time; besides, many other plants may be brought in which might be too late next month, such as Strawberries and store pots of plants, of which a large stock may be required for the flower-garden. As soon as all the eyes of a Vine are fairly started into growth, gardeners consider them out of danger, and from this period forcing is often carried on rather to suit the views of the gardener than the capacity of the plant; but if the interest of both were equally considered, they would have a better chance of being longer together. Until the breaking of the buds, the Vine must have its own way, otherwise the top-most buds will take the lead, and many of the bottom eyes will not break at all.

PEACH-HOUSE.—The Peach is never out of danger till you catch it ripe in the net; success depends on the degree of attention you pay to it. Shaking the trellis or main branches when the trees are in blossom will assist in dispersing the pollen, and thus part of it will be sure to touch the stigma. When out of bloom, increase the moisture. If green-fly appears upon the young shoots, fumigate the house occasionally. As prevention is always better than cure, a little smoking once a week will keep these pests under till the leaves are more hardened. Give plenty of air, a little of which may be retained on all night. No fires will be required at night while the frost keeps away.

CHERRY-HOUSE.—Keep the temperature down to 50° till the trees are out of blossom, then gradually raise it to 56° with air day and night. A mild, moist atmosphere, and guarding against sudden changes and insects, are the proper requisites here.

FROS.—These, like the Vine, are gross feeders. Every alternate watering should be with liquid manure. Like the Vine, also, there is no end to their growth, if well supplied in this way. You must therefore pinch out their leading buds at every third or fourth joint, and this you must continue as long as they keep growing; they will then produce a fruit at every eye.

CUCUMBERS AND MELONS.—During the early stages of these plants, a brisk, moist heat, with a little air, and the plants kept near to the glass, are the chief requisites. If, at any time, they get a check from too much bottom-heat, too low a temperature, insects, or any other cause, the best way will be to throw them away and take the next strongest plants. One failure in this way will teach a man more useful knowledge than all the calendars in the world. No annual plant will pay for doctoring, much less the Cucumber or Melon.

ASPARAGUS.—If you have plenty of plants and command of dung, leaves, or tan, you need never want Asparagus from Lord Mayor's Day till it is cut from the open ground. Yet I know no plant that is more easily injured by a sudden rise in the bottom-heat, or by confinement in close frames.

CAULIFLOWERS.—If a sudden hard frost should come upon us, they must suffer very much, as they are now as tender as the Pea-largiums in the greenhouse. Stir the ground about them, and strew some coal or wood-ashes round them; this will help to keep down the damp and slugs.

MISCELLANEOUS.—August is the best time in the year to sow the main crop of Onions, to be transplanted by the end of February or the beginning of March; but by sowing now on a slight hotbed, or in boxes in any house at work, much time and seed may be saved, and a surer crop may be obtained next summer. Transplanting Onions is as old as the hills; but prejudice has still her day and week in spring to sow her Onions on the same bed on which they were sown at the beginning of this century. Peas and Beans may be slightly forced for transplanting; also a few Cauliflower-seeds for the earliest crop, together with Radishes, Lettuces, and Potatoes. Seeds of the same kinds may also be sown on warm borders, with some protection at hand in case of rough weather. Seeds should never be sowed at this time, for fear of losing a crop; the loss is trifling compared with the chance of an earlier crop than usual.

Out-door Department.

Who would not be busy out of doors such a winter as this? I proposed to do a hundred jobs in-doors this winter, all of which must be put off for rainy days. The Peach-trees are much earlier than I ever recollect them, and unless they get a seasonable check, every one of them must be covered this season. Nailing has been an easy task. I hope the Peach and Apricot-trees will be got over as easily as the harder fruit-trees. Those who have not yet ordered their fruit-trees from the nurseries should lose no time now. We shall have an early spring, and the late planters must suffer.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—Frosty weather is always best for stove-plants, because we have generally bright sunny days; but perhaps what we lose by dull, mild winters, we gain in the less expense of our firing. The weather has been so tempting lately for keeping the men out of doors, that I fear the insects are not yet subdued; but where house-plants are properly attended to, that is, where plenty of hands are allowed to manage the houses, there are very few insects to be met with, except the annual crop of green-fly, which is soon got rid of. The cheapest way of curing a plant overwhelmed with scale insects, is to throw it away to the rubbish heap, and replace it from the nursery, or from a top or root-cutting well cleaned. This has always been my own practice, and I always had more plants than I had room for. I have seen others persevering in cleaning and scrubbing their plants, till the expense of the work exceeded the price of the plants by many per cent. Cleaning the leaves of plants, however, from dust, &c., is a different affair, and will always pay its expenses in more than one way: this must be always attended to, where the engine or syringe cannot reach the plants. I can never use the syringe in the conservatory on account of flowers; and all the plants there have their leaves washed over occasionally with a little warm water and a piece of sponge.

GREENHOUSE.—Any Camélias that have no flower-buds may now be sent to the stove, or vinery, or anywhere else where a gentle heat is kept, and as soon as they begin to grow, may have plenty of water every day till their growth is finished. I believe if the pots were plunged to the rims in a tank of warm water during the short time they are making their growth, it would not hurt these plants. They may be kept in the stove till their flower-buds are formed; then, if they are kept in a cool frame all the summer, and shaded a few hours in the middle of the day while the weather is hot, and brought to the greenhouse by the end of August, they will come into flower about the end of October. Another lot that are now in flower may be put to forcing a month hence for a succession. A third lot might be so treated in April, and the remainder of the stock may be kept unforced. This will carry on the succession through the winter till the end of spring. October is the best time to pot the general stock of Camélias; but the early forced ones may be potted a month or six weeks after their blossom-buds are formed. Good turfy loam for established plants, with a handful or two of rough ground bones and a little sand; one-half peat, the other half sandy loam, will make young plants grow faster; but in this they will not set their blooms so well. The whole of them require to be rather under-potted; that is, in smaller pots, according to the size of the plants.

PITS AND FRAMES.—The whole of the Verbenas, Petónias, Heliotropes, Sálvias, and all the soft plants for planting out in the flower-beds, except the scarlet Pelargoniums, are best from spring propagation. Those in the store pots may now be introduced into heat for that purpose; but many of them this mild season can be left till the first crop of cuttings are taken off; as they are in active growth. If the sorts are not scarce, it is fully soon yet

to begin with them; as they will require too much room before we can trust them out in May.

Out-door Department.

There never has been such a season for planting and for carrying on improvements. Avoid digging among shrubs after they begin to spread their roots. The annual injury done to fine trees and shrubs by the common practice of digging the borders is incalculable; to spread rotten composts of leaves and different soils over the borders is much preferable, if they are in want of assistance in that way.

NURSERY AND FOREST DEPARTMENT.

FOREST AND COPPICK.—Game will, in all probability, pair this season sooner than usual. See, therefore, that the work is also got over sooner on that account. Sparrows have been building their nests for the last three weeks, and they are no bad judges of the season. Clear out the felled timber as soon as possible, if only to the outside of the plantations at first. As to planting, everybody has been actively engaged in it all the winter who had any to do.—D. Beaton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the Week ending Jan. 26, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.		THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 4th Feb. 1833, and 2d, 1835—thermometer 56°; and the lowest on the 4th in 1830—thermometer 12°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Jan. 27, 1843.

[The Half-sieve contains]	34 imperial gallons.
The Sieve	7 "
The Bushel Sieve	10 1/2 "
The Bushel Basket	1 imperial bushel.
Pannets for Seakale are	7 1/2 in. wide and 2 in. deep.
" Radishes	8 "
" Mushrooms	7 "
" Salad	2 "

The market has been, generally speaking, well supplied with most articles during the past week; the demand, however, has been rather limited. **Fruit:** There is a slight diminution in the price of Pines, which consist principally of Queens, and a few handsome Envoles. Scarcely any hothouse Grapes have been offered during the week; foreign samples of excellent quality are, however, plentiful. The supply of good dessert Pears is sensibly on the decrease, and seems to be confined chiefly to Beurré Rance and Easter Beurré; the former from 10s. to 12s.; the latter from 8s. to 10s. per half-sieve: a few samples of Ne Plus Meuris are also offered, but not generally. Baking Pears are plentiful, from 2s. to 2s. 6d. per half-sieve. The prices of Apples scarcely differ from those quoted in our last Report. A few tolerably good Cucumbers are occasionally offered, from 4s. to 6s. per brace. **Vegetables:** Asparagus is improving in quality, and is slightly reduced in price; the best bunches fetching from 5s. to 8s. each. Seakale, in consequence of the mildness of the weather requiring little artificial heat, is unusually abundant, and very good; it may be obtained from 4d. to 1s. 6d. per punnet. French Beans are from 2s. 6d. to 3s. per 100. Brussels' Sprouts are becoming less plentiful. Good White Cabbages are offered from 2s. to 4s. per dozen. Onions are of excellent quality, and fetch from 5s. to 6s. per bushel. The supply of Lettuces and Endive is pretty good; Cabbage Lettuces selling from 4d. to 6d. per score; and Cos, from 9d. to 1s. per score. Rhubarb, although good, is very little in request; the best bundles do not fetch more than 1s. each. Mushrooms are plentiful, from 4d. to 9d. per pottle. **Flowers:** The display of cut flowers has been very brilliant throughout the week; amongst them we many mention Amaryllis Johnsoni, Lachenalia tricolor, Acacia pubescens and vestita, Euphorbia jacinthiflora and splendens, Poinsettia pulcherrima, Combretum purpureum, Cyrtopodium insigne, Bigonia venusta, and Pæonia papaveracea.

PRICES, SATURDAY, JAN. 28, 1843.—FRUITS:—

Pine Apple, per lb. 3s. to 5s.	Cucumbers, per brace, 4s. to 6s.
Grapes, Spanish, per lb. 6d. to 1s.	Melons, Spanish, 2s. to 4s.
Portugal, 1s. to 1s. 6d.	Walnuts, per bush., 12s. to 16s.
Apples, dessert, per bush., 6s. to 8s.	Almonds, per peck, 6s. to 7s.
Kitchen, 2s. to 5s.	Sweet Almonds, per pound, 2s. 6d. to 3s.
Pears, dessert, per hf. sieve, 2s. 6d. to 12s.	Filberts, English, per 100 lbs. 60s. to 65s.
Pumelo, per doz., 8s. to 12s.	Cob Nuts, per 100 lbs. 65s. to 70s.
Oranges, per doz., 4s. to 14s.	Nuts, per bushel—
— bitter, per 100, 8s. to 12s.	— Brazil, 16s. to 20s.
— Lemon, per doz. 1s. to 2s.	— Spanish, 18s.
— per 100, 5s. to 14s.	— Barcelona, 24s.
Chestnuts, per peck, 3s. to 6s.	— Cob, 14s.

VEGETABLES.

Savoy, per doz. 3d. to 1s. 3d.	Spinach, per sieve, 1s. 6d. to 2s.
Cabbage, White, per doz. 2s. to 4s.	Leeks, per doz. bun., 1s. 6d. to 2s. 6d.
— plants, per doz. 1s. 6d. to 2s. 6d.	Onions, per bushel, 5s. to 6s.
— Red, for pickling, 2s. to 4s. 6d.	— Fickling, per hf. sv., 3s. 6d. to 4s. 6d.
Brussels' Sprouts, per hf. sv. 1s. to 2s.	— Green, p. doz. bun. 3s. to 4s.
Broccoli, White, per bunch, 1s. to 3s.	— Spanish, per doz. 1s. 6d. to 4s.
— Purple, 9d. to 1s. 6d.	Garlic, per lb. 3d. to 8d.
Beans, Kidney, forced, per 100, 2s. 6d. to 3s.	Shallots, per lb., 1s.
Potatoes, per ton, 50s. to 75s.	Asparagus, large, per 100, 5s. to 8s.
— per cwt. 2s. 6d. to 4s.	— Second, 2s. 6d. to 3s. 6d.
— per bushel, 1s. 6d. to 2s. 6d.	— Spruce or Small, 1s. to 2s. 6d.
— Kidney, per b., 1s. 6d. to 2s. 6d.	Sea-kale, per punnet, 4d. to 1s. 6d.
— Scotch, per ton, 45s. to 50s.	Lettuce, Cab., p. sv., 4d. to 6d.
— New, per lb., 4d. to 8d.	— Cos, 8d. to 1s.
Jerusalem Artichokes, per half-sieve, 1s. to 1s. 6d.	Endive, per score, 3d. to 1s. 6d.
Turnips, per doz. bun., 1s. 6d. to 2s.	Celery, p. bd., (12 to 15) 6d. to 2s.
Red Beet, per dozen, 9d. to 1s.	Rhubarb Stalks, per bale, 6d. to 1s.
Scorzonera, per bundle, 1s. 3d. to 1s. 6d.	Sm. J. Sa. ads, per punnet, 2d. to 3d.
Salsify, per bundle, 1s. 3d. to 1s. 6d.	Corn Salads, per hf. sieve, 9d. to 1s.
Horseradish, per bundle, 1s. 6d. to 4s. 6d.	Watercress, per doz. sm. bun. 4d. to 6d.
Radish, per doz. hands (24 to 30 each) 6d. to 1s.	Fenel, per doz. bun., 1s. to 1s. 6d.
— Turnip, p. doz. beh., 1s. to 1s. 6d.	Fennel, per doz. bun., 2s. to 4s.
Carrots, per doz. bunch, 4s. to 6s.	Mint, per doz. bunches, 2s. to 4s.
— Horn, per bunch, 3d. to 6d.	Mushrooms, per pottle, 4d. to 9d.
Parsneps, per dozen, 6d. to 1s.	

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—(The publisher repeats the following notice, as, since last week, Three more Numbers are out of print.)—We are so often applied to

for particular Numbers of the *Gardeners' Chronicle*, to complete sets, and so many are now out of print, that we think it will save all parties trouble if we publish a list of the Numbers which may still be had. Any subscriber who will forward to our Publisher post office stamps equivalent in value to as many Numbers as are required, shall have them sent. If parties find that they have any duplicates, or wish to part with their back Numbers, we shall be glad to exchange them, if clean. Those subscribers who are very anxious to complete their sets should write at once, as we have very few copies of some of the Numbers.

1841: 1, 2, 4, 5, 6, 7, 8, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 41, 46, 47.

1842: 1, 4, 5, 6, 8, 9, 10, 11, 12, 16, 18, 22, 23, 24, 39, 41, 50, 51, 52, 53.

MANURES.—*Amateur*.—You are perfectly right; so much so indeed, that no marking the spots is required to prove the fact. —*A Subscriber*.—For your Beans, try Potter's Guano mixed with 2 or 3 times its bulk of cinder-siftings, peat-mould, black earth, or any such substance. One cwt. and a half an acre will be enough. —*No Chemist*.—Gas-lime that has been reburnt is not what we mean, and is of no importance. It is the offensive lime, as it comes from the gas-works, that is valuable. Like all the really good manures, it will destroy everything, unless it is very much weakened by mixtures with common manure, or old compost. The mistake you and your friends have made, consists in your having employed a great deal too much of it unmixed with other substances.

SALT.—*An Amateur* states that he has a small garden which is much infested with cockchafer grubs, which have destroyed several valuable plants. He has been told that salt, if mixed with the soil, will kill them. We should imagine, that salt would be more likely to kill the plants than the grubs.

LIME-WATER.—*A Yorkshireman*.—As water can only hold a certain quantity of lime in solution, it is immaterial how much of that substance you mix with it. The mixture should be well stirred, and should be left until it has become clear, when it will be fit for use. We should imagine that half a gallon per square yard would be sufficient to destroy worms on lawns.

WOOD-ASHES.—*A. B. D.*—Wood-ashes will not be injurious as a top-dressing to such plants as *Ixora rosea*, *Stephanotis floribunda*, and *Manettia cordifolia*. We know nothing further respecting their action upon worms than is stated by "R. S. V. P." at p. 870 of last year. Why not use lime-water for destroying them, when it can so easily be prepared?

HEATING.—*H. Glendinning*.—The principle of heating in Mr. Rendle's apparatus is the same as that of Corbett, and his is the same as that of many others. In all cases where hot water is employed the principle is the same. It is the application of it which is different, and here we consider Mr. Rendle's original.

—*P. P.*—A tank made like a square beer-cooler will hold water, and serve for heating in Mr. Rendle's way. In a house of the size you mention, 15 feet by 6 will be large enough. The boiler is better outside the house.

PINE-APPLES.—*J. Gray* should state the place where his method of growing this fruit has been practised, before we can publish his communication.

VINES.—*Comus*.—In determining at what time of the day Vines should be steamed, we would have you look around into Nature. There you will find that it is the earliest part of the morning that vegetation is involved in mists, which are afterwards dispelled by the sun. Follow this in your artificial practice.

HOT-BED.—*A Shropshire Subscriber*.—The depth of dung upon which a 3-light frame is placed at this early period, should not be less than 4 feet; and, as you have good facility for drainage, it will be better to remove the soil, where the bed is to stand, to the depth of 2 feet, and to place a layer of faggots or brushwood beneath the dung. This will prevent the water which usually collects about these places from chilling the heat of the bed.

LAUREL.—*Inquisitive*.—There is no doubt if your Portugal Laurel, which has grown to the height of 25 feet, were cut down, and a few leafy shoots were preserved near the base of the stem, it would in time become a bushy plant. —*J. M. H.*—It is not too late to transplant Laurels; but this kind of work should be concluded as soon as possible.

CLIMBERS.—*T. M. H.*—We recommend you to plant the following climbers against your S. E. wall: *Wistaria sinensis*, *Clematis azurea grandiflora*, *Sieboldi*, *grata* and *Hendersoni*, *Jasminum revolutum* and *officinale*, *Magnolia grandiflora*, *Bignonia radicans*, *Caprifolium gratum*, and *Ampelopsis quinquefolia*; to which you may add the *Lilae*, *Bougainville*, and *Yrshire Roses*.

HERBACEOUS PLANTS.—*Oikos*.—There are so many good herbaceous plants that it is difficult to say which are the six best. Besides, we do not know what your objects are. The following 6 are amongst the best for general purposes:—*Alyssum saxatile*, dwarf, flowers yellow; *Arabis grandiflora*, dwarf, white; *Asphodelus luteus*, middle sized; *Anemone vitifolia*, middle sized, white; *Delphinium grandiflorum* (double var.), tall, deep blue; *Phlox paniculata*, tall, flowers lilac.

FURZE.—*J. W. T.*—Where strong layers of Furze can be procured, it is probable that, if it was planted as soon as all danger of severe frost is past, it would form a cover in much less time than if seeds were sown upon the same ground. In sandy soils, and where only weak plants are to be had, the safest way is to sow the seeds in April.

UNDERWOOD.—Nothing will grow well under Fir-trees which are thick at their heads and bare below. The best plants are *Hollies*, *Common Laurels*, *Blackthorn*, and *Buckthorn*; but all these must have light, and the soil must be well broken up before they are planted.

PERISTERIA ELATA.—*W. M.*—This plant thrives best in a soil composed of light turfy loam and leaf-mould. It should, while in a growing state, be allowed plenty of pot-room and a good supply of water.

CAMELIAS.—*Z.*—You cannot do better than shake all the soil from the roots of your unhealthy Camellias, and repot them into a mixture of turfy loam and peat. When potted, they should be plunged into a gentle bottom-heat until the plants are fairly established. —*G. F.*—The Double White and fimbriated Camellias generally form a large number of flower-buds, many of which they cannot perfect, even if in high health. Your mode of treating them seems right; and therefore the only advice we can give you is, to thin out the buds and keep the temperature rather lower; so that the flowers may be prevented from opening until the sun has more power; unless it is your wish to have the plants in full flower very early.

FUCHSIA SPLENDENS.—*B. B. H.*—This plant bears considerable resemblance to *F. fulgens*, but is superior to that species in the brightness of its colours. The reason why your plant grows so luxuriantly and does not flower, is no doubt caused by your having potted it in too rich a soil. It should be rather under than over potted, and the soil in which it is grown should not contain any stimulating manure.

THE TUSSAC GRASS.—*W. S.*—This is the *Festuca flabellata* of Lamarck. We will give you more information about it next week.

PANSIES.—*A Pansy-Grower*.—We do not recommend you to use either bone-dust or horn-shavings in your compost for Pansies; they are of too drying a nature for the purpose. Good loam, enriched with ordinary manure, is the best soil you can make use of.

TULIPS.—*W. S.*—The reason why the Florentine Tulip produces one very large root and many small ones, is this:—The small roots are merely intended to feed the old bulbs to which they belong, and which will die as soon as its flower has been matured; the large root is for the nourishment of a new bulb. If you trace this large root to its origin, you will find that it is the lower end of a tubercle just beginning to swell into a bulb; and

the large apparatus with which, as you see, nature supplies it, is merely to enable it to organize itself rapidly. As the young bulb gains size it will probably produce other roots.

FRUIT-TREES.—*W. P. K.*—You had better head down those sorts of Pears that do not succeed in a confined situation, surrounded with buildings, and graft them with such good varieties as you find by experience to do well there. You may also add to your collection Hacon's Incomparable, Passe Colmar, Dunmore, Knight's Monarch, Thompson's, Winter Nelis, and No Plus Meuris. —*B. W.*—Six good dessert Apples for the neighbourhood of Manchester are, the Kerry Pippin, Pearson's Plate, Sykehouse Russet, Court of Wick, Court-pendu Plat, and Boston Russet. —*S. S.*—In some seasons, upon trees that usually produce well-flavoured fruit, the Chaumontel acquires a bitterness, and also fails in becoming perfectly melting. The past was one of those seasons; its peculiarities, as affecting the qualities of fruits, were, a hot dry summer, succeeded by wet and cloudy weather.

GRAFTING STOCKS.—*Simpleton*.—Crab-stocks from woods will do for grafting on, and are generally more hardy than those raised from the hips of good Apples; species being in one sense perfect, whilst varieties are more or less imperfect. Many of the Perry varieties of Pears have good seeds, from which stocks may be raised. You will find the time and manner of sowing at vol. ii. p. 745; but you will get stocks properly reared from the growers at probably less expense than you can raise them. Cherries are grafted on Cherry or Mahaleb stocks. The other kinds of fruit you mention are grafted or budded on Plum-stocks.

MAYDUKE CHERRY.—*R. G.*—That the Cherry known as the Mayduke for two centuries has derived its name from Madoc, a district in France where Cherries are much grown, is very doubtful; for Duhamel and other French authors have no such name as Madoc in their nomenclature. On the contrary, they describe the Duke Cherries as having been received from England or Holland. Duhamel states that there are three varieties of the Royale, or "Cherry-duke," namely, the Royale Hâtive, Duc de Mai, Mayduke, of which the fruit ripens in the end of May or commencement of June; the Royale Tardive and the Holman's Duke. M. de la Bretonnerie, in "L'Ecole du Jardin Fruitier," describes the Cerise d'Angleterre, ou Cherry-Duck des Anglais. This, he says, is scarcely different from La Grosse Cerise Hâtive, "which has lately been adorned with many fine names, as the Royale Hâtive, Duc de Mai, &c.; although it ripens in the end of June, it is the May-duke des Anglais."

In Kraft's *Pomona Austriaca* "Der May Herzog, Cerasus præcox regia, Dux Majalis, Royale Hâtive, Duc de Mai," is described as ripening in the middle of May; and Kraft's figure is undoubtedly that of our Mayduke. The Cerise de Hollande of the French has also been proved to be the Mayduke. This excellent variety, it is admitted, is never perfectly ripe in May, unless when forced, and therefore the name is not strictly applicable; yet in Langley's *Pomona* it is stated to have ripened at Twickenham, in 1727, on May 20, Old Style, or the last day of May, New Style. In warm seasons, Cherries, at the present day, are gathered sufficiently ripe to sell, if not perfectly so for eating, from south walls, at the place just mentioned, in the commencement of June. In the Report on Covent Garden Market for the week ending June 4, 1841 (see vol. i., p. 368), it is stated that "a large quantity of Cherries have been imported from France during the week, and fetch about 1s. per lb." These, to be in the London markets in the first days of June must have been gathered in France in the end of May; and they were Mayduke Cherries. In the Report of the week following, ending June 11, 1841, we find that "Cherries, both forced and natural, abound." It is also to be recollected, that when the variety in question had received the appellation of Mayduke, the Old Style was the mode of reckoning, consequently the 11th of June would be accounted the last day of May. These, it is presumed, are strong proofs in favour of the name having been Mayduke, and that the latter is not a corruption of Madoc, as some suppose. If it be such, proof requires to be adduced.

FRENCH BEANS.—*Anxious Inquirer*.—Your French Beans are infested with the red spider, an insect to whose attack they are extremely liable. The greatest check which you can put upon their ravages will be to syringe your plants early in the morning before you admit any air to the house, and again in the evening as soon as it is closed. The atmosphere of the house should also be kept abundantly moist for a few days; there is nothing which accelerates the increase of these pests so much as a dry atmosphere.

CLUB IN CABBAGES.—*A Subscriber*.—The best remedy with which we are acquainted for preventing the Club in Cabbages, is to fork into the ground, previously to sowing the seeds, a good dressing of wood-ashes, which may easily be procured by burning the prunings of trees, refuse vegetables, &c. At p. 21 of the *Chronicle* for 1841, it is also recommended in planting out Broccoli, Cabbages, &c. to fill the holes partially with a mixture of wood-ashes and sand. It is very probable that Spirits of Tar would be as beneficial in checking the Club in Cabbages as in preventing wireworms from attacking Carrots.

POTATOES.—*Newtown*.—The difference in the condition of sets, when new Potatoes are taken up, probably depends upon the state of ripeness of the sets. When they are quite mature, and are planted, their contents are readily converted into organized matter, and the consequence is, ripe and good Potatoes; if, on the contrary, the sets are ill-ripened, they contain comparatively little organized matter, and being but slightly affected by the young Potatoes, the latter are small and bad, and the sets themselves remain but little changed. Potato seed from hot and dry places will produce tubers earlier than if it came from cold, damp situations.

WOODLICK.—*A Constant Reader*.—You may reduce the number of woodlice which infest your Mushroom beds by placing a few cold boiled potatoes separately in pots, and covering them loosely with moss. These are to be set as traps in different parts of the beds, and must be looked to every morning. The insects which collect therein may be easily destroyed by immersing them in boiling water. The method adopted by Mr. Sellers is to procure a few half-inch boards, about three inches broad, one edge having a groove to contain liquid, the other being wedge-shaped to insert into the soil. When the Mushroom beds are surrounded with these boards, and the earth is pressed so tightly round them as to prevent the insects from getting beneath them. The grooved upper edge is then filled with tar, which effectually preserves the Mushroom beds from the attacks of woodlice, which cannot pass over the pitchy barrier. The same means will also protect them from earwigs.

ANTS.—*A. B. D.*—Ants, unless very numerous, will do no injury amongst Orchidaceous plants.

TIMBER-PRUNING.—*Arbor*.—We are glad to find your opinions on this subject so much like those we constantly advocate.

AVENUES.—*A Gardener*.—In our opinion, these are among the noblest ornaments of a country mansion; it has been barbarous taste to destroy them, and it is good taste to restore them where the house is of any importance. Limes, Elms, and Ash-trees are the best for the purpose.

PRESERVING NETS.—*J. M. H.*—Kyan's Patent is of no service in preserving nets. The best plan is to tan them.

LOCOMOTION OF PLANTS.—*H. F.*—Although physiologists deny that plants can shift their quarters, and thus distinguish them from animals, yet it is very certain that they do somehow go from one place to another in a mysterious manner. These removals take place in various ways, and in the common Hepatica thus: what we call the root of that plant is really an underground stem, which grows upwards from its point, like other stems; if, then, we bury it a few inches underground, it will every year rise nearer and nearer to the surface of the ground, and at last will stand above it. Crocuses will do the same thing.

BRITISH WINES.—*Amateur*.—We have no fancy for British Wines, and really cannot undertake to advocate them. Those who like them will make them without any assistance of Horticultural Societies, and those who don't like them cannot be so influenced. The thing has already been done by the Caledonian Horticultural Society. If you wish for our opinion, it is, that almost all British Wines are undrinkable. Nevertheless, we will not dispute the truth of your assertion that Gooseberry Wine is often as good as Champagne. Why should it not be, when it is notorious that enormous quantities of the stuff called Champagne is prepared in England from Rhubarb stalks?

SWEETS.—These young gentlemen are not gardeners. We presume the law relating to them is just the same whether they sweep the chimney head foremost or feet foremost. We would not advise you to try the experiment of evading the law.

MISCELLANEOUS.—*B. P.*—You will find excellent directions for the treatment of the Ranunculus at pp. 420 and 469 of the *Chronicle* for 1842. —*An undervaluing Bee-keeper* had better procure Dr. Bevan's work on the Bee. —*J. R. J.*—Your Fern is the *Asplenium Ruta-muraria*. —*A. E.*—Of your Brazilian seeds, 1. is *Araucaria braziliensis*, which is too tender to stand out in this climate. 2. is *Anda Gomezii*. 3. *A. Sapindus*. 4. *Sophora tomentosa*. 5. *A. Cana*. None except the *Araucaria*, which is now becoming common, is of much interest in a Horticultural point of view. —*Alpha*.—It is possible that some of the Melon-seeds which have been preserved since the close of the last century, may germinate; but this will depend entirely upon the manner in which they have been kept. —*A Constant Reader's* plant is *Lachenalia tricolor*. —*Amateur*.—Cotoncater is to be found in every book on hardy shrubs published for the last 20 years; therefore, as you have Mr. Loudon's works, we can only beg you to look again. Your question about Apples has also been answered, and for that too we must beg you to look again. —*H. Brown*.—Of your plants, 1. is a *Talinum*; 3. *Justicia flavicoma*; 4. *Gnaphalium imberbis*; 7 appears to be *Anthyllis barba Jovis*. The remainder are such miserable specimens that it is impossible to recognise them. —*W. M.*—It is highly probable that the leaves of your Orange-trees have been eaten either by earwigs or by woodlice. —*J. W. T.*—Mearns's Treatise on the Vine is not yet published. —*G. D.*—From the punctures upon the Azalea leaves, we presume that the disease is occasioned by an *Acarus*, or perhaps an *Aphis*; but as we could find no insects, it is impossible to answer your question satisfactorily, which we will endeavour to do if you will send us some leaves with the animals complained of. —*R. X. X.*—If not above four lines, 3s. A Post-office order may be sent. —*Broughton*.—Your plant is a new species of *Odontoglossum*. It has already flowered with Mr. Rucker.

—*C. D.*—Your Apple is not the Golden Harvey or Brandy Apple; it appears to be the Russet Nonpareil. —*J. R.*—No such plant is known to botanists as *Dendrobium Shepherdi*. What you have sent is a very trifling variety of *D. Pierardi*. —*A Subscriber*.—The bloom of your seedling Camellia was not sufficiently expanded to enable us to judge whether the centre of the flower, when full blown, is full and perfect. The colour is very good, and the outer rows of petals well-formed, and smooth on their edges, but rather thin and small; it is a very pretty variety, and worth cultivating. —*M. C.*—Your plants are:—1. *Cassia acuminata*, 2. *Acacia melanoxylon*, 3. *Edwardsia microphylla*, 4. *Schinus Molle*; all of which are tender, except the *Edwardsia*, which will succeed, with slight protection in severe weather, against a South wall. 5. is some species of *Rhus*. —*Fair Play* should pay in advance, either by the quarter, half-year, or twelvemonth, as most convenient; newsmen could not thus charge extra. At any rate, if a Post-office order is sent to us for 13s., we will take care he has 26 Numbers. —*J. B.*—The native Pear is *Xylomelum pyrifolium*. The dried plants are of no sort of value or interest. They are left in Charles-street. —*Hibernicus*.—There is such a plant as *Ribes inebrians* in the Garden of the Horticultural Society; but such things are only given to the Fellows of the Society. —*A. R., Sandford*.—Your Apples are 1, 2, Margil; 3, French Russet; 4, 11, Nonpareil; 7, Dutch Mignonne; 8, Royal Russet; 9, Fenouillet Gris; 10, Downton; 12, Wheeler's Russet; 13, Lemon Pippin; 15, Braddock's Nonpareil. —*T. S., Clifton*.—The Apple you sent is the Newtown Pippin. Your Pear is the Bishop's Thumb; it is one of those that, in some seasons, do not become melting, especially if grown on a wall having an aspect not in any degree inclined to south. If the beginning of autumn be wet and cloudy, although the summer may have been hot, Pears are in consequence deteriorated.

As usual, many letters have arrived too late for answers this week. Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenants may have them delivered in any part of London by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies required.

NEWS OF THE WEEK.

THE discussions on the Right of Search in the Chamber of Peers have terminated favourably to the French Cabinet and to the general interests of peace. The amendments proposed by different Peers in the debate on the Address, for the purpose of embodying in that document an expression of feeling hostile to the Slave-Trade Treaties, have been negatived by a majority of 51; and the Ministerial Address, which contains no allusion whatever to the subject, has been adopted without modification. In the Chamber of Deputies, a result scarcely less satisfactory has been obtained; the draft of the Address proposed by the Commission merely alludes to the subject in answer to the passage in the King's Speech; it calls for no revision or even reconsideration of the treaties of 1831 and 1833, and confines itself to an expression of the wishes of the Chamber, that at some future period the commerce of France may be placed under the exclusive control of the national flag. It neither specifies a period for this event, nor suggests the opening of negotiations for its accomplishment. No one who has followed the course of French politics for some months past can fail to perceive how great is the importance of this Ministerial triumph to the whole of Europe. M. Guizot declared in the Chamber of Peers, that negotiations with England at the present moment could only lead to an act of weakness or an act of madness; the British Government, he said, could not yield without compromising its dignity; and he considered the existence of good relations between France and England, both politically and morally, as far preferable to the abrogation of the Right of Search Conventions. He was convinced that the national independence was not

involved in the question at issue, and the Government was determined not to depart from the complete and loyal execution of the treaties. These arguments have prevailed over the clamour of the journals, and the danger which last week threatened the peace of Europe has for the present subsided. The discussion on the Address in the Chamber of Deputies is still in progress; and although it is impossible to foresee the ultimate decision of an assembly so uncertain in its impulses as the Representative body, it is still believed that the Ministerial party are strong enough to prevent the adoption of any hostile amendment.—From Spain we learn that the Captain-General of Barcelona has adopted the extreme measures of severity with which he has long threatened the inhabitants who refused to pay the war contribution. Soldiers are now quartered on the houses of all persons in arrear, who are to defray the expenses of the Military upon a scale which doubles the amount daily until the contribution be paid up. In Madrid there is nothing new, except the meetings of electors and candidates, and the increasing rumours of Ministerial changes.—From Portugal we learn that the Address, in answer to the Speech from the Throne, has been carried, almost without discussion, by a large majority, and that the forthcoming Budget is of the most satisfactory character. It embodies a great number of financial reforms, and shews that under the administration of the present Government the long-standing deficiency in the revenue has already substantially disappeared.—The affairs of the Levant are rather more promising than usual; the appointment of a Christian Prince to the Government of the Christian portion of the Lebanon has given rise to much rejoicing, and has produced a tranquillising effect on all classes of the people. The Austrian Cabinet continues to concentrate troops on the Eastern frontier of the Empire, but the affairs of Servia, to which this measure has immediate reference, will no doubt be settled by diplomacy, without the necessity of an appeal to arms.—From the United States we learn that the question of the Oregon territory has become the prominent topic of discussion in Congress, and that the President has sent a message to the House of Representatives, recommending negotiations with the Chinese Government for the purpose of obtaining for the commerce of the United States the same privileges as those ceded to Great Britain by the recent treaty.

At home, few subjects for some time past have so much excited the feelings of the public as the death of Mr. Drummond. The Papers of all shades of politics concur in the expression of cordial sympathy for his untimely fate, and of respect for his personal character. Our readers will find under our Metropolitan News a concise summary of the facts which have transpired since our last, and will see that the assassin has been committed to take his trial on the capital charge.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, remain at Windsor Castle, and continue quite well. The Prince has shot over the preserves in the Great Park during the week, and the Queen has occasionally taken walking exercise in the Home Park. It is announced that the Queen will not open Parliament in person, but will remain at Windsor until the beginning of March. Her Majesty will then come to town, and remain at Buckingham Palace until her accouchement is over—an event which is expected to take place at the end of March or the beginning of April.

Court Mourning.—The *Gazette* of last night contains orders for the Court to go into mourning until the 12th Feb. for her late Royal Highness the Duchess Dowager of Schleswick Holstein Sonderbourg Augustenbourg, mother of her Majesty the Queen of Denmark, and great granddaughter of King George II.

Parliamentary Movements.—It is said that the Duke of Cleveland will move the address in the House of Lords in answer to the Queen's speech on the opening of the session, and that Lord Courtenay, eldest son of the Earl of Devon, will move the address in the Commons.

Gazette Announcements.—The Queen has been pleased to appoint the Right Hon. Sir Charles T. Metcalfe, Bart., to be Governor-General of Canada, New Brunswick, and Nova Scotia.

Foreign.

FRANCE.—*Chamber of Peers.*—The Paris papers, as might have been anticipated, have been filled during the week with comments on the debates in the two Chambers. The proposed address of the Chamber of Peers, in answer to the King's speech, has given rise to a long and interesting debate, involving questions of the highest importance to Great Britain. The draft of the address, prepared by the Duc de Broglie, contained no allusion to the Right of Search; the Opposition, therefore, proposed various amendments, for the purpose of making the address convey an expression of the popular feeling on the subject. The Marquis de Turgot moved the following:—"Those good relations (with Great Britain) would be better insured, if, on a new examination of the treaties of 1831 and 1833, the inconveniences which their execution have revealed were removed by fresh negotiations." The Prince of Moskowa proposed the following amendment:—"We

hope that your Majesty will see the necessity of taking into consideration the opinion that has manifested itself relative to the right of mutual search stipulated in the treaties of 1831 and 1833." M. de Brigue moved the following:—"We congratulate the Government of your Majesty for not ratifying a convention which would have proved, for the independence of the French flag, an aggravation of the treaties of 1831 and 1833." The arguments of the different speakers would have little interest for our readers. We shall therefore confine ourselves to the speeches of M. Guizot in the Chamber of Peers, which are highly important, as developing the views of Government on the questions at issue. In the speech of Saturday he confined himself to the charges of the Opposition in regard to the decline of French influence. In Egypt, he said, the position of France was far more favourable than before 1840. In Syria not only has France taken up its habits of protection, but it has also extended them. [All the religious establishments of Syria have received new succours. In the college at Autourah, free scholarships have been endowed, and a consulate has been formed at Jerusalem. The appearance of a Protestant bishop at Jerusalem had given rise to some fears. I asked the opinions of the Catholic bishops and chiefs of the Christians in Syria, and in the empire of the East; they replied that, far from being a cause of fear, the presence of our Protestant bishop would tend to bind not only the Catholics among themselves, but also to France. That is an opinion which we did not suggest to them, but which they themselves conceived from their knowledge of their situation and wants. We wish there to strengthen and maintain the Ottoman empire, and at the same time protect the Christians within it. We have done both. For example: the Greek Christians obtained permission to rebuild the cupola of the church of the Holy Sepulchre, and then have it as a property. They obtained a firman for this. We obtained the recal of the firman, though it was obtained under Russian influence; and all Catholics have the right to contribute to the pious task. I shall now pass to Spain. Somebody spoke of projects of usurpation entertained in that country. I see, and I believe, nothing of the kind. Even if our relations with the present Spanish Government want intimacy—even if we have to complain of its conduct, and of its mistakes with regard to most important points in our relations—still we must do it justice. I see no sign of usurpation; no power keeps so attentive an eye on Spain as France does. We know very well that our national interests and our honour are bound up in Spain with the throne of Isabella, and the maintenance of the House of Bourbon on that glorious throne. We have not forgotten, and never will forget this. In regard to the other Powers, we stand in the most true, regular, and useful position—that is, without especial intimacy with any one in particular, but in good intelligence with all. France has lived a long time in Europe as a fiery meteor, seeking its place in the general system of European states. She was forced to it. She had to raise to general recognition her new social state. She had no place made for her; her place was contested to her—often unjustly. Now, however, she has conquered; Europe has accepted her social and political reforms. This is the key of French policy henceforth. Her state, however revolutionary, however at variance with that of the rest of Europe, has been accepted and recognised—it little matters with reluctance and ill-humour, or not. This being achieved, France should cease to be the burning and shifting meteor, in order to become a fixed and settled planet, moving in the proper orbit assigned to it in the European system. The present Cabinet has made the same choice that was made by the statesmen of 1830 and 1831. There were then, as now, a violent and a pacific, a turbulent and a tranquil policy to choose between. We have chosen the pacific and the tranquil, and you will approve and fortify our choice."—On Monday, M. Guizot replied to the amendment of the Marquis de Turgot and M. de Brigue on the right of search. He began by saying that he would not trouble himself with those nice questions of theory which complained of cession of sovereignty and such things. He would at once examine the reality of the facts. The treaties existed, and bound France not only towards England, but also towards other Powers, which she had solicited to concur in them. Thus, France had advised and obtained the adhesion of Denmark in 1834, of Sweden and Sardinia in 1836, of the Hanse Towns and Tuscany in 1837, and of Naples in 1838. Negotiations to the same effect had been likewise opened by her with the Cabinets of Madrid, Lisbon, and Rio Janeiro. In making these overtures, France invariably assured those Powers that the concessions required of them were conformable to the real principles of the maritime laws, which France had always defended. These treaties had existed during ten years without any serious objection being raised against them. In that interval only twelve complaints were made. Several were found groundless, two had obtained satisfaction, and three remained unadjusted. If the treaty necessarily produced so many abuses, how was it possible that it could have been executed during ten years in silence? Had it not been for the treaty of 1841, the conventions of 1831 and 1833 would never have been thought of. He was not of opinion that the public feeling excited by that treaty imposed upon the Government an obligation to prosecute its abrogation. The object for which they were concluded still existed: it was notorious that French, Spanish, and Portuguese vessels were still engaged in the slave-trade. They could not suspend the treaties. They must be executed loyally as long as they existed. But we are asked to open negotiations. Such negotiations for the revision of these treaties would, in the state of irritation into which the right of search has cast the two countries, lead to no

good result. It would be highly inopportune. On a former occasion there had been, as at present, hostile demonstrations on the part of the French Chambers and press, and when the English Government was pressed by the French Government to consent to modifications, the reply of Lord Aberdeen was, that after such menaces and hostile manifestations, the British Government could not yield without compromising its dignity. At certain times difficulties of this kind were insurmountable. In the present state of people's minds on both sides of the Channel, negotiations could lead only to an act of weakness or an act of madness. "And, for my part," said M. Guizot, "I can lend myself neither to one nor the other." He told Lord Palmerston in 1840,—"My Lord, you sacrifice *la grande politique à la petite*,—the existence of good relations between France and England are worth more than Syria;" he would now say to the Chamber, "You sacrifice the *grande politique à la petite*,—the existence of good relations between France and England, politically and morally speaking, are far preferable to the abrogation of the conventions of 1831 and 1833." "We have," said M. Guizot, in conclusion, "rights to respect; to propose new negotiations would be an act of levity and blameable imprudence and temerity. The Government of the King is convinced that the *status quo* is not in the least derogatory to the national independence, and it is consequently determined not to depart from the complete and loyal execution of those treaties; and I repeat, it would neither be wise nor opportune to propose any modification thereof at this moment to the English Cabinet." The Duc de Broglie followed in a powerful speech in favour of the Address, and on Tuesday evening the Chamber divided, when the amendments of M. de Brigue and the Marquis de Turgot were supported by 67 votes, and the original Address by 118, giving therefore a majority of 51 to Ministers. The other amendment of the Prince of Moskowa was then abandoned. This result produced a rise in the funds, and every account describes the effect of M. Guizot's speech as perfectly surprising. In the House, it is said that his calm and dignified reasoning appealed at once to the understanding—that many were convinced by his arguments; and the Assembly, which had before been agitated and disturbed, became suddenly grave, and listened with earnest attention. Even the Republican *National*, one of the bitterest opponents of M. Guizot, pays him the highest compliment:—"His speech," it says, "was expected with impatience; and in listening to his exordium, so brilliant and so happy, we feared for the moment lest the miraculous gift of eloquence might not give a triumph to the worst of causes."

Chamber of Deputies.—The influence of the journals which have taken the lead in the attacks on the Right of Search is obviously stronger in the Chamber of Deputies than in the Chamber of Peers. The draft of the Address proposed to the Representative body contains the following express allusion to the right of search:—"United by a sentiment of humanity, the Powers apply themselves to the suppression of the infamous slave-trade. We have seen with satisfaction that, by persevering in lending the assistance of France to this just enterprise, the Government of your Majesty has not given its assent to the extension of the existing conventions. For the honourable execution of those treaties, as long as they shall not be abrogated, we rely upon the vigilance and firmness of your Government; but, struck with the inconvenience which experience has pointed out, and in the interest of the good intelligence which is so necessary for the accomplishment of the common object, we anticipate with all our wishes the time when our commerce shall be placed under the exclusive guardianship of our flag." The public discussion on this Address commenced on Thursday, and is not expected to be concluded for some days.

SPAIN.—We have accounts from Madrid to the 15th. They are still full of rumours of Ministerial changes, but of a conflicting nature, and evidently unsupported by official authority. Associations of electors continued to be formed; those of the pure *progresistas*, in particular, were very numerous. One of their meetings took place on the 13th, under the presidency of Senator Juan Lasana. Their object was to devise means of insuring the return of the candidates of that party at the next election. They adopted the following programme:—"The Constitution of 1837, neither more nor less than the throne of Queen Isabel II., and the regency of the illustrious Duke of Victory." The trial of the Editor of the *Heraldo* for a libel on Government had terminated in his acquittal by a large majority; in short, after this case, and that of the *Sol* a few days previously, it was considered very doubtful if a jury could be found to convict the conductor of a public journal. The Barcelona journals of the 16th inst. announce that General Seoane had commenced the measures of severity with which he threatened those who should refuse to pay the war contribution. He had consequently placed a corporal and five privates upon the house of each person in arrear, who is to pay the corporal seven francs, and the soldiers five francs per day. This tax is to be doubled the second day, tripled the third, and so on, until the contribution be paid up. The *Phare des Pyrenees* states, that on the 14th inst. the Bishop of Barcelona, attired in his pontifical robes, paid an official visit to the French Consul in that city, to thank him in the name of humanity for the services which he rendered during, and subsequent to, the insurrection, to the population of Barcelona, and to congratulate him upon the recompense which had been bestowed upon him.

PORTUGAL.—We have news from Lisbon to the 16th, and from Oporto to the 17th inst. Previously to the departure of the packet from Oporto on the 17th inst., a telegraphic despatch was received from Lisbon by the

Governor, announcing that the Address in answer to the speech from the Throne had been carried, almost without discussion, by a majority of 69 to 21 votes. When former debates on the Address have occupied several weeks, this very speedy settlement of the question is calculated to convey a favourable impression of the strength of Government. The Finance Minister will immediately bring forward his budget, which is said to be of a most satisfactory character. It embodies all the economies lately effected, imposes no general items of taxation except on hemp, flax, iron, and fresh fish; recites an increase in the revenue of 200 contos by the improved assessment of the *decima*, and of 100 contos by giving an increased extension to the *Lisbon octroi*; and it further shows the deficit to have already substantially disappeared. A decree will be likewise made public, empowering all foreign bondholders to receive their dividends in Lisbon, by which they will save the 3 per cent. deducted in London for income-tax, and the Government will likewise save the 2 per cent. commission. The negotiations for the tariff convention remain in the same state.

HOLLAND.—Accounts from the Hague state that his Majesty has been suffering from indisposition, but is so much better that no further bulletins will be issued. They also state that the members of the Second Chamber of the States-General have received the preliminary report of the central section to the Chamber on the project of law relative to the treaty between the Netherlands and Belgium; and an answer of the Government to the objections made in the Chamber, both against the project of law, and the treaty itself. It is affirmed that these documents were communicated to the Chambers with a request to keep them secret. In the sitting of the Chambers on the 19th, a long address of the merchants of Amsterdam was presented, stating their objections to the treaty now under discussion.

GERMANY.—The Frankfort papers announce that the Diet of the Confederation held its first sitting for the year on the 19th inst., and that Count Von Drutsoff, the representative of Prussia, presided. The Leipsic papers announce that the King of Prussia has apprised the directors of the Cologne Railroad that His Majesty, in order to encourage their enterprise, has decided that the indemnity, which, by the 38th section of the Railroad Act, was to be paid by the company to the administration of the post-office, should be remitted.—The Editor of the Leipsic *Allgemeine Zeitung*, in a recent Number, gives the readers of that paper the solemn assurance, 1. That the poet Herwegh never intimated to him (the Editor) a wish that the letter to the King of Prussia should not be printed; and 2. That the publication in that paper did not take place till after the letter had been in extensive circulation for some time previously in a manuscript form. The measures against the paper are now published in all the official journals of Berlin, and are so strictly enforced that it is quite unlikely that the proprietors will be able to obtain a modification or revocation of the prohibition. The directors of the Anhalt railway have received orders to see that the journal is not clandestinely introduced by their officers, and the booksellers know that they are closely looked after, and that the penalty will be infallibly inflicted on any disregard of the prohibitions; accordingly, hardly a copy of that journal has reached Berlin. The Cologne papers, and other journals of the Rhenish provinces, have received notice from the Censors, that conformably to strict directions from superior authority, they are not to insert in their columns in future any article from the Leipsic *Allgemeine Zeitung*, which may have been copied into other journals, either wholly or in part, or in an abstract. The same regulation applies to all articles, whether of German or Foreign journals, in which the prohibition of that journal is blamed; articles in favour of the prohibition are not yet forbidden. From this rigorous prohibition, which will doubtless be extended to all the journals in the Prussian dominions, it is evident that it is intended to prevent the public in Prussia from learning anything of the contents of the paper. These severe means seem to do away with the hope that the prohibition would be revoked.—Letters from Berlin state that the King of Hanover appears everywhere in the uniform of the Prussian regiment of Hussars, of which he is the Colonel, and that it is considered very complimentary by the Prussians, as such an uniform is generally inconvenient to a man of his advanced age. It seems that the marriage of the Crown Prince is to take place in the third week of February, but the day does not appear to be fixed.

ITALY.—Accounts from Naples, dated the 12th inst. state, that a gloom has been suddenly cast over the gaieties of that city, by the death of Prince Antonio, fourth brother of the King. His Royal Highness had during last autumn one or two apoplectic fits, and was seized by typhus fever lately, and died on the 12th. It was the King's birthday, but all the Court commands had been countermanded, and, for the first time for many years, no gala would be given at St. Carlo, in honour of the occasion. These letters announce that the Neapolitan Government has determined on establishing steam-packets between Messina, Palermo and Naples three times a week, for the conveyance of letters and passengers, at very low rates. The days of departure from Naples are Fridays for Messina, and Mondays and Thursdays for Palermo. The Mediterranean appears to have been severely visited by the storms that caused so many calamities last week in the Channel; merchant-vessels have been lost on all parts of the coast. The wind raged with such violence at Genoa during several days, that the inhabitants residing near the pier had been obliged to abandon their houses, where their lives were in danger. A letter from that city dated the

18th inst., states that the agitation of the sea continued and even increased during the 13th, 14th, and 15th, and caused considerable damage in the port and neighbourhood. Two French vessels were lost in the waters of Spezzia, and much injury was done to the new mole and the ramparts of Mala Paga, where the foundations of the barracks appropriated to the Custom-house troops were considerably shaken. On the evening of the 15th the Archbishop, together with the Chapter, and accompanied by all the clergy of the place, the municipal authorities, and a great concourse of people, blessed the sea, from the heights of the mole.

GREECE.—Letters from Athens confirm our previous accounts of the disastrous condition of the country, and state that an explosion is almost inevitable. After the melancholy seizure of the Finance Minister with insanity, he was succeeded by M. Ralli, Minister of Justice, who is now Minister of both these departments. As general poverty has begun to be felt, Government have resolved to make some economy in the public expenses, by abolishing the two embassies in London and Paris, the salaries of the civil engineers, and the pensions of all veteran military men, by giving them a certain portion of the public land. Many other economical measures have been adopted, as the former prodigality of Government had exhausted the public money, and it was impossible to impose any more taxes on the already impoverished people. The King of Greece has forwarded to Mr. Emerson Tennent the star and other insignia of a Knight of the Redeemer, of which Order his Majesty has created him a Grand Commander, in recognition of his early services, military and literary, in behalf of that country. Mr. Tennent is said to be the only commoner on whom this distinction has been conferred.

TURKEY AND SYRIA.—The French steam-ship which was the bearer of the Levant mail due at Marseilles on the 11th, had not reached Malta on the 9th, and serious apprehensions are entertained that she perished in the tempest which appears to have extended from the British Channel to the coast of Egypt. We have, however, a mail from Malta, bringing dates from Beyrout of Dec. 15, and Malta of the 8th inst. The letters from Beyrout of the 15th ult. state that the account of the appointment of a Christian Prince over the Christian part of the mountains had produced a most tranquillizing effect among all classes of the population. The Sheikh Shibley-el-Arian had made his submission to Ahmed Pasha of Damascus, who had presented him with a shawl and pelisse. The marauding parties, who intercepted for some time the communications between Beyrout and Damascus, had returned to their homes, and the mail from the latter arrived on the 15th without accident. A large council of Pashas has been held at Beyrout, in which the subject of discussion was whether or not an amnesty should be granted to the Christians, and which the different Consuls were of course anxious to obtain. The discussion was of a boisterous nature, and terminated in a resolution not to grant the amnesty. From the Danube we learn that Prince Metternich is still concentrating troops on the eastern frontier of the empire, for the purpose of watching the progress of affairs in Servia. There seems to be no doubt that Austria has joined Russia in remonstrating against the deposition of the Obrenowicz family. It is said, however, that although this policy is apparently in accord with that of Russia, the design of the Russian Cabinet in remonstrating on the result of a revolution in which it had taken no inconsiderable part, was merely a feint, intended to induce the other European Powers to support Prince Alexander against Russia, though he was in reality the object of her choice. The present course of Austria is therefore entirely opposed to the expectations of Russia.—Accounts from Bucharest state that M. Vaillant, a Frenchman, who wrote a pamphlet against the Russian Government, and who had in consequence been banished from Wallachia, had again returned in disguise, but, having been discovered, was marched to the frontier under the charge of a detachment of gendarmerie. The French Consul at Bucharest, who was appealed to by M. Vaillant, refused to interfere, as the latter had not deposited his passport at the Consulate.

EGYPT.—We have accounts from Alexandria to the 16th ult. The Pacha is making extraordinary efforts to repair the losses occasioned among the cattle by the recent murrain. His frigates and smaller vessels have been employed in bringing cargoes of cattle from Tarsus, and have been despatched again as soon as they have landed their cargoes. To facilitate the importation the Pacha has granted leave to every sailor on board to purchase one sheep each on his own account, which they are allowed to sell on arrival; several Greek vessels from Anatolia have also arrived with cargoes of bullocks consigned to French merchants. A Sardinian war-steamer had arrived, announcing the intention of the Sardinian Government to send to Jerusalem a Consul and a Vice-Consul.

UNITED STATES AND CANADA.—The packet-ship Cambridge, which sailed from New York on the 3rd inst., arrived off Liverpool on Tuesday night. She has brought news four days later than the advices received by the mail steamer. The proceedings in Congress possess some interest for the English reader. The Oregon territory question, which now that the north-eastern boundary one is settled, is likely to become a prominent topic in the United States, had engaged the attention of the Senate. That assembly was entirely occupied on the 30th ult. with the consideration of a bill for the occupation and settlement of the territory of Oregon, and extending certain portions of the laws of the United States over the same. The bill assumes that "the title of the United States to the territory of Oregon is certain, and will not be abandoned." The President had sent a communication

to the House of Representatives, recommending negotiations to be entered into with the Chinese Government, to secure for the commerce of the United States the same advantages as would be enjoyed by Great Britain by the ceding of the four ports and the possession of Hong-Kong. It was referred to the committee on foreign affairs. The inquiry into the mutiny and execution of Mr. Spencer and others on board the Somers was still in progress, but no new facts of importance were elicited. We regret to find, by the Montreal papers received by the Cambridge, that the health of Sir C. Bagot was described by his medical advisers as "in a most precarious state." The rumoured appointment of Lord Eliot as his successor was not correct, and it is now announced that Sir Charles Metcalfe, late Governor of Jamaica, has been appointed the new Governor-General of Canada.

CITY.

Money Market, Friday.—Consols closed at 94½ for the Account, and 94½ to ¾ for money; Threes per Cent. Reduced, 95½ to ¾; Three-and-half per Cents. Reduced, 101½ to 2; New Three-and-half per Cents., 101 to 101½, Exchequer Bills, 63s. to 65s. prem.

Metropolis and its Vicinity.

Death of Mr. Drummond.—The favourable opinion given by the surgeons on Friday night led to the impression that the life of this unfortunate gentleman was not in danger. Our readers will learn with great regret that this belief has unhappily not been realised, and that Mr. Drummond expired on Wednesday morning. In the course of Saturday afternoon unfavourable symptoms began to manifest themselves, and great apprehensions were entertained by Mr. Bransby Cooper and Mr. Guthrie for his life. It at length became necessary to open the temporal artery, inflammation of an alarming character having occurred. The copious bleeding somewhat relieved the most urgent symptoms, and Mr. Drummond went on tolerably well until Sunday night, when the inflammation returned. At 3 o'clock on Sunday the whole case had assumed a more unfavourable aspect, the difficulty of breathing was very great, and Dr. Chambers and Dr. Hume were called in. An improvement took place in the evening, but it was of short duration, and on Monday morning it was evident that recovery was very doubtful; during the whole day the case maintained the same serious character, and on Tuesday morning the inflammation and difficulty of breathing had become so urgent, that a repetition of the bleeding was indispensable. Towards night the symptoms were much aggravated, and the medical attendants gave up all hope. At 2 on Wednesday morning the unfortunate gentleman still survived, although his dissolution was momentarily expected; he was then suffering from great oppression, but retained his consciousness and was perfectly resigned. He continued for some hours in the same calm state as from the first; and although no mitigation of the unfavourable symptoms took place, he did not appear to be afflicted by any acute pain; but the difficulty of breathing continued to increase, and it now became manifest that the period of dissolution was rapidly approaching. At half-past 10 on Wednesday morning Mr. Drummond breathed his last, and died without a struggle, in the presence of Mr. Guthrie, his three brothers, and his sister, Miss Drummond, who remained by his side to the last moment of his existence. It is understood that Mr. Drummond appeared to suffer little pain in his last moments. The mournful intelligence was quickly disseminated at the west-end of the Metropolis, messengers having been constantly sent to inquire the state of the patient from all the public offices. A messenger was also despatched to the Queen at Windsor Castle, her Majesty having taken great interest by frequent inquiries after the unfortunate gentleman. The melancholy intelligence was the all-absorbing topic of conversation at the west-end of the town in the beginning of the week. Sir J. Graham and several Cabinet Ministers, shortly after it was known that Mr. Drummond had breathed his last, went to the residence of Sir R. Peel in Whitehall-gardens. Upon the Premier being informed of the fatal termination of the assassin's attack, it is said that he was greatly affected, and immediately directed that his condolence should be forwarded to the afflicted relatives. Mr. Drummond, we understand, was in his 50th year, universally respected by all who had the pleasure of his acquaintance, and, in the transaction of official duties, he was courteous and obliging to every one who had occasion to apply to him on business of a public nature, however trifling it might be. He had been private Secretary to Lord Ripon when Chancellor of the Exchequer, and was afterwards attached, by the same confidential duties, to Mr. Canning, the Duke of Wellington, and Sir Robert Peel. The Duke of Wellington had such confidence in his integrity, that on one occasion he publicly stated in the House of Lords his great satisfaction that Mr. Drummond had done him the honour to become his private secretary. There has seldom been an instance in which the life of an individual has been sacrificed by the hands of a murderer that has created so painful an interest amongst all classes of the community. In regard to the assassin M'Naghten, very little of an authentic character has yet transpired. On Saturday, he was examined at Bow-street. After several witnesses had deposed to the main facts, the prisoner at first refused to say anything, but was afterwards brought back at his own request, and said, "I wish to say that it is the Tories of my native city who have driven me to this act. They follow and persecute me wherever I go; and they have, by their treatment of me, already ruined my health and disordered my mind. I can't sleep at nights, and have no rest night nor day. They have followed me

to France, to different parts of England, and other places—in short, wherever I go. The system they have pursued towards me was such that I could go no longer. I believe I have been driven into a consumption by them. I believe I shall never be the same individual again that I was before. I used to have good health and strength. They have accused me of crimes of which I was never guilty. They have done everything in their power to harass my mind and to persecute me; and, in fact, to murder me. That is all I have to say at present, and it can be supported by evidence." The prisoner here paused. The magistrate then asked, "Have you anything more to say?"—Prisoner: "Only that they completely disordered my mind. I am quite a different man from what I used to be before they commenced their persecutions." He was then conveyed to Tothill-fields Prison, and from the above remarks and other circumstances which have occurred in the prison, there is little doubt that he intends to plead insanity. On Monday, several medical men of eminence connected with the various lunatic asylums of the Metropolis, amongst whom were Drs. Monro and Sutherland, visited the prisoner, for the purpose of ascertaining whether he suffered from aberration of mind. The result of their interview was the unanimous conviction that the statement of the prisoner was a premeditated one, and that there is no mental derangement whatever.—The inquest on the body of Mr. Drummond took place on Thursday, Mr. Maule, Solicitor to the Treasury, appearing on the part of the Crown as prosecutor. The evidence consisted in the accounts of the policeman, and a man called Hodge, a carpenter, who saw M'Naghten fire, and in the testimony of Mr. Guthrie, the surgeon. The latter put in a written account of the *post mortem* examination, stating that the ball in its transit passed directly through the abdomen, perforating the diaphragm, and producing a large effusion of blood; and that the surgeons considered such a wound to be inevitably fatal. The jury returned a verdict of "Wilful Murder" against Daniel M'Naghten, and the coroner issued his warrant for the committal of the prisoner to Newgate. The belief that the shot was intended for Sir R. Peel becomes more and more general, and would seem to be borne out by the whole circumstances of the case. Mr. Drummond was about the same stature and stoutness as Sir R. Peel, but had a more active and elastic gait. There was no resemblance of features; but he was necessarily a frequent inmate at the Premier's house, and had just parted with Sir Robert's children when he met with his untimely fate. It is said, indeed, that Sir R. Peel has now no doubt that Mr. Drummond received a blow which was intended for him.

The Wreck of the Conqueror.—The following particulars have been obtained since our last from the boy Abchurch, the only survivor of this melancholy catastrophe:—It appears that they saw the French coast on Thursday night, having made the Lizard light on Monday. The sea was very boisterous on Wednesday and Thursday, and the captain did not appear to have much faith in the skill of the fisherman, who had been taken on board off Torbay, to steer the ship through the Channel. Abchurch says the ship struck about ten at night. The captain went into the cabin, and informed the ladies and the other passengers that they were on the French coast, where no boats were likely to put off to their aid, nor any other assistance could be afforded, and that they must trust to Providence for protection. During the night the men behaved remarkably well, and obeyed every order given by the officers with great fortitude. The ship held together until nearly five o'clock on Saturday morning, when her bottom timbers began to give way. Captain Duggan now went down into the cabin and told the ladies that it was all over, and that he would see them put into the boat, and perhaps they might reach the shore. At this time Mrs. Thompson was dressed, and sitting by the side of her children's cot; Miss Turton and the other ladies were also dressed. About nine the vessel broke up, and although greatly alarmed, the ladies got safely on the deck; and Capt. Duggan and Mr. Rogers, the surgeon, handed them into the boat, which was suspended from the side of the vessel by the "falls." In consequence of the tackle being entangled, the boat could not be lowered in the usual way, and the lines being cut, it dropped into the sea. Abchurch and another boy were the only sailors in the boat, and the former states that the whole of the ladies kept their seats firmly, while they endeavoured to pull towards the shore. The sea at this time washed the deck of the vessel, and the communication between the fore and aft decks was almost entirely cut off. The boat had not left the ship more than three minutes before it was struck by a wave and capsized. The whole of the passengers were thrown out, and Abchurch alone, with one of Mrs. Thompson's children, regained the boat. Abchurch recollects nothing more after this period, except being again washed into the sea, and again reaching the boat. In addition to these facts, a French gentleman, M. Dupont, who went down to the Sands soon after the boat left the ship, has made known some facts, which leave little doubt that many of the passengers and crew were plundered by the people of the coast. The boy Abchurch states that all the passengers in the boat were fully dressed, whereas M. Dupont found most of them stripped. He also states that when he arrived on the Sands, he saw Miss Turton expire, and that she had evidently been plundered. The body of Captain Duggan has not yet been recovered, and there is reason to fear that he, like Miss Turton, met with some foul treatment, and that his body was afterwards buried in the sand. This surmise appears to be strengthened by the fact, that some articles which are known to have belonged to that gentleman have been recovered from different parties. A bill has been recovered for 145*l.*, endorsed by Capt. Duggan only the day before the wreck, and also a

letter to the owners, both of which came on shore quite dry, although the body of the captain himself has not been found. No doubt is entertained at Boulogne, that when the captain was thrown on the shore, these things were taken out of his pocket by some individuals, who afterwards stowed away his body in the sand. It is supposed that many were not dead when they reached the shore, and might have been recovered by proper treatment. It is admitted that very little assistance was rendered to any of them, with the exception of the boy Abchurch, who was taken to the Lighthouse and properly attended to. A strong opinion has long been expressed by nautical men with reference to the neglected condition of this dangerous coast, which the recent sacrifice of life will tend to strengthen; and it is hoped that the Governments of other countries will now interfere, and either erect new Lighthouses, or provide life-boats along the shore. On Wednesday a meeting of the merchants and shipowners of London took place at the Universal Hall of Commerce, in Threadneedle-street, for the purpose of taking into consideration the most advisable plan of relief for the widows and children of the seamen lost by the wreck of the *Reliance* and *Conqueror* in the late gales. Sir John Pirie presided, and stated that a concert had been proposed as the most eligible mode of raising a fund for their relief, and that Mr. Moxhay, the proprietor of the Hall of Commerce, had, upon being applied to on the subject of lending the building to the purposes of the charity, declared that he would, without the charge of one farthing, not only dedicate the great room to the accommodation of an audience, but light it up with gas, and fit it out with seats at his own expense. On the motion of Lord Dudley Stuart, the thanks of the meeting were given to Mr. Moxhay, and a committee was appointed to make arrangements for the concert without delay.

Illness of Sir George Cockburn.—We regret to state that Sir George Cockburn, one of the Lords of the Admiralty, burst a blood-vessel in the lungs on Saturday, and was for some time in a precarious state. On Tuesday, however, the hemorrhage had nearly ceased, and the bulletins since issued at the Admiralty announce that, although still suffering from cough, he is proceeding favourably.

Income Tax in the City.—Our readers are aware of the excitement which has prevailed for some time in the ward of Tower on the subject of the income-tax, and that the dissatisfaction produced by the numerous cases of surcharge led to a public meeting and the appointment of a committee to inquire into the circumstances. The inhabitants of the district were again called together last week for the purpose of learning the result of this investigation. After a long statement by Mr. Shearman of the proceedings of the committee, in submitting a memorial to Government, a letter was read from the Chancellor of the Exchequer, regretting that any proceedings should have taken place in assessing the Tower Ward calculated to give rise to complaints on the part of the inhabitants, but stating that on reference to the act, imposing the property-tax, "he did not find that the Government possesses any power, either of themselves, or by direction to the commissioners, to quash an assessment made and allowed, as this had been, by competent authority. The only mode of relief appointed by law for persons aggrieved by an improper assessment, is an appeal to the general commissioners." After a long discussion, it was resolved—"That it is the opinion of this meeting, that the duties of Government surveyor and local assessor, under the Property and Income-tax Act, are not sufficiently defined; that an indistinct combination of duties thrown upon officers appointed by, and amenable to, two separate authorities, renders such officers virtually irresponsible for their acts; that this gives the possession of uncontrolled power, which under any circumstances is objectionable, but which becomes intolerable when exercised by those who are employed in carrying out the difficult provisions of the Property and Income-tax Act; that, therefore, according to the present construction of this act, there is no clear and immediate remedy for the neglect or misconduct of these officers, and acts of injustice and arrogance can thus be perpetrated, as in the case of this ward, for which the right of appeal affords no adequate redress."

Court of Aldermen.—A Committee of the whole Court met on Saturday for the purpose of determining whether certain documents referred to in the affidavit, but not filed in the proceeding in the Court of Queen's Bench, in the case of Alderman T. Wood, ought to be printed with the affidavits. A long discussion took place, in which some of the Aldermen expressed an opinion that as these documents were referred to in the affidavits of the parties, they were necessary to elucidate the matter, and ought to be printed. Alderman Musgrove was of opinion that the committee ought to be put in possession of all papers bearing upon the case, and it was probable that the exhibits were referred to in such a manner as to render the printing of them indispensable. He believed that justice required the printing of the exhibits, and after disclaiming all idea of prejudicing Alderman Thomas Wood, he submitted an amendment to that effect. The resolution of Sir Peter Laurie, "That the affidavits should be printed without the exhibits," was adopted, six hands having been held up for the motion, and three for the amendment. Alderman Thomas Wood then announced that in the future stages of the case, he should be attended by Mr. Laurie, the City pleader, and Mr. Wire as his counsel and solicitor.

City Improvements.—At the meeting of the Court of Common Council last week, Mr. R. L. Jones, in bringing up a report relative to the new street from Holborn Bridge to Clerkenwell, said that if the construction of the new street depended upon the corporation alone, it would have

been accomplished long ago; but without the consent of Government, by whom alone the delay was occasioned, the very desirable object of the corporation could not be effected. He believed that every difficulty would speedily be removed, and the moment the sanction of Government was obtained, it would be seen that the City authorities were not fairly chargeable with neglect or supineness.—The report of the Royal Exchange Committee alluded to the selection of Mr. Richard Westmacott to execute the sculpture for the tympanum of the portico, at an expense not exceeding 3,150*l.*, and stated that the committee felt gratification at seeing the satisfactory progress which had been made in the new building during the last year.

Metropolitan Charities.—The Quarterly Court of the Seamen's Hospital, established for the relief of sick and diseased seamen, on board Her Majesty's ship *Dreadnought*, was held last week. Rear-Admiral Young in the chair. The committee reported that, during the past quarter, 926 in-patients had been received into the hospital, of which number 704 had been discharged cured, leaving 222 still under treatment; 507 out-patients had likewise been relieved. These operations, however, left the society in debt to the amount of 441*l.* Typhus fever had prevailed to a great extent amongst the mariners frequenting the port of London. Many of the natives of the South Sea Islands had fallen victims to consumption, whilst among the Lascars and the natives from the Marquesas islands great mortality had prevailed. Since the first establishment of the institution, in 1821, 43,541 in-patients had been admitted, and advice, medicine, and medical stores dispensed to 16,834 out-patients.—On Monday the annual meeting of the London Orphan Asylum took place, when 8 girls and 17 boys were elected from a list of 135 candidates. The Rev. Dr. Read read the report, from which it appeared that 54 children had left the asylum during the year, and that at the close of the election the number in the institution would be 389, for which the size of the building was inadequate, and the committee regretted that the subscription for its enlargement, called the Wellington fund, had made so little progress, there being two-thirds still wanting. The legacies and subscriptions for the year ending the 31st December, amounted to 10,639*l.* 14*s.* 2*d.*, which, after the expenditure, left a balance in hand of 450*l.* 8*s.* 10*d.* The funded capital was about 46,000*l.*

Wood Pavement.—We alluded in our last to the opposition shown by the Court of Aldermen to the use of wood pavement in the City. On Tuesday, one of the Sergeants of Police, who had been appointed to take an account of the accidents which occurred in the Poultry, attended at Guildhall with his report. It appeared from this that the number of horses that fell on the wood pavement in the Poultry on Friday evening, the 20th, between 5 and half-past 6, was 5; on Saturday, from half-past 9 in the morning to the same hour at night, 3; on Sunday, from 2 to 8, p.m., 4; on Monday, from 8, a.m., to half-past 7, p.m., 7; total, 19 horses. Sir P. Laurie observed, that it appeared from this report, that between Friday evening and Monday evening, there being no frost in the interval, as many as 19 horses had fallen down on that short piece of wood pavement. He asked the Sergeant if some accident had not happened to one of the mails on that spot? The Sergeant said it was the Norwich mail; it was delayed half-an-hour by the circumstance, and all the horses were thrown down. When it was raining fast, or when the pavement was quite dry, the horses kept their footing; but at other times so great was the danger, that the butchers frequently drove down Bucklersbury to avoid the wood pavement in the Poultry. Sir P. Laurie said, the dismounting of the regiment of Life Guards in Argyle-street to cross Oxford-street, and remounting as soon as they had crossed, was proof of the danger to the most experienced horsemen. The Animals' Friend Society, and the kindred associations, would do more good by collecting facts on the mischief of adopting the wood pavement than by hunting after the cases they usually brought before the magistrates. A gentleman referred to the danger of crossing from Cheapside to St. Paul's Churchyard; since the east end of the yard had been paved with wood, light vehicles now came without noise and in the dark upon the persons crossing. Sir P. Laurie said the wood pavement could not be used at all upon declivities such as Holborn-bridge and Blackfriars bridge. He had no greater pecuniary interest in promoting the use of granite pavement than of wooden pavement; he had no interest in either; and if any accident were to happen to a horse belonging to him from travelling over the wood pavement, he would bring an action against the parish authorities who caused it to be laid down; for he would maintain that nobody had a right to make the public highway impassable. Even a shopkeeper, he thought, might sustain an action for the damage he sustained by rendering his premises unapproachable with safety by customers who rode on horseback, or who kept valuable carriage-horses. He directed the officers to continue to register the accidents.

The Scottish Monument.—On Saturday the Marylebone vestry assembled to take into consideration the communication from the Commissioners of Woods and Forests in reference to the erection of the column in the Regent-circus, alleging that the ground was the freehold property of her Majesty, and announcing that, if the vestry attempted to carry the resolution into effect, an injunction would be issued in the Court of Chancery. Mr. Gomm remarked that the vestry had placed themselves in a most pitiable situation. When the question was first introduced, they were told that they had not power to proceed with the column, when they observed they did not care for legal advice, nor the Attorney-General's opinion. Now they were dumb-founded. The present result was the triumph of common sense, which was not a quality, he was very sorry to say, very common in

that vestry. Mr. Gibson stated that he was glad the Government had interfered, as the vestry would now make choice of a spot which was a Roman road 30 or 40 years before the Christian era. He alluded to Tyburn, where the column would be much more conspicuous. It was then resolved, "That the vestry having taken into consideration the communication from Messrs. Pemberton and Co., have resolved that, in consequence of the objections raised on the part of the Queen as the alleged freeholder of the soil beneath the pavement of the Regent-circus, it is expedient that the sanction afforded by the vestry to the erection of the column in the Regent-circus by Mr. Hume, M.P., be withdrawn, and that the same hereby is withdrawn; but the vestry at the same time protest against there being any legal right vested in the Commissioners of Woods and Forests in any way tending to abridge the entire and exclusive control of the vestry over the carriage-way and footway in the Regent-circus."

Public Meetings.—The Half-yearly General Meeting of the proprietors of the St. Katherine's Docks was held last week, for the purpose of declaring a dividend. The chair was taken by Mr. Thomas Tooke, who stated that the credit-balance on the 1st January, 1842, was 120,526*l.* 2*s.* 10*d.*, and that the like balance brought forward on the 1st inst. was 121,184*l.* 19*s.* 9*d.*, and after making suitable provision in advance for interest upon debentures payable in April next, and also for the payment of the dividend about to be declared, the net balance or *rest* would amount to the sum of 76,135*l.* 8*s.* 8*d.*, being an increase as compared with the *rest* at the corresponding period in 1842—a result, considering the general depression of trade during the past year, of a satisfactory character. The number of ships that had entered the Port of London in 1841, was 6,619, and that in 1842, was 6,381, being a decrease of 238. The amount of tonnage in 1841, was 1,313,210, and in 1842, 1,288,490, being a decrease of 24,720. The Chairman after having briefly commented upon these returns said, that it was the opinion of the Court of Directors that a dividend of 2½ per cent. for the half-year ending the 31st ult. should be declared, the Company defraying the charge of the income-tax. This proposition was agreed to, and the dividend declared at the rate specified by the directors.—On Monday a special general meeting of the proprietors of the Union Bank of Australia was held, for the purpose of declaring a dividend for the half-year. The report stated that the accounts received from the colonies down to September last, were very satisfactory as respected the various branches. The result of the half-year enabled the directors to declare a dividend at the rate of 5 per cent. for the half-year. The net assets up to December, 1842, were as follows:—Paid-up capital in London, 616,640*l.*; in the Colonies, 163,875*l.*; net profit for the half-year, 47,967*l.*; making together 828,482*l.* The amount of undivided profit was 64,109*l.*, to which, after deducting expenses of working, bad debts, &c., was to be added 47,967*l.*, less 4,796*l.*, being one-tenth of the reserve-fund, making together, 43,170*l.* To this was to be added, amount of undivided profit, 107,280*l.*, which after deducting last dividend, left a balance of 70,280*l.* The reserve-fund now amounted to 24,475*l.* The chairman stated that there was no probability, at present, of the remaining capital being called up. The amount of the reserve-fund was invested in the Three-and-a-Half per Cents., and the subject of the charter was at present in abeyance, in consequence of some references now making by Lord Stanley in the Colonies.—A very numerous meeting in favour of the National Temperance Society took place on Monday, in Exeter Hall. The chair was taken by Mr. B. Rotch, when the objects of the Society, and the advantages of the habits of temperance were advocated by Mr. Bowley, of Gloucester, Mr. Buckingham, the Rev. G. McDonald, of Leeds, the Rev. Mr. Stovel, and other gentlemen. Mr. Hunt, a farmer, expressed his belief that teetotalism would be an efficient remedy for the existing distress among the agricultural and other labourers, as well as a means of moralizing the lower orders. A collection was made, with an appeal for contributions of a larger character, in reduction of a debt of 700*l.* due by the society, between 500*l.* and 600*l.* of which sum was already raised.—The half-yearly meeting of the United Mexican Mining Company, was held on Wednesday, Sir John Easthope in the chair. From the report it appeared that the mine of Rayas was working prosperously, the ore sold having produced 157,618 dollars; the outlay was 77,653, leaving a balance of 79,965, of which the company's share was 44,980 dollars. The assets were 11,168*l.* 18*s.* 3*d.* The available surplus was about 7,547*l.* 8*s.* 3*d.*, which, in addition to 6,500*l.* expected from abroad, would make a total of 15,047*l.* 8*s.* 3*d.*, with which the directors proposed to pay off 11,906*l.* 5*s.* on the red scrip, which was about 25 per cent. The report was considered satisfactory, and seemed to inspire the shareholders with the hope of a general dividend being declared before a very long time shall have elapsed.

East India Trade.—Mr. Stikeman, of the East India and China Association, has just published his comparative statement of the number of British ships, with their tonnage, which have traded with places within the limits of the East India Company's charter in the years 1841 and 1842. Of the number of vessels entered inwards, the returns show a decrease in 1842 of 37 ships, 25,533 tonnage, and 2,126 men—the difference between 788 ships, 318,980 tonnage, and 16,304 men, and 751 ships, 293,427 tonnage, and 14,178 men. Of the number of vessels cleared outwards, the returns show a decrease of 186 ships, 61,738 tonnage, 3,113 men—the difference between 1,006 ships, 408,607 tonnage, and 21,392 men, and 820 ships, 346,869 tonnage, and 18,279 men. One of the most unexpected results is, that a decrease of no less than 146

ships has occurred in the clearances for the Australian colonies and New Zealand. The clearances for Bombay and Calcutta also exhibit a considerable decrease.

The Corn-Law Movement.—On Monday, at the meeting of the Directors and Guardians of the Poor of Marylebone, a memorial was presented, signed by several ratepayers, calling upon the board to lend their co-operation in the movement now taking place throughout the borough in favour of a repeal of the Corn-laws. Mr. Soden moved, that every assistance be given by that board in aid of the movement now going on, not merely throughout that borough, but throughout the country. Bread partook greatly of a parochial character, inasmuch as it concerned in particular the poor as well as all the ratepayers. Other speakers contended that the question was political, and not parochial. The motion, however, was carried, with only five dissentients.

Greenwich.—On Friday a disturbance broke out in the Upper School of the Royal Asylum. It appears that Lieutenant Rouse, one of the directors of gymnastics, had restricted the intercourse between the boys and their friends, which so irritated the pupils that they commenced a general row, smashing the windows with slates, rules, brickbats, and other missiles, and breaking upwards of 1,000 panes of glass. Five of the ringleaders of the disturbance have been placed in confinement. An investigation is going on by order of Sir Robert Stopford before the principal officers of the institution. There are nearly 800 boys, the sons of commission and warrant officers, in the upper school, and many of them are 15 or 16 years of age, who, on a former occasion, expelled the police by a volley of stones.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Jan. 14:—West districts, 131; North districts, 191; Central districts, 186; East districts, 203; South districts, 239. Total, 953, (502 males, 451 females.) Weekly average for the five last years, 903, (461 males, 442 females,) and for the five last winters, 1,004.

Provincial News.

Ashton.—A demonstration in favour of free trade principles was made here on Monday, at which Mr. Hindley, the member for the borough, gave in his adhesion to the agitation of the Anti-Corn-law League for total and immediate repeal. Mr. Hindley took the chair, and the meeting was addressed by Mr. Cobden, Mr. Brotherton, Colonel Thompson, Mr. T. Gisborne (late M.P. for North Derbyshire), Mr. McCallagh, and other gentlemen. Mr. Hindley, after speaking at some length in favour of the doctrine of free trade, alluded to the comparative merits of a fixed duty and a total repeal. To what, he said, were he and others driven who had been desirous rather to take a practical course when those in power were willing to give a fixed duty? Their alternative was no longer between a fixed duty and a total repeal; for Sir R. Peel had declared that those who advocated a fixed duty had the worst of the argument, and that those who voted for the total and immediate repeal had far better ground. Was he then to be turned about from one thing to another—to be sent over from Whigs to Tories, from a repeal to a fixed duty—roasted on one side, and boiled on the other? Not at all. Moreover, the landowners said they could not do with a fixed duty at all, but they could understand a perfectly free trade. If the farmers and landlords would have nothing to do with a fixed duty, why should he take the trouble to advocate it, when his own constituents would not go along with him in doing so? That was his justification for giving up a fixed duty, which he had likened to descending down the stairs, instead of jumping from the top to the bottom at the risk of breaking their necks. But when he saw the commercial community in such a state, when he saw the house burning, was it a time to consider about going down stairs? The question was now practically not between a sliding scale and a fixed duty, but between a sliding scale and a total and immediate repeal. He would say, in justice to himself, and to those who had fought and acted with him, that they were not responsible for that alternative. He would take upon himself no such responsibility, now that the very farmers had begun to say that the question must be settled, as the question of rents and engagements generally was involved in it, and that they would rather know at once what they had to do and suffer, than be left in an uncertain and unsettled state, which disabled them from making engagements with their landlords. In conclusion, he assured the meeting that he should go along with them heart and hand in the establishment of free trade and the abolition of monopoly.

Barnstaple.—A letter has been received at Lloyd's from a resident at Braunton, near this town, giving an account of the conduct of the wreckers on the north coast of Devon during the late storms. The following is an extract:—"On the night of Saturday last, two very large merchant ships belonging to Liverpool, and bound for the coast of Africa, were wrecked near our dangerous bar—the lives were happily saved, but the scenes of audacious plunder which immediately ensued, and which have continued up to the present time, are of the most revolting description. On Sunday all our opposing sects were merged into wreckites, and never was a more busy day of rest for man and beast. The shore was thronged with wretches hardened as the rocks that surrounded them, wholly intent on plunder. Farmers from this and the adjoining parishes continued through the day to cart off whatever they could put their hands on, and the night came without causing a cessation of their labours; and that which is most remarkable is, that not a single magistrate made his appearance to check the work of devastation. The collectors of the neighbouring

ports betrayed the same want of energy and promptitude. I believe the highest official authority was the comptroller from Barnstaple, but it must be borne in mind that I am speaking of the wreck on the Braunton side. There was nothing approaching to a properly-organised police, and those set to watch, if not participating in the plunder, were singularly indifferent in its prevention." The writer concludes by expressing his belief, that "some of the more wealthy offenders have been more prominent, and certainly more wholesale in their proceedings, than the numerous poor wretches who might plead their fourteenpence a-day, the amount of husbandman's wages in this parish, as some incentive in following the example."

Birmingham.—A meeting of the Chamber of Commerce of this town took place last week, to receive the report of a committee relative to a correspondence which has been for some time carried on between the committee and Sir R. Peel. It appears that on the 29th July last the committee addressed a letter to Sir R. Peel, applying for a personal conference. Sir Robert, in his answer, proposed that instead of a conference, the facts intended to be stated to him should be communicated in writing. The committee then forwarded a memorial, setting forth the state of extreme distress of the town of Birmingham and the surrounding districts, the embarrassments of the manufacturers, and the wretchedness of the unemployed operatives, but repudiating in the strongest terms the idea that the distress alluded to was at all to be traced to over-production. The memorial concluded by urging Government to adopt some step with a view of putting matters in the manufacturing districts upon a better footing. To this document an answer was returned, stating that Sir Robert had laid the memorial before her Majesty's Government; that Government lamented the existence of the distress it detailed, but that they trusted that the measures introduced during the session would have the effect of promoting the interests and bettering the condition of the manufacturing districts. Certain resolutions were then forwarded through the Mayor of Birmingham to the Home Secretary, expressive of fears that, as the causes which had produced the late disturbances were still in active operation, the peace of the manufacturing districts could not be safely relied on, and intimating a desire on the part of the applicants that the matter should be taken under the serious and immediate consideration of the Government. A reply was received from Sir James Graham, stating that Government could not hold out any expectation that it was within their power permanently to alter the condition of the working classes.—On the 4th November another memorial was forwarded from the Birmingham Chamber of Commerce to Sir R. Peel. It stated that trade was still declining, and distress consequently upon the increase; that in the opinion of the memorialists one of the main causes of this unfortunate state of things was the present state of the currency, the attempt of the Legislature to "subject the circulating system of the country to the ancient standard of value;" and that the restrictions placed by foreign nations upon our manufactured goods were partly occasioned by this defective policy with respect to the currency. The memorial proceeded to make certain recommendations founded upon these views, and concluded by calling on Sir R. Peel to take the subject of the currency into his immediate and serious consideration. The reply, dated Nov. 7, intimates that the Premier quite differs in his views of the currency from those adopted by the committee, and dissents from the conclusions at which they had arrived. Another memorial was then despatched by the committee, dated the 26th November. It proceeded still further to argue the question in dispute, denying that in the previous paper the memorialists had recommended any specific course to be adopted; but, in general, reiterating their conviction of the soundness of the principles they had laid down, and the correctness of the facts they had stated. They observe that, in their mature opinion, "a considerable permanent expansion of the circulation, not subject to be contracted by circumstances over which the public have no control, is essentially necessary for safety and effectually sustaining a permanent demand for labour." On the 3d Dec. Sir R. Peel replied, maintaining the correctness of the views he had already expressed on the question, and disapproving of the suggestion that the Government should be empowered to issue paper money, which should be issued as a legal tender. To this letter the committee replied at considerable length in a memorial, still further arguing the questions at issue, and requesting permission to publish the correspondence. Sir R. Peel at once assents to the publication, and tells the committee that he does full justice to the motives by which they have been actuated in representing to Government their opinions on the subject of the currency, and thanks them for the courteous and temperate manner in which those opinions have been conveyed. "Each bill or note," he says, "if it is to answer the purpose of an instrument of exchange, and to be made a legal tender, must profess to be of a certain value, to be equivalent, that is, to a certain nominal amount of money, five pounds, ten pounds, 100 pounds, according to the amount of the note. In what sense will the word 'pound' be used? It will not mean a definite quantity of silver or gold, or of any substance intrinsically valuable, for the paper is not to be convertible, either at present or at any future period. What, then, will the word 'pound' imply? This question is at the root of the whole controversy. It will be no answer to it to observe that the paper is based on the national solvency, or that the amount of it is limited to the amount of the quarterly dividends." The Committee reply, in explanation, "That their proposition is to limit the issues of national paper to Government, and to

limit the amount issued in the manner described in their memorial, and that all other issuers of paper should be liable to take up the paper money they issue in the national paper, in the same manner as their issues are now redeemable in Bank of England paper. The national paper thus limited could not exceed the amount of the claims which Government have upon the nation; and the Government, being bound to take back this paper in discharge of taxes, would insure to the holders of the paper the same quantum of value which it cost the holder to obtain."

Boscastle.—We are happy to find that the crew of the Jessie Logan, whose wreck was reported in our last, are safe, and have arrived at Cork in the Lynx, from Messina. The Jessie Logan left Calcutta on September 4th, and on the 13th inst. was struck by a heavy sea, which carried away bulwarks and poop, stove in her stern, swept the decks, broke the pumps, sprung foremasts, and carried away all her sails. The cook was drowned in the fore-castle, the carpenter and two men were much injured. On the 15th, the Lynx bore down for them, and took them all on board. At the time she was abandoned she had 13 feet of water in her hold. Soon after the Jessie Logan drove on the rocks and became a wreck, another vessel, called the Elizabeth Aletta, was driven by the hurricane upon the sands at Cruckington Haven, six miles N.E. of Boscastle Harbour, where, in the course of an hour, she was totally lost, and all on board perished. A party of the Coast Guard saw the vessel come ashore, and the crew take to the rigging, where they remained but a short period, for on the vessel striking the sands, her masts were started and fell overboard, carrying with them the crew, none of whom were seen alive afterwards. They were supposed to consist of 11 seamen, with the master.

Bristol.—Among the other disasters in the Bristol Channel during the late storm, the papers announce the loss of the ship Lily, of 600 tons, belonging to Liverpool. She was on her passage to the coast of Africa, and was driven on the Taunton Sands with two other vessels in the hurricane of Friday week. The crew lashed themselves to the rigging, and were saved by a vessel called the Appledore, which bore down to their assistance. The ship went to pieces during the following morning, and severe conflicts arose between the Coast Guard and the wreckers, who plundered the cargo to a great extent.

Buckingham.—The sixth annual meeting of the Conservative Association of Buckingham and the neighbouring districts took place on Tuesday. The anniversary was celebrated by a public dinner in the Town-hall, which was appropriately arranged and decorated for the purpose. The Duke of Buckingham presided, supported by a large number of the gentlemen of the county. After the routine toasts, Dr. Marsham, Warden of Merton College, spoke at great length on the Anti-Corn-law League. He said, if well governed (as he had no doubt England would be, under Sir R. Peel), this country had power to defy the whole world. It had the largest population, looking to Asia, Africa, America, and Europe, that had ever been under the sway of any empire; and, if the country were properly governed, it had the power to defy all the world, and live in peace and happiness. They say that the utmost that the kingdom produces is 16,000,000 quarters of corn annually; and that as the population amounts to 26,000,000, and as it is necessary that every man should have one quarter of corn annually to live on, they infer that 10,000,000 people are starving. But this is not the case: they forget that 5,000,000 live on oatmeal, and more than 5,000,000 rejoice in potatoes. Put these together, and it will be found *communibus annis*, that the kingdom does in fact support its population, and without much distress. He knew it was said that it was a good maxim "to buy in the cheapest and sell in the dearest market." This was a maxim which he confessed he did not like. He knew he should be told that nothing was more foolish than to prefer one's own countrymen to others. It might be said, why should a man like anybody but his own dear self? But one cannot help doing so, and he declared that he would rather lay out 1s. with Mr. Cobden, bitter enemy as he was to the agriculturists, than with any Frenchman or other foreigner, because he knew that if 11½d. out of that shilling went into Mr. Cobden's pocket, helping to make him a millionaire, the other halfpenny went into the pocket of some other person, and that other person was his (Dr. Marsham's) countryman. Sir Thomas Fremantle returned thanks for the toast in honour of Her Majesty's Ministers. He said that from the private and personal communications which he necessarily had with Ministers, officially and otherwise, from time to time, he felt assured that in all their measures they look only to the promotion of the interests of the country in the most extended and beneficial sense. They are aware that many of their measures must be in the first instance misunderstood—that the first effect of those measures must be to produce some individual suffering; but if time be given them to mature their measures, and to give to them their full scope and effect, they do hope and trust that those measures will ultimately be found conducive to the real benefit and prosperity of the country—to the prosperity of the agricultural, not less than of the commercial interest. Mr. E. Dayrell then proposed the health of the Conservative members of both Houses of Parliament. He said it was useless to attempt to disguise that there did prevail amongst them a difference of opinion with respect to some recent measures of the Government; and, however much he might desire not to touch upon such topics, or to run the risk of interrupting the harmony of the meeting, still he thought that when the meeting of Parliament was so near at hand they ought not to allow it to go forth that all had passed off with perfect

unanimity on that occasion, as far as their approval of those measures of the Government was in question. No man had more respect than he had for the talents of Ministers—no man felt more than he did the difficulties of their position; but at the same time, he contended, they were bound to let them know what their real sentiments were; and if they felt that mischief had been brought about by their measures, they were bound feelingly to speak their opinions, and not allow that unanimity to be inferred which they knew did not exist. He remembered that, on a former occasion in that hall, the advent of the present Ministers to power was looked upon as the panacea for every evil, and the harbinger of every good. How had those expectations been realized? If they thought they had been disappointed, should they not be candid and straightforward enough to say so? If they did not speak out they would not deserve the remedy which, by perseverance, they would otherwise attain. All he would hope was, that they would in future look most narrowly into the course pursued by Ministers, and endeavour so to shape it as to secure the advantage of the agricultural interest. The Earl of Orkney returned thanks. He had been one of the unfortunate minority of 17 which had opposed the Ministerial measures just alluded to, and he could prove, if necessary, that these measures, now that they had passed, had fully borne out the expectations which those 17 entertained of it. He had just come from Scotland, and it was of no use mincing the matter as to the effect of these measures on the agricultural interest there. One-third of the agricultural property of Scotland was gone to the winds. The effect of free trade would be to throw all the "poor" land out of cultivation. Speaking of Scotland, he could say that land which was now growing a very decent quantity of corn, would, if those principles were carried out, only grow a decent quantity of grouse. If we drew our supplies from abroad, and threw our own land out of cultivation, this country would, before three years were over, become a province of France or Russia. After some general arguments against free trade opinions, the noble Lord went on to say, that next session he should give his votes independently and honestly, and he would say he had that confidence in Ministers to believe that, if they were to see that they had gone too far, they would have the courage to retract. Mr. C. S. Murray and the Hon. Capt. Fitzmaurice returned thanks for the toast of "The Members of the County," proposed by Col. Hall. Sir T. Fremantle acknowledged a similar compliment paid to the Members for the borough. He particularly adverted to Lord Orkney's statement that one-third of the property in Scotland was already confiscated, and that if we went on as we were now going on, we should be a province of France. He certainly thought his noble friend had shown in his speech, that, to quote the words of the song, he was "royally fresh." He denied the statement that the depreciation of prices in the agricultural districts was attributable to the measures adopted in the last Parliament. Such political economy, in his opinion, savoured of after-dinner eloquence. If the manufacturing interest had been languishing for the last 12 months, and if the artisans had been turned out from their work for a considerable time, was it extraordinary that, when the extent of consumption had been thereby diminished, the agriculturist was not able to get so good prices as heretofore? In considering this subject, the state of the revenue might be referred to. He lamented that the Customs and the Excise had fallen off; but was not that circumstance an indication of a want of power on the part of the people to purchase or consume? Was it to be wondered at that the people were unable to purchase corn when they were unable to purchase sugar and other articles? Sir J. Chetwode proposed the health of the chairman, the Duke of Buckingham. In returning thanks his Grace said, "The topics of this evening have been so varied and so ably entered into on all sides, that for me again to enter on them would only be going over beaten ground. As I have had already the honour to say often, and more recently at a dinner of a Conservative association in this county, I still hold the opinion which I have always maintained, and which, by the blessing of God, I will continue to maintain to the grave. I shall content myself now with expressing my fervent and zealous determination to maintain those feelings and opinions which I have always expressed, and with assuring you that you will always find in me a faithful advocate—one prepared to maintain, to the utmost of his power, the agricultural interest of the United Kingdom. I have little doubt that the members for this county will do their duty. I trust that they will steadily maintain their position, and resist any further attempt—if such an attempt should be made—to interfere with the rights and privileges of the agricultural interest. The time is now come for the Government of the Queen to take their ground. I think they have done wrong in the course they have taken with regard to agriculture, and I think also we are entitled to call on them to stand steady where they are, to maintain the ground on which they are now placed, and not to give way one jot further. As your neighbour, and as a private country gentleman, I can now do no more than act heartily with you hereafter on every occasion. You will find me most zealous for your interests, and also in my endeavours to promote the employment of the labouring population whenever it is in my power, and so long as I exist, whatever may be said of me for holding the honest opinions which I avow I hold, you will never find me flinch from doing my duty to myself, to my Queen, and to my country." Several toasts were then given, including "The Mayor, Aldermen, and Town Council of Buckingham," "The British Farmer, and success to Agriculture," and other appropriate toasts.

Caermarthen.—We have already noticed the lawless

proceedings in the neighbourhood of St. Clear's, and the march of a party of marines from Milford in search of the rioters, called "Rebecca and her daughters." We now learn that the troops have arrived at the spot, and that the reward for the apprehension of the offenders has been increased from 50% to 100%. Notwithstanding these precautions, on Monday night the rioters sent a message to the marines, that they were about to pay a visit to the gates, and that they should be glad to meet them. Between 3 and 4 in the morning a detachment of marines, accompanied by four officers, set out for the gates, to ascertain if the men intended carrying their threat into execution. When they arrived at Trevaughan-gate, it was found to have been levelled to the ground, and part of the toll-house destroyed. Not one of the rioters, however, was to be seen, as they had dispersed in different directions after they had levelled the gates. On each of these excursions the mob, consisting of a large number of men and boys, all of them well mounted, most of them dressed in women's clothes, and armed with guns, pistols, pitch-forks, hay-knives, reaping-hooks, crowbars, or some other weapon, are invariably headed by Rebecca, who is described as being a strong tall man, well disguised, and having unlimited authority over the rest of the party. The farmers in the neighbourhood have refused to be sworn in as special constables, and many of them have paid the fine of 5% for such refusal. The peasantry of that part of the county appear to be in a state of great excitement, and it is feared that the affair will not be terminated without the effusion of blood.

Carlisle.—About a fortnight since, a fire broke out at Netherby Hall, the seat of Sir James Graham, which, but for the successful exertions of those on the spot, might have been attended with disastrous results. About six o'clock three female servants, the only occupants of the house, were alarmed by the appearance of dense smoke in the room they occupied, and on proceeding to ascertain whence it issued, discovered that the carved wood-work of the hall was in flames. They immediately communicated the fact to the gardener, who was not far distant from the house, and he at once proceeded to the scene of the fire, taking with him a small engine used in watering the garden. With this apparently insignificant apparatus, and aided only by his three assistants, he succeeded, after considerable exertion, in putting out the fire before it had made much progress.

Liverpool.—For some time past, the magistrates have been occupied with prosecutions for Sabbath-breaking, which have excited a good deal of attention in the town. The first case investigated was that of a person called Shepherd, a news-vender in the Vauxhall-road, who had been summoned on a charge of having his shop open for the sale of the London journals and other publications on the preceding Sunday. This was the third occasion, during as many weeks, on which he had been summoned on a similar charge. On the two former occasions he had been fined in the penalty of 5s. for each offence, but on both he informed the court that it was impossible for him to meet the demands of his customers unless his shop were open on the Sunday; that he was determined to keep it open, even though he should thereby subject himself to a 5s. penalty for every infraction of the act during the next twelve months. Mr. Rushton, while he admitted the justness of this line of reasoning, declared, at the same time, that he had only to deal with such cases as might happen to be brought before him, and that as infractions of the Act had taken place, he must again fine him. Mr. Shepherd, in the meantime, wishing to bring the subject more at large before the public, had summonses served upon William Spence, the mayor's coachman, for having driven his worship to and from church on Sunday; and also upon Mr. Jones, the master of the Exchange; Mr. Hughes, the master of the Lyceum; and Mr. Griffiths, the master of the Athenæum news-rooms; for having had their premises open for public amusement and instruction upon Sunday last. The case of the mayor's coachman was first considered: the town-clerk, who appeared on his behalf, contended that neither a stage-coachman nor the coachman of a private gentleman came within the meaning of the act; and the magistrate, acquiescing in this view, decided that the case could not be sustained. The other cases broke down for want of evidence to prove that the parties were masters of the establishments. The magistrates therefore dismissed the summonses, stating that if the law were odious, it was the duty of the public to petition for its repeal, and not for any individual to mention its odiousness in the presence of the bench; he thought the law was good, inasmuch as it was designed to preserve the Sabbath in the way it should be preserved.—The receipts at the Custom-house at this port, for the year ending the 5th inst., amount to 3,904,379*l.*, being a decrease, as compared with 1841, of 200,514*l.*, and with the preceding year, of 702,947*l.*

Merthyr.—About 3,000 of the Gellygaer and Monmouthshire colliers proceeded, on the 16th inst., to Mr. Powell's colliery at Duffryn, for the purpose of compelling the men of those works to strike. The police of the district having had timely intimation of the intended movement, mustered in strong numbers; and the mob, finding themselves so received, and that the colliers of the latter works were disposed to remain at work, very soon dispersed. No intimidation or threats were used towards the men composing this colliery. On the following morning the manager was at his post to receive the workmen. Several came in their best clothes, and refused to continue their work, assigning no reason. Another meeting was held on the 18th inst. by the colliers between Pontarberbargoed and Blackwood.

Manchester.—The usual weekly meeting of the Anti-Corn-law League was held at the Corn Exchange, on the

19th, and was numerously attended. The chair was occupied by Mr. George Wilson, the president of the council. Mr. Thornely, M.P., gave an account of his recent visit to the United States. He said he had made an abstract of the reduction which had taken place on several articles of American exports, and, when he visited Washington, he presented one of the written statements he had so drawn out to the President, assuring him that in many respects those reductions would increase the trade and commerce between the two countries. The President, who was an agreeable, light-hearted man, immediately replied, that he saw not how the Americans could ship corn to England under the existing corn-laws, and added—"I wonder you do not take our Indian corn, but I have heard your horses would not eat our American Indian corn." He (Mr. Thornely) assured him that he was in error upon this point, inasmuch as the English horses evinced more wisdom than their masters, because they ate all the Indian corn laid before them. It was well known that in the last session of Congress the Americans had been imposing duties on imported goods; but this fact made him the more anxious to bring about a repeal of the Corn-laws, in order to affect the commercial legislation of the United States, because the Congress at present sitting would come to an end upon the 4th of March, and because it was confidently believed that the future Congress would be considerably more favourable to free trade.—Mr. Ricardo, M.P., then addressed the meeting. He said, that he would not oppose the corn monopoly a whit more strenuously than he would oppose any other that might happen to exist. He would oppose any attempt to create a monopoly for the cotton manufacturer or the potter by restrictive laws. He believed that no restrictive laws were required, and that any enterprise which depended on protection for support was resting on a rotten foundation. He believed that the first effect of the repeal of the Corn-laws would be to throw bad lands out of cultivation, and that "protection" meant high rents. He wished that this objectionable word had been blotted out from the tariff altogether; and he asked how it came that we had abandoned the system by which we had become wealthy? He contended that all nations were free-traders in the outset; that subsequently they abandoned the principle; and that it then took years of struggle and sacrifice to regain their position. He believed that Sir R. Peel would help the League if he dared. He could not believe that a statesman of Sir Robert's experience and unquestionable ability could be blind to the fact that some further development was necessary to be given to our resources and industry. The meeting was subsequently addressed by Mr. Moore, Mr. Rawson, Mr. Brookes, and Mr. Brotherton, M.P.

Newcastle.—On Friday last the inhabitants of Newcastle entertained Mr. Cobden, Colonel Thompson, and Mr. John Bright, the deputation from the League, with Mr. J. Wilson, at a public *soirée*. The hall was crowded, and the gallery was occupied by a large number of inhabitants. The committee had issued 500 tea-tickets, which were bought up with unusual rapidity, and were all disposed of by Thursday; on Friday they were at a premium. At the doors there were hundreds of applicants, eager to obtain admission by money payments. The total number present amounted to upwards of 1,000, of whom about 200 were ladies. Sir John Fife presided. After the usual preliminary business, it was resolved—"That this meeting, convinced of the injustice and impolicy of all restrictions on the importation of food for the people, and of all taxes which, under the guise of protection to one class of the community, inflict a robbery upon every other, applaud the zealous efforts of the National Anti Corn Law League for the total and immediate repeal of the Corn Laws, and warmly welcome to Newcastle the distinguished members of its council now present, namely, R. Cobden, Esq., M.P. for Stockport, Col. Thompson, of London, John Bright, Esq., of Rochdale, and James Wilson, Esq., of London." The meeting was then addressed by these gentlemen at considerable length, on the different questions connected with free-trade, and with the proceedings and prospects of the League.

Portsmouth.—A Court-Martial was held on Tuesday on board her Majesty's ship *Camperdown*, for the trial of Lieut. H. Winthrop, the Commander, and the officers and crew of H.M.'s steamer *Spitfire*, for losing that vessel on the Half-Moon Keys Rock, off Belize, on the night of the 10th September. Captain W. H. Sheriff, superintendent of Chatham Dockyard, presided. After examining several witnesses and hearing the statement of the Commander, the President informed Lieut. Winthrop that the members of the Court, having duly considered the evidence brought before them, had come to the unanimous decision that he had done all that could be expected under the circumstances, and that it was by no fault of his that the vessel had been lost, and that they did, therefore, fully acquit him, his officers, and crew, of all blame. He had great pleasure in returning him his sword, and was much gratified at the testimony which had been given of his firmness after the disaster, and his successful exertions in saving the lives of those placed under his charge.

Preston.—As an instance of the progress of machinery, it is stated that the principal manufacturing concern in this town will, after the whole of the contemplated improvements are completed, have, besides other machinery, 1,440 power-looms, each of which will be able to produce weekly six pieces of 25 yards, making a weekly aggregate of 122 miles and 280 yards of cloth. Another account of the same kind states that Mr. Atkinson, the rope-manufacturer of this town, has received an order from the Admiralty to manufacture 75,000 fathoms, or 85 miles 400 yards, of line for Sir E. Belcher, of the *Samarang*, going on an exploring expedition.

Sheffield.—The Yorkshire papers continue to give long accounts of the stoppage of the Sheffield Old Bank,

known as the firm of Messrs. Parker, Shore, and Co. There seems to be no doubt that their stoppage was caused by the decay of the trade of the town. When the era of bad trade commenced, many of their customers were in debt, and they took securities which, a few years ago, would have been considered ample, but which now, for want of trade, have sunk so low that they will not fetch half their original value. The favourable circumstance in the event of the week is, that the other banks of the town have escaped a run. They are stated to have been well prepared to have stood the panic. The liabilities of Messrs. Parker and Co. are stated at about 600,000*l.*, and the apparent assets at 725,000*l.*, but the latter sum does not include bad debts. At a public meeting of the merchants, manufacturers, and other inhabitants, on the 16th inst., the Master Cutler in the chair, a resolution was unanimously adopted, expressing an entire and unabated confidence in all the banks at present existing in Sheffield.

St. Asaph.—A meeting of the freeholders of the county of Denbigh, convened and presided over by the High Sheriff, was held at Ruthin, on Saturday last, to petition Parliament for the repeal of the Act passed in the late reign, which proposes to unite in one Bishopric the present Sees of St. Asaph and Bangor. Resolutions were moved and seconded by Viscount Dungannon, Hon. W. Bagot, Sir Watkin Williams Wynn, Mr. Mainwaring, M.P., and other gentlemen, and a petition to both Houses of Parliament against the proposed union of the two dioceses and the alienation of their revenues to Manchester was adopted. The local papers state that the Lord Lieutenant and all the resident gentry are unanimous in their opposition to the measure, and that nearly every parish in the county has petitioned Parliament against it. A meeting to the same effect has also been held at Cambridge, and a petition adopted against the union of the two Sees.

Wigan.—The Manchester papers mention with satisfaction, that the Rev. W. Corbett, the Catholic minister of Hindley, near this town, has opened an institution for the diffusion of knowledge, taking upon himself the expense of the building, the payment of the teachers and attendants, and furnishing it with books and papers. All the incidental expenses of its management will also be defrayed from his private purse.

Railroads.—The returns for the week on the principal lines are as follow:—Greenwich, 689*l.*; Northern and Eastern, 1,053*l.*; Eastern Counties, 819*l.*; London and Birmingham, 13,186*l.*; Croydon, 194*l.*; Brighton, 2,487*l.*; Liverpool and Manchester, 3,470*l.*; Grand Junction, 5,912*l.*; York and North Midland, 1,232*l.*; Blackwall, 467*l.*; Great North of England, 1,121*l.*; Sheffield and Manchester, 271*l.*; Manchester and Birmingham, 2,148*l.*; Manchester and Leeds, 3,379*l.*; Midland Counties, 2,248*l.*; Hull and Selby, 669*l.*; Birmingham and Gloucester, 1,484*l.*; Edinburgh and Glasgow, 1,421*l.*; Birmingham and Derby, 1,102*l.*; North Midland, 3,143*l.*; South Western, 4,016*l.*; Great Western, 9,964*l.*; South Eastern and Dover, 1,306*l.* A special general meeting of the Birmingham and Gloucester Company was held last week at Birmingham, for the purpose of considering the appointment of a committee of investigation into the prospects of the undertaking. Captain Moorsom, R.N., presided, and stated that the directors were by no means averse to the appointment of a joint committee. After a long discussion it was resolved that a committee, consisting of five shareholders and four directors, be appointed for the purpose of considering any measures calculated to reduce the working expenses, and increase the traffic of the line; the committee to report to some subsequent meeting. The daily papers mention, as a new proof of the public benefit resulting from railway expedition, that, on the 16th, a letter having been received in Doctors' Commons from Portsmouth, containing instructions to arrest a vessel which had arrived in that port, in a salvage cause, a warrant issued from the Registry of the Admiralty Court, and was despatched to Portsmouth in time to arrest the vessel at half-past 2 o'clock on the same day the letter was received in London.—The great blast at Round Down Cliff, for the new works on the London and Dover Railway, consisting of 18,500*lbs.*, or eight-and-a-half tons of gunpowder, was fired by means of the voltaic battery on Thursday, in the presence of an immense concourse of spectators, including Sir John Herschell, Gen. Pasley, and a large number of eminent engineers. The battery was directed by Lieut. Hutchinson, R.E., and as soon as the wires were connected, the earth, according to the account of an eyewitness, trembled to half-a-mile distant—a stifled report was heard; the base of the cliff, extending on either hand to upwards of five hundred feet was shot as from a cannon from under the superincumbent mass of chalk seaward, and in a few seconds, not less than 1,000,000 tons of chalk were dislodged by the shock, and settled down into the sea below. Loud cheers followed the blast, and a royal salute was fired. The sight is described as truly magnificent, and the interest of the proceedings is increased by the fact that no accident occurred.—The meeting of the proprietors of the Great Western Railway adjourned to Thursday, from last week, has terminated in the adoption of the plan incorporating by purchase the Cheltenham and Great Western Union line with their own undertaking, as proposed in the first instance by the directors. The ballot gave an enormous majority over the opposition, the number of shares in favour of the proposal being upwards of 6,000, and that of its opponents being less than 600.

IRELAND.

Dublin.—Intelligence was received in Dublin on the 19th instant of the death, on the previous evening, of Viscount Ferrard, son of the celebrated John Foster, first

Lord Oriel, and the last Speaker of the Irish House of Commons. Viscount Massareene, his Lordship's eldest son, succeeds to his large estates, and thereby unites in himself the titles of Baron Oriel of the United Kingdom with those of Viscount Ferrard and Viscount Massareene in the peerage of Ireland.—The four representative Spiritual Peers for the ensuing session are, the Lord Primate, and the Bishops of Tuam, Derry, and Limerick.—The Dean of St. Patrick's is to be consecrated Bishop of Cashel, Waterford, and Emly, in St. Patrick's Cathedral, tomorrow the 29th instant. His Grace the Archbishop of Dublin will perform the solemn ceremony, assisted by the Bishops of Cork and Ossory.—The Poor-Law Commissioners have issued a circular in reference to the intended alteration of the Irish Poor-Law. They request to be provided with "an account of the total number of persons rated in the last rate made in the South-Dublin Union, and the total net annual value of the property rated in the union. Also an account of the number of persons in such rate whose valuation was respectively not greater than 1*l.*; greater than 1*l.*, and not greater than 2*l.*; greater than 2*l.*, and not greater than 3*l.*; greater than 3*l.*, and not greater than 4*l.*; greater than 4*l.*, and not greater than 5*l.*; and the amount of arrears for valuations not greater than 5*l.*, carried on from a previous rate."—Lord Eliot, in acknowledging the receipt of a resolution of the Board of Guardians of the South-Dublin Union, on the impolicy of placing the medical charities under the control of the Commissioners, has announced that it is not the intention of Ministers to bring forward, in the ensuing session, any measure relating to the medical charities of Ireland.—At the meeting of the Repeal Association, on Thursday, another address from Mr. O'Connell "to the people of Ireland" was read. The hon. gentleman, in this address, refers to the progress of the Anti-Corn-Law League, in illustration of the power of peaceful and combined agitation, and declares his belief that the League is too well organised, and its combination too extensive, not to succeed. "It is thus," he says, "that every day develops the transcendent force of legal and peaceable combination for the amelioration of political institution. It is for this purpose that I require three millions of enrolled Repealers. No reasonable man can doubt, that if I obtained these three millions of avowed, combined, and co-operating Repealers, the Repeal of the Union could not possibly be delayed." The Rent for the week was nearly 200*l.*

Belfast.—The Irish Presbyterian Church has resolved to celebrate its second centenary of Presbyterianism in Ireland this year, by a subscription fund, to enable the General Assembly to build houses of worship in the Roman Catholic districts of the south and west, to establish Irish schools, to preach the gospel to Roman Catholics, and to employ scripture readers in the Irish language.

SCOTLAND.

Edinburgh.—The Judges of the first division were occupied on Thursday and Friday in delivering their opinions in the *Stewarton* case, which involves the question as to the legality of the acts under which the ministers of Parliamentary churches, of chapels of ease, or of *quoad sacra*, extension, and secession churches, were admitted by the General Assembly to the full status and privileges of parochial ministers. Of the Judges whose opinions have already been given, the Lord Justice Clerk, Lords Meadowbank, Medwyn, Cunningham, Murray, and Wood, consider that the acts in question are illegal, and that the suspension and interdict in the present case ought to be sustained; on the other hand Lords Moncrieff, Cockburn, and Ivory, support the legality of the acts in question. The Lord President and Lord Mackenzie delivered their opinions on Thursday, and both were conclusively against the legality of the erection of *quoad sacra* parishes, and the admission of their ministers into the General Assembly. The judgment of the former occupied two hours in the reading. Lord Jeffrey and Lord Fullarton delivered their opinions on Friday in favour of the General Assembly. The Judges have now all delivered their opinions—eight being against the legality of the *quoad sacra* parishes, and five in favour of the church. The effect of this decision will materially weaken the non-intrusion party in the Assembly, but it is understood that the House of Lords will be appealed to. It is rumoured that Mr. Fox Maule intends to bring in a bill on the Kirk question in the ensuing session of Parliament.

Stirling.—On Tuesday week a demonstration in favour of the principles of free-trade took place in this town, when about 1,500 people, including a large proportion of ladies, met at a *soirée* in the Corn Exchange of the burgh. The chair was taken by Mr. W. Murray, of Polmaise and Touchadan, an extensive landed proprietor, and Provost Galbraith, of Stirling, acted as vice-chairman. Mr. Cobden was introduced to the meeting by the chairman, and addressed them in a long speech in favour of the League and the general principles of free-trade.

Lanark.—The Glasgow papers state with expressions of dissatisfaction, that the iron-masters and coal-proprietors of Lanarkshire, taking advantage of the unsettled state of the mining districts, the impoverished state of the country, and the contemplated reduction of wages that is to be, have taken the usual means of convening a meeting of the county for the purpose of raising a police force for the protection of property in the neighbourhood of Airdrie, Coatbridge, &c., where the principal works are situate.

THEATRICALS.

DRURY-LANE.—On Saturday evening Shakspeare's play of *Cymbeline* was revived in the purity of its original text at this theatre. It was a bold experiment, for the play is not a "strong" one, according to the ordinary notions of

stage effect; but it was well cast, and the result was a cordial reception from a very crowded house. Miss H. Faucit appeared as *Imogen* with great advantage, and sustained her difficult part with a delicacy of feeling which showed that she appreciated the character. Mr. Macready's *Iachimo* was a still more remarkable instance of thorough feeling for the spirit of his part. Mr. Anderson was animated and forcible as *Leonatus*. Mr. Phelps played the old lord *Belarius* with the homely truth which has now become the characteristic of his style. The play was well got up in every respect, and on the fall of the curtain Miss Faucit, Mr. Macready, and Mr. Anderson, were called for, to receive a renewal of the applause already so abundantly bestowed upon them during its progress.

COVENT-GARDEN.—A new comedy, by the author of *Marriage*, bearing the title of *Mothers and Daughters*, was produced on Monday at this theatre with success. It was placed upon the stage with great completeness, and needed no assistance which the tact of the manager could bestow, to render it successful. The plot was deficient in the vigour and vivacity which distinguished Mr. Bell's first production, and seems to have been founded on the model of the well-known stock comedies of the last century. The characters are therefore not new, and though they are sketched with talent, they show the same want of vigour which characterises the general management of the plot. The leading characters are an intriguing mother, with her head full of projects for her daughter's advancement; the daughter, an artful coquette, delighted to overreach her mother; a humble companion, suffering under the insolence of her patroness; a scampish adventurer, endeavouring to keep up appearances; a middle-aged man, who has recently inherited a title; a young lover; a fat baronet, Sir Gregory Plump, a suitor to Lady Manifold; a servant who tells fortunes in cards, and a foppish valet. The heroine of the piece was worthily represented by Miss Vandenhoff, and the remaining characters were sustained by Mrs. Orger, Mrs. W. Lacy, Mr. Vandenhoff, Mr. Bartley, Mrs. Humby, and Mr. Cooper. Mrs. Orger's personation of *Lady Manifold*, the intriguing mother, was one of the most finished pieces of acting which has been seen upon the stage for many a day; it was lady-like, subdued, and perfectly true to possibility; there was no caricature, no exaggeration, but the conception of the character was complete, and controlled by that artistical delicacy which is the true realisation of natural comedy. The play went off with great applause, and was announced by Mr. Vandenhoff for repetition; after which the author was called for, and bowed from the front of one of the boxes.

Miscellaneous.

Archives of Barcelona.—It is known that amongst the buildings set on fire during the bombardment of Barcelona was that containing the archives of Catalonia. The following account will show how great the loss of these documents must be in an historical point of view:—There were collected there charters and acts of the early Courts of Barcelona, from the year 844, and documents relating not only to the province of Catalonia and the Courts of Roussillon and Cerdagne, but to the kingdoms of Arragon, Valencia, Majorca, Sardinia, Sicily, and Naples. The building contained the proceedings of all the Ministers from the union of the kingdom of Arragon with the principality of Catalonia, as well as copies of all treaties of peace, alliances, and such matters. There were also deposited there the original papers of the States-General, in 50 volumes, from those held at Perpignan by Peter IV., in 1350, to those held by Philip V., at Barcelona, in 1702. Not less than 856 original bulls of the Pope were there, of which the dates ranged from the Pontificate of Benedict IX., in 1024, to that of Clement XI., in 1709. There were 17,640 documents, written on papyrus, parchment, or cotton paper. Those on parchment or paper were rolled up separately, but the parchments were tied up in collections. At the period when paper was first made of rags, about the thirteenth century, registers were formed to copy letters patent and other acts proceeding from the sovereign authority. These registers, begun in 1214, were concluded in 1808, and comprised 28 reigns from James I. to Charles IV. They were 6,070 in number, and each register contained between 300 and 400 leaves in folio. The learned Capmany affirms, in the preface to the fourth volume of his *Mémoires Historiques sur Barcelone*, that the archives of the Crown of Arragon were the most memorable in Europe, if their antiquity, good preservation, extent, variety, and importance, were taken into consideration.—*Galignani*.

Coincidences.—“During the year 1842 there died,” says the *Courier Français*, “the last of the Abbesses crosses of France (Madame the Countess de la Marche); the last of the Chanoinesses of Remiremont (the Countess of Arma de Monspey); the last of the Prelate Abbés of Flanders (the Abbé Delvigne); the last of the Augustinian Monks of France (the Abbé Mollard); the last of the Hermits of Switzerland (the Hermit Kauffman), found frozen in the forest of Dufikon; the last of the Councilors of the Parliament of Navarre (M. du Parage); the last of the companions of the famous Paul Jones, and the last of the companions of Cook. This is an entire society, an entire age, which has disappeared!”

Watery Volcano.—The accounts received this week by the Lisbon mail give the particulars of a remarkable phenomenon which occurred on the 8th inst., at a small hamlet not far from Peniche, a fortified town on the coast, and distant about two Portuguese leagues from the sea. A correspondent of the *Morning Post* gives the following account of it:—“At an early hour of the morning, the proprietor of a small farm, together with his wife and sons, left their home for the purpose of sowing beans in a neighbouring plot of ground, detached from the cottage

occupied by them. On their arrival at the place, they were terrified by the sound of repeated claps of subterranean thunder, which lasted for some time. On a sudden, a tremendous explosion took place, followed by a dense cloud of earth, thrown to an incredible height, which was succeeded by a column of water belched from the bowels of the land in the most awful manner, spreading as it rose in all directions. This eruption from the watery volcano lasted for half an hour, deluging the place around for miles. On examination, the mouth of the crater formed by this convulsion of nature was found to exceed six yards in diameter, and of a perfectly circular form. After the column of water, which was salt, as though fresh from the ocean, had spent its force, the gulf continued for two whole days to bubble up and overflow the land, and then the water appeared to return from whence it came. A few days afterwards the same subterranean sounds were repeated, but no eruption ensued. The above fact, which was transmitted to Lisbon officially, has, it may be well supposed, formed the terror and matter for conjecture of the whole country round.”

Law.

VICE CHANCELLOR'S COURT.—[Before Sir Lancelot Shadwell.]—*Perkins and Others v. the Deptford Pier Company, Leeson, and Prichard.*—This cause came before the court, upon a demurrer, put into the bill by the defendant Prichard for want of equity in the plaintiff's case, multifariousness, and want of parties. There were one or two other technical grounds of demurrer, but the substantial ground was, that of want of equity. In support of the demurrer, it was contended that the defendant Prichard was admitted to be first mortgagee of one part of the property, and therefore as to that the only relief the plaintiffs could have in equity was redemption, assuming that the plaintiffs were second mortgagees, and that there was an offer to redeem. The only attempt to establish any other equity by the plaintiffs was an allegation of collusion, as in the bill stated; a mere allegation of collusion was nothing, unless facts were stated showing it. The allegation of collusion in substance was this, that the defendant Prichard, being a mortgagee of the sum of 1,000*l.*, mortgage money and interest, brought an action, and that the company and Leeson being willing that he should be first paid, did not defend the action. That was no collusion, because the defendant Prichard had a right to bring his action, and there was no impropriety in the company not defending it. Prichard having obtained a judgment, the plaintiffs, who were mere creditors upon the tolls, had no right to interfere to prevent Prichard from perfecting his legal remedy against the land by getting an *elegit*. This, besides, was not a bill on behalf of creditors for a general administration of the company's estates. The counsel in support of the bill insisted on the point of equity, that inasmuch as the plaintiffs were debenture creditors under the 16th clause of the company's act, they had no legal remedy, and that the defendants by obtaining writs of *elegit* would get a legal title to the company's property, and would thereby destroy the undertaking and consequently do away altogether with the tolls, &c., upon which the act of Parliament created the plaintiff's securities; that there was collusion between Prichard and the company in bringing the action, and, therefore, the plaintiffs had a right to come to this court and require the court to restrain the defendants from getting the legal right. The plaintiffs could not bring any action at law to recover their principal and interest on those debentures, nor could they bring an action of ejectment to recover possession at law. All these points had been decided in the courts of law; every railway company had been in the habit of giving those bonds or debentures, and many millions of money had been lent upon them, and unless a court of equity could interfere, they would be of no more value than an I O U at a gaming table. The Vice-Chancellor said, that the plaintiffs having taken such security as was given by the 16th clause of the company's act, they had no claim upon the lands; their security was only on the tolls and duties, and the plaintiffs could not interfere with the defendants' right to get a better security, for Prichard had a right to sue, and this court could not restrain the legal right; even if the bringing the actions was an arrangement between the company and the defendants, he could see no collusion in that which would affect the parties in equity. He must, therefore, allow the demurrer with costs.—This decision is one of very serious and considerable importance to all persons holding debenture securities like those in question, as the decision shows, that any other creditor, by due diligence, perfecting his legal right by obtaining a judgment and execution at law, may come in, and by taking possession of the land, obtain priority of payment of his claim to the prejudice of the debenture creditor.

COURT OF EXCHEQUER.—*Heywood v. Beecher*.—This was an action to recover the sum of 30*l.* 10*s.*, alleged to be due to the plaintiff for work and labour done, under the circumstances detailed below, which afford a good insight into the “house-agency” business in London. The plaintiff is a house-agent carrying on his business in the neighbourhood of Knightsbridge, and defendant is a gentleman residing at Brighton, where he holds the office of clerk to the directors of the poor, as well as others of importance in that town. The plaintiff brought his action to recover the amount in question as the commission due to him for having been instrumental, in the character of a house-agent, in letting a house, No. 55, Cadogan-place, and selling the furniture therewith, the property of defendant. In reply, the latter said that he was not liable to the charge so made, inasmuch as he had never given instructions or authority to plaintiff to act for him. In support of his case the plaintiff called Mr. Stewart, the son of the lady to whom the premises had been let and the furniture sold, who proved that his mother had entered upon the negotiation solely upon the information they had obtained at the office of the plaintiff, where, too, it was that they had become acquainted with the fact that the premises were to be disposed of. Mrs. Stewart eventually closed the bargain with defendant, by agreeing to take the house on a lease of 14 years at the annual rent of 100 guineas, and to pay 700*l.* for the furniture. It was further stated that defendant, or some person who represented himself to be that gentleman, had called at the office on the 3d of August last year, and had left the particulars of the house which was to let, and that those particulars were thus entered in the letting book, “Mr. Beecher, to be let, furnished, at five guineas a week, per annum, or unfurnished, at 100*l.* per annum, furniture and fixtures, 800*l.*, 55, Cadogan-place, &c.” These particulars, as thus set forth, were given to Mrs. Stewart, and thereby paved the way for the arrangement which was ultimately made between defendant and that lady. The lease was granted in September, but the plaintiff did not make any application for payment, nor indeed did he send in any bill until the month of November. The plaintiff's poster also stated, that defendant had called at the office one day when he was the only person in the way, and that that gentleman, in the course of their conversation, had desired him to tell his master, that he never paid more than 2*½* per cent. to a house-agent. This was the outline of the plaintiff's evidence. On the part of defendant a number of witnesses were called, and amongst them one of his servants, whose testimony went to show that the board “to let” (which she produced) referred the parties for particulars and cards to view to Messrs. Rogers and Dear, and not to plaintiff. She also stated that her master, who only came to town occasionally, was not in London at the periods alleged by the witnesses for plaintiff. This latter statement was subsequently borne out, although there was a variance of a day or two between

the dates of the parties, by two gentlemen who are clerks to defendant at Brighton, both of whom said most positively, that from the nature of the duties defendant had to perform, and indeed had performed in person, in connexion with offices he held with the directors of the poor in his own town, he must have been in Brighton upon the days when it had been alleged he had been in London. Messrs. Rogers and Dear also proved that they were the house-agents who had been employed by defendant. They, however, had no recollection of having given any cards to view this particular house, although they could not swear that they had not. One of these witnesses stated that he remembered inquiries having been made of him respecting the house by a person whom he had reason to suspect was in the service of plaintiff, some time prior to the premises being disposed of. This latter fact was intended to apply to a statement of the counsel for defendant, which went to show that it was not at all an uncommon thing for the less respectable of the house-agents to send to others in the business, and having obtained the full particulars of premises they might chance to have for sale or letting, then to place those very premises on their own books, accompanied with a public intimation that such property was to be disposed of on boards, which they exhibited in the windows of their offices, and when let to demand their commission, and the inference intended to be drawn was, that such had been the proceeding in the present instance. Mr. Baron Rolfe summed up the case, and told the jury that the question they had to determine was, whether or not the plaintiff had made out to their satisfaction that he had been employed as his agent by the defendant to dispose of these premises. It was quite certain from the evidence given by Mrs. Stewart and her son, that it was through the medium of the plaintiff's office they had obtained a knowledge that the premises were for sale. That fact, however, he must tell them, did not entitle the plaintiff to recover, unless he could prove that he had been employed by the defendant. The jury would therefore say by their verdict whether the case as made out by the plaintiff was sufficient to satisfy them that the defendant had given the plaintiff instructions upon the subject. The jury, after a few minutes' consultation, returned a verdict for the defendant.

SPORTING.

TATTERSALL'S, THURSDAY.—DERBY.—6 to 1 agst Scott's lot (taken to 200*l.*); 8 to 1 agst Mr. Blakelock's A British Yeoman (taken and afterwards offered); 17 to 1 agst Colonel Peel's Murat (taken 18 to 1); 23 to 1 agst Lord Eglinton's Aristides; 25 to 1 agst Colonel Anson's Napier; 30 to 1 agst Mr. Bell's Wine-sour; 40 to 1 agst Mr. Bowes's Cotherstone; 50 to 1 agst Duke of Grafton's Cataract (Oxygen colt) (taken); 50 to 1 agst Mr. Griffith's Newcourt (taken); 1000 to 15 agst Mr. Goodman's Cassium colt (taken); 1000 to 15 agst Mr. Mostyn's Birdlime colt (taken); 2000 to 25 agst Major Yarbrough's Dumping (taken); 1000 to 10 agst Colonel Peel's St. Valentine (1000 to 15 taken once); 1000 to 10 agst Mr. Bell's Blackrock (taken); 1000 to 5 agst Mr. Goodman's Botherem (taken). **OAKS.**—20 to 1 agst Mr. Price's The Lily (take 25 to 1); 400 even between The Lily and Lord Westminster's nomination. Offers take 7 to 1 about Maria Day.

MARK LANE, FRIDAY, JAN. 27.—We have but few arrivals of English Wheat since Monday, and the trade was exceedingly dull at a further decline of 1*s.* to 2*s.* per qr.—There was scarcely anything doing in Foreign, which was held at the same prices; in bonded we did not hear of any transactions. Barley was a heavy sale, and none but the selected qualities would realise Monday's prices.—Peas and Beans are unaltered in value, and Oats exceedingly flat.

Hort. Soc. Exhibitions, remarks on naming plants at	53 c

FUCHSIA BROCKMANIA.—This splendid FUCHSIA was raised by P. PADDEN, Gardener to the Rev. William Brockman, of Beachborough, Kent. It has been justly admired by all who have seen it, and repeatedly noticed by the Editor of the *Gardener's Chronicle* as a superb variety, "distinguished by the firmness of texture, large size, and diversity of colour between the sepals and petals." (See "P. P. Notices to Correspondents," August 13, 1842). It bears remarkably fine foliage, is of vigorous habit, and a most profuse bloomer; therefore confidently recommended as desirable in any collection, and indispensable to the exhibitor. Strong Plants will be sent out early in spring (carriage-free to any part of the kingdom) upon the receipt of a post-office order for 7s. 6d. As the Plants (so far as the limited stock will allow) will be sent according to priority of order, early notice is requested. To Nurserymen ordering Six Plants, the usual allowance.—Direct to Mr. PADDEN, Gardener, Beachborough, Hythe, Kent.—Dec. 1, 1843.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEEES, AND LILUM LANCIFOLIUM.

H. GROOM, CLAPHAM-RISE, NEAR LONDON, (removed from Walworth.) By APPOINTMENT, FLORIST TO HER MAJESTY, respectfully informs the Nobility, Gentry, and Public, that this is the best season for planting the above Flowers, and that he can supply them of first-rate quality at the following prices:—

RANUNCULUSES, 100 roots in 100 superfine sorts	£4 4 0
Superfine mixtures from 5s. to 21s. per 100.	
ANEMONES, 100 roots in 100 superfine sorts	3 0 0
Superfine mixtures from 7s. 6d. to 21s. per 100.	
AURICULAS, 25 superfine sorts, 1 plant of each	3 13 6
CARNATIONS, 25 superfine sorts, 1 pair of each	3 10 0
PICOTEEES, 25 superfine sorts, 1 pair of each	2 10 0
YELLOW PICOTEEES, 12 superfine sorts, 1 pair of each	2 2 0
LILUM LANCIFOLIUM ALBUM, from 5s. to 42s. each.	
PUNCTATUM, from 10s. 6d. to 42s. each.	
SPECIOSUM, small bulbs, at 63s. each.	

H. G. also begs to say that he has a few Trees of his PRINCESS-ROYAL PEAR for sale, at 5s. each.—The Trade supplied.

DOUBLE ITALIAN TUBEROSE ROOTS, 4s. per dozen.—The Annual Importation of these delightful and fragrant BULBS has just been received at ARTHUR COBBETT'S, late Mr. C. BARRON'S, Italian Warehouse, 18, Pall Mall. Where also may be seen a Choice Collection of Orange, Lemon, Citron, Lime, and Cypress Trees, Catalonian and Arabian Jasmines, &c., just arrived from Italy.—N.B. Importer of choice Honeycomb, Parmesan and Gruyere Cheese, New Salad Oil, and other Foreign Produce, &c. Lists, with Prices, may be had.

SEEDLING DAHLIAS FOR 1843.
MRS. JAMES RICHARDSON, and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842.—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—From the *Gardener's Chronicle and Gazette*.

Also obtained the following prizes:—No. of Blooms Exhibited.	
1st prize at Hull, Aug. 30th	12
1st prize at Beverly, Sept. 7th	2
Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th	4
1st prize at Leeds, Sept. 21st	12
1st prize at Newcastle, Sept. 21st	6
1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th	6
1st prize at the York Floral and Horticultural Society, Sept. 28th	18
1st prize at the York Floricultural Society, Oct. 1st	12
1st prize in its class as the best white or blush, ditto.	

Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10s. 6d.

All orders addressed J. EDWARDS, Florist, Layerthorpe, Nursery and Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

DAHLIA "VIRGIL,"—MRS. MOUNTJOY

begs to say they can spare a few fine Roots of the above DAHLIA, which were grown in No. 12 pots, each Root breaking from 2 to 8 eyes. Price from 3 to 5 guineas. A remittance from unknown correspondents is respectfully requested.

Ealing, 1st Feb., 1843.

LIVERPOOL BOTANICAL INSTITUTION.
EXHIBITIONS at the GARDEN for the year 1843.—The Exhibitions will take place on Friday, May 5, Friday, June 23, and Friday, September 9, when the following Prizes will be awarded at each Meeting.

CLASS I.	
Letters for Exhibition.	No. of Plants to be exhibited.
A	Greenhouse Azaleas in collections, not more than 2 plants of a sort
B	Cape Heaths, in collections of 6 species
C	Exotic Orchidaceae, 3 specimens
D	Pelargoniums in pots, in collections of 10 varieties
E	Pelargoniums in pots, ditto of 6 varieties
F	Garden Roses, including Moss, Provence, &c., 12 bunches of 3 blooms each, and not less than 12 varieties
G	Chinese Roses, or Chinese Hybrids, such as the Noisettes, Bourbon, &c., 12 bunches of 3 blooms each, 12 varieties
H	Fuchsias, in 6 distinct varieties
I	Stove or Greenhouse Plants, in miscellaneous collections
K	Stove or Greenhouse Plants, ditto
L	Stove or Greenhouse Plant, best ornamental single specimen
M	Forced Hardy Plants in pots; as Roses, Rhododendrons, Azaleas, Verbenas, &c. &c.
N	Herbaceous Calceolarias, in 6 varieties, in pots
O	Shrubby Calceolarias, ditto
P	Carnations and Picotees, in pans, all distinct
R	Pinks, ditto ditto
S	Dahlias, ditto ditto
T	Tulips, ditto ditto
V	Pansies, ditto ditto
W	Cut Flowers, in ornamental groups or baskets
X	Miscellaneous Flowers in pots set in boxes, baskets, or stands; including Auriculas, Ranunculus, Hyacinths, the newest varieties of tender annuals, &c. &c.
Total £50	

CLASS II.	
Letters for Exhibition.	No. of Plants to be exhibited.
AA	Grapes, the best dish
BB	Pines, the best
CC	Melons, the best
DD	Peaches, the best dish of 3 specimens
EE	Nectarines, the best dish of 3 specimens
FF	Miscellaneous collections of Fruit, consisting of at least 6 different kinds of Hothouse or Wall-fruit, in dishes
GG	Miscellaneous collections of other Fruits, consisting of at least 6 diff. kinds, in dishes
HH	Miscellaneous collections of Frame or Early Vegetables, including Cucumbers, Rhubarb, French Beans, Lettuces, &c., to be exhibited at the May Meeting only, in Baskets
Total £16 0	
EXTRAS at discretion of the Judges £4 0	
Grand Total to be contended for at each Meeting £70 0	

Exhibitors will be required to sign a declaration that all Plants exhibited have been in their possession Two Months; also, that all Flowers, Fruits, and Vegetables exhibited, are of their own growth and production; and if such declaration cannot or shall not be duly signed, the Premiums awarded will be withheld; and all Fruit must be set out in dishes with leaves, the same as if served up for Dessert.

In order to facilitate the regulations as far as possible, in cases of specimens brought from a distance, arrangements will be made to receive all such as shall be brought during the afternoon of the previous day, into one of the greenhouses of the Institution, which will be cleared for the purpose.

A printed copy of the regulations (which resemble as closely as local and other circumstances will permit those of the Horticultural Society of London) may be had by application to Mr. SHEPHERD, the Curator at the Garden; or to JOSEPH DICKINSON, M.D., Hon. Secretary, 24, Great George-square, Liverpool. Jan. 27, 1843.

N. GAINES, FLORIST, SURREY-LANE, BATTERSEA, begs to inform the Nobility, Gentry, and others, that his STOCK of PELARGONIUMS now ready for sending out are strong healthy plants. The following are a few of his Seedlings, which have been proved, and can be recommended, viz.:

Gaines's Duchess of Sutherland	42s
land	63s
Pride of Surrey	63s
Orange Perfection	63s
Amulet	63s
Lady Sale	42s
Emperor Superb	42s
Gaines's Lady Duncannon	42s
Royal Adelaide	42s
Prince of Wales	42s
Countess Eldon	42s
Princess Royal	42s
Conspicuum	42s
DAHLIAS.	
Gaines's Lord Prudhoe—dark crimson	10s 6d
Lady Prudhoe—blush white	7 6
Lady Duncannon—blush, shaded with lilac	10 6
Lady of the Lake—Peach blossom	10 6
Venus—clear white	10 6
Surpass Primrose—fine large primrose	7 6
Elegans—rosy purple	10 6
Golden Yellow—bright yellow	7 6
Catalogues of Pelargoniums, Dahlias, Pansies, Calceolarias, Verbenas, Fuchsias, &c., may be obtained by applying as above. Feb. 2, 1843.	

PET RIVAL DAHLIA (BUSHELL'S), and KENNINGTON ROSE (WELDON'S).—These Dahlias (though risen and grown within one mile of the General Post Office, London, have obtained prizes), will be sent out through the Trade in May next.

PET RIVAL—Purple Maroon, finely-cupped, and depth of Petals never showing the eye, good habit, and always true; height 3ft. Plants, 10s. 6d.

KENNINGTON ROSE, superior to Wheeler's MARIA, constant and fine habit; height 4ft. Plants 7s. 6d. Exchanges and liberal discount to the Trade on early application to J. BUSHELL, 12, Hall-place, Kennington Lane.—Feb. 3.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, Nurseryman, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undervalued low prices—including the following Fuchsias:—Conspicua arborea (Cateugh's), Venus victrix, (Cripps'), rosea alba, Money-penny, magnifica racemiflora, &c. Also the following distinct Verbenas:—Queen Aurora, Stewartii variegata, Mortlock's Superb, Burleyana, &c. &c. Fuchsias, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents.

W. M. obtained a Prize of 10L, open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

W. HEALE & SON, NURSERYMEN, &c., Caine, and Devizes, Wilts, beg to announce to the growers of DAHLIAS that they have purchased the entire stock of "Swindon Rival," (Compton's), a decidedly first-rate variety, only being in the hands of an inexperienced amateur, it was not grown to advantage last season. It was recommended at the Salt-Hill show for a prize, and took several prizes as a Seedling in 1841: colour, dark rosy purple; habit of growth similar to "Springfield-Rival." Plants in May, 10s. 6d. The usual allowance to the Trade.

W. H. & Son being so confident of the superior qualities of the above, pledge themselves to deduct the amount charged if not approved.—Nursery, Devizes, 27th Jan., 1843.

TO GENTLEMEN AND AMATEUR FLORISTS.

The time of year is now fast approaching for planting that delightful flower, the Ranunculus; a few hundred roots to be parted with at 42s. per hundred, (with names); planting time, February and March. Apply (pre-paid) to Mr. EYRE, Farnham, Surrey; where may be seen, in the blooming season, in Mr. EYRE'S Collection of Pelargoniums, "a few Seedlings," taken into flower in July last, 1842, with many of this year's. Some possessing striking foliage, cultivated and grown in small pots, "in their true and natural state, without that pernicious aid," chemical watering, which can only serve to raise and drive "colorem contra naturam," for a short period.—Farnham, January 23, 1843.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

FUCHSIA ST. CLARE.—The above magnificent FUCHSIA was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. Youell obtained the entire stock. In May last, it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardener's Chronicle* of the 14th of that month, as follows: "Your Seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. YOUELL, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage, and as a proof of its being a profuse bloomer, they have a plant in flower at the present time (September 15th) on one branch of which there are upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower-garden. YOUELL and Co. purpose sending it out in the second week of April next, at 10s. 6d. per plant, free of postage, to any part of the United Kingdom; and all orders they may be favoured with will be executed in rotation. Orders for the Continent will receive every care in packing, so as to ensure their safety. The usual discount to the Trade, when not less than six plants are ordered.

Messrs. YOUELL have also much pleasure in announcing, that they are in possession of the entire Stock of two beautiful new Verbenas, raised by Mr. Edmonds, gardener to John Lacon, Esq., of Ormesby Hall, which were kindly presented them by that gentleman. The one named "Laconii," is a fine blue, delightfully fragrant, of vigorous but compact habit, and the heads of flowers measuring upwards of three-and-a-half inches in diameter. The other, named "Princess Royal," is of the purest snowy white, the flowers remarkably large, and extremely fragrant; nothing can exceed the purity of the white in this beautiful variety, and it possesses that acquisition not to be found in any of its class—of retaining its clear white during fading. It would be as well to remark, that the petals of the flowers of the above meet so closely, as to form a perfect ball. They will be ready for sending out by post (free) to any part of the United Kingdom, in the second week of April, at 5s. 6d. per plant. Gt. Yarmouth Nursery, October 6th, 1842.

P.S.—Their Catalogue of Fuchsias may be had on application, and will be found to contain every variety worthy of cultivation.

SEEDLING LARCHES.—Several Hundred Thousands of Two and Three Years' old Seedling Larches, of first-rate quality, and at very moderate prices, are for sale by DICKSON and TURNBULL, Nurserymen, &c., Brechin. N.B. Will be put free on board a vessel at Montrose, from which port there is a regular trader once a week to London, &c.

SEEDLING LARCHES, &c.—The SUBSCRIBERS have still a large quantity of fine 2-year Seedling SCOTCH FIR, 3-year Seedling NORWAY SPRUCE, and 2-year SLED-LING LARCHES; also 1 and 2-year TRANSDANIAN LARCHES, and some fine 2-year Transplanted TROLLSE LARCHES. The 2-year Seedling Larches, being of extra fine quality, are well worth the attention of the Trade and Gentlemen in filling up their Nurseries. Any of the above will be laid down, freight paid to London, Hull, or Newcastle, at a moderate price. They have also fine 1-year Seedling BEECH, which will be sold at Two Pounds per 25,000.

WM. URQUHART & SONS, Dundee.

PATRONIZED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, AND MANY OF THE NOBILITY.

THE FASTOLFF RASPBERRY.—For many years past there has been cultivated in the neighbourhood of Yarmouth, adjacent to the ancient Castle of Sir John Fastolf, a red Raspberry of a most extraordinary size and rich flavour. The Nobility who visit the sea-coast here have invariably expressed their astonishment at the exceeding fineness of the fruit of this variety, and until lately YOUELL and Co. have not been enabled to obtain a sufficient stock of it to bring it into public notice; but having now obtained a supply (although limited) of fine Canes, beg to offer them on the following terms, and they can be sent with safety to any part of the United Kingdom, on the receipt of a Post-office order.

Packages containing 50 Canes, 25s.—Packages containing 25 Canes, 14s.—Package included.

The few to whom YOUELL and Co. have sent it, have expressed their high admiration of its superiority over other varieties; and a letter just received from a Gentleman in Derbyshire, to whom this variety was sent, states that it invariably takes prizes at the Hort. Shows in his neighbourhood. In conclusion, YOUELL and Co. beg to state that they have not, nor do they intend to recommend any article but that which they can do with confidence; and in this instance they feel fully assured of its giving the most entire satisfaction.—Great Yarmouth Nursery, Norfolk, Jan. 26, 1843.

HENRY HAMMOND, NURSERY AND SEEDSMAN, Mundford, near Brandon, Suffolk, respectfully announces to the Nobility, Gentry, and the Public generally, that the late fine season for preserving his admired **WHITE CAPE BROCCOLI** enables him to offer it at 3s. 6d. a packet, which will contain half an ounce. The many orders already received from those who were purchasers last year justify H. H. in again offering it to the public. The flavour is not only equal to any Cauliflower, but it is as hardy as any of the Cabbage tribe. By sowing in March, the end of May, and August, a supply may be had nearly all the year. If any gentleman wishes for information respecting its quality, a reference to the undermentioned Gardeners will meet with an immediate reply:—Mr. Wyke, His Grace the Duke of Grafton, Euston Hall, Mr. Piper, Right Hon. Lord Walsingham, Merton Hall, Mr. Hammond, Sir Richard Sutton, Bart., Lynford Hall, Mr. Brownly, John Angerstein's, Esq., Weeting Hall, Messrs. Flanagan, Seedsmen, Mansion-house-street, London, who can warrant the stock, and will carefully execute any orders entrusted to them.—A good PROPAGATOR in the Out-door Department is wanted.—Mundford, Jan. 19, 1843.

HOME-GROWN SEEDS.

MESSRS. SUTTON AND SONS respectfully acquaint those readers of the *Gardeners' Chronicle* who have not yet introduced them with their commands, that their grounds, being situated at considerable distances from each other, and of different soils, they are enabled by strict attention to grow Garden-Seed true to their kinds, and can supply their Customers with Seeds which they know to be new, thereby preventing disappointment in the crops. The Annual Seed Catalogue is now published, and may be had gratis on application.

The following articles are particularly recommended:—*s. d.*
100 Ranunculuses, in 50 fine varieties by name . . . 1 5 0
30 do., in 50 do. 0 15 0
The most approved kinds of Kitchen Garden Seeds, in a complete collection for a Nobleman's or Gentleman's family 2 2 0
Ditto, ditto, for a smaller Establishment 1 1 0
Ditto, ditto, of Flower-Seed, containing all the new kinds worthy of recommendation; together with the best of the old sorts, with instructions inclosed 1 10 0
Ditto, in smaller collection, equally choice 1 1 0
Ditto, ditto, ditto 0 10 6
Double Italian Tuberoses, fresh imported, per dozen . . . 0 4 0

J. S. and Sons, having a stock of all the new kinds of Kitchen Garden and Flower-Seed, they will be included in the above collections; or they may be obtained separate, according to order, at moderate prices.

N.B.—Parcels delivered free to the Railway-station, or any part of London.—Reading Nursery, Berkshire, Jan. 25th.

TO NOBLEMEN, GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHEROE AND MORRIS will submit to Public Auction, at the Mart, Bartholomew Lane, on Tuesday, Feb. 11, and Friday 14, 1843, at 12 o'clock each day, about 100 Double **AMELIAS**, from one to four feet, the whole beautifully furnished with bloom buds, Fine Hybrid Rhododendrons, Magnolias, Azaleas, Andromeda floribunda, Kalmias, &c.; Standard and Dwarf Roses of the best varieties, Dahlias, &c. May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV. Lower RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 2	2 10 11	2 19 9	3 11 9	4 8 0

The Bonus declared in 1834 amounted upon an average to 161 per cent. on the premiums then paid; and in 1839 a second Bonus was awarded, amounting on the average to 311 per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding in a decked, sailing, or steam vessel, from any one Port to or from another during peace, to Assurers, not being sea-faring men by profession. Licenses are granted to go to any part of the world, on terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent. J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical; it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, solicit an inspection of their improved Conical Boiler. (See Editor's description, *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They are complete without furnaces or setting in brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 5l. 5s. and upwards. Further particulars, with plans and estimates for heating any description of building, may be obtained as above; where also may be seen the improved Wrought-iron Boiler, as applied with Chanter's Smoke-consuming Furnaces at Chatsworth, and many other of the Nobility's Seats. Iron Fencing, Hurdles, Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes.

N.B.—WATTE'S New Patent Land-presses and Drills.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

PENN'S SYSTEM PERFECTED—FOR OBTAINING A FREE CIRCULATION OF HEATED PURE ATMOSPHERIC AIR THROUGHOUT HORTICULTURAL & OTHER BUILDINGS.

W. HILL having had every opportunity of making himself acquainted with the best method of constructing Horticultural Buildings of every kind—to command the above truly-desirable result—and having with much satisfaction witnessed the gradual improvement in the adaptation of this principle to almost every variety of Building, begs to announce to the Nobility and Public generally, that he erects CONSERVATORIES, HOTHOUSES, PITS, &c., &c., upon the above system, which has (at an immense cost to the inventor), been brought to great perfection, and beats the same by HOT-WATER APPARATUS, with improved Tube or Conical Boilers. W. HILL also adapts DR. ARNOTT'S NEW BALANCED REGULATOR to the Boiler Apparatus, by which an immense saving of fuel is effected, the greatest regularity of Temperature preserved, and much time and trouble saved. PENN'S SYSTEM only requires publicity to be appreciated. The Public are therefore invited to inspect its efficient working at the Inventor's Residence, Lewisham. The great end gained by adopting this system, is a perfect and rapid circulation, producing consequently an equable temperature throughout the building (of whatever construction), and renders access to it at all times safe and agreeable, ladies of the most delicate constitution being enabled to remain for hours in a temperature greatly exceeding summer-heat, with as much comfort as could possibly be derived from an out-door temperature equally high. W. HILL would refer any, who may desire to apply the above system to Forcing-Houses in particular, to Mr. JOHN WILLMOT, of Isleworth, who after 40 years' experience has adopted this system throughout his extensive Establishment. Designs, and any further information, upon application to W. HILL, Builder and Surveyor, Lewisham.

RENDLE'S TANK SYSTEM OF HEATING.

WILLIAM E. RENDLE having received several communications from various parts of the country, concerning his "Tank System of Heating," which will ultimately become universally adopted in all forcing establishments where bottom-heat is required, begs to announce to those Gentlemen, as well as to others who wish for information respecting it, that it is W. E. R.'s intention to publish a well-executed Engraving, with a Treatise appended, which will contain every information requisite to set up or adapt the Apparatus for Houses of various sizes, with the cost of materials, fixing, &c.

Every Pinery in the kingdom ought to be fitted up on this principle. W. E. R. is induced thus to bring this system prominently before the public, knowing that it will be of the greatest utility, and of immense importance to Horticulturists. The cost of the Treatise will be regulated according to the number of subscribers.

Union Road Nursery, Plymouth, Jan. 23, 1843.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS.
CROSSKILL'S LIQUID MANURE CART, which received the Honorary Reward of the Roy. Agricultural Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C, B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price delivered in Hull, 25l.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12l. 12s.

GUANO ON SALE
BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

WANTED. An OUT-DOOR APPRENTICE to the NURSERY and SEED BUSINESS near London, a respectable Youth, 15 or 16 years of age. He must write a good hand, as he will have to assist in Bookkeeping. A premium will be required. For further particulars, apply by letter only, with name and address, to A. B., 38, Queen-street, Cheapside, London.

AN ESTABLISHED SEED-HOUSE in LONDON has a Vacancy for one or two Respectable Young Men, of active and persevering habits, good address, and well versed in the general Seed business, likewise in the Nursery department. They may be required to travel. Particulars of age, present occupation, and qualifications to be addressed to WARRERS' Seed-Warehouses, 3, Laurence Poultny Lane, Cannon Street, London.—Personal application will not be attended to.

WANTS a SITUATION as GARDENER, a Man aged 33. Has had extensive experience in the business in all its various branches, particularly the management of PINES, VINES, &c. An unobjectionable character. N.B.—In or out of the house. Address A. B., 23, Norton-street, Portland-place, London.

WANTS a SITUATION as GARDENER, a Respectable young Man, aged 30, who has a practical knowledge of his business in all its branches, and can be well recommended from the situation he is about to leave. Address, A.B., at Mr. BELL's, Bookseller, Richmond, York.

WANTS a SITUATION as UNDER GARDENER.—A sober steady Young Man, who has a good knowledge of his Business, but wishes to improve himself in the Plant department. Can be well recommended from his last place. Address, stating particulars, to W. L., 34, Riley-street, King's-road, Chelsea.

WANTS a SITUATION as GARDENER, a married Man, about 30 years of age. Is well acquainted with Horticulture in its different branches, and obliging in disposition. Satisfactory references will be given as to abilities and moral character. Wages expected, 14 per week.—Address, G. W., 16, Bennett's-buildings, Kennington-lane, Surrey.

WANTS a SITUATION as GARDENER, single-handed, a middle-aged married Man, who can have a good recommendation from the place he is just leaving, and likewise can be well recommended if needed to take charge of a little land. No objection to any part of the country. Direct to J. JONES, Chislehurst, Kent.

WANTS a SITUATION, as GARDENER, or GARDENER and COACHMAN, a respectable young Man, without incumbrance, aged 33, with a four years' good character. Is fully capable of taking the management of Kitchen and Pleasure-Garden, with Vinery, Greenhouse, &c.; can Brew, and has been used to the management of Grass Land and Horses; would be at liberty at a short notice. His wife could act as Cook, and manage a small Dairy, if required.—Address, A. B., at Mr. HOLT's, Waterloo-street, Leicester.

WANTS a SITUATION, as GARDENER, a middle-aged, married Man, without incumbrance, who has a good knowledge of Plants and Fruits generally. For a long period he has paid considerable attention to the growth and training of the Grape-Vine, and from which he will undertake to produce a crop in 16 months after the Vine is planted. To any gentleman whose Gardens or Vinery have been neglected, and who is desirous of re-establishing them, more especially the latter, upon the most approved system, the Advertiser flatters himself, he will be found serviceable. He can be recommended by Richd. Crawshaw, Esq., and can have a character of six years' standing from his present employer. Letters addressed, post paid, to O. P. Q., Post-office, Brandon, Norfolk, will meet with immediate attention.

WANTS a SITUATION, as GARDENER, a single Man, aged 33, who has a practical knowledge of his business; can be well recommended. Lowest wages accepted: 30 guineas, board, and lodging.—Address to A. M., Post-office, Barnet, Herts.

WANTS a SITUATION as GARDENER, a married Man, with good character, without incumbrance, aged 39, who perfectly understands his business. He is a good brewer, and would have no objection to take the management of land.—Direct to JAMES BROCKWELL, gardener, Kingston-bottom.

TO NOBLEMEN, GENTLEMEN, FARMERS, & GRAZIERS.—WANTED by a Young Man, (a native of Cumberland) a SITUATION as FARM BAILIFF, in any County in England. The Advertiser has been brought up in Cumberland to Farming and Grazing; and is acquainted with thorough Drainage system, Subsoil and Trench Ploughing, and with most of the modern improvements in Agriculture; and would be able to give respectable references, and produce sufficient testimonials as to character, and capabilities, &c. Address, A.L., Post-office, Bampton, Cumberland.

A GENTLEMAN who is about to part with his GARDENER wishes to recommend him to any person in want of a good servant. He is a married Man, without children, middle-aged, and understands his business in every department. Apply by letter, post-paid, to A. B., at Mr. Jenkins', 51, Cornhill.

BONE MANURE. ADULTERATION DETECTED. The extent to which Bone Manure is adulterated is so great as to render it imperative upon the Farmer to ascertain, by chemical analysis, the quantity of PURE BONE it contains.

W. H. POTTER undertakes to examine any Sample that may be submitted to him, and within two days after the receipt thereof, to return the correct percentage of PURE BONE. Mr. Potter's charge is 5s., which should be enclosed with an average sample, say 1lb., and sent (carriage paid), to the Artificial Guano Works, 28, Upper Fore-street, Lambeth, where Unadulterated Bone may be had, either in dust or 4-in. pieces.

W. H. POTTER examines every species of Artificial Manure, and reports upon them at the above charge. Soils very carefully analysed.

S. GIRLING'S CATALOGUE OF ENGLISH AND FOREIGN DAHLIAS can now be had on prepaid application. It contains as well, a List of Fuchsias, Pelargoniums, Panaces, and Verbenas, any of which S. G. will be happy to receive orders for; and pledges himself to supply early plants correct to name, and on liberal terms where a quantity is wanted. The trade liberally supplied.
Dane Croft Nursery, Stowmarket, Suffolk.

BEAUTIFUL AND DISTINCT FUCHSIAS. YOUELL & Co. have much pleasure in announcing that their CATALOGUE of the above is in the Press, and may be had on application. It will be found to contain all the really good and distinct kinds, to the exclusion of such as are merely nominal varieties, and will prove a valuable guide to those who intend competing at the Horticultural Exhibitions of the ensuing season.—Great Yarmouth Nursery, Norfolk, Feb. 2.

In the Press, and will be published in a few Days, in One small

RURAL CHEMISTRY.
By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 4, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Monday, Feb. 6.	Entomological	8 P.M.
	Horticultural	2 P.M.
Tuesday, Feb. 7.	Linnean	8 P.M.
	Floricultural	6½ P.M.
Wednesday, Feb. 8.	Medico-Botanical	8 P.M.
Saturday, Feb. 11.	Royal Botanic	3½ P.M.
Tuesday, Feb. 14.	Zoological	8½ P.M.
Wednesday, Feb. 15.	Microscopical	7 P.M.
Friday, Feb. 17.	Geological	1 P.M.
	Botanical	8 P.M.

It is very evident, from the letters that have been addressed to us by our correspondents, that the observations we lately made upon the night temperature suited to Vines were not without their use. In general, the correctness of our opinion is admitted; but, in one or two cases, the writers have doubted whether shanking and bad colouring are to be ascribed to mismanagement at the early period of forcing. In one instance, we are assured that in a house where the Vines broke well, flowered well, set well, and where the temperature was kept low at night, the berries, although all was well with them till they began to colour, then took to shanking and shrivelling, so that there was not half a crop. Now we beg it to be observed, that we did not say that shanking is to be ascribed exclusively to mismanagement of temperature: we only pointed it out as one of the causes of this troublesome disease, and a common one. It may doubtless be produced by other means, such as a cold wet border; but into this we shall not go at present. Our immediate object is merely to insist upon the manner in which the atmosphere should be regulated.

We may all of us rely on this, that we cannot break the laws of nature with impunity; we may violate them indeed for a time, but in the end punishment is sure to overtake us. It is a universal law of nature, that, in temperate countries, in the early part of the year, the nights are cold, whatever the days may be. We have already mentioned the case of the islands of the Mediterranean: let us now turn our eyes still further to the eastward. Nowhere is the climate more sultry than in Afghanistan. We are told that General Pollock's troops at Jellalabad were forced to dig holes in the ground to hide themselves from the heat. The condition of Cabul must be much the same. At Candahar, we are informed by Mr. Atkinson that, in May, the heat of the tents was generally 110°; and at midday, in the sun, 140°. Now, in no part of the world are the Grapes more delicious than at Candahar and Cabul. On the 30th June, this traveller saw donkeys laden with panniers of fine purple Grapes; and at the same time, the paper on which he was writing curled up and became as crisp as if it was before a blazing fire. When he reached Cabul, in August, he found the bazaar filled with delicious Grapes in astonishing profusion. Now what sort of nights had the troops in the spring of the year, when the Vines were growing and flowering, and preparing themselves to bear fruit? Why, on the 7th March, near Shikarpore, 200 miles south of Candahar, and above 500 south of Cabul, in the Desert, we are told that the march took place in "a brilliant starlight night; frost seemed to be in the air, it was so cool and bracing; after midnight, the servants made up a blazing fire, "for the north wind was blowing bitter cold, and the traveller was glad of hot brandy and water." Nevertheless, the day before, Mr. Atkinson had been grilling at Shikarpore, and the march was over level plains, and not among the mountains. Two days afterwards the weather is described as being oppressively hot at midday. Then on the 19th March there was a hailstorm at night, and the air was "cold and bracing;" and so on.

Here, then, in a country totally different from the islands of the Mediterranean, where the Grapes are famous for their excellence, we have even greater variations in temperature between day and night in the month of March, when the Vines are shooting: the air is cold and bracing by night, and grilling by day. And this is but one of the innumerable wise provisions of nature, which prevents the destruction of vitality from undue stimulus. Vegetation, violently spurred onwards by heat during the day, is refreshed at night by a total cessation of all excitement; were it otherwise, the powers of life would soon be exhausted, and such plants as the Vine would inevitably perish. A man cannot live if his sleep is prevented; in like manner, plants cannot flourish if that kind of rest which is natural to them, and is produced by the combined influence of coolness and darkness, is withheld.

* Atkinson's Afghanistan, p. 104.

Let it not, however, be supposed that a low temperature at night is requisite during the whole period of growth of the Vine; that the contrary is the case when the fruit is ripening, we shall shew at an early opportunity.

THE use of all manures is to increase the natural fertility of the soil, or to restore that which has been diminished by vegetation. The idea of a universal pabulum for all plants is nearly exploded; and all the attempts to discover it are, by many, considered to be on a par with the finding of the philosopher's stone or the universal medicine. The improvements in Chemistry have discovered various and different substances in every different family of plants; not only such as are peculiar to organised matter, and are the result of the decomposition of vegetable and animal substances, but others likewise, which belong to the mineral kingdom. These can be exhibited unaltered in the residue of chemical decomposition, whether in the dry way, by means of heat,—or in the humid way, by means of the action of other substances, which destroy the cohesion of the parts, or change their affinities. Thus the earths, silica, lime, magnesia, alumina, and several of the metals, especially iron, are found in the ashes of plants which have been burned; and from the regular proportions of these in plants of the same kind, whatever be the nature of the soil in which they are raised, we must conclude that they are in some measure essential to their formation. However involved in darkness and doubt the growth and nourishment of plants is in the present state of science, there are certain principles which may be considered to be fully established by experiment: of these one is, that whatever enters the body of a plant, whether by the roots or the pores which are distributed along its surface, especially in the leaves, when they are developed, must be so minutely divided, that its particles are invisible, not only to our naked eyes, but even assisted by the high magnifying powers of the microscope: that is, they must be fluid, whether in a liquid or aeriform state. It is useless, therefore, to present to the pores, or mouths, if we may so call them, of plants, substances which cannot enter into them, however well adapted they may be to serve as nourishment or increase. Mineral substances must therefore be dissolved in suitable menstrua before the plants can imbibe them. Organic substances naturally decompose in the state of gas, and these gases may contain various matters in solution. It is more than probable that water and atmospheric air are the chief menstrua in which the food of plants is dissolved; as we well know, that without the presence of both, plants soon become diseased, and die. All water, except perhaps that which has been purified by repeated distillations, contains portions of various substances in solution, so minute, that the art of the analyst has not yet found means to show their presence or ascertain their proportion. We need not be surprised at this when we apply to arithmetical calculations: one grain of any substance dissolved or diffused in one pound of water (avoirdupois) is only $\frac{1}{7000}$ part of the water; yet, when we consider that many plants absorb and evaporate their own weight in water in 24 hours, and that the substance diffused or dissolved in this water may remain behind in the plant, we can readily conceive a great deposition of substances which are perfectly inappreciable on an analysis of the sap; besides, we cannot doubt but minute particles of every substance which exists on the earth are continually floating in the atmosphere, and there exerting influences which are quite beyond the reach of the most skilful analyser of air. How could we otherwise account for the formation of solid meteors, which appear to be generated in our atmosphere, unless they are supposed to be projected from the moon, which is a very improbable supposition? We may therefore philosophically lay down as a certain fact, that extreme division is an essential condition in all substances which are to enter the body of plants and contribute to their formation and increase. And we need not be astonished if we find accumulated in plants substances of which no trace can be discovered in the soil.

From these preliminary observations we may draw this conclusion: that it is not sufficient merely to add to the soil any of the substances which are found in the plants when come to maturity, but we must so arrange all the circumstances accompanying this addition that they may be presented to the plants in the state in which they may be absorbed and assimilated. No fact is more undeniable than that soils, the mechanical constitution of which is favourable to the development of the roots, and in which they can be properly fixed, so as to support the plant, are found to be fertile in proportion to the quantity of organic matter intimately combined with the earth, within certain limits, and with certain exceptions; and that this fertility, however great, diminishes in process of time, if plants are allowed to grow in these soils, and are carried away when they come to maturity. A soil of inexhaustible fertility is a mere creature of the imagi-

nation; and the reduction of this fertility is always accompanied with the diminution of the organic matter. This intimate union of organic matter and the soil is the result of the slow deposition of various earths suspended in water, together with certain results of the decomposition of animal and vegetable substances. There seems to be a peculiar affinity between extremely divided earth and the residue of organic decomposition, which prevents their being dissipated and lost so long as the soil remains undisturbed; but the slightest tillage which exposes this compound of earth and organic matter, commonly called virgin earth or humus, to the influence of the air, produces an action abundantly supplying the plants which have begun their vegetation from the seed with that pabulum which causes their healthy increase. The roots increase as well as the stems and leaves; and while the former absorb the moisture and gases afforded by the soil, the latter imbibe other elements from the surrounding atmosphere; and thus, every part performing its proper functions, a healthy and vigorous plant is produced, and its fruit brought to maturity.

These simple facts, and the principles founded on them, must be steadfastly kept in view, whenever we attempt to explain or account for the action of various manures; and here chemical science greatly assists us, by pointing out the probable effects of certain mixtures of substances, which either act upon each other, or undergo spontaneous chemical changes in certain situations. We can never do better than take Nature for our guide, and endeavour to imitate her operations. We cannot, it is true, artificially form a soil of the greatest and most permanent fertility: we cannot disintegrate rocks, and, washing out their minute particles, intimately blend various kinds together, and slowly deposit them to form a soil—although the process of warping, practised on the banks of some rivers, is a close and rapid imitation of the natural depositions. We have certain earths and minerals ready formed and mixed in the soils we cultivate; all we can do is to find the easiest mode of improving the texture and composition of these soils, so as to make them more and more fertile. It is not relevant to our present purpose to speak of the mechanical means of improvement—of the mixture of earths of opposite qualities—or of the regulation of the moisture: these must be treated of separately. We now confine our observations to the simple addition of substances, which directly or indirectly furnish materials for the increase and healthy vegetation of the plants cultivated. The subject naturally divides itself into two parts: the first relates to the substances which afford the elements by which plants increase; and the second, to those which act as assistants or solvents of these substances; and, as it were, prepare the food, bringing it to the state in which the plants can readily and gradually absorb it. This is exactly what some authors have distinguished as *enriching* manures and *stimulating* manures. We shall see that some substances may be ranked in both these divisions.—M.

WHILE the planting season continues, we are desirous of calling the attention of our readers to the Levant, or Turkey, or Mossy-cupped Oak (*Quercus Cerris*), of which so little seems to be known in this country.

It is one of the most ornamental of the Oaks, grows very fast in poor soil, and forms excellent timber for in-door purposes, as is admitted by every one; and for naval purposes also, where the climate suits it, if that opinion is correct which refers the Sardinian Oak now so extensively employed in the Government Dockyards to *Q. Cerris*.

Be this as it may, there is no doubt that the Turkey Oak is one of the most profitable to a planter; and that being so, it matters little whether it is to be converted into line-of-battle-ships, floors, doors, or the shopkeepers' counters. Mr. Loudon, in his *Arboretum Britannicum*, gives the measurement of a few specimens, of which he had obtained information; and they, in some instances, show that the tree will lengthen even more than three feet annually!

To the cases mentioned by that author, Sir Henry Bunbury enables us to add two others: Two Levant Oaks, which had been planted (from the nursery) at Great Barton, in the winter of 1822-3, have been cut down this winter, 1842-3, when the following were their measurements:—

No. I.—40 feet high; girth at one foot from the ground	ft. in.
4 feet	3 6
8 feet	3 0
12 feet	2 9
No. II.—41 feet high; girth at one foot	3 2
4 feet	2 6
8 feet	2 3

At the same place, there are several others standing about 50 feet high, and carrying up stems which do not taper so much as the two that have been felled; but their girth at bottom is less. The soil is clay.

We have lately inserted a notice or two concerning a mode of dispensing with manure, which has origin-

ated with a Mr. Bickes, of Kastel. In another column will be found a letter upon the subject, to which we invite attention.

ALTHOUGH Farming is not exactly our vocation, we are always glad to open our columns to the principles of cultivation; for they are the same in Agriculture as in Horticulture, only that the former applies them on the larger scale. We, however, like our neighbours, find a pretty considerable number of people who laugh at principles, and tell us that there is nothing like practice; in which they are so far right that principles would be of little use unless practice carried them into execution. We cannot, however, too often assert, that practice without principles is a broken reed to lean upon, and will most undoubtedly fail those who cling to it alone in the coming storm; and we now extract from our excellent contemporary, the *Maidstone Journal*, a specimen of the effects of people knowing something more than their grandfathers; which specimen we advise all the rule of thumb folks to examine for themselves.

At a recent meeting of the Maidstone Farmers' Club, the President, in giving the health of one of the Members, a Mr. Barnes, took occasion to make the following remarks:—"Not only was that gentleman very eloquent and instructive at their meetings, but he carried out in practice what he advanced as theory. Last year, he (the President) paid him a visit just before reaping, and the difference between his Corn and that of his neighbours' was such as no one would believe who had not seen it; he saw some pieces close to his land, where there was hardly two quarters an acre of produce, while on Mr. Barnes' there was not less than four or five quarters an acre. That was a very extraordinary difference in such a district as the Weald of Kent, and in such a season as that of last year, it struck him with surprise." Mr. Barnes, in reply, ascribed his success to the outlay of capital in under-draining and manuring, and among other things, stated that "he had not been a grower of Turnips for some years, having formerly attempted it and failed. However, after under-draining to some extent, he attempted again this year, and succeeded beyond anything in that neighbourhood." We trust Mr. Pusey will ask Mr. Barnes for his evidence when he has obtained the committee which we understand it to be his intention to move for as soon as Parliament meets.

BOTTOM-HEAT.

THE importance of Bottom-heat, not only for Pines and Cucumbers, but for everything else in some degree, is now generally acknowledged; and since nature has established it as something like a general principle all over the globe, I see no reason why we should be sceptical as to its utility.

If a Nurseryman is anxious to propagate a valuable plant, he generally has recourse to bottom-heat. A gardener waters his Vine or his Peach-border inside the house with tepid water (seeing that he has no other means of conveying a degree of warmth to the ground), in order to get a fund of sap in motion to supply the demand made by the buds in the earlier stages of development. In forcing Asparagus or Sea-kale at an early period, the process will be extremely tardy, unless we can command a bottom-heat of about 80°.

It appears somewhat astonishing to think that the Pine-apple should luxuriate in a bottom-heat of 90° or 95°, whilst a temperature of 70° or 75° is found sufficient for the top. The discrepancy in nature does not amount to this; therefore it is plain that, although nature is, as to general principles, an unerring guide, yet a great latitude has been provided for by the great Architect, both with regard to heat and moisture. Indeed, had it not been so, man, beast, and vegetable could not so readily have adapted themselves to change of situation, and the valuable Potato must have remained to grace its native hills in Quito.

I see that in Dr. Lindley's "Theory of Horticulture," the average heat of the earth during each month is given; but there needs, I think, a classification, founded on the natural divisions of the seasons. I will therefore, to draw attention to the subject, suggest that, for all practical purposes in gardening, the year might be divided somewhat after the following manner:

1st, accumulating period, (say) May, June, July, Aug. 2nd, stationary period, (say) September and April. 3rd, dispersing period, (say) October, November, December, January, February, March.

Of course the above-assumed periods refer to the heating of the earth by the sun; and by "stationary" I mean those periods when the average temperature of the atmosphere and of the earth are nearly the same.

It will be seen at a glance that the above is a mere speculation, and therefore cannot mislead; but of course there is a meaning in everything. Thus, the accumulating period sets everything in the vegetable kingdom in motion, and progressively increases that motion up to the time that the meridian sun exhausts the tender leaf; at which period there is, and had need be, the most complete action of the root by means of bottom-heat; this continues until the fruit is perfected, and the bud filled and organised for the ensuing year.

The stationary period is the withdrawing of excitement in the autumn, which allows the vegetable system to in-

cline to its period of rest; and again in the spring, to prevent the too eager buds from hurrying into action.

The dispersing period, in which the vegetable world, no longer needing the excitement of bottom-heat, returns a part of its borrowed store to the atmosphere, there to alleviate, in some degree, the rigours of the season, if the winter is long and severe.—Robert Errington, Oulton, near Tarporley.

TRELLISES FOR CLIMBERS.

EFFECTS OF PUTRID VEGETABLES, &c. ON THE GROWTH OF PLANTS.

It is well known that in adding decomposing vegetable matter to the soil, we supply to plants those substances which enter into their composition, and which exist in different states of combination. When such matter is to be applied as a manure to plants whose roots are confined in pots or any other given space, it must be made soluble in water; and chemical analysis plainly shows that all plants are resolvable into a certain number of simple bodies, and that these bodies enter readily into combination with water.

Water, therefore, is apparently the source through which this nutriment is to be conveyed to the absorbent vessels; and wishing to have ocular proof of the effects of such a liquid, and that too in an economical way as possible, I had an upright cask, with one end taken out, filled with leaves of Cabbage and any other succulent plants; these were pressed down, and rain-water was added until the mass rose level with the surface. In this state putrefaction proceeded quickly, and in three or four weeks it was complete; this, however, depends entirely upon the state of the weather.

That I might be the more certain of its fertilizing effects, 500 scarlet Pelargoniums were subjected to an experiment. These had been exposed for the greater part of the year to all the variations of the weather, being pot-bound, having literally nothing to subsist on but what was supplied to them in a fluid state. One-half of them were supplied with the liquid from the cask, the other half with rain-water, and this experiment was carried on for upwards of a month—a sufficient time to prove its usefulness.

At the expiration of that period, no one ignorant of their treatment could have believed that they were all of the same age, and had been treated alike in every other respect; the difference was so much in favour of those that had been supplied with vegetable liquid; they had not only grown more vigorously, but their leaves were larger and of a darker green.

However fertilizing this liquid may be of itself, it is made still more so by the addition of animal urine in lieu of rain-water; I also found that the vegetable fibre decomposed with greater facility when acted upon by the urine of cattle in a fresh state, at the same time that the latter forms a liquid, holding in solution all the ingredients that constitute the food of plants, and fitted to supply nutrition in that form in which it can be received by the most minute spongioles. When Orange-trees, that had been sickly for years, were supplied with this liquid, their leaves turned from yellow to green, they bloomed freely, and set their fruit the same year.

That this fluid may not receive more than its due, I will subjoin the previous treatment of the above plants. Early in spring, all the earthy matter was washed from their roots; they were repotted into fresh soil and plunged in a gentle hot-bed, where they made numerous fibres. The liquid was then copiously given; and at no time should this or any other artificial liquid, unless in a very diluted state, be applied to plants where a deficiency of fibres exists. I have supplied this liquid to numerous

stove and greenhouse plants, with very beneficial results, more especially to those with succulent roots, and at no time did it destroy or fail in its effects. Unless sulphuric acid or some other fixing substance is mixed with it, this liquid cannot be used in any confined apartment, on account of the noxious effluvia that is given off. Where a constant supply is required, two casks or cisterns are necessary, that the contents of one may be putrefying while the other is in use; the portion that remains after the liquid is drawn off, if mixed with light loam, forms an excellent compost.—Robert P. Drummond, Foreman, Minto House, Roxburghshire.

ON MANURING WITH GREEN CROPS.—No. VIII. (By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 52.)

3. *Bannatic Globe Thistle* (*Echinops bannaticus*).—This plant, a native of Hungary, has been cultivated for some time past as an ornament; it is biennial, and attains a height of 8 feet. I may state that I know, from experiment, that it will be a very valuable acquisition to the farmer, as well for fodder as for green manure. As fodder it is important, because, if planted the year before, it will be 3 feet high by the middle of the following May, and furnish an astonishing mass of herbage at a period when Red Clover is scarcely 4 or 5 inches high. I have given it repeatedly to swine, sheep, cows, and horses, in considerable quantity, and have always found that it was eagerly eaten by them, even when they have had plenty of Clover. If mown when 2 or 3 feet high, it grows up again speedily, and can be cut once or twice more in the same season. Its qualities for green manure are, that its roots reach 3 or 4 feet in the subsoil, that it succeeds very well on poor loamy land, does not suffer from either frost or severe drought, is not attacked by vermin, and yields a mass of herbage nearly incredible; the Magdeburg acre will yield, if the *Echinops* is 6 or 7 feet high and about to blossom, 40,000lbs. I have never grown it to that extent; still, from the ground I have planted, I have been able to judge of its fertility. It yields an astonishing quantity of seed. My experiment, as to its manuring qualities, succeeded as well as might have been expected; yet I observed that it decays underground more slowly than other plants. If it should turn out to be practically a good fodder, which I doubt the less because it is one of the Thistles with very soft small spines, the first cutting might be used in that way, and the second ploughed in green. Considering the *Bannatic Globe Thistle* such an important plant, I examined its chemical composition, and it will be seen from the following results how much manuring matter 40,000lbs. of the green material will furnish.

1000lbs. of the green plant consist of—	
800.0 lbs. of water in fluid form.	
2.0 " nitrogen, probably.	
3.0 " potash.	
1.7 " soda.	
1.6 " lime.	
0.7 " magnesia.	
0.1 " sulphuric acid.	
0.8 " phosphoric acid.	
0.9 " chlorine.	
110.0 " carbon.	
79.0 " hydrogen, oxygen, silica, alumine,	
1000.0lb. oxide of iron, and manganese—of	
	the three latter substances merely
	traces.

1,000 lbs. of the dry plant contain 700lbs. actually nourishing material, amongst which are much mucilage and albumen.

40,000 lbs. green herbage would, therefore, bring into the furrow-slice of one acre, 80lbs. nitrogen, 120lbs. potash, 68lbs. soda, 64lbs. lime, 28lbs. magnesia, 4lbs. sulphuric acid, 32lbs. phosphoric acid, 36lbs. chlorine, and 4,400lbs. of carbon; consequently, the soil would receive from that *Globe Thistle* more manuring substances than from any other plant hitherto known. The small amount of sulphuric acid is remarkable.

For the sake of experiment the seed ought to be sown in May, and the plants to be transplanted in July or August, perhaps best after Rye. Although this Thistle is a plant of easy cultivation, it must be kept free from weeds, although they are not likely to overrun it, its own growth being so very luxuriant. That its principal success depends on the quality of the subsoil does not require further explanation.

(To be continued.)

AMATEUR'S GARDEN.—No. V.

As the busy season of seed-sowing is at hand, proceed with the general work both in the flower and kitchen garden, as fast as possible. Borders, containing herbaceous plants, that were not dug over in the autumn, should, now that the bulbous plants are above-ground, be attended to immediately. Instead of being dug they should be neatly forked over, previously dressing the ground, if poor, with rich compost or manure, and taking care to disturb the bulbs as little as possible. Coarse-growing plants, such as Asters, Achilleas, Phloxes, Stenactises, &c., must be reduced in size. In doing this retain a portion of the outside only, removing the other part and the centre; or, if necessary, take the plant up altogether, and after adding some fresh compost to the soil, replant the best part of the old stool. In this way, neat compact plants may be obtained, and what is an advantage in small gardens, some of the coarse-growing ones will be checked in their growth.

Many of the more hardy of the autumn-struck plants for grouping, such as *Pelargoniums*, *Calceolarias*, com-

mon Verbenas, &c., may now be potted off into small pots, and placed under the shade of the greenhouse plants until well rooted; so as to be ready to plant out in sand in temporary pits towards the end of March, and set the pots at liberty for other things. Very small pots must be used, my object being to get a compact ball of roots, which, when plunged in sand, will produce a dense mass of fibres, ready to push into the soil directly after the plants are placed in their permanent quarters.

For this reason, I would advocate the autumn as the best season for striking cuttings, because every day in spring brings its work, while autumn is comparatively an idle time in the garden; therefore, as three dozen plants can on an average be kept under every superficial foot of glass, let us get over these things in autumn, have them potted off early in spring, and plunged out in temporary pits, so as to set the other pits and frames at liberty for more useful purposes. Any new or scarce plants, of which your stock may be limited, had better be placed in heat to produce cuttings for propagation. Among the things not so extensively grown as their merits entitle them to be, I may mention *Nieremburgia intermedia*, *gracilis*, *filicaulis*, and *calycina*, *Lantana Sellowi*, the old *Ruellia formosa*, *Bouvardia triphylla* and *splendens*. Both the latter plants are readily increased by pieces of the roots cut into portions about one inch long, placed over some light sandy soil, covered about half an inch deep, and plunged in a gentle bottom-heat. The young plants must be potted off when about one inch high, and the strongest of them will do to bed out the first season. The old plants should be parted and potted in March, and placed in heat, until they have produced shoots two inches long; after which they must be hardened off previously to being planted out. *B. splendens* strikes freely from cuttings, but the other kind is best increased by roots.

A few seeds of *Brachycome iberidifolia*, *Schizanthus Hookeri*, *Priestii*, and *humilis*, *Mesembryanthemum tricolor*, *Rhodanthe Manglésii*, *Clintonia pulchella* and *elegans*, *Phlox Drummondii*, and *Portulaca Thellussonii*, may be sown on a gentle heat to bloom in pots; and some of the autumn-sown ones will require repotting.

In the kitchen-garden plant a few early Potatoes at the foot of a south wall, or on a warm border; but if they can be placed on a slight hotbed, so as to start them into growth a little, they will be as well planted three weeks hence. Make a small sowing of Lettuce, and also get in another crop of early Peas, and the first crop of Windsor Beans. Lay in a stock of different kinds of soil under cover, while it is dry, ready for potting with next month. —W. P. Ayres.

HOME CORRESPONDENCE.

To Kill Insects for the Cabinet.—Two or three paragraphs, pointing out the best methods of killing insects, have appeared in your Paper, which, in my opinion, cannot have been written by practical entomologists. I have slain tens of thousands for my cabinet, and send you my mode. For such Coleoptera, Dermaptera, Orthoptera, Hemiptera, and Homoptera, as have not bright colours, the readiest way is to shake them out of the bottles or boxes into which they have been collected, into a cup of boiling hot water; and as soon as dead to lay them upon blotting-paper, to absorb the moisture. For gay-coloured species of these orders, and such Hymenoptera and Diptera as will allow of the ordinary mode of setting by means of a pin passed through them, the best plan is to plunge the bottle or box, if of tin, into the boiling water, or to hold them to a hot fire for a few moments without taking out the corks or removing the lids. All the Lepidoptera, except the small Tortricidae and Tineidae, and all the Neuroptera, Trichoptera, the larger Hymenoptera, and Diptera, and indeed any insect, may be most expeditiously killed, and with least danger of injury to the specimen or operator, by piercing, after having passed the pin through the insect in the usual way, the under side of the thorax of the specimen with a pointed quill dipped in a saturated solution of oxalic acid. Death is in most cases instantaneous. The solution is most readily kept in a small phial, such as perfumers use for oils, &c., with a piece of a quill fixed in the cork. A single drop will destroy any insect; and a quarter of an ounce of acid will serve a lifetime, by merely adding a little water as it evaporates. Of course the quantity of water should never be sufficient to dissolve the whole of the acid. To kill minute Lepidoptera, which are collected into separate pill-boxes, the best way is to elevate the lid of each box a little—not so far as to allow the inclosed moth to escape—to pile the boxes thus partially opened under a large tumbler or small bell-glass, and to burn a brimstone match underneath. Such minute Hymenoptera and Diptera as are mounted on pieces of card-board for the cabinet should be thrown into boiling water, as directed for the majority of the Coleoptera, &c.; and by moving each specimen about in the water with the point of a setting needle, the wings and legs can be placed in the proper positions, and then a slip of writing-paper plunged underneath each specimen, and drawn out at an angle, will bring the insect with it without disturbing its position. These slips of paper should be laid aside for a few days to dry, when the specimens will be found in most beautiful order for mounting on the card-board. I may mention, for the benefit of the Tyro in collecting, that he ought always to put a few pieces of soft paper in each bottle or box into which a number of insects are collected, not only to absorb the moisture arising from them, which frequently spoils the villose species, but to prevent, as much as possible, their mutilating each other. Indeed, he ought to use some judgment in placing different genera into one bottle or box, or he may find, after a hard day's collecting, that a *Cicindela* or *Crabro*

has industriously converted his collection of insects into one of mere legs and wings. I would caution him too against using spirits of wine and corrosive sublimate to kill mites, &c.; the loss or change of every bright colour will be the result. The safe plan is to bake the infected insect for a few minutes in a slow oven or in a tin-box.—S.

The King of Prussia's Palm-house.—The Palm-house on the Peacock's Island, near Potsdam, which was finished and opened to view in the year 1831, deserves the notice of all connoisseurs, as it is unquestionably one of the most beautiful erections of its kind, and contains much that is remarkable and interesting to botanists and the lovers of plants. It is 100 feet in length, by 40 feet in height, and 35 feet in depth. Properly speaking, however, the depth is 54 feet, as at each end of the back front it includes apartments for the gardeners, and the middle forms an alcove, in which the marble fragments of an Indian pagoda have been erected with the requisite restorations. This large space has not been narrowed by cross beams nor supports; and one cannot but admire the boldness with which the design has been carried into execution. It is lighted on all sides, and is ornamented tastefully with various Indian devices. The Palms which are placed in it were purchased by the King from M. Fulcheron, of Passy, near Paris. They consist of forty-one different species; the number of them, however, amounts to eighty, as of several of the species there are various specimens, and some have been obtained from other places. Particularly distinguished is a specimen of *Chamærops humilis*, which was formerly in the botanic garden at Bonn, and was brought from thence in 1831. This tree is 300 years old, has a trunk $\frac{1}{4}$ foot in diameter, and 10 feet in height to the crown, which is 9 feet in diameter. The height of the whole is 16 feet. It blows in the winter months, and bears male flowers, with which the female flowers of the smaller plants were fertilised in February of the year 1834, so that they have already a show of male fruit. *Lantana borbonica* is remarkable for its fine growth and the richness of its leaves, forty of which form the crown, which is upwards of 24 feet in diameter. *Zamia tridentata* and *revoluta* have trunks of 1 foot in diameter. A specimen of the Sago Palm, *Cycas revoluta*, has a trunk 3 feet in height. Several of the plants have flowered. *Chamærops humilis*, with male and female flowers on different plants:—a small specimen exhibited in Feb. 1832 a female spathe of flowers, of which several ripened into fruit; but after germination they decayed. This year the same plant has borne only male flowers.—H.

Cydonia japonica.—In your answer to "A. A." p. 857, you express a doubt whether *Cydonia japonica* will bloom well on a wall with a north aspect. I have on a north wall two plants which bloom as profusely as any that I have seen in other situations. The buds are now appearing in thousands, and some of the earlier are expanded, which I attribute to the late unusual fine weather.—*Quercus*.

Exhibition of Roses in Pots.—It is acknowledged upon all hands that this is unknown ground, and that exhibitors will have to contend with considerable difficulty. Now, I hope that the prizes offered will not be withheld upon the ground that the best collections at the ensuing shows are not what we may reasonably hope they will be at another time. I have no doubt that in future years, it will become as much a matter of course to exhibit in this class as in any other; but there is certainly more credit due to him who shall in the infancy of the thing put upon the table a respectable collection, than to those who, profiting by experience, shall attain to considerable perfection. To private growers the attempt will be attended with considerable expense, and as I have said above, I hope the reward will not be withheld from the best exhibitor, though he be but moderately successful. Let him wear the garland that wins it.—*Rosebud*. [We have no doubt that the Horticultural Society agrees with *Rosebud* in these views.]

Egyptian Silk.—There is a plant very common on the banks of the Nile, both in Upper Egypt and Nubia, and at Dongola. The silk, of which I send a specimen, is manufactured into cords and other substances of domestic use. It usually grows 4 or 5 ft. high, has largish leaves, which generally have the appearance of being sprinkled with white powder, and bears star-shaped purple flowers, with white eyes, about the size of Auriculas. The pod, when green, has the appearance of a large green Peach, but is quite empty with the exception of a small core containing the seeds (enveloped in the silk), which is attached to the skin by small fibres. It is called by the Arabs "Oshour." I have succeeded in raising some small plants of it; only one of which, however, seems likely to thrive.—*C. J. W.* [This is the *Asclepias* (now called *Calotropis*) *gigantea*, which Forskahl tells us is called by the Arabs *Oshour*. It is too tender to live out of a greenhouse in this country. The silky substance surrounding the seeds is of beautiful texture.]

Cabul.—Your correspondent 'R.' has kindly given us the desired information respecting the Holly-oak and other plants alluded to by Lieut. Eyre in the deeply interesting account of his captivity in Afghanistan. 'R.'s sources of information are doubtless authentic, and perhaps he would oblige us still further by explaining to what geological peculiarities the barren Hindoo Koosh owes its sterility, while the Himalayan range, of which the Suffeed Koh appears as the S.W. extremity, is covered with fine forests. It would be highly interesting to know if 'Ivy' has been remarked as growing at Cabul. Several ancient writers describe the Macedonians, under Alexander, to have been thrown into an ecstasy of delight at the discovery of Ivy at Nysa (which is generally believed to be the Cabul country), where alone it was to be found in

the East. The Silphium, spoken of by Arrian, has been conjectured by the late-lamented Sir A. Burnes to be the *Assafoetida* which abounds about Cabul; and from him we learn that Grapes are there so plentiful as to be given to the cattle for three months of the year. This circumstance is a strong corroboration of the identity of Cabul with Nysa, the birth-place and favoured spot of Bacchus.—*Atlas*.

Sugar.—Observing at p. 41 of the *Chronicle* an inquiry by "J. E. M." respecting a plant indigenous to Greece, from the root of which it is intended to extract sugar, and which he thinks is a species of *Narthecium*, I beg to recal your attention to the subject as related at p. 351 of last year's volume, where it is stated to be an *Asphodel*, and in an editorial note presumed to be the *Asphodelus fistulosus*.—*W. W. E.* [We had forgotten all about it.]

Our Prejudices.—How many they are, and how idle! I was never more convinced of this than by a visit to Mr. Beck's. I had always believed that a pot must be porous in order that a plant might thrive in it; indeed, I selected my pottery, though at a great and expensive distance, on account of the pots possessing that quality. Judge, then, my surprise and conviction, when I saw a greenhouse, 26 ft. by 10, filled with *Epacris*, *Heaths*, *Pelargoniums*, *Calceolarias*, and *Cinerarias* all in perfect health and luxuriance, growing in pots of slate—a material perfectly impervious to moisture! If any one is possessed with the same prejudice as myself, let him go and see for himself; and if he be an observer, he may learn more than this: he will find that stoves and forcing-pits can be erected without the aid of engineers; and that there is such a thing as having a potting-shed an ornament, instead of a disgrace, to the garden in which it is placed.—*Convent*.

From the Herbage Book of Richard More, Rector of Redenhall, in the County of Norfolk.—(Factum est istud à Domino, et est mirabile.) One Barleycorn set in my garden about the beginning of Sept., 1600, brought forth 101 ears, whereof 6 grew upon one stem or stalk, and all the rest upon their single and several stalks, and the whole increase of Corn which that produced was as followeth:—Imprimis: Gathered hereof, August 20th, 2 ears, which had in them 31 full corns, 13 withered corns, besides 6, which were lost by birds—in all 54. Item, 24th August, 7 ears, which had in them 208 full corns, besides 12 withered, and 4 perished either by birds or shelling before they were gathered. This one Barleycorn brought forth 96 stalks, whereof one stalk had 6 ears, and all others only single ears, so that in all there were 101 ears, whereof the principal ears had 34 corns a-piece, the second 32, the third 30, and the mean and ordinary sort 28. So that if one indifferently cast them one with another to have but 26 corns a-piece, it will be found, that of this one corn there came 2,626—at 24 a-piece 2,424.—*A. E. K.*

Rhubarb.—Your correspondents at pp. 25 and 37 have recorded their opinions of the Tobolsk and Admirable Rhubarb. I send for your inspection a specimen of the Victoria, six three-year old roots of which were placed in a pit in December; and the accompanying stalks are from these roots, after being hard pulled for three weeks. I do not consider its size worthy of notice, but the quality and colour are equal to, and the roots are as productive as any other variety with which I am acquainted. The mode of forcing which I adopt might be pursued in many situations where pits and frames are not thought of. I convey through the pits and frames the waste condensing water from a steam-engine, by means of which, without further assistance, I can raise Cucumbers, Melons, or force flowers, roots, &c. I am at present about to apply this heat under the surface of the ground to Strawberries and other plants without covering; and if successful, I intend to heat a large surface of open ground—the heat to be applied in the usual season of growth.—*W. R. Morris, Deptford*. [The stalks of the Victoria Rhubarb forwarded to us by Mr. Morris, with the above communication, fully support the character ascribed to it. The average length of the stalks is 14 inches, and their circumference $3\frac{1}{2}$ ins.; that of the largest being $4\frac{1}{2}$ ins. In colour and delicacy of appearance they equal anything of the kind which has hitherto come under our notice.]

Bees.—In answering a "Despairing Beekeeper" at p. 6, "C. S." mentions, among other things, that "the high temperature of the hive complained of might have been prevented, by giving air to the side boxes, and by removing and cleaning the tubes daily." This is partly true; but when so much has been admitted on the instinct of Bees, I may be allowed to ask—if they found the cooling tube agreeable, how came they to seal it up? I should like to know also, if the judges who awarded a prize to "C. S." for 91 lbs. of honey, taken from one hive, saw that great produce weighed,—how long the Bees had been in the hive,—whether only one swarm was put into it, and in what state he expects they will be in during the month of March?—*J. D.*—Many hives have been invented for rearing that most interesting and useful insect, the Bee, most of which are faulty in the essential point of thorough ventilation, without which our little honey-makers cannot prosper. To obtain a proper circulation of air, there is no hive so good as that made of Straw; the temperature being much more equal than in the wooden hives, and for this reason—in the former, the atmosphere penetrates at innumerable orifices, and in small quantities, without draft; whereas in the latter, it can only be admitted at certain places, causing currents injurious to the Bees. In the winter, straw keeps out frost better than wood, and can be made of any shape to suit the fancy of the amateur, without destroying the advantages of free ventilation, which is of such vital importance to the industrious insects. The aspect of the Bee-shed (and it is advisable to have the hives protected both from severe weather and great heat) should

Treatment of the Vine in the Ionian Islands.—The mode of cultivating the common Vine is much the same in all the islands, and appears to be well understood. The Vines are pruned in February and March; about the same time, or a little later, the ground around them is dug with a hoe, and raised in heaps, which are levelled in May. In June the extremities of the young shoots are broken off, and the vintage commonly begins in September; in Corfu, the 19th of September is fixed by custom for its commencement. The vineyards are not commonly manured, nor are the Vines supported by stakes. The latter the proprietors cannot afford to use, the low value of the produce does not warrant the expense. The Vines are kept low, and are generally treated very much in the same manner as in France. In proportion to the poverty and poor-ness of the soil, the greater is the rigour with which the pruning-knife is used. In some rocky situations, as in the district of Erisso, in Cephalonia, where the Vine is planted in the crevices of the rocks, and the rock, it is said, is even hollowed out to receive it, only one or two of last year's branches are preserved, and of these the greater part is removed,—only two or three eyes or buds being allowed to remain. This severity is exercised on principle, and from long experience of its beneficial effects. An intelligent Zantiote with whom I conversed on the subject, re-marked, that it is the property of the Vine to extend its branches much more rapidly than its roots; and in con-sequence, unless severe pruning is used, the branches will exceed in proportion the roots, and the plant will be weakly and unproductive; and he added, that as the fruit-bearing branches are strictly annuals, and derived from buds of the last year, older wood is merely an encum-brance. He had been in England, and he expressed sur-prise at the manner in which the Vine is commonly treated there, by being allowed to be overloaded with old wood; he mentioned too the surprise and astonishment which he excited, by pruning his landlady's Vine, in the neighbour-hood of London, according to the Zantiote's rigorous method. The poor Vine, curtailed of its branches, was considered ruined. In the autumn, however, ample com-pensation was given in a vintage of unexampled abundance—the barren Vine was made fruitful. The cuttings of the Vine, and the early shoots which are broken off, are carefully collected. The latter are given to the cattle; and even the dry branches are similarly used. I have often seen a bundle of dry Vine-twigs thrown before a horse for a baiting, which the poor animal, not being able to get any-thing better, contrived to masticate. The Currant Vine is far less generally cultivated than the common Vine; it is chiefly confined to Zante, Cephalonia, and Ithaca. The attempts to extend its cultivation to the other islands have been partial, on a very limited scale, and attended with doubtful success. This, I believe, is not owing, as has been asserted, to any unfitness of soil in the other islands, for their soil is very analogous, but rather to some differ-ence of climate, especially about the time of ripening, gathering, and drying the fruit; consisting in greater lia-bility to rain, a heavy fall of which is ruinous to the crop, and which, in the Currant islands, during the period of the gathering, is considered as a great calamity. In confirm-ation, I may remark, that equally in Zante, Cephalonia, and Ithaca, the Currant Vine is planted in different soils and in different situations,—in grey marl and in red clay, in the plains and amongst the mountains, where nothing is common except the long, dry, season. A certain soil and situation, however, is considered most suitable for its cul-tivation; especially the calcareous marls, which are easily worked, have great depth, are easily penetrated by the roots, and are retentive of the moisture; and low situations, where water can be easily introduced and irrigation effected. The marl of the plain of Zante contains a little sulphate of lime, and I have detected sulphate of lime in the Cur-rants of that district. It is a question whether this com-pound in a minute proportion may not be beneficial, and whether the excellence of the soil may not in part depend on its presence. The produce being valuable, and the profit to the cultivator often great, much attention has been paid to the Currant plantations. I shall briefly mention the manner in which they are managed in Zante, where, perhaps, the Currant Vine has been brought to its greatest perfection. As abundance of water and irriga-tion are essential to the fertility of the Currant Vine, mea-sures are taken to secure this; and accordingly, the plant-ations are surrounded by mounds of earth and ditches (the ground thrown up in making the latter forms the mounds),

provided with sluices, by which the admission or exclusion, and quantity of water can be regulated. Before the heavy rains in Oct. and Nov. the ditches and mounds are put in order. Both the broad hoe and the spade are used for this purpose, and almost for this alone is the spade employed. The mound is often planted with the Aloe, which, growing luxuriantly in rows and attaining to a large size, has a very stately and striking appearance, and is useful as well as ornamental. It makes, by means of its large, strong, prickly leaves, an admirable fence. The Vines are planted in rows, with perfect regularity, 3 or 4 feet asunder. A new plantation is formed either by laying shoots or by grafting the Currant Vine on the common Vine. The best shoots for propagation are obtained by cutting the parent trunk very low beneath the ground; after this operation, the shoots spring up very vigorously. They are cut off in December, covered with light mould, and planted in spring; 6 or 7 years elapse before they come into bearing. The process of grafting has, of late years, been much in use, since the value of the fruit of the one has exceeded that of the fermented juice of the other, and especially in Cephalonia. It has, moreover, this advantage, that the grafted Vine becomes productive in a much shorter time; in 3 or 4 years it is in full bearing. The operation of grafting is thus conducted:—a pit is dug, exposing the trunk of the common Vine 1 or 1½ foot below the surface; the Vine is amputated as low as this, and two or three perpendicular incisions are made in the stalk with a chisel near the bark, into which the last year's shoots of the Currant Vine are inserted, of such a length as to have two or three eyes or buds above the surface. Then some moist marl is applied to the engrafted part, wrapped in leaves, and bound with rushes, and the earth is thrown into the pit. The season for grafting is, of course, in spring, when the sap is ascending. The pruning of the Currant Vine is an operation said to require much judgment, not as regards time, for that is fixed by custom, but in relation to the quantity of wood to be removed,—the quality and even position of the branches to be left. It is not completed at once, but at intervals. In December the Vines are cleaned; the dead, weakly, and unpromising branches are removed; only a certain number of the more vigorous shoots of the preceding spring are left,—selected on account of their position, and the indications afforded in their buds of their fruit-bearing powers. Towards the end of February, the knife is again applied, and the remaining branches are curtailed, so as to insure active vegetation. Each eye is considered equivalent to a fruit-bearing branch; and no more are left than it is supposed can be amply nourished, 3 or 4 being the usual number. The Currant grounds, where there is a command of water, are flooded from the latter end of October or beginning of November, till the latter end of December, when the sluices are opened and the excess of water is allowed to run off. The after-irrigation is merely to keep the ground moist. About the same time that the Vines receive their last pruning, the earth is moved about their roots, being scooped out round the stems, and piled in small heaps at a little distance, thus favouring the watering of the plants and the warming of the roots, as well as the exposure of the soil to the influence of the air. In April, the ground is moved a second time, and that deeply; then the surface is levelled. Occasionally manure is used; it is, however, far from a general practice. It is said to increase the quantity of fruit, but to injure its quality. The new soil brought down from the hills by rain, is considered the natural and most appropriate manure. The Currant Vine is allowed to grow without check; the ends of its shoots are not broken, like those of the common Vine; and the luxuriance of its annual shoots, in favourable circumstances, is extraordinary. They are always supported by stakes. Great care is paid, at all seasons, to the Currant plantations, especially in spring, when vegetation is commencing, and the opening buds and young shoots are so tender as to be very susceptible of injury. If the bud is broken, the embryo bunch is destroyed. The Currant Vine is one of the earliest kinds. Its fruit is often sufficiently ripe for the table in the last week in July: it is then of a purplish hue, not too luscious, as when thoroughly ripe, but agreeably sweet and sub-acid. The period of the vintage in the plain of Zante is commonly in the middle of August; and this is a very interesting and important period to the Zantiote.—*Davy's Notes and Observations on the Ionian Islands.*

On Wood.—"He would if he could."—*Old Proverb.*—Wood may be divided into several heads; and my own head has consequently come in for a fair share of it. There is the Lignum Vitæ, or the log of life, which may be taken to represent a living log, and of these I have several specimens in my own family. The woods and forests are an interesting branch of this subject. These woods begin at Waterloo-place and end somewhere about Albany-street. Where the forests are, has not been discovered; but perhaps they extend as far as the Fishmonger Groves at Charing-cross. These woods and forests are capable of granting leave to persons who wish to build; but they do not seem to partake in any other manner of the florescent character. Wood pavements are an innovation on all old practices; though it is contended that they are only an extension of the ancient custom of wearing wooden legs, which involved the necessity of walking on wood, at least, in some measure. It is true there is a street called Wood-street, Cheapside; but though I have inspected the pavement very minutely, and tested the materials by scratching with my nails, I have not arrived at anything satisfactory. My objection to paving with wood has been accounted for by saying that I cannot bring myself to approve of a practice of trampling upon what, in reference to the heads of the City, may be called our

own species. This I deny! It is said in favour of wood, that it enables one to go quietly on one's way, but I had rather make a noise in the world, and if one pays a good price for a carriage, one ought at least to have the luxury of hearing the wheels rattle. It may be said in favour of the antiquity of wooden pavements, that there is an old expression about "hallooing before we are out of the wood." Perhaps there is an Act of Parliament prohibiting the itinerant vendors of certain commodities to cry their wares at halloo until they are out of the wood. I say, there is, perhaps, such an Act of Parliament, but I am bound to admit that perhaps there isn't. In conclusion, let me say, that I am not a bigoted enemy of wood paving, and I am still ready to consider the matter, or, in other words, to give my head to it.—*Punch.* [Antiquities of Gardening; Green Peas.—The taste for Green Peas appears to have been carried to great excess in the time of Louis XIV. Bonnefonds mentions them in his "Jardinier Français," 1651, and describes them as the Dutch Pea, or Pea without shell; and adds, "Until very lately they were exceedingly rare." Roquefort says they were first introduced by M. de Buhl, the French Ambassador in Holland, about 1600. The author of a Life of Colbert, 1695, says, "It is frightful to see persons sensual enough to purchase Green Peas at the price of 50 crowns per litron" (little more than an English pint). This kind of pompous expenditure prevailed much at the French Court, as will be seen by a letter of Madame de Maintenon, dated 10th May, 1696. "The subject of Peas, continues to absorb all others," says she; "the anxiety to eat them, the pleasure of having eaten them, and the desire to eat them again, are the three great matters which have been discussed by our Princes for four days past. Some ladies, even after having supped at the Royal table, and well supped too, returning to their own homes, at the risk of suffering from indigestion, will again eat Peas before going to bed. It is both a fashion and a madness." It is curious to remark that, notwithstanding the fashion and consequent high price of the article, to produce them in the beginning of May was the earliest period that the art of Horticulture was at that time capable of.

Mr. Weekes's Annual Dinner.—The fourth anniversary dinner given by Mr. J. Weekes to the various members of the Horticultural profession was held on Thursday evening last, at his manufactory, in Gloucester-place, King's-road, Chelsea. The room was handsomely fitted up for the occasion, and was crowded with guests, principally gardeners, who collected to the number of a hundred to do honour to their host's hospitality.

Source of Fat in Animals.—The observation by Liebig, that the fibrin of plants and animals is identical in its composition, led to the inevitable conclusion, that the animal organisation merely modifies the state of the substances presented to it by the vegetable kingdom, and does not form any solids, as plants do, from their gaseous constituents; or, in other words, the fibrin or curd of milk exists ready formed in the vegetables which serve as the food of the cow, while the main constituents of the blood, in like manner, are derived directly from the vegetable matters which constitute the food primarily of all animals. No exception could be urged to this affirmation in reference to the formation of blood and muscle. The anomaly which presented itself was in the instance of fat, which, as far as experiment had carried us, did not appear to exist in sufficient abundance in vegetable food, to authorise us to ascribe its origin to such a source. Liebig quotes the instance of a lean goose, weighing 4 lbs., which, in 36 days, gains 5 lbs. weight by consuming 24 lbs. of Maize, and yields 3½ lbs. of pure fat. The latter could not be derived from the Maize, said Liebig, because Maize, according to such experiments as had been made upon it before Liebig wrote, did not contain the thousandth part of its weight of fat. The ingenious views of Liebig have led Dumas and Payen to make a series of experiments, for the purpose of determining the quantity of fatty or oily matter in Maize. They have found 9 per cent. of yellow oil to exist in this vegetable; hence they conclude, when a lean goose eats 24 lbs. of Maize, it takes up 2½ lbs. of fatty matter, which, with the fat previously existing in the animal, is sufficient to account for the source of the 3½ lbs. of fat. Dumas adds the remarkable intelligence, that Hay, such as it is met with in the trusses eaten by animals, contains 2 per cent. of fatty or oily matter.—*Proceedings of the Philosophical Society of Glasgow.*

Truffles.—The Paris states that at the last market held at Angoulême, 2000 lbs. of Truffles were sold at 3f. 25c. per pound. "A farmer at Dordogne," says that journal, "has found means of cultivating Truffles like any other vegetable. It has been ascertained that they grow near or under the shade of a peculiar species of Oak. This person planted some years ago a considerable number of those Oaks, and we have been assured that he sold last year 100,000f. worth of Truffles. He expects this year to realise by their sale double that amount."

GARDEN MEMORANDA.

Dr. Neill's Garden, Canon Mills, near Edinburgh.—This is situated on the north side of the town, and although a small spot, is nevertheless very interesting, on account of the number of new and beautiful plants which have been raised in it, and disseminated throughout the country. In one of the stoves we observed a noble specimen of the Coffee-plant in high health, and covered with berries. In the same house there are good specimens of the Mahogany-tree, the Pimento, Nepenthes distillatoria, and various other objects of interest. Dr. Neill has been much annoyed with the new railway from Edinburgh to Leith, which threatened at one time to destroy his garden; but we were glad to see that it is still uninjured, although the Loch by the side of it has been completely drained. Every lover of science and horticulture in the country would have felt nearly as much as Dr.

* *Pois sans Parchemin*, is a variety cultivated at the present day, the pods of which, being destitute of tough lining, are used like those of Kidney Beans.

Neill himself had anything happened to this garden. We understand that the Caledonian Horticultural Society have requested him to sit for a bust, to be executed by Mr. Steele, in marble, which is to be placed in their new hall at the garden.—R. F.

Reviews.

Popular Flowers: The Geranium; its Propagation, Cultivation, and General Treatment in all Seasons. By Tyas and Co.

THIS is the first of a series of Treatises, each to be devoted to some popular flower. In the introductory remarks the Author states, that "It is matter of surprise that so few of those who possess them (Pelargoniums, are so little acquainted with their proper treatment, simple though it be; and the pleasure they feel in beholding their beauty is marred by seeing them prematurely decay, droop, and die. For such these few pages are compiled." We wish we could say they were likely to answer that purpose; but the work bears evidence of not being written by a practical person, and the Author loses sight of the object with which he started; for, although some of the directions are good, others are insufficient for the purpose, and a few would lead to curious results: for instance, to extirpate the green-fly, the Author recommends the eggs to be destroyed in winter, and as the cheapest mode, to "wash your plants with hot water at 200 degrees!" To instruct persons so ignorant of the management of flowers as the Author supposes the generality of people to be, requires that the directions for the different operations should be much more precise and ample than those which he has supplied.

CALENDAR OF OPERATIONS for the ensuing week.

ACTIVE preparations must now be made for sowing seeds. New or well-cleaned pots, plenty of drainage, and light, dry, loamy soils, with dry sand and peat, will be indispensable. Nurserymen and gardeners who have command of stove-heat have sown many seeds last autumn, which those who have no such conveniences must have delayed till the return of spring. The seeds of such plants as are liable to damp off in winter, or are otherwise difficult to manage through their early stages, are generally not sown till this time. *Ipomoea rubro-carulea*, with *Thunbergia alata* and its varieties, belong to this class; also later-ripened seeds of fancy flowers, such as *Pelargoniums*, *Calceolarias*, *Fuchsias*, and many other florist's flowers. Many amongst these are too precious in the eyes of the possessor to be risked through the vicissitudes of a long winter, but they are safe now, and must be got forward with all possible speed. The *Thunbergia* seldom germinates under three or four weeks, even in the warmest hotbed, in which it delights; *Ipomoea rubro-carulea* soon springs up, but not too quickly now for a plant which flowers so late in the autumn, after all other *Ipomoeas* have bloomed. August is the best time to sow it, where it can be carried through the winter on a dry shelf in the stove. Early last autumn I grafted many of these on young plants of *Ipomoea Learii*; they have all succeeded, and some of them are showing flower-buds. If these should grow as freely as seedlings, this will be the best plan for seeding them; at any rate, this is the easiest way to keep them through the winter, and to increase them. The beautiful Swan Daisy (*Brachycome* never germinates under a month or six weeks, it ought, therefore, to be amongst the first sown, in order to have strong plants fit to turn out in May. Independently of the brilliancy of its blue starry flowers, it is the best of annuals for a very dry summer like the last; but with many other small flowering Syngenesious plants it suffers much from wet. We had several beds of it here last season blooming freely for nine or ten weeks, with scarcely any assistance from the watering-pot. I think we shall always have to treat it as a half hardy plant at first. A correspondent at p. 235 of last year's *Chronicle*, sowed seeds of it late in the autumn, and kept them through the winter in the greenhouse, and they all vegetated in the spring. The seeds of this blue Daisy, though as small as dust, are thus proved to possess strong vitality. Every one who has been accustomed to gardening knows how to sow seeds; a few simple rules will therefore be sufficient for those who are just commencing. Whatever sized pots you use, it is a good rule to fill them up one-half with drainage; rough-sifted coal-ashes are as good as anything for this purpose. Very small seeds, such as those of *Lobelias*, *Calceolarias*, *Gesneras*, and the whole tribe of *Rhododendrons*, *Azaleas*, and *Heaths*, require to be sown very thinly upon the surface—the pots being previously watered. Only one kind of seed should be sown in a pot, as these are liable to be disturbed by watering, and thus get mixed together. After sowing, press the seeds down gently, to imbed them in the surface, and sprinkle a little white sand over them; not, however, with a view of covering the seeds, but to make a firmer surface, which future waterings will not so easily disturb, and which will, in a great measure, prevent dampness. As a further precaution against damp, to which these small seedlings, and many other things, are peculiarly liable on their first appearance, keep a potful of sand on the top of the fire-place, or over a hot pipe or flue, for the next four months; and as soon as tender seedlings of any sort make their appearance, sprinkle a little hot sand in amongst them occasionally, whenever they show any indications of dampness. I have never found this plan to fail. Let "Inquirer" follow this plan, and his seedling *Rhododendrons* will quickly be nice plants. As soon as he can take hold of them, he ought to transplant them into fresh soil, one half peat and the other half sand. Indeed, all seedlings in pots should be transplanted as soon as they can be safely handled. When several kinds of seeds are to be sown in one pot, as must often happen when a large number of packets are received from abroad, the seeds must be sorted, and those which bear the nearest resemblance to each other should be sown in one pot; thus, for instance, seeds of common Broom, the old blue Lupine, and Cobbett's Locust-tree are suited for one pot; the stones of Peaches, Cherries, and Plums would answer with another; Nuts and Filberts for another. However, after all the pains we can take, some of the seeds will vegetate before the rest. All sorts of seeds in pots should merely be covered with soil, especially if they have travelled far, or are at all doubtful; and no more water should be given them than will keep the soil from getting quite dry.

I am sure there are thousands of the same opinion as "An Inquirer" at p. 54, who thinks that "a series of papers on the management and decoration of conservatories in more full detail would be generally acceptable." I shall endeavour from time to time to point out the most useful plants for this purpose, with an outline of their management, in the same manner as a few were given last week. As to *Orchidaceae*, they are, of all other plants, while in flower, the most suitable for a conservatory; and to give a list of those fit for this purpose would be to reprint Messrs. Loddiges' catalogue of them. At different times, I have seen a thousand species and varieties of them in flower, every one of which would live when in bloom, and their flowers would last longer, in a temperature of from 45° to 50°; which is the most suitable heat in winter for a house attached to living rooms, because the comfort of the family, as well as of the plants, is to be taken into account. A great many of the splendid *Dendrobiums* are coming into flower now, after being kept dry for the last two months; if these are taken into a moist atmosphere, and supplied with water in succession, they may be had

in bloom till May. A stove plant, just making its growth in spring, would, indeed, be apt to droop by a sudden change of temperature; it would not, therefore, be advisable to remove it till the young growth was a little hardened. Whenever danger is apprehended in this way, let the new comer have the warmest and quietest corner, till he gets a little accustomed to the change. The *Hedychium*, fortunately, are the easiest of all plants to manage and to increase, and they are as sweet as the Italian *Tuberosus*. They may be kept dry for three or four months in winter, if necessary, or they will grow very well out of doors in front of the Vinery or stove, and live over the winter with little or no protection; but I am not aware that they have yet been flowered in the open air in this country. They have long, creeping, underground stems, which float near the surface of marshes in the tropics, in the same manner as our *Sedges* (*Iris pseud-acorus*) do in ponds and ditches. These creeping stems are full of eyes like a Potato; every piece, however small, with an eye, will make a plant. But to flower them the same season, take strong pieces five or six inches long, and pot them in very rich loam; plunge the pots in the Cucumbers frame, and as soon as they begin to grow, recollect they are marsh plants, and can hardly have too much moisture. They will soon get too tall for the frame, and may be removed to a Vinery, Stove, or any other place where there is plenty of heat and head-room. They will require two pottings before they flower; rich, strong loam should be used for the last. As the bottoms of the stems throw out roots, you may pot them a little deeper each time. Later in the season it will be as well to start them in a Vinery, and as soon as they begin to throw up their flower-stems, move them towards the door, to harden them before they are taken to the conservatory.

1.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—See that you have a stock of dry, rich loam in an open shed for potting by-and-by. If you use tan, you will find it very troublesome, unless it is thoroughly dry and sweet before putting into the beds. Strong fires have not been wanted lately, neither have we had much sun, so that little water and syringing are wanted. The plants have seldom been more healthy at this season, owing, no doubt, to the large portions of air given and the small quantity of coals used.

VINERY.—How strongly the Vines break this season! The borders have not been chilled; and, being so well drained, they retain no superabundant moisture. Though the Vine is very thirsty in summer, it luxuriates in a dry, warm bed in winter. Plenty of air and moisture are now required.

PEACH HOUSE.—The bees have been busy here for the last ten days, carrying home loads of pollen every night. Who would shut up bees such weather as this! They have also found out the Strawberries and Kidney-beans in flower; but they are frightened at the Stanhopeas.

CHERRY-HOUSE AND FIGS.—Same as last week, if there is no alteration in the weather.

CUCUMBERS AND MELONS require the usual routine of air, heat, and moisture, and a good supply of young plants to be kept in reserve, till the first crops are fairly established in the fruiting beds. I have had some letters lately about long Cucumbers, but the subject is not of sufficient public interest to be noticed in the Calendar; and I cannot undertake to answer letters from strangers.

POTATOES, CARROTS, RADISHES, CELERY, and CAULIFLOWERS, with Herbs, Lettuce, &c. may be forwarded on slight hot-beds through the spring, according to the wants of the family; also on warm borders. If the soil is too wet when you want to sow anything out of doors, sift a barrowful of light soil from the dry sheds, and lay an inch or two of this all over the border; on this sow your seeds, press them gently down, and cover them with the dry soil according to their sizes.

Out-door Department.

When the Peaches and Apricots are just ready to open their blossoms, you must be ready too with a wash of lime, soot, sulphur, and soft soap, to paint them all over. The later this is done the better. For the other trees on the wall, or in the orchard, six weeks hence will be time enough to wash them; but for any of those on which you have noticed any red spider for the last season or two, you must mix a portion of sulphur with the soot and lime.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Provided the stove plants are clean, there is little to do among them now. They will become more easily excited every day, and they should therefore be kept cooler at night with air for three or four hours in the day time. If the thermometer is between 55° and 60° in the morning, there can be no harm on either side; and with a little fire in the morning, you can give air early. Young *Orchidææ* will persist in growing this spring with the slightest excitement; probably the heat of last season ripened them better and earlier than usual. They had better be assisted rather than checked now; for if they once get deranged they are not brought round again so easily as most other plants. A few of the *Lantanas* may now be brought from the cold houses to get them forward for flowering in the conservatory next June. They are useful plants when treated thus. After flowering, they should be closely pruned, and if they are merely saved from the frost through the winter, it is enough. Very little heat will make them grow away freely in spring, and the usual criterion for potting at this time is when the eyes are just beginning to swell. All plants that have been a long time at rest may also have all the soil shook from their roots when they are beginning to grow; their roots may thus be examined, and pruned if they are too many or too strong. They may then be potted in fresh soil and in small pots at first: they will then require several pottings through the season, as the pots become full of roots; *Lantanas* require rich light soil, and to be watered once a week with liquid manure. *L. aculeata* and its varieties are the tallest sorts, and will answer well if trained up like Standard Roses, and pruned in a similar manner in the autumn. *L. munda*, *violacea*, and *crocea*, are not so tall, and look better as low bushy plants.

GREENHOUSE AND CONSERVATORY.—There is no place like the conservatory after all. If I had a hundred hot houses, I would not grow a single flowering plant unless I could bring it into the conservatory while it was in flower, with the exception of Heaths and good specimens of *Epacris*. These are soon stifled in living rooms and conservatories, but fortunately they are very cheap in the nurseries. A hundred nice little plants of them may be had at any nursery at a shilling each. *Pelargoniums* are the most accommodating plants for the conservatory; we have them in full flower here from January to October. The forced ones bloom till May, and after the general stock has done flowering by the end of June, the February cuttings and retarded old plants carry us through to October. Anna Boleyn Pinks we have regularly in flower ten months in the year: the first crop is just beginning to bloom. Pippings put in last October will soon be played out on a warm border; these will flower next June after the regular stock has bloomed in the open ground, and pippings put in now will follow these through July and August; while the March cuttings will come in later. In September we pot many of the more backward flowering ones to preserve them from frost; these will yield a few flowers till Christmas, or at least till late in November. *Acacias* should never be planted out in the borders of the conservatory, they are so greedy, that no other plant has a chance of growing within their reach; as early flowering plants, they are very useful to be brought in, but they do much better out of doors in summer. If a well-grown specimen of the old *Acacia armata* were to be shown now in flower for the first time, and said to be from Mexico or China, would it not make us stare? Two or three dozen good plants of this would keep up a succession of flowers from New Year's day till the middle of May. *Camelias* and *Oranges* are the best plants to plant out permanently in the conservatory, and as they require but little nourishment,

the climbers will have a better chance of success. The *Kennédias*, *Gompholobiums*, and similar delicate climbers, are always best near the eye, and on that account are better fitted for pot culture, and trained on such wire trellises as have been lately figured in the *Chronicle*, than to be planted out in the borders of large conservatories. *Passion-flowers*, *Ipomoeas*, strong *Bignónias*, indeed strong-growing climbers in general, are only to be seen to perfection when planted out in rich well-drained borders. Where can you find a better climber for the conservatory than the old *Plumbago capensis*, which will produce hundreds of spikes of flowers for four or five months, say from May to September? Look at the same plant in the largest pot that can be made, and it is nothing; I will, however, devote a chapter to climbers when the Calendar gets a little lighter.

PITS AND FRAMES.—As the forcing plants are taken away from these, keep filling up with plants from the greenhouse, if it were only to keep some of them more backward in flowering. To have a large stock of such plants as suit the demands of families rather than a large collection of species, is one of the grand secrets in gardening; and to have the different families in different situations, with a view to have them flower at different periods is the next. Where you see a dozen or two of the same species in flower for a few weeks, and then a blank for the rest of the year, you need not expect to find the philosopher's stone very near such a place. It is hardly necessary to say that no covering is required for cold pits in fine weather, except to keep off rain, and guard against frost.

Out-door Department.

Let not another day pass without uncovering half-hardy plants that have been so thickly covered in anticipation of a hard winter. Let there be no delicacy at all about this matter; strip them all; and if you find that any of the shoots or eyes have made a blanched growth, cut them off, and leave the plants quite exposed; but keep the coverings at hand, to be put on whenever the thermometer falls four or five degrees below freezing. If you hear anything about "sudden changes," say they are very dangerous on paper, but harmless in the open air, this mild season.

NURSERY AND FOREST DEPARTMENT.

FOREST AND COPSE.—One of the earliest plants to grow is the common Hawthorn or Quick; their buds are always forward by the end of February—indeed, they are beginning to swell now; yet the nurserymen seldom get their spring orders for this plant till many weeks after their planting season is over. Are you going to plant any Quick this spring? Of all things belonging to our rural economy, the things we manage worst in this country are our hedges and hedge-row timber. However, we must first drain our lands, then subdivide them by degrees, and plant according to the soil, and with an eye to the adjoining crops.—*D. Beaton, Shrubland Park Gardens, Ipswich.*

State of the Weather near London for the Week ending Feb. 2, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.			THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 10th in 1831—thermometer 65°; and the lowest on the 5th in 1830—thermometer 10°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Feb. 3, 1843.

LITTLE alteration has taken place in the prices during the past week; the supplies have been good, and the demand for some kinds of fruit has been a little brisker. *Fruit:* Pines, considering the earliness of the period, are well supplied from 3s. to 5s. per lb. Foreign Grapes of excellent quality continue to be brought to market. Pummelos are less abundant. A few Malta Blood and Tangerine Oranges are offered; the former from 3s. to 4s. per dozen; the latter, from 2s. to 3s. per dozen. Dessert Pears are becoming less plentiful. Amongst the Dessert Apples are the American Lady, from 6d. to 1s. per dozen; Nonpareils, from 4s. to 12s. per bushel; Ribstone Pippins, from 5s. 6d. to 7s.; and Golden Harvey, at 4s. per bushel. We observed some excellent samples of Shepherd's Seedling and Alfriston Apples, both of first-rate qualities for culinary purposes: the former from 4s. to 5s.; the latter from 4s. 6d. to 5s. 6d. per bushel. There are still a few Lemon and Blenheim Pippins remaining, from 4s. to 5s. per bushel. A few Cucumbers are offered, at the price quoted in our last report. *Vegetables:* The supply of Asparagus is considerably greater than the demand; its quality is good, and the best bunches fetch from 4s. to 8s. each. Seakale continues good, and may be had from 6d. to 1s. 9d. per punnet. French Beans are scarce, and have risen to 3s. and 3s. 6d. per 100. Broccoli is something cheaper: the White being from 9d. to 2s. per bunch; the Purple, from 6d. to 1s. 3d. per bunch. Good Rhubarb is tolerably abundant, and fetches from 6d. to 1s. 3d. per bundle. Cardoons are occasionally offered, from 1s. 6d. to 2s. each. Mushrooms are plentiful, from 4d. to 9d. per pottle. *Flowers:* The continued mild weather has rendered the supply of cut flowers unusually large. Amongst them are *Acacia armata* and pubescens, *Passiflora racemosa*, *Rondeletia speciosa*, *Euphorbia jacquiniiflora*, *Amaryllis vittata*, *Lily of the Valley*, *Omphalodes verna*, Chinese Primroses, Tulips, Hyacinths, &c.

PRICES, SATURDAY, Feb. 4, 1843.—FRUITS.—

Pine Apple, per lb. 3s. to 5s.	Cucumbers, per brace, 4s. to 6s.
Grapes, Spanish, per lb. 1s.	Melons, Spanish, 3s. to 4s.
Portugal, 1s. to 2s.	Walnuts, per bush., 12s. to 16s.
Apples, dessert, per bush., 3s. to 7s.	Chesnuts, per peck, 3s. to 6s.
Kitchen, 2s. 6d. to 6s.	Almonds, per peck, 6s.
Pears, dessert, per doz. 5s. 6d. to 12s.	Sweet Almonds, per pound, 3s.
Pummelos, per doz., 9d. to 2s.	Filberts, English, per 100 lbs. 60s. to 65s.
Oranges, per doz., 9d. to 2s.	Cit Nuts, per 100 lbs., 70s. to 80s.
per 100, 4s. to 12s.	Nuts, per bushel—
bitter, per 100, 8s. to 14s.	— Brazil, 16s.
Malta Blood, per doz., 3s. to 4s.	— Spanish, 18s.
Tangerine, 2s. to 3s.	— Barcelona, 24s.
Lemons, per doz. 1s. to 2s.	— Cob, 14s.
per 100, 5s. to 14s.	

VEGETABLES.

Savoy, per doz. 3d. to 1s. 3d.	Parasprays, per dozen, 6d. to 1s.
Cabbage, White, per doz. 2s. to 4s.	Spinach, per sieve, 1s. 6d.
plants, per doz. 1s. 6d. to 2s. 6d.	Leeks, per doz. bun., 1s. 6d. to 2s. 6d.
Red, for pickling, 2s. to 4s. 6d.	Onions, per bushel, 5s. to 6s.
Brussels Sprouts, per hf. sv. 1s. to 2s.	Pickling, per hf. sv. 3s. 6d. to 4s. 6d.
Broccoli, White, per bunch, 9d. to 2s.	Green, p. doz. bun. 4s. to 4s.
Purple, 6d. to 1s. 3d.	Spanish, per doz. 2s. to 4s.
Beans, Kidney, forced, per 100, 3s. to 3s. 6d.	Garlic, per lb. 6d. to 8d.
Potatoes, per ton, 40s. to 70s.	Shallots, per lb., 1s.
per cwt. 2s. to 4s.	Asparagus, large, per 100, 4s. to 6s.
per bushel, 1s. 3d. to 2s. 6d.	Second, 2s. 6d. to 3s. 6d.
Kidney, per bush., 1s. 6d. to 2s.	Spruce or Small, 2s. to 2s. 6d.
Scotch, per bushel, 1s. 6d.	Sea-kale, per punnet, 6d. to 1s. 6d.
New, per lb., 6d. to 8d.	Lettuce, Cab., p. sv., 4d. to 6d.
Jerusalem Artichokes, per half-sieve, 1s. to 1s. 6d.	Cos, 9d. to 1s.
Turnips, per doz. bun., 1s. 6d. to 2s. 6d.	Endive, per score, 9d. to 1s. 6d.
Red Beet, per dozen, 9d. to 1s.	Celery, p. bd., (12 to 15) 6d. to 2s.
Scorzenera, per bundle, 1s. 8d. to 1s. 6d.	Rhubarb Stalks, per bundle, 6d. to 1s. 8d.
Salsafy, per bundle, 1s. 3d. to 1s. 6d.	Small Salads, per punnet, 2d. to 3d.
Cardoons, each, 1s. 6d. to 2s.	Corn Salads, per hf. sieve, 9d. to 1s.
Horse Radish, per bundle, 1s. 6d. to 4s. 6d.	Watercress, per doz. sm. bun. 4d. to 6d.
Radish, per doz. hands (24 to 30 each) 9d. to 1s.	Parsley, per half-sieve, 1s. to 1s. 6d.
Turnip, p. doz. boh., 1s. to 1s. 6d.	Fennel, per doz. bun., 2s. to 4s.
Carrots, per doz. bunch, 4s. to 6s.	Sage, per doz. bunches, 2s. to 3s.
Horn, per bunch, 4d. to 6d.	Mint, per doz. bunches, 2s. to 4s.
	M. strumma, per pottle, 4d. to 9d.

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—(The Publisher repeats the following notice, as, since last week, Five more Numbers are out of print.)—We are so often applied to for particular Numbers of the *Gardeners' Chronicle*, to complete sets, and so many are now out of print, that we think it will save all parties trouble if we publish a list of the Numbers which may still be had. Any subscriber who will forward to our Publisher post-office stamps equivalent in value to as many Numbers as are required, shall have them sent. If parties find that they have any duplicates, or wish to part with their back Numbers, we shall be glad to exchange them, if clean.

1841: 1, 2, 4, 5, 6, 7, 8, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 41, 47.

1842: 4, 5, 6, 8, 9, 10, 11, 12, 16, 18, 24, 39, 41, 50, 51, 52.

SOILS.—A. E.—We are not aware that chalk or limestone are injurious to the growth of Peas as a vegetable. It is known that quicklime, employed for the destruction of slugs which infest young crops of Peas, does not injure the plants.

MANURES.—A. L. M.—We presume that the reason why your gas-water, diluted to the extent of 7 times its bulk of water, proved too weak, was, that it had originally little strength. There is no uniformity in this respect at the gas-works. What we have about London is, we understand, very much stronger than that of the country. Now is an excellent time to apply it; if mixed with liquid manure, so much the better. But you should fix it with sulphuric acid, or some other cheap substance. The addition of gas water to compost heaps, and collecting of weeds, is an excellent method of employing it; but in all these cases it should be fixed, or a large proportion of the best part will fly off. We have discontinued giving the price of manures because there is no uniformity among the vendors. Guano, for example, is charged by one house 11s. a ton; and by another, 20s. Your best way is to apply to the advertisers for their prices.

A. B.—You will find an account of the effect of nitrate of soda upon Beans at p. 821 of last year's *Chronicle*.—J. M.—We cannot of our knowledge state whether guano is a good manure for Potatoes; but good crops have been grown upon land manured with guano alone, as you will find by referring to an account of some experiments at pp. 693, 710, and 806 of last year's volume.—X. Y. Z.—It does not much matter what sort of peat you mix with fermenting stable litter; the heathy black soil will decompose more easily than the peat from which turves are cut, and is, so far, the better of the two. If you have these materials, and are near gas-works, we would advise you to try the experiment of rotting them with gas-water. It is well worth doing; and then, perhaps, in return for our advice, you will favour us with the issue of the experiment.—A Friend.—Tan cannot be advantageously used for manure until it has been rotted; which is best effected by mixing it with decaying matters in a state of strong fermentation; stable litter will do. You cannot do better than mix the contents of your cesspool with mould, cinder-siftings, or any such substance; do not employ lime, unless in the form of chalk or lime rubbish. If you can get ammoniacal liquor, mix that with your Tan and throw it in heaps; or with leaves, weeds, and similar rubbish. Now is a good time to dress Grass-land with such matters, if ready.—H. B.—We are very sorry to hear that you have been mixing salt with the contents of your cesspool. By no means continue to do so; but ascertain, by pouring some, mixed with four times the quantity of water, upon Grass, whether it can be used at all or not. We fear it will turn out that you will only be able to employ it by mixing it with a large quantity of black mould or cinder-siftings, or charcoal dust, or fine coal, and converting it into compost. It will, however, in its present state, mixed with four times the quantity of water, be well suited for Asparagus, Sea-Kale, Celery, the Cabbage tribe, and any other plants that are found near the sea.

NITRATE OF SODA.—J. S.—The rate at which this has been successfully applied to Strawberries is 3oz. to the square yard. The proper season for using it is when the plants are just beginning to grow. For information respecting the application of salt to Asparagus-beds we must refer you to pp. 729 and 760 of 1842.

CLOACINE.—S. G.—For an explanation of the meaning of this word, see p. 824 of the *Chronicle* for 1842.

VINES.—J. A. and J. B.—You must either make up your mind to introduce all the Vines into your house at once, or to dispense with the use of hot dung upon the border inside, because, the Vines being planted within the house, the heat of the dung will set in motion the sap of the Vines outside, as well as of those within, and the consequence would be, that the first frost would prove fatal to the former. The Chasselas de Fontainebleau is the same as the Sweetwater, and does not possess a musky flavour.—Flora states that she has a Vinery with the Vines planted within it, the roots being unable to extend beyond its walls. The lights have never been taken off, as the house is used for wintering plants. The hot-water pipes have from necessity been in action during the winter, and the roots of the Vines have not been watered since last September. She wishes to know if it is right to withhold water until the buds begin to move? [Certainly not; the borders should be watered immediately, as the heat from the pipes must necessarily have rendered them very dry. If this is delayed until the buds begin to swell, the Vines will break very weak.]

CHIMONANTHUS.—H. D.—This genus contains only two species or three varieties. They are all profuse flowerers, are equally hardy and equally fragrant.

ALTHEA FRUTEX.—C. W. R.—This plant, which is now called *Hibiscus Syriacus*, is propagated by seeds and layers, and will grow in any open situation where the soil is tolerably good.

RHODOENDRONS.—A German.—*Rhododendron lepidotum*, *campanulatum*, *cinnamomeum*, *barbatum*, and *anthopogon*, have been introduced from Nepal; *R. macranthum* and *reticulatum* from Japan; but we know nothing of the two latter.

MIGNONETTE.—A Subscriber.—Your treatment of this plant cannot but be right, if you have a large quantity of it now in flower. It is the lowness of temperature in the house where it is grown that causes it to be destitute of perfume. If you convey the plants to a warm room or conservatory they will soon regain their fragrance.

CREPERS.—*Dianthus*.—For training over trellis-work in a narrow shady passage, we know no creepers so well adapted as *Clématitis flammula*, *grata*, *viticella*, and *Hendersoni*.

CLIMBERS.—J. R. W.—We know of no Climbing-plant except

Ivy that would cling to a rough-cast wall without being secured to it in some way or other. With occasional fastenings, Ampelopsis quinquefolia or Virginian Creeper, Clematis viticella and flammula would be the best for your purpose.

PERENNIALS.—*J. J.*—The following are 12 handsome perennials with their English names:—Showy Stenactis, handsome Evening Primrose, large fruited do., great-flowered Larkspur, double var., various coloured Monkshood, elegant Starwort, Iberian Crane's-bill, Gentian-like Pentstemon, creeping Lychnidea, bristle leaved do., sweet scented do., and American Cowslip.

OAKS.—*W. F.*—Your Oak, although not the Holly-Oak of Cabul, is a curious plant. We do not know it. If you have a duplicate plant, we should be much indebted to you for one. Lime rubbish is a good material to warm and lighten the soil in which the Ilex is cultivated.

SCOTCH FIR.—*J. M.*—The Scotch Fir, like all other trees, indicates its having attained its full growth when its extremities begin to die off, or when little change takes place in it from year to year. A Scotch Fir is seldom worth leaving longer than 60 years.

ACHIMENES LONGIFLORA.—*J. J.*—We never had the slightest difficulty in making young plants of Achimenes longiflora form bulbs, unless the cuttings were struck very late in the season. Even then, little scaly buds are formed round the base of the stem; which, with care during winter, will make good plants next year. Cuttings may die down without producing bulbs, but in this case they have not grown well, or have been struck very late.

TROPEOLUM MORITZIANUM.—*A Constant Reader.*—After this plant has bloomed, water should be gradually withheld from it, and the pot containing the tuber should be stored away in some dry situation, until the season for starting it into growth returns. The tubers should then be repotted, and placed in a gentle heat.

VERBENAS.—*A Subscriber.*—If Verbenas are wanted for blooming in pots, they should be kept regularly shifted into pots of a larger size as they require it, and should be grown either in a pit or greenhouse, where they receive the full benefit of the sun and air. Any free, rich soil will suit them.

MUSA CAVENDISHII.—*A Subscriber.*—To grow this plant properly it should have a house entirely devoted to it. It will, however, attain to tolerable perfection, if planted out in the corner of a Pine-pit, where there is sufficient room for the full expansion of its leaves. The soil which suits it best is a mixture of sandy loam, partially decomposed manure, and a little sand. Musa Cavendishii delights in a strong moist heat, and should be frequently syringed over-head, especially during the summer months. When grown in tubs, the latter should be well drained, as the plant requires to be liberally supplied with water, which should never be allowed to stagnate about its roots. For further information we must refer you to p. 101 of the *Chronicle* for 1841.

VIOLETS.—*A Berkshire Subscriber.*—From your statement we should suppose that your Neapolitan Violets have received too much water, or that the frame in which they have been grown has been kept too close in damp weather. Water should only be applied to them when they really want it, and then it should be given freely, and early in the morning, so that the plants may have plenty of time to dry before the frame is closed.

TREE-VIOLET.—*Hants.*—Although called the Tree-Violet, you must not expect that this plant will ever attain a gigantic size. It seldom, under the best treatment, acquires a greater height than two feet. If kept in a rather shaded part of the greenhouse, and potted in a mixture of sandy peat and loam, with proper attention paid to it as regards air and watering, it will soon repay you for your trouble.

FUCHSIA CORYMBIFLORA.—*C. W. R.*—We suspect the best mode of flowering Fuchsia corymbiflora in the open air will be, to grow it away freely in spring in a greenhouse or pit; and, as soon as there is no longer any fear of frost, to plunge the pot in a sunny situation in the open border.

HEATHS.—*A Constant Reader.*—The following are good old kinds, with tubular and inflated flowers, which bloom throughout the summer:—Erica ventricosa superba, vent. stellata, vent. globosa, Ewerana, tubiflora, vestita coccinea, vest. rosea, sulphurea, Hartnelli, tricolor, ampullacea, eximia, echiniflora, Boweiana, mammosa, viridiflora, Irbiana, reifgens, retorta, perspicua, Massoni, exurgens, Aitoniana, and depressa.

POMEGRANATE.—*Flora.*—Who has had a plant of the Pomegranate in a conservatory for 10 years, which has not produced a flower, must have kept it in a damp and shaded situation. If planted in a loamy soil, and grown in a dry and airy part of the house, it will, no doubt, flower abundantly.

TULIPS.—*T. W. B.*—Tulip-beds only require to be protected from frost, rain, and snow. If they are covered in mild, open, weather, the plants will become drawn, and will consequently flower weakly.

PINKS.—*Dianthus.*—Carnations and Picotees belong to the same order as the Pink, of which they are varieties.

ROSES.—*Dianthus.*—It will not be too late to plant out Standard and other Roses in March. When removed so late, they would be benefited by a slight mulching above the roots, which would prevent the sun and wind from drying the surrounding soil too rapidly. —*Oikos.*—Your Banksian Rose is beautiful. No doubt some plants require light more than others; as we see in our wood plants and the flowers of the open country. Plants cannot dispense either with leaves or light; the former are the organs of digestion, the latter is the agent which enables those organs to act. —*W. F.*—It is the old original Boursault Rose that is suited for stocks.

YELLOW ROSE.—*Philo-Chronicle.*—We would not advise you to plunge your Cape-bulbs in bottom-heat—they will soon start in the greenhouse. You cannot do better than attend to Mr. Herbert's directions. A warm greenhouse is quite sufficient for the greater part of them; the smaller free-flowering kinds may be grown in pits or frames.

PANSIES.—*E. P. J.*—We comply with your request in naming 12 first-rate Pansies. It is difficult to select so small a number and call them the best, as there are others of equal merit which deserve to be enumerated. Thomson's Eclipse, Miss Stainforth, Corona, Jehu, Desirable, Ultraflora, Venus, and Princess Royal; Cook's Alicia, Brown's Curion, Pearson's Black Prince, and King's Exquisite.

CAPE-BULBS.—*Philo-Chronicle.*—We would not advise you to plunge your Cape-bulbs in bottom-heat—they will soon start in the greenhouse. You cannot do better than attend to Mr. Herbert's directions. A warm greenhouse is quite sufficient for the greater part of them; the smaller free-flowering kinds may be grown in pits or frames.

FRUIT-TREES.—*A Subscriber.*—Espalier-trees ought not to be less than 15 ft. apart, even on dwarf stocks: if on free stocks the distance may be 20 ft. The Paradise stock is best for Apples intended to be trained as dwarf standards; and for such, a distance of 15 ft. apart each way will be quite sufficient. The Citron des Carmes Pear will grow on the Quince, but succeeds better on the Pear-stock.

WALL-FRUIT.—*A Friend.*—Stick twigs of Spruce Fir, or any such tree, or Birch twigs, among the branches of fruit-trees on walls flowering early.

APRICOTS.—*A Subscriber.*—If nets are not too expensive, they are the nearest protection for Apricot-trees in blossom; but they must be doubled or trebled, and supported at a distance from the lower parts of the tree by means of forked sticks or by poles reaching from the ground to the top of the wall. Where nets cannot be procured, shoots of Spruce Fir or Birch may be stuck in between the branches of the tree and the wall, so as to protect those parts where the blossoms are most numerous.

FIG.—*J. W.*—If you cut through a Fig when about half-grown, you will be able to observe the blossom within the fruit.

APPLES OF SODOM.—*A Subscriber.*—The story of the Apples of

Sodom being fair to the eye, but filled with ashes and sulphur, is an idle tale.

ONIONS.—*Amicus* objects to our statement, that "The seeds of the White Spanish Onion, which are sold by the London Seedsmen, are chiefly imported." He says that the bulk of White Spanish Onion Seed is grown in England, and that what is imported is a very small proportion. We believe this depends on the season, and that occasionally, at least, very large quantities of the seed have been obtained from Paris.

PARSNIPS.—*W. W.*—We are not aware that the flavour of Parsnips grown on chalk is better than elsewhere.

ASPARAGUS.—*G. W. F.*—In the formation of Asparagus beds, and where plenty of time can be allowed for the plants to establish themselves previously to being cut, seeds are preferable to young plants; but in cases where it is desirable to cut from the plants in the second season after the beds are formed, strong two-year old plants will be more serviceable.

BELGIAN CARROTS.—*J. G. F.*—It is recommended that this should be drilled on the flat in rows 18 inches apart; the seed should be mixed with damp sand some days previously, and well separated, or it will be difficult to drill, on account of its holding together so much. If the land is in good heart, or if they follow Turnips, no manure will be required to obtain 25 tons per acre.

RHUBARB.—*Hants.*—Although Seakale-pots may not be quite so well adapted as a frame for forcing Rhubarb in, yet they will answer the purpose very well where the latter cannot be spared. We apprehend that the decay of your Rhubarb-stalks was not attributable to your having used Seakale-pots, but to the over-violent heat of the fermenting material employed. It should always be borne in mind that if the trial-stick, which is usually placed in forcing beds, feels barely warm to the hand, the heat is quite sufficient for Seakale, Rhubarb, &c.

CHINESE CABBAGE.—*A. E.*—The Chinese Cabbage (Pe-tsai), will only form heads like a large Cos Lettuce; it requires to be sown in August, and grown in very rich soil, otherwise it quickly runs to flower.

INSECTS.—*Dundee's* insects infesting his Peach-trees are in cocoons at present; we wish he would watch them, and send some of the animals to Mr. Curtis when they come forth in the spring. Ammoniacal liquor would be the best remedy; but before applying it, all the old shreds should be removed. The walls, if old, ought to be fresh painted, and the nail-holes and crevices well filled up with mortar, then the stems and all the old bark must be well rubbed with the liquor, for which purpose a stiff painter's brush is the best.

LAUREL-LEAVES.—*A. Prentice.*—Where bruised Laurel-leaves are recommended for killing insects, the common Laurel is meant, and not either the Portugal Laurel or the Sweet Bay.

BOOKS.—*A Young Gardener.*—Donn's Hortus Cantabrigiæ is quite superseded by more modern works. —*A German.*—You will most likely find the information you require respecting the construction of greenhouses and garden ornaments in Loudon's Encyclopedia of Gardening. —*Payage.*—We quite agree with you, and, in fact, we have done what you wish. At p. 835, of 1842, you will find the title, &c., of Mr. Bailey Denton's pamphlet. After having once given its full designation, it is hardly necessary to repeat it at so short an interval of time. The Stamp-office will not let us quote prices of articles for sale.

LAWNS.—*A. A.*—You will find soot, if you can procure it unadulterated, to be a more efficient restorative to weakly Grass than nitrate of soda.

GRAVEL-WALKS.—*B. D.*—The best method of extirpating Grass which springs up from beneath a gravel-walk, and spreads over its surface, is to break up the walk and pick out carefully all the under-ground runners which may be met with. Where it is not desirable to disturb the walk, the best way is to spread salt in considerable quantities over its whole surface; and if after the first application it is found that portions of the Grass still exist, let another coating of salt be applied, which will effectually destroy it. Care must be taken, however, if the walk is edged with Box, that the salt does not come in contact with it, otherwise it will destroy the edging also.

SEEDS.—*A Subscriber* is, we fear, unlikely to succeed either with Alpine seeds seven years old, or with tropical seeds three years old. He had better read the chapter on Seed-sowing in the "Theory of Horticulture." Newly-slacked lime is, probably, the best material for assisting in this process. Others have used oxalic acid; but it is rare for such experiments to succeed.

—*J. B. W.*, who has some Broccoli seed which came up well last year, and who wishes to know whether the remaining portion might be safely sown during the ensuing spring, had better sow a portion of it in a small pot, and place it in a warm situation: he will soon see then whether it will germinate. We know no reason why plants raised from this seed should not produce as good heads as from seed saved at a later period.

HIMALAYAN SEEDS.—*E. C.*—The greater portion of the seeds which you have received being those of hardy plants, a spent Cucumber-bed will be a suitable place to raise them in. Nos. 27, 29, and from 31 to 37 inclusive, as well as from 40 to 43, being tender, they will require the temperature of a hotbed or stove. You will find good practical directions for the treatment of the seeds of Conifers at p. 83 of the *Chronicle* for 1842.

DRAINAGE.—*W. W.*—We will answer your memoranda next week. **POTS.**—*X. Y. Z.*—We cannot answer your question; it should be addressed to Mr. Brown.

GARDEN POTS.—*H. H.*—Your pots are very good, but the plan is not at all new. We have seen the same sort years ago.

GARDENERS' SOCIETIES.—*Alexander Webb.*—If you read our observations with more care, you will find that neither we nor Mr. Peter Mackenzie have said a word in disparagement of the Society you mention. The remarks were general, but if any one finds the cap fit him, he must even be content to wear it. It is of little use for a man to read, unless he understands what he reads. Did you never hear the story of the bull who shut his eyes before he ran his head against the wall? We have a curious letter before us, upon this subject, but as it is anonymous we cannot use it. The writer gives a very unfavourable account of the drinking habits of some Hammersmith gardeners.

COTTAGERS.—*E. A. C.*—We will adopt your suggestion. **ALIQUOTS.**—*M. E.*—Thanks. We were aware of the information you have been so good as to point out. A good many communications have reached us, and as soon as we think the batch large enough, we shall endeavour to reduce the facts and opinions into some consistent form.

EXHIBITIONS.—*A Constant Subscriber.*—If your specimen of Dendrobium speciosum is really a good one, it would be worth exhibiting at the meeting of the Horticultural Society; as we have not, however, seen the plant, we cannot give any opinion respecting it.

MARTAGON.—*P. P.*—Thanks; we are inquiring among our Oriental friends.

GOLD AND SILVER FISH.—*A Friend.*—These are regularly sold in Covent Garden Market.

ICE.—*J. W.*—The reason why, in filling an Ice-house, Straw is placed between the ice and the wall, is because Straw acts as a good non-conductor of heat.

PLACES.—*J. M.*—We know nothing of the persons who procure situations for a consideration. You can only learn by means of advertisements.

JOURNALS.—*A. Prentice.*—Divide your books into as many parts as you have subjects; and then subdivide again for smaller things. For instance, take a division for the Kitchen Garden, and then make subdivisions for Peas, Beans, Lettuces, &c., and enter everything distinctly under each head. If you do this and leave room enough in each case, you need have no confusion, nor will you want an index.

MISCELLANEOUS.—*N. O. P.*—Your plants are 1. Cytisus sessilifolius. 2. Pyrus melanocarpa. 3. Clematis cirrhosa. 4. Teucrium fruticans. —*Daphne.*—Those of your plants which we can distinguish from such miserable fragments, are, 1. Saxi-

fraga lingulata. 2. Sempervivum arboreum. 3. Sempervivum tortuosum. 4. Cacalia tomentosa. 5. Buddlea globosa. 9. A. cucalyptus. 11. Stapelia batonia. 13. Justicia carnea. 14. Acacia venusta. 15. Hypericum baleanicum. 17. Euphorbia polygona. 19. Rhododendron dauricum. —*Southamptonian's* plant is Veronica agrestis. —*D. M. C.*—You will probably obtain what you want by an advertisement. We cannot assist you. —*A. L. M.*—We have received the money for No. 18, but you have given neither your name nor address. —*J. M. T.*—The plant which you found growing in a garden at Isola Bella, in the Lago Maggiore, and which bears a fruit somewhat resembling an Apple, is the Mactra aurantiaca, or Osage Orange.

—*Haleyon.*—Your plant is Muscari ambrosiacum. —*John Bacchus.*—There is a variety of Elder with yellow berries. —*If R. T.* will favour us with a portion of the bark of the Ash-tree infested as he describes it to be, we will endeavour to answer his queries, which it is impossible to do in the absence of specimens.

—*R.*—*Dianthus.*—We have not seen Mr. Wilson's Pelargonium about which you inquire, nor were we aware that he had one under that name. —*J. D.*—The best of your seedling Cinerarias is No. 1, but they are all defective in the extreme narrowness of the petals; many of the new sorts are greatly improved in this respect, and have the spaces between the petals well filled up. —*Philo-Chronicle.*—Bletia hyacintha is the proper name of the plant you mention; however, it is sometimes called B. hyacinthoides. —*Native of the Mountains.*—We have nothing to do with the work, and it must be ordered through a local bookseller. —*J. S.*—Fivepence each. —*Inquirer.*—Your advertisement, if not above four lines, would be 3s. —*J. R. J.*—Your plant is Cineraria tussilaginis.

—*Erica.*—Many thanks for your communication. —*E. A.*—No. 10 of 1842 contains the article to which you allude; it may be obtained by addressing a letter to our Office, inclosing postage-stamps to that amount. —*J. W.*—The wounds upon your Pear appear to have been caused by an insect. —*J. S.*—We cannot offer you more than 5d. each for your Numbers. —*J. Williams.*—Your plant is Pittosporum bicolor. —*D.*—Your Apples are, 1. Fearn's Pippin; 2. appears to be the Kentish Fill-basket; 3. French Crab. —*W.*—No. 1 is Lycopodium Selago; the other seems to be a morsel of L. complanatum.

As usual, many letters have arrived too late for answers this week. Mr. PAXTON'S COTTAGER'S CALENDAR is now reprinted in the form of a small volume, for general distribution, price 3d. each copy; it may be ordered of all Booksellers. Gentlemen wishing to distribute copies among their cottage tenants may have them delivered in any part of London by remitting a Post-office order to this Office, at the rate of 5s. for every 25 copies.

NEWS OF THE WEEK.

HER MAJESTY'S speech at the opening of Parliament will be found almost exclusively to refer to past events, and to give little indication of the future policy of Ministers. It begins by referring to the treaty with the United States, and expresses a belief that the amicable relations of the two countries have been confirmed by the adjustment of the questions which had so long endangered the continuance of peace. It announces the termination of hostilities with China, and ascribes the result to the liberality of Parliament; it adverts to the settlement of Syria, and to the success of the Allies in securing to the Christian population a system of administration to which they were entitled. The difference between Turkey and Persia, and the probability that it will be settled by the joint mediation of England and Russia is the only point in which the speech makes any precise allusion to the future. It states, with expressions of great satisfaction, that a commercial treaty has been concluded with Russia, but gives no insight into the details. It refers to the late events in Afghanistan, passing a high eulogium on the ability with which the military operations have been effected, and on the valour manifested by the European and native troops. After the usual notice of the estimates for the ensuing year, and the reductions made in the naval and military forces, it proceeds to the falling off in the ordinary sources of revenue, ascribing the deficiency to the depression of the manufacturing industry which has so long prevailed—to the extensive reductions in the import duties—and to the fact, that little progress has yet been made in the collection of the Income-tax. After a brief allusion to the loyalty of her Majesty's reception in Scotland, and to the strike in the manufacturing districts in the course of last autumn, the Speech concludes by announcing, as the programme of the session, that measures connected with the improvement of the law, and with various questions of domestic policy, will be submitted for consideration. The debates in both Houses on the Address were more than usually interesting; the foreign policy of the Government was the chief topic of discussion, but no amendment was moved, and the Address was consequently carried without opposition. The subjects noticed in the Speech, and the various questions incidentally touched upon in the debate, give abundant promise of a busy session; and there is no doubt that there will very shortly be matter enough, and of stirring interest, to engage the attention of the public.

From France we learn that the debate on the Address in the Chamber of Deputies commenced on Friday, and that it still continues to be the exclusive subject of discussion. In the beginning of the week the Ministerial triumph in the Chamber of Peers seemed to exercise an important influence on the Deputies, and it was anticipated that Ministers would be equally successful in both Chambers. An amendment, however, was carried in reference to the paragraph on Eastern affairs, in which the Cabinet was left in a minority of 3. The question was not one of great importance, and was therefore unlikely to lead to the resignation of Ministers; but the result is not the less significant as showing the relative strength of parties. The debate on the Right of Search commenced on Tuesday, and is chiefly remarkable for the strong expressions of hostility to Great Britain which fell from the leading speakers

M. Guizot has been unmoved by these demonstrations, and has again announced his determination to abide by the treaties, and to stake the existence of the Cabinet on their loyal execution.—From Spain we have little news; the elections still occupy attention, but the result is doubtful and the Government is by no means certain of a majority. In Barcelona, the extreme measures adopted by the Captain-General have caused great sensation, and many of the inhabitants, fearing to be delivered up to the military commission, have submitted to the war contribution.—From Portugal we have unfavourable accounts of the tariff negotiations; the concessions proposed by Portugal are so slight, and are coupled with such conditions, that the British Government is not likely to accept them, and it is generally believed that the Convention is virtually at an end.—From the United States we learn that the last debate on the Oregon territory took place on the 12th ult., and that after a long and warlike discussion in favour of its appropriation, the bill providing for its immediate occupation and settlement had been engrossed.—The accounts from Canada report more favourably of the health of the Governor-General than we were led to anticipate by the last advices, and state that his Excellency will shortly return to England.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal remain at Windsor, and continue in good health. The Queen has taken her usual walking exercise during the week, and the Prince has enjoyed the diversion of shooting in different parts of the Park. On Tuesday the Queen held a Privy Council at Windsor, at which Her Majesty's Speech on opening the Session of Parliament was arranged. The list of Sheriffs was pricked for the present year, and Sir Charles Metcalfe was sworn into office as Governor General of Canada. Major-General Wemyss has been succeeded by Colonel Arbuthnot, as the Equerry in Waiting on the Queen; Lord Hardwicke has succeeded the Earl of Morton as the Lord in Waiting; the Countess of Charlemont has succeeded the Duchess of Norfolk as the Lady in Waiting; the Hon. Misses Stanley and Hamilton have succeeded the Hon. Misses Liddell and Lister as Maids of Honour on Her Majesty; and Colonel Wyld has succeeded Colonel Bouverie as the Equerry in Waiting on Prince Albert.

Official Appointments.—Mr. Stephenson, junior secretary to the Premier, has succeeded Mr. Drummond as Chief Private Secretary, and Mr. Arbuthnot of the Treasury has been appointed junior secretary in the room of Mr. Stephenson. Mr. David Pollock has received the appointment of Commissioner of the Insolvent Debtors' Court, vacant by the decease of Mr. Bowen.

Parliamentary Movements.—The election for an Irish Representative Peer in the room of the late Lord Gort terminated on Monday night, at 12 o'clock. There were two candidates—Viscount O'Neill, Conservative, and Lord Oranmore, Whig. The numbers were for Lord O'Neill, 46; Lord Oranmore, 1; Lord Trimlestown was the only peer who voted for the latter.

New Sheriffs.—The following is a list of the New Sheriffs chosen by her Majesty in Council, at the Court held on Tuesday, at Windsor Castle. *Bedfordshire*.—W. Sutcliffe, of Great Bramingham, Esq. *Berkshire*.—Sir R. G. Throckmorton, of Buckland House, Bart. *Buckinghamshire*.—J. Trevor, sen., of Broughton House, Aylesbury, Esq. *Cambridgeshire and Huntingdonshire*.—E. H. Greene, of Hinxtun, Esq. *Cumberland*.—R. Hodgson, of Salkeld Hall, Esq. *Cheshire*.—J. Dixon, of Astle, Esq. *Derbyshire*.—W. Mundy, of Markeaton, Esq. *Devonshire*.—W. J. Clarke, of Buckland, Esq. *Dorsetshire*.—J. C. Dale, of Glanvilles Wootton, Esq. *Durham*.—E. Shippersden, of Durham, Esq. *Essex*.—H. J. Conyers, of Copped Hall, Epping, Esq. *Gloucestershire*.—R. S. Holford, of Weston Birt, Esq. *Herefordshire*.—Sir E. F. S. Stanhope, of Holme Lacy, Bart. *Hertfordshire*.—C. J. Dimsdale, of Essendon-place, Esq. *Kent*.—F. Perkins, of Chipstead-place, Esq. *Leicestershire*.—Sir W. W. Dixie, of Bosworth Park, Bart. *Lincolnshire*.—G. H. Packe, of Caythorpe, Esq. *Monmouthshire*.—Sir D. Muckworth, of Glen Usk, Bart. *Norfolk*.—W. G. T. D. Tyssen, of Foulden, Esq. *Northamptonshire*.—Sir A. de Capell Brooke, of Oakley, Bart. *Northumberland*.—T. Anderson, of Little Harle Tower, Esq. *Nottinghamshire*.—T. D. Hall, of Whatton, Esq. *Oxfordshire*.—W. H. Vandars-tegen, of Cane-End House, Esq. *Rutlandshire*.—G. Fludyer, of Ayston, Esq. *Shropshire*.—Sir A. V. Corbet, of Acton Reynald, Bart. *Somersetshire*.—The Hon. P. P. Bouverie, of Brymore, Staffordshire. *Staffordshire*.—J. S. Manley, of Manley Hall, Esq. *County of Southampton*.—W. Hughes Hughes, of Ryde, Esq. *Suffolk*.—W. Long, of Saxmundham, Esq. *Surrey*.—R. Sumner, of Puttenham Priory, Esq. *Sussex*.—M. Brisco, of Coghurst, Esq. *Warwickshire*.—A. F. Gregory, of Stivichall, Esq. *Wiltshire*.—H. S. Olivier, of Potterne, Esq. *Worcestershire*.—W. Robins, of Hagley, Esq. *Yorkshire*.—Sir J. W. Copley, of Sprothorough, Bart. **WALES.**—*Anglesey*.—O. Roberts, of Tynewydd, Esq. *Breconshire*.—W. Maybery, of Brecknock, Esq. *Carmarthen-shire*.—D. Jones, of Bodfan, Esq. *Carmarthenshire*.—Postponed. *Cardiganshire*.—F. T. Gibb, of Hendrefelen, Esq. *Denbighshire*.—J. Townshend, of Tre-vallyn, Esq. *Flintshire*.—Sir P. Mostyn, of Talacre, Bart. *Glamorganshire*.—J. Homfray, of Llandaff House, Esq. *Montgomeryshire*.—Sir J. Conroy, of Plasypennant, Bart. *Merionethshire*.—O. J. E. Nanney, of

Cefnddeuddwr, Esq. Pembrokeshire.—G. L. Phillips, of Dumbledale, Esq. *Radnorshire*.—E. D. Thomas, of Wellfield House, Esq. **IRELAND.**—His Excellency the Lord-Lieutenant has appointed the undermentioned gentlemen to the office of High Sheriff for 1843:—*Antrim*.—J. McNeile, Esq., of Parkmount. *Armagh*.—J. M. Stronge, Esq., of Tynan Abbey. *Carlow*.—T. T. Vigors, Esq., of Erindale. *Carrickfergus Town*.—E. Bruce, Esq., of Scoutbush. *Cavan*.—W. Emery, Esq., of Ballyconnell House. *Clare*.—W. Skerrett, Esq., of Finnevara. *Cork*.—Hon. A. G. Annesley, of Anne's Grove. *Cork City*.—J. Morgan, Esq., of Tivoli. *Donegal*.—J. R. Boyd, Esq., of Ballymacool. *Down*.—P. J. Nugent, Esq., of Portaferry. *Drogheda Town*.—R. Smith, Esq., of Drogheda. *Dublin*.—C. Cobbe, jun., Esq., of Newbridge. *Dublin City*.—D. C. La Touche, Esq., Bank. *Fermanagh*.—R. Hall Esq., of Innismore. *Galway*.—R. Gregory, Esq., of Cool Park. *Galway Town*.—N. Lynch, Esq., of Barna. *Kerry*.—P. Mahony, jun., Esq., of Kilmeany. *Kildare*.—J. La Touche, Esq., of Harristown. *Kilkenny*.—R. Tyndal, Esq., of Oakland. *King's County*.—H. Trench, Esq., of Newtown. *Leitrim*.—J. R. Godley, Esq., of Killegar. *Limerick*.—R. Maxwell, Esq., of Islandmore. *Limerick City*.—J. N. Russell, Esq., of Limerick. *Londonderry City and County*.—W. H. Ashe, Esq., of Ashbrook. *Longford*.—W. S. Ball, Esq., of Abbeylara. *Louth*.—S. M'Clintock, Esq., of Newtown. *Mayo*.—M. Pratt, Esq., of Ennisco. *Meath*.—J. Farrell, Esq., of Moynalty. *Monaghan*.—J. Hatchell, Esq., of Bessfield. *Roscommon*.—C. Molloy, Esq., of Oak Port. *Sligo*.—A. B. Cooper, Esq., of Cooper-hill. *Tipperary*.—A. Going, Esq., of Ballyphilip. *Tyrone*.—R. Gordon, Esq., of Florida. *Waterford*.—C. E. Kennedy, Esq., of Johnstown. *Waterford City*.—R. W. Morris, Esq., of West Lodge. *Westmeath*.—G. A. Boyd, Esq., of Middleton-park. *Wexford*.—J. Goff, Esq., of Horetown. *Wicklow*.—R. Hudson, Esq., of Spring-farm.

Foreign.

FRANCE.—*Chamber of Deputies.*—The debate on the Address in the Chamber of Deputies commenced last Friday, and has continued exclusively to occupy the attention of the public up to the present time. The four orators who commenced the debate, and whose speeches occupied the entire sitting of Friday, are men of what the French call *esprit*, brilliant and imaginative, but deficient in the practical qualities of statesmen. M. Gustave de Beaumont commenced by declaring that he saw no Ministry before him at all, because M. Guizot did nothing that he wished himself, and wished nothing that he did. A Minister was no Minister who obeyed a majority, without having a will of his own; and M. Guizot being in this position, ought to withdraw. He declared that he was, at first, rejoiced at the non-ratification of the treaty of 1841; but that, afterwards, his rejoicing was turned to discontent, because the English seemed quite satisfied and made no noise or complaint. After some observations from M. de Carné, M. de Lamartine occupied the tribune, and declared that he should fling aside henceforth all allegiance to the Conservative party. The opposition in this country, said M. de Lamartine, is not the anarchic, democratic party that people would have it believed. It is like the English Whigs, a party of liberal ideas and progress, yet fraught with every really useful Conservative principle, and with all that is necessary to order and good government. "We will be the modern Whigs of France," he exclaimed. He dwelt more on French than on foreign policy, and accused not merely M. Guizot, but his predecessors, including M. Thiers, of having taken a wrong direction. He denounced the fortifications of Paris as libicide, and he remarked that it was not till the fortifications were in progress, that they had dared to broach the doctrine of moral complicity in order to crush the press. He surprised the Chambers by declaring that the *system* (a new word with French political writers, to mean the King himself) is answerable for all the political mischief of the day; and he did not shrink from declaring that all national and liberal interests were sacrificed to dynastic ones. The Minister of Public Instruction replied to M. Lamartine, refuting and deprecating the chief measure of foreign policy recommended by him, viz., intervention in Spain. M. de Rochejaquelein and M. de Gasperin followed; the latter declared that the Right of Search was the best mode of suppressing the Slave-trade. He was succeeded by M. de Tocqueville, who laboured to show that the entire cause of the difference and irritation between England and France lay in M. Guizot. He characterized him as the great culprit, the great firebrand, and great stirrer of quarrel. He accused M. Guizot of making the great mistake of supposing that French anger against England could cool. M. Guizot's policy was altogether based on this supposition: but it was a mistaken one. However slight the original cause of the present difference between the nations, so slight that such causes of difference must be expected to arise every day between two countries of such vast interests, influence, and ambition—nevertheless the hatred of the French has gone on increasing every month since 1840. His chief reason for breaking the treaties was that the country desired it; and his second reason was, that he thought England would put up with the injustice. M. St. Marc Girardin, the second in the Ministry of Public Instruction, declared that he was for other modes of putting down the Slave-trade. One was for France to abolish slavery in her own colonies, and then to aid England in closing and putting an end to the slave markets of Brazil and Cuba. Another mode which he approved of, was that so lightly abandoned by Lord Aberdeen and the English Advocate General, viz.

the destruction of slave factories on the African coast. He regretted to find that English cruisers were forbidden to persevere in that humane and rightful task. On Monday M. Ducos, of Bordeaux, spoke violently against England. M. David, ex-consul at Smyrna, then proposed an amendment on the paragraph respecting the East, requiring that France should claim and resume all the rights that she enjoyed in the Levant in 1835. M. Berryer moved the omission of a portion of this new paragraph, and an animated debate took place, in which M. Guizot ably defended the Eastern policy of the Government. France, he said, had abandoned none of her former treaties with Turkey, nor any of the rights and privileges which she had hitherto enjoyed; the French flag continued to be hoisted on the churches and convents of Syria, and, even in 1840, during the civil war, it never ceased to afford protection to the Christian population of Lebanon. France could not, in virtue of those treaties, interfere alone to procure a better Administration for Syria; she could only use her influence; she had laboured, in conjunction with England and Austria, to effect that purpose, and she had succeeded in compelling the Porte to acknowledge the liberties of the Christian population of Turkey. France could not have succeeded alone, and it was only when it found the great Powers unanimous in this demand that the Divan had yielded. M. Janvier then showed that, from 1840 to 1843, Russia has been unceasingly employed in resisting all the other Powers at Constantinople, and that whilst the English fleet was aiding the Syrians to fling off the Egyptian yoke, Russia was negotiating at Constantinople for a transference to herself of the Christian protectorate of Syria. He showed that all through 1842, Russia prevented the Porte from yielding to the views of the other Powers respecting the Lebanon, and only joined them at the last hour, and then only from the fear of being left isolated. M. Berryer admitted that the adoption of M. David's amendment by the Chamber would be attended with inconveniences, but he could not concur with the committee in declaring that the population of Syria had received and obtained an Administration in harmony with their fate and wishes, since it was only a trial the Porte had consented to make at the invitation of the Powers. He maintained that it was England who had opposed the restoration of the Emir Beschir, whose family had possessed the Government for upwards of 200 years. He thought that France should not congratulate herself on the establishment of an order of things that was not her own work, for fear of ruining still more her influence with the population of the Levant, who should always be accustomed to look up to her exclusively for protection. The Chamber then divided, giving 206 for the amendment, and 203 for the address; thus leaving Ministers in a minority of 3. This result is not so serious as to lead to their resignation, although it is important as showing the relative strength of parties. The discussion on the paragraph relating to the Right of Search commenced on Tuesday. M. Dumon, the reporter of the Commission, M. de Valmy, and the Marquis de Langle spoke. M. Dumon said—"That desiring the treaties, while they existed, to be executed, the Commission, nevertheless, expressed the wish of the Chamber that the moment should come when French ships would be under the surveillance of their own flag, and no other; but it left the Government its liberty and its responsibility." Two amendments were presented to the Chamber in the course of the debate, differing very slightly from each other. The first, that of M. Chasseloup Laubat, proposes to add and insert, in the last sentence, that the Chamber "calls, by its vows, for the moment when negotiations, followed up with prudence and conviction, shall have replaced our commerce under the exclusive surveillance of our flag." The other, by Colonel Lespenasse, is much the same, only more brief. In the debate on Wednesday, M. Guizot declared "that he would not open any negotiations for the modification of the treaties of 1831 and 1833, until he saw fair prospects of obtaining that modification from England by a common accord, and with success." This challenge to opposition was received by what the papers call profound agitation. The Minister was known to have staked his continuance in power on the rejection of M. Laubat's amendment. The division was not expected to take place for a day or two, and the debate was still in progress at the date of the last advices.

SPAIN.—The arrivals from Madrid come down to the 24th ult. They continue devoid of any intelligence possessing general interest. The elections still occupied the public attention; but the result of them is as uncertain as ever, and the Government is by no means certain of a majority. Three of the Ministers were suffering from illness at the date of these letters—the Comte Almodovar, M. Calatrava, and M. Zumalacarreui; though whether they were seriously indisposed or not is not mentioned. Arrangements had been made by the Spanish Government for paying the arrears due to the British Auxiliary Legion. The papers state that the provincial deputation of Burgos had followed the example given by that of Saragossa, and had issued a manifesto censuring the Government measures. It was not believed that any real progress had been made in the commercial treaty. The affair of M. Lesseps was by no means arranged. The Duke of Gluckberg, French envoy, still insisted on reparation; but, on the other hand, the Regent had received testimonies from Barcelona sufficient to prove the alliance between the French Consul and the result. The accounts from Barcelona are a mass of crimination and recrimination between the two political parties in that city—of complaints of alleged tyranny on the one side, and of disaffection on the other. Gen. Seoane's measure of quartering the troops upon the inhabitants, which at

subject came before their Lordships.

LORD BROUGHAM had no hesitation in saying that a few leagues of territory, more or less, were a consideration wholly insignificant when compared with the permanent object of securing peace between Englishmen and their kinsmen in America. But even on this minor question of mathematical boundary, important advantages were secured by us, inasmuch as we now commanded the navigation of the river St. John down to the Bay of Fundy. The termination of the war in Afghanistan he looked upon as a happy deliverance, and the noble Duke's vindication of the Governor-General's policy would be decisive with the world. He must, however, condemn the cruelties of the troops, and the destruction of bazaars and cities and works of peace, as acts unworthy of a Christian people. It may be capable of explanation, it may be possible to extenuate it, it may even, for aught he knew, be possible to justify and defend it—but he had seen, with anxious pain and grief, and as an Englishman viewing the conduct of his countrymen brought before the bar of public opinion all over Europe—he had seen, with a kind of shame, certain passages that have accompanied the termination, otherwise glorious, of these unhappy and inglorious hostilities. Prodigious works of human industry and of skill, as well as of the wealth of past ages—great and mighty bazaars, the resort of trade and the sources of peaceful commercial prosperity, levelled with the ground and their fragments scattered—great cities set fire to by the avowal of the incendiary general himself in four several places in one night—troops let loose upon the unoffending people by the avowal, not of the captain, but at least of a military eye-witness who participated in

the slaughter—people hunted down—"thousands of individuals hunted down," is the phrase, "like vermin, for two days and two nights." All this, for aught he knew, may be explained and palliated—all this, for aught he could tell, and God grant it may be so, may receive its full justification, but as at present advised he confessed he heard with pain, with horror, and with shame, these passages towards the end of the Afghan War. He then defended the French Government from the charges brought against them by the Spanish authorities, and said it was quite absurd to blame the French Consul for anything that had taken place at Barcelona. The noble Lord concluded by entering into an eloquent exposition of the vast importance of peace between Great Britain and France to the interests of the world.

Earl AUCKLAND declared that he had entered upon the Afghan war because he thought it essential to the safety of our Indian empire—because he saw a danger approaching, to avert which the war had become absolutely indispensable. He could think of nothing more invidious and unseemly than for one Governor-General lately returned, and another lately installed, to bandy crimination against each other; and during the last weeks of his administration of the Indian Government his every care had been to place in the hands of his successor all possible means for prosecuting operations in Afghanistan. With respect to the Chinese war, he gave every credit to the present Government for the ability and readiness with which they had adopted the plans already in progress; but these plans had been taken up under the former Administration, and at his (Lord AUCKLAND's) suggestion, and his conviction was that if no change of Ministers had occurred, the same results would have been carried out.

The Duke of WELLINGTON and the Marquis of LANSDOWNE said a few words in mutual explanation, the former repeating his vindication of Lord Ellenborough's measures, and his readiness to defend them on any day which Lord Lansdowne might appoint. Lord COLCHESTER felt the utmost satisfaction at the manly and straightforward manner in which the Noble Duke had vindicated the conduct of the Governor-General of India. The Marquis of LANSDOWNE thought the most important question, and one which he hoped would early occupy their Lordships' deliberations, was that of measures calculated to restore prosperity to the country; and Lords COLCHESTER and MINTO made explanations respecting the sailing of the Chinese expedition.

Lord ASHBURTON, in reply to an observation by Lord Clanricarde, deprecating concessions alleged to have been made by him relative to the right of search, explained that no discussion on the right of search had taken place in the course of the negotiations, inasmuch as this country claimed no right to search American vessels. But on that of the right of visit, he had been given to understand that despatches which had been received from Lord Aberdeen left nothing to be feared. He apprehended no change from the Oregon boundary question, and no circumstance in the course of a long life had given him greater satisfaction than that of having been instrumental in the completion of the late treaty.

The Earl of HARRINGTON made a statement relative to the unprepared state of many of the vessels in commission, when the present Government came into power. This again called forth another explanation from Lord Minto.

Earl STANHOPE, who intended to move an amendment on the Address, rose and stated that, after what had taken place, it appeared more advisable to put it into the form of a separate motion, and gave notice of his intention on Thursday next to propose "That this House do resolve itself into a committee of the whole House, for the purpose of taking into its most serious consideration the present condition of the productive classes of the United Kingdom, with a view to providing for their profitable employment and to the improvement of their condition."

The Bishop of EXETER hoped that the political influence of Britain would not be the only thing introduced by us into China; but that we would carry practical Christianity with us, and by our conduct prepare the idolatrous population of that huge empire for the appreciation of the sacred truths of true religion.

The address, which was as usual, an echo of the speech, was then agreed to, and ordered to be presented to her Majesty.

The Duke of WELLINGTON gave notice that on Tuesday, the 14th inst., he will move the thanks of the House to the Naval and Military officers and men engaged in service in China; and that on Thursday, the 16th inst., he will move the thanks of the House to the officers and troops concerned in the Military operations in the East Indies.—After some routine business, and the reappointment of Earl Shaftesbury as Chairman of Committees, the House adjourned to Monday.

HOUSE OF COMMONS.

The House of Commons, after receiving some notices of motions for future days, proceeded to the consideration of the speech from the Throne, which was read as usual by the Speaker.

Lord COURTNEY then rose to move an address embodying the topics of the speech. He declared his satisfaction at the adjustment of the differences with America, by reason of her common origin, language, and laws, and the influence which must be produced on the whole civilised world by the state of the relations between two countries circumstanced like England and the United States. He congratulated his hearers on the successes in Afghanistan, rejoiced in the fortune which had attended our efforts in China, and hailed in their results a hope of extended markets for our domestic produce; expressing a deep sympathy with his suffering countrymen, but deprecating all partial sacrifices as between the different classes of British industry, and avowing his confidence in the dispositions and abilities of her Majesty's present advisers to relieve the country and promote her welfare.

The motion was seconded by Mr. P. MILES. In adverting to Eastern events, he relied with peculiar gratification upon the pacific policy announced by our Indian Government, and upon the commercial prospects opened by our treaty with China. He touched with praise upon the arrangements concluded between England and America, expressed his regret for the domestic disturbances of last year, attributing them in great measure to the unprincipled endeavours of those who had excited the indignant; and declared his general approbation of the vigorous measures adopted to restore the credit and finance of the country.

Mr. C. WOOD desired to reserve his judgment upon most of the points of the speech until the House should be in possession of further information. Generally speaking, he believed the speech would be satisfactory; but he lamented that on the subject of domestic distress it held out only sympathy, and no practical relief. In Lancashire and in Scotland, the great seats of our trade, the suffering was almost unabated. The late Ministers, to cure these evils, had attempted measures for the extension of trade. A similar disposition had in the last session been evinced by the present Ministry; but there was no indication of that disposition in the present speech.

Sir ROBERT PEEL trusted, from the tone of the House, that the address to be laid before her Majesty would be unanimous. On the subject of the American treaty, he should be prepared to show, that, if it had not obtained for us all which we were strictly entitled to expect, it was, on the whole, an eligible adjustment, giving us more than had been awarded by the arbitration of the King of the Netherlands, and securing to us all that was really important in our claims. His own sincere respect for the United States, and his earnest desire to preserve a good understanding with their people, made it painful to him to say that the recent message of the President did not give an accurate representation of what had passed in the negotiations. We had not claimed the right of search, which was a belligerent right. What we had claimed was only the right of visitation—the right to visit a vessel bearing the American flag for the purpose of ascertaining whether she be really American; which if on that visit she should turn out to be, she must be liberated, even though she should clearly appear at all points a slaver. He owned himself surprised that America, surrounded as she was with small states, by every one of which she was in danger of

having her flag assumed, should resist a rule the establishment of which would be so much for her own advantage. It was his duty to tell the House of Commons that not only had Lord Aberdeen's despatch of December, 1841, upon this subject been maintained in all its principles, but during the 14 months since elapsed there had not even been so much as an attempt on the part of the American Government to answer it. On the subject of finance, he admitted that there was a great deficiency. He had stated last year that, in addition to the deficiency which he had found on coming into office, he proposed to cause a further deficiency still. He had accordingly remitted duties on 700 articles; reductions had all taken effect; but the Income-Tax imposed to meet them had not yet come into productiveness. Undoubtedly there had been a great falling off in the Excise, mainly on the article of malt; but that had arisen in a great degree from the very unfavourable harvest of 1841. There still, indeed, existed severe distress; but let not the House infer thence that there must needs be a permanent diminution of consumption. Another cause of the late falling off had been the disturbed state of the manufacturing districts. This was not a fit occasion for entering at large upon financial statements; but he did now discern some favourable changes on which he could not forbear from founding good hopes. It was complained that the speech announced no new measure with respect to corn. He had no such great measures of change to propose as gentlemen seemed to expect. Whenever he should make a change, it would be a change accordant with the principles he had propounded; but he must always remember that in this country the general rule had been protection. He believed the reduction which had already taken place in the price of the necessities of life had actually verified his prediction that the Income Tax would be compensated by the general cheapness of living.

Lord JOHN RUSSELL, in reference to a notice, given before the debate, of a motion of thanks for the services of our officers in India, adverted to some Indian topics upon which he deemed it requisite that further information should be previously furnished—one, the vindictive excesses said to have been committed by our troops; the other, the share of Lord Ellenborough in issuing the directions which led to our successes. There were a couple of proclamations too remarkable to be passed over. One of them contained such a misrepresentation of a preceding Governor's policy as was seldom uttered even in the heat of party debate; and it breathed, with respect to Afghanistan itself, a spirit rather of revenge than of calm and statesmanlike policy. The other proclamation was so oddly worded, that many people who had last year been taken in by the clever imitation of a debate in the French Chambers, and were therefore much on their guard against a second deception, were thoroughly persuaded this was another hoax. For his own part, he viewed it more seriously; especially in respect of the tone which it took—a strange tone for a Christian Governor—of reverence for the objects of idolatrous worship. These things, he owned, had raised in him some misgivings as to the judgment of the individual intrusted with the grave and almost awful responsibility of governing India. With regard to the American treaty, he would say that he did not view it with the satisfaction which some seemed to feel; he doubted whether any treaty would be really advantageous which on its very face was detrimental to the country consenting to it. Coming now to domestic affairs, he would declare that the experience of the past year had confirmed him in his objection to the sliding scale, and in his conviction that a fixed duty was the thing required. Under the present scale, the foreign wheat was poured in just as the home harvest was becoming available: the garden was watered at the moment when it was beginning to rain. He had, however, heard nothing to-night which convinced him that Sir Robert Peel would not yet make much further alteration in the Corn-laws. But, on such a question, to withhold alterations which were really intended was vastly inconvenient and injurious, and left everything unsettled, both for the grower and for the labourer. The agricultural members were now placed by the Government in a very awkward situation; the arguments on which they were put to defend the tariff were arguments which forced them to condemn the Corn-law, and vice versa. He was no subscriber to the opinions of the Anti-Corn-law League; he wished the Minister would propound something which should put an end to agitation. He was glad to hear that the prospects of the revenue were more favourable than they had been supposed; but he must say that the opinion he had always expressed, by his vote and otherwise, against the Income-tax had been confirmed by the experience of what had recently happened. He then put several cases of hardship and vexation in the collection of the tax, which he contended was often overcharged, in the expectation that the party called upon would pay rather than submit to the annoyance of appealing.

Sir C. NAPIER condemned Lord Ashburton's treaty, and Mr. WALLACE expressed his belief that the speech would be received with dissatisfaction in every quarter of the kingdom.

Lord STANLEY addressed himself to the speech of Lord John Russell, whom he blamed for a premature introduction of the questions connected with Afghanistan. He would, however, now declare, that it was the intention of Ministers, on the approaching motion for a vote of thanks, to claim for Lord Ellenborough a share in the honour of our Indian successes. There might be faults to be found with the taste of particular phrases, but when the whole case, with all its facts, should be before the House, the House would judge of it as a whole, and then he should not fear their verdict, and he assured the House that nothing was further from the mind of the Governor-General than to countenance the idolatry of the people under his rule. The noble Lord had blamed the Ashburton treaty as though it would have been easy to conclude a more favourable one; but if that was so easy, why had not the late Government done so in their 10 years of Administration? He believed that the territory given up was valueless in an agricultural, and valueless in a military point of view.

Lord PALMERSTON, as it was his intention to bring the Ashburton treaty by specific motion under the notice of the House, would not now follow Lord Stanley into the details of the subject; but considered Lord Ashburton, by reason of his known opinions and connexions, to have been ill selected as a negotiator upon such a subject. As to Lord Ellenborough and his proclamations, instead of thanking such a Governor, the Cabinet should have recalled him. After a few words about Syria, whose present affairs he treated as of minor importance, he adverted to the hardships of the income-tax upon persons of small means. Perhaps they were unavoidable; but, if so, the Government should not have boasted that persons of small means were exempt from all the evils of that impost. He concluded by asking whether the number of cruisers on the coast of Africa was about to be reduced, and whether any change had been made in their instructions?

Sir R. PEEL answered both questions substantially in the negative.

Sir ROBERT INGLES would not condemn the general policy of Lord Ellenborough, but he must express his deep disapprobation of that passage in one of the proclamations in which a Christian Governor, on a subject connected with religion, employed language such as no Mahometan ruler would have suffered himself to use. It was not, as Lord Stanley had put it, a matter of taste; the Government ought not to take that sort of ground, they ought to discontinue such an officer.

Mr. VILLIERS complained that the speech disregarded the sufferings of the people at home. It would not do to say there were no remedies. Remedies there were, and which the people expected and desired. They would not be satisfied with what had passed this evening. Sir R. Peel had uttered nothing which looked like an intention to repeal the Corn Laws, and the people were now, therefore, in a hopeless state. Their excitement was general.—Lord HOWICK thought it the duty of the House, passing by all minor topics, to apply itself to the subject of the national distress.—Mr. HUME called on Sir R. Peel to carry out his own principles without reference to the opposition of his friends,

and Mr. FERRARD said no good would come till machinery was taxed, and that the masters cared nothing for their labourers.—After some observations from Mr. EWART, Mr. M. GIBSON, Mr. BROTHERTON, Mr. G. BANKES, and other Members, the Address was carried without a dissentient voice.

Friday.—Lord ELIOT stated that it is not the intention of Government to introduce any measure this session to change the mode of assessment for Poor-rates in Ireland.—On Lord COURTNEY bringing up the report on the Address, Mr. WALTER introduced the question of the Corn-laws, and spoke in favour of a fixed duty. Sir R. PEEL, in answer to Mr. VILLIERS, stated that he did not contemplate at present any alteration in the Corn Bill as agreed to last session. He did not think that sufficient time had elapsed to give that bill a fair trial.—A long discussion took place on the Scottish Poor-law system; and various notices of motion in reference to the deficiency of the revenue, the writ for Sudbury, &c., were given.

CITY.

Money Market, Friday.—Consols for money and the Account left off at 94½; Bank Stock, 173 to 174; India Stock, 266 to 267; Exchequer Bills, 63s. to 65s. premium; Three per Cents. Reduced, 95½; Three-and-half per Cents. Reduced, 102 to 103; New Three-and-half per Cents., 101½ to 102; & Long Annuities, 12 15-16ths.

Metropolis and its Vicinity.

Funeral of Mr. Drummond.—On Tuesday morning the funeral of Mr. Drummond took place in the churchyard of Charlton, near Woolwich. In accordance with the desire of the deceased's relatives, it was conducted in the most private manner, and the mourners consisted solely of members of the family. On reaching the churchyard, the body was met by the Hon. and Rev. Mr. Boscawen, Vicar of Wotton, who performed the service. The church was fully attended by the most respectable inhabitants of the neighbourhood, all of whom appeared to be much affected by the scene. The great respect entertained for Mr. Drummond induced a large number of his friends to request permission to pay the last tribute of respect to his remains by attending the funeral, which was only prevented by the desire of the family to conduct the ceremony in as private a manner as possible. Their Royal Highnesses the Duke of Cambridge, the Duchess of Gloucester, the Princess Sophia, the Duke of Wellington, and Sir Robert and Lady Peel, were among the many individuals who were desirous to testify their esteem on this occasion; but, in accordance with the wishes of the deceased gentleman's family, the attendance of their carriages was gratefully declined. Mr. Spencer Percival, who was distantly connected with the Drummond family by marriage, and whose untimely death by the hands of an assassin must be well known to our readers, is buried in the same church. The following account of the death-bed of Mr. Drummond has appeared in the *Morning Post*:—Mr. Drummond suffered very little pain during his illness; so little, that on being pressed on this point by his medical attendants on Sunday, he asked them what they called pain—what they meant by it? and after laughing with them about it, came to the conclusion that his suffering was from oppression. On Monday he complained of shooting pain from the wound in the back to the front, but more of the uneasiness of the oppression—a check in breathing—than of anything else. This came on the first night, and although relieved from time to time, and especially by the loss of blood, was never entirely removed. On Monday evening, at half past six o'clock, a change in the manner of breathing was observed, and Mr. Guthrie was sent for, who, on his arrival at seven, informed his family there was no longer any hope of his recovery, and that any restriction he had placed on them was withdrawn. At ten, the usual consultation took place, and as Mr. Drummond was quite unconscious of his danger, his medical attendants thought it right to declare their inability to be of further use, and to leave his family the duty of making him acquainted with his state. At nine o'clock on Wednesday morning, when a pulse could be felt nowhere, and a slight fluttering of the heart was alone perceptible, he retained the power of moving his limbs, pressed Mr. Guthrie's hand, and with that sweet smile on his countenance which was so endearing, asked if all hope was past? On Mr. Guthrie's replying that all hope in this world was over, and that he must put his trust in God, he said, "Well, I have endeavoured to live honestly, doing as much good as I could, and I place my hope in God's mercy for my redemption." Turning to his sister, whose self-devotion had been unequalled, and who was crying by his side, he said, "We have lived long and happily together, and my only regret is in parting with you." He then asked if he should live much longer, and on being told perhaps an hour or two, he said, "The sooner the better—I don't feel pain," and added, with a smile, "that ugly French word *mal-aise* expresses most fully my burden." Shortly after he said, "Will it be presumptuous in a man in my situation to ask for a little wine and water, with soda or potass-water?" and on its being given to him, conveyed it to his mouth and drank.—The final examination of M'Naghten at Bow-street took place on Monday. The evidence differed in no material point from that which has already been before our readers, except that an inspector of police deposed that the prisoner, in a conversation with him in the cell, on being asked if he was aware who the gentleman was at whom he fired, replied, "Sir Robert Peel, is it not?" After the usual depositions had been taken, he was fully committed on the charge of Wilful Murder. It is stated, in reference to his admission that the shot was intended for Sir R. Peel, that on the Queen's visit to Scotland, Sir Robert invariably rode in one of the Royal carriages, while his private carriage was occupied on every public occasion by the deceased gentleman, who, from that circumstance, was taken for the Premier by the greater part of the spectators. It is stated that M'Naghten was very anxious to see the Premier while in Scotland, and Mr. Drummond was pointed

out as Sir R. Peel; and this impression was further confirmed by seeing the deceased gentleman more than once leave the Premier's residence in Privy-gardens.

Illness of Public Men.—The daily papers announce that Lord Aberdeen, Secretary of State for Foreign Affairs, was unable to attend the Privy Council at Windsor Castle on Wednesday, in consequence of indisposition, or to dine with his political friends at the Duke of Wellington's in the evening. Dr. Holland is in attendance on his Lordship. Sir R. Peel, on his return to town from Windsor Castle, had a lengthened interview with his Lordship, and it is now stated that his illness is not likely to interfere with his public duties.—The Bishop of London has for the last three weeks been so unwell that he has not been able to attend to his clerical duties. Within the last few days, however, his Lordship has so far recovered as to enable him to come to town and take his usual exercise.—Capt. Sir T. Trowbridge, who is at present staying in Paris, has been seized with a sudden attack of paralysis, but no immediate danger is apprehended.—The bulletins issued this week at the Admiralty report favourably of Sir George Cockburn, and announce that the more urgent symptoms are subsiding.—Admiral Sir Charles Nugent, who has been confined four months at the Charing-cross Hospital, for a dangerous fracture of the thigh near the hip joint, which had placed his life in imminent peril, is so far recovered as to be able to leave the Hospital. Since his departure Sir Charles has written to the Hospital inclosing a check for 200 guineas, and adding that he was hereafter to be considered an annual subscriber of 10 guineas.

Royal Society.—The Marquis of Northampton, as President of the Royal Society, gives his *soirées* to the Fellows on Saturday, the 25th inst., March 11th and 25th, and April 8th, at his mansion in Piccadilly.

Meetings of Societies.—A preliminary meeting of gentlemen interested in ethnological inquiries took place on Monday evening, at the house of Dr. Hodgkin, in Lower Brook-street, with a view to the formation of a society for the more systematic prosecution of those inquiries. Mr. R. King read a paper from the pen of Dr. Dieffenbach, pointing out the advantages of such an institution, in combining the scattered information collected by individuals on the psychological, physical, and philological characteristics and affinities of the different branches of the human race. Several gentlemen, in the course of the evening, addressed the meeting, and resolutions were adopted declaring the expediency of forming an Ethnological Society, and appointing a preliminary committee, with power to add to their numbers, for the purpose of taking the necessary steps towards the organisation of the society.—The 50th anniversary meeting of the Baptist Missionary Society was held last week at the Chapel in the Blackfriars-road. The Rev. Dr. Prinse, who has recently returned from a mission to Africa, gave at great length an account of the manners and customs of those portions of Western Africa he had visited, and said that a number of Sunday and daily schools had already been established, and many chapels and places of worship were opened; and by the exertions of the missionaries, civilisation was making rapid strides, and marriage according to Christian customs was beginning to be of daily occurrence. The Rev. Mr. Sherman and other ministers addressed the meeting, and many narratives were given of the narrow escapes and sufferings the missionaries had experienced. The business of the evening was concluded by a collection.

The Scottish Monument.—On Saturday at the meeting of the Marylebone Vestry, the clerk laid before the Vestry a letter from Mr. Hume, with respect to the recent interference of the Commissioners of Woods and Forests, by a threat of injunction against the Vestry, in the event of their proceeding with the erection of the proposed column to the "Scottish Martyrs." In this letter Mr. Hume said, "I have directed the excavation made preparatory to the commencement of the work in the Circus to be immediately filled up; and I desire, on my own behalf and on that of the committee who are charged with the erection of the monument, to express our thanks to the Vestry for the cordial co-operation to effect that object, which, although frustrated for a time, will soon, I trust, be elsewhere accomplished." It was then resolved that Mr. Hume's letter be entered on the minutes of the Vestry, and that the committee be re-appointed to consult with Mr. Hume on the selection of some other spot for the erection of the column.

Conspiracy on board a Convict Ship.—Intelligence has been received of an intended massacre of the officers and civilians on board the *Eliza*, Government transport, which sailed from H.M.'s Royal Arsenal, Woolwich, a few months since, with convicts for Botany Bay. It appears that, as the vessel neared the Line, a murderous conspiracy existed among some of the convicts, which would have terminated, no doubt, in the destruction of those marked down as their victims. There were 267 convicts on board, among whom was a soldier who had been transported for 14 years for striking a sergeant. He privately sent a letter to the surgeon, informing him of the intended outbreak on the morning of March 4; that the design was to put to death all the soldiers, officers, passengers, and such of the crew as offered the least resistance, and then to steer for the Brazilian coast. Extra sentinels were immediately posted, and at 3 o'clock on the eventful morning the passengers and crew were summoned on deck, when their situation was explained to them, and all, being then well armed, were ordered to defend their lives to the last. The surgeon was unwilling to sacrifice the life of the sergeant, whose duty it was to open the convicts' gate at 4 o'clock—all was breathless anxiety, when the surgeon advanced to the gate, desiring a couple of file, of

soldiers to advance and shoot the first prisoner who dared to pass except the one he named. The convicts at once perceived their plot was discovered, retired to their berths, and threw the bolts and all offensive weapons out of the ports into the sea. The ringleader was a young man of the name of Dickenson, who had been an apothecary's assistant in Thavies'-inn, Holborn. He leaped overboard immediately after the discovery, and was drowned. Every precaution was adopted for the security of the convicts, who were handed over to the civil power on arrival.

Fires.—On Saturday morning, about six o'clock, a fire broke out in Lord Hillsborough's mansion in Upper Grosvenor-street. It was first discovered by a police constable, but before he could successfully give an alarm, a body of flames burst through the second-floor windows, and rapidly extended over the building, rendering the exertions of those persons who first assembled to rescue any portion of the furniture altogether unavailing. Several engines were soon on the spot, but, owing to a want of water, some time elapsed before they could be put into operation. Shortly before seven the roof fell in, carrying the back floors with it, and about a quarter before eight, the front floor also gave way and carried two firemen with it into the hall underneath. Active measures were immediately taken to clear the entrance to the hall, and both men were extricated; one was comparatively slightly injured, but the other dreadfully burnt. By this time, the flames were spreading through the lower part of the premises, and the glare of the conflagration might have been seen for several miles distant. A more plentiful supply of water was shortly after obtained, and the effect of the engines began to be visible in arresting the progress of the flames to the adjoining houses. The mansion was occupied by Sir George de Larpent, Bart., and Sir Charles Cockerell; the former with his family had started but half an hour before for Bristol. The Earl of Hillsborough, who, with his family, are at present in Warwickshire, had insured the mansion itself in the Westminster Fire-office. The losses sustained by Sir George de Larpent and Sir Charles Cockerell are stated to be exceedingly heavy, neither party being insured. The total loss will not be less than from 10,000*l.* to 11,000*l.*

Police.—The magistrates of the different Police-courts have received from Messrs. Roberts and Co., the bankers, a donation of 10*l.* each, being a portion of a legacy of 1,500 francs bequeathed by the late Mons. Le Montblanc, Archbishop of Tours, for charitable purposes, to be dispensed amongst the poor of London. The testator requested, that in the distribution a preference should be given to those of the Roman Catholic religion.—On Friday, a man called Thomas Patterson, against whom four warrants were issued some time since for exposing certain publications at a shop in Holywell-street, tending to bring religion into contempt, was apprehended and brought before the magistrates at Bow-street. The case was fully proved, and the prisoner was fined 40*s.* for each offence. He refused to pay the fines, and was committed to prison for one calendar month.

Rotherhithe.—A contest respecting Church-rates has been going on for some days at St. Mary's in this parish. The poll commenced on Monday at eight, and closed at four, when the numbers were—For the enforcement of the rate, 285; against it, 126—majority for the rate, 159.

Greenwich.—Thirteen boys of the Upper Naval Schools have been expelled for their insubordinate conduct on Thursday week, when they did considerable damage to the windows. On Sunday last there was another outbreak, which was, however, easily repressed. The damage done on the two occasions is estimated at 100*l.* One hundred boys are to be added to the present number in the upper school, in lieu of the girls' school, which was done away with some time since.

Woolwich.—Sir James Graham has officially communicated to the Master-General of the Ordnance, that Her Majesty has permitted the non-commissioned officers and men of the Royal Artillery to accept the Cross of the Spanish Order of Isabella II., in approbation of their conduct while serving on the north coast of Spain in 1837. The Master-General has announced in General Orders, that, in consideration of the gallantry displayed by the Royal Artillery when serving with the troops recently employed under the orders of Lieut.-General Sir Hugh Gough on the coast and rivers of China, Her Majesty has been pleased to permit the Royal Artillery to bear upon their appointments the word "China," and the device of the Dragon, in commemoration of their distinguished services.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Jan. 21:—West districts, 145; North districts, 152; Central districts, 193; East districts, 234; South districts, 219. Total, 960, (490 males, 470 females.) Weekly average for the last five years, 903, (461 males, 442 females,) and for the last five winters, 1,004.

Provincial News.

Aylesbury.—In consequence of considerable difference of opinion existing amongst the county magistrates of Bucks as to the legality of Justices deciding upon cases, and summarily convicting (as the case may be), at their private residences, Sir Harry Verney recently wrote to the Home Secretary requesting his opinion on the subject, for the guidance of the magistrates. Sir James Graham, in his reply, states, that it appears to him "that in any district in which there is a regular and fixed place for holding the petty sessions, to which the public have access, the most desirable course to adopt is, that the cases which are to be brought before magistrates should be there heard and adjudicated; though certainly it is not illegal for the magistrates to hear cases at the office of their clerk."

Cambridge.—The Rev. Alfred Ollivant, D.D., Trinity College, late Vice-President and Professor at St. David's College, Lampeter, and Prebendary of St. David's and Brecon, was on Wednesday elected to the Regius-Professorship of this University, vacant by the resignation of the very Rev. Dr. Turton, Dean of Westminster. The other candidates were the Rev. Dr. Mill and the Rev. Dr. Chris. Wordsworth.—A meeting of the Archdeaconry of Ely took place last week, at which two petitions to Parliament were resolved upon; one of them, that the Sees of St. Asaph and Bangor might not be united; the other, for an increase of the number of churches, and a subdivision of the larger parishes. This latter petition contained the following paragraph:—"That your petitioners would humbly submit to the thoughtful consideration of your Honourable House, whether it be not worse than useless to complain of the want of attachment to our Protestant Reformed Episcopal church, on the part of a large portion of the population, when they are necessarily and inevitably excluded from all participation in its benefits; and, therefore, that it is the imperative duty of the Legislature to confer on the Established Church those powers and facilities of instructing the people, without which its doctrinal excellencies may be of no avail, and its healing and beneficial influence may be lost to the body politic." After the petition had been proposed to the meeting, the Rev. C. Warren, of Over, said, "That as the Episcopal Church was distinctly named, the words 'Protestant Reformed' were superfluous, and therefore unnecessary. He proposed as an amendment, that those words be left out. The Rev. F. W. Collison seconded the amendment, on the ground that the Church had never called herself Protestant. The same thing was meant by himself and the framer of the petition, but he thought unanimity was more likely to be attained by the omission of the words."—The Rev. G. Spence opposed the suggestion. There were not many, he hoped, who considered that the Church had ceased to be 'Protestant' or 'Reformed,' or who, as Ministers, had ceased to glory in her as a 'Protestant and Reformed' Church. As a matter of principle, he, for his part, felt the highest pride and glory in having the honour to be a Minister of the "Protestant Reformed Episcopal Church," and he could not sit still when a proposition was made to erase the first two most significant words. After some discussion the amendment of Mr. Warren was negatived by a majority of 19 to 6, and the words of the original resolution were retained unaltered.

Chichester.—At the Court of Bankruptcy last week, Mr. Commissioner Fane delivered his judgment in the case of an application for a certificate of Mr. Charles Ridge, one of the partners in the Chichester old bank. Having complimented the assignees on the zealous manner in which they had performed their duty, the commissioner proceeded at considerable length to recapitulate the facts connected with the bankruptcy; but as they have been already reported by us in former Numbers, it will be unnecessary to repeat them. He commented in strong terms on the fact of the bankrupts having retained in their service a clerk named Goodem, although he had appropriated to his own use 11,500*l.* of their notes, the only reason for his retention being the dread of the bankrupts that he should disclose the state of their affairs. Another feature of the case which the commissioner considered to bear heavily against the bankrupts was, their having, up to the last moment, received as deposits the savings of poor and industrious persons, promising them security and 3½ per cent. interest, whereas on their failure for the sum of 139,972*l.*, their estate only realised 6*s.* 3*d.* in the pound. Having alluded at some length to the alteration in the Bankrupt Law, which invested in the commissioner the power of giving or withholding the certificate; he proceeded to say that the conduct of Mr. Charles Ridge, now before the court, had been wholly without excuse. He ought to have wound up the affairs of the bank immediately after the great loss it had sustained (nearly 50,000*l.*) in the failure of Fry and Chapman, their London agents, the assets of himself and partners being entirely insufficient to meet the emergency. On the occurrence of that event the course of Messrs. Ridge was plain. They should have called their creditors together; but, instead of doing so, they paid away 12,500*l.* in legacies to keep up the delusion, and allowed their own servant to rob them with impunity of several thousand pounds. By such conduct they delayed the evil day, but in doing so involved hundreds of persons in humble life in their ruin. It was impossible to do otherwise than visit such conduct with the marked censure of the court. The Act of last session gave the commissioner power either to refuse or suspend the certificate. Now he was unwilling in any case to refuse a certificate absolutely, unless he believed there was some concealment of property, a circumstance which was not at all alleged against the Messrs. Ridge. All he should do, therefore, was to suspend their certificate, and to make their ultimately obtaining it depend on fair and proper conditions. He would suspend Mr. C. Ridge's certificate for two years from the date of the bankruptcy, and the conditions which he should require to have fulfilled previous to granting it would be, that it should not protect any property which might hereafter fall to the bankrupt, either by will or as heir-at-law, as next of kin, or by death intestate. This would enable the bankrupt to resume business, if he could find persons to trust him, and would secure to his future creditors the fruits of his future industry; while, on the other hand, it would secure for his present creditors such advantages as the accidents of life might furnish. He should therefore sign Mr. Charles Ridge's certificate for the 26th November, 1843.

Devonport.—We are glad to learn by the *West of*

England Conservative that the Mechanics' Institute of that town is about to set a good example, by the introduction of lectures on Horticulture. The first lecture will be delivered on Tuesday next, by Mr. W. E. Rendle, of the Union-road Nursery, at Plymouth, who will trace the rise and progress of Horticulture from the earliest ages to the gardening of the nineteenth century, and will illustrate his lecture by choice plants in flower. The leading subjects touched upon in his synopsis are, the formation of the London Horticultural Society; the subsequent formation of Provincial societies throughout the country; the New Zealand Horticultural Societies; the Chiswick exhibitions; short histories of the apple, pear, and other fruits; brief historical facts relative to the dahlia, the pelargonium, the pansy, &c.; the tulip mania; usefulness of horticultural societies in distributing prizes to honest and industrious cottagers, in thus encouraging them to cultivate their gardens, and affording partial maintenance for their families; and the great pleasure derivable from the cultivation of flowers.

Liverpool.—In a recent article on the system of farming which prevails in Lancashire and Cheshire, the *Liverpool Times* states that the Earl of Derby and Lord Francis Egerton have embarked in agricultural improvements, and, as a means, have given suitable leases to their tenants. The article in question states that "The farming is very fair on the lighter soils of Lancashire and Cheshire, about Liverpool, Hale, Warrington, Flixton, Altringham, Newton-in-the-Willows, Ormskirk, Southport, and Rufford, and altogether greater and more successful efforts have been made to improve moss or bog land in Lancashire and Cheshire than in any other part of England. The field cultivation of the Potato is as well understood in Lancashire as that of the Turnip is in Norfolk or the Lothians; the crops of that root grown in this county are superior, both in quantity and quality, to those grown in any other part of England, and the Wheat and Clover crops grown after them are also very good. It is the stiff clay lands which are the disgrace of the Lancashire and Cheshire farming. They are almost uniformly wet, and covered with rushes, although when well drained and farmed, as on the estate of Mr. B. Bretherton, at Rainhill, they form excellent meadow and pasture land, when laid down in grass, and yield large crops of wheat, beans, oats, and barley, when worked with the plough. All that is wanting in Lancashire is good effectual draining; but there is no reason to expect that that will become general in this county until long leases are introduced in place of the present holdings, nine-tenths of which are determinable by a six months' notice. Two of our great landholders, namely, Lord Francis Egerton and the Earl of Derby, seem to be aware of this, the former having recently re-let a great part of his Lancashire property on very favourable terms, and the latter now offering long leases and advantageous conditions, on all the farms which from time to time fall into his hands."—On Tuesday night a free trade banquet was held at the Amphitheatre, attended by nearly a thousand people. The boxes were filled by ladies, and the galleries crowded by persons who were admitted at a low price to witness the proceedings. The chair was filled by Mr. Thornely, the member for Wolverhampton, supported on his right by Mr. Villiers, Dr. Bowring, Sir De Lacy Evans, Colonel Thompson, and Mr. Hindley, M.P.; and on his left by Mr. O'Connell, Mr. T. M. Gibson, Mr. Sharman Crawford, and other advocates of free trade, most of whom addressed the meeting at considerable length.

Manchester.—On Saturday night a destructive fire broke out in an extensive pile of warehouses in Norfolk-street, close to the Post-office in this town. The warehouses, at the time of the conflagration, were crowded to the ceiling with calicoes, yarns, counterpanes, damasks, &c. The fire originated on the second floor, in Messrs. Clayton and Gladstone's warehouse. The number of persons who were drawn together on the first outbreak was so great, that all the efforts of the police to keep them back were unavailing; it was consequently found necessary to call in the aid of the military; and three companies of the 15th, by forming themselves in detachments, soon cleared the mob from all the approaches to the warehouses, and protected such portions of the property as were rescued from the flames. The building was entirely destroyed, and the damage done is estimated at 50,000*l.*—On Friday, the 27th, a dinner was given in this town to Mr. Emerson Tennent, M.P., for the purpose of celebrating the passing of the Copyright of Designs Bill, and of presenting that gentleman with a service of plate, in testimonial of the gratitude of the calico-printers throughout the kingdom for his exertions on their behalf. Mr. Tennent has for some years past exerted himself in order to procure a Legislative enactment for securing a reasonable copyright of designs in various branches of art and manufacture; and our readers are aware that an Act for this object was passed last session. The calico-printers, the parties more especially benefited by the Act, accordingly opened a subscription for the purpose of presenting Mr. Tennent with some testimonial of their gratitude; the subscription amounted to 1,850*l.*, and was appropriated to the purchase of a service of plate, containing 106 pieces, and weighing upwards of 3,000 ounces. About 70 gentlemen were present at the dinner, and Mr. Tennent addressed them at great length on the various questions connected with their branch of manufacture.—The first great aggregate meeting of the demonstrations of the Anti-Corn-Law League in this town was held on Monday in the new Free-Trade Hall, Peter-street. The principal object of the meeting was to give a report of the progress of the Great League Fund. The meeting was limited to registered members of the League, and deputies from distant towns—a few seats having

been reserved for ladies—but, notwithstanding this limitation, the hall was crowded to overflowing. The numbers present have been variously estimated at from 7,000 to 10,000 persons. Mr. M. Philips, M.P., presided. Our space will not allow us to give the particulars of the various speeches delivered on the occasion; we can merely state that the list of subscriptions announced as already received exceeded 40,000*l.*, without including Manchester, which has already subscribed 7,000*l.*, and the metropolis, in which the subscriptions amount to about 3,000*l.* Mr. Bright, however, showed a long list of towns which had not been visited, but which it was intended forthwith to visit, and the result he expected would be a great addition to the subscriptions. The largest sums in the list announced on Monday were the following:—Manchester, 7,000*l.*; Glasgow, 2,500*l.*; Rochdale, 2,200*l.*; Liverpool, 2,200*l.*; Huddersfield, 1,800*l.*; Leeds, 1,500*l.*; Halifax, 1,010*l.*; Ashton, 1,000*l.*; Bristol, 1,000*l.*; Edinburgh, 1,000*l.*; Bolton, 936*l.*; Bury, 928*l.*; Nottingham, 850*l.*; Sheffield, 800*l.*; Burnley, 700*l.*; Bradford, 600*l.*; Blackburn, 600*l.*; Birmingham, 500*l.*; Bacup, 500*l.*; Dundee, 500*l.*; Leicester, 500*l.*; Oldham, 500*l.*; Stockport, 500*l.* A singular circumstance occurred while Mr. Massie was in the act of stepping forward to address the meeting. The whole of the gas-lights went out. The circumstance was attributed by Mr. Wilson, the chairman of the League, to intention, and it was announced that the utmost exertions would be made to discover the author of the attempt to create confusion in that large assemblage. A considerable addition to the subscriptions was made before the meeting separated.

Plymouth.—On the night of Friday, the 27th, the Greek brig *Taxiarches*, from the Danube, for Hull, but last from Falmouth, where she took a pilot, went on shore on the south-west side of the Rame Head, near this port. Her pilot was below at the time, having previously left instructions to have the brig steered to the south-east. Unfortunately she was steered to the north-east. It being thick at the time, and the vessel, having a fair wind and studding-sails set, ran on the rocks before the crew knew where they were. The crew were saved, but the vessel will probably go to pieces.

Rye.—To the list of wrecks consequent on the late boisterous weather, another calamity, occurring on the Sussex coast, is now added, in the total loss of the *Arundel* yacht, bound for Hong Kong and Macao, which took the ground on Winchelsea-track, on Saturday night, and soon became a perfect wreck. The *Arundel* left Gravesend on Thursday week for the Downs, under the care of Mr. Davison, senior pilot to her Majesty, who had the conduct of the squadron on the occasion of the Queen's visit to Scotland. She arrived safe in the Downs and on Friday morning was working down Channel against a strong westerly wind. All seems to have gone on well up to midnight on Friday, at which time she was off Dungeness. In beating up the Sussex coast, it appears that Mr. Davison, presuming on the yacht's well-known sailing qualities, must have run too near shore. On Saturday morning the soundings were taken, and the vessel was discovered to be in shallow water. The pilot immediately put the helm down, but before the track of the vessel could be influenced by it, she struck heavily, and soon after became firmly embedded in the sand. The four passengers were saved by the life-boat of this place under the command of Lieut. Ralph, and about 4 A.M., the captain and the crew took to the ship's boats, and succeeded in reaching the shore although a heavy surf was rolling upon the beach. The *Arundel* was well known as one of the finest vessels belonging to the Royal Yacht Squadron, and was built by the late Duke of Norfolk from timber grown on his own estate. At the sale of the duke's property, she was purchased by Capt. Richardson, who intended her for the local trade in China, her peculiar build and extraordinary sailing qualities adapting her for that service.

Windsor and Eton.—On Tuesday a man named Samuel Prentice underwent a private examination before two county magistrates, on a charge of being found in the stores of Windsor Castle with a felonious intent. It appears that on Friday night, the 27th, in consequence of an accidental ignition of one of the men's caps, a porter in the Lord Chamberlain's department was left in the store-room for the night as a security against fire. About half-past five in the morning he went down to the lower room to look at the clock; when there he heard some one getting over the gate of the yard in front of the store-room; his attention being drawn to the door, he heard some one come up, and he then hid the lamp. He heard a key put into the lock, and unlock it. He heard some one enter the door, and he then showed his light, and saw that it was the prisoner, who has been employed as the working bell-hanger in the Castle, and usually works at a shop in the tower moat, opposite the store-rooms. He had every opportunity of acquiring a thorough knowledge of the place, and of the description of the articles which were kept there. After the usual evidence the prisoner was committed for trial.

Railways.—The returns of the traffic on the leading lines, for the last week, are as follows:—Greenwich 730*l.*, Eastern Counties 813*l.*, Croydon 198*l.*, Liverpool and Manchester 3,551*l.*, Brighton 2,547*l.*, Newcastle and Carlisle 1,197*l.*, Grand Junction 6,315*l.*, Blackwall 507*l.*, Great North of England 1,262*l.*, Glasgow and Paisley 786*l.*, Birmingham and Gloucester 1,516*l.*, Edinburgh and Glasgow 1538*l.*, Hull and Selby 729*l.*, Birmingham and Derby 1030*l.*, Midland Counties 2,111*l.*, North Midland 3,242*l.*, South Western 4,285*l.*, Great Western 10,777*l.*, London and Birmingham 13,311*l.*, Northern and Eastern 1,111*l.*—The Board of Trade have addressed a very important circular to the Secretaries of all the Rail-

way Companies on the subject of retrenchment. The propriety of these reductions has been often discussed, and is now formally condemned by the official caution given to the management of the different lines. The circular bears special reference to the case of Mr. Harvey, a commercial traveller from Glasgow, whose death, as our readers will recollect, was occasioned by a collision at the Barnsley station, on the line of the North Midland Railway. The following extract contains the most important portion of this document:—"The experience of the last three years has fully satisfied their lordships that the comparative exemption which has been latterly enjoyed from the alarming accidents which occurred so frequently during the infancy of railway travelling, is to be attributed mainly to the gradual formation of establishments of experienced and trustworthy engine-drivers and other servants, upon all the leading passenger railways, and that it is only by maintaining such establishments that a repetition of such accidents can be effectually prevented. This opinion has been confirmed by the recent accident upon the North Midland Railway, and the investigations which their lordships have directed, in consequence, have fully satisfied them that sudden and sweeping reductions in the branches of the establishment connected with the public safety, can rarely be attempted without occasioning great danger. Under these circumstances, although my lords have no wish to interfere with the discretion of the directors of railway companies especially in cases where pecuniary considerations are involved, they think it their duty to remind them of the heavy responsibility which they will incur if they allow themselves to be influenced by a mistaken economy, so far as to attempt reductions, either in the number and efficiency of the establishment which previous experience has led them to consider necessary for conducting the public traffic in safety, or in the accustomed wages of the class of servants upon whose intelligence, sobriety, and habitual good conduct the safety of the passengers depends."—A resolution was passed by the shareholders of the Bristol and Gloucester Railway at the meeting held last week, authorizing the Directors to raise the money to complete the line. The cost of the work is estimated at between 160,000*l.* and 170,000*l.* It appears by the reports in the Provincial papers that the shareholders of the Gloucester and Berkeley Canal Company have consented to support the Dean Forest Railway in the line of road already laid down. It is stated that when the Bristol and Gloucester line comes into full action, the revenue derived by the carriage of coal to Stroud will be cut off, and therefore that the only means to create an equivalent would be the bringing of the article from the Forest of Dean to Gloucester at a price to enable its delivery at Stroud cheaper than could be done by the Bristol and Gloucester Company.—On Tuesday, the half-yearly general meeting of the London and Greenwich Company took place, and a dividend of 1*s.* per share was declared, the accounts showing a net surplus of 2,207*l.* 12*s.* 4*d.*, after paying interest on bond and loan debt, and the "preference shares." The directors were also authorized to raise 50,000*l.* remainder of the capital by mortgage without power of sale, the interest to be payable half-yearly, and the principal at the end of seven years. The mortgage bonds will be offered to public tender, the interest to be fixed by the offerer, and the lowest rate to be accepted. These bonds will have the preference over all shares. A long discussion took place on the adoption of the report, and the disputed question of the tollage was revived, the shareholders appearing firm in resisting any infringement of their original rights. An unsuccessful attempt was made to get the appointment of a committee to reconsider the question, and Mr. Wilkinson, the chairman of the Croydon Company, who endeavoured to address the meeting, was quite unable to obtain a hearing. The income of the company from the traffic appears by the balance-sheet to be 27,106*l.*—Subsequent to the great blast of Round Down cliff, on Thursday week, by means of 18,000*lbs.* of gunpowder, it has been ascertained by measurement that the immense mass of rock dislodged covers a surface of 18 broad acres, and is not less than 25 feet deep. The shock was so slightly felt in some parts of the cliff, that the party in charge of the voltaic battery thought the experiment had failed. It is said that the saving to the South-Eastern Railway Company by this blast will be at least 10,000*l.*—The half-yearly meeting of the Grand Junction Company was held on Tuesday last at Liverpool. It appeared from the report that the clear profit of the half-year was 119,470*l.* 2*s.*, to which was to be added 5,612*l.* 4*s.* 3*d.*, surplus from the previous half-year, making a total of 125,082*l.* 6*s.* 3*d.*; from this amount the directors recommended that a dividend of 5*l.* per share, and proportionate amounts on the other stock, be declared; this would absorb 110,165*l.*, leaving a balance of 14,917*l.* 6*s.* 3*d.*, which the directors proposed to appropriate as follows:—Income tax for half a year 3,653*l.* 17*s.* 10*d.*, depreciation and renewal of stock 5,000*l.*, leaving to be carried forward to the credit of the present half-year the sum of 6,263*l.* 8*s.* 5*d.*

IRELAND.

Dublin.—On Sunday, the Very Rev. Dean Daly was consecrated Bishop of Cashel and Waterford in the Cathedral of St. Patrick's. The officiating prelates were, the Archbishop of Dublin and the Bishops of Cork and Ossory. Every available spot in the church was occupied, and hundreds had to leave without being able to obtain an entrance to the choir.—Intelligence has been received in Dublin that Durrow Castle, the family mansion of Lord Norbury, has been burnt to the ground, and that very little of the furniture or other property has been saved.—A meeting, of which a very long notice had been given, to forward the plan of erecting some lasting testimonial to

the merits and services of the Rev. Father Mathew, took place last week in the Theatre Royal. The Duke of Leinster presided, and said that it afforded him the greatest pleasure to preside at this meeting, and in every way to show the respect and esteem he entertained for the Rev. Mr. Mathew. The immense assemblage before him, he said, assured him that the meritorious conduct of that individual was no less highly estimated and felt by the country. The resolutions for the purpose of carrying into effect the object of the meeting were moved and seconded by the Marquises of Headfort, Clanricarde, and Kildare, Judge Moore, Sir G. Hudson, Bart., Sir J. Burke, M.P., Mr. Wyse, M.P., Mr. Smith O'Brien, M.P., Mr. Tuft, M.P., the Hon. Colonel Southwell, and Mr. O'Connell, and were carried without a dissentient voice. Several of the leading peers and gentry of Ireland were present, and the boxes and galleries of the theatre were crowded to excess.—A large meeting has been held in Dublin for the purpose of expressing dissatisfaction with the Irish Poor Law. It was attended by noblemen and landowners of all shades of party politics, the chair being taken by the Duke of Leinster, and the resolutions proposed and seconded by the Marquess of Downshire, Lord Ormonde, Lord Roden, Lord Charleville, and others; while there was a numerous attendance of members of Parliament, both Ministerial and Opposition. A resolution was carried to the effect that—"It being the conviction of the meeting that the law, unless to a great extent remodelled, would every year become less effective as regards the objects intended by the Legislature, and that it would tend, at no distant period, to the serious embarrassment of any Government, a deputation be appointed to urge upon His Excellency the necessity of an immediate and searching inquiry into the operation of the whole system." A deputation waited upon the Lord-Lieutenant accordingly, and stated the resolutions to which the meeting had come. His Excellency, in his answer, said, "The Government were quite alive to the importance of the subject, and most anxious to receive information upon it, particularly so from gentlemen of such rank and intelligence, and whose object was to improve the law; that the question was manifestly one of great difficulty," &c.; and he concluded by observing, that it was impossible that "legislation should take place early in the session, as the meeting recommended."—A new Irish Registry Bill is said to be in preparation, in which the existing 10% household franchise will be retained, and a new franchise added similar to the tenant-at-will, or Chandos qualification in England, to be fixed at the annual payment of 30%, according to the Poor-Law valuation.

SCOTLAND.

Edinburgh.—The Court of Session was occupied last week in hearing the arguments of counsel in the well-known cases of Auchterarder and Strathbogie, the whole Court, with the exception of the Lord Justice Clerk, being present. The counsel who appeared for the several parties were Mr. Rutherford, the Solicitor-General, and the Dean of Faculty. The arguments of Mr. Rutherford and the Dean of Faculty were of considerable length. The Court intimated that they would give judgment on a future day.—The *Caledonian Mercury* announces that they are authorised to state that the appeal taken to the House of Lords, in name of the dissentient parishioners of Culsa-mond, against the decision of the Court of Session, by which the settlement of the Rev. Mr. Middleton was sustained as valid, has been abandoned, by directions from the law committee of the General Assembly. The decision of the court below must now, therefore, be regarded as final and conclusive of one of the great church cases which have recently occupied so much public attention, and excited such general interest.—It is rumoured that Mr. Fox Maule, in his proposed measure for the settlement of the troubles of the Scotch Church, favours the views of the majority, and that his measure will probably be a mere enactment of the veto, or a repetition of some of the Bills which have been already introduced into Parliament.—The Lord Justice General, the Lord Provost, and other gentlemen, met as a committee at Holyrood House last week, to accompany Mr. Nixon, the Master of Works for the Woods and Forests, over the ground to be converted into a carriage-drive round Salisbury Crags and Arthur's Seat. The line is to commence near the temporary gate in the Abbey-hill, pass through Queen Mary's gardens to the front of the Palace, across the paved Palace-yard, and again through the gardens at the south of the Palace, to a point about the beginning of the irrigated meadow. From this point a road is to be made eastward to the Duke's-walk, and along that walk to the Watering-stone at Meadowbank. Another road is to be continued from the point in the irrigated meadow southward, along the bottom of Salisbury Crags, till it reaches the road leading to the Powder-house. Thence it is to double round the hill, towards the shepherd's house, commonly called David Dean's cottage. It is ultimately intended to carry the road to Duddingstone by a line nearly the same as the present foot-walk. The committee were satisfied, not only with the utility of such lines of road, but also with the beauty of the scenery, and the great additional attraction the roads must give to the city. The works will be in operation within two or three weeks, and it is intended to have them exclusively executed by the Edinburgh labourers now out of employment.

Glasgow.—The installation of Mr. Fox Maule, as Lord Warden of the University of this city took place on Thursday week, in the Common Hall; he was received with great enthusiasm.

Miscellaneous.

Autographs.—At the recent sale of the Marquis Wellesley's library an eighteenpenny pamphlet, entitled, "A

Letter to the Duke of Wellington on the Present State of India," published only last year and still on sale, procured the enormous sum of 95*l.* 1*l.*s.; merely because it contained two or three MSS. notes by the late marquis, in reference to some passages quoted from Mr. Alison's History. This circumstance is so unprecedented, that the following account of the manuscript comments, taken from the *Times*, may not be unacceptable to our readers:—At page 6 of the pamphlet the text says, "He (the Marquis) sent indeed a strong Army of observation under Sir J. Craig," &c. The note thereon is,—"The Army, 'in the field,' as it was called, and as in my time it 'always' was, with all equipments, prepared for immediate service, was the only preparation made against the 'certainly meditated' attack of Zamaun Pchah.—W." [The text spells it "Schah."] At page 15 the text quotes from "Alison's History," vol. vii., pp. 184 and 185, where that author speaks of the overthrow of Colonel Monson's division, and the disastrous confidence thereby generated among the restless and rebellious native chiefs, &c.; the writer of the pamphlet observes, "When again, in the war with Holkar, the Marquis deviated from his usual policy," &c., and "these impending evils were arrested by a recurrence to those better and wiser councils, which, with the one exception, characterised the whole of the Marquis Wellesley's government," &c. The Marquis, in his note exclaims—"I never deviated at any time from my fixed policy; Monson (a poor, weak, though brave man), with the best intentions, deviated from it, and I spared him on a fixed principle, 'never to cast blame on those whose intentions were fair and honest, although my own fame might suffer.' All the phrases 'departed,' 'recurring to,' &c., are quite misapplied—they should be corrected. Monson's advance and retreat were no acts of mine. I wish the author of this letter, who seems to be a well-informed and judicious person, would inform Mr. Alison of these facts. Mr. Alison's work is excellent, and most fair to me, but he has made some mistakes which I could correct if I knew him or any of his friends.—W." The pamphlet was purchased for the Duke of Wellington, and it is said that, on the price being mentioned to him, he evinced, not unnaturally, the utmost surprise. The competitor against Mr. Hatchard, who bought the lot, was Mr. Blackwood, the publisher of Mr. Alison's History, that firm desiring to possess such testimony to the general excellence of the work. Mr. Hatchard's order, however, was unlimited—merely "buy it;" and, if Mr. Alison's publishers had not entered the field, there were others prepared to go to a very high price. One gentleman was ready to go as high as 50*l.*, so that his Grace had no chance of obtaining a bargain. The circumstance is unprecedented in the history of sales of books and autographs.

"Old Mortality."—The only occupation of the old man was wandering about the country, repairing the tombstones of the Covenanters, travelling from one churchyard to another, mounted on his old white pony, till he was found dead one day by the road-side. His family experienced a singular variety of fortune. One of his sons went to America, and settled at Baltimore, where he made a large fortune. He had a son who married an American lady, and the latter outliving her husband, became Marchioness Wellesley! His daughter was married to Jerome Bonaparte, and after her separation from him wedded Monsieur Serurier, the French consul at Baltimore. What would "Old Mortality" have said, as he bored among the neglected grave-stones in Scotland, had he foreseen that the widow of his grandson was to become an English Marchioness, sister-in-law of the Duke of Wellington, and his granddaughter Queen of Westphalia, and sister-in-law of Napoleon!—*Inverness Courier.*

Law.

ARCHES' COURT.—*Nunn against Varty and Mopsey.*—Sir H. Jenner Fast delivered his judgment in this case, which was an appeal from the Consistory Court of London in a cause of subtraction of church-rate, promoted by the Churchwardens of St. John, Hackney, against Mr. Nunn, a parishioner, the amount sued for being 3*s.* 4*d.* The sentence appealed from rejected the allegation in opposition to the rate, the learned Judge in the court below holding that it pleaded no sufficient grounds to invalidate the rate. The questions principally turned upon the construction of the local acts relating to the pulling down and rebuilding the parish church, in conjunction with the Church Building Acts, under which the original parish had been divided into three separate and distinct parishes. The Dean of the Arches now affirmed the judgment of the Court below upon every point, pronounced against the appeal, and condemned the appellant in the costs.

CENTRAL CRIMINAL COURT.—The fourth session during the present mayoralty commenced on Monday before the Lord Mayor, the Recorder, and usual civic authorities. The Grand Jury having been sworn, the Recorder proceeded to deliver his charge, and said that, on a perusal of the calendar, and a careful consideration of the facts disclosed in the depositions returned to the Court, it did not occur to him to make any particular observations with respect to the general nature of the charges, which were of the ordinary character, and supported by ordinary evidence. There was, however, one case of a very serious nature, being a charge of murder, committed in the streets of London, in the light of day, and as there appeared upon the face of the depositions no apparent motive for the commission of the offence, it became more necessary for him to draw their particular attention to the case. He would therefore address a few observations upon the charge of murder, and would preface those observations by remarking, that in case of a defence being set up on the ground of real or supposed insanity, it was not their province to take such matter into their consideration, and throw out a bill in consequence. He made those observations, because it would be necessary very particularly to allude to a defence of insanity, because such a defence, if established at the trial, would excuse the party charged; but it was not a question for their determination. In alluding to the definition of the crime of murder, he would observe that it might involve the question, whether the accused was sane or not, and if insane, whether the offence was committed during a lucid interval. He had considered it necessary to advert to the nature of such a defence, for the purpose of cautioning them against deciding on such grounds; for, although in his observations it would be necessary to allude to such a state of things, still it would not be for them to consider whether the offence was committed by a person of unsound mind.

In the case of "The Queen v. the wife of John Hodges," when the grand jury came into court, the foreman stated, that a bill had been presented to them against a mother for the murder of her child, and they had thrown it out, because the evidence of all the witnesses went to show she was insane. Mr. Baron Alderson, who was on the bench, said, "Then, gentlemen, you did wrong; you ought not to try that question. If you are of opinion the acts done by her were such as, if they had been done by a person of sound mind, would have amounted to murder, it is your duty to find the bill, otherwise you afford no security to the public by the confinement of the insane person." That opinion in no respect was any hardship upon the party accused, because the Legislature had taken particular care to provide for persons in a state of insanity, either when arraigned, or when under trial. By the 39th and 40th George III., c. 94, sec. 2, it was enacted, that if any person indicted appeared when arraigned insane, a jury might be empanelled to try his sanity, and upon being found insane, he was to be kept in safe custody till Her Majesty's pleasure should be known, and by a previous clause in the same statute, it was enacted that if a person was acquitted upon the ground of insanity, the jury must deliver a special verdict to that effect, and the accused would then also be detained—a necessary course, not only for his own safety, but also for the safety of the public. He particularly called their attention to these circumstances, because in ordinary cases a jury might be induced to throw out a bill, if upon hearing the witnesses on behalf of the prosecution only, it appeared that the accused was not in his right mind; but in a case of this description they would be pleased to attend to the directions he had given them, and not try the question of sanity or insanity; for, according to the provisions of the statute to which he had already alluded, that was a question to be determined by another tribunal. Having made these preliminary remarks, he would call their attention to what the law deemed the crime of murder. My Lord Coke said, "When a person of sound memory, and of the age of discretion, unlawfully killeth any reasonable creature in being, and under the King's peace, with malice aforethought, either express or implied, so as the party die of the wound within a year and a day after the same, it is murder; but the offence cannot be committed by an idiot, lunatic, or infant." And Lord Hale describes the age of an infant to be under seven years. Now, although it was held by law that an insane person could not be found guilty of the crime of murder, still it was necessary, in order to exempt a party from such a responsibility, to prove that at the time he committed the offence, he was incapable of distinguishing right from wrong. Sir Michael Foster, in his treatise on homicide, said—"In every charge of murder, the fact of killing being first proved, all the circumstances of accident, necessity, or infirmity, are to be satisfactorily proved by the prisoner, unless they arise out of the evidence adduced against him; for the law presumes the fact to have been founded in malice until the contrary appears." Some misapprehension appeared to have been entertained with respect to the words malice aforethought; but the same learned authority upon that subject said, "When the law maketh use of the words malice aforethought, as descriptive of the crime of murder, it is not to be understood in that narrow restricted sense to which the modern use of the word malice is apt to lead one—a principle of malevolence to particulars; for the law by the term malice, in this instance, meaneth that the act hath been attended with such circumstances as are the ordinary symptoms of a wicked, depraved, and malignant spirit;" and again, "and I believe most, if not all, of the cases which in our books are arranged under the head of implied malice, will, if carefully adverted to, be found to turn upon this single point—that the fact hath been attended with such circumstances as carry in them the plain indications of a heart regardless of social duty, and fatally bent upon mischief." To these observations he (the Recorder), would add, that if in the prosecution of a guilty purpose, another offence, not intended, was committed, the party was equally guilty as if he had accomplished the crime he contemplated; so, if a person attempted to take the life of another, and by mistake or accident, or from any other cause in furtherance of such design, killed another party, the law presumed malice; although the blow which caused death to the individual was intended for another, the offence was in law the same, inasmuch as it was an unlawful taking away life. If, therefore, in the course of the investigation, it should appear from any expression used by the accused, or from any other facts that might be adduced in evidence, that some other person had been aimed at, or that the accused had another person in his mind, the offence was equally one of murder. As far as he could judge from the depositions, the facts which would be laid before them would be short and extremely simple; they would in all probability find that the unfortunate deceased was walking in the street whilst in the occupation of his usual avocations, that he was followed by the prisoner, who drew a pistol, which he discharged at him, and that the ball took effect; that he then attempted to fire another pistol, but was frustrated in his attempt, and taken into custody with the pistols in his possession. They would also probably learn that the person wounded died in a few days from the effects of the wound; and it might also be shown that the accused inflicted the wound intentionally. If such facts should be proved in evidence, their duty would be extremely short. If they should be of opinion that the accused intended to do what he actually had done, and he (the Recorder) apprehended they would have but little doubt that he intended to commit the offence, then it would be their duty to return a true bill. The accused would then be put upon his trial, and if such an infirmity of mind as had been alluded to appeared to exist, it would be disposed of by the petty jury. He had ventured to advert to the nature of the defence which possibly might be set up. But it might be that no such defence would be offered, still he thought it right to take every opportunity of distinctly laying it down as the law of the land, that unless a person actually did not know right from wrong, it could not amount to a legal defence to a charge of murder; if the fact of the commission of any great and serious crime was in itself to be held or considered a proof of insanity, there would be no safety or security for the public, and the consequences would be dreadful to contemplate. To a certain extent every atrocious crime was irrational; at least, it was irrational to run the peril of what might be the consequences of such a crime both here and hereafter. Again, he would say that if such defences were on slight grounds to be admitted as an excuse for crime, the very foundation of society would be shaken and destroyed. Should the facts of the case be presented to them as he had stated, it would be their duty to put it in a train for further investigation; and should there be any grounds for setting up such a defence as he had ventured to allude to, the accused would have the benefit of it at the hands of the petty jury.

Trial of M'Naghten.—The grand jury having found a true bill against Daniel M'Naghten for the murder of Mr. Drummond, he was placed at the bar on Thursday to take his trial. After the indictment had been read, the clerk of the arraigns asked him whether he was guilty or not? The prisoner made no reply. Mr. Cope, the governor of Newgate, asked him if he heard the question? Lord Abinger said the prisoner must answer the question of his own accord. After a short pause, the prisoner exclaimed loudly, "I was driven to desperation by persecution." Mr. Clarkson said he was about to make an observation. Lord Abinger said the court could not hear him until the prisoner had pleaded. The question was repeated, but the prisoner remained silent. Lord Abinger then told him that he was asked whether he was guilty or not. Prisoner. I am guilty of firing. Lord Abinger. That is a negative plea; but do you mean to say you are not guilty of the rest of the charge, namely, intending to murder Mr. Drummond? Prisoner. Yes. Lord Abinger. Very well, that is equivalent to a plea of not guilty, and, therefore, let that plea be recorded. The same plea was then recorded to the charge upon the coroner's inquisition. Mr. Clarkson then rose and said that he was instructed to apply to the Court, on behalf of the prisoner, to allow the trial to be

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 6—1843.

SATURDAY, FEBRUARY 11.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Achimenes longiflora, its treatment	73 a
Afghanistan, variation of its climate	67 a
Amateur's Garden	63 c
Antiquities of Gardening	7 b
Asparagus beds, to form	73 b
Bananae Globe Thistle as a green manure	68 c
Barleycorn, remarkable produce of	69 c
Bees, treatment of	69 c
— straw hives best adapted for	69 c
Bicke's art of cultivating the ground without manure, remarks on	70 a
Blackbird, remarkable specimen of	70 a
Books on plans and garden ornaments	70 a
Bottom-heat, remarks on	73 b
Bulbs, Cape, their treatment	73 a
Cabul, remarks on its vegetation	69 b
Carrots, Belgian, to sow	73 b
Casspool, contents of, for manure	73 c
Chinese Cabbage, its treatment	73 l
Couch grass, to extirpate from walks	73 b
Cydonia japonica, for a N. wall	69 b
Draining, its beneficial effects in the Weald of Kent	68 a
Egyptian Silk plant	69 b
Fat in animals, sources of	71 b
Fruit-trees, stocks for	73 a
— on walls, to protect	73 a
Fuchsia corymbiflora, to grow in the open air	73 a
Gardeners' Societies, remarks on	73 b
Gas-water as a manure	73 c
Heaths, good kinds	73 a
Heads, their treatment	73 a
Insects, effect of Laurel-leaves on	73 b
— to kill for the cabinet	69 a
Journals, to prepare	73 b
Lawns, not as a manure for	73 b
Madeira, vegetation of	70 b
Manures, their use	67 b
— the manner in which they are taken up by plants	67 b
Mandarin, with green crops	68 c
Mignonette, cause of its losing its fragrance	72 c
Musa Cavendishii, its treatment	73 a
Neill, Dr., his garden noticed	73 a
Nitrate of Soda, quantity to apply	73 a
Oak, Turkey, its value for timber	73 a
Palm house (of the King of Prussia), remarkable plants in	73 a
Pansies, good kinds	73 a
Peat, to convert into manure	73 a
Perennials, good	73 a
Plants, stove and greenhouse, treatment of	71 c
Pomegranate, its treatment	73 a
Popular flowers—the Geranium, rev.	71 c
Prejudice against slate pots	69 c
Rhubarb, to force	73 b
— Victoria, a good kind	69 c
Roses, to exhibit in pots	69 b
— to plant	73 a
— stock for	73 a
— yellow	73 a
Sand, cure for	70 a
Seeds, remarks on sowing	7 c, 73 b
Sudon, apple of	73 a
Straw, its use in the ice-house	73 b
Sugar-plant of Greece—an Asphodel	69 c
Sweeps, remarks on	70 a
Tan, to convert into manure	73 a
Tree violet, its treatment	73 a
Trellises for climbers	68 b
Tropaeolum Moritzianum, its treatment	73 a
Truffles, cultivated in France	71 b
Tulip-beds, to protect	73 a
Urine and Vegetable refuse, as a Manure	68 b
Vegetables, putrid, their effects on the growth of Plants	68 b
Vines, necessity of watering when rooted within the house	73 c
Vines, remarks on forcing	67 a
Vines, their treatment in the Ionian Islands	70 c
Violets, Neapolitan, cause of their failure	73 a
Weeke's, Mr., his annual dinner	73 a
Wells, quarry respecting	70 a
Wood, Punch's remarks on	71 a
Worm-casts on lawns, to prevent	70 a

EXHIBITIONS, to be held at the GARDENS of the ROYAL BOTANIC SOCIETY OF LONDON, Inner Circle, Regent's Park. Schedule of Prizes for subjects to be exhibited on the following days:—

Wednesday, May 24,
Wednesday, June 28,
Wednesday, July 19, 1843.

The Prizes to be awarded consist of Gold and Silver Medals, Silver Vases, and other pieces of plate. Successful competitors may, at their option, receive their prizes in medals, plate, or money.

CLASS I.

A. To be awarded at the Exhibitions to be held on May 24 and June 28. Stove and Greenhouse Plants, collections of 50 plants—1st prize, value 15*l*.; 2nd, 10*l*.; 3rd, 5*l*.

B. To be awarded at the Exhibitions to be held on July 19. Stove and Greenhouse Plants, collections of 35 plants—1st prize, value 10*l*.; 2nd, 7*l*.; 3rd, 4*l*.

The following Premiums to be awarded on each of the three days of Exhibition:—

C. Stove and Greenhouse Plants, collections of 25 plants—1st, 7*l*.; 2nd, 3*l*. 10*s*.; 3rd, 2*l*. 10*s*.; 4th, 1*l*.

N.B. Persons exhibiting in A. or B. cannot exhibit in C. also.

D. Stove and Greenhouse Plants, collections of nine distinct kinds—1st, 3*l*.; 2nd, 2*l*.; 3rd, 1*l*.

N.B. Persons exhibiting in A. B. or C. cannot exhibit in D. also.

E. Stove and Greenhouse Climbers, collections of six distinct kinds—1st, 4*l*.; 2nd, 2*l*. 10*s*.

F. Single Specimens of Ornamental Plants, being new or rare species—1st, 3*l*. 10*s*.; 2nd, 2*l*. 10*s*.; 3rd, 1*l*. 10*s*.; 4th, 1*l*. N.B. The plants exhibited in F. are eligible for competition whether in bloom or not.

G. Ornamental Specimen Plants, for which Prizes are not otherwise offered—1st, 1*l*. 10*s*.; 2nd, 1*l*.; 3rd, 10*s*.

N.B. The prizes in G. are intended as rewards for miscellaneous productions of extraordinary merit.

H. Cacti, tall-growing kinds, collections of not fewer than nine plants—1st, 3*l*. 10*s*.; 2nd, 1*l*. 15*s*.; 3rd, 1*l*.

I. Fuchsias, collections of nine distinct kinds—1st, 1*l*. 5*s*.; 2nd, 1*l*.

K. Scarlet Pelargoniums, collections of six plants—1st, 1*l*. 10*s*.; 2nd, 1*l*.

L. Pelargoniums, collections of six varieties, grown in No. 24-sized pots—1st, 3*l*.; 2nd, 1*l*. 5*s*.

M. Pelargoniums, collections of six varieties, grown in No. 12-sized pots—1st, 3*l*.; 2nd, 1*l*. 5*s*.

N.B. Nurserymen and private Growers exhibit independently of each other in L. and M.

N. Pelargoniums, collections of four varieties, grown in No. 8-sized pots—1st, 2*l*. 10*s*.; 2nd, 1*l*. 10*s*.; 3rd, 1*l*.

O. Herbaceous Calceolarias, collections of not fewer than six varieties, grown in No. 12-sized pots—1st, 2*l*.; 2nd, 1*l*.

P. Shrubby Calceolarias, collections of not fewer than six varieties, grown in No. 12-sized pots—1st, 2*l*.; 2nd, 1*l*.

Q. Roses grown in pots, collections of six plants—1st, 2*l*.

R. Moss Roses, cut blooms, collections of not fewer than 12 varieties, which must be named, and not more than seven blooms or buds of each variety exhibited—1st, 1*l*. 10*s*.; 2nd, 1*l*.

S. Roses of any kinds not varieties of Moss, cut blooms, collections of not more than 150 varieties, and to be exhibited as in R.—1st, 2*l*. 10*s*.; 2nd, 1*l*. 10*s*.; 3rd, 1*l*.

T. Roses of any kinds not varieties of Moss, cut blooms, collections of 50 sorts, and to be exhibited as in R. and S.—1st, 1*l*. 10*s*.; 2nd, 1*l*. N.B. None but amateurs can exhibit in T.

Exhibitors in R., S., and T., to provide their own boxes or stands, which are not to exceed eight inches in depth at the back, nor 20 inches from front to back. The covers of all boxes must be made to remove.

U. Seedling Pelargoniums—1st, 1*l*. 10*s*.; 2nd, 1*l*.; 3rd, 10*s*.

V. Seedling Calceolarias—1st, 1*l*.; 2nd, 10*s*.

W. Seedling Fuchsias—1st, 1*l*.; 2nd, 10*s*.

X. Seedling Roses—1st, 1*l*.; 2nd, 10*s*.

Y. Seedling Cinerarias—1st, 10*s*.

Z. Seedling Verbenas—1st, 10*s*.

Z. Z. Seedling Pansies—1st, 10*s*.

N.B. The prizes from U. to Z. inclusive will be awarded at the discretion of the judges, and certificates will be given to such seedlings of merit as have not prizes awarded to them. The subjects for exhibition from U. to Z. inclusive will not be eligible for competition unless they are exhibited in the pots in which they have been cultivated, and they must also be accompanied by the names which they are to bear. No seedlings can be allowed to compete for prizes unless in compliance with the above conditions.

CLASS II.

The exhibitions in this class are intended to display the effect of natural classification, in bringing together groups of highly ornamental plants, by which the habits and affinities of natural orders or of genera will be represented.

A. A. Orchidaceous Plants, collections of not fewer than five exotic species—1st, 7*l*.; 2d, 3*l*. 10*s*.

B. B. Orchidaceous Plants, single specimens—1st, 3*l*. 10*s*.; 2d, 2*l*.

C. C. Ericaceous Plants (Cape heaths), collections of 20 distinct kinds—1st, 7*l*.; 2d, 3*l*.

D. D. Ericaceous Plants (Cape heaths), collections of 15 distinct kinds—1st, 7*l*.; 2d, 3*l*. 10*s*.; 3d, 1*l*. 10*s*.

N.B. None but Amateurs and Gentlemen's Gardeners can exhibit in D. D.

E. E. Ericaceous Plants (Cape heaths), collections of six distinct kinds—1st, 3*l*. 10*s*.; 2d, 2*l*.; 3d, 1*l*.

N.B. Persons exhibiting in C. C. or D. D. cannot exhibit in E. E. also.

F. F. Ericaceous Plants (greenhouse Azaleas), collections of 18 Plants—1st, 5*l*.; 2d, 2*l*. 10*s*.; 3d, 1*l*.

G. G. Ericaceous Plants (greenhouse Azaleas), collections of four varieties—1st, 1*l*. 10*s*.; 2nd, 1*l*.

N.B. Persons exhibiting in F. F. cannot exhibit in G. G. also.

H. H. Ericaceous Plants (Rhododendrons in pots), collections of nine varieties—1st, 1*l*. 5*s*.; 2nd, 1*l*.

I. I. Gesneraceous Plants, collections of not fewer than twelve distinct kinds—1st, 2*l*.; 2nd, 1*l*.

K. K. Amaryllidaceous Plants in pots (hardy kinds not included), collections of not fewer than six species—1st, 1*l*. 10*s*.; 2nd, 1*l*.

L. L. Collections of the genus *Tropaeolum*, not fewer than three kinds—1st, 2*l*.; 2nd, 1*l*.

M. M. Collections of the genus *Lilium*, in pots, not fewer than six kinds—1st, 1*l*. 10*s*.; 2nd, 1*l*.

N. N. Collections of the genus *Statice*, in pots, not fewer than twelve kinds—1st, 2*l*.; 2nd, 1*l*.

O. O. Collections of British Ferns, in pots—1st, 2*l*. 10*s*.; 2nd, 1*l*.

P. P. Named Collections of Agricultural Grasses, either in pots or cut specimens—1st, 1*l*.

CLASS III.

Q. Q. The best Microscope exhibited at any of the Meetings—10*l*. 10*s*.

REGULATIONS FOR THE OBSERVANCE OF EXHIBITORS.

1. EXHIBITIONS.—The Exhibitions will be open to all Competitors, whether Fellows of the Society or not.

2. TIME FOR THE RECEIPT OF SUBJECTS ON THE DAYS OF EXHIBITION.—In order that the subjects received for competition may be promptly arranged and displayed to advantage, exhibitors are requested to communicate their intentions to the Secretary, previously to the several days of exhibition, specifying the probable extent of table-room, in square feet or otherwise, which their plants or flowers will require.

At half-past Eight o'clock in the morning precisely the gates will be closed, after which time no subjects for competition can, on any account whatever, be received.

Exhibitors are requested to bear in mind, that the Judges must proceed at Ten o'clock to examine the merits of the subjects exhibited, by which hour the setting and arranging of all plants and flowers must be completed; and as exhibitors alone are supposed to know their own Exhibitions, they are specially requested to apply to the Clerk for Tickets to attach to them, and to see that all their Exhibitions are marked and entered in the books with the proper letters.

At Seven o'clock in the evening the Exhibitions will close, when all flowers and plants will be delivered up to the Exhibitors.

3. ADMISSION OF EXHIBITORS.—Assistant Gardeners will be admitted with the Exhibitors until half-past Eight o'clock in the morning; but no persons whose services are not required in that capacity will be allowed to enter with the Exhibitors, nor can any persons remain after Ten o'clock who are not engaged by the Society.

All persons who supply objects for Exhibition for which awards are offered, will be readmitted to the Garden at Two o'clock, by delivering up at the workmen's gate their Pass-ticket, for which they must apply at the Office before Ten o'clock.

4. SUBJECTS FOR EXHIBITION.—It is particularly desired that all plants be distinctly labelled with their scientific names, and the places whence introduced, when practicable.

Exhibitors will be required to sign a book, stating in what letter their plants are to be exhibited; and they are particularly requested to observe that no omissions or mistakes arising from improper entries can be rectified after the awards have been made.

Exhibitors who shall obtain a First Prize cannot receive any other award in the same letter, except in F. G., and from U. to Z. Z. inclusive.

Objects of decidedly inferior quality will not be received for competition, and the Judges will be required not to make any award where the subjects exhibited do not appear to them to deserve such a mark of distinction.

No Judge will be appointed from among the Fellows or Members of the Society.

Successful Competitors are requested to notify to the Secretary, within one fortnight after the premium shall have been awarded, in what form they are desirous of receiving their prizes.

N.B.—Exhibitors coming from the North-East of London may approach the Gardens from Albany-street by the Cambridge Gate. Exhibitors from the South and from the West may approach by Portland Place and the New Road, and enter by the York Gate.

NEW AND SUPERB SEEDLING DAHLIAS on SALE by F. and A. SMITH and Co., FLORISTS, &c., HACKNEY, LONDON:—

BIANCA, Wildman, pure white, cup petals, large size, the centre well up, very deep flower (having from 25 to 30 rows of petals), first-rate form, of excellent habit, and very free bloomer: the flowers have long upright foot-stalks. It was pronounced a first-class flower by the Horticultural Society of London, Aug. 3, 1841; obtained a second prize at the South London Horticultural Show, Sept. 14; and a first-class prize at the Horticultural Soc. of London, Sept. 23; a first-class opinion was pronounced by the Horticultural Soc. of London, Aug. 16, 1842; it obtained a prize at Salisbury Plain, Aug. 31; the first prize at the Hammersmith Show, Sept. 27; and was pronounced a first-class flower by the Horticultural Soc. of London, Sept. 27, when 24 blooms were produced, although that Society very fairly qualified their approbation upon other occasions, when the flower, for reasons afterwards explained, appeared before them in a less perfect state. Opinions of the Press:—See *Gardeners' Gazette*, Sept. 24, p. 625: "This flower has been unfortunately very badly grown during the season; being exclusively cultivated in the neighbourhood of London, it has not been fit for competition at either of the shows for the cup. The blooms produced on Tuesday, though by no means equal to those of last season, or the early part of the present, gave promise that it will be a decidedly first-rate variety, when it comes into the hands of country growers, the centre being in every instance perfectly up, the petals cupped, and the flower well formed." See Report in same paper, Oct. 1, p. 639: "Wildman's Bianca, which has scarcely produced a bloom fit for showing until the latter part of the season, was in fine condition, a great number of blooms being shown, the whole of them first-rate." See Report in the *Florists' Journal* of Nov. last, p. 251: "We some little time since paid a visit to Messrs. Smith's Nursery, at Hackney; the Dahlias were in fine bloom, though evidently struggling with the smoke, &c., of that confined district. Too much credit cannot be given to these gentlemen for their strenuous

exertions to overcome so great an obstacle. In the collection which is large, we particularly noticed that beautiful white, Wildman's Bianca; there were several plants of it, and all held good flowers. 10*s*. 6d.

DUKE OF WELLINGTON, Smith, rich scarlet crimson, fine cup petals, the centre well up, is of great depth and substance, a first-rate flower, a very profuse bloomer, and quite new in colour; it has obtained a prize at the South Essex Show, in Sept.—See Editor's opinion in the *Gardeners' Chronicle*, Sept. 3, 1842: "In the Duke of Wellington, rich scarlet crimson, the centre is full, although a little depressed, and the petals are well arranged: it is a desirable flower, and rich in colour." 1*l*. 5*s*. 6d.

GENERAL SIR R. SALE, Smith, crimson purple, cup petal, well up in the eye, of good size, and great depth of petals, very profuse and constant bloomer, with long upright foot-stalks; and is considered by competent judges the best flower of its colour yet offered to the public; it was pronounced a first-class flower by the Horticultural Society of London, Aug. 16, 1842; obtained a prize at Salisbury Plain, Aug. 31; a prize at South Essex, Sept. 8; a prize at Kingston, Sept. 15; a prize at Salt Hill, Sept. 16; a prize at Victoria Gardens, Stepney, Sept. 19; a prize at the Horticultural Soc. of London, Sept. 20; a prize at Sunbury, Sept. 22; a prize at Hammersmith, Sept. 27.—See Editor's opinion, *Gardeners' Gazette*, Aug. 6, 1842. "So far as we have seen, during the present season, the growers appear to be aware of the properties required in a show Dahlia, and most of those exhibited on Tuesday possessed them in a considerable degree. Decidedly the best of these is Smith's Sir Robert Sale, a beautifully-formed dark flower, shown at both meetings, but not adjudicated on by the Horticultural Society, on account of no more than one bloom being shown."—See Editor's opinion, *Gardeners' Chronicle*, Sept. 3. "Your crimson purple Dahlia (Sir R. Sale) is a flower of first-rate properties, fine, general form, centre well up, with great depth of petals." 10*s*. 6d.

RIVAL YELLOW, Smith, deep golden yellow, fine cup petals, of great substance and depth, the centre well up, of excellent form, very constant and good habit. This Dahlia is warranted the best of its colour yet offered to the public. As the stock is very limited, early application is necessary to secure plants, many orders having already been received; no allowance on this variety. 10*s*.

RAINBOW, Smith, yellow, beautifully edged with rosy purple, of good form, very constant, free bloomer, and excellent habit; the flowers have long straight footstalks; quite a new and distinct variety from any other in cultivation. The form of this flower improves as the season advances, sufficient to constitute it a show flower. 10*s*. 6d.

ORION, Smith, light yellow, cupped petals, of good form, very constant, and profuse bloomer; 3*ft*. 7*s*. 6d.

FANNY WAUGH, Forster, deep lilac, of fine form; it has obtained a first-class prize at Hexham, and was in the second stand of 18, and the second of 24 blooms at the same place; was placed first in its class at the Dahlia Show near Corbege, and second at the Great North of England Open Show at Jesmond, near Newcastle. This variety is very constant, of medium size, great depth of petals, the centre well up, and of good general habit; 4*ft*. 10*s*. 6d.

EARL OF LEITRIM, Ogilvy, deep purple, cup petals, large, and of good form; has obtained several prizes; 5*ft*. 10*s*. 6d.

SULTANA, Appleby, dark maroon, occasionally striped with light purple, fine form. 10*s*. 6d.

ORYNTHIA, bluish edged, and tipped with rosy purple; good form; 4*ft*. 10*s*. 6d.

GREAT WESTERN, Bragg, puce, very large, good shape; 7*s*. 6d.

PERPETUAL GRAND, Brown, maroon, fine form, 10*s*. 6d.

BELSIZE RIVAL, Pipe, rosy bluish, cup petals, fine form, good habit, and very constant; 4*ft*. 10*s*. 6d.

SURPRISE, Oakley, crimson, tipped with white; 4*ft*. 10*s*. 6d.

EMPRESS OF WHITES, G. Smith, creamy white, good form, very dwarf grower; 2*ft*. 10*s*. 6d.

CONFIDENCE, Cook, shaded orange, good form, very constant, fine habit; 4*ft*. 7*s*. 6d.

VIRGIL, Mountjoy, maroon, good shape, very constant; 4*ft*. 10*s*. 6d.

WINDMILL-HILL HERO, Miller, rich deep crimson, cup petal, round shape, good form; 4*ft*. 10*s*. 6d.

VAN AMBURGH, Miller, rosy lilac, good shape, and constant show flower, 3*ft*. 10*s*. 6d.

PET RIVAL, Bushel, red crimson, cup petals, and very constant; 3*ft*. 10*s*. 6d.

NORTH MIDLAND, Evans, deep crimson, cup petals, and fine form; has taken several prizes; 3*ft*. 7*s*. 6d.

ESSEX TRIUMPH, Turville, fine dark, fine form; 4*ft*. 10*s*. 6d.

BEAUTY OF SUSSEX, Mitchell, white, deeply edged with carmine; 4*ft*. 10*s*. 6d.

MRS. JAMES RICHARDSON, Edwards, bluish white, occasionally tipped, good form, has taken several prizes, 4*ft*. 10*s*. 6d.

LADY SALE, Todd, ruby carmine, good form, 4*ft*. 10*s*. 6d.

MIRANDA, Brown, bluish white, shaded with rose. 7*s*. 6d.

QUEEN OF SUMMER, creamy white, with crimson purple tip and dark centre, good form. 10*s*. 6d.

RETRIEVER, Dewar, ruby crimson, fine form, 4*ft*. 10*s*. 6d.

IMOGENE, Dewar, lilac, first-rate, 2*ft*. 10*s*. 6d.

CLAUDINE, Forster, white, tipped with rosy pink, fine form, 3*ft*. 10*s*. 6d.

GREAT MOGUL, Atwell, deep maroon, 4*ft*. 1*l*. 5*s*. 6d.

F. and A. S. and Co. take this opportunity of informing those of their friends who may not be aware of it, that their Dahlias being grown in the immediate vicinity of London, they cannot produce their blooms in such perfection as those who have every advantage of a country situation; added to this, their Plants were from August to the end of September so infested with the thrip, that they could not produce even a tolerable specimen of Bianca, to compete at any of the three shows for Mr. Wildman's prize; as a proof of this, at the first show there was no competition; they could not produce a bloom; at the Salt-hill (the second), and the Horticultural (the third), the Plants were not sufficiently recovered to compete with effect; as the season advanced, the Plants produced fine blooms in profusion, so as to enable them to exhibit twenty-four fine blooms at the Evening Meeting of the Horticultural Society, when it was pronounced a first-class flower. In conclusion, they recommend Bianca as a white of first-rate qualities, and second to none.

The same observations as regard the thrip may be applied to Rival Yellow; and having but three plants, they had not an opportunity to compete for prizes.

VERBENA SPECIOSA, Kyle, colour bright vermilion, with bluish or rosy eye, large trusses, and very free bloom of strong upright growth; it obtained a certificate of merit at the Exhibition of the Horticultural Society of London, July 9, 1842. The Verbena is handsome and very brilliant; it is no doubt a good variety. See p. 425, *Gardeners' Chronicle*, Editor's opinion. Plants in May, 5*s*.

PAULOVNIA IMPERIALIS, strong plants, in 60-sized pots, in May, 7*s*. 6d.

A large Collection of Pelargoniums, comprising most of the new varieties; also Fuchsias, Ericas, Calceolarias, Camellias, Greenhouse and Stove Plants.

Orders for Exportation promptly executed. A satisfactory reference required from unknown correspondents.

DAHLIAS.

JOHN KEYNES, Florist, Salisbury, most respectfully begs to thank his Friends for their support last season in ordering "Dodd's Prince of Wales" and "Twynford Perfection," and to assure them that it shall be his study to offer nothing but FIRST-RATE SHOW FLOWERS. In announcing varieties for May, 1843, he hopes to merit their continued approbation and confidence.

LIST OF DAHLIAS, 1843.

	s.	d.
Favourite (Dodd's)—clear white, edged with pink; the finest of its class; full centre; great depth of cupped petals; large and circular; not to be surpassed for form, and is safely warranted as a grand show-flower; most distinct. Plants in May	10	6
Colonel Baker (Dodd's)—dark claret; fine show-flower; most certain: very deep; cupped; rising centre; finest form; new colour; quite distinct from any other. Warranted. Plants in May	10	6
Violet Perfection (Keynes)—deep purple, with most vivid light violet shade in the centre of each petal; fine form; shape and growth of Metella. The shading of this flower is so prominent as to make it indispensable as a first-rate show-flower. Warranted. Plants in May	10	6
Paul Fry (Brown's)—light ruby; fine show-flower; perfect shape; not new in colour, but superior in its class. Plants in May	10	6
Virgil (Mountjoy's)—dark maroon; first-rate	10	6
Surprise (Oakley's)—purple, distinctly tipped with white; finest of its class	10	6
Confidence (Cook's)—orange buff; first-rate; best of its colour	10	6
Great Mogul (Attwell's)—dark red	10	6
Asmodeus (Wheeler's) very dark	10	6
Queen of the Isles (Low's)—white, edged with crimson; beautiful colours; quite distinct; first-rate form	10	6
Hero of Stonehenge (Whale's)—dark crimson; first-rate	10	6
Swindon Rival (Compton's)—dark rose; decidedly first-rate	10	6
Prince of Wales (Dodd's)—finest yellow	5	0
Mrs. Shelly (Mitchell's)—fine dark peach	5	0
Competitor (Hodges)—light rose; extra fine; first-rate	5	0
Prince of Wales (Girling's)—shaded purple; fine	5	0
Princess Royal (Hudson's)—light buff, tipped with purple	5	0
Bedford Surprise (Shepherd's)—shaded rose; extra fine	5	0
Admiral Stopford (Trenfield's)—very dark; first-rate	5	0
Twynford Perfection—shaded rose; first-rate form	5	0
Horace (Mountjoy's)—dark	5	0
Prince Albert (Adams)—orange buff	5	0
Marquess of Lansdowne (Brown's)—buff	5	0
Sir F. Johnstone—purple	5	0
America (Drummond's)—shaded purple	5	0
Lady Alice Peel (Jackson's)—light rose	5	0
Rose Unique (Ansell's)	5	0
Westbury Rival (Hall's)—purple	5	0
Northern Beauty (Robinson's)—light edged pink	5	0
Candidate (Silverlock's)—dark purple	5	0
Lady Anne Murray (Cateleugh's)—light mottled	5	0
Gipsy Maid (Girling's)—very dark	5	0
Duke of Cornwall (Low's)—rose	5	0

The following first-rate Varieties, 12s. per dozen:—

Fanny Keynes (Keynes)	Maria (Wheeler's)
Scarlet Defiance (Cozens')	Metella (Brown's)
Argo (Widnall's)	Nicholas Nickleby (Cormack's)
Andrew Hofer (Holmes')	President of the West (Whale's)
Beauty of the Plain (Spary's)	Pickwick (Cormack's)
Optima (Thurtell's)	Phenomenon (Whale's)
Lady Dowager Cooper (Jackson's)	Satirist (Headland's)
Burnham Hero (Church's)	Rouge et Noire (Ansell's)
Euclid (Ward's)	Triumph (Milliez')
Conservative (Low's)	Springfield Purple (Gaines's)
Tournament (Cateleugh's)	Climax (Jeffrey's)
Eclipse (Ditto)	Queen (Widnall's)
Tournament (Union)	Eclipse (Ditto)
Admiral (Spary's)	Majestic (Ditto)
Indispensable (Girling's)	Duchess of Richmond (Fowler's)
Bridesmaid (Brown's)	Egyptian King (Wilmer's)
Lady Middleton (Jeffrey's)	Grace Darling (Dodd's)
Le Grand Baudine (Low's)	Ne plus Ultra (Widnall's)
Maid of Bath (Davis's)	Rival Sussex (Standford's)
Hope (Neville's)	Springfield Rival (Inwood's)
	Unique (Ansell's)

Fine dry Roots of Dodd's Prince of Wales, 15s.; Twynford Perfection, 10s.; Westbury Rival, 10s.; Adam's Prince Albert, 10s.; Fine Old Varieties, 3s. 6d. each.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTÉES, AND LILUM LANCIFOLIUM.

H. GROOM, CLAPHAM-RISE, NEAR LONDON, (removed from Walworth), By Appointment, Florist to Her Majesty, respectfully informs the Nobility, Gentry, and Public, that this is the best season for planting the above Flowers, and that he can supply them of first-rate quality at the following prices:—

RANUNCULUSES, 100 roots in 100 superfine sorts	£4 4 0
Superfine mixtures from 5s. to 21s. per 100.	
ANEMONES, 100 roots in 100 superfine sorts	3 0 0
Superfine mixtures from 7s. 6d. to 21s. per 100.	
AURICULAS, 25 superfine sorts, 1 plant of each	3 13 6
CARNATIONS, 25 superfine sorts, 1 pair of each	3 10 0
PICOTÉES, 25 superfine sorts, 1 pair of each	2 10 0
YELLOW PICOTÉES, 12 superfine sorts, 1 pair of each	2 2 0
LILUM LANCIFOLIUM ALBUM, from 5s. to 42s. each.	
PUNCTATUM, from 10s. 6d. to 42s. each.	
SPECIOSUM, small bulbs, at 63s. each.	

H. G. also begs to say that he has a few Trees of his PRINCESS-ROYAL PEAR for sale, at 5s. each.—The Trade supplied.

W. BRAGG intends Advertising on Saturday next a List containing the Names of the Nurserymen and Florists who have ordered, and who will be able to supply Plants in May next, of his Superb White Dahlia **ANTAGONIST**, which will be let out to the Trade only. On the first occasion of this Flower being shown for Mr. Wildman's Prize at the Floricultural Society, Sept. 6th, the Judges pronounced it to be "decidedly first-rate." The *Gardeners' Gazette*, in report of Salt-Hill Show, speaks of it thus:—"The Seedlings were both numerous and beautiful; among them Bragg's **ANTAGONIST** was successfully shown for Mr. Wildman's Prize of Five Guineas offered for the best White Dahlia. This Flower, which has been remarkably constant through the season, was shown in great perfection, and was placed first by the Judges of all the other Seedlings exhibited." The *Gardeners' Chronicle* describes it, when shown at Salt-Hill, as follows:—"BRAGG'S **ANTAGONIST**, white; this is a full-sized and finely-formed flower, with good petals, and great purity of colour, was placed first." The *Gazette* of Oct. 1, in its report of the Floricultural Society's meeting, in speaking of it as a flower of first-rate excellence, adds, "This White Dahlia, which has been extensively shown from a small stock, and carried off the Cup for the best white, was still able to produce one good bloom, which for form, substance, and arrangement, was all that could be desired; the remainder, to make up the number required, were young blooms imperfectly expanded." North Star Tavern, Slough, Feb. 9, 1843.

FUCHSIA ST. CLARE.

YOUELL & Co. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their Advertisement of the above magnificent Fuchsia, inserted in this Paper of the 4th February, together with their two new Verbenas. Great Yarmouth Nursery, Feb. 9, 1843.

ROSES.

MR. HOOKER has a few PLANTS to spare of the New Persian Double Yellow ROSE, on short stems, at 15s. each. And also the following, if the selection of sorts is left to him:—Standard Roses of the best Summer Blooming kinds, 24s. per doz. Short Standards 1 to 2 feet (suited for potting, or planting in clumps), of Perpetual, Hybrid Perpetual, Bourbon, and other Autumnal Roses, at 18s. per dozen. Dwarf Garden Roses, of the best kinds, 6s. per dozen. Nursery Gardens, Brenchley, near Lamberhurst, Kent.

BEAUTIFUL AND DISTINCT FUCHSIAS.

YOUELL & Co. have much pleasure in announcing that their CATALOGUE of the above is in the Press, and may be had on application. It will be found to contain all the really good and distinct kinds, to the exclusion of such as are merely nominal varieties, and will prove a valuable guide to those who intend competing at the Horticultural Exhibitions of the ensuing season.—Great Yarmouth Nursery, Norfolk, Feb. 9.

SPLENDID NEW HYBRID FUCHSIAS.

WILLIAM DEANS, Nurseryman and Florist, Jedburgh, North Britain, begs to intimate that he intends sending out the following six NEW HYBRIDS, which were exhibited at the Roxburghshire Horticultural Society's Show in September last, and at the Grand Horticultural Fête at Kelso during the same month; they were staged at both places against all the NEWEST and BEST FUCHSIAS then out, and declared to be UNRIVALLED, and gained the first prize at both Shows. They will be found indispensable to those who grow for competition; no better proof of their superiority need be adduced than the numerous orders already received for them from those who have seen them in bloom. Plants in May, 1843.

- 1.—FUCHSIA DEANSIA: the Tube of great thickness; Sepals broad, and of a deep crimson colour; Petals large, rosy purple; Blooms of great size and substance; a free grower, profuse bloomer, and of very fine habit, 10s. 6d.
 - 2.—NORRIS: Tube and Sepals dark crimson; Petals light purple; Blooms very large and of great substance; free bloomer, vigorous grower, and fine habit, 7s. 6d.
 - 3.—RECURVA: Tube and Sepals light crimson; Petals rosy purple; Blooms large; the Petals beautifully recurved; free flowerer, and very distinct, 3s. 6d.
 - 4.—EFFUSA FASCICULATA: Tube and Sepals of a carmine colour, with green tips; Petals rosy purple; immense bloomer, some of the Joins producing Thirty Blooms; same size or rather larger than F. Standishii, being thicker in the Tube; free grower, 3s. 6d.
 - 5.—RACEMIFLORA ELEGANS: size and colour of the Blooms very much resemble F. Moneypanii; points of the sepals tipped with green, but greatly superior in habit to the latter, the branches presenting beautiful racemes of flowers; a free grower, 3s. 6d.
 - 6.—INFATA ARBOREA: Tube and Sepals very deep crimson, tipped with bright green; Petals purplish; quite a Tree Fuchsia; Foliage large, and quite distinct from any other yet out, and but for the Blooms, would hardly be recognised as a Fuchsia, 3s. 6d.
- All Orders addressed WM. DEANS, Jedburgh, or to Messrs. CORMACK and Co., New Cross, near London, or their Conservatories, at Covent Garden, or to Messrs. RONALD's, Brentford, will be duly attended to. Any person purchasing the lot, upon receipt of a Post-office order for 1/ 10s., the six will be sent, postage, to any part of the United Kingdom, carefully packed in a tin-case with Moss.—Jedburgh, 7th Feb., 1843.

PET RIVAL DAHLIA (BUSHELL'S), and KENNINGTON ROSE (WELDON'S).—These Dahlias (though risen and grown within one mile of the General Post Office, London, have obtained prizes), will be sent out through the Trade in May next.

PET RIVAL—Purple Maroon, finely-cupped, and depth of Petals never showing the eye, good habit, and always true; height 3ft. Plants, 10s. 6d.

KENNINGTON ROSE, superior to Wheeler's MARIA, constant and fine habit; height 4ft. Plants 7s. 6d. Exchanges and liberal discount to the Trade on early application to J. BUSHELL, 12, Hall-place, Kennington Lane.—Feb. 3.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, Nurseryman, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undernamed low prices—including the following Fuchsias:—*Conspicua arborea* (Cateleugh's), *Venus victrix* (Cripps'), *rosea alba*, *Moneypanii*, *magnifica*, *racemiflora*, &c. Also the following distinct Verbenas:—*Queen*, *Aurora*, *Stewartii* variegata, *Mortlock's Superb*, *Burleyana*, &c. &c. Fuchsias, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully picked in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents.

W. M. obtained a Prize of 10/., open to all England, for a Collection of Fuchsias, Pelargoniums, &c. at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

TO GENTLEMEN AND AMATEUR FLORISTS.

The time of year is now fast approaching for planting that delightful flower, the Ranunculus; a few hundred roots to be parted with at 42s. per hundred, (with names); planting time, February and March. Apply (pre-paid) to Mr. EYRE, Farnham, Surrey; where may be seen, in the blooming season, in Mr. EYRE's Collection of Pelargoniums, "a few Seedlings," broken into flower in July last, 1842, with many of this year, 1843. Some possessing striking foliage, cultivated and grown in small pots, "in their true and natural state, without that pernicious aid," chemical watering, which can only serve to raise and drive "colorem contra naturam," for a short period.—Farnham, January 23, 1843.

SEEDLING LARCHES, &c.—The SUBSCRIBERS have still a large quantity of fine 2-year Seedling SCOTCH FIR, 3-year Seedling NORWAY SPRUCE, and 2-year SEEDLING LARCHES; also 1 and 2-year TRANSPLANTED LARCHES, and some fine 2-year Transplanted TYROLESE LARCHES. The 2-year Seedling Larches, being of extra fine quality, are well worth the attention of the Trade and Gentlemen in filling up their Nurseries. Any of the above will be laid down, freight paid to London, Hull, or Newcastle, at a moderate price. They have also fine 1-year Seedling BEECH, which will be sold at Two Pounds per 2,000.

WM. URQUHART & SONS, Dundee.

ORANGE AND LEMON TREES, JASMINE PLANTS, and TUBEROSE ROOTS.—A Choice Collection of the above-named Trees, varying from 3 to 6 feet in the stem, and from 10s. to 3s. each, has just been received from Italy, and, together with the Catalonian and Arabian Jasmine Plants, and Double Italian Tuberoses, may be seen at A. COBBETT's late Mr. C. BARRON's, Italian and Foreign Warehouse, 18, Pall Mall.—N.B. Packed carefully, and sent to any part of the Kingdom. Also Importer of fine Lucca Oils, Parmesan and Gruyere Cheese, Gorgona Anchovies, Macaroni, &c. &c. Lists with Prices may be had, &c.

WANTED, in a COUNTRY NURSERY, a NURSERY GARDENER from 25 to 35 years of age, perfectly honest, sober, active, and industrious. He must be well acquainted with Greenhouse plants; as to watering, potting, dressing, and resetting of Plants which are under his care, as well as the propagation of them. For further particulars apply personally, or by letter prepaid, to the Editor of this Paper. * * * None need apply whose character will not bear the strictest investigation.

WANTS a SITUATION as UNDER GARDENER, a Young Man, who has a good knowledge of his Business, and wishes to place himself under a Head Gardener of experience. He can be well recommended from the place he has just left. Wages, 18s. per week. Direct to A.B., Mr. DENNIS, Nurseryman, King's-road, Chelsea.

HEAD GARDENER.—Wanted a Single Man about 30 or 35 years of age. He must thoroughly understand his business in all its departments—particularly early and late Forcing, be able to produce a constant succession of Flowers, &c., &c. State lowest terms required, length of Character, reference, &c. Address to A.B., Mrs. SMALLPIECE, Butcher, Kingston, Surrey.

WANTS a Situation, as ASSISTANT in the SEED TRADE, a YOUNG MAN, who has been accustomed to the Shop and Counting-house. Unexceptionable references will be given. Address I. U., at the Office of this Paper.

WANTS a SITUATION, as GARDENER, or GARDENER and BAILIFF, a Married Man, aged 35, a native of Scotland, who perfectly understands Hothouses, Greenhouses, Forcing, and Pinery; and has no objection to act as general agricultural servant, as he understands Cattle and Land. Direct to M. W., at Mr. Simpson's, 81, Mount-street, Grosvenor-square.

WANTS a SITUATION as GARDENER, in a Single-handed place, a Young Man, aged 24, who has no objection to make himself generally useful. Direct to A.B., Mr. LITTLE's, Nurseryman, King's-road, Chelsea.

WANTS a Situation as Out-door GARDENER, a most active and industrious Married Man, aged 40, who is perfect Master of his business in all its departments—Pines, Vines, Green and Hothouses, Wall-trees, Kitchen and Flower Gardens, &c., and would take charge of Meadow-land, and Cattle. His wife is an excellent Landress. Can give most unexceptionable characters. Address O.H., 1, Bath Buildings, City-road.

WANTS a SITUATION as GARDENER, a Respectable young Man, aged 30, who has a practical knowledge of his business in all its branches, and can be well recommended from the situation he is about to leave. Address, A.B., at Mr. BELL's, Bookseller, Richmond, York.

WANTS a SITUATION, as GARDENER, a Respectable married Man, aged 28, without any family. He can give highly respectable references as to character and abilities; and the gentleman he is now about to leave will feel much pleasure in recommending him.—Address, P. P., Mr. CONWAY, Nursery, Old Brompton.

JAMES DICKSON & SONS, NURSERYMEN, SEEDSMEN, and FLORISTS, have much pleasure in announcing that they have succeeded in making a valuable addition to their extensive stock of CALCEOLARIAS, by the purchase of the entire stock of those richly-spotted varieties raised by Isaac Anderson, Esq., which took the first prize for seedlings at the Royal Caledonian Horticultural Society's meeting of the 15th July last, and were justly described as being the finest varieties yet exhibited. There are six distinct varieties, named as follows:—George Heriot, Grahami, Greigiana, Ariadne, Margaret, Neillii. These will be sent out in rotation of order, early in April next, at 30s. per set, or 7s. 6d. each. Early orders will oblige, and meet with prompt attention; but as the stock of some of the varieties is very limited, early application can only be guaranteed execution.

Seed Warehouse, 32, South Hanover-street, Edinburgh; Nurseries, Inverleith, and Broughton Park.

Note.—Messrs. J. D. & SONS are now sending out plants of that beautiful and distinct variety of Epiphyllum truncatum, called Epiphyllum truncatum elegans, which attracted so much notice at the Horticultural Society's Show.

WILLIAM LYNN, NURSERYMAN, SEEDSMAN, and FLORIST, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a GARDEN TOOL WAREHOUSE, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. W. L. begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which, he trusts, with industry, punctuality, and attention, will secure to him general patronage.

W. L. solicits particular attention to his new PEA, LYNN'S DWARF WRINKLED MARROW, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn Pea ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, enclosing a postage-stamp.

HENRY HAMMOND, NURSERY and SEEDSMAN, Mundford, near Brandon, Suffolk, respectfully announces to the Nobility, Gentry, and the Public generally, that the late fine season for preserving his admired WHITE CAPE BROCCOLI enables him to offer it at 3s. 6d. a packet, which will contain half an ounce. The many orders already received from those who were purchasers last year justify H. H. in again offering it to the public. The flavour is not only equal to any Cauliflower, but it is as hardy as any of the Cabbage tribe. By sowing in March, the end of May, and August, a supply may be had nearly all the year. If any gentleman wishes for information respecting its quality, a reference to the undermentioned Gardeners will meet with an immediate reply:—Mr. Wylie, His Grace the Duke of Grafton, Euston Hall; Mr. Piper, Right Hon. Lord Walsingham, Merton Hall; Mr. Hammond, Sir Richard Sutton, Bart., Lynford Hall; Mr. Brownly, John Angerstein's, Esq., Weeting Hall. Messrs. Flanagan, Seedsmen, Mansion-house-street, London, who can warrant the stock, and will carefully execute any orders entrusted to them.—A good PROPAGATOR in the Out-door Department is wanted.—Mundford, Jan. 19, 1843.

NEW AND CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, and Co., have a large Stock of all the newest and choicest FLOWER SEEDS, to the cultivation of which great attention has been paid, and which are this season more than usually fine. L. P. and Co., can therefore with confidence recommend them, as being in every respect to be depended on; and beg leave to offer for sale,

25 packets	for 15s.
50 do.	25s.
100 do.	35s.
150 do.	42s.

Delivered, carriage free, to any part of the kingdom. Catalogues may be had on application as above. Exeter Nursery.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLAVE. They may be seen in use at WORTON COTTAGE, ISLE-WORTH, upon application to the Gardener—Sundays excepted.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 11, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, Feb. 14	Zoological	8½ P.M.
Wednesday, Feb. 15	Microscopical	7 P.M.
Friday, Feb. 17	Geological	1 P.M.
	Botanical	8 P.M.
Tuesday, Feb. 21	Horticultural	2 P.M.
	Linnæan	8 P.M.
	Floral	8½ P.M.
Wednesday, Feb. 22	Geological	2½ P.M.
	Meteo-Botanical	8 P.M.
Saturday, Feb. 25	Royal Botanic	3½ P.M.
COUNTRY SHOWS. Feb. 23.	Ipswich Cucumber.	

In some observations we lately made upon the preparation of Roses for growth in pots, we mentioned, upon the authority of a correspondent, that the Boursault Rose was employed successfully as a stock for such a purpose. If this variety is selected, choice should be made of the common semi-double sort, with deep red flowers, on which, as is well known, Roses take very freely by buds. It has, however, been suggested to us that Rose de Lisle would be still better for a stock, because, not only do buds take very readily upon it, but it is less disposed to throw up suckers. Those who are interested in this matter would do well to try both these stocks. Possibly each may have its advantages.

ALTHOUGH we are convinced that the nuisances which everywhere exist in consequence of the accumulation of stagnant filth will never be effectually abated till some such Drainage Act as we have already recommended shall have passed, yet we entertain no doubt that in some districts much might be done by a little unexpensive contrivance. Cottagers, in particular, should have their attention called to the simple means by which their personal comfort and the productiveness of their gardens may be so readily increased.

It is the usual plan with these persons to throw everything, ashes, sweepings, peelings, slops, &c., upon a heap, close to their back door, without the slightest regard to cleanliness or health. Now such accumulations cannot but engender pestilential diseases, which are just as dangerous to their neighbours as to themselves. Nevertheless in a great many places there would be neither trouble nor difficulty, and a very little expense, in entirely stopping this sort of nuisance. What we would propose is, that the cottager should be furnished with the means of burying all sorts of household refuse as soon as it is formed; and that the same amount of trouble which is required to go to the back door and to throw down the refuse, should be sufficient to bury it. It is obvious that this can only be done by means of tanks with a movable cover.

If you put a cottager to unusual trouble, he will possibly consider the advantage of cleanliness and the gain for his garden less than the additional trouble to which he is exposed; or if he does not think so, his wife will, and that will practically amount to the same thing. If you ask him to incur present expense for the sake of future gain, you, in the first place, propose to him that which he has not the means of doing, or, which, if he had the means, would not be so evidently useful as he knows the money to be which it would cost. To furnish a cottager with the means of avoiding the creation of nuisances must generally be a landlord's business. We believe, however, that the cottager himself might be induced to bear a part of the cost, if his part was nothing more than labour.

The best kind of receptacle that could be formed would be an underground tank, constructed of brick-work, and lined with roman cement, the mouth of which should be carried two feet above the ground-level, and furnished with a hinged lid. But such a contrivance would probably be, in almost all cases, much too expensive. We would therefore suggest the following plan. Suppose a cylindrical receptacle, 6 feet deep, and 4 feet in diameter, were considered sufficient, we should construct it thus: Let a hole be dug, 8 feet deep, and 8 feet in diameter; let the bottom be then "puddled" firmly with clay, or clay and chalk in a chalk county, to the depth of 2 feet, and over that place one layer of bricks on edge, as is done in making stable floors: this would make the bottom water-tight. Then upon this foundation raise a circular wall, in the same way as in building a well, only form a layer of "puddle" 2 feet thick all round, and in the inner face of this, bed the bricks. From the ground-level run up a 9-inch wall to the height of 2 feet, and on that fix the wooden lid. We conceive that a plan of this sort would be sufficiently water-tight for the purpose to which it would be applied. It would cost a very small sum, chiefly for the bricks and wooden lid; half-vitrified bricks, unfit for building purposes, might be employed; in many places

the earth excavated would be stiff enough to convert into puddle; and at all events the chief expense of clay, if it has to be procured, would be the cartage. The labour the cottager should himself execute.

When in possession of a tank of this sort, he should be taught to throw into it refuse of all kinds, old rags, cinder ashes, bones, soapsuds, pot-boilings, Potato-parings, especially if boiled (as always ought to be the case in a cottage, in order to avoid the waste of Potatoes), straw, weeds, leaves, refuse vegetables, and so on. In addition, a drain should run into the tank, so as to carry into it all other fluid refuse. If this were done, no water would have to be added, but the whole mass would by degrees decay and putrefy, forming a material of the richest fertilising description. Its smell would no doubt be offensive, but infinitely less so than if exposed to the air; and one pound of bleaching powder, worth 6d. now, but capable of being sold far cheaper if the demand were larger, would purify the whole contents of such a tank. In the absence of bleaching powder, the mere throwing into it from time to time a few shovels of dry earth, some peat where that abounds, sawdust, old tan, or any such material, would take off the smell to a considerable extent, and improve the quality of the mixture. The contents of such a tank, when putrid, may be taken out in buckets; if fluid, or if solid, may be dug out and applied to the garden, or be mixed with more earth, and allowed to remain in a heap till it is wanted. In those cases where a cottager has no garden, it might be sold to the neighbouring farmers, who, if they understand their interest, will readily buy it. If sold at the price of common farm-yard dung, it would well repay the cottager for the little trouble it cost him to prepare; but, in reality, it would, if prepared with skill, be worth four or five times as much.

The reason why we recommend no water to be added, is, that the slops and soapsuds will of themselves supply as much or more liquid than is requisite to enable the mass to putrefy properly.

Long before attempts were made to analyse organic substances, and to discover their ultimate elements, experience had shown that animal and vegetable matter in a state of decomposition greatly increased the produce of the soil to which it was added. It is only surprising that the exact state of decomposition, which produced the greatest and most lasting effect, should not have been accurately ascertained for every variety of soil; and that, at this moment, the question, whether fresh, half-rotten, or entirely decomposed organic matter is the most useful and economical manure is not yet satisfactorily answered. The reason of this uncertainty is the little attention which the cultivators of the soil are in the habit of paying to many of their own operations, and the contempt with which learned and scientific men at one time looked upon all the mechanical arts, and more especially the tillage of the land, generally left to servile hands. But a new æra has sprung up: men of science now perceive the vast field open to their researches; and agriculture obtains the rank which its importance deserves. We may therefore hope to see new light thrown upon every subject connected with the cultivation of the soil.

It may perhaps appear superfluous to lay before practical farmers the importance of great attention to the management of the manure collected in their stables and farm-yards. It would seem impossible that a man should have farmed many years without knowing what is most efficacious and economical. Is it to be supposed that the scientific man will from his closet point out facts which the practical farmer has overlooked? Can his minute experiments, and the theories founded upon them, throw a new light on the subject? One would think not; yet when we examine the yards, dunghills, sheds, and stables of the generality of farms, we find very few in which the grossest errors and the most profligate waste cannot be pointed out. In some, the straw and dung are allowed to accumulate during all the time the cattle are fed in the yards. In many, the surrounding buildings with every shower pour down a flood of water, which slowly percolates the mass, and often runs off by drains into ponds and ditches, and thence into rivers, carrying off the very essence of the dung, as may be seen by the brown colour of the water, or else stagnates in some hollow parts, chilling the dung, and impeding its decomposition. In the stables there is a constant pungent smell, which is produced by an accumulation of the fluids formed there, unless it be allowed to escape by ample ventilation. Its presence is an evil, and its dispersion a loss: few farmers know the cause, and still fewer the remedy. Chemical science at once explains the cause and suggests means of removing the evil. By a minute attention to all the circumstances attending the decomposition of animal and vegetable matter, it discovers the spontaneous changes which take place, and finds means to regulate them, checking or promoting decomposition as is most convenient and advantageous to the farmer. Thus the

oldest farmer may obtain useful hints for the construction of his dung-heaps from men who never handled a dung-fork. It does not follow from this that he is to adopt every suggestion, of which some may be fanciful, others uncertain: but let him attend to common sense; let him put faith in the facts which science has clearly established, and apply them according to his own judgment and experience, he will soon see the advantage of some reforms in his operations, and his eyes will gradually be open to his real interest. One or two experiments will not suffice to establish an improved practice, because so many circumstances interfere with the result. The effects of temperature, moisture, and evaporation have a great share in producing different, and sometimes contrary, effects, in similar experiments: perseverance and patience will, however, settle many points which may still be involved in doubt. Farmers are proverbially slow in adopting improvements: it is well that they are so; for if they were to adopt every thing which is new, they would most likely suffer many disappointments. We only wish to remove an obstinate adherence to old practices which can be clearly shown to be erroneous, and a ready adoption of every improvement which is clearly proved, by experience as well as theory, to be advantageous. On this principle we will avail ourselves of our own experience, as well as of the facts discovered by science, to diffuse a knowledge of the most profitable mode of increasing the quantity of enriching manure on a farm, and of the means by which its efficacy may be promoted.—M.

In the late Number of the Journal of the Royal Agricultural Society, Mr. Pusey mentions incidentally that gypsum, or sulphate of lime, has not been found to answer as an agent for destroying the volatility of ammonia, or, in other words, for fixing it in manure. This does not correspond with such information as we possess, or with such experience as we have had on the subject, and we cannot but think that there must be some mistake in the statement: for assuredly if sulphate of lime is brought into contact with ammonia, under favourable circumstances, the lime will be separated, and sulphate of ammonia, which is not volatile, will be formed. Nevertheless, since a doubt on the subject has been expressed by such deservedly high authority, we would strongly recommend those of our readers, who have the opportunity, to determine the question experimentally; for it is of very great importance, and cannot be too soon settled one way or the other.

Professor Henslow, in a letter full of good sense, addressed to the Editor of the *Bury Post*, recommends the following mode of trying the experiment:—

"Two dunghills are to be prepared, as nearly alike in all respects as it is possible to make them; one with, and the other without, the addition of gypsum. Two separate and equal portions of the same field are to be manured with these. I shall say nothing about the respective quantities of the materials, or the time they are to be allowed to rot. A little variety, among the numerous trials which I expect to hear of, will be useful, and indeed necessary, to the speedy determination of the important problem to be solved. Let the gypsum be sifted over the several layers as they are deposited in one of the heaps. I would suggest there should be about enough to just cover the surface, without placing it on very thick. The returns should give precise information of the following particulars, and any others that may suggest themselves.

1. The quantity of straw used in each heap.
2. The quantity of animal excrement.
3. On what day each was begun.
4. On what day each was completed.
5. On what day they were carried and deposited in the soil.
6. The number of loads, and weight of each.
7. The extent of land manured by each.
8. The quantity of gypsum used to one of the dunghills.
N.B.—A comparatively small quantity is all that can be required.
9. Any difference in the coming up and appearance of the crops on each piece of land.
10. When each arrived at maturity.
11. The precise amount of produce.
N.B.—It is needless to reply to this question by guess or estimate. It must be answered by the scales.
12. Any peculiarity in the qualities of each produce."

Another method where favourable opportunities exist would be to use the mowings of a lawn, moistened with gas-water, and thrown in a heap. If this is done, the mass ferments violently, putrefaction rapidly comes on, and a great quantity of ammonia and sulphuretted hydrogen are given off. We would allow one heap to decay in the ordinary manner; to the other we would add gypsum, as above recommended; and we would afterwards try the heaps one against the other.

"Although," says Professor Henslow, "these particulars may require nothing more than an ordinary degree of intelligence, and a little industry to note them, yet, if they are correctly stated by about 50 experimenters, without any attempt to coax the results into accord-

ance with previous notions and prejudices, they may determine a very important problem in the present state of agricultural science."

ON PLANTING.

OAK, Elm, Beech, Sycamore, Spanish Chesnut, and some other trees, when planted so as to stand clear of everything else, are apt to throw out vigorous branches of nearly equal strength, which sometimes cause the trees to grow forked, and leave no straight stem. When there are many shoots of nearly equal sizes, the best method is every year to remove close to the stem from three to five of the strongest, so that the straightest and best only is left for a leader to form the stem or trunk of the future trees.

A person who understands the nature of this work (and any one of common capacity might, with practical instruction be made to comprehend it in a few hours), might thus thin out vast numbers in a day; and by repeating this once or twice annually for a few years, he would train up thousands of fine trees in lieu of those useless unsightly objects which are at this day to be met with in most plantations.

Any one who takes a pleasure in rural affairs might effect this for his own recreation, while walking or riding through his plantations; and when he understood its nature, he could instruct any of his servants or labourers how to do it, and judge when it was properly performed.

When it is considered what a number of trees a skilful person could go over in a day, and when we look forward to the value of a well-formed tree of any kind that has arrived at maturity, compared with one of those huge ill-formed ones that have been neglected, which when cut down, after having encumbered the ground for 50 or 100 years, is of little value except for the fire; and when we contrast the difference, and reflect that a few cuts of the knife would have made it a tree of great utility, how much is it to be regretted that such important results should be lost, from the want of applying annually so useful and simple a remedy!

We frequently see near gentlemen's houses, where plantations are made for ornament and shelter, a quantity of trees planted thickly for the purpose of making a blind as quickly as possible; these are suffered to grow up without one being removed or pruned, until the side branches are killed and the trees become naked at the bottom. As soon as the trees grow so near each other that pruning will be of no avail, some of them should be taken out entirely. By attending to this simple rule, permanent trees, with the branches to the very ground, if required, may be obtained. Some may be left to nature unpruned, or trained to any form which fancy may suggest, if such should be the taste of the proprietor.

If young persons, when they begin to plant, would but well consider these things, they might live to see valuable and ornamental trees of their own planting flourishing round their domains. In low situations, where the soil is rich and deep, and by the sides of drains, Ash or Elm may be planted, with any of the Fir-tribe, either separate or mixed, as may be judged expedient. In high and cold situations more of the Fir-tribe may be more abundantly planted; where the Larch will thrive, however, it is preferable to any other.

The Sycamore thrives well on high, bleak situations, and looks well as an ornamental tree on the outskirts of plantations, or in high lands, if the ground is hilly; its bushy, dark green foliage, makes it a conspicuous object in the distance. Instead of mixing Alder, Birch, Poplar, Willow, and Sycamore trees, more of the Mountain Ash, Bird Cherry, and Hazel should be introduced; where coif rods and etherings for hedges or other purposes are saleable, a great profit would then be secured to the proprietor.

To ensure success in planting, it is evident that the ground should be laid dry by draining, and that the places where the plants are to stand should be raised with good earth; this will cause the ground to be much drier, and can be done at less expense than by digging holes previously. The tender shoots of the Spanish Chesnut are less liable to be killed by spring frosts in high situations than in low or moist places; whence it appears that this tree will thrive in much higher and colder districts than is generally imagined, particularly if sheltered in its infancy by other plants.

The Chesnut, Maple, Ash, Beech, Elm, Sycamore, and Silver Fir, will increase in girth 1 inch to 1½ inch per year on an average of 100 years, if they have sufficient room to make branches. This must show the utility of thinning and pruning woods in proper time; Oaks, if they have sufficient room, will, on an average, increase about an inch or little more in girth every year; but by neglect or mismanagement, this may be retarded, so as not to increase more than a ¼ of an inch yearly. In 20 years from planting, with early care and proper management, a gentleman may look forward after taking out a crop of Larch, to have Oak, Ash, and Elm trees from 20 inches to 2 feet and upwards in girth.—R.

ON MANURING WITH GREEN CROPS.—No. IX. (By PROFESSOR CHARLES SPRENGEL. Translated from the German.)

(Continued from page 68.)

THE Common Magdeburgh acre consists of 180 square rods, or 25,920 feet Prussian, which is about ⅓ of an English acre.]

Plants which are used for Green Manure without being sown.—In the neighbourhood of the sea and in similar places some of these plants, which the waves have thrown ashore, or which grow in lakes and stagnant waters, yield a very powerful manure. Those which have been most used are Chara, Crowfoot (Ranunculus), Duck-weed

(Lemna), Pond-weed (Potamogeton), Hornwort (Ceratophyllum), Bulrushes, and Fern.

1. *Chara* (Chara).—The species of this genus are all annual, and grow only in stagnant water, rich in saline matter, whence we may conclude that such substances enter abundantly into their composition. Chemical analysis confirms this, as 1000 lbs. of the green Chara (*C. vulgaris*) consists of 158 lbs. of carbonate of lime, mostly deposited on the plant itself, 8 lbs. of chlorine, and 12 lbs. of soda. They contain, moreover, a great quantity of nitrogen, as much as 3.9 lbs. in 1000 lbs. of the green plant. No doubt they also contain much sulphur, and phosphorus in abundance, for in their speedy decomposition much sulphuretted and phosphoretted hydrogen are developed. Although growing in water, they contain a comparatively small amount of that fluid (in 1000 lbs. of the green plant, 596 lbs. of water), all which leads us to the conclusion that even in small quantities they must be a powerful manure. In fact, experience has already shown, that if used too copiously they produce a too luxuriant growth. In collecting the Chara for manure, it is drawn out of the water by hooks used by a person standing upright in a boat. It is then collected on shore, either in large heaps, where it is left for some time, to rot, or is conveyed at once on the land, where it is spread thinly and at once ploughed in. The latter plan is the best; because, when Chara rots in heaps, it loses much gaseous manure, gases in the form of ammonia, sulphuretted and carburetted hydrogen, &c. The quantity of Chara required for an acre of land is 9 or 10,000 lbs., which is considered equal to a strong manure of dung. The crops will grow well for the next 3 or 4 years—a circumstance easily explained; because 5,000 lbs. of the green herbage convey 800 lbs. carbonate of lime and 20 lbs. nitrogen to the soil. Barley succeeds best after Chara.

2. *Long-leaved or various-leaved Crow-foot* (*Ranunculus fluitans*, *R. aquatilis*).—These often grow in large quantities in stagnant water, or in slow, shallow rivers and brooks. Like the preceding, they are drawn out of water with hooks. It is best to plough them in at once; but, as they do not act as powerfully as Chara, a greater quantity must be used. In some places, they are also given to cattle as fodder. They have not yet been chemically analyzed.

Hornwort, like Chara, is incrustated with carbonate of lime, and acts more powerfully. *Duckweed* deserves less attention.

(To be continued.)

TRELLIS FOR CLIMBERS.

AMATEURS' GARDEN, No. VI.

THE sudden change in the weather on the evening of the 3rd inst., which brought on 12° of frost, no doubt injured the greenhouse plants of Amateurs as well as practical gardeners; and as the previous mild weather had induced a luxuriant growth, they were in consequence rendered more susceptible of injury than if the season had previously been more rigorous. If the best remedy for recovering plants has been adopted, viz., syringing them with water at a temperature of 40°, by which the water loses 4° of heat, and the plants receive heat in the same proportion, and are thus brought to a temperature of 36°, but little injury will have been the result, further than that the plants will have sustained a severe check; but if the sun was permitted to shine upon the plants, or the house was suddenly heated before they were thawed, their tissue will have been so much ruptured that there will now be no remedy but to cut them back to the sound wood, and excite them gradually into new growth. It is highly important that plants after being frosted be excited very gradually, because it is evident that a frost, sufficiently severe to destroy the foliage, must also have acted injuriously on the young roots surrounding the interior of the pots; and therefore any attempt to stimulate the plants into new growth before they have made fresh roots must be attended with unsatisfactory results. Hence it is necessary to ventilate the house freely, and not to attempt to force the plants until they show signs of

growth. These remarks apply particularly to soft-wooded things, as Pelargoniums; but with hard-wooded plants, their very existence, after being frosted, depends upon their not being stimulated by heat.

Tender plants in the open air generally suffer more from spring frosts after a mild winter than they do after a severe one; as, in the former case, they are excited into premature growth; while in the latter, they are kept in a dormant state until all danger of frost is over. Hence, as I remarked, relative to the management of tender Roses, it is not protection that they require, so much as treatment to keep them in a dormant state. For this reason, in mild winters, the covers of plants should be so contrived, and constructed of non-conducting materials,—such as reeds or straw, which are non-conductors in consequence of the air confined in their stems,—that, by admitting a current of air through the covering, the plant will be actually colder than if it was fully exposed to the influence of the atmosphere; and yet, when closed up for the night, the cover will, by intercepting the radiated heat, render the internal some degrees warmer than the exterior air. From these remarks, the Amateur will see that it is quite as necessary that plants should be covered in a mild season to keep them from growing, as it is that they should be protected from the cold in severe ones.

Pelargoniums which it is intended to bloom in the greenhouse must now be removed into their flowering-pots; and the branches must, moreover, be tied out, if large symmetrical plants are desired. Those stopped in November will flower in May; a second lot should now be stopped to flower in June and July; and a third about the middle of April, to bloom in August and September. For growing the Pelargonium, I have never found anything equal to the parings of grass verges, or thin turf one year old, and leaf-mould and peat-earth, in the proportions of four parts of the former to two parts of each of the latter, roughly mixed together but not sifted. In fact, I never sift soil under any circumstances, unless for the purpose of taking the fine particles out and using the turfy portions only. This compost, with the admixture of a little sand if the plant is delicate, or loam, if of luxuriant growth, will answer for all kinds of greenhouse plants, with the exception of Heaths, and other delicate-rooted hard-wooded plants.—W. P. Ayres.

HOME CORRESPONDENCE.

Grafting as practised by the Ancients.—The *Gardeners' Chronicle* having admitted several communications on the subject of biblical botany, in which, in common with several of your readers, I have felt much interested, I am induced to trouble you with the following, in hope that it may attract the attention as well of vegetable physiologists and of practical gardeners as of those occupied with the interesting subject of the botany of the Bible and in the horticultural practices of the ancients. The point to which I wish to direct attention is that of grafting as practised by the Romans, not in reference to the whole question, but to a particular point of it; namely, the practice which seems to have been common, of grafting from wild plants on a cultivated stock. We are in the habit of doing exactly the reverse, and by this means preserving the peculiar characteristics of our esteemed fruits. There would be no object in grafting from a wild plant on any of these cultivated stocks; but where the produce of a wild plant is of a useful nature, what would be the effect of grafting on a cultivated stock? would the grafted branches be more vigorous—would they be more prolific—or would they be merely useful in filling up blanks in a tree in full bearing? These questions will perhaps be more intelligible if I adduce the Olive as the plant on which this method of grafting was practised. We read in Holland's edition of Pliny, xvii., ch. 18: "In Barbarie, the people have this practice peculiar to themselves; for to graft in a wild Olive stock, whereby they continue a certain perpetuity; for even as the boughs that were grafted and (as I may say) adopted first, wax old and grow to decay, a second quickly putteth forth afresh, taken new from another tree, and in the same old stock sheweth young and lively; and after it a third successively, and as many as need; so as by this means they take order to eternize their Olives; insomuch as one Olive-plot hath been known to have prospered in good estate a world of years. This wild Olive aforesaid may be grafted either with scions set in a cleft, or els, by way of inoculation, with the scutcheon aforesaid." Pliny himself describes the whole much more briefly, e. g.: "Africae peculiare quidem in Oleastro est inserere. Quadam aternitate consenscent proxima adoptioni virga emissa, atque ita alia arbore ex eadem juvenescente: iterumque et quoties opus sit, ut ævis eadem oliveta constant. Inseritur autem Oleaster calamo, et inoculatione." The Olive is well known, and is universally acknowledged to have been early cultivated by the Romans, and in Greece, as well as in Syria and Palestine. The Oleaster has been a subject of dispute, because this name has been applied to different plants, which we need not notice on the present occasion, inasmuch as I think the practice of grafting the Oleaster or Wild Olive on the cultivated Olive, so as to "eternize" their Olive plantations, proves beyond a doubt that the term Oleaster was often, if not usually, applied to the true Olive, or *Olea europæa*, when growing in a wild state, as no grafting of plants of other genera—or, indeed, of species of *Olea*—ever could have produced Olives, even if they had taken as grafts. The passage of Scripture which this practice tends to elucidate is that in St. Paul's Epistle to the Romans, xi. 17, where he warns them against self-colouring, &c.—"And if some of the branches be broken off, and thou, being a wild Olive-tree, wert grafted in among them, and with them partakest of the root and fatness of the Olive—"

tree; boast not against the branches," where the Jews are compared to the natural branches of the Olive-tree, and the Gentiles to those of the Wild Olive-tree, grafted in place of the natural ones, which had been broken off. The same figure is continued through several verses, and again in verse 24. "For if thou wert cut out of the Olive-tree, which is wild by nature, and wert grafted contrary to nature into a good Olive-tree, how much more shall these, which be the natural branches, be grafted into their own Olive-tree?" These passages puzzled many commentators, until Bredenkamp ascertained that it was the practice in ancient times to engraft the wild upon the cultivated Olive-tree. This explanation has also been given by the editor of the "Pictorial Bible;" but then the Elæagnus is adduced as the Oleaster or Wild Olive-tree. Theophrastus and Columella are also mentioned as describing the same practice. Can any of your readers inform those interested in this subject, whether this practice is ever followed in the present day with the Olive in the South of Europe, or other places where it is cultivated—or is it adopted with any other tree which may bear useful produce in a wild state? I believe something of the kind is sometimes practised when it is wished to fill up a blank in trees, where branches have been broken off accidentally. Would it be useful in cases of decay, and would the newly-engrafted parts live longer, be more vigorous, or bear more plentifully, than if grafts had been taken from the cultivated plant? Or did the ancients only adopt the practice because the Wild Olive was abundant and easily procurable?—R.

Timber.—It is well known that when Oak trees are felled at the usual season, i. e. the end of April, and are stripped, the sap, or outer part of the timber, is quite useless; it being liable to decay, even when kept dry, in a very short time—in three or four years. But if the timber is felled in the winter, before the juices have risen at the tree, this sap, or outer part of the timber, is nearly or quite as durable as the heart; this I know from experience. However, if the timber is felled in the winter, the bark cannot be stripped, and is lost. It has occurred to me that the trees might be pollarded close in the stripping season, and the bark stripped from the limbs and trunk of the tree, and the trunk left standing till the following winter, when it might be felled. Would the juices of the tree return into the ground through the stripped trunk, so that the sap or soft part of the timber might become as durable as in trees felled with the bark on in the winter?—A. H. [It is a common practice to strip trees while standing, and to leave them so till the succeeding autumn, with a view to the improvement of their sapwood; and a good practice it is. It would seem as if the decay of sapwood arose in part from its containing much nitrogen, which is very abundant in trees in the spring, but disappears by the autumn.]

The Baloot Oak.—The name given by your correspondent "R." to the Holly-Oak of Afghanistan has attracted my attention. He calls it Baloot, which is, apparently, the local name in the Affghan, or in some other Indian dialect. There is a prickly-leaved evergreen Oak, resembling a Holly, which is found in Spain, and which is said to extend along the coast of Mauritania, and to be found as far East as Babylon and Mesopotamia. This is the Spanish Bellota, more properly, perhaps, called the Encina, for Bellota would appear to be the name of the fruit, (which is good to eat, and when roasted is not unlike the Spanish Chesnut,) and Encina that of the tree itself, as we may learn from Don Quixote (Part I., Chap. xi.), when the knight at dessert "tomó un puño de Bellotas en la mano," and commences a eulogium upon the Golden Age—a time, he said, when no food had to be cultivated—when all that was necessary was "alzar la mano y alcanzarle de las robustas Encinas." The modern Greek oak, "Valonia," and the ancient "Balanos" (Acorn), from which it is derived, are not without resemblance to Bellota and Baloot; and the Hebrew name for Oak is "Alon;" but the Affghans, although claiming descent from the children of Israel, have nothing in common with the Hebrew language. Can you tell me whether the Baloot of Afghanistan is the same tree as the Bellota of Spain—and if so, to what language they owe the origin of their names?—Catherine.—[The Bellota of Spain is the Quercus Ballota of Botanists, a species very nearly the same as Q. ilex, the common evergreen Oak. There is no authority for supposing the Holly Oak of Afghanistan to be this, although it may possibly be so, because there exists in the Himalayas the Quercus incana of Roxburgh, which is probably nothing more than an Indian form of the Q. Ballota. Dr. Royle, in his valuable Illustrations of the Botany of the Himalaya Mountains, (a work, by the way, which ought to be in every public library in the country,) tells us that the Acorns of this Q. incana are sold in the Indian bazaars under the name of Bulloot; and further, that Persian writers speak of a Shah-bulloot, and a Bulloot-ool-mulik.]

Cultivation of Roses in Pots.—The following plan of growing China Roses in pots, which I have successfully practised, may be interesting to your readers, and if properly followed, the cultivation of Roses in pots will be found as easy, and will present as few difficulties as that of any other plant. As soon as the seeds of the Common Dog Rose are ripe they should be sown on a bed where they may remain until the following autumn; then let the young plants be taken up and potted in 48-sized pots, previously cutting them back to one or two eyes. Plunge them in a bed in the open air, where they may remain until the beginning of July, when the weakest plants should be pinched back to three or four inches above the pot, while the strongest may be left one or two feet high; this will cause them to throw out laterals, and the plants

will look a year older. Towards the end of August the plants should be budded; in the month of November they should be headed down to within an inch of the buds, and all thorns and shoots should be removed. They should afterwards be potted in 32-sized pots, and protected during winter from frost. In the month of January, I start them into growth, by placing the plants in a frame heated by dung, and as soon as the buds have pushed about three inches long, I pinch them back to within one inch of the stem. This must be repeated once or twice until the plants have formed heads, and if any suckers or shoots from the stock appear, they should be immediately removed. By giving plenty of air in fine weather, and following the above directions, as fine Roses may be obtained in the month of May as can be grown in the open air during any period of the year. In the following autumn the plants will require to be potted. After pruning them well back, shake most of the soil from the roots, and shift them into pots a size larger: under this treatment they will stand for several years. The reason why I prefer the Dog Rose for stocks is, that the flowers will last longer, and will be of a finer colour upon that than upon any other stock. Many persons fancy that stocks are too weak at so early an age. It is not, however, the strongest stock that produces the finest flowers, but the one that makes the most roots. I am certain that no stock can be produced from cuttings or layers which will root so well as seedlings. Other kinds of Roses as well as China will do well under this treatment, but they do not require to be pinched back, otherwise they will bear no flowers. The following sorts will succeed better on the Quatre Saisons than on any other stock: viz. the Banksian Rose, R. berberifolia, bracteata, and multiflora. Many other kinds also do well upon the Quatre Saisons, which I would propagate from layers, roots, or cuttings. I prefer the latter, however, which, if taken from the old stocks in autumn, and laid in the ground covered to the depth of three inches, will in the spring following throw up plenty of suckers or plants. These may remain in the bed until the autumn, when they should be taken up, potted, and treated in the same manner as recommended for the Dog Rose. Many China Roses do well on the Quatre Saisons, but the flowers do not last so long, nor have they so bright a colour. If I wish to grow large Standards in pots, I procure in the autumn good plants of the Dog Rose from the woods, cut all the branches off from the stem, and carefully remove all laterals or suckers from the roots. I then put them in 24-sized pots, and plunge the pots in the ground, where they remain until July; at which time they must be budded. In the spring they are cut back to about an inch above the bud, and are not allowed to flower the first year. By pinching off the blooms as soon as they appear, the Roses flower much finer the ensuing season.—Joseph Baumann.

Amaryllis Belladonna.—No wonder, though some of your correspondents are surprised at it, that this flower is so scarce. I have tried, I believe, every receipt which has appeared, as to soil, treatment, &c., and during six years I have never had one in flower. Can you add any new prescription to all the former? for I will not throw away my bulbs yet. I am equally unfortunate with A. speciosissima, A. altissima, and Crinum capense. I now have them all in a warm S. border, but never get beyond leaves.—A Country Vicar. [A. belladonna has been growing many years in the garden of the Hort. Soc., at the foot of a south wall, in common black garden soil. It receives no other care than being protected from wet in winter by a thatched roof attached to the top of the wall; and it flowers beautifully every autumn. A. formosissima (the Jacobea Lily) must have two or three months' drought. Crinum capense requires a wet situation. See The Dean of Manchester's remarks on this subject, at p. 581, of Vol. I.]

Bees.—In the Chronicle, at p. 53, Mr. Grant has given an interesting account of the manner in which he managed his Bees during the last season, and likewise the drawing of a hive on the collateral plan. I have a few remarks to make on both, with the view of adding my mite of experience to the knowledge of Bee-keeping. The first paragraph I shall notice is, where Mr. G. says, "I am of opinion that Bees will thrive best if left to their own natural instinct;" of course meaning not confined in their hives during winter. If the instinct of Bees was not obedient to the laws which govern the climate whence they originated, this might be true; but as it is so, there is sometimes danger in letting them have their own natural instinct or will, especially in winter; as they are often deceived in our variable climate by the fitful warmth of the winter's sun, whose transient gleams cause them to sally forth and fall benumbed upon the snow. Moreover, if the entrance to the hive be not closed, the large Tom-tit, who at this season is a hungry spy upon Bee-hives, will sily rap at the door and devour the inmates as they appear to answer his cunning call. Again, Mr. G. mentions that his "Bees left the hive on the 25th of Dec., and returned laden with pollen as would have been the case in May." This I do not doubt; but the Bees would have been better at home, for any nourishment which they would get at that period. If last season had been a bad one for Bees, the present mild winter would have been fatal, especially to weak hives, by arousing them at an improper time by unseasonable warmth instead of keeping them torpid. To preserve the hives cool by shading is better than to allow the Bees to wander abroad at the time referred to. When this plan is adopted, a very small hole will allow sufficient air to the Bees, and there need be no fear of their striving to enlarge it, as was the case with Mr. G.'s Bees. His remarks on zinc not being good for Bees to feed from are very good; but if the condensed steam from the hive had not rested upon

it, the Bees would have taken no harm; indeed they are fond of sipping it with their proboscis. There is danger, however, and a great one, when there is much condensed steam; because it makes the hive unhealthy for the Bees, and gives rise to the plan of ventilating them in winter; but in drawing off the damp air, there is a danger also of admitting more from the atmosphere. The next thing I shall notice is, where Mr. G. says "Up to Dec. 26, I only witnessed three dead Bees from my hive, there being no Drones to kill." If the first part of this sentence mean that only three Bees died during the season, it is strange indeed, for Bees are short lived; in fact, there must have been several hundred dead Bees instead of three. As to there being no Drones in the hive, I never knew a hive without them at the usual time. By the bye, Mr. G. considered that two of the dead Bees alluded to, must have been "strangers or unruly members of the community." He was led to think so by seeing them stung to death in front of the hive. This, however, might happen, though neither was the case, for Bees have a dislike towards their sick; nay, if they happen only to lose their wings, they are cast out of the colony. This shows there is an inherent enmity in insects towards their sick, as well as in some kinds of birds. Mr. G. truly observes that it is a bad plan to lift the hive from the board after the season is past, for the Bees cannot collect propolis to seal it down. Mr. G. observes also that tobacco-smoke is injurious to Bees. Now, when smoke is used, that from large puff-balls is the safest and best; Amateur Bee-keepers ought not to be without it when it can be had. I shall now notice Mr. G.'s hive: the important feature of it over the common collateral one, is, that the central part is made of straw instead of wood, and that the end boxes are lined with India-matting. This is an improvement, for straw is a bad conductor of heat, and is of course more congenial for Bees than wood; but I question after Mr. G. has tried his hive a season or two more, whether he will tell us again that it prevented his Bees from swarming, and obviated the complaint of a "despairing Bee-keeper," viz., that Bees kept in boxes generally die during the winter. This too common complaint is not owing to the wooden boxes, but to the brood being unavoidably destroyed when the honey is taken; many of the Bees left being of an age to die before the following spring.—I may subjoin that at p. 69, "W. W.," in noticing the advantage of straw hives in preference to wooden ones, says, "In the former, the atmosphere penetrates at innumerable orifices, and in small quantities, without draft." In a strong hive, however, this will not long be the case, for the inmates will soon seal or rather glaze with propolis the inside of their dwelling, to make it air-tight. "W. W." also recommends robbing Bees at night; why not do it in the middle of a fine day when many of the Bees are abroad? However, with his Bee-dress and glass eyes he may face Bees both by night and day.—J. Wighton.

Gold Fish.—Having latterly observed in the Chronicle some interesting communications relative to the preservation of Gold Fish, or I believe, in more scientific language, *Cyprinus auratus*, I am desirous of adding my mite to the fund of general knowledge already possessed respecting it. As the incident to which I am about to refer is so much at variance with what appears to have been the experience of previous correspondents, it may be proper that I should first assure those who are interested in this matter that my object is not to call in question the veracity of their statements. I wish merely to direct their attention to a circumstance which would seem to show that the habits, or rather the hardness of the fish in question, is but imperfectly known. The circumstance to which I would refer occurred during the winter of 1825 and 1826, which has not since been surpassed either in severity or duration. At Bretton Hall, near Wakefield, in what was called the plant-ground, and on a level with a gravel walk, stood a semicircular stone cistern; being on the straight side, about $4\frac{1}{2}$ feet in length, and 2 feet in depth. The plant-ground being frequently visited by the family, and the stone cistern being near the edge of one of the principal walks leading through it, three of the finest of the gold fish were taken from one of the ponds in the pleasure-ground, in which they were preserved, and placed in this cistern. Here they remained during the summer, and were entirely forgotten, until some time after the frost had commenced; and, indeed, until the ice on the cistern had become so thick that no doubt whatever was entertained that the fish were already dead; and therefore no further attention was then paid to them. The frost continued about three months, and during the greater part of that time, certainly very little, if any, of the water in the cistern could have remained in a fluid state. The expansion of the water in freezing (it being confined by the sides of the stone cistern) occasioned the ice to be thrown upwards, and rent and broken in many parts of its surface; whether by this means the fish were occasionally supplied with air, I shall not venture to state; my own impression, however, must be, that the exclusion of air by the ice was as complete as the nature of ice could render it, as the parts which were thus broken up were again immediately united by the frost. At the end of about three months, when the frost subsided, and the ice had nearly disappeared, I examined the cistern, and found the fish not only alive, but in excellent condition; certainly, not at all in less vigorous health than when placed there at the commencement of the preceding summer. That all gold fish are equally hardy, and that in all cases and under all circumstances they are capable of enduring similar treatment to that which I have described, I do not by any means pretend to affirm. I am, however, quite sure that the gold fish in Yorkshire, which perhaps do not differ in

any particular from those in other parts of the country, are so hardy as to make it a matter of no importance whether the pond in which they are preserved be covered with ice for four-and-twenty hours or four-and-twenty days; and it is equally unimportant whether, during that time the ice be broken once a day or twice a day, or whether it be broken at all.—*R. Marnock, Royal Botanic Garden, Regent's Park.*

Tansy as a Manure.—The perusal of Professor Sprengel's paper, at p. 52, forcibly brought to my mind a circumstance which attracted my attention 15 years since, when I took a small residence, the property of an old gentleman who cultivated Tansy as a cure for some of the "ills that flesh is heir to." One of the first operations on the premises was to turn under an extensive and well-defined bed of Tansy; the east side of the bed was covered over with fine turf, forming the half in width of a new approach to the lawn. The turf over this portion of the Tansy-bed always presented a most luxuriant appearance during my occupation; in fact, it was an eyesore—the lawn and approaches requiring in genial weather to be cut only every other day, whilst the small portion over the Tansy bed ought to have been cut daily. Upon the other portion of the said bed and land adjoining I sowed Cos Lettuce seed, where the boundary line of the old Tansy-bed was so conspicuous that any one viewing the Lettuces previously to being pricked out must certainly have mistaken them for two successive crops. The soil was a strong heavy clay. Forsyth, in his "Italy," points to the value of Tansy as a green manure, so far back as 1802, but without seeming to have drawn the attention of our own agriculturists to the benefit to be derived from such a course. In a district where manure appears to be scarce, where the farmer is obliged to resort to the distant sewers of the city, where "they send poor men and asses to pick up dung upon the roads, and at certain resting-places on the highway they spread litter for the cattle that pass to stall for their benefit," necessity seems to have been the mother of the invention, if I may be allowed the expression, to keep the land perpetually in heart; for, says he, the "rich plain of the Val d'Arno yields usually two harvests a year; the first of Wheat, the second of some green crop; which last is ploughed up [in] and left to rot on the field as manure for the next."—*I. K. S.*

Worms and Corrosive Sublimate.—I tried an experiment with one ounce of this mineral in 40 gallons of water on a portion of my lawn, and nothing could succeed better. There were gathered up from this quantity worms which filled at least two inches of depth in a stable-bucket.—*Agger.* [Capital manure these gentry would make.]

Spirits of Tar.—In your volume of last year, at p. 321, I added my testimony to the utility of Spirits of Tar as a preventive to wire-worm in Carrots. No doubt there are other natural enemies with which we have to contend; yet how numerous soever they may be, I am inclined to believe that the substance which causes the destruction or expulsion of the one would produce the same effect upon the other. Spirits of Tar, as before stated, are useful in more ways than one in the Horticultural world; yet in whatever respect your correspondent "C. M'In" finds (or thinks) that it will be beneficial, it is only by experiment that he can prove the results. For my part, I can only speak from experience, when I say that Spirits of Tar will destroy the Elater obscurus, or wire-worm. He advises me to dig Spirits of Tar into the ground in Autumn, and to repeat the dose in Spring (as I before purposed); this, I think, would be expense incurred to no purpose. In my former account I have stated that each ridge is thrown up, so that the frost can freely penetrate it; consequently, if frost destroys these pests, Spirits of Tar are of no benefit in the Autumn preparation of land. If, however, we were to apply Spirits of Tar in Autumn (and supposing that they are not volatile), does your correspondent mean us to apply at both seasons the quantity mentioned by him, or the one half in Autumn and the other in Spring? and if Spirits of Tar are not volatile, why must the dose be repeated each succeeding season (see p. 53, of 1841)? If C. M'In's coat smells as strongly at the end of six months as it did when first besmeared, how is it that one application will not suffice for two crops? I am afraid that when the remedy is applied to its cold earthy bed, the result would, in less than six months, prove otherwise. The third application of Spirits of Tar as a top-dressing to Carrot ground, convinces me that those who follow the rules laid down by me in a late Number will derive advantage from it. In conclusion, may I ask your correspondent to favour me, through your columns, with his opinion as to the manner in which these Carrot pests increase?—*A Rosshire Gardener.*

Native Guano.—In reply to your Stirling Correspondent, p. 51, I would remark that I have been told that last year the deposit of the Solan Goose, taken from Ailsa Craig, was tried against Guano, and the result was that the Guano was immensely superior. I am not prepared to say to how great an extent, as my informant had forgotten the exact particulars, but I believe I am correct in saying that 1 cwt. of Guano was at least equal to 10 cwt. of the deposit of the Solan Goose. The experiment was made, I think, in the neighbourhood of Paisley. I have been told that Sir G. Warrender is to institute several experiments this season with the deposit of the Solan Goose taken from the Bass Rock.—*J. N. V.*

Belgian Carrots.—At p. 73, you have given some advice as to the cultivation of white Belgian Carrots, with which I differ from you as to the distance of the rows. They should not be more than 12 inches apart, and the plants in the rows should be left from six to 9 inches

apart, according to the productive quality of the soil. If the plants are thin, they split and grow bunched headed, and are more apt to rot upon being stored. Forking the land, as I have described at p. 869, of vol. ii., is the best plan of preparing the soil; and in fact for almost all gardening and farming purposes the fork is superior to the spade, which I hope will generally be abandoned. In consequence of the note referred to above, I have had many applications for these forks from various parts of the Kingdom. I add the following proof that thick plants bring a good crop. The field was forked 14 inches deep and the seed sown broadcast, having been previously mixed and well divided by sand.—One rod produced 628 Carrots, weighing 521 lbs., being 4 cwt. 2 qrs. 17 lbs., or at the rate of 37 tons, 4 cwt. 52 lbs. per acre. In another part of the field, where the plants were not quite so thick, the weight was 3 tons per acre less. The field belongs to Mr. Beadle of this place; and the greatest accuracy was observed on the occasion of taking them up, as it was to determine a bet of Carrots versus Swedes. The former won.—*Henry Dixon, Wilham.*

Drainage Bill.—Why should not neighbouring proprietors who suffer from a Mill, be entitled to purchase it, the value to be ascertained in the same manner as land taken under a Railway Bill? I know an estate seriously injured by a mill-dam not worth 30*l.* per annum, which belongs to a neighbour, but who will not sell it, and thereby prevents the drainage of a large district.—*J. N. V.*

Wells.—If your correspondent (p. 70) will throw a bushel of charcoal, thoroughly crushed, into his well, which is in a bad state from the circumstance of hay having been inconsiderately made use of in its construction, I think it will remedy the evils of which he complains. Should it fail of success, it can do no harm, and the expense incurred will be trifling.—*R. E. K.*

Potato Paint.—Take 1lb. of potatoes, skinned and well baked, bruise them in three or four times their weight of boiling water, and then pass them through a hair sieve. Add 2lbs. of chalk in fine powder, previously mixed in double the weight of water, and stir the whole well together. This mixture will form a glue, to which any colouring powder may be added, even charcoal, brick, or soot, for painting gate-posts, &c., which are exposed to the action of the air. This receipt is taken from *Bell's Weekly Messenger* of the 30th ult.; can you recommend it?—*H. B.* [We never before heard of this mixture, but we should doubt its being durable. Perhaps some one can tell us about it.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Feb. 7.—*J. Bateman, Esq.*, in the chair. *Mrs. Alfred Hill, J. Gray, and R. C. Griffith, Esqrs.*, were elected Fellows. *Sir G. Staunton, Bart.*, exhibited portions of the stem of the Sugar Cane, from plants grown in a stove at Leigh Park, where many of them attained more than 20 feet in height; the specimens appeared to contain a full proportion of sugar, and to be as fine as those grown in their native country. From Mr. Goode, gr. to Mrs. Lawrence, a collection of Orchidaceous plants, containing a specimen of the pretty *Dendrobium Wallichii*, differing but little from *D. nobile*; *Phalenopsis amabilis*, the beautiful Butterfly plant, pure white, and of an elegant form. *Huntleya violacea*, a rare plant, bearing a very curiously shaped flower of a deep violet colour; a handsome dark variety of *Cyrtorchilus maculatum*; *Zygopetalum crinitum*, having the raised violet markings of the labellum studded with glandular hairs of the same colour; and a species of *Epidendrum*, with brown and white flowers, commonly called the "Bottle bulb," from the resemblance of that portion of the plant to a Florence flask; a Knibbiana medal was awarded for the *Dendrobium*, *Phalenopsis*, and *Huntleya*. From Mr. Beck, of Isleworth, a collection of plants in slate pots, consisting of three seedling *Epacris*, a seedling *Erica*, *Coronilla glauca*, and several *Hyacinths*: the vigorous appearance of these plants, the former so difficult to preserve in health at this season of the year, clearly proves how erroneous were the assertions formerly made, that plants would not grow in any material which was not porous. The seedling *Erica* was a pretty variety, not unlike *E. transparens nova*, and, as well as the three *Epacris*, was raised by Mr. Storey; one of the latter was of a delicate flesh-colour when fully expanded, the unopened buds being tipped with dark rose. Mr. Beck also exhibited slate boxes of different sizes, some of them taken to pieces to show the close manner in which they might be packed; as the different parts are secured together by screws, this is easily effected. To the bottoms of the larger boxes brass rollers are affixed instead of iron ones, which usually stain the floor or pavement where they are placed. From W. H. Storey, Esq., a well grown plant of *Erica sebana*, covered with light-green drooping flowers, from which the dark bristly stamens protrude in a remarkable manner. From Messrs. Veitch, a plant of the new *Trojanum azureum*, bearing an abundance of its delicate blue flowers, which were considerably darker than when exhibited at a previous meeting, and it is not improbable that as the plants acquire more strength, the blossoms also will become of a deeper tint. Messrs. Veitch also exhibited a plant of *Stenochrysis australis*, a terrestrial Orchidaceous plant, bearing spikes of singular light brick red flowers. From Mr. Lee, of Bradmore, Hammersmith, well-bloomed specimens of *Polygonum colemanianum*, and *album multiflorum*; the latter a variety of no excellence as a florist's flower, but without doubt the best kind for early forcing; a certificate was awarded for it. From Messrs. Chandler, a large collection of cut *Camellia* flowers, comprising most of the best varieties in cultivation; the blooms of *C. albaeflora*, *imbricata*, *fimbriata*, *Hume's Blush*, *Waratah* and *Donckelarii* were very beautiful. From Mr. Gaines, several seedling *Correas*, 3 *Cinerarias*, called true blue, alba, and Lady of the Lake, a seedling *Camellia*, and a well-bloomed specimen of *Camellia tricolor*; a certificate was awarded for the latter. From Mr. J. Cuthill, a seedling *Camellia* with red flowers, said to have been raised from seed obtained at Canton. From Mr. W. Appleby, gr. to J. Dobinson, Esq., a seedling *Cineraria*. Mr. A. Toward, gr. to H. R. H. the Duchess of Gloucester, exhibited a leaf fork, much used at Bagshot Park: the tines are made of locust-wood, shod with iron, which renders it lighter than those wholly formed of that metal, now in general use; from its size it is also capable of lifting a great quantity of leaves at once. From the Gardens of the Society, a collection of plants, amongst which were a handsome *Acacia*, called *A. rubida*, bearing long racemes of yellow balls of flowers, and remarkable for retaining longer than any other kinds the two-fold character of its leaves, some being simple, others compound, upon the same branch: although not of so dwarf a habit as *A. verniciflua*, exhibited at the last meeting, it might nevertheless with judicious pruning be kept within the limits of a small greenhouse. *Scuticaria Steelii*, an exceedingly pretty species, with thong like leaves and fragrant flowers, found in Demerara, growing on Palm-trees; *Dendrobium discolor*, producing a raceme of dingy flowers with singularly twisted segments; *Spiranthes cernua*, one of the terrestrial Orchidaceae which abound in Mexico and Guatemala, with curious wax-like

flowers, worthy of cultivation on account of its unusual appearance, as well as for the facility with which it may be cultivated, and the length of time which it continues in bloom; *J. castel-laifera*, a species lately introduced by Mr. Hartweg, with pale green flowers; and *Begonia vitifolia*, not a showy species, but valuable for blooming at this period of the year. Cut flowers of *Chimonanthus fragrans*, *grandiflorus*, and *parviflorus* were also exhibited; the latter, although much smaller than either of the others, is no less worthy of cultivation, as the flowers are more fragrant, and are produced later than those of the other two varieties. The fruit from the Gardens consisted of *Easter Beurre* and *Beurre Rance* Pears, the latter being from Standards, and proving this season to be much superior in flavour to those grown upon wall-trees; amongst the Apples were the *Cornish Gildflower*, a highly flavoured Apple, much grown in Cornwall, but seldom met with elsewhere; the tree is rather a shy bearer, and it should be observed in pruning that it bears chiefly upon the extremities of the shoots; *Sturmer Pippin*, an excellent keeper, and retaining its brisk flavour until a late period; *New Rock Pippin*, a firm, rich, Apple; and the *Boston Russet*, a good American dessert Apple, succeeding better in this climate than the *Newtown Pippin*.

FLORICULTURAL SOCIETY.

Feb. 7.—*Mr. Mauger* in the chair. It was resolved that a perpetual chairman should be chosen for the ensuing year, and *Mr. Mauger* was elected to fill that office. *Mr. Wildman* read a paper upon the qualifications of the *Dahlia*. He began by adverting to the exhausted subject which he had to deal with; and proceeded next to notice the relative value of the three general and leading properties, form, colour, and size—a combination of which must not be wanting in any first-class seedling; but the two latter, however desirable, might upon emergency be dispensed with in collections, to a certain extent, without deteriorating their general appearance. The only flower possessing form which often really damages a stand is *Nicholas Nickleby*; but it was rendered more than usually conspicuous by its peculiarity and striking defects. In order to show the advances which had been made, both in the flower and in correctness of opinion, as to what constituted beauty, he turned to the Horticultural and other early publications, in which many loose and misshapen flowers had been figured, and described as good, even by some of the then, best judges. Proving that accurate notions of excellence or perfection are not intuitive, but acquired by observation and comparison. Our opinions, therefore, advance in proportion as they are influenced by the production of more perfect things, not contemplated at the time our first ideas were formed. General form was a combination of other points, worked out upon the same principle as that by which itself was governed: thus, if the form, as a whole, was to be circular, the jaws of petals, as well as the petals themselves, must be circular also; and so on throughout. He should therefore pursue the plan adopted in the forms used by the Society last season in the judgment of seedlings, and begin with the petal. In suggesting these forms, he had the best hopes of their effect, and the result had not ended in disappointment, for where every point must be commented on, and separate reasons assigned for the decision, laxity could not well prevail, and partiality would be instantly detected. He strongly recommended those who wished to obtain an intimate knowledge of the structure of any particular flower, to resort to frequent dissection—which, in the *Dahlia* especially, from its exact and apparently mechanical arrangement, would well repay the trouble. Having recapitulated the general and well known properties of the petal, *Mr. Wildman* stated that upon a very slight inspection it would be found to be composed of three parts, which would readily divide. The central division would be found to be broader than the others, which, by their adhesion from their inner edges, assume a sickle shape, so as to embrace and fit exactly those of the middle segment, and give the petals a cupped form. The sickle shape, however, of the outer sides cannot long be retained after separation, for when released from the connexion they become nearly straight. Upon the shape of these several parts and the manner in which they were naturally joined together, the form of the petals, as well as the appearance they ultimately assume, mainly depend, as to whether they were too much or too little cupped, quilled or otherwise abruptly indented or stumpy; the indentations in the edge, as well as notches, are also often thus accounted for. *Mr. Wildman* then minutely described the parts and their several defects. The faults he had alluded to were mostly observed; but there was another to which general attention had never been sufficiently directed, and which was often overlooked, although it occurred in some of the best flowers; he meant a diamond-like shape, which the inner part of the petal was apt to take, causing an angularity of appearance throughout the flower; as was the case with *Widman's Queen*, however good in other respects, *Springfield Rival*, and several others; and yet, in all these cases, the outline of the petal was good, and it was only the manner in which the inner part was disposed that caused the defective appearance. The petals of *Wind-or-Rival* and several others were mentioned in contradistinction. It was necessary that the petals should be proportionate. *Pickwick* was an example of too small a petal, whilst in *Andrew Hofer*, *Unique*, *Maid of Bath*, &c., they are too large. Petals like those in *Warminster Rival* and *Cometess of Pembroke* often had a striking appearance, but the flowers in which they occurred could never be depended upon; they were always thin and deficient in the centre. Reflexed petals were generally considered to be bad, and so they are, if they are reflex, or do so in the strict sense of the term; but it is absolutely necessary that some should be depressed, as otherwise it is impossible to obtain a deep flower. If the back petals be too horizontal, the flower, working from flat bases, will be shallow, with a low centre; but if, on the contrary, it works downwards from the disk, the under petals will be well depressed, but the cupping will be gradual, and the centre high. Now these are the opinions of all who have a knowledge of the flower; but until recently the very opposite idea was entertained—and in a lecture delivered at the Metropolitan Society a very few years ago, the following remarks occur:—"The only flower which is perfect on the outer edges, and this forms a perfect circle without notches, is the 'Springfield Rival'; this fails on the side view, because the eye does not rise to the top, and the back petals reflex. Our notions of perfection may be estimated thus: Would the *Springfield Rival* be handsomer if the eye or crown rose up to a complete half-circle with all its present beauties? Secondly, would it be better if, instead of the present reflection of the petals on the underside, they were perfectly square and flat? If these points be conceded, our notions of perfection are established; for certainly in the beauty and accuracy of the petals no art could effect an improvement, nor could the compasses of the mathematician improve the circular outline of the *Springfield Rival*, as you view it front." The lecturer evidently was not at that time aware, that the concession of the one point must defeat the other. *Mr. Wildman* agreed that a long petal was decidedly bad, but that too short a one was equally so; and he had always set down flowers described as having short cupped petals as worthless. They should not be short—they should be proportionate—for if they be short, the centre can never be high, but will be generally hard and the flower flat. All flowers vary so much, according to seasons and localities, that, however careful may have been our observation, there is still some risk in selecting any particular variety as the best. In the year 1841, *President of the West* was decidedly pre-eminent; in 1842 it was worthless. In 1841 *Cateugh's Tournament* was very good; in 1842 it was equally bad. The finest bloom of any *Dahlia* he saw last year, in fact as beautiful as any he had ever seen, was a bloom of *Lady Cooper*, exhibited by *Mr. Bragg*, at Salt Hill; not a fault was to be seen, and although of extraordinary size, it was as close and delicate as the smallest flower. Those who have grown *Lady Cooper* in the neighbourhood of London, where it fails on account of the hardness of the eye (though not excessive even there), can scarcely conceive the difference. The next point was arrangement—which, if not

good, would have the effect of damaging all the rest; for the flower being composed of rows of petals, placed evenly one above the other, in decreasing concentric circles, it must be obvious that the slightest malformation in the receptacle, or in the manner in which the petals were placed in it, would have the effect of causing a derangement which often pervades the whole flower—one petal displacing another throughout. This defect in some varieties occurred but seldom, in others frequently, and in some constantly; in some it was accidental, in others constitutional; and if, in the latter case, it were at all considerable, it must be fatal to the variety. Various instances of this derangement were given; and it was remarked, that, under such circumstances, censors were never justified in attributing these occurrences, in a new variety, to accident, and that the only safe course was to be governed by fact, and not by conjecture. Independently of the mere arrangement of the petals, the transition from the fully-expanded ones to those completely closed, should be regular and gradual from the centre, both with regard to the size of the petals and to their expansion. Sometimes all the expanded petals were nearly of the same size, when a disproportionate space must unavoidably be left between the expanded rows and those that form the centre, which then always appears large and coarse, instead of compact, as when formed by imperceptible gradations. The form and height of the centre was then adverted to; though a sunk centre was a defect, it was not a total disqualification, and might be more readily passed over than a cross or misshapen eye, than which scarcely a greater fault existed. The highest centres were not always the best formed; in some flowers they stood upright, as in Metel, instead of curving gently and compactly inwards. The scale, if perceptible, was bad anywhere, but more so in the centre, especially if it formed a glossy, obdurate eye, as in Spary's Conqueror of the Plain, in which it was most detestable and disappointing. Mr. Wildman made some other remarks, in which several of the members joined, with regard to other flowers; and having recapitulated several of the points, mentioned the general form and outline of the flower as a whole. A full flower was generally preferred, and in the Dahlia especially it was desirable, the petals being smaller, as compared to its size, than many other flowers. In self-coloured flowers it added much to solidity of appearance, as well as density and brilliancy of colour, so long as there was no confusion, and every part was distinct and clear. In edged flowers some allowance might, perhaps, be made, the beauty consisting in two parts of the petals, one of which, if too close, or at all crowded, must be hidden. These observations, however, did not apply to the Dahlia only, for, in his opinion, the Carnation, the beauties of which are in the interior of the petal, should not be governed strictly by the same rule as the Picotee, as too great a fulness would obviously conceal in the one what would be still conspicuously seen in the other. The next point alluded to was colour; and the remarks were generally confirmatory of the rules hitherto adopted. In alluding, however, to the necessity of the colour penetrating through to the back of the petal—such a principle applied more to self-coloured than edged flowers, in the latter of which the colour was too often at the back of the petal, and not on the face. The difference, however, occasioned (for into the distribution and cause of colour he could not enter) arose from the nerves at the back of the petals of dark flowers being of a light colour, and those in light flowers being, on the contrary, dark, the colouring being apparently diffused in the one throughout the intermediate spaces, and in the other drawn from them and concentrated in the nerves. The colour is then stronger at the tip, where they all meet together. It is of course more perceptible in some varieties than in others, but Eva, Penelope, and several other flowers, might be mentioned as examples. Sometimes the colour also appears as a vein on the face of the petal. A flower with a neat edge, having the colour well concentrated is still a desideratum, most of those we at present possess being only mottled, or faintly clouded. Size was the only remaining point. It was the only one that could be detrimental if carried to excess, and had been properly considered as of the least importance. It was essential, no doubt, for (as it had been quaintly observed) a good large flower is better than a good small one, but it might with equal justice be asserted that size alone will never make a flower good; whereas with form alone it never can be positively bad. Size should nevertheless, not be unfairly underrated, for so long as it is unattended with coarseness, as is the case with the splendid specimens exhibited by Mr. Brown, and other judicious and successful cultivators, it must decide precedence. To this the very best judges can have no objection, and by them it will never be lost sight of, so long as it is not carried to such an extent as to destroy uniformity, and it is only against an undue weight, and the unfair share of attention which it attracts in the eyes of the general or superficial observer, that restrictive observations have been sometimes directed. Attempts have been made to describe what it ought to be, in inches; but such a plan cannot be supported, and is impracticable. The number of inches, moreover, have often varied according to circumstances and alteration of opinion, to both of which every thing must submit. Mr. Wildman then slightly alluded to culture, stating (as he said had already been repeatedly done) that the chief requisites were a rich, fresh loam, well manured, an open situation, plenty of water, frequently and abundantly given, and a liberal use of the knife, especially in disbudding free and abundant bloomers. These were all absolutely necessary; but even then, without a free and pure atmosphere all our labours would be lost, however meritorious; for a Dahlia, of all flowers, required a strong air;—and it was in this respect that the metropolitan Florists could never compete with their country rivals. In fact, so great was the difference that many flowers, which, with the one are most desirable, are with the others, if not worthless, absolutely useless. Hard-eyed flowers would never do in London, nor those that were thin or soft in the country,—the first requires a strong air and free growth, which the latter cannot bear; as instances, he mentioned Gregory's Regia, as a useful London flower, but worth nothing in the country. Cox's Defiance, though hitherto a favourite in country, could seldom or ever be exhibited by a London grower. Lady Cooper, again, often beautiful in the country, was useless here, the back petals falling ere the others are blown. The same with Hudson's Princess Royal. Wildman's Queen again, was excellent in the one place,—notwithstanding the angularity of petals before mentioned, which it then in a great degree loses,—has the same defect. Hope was a flower that does well in both places, so also were Unique, Maria, and Catleugh's Eclipse (though uncertain). Dodd's Prince of Wales again is easily bloomed in the neighbourhood of the metropolis, but it is always deeply and abruptly sunk in the centre. Several others could be mentioned, but enough had been said to show that sufficient change is caused by locality to justify variety in opinion, and to render it imperative upon us to refrain from forming hasty or premature opinions, both for the sake of our own consistency and the sincerity of those we may be induced to condemn. The fact, nevertheless, often imposes upon censors a difficult task, who, judging in ignorance of circumstances, are required, on inspection of one or a few specimens to form an opinion upon seedlings, which, whether favourable or otherwise, may ultimately turn out to have been delusive. But this cannot be avoided, unless the censors be apprised of things which they ought not to know, and a door be thus opened to partiality, which would be a greater evil. Raising new varieties from seed was then touched upon, after an allusion to the disinclination of those who really possessed practical knowledge to divulge their secrets; the little, however, that had been written upon the subject had been so erroneous, and evidently written in ignorance, that a few remarks could not be refrained from. Some recommend that seed be saved from thin, others from full flowers; some recommend fertilization, others neglect it; but unless the parties who give the advice have carefully marked the seed and noted the result, their recommendations are founded on conjecture only. If they have

taken these precautions, and really wish to enlighten the inexperienced, it would have been far better to have detailed specifically the result of their practice in each instance, than merely to have indulged in unsupported and vague directions. Glory of Plymouth had, to the great astonishment of all who possessed the slightest knowledge of the parts of the flower, been repeatedly recommended as a good flower from which to save seed. Now Glory of Plymouth is one of the most double flowers that has ever yet been raised, and, like Globe Crimson, full to the centre; and it might be asserted, without fear of contradiction, that it never had been seeded, and was incapable of bearing seed. This was not a matter of opinion, but one of fact; and any misstatement could be easily disproved. He knew an Amateur who, once relying upon this recommendation, had been induced to grow twenty plants for the sake of the seed; but, as might have been anticipated, he was utterly disappointed. Mr. Wildman then detailed the result of his experience (which he admitted was limited) with many of the flowers from which he had saved seeds. So much depended upon accident or circumstances over which we had no control, that it was difficult to recommend one in particular; but seeds from thin flowers generally, however good their style, ended in disappointment,—his Windsor Rival was an example. Constancy in the parent was, he thought, a matter of little moment, provided defective blooms were immediately removed, and none but the best left for seed. Brightness and clearness of colour were desirable, but no dependence could be placed upon the exact colours that might be produced. If fertilization were resorted to, the best blooms, whether occasional or otherwise, from which seed might be obtainable, should be selected, the colours chosen being distinct and opposite, and not compound. To those who would not take the trouble to resort to artificial fertilization, he would recommend that a few of the very best varieties, including one or two that seed more freely, be planted together, apart from all others; the chances then would be far more favourable. Having now fulfilled his promise, and said sufficient to answer the purpose of exciting observations on the part of others more competent than himself, Mr. Wildman concluded by submitting a brief summary for adoption or improvement by the Society. He said that he should only make three general heads, viz., Form, in which was included most of the detail; Colour and Size; he should also at first confine these heads to properties only, stating defects afterwards. 1st, Form.—The outline should be that of about two-thirds of a globe or sphere; the rows of petals forming this globular outline should describe unbroken concentric circles lying above each other with evenness and regularity, and gradually diminishing till they approach the crown. The petals forming these rows should be spirally arranged, and alternate, like the scales of a fir cone; those in each superior row concealing the joints in the rows beneath, and causing the circle to be unbroken and complete. They should be broad at the ends, perfectly free from notch or indentation of any kind, firm in substance, smooth in texture, uniform in size, and evenly and freely expanded in each row, but largest in the outer ones, gradually and proportionably diminishing until they approach the crown, where they should gently turn the reverse way, pointing inwards and forming a neat and close centre. 2d, Colour.—If in a self, it should be dense and clear; if in an edged flower, concentrated and well defined: in both cases it should penetrate through the petal, with an appearance of substance and solidity. 3d, Size, which must be comparative. The following are the defects: In Form.—Want of roundness or of depth, flatness of face, squareness of shoulder, sinking in the centre. In the Rows.—Wide interstices between the petals in each row, or between the rows themselves; broken circles, overhanging each other or diminishing abruptly; want of arrangement, and looseness. In the Petal.—Notches or indentations on the edge, sharp points, angularity, cupping too deeply with wide mouths; abrupt hollows in the face or ribbiness; being too broad, coarse, or overwrapping each other sideways, or being too narrow and guttery, or not touching each other in the rows; quilling, or curling, or showing the back in any manner; curling too much upwards, turning quite back, or being upright in the centre; want of substance, and not concealing the scale. Colour, 2.—Cloudy or mottled, thinly laid on in patches, or in spots, or variable; not being the same at the back as on the face of the petal. Size.—Being below the average, or so large as to be coarse; showing a yellow disk or a hard and scaly centre, cross eye, petals damaged in any manner, blooms dead or decaying. Mr. Wildman concluded by remarking that the object ought to be to obtain freedom without looseness, boldness without coarseness, and symmetry and uniformity without stiffness or formality. Then would our flowers conform to our own conventional usages, and gratify the common as well as the more fastidious observer.

MISCELLANEOUS.

Stephenson's Double Cylindrical Boiler.—We have inspected this Boiler, which appears to be an improvement upon the conical one described at p. 175 of last year's *Chronicle*. Unlike that, the fuel in the present instance is supplied at the top of the dome; but the chief advantage which it possesses is derived from an inner cylindrical boiler, which presents a larger surface to the action of the fire, and serves as a hopper to contain a store of fuel. The inner boiler extends from the top of the dome to within about eight inches of the grating, on which the fire rests; it is connected at its base by two pipes, with the external boiler, with which it also has free communication around the top. There is a space of two inches between the two cylinders, so that the flame acts equally upon both; and it is stated that a more perfect combustion of the smoke is thus attained. As in the conical boiler, the flow-pipe proceeds from the top, on one side of the door through which the fuel is supplied; the return-pipe enters at the bottom, and the pipe for conveying the smoke away is situated on one side. The Double Cylindrical Boiler appears to possess obvious advantages for the tank system of heating lately brought into notice by Mr. Rendle. Being made of copper, its appearance is neat. It can be erected in any part of the building, from which, when not in use, it may be removed at pleasure.

THE NATURALIST'S CORNER.—No. IX.

(Continued from page 24.)

29. *The Wood of the Cypress* tree scarcely ever decays, or is worm-eaten; for which reason the ancients used to make the statues of their gods with it. The imperishable chests which contain the Egyptian mummies were of Cypress. The gates of St. Peter's church at Rome, which had lasted from the time of Constantine to that of Pope Eugene the Fourth, that is to say, 1100 years, were of Cypress, and had in that time suffered no decay. 30. *Diocletian* retired from the throne into his native province, and there amused himself with building, planting, and gardening. His answer to Maximian is deservedly celebrated: he was solicited by that restless old man to reassume the reins of government and the imperial

purple; he rejected the temptation with a smile of pity, calmly observing, that if he could show Maximian the cabbages which he had planted with his own hands at Salona, he would be no longer urged to relinquish the enjoyment of happiness for the pursuit of power.

31. *Alhagi*.—Among the wild plants of the Sabel, or western part of the North African desert, there is, among species of Acacia and the Hedysarum alhagi, or Alhagi maurorum, a thorny plant about 18 inches high, which remains green all the year round, grows in many parts of the Desert in the sand, and is eagerly eaten by the camels: it is almost the only plant that supplies them with food while they are traversing the Desert. Near the most south-western corner of the Sabel are extensive woods consisting of Acacia-trees, from which by far the greatest part of the gum is obtained which in Europe is consumed under the name of Gum Arabic. It is collected by the Moors, and then sold to the French and English merchants in St. Louis on the banks of the Senegal river.

32. *Linnaeus*, one day, when collecting plants with his pupils, covered with his hand a green turf, saying that he had that under his hand whose consideration might justly occupy all of them for a considerable portion of their lives. He verified this assertion by showing that within that space there were thirty-four different species, either of Grass, or Moss, or insects, or animalcules, or varieties of mineral. "How, then," continued Linnaeus, "shall we estimate the total productions of the entire globe, when the little space that my hand covered is found to contain so many various objects?"

(To be continued.)

GARDEN MEMORANDA.

Moredun, the Residence of D. Anderson, Esq.—This place is pleasantly situated about three miles south of Edinburgh, and commands good views of the Pentland Hills, Arthur's Seat, Craigmillar Castle, and several other objects of interest in that neighbourhood. The forcing-houses in the kitchen garden are very extensive, and are managed in a clever manner by Mr. Watson, the gardener. The forcing is commenced earlier here than in any other garden in Scotland with which we are acquainted. There are three vineries and five peach-houses, besides a considerable extent of pits and frames for the growth of Melons and Cucumbers. The first vinery and peach-house have had fires on since the 1st of December, and are both now considerably advanced. The earliest Vines, when we saw them, about three weeks ago, were just showing flower, and the peach-house was then in one mass of bloom. The fruit in these two houses is generally fit for table on the 1st of May; and from that time until the end of the season there is always an abundant supply of Peaches and Grapes in succession. The late Baron Moncreiff, to whom the place once belonged, used frequently to boast, that, from his own garden within a few miles of Edinburgh, he could, by the aid of glass, coal, and a good gardener, match any country in Europe in Peaches, Grapes, Pines, and every other fine fruit, excepting Apples and Pears. The greenhouse, which is placed in a corner of the flower-garden, contains some well-grown Heaths, Epacris, Azaleas, Camellias, and other greenhouse plants. We noticed particularly two splendid specimens of Erica melanthera, about 12 feet in height, and bushy to the ground. The pretty E. hyemalis, with E. colorans, and several specimens of Epacris, were in full flower, and made the house look very gay. The collection of Mammillarias is rich for this part of the country, and contains many pretty specimens. The flower-garden is separated from the other part of the grounds by a fine Holly hedge, about 120 yards long, 9 feet broad at the bottom, and 22 feet high. Such hedges are common in this part of Scotland, where Holly seems to flourish remarkably well. In one of the back sheds, which has been converted into a Mushroom-house, we observed a most abundant crop of this excellent vegetable. Knowing that Mr. Watson was particularly successful in their cultivation, we asked him to explain his mode of management for the benefit of the readers of this paper. The following is his practice. He does not use droppings to make up the beds with, as is frequently done by Mushroom growers, but merely shakes the very long straw out from amongst the dung. Without allowing it to heat, he makes up the beds about 14 inches deep, and puts on the spawn at once. The bed is then beat slightly, and the spawn is covered over about 2 or 3 inches thick with the same kind of dung as was before used. Care must now be taken to prevent the heat from becoming violent, which is easily prevented by trampling or beating down the bed; and when the heat begins to decline, the soil is put on in the usual way, and the whole is beat firmly down. Water is then given when necessary, and the Mushrooms, in about 6 weeks from the time of making up the bed, come up in abundance. Such is Mr. Watson's practice, and when we saw the beds they exhibited the best possible proof of its utility.—R. F.

Reviews.

Doyle's Cyclopædia, Part X., carries the reader to Peat and Potato, two essentially Irish subjects, concerning which we anticipated a good deal of information; nor are we disappointed. In the article on Peat we have the details and results of Lord Clonbrock's experiments in draining the flat red bog of Critt, in the county of Galway. Upon the whole, the cost in this instance seems to have been greater than the advantage, having amounted to 30l. per Irish acre; but in other cases 10l. an acre have sufficed for completing the work. Black bog within two feet of the blue lime gravel seems to answer best; and Mr. Bermingham, Lord Clonbrock's intelligent agent, considers that subsoil draining and gravelling would repay the cost on the wet and dry mountain land which abounds in Ireland, resting on a firm bottom near the surface. In the account of the Potato, a good deal of space is occupied in considering the cause of its failure which has now become so general; but we do not perceive that much light is thrown upon that puzzling subject. More satisfactory are the details of management, from which we make the following extract:—

"In proof of the advantage of complete pulverization we may cite an experiment of Mr. Lyster, of Thurles, in the county of Tipperary. In the year 1836, after planting and managing three acres of Potatoes in the usual way, he employed men at the proper time for earthing, to dig between the rows, and as deeply and finely as possible, from plant to plant, throwing up at the same time with the spade two or three inches of earth to keep the plants steady. The result was, that he had about 190 barrels (20 stone each) to the plantation acre. At the same time he planted half an acre, treated, for the sake

of experiment, in the ordinary way, moulded with the plough, &c., and had only at the rate of 100 barrels per acre in return. The extra cost of labour was 40s. per acre. But he had another counterbalancing advantage from digging well and deeply—three barrels more of Wheat than from the part tilled with the plough in the common way. It must, however, be stated, that the same favourable result did not attend the repetition of this practice in the year 1838, owing, it is supposed, to the great moisture of the season. The plant deriving in consequence a greater proportion of its aliment from the atmosphere, needed not, as in the former year, to penetrate the great depth of land prepared for the ramification of the fibres, if so disposed; yet even in this case, the advantage was sufficient to repay the extra cost. Such and so varied are the circumstances which must combine for the successful culture of vegetables. To lay down general rules is therefore often as unwise as difficult. The result of an isolated experiment should not decide any doubtful question, which can be only satisfactorily solved by the results of a long series of trials."

CALENDAR OF OPERATIONS for the ensuing week.

In the Calendar at page 24 I stated that the Conservatory ought to be in a blaze with forced flowers from the stoves, and I referred to a good list given by Mr. Green for that purpose, at page 149 of Vol. I. of the *Chronicle*, and continued at page 227 of the same. It appears, however, that this volume is not in the hands of all the present readers of the *Chronicle*, as many correspondents have demanded a similar list from me. In supplying the following from my own practice, I would again repeat what I last week said, in reference to collections of plants. Many amateurs seem to think that a large collection is necessary to keep up a constant succession of bloom; but such is not the case. I once had charge of a host of rare plants from all parts of the world, amounting to upwards of 15,000 pot plants; yet out of this mass, I had some difficulty to keep up a respectable appearance in the conservatory, and ladies would often think it lost time to walk through the houses. With only two families of plants (Camellias and Pelargoniums) Mr. Paxton could keep up a constant blaze of flowers all the year round in the large conservatory at Chatsworth, with only one drawback, namely, the want of blue and yellow colours. The latter he could supply all the year round, by beginning with the early Tulips, Narcissuses, Acacias, Calceolarias down to the Yellow Chrysanthemums at the end of the season: the blue colours are not so plentiful. Will some kind practical hand assist me in making out a list of blue flowering plants, that can be bloomed in the conservatory throughout the year; beginning with the forced blue Hyacinths? Although I have thus shown the minimum by which a blaze of bloom may be kept up, I do not of course mean that we should confine ourselves in this way—far from it, as my list for January sufficiently shows. From my own observations, however, when visiting the best-kept conservatories in this country, I know that the effect is often marred by our wish to show the extent of our rich collections, and that we have not yet paid that attention to the due distribution of colours that the subject deserves, both in conservatories and flower-gardens. In our progress towards this desirable result, we should never rest satisfied with our own arbitrary rules of perfection, but consider the goal already attained as forming only a fresh point of departure. To the list of plants in flower last month many others might be added, according to circumstances.

STOVE PLANTS that will flower freely in a temperature of 45° are—*Poinsettia pulcherrima*, *Aphelandra cristata*, *Justicia speciosa*, and *coccinea*, *Eranthem pulchellum*, *Begonia octopetala*, *Spermatoclyon azureum* (sweet), *Phaius grandifolius*, *Euphorbia jacquiniiflora*, *Echeveria gibbiflora*, *Gesnera elongata*, *longiflora*, *lateriflora*, and *mollis*, *Pancratium amomum* (sweet), *Ardisia crenulata* (for its berries).—**ORCHIDACEÆ**.—*Zygopetalum Mackaili*, *Cymbidium sinense*, *Cypripedium insigne* and *venustum*, *Dendrobium nobile*, *ceruleum*, *moniliforme*, and *secundum*; *Epidendrum nutans* and *cochleatum*, *Trichopilia tórtilis*, *Oncidium pubes* and *Cavendishianum*, *Lælia anceps* and *Barkerii*, *Odontoglossum Rossii* and *elatum*.

1.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINEAPPLE.—If the succession plants have been potted early last autumn, they will probably have filled their pots sooner than usual this mild winter, and will therefore require to be re-potted earlier on that account. See that soil, pots, dung, leaves, or tan, are ready for shifting them soon, but do not hurry them by increased heat for that purpose.

VINEY.—As the eyes break, increase the heat a little, and attend to tying and stopping the earliest a joint or two above the bunches; keep a moist atmosphere, which it is not difficult to do this season, as strong fires are not required.

PEACH-HOUSE.—As the trees go out of blossom, increase the temperature to 60°, with plenty of air; regulate the wood-buds by rubbing off those not wanted for leaders or bearers next year. As this work is always done by the principal manager, I need not caution him about displacing the newly-set fruit. The syringe would now be useful, if only to displace the remains of the decayed flowers; but as long as the weather keeps damp this should be avoided, in order that the paint with which the trees have been brushed over for killing the eggs of insects, &c., may not be washed off.

CHERRIES.—These may now have the same temperature as the Peaches. The green and black fly are very fond of the newly-unfolded leaves; see that they do not get ahead. The young leaves are also more liable to be injured with sudden gleams of sun than those of the Peach, and must be guarded against casualties of this kind.

FIGS.—The earliest have now set the first crop of fruit. The shoots must be stopped above the fruit, and the plants well supplied with water, both at the roots and overhead, as the Fig will soon resent any neglect of this sort by casting its fruit.

CUCUMBERS AND MELONS.—I find these plants do better by Mr. Green's method (Vol. I., page 35), and with ten times less trouble than any other plan I have seen tried. We have Mr. Green's plan engrafted on the low Dutch system of pit-houses, where you can walk behind the plants under a slate roof. These low pits are in general use about Manchester and Liverpool, and in no place with more effect than at Knowsley Hall, the seat of the Earl of Derby, see Vol. I. p. 567. We have thus the great desideratum of moist bottom-heat, which we have been aiming at since the introduction of the hot-water-system. Mr. Rendle promises an economical application of this mode, to which I shall allude next week.

MUSHROOMS.—In spawning new beds at this early season, use about double the quantity of spawn that would be thought necessary at a later period; and unless this spawn is of your own making, or that you have already proved it, you had better take some of all the bricks, to have a better chance of its being good. Mushrooms are an uncertain crop at all times, and any little attention we can give to these minor details will lessen our own reproach when disappointment occurs. If the beds are about 70°, and the house 10° less, with a rather moist atmosphere and a good look-out after woodlice or other pests, it is all that we can trust to.

POTATOES.—Keep a constant supply of these in pots for some time to come, and as they begin to grow, or to be drawn up by too great a heat, remove them to better quarters. As they get hardened, plant them out in slightly-prepared hot-beds; except for the earliest crop, no glass will be required. Thick straw mats, to

be thrown over them in frosty weather and at night, will answer very well if they are planted out in turf or other cold pits.

STRAWBERRIES.—Successions of these will be brought into frames and houses according to the means at command; the whole stock for forcing this season should be looked over and placed in some litter at the front of the houses or south walls; if they have not, indeed, been there all the winter.

Out-door Department.

RADISHES and other Salads with Cauliflower-plants must be looked over occasionally, to see that no failure occurs from damp or vermin. Successions of these and of Spinach may be sown at intervals as the weather permits.

ORCHARD.—The Apricot and Peach-trees have now got a most seasonable check without sustaining any injury. No time should be lost in getting them pruned and nailed. Look out what netting, canvass, or bunting you have to protect them with by and bye; and if you are short of these materials, get Spruce-boughs or fern ready in case they should be wanted. These trees seem in a ripe and healthy state this season, and if we do not get wet at the time they are in blossom, a few degrees of frost will do them little injury.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—There is no change wanted in the temperature here yet. The late snow has turned more hands into the houses, and in many places, not before they were wanted. All the plants, pots, stages, and walls, required a thorough cleaning; new labels added to the plants, the climbers trained, &c. If a small portable potting-bench could in bad weather be brought into a corner of this house occasionally, seeds could be sown, plants potted, and cuttings made, and many other little jobs got forward in half the time and with infinitely more comfort for the men and the plants than if they were done in cold, comfortless sheds. The men will not be so liable to catch colds as if they were in and out all day, thus depriving their employers of their labour for some days, after the return of mild weather, when their services are most wanted. Many of the Orchidaceæ that have been kept dry through the winter should now be prepared for a fresh growth, by picking out as much of the dry materials in which they have been growing last year as can safely be done without injuring their roots; all decayed roots should be cut back to where they are fresh. Get the dry pieces of peat well saturated before you add fresh ones, which will save a great deal of watering after potting, and thus soddening the fresh compost, to the injury of the plants. See that the swollen eyes at the bottom of the plants are not much covered. A few additional degrees of heat will then be necessary.

GREENHOUSE.—Slight fires in the daytime, with air, will in many places be necessary to prevent damp while the weather keeps dull, and little watering will be wanted.

CONSERVATORY.—There is nothing more injurious to the blooms in this house than currents of cold, damp air. The Camellias are the first to indicate this; a few of them placed near the ventilators should be your guide, rather than the thermometer, which at best is of little use at any time in this house. As the forced hardy bulbs are done flowering, cut off their flower-stems and remove them to the reserve pit; turn them out of the pots, and plunge the balls in a light moist compost, and protect them in cold weather. This pit does not require glass.

COLD VINEY.—There is another family of real stove plants that will do here all the winter, and will be found very useful for the conservatory for three or four months after midsummer, if they are now removed to the stove, and forced till the end of May. These are the varieties of the *Hibiscus sinensis*, the double red, double buff, and the double fawn-colour; there is also a double white variety, but it is not very conspicuous—the single one is gaudy enough. There is also the *Hibiscus liliiflorus*, with a dozen beautiful varieties from it, all single and free flowerers, one or two as beautiful for summer conservatory plants as any with which I am acquainted; but unfortunately they have no trivial names, and they are difficult to be met with in the nurseries.

PITS AND FRAMES.—After such a mild winter, the plants here are not in a condition to be shut up close during snowy, damp, or rainy weather. All you can do is to give air at the top and bottom of the sashes, preserving the same angle. This is a good time for the florist to take his Auriculas and Carnations to the potting bench, to give them their spring top-dressing, and otherwise assist his favourites by a regular look over top and bottom.

Out-door Department.

Under this head I committed myself seriously last week, by trusting to our country weather prophets; after all they are not to be relied on any more than the almanack-makers. As soon as the lawns get a little dry after the snow, give them a thorough good rolling, and send a careful man round with a barrowful of nice smooth turf. Tell him to pick out all the Cock-foot Grass, Plantains, and any other *tussacks* which disfigure the green carpets, and let him cut off pieces of his fine turves to fill the blanks.

NURSERY AND FOREST DEPARTMENT.

FOREST AND COPPICE.—All that I can think of under this head is, that, where the coppice stools have all been cut down, the soil might be scratched here and there in the open spaces, and Acorns, Sweet Chestnuts, Ash keys, or any other suitable seeds dropped in. If the mice and rabbits should not destroy these seeds, they will come useful at some future period.—*D. Beaton, Shrubland Park Gardens.*

State of the Weather near London for the Week ending Feb. 9, 1843, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 16th in 1831, and 16th and 17th in 1837—thermometer 55°; and the lowest on the 13th in 1838—thermometer 14°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending Feb. 10, 1843.

The late sudden change in the weather has not, as might have been expected, made much alteration in prices. Although

the supplies during the past week have not been large, yet the great quantities of vegetables which were brought in the preceding week have kept the market well furnished. **Fruit**: Pines, which consist chiefly of Queens and Montserrat, have made a trifling advance. Foreign Grapes are well supplied: the Lisbon from 1s. to 1s. 6d. per lb., and White Portugal from 9d. to 1s. per lb. Pears, from their scarcity, are becoming exceedingly dear; the two principal sorts are Beurré Rance and Easter Beurré, both fetching 18s. per half-sieve. Dessert Apples are also somewhat dearer: Nonpareils being from 10s. to 15s. per bushel, Newtown Pippins 3s. per doz., and the American Lady Apple 1s. per doz. We likewise observed a few late Downton Pippins, from 3s. to 4s. per bushel. The Wellington, an excellent culinary Apple, fetches from 4s. 6d. to 5s. 6d. per bushel. A few good Cucumbers are offered, from 3s. to 10s. per brace. **Vegetables**: The price of Asparagus has scarcely varied since our last Report, in consequence of the trifling demand which there is for it. Seakale is of excellent quality, and the best punnets fetch from 1s. 6d. to 2s. each. The supply of French Beans is very limited. Broccoli is somewhat cheaper, the White fetching from 6d. to 1s. 6d., and the Purple from 6d. to 1s. per bunch. Celery is tolerably abundant, and of fair quality, but small, from 6d. to 1s. 6d. per bundle. Endive continues good, and has advanced to 1s. and 2s. 6d. per score. Salading of all kinds is plentiful. Mushrooms, of large size, may be obtained from 5d. to 1s. per pottle. Truffles are offered from 3s. to 4s. per lb. **Flowers**: The cut flowers consist chiefly of Camellias, Azaleas, Rhododendrons, Brugmansias, Amaryllises, Cinerarias, Hyacinths, Anemones, and Tea Roses, with Sparmannia africana, Templetionia retusa, Combretum purpureum, Acacia pubescens and vestita.

PRICES, SATURDAY, Feb. 11, 1843.—FRUITS:—Pine Apple, per lb. 5s. to 8s. Grapes, Spanish, per lb. 1s. Portugal, 1s. to 2s. Apples, dessert, per bush. 3s. to 12s. Kitchen, 2s. 6d. to 5s. 6d. Pears, dessert, per hf. sieve, 2s. 6d. to 12s. Pummelo, per doz., 9s. to 12s. Oranges, per doz., 5d. to 2s. — per 100, 4s. to 14s. — bitter, per 100, 8s. to 16s. — Malta Blood, per doz., 3s. to 4s. — Tangerine, 2s. to 3s. Lemons, per doz. 1s. to 2s. — per 100, 5s. to 14s.

VEGETABLES:—Savoy, per doz. 3d. to 1s. 3d. Cabbage, White, per doz. 2s. to 4s. — plants, per doz. 1s. 6d. to 3s. 6d. — Red, for pickling, 2s. to 4s. 6d. Brussels Sprouts, per bunch, 6d. to 1s. 6d. Broccoli, White, per bunch, 6d. to 1s. 6d. — Purple, 6d. to 1s. Beans, Kidney, forced, per 100, 3s. to 3s. 6d. Potatoes, per ton, 50s. to 80s. — per cwt. 2s. 6d. to 4s. — per bushel, 1s. 6d. to 2s. 6d. — Kidney, per bush., 1s. 6d. to 2s. — Scotch, per bushel, 1s. 6d. to 2s. — New, per lb., 4d. to 8d. Jerusalem Artichokes, per half-sieve, 1s. to 1s. 6d. Turnips, per doz. bun., 1s. 6d. to 2s. 6d. Red Beet, per dozen, 9d. to 1s. Scorzoner, per bundle, 1s. 6d. to 1s. 6d. Salsify, per bundle, 1s. 6d. to 1s. 6d. Cardoons, each, 1s. 6d. to 2s. Horse Radish, per bundle, 1s. 6d. to 4s. 6d. Radish, per doz. hands (24 to 30 each) 9d. to 1s. — Turnip, p. doz. beh., 1s. to 1s. 6d. Carrots, per doz. bunch. 4s. to 6s. — Horn, per bunch, 4d. to 6d. Parsneps, per dozen, 6d. to 1s.

Notices to Correspondents.

BACK NUMBERS OF THE GARDENERS' CHRONICLE.—Numbers still to be had:

1841: 1, 2, 4, 5, 6, 8, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 41, 45, 47.

1842: 1, 4, 5, 6, 8, 9, 10, 11, 12, 16, 18, 22, 23, 24, 39, 41, 50, 51, 55. [Five-pence each will be given for any Numbers not in this List.]

J. M.—We should be sorry to offend you, but still more so to offend good taste, by allowing capacious disputes to take the place of gentlemanly discussion. In our opinion, turmeric-paper is not a good test for ammonia in the hands of persons unaccustomed to its use; nor will it, in fact, under any circumstances, indicate the presence of small quantities of ammonia so well as the excellent method proposed by Mr. Solly. With regard to the other question, we have already done you full justice, and we see no reason for troubling our readers further in the matter. We are not aware that you have any claim to the discovery that carbonic acid will decompose the alkaline silicates; but Wiegman and Poelsdorff have shown that it decomposes even earthy silicates, which the most powerful acids would not affect. If you can claim that discovery, you should send your evidence to some of the chemical Journals.

MANURES.—*A Country Vicar*.—There is no liquid manure better adapted for Pelargoniums than that prepared from cow-dung, as recommended at p. 808.1.—*M. C.*—If you have a tank for liquid manure, let the soapuds drain into it. If you have not, add them to a compost heap, or to a dung-hill. If you have a receptacle for the drainage of a piggery, then the soapuds may be added to that. It matters not at all what is done with them, provided they are added to other manuring substances.

Amateur.—You have gone to a very bad market for your green vitriol. It is not worth above 5s. a ton, instead of 2s. a hundred weight. Where such substances are wanted in quantity they should always be bought of the great wholesale houses, and not in the shops. How much to use will depend on the quantity of ammonia in your manure. You had better ascertain that experimentally: a small quantity only, either dissolved in water or strewn among the manure in fine powder, will suffice. As far as we can make out, your seed, which is crushed to pieces by the letter-stamper, is the Stone Pine, or Pignon, a hardy tree, which will grow in almost any soil that is well drained.

S. C.—Tan rots slowly in the ground, and is by no means suited to plants as a manure till it is quite decomposed; we have seen it, when undecayed, produce very bad effects. If you mix it with cloacine, or any such substance, it will then decay rapidly, and become a good agent; if you burn it, you save the best part, namely, the ashes; and probably this is the most economical mode of employing it, unless you could char it. The action of guano and cloacine is very similar: the former may certainly be substituted for the latter; but the one costs 12l. or 13l. a ton, and the other nothing.—*A Subscriber*.—Gas-lime is too strong to be applied directly to any kind of crop; it should be mixed with 3 or 4 parts its bulk of mould, and applied as a top-dressing or drilled in with seed.—*A. L. M.*—It is very difficult to answer your question. We will make some experiments, and endeavour to give you the result next week.

PASTURE GRASSES.—*G. J. T.*—The best Grasses, and their proportions, per acre, are the following:—

White Clover, 6 lbs. Trefoil, 4 lbs. Cow-grass, 4 lbs. Trit. repens. Medicago lupulina. Trifolium medium. Perennial Rye-grass, 1 peck; Italian Rye-grass, 1 peck; and a mixture of Anthoxanthum odoratum, Poa trivialis, Festuca ovina, and Dactylis glomerata, of each, 1 lb. Let the ground be well prepared, and the surface very fine; sow the three parcels of seed separately; roll the land well; and when the Grasses are up, roll again; when 5 or 6 inches high, feed off with cows or young cattle. Next spring, top-dress with earth or ashes, bush-harrow and roll well, and then put on sheep, and keep it fed off close, and you will have a fine pasture. The seed may be sown in March or August: the latter is the surest.—*M.*

SPADE-HUSBANDRY.—*D. W. S.*—The implements for spade-husbandry are very few and simple. A broad and a narrow long spade, a strong fork with 4 flat prongs, a strong large rake, and

a smaller one, and hoes of different sizes, will be all that is required. A small light one-horse plough and corresponding harrow would greatly assist, leaving sufficient manual labour in bringing the surface to a good tilth, forming regular beds, and keeping the whole in a neat garden-like order; a small light cart is indispensable. Salt may be dug in as an experiment, but we have no great faith in its effects on insects, unless it be put in such quantities as would injure vegetation also. In a very light soil salt used before winter might do some good, and would be washed out by the rains before the seed is sown. The dibbling-machine mentioned in the Journal of the Royal Agricultural Society of England is merely a light wheel with knobs on its circumference to make depressions in the ground in which the seed may be deposited by hand: any wheelwright would make it at a small expense. It would not do the work so well if the distance between the dibble-holes is small. Until some machine be perfected to deposit the seed, as well as to make the holes, the common hand-dibbles will be found the most expeditious and useful. *M.*

HEATING.—*G. A. C.*—Mr. Rendle's Treatise upon the Tank System of Heating is not yet published, as you will find by referring to his Advertisement in the columns of our Paper. — *N. W. G.*—Mr. Rendle will shortly publish a treatise, containing a plan and description of his apparatus for heating. Rogers' is a good and economical boiler. — *H. G. B.*—You had better defer putting up your apparatus for a short period. We shall probably be able to give you some further information in a short time. *t*

HOT-BED.—*Rus.*—There is danger of your young plants being injured by the steam which collects in your hot-bed, unless you take some means to get rid of it. Cannot you tilt the lights at the back of the frame to the height of half an inch? *t*

VINES.—*R. W.*—If you intend to train your Vines upon the spur system, 6 or 8 feet is too great a length to leave them at the winter pruning in the second year after planting. Two or three feet will be sufficiently long for the strongest, and the weak ones should be cut shorter still, in proportion to their strength. *t* — *Perth.*—The Dutch Hamburgh is synonymous with the Old Black Hamburgh. *t*

GRAPES.—*A Gardener.*—If by the New Black Hamburgh you mean Wilmot's New Black Hamburgh, it is a good kind, with larger berries and firmer flesh than the Old Black Hamburgh. The Cannon Hall Muscat is also a good Grape, requiring a high temperature, and producing larger bunches and berries, with a less musky flavour, than those of the Muscat of Alexandria. *t*

PERENNIALS.—*W. G. B.*—The following are good herbaceous perennials for blooming in pots:—*Primula cortusoides*, *Saxifraga oppositifolia*, *Epimedium macranthum*, *Helonias bullata*, *Phlox nivalis* and *setacea*, blooming in April; *Ranonda pyrenæica*, *Dodecatheon Meadia*, *Hotia japonica*, *Cypripedium calceolus*, *Lobelia speciosa*, and *Pentstemon gentianoides* coccinea, in May; *Campanula pyramidalis*, *Silvia Grahami*, *Pentstemon speciosus*, *Lobelia ignea*, *Cypripedium spectabile*, and *Phlox amœna*, in June; *Chelone centranthioides*, *Campanula nitida*, *Lychnis chalcedonica*, double var., *Spigelia marylandica*, *Gentiana septentrionalis*, and *Spiraea trifoliata*, in July; *Silvia patens*, *Campanula fragilis*, *Mimulus Smithii*, *Lychnis Bungeana*, *Amphicome arguta*, and *Nuttallia grandiflora*, in August; *Silvia splendens*, *Pentstemon Murrayanus*, *Campanula garganica*, *Lychnis coronata*, *Isotoma axillaris*, and *Alstromeria tricolor*, in September. Their period of flowering will, of course, depend greatly upon the treatment which they receive. *t*

OAKS.—*H. T. S.*—*Quercus suber* can scarcely be said to be hardy in this country. It is only in favourable situations that it attains to any size. The same may be said of *Q. virens*. We do not know what *Q. virens heterophylla* is. *t*

EVERGREEN OAK.—*Flora.*—No doubt your Evergreen Oak, if headed to within 3 feet of the ground, will shoot afresh; but it would be better to use the knife less freely. If the larger branches were cut back to a well-placed shoot, and the rest allowed to remain unpruned, your purpose would perhaps be answered equally well, and the tree would not present such a mutilated appearance. *t*

IVY.—*A Subscriber.*—We have on former occasions expressed our opinion that Ivy renders a house dry rather than damp, and this has been confirmed by various correspondents, although it has been denied by others. We believe the fact to be this: Ivy may render a house damp by retaining snow in winter, which changes to water, trickles down the walls, and never thoroughly evaporates. But this is a rare occurrence, and may be prevented by beating the Ivy after snow storms, and will only be an inconvenience when houses are built with mud. No doubt, when walls are not of sound brickwork, or of some other hard materials, the Ivy may introduce its roots into the masonry, and thus do mischief, allowing water to run down its branches and to follow them into the crevices where they have insinuated themselves. But in all cases of well-built houses we are convinced that Ivy is beneficial, so far as keeping the walls dry. *t* — *Holcus.*—It is doubtful whether Ivy will naturally attach itself to Larch poles which have received one or two coatings of paint. We should think it would hardly emit roots when placed in contact with the latter, unless the paint was laid on very thinly, and had thoroughly soaked in. *t*

HARDY SHRUBS.—*Chiltern.*—The following are the most showy, dwarf, hardy shrubs. 1. *Pæonia Moutan* and varieties, 1 to 2 ft. high, flowers pink and white, blooming in May. 2. *Berberis aquifolium*, 2 to 4 ft., flowers yellow, March and April, evergreen. 3. *Ribes sanguineum*, 3 to 5 ft., flowers red, April; *R. aureum*, 3 to 4 ft., flowers yellow, May. 4. *Amgdalus nana*, 2 to 3 ft., flowers red, April and May. 5. *Daphne cneorum*, 6 in., flowers pink, May, evergreen and spreading. 6. *Berberis empetrifolia* and *dulcis*, 1 to 3 ft., flowers yellow, May, spreading and evergreen; *Calycanthus floridus* and varieties, 3 to 4 ft., flowers brown, sweet scented, June and July; *Ceanothus americanus*, 2 to 3 ft., flowers white, June and July; *Coronilla émericus*, 3 to 4 ft., flowers yellow, July; *Cotoneaster rotundifolia*, 1 to 1½ ft., flowers white, May and June, evergreen, creeping; *Cytisus purpureus* and varieties, 1 to 2 ft., flowers June; *Cytisus ruthenicus*, 2 to 3 ft., flowers yellow, May and June; *Dedzia scabra*, 3 to 4 ft., flowers white, in June; *Philadelphus hirsutus*, 2 to 3 ft., flowers white, July; *Sparganium multiflorum*, 3 to 5 ft., flowers white, June; *Spiraea arifolia*, 4 to 6 ft., flowers white, August; *Spiraea bella*, 2 to 3 ft., flowers bright red, May and August; *Spiraea tomentosa*, 2 to 4 ft., flower red, June and July; *Syringa Jossikæa*, 3 to 5 ft., flowers purple, June and July; *Hibiscus syriacus* and varieties, 4 to 5 ft., flowers August and September; *Viburnum Tinus*, flowers all the winter and spring, 3 to 4 ft.; *Garrya elliptica*, 3 to 5 ft., produces curious catkins in the winter, evergreen; *Daphne mezereum* and varieties, flowering in the autumn and spring. *t*

UNDERWOOD.—*F. E. C.*—The following ornamental evergreen and deciduous plants may be recommended for planting under trees: common and variegated Holly, *Aucuba japonica*, *Laurus tinus*, *Berberis aquifolium*, *Viburnum opulus* and *oxyococcus*, *Ribes sanguineum*, *Cornus sanguinea*, *Hypocissus androsæmum* and *calycinum*, and *Symphoricarpos racemosa*. *t*

CLIMBERS.—*A Subscriber.*—For a wall with a north aspect you had better procure the following: *Caprifolium gratum*, *Jasminum officinale*, *Periploca græca*, and *Clematis flammula*. *t*

MISTLETOE.—*E. H.*—Ample directions for grafting the Mistletoe will be found at p. 304 of the *Chronicle* for 1842. *t*

CONIFERÆ.—*A. H.*—Animal manures are found to be injurious to Juniperus, Cupressus, Thuja, and similar Coniferous plants, as well as to Abies and Pinus. *t*

CHRYSANTHEMUMS.—*Amateur.*—Some practical directions, which will suit your case, will soon be given for the management of these plants. *t*

ARBUS.—*S. R. E.*—If you intend to remove your large *Arbutus* this spring, it should be done immediately, and with the greatest care. It would, however, be much better to defer its removal until the autumn, on account of the easterly winds which we

may expect in March, from whose drying effects it will be hardly possible to preserve your plant, when newly removed. *t*

BERBERIS OLUM/CRÆ.—*A. H.*—This will succeed in any common garden mould: your plant probably does not like the peaty soil in which it is grown. *t*

CYDONIA JAPONICA.—*A. H.*—It is stated that this plant blooms freely on a north wall, and certainly it ought to do well on a wall with a west aspect. The soil in which it is growing must either be bad or very damp. *t*

MADIA SATIVA.—*N. W. G.*—This is an annual, and has not an English name. Seeds of it may be procured of the nurserymen. *t*

FUCHSIAS.—*A. H.*—The following sorts, in addition to those you possess, will be the most likely ones to stand out in the open ground with slight protection: *F. cónica*, *gracilis*, *globosa* major, *formosa elegans*, *Clintonia*, and *Thompsonia*. *t*

RHODODENDRONS.—*A. H.*—With *R. strictum* we are not acquainted. *R. barbatum* is at present scarce, because it is difficult to propagate. *t*

ACHIMENES LONGIFLORA.—*J. L. S.*—This plant has been repeatedly advertised in our columns; it may be procured of any respectable nurseryman. We cannot undertake to name the price of such things. *t*

OXALIS BOWEI.—*Forst.*—You have done wrong in turning out of the pot the plant of *Oxalis Bowei*, which you received in a growing state. If it had not bloomed, it should have been kept growing; but if it had flowered, water should have been gradually withheld, until the plant was brought to a state of rest. There is no difficulty in making it bloom. The bulbs should be potted 5 or 6 in a pot, in sandy peat and loam, and should be placed in a warm frame until they have each formed several leaves, when they may be removed to the greenhouse, where they will continue to flower for a length of time. *t*

TREE-VIOLET.—*D. W.*—The tree-Violet is a semi-double flowering species; it may be procured of most nurserymen. For an account of its treatment, see p. 73 of last week's *Chronicle*. *t*

CONSERVATORY CLIMBERS, &c.—*Rus in Urbe.*—We really despair of your being able to get any shrubby or climbing plants to do well in the situation you describe, "in the vicinity of Regent-street, with a north-east aspect, where the sun never reaches summer nor winter." You may, however, try the following, which you can procure for a trifle in any respectable nursery: *Climbers*—*Kennedia monophylla*, *Cobæa scandens*, *Eccremocarpus scaber*, *Ipomœa Learii*. *Shrubs*—*Pimelea decussata*, and *hispida*, *Chorozema varium*, *Correa pulchella*, *Hovea Celsi*, *Cytisus rhodopneæ*, *Acacia vestita*, *pulchella*, and *armata*; *Cinerarias*, *Tea-scented* *Roses*, *Chinese Primroses*. The above are strong-growing things, and will do if anything will. We should imagine that Ferns would also succeed well. We cannot recommend any nurseryman in particular. *t*

SEEDS.—*J. L. S.*—All the seeds contained in your list will be benefited by being raised in a gentle heat. *t* — *C. R. D.*—The seeds which you have received from the Cape had better be sown on a gentle hot-bed. You will find good practical directions for sowing seeds in the *Calendar* of last week. *t*

LEUCADENDRON PLUMOSUM is a Proteaceous plant, *Echium feroissimum* a Boraginaceous plant, and *Aristea major* an Iridaceous plant. *t*

ROSES.—*J. N. V.*—We doubt whether it is possible for gardeners, who are now only beginning, to get Roses ready for showing in pots sooner than 1844; by that time, however, they may be quite prepared: and therefore we would advise you to offer your premium for that year. As to the conditions to be imposed, we hardly know what to advise until the practice shall have begun. You might distinguish two classes of Roses: climbers, and not climbers; and you might separate the Moss Roses from others. We think, however, that it would be as well in the first instance to offer your prizes merely for a defined number of Roses in pots, leaving the growers to suit their own skill or convenience. *t*

CHILDREN.—The following are good Roses for planting out in a border upon their own bottoms: *Moss*—*Blush*, *Crimson*, *De Meaux*, and *Common*. *Provence*—*Old*, or *Cabbage*. *Blush*—*Maiden's* and *Celestial*. *Hybrid*—*George IV.*, *Globe*, *Whit-thep*, and *Village Maid*. *China*—*White Sweet-scented*, *sanguinea* and *common*, for flowering in the autumn. *t*

AURICULAS.—*A Country Vicar.*—Auricula seed is usually sown directly after it is gathered. It should be sown in a well-drained pot, in a mixture of loam and leaf-mould; and the seeds should be covered as slightly as possible with soil. The pots should be placed in a cool frame and kept shaded until the young plants make their appearance. As soon as the seedlings are large enough they should be pricked off, about 2 inches apart, in pans or wide-mouthed flower-pots, and gradually hardened off. If you have any seed by you, it had better be sown towards the end of this month. *t*

MELONS.—*S. C.*—The Beechwood Melon, although not so large as the Rock Cantaloupe, is, in our opinion, when well grown, superior to that variety. The rind is thinner than in the generality of Melons, a quality which the Rock Cantaloupe cannot lay claim to. *t*

POMEGRANATE.—*S. C.*—The soil best suited for this plant, when trained against a wall is a mixture of turfy loam and peat, well drained with broken bricks or lime rubbish. *t*

PEARS.—*B. C.*—The following Pear-trees, proper for being trained as standards with the branches downwards, will, in addition to those you already possess, afford a succession of fruit. *Dunmore*, *Fondante d'Automne*, *Thompson's*, *Glout Moreau*, *Hacon's* *Incomparable*, *Winter Nelis*, *Ne Plus Meuris*, *Easton Beurré*, and two of *Beurré Rance*. *t*

A New Subscriber.—As regards the future success of the trees, or the quality of their fruits, it is immaterial whether you obtain plants of the *Chau-montel* and *Duchesse d'Angoulême* from Jersey or from the nurseries in this country. It rarely occurs that the flavour of either of these varieties, when grown in this climate, is equal to that of the Jersey fruit. You will find the *Marie Louise* and *Hacon's* *Incomparable* preferable. *t*

PLUMS.—*A New Subscriber.*—There is perhaps no variety of Plum more luscious than the *Green-Gage*. *t*

FILBERTS.—*A Young Gardener.*—As your object is to have dwarf Filbert trees, that would of course have been best attained by heading down the main stems to within a foot or 18 inches of the ground. One clear stem is generally to be preferred; and in your case more than four ought not to have been retained. In your confined situation, with a high wall on one side and a Quick hedge on the other, you can scarcely expect that Filbert-trees will bear near the ground; and, therefore, by not cutting down lower than four feet, they will probably bear sooner than if they had been cut lower. You can try the effects of root-pruning next autumn; and you can clear away suckers, without removing the trees, by means of a proper suckering iron. *t*

CANKER.—*Allingtonian.*—Having taken due precautions in draining your soil, all you can do with your trees which now begin to canker on reaching the clayey subsoil is to remove them in autumn, and replant them; taking care that the roots are spread out near the surface. Shorten the shoots at Midsummer, and the portion left will become better matured. Let all cankered parts be cut clean away, and let the wound be covered with clay. *t*

PEAS.—*Allingtonian.*—The largest Pea in the pod is the *Milford Marrow*. *t*

FRENCH BEANS.—*A Gardener.*—The dwarf Red-speckled and *Fulmer's* *Early* are both good kinds for forcing. *t*

BELGIAN CARROTS.—*E. A. C.*—The beginning or middle of March, according to the season, is the proper time to sow the Belgian Carrot; 4 lbs. per acre is sufficient, if the seed is good. The seed should be mixed with moist sand ten days or a fortnight before sowing, and repeatedly turned, then drilled in rows 18 inches apart, and slightly covered by a bush-harrow. The ground should have been trenched, clean, and in good heart, but not manured for the Carrots. They should be kept very free from weeds in their first stage, by hand-weeding, and afterwards thinned out to a foot apart, by pulling out the smaller, which may be given to cattle. *M.*

ARTICHOKE-LEAVED LETTUCE.—*B. C.*—We are not aware that the Artichoke-leaved Lettuce can at present be obtained in this country. *t*

RED SPIDER.—*R. W.*—Your *Cianthus* is infested with the red-spider, to whose attacks it is extremely liable. You will find a moist atmosphere, and an occasional syringing on fine mornings, to be the most efficacious remedy in destroying these insects. *t*

BOOKS.—*M. Ryde.*—There have been some useful treatises upon land-surveying published by Mr. Bell, in Chambers' Educational Course, which we advise you to procure. *t* — *G. I.*—If you will consult the Advertisement, you will see who the Booksellers are of whom the Horticultural Society's Catalogue of Fruits can be procured. — *Alpha.*—Rogers' Vegetable Cultivator is the best. *t*

HORTICULTURAL SOCIETY'S GARDEN.—If a *Young Gardener* is desirous of obtaining admission as a workman into the garden of the Horticultural Society, he must obtain the recommendation of a Fellow of the Society. If the authorities at the Garden appointed for the purpose of testing his abilities were satisfied with him, a young gardener would be received in two or three years from the time of his application. *t*

EXHIBITIONS.—*P. M.*—Any person, whether a member or not of the Horticultural Society, can exhibit at the meetings in Regent-street. The articles for exhibition must be addressed to 21, Regent-street; and it is requisite that they should be in the room three hours before the hour of meeting. The days of exhibition are always recorded above the leading articles in our Paper a week or two previously to their taking place. *t*

LAWNS.—*J. J.*—Hand-weeding or constant mowing appear to be the only probable means of eradicating the *Chrysanthemum leucanthemum* from your grass-plot. *t*

LOCOMOTION OF PLANTS.—*J. K. S.*—Perhaps the explanation we gave is not clear. What was meant was this; that many underground stems seem to move upwards, in consequence of their new stems growing upwards, while the old one dies, and is left behind. It is difficult to make this plain without a drawing; perhaps, however, the following illustration may be intelligible. Let a cube *a* be buried 3 inches underground; suppose it produces on its upper side another cube *b*, and that *a* then dies; it is clear that *b* will be nearer the surface than *a*; in like manner let *b* produce *c* from its upper end, and then die; it is clear that *c* will be nearer the surface than *b*; and so on. This is the general cause of the apparent locomotion in underground stems. *t*

FAMILIAR BOTANY.—*Une entre Mille* reproaches the author of the articles under this name with his neglect of that gentler sex which sees nothing pleasant in manures, although they be redolent of high rents. She says that she, with many more, would appeal to him as a man of good feeling, whether it is fair, week after week, to disappoint those who think his papers the best vindication of Botany from the charge of being a musty science. We therefore print this as a memorandum for our lazy correspondent, with whom, if he were not our very particular friend, we should be ready to quarrel, for thus disappointing our readers, and exposing us to the danger to be apprehended from a young lady, who describes her temper as being impatient, and who will not be denied. *t*

COTTAGE GARDENS.—*E. Johnstone.*—We will attend to this subject shortly. *t*

WARD'S CARES.—*A. H.*—An improvement has been made in these latterly in the form of a small door, by means of which dead leaves, weeds, &c., can be extracted. Seeds will vegetate freely in Ward's Cases. If the plants which they contain are kept in a constant state of excitement, they will continue to put forth leaves until they are entirely exhausted; but where a due period of rest is allowed, a deciduous plant will shed its leaves at the proper season. We doubt whether such bulbs as *Nerine* and *Cyrtanthus* would succeed in them; but if a proper season of rest were given to *Cypripediums*, *Satyriums*, and other terrestrial Orchidaceæ, they would probably thrive in such a habitation. *t*

MISCELLANEOUS.—*A Constant Reader.*—No. 1 of your Moths is *Sphinx Ligustri*; 2 is *Plusia gamma*, described and figured at p. 52 of the *Chronicle* of last year. We cannot possibly undertake to name Cryptogamic plants, unless they have some known importance in rural economy. *t* — *G. A. C.*—There is a yellow *Cineraria*, called *C. tussilaginis*. *t* — *J. Buchus.*—The yellow-berried Elder may be procured of any nurseryman. You will find, by referring to the "Notices to Correspondents," in last week's paper, that your question respecting the *Chasselas* Grape is answered. *t* — *A Lady.*—We regret that we are unable to give you the information. *t* — *S. C.*—It is irregular for Fellows of the Horticultural Society to procure plants or seeds for others, if they are in the habit of procuring them for themselves. *t* — *Devonian.*—We are not acquainted with any variety of Apple one-half of which is sour and the other sweet; but the thing is possible. You will find some speculations concerning such matters in p. 396, 1841. *t* — *M. W. K.*—Your *Camellias* were so much crushed when they arrived, that two of them only can be identified. 2 is *C. Colvilli*, and 3 is *C. imbricata*. *t*

R. W.—Your *Epacris* is the true *E. impressa*. *t* — *P. O. B.*—Your *Acacia* is in too young a state to be recognised; it is probably *A. melanoxylon*. The other plant is *Ruscus androgynus*, which is far from being so rare as you suppose. *t*

H. Hunt.—The only part which appears to be new about your flower-pots is the raised bottom of the saucer, with holes in it. *t* — *A Dublin Subscriber.*—Your seedling *Fuchsia*, called *Eliza*, is more remarkable for singularity than beauty. In consequence of length of flower it resembles *F. fulgens*; but in consequence of the tube being of equal thickness throughout, it is less elegant than that species. In this respect, and in the form of the leaves, it approaches *F. cordifolia*. *t* — *S. C.*—The proportions in which Linseed-oil and bees'-wax are mixed in preparing calico has already been stated at p. 36 of this year's *Chronicle*. *t* — *D. H. B.*, *Bristol.*—5d. each for all Numbers not in the list. *t* — *J. G.*—Your Apple is the *Shustoke* *Pippin*. *t*

J. J.—Your Apples are—2, *Court of Wick*; 3, *Beachamwell*; 1 and 4, *Dutch Mignonne*; 5, *French Crab*; 6, *French Russet*; 7, *Minchal Crab*; 8, not known; 9, *Hall Door*. *t* — *Curcener.*—Your Pears are, 1, *Black Worcester*, 2, *Easton Bergamot*. *t*

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE Overland Mail arrived on Monday, with accounts from India to the 2nd ult., and from China to the 19th Nov. The Indian news announces the arrival of the troops at Ferozepore, and the consequent completion of the evacuation of Jellalabad. Their route through the Punjab was unattended with difficulty or obstruction, but the troops suffered much from sickness, and many serious differences arose among the officers during the march. The chief topic of discussion in the Indian papers is the proclamation of Lord Ellenborough respecting the sandal-wood gates of the Temple of Somnauth, which appears to have been received with astonishment in all parts of our Eastern empire. Even the journals which have uniformly advocated the policy of the Governor-General declare that from one end of India to the other it has been made the subject of the severest censure. — From China we learn that the last division of the fleet with the Plenipotentiaries returned from the Yang-Tze-Kiang river to Chusan on the 17th Oct., and that, before leaving

Nankin, the Chinese Commissioners gave an entertainment to the British officers, during which the most friendly feelings were manifested on both sides. The Emperor had issued various decrees remarkable for the absence of the usual expression of dislike to foreigners, and for the acknowledged wish to maintain an "everlasting peace." Negotiations are to be commenced for the purpose of settling the details of our future commercial arrangements, and it is said to be the opinion of the Viceroy, that the Americans and other foreigners will henceforth be admitted to the same privileges as those conferred upon the British by the recent treaty.—From France we have the important intelligence that the debate on the Address in the Chamber of Deputies has terminated in favour of Ministers by a large majority. In the discussion of the paragraph on the Right of Search, M. Guizot repeated the declaration he had previously made to the Chamber of Peers, that he would not negotiate for the abolition of the existing treaties with Great Britain; and in spite of all the clamour raised against the treaties by the press, no amendment was moved, and the Address was consequently passed without modification.—The accounts from Spain are by no means satisfactory; the dispute with France respecting the conduct of the Consul at Barcelona is still unsettled, and the affairs of that city have again become so threatening, that it has required extraordinary precautions on the part of the Captain-General to prevent another outbreak.—Few circumstances in our Foreign News have occasioned more surprise than the announcement of a fact in relation to the late treaty with the United States, which the daily papers of all shades of politics, denounce as a diplomatic fraud unexampled in modern history. It appears that a map was discovered at Paris about two years since, on which the boundary so long in dispute between this country and the United States was marked by no less a person than the celebrated Dr. Franklin. This document proves that the United States never had the slightest shadow of a right to any part of the territory in question, and that the line of boundary claimed by Great Britain actually fell short of that which Dr. Franklin laid down as the limits of the two countries, as settled by the Plenipotentiaries of 1793. It appears also that Mr. Webster, during the negotiations with Lord Ashburton, had this map in his possession, unknown, of course, to the British Ambassador, while he solemnly assured his Lordship of his conviction that the framers of the original treaty intended that the line should be carried to the north of the St. John.

At home, the proceedings in Parliament have hitherto been confined chiefly to notices of motions, and to incidental conversations on topics which will hereafter become the objects of more formal discussion. Among the Ministerial announcements, the most important have been the declarations of Sir R. Peel that no further change in the existing Corn-Law is contemplated at present, and that it is the intention of Government to propose a measure for Church Extension. For the details of these proceedings, and for the particulars of a debate on Lord Ellenborough's Proclamation, we must refer our readers to our Parliamentary Report.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, continue at Windsor Castle. Her Majesty and the Prince have taken their usual daily promenade in the Home Park, and the Prince has occasionally hunted with his pack of harriers. Yesterday being the third anniversary of Her Majesty's marriage, Her Majesty gave a dinner party and concert at Windsor Castle in honor of the event. It is understood that early in the approaching season it is the intention of the Duke de Montpensier, son of the King of the French, to visit this country, and stay about three weeks. The Lord Chamberlain has appointed Mr. G. Marton, M.P. for Lancaster, and Mr. Neeld, M.P. for Cricklade, to be gentlemen of the Privy Chamber in ordinary.

Church Preferment.—The Bishop of London has appointed the Rev. Thomas Dale, vicar of St. Bride's; the Rev. Lancelot Sharpe, rector of Allhallows Staining; and the Rev. Henry Soames, to prebendal stalls in St. Paul's Cathedral.

Foreign.

FRANCE.—The debate on the Address which was carried on with so much party animosity in the Chamber of Deputies at the date of our last accounts, closed on Friday, by a majority of 278 votes in its favour over 101 dissentients. Notwithstanding the numerous amendments moved for the purpose of compelling M. Guizot to negotiate with England for the abandonment of the Slave-trade treaties, not a single Member of Opposition persisted in calling for a division on the paragraph respecting the Right of Search; and after all the violence of language which had been employed both by the Press and in the House, the firmness of the Minister in refusing to negotiate was completely successful. The paragraph, as drawn up by the Commission, passed the Chamber unanimously on Thursday evening. There have been few instances in the modern history of France in which a Minister has been more distinguished by his frank and manly position

on a question of serious consequence to Europe, than M. Guizot has been during the whole of this debate. Though standing almost alone, he declared not only that he would not negotiate, would not promise or pretend to negotiate, but that he considered a good understanding with England indispensable to the welfare of France. He declared that the animosity created by the treaty of July was not so universal or profound; and that, in spite of journalism and party rancour, there still existed abundance of amicable sentiment on both sides of the Channel, which might re-cement the alliance between the two nations. He contended that there existed no chance that a new negotiation with England for the revision of those treaties would be attended with success, and that such a negotiation would, as he had already stated in the House of Peers, end in an act of weakness or folly. For his part, he should not take the initiative of such a proposition, until he believed with sincerity and with a deep conviction that a negotiation of the kind might obtain a favourable result. He afterwards vindicated himself against the charge of having made too many concessions to England, and mentioned several instances in which he had resisted her pretensions. He admitted, however, having done a great deal to maintain his country on good terms with England, because he was intimately convinced that the Government of Great Britain, the Parliament, and the whole nation, bore no ill-will to France; that, on the contrary, they professed the highest esteem for her, and were animated with a sincere desire of continuing at peace with her, and that it would require real events, and not mere newspaper articles, to impair that good feeling of England towards France. France, besides, was particularly interested in maintaining those good relations, if she wished to avert the formation of a new coalition against her. Such a friend and ally was indispensable for France. England required no sacrifice as the price of her amity. (M. Garnier Pages, a deputy of the Opposition, here stood up, and exclaimed, "This is an English speech!" A great tumult ensued. The Conservative members loudly demanded that M. Garnier Pages be called to order, but the President took no notice of the clamorous invitation.) M. Guizot continued,—I think that I have said nothing that cannot be avowed by the best Frenchman. He then proceeded to show that his endeavours to re-establish the good relations between the two countries had been crowned with success. Thus he had concluded conventions on matters which had ever presented insuperable difficulties. He had adjusted the long-pending affair of Portendic, and signed with England a Post-office convention, another convention relative to extradition, and a fourth concerning the fisheries on the French coast. The British Ministry, he would say, had evinced throughout a spirit of moderation, good-will, and equity, which had greatly facilitated the issue of the negotiations. M. Guizot then concluded by declaring that the Government would not consent to open any immediate negotiation for the revision of the treaties of 1831 and 1833, nor accept a mission which he considered contrary to the honour and well-understood interests of the country.—The address having been carried, it was presented to the King in the usual course; His Majesty, in his reply, took no notice of the paragraph respecting the Right of Search, nor of any point which had been the subject of so much angry discussion; but simply thanked the deputies for their sympathy in his late bereavement, and for their concurrence in strengthening the public institutions, and expressed his hope for their support in insuring to the country the enjoyment of all the blessings of peace and order.—The Minister of Marine, Admiral Duperre, has resigned his office on account of ill health, and has been succeeded by Admiral Roussin.—Rumours of a fresh misunderstanding with Spain were current in Paris, and the Funds fell in consequence, in the beginning of the week. Many of them, however, have proved to be pure inventions. The state of the relations between France and Spain at this moment is not satisfactory, but there exists nothing that would justify an expectation that the difference which has unhappily arisen will terminate in hostilities.—There is no miscellaneous news, if we except the announcement that our countryman Mr. McCulloch has been elected a foreign associate of the Academy of Sciences, in the room of M. de Sismondi, the historian. The accounts from Algiers state that Abd el Kader has again made his appearance, and is exciting the Kabyle population to revolt.

SPAIN.—We learn from Madrid that a great effort was being made to effect a union of Absolutists, Moderados, and Republicans, to turn out the present Ministry, and thereby prevent the consummation of a treaty of commerce with England. A letter of the 28th states that Don Francisco de Paula would offer himself as a candidate at the ensuing election at Saragossa with every chance of success. The dispute with France in regard to the affair of M. Lesseps has assumed a more serious aspect, and it is said that the Regent has received such strong proof of the Consul's connexion with the late insurrection that he refuses to comply with the demand of France for satisfaction. The accounts from Barcelona are of the 28th ult. They state that great irritation prevailed in that city, and but for the precautionary measures adopted by General Seoane, another and more desperate revolt would have taken place. The last delay fixed for the payment of the extraordinary contribution having expired, and little more than one third of it having been actually paid in, the Captain General, as our readers are aware, had recourse to rigorous means to conquer the obstinacy of the inhabitants, but which equally failed to produce the desired effect. On the 26th, the General, apprehending an explosion, issued a bando, denouncing death against every individual who, by their speeches, writings, or even by songs, should

excite the people to revolt. Notwithstanding the menacing attitude of the military authorities, the agitation continued to increase. The soldiers quartered on the 200 wealthiest inhabitants were hooted wherever they appeared, and the people had in several instances removed the numbers from the fronts of the houses in order to annoy the military. On the 27th the 25 alcades who had been summoned by the Governor to accompany the soldiers to the houses, having declined performing that duty, had been arrested and confined in the citadel. But, after detaining them for two hours, General Seoane, dreading the consequences of this act of violence, ordered them to be set at liberty. The provisional deputation, on the other hand, positively refused to assess the ordinary taxes, grounding their objection on their not having been voted by the Cortes. That body even intended to leave Barcelona, to settle at San Felin de Llobregat. M. Kock, a rich and influential citizen, who had soldiers billeted on him for eight days, was arrested on the 27th and conveyed to Montjouch for refusing to pay his quota of the contribution. The journalists, reassured by the declaration of the military commission, which declared itself incompetent to try offences of the press, commented in the most hostile manner on all the acts of the Captain-General, and even openly attacked the Regent himself. The *Papagayo*, one of the most violent organs of the Opposition, having reappeared on the 25th, the police notified to its Editor that he would be shot if he published another Number. Extreme measures were likewise in contemplation against the *Constitutional and Impartial*; and General Seoane, it was said, had threatened to seal up their presses. The last accounts add, that the exasperation of the public at the forced contribution, and the manner in which it was levied, was nearly at its crisis, and that deplorable occurrences were expected to take place. Some persons imprisoned for non-payment of their proportions of the contribution were set at liberty as a measure of precaution.

PORTUGAL.—We have accounts from Lisbon to the 30th ult. The Minister of Finance read the annual report to the Chamber on the 28th, which was accompanied by several projects of law, one of which is a loan of 900 contos on the tobacco revenues of the next three years; with which he states that he shall be able to pay off all the engagements due on the revenue and customs duties for the current year. The Portuguese government, it is stated, had not been consulted upon the last offers sent home on the tariff question, and it is therefore considered still possible, that some arrangement may be made, should the views of our government, in some degree, be approximated to those of the Portuguese.

BELGIUM.—Letters from Brussels state that the Louisa Maria, which is to carry the first settlers to Central America, on account of the Belgian Colonisation Company, will leave Ostend between the 10th and 15th of this month. The last census of the population of Brussels makes the total amount 110,760, not including the garrison, the military school, and the patients in the hospital.—The Chamber of Representatives on the 1st inst. sanctioned the treaty with Holland by a majority of 77 to 8.

GERMANY.—The *Austrian Observer* announces the arrival at Trieste on the 22d ult., in good health, of the Archduke Frederick of Austria on board the frigate Bellona, which sailed from Spithead on the 1st ult.—Letters from Berlin state, with great satisfaction, that the *Leipzig Allgemeine Zeitung* will be again allowed to circulate in Prussia after Easter. It is said that the Editor will be more cautious in future, and that satisfactory promises to this effect have been made.

ITALY.—A letter from Rome of Jan. 23 informs us that the cold is continually increasing, and water was then freezing not only in the streets, but even in the interior of the houses. It alludes also to the late eruption of Mount Etna, and states that it has been constantly observed that severe winters at Rome have been coincident with volcanic eruptions at Naples or in Sicily. The members of the Academy of St. Luke, at Rome, elected at their last meeting Mr. Barry, the architect of the new Houses of Parliament, as one of their members. Rome is crowded with English; lodgings are enormously dear, and the Protestant chapel is not sufficiently large to accommodate its numerous congregation. It is expected that when the influx of strangers arrive for the forthcoming carnival, they will meet with the fate of some recent travellers to Naples, who were compelled to drive out to the Campagna for apartments. Our countrywoman, Miss Clara Novello, is the prima donna of the Tordinona theatre this season; she was not altogether successful on her first appearance, but she has since so completely captivated the Roman audience, that on her benefit night they escorted her to her lodgings by torchlight, and continued in the street cheering her with *vivas* until daybreak.—A pack of fox-hounds, belonging to Lord Chesterfield, is daily expected in Rome, from England, to hunt the Campagna. Horses are expected from Florence; and his lordship, it is said, is determined to show the Roman citizens the sports of English country gentlemen!

RUSSIA.—The treaty of commerce between Great Britain and Russia, alluded to in the Queen's Speech last week, has just been published. The general purport of the articles (which are 16 in number) is to secure for the vessels of both nations reciprocal privileges and immunities. Thus the ships of Great Britain, on entering or departing from any Russian port, will not be subjected to higher duties than those imposed on Russian ships; whilst in return, the latter, on entering our ports, will be treated as if they were British. Also, British and Russian vessels arriving from other countries than those of the contracting parties are to be admitted on payment of the same duties as would be required of them by their respective nations. And, generally, the vessels and sub-

jects of the two nations are to enjoy all the privileges in either country to which they would be entitled in their own.—The St. Petersburg papers contain a detailed official report on the loss of the Engermanland, ship of war, on the Norwegian coast, which was fully noticed by us at the time. From it we learn that the *Gottenburgh Journal*, from which the first account of this misfortune was translated into the other journals of Europe, did not state the particulars correctly, but gave them merely as they had been collected from rumour. The crew is now acquitted of every kind of blame in the affair. The Commission appointed to try the case laid down the following questions for solution:—"1. Was the loss of the ship occasioned by the commander's non-observance of the naval rules? 2. After the ship sprung a leak, were all the proper measures for saving her and the crew adopted? 3. Has the captain been guilty of the offence of abandoning the ship? 4. Did the conduct of the officers and the behaviour of the crew correspond in all respects with their several duties?" The report states that, "In respect of the first question, neglect of the nautical regulations can by no means be laid to the charge of Captain Tresskin, and the loss of the ship can be attributed only to an unfortunate accident. On the second question the answer was unanimous, that all had been done that it was possible to do in such a case. With respect to the third question, it was also the unanimous opinion of all the officers and crew, that the captain, when he fell overboard, did not leave the ship voluntarily. To the fourth question it was replied, that all the officers of every rank, and all the crew without any exception had completely performed their duties, and that the commission could not fail to observe with satisfaction the very remarkable maintenance of discipline, of which similar cases seldom afford example." The report contains a list of the crew, from which it appears that 503 were saved and 389 drowned.

TURKEY.—Letters from Constantinople of the 17th ult. have been received. They are chiefly occupied with two innovations, which may almost be called events in Turkey, so great is the surprise they have created. The first occurred on the occasion of the procession of the Sultan in the Courban Beiram from the Seraglio to one of the principal mosques. That ancient palace, more especially at the time of religious ceremonies, when occupied by the Sultan, is guarded with extreme jealousy by Mussulmans, the available troops of the capital being gathered around it for its ostensible protection, and at no former Beiram was any Frank ever known to have entered within its walls. At the opening of the Beiram just concluded, and when a vast population thronged the vicinity of the imperial entrance to witness the procession of the Sultan at sunrise, Sir S. and Lady Canning, in an English carriage, with postillions and outriders, drove up to the archway, and, after a countersign had been exchanged, at once entered the palace with every observance of military honours. The second innovation took place in the Imperial Palace: the Sultana Valedé (mother of the Sultan) having heard much of the Italian Opera, expressed a desire to witness a representation. A small theatre was therefore erected in the Palace, and the director of the Pera Opera was ordered to prepare *Belisario* for the gratification of the imperial harem. This opera was selected from its connection with the ancient history of Constantinople. The representation took place with the full *dramatis personæ* and orchestra, in presence of the Sultana mother and all her ladies, together with many others belonging to the harem; the whole, in consequence of the presence of the male performers, were veiled. The libretto had been translated into Turkish, by our countryman, Mr. Churchill, so that the ladies who could read were enabled, in some degree, to follow and comprehend the story, though they could by no means comprehend the shakes, quivers, and embellishments of the artists. One lady was said to have been so much moved at the fallen state of the blind hero that she burst into tears, and, after exclaiming "Allah, Allah, who can refuse charity to such great misfortunes?" threw her handkerchief, with some piastres, at *Belisario's* feet.—The Servian affair appears to be abandoned by Russia as an accomplished fact, which it would be imprudent to disturb. The nomination of the Walachian Hospodar has produced no sensation in the Turkish capital. The departure of the Persian boundary commission for Erzerum had been delayed by the indisposition of Captain Williams, who, it was hoped, would be able to proceed on his voyage to Trebizond in a few days.

INDIA.—The Overland Mail arrived in town on Monday, with accounts to the 2d ult. The two armies of Candahar and Jellalabad had arrived on the 2d at Ferozepore, and the evacuation of Afghanistan has consequently been completed. The Governor-General, with the Commander-in-Chief, and a portion of the army of reserve, was present at Ferozepore to welcome them. The honour of priority of entry was given to Sir R. Sale's "illustrious garrison," as a reward for their defence of Jellalabad. At one end of the bridge over the Sutlej, a pavilion had been erected, where Lord Ellenborough stationed himself, with his secretaries, while the troops passed. He raised his hat and bowed to Lady Sale, and some other ladies on elephants, who led the column. On General Sale crossing, the Commander-in-Chief rode up and shook him warmly by the hand. The march through the Punjab was effected without difficulty or obstruction, but so hurriedly that it is said to have rather resembled a retreat than a retirement from a conquered country. Sickness prevailed to a great extent among the men of Colonel Wild's brigade during their progress; dysentery, carried off numbers daily, and disabled the majority of the force. When they left the encampment at Peshawur 400 were in hospital, seven days after the number had increased

to 1,000; the other brigades did not escape; the 2d sometimes averaging 100 sick men per regiment, and in the 4th small-pox was very prevalent. The rivers of the Punjab were crossed without trouble—three of them being provided with pontoon bridges. The Sikhs appear to have behaved in a civil and orderly manner, and to have brought in provisions for the force, which they disposed of at reasonable rates. Many and frequent differences arose between the officers of the force during the march; and it excited general regret that those who had fought so well together should disagree while returning from the scene of their exploits. The old jealousy between Generals Pollock and Nott appears to have revived; as General Nott tendered resignation of the command of his division, which, however, the Commander-in-Chief refused to accept. A quarrel also took place between Brigadier Wild and Colonel Moseley, and the latter gentleman was for some time under arrest. The matter, however, was eventually settled by the mediation of General M'Caskill. On Lord Ellenborough's arrival at Lodianah, he received Dost Mahomed, and quietly dismissed him; a course considered to be far preferable to the proposed plan of making the Chief present himself before a public durbar. Among the events which engrossed the attention of the Indian journals during the month of December, the proclamation by Lord Ellenborough, addressed "to his brothers and his friends the princes, and chiefs, and people of India," respecting the Gates of Somnauth, and already so notorious in England, had given rise to the most extraordinary comments. It appears to have met with no favour in any quarter. Even the *Bombay Times*, the paper which has hitherto supported his Lordship's policy in all particulars, declares, that "from one end of India to the other there is not a single journal which has not made it the subject of the severest censure, of scorn, or of ridicule. The unanimity of the press has been absolute—and no marvel; that of the public has been, we have no doubt, the same. When it reached the Supreme Council, it is said to have nearly convulsed them with laughter." It appears, also, that the Temple of Somnauth is in ruins. The only records of its destruction are in the Persian language, and removed from the knowledge of the Hindoos. The population of the place is Mussulman, and the little that remains of the temple itself is converted into a Mahomedan mosque. The following extract from the journal just quoted gives some curious particulars on this point:—"The gates whose recovery appears, from the proclamation, to have been the principal object of the war, were taken, according to a dubious tradition, some forty years before the date of the Norman Conquest, from the Temple of Somnauth, in Guzerat, where, for 400 years, a mosque has existed, and where the population is now entirely Mahomedan. For 800 years they have been attached to the tomb of Mahmoud of Ghuznee; it is by no means certain, indeed, that they ever were anywhere else; the state of our knowledge of the history of the reign of Macbeth will give some notion of the faith to be placed in the traditions in reference to Mahmoud of Ghuznee—a cotemporary king! These trophies are to be sent back to the place whence, it is said, they came; but that place is now desolate; a temple must be built, and a population of Hindoo worshippers collected in the heart of an entirely Mahomedan country, before the gates can find a post of rest. About 15,000,000 of the best-disposed British subjects in India are Mahomedan; who look upon the desecration of the tombs of their ancestors as the most intolerable injury that can be inflicted on them. Mahmoud of Ghuznee, whose sepulchre has been despoiled, is regarded by them as the great light and pillar, the champion and the pride of the Mahomedan faith in India, and by all of them must Lord Ellenborough's Gate Proclamation be viewed as an indignity. It is regarded as a compliment by no one; the Hindoos know nothing whatever of the tradition of the gates—it is referred to by none of their historians: and should we urge them to wipe off the insults of 800 years, we may put them in mind of others of more recent date, which they have to avenge." A demand had been made upon the Ameers of Scinde for their assent to a treaty, by which Kurrachee and Tatta, and a strip of land extending along the bank of the Indus, with the towns and forts of Sukkur, Bukkur, and Roree, and as far as their territory reached, should be made over to the Company. The Ameers appeared at first eager to make a determined resistance, but troops had been sent against them. The rumour of Tharawaddie's death has been contradicted. He appears now to be thoroughly convinced of the inutility, on his part, of trying any struggle with the British power in the East. The Hindostan steamer arrived at Madras on the 19th Dec., and started on the following day for Calcutta.

CHINA.—The news from China comes down to the 19th November from Macao, to the 15th from Hong Kong; and to the end of October from Chusan. The last division of the fleet with the Plenipotentiaries having left the Yang Tze-Kiang river, had on the 17th October reached Chusan, where a portion of the troops was to be stationed for a time. Other portions were stationed at Amoy and at Hong Kong, which is governed by Lord Saltoun, and is represented as so thriving that a proposal had been made for erecting a theatre there. Capt. Balfour, of the Madras Artillery, who had gained a considerable knowledge of the Chinese language and character, was named British Consul-General, to reside at Shanghai. Various decrees had been published by the Emperor, in which the national dislike of the Tartars to all foreigners was in some measure concealed, and a wish to maintain the "everlasting peace" exhibited. English merchants and their "families" are to be permitted, according to those decrees, to reside at Canton, at Fowchowfoo, at

Amoy, Ningpoo, and Shanghai; and their ships are to have places for repairs. Hong Kong is ceded in perpetuity as a colony to Great Britain, and the Hong, or monopoly merchants are to be abolished. Sir H. Pottinger was expected to arrive at Hong Kong towards the end of November or beginning of December, in order to carry on the negotiations respecting the commercial tariff. The Commander-in-Chief, Sir Hugh Gough, intended to sail for Calcutta in the beginning of December. Several of the regiments appear to have suffered severely from sickness. The Chinese were repairing all their fortifications. It would appear that, on the arrival of Sir H. Pottinger at Hong Kong, negotiations are to be commenced with the Chinese Commissioners, for the purpose of settling the details of our future commercial arrangements. The conferences are to take place on the island of Lantau, half way between Canton and Hong Kong, where preparations have already been made for the reception of the Chinese officers. It is reported to be the opinion of the Viceroy, that Americans and other foreigners will henceforth be admitted to the same privileges as those conferred on the British by the new treaty; and it seems that, on the arrival of the commissioners, a notification to this effect is likely to be issued. Before leaving Nankin, the Imperial Commissioners gave a grand entertainment to a great many officers of the Navy and Army, during which professions of the most friendly feelings on both sides were not wanting; and we learn that whenever English officers went on shore the people behaved very peaceably. Shanghai has been visited by several of them, and all speak in the highest terms of the beauty of its situation, and of the advantages it is likely to offer as a place of trade. The Chinese themselves seem to anticipate the future intercourse with foreigners, and the profits they are likely to derive therefrom, with considerable satisfaction; and behave, mandarins as well as common people, with great politeness towards their visitors. The house occupied by Captain Balfour, the Consul-General, is spoken of as beautifully situated. At Chusan, all sorts of provisions were plentiful and cheap, European as well as Chinese; and the sickness which the force had brought with it from the Yang-tsze-keang was diminishing.

UNITED STATES.—Within the last few days a pamphlet, on the treaty lately concluded by Lord Ashburton, has been published by Mr. Featherstonhaugh, one of the commissioners appointed a few years since to examine the disputed territory. In a postscript to this pamphlet, Mr. Featherstonhaugh states that, since the work was sent to press and made ready for publication, "an unexpected piece of information has transpired, so vitally connected with the late negotiations at Washington, that the author, even after the pamphlet has been announced for sale, felt himself compelled, by its unparalleled importance, to lay it before the world." This information is nothing less than that during the whole period of the recent negotiations at Washington, Mr. Webster was in possession of the most conclusive evidence, that the claim of Great Britain was established beyond the possibility of cavil—or, as Mr. Featherstonhaugh says, "he had the highest evidence in his possession which the nature of the case admitted of, that the United States never had the slightest shadow of a right to any part of the territory which they have been disputing with Great Britain for near 50 years." It appears that Mr. Jared Sparks, who has been for some time engaged in collecting materials for a history of the United States, found in the Foreign-office an original map, presented by Dr. Franklin (the negotiator of the treaty) to Count de Vergennes, then Minister of Louis XVI., which was inclosed in the following letter:—"Passy, Dec. 6, 1782.—Sir,—I have the honour of returning herewith the map your Excellency sent me yesterday. I have marked with a strong red line, according to your desire, the limits of the United States, as settled in the preliminaries between the British and American plenipotentiaries. With great respect, I am, &c.,—B. FRANKLIN." In communicating this map and letter to Mr. Webster, Mr. Sparks observes:—"Imagine my surprise on discovering that this line runs wholly south of the St. John and between the head waters of that river and those of the Penobscot and Kennebec. In short, it is exactly the line now contended for by Great Britain, except that it concedes more than is claimed." This occurred about the beginning of last year, and it further appears that Mr. Webster, unknown to Lord Ashburton, had this map in his possession during the whole of the negotiations, while he solemnly assured his Lordship of his belief, not only in the justice of the whole of the American claim, but his conviction that the framers of the treaty of 1783 intended that the line should be carried to the north of the St. John. It is stated also, that when the Senate discussed, with closed doors, the treaty agreed to by the two Commissioners, a number of Members refused to vote for the ratification, upon which the Chairman produced the map received from Mr. Webster, and the affair was instantly settled. The transaction is denounced by our daily contemporaries, without a single exception, as a diplomatic fraud, unparalleled in modern history; and the *Times* (ministerial paper) calls upon the Government to "put henceforth no confidence in American protestations, and not again to negotiate with a people devoid of the commonest principles of honour; but before any tricks are played us in the Oregon, to send a fleet of heavy-armed and well-manned steam-boats, to protect our rights in the fertile valley of the Columbia River."

Parliament.

HOUSE OF LORDS.

Monday.—HER MAJESTY'S answer to the Address of the House was read to their Lordships by the Lord Steward, and ordered to be printed.

A conversation on the Poor Law in Ireland ensued, upon a

motion of Lord CLANRICARDE for returns relative to the operation of the law. The noble Marquis made several complaints of the law, and particularly that the relief received by the poor was in no way commensurate with the burden inflicted on the ratepayer. The returns were ordered, and the Duke of WELLINGTON announced that, after proper information is obtained, a Bill will be introduced for making alterations in the law.

Lord COTTENHAM laid on the table two Bills relating to the law of debtor and creditor, and to that of arrest for debt. The Lord CHANCELLOR stated, in reply to Lord Campbell that, among some of the important objects the Government had in view in improving the law, was the improvement of the administration of the law in the Ecclesiastical Courts; and a Bill was prepared applicable to that complicated subject, which would shortly be laid before the house. Another measure was one corresponding with that introduced last session, for the establishment of Local Courts with respect to claims of a small amount; and another was connected with the law of insolvency, and the administration of that law.—A Bill of Lord DENMAN's for amending the law of evidence was read the first time.

Tuesday.—Notice was given by Lord MONTEAGLE, that on the 23d he should move for a committee of inquiry into the operation and effect of the new Corn Laws. Certain papers relating to the Church of Scotland were ordered, on the motion of Lord CAMPBELL.—Lord BROUGHAM, in a speech of some length, called the attention of the House to the fact, that in 1823 a proposition, including far more stringent rights of search than those which are now in question between England and France, had emanated from the United States, and had been presented to England and others of the leading European powers. A treaty, founded on this proposal, had been signed, and all the preliminaries completed. The only reason that prevented its final consummation, was that it included America and American ports, amongst the districts and places liable to search. The noble Lord therefore contended that M. Dupin and other members of the French Chambers were altogether wrong in objecting to the right of search, on the ground that America was opposed to the principle of the practice.

On the motion of Lord DENMAN, the Bill for improving the law of evidence was read a second time, and ordered to be committed on Thursday.

Thursday.—Earl STANHOPE brought forward the motion of which he had given notice, on the condition of the working and productive classes of the community. He adverted to an observation once made by Mr. Fox, that the minority in the House of Commons very frequently represented the majority of the nation—and suggested that the truth of this remark was confirmed by the fact, that free-trade doctrines—doctrines which struck against the vital rights and interests of the people, were now so prevalent in Parliament—while the result of the last general election on, and the impression which existed the year before last as to the course which would be pursued by the present Government, proved that those doctrines were detested by the country. On that occasion, a strong body of men considered friendly to protection for native industry was returned, and not alone from the agricultural districts; and he could not sufficiently condemn the servility of those who had crept into Parliament under false pretences. If Sir R. Peel, at the time when the elections were going on, had in contemplation any such measures as he had since introduced, he should have stated this openly and candidly when he saw the gross delusion upon which the elections were proceeding. The present Government were treading in the steps of their predecessors, and unfortunately possessed the power, which the former Administration had not, of giving effect to their destructive proposals. In his opinion, a perseverance in the present system could end in nothing short of social revolution. He then referred to the miserable condition of the hand-loom and silk-weavers, for whom nothing had been done. It was not in the power of man to portray the misery of the working classes—and this dreadful state of things was fast spreading among the agriculturists. The farther we had proceeded with free-trade experiments, the more hopeless and deplorable became the state of the people. The hand-loom weaver, for instance, who earned 281 lbs. of food at the commencement of the present century, could latterly earn no more than 81 pounds when in employment. He was glad to have the authority of the Duke of Wellington against the unrestricted competition of inanimate with human labour, and quoted the opinions of Mr. Pitt and Sir John Beckett—a gentleman whom he described as a genuine Tory of the old school, not a mere Conservative, a word which has latterly become one utterly without a meaning—on the importance of providing remunerating employment for the working producers. The new Tariff and the new Corn Law—measures adopted with the most reckless disregard of consequences—were great instruments in aggravating the prevailing distress, and the declaration of leading members of Government that they adhered to the principles of free trade, and would pledge themselves to no permanent measures of protection, spread alarm and despondency amongst the most valuable portion of the community. The remarkable falling off in the Excise returns was a palpable indication of decreased power to purchase the comforts of life. Mr. Pitt himself had declared that if, during the prevalence of general distress and diminution of wages, Parliament did nothing to redress the grievances of the people, its power would be at an end; and it was his (Lord Stanhope's) conviction that a refusal to do so would cause such excitement and irritation as must lead to organic changes in the constitution. The noble Earl stated that one of his wishes was to obtain the repeal of the new Tariff and the new Corn Law; and concluded by moving for a committee of the whole House to take into consideration the present condition of the working classes of the country, with a view to providing them with employment.

The Earl of Ripon complained of the tone taken by Lord Stanhope in imputing to the Government either ignorance or recklessness of the interests of the country, and defended Sir R. Peel against any insinuation of having acted with duplicity previous to and pending the election of 1841. Never was a charge more unjust and groundless, not only as regarded the Premier, but every member of the Administration. He could truly say they had expressed no sentiments within the last eighteen months that they had not always avowed; and he (the Earl of Ripon) had always been opposed to the restrictive system as a great evil, and invariably supported any modification of it. It was no sign of exceeding and deplorable depression in the silk trade that it was spreading in many directions; and Lord Stanhope ought to recollect that distress in Spitalfields was often complained of under the prohibitive system—a system which was not established till the middle of the last century, and not in the good old times of which the noble Lord was so ardent an admirer. Looking at the quality and quantity of the cattle imported, it was ridiculous to think that the new tariff could operate upon provision-growers so disastrously as some seemed to fear; and the Corn-law was a measure which had worked well for its intended object. The notion of rewarding labour by taxing or stopping machinery was most visionary. Much as they all deplored the existing distress, no hope could be held out of relief from legislative measures; and he trusted their Lordships would withhold their consent from the appointment of a committee, which could only end in disappointment.

Lord BEAUMONT supported Lord Stanhope's motion; he declared himself dissatisfied with Sir R. Peel's recent declarations as to the Corn-law, and hoped that the Government would avow its intention of crushing the giant monster which had arisen in the shape of the Anti-Corn Law League.—Lord BROUGHAM professed himself utterly unable to detect the free-trade which Earl Stanhope said was ruining the country. Under the new Tariff there had been but 3,100 cattle and 315 pigs imported, one-and-a-half per cent. on the tariff he strongly censured the speeches of certain reverend gentlemen, members of the Anti-corn Law League, at a meeting held in the metropolis, which, he said, were calculated to lead to the taking away of innocent life.—The

Earl of RADNOR opposed the motion, and recommended the total repeal of the Corn Laws.—Lord ASHBURTON avowed himself a moderate free-trader, as he had always been, but he was not so absurd as to advocate a removal of all restrictions without reference to the peculiar circumstances of the country. Under our artificial circumstances, with a huge national debt, it was impossible to adopt a purely level system of free-trade. We were not allowed, in this country, to grow beet-root for sugar, nor yet tobacco, which might be profitably cultivated, because to do so would affect a portion of our revenue, which we could not afford to lose.—The Marquess of CLANRICARDE, as a free-trader, said that he was opposed to differential and protective duties, but did not suppose that the abolition of monopoly involved the abolition of necessary revenue duties.—Earl STANHOPE replied; and on a division his motion was rejected by 25 to 4.

Friday.—The Law of Evidence Bill was read a third time and passed.—The Marquess of CLANRICARDE complained that no papers had yet been laid before the House respecting Afghanistan.—The Duke of WELLINGTON said they were in the course of being printed. In regard to the nature of his motion, he had distinctly stated before, and he stated it over again, that he intends on Thursday to move a vote of thanks to the army in India, and that in making that motion he will not touch upon any political matters either antecedent or subsequent to the advance beyond the Indus. The conduct of the Governor-General will only be included so far as it relates to the conduct of the army and military matters, and nothing else; and the papers, when presented, will show what the conduct of the Governor-General in relation to India has been.

HOUSE OF COMMONS.

Monday.—After several notices of motion had been given, Ministers answered various questions asked by different Members about the intention of Government respecting important subjects of diplomatic, commercial, and domestic policy. In reply to Mr. CORBEN, Sir R. PEEL stated that he should not announce the intentions of Government respecting the sugar duties, and that he should take the same course if questions were asked relating to other articles of the tariff. In answer to Lord PALMERSTON, he said that Brazil had acquiesced in the interpretation put by the British Government on the term for which the commercial treaty is to last, and that the treaty will therefore continue in force till November, 1844; that negotiations were on foot for a new treaty; and lastly, with respect to the question of the State duties between this country and Hanover, that no definite settlement had yet been come to.—In reply to Mr. LABOUCHERE, Sir R. PEEL expressed a doubt whether it would not be better to break off the correspondence with Portugal altogether, rather than submit to the evils arising from delay. "Within the last few days the Government had received a communication which led him to think that the time would soon arrive when it would be necessary to terminate the negotiations altogether, or make some new arrangements." But, with respect to France, he hoped that such an arrangement would be made as would, politically as well as commercially, be promotive of friendly and beneficial relations between the two countries.—In reply to Capt. PEARCE, Sir R. PEEL gave explanations in reference to the arrangements for the suppression of the slave trade, the most important of which was that this country had entered into no engagement limiting the number of its cruisers, and that there must be some mistake in a report attributing any such statement to M. Guizot.—In reply to Mr. ROEBUCK and Lord JOHN RUSSELL, Sir R. PEEL said that the papers relating to the Afghan war would be produced before the vote of thanks is proposed, and that the vote will be confined to the public operations.

The Royal answer to the Commons' address was read. Colonel RUSSELL declined pressing his motion for the issue of a new writ for the borough of Sudbury; and a motion by Mr. TUFFNELL, that the Speaker do not issue his writ before the 20th of March was agreed to.—Mr. TUFFNELL then moved for leave to bring in a bill for the disfranchisement of the borough. The motion was met by Mr. BLACKSTONE with one for inquiry. But Sir ROBERT PEEL and Col. WYNDHAM, as well as Mr. T. DUNCOMBE, having expressed their intention of supporting the bill, leave for its introduction was carried without a division.

Sir C. NAPIER excited much amusement by asking Sir R. Peel for a copy of a map marked with a broad red line, which it was alleged Mr. Webster had produced in the American Senate during the discussions on the boundary question.—Sir R. PEEL replied, that it was in the King's Library at Paris; and Sir C. NAPIER, amidst continued laughter, said that perhaps the right hon. Baronet would be so good as to write to the French Government for it?—Several resolutions relative to the private business of the House were proposed by Mr. EWART, and rejected on a division by 84 to 27.—A motion of Mr. BROTHERTON's, for returns of offences against the Factory Act; and one of Sir ROBERT INGLIS, appointing the Library Committee, were agreed to.

Tuesday.—After several questions had been put on miscellaneous subjects, the bill for the disfranchisement of Sudbury was brought up by Mr. TUFFNELL, and ordered for a second reading on Monday week next.—Mr. ROEBUCK having postponed the motion of which he had given notice relative to the Afghan war, Mr. T. DUNCOMBE postponed till the 21st inst. a motion of which he had given notice, relative to Lord Abinger's charge in Liverpool on the trial of the persons implicated in the late riots.—Returns relating to the expenses of criminal prosecutions in Ireland were ordered on the motion of Mr. HUME, as well as various papers relating to the Danish claims.—In answer to observations from Sir George Staunton, Sir R. PEEL took occasion to compliment the ability and discretion of Sir H. Pottinger, and remarked that it would be absolutely necessary to have some regular system of jurisdiction established in the island of Hong-kong, but that it would be prudent to postpone discussion on the subject until Sir Henry's opinion be known.—In answer to Mr. T. DUNCOMBE, Sir R. PEEL stated that a measure on the subject of the County Courts would on an early day be submitted to Parliament, as also a measure relating to the registration system. Sir J. GRAHAM, in reply to Lord J. Russell, announced that Lord Stanley and himself had deemed it prudent to abandon the project of sending juvenile convicts to the Cape of Good Hope.—On the motion of Mr. WALLACE, a select committee for inquiring into the long-continued distress in Paisley, was ordered to be appointed.—Mr. F. FRENCH obtained leave to bring in a bill for the better regulation of medical charities in Ireland. The hon. Member complained of several abuses in the present system; but Lord ELTON gave slight encouragement as to the future progress of the Bill.

Mr. ROEBUCK brought forward his motion, "That a humble address be presented to her Majesty, praying that pardon may be extended to all persons transported from Upper and Lower Canada to our penal colonies for political offences committed during the late disturbances in those provinces."

Lord STANLEY, though he felt it painful to interpose against any exercise of the prerogative of mercy, was obliged to resist the present motion. Under any circumstances it was constitutionally inexpedient that the House of Commons should interfere with that prerogative; but in this case there were also special reasons against such an interference. In the tranquil and contented state in which the Canadian population were now admitted to be, it was peculiarly undesirable to revive the subjects of past dissension. The recent policy and appointments of Sir C. Bagot, which had discarded all distinctions of origin, had been in full union with the views of the Government at home. Whatever difficulty had existed under the separate constitutions of the Canadas was removed by their union. There was now an end of the danger lest the English Canadians should be overwhelmed by the French race. It would be an injustice to the French Canadians to suppose that they considered the termination of past discords as involving impunity to such a crime as treason. If those who had committed that high offence were now at once to obtain a full amnesty for their acts, the loyal, who had bravely made so many sacrifices, would have reason to complain of a Government which should thus confound its faithful subjects

with the disturbers of the public peace. He then stated the circumstances under which the insurgents had been taken, and explained the lenity with which they had been treated. In both the Canadas the whole number of executions had been but 29; the remainder, to the number of 136, had been subjected only to transportation—no very severe penalty for men who, throughout a Canadian winter, had agitated a country with a murderous, predatory, and buccaneering insurgency. The hon. mover did not even distinguish between the different degrees in the guilt of these transported culprits. Directions had long since been given to Sir C. Bagot to consider, with clemency, those cases in which there might be circumstances of alleviation; but the Government could not consent to this indiscriminate restoration; they could not consent to connect the boon lately bestowed on the respectable classes of the French Canadians with a sweeping re-introduction into the colony of the seditious, the disaffected, and the disorderly.—Mr. EWART seconded the motion, but Mr. HUME advised Mr. Roebuck not to press it to a division against the obvious wish of the house.

Mr. C. BULLER regretted the motion, as one by no means calculated to advance the objects most desirable for Canada. He disliked the interference of the House of Commons with the prerogative of mercy; and he also disliked, except under extreme necessity, the interference of the Imperial Parliament with the colonial Administration. He eulogized the policy of Sir C. Bagot, and the subsequent appointment of Sir C. Metcalfe, both of which he regarded as guarantees for the good government of Canada. He thought it inexpedient to fetter the Administration of Sir C. Metcalfe, whom there was no ground for distrusting, and he recommended it to Mr. Roebuck to withdraw his motion.

Mr. ROEBUCK, in reply, denied that the house committed any interference with her Majesty's prerogative of mercy by merely soliciting her to exercise it. He concluded, however, by asking leave to withdraw his motion, which was granted accordingly.

Mr. M. SUTTON obtained leave to introduce a bill for making some amendments in the law affecting transported convicts. The house then went into committee of supply, and passed the usual vote, "that a supply be granted to her Majesty."

Wednesday.—The speaker took the chair at ten minutes before four, at which hour there were only 25 Members present, and the House was consequently adjourned.

Thursday.—Several notices of motions were given, among which was one of great length by Mr. FERRAND, being an amendment to Mr. Villiers' motion for the total repeal of the Corn-laws, the reading of which took up some time. Sir R. INGLIS objected particularly to one expression in it, by which the term "Bank of Squander" was applied to a well-known establishment in Manchester. Mr. ROEBUCK also asked if it was competent for the honourable member to place a political pamphlet in the shape of a notice on the paper. The SPEAKER recommended Mr. Ferrand to withdraw his notice, which he did.—Sir R. PEEL, in reply to Sir C. Napier and Dr. Bowring, gave some information on the affairs of Syria, and begged members to carry out their non-intervention principles so far, as not to make the British Government responsible for the acts of the Turkish authorities. Sir R. PEEL, also, in reply to Mr. Hawes, intimated his intention of bringing in, on the part of the Government, a measure of Church Extension, the principal feature of which will be to make the accruing and increasing property of the Church, which may be at the disposal of the Ecclesiastical Commissioners, available for providing for the spiritual wants of the people.

Dr. NICHOLL, Judge Advocate-General, moved for leave to bring in a bill to alter and amend the law relating to the administration of justice in the Ecclesiastical Courts of England and Wales. He briefly sketched the origin of our ecclesiastical jurisdiction, and showed that it had been gradually encroached on, and appropriated by the statute law, until the basis of the jurisdiction had been swept away. Yet there were no less than 400 Ecclesiastical or Diocesan Courts, under various titles or classes, subordinate to one another, empowered to grant probate of wills, entrusted with the custody of wills, and having jurisdiction in the administration of property, upwards of forty-three millions annually passing under their seal. Their number, their conflicting decisions, their costliness and inadequacy, have long called for reformation; and the present bill proposes, therefore, to separate the spiritual and temporal jurisdictions, to erect a Court in London, with a Judge to be appointed by her Majesty, for the temporal jurisdiction, and to effect certain alterations and improvements in the constitution of the Ecclesiastical Courts having cognizance of spirituals. He then stated the procedure to be adopted with respect to the administration of property in the proposed new Court, with which is to be connected a central general registry of wills, and to which also is to be transferred from the Local Courts the jurisdiction in the matter of church-rates. The Ecclesiastical Commission, upon whose recommendation these changes have been undertaken, was composed of men whose names carried authority with them; and the bill would effect a great practical improvement, long desired, and which, for many years, has occupied the attention of the Legislature. Dr. Nicholl concluded by stating the position in which he himself would be placed by the proposed changes. Mr. JARVIS, Dr. STOCK, and Sir R. INGLIS, commented on the provisions of the bill, objecting to the "centralization" of the jurisdiction, as to property which would be affected by the election of the new London Court. Sir R. INGLIS, in particular, said he would not give his consent to the introduction of the bill, unless he were assured that the Courts of the two Universities were not to be abolished. After some further conversation, Dr. Nicholl replied to the objections, and leave was given to bring in the bill.

Mr. VILLIERS, Mr. M. GIBSON, and Mr. EWART, pressed Lord Stanley to say whether or not the Government intended to bring in a measure this session, to alter the scale of duty on the introduction of colonial grain; but the noble lord declined to do so until the papers were before the House.

Mr. VERNON SMITH moved for a copy of any despatch from the Governor-General of India to the Court of Directors, containing a proclamation addressed to the chiefs and princes of India, respecting the recovery of the gates of the Temple of Somnath, and any answer of the Court of Directors to the Governor-General of India. He explained the object which he had in view in moving for this document, and commented on the mischievous nature of the proclamation. Lord Ellenborough had not only encouraged gross and licentious idolatry, but was risking the excitement of fanatical animosity between Hindoos and Mahomedans; while the gates so pompously brought back required the erection of a new temple and the purchase of a new idol. The man who could issue such a proclamation was unfit to be trusted with the government of India—that great empire was unsafe under his rule. There were other rumours, too, which, if true, would indicate that Lord Ellenborough's head had been turned by his elevation.

Mr. BINGHAM BARING attributed the attacks on Lord Ellenborough, through the medium of the press in India, to his financial reforms, which raised up enemies. The sandal-wood gates were regarded as a national trophy by both Hindoos and Mahomedans, and were viewed as such without reference to religious opinions. Lord Ellenborough had therefore in view the gratification of a general feeling of triumph over their Afghan oppressors, in his proclamation to the princes and chiefs of India. The documents moved for would be granted—that is, a copy of the proclamation, with anything in Lord Ellenborough's correspondence which had reference to it.

Sir R. INGLIS hoped that Lord Ellenborough had better friends and defenders than Mr. Bingham Baring. The House was not a tribunal for judging of taste in composition, for if it were, other proclamations might be brought before it. But the fact of the restoration of the gates was before it. These gates, and their history, were really utterly unknown to the Hindoo people; the temple had also been so thoroughly destroyed and desecrated as to have lost all veneration in the Hindoo mind. The original cause of its destruction by Sultan Mahmoud was abhorrence of

disgusting idolatry; he was a barbarian, but a barbarian endowed with many great qualities. Was it worthy of a Christian governor to desecrate the sanctuary of the dead for the purpose of conciliating a divided people, by paying homage to idolatry? Lord Ellenborough governed at least ten millions of Mahomedans, whom he ran the risk of offending. He (Sir R. Inglis) would not be satisfied even with a simple disavowal of the proclamation by Sir Robert Peel—the country expected a vote of censure.

Sir R. Peel thought it would have been fairer in Mr. Vernon Smith to have confined himself to a simple request for papers, which he knew would be conceded, instead of attempting, before the evidence was before him, to prejudge and prejudice a question on which he proposed to found a motion. Mr. Smith had himself borne testimony to his knowledge of Lord Ellenborough's ability; and all who knew the religious feelings of that noble lord must acquit him of any intention whatever of wounding the Christian spirit of this country. The Government were not in possession of any explanation as to the proclamation; but he would read extracts from correspondence addressed to him by the Governor-General, showing, that at the very time the proclamation appeared, he was under the impression of devout Christian feelings. Sir R. Inglis had given too much credit to the character of Sultan Mahmoud, when he attributed his repeated invasions of India to abhorrence of idolatry; and in the work of Mr. Mountstuart Elphinstone, he would find that these gates were spoken of precisely as Lord Ellenborough viewed them, namely, as a military trophy. He believed that it never entered into the head of the Governor-General either to pay any homage to idolatry, or to "restore" the temple of Somnath. At the same time, he was bound in candour to admit that the proclamation had attracted the attention of the Government, and they had frankly communicated their opinions on it to Lord Ellenborough. But the real question was, whether or not a single isolated act of any public man should be made the pre-text for running him down. He reminded the House of the difference between the condition of India now and a year ago; then terrific disasters to repair, now peace restored; and was it just or fair in the authors of these disasters to fasten on this proclamation, and to attempt to excite public feeling, or to propose a vote of censure against the man whose energy and policy had repaired them?

After some observations from Mr. MANGLES and Mr. HUME, Lord JOHN RUSSELL remarked that Sir Robert Peel, though using guarded official terms, had himself censured the proclamation, if he had not even sent out a rebuke to Lord Ellenborough. All he (Lord J. Russell) had gathered from the public papers concerning the opinion that Lord Ellenborough could not be safely entrusted with the undivided control of our Indian empire. The military officers engaged in the late operations were deserving of all praise; but not so the Governor-General, whose arraignment did not rest merely on the proclamation respecting the gates of Somnath, but on other branches of his conduct. Was it not absurd to talk of the Indus as the "natural limits" of our empire, when at this very moment a force had been collected to wrest from the Amirs of Scinde a territory situated to the west of that river? Permanent occupation of Afghanistan had never been Lord Auckland's policy; the evacuation could have been ordered in perfect consistency with the principles on which the invasion was founded, and under these circumstances, what Lord Ellenborough had done could not be considered a condemnation of the policy of his predecessor.

After some further conversation, Mr. SMITH altered his motion to one for copies of the proclamation respecting the gates of Somnath and of that of Simla, dated the 1st October last. The motion in this form was agreed to.

Friday.—Mr. FOX MAULE presented the petition of the Commission of the General Assembly of the Church of Scotland. Mr. MANNERS SUTTON obtained leave to bring in a bill to amend the laws relating to turnpike trusts in England and Wales, in order to provide some remedy for the competition of railroads. Mr. LIDDELL obtained leave to bring in a bill for preventing the fraudulent personation of voters at contested elections. He proposed to give a summary remedy against fraudulent personation, by enabling the returning officer to give into custody any voter accused of personation, so as to secure prompt punishment. Sir JAS. GRAHAM gave notice that on Friday next he will move for leave to bring in a bill for the better Registration of Voters in England and Wales.

CITY.

Money Market, Friday.—Consols closed 94½ for Acct.; and 94¼ for money; Bank Stock, 174; Three per Cents. Reduced, 95½; Three-and-a-half per Cents. Reduced, 102½; New Three-and-a-half per Cents., 101 to ¼; India Stock, 268; Exchequer Bills, 64s. to 66s. prem.

Metropolis and its Vicinity.

The Weather.—The weather on Saturday was of a most boisterous character. At high water, about half-past three, A.M., the tide, owing to the strong northerly wind that lasted all the previous night, was so high in the river, that the houses and wharfs on the banks at Lambeth, Vauxhall, and other places, were flooded. The houses in Upper and Lower Fore-street were inundated to the depth of ten feet; and in consequence of the rapidity of the flood, much damage was done to the numerous vessels lying in the river, and also to the ground-floors of the houses. The tide rose so rapidly that the police were unable to get round to the river-side to call up the parties. The overflow in the neighbourhood of York-road was the highest ever known, and boats took the place of the usual mode of conveyance. The streets near the river at Gravesend, Woolwich, and Greenwich, were also overflowed; and the ground-floors, cellars, and kitchens of the houses were inundated, and much property destroyed. Fifteen coal-ships drove from their anchors and went ashore in Woolwich Reach; they all sustained damage, and were not got off without great difficulty. Eight laden barges were sunk in the reach, and about one o'clock, when the wind was blowing a hurricane from the north-west, 40 watermen's boats were sunk at Greenwich. The storm increased at night, and was severely felt at the mouth of the river.

Wreck of the Larkins East Indiaman.—Another vessel is added to the list of the homeward-bound, which, at the very close of their voyage, have suffered shipwreck in the Channel. The Larkins, a fine ship of 800 tons, belonging to Messrs. Haviside, of Cornhill, which arrived in the Downs on Thursday last, from China, after breaking from her moorings on Saturday night, went ashore on the Walpole Rock, a mile east of Margate, about four o'clock on Sunday morning. The circumstances of the present loss differ materially from the recent calamities on the French coast, as the Larkins had reached the Downs in safety, and was riding at her anchorage when the heavy gale sprung up on Friday night. Two steam-tugs had been despatched from the river to bring her into the docks, but on their arrival within sight of the ship, the weather was so boisterous that it was found impossible to make

head against it, and they were both compelled to take shelter in Margate-roads—one of them having lost an anchor and chain. The Larkins rode out the gale well during Saturday morning, having 120 fathoms of chain out; but about midnight it was discovered that she was driving near shore; and the Captain considered it advisable to cut both the main and mizen masts away, in order to save the ship from striking. In this, unfortunately, he was not successful, as she went on shore with the flood-tide about four, A.M., on Sunday morning. The ship was laden with tea, and had only one passenger.

Metropolitan Improvements.—On Wednesday, the 1st, measures were taken, for the first time, for the formation of the new street between Oxford-street and Holborn. In consequence of an order from the Commissioners of Woods and Forests, many of the houses have been vacated and sold, and preparations made for pulling them down immediately. The line from the Rookery in St. Giles's will proceed along the south of Phoenix-street, across Museum-street, between Hart-street and Hyde-street, crossing the latter, and will enter Holborn at the King's Arms Tavern, which has been purchased by the Commissioners. Preparations have also been commenced for the new buildings which the benchers of Lincoln's Inn are about to erect in their garden, under the superintendence of Mr. Hardwick. They will consist of a dining-hall, a drawing-room, a council-room, and a library. The structure will be of deep red brick, interlaced with bricks of darker colour. The quoins and dressings will be of stone. The style of architecture may be referred to about the middle of the Tudor period, more inclining to the highly-decorated perpendicular of the time of Henry the Eighth than the cinque cento mixture of the reign of Elizabeth. In both of the large apartments the roofs will be formed of beams of oak, springing from corbels, with panels and pendants. The hall-roof will be the more decorated of the two, and something like that of Hampton Court, though less elaborate. The dimensions of the hall will be 120 feet in length, by 45 feet in breadth, and 54 feet in height. The dimensions of the library will be 80 feet in length, by 40 feet in breadth, and 48 feet in height. The building will occupy about two years, and a great portion of the fine terrace-walk, which was raised in the time of James I., and also of the avenue of trees, which has so long afforded shade and ornament, will be demolished.

Wood Pavement.—At the meeting of Commissioners of Sewers, last week, Sir Peter Laurie gave notice of a motion, "That in the opinion of this Court the Wood-pavement in the Poultry is dangerous and inconvenient to the public, and ought to be taken up and replaced by the granite pavement."—Since our last notice of the proceedings at Guildhall, the foreman of the post-boy establishment has waited upon Sir Peter Laurie, to inform him of two accidents which had occurred to post-boys from riding over the wooden-pavement. He stated that when it was frosty the wood-pavement was totally unsafe for horsemen, for if a horse slipped while going fast, it could not recover itself. The Post-office authorities, he said, now direct the boys to go any way round to avoid wood-pavement. Some tradesmen in the City attended to prefer complaints against the pavement, and Sir Peter Laurie said that he had received a letter from Mr. Hume, who predicted that within two years the streets would be repaved with stone.—On Saturday a numerous deputation of gentlemen waited upon the Marylebone vestry to present a memorial, signed by 221 ratepayers resident in Baker-street and York-place, Portman-square, praying the vestry to have these thoroughfares paved with wood. One of the gentlemen remarked that, notwithstanding the opposition given to wood-paving by Sir P. Laurie, he had no doubt that the whole of London would soon be paved with that material. It was eventually agreed that the memorial should be taken into consideration by the vestry.

East India House.—On Wednesday a special general Court of Proprietors was held at the East India House, pursuant to an intimation given by the Directors at the half-yearly meeting in December last, and in consequence of a notice given by Mr. Lewis, "to call the attention of the Court to the papers which have recently been printed and laid before the proprietors, in relation to the commission of inquiry held at Sattara in October, 1836, and the conduct of the commissioners who sat on that inquiry." Sir J. L. Lushington presided. Mr. Lewis then brought forward his motion: "That after a full and anxious consideration of all the circumstances of the case of the Rajah of Sattara, this Court is of opinion that justice, no less than the character of the British Government in India, require that either the Rajah be restored to his throne, or a full and impartial inquiry be instituted into all the circumstances of his case." A long debate ensued, which lasted several hours, and was at length adjourned to Thursday. The question was then discussed in detail by several proprietors; and after a long and desultory debate, during which the chairman said that the proprietors could not rescind an act of the Board, a motion for the adjournment of the Court was carried by a majority of 46 to 16.

Embezzlement.—Within the last fortnight it has been ascertained that Mr. R. W. Spearman, Secretary to the Master of the Horse, has absconded. It appears that a short time since the Earl of Jersey, in consequence of rumours which had reached his Lordship, sequence of rumours which had reached his Lordship, called upon Mr. Spearman to make up his accounts, for the purpose of ascertaining the amount of money in his hands, and the mode in which various sums had been disposed of. On Friday fortnight Mr. Spearman absented himself from the office, and a few days subsequently wrote a letter to Lord Jersey without date or address, in which he stated, that, in consequence of the unsettled nature of his accounts, which were in an exceedingly de-

ranged state, it was not his intention again to return to the duties of the office. Mr. Spearman has never been seen since; and it is expected by his friends that he has taken his departure either for the Continent or America. He had held the appointment during a period of upwards of thirteen years, at a salary of 700*l.* per annum, with an excellent official residence at the Queen's-mews, and numerous perquisites.

Brentford.—A company is being formed for the purpose of establishing a canal between Staines and Brentford, which will save about twelve miles water-carriage between Staines and London. It is said that the undertaking, if carried out, will be the means of conveying the Midland Counties coals to that neighbourhood at about one-third less than the present cost, and will also operate materially in reducing the price of carriage on heavy goods from Birmingham and other manufacturing districts.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Jan. 28:—West districts, 140; North districts, 203; Central districts, 174; East districts, 216; South districts, 241. Total, 974, (468 males, 506 females.) Weekly average for the last five years, 903, (461 males, 442 females.) and for the last five winters, 1004.

Provincial News.

Caermarthen.—The lawless proceedings of the rioters, who have obtained so much notoriety by the name of "Rebecca and her daughters," have increased rather than diminished since our last report. No clue has been obtained to lead to their detection, and as yet not a single offender has been apprehended, although the civil force, the yeomanry, the marines from Pembroke, and a corps of pensioners are on the spot. Last week they destroyed a gate on the Whitland Trust, and a few days before, while in the act of demolishing a toll-bar, they sent word to that effect to the yeomanry, who were stationed at another gate. On receiving this report, the yeomanry immediately hastened to the spot, but on their arrival they found, to their mortification, that the gate was already levelled with the ground, and the rioters fled. It was afterwards discovered that the reason for conveying this report to the cavalry was, to induce them to quit the gate at which they were then stationed, in order that the mob might do the work of destruction on that also, without molestation from the troops. Accordingly, on the return of the latter, they discovered that Rebecca and her daughters had been there during their absence, and had accomplished their design. A letter was last week received by the mayor of Haverfordwest, signed by Rebecca, informing him that she and her children intended shortly to visit him. This was at first thought to be a hoax; but on Thursday, the 2d, the gate at the top of Prendergast, on the Fishguard Road, was removed into a field a quarter of a mile distant from the toll-house, and there sawed to pieces. Three threatening notices have been received at Narberth workhouse, to the effect that unless the paupers have better food given them, "Rebecca" will attack the house. A mob assembled a few days since, and destroyed the Prince's gate, and the authorities of Caermarthen have received notice that the parochial gates will next be levelled. It is generally believed that the workhouses will be the object of attack, and the lower orders imagine that "Rebecca" is a county magistrate. The *Welshman* observes, that it is not the least remarkable circumstance in this extraordinary movement, that when the troops appear in one part of the country, "Rebecca" invariably appears in another, perhaps 14 or 15 miles distant.

Hull.—A meeting of shipowners was recently held at Hull, to take into consideration Captain Fitzroy's Bill for ascertaining the qualifications of persons seeking to be masters and mates in the merchant-service. Mr. E. Gibson, Mr. Alderman Thompson, and others connected with the shipping interest, took a part in the proceedings. From the statements made, it appeared that there was a great demand for masters and mates, and that more vessels have been lately lost than in former years. From 1805 to 1815, including sea risk and water risk, the average loss was a ship a-day; from 1820 to 1825 three-and-a-half ships were on an average lost, and from 1826 to 1832 the loss was reduced to two ships a-day. These losses were attributed to the defective knowledge of masters and mates. After a desultory discussion, it was admitted by the speakers, that, although they were opposed to the bill, yet a nautical education for masters, and the establishment of Government schools for the promotion of education, were indispensably necessary. A motion of education, were indispensably necessary. A petition signed by 94 shipmasters against the bill has been drawn up for presentation to the House of Commons. The chief objections urged against the bill are, the appointment of navy officers to be examiners, the emolument that would thereby arise to the Trinity-house, and the Government patronage that would be exerted.

Leeds.—The following is a return of the relief given in money and bread to the poor of the township of Leeds, including both the in-door and the out-door paupers, and also of the number of applicants for relief at the workhouse, for the last four years. The relief given in 1839 was 14,105*l.* 1*s.* 10*d.*; in 1840, 14,934*l.* 15*s.* 5*d.*; in 1841, 17,275*l.* 14*s.* 8*d.*; and in 1842, 23,358*l.* 14*s.* 5*d.* The number of applications for relief in 1840 was 3,481; in 1841, 7,316; and in 1842, 14,839. Thus the increase in the amount of relief granted to the poor from 1839 to 1842 is no less than 65 per cent.; and the increase in the number of applications for relief from 1840 to 1842 is 326 per cent.—On Sunday week the body of a female, greatly mutilated and burnt, was found in the river Aire, near Knostrop Lock, the head, arms, and legs being entirely removed. An inquest has been held on the body, but nothing has been elicited to throw any light on the

affair, although a reward, with the addition of a free pardon, except to the actual murderer, has been offered to any person who will give such information as will lead to the conviction of the murderer.

Manchester.—The great Anti-Corn-Law banquet in the Free-Trade Hall took place on Wednesday week, when 3,400 ladies and gentlemen took their seats in the body of the hall, and 400 in the galleries. Every seat was occupied, for the tickets had been at a premium for some days previous. Twenty-one tables had been placed for the accommodation of the company—four on the dais, and seventeen in the body of the hall; each being 100 feet in length. On the following morning a meeting of 300 Dissenting ministers was held in the Town-hall, to consider the bearing of the Corn-laws upon the physical, moral, and religious condition of the people. The Rev. Dr. Burns, of Leeds, presided, and various resolutions in opposition to the Corn-laws were carried. The aggregate meeting of the delegates was held on Friday morning, in the Town-hall, to receive the reports of the Committees and to determine the future course of proceedings to be adopted. Mr. H. Ashworth presided. The report of the Committee of Manufacturers was read, and a series of resolutions was carried, recommending that petitions from every part of the country be prepared for presentation as early in the session as possible—that the electors endeavour to induce their representatives in Parliament to vote for the total and immediate repeal of the Corn-laws—that meetings be held to ensure the return of free-trade members—and that the friends of the movement enter into some pledge to accomplish the entire abolition of the Corn-laws by associations, by pecuniary contributions, and by all constitutional means. It was then resolved, "That the Council of the National Anti-Corn-law League forthwith adjourn its sittings, *pro tem.*, to London, and that it shall summon a conference of deputies at such time as it may deem expedient." The closing meeting of the week took place on the same evening, in the Free-trade Hall, and was attended by no less than 6,000 persons.—A meeting of the proprietors of the Bank of Manchester was held on Monday, when some facts of importance were made known. It was announced that the accounts of the late manager, Mr. Burdekin, exhibited a deficiency of about 30,000*l.*, which had been concealed through his own ingenuity, and the assistance given him in his clandestine operations by certain bill-brokers in the City, who were supplied, for the purpose, with bills bearing the endorsement of the bank to any amount required. The directors laid before the meeting a statement showing the condition of the bank affairs at the end of the year. From this it appears that the liabilities had been progressively reduced to the extent of 480,996*l.* since October 27; and, since the making up of the accounts, 120,000*l.* further has been liquidated. On the other hand, the estimated ultimate loss has been increased by the sum of 29,922*l.*; a difference ascribed in part to a falling off in the value of some of the outstanding assets, in part to the discovery of more extensive frauds committed by Mr. Burdekin, and in part to the accumulation of interest and other charges. It was at length resolved that the bank be not dissolved, and that the directors be requested, at the earliest practicable period, consistent with the interest of the bank, to lay before the proprietors a list of all the debtors, with the amount owing by each individual, together with a full statement of all the circumstances connected with the mismanagement of the concern.

Morpeth.—A church-rate attempted to be levied by the Hon. and Rev. F. Grey, a son of Earl Grey, at Morpeth, has given rise to a division among the people of the parish and town. It has immemorially been the custom to collect the church-rate in the proportion of one-third from the inhabitants of the suburban portion of the parish, and the remaining two-thirds from the inhabitants of the town. The latter now wish the rate to be collected and levied in equal proportions; but to this the country parishioners are opposed. The question is to be decided by the opinion of an eminent civilian.

Sheffield.—As an instance of the extraordinary depreciation in the value of property, the *Sheffield Iris* states that a grinding wheel erected in this neighbourhood within the last 20 years, at the cost of 5,300*l.*, was lately sold for 1,000*l.*

St. Asaph.—The projected union of the Sees of St. Asaph and Bangor continues to attract attention in various parts of the kingdom. Meetings of the clergy have been held in different parts of England and Wales to take into consideration the propriety of petitioning Parliament to repeal so much of the Act 6 & 7 William IV., c. 77, as provides for the union of the two Sees. At all these meetings the feeling of the public was unanimously opposed to the change; and numerous petitions have been presented this week to both Houses of Parliament on the subject.

Whitby.—One of the most distressing shipwrecks that has occurred on this part of the coast for several years took place on Saturday morning at the entrance of Robin Hood's Bay, a few miles to the south of this harbour, whereby a party of the Coast-Guard Service, belonging to the station at that place, under the command of Lieut. Lingard, R.N., with the crew of the distressed vessel, consisting of six persons, were drowned. As soon as the vessel, a collier brig from London, struck, the Coast-Guard went off in the life-boat, and succeeded in gallant style in taking the crew from the wreck. They were returning to the shore, when a heavy sea capsized the boat, and all hands perished in sight of the people assembled on the beach, who were unable to render them assistance. An attempt was made by the commander and crew of a brig, which happened to be within a short distance of the spot, to go to their relief, but their boat was upset, and they narrowly escaped meeting with a similar fate.

Railways.—The traffic for the week on the principal lines is as follows:—Greenwich, 718*l.*; Eastern Counties, 844*l.*; Liverpool and Manchester, 3,676*l.*; Croydon, 201*l.*; Newcastle and Carlisle, 1,232*l.*; Brighton, 2,588*l.*; Grand Junction, 6,646*l.*; York and North Midland, 1,350*l.*; Blackwall, 537*l.*; Great North of England, 1,065*l.*; Sheffield and Manchester, 273*l.*; Manchester and Birmingham, 2,366*l.*; Manchester and Leeds, 3,646*l.*; Glasgow and Paisley, Kilmarnock and Ayr, 759*l.*; Birmingham and Gloucester, 1,686*l.*; Edinburgh and Glasgow, 1,538*l.*; Midland Counties, 2,213*l.*; Birmingham and Derby, 1,192*l.*; North Midland, 3,572*l.*; South Western, 4,068*l.*; Great Western, 11,037*l.*; South Eastern, 1,509*l.*; London and Birmingham, 13,330*l.*—The half-yearly meeting of the Liverpool and Manchester Company took place last week, at Liverpool. The report adverted with regret to the continued depression of trade and manufactures, and stated that during the half-year just ended the business of the railway experienced an extraordinary check by the disturbances in the manufacturing districts in August last. The period of the year which is generally relied on as most propitious to railway travelling was thus rendered comparatively unprofitable. The total receipts for passengers had fallen off to the extent of 8,000*l.*, and from merchandise to the extent of 5,000*l.*, as compared with the corresponding period of the previous year. The accounts showed the receipts to be 123,746*l.* 1*s.* 4*d.*, and the expenses 60,497*l.* 10*s.* 7*d.*, leaving a balance of 63,696*l.* 10*s.* 9*d.*; to which must be added the amount reserved in July last for the income-tax, not yet paid, making a total of 65,865*l.* 3*s.* 2*d.* The directors recommended a dividend of 5*l.* per 100*l.* share, which, on 12,090 shares, amounted to 60,450*l.*; and would leave a balance of 5,415*l.* 3*s.* chargeable with the income-tax for the year. This charge being liquidated, there would be a small residue to be carried to the credit of the next half-year's account. A dividend of 5*l.* per 100*l.* share was declared to be paid early in the present month.—The half-yearly meeting of the Grand Junction Company was held last week at Liverpool. It appeared from the report that the clear profit of the half-year was 119,470*l.* 2*s.*, to which was to be added 5,612*l.* 4*s.* 3*d.*, surplus from the previous half-year making a total of 125,082*l.* 6*s.* 3*d.*; from this amount the directors recommended that a dividend of 5*l.* per share be declared; this would absorb 110,165*l.*, leaving a balance of 14,917*l.* 6*s.* 3*d.*, which it was resolved, in accordance with the report, to appropriate as follows:—income-tax for half a year, 3,653*l.* 17*s.* 10*d.*; depreciation and renewal of stock, 5,000*l.*—leaving to the credit of the present half-year the sum of 6,263*l.* 8*s.* 5*d.* A sum of 1,200 guineas was also ordered to be appropriated towards the church erecting at Crewe.—The meeting of the North Union company was held last week, when the usual dividend of 2*l.* 10*s.* per share was declared to the proprietors. The receipts were 30,107*l.* 5*s.* 3*d.*, the expenditure, 14,181*l.* 7*s.*, leaving a surplus of 15,925*l.* 18*s.* 3*d.*, from which the dividend was to be paid. The small balance of 78*l.* would be carried to the next half-year's accounts, which are expected to be more encouraging, the revenue of the company on the present occasion showing a decrease of 4,000*l.* compared with the corresponding period of 1841—the late disturbances in the manufacturing districts having sensibly affected the traffic on the line.—The half-yearly meeting of the proprietors of the Brighton Railway has been held this week. The report shows the ascertained cost of the line to be 2,580,645*l.*, and the further probable liabilities 50,322*l.*; making the total cost of construction 2,630,967*l.* The amount of additional capital required being 29,881*l.* The total revenue 120,600*l.* Under these circumstances, the directors express their regret that they cannot recommend the present dividend to exceed 20*s.* per share. The further capital required, of 29,881*l.*, is stated to have arisen from increased expenditure at the London-bridge station, the purchase of additional engines, carriages, &c. The draft of a bill has been prepared to raise a loan of 300,000*l.* on the loan notes of the company, and to reduce the number of directors. The total expenses of the line for the half-year, including interest and expenses on debentures and loan notes, are 79,170*l.* 17*s.* 8*d.* A vote of want of confidence in the directors was passed, together with a resolution that the whole of the present directors be required to resign after the passing of the new Bill. The state of affairs of this railway, exhibited by the report, has been viewed very unfavourably in the market, and the shares have fallen nearly as much as 2*l.* each.—The directors of the Midland Counties Company have issued their reply to the report of the Committee of investigation, in reference to their management. They state that the principle of the reductions proposed has already been put into operation, not on the suggestion of the report, but from the result of inquiries instituted by a sub-committee of their own board. The facts brought forward are generally considered to remove the unfavourable impression previously entertained of their management.

IRELAND.

Dublin.—The Lords of the Treasury have returned an unfavourable answer to the memorial of the Royal Dublin Society, praying their Lordships to recommend to Parliament two supplementary estimates for the sums of 2,800*l.* and 4,000*l.*; the former for the completion of certain alterations and buildings on premises adjoining Leinster House, intended for a new museum; and the latter for the purpose of erecting new conservatories and other buildings in the Botanic Garden. In their reply, their Lordships refer to the rapid and progressive diminution of the members of the Society, and state that they cannot but view this as an indication of the little interest which the educated portion of society in Dublin, compared with

that of other great towns, take in the support of the objects of such an institution. It gives rise, moreover, in their opinion, to grave doubt as to the future ability of the Society to raise any adequate revenue for the support of their necessary establishments. Their Lordships, therefore, in the words of their reply, "feel that, if they should undertake what is now proposed, which is, in fact, little short of making a new botanical garden by rebuilding extensive conservatories and lecture-rooms, the sums to be provided would not be limited to that which has been stated in the estimate, or even to that which the erection of such buildings might ultimately cost; but that they would hereafter have to adopt one of two alternatives, either the providing the whole sum required for their maintenance, when erected, and for their application to useful instruction; or, after incurring all the expense of building, to permit the whole establishment of the botanical garden to fall into decay. Considering also the number and extent of literary and scientific institutions in other large towns of the United Kingdom, and the comparatively large amount of private contributions raised for their maintenance, their Lordships cannot but feel that a compliance with the request of the Dublin Society for a grant of 4,000*l.* for their botanical garden alone would be viewed with just jealousy by others, to whom grants of money have been refused, and be at once a precedent for unlimited concession in other quarters, and a check to individual subscription in all." For these reasons, they do not deem it advisable to recommend to Parliament the grant proposed by the Society.—The opposition to the Poor Law is gradually increasing in various parts of the country. In addition to the late meeting in this city, meetings have been held in Tyrone, Fermanagh, Limerick, Cork, and Clare, some demanding total repeal, others seeking such amendments as may better adapt the law to the peculiar circumstances of Ireland. In Roscommon also a meeting has been convened, by requisitions signed by Peers of both political parties, followed by a long list of the leading gentry and clergy, Roman Catholic as well as Protestant, and no less than 13 Poor Law guardians.—The weather has been exceedingly severe in Dublin; the state of the Channel is described by the oldest seamen as having been dangerous beyond precedent, and great fears were entertained that many of the steam-boats from Holyhead would never have made the land in safety.—Lord Jocelyn has resigned the office of steward of the vice-regal household, and has been succeeded by Mr. Seymour.

Tipperary.—A man named Dwyer, charged with the wilful murder of Mr. James Scully's herdsman, was arrested on Sunday week. He had only been discharged a few days from Bridewell, on suspicion of being one of Mr. Scully's murderers. On Tuesday, of last week, a party of twelve armed men proceeded to the lands of Ballysheehan, near Clogheen, for the purpose of obtaining possession of some decrees which had been got by a Kerryman, for money due to him. The party placed sentinels at the adjoining houses; the owner of one of them, named Slattery, a respectable man, came out of his house, hearing that armed men were in his yard, when he was immediately shot, and died instantly. The murderers then seized the decrees, valued at 150*l.*, and have not since been heard of.

Cork.—The Earl of Rosse has given notice that the next general meeting of the British Association will be held in this city in the month of August.—The Rev. T. Foley, of Youghal, has published an account of a series of miracles now in operation at a convent in that town, which promise to equal the Alpine miracles witnessed and described by Lord Snrewsbury. He states that there is a young nun in the convent, a relative of his own, on whose hands, feet, and side are depicted the wounds of the Saviour; and that at the communion blood is seen to flow from those apparent wounds. He adds that many witnesses will verify the miracle upon oath; but the local papers mention, that in the present state of the affair, the clergy of the district have not come to a final judgment whether the appearances are supernatural or not.

Belfast.—In compliance with several requisitions, the Moderator of the Presbyterian Church has called an extraordinary meeting of the Assembly for Wednesday, the 15th inst. The subjects for consideration are, the state of the parent church, the marriage question, and the bicentenary fund. It is expected that, in regard to the latter subject, there will be a report from all the congregations.

Down.—The Bishop of Down and Connor, in reply to a memorial of lay members of his flock, has refused in positive terms to withdraw from the Church Architecture Society, which, it is alleged, is favourable to the adoption of Puseyite or Roman Catholic models and decorations. The reply of Dr. Mant is very long; it attributes the measure to the hostility of an individual, and declares his Lordship's opinion, that the object of the application was not only to vilify the society, but to place a bishop under the dictation of his clergy, in opposition to all ecclesiastical discipline. "I am bound," he says, "by a sense of duty to the Church Architecture Society, to yourselves, likewise, gentlemen and brethren, to the diocese in general, to the Church at large, and in all, to the great Head and Guardian of the Church, not to suffer my office to be thus depreciated, insulted, set at nought, and trampled on by a subordinate minister."

SCOTLAND.

Edinburgh.—The Commission of the General Assembly have presented a petition to the House of Commons on the subject of the differences which have so long agitated the church of Scotland. It gives a long and minute analysis of the statutes of the Scottish Parliament, by

APPELIUS & EICHEL, Florists, &c., Erfurt, Prussia, having received an order for different SEEDS without signature, and the post mark being unintelligible, think this advertisement offers a chance of ascertaining the name and address of the parties, and beg that application will be made at the Office of this Paper.

MOSES, &c.—For SALE, a few Packets of rare Scottish CRYPTOGRAMIC PLANTS, chiefly Alpine, each Packet (price 5s.) containing 60 species of Mosses, Lichens, and Hepaticae, carefully named and localised. A Packet or two (price 10s.) containing 120 species each, may be had. Also, a few Packets of Mosses for Beginners (5s. each) containing 60 species illustrative of the principal British Genera, affording to young Gardeners and others an easy opportunity of becoming acquainted with this beautiful tribe. Can be sent by post to any part of the kingdom, and payment transmitted by Post-office order. Early application is requested, addressed Wm. GARDINER, 40, Overgate, Dundee.

W. G. can also still admit a few more Subscribers to his intended Distribution of Plants this season from the Clova, Braemar, and Cairngorm Mountains, &c. Terms, 2l. for a parcel of 500 specimens, Phenogamic and Cryptogamic; and, to accommodate those wishing a small number, a few parcels of 250 specimens will be prepared at 1l. each to Subscribers. Dundee, Feb. 4, 1843.

GEORGE CHARLWOOD, SEEDSMAN, 14, Tavistock-row, Covent-Garden, begs to announce to his Friends and the Public that he has received his usual extensive supply of GERMAN STOCKS, ASTERS, and BALSAMS, &c., which he begs to offer at the following reduced prices:—

GERMAN STOCKS.			
50 var. of 300 seeds each	40s	48 var. of 100 seeds each	15s

Wallflowers, Larkspurs, Scarlet and Purple Giant Stocks, 1s. per packet each.

German Carnation, from the finest collection, 100 seeds, 2s. 6d. per packet.

French Carnation, 1s. per packet. Do. Picotee, 1s. per packet.

Together with the following New and Scarce Flower Seeds:—

Anagallis azurea grandiflora	Ipomopsis elegans
Argemone grandiflora	Lychnis fulgens
Brachycome ibidifolia	Leucaria senecioides
Campanula pulcherrima	Lobelia begonioides
Cacalia aurea	" fulgens
Clintonia pulchella	" splendens
" elegans	Martynia proboscidea
Calceolaria from superb vars.	Oenothera Drummondii
Cynoglossum glochidiatum	" macrocarpa
Euphorbia variegata	Pentstemon cobaea
Gaillardia picta coccinea	" gentianoides fruticosa
Gloxinia rubra	Portulaca Thellusonii
" speciosa	Phlox Drummondii
Hebeaurelia tenuifolia	Podothea capitata
Hibiscus Manihot	Rhodanthe Mangelsii
Ipomoeas in many varieties	Schizopetalon Walkerii
Isotoma axillaris	Thunbergia, 4 varieties

G. C. begs to state that he is in daily expectation of a further supply of American Tree and Shrub Seeds, when his Catalogue will be immediately printed.

TO NOBLEMEN, GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to Public competition at the Auction Mart, Bartholomew Lane, on Friday, Feb. 17, and Tuesday, 21st, 1843, at 12 o'clock, about 300 Double CAMELLIAS, from one to four feet, the whole beautifully furnished with bloom buds, Fine Hybrid Rhododendrons, Magnolias, Azaleas, Andromeda floribunda, Kalmias, &c.; Standard and Dwarf Roses of the best varieties. Also a splendid assortment of Dahlias. The Camellias will be sold on Friday, the 17th. May be viewed the morning of sale. Catalogues had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

ANNUITIES.—In the AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuity holders participate in the profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its funds at a high rate of interest.

DIRECTORS.
Edward Barnard, Esq., F.R.S. C. E. Mangles, Esq.
Henry Buckle, Esq. J. B. Montefiore, Esq.
John Henry Capper, Esq. J. H. Ravenshaw, Esq.
Gideon Colquhoun, jun., Esq. William Walker, Esq.

BANKERS.—Union Bank of London.
COLONIAL BANKERS.—The Bank of Australasia (incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

SECRETARY.—Edward Ryley, Esq.

SOLICITORS.—Messrs. Swain, Stevens, and Co.
Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

WIRE-WORK, HOT-WATER APPARATUS, GREEN-HOUSES, &c.

ST. THOMAS BAKER, MANOR-HOUSE, MANOR-PLACE, KING'S-ROAD, CHELSEA, Manufacturer of IN-VISIBLE WIRE FENCE, to resist Grazing Stock, and rendered Rabbit-proof. WIRE-WORK in Trainers, Arches for Walks, Bordering, Flower-stands, Pheasantries, &c. HORTICULTURAL BUILDINGS, Green and Hothouses, Conservatories, &c. The same heated by HOT-WATER APPARATUS, on improved and economical principles.

Parties waited on in Town or Country, and Drawings and Estimates free. Work for the Trade as usual.

BONE MANURE. ADULTERATION DETECTED.
The extent to which Bone Manure is adulterated is so great as to render it imperative upon the Farmer to ascertain, by chemical analysis, the quantity of PURE BONE it contains.

W. H. POTTER undertakes to examine any Sample that may be submitted to him, and within two days after the receipt thereof, to return the correct percentage of PURE BONE. Mr. Potter's charge is 5s., which should be enclosed with an average sample, say 1lb., and sent (carriage paid), to the Artificial Guano Works, 28, Upper Fore-street, Lambeth, where Unadulterated Bone may be had, either in dust or 4-in. pieces.

* * * Mr. POTTER examines every species of Artificial Manure, and reports upon them at the above charge. Soils very carefully analysed.

NEW BOOKS AND NEW EDITIONS

PUBLISHED BY

JOHN W. PARKER, WEST STRAND.

LIFE AND CORRESPONDENCE OF THE LATE SIR ASTLEY PASTON COOPER, Bart. From Documents bequeathed by him for the purpose.

By BRANSBY B. COOPER, Esq., F.R.S.

Two Volumes 8vo, with Portrait, from the Original Picture by Sir Thomas Lawrence, 21s.

AN INTRODUCTION to the STUDY of CHEMICAL PHILOSOPHY; being a preparatory view of the Forces which concur to the production of Chemical Phenomena. By JOHN FREDERICK DANIELL, F.R.S., Professor of Chemistry in King's College, London. With numerous Illustrations, the 2nd Edition, revised and much enlarged. 21s.

PRACTICAL CHEMISTRY for FARMERS and LANDOWNERS. By JOSHUA TRIMMER, F.G.S. 5s.

By the same Author, 8vo, with Two Hundred Illustrations, 12s.
PRACTICAL GEOLOGY and MINERALOGY, and the CHEMISTRY of METALS, with an Introductory Discourse on the Nature, Tendency, and Advantages of Geological Pursuits.

THE DOMESTIC GARDENER'S MANUAL; being an Introduction to Practical Gardening, on Philosophical Principles; to which is added, A NATURALIST'S CALENDAR, and an Appendix on the Operations of Forcing, including the Culture of Vines in Pots. By JOHN TOWERS, C.M.H.S. Second Edition, Enlarged and Improved, One large Volume, 8vo, 13s.

ROSES IN POTS.

THE GARDENER and PRACTICAL FLORIST, No. XXVII., price 3d., will contain a Complete Treatise on the Culture, Management, and Exhibition of Roses in Pots, by GEORGE GLENNY; together with the usual variety of Articles on Horticulture and Floriculture by the Editor.

* * * Four Postage-stamps sent to the Publisher, R. GROOMBRIDGE, 5, Paternoster-row, will secure the free delivery of this Number per Post.

THE ILLUSTRATED

POLYTECHNIC REVIEW, No. VI., for Saturday, February 11th, will contain:—The Editor's Reply to the Athenaeum of Saturday last—Anatomy, in its application to the Fine Arts, by H. J. Townsend, Esq., R.C.S., No. 2—The Exhibition of the British Institution—Reviews—Notices of Science, Music, Theatricals, &c. Price 5d. stamped for post, 4d. unstamped. Office, 143, Strand.

S. GIRLING'S CATALOGUE OF ENGLISH AND FOREIGN DAHLIAS can now be had on prepaid application. It contains as well, a List of Fuchsias, Pelargoniums, Pansies, and Verbenas, any of which S. G. will be happy to receive orders for; and pledges himself to supply early plants correct to name, and on liberal terms where a quantity is wanted. The trade liberally supplied.

Dane Croft Nursery, Stowmarket, Suffolk.

GARDEN NET.—New Garden Net, viz., Herring Net, one-inch mesh, made with machinery, 1½d. per yard in any length or width. Old Fishing Net, properly mended up, in lengths 30 or 40 yards, 8 and 10 feet deep, 3d. per yard square. Woollen and Worsted Net, fine Blossom and Wasp Net, made from Hemp, Bunting, Screens, &c. &c. Woollen Tie for Flowers. Also Sheep-folding Nets, Fishing Nets, Rabbit and Hare Nets. Nets for Fences against Rabbits, Dogs, Poultry, &c., 2d. per yard; also for covering in Poultry yards, Pheasantries, &c., 2d. per yard. Superior expanding Tents for Lawns, &c., 5l., 36 feet round. Tarpaulins for Wagon and Stack Covers, Garden frames, &c., 2s. per square yard made up.

ROB. RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New Road, near Euston-square, London.

N.B.—1600 London Policemen's Capes for Farmers' Servants, 1s. 9d., 2s., and 2s. 6d. each.

SHIRLEY VINEYARD, near Southampton.—The Proprietor of this Establishment respectfully announces that he has now made sufficient progress in it to enable him to commence, forthwith, a series of experiments of a most important character, and on an extensive scale, relative to the Culture of the Vine under Glass; the object of which will be to free that interesting and valuable branch of Horticulture from the difficulties and uncertainty which have hitherto surrounded it, and to place it on such a basis, as to ensure the production of very superior fruit, with ease, certainty, and economy.

In the prosecution of this design, and in that of cultivating the Vine on open walls; and also in the propagation of Vine Plants in the nursery department of the Vineyard, he is desirous of having associated with him a few respectable Youths, as Articled Pupils, who, in addition to being taught the most improved mode of Vine Culture in all its various branches, and (as necessarily involved in it) the Theory and Practice of all the grand Principles on which the delightful Science of Horticulture is based, will also enjoy a great number of valuable EDUCATIONAL ADVANTAGES, of a sterling practical character, and such as, in combination with the above, will enable them, with industrial application, to occupy, at the expiration of their pupilage, a superior and independent rank in society.

To Parents who are desirous of providing for their Sons the knowledge of a superior and profitable pursuit, in preference to their becoming dependent on the precarious issue of mercantile or trading occupations, the opportunity thus offered may be considered as highly deserving of their attention.

As the Pupils will be considered as members of the family, and treated in every respect in the most liberal manner, a suitable Premium will be required.

Applications, personally or by letter, may be made to Mr. CLEMENT HOARE, at the Vineyard.

It is intended to limit the number of Pupils for the present to four, and Mr. H. will be ready to receive them in the ensuing month of March. February 8, 1843.

NOTICE.—All Persons having any CLAIM upon the ESTATE of the late Mr. MICHAEL WATERER, Nurseryman, Knaphill, Herts, Surrey, are requested to send in their Accounts without delay; and all persons indebted to the said Estate are requested to pay the same to HOSIA WATERER, Knaphill, or to JAMES WATERER, Chertsey, Executors to the deceased.

ROWLAND'S ODONTO, or PEARL DENTRIFICE.

A Vegetable White Powder, prepared from Oriental Herbs of the most Delicious Odour and Sweetness, and free from any mineral or pernicious ingredient—it eradicates Tartar from the Teeth, removes decayed spots, preserves the Enamel, and fixes the Teeth firmly in their sockets, rendering them beautifully white. Being an anti-scorbutic, it eradicates Scurvy from the Gums, strengthens, braces, and renders them of a healthy red; it removes unpleasant tastes from the mouth, which often remain after fevers, taking medicine, &c., and imparts a delightful fragrance to the breath.—Price 2s. 9d. per box, duty included.

ROWLAND'S ALSANA EXTRACT immediately relieves the most violent Toothache, Gum-boils, Swelled Face, &c.; it is also an excellent Stomachic, in cases of Flatulency, Spasmodic Affections, &c., and gives instantaneous relief.—Price 2s. 9d., 4s. 6d., and 10s. 6d. per bottle.

NOTICE.—A. ROWLAND & SON, 20, HATTON-GARDEN, LONDON, is engraved on the Government Stamp, which is pasted on each article; also printed, in red, on the wrapper of the latter. Sold by them, and by Chemists and Perfumers.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed, to the Editor.—Saturday, February 11, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 7—1843.

SATURDAY, FEBRUARY 18.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Amorpha, belladonna, its treat- ment	85 b	Manure, an economical method— of aving	83 a
Amorpha, Garden	84 b	— remarks on	83 b
Ammonia, turmeric as a test for Arbutus, to remove	83 c	— waste of	83 a
Arbutus, to remove	83 c	Manuring with green crops	84 a
Bees, Wighton's remarks on	89 b	Moreduin, noticed	87 c
Boiler, Stephenson's double cy- lindrical	87 b	Naturalist's Corner	87 b
Books on land-surveying	89 c	Oak, Baloot, remarks on	85 a
Canker, to cure	89 b	— evergreen, to prune	89 b
Carrots, Belgian, yield best when thickly sown	86 a	Olive, ancient method of grafting	84 c
Cham, as a green manure	89 b	Oxalis Bowei, its treatment	89 b
Climbers, for a conservatory	89 b	Paint, from Potatoes	86 b
Conifers, manures injurious to	89 a	Pears, for standards	89 b
Conservatory plants	88 a	Perennials, for pot culture	89 b
Cottagers, cheap method for them to prepare manure	83 a	Planting, remarks on	84 a
Crow-foot as a green manure	84 b	Red-spider, to destroy	89 a
Dahlia, its qualifications	86 b	Rose de L'Isle, a good stock for budding on	83 a
Doyle's Cyclopaedia, rev.	87 c	Roses, remarks on exhibiting	89 b
Drainage Bill, remarks on	86 b	— for the open border	89 b
Filberts, to train	89 b	— their treatment in pots	89 a
Fish, gold, their hardiness	85 c	Shrubs, ornamental	89 a
Fuchsias, for the open ground	85 c	— for planting under trees	89 a
Gas lime, to apply	88 c	Soapsuds, to convert into manure	88 c
Grafting, as practised by the an- cient	84 c	Spade-husbandry, implements for	88 c
Grasses, for pasture	84 c	Spirits of tar, when to apply	85 a
Guano, native, remarks on	86 a	Stove plants, list of	88 a
— price of	88 c	Sulphate of lime, as a fixer of ammonia	88 c
Gypsum, as a fixer of ammonia	83 c	Tansy, as a green manure	86 a
Hort. Soc. Gardens, admission of workmen to	89 c	Tan, to convert into manure	88 c
— Rooms, to exhibit plants at	89 c	Timber, best time to strip the bark from	85 a
Ivy, as a covering for houses	89 c	Trellis for climbers	84 b
Magdeburg acre, its contents	84 a	Vitriol, green, to use	88 c
		Ward's Cases, plants for	89 c
		Walls, to sweeten	86 b
		Worms, destroyed by corrosive sublimite	85 a

FUCHSIA TODDIANA.

THOS. CRIPPS, Florist, &c., Tonbridge Wells, Kent, respectfully informs his friends that he has purchased of Mr. Todd (late Gardener to CAPT. MONYPENNY, and raiser of the Fuchsia "Monypenny") the above extraordinarily beautiful and distinct variety of this now justly-esteemed and popular class of Flowers, specimens of which were submitted to the inspection of the Editor of the *Gardeners' Chronicle*, in August last, under the initials "A. B.," the opinion of which was as follows:—
"A. B.—Your Fuchsia is one of considerable beauty, and differs in the great length of the divisions of the calyx from any which we have yet seen. Its colour is also bright, and not dimmed with that dirty tinge which usually prevails amongst this class of flowers."—*Gardeners' Chronicle*.

After the opinion of so distinguished an authority, it would be useless to attempt further to extol the merits of this charming flower than to state its size and colour; the latter of which is—calyx, a very bright red, with corolla of a pale puce; and the former excels that of any other Fuchsia extant, being nearly four inches in length, and of proportionate magnitude, the plant itself being of a most vigorous growth, and foliage beautiful.

Coloured engravings of it may be seen at Mr. CHARLWOOD'S, Seedsman, Covent Garden; Mr. LOWE'S, Clapton Nursery; and Mr. PAWLEY'S, White Hart Inn, Bromley, Kent; at which places, and of Mr. HARRISON, Downham, Norfolk, orders will be received for plants, to be sent out at the end of April, at 10s. 6d. each, with the usual discount to the trade, if six or more are taken at once. As small plants can be safely transmitted through the post, by forwarding a Post-office order for 10s. 6d. persons will have them sent free of postage. All the new Fuchsias can be had at the same time. Strong plants of Manettia bicolor, the new Greenhouse Climber, 10s. 6d., are now ready.

A Catalogue of T. C.'s extensive collection of Roses can be had on application, enclosing two Postage-stamps.

GEORGE CHARLWOOD, SEEDSMAN, 14, Tavistock-row, Covent-Garden, begs to announce to his Friends and the Public that he has received his extensive supply of GERMAN STOCKS, ASTERS, and BALSAMS, &c., which he begs to offer at the following reduced prices:—

GERMAN STOCKS.			
50 var. of 300 seeds each	40s	48 var. of 100 seeds each	15s
50 " 150 " "	20s	35 " 100 " "	12s
50 " 100 " "	15s	24 " 100 " "	8s
25 " 300 " "	20s	18 " 100 " "	7s

Wallflowers, Larkspurs, Scarlet and Purple Giant Stocks, 1s. per packet each.

German Carnation, from the finest collection, 100 seeds, 2s. 6d. per packet.

French Carnation, 1s. per packet. Do. Picotee, 1s. per packet.

Together with the following New and Scarce FLOWER SEEDS:—

Anagallis azurea grandiflora	Ipomopsis elegans
Argemone grandiflora	Lychnis fulgens
Brachycome iberidifolia	Leucaria senecioides
Campanula pulcherrima	Lobelia begoniaeolia
Cacalia aurea	— fulgens
Clintonia pulchella	— splendens
— elegans	Martynia proboscidea
Calceolaria from superb vars.	Oenothera Drummondii
Cynoglossum glochidiatum	— macrocarpa
Euphorbia variegata	Pentstemon cobaea
Gaillardia picta coccinea	— gentianoides fruticosa
Gloxinia rubra	Portulaca Theilusonii
— speciosa	Phlox Drummondii
Hebenstretia tenuifolia	Podothea capitata
Hibiscus Manihot	Rhodanthe Manglesii
Ipomoeas in many varieties	Schizopetalon Walkerii
Isotoma axillaris	Thunbergia, 4 varieties

G. C. begs to state that he is in daily expectation of a further supply of American Tree and Shrub Seeds, when his Catalogue will be immediately printed.

CULTIVATION OF PINES WITHOUT POTS.

One of the many advantages derivable from the "Tank System of Heating" is the easy practicability of Cultivating Pines without Pots, an object of paramount importance to the cultivators of this delicious and much esteemed Fruit.

A Treatise, with Engravings, will shortly be published, containing every information to set up or adapt the apparatus, with cost of materials, fixing, &c. Price 5s. each copy. Orders are requested forthwith to be sent to Mr. WM. RENDLE, Union-road Nursery, Plymouth.—Feb. 15th, 1843.

LIVERPOOL BOTANICAL INSTITUTION.

EXHIBITIONS at the GARDEN for the year 1843.—The Exhibitions will take place on Friday, May 5, Friday, June 23, and Friday, September 8, when the following Prizes will be awarded at each Meeting.

CLASS I.		No. of Plants to be exhibited.		Amount of Prizes.		
Letters for Exhibition.		By Nurseriesmen.	By Private Growers.	First.	Second.	Third.
A	Greenhouse Azaleas in collections, not more than 2 plants of a sort	6	3	15	0	10

Total £16 0						
EXTRAS at discretion of the Judges				£4	0	
Grand Total to be contended for at each Meeting				£70	0	

Exhibitors will be required to sign a declaration that all Plants exhibited have been in their possession Two Months; also, that all Flowers, Fruits, and Vegetables exhibited, are of their own growth and production; and if such declaration cannot or shall not be duly signed, the Premiums awarded will be withheld; and all Fruit must be set out in dishes with leaves, the same as if served up for Desert.

In order to facilitate the regulations as far as possible, in cases of specimens brought from a distance, arrangements will be made to receive all such as shall be brought during the afternoon of the previous day, into one of the greenhouses of the Institution, which will be cleared for the purpose.

A printed copy of the regulations (which resemble as closely as local and other circumstances will permit those of the Horticultural Society of London) may be had by application to Mr. SHEPHERD, the Curator at the Garden; or to

JOSEPH DICKINSON, M.D., Hon. Secretary, 24, Great George-square, Liverpool. Jan. 27, 1843.

N. GAINES, FLORIST, SURREY-LANE, BATTERSEA, begs to inform the Nobility, Gentry, and others, that his STOCK of PELARGONIUMS now ready for sending out are strong healthy plants. The following are a few of his Seedlings, which have been proved, and can be recommended, viz.:

PELARGONIUMS.	
Gaines's Duchess of Sutherland	42s
— land	63s
— Pride of Surrey	63s
— Orange Perfection	63s
— Amulet	63s
— Lady Sale	42s
— Emperor Superb	42s

DAHLIAS.	
Gaines's Lord Prudhoe—dark crimson	10s 6d
— Lady Prudhoe—blush white	7 6
— Lady Duncannon—blush, shaded with lilac	10 6
— Lady of the Lake—Peach blossom	10 6
— Venus—clear white	10 6
— Surpasse Primrose—fine large primrose	7 6
— Elegans—rosy purple	10 6
— Golden Yellow—bright yellow	7 6

Catalogues of Pelargoniums, Dahlias, Pansies, Calceolarias, Verbenas, Fuchsias, &c., may be obtained by applying as above. Feb. 2, 1843.

FLORISTS TO HER MAJESTY, THE QUEEN DOWAGER.

BEAUTIFUL AND DISTINCT FUCHSIAS.

YOEUELL AND CO., in submitting their Catalogue of Fuchsias for 1843, take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attended their mode of selecting last season's collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOEUELL and Co. also feel desirous of calling attention to their peculiar method of executing orders for this tribe of plants; namely, that they will deliver them free of postage, on the receipt of a post-office order, to any part of the United Kingdom, in the first week of April next, in collections, upon the following terms: Twelve fine show varieties 12s. Twelve extra fine show varieties 16s. Twelve extra fine ditto 21s.

The selection being left to YOEUELL and Co.

DESCRIPTION OF FUCHSIA ST. CLARE.

This magnificent Fuchsia was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOEUELL obtained the entire stock. In May last it was submitted to Dr. LINDLEY for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month, as follows:—"Your Seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus." As a proof of its being a most profuse bloomer, Y. & Co. had a plant in flower on Sept. 15, 1842, on one branch of which were upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower-garden. Price 10s. 6d. per plant, sent free of postage to any part of the United Kingdom.

Nurserymen who have not ordered Plants will have their names added to this list as soon as received.—Slough, Feb. 16.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON, and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842:—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—From the *Gardeners' Chronicle* and *Gazette*.

Also obtained the following prizes:—No. of Blooms Exhibited.
1st prize at Hull, Aug. 30th 12
1st prize at Beverly, Sept. 7th 2
Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th 4
1st prize at Leeds, Sept. 21st 12
1st prize at Newcastle, Sept. 21st 6
1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th 6
1st prize at the York Floral and Horticultural Society, Sept. 28th 18
1st prize at the York Floricultural Society, Oct. 1st 12
1st prize in its class as the best white or blush, ditto.
Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10s. 6d.

All orders addressed J. EDWARDS, Layerthorpe, Florist, Nursery and Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

SEEDLING RANUNCULUSES.

Messrs. TYSO & SON, WALLINGFORD, beg to inform those gentlemen who may be unacquainted with their seedling Ranunculuses, that they have made a selection of 25 superb kinds, whose quality has been tested at various Horticultural Exhibitions. The assortment named below contained specimens in most of the classes; these varieties are of vigorous habit, and are recommended as fine Show Flowers to those desirous of cultivating for competition. Yellow-edged class: Edgar, Herbert. Yellow-spotted: Alexis, Saladin, Comptroller. Yellow mottled: Competitor. Yellow: Dictator, Raphael. Buff spotted: Felix, Maurice. Buff edged: Basilica, Cyrus, Vendome. Buff mottled: Adolphus, Beula. White-edged: Attractor, Orlando. White spotted: Eureka, Luna. White mottled: Cathcart, Orsippus. White: Hermon. Various: Amasis, Jubal, Regent.—Price of the 25 sorts, 4l., being 25 per Cent. under the Catalogue price, if taken singly.

Messrs. T. & Son's General Descriptive Catalogue for 1843 may be had GRATIS, and will be sent prepaid to persons enclosing a twopenny postage label.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, Nurseryman, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undervalued low prices—including the following: Fuchsia—Conspicua arborea (Cattleg's), Venus victrix, (Cripps), rosea alba, Money-penny, magnifica, racemiflora, &c. Also the following distinct Verbenas:—Queen, Aurora, Stewart, variegata, Mortlock's Superb, Burleyana, &c. &c. Fuchsia, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents.

W.M. obtained a Prize of 10l., open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

LARCHES.

RICHARD SMITH, NURSERYMAN, Worcester, has about 300,000 TRANSPLANTED LARCHES, from 1½ to 2ft., and also from 2 to 3 ft., of first-rate quality, to be disposed of, at very moderate prices.

ORANGE AND LEMON TREES, JASMINE PLANTS, and TUBEROSE ROOTS.—A Choice Collection of the above-named Trees, varying from 3 to 6 feet in the stem, and from 10s. to 30s. each, has just been received from Italy, and, together with the Catalonian and Arabian Jasmine Plants, and Double Italian Tuberose Roots, may be seen at A. COBBETT'S late Mr. C. BARRON'S, Italian and Foreign Warehouse, 18, Pall Mall.—N.B. Packed carefully, and sent to any part of the Kingdom. Also Importer of fine Lucca Oils, Parmesan and Gruyere Cheese, Gorgona Anchovies, Macaroni, &c. &c. Lists with Prices may be had, &c.

PINE PLANTS for SALE, HEALTHY and CLEAN.—About 1000 Fruiting and Succession Pine Plants to be sold; a great Bargain.—For particulars apply on the Premises, S. ROSLING'S, Peckham Rye Terrace.

PATRONIZED BY HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, AND MANY OF THE NOBILITY.

THE FASTOLFF RASPBERRY.—For many years past there has been cultivated in the neighbourhood of Yarmouth, adjacent to the ancient Castle of Sir John Fastolff, a red Raspberry of a most extraordinary size and rich flavour. The Nobility who visit the sea-coast here have invariably expressed their astonishment at the exceeding fineness of the fruit of this variety, and until lately YOUELL and Co. have not been enabled to obtain a sufficient stock of it to bring it into public notice; but having now obtained a supply (although limited) of fine Canes, beg to offer them on the following terms, and they can be sent with safety to any part of the United Kingdom, on the receipt of a Post-office order.

Packages containing 50 Canes, 25s.—Packages containing 25 Canes, 14s.—Package included.

The few to whom YOUELL and Co. have sent it, have expressed their high admiration of its superiority over other varieties; and a letter just received from a Gentleman in Derbyshire, to whom this variety was sent, states that it invariably takes prizes at the Hort. Shows in his neighbourhood. In conclusion, YOUELL and Co. beg to state that they have not, nor do they intend to recommend any article but that which they can do with confidence; and in this instance they feel fully assured of its giving the most entire satisfaction.—Great Yarmouth Nursery, Norfolk, Jan. 26, 1843.

FLOWER-SEEDS, 36 packets, 10s., 18 do., 5s., forwarded postage-free to any part. Apply to Mr. Brown, Curator, Botanic Garden, Colchester. Any preferred species may be specified in the order. A mixed selection, containing 30 varieties, for sowing indiscriminately on Borders, 5s. Pelargonium, Petunia, and Heliotropium, 1s. per packet.—P.S. Enclose a Post-office order or Stamps.—Feb. 1st, 1843.

HARDIE'S EARLY CANTALOUPE MELON.

WM. HARDIE begs to inform Melon-growers that he has still a quantity of his very superior EARLY MELON SEED to dispose of; to be had of him at J. JARRETT'S, Esq., Carneston Court, near Bath; or of Mr. J. CARTER, Seedsman, 238, High Holborn, London, at 2s. 6d. per packet—will be forwarded directly on receipt of the order for the money. This is the time to sow it, to know its qualities; if it is sown now, it may be had on the 1st of May. I warrant it to set its fruit under the most adverse circumstances in which a Melon-plant can be placed; it has been shown at Chiswick these last two seasons in May. I cut 60lbs. weight of fruit from three plants last year, from two crops; with attention I have taken three crops from the same plants. The flavour is excellent, and it may be grown to 6lbs., according to the number of fruit on each plant.

NEW AND CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, and Co., have a large Stock of all the newest and choicest Flower Seeds, to the cultivation of which great attention has been paid, and which are this season more than usually fine. L. P. and Co., can therefore with confidence recommend them, as being in every respect to be depended on; and beg leave to offer for sale,

25 packets	for	15s.
50 do.		25s.
100 do.		35s.
150 do.		42s.

Delivered, carriage free, to any part of the kingdom. Catalogues may be had on application as above.
Exeter Nursery.

APPELIUS & EICHEL, Florists, &c., Erfurt, Prussia, having received an order for different SEEDS without signature, and the post-mark being unintelligible, think this advertisement offers a chance of ascertaining the name and address of the parties, and beg that application will be made at the Office of this Paper.

HOME-GROWN SEEDS.

Messrs. SUTTON and SONS respectfully acquaint those readers of the *Gardeners' Chronicle* who have not yet hitherto honoured them with their commands, that their grounds, being situated at considerable distances from each other, and of different soils, they are enabled by strict attention to grow Garden-Seeds true to their kinds, and can supply their Customers with Seeds which they know to be new, thereby preventing disappointment in the crops. The Annual Seed Catalogue is now published, and may be had gratis on application.

The following articles are particularly recommended:—*£ s. d.*
100 Ranunculuses, in 50 fine varieties by name 1 5 0
50 do., in 50 do. 0 15 0

The most approved kinds of Kitchen Garden Seeds, in a complete collection for a Nobleman's or Gentleman's family 2 2 0
Ditto, ditto, for a smaller Establishment 1 1 0

Ditto, ditto, of Flower-Seeds, containing all the new kinds worthy of recommendation; together with the best of the old sorts, with instructions inclosed 1 10 0

Ditto, in smaller collection, equally choice 1 1 0
Ditto, ditto, ditto 0 10 6
Double Italian Tuberoses, fresh imported, per dozen 0 4 0

J. S. and SONS, having a stock of all the new kinds of Kitchen Garden and Flower-Seeds, they will be included in the above collections; or they may be obtained separate, according to order, at moderate prices.

N.B.—Parcels delivered free to the Railway-station, or any part of London.—Reading Nursery, Berkshire, Jan. 28th.

ECONOMIC LIFE ASSURANCE SOCIETY,

No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON.

Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The Bonus declared in 1834 amounted upon an average to 16½ per cent. on the premiums then paid; and in 1839 a second Bonus was awarded, amounting on the average to 31½ per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.
By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

WANTED one or two respectable Young Men in an established Seed-house in London. They must be of active and persevering Habits, good Address, well acquainted with the general Seed and Nursery Business, and may be required to travel. Security will be required. Address to WARNER'S Seed Warehouse, 3, Lawrence-Poultny Lane, Cannon-street, London, stating age, present occupation, and other particulars. Personal Application not attended to.

WANTS a SITUATION as GARDENER, a steady active man, a native of Scotland, without incumbrance, age 38, who thoroughly understands his business; can give a satisfactory reference to the gentleman he is leaving. Can take charge of a small farm or Forest work, if required. Direct to A. B., Mr. BLOCKLEY'S, stationer, 8, Seymour-place, Camden-town.

WANTS a SITUATION as GARDENER, or GARDENER and BAILIFF, a respectable middle-aged married Man, without incumbrance, who has acquired a thorough practical knowledge of his Business in every department. Testimonials as to his superior fitness can be obtained of Gentlemen and Men of Practice. Lived 5 years in his last place. Direct to F. DOVE, South Grove, Mile-end Road.

WANTS a SITUATION as HEAD-GARDENER, a married Man, age 30, without incumbrance, who perfectly understands the management of Hothouse and Greenhouse, and likewise Early Forcing and every department in general; and who can have 2 years' good character from the place he has just left. Direct G. H. MACPHERSON, Nursery, Plaistow, Essex.

WANTS a SITUATION as GARDENER, or GARDENER and BAILIFF, a steady single Man, aged 35, a native of Scotland, who understands Forcing, Pruning Vines and Peaches, and the Management of Land and Cattle. Address to M.C., Mr. PEACOCK'S, 104, Mount-street, Grosvenor-square.

WANTS a SITUATION, as GARDENER, in or out of the house, a single young Man, aged 25, who well understands Wall-trees, Framing, Greenhouses, Hothouses, and Kitchen-Garden, managing the Pleasure-ground, Flower-Garden, and Shrubberies. Can be well recommended from his last place, where he lived upwards of three years as undergardener. Direct to C. B. D., Mr. LANGLEY'S, Grocer, Roehampton, Surrey.

WANTS a SITUATION as GARDENER, a married Man, who can have two years' character from his employer; has no objection to take charge of a horse and chaise, if required; the country not objected to.—Address, W. CLARK, Mr. Elmkins, High-street, Homerton.

WANTS a SITUATION, as GARDENER, or GARDENER and COACHMAN, a respectable Young Man, without incumbrance, aged 33, with a four years' good character. Is fully capable of taking the management of Kitchen and Pleasure-garden, with Vinery, Greenhouse, &c.; can brew, and has been used to the management of Grass Land and Horses; would be at liberty at a short notice. His wife could act as Cook, and manage a small Dairy if required.—Address, A. B., at Mr. HOLT'S, Waterloo-street, Leicester.

AUSTRALASIAN, COLONIAL, and GENERAL LIFE ASSURANCE and ANNUITY COMPANY.

CAPITAL £200,000—IN 2,000 SHARES.

DIRECTORS:

Edward Barnard, Esq., F.R.S. C. E. Mangles, Esq.
Henry Buckle, Esq. J. B. Montefiore, Esq.
John Henry Capper, Esq. J. H. Ravenshaw, Esq.
Gideon Colquhoun, Jun., Esq. William Walker, Esq.

BANKERS—Union Bank of London.

COLONIAL BANKERS—Bank of Australasia (Incorporated by Royal Charter, 1836), No. 2, Moorgate-street.

PHYSICIAN—P. FRASER, Esq., M.D., No. 62, Guildford-street, Russell-square.

SOLICITORS—Messrs. Swain, Stevens, & Co.

SECRETARY—Edw. Ryley, Esq.

The Advantages offered to EMIGRANTS to the Australasian Colonies by this Company are,—First, That no extra Premium is charged for Residence in any of the Australasian Colonies, except in New Zealand. Second, That no extra Premium is charged to those who Assume for the whole term of Life, for one voyage out to the Australasian Colonies, and for one return voyage; and that Premiums may be paid and Claims settled in those Colonies. And to all Persons who wish to Assure their Lives, the Company offers unusually favourable Rates of Premium, participation in Profits, and the guarantee of an ample subscribed Capital.

Prospectuses and full Particulars may be obtained at the Offices of the Company, No. 126, Bishopsgate-street.

HORTICULTURAL BUILDING and HEATING by HOT WATER.

J. WEEKS and Co., ARCHITECTS, &c., GLOUCESTER-PLACE, KING'S-ROAD, CHELSEA, Hothouse Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING of HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing Houses 300 ft. in length.

Their improved plan of BOTTOM HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

WANTED to purchase, a clean Copy of the GARDENERS' CHRONICLE for 1841, bound or unbound. Address (stating price and condition) to J. N. MORTON, Bookseller, Boston.

The Gardeners' Chronicle.

WE rejoice to find, from a late Report of the "Institution for the Relief of Aged and Indigent Gardeners and their Widows," that the funds of the Society are in a prosperous state. The Committee have been enabled to purchase 200*l.* Three per Cent. Consols in addition to 400*l.* already funded in the three previous years; leaving, after the payment of debts, the sum of 47*l.* 12*s.* 1*d.* in the hands of their bankers. The total amount of subscriptions for 1842 was 249*l.*, showing an increased income of 61*l.* 16*s.* over that of the preceding year. It is announced that an election of two pensioners will take place on the 1st of June next, and that two more will be elected in the following January.

While we thus congratulate the Society upon its flourishing condition, we at the same time hope that, as it has for its object the welfare of distressed and meritorious individuals, it will continue to meet with that support which it so eminently deserves. Based on the best of principles—that of charity towards our fellow-creatures—such an institution if properly conducted, as there is no reason to doubt will be the case in the present instance, cannot fail to exert a beneficial influence. We therefore earnestly renew our appeal to every Gardener who has it in his power to subscribe his mite towards the assistance of his less fortunate brethren. In thus adding to the happiness of others, he will but increase his own; and he may in some measure be providing for himself, should an unexpected reverse of fortune overtake him at a future period.

Under the present judicious regulations it is scarcely possible that the funds of the Society should be bestowed upon any who are not really necessitous and deserving. Where, then, can the wealthy and charitable find a more fitting opportunity for following the bent of their kind dispositions than in seeking to alleviate the distress of their aged servants, whom infirmity and other misfortunes have thrown upon the world for support? We feel assured that this excellent Institution only requires to be more generally known to meet with still more extended patronage. It is conducted by honest men, for honest purposes; there are no hawks among them: and it deserves, in our opinion, not only all it has received, but a much more ample amount of receipt—provided always that it keeps itself clear of scampish managers.

THE slow and spontaneous decomposition of vegetable substances in the earth is the natural mode by which the soil is enriched. When the land has been long left entirely to itself, and all that is produced decays on its surface, the plants which are found to grow on it are of a richer and more succulent nature, in proportion to the time it has been thus accumulating fertility. Under very favourable circumstances, where moderate heat and moisture have concurred in producing luxuriant vegetation, where no floods have carried off the accumulated vegetable mould, and where a porous subsoil has not permitted the waters to stagnate, the black earth is so rich that to add manure to it would be to spoil it. It is already of too loose a texture, and an addition of the most barren clay, in a pulverised state, would increase its productiveness. Such soils are found on the banks of rivers, in uninhabited countries. The first settlers in Virginia found what they considered as land of inexhaustible fertility: for many years they had only to sow or plant, and to reap; weeding was the only thing which required attention. Many of these spots are now abandoned as absolutely barren. The accumulated humus has been long exhausted. The moisture is evaporated under a hot sun; and only the hardiest weeds will thrive in the soil. Very little care and foresight might have prevented this; the judicious addition of manures would have kept up the absorbent power of the humus; and, with very little trouble, the fertility might have been maintained for ever. This error is but too common; when land is in very good heart, a much smaller portion of manure will keep it so. One of the properties of humus, and also of all animal manures, is to attract moisture from the atmosphere; and on this, more than on its affording nourishment, depends the development of the embryo plant. Seeds want only a certain warmth and moisture to vegetate; the young

plants require no other food than that which is contained in the seed, until the seed-leaf is fully expanded and the rough leaf appears; heat and moisture then are the circumstances to be promoted. A small quantity of fermenting dung will excite the action of a great quantity of humus, which will actually generate heat and moisture: for it is well known now, that water is produced by a combination of the hydrogen and oxygen evolved in the decomposition of humus, at the same time that water is also evaporated by the leaves, and probably decomposed. Nature has provided a wonderful circle of decompositions and recombinations: we have only to watch her operations, and assist them by furnishing materials for her to work upon. Physiologists and chemists, by their researches, greatly assist the practical cultivator of the soil; but their love of classification and building systems often leads them into error. No sooner had vegetable mould, separated from the earths, become the object of experiments, than chemists discovered the composition of a substance to which they gave the name of *humic acid*, or *Umic acid*, composed of definite proportions of the elements of vegetable substances. Humic acid was immediately invested with the power of affording all the food plants required, and the heat and moisture produced in the decomposition of organic matter in the soil was lost sight of. The actual quantity of humic acid in any soil was thought to be the exact measure of its fertility. But it is yet to be proved that pure *humic acid* ever exists in any manure, although it can be prepared from it, or from rotten wood, or from peat. *Humus*, however, is not *humic acid*, and should not be confounded with it; but it is simply a very compound residue of slow decay and spontaneous combustion of vegetable and animal substances in the earth, the action of which is excited by exposure to air and moisture; and this action goes on till all the volatile elements of the humus are separated, and nothing is left but the fixed salts and earths it may contain. We must endeavour to afford fresh matter for this decomposition, or, if we may say so, fresh fuel for its combustion; and if we proportion our supply to the waste produced by vegetation, we shall keep up the fertility to the degree in which we found it; if we give more, judiciously, we gradually increase the fertility: but we may give too much at a time, and thus, instead of assisting vegetation, we may impede it by over nourishment, and much of our manure will be lost by dissipation in the atmosphere, or by being carried off in solution by the waters which pass through the soil. These principles should be kept in view in the practical application of manures; and if experience confirms their truth, we shall have obtained a clearer insight into the mode in which different kinds of manures assist vegetation and increase fertility in the soil.—M.

THE many inquiries which were addressed to us last year upon the subject of rooks induce us to mention, now that the season for building has begun, or is very near at hand, that, in the opinion of a friend, (whose ornithological knowledge would, if we might appeal to it, carry the greatest weight with it,) the most probable means of attracting rooks, and inducing them to build, is to send a boy into the branches of a tree with bundles of twigs, made fast to the branches in such a way that the rooks may use them for their nests without upsetting them and losing them. The bundles of sticks act in the first instance as a decoy, and afterwards as a means of enabling the rooks to establish themselves.

THAT failure of Clover upon land, which has given rise to the saying that a field is clover-sick, or tired of Clover, has never been satisfactorily explained. We see that the Rev. Mr. Thorp, of Womersley, near Pontefract, has ingeniously endeavoured to account for it,* by supposing it to arise from the effects of frost. He is of opinion that it cannot arise from the soil being exhausted of certain kinds of food necessary to Clover; and he arrives at this conclusion from finding no material difference in the chemical analysis of good Clover land and land clover-sick. And he is unwilling to recognise the doctrine of root excretions, which some have thought to account for the failure of Clover, partly because the experiments of Macaire Prinsep, on which that doctrine has been founded, have been disproved by Meyen and Unger; and partly because, had they not been disproved, they would not account for all the circumstances connected with the action of Clover on soil. For Mr. Thorp's arguments in support of his own views we must refer our readers to the paper itself. We can only state that he thinks the remote cause of injury to Clover, by the action of frost, arises from the want of a certain degree of cohesiveness of the particles of soil among themselves, the consequence of which is a diminution of the power of the soil in retaining heat. According to the experiments of Schubler, the power of retaining heat is nearly in proportion to its weight; and consequently loose puffy soils retain it less than compact soils.

* Journal of the Royal Agr. Soc., vol. iii. p. 326.

Mr. Thorp in all cases finds clover-sick land more loose than where Clover flourishes; a circumstance which he ascribes to various causes, often local; and hence he concludes that loss of heat, or, in other words, cold, is what destroys the Clover.

We cannot stop to examine this theory very closely, but we will content ourselves with asking how it applies to the well-known fact, that, if land is apt to become Clover-sick at the end of four years, it is not so at all if the time of rest is extended to eight years? It is the practice in some places to substitute Rye-grass for Clover every four years; and where that is done clover-sickness is not heard of, although, if the alternation of Rye-grass is neglected, the land immediately becomes again tired of Clover.

WE hasten to lay before our readers the following letter:—

To the Editor of the Gardeners' Chronicle.

SIR,—A chemical friend of mine has kindly directed my attention to the fact of a manure being advertised under the name of "Dr. Daubeny's Sulphate of Ammonia;" and assures me, moreover, that a sample of it which he has examined contains not a trace of the above-named alkali.

Now, as I entertain a perfect conviction of my informant's accuracy, I am unwilling even to wait until I have succeeded in procuring the article in question, before I assure the agricultural public, through your columns, that, so far from having authorised the manufacturer to use my name, I do not even know who he may be, and am at the present moment at a loss to know where to apply for a sample of it.

I can only conjecture, that he may have intended to follow the instructions given in one of my Agricultural Lectures, which were published in the Journal of the Royal English Agricultural Society, in which I pointed out the manner of converting the impure ammoniacal carbonate present in the coal gas liquor into sulphate of ammonia by means of gypsum.

I had no sort of intention of claiming that method as my own, as it was a mere application of a well-known chemical process to the case of the gas-liquor; but as the manufacturer, whoever he may be, has thought fit, without consulting me, to give me the credit of the invention, I regret to find that he has brought it into discredit, by some blunder he appears to have made in the mode of his manipulation. I remain, Sir, your obdt. Servant,

CHARLES DAUBENY,
Professor of Botany and Chemistry, in
the University of Oxford.

Oxford, Feb. 14, 1843.

P.S.—Allow me to take this opportunity of correcting an error which has crept into the same lecture, from which the unknown individual alluded to may have intended to take the method of forming the sulphate of ammonia, which he has chosen to call by my name. Amongst the substances therein enumerated by which carbonate of ammonia may be fixed, common salt is mentioned. Now, although, according to Berzelius' principles, if a solution of muriate of soda be mixed with one of carbonate of ammonia, a portion of the latter would be decomposed, and a certain amount of muriate of ammonia generated, yet, for reasons with which I will not detain you at present, this circumstance would not assist us in preventing the escape of the ammonia, and therefore would not enable the agriculturist to economize the useful principles of his dung-heap. Professor Henslow is quite right in questioning the utility of such an addition, as he has done in a Letter to the Farmers of Suffolk, published in a provincial newspaper.

FAMILIAR BOTANY.—No. XII.

Gnomes! whose fine fingers fill the organic cells
With virgin earth, of woods and bones and shells;
Mould with retractile glue their spongy beds,
And stretch and strengthen all their re-threads—
You! with nice eye, the slow solution watch,
With fostering hands the parting atoms catch;
Join in new forms, combine with life and sense,
And guide and guard the transmigrating Eos.

Hardening the Texture.—Not more does the strong and vigorous ostrich differ from the soft yolk where it was engendered than does the full-grown plant from the speck of jelly out of which it is elaborately formed by the inscrutable powers of nature. Wonderful is the process in either case! In the one we have a gigantic framework of hard bones derived from a little fluid and delicate membrane; in the other, we have timber still harder and more enduring, the beginning of which was a speck of gum.

To the limited faculties of man is denied the power of discovering the means by which a shapeless inanimate mass becomes organised as a thing of life and activity. It is not given to him to control or even to understand the forces which compel the viewless atoms of the air to combine themselves into solid forms, animated by the breath of life, covering the surface of the earth, performing their allotted duties for a time, and then returning to the same invisible matter from which they were derived, abstracting nothing when created, adding nothing when destroyed. All these things, produced at the command of the Great First Cause, are subjects of admiration only, not of investigation. We may know indeed whence matter comes and whither it goes, but why the same elements are combined into the forms of a quadruped, a bird, a fish, a reptile, or a plant, no man can say; and it is only those who are foolish that attempt the discovery. While, however, these mysterious effects are beyond all scrutiny, there are others of a secondary

kind, the nature and causes of which have been revealed to the patient observer. Among these, one of the most interesting is the hardening of the tissue or texture of a plant.

When a plant is first formed, its parts are delicate as the finest cobweb, thin as the most untouchable membrane, incapable of enduring the light of heaven. The plant is then shrouded in darkness; and in the recesses of the seed it undergoes its earliest changes. By degrees its parts harden, by attracting and absorbing the charcoal which, in the form of a viewless air, is floating around them. This they continue to feed on hour by hour and day by day, constantly adding something to their texture, till at last the microscopical point, once too delicate to be breathed upon, is enlarged into a seed pregnant with the future tree. This curious process of hardening consists mainly in lining the cavities of the tissue with layer after layer of condensed charcoal, in various chemical states; which, however, is rendered stronger and harder by the addition of earthy substances, such as lime and magnesia, and even of some of the metals, such as copper, which is found in notable quantity in Coffee and Wheat.

Now what occurs to a plant at its earliest period of life continues to go on during all the remainder of its existence. The seed pushes forth a root, the texture of which is white, tender, half-transparent, and crushed by a touch; but the root speedily robs the earth of its air of charcoal, and such other substances as potash, lime, or flint, dissolves them in its vital fluids, and then, introducing them into its cavities, lines those tiny spaces with a crust which often renders the root as hard as solid bone.

The same takes place with the stem. The wood of the solid Oak was once a thin cobweb-like substance which would perish if nature did not bathe it in a gummy fluid, wherein its first growth is accomplished. Then, organized as a soft spongy substance, it serves as a passage through which charcoal passes in its invisible form, along with all those imperishable materials that it sucks out of the earth in its sap. The charcoal is gradually condensed upon the sides of its cavities, lining them with layer after layer of a harder substance: along with the charcoal are entangled the earthy matters of the sap, and thus in time the heartwood of the Oak-tree is produced. At first, when the cavities are young, and nothing has been deposited upon their inside, the sap flows freely through them; but by degrees they become furred over, their passages are more and more choked up, and at last the heartwood of the Oak presents an impassable barrier to all further movement of the sap in its direction. If it were on the outside of the tree, the heartwood would be thrown off like the bark, which perishes from a similar cause, but being covered by the younger wood, it is so guarded and incorporated with the still living timber, that no separation can take place. And thus, by a wise provision, the appetite of a tree falls off as it grows larger, so that though the whole earth were covered with forests it would still be able to feed them.

Leaves undergo the same processes; only, in consequence of the action of light upon them, much of the charcoal which they attract from the air arranges itself in the state of coloured masses. The tints of the emerald, and ruby, and sapphire, are there, and we cease to wonder that a diamond should be charcoal, when we know that all the colours of the precious gems are constantly derived from such a source in the laboratory of the leaf. Here, again, takes place the same furring of the cavities of the leaf, by the deposit within them of sedimentary matter. The delicate membranes become thick and hard; earths and salts blend with the charcoal to line the sides of the passages through which the air and fluids pass; at last the delicate conduits in the interior of a leaf cease to supply it with the food it wants; it withers and it dies.

Nor, if we turn to the fruit, is this singular process discontinued. On the contrary, it is here that nature exerts her greatest hardening power for the safeguard of the seed. The stone of the Peach, which is harder than any wood, the shell of the Cocoa-nut, the bony skin of Indian Shot seed, were once as tender and thin as the petal of a Lily; but, from an early period of their existence, they begin to attract their hardening substances from the parts around them, or from the tree that bears them; and a few short weeks will often witness the conversion of the softest pulp into steely matter. Still it is brought about by lining the delicate cavities of a plant with charcoal and earthy or metallic matters, deposited layer upon layer, one within the other, till every cavity is full.

To some, these things may be incomprehensible; to others, they may seem incredible; and yet they are all capable of being witnessed by those who have the skill to observe. Men call them modern discoveries, and so they are—

Yet all these were, when no man did them know;
Yet have from wisest ages hidden been,
And later times things more unknown shall show.
Why then should witless man so much misween,
That nothing is but that which he hath seen?

The precise manner of observing them is with the microscope, and the apparatus that belongs to it. Yet something of it may be seen by other and more ready means. Take a thin shaving of Rosewood, and throw it into aqua fortis, a little warmed; you will soon find the dark colour disappear as the aqua fortis dissolves it; then remove what remains, wash it in water, and dry it; what is left is the original delicate texture, such as existed before the substances dissolved by the aqua fortis had been deposited within it. Or take a piece of a deal match, without the sulphur, burn it carefully, and you will find that after all the charcoal has been consumed, there remains a whitish ashy film, which consists of the earthy and metallic substances that had been entangled in the charcoal, and had assisted in giving it hardness. In Wheat-

straw a skeleton of flint is left behind when it is carefully burnt.

We may wonder how plants contrive to feed on such substances as these, or how a flint is to be dissolved in water and drank by the roots; but such is the fact, for in plants we always find them when they have grown old. It is strange enough that a flint should be dissolved by the breath of a plant; and yet we know that it is so, for chemists have proved it.—R. E.

THE ROSE GARDEN.—No. IV.

AMONG the diversified families of autumnal Roses, none are, perhaps, more beautiful, or more deserving the especial notice of the Amateur, than those designated Bourbon Roses. A few years since two varieties only were known; at the present time more than 100 are named in catalogues. These seem to have divided themselves into three or four well-marked groups. The type of one of these is a most interesting variety, viz., Gloire de Rosamene, which I should imagine to have originated by crossing the common Bourbon, known in France as "Bourbon Jacques," with Rosa sempervirens; at any rate, it is a remarkable variety, with elegant lacinated foliage, and gorgeous clusters of semi-double brilliant crimson flowers. This Rose and its congeners by no means group well with other members of the same family. It will often in one season make shoots six feet or more in length, while its humbler relatives content themselves by remaining as dwarf bushes. It is therefore only as isolated plants, either as pillar Roses or on a trellis, that varieties of this group of Bourbons are cultivated with a happy effect. One of the best, and nearly the first, raised from the type, is well known as Le grand Capitaine, with flowers of equal brilliancy, but more double than those of its parent. It is to be regretted that it has not the same peculiar luxuriance of habit; but this we have in an eminent degree in *Enfant d'Ajaccio*, lately raised at Lyons, having flowers nearly or quite double, with the fine lacinated foliage and robust habit of *Gloire de Rosamene*, and, above all, possessed of fragrance in a high degree.

At Le Mons, a seedling, called *La Bedoyère*, with perfectly double flowers, has been raised. The colour is not, however, so brilliant as that of its parent. At Lyons, also, a seedling has been originated from the same source, with similar remarkable foliage, and described as of fine form, "et d'un effet superbe;" it has been named *Comte d'Eu*. This seems robust in habit, and will doubtless be an interesting acquisition. Madame Lucy Astaix is also a new Rose, belonging to this group, which was raised at Lyons; it is of a pale, but brilliant carmine. A pretty dwarf Rose, known as *Bossuet*, of this section, forms a most elegant bush.

The group next in interest to the foregoing is that which has Madame Desprez as its type. This fine robust Rose is a hybrid between the Bourbon and *Noisette*; from the latter it derives its large corymbs of flowers. The varieties of this section do not harmonise with other Bourbons in grouping; they form fine pillar Roses and admirable standards; in which respect they surpass all others in the family of Bourbons, uniting well with the stock, and annually increasing in beauty. In very rich soil, shoots of too great luxuriance will often make their appearance as standards, so as to destroy the proportions of the plant. These should be shortened as soon as they have made about half their growth; they will then produce numerous smaller flowering stems. The most remarkable and beautiful varieties of this group are—*Triomphe de Plantier*, *Splendens*, *Crimson*, *Madame Desprez*, *Cardinal Fesch*, *Desgaches*, *Julie de Joyes*, *Comtesse de Colbert*, *Thiaffait*, *Comice de Seine et Maine*, *Paul Joseph*, and a new white Bourbon, raised at Lyons, called *Madame Lacharme*. The latter may with justice be called "White Madame Desprez," as it has precisely the habit of that Rose; its flowers are described as "pure white." For pillars, as standards, and for planting in beds, with their shoots supported by a stake, these magnificent autumnal Roses may be safely recommended to the notice of the Amateur.

The third group of Bourbons worthy of particular notice is that containing those which have the Chinese and Bourbon Roses for their joint parents. The leaves of these will by the nice observer be seen to be more pointed than those of the generality of Bourbons; the lower part of their flowers more compressed, and not so exactly hemi-spherical as those of the true Bourbon family. One of the most remarkable and beautiful in this group is *Proserpine*, than which no Rose can be conceived more splendid, with its deep crimson flowers, shaded with glossy purple. *Ceres* is also exceedingly beautiful; its flowers are of a brilliant Rose, its petals thick and wax-like. *Comtesse de Ressaiguier*, *Manteau de Jeanne d'Arc*, *Mademoiselle Rachel*, *Reine du Congrès*, are all Roses of the most delicate blush, approaching to white. These, with *Anne Beluze* and *Beluze*, have all been raised at Lyons by Monsieur Beluze; and form a remarkable and interesting group; *Pucelle Gemoise* and *Armosa* are two well-known varieties, also belonging to these Chinese Bourbon Roses. My remarks on other Bourbon Roses I will, with permission, give in another paper.

The *Blush Boursault*, *Belle de l'Isle*, *Boursault Florida*, or *Rose de l'Isle*, which, I believe, is also known under one or two other names, makes the best stock for budding on; it strikes readily from cuttings planted in the autumn. My practice in budding on the *Boursault* is perhaps an improvement on that given at p. 51. The strongest shoots are selected early in July for layering; flower-pots of the size 48 are taken, and the aperture at the bottom is enlarged so as to allow the end of the shoot to be passed through. After doing this, the shoot is tongued, the pot is drawn up till the tongue is about in

the centre; it is then filled with a mixture of rotten dung and sand in equal parts, and well pressed down. The shoot may be budded at the time of layering or afterwards, accordingly as the buds are ready. The shoots should be headed down at the time of budding to within two eyes of where the bud is inserted. The buds of all the Bourbon, Tea-scented, Chinese, and hybrid autumnal Roses will push immediately; these may be removed from the stools in August, potted into larger pots, and forced with great success the following spring.—Z.

THE PINE-APPLE.

BEING desirous of calling the attention of Pine-growers to the great benefit that might be derived from fruiting the same plant for several successive years, instead of raising a fresh stock annually, as is now practised, I beg to suggest the following plan for effecting that desirable object.

The pit in which they are grown should not be less than 10 feet wide, and should be built in divisions of five lights each; the frame-work being also so constructed that the part belonging to each division could be raised separately when required. The thickness of the wall at back and front should be 4 inches, with only a pigeon-hole occasionally along the bottom, to allow the water to drain from the interior of the pit. Within the outer wall, and at about 4 inches from it, another wall, a foot less in height, should be raised; the cavity between being intended for the reception of a hot-water pipe, which must be fixed before the inner wall is completed, and should be about 2 feet above the level of the floor of the pit.

The depth of the pit should be about 6 feet; the front being a little higher than the ground level, and the angle of the roof left to the builder's taste. I should recommend a cavity, 2 feet wide at the bottom, and 6 inches wider at top, to be formed round the pit, about 6 inches deeper than the level of the interior, to hold a lining, so that the hot-water apparatus might only be called into use during severe weather. The bottom of the pit should be covered several inches deep with rough stones, over which any common slabs, or, in their absence, pieces of turf, may be spread. This will prevent the tan, which is next to be brought in to the depth of 18 inches, from falling down amongst the stones.

The compost in which the plants are to be plunged should be about 1 foot deep. The latter, when planted, should be just upon the point of throwing up their fruit. The pit will be sufficiently capacious to admit of four rows being planted out in angles 2 feet apart. After the first fruit has been cut, one or two of the best suckers should be left, as low down as possible, on each stool; the old leaves should be trimmed off, and a few inches of fresh compost should be added, so as to raise the mould up to the base of the suckers.

This treatment might be continued annually; and as soon as the plants reached the glass, pieces of wood, about 4 inches thick and a foot in height, made secure at the corners by means of small bolts, might be raised upon the wall beneath the frame-work. Upon the top of each piece of wood there should be a groove, in which the bottom of each succeeding tier would fit.

Each division of the pit being separate, the frame-work might be taken off whenever it was necessary to add another tier of wood; and the top of the pit being built but little above the level of the ground, these tiers of wood might be continued to the height of two or three feet. It would not be necessary to raise the lining higher than the top of the brick wall, as there would no doubt be sufficient heat in the bed from the lining and the hot water; which latter, being in the cavity, would warm the soil sufficiently. Boards made to fit above this cavity would be beneficial in keeping the dirt from falling down between the pipe and the walls when mould was required in the pit. The boiler and fire-place might be situated at one end of the pit.—I. Gray, Esher.

AMATEUR'S GARDEN.—No. VII.

THE time has arrived for the florist to bestir himself. Auriculas and Polyanthus must receive their spring-dressing by removing the surface-soil of each pot down to the roots, and replacing it with the usual compost. Avoid using rich manure for this or any flower; for it may be asserted as a natural law, that as all plants like fresh soil and leaf-mould, a compost of these two ingredients with a little sand will grow plants as healthily (though possibly not so luxuriantly) as a complicated admixture of more stimulating materials. After the plants are replaced in the frame, they must have all the air possible by day and night in mild weather, but must be protected from frost. A gentle shower of rain will not injure them on a mild morning, but take care that the water does not stagnate in the centre of the plant, or the bloom will be injured.

Ranunculuses and Anemones should be planted before the end of the month. Some excellent observations on the management of the former, by Dr. Horner and Mr. Lightbody, will be found at pp. 420 and 469 in the Vol. for 1842.

Carnation and Picotee layers that have been stored in frames in small pots may now be removed into their blooming ones, taking care that the soil used does not contain wireworms, which are their most deadly enemy. Where there is convenience, the plants may be returned to the frame after being potted; but where there is not, they must be so placed together in a sheltered situation that they can be protected from rain. Sow Carnation-seed in pots or seed-pans in light soil, and protect it from rain and vermin.

In the Flower-garden, finish pruning Roses; in doing so, thin out the weak shoots, and shorten the strong and

well-ripened ones to four or six buds, according to their strength. Strong-growing kinds, such as *Brennus*, *Fulgens*, *Triomphe d'Angers*, and others of similar habit, with most of the *Noisette* Roses, when budded on tall stems make beautiful objects, if, instead of being shortened, the shoots are turned down and tied to the lower parts of the stem, so as to form a balloon-shaped plant. In the borders, sow Sweet Peas and Larkspurs, and prepare for the general sowing of Annuals next month; but do not rake the borders at present, or they will be rendered almost impenetrable for the whole of the season. Hoe or fork them over two or three inches deep as often as you please, but do not rake them until the dry winds of March have abstracted a little of the superfluous moisture from the soil. For the sake of a few days' neatness in the early part of the spring we frequently do more injury to the soil and summer flowers than can be remedied during the remaining parts of the season.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Treatment of Coppice-Wood.—In the Calendar at p. 8 of the *Chronicle* for 1843 is the following paragraph:—"Coppice-woods are like old Raspberry-stools, with only this difference, that a chance shoot here and there has got the lead, depriving all the rest of their due nourishment; this should not be so." The following instance will in some measure illustrate the truth of Mr. Beaton's remarks, and give some idea of the loss sustained from this neglect in a piece of coppice-wood, which belonged to the late Mr. De Winton, of Maeslough Castle. This Copse was situated in Cwm Neath, Glamorganshire, and being about 40 miles from the bulk of his property, but very little was known of it further than from the map-book, which stated that it contained 82 acres. In 1837 application having been made to purchase it, Mr. De Winton sent another person and myself to value it. An old farmer, who had charge of it, told us that it had not been cut down for 35 years; it was evident that no care had been taken of it during that period. It consisted principally of Oak, Birch, and Alder. The previous cutting had been done in a ragged and slovenly manner, and in the following years no care had been taken to thin out and regulate the young shoots, which were entirely left to nature. On many of the stools nearly a score of shoots, with scarcely a branch on them, and only a few leaves at their extremities, were striving for the mastery; on others one or two shoots had been fortunate enough to get the lead early; and these, in many cases, had acquired the habit of trees, whose side branches had overtopped and choked the weaker ones, which had struggled hard for many years for existence, but were either dead, or in a sickly and stunted condition. Indeed, a great number of stools were quite dead, owing to the shoots from the neighbouring stools having overhung and choked them. This state of things greatly lessened the value of the copse, and would also cause a considerable expense in filling up and vacancies caused by dead stools. Even the large overgrown shoots by no means made up for the loss of those which they had destroyed; on the contrary, they were objected to as being too heavy for Pit wood, and of very little value to cut up for any other purpose. Several agents from the Iron Works stated that the copse would have been of considerably more value when from 25 to 28 years old. This was our opinion also, and after having carefully examined the copse, we selected a part where we considered there was an average crop; and having measured off $\frac{1}{4}$ th of an acre, we selected and marked the best Maiden Oaks, and other trees, at the rate of 60 to an acre, always preferring Oaks where they could be had. These were to remain for timber-trees. Everything else was cut down and sorted; and after having been carried to a convenient place, was weighed and valued as follows:—Pit-wood, 4 tons $7\frac{1}{2}$ cwt., at 21s. per ton, £4. 11s. 10 $\frac{1}{2}$ d.; Cord-wood, 1 ton, $17\frac{1}{2}$ cwt., at 5s. per ton, £0. 9s. 4 $\frac{1}{2}$ d.; or £40 10s. per acre. Total value of 83 acres, £3,321. The Copse was then advertised for sale; and according to certain regulations for cutting, clearing away, &c., it was very soon after sold for £3250, being £71 below our valuation. If this Copse had been properly managed, and sold when 28 years old, the value would, in all probability, have been about £4000; or even if it had been cut down and sold then at the above price, the next crop would have been advanced seven years, or one-fourth of the time that the above crop was in coming to perfection; and, therefore, the loss on that score cannot be considered to be less than one-fourth of the price for which it was sold; viz., £812 10s. Perhaps there is no greater hindrance to the proper management of plantations than game, when they are the hobby. One might as soon expect to get permission to pull down the Mansion, as to enter one of those pet covers, to thin, prune, and regulate the trees, which are generally, by the time they are 20 years old, so crowded and drawn up, that they are little better than hop-poles. In extensive plantations, the loss to the proprietors is incalculable; but in game covers, where the sound of the axe and saw must not be heard, this might be greatly obviated, by planting at a much greater distance than is generally done; so that the trees would not require thinning, and when full grown, would merely touch each other. Betwixt them the Portugal and common Laurels, Holly, Box, Evergreen Privet, and any other berry-bearing shrubs, might be planted, which would answer for shelter and food for the game. If the ground had been trenched previously to planting, they would very soon make an excellent cover for the game, and likewise answer for nurses to the trees. In such cases, there is no occasion to plant rooted plants of the common Laurel, as it will do as well if the prunings from a shrubbery are taken and cut into lengths from two to three feet each, and laid, without

any other preparation, in shallow pits; covering them about six inches deep with earth, and leaving out as many of the points of the lateral shoots as convenient. I have found Laurels so treated make fine bushy plants, suitable for the above purposes.—*James Alexander, Carlton Gardens.*

Old Yews.—What is the best season to cut Yew? I shall be compelled to cut down 5 Yew-trees of considerable growth, and as the wood is very valuable, I wish to cut it to the best advantage. I presume that if cut in the course of the present month and left to die with the foliage on, it would be in the most favourable state. One tree is about 2 ft. in diameter, in full vigour, and I guess them all to be about 150 or 170 years old.—*J. R.* [Will some correspondent, who has performed such an operation, oblige us with his advice upon this point?]

Bees.—It affords me great satisfaction to be able to state that the plan which I have adopted with my Bees, as stated at p. 53 of the *Chronicle*, has been completely successful, as up to the present time (Feb. 9) I have only witnessed four dead Bees, in addition to the three formerly noticed, and not one dead Bee since the 30th December. It was on that day that I found the four dead Bees on the ground, killed, as I think, in the same manner as the former, about a foot in front of the hive, at a time when there were several thousands of the inmates abroad, owing to the mildness of the weather. Three of these Bees were decidedly young ones, and I observed the full-grown Bees busily engaged at the mouth of the hive, in cleaning other young ones, although at that unusual period of the year. It has been stated, that exposure to the South causes Bees to go abroad when the sun shines upon the hive, and that many perish in consequence of the cold on such occasions. My impression, however, is, that in a well-ventilated hive they do not go abroad when there is the least danger of suffering to any extent from cold, unless they are compelled by hunger to do so. Indeed, I look upon them and their motions as equal to the best barometer in announcing the state of the weather; and as a proof that such is the case, I may observe that mine only left the hive, in very great numbers, on one day in the middle of January, when it was very mild, and again on January 28. On January 29, 30, and 31, and on February 1 and the forenoon of February 2, a few left the hive; and on the evening of the first four days hung in clusters from the combs in beautiful perspective, until at the back part of the hive they were within about half an inch of the bottom board. On the evening of February 2, I remarked that I thought we were going to have bad weather, as on looking into the hive, I could not observe a single Bee, the whole of them having retired to the upper part. The morning of February 3 was one of the brightest that has been witnessed this season, and was accompanied with a powerful sun, although the wind, in exposed places, felt a little sharp; consequently my prognostication that bad weather was near at hand was laughed at; but in the course of the afternoon I could laugh in turn, as it will be recollected that on that day, when the sun had passed the meridian, the Metropolis and Woolwich were visited with one of the most severe snow storms that has been experienced this season. From that day to the present not a Bee has been seen, and therefore I imagine that the weather, although open, is not yet settled. I recently observed a number of glasses for hives exposed for sale, with ventilators formed of perforated zinc, and felt surprised that a metal so apt, under peculiar circumstances, to form sulphate of zinc (a poison), should be used internally in any shape in Bee-hives or glasses, when a common swan or goose-quill might be notched so as to answer all the purposes of ventilation, when required. The fact proved by Mr. Davis, who has the charge of Her Majesty's kennel, that water passing through lead pipes was sufficient to bring on paralytic symptoms in dogs, ought, I think, to be a warning to Bee-keepers not to use metal in any shape, which might be liable to come in contact with the sensitive little winged lancers, designated at the commencement of this communication.—Since writing the above I have observed Mr. Wighton's remarks at p. 85, and from the good tone in which they are written, the surest means of eliciting the experience of all parties, I cannot but be pleased with his observations. In reference to my statement, which he thinks "strange," that up to Dec. 26, I had only witnessed three dead Bees from my hive, I wish to give the following explanation:—My communication, which appeared in the *Chronicle* of Jan. 28, was made in consequence of a "Despairing Bee-keeper" stating, that on returning home in January after a short absence, she found great numbers of her Bees dead in the bottom of the hive. I stated the number I had observed in connection with my hive, and have now added one more—the number to the present date, Feb. 13, for the purpose of showing that my hive has continued quite clean, and as pure and sweet as it could be in the middle of summer. I do not wish it to be understood that the number of Bees I have specified are all that have died belonging to my hive. All I can state with certainty is that if any others have died, they have not died at home, as I have not only carefully examined the bottom of the hive and side-boxes every evening with the aid of a lighted candle, but I have also, on an average, once, and sometimes three or four times a day, carefully inspected the ground in front and round the hive, and on many occasions the whole of the garden where I keep my Bees, to endeavour to find any that might have been carried or dropped down at a distance, but I have not discovered more than the number already given. I may add that I have never fed my Bees in any way directly or indirectly; I am merely allowing them to take their own natural course, and only endeavour to assist them when I imagine I can do so beneficially. I am quite disinterested

in the observations which I have made, as it will afford me great pleasure at all times to communicate such facts as I may notice regarding these industrious and valuable insects, when judiciously managed: or to answer gratuitously by letter any questions put by parties who may feel desirous of knowing the plans which I intend to adopt during the swarming season. My views relative to forming artificial swarms, so as to increase the number of stocks, and to prevent swarming when preferred, are as yet only theories in my mind, and therefore I am reluctant that they should appear in print until they are tested. As I consider myself successful in one point, namely, securing the health of my Bees during winter, I am not without hope that I shall succeed equally well in my future experiments with them, as I become more fully acquainted with their peculiar habits, and have an opportunity of observing incidents which may greatly influence their beneficial management, and consequently render them a source of pleasure to the rich, as well as a profit to the industrious, although poor and humble cottager.—*John Grant, Ed. of the Army and Navy Register, Woolwich.*—I find the same difficulty that a "Despairing Bee-keeper" complains of, (p. 837 of 1842), in keeping the temperature of the side-boxes at 90°. So far is this from being the maximum, that it very often rises to above 100°; then, if a queen be ready, a swarm goes off without waiting for the side-boxes to be filled. This temperature is reached, even although the lid may be raised from the board on which the boxes stand. I also, like your correspondent, find it impossible to prevent the Bees from plastering over the holes of the ventilating funnel, with wax or propolis; and this requires to be examined every day or two. Will some of your correspondents, who thoroughly understand Nutt's method, tell me where I have failed?—*T. G. Clitheroe.*

Killing Insects for the Cabinet.—I wish to say a word to "S.," who writes a letter at p. 69, in which he recommends a most cruel mode of killing insects for cabinets: I will not say how, as I hope all the young readers of your interesting miscellany were touched with pity for the poor insects, and grief at the thought that any one could sit down and recommend such a system of torture as is there represented. I would only ask "S." to remember that the God who made those insects will be his or her Judge! and that "The merciful man is merciful to his beast."—*D. H. W.*

Aviaries.—The addition of an aviary to the amateur's garden increases the pleasure of his Horticultural labour, gives a cheerfulness to the scene, and well repays any attention to the comforts of the little songsters. What can be more joyous than the early carol of the canary and goldfinch on a bright spring morning?—and even in winter, the sharp chirp and quaint notes of the chaffinch and bulfinch are delightful. The facility with which birds can be preserved through the winter in the open air, and the simplicity and cheapness of their food, makes it desirable that no pleasure-ground or garden should be without an aviary. Any snug corner facing the South or South by East, is the most favourable position. A bird-house, eight feet by four, and eight high, is sufficiently capacious to contain 40 or 50 inmates; the roof should be conical, as it provides a warmer roosting-place at night than a flat one. The back and sides should be built up, and the front divided into two compartments, each covered with neat wire-work, small enough to keep out mice. The frame to which the above is attached must rest on a raised brick foundation, about 10 inches high. The flooring ought to be well drained, and flagged, to prevent vermin from intruding. The interior should be white-washed, and the wire, &c., painted green. I have an aviary in which I keep canaries, bulfinches, chaffinches, goldfinches, redpolls, &c., during winter, by merely protecting one-half of the opening in front with a thick linen-curtain, which may be dressed with oil to make it more durable, and is drawn at night or during cold weather. This is all the precaution I have taken for the last three years. A Java sparrow has been out all this winter, and does not appear the worse for the exposure. Their food consists of coarse oatmeal, canary-seed, in small quantities, white bread soaked in boiling water, which must not be allowed to get sour, and occasionally green food. The bulfinches eat barley greedily. I never indulge my favourites with hemp or rape, and I find they keep in better health by depriving them of these heating seeds. Fresh water and gravel or sand are indispensable for an aviary.

Gold Fish.—Your correspondent "T. F.," at p. 54, deserves the thanks of many of your subscribers, and my own among the number, for his communication relative to Gold Fish. As one good turn deserves another, I will give him three hints which may be useful: In frost, a bundle of reeds, if placed endways, will supply air enough for his pond, without breaking the ice; and for breeding, he will find his fish to like a better locality than the leaves of the Lily; this he may easily construct of rockwork. The water also may be improved by spreading calcined flint, about the size of Peas, at the bottom of the pond, which, from its extreme whiteness, will give his fish an appearance of tenfold brilliancy.—*An Amateur of Fish.*

Red Spider.—I see many questions asked and answered about the Red Spider; but all these appear to apply to hothouses, conservatories, &c. I have some Damson-trees, the leaves of which turn as brown as if they had been scorched by a fire, and drop off prematurely; a great portion of the fruit does the same, and all that remains is poor, and deficient in flavour. My wall-trees used to be affected in the same manner to such an extent that some of them died; but I have now discovered a remedy which appears to be effectual. Most of your readers will, no

doubt, have heard, that the best method of administering flea-powder, is to take that saltatory insect by the neck before he awakes in a morning, and cram the said powder down his throat. In like manner, before my Red Spiders awake, I catch them all, and put them in the stocks, and keep them there until they promise to reform; in other words, I have a thin starch made from potato flour; and before it has become so cold and stiff as to lose its fluidity, I syringe the trees with it by means of the garden engine. The force with which it is driven against the tree and the wall effectually covers all the leaves, both on the upper and under sides; and every Red Spider is thus firmly secured. It is true, the trees look rather unsightly for a while; and it is also true, that this starch does not destroy the eggs; and that it is, therefore, desirable to repeat it; but all the Spiders are killed, the leaves become fresh and green, and the tree begins to grow and thrive again. The same plan may be recommended for the Muscle Scale on wall-trees, if applied after the insects have hatched, or before the females have deposited their eggs.—*T. G.*

Dahlias.—In your last report of the proceedings of the Floricultural Society one or two errors have occurred, which I should wish to see corrected: In p. 86, col. c., line 53, for "stumpy" read "bumpy;" in the same column, line 78, for "working from flat bases" read "a flat base;" and in p. 87, col. d., line from the top 22, for "his Windsor Rival" read "Windsor Rival." But the more important error is the omission of the word, "Disqualifications," by which two sentences, having originally no connexion, are joined together; and the "defects in size" are stated to be, "being below the average, or so large as to be coarse; showing a yellow disk, or a hard and scaly centre, cross eye, &c." whereas the word "disqualifications" should have followed the word "coarse," and the sentence should have been—"Disqualifications: showing a yellow disk or a hard and scaly centre, cross eye, petals damaged in any manner, blooms dead and decaying." It will be seen that I have treated the defect of what is technically termed a "cross eye" as a positive disqualification. I know that such has not hitherto been the practice; but, in my opinion, the fault is so glaring, and so obviously arises from inherent malformation, that it should cause any bloom or any collection of blooms in which it occurs to be altogether rejected. The other grounds of disqualification have long since been recognised, but none of them have, consistently, been practically enforced. The only stipulation generally made in offering prizes is, that they shall be awarded to the best; and the propriety of withholding them under any other circumstances than those of fraud and deception, bad as the best may be, is very questionable; but so long as a different practice is pursued with regard to other flowers, and more stringent rules are absolutely enforced against the Carnation, Picotee, &c., I see no reason why the Dahlia, which produces blooms in greater abundance, should not be treated in a similar manner. With this view I have brought the question before the Society; and although in this as perhaps in other things I may be in error, I have no doubt the subject altogether will be properly dealt with, and my object answered. The ruling desire of those who have been entrusted with the affairs of the Society is to act fairly and impartially towards all, whether members or otherwise; and I regret to see that they do not meet with a corresponding return on the part of some who appeal to them; the decisions of the censors (upon seedlings) being often sadly perverted to suit private purposes. An instance has recently occurred in the case of the Dahlia, called "Mrs. James Richardson," which is represented by the owner to have been selected by the Society as one of the best six of the season; whereas no such province is assumed by the Society, nor has anything been done to justify the assertion. The flower was submitted for inspection upon two occasions during last year, on the first of which it was in a first-rate state, and classed accordingly; but on the next occasion it was not so good, and decided to be only second-rate. I am aware that only six Dahlias were placed during last year in the first class; but many of these did not uniformly support that character, and might not, therefore, have been preferred on the whole to one or two others that had consistently proved themselves to be excellent second-class flowers, and not liable to such sudden or frequent fluctuations. Allusion to this subject gives me an opportunity of advertizing to the system pursued by the Society, and of explaining the differences which sometimes appear to exist in their decisions, by describing a flower to be first-rate at one time and only second-rate at another. This, I will admit, is an apparent, but not an actual, inconsistency, so long as the decisions are in conformity to the existing fact, the only ground upon which they are ever given. From change of seasons and other circumstances, there is scarcely even an old variety, however good, which is uniformly first-rate: it is, therefore, unreasonable to suppose that a seedling will not be liable to the same variations; and it would be worse to expect the Society not to see or not to tell the fact. The present plan has been adopted in order to encourage frequent exhibition, and that parties might ultimately, by a comparison of the judgments given upon the various occasions, be enabled to form their own conclusions. Any other system could only be effected by reserving the decisions until the end of the season, and thereby keeping parties, in the mean time, in ignorance of what they are most anxious to know at as early a period as possible.—*T. C. Wildman.*

Striking Cuttings.—A friend of mine contrived a plan for affording the cutting-pot a sufficient supply of moisture without making it too wet, which I think only requires to be known that it may be generally adopted. The cuttings upon which it was first tried were those of *Nérion*

splendens, and not a single one failed: with others it has been equally satisfactory. The method is, to plunge a large 60-pot, made water-tight at the bottom, in the centre of the larger pot in which the cuttings are to be placed. By keeping the smaller pot always filled with water, the cuttings will be duly supplied through its pores.—*William Proctor, Gardener, Tarbat House, Rosshire.* [There is nothing new in this; it has been practised for many years, and is extremely useful in striking plants which are fond of moisture.]

To destroy Earwigs and Woodlice.—I beg to inform you of a simple plan which I have successfully adopted for years to destroy earwigs and woodlice, viz., some joints of withered Hemlock or Bean stems placed under walls or about their haunts through April and May. These must be examined daily; and if gardeners would give themselves this trouble, they would soon rid themselves of these vermin.—*Cestus.*

Camellias.—At p. 56, Mr. Beaton advises Camellia growers to place those plants which have no flower-buds in the forcing-house, to induce an early formation of them for next season, and says he believes that "if the pots were plunged up to their rims in a tank of warm water during the short time they are making their growth, it would not hurt them." As this plan might be adopted by some on the negative recommendation of Mr. B., I beg to offer an opinion on the probable result of such an experiment. I think that after such treatment the newly-formed fibres would be so situated, that they could neither grow, nor be extricated from it without sustaining great injury; that is, they would be firmly fixed in a hardened clod of earth. Nor do I think that anything would be gained by forcing them so early as this. I might base this opinion on Mr. B.'s own excellent observations at p. 39, where, in speaking of forcing in winter, and the little difficulty attending it, where the object is to enlarge the plant without reference to flowers or fruit, he says, "But having no control over light, which is the most important agent in the growth of plants, we must so apply heat and moisture as to accord with the quantity of solar light which our dull winters afford." But my own opinion is deduced from experience, and I have for several years had Camellias in bloom by the end of October, which did not make their annual growth till April, (and that frequently in a Greenhouse) at which time I can command a temperature from 55° to 65° with a slight shading, I have no doubt of success. I always allow them to remain in the house till the buds are well formed, and the young wood changed to a brown colour, which is seldom before the end of June. They are then placed in a partially shaded situation out of doors, for about eight weeks. Plants so treated enjoy the concurring aid of all the agents essential to vegetation, at a time when they are most needed; and with increased light and heat acting on the healthy organs of respiration and digestion, go on storing up highly elaborated sap to expend in the expansion of flowers, as soon as impulse is given to them after their periodical rest. Whereas, in those which are forced now, and are removed to a cold frame afterwards, vegetation is for a long time suspended, and as it sometimes happens, is resumed in the summer in the formation of fresh shoots.—*W. Sherwood, Gardener to J. R. Mills, Esq., Stamford Hill.*

Yellow Rose.—In answer to "Philo-rosea," at p. 73, Mr. Proctor informs us that the plant referred to by him, at p. 54, not only produced last season above four dozen perfect flowers, but that it has bloomed profusely for several seasons. In addition to those last year exhibited at the meeting of the Caledonian Society, four flowers were also transmitted to the Northern Horticultural Society at Inverness.

Amaryllis Belladonna.—Some of your correspondents still maintain that it is difficult to flower this beautiful bulb, which to me appears rather strange. Last autumn I obtained nearly 300 spikes of flowers without any difficulty. Many persons saw them at the time; and if your correspondents will pay me a visit next September, they will be able to judge for themselves. They are planted as closely as possible to a south wall, in a good sandy loam. Possibly the failure of other persons may be occasioned by a wet soil, or by having taken up the bulbs to divide them, or by having destroyed the leaves in winter or spring. It is a bad practice to part them, unless they are very crowded. I had some in pots, but they bloomed weak compared with those in the open ground. If the borders are wet, I recommend large holes to be dug to receive plenty of drainage, and to be filled up with good turfy loam and sand. The bulbs should then be dug up, without being disturbed more than possible; and if planted in a warm situation, I am certain there will be no complaint of their failure.—*Caleb Diplock, Botanical Gardens, Twickenham.*

Vines.—The following casualty, the cure of which it may be useful to some persons to know, happened to my Vines to-day (Feb. 15). I left them about 1 P.M. in good order, but on returning about an hour afterwards I was surprised to find the young shoots drooping, as if they had been detached from the parent plant. I was for some time at a loss to know what could be the cause; and the Vines being planted outside, I went to see whether the covering upon the border was all right. I found that the birds had scratched part of it away, and I at once attributed my mishap to the frost having penetrated to the roots. I got a quantity of fermenting leaves, and some water about milk warm; the latter I poured over the stems, and then covered them up with the leaves; I afterwards syringed the foliage all over, and in about 20 minutes the Vines were as healthy and strong as ever. Had this taken place during the night, they must all have perished.—*D. M. C.*

The Fastoff Raspberry.—In the late Numbers of the

Chronicle the Fastoff Raspberry is advertised, and highly spoken of. I should be obliged if any correspondent who has tried these plants at a distance from the sea could inform me if they succeed well, as I have been told that sea-sand and burnt sea-weed have a wonderful effect on the size and flavour of the Raspberry; and if this is true, it may account for the superiority of the Raspberries in the Great Yarmouth Nursery; which possibly would degenerate if removed from thence, or from near the sea.—*J. L.*

Melon Seeds.—For the information of *Alpha*, at p. 57, I beg to state my conviction, that little or no care is required for the conservation of the germinating power in Melon-seeds; the only condition appearing necessary is, that the seed when laid by should be capable of producing healthy plants. The following facts in support of the above are worthy of being recorded. Some 20 years ago or more, the late W. Morehead, Esq., of Hertfordshire, rummaging one day in an old bureau, discovered a packet addressed to his grandfather 70 years back, which contained Melon-seeds forwarded by a friend of the grandfather's from one of our West India Islands, accompanied with a high recommendation in their favour. The seeds were immediately placed in the hands of his gardener, who in the ordinary mode of cultivation succeeded in raising from them a fine-flavoured variety. The only other instance with which I will trouble you is furnished by another late neighbour of mine, who similarly found in his bureau a packet of Melon-seeds sent him by a friend 25 years previously. They had lain in his bureau, and had been overlooked during that period; from this seed, however, good fruit was also produced, under the ordinary skill of the gardener.—*I. K. S.* [In all these cases due care to preserve vitality had obviously been taken without the parties concerned being aware of it.]

Prejudices.—"Our prejudices, how many they are, and how idle!"—Indeed they are; and I intend this line of your correspondent's (p. 69) to serve as my text in a few short communications to your readers—I hope they will be taken in the spirit in which they are written. Few things disappoint me more than, in looking over a private grower's collection of Pelargoniums, Calceolarias, Roses, &c., to find them numbered and not named. If you ask the reason, ten to one but you are told that it is done to prevent portions of them from being stolen, which would most likely be the case if gardeners or other visitors saw the names. You are obliged to keep asking what is the number of this and that, till you are as tired of inquiring as your friend is of answering—that is, if he has his book, which is not often the case. Now what is this but a prejudice? All my plants are marked on good-sized labels, and on both sides; and it gives me pleasure to say that I have never yet lost even a leaf. If it had been otherwise, I would rather put up with the trifling inconvenience than deprive my visitors of the pleasure of knowing at a glance the names of the different varieties.—*Edward Beck, Isleworth.*

Asparagus.—In your observations, at p. 435, vol. ii., upon Asparagus grown in bottles at Nice, and the failure of this method when tried in England last year, you attribute the success to the greater warmth of climate and more rapid vegetation in the South of France. I put some Asparagus roots into my Melon pit in November, and had the thermometer at 80°; they soon sprung up, and I put a glass soda-water bottle (which is free from the bottom projection inside) over each of two of the heads. They grew into the bottles, turned round well in them, and began to sprout, although, of course, not strongly. I have been obliged to cut them lately, as I want the pit for Melons. The Asparagus was very hard and stringy when boiled. I failed to give them air, the heat was not regular, and in other respects they were not managed well; but it appears to me that a skilful Gardener might succeed much better—perhaps completely. I hope we shall hear of the bottle plan being tried with success in the ensuing spring; probably in a full south situation, under a wall, with a glass, and having a lining of warm litter around. At p. 471, a correspondent, signing himself "J. A. P.," speaks of an Irish method of growing Asparagus in tin tubes; and he signified his intention to give some further light upon the subject, but he does not appear to have done so.—*S. C.*

Onion Maggots.—Several questions have been asked respecting the Onion maggot, which for many years destroyed the greater part of my Onions until I adopted the following plan: I sowed the seeds about the beginning of March, and when the plants are about 5 or 6 inches high I strew a little soil over the bed, and with a large iron roller I roll the beds until they appear to be as hard as the garden walks. After this, the Onions grow up strong; and I never lose one either by rolling them or from the maggot. I sowed my winter Onions about the last week in July, and I roll them in the same manner. My crops are always good. I ought also to state that the soil is very light.—*J. Parks, North Shields.*

Refuse Vegetables.—In perusing Professor E. Sprengel's interesting articles, "On Manuring with Green Crops," it struck me that many gardeners might be, like myself, under the necessity of wheeling their refuse vegetables to the farm-yard or some other place, where the unpleasant smell of their decomposition would not annoy their superiors. That I may prevent the loss of so much valuable manure, I make a point of wheeling at one time upon the land as large a quantity of the refuse vegetables as possible, and set a man to chop them with a spade small enough to be easily dug in, which is done directly. I find them an excellent dressing in all soils, but in stiff heavy ones superior in every instance. The crops bear evidence in their favour, and neatness is in favour of the direct application. If hoeing, raking, and wheeling away

the gatherings were to be replaced by pointing or forking over the ground between crops or flowers, labour would ultimately be saved, the crop would be benefited, and weeds would be eradicated.—D. R.

Worms.—I think that much has been said to no purpose respecting worms on lawns. Have any of your readers informed themselves what has been the state of a lawn which has, for two or three years, been totally divested of worms? These active little fellows are Nature's agriculturists; they drain and irrigate the soil by a method superior to any that we clumsy cultivators are competent to perform. When the surface has an overflow of water, their works come into operation to relieve it—not to carry the superabundance of moisture away, to be useless, but to loose it into the subsoil, which they perforate in all directions, so that it may be readily distributed; and by the same ducts brought forth again when the thirsty surface demands it. More than this, they labour nightly; and who will say their labour is useless, when they bring up to the surface virgin earth, impregnated with animal matter, as manure for the Grasses? What would be the state of turf without a perforation—solid as a brick, as it is in dry weather—incapable of the transmission of moisture, either by ascent or descent? Should there be only a few showers in summer, all must quickly evaporate into a heated atmosphere but for the industrious worm, who, aware of the fact, for he often anticipates the shower, opens his little aqueducts ready to receive the welcome fluid into his subterranean reservoirs, where it is preserved for subsequent distribution when the thirsty Grasses demand it.—M. A. Dun.

Cattle.—I beg to call attention to the fact, that "the depasturing of sheep on cow pastures communicates a nauseous and unsavoury taste to the butter and cheese produced therefrom." Can you or readers account for this?—Cestus.

Couch-Grass.—I do not think it is generally known that this pest (*Triticum repens*), may be easily got rid of by trenching. If care be taken to bury all the roots at least six inches deep, they will never again reach the surface. I have repeatedly tried it with success, and I consider it a much cheaper and effectual method, even in field-culture, than the tedious and imperfect one of ploughing, scarifying, harrowing, &c., not to mention the very great advantage to the succeeding crops, by moving the soil to the depth of 16 or 18 inches.—Lusor.

PROCEEDINGS OF SOCIETIES.

LINNEAN SOCIETY.

Feb. 7.—E. Forster, Esq., in the Chair. E. Forbes, Esq., professor of Botany at King's College, was elected a fellow. The Rev. Mr. Hinckes exhibited a specimen of *Neottia gemmipara* procured by Dr. Wood, of Cork, from Castletown, near Bantry Bay, where this plant was originally found by Mr. Jas. Drummond, and on whose authority it was admitted into the Irish Flora. The original specimen from Sir J. E. Smith's herbarium was also exhibited. The plant of Mr. Hinckes was much longer in the stem, and the flowers less crowded, than that from Smith's herbarium. The roots agree with the original description and drawing of Mr. Drummond. A note from Mr. Hinckes accompanied the specimen, in which he stated his conviction that this rare plant was still an inhabitant of Ireland. Mr. A. H. Hassall finished the reading of his paper on the reproduction of the *Coniferae*. The structure of the last family of *Vanher*, the *Prolifera*, was considered, also that of the branched *Coniferae*. Their mode of reproduction, and many of the phenomena exhibited by the reproductive granules, or zoospores, of this class of plants were described.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

Feb. 1.—At the first monthly meeting, his Grace the Duke of Richmond in the Chair, 45 gentlemen were elected Fellows.—Mr. R. Barker, chairman of the finance committee, presented the committee's monthly report, on the state of the society's funds, the current cash balance being 1,777*l.*, and the amount of invested capital 6,700*l.* stock. The committee recommended two additional clerks for the despatch of increasing business, and the adoption of post-office orders for the transmission of subscriptions, both which suggestions were adopted. Mr. Pym reported that the arrears of subscriptions in Bedfordshire, received by him, amounted to 54*l.* Mr. Wyon transmitted the Great Seal confided to his execution, which was adopted as the seal of the society; and Mr. Dean having laid before the council the approved lease of the house in Hanover-square, for 99 years, at an annual rent of 300*l.*, the society's seal was affixed to it, and the contract signed. The following resolutions were carried.—1. That a card of the meetings of the council be printed for the use of the members. 2. That the Duke of Richmond, Earl Spencer, the Chairman of the Journal Committee, the Chairman of the Finance Committee, and Mr. Gibbs, be appointed a committee to inquire respecting a more economical mode of printing the journal. 3. That the finance and journal committees be requested to settle a scale of charges for inserting advertisements in the journal; and that the publisher receive advertisements accordingly.—The Rev. W. L. Rham gave notice that he should move for a sub-committee of the journal committee, to whom all papers and agricultural correspondence should be referred; Mr. Raymond Barker, for a permanent house committee; and Mr. Gibbs, that an annual list of the members be printed, showing the state of arrears (if any) due from each member, no member being allowed to have his copy of the journal delivered to him until his subscription shall have been paid.—The Duke of Rutland placed at the disposal of the society a cow, whose extraordinary enlargement of one side of the body without apparent cause and while in perfect health had already been brought under notice by the Duke of Richmond.—Numerous donations were received, of books for the society's library, and for the museum the model of a new roller, invented by Mr. C. Cherry, for pressing and equalising the surface of land.

Feb. 8.—P. Pusey, Esq., in the chair. T. J. M. Bartlett, Esq. was elected a governor, and 151 gentlemen Fellows of the Society.

NORWICH AND NORFOLK HORTICULTURAL SOCIETY.

Feb. 1.—The Thirteenth Annual Meeting was held at the Norfolk Hotel. The Rev. O. Matthias in the chair. From the Report we extract the following:—That the receipts of the society for the past year have amounted to 286*l.* 12*s.* 6*d.*, of which 127*l.* was taken at the doors. The number of subscribers was 408, of whom 83 were new ones; being an increase, in two years, of 208 new members. This large increase of subscribers during the last two years testifies that there is an increasing feeling for the success of horticulture; and that the liberal funds placed at the disposal of the society have contributed to foster such feeling. The amount paid to members has been 147*l.* 12*s.* 6*d.*—an unusually large sum; to cottagers, 62*l.* 4*s.* 6*d.*—a sum above the usual average. These large sums, together with having paid judges from a distance, have occasioned a slight deficiency in the balance of the cash account; but the committee feel that this will only be an additional inducement to the subscribers to renew their ex-

tions in behalf of the society. They view with regret the little support which they have received from the citizens of Norwich; and they hope that this simple appeal will induce many of them to place their names on the subscription list. The desire of the committee is to increase their means, that they may extend the usefulness of the society, and thereby be enabled to reward merit in every case that comes within the meaning of its objects. They draw the attention of subscribers to the fact, that during the past season the society has distributed, in cash, 209*l.* 17*s.*, exclusive of prizes in plate, in 1238 portions, varying from 6*d.* to 5*l.*, viz., to members 422 prizes, to cottagers 816; and it is their opinion that the late shows have been a great improvement on those of previous seasons. The Dahlia show was the only one that evinced any decline; not in the productions exhibited, but in the amount of receipts. This society for several years have made amateurs and nurserymen show in separate classes for Dahlias; last season they made the like distinction with regard to Roses, and finding such division to be approved by the exhibitors, the committee, in furtherance of their desire to promote the interest of amateurs and nurserymen, recommend that in future no nurseryman or dealer be allowed to compete with amateurs for the same prizes in flowers of every other description. The report having been read, Sir J. P. Boileau, Bart., was elected President, and Lord Bayning Vice-President for the ensuing year. The Hon. and Rev. R. Wilson, the Rev. W. Howard, Wm. Burroughes, Esq., the Rev. A. Herring, C. E. Tuck, Esq., the Rev. J. Arthy, W. Matchett, Esq., E. St. Quintin, Esq., R. N. Bacon, Esq., R. Hansell, Esq., and Mr. J. Cann, were added to the committee. J. Kitson, Esq., was re-elected Treasurer. Mr. C. S. Gilman was re-elected Honorary Secretary. The following addition was made to the 9th Rule:—"And that any person detected in stealing or injuring any article exhibited, be prosecuted; and that no person so expelled shall be readmitted as a member of the society without the recommendation of a special committee." An addition was also made to the 7th Rule, "That all flowers must be named and staged by half-past ten o'clock on the morning of exhibition, or be precluded from being shown for prizes."

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

HOVEA RACEMULOSA. Spikeletted Hovea. (*Greenhouse Shrub*). Papilionaceae. Diadelphica Decandria.—Although this cannot be said to rival such species as *Hovea purpurea* or *Celsi* in the brightness of its colours, it is by no means unattractive, when well contrasted with plants whose colours are not bright enough to kill it. It belongs, moreover, to a set of greenhouse shrubs of easy cultivation and small size, which are well adapted for decorating the shelves of the conservatory. It is a native of the Swan River Colony, whence the seeds were obtained by Capt. J. Mangles, R.N. It first flowered in the garden of R. Mangles, Esq., of Sunning Hill.—*Botanical Register*.

PHAIUS ALBUS. White Phaius. (*Stove Epiphyte*). Orchidaceae. Gynandria Monandria.—This truly beautiful plant is stated by Dr. Wallich (to whom our stoves are indebted for its introduction) to be a native of trees on Mount Chandaghi, in Nepal, and in the neighbourhood of Silhet. It flowered in the Royal Botanic Garden of Kew, in July, 1842. It is a caulescent species, with rather remote oblong lanceolate leaves, having long sheathing bases, which clothe the entire stem. The raceme springs, as it were, from the sheathing base of the upper leaf, and consists of from six to eight large, delicate, drooping flowers.—*Curtis's Botanical Magazine*.

MISCELLANEOUS.

Bulbous-rooted Barley.—According to M. Fleurot, Curator of the Botanic Garden at Dijon, this plant possesses the following advantages for composing artificial meadows:—1. It will grow in the most barren soil. 2. It tillers like wheat, and produces an abundant herbage. 3. It sows itself, so that it will form a permanent artificial pasture. 4. It commences growing when other fodder plants are dormant. 5. It is perfectly hardy. We have found that when sown in April, this plant produces throughout the summer a dense herbage. The ear at its first development resembles that of Rye, to which the whole plant may be compared, except that it is not glaucous and much more leafy. It has the merit of yielding an abundant herbage, which will no doubt prove excellent fodder; but the small quantity of perfect seeds which the ears contain, together with their ripening in succession and the facility with which they fall from the husks, render it difficult to propagate extensively. We, however, think it a plant worthy of exciting general interest. The practicability of increasing it by division of the roots will, for the present, render it useful for cultivation on a small scale. It is possible that the small bulbs which the old stools produce in great numbers, may prove an easy and cheap method of increasing it extensively. In poor soils, the Bulbous-rooted Barley does not grow very vigorously, and in this point, our observations differ from those of M. Fleurot.—*Bon Jardinier*.

New Botanical Work.—The *Allgemeine Zeitung* announces a new Botanical Magazine, to appear weekly, under the auspices of Professor Mohl, of Tübingen, and Professor Schlechtendal, of Halle. It is to contain all the newest information on Botanical subjects, and to be illustrated with many plates.

Agri-Horticultural Society of India.—The President in Council having issued an order disqualifying Government Servants, civil, military, or medical, from holding office as Secretary of any permanent public Society, it is understood that Mr. Griffith is no longer an eligible candidate for the Secretaryship of this Society. (See *Gardeners' Chronicle*, p. 39.)

Lindon's Patent Spade.—This kind of tool, which is case-hardened in a particular way, has been in use all this winter by the people employed in ground-work at the Garden of the Horticultural Society, where it is found far superior to the best of the common spades. The edge is so constructed that it always remains hard and sharp, instead of wearing round, and blunt, or broken.

Fox-hunters.—"It has often been said that growing Wheat is not injured by a field of fox-hunters riding over it; and even produces more grain in consequence. On light soils it does not do the injury that might be expected from appearance; but on strong land it does great harm, for in all the holes formed by the horses' feet, and particularly if going down hill, water will stand, and the plants in those holes will die."—*Journal of the Royal Agricultural Society of England*; Vol. III. p. 305.

Testimonial to Dr. Neill.—It gives us pleasure to learn that the Scottish Practical Gardeners have come

forward in a liberal manner to testify their respect for Dr. Neill, on account of his long and valuable services in their behalf. We understand that a handsome silver vase, with a pedestal emblematical of the varied productions of Flora and Pomona is about to be presented to him. The testimonial will be accompanied by the names of above 500 of the Scottish Practical Gardeners, resident in various parts of the three kingdoms. The subscriptions for it have nothing to do with those for Dr. Neill's bust, now executing, which is subscribed for by the members of the Caledonian Horticultural Society and his private friends.

GARDEN MEMORANDA.

Royal Caledonian Horticultural Society's Garden, Edinburgh.—This garden is pleasantly situated within a short distance of Edinburgh, on the north side of the town. It contains an excellent collection of fruit-trees and other ornamental plants, which are propagated for distribution. All the different modes of training hardy fruit-trees are practised, so that visitors are able to see at once the method which is most likely to suit them. The Pinetum forms a belt, which extends a considerable way round one side of the garden, and contains the greater portion of the Pines in cultivation. In one part of the grounds we were much struck with a Hornbeam hedge, the main stems of which have been planted and trained like diamond-shaped network, and now forming a beautiful and very strong fence. In the houses there are some good specimens of the more ornamental plants generally cultivated. Mr. M'Nab, jun., is still carrying on his curious and interesting experiments, which were so fully described in his paper read to the Botanical Society of Edinburgh, and published, with the drawings, in the *Gardeners' Chronicle*, at p. 531 of 1841. We allude to the suspension of different things in the air, and supplying them with water only. The common Oleander, *L'cus elastica*, *Acróstichum alaicorne*, *Bilbergia nudicaule*, and various other plants are growing well in this manner; and in those instances in which they are inverted, it is very curious to see the efforts which are made by them to regain their natural position. We also had an opportunity of witnessing in this garden the effects produced upon hard wooded greenhouse plants, by bending down their stems. Epacrises, for example, which had grown tall and bare, are induced to send out numerous shoots from all parts of the stems, and consequently become compact bushes; many other things are by this means thrown into a flowering state. The plants of course look bad and unnatural for a little while, at first, but this stiffness is soon hidden by the young shoots. The collection of Orchideous plants is good, and contains some very large and fine specimens. Collections of these plants are still rare in Scotland; but as all the public gardens in the country are growing them, we shall very soon see them more common in private establishments. Mr. M'Nab, since he has had the management of this garden, has built a greenhouse for small plants which is particularly deserving of notice, and would be very suitable for amateurs, or those who have small gardens. It is span-roofed, the roofs facing east and west, 8 feet high, 9 feet wide, and having a passage in the middle, with stone shelves at each side. A person can thus easily walk down the middle, and attend to the plants on either side; and the position in which the house is placed prevents the plants from being injured by bright sunshine in the middle of the day in summer. The new Exhibition Hall lately erected is a pretty and appropriate building, and will doubtless be most useful for the purposes for which it is intended. The scenery round this garden adds greatly to its beauty and interest. On the north and west sides are seen the Botanic Garden and the pleasant green fields and woods which surround Inverleith House; and on the south the New Town of Edinburgh, with the Pentland Hills and Arthur's Seat in the background.—R. F.

Reviews.

A Comprehensive View of the Culture of the Vine under Glass. By James Roberts. 8vo. Longman & Co. 1842.

THE author of this little treatise is evidently a practical man, who has had considerable experience in the cultivation of the Vine. In the Preface it is remarked that "we have not progressed in the culture of this noble exotic for the last 20 years in the same ratio as in that of the minor fruits." This is unquestionably true; but it is also equally undeniable that this slow rate of improvement is less the fault of gardeners than of their employers. Among the hundreds who have the management of Vines, how many are there with the means at their disposal to treat those Vines in the manner recommended in this work? We may safely answer, Not one in a hundred. We do not, however, mean to infer that the high-pressure system is the only one by which good Grapes can be obtained; on the contrary, many Grape-growers produce excellent fruit who have not the advantage of the apparently unlimited resources possessed by Mr. Roberts; still it will in all cases be found that the principles followed are similar to those which govern his practice. These are—1st, an abundant supply of food, with numerous healthy roots to appropriate it; 2d, a yearly supply of perfectly-formed bearing-wood; 3d, restricting all the vigour of the Vines to the formation of fruit for the present, and wood for the next year; and 4th, duly proportioning the weight of fruit to the strength of the Vines. Upon the judicious application of these simple principles rests the art of growing good Grapes; we will therefore proceed to examine the author's method of reducing them to practice.

With regard to the formation of the border, so as to ensure "an abundant supply [of food,] and numerous healthy roots," upon which the production of good crops of fine fruit during successive years essentially depends, the author thus describes his own system:—"The width of the borders outside the houses should be 24 feet (which I consider quite sufficient), cleared out to the depth of 3 feet 6 inches, upon a bottom of retentive clay, well prepared, with one foot of fall from back to front. A main drain, 1 foot 6 inches deep, ought to run along the extremity of the border, with cross-drains in an oblique direction leading into it, so as to have a perfect command in draining off superfluous water; which I consider an essential point to attend to, so as to lay them dry (more particularly where the climate is humid). I then lay upon the bottom thus formed broken stones and lime rubbish, to the depth of 1 foot, having a depth for compost of 2 feet 6 inches." These directions are very proper where the situation is low and wet, or the natural soil retentive of moisture; in many cases,

however, a less expensive mode of proceeding will suffice. The quantity of drainage ought, of course, to be regulated by the nature of the soil, the situation, and the climate of the district. When the subsoil is porous, and consequently dry, the cross-drains and the stratum of clay may be dispensed with. A drain along the front, and also one at each end of the border, should always be provided, to catch the soakage from the adjoining ground, and for the ready passage of water during excessive rains, &c. On the driest ground a layer of stones spread over the bottom will be advisable, to prevent the roots from penetrating too deeply; and in cases where these are necessary to facilitate drainage, a thicker bed should be used, with some leaves or litter spread over them, to prevent the soil from filling up the interstices. Mr. Roberts uses, in addition, large lime-stones, placed six or eight feet apart upon the broken stones, &c. "to retain moisture in a dry season, and to facilitate the drainage in a wet one." Where the situation of a Vinery is irremediably low and wet, the border for the Vines to grow in ought to be made, nearly or wholly, according to circumstances, above the surface of the surrounding ground.

The soil the author recommends consists of—"two parts, the parings of old pasture-land, a strong loam, laid up one year (or till the sward is half decomposed) in the form of a potato-hod, close covered in with soil, and never turned; one part, the turf, with four, inches of the soil, of a looser texture, laid up for the same period and not turned as before; an eighth part scrapings of the highways, formed from limestone or other hard material, and the other eighth part, half-decomposed horse or cow-dung. I am not an advocate for turning over and mixing the materials promiscuously together, as, by often turning, the compost becomes too solid, losing a great portion of its fertilizing property by such repeated intermixture; and unless it be of a very sandy, loose texture, the border will in a few years become impervious both to water and to atmospheric air, which are of incalculable benefit to the growth of the Vine."

Those who are unable to procure all these different materials will find a good substitute in turfy loam, dug from two to four inches deep, according to its texture and quality. If the soil is collected early in autumn, and from one-eighth to one-sixth part of good dung spread amongst the layers when laid up into a ridge, the border might be made in the following spring, adding at that time a portion of lime-rubbish (that is, old mortar and brick-bats), or broken lime-stone, with a good quantity of unbroken bones. But whatever kind of compost may be made use of, it ought on no account to be worked when wet. Mr. Hoare, in his admirable Treatise on the Vine, has shown that bones are a most valuable ingredient in Vine borders, as, owing to the slow progress of decomposition, they furnish nutritive matter to the roots in after years, when the more soluble manures are exhausted. But besides the compounds before enumerated, Mr. Roberts mixes throughout the whole mass of soil a quantity of carrion cut into small pieces, in the proportion of one good-sized horse or cow carcass to every ten or twelve square yards; using caution, and not bringing it to the surface of the border within one foot, as its assistance is not wanted the first year." Although it is well known that the Vine is what is termed "a gross feeder," we could hardly have supposed that its roots delighted to revel in a profusion of one of the most powerful of all known manures. Yet, without doubt, the author has found animal flesh in large quantities beneficial: in fact, he seems to regard it as the most important element in the composition of the border. We have dwelt at some length upon this part of the subject, because it is of the utmost importance; for the most scrupulous attention to the internal management of a Vinery will avail but little unless the roots of the plants are in a condition to furnish a sufficiency of food.

The author very properly deprecates the notion of chambering, and heating the border with flues or pipes; and to protect and assist the roots while in action, he advises the border to be covered two or three feet thick with fermenting dung and leaves; justly attributing a prevalent cause of failure in Grape-forcing to the great difference in temperature between the roots in an exposed border and the foliage in a warm house.

In his lists of sorts suitable for the various structures in which Grapes are usually grown, he has inadvertently included the White Muscat among those proper for the rafters of a greenhouse. He reprobates the system, now unfortunately so general, of sending out with a high character and a higher price some well-known or comparatively worthless sort as a "new seedling;" and suggests the institution of "a council or committee, including some of the best practical men, to try, discuss, and give unbiassed opinions on the merits or demerits of all seedling fruit, before they are pronounced worthy of cultivation (similar to the Horticultural Society for Flowers)." [In our opinion, the Horticultural Society of London is the right judge to select; well-informed and above all interested bias. If a new Grape is not stamped with their approbation, a man is unwise to buy it.]—W.

(To be continued.)

Popular Flowers. The Pansy—its Propagation, Cultivation, and general Treatment in all Seasons.

By J. Tyas & Co.

The second Number of this work is devoted to the Pansy. Although advancing nothing new in the cultivation and management of the flower, the directions are generally good, and the present Number is compiled with greater care than the preceding one. It has probably been looked over by some judicious friend. These little treatises are susceptible of great improvement, not only in

the matter, but in the illustrations, which ought to exemplify the qualities which constitute perfection; the lists at the end should, moreover, embrace all the standard flowers of each subject.

CALENDAR OF OPERATIONS for the ensuing week.
