FISH.—*Totty.*—The Jack does not like either Perch or Tench, but will eat both. The best food for him, we believe, is small Dace, Roach, and Gudgeons.

GARDEN POTS.—*Rus in Urbe.*—We cannot learn where the half garden-pots, to hang against a wall, are manufactured. We doubt whether they can be had now without special order.

DRIED PLANTS.—*J. S.*—A full account of the method of drying plants is given at p. 527 of 1842.

FOUNTAINS.—*X. Y. Z.*—We cannot advise you, knowing nothing of the means you possess of forming a fountain. You must have a head of water of considerable size, for nothing is more miserable than a little wretched fountain which the first heavy rain seems to extinguish. You had better consult some engineer near you.

MISCELLANEOUS.—*Cane.*—The Sugar Cane does not flower in this country. When it does flower, it is something like the Reed buried in silvery hairs.—*A Constant.*—We have not remarked, nor do we learn that others have discovered, "that toads and multitudes of worms were killed by the rain of Wednesday night, the 21st ult."—*S. F. G.*—It is impossible to name the varieties of Rhododendrons which you have sent; they have no settled names.—*W. J. W.*—The leaves of your Pelargoniums appear to have been attacked by some mining insects, for which there is no remedy except picking off those leaves which are infested, and burning them.—*J. Rainbow.*—We will endeavour to meet your wishes. The roots of Irises received from the nurseries in autumn or early in spring ought to flower the following season.—*W. N. B.*—We cannot pass an opinion upon your seedling *Cineraria*, after the flowers have been crushed in a letter amongst dry Moss.—*H. M.*—Mr. Kernan's, 4, Great Russell-street, Covent Garden.—*W. T. C.*—The largest of the *Magnolia* leaves belongs to the Exmouth variety of grandiflora; the other is the common kind.—*A Constant Reader.*—1 is *Eucalyptus pilularis*; 2, *A. Pomaderris*.—*C. R. B.*—We had no intention of hurting your feelings; we always answer inquiries, but we have not room for controversy upon dry points of science. If you will

consult some chemical friend, you will soon see that you have been laying down the law much too decidedly.—*M. C.*—Of your Camellias, 1, is the Double Red; 2, is *C. myrtifolia*; 3, *anemoniflora*, of which 4 appears to be a smaller variety.—*W. M.*—We cannot undertake to name plants not in flower. Those which we can distinguish are, 2, *Lissanthus sápidus*; 3, *A. Leucopogon*; 4, one of the hybrid *Correas*; 8, appears to be *Trymálum odoratissimum*.—*M. A. G. P. B.*—Your fruit is Vanilla, and the seed will not grow.†
As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE occupation of the island of Tahiti by the French Government has been considered of sufficient importance to be the subject of discussion in both Houses of Parliament. In the Lords, on Monday, the Marquess of Lansdowne called the attention of Ministers to the position of the English missionaries, to whom the natives of that and other islands in the Pacific are indebted for considerable advancement in the arts of civilisation. He did not regard this acquisition on the part of France with unnecessary jealousy, but he thought that the interests of the British residents should be protected. Lord Aberdeen concurred in the opinion that the establishment of the French in these islands is not likely to produce any injury to the commercial or political interests of Great Britain; and stated that the French Government had given our Ambassador in Paris the most satisfactory assurances of protection and encouragement to the missionaries. Sir R. Peel made a similar statement in the House of Commons, adding, that stipulations had been expressly made in the convention for the protection of all religious worship. Lord Campbell last night brought forward his motion, embodying a series of resolutions on the subject of the Scotch Church. The object of these resolutions was to express the desire of the House to protect and confirm the Church in the possession of her legitimate privileges, but at the same time to uphold the system of patronage, and affirm the impolicy of conceding the claim of the Church to a jurisdiction in civil matters superior to the common law of the land. The motion was opposed by Lord Aberdeen, and withdrawn without a division. In the Commons, on Monday, a long and desultory debate took place in a Committee of Supply on a variety of miscellaneous votes, the discussion of which involved many questions of general interest. Several divisions took place on particular items, but the votes were ultimately carried by large majorities. On Tuesday, Mr. T. Duncombe brought forward his motion for a select committee to inquire into the alleged misconduct of the magistracy during the disturbances of last autumn. The motion was opposed by the Attorney-General, who contended that the conduct of the rioters was little short of high treason, and that if any charge should be brought against the Government, it ought to be that of having exhibited too much leniency in the prosecution of such offences. After an animated debate, the motion was negatived by a majority of 164. On Thursday, Mr. Ferrand obtained leave to bring in a bill to compel the allotment of waste land in England, for the particulars of which we must refer to our Report.

Our Foreign news is not of great importance. In France, the Ministry have again been successful in a division in the Chamber of Deputies on a motion for preventing deputies from accepting office or receiving promotion during the session; the motion was opposed by Government, and rejected by a majority of 26.—From Spain we learn that considerable uncertainty prevails in regard both to the actual results of the late elections and to the prospects of the Cabinet. A change of Ministry is confidently talked of at Madrid, and it is supposed that the Regent will find it necessary to modify the Cabinet before the assembling of the Cortes.—The accounts from Lisbon are still unsatisfactory; the tariff question continues in an unsettled state, and business is in a great measure suspended by the uncertainty in which it is involved.—The German news announces the determination of Austria to accede to the Customs Union, the Cabinet of Vienna having been convinced of the political influence obtained by Prussia in placing herself at the head of the Confederation. The result of this measure, which is characterised in diplomatic circles as a skilful manœuvre, will be to transfer all questions relating to the tariff to the Diet at Frankfurt, the Presidency of which belongs to Austria.—The Levant mail brings further accounts of the disputes between Turkey and Russia on the affairs of Servia, but they add little to the information received by previous advices.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, continue at Buckingham Palace, and are in excellent health. On Tuesday her Majesty and Prince Albert honoured the performance of the French plays with their presence.—Sunday was the birth-day of his Royal Highness Prince George of Cambridge. The Prince and the Duchess of Cambridge visited her Majesty at Buckingham Palace. His Royal Highness Prince Albert, and other members of the Royal family, visited Prince George at his residence in St. James's

Palace.—The Viscountess Jocelyn has succeeded the Countess of Charlemont as the Lady in Waiting on the Queen; and Lord Byron and Captain Meynell have succeeded Viscount Sydney and Captain Duncombe, as the Lord and Groom in Waiting on her Majesty.—His Royal Highness the Crown Prince of Wurtemberg and suite arrived in town on Thursday morning by the Netherlands steam-boat Batavier, from Rotterdam. The Prince has taken up his residence at Mivart's Hotel, where he has been visited by different members of the Royal family.

Official Appointments.—The office of Inspector of Prisons, vacant by the death of Dr. Shortt, has been conferred by the Secretary of State upon Mr. J. G. Perry, surgeon to the Foundling Hospital, and late secretary to the Royal Medical and Chirurgical Society of London. Mr. Clark, son of Sir James Clark, physician to her Majesty, and Mr. Cole, son of Sir Lowry Cole, have been appointed by Sir R. Peel to the two vacant situations of junior clerks in the Treasury.—It is announced on authority that there is no foundation for the paragraph copied a short time since from the *Greenock Advertiser*, stating that Mr. Thomas Pottinger was appointed Resident at Hong Kong.—The Marquess of Anglesea has received from her Majesty the gold stick of office as Colonel of the Royal Horse-Guards, vacant by the death of Lord Hill.

Parliamentary Movements.—The representation of Nottingham, vacant by the decision of the committee which unseated Mr. Walter, is likely to be warmly contested. At a meeting of the electors on Saturday, Sir George Larpent and Mr. Gisborne were proposed, and after a show of hands the numbers were declared to be five to one in favour of Sir G. Larpent. Mr. Gisborne has since issued an address, announcing that he will stand if a majority of the electors desire it. The Chartists have decided on bringing forward Mr. Feargus O'Connor, and the complete suffrage party intend, it is said, to propose Mr. Sturge.—Capt. Beresford has announced himself as the Conservative candidate for Athlone, in the place of Mr. Farrell, who was unseated last week by the Parliamentary committee, and Mr. Collett has come forward on the Liberal interest. The election was appointed to take place yesterday.

Education, Science, and Art.—By a statement just laid upon the table of the House of Commons of the estimates for 1843-4, for the purposes of education, science, and art, it appears that there will be required for public education in Great Britain, 50,000*l.*; ditto in Ireland, 50,000*l.*; schools of design, 4,411*l.*; Professors at Oxford and Cambridge, 2,006*l.*; University of London, 5,148*l.*; Universities, &c., in Scotland, 7,380*l.*; Roman Catholic College in Scotland, 8,928*l.*; Royal Irish Academy, 300*l.*; Royal Hibernian Academy, 300*l.*; Royal Dublin Society, 5,600*l.*; Belfast Academical Society, 1,950*l.*; British Museum Establishment, &c., 32,576*l.*; ditto buildings, 37,485*l.*; ditto purchases, 5,275*l.*; National Gallery—purchase of pictures and expense of the Gallery, 1,600*l.*; Museum of Economic Geology, 2,008*l.*; and Scientific Works and Experiments, 4,000*l.*;—the total for the year 1843-4 is 210,967*l.* The total for 1841-2 was 212,524*l.*; and for 1842-3, 210,889*l.* In the expense, therefore, of 1843, as compared with 1841, there will be an increase of 6,443*l.*; and as compared with 1842, of 8,078*l.*

Expenses of Public Departments.—The sums required for these services, for the year ending March 31, 1844, will be—Two Houses of Parliament, 67,350*l.*; Treasury, 53,800*l.*; Home Department, 26,000*l.*; Foreign ditto, 66,273*l.*; Colonial ditto, 25,557*l.*; Privy Council-office and Office for Trade, 33,000*l.*; Lord Privy Seal, 2,000*l.*; Paymaster-General, 35,893*l.*; Comptroller of the Exchequer, Paymaster of Exchequer-bills, and Paymaster of Civil Services, 18,413*l.*; State Paper-office, 2,550*l.*; English Ecclesiastical Commissioners, 3,000*l.*; Poor-Law Commissioners, 51,608*l.*; Mint, including coinage, 50,958*l.*; salaries and expenses of public records, 11,775*l.*; inspectors and superintendents of factories, 8,880*l.*; offices in Scotland, 1,815*l.*; household of the Lord Lieutenant of Ireland, 6,464*l.*; Chief and Under Secretary's office, and Privy Council-office, Ireland, 22,260*l.*; Paymaster of Civil Services, Ireland, 4,937*l.*; Commissioners of Public Works, Ireland, 2,400*l.*; Secret Service, 39,200*l.*; printing and stationery, 232,533*l.*; printing proclamations, &c., in Ireland, 4,950*l.* The total expense for the year 1843 will be 771,736*l.*; for 1841 it was 738,472*l.*; for 1842 it was 760,167*l.* In 1843 there will, therefore, be an increase of 33,264*l.* as compared with 1841, and 11,569*l.* as compared with 1842.

Royal Commission of the Fine Arts.—Several meetings of the Commissioners appointed to consider the decorations to be adopted for the interior of the new Houses of Parliament have taken place during the last month, at all of which Prince Albert has presided. The following notice was issued on Saturday:—1. That the cartoons or drawings intended for competition, according to the notices published in April and July, 1842, will be exhibited in Westminster Hall, whither they are to be sent between the hours of ten and five on any day, Sunday excepted, during the first week in June next, when agents will be in attendance to receive them; but no drawing will be received after Wednesday, the 7th of June. 2. Each candidate is required to put a motto or mark on the back of his drawing, and to send, together with his drawing, a sealed letter, containing his name and address, and having on the outside of its cover a motto or mark similar to that on the back of the drawing. The letters belonging to the drawings to which no premium shall have been awarded, will be returned unopened. 3. The title of the subject of each drawing, together with the quotation, if any, to illustrate it, must be affixed either to

the back or front of the drawing. 4. Each drawing is to be sent upon, or accompanied by, a stretching-frame; but no ornamental frames, in addition to the stretching-frame, will be admissible. 5. The artists, or their agents, may attend to examine the works sent by them, and to re-stretch such drawings as shall have been detached from their stretching-frames, and rolled for the convenience of carriage. 6. No drawing will be allowed to be retouched after having been received, except to repair an injury occasioned by accident, and then only by the artist himself. 7. Every possible care will be taken of the works sent; but in case of injury or loss, the commissioners will not be responsible. 8. All the drawings will be exhibited, and catalogues will be published. 9. The names of the judges appointed to award the premiums will be made known.

Foreign.

FRANCE.—The principal topics of interest in the Chamber of Deputies are the discussions on the motion of M. de Sade, for preventing deputies from accepting place, or receiving promotion, during the session; and on the propriety of a general reduction of postage on inland letters. The former question was disposed of on Thursday, when the motion was rejected, by 207 votes against 181. In regard to the postage question, the Minister of Finance said that the negotiations for a reduction of the postage on letters between France and this country had made considerable progress, and were likely very shortly to yield a result which would facilitate the correspondence between the two countries, and promote the interests of both. With regard to the establishment of a moderate and uniform rate of postage in France, he admitted the simplicity and other advantages of a uniform postage, but contended that the increase of letters in England has not been, during the last two years, equal to the rise of the first year of the experiment; and that the increased number of letters has required a more considerable service, and that service is daily increasing—as it cost 750,000*l.* in 1839, and 938,000*l.* in 1842.—The papers give some further particulars of the manner in which the possession of Otaheite was accomplished. The English missionaries strongly opposed the native women going on board any vessels which arrived. The French admiral, says a letter from an officer of the frigate, most certainly would not have admitted the women on board, had not the English missionaries opposed it; but hearing that they did oppose it, the admiral had 100 women on board, dancing and feasting till a late hour—the result of which was, the acknowledgment of French supremacy.—It appears that so powerful an opposition to the Paris and Calais railroad treaty had been raised, that the affair was on Saturday nearly as far from being arranged as ever. The demand of the inhabitants of Boulogne, that the railroad should pass through their city, was resisted by the projected company, on the ground that the intercourse with Great Britain alone would not indemnify the proprietors, whose interests required that the line should contemplate a union with that of Lille and Belgium.—The *Quotidienne* of Monday states that the Duke de Nemours narrowly escaped the same fate which befel the Duke of Orleans in July last:—"Driving in a low carriage drawn by four horses, one of the leaders fell, which caused the carriage to be overturned; but the Duke previously jumped out, and fortunately escaped unhurt."—The commission for erecting the tomb of the Emperor Napoleon has decided that the baldachin of the altar in the church of the Invalides, with its gilded columns, shall be suppressed; that the equestrian statue of the Emperor shall be erected on the Esplanade, and not in the Cour Royale, as designed by the architect; and that the figure of the Emperor shall be in his historical dress, and not in the Roman costume.—On Monday morning several persons of the suite of Prince Augustus of Saxe Coburg arrived at the Palais Royal. It is stated in some of the German papers that, by the contract of marriage between this Prince and her Royal Highness the Princess Clementine, the bride is to have an income of 300,000 francs per annum, and the Prince 100,000 francs per annum.—The Magdalen by Canova, in the Aguado Gallery was sold at Paris on Tuesday for the sum of 59,500*l.*, to the Duke de Saragaglia. It is said that this treasure of art is to be taken to Italy.—Some excitement has been caused in political circles by a recent publication of Prince Dolgarouki, containing biographical sketches of the principal families in Russia. The Prince has incurred the anger of the Emperor by this work, and has been summoned to return immediately to St. Petersburg.—The *Echo* of Chateaulin, in the Finisterre, gives the following details of some curious discoveries lately made at Crozon, in that department. The immense quantities of sand drifted away by the violent winds of January, and which blocked up several villages, left bare a solid hillock, of about thirty feet in circumference. Some bones, observed on the surface, created an idea that it was an ancient tumulus, and induced the curious to explore it. It was soon found to contain a great number of skeletons, both male and female, in perfect preservation; and the north-west side had been exclusively appropriated to children. Various conjectures have been formed as to the origin of the tumulus, but the indications subsequently found, though few, give preponderance to the conclusion that it was Roman. These are two medals, or coins, one of silver which is not described, being perhaps too much defaced, and the other of copper, of the size of an *obolus*, frequently put into the mouths of the dead, under the idea of enabling them to pay Charon for their passage over the Styx. It bears on one face the name and effigy of the god Mars, and on the obverse, Romulus and Remus

being suckled by the she-wolf. This opinion is strengthened by the known fact of a Roman encampment having been some time ago traced in the immediate neighbourhood, with unquestionable relics of that people.

SPAIN.—We have accounts from Madrid to the 20th ult. They state that the results of the elections were still doubtful; but that, although the belief prevailed that they were unfavourable to the Government, the Cabinet seemed determined to meet the Cortes. The speech to be delivered on the occasion was under discussion. The list of the Senators to be appointed by the Government was already drawn up, and it included none of the candidates of the Moderado party. A change of Ministry was however talked of, and Gen. Chacon was mentioned as likely to be selected to form a new Cabinet. Three of the Ministers—Rodil, Almodovar, and Zumalacarreguy—had been returned neither as Senators nor Deputies. The election of the Infante Don Francisco de Paula had given the more displeasure to the Government, as the extreme fraction of the Opposition intended to raise him to the Presidency of the Chamber of Deputies. It was expected that the Regent would do his utmost to have his election annulled.—It was reported at Madrid that Mr. Aston, the British Minister, would retire, and be succeeded by Lord Mahon.—Private letters state that the Government, intent upon its own safety, pays no attention to the innumerable assassinations, highway robberies, kidnappings, false coining, and hundreds of other atrocities. Almost every province has now its dominant band of brigands, who mock the pursuit of the troops, and commit all kinds of enormities in open daylight. A member of the Infante Don Francisco de Paula's household, who had arrived in Madrid for the purpose of preparing a residence for the Prince, was robbed on the road of all his wardrobe.

PORTUGAL.—We have Lisbon news to the 20th ult. Lord Aberdeen's answer to the Portuguese *ultimatum* had arrived at Lisbon. The latter was not considered satisfactory, and our Government adheres to its own proposals. What the Portuguese Government intended to do had not transpired, and much anxiety existed, business being in a great measure suspended by the uncertainty.—The Cortes had been occupied with the Roads Bill, which was still before the Chamber of Deputies. The latter had given the Government a vote of confidence, empowering it to carry into effect, during the recess, such measures as it deemed necessary for the welfare of the colonies: giving an account of its proceedings at the commencement of the following session.

HOLLAND.—The Dutch papers give extracts from the Java journals, containing the following singular account from Rambang of 31st Oct.:—We have lately had extraordinary natural phenomena several times, but always in the daytime. In different places, at some distance from each other, there have been heavy storms of hail, accompanied by high winds. The hail-stones were of the size of tamarind-stones, not round, but angular. On the whole, but little damage was done, except to some tobacco plantations. The natives, who had never seen so strange a phenomenon, shivered when they took up the cold hail-stones, and were quite annoyed when they melted in their hands.

GERMANY.—The *Cologne Gazette* states, that the Austrian Government, having at last become convinced of the political influence which Prussia has obtained by placing herself at the head of the German Customs Union, has resolved to accede to this union as soon as the northern states shall have done so. The Zollverein will then be considered to make an integral part of the confederation. This arrangement will operate advantageously for Austria, as the questions of the tariff will be decided by the Diet at Frankfurt, the presidency of which belongs to Austria, and the Prussian Government, which aspires to the first rank, will be placed in the second by this skilful manœuvre. The accounts received from Vienna state that the Archduke Charles is much better.—The King of Prussia has been pleased to transmit, through his ambassador in London, a gold medal, bearing his portrait, to the author of "Frederick the Great, his Court and Times," "in token," says the letter from his Majesty which accompanied this present, "of my approbation of your meritorious work." The great establishment in Berlin, known by the name of the Coliseum, was totally destroyed by fire on the 21st ult. The origin of the fire is not known. The presence of several members of the royal family encouraged the firemen.—The *Hanover Gazette* of the 17th ult. states that Madame Caroline Herschel, sister of the celebrated astronomer, the late Dr. Herschel, resides in that city, and, though arrived at the advanced age of 94 years, enjoys excellent health, and has acquired a distinguished reputation in the scientific world. It is understood that the King of Hanover is expected to arrive on a visit to this country about the middle of May, orders having been received to prepare his apartments in the Ambassadors' Court for his reception by that period. The King is expected to remain six weeks in town. The government of the kingdom during his Majesty's absence will be delegated to the Council of State, of which Prince Bernhard of Solms Braunnfels is President.—The comet has been observed in Germany. The journals are filled with details from astronomers beyond the Rhine, agreeing very closely with the observations made in Paris.—Letters from Vienna were received in town on Thursday, announcing the accouchement of the young Princess Nicholas Esterhazy, the daughter of the Earl of Jersey. She was confined on the 21st inst. of a son and heir, and when the accounts left Vienna both the Princess and infant were doing well.

ITALY.—By a letter lately received from Rome, we learn that the sport afforded by Lord Chesterfield's foxhounds has created a great sensation there: they have had

some admirable runs in the Campagna; and almost all the aristocracy of Rome were assembled, either to witness or join in the chase. Lord Chesterfield has presented the pack to the society there, and a large subscription has been raised to keep it up.—The *Diario di Roma* says:—"As it is well known that the great number of paintings composing the gallery of the late Cardinal Fesch must require several successive sales, it has been decided that they shall commence on the 17th of April."

TURKEY.—The Levant mail has brought letters from Constantinople, which refer chiefly to the contention between Russia and Turkey regarding the internal affairs of Servia, and to the course pursued by the French and British agents in that quarter, but they contain little that would interest our readers. They state that the Greek Government has consented to open direct negotiations for the adjustment of the preliminary questions, which have hitherto rendered a definitive settlement impracticable. A letter from Semlin, March 6, states that the Sultan intends this spring to visit Belgrade, and from thence to proceed to Vienna. Several persons had been arrested at Belgrade, as conspirators in the recent plot for overturning the government of Servia.

CAPE OF GOOD HOPE.—Advices have been received, by the Blonde frigate, from the Cape, of the 23d January. The accounts regarding the insurgent Boers are very conflicting. Some state that no resistance will be made, others exactly the reverse. A messenger from Philipolis, who arrived at Graham's Town on the 31st of December, brought information that the Boers were assembling in that neighbourhood in force, and that if the troops should attempt to cross the Orange River, their passage would be disputed. The latest accounts state positively that Colonel Hare had determined to cross the Orange River. The Kaffirs are said to be anxiously watching the movements of the authorities as regards the disaffected farmers, and only waiting the result to decide upon their own measures. Marauders were lurking on every part of the colonial border, and carrying off cattle. Apprehension had been entertained that the Kaffir chiefs had organized an extensive combination of their tribes to attack the colony, but it seems to have been postponed or abandoned, if, indeed, it had ever been seriously entertained. At Cape Town an unseemly display of feeling on the part of some of the Dutch residents had taken place, during the festivities of a dinner given to the officers of the Netherlands ship Palambang, the healths of the Court at the Hague and the Ministry having been most enthusiastically responded to, while that of her Britannic Majesty was most slightly treated, and by several absolutely unacknowledged. This dinner, it is stated, was presided over by M. Van Breda, one of the Legislative Council of the colony, and several of the party were subordinate officers of the civil service. The Cape papers are much occupied in canvassing the merits of the Natal question, and this incident, among others, is introduced to give weight to the arguments they bring to bear upon it.

Parliament.

HOUSE OF LORDS.

Monday.—The Marquis of Lansdowne asked information of Lord Aberdeen respecting the occupation by the French Government of the island of Tahiti. He did not view this acquisition of territory on the part of France with any unnecessary jealousy, but wished that the interests of a number of British subjects who had taken up their residence in the islands of the Pacific, and to whom the natives were indebted for considerable advancement in the arts of civilisation, might be protected.—Lord Aberdeen was also of opinion that no injury to the commercial or political interests of this country was to be feared from the establishment of the French in these islands. With respect to the missionaries, he had already caused representations to be made at Paris, and they had been met by the most satisfactory assurance of protection and encouragement. An article to that effect had, indeed, been appended to the convention which had been entered into, and he confidently relied upon the good feeling of the King of the French and of M. Guizot for its due execution.

Tuesday.—The Dogs' Bill was brought up for the House of Commons, and read a first time amidst much laughter.

Lord CAMPBELL laid on the table the five resolutions which he intended to propose on Friday, on the subject of the Scotch Church. The three first express the opinion of the House, that the church should freely possess her rights and liberties, that any shock which may endanger its great national establishment would be regarded by the House as a national calamity, and that the demands of the church, contained in the papers laid before the House, should be conceded by the Legislature, as far as they can be safely granted consistently with the permanent welfare of the church and the existence of subordination and good government in the country. 4. That, considering that patronage has subsisted in Scotland from the remotest times, and is recognised in the most venerable authorities of the law of that country, that the preservation of patronage was made an express condition on which the present Reformed Church of Scotland was established and endowed by the State; that it has been confirmed by several subsequent statutes, that the present Ministers of the Church of Scotland were introduced into it according to the law of patronage; and that if this law be under due superintendence and control, there appears to be no other law more likely to secure the introduction, as pastors into an endowed church, of men of learning, piety, zeal, good morals, and sound doctrine, the demand of the Church of Scotland, that patronage shall be abolished as a grievance, is in the opinion of this House unreasonable and unfounded, and ought not to be conceded. 5. That this House acknowledging the independent, exclusive, and supreme jurisdiction of the Courts of the Church of Scotland in all matters spiritual, is of opinion that the demand of the Church of Scotland that the law shall be framed so as to give to the Church Courts absolute authority in every case to define the limits of their own jurisdiction without any power in any civil Court in any way to question or interfere with their proceedings, decrees, and orders, although they may exceed their jurisdiction, and in suits professedly spiritual, may treat of civil and temporal matters, and may violate the statute or common law of the land, and that no action or proceeding shall be instituted against any members of the said Courts for a refusal to do acts required by the Legislature to be done, by which refusal the Queen's subjects are prejudiced in their civil rights; notwithstanding that such demand be under the qualification that the decrees and orders of the Church Court shall not be binding in other courts, or fetter them in any way in the regulation of their conduct, according to their conscientious conviction in regard to the matters they have to decide, is unprecedented in any Christian Church since the Re-

formation, is inconsistent with the permanent welfare of the Church of Scotland, and the existence of subordination and good government in the country, and ought not to be conceded.

Thursday.—The Consolidated Fund (8,000,000*l.*) Bill was read a third time and passed.—The Coast of Africa Settlements and Falkland Island Government Bills passed through committee.—The Earl of Wicklow moved for returns relative to the amount of duty from the distillation of spirits in Ireland. He did not blame the Government for imposing the additional duty on Irish spirits, as it had been considered as an equivalent for the income-tax. But the experiment had proved a failure, for it had yielded only 15,000*l.* a-year to the revenue, while it led to a total disorganisation of society, by the encouragement which it gave to illicit distillation, the fruitful parent of every immorality. He hoped that the Government would retrace their steps.—The Duke of Wellington regretted that the motion had been brought forward before all the information on the subject had been laid on the table of the House. The revenue had been increased by a larger sum than 15,000*l.*, for a large quantity of spirits had been imported into Ireland from Scotland, the duty paid on which should be added. He denied that drunkenness had increased in Ireland during the past year; on the contrary, it could be proved that it had considerably decreased.—Lord MONTAGUE affirmed that crime had increased concurrently with the increase of duty on spirits. Many of the distillers in Ireland were, he said, in favour of the existing state of things, in the hope that illicit distillation would have the effect of breaking up the temperance system, by which, on the reduction of duty, the trade would fall into their hands. The tax produced nothing, and was no equivalent for the income-tax; but even if it were, it was better that the property rather than the morals of Ireland should suffer.—Lord FITZGERALD said that, if he were convinced that increase of crime and social demoralization were the result of this increase of duty, he should not for a moment argue for its retention. But he did not think that it had produced these mischievous effects; and the Government were not prepared to abandon an experiment still in progress.—The Earl of Wicklow replied, and the papers were ordered.

Friday.—Lord CAMPBELL moved the resolutions of which he gave notice on Tuesday, and which are fully described in our report of that day.—Lord ABERDEEN opposed them, on the ground that their adoption would aggravate the difficulties of Parliament in dealing with the subject. He moved the adjournment of the House as an amendment.—Lord BROUGHAM, the Earl of HADDINGTON, Lord COTTENHAM, and the Lord CHANCELLOR, censured the conduct of the majority in the Kirk, after which Lord CAMPBELL replied, and said he would not press his resolutions to a division.

HOUSE OF COMMONS.

Monday.—The first order of the day was a committee of supply, the civil and miscellaneous votes being the subject of consideration. The first vote was one of 110,000*l.* for civil contingencies, which being made up of a great variety of items, some of them very small, led to a long and desultory conversation.—Mr. WILLIAMS contrasted the moderate expense of the United States for embassies with the amount expended by this country. It was a disgrace to the nobility of this country that none of them would do honour to their Sovereign without coming on the heavily-taxed people of this country.—Sir G. CLEER said that the mission of the Earl of Wilton to carry the order of the garter to the King of Saxony was an example of the desirated disinterestedness; he received no recompense, and it was but reasonable to pay the expenses of his journey.

Capt. PEBELL drew attention to the state of the relations between this country and France with respect to the mutual right of fishing, which has so long excited ill feeling. Thereupon a somewhat lively discussion occurred between Sir R. PEEL and Lord PALMERSTON as to whether the Whig government or the Tory government which preceded it were to blame for leaving this question, amongst others, unsettled. It concluded by Sir R. PEEL assuring the House that Government was labouring to settle it, and that as soon as possible he would communicate all the requisite information on the subject.

Mr. HUME commented upon some of the items of the vote, contending that they should be referred to a committee. There was hardly one item which ought not to be the subject of separate and mature deliberation. He found a charge in the civil contingencies of more than 1,000*l.* for the mission of Lord Wilton to the King of Saxony with the insignia of the garter. He had no objection to the distribution of such baubles among those who fancied them, but he did not like to see them made thus expensive to the country. Then there was a charge for the christening of the Prince of Wales; and, moreover, a charge for arming his arms—the arms of a child in his cradle! Why was not this defrayed from the large revenues of the Duchy of Cornwall? He objected to other items, individually small, but constituting a large aggregate burden on the public.

Sir R. PEEL explained, that the items objected to by Mr. Hume were not estimates of the future expenditure, but accounts of the past. He contended that there was a much more efficient control over expense when estimates were submitted on the responsibility of Government than there would be if they were introduced under the supervision of a select committee. In the case of the mission to Saxony, Lord Wilton received no remuneration for his services; the public was charged with no expense for the noble Lord except that of his conveyance, and, though Mr. Hume might think the Garter a bauble, yet, as long as its insignia were an object of ambition to the greatest Sovereigns of Europe, the English people would hardly like to see them packed up in straw and sent in a deal box by coach. The hon. Member had pointed to the revenues of Cornwall; but the Queen, on the birth of the present Prince of Wales, had divested herself of the whole of those revenues, and assigned them to trustees for the Prince. The expenses of his christening had been defrayed by the Queen from her own funds; and the only charge to the country was for the fittings of St. George's Chapel, her Majesty having thought it proper, at whatever inconvenience to herself, that the sacred rite should be performed in public, for the sake of example to all her subjects: So little had she sought to relieve the Privy purse at the cost of the people, that she had voluntarily submitted her own private revenue to the income-tax.

Captain BERNAL objected to the item for the expense of conveying the Bishop of Jerusalem to the coast of Syria, which was compared with the smaller item of the expense of conveying Lord Ashburton to and from America. This raised a lively discussion, and, on a division, the vote was affirmed by 112 to 37.

Sir G. CLEER then proceeded to move the miscellaneous estimates.—Mr. HUME took occasion to blame the practice of closing the National Gallery for six weeks of every spring.—Sir R. PEEL answered, that it was necessary to allow some vacation to the officers having charge of the pictures, and that there was great difficulty in finding temporary substitutes to whom that charge could be safely confided. He spoke of the good effect which had attended the opening to the public of places where national taste could be improved, and stated, that in 17 years, during which the British Museum had now been generally accessible, the only damage done had been the breakage of two panes of glass by the accident of a boy falling against them.—Some explanations were given by Sir G. CLEER respecting the discontinuance of the outlay incurred in the partial construction of a calculating machine under the superintendence of Mr. Babbage. The new discoveries of that gentleman himself had made the principle of it obsolete, and Government had hesitated to engage in the construction of a costly machine upon the new principle.—Mr. HAWES indicated the expenditure already incurred for this object. The prosecution of it had led to the invention of several beautiful instruments, which had been found highly serviceable in the cotton manufacture; and the importance of a process by which tables of logarithms could be secured against the possi-

bility of error would be best understood from the consideration, that one mistake in a decimal place might cause the shipwreck of a cargo three times as costly as the machine.

Mr. HUME and other members pressed that the office of Woods should restore the fountain in the park at Bushy, and allow the public to drive through the park at Richmond. At present only pedestrians were admitted, except by special leave from the Ranger.—Mr. HAWES added, that at some periods of the year even pedestrians were warned off the grass, and restricted to the high road; for fear, it was said, of disturbance to the game, of which there was really no danger.—Sir R. PEEL and Lord LINCOLN declined to encourage these suggestions.—Mr. HUME declared himself anxious also that the public should have access to Primrose-hill.—Lord LINCOLN expressed his hope, that when the existing lease should expire, which would be in five or six years, an arrangement might be effected for that purpose.—Mr. HORSHAM mentioned an application made to Lord Sidmouth, the Deputy-ranger of Richmond-park, by a member of Parliament living in the neighbourhood, for liberty to drive through the park, which had been refused.—Lord LINCOLN declared his surprise at this statement, as he knew that such accommodation had been very generally given by Lord Sidmouth to families in that vicinity. He believed that Mr. Hawes himself, as being a gentleman of respectable appearance, had always been allowed to pass the gates. Mr. AGLIONBY complained that the public, who contributed to the expense of the park, should be excluded from the enjoyment of it, unless this enclosure were preserved, which it was not, for the private use of the Queen.—Mr. HUME said, it seemed to be not a Royal park, but a Sidmouth park.—Mr. HAWES bore testimony to the liberality with which Lord Sidmouth granted the passage through the park to gentlemen having residences, even though but temporary, in that neighbourhood.

On the vote for the expenses of the works at the new Houses of Parliament, Mr. HUME objected to the site, which ought, in his opinion, to have been in St. James's-park. Under the circumstances, however, the only satisfaction they could have was to complain.—The Earl of LINCOLN expected the Houses to be so far forward in two years as to enable the Lords to occupy their new chamber. 12,000*l.* were granted for the improvements in Trafalgar-square.—On the vote for the expenses and salaries of the officers of both Houses, Mr. HUME called for a statement in detail of the grant for the House of Lords, and moved the postponement of the sum until it was furnished. The House affirmed the vote by 135 to 47.—On the vote for the Exchequer department, Colonel SRETHER repeated his dissatisfaction at the arrangement by which Lord Montagu was placed at its head. He paid some high compliments to Mr. Goulbourn; and then, returning to the subject of Lord Montagu's office, announced his intention of proposing, on a future day, an address to the Queen for the noble Lord's removal from it.—Another division took place on the vote for the ecclesiastical commission, Mr. HUME considering that the expenses should be defrayed out of the property of the Church. The vote was carried by 140 to 33.

The vote for the salaries and expenses of the assistant poor-law commissioners being brought up, Capt. PEACHELL spoke in defence of the Gilbert unions, and Mr. FERRAND, who warmly denounced the conduct of the assistant poor-law commissioners, pronounced them to be swindling and oppressive, and dared the Government to thrust the new poor-law down the throats of the people of the north of England.—Sir C. NAPIER was afraid that Mr. Ferrand was afflicted with monomania, with respect to the Keighley or Bingley union. He moved that the chairman report progress, which was agreed to, and the House resumed.

Tuesday.—Sir J. GRAHAM, in reply to Lord J. Russell, said that it had been determined to postpone proceeding with the entire Factory Bill until after Easter.—Dr. NICHOLL, in reply to Lord R. Grosvenor, gave some statements to show that the saving under the Ecclesiastical Courts Bill would be greater than had at first been calculated.—Mr. HUME, not having been able to obtain precedence on Friday for his motion of thanks to Lord Ashburton, fixed it for Tuesday next.

Sir G. GREY put a question to the Government similar to that asked by Lord Lansdowne on Monday in the House of Lords, on the protectorship lately accepted by the French Government in the Pacific.—Sir R. PEEL explained the arrangement by which the nominal sovereignty of Otaheite was offered to the French Government, the territorial possession and actual administration still remaining with the Queen Pomaree. Stipulations had been expressly made in the convention for the protection of all religious worship, and for the free exercise of their functions by the English missionaries resident there. The Government had made communications to the French ministers on the subject of these British residents, and the assurances received had been entirely satisfactory.

Sir R. PEEL, in answer to Mr. Hume, stated that though he did not wish to speak with too much confidence, he hoped our commercial negotiations with Naples would soon be brought to a satisfactory conclusion.—Mr. EWART gave notice that, when the Factory Bill was brought forward, he would move an instruction to the committee to take the regulation and education clauses separately.

Mr. T. DUNCOMBE brought on his motion for a select committee to inquire into the allegations of sundry petitions respecting the conduct of the magistracy during the disturbances in August last. He knew he was not addressing an impartial audience; the benches of the House were covered with justices of the peace—the "great unpaid;" but he had an important public duty to perform in bringing the subject forward. He gave a sketch of the origin and spread of the disturbances, especially as to the circumstances attending the entrance of the mob into Manchester; and adduced statements in order to show that there had been great oppression and illegal measures resorted to in order to repress the outbreak. Good and substantial bail had been refused on the score of political opinion, seemingly as the result of a conspiracy on the part of the magistrates, and acted on in cases where the accusations had either been abandoned or not substantiated, and the spy system had been resorted to, policemen in plain clothes having been employed in order to entrap individuals. Something should be done in order to secure the liberty of the subject, and to prevent the occurrence of similar acts of oppression. At Nottingham, prisoners had been tried at quarter sessions, who had been convicted by the same jury on different indictments, and on evidence applicable to different individuals: at Preston and Blackburn the magistracy had needlessly and wantonly employed the military, and had caused loss of life, and many severe injuries; and at Halifax an offending old man had been deliberately shot, and no investigation had ever been made into the circumstances by the local authorities. There was a strong feeling in the country that no justice was to be obtained for the poor man; the people looked with strong anxiety to the course which the House would pursue; and he hoped he had satisfied them that he had made out a strong case for inquiry.—Gen. JOHNSON seconded the motion.—The ATTORNEY-GENERAL remarked that the House had no means of affording redress, and that a committee of inquiry would therefore be nugatory. A remedy for the refusal of bail, or for illegal and unconstitutional conduct in the magistracy, was to be found by an appeal to the law, which had the power to investigate by oath, and to award heavy damages, if the cases were proved. The necessity for the interference of the military was deeply deplored by the Government, and if sympathy was of any use, the sufferers undoubtedly possessed it. But he did not believe in the alleged fact of the outrage at Halifax; and, even if it were true, it was a case for a jury: the individual who committed such an outrage was amenable with his life to the law. He read extracts from an inflammatory placard (a copy of which he exhibited) which had been published at Preston, exciting the people by the allegation that "the blood of their brothers" had been causelessly shed, while on the subsequent trials it had been admitted, on behalf of the prisoners, that the conduct of the military and police, under very trying circumstances, was free from blame. He deeply

regretted that this motion had been made: individuals convicted at the recent trials were yet to be brought up for judgment, and under these circumstances he would willingly have been spared the necessity of vindicating the administration of justice. It ever was a time when this country was on the brink of a civil war, it was during the late disturbances, when one hundred and fifty mills were stopped, thousands of men were marching through the country, and one individual boasted that he had addressed three hundred thousand persons. The Chartists fell into the mistake of supposing that if they committed no actual violence they were not breaking the law; but he affirmed that every person who was engaged in going about stopping employment, with a view to change the laws of the land, was guilty of high treason—in fact, in one case a bill for high treason had been found, but the Government had thought it better not to proceed on it. A placard posted over Manchester pointed distinctly to revolution; the Chartist delegates said, in their own words, that "centuries might roll by" before another such golden opportunity might be afforded them to effect their objects by aid of the general excitement. A great and general combination existed: and much of the severity with which the magistrates treated the cases was undoubtedly under the just impression that they were dealing with the crime of high treason, and that the Government would consider it as such. If any charge should be brought against the Government, it ought to be that of having exhibited too much leniency in the prosecution of these grave offences.

Lord F. EGERTON, Mr. PAKINGTON, Mr. CLIVE, Mr. W. PATERN, Col. ROLLESTON, Lord INGESTRE, and Mr. BROTHERTON severally brought forward proofs of the praiseworthy conduct of the magistrates in their respective localities, who had been charged by Mr. Duncombe with acting cruelly and unjustly.—Mr. FIELDEN and Mr. SCOTT supported the motion.—Captain BERKELEY said he would vote for the inquiry, on the ground only that, being himself a magistrate, he desired investigation into his conduct.—Mr. G. W. WOOD said the motion was ill-timed, unsupported by facts or arguments, and a stigma on the magistrates which they did not deserve; but it was nevertheless his intention to give it his vote.—Sir J. GRAHAM said that a more full, complete, and spirited answer to any case had never been made in his presence than that which had been given to this motion by the Attorney-General. In the Dudley case, though the general conduct of the magistrates had been approved by the Court of Queen's Bench, yet, as they had been wrong on a point of law, damages were awarded, and the wrong was satisfied. The other cases have been completely explained, and left no ground for the motion. Sir Charles Napier, on the previous evening, had said that "monomania was the order of the day;" whenever the words Poor-law are mentioned, the hon. and gallant Member for Brighton (Capt. Pecheil) rises and beholds in his mind's eye that terrestrial paradise of his—the Gilbert Union. Whenever an Assistant Poor-law Commissioner is named, up starts the hon. Member for Knaresborough (Mr. Ferrand), his soul haunted by the terrible images of Mr. Mott, the Bingley Union, and the oppressed poor of the North of England. Now Mr. Duncombe he always considered to have a mind clear and an understanding unclouded by prejudice. But, alas! even he is not free from this all-afflicting monomania—he is haunted by the idea that all the judges of the land are wrong in their law—that all the magistrates are tyrants and oppressors—that all juries are neglectful of their duties, and that the Chartists are the most ill-used and innocent persons in the world. A dangerous state of things had been happily terminated; and though the Preston case was an unhappy one, the authorities had been fully vindicated by the verdict of a coroner's inquest. The motion was ill-timed and unsustained by facts, and he trusted it would be rejected by an overwhelming majority.—Mr. MUNTZ would have voted for the motion had it not been for the proceedings in the Court of Queen's Bench, in the case of the Dudley magistrates, which showed that the law would not tolerate such conduct.—After some observations from Mr. V. STUART, Mr. AINSWORTH, and Capt. VIVIAN, Mr. T. DUNCOMBE, in reply, said that if he was afflicted with monomania, he was so in common with every man out of the House.—On a division, the motion was rejected by a majority of 164—the numbers being for it, 32; against it, 196.

Wednesday.—There being only 30 members present at 4 o'clock, the House was adjourned until Thursday.

Thursday.—Mr. ESCOTT called attention to the heavy fees exacted from defendants at quarter-session, when delirious of traversing, and the inability to pay which compels prisoners to take their trials whether prepared or not.—Sir J. GRAHAM apprehended that courts of quarter-session had the power to put a stop to the abuse; and if not the Government would willingly bring in a bill to rectify it.

Mr. HUME moved the issue of the writ for Nottingham, which was seconded by Sir R. H. INGLIS.—The Earl of LINCOLN had no intention to oppose the issue of the writ. Under the circumstances, the election having been declared void on the score of bribery, he had been justified in moving its suspension until the evidence was in the hands of Members, more especially as he had himself been witness of demoralising and disgusting scenes at former elections. But he was bound to admit that the last election had exhibited a great improvement, and circumstances had come to his knowledge which wholly exculpated Mr. Walter from any participation in the improper practices for which he had been unseated.—Col. WOOD (Brecon) thought that some precaution should be taken to prevent the guilty recipients of bribes at the last election from renewing their practices at the next one, and again causing a Member to be unseated.—Mr. T. DUNCOMBE had last session made a similar proposition in the case of Ipswich, but it had not been approved. The Duke of Newcastle, in a recently-published correspondence, had blamed the "democratic section" of the House for causing the suspension of the writ for Nottingham. But it was right that it should be known that it was the noble Duke's nearest relative (the Earl of Lincoln) and the Government who had caused the suspension of the writ.—Mr. COCHRANE wished it were competent for him to move that Mr. Walter be permitted to stand as a candidate at the next election.—Mr. HOGG declared that, as chairman of the committee, he had acted with a rigid sense of responsibility, and that the evidence disclosed not a few casual or isolated cases of bribery, but afforded proof of an organised system in the town. Mr. Walter had unfortunately, perhaps unconsciously, mixed himself up with the party whose practices had been the cause of his being unseated.—Lord J. RUSSELL was glad to hear this statement, for the perusal of the evidence had led him to a similar conclusion. Though not going to oppose the issue of the writ, the House had nevertheless done right to suspend its judgment. He had no doubt that the practice of bribery would receive a severe check if committees did their duty, and the law were resolutely put in force.—Mr. BERNAL thought that Mr. Hogg, with the opinion which he had expressed respecting an organised system of bribery, should have caused a special report to have been made to the House. It was a disputed question whether or not a Member unseated, as Mr. Walter had been, could stand again; and it ought to be set at rest by a declaratory Act. For himself, he did not look forward to such a political milestone as Lord John Russell anticipated. He was afraid that corruption would prove too powerful, and that Members would be still exposed to the machinations of invidious friends and judicious enemies.—After some observations from Mr. D'ISRAELI, Sir G. GREY referred to the case of the election last year of Newcastle-under-Lyne, where it had been decided that a member unseated for bribery, by himself or agent, could not stand again.—After some further conversation, Lord J. MANNERS moved the adjournment of the debate until next day, in order to enable a motion to be made which would settle the question as to Mr. Walter being enabled to stand again.—Mr. HUME approved of this course; and Mr. COCHRANE said that if the debate were adjourned, he would move as an amendment for leave to bring in a bill to enable Mr. Walter to stand again.—The SPEAKER informed him that it would not be competent for him to do so, as he had already spoken in

the debate.—Some conversation followed, after which Colonel WYNDHAM opposed the adjournment, as did Sir R. INGLIS, Sir T. WILKS, and others.—Sir R. PEEL having made up his mind, after consideration, to vote for the issue of the writ, had heard nothing to alter his determination. By the statute of George the Second, a Member unseated for bribery, whether committed by himself, or without his cognizance, by his agents, could not stand again; and it would operate as a salutary check on a constituency, when aware that their Member was liable to bear the penalty of their misdeeds.—Mr. HOGG explained the sense in which he had used the expression of "an organised system." The evidence was of a constructive nature, and disclosed not a few isolated cases, but a system of bribery, by people acting in combination.—Mr. BERNAL remarked that, by the recent statute, an election committee was required to report whether or not a Member was a participator in the acts of bribery for which he is unseated; to which Mr. STUART replied that this involved no anomaly, as the Member, though prevented from standing again, was not exposed to the criminal consequences of the acts of his agents.—Some other Members addressed a few observations to the House; after which Lord J. MANNERS withdrew his amendment, and the issue of the writ was ordered.—Sir R. PEEL stated that he would move the adjournment for the Easter Recess on Wednesday next.

Mr. FERRAND moved for leave to bring in a bill to compel the allotment of waste land in England. The people in the manufacturing districts were dying of starvation, and the distress was extending into the agricultural districts. The country stood on a volcano; the House was shortly about to separate for the Easter holidays, and what could they say to their constituencies? Nothing had been done; no practical measure had been brought forward; the time had been spent in talk. A remedy for the condition of the people was the allotment system, of the efficacy of which he produced various statements; and he proposed that out of every hundred acres of waste land belonging to a parish, there should be one-twentieth part, or five acres, reserved in trust for the poor, being vested in the lord of the manor, the incumbent, and the churchwardens; and out of the entire amount allotted there should be at least five acres for drying-ground, and five acres for recreation. A rate of threepence in the pound to be assessed for the expense of allotting and inclosing the waste land; cottages to be erected, the rents to be appropriated towards repaying the expense incurred, and when a surplus shall accrue, the amount to paid into the poor fund. The Tithe Commissioners to carry the Act into execution.—Colonel WYNDHAM wished to see Mr. Ferrand's Bill introduced; but in the present depressed state of agriculture, he wanted to see the lands already in cultivation kept in it, instead of grubbing about the heaths. He would stand by the Government so long as they stood by agriculture.—Lord WORSTLEY was afraid that the proposed bill would be wholly impracticable; but he would not be so ungracious as to oppose its introduction.—Sir J. GRAHAM could not see in the proposed scheme anything else than a project for maintaining the working population at the public expense. These waste lands were in general distinguished for their sterility; and he entertained the greatest doubts of the practicability of a measure for their allotment. While not opposing the introduction of the bill, he wished to guard himself from encouraging the expectation of any benefit being likely to arise from it.—Lord J. MANNERS believed that there was a growing feeling in the country in favour of some such measure as that proposed by Mr. Ferrand. He adduced the example of the religious brotherhood of Charlewood Forest, who are successfully reclaiming a barren and stony moor; and declared that he would not give up the belief that it was possible, by careful cultivation, to produce sufficient wheat in this country for the maintenance of its entire population; and he thought that in the present entire deadness of the public mind to all party political excitement, the scheme might be tried.—Mr. HUME regarded the project as one of those schemes of home colonisation which absorb capital to an extent quite disproportionate to any chance of profitable return. It was useless to waste money on cultivating the barren soils of England, when we could more profitably exchange our labour for the corn of other lands.—Sir J. HANMER believed, that instead of there being an entire absence of political feeling amongst the people, that there was a growing spirit of discontent, only to be abated by practical measures for their relief, of which he considered the present measure to be one, though not a prominent one. But free trade he was certain we must arrive at; as to taxing or stopping machinery, we might as well try to stop the satellites of Jupiter.—Mr. BROTHERTON wished to know if these waste lands were proposed to be inclosed for the benefit of the rich or poor. With the corn-law monopoly, the bill would only serve the purposes of the owners of land, who by inclosure bills have been appropriating every available common.—Lord POLINGTON believed that the bill would benefit the poor, and therefore he would support it.—Mr. AGLIONBY was desirous of seeing the bill introduced, in order that its provisions might be carefully considered, though he feared that the project would not prove practicable or beneficial.—Mr. S. CRAWFORD denied that the waste lands could not be profitably cultivated. They might not return a productive outlay to the capitalist, but in the hands of the working man they would yield a sufficiency for maintenance. He supported the bill. Leave was given to bring in the bill.

Sir VALENTINE BLAKE moved for leave to bring in a bill to repeal and abolish all the oaths now taken by members of Parliament, on taking their seats, except the oath of allegiance.—Sir J. GRAHAM did not think it to be either politic or expedient to disturb the existing law, and opposed the motion.—Mr. ROSS had a strong feeling on the subject of oaths, and supported it.—After a few observations from Mr. BORTAWICK and Mr. HUME.—Sir R. PEEL referred to the terms on which the question of Catholic emancipation was settled in 1829, and declared that it was impossible for him to accede to the motion.—Sir T. WILKS considered that the oaths now taken did not bear the construction which had been put upon them by Sir V. Blake.—Dr. STOCK added a few observations; and on a division the motion was rejected by 104 to 17.

Mr. ELPHINSTONE then moved for leave to bring in a bill for establishing a court for marriage and divorce, which was opposed by Sir R. H. INGLIS, and, after a brief conversation, the House divided.—For the bill, 47; against it, 47.—The SPEAKER gave his casting vote in favour of the bill, which was brought in and read a first time.

Friday.—The consideration of the Miscellaneous Estimates was resumed. On the vote of 56,500*l.* for the Poor Law Commission, an amendment for reducing it to 20,000*l.* was moved and negatived by 93 to 14. Votes were then taken for the Mint, the Public Records, Secret Service, the Treasury, the Model Prison, and the Milbank Penitentiary. A discussion arose on the item of 15,000*l.* for the expenses of the Special commission, and Sir J. GRAHAM agreed to postpone it until particulars were before the House.

CITY.

Money Market, Friday.—Consols; for money and account, closed at 96½ to 7; Three-and-half per Cents. Reduced, 101½, ex div. for the opening; New Three-and-half per Cents., 102½; Bank Stock, for account, 186; Exchequer Bills, 62s. to 64s. prem.

Metropolis and its Vicinity.

Consecration of the New Chapel Royal.—The ceremony of consecrating the new Chapel Royal, at Buckingham Palace, took place on Saturday, the Archbishop of Canterbury officiating. At half-past eleven, the Bishop of London arrived at the Palace in his episcopal robes; his lordship was shortly followed by the Archbishop of Can-

terbury, attended by his chaplain. At twelve o'clock the Queen and Prince Albert entered the royal closet, accompanied by her Royal Highness the Duchess of Kent. In attendance were the Duchess of Buccleuch and the ladies in waiting; the Lord Steward, the Lord Chamberlain, and other members of the Household. The pews in the side aisles of the chapel were filled with company, consisting of the lords and ladies in waiting, and the ladies of the principal officers of the household. Among those present were the Duke and Duchess of Norfolk, the Countess Delawarr, the Earl of Lincoln, and Mr. Blore, the architect. The seats in the centre aisle of the chapel were appropriated to the household. On her Majesty's arrival, the Archbishop of Canterbury, attended by his chaplain, proceeded to the communion table, where her Majesty's warrant was presented, commanding him to consecrate the chapel. His Grace received the warrant, and directed the registrar, Mr. Dyke, to read it; and the same having been read, his Grace declared that he was ready to consecrate the chapel. The Archbishop then proceeded to the consecration and dedication, and walked in procession, preceded by Mr. Lingard, sergeant of the Chapel Royal, down the middle aisle, and returned up the same to the communion table, attended by his officers, the Right Hon. Dr. Nicholl, vicar-general, the Bishop of London, the Bishop of Norwich, clerk of the closet, the Rev. Dr. Hodgson, Dean of Carlisle, and the Rev. Dr. Sleath, sub-dean. The chapel is erected on the site of one of the conservatories. The interior has a very light and elegant appearance; the side aisles are divided from the centre by two rows of fluted composite columns, supporting a painted ceiling divided into compartments, and ornamented in stucco. It is lighted by windows at the sides, finished with architraves, and surmounted by pediments. The Queen's closet is elevated on Doric columns across the west end of the chapel; the altar fronts the royal closet at the opposite end. The communion table had a covering of crimson velvet embroidered with gold; the back of the altar, the seats, and the cushions, were likewise of the same materials. The front of the Queen's closet, the pulpit, and the reading-desk, were also covered with crimson velvet edged with bullion fringe and bordered with gold lace. The royal closet is lighted by a number of small circular-headed windows, and corresponding windows are also introduced at the other end of the chapel, over the altar. The pews in the side aisles, occupied by the lords and ladies of the household, and the seats in the middle aisle, are covered with crimson. After the ceremony, the Archbishop of Canterbury, the Bishops of London and Norwich, and the clergy, and the ladies and gentlemen of the household present at the consecration, partook of a *dejeuné* at the palace. On Sunday morning her Majesty and Prince Albert, the officers of the household and their ladies, attended divine service in the Chapel. The Bishop of London preached the sermon, taking his text from Psalm cxxiii., verse 1.

Her Majesty's Levee.—His Royal Highness Prince Albert held a levee, on behalf of her Majesty, on Wednesday afternoon, at St. James's Palace. His Royal Highness and suite arrived from Buckingham Palace shortly before two o'clock. The levee was the first this season, and was numerously attended. Several presentations took place in the foreign diplomatic circle, and at the general levee. The Prince was attended by the principal officers of his household, and by several members of her Majesty's suite.

Opening of the Thames Tunnel.—The ceremony of opening the Tunnel to the public took place on Saturday last. The rendezvous was the Rotherhithe shaft on the Surrey side of the river, where two marquees had been erected, one for the accommodation of the directors and proprietors with their friends, and the other for the reception of visitors. The hoisting of flags and the ringing of bells naturally drew a great crowd of idlers to the spot at an early hour of the day, but it was not until 4 o'clock in the afternoon that the ceremony commenced. The procession started from the marquee down the staircase in the following order: First came the band of the Fusilier Guards, and persons carrying various flags and banners, the clerks, engineers, directors, and other officers, and, lastly, the visitors, an immense number of persons, including ladies. The route taken was along the western archway of the tunnel; on arriving at the shaft at Wapping, that was ascended and paraded, and then the procession returned by the eastern archway to Rotherhithe. The watermen hoisted a black flag at the Tunnel-pier to indicate their feelings upon the occasion, considering that by the tunnel the "Redriffe Ferry," and consequently their interests, have been undermined. Among the visitors present at the ceremony were the Earl of Lincoln, Lord Dudley Stuart, Sir R. Inglis, Sir E. Codrington, Sir W. Clay, the Hon. Mr. Byng, the Lord Mayor, Mr. Hume, M.P., Mr. Roebuck, M.P., Mr. Hawes, M.P., Mr. Warburton, Mr. Rennie, Mr. Babbage, Dr. Wollaston, Mr. Faraday, Mr. Maudslay, Mr. Field, and other scientific persons. In the evening the directors entertained their friends at the London Tavern, and upwards of 100 guests sat down to dinner. Mr. Hawes, chairman of the directors, in the chair.—The number of persons who visited the tunnel from six o'clock on Saturday night to six o'clock on Sunday night, amounted to about 30,000. The admission money being a penny each, the sum thus realised would be about 125*l*. On Sunday, the vicinity of the tunnel was immensely thronged, and many were disappointed in obtaining admission into it. Several who were on the Middlesex side proceeded by boats to the Surrey side of the Thames, in the hopes of approaching the entrance, but with no better success, as on each side the crowds were almost equally numerous. In the course of the day, in order to prevent confusion, a body of police

attended. On Monday the access to the tunnel was much more easy, and the numbers admitted were about 450 an hour.

Metropolitan Improvements.—In the House of Commons on Monday, on the vote of £140,000 as the expenses of the works of the new Houses of Parliament, Dr. Bowring wished to know whether any determination had been come to by the Commissioners as to the internal decorations of the houses—whether fresco painting were intended to be adopted or not? Sir R. Peel replied that the Commissioners had not come to any decision as to the internal decoration. They had invited designs, which would be exhibited in Westminster-hall in May or June next, and the decision of the Commissioners was suspended until that exhibition had taken place. Mr. Hume said that it now appeared that the new houses, the expense of which was estimated at £770,000, would cost £1,016,000. It was plain that one of the Commissioners was right in saying of these new buildings that "they would look well on paper, but were not fit for use." For half the money they might have had a dry, good building, instead of being buried underground. For his part, all the satisfaction he now had was to complain.—On the vote of £12,000 for the improvements in Trafalgar-square, Mr. Cochrane said he understood it had been determined to reduce the height of the Nelson column in consequence of the insufficiency of funds to carry out the original design; under these circumstances, he suggested that a portion of the sum now proposed to be voted should be appropriated to the completion of the pillar. The Earl of Lincoln explained that the height of the pillar had been reduced, not on account of any inadequacy of funds, but on grounds connected with public safety. In regard to the river navigation, Mr. Gladstone, in answer to Dr. Bowring, said that the subject of the necessity of adopting some regulations to prevent the overloading of steamers on the Thames was worthy of attention, and he would direct the attention of a committee to it which is now sitting on a collateral subject. In reference to the roads of the metropolis, Sir James Graham replied to Lord Ingestre, that the Government had no measure in contemplation for the better lighting of the metropolitan roads. For some observations on Richmond Park, we must refer our readers to our Parliamentary summary.

Street Sweeping.—The first exhibition in the metropolis of the self-loading cart, or street-sweeping machine, which has for some time been in use in Manchester, took place last week on the wood-pavement in Regent-street, and attracted during the day crowds of persons to view its novel apparatus. The machine has been brought up from Manchester under an arrangement with the Commissioners of Woods and Forests, and under whose auspices the experiment was made. The cart is drawn by two horses and attended by a driver, and as it proceeds it causes the rotatory motion of the wheels to raise the loose soil from the surface of the wood, and deposit it in a vehicle attached to the cart. Proceeding at a moderate rate through Regent-street, the cart left behind it a well-swept tract which formed a striking contrast with the adjacent ground. It filled itself in the space of six minutes, its power being equal to that of 40 men, and its operation being of a threefold nature, that of sweeping, loading, and carrying at the same time; which under the old process formed three distinct operations.

Female Orphan Asylum.—On Thursday a special general court of the guardians of this Asylum was held at the institution in the Westminster-road, for the purpose of electing a morning preacher, in the room of the late Mr. Goode. There were originally 11 candidates for the appointment, but the contest was between the Rev. C. E. Wylde, of Trinity-chapel, Lambeth, and the Rev. W. Jowett, of Stockwell-chapel. At the close of the poll the numbers were—for the Rev. Mr. Wylde, 373; Mr. Jowett, 328; majority, 45. The close of the poll having been announced by the chairman, Mr. John Curling protested against the election generally on the ground of the unfair conduct of the committee in issuing an advertisement a few days before the meeting recommending Mr. Wylde, and also because the election was void, on account of unqualified votes having been received; he also stated that the proceedings would be laid before the Bishop of Winchester on an appeal to his decision.

Bethlehem Hospital.—A warrant was issued from the Home-office a few days since, under the seal of the Secretary of State, directing the governor of the Compter to remove monomaniac James Stevenson to this hospital, to be confined during her Majesty's pleasure.

Seamen's Hospital.—The friends and supporters of this benevolent institution assembled on Wednesday in large numbers at the London Tavern to celebrate the 22d anniversary of its foundation. The Hon. Sydney Herbert, Secretary to the Admiralty, presided, supported by a great number of naval officers. The donations announced after the dinner amounted to upwards of 1,000*l*. The number of patients admitted during the past year amounted to 2,737; and relief, medicine, and advice had been given to 1,982 out-patients, making 62,608 seamen of all nations since the foundation of the asylum.

Canada Company.—The annual meeting of the Canada Company took place on Wednesday. From the report of the Directors, it appears that satisfactory progress is making in the sales of land under the new principle of allowing emigrants to pay by annual instalments, thereby affording them longer credit, and enabling persons of small means to acquire property by the exercise of their own industry. So well has this principle answered in the sales of tracts in the Huron district, that the Directors have determined on throwing open the greater portion of their Crown reserves upon similar conditions in order to expedite prosperous settlements in the North

American colonies. The sales of land by the Company for 1842, produced 66,270*l*. currency, of which 37,477 acres of Crown reserves, at the average of 12*s*. 11*d*. per acre, and 28,127 acres of Huron tract, at the average of 11*s*. 7*d*. per acre, gave 40,430*l*. currency. The remainder of this sum was for the sale of town-lots in Guelph and in the Huron tract, in addition to sales on annual rents for twelve years, on the new system above alluded to.

The British Colonies.—A memorial has been got up within the past week, addressed to Sir R. Peel, as the head of her Majesty's Government, by the shipowners, merchants, bankers, and others, of the City of London, calling upon him to propose some extended scheme of systematic colonisation. So great is the interest it has excited in the City, that it had, up to five o'clock on Wednesday evening, upwards of 1200 names appended; which, with the prayer, stretched over 13 skins of parchment in double columns. It is understood that it will be presented to the Premier upon the earliest convenient day.

Anti-Corn-Law League.—The third weekly meeting of the League was held on Wednesday night in Drury-lane theatre, when the house was, as on the two former occasions, overcrowded in every part. Mr. G. Wilson took the chair, and commenced the business of the meeting by offering the apology of the council to those parties who had experienced a difficulty in procuring admission to the theatre. The applications were so numerous, that the council felt that had the theatre been twice its size, they would still have been unable to supply all those who had requested tickets of admission. The first speaker of the evening was Mr. James Wilson, of London, who was followed at considerable length by Mr. W. J. Fox, Mr. T. Gisborne, and Mr. Cobden.

Public Meetings.—On Tuesday a meeting of the watch and clock makers of the Metropolis took place at the Crown and Anchor, "To take into consideration the best means to be adopted with reference to a bill before Parliament, called The British Watchmakers' Company." There were nearly 2,000 persons present. Mr. Watson, of King-street, Cheapside, was called to the chair, who opened the business of the evening by alluding at great length to the several companies in France and other places, which had been got up under the superintendence of Mr. Ingold, and who was to be the head of the new company, which, in his opinion, was one of the many bubble ones almost daily coming before the public. A committee of their trade had wished to see the machinery of the company, but that request had been refused; the only answer they could obtain was, that the new company intended to begin and finish a watch in one hour. Several gentlemen having addressed the meeting at great length, it was resolved to petition Parliament against the bill. This is now unnecessary, as the bill was thrown out last night in the House of Commons.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Mar. 18:—West districts, 148; North districts, 214; Central districts, 184; East districts, 225; South districts, 224. Total, 995, (529 males, 466 females.) Weekly average for the last five years, 903, (males 461, females 442,) and for the last five winters, 1004.

Provincial News.

Incendiary Fires.—We regret to observe that several incendiary fires have been again reported, although all the parties convicted at the late assizes have been sentenced to the full term of transportation. On Tuesday, notice was issued from the Secretary of State's Office, stating that on the night of the 7th inst., a cottage at Thornhill, Wilts, to which two other cottages adjoined, was maliciously set on fire by inserting combustible materials in the thatch of the building. Government offer a reward of 100*l*., and the union and parish-officers a further reward of 50*l*., for the discovery of the incendiaries; and a promise of her Majesty's pardon is held out to any one concerned (except the person who actually set fire to the premises) for such evidence as may lead to the same result. Another reward of 100*l*. was also offered on Tuesday for the discovery of incendiaries who, on the 23d inst., set fire to the lambing-sheds at Merly-farm, Wimbourn, Dorsetshire. The seventh case of arson since harvest, in the parish of West-Bergholt, near Colchester, occurred on Saturday night, the 18th inst., on the farm of the late Mr. Bradbrook. A cart-lodge near the house was discovered to be on fire, but fortunately in sufficient time to prevent extensive damage. It is mentioned that almost every fire in Essex has taken place on a Saturday night.

Aberystwith.—A public meeting was held in the town-hall of this place last week, for the purpose of conveying to the Duke of Newcastle the general regret consequent upon his determination to part with the Hafod estate, and thereby dissolve his connexion with the principality. An address expressive of this feeling was unanimously carried.

Bath.—On Saturday morning this city was in a state of alarming riot, in consequence of the acquittal of a man called Parsons, lately tried on the charge of having killed his wife in this city. On his arriving after the trial, he was followed by the execrations of the populace, in number about 2,000, to his house, whence he was forcibly dragged out, and nearly killed, before the police could succeed in extricating him. The ringleaders in this imitation of Lynch law are in custody.

Brighton.—The process of boring the Artesian well for fresh water under the sea is still in operation at the outer head of the Chain-pier. The workmen have reached a depth of about 100 feet, but have not yet accomplished the desired object. A small quantity of water has been obtained, but it is said to be rather brackish.—A melan-

choly accident occurred here on Monday afternoon, by which Miss Granville, a young lady, 19 years of age, daughter of Mr. W. Granville, of Bedford-square in this town, was thrown from her horse, and so seriously injured that she died in a few hours. It appears that Miss Granville, who was on the point of being married, was riding on the Dike-road with some friends, when her horse ran away with her; she became frightened, and threw herself off, falling back upon her head. The horse was stopped soon afterwards. The jury at the inquest returned a verdict of accidental death, with a deodand of 1s. on the horse.

Carmarthen.—On Friday last, two more gates were levelled to the ground by Rebecca and her daughters. They appeared about midnight at the Narberth east gates, and commenced the work of demolition, which was completed on the two gates in the space of about 20 minutes. The party in this instance consisted of about 60 persons, headed by an athletic female on horseback, who gave the command with considerable coolness and promptitude. The demolition, says the *Welshman*, was witnessed by several cottagers living by the gates, but not a person interfered; and Rebecca and her children, having fired two or three shots of triumph, retired, passing through the town as if they had done good service to its inhabitants by having thus asserted their own supremacy over the laws.

Cheltenham.—The Manor of Cheltenham, last week, underwent a change of owners—Lord Sherborne having sold his manorial rights and immunities to Mr. James Agg Gardner, for the sum of 39,000*l.* The negotiation for this transfer has been going on for nearly two years. The purchase includes, it is said, in addition to the heriots on the copyholds of the manor and the tolls of the markets and fairs, the market-house and arcade, as well as the interest possessed by Lord Sherborne in Trinity-church, together with some other properties pertaining to his Cheltenham estate. The manor of Cheltenham had been in possession of the Sherborne family for 225 years—John Dutton, an ancestor of the present peer, having purchased it of Charles, Prince of Wales, in 1618, for the sum of 1,200*l.*

Exeter.—We learn from *Woolmer's Gazette* that the Bishop of Exeter has been under the necessity of seeking legal protection from an unfortunate clergyman, the Rev. W. H. Tucker, who has been several times in the Asylum in this city, and in other lunatic establishments. It appears that during several weeks past he has addressed letters to the Bishop of Exeter, containing threats of a very violent description, and has also expressed similar threats against the Bishop in letters written to the Chancellor of the diocese and to the Archbishop of Canterbury. It is said that the Bishop was under the necessity of removing Mr. Tucker from the charge of a parish into which he had been irregularly introduced as curate, and it is supposed that this was the exciting cause of his hostility. He was examined last week before the magistrates at Torquay, and, as there was no doubt of his insanity, he was sent to the Lunatic Asylum in this city for safe custody.

Marlborough.—The new School for the Sons of Clergymen, founded last year under the patronage of the Archbishops and Bishops is expected to come into operation about Midsummer next. The course of general study will approximate as nearly as possible to that pursued at Eton and Harrow. When the arrangements now in progress are complete, there will be ample accommodation for 200 pupils, exclusive of apartments for the head masters, assistants, and servants. There are already 1,370 subscribers, a great number having qualified as life governors, and the sum subscribed, including donations, somewhat exceeds 14,000*l.* It is calculated that about 3,000*l.* will cover all costs of outfit, the residue being converted into stock.

Portsmouth.—The new steam-yacht, the *Victoria* and *Albert*, building at Pembroke for her Majesty's private use, is shortly expected at this port. She is to be rigged as a polacca, a style of rigging very prevalent in the Mediterranean, and much admired for its beauty. It consists in the lower masts, topmasts, and top-gallantmasts being all formed of the same spar, and all her yards will strike. She will be fitted with Smith's wire-rope. Her breadth of beam will be 33 feet, and her length 200 feet. —The *Hampshire Telegraph* states that Mr. Abbinett has again been successful in his process of raising sunken vessels, having last week raised the brig *New Holland*, of 167 tons, with the whole of her cargo (330 tons of coals) on board. The vessel took the ground on the 19th inst., while under repairs, in consequence of the late extraordinary low run of the spring-tides, and slipped off the bank and sunk in deep water. The use of lumps, chains, &c., was promptly afforded by the government authorities, and a party of seamen and marines, from the *St. Vincent*, having volunteered their assistance, under the direction of Mr. Abbinett, the object was accomplished, notwithstanding the difficulty of the brig's position, her stern, from the nature of the ground, being from 12 to 15 feet higher than the bow, in the short space of 48 hours.

Rochester.—On Wednesday evening, in consequence of information given to the police of this city, a young man, who gave his name John Richmond, was brought to the station-house from a public-house, High-street, on a charge of threatening to take the life of the Queen and Sir R. Peel. On Thursday the prisoner was brought up before the borough magistrates. He is a young man about 27 years of age, and has the appearance of being a tradesman. He said his name was John Richmond Ellis, that he was a native of Margate, and by trade a confectioner. The charge was fully proved by the evidence of several witnesses, and the prisoner was remanded, in

order that the Mayor might communicate with Sir J. Graham on the subject.

Railways.—The returns of traffic on the principal lines for the past week were as follow:—Northern and Eastern, 1,199*l.*; Greenwich, 753*l.*; Eastern Counties, 965*l.*; Croydon, 213*l.*; Liverpool and Manchester, 3,505*l.*; Brighton, 2,177*l.*; Grand Junction, 6,728*l.*; York and North Midland, 1,714*l.*; Blackwall, 587*l.*; Great North of England, 1,236*l.*; Midland Counties, 2,119*l.*; Manchester and Leeds, 3,907*l.*; Edinburgh and Glasgow, 1,948*l.*; Birmingham and Gloucester, 1,708*l.*; Birmingham and Derby, 1,038*l.*; North Midland, 3,637*l.*; South Western, 4,560*l.*; Great Western, 11,028*l.*; London and Birmingham, 12,873*l.*; South Eastern and Dover, 1,437*l.*—The periodical meetings of railway companies have passed for the present half-year, with the exception of one or two of minor importance, the particulars of which may be briefly noticed: At the meeting of the Lancaster and Preston Junction Company, on the 15th ult., a dividend of 16s. was declared on the whole shares, and 10s. 7d. on the three-quarter shares, subject to deduction of the income-tax.—The Aylesbury Railway is about to pass into the hands of the London and Birmingham Company, and a committee has already been appointed to negotiate the terms of sale. In the meantime a dividend of 8s. per share is to be paid to the proprietary.—At the Ulster Company's meeting a dividend of 10s. per share was declared, leaving a small sum to be carried to the reserve fund for the balance of profits of the half-year, stated to be 5,336*l.* 7s. 10d. The management of this undertaking, having a proper regard to economy in its various departments, find a steady increase in its revenue, and a good development of traffic.—Considerable excitement prevails at the present moment in the railway world with reference to the contest now going forward between two of the principal companies, whose lines radiate to the north, with reference to their extension through the county towns of Cambridge, Peterborough, and Lincoln. The London and Birmingham Company support the line from Peterborough to Blisworth as connected with their line, and the Northern and Eastern advocate an extension from their present terminus at Bishop's-Stortford—first to the town of Newport, in Essex, a distance of ten miles—and thence on to Cambridge. In support of this latter project a public meeting was held last week at Cambridge, for the purpose of considering the propriety of constructing the proposed line of railway from Blisworth to Peterborough, and for taking the necessary steps for an extension of the Northern and Eastern line from Bishop's-Stortford to Cambridge, and from thence on to Peterborough. The Earl of Hardwicke, Lord-Lieutenant of the county, took the chair, supported by Earl Fitzwilliam and a large number of the landed proprietors of the adjacent counties. The meeting resolved that the bill now in progress for making a branch railway from the London and Birmingham line from Blisworth to Peterborough would give to the London and Birmingham Company an entire monopoly of conveyance to the north, and interfere with the further progress of the Northern and Eastern line—the extension of which would, in the opinion of the meeting, be more serviceable to the whole of the districts extending north. After a long discussion on the advantages to be derived from the proposed extension on the part of the North-Eastern Railway, another resolution was passed, recommending the raising of capital for the purpose of carrying out the undertaking.—The engine driver, Jenkins, committed on the coroner's warrant for the manslaughter of Mr. Harvey, at the Barnsley station of the North Midland Railway, has been acquitted.—The Eastern Counties Railway was opened to the public on Wednesday, for the first time, throughout the entire line, when it was traversed by a passenger-train from London to Colchester. The mayor and town-council of Colchester celebrated the event by inviting the directors of the company and other guests from the metropolis, to an entertainment in their town-hall. Along the whole line between Brentwood and Colchester, it appeared as if all the towns and villages in the neighbourhood had poured out their whole population to welcome the train; and on its arriving at Colchester, it was welcomed by the cheering of thousands, who had collected near the station-house, waiting for its approach. The guests afterwards formed into a procession to the town-hall, where they were entertained by the corporation. Sir H. Smith, M.P. for the borough, in the chair. The ceremony passed off without the slightest accident.

IRELAND.

Galway.—At the late assizes for this county, a criminal proceeding was tried before Judge Perrin, arising from that once fertile source of blood and violence, a faction feud, and ending in a homicide. The parties engaged on both sides were proved to have been inflamed with drink—a circumstance which is now of rare occurrence in Ireland. The Judge publicly noticed a circumstance so remarkable; he inquired of the witnesses whether the Temperance Society had been introduced into that part of the county where the riot occurred; and in his address to the jury declared that such another case had not been brought before him for the last four years: or, in other words, since the date of that reformation by which Father Mathew has accomplished so much for social peace and the orderly submission to law.

Cork.—About fifty gentlemen, members of the committee appointed to conduct arrangements preliminary to the approaching meeting of the British Association, assembled last week in this city. Letters were read from a number of gentlemen resident in England and Ireland, distinguished for their scientific and literary research,

intimating their determination to attend the meeting. The secretary stated that having heard, from a source presumed to be good authority on the matter, that it was really the intention of her Majesty to visit Ireland in the present year, he had written to Lord Delawarr on the subject, from whom he had received a letter, stating that Lord Delawarr had no reason to know that the Queen would visit Ireland in the month of August. It was then resolved to commence the sittings of the association on Thursday, the 17th August, thereby, it was hoped, securing the presence of the Judges at the Summer Assizes, and of the country gentlemen in town.—The Earl of Roden steamer was lost on Wednesday week, near Poorhead, on her voyage from Papaye to London. The crew and passengers were saved, together with the greater portion of the cargo, but the vessel is likely to go to pieces.

Waterford.—The collection of the poor-rate at Gaultier commenced again on Tuesday week. A troop of Hussars, a company of Infantry, and about 150 police, stole a march at 4 in the morning on the recusants, and after journeying about 30 or 40 miles, brought home two cows, evidently in the last stage of death from starvation, and two pigs. The alarm was given the instant the military were seen, and the cattle vanished as if by magic. But for the interference of the Roman Catholic clergy it is said that there would have been a great loss of life. There appears to be no further apprehension that any actual resistance will be offered to the authorities; but there is a general impression that passive resistance will continue.

SCOTLAND.

Edinburgh.—The action of damages raised by Mr. Clark, against the majority of the Presbytery of Dunkeld, for refusing to take him on trial, with a view to induction, was brought before a jury last week, and damages to the amount of more than 2,000*l.* were awarded to him. A petition has just been presented to the Principal and Professors of the University, praying for the restoration of the academical costume, or college gown, as formerly worn in the University of Edinburgh, and still in use in the Colleges of Glasgow and Aberdeen, and recently introduced into Durham University, King's College, and University College, London. This petition has been signed by 380 of the matriculated students of the University, and has been received in a favourable manner by several members of the Senatus Academicus.

Glasgow.—A journeyman shoemaker, named M'Coleman, whose insanity would appear to have fixed upon Sir R. Peel as the object of his delusions, made his appearance last week in the Sheriff Clerk's office in this city. His business, he said, was to have two clerks to go up with him to Sir R. Peel on important business. He talked unconnectedly on different subjects with the persons in the office, but always ended in something about going up to London to Sir Robert. He insisted also upon his being the father of M'Naughten, and threatened, if his wishes were not complied with, to assassinate all who opposed him. Finding that he was undoubtedly insane, the authorities conveyed him to the lunatic asylum.

Dumfries.—We learn by the local papers that the earthquake which was so generally felt in the north of England on the morning of Friday fortnight, was experienced in many parts of Scotland. In Dumfries, the inhabitants, in some instances, were awakened from their sleep, and got up, under the belief that robbers had entered their houses. The shock was felt as far as New-abbey and Kirkbean. It is said that, with the exception of a slight vibration along the range of the Tinwald hills, about 12 years ago, no earthquake has been felt in this locality for upwards of sixty years. The loch at Closeburn was observed to be much agitated on the day of the great earthquake which devastated Lisbon; and a slight shock was felt in the same spot about two years ago, which extended at that time over the north of Scotland. In the present instance, however, the shock appears to have proceeded from south to north, as it was felt here and throughout various parts of England at the same hour.

Miscellaneous.

The Aerial Steam-Carriage.—Our readers perceived by our Parliamentary Report of last week that a Bill, constituting a Company for the working of this invention, had been brought forward in the House of Commons. The following account, communicated to the *Times*, by a correspondent, may therefore be interesting to our readers:—"When it was announced some time ago, by the ordinary monthly lists of patents granted, that Mr. Henson had invented a machine capable of conveying despatches and passengers through the air, the general impression was, that some moody and enthusiastic projector was about to exhibit the produce of his day-dreams. Our readers may therefore be somewhat surprised to learn that this is in truth no visionary scheme, but a design of very scientific conception, carefully and perseveringly wrought out. It would perhaps be too much to affirm (what yet we cannot deny) that the machine in its present state will certainly succeed; but the least which can be said is, that the inventor has most skilfully removed the difficulties which have hitherto debarred us the possession of the long-coveted faculty of flight, and has made its eventual, perhaps early, attainment, a matter of little less than certainty. All former attempts of this kind have failed through the want of a source of power whose energy bore a sufficiently high ratio to the weight of the requisite machinery. Could this source of power have been found, there was ingenuity enough to turn it to the desired account. Mr. Henson, in overcoming the difficulty, has first divided it. To set a machine a-going, and bring it up to a given velocity, is one thing; to maintain that velocity against opposing forces, is another. Now, in the

case before us, the power necessary for starting is much greater than that required for maintaining the flight. Mr. Henson, therefore, starts his Aerial Carriage by means of an apparatus which he does not carry with him, and then embarks only the smaller power and lighter machinery, which are sufficient for keeping up the original velocity. But even this happy device would not have succeeded if the inventor had not also effected an extraordinary reduction in the weight of his steam-engine. Our engineering readers will be somewhat surprised to learn that the engine of 20 horses' power now in preparation for the aerial carriage weighs, with its condenser and requisite water, but 600lbs. To the united effect of these different branches of this important invention must we attribute our present prospect of making our paths in the air. We proceed now to describe the machine itself, and its mode of flight:—Its car, inclosed on all sides, and containing the passengers, managers, burden, and steam-engine, is suspended to the middle of a framework, which is so constructed as to combine great strength with extreme lightness, and is covered with any woven texture which is moderately light and close. This main-frame or expanded surface, which is 150 feet long by 30 feet wide, serves in the most important respects as wings; yet it is perfectly jointless and without vibratory motion. It advances through the air with one of its long sides foremost, and a little elevated. To the middle of the other long side is joined the tail, of 50 feet in length, beneath which is the rudder. These important appendages effectually control the flight as to elevation and direction, and are governed by cords proceeding from the car. Situated at the back-edge of the main-frame are two sets of vanes or propellers, of 20 feet in diameter, driven by the steam-engine. We have already said that the velocity of the machine is imparted at its starting. This is effected by its being made to descend an inclined plane: during the descent the covering of the wings is reefed, but before the machine reaches the bottom that covering is rapidly spread: by this time the velocity acquired by the descent is so great, that the resistance produced by the oblique impact of the sloping under-surface of the wings on the air is sufficient to sustain the entire weight of the machine, just as a brisk wind upholds a kite. But while the pneumatic resistance thus procured by the velocity prevents the falling of the carriage, it opposes also its forward flight. To overcome this latter and smaller resistance is the office of the steam-engine. The chief peculiarities of this important member of the carriage are the respective constructions of its boiler and condenser. The former consists of hollow inverted truncated cones, arranged above and around the furnace; they are about 50 in number, and large enough to afford 100 square feet of evaporating surface, of which half is exposed to radiating heat. The condenser is an assemblage of small pipes exposed to the stream of air produced by the flight of the machine. It is found to produce a vacuum of from 5lbs. to 8lbs. to the square inch. The steam is employed in two cylinders, and is cut off at one-fourth of the stroke. Our engineering readers will be able to gather, from these particulars, that the steam-engine is of about 20 horse-power, supposing the evaporating power of the boiler to be equal, foot for foot, to that of the locomotive steam-engine. Less certain is the determination of the resistance to be overcome. Mechanical science is notoriously defective in all that relates to the oblique impact of solids and fluids, and is particularly so on the points involved in this subject. Experiments do not supply the lack of sound theory; for, not only has their purpose been to ascertain the effects of large angles of impact to the neglect of the smaller ones here concerned, but the objects of the experimenters (Robins, Hutton, Borda, &c.) have always required the determination of the resistance in the direction of the moving body, to the neglect of that which is perpendicular to that direction; while here their effects are so intimately connected that one cannot be determined without first knowing the other; and of that which is to be first known, viz., that which supports the vehicle, we have no information on which the smallest reliance can be placed. Mr. Henson, we understand, has formed his conclusions from the best observations he could make on the flight of birds, and we think he has done wisely. We are informed, however, that the resources of mechanical art are by no means exhausted by the present construction of Mr. Henson's engine, and that recent inventions are available by which its power may be doubled with little increase of weight. The area of the sustaining surface will be, we understand, not less than 4,500 square feet; the weight to be sustained, including the carriage and its total burden, is estimated at 3,000lbs. The load is said to be considerably less per square foot than that of many birds. It may assist the conceptions of our non-mechanical readers, to add that the general appearance of the machine is that of a gigantic bird with stationary wings; that the mechanical principles concerned in its support are strongly exemplified in the case of a kite; and that its progress is maintained by an application of power like that which propels a steam-boat. In the operations of nature, particularly in the flight of birds, will be found many striking illustrations of the principles on which the inventor has proceeded. Whatever may be the immediate issue of the present attempt, we think it is impossible not to award to the inventor the highest credit due to the removal of the great difficulties which have hitherto defeated all similar inventions; nor do we doubt, that in following out the path he has opened, complete success will eventually be obtained; whether that success will be, as we wish, early and entire, or whether it will be delayed and gradual, depends on the facts as to oblique pneumatic resistance, which have yet to be ascertained. It is, however, high time to begin to consider in the spirit of careful inquiry and cheerful hope what will be the

changes, commercial, social, and political, which the possession of this new-born power will necessarily bring about."

The Comet.—Sir John Herschel has addressed the following letter to the *Times*, dated Collingwood, March 24.—"I obtained a very good view of the head of the comet this evening, as near as I could identify the stars in the strong twilight from the roof of my house, near one of the stars of (rho) Eridani. Its appearance was that of a star of about the fifth magnitude, but dim, and having no sharp nucleus. I could only use a very low magnifier, so that the tail appeared to rise at once from the nucleus, without interval or any appearance of division into two streams. It is a much less conspicuous object than might have been expected from so superb a train; but there will be no difficulty whatever in observing it with fixed instruments."—Sir James South, on the 26th, wrote from Wimbledon Park as follows:—"Last evening, at a few minutes after eight, the comet's tail was here visible. The brightest part of it was under the stars rigel and kappa of Orion. From what cause I know not, but it appeared to me more below these stars than when I saw it at Kensington on Friday last; nor could I see it so far towards theta of the Canis Major as I then did. In its direction from Rigel towards the horizon, I at times could trace it within six or eight degrees of the horizon. Its actual situation, however, amongst the fixed stars I could not determine, from the presence of overwhelming zodiacal or other light, to which also I refer my inability to trace it lower, for with a night-glass I could frequently perceive small stars nearly grazing the horizon. Not the smallest vestige of anything like nucleus did the night-glass show me." While these and other astronomers have no doubt whatever that the brilliant light seen in the western hemisphere is the tail of a comet, M. Foster, an astronomer of Bruges, in a letter in the Antwerp papers of the 23d ult., says he has no doubt that the phenomenon is the *zodiacal light*. Mr. John Taylor, of Liverpool, in a letter published in one of the journals of that town, maintains the same opinion. The following letter on the subject has been addressed to the *Morning Chronicle* by a correspondent at Reading:—"Turning over the leaves of the translation of a very old Latin work, entitled 'The Sphere of Marcus Manilius,' printed in the year 1675, which contains records of a vast number of comets which have appeared, I was much surprised to find the following entry, which I have copied *verbatim*:—'March, 1668.—On the 5th and 10th of March a comet was observed by Sig. Cassini, at Bologna, about the first hour of the night (after the Italian way of counting). The head or body was not seen, being hid under the horizon; the tail was of a stupendous length, being extended, as it appeared (at Lisbon, in Portugal), over almost the fourth part of the visible heavens, from west to east—from the *Whale*, through *Eridanus*, to the star which precedes the *care of Lepus*, as observed at Bologna, by Sig. Cassini.' This, Sir, you will perceive, is a striking coincidence. I think the present visitor is completely identified, or rather, I suggest this to the astronomical authorities. If this be the same celestial body, its period would be 175 years."

The late Dr. Southey.—Our obituary of last week contained the announcement of the death of Dr. Southey, on Tuesday, the 21st ult., at his residence at Keswick. Although our readers were in a great measure prepared for this event, by the letter from Mrs. Southey, which appeared in our columns a few weeks since, (*ante*, p. 110,) we do not doubt that the following particulars, extracted from an article in the *Morning Chronicle*, will be acceptable:—"For the last three years, Dr. Southey had been in a state of mental darkness, and a twelvemonth ago he was not able to recognise those who had been his companions from his youth. Scarcely could his wife console herself with the poor hope that he recognised even her. Excess of mental labour in every department of literature—poetry, history, biography, criticism, and philosophy, continued from year to year, without cessation—bowed his strong spirit at last, and obscured the genius which had so long cast a glory upon the literature of the age. In early life, when his powerful and brilliant imagination was imping its wing for the daring flights that it afterwards took, he formed the most exalted notions of the perfectability of man, indulged in the most generous aspirations for the welfare and improvement of the human race, and seriously thought, with other kindred spirits, of founding a colony in the back woods of America, where guilt and sorrow should be unknown, and perfect equality, freedom, and happiness, should reign for ever. A better knowledge of the world soon dissipated these Utopian reveries; but his ardent imagination, that could confine itself to no middle course, went to the other extreme, and Dr. Southey soon became as violent in his Toryism as he had been in his Liberalism. As a poet, with an exuberance of imagination seldom equalled, and a mastery of versification never surpassed; and as a prose writer, at once elegant and forcible, his name will endure as long as the language in which he wrote. The 'wild and wondrous tale' of 'Thalaba,' and the almost equally wondrous 'Curse of Kehama,' are the poetical pieces on which his fame will principally rest. As a prose writer he was a perfect model of style—easy but not feeble—stately but not cumbersome, and learned but not pedantic. Besides innumerable articles in the *Quarterly Review*, to which he was a principal contributor, we believe, for nearly 30 years, his chief prose works are, a 'Life of Nelson,' 'The Book of the Church,' 'A History of the Peninsular War,' 'Letters from Spain and Portugal,' 'Essays on the Progress and Prospects of Society,' 'A History of Brazil,' 'Lives of the British Admirals,' &c. He also wrote biographies of Kirke White and Chatterton, and edited their works, besides editing collections, both of the principal and minor

English poets. He was appointed Poet Laureate in 1812. He was twice married—first in very early life, and again but a few years before the mournful overclouding of his intellect, to Miss Caroline Bowles, a lady whose name as a poetess had been long and favourably known to the public, and who in the last sad and blank years of his life watched over him with the tenderest solicitude, and did all that the most devoted affection could do to lighten the heavy load of his existence. In all the relations of life Dr. Southey was universally allowed, by those who knew him best, to be truly exemplary. By his own family he was adored; and we have always understood that the burden of maintaining the family of a man of genius, whose irregular habits ill qualified him for the discharge of the ordinary duties of life, chiefly devolved on Dr. Southey. Till his mind was unhinged, he retained his habitual kindness of disposition; and the gentleman who accompanied him, a year or two ago, on a continental tour, undertaken for the sake of his health, dwelt with fond affection on the many amiable traits of his character which broke forth amidst all his suffering. Dr. Southey was a gentleman in the best sense of the word. His house at the Lakes was ever open to all who presented themselves with suitable introduction, and there are few persons of any distinction who passed through that picturesque region who have not partaken of his hospitality."

Labo.

ARCHES COURT.—The Baintree Church-rate Case.—Sir Herbert Jenner Fust on Saturday gave an elaborate judgment on this well-known church-rate question, of which we are compelled to confine ourselves to the following brief abstract: The case came before the Court on an appeal from the Consistory Court, on the rejection of a libel given in by Messrs. Velez and Joslin, churchwardens of Baintree, against Mr. Gosling, in a cause of subtraction of church-rates. The vestry called to make the rate voted that no rate should be made upon principle. The churchwardens and the minority made a rate of 2s. in the pound, and Mr. Gosling refusing to pay it, he was cited to the Consistory Court. Dr. Lushington held that a rate so made was invalid, and rejected the libel, which virtually put the churchwardens out of Court. Sir Herbert Jenner Fust on Saturday reversed the decision of the Judge of the Court below, and admitted the libel. If not appealed from, and the decision stands, it will legalize church-rates, though made by the minority and churchwardens in vestry. Sir Herbert Jenner Fust held that common-law right imposed upon parishioners the duty to repair the church—they had no legal right to vote that a rate should not be made, and that such vestries were improper and void. The parishioners could reduce the amount of a rate proposed, if more than would cover the estimated expense of the repairs required, but not get rid entirely of the obligation put upon them by the law.—Costs deferred.

NORFOLK CIRCUIT.—ASSIZE INTELLIGENCE.—(Cambridge).—*John Frederick Mortlock* was arraigned, and pleaded "Not guilty" to an indictment which charged him with having discharged a pistol, loaded with powder and bullet, at his uncle, the Rev. Edmund Mortlock, with intent to murder him, or to do him some grievous bodily harm. This case, which has excited the greatest interest among all classes in this town and University, came on at the sitting of the Court, and occupied the greater portion of the day. A few years ago the same individual who was now charged with attempting to shoot his uncle, the Rev. Edmund Mortlock, was tried and acquitted on a charge of attempting the life of another uncle, Thomas Mortlock, Esq., of Abington Hall, in this county, by firing his residence. On that occasion, after the trial, certain arrangements were entered into by the uncles and friends of the young man, by which it was hoped that he would be induced to adopt a new course of conduct, and abstain from a system of annoyance which he had before indulged in. For some time matters went on comfortably, and though the conduct of the nephew was not such as was worthy of approbation, he yet did place such a check upon his wayward temper and habits, as to excite a hope that he would ultimately become a worthy member of society. This state of amendment, however, did not long continue, and it would appear that latterly he renewed his former course, threatening to inflict some lasting injury on his uncles, sometimes by letter, and sometimes by word of mouth, till at last they all went, more or less, in fear of their lives from his violent behaviour, though the most earnest attempts were from time to time made, by compliance with his demands and submission to his caprices, to avert the danger of an outbreak. At length matters came to a crisis, and on the day named in the indictment, in the month of November last, the prisoner suddenly made his appearance in the rooms of prosecutor, who is a fellow of Christ's College, in this University, and produced a pistol, which he snapped at the body of his relative, saying he would shoot him. Upon this Mr. Mortlock arose, while a friend, Mr. Mitchell, who was with him, seized the poker for self-preservation. The prisoner then, addressing himself to that person, said he had better not interfere, and brandished a dagger in his face. Taking the hint, Mr. Mitchell withdrew from the room, when the prisoner seized his uncle by the throat, and presenting another pistol at his heart, asked what there was to prevent his killing him? To which he replied, "That such an act would do more injury to the actor than the sufferer," and warned him against the perpetration of such a deed, which he never could recall. The nephew then fiercely demanded promise from his uncle not to prosecute him, but before he could be well answered, a gentleman, having heard from Mr. Mitchell what was going on, rushed into the room. At that instant the prisoner dropped the pistol to the level of his uncle's stomach, and discharged it in a direction across his body. Mr. Mortlock then left the room, exclaiming, "Oh God! I am shot!" and was followed by his friend, who ran for medical aid. The prisoner now left alone, bolted the outer door of the rooms, and the alarm being speedily raised in the college, loudly threatened to shoot the first man who dared to enter. The dread of this threat being carried into execution, caused a demur of some few minutes among the authorities, during which time the prisoner effected his escape into the fellows' garden by tying two hunting whips together. Having thus descended from his uncle's bedroom into the garden, he scaled the wall and made off towards the Cam, along the banks of which he wandered till nightfall, when his singular conduct excited the suspicions of two men who were watching their eel-traps. Upon being challenged by these men, he ran off, but had not got very far when he turned round upon his pursuers, and successively fired a pistol at each. Strange to say, however, though each pistol took effect, yet neither of the men received any further injury than a smart rap and confusion. After this rencontre the prisoner was taken and kept till the following morning, when he was committed to take his trial on this charge. The above facts being proved, Mr. Ficklin, surgeon, who had been called in to attend the prosecutor, deposed that on examining his person he found that the ball which was discovered in the trousers of the prosecutor, had slightly injured the outer skin, producing a scarcely-perceptible abrasion thereof to the extent of a sixpence, on which was a small quantity of blood.—Mr. Justice Coleridge, upon this state of things, intimated to the learned counsel that as there did not appear to have been any wound inflicted, there was an end of

the capital charge.—Mr. Sergeant Byles having acquiesced in this view of the case on the part of the prosecutor, who, he said, was by no means anxious to press the charge against his misguided relative. The prisoner was called on to make his defence, which he did in a long and energetic appeal to the court and jury, detailing his grievances and accusations of anonymous as well as direct injuries of a pecuniary character which he alleged he had received at the hands of his uncles. These may be resolved into a claim, on his part, to certain information touching the management and disposition of his father's property by them, and a refusal of any such on their part. Concerning these disputes, as the prisoner stated, certain Chancery proceedings had lately been instituted by him against them. His Lordship, at the close of the prisoner's statement, which was very lengthy and discursive, calmly submitted the evidence to the consideration of the jury, who would say by their verdict whether that count was proved which charged the prisoner with having fired at his uncle with intent to do him some grievous bodily harm. No injury indeed would appear to have been received by that gentleman, but the prisoner might well have intended to inflict some signal mark of his anger or passion upon the prosecutor, though he had not succeeded in so doing; and unless they, the jury, should be of opinion, as he had now asserted, that the only object of the attack was to frighten and annoy his uncle, they would say so by their verdict, and convict him of the charge laid in the second count. The jury, after a long deliberation returned a verdict of Guilty on the second count, and the prisoner, after a suitable exhortation from the bench, was sentenced to 21 years' transportation.

years' transportation.—(Oxford Circuit.—(Stafford).—(The Staffordshire Riots).—The Queen v. Cooper and Others.—Thomas Cooper, Joseph Capper, and John Richards were indicted (together with William Ellis, who was transported at the last special commission) for conspiracy and sedition. This trial commenced on the 20th March, before Mr. Justice Erskine and a special jury, and was only brought to a close on Thursday last. The evidence on both sides was given at such extraordinary length, and the line of defence so considerably prolonged the trial, that it would be impossible to give in a brief abstract a clear notion of its bearings. In the course of the defence, the prisoner Cooper attacked the Anti-Corn-Law League. He proceeded to read from the "Quarterly Review" passages from speeches by Mr. Cobden and other members of the League, and also resolutions of that body agreed to at their conferences of a violent tendency. He dilated upon these extracts with great energy and fluency, asking the jury if they could be guilty of the injustice of convicting the three humble individuals before them, whilst the members of Parliament and aldermen still retained their seats and their honours after inciting the people to acts of violence and outrage. Those men with whom he combined never burned houses, or committed any acts of violence, but he and his friends contended that they had a perfect right, while they denounced all violence, to advise the suspension of labour until the Charter was established as the law of the land. That was a strictly constitutional mode of proceeding. But there were vipers in the form of men—they were the real incendiaries. He meant the agents of the Anti-Corn-Law League. He would establish this by the most incontestable evidence. Was Ridgway to escape—was Mason to escape—was Cobden to escape—was the editor of the "Anti-Corn-Law Circular" to escape,—and innocent Chartistists like himself, who were the sincere advocates of peace, law, and order, to be convicted? Having denounced violence, the defendant said, he would next state to the Jury what really were the doctrines which he entertained, and what, in his addresses, he had always taught the people at public meetings. The learned Serjeant (Talfourd) in his opening address, for the prosecution, had stated that the present prosecution was not directed against Chartist principles; he admitted that the people of this country had a constitutional right to meet and discuss the expediency or expediency of adopting the Charter; but the learned counsel had said, that a cessation of labour would lead only to theft. If so, then let the real offenders—the rich strainers after wealth, the really guilty parties, be punished, and not the innocent Chartists. Who were they who caused a cessation of labour in the Potteries? Why, those who reduced the poor man's wages—those who, when a partial turn-out occurred, advised the people to make a general holiday—those who, with the object of advancing the views of the Anti-Corn-Law League, were desirous of plunging the country into revolution. He would now tell them what he really had taught them in the Potteries or elsewhere. He would admit that, on the 15th Aug., there was a conspiracy; but that conspiracy was not for seditious purposes, but for the maintenance of "peace, law, and order." The defendant went on to show, that his sermon, delivered on the 10th April, was a mere exposition of facts as detailed in English history, and from these he argued the right of the people to annual Parliaments, and the other points contained in the people's Charter. After adverting to some facts in his personal history, he dwelt, with severity, on the conduct of Sir John Easthope and Sir E. L. Bulwer towards him; the latter, he said, had been assisted by him in certain elections at Lincoln, and promised to present, to his own publisher, a MS. of a romance written by the prisoner, but had not redeemed that promise. When he proved to them, he continued, that he was not in the Potteries on the 12th August, when he showed that, although on the 15th he did conspire, but not to effect violence, but to preserve peace—when they bore in mind the practices of other parties protected, if not aided and abetted by the members of the late Government—when they remembered that, if the Chartists were guilty of agitating in support of their principles, they were only following, in a humble way, the example of others occupying high places in the country—when they recollected all these things, he could not bring his mind to believe that the Jury would find himself or his aged friends guilty of the offence imputed to them. No, they would never return a verdict of guilty against such humble men, when magistrates, members of Parliament, and members of the Anti-Corn-Law League were allowed to go at large, unprosecuted and unpunished—when Government quietly allowed the growth of a gigantic conspiracy, daily bearding Parliament itself, and such as before was never allowed to exist in this country. No, whatever their respect might be for Sir R. Peel and his Government, he did hope, while such lofty criminals were allowed to go at liberty, the Jury would not feel justified in punishing the humble but honest individuals then upon their trial. Let, however, their verdict be what it might, he should bow with due respect. This, however, he might be allowed to say—a verdict of guilty would not subdue the spirit of a Chartist, conscious that, in all he had done, he had only sought to benefit his fellow-men. It was impossible to put out the light of democratic truth in this country. The defendant concluded an energetic speech of upwards of ten hours' duration by expressing his confidence in a verdict of acquittal.—Richards and Capper then addressed the Jury in short speeches, principally resting their hopes of a successful defence upon *abhis*, which they proposed to prove, and character. Witnesses were then called and examined for the prisoners, at considerable length. Their examination did not terminate until Wednesday, when Mr. Serjeant Talfourd replied on the case generally. His speech occupied four hours; he concluded by expressing a hope that if the jury had any doubt as to the guilt of the prisoners (and he confessed he thought the evidence against Capper was slight), they would give them the benefit of it. Mr. Justice Erskine immediately adjourned the Court, and commenced his summing up on Thursday morning. He concluded at 8 o'clock, and the jury returned a verdict of guilty against all the prisoners, recommending Capper to mercy. Judgment deferred till next term.

HOME CIRCUIT.—(Lewes).—*Holloway v. Hare*.—This was an action to recover damages for a libel, brought by the plaintiff, a clergyman of the church of England and late curate of Eastcan, against the Rev. Mr. Hare, the archdeacon of Lewes. The declaration alleged that the defendant had published a certain letter, containing divers libellous charges against the plaintiff, which letter was sent to a lady named Gilbert. The defendant

were laid at 2,000*l*. The defendant pleaded a justification. Mr. Platt, Mr. Clarkson, and Mr. Peacock, were for the plaintiff; Mr. Thesiger, Mr. Sergeant (hannel, and Mr. Ogle, appeared for the defendant. The case was argued at great length, and lasted two days, when the Jury, after one hour's deliberation, returned a verdict for defendant.

product for defendant.

MIDDLELAND CIRCUIT.—(Leicester.)—*Trial of William Jones the Chartist Leader.*—William Jones, who had been out on bail, was placed at the bar upon an indictment, charging him with having used seditious language, and unlawfully endeavoured to excite the people against the police force and the army, at a large assemblage of persons, near the town of Leicester, during the disturbances in August last. The case excited great interest, from the fact of its being considered that Jones had been sent to Leicester, to supply the place of Cooper, as also from the oratorical ability of the defendant, who, it was expected, would make a powerful appeal to the jury. Mr. Waddington for the prosecution commenced by imploring the jury to dismiss from their minds any prejudice they might entertain towards the defendant, and bring to the case a fair, calm, and just consideration. He then proceeded to state that the indictment charged the defendant with having, on the 28th of August last, in the borough of Leicester, addressed to a large number of persons a speech of a most seditious nature, calculated to excite his hearers to an opposition to, and resistance of, the police. He (the learned counsel) admitted the right which Englishmen possessed of assembling together and freely discussing public grievances, and if they were of opinion that the assemblage in question was of a peaceable character, and that the defendant—although with mistaken and intemperate zeal—intended to lay before his fellow subjects grievances of a public nature, which demanded redress, his only intention being to state his opinion on such subjects, then he would at once tell them that he was entitled to an acquittal. Although the right of free discussion might be exercised under circumstances of great decency, and sometimes public danger, yet if they thought the defendant had no intention to excite his hearers against those in authority, or induce them to violate the laws, they were bound to give him the benefit of such an opinion, because the charge against him was, that he could not but have had such intentions; and when they looked at the surrounding circumstances—at the state of the town and of the country at the time when the defendant delivered his oration, as well as to the persons to whom it was addressed, he apprehended they would be obliged to come to the conclusion that he must have been actuated by the motives ascribed to him by the indictment. At the time when the speech was delivered, a large number of the lower orders were ripe for insubordination, and it was difficult to keep them in obedience to the laws even without such inflammatory speeches. A proclamation had been issued by the Queen on the 9th August, in consequence of the state of the country, calling upon all persons to preserve the public peace; and a proclamation was also put forth a few days after, by the magistrates of the borough of Leicester, declaring all assemblages of persons in considerable numbers illegal. The yeomanry cavalry had been called out. A portion of them had been quartered at the county gaol, and the police officers had been insulted in the execution of their duty, about ten days before defendant came to Leicester. On the evening of Sunday the 28th of August, a most improper day, the defendant attended as principal speaker at a meeting of some thousands, and delivered the speech which was the subject of the indictment. He was an itinerant lecturer, and a perfect stranger in the town into which he had most improperly intruded himself upon that occasion, for the purpose of calling the people together and haranguing them. The learned gentleman then proceeded to state the words complained of, and called witnesses to prove the facts. The defendant then delivered a very eloquent address to the Jury, which occupied nearly four hours. The situation in which he was placed was not only novel, but painful; for although he had been born and brought up amid the wretchedness which is the lot of the working man, he had never before been charged with an offence against the laws of his country, and his character would bear a fair comparison with those who had placed him in that situation. He had to grapple with many difficulties, with the ingenuity of counsel, with legal technicalities, yea, even with the prejudices of that class to which the Jury themselves belonged. He stood, however, at that bar the representative of great principles, and he was proud of the honour of being selected as a victim of persecution, because of his political opinions. He did not lament his not having the aid of counsel, for he should despise an acquittal obtained by unmanly quirks and legal quibbles. Some persons in his situation had been liberated on their consenting to enter into recognisances to keep the peace, and thus compromising the freedom of discussion, which was the birthright of every Englishman. He would not accept such terms—he would agree to no compromise—he was there to ask for justice—stern, unbending justice, and he demanded it for himself and for his country, in the name of the great Being by whom they had sworn to act justly. It was notorious that for many years the class to which the Jury belonged had had no sympathy with his class; and it was therefore possible that they might view his case through the darkened medium of prejudice, and feel a strong pre-inclination to convict him. But they did not sit there as the representatives of any political body—they did not occupy that Jury-box as members of either the Whig or Tory faction—they were placed there as the arbitrators between him and Government—they were there to decide whether he had or had not inflicted an injury on society, and all political considerations and opinions should be discarded from their consideration. The defendant went on to contend, that he had not used the language attributed to him; both of the witnesses who spoke to it had not taken a note on the spot, but trusted to their memories; they had been schooled into the part which they had played; they had been told that if the Jury could know the context, if they had heard the whole of his address, they could not convict him. The men who had been called were incapable of comprehending the meaning of any sentence which possessed the least profundity of thought, and it would be great injustice to rely upon the sentences which they had given, concocted, as they had been, from one or two detached phrases, and tortured by the ingenuity of those who had sent them to the meeting into expressions of a violent character. The defendant proceeded to condemn the police force as an innovation on the original constitution of the country, copied from despotic governments, and stated that he would not purchase an acquittal by saying that he approved of the institution of such a force, or the general conduct of the men who belonged to it. He had always advocated peace and order, but it was true he had denounced the government as tyrannical.—Mr. Baron Gurney (with vehemence): Then you have done wrong, exceedingly wrong. We know nothing of you, sir.—The defendant: That was my conviction, my lord.—Mr. Baron Gurney: You may hold your convictions as you please, sir; but you have no right to hold out to the people that the government is tyrannical: that's a crime.—The defendant: I will contrast my language with that used in 1831 by the very magistrate who committed me. I am the disciple of the agitators of that period, and, whilst following their example, the language attributed to me is much less inflammatory than that which I can show was used.—Mr. Baron Gurney: I cannot allow it. I will not allow anything you are supposed to have said to be justified by what might have been said by other people. I have nothing to do with that.—The defendant: I am merely saying that I did not use such expressions as were used by these gentlemen, even supposing that what the witnesses have said is true, which I flatly deny. I am not going to put them in as evidence, my lord.—Mr. Baron Gurney: Very well. It cannot be given in evidence, and therefore cannot be introduced here.—The defendant continued; If he had expressed his opinion of the police, his own class had been vilified with impunity. Had they not been called a dirty, unwashed, swinish multitude? Upon the paltry evidence which the jury had heard he had been dragged from his bed at midnight to a gaol, and kept four weeks in confinement there, waiting for bail. No disturbance of any kind had

taken place. But there was a secret cause for this prosecution—he was a Chartist.—Mr. Baron Gurney: You are not charged with being a Chartist here. The reason why there was no further disturbance might have been that you were at once taken into custody.—The defendant: It is of no use for me to proceed further with my defence. I would convince you, gentlemen, of my innocence, if allowed to adopt the line of defence which I had marked out for myself. What became of the boasted right to assemble publicly and discuss their grievances, if they were to be dragged away to a dungeon for expressing their opinions at peaceable meetings? If the jury found him guilty, their verdict would justify the government in any attempt which they might make to suppress the liberties of the people; and thus any man who raised his voice against existing institutions—such, for instance, as church-rates—might be arrested and thrust into gaol. In conclusion, he contended that society was not properly constituted for man's physical and moral happiness, and he was, therefore, justified in urging his audience to adopt such means as would tend to establish a better state of things. The defendant concluded a very able address, by stating that he should leave his case in the hands of the jury, confident that the result must be a verdict of acquittal.—Mr. Baron Gurney briefly recapitulated the evidence, and, in no very equivocal terms, expressed his conviction of the defendant's guilt.—The jury having retired for half an hour, returned with a verdict of Guilty, stating that they thought the defendant had used the words charged against him under feelings of great excitement.—Mr. Baron Gurney sentenced the defendant to six months' imprisonment, and to enter into his own recognizances in £200, and find two sureties in £25 each to keep the peace for three years.—The trial lasted until ten o'clock at night, and concluded the business of the Assizes.

SPORTING.

TATTERSALL'S, THURSDAY.—DERBY.—7½ to 1 agst A British Yeoman; 15 to 1 agst Mr. Goodman's Maccabeus; 20 to 1 agst Mr. Bowes's Cotherstone (taken freely); 20 to 1 agst Colonel Peel's Murat (taken); 25 to 1 agst Mr. Bell's Wincemar; 25 to 1 agst Lord Westminster's Languish colt; 25 to 1 agst Sir G. Heathcote's Amarino; 25 to 1 agst Lord Eglington's Aristides; 30 to 1 agst Colonel Anson's Napier (taken freely); 30 to 1 agst Lord G. Bentinck's Gaper (taken freely); 40 to 1 agst Mr. F. Taylor's Gamecock (taken); 45 to 1 agst Lord Orford's Mercy (colt taken). 45 to 1 agst Mr. Griffith's Newcourt (taken). 45 to 1 agst Duke of Richmond's Cornepan (taken); 50 to 1 agst Mr. D. Cook's Trueboy; 50 to 1 agst Colonel Peel's St. Valentine; 2000 to 25 agst Mr. Ford's Humbug; 1,000 to 10 agst Lord Exeter's Lucetta colt (taken); 700 to 100 agst Cotherstone, Aristides, and Languish colt (taken).

MARK LANE, FRIDAY, March 31.—On Wednesday there was more animation in the Wheat Market, and a fair business was transacted; but this morning there was very little life in the trade, and sales have been to a limited extent at the same prices as on Monday. Barley comes sparingly to Market, and the demand is falling off; in prices no alteration. Peas and Beans are a very dull sale on Monday's currency. Oats are more saleable, and the stock is reduced.

GAZETTE OF THE WEEK.

[illegible]

MARRIED.—On the 27th ult., at Dublin, the Rev. Sir Nicholas Chinnery, Bart., to Anne, elder daughter of the Rev. John Vernon, of Ankerage, Essex. On the 24th ult., at Kilmington, Herts, by the Rev. J. Sullivan, an English clergyman, to the late Lieutenant-Colonel. Monner Williams, Surveyor-General of Bunbury, to Colonel Ansell, fourth daughter of the late Rev. John Ansell, of Buntingford, Cambridgeshire. On the 27th ult., at Eridge, Kent, the Right Hon. Henry Earl of Abergevenny, K.G., in his 54th year—On the 26th ult., Mr. Thomas Dunford, upwards of 17 years gardener at Stevenstone, in the service of the late Lord Rolle and his Trustees, in his 44th year.—On the 18th ult., at Home, the most noble William Duke of Manchester, in his 73d year.—On the 9th of Sept., on the McLeary River, New South Wales, Henry Robert Oakes, Esq., formerly of the Hon. East India Company's Service.—On the 24th ult., at Reading, Lieut.-Col. Milford Sutherland, formerly in command of the 91st Regt.

Now ready, neat cloth, price 4s. 6d.,
RURAL CHEMISTRY.
 An Introduction to the Study of the Science in Relation to
 AGRICULTURE.
 By EDWARD SOILY, Esq., Jun., F.R.S., F.L.S.
 Experimental Chemist to the Horticultural Society of London,
 Hon. Mem. of the Royal Agricultural Society, Lecturer on
 Chemistry, at the Royal Institution of Great Britain,
 &c. &c. &c.

Extracts from the Introduction:—

"A knowledge of the chemical composition of soils, and the various substances employed as manures, enables us to comprehend the mode in which the latter act; and a knowledge of the nature of these substances, which plants require points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knew what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them; he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

Index of Contents.

Acclimatizing	Cherry-tree gum	Growth of plants
Acid, benzoic	Chloride of sodium	Guano
Acid, carbonic	Chlorine	Gum
Acid, humic	Cider	Gum arabic
Acid, lactic	Citric acid	Gum, cherry-tree
Acid, muriatic	Clay	Gum, resin
Acid, nitric	Clay, burnt	Gunpowder
Acid, phosphoric	Climate, effects of	Gypsum
Acid, sulphuric	Clover, analysis of	Hair
Acid, sulphurous	Coal, ashes of	Hard water
Acid, uric	Coal gas	Hartshorn
Acids	Cocoa-nut oil	Heat
Acids, organic	Cohesion	Heat, latent
Acids, tests for	Colic	Hoofs
Action of plants on	Colour	Horns
the air	Colour of soil	Humates
Active principles of	Colours, changing of	Humic acid
plants	Colours of plants	Humus
Ablutivity	Colouring matter	Humus, decay of
Air	Combination	Hydrogen gas
Air, bad	Combining numbers	Hydrogen, carburet-
Air, good	Combining weights	ted
Air, inflammable	Combustion	Hydrogen, sulphur-
Alabaster	Combustion, results	etted
Albumen, animal	of	
Albumen, vegetable	Common salt	Inflammable air
Ale, bottled	Composition of bodies	Inflammable gas
Alkali, volatile	Composition of soils	Inorganic manures
Alkalies	Composition of water	Iodides
Alkalies, vegetable	Compounds, binary	Iodine
Alum	Compounds, all definite	Iron
Alumina, sulphate of	ite	Iron, carbonate of
Ammonia	Compounds, saline	Iron, oxide of
Ammonia, fixing	Compounds, ternary	Iron, peroxide of
Ammonia, fixing by	and quaternary	Iron, protoxide of
acids	Contagion	Iron-stoves
Ammonia, fixing by	Contagious matters	Iron, sulphate of
gypsum	Copperas	Iron, sulphuret of
Ammonia, fixing by	Corn	Isinglass
co, peras	Crops, rotation of	Ivory
Ammonia, carbonate	Cubic metre	Kelp
of	Cultivated lands	Latent heat
Ammonia, muriate of	Decay	Lead, red
Ammonia, phosphite of	Decay of humus	Lead, white
Ammonia, sulphate of	Decomposition	Lead, oxides of
Ammonia, urate of	Decomposition of	Leaves
Ammoniacal liquor of	stony particles	Leaves, use of the
the gas works	Deliquescent	Legumine
Animal manures	Dew	Lettuce
Animal principles,	Diamond	Light
proximate	Division, mechanical	Light, effects of
Animal substances	Drawing	Lighting a fire
Aquatic	Ditch	Lignin
Arrow-root	Dutch rusts	Lime
Attraction	Parths	Lime, carbonate of
Ashes	Earthy substances	Lime, caustic
Ashes, wood	Earthy substances in	Lime, when useful
Ashes of plants	plants	Lime, when not to be
Ashes of coal	Effluence	used
Ashes of sea-weed	Elements	
Atoms	Embryo	Lime, muriate of
Bad air	Embryo of a seed	Lime, nitrate of
Banna	Epsom salts	Lime, phosphate of
Barley	Equivalent weights	Lime, quick
Barley, analysis of	Excrements	Lime, sulphate of
Bases	Excrements of sea-	Limestone
Bay salt	fowl	Limestone, magne-
Beans, analysis of	Experiments	sian
Beet, analysis of	Following	Lime seed
Binary compounds	Farm-yard manure	Liquid manure
Bleaching	Fat	Litharge
Blood	Fatty substances	Loss of manure
Bone	Fermentation	Lucerne, analysis of
Bones, boiled	Fertility	Magnesia
Bones, green	Fibre, woody	Magnesia, carbonate
Bottled ale	Fibrin	of
Bran	Fire-damp	Magnesia, caustic
Breathing of Animals	Fire, fighting a	Magnesia, muriate of
Brimstone	Fixed oil	Magnesia, phosphate
Bromides	Fixing ammonia	of
Bromine	Flax	Magnesia, sulphate of
Buckwheat, analysis	Flesh of animals	Magnesia, salts of
of	Fruit	Magnesian limestone
Bubbling, or efferves-	Flowers, use of	Magnesium
cence	Food of animals	Maiting
Burning	Food of plants	Malic acid
Burning of plants	Food, too great a sup-	Manganese
Burnt clay	ply of	Manganese, oxide of
Carbon	Formation, of soils	Manure
Carbon in plants	Formation of seed	Manures, animal
Carbonate of ammo-	Foul smells	Manures, inorganic
nia	Fruit, ripening of	Manures, farm-yard
Carbonate of iron	Fruit, unripe	Manures, green
Carbonate of lime	Fungi	Manures, loss of
Carbonate of magne-	Fumigation	Manure, liquid
sia	Gas	Manures, organic
Carbonate of potash	Gas, inflammable	Manures, saline
Carbonate of soda	Gas-liquor	Manures, strong
Carbonic acid	Gas-works	Manures, vegetable
Carbonic oxide	Gas-works, ammoni-	Marble
Carburetted hydro-	acal liquor of	Meat
gen	Gas works, refuse of	Mechanical division
Carcases	Geatne	Metallic oxides
Carrot, analysis of	Germination	Metals
Cassia	Germination in oxy-	Minium
Castor oil	gen	Mixture
Caustic lime	Glass	Mouldiness
Caustic potash	Glauber's salts	Mucilage
Caustic substances	Gum	Muriates
Cham	Gum, resin	Muriatic acid
Changes, chemical	Gum, cherry-tree	Muriate of ammonia
Charcoal	Gum, resin	Muriate of lime
Charring	Grass	Muriate of magnesia
Cheltenham salts	Green bones	Muriate of soda
Chemical changes	Green manures	Muscle of animals
	Green vitriol	Mustard
		Natural vegetation

Index of Contents—continued.

Nature of the soil	Pruning	Sodium
Nitrates	Putrefaction, results	Sodium, chloride of
Nitrate of lime	of	Soft-water
Nitrate of potash	Putrefiable matter	Soils, analysis of
Nitrate of soda	Putrefying animal	Soils, colour of
Nitre	matter	Soils, composition of
Nitre, cubic	Putrid urine	Soils, formation of
Nitric acid	Pyrites	Soils, nature of
Nitrogen	Quartz	Soot
Nutrition of plants	Quicklime	Sorrel
Oats, analysis of	Rain-water	Spirit
Oil	Rape	Spirit of salt
Oil-cake	Raw bones	Spirit of wine
Oil, castor	Red cabbage	Spring-water
Oil, Cocoa-nut	Red lead	Starch
O.I. fixed	Refuse of gas-works	Steam
Oil, Olive	Resins	Stoves
Oil of vitriol	Respiration	Straw
Oil of Poppy	Results of combus-	Strong manures
Oil of Rape	tion	Subsoil
Oil of Linseed	Results of putrefac-	Subsoil-ploughing
Oil of Mustard	tion	Substances, in soils,
Oil of Lavender	Rhubarb	organic
Oil of Cloves	Ripening of fruit	Substances, volatile
Oil of Lemons	River-water	Substratum
Oily matters	Rock-salt	Sugar
Olive oil	Rotation of crops	Sulphates
Organic acids	Rust	Sulphate of alumine
Organic manures	Rusting	Sulphate of iron
Organic substances in	Rye, analysis of	Sulphate of lime
soils	Saccharine matter	Sulphate of magnesia
Organised matters	Sago	Sulphate of soda
Oxalic acid	Saintfoin, analysis of	Sulphur
Oxide, carbonic	Sal ammoniac	Sulphuret of iron
Oxide of manganese	Saline compounds	Sulphuric acid
Oxide of iron	Saline manures	Sulphurous acid
Oxides, metallic	Salts	Sulphuretted hydro-
Oxygen	Salt, bay	gen
Paring	Salts, Cheltenham	Sunflower
Parsnep, analysis of	Salt, common	Tapioca
Pearlash	Salts, Epsom	Tartaric acid
Peas, analysis of	Salts, Glauber's	Teeth
Peat	Salts of hartshorn	Ternary and quater-
Peroxide of iron	Salts of magnesia	nary compounds
Petre	Salts of potash	The Tropics
Phosphate of ammo-	Saltpetre	Tobacco
nia	Salts of soda	Tracle
Phosphate of lime	Salts of iron	Turf
Phosphate of mag-	Salts, metallic	Unripe fruit
nesia	Salt, rock	Urea
Phosphoric acid	Sand	Urine
Phosphorus	Saw dust	Urine, putrid
Pickling	Sea fowl, excrements	Use of the leaves
Plants, burning of	of	Use of plants
Plants, action of on	Sea-shore	Vapour in the air
the air	Sea-water	Vegetable alkalies
Plants, death of	Sea-weed	Vegetable manures
Plants, food of	Seeds and fruit	Vinegar
Plants, growth of	Seed, formation of	Vitriol, green
Plants, nutrition of	Selection by the roots	Vitriol, oil of
Plaster-stone	Shells	Volatile alkali
Ploughing, subsoil	Shell-sand	Volatile oil
Poppy	Silica	Volatile substances
Potash	Silicates	Water
Potash, carbonate of	Silicate of potash	Water, composition of
Potash, caustic	Silicic acid	Water, hard
Potash, nitrate of	Silicic acid	Water, rain
Potash, salts of	Silicic acid	Water, river
Potash, silicate of	Silicic acid	Water, sea
Potassium	Slag	Water, soft
Potassium, chloride	Smell	Water, spring
Potato-flour	Smells, foul	Wheat, analysis of
Potatoes	Smelting	Weeds
Pottery	Soap	Weed-ash
Protoxide of iron	Soap-making	White of egg
Proximate animal	Soap-boiling	White lead
principles	Soda	Wood-ashes
Principles, active	Soda, carbonate of	Woody fibre
Proportions	Soda, muriate of	Wool
	Soda, nitrate of	Yeast
	Soda, sulphate of	

London: 3, Charles-street, Covent Garden; and may be ordered of all Booksellers.

GARDEN NET.—New Garden Net, viz., Herring Net, one-inch mesh, made with machinery, 1½d. per yard, in any length or width. Old Fishing Net, properly mended up, in lengths, 30 or 40 yards, 8 and 10 feet deep, 3d. per yard square. Woollen and Worsted Net, fine Blossom and Wasp Net, made from Hemp, Bunting, Screens, &c. &c. Woollen Tie for Flowers. Also Sheep-folding Nets, Fishing Nets, Rabbit and Hare Nets. Nets for fences against Rabbits, Dogs, Poultry, &c., 2d. per yard; also for covering in Poultry-yards, Pheasants, &c., 2d. per yard. Superior expanding Tents for Lawns, &c., 5l., 36 ft. round. Tarpaulins for Waggon and Stack Covers, Garden-frames, &c., 2s. per square yard made up.

Rob. Richardson, Net and Tent Maker, 21, Tonbridge-place, New Road, near Euston-square, London.
 N.B.—1000 London Policemen's Capes for Farmers' Servants, 1s. 9d., 2s., and 2s. 6d. each.

IMPROVED WIRE FENCING.

J. W. GIDNEY begs to inform Noblemen and Gentlemen that in consequence of the increased demand and improvements in the machinery for producing his **IMPROVED STRAINED WIRE FENCING**, coupled with the depression in the Iron trade, he is enabled to offer the same at a considerably reduced rate, and warrants this Fence, as constructed by him, to stand against all kinds of cattle, and for neatness, strength, durability, and cheapness, to excel all other kinds of Fencing. List of Prices, with a sketch, may be had by applying at his Manufactory, East Dereham, Norfolk.

ORNAMENTAL WIREWORK FOR THE GARDEN,
 390, OXFORD-STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in **FANCY WIREWORK**, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hothouse Engines, Syringes, Fumigating Bellows, and other Horticultural Implements. **G. B. Thompson's Improved Waterpots**, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

TO FLORISTS AND GARDENERS.

TO LET, a small **FLORIST'S BUSINESS**, in one of the best thoroughfares near London, with a good jobbing Connexion. Greenhouse, Seed-shop, and Stock, if required. The present occupier leaving in consequence of ill health.—Apply personally to **T. JENNINGS**, near the Chapel, South Lambeth, Surrey.

COMPOUND DECOCTION OF SARSAPARILLA.
 —Scurvy, Scrofula, Eruptions on the Face, Roughness of the Skin, Chronic Rheumatism, Indigestion, Chronic Liver Affections, General Debility, particularly when caused by excess; the effects of taking Mercury are among the numerous diseases and affections for which this invaluable alterative is almost a specific. To those effected with, or predisposed to, any of the above disorders, a course, spring and autumn, is generally recommended by the Faculty. The preparation of this Decoction is, however, difficult, and its dose somewhat large. All its virtues are possessed in a portable and pleasant form, by the Concentrated Compound Decoction of Sarsaparilla, prepared by **BENJ. MOXON and SONS, Chemists, Hull.**
 Sold in Bottles, at 4s. 6d., 12s., and 22s. (equal to 6, 16, and 32 pints of the Decoction), by all respectable medicine vendors.—London Agents: Barclay & Sons, Sutton, Edwards, Newberry, &c.; York, Dennis and Son; Dublin, at Butler's Medical Hall; Edinburgh, J. and R. Rimes; Quebec, J. Musson.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of **SHADING**, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

BEE-HIVES.—**GEORGE NEIGHBOUR and SON** beg to inform their Apian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Beehives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. **G. N. and Son** have also Glass Hives and other articles connected with Bee Management, at their Apian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton street, London. Letters of inquiry relative to the above must have Postage Stamps Inclosed.

*** "NUTT ON BEES" (5th Edition), now published.

ROYAL POLYTECHNIC INSTITUTION.
 During Lent the **DISSOLVING ORRERY** will be exhibited on the Mornings and Evenings of **WEDNESDAYS & FRIDAYS** when the **THEORY OF COMETS** and other **CELESTIAL PHENOMENA** will be explained and illustrated by **Diagrams**. At work daily, a complete arrangement of **COTTON-SPINNING MACHINERY**, consisting of a **CARLING, ROVING, and SPINNING FRAME**. Cary's **NEW MICROSCOPE**, magnifying **SEVENTY-FOUR MILLION TIMES**. **DISSOLVING VILWS.** The Science of Electricity demonstrated by the **COLOSSAL ELECTRICAL MACHINE** at a Quarter to Three daily, and at Eight in the Evening, except Wednesday and Friday evenings. Lectures Daily on **CHEMISTRY and NATURAL PHILOSOPHY**, by **DR. RYAN** and **Professor BACHHOFFNER**. The **CLASS LECTURES** are continued as usual. Admission, One Shilling, Schools, half-price.

IMPORTANT.—"After more than two years' constant trial, I can give the most unqualified and decided testimony in favour of your Ventilating Waterproof Frock. I have been much exposed in an open chase to all weathers, frequently for six hours at a time, to the most dreary rain, so as to appear externally like one sheet of water, but never found your Coat fail in keeping me perfectly dry (and this, too, without the least appearance of confined perspiration). I cannot express the comfort and satisfaction it affords me. If my testimony is of value, pray make any use you please of it.—**DELF and Son, Surgeons, 9, Alfred-place, Newington, Surrey. Feb. 10, 1843.** To Mr. Berdoe." The garment referred to is **BERDOE'S VENTILATING WATERPROOF FROCK**, a respectable and established garment, made only by **W. BERDOE, Tailor, Waterproof, &c., 60, Cornhill**, (eight doors from Bishopsgate-street).

H. WALKER'S NEEDLES (by Authority the "Queen's Own"), with the New Large Eyes, are easily threaded (even by blind persons), and worked with great ease, having improved Points, Temper, and Finish. The Labels are correct Likenesses of Her Majesty and His Royal Highness Prince Albert in relief, on coloured grounds.

H. WALKER'S Improved Fish-hooks, Steel Pens, Hooks and Eyes, Bodkins, &c., are particularly recommended to notice. For the Home Trade, neat packages of Needles or Pens, from 1s. to 10s. value, can be sent free by post by any respectable dealer, on receipt of 13 penny stamps for every shilling value. Every quality, &c., for shipping.

H. WALKER, Manufacturer to the Queen, 20, Maiden-lane, Wood-street.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER, an active, experienced, married Man, age 30, who understands Fencing in all its departments. Can have a two years' unexceptionable Character from his late Employer. Direct to **Mr. J. MARSHALL, 1, Park-road, Clapham.**

AS GARDENER, a married Man, aged 35, who perfectly understands his business; would also undertake the management of Land or Stock of any description, if required. Has had a practical knowledge of cattle from his childhood. His wife could also manage a Dairy or Poultry yard. Can have four years' good character from the gentleman he is leaving.—Direct **A. B., Messrs. PAUL & SON, Nurserymen, Chesham, Herts.**

AS GARDENER, a single Man, aged 27, who is well acquainted with the management of Pines, Vines, &c., Hot-house and Greenhouse Plants, and Gardening in general. Can be highly recommended for strict integrity, and a general knowledge of his profession. Direct to **E. H., Mr. KERNAN'S, Seedsman, 4, Great Russell-street, Covent Garden.**

AS GARDENER, a single Man, aged 45, who understands his business in every department. Can have a good character from his last place.—Direct to **G. B., at Mr. KERNAN'S, 4, Great Russell-street, Covent Garden.**

TO THE NOBILITY, GENTRY, &c.

AS PRACTICAL GARDENER, or GARDENER AND FORESTER.—**H. BOWERS**, of La Chaux, having concluded his present engagement, is at liberty to engage with any Nobleman or Gentleman in want of a person thoroughly qualified as above. The advertiser having devoted all his life and energies to the practice of his profession, on the most improved principles, having acquired experience in large establishments, and also in distinguished families as principal Gardener, Forester, Designer, Planter, and General Improver of Gardens and Estates, is perfect master of his business. **H. B.** is married, and in the prime of life. Can be highly recommended by the most eminent Horticulturists, and the Nobleman he is leaving. Letters addressed to **H. B., at Messrs. J. & C. LEE'S Nursery, Hammersmith**, will meet with immediate attention.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, the Proprietors of Whitehall, in the City of London, and Published by the Office, 3, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 1, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

DAHLIAS.

W. R. WHALE, Florist, &c., Elcot, Hungerford, Berks., begs leave to call the attention of FLORISTS generally to his select List for 1843.

WHALE'S HERO OF STONEHENGE—a dark mulberry colour, of great substance, circular form, with short stiff cupped petals, full centre, constant the whole season, fills when young, good habit; height, 4 feet.

(The usual discount where a dozen plants are taken.)

Took the following Prizes, viz.—First at Stonehenge, on Salisbury Plain. First at Devon and Exeter, Silver Medal, 4 ounces. Second at Marlborough. First in a winning stand of Twelve. A Prize at Salt Hill; and several at the Metropolitan Shows, the only places exhibited at.

NOVELTY (WHALE'S)—ruby ground, tipped with buff, quite new in colour, of good substance and full size, circular form, short stiff cupped petals, of large size: an every day flower, constant of dwarf habit, 2 to 3 ft. high.

APPLAUSE (WHALE'S)—a pale orange, new in colour, fine clear stiff cupped petals, circular form, rather flat in the centre, but rises in water, a good back row flower. This variety will be scarce, all having perished but two roots. Height 4 feet.

FAVOURITE (DODD'S)—clear white, edged with pink, good show flower.

COLONEL BAKER—dark purple, show flower.

SIR R. SALE (SMITH)—dark, first rate.

VIOLET PERFECTION (KEYNES)—first-rate.

PAUL PRY (BROWN'S)—ruby, show flower.

VIRGIL (MOUNTJOY'S)—dark purple extra.

SWINDON RIVAL (COMPTON'S)—rose extra.

SULTANA (APPLEBY)—very dark extra.

MRS. J. RICHARDSON (EDWARDS)—light-edged with purple, first rate.

MRS. SHELLEY (MITCHELL'S)—peach blossom, first rate and scarce.

ADMIRAL STOFFORD—dark maroon, good show flower and scarce.

CORONATION (HARRISON)—good show flower.

LADY ALICE PERL (JACKSON)—rose, good.

SALFORD RIVAL UNION—dark, good show flower.

PRINCE OF WALES (DODD'S)—yellow.

PRINCESS ROYAL (HUDSON)—light, tipped buff.

HORACE (MOUNTJOY'S)—dark, good show flower.

BEDFORD SURPRISE, Sheppard, fine show flower.

NORTHERN BEAUTY—light tipped, useful show flower.

ATTILA (WHALE)—rosy, lilac, fine shape.

SIR F. JOHNSTONE (HILLIER)—good show flower.

AMERICA (DRUMMOND)—fine dark show flower.

TWYFORD PERFECTION—shaded rose.

WHITE DEFENCE (LANGELLIER)—fine.

Candidate (SILVERLOCK)—dark puce, fine.

Marchioness of Exeter (WIDNALL)—light tipped with purple.

Lady Glentworth (WIDNALL)—shaded purple.

Majestic (WIDNALL)—rosy lilac, good show flower.

Lady Ann Murray (CATLEIGH'S)—light mottled.

Gipsy Maid (GIRLING'S)—dark, useful show flower.

Prince of Wales (GIRLING)—purple, fine shape.

Westbury Rival—purple.

Miss Abbot—lilac, good.

Welbeck (TILLERY)—rose.

Rose Unique—Ansell.

Stanley (JONES)—light tipped.

Nearly every other variety in cultivation may be obtained of W. R. W. at moderate prices.

SPLENDID NEW CACTUS "CONWAY'S GIANT."

P. CONWAY begs to inform those Friends who have favoured him with orders for the above that their Plants will be ready on the 10th of April. A few good Plants still to be disposed of, 2 guineas each.

CONWAY'S New Pelargonium "LANE," decidedly the best yet raised for early forcing, which is fully admitted by the principal London Florists who have seen it in bloom—7s. 6d. each. An allowance to the Trade where two plants are taken.

For description of these two new productions see advertisement in the *Gardeners' Chronicle* of March 11.

SCARLET PELARGONIUMS. The best varieties for potting and bedding out.—Old Brompton, March 29, 1843.

NEW AND SUPERB FUCHSIAS.

YOUELL & CO. have much pleasure in referring the readers of the *Gardeners' Chronicle* to their List of the above elegant tribe, advertised in this Paper of last week. It comprises all the really good varieties to the exclusion of such as are merely nominal, and are now ready for sending post-free to any part of the United Kingdom, on the receipt of a post-office order, at the following prices:—

12 Fine show varieties	s. d.
12 Extra do.	12 0
12 Ditto, ditto, very superior	16 0
	21 0

The selection being left to YOUELL & Co.

CARNATIONS AND PICOTEEES.

The following are the prices from YOUELL & Co.'s extensive Collection, consisting of upwards of 800 varieties, of the most select sorts:—

25 Pairs of extra-fine and first-rate show-flowers	s. d.
12 Do. Do. Do.	5 0 0
12 Do. Do. Do.	2 10 0
25 Do., very fine Do. Do.	3 0 0
12 Do. Do. Do.	1 10 0
12 Do., extra fine, and show Pinks	0 12 0

The selection being left to YOUELL & Co.

ARAUCARIA IMBRICATA.—Fine strong Plants, 8 inches high, 60s. per dozen; 10 inches, 84s.; 1 foot, extra fine, 21s. per plant. 30 packets of select Flower Seeds 8s., sent free of postage.

THE FASTOLFF RASPBERRY. Patronised by HER MOST GRACIOUS MAJESTY THE QUEEN, HIS GRACE THE DUKE OF RUTLAND, THE EARL OF HARRINGTON, THE LORD BISHOP OF LONDON, LORD VISCOUNT LORTON, AND MANY OF THE NOBILITY.

YOUELL & Co. have only a few packages remaining for sale of the above highly valuable Raspberry, at the following prices:— Packages containing 50 Canes, 11. 5s.; Do., 25 Canes, 14s., package included; sent to any part of the United Kingdom on the receipt of a Post-office order.—For further particulars, see their former Advertisements; and they beg to refer the readers of the *Gardeners' Chronicle* to page 138 of this Paper, as a proof they have not exaggerated in their recommendation of it; which ought to be cultivated in every garden in the kingdom. Great Yarmouth Nursery, Norfolk, April 6, 1843.

HUGH LOW and CO. have for Sale the following

Plants, which are all well deserving of cultivation:—

Achimenes grandiflora, very large, beautiful pink, small plants, each	s. d.
Achimenes pedunculata (see Bot. Register) small plants, each	15 0
Achimenes rosea (see Bot. Register), each	10 6
longiflora (see Paxton's Mag. of Bot.), each	2 6
Bridgesia spicata, new climber from Chile, each	7 6
Campanula grandis, each	1 6
Gesneria zebrina, strong tubers, each	2 6
Gloxinia macrophylla variegata, from Brazil	5 0
speciosa, var. from Brazil, each	5 0
tubiflora, flowers 3 to 4 inches long, pure white, strong tubers	21 0
Hardenbergia macrophylla	2 6
Kennedy's Marryatæ	3 6
Manettia bicolor, beautiful climber	5 0
Nyphæa oblonga, beautiful dwarf plant, resembling a Gloxinia	10 6
Paulownia imperialis	7 6
Physolobium carinatum, fine	5 0
Siphocampylus betulæfolius (see Paxton's Mag. of Bot.)	7 6
Siphanthus elegans (Loasa volubilis), beautiful creeper, will continue in flower from May till December (see Sweet's Flower Garden, and Pax. Mag. of Bot.)	5 0
Statice Dickensonii	10 6
Verbena Howardiana, the finest blush rose-coloured	
Verbena yet out, very fragrant	3 6

A reference to some House in London will be required from unknown Correspondents. The usual Allowance to the Trade.

Clapton Nursery, London, March 29, 1843.

WILLIAM MAY begs to announce that he can now

supply the following new and showy plants, for the first time offered to the Public.

Bomaria (Alstroemeria) s. d.	Buenos Ayres, bloom s. d.
pubescens (Peru) 5 0	four inches long, very splendid 21 0
rubra (Peru) 5 0	Passiflora, new Mignon-
Fuchsia Ballooni (May's) 10 6	ette-scented, not yet named, very sweet (from Peru) 10 6
Tweedia rosea (per doz., 18s.) 2 6	Gesneria alba (of Tweedia)
W. M. can also supply the following well-known favourite Plants, viz.:— s. d.	
Pentlandia miniata 5 0	Verbenas, Knight's new varieties, viz., Fanny
Cypripedium insigne (per doz. 18s.) 2 6	Elssler, Westongii, Ovid
Calceolaria, Lady Con- stable 10 6	conspicua, Prince of
Ismene peduncularis (per doz. 12s.) 1 6	Wales, Brownleas, ma-
Fuchsias, 20 fine distinct hybrid varieties, for 20 0	jestic, Bride, Leonora, formosissima, and Da-
One Hundred sorts of showy Hardy Herbaceous Plants, named, of W. M.'s selecting, for 42s.	visoni—the set for 20 0

Hollyhocks, all warranted saved from double flowers, seeds in packets of 200 for 2s. 6d., 500 for 5s.

Hope Nursery, Leeming-lane, near Bedale, Yorkshire, April 5.

SPLENDID NEW PELARGONIUM, "THE ARCHBISHOP OF CANTERBURY."

WILLIAM MASTERS begs to offer the above new Seedling, at 42s. each. It is a remarkably free Bloomer, having its upper Petals rosy crimson, with a deep and well-defined spot; the lower being of a delicate pink, inclining to white in the centre.—Exotic Nursery, Canterbury.

SEEDLING FUCHSIAS, "IVERYANA," AND "GEM."

W. IVERY, Florist, Peckham, near London, begs to offer the above distinct varieties, having been exhibited at Regent-street Rooms last autumn, and greatly admired. For size, substance, and brightness of colour, have not their equal: of superior habit and abundant bloomers. W. I. being a grower of all the newest varieties can, with confidence, recommend the above Plants. Can be had after the 15th April, at 7s. 6d. each.—A select Catalogue may be had, on application, of the newest FUCHSIAS, CINERARIAS, VERBENAS, &c.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

FUCHSIA ST. CLARE.—The above magnificent

Fuchsia was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last, it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month, as follows:—"Your Seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. YOUELL, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage, and as a proof of its being a profuse bloomer, they have a plant in flower at the present time (September 15th) on one branch of which there are upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower garden. YOUELL and Co. are now sending it out at 10s. 6d. per plant, free of postage, to any part of the United Kingdom; and all orders they may be favoured with will be executed in rotation. Orders for the Continent will receive every care in packing, so as to insure their safety. The usual discount to the Trade, when not less than six plants are ordered.

Messrs. YOUELL have also much pleasure in announcing, that they are in the possession of the entire stock of two beautiful new Verbenas, raised by Mr. Edmonds, gardener to John Lacon, Esq., of Ormesby Hall, which were kindly presented them by that gentleman,—the one named "Lacconii," is a fine blue, delightfully fragrant, of vigorous but compact habit, and the heads of flowers measuring upwards of 3½ inches in diameter. The other named "Princess Royal," is of the purest snowy white, the flowers remarkably large, and extremely fragrant; nothing can exceed the purity of the white in this beautiful variety, and it possesses that acquisition not to be found in any of its class,—of retaining its clear white during fading. It would be as well to remark, that the petals of the flowers of the above meet so closely, as to form a perfect ball. They are ready for sending out by post (free) to any part of the United Kingdom, at 5s. 6d. per plant.

P.S.—Their Catalogue of Fuchsias may be had on application, and will be found to contain every variety worthy of cultivation. Great Yarmouth Nursery, April 6, 1843.

MAGNIFICENT NEW VERBENA, "PRINCE OF WALES."

WILLIAM WOOD and SON, having obtained the entire Stock of the above very splendid VERBENA, beg leave to offer it to the Public, feeling assured that they can with the greatest confidence recommend it as worthy of especial notice. This desirable variety is a beautiful Flesh colour; the heads of flowers measuring 3½ inches in diameter, and exceedingly fragrant. Plants of the above will be ready for delivery in May, at 3s. 6d. each; the usual discount to the Trade when six plants or more are ordered.

W. W. & Son would also solicit attention to their superb Collection of all the New Verbenas, Fuchsias, &c., and other spring Plants adapted for Bedding, Catalogues of which will be sent free on application.

Verbenas, consisting of the best varieties, and left to their own selection, in tin cases, per post, at 3s. per doz., or in pots at 4s. per doz. Fuchsias, per post, at 4s. per doz. Petunias, fine sorts, at 4s. per doz., in tin cases. All orders sent per post will be prepaid.

Please address—Woodlands Nursery, Maresfield, near Uckfield, Sussex. Agents in London, Messrs. WARNER and WARNER, 28, Cornhill; and Mr. CARTER, 238, High Holborn.

SEEDLING DAHLIAS FOR 1843. MRS. JAMES RICHARDSON, and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842:—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—From the *Gardeners' Chronicle and Gazette*.

Also obtained the following prizes:—No. of Blooms Exhibited. 1st prize at Hull, Aug. 30th 12
1st prize at Beverley, Sept. 7th 2
Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th 4
1st prize at Leeds, Sept. 21st 12
1st prize at Newcastle, Sept. 21st 6
1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th 6
1st prize at the York Floral and Horticultural Society, Sept. 28th 18
1st prize at the York Floricultural Society, Oct. 1st 12
1st prize in its class as the best white or blush, ditto. Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10s. 6d.

All orders addressed J. EDWARDS, Layerthorpe, Florist, Nursery and Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

VERBENAS.

J. HALLY, NURSERYMAN and FLORIST, Blackheath, Kent, begs to offer the following New VERBENAS:—"Rosy Queen," a large-flowering, very bright rose-coloured variety, with round truss of flowers, and fine shrubby habit. "Roseo-alba," a beautiful rosy pink, with white centre, carrying a large flat truss. HALLY's "Lilacina," a bright lilac, with very large flower and compact truss. The above are all of fine bushy habits, and very free bloomers, and are now ready to send out in Autumnal plants at 3s. 6d. (or 42 penny postage stamps) each. The three Varieties 10s. Fine healthy Plants of Rosa Devonensis, from 30s. to 42s. per dozen. The "Monarch" Camellia, from 10s. 6d. to 42s. each. "Marchioness of Exeter," do, from 21s. to 63s. The usual allowance to the Trade.

THOMAS BROWN, NURSERYMAN, SEEDSMAN, and FLORIST, Slough, near Windsor, in submitting the following few select sorts of Dahlias, begs to direct attention to the **ESSEX TRIUMPH**, which is justly pronounced the most extraordinary flower ever produced, being a colour yet unseen in this beautiful and showy tribe of plants, and without which no stand hereafter can be considered complete. The Award of Prizes and Notices in the various Floricultural Publications given below will be the best proof of this unrivalled Dahlia's constancy and perfection.

1841. Chelmsford	Sept. 12-1 Bloom	1st Prize.
" Halstead	" 17-1 "	1st Prize.
" Salt Hill	" 28-1 "	(5l. Cup) 1st Prize.
1842. Floricultural Society	" 6-9 "	1st Class.
" South London	" 13-4 "	1st Prize.
" Salt Hill	" 16-4 "	2d Prize.
" Floricultural Society	" 20-6 "	1st Prize.
" Do. (best Dark Dahlia).	" 21-1 "	1st Prize.
" Sunbury	" 22-3 "	1st Prize.
" Halstead	" 23-1 "	1st Prize.
" Floricultural Society	" 27-12 "	1st Class.
" Ditto	Oct. 4-6 "	1st Class.

The Floricultural Society of London described it as follows:—**ESSEX TRIUMPH**.—Form, good. Substance, good. Arrangement, good. Colour, dark maroon, good. Eyes, complete and good in every specimen. Depth, great and globular. Size, full. General Form, excellent. Class of Quality, first rate.

NOTICES OF THE PRESS.

From the GARDENERS' CHRONICLE.

Report of Seedlings shown at the South London Floricultural Exhibition, on the 13th September.

"The first prize was awarded to 'Essex Triumph,' a fine and very deep maroon-coloured flower of first-rate properties, with petals of good form and substance, centre finely elevated, and general form perfect."

Salt Hill Show, on the 16th September.

"Essex Triumph.—This noble flower is quite a model of perfection, fine in form, and deep in petals, with a centre high and finely developed. The colour is a very deep rich maroon, the petals are finely cupped, of good substance, and well arranged. The Floricultural Society of London's Exhibition on the 22d Sept."

"Essex Triumph."—This fine flower was noticed last week in our report of the Salt Hill Show; it now occupies the post of honour, a situation it worthily filled, in addition to which it was placed first in class-showing, as the best dark flower. As a test of its constancy thirty-six blooms were exhibited in the room uniformly good. The general form of the flower is excellent, its size medium, with great depth of petals, the eye being perfect in all the specimens. To these fine properties we may add, that the petals are finely formed, of good substance and well arranged; the colour is of the deepest rich maroon, and being very uniform throughout, gives great grandeur to the appearance of the flower."

From the GARDENERS' GAZETTE.

September 17th.—"Essex Triumph.—The dark flower shown last week at the meeting of the Floricultural Society, is decidedly the best of the season and obtained the first prize."

September 24th.—"Essex Triumph, a highly symmetrical dark variety, already successfully exhibited before this Society, as well as at Salt Hill, the South London Show, and elsewhere. Besides the stand for competition a large tray of blooms was sent by Mr. Thomas Brown, of Slough, who has purchased the stock, and they exhibited a remarkable constancy, every one of them keeping up its character."

October 1st.—"Essex Triumph.—This flower, which has perhaps the finest formed petals of any yet seen, fully kept up its former character."

From the London Daily Papers.

"The most extraordinary novelty at this exhibition (the Surrey Zoological Gardens) was a Black Dahlia, called 'Essex Triumph,' said to have been purchased by Mr. Brown, of Slough, near Windsor, at the large sum of 100 guineas: it was the admiration of crowds, which during the day thronged round the blooms, and made it most difficult to approach the tables near enough to get a sight of it. The Scientific and the Amateur appeared delighted with the boon, that another season their gardens would be possessed of."

FUCHSIA TODDIANA.

PLANTS OF THIS MAGNIFICENT FUCHSIA, (the Flowers of which, in point of size, rival any other of its kind yet sent out, being nearly four inches in length) will be ready by the end of April, at 10s. 6d. each, with the usual discount when six are taken. For description, see *Gardeners' Chronicle* of the 11th inst. Agents for London, Mr. CHARLWOOD, Seedsman, Covent Garden; and Messrs. Lowe and Co., Clapton Nursery, at which places also drawings may be seen.—THOMAS CRIPPS, Tunbridge Wells Nursery, March 16, 1843.

EXHIBITION OF CAMELLIA JAPONICA, or **JAPAN ROSE**.—A Collection of these beautiful Exotics is now in bloom at CHANDLER and SONS' Nursery, Vauxhall. Admittance gratis.

WILLIAM WOOD AND SON have the pleasure to inform their friends that May is considered the best month for bedding out China, Bourbon, and other Roses from pots, and of which they have a large stock of fine Plants offered at the undernamed reasonable prices, where the selection is left entirely to W. W. and Son.

Woodland's Nursery, Maresfield, Uckfield, Sussex.

MITCHELL'S Unrivalled Variegated DAHLIAS, viz., the **BEAUTY OF SUSSEX** and **BLANCHE SHELLEY**.

JAMES MITCHELL begs to announce his intention of sending out in May the above Seedling Dahlias, which he can recommend with confidence to the most limited grower; they have been justly pronounced both by foreign and English growers to be the most beautiful and the most valuable acquisition ever offered to the public. J. M. will also have fine plants of Mrs. SHELLEY, which is first-rate and very scarce. The **BEAUTY OF SUSSEX**,—This Dahlia has been placed before any other two-coloured flower, at all the principal Shows in England, viz.—the Salt Hill, the Floricultural, the South London, Maidstone, and Tonbridge Wells Shows. Colour, delicate pink, strongly edged with Cherry—the petals are cupped, of firm texture, and well arranged, never confused; the general form is excellent, and rising well in the centre; a constant show-flower—4 feet, 10s. 6d. **BLANCHE SHELLEY**, white, delicately tipped with purple, beautifully-cupped petals, superior form, and of great depth: a constant show-flower—5 feet, 10s. 6d. Mrs. SHELLEY, delicate rosy pink, cupped petals, a constant show-flower—4 feet, 5s. —The usual allowance to the trade, where a dozen plants are ordered. —Piltown Nursery, Maresfield, Uckfield, Sussex.

TO CARNATION and PICOTEE GROWERS.—

T. ASHALL respectfully informs the above Growers that he has purchased the entire Stock, from Mr. Dover, of two splendid SEEDLING CARNATIONS, in consequence of Mr. D. giving up the fancy. T. A. begs to offer strong Plants, viz.:

PRINCE OF WALES (Dover's), C. B. This flower is pronounced by eminent judges to be first-rate; price 10s. 6d. per pair. **JEMMY WEBB** (Dover's), S. B., was awarded a prize at the Carnation Show at the Crown and Anchor last season; at 7s. 6d. per pair. See the Report of the Floricultural Society. T. A. has no objection to take new plants in exchange.—Camden Nursery, Camden-town, March 31, 1843.

NEW ROSES.

T. RIVERS, jun., begs to call the attention of his Friends to the following selection of new Hybrid, Perpetual, and other Autumnal Roses, all of which are first-rate varieties, and good healthy Plants.

" Golden Yellow—bright yellow	7 6

Catalogues of Pelargoniums, Dahlias, Pansies, Calceolarias, Verbenas, Fuchsias, &c., may be obtained by applying as above. Feb. 2, 1843.

NEW, GOOD, AND CHEAP.

WILLIAM MILLER, NURSERYMAN, Ramsgate, Kent, having selected from the many new FUCHSIAS and VERBENAS Splendid Collections, intends offering them to the Public at the undernamed low prices—including the following Fuchsias:—Conspicua arborea (Catleugh's), Venus victrix, (Cripps'), rosea alba, Money-penny, compacta, racemiflora, &c. Also the following distinct Verbenas:—Queen, Aurora, Stewartii variegata, Mortlock's Superb, Burleyana, &c. &c. Fuchsias, 10s. 6d. per doz. in tin cases (post-paid), or in pots 12s. per doz.; package and carriage paid to London. Verbenas, 3s. 6d. per doz. in tin cases (post-paid), or in pots 4s. per doz., package and carriage paid to London.—Persons may depend upon their being good Plants, carefully packed in moss, and correct to Name. They will be sent out according to priority of orders in April. A remittance from unknown correspondents. Fuchsias for Bedding or borders at 3s. 6d. per dozen, post-paid, or 4s. in pots. W. M. obtained a Prize of 10l., open to all England, for a Collection of Fuchsias, Pelargoniums, &c., at the Isle of Thanet Floricultural Show, July, 1842.

List of Pelargoniums, &c., can be had on application.

JOHN MILNE, NURSERYMAN, Stoke Newington, Middlesex, has now on Sale a fine Stock of that beautiful Creeper, *Scyphanthus elegans* (Loasa volubilis), which he is enabled to offer at 3s. each, or 30s. per doz. Plants may also be had of WARNER and WARNER, Seedsman, 28, Cornhill, opposite the Exchange.—The usual allowance made to the Trade.

MOUNTJOY'S VIRGIL DAHLIA.—ON MONDAY

NEXT, Plants of the above first-rate variety will be sent out at 10s. 6d. each, postage included, on receipt of Post-office orders.

Phlox Drummondii, 100 seeds, 1s.

25 papers choice Flower-seeds, 10s.

Union-road Nursery, Plymouth.—April 6, 1843.

WIDNALL'S Catalogue of CHOICE DAHLIAS, PELARGONIUMS, PERENNIALS, and Greenhouse Plants, with full descriptions and reasonable prices affixed, is now ready for delivery. Application to be made at the Grantchester Nursery, Cambridge.

S. GIRLING'S Catalogues of ENGLISH and FOREIGN

DAHLIAS, PELARGONIUMS, PANSIES, VERBENAS, & FUCHSIAS, are ready, and can be had on prepaid application. The plants are healthy and strong; and the earliest orders will receive the first attention. Plants of most of the varieties can be had after the 20th of April; those cultivated by other growers procured, and forwarded the first week in May. Dane-Croft Nursery, Stowmarket, Suffolk.

CHOICE STOVE, ORCHIDACEOUS, GREENHOUSE, and HERBACEOUS PLANTS, SHRUBS, TREES, &c.

JACKSON'S PRICED CATALOGUE for 1843

may be obtained on application by Post, by forwarding two penny postage-stamps to T. JACKSON, Nurseryman, Kingston, Surrey; or, on personal application, gratis.

Kingston Nursery, March 23, 1843.

MESSRS. H. LANE and SON beg to announce

that their select Catalogue of PELARGONIUMS, FUCHSIAS, VERBENAS, HEARTSEASE, &c. &c., for the present year may be had on application at the Nurseries, Great Berkhamstead, Herts. For Character, &c., of FUCHSIA LANET, see Advertisement in *Gardeners' Chronicle* of Dec. 17, 1842. —Great Berkhamstead, March 31, 1843.

FLOWER SEEDS, &c. sold by EDWARD SANG

and SONS, NURSERYMEN, Kirkcaldy, N.B. The following prices include carriage to all parts of Britain:—

Catalogues forwarded on application.—April 1, 1843.

WILLIAM LYNN, NURSERYMAN, SEEDSMAN,

and FLORIST, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a GARDEN TOOL WAREHOUSE, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. W. L. begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit-Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which, he trusts, with industry, punctuality, and attention, will secure to him general patronage.

W. L. solicits particular attention to his new PEA, LYNN'S DWARF WRINKLED MARROW, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn PEA ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, inclosing a postage-stamp.

WARNER and WARNER, SEEDSMEN, No. 28,

Cornhill, London, beg respectfully to return their best thanks to their friends for the liberal patronage bestowed upon them for many years past, and at the same time to contradict a report which has been circulated of their intention of retiring from business.

W. & W. most respectfully make it known to their friends that they have no such intention. Having made a change of some of the hands they had engaged for many years, their situations are filled up with men of general and practical abilities, and they trust they will ever give satisfaction to those who kindly favour them with their support.

N. B.—W. & W. beg further to call the attention of their Friends and the Public to their large Collection of Herbaceous Plants, including all the New and Choice varieties. The new Afghan Clover, 6d. per paper.

HENRY HAMMOND, NURSERY AND SEEDSMAN,

Mundford, near Brandon, Suffolk, respectfully announces to the Nobility, Gentry, and the Public generally, that the late fine season for preserving his admired WHITE CAPE BROCCOLI enables him to offer it at 3s. 6d. a packet, which will contain half an ounce. The many orders already received from those who were purchasers last year justify H. H. in again offering it to the public. The flavour is not only equal to any Cauliflower, but it is as hardy as any of the Cabbage tribe. By sowing in March, the end of May, and August, a supply may be had nearly all the year. If any gentleman wishes for information respecting its quality, a reference to the undermentioned Gardeners will meet with an immediate reply:—Mr. Wylie, His Grace the Duke of Grafton, Euston Hall; Mr. Piper, Right Hon. Lord Walsingham, Merton Hall; Mr. Hammond, Sir Richard Sutton, Bart., Lynford Hall; Mr. Brownly, John Angerstein's, Esq., Weeting Hall. Messrs. Flanagan, Seedsman, Mansion-house-street, London, who can warrant the stock, and will carefully execute any orders entrusted to them.—Mundford, April 5, 1843.

HORTICULTURAL SOCIETY OF LONDON.—

The last day, on which Tickets for the ensuing Exhibitions at the Garden can be issued to Fellows at the privileged Price of 3s. 6d. each, is Tuesday, April 18.
21, Regent-st., April 7, 1843.

The Gardeners' Chronicle.

SATURDAY, APRIL 8, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, April 11	Zoological	8½ p.m.
Tuesday, April 18	Horticultural Linnæan	8 p.m.
Wednesday, April 19	Horticultural Flora	8 p.m.
Friday, April 21	Microscopical	8 p.m.
Saturday, April 22	Botanical	8 p.m.
	Royal Botanic	4½ p.m.

We last year gave our readers some information (p. 299) concerning the new Fruit and Kitchen Garden which is in course of formation for her Majesty at Frogmore. Having recently had an opportunity of again inspecting the works, we are sure that every one will be glad to know what progress has been made.

The departments intended for dwarf trees are in almost all cases planted. About 4,000 feet of wall have been erected, and these are all planted with the choicest fruit-trees. The great range of forcing-houses, with a dwelling-house in the middle, is in an advanced state, and will—in part, at least—be ready to receive plants in a month or two. A low terrace-wall, parallel with the main range, cuts off the quarters of fruit-trees and kitchen-garden produce from a turfed border, laid out in parterred flower-beds, which will form a fine object by the side of a broad gravelled roadway in front of the forcing-houses, but separated from them by the necessary Vine-borders. At the back of the principal range of glass have been constructed fruit-rooms, mushroom-houses (one of which is at work), store-rooms, lodging-rooms for men, potting sheds, and other useful places. Then, in rear of this large range, is a vast quantity of pits and small houses for succession Pines, Cucumbers, Melons, Strawberries, and all the infinite variety of forced produce required for her Majesty's table.

It would be premature to enter into greater details at present, but we trust that hereafter, when all is finished, we shall have an opportunity of giving plans of the whole arrangement. There are, however, some points to which attention may be at once directed.

In the first place, all the heating is effected with hot-water pipes, the upper rows of which are cast with evaporating pans; the boilers are of the wagon shape, and the fittings of the furnaces and ash-pits are on the same plan as that adopted from Mr. Ainger's designs in the Horticultural Society's great conservatory at Chiswick. In order to feed the evaporating pans, hollow copper tubes, pierced with holes and connected with a reservoir, are carried along the range of pipes a little above the pans, so that water can at any time be turned on or off.

Ventilation is effected by sliding down the sashes, by pierced shutters in the back wall, and by front perpendicular sashes hinged at the upper edge. There are some beautiful mechanical contrivances connected with these arrangements. A screw on the back wall will slide backwards and forwards, at the same moment all the pierced ventilators alternating with 15 sashes; and by means of a rack and quadrant the 15 other front perpendicular lights may be elevated more or less without any necessity to walk upon the Vine-borders or to touch the sashes. The importance of this in preventing the destruction of glass, and in the saving of labour, need not be insisted on.

The sashes and rafters are of metal, and the glass, which is in long lengths, and cut to a half-lozenge at the laps, is of British sheet glass, by far the best material for garden purposes. The laps are constructed with lead, and a hole is left at the point of the lozenge for the escape of condensed water.

While the general design of this regal garden, as far as it has been carried out, does honour to the judgment of the noble Lords who have sanctioned the plans of Mr. Ingram and the architect, we are also bound to add that the beautiful workmanship of Mr. Jones, of Birmingham, who constructs the iron roofs, metal sashes, and mechanism, of the Messrs. Baileys, who have the contract for the heating apparatus, and of those who have been engaged in the builder's work, fully justify the confidence that has been placed in them by the Commissioners of Woods and Forests.

POTATOES, some say, are the curse of Ireland; we say they are the blessing of overpeopled Europe. Be that as it may, everybody is now thinking of their Potato crop, and therefore it is desirable to mention a few well-attested facts relating to their cultivation which have come out during the last year, exclusive of such notices as have from time to time appeared in our *Chronicle*.

It appears from a pamphlet recently published by

Messrs. Gibbs and Co.,* that guano has been found a very useful application. Mr. Robert Bell, of Gunsbro', near Listowel, states that this substance, drilled in at the rate of 2½ cwt. per acre, produced an extraordinarily heavy crop, the most abundant indeed ever seen in his part of Ireland; he also found nitrate of soda very efficient, but guano was the best. A farmer, however, writing anonymously in the *Galloway Register*, asserts that guano, with him, was inferior to farm-yard dung on light land; the produce of the latter being 12 tons 8 cwt., while guano produced only 10 tons on the same quantity of land, although he used 6 cwt. an acre; but then his Potatoes obtained with dung, cost him 14s. 2d. a ton, while those from guano cost but 7s. 2d.; so that the crop obtained with guano was most profitable. In these results, however, there is nothing like the precision that is found in some capital experiments, recorded by Professor Johnston in the last Number of his valuable suggestions† for experiments in agriculture.

For the details of the experiments we must refer to the pamphlet itself, which should be, and from its cheapness may be, in the hands of every farmer and master gardener in the kingdom. They were conducted by Mr. Fleming, of Barochan, and are models for imitation.

In a light loamy soil, with a hard subsoil retentive of water, the following produce was obtained:—

No.	LOW FIELD, BAROCHAN. Description of Top Dressings.	Quantity of dressing applied per imperial acre.	Produce in pecks of 35 pounds each.		Produce in tons, &c., per imperial acre.		Cost of dressings per imperial acre, including cartage and putting on.	
			cwt.	pecks.	bolts.	tons.	cwt.	qrs.
1	Sulph. of Magnesia	1	180	90	22	10	1	9 0
2	Nitrate of Soda	1½	151	75½	18	17	2	1 4 9
3	Sulphate of Soda	1½	148	74	18	10	2	3 0
4	Sulph. of Ammonia	1½	144	72	18	—	1	4 9
5	Nitrate of Potash	1½	128	64	16	—	1	11 0
6	Sulphate of Soda	1½	116	58	14	10	1	11 0
7	Nitrate of Soda	1½	106	53	13	5	0	12 6
8	Sulph. of Ammonia	1½	98	49	12	15	0	15 0
9	Sulphate of Soda	2	98	49	12	15	0	0 0
10	Nothing but Dung	40 cub. yds.	98	49	12	15	0	0 0

In this case, an amount of produce, very unusual under any circumstances, was obtained by mixing together two salts, neither of which was remarkable for its effects when employed separately; and, according to the table, at the cost of 29s. only, in addition to the ordinary dressing of manure. The farm-yard manure was spread at the bottom of the drills when the Potatoes were planted (April 18), and the saline matters were added afterwards (June 1) as a top-dressing; the sort employed was the Early American, and the distance between the rows was 26 inches. It is hard to say, in this case, what the action could have been; we cannot well refer it to the sulphate of magnesia, although that agent has been strongly recommended by Liebig, combined with cloacine; for when used by itself, it produced, in the experiment now recorded, only 13 tons and a quarter; and in another case, mentioned by Mr. Fleming, not quite 11½ tons were obtained from it. Nor does it appear clear for what reason sulphate of magnesia should be so useful; for, according to Sprengel, magnesia in good mealy Potatoes, analysed by him, did not exist to the amount of more than 0.104 in 100,000 parts of the fixed matter, nor did this earth exceed 0.488, in a case where Potato parings were analysed by themselves. Neither is the mystery in any way explained by a curious case mentioned by Professor Johnson in another place, where produce at the rate of 30 tons an acre was gathered from a small plot of ground, top-dressed "with a mixture of ½ nitrate of soda and ¾ sulphate of soda." The fact, however, is most interesting and important, whatever the explanation of it may prove to be.

In another experiment by the same gentleman, guano, used at the rate of 3 cwt. an acre, brought a crop of 18½ tons, merely when put in with the sets and not subsequently top-dressed, no other manure being used, and the whole cost therefor being about 36s. an acre. In a second case, under the same circumstances as the last, when a different sort of Potato was employed, and where the soil unmanured brought only 6½ tons, 4 cwt. of guano, worth 48s., produced rather more than 14½ tons; 4 cwt. of guano with 25 bushels of ashes, 15½; and the same quantity of guano with 20 bushels of charcoal, 17½ tons; on the other hand bone-dust, at the rate of 45 tons an acre, only yielded 9½ tons of produce.

What the subsequent effect of these substances on the land may be is an important point to determine, but cannot be at present stated. This valuable fact

* Guano; its Analysis and Effects; illustrated by the latest experiments.

† Suggestions for Experiments in Practical Agriculture, No. III., Blackwood.

seems however to have come out, namely, that sets taken in 1842, from Potatoes treated with the nitrate and sulphate of soda in 1841, produced a better crop than sets obtained from the same variety, which had not been so dressed, to the extent of 2½ tons per acre.

"In so far, therefore," says Prof. Johnson, "as this experiment is to be relied upon,—for we must not be hasty in drawing general conclusions,—it appears that the benefit to be derived from a skilful treatment of the Potato plant does not terminate with the greater immediate crop we reap, but extends also into future years, improving the seed and rendering its after-culture more productive.

"This idea is worth pursuing, were it only for the purpose of making out the possible existence of so important a physiological law—how much more when it appears so pregnant with important practical results. But thus it is in all cases, that the prosecution of experimental research, with immediate reference either to purely scientific or to purely practical results, ends in improving and benefitting both abstract science and economical practice.

"I am unwilling to follow out or to reason upon this possible law, as if it were really established; but the possibility of its truth appears to throw light upon such questions as this—why the seed must occasionally be changed if large crops are to be continually reaped. One soil may be adapted to give the plant a large supply of this or that substance in which the other soil is comparatively deficient: and it may be possible to medicate our seed-corn, while growing, so as to give it the qualities which at present it can acquire only by a change of soil."

Next week we shall return to this important subject.

We are much pleased to find that our own opinion with respect to the advantage of small allotments let to labourers is confirmed by numerous letters received on the subject. All those who have tried the system, without exception, are satisfied with the result. It is to be regretted that some tenant farmers are still prejudiced against it; and we should rejoice if we could convince them of the unreasonableness of their fears. They think that the labourers' time and attention will be too much taken up by their gardens, and that they will neglect their regular work. Experience has shown that this is a groundless fear. The farmer should make the occupation of a small portion of land a part of the wages paid to the labourer, and hire him by the year, with the condition that any wilful neglect or misconduct which would justify the dismissal of the labourer, would also deprive him of his garden; the value of the growing crop, according to a fair valuation, being paid him. There must be a mutual tie between the farmer and his labourer, and this can never exist where their interests seem opposed to each other. If the labourer knows that whenever his employer can do without him and save the wages which he pays him, he will discharge him, he can feel no interest in his master's prosperity; but when he sees that the master strives to find constant employment for his regular men, and that it is only when driven by absolute necessity, from their misconduct or his own losses, that he discharges any of them, the labourer will do his utmost to do his work well, and will feel the same interest in his master's success as farm-servants living in the family used to do. His master, on the other hand, will rejoice to see his men comfortable, and will encourage their industry, allowing them now and then a spare day, if they require it, to work in their gardens, for which they will gladly allow a day's pay to be deducted from their wages. But the great advantage of small allotments is, that the labourer's wife and family can be usefully employed, and will, in general, suffice for the lighter, but most important, part of the work, which consists in hoeing and weeding the crops, gathering the produce, feeding the pigs, and wheeling out the manure to make composts. Children, under the guidance of the mother, delight in such work, and learn early in life the advantages of industry. We would that, besides the allotment—which, if possible, should not be far from the dwelling—every labourer's cottage had a neat, small garden, with patches of flowers and beds of culinary vegetables; for this purpose, 10 poles (the 16th of an acre), are sufficient. The allotment may be from a quarter to half an acre, according to the number in the family; and in this may be raised such crops as suit the soil, a certain portion being provided for the pigs, which not only add to the food of the family but provide the manure. Far from interfering with the master's interest, this occupation will fill up that time which is now too often devoted to the beer-shop. An uneducated man has few resources in himself; active employment, without too great fatigue, is a recreation to him; and the more comfortable his home is, the happier he will be, and the more cheerfully he will perform his duty.

Fully impressed with the truth of what we have here asserted, we will most readily concur in the amelioration of the condition of the agricultural labourer

by giving all the information which we are possessed of respecting the laying out and the management of small allotments, which may be considered as something between a kitchen-garden and a field; and if we can induce proprietors and occupiers of land to enter into our views, and encourage industry, sobriety, and honesty in the labouring population by a proper attention to their welfare, we shall be amply rewarded for all the pains we have taken to investigate the subject and to collect information.—*M.*

[In our notice of this subject in the last Number, we regret to find that "Colne" has been incorrectly printed for "Calne," and "Burnhill" for "Bremhill."]

ON THE TRANSMISSION OF CUTTINGS TO INDIA.

ON a former occasion (p. 539, 1842), you published an account of the attempts which had been made to transmit cuttings of fruit-trees to India, when the partial success with some, and the complete success with others, was detailed. It was then stated that almost all the cuttings of the Jargonelle Pear which had been sent to Bombay, and arrived in January, had rooted, and were very flourishing till the hot season came on. Bombay is 6000 miles from Falmouth, and is the first point of India which the cuttings reach, after leaving the steamer; having, however, made a short journey across the Desert, or from Cairo to Suez. The equability of temperature at sea being much greater than on land, the trial is much severer when seeds or cuttings have to be carried a long journey over the heated plains of a country like India.

In the former communication, it was also stated, on the authority of Dr. Falconer, that the cuttings of fruit-trees, especially of a Jargonelle Pear, &c., Malo di Carlo Apple, after making a further journey of 900 miles from Bombay to Saharunpore, had arrived there in a more or less vigorous state; and that when put into the ground, there was every prospect of the development of buds and of roots being effected. These cuttings had had their ends dipped in sealing-wax, were rolled up in cotton, and afterwards wrapped up in an envelop of India-rubber cloth; the object being to retain the natural moisture of the cuttings, and to prevent their being dried up by the exposure to great heat.

So much success having attended this trial, it was determined to repeat the experiment at the favourable season, that is, in November last; when the cuttings are in a fit state to travel, and the temperature is lower than at any other time of the year, if we consider the time of their departure from this country, and that of their arrival in India. Some modification was made in the mode of packing. Instead of the ends being dipped in sealing-wax, the whole cutting was coated with bees-wax, then wrapped in cotton, and afterwards enveloped in India-rubber cloth.

The packets were made up at the India House on the 30th of October, and must have left Falmouth on the 1st of November. From Bombay, which the mail usually reaches in about 40 days, the cuttings had to be carried a land journey of about 1320 miles, to the Botanic Garden at Calcutta, which they reached on the 30th of December. A letter from Mr. Griffith states that three out of the five Apple-cuttings seemed quite fresh; of these, two were Golden Pippins, and one Duchesse d'Angoulême. The ground having been carefully prepared for their reception, and the season favourable, it was hoped they would succeed; but a postscript of the 15th of January states that the Apple-cuttings remained in the same state, but that the seeds sent were almost all coming up beautifully. This experiment was made rather for the purpose of ascertaining how the mode of packing would answer, than with the hope of the cuttings succeeding completely. But enough has been learnt for future trials with cuttings of trees better suited to the Calcutta climate.

"By the same mail a number of cuttings were sent to the Botanic Garden at Saharunpore; these arrived on the 28th of December. Dr. Jameson, who has taken charge of the Garden since Dr. Falconer has been obliged to leave in consequence of ill-health, writes on the 20th of January the following report of the state they arrived in:—1, Duchesse d'Angoulême, one specimen alive, the other dead, probably owing to the lateral twigs having been cut off and not sealed up. 2, Golden Pippin, with faint vitality, the pith discoloured, and the liber faintly green. 3, Glout Morceau, one dead, owing to the lateral branches having been cut off and not sealed; two alive, being devoid of them. 4, Malo di Carlo, in fine condition. 5, Gansel's Bergamot, upper end faint vitality; two specimens dead, the lateral twigs having been cut off and not sealed; three specimens in good condition. 6, Colmar, faint vitality upper end. 7, Jargonelle; eight specimens, all in good condition. "From the above statement it will be seen that this transmission may be considered a most successful one, and if cuttings void of lateral branches are sent, no doubt every one will arrive in good condition."

The success having been so considerable, and the additional experience, with the adoption of Mr. Beaton's suggestions (vide *Gardeners' Chronicle*, vol. ii. p. 558), will no doubt enable future trials to be made with complete success.

The cuttings sent to Bombay do not seem to have reached in such good order as last year, nor indeed so well as those sent at the same time to Calcutta and Saharunpore, the reasons for which do not appear; but great success has attended an attempt to send some seeds, which had not previously been found to travel well—that is, the Spanish Chestnut and Filbert: these in previous travels not only became decomposed, but destroyed every

thing else that was contained in the same package. On the present occasion, the Chestnuts and Filberts were enveloped in a coat of Bees'-wax, so as to be in fact hermetically sealed from the influence of the elements, and all at the same time to retain their natural moisture. It was intended to have enveloped the Chestnuts, &c. in a coating of gum, but the mucilage not being thick enough, ran off, and required some time to dry; bees'-wax is preferable. Respecting these, Dr. Gibson writes on 23d Jan.: "The cuttings look dry, but I do not despair of them. Most of the Chestnuts were in good, and I hope vegetating, order; so also the Filberts, whereof I tasted one, and it had not the slightest smack of rancidity. As I fear trusting them to the dry Deccan air at this season of the year, I have taken the precaution of putting them in pots before sending them up the Ghauts." If these vegetate, the success will hardly be less important than that with the cuttings, for we may not only send such seeds to India, but also obtain from thence others, such as the Acorn, which we now find so much difficulty in obtaining in a vegetative state.—*J. F. R.*

FAMILIAR BOTANY.—No. XV.

Un feuille m'instruit plus sur mon être,
Que de vains arguments où se perd la raison.

Buds.—If any part of the curious economy of plants more than another justified this expression of the French writer, it may be found in the beautiful order and admirable contrivance manifested by the buds which are now everywhere pushing out from the branches of trees and expanding into leaves.

Only a few days since, these bodies were seemingly dead; they were dry tubercles sitting close to the branches, and scarcely distinguishable from the bark. Some were covered with wool, as in the Magnolia and a few of the Poplars; others were coated over with varnish, like the Horse-chestnut and Tacamahac tree; while others were guarded with serried rows of shelly scales. Now that the warmth and the rain and the sunny days of spring have come, the buds have aroused themselves from their slumbers, and the wool, the varnish, and the guardian scales themselves, are disappearing.

It was not without a motive that in the autumn the trees were caused to clothe themselves with wool, or to exude a varnish impenetrable to rain, or to form shell within shell, as an outer coating of their buds. An inspection of the latter just at this season of the year explains the cause of all this unerring care. The buds are the seat of vitality; they are the points whence vegetable life is extended; they are the cases that inclose the tender organs which afterwards become the branches and the flowers. And most wonderful is the beautiful order with which these parts are disposed in their winter receptacle. Every tree affords a study most worthy of contemplation. Those, indeed, who look with idle eyes on the fair works of the Creation can perceive nothing extraordinary in a bud; for them it is a lump, a wart, an anything, rough and dingy, hard and dry—as little interesting as a stone; they know nothing of the admirable symmetry with which its interior is arranged; they dream not of its contents being as perfectly organised as the most complicated parts of their own frame. And yet an inspection of the first tree that moves in the spring might read them a lesson well worthy their remembrance.

Take the Abele tree: there we have row over row of dry, brown, downy scales, each forming a little cavity which intercepts the cold. Immediately beneath them lies a pair of tiny leaves rolled round each other, and buried in wool; if they are turned back another pair is disclosed yet smaller, again rolled over each other, and beneath these another and another and another pair, each smaller than the last, but each exactly like that which preceded it, until the eye is unable to separate the tiny forms that lie within the innermost of the many living chambers. Of these half-invisible forms, each will by degrees expand itself into the likeness of that which went before it; the centre of the bud will lengthen out to make room for them, and so from the dry, brown, downy tumour of the winter, a living branch will by degrees extend.

Look next upon the Horse-Chestnut.—Its bud consists of large, shining, varnished scales, impenetrable to rain; these by degrees repel each other and drop off; even the outermost and smallest of them are placed in opposite pairs, crossing each other; their successors maintain the same position, but are thinner and greener; and they so stick together by their natural glue that they can hardly be separated by the hand without tearing; yet at the command of the sunbeams they readily slide over each other, and at last form a green rosette of many parts, looking like an early flower. In no case is the arrangement of overlying each other in opposite pairs, crossing and covering each other, departed from. But as we approach the centre of the bud, the varnish disappears and is replaced by a wool, thin at first, but thickening greatly as we approach the interior. Arrived beyond the outer circles of the scales, we come upon little parts, folded like a lady's fan, and looking like tiny hands clasped in prayer, but enveloped in the softest wool; these too are in opposite pairs, crossing each other as before, and so diminishing towards the centre that at last they become too delicate and fine to be separated from their downy coating.

And so it is with all buds; they are always organs containing the beginnings of leaves or flowers, most curiously disposed one within the other, and gradually unfolding as the powers of growth are renewed by the genial influences of spring. And, what is more especially worthy of note, each bud, of all the myriads that are borne upon a tree, is exactly like the others, in all their minutiae of structure; on whatever plan one tender leaf is folded up in a

bud, upon that exact plan are folded all the other leaves; and every leaf, in every bud, of every branch, of every individual of that same species, is the same. There is no error, no deviation, no uncertainty in this matter; but the rule is universal and without exception. Can anything be a more wonderful evidence of design and admirable plan in the creation than such a fact as this? Can any conceivable circumstance exceed in beauty that of millions of buds on a tree, suddenly starting at once into leaf, each being so exactly like its fellow, that no one shall be able to detect a difference among them? The mind can imagine nothing more worthy of study than these curious facts; they belong to a field of observation of which the idle world knows nothing; they open out a source of admiration, the stream from which is deep and wide, and inexhaustible. The quiet enjoyment which they supply, how infinitely is it beyond the unsatisfactory and painful pleasures of the idle throng of fashion!

Ah! world unknown! how charming is thy view!
Thy pleasures many, and each pleasure new.
Ah! world experienced! What of thee is told?
How few thy pleasures, and those few how old!

R. E.

HEATHS.

(Continued from page 206.)

The next but principal item in Heath cultivation is the soil. Near London, some 15 years ago, the Wimbledon Common peat was sought after, and considered absolutely indispensable; within these few years, the Shirley peat has been greatly preferred. The former has caused the dissolution of several of my best plants, not only Heaths but other things. I can only designate it as a clayey peat, which, when wet, retains the moisture for a long time. The Shirley is an improvement upon it, but it requires to be kept full two years in a mass before the fibrous or rooty portion of the sod has rotted and amalgamated with the peaty particles. This peat I consider also to have its defects; these are—a sponginess, with a considerable quantity of Grass, which ought to be carefully removed. I have found that the thin layers of peat found in woods on a gravelly substratum, varying from three to eight inches in thickness, and containing white grit, is extremely light and porous, being composed of much vegetable matter. The wood growing on such soil is generally Oak underwood. I have found this peat, when mixed with a 12th part of Reigate sand, particularly adapted to the growth of Heaths, and in fact for most other purposes for which this soil is used, as it will bear to be pressed down in potting without fear of its stopping the water.

In watering Heaths I do not regard the temperature; I have never discovered any ill effects from using water from the open air, provided the front sashes are open, which is the case on all occasions when the thermometer will maintain a height of 35° in the house. The quality of the water is the main point, and rain-water only should be used. The following will show, however, that sudden cold is not productive of injury to Heaths:—In Murphy's winter, my careless gardener did not prepare against an unexpected change during the night; a very severe frost took place, and the surface mould of the pots was actually frozen without injuring the Heaths, of which I had some 60 or 70 sorts. My maxim is to avoid heat if possible; therefore my gardener was partly exonerated, although a careful man should be on the alert for change of weather, if the night should be clear and cold. But when compelled, by unusually severe frost, to shut up the house, be careful on the return of mild weather not to expose the plants too much at first. It will be found that the shoots have made a slight advance by confinement, and a sudden check therefore, produced by wind and air, will be liable to turn them brown.

Having described my mode of choosing, potting, and watering Heaths, as well as selecting Peat-mould, I will subjoin my plan of treating these plants in summer, about which different opinions exist. Some collections are, about the middle of June, taken out of the house and fully exposed to wind, rain, sun, damp nights, &c., during the remainder of the summer. Others I have observed partially exposed, having the shade of trees from midday sun; while a third collection is wholly kept within the house. The first plan is adopted by nurserymen, from the facility which it affords in watering; and the plants being placed close together, they fare better than you would expect, and afford a kind of protection to each other. Still the burning sun of July, August, and part of September, with the succeeding heavy dews, has the effect of depriving the plants of their leaves; hence those unsightly things which exhibit a bare stem for three parts of their height. From first to last, the preservation of the foliage is the main object of the cultivator. Full exposure to the sun is certainly not the way to preserve it; and wholly depriving the plants of it, encourages the mildew, or turns them pale. My house is lofty and in a very airy situation, with the stage near enough to the glass to allow plants three feet high to stand on it; yet at its lowest side, it is five feet from the flooring of the house. I have a bench raised three feet from the floor, and five from the glass, attached to the supporters of the stage; and on this the specimens stand. Another bench is placed over the flue, but separated six inches from it; this I recommend to be as low as possible, that the plants behind may have the full benefit of air; whereas, if they were placed on a level with each other they would intercept the drying breeze. I prefer the old flue to hot water, as, being attached to the brickwork, it certainly dries the house. I know it may be said that the dryness produced by a flue is injurious to plants; but with Heaths, within 100 or more miles of London, we are seldom obliged to use fire in a house perfectly closed, although in very sharp frost

it is sometimes necessary; yet, during the day, the sun will run up the thermometer, without any fire-heat, to 50 or 55 deg. In very damp weather, I heat the flue, and open all the sashes, for the purpose of admitting a larger volume of air; the lower sashes on the roof also slide up.

The benches in front on which the specimens stand, I recommend, during the summer, to be filled up on either side with planks, so as to form a trough, which for 8s or larger pots should be one foot in depth. This may be filled with cinders, and gently sprinkled in very hot days with water. It has the effect of preserving the pots cool, yet not damp, for any length of time; and constant drenching is thereby avoided. On hot sunny days I shade and open every sash and door. It frequently happens, however, that in June, and even July, we have a bright sun, yet not accompanied with intense heat; in which case I give the Heaths the full benefit of it, and a slight syringing early in the morning; but this must be done with judgment. About the first week in August the house should be cleaned; putting the plants, arranged in the same manner as in the house, on a bench and stage of a similar construction to the one in-doors, but against a north wall, and in an airy situation. From the sides of the stage raise two or more upright supporters, upon which fit on some canvas blinds, not only to protect the top, but the sides, when high wind or heavy rains are likely to prevail. I recommend the top to be waterproof. In the third week in September, house the plants, but give night and day all the air possible. By degrees the wood will become ripened, and there will then be no fear of mildew. This plan I have partly pursued, and would carry out entirely, but for the expense.—*Erica*.

ON VEGETABLE MANURE.

By PROFESSOR CHARLES SPRENGEL. (Translated from the German.)

(Continued from page 208.)

d. *Oat Straw*.—100,000 parts of ripe air-dried Oat straw consist of 47,000 parts of woody fibre, 0.800 of resin and wax, 52,000 parts of substances soluble in water and potash; which latter substances contain (according to Boussingault) 360 parts of nitrogen. 100,000 parts of the straw contain of mineral substances:—

4.584	parts of silica
0.152	" lime
0.022	" magnesia
0.870	" potash
0.002	" soda
0.006	" alumina
0.002	" oxide of iron
0.006	" oxide of manganese
0.012	" phosphoric acid
0.079	" sulphuric acid
0.005	" chlorine

5.740 parts of mineral substances.

100 parts of Oat-straw contain, therefore, 5.7 lbs. mineral substances, amongst which are nearly $\frac{1}{10}$ lb. of potash. If, therefore, amongst the dung carried on a Magdeburg acre of land, there are 3,000 lbs. of stable-straw, this acre will so obtain 27 lbs. of potash, which must have a great influence on the crops. The nitrogen of the straw is of less importance, as 2,000 lbs. do not contain more than 10 or 11 lbs. As the straw of Oats also contains little lime, magnesia, soda, sulphuric and phosphoric acid or chlorine, so far as these mineral substances are concerned, it is incapable of yielding such good manure as Rye-straw, Wheat, or Barley; and this is consistent with the experience of large farms.

e. *Buck-Wheat Straw*.—100,000 parts of ripe air-dried Buck-Wheat-straw contain 54,000 parts of woody fibre, 1,000 parts of resin and wax, and 45,000 parts of substances soluble in water and potash; according to Boussingault, the latter contain 460 parts of nitrogen.

100,000 parts of the straw contain of mineral substances:—

0.140	parts of silica
0.704	" lime
1.292	" magnesia
0.332	" potash
0.062	" soda
0.026	" alumina
0.015	" oxide of iron
0.032	" manganese
0.217	" sulphuric acid
0.288	" phosphoric acid
0.095	" chlorine

3.203 parts of mineral substances.

100 lbs. of Buck-Wheat straw consequently contain 3.2 lbs. mineral substances. As these are principally such as are most nutritious to plants, and as the quantity of nitrogen is also considerable, it is evident that Buck-Wheat litter will yield better manure than that of Barley, Oats, or Rye. The straw of Buck-Wheat forms an exception to the general rule, that the manuring qualities of plants are in the same ratio as their nutritive qualities, it being a bad fodder; this, however, is caused by the presence of a peculiar substance, which is apt to injure cattle. Indeed, some other species of Buck-Wheat, such as *Polygonum Hydropiper*, *Persicaria*, *ambibium*, *lapathifolium*, and *minus*, are also noxious to cattle.

Buck-Wheat straw, under favourable circumstances, undergoes speedy decomposition, for which reason manure obtained from its litter will only act for a short time. Like the straw of Oats and Barley it shrinks much when used as litter, so that more of it is required than of either Rye or Wheat-straw, for keeping the beds of cattle dry.

(To be continued.)

ON THE CULTIVATION OF CHRYSANTHEMUMS.

A CORRESPONDENT, signing himself "Amateur," writes as follows: "I had a pretty good show of Chrysanthemums last season, but yet not to my mind, and therefore I should like to know the best way of beginning with them, so as to produce the finest flowers—the shape and bushiness of the plants being no object, as they are placed close together on a stand when in flower. Should the shoots which are growing thickly on the old stools in the greenhouse be taken up with roots now, or allowed to grow on, and the stems made into cuttings afterwards? If taken off now, should they be 'stopped'—if so, when should this be done? I grew a flower of Magnet to 5½ inches in diameter, but there was only one upon the plant."

There is one error in the cultivation of Chrysanthemums into which the inexperienced Amateur is apt to be led, and that is—neglecting or paying but little attention to his plants after the flowering season is past. They are either allowed to remain in a warm greenhouse, and forced into growth, or they are thrown aside and neglected until late in the summer, when he recollects that they are wanted for winter flowering. Like the greater part of herbaceous things of this description they are tenacious of life, and easily grown; but if they are to be cultivated well, a regular system of management is necessary. After the flowering season is past, and the old stems cut down, the plants should be removed from the greenhouse or conservatory, and placed in a cold frame, where they are merely protected from severe frost. Here they should have plenty of air, and on fine days the lights should be drawn quite off, and the plants fully exposed. When the winter is mild, they will stand very well unprotected; but owing to their having been grown and excited in the greenhouse, they are more apt to suffer from severe weather than if they had been planted out in the open air; for this reason it is always better to have the means of giving them some slight protection. If they are kept too close and warm in winter, they begin to grow fast, the leaves are yellow, and the stems weak, and consequently they form bad cuttings when the season of propagation comes round. But if they are merely protected and attended to as has been already described, they grow slowly and make excellent cuttings.

The proper time for striking cuttings depends upon the objects which the propagator has in view. Nurserymen who want a good stock of a particular kind may propagate it at almost any season, and generally begin very early in spring. But for ordinary purposes, from the middle of March to the middle of April, is quite soon enough, and the Amateur can then do so without any artificial heat, which is of great consequence to those who have very limited gardens. It matters very little whether the cuttings are taken off with roots or without them, as in the latter case they will form them in a few days, and soon begin to grow rapidly. The frame should be kept very close, moist, and shaded, until the cuttings have formed roots for their support; when this takes place a little air may be admitted gradually as the plants will bear it, and then afterwards they must be fully exposed.

The shifting of the plants in the earlier part of the summer should be particularly attended to. If this is neglected, no good after-management will save them from losing their leaves and looking badly in autumn and winter. As soon as they are fairly starting into growth, the top of each should be nipped out with the finger and thumb, which will cause several young shoots to spring from the under part of the plant, and thus form it into a compact bush. This may be repeated two or three times with advantage in the earlier part of the season with the free-flowering kinds; but after the plant is fairly formed it should be discontinued, otherwise the flowering will be injured. The cultivator must exercise his own judgment in this respect, as it may suit the purpose in some parts of the country and not in others, as well as with some of the varieties only. For example, about London the system answers admirably; but it is very doubtful whether it would do about Edinburgh, or further north, particularly in cold, wet summers. "Amateur," whose letter was quoted at the commencement, should attend particularly to this part of the treatment, as his plants would probably flower better if not "stopped," or, at most, only once, as he does not care about handsome specimens. The size of the pots into which the plants are shifted will depend entirely upon the views of the cultivator. Large pots, such as 16s, 12s, and 8s, for the last shifting, answer well for those who wish to see fine leafy plants, in preference to others with naked stems; but where this size is inconvenient, of course they must be grown in smaller pots—they may be flowered well in 32s and 24s.

The soil for their growth can scarcely be too rich; about equal parts of loam, dung, leaf-mould, and sand, make an excellent compost. Manure-water is also an excellent material, with which they can be watered twice or thrice a week during the growing season. Exposed as they are, fully to the sun, they require a very abundant supply of water, which ought never to be neglected, because if it is, the under-leaves will fall from the plants and make them unsightly. An abundant supply of water, and particularly manure-water at certain times, rich free soil, judicious "stopping," and ordinary management in other respects, will always ensure an abundant bloom upon these plants in autumn and winter, when we have little else to render our greenhouses and conservatories gay. And as they are grown all the summer in the open air, those who have a cool vinery or any other empty house in the autumn, can easily have plenty of flowers at that season, with but little extra room. They may be removed to the house about the middle of October, when some of the earlier kinds are just coming into flower. It

is a bad plan to take them in too early, as the leaves generally begin to fall soon afterwards.

Those who wish to make very large specimens of these plants with little trouble, sometimes plant them out in a rich border in April or May, as soon as the cuttings are rooted. Here they grow with great luxuriance, and are very large and bushy when the time comes for taking them up and removing them into the greenhouse. In autumn they are taken up very carefully, and placed in a shaded situation for a few days, until they recover from the effects of the operation, and are then taken to the greenhouse. There is another plan for making small dwarf flowering specimens, which deserves especial notice. The young shoots which have grown to a considerable length have their points "layered" about the month of August in small pots. As soon as they are well rooted they are cut from the parent stock, repotted, and placed for a short time in a shaded place until they recover. They are then subjected to the same treatment as the others, and generally flower on stems about a foot or 18 inches in height.—*R. F.*

AMATEUR'S GARDEN.—No. XIV.

THE secret of obtaining a brilliant display of flowers throughout the season lies more in cultivating a great quantity of good plants than a great variety of sorts. Thus, at this season, the garden should be gay with Polyanthus, Auriculas, double Primroses, the lovely little *Omphalodes verna*, *Drabas*, common Wallflowers, various species of *A'rabis* and *Aubrétia*, and many other Alpine plants; while among shrubs nothing can be more beautiful, at this season, than the various kinds of *Ribes* and *Berberis*, with the showy *Magnolia conspicua*, whose pure wax-like and deliciously fragrant flowers render it a treasure, without which every garden must be incomplete. These are plants comparatively common and easily obtained, yet how seldom is it that we see them grown in any quantity; in fact, these good old things have been, of late years, altogether neglected; while we have been running after Dahlias and other ephemera, which require great pains to cultivate them well, and which frequently are no sooner in bloom than they are cut down by the frost. This is neither good taste nor good management, and therefore the Amateur is earnestly recommended to set about increasing his stock of spring-flowering plants. Flower-gardening, indeed, will never be well done unless the arrangement is made as the season passes on; thus, at this period it should be determined what plants are to be put in the beds next spring, and preparations should be made accordingly; and at the proper time a similar arrangement should be made for the summer and autumn display, in the coming year.

Gardening is an occupation wholly dependent on forethought, and although it cannot be expected that the Amateur, who only cultivates flowers as a little recreation, and to vary the monotony of business-life, should recollect all that requires to be grown in the flower-garden, yet, by making memorandums at the proper time, and by referring to them occasionally, he might provide himself with many things which, by trusting to memory, are wholly forgotten until the season arrives when they should have been in bloom.

What can be more beautiful than a large bed of common garden Anemones? These, when selected and grouped in separate beds, according to their complementary colours, are brilliant objects; yet how rarely do we see them extensively cultivated. This is a good season to sow them and, in fact, biennials of all kinds. The Anemone delights in a strong rich soil. The best way to sow it is to make the soil fine and light, and then to mix the seed with a quantity of dry mould; scatter it thinly over the prepared border and cover it with sifted soil from the potting-shed. Seed sown now will produce flowering-plants this time next year, and there is an old saying with some truth in it, viz., that if you sow every month you will have Anemones in bloom throughout the year.

Seed of Auriculas and Polyanthus must be sown in pots and transplanted into rich light soil, and those who are partial to Gladioluses could not do better than sow some seed in heat, and transplant them towards the end of May into very rich soil; part of them will make flowering plants the first season, and the whole of them in the second. This subject will be entered into more fully next week.—*W. P. Ayres*.

HOME CORRESPONDENCE.

Fixing Ammonia.—At p. 205 of the *Chronicle* I observe some excellent remarks on the management of manure-heaps; which, if they were only generally acted upon throughout the country, would speedily compel us artificial-manure-manufacturers to turn our hands to another trade. I do not, however, consider, that we have any immediate cause of fear on this point, for no one has watched the movements of the public mind without observing its slow progression towards those things which are proved to be the most conducive to its welfare. I trust I am not so selfish or so narrow-minded as to set my separate interests against those which affect the happiness and well-being of so many millions of my fellow-creatures, or to refuse to give all the information I can on this important subject, because it may perchance tend to injure me, ultimately, in my business. You will bear with me, then, for a few moments while I make an observation or two on the substances you have named as Fixers. I will take that you have mentioned first—Oil of Vitriol. I know of only one objection to this; which is, if it be used in slight excess, it will retard or altogether arrest that fermentation which it is so desirable to encourage; for it is known that while alkalies and the alkaline earths favour *eremacausis* or natural decay, the

acids and chlorine check or stop it altogether. Green Vitriol, if judiciously used—taking care to avoid a large excess, is an excellent fixer; and has this great advantage over almost every other—that it fixes uncombined or caustic ammonia, and the other volatile salts referred to in my former letter; viz., the Hydrosulphate and Hydrocyanate of ammonia, decomposing both and forming Sulphate of ammonia. Wherever Sulphate of iron is used, the compost should be long exposed to the air and frequently turned before it is laid on the land. The price of Blue Vitriol is against its use, even if it could be proved that the copper-salts formed are not injurious to vegetation. It acts in the same way as Sulphate of iron, but, unlike it, it forms very readily a soluble compound with ammonia, possessing highly poisonous properties—at least to the human frame, and probably also to plants. [Experiments, now going on in the garden of the Horticultural Society, distinctly show that blue vitriol is not poisonous to plants, unless in excessive quantity.] Iron, it is well known, is almost always present in the ashes of plants; from whence it may be inferred that it acts in some way or other beneficially upon them, but the presence of copper has not been satisfactorily demonstrated. I could wish you had left out Salt and Lime from your list of fixers; for if there is one thing more than another likely to give ammonia notice to quit, it is this. It is true, that you caution the farmer not to use them separately, but I never yet saw a mixture of Salt and Lime so perfectly decomposed, even after months had elapsed, that it might be safely added to an ammoniacal compost. These two substances act very imperfectly on each other, and it is only under certain conditions, difficult to be realised in practice, that they act at all. The only chance in favour of this compound is that by long, very long, exposure, the free Lime may be completely converted into carbonate of Lime (chalk). It is quite certain that, however perfectly the Salt and the Lime, under the favourable circumstances referred to, may have mutually acted the one on the other, the moment sufficient water (and that not a large quantity either) is added, the two new compounds revert to their original state—excepting only that the Lime is now combined with carbonic acid, taken from the atmosphere. It is not necessary that I should say a word upon the Gypsum, it having lately occupied so much of the attention of both farmers and chemists; nor upon the Salt, as that is already adverted to in my last letter on that subject. In conclusion, I would propose that Muriate of Lime (chloride of calcium), which can be bought at about 3l. per ton, be substituted for Salt and Lime as a fixer.—*W. H. Potter, Chemical Works, Upper Fore-street.* [When we mentioned Salt and Lime, we intended that coarse Muriate of Lime, which is now prepared by farmers by saturating chalk with brine. Muriate of lime, in its manufactured state, is an excellent fixer, as we know from direct experiment.]

Vine-borders.—I notice that, at p. 211, Mr. Errington has made some allusion to my method of forming and heating Vine-borders, as detailed in my Treatise on the Vine. He there states—"The soil recommended by Mr. Roberts is composed of $\frac{2}{3}$ loam: this, in my opinion, is excellent advice. Loams, however, in point of mechanical texture and tenacity, have so extensive a range, that something more explicit is necessary, especially with the young amateur; and it is to be lamented that, in the present imperfect state of Horticultural knowledge, we have not a more definite mode of conveying our ideas on that head. Mr. R. recommends strong loam: by this, I presume, he means loam in which the clayey principle predominates. I much doubt the propriety of using adhesive loam at the depth recommended, viz., 30 inches." I give Mr. E. credit for his remarks, but at the same time I think he cannot have read my Treatise. I will try to make myself better understood: My Vine-border, as stated in the Work, is composed of two parts—strong loam, the parings of old pasture land, i.e., the turf with an inch of soil, or as thin as a man with a proper paring-spade could prepare it; one part turf, with 4 inches of the soil, of a looser texture; therefore the soils in preparation for the above could not reasonably be called a strong loam in which clay predominated. I have so far expressed myself as to the soils used, and have yet to learn that a strong loam is that in which clay is most predominant. Had I been asked to name a soil where clay did predominate, I should have called it a strong clayey loam; or had I been asked what constituted a very strong loam, I should have reported a loam approaching to clay. But by an impartial perusal of my Treatise, it will be there seen, that with what Mr. E. calls loam, in which clay predominates, I used one-fourth loam of a loose texture. Therefore, when the two distinct loams became blended together in the border, with a portion of the scrapings of roads, I am at a loss to know how clay could predominate. Before I leave this part of the subject, I may state, from the successful practice which I have had in the culture of the Vine, that to grow Grapes well (i.e., well-swelled fruit) the greater part of the borders should be composed of strong loam. I now beg to refer Mr. E. to the conclusion of my hints for the formation of borders, at p. 12; I have there distinctly stated as an improvement in my future practice, that I would not allow the borders to be deeper, when filled and settled, than from 15 to 18 inches, still bearing in mind that the majority of my materials is composed of strong loam. Mr. E. cannot reconcile himself to the quantity of fermenting material laid on the border for the benefit of the roots; but I would remind him that it is not a mass of cold dung, but a regular congenial heat so applied, which I find of the greatest benefit. I always leave my borders exposed, or nearly so, from the beginning of July to the

period of commencing forcing; which practice, by the heated material being laid on the roots during the time the Vines are in action, has a strong tendency to encourage the roots to the surface of the borders; so that from solar and atmospheric influence during the two warmest months in the year, viz., July and August, they become as perfectly matured as the branches, and are able to bear any ordinary fluctuations of the weather until the time I begin to force. I wish, before I conclude, to inform Mr. E. that the Vines at this place, only planted in 1839, are now carrying their fourth crop of fruit—not light, but heavy crops. In a second house were counted the other day upon six Vines, trained with single rods on my system of spurring, 422 perfect bunches; some of the Vines producing from one eye six perfect bunches.—*James Roberts, Eshton Hall, Skipton.*

Grafting the Vine.—The methods of grafting the Vine described at p. 208 are, no doubt, efficient; there is, however, another good mode of doing it, which is performed in the following manner:—A graft of last year's wood is spliced by the middle, with or without a tongue, after the manner of inarching, to similar wood of nearly the same size, upon a healthy plant, and is afterwards bound up and clayed over. One bud is left above the clay, beneath which the lower part of the graft hangs at full length, so that the end may be plunged into a bottle of water, in

which roots will be thrown out. The stock should be in leaf, with shoots six or eight inches long, and the graft must have been carefully kept, so as to have good swelling buds at that time. The growth of the grafted portion of the stock should be encouraged until the graft seems to have taken, when the latter must be favoured. The whole tree may fruit as usual, but it should be pruned to the graft in the autumn; the next year it will make bearing-wood of great length. I prefer the green wood for grafting, provided the desired sorts have not to be brought from any great distance, and practised with the bottle, &c. in the same way as the last. This succeeds best about June, when the young shoots will cut firm. In this case several buds and leaves should be left above the clay. I have many in bearing on both methods in a cool Vinery; but I have not tried either mode out-of-doors.—*Rhombus.*

Grapes.—A friend of mine had a fine crop of Grapes last year; and an old gardener, who fancied that there was too much heat, advised him as they were colouring, to "give air." He accordingly opened the front lights, and more than half of his crop shrivelled. The soil is light sandy loam, and very well drained.—*Jemsheed.*

Fig-trees in Vineries.—Having occasionally observed in the *Chronicle* queries as to the practicability of growing Figs on the back wall of a Vinery, I may mention that a day or two ago I counted nearly thirty dozen of fine well-sized Figs on one plant, on the back wall of one of my houses. I do not expect them all to come to maturity, but I have some reason to hope that a great many will, for last year I gathered at least twenty dozen fine Figs from the same plant. My Vines did not suffer from this in the smallest degree; as a proof of which, my Gardener gained the first prizes for Grapes at our Horticultural meetings, and one bunch of Black Hamburgs which I weighed myself was upwards of 2½ lbs. The promise of this year is even greater than that of last. I may add that a bag of Guano has been standing in the Vinery for above a month in a barrel which has no lid. A flower-pot with some Guano in it, was accidentally left on the top of the bag, and the whole was covered with some matting. On looking at the flower-pot yesterday, I was surprised to find it covered within and without with a beautiful incrustation like frost on a pane of glass. I send you a specimen of this curious production.—Query—Is the exhalation from the Guano, which is thus evidently strong, beneficial to the Vines? That it is not hurtful is proved by the remarkably healthy appearance of the Vines at this moment. They have never looked better.—*J. N. V.* [We think it probable that it is not an exhalation so much as an absorption and efflorescence which has been observed. Upon submitting it to Mr. E. Solly, he ascertained it to be principally phosphate of ammonia.]

Carnations.—I have neither time nor inclination to enter into a discussion as to whether the Carnation should be as double as the Dahlia, or otherwise, knowing, that so long as florists' flowers are cultivated, there will always be "tot homines tot sententiæ." I should, however, feel obliged by Mr. Orson's explaining (through the medium of your pages) the following portion of his paper on the properties of the Carnation, read at a late meeting of the Floricultural Society. "One of the flowers most in note was Brook's Flora's Garland, possessing fulness of size, peculiarity of colour, and pureness of white, but having one imperfection, which, from its fulness, has been overlooked, viz., irregularity of marking, the colours in many petals not running through from the edge to the centre of the flower, but appearing in stripes and spots, and terminating abruptly midway in the petal. Upon this account, extreme fulness in a Carnation is objectionable." Does Mr. Orson mean to lay down as a general principle, that because a Carnation is very double, as a natural consequence, it must be imperfectly marked? From reading the article alluded to (p. 191), myself and several friends are unable to draw any other inference or come to any other conclusion than the foregoing. I would also ask Mr. Orson whether, supposing a flower is regularly marked, with good form and petal, and in other respects desirable, its being

extremely full would be objectionable? From Mr. Orson's statement, it appears his only objection to a very double Carnation is, that Flora's Garland and some others come confused and imperfectly marked; but surely this is no really substantial or valid argument against very full flowers, provided they are as well formed and striped as semi-double ones; and there is no reason why seedlings may not be raised with good centres quite as full, nay, even fuller than Garland, coupled with regular, bold, and clear striping, equal in the latter respect to the best varieties at present in cultivation.—*C. K.*

Sowing Seeds.—The reason why seeds sown in wet weather do not succeed so well as when sown in dry weather, (quickly followed by rain) is, that in the former instance there is not a due adherence of the soil to every portion of the surface of the seed. The inconvenience and waste experienced in sowing seeds in wet weather would be obviated by placing both above and below them a layer of finely-pulverised dry soil. Thus would the advantages of both desiderata be combined.—*C.* [We agree to the plan, but we doubt the reasoning.]

Bees.—I do not know whether your correspondents who treat on the subject of Bees are aware that the cultivation of the Dahlia is incompatible with the success of the Bee-keeper. For many years I was very successful with my Bees, having upwards of twenty hives yearly, and, of course, abundance of honey; but from the time that I commenced growing Dahlias, the Bees declined, and I had, at last, to give up those useful insects altogether. They became intoxicated by feeding on that flower; many of them I found dead in the blossoms, or lying on the ground underneath, and those which got home formed little or no honey. I have heard the same remark made by many persons to whom I have mentioned it both in England and Ireland; and certainly, in this part of the latter country, honey has become a scarce article, which is here attributed to the above-mentioned cause.—*W.*

Eggs.—Some little while since, a correspondent remarked, that the eggs of some hens, which had probably eaten of something containing lime from gas-works, tasted strongly of sulphuretted hydrogen. This is not more strange than that hens, which by chance have eaten onions, or the tops of them, should lay eggs which taste strongly of onions, as I have frequently remarked; and this occurred, indeed, only a few days since, when the growing tops of onions were thrown into the stable-yard, to which my fowls have access.—*Devoniensis.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

April 4.—Dr. Henderson in the chair. The Rev. G. C. Bethune and G. F. Girdwood, Esq., were elected Fellows. A communication from Capt. Dwyer, Commandant of the Island of Ascension, was read, containing an account of the success or failure of various kinds of European vegetables, seeds of which had been transmitted to the island. From this it appears that the island is subjected to what are there called "blackwinds," which prove destructive to Haricots, several kinds of Lettuces, and all the taller sorts of Peas; of the latter, two dwarf kinds, viz., *Pois nain de Hollande*, and *Nain vert petit*, stood the climate well, with the *Versailles*, Sugar, and *Alphonse Cos* Lettuce, *Batavian Endive*, Portuguese Cabbage, and Vegetable Marrow. Amongst annual flowering plants, it is remarkable that those which succeed best are such as have been introduced from the N.W. parts of America or from other comparatively cool climates, comprising *Nemophila insignis* and *atomaria*, *Lupinus Hartwegii*, *polyphyllus*, and *grandifolius*, *Erysimum Perofskianum*, and *Campánula Lórei*. A Paper, accompanied by a model, was also read from Mr. T. Torbror, of Knightsbridge, relative to a new method of arranging the sashes in forcing and other houses, so that when air is given the light may not be intercepted by one sash overlaying the other. To effect this, it is proposed (allowing the roof to be 15 feet wide) that the two lower sashes should each be 6 feet long, and the upper sash 3 feet; and that the rafters should be continued for a short space at the same angle over the back-wall of the house; in giving air, the lowermost sash will slide downwards, the middle one will either remain stationary or move up or down as may be required, and the upper one will, by means of a pulley attached to the back wall, be drawn upwards along the projecting rafters—or, by having the sash secured at the back by hinges, it may be raised vertically by iron rods to any desired height. From Mr. Goode, gr. to Mrs. Lawrence, was a collection of plants, containing an exceedingly beautiful specimen of *Erica transparens*; *Dendrobium densiflorum*, bearing two dense racemes of gorgeous yellow and orange flowers; *Jasminum ligustrifolium*, trained to flat trellis, and covered with sweet-scented white star-like blossoms; *Æschynanthus maculatus*, forming a dark green bush, studded with clusters of vermilion and orange; fine plants of the lovely and fragrant *Cytisus filipes*, *Camélia elegans*, and *Epacris pungens*: a Knightian medal was awarded for the *Dendrobium*, *Erica*, and *Æschynanthus*. Mr. Green, gr. to Sir E. Antrobus, Bart., exhibited *Erica aristata*, potted upon the "one-shift system," forming one mass of bloom, and being, in fact, a perfect model of cultivation; with *E. Willmoreana* and *Linnæoides*, and a handsome specimen of a variety of *Tropæolum tricolor*, with smaller and longer flowers, having more orange about them than those of the old variety: a Knightian medal was awarded for the latter and *Erica aristata*. From Mr. W. Lee, of Bradmore, Hammer-smith, several forced *Pelargoniums*. Mrs. Wray, of Cheltenham, sent a magnificent cluster of the beautiful, large, white, funnel-shaped flowers of *Beaumontia grandiflora*, taken from a plant which three years ago was only a few inches high, but which on being put into a box, and placed at the back of a cool stove, made vigorous growth, and is this season producing its flowers for the first time, both on the old spurs and upon the young runners: a Banksian medal awarded. From Mr. Paxton, gr. to his Grace the Duke of Devonshire, a species of *Cymbidium*, from the East Indies, probably new, and called *Devonianum*; although not possessed of much brilliancy, it differs in colour, as well as in foliage, from other cultivated species: a certificate awarded. Mr. Beck, of Isleworth, exhibited a pretty half-shrubby seedling *Calceolaria*, called *Premier*, of good form and colour. Mr. Jackson, of Kingston, sent an extremely fine specimen of *Erica tróssula*, clothed with large tresses of snow-white flowers; *E. phytodes*, with small pellucid wax-like blossoms; *E. transparens*, and the delicate rosy purple, *E. ussiana*: a certificate was awarded for *E. tróssula*. From J. Allnutt, Esq., a collection of cut *Camelia* flowers; a handsome seedling *Camelia*, called *Allnuttii*, with flowers of a clearer white than those of the old double white; *C. ochroleuca*, white, with a tinge of yellow; *C. speciosa*, and several pretty *Ericas*: a certificate awarded for *C. Allnuttii*. From the Very Rev. Dr. Garnier, Dean of Winchester, fine cut flowers of *Magnolia conspicua*, purpurea, gracilis, and *Soulangeana*, several hybrid varieties of *Rhododendron*, and *R. campanulatum*, from plants in the open air: a certificate awarded for the *Rhododendrons*. From Mr. Clarke, gr. to W.

Block, Esq., a collection of plants, amongst which were well-grown specimens of *Polygala oppositifolia*, *Leschenaultia formosa*, *Bossia ensata*, and the double purple *Azalea*: a certificate awarded for the three latter. From Mr. Low, of Clapton, small plants of a species of *Pultenaea*, with dense heads of dark yellow and reddish-brown flowers, and a pretty species of *Bossia*, both raised from Swan River seed; a seedling *Epacris*, raised from seed of *E. grandiflora*, which it resembles in habit, but not in the form or colour of its flowers; and a beautiful seedling *Camellia* of a dark carmine colour, with finely-formed back petals, but not well filled up in the centre: a Banksian medal awarded for the two former plants. From C. B. Warner, Esq., a well-grown specimen of the lovely *Dendrobium pulchellum*; *Epidendrum macranthum*, a beautiful hardy plant, with singularly formed white and purple flowers; and two Madras Citrons: a Banksian medal awarded for the *Dendrobium*. Mr. Conway exhibited several seedling *Azaleas*, of a dark salmon colour, with well-bloomed plants of *Pelargonium Lancelotti*. From Mr. Rivers, of Sawbridge-worth, were a beautiful collection of cut Rose-blossoms, particularly of *Pactolus*, a yellow tea-scented variety; *Madame Bureau*, a white China, with salmon-coloured centre; and *Duc d'Aumale*, a crimson Bourbon, finely cupped: a certificate awarded. From Messrs. Lane, of Berkhamstead, a well-grown collection of Roses in pots, comprising *Eugène Beauharnois*, an exquisitely-formed China Rose, of a deep crimson colour; *Armosa*, a flesh-coloured Bourbon; *Duchess of Sutherland*, *Comte de Paris*, and *Madame Laffay*, hybrid perpetuals; Messrs. Lane also exhibited two boxes of cut Rose blossoms, and a good specimen of the double white Chinese *Primrose*: a Banksian medal awarded for the Roses. From Messrs. Paul, of Cheshunt, there was also a very handsome collection of cut Roses, for which a certificate was awarded; with a singular and rather handsome seedling *Cineraria*, showing a disposition to quill, by the purple rays of the flower being drawn together at some distance from their bases, and thus forming a tube having a silvery appearance: for this a certificate was also awarded. Mr. J. Thomson, of Ham-mersmith, sent several pretty seedling *Cinerarias*. From Lady Rendlesham were some handsome and well-flavoured Oranges, grown in a greenhouse. Mr. C. Ewing, gr. to O. F. Meyrick, Esq., of Anglesea, some fine forced Cherries, but not quite ripe; for which a certificate was awarded. From Mr. S. Hooker, specimens of the Scarlet Nonpareil and Gooseberry Pippin, in an excellent state of preservation. From the garden of the Society were a collection of Orchidaceous and other plants, comprising a small specimen of *Dendrobium Heyneanum*, a pretty species, very lately received from the West coast of India, with delicate white flowers, having a lemon centre; the beautiful *Oncidium luteum*, several species of *Epidendrum*, a fine specimen of *Cyrtopodium punctatum*; a new species of *Spiraea*, called *lanceolata*, from Japan, with corymbs of pretty white flowers, bearing considerable resemblance to those of *S. chamaedrifolia*; *Acacia alata*, blooming profusely; *Saxifraga ciliolata*, and a blue *Cineraria*, called *Unique*.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

March 29.—T. R. Barker, Esq., in the chair. The Hon. Col. E. G. D. Pennant was elected a Governor, and 25 gentlemen Members. The prize-sheet of the Royal Agricultural Improvement Society of Ireland was transmitted, with information that the next Cattle Show would be held in Belfast on the 31st of August. Mr. A. Nicholl transmitted a statement of the advantages attending the use of the Concrete Furrow Draining of Lord Hay. Mr. Baker transmitted a collection of facts, illustrated by coloured plans, relative to the capabilities and cultivation of the soil upon the Small Allotment System in Rutlandshire.

MISCELLANEOUS.

Tests for Doctored Clover Seed.—For Coloured Red Clover Seed.—Fill an ounce phial one-third full with the suspected seed, and fill it up with muriatic acid diluted with two parts of rain-water. If, after standing three or four hours (being frequently well shaken), the liquor be coloured green, or greenish yellow, the seed is doctored; or, provided the seed be clean and free from dust, and the acid is made cloudy or opaque, it is doctored. The acid, when applied to genuine seed in the same manner, will remain perfectly transparent; therefore, if the acid is not clear the seed is doctored, although no colour may appear, as described. For Coloured Trefoil and White Clover Seed.—Fill an ounce phial one-third with the suspected seed, and add spirit of sal ammoniac until it be two thirds full; cork and shake the phial, and let it stand a few seconds, not exceeding half a minute, for if it stands longer the genuine seed will colour the liquid. If the liquid be coloured either yellow or yellowish green, the seed has either been dyed, or its natural colour has been brought to the surface by some artifice. For Bleached Red Clover, White Clover, and Trefoil.—Take a four ounce bottle one-third full of the suspected seed, fill it up with boiling water, frequently shake it, and when it is cold, if the liquid change the blue colour either of litmus paper, or of the leaf of a cabbage red, the seed is doctored. N.B.—You may obtain the spirit of sal ammoniac, the muriatic acid, and the litmus paper, at a trifling cost of any chemist or druggist, and the cabbage-leaf used must be that of the red cabbage.—*Mark Lane Express.*

Directions for Planting Melons.—(Extracted from a Letter written by Robert Godschall to the Hon. Alex. Stanhope, then British Minister at Madrid, dated Sevilla, Feb. 13, 1691.)—"Put the seeds 6 or 8 hours into lukewarm water, and after into a blanket, and let them lie about 24 hours in the sun wrapped in the blanket; in which time they open, and seem to sprout at one end. They plant 3 or 5 together in one hole; and when they grow up, with an instrument of iron they rake towards the root every day, so as that the earth lies loose about them like the earth of a molehill."

Prof. Henslow's Letters.—We are glad to find that these useful Letters, addressed to the farmers of Suffolk, are now to be published in a separate form, as we learn from the following paragraph in the *Bury Post*:—"More than one person has expressed to me a desire that I would myself republish and edit my Letters to you, under the form of a pamphlet. The following considerations have determined me to do so. Although I believe I have not allowed the interest I have felt in this correspondence very materially to trespass upon my attention, to the exclusion of any of the more important duties attached to my position as a parish priest, yet it is evident that whatever of thought, time, or money, I have allotted to this subject during the past three months, might have been otherwise devoted in some way advantageous to my parish. It seems to me, then, that I may possibly be able to make some amends for such deficiencies by appropriating to some parochial utility or other, whatever may

accrue from the republication of these letters. I have, therefore, no very delicate scruples about requesting any of you to promote their circulation, if you think them calculated to excite the farmers of other counties to co-operate, after the example of the farmers of Suffolk. I see no reason why we should not have at least 100 distinct experiments performed every year; and each carried on by between 30 and 50 practical men, whilst each man need not be called upon for more than a single experiment annually. I propose inserting in this pamphlet my Address to the Hadleigh Club, and to add a few explanatory notes, or some sort of commentary and glossary, which may give them a more general character, and enable them to serve as a precursor for inducing the farmers of other counties to listen to any future suggestions which may possibly (and will probably) be made to them, for organising a complete system of experimental co-operation throughout England.

Weight of Manures.—We have been favoured by Mr. Fothergill, the extensive dealer in artificial manures, with the following statement of the weight per bushel of those kinds most in use:—

	per bushel—lbs.	lbs.		per bushel—lbs.	lbs.
Agricultural salt	75	to 80	Nitrate of soda	80	
Alexander's compost	65		Petre salt	75	
Bone-dust	42	„ 44	Rape-dust	56	
Clarke's dessicated com-			Saltpetre	80	
post	60	„ 65	Soda ash	60	
Daniell's Bristol ma-			Sulphate of ammonia	70	
nure	50		— soda	60 to 65	
Guano, foreign	65		Trimmer's composts		
— Potter's	65		for Clover, Wheat,		
Gypsum	80	„ 84	and Turnips, each		
Hunt's new fertilizer	65		respectively	60	„ 65
Muriate of ammonia	65	„ 70	Urate	50	
— lime					

Dahlias.—At the request of several correspondents we publish a list of Dahlias which have been the most successful during the past season. From the imperfect manner in which many of the Country Shows are reported, it is impossible to give a correct return, but the present will be found sufficient to answer the purpose.

North-West America.—We are glad to announce that Sir William Hooker has arranged for a Collector to go to North-West America and California. He starts in June, via Hudson's Bay, and on reaching the Rocky Mountains, next spring, will strike due south into California, and reach the coast at San Francisco.

Evergreen Beech.—This beautiful tree, the *gloria et decus* of the most southern regions of South America, has reached England alive, and now exists in the Royal Botanic Garden, Kew, whither it has been sent by Dr. Joseph Hooker from Tierra del Fuego. If it should prove hardy, it will be an invaluable acquisition.

GARDEN MEMORANDA.

S. Rucker, Esq., West Hill, Wandsworth.—It is questionable whether, even in their native climates, Orchidaceous plants present a more luxuriant or gorgeous appearance than at this place. Many of the specimens are of gigantic size; *Acanthophippium bicolor*, *Peristeria elata*, and *Phalaen grandifolia*, being grown in 2-sized pots, together with *Maxillaria Harrisoniae*, whose beautiful and fragrant wax-like flowers, freely produced, are partially concealed by its shining, deep green leaves. *Dendrobium fimbriatum*, grown amidst broken pieces of peat and potsherds, forms quite a mass of brilliant orange, the labelum of each blossom being surrounded with the most delicate fringe; while, suspended above it, and cultivated in a small basket of sphagnum, is a healthy specimen of the purple variety of *Dendrobium pulchellum*, of a light violet purple colour, having the interior of the lip strongly marked with orange. A species of *Gongora* from Mexico will, in a few days, be fully in bloom; it appears likely to prove new, inasmuch as the unexpanded buds, instead of tapering to a point, like others of this genus, bear some resemblance in form to a common garden Bean. The lovely *Epidendrum Stamfordianum*, of a pale green colour, beautifully streaked and spotted with purple, is also in flower, with the rare *Epidendrum aurantiacum*; the finely-formed *Dendrobium aggregatum*, with light yellow flowers, having orange centres; the singular *Mormodes atropurpurea*, the small variety of *Oncidium ampliatum*, *Dendrobium macrophyllum*, with racemes of violet purple; the pretty *Oncidium pubes*; *Epidendrum pictum*, with eight spikes, each 8 or 9 ft. long, and covered almost from the base to the summit with yellow and olive-green flowers; the sweet-scented *Epidendrum Clowesianum*, and many others. Several species of *Aerides* and *Saccolabium*, cultivated in baskets of sphagnum, are in a most vigorous state, throwing out roots like small ropes. We noticed here a thriving plant of *Nepenthes ampullacea*, with broader and shorter pitchers, and of a lighter colour than those of the old distillatoria, from which they more over differ in being spotted with purple, and in being furnished at the back with a pair of wings edged with a tooth-like fringe. *Azalea variegata* has here been found to force well: a small plant which was last spring growing in a 60-sized pot was placed in stove-heat and regularly shifted until the approach of winter, when it was removed to a cold pit to rest; it has since been returned to the stove, and is now a handsome bushy plant, producing its beautifully-variegated flowers in abundance. In the greenhouse are a fine plant of *Camellia reticulata*, and several other varieties, with numerous *Heaths* and *Epacris* in bloom. A convenient, low, span-roofed house, divided by a partition into two compartments, has lately been erected, principally for the purpose of early forcing. A walk runs along the centre, and on

each side, about 4 ft. from the ground, is a stone shelf for the reception of pots containing Strawberries, Roses, &c. Beneath the shelves are beds for Mushrooms, Seakale, Rhubarb, Saladings, &c., which are found to do remarkably well there. The house is heated by hot water traversing in a 4 inch iron pipe connected with one of Rogers's small conical boilers. As the flow and return pipes are both on the same side of the house, the hot water can at any time, by means of a valve, be shut off from the compartment farthest from the boiler. In a small conservatory adjoining the dwelling-house the elegant *Glycine sinensis* is just expanding its lively pale blue flowers; *Rhododendron arboreum*, *Azaleas*, *Camellias*, and *Cinerarias*, are also blooming in profusion. To give some idea of the forwardness of vegetation in this part of the country, we may state that Peach-trees on walls are, for the most part, out of blossom; Pear and Plum trees are in full bloom; the Whitethorn and Elm are bursting into leaf, while the Lilac and Horse-Chesnut are already putting forth their panicles of flowers.—*R. A., April 3.*

Reviews.

Trials and Effects of Chemical Fertilizers, with various Experiments in Agriculture, &c. By Sir J. Murray, M.D. Part I. Curry. 8vo.

We are told on the title-page of this pamphlet, that it contains an account of experiments in Agriculture for aerating soils and composts, increasing the food of plants, improving irrigation, and abating the ravages of insects. What aerating soils may be, we have been unable to discover, unless it is Irish for aerating; and as to experiments, we are equally unable to find any that deserve the name. It is true that there is a certain number of statements, to the effect, that where Sir James Murray's fertilizers, which it is the object of the pamphlet to recommend, have been tried, they have produced stronger crops, and better crops, and more luxuriant crops; but they are all too vague and destitute of distinct results to be worthy the name of experiments. If we turn to another place to ascertain what the fertilizers are, about which the pamphlet is written, we are equally perplexed. We only learn that they consist of "soluble superphosphate of lime, with ammonia and silic, combined with several chemicals;" but what these chemicals are, the book does not tell. This however, is plainly announced, that Sir James Murray's patent fertilizers are to be sold in barrels, one red and acid, the other dark and alkaline. What their value may be remains to be ascertained. They may be good materials, in spite of the bad shape in which they are announced, just as the pamphlet itself contains some statements worth attention, notwithstanding that it has far too much the appearance of the puffs circulated by vendors of quack medicines. We shall be glad to have the opportunity of announcing the results of some authentic trials with these substances, which have at all events the merit of cheapness, so that no great cost will be incurred in trying them.

CALENDAR OF OPERATIONS for the ensuing week.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Increase the quantity of water to the fruiting plants, and let it be good liquid manure every other watering while the fruit is swelling. A brisk heat of not less than 65° in the morning, a humid atmosphere, and a steady bottom-heat, will also greatly assist the swelling of the fruit. If the bottom-heat for the succession-plants is steady, the common routine of watering, shading, and giving air is all that will be necessary for some time to come.

VINERIES.—Vines in greenhouses, where the temperature is made to suit the plants, require particular attention now. Within the last 15 years, Gardeners have found out the good effects of keeping their greenhouses warmer at the end of the spring, when plants begin to grow. By this treatment the Vines may be said to be in a slight degree forced; and as the sap has been in active motion for many weeks past, the least encouragement will make the top buds start, and deprive the lower ones of their due share. The old method of training the Vines horizontally with the points of the shoots turned up to the glass should always be adopted in greenhouses, until every eye break forth into leaves, which they now promise to do quickly. More frequent syringing will suit the Vines, and also the general dry of Greenhouse plants while they are making their young growth.

PEACH-HOUSE AND CHERRIES.—Every thing here is now so far forward, that they may both be classed together. Air, moisture, and attention to the temperature are all that is necessary, unless insects have made their appearance.

FIGS.—A moist atmosphere, plenty of light, a good supply of liquid manure, and a temperature of about 61° in the morning, are conditions which will suit forced Figs till the fruit begins to ripen.

MELONS AND CUCUMBERS.—On the whole, this has been a good season for early Melons and Cucumbers, especially for Gardeners who are fortunate enough to have hot water instead of fermenting manure for early forcing. These plants will grow more luxuriant with hot water, and require less sun than if grown with dung or tan. Melons will also set their fruit more easily in with dung or tan. Melons will also set their fruit more easily in with dung or tan. Melons will also set their fruit more easily in with dung or tan.

SEEDLINGS.—Forward all your Tomatoes, Capsicums, Egg-plants, Ice-plants, and all others in slight hotbeds, as they several want more pot-room and air. Vegetable Marrows and Cucumbers may now be sown for the summer crop out of doors. There is no want of long Cucumbers for early forcing, but real good sorts for pickling are very scarce and difficult to be obtained here. The frames in which early Carrots, Radishes, &c. were sown may now be removed for other purposes, and a few hoops placed over the beds ready to have mats thrown over them in cold nights. The hand-glasses over Cauliflowers may remain off while the nights are mild. April has come in with promising smiles, and if we get a cold day now and then, things are in a fit state to bear it.

Out-door Department.

VINE BORDERS.—As the weather throughout the month of March has been so mild and dry, and as April has come in with warm showers, the mulching over these borders may now be safely removed, and after a few dry days the whole surface may be forked over two or three inches deep. If the borders have been made within the last three or four years, they may not yet stand in need of much assistance from manures, but if they are of older date, or any doubts are entertained of their richness, and moreover, if there is an appearance of a heavy crop, the borders should now have a good top-dressing of rich, but not liquid manure. It is too early yet to apply liquids to any mass of rich earth like a Vine-border. If you have access to pigeon dung it will pay best on the Vine-borders and Asparagus beds at this time; and as a little of it goes a great way, it will add much

to their richness without adding to their bulk or depth, which is a great recommendation.

PEAS AND BEANS.—Continue a regular succession of these and other successional crops in the kitchen-garden, and as your time will admit, you may sow Leeks, Cardoons, a little Cabbage, Brussels Sprouts, Cauliflower, and Autumn Broccoli seed; and if there are any arrears in your other sowings, bring them up. Also prick out seedlings of the early-sown crops as they are fit; all these young plants are encouraged by being planted on sheltered borders, and in light, rich soil. See that everything is done in a neat, workmanlike manner.

ORCHARD.—If you have any doubts about the names of recently-planted Peach and Nectarine trees, or any of the old ones, mark them before they are out of blossom; that is, mark if the flowers are small or large ones, by cutting a notch or No. 1 on a stick for one kind of flower, and No. 2 for the other kind; two numbers will do for the whole. This is the first regular step in ascertaining the true name; the glands and serratures, if any, on the leaves will be the next step by-and-by, and you will then have a chance of making out the name when the fruit is ripe, by comparison with the published lists. As yet there is a fair promise that Peaches and Apricots will set well. Continue to disbud them gradually, thinning the buds from the strongest shoots first. The point of a sharp knife should be used for disbudding, in preference to rubbing them off with the finger.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—When the greater part of the plants are shifted, keep the house closer for a week or two, to encourage the roots to strike freely into the fresh soil. Keep up a moist atmosphere also, and give less water to the roots, as the fresh soil, after the first watering, will be moist enough for some time. *Rondeletia speciosa* is an excellent plant to flower in the conservatory for seven or eight weeks in summer. It is rather difficult to grow it to a good specimen, and more so to propagate it by cuttings; but if you get young shoots long enough for layering in the pot they will root freely in three weeks.

GREENHOUSE.—For the next four or five weeks greenhouses are, for the most part, very difficult to manage well; between the Vines on the rafters, the Pelargoniums, Heaths, and other hard-wooded plants, it is often difficult to determine the best course to pursue on the spot, and more so to give directions under such conflicting circumstances. All that can be said in a general way is to keep the more tender plants in the warmest end of the house, and the hardier ones at the coldest, and near the door or ventilators; any of the latter plants which show signs of being too much confined should be removed to the cold pits, or to some well-sheltered place.

CONSERVATORY.—In this central place of attraction there will be some difficulty to contend with for a few weeks. Forced Roses, Lilacs, Azaleas, &c., will be going out of bloom, and must be removed, to give place to a fresh lot; but where can they be sheltered till they get hardened enough to bear the open air? Every one must answer the question according to his means. This is the best time to hybridise the finer varieties of Rhododendrons and Azaleas which have been forced, as none of the more common sorts can now interfere with the experiment.

PROPAGATING PITS.—After the supply for the flower-beds is propagated and a little forwarded, put in for a reserve a quantity of cuttings of such plants as flower late in the autumn, to take the place of those which go off in September. All the *Heliotropes* for forcing next winter should be propagated now, and kept cramped in small pots through the summer. *Anagallis* for store plants next winter should be managed in the same way. Any other plant that is found difficult to preserve through the winter should now be propagated, while the pits are at work, and if kept stunted in small pots during summer, they will get so hardened and stocky as to keep with ease through the winter. One of the nicest plants for a "gem" in the flower-garden is the *Bouvardia triphylla*; it may now be propagated by root-cuttings to any extent.

Out-door Department.

The late showers have brought forward the grass before most persons were prepared for mowing; but every kind of work must give way for the scythe, unless it be planting a few evergreens, that could not be done sooner, owing to alterations which were going on. Early mowing is the life and soul of lawns, and you can tell in August whether the first mowing was deferred too long, by the stronger grasses having partly killed the finer herbage, which gives the *polish* to our best-kept lawns. The seeds of any hardy perennials may be sown with the hardy annuals for summer flowering. Where families do not return to their country seats till the end of June, it is too soon yet to sow annuals for blooming in July. I do not know any place where annuals are more cultivated than in this. The majority of gardeners have set their faces against them since *Verbenas*, *Petunias*, and similar plants, have increased so much. Ten-week Stocks and China Asters, for the first crop, should now be sown. The Sweet Scabious, if sown now, will come in useful next September, to fill up some bed or blanks when flowers are getting scarce.—*D. Beaton, Shrubland Park Gardens.*

State of the Weather near London for the Week ending April 6, 1843, as observed at the Horticultural Garden, Chiswick.

Mar.	Day.	Barometer.			Thermometer.			Wind.	Rain.

The highest temperature during the above period occurred on the 15th in 1840—thermometer 70°; and the lowest on the 10th in 1837—thermometer 23°.

REPORT ON COVENT-GARDEN MARKET,

For the Week ending April 7, 1843.

In consequence of the mildness of the weather the supplies have been abundant, but trade continues dull. **Fruit:** Pines are more plentiful, and consist principally of Queens, with a few Envoles, from 6s. to 10s. per lb. A few well coloured hothouse Grapes (Black Hamburg) have appeared, from 10s. to 20s. per lb. Strawberries of good quality are offered from 1s. to 2s. per oz. Easter Beurre Pears, of which there is a small quantity, are selling at 20s. per half-sieve. The mild weather having brought in a plentiful supply of Rhubarb from the open ground, it has caused a depression in the demand for culinary Apples; Nonpareils fetch from 6s. to 20s., and Golden Pippins 15s., per

bushel; New town Pippins are selling at 4s. per dozen. Cucumbers are plentiful, from 2s. to 5s. per brace, the greater portion consisting of the Syon House, which does not go off so well since the prickly sorts have become more abundant. **Vegetables:** Asparagus still maintains its price, the best bunches selling from 5s. to 10s., and the smaller ones from 1s. 6d. to 3s. each. Seakale from the open ground is becoming general, which has somewhat reduced its price. White Broccoli is abundant, and may be had from 4d. to 1s. 6d. per bunch; the purple fetching from 5d. to 1s. per bunch. French Beans are improved, and a trifle cheaper. Good Onions are scarce, having, for the most part, begun to grow; they are selling from 5s. to 8s. per bushel. Cos Lettuces are from 1s. 6d. to 2s. 6d. per score, and Cabbage Lettuces from 1s. to 2s. per half-sieve. Endive is from 1s. to 2s. per score. Celery is inferior, and fetches from 6d. to 2s. per bundle. New Frame Potatoes are from 1s. 6d. to 2s. 6d. per lb.; several boxes of new Potatoes have arrived from Lisbon; these sell from 4d. to 6d. per lb. Rhubarb is abundant, and sells from 4d. to 1s. per bundle. Mushrooms are also plentiful from 3d. to 9d. per pottle. **Flowers:** Cut Flowers are offered in great variety, comprising *Camellia reticulata* and various other sorts, *Pæonia Montana*, *Magnolia conspicua*, Heaths, Acacias, Cloves, Pinks, Anemones, Calceolarias, Pelargoniums, Jonquils, Gardenias, &c.

PRICES, SATURDAY, April 8, 1843.—FRUITS:—

Pine Apple, per lb. 6s. to 10s.	Lemons, per 100, 5s. to 14s.
Grapes, hothouse, per lb. 10s. to 30s.	Cucumbers, per brace, 2s. to 8s.
Spanish, per lb. 1s. to 1s. 6d.	Walnuts, per bush., 12s. to 18s.
Portugal, 1s. to 2s.	Chestnuts, per peck, 4s. to 7s.
Apples, dessert, per bush., 5s. to 14s.	Almonds, per peck, 6s.
Kitchen, 4s. to 8s.	Sweet Almonds, per pound, 3s.
Pears, dessert, per hf. sieve, 4s. to 20s.	Filberts, English, per 100 lbs. 5s. to 6s.
Strawberries, forced, per doz., 1s. to 2s.	Cob Nuts, per 100 lbs., 6s. to 7s.
Pomegranates, per doz., 6s. to 12s.	Nuts, per bushel—
Oranges, per doz., 1s. to 2s. 6d.	—Brazil, 16s.
per 100, 5s. to 10s.	—Spanish, 18s.
bitter, per 100, 5s. to 30s.	—Barcelona, 24s.
Lemons, per doz. 9d. to 2s.	—Cob, 12s. to 14s.

VEGETABLES.

Savoy, per doz. 6d. to 1s.	Spinach, per sieve, 1s. to 1s. 6d.
Cabbage, Red, per doz. 2s. to 5s.	Leeks, per doz. bun., 2s. to 3s.
plants, per doz. 1s. 6d. to 3s.	Onions, per bush., 12s. to 18s.
Broccoli, White, per bunch, 4d. to 1s. 6d.	—Pickling, per hf. sv., 4s. 8d. to 5s.
Purple, 6d. to 1s.	—Green, per doz. bun. 3s. to 4s.
Beans, Kidney, forced, per 100, 1s. 6d. to 2s. 6d.	—Spanish, per doz. 1s. 6d. to 6s.
Potatoes, per ton, 45s. to 75s.	Garlic, per lb. 6d. to 8d.
per cwt. 2s. 6d. to 4s.	Shallots, per lb., 1s.
per bushel, 1s. 6d. to 2s. 6d.	Asparagus, large, per 100, 5s. to 10s.
Kidney, per bush., 1s. 6d. to 2s. 6d.	—Spruce, or Small, 1s. to 2s.
Scottish, per bush., 1s. to 2s. 6d.	Sea-kale, per punnet, 9d. to 1s.
New, per lb., 1s. to 2s. 6d.	Lettuce, Cabbage, per hf. sieve, 1s. to 2s.
Jerusalem Artichokes, per half-sieve, 1s. to 1s. 6d.	—Cos, 1s. to 2s. 6d.
Turnips, per doz. bun., 1s. to 2s. 6d.	Endive, per score, 9d. to 2s.
Red Beet, per dozen, 9d. to 1s.	Celery, per doz., 12s. to 15s. 6d. to 2s.
Scorzoneria, per bundle, 1s. 3d. to 1s. 6d.	Rhubarb Stalks, per bdl., 4d. to 1s.
Parsnips, per bundle, 1s. 3d. to 1s. 6d.	Small Na ads, per punnet, 4d. to 1s.
Cardoons, each, 1s.	Corn Salads, per hf. sieve, 9d. to 1s.
Horse Radish, per bundle, 2s. to 4s. 6d.	Watercress, per doz. am. bun. 4d. to 6d.
Radish, spring, per doz. bands, 1s. to 1s. 6d.	Parsley, per half-sieve, 9d. to 1s.
Kidney, per doz. bun., 1s. to 1s. 6d.	Tarragon, per doz. bunches, 2s. to 3s.
Salsify, per doz. bun., 1s. to 1s. 6d.	Fennel, per doz. bun., 2s. to 4s.
Carrots, per doz. bun., 4d. to 6d.	Mint, per doz. bunches, 3s. to 4s.
—Horn, per bunch, 4d. to 6d.	Mushrooms, per pottle, 3d. to 9d.
Parsneps, per dozen, 6d. to 1s.	

Notices to Correspondents.

DRAINAGE.—*J. J. M.*—Your plan of having cross-drains is very good, and is worth the additional expense. What is the use of a foot in depth under the tiles, or rather pipes, you use? To make a firm foundation they may certainly be useful; but three inches loose over the tiles, appears to us a better arrangement. We cannot enter into the details of draining land, which we may hereafter give in a leading article. The whole depth of your drains must depend on the depth of the soil over the firm subsoil, and the depth at which you mean to plough and subsoil-plough the land.—*M.*

TILLAGE.—*A Young Farmer.*—It is yet time to top-dress upland meadows, if they are not too forward; but no time should be lost. All the substances you mention are useful. The experiments with new artificial manures are so various in their results that we would not give any decided opinion; all these substances may be mixed with earth into composts, or put on in a dilute liquid state; urine should have undergone a partial decomposition, and be diluted with water, or it will burn the grass. Guano has much the same effect as urine. The ammoniacal liquor, when poured on vegetable substances, decomposes them rapidly, and hence is extremely useful to accelerate the rotting of long farm yard manure. You had better make your experiments on a moderate scale, before you decide upon what is most advantageous. There are various essays on particular manures, the names of which you will find in any catalogue of new publications. Very fine seed Wheat will always sell above the market price; but this is not noticed in the returns, as the quantity sold is generally small.—*M.*

GRASS-LAND.—*M., Carnarvon.*—When Italian Rye-grass is used alone, it is best to sow it immediately after harvest. If sown in a spring crop it will grow too fast, and injure the crop. It will ripen its seed before the Wheat and as soon as the Barley. It is advisable to sow a considerable quantity, say from 30 to 40 lbs. per imperial acre. It will give very early spring feed till the month of May, and then it will still produce a good crop to mow or to stand for seed. When it is fed off it will last much longer than when it is allowed to ripen its seed.—*M.*

CLOVER.—*Jack Spratt.*—Cow-grass is better suited for laying down land to remain several years in grass, than as a substitute for broad Clover. We have never sown it alone, but we should think that as it is a species of Clover, it will more or less affect the broad Clover sown soon after it.—*M.*

MANURES.—*T. A. N.*—Tar will do no harm; an old tar-barrel is a very good vessel for holding liquid manure. The cessation of effervescence when oil of vitriol is added to gas-water is a good sign of the fixation of the ammonia.—*Alpha.*—Common caustic soda will not answer the same purpose for manure as nitrate of soda. The latter can be procured in small quantities of Mr. Fothergill, 40, Upper Thames-street.—*Jack Spratt.*—Gas-lime will always burn grass-land if applied by itself, or not sufficiently mixed with mould. We have seen it produce excellent effects when properly applied, and we should not have expected any injury to arise from yours, which seems to have been sufficiently mixed. However, it is probable that in your case it was stronger than usual, or perhaps you used it during very dry weather. We shall be curious to know whether the late heavy rains have not recovered the grass, and produced some strikingly favourable result. Those who have used it say that it drives away insects and their grubs.—*M.*

SOILS.—*T. A. N.*—By fermenting leaves, and turning them over frequently, they will be most readily converted into mould.—*M.*

Geophytes.—We see no reason why tufts of sedgy Grass, such as are commonly called hassocks, after being baked to destroy vegetation and insects, should not answer the purpose of drainage when mixed with charcoal.—*M.*

LIME.—*Mrs. Th. Cooke.*—When hot lime is put upon land containing little vegetable fibre for it to act upon, it is very probable that it may burn the young roots of the Wheat; much depends on the quantity put on, and the state of the land. On a light, poor soil we would not recommend lime, unless farm-yard dung was used at the same time. The failure of your crop may be owing to the exhaustion of the soil; the lime may have rendered all the humus soluble, and thus promoted the first growth; but the crop may have been starved afterwards. Examine your soil, and see how much organic matter it contains; this may lead to a solution of your question.—*M.*

SAND.—*R. B. E. P.*—Sea-sand for Horticultural purposes will not serve as a substitute for silver-sand.—*M.*

GRATINGS.—*Rusticus pugnax.*—In stating that it is better to bud Roses than to graft them, we referred to the degree of certainty attending the two processes, and we believe expressed

the general opinion of Rose-growers. If, however, you have any evidence to the contrary, we shall be happy to print it, and shall be much obliged to the bargain.—*M.*

VINES.—*Carion.*—We cannot recommend the introduction of Vines into a greenhouse, because it generally happens that either the plants suffer from too much attention being paid to the Vines, or *vice versa*. In a house with a south aspect, but shaded at two o'clock by an adjoining building, Vines would succeed, provided they had the full benefit of the morning sun.—*Merlin.*—When Vines planted outside the house are not forced before the middle of April, it is unnecessary either to inclose the stems or to cover the border with fermenting material.—*Ficus.*—You may either graft or inarch your Vines, as you think proper. You will be more certain to succeed by the latter method; in which case you must wait until the Vines have made shoots two or three feet in length.—*J. H.*—We would not advise you to cut back the unsightly stems of your Pot-Vines within a short distance of the roots, unless there is a shoot of last year's growth below the point of incision. A better plan will be to transfer your Vines into larger pots, and coil round the interior the old stems, which will throw out fresh roots. You must not expect your Vines to bear fruit unless you pot them annually in fresh soil, at the same time shaking the old compost from the roots. The size of the pots must depend upon the strength of the plants.—*Jemshed.*—Plants of the Kishmish and Aleppo Grape may be obtained of almost any respectable nurseryman. So also may the Pomme Api.—*M.*

GRAPES.—*Guichenet.*—We are not sufficiently acquainted with the Black Muscat of Alexandria to give you any information respecting its good or bad qualities. From its being so little cultivated we should suppose that it is not of much importance.—*M.*

CUCUMBER-BED.—*H. C.*—We do not anticipate any inconvenience from your adding gypsum to your Cucumber bed, neither do we expect much advantage. A heating Cucumber-bed is, we fear, too dry to enable the gypsum to act advantageously; it requires water or a very wet litter. If you use it, merely sift it over the litter as you make up the bed, so as to have it well mixed. It is very cheap, is itself a good manure, and the quantity is immaterial.—*M.*

ARAUCARIA.—*T. M. C.*—Your seeds are those of *Araucaria imbricata*. They should be sown separately in small 60-sized pots, filled with dry loam, and afterwards placed in gentle, but not damp, peat, until they show signs of vegetating, when they must be removed to a cooler place. Harden them off by degrees, and water them sparingly at first; after they have fairly commenced growing you may repot them, and in the following spring they may be turned out into the open ground. *Araucaria* is a barbarous word, derived from the *Araucana* country, where this tree grows. In *bricata*, in botanical language, refers to the manner in which certain parts are arranged over each other, like tiles on a house. This tree is quite different from that which furnishes the wood called Kauri.—*M.*

CONIFERAE.—*A Constant Reader.*—The seeds of Coniferous plants should be sown in pans, in dry sandy loam. The pans should be placed in a gentle, but not a moist heat, removing them when the young plants make their appearance to a cooler place, giving them but little water at first, and hardening them off by degrees. When fairly up, they should be potted off singly into small pots, in sandy loam and peat, and placed in a close frame for a few days. They will require little attention afterwards beyond the ordinary routine of watering and shifting into larger pots.—*M.*

CHIMONANTHUS.—*Salopian.*—This plant, when grown against a south wall, in a well-drained border, will scarcely fail of blooming profusely. The probability is that, like your Roses, it has penetrated into the clay.—*M.*

ROSE ACACIA.—*Salopian.*—It will not injure your Rose Acacia, which is growing out of bounds, to cut back a few of the young shoots to spurs. It will perhaps induce it to flower more freely.—*M.*

STOCKS.—*A Subscriber.*—There is no means of distinguishing between single and double Stocks until they flower. The most essential point towards obtaining double flowers, is to procure good seed.—*M.*

BEBERIS.—*An ignorant Subscriber.*—*Berberis dulcis* and *empe-truifolia* are both hardy in the neighbourhood of London. A soil composed of loam and peat or leaf-mould, suits them best; and they should be planted in a warm situation, not shaded by trees.—*M.*

IPOMÆA.—*A Young Gardener.*—The best time for sowing *Ipomœa Quamoclit*, and *rubro-cœrulea*, for planting in the open air, is the end of February. They will both succeed under similar treatment, viz., to sow them in a gentle hot-bed, to pot them off separately and encourage their growth, until the end of May, when they may be planted out in light, rich soil, in a sheltered situation. *Tropæolum pentaphyllum* and *Maurândyas* may be turned out at the same time.—*M.*

LILY OF THE VALLEY.—*Ainsley.*—The only manner in which you can thin your crowded beds of the Lily of the Valley is to take up and divide the roots in autumn, and replant them six or eight inches apart.—*M.*

FLOWERING PLANTS FOR WALLS.—*T. P.*—A *Magnolia* will do for planting on either side of a porch with a S. aspect. Upon a dwelling fronting the east but well-sheltered, you may train *Glycine sinensis*, *Bignonia radicans*, *Clématis montana*, *Hendersonia* and *flammula*.—*M.*

FIRS.—*T. P.*—We know of no plant, excepting Ivy, which will cling to the bare stems of fir-trees.—*M.*

BORDER-FLOWERS.—*A. K.*—We would recommend as border-flowers to a large Dahlia bed, the different varieties of *Verbena*. As no blue Dahlia has yet been raised, *Anagallis cœrulea grandiflora* and *Monelli* would probably look well in a similar situation.—*M.*

LIME-TREES.—*A grateful Reader.*—If you place your mound of earth on one side only of the Lime-trees you so greatly prize, you are not likely to do them material harm. If you leave a space of six feet between the trunk and the mound, you will probably be safe; indeed, in our own case, we should not be much afraid of carrying the mound quite up to the hole, if it were necessary to do so. The first distance is, however, the safer.—*M.*

EVERGREEN OAKS.—In reply to a correspondent, *Anne* states that she has many evergreen Oaks, and finds several grow freely; the soil is decidedly chalky. She does not find that the Almond and Apricot grow well, though the Peach and Nectarine succeed.—*M.*

PLANTAIN.—*S. L.*—The only effectual means of eradicating Plantain, or Rib-grass, from lawns, is to keep continually cutting away its leaves as often as they appear above-ground. If a pinch of salt is dropped upon the wounded crowns, it will accelerate the destruction of the roots.—*M.*

MOSS.—*A. K.*—There is no effectual means of removing moss from Larch-trees.—*M.*

SPHAGNUM.—*A Subscriber.*—Sphagnum is a coarse kind of Moss which grows in marshy places. On account of the power which it has of retaining moisture, it is particularly suited for gardening purposes.—*M.*

CHRYSANTHEMUMS.—*H. Gray.*—We beg to refer you to a paper upon the cultivation of these plants, in another part of the Paper.—*M.*

IPOMÆA LEARII.—*An ignorant Subscriber.*—This plant usually flowers well in a warm greenhouse. Perhaps you have kept it where it has been shaded by other plants. Place it where it will have plenty of light, and water it freely whilst growing.—*M.*

ARUM.—*A Constant Reader.*—From the limited information which you have afforded us respecting your Arum, by which we suppose you mean *Calla æthiopica*, it is impossible to give you any advice respecting it. The probability is, that you have not exposed it sufficiently to light. Instead of keeping it in a sitting-room during the summer, it should be placed out-of-doors, and in water so much the better.—*M.*

AMPHICOME ARGUTA.—*Salopian.*—This plant may, in some situations, have proved hardy, but it is not generally so. The

great difficulty, when grown in the open air, is to keep the soil around it nearly dry during winter. Particular care must therefore be taken in draining the border thoroughly with lime-rubbish, the surface soil being composed of turfy loam and heath-mould.

CUSTARD APPLE.—*An ignorant Subscriber.*—This plant seldom succeeds well under cultivation in this country. It can only be grown in the temperature of a stove. When raised from seed, unless under very favourable circumstances, it is not likely to flower in less than 10 or 12 years.

PARAGUAY TEA.—*Alpha.*—We are not aware that plants of the Paraguay Tea, or *Ilex Paraguayensis*, can be procured at present in this country. We believe that there are specimens of it in the Royal Botanic Gardens at Kew, and at the Botanic Garden, Glasgow.

ERICAS.—*Sanguinea.*—If *Ericas* and *Epacris*, at the time of potting, are in good health, their balls of earth should not be reduced.

GREENHOUSE PLANTS.—*A Subscriber ab initio.*—Will find lists of good greenhouse and conservatory plants at p. 216 of this year, and at pp. 697 and 899 of 1842.

CLIMBERS.—*T. P.*—The sketches of trellises which have occasionally appeared in the *Chronicle* are adapted for a multitude of Climbers; more especially for *Tropæolums*, *Thunbergias*, *Mandarinias*, *Zichyas*, *Kennedias*, the smaller kinds of *Hardenbergia* and *Passiflora*, *Philiberti*, and *Aristolochias*. Equal parts of fibrous loam and heath-mould, with a small proportion of silver-sand, will suit any of the above plants.

FERN.—*Gallus.*—We do not know whether any English Botanical collector is now in South America, of whom Ferns may be obtained. The newly-introduced species have not been figured in the English Botanical periodicals, except, perhaps, in one or two rare instances.

DAHLIAS.—*Dahl.*—The descriptive list which you think would be useful cannot be prepared till the plants are in bloom; it would be useless to attempt it without having the flowers to refer to. With regard to the success of the Dahlias sent out in 1841, we have examined the lists of those shows where the names of the flowers are given, and we have inserted those that have been generally exhibited. It is to be regretted that the shows are not better reported; many give the names only of the successful exhibitors—others report only one or two stands; so that no correct estimate can be formed from them. The leading favourites of those sent out in 1841 are as follows:—*Brown's Bridemaid*, *Maid of Bath*, *Burnham Hero*, *Indispensable*, *Catleugh's Eclipse*, *Dowager Lady Cooper*, *Sparry's Admirable*, *Fanny Keynes*, *Widnall's Eclipse* and *Queen*, *Catleugh's Tournament*, *Constancy*, *Conqueror of the World*, and *Eucled.* Respecting the seedlings sent out last season, it is more difficult to come to a satisfactory conclusion, as much depends upon the stock a grower has to propagate from. Very few of the new flowers appeared at the shows during the season; of those that were exhibited, *Dodd's Prince of Wales* and *Hudson's Princess Royal* appeared in most of the winning stands; next to these, but greatly below them in numbers, *Whale's Attila*, *Brown's Marquess of Lansdowne*, *Low's Duke of Cornwall*, and *Girling's Ploughboy*. An opinion of the Dahlias to be sent out this season has appeared in last year's *Chronicle*, pp. 622, 639.

ROSES.—*Salopian.*—Your want of success with climbing Roses is accounted for by your statement, that the sub-soil within a foot of the surface consists of hard clay. *P. J.*—It is true that Roses in pots were exhibited at one of the Horticultural Society's Garden Exhibitions some years ago; and uncommon bad ones they were. *A Young Gardener.*—It is not very probable that your Rose grafts will take unless you cover them with grafting clay to exclude the air; in which case, if the operation has been properly performed, there is no reason why they should not succeed.

PELAGONIUMS.—*A Subscriber.*—There is no remedy for the spots upon the leaves of your *Pelargoniums*, which are caused by some mining insect, except cutting off all the infected leaves which can be spared and burning them. *Fewprios.*—You may discard *Beauty of Ware*, *Lady Murray*, *Imogene*, *Isidorium*, *Chef d'œuvre*, *Sidonia*, *Foster's roseum*, and *Fanny Gartli*; and substitute the following sorts: *Matilda*, *Cyrus*, *Witch*, *Annette*, *Hodge's Emperor*, *Gaines's Rising Sun*, *Grand Monarch*, *Madeleine*, *Amethyst*, and *Garth's Queen of the Fairies*.

FUCHSIAS.—*Sanguinea.*—We are not yet sufficiently acquainted with the new hybrid *Fuchsias* to be able to give you any advice respecting them.

POLYANTHUS SEED.—*Miss A. G.*—You had better sow your *Polyanthus* seed in pans, in a light and moderately-rich soil, and give the seed, when sown, a slight covering of sifted soil. The pans should then be placed under hand-glasses. It is better to raise them without bottom-heat, as the young plants are apt to camp off. As soon as the seed begins to vegetate, air should be given; and as they increase in size, care must be taken to keep away slugs. When the sun has much power, it will be advisable to remove the pans to an east or north aspect, to prevent them from becoming too dry. In August they will be ready to transplant, and for their management after this period, you cannot do better than follow the directions given by Dr. Horner, in his excellent paper on the cultivation of the *Polyanthus*, at p. 20, Vol. ii.

HYACINTHS.—*H. Gray.*—You will find good directions for the treatment of these bulbs after flowering at pp. 107 and 756 of 1842.

FRUIT-WALLS.—*P.* being about to erect a garden-wall, has been advised, that if built 16 inches wide at the bottom and diminished gradually to 4 inches at the top, a slight inclination inward will be obtained, which, it is presumed, would be beneficial to the trees, inasmuch as their lower branches would receive the dews and gentle rains, which, in the perpendicular wall, are almost wholly retained by the upper branches, and he asks our opinion as to the value of the suggestion. We think there can be no doubt that such a plan would be disadvantageous, because more injury would be done to the blossoms in spring, by the radiation of heat from the wall in clear frosty nights than there could be gain by the anticipated action of dews in summer. He also proposes to inclose his garden in part only, by a south wall and two wings, forming an obtuse angle with it, which we regard as a good arrangement.

FRUIT-TREES.—*C. C.*—The protection which is afforded to fruit-trees by a piece of net, 2 ft. wide, stretched across the upper ends of poles resting on the top of the wall, must be very slight. To be at all effectual, the net should be twice or thrice doubled, and should reach at least half-way down the poles.

BROCCOLI.—*Curran.*—To obtain a succession of Broccoli during autumn and winter you will find it advantageous to make two or three different sowings between the beginning of May and the middle of June. A selection of sorts, with remarks upon their treatment, is given at p. 300 of 1842.

CUCUMBERS.—*Noodle.*—Cucumbers will bear a temperature exceeding 100° by sun-heat, without injury; but it is not advisable to allow the bed in which they are grown to stand above 90° for any length of time. It is rather early to leave off nightly coverings for the beds, which should, however, be uncovered early, that the plants may have the benefit of the morning sun. The beds at night should range between 65° and 70°.

TURNIPS.—*Anne.*—There is no effectual means of stopping the ravages of the Turnip-fly.

ASPARAGUS.—*Maritimus.*—You will greatly benefit both *Seakale* and *Asparagus* beds by watering them with sea-water.

RAMPION.—*H. B. H.*—This plant is grown on account of its edible roots, which, after being peeled, are eaten like Radishes. The seeds should be sown in drills six inches apart, any time between this and June, upon light, open soil; in hard or stiff land, the roots are liable to grow forked. *A Subscriber.*—To sow the seed of the Rampion on light open soil, and

not too early in the season, are the principal points in its cultivation. All that the plants require until they are fit to draw, is to thin them out, if necessary, 4 inches apart, and to water them in dry weather.

TRUFFLES.—*A. K.*—Truffles are propagated by breaking into pieces the old decayed tubers, and planting them two or three inches deep in a mixture of rotten leaves and loam.

RED SPIDERS.—*A Subscriber.*—If the red spider is very numerous upon your *Calceolarias*, dust the under-sides of the leaves with flower of sulphur; but if it is only just making its appearance, you may keep it under by preserving a moist atmosphere where the plants are grown, and by syringing them every fine morning.

ONION MAGGOT.—*Ficus.*—It is stated that Onion-beds upon which soap-suds and urine have been thrown during the winter previously to the ground being dug, remain free from the attacks of the maggot during the following season. By applying the same materials in a diluted state to your Onions while growing, the same result may possibly be obtained.

WIREWORM.—*Agricult.*—Spirits of tar are the most effectual remedy with which we are acquainted for destroying the wireworm. We should therefore recommend you to saturate some sand with that compound, and mix it with the soil in your Ranunculus and Anemone beds when you turn them up in autumn.

SCALE ON TREES.—*G. W.*—The best remedy for destroying the scale on Pear and Apple-trees is, when the young insects issue from beneath the scales at this season of the year, to wash them off with lime-water. This washing should be repeated until the old scales are deserted.

BOOKS.—*W. D. F.*—Lindley's "School Botany" is the more exact, but the same author's "Lady's Botany" is the more popular book for teaching children the natural system of botany. "Newman on British Ferns" is the best book we have on that subject; every species is illustrated with figures.

FAMILIAR BOTANY.—*W. B.*—You are quite right; the commonest name of *Ranunculus Ficaria* is Pilewort; but that is a disagreeable name, and "R. E." prefers Figwort, which is the translation of the Latin word. The plant is also called the lesser Celandine, but that is objectionable, because of its liability to confusion with *Chelidonium majus*, the common Celandine.

THE PIGUA PLANT.—*Quercus.*—There is no plant known by this name except to the vendors of Piqua-tea, which seems to be a sort of hay-tea, if we are to judge by the fragments of stems of which it consists.

LAWNS.—*Paul Jones.*—Your proposed plan is good, but will certainly be improved by paring and burning; for the following reasons:—1, Your heavy clay will be mechanically improved by the operation; 2, You will be certain to destroy all coarse grass, weeds, and grubs; and 3, That being effected, you will save the expense of trenching, because digging will be quite enough. It will also be useless, if burning is well executed, to follow the land at all; but you may lay it down immediately after the digging. If you have any lime-rubbish at hand, from old buildings, a dressing of that after burning, and before digging, will be very useful.

GRASS-SEEDS FOR LAWNS.—*J. B.*—The best grasses for a lawn are the following, with the proportion of seed requisite of each per acre: *Cynosurus cristatus*, 6lbs.; *Festuca duriuscula*, 3lbs.; *F. tenuifolia*, 2lbs.; *Lolium perenne tenue*, 20lbs.; *Poa nemoralis*, 12lb.; *P. nem. sempervirens*, 12lb.; *P. trivialis*, 12lb.; *Trifolium repens*, 7lbs.; *T. minus*, 2lbs.

MOWING.—*Fungus.*—The quantity of lawn-grass which a man may mow and sweep in a day, varies so much with the state of the weather and the quality of the grass that it is impossible to name any certain extent. It is seldom in summer that mowing can be performed after ten o'clock in the morning. A quarter of an acre may therefore be taken as the average quantity. In this case the sweeping will not occupy more than two or three hours. The value of the work will of course vary with the price of labour in different parts of the country.

PAINT.—*H. C.* inquires for the best cheap stone-colour paint for rough out-door horticultural purposes. We believe the best is the anti-corrosive—but painters don't like to use it because it is difficult to work. The best black paint we know is the black oxide of manganese.

CREATS.—*M. W. K.*—We fear you have been sadly cheated; it is unwise to deal with people whom nobody knows anything about. There are no such things as a yellow tree Peony or a yellow Moss Rose. To buy plants by drawings is like purchasing an estate on the faith of the description of a puffing auctioneer.

FLOWER-POTS.—*A Subscriber.*—The sizes of flower-pots vary considerably in different parts of the country. The following are the dimensions of the different sizes in the neighbourhood of London:—

	2s are 18in. in diameter at top, and 14in. deep	1s	12
4	15	13	11
6	13	11	9
8	12	10	8
12	11½	9	7
16	9½	7	6
24	8½	6	5
32	6	5	4
48	5	4	3½
60	3½	3	2½
Thumbs	2½	2	1½

POULTRY.—*A Constant Reader* will find good information upon this point in the article "Poultry" of the "Penny Cyclopaedia" (by Martin Doyle), and also in his own "Cyclopaedia."—*M.*

MISCELLANEOUS.—*Zeta.*—Your question is answered at p. 73 in the *Chronicle* for the present year. *Polly.*—The eye of your *Polyanthus* is not circular, and it forms a ragged edge with the ground colour; the edging is also irregular round the segments, and too broad down the centre of each. *Mr. Terry.*—We do not consider your seedling *Chieranias* any improvement upon many sorts already in cultivation. The flowers are too small in two of the specimens, and the white has a confused and dusty appearance; in the larger-flowered variety the white is very pure, but we have many in the same style. *T. W.'s* weevils are the *Curculio* (*Otiorynchus*), *tenebrioides*. The smaller specimen being the male, and the larger one the female. *R.*—*J. W., Chichester.*—Much obliged, but we really cannot understand the plan. Cannot you send us a better drawing? *A Subscriber.*—It is not very likely that a Grass growing in Devonshire should be the same as the Tussock Grass of the Falklands. What you have sent consists of the flower of *Arundo Phragmites*, the common reed, the leaf of some other plant, and the shoot of an *Equisetum*. This monstrous trifurcate cost you 3d. for postage, us 2d. for extra postage, and our readers the loss of a few lines of readable matter. Was such a question worth such an expense? *A Housekeeper's* question is rather too absurd; and we really cannot oblige her with an answer. *An Original Subscriber.*—Your seedling *Fuchsia* is pretty, and bears some resemblance to *F. Lanei*; it does not, however, equal that variety either in size or brilliancy of colour. *W. S. D.*—Your plants are, 1, *Semprevivum tortuosum*; 2 appears to be *Leptospermum scoparium*; 4, *Kleinia articulata*; 5, *Acmadénia juniperina*. *Aliquis.*—No such plant is known in this part of the country as the Roman Iris. *A. K.*—The Fungus is a species of *Boletus*, springing from the dead parts of trees, which it eventually destroys. *Evergreen.*—Your plants are, 1, *Ceratonia siliqua*; 2, *Solanum crispum*; 3 appears to be *Linum flavum*. *R. B. R. P.*—Your plants are, 1, *Acacia prostrata*; 2, *Diosma capitata*. *J. A.*—Your specimen is not a *Marchantia* at all, but *Jungermannia epiphylla*. *Juvenis.*—What can it possibly signify to you, me, or any other person of respectability what such people write, say, or do? They are much more dangerous to their friends (?) than to anybody else. *Agricult.*—Some of the best Carnations have been enumerated in the late Numbers

of the *Chronicle*. Select lists of Pansies will be found at pp. 79 and 105. *S. F. G.*—The *Azalea* is correctly named *A. Young Beginner*.—Your plants are, 1, *Epidendrum ellipticum*; 2, *Acacia prostrata*; 4, *Pultenaea subumbellata*; 6, *Corydalis bulbosa*. The remainder are not sufficiently advanced to be distinguishable. *A Young Botanist.*—We cannot undertake to determine the names of East and West Indian seeds. *G. L.*—If you wish us to ascertain the names of your plants, you must send proper specimens: those which we can make out are, 1, *Linum flavum*; 2, *Lilium floridanum*; 4, *Justicia speciosa*; 5, *Westringia rosmarinifolia*; 6, A species of *Pittosporum*. *Stura.*—The *Oncidium* is *O. stramineum*. *G. G.*—Your plants are, 1, *Hermannia alnifolia*; 3, *Phylla ericoides*; 4, *Acmadénia pungens*. *J. K. F.*—Many thanks for your communication, which we would have availed ourselves of had we not been in possession of a more extensive list. Both have been prepared from the same source, and though they differ in numbers, the scale is the same. *Ererton.*—The climbing annual to which you allude is *Ipomœa Quamoclit*. *Lincoln's Inn.*—The Pear is *Buchanan's Spring Beurre*, known in some collections as the *Winter Beurre*. The Apple is the *Petworth Seedling*, and probably the same as the *Petworth Nonpareil*. *Vertumnus.*—Your plant is *Lapeyrousia anceps*. *E. M. W.*—*Lasor*, and several others. Thanks. *An Inquirer's* plant is *Acer neapolitanum*. *T. O. S.*—The Milford Marrow Pea is a large green Marrow; those you sent are not.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE overland mail from India and China has brought advices from Bombay to the 1st March, and from Canton to the 21st January. The Indian news is of great importance, containing the accounts of a hard-fought battle between the British Army under General Napier, and the Ameers of Scinde, in which 22,000 Beloochees were totally overthrown by a corps of our Indian Army, amounting to no more than 2,800 men. The loss of the enemy is estimated at 5000 men, 1000 of whom were left dead on the field, together with the whole of their artillery, ammunition, standards, some treasure, and a considerable quantity of stores. The loss of the British amounted to upwards of 200, including several officers, who conspicuously distinguished themselves in the battle. Three days after the action, the Ameers surrendered themselves, unconditionally, as prisoners of war, and the British colours were hoisted over the city of Hyderabad. The Governor-General arrived at Delhi on the 5th Feb., and was preparing to go to Agra, where his presence was considered necessary to put an end to the disturbances in the Bundelkund territory. It was rumoured that the Brahmins of Sonmuth had declined to receive the celebrated gates, on the ground that they had been polluted by their application to a Mahomedan tomb; it was therefore necessary to devise some other destination for these trophies. From China the news is satisfactory so far as it conveys the assurance of continued tranquillity, but in other respects it is comparatively unimportant. The Emperor and his Commissioners had shown the strongest desire to maintain friendly relations with the British Officers; and the prudent measures of the Municipal authorities of Canton had successfully repressed the angry feelings which led to the riot of the 7th December. The high Imperial Commissioner, deputed by the Chinese Government to conduct the commercial negotiations with Sir H. Pottinger, had arrived at Canton, and the first conferences were arranged to take place on the 21st January. Our French news is chiefly of domestic interest, and our intelligence from Madrid adds little to what was known last week on the constitution of the New Chamber. The Portuguese Government have refused the terms offered by Lord Aberdeen on the tariff question, and it is expected that the British Cabinet will at once break off the negotiations. From the Levant, we have accounts of the remarkable fatality which has attended the commission appointed to arrange the differences between Persia and Turkey. Both the Persian and Turkish Plenipotentiaries had died suddenly; the two English Commissioners narrowly escaped an accidental death, and the two Tatars sent with the intelligence to Constantinople had died on their way. From the United States we have the President's message in reference to the disputed construction of those portions of Lord Ashburton's Treaty which relate to the right of search. Mr. Tyler declares against any pretension on the part of Foreign Powers to visit vessels sailing under the American flag; and hints, in no very obscure terms, to the disposition of his Government to maintain this principle by the aid of its whole naval power.

The message of President Tyler has naturally occupied attention in both Houses of Parliament; Lord Aberdeen and Sir R. Peel have declared that the difference of construction to which the message referred was more apparent than real; and the thanks of the House of Lords were voted last night to Lord Ashburton for the conclusion of the treaty. On Tuesday, Lord Ashley brought forward his motion condemnatory of the continuance of the trade in opium, which he characterised as inconsistent with the honour and duties of a Christian kingdom. The motion was opposed by Ministers and ultimately withdrawn, on the ground that negotiations were now in progress on the subject of this trade, the fate of which might be risked by any hasty resolution of the House. On Thursday Mr. C. Buller moved an address to the Queen, for an inquiry into the best means of exten-

sive and systematic colonisation. He did not propose any specific plan, or an alteration of the existing system, but urged the Government to extend its principle and investigate every point of the subject, in order that the best course might be adopted. Lord Stanley opposed the motion as unnecessary, because an enlarged system of emigration was already in operation under the superintendence of Government. After a long and interesting debate, Mr. C. Buller expressed his satisfaction that the motion had excited so much attention, and consented to leave the question in the hands of the Executive.—The revenue returns for the past quarter have been published this week; they confirm the anticipations of the productiveness of the Income Tax, and show a steady increase in the Post-office; but on all the other branches of revenue there is still a falling off. The results, however, are more satisfactory than those exhibited by the quarter ending in January last, and they may be considered to indicate that the country has surmounted the worst of its embarrassments.

Home News.

Court.—Her Majesty and Prince Albert continue at Buckingham Palace. Her Majesty during the week has taken her usual daily walk in the gardens of the Palace, and is in excellent health. All the arrangements have been made at the Palace in anticipation of her Majesty's accouchement, which is expected to take place almost daily.—Lord Charles Wellesley, clerk marshal, has succeeded Colonel Buckley in the duties of equerry in waiting on the Queen, and Colonel Bouverie has succeeded Maj.-Gen. Sir Edward Bowater as equerry in waiting on Prince Albert.—The King of Hanover is expected to arrive in London on a visit to this country, in the course of the present month.

Official Appointments.—Capt. Fitzroy, late member for Durham, has been appointed Governor of New Zealand. It is rumoured that Mr. Pemberton is to have the seals of the Duchy of Lancaster, as Chancellor, and that the Hon. J. Talbot, son of Earl Talbot, is to succeed Mr. Pemberton as Attorney-General to the Duke of Cornwall. Mr. Wordsworth has been appointed Poet Laureate, in the room of the late Dr. Southey.

Parliamentary Movements.—The contest for the representation of Durham, vacant by the appointment of Capt. Fitzroy to the Governorship of New Zealand, terminated on Tuesday in the return of Lord Dungannon; the numbers were—for Lord Dungannon, 507; for Mr. Bright, 406. The Nottingham election closed on Thursday, when Mr. Gisborne, the Liberal candidate, was returned by a majority of 117; the numbers were: for Mr. Gisborne, 1848; for Mr. J. Walter, jun., 1731.—The Athlone election has terminated in the return of Mr. Collett, the Liberal candidate. The numbers were: for Mr. Collett, 114; for Capt. Beresford 108. A petition has been presented by the liberal electors of Cambridge against the return of Mr. Fitzroy Kelly. A vacancy has occurred in the representation of East Suffolk by the death of Sir B. Vere.

The Revenue.—The official returns of the revenue for the year and quarter which ended on the 5th inst. have just been published. They more than confirm the anticipations of the productiveness of the Income-tax, which causes an increase in the total amount of the returns; but, with the exception of the Post-Office, they still show a falling-off on all the other branches of revenue. The total ordinary income for the year ended April 5, 1842, was 45,363,827*l.*; that for the year just ended was 46,078,810*l.*—showing an increase on the year of 714,983*l.* The total ordinary income for the quarter ended April 5, 1842, was 8,720,532*l.*; that of the quarter just ended was 10,469,477*l.*—showing an increase on the quarter of 1,748,945*l.* The following are the details:—The returns for the Year exhibit an increase in the Income-tax of 2,456,288*l.*; Post-Office, 103,000*l.*; Miscellaneous, 425,969*l.*; to which must be added, Imprest and other moneys, 154,913*l.*; Repayments of Advances, 65,614*l.*—making the total increase 3,205,784*l.* There is a decrease in the Customs of 1,076,336*l.*; Excise, 1,059,093*l.*; Stamps, 146,790*l.*; Taxes, 146,082*l.*; Crown-Lands, 62,500*l.*—making a total decrease of 2,490,801*l.*, which, deducted from the above increase of 3,205,784*l.*, gives, as stated above, a total increase on the year's accounts of 714,983*l.* The returns for the Quarter show an increase in the Income-tax of 1,885,232*l.*; Post-Office, 2,000*l.*; Miscellaneous, 218,363*l.*—making a total of 2,105,595*l.* They show a decrease in Customs of 275,516*l.*; Excise, 1,788*l.*; Stamps, 6,361*l.*; Taxes, 8,055*l.*; Crown-Lands, 15,500*l.*; Imprest and other moneys, 8,807*l.*; Repayments of Advances, 40,623*l.*—making a total of 356,650*l.*, which, deducted from the above increase of 2,105,595*l.*, shows a total increase in the quarter's accounts of 1,748,945*l.*

Colonial and Consular Services.—The estimates for the year ending March 31st, 1844, are:—Bahamas, 3410*l.*; Bermudas, 4049*l.*; Prince Edward's Island, 3070*l.*; Sable Island, Nova Scotia, 400*l.*; Sierra Leone, Gambia, and Gold Coast, 13,680*l.*; St. Helena, including allowances to late servants of East India Company, 11,500*l.*; Western Australia, 7785*l.*; Port Essington, 1468*l.*; Falkland Islands, 4350*l.*; New Zealand, 61,093*l.*; Heligoland, 1023*l.*; Governors and others, West Indies, 18,667*l.*; Clergy, North America and New Zealand, 12,190*l.*; Indian Department, Canada, 18,895*l.*; Emigration, 11,286*l.*; Justices in the West Indies, Mauritius, &c., 49,700*l.*; Negro Education, 18,000*l.*; Captured Negroes, Support, &c., 35,000*l.*; Commissioners, for Suppression of Slave Trade, 23,000*l.*; Consuls Abroad,

104,700*l.*—Total, 403,336*l.* The total for the year 1841, was 381,212*l.*; and for 1842, 392,154*l.*; thus showing an increase, as compared with 1841, of 22,124*l.*; and of 11,182*l.*, as compared with 1842.—The charge for the establishment in China, which has usually formed part of this estimate, will be submitted in a separate estimate, as soon as the arrangements are completed.

Houses of Parliament.—A return made to the House of Commons, published this week, states that the total amount already expended for building the new Houses of Parliament is 380,483*l.* 10*s.*; the amount voted has been 438,500*l.*; and consequently, 58,016*l.* 10*s.* is in hand unexpended, which will be required for works now in progress of completion. It is estimated that a further sum of 578,424*l.* 12*s.* 9*d.* will be required to complete the buildings. The total amount of Mr. Barry's estimate will therefore be 1,016,924*l.* 12*s.* 9*d.*, besides what will be required for completing the landing-places, making good the pavings, furniture, and fittings, and for decorations by works of art.

Yeomanry.—A parliamentary return of the number and expenses of the effective yeomanry of Great Britain, in the year 1842, states the number of troops to have been 247, containing 831 officers and 13,358 men; the total expense connected with whose maintenance was 101,831*l.* 8*s.* 11*d.* The amount voted by Parliament was 82,458*l.*, thus showing the excess of expenditure beyond the vote of Parliament to have been 19,373*l.* 8*s.* 11*d.* The reason of the excess arose from unforeseen charges on account of corps called out in aid of the civil power. Six yeomanry corps, containing six troops and 472 men, now serving gratuitously, are to be placed upon the permanent establishment from the 1st of this month; and seven additional corps, to consist of 16 troops and 935 men, are expected to be raised for the present year.

Stamp Duties on Legacies, &c.—A Parliamentary paper, just published, shows that in the year ending the 5th Jan., 1843, the total amount of duty paid for legacies, probates, and administrations, was—in England and Wales, 2,001,960*l.* 7*s.* 8*d.*; in Scotland, 150,213*l.* 11*s.* 2*d.*; in Ireland, 114,923*l.* 15*s.* 6*d.*; total 2,267,105*l.* 14*s.* 4*d.* Duties received since 1797—in England, 59,643,426*l.* 6*s.* 11*d.*; in Scotland, 3,287,910*l.* 10*s.* 8*d.*; in Ireland, 1,664,853*l.* 8*s.* 0*d.* Total duties received since the 1797 amount to 64,596,190*l.* 6*s.* 4*d.*

Foreign.

FRANCE.—The recent debates in the French Chambers have been mostly of domestic interest, and M. Barrot's notice of a motion, for limiting the jurisdiction of the Court of Peers, and liberating journalists from that of the Correctional Police, occupies the chief attention of the Paris journals of Monday. In the Chamber of Deputies, on Friday, M. Desjoubert expressed an apprehension that the Government was about to commit a great imprudence in reviving the old claims of France to the Island of Madagascar. M. Guizot, in reply, entered upon a full exposé of the system pursued and contemplated by the French Government in the Pacific, and now in the Indian Sea; and which, he explains, is "not to compromise or commit France by endeavouring to form extensive colonial establishments at a long distance from home, and to incur by such proceeding the danger of involving her in serious contests with the natives of those countries, or with foreign powers generally. That which is advantageous to France and indispensable for her, is to possess points on the globe destined to become great centres of trade and navigation, and which will prove secure and strong maritime stations, which would at once serve in aid of our commerce by affording harbours and shelter for our shipping, with means of refit, without our being compelled to resort for those objects to foreign ports." The bill relative to the organization of the Privy Council, and the bills for confirming the provisional arrangements entered into by the Minister of Public Works with the companies contracting for the railroads from Paris to Calais and Lille, and from Avignon to Marseilles, were presented to the Chamber on Monday.—The nuptials of the Princess Clementine of Orleans are fixed for the 20th inst., and will be celebrated at Fontainebleau.—Accounts from Algiers state that General Bugeaud is making immense preparations for another campaign, which is to commence about the 18th April, and is announced as likely to consolidate the domination of France before the end of the present year. In the meanwhile, the French troops are fighting in almost all directions. General Lamoriciere is engaged on the Upper Oued-Riou, near the margin of the desert; General Gentil is struggling with the enemy at Mazonna; Generals de Bar and Changarnier are actively fighting in the Dahra and the Beni-Menacer Mountains; the Medeah column has perpetual conflicts with the Kabyls of the east; General d'Hilliers and two Colonels are combating the Kabyls of the mountains between Bona and Constantina; and, lastly, the column which recently yielded the Duke d'Aumale a splendid tribute in the *Moniteur*, has returned from the expedition in such a state of exhaustion, that a large proportion of the men are now in the hospitals.

SPAIN.—We have advices from Madrid to the 29th ult. The new chamber is said to be composed as follows:—Anti-coalitionists, 103; Coalitionists, 61; Doubtful, 18. It is expected that the 103 will support the Regent, and all the measures of the present ministry. As to the exact men they may desire, some doubt still exists; it is, however, reported as certain that the Government had despatched a courier to General Sancho, the minister in London, calling upon him to repair immediately to Madrid, the Regent being desirous to consult him on the organization of a new Ministry.—The contract for the quicksilver mines of Almaden was on the 28th ult.

adjudged to Messrs. Rothschild. The price (81½ dollars per metrical quintal) is 21 dollars higher than that fixed by the contract which is to expire in November next. The new contract is to endure for four years.

PORTUGAL.—Accounts from Lisbon to the 27th ult., mention that the *ultimatum* of Lord Aberdeen on the tariff question has been rejected by the Portuguese Government, which will not consent to any reduction on English woollens beyond their former propositions. It is therefore expected that the English Cabinet will at once break off the negotiations, and that the convention is virtually at an end.—The comet had caused a great sensation at Lisbon, many of the inhabitants believing that the end of the world was come. All the confessionals of the city were crowded with penitents for many days, and several people were so much affected that they have been sent to the public madhouse.

SWITZERLAND.—On the morning of the 25th ult., at seven o'clock, a severe shock of earthquake was felt at Basle and its neighbourhood. The barometer fell at the time only about one line, but a sudden change of weather followed immediately, it having been unusually mild for the season previously to the shock, and severely cold afterwards.

GERMANY.—The Diet of the States of Prussia was opened on the 16th ult., at Königsberg, by a speech from the Royal Commissary, remarkable for its liberal expressions. "A powerful spirit," he said, "of a beneficent nature, as well as of a mischievous character, is abroad in the present age; and, therefore, is it the more necessary for all who have the true welfare of their country at heart to keep a clear, unclouded view before them; not to permit theories—specious perhaps, but nevertheless superficial in themselves, to misguide them; not to let the blessed light, which is so happily kindling, grow into an all-consuming flame; finally, not to exchange the solid good we enjoy for doubtful or deceiving hopes in prospect." According to a circular from the firm of Brockhaus, of Leipsic, as proprietors, the German *Allgemeine Zeitung* reappeared on the 1st inst., Professor Bülow having consented to become the editor; and with this change the journal will again be licensed in the Prussian dominions. The *Carlsruhe Gazette* states that a shock of an earthquake was felt in the district of Loerrach, in the Grand Duchy of Baden, on the morning of the 25th ult. The doors and windows of the houses were forced open, and furniture was thrown down, but no house fell, and no person was injured.—A suspension-bridge, surpassing all that has been seen, is to be constructed at Vienna, across the Danube. It will be 1,470 English feet in length, with only one pier in the river. The Postal convention is spreading in Germany, from north to south. Austria and Saxony have concluded an agreement by which 6 kreuzers shall be charged for every distance short of ten German miles, and 12 kreuzers for every greater distance. There are cases, however, in which slight augmentations take place.—The first vessel which reached the free port of Treves, from Holland, was the occasion of a great fête on the 17th.

ITALY.—Advices from Rome mention that the Pontifical Government had abolished, to a certain extent, the exorbitant privilege which hitherto insured impunity to malefactors who sought an asylum in the churches and convents of the Pope's dominions. A recent legislative enactment provides, that hereafter the secular authorities may cause to be followed and arrested, wherever they may take refuge, all individuals guilty—1st, of the destruction of relics, or images of the saints; 2d, of profanation of the churches; 3d, of insults by words or violence against clergymen dressed in their costumes; 4th, of high treason; 5th, of murder; 6th, of highway robbery, either singly or with the aid of accomplices; and 7th, of coining.—A letter, dated Milan the 24th ult., states that four earthquakes had been felt in Calabria since the 27th December. The last occurred on the 13th February, but fortunately no injury was sustained.—Letters from Naples state that the nucleus of the comet had been distinctly seen there.

TURKEY AND PERSIA.—We have intelligence from Constantinople of the 17th, and from Smyrna of the 19th ult. The arrangement of the difference between Turkey and Persia is said to have made no progress since our last accounts from the Turkish capital. The Trebizond packet had brought despatches from Persia, from which it appears that Meerza Jaffer, the Persian Plenipotentiary to the Conference at Erzeroum, had died suddenly at Tabreez, a few days after the death of Nourri Effendi, the Turkish Plenipotentiary, at Erzeroum. A most extraordinary fatality has displayed itself on this occasion, and no Eastern story-teller, who delights in marvellous coincidences, could have imagined a series of disasters more astonishing than those which have distinguished these ill-fated conferences. Before starting from Constantinople, Captain Williams, the English commissioner, was, immediately after his nomination, taken dangerously ill, so as to necessitate the appointment of a coadjutor, the Honourable Mr. Curzon. Shortly after the arrival of these gentlemen, accompanied by Mr. Redhouse, their interpreter, at their post, the whole party narrowly escaped suffocation, having fallen asleep in a room heated by charcoal. It is also stated that the Tatar despatched from Erzeroum to Tabreez to announce the death of Nourri Effendi, and the Tatar sent from Tabreez with the news of Meerza Jaffer's death, had both died on the way.—The news from Syria is not important. The comet had been seen at Smyrna during several successive evenings.

INDIA.—The Oriental steamer arrived at Malta from Alexandria on the 30th ult., bringing the Overland India Mail, despatched from Bombay by the Victoria steamer, on the 1st ult. The dates are therefore to the 1st March from Bombay, and to the 22d January from China. On

the 17th February, General Sir C. Napier obtained a brilliant victory in Scinde, near Hyderabad, after three hours of a desperate struggle; 22,000 Beloochees were entirely defeated by 2,700 English, who had 250 killed or wounded, including 18 officers. It appears that the British Government, having introduced civilisation into a portion of Scinde, and taken possession of the Indus, the navigation of which became a matter of general benefit, a demand was made on the Ameers to give up, for the use of that navigation, certain strips of land lying along the river. They, feeling that they could not immediately refuse, temporized, until at length their troops were collected, when, on the 14th February, they sent word to Major Outram to retire from their city. Major Outram, who did not suppose that they would proceed to extremities, delayed. On the 15th, the residency of the British Political Agent was attacked: it was gallantly defended by 100 men for several hours; but at length, their ammunition having been expended, the British soldiers retired, with a small loss, to the steamers, and proceeded to join Sir Charles Napier, then at the head of about 2,700 men, at a distance of 20 miles from Hyderabad. The Ameers, in the meantime, hastened to attack the British force. On the following day, Gen. Napier marched to Mutharee, and, on his arrival there, ascertained that the Ameers were in position at Meeanee, distant about ten miles, to the number of twenty-two thousand men. Being aware that any delay for reinforcements would both strengthen the confidence of the enemy, and add to their numbers, although his own force was not one-seventh part of the enemy's, Sir C. Napier resolved upon making an immediate attack, and, accordingly, marched towards Meeanee at four o'clock in the morning (the 17th). At eight, A.M., the advanced guard of Gen. Napier's force discovered the enemy's camp, and at nine o'clock the British troops formed in order of battle, being composed of about 2,800 men, of all arms, and 12 pieces of artillery. The enemy opened a most determined and destructive fire upon the British troops, and, during the action which ensued, with the most undaunted bravery repeatedly rushed upon them sword in hand. After a most resolute and desperate contest, which lasted for upwards of three hours, the enemy was completely defeated and put to flight, with the estimated loss of about 5,000 men, 1,000 of whom were left dead on the field; together with the whole of their artillery, ammunition, and standards, a considerable quantity of stores, and some treasure. The following day, Meer Roostum Khan, Meer Nusseer Khan, and Meer Wullee Mahomed of Kyrpore; Meer Nusseer Khan, Meer Shadad Khan, and Meer Hoossein Khan of Hyderabad, came into the camp of Gen. Napier, and unconditionally gave themselves up as prisoners of war; and the British colours were hoisted over the city of Hyderabad on the 20th February. The Governor-General, in his official report, states, with regret, that considerable loss has attended this brilliant victory. In particular, he mentions the following officers, who, after having conspicuously distinguished themselves, died on the field of battle:—Major Teasdale, commanding 25th Reg., B.N.I.; Captain Tew, her Majesty's 22d Reg.; Adjutant Cookson, 9th Reg., B.L.C.; Brevet-Major Jackson, 12th Reg., B.N.I.; Brevet-Captain Meade, 12th Reg., B.N.I.; and Lieut. Wood, 12th Reg., B.N.I. The intelligence from Afghanistan is, that anarchy continues to prevail there. Akbar Khan is said to be master of Cabul, and his father Dost Mahomed is proceeding from Lahore towards Peshawur, as if to join him. Akbar Khan has threatened to invade the province of Peshawur, and to take it from the Sikhs, but the good treatment of Dost Mahomed by the latter may prevent that invasion. From Candahar, news has been received that Sufter Jung had been compelled to quit that city, and to seek safety in flight. Lord Ellenborough, who had arrived at Delhi on the 5th February, was preparing to go to Agra, where his presence was considered necessary—not only on account of the death of Scindia, the powerful chief of Gwalior, at the age of 27 years, to whom an adopted heir has been named—but also in order to contribute, by various arrangements, to put an end to the disturbances in the Buldelkund districts. Col. Malcolm left Bombay on the 18th February, on board a steamer, in order to deliver the ratified treaty to the Plenipotentiary. The Court-Martial on Gen. Shelton and Major Pottinger has terminated in their acquittal.

CHINA.—We have advices from China to the 20th Jan., but the news is unimportant. Tranquillity continues to be preserved in Canton, and the discontented spirit which led to the riot of the 7th December, and which still in some degree prevails amongst the populace, seems likely to be entirely subdued by the prudent measures of the municipal authorities. An attempt had been made to blow up one of the public gates of the city, but the prompt issuing by the government of proclamations, couched in a decided tone, and which had the effect of preventing any serious disturbances, proved at the same time the anxiety of the Chinese officers to confirm the good feeling now subsisting between the two governments. As a further proof of their sincerity it may be mentioned that in a recent number of the *Pekin Gazette*, an announcement is made that the "strongest imperial commands" have been given to the governors, &c., of the Che Keang, Fukeen, and Keangnan provinces, to use their utmost endeavours for the maintenance of friendly relations. Elepoo, the high imperial commissioner, deputed by the Chinese Government to conduct the commercial negotiations with Sir H. Pottinger, arrived at Canton on the 10th January, and took up his residence in the city. He immediately apprised the plenipotentiary of his arrival, and it was arranged that the first conferences should be held at Whampoa, about the 21st January. When

Elepoo reached Canton, the Hong merchants expressed their desire to have an interview with him, which he declined; and it is now said that he has demanded from them, by next June, the whole amount of their debts, which is to the extent of three millions of dollars.

UNITED STATES.—The packet-ship Philadelphia arrived off Dover on Friday, with American papers to the 4th March; and on Saturday the Great Western steamship arrived at Liverpool from New York, which place she left on the 17th ult., having experienced very rough weather in the Atlantic. The Oxford and the Patrick Henry packet-ships also arrived at Liverpool on the same day with the Great Western, but the news by the steamer being several days later, embraces all that was conveyed by the other vessels. On the 27th February a message from the President was read in the House of Representatives, in reply to a request from the latter body for a copy of any communication received from the British Government as to the construction put by the President on those portions of Lord Ashburton's treaty which relate to the right of search question. Mr. Tyler, in his message, strongly declares against any pretension, on the part of foreign Powers, to visit vessels sailing under the American flag. Mr. Webster, the Secretary of State, supplied the substance of a communication from Lord Aberdeen to Mr. Fox, the British Minister in Washington, wherein his Lordship protests against the supposition that any one of the principles, in respect to this question, heretofore contended for by Great Britain, was in the slightest degree compromised by the late treaty. The President says, "I regarded the eighth article as removing a possible pretext—on the ground of mere necessity—to visit and detain our ships upon the African coast, because of an alleged abuse of our flag by slave traders of other nations. We had taken upon ourselves the burden of preventing any such abuse by stipulating to furnish an armed force—regarded by both the high contracting parties as sufficient to accomplish that object. Denying as we did and do, a colour of right to exercise any such general police over the flags of independent nations, we did not demand of Great Britain any formal renunciation of her pretension. Still less had we the least idea of yielding anything ourselves in that respect. We chose to make a practical settlement of the question. This we owed to what we had already done upon this subject. The honour of the country called for it, the honour of its flag demanded that it should not be used by others to cover an iniquitous traffic. This Government, I am very sure, has both the inclination and the ability to do this; and, if need be, it will not content itself with a fleet of 80 guns—but sooner than any foreign Governments shall exercise the province of executing its laws, and fulfilling its obligations, the highest of which is to protect its flag alike from abuse and insult—it would, I doubt not, put in requisition for that purpose its whole naval power. The purpose of this Government is faithfully to fulfil the treaty on its part; and it will not permit itself to doubt that Great Britain will comply with it on hers. In this way peace will be best preserved and the most amicable relations maintained between the two countries." The Presidential campaign is fairly opened. The following are named as candidates for the office:—Mr. Tyler, Mr. Van Buren, Mr. Calhoun, Mr. Cass, Judge M'Lean, Mr. Johnson of Kentucky, and Mr. Buchanan. The great contest will be between Mr. Van Buren and Mr. Calhoun. It is thought, however, by the friends of Mr. Tyler that the struggle will end in his nomination. Mr. Webster, it is understood, is on the point of retiring from the Cabinet, and Mr. Cushing, it is said, will succeed him as Secretary of State. A rumour prevailed that Mr. Webster will be appointed Minister at London, in the place of Mr. Everett, who is going to China.—The comet, the sudden appearance of which in our hemisphere has excited so much interest, had as suddenly appeared in the western hemisphere. Its tail was first observed on the 5th ult., and excited as much interest in America as in Europe. On the 11th, the head was observed considerably elevated above the horizon, and close to the well-known star Beta of the Whale. At 7 o'clock, its right ascension was 1 hour 43 minutes, and its declination 11½ degrees. "The nucleus presented the appearance of a bright central spot, enveloped in a misty haze, elongated in the direction of the train, the whole somewhat resembling a lamp seen through a shade of ground glass."

WEST INDIES.—The royal mail steamer Teviot arrived on Sunday with mails from Mexico and some of the West India Islands, but none from Jamaica. She brought about 700,000 dollars and 105 serons of cochineal on freight. The Avon was thirty days on her outward passage, having expended all her coals in fifteen days after leaving Falmouth. The Trent had not arrived. Another expedition, consisting of 600 to 700 men, had sailed in the steamer Montezuma, from Vera Cruz, for Campeachy, private reports from which place were unfavourable, but nothing official had been reported by the Mexican Government. From St. Thomas's we learn that several slight shocks of earthquake have been experienced there since the departure of the last mail boat, but causing no injury of any kind. A letter from St. Domingo says that all the southern part of that fine island is in a state of civil war. St. Jeremie is the head-quarters of the Revolutionists, where there are 5,000 insurrectionists under arms, their object being the establishment of a government system similar to that of the United States.

BRAZILS.—We have accounts from Rio to the 8th Feb. They state that Mr. Ellis's mission has entirely failed, and that he is making preparations to return to this country immediately, in the Malabar. His proposal for a fresh treaty has been rejected by the Brazilian Ministers, the terms not being such as they are willing to accept; but

they have offered to treat if the English Government will reduce the duties on Brazilian sugar and coffee to the same rates as those on sugar and coffee the produce of the British colonies. Mr. Ellis had no power to negotiate on any such terms, and it was understood that he would remain only until the Malabar was ready to sail, unless this display of decision should shake the determination of the Brazilian Government.

Parliament.

HOUSE OF LORDS.

Monday.—A conversation occurred respecting the last message of President Tyler, on the subject of the right of visitation as affected by the treaty of Washington. The Marquess of LANSDOWNE remarked upon the difference of opinion as to the true construction of the eighth article of the treaty, and requested any information Ministers could afford.—Lord ABERDEEN professed his willingness to produce whatever papers might be required, and the motion in which Lord Lansdowne had embodied his request was agreed to.—Lord CAMPBELL, while in the act of expressing his regret at the absence of Lord Brougham, whose motion in approbation of the conduct of the negotiation stood for the following evening, was suddenly interrupted by the appearance of the learned ex-Chancellor. A series of explanations followed, which ended in the postponement of Lord Brougham's motion until Friday next. Lord ABERDEEN then expressed his conviction that, although the difference of construction to which the President's message referred, related to a very important part of the treaty, it was more apparent than real, that it could lead to no serious inconvenience, or produce any unpleasant consequences. Lord BROUGHAM pledged himself to demonstrate the truth of this opinion, and in its correctness Lord ASHBURTON concurred. He had inquired into this, among other matters which were subjects of complaint, during his visit to the United States, and had heard nothing but expressions of satisfaction at the explanation given by this country.

Lord WICKLOW then moved the second reading of the Dogs' Bill, but was opposed by Lord Campbell, Lord Malmesbury, and Lord Wharnclyffe. Lord Carnarvon and Lord Brougham supported the Bill, but on a division the numbers appeared equal, and the Lord Chancellor declared in favour of the "Non-Contents." The bill was accordingly lost.

Tuesday.—The business this evening consisted in the presentation of petitions, and the forwarding of some routine business, of no general interest.

Thursday.—Lord MONTEAGLE moved for returns relating to the import and export of woollens and cottons, his object being to show the alarming decrease which had taken place, and from which he inferred that nothing could be more injurious in a country like this than taxes on raw materials.—The Duke of WELLINGTON said that the repeal of those taxes would involve a loss to the revenue of 800,000*l.*, and it would, therefore, be better to wait until they ascertained the state of the revenue. The income tax was to cease in two years, and it would then be necessary to have a sufficient revenue to meet the expenditure of the country. He recommended that the returns should be for a period of ten years, instead of seven, as moved for, and he proposed an amendment to that effect.—Lord MONTEAGLE agreed to the amendment, and after some remarks from Lord ASHBURTON, the returns were ordered.

Lord BROUGHAM expressed a hope that some intimation would be given as to whether the last quarter's income-tax might be considered as a fair criterion of its produce for the year. He always thought that the tax would produce six millions; but from the present quarter's returns, it might be taken as over seven millions.—Lord WHARNCLYFFE said it was no criterion one way or another, as it included a portion of the previous quarter, while a considerable proportion of the last quarter remained unpaid. He would, however, endeavour to ascertain the state of the information.—The Duke of WELLINGTON said he understood the produce of the tax would be about four millions and a half; but Lord BROUGHAM considered that it would be more.

Friday.—Lord BROUGHAM brought forward his motion for a vote of thanks to Lord Ashburton, for having successfully negotiated the recent treaty with America.—The Duke of CAMBRIDGE cordially supported the motion.—The Marquess of LANSDOWNE opposed it as unprecedented; and since he could not view the treaty with satisfaction, he moved, as an amendment, the adjournment of the House.—Lord ABERDEEN, Lord COLCHESTER, Lord DENMAN, and the Earl of CARNARVON, spoke in favour of the vote, and Lord CAMPBELL against it; when the question of adjournment was put and negatived, and the motion was carried without a division.

HOUSE OF COMMONS.

Monday.—Lord JOHN RUSSELL, with reference to Mr. Hume's approaching motion upon the Washington treaty, desired to notice the great difference between the British and American Governments respecting the construction of the 8th article (that which regards the Right of Visit), and to ask for the production of some of the papers relating to that adjustment; observing that the House could not very conveniently discuss the merits of the negotiator, unless the real effect of his negotiation were made clearly apparent.—Sir R. PEEL declared his intention to present several papers respecting this matter; but stated that Lord Ashburton had not been authorized to negotiate at all upon the right of visit, the British Government having in no degree departed from the principle affirmed in Lord Aberdeen's communication to Mr. Everett, which was dated December, 1841, and had never been answered by the American Government.

On the motion to re-commit the Voters' Registration Bill, Lord J. RUSSELL adverted to the insertion of the new clauses, investing the Judges of the Common Pleas with the jurisdiction of final appeal from the revising barristers. These clauses were, in his opinion, too important to be properly introduced into a bill on its re-commitment *pro forma*. Had these clauses investing the House of its final control, been contained in the bill as originally drawn, he was not sure that he could have consented to the second reading.—Sir J. GRAHAM said that this alteration had been regularly introduced, while the bill was under consideration in committee; but as it was now to be reconsidered, any objections might be made to this appellate jurisdiction, the object of which was to refer to the decision of a court of law, not a question of fact or of evidence, but one strictly of a legal nature.—After a few observations from Sir GEORGE GREY and Mr. HUME, the bill was recommitted, and the committee proceeded clause by clause. A conversational discussion arose on various clauses, but no material difference of opinion arose until on arriving at the 58th clause, Lord J. RUSSELL renewed his objection to the bestowing an appellate jurisdiction to the Court of Common Pleas, and hoped that the Government would, at all events, postpone the period of parting with the power of the House of Commons. He objected to bestowing this power on the judges, who might be exposed to the charge of partiality if they happened to decide a case in accordance with what were known to be their political feelings; experience also warned us, that there was a tendency in lawyers to interpret the law in the narrowest possible spirit, especially in matters connected with the liberty of the subject.—Sir J. GRAHAM contended that in ancient as well as in modern times, the courts of law had taken a prominent part in protecting the rights and liberties of the people. The noble Lord, in the Irish Registration Bill, had recognised this very principle, and to a greater extent, for the Judges of Assize in Ireland were given by his bill jurisdiction not only in questions of law, but also in questions of fact and evidence.—After some observations by Mr. DARBY and Mr. RUTHERFORD, Mr. ROXBURGH said that they were about to thrust on the judges a mass of business which, overwhelmed as they

were already, they would never get through without neglecting their more legitimate vocations.—The ATTORNEY-GENERAL contended that the courts of law were the fitting judges of a point of law, which he would refer to their consideration, not with the slightest intention of diminishing the authority of the House of Commons, but for the more effectual settlement of disputed legalities.—After some remarks from Lord JOHN RUSSELL and Mr. HARDY, Mr. C. BULLER appealed to actual experience in proof of the great inconvenience of referring any political matter to the decision of the judges—decisions would always be interpreted according to political bias. Instead of parting with their power, let them rather amend their election committees, and simplify their system of procedure.—The SOLICITOR-GENERAL explained that the intention was, that the Court of Common Pleas should decide on the validity of any particular vote submitted to its judgment by the revising barrister, and that its decision on that particular vote should be final and conclusive. This was not parting with the power and privileges of the House of Commons. Questions connected with the municipal franchise were constantly referred by political parties to the Court of Queen's Bench, and nobody thought of impugning the impartiality of the judges.—Sir G. GREY, considering that some appellate jurisdiction was necessary, was disposed to view the one proposed as the best.—The committee then divided, affirming the clause by 164 to 51.—The rest of the evening was occupied with discussing the successive clauses of the bill, which passed unopposed.

Tuesday.—Lord ASHLEY, after presenting three petitions from the Wesleyan, Baptist, and London Missionary Societies, brought on his motion condemnatory of the continuance of the trade in opium, and the monopoly of its growth in the territories of British India as being "destructive of all relations of amity between England and China, injurious to the manufacturing interests of the country, by the very serious diminution of legitimate commerce, and utterly inconsistent with the honour and duties of a Christian kingdom; and that steps be taken, as soon as possible, with due regard to the rights of governments and individuals, to abolish the evil." Disclaiming all personal interest in the question, and any feeling of hostility to the East India Company, he adduced personal testimony to the injurious effect of the trade on the moral of the Chinese, and its tendency to diminish and destroy our influence with the better classes; and adduced comparative statistical statements to show the injury done to legitimate commerce. Some remarkable tables showed that, as the importations of opium increased, that of cotton goods fell, and vice versa. A parallel case occurred in Ireland, where the people, when dissuaded from the use of intoxicating liquors, spent their money in the purchase of meat, bread, and clothing, and were in all respects a happier and a better population. But though the commercial aspect of the question was important, the moral bearings of the case were much more so. The deleterious effects of the drug on the minds and bodies of the Chinese were testified to by various witnesses. In India its influence was equally pernicious; it was converting the inhabitants of Assam into a treacherous, cowardly, and cruel people, whose characteristics, as appeared from old accounts, were those of a manly, active, and intelligent race. The monopoly of the cultivation of opium in India was oppressive in its administration, and generally obnoxious to the ryots, who would prefer the cultivation of other articles. It had been said that the poppy was only cultivated on waste lands; such was not the fact, as its growth required rich and fertile soil. An individual who had resided seven years in China had furnished him with the details of his experience: and he asserted that the opium-clippers were furnished with arms from the Government arsenals, and were regarded by the Chinese as being practically vessels of war engaged in our service. The East India Company did not, however, stand alone as the supporters of the vile traffic, for a committee of the House of Commons had declared its opinion that it was not expedient to disturb the trade, as an equal amount of revenue could not be so conveniently raised from any other source. Mr. Macaulay, on a late occasion, had declared that anything which tended to degrade Christianity was treason against the civilization of the human race. This traffic did prejudice the Chinese against Christianity, whose first inquiry of the missionaries was why their countrymen brought them this obnoxious drug? Even so late as last Wednesday, the Baptist Missionary Society had come to the conclusion of not sending a missionary to China, but of transmitting the sacred Scriptures through the medium of the American missionaries, because the feeling was so strong against the British, on account of the opium traffic. Persons conversant with the details of the trade, said that the mere abolition of the monopoly would at once abate nine-tenths of the evil; and its practicability was affirmed by official persons, who had given their opinion that the prohibition of the growth of the opium in British India would strike at the root of the evil. It was alleged that the Chinese were not sincere in their efforts against the opium trade. But that was a matter we had nothing to do with: if the Chinese Emperor, instead of prohibiting the importation of opium, were to lay an *ad valorem* duty on it, he might realise a million sterling in duty. But as he did not do this, we were not warranted in charging the Chinese Government with insincerity. The noble Lord after adducing the names of our most eminent medical men, who have given their testimony against the growth of the opium, and denying that its prohibition in India would tend in any way to increase it in any sensible degree in any other country, concluded by appealing to the good sense and good feeling of the House, and glanced at the responsibility which the wide extent of our empire involves, and which called upon us to pursue a policy which would seek the peace and goodwill of the human race.

Mr. BROTHURTON seconded the motion. He felt its importance commercially and morally—in a humane and in a religious point of view, and considered that Lord Ashley deserved well of the House and the country in bringing it forward. What was morally wrong could never be politically right. For the sake of the people of China, as well as of this country—for the interests of commerce and morals, he hoped the House would interfere and stop the opium trade.—Mr. BINGHAM BARING said that the evils had been greatly exaggerated. If the growth of the poppy were given up in the Company's territories, he feared that it would only give encouragement to a system of smuggling opium from the neighbouring states, which it would be as impossible for the E. I. Company to check, as it would be for the Chinese to keep the drug out of their market. The effect of the monopoly was beneficial to India, for it confined the growth of the poppy to particular districts, in which opium was not consumed. He did not mean to contend that the revenue should be maintained in opposition to every moral consideration; but the only effectual way to put a stop to smuggling, was to induce the Emperor of China to legalise the trade, and there was no reason to suppose that the despatches now on their route to this country would not contain a notification of it. He concluded by moving the previous question.—Sir G. STAUNTON observed, by way of preliminary, that the owners of the confiscated opium in China were entitled to full and fair compensation. A fallacious analogy had been drawn between the consumption of spirits and opium, and it had been argued that we could not put down the one any more than the other. He had twice travelled through the great empire of China from one end to the other; and from his official station, had had much intercourse with the people, and had found less annoyance from its police than he has frequently experienced on the continent of Europe. The Chinese were a shrewd people, and were sensitive to the importance of a commercial intercourse with this country. But unfortunately we were unpopular with them, especially at Canton, where the feeling against us had risen to hatred; and this was not mitigated by the smuggling of opium; for so strong was the feeling amongst the better classes, that it was believed that the Emperor could not hold his throne for a month if he were to legalise the traffic. He was anxious that the opium trade should be discountenanced by this country before it involved us in another war; and he encouraged

Lord Ashley to persevere in his efforts by the example of Mr. Wilberforce.—Lord JOCELYN said that the scenes which he had himself witnessed fully bore out the picture of the physical and moral evils of the traffic which had been exhibited by Lord Ashley; and if he believed that the motion would tend to put down a trade derogatory to this country he would support it. But he considered that the monopoly of the growth of opium kept its production in check, though he admitted that for selfish purposes the Indian Government had recently too much stimulated the growth. But though he condemned the trade, he felt that both in a commercial and financial point of view, we should hesitate before adopting so decided a line of policy.—Captain LAYARD had visited China, and had witnessed what had led him to condemn the opium trade. True, we had triumphed over the Chinese; but, because we were strong, we should not despise them.—Mr. HOSE asked what substitute could be proposed in place of the present strict monopoly of the cultivation of the poppy? Would they inflict on India a body of Excise officers, the most obnoxious to the natives that can be conceived? Not only did the monopoly act as an effective check, but its evils were grossly exaggerated. The prohibition of the trade by the Chinese had made it an objectionable traffic; and if we entered into any stipulation on the subject, our Government would be held by the Chinese responsible for any infraction of their fiscal laws, extending over the care of an extensive coast, abounding with harbours. The only legitimate way of putting down the contraband traffic, with its accompanying evils, would be by legalising the trade, which he expected that early intelligence would have communicated.—Sir E. COLEBROOK contended that we could not hold any middle course—we must either legalise or prohibit the trade.—Mr. LINDSAY opposed the motion at some length; after which the adjournment of the debate was moved, but on a division was resisted by 118 to 26.

Some further debate took place on the necessity and expediency of an adjournment, but the debate was ultimately resumed. Lord SANDON and Sir R. H. INGLIS warmly supported Lord Ashley's resolution, and declared that no precarious revenue, like that derived from this traffic, could justify its continuance.—Sir R. PEEL intimated that our Plenipotentiary in China was authorized to negotiate on the subject of this trade, and that a negotiation was at this moment going on. The fate of this negotiation might be risked by any hasty resolution of the Houses deprecating altogether the growth of opium in India. He asked Lord Ashley, as being the safest course, to allow the Government to give the subject that cautious deliberation which it deserved. He said he did not recommend the House to reject the motion, nor to neglect the subject of it; but he only asked them, in the existing state of our relations with the Celestial Empire, to leave the question in the hands of the Executive.—After a few words from Mr. AGLAND, Lord Ashley withdrew his resolution, on the understanding that it would interfere with pending negotiations.—Lord LINCOLN obtained leave to bring in a bill to empower the Commissioners of Woods and Forests to appropriate for building purposes the areas of Thatched-House-courts, and to widen and improve Little St. James's-street.—Lord STANLEY obtained leave to bring in a bill to authorize the Legislatures of the Australian colonies, including New Zealand, to pass laws regulating the admission of unsworn testimony in civil and criminal cases.

Wednesday.—After the presentation of petitions, the Sudbury Witnesses' Indemnity Bill was read a third time and passed. No other business was transacted. Among the petitions was one from certain electors of Cambridge against the return of Mr. Fitzroy Kelly, as Member for that borough.

Thursday.—Mr. C. BULLER moved an address to the Queen, praying her Majesty to take into her consideration the means by which extensive and systematic colonisation may be most effectually rendered available for augmenting the resources of her empire, for giving additional employment to capital and labour, both in the United Kingdom and in the colonies, and thereby bettering the condition of her people. It appeared to him that the cause of the distress in this country was plainly the constant accumulation of both capital and labour within a restricted field of employment. Unless some field for the additional capital and labour which yearly increased, were provided, the distress would go on yearly accumulating. It was with the view of remedying the competition of capital against capital, and of labour against labour, that he proposed an extensive system of colonization. He did not propose it as a panacea, but as a remedy that ought to be tried, either in conjunction with, or independently of, others. He proposed colonization as subsidiary to free trade, and as another means of obtaining the same object. He did not bring forward any specific plan for carrying out his views, because what he proposed was not an alteration of the existing system, but an extension of its principle. What he wanted to urge on the Government was, to follow up the system begun in 1832, and which had been consolidated by the emigration commission; and that they should investigate every point of the subject, and adopt that course which appeared to them to be the best.—The motion was seconded by Lord ASHLEY.—Mr. S. CRAWFORD moved, as an amendment, that the resources derivable from the lands, manufactures, and commerce of the United Kingdom, if fully brought into action, are adequate to afford the means of giving employment and supplying food to the whole population. Mr. GALLY KNIGHT supported Mr. C. Buller's motion. It was, he said, their duty to leave nothing undone which might appear in any way calculated to alleviate the evils under which the country suffered.—Lord STANLEY, concurring in the general principles laid down in his speech by Mr. C. Buller, could not go with him in the proposition with which he had concluded his speech, for a larger and more extensive system of emigration, under the guidance of Government, than that which now is, and for some time has been in operation. The motion was unnecessary, because a very enlarged system of emigration, under the superintendence of the Government was already in operation; and it was mischievous, because calculated to lead to expectations on the part of the public the fulfilment of which would be found to be impracticable. The noble Lord then entered into a statement of the progress of emigration, and the means adopted by the Government of late years in promoting and assisting it—a statement containing information which cannot possibly be condensed. In Canada, such were the arrangements made by the agents appointed by the Government, that from the moment of the emigrant's leaving this country until he arrived at the very extremities of the colony, he was never from under the care and protection of the Government. With respect to Canada now, he thought it inadvisable for the Government to encourage that pauper emigration, which experience shows was already sufficient in proportion to the means of employment. Canada was not the place for persons to go to, who had nothing but their labour to depend on; neither was it a place for those who had large capitals to invest in weighty speculations. With respect to Australia, no colony in the world had ever made such rapid advances as that of New South Wales. Under the system of land sales, the produce of which is applied to purposes of emigration, New South Wales had rapidly progressed. From 1832 to the present time the total amount received from the land sales exceeded a million pounds; and of this large sum not less than 900,000*l.* had been given in aid of emigration, the remainder being applied to other legitimate charges. Besides this, a surplus of the revenue of the colony had been devoted to the encouragement of emigration. The noble Lord then entered into an explanation of the way in which lands were sold by auction, rather than by having any fixed price placed on them; and accounted for the diminution of the sales by the bursting of a speculation bubble, similar to what had taken place in the land sales of the United States, by which fictitious capital had been employed in extensive jobbing. After many details, descriptive of the actual condition of the colony, Lord STANLEY concluded by declaring that, as he could not concur in the amendment moved by Mr. S. Crawford, he should vote against it; and then, as he believed the system of remedy proposed by Mr. C. Buller

was already practically in operation, he should move the previous question on the original motion.

Lord HOWICK and Sir R. INGLIS thought the motion opened a fair subject for inquiry.—Mr. HUME and Lord F. EGERTON concurred in their approbation of Mr. C. Buller's ability in bringing the motion forward.—Lord J. RUSSELL joined in the compliment, but without a more specific plan he could not join in pressing the motion on the adoption of the House. He recommended Lord Stanley to diffuse information on the subject throughout the country, and trusted he would not rest satisfied with what had been done; meantime he thought it best that it should be left in the hands of the Executive Government. Though believing that there was much distress still existing in the country, he drew encouragement from the revival in the manufacturing districts, and was satisfied that we should get over our difficulties.—Sir HOWARD DOUGLAS and Mr. S. WORTLEY next addressed the House; after which Mr. C. BULLER spoke shortly in reply, and the motion as well as the amendment were withdrawn.

Friday.—On the House going into committee of supply, Mr. SHAW protested against the vote for the national system of education in Ireland. Lord ELIOT defended it, and Sir R. PEEL contended that the system was producing the happiest effects in promoting kindly and tolerating feelings. A long discussion ensued, after which the vote was agreed to. A division took place on the vote for Maynooth, which was affirmed by 120 to 40. On the vote for the British Museum, Sir R. PEEL adduced the great increase in the number of visitors, as a proof of the manner in which it was estimated by the public. A desultory discussion ensued, during which Sir R. PEEL expressed his hope that Westminster Abbey would soon be opened to the public. The vote was then agreed to, with several others of minor interest.

CITY.

Money Market, Friday.—Consols closed at 96½ to 7, for Time and Money; New Three-and-half per Cents., 102½ to ½; Bank Stock, 184½; Three per Cents., Red., 96½ to ¼; Three-and-half per Cents., Red., 101½ to ¾; India Bonds, 76 prem.; Exchequer Bills, 68 to 70 prem.

Metropolis and its Vicinity.

Dinner at the Mansion House.—On Wednesday the Lord Mayor entertained her Majesty's Ministers and a distinguished party at the Mansion House. Those present were Sir Robert and Lady Peel, the Lord Chancellor and Lady Lyndhurst, the Speaker of the House of Commons, the Duke and Duchess of Norfolk, the Duke of Buckingham, the Earl of Ripon, the Earl of Liverpool, the Earl and Countess Delawarr, and about 150 other guests. After the usual toasts, Sir R. Peel proposed the health of the Lady Mayoress, the Lord Chancellor, and that of the Lord Mayor. The speeches were confined chiefly to the usual complimentary subjects, and few of them presented matter for extract, excepting that of Mr. Everett, the United States' Minister. He said that one of the most important duties which he had to perform, was to cherish by every means in his power a good understanding and kind feelings between England and America. Eighteen months ago the prospect seemed a dark and anxious one, and he had looked forward with no very agreeable feelings to what might be the issue. For the change which had taken place, they owed much to the conciliatory policy of her Majesty's Government in taking an important step towards the adjustment of matters in discussion between the two countries; and he was desirous on this occasion to say, that, although his feelings were naturally strong in favour of the American claims in the late dispute, it seemed to him that the adjustment brought about by Lord Ashburton was equally honourable and advantageous to either country. He thanked them for the kind feeling which they had manifested towards himself and his country, and could assure them that he believed the most important part of his duty was to do all he could for the preservation of a good understanding between the two countries of Great Britain and America.

Attempted Assassination in St. Paul's.—An attempt at assassination was committed, on Saturday afternoon, between three and four o'clock, during the performance of afternoon service, at St. Paul's Cathedral, by a young lad residing at Bayswater, called Augustus Sintzenich. The prisoner, it appears, was in the area of the choir, about two yards from the Rev. Mr. Haden, one of the minor canons, who was officiating for the Bishop of Llandaff, and was observed by Mr. Hardy, one of the congregation, who saw the prisoner draw from his breast what he at first mistook for a book, but upon the light shining upon the barrel, he perceived that it was a pistol, and immediately gave the alarm to the congregation, as he was some distance from the prisoner, and could not get at him. The prisoner was seized immediately, and a bystander, Mr. Howton, succeeded in getting the pistol from his hand, after some resistance. The moment which the accused chose for carrying out his purpose was immediately upon the conclusion of the prayer for the Queen. Some doubt exists whether the pistol was snapped; Mr. Hardy, who first observed the prisoner, states that he saw the spark, and Mr. Howton, who seized him, states that he snapped the trigger, but it missed fire. On examining the pistol, it was found to contain powder and five shots, but no wadding whatever. The prisoner was then conducted to the dean's audit-room or vestry, and a brief statement was there made by the witnesses. When he was first seized the prisoner trembled very much, and remarked, "You need not hold me so tight, for I have nothing more about me, and am not going to run away." After the Bishop of Llandaff had satisfied himself of the truth of the charge, the prisoner was conveyed to the station-house in Black-horse-court, Fleet-street, where he wrote a letter to his brother, which leaves no doubt of his intention to fire, as he distinctly states, "I took it into my head to have a pop at the clergyman at St. Paul's." On Monday, the prisoner was examined before the Lord Mayor, when his counsel said he could prove his insanity, and suggested the propriety of the Lord Mayor's directing that he should be taken care of, under a late statute of the Queen. The Lord Mayor said he considered the

case ought to go to a jury. The prisoner's counsel pressed the suggestion very strongly, and stated that the prisoner had imbibed ideas of the legitimacy of certain sovereigns, and would insist that the Stuarts ought to reign instead of the House of Brunswick. The prisoner was strongly excited by the performance of *Rob Roy* at the theatre, and seemed to believe that James Stuart, a Scotch piper, had a claim to the crown, in consequence of a lineal descent from that unfortunate family. The prisoner entertained thoughts of raising the claim in favour of the piper. His principles were high church and state principles; and he constantly attended divine service. His opinion of the right of the Duke of Bourdeaux to the throne of France was also strong. The Lord Mayor said a jury must determine the case; it was the duty of the magistrate to commit. He would, however, postpone the case for a day or two, in order to make more particular inquiry.

American Bondholders.—A deputation, consisting of Mr. Scholefield, M.P., Sir Edward Codrington, the Hon. William Leslie Melville, the Hon. G. F. Hotham, Mr. Marshall, M.P., Mr. B. B. Williams, and Mr. Redfern, waited on Friday last, upon Mr. Everett, the United States' Minister, with a memorial, signed by upwards of nine hundred holders of the State Stock of America. In replying to this memorial, Mr. Everett promised to forward it to the President, and expressed deep sympathy with the bondholders. "I concur with you fully," he said, "in protesting against the doctrine that a state, which has pledged its faith and resources, can release itself from the obligation, however burthensome, in any way but that of honourable payment. Fatal delusions, in times of great distress, occasionally come over the minds of communities, as well as individuals; but I rejoice in the belief that the number is exceedingly small of those who have in any form advanced the idea of what has been called 'repudiation.' I am convinced that those states which unhappily have failed to make provision for the interest due on their bonds, have done so under the heavy pressure of adverse circumstances, and not with the purpose of giving a legislative sanction to a doctrine so pernicious, unworthy, and immoral. The memorialists are pleased to give me credit for sympathy with their sufferings. There is, perhaps, no person, not himself directly a sufferer, who has had so much reason as myself to feel deeply all the evil effects—the sacrifice, not merely of material prosperity, but what is of infinitely greater consequence, of public honour—resulting from this disastrous failure. The reproach which it has brought on the American name has been the only circumstance which has prevented a residence in the land of my fathers being a source of unmingled satisfaction to me. You may well believe, therefore, if any opinion of mine can have an influence, (as you suppose) over any portion of my countrymen favourable to the great end you have in view, it will be, on all proper occasions, as it has been, most emphatically expressed. * * * The general Government of the United States, after having paid off a public debt of more than two hundred millions of dollars, has found itself unable to negotiate a trifling loan in this great metropolis of the financial world, whose superabundant capital, but for the default of some of the states, would have continued to be for those states themselves, and for individuals, a vast gold mine of unexhausted capacity. In addition to these public embarrassments, private fortunes, almost without number, have been destroyed in the general wreck, of which the failure of the States, as cause or effect, is one of the principal elements. I doubt if, in the history of the world, in so short a period, such a transition has been made from a state of high prosperity to one of general distress, as in the United States, within the last six years. And yet, gentlemen, the elasticity and power of recovery in the country are great beyond the conception of those who do not know it from personal observation. Even within this disastrous period to which I have alluded, a private commercial debt to this country, estimated at twenty-five millions of pounds sterling, has been paid by the American merchants, with as little loss to the creditor as would attend the collection of an equal amount of domestic debt in this or any other country."

Royal Institute of British Architects.—A special meeting of this institute was held on Monday, to present the medals awarded during the session, when his Royal Highness Prince Albert took the chair. Mr. Fowler, honorary secretary, having read Bacon's description of a princely palace, Mr. Arthur Johnson was presented to the Prince as the author of the best design founded on that description, and received the Soane medalion. In like manner his Royal Highness presented to Mr. E. Chamberlain the medal of the institute, and to Mr. J. W. Papworth the medal of merit, for essays on synchronism, in connexion with architecture. Mr. Bailey announced the subjects for essays and drawings, for which the council proposes to offer medals next year, and then read a communication from Mr. C. Parker, on the methods employed in constructing foundations in Venice, the soil of which city is of a nature to require the greatest care, and yet where failure is seldom if ever seen. Thanks having been voted to the author of the paper, Mr. Barry addressed the Prince in the name of the institute, and assured his Royal Highness that the remembrance of the day, and of the kind manner in which his Royal Highness had fulfilled its duties, would long remain in the memory of the members. The Prince replied: "Gentlemen,—It gives me great pleasure to have this opportunity of meeting you." The Prince examined the collection of casts and models belonging to the institute, and seemed to enter fully into all the matters which came before him.

Metropolitan Improvements.—A general meeting of the committee of the Metropolitan Improvement Society was

held last week, Lord Robert Grosvenor in the chair. A discussion took place upon the merits of a plan submitted by the executive committee, for a new line of road to connect the eastern and western extremities of London. This line proposed in the plan was to commence in the Strand, opposite Duncannon-street, where it would be carried by a short diagonal street down to the Thames; it would then follow the line of the projected embankment nearly to Southwark-bridge, when it would divide into two branches—one branch leading to the Bank, another to the terminus of the Blackwall Railroad, and thence joining the great Essex road at Whitechapel. A resolution was adopted, to the effect that the object proposed was one of great practical importance, and that it would be desirable to invite the Government commission now sitting to inquire into the practicability of thus rendering the Thames embankment subservient to the formation of a new and broad foot and carriage way, by which the narrow streets of the city might be relieved of some portion of the traffic at present liable to continual obstruction. Mr. Walker addressed the meeting on the state of the burial-places of London. The many serious evils arising from interments in the heart of crowded cities had been repeatedly laid before the public by him in various publications, and a great body of evidence had been collected on the subject by the committee of the House of Commons. Much opposition, however, might be anticipated from interested parties to any legislative measure for abolishing the existing practice. At Enon Chapel, Clement's-lane, as much as 900*l.* had been received within six years, for interments, in a space of ground only 59 feet by 29. This would give an idea of the vested interests that would be arrayed against any project for establishing national cemeteries in the suburbs, and he was therefore anxious that the society should aid in the efforts which had been made to obtain the interference of the Legislature on the subject. Dr. Southwood Smith said it would be almost impossible to exaggerate the evils occasioned by the practice of burying the dead amidst the habitations of the living. The fever and mortality of the metropolis might be greatly diminished if a few simple sanitary precautions were adopted, and one of obvious necessity was the abolition of interments in the existing churchyards. Numerous deaths, and a general shortening of the average duration of life, might be distinctly traced to this cause. Mr. Hickson gave some details of the management of the Paris cemeteries; and Lord R. Grosvenor suggested that the society should petition the Government to abolish interments within the metropolis. This suggestion was adopted, and referred to the executive committee to be carried into effect. In connection with this subject, we may notice a discussion which took place at a Court of Common Council last week, when a petition was presented calling upon the corporation to prevent the proposed Act from being applied to Bunhill-fields and other burying-places in the city. Mr. R. L. Jones said the object of the petition was to make the corporation fight the battles of other people in Parliament—to fight, in fact, for those interested in all the burying-grounds in and round London. He called upon the Court to put a stop to such work at once, and moved an amendment that the petition be laid upon the table. After considerable discussion, which strongly proved the established opposition of the Court to the burial of the dead in and near cities, Mr. Jones's amendment was carried by a very large majority.

Colonial Church Society.—A meeting of the West-London Ladies' Association, connected with this society, was held on Tuesday at the Hanover-square Rooms, for the purpose of considering the best means of extending the objects of the society. Mr. John Labouchere took the chair, and said that the society had been formed in 1836 for providing for the spiritual wants of the inhabitants of the colonies, as well as for the wants of those Englishmen who might be residing on the Continent of Europe, and he considered that on those grounds the society had strong claims on the Christian portion of the inhabitants of this country. It was the duty of Government to provide not only for the temporal welfare of the inhabitants of the colonies, but also for their spiritual welfare, and he conceived there was much cause of complaint that nothing had been done in that respect. More than 1,500 persons annually emigrated from our shores for the colonies, and it was a lamentable fact that no provision whatsoever had been made by the Government for their spiritual wants. Looking at the smallness of the amount which had been entrusted to the charge of that society, he thought a good deal had been done. He understood that the stated income did not amount to more than 500*l.* annually, whilst the claims upon the institution were upwards of 3,000*l.* He trusted that by the exertions of the supporters of that society every inhabitant of the colonies would possess the means and opportunity of attending a place of divine worship. It was then resolved, on the motion of the Rev. Mr. Hanson, seconded by the Rev. B. Noel, that the spiritual condition of the British colonies is such as to call for the most vigorous exertions, and that the society offers an excellent channel through which the members of the Church of England might convey assistance to the colonies.

Temple Church.—His Royal Highness Prince Albert on Saturday attended a rehearsal of the choir at the Temple Church. His Royal Highness proceeded there on foot, attended by only one servant; on presenting himself at the door, being unexpected, the doorkeeper refused him admittance, at the same time offering to take his card to the choir-master. An explanation, however, soon ensued, and in a few minutes several of the benchers were in attendance, and escorted his Royal Highness over the church, at the beauties of which he expressed much admiration. The choristers sang several compositions, with

the performance of which his Royal Highness expressed himself highly gratified. After staying half an hour, the Prince proceeded home on foot.

The Wilkie Testimonial.—The daily papers announce that Mr. Joseph has just completed the model for the statue of Sir David Wilkie, which was exhibited to the subscribers in the beginning of the week. In likeness, the head of the statue is said to be admirable. The position is good, and the handling of the clay very broad and firm. The left foot is slightly advanced, and the left hand of the figure rests upon a sketch-book. A shepherd's plaid hangs on the left shoulder, and falling behind the right foot, serves as the principal support of the figure.

Wood Pavement.—On Tuesday a meeting of the Commissioners of Sewers for the City of London took place at Guildhall, for the purpose of receiving a report of the sub-committee appointed to take into consideration the propriety of paving Cheapside with wood. The chair was taken by Alderman Gibbs, and a great deal of interest appeared to exist among the members, upon a question affecting so important a thoroughfare. The report of the committee set forth that the petitions from the Postmaster-General to pave with wood St. Martin's-le-Grand; from the inhabitants of King William-street, Princes-street, Bishopsgate-street, Cheapside, Cannon-street, Upper Thames-street, St. Bride's, Tokenhouse-yard, the Poultry, and at least twenty other places, to the like effect, having been duly considered, the committee recommended the carrying out forthwith the principle of wood-paving throughout Cheapside, the remainder of the Poultry, and Bishopgate Within; but feeling it impossible to comply with the prayer of the whole of the other memorialists without raising the rates to the highest amount allowed by law, they did not deem it advisable to adopt the principle of wood-paving further during the present year. Sir P. Laurie opposed the recommendation of the sub-committee, upon the grounds already so frequently discussed, viz., the danger to man and horse, and proposed, as an amendment, that no wood-pavement should be introduced for one year. Alderman Copeland seconded the amendment. Mr. R. L. Jones denied the statement of Sir P. Laurie, that the Woods and Forests were adverse to wood-paving, when they were still carrying it out to a large extent. They had only the last week made a large contract for paving the metropolis roads in the town of Kensington with that material. He contended that as many horses fell down upon the stone-pavement as on the wood. After a discussion which lasted several hours, the question was put, and Sir P. Laurie's amendment negatived by a majority of at least two to one, and the report adopted. Mr. Obbard then gave notice that he should move, at the next Court, that Fleet-street be paved with wood from Fetter-lane to Chancery-lane.

Catholic Institute.—A meeting of the Catholic Institute of Great Britain was held last week, to take into consideration the educational clauses of the Factory Education Bill, now in progress in the House of Commons, Lord Stourton in the chair. The Hon. E. Petre addressed the meeting at considerable length, and contended that the present bill, as regarded Protestantism and Catholicism, was a measure fraught with evils and danger, especially with regard to the education of factory children of the Catholic persuasion, and called upon the Catholics in general to come forward and make a firm and determined stand to protect themselves in their religion. A variety of resolutions were proposed, against the various clauses of the bill, as it relates to the Catholic population. Instructions were then given to form a committee to draw up a petition against the bill, which was to be immediately forwarded to the Catholic clergy throughout the country for signature by their respective congregations. A vote of thanks was given to the Earl of Arundel and Surrey, for his Lordship's advocacy of the Catholic interests in the House of Commons.

Anti-Corn-Law League.—The fourth weekly meeting of the Anti-Corn-Law League took place on Wednesday evening in Drury-lane Theatre. The attendance was fully as great as on the three preceding occasions. There were a great number of ladies in the boxes, and the platform was unusually crowded. Mr. Wilson presided, and opened the business with the usual statement of their progress. The meeting was then addressed by Mr. Hume, M.P., Mr. Brotherton, and Mr. Milner Gibson.

Anniversary Dinners.—The anniversary dinner of the Covent Garden Theatrical Fund took place on Wednesday, in Freemasons' Hall. The Duke of Cambridge presided, and was supported by about 150 gentlemen. The annual address was delivered by Mr. Bartley, and the donations and subscriptions amounted to about 800*l.*—The anniversary of the Marine Society took place on the same evening, at the London Tavern, the Earl of Haddington in the chair, supported by about 70 gentlemen. The list of subscriptions at the close of the dinner was about 700*l.*

Accidents.—On Tuesday morning, at four o'clock, an accident occurred to Mr. B. Ferrand Busfield, late of Magdalen Hall, Cambridge, a near relation of the members for Bradford and Knaresborough, which terminated fatally. It appears that Mr. Busfield, who has been lately on a visit to his mother at Bath, left town at an early hour, for the purpose of going on a cruise in her Majesty's steam-ship *Vulcan*, a revenue vessel, which has been recently fitted out at Blackwall. He proceeded in a cab to the Brunswick-wharf, at Blackwall, and upon arriving opposite the Hotel Tap it was necessary to cross a bridge over the railway, which leads to a narrow path communicating directly with the wharf. The cabman, on reaching the bridge, said he did not think he could proceed further, when Mr. Busfield alighted and walked along the path leading to the wharf, and immediately afterwards called out to the cabman to proceed, and said it was all

right. The cabman drove towards the wharf, and had just reached it when he heard Mr. Busfield hailing the steamer moored opposite, and directly after a splash in the water was heard, and cries for help. The cabman immediately raised an alarm, a boat put off from the Vulcan, and drags were procured; but Mr. Busfield was never seen afterwards; and it is concluded that in stepping from the wharf to the barge he fell into the river and was drowned. The Commander of the Vulcan gave directions to the boatmen in the neighbourhood to continue their search for the body, and offered a reward of 10*l.* for its recovery, but it is not probable that the body will be recovered for several days. The Commander was Mr. Busfield's intimate friend, and had invited him to join the vessel on her intended cruise. It is only a fortnight since that intelligence was received of the death of a brother of the deceased, in Canada, by drowning.

The Thames Tunnel.—The curiosity manifested by the public to view this interesting work remains undiminished, and the number of visitors on Sunday last fully equalled that of any day since the thoroughfare has been thrown open. The neighbourhood of Wapping has been materially affected by the attraction of company to its vicinity, and the shops are deriving a large accession of business. On Monday the archways presented the appearance of a fair—several stalls having been erected in the shafts by permission of the directors, where refreshments are supplied—while the tunnel forms a promenade for the visitors. A printing press is also erected in the western arch, where a brief account of the undertaking is struck off, 76 feet below high-water mark. The average number of visitors last week exceeded 11,000 daily, and on Sunday upwards of 30,000 paid for admission.

Greenwich.—On Wednesday morning about one o'clock, the inhabitants were aroused by an alarm of fire in the extensive range of buildings known as the College brew-house. The flames spread with great rapidity, and for a long time threatened the destruction of much of the surrounding property, but a good supply of water being obtained, their ravages were eventually confined within the limits of the building. The alarm occasioned by the conflagration was very great, and the whole of the officers of the Hospital with a large number of the pensioners were on the spot to render assistance in extinguishing the flames. The College brew-house is detached from the hospital, and is a handsome building, seventy feet high, extending to a length of fifty feet. The fire is supposed to have originated through the overheating of flues. The damage is estimated at 8,000*l.*, and the whole of the property is uninsured.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, Mar. 25:—West districts, 136; North districts, 220; Central districts, 198; East districts, 225; South districts, 207. Total, 986, (512 males, 474 females.) Weekly average for the last five years, 903, (males 461, females 442,) and for the last five winters, 1004.

Provincial News.

Derby.—The three men, Bonsal, Bland, and Hulme, convicted at the last Assizes for the murder of Miss Goddard, were executed on Friday. No less than from 30,000 to 40,000 persons were present. Bonsal acknowledged to the chaplain that he perpetrated the murder. He stated that Bland stood outside the murdered lady's door, and that he and Hulme were in the room; that while they were engaged "rummaging" the drawers, Miss Goddard sprang out of bed, and ran to the door, where Bland stopped her, and pushed her back into the room, and that Bonsal then killed her with the crow-bar.

Falmouth.—The *Falmouth Packet* states, that by far the largest engine ever constructed is now in process of manufacture at Hayle. The piston rod, which was forged last week, is 19 feet long, 13 inches diameter in the middle, and 16 inches in the cone, and weighs 3 tons 16 cwt. It will work in an 80-inch cylinder, which will stand in the middle of another cylinder of 144 inches diameter. Five other piston rods will work between the inner and the outer cylinders. The 80-inch cylinder was cast last week, and the large one will be cast soon. The pumps are to be 64 inches in diameter; a measurement which may afford some idea of the size and power of the engine. It is intended for draining the Lake of Haarlem.

Kingston.—The borough magistrates have been actively engaged in an investigation of a charge against Samuel Stone, a lawyer's clerk, and Christopher Wardell, of having stolen a quantity of Bank of England notes, gold, and silver, the property of Mr. Andrew Dunlop, of the Dolphin Inn, in this town. The magistrates were engaged nearly nine hours on Tuesday in the investigation of the case, and it was then adjourned until Wednesday morning. In order that the charge against the prisoners should be understood, it may be necessary to explain that the robbery in question was committed in July last, and the prisoners were taken up at the time and underwent two examinations, and a strong case of suspicion was made out against them. The magistrates, however, did not feel themselves justified in committing the parties to take their trials, and they were set at liberty. Stone immediately commenced an action against Mr. Dunlop for false imprisonment, to which the defendant pleaded that he was justified in giving the plaintiff into custody, inasmuch as he had really committed the felony; and the jury, after a long trial, the point being distinctly put to them by the Lord Chief Justice, confirmed the plea by finding for the defendant. Stone and the other man, Wardell, were immediately taken into custody, and, after two examinations, were remanded. It will not be necessary to state fully the circumstances under which the robbery was committed. A person, described as a tall

man, with very high shoulders, went into the house of the prosecutor, and under pretence of getting a 5*l.* note for silver to the same amount, ascertained where the prosecutor kept his money in the bar, and soon afterwards two other men went into the bar, and by various pretexts succeeded in inducing the prosecutor and his daughter to leave them there alone, and they took the opportunity of stealing the money. The prisoners were sworn to positively by the daughter of the prosecutor as being the men in the bar, and who must have committed the robbery, and she identified them the moment she saw them. Several other witnesses confirmed her testimony, and also proved that the prisoners were in connection with the tall man, and that they all went away together after the robbery. The defence set up for the prisoners was, that they resembled two members of the swell mob, who had committed the robbery, and that they were perfectly innocent; and, although it was admitted that they were in Kingston on the day of the robbery, that they had never been near the house of the prosecutor. The robbery was supposed to have been committed between one and two o'clock on the 21st July. After witnesses had been examined on these points, the magistrates, on Wednesday, said that, under the circumstances, they felt they had no other course to pursue than to commit the prisoners for trial. The witnesses were then bound over, and in the course of the day the prisoners were conveyed to the county gaol.

Melton Mowbray.—An extensive robbery was committed on the night of Sunday last at the residence of the Earl of Wilton, at Melton Mowbray, under circumstances which at the present moment are enveloped in mystery. Among the property stolen are Bank of England notes to the amount of about 200*l.*, notes of the Grantham Bank to the value of 100*l.*; and a box containing a gold watch, gold snuff-boxes, and various articles of jewellery. The exact circumstances under which the robbery has been committed have not transpired; but the matter has been placed in the hands of the detective force.

Rochester.—The man, named Ellis, who stood remanded on a charge of having threatened to assassinate the Queen and Sir Robert Peel, was brought up on Saturday before the magistrates for further inquiry. The Mayor said that he had received a letter from the Secretary of State respecting him, and that Sir J. Graham advised the magistrates to require moderate and reasonable bail for the period of 12 months. The prisoner said that he had last worked as a confectioner at Gravesend, and that his father, whose name was Edward Ellis, had been a captain in the navy, and had been dead 21 years. The Court consulted for some time, when they required the prisoner to enter into his own security of £10, and to find two sureties of £5 each, to keep the peace toward her Majesty and all her subjects. Bail not being forthcoming he was committed to prison for one year.

Southend.—An inquest has been held in this town on the body of Capt. Edward Johnson, who was found dead in his bedroom, on Thursday week, from the shot of a pistol, which was supposed to have been accidentally discharged. The evidence showed that the unfortunate gentleman was found deluged in blood, without any apparent wound or mark of violence. His lips were closed, and when the surgeons arrived they were at a loss to conjecture from whence the blood had flowed. However, upon search being made, the pistol was found, which had recently been discharged, and upon opening the lips of the deceased the upper jaw was found to be completely shattered, the ball having lodged in the back of the head, but was subsequently extracted. The witnesses were confident that the deceased never intended to commit suicide, but that his death was caused in some way or other by accident. He was described as a sensible, gallant officer, and the last man in the world that would commit self-murder. The jury, after a long inquiry, returned a verdict that the deceased was accidentally shot.

Windsor.—In consequence of some recent investigations by a medical gentleman at Windsor, in the case of one of the whippers-in to the Royal hunt, who was labouring under the effects of paralysis, the cause of kennel lameness has been found to proceed from the presence of lead in the water which is supplied to the kennel at Ascot, by means of pipes composed of that metal, through which the water is conveyed for a considerable distance. Since the discovery of the presumed cause of lameness in the Royal pack, the water has been analysed by Dr. Ryan, of the Polytechnic School, and by Mr. Phillips, the chemist, by order of the Commissioners of Woods and Forests. The results of Dr. Ryan's two experiments are as follow:—The first examination was made from a sample of water taken from the source or spring-head, before it had entered the leaden pipes, when the specific gravity of 60 deg. was found to be 1,000.18. The imperial pint, on evaporation to dryness, yielded 2.37 grains of solid matter. The solid contents of an imperial pint were found by Dr. Ryan to be—chloride of sodium, 1.54 grains; chloride of magnesium, 0.71 grains; sulphate of lime, 0.128 grains; and a trace of carbonic acid. The second examination was made of water taken from the leaden pipes at the Royal kennel at Ascot, when the specific gravity was found to be 100.42. Upon an imperial pint of this water being, as in the former experiment, evaporated to dryness, it yielded two grains of solid matter, viz.:—carbonate of lead, 164 grains; organic matter, and traces of chlorides of sodium and magnesium, and sulphate of lime, .038. It has, therefore, been calculated by Dr. Ryan, that every imperial gallon of the water used at the Royal kennel, after passing through the leaden pipes, contains 1.312 grains of the carbonate of lead.

Railways.—The following are the returns of the principal lines for the past week:—London and Birmingham,

13,600*l.*; Great Western, 11,408*l.*; South Western, 4,946*l.*; South Eastern, 1,610*l.*; Eastern Counties, 1,027*l.*; North Midland, 3,620*l.*; York and North Midland, 1,586*l.*; Greenwich, 762*l.*; Croydon 259*l.*; Brighton, 2,864*l.*; Blackwall, 629*l.*; Hull and Selby, 950*l.*; Grand Junction, 6,506*l.*; Midland Counties, 2,276*l.*—It appears from the report of the railway department of the Board of Trade, that during the year 1842, nearly 200 miles of railway communication have been opened to the public throughout England and Scotland. Among the principal lines which have been opened, or only partially so, may be mentioned the Birmingham and Derby, to the extent of 10 miles; the Gosport branch of the South Western, 15 miles; the Edinburgh and Glasgow, 46 miles; the Manchester and Birmingham, from Stockport to Crewe, 26 miles; the Oldham branch of the Manchester and Leeds, 2 miles; the Bristol and Exeter, from Taunton to Bridgewater, 11½ miles; The London and Dover to Tonbridge, 42 miles; the Sheffield and Manchester, 3 miles; the Northern and Eastern, to Bishop's Stortford, 3 miles; and the Eastern Counties, to Colchester, 31 miles.—The half-yearly meeting of the Bristol and Gloucester Company was held last week. It was stated that the receipts to the 31st December had amounted to 325,974*l.*, and the expenditure to 222,265*l.*, leaving a balance available for the shareholders of 96,509*l.* From this it was intended that a dividend equal to 2*l.* per share should be paid on the joint stock of the Bristol and Coalpit-heath Line. It was also resolved that the negotiation now in progress with the Great Western Company, in regard to the construction of the line from Stonehouse to Gloucester, and the terms upon which it should be leased to the Birmingham and Gloucester Company, should be continued under the superintendence of the committee of management. This committee was also empowered to raise further sums upon loan notes, for the completion of the line, not to exceed 260,000*l.* in the whole, nor at an interest beyond five per cent. It was arranged that, for the future, the members of the committee of management should be but fourteen in number.—At the half-yearly meeting of the Newcastle and Carlisle Company, held at the latter town, a dividend, at the rate of four per cent., was declared out of the profits for the half-year, amounting to 15,063*l.*

IRELAND.

Dublin.—The merchants and inhabitants of this city have held a meeting, the Lord Mayor in the chair, for the purpose of taking steps to have the "remonstrances of the citizens of Dublin" on the subject of the withdrawal from Ireland of the mail-coach contracts conveyed in the most effective manner to the Lord Lieutenant and the Lords of the Treasury. Considerable excitement prevailed, and it was resolved to petition Government on the subject. It appears, however, from a conversation in the House of Commons, that the question is already settled, and that the contract has been given to a gentleman of Glasgow.

Meath.—The Marquis of Downshire is about to try his title with the Crown to present to the large living of Ardnuscher, which has been some time vacant, in this diocese. For this purpose he has nominated the Rev. Graham Crozier, vicar of Rathconnell, to the benefice. The Crown has presented for more than 200 years successively to the living. Perhaps when the parties have expended 20,000*l.* in voluminous pleadings and trials at the bar, and in courts of error, and the House of Lords, a clergyman may be instituted. The law expenses in contesting Killucan with Lord Clanricarde cost Bishop Alexander 12,000*l.* It is now partly through the same title that the Marquis of Downshire is claiming Ardnuscher.

Cork.—The arrangements for the approaching meeting of the British Association are the general topic of attention. The Marquis of Northampton has signified his intention to be present, and during his stay his lordship will be domiciled at Castle Mahon, the seat of Sir Wm. Chatterton.—The Barbadoes, which put into this port in distress, with emigrants, bound for Prince Edward's Island, is to be sold for the support and maintenance of the passengers, who were engaged to be landed at their destination by a London company, under the name of the British American Association, which was lately the subject of discussion at the London police courts.

SCOTLAND.

Edinburgh.—The Scotch papers state that several ministers who had joined the Non-Intrusion party in the Church, have signified their intention of withdrawing from that body, on the ground that the recent demands have not been justified. The "Edinburgh Constitutional" states that they have seen a letter from the Rev. James M'Farlane, Minister of Muiravonside, requesting them to announce that he has "withdrawn from the Convocation because they refuse to accept a settlement on the principle of the *Liberum Arbitrium*, plainly offered by Parliament, when their spiritual jurisdiction would be sufficiently secure."

Inverness.—The local papers mention another serious accident to the works of the Caledonian Canal. About eight o'clock on the evening of Friday week, one of the stone aqueducts, or culverts, erected in the western district for the purpose of conveying the mountain streams under the bottom of the canal, gave way, carrying with it a considerable portion of the embankment on both sides. In the course of a few hours all the water in the reach between the Bannavie locks and Gairloch, six miles in length, was poured from the breach into the valley of the Lochy. The canal banks, to the eastward of the culvert, have been undermined by the action of the water, and the material deposited in the bed of the river, to such an extent, that some months must elapse before the damage

done can be repaired, and the navigation again opened from sea to sea. This accident, the papers observe, is trifling compared to what it might have been. Had Loch Lochy, instead of being very low, as it was when the culvert gave way, been in the flooded state at which it stood during the winter, the Gairloch lock, on the drying of the reach, would, in all probability, have yielded to the pressure from above, and the whole surface of Loch Lochy, from twenty to thirty feet in depth, would have forced its way to the sea. It is difficult to estimate what might have been the effects of such an inundation.

Labo.

COURT OF CHANCERY.—Drever v. Mawdesley.—In this cause the Honourable Thomas Erskine had been appointed receiver of the tithes for the benefit of the creditors, and had acted as such for some years under the authority of the Court. Having neglected, however, to pass the accounts within the time prescribed, he was specially ordered to do so, and a large balance of 3,900l. he was appearing to be due by the report of the Master, Mr. Erskine was directed to pay that sum forthwith. This sum, with other moneys from the same source, had been deposited in the bank of Dainty, Ryle, and Co., of Macclesfield, under the head of tithe account, and on the firm having proved insolvent, two dividends of 4s. and 2s. were awarded to Mr. Erskine. These dividends he proposed to pay, but the Vice-Chancellor held that he was answerable for the whole amount, and made an order accordingly for immediate payment. Mr. Bethel and Mr. Lloyd, in support of an appeal against that order, observed that Mr. Erskine had done in the present case that which receivers were always enjoined to do, and which, by neglecting, they had, on many occasions, rendered themselves liable to make up deficiencies. He had most carefully abstained from mixing the receiver's money with his own, and placed it for safe custody in a bank, under the head of a tithe account. No profit or emolument of any kind was derived from the office, and it was impossible therefore, on any rule of the Court, or on any principle of equity or justice, to sustain the Vice-Chancellor's order, and make Mr. Erskine responsible for the unfortunate failure of the bank in which the money was placed for security. Mr. Coe and Mr. Rennel, in support of the order, relied on the neglect of Mr. Erskine to pass his accounts. If the account of 1840 had been regularly passed at Michaelmas, and the balance paid in, there would have been no loss, because the bankers did not fail till June, 1841. Mr. Erskine had been pressed to pass his accounts, and must take the consequences. It had been said that no emolument was derived from that office; but country bankers generally allowed interest on their deposits, and it was desirable to know why Mr. Erskine persisted in keeping so large a sum in the bankers' hands, instead of passing the accounts at the stated periods. The Lord Chancellor, having consulted the registrar, observed, that it was not the general practice for receivers to pass their accounts until called on to do so. It was, however, a very serious thing to hold Mr. Erskine responsible for a loss under such circumstances, and before he did so, there must be further inquiry. His Lordship gave the parties leave to present a petition, with affidavits containing the required explanation.

Suisse v. Lord Lowther.—This was an appeal from a decision of the Vice-Chancellor Wigram, directing the payment to Suisse of a sum of 3000l. bequeathed to him by a codicil in the will of the late Marquess of Hertford. The executors had resisted the payment on the allegation that the sum given by the codicil was a substitution for other sums bequeathed at different periods, by other and prior instruments, and they appealed against the decree. The Lord Chancellor gave judgment, and confirmed the decision of the Vice-Chancellor. His Lordship took an elaborate review of the different codicils by which money was given to Suisse, observing that in the whole they bestowed on him the sum of 11,600l., before the testator made that final request, in which he gave Suisse the sum of 3000l. in a codicil which also made a provision for other servants. In his Lordship's opinion, there was no reason for assuming that the testator in this last instrument intended to deprive Suisse, whom he called a most excellent man, of the benefits given him on former occasions, and to substitute a sum of 3000l. for 11,000l. His Lordship therefore dismissed the appeal with costs.

VICE-CHANCELLOR'S COURT.—(Before the Vice-Chancellor of England).—**Boulanger v. East India Company.**—Mr. Bethel and Mr. Young moved for the production of documents in the possession of the East India Company, relating to one Claude François Bonnet, a native of France, said to have been a ship-builder in Bengal, where he accumulated, it was supposed, an enormous fortune, and died intestate about 1793. The bill was filed by the plaintiff, Pierre Henri Boulanger, as his administrator in this country, through one of his next of kin in France, against the Company, who were supposed to have taken possession of the intestate's property in the absence of any kindred in India. Mr. Wigram and Mr. Lloyd appeared for the Company, and said the tale seemed expressly got up for the 1st of April. The learned counsel said that for some years past the Company had been overwhelmed with applications about this Monsieur Bonnet, and that they had caused the most diligent search to be made in their books, and could find no trace of the existence of any such person, and, of course, they denied that they had possession of his supposed fortune. Indeed, the representations which were made about him by those anxious inquirers were so extravagant, that the Company were led to discredit the whole story. They were told, for instance, that he had been King of Madagascar, that he died worth upwards of a million, the greater part of which had been in the Company's bank at Bengal, that he was seen in London in 1816, and that he had a forest of a hundred and fifty miles in length on the coast of Comorand. In short, there seemed to prevail a very great delusion, or monomania, on the subject, and the Company would be glad to lend their assistance, in order to disabuse those unfortunate victims who spent their money on such a wild pursuit. The thing had gone so far, that a pack of French adventurers had got up a company in France (*compagnie en commandite*), with shares of 1,000, 500, and 250 francs, for the purpose of recovering this property, which was represented to the subscribers to be worth 2½ millions of francs. Of this fortunate youth the East India Company could find no trace in their books. His Honour having observed that the new aerial machine might possibly be of use in discovering him, made an order for production, according to the terms of the order made by the Lord Chancellor in a late case of *Smith v. East India Company*, when the question was much discussed, to what extent the Company was protected from production of such documents as were of a public nature.

Evors v. Commissioners for Building Churches.—Sir Charles Wetherell moved for an injunction to restrain the defendants from building a church in the parish of Newtown, in Montgomeryshire, without providing for the plaintiff such pews, sittings, and chancels, as he had in the old parish church. The plaintiff, the Rev. George Arthur Evors, a gentleman of fortune in Montgomeryshire, claimed, as owner of Newtown Hall, a prescriptive right to an ancient freehold chapel or chancel, in the parish church, containing no less than eight pews, with eight seats each, and a gallery, and in which were erected several tombstones and monuments of great antiquity, and particularly two vaults, in which the remains of his ancestors had been deposited since the time of Edward IV. The owners of the Hall had time immemorial enjoyed this chapel, and paid for its repair, and were exempt from church-rates. Of late years this old parish church had fallen out of repair, and upon application by some of the parishioners to the commissioners for building churches, the

latter had agreed to advance 2,000l. towards building a new church, for which the plaintiff and the rest of the parishioners subscribed liberally. At first the plaintiff wanted the new church to be built on the site of the old church, but when it was stated to him that the commissioners could not advance money for such a purpose, he proposed that the new church should be built on a piece of land which he offered to give on his own estate, and he declared his readiness to pay for a chancel for his own especial use, as an ornamental addition to the church. For some reason, however, he seemed to change his mind about giving the site; and meantime Mr. Pugh, who resided in the same borough, offered a site at another part of the parish, which was finally accepted. The plaintiff then retracted his offer to build the chancel, and insisted he had a right to have the same privileges secured to him in the new church which he possessed in the old; and it was contended that the new church would become substantially the parish church, and that the old church would be let fall into decay, to the great detriment of the plaintiff, to whom his rights in his ancient parish church were an object of great attachment. Mr. Twiss and Mr. Wray, on the part of the commissioners, contended that the whole argument on behalf of Mr. Evors turned upon a mistake in fact, an assumption of an intention by the commissioners to rebuild the parish church. That was the affair of the parish, and not of the commissioners. The money placed in their control was intended for building additional churches in parishes where the population had grown much too large for the church accommodation. The commissioners had only lent their assistance in building a district church. Over the parish church they had no power, they had assumed none, nor did they intend to build a church which should be a new parish church, or a substitution for the old parish church. The learned counsel then commented on the vacillating conduct of Mr. Evors during the whole negotiation, as a sufficient answer to an application for an injunction. His Honour observed, that besides the four Acts of Parliament which had been commented on at such length, there were five others on the same subject which had not been cited. He would, therefore, take time to consider his judgment.

ROLLS COURT.—Marquess of Hertford v. Lord Lowther.—Mr. Tripp, on behalf of Sarah Louisa Princess of St. Antonio, stated, that the late Marquess of Hertford, by his will and codicils, had bequeathed to her legacies amounting to 40,000l.; it was now asked that this sum, together with 122l. 14s. 8d. for interest, might be paid to her. Mr. Follett, on behalf of the executors of the late Marquess, said that the present petitioner was domiciled at Naples, and he was not aware that there was any authority to receive the money. Lord Langdale directed that the money should be carried over to the separate account of the petitioner, with liberty for all parties to apply to the Court. He, however, refused to give any costs of the petition.

ASSIZE INTELLIGENCE.—MIDLAND CIRCUIT.—(Warwick).—**The Warwickshire Chartists.**—George White surrendered to answer an indictment for sedition and a riotous and unlawful assembly at Birmingham in August last. The bill had been found at the Birmingham Borough Sessions, on the 22d October last, at which time the defendant was in custody under the commitment of the magistrates, and the indictment was removed by *certiorari* into the Court of Queen's Bench. On the 29th October a summons had been taken out before a Judge at Chambers, and the defendant was admitted to bail by Mr. Justice Cresswell, on the 10th November, when recognisances were entered into by himself in 200l., and four sureties in 50l. each, that he would appear and plead to the indictment, and appear on the return of the *postea* in case he should be convicted. Mr. Sergeant Adams stated the case on behalf of the Crown at some length. He spoke of the fears that extensively prevailed in the town and neighbourhood, of the meeting of the magistrates on the 20th, and of their notices by placards and advertisements in the public papers of the forbiddance of such meetings. He alluded to the state of things which rendered it necessary for the magistrates to apply for, and the Government to supply, a reinforcement of military. In addition to the Dragoons usually quartered in the barracks at Birmingham, a force of Infantry and Horse Artillery had been procured. The Warwickshire, Worcestershire, and Staffordshire regiments of cavalry had been also on duty in the neighbourhood of the town, and of the iron and coal districts. The pensioners, too, had been embodied and drilled, and great numbers of the respectable inhabitants sworn in as special constables. The learned counsel observed upon the extremely mischievous tendency, especially in times of popular excitement, of such proceedings and conduct as the defendant stood accused of. The gentlemen of the Jury, he said, would pronounce whether the charges, or any and which of them, laid in the indictment were made out to their entire satisfaction. Witnesses were then examined in support of the prosecution, and on Saturday night, the proceedings were adjourned to Monday. The defendant then addressed the Jury in his defence; his speech occupied one hour, but the principal points he made may be briefly stated. The chief difficulty he confessed he laboured under was, not his want of legal knowledge, but his inexperience in addressing an auditory of the description of that before him, persons moving in a different sphere from that to which he himself was accustomed, and who, probably, had imbibed prejudices against Chartism, with which he should find it difficult to combat; but he was supported by the belief that the indictment upon which he had been arraigned, and which had been removed into that Court by writ of *certiorari*, had not been sustained by any evidence the Government had thought fit to adduce in its support. He complained of the way in which he had been treated. When before the magistrates at Birmingham, he had been told bail would be required of himself in 200l., and two sureties in 100l. each; yet when he got to Warwick he found he was required to find bail in six sureties of 100l. each; and under all the circumstances, he considered himself as snared against rather than having snared. He had been taken from his home, his family, his friends, incarcerated eleven weeks in a gaol, mixed up with felons and characters of the very worst description, and all the time he was ready with the good and sufficient bail which in the first instance had been required of him. The Learned Serjeant who conducted the prosecution had in his opening address, and in the evidence he had thought fit to give, attempted to connect him with the strike of the colliers; in which attempt he had signally failed, notwithstanding the police of Birmingham had done their utmost to bring that charge home to him; while with regard to the terror it was said he had inspired in the minds of the peaceable inhabitants of Birmingham, there was not a single inhabitant of that town called to prove the allegation; while, on the contrary, he could, if need was, call many persons to speak to the reverse. There was no evidence to support the count for riot—that, in fact, had been abandoned, and he would show that the other counts laid were equally destitute of proof. But it was said he was a Chartist, and that was enough to justify every vagabond who might be in the police to go prying round corners, watching his movements, as though he were the regicidal wished to make him out. The truth was, he had sympathized with the condition of the thousands he knew were starving around him. Their wretchedness it was that had moved his soul to pity; and was he to be hunted out of the pale of civilised society on that score, and because he boasted of being a Chartist? No. He challenged his persecutors to show anything against his character. He had always done his duty as an honest man, and acted decorously and well. He had injured no man, his name or property; nor had he ever been the base individual to counsel others to do so. Then why should he be singled out as an object for persecution? If the petty jurymen then in Court, who had come from the town of Birmingham—if they were asked whether he had ever been the means of injuring them in their vocation by any meetings he had held—they would say, to a man, "Nothing of the sort;" and so would every respectable inhabitant of the borough. He held certain political opinions—these were Chartist opinions. He did not

deny it. But was it to be said, the intention of himself and others holding these opinions was to rob and plunder? Ah! they knew the working classes of their country better—they were an industrious and contented set of men when they had work to do, and willing to work they were—Oh! how willing; but how could they be quiet or happy when they had empty stomachs? It was not their wish to injure any one; but they thought, and he (the defendant) imagined they thought rightly, that the labour of the poor was as much entitled to protection as the property of the rich; while, as for himself, he was to be got rid of by his political opponents, because he did not choose to make one of their political chessboard. The defendant, after making a few other observations, proceeded to remark upon the evidence, while in respect of the Birmingham police, he averred the force was composed of the greatest blackguards, thieves, and ruffians that had ever disgraced humanity. In conclusion, he stated no case had been made out against him, and he therefore left his case with confidence in the hands of the jury. Mr. Baron Alderson, in summing up, said there were five counts in the indictment, to four only of which would it be necessary for the jury to direct their attention, as, in his opinion, the allegation of riot was not made out, and the other counts related to holding seditious language, and to convening unlawful assemblies. In order to make out that defendant had been guilty of using seditious language, the jury must be satisfied the words imputed to him were said, and said in the sense in which the indictment charged. With regard to unlawful assemblies, his Lordship told them what the law was. Where large bodies of men met together for some private purpose, which was conducted in a way to excite alarm and terror in the minds of persons of ordinary firmness of character—not mere timid women—that was an unlawful assembly. His Lordship then went through the evidence, pointing out what he considered to be the points therein favourable, or otherwise, to the defendant, and after a most elaborate and impartial summing up, the jury retired to consider their verdict, and ultimately returned with one of Guilty on the first, second, and third counts—that for using seditious language. A second indictment against the same defendant, and for a similar offence, committed on the 25th of August, which had begun when the former jury retired, was now given up, it being stated by the counsel for the Crown that the verdict obtained was sufficient to vindicate the law, the chief object it had in view. Mr. Baron Alderson was about to pronounce sentence, but upon the application of the defendant (the Crown not pressing for judgment at the instant) it was postponed, and the defendant will have to be brought up to the Court of Queen's Bench to receive the same in the ensuing term.

SPORTING.

TATTERSALL'S, THURSDAY.—DERBY.—14 to 2 agst Mr. Blakelock's A British Yeoman (taken); 16 to 1 agst Colonel Peel's Murat (taken); 16 to 1 agst Mr. Goodman's Maccabees; 16 to 1 agst Mr. Bowes's Othello; 25 to 1 agst Lord Egmont's Aristides; 25 to 1 agst Colonel Anson's Napier; 20 to 1 agst Mr. Bell's Winesour (taken freely); 28 to 1 agst Mr. T. Taylor's Gamecock (taken); 30 to 1 agst Lord G. Bentinck's Gaper (taken); 30 to 1 agst Sir G. Heathcote's Amaro; 30 to 1 agst Lord Westminster's Langish colt; 45 to 1 agst Duke of Richmond's Cornopcan; 1000 to 20 agst Lord Orford's Mercy colt (taken); 50 to 1 agst Lord Chesterfield's Parthian; 50 to 1 agst Mr. Theobald's Highlander; 1000 to 10 agst Colonel Peel's St. Valentine (taken).

OAKS.—5 to 1 agst Lord Westminster's Maria Day (taken).

MARK LANE, FRIDAY, APRIL 7.—The Wheat Market was quiet to-day, and the sales of Foreign have been very limited. Of English there was scarcely any at Market, but prices may be considered fully equal to Monday. Barley sells slowly at the same rates. Peas and Beans remain without alteration. The supply of Oats is small, and our currency was fully supported.

GAZETTE OF THE WEEK.

BANKRUPTS.—H. Wood, Fleet-street, bookseller.—W. Burton, Cambridge, draper.—J. Hutton, Ringwood, Hampshire, draper.—J. R. Hitchcock, New Sarum, Wiltshire, booter.—J. Nye, Bridge-house-place, Borough, surgical instrument-maker.—J. Howe, Sheffield, table-knife-manufacturer.—H. Morris, Stourbridge, Worcestershire, grocer.—E. Wheeler, Birmingham, corn-dealer.—T. Eardley, Newcastle-under-Lyme, Staffordshire, hat-manufacturer.—J. Higham, Kearsley, Lancashire, victualler.—J. Travell, Sheffield, tailor.—Brook, Longwood, Yorkshire, woollen-cloth merchant.—J. E. Pearson, Sheffield, wine-merchant.—J. Evans, Liverpool, coal-dealer.—J. Shaw, Seymour-place, Camden-town, builder.—B. Vines, Poole, grocer.—D. Redmond and J. Gallup, Charles-street, City-road, iron-founders.—J. C. Walne, Stowmarket, Suffolk, hop-merchant.—C. Willmer, Tillingham, Essex, draper.—J. George, Bread-street, City, silk-manufacturer.—T. Rolph, New Bridge-street, merchant.—J. Fuller, Elxton, Lancashire, logwood-grinder.—T. M. Whiteley, Liverpool, hatter.—J. Whitaker, Whalley, Lancashire, woollen-manufacturer.—B. Lewis, Haverfordwest, cabinet-maker.—E. Dickinson, Longdon, Shropshire, draper.—Norman, Wadebridge, Cornwall, grocer.

SCOTCH SEQUESTRATIONS.—D. Smith, Edinburgh, merchant.—John Boyack and James Boyack, St. Andrews, fishers.—J. D. Rattray, Dundee, ironmonger.—T. Henderson, Perth, ironmonger.

BIRTHS.—On the 5th inst., in Connaught-place, the Viscountess Bernard, of a daughter.—On the 4th inst., at 30, Grosvenor-street, Lady Millicent Jones, of a daughter.—On the 5th inst., in Southampton-street, Bloomsbury-square, Mrs. Luke James Hansard, of a daughter.—On the 5th inst., at 13, Park-place, St. James's, the lady of the Rev. E. Banks, of a daughter.—On the 1st inst., at Ham, the lady of General Montholon Count de Lee, late of Petersburg Lodge, Petersburg, of a son.—On the 3d inst., Mrs. Warner, of the Theatre Royal, Drury-lane, and Euston-place, Euston square, of a son.—On the 4th inst., at Portland-place, the lady of W. W. Chute, Esq., M.P., of a daughter.—At Ashley Park, Lady Fletcher, on the 1st inst., of a son.

MARRIED.—On the 5th inst., at the parish church of St. Alphege, Greenwich, Capt. H. M. Dobbie, to Ellen, eldest daughter of E. H. Locker, Esq., Commissioner of Greenwich Hospital.—On the 27th ult., the Hon. J. C. Dundas, M.P., only brother of the Earl of Zetland, to Margaret, daughter of J. Talbot, Esq., of Talbot Hall, county of Wexford.—On the 4th inst., at St. James's, G. V. Rathbone, Esq., of Mornington Cottage, Mornington-road, Regent's Park, eldest daughter of W. Cobbe, Esq., of Bruton-street, Berkeley-square.

DIED.—At Genoa, on the 25th ult., Lady Erskine, wife of the Right Hon. Lord Erskine, her Majesty's Envoy Extraordinary and Minister Plenipotentiary at the Court of Munich.—On the 5th inst., at his residence in Portico, H. Thompson, Esq., R.A., Keeper of the Royal Academy.—On the 3d inst., at the Grange, the Hon. and Rev. Thomas Mordaunt, Rectory of Bedale, in the 75th year of his age.—On the 22d ult., at his seat, Broomham, in the county of Sussex, Sir William Ashburnham, Bart., in the 74th year of his age.—On the 6th inst., at her residence, 149, Albany-street, Regent's Park, Mrs. Honey, the popular vocalist, in the 36th year of her age.

WHITE FIELD CARROT SEED of the finest quality, at 3s. 6d. per lb., for not less than 7 lbs., may be obtained of GORDON, THOMSON, & BASKETT, Seedsmen, 25, Fenchurch-street, London.

VALUABLE ORCHIDACEÆ FROM INDIA.
MESSRS. J. C. and S. STEVENS beg to announce that they have just received notice of a BOX of ORCHIDACEÆ collected in the Presidency of Bombay between the 20th and the 25th Feb. last, being on board the "Oriental." They will be landed at Southampton on or about the 18th inst., and immediately sold by Auction at their Great Room, 38, King st., Covent Garden. Due notice of the day of Sale will be given.

TO GENTLEMEN, FLORISTS, AND OTHERS.
MESSRS. PROTHOROE and MORRIS beg to announce they are instructed to submit to Public Competition, at the Auction Mart, Bartholomew Lane, on Thursday, April 13, 1843, at 12 o'clock, a very rare Collection of CARNATIONS and PICOTÉES (the entire Stock of a celebrated Amateur), LUCASIAS, VERBENAS, PINKS, DAHLIAS, and a variety of Plants in bloom. Also a quantity of Carnation Sticks, Shades, &c. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

MR. JOHN KING begs to give Notice that he intends to sell by Public Auction, on the 12th day of April, 1843, at 10 o'clock, on the premises, Brixton-road, a fine collection of Greenhouse plants, a fine large specimen of ACACIA ARMATA, 12 feet high, in full blossom; some of the new SCARLET PELARONIUMS, CHINA ROSES, &c. &c. Also a large collection of Herbaceous plants, Flower Seeds, &c. Catalogues on the premises, of Mr. LARK, Seedsmen, Bishopsgate-street, and of the Auctioneer, Hackney-road.

ECONOMIC LIFE ASSURANCE SOCIETY,
No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON.
Established 1823. Empowered by Act of Parliament, 3 William IV.
LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE.
That entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0
per cent.								

The Bonus declared in 1834 amounted upon an average to 16½ per cent. on the premiums then paid; and in 1839 a second Bonus was awarded, amounting on the average to 31½ per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam vessel) from any one Port thereof to another during peace, to Assurers, not being sea-faring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25s. to 500s., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of FREDERICK LAWRENCE, Resident Secretary, 112, Cheapside.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS & Co., Architects, &c., Gloucester-Place, King's Road, Chelsea, Hothouse-builders and Hot-Water Apparatus Manufacturers, seeing that several parties pretend to lay claim to the Open Trough, Tank, or Gutter system of heating, J. W. & Co. here lay before the Horticultural world their practice respecting it, they having fixed and circulated water in open Troughs now upwards of 16 years, and their works are now to be seen that have been fixed that time, at DAVID PUGH'S, Esq., Welsh Pool, Montgomeryshire, the Duke of Bedford's, Woburn; Sir EDMOND ANTHOBS, Cheam, and up to the present time they could give a list of 200 names, where they have fixed that principle, or their improvement on it. The above sketch represents a pit, shewing the principle for the purpose of Bottom-Heat, which answers well. J. W. & Co. solicit an inspection of their improvements in Building, Heating, and Ventilating, at their Horticultural Manufactory, Gloucester-Place, Chelsea.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—**STEPHENSON and Co., 61, Gracechurch-street, Inventors** of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.
N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

PENN'S SYSTEM OF HOTHOUSE BUILDING WARMING, and VENTILATING.—The superiority of the principle first introduced by JNO. PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the Nobility, Horticulturists, and the Public generally, that having, in conjunction with the Inventor, devoted much time and study to perfect the same in the construction of Conservatories, Stoves, Greenhouses, Pits, and other Horticultural Erections, and to heat them with IMPROVED HOT-WATER APPARATUS, to ensure ANY DEGREE OF TEMPERATURE, earnestly solicits their inspection of the working of this system at the Inventor's residence, Lewisham.

The peculiar advantages in Houses erected upon, or altered to, this principle, are—Free and rapid Circulation, Equality of Temperature, and safe and agreeable access, at all times, to the most delicate constitutions.

Churches, Chapels, Manufactories, or other large Public Buildings and Dwelling-houses, warmed and ventilated. The Heating Apparatus, which is of the very best description, combining Durability and Simplicity with Economy in the Consumption of Fuel, is manufactured by and fixed under the superintendence of JNO. PENN, Esq., Engineer.

Reference is permitted to JNO. WILLIAMS, Esq., Isleworth, and numerous other Gentlemen, who are practically acquainted with the merits of W. HILL's mode of applying Mr. PENN's principle.

Designs, and every information, may be obtained on application to W. HILL, Builder and Surveyor, Lewisham.

MANURES.—Guano, Nitrates of Soda, and Potash, (pure), at the Importers' prices. Also Gypsum, Potter's Guano (superior to the Foreign), Urate, Bone-Dust, Sulphate of Ammonia, and all other Chemical Manures, on the lowest terms for cash. Rock Salt and Agricultural Salt.—Sold by MARK FOTHERGILL, Merchant and Agricultural Agent, 40, Upper Thames-street.
*** Pamphlets treating the above may be had of Mr. F.

LIQUID MANURE.—PUMPS of a superior construction for Liquid Manure, portable and stationary. Garden Pumps, Hydraulic ditto, and for deep Wells; also for Ships, Barges, Tanners, Brewers, Soap-boilers, &c. Pumps kept for Hire, for Wells and Excavations.—BENJAMIN FOWLER, late GEORGE TURNER, 63, Dorset-street, Fleet-street.

GUANO ON SALE.—BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. Cotton, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 13 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

*** Potter's Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE.—Any quantity of this VALUABLE MANURE can be had from the bonded Stores of the Importer, either in London or Liverpool, on application to CORNWORTH, POWELL, and PAYOR, St. Helen's Place, London; EDWARDS, DANSON, and Co., Liverpool; or WM. JOS. MYERS and Co., Importers, Liverpool.

LATEST WORK ON CHINA.
Now ready, in 3 vols. small 8vo, with a Map, and 36 Engravings by Jackson, price 15s.

AN HISTORICAL & DESCRIPTIVE ACCOUNT of CHINA, from the Earliest Ages to the Peace of Nanking. By HUGH MURRAY, Esq., F.R.S.E., and other Eminent Authors. 3d Edition, revised and enlarged.

In a few days, by the same Author,
AN HISTORICAL & DESCRIPTIVE ACCOUNT of BRITISH INDIA, from the most Remote Period to the Conclusion of the Afghan War. 4th Edition.

OLIVER and BOYD, Edinburgh; SIMPKIN, MARSHALL, & Co., London.

Just published, price 1s., by LONGMAN and Co., London; W. CURRY, Jun., and Co., Dublin; FRASER and Co., Edinburgh.

TRIALS and EFFECTS of New CHEMICAL FERTILIZERS, with various Experiments in Agriculture, for Aerating Soils and Composts—Increasing the Food of Plants—Improving Irrigation—and abating the Ravages of Insects. By Sir J. MURRAY, M.D., Member of the Royal Agricultural Societies of England and Ireland.

Sir JAMES MURRAY'S New Fertilizers for Early Crops, 20s. per cask, eight casks to a ton, may be procured of the London agents, GIFFORD & LINDER, 104, Strand; or EVANS, 79, Dame-st., Dublin.

H. WALKER'S NEEDLES (by Authority the "Queen's Own"), with the New Large Eyes, are easily threaded (even by blind persons), and worked with great ease, having Improved Points, Temper, and Finish. The Labels are correct Likenesses of Her Majesty and His Royal Highness Prince Albert in relief, on coloured grounds.

H. WALKER'S Improved Fish-hooks, Steel Pens, Hooks and Eyes, Bodkins, &c., are particularly recommended to notice.

For the Home Trade, neat packages of Needles or Pens, from 1s. to 10s. value, can be sent free by post by any respectable dealer, on receipt of 13 penny stamps for every shilling value. Every quality, &c., for shipping.

H. WALKER, Manufacturer to the Queen, 20, Maiden-lane, Wood-street.

BENEVOLENT INSTITUTION for the RELIEF OF AGED AND INDIGENT GARDENERS AND THEIR WIDOWS.—A General Meeting of the Subscribers to this Institution will be held on Thursday, the 1st day of June next, for the special purpose of Electing two Pensioners.

All Persons desirous of becoming Candidates are requested to forward their Testimonials on or before Saturday the 22d inst. (as after that time none can be received), to the Secretary of whom Copies of the Rules and Lists of Subscribers, may be obtained.—EDWARD R. CUSLER, Secretary, 97, Farringdon-st.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

MOXON'S EFFERVESCENT MAGNESIAN APERIENT may be had of all respectable medicine-vendors throughout Great Britain and Ireland, and nearly every part of the civilized world. In all parts it has met with the sanction of members of the medical profession, who recommend it to their patients as the best Family Purgative ever discovered. It is of eminent service in pains in the Head, casual or Habitual costiveness, Bilious Affections, Nausea, Sickness, Heartburn, Indigestion, Gout, Piles, Fistula, and as an aperient saline draught in all febrile affections. It is an effectual remedy for derangement of the stomach and head, resulting from excess either in eating or drinking. It possesses all the medicinal powers of the most approved saline Aperiants, without the disagreeable taste which distinguishes medicines of that class, and is so agreeable that even children can take it without dislike. Prepared only by BENJAMIN MOXON & SONS, Chemists, Hull. Sold in bottles at 2s. 9d., 4s. 6d., and 11s. Observe—the genuine medicine has "MOXON & SONS" (then co-partners), Chemists, Hull, engraved on the Government stamp.—Wholesale Agents, BARCLAY and SONS, &c., London.

BEE-HIVES.—GEORGE NEIGHBOUR and Son beg to inform their Apiarian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Beehives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and Son have also Glass Hives and other articles connected with Bee Management, at their Apiarian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps inclosed.

*** "NUTT ON BEES" (5th Edition), now published.

FOUNTAINS, VASES, TAZZAS, FIGURES, &c., in Marble, Artificial Stone, and Parker's Cement, to be seen at WYATT, PARKER, and Co.'s WHARF, Holland-street, Surrey, foot of Blackfriars-bridge. Also a large Collection of Chimney Shafts, Pedestals, Capitals, Consoles, Trusses, &c.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTH, upon application to the Gardener—*Sundays excepted.*

BEE-HIVES, &c.—Illustrations of Apiaries, Beehives, Feeding-Machines, and all the Apparatus connected with the Apiary; a Sheet-List, price 1s., published by J. MILTON, may be had of Messrs. PARKER, West Strand; also at J. MILTON'S, Italian Warehouse, 10, Gt. Marylebone-st., Wimpole-st. "These are Illustrations referred to in the Practical Bee-Keeper," a Treatise on Bees now publishing. All letters prepaid.

TO GROWERS OF SUCCULENTS.

AN AMATEUR has about 100 established Plants of the MELOCACTUS DEPRESSUS, imported last Spring; also a number of duplicates of CACTI and ALOES, which he wishes to part with, either for cash or plants of the same tribe not contained in his collection. Particulars may be had by applying to H. L., 3, Thomas-street, Horselydown, London.

WANTED, by a Clergyman in the Country, an active, useful Man as GARDENER. He will have to look after two Cows, and a Horse and Carriage, and must be well acquainted with a Gardener's business. Address, post-paid, to J. E. R. Post-office, Newbury.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, a respectable Married Man aged 33, who has a competent knowledge of the various departments of his profession; has held the situation he has just left five years. Satisfactory references can be given. Direct to A. B., care of Mr. LANE, Gardener, Hurlingham House, Fulham.

AS GARDENER, a Young Man, 28 years of age. He can be highly recommended for strict integrity and a general knowledge of Gardening in all its various departments, by some of the Noblemen's Gardeners he has lived with.—Direct to C. S., care of Mr. ROBERTS, Albion, Thornhill-road, Islington.

AS GARDENER, an active, industrious, married Man, without children, aged 39, who perfectly understands the management of the Vinery and Greenhouse, Wall-trees, Kitchen and Flower Garden, early and late Forcing. Has no objection to the care of Meadow Land and Stock. His wife is an excellent Dairymaid, and understands the management of Poultry. Can have eight years' excellent character from a highly respectable family. Direct to W. H., 38, Britannia-street, City-road.

AS GARDENER, a young MAN, 24 years of age, who understands Early Forcing; he has had the care of Pines, and would have no objection to take charge of a Horse and Chaise, or a few Cows, if required. Can have a good reference from his last employer. Direct to I. P., care of Mrs. SMEDLEY, Sydenham.

AS GARDENER, a single Man, aged 39, who is able and willing to work, and is well acquainted with the treatment of Pines, Vines, &c. and with Gardening in general. He has lived three years in each of his last situations. Letters addressed to J. L. Ross, West Wickham Hall, Kent, will be immediately attended to.

AS SECOND GARDENER, a respectable young Man, 24 years of age, who has been brought up in the Business, and has a good knowledge of Forcing of every description, having been Foreman in his two last situations. He has lived in some of the principal places in the North, and can be well recommended by the Noblemen's Gardeners he is about to leave.—Address N. B., Post Office, Catterick.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 8, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 8, 1843.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 15—1843.

SATURDAY, APRIL 15.

PRICE 6d.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN THE LAST NUMBER.

Allotment system, remarks on	227 c	Lawns, to improve	233 b
Amateur's Garden	229 c	Grass-seeds for	233 c
America, N. W., collector for	231 b	Le. its effect on Wheat	232 b
Ammonia, Mr. Potter's remarks on fixing	229 c	Manures, artificial, weight per bushel	231 b
Amphicome arguta, its treatment	232 c	Manures, vegetable	229 a
Araucaria, treatment of seeds	232 c	Melons, ancient directions for planting	231 a
Ascension Island, growth of various plants in	230 c	Mowing, average rate of, per day	233 b
Beech, evergreen, introduction of	231 b	Murray's Trials and Effects of Chemical Fertilizers, revd.	231 c
Bees, effect of Dahlias on	230 c	Onion Maggot, to destroy	233 b
Calla, its treatment	232 c	Paint, for Horticultural purposes	233 b
Carnations, remarks on their properties	230 b	Pelargoniums, select	233 a
Caryophyllus, their treatment	230 b	Pigeon plant	233 c
Clover seed, doctored, test for	231 a	Plantain, to destroy	233 c
Conifers, treatment of seeds	232 c	Polyanthus, treatment of seeds	233 a
Cow-grass, to lay down land with	232 c	Potatoes, effect of various manures on	227 a
Custard Apple	233 a	Poultry, good works on	233 b
Cuttings, their transmission to India	231 a	Ramp, on, its treatment	233 a
Dahlias, list of winning flowers	231 b	Red Spider, to destroy	233 b
Draining land, remarks on	232 c	Rucker, Mr., his garden noticed	231 c
Eggs, effect of food on	232 c	Rye-grass, Italian, to sow	232 b
Familiar Botany—Buds	232 c	Sashes, new method of arranging	233 b
Fig-trees, to grow in Vinerias	233 b	Sole on trees, to destroy	233 c
Flower-pots, sizes of	233 b	Straw, to sow	230 c
Fruit-trees, to protect	233 a	Tillage, remarks on	229 a
Gas-lime, its effect on grass	232 b	Truffles, to propagate	232 b
Grapes, effect of frost-air on	232 b	Vine-borders, Roberts on	230 a
Guano, as a manure for Potatoes	227 c	Vines in pots, treatment of	232 c
Heaths, their treatment	232 c	Walls for fruit-trees, to erect	233 a
Henslow, Prof., separate publication of his letters announced	231 a	Windsor, Progress of the Royal Gardens at	227 a
Ipomoea Guianensis, its treatment	232 c	Wireworm, to destroy	233 b

UNDER THE PATRONAGE OF HER MAJESTY.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.—The First Grand Flower Show of the season will be held at the HORNS TAVERN, KENNINGTON, on Wednesday next, April 19th, 1843. During the afternoon will be given a Concorso degli Strumenti di Fatti—Conductor, Mr. DEAN. Open from 1 till 7. Admission, One Shilling.

R. H. CUMING, Hon. Sec.

HEARTSEASE SOCIETY.—President, Sir J. SEBRIGHT, Bart. The next Show of the above Society will be held at Mr. LIDGARD'S, Thatched-House Inn, Hammersmith, on TUESDAY, May 9, when Prizes will be given on the same liberal scale as last year, a schedule of which can be obtained of the Honorary Secretary, Mr. R. S. MOUNTJOY, Ealing, Middlesex. Subscription—10s. per annum.—April 11, 1843.

FLORICULTURAL SOCIETY OF LONDON.

At the EVENING MEETING, on TUESDAY next, the 18th inst., at the Crown and Anchor Tavern, Strand, 1st and 2nd Prizes will be awarded to Amateurs and Nurserymen respectively, for the best Green, Grey, and White-edged AURICULAS; together with 1st and 2nd Class Prizes to Seedlings: the Flowers to be ready for the Censors at 8 o'clock precisely. The competition (except for Seedlings) to be confined to Members. The Seedling Class will, as heretofore, be open to all: but no Prizes will in future be paid on any account, except to Subscribers to the Society.

T. C. WILDMAN, Hon. Sec.

JOHN MILNE begs respectfully to offer to the Nobility, Gentry, and Public the following plants:—A fine specimen of *Araucaria excelsa*, in pot, standing 8 ft. high, probably one of the finest in England, for sale, price 25l. Ditto, 5 ft. high, 10l. Fine specimens of *Rhododendron arboreum* (true), 8 ft. high, each, 7l. 7s.

Two very large *Bonaparte juncea*, 4l. 4s. each. *Lilium lancifolium album*, 5s.; *Do. do. punctatum*, 7s. 6d. each. *Rosa Devonensis*, 2s. 6d. each. A fine collection of *Azalea sinensis*, *Camellias*, *Pelargoniums*, *Ericas*, *Epacris*, *Gesneras*, *Gloxinias*, *Achimenes*, &c. &c. Likewise a general collection of Greenhouse, Herbaceous, and Rock plants, too numerous to insert. J. M. can also spare 100 fine large plants of *Andromeda floribunda*, 10s. 6d. and 12s. 6d. each.

PLANTS FOR BEDDING OUT.

Alstroemeria, 6 varieties, s. d.	Lynchnis fulgens	s. d.
each 1s. to 1 6	each 1 0	
Bouvardia triphylla 1 6	Mimulus, 6 fine varieties,	
Calceolaria, 12 vars., p. doz. 9 0	per doz. 6s. and 9 0	
Campanula grandis, each 1 6	Mule Pink, per doz. 6 0	
Catananche, 2 vars., each 0 9	Oenothera macrocarpa,	
Chelone barbata, per doz. 6 0	each 1 6	
Fuchsia, 25 varieties of the newest and most approved sorts, large plants, per doz. 12 0	Oenothera taraxacifolia, ea. 0 9	
Do. do., smaller, per doz. 9 0	Oxalis, 6 fine vars., p. doz. 6 0	
Fuchsia fulgens, 2 varieties, per doz. 9s., each 1 0	Pentstemon, 6 fine vars., per doz. 9 0	
Gentiana, 5 vars., per doz. 6 0	Petunias, 8 vars., per doz. 6 0

The above plants are all in pots; and a general supply may be had throughout the season.		Roses, large plants, each	1 6

N.B.—Plants for Bedding or Creepers ordered to the amount of 20s. will be forwarded to any part of London carriage free; a reference or Post-office order will be required of unknown correspondents.—Albion Nursery, Stoke Newington, Middlesex.

NEW AND CHOICE DAHLIAS AND FUCHSIAS, by F. & A. SMITH & Co., FLORISTS, &c., Hackney, London. For May, 1843. NEW AND SUPERB SEEDLING DAHLIAS:—

BIANCA, Wildman, pure white, cup petals, large size, the centre well up, very deep flower (having from 25 to 30 rows of petals), first-rate form, of excellent habit, and very free bloomer; has obtained four prizes, and was pronounced a first-class flower by the Floricultural Society of London. 4 ft.—10s. 6d.

DUKE OF WELLINGTON, Smith, rich scarlet crimson, fine cup petals, the centre well up, is of great depth and substance, a first-rate flower, a very profuse bloomer, and quite new in colour; it obtained a prize at the South Essex Show in Sept. 4 ft.—10s. 6d.

GENERAL SIR R. SALE, Smith, crimson purple, cup petals, well up in the eye, of good size, and great depth of petals, very profuse and constant bloomer, with long, upright foot-stalks, and is considered by competent judges the best flower of its colour yet offered to the public; it was pronounced a first-class flower by the Floricultural Society of London, Aug. 16, 1842; obtained a prize at Salisbury Plain, Aug. 31; a prize at South Essex, Sept. 8; a prize at Kingston, Sept. 15; a prize at Salt Hill, Sept. 16; a prize at Victoria Gardens, Stepney, Sept. 19; a prize at the Floricultural Society of London, Sept. 20; a prize at Sunbury, Sept. 22; a prize at Hammersmith, Sept. 27. 4 ft.—10s. 6d.

RIVAL YELLOW, Smith, deep golden yellow, fine cup petals, of great substance and depth, centre well up, of excellent form, very constant, and good habit. This Dahlia is warranted the best of its colour yet offered to the public. As the stock is very limited, early application is necessary to secure plants, many orders having already been received. No allowance on this variety. 4 ft.—10s.

RAINBOW, Smith, yellow, beautifully edged with rosy purple, of good form, very constant, free bloomer, and excellent habit; the flowers have long, straight footstalks; quite a new and distinct variety from any other in cultivation. The form of this flower improves as the season advances, sufficient to constitute it a show flower. 4 ft.—10s. 6d.

BEAUTIFUL SEEDLING PANSIES AND SHRUBBY CALCEOLARIAS.

MR. H. MAJOR, of Knosthorpe, near Leeds, has to dispose of healthy Plants of his much-admired Pansy, Bridggron, together with two other beautiful Seedlings, Miss E. Crossland and Mulberry Splendens at 5s. each. See opinion of *Floralist's Cabinet* for November, 1842, *Gardener's Gazette*, September 24, and *Gardener's Chronicle*, October 22, and for further description see Catalogue. The above three Seedlings, together with the following nine, may be had for 25s. post free: Lovely Bride, Glory of Knosthorpe, Jehu, Curion, Prince Albert, Rival Yellow, Maid of Milan, Dark Perfection, and Eclipse. Likewise most of the leading varieties of Pansies at moderate prices. The usual allowance to the Trade on Bridggron if six plants are taken. No allowance on the other two seedlings. Also will be ready in May the following Eight Seedling Shrubby CALCEOLARIAS for 2l. H. M. can recommend them as being handsome and very distinct varieties; they will be found an acquisition to the most limited collection.

Field Marshal.—Orange, strongly marked with brown, lemon edge, good bold well-formed flower, better than an inch across. Enterprize.—Very rich deep mahogany colour, fine formed round flower, noble, better than an inch across. Novelty.—Lemon colour, strongly spotted with amaranth, fine form, singular, and very pretty, nearly an inch across.

Knosthorpe Hero.—Noble, light yellow, strongly marked with beautiful maroon spots, fine form, better than an inch and a quarter across. Purity.—Beautiful clean white, good shape, the best white out, inch and an eighth across.

Field Marshal.—Orange, strongly marked with brown, lemon edge, good bold well-formed flower, better than an inch across. Mrs. Meynell, Ingram.—Clean white, centre of the flower and throat spotted with pink, beautiful round flower, inch and an eighth across.

Bridal Ring.—Clean creamy white, edged or bordered with buff, fine form, better than an inch across. The eight Seedlings sent out last year for 2l. may now be had for 1l. Also a few other kinds from 1s. to 2s. 6s. each. H. M. wishes it to be understood that he is offering none but his own Seedlings, which he has carefully selected out of thousands. A few packets of very select Pansy Seed, at 2s. 6d. and 5s. per packet. A Catalogue of Pansies, together with a few select Dahlias, may be had on post-paid application. From unknown correspondents a remittance is respectfully requested with the order.—Knosthorpe, Feb. 16, 1843.

1000 PLANTS OF THE NEW PELARGONIUMS FOR SALE.

JOHN HANCOCK & SON beg respectfully to inform their friends that they have a few more plants for sale of their splendid Pelargonium, *NORTHERN BEAUTY*, which they can with confidence recommend (descriptions of these splendid plants appeared in the *Gard. Chron.* Oct. 22d); price, per plant, 42s. They also beg to announce that they cannot supply plants of their new Calceolaria, Miss JACKSON, as advertised to be sent out in May, owing to the shortness of the stock, having now received orders for double the quantity they can supply. This is warranted to be a first-rate and beautiful variety, and not surpassed by any other variety extant.

J. H. & SON have a few more splendid varieties of CALCEOLARIA to offer, of which they have purchased the entire stock, a descriptive list of which will shortly appear.

All Cultivators of the Pelargonium are invited to apply for HANCOCK'S CATALOGUE of NEW and SUPERB PELARGONIUMS, containing accurate descriptions of nearly all varieties worthy of cultivation, with CHOICE CALCEOLARIAS, PANSIES, NEW VERBENAS (including Knight's new varieties), and FUCHSIAS, &c., which may be had on application by inclosing two postage stamps. Also, their CATALOGUE of New and Choice DAHLIAS and FLOWER-SEEDS is ready.—Wear Nursery, Durham, April 11.

MITCHELL'S Unrivalled Variegated DAHLIAS, viz., the BEAUTY OF SUSSEX and BLANCHE SHELLEY. **JAMES MITCHELL** begs to announce his intention of sending out in May the above Seedling Dahlias, which he can recommend with confidence to the most limited grower; they have been justly pronounced both by foreign and English growers to be the most beautiful and the most valuable acquisition ever offered to the public. J. M. will also have fine plants of Mrs. SHELLEY, which is first-rate and very scarce. The BEAUTY OF SUSSEX.—This Dahlia has been placed before any other two-coloured flower, at all the principal Shows in England, viz.—the Salt Hill, the Floral, the South London, Maidstone, and Tonbridge Wells Shows. Colour, delicate pink, strongly edged with Cherry—the petals are cupped, of firm texture, and well arranged, never confused; the general form is excellent, and rising well in the centre; a constant show-flower—4 feet, 10s. 6d. BLANCHE SHELLEY, white, delicately tipped with purple, beautifully-cupped petals, superior form, and of great depth: a constant show-flower—5 feet, 10s. 6d. Mrs. SHELLEY, delicate rosy pink, cupped petals, a constant show-flower—4 feet, 5s.—The usual allowance to the trade, where a dozen plants are ordered.—Pittdown Nursery, Maresfield, Uckfield, Sussex.

NEW ROSES.

T. RIVERS, jun., begs to call the attention of his Friends to the following selection of new Hybrid Perpetual, and other Autumnal Roses, all of which are first-rate varieties, and good healthy Plants.

HYBRID PERPETUAL.	s. d.	stocks, six-inch stems, in pots, the remainder are on their own roots in pots.]
1. Auberon	5 0	
2. Augustine Monchelet	5 0	
3. Clementine Seringe	10 6	
4. Comte de Paris	2 6	
5. Doctor Marx (Laffay)	10 6	
6. Doctor Marjolin (Do.)	10 6	
7. Duc d'Aumale (Do.)	7 6	
8. Lady Alice Peel (Do.)	10 6	
9. Lane (Do.)	19 6	
10. Madame Laffay (Do.)	3 6	
11. Prince de Galles (Do.)	10 6	
12. Prince Albert (Do.)	3 6	
13. Prudence Rosier	5 0	
14. Reine de Lyon	21 0	
15. Rivers (Laffay)	7 6	
16. Ebène, deep crimson-purple	s. d.	
17. Momus, very dwarf	5 0	
18. Proserpine	7 6	
19. Edouard Defosses	5 0	
20. Madame Aubis	7 6	
21. Cardinal Fesch	5 0	
22. Madame Bréon	3 6	

[The above are quite hardy and very fragrant; Nos. 3, 12, and 13 remarkably so. Nos. 5, 6, 8, 9, 11, and 14 are quite new; these are grafted on Boursault on very erect and stiff peduncles. For many other fine varieties T. RIVERS begs to refer to his Catalogue for 1842-3.—Sawbridgeworth, Herts, April 6, 1843.]

JOHN MILNE, NURSERYMAN, Stoke Newington, Middlesex, has now on Sale a fine Stock of that beautiful Creeper, *Scypanthus elegans* (Loosa volubilis), which he is enabled to offer at 3s. each, or 30s. per doz. Plants may also be had of **WARNER and WARNER**, Seedsmen, 29, Cornhill, opposite the Exchange.—The usual allowance made to the Trade.

MESSRS. CORMACK & CO. beg to announce that their new FUCHSIA CORMACKII is now ready to send out, at 7s. 6d. each. It was exhibited at the Horticultural and Floricultural Societies' Shows last season, when it was generally admired for its fine foliage and distinct flower. Application to be made at the Bedford Conservatory, Covent Garden, and New Cross, Surrey.

SPLENDID NEW PELARGONIUM, "THE ARCHBISHOP OF CANTERBURY."

WILLIAM MASTERS begs to offer the above new Seedling, at 42s. each. It is a remarkably free Bloomer, having its upper Petals rosy crimson, with a deep and well-defined spot; the lower being of a delicate pink, inclining to white in the centre.—Exotic Nursery, Canterbury.

SEEDLING FUCHSIAS, "IVERYANA," AND "GEM."

W. IVERY, Florist, Peckham, near London, begs to offer the above distinct varieties, having been exhibited at Regent-street Rooms last autumn, and greatly admired. For size, substance, and brightness of colour, have not their equal of superior habit and abundant bloomers. W. I. being a grower of all the newest varieties can, with confidence, recommend the above Plants. Can be had after the 15th April, at 7s. 6d. each.—A select Catalogue may be had, on application, of the newest FUCHSIAS, CINERARIAS, VERBENAS, &c.

FUCHSIA TODDIANA.

PLANTS of this MAGNIFICENT FUCHSIA, (the Flowers of which, in point of size, rival any other of its kind yet sent out, being nearly four inches in length) will be ready by the end of April, at 10s. 6d. each, with the usual discount where six are taken. For description, see *Gardener's Chronicle* of the 11th inst. Agents for London, Mr. CHARLWOOD, Seedsmen, Covent Garden; and Messrs. Lowe and Co., Clapton Nursery, at which places also drawings may be seen.—THOMAS CRIEKS, Tunbridge Wells Nursery, March 16, 1843.

WILLIAM WOOD AND SON have the pleasure to inform their friends that May is considered the best month for bedding out China, Bourbon, and other Roses from pots, and of which they have a large stock of fine Plants offered at the undervalued reasonable prices, where the selection is left entirely to W. W. and Son.

DWARF ROSES.

	per doz.—s.	s.
Isle de Bourbon	12	18
China or Bengal	9	12
Tea-scented	12	18
Noisette and Climbing, strong	9	12
Banksian Yellow and white, extra strong	18	

W. W. & Son will also have ready for delivery at the same time the following select showy plants:—

	s. d.
Azalea Jenneri (Denyer), magnificent, large, rose colour	each 21 0
Fuchsia belladifolia	2 0
„ conspicua arborea	1 6
„ Enchantress	10 6
„ Eppsi	10 6
„ St. Clare (Yonelli)	10 6
„ Venus victrix	1 6
Kennedy's Marryattae	1 6
Passiflora fragnans	5 0
Phlox Drummondii	per doz. 3 0
„ formosa, fine scarlet	9 0
Zichya villosa	each 3 6

Cinerarias, eight superb varieties for Pelargonium, Lady Webster (Denyer's), the most superb, deep rose, with a pure white centre, rich deep spot on upper Petals, flower exceedingly large and well-formed, habit first-rate, each 21 0 Woodland's Nursery, Maresfield, Uckfield, Sussex.

MAGNIFICENT NEW VERBENA, "PRINCE OF WALES."

WILLIAM WOOD AND SON, having obtained the entire Stock of the above very splendid VERBENA, beg leave to offer it to the Public, feeling assured that they can with the greatest confidence recommend it as worthy of especial notice. This desirable variety is a beautiful Flesh colour; the heads of Flowers measuring 3½ inches in diameter, and exceedingly fragrant. Plants of the above will be ready for delivery in May, at 3s. 6d. each; the usual discount to the Trade when six plants or more are ordered.

W. W. & Son would also solicit attention to their superb Collection of all the New Verbenas, Fuchsias, &c., and other spring Plants adapted for Bedding, Catalogues of which will be sent FREE on application.

Verbenas, consisting of the best varieties, and left to their own selection, in tin cases, per post, at 3s. per doz., or in pots at 4s. per doz. Fuchsias, per post, at 4s. per doz. Petunias, fine sorts, at 4s. per doz., in tin cases. All orders sent per post will be prepaid.

Please address—Woodlands Nursery, Maresfield, near Uckfield, Sussex. Agents in London, Messrs. WARNER and WARNER, 28, Cornhill; and Mr. CARTER, 238, High Holborn.

CHOICE PANSIES.

J. HENCHMAN begs to inform Growers of the PANSY that he has still on hand a few healthy Plants of his six seedling varieties, at 21s. the collection.

J. H. has also a few choice varieties to offer at from 9s. to 18s. per dozen.

J. H. begs to state that there is, at present, a VACANCY in his Establishment (which comprises a general Nursery Stock) for a respectable Youth as APPRENTICE. A moderate Premium required.—Edmonton, London, April 13, 1843.

HORTICULTURAL SOCIETY OF LONDON.—
The last day, on which Tickets for the ensuing Exhibitions at the Garden can be issued to Fellows at the privileged Price of 3s. 6d. each, is Tuesday, April 18.—21, Regent-st., April 7, 1843.

The Gardeners' Chronicle.

SATURDAY, APRIL 15, 1843.

Wednesday, April 26	Geological	8½ P.M.
	Medico-Botanical	8 P.M.
COUNTRY SHOWS, April 29	Limerick.	

As the department called "Notices to Correspondents" is increasing at a rate which threatens to encroach inconveniently upon the space required for other matters, we should be greatly obliged to our Correspondents if they would not put questions to us which have been repeatedly and recently answered in previous Numbers. It would also save them expense if they bore in mind—1st, That names cannot be given to bad, or badly-packed specimens; 2nd, That unknown plants must have flowers attached to them; 3rd, that Cryptogamic plants, not having any connexion with cultivation, are not included in the subjects to which we furnish replies.

It should also be remembered that many questions require some consideration; occasionally, indeed, a good deal of inquiry before a satisfactory reply can be returned; and that many of our advisers upon practical matters live in the country, when some time is requisite to obtain their answers; this is more especially the case with Agriculture, in which we profess little knowledge ourselves, but rely upon a friend whose farm is at a distance from London. For it must be obvious that if replies to practical inquiries are not given by experienced persons, actually engaged in the operations to which their answers relate, the latter can never be trustworthy, and would not have that authority which those who obtain them from us well know that they possess.

Our practice has hitherto been to answer all reasonable questions, however trifling they may be; upon the principle, that, if a man is ignorant of what he ought to know, he will never be enlightened by the "pooh!" of those who happen to possess better information. Those, indeed, who are well informed on one subject are continually obliged to go to others for advice, upon what may appear to those others very trifling matters.

A judge might think a man very ignorant who asked him the difference between the *jus civile* and *jus gentium*; but if that judge were to ask whether it is true that sugar is only charcoal and water, he might fall rather low in the estimation of a chemist; and then again the chemist who should not know Barley from Rye would be despised by the farmer, who could not himself distinguish Epsom salts from oxalic acid. The truth is, we none of us know much of anything, except that which has from accidental circumstances formed the great object of study all our lives, even if we are so fortunate as to understand that. When therefore we receive trifling questions, we feel as much bound to answer them as if they were ever so difficult. We are not among those *quos janua clausa juvat*; on the contrary, we wish to see the gates of knowledge expanded wide, and are quite satisfied with the humble situation of their janitor. We therefore repeat that we have no intention of departing from the plan which has been hitherto pursued; but, at the same time, we do trust that the good sense of our correspondents will prevent their making inquiries about matters to which they can obtain a sufficient answer by looking back to our indexes, or to the replies that have been frequently given to others upon the same subject.

It is probable that one of the reasons why natural manures are so much more valuable than any of the simple manures, is their consisting of many different ingredients, so that if one does not take effect upon a crop another may. Thus we see that farmyard-dung, guano, cloacine, and compost-heaps, produce invariably a good effect; while nitrate of soda, sulphate of soda, and the other saline ingredients now so extensively employed, sometimes succeed, sometimes fail, and always succeed best when used in addition to the ordinary manures. Experiments show that plants are but little improved by simple substances when they can get nothing else, and that it is only when the soil in which they grow has been manured, and still retains a quantity of the organic matter so introduced, that the effects of simple substances become advantageous.

This is to some extent exemplified in the valuable experiments by Mr. Fleming, of Barochan, to which we last week alluded. On a soil which, without

being recently manured, produced 6½ tons of the Red Don Potato, 50 bushels of Wood-ashes (which may be regarded as a simple manure) raised the crop only three quarters of a ton at the expense of 25s.; but 4 cwt. of natural guano, a very compound substance, added more than 7½ tons at the total cost of 48s. (reckoning guano at its present price). But when 25 bushels of Wood-ashes were added to 4 cwt. of guano, the crop rose about 1½ ton further at the additional cost of 12s. 6d. So that, where wood-ashes were used alone, the small quantity of Potatoes obtained by them cost 33s. 4d. a ton, while, in combination with guano, the same substance furnished Potatoes at the expense of only about 8s. a ton.

This strikes us as an important fact, and one upon which it would be well to experiment further in the present season. But it is rendered still more remarkable by another experiment. To the guano and wood-ashes 20 bushels of charcoal were added, at a cost of 7s. 6d., and the effect was to add 1½ ton more to the crop; so that now the additional crop cost scarcely more than 4s. a ton.

This may be stated a little differently in the following manner:—

Where wood-ashes (a simple manure) were used alone, the Potatoes, obtained beyond what the land would yield without any manure whatever, cost 1l. 13s. 4d. per ton.

But where wood-ashes were used in addition to more complicated manures the crop was largely augmented at an expense in manure amounting only to from 6s. 3d. to 6s. 8d. per ton of extra produce.

These things seem to prove conclusively that the best way of using saline or simple manures for the Potato-crop is to apply them in addition to common manure, and not on any account to trust to them by themselves.

Probably influenced by a conviction that the true way of preparing artificial manures is to compound them of many different substances, Mr. Fleming was led to try two other experiments, with the view of determining how far economical mixtures may be made to supersede farm-yard dung in the growth of Potatoes. The first was as follows:—

No.	INGREDIENTS.	Quantity intended to manure four Acres.			Cost of Substances for four Acres.		
		cwt.	qrs.	lbs.	£	s.	d.
1	Rape-dust	5	0	0	1	10	0
2	Bones dissolved in Mu- riatic Acid	2	0	0	0	12	0
3	Sulphate of Magnesia . .	0	2	24	0	6	0
4	Carbonate of Lime . . .	2	0	0	0	1	6
5	Nitrate of Soda	0	2	0	0	10	0
6	Common Salt	1	2	0	0	2	3
7	Sulphate of Soda	1	2	0	0	9	0
8	Sulphate of Ammonia . .	0	2	0	0	10	0
9	Sulphur	0	0	2	0	1	0
10	Dry Moss-Earth	6	2	0	—	—	—
		20	0	26	4	1	9

REMARKS.—The above mixture was sown in the drills at the rate of about 5 cwt. per imperial acre, at a cost of little more than 1l. sterling, and produced a fair crop of potatoes of a remarkably fine quality: 43 bolls per acre of imperial Renfrewshire measure, weighing 5 cwt. each, upon a poor and light, although new soil, but not worth more than 25s. per acre. Great caution is required in using this mixture, as it is very apt to burn the cut sets if laid directly upon them. A little earth should be put between the cut potato and the manure.

In this instance the crop was 10½ tons an acre, and the cost of the manure was rather less than 2s. a ton of produce.

The other case was the following:—

No.	INGREDIENTS.	Quantity mixed to manure one Acre.			Cost of Substances for one Acre.		
		cwt.	qrs.	bush.	£	s.	d.
1	Saw-dust, mostly from Alder .	—	—	40	—	—	—
2	Potash & Lime mixed, 14 mon. old	—	—	10	0	7	6
3	Common Salt	1	2	—	0	2	3
4	Sulphate of Ammonia	1	0	—	1	0	0
5	Sulphate of Soda	0	2	—	0	3	6
6	Sulphate of Magnesia	0	2	—	0	4	0
7	Coal Tar, 20 gallons, say . .	—	—	—	0	10	0
		3	2	50	2	7	3

REMARKS.—The potatoes planted with the above mixture came quickly through the ground, and were very luxuriant in foliage. They were lifted 15th October, after being cut down by frost whilst still unripe and growing. On being taken up, they were found to yield a produce of 56 bolls of Renfrewshire measure, weighing 5 cwt. each, per acre, of very fine potatoes, many of which weighed from 24 to 30 oz. each. N.B. This mixture, after being put together, fermented, and was frequently turned, but kept dry.

Here the crop was 14 tons an acre, at the expense of 2s. 11d. a ton.

All this seems strongly in favour of mixed manures, and especially of that which is naturally compounded. It seems too to show that the best way of using simple saline substances is not alone, but as an aid to those in common use. We trust that many of our friends will investigate this point and communicate to us their results.

WHEN a proprietor is inclined to benefit the labourers by letting them have small allotments of land, he naturally considers what fields can be most conveniently spared from his farms. These are

generally the most distant from the farm-house. If the cottages of the labourers are scattered, as is frequently the case, it may be difficult to find a situation which shall be central, and not too far from the cottages. Unless very great inconvenience should arise to the farmer from being deprived of a field very near his farm-house, where he cultivates green crops to feed his horses and cows, the convenience of the labourers should be first consulted. Every farmer reluctantly gives up a convenient field, and fears trespasses, if the allotments lie amongst his fields; but an easy access from a public road is essential to an allotment-field, and if this be secured there will be little fear of trespass. The field should be well fenced in, and the occupiers of the surrounding fields should have the care of the hedges and ditches, for which a proper allowance may be made to them. We shall suppose a field of 10 acres, abutting on one side on a high road, and centrally situated, not too far from the village or most populous part of the parish. This may have a road laid out through the middle of it, entering from the high road by a double-paled gate. The width of this road should not be less than 15 feet. It may be ploughed lengthways, and the top earth thrown up on each side in a long ridge, leaving a firm bottom to the road. When this has been trodden for some time it will be sufficiently hard to bear the wheels of a light cart occasionally, when the crop is taken off or the manure carried on the land. If the field is a rectangle, the road will divide it into two equal parts, each nearly 5 acres; and by dividing the length of the road into 20 equal parts, and making a narrow path at every division at right angles to the road, we shall have 40 allotments of nearly a quarter of an acre each. The soil should be at least of a medium quality, naturally dry or well drained, so as to be worth, to let to a farmer, about 25s. or 30s. per acre: adding to this 10s. per acre for tithes and all other burdens on the land, the gross rent will be 35s. or 40s. per acre, or 10s. per allotment; but as some expense is incurred in the road and paths, we will set them at 12s. each. The earth heaped up on each side of the road is intended to be mixed with manure into a compost, and wheeled over the allotment adjoining, or it may be used at once to fill up any low places to lay the whole level. The paths should be at least two feet wide, and a foot below the surface of the allotments, so that these shall have the appearance of a long raised bed. They should then be trenched as deep as the soil is good, and a little of the subsoil may be brought to the surface. The mode of cropping must be left to the judgment of the occupier of the allotment—with these restrictions only, that no Potatoes shall be planted without manure of some kind, to the amount of three wheelbarrow loads per square rod, at the least, and that two white straw crops shall not be taken in succession. All other details to be perfectly free.

When the field has been prepared, as before described, a general notice may be given that application may be made for allotments; and when a sufficient number of applicants are found, the allotments should be distributed by drawing lots, each having its number. A set of regulations should be drawn up, and read to the men, to which they are to assent by signing their name or making their mark.

The 1st and indispensable condition is, that the rent shall be paid on a certain day.

2d, That the allotment shall be cultivated by manual labour only, except the carrying of the crops or of manure.

3d, That any occupier convicted of a misdemeanour, or higher offence, shall lose all right to the occupation of his allotment, and to all the crops upon it.

4th, That any tenant of an allotment shall quit possession at any Michaelmas-day, on having notice three months before.

5th, That any trespass on another allotment shall cause the immediate forfeiture of that which the trespasser occupies, the value of the growing crops being paid him by the landlord, deducting the rent: the fact to be proved to the satisfaction of the proprietor and of three indifferent occupiers of allotments.

6th, That any infringement of the rules agreed to shall cause a forfeiture of the possession and of all the crops on the land.

These are some of the rules which have been found practically useful, and to which the labourers willingly have agreed, in most cases which have come under our notice.—M.

DESCRIPTIVE LIST OF PICOTEES.

(Concluded from p. 207.)

RED PICOTEES.

Nulli secundus (Mansley's).—White very pure, and the edging remarkably neat; petals well formed; much too thin for growers in the south, and certainly not having a petal to spare in this part of the country; it is nevertheless a variety that will be much grown.

Bloomsbury (Clegg's).—A large and coarse flower; petals much serrated; only fit for borders.

Mrs. Judson (Wheatley's).—This variety has two serious drawbacks: viz., it is late in blooming, and has a short

awkward pod; it is, however, a full clean flower, with a heavy and well-defined edge, and crowns well.

Lady Peel (Pullen's).—A vigorous grower, with a good pod and fine petal; rather coarse.

Vespasian (Gidden's).—A delicate and finely-formed flower, requiring very little dressing; the feathering is neat and distinct; one of the best in its class.

Victoria (Muscroft's).—Large and of good colour, but rather apt to stripe.

Queen of Sheba (Wakefield's).—A very large and fine flower, with a good pod; it blooms rather early, has a deep feathering of purple, and is sometimes coarse.

Nottingham Hero (Robinson's).—A large flower, with a very fine petal, crowning well; much in the style of Vespasian, the edge being remarkably neat, and the white very pure; first-rate.

Mr. Muggleston (Robinson's).—Very large; extra fine shape; petals pencilled with dark purple: this and the preceding have only been let out this season.

Hope (Brinkler's).—A full and good-shaped flower, of medium size; edge very neat, and white pure.

Trip to Cambridge (Dickson's).—Heavy-edged purple. The first flower I had of this sort was superb; quite up to the mark, and decidedly first-rate. The late flowers are apt to bar in a slight degree.

Grace Darling (Ely's).—Rather heavy-edged; white pure, and the feathering true and distinct; a desirable flower.

Pluperfect (Wilson's).—This variety throws many old sorts into the shade. With me it is fine; the petals are good, and the purple lace well defined.

Queen Victoria (Kirtland's).—Rather small, but of fine form and good petal; the edge is very delicate: when the buds are reduced to about two, it will often come very pretty.

Nehemiah (Hufon's).—A fine old flower, and a general favourite in this part, where it is scarce: it sometimes bars, but when in its best state is excellent.

Delight (Jackson's).—A vigorous grower, with a good pod; the purple edge is heavy, and of a lively colour: it is apt to bar, and must be classed as second-rate.

Victoria (Crask's).—A fine clearly-defined flower, rather too thin for the south, but in Lancashire a decided favourite. In order to show the difference of opinion and the necessity of some fixed rule for judging, I will quote the memorandums of two eminent florists. The one residing in the north says, "Crask's Queen Victoria will beat Nulli secundus in a canter," though the latter flower is there much esteemed; whilst my south country friend observes, "Crask's Queen Victoria I bloomed two or three years ago, and did not much like it. I consider it an inferior flower."

Isabella (Hufon's).—A rather pretty sort, but barring too much: it is now completely distanced by many other flowers.

Miss Hunter (Hufon's), alias *Toone's Miss Garle*.—A large and finely-shaped heavy-edged flower, vigorous in its habits: a desirable variety.

Mary (Lee's).—Good-shaped light-edged purple Picotee; white pure, edging true. It is said of this variety by the raiser (though I do not vouch the fact) that it will vary, according to situation, in the length of its pod, being sometimes short and at others long. I have not observed this peculiarity in any other variety.

ROSE PICOTEES.

Few of this class are grown in this neighbourhood; the following are amongst the best:—

Queen Victoria (Green's).—A large, finely-shaped, heavy-edged flower, distinctly marked, and crowning well; first-rate, but with me rather late.

Favourite (Gidden's).—Beautiful light-edged, extra shape, good size, and I am sure will be a "favourite" with many others besides the raiser: it is the best light-edged Rose I have yet seen.

Fanny Irby (Wilson's).—Flowers of medium size, rather heavily-edged with rosy salmon-colour: a desirable variety.

Marchioness of Westminster (Evans's).—A large and rather late flower; white pure, edge heavy; sometimes inclined to Bizarre: a fine sort.

Queen Victoria (Wain's).—White pure, and edge distinct; it opens, however, in a confused manner.—*T. F. Wood, The Coppice, Nottingham.*

ENTOMOLOGY.—No. XLIII.

THE LACKEY MOTH, *Bombyx (Chisocampa) Neustria*.—During the winter and spring curious hard rings are not unfrequently found closely and firmly embracing the naked twigs of fruit-trees and bushes (fig. 1); they are of a greyish colour, and composed of spiral lines of little horny globules, each having a minute dent in the centre; the mass is scarcely half-an-inch long, yet it often contains 300 eggs, for such they are, and produce about the beginning of May, or earlier, small black hairy caterpillars, which immediately cover the ring of eggs with an exceedingly fine web, and this they keep extending until they change their skins the third time; into this web, which eventually becomes very conspicuous, and forms a tent sufficiently large to accommodate 200 caterpillars, they retire at night, and remain secure in wet weather, and if disturbed whilst feeding, they either retreat into their tent with great alacrity, or if too far from home, or violently agitated, they let themselves down by silken threads, which enable them to find their way back when the danger is over. They continue to feed until about Midsummer, when they are full grown, and are sometimes an inch-and-a-half long, and upwards; they are clothed with longish hairs, and are very gaily dressed, their livery being blueish-grey, ornamented with 6 scarlet

stripes, and a white line down the back, all edged with black; the head is slate-coloured, or blueish, with 2 black spots like eyes, and the first thoracic segment is not striped, but blue, with 2 black spots, and a scarlet space between them; on the rump is a black tubercle; the 6 pectoral feet are black, the 8 abdominal, and 2 anal feet are brownish as well as the underside (fig. 2). At this period of their lives they are not gregarious, but each one shifts for himself, and when about to change to a chrysalis they wander about until they find some secure retreat, where they spin a pale-yellow silky cocoon, powdered with yellow, and loosely enveloped with the hairs from their skins; within this the larva becomes a slate-coloured pupa, the abdominal rings being powdered with yellow.

The Moths, which hatch in July, are very variable in colour, especially the males, which are much smaller than the females, they are either ochraceous or rust-coloured; the antennae are bipectinated; the wings are rather short, the superior having two oblique rather wavy lines across the middle, which form a bar, and in the dark specimens the lines are edged with ochraceous, and the fringe is always variegated with a few rusty spots; the abdomen is tufted at the apex (fig. 3), in the female the antennae are much less pectinated; the bar is sometimes broad, at others, narrow, and is often of a darker shade than the rest of the wing; the abdomen is large, ovate-conic at the tip; expanse of male $1\frac{1}{2}$ inch, of female $1\frac{3}{4}$.

The Lackey caterpillars will feed upon various trees, as the Oak, Elm, Birch, Poplars, and Hazel, but in England the Sloe is most subject to their attacks, and occasionally our fruit-trees suffer. We know nothing, however, of the mischief committed by these web-spinning larva in this our favoured isle; in France, their ravages are represented as most appalling; for miles sometimes the Apple-trees are defoliated, and in former times they must have been even worse, for there is an old law to enforce proprietors to exterminate the inhabitants of these webs, by cutting them off with a pair of shears, having long handles, and this was termed *dechéniller*, literally to uncaterpillar.

There are two powerful Beetles on the Continent which live upon these Caterpillars: one is the splendid *Calosoma sycophanta**; the other, *C. inquisitor*: the former is only an occasional visitor to England; the latter is sometimes more frequent in our woods and forests. Protected, however, as the Caterpillars are by their webs, from drenching showers and the sun's rays, they are not secure from the attacks of other enemies, especially of a fine Ichneumon, called *Cryptus cyanator*, Grav.†; which forms a case within the body of the larva, and instead of the Lackey-moth, this fly issues from the cocoon. A smaller fly named *Microgaster Gastropachæ* also infests the Caterpillar, and forms pale yellow cocoons; but one of the most valuable parasites is a minute fly called *Teles ovulorum* by Bouché. Hard and horny as the eggs are, and cemented together with a glue which hardens by exposure to the air, and resists the effects of rain, snow, and frost, it seems astonishing how the eggs of the pigmy fly can be introduced into those of the Moth; Bouché, however, has thrown some light upon the subject; he says, "The female *Teles* lays one egg in each of the Moth's eggs when they are quite soft. Several times I have seen that out of the whole ring of eggs, nothing, with scarcely an exception, but these little flies have come forth;" and I may add that after the Caterpillars have hatched, the inoculated eggs remain closed, with little maggots inside, which are in that state at this time of the year, and no doubt change to pupa so as to arrive at their perfect state in time to attend upon the female Lackey-moths when they deposit their eggs.

Chaffinches and sparrows are very serviceable in the destruction of this pest, and when orchards are infested, the best mode is to search for the rings of eggs in the winter, to cut off the twigs and burn them. As the Caterpillars are very conspicuous, they may be crushed upon the trunks and branches, and the nests should be collected by holding a sieve or bag under them; the cocoons may likewise be detected between the leaves of trees and shrubs, in hedges, on the tops of walls, under the ledges of rails, &c. As the Moths seldom fly, especially the females, but remain concealed amongst the herbage and leaves upon the ground, little good can be effected by pursuing them.—*Ruricola.*

TREATMENT OF PHLOX DRUMMONDI.

In consequence of the desire expressed by a correspondent to become acquainted with the mode of treatment by which *Phlox Drummondii* is made to bloom so beautifully in the Horticultural Society's Garden, we have procured the following information respecting it:—The

seeds should be sown about the end of March in pots filled with a light sandy soil, and placed on a moderate hotbed, or in a Cucumber or Melon-frame. In this situation they will soon germinate, and before the first rough leaf appears they should be potted off, three or four together, into a large 60 pot, placing the plants at equal distances round the sides. When potted, they should be returned to the frame and kept close for a few days to recover from the effects of their removal; after which, they should be gradually hardened off by giving them plenty of air during the day in fine weather; finally, about the beginning of May, they should be removed to a cold pit or frame, where they can be fully exposed during the day, covering them with the lights only at night, and in bad or cold weather. About the end of May, when all danger of late spring frost is over, they may be planted in the open border. The soil into which they are transferred should be either a light rich sandy soil or peat, with which a little well-rotted dung has been mixed. The plants will require to have a little water once or twice after they are planted, especially if the weather is dry at the time; but it is advisable not to water them after they are once well established. The chief causes of failure are—sowing the seeds too soon, or allowing the plants to get very dry or pot-bound before they are planted out; if once they become stunted they will never make good plants; and the same may be said of those which have been kept in too warm a place.

ON VEGETABLE MANURES.

By PROFESSOR CHARLES SPRENGEL. (Translated from the German.)

(Continued from page 229.)

f. Bean-Straw.—100,000 parts of not quite ripened air-dried Bean-straw contain 51,000 parts of woody fibre, 1,000 parts of wax, and 48,000 parts of substances soluble in water, and the ley of potash; the latter most probably consists of 1,000 parts of nitrogen, as Boussingault has found in 100,000 parts of Green-Pea straw 1790 of nitrogen. This great quantity of nitrogen in Bean-straw is the more certain, because Beans and Peas belong to the same natural family of plants, and because experience has shown good Bean-straw to be as nutritive as Pea-straw.

100,000 parts of the straw contain of mineral substances:—

0.220	parts of silica
0.624	" lime
0.209	" magnesia
1.656	" potash
0.050	" soda
0.010	" alumina
0.007	" oxide of iron
0.005	" oxide of manganese
0.134	" sulphuric acid
0.226	" phosphoric acid
0.008	" chlorine

3.221 parts of mineral substances.

100 parts of Bean-straw consequently contain somewhat more than $3\frac{1}{2}$ lbs. of mineral substances, and amongst them, several which are most powerful manures. When we add that Bean-straw is also very rich in nitrogen, it is obvious that the manure obtained by its litter must be much better than that obtained from Rye. If 3,000 lbs. of Bean-straw (contained in a certain quantity of manure) are carried on one Magdeburg acre, the land will receive 20 lbs. of nitrogen and nearly 50 lbs. of potash, which is in itself a powerful fertilizing agent, whilst the same area would receive from 3,000 lbs. of Rye-straw only 6 lbs. of nitrogen and $\frac{1}{10}$ lb. of potash. We cannot then doubt that the manure of Bean-straw is much more valuable than that of Rye, especially since the amount of phosphoric acid, chlorine, lime, magnesia, and soda, is as abundant as that of nitrogen and potash. But Bean-straw is very woody, and therefore more difficult to decompose than any of the sorts of straw hitherto mentioned. Manure from Bean-straw is therefore best adapted to clayey soil, which it keeps loose for a longer time than Rye or Wheat-straw.

g. Pea-Straw.—10,000 parts of rather green air-dried Pea-straw consist of 29,500 parts of woody fibre, 1,500 parts of wax, and 69,000 parts of substances soluble in water and potash, which latter contain 1,700 parts of nitrogen, according to Boussingault.

100,000 parts of Pea-straw contain of mineral substances:—

0.996	parts of silica
2.730	" lime
0.342	" magnesia
0.235	" potash and soda
0.060	" alumina
0.020	" oxide of iron
0.007	" oxide of manganese
0.337	" sulphuric acid
0.240	" phosphoric acid
0.004	" chlorine

4.971 parts of mineral substances.

100 parts of Pea-straw, therefore, contain nearly 5 lbs. of those very mineral substances which the plants generally do not find in the soil in sufficient quantity. If we consider, moreover, that Pea-straw also contains a considerable quantity of nitrogen, and that with 3,000 lbs. of straw 54 lbs. of nitrogen are carried on a Magdeburg acre, we see clearly why this kind of straw is so valuable. Pea-straw is, however, chiefly used as fodder, not as litter, and only the more woody parts, rejected by cattle, find their way to the dunghill. Therefore the soil of Pea-straw-fed cattle will be better than that from Rye-straw, &c. It does not remain longer in the soil than Rye or Wheat-straw.

(To be continued.)

AMATEUR'S GARDEN.—No. XV.

IN addition to the plants noticed in my former article, I would earnestly recommend the cultivation of the various *Gladiosi*. Nothing can be more brilliant than a large bed of *G. psittacinus*; in fact, *G. floribundus*, *blandus*, *cardinalis*, *Victoria*, and the whole of the genus, are beautiful. No time should now be lost in procuring and sowing the seed, which would, indeed, have been best sown early last month. A few more plants requiring similar treatment are, *Tigridia pavonia* and *conchiflora*, and *Anomatheca cruenta*: the two former make showy groups throughout the season; and the *Anomatheca*, if four or five bulbs are planted in a pot, plunged in a bed when in bloom, is a gem for the flower-garden in May. The *Tigridias* may be treated like *Gladiosi*; but the *Anomatheca* will be best pricked out two inches apart, in seed-pans, in light rich soil, and sheltered in a frame until well established.

The following, though not new, may be regarded as some of the most showy plants that can be grown, and ought to be extensively cultivated in all gardens; viz., *Aquilegia glandulosa*, gl. rubra, formosa, canadensis, arctica, (a superb plant), grandiflora, sibirica, and speciosa; *Camp-nula carpatica*, persicifolia, p. alba, pulcherrima, pyramidalis, and medium, or Canterbury-bells (both blue and white); *Delphinium azureum*, americanum, chinense, elatum, grandiflorum, speciosum, Barlowi, and many more; *Dianthus collinus*, hispanicus, h. splendens, fimbriatus, superbus, pumilus, aggregatus, and barbatus; *Digitalis* (the new spotted variety), D. purpurea, and purpurea alba; *Lupinus elegans*, nootkatensis, polypyllus, p. albus, grandifolius, ornatus, and tristis; *Eurothera macrocarpa*, speciosa, Drummondii, and tatarica; *Papaver bracteatum* and nudicaule; *Pentstemon atrorubens*, atropurpureus, campanulatus, digitalis, gentianoides, g. coccineus, roseus, and speciosus; *Potentilla arguta*, Hopwoodiana, Russelliana, formosa, and atrosanguinea; *Stachys coccinea* and speciosa; *Gentiana acaulis* and guttata; *Guillardia bicolor*, Drummondii, picta, and Richardsonii; *Ononis rotundifolia*; *Antirrhinum caryophylloides*, majus album, and pictum. To these may be added *Hollyhocks* and the *Marvel* of Peru; and with the plants named last week and a few more alpine plants, such as *Saponaria ocymoides*, *Scutellaria alpina* and *garganica*; *Erinus alpinus* and hispanicus; *Myosotis alpestris*, *Pulmonaria virginica*, *Sanguinaria canadensis*, *Saxifraga granulata*, *Soldanella alpina*, and the dwarf *Phloxes*, such as *verna*, *subulata*, *setacea*, *nivalis*, *amoena*, and a few more of the taller kinds, a garden may be kept in a blaze of beauty throughout the season.

The whole of the first-named plants may be sown in any favourable situation in the open air; but the alpine plants would be better sown in pans, and placed in a warm shaded place until they begin to grow. Perhaps some difficulty may be experienced in procuring seed of some of the plants, and if so, take cuttings or layers, or divide the plants when they are out of bloom; in fact, do anything to multiply the stock.

The seed of most of the plants must be sown very thinly; and if the seedlings are thinned, or some of them transplanted when not too large, they will most of them bloom next season.—*W. P. Dyres*.

HOME CORRESPONDENCE.

Fixing Ammonia.—I trust the interest that is now felt, and the inquiries that are being constantly made, on the subject of fixing ammonia, will be a sufficient excuse for my troubling you again. I now propose to make a few observations on the fixation of ammonia by common salt; and as there seems to exist much diversity of opinion on the subject, I will give you the results of some practical trials, made with the express view of ascertaining to what extent, and under what circumstances, the carbonates of ammonia are decomposable by salt (chloride of sodium). That salt, when added to a concentrated solution of sesquicarbonate of ammonia, (the volatile salt of commerce,) will, after a short interval, in the cold, decompose it, forming an insoluble bicarbonate of soda, has been known for several years; but it is not so generally understood that a patent for the formation of carbonate of soda, based upon this principle, was taken out about four years since. It is generally known by the name of Dyar and Hemming's Patent. The undertaking has, I believe, been abandoned, not on account of faultiness in the principle, but it could not be worked profitably, from the difficulty experienced in recovering the ammonia, after it had served for the decomposition of the salt. An outline of the process actually employed by the patentees may not be uninteresting to your readers, as it bears directly upon the subject we are considering, and may serve to throw upon it some practical light. For the sake of economy, the source selected for the ammonia was the common gas-liquor; but in this state it was too much diluted to answer the purpose; it was, therefore, distilled in a wrought-iron still, until about one-third was brought over; sometimes this product was not strong enough; it was then re-distilled, and half brought over. The strength thought to be desirable was when the liquid had a specific gravity of 1.040, and required, in 100 parts, about twenty-five parts of oil of vitriol for its saturation. In this state the gas-liquor smelt very strongly of ammonia, which it contained in large quantity, in the caustic or uncombined state, with comparatively little carbonate of ammonia. But, as with gypsum, so with common salt, the whole of the ammonia must be in the state of carbonate (bicarbonate) for perfect decomposition to take place. Hence it became necessary to seek a supply of carbonic acid. This was obtained by drawing atmospheric air through a coke fire, in which a portion of chalk was always kept, and by this means a gas was obtained, seldom containing as much as 25 per cent. carbonic acid; and usually from 18 to 22. As much salt

was added to the strong gas-liquor as it was known it could hold in permanent solution, and then by a force-pump, the air from a coke-stove, previously cooled by passing through cold water, was introduced by various inlets, which put the whole into brisk agitation. This state of things was allowed to continue until, when a sample was drawn and allowed to stand, much of it became solid by the deposition of bicarbonate of soda, which I had occasion to remark is insoluble in a strong solution of salt and sal ammoniac. At this period the whole was let out on a linen filter, and allowed to drain as dry as possible. What remained on the filter was pressed in an hydraulic press, and carried to close ovens furnished with a condensing apparatus, where it was brought to the state of soda ash, or impure carbonate of soda. The ash produced by this process, when good articles are employed, is extremely pure, sometimes containing only from 2 to 5 per cent. of impurity; and this nothing but common salt, from the brine which the cake contained after pressing. The liquid which ran through the filter contained most of the ammonia originally employed, in the state of muriate; it also contained about half the salt used, for it is quite impossible, by any excess of carbonate of ammonia, quite to decompose the chloride of sodium. The mode adopted for the recovery of ammonia was as follows:—the liquid from the filter, combined with that from the ovens, was conveyed to iron stills, and distilled so long as the runnings smelt of ammonia. This was reserved to be used over again instead of fresh gas-liquor. What remained in the stills (muriate of ammonia and salt) was either diluted with water, mixed with sufficient quicklime, and distilled as before, or evaporated to dryness, removing the common salt as it formed and fell during the evaporation, and then mixing the dry residue with twice its weight of chalk; being afterwards sublimed, to produce the carbonate of ammonia of commerce. This was either sold in the market, or dissolved in water, and salt added as before mentioned. These processes for the recovery of the whole of the ammonia are bad in principle, or require such perfection in the apparatus, and carefulness and dexterity on the part of the workmen, that they very imperfectly answered the purpose. But however badly the purpose of the deluded proprietors was served, we may make their experience useful in solving the question with which we set out—"will salt fix ammonia?" The reply is, it will not fix caustic ammonia at all, nor will it in any other state but that of bicarbonate (the salt of commerce is a mixture of carbonate and bicarbonate), and even this only imperfectly, and under favourable circumstances, and not at all, if beyond a certain proportion of water be present. Also, unless the bicarbonate of soda, when once formed, be removed from the liquor in which it was produced, a reaction soon takes place, which goes far to restore the substances to their original state. Such things are not uncommon in chemistry. But I said I would add some practical results, which if I omit doing, your readers may perhaps exclaim, "Here is much ado about nothing!" The following experiments were made to discover the influence of varying quantities of the ingredients; viz., carbonate of ammonia, salt, and water, also of time of contact, and the application of a stream of carbonic acid gas:—

	Carb. Am.	Salt.	Water.	Time.	Oil Vitriol to saturate the Soda Ash.
No. 1	120 parts	60 parts	200 parts	1 hour	14
2	90	60	200	1	19
3	60	60	200	1	17
4	120	60	200	1	19
5	90	60	200	1	20
6	60	60	200	1	20

In 4, 5, and 6, carbonic acid (pure) was passed through the whole time. The salt was dissolved in the water, and the carbonate of ammonia, in fine powder, added: much cold was produced. When agitated, a slight effervescence was observed; and at the end of the hour (agitating all the time), it was thrown on linen, the soda pressed and heated to redness, then saturated exactly by oil of vitriol. It appears from these results that under the most favourable circumstances, and with a large excess of carbonate of ammonia, we cannot decompose much more than half the salt used.

	Carb. Am.	Salt.	Water.	Time.	Oil Vitriol.
No. 1	60	60	300	1 hour	10
2	60	60	250	1	13
3	55	60	200	1	16
4	50	60	200	1	14

When bicarbonate of ammonia was used, the result was—

	Bicarbon.	Salt.	Water.	Time.	Oil Vitriol.
No. 1	90	60	168	1 hour	31
2	90	60	168	1	32
3	100	60	168	1	32
4	60	60	168	1	31

We here see, in a striking manner, that varying the quantity of ammonia scarcely influences the result, but that the diminished quantity of water has considerably increased the amount of decomposition; perhaps, also, the shorter period of time was not without its influence. I varied these trials in many other ways, which it would be tedious to mention; but the conclusion of the matter is, I think, plain, and it is this;—that the farmer is not to look to common salt to fix his ammonia as it is evolved from the stable and the dung-heap. Salt is good in its way, and answers a thousand purposes of utility; but nature will not step out of her path to endow it with properties to support any theory, how plausible soever.—*W. H. Potter*.—*Chemical Works, Upper Fore-street*.

Draining.—In those parts of Gloucestershire where the soil is stiff, clay-draining is extensively practised on grass-land, for which it is most effectual, answering all the purposes of tiles, at a much smaller expense. The plan is as follows:—A trench is dug three feet deep, in the shape of a wedge; at the bottom of this a certain number of solid pieces of wood resembling tiles are placed,

and attached to each other by two half-links of a chain, acting as a hinge. On the top of these the clay is thrown in small quantities, and well rammed down, to the depth of twelve inches; the remainder of the soil is then filled in, and the turf replaced. The wooden models are withdrawn by a strong lever being fixed at the outer end, by which means the drain is left perfect in form, and as smooth as a polished table. This will last for years, and will carry the water off admirably. In draining a small orchard last year, a drain was cut across which had been in use 18 years without exhibiting any signs of damage. The price including all charges is, I believe, about 1½d. per yard.—*W. W.*

Improvement of Land.—He who provides additional employment for labour, and by that employment produces more food, and at the same time increases the return for his capital, is a sincere friend to himself, his country, and to the cause of humanity. Entertaining this opinion, and having some spare capital, I said to myself, Shall I with this thousand pounds purchase a few more acres of land, and thus increase the competition for it; or had I not much better invest it in improving one of the farms I now have—about 130 acres? I determined on the latter course, and how gratifying to my feeling has it been to see about 20 men and boys employed in draining, others in making tile-pipes (300,000), some in carting them, and again some in collecting and carting stones to fill the drains, besides those engaged in putting down and removing the timber, and trimming close the high, unsightly fences, taking in the waste-pieces, &c. When twelve months shall have completed these improvements, am I not to look forward to the permanent employment of more hands by an improved rotation of crops and increased produce? My plans, however, were not, at first, accepted without difficulties and objections. My tenant (a truly worthy person,) had prejudices, and five years of his lease were unexpired. I said, "Your land, in its present wet state, is not growing two-thirds of what it should do." He replied, "I farm clean and regular, and carry off all the top-water; but I don't believe under-drains are of any use in our strong soil, although I agree as to putting down timber and low fences." "Well, then," I said, "let us agree to this: the whole expense shall be mine, taking as my remuneration, two-thirds of the extra-produce over and above what your books will show as the produce of the last seven years; the other third shall be yours." To this he readily consented, and is now perfectly convinced of the importance of perfect drainage, low fences, and little timber; and of the prospect of this farm being very quickly as good a one as most in the county of Essex. Let capitalists, instead of buying more land, improve what they have; they will not only increase their rents, but do a great national service, and we shall hear but little of over-population and the necessity of removing our able-bodied Agricultural labourers to other and distant parts. I should add, (having three cottages on the property,) I mean to adopt your excellent recommendation of allotments to the deserving labourer.—*J. J. M., Stamford-hill*.

Steaming Hay for Cattle.—At p. 175 "A Hertfordshire Farmer" asks information respecting the process of Steaming, which will make musty Hay palatable to Cattle, &c. Should your Leicestershire correspondent not answer his inquiries, I shall be very happy to do so, as I know of nothing so desirable and economical, even in a small farm (and no large one ought on any account to be without it), as a Steaming apparatus. I will with pleasure send him the size and cost of my Steam-house, &c., which is calculated for a small farm of 60 acres, and with which I make all musty Hay—tops and bottoms of stacks, the parts which horses and cows reject from their mangers, &c.—palatable, and, I believe, nutritious food. I likewise get a great deal of Straw eaten by horses. The same apparatus steams sufficient Turnips or Potatoes for from 100 to 200 pigs, as well as horses and cows. The cost of fuel is about 4s. a week (coal 8s. 9d. per ton). Perhaps the plan of a Steam-house would be acceptable to some of your readers, as few have an opportunity of seeing well-regulated farms, except those situated in our best agricultural districts, and even there Steaming is little practised. A small farmer in this vicinity keeps up all day an enormous fire in his kitchen, that he may boil Potatoes for 2 horses and 2 pigs. An eighth part of the extra coal would steam four times the quantity.—*W. D. F.* [We shall be much obliged by the promised information.]

Cellar for Roots.—What is the best mode of making a root-cellar or room, so as to avoid the wasteful and clumsy mode of clamping Potatoes, &c.? I propose to dig out about 4 feet of soil (clay with me), and, after draining, to pave it, and then to build up a very thick clay wall, about 4 feet high, and thatch with Furze at least 3 feet thick. This I consider will effectually keep out frost. The bottom part I propose for roots, and the upper part is to be fitted up with shelves for Apples and Pears; double small windows and double doors. I can find no description of a mode, formerly in use, of building with rammed clay, something like the mud walling of the chalk countries. It is called Pisa. Can any correspondent suggest a more complete or economical mode, or inform me how the Russian cellars are constructed?—*Totty*.

Potting Plants on the One-shift System.—It does not astonish me to see that the "one-shift" system described at p. 135 has already called forth the doubts, misbeliefs, and opposition of people who have been so long accustomed to practice—and that with the best success—a very different mode of shifting pot-grown plants. If I had not entertained confidence in the practical knowledge of the writer, I should certainly have felt some doubts respecting it, because I have sometimes known the death or ill-health of a plant attributed, and with some justice, to the circumstance of its being removed or shifted out of a small pot into a much

larger one—though not so large as recommended in the article in question. As there is, however, a right and a wrong way of doing everything, success or failure must depend upon which of these two opposite modes guides the operation. Few of those persons who sift soil for their pot-plants will adopt the one-shift system, or allow of its being successfully practicable, and they are quite right. Roots, from their nature, diverge out horizontally, will always (be the pot ever so large) extend towards, and soon reach, the side of the pot, and that often in sifted soil, without making scarcely a lateral fibre or spongione; because it is only at the sides that they can receive the necessary quantity of air and moisture, and without sufficient of both a plant cannot do well. It is the absence of air excluded by the compact nature of the sifted soil run into a mass by handwatering, that in a pot prevents the formation of roots and fibres in the centre of the ball of earth; which circumstance, joined to the tendency of a body of fine but ill-drained earth to sour when watered profusely, occasions the death of plants shifted into too large pots by the common mode. But whosoever will read the article again will observe that instead of these evils, the best and only cure for them is detailed. Unsifted soil is recommended; thus providing for the admission of air, and guarding against the possibility of the soil running together (as it is called); moreover, pieces of porous stone are to be intermixed with the soil, to form reservoirs of moisture and air, and at the same time barriers to make the roots deviate and divide in their course before they reach the side of the pots. To this is to be added attention to proper drainage, without which but comparatively few terrestrial plants will do well. The system is worth trying before we condemn it.—*John M'Donald, Riccarton.*

Top-Dressing for Orange-trees.—Last year I purchased a box of Oranges, many of which proved to be rotten; it occurred to me that they might be turned to some account as a top-dressing for Orange-trees; and I accordingly applied a number of them to a large plant which had been in a stationary state for two years. The result has answered my expectation, for nothing can exceed the vigour of its present growth; it is covered with fine young shoots, and promises to flower freely. I am so satisfied with this experiment that I mean to follow the same plan with other Orange plants this year; and with this view all bad Oranges and even Orange-peel are saved.—*J. N. V.* [An excellent idea this.]

Cape Corms.—Will any of your correspondents kindly state the very best method of cultivating Cape Corms, mentioning any differences in genera or species? Books are sadly deficient in real information on the subject; all they state is, that Cape Bulbs (including Corms) require so and so, and they may be increased by seeds or offsets. What I want to learn is, which is the best method of cultivating each individual plant—should the offsets be taken off or not, and if so, at what season should bottom-heat be employed in inducing them to root before they shoot or not. (on account of the darkness produced by necessary protection during January,) or for other reasons? That lovely tribe, the Iridaceæ—is not, as yet, nearly so universally cultivated as it deserves to be; ranking next, I would say, to Orchidaceæ in loveliness, although perhaps wanting their grotesque forms and delicious odours,—principally I believe from a want of sufficient knowledge of them. We all learn some loose general notions of this and that order or genus; but what we require to know is the habitudes with regard to locality and climate of each individual of the vegetable kingdom.—*H. B. H.*

Roses.—I wish your correspondent who writes the interesting articles entitled "The Rose Garden" would give us a pretty full and explicit account of the propagation, &c., of the various kinds of Roses, as now classed in the best catalogues—say that of Mr. Rivers for this year. He would thus concentrate this very material department of Rose-growing, so as to admit of ready reference; for although he gives many excellent hints in his papers, yet of necessity they are so scattered as not to be easily turned to. He should treat of each division separately, *e. g.*, Provence, Moss, French, Hybrid Provence, Hybrid China Roses, &c., detailing the most suitable soil and situation to grow them in, the time and manner of propagation—whether by buds, layers, or cuttings—and their various management; pointing out any peculiar treatment required by any of the varieties; the proper mode of pruning, and the season for it, noticing any particular variety which is an exception to the general rule; and the best mode of protecting the tender sorts during winter. Such a paper would, in fact, obviate any necessity for entering into these details when writing upon the varieties themselves. When Mr. Rivers first published his *Rose Amateur's Guide*, I, knowing his celebrity, was most desirous to possess it, considering that when a nurseryman quits his grounds and takes up his pen as an author, he is bound to furnish every information on the subject on which he writes, and that the expression "modes of culture," in the title-page, included the whole process of inserting the bud, making the layer, and putting in the cutting. You may therefore judge of my disappointment, when I found not one word on this part of the subject in the whole book; I afterwards bought the second edition, and hoped that the idea conveyed by the saying of a late nurseryman of my acquaintance—who amassed a large fortune in his business, and who was most communicative on all matters about the treatment of plants—that "the day was gone by for secrets in gardening, and that he never sold a plant less for telling all he knew," would have occurred to Mr. R., and that the omission in the former edition would have been supplied. Not so, however. True it is we have some excellent directions as to raising seedlings, and are gravely assured that "instructions for budding, grafting, and other modes of propagating Roses, are given in every gardening

book;" and that "Roses may be struck from cuttings, and budded and grafted from March to September, if the buds, grafts, and stocks are in a proper state!" Instead, however, of any hints or directions on these points, the too sanguine Amateur, anxious to "try his hand," is deterred by the *preventive check*,—"it is only incessant practice that can give this knowledge,"—coupled with a deferred provisional promise to make a book on the subject when Mr. R. grows Roses for pleasure rather than profit. I hope that that time is not far distant, and that long before the "hoar frost of age sets in" a third edition may be called for, in which we shall find every deficiency in this respect supplied with a liberality and minuteness which will most assuredly meet with their reward. Depend upon it, no nurseryman will ever be a sufferer by so doing. The new varieties, at all events, must pass through his hands; and there are few who will lay themselves under obligation, either for buds or cuttings of Roses, that nurserymen need care about retaining as customers. It is the satisfaction of knowing how to manage and multiply his plants that induces the Amateur to cultivate them; and there is no surer bait to allure him to the nursery than to contribute to his success in such matters. Once make him a successful Rose-grower, and he must prove a good customer. Meanwhile, until Mr. R. unlocks the treasures of his skill, I hope your correspondent will favour us with the result of his experience as a Rose propagator, &c., and add to the obligations he has already conferred upon all lovers of the "Queen of flowers."—*S.*

Destroying the Eggs of Insects on Roses.—Mr. Beaton has suggested (p. 176) the application of the mixture which is used for destroying the ova of insects on Vines, Peach-trees, &c. to the shoots of Rose-trees as soon as pruned. Eggs of the ordinary "worms" the bud," which prey on these plants, are deposited by the females in the autumn of the previous year on the bark, and especially around the buds; and I should say that it is in this stage of their existence they should be attacked. As, however, the application must necessarily be subject to the vicissitudes of the weather, I would recommend that it be made as adhesive as possible. Probably glue or size would answer, but I hardly know how the soft soap and these substances will agree.—*S.*

Forcing Roses.—It is generally asserted that Roses do not succeed, if forced, two years successively. This I find from practical experience to be an erroneous opinion, as I have forced the same plants five consecutive seasons. They have been treated as any other potted plant would be, namely, shifted as they increased in size, and this year they have bloomed more profusely than they did the first season: in fact, they have annually improved in the number and beauty of their blossoms. My collection consists of Moss, Spong, Cabbage, Unique, Wellington (Hybrid China), Crimson Perpetual, and Smith's Yellow Noisette, which succeeds much better as a forced than as a Garden Rose. I am induced to mention these circumstances respecting forced Roses, from the failure which I perceive in that department, in many gardens where there is every facility for procuring them; and there is no flower so highly appreciated, even by non-Amateurs, as a forced Rose.—*Perseverance.*

Yeast Plant.—I send you a drawing of a seed (natural size), in the hope that you may tell me to what it belongs. It was brought from America by a friend, who, when at Wisconsin, about 200 miles from New York, found the inhabitants of a cottage making bread, and using the dried leaves of a plant on which this seed was found, instead of yeast! As it was in winter, he could not obtain a fresh specimen, and all the flowers had been cut off and the stalks thrown away; but after a diligent search among the withered store that was hung up for use, he found one capsule that had been left on by chance, and it fortunately contained seed. He was not sufficient botanist to ascertain the correct name, but he thought it was a Scabious. I should be glad to know if you or any of your readers were aware that any plant possessed the property of yeast, as, in remote parts of any country, it would be worth cultivating for this alone. After such seed as this has been committed to the soil, is it usual for the pappus to become elongated? I had but two given to me, and having occasion to disinter one of them, I found to my great surprise that the pappus had grown nearly twice as long as it was when put in about seven days previously.—*A Lady, and constant Reader.*—[We do not recognise this. It is, however, to all appearance, the fruit of some composite plant allied to Verbenaceæ.]

Kitchen Garden Economies, No. 1.—A very delicate vegetable, quite equal to Seakale or Asparagus, and of a taste intermediate between the two, may be easily raised in any quantity by any one who has a few square yards of garden ground, at several different times during the winter and spring, according as the succession of crop is required. Plant ten or twelve Turnips (any delicate kind) as closely as possible, and cover them with a box or Seakale pot: heap fermenting stable litter over and around, as for Seakale; and in about the same time or a fortnight more, a crop of blanched Sprouts will make their appearance. The crowns of the Turnips should not of course have been removed too closely. In dressing them for table, when they are about half done, pour away the water and give them some fresh; when cooked, serve them up with melted butter on toast.—*Sprouts.*

Preserving Fruit.—In answer to "Quercus," p. 190, I beg to state that good Currant jelly may be made from wet Currants. I think the objection is to their being packed wet in baskets and having to stand some hours in market. They may, if desired, be strewn on a dresser, with a cloth upon it, in a warm kitchen, for an hour, to dry.

Strawberries and Raspberries are more objectionable when gathered wet; but boiling the pulp five minutes, previously to adding the sugar, is the best remedy. Pine-Apple jelly would be an expensive article, as it would require 4 lbs. of Pines to make 1 lb. of jelly; nor do I think it would jelly freely, on account of its powerful acidity. The jelly of Pine-jam never partakes of the firm character of other jams.—*E.*

Cydonia japonica.—I have tried the fruit of Pyrus, or Cydonia, japonica, mixed with Apple in a tart, and I find it a very good substitute for Quince.—*C. G.* [It is a sort of Quince.]

Bees.—Stocks of Bees should now be carefully examined, by lifting them up gently from their stands, for the purpose of clearing away any filth or dead Bees, moths, &c., which have lodged there during the winter; and where they are light and the population numerous, it is requisite to give them a liberal feeding. It has often been found that a single pound of good honey, given at this season of the year, as the population is now increasing, and when it can only be obtained by them in the field in small quantities, will save them from starvation. When the spring is wet, cold, and unfavourable, they may be fed with great advantage even until the middle of May, by mixing a pound of the best honey in a wine-glass of pure soft water, and incorporating them together by a gentle warmth. This can be given to them in a flat plate or saucer in their hives, and the liquid can be covered with a piece of perforated paper. If "J. T. A." will take the pains to plaster her old straw hives with Roman cement, or even with common mortar, they will last for many years. They may be made ornamental, and will do well as stocks to swarm in. The Bees and combs should by no means be taken from the old hives.—*W. Savage, Swaffham.*—I observe in the *Quarterly Review*, in the article on "Bee-Books," a recommendation to paint the inside of straw hives, with a view to save the Bees the trouble of smoothing them. Will Dr. Revan kindly say if he approves of this suggestion?—*A Bee-keeper.*

Fumigating Greenhouses.—In Mr. Ayres' directions to the amateur, at p. 189, he speaks of a plan adopted by him for fumigating greenhouses. I have used a similar one for many years, and would refer him to a description of it by me, in p. 49, vol. viii., of the "Floricultural Cabinet." I merely light the tobacco with paper placed under the stand.—*C. W. F.*

PROCEEDINGS OF SOCIETIES.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

April 5.—P. Pusey, Esq., M.P., in the chair; 16 Members were elected. Col. Challoner presented the Monthly Report of the Finance Committee, showing that the receipts during the month of March had been 1,130*l.*, and that the current cash balance on the last day of that month amounted to 2,065*l.* The Committee recommended a further purchase of 1,000*l.* stock in the New 3*4* per Cents. Mr. Pusey reported that the 20*l.* offered for the best Essay on the Rotation of Crops for Heavy Lands, had been adjudged to Mr. W. Stace, of Berwick, near Lewes, and that the Essay would appear in the next part of the Journal. Col. Challoner brought forward the Report of the Derby Committee, on the arrangements for the ensuing Meeting, connected with the Show Yard, Dinners, Trial of Implement Field, &c. Mr. Colville, M.P., chairman of the Committee, stated that the Directors of the Midland Counties Railway had decided to supply any number of special trains on that occasion, requiring only the usual fares for passengers, and half the fares for cattle and farming implements. It was resolved "that in future the Journal shall be issued in half-volumes twice in the year, containing the same amount of matter as heretofore." Dr. Lyon Playfair was elected Analysing Chemist to the Society. Mr. Pusey stated that Dr. Playfair was engaged in establishing at Manchester a chemical laboratory for the purposes of his scientific investigations, connected with the subject of agricultural chemistry, where he would receive all inquiries which the Council might make of him, charging all business referred by them at the mere cost of manipulation; and replying, without charge, to their letters of consultation; individual applications of a professional character being subject to a certain scale of charges, which would be left with the Secretary for the information of Members. The following gentlemen were appointed a committee to examine Sir F. Mackenzie's suggestions for establishing model farms in England and Wales:—Earl Spencer, Earl of Euston, Earl of Ducie, Mr. Browne, Mr. Burke, Mr. Hobbs, Sir F. Mackenzie, Rev. Mr. Rham, and Mr. Shaw. Messrs. T. Gibbs and Co. presented specimens of the Bokhara Clover, Lucerne, spotted Chicory, Pastel, and Swiss Chard Beet. Mr. H. Gibbs stated that the specimens were intended to illustrate the comparative earliness of Bokhara Clover, Lucerne, &c., and had been grown on a sharp mould on a gravelly sub-soil, at their experimental garden at Brompton: the Lucerne appearing from this trial to be earlier than the Bokhara Clover. He further stated that he had offered some fresh Bokhara Clover to a horse which was at hard work, but upon good keep, and that it had refused to eat it; that he then offered to the same horse a portion of the Lucerne, which was taken with avidity; the two being mixed, the horse picked out the Lucerne, and only ate two small portions of the Clover.—Mr. S. Brittain, secretary of the Chester Agricultural Society, communicated a memorial from the chairman and committee of that society, soliciting that the annual country meeting of 1845 should be held in that city.

LINNEAN SOCIETY.

April 4.—E. Forster, Esq., in the chair. Mr. Sutter, of Paramatta, New South Wales, was elected a Fellow. A collection of plants, procured during a journey through Nordland and Finmark, was presented by Mr. N. Lund. Mr. Cuming presented several specimens of fruits and seeds from the Philippine islands; amongst others the true St. Ignatius Bean, or Coleolonga seeds, which are used by the natives as a remedy in cholera; also Acorns from a species of Quercus, unknown. Mr. Parkinson presented a specimen of the Ambigo, or Navel Orange, brought to this country from Pernambuco, where it is cultivated in considerable quantities; it is seldom seen in the British market. Prof. E. Forbes presented a specimen of Goniaterr abensis, a new British Starfish, discovered by Mr. MacLaurin. A specimen of Walnut-tree wood was presented by Mr. Wallis. A continuation of Mr. Griffith's paper on the Ovale of Santalum, &c. was read.

BOTANICAL SOCIETY OF LONDON.

Feb. 17.—J. E. Gray, Esq., President, in the chair. The following donations were announced:—British Plants from Dr. Streeter, and Foreign Plants from Mr. S. Simpson. Donations to the library were announced from Mr. Hewett C. Watson, V.P., and Mr. E. Newman. Mr. T. Clarke, jun., presented specimens of a very large variety of Lastrea filix mas, found by him at King's-Cliff Valley, near Bridgewater. Mr. G. H. K. Thwaites communicated a paper upon the discovery of Grimmia orbicularis, a Moss new to Britain, which was found by him upon St. Vincent's Rocks, Bristol. The foliage is not distinguishable from that of

Grimmia pulvinata; the capsule, however, is quite distinct, being globose instead of ovate, and having a conical instead of a rostrate operculum. Both species grow upon St. Vincent's Rocks, and are sometimes intermingled, but each retains its peculiar characteristics, so that *Grimmia orbicularis* cannot be considered a variety of *Grimmia pulvinata*. Specimens of the former species accompanied the paper. A paper was also read from Mr. T. Beesley, being "Additions to the List of Plants found in the neighbourhood of Banbury, Oxfordshire, in 1842."

March 17.—J. E. Gray, Esq., President, in the chair. Mr. D. Moore, of the Royal Botanic Garden, Dublin, presented a specimen of *Carex paradoxa* (Willd.), found by him in Ladeston Woods, Mullingar, Westmeath, Ireland, in July last. Mr. R. Castle presented a specimen of *Araucaria excelsa*. Colonel Jackson presented an interesting collection of Foreign Plants. The President presented the first Fasciculus of Lee's British Willows; British plants had also been received from Mr. T. B. Hall, Dr. Ayres, Mr. Henfrey, and Miss Beever. Donations to the library were announced from the American Philosophical Society, Prof. Meneghini, and Mr. W. M. Chatterley. Mr. Arthur Henfrey read a paper "On the British Species of *Stictis*." Specimens of British and Foreign species in the Society's collection were exhibited.

MISCELLANEOUS.

New Cactus.—We have just seen a highly beautiful seedling Cactus, which rivals, or even exceeds, Conway's Giant Cactus, in size. It was raised by Mr. Errington, gr. to Sir P. Egerton, and is intended to be called *C. Ackermanni*, var. *regalis*. It possesses the rich scarlet colour of *C. Ackermanni*, and has a slight tinge of violet running up the sides of each petal. The petals are broad, and fall well back. The stigma and anthers are of a bright violet colour.

New Camellia.—We have received, from the Dean of Manchester, under the name of *Camellia Lysantha*, a very beautiful seedling, raised at Spofforth. Its maternal parent was a seedling from the old single red-fertilized with the common-striped *Camellia*, and was itself crossed with the Myrtle-leaved variety. The colour is a bright carmine, with stripes of pale pink running down the centre of each petal. The outer petals are rounded, and when the flower is about half-open, are beautifully cupped; when fully expanded, however, they fall back in the same manner as those of the old double-white. The inner petals are somewhat pointed, but fill well up in the centre.

Packing Plants.—In a late Number of the *New Zealand Journal* there is an interesting communication from Mr. R. Stokes, of Wellington, in which, after stating that too great pains could not be taken in choosing the best varieties of fruit-trees for importation, he remarks, that "the plants should be packed in cases lined with zinc, so as to be air-tight; the roots being well packed in damp Moss, and the plants secured from moving about by the same substance. No straw should be used, as it ferments with the moisture, to the serious injury of the plants. Amongst a collection of fruit-trees received from England, which were carefully packed, and which had been 9 months out of the ground, those packed in Moss only were in good condition; where straw had been used the plants were either dead or more or less injured." Mr. Stokes further states that he has in his garden at Wellington—besides an ample supply of vegetables—Rhubarb, Strawberries, Raspberries, Gooseberries; black, red, and white Currants, Peaches, Nectarines, Apricots, Figs, Plums, Apples, Pears, Cherries, Filberts, Mulberries, and Quinces. Amongst the flowers are Magnolias, Camellias, the Daphnes, Oleander, Passion-flower, Honey-suckle, Jasmine, Ranunculus, Tulips, Picotees, and Roses. Vines, of which cuttings were procured from Sydney and from England, he expects to thrive well, and to produce Grapes fit for table; as the thermometer, from the end of December to the middle of February, usually stands between 75° and 80°.

"The Chinese Husbandman," Sir George Staunton correctly observes, ('Embassy,' vol. ii. p. 476,) "always steeps the seeds he intends to sow in liquid manure, until they swell, and germination begins to appear, which experience (he says) has taught him will have the effect of hastening the growth of plants, as well as of defending them against the insects hidden in the ground in which the seeds were sown. Perhaps this method has preserved the Chinese Turnips from the fly that is often fatal to their growth elsewhere. To the roots of plants and fruit-trees, the Chinese farmer applies liquid manure likewise, as contributing much towards forwarding their growth and vigour."—*The Chinese*, by J. F. Davis, vol. ii. page 394. Knight, 1836.

GARDEN MEMORANDA.

Royal Botanic Garden, Kew.—The great improvements which have been effected during the last twelve months, and to which we briefly alluded at pp. 528 and 655 of last year's *Chronicle*, have added much to the value and beauty of these gardens. Many more extensive alterations are contemplated, but they are not yet definitely settled on. To those who delight in our native flowers, the collection here will prove interesting. It is already very rich, and is rendered of easy reference by the plants being arranged, as in all other cases wherever practicable, in their natural groups, with the name of each species distinctly written on a label appended to it. Around the British garden, on the northern and western sides, is situated a neat piece of rockwork, planted with the different native Ferns and the hardy kinds from N. America. In a small house adjoining, are a variety of Banksias and Dryandras, raised from Swan River seed, just appearing above ground; and at the back, partly concealed amongst a mass of Ferns, the rare *Bonatea speciosa*, a terrestrial Orchidaceous plant in flower, exhibiting a surprising instance of the peculiar modes to which nature resorts of fertilizing the flowers of those plants, in which the anthers and stigma are so placed that they cannot come spontaneously in contact with each other. The anthers, in this plant, are contained in two hollow cases, situated in the upper part of the flower, and are connected by a thread-like appendage with a small viscid gland, liable to be disturbed by any insect or external body touching the interior of the flower. Should an insect touch this gland, the latter immediately adheres to it, and the anther is thus drawn from its cell, and the pollen masses fall upon the viscid surface of the stigma, placed in the

lower part of the flower. In the Fernery, which contains an extensive collection, the plants are arranged upon a clever plan lately adopted by Mr. Smith, of subdividing many of the genera, so as to do away with the apparent incongruity which existed in the structure of their fronds. Slate labels, which are neat, and only answer when the surface has been painted previously to the name being inscribed on it, are affixed to each specimen, and exhibit its name, native country, and the group to which it belongs. Several plants of *Lomaria antarctica*, or the Tree Fern of the Falkland Islands, lately received from Dr. J. Hooker, appear likely to do well. A large specimen of *Garcinia Mangostana*, or the Mangosteen, in this house, which is heated by flues, affords a striking instance of the ill effects of fire-heat when compared with those of hot water. The branches are almost devoid of leaves, and the plant appears altogether in a sickly condition; whereas, one in a neighbouring stove, heated by hot water, is altogether the reverse, and with specimens of *Franciscia hydrangeaeformis* and several other seedlings lately introduced by Mr. Gardner from Brazil, and a variety of rare plants, are in a most healthy condition. In the latter house a multitude of seeds from China, Swan River, and the South of Africa, are germinating. The Orchidaceous-house contains in bloom numerous plants of the large variety of *Oncidium ampliatum*, one bearing a panicle 4 ft. in height; *Rodriguezia planifolia*, with racemes of yellowish green flowers; *Pleurothallis marginata*, a delicate little object, scarcely 3 ins. high, flourishing on the bare shells of the Cocoa nut; and the beautiful *Epidendrum macrochilum*, with a dark-brown perianth, and a pure white labellum, having in the centre a bright purple spot. In the adjoining house are healthy plants of the new *Achimenes longiflora*, and in flower, *Manettia bicolor* on a balloon-shaped trellis, *Angelonia Gardneriana*, numerous *Gloxinias*, one of which, *G. discolor*, having the spaces between the veins on the under surface of the leaf of a dark red, and with flowers of light blue, gradually softening to white as it approaches the throat, is exceedingly beautiful. Here, also, are two specimens of the pretty little herbaceous plant exhibited last summer by Mrs. Lawrence, at the Horticultural Society's Rooms, under the name of a *Pentstemon*, from Mexico; it produces an abundance of seed, and a constant succession of flowers. Of the evergreen Beech, mentioned at p. 231, as having been lately received from Tierra del Fuego, there are several plants; the foliage is small and of a dark shining green, but it will probably increase in size as the plants acquire strength. Amongst the *Banksias*, *Dryandras*, and *Hakeas*, are many magnificent specimens in bloom, particularly *Banksia ericifolia*, *Dryandra formosa* and *floribunda*, *Hakea salicifolia*, and *nitida*; the two latter dense bushes, bearing a cluster of white at the axil of every leaf. In the same house are also *Illicium religiosum*, with fragrant greenish white flowers, and *I. floridanum*; *Tasmannia aromatica*, *Anadenia vestita*, with pendulous branches clothed in white, and *Isoegon Londoni*, bearing a terminal head of rosy purple. The house containing the Leguminous plants is remarkably gay with *Acacias*, one species of which, marked Mr. Lambert, with drooping branches, terminating in a large panicle of dark yellow flowers, and racemes of the same springing from the axils of the leaves, is exceedingly beautiful. With the yellow of the *Acacias*, the bright blue of *Hovea Celsi*, and the less striking colours of *Prostranthera violacea* and *rotundifolia*, the deep rosy tints of several species of *Boronia*, and the rich orange and red of *Chorozema varium* afford a pleasing contrast; and to these may be added several species of *Pimelea*, *Diosma*, and *Gnidia*, *Loddigesia oxalidifolia*, *Lachnusa ericifolia*, *Zeria lanceolata*, and *Eriostemon cuspidatum*. In front of one of the stoves is a large plant of the old white *Camellia*, about 8 feet high, and as much in diameter, which has been blooming regularly since Christmas, although exposed to the vicissitudes of the weather; the late cold winds have, however, considerably discoloured both the flowers and the foliage. The houses lately erected for Heaths and Cacti are both handsome span roofed buildings, connected with each other; that for the former being fitted up with a stage in the centre, and a broad shelf running around the sides and end, and containing a choice collection of this handsome tribe, the latter having stone shelves around the sides only, for the reception of *Gastérias*, *Haworthias*, *Melocacti*, and the smaller kinds of *Euphorbia*; the larger specimens of the latter, in which the collection is very rich, being placed with Cacti on the floor in the centre of the house. In one corner were shown four singular fleshy plants, of a light-brown colour, which had been introduced by Mr. Burke from the interior of Africa; one called the Yeast-plant, which the natives take, when chopped to pieces and mixed with honey, to throw themselves into a state of intoxication. On the south side of the house, containing Cacti, are fine specimens of *Thea viridis* and *Böhea* the green and black Tea, which survive the winter under a slight covering of mats. Of two *Banksias*, planted out in the open ground in the autumn, one is quite dead—the other, being somewhat sheltered by surrounding trees, may possibly survive. The large Aloe-house, or new conservatory, contains magnificent specimens of *Euphorbia grandidens*, *Chamaecrops humilis* (plants of both sexes being in flower), *Corypha australis*, *Fourcroya gigantea*, *Cycas* and *Zamia*; the larger plants standing in the centre and the smaller ones being placed on a stone shelf running round the interior of the building. *Aloe africana* has thrown up a flower-spike 10 feet high; several other species are in bloom, with a pretty *Convolvulus*, called *panniculatus*, of a light blue colour, with a white centre; various *Dracenas*, *Clivia nobilis*, and *Dianella caerulea*. This house appears to answer perfectly to be in excellent health. The old conservatory, although rendered lighter by having had the walled ends converted into large glazed doors, is still necessarily dark, in consequence of the retreat for *Araucarias* and other New Holland plants. One noble specimen of *Araucaria excelsa* had grown too high for the building, and its top was therefore compelled to be cut off. The large *A. imbricata* in the centre of the grounds has been left wholly unprotected, without sustaining the slightest injury; the upper branches are producing several cones. —R. A. April 10.

Mrs. Merryatt's, Wimbledon.—At this place there is in flower a beautiful specimen of the rare *Schomburgkia marginata*, an epiphyte, found growing abundantly near the town of Paramaribo, in Surinam, on the rough bark of a species of *Erythrina*. The flowers resemble, in form, those of *S. crispata*, and are borne on long drooping footstalks. The petals and sepals are chocolate brown, edged with yellow; the labellum of a pale flesh-colour, slightly stained with buff.

Reviews.

Horticultural Essays; being the Papers read at the Meetings of the Regent's Park Gardeners' Society for Mutual Instruction. Part I.

This is an 8vo pamphlet, of 73 pages, containing the various Essays which have been read at the weekly evening meetings of the above institution during the first half-year of its existence. There can be no doubt of the beneficial effects produced by these evening discussions, when conducted in a proper manner, in establishing a friendly intercourse amongst gardeners, and a more general diffusion of their individual experience in the practical part of their profession. We are happy to find, from a perusal of these papers, that the above Society appears likely to produce this desirable effect.

The Essays consist of remarks upon the Geographical Distribution and Cultivation of Cacti; the history and

treatment of the *Camellia*; the cultivation of Mushrooms; planting and training Pear-trees; the drainage of plants in pots; on the Atmosphere and on the nature and properties of Water, with reference to its application to Horticulture; with some account of the genera *Quercus*, *Salix*, and *Agaricus*, and of the natural order *Tropaeolaceae*. They contain some useful information on the subjects of which they treat, and are, for the most part, written in a clear and intelligible manner.

In the list of subjects, at the end of the work, intended to be brought forward at the ensuing meetings, we are glad to observe that our native plants are not forgotten; but that it is proposed, at every monthly meeting, to notice those portions of the British Flora which may be found in bloom during the succeeding month. This notice might be rendered still more useful by the addition of the localities in the neighbourhood of London where the rarer species are most likely to be met with.

CALENDAR OF OPERATIONS for the ensuing week.

Judging from a few varieties which I have lately tried, the whole tribe of herbaceous Pæonies may safely be added to our list of plants for early forcing, as they are easily excited and answer remarkably well. They do not require any special preparation for this purpose: their large fleshy roots being well stored with organisable matter, they force in any light soil as easily as *Seakale* or *Rhubarb*. They are very gay among other forced flowers in the conservatory, their only fault being the short time which they continue in flower. This is, however, balanced by the ease with which they are increased, as the short time it takes to force them into bloom. The tree Pæonies I have often forced early, but they remain for a shorter time in flower, both in the open air and when forced, than the herbaceous ones.

I have also this spring submitted a dozen varieties of *Scabellaria* Pelargoniums to forcing, with a view of comparing their capabilities in this way. Mr. Frost's *Compactum* is by far the best of this class for forcing, and also the best "house plant" amongst them at all times; in a flower-bed it has as yet no rival. It is not a decided scarlet, but in a consecutive arrangement of colours, it would come in between the scarlet and pinks. Judging from a few other trials, I believe many of the *Indicatas*, *Crotolarias*, *Swainsonias*, *Galegas*, &c. will be found suitable for early forcing. In short, I have not tried a single Papilionaceous plant which has not easily yielded to gentle forcing; and I have no doubt that all our perennial Lupines are well suited for the purpose. The common *Laburnum* is also well adapted, and when trained like a standard Rose, it takes up little room, and contrasts beautifully with the *Glycine sinensis*. Numerous other common plants will no doubt force equally well, and with such a host within our reach, who would be without a "blaze" of spring-flowers in the conservatory, when little is to be had out of doors. We are indebted to the great Rose-growers for making known from time to time those varieties of new Roses which are best suited for early forcing; and although Mr. Rivers has attached to me as having done injustice to one of his favourite stocks, he must be placed foremost amongst such contributors; and I am glad to have the testimony of this superior knowledge against the evidence of my senses. It may perhaps be supposed from what is stated in the Calendar (p. 215), that Gesneraceous seeds are difficult to vegetate, but that is not the case; a tough and almost the smallest they nevertheless retain their vegetative powers for a long time, and travel safely from abroad. They will also endure the intense bottom-heat to which I alluded, although it is not necessary for them. I find by a recent experiment that the seeds of the different *Achimenes* will stand as much bottom-heat as those of the stove Gesneraceae—a heat that would soon injure established plants of either of them.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINKY.—With the exception of a few trailing plants, which may have obtained their full size, and which should therefore be kept more dry, the rest of the stock, old and young, will do with the routine already pointed out.

VINEY.—Every assistance, in the way of more light and air, with less water and a drier atmosphere, should now be given to the earliest house, in order that the fruit may be well coloured and of good flavour; for the later houses see the directions for the last week or two.

PEACHES AND CHERRIES.—Same as last week; and let them, by all means, have plenty of air and light.

FIGS.—When the first crop begins to ripen, the plants should have a drier atmosphere, and less water at the roots. This is therefore a favourable time for the appearance of the red-spider, which must be guarded against by a little sulphur on the pipes or flues in the usual way.

MELONS.—If any difficulty occurs in getting these to set well, increase the linings and give more air, which will keep the frames drier. As soon as the fruit-blossoms begin to fade, pick them off, otherwise they may injure the young fruit. Keep up a brisk heat of 75°, and they will soon set in abundance.

KIDNEY BEANS.—From this time these are dangerous plants in Vineries, or in any other houses where they are not done, because they are peculiarly liable to the red-spider; fortunately, the syringe will not injure their fruit, but rather improve it; you may therefore ply it both morning and evening, if there is any appearance of the spider. This will increase the vigour of the plants, and completely keep down these pests.

HALF-HARDY PLANTS. such as Tobacco, Capsicums, Tomatoes, &c., should not suffer any check from want of pot-room, water, or from cold draughts of air. Being annuals of a tender nature, they cannot afford to lose any time.

Out-door Department.

ONIONS.—In most places the young Onions are now fairly above ground. The soil should be well stirred between the rows, but this must be done when it is quite dry.

BROCCOLI.—If the spring crop should come in—as is often the case—faster than they are used, you had better remove parts of the plants to some cold shady border, and put them in by the heels: this will check them, and prolong their season.

LETTUCES.—From the middle of May to the middle of August I never like to transplant any sort of Lettuce, because they do so much better without removing—particularly if the summer is dry and hot, like the last. From this time, therefore, I sow every other week till August, either in rows and broadcast, and rather thinner than usual. As soon as the young plants have four leaves, they are thinned out to regular distances. If the ground is rich, and has been well stirred before the seeds were sown, the plants will not want watering in the driest summer.

POTATOES.—For every week that Potatoes are kept out of the ground after the middle of this month 10 per cent. of the weight of the crop is sacrificed.

ORCHARD.—Disbudding Peach and Apricot trees is the most particular business here. The change to frost and cold north winds on the 10th has injured these in some late situations, and those who were not prepared with coverings will run short of an average crop.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—It is not safe to defer shading the Orchidaceae any longer; but this is only necessary for a few hours, when the sun has great power. When I mentioned the *Hibiscus rosa-sinensis* and *liliflorus*, with their varieties, as useful stove plants that would flower in the conservatory, I ought to have mentioned H.

Cameroni as a suitable plant for the same purpose: this flowers occasionally from March to October. I have it grafted standard high on a stock of liliflorus, on which it grows stronger than on its own roots. Grafting stove and other pot plants, with a view of increasing or diminishing their growth, is a branch of gardening well worthy of being generally adopted.

GREENHOUSE.—The increased heat for this house is not intended to be by fire heat, but by giving less air and shutting up the house early in the afternoon, when a moderate use of the syringe may safely be applied. If the green-fly appears in the greenhouse about this time, depend upon it the plants have been kept too cold, and the atmosphere too dry.

CONSERVATORY.—To the list of Pelargoniums fit for forcing add Jewess and Vulcan:—two rather new ones, which bear heat as well as Alba multiflora, carry their trusses more stiff than Admiral Napier, and come in as early as the latter. This is a good time to strike cuttings of these, to make plants for next winter's forcing. I have no doubt but we shall have in a few years such a variety of forcing Pelargoniums, that the conservatory will be as gay in January as it usually is in June.

PROPAGATING-PIT.—Never let this pit be at rest till you have at least one third more plants than are required for the first planting of the flower-garden. Where annuals are grown to any extent, a great number of more permanent plants must be kept in reserve to succeed them as they begin to fade.

ANNUALS. To do justice to these they should be grown in masses, and, if possible, in fresh light rich soil. The Godolias are an exception, their fine tints and markings are brought out better in poor sandy soil; and a few, such as Phlox Drummondii and Schizanthus retusus, do best in moist peat beds. I have heard complaints about the difficulty of raising Phlox Drummondii from seeds, and I have once or twice experienced the same; I believe that like many of the Pentstemons, they vegetate best in a close cold pit. There are three distinct varieties of this Phlox, which can only be perpetuated true by cuttings; if you sow seeds from the large dark variety, you will obtain the three sorts over again.

Out-door Department.

Mowing, sweeping, and rolling the lawns, and finishing off the spring alterations and improvements, form the chief employment here. Everything about the flower-garden should now be in good order. Some of the more tender annuals that have been sown in the borders will probably require some slight protection until the weather is more settled, as well as beds of Hyacinths and Tulips. This is also a critical season for the Auricula, which must be well guarded from cold winds and strong sunshine. All late planted ornamental trees or shrubs should be watered regularly till they are well established—say till the nights begin to lengthen after Midsummer; to mulch over the roots with short grass is a good plan. —D. Benton, Shrubland Park Gardens, Ipswich.

State of the Weather near London for the Week ending April 13, 1843, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT-GARDEN MARKET. For the Week ending April 14, 1843.

NOTWITHSTANDING the unseasonable state of the weather, the supplies have been well kept up during the past week, but the demand has not been great. **Fruit:** The supply of Pines is limited; these, with Hothouse Grapes and Easter Beurre Pears, are selling at the prices mentioned in our last Report. A few forced Cherries have been sold during the week at the rate of 30s per lb. Strawberries are offered in larger quantities, from 6d. to 1s. 6d. per oz. Apples are abundant; Nonpareils fetch from 12s. to 20s.; Gloucester Pippins, 10s.; Golden Knobs, from 7s. 6d. to 8s. 6d.; Golden Pearmain, from 5s. to 7s.; and Court of Wick, from 5s. 6d. to 7s. per bushel; a few Golden Pippins are offered at 20s per bushel. Amongst the culinary Apples, Gooseberry Pippins and Hanwell Sourings have advanced to 7s. 6d. and 9s. per bushel; French Crabs fetch from 4s. 6d. to 6s. per bushel, and Stone Pippins, which may be used either for dessert or culinary purposes, from 5s. 6d. to 6s. 6d. per bushel. Cucumbers are exceedingly good, fetching from 2s. to 6s., and in some instances, 8s. per brace. **Vegetables:** Asparagus of good quality is well supplied from 6s. to 9s. per bunch; the smaller ones selling from 1s. 6d. to 4s. each. Seakale is plentiful and somewhat cheaper, being from 6d. to 1s. 6d. per punnet; the purple may be had from 4d. to 2s. per bunch; the cabbage-plant is tolerably abundant, from 1s. to 3s. 6d. per doz. bunches. French Beans are more numerous, and fetch from 1s. 6d. to 3s. per 100. Young autumn sown Carrots are offered from 4d. to 1s. per bunch. The supply of New Spring Potatoes is limited; the autumn-planted ones are more liberally offered from 3d. to 8d. per lb. Long Radishes are from 6d. to 1s. 3d.; and Turnip Radishes, from 2s. to 3s. per dozen hands. Green Basil has appeared at 1s. per bunch. Mushrooms are extremely plentiful and good, from 3d. to 9d. per punnet. **Flowers:** The display of cut flowers has been exceedingly fine, comprising *Glycine sinensis*, *Cactus speciosus* and *speciosissimus*, *Burchellia capensis*, *Edwardsia microphylla*, *Chorozema vatum*, *Ageratum coelestinum*, *Polygalas*, *Kalmias*, *Orange flowers*, *Pinks*, *Roses*, *Camellias*, *Auriculas*, &c.

PRICES, SATURDAY, April 15, 1843.—FRUITS:—

Pine Apple, per lb. 6s to 10s	Lemons, per 100, 4s to 14s
Grapes, hothouse, per lb. 10s to 20s	Cucumbers, per brace, 2s to 6s
— Spanish, per lb. 1s to 1s 6d	Wauana, per bush, 12s to 16s
— Foreign, 1s to 3s	Chestnuts, per peck, 4s to 7s
Apples, dessert, per bush, 4s to 16s	Almonds, per peck, 6s
— Kitchen, 3s 6d to 7s	Sweet Almonds, per pound, 3s
Pears, dessert, per lb. 5s, 20s	Filberts, English, per 100 lbs. 50s to 55s
Strawberries, forced, per oz., 6d to 1s 6d	Cob Nuts, per 100 lbs., 60s to 70s
Pomegranates, per doz., 6s to 12s	Nuts, per bushel—
Oranges, per doz., 1s to 3s 6d	— Brazil, 10s
— per 100, 5s to 16s	— Spanish, 18s
— bitter, per 100, 7s to 80s	— Barcelona, 24s
Lemons, per doz. 9d to 2s	— Cob, 12s

VEGETABLES.

Savoy, per doz. 6d to 1s	Spinach, per sieve, 9d to 1s 6d
Cabbage, Red, per doz. 2s to 5s	Leeks, per doz. bun., 2s to 3s 6d
— plants, per doz. 1s to 3s 6d	Onions, per bushel, 5s to 8s
Broccoli, White, per bunch, 4d to 2s	— Pickling, per hf. sv., 4s 6d to 5s
— Purple, 4d to 6d	— Green, p. doz. bun., 2s to 4s
Beans, Kidney, forced, p. 100, 1s 6d to 3s	Garlic, per lb., 6d to 1s
Potatoes, per ton, 40s to 75s	Shallots, per lb., 1s
— per cwt. 2s to 4s	Asparagus, large, per 100, 6s to 8s
— per bushel, 1s 6d to 2s 6d	— Spruce, or Small, 1s 6d to 4s
— Kidney, p. bush., 2s to 2s 6d	Sea-kale, per punnet, 6d to 1s 6d
— Scotch, per bushel, 1s 6d	Lettuce, Cabbage, p. hf. sieve, 6d to 2s
— New, per lb., 1s to 2s 6d	— Cos, 6d to 2s 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Endive, per score, 6d to 2s
Turnips, per doz. bun., 1s 6d to 2s 6d	Celery, p. hf. (12 to 15) 6d to 2s
Red Beet, per dozen, 9d to 1s	Rhubarb Stalks, per bundle, 6d to 1s 6d
Scorzoner, per bundle, 1s 3d to 1s 6d	Small Salads, per punnet, 2d to 3d
Salsify, per bundle, 1s 3d to 1s 6d	Corn Salads, per hf. sieve, 9d to 1s
Cardoons, each, 1s	Green Basil, per bunch, 1s
Horse Radish, per bundle, 2s to 4s 6d	Watercress, per doz. bun., 4d to 6d
Radish, spring, p. doz. hands, 2s to 3s	Parley, per half sieve, 6d to 1s
— Turnip, p. doz. hands, 2s to 3s	Tarragon, per doz. bunches, 2s to 3s
Carrots, per doz. bunch, 4s to 6s	Fennel, per doz. bun., 2s to 4s
— Young Horn, per bunch, 4d to 1s	Mint, per doz. bunches, 3s to 4s
Parsneps, per dozen, 6d to 1s	Mushrooms, per pottle, 3d to 9d

Now ready, price 4s. 6d.,

RURAL CHEMISTRY.
By EDWARD SOLLY, Esq., Jun., F.R.S.,
Experimental Chemist to the Horticultural Society of London,
Hon. Mem. of the Royal Agricultural Society, and Lecturer
on Chemistry at the Royal Institution.
London: 2, Charles-street, Covent-Garden.

Notices to Correspondents.

DRAINING.—There is no objection to your pipes placed over the stones, except that there a common flat tile would answer the same purpose of keeping the soil from washing in. If expense is no object, your plan is not to be found fault with; but we still think, that if the pipes were lower down, they would carry off the water better, and the stones would allow the water which oozes from the sides of the drains into them, to run off by the drains. Seventeen inches below the surface is rather too little for the pipes; at all events, we never have had them at a less depth than 22 inches, in order to keep a sufficient quantity of firm earth undisturbed over them. M.

MANURES.—J. W.—Your plan of mixing gas-lime with weeds, soil, and refuse vegetable matter, and of allowing it to lie and be turned over several times before being used, is a very good one. J. B. H.—Sulphate of ammonia, applied when plants are beginning to grow, may be used at the rate of 2 cwt. to an acre. If, however, you use the impure sulphate, instead of the clean crystals, you should mix it with earth if you apply it broadcast; it is, however, like all such salts, best administered in solution. We are not acquainted with the effect of Watson's Granulated Manure; it contains some ammonia, and is probably a good material. R. R. A.—Your plan of managing cloacine is good; by all means add the fluid you mention, and black earth, mud, charcoal-dust, soot, or something of that kind to absorb it. Sand will do no good to the manure, but much to your land; lime-rubbish from old buildings will do more. The quantity of gypsum is not material, for an excess will be of service in your case. Prof. Henslow's letters are about to be reprinted in a separate form. J. W. T.—As you can command peat earth, your very best way of proceeding with your cloacine will be, to disinfect it by throwing bleaching powder largely diluted with water into the places that contain it. That will entirely remove its offensive character. Then place it in a heap, mixing it continually with peat, until the whole is packed away. Cover it with earth and leave it. If this is done, and rain is not allowed to wash away the soluble parts, you will have a very powerful compost heap. It will be as well during the summer to watch it, and if any fluids are seen to soak away, to cause them to be promptly restored, as directed at p. 205. The mixture will be very strong, and a little will go a long way. If in making up the heap you can add straw, stubble, cinder-siftings, or any substance of that kind, to weaken it, so much the better. The cloacine will very well bear at least twice its bulk of foreign matter. Q. in a corner.—We do not think it necessary that your overplus water should putrify; it will be rich in saline matters that are soluble, and that will give it its chief value. Neither is it very important to fix its ammonia further than would be effected by mixing it with soot, or some such absorbent material. As your land is poor and sandy, you will find it necessary to add organic matter, and soot will go some way towards furnishing this. Your best plan would be to use the surplus water for moistening a dunghill or compost heap, not allowing it to soak away, and to employ the mixture for your sandy land. J. B.—Neither salt nor lime separately will fix ammonia; but muriate of lime, in which the muriatic acid of the salt is transferred to the lime, will do so. What is called salt and lime is a very imperfect sort of muriate of lime, formed by soaking a layer of chalk, or still better of lime, with very strong brine; then adding another layer, soaking it again, and so on until there is a good heap, which must be left undisturbed for three months, when muriate of lime and carbonate of soda will, to a great extent, have replaced the original materials. It is probable that this "salt and lime" to which we alluded, is a pretty good fixer; and it has certainly the good property of doing no harm. Cinder-siftings are very different in their nature from wood-ashes, they consist of small particles of coal and cinders, while wood-ashes are composed exclusively of the saline and earthy matters of wood after the charcoal is burnt away. We do not remember ever to have said anything of Peat-ashes; they are the same as wood-ashes; but Peat itself, unburnt, will retain ammonia by absorption. Gypsum will only fix the carbonate of ammonia in gas-water; not the caustic ammonia; therefore oil of vitriol is to be preferred. C. K.—Charcoal is a valuable addition to most manures. Its open, porous nature renders it peculiarly useful when mixed with rich manures, abounding in ammonia, as it prevents the loss of that volatile substance. By the gradual action of the air it yields certain gaseous matters requisite to plants; and moreover contains all those substances which render wood-ashes valuable as manure. In general, charcoal is too dear to be used as a manure, but where it can be obtained at a cheap cost, there is little doubt it may be applied with great advantage, and especially in connexion with ammoniacal or strong animal manures. In making a compost, and converting saw-dust, &c., into mould by gas-water, it would be better not to mix other substances, such as charcoal, with the saw-dust; it is desirable to decompose the saw-dust as rapidly as possible, and the addition of charcoal would only retard it. In order to fix ammonia it is better to take sulphuric acid, or some convenient salt, such as green vitriol, or common muriate of lime. A little excess of these substances does no harm whatever; the result of some of Mr. Solly's experiments at the Horticultural Gardens showed that 10 gallons of the strongest mineral acids per acre produced no evil effect whatever on Grass land. The tar of the wood-distillers is, no doubt, acid, but it is hardly probable that it could be used advantageously to fix ammonia; at the same time it is always worth while to try the effects of refuse matters as manures, but they must be used in small quantity, and with caution. E.

LIQUID MANURE.—T. W.—To prepare guano-water, mix 4lbs. of guano with 12 gallons of water, and let it stand for 24 hours before being used. The same guano will do for mixing again, with the same quantity of water, after the first is drawn off. —Pry.—The best material for fixing the ammonia in your manure-casks is oil of vitriol. Dilute it in double its quantity of water, and keep adding it a little at a time to your liquid manure, until the effervescence ceases. When this takes place the ammonia is fixed. J.

HEATING.—Frank.—If you do not take your flow-pipe from the upper part of your boiler, you will get no circulation; or, at the best, a very imperfect one. Possibly by screwing the boiler-lid down, and applying a powerful fire, you might succeed in overcoming the difficulty; but it is far wiser to use the ordinary means. The rule is to place the boiler a little lower than the tank or pipes, and to feed them by a pipe from the highest part of the boiler, while the latter is refilled by a pipe passing into it near the bottom. J.

GRAPES.—An Original Subscriber.—The Claret, or Blood-red Grape, has the deepest-coloured juice of any cultivated in this country; the colouring matter, like dark claret, being diffused throughout the pulp. This and the Tinta are the principal sorts grown abroad for giving colour to wines made from other Grapes; although many varieties have a purplish juice, yet they only produce a colourless wine, unless fermented with the skins. J.

VINES.—F. L.—Previously to removing the roots of your Vines from the interior of the house, to a border on the outside, there will be no necessity for your surrounding the stems with earth to encourage the formation of fresh roots, unless those upon which the Vines depend are in bad condition. You will not injure the Vines by laying the stems for the length of a few feet under a gravel walk, running close to the front of the Vinery, provided you cover them sufficiently with soil to prevent their being acted upon by frost. The best time for removing them is just after the leaves have fallen. We do not know sufficient of either the Victoria or Stillward's Sweetwater Grapes to be able to say anything respecting them. J.

PLANTS FOR BEDS.—Perseverance.—Mimulus moschatus, Calceolaria integrifolia, and viscosissima, Lysimachia nummularia, and Pansies, will do for filling beds required to be yellow. For white ones you may take Verbena pulchella alba and tauricoides, and Petunia nyctaginiflora. J.

HARDY HEATHS.—H. C.—Your Erica is E. carnea, from which, E. herbacea differs in being somewhat paler. The following are also hardy: E. arborea, multiflora, mediterranea, vagans, cinerea, tetralix and its white variety, stricta, australis, and ciliaris. J.

ANNUALS.—E. H. L.—Sweet-scented annuals and biennials are extremely rare, and consist almost entirely of Sweet Peas, Mignonette, and Stocks. Centaurea suaveolens and moschata, with Cnothera suaveolens are also fragrant in a slight degree. J.

PERENNIALS.—Winton.—Twelve good herbaceous perennials are Delphinium Barlowi, Pentstemon gentianoides, Phlox Thompsoniana, and stolonifera, Geranium ibéricum, Chelone barbata, Potentilla Hopwoodiana, Cnothera speciosa, Dodecatheon Meadia, Gentiana septemfida, Lupinus polyphyllus, and Aljssum saxatile. J.

RHODODENDRONS.—Sarah.—The north side of a dwarf wall will be a suitable situation for choice Rhododendrons, if they receive the full light of the sun after attaining the height of 3 or 4 feet. A border of prepared soil 3 feet wide and deep will be capacious enough for them. Where Peat is difficult to obtain, a fair proportion of leaves and old cow-dung, added to the soil, will be beneficial. The decayed leaves of Scotch and other Pines is injurious. Mr. Smith informs us that he believes the principal cause of his Rhododendron Rollisoni blooming in so young a state was from its being a grafted plant, and from its having been subjected to great heat during the previous summer. J.

BLUE BELL.—M. C. W.—To kill the roots of the Blue-bell, and all similar plants with underground stems, the constant destruction of the leaves should be resorted to. If these are cut off as often as they appear above ground, the roots after a time must necessarily perish. J.

COLTSFOOT.—C. G.—There is no means of extirpating this plant when it has once taken possession, except by thorough draining and constant destruction of the foliage. It is of no use to cut off the leaves once or twice unless their removal is effected as often as they make their appearance, the plants will soon be as strong as ever. J.

SALVIA PATENS.—Hibernia.—This plant is readily increased either by cuttings or by dividing the tubers, with a bud attached to each, as with Dahlias. J.

LOBELIAS.—Rusticus.—Either sow the seeds of the more tender kinds on a slight hotbed, or in a pot or pan, covering them very lightly with soil, and placing the pot in a warm greenhouse. They will sometimes lie in the ground for a considerable period without germinating. J.

HEATHS.—Perseverance.—If Heaths and Epacris receive a good shift now, there will be no necessity for re-potting them in autumn. J.

VERBENA.—J. G. S.—Verbena delight in a compost of half loam and the remainder equal parts of heath-mould and well-decayed manure. They will thrive, however, in any free soil. —Phalanx.—None of the Verbenas cultivated in flower-gardens are really hardy, although in any favourable situation they occasionally survive the winter. The most common kinds, possessing fragrance, are V. Neilli and tauricoides. J.

CAMELLIAS.—An Amateur.—Probably your Camellias require more light and heat to make them develop their flower buds. After the plants have bloomed, repot them and place them in a moderately warm and moist atmosphere, where they should remain till the blossom-buds can be distinguished, about the size of Peas, upon the ends of the shoots; they may then be removed to their winter quarters. J.

TECOMA JASMINOIDES.—A Lady.—Tecomia jasminoides and Bignonia jasminoides are the same thing. This plant thrives in a mixture of turfy loam and heath-mould, and is only seen in perfection when planted in the border of a conservatory. J.

SEEDS.—T. S. H.—Sow your New Holland seeds in pans, in a soil composed principally of heath-mould, with a slight portion of loam and sand. Place the pans in a moist and gentle heat, and when the young plants are sufficiently large, transplant them into separate pots, five or six in each. Afterwards you may pot them off separately, and give them the ordinary treatment of greenhouse plants. J.

PELARGONIUMS.—J. G. H.—Instead of sinking a pit 3 feet deep beneath a frame, for the purpose of keeping the pots from being heated to such an excess, in summer, as to be injurious to the roots of Pelargoniums, we would recommend you to keep the plants as near to the glass as possible without injury, to keep the lights well tilted, and to throw over them, in bright days, some fine canvas or close netting, to break the force of the sun's rays. J. T. L.—Nitrate of Potash, applied in extremely minute quantities, is beneficial to the growth of Pelargoniums; but if used in excess, it will destroy them. The term Geranium includes those native flowers which are found wild in the hedges; by Pelargoniums are meant those plants with unequal petals, cultivated in greenhouses. J.

RANUNCULUS.—John Horticola.—It is too late now for planting the roots of Ranunculus. If required for early blooming, they should be planted in November; if for later flowering, in the beginning of February. We do not imagine that there would be much difficulty in blooming them in boxes, provided the roots were not crowded; the soil should be rich and retentive of moisture, and should be kept well watered after the roots begin to grow. J.

ANEMONE.—John Horticola.—The roots of Anemone may be planted at almost any period of the year. If you are desirous of growing them in boxes, the latter should be at least nine inches deep, and of any required width and length. Let the soil be light and rich, and plant the roots about 1½ inch deep, and not closer to each other than 5 inches. In order that they may flower well, give them plenty of water, and let them be freely exposed to the sun until the blooms begin to expand; they should then be shaded during the heat of the day. J.

CAPE BULBS.—S. D.—Of the bulbs which you have received from the Cape, the following will succeed best in a stove:—Brunsvigia Josephinae, multiflora, and falcata; Cyrtanthus obliquus and odoratus, and Hemantthus tigrinus. They should all

be planted in well-drained pots, in light loam, with the necks of the bulbs barely above the soil. They should be watered sparingly until roots are formed, but when they begin to grow water should be freely supplied. After the three former bulbs have flowered or made their annual growth, they should be removed to a dry part of the stove to rest. *Cyrtanthus obliquus* and *odoratus* should be kept near the glass, in a cool part of the house; and instead of allowing them to rest with the other, keep them gently growing by a sparing supply of water. *Nerine undulata* and *Valloia purpurea* are greenhouse bulbs, requiring the same soil as the above, a plentiful supply of water when growing, and to be kept dry during the rest of the year. The remainder of your bulbs are of the nature of the *Ixia*, and require the same treatment as that plant. The general rule in all these cases should be to water them in proportion to the rate of growth, and to withhold it entirely when they are not growing.

Figs.—*J. M.*—Haying room for only one Fig-tree against the back wall of a Peach-house, you cannot do better than plant the Brown Turkey. You may perhaps succeed in grafting Figs immediately after they have burst into leaf. The French prefer the mode called flute-grafting.

Stocks.—*An Original Subscriber.*—The French Paradise Stock is distinguished from all others by its very dwarf growth, clear chestnut-coloured shoots, and small fibrous roots, which spread near the surface. The English Paradise may be either referred to as the Doucin of the French, or the Dutch Paradise; for, in English Nurseries, trees propagated on either are said to be on Paradise stocks: of these two, the Doucin has the darkest shoots. Their effects on the growth of the trees worked upon them are similar, being intermediate between the very dwarf habit induced by the French Paradise, and the free growth resulting from the crab or free stocks. If you send a Stock when it has made a young shoot, we can then inform you of the sort.

Grafting.—*Discipulus.*—We really do not see what objections can be raised to the mode of grafting Vines described by "Rhombus," at p. 230. To promote the speedy union of the scion and stock, and to prevent the access of air and moisture, he binds them firmly together, and afterwards surrounds them with clay. The lower part of the scion is plunged into water, but at such a distance that the moisture cannot come in contact with the point of junction. We believe the receipt for preparing grafting-wax, given at p. 71, of 1842, to be the best which has yet been made known. If you have found it of great service in grafting Roses, Apples, and Pears, there is no reason why it should not be equally applicable to Vines. Unless the wood to be bound is perfectly dry, the composition will not adhere to it, and on account of the difficulty which there is in meeting with it, in this condition, grafting-clay is, perhaps, preferable.

Onions.—*H. B. K.*—The Globe Onion is hardy enough to stand our ordinary winters; and from this the variety you have received under the name of New White Globe is probably not very different. Sow in any open exposure in August or September.

Peas.—*Perseverance.*—You may sow Knight's Tall Marrow Pea now. It will be about 10 or 12 weeks before it arrives at perfection.

Asparagus.—*G.*—It is better to form beds of Asparagus by sowing the seed than by transplanting the young roots. There is but one kind of Asparagus, therefore it does not signify where you procure the seed. If the beds are well attended to with respect to manuring and watering with salt-water, they will bear to be cut from the third season after planting. *W. B.*—Salt has a very powerful effect on Asparagus, as may readily be supposed from the fact of the latter being a maritime plant. It may either be applied by spreading it on the surface of the beds, to be washed in by rains, or it may be dissolved in water, and applied in a liquid state. We should hardly suppose that salt used in either way, at this advanced period of the year, would be injurious to the young heads of Asparagus. At p. 435, of last year's *Chronicle*, you will find a statement to this effect, from a correspondent, who was somewhat similarly situated to yourself.

Gourds.—*Junius.*—The Mammoth Gourd is so much like the Potiron jaune, that they are probably the same thing under different names. The former may be had of the principal London seedsmen.

Rhubarb.—*J. W.*—The only way to prevent Rhubarb from flowering is to break off the flower-stalks as fast as they appear.

Carrots.—*An Inquirer.*—The Altringham Superb, or Green-topped Carrot, is distinguished by the top of its root being green; the root tapers gradually, but ends rather abruptly; the flesh is crisp and very sweet, of a bright orange colour, with a small dark-coloured heart. The Large Surrey tapers gradually to the extremity, and its flesh is reddish, with a yellow heart. The Long Horn is an earlier variety than the pre-ceeding; its root is long and cylindrical, terminating abruptly; its flesh is reddish-orange, with a small heart almost of the same colour.

Turnip.—*An Inquirer.*—The Globe Turnip is a good sort to sow in June for cattle.

Ants.—*An Amateur.*—Place in water the pots in which the ants congregate for about an hour, and they will all be expelled.

Insects.—*F. J.*—The best method of destroying the black-fly, which infests Peaches, Cherries, &c., is to plunge the ends of the young shoots so infested into a small pan or feeder containing tobacco-water. *J. M.*'s animals are a species of tainting tobacco-water. *Clausilia nigricans*. Old wall's harbour shell, called Turbo (Clausilia) nigricans. Old wall's harbour shell, and the simplest method of getting rid of them is to destroy their haunts by stopping up the cracks and holes in the walls with mortar. *R.*—*Laura.*—The most effectual mode of getting rid of the insects complained of will be to wash over the affected parts of the furniture either with spirits of turpentine or corrosive sublimate. This may be done with a brush, fine or coarse as may be. If the furniture is washed with spirits, it ought to be repeated once or twice; but if the furniture is varnished, the spirits will probably remove the artificial polish.

Books.—*John Horticultor.*—The best old edition of "Miller's Gardener's Dictionary" is the 8th.

Familiar Botany.—*A Subscriber.*—So many persons object to calling the Ficaria Figwort, that we must suppose *R. E.* to have judged wrongly in thinking that the translation of its Latin name would be better than its disagreeable common name. The worst of calling it the little Celandine, is that Celandine itself is so very different a plant, and has no relation to the Ficaria. Some of these days *R. E.* will take up Scrophularia, and then he will answer himself for his own domgs.

Hollies.—*J. W.*—The best time for transplanting seedling Hollies is the spring, when there is no danger of their suffering from severe frost.

Tan.—*H. J.*—The substance which springs up amongst the tan in your stove, being first white and afterwards changing to a brown or orange colour, is the spawn of a Fungus called *Reti-cularia hortensis*. This will continue to extend itself over the bed so long as the bark is kept moist, unless it is got rid of by constant removal of those portions of the tan upon which it makes its appearance.

Plans of Gardens.—*P. H.*—No plans of the kind which you describe are published, except in connexion with other matters. You will find an abundance of them in London's Encyclopædia of Gardening, and in the Gardeners' Magazine.

Management of Gardens.—*Advocate.*—It is impossible for a person who has not received a Gardener's education to carry on properly the management of an extensive garden. Books and magazines are exceedingly useful aids, but it will not do to trust to them alone.

Floors.—*Waglog.*—Gas-tar, cinder-ashes, and sand, if prepared exactly as stated at p. 379 of 1842, form an excellent floor for sheds and other buildings.

MISCELLANEOUS.—*Phalanx.*—We will see what can be done.

Quisquilius.—The plant is *Physianthus abicans*.—*S. H.*—We cannot answer questions connected with the law. You had better consult your solicitor. *J. Briggs.*—Your plant is *Myrsine africana*.—*Hibernia* will find the required information respecting Sea-kale at p. 216. *Woodend.*—Your small plant is *Gentiana acaulis*; the other is *Ribes adreum*.—*D.*—Your seedling *Cinerarias* are very poor specimens. As you appear anxious to raise good varieties, the better plan for you to pursue is, to purchase three or four fine sorts, and to save seeds from them. This method will increase your chances of success. *B. G.*—Your Pansy is a pretty flower, of good substance: but unless the side petals come more perfect in the marking, it will not be worth sending out. *W. Earl.*—Your Pansy, named "Werner," is a high-coloured flower, of good properties; the eye is fine, surrounded with a rich yellow centre, and the margin around the lower petals is broad, dark, and perfect, of a deep purple. *M. D. T.*—Your *Gesnera* is one of the many varieties of *G. Douglasii*.—*Rusticus.*—No. *Sudbury Subscriber.*—Your plant is *Corydalis bulbosa*.—*Apple.*—The variety you sent is tolerably good, but its cultivation cannot be recommended. *Honiton.*—No. 13 for 1842 is out of print. *Flora.*—Mr. Knapp, Green-street, Church-street, Blackfriars. You can get your volume bound at Brighton.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE customary adjournment of Parliament for the Easter Holidays took place on Tuesday, when the House of Commons was adjourned to Monday the 24th, and the Lords to Tuesday the 25th inst. Prior to the adjournment, Lord Brougham introduced his bill for the better prevention of the Slave Trade. The chief objects of this measure are to decide, by a declaratory act, that a British subject residing in a foreign country, who buys slaves and transports them to his own plantation, is guilty of felony—to legislate respecting the transmission by legal means of foreign slave plantations—and to prohibit the buying and selling of slaves by joint-stock companies, established in England for the purpose of carrying on the trade abroad. In the Commons, on Monday, Lord J. Russell laid upon the table the resolutions relating to Education which he proposes to bring forward after Easter; and Sir J. Graham stated that several of the points they embraced have already been considered by Government in deciding on the modifications they have introduced into the Factories Bill. The Bill giving to the Court of Common Pleas an appellate jurisdiction on the subject of disputed votes was passed, after a division in which Sir T. Wilde's motion for making the jurisdiction of the court of law the subject of a separate bill was negatived by a large majority. The second reading of the Ecclesiastical Courts Bill was opposed by Sir Robert Inglis, on the ground that it was a deliberate step towards the separation of the Church from the State, and that the change in the probate and custody of wills was not justified by necessity. Sir J. Graham defended the bill, and refused, on the part of Government, to withdraw or refer it to a select committee. An adjournment was called for, and carried, on a division, by a majority of 51 to 136. On Tuesday, Dr. Bowring brought forward a motion respecting the Bishopric of Jerusalem, which was opposed by Sir R. Inglis, Sir R. Peel, and Lord Palmerston, and withdrawn without a division. On the motion of Mr. Cooper, a select committee was appointed to inquire into the best mode of setting apart a portion of all waste lands which shall be inclosed by Act of Parliament, to be let out in small allotments to the labouring poor of the district.

From France, we learn that a new post-office treaty has been concluded with this country, by which the rates at present in force will be reduced one half. From Spain we have accounts of the opening of the Cortes on the 3d inst. The royal speech alluded chiefly to the state of the national finances, to the insurrection at Barcelona, and to the near approach of the Queen's majority. The rumours of a change of Ministry gain ground; but it is understood that no change will take place before the Chambers are regularly constituted. In Portugal a partial modification of the Cabinet is also talked of, in consequence of the expected retirement of the Ministers of Foreign Affairs and Justice. The affairs of the Levant are still the source of much uncertainty, and the disputes between the Porte and Russia on the recent revolution in Servia are likely to lead to still further embarrassments in Turkish policy. From the United States we learn that Sir C. Metcalfe, the new Governor-General of Canada, arrived at Boston on the 20th ult.

Home News.

Court.—The Queen and Prince Albert, the Prince of Wales, and the Princess Royal, continue at Buckingham Palace, and are in excellent health. Her Majesty has taken her usual morning walk during the week in the gardens of the Palace, and took an airing in an open carriage on Tuesday. The Duke of Sussex has been indisposed for some days at Kensington Palace, and still continues unwell. The Crown Prince of Wurtemberg, on Sunday, drove as far as Hampstead, and visited the Zoological Gardens; in the course of the present month his Royal Highness intends to set out on a tour in the provinces. The Countess of Mount Edgcumbe has succeeded the Viscountess Jocelyn as the Lady in Waiting on the Queen; and the Marquess of Ormonde and Mr. Ormsby Gore have succeeded Lord Byron and Captain Meynell, as the Lord and Groom in Waiting on her Majesty.

Official Appointments.—Lieutenant-Colonel Chesney,

who was employed in the Euphrates expedition, and several other important missions, has been appointed to proceed to Hong Kong, as Commanding-officer of Artillery.

Parliamentary Movements.—Lord Rendlesham has issued an address as Conservative candidate for East Suffolk, in consequence of the death of Sir C. B. Vere; and Mr. Shafto Adair (who contested the eastern division of the county in 1841), has come forward on the Whig interest. Sir W. Myddleton is also mentioned as likely to come forward on the Conservative interest.

The Royal Navy.—The actual number of ships of all classes of the Royal Navy in commission on the 1st day of December, 1842, was 233. The total number of the complements of these ships, officers and men, was 39,646. Of the above ships there were 2 first-rates, having 1,950 officers and men; 6 second-rates, with 4,700 officers and men; 7 third-rates, with 4,500 officers and men; 8 fourth-rates, with 3,801 officers and men; 12 fifth-rates, 4,000 officers and men; and 14 sixth-rates, 2,990 officers and men. There were 41 sloops, the total of whose complements was 5,458. The gun-brigs, &c., were 39, with 1,602 officers and men; and 7 packet-brigs, with 308 officers and men. There were 14 vessels engaged in surveying, with 1,014 officers and men. There were 14 stationary or guard-ships, with complements amounting to 5,368; and 3 yachts, with 289 officers and men. The number of steam-vessels in commission was 66, and these had 3,666 officers and men. The total number of ships of all classes laid up in ordinary on the 1st of December, 1842, was 240. Of these there were 16 first-class, 15 second-class, 46 third-class, 33 fourth-class, 64 fifth-class, and 10 sixth-class. The sloops were 8, brigs 15, packet-brigs 11, cutters 6, and steam-vessels 16. The total number of all classes in commission and in ordinary is 473.

East India Pensions and Appointments.—A return of the pensions granted by the East India Company to persons in their civil, military, marine, medical, and ecclesiastical services, for the eight years ending the 30th June, 1842, has just been presented to the House of Commons, and which shows the following results:—The amounts paid at the three Presidencies of Bengal, Madras, and Bombay, during the aforesaid period, was, in the civil service 700*l.*; in the military 96,269*l.* 17*s.* 5*d.*; in the medical, 26,211*l.* 12*s.* 6*d.*; ecclesiastical, 5,241*l.* 5*s.*; Lord Clive's fund, 1,316*l.*; Bengal pilot service, 1,878*l.* 10*s.*; Indian navy, 11,805*l.*; and to steam engineers, 300*l.* During the same period the appointments made by the Court of Directors have been as follows:—Volunteers for the Indian navy, 99; volunteers for the pilot service, 96; steam engineers, 141; cadets, 2,255; assistant-surgeons, 415; civil service, 132.

Sycee Silver.—A Parliamentary paper delivered last week shows that the quantity of silver imported from China in her Majesty's ship Conway, in January 1842, amounted to 2,001,200 dollars, weighing 143,639*lb.* 2*oz.* 5*dwt.* gross, the standard weight of which was 148,526*lb.* 4*oz.* 2*dwt.* This sold from the Mint, realized 440,729*l.* 10*s.* 6*d.*, at the respective prices of 59½*d.*, 59½*d.*, and 59½*d.* per ounce. There was no charge for melting the silver, Mr. Mathison, the Mint refiner, under the sanction of the Treasury, having undertaken to defray all expenses, in consideration of being allowed 3½ grains of gold (less 10 per cent.) on every pound weight gross of silver. The gross weight of gold extracted therefrom, was 2,530 *oz.* 1*dwt.* 17*gr.*; allowance to Mr. Mathison, after deducting 10 per cent., 940*oz.* 13*dwt.* 9*gr.*, leaving 1,589*oz.* 8*dwt.* 8*gr.* gross, which produced in standard weight 1,729*oz.* 7*dwt.* 21*gr.* The expense of transporting the treasure from Portsmouth to the Mint was 200*l.* 15*s.* 8*d.* Gratuities to Mint officers, clerks, porters, &c., for extra exertions, 466*l.* 15*s.* 8*d.* The amount which the gold produced, at 3*l.* 17*s.* 9*d.* per *oz.*, was 6,723*l.* 0*s.* 4*d.* By sending the silver to the Mint, instead of selling it in the market, at the estimated price of 59½*d.* per ounce, the Mint obtained a profit of 654*l.* 12*s.* 9*d.*

Foreign.

FRANCE.—The principal domestic topic referred to in the Paris papers is the projected railroad between Paris and Calais, to which the Opposition offer a strong hostility. In the standing committees of the Chamber of Deputies the undertaking appears to have been regarded with disfavour. Five out of those nine bureaux declared themselves on Saturday desirous to induce a modification of the measure would, in its present form, receive the sanction of the Legislature. Prince Augustus of Saxe Coburg, the intended husband of the Princess Clementine of Orleans, arrived at the Palais Royal on Thursday last. He was complimented on his arrival by the Court and the Corps diplomatique. A new postal treaty between France and England was signed in London on Monday last, by the Count de St. Aulaire the French Ambassador on the part of France, and the Earl of Aberdeen on the part of England. By this treaty the charge upon letters, under the weight of half-an-ounce, will be a uniform one of one franc—instead of two francs, the present rate, for those received in France from England, when not prepaid there—or as pre-payment from France to England; and tenpence under similar circumstances in England, instead of one shilling and eightpence, as now charged. The treaty is to come into operation on the 1st June next. A petition was presented to the Chamber of Peers on Monday last, praying that Don Carlos might be set at liberty; but the Chamber, after having heard the explanations given by the President of the Council and the Minister for Foreign Affairs, which were considered satisfactory, rejected the petition.—The telegraph brought news to Paris on Saturday that the belfry tower of Valenciennes, 210 feet high, had fallen

down and killed eight persons. It appears that the structure, for the repair of which 80,000 francs had recently been voted, suddenly sunk down about two hours after the labourers who had been working at it, alarmed by the falling of some loose stones, had quitted their dangerous position. Most of the persons occupying the houses at its base also quitted the scene of destruction in time to save their lives; but this was not the case with all. The wife of an officer of the garrison was killed, and the man posted on the top of the tower came down with the ruins, and was taken out dead. The occurrence excited a good deal of alarm in the town, and the more so, as a fire broke out among the ruins immediately after the fall.

SPAIN.—The opening of the Spanish Cortes took place with due solemnity on the 3d. The Regent repaired to the royal palace, where the peers and deputies, in full costume, were in waiting to accompany her Majesty. Her Majesty, accompanied by the Regent, by the Countesses Mina and Altamira, went in a carriage drawn by eight horses, superbly caparisoned. The ceremony took place in the Senate-room, where the Regent read the royal speech. The topics it notices relate chiefly to the finances, to the affair of Barcelona, and to the approaching period when the Queen will assume the reins of government. As regards the state of the finances, "it requires," the speech states, "the most particular attention of the Cortes. Important reforms have been made in the administration—in the accounts of the public revenue—as well as in the system established for the sale of the national property; but, without the necessary means of covering, not only the ordinary and current expenses of the public service, but also the obligations successively contracted, through the constant effects of a want of equilibrium between the receipts and expenses of the treasury, every day the difficulty of obtaining a complete and satisfactory organization of that vital part of the administration of the State must become greater." On the affair of Barcelona the speech observes that "Various advantageous modifications as respects economy would have been introduced into the army, and several had already been submitted to the Cortes, but an unexpected insurrection suddenly broke out and paralysed those prudent economies, and it became necessary to check so great an evil by the co-operation of all the public forces. On that occasion, as on all others, the army proved a pattern of subordination, discipline, loyalty, and valour. Thanks to its virtues, and to the noble and frank co-operation of the National Guard, the commotion which would have proved so fatal, had it been suffered to gain ground, was stifled at its commencement, and tranquillity was completely restored. Owing to this tranquillity, and to the effects of the reforms which have been accomplished, the material interests of the country are daily increasing; our communications are developing themselves; agriculture and industry impart more activity to our commerce, and public instruction is considerably improving." In regard to the Queen's majority, it says—"The happy moment has come when the Cortes are about to have the opportunity (and their patriotism will not suffer it to escape them) of accomplishing the wishes of the nation, and the duties we have to fulfil towards the august and young Princess who is now seated on the throne of her forefathers. Laws calculated to consolidate the State on its foundations—laws that will open the sources of public prosperity. Such is, Gentlemen of the Senate and Deputies, what the country demands, and what the dignity and welfare of our native land and of Queen Isabella II. require. May her Majesty, on assuming the reins of Government at the approaching happy period, encounter no obstacle in doing the good which her generous heart is preparing for the nation. May her Majesty find, in the blessings and applause she will reap, the precious result of our labours and sacrifices." After the delivery of this speech, the Queen, Regent, and their suite, left the hall in the same order they had come. The speech was listened to with great attention; but no cheers were heard. It was rumoured that MM. Cortina, Chacon, and Sancho would form part of a new Ministry, but it was generally understood that no change would take place until about the 20th of the month, when the Chambers should be regularly constituted. The struggle for the presidency will, it is said, be between Senors Cortina and Gonzales. The Infante Don Francisco was not present at the opening of the Cortes, nor does he seem to enjoy much popularity at Madrid. The Gazette publishes the decree of the Regent, appropriating the necessary funds for the regular payment of the interest of the Three per Cent. Stock, from the 1st January next. The promulgation of that decree had created a most favourable impression in financial circles.

PORTUGAL.—We have accounts from Lisbon to the 3d inst. It was reported that a partial change in the Ministry was not unlikely to happen before long, the probable retirement of the Ministers of Foreign Affairs and of Justice being spoken of; in which case it was thought that Senhors Silva Carvalho and Magalhaes would come in. The Chamber of Peers had been occupied with the Douro Wine Company Bill, and had adopted the basis of the measure sent up from the Chamber of Deputies. The inhabitants of Oporto were about to send a deputation to Lisbon in favour of the tariff convention. The British merchants had petitioned Lord Aberdeen, through the consul, to put an end to the uncertainty which has so long prevailed, and bring the matter to a final settlement of some kind. The Portuguese Government had at length yielded to Lord Howard's remonstrances respecting the duties on cheese, and agreed to place British cheese on the same footing as Dutch cheese, in accordance with the letter and spirit of the treaty. The duty will be 1½d. per lb. H.M.S. Vanguard had arrived at Lisbon, from Malta.

GERMANY.—Letters from Berlin mention that the 23d inst. being the birth-day of the Prince Royal, the mask and ball, representing a Court fête at Ferrara in the sixteenth century, which afforded so much satisfaction on the 28th of last month, was repeated at the Royal Palace on that night. It is said that the King has determined to send an agent to China, for the purpose of exploring the country, with commercial views, and has granted 10,000 dollars from his private purse for that purpose. It is also mentioned as certain that proposals have been made to the missionary, M. Gutzlaff, who is a native of Prussia, but at present in the service of our Government as Vice-Consul and first interpreter to our Commissioners, to accept the appointment as Prussian Consul at Canton.

ITALY.—A letter from Naples states that the Queen was safely delivered of a daughter on March 24th, at Caserta. The young Princess was baptised on the same day, in the presence of the Ministers and high dignitaries of the Kingdom.

RUSSIA.—M. Allier, lecturer in the University of St. Petersburg, has discovered in the Imperial Library 341 letters of Henry IV. of France, which have not appeared in other collections. M. Allier has received from the French Minister of Public Instruction a very complimentary letter for communicating a copy of these letters to the commission employed at Paris in making a complete collection of documents relative to Henry IV.—M. Voskressensky, a member of the Imperial University, having analysed the different sorts of coal found in the south of Russia, has drawn up a comparative table of their qualities. The result shows that the best Russian coal, which is to be found in the territory of the Cossacks of the Don, contains 94.234 per cent. of carbon, and the most inferior, that of Teflis, contains 63.649 per cent. of carbon. A comparative table of analyses of the coals of England and France is added, according to which the best of all, the Newcastle coal, contains only 84.846 per cent. of carbon, and the best of the French coals only 9.198 per cent. Thus the coal of Grouschewskaja surpasses in quality the best English and French coals.

UNITED STATES.—The new packet-ship Montezuma, Captain Lowber, which sailed from New York on the evening of the 20th ult., arrived at Liverpool on Tuesday, after a quick passage of 17 days. She has brought papers four days later than those received by the Great Western, but their contents are unimportant. There had been a severe storm at New York on the 17th, which caused some damage to the shipping. The Consul-General of France at New York had announced officially, that in consequence of the distress attendant upon the earthquake of the 8th February, the ports of Guadeloupe are declared open for the admission of provisions of all kinds, and of wood suitable for building purposes. Accounts of the 3rd ult. had been received from Hayti. The revolutionists had increased, and were 12,000 strong. Several regiments of President Boyer's troops had joined the revolutionists, and all communication with Port-au-Prince had been cut off.

TURKEY.—The *Augsburg Gazette* of the 15th inst. publishes the following precise details of the Russian ultimatum relating to Servia:—1. Russia demands that the authors and abettors of the revolution of September be brought to trial. 2. The Emperor demands that Prince Alexander Kara Georgewitsch should be deprived of his command. 3. That a new Sovereign should be immediately elected according to the existing laws. But the Sultan may annul the firman of his father, the Sultan Mahmoud, which rendered the throne of Servia hereditary in the family of Obrenowitch, and if the complaints made against Prince Michael be well founded, the Sultan will be permitted to exclude Prince Michael from the number of candidates. M. de Boutenief received, at the same time with this ultimatum, instructions to give the Ottoman Porte but 24 hours to return an answer, and in case of a refusal, to break off all diplomatic relations with the Divan, and withdraw provisionally to Bujukdere, where a Russian ship of war is stationed.

AUSTRALIA.—The advices from the Australian colonies come down to the 19th November from Sydney, and to the end of October from Hobart-town, Launceston, and Port Philip. At Sydney, the Custom-house returns of imports and exports had been published, and the value of these respectively amounted to 1,283,538*l.* and 862,027*l.*, showing an excess of imports at the rate of 48½ per cent. The returns of the previous year showed an excess at the rate of 171½ per cent., and hence it appears the trade of the colony is returning to a satisfactory position. The imports for 1842 are stated to be considerably less than in any former year since 1836, and the exports less than in any year since 1838. The Port Philip advices are unsatisfactory. Heavy rains had flooded the country, and it was expected that considerable damage would be occasioned by the Yarra Yarra having overflowed its banks. The farmers would suffer much from the disadvantageous circumstances under which they would have to clip their flocks. The crops had already been deteriorated by the state of the weather.

CAPE OF GOOD HOPE.—The Cape of Good Hope papers are of the 10th February, received by Her Majesty's ship *Druid*, which touched at that port on her passage homeward with treasure from China. They state the satisfactory settlement of the disturbances in the territory beyond the north-eastern boundary. Colonel Hare, it appears, has had an interview with the leading farmers, who have consented to recognise British supremacy, and the Col. is shortly to return to Graham's-town with his troops, leaving at Phillipolis about 200 men, as a preventive corps, should any further feeling of insubordination be manifested.

Parliament.

HOUSE OF LORDS.

Monday.—Lord BROUGHAM begged to ask the President of the Council whether there was an objection to lay before the House a return of the expense of building the Victoria Tower in the new Houses of Parliament. Anything more in opposition to good taste than this tower he had never seen, and he trusted that the plan would be altered in respect to its erection. — Viscount DUNCANNON begged to point out that the Victoria Tower was a part of the original plan and estimate. He thought his noble friend must refer in his observation to the Centre Tower, to be erected for the purpose of ventilation, which had been added to the original plan. — Lord WHARNCLIFFE answered the noble Lord that the cost of the building of the Victoria Tower would be found in the original estimate, of which it formed a part.

Tuesday.—Lord ASHBURTON said, before their Lordships proceeded to the business of the day, he hoped he might be permitted to take the earliest opportunity of making his most earnest acknowledgments to their Lordships, and his deep sense of gratitude for the resolution which, by the votes of the proceedings of the House, he found was passed on Friday last. This resolution, however grateful and gratifying to himself personally, was rendered in his mind infinitely more valuable by the opinion which accompanied it, expressed by their Lordships, namely, the expression of the satisfaction of their Lordships at the restoration of a good understanding with the United States, which it was alike the duty and interest of both countries to maintain. An expression so full of wisdom and sound policy, delivered by such a body as the Peers of this kingdom, could not fail to have the most valuable effect in producing that consummation which was in itself so much desired by their Lordships. The overwhelming importance in his mind of the settlement of those unfortunate differences which had gradually grown up between the two countries, was his great inducement to undertake the task;—and, probably, in doing so he did not sufficiently estimate his own deficiencies for its execution. He had, however, the good fortune to perform that duty in a manner which has been approved of by his Sovereign—by her Ministers—and he had now to add, by the almost unprecedented honour of the approbation of their Lordships' House. It was quite impossible for him to express to their Lordships how deeply sensible he was of this honour. In countries under free Governments, such as they had the happiness to live under and in America, it was natural that a question of this importance should be discussed with great freedom, and that had been the case in relation to the treaty which it had been his business to negotiate. Although he trusted that the conditions were such as were likely to be conducive to the future maintenance of peace between the two countries, and that they had fairly and honourably settled the questions which were in dispute, he might fairly assure their Lordships that the more minute question of more or less of boundary which has been the subject of so much discussion, both on this and on the other side of the water, weighed, in his estimation, very little in comparison with the larger question of a settlement which should be satisfactory to men of honourable minds in both countries; for if it were not satisfactory to men of honourable minds in both countries, it would not be likely to have any permanency. It was not his intention to go at all into any questions connected with the subject of these transactions. He had only finally again to express to their Lordships the deep sense he entertained of that approbation which they had been pleased to express, which was the highest reward he could receive for the humble efforts he had made in what he conceived to be a good cause.—The Duke of WELLINGTON.—My Lords, having had the satisfaction of hearing my noble friend, I have great pleasure in moving that the words addressed to the House by the noble Lord on this occasion be entered on the Journals.—Agreed to.

Lord BROUGHAM then introduced his bill for the better prevention of the slave-trade. His first object was to decide by a declaratory act, that a British subject residing abroad, but not within the bounds of a British settlement, buying slaves and transporting them to his plantation, was guilty of felony. The next object was to legislate respecting the transmission by legal instruments of foreign slave plantations; and the third, to prohibit the buying and selling of slaves by joint-stock companies established here for the carrying on projects abroad. He wished also to insure a better mode of trial where slave-trading practices were imputed to British subjects, and to impose upon parties engaged in the African trade some species of superintendence which would confine them to their legitimate traffic. After some observations upon the apparent inconsistencies of the American Government, which, having declared the slave-trade piracy, yet complained of any proffered assistance on the part of a friendly Power in carrying into effect its own law, the noble Lord moved that the bill be read a first time.—Lord CAMPBELL entirely concurred in Lord Brougham's concluding remarks, but Lord ASHBURTON, although admitting that the extension of such opinions was extremely desirable, trusted that the country would not be understood as intending to enforce them contrary to the law of nations.—Lord CAMPBELL contended that the slave trade had been universally recognised as piracy, but was corrected by Lord ASHBURTON, who quoted France as a country whose acquiescence in this doctrine was still to be obtained.—Lord DENMAN, although he was convinced that the more the subject was considered, the more widely would his opinion be agreed in, that the pirate and the slave trader were by natural law constituted public enemies, felt the necessity of obtaining the co-operation of other countries too strongly to recommend any departure from the letter of our treaties. He vindicated the decisions of the American judges on the subject; but thought that it was only by a general combination of the naval powers that the abolition of the slave-trade could be effected. The bill was then read a first time; and on the motion of the Duke of WELLINGTON their Lordships adjourned until Tuesday, the 25th inst.

HOUSE OF COMMONS.

Monday.—Lord JOHN RUSSELL laid on the table the following resolutions relating to education, of which he had given notice, and which he proposes to bring forward after Easter:—"1. That in any bill for the promotion of education in Great Britain, by which a board shall be authorized to levy, or cause to be levied, parochial rates, for the erection and maintenance of schools, provision ought to be made for an adequate representation of the rate-payers of the parish in such board. 2. That the chairman of such board ought to be elected by the board itself. 3. That the Holy Scriptures, in the authorized version, should be taught in all schools established by any such board. 4. That special provision should be made for cases in which Roman Catholic parents may object to the instruction of their children in the Holy Scriptures in such schools. 5. That no other books of religious instruction should be used in such schools unless with the sanction of the Archbishops of Canterbury and York, and the concurrence of the committee of Privy Council for education. 6. That, in order to prevent the disqualification of competent schoolmasters on religious grounds, the books of religious instruction, other than the Holy Bible, introduced into the schools, should be taught by the clergyman of the parish, or some person appointed by him, to the children of parents who belong to the established church, or who may be desirous that their children should be so instructed. 7. That all children taught in such schools should have free liberty to resort to any Sunday school, or any place of religious worship which their parents may approve. 8. That any school connected with the National School Society, or the British and Foreign School Society, or any Protestant Dissenters' school, or any Roman Catholic school, which shall be found upon inspection to be efficiently conducted, should be entitled, by license from the Privy Council, to grant certificates of school attendance, for the purpose of employment in factories of children and young persons. 9. That, in the opinion of this House, the committee of Privy Council for education ought to be furnished

with means to enable them to establish and maintain a sufficient number of training and model schools in Great Britain. 10. That the said committee ought likewise to be enabled to grant gratuities to deserving schoolmasters, and to afford such aid to schools, established by voluntary contributions, as may tend to the more complete instruction of the people in religious and secular knowledge, while at the same time the rights of conscience may be respected.

Sir JAMES GRAHAM said that several of the points embraced in the resolutions had been under the consideration of the Government, and that in consequence important modifications will be introduced into the Factories Bill.

Mr. F. T. Baring presented a petition from Mr. Rowland Hill, complaining of the treatment he had experienced from the Government with respect to the carrying out his plan for the establishment of a penny postage. After setting forth the events which led to the reduction of the postage the petitioner states that Mr. Hill was employed for a limited period to superintend the working of his plan, and then proceeds as follows:—"But your petitioner has now to state to your honourable House that since the month of August, 1841, scarcely any progress has been made towards the completion of your petitioner's plan; on the contrary, one important improvement, which had received the sanction of the late Treasury Board, and which would have been highly beneficial to the rural districts, and in all probability advantageous to the revenue, has, your petitioner is led to believe, been indefinitely postponed. That certain inquiries essential to the success of an important improvement then in progress, which inquiries were about to be prosecuted by your petitioner under the authority of the Treasury Board, as at present constituted, were, by the interposition of the Post-office, prevented from taking place; and the authority whereon they were to be made was withdrawn. That all your petitioner's efforts to promote economy and the public convenience, by introducing the remaining parts of his plan, have been ultimately frustrated. That at the expiration of the third year of your petitioner's engagement, viz., on the 14th of September last, when many specific improvements recommended by your petitioner, some involving large savings of public money, were actually in progress, the Lords of the Treasury terminated your petitioner's engagement, thus depriving him of every chance of completing his appointed task. That the plan of Post-office improvement, thus left incomplete, has from the first been stated by your petitioner to consist of the following parts:—1. A uniform and low rate of postage; 2. Increased speed in the delivery of letters; 3. Greater facilities for their despatch; 4. Simplification in the operations of the Post-office, with the object of reducing the cost of the establishment to a minimum. That the only portion of the plan which is as yet fully carried into effect is the institution of the penny rate. That for increased speed in the delivery, or greater facilities for the dispatch of letters, little or nothing has been done. That with regard to the simplification of arrangements, and consequent economy, though many important and successful changes have been made, yet little has been effected in proportion to the opportunities afforded by the adoption of uniformity of rate and prepayment. That the opinion which your petitioner expressed, both in his pamphlet and in his evidence before the committee of your honourable House, was to the effect that the maintenance of the Post-office revenue, even to the extent on which he calculated (about 1,300,000*l.* a year), depended on carrying into effect the plan as a whole. That the opinion adopted by her Majesty's Government, that the further progress in Post-office improvement may be left to the Post-office itself, is contrary to all past experience, and is contradicted by measures recently adopted by that establishment. That the questions to which your petitioner sought to gain the attention of the Treasury involve savings to the extent of hundreds of thousands of pounds per annum; an advantage to the revenue entirely independent of that augmentation of letters which the whole experience of the Post-office shows may safely be anticipated from the adoption of those measures suggested by your petitioner, which have reference to increasing the utility of the Post-office to the public. That notwithstanding the extreme depression of trade which existed when the penny rate was established, and has continued to prevail ever since, and notwithstanding the very imperfect manner in which your petitioner's plan has been carried into effect, the want of due economy in the Post-office, the well-known dislike to the measure entertained by many of those persons to whom its execution has been entrusted, and the influence such dislike must necessarily have had on its success, yet the results of the third year of partial trial, as shown by a return recently made to the House of Lords, are a gross revenue of two-thirds, and a net revenue of more than one-third of the former amount. That the present gross revenue, as shown by the same return, is almost exactly the same as it was under the fourpenny rate. That the net revenue of the Post-office increases from year to year, while every other branch of revenue appears to be decreasing. That, looking to these results, your petitioner trusts your honourable House will see no reason to doubt that a few years with a revived trade would suffice to realize all the expectations which he held out, provided the whole plan be carried into effect with zeal and economy. Your petitioner desires to submit the truth of the foregoing allegations to the severest scrutiny, and therefore humbly prays that your honourable House will be pleased to institute an inquiry into the state of the Post-office, with the view of adopting such measures as to your honourable House may seem best for fully and fairly carrying into effect your petitioner's plans of Post-office improvement, and thus realizing the undoubted intentions of the Legislature."

In reply to Lord Palmerston, Lord STANLEY said that in the case of the Creole no fresh instructions had been sent out to the Governor of the Bahamas, with a view of providing for any future hypothetical case, but that the confidential opinion of the law-officers of the Crown has been transmitted to him; and the House might rest assured that the right of slaves to their freedom, when in a British port, would not suffer in the hands of the Government.

Sir R. PEEL, in reply to Mr. Ewart, said he had not heard of the report that Mr. Ellis was on his return to this country from the Brazils without accomplishing his mission.—In reply to Mr. Stuart Wortley, it was stated by Sir R. PEEL that a slave trade was carried on by Arabs in the territories of the East India Company, chiefly on the Bombay coast, and that individuals had been prosecuted and punished for participating in it. A new act, however, of which the credit was due to Lord Auckland, was just coming into operation, which would effectually check the traffic.

The third reading of the Registration of Voters Bill was passed, and then Lord C. FITZROY moved the addition of a clause, in order to define more clearly the 10*l.* franchise, but it was objected to by Sir J. GRAHAM, and withdrawn.—Mr. COLVILLE proposed another clause, in order to secure to a real voter who has been personated the exercise of his right, so that it shall be received by the returning officer as a "tendered vote," but not counted on the poll.—Some conversation arose on the legal effect of this clause; but as the Solicitor and Attorney-Generals expressed their approbation of it, the clause was added to the Bill by way of rider, as were one or two other additions.

Sir T. WILKES then called attention to the provision of the Bill giving to the Court of Common Pleas an appellate jurisdiction on the subject of disputed votes. In 1604 the House of Commons had secured its right of absolute control over the elective franchise, which had not since been questioned. He pointed out what he considered to be the inconvenience of giving the appointments of the revising barristers to the judges: such a patronage had a tendency to destroy the independence of the bar, and, therefore, to injure the interests of the public, so far as an independent bar was concerned; and he objected to bringing the elective franchise within the jurisdiction of a court of law at all. The preservation of its jurisdiction was essential to the existence of the House; let them once part with their right, and it was gone for ever. Sir R. PEEL's bill for the trial of controverted elections had not yet received a fair trial; it was capable of great improvement. At all

events, he thought that it was too grave a matter to be disposed of in the present manner; it ought to be made the subject of a separate bill, and so receive a more deliberate consideration.—Sir J. GRAHAM complimented Sir T. WILKES as the intrepid defender of the privileges of the House; but he denied that the clause to which he had objected was any surrender of those privileges. The argument of the learned gentleman was based on a misconception; the clause did not go so far as a provision of the Irish Registration Bill, which had been proposed by the late Government. The power of an election committee of the House remained intact by the present bill; and he could not see what danger could be dreaded from the reference of a point of law to the Common Pleas, which could be adjudicated upon in the face of public opinion. He would much sooner trust the judges of a superior court of law, than assessors to be appointed by a majority of the House, or even by the more impartial judgment of the Speaker.—Lord J. RUSSELL could not allow the privileges of the House to be parted with without a further protest, and the reference to the case of Ireland had but little weight with him. There, the judges had given a legal decision relative to the franchise according to their known political feeling, Tories deciding one way, and Whigs another. They were now proposing to render a decision of the Court of Common Pleas, on an appeal from the revising barrister's court, binding on a committee of the House. Mr. Fox had said that the representation of the people, and trial by jury, were the two safeguards of the liberties of the people; and here they were about to submit the rights of every elector in the kingdom to the conflicting and varying opinions and decisions of the judges.—The SOLICITOR-GENERAL remarked, that by an act passed previous to the Reform Bill, there was an appeal, in Ireland, from the revising barrister to the judge of Assize. After the passing of the Irish Reform Bill, it was a conflicting and disputed question as to the right of election committees to open the registry in Ireland, and the late Sir M. O'Loughlin, on the part of the then Government, brought in a bill to render the decision of the judge, on appeal, binding on a committee of the House of Commons. By the present bill, the decision of the Common Pleas was merely made binding on an election committee in the particular case, and on the point involved. He regretted that Lord J. Russell, considering the weight of his opinion, should have expressed himself as distrusting the judges of the land, in a matter where political feelings could not possibly operate. There was nothing given up by this bill which could be considered as an abandonment of the privileges of the House; it was merely carrying out an original intention of the Reform Act, only substituting as the court of appeal the four judges of the Common Pleas, instead of three revising barristers.

—Mr. HUME supported the clause, and in so doing would be sorry to think he was parting with the privileges of the House.—On a division, the motion of Sir Thomas Wilde was rejected by 102 to 26.—The bill then passed.—The second reading of the Ecclesiastical Courts' Bill was next proposed, and Sir R. H. INGLES said the opposition to the bill was various in its character, some opposing it because it went too far, others because it did not go far enough; but all repudiated this particular measure. It was the destruction of ancient institutions—proposing at one fell swoop to extinguish no less than three hundred and eighty courts, some of them coeval with the Conquest. Clerical and lay peculiarities were to be destroyed; the changes in the proving and custody of wills were not justified by any necessity; for on the principle that justice should be brought home to every man's door, it was important that they should be enrolled as near the respective localities of the parties interested as possible; and after reviewing at some length what he considered would be the effect of the various alterations contemplated by the bill, such as that it was a deliberate step towards the separation of the Church from the State, the destruction of the authority of the Archbishop of Canterbury, &c., he recommended its withdrawal, as it was impossible to carry it during the present session of Parliament. He concluded by moving that the bill be read a second time that day six months.—Sir J. GRAHAM would not shrink from the responsibility of pressing this measure on the consideration of Parliament, because he was firmly convinced it was for the public interest. No judicial change had ever been proposed on higher authority, ecclesiastical, judicial, and legislative; and until he heard the argument of Sir R. Ingles, he was not prepared for the fact that any Member of the House could possibly defend the existence of those scattered ecclesiastical courts whose numbers and decisions had led to such extensive litigation. The highest legal functionaries had given their opinion that the expense of probate of wills would not be greater in London than in the country; while the convenience of centralising the custody of wills where all the great disputes on property were mainly adjudicated upon, were advantages of prime importance, and of the great public utility of which they were convinced, even though they admitted that some private interests might be affected by it. In this spirit, the Government would neither withdraw the bill, nor refer it to a select committee, but leave it to the House to decide at once on its principle, and they would view its rejection with the regret which their sincere conviction of its importance involved.—Mr. JARVIS contended that the bill perpetuated, instead of reforming, the monopoly and abuses of Doctors' Commons, in which 34 proctors had the sole privilege of taking apprentices, with each of whom a fee of a thousand pounds, or thereabouts, was required. He strongly objected to the centralisation of wills in London; and as for the registry, if that were all that was required, they had already all the machinery at the Stamp-Office, in the collection of the legacy duty. The most objectionable parts of the criminal jurisdiction of the Ecclesiastical Courts were retained by the bill, as the Bishops' Courts, with the trials for schism, heresy, brawling, &c.; while the increase of salaries and patronage to the functionaries in London, and the necessary withdrawal of the more respectable practitioners from the country, with the sacrifice of their established business, rendered the measure as objectionable on private as on public grounds.—Colonel SMITH protested against this addition of salary and patronage to the practitioners of Doctors' Commons, who were already rich enough and idle enough. The bill was an infringement of vested rights, and of the rights of the people.—The debate was proposed to be adjourned, but a division was called for, when there were—136 for the adjournment, and 51 against it.

Tuesday.—Sir JAMES GRAHAM, in answer to Mr. Hindley, stated that certain modifications of the original proposals of Government on the subject of education were under consideration, though not yet matured. He declined to say whether or not any of the principles of Lord J. Russell's resolutions would be adopted.—In reply to another question, put by Mr. M. Gibson, Sir R. PEEL said he intended to introduce another Bill, extending the provisions of the Factory Bill to the lace and cotton print branches of manufacture. He also said he had not yet had an opportunity of seeing the report of the commission of inquiry into the state of the agricultural districts.—In answer to Mr. ESEOTT, Mr. VILLIERS stated that it was his intention to follow up, in the present session, his motion on the subject of the importation of foreign corn, which stands for the 4th May.—Sir J. GRAHAM, in reply to Mr. Roebuck, stated that the Government could not undertake the condensation of the criminal law recommended by the commissioners in their report. A commission to do so, if appointed, should, he thought, be appointed by Parliament rather than by the Crown.

On the motion of Sir R. PEEL, the House, at its rising, was ordered to stand adjourned to the 24th inst.

Mr. B. COCHRANE gave notice, for the 27th inst., to move for a select committee to inquire into the system of education adopted at Maynooth College.—Lord J. RUSSELL fixed the 2d May for the proposition to the House of his education resolutions.—Sir R. PEEL gave notice that, on the 4th May, he would move for leave to bring in a bill to endow additional ministers of the Church of England in certain populous districts.—Mr. F. KELLY gave notice to ask for leave, on the 27th inst., to bring in a Bill to amend the

Act for the regulation of Municipal Corporations in England and Wales.—Mr. SCHOLEFIELD gave notice of a motion declaring the expediency of laying a further tax on income arising from property, as a substitute for the existing taxes on tea, malt, and sugar.—Mr. EWART gave notice, for the 9th May, to move for leave to bring in a bill to abolish transportation as a punishment.—Mr. T. DUNCOMBE gave notice for the 27th inst., to move for a select committee to inquire into prison discipline.

The adjourned debate on the Ecclesiastical Courts Bill was further adjourned to Friday, the 28th inst.; and the Factory Regulations Bill was fixed for Monday, the 1st of May.—Mr. EWART postponed his motion on the subject of National Education.

Sir J. WALSH moved for leave to bring in a bill to amend the Act, commonly called the Hobbouse Act, for the regulation of the Metropolitan vestries.—Mr. GALLY KNIGHT, Sir B. HALL, Capt. ROT, Mr. HAWES, and Mr. HUME opposed the motion.—Colonel T. WOOD and Mr. MACKINNON thought the bill attempted to go too far, but would not oppose its introduction.—Sir J. GRAHAM, seeing the little support the bill received, recommended Sir J. Walsh not to press it. It was then withdrawn.

Dr. BOWRING then rose to move for the correspondence of the British Government with the Porte on the subject of the Bishop of Jerusalem. He considered that Dr. Alexander was an injudicious selection, inasmuch as, being the son of a Jew, he was liable to be associated with feelings of contempt in Oriental minds; and on his arrival, his wife and family excited much astonishment, celibacy being associated with sanctity in the East. The sanction of the Porte, solicited by this country, to the erection of a Protestant church in Jerusalem, was on a par with the idea of an Act of Parliament to sanction the erection of a Mahomedan mosque in this country. In the existing state of the Holy Land, the establishment of the Protestant bishopric was only calculated to excite prejudices and fanaticism.—Sir R. INGLES defended the acquirements and character of Bishop Alexander, and said that it was no reproach to him that he was of Jewish descent, seeing that the first bishop of Jerusalem was St. James. [Here a motion was made that the House be counted; but as exactly 40 Members were present, Sir R. H. INGLES continued.] He approved of the political expediency of having in the Holy City a representative of the Protestant Church: and read an extract of a letter from Bishop Alexander addressed to himself, in which the Bishop stated that many of the accounts respecting him in the public prints were fabrications.—Sir R. PEEL thought that Dr. Bowring appeared to be actuated by personal feelings of hostility towards the Bishop of Jerusalem, and had spoken of him in a tone of levity. The manifestation of this spirit, added to the force of reasons, on public grounds, led him to refuse the production of the correspondence. The Bishop had been received with cordiality, and had received marks of respect from the dignitaries of the Greek and Roman Catholic faith; and on the showing of Dr. Bowring himself, who had said that many Christians in Syria nominally professed Mahomedanism, it was desirable that a bishop should be stationed there, in order to have their spiritual interests under his care. There was no law to prevent the erection of a Mahomedan mosque in this country; and Dr. Bowring might even indulge his apparent predilection for that faith by preaching in it. Nothing was asked from the Porte which was unreasonable, in giving its permission to the erection of the Protestant church in Jerusalem, and much exaggeration had been used with respect to the subject.—After some remarks from Mr. Hume, Lord PALMERSTON concurred in the view which had been taken by Sir R. Peel, in refusing to produce the correspondence, and expressed his regret at the spirit which had been evinced by Dr. Bowring. In particular, he was surprised that it had been made a matter of comment that Dr. Alexander had a wife and family, seeing that, even in the Greek church, priests were under an obligation to marry, though bishops were not. He approved of the policy which had led to the establishment of the Protestant bishopric in Jerusalem, the negotiations on which had commenced before he left office, and thought that it would have a beneficial effect in allaying feelings of fanaticism, and in promoting good-will.—Dr. BOWRING disclaimed being actuated by any personal or improper feeling in bringing forward his motion, which he withdrew.

On the motion of Mr. W. COWPER, a select committee was appointed to inquire into the propriety of setting apart a portion of all waste lands which shall be inclosed by Act of Parliament, to be let out in small allotments to the labouring poor of the district; and also as to the best mode of effecting the same.—The House at this period was counted, and forty Members not being present, it stood adjourned to next Monday week, the 24th inst.

CITY.

Money Market, Thursday.—Consols left off 96½ to 7 for Money, and 97 to ½ for Account; Three per Cent. Red., 96½ to ½; Three-and-half per Cent. Red., 101½ to ¾; New Three-and-half per Cent. Annuities, 102½ to ¾; Bank Stock, 183 to 4; India Stock, 269 to 70; India Bonds, 76s. to 78s. prem.; Exchequer Bills, 68s. to 70s. prem. Yesterday being Good Friday, the Market was of course closed.

Metropolis and its Vicinity.

Improvements in St. James's.—The bill now before Parliament to empower the Commissioners of Woods and Forests to appropriate to building purposes the area of Thatched House Court, and to widen and improve Little St. James's-street, has just been printed. The preamble sets forth that the buildings in Thatched House Court having been, or being now in progress of being pulled down, with a view of raising on their site houses of a superior class, and there being no longer need for keeping open the area or entrance to the court, which is vested in her Majesty, it is desirable to include the space in the site of the new erections. The bill accordingly proposes to discharge her Majesty of the rights of way, and the jurisdiction of the Paving Commissioners of St. James's, so far as regards paving and lighting, the jurisdiction of the commissioners as to rating being retained, and the rights of certain lessees of part of the property being regarded. The bill further empowers the Commissioners of Woods and Forests to widen the entrance to Little St. James's-street, from 10 feet to at least 24 feet throughout, the additions being thereafter considered as part of the public street.

Dinner at the Mansion House.—The Lord Mayor on Wednesday evening gave an entertainment to a distinguished circle of guests, including most of the Members of the late Ministry. The company numbered about 150. Lord Lansdowne returned thanks on behalf of the House of Peers, Lord Palmerston on behalf of the House of Commons, and Lord John Russell on behalf of the City Members.

Death of the Master of Dulwich College.—The daily papers announce the death of John Allen, Esq., the master of Dulwich College. He was distinguished by

Lord Byron, as "the best informed and one of the ablest men he knew." He was elected Warden in 1811, and succeeded to the Mastership in 1820. A vacancy having thus occurred in the mastership, by the statutes of the College, the master must be elected on the 1st day of May next, and any candidate for this valuable appointment must be of the name of Alleyn or Allen, and unmarried.

Explosion of the Waltham Powder Mills.—On Thursday afternoon an explosion, attended with fatal consequences, took place at Waltham Abbey in the gunpowder-mills belonging to Government. Four mills were destroyed, and seven of the workmen were killed. Five were carried over the river to a considerable distance, and fell lifeless in the marshes; the other two were buried in the ruins. The shock was so severe that the windows of the church and numerous houses were shattered, and the report was distinctly heard in several parts of the Metropolis.

Chartist Meeting.—A very crowded meeting of Chartist was held on Monday night, for the purpose of presenting an address to Mr. T. Duncombe, thanking him for calling the attention of the House of Commons to the conduct of Lord Abinger. Mr. Feargus O'Connor was in the chair. A resolution having been passed expressive of regret that the House of Commons had refused an inquiry into the conduct of Lord Abinger at the late special commission, it was resolved that the thanks of the meeting be offered to those Members of the House of Commons who voted for Mr. Duncombe's motion of inquiry, and an address was presented to Mr. Duncombe expressive of their admiration of his conduct. Mr. Duncombe, in his reply, said that he had read the trial of Jones, a Chartist, who was tried at Leicester by Judge Gurney; and whenever an opportunity offered itself, or a petition should come from Jones before the House of Commons, he should have no hesitation in stating to the House his opinion of the conduct of that judge.

Anti-Corn-Law League.—The fifth meeting of the League took place in Drury Lane Theatre, on Wednesday. The house, as usual, was crowded in every part, and the attendance of ladies was greater than on any former occasion. Mr. Wilson presided, and the speakers of the evening were, Dr. Bowring, Mr. Elphinstone, M.P. for Lewes, the Rev. J. Burnet, of Camberwell, and Mr. Heyworth, of Liverpool.

Missionary Societies.—A meeting was held on Wednesday, at Exeter Hall, of the friends of the Protestant missions, for the purpose of adopting measures said to be required by the recent aggression of the French on Tahiti, and for securing the general interest of British missions in the islands of the South Pacific. Mr. Hindley, M.P., presided. A series of resolutions was entered into condemning the conduct of the French Government, and calling upon all the Protestant churches in Europe and America to join in restoring to the Queen of Tahiti the independence of which she has been deprived.

Street Sweeping.—On Monday an exhibition of the self-loading cart, or street-sweeping machine, which is now in daily operation in Regent-street, took place in the vicinity of Oxford-street, for the purpose of enabling the paving boards of various metropolitan parishes to judge of its practical operation and utility. The two machines were each drawn by two horses, and as they proceeded, the rotatory motion of the wheels acted upon a series of brooms, hung behind the cart by a light framework of iron, so that the brooms successively swept the surface of the ground, carrying the soil up an inclined plane, at the top of which it fell into the body of the cart, leaving behind a smooth and well-swept track. The machines proceeded through Vere-street, Henrietta-street, Marylebone-lane, and over the wood pavement in Oxford-street. In traversing these streets, the machines had to pass over three different species of pavement, viz., the Macadamised, the stone, and the wooden pavement, where a sort of artificial mud had been created by the recent watering of the streets. On reaching the wooden pavement, the machine swept an area of upwards of two thousand yards in the space of about fifteen minutes, leaving it in a state of perfect cleanliness. They performed the work of about eighty men in the space of three-quarters of an hour, and combined the threefold process of sweeping, loading, and carrying in one operation. During the day, the inventor explained, by means of a model, the mechanical action of the machine, and stated, that by an experiment recently made before Sir J. M'Adam, the machine had proved its applicability for sweeping Macadamised roads, upon which it filled itself in the space of five minutes.

New Hospital.—A subscription is in progress for the establishment of a new Hospital for the Marylebone and Paddington districts. A meeting was held recently, Mr. B. B. Cabbell in the chair, at which it was resolved, "That the north-western district of London having grown immensely in point of population and wealth, and remaining destitute of any adequate means of relief for its poorer inhabitants, when suffering from accident and disease, it becomes the duty of this wealthy and increasing district to provide against casualties and serious illness occurring among its poorer population; and it is the opinion of this meeting that this desirable object can in no way be so effectually and permanently attained as by the foundation and maintenance of a Hospital, of a size adequate to the necessities of the district; and that in order to render the proposed Hospital as efficient as possible, an Ophthalmic and a Maternity Department be attached to it, in addition to the usual Medical and Surgical Departments of Hospitals." A Committee was appointed to receive subscriptions, and from the list already published, there is reason to believe that the benevolent object of the meeting will soon be carried into effect.

The Nelson Monument.—Admiral Sir Robert Stopford,

the Governor of Greenwich Hospital, has consented to allow a number of veterans from that establishment to attend the ceremony of placing the statue of Lord Nelson upon the column in Trafalgar-square, "because he is sure it will be as gratifying to the feelings of the men themselves as interesting to the assembled spectators." The Admiral also promises "to furnish the committee with the number of the present inmates of the hospital who fought under the great naval hero, either in the glorious battle of Trafalgar or other of his naval victories, and whose present state of health will enable them to attend."

Colonial Society.—An adjourned general meeting of the Members of this Society was held on Wednesday, for the purpose of framing a memorial to the Secretary of State for the Colonies, urging the propriety of adopting immediate measures for the encouragement of systematic colonization. The Earl of Mountcashel took the chair, and opened the proceedings by adverting to the interest lately exhibited with reference to emigration and colonization, not only by the citizens of London and our large commercial communities, but within the last few days by Parliament itself. It was, therefore, thought desirable, that the sense of a body so important as the Colonial Society, comprehending within it a large number of persons connected with our colonial possessions, should give some definite expression to their feelings. After a good deal of discussion on the merits of different plans which were proposed, it was resolved that the subject be referred to a committee, and that a memorial be presented to the Colonial Secretary, expressing the hope of the Society that Government will take up the consideration of colonization as a question of vital importance to the country.

The late Accident at Blackwall.—Since we noticed the fatal accident at Blackwall, to the brother of Mr. Ferrand, M.P. for Knaresborough, the river has been dragged; and as a last expedient, cannon have been fired, and the diving apparatus has been used for the purpose of recovering the body; but all attempts have been ineffectual. It is now considered very doubtful whether the body will ever be found, as the tide was running down at the time with great rapidity, and the body was probably carried out to sea.

Thames Tunnel.—The number of persons who passed through the Tunnel on Sunday was 22,215, and the place, in addition to this influx of visitors, presents a busy appearance from the circumstance of stalls having been put up by various parties for the sale of fancy articles, not the least curious being the small ornaments made from the clay of the Tunnel itself. A large number of workmen, employed on either side of the river, avail themselves, morning and evening, of the shortened communication now established between the two shores.

Inquests.—On Saturday an inquest was held on the body of the Earl of Hopetoun, who was found dead in a hackney cabriolet, which he had hired to take him from the House of Lords, where he had been in attendance during the long debate on Lord Brougham's motion, to Stevens's Hotel, New Bond-street. The cabman deposed that at one o'clock on Saturday morning he was waiting in Palace-yard for a fare, when the deceased gentleman engaged his cab, which at this time was about 40 yards from the House of Lords. At the time when the deceased gentleman called the cab, he was walking with an umbrella in his hand, apparently quite well. Witness opened the door, and the gentleman got in, telling him to drive to Stevens's Hotel. The gentleman spoke well, and in a firm tone. When witness got to the hotel he opened the cab-door without getting down from his box. Finding the gentleman did not get out, he dismounted, and looked into the cab, and saw the gentleman's head leaning down on the right side. Thinking he was asleep, he pulled him twice to awaken him, but as he did not move he rang the bell of the hotel, which was answered by the porter. The porter got a light, and made another attempt to wake the gentleman, witness and the porter being still under the impression that deceased was asleep. The porter called his lordship's servant, who came and felt the pulse of the deceased, and then found that his master was dead. Dr. Seymour deposed that Lord Hopetoun had repeatedly consulted him during the past year. He complained of symptoms which appeared to witness to denote disease of the heart, or the immediate great vessels, as their origin. Witness had communicated his alarm on the subject to several members of his lordship's family. His lordship had recently improved in health, but, from the nature of his complaint, witness was by no means surprised to hear of the event which had so suddenly occurred. There could be no doubt whatever of his lordship having died from the complaint under which he laboured. His lordship had told witness that whenever he made any considerable exertion he felt great pain about the region of the heart. The jury expressed their unanimous conviction as to the cause of Lord Hopetoun's death, and concurred in a verdict of "Died suddenly by the visitation of God."

Criminal Statistics of the Metropolitan Police.—The annual returns just published by the Commissioners of the Metropolitan Police, giving an account of the trades or occupations of the persons taken into custody during the year 1842, show the following results:—Out of the 65,000 persons—45,000 of whom were males and 20,000 of them females—there appear to have been taken into custody, 82 artists, 487 bakers, 128 brushmakers, 52 bar-men, 183 brassfounders, 12 brewers, 529 bricklayers, 43 brokers, 240 bookbinders, 611 butchers, 11 buttonmakers, 1,008 carpenters, 4 clergymen, 440 clerks, 1,068 coach and cabmen, 118 coachmakers, 198 corkcutters, 43 compositors, 67 clockmakers, 98 curriers, 96 cutlers, 141 carvers and gilders, 138 drapers, 229 dyers, 256 engineers, 5 excisemen, 65 fishmongers, 506 French polishers, 343 gardeners, 100 glass-makers, 76 gloves, 111 goldbeaters,

88 greengrocers, 111 grocers, 197 hairdressers, 303 hatters and trimmers, 1 interpreter, 65 ironmongers, 99 jewellers, 15,464 labourers, 60 sawyers, 887 laundresses, 77 masons, 158 medical men, 13 millers, 1,043 milliners, 68 musicians, 10 opticians, 463 painters, 301 paper-makers and stainers, 18 pawnbrokers, 2 postmen, 312 printers, 32 publicans, 6 reporters, 1,445 sailors, 171 sawyers, 125 saddlers, 871 male servants, and 1,133 female servants, 1 sheriff's officer, 66 shopkeepers, 1,115 male and 309 female shoemakers, 822 smiths, 366 soldiers, 17 surveyors, 296 sweeps, 1,290 male and 485 female tailors, 317 tinkers and tinmen, 31 tobaccoists, 48 toolmakers, 50 turners, 152 watchmakers, 172 watermen, 424 male and 189 female weavers, 19 woollsorters, and 12,626 males and 15,968 females of no trade or occupation. As stated above, there were in the whole number of 65,000 persons, 45,000 males and 20,000 females, the majority of the offences ranking principally under the heads of drunkenness, larceny, assault, and misdemeanour. Of the foregoing number, those under 10 years of age were, males, 54, females, 16; under fifteen years of age, males, 1,316, females, 134; under twenty years of age, males, 4,310, females, 1,581; under twenty-five years, males, 4,638, females, 1,743; under thirty, males, 3,224, females, 1,148; under fifty, males, 1,919, females, 769; and under sixty, males, 823, females, 313. Of the 65,000 persons taken into custody, 13,000 of the males, and 6,000 of the females, could neither read nor write; 26,000 of the males and 12,000 of the females could read or write but imperfectly; only 5,000 of the males and 987 of the females could read and write well, while but 516 of the males and 145 of the females had received a superior education. Out of the 4,431 persons, male and female, committed for trial during the year, against two males only was sentence of death pronounced and carried into execution; 26 males and 1 female were transported for life; and 512 males and 234 females acquitted. The total number of murders during the same period amounted to 25, of which 18 were committed by males and 7 by females. There were 26 cases of shooting at, stabbing, and administering poison; 15 cases of concealment of birth, 13 of manslaughter, one of treason, 22 of rape, 28 of bigamy, 5,193 of assaults, 220 of burglary, 48 of robbery, 10,000 of larceny, 639 of forgery, 119 of suicide, 48 of the latter being of males, and 71 females. It appears, from a comparative statement of the returns for 1841 and 1842, that the number of persons taken into custody during the former period amounted to 68,961, and during the latter to 65,704; the number of persons discharged in 1841 was 36,708; and in 1842, 33,609; the number of persons committed for trial during 1841 was 4018, and in 1842, 4,651; the number of persons convicted and sentenced in 1841, was 3,020, and in 1842, 3,316; the number of acquittals in 1841 amounted to 618, and in 1842 to 746.

Woolwich.—A large mortar, cast at the foundry of Messrs. Walker and Co., for Mehemet Ali, and weighing 13 tons, was proved last week at the butt in the Royal Arsenal. The diameter of the bore of this mortar is 20 inches, and the charge of powder was 80 lbs. weight. The ball fired on this occasion weighed 1,010 lbs., and required a number of men, with a powerful pinion lever, to move it into the mortar. On being fired the ball entered the butt, throwing the earth to a great height, and the piece of ordnance itself, notwithstanding its immense weight, recoiled about from 18 to 20 feet. On examining the mortar after it was fired, it appeared quite perfect.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, April 1:—West districts, 143; North districts, 168; Central districts, 209; East districts, 194; South districts, 232. Total, 946, (461 males, 485 females.) Weekly average for the last five years, 903, (males 461, females 442,) and for the last five winters, 1004.

Provincial News.

Incendiary Fires.—An incendiary fire occurred on Saturday last, the 8th inst., at Hartest, Suffolk, on the property of Mr. G. W. Poley, which destroyed two barns, outhouses, and several dwelling-houses. The Suffolk Fire Office, the overseers of Hartest, and the local Association for Prosecuting Felons, have offered a reward of 100*l.* for the discovery and apprehension of the incendiary.

Aylesbury.—On Saturday last a meeting of the electors, freeholders, and inhabitants of Buckinghamshire, convened by the high sheriff, was held in the County-hall, "for the purpose of considering the distressed state of the agricultural and labouring classes, occasioned by the new tariff, and of obtaining for them that redress which justice demands and the present condition of the country renders indispensably necessary." The meeting was attended by Earl Stanhope, Lord Nugent, Sir J. Dashwood King, Sir Harry Verney, and a numerous body of leading farmers. The resolution proposed by Earl Stanhope, was "that the agricultural, the manufacturing, and the other industrious classes of the United Kingdom, do not receive that protection of their industry to which they are entitled; that they have already been grievously injured by the effects of the new Corn-law and of the new tariff, and have a right to demand from Parliament that they shall be fully and effectually protected in the home market from the competition of foreigners, who, being far less burdened with taxes, are able to undersell them." An amendment was proposed by Lord Nugent, and another by Sir Harry Verney, but they were negatived, and Lord Stanhope's resolution carried. It was then resolved that a petition be presented to both Houses of Parliament, embodying the terms of the resolution. Lord Nugent then addressed the meeting, and said that looking to the circumstance of Lord Stanhope's motion being carried by a comparatively

small majority, he inferred a short life to the present Corn Law, and firmly believed that if they had not free trade during the present Parliament, the next Parliament would be elected to give it to the people.

Bath.—On Saturday night the walls of Bath were placarded with notices, having attached to them the names of London printers, stating that, at the request of Mr. Roebuck, the "aerial steam-coach" would commence its proceedings on Monday, by making a trip from London to this city, and that it would alight on Beechen Cliff, at half-past one o'clock, "Bath time," after a journey of 20 minutes. Accordingly, the crest and sides of Beechen Cliff were crowded, at the hour named in the bills, by some hundreds of persons—all eagerly watching for the appearance of the flying visitor from town. Large numbers stood their ground long after the appointed hour, under the conviction that the delay in the arrival of the machine was most probably caused by some mishap incident to its first journey, and that it would certainly arrive in the course of the afternoon. The house-tops in the lower part of the city also displayed numerous groups of anxious expectants, who at length discovered that the promised visit was a hoax.

Brighton.—The workmen employed at the Artesian Well, at the head of the Chain Pier, have succeeded in obtaining a plentiful supply of fresh water, at a depth of 200 feet from the level of the Marine-parade. The directors intend erecting an ornamental fountain in the centre of the promenade, affording a continual stream of spring water.

Deal.—During the past week, owing to the prevalence of westerly gales, a great accumulation of outward-bound and coasting vessels took place in the Downs. On Monday morning, the wind having chopped round to the eastward, a fleet of 500 sail got under weigh, and proceeded down Channel with a favourable breeze. About nine o'clock the line of ships stretched from the South Foreland towards Dungeness, in length about five or six miles, presenting one of the most magnificent sights ever witnessed in the Channel. Indeed, it is said that the oldest inhabitants of those shores never before witnessed so many vessels in full sail in so narrow a space. It seemed to the eye of the spectator, that at many parts of the fleet the vessels must have been yard-arm and yard-arm, so closely did they appear to be ranged together.

Hythe.—In consequence of the plunder perpetrated by the wreckers who infest the Kentish coast on the recent loss of the schooner Francis, off Dungeness Lighthouse, the Lord Warden has commenced criminal proceedings against the ringleaders; and their trials are expected to come on at the ensuing assizes. So extensive were the depredations, that the tallow which formed the cargo of the wreck was carried into the adjacent towns, Lydd and New Romney, by cart-loads, and sold at the rate of 3d. per lb. Many of them, on the strength of the wreck, purchased moulds, and carried on a profitable trade in the candle manufacture.

Kingston.—We noticed in our last the particulars of a charge of felony, preferred under remarkable circumstances, against an attorney's clerk, called Stone, and an innkeeper named Wardell, who were charged with stealing some money from the Dolphin Inn, in this town, on the 21st July last. The case was tried on Tuesday, at the Surrey Sessions. The court was crowded at a very early hour, and continued so until the conclusion of the trial, which was not until near one o'clock in the morning, having lasted 13 hours. The leading facts of the case were given last week, when we stated that the whole strength of the prosecution rested on a question of identity, the prisoners being said to resemble in many important particulars the persons by whom the robbery was committed. They were eventually taken before the Kingston magistrates, and, after a searching investigation into their case, they were discharged. Stone then commenced an action against the landlord for false imprisonment, which was tried before Lord Denman at the late assizes, and after a trial of two days, the jury returned a verdict for the defendant. In consequence of this verdict the prosecutor caused the prisoners to be again taken into custody on the same charge, when they were taken before the Kingston bench, and fully committed to these sessions for trial. On behalf of the prosecution, the landlord's daughter swore in the most positive manner to their identity, and her evidence was in some manner corroborated by the ostler. There was, however, a great discrepancy in the depositions, and an evident contradiction in the evidence she gave in July, and the testimony she gave last week at Kingston. She spoke confidently to the dress of the prisoners, and accurately described a ring with a red stone, which the prisoner Wardell wore at the time of the robbery; it was proved that on his apprehension he had a similar ring on his finger. The girl, and her father and mother, underwent the most rigid cross-examination by Mr. Chambers, and, with regard to the time, the testimony of all of them was considerably shaken. The prosecutor admitted he would not give them into custody, for he thought they were not the men, being unable to identify them. Several other witnesses were called for the prosecution, but their testimony did not in any manner strengthen the case. Mr. Chambers addressed the jury on behalf of the prisoners, he spoke for upwards of two hours, and delivered one of the most powerful defences ever heard in a court of justice. At the conclusion of his speech he was so loudly applauded that the chairman ordered that such ebullition of feeling might be immediately checked, or the court should be cleared. The chairman, in summing up, said the case was a very peculiar one, and had occupied an unusual length of time. He would leave two points to the jury, which were, whether the two prisoners at the bar were the same persons who entered the

Dolphin public-house, it being admitted that they were at Kingston on that day; and then again, in the second place, did the jury believe they were the same two men who joined the tall man on the bridge. There was one remarkable circumstance, that of the ring—the prisoner Wardell having a similar ring on his finger as described by the child, at the time of his being taken into custody. The jury returned a verdict of Not Guilty.

Newcastle.—One of those disastrous fire-blasts which so frequently happen in this district occurred on Wednesday morning, the 5th inst., at the Stormont Main Colliery, which belongs to Messrs. Grace and Co. At the time of the explosion there were upwards of 50 men at work, and so slight was the effect of the shock, that the workmen at bank knew nothing of it until apprized by some of the survivors, who escaped by reaching the pit-shaft. On the alarm being given, every exertion was used to rescue, if possible, the men below; but some hours elapsed before it was deemed prudent for any one to venture into the mine. During the course of the day 24 bodies were brought up quite dead, while 8 more, who were severely burnt, were brought out alive, but 3 have since died. The others are expected to recover. There was only one horse killed, and the damage sustained by the workings is considerable, the explosion being very limited in its range. The jury, at the inquest, returned a verdict of Accidental death.

Northleach.—An inquest has been held at Cheltenham, on the body of Richard Jones, a prisoner, who died a few days since in the Northleach House of Correction. The inquiry excited great interest, and was three times adjourned; on the last occasion it was continued for seven hours. Both coroner and jury closely examined the witnesses, with a view to elicit the particulars of the mode of discipline practised at the prison. The coroner recommended the jury to forward a memorial to the Secretary of State, praying for a still farther improvement in Northleach prison. The jury during the long inquiry, repeatedly declared their conviction that the hard work and scanty food of the prison was the cause of the evil then complained of; and that it was the system, and not the particular individuals who administered the law, that was to blame. Several witnesses were examined, and the jury, after an hour's deliberation, unanimously agreed to the following verdict: "That the deceased, Richard Jones, died from the ill-treatment he received while in Northleach House of Correction, from hard labour, want of food, and from no other causes." The jury in addition, wished it to be recorded that they had unanimously agreed that the authorities of Northleach were deserving of censure for their conduct throughout the affair.

Reigate.—At the Surrey Sessions, on Saturday, the case of Mr. T. Colson, appellant v. the Justices for the Croydon division, came on, as an appeal from the decision of the Justices, in refusing to grant to the applicant, who is superintendent of the works of the Croydon Railway, a victualler's license for his house, known as the Annarsley Tea-gardens. The appellant's house was built three years ago by the directors of the Railway Company. The license, after a long inquiry, was granted. This is said to be the first time, within twenty years, that an appeal of this kind has been successful.

Wakefield.—At the quarter-sessions for the West-Riding, held in this town, on Thursday, Joseph Whiteley, a collier, from Elland, near Halifax, was tried before the magistrates, for having assaulted and ill-used James Whiteley, his apprentice. As the evidence in this case is already known to our readers, it is not necessary to repeat it. It was considered by the jury conclusive against the prisoner, and they accordingly found him Guilty. The Chairman, in passing sentence, said that he had been found guilty of one of the most atrocious offences ever brought before a court of justice. He had ill-treated in a most cruel manner an orphan relation of his own, who had nobody else but him to look up to for protection. There could be no doubt of the fact, that without any reason whatever he had ill-treated him in a way that no person in court could have heard, and that no one could read of, without horror. He was sorry that the law did not allow the Court to inflict a severer punishment; but the sentence of the Court was that he be imprisoned in the House of Correction for 2 years. He was sorry that they could not sentence him to hard labour, or inflict any severer punishment.

Railways.—The following are the returns of the under-mentioned Railways for the past week:—London and Birmingham, 14,039l.; Great Western, 11,360l.; South-Western, 5,283l.; South-Eastern, 1,724l.; Eastern Counties, 1,535l.; North Midland, 3,518l.; York and ditto, 1,416l.; Greenwich, 661l.; Croydon, 204l.; Brighton, 2,526l.; Blackwall, 609l.; Hull and Selby, 936l.; Grand Junction, 6,860l.; Midland Counties, 2,208l.—At the annual meeting of the proprietors of the Newcastle and Carlisle Company, held on the 28th ult., a dividend was declared of 4l. per share of 100l. each, and so on in proportion for the quarter shares payable to the shareholders on the 21st instant. To meet this dividend the sum of 536l. 0s. 8d. has been taken from the profits of former years; but the reserved fund will still amount to 49,377l. The accounts of revenue and expenditure for the past year exhibited a profit of 15,063l., which, considering the depressed state of trade and commerce, the directors believed would be satisfactory to the proprietors.—The directors of the Durham and Sunderland Company held their half-yearly meeting on the 24th ult., and declared a dividend of 10s. per share, clear of the half-year's income-tax. The receipts from ordinary traffic on this line, for the half-year terminating on the 28th Feb., were 15,365l., being 1,368l. less than the corresponding half-year of 1842; but the working charges were 1,103l. less than they

were during that period of 1842, and there has been a considerable increase of passengers.—The Kilmarnock branch of the Glasgow and Ayr Railway was opened on Monday the 3d inst.—It is understood that on Easter Tuesday another grand blast of the cliffs on the line of the South-Eastern Railway, near Dover, will take place. The operation will be on an extensive scale, as it is intended to explode sixteen mines simultaneously, by means of the galvanic battery. The time appointed is four o'clock in the afternoon, in order to give an opportunity for the scientific men and others who take an interest in these remarkable works, to arrive by the morning train from London.

IRELAND.

Dublin.—We noticed in our last the excitement occasioned by the mail-coach contracts having been given to a Scotch gentleman. The accounts received this week state that the most lively interest is felt throughout Ireland on the subject, and that memorials indeliberate against the new contract are in course of signature.—At the weekly meeting of the Repeal Association on Monday, Mr. Steele, in seconding a resolution of thanks to the American repealers, announced that he had been appointed by the Association to go from one end of America to the other, to agitate the question of repeal; and he wished now to state that he was ready and willing to fulfil that engagement whenever he was called upon.—Mr. O'Connell said that before the resolution was put, he was anxious to mention that his eldest son would accompany Mr. Steele to America, to assist in obtaining independence for his country. He then announced the repeal rift for the week to be 448l. 4s.

Monaghan.—On Monday, the 3d inst., an outrage took place in the Barony of Farney, near the town of Carrickmacross, part of the estate of Mr. Evelyn Shirley, M.P. A multitude of people, to the amount of 10,000 or 12,000, of whom very few were tenants on the estate, assembled in Carrickmacross, and there seized Mr. Trench, Mr. Shirley's agent, who had come forward to address them, and dissuade them from violence. This gentleman they dragged with them to Lough Fea Castle, where they supposed Mr. Shirley was staying, endeavouring by menaces and ill-treatment to extort a promise from him that he would use his influence with Mr. Shirley to obtain a reduction of their rents, by 25, or as some say, 50 per cent. This promise he courageously refused to give; and after receiving some severe bruises from his assailants, he was surrendered into the hands of a neighbouring gentleman. The papers add that the great majority of this mob consisted of strangers; that Mr. Shirley has always treated his tenants considerably and kindly; and that similar and greater outrages have before been perpetrated by the peasantry upon persons who had devoted their capital to the employment of native labourers and the improvement of native produce. Large rewards have been offered for the apprehension of the offenders.

SCOTLAND.

Edinburgh.—The Duke of Sutherland has addressed a letter to the clergy of Sutherland on the affairs of the Church of Scotland, from which the following is an extract:—"I deeply regret to find you and other friends adopting measures which in my conscience I believe injurious to the welfare, and likely to impair the means and usefulness of that establishment, and detrimental to all the interests committed to her charge. Whenever the application which you mentioned as proposed to be made to the Legislature may be brought before Parliament, I shall not fail to endeavour to discharge my duty as a peer of Parliament. I cannot, however, refrain from expressing my hope that in the meantime further consideration on the part of yourself and other friends may prevent the crisis which now seems impending. It is not for me to endeavour to control or moderate the feelings which, on your part conscientiously entertained, have much effect in maintaining and increasing the uncertainty of the connection between the State and Church—of which I should much lament the separation. Having always admired and respected the piety and moral and religious principles of the people of our Highlands, I have been disposed to associate those feelings on the part of the congregations with the labours of their pastors, and considered that under the present system we have enjoyed the very great advantage of having men fearing God, and well qualified to give diligent care and labour in the parishes committed to their charge. Therefore, not desiring innovation and disturbance, I cannot but regret the spirit which now encourages agitation among our congregations, and I consider it a melancholy proof of the instability of our human understanding." His Grace has addressed a similar letter to the elders and parishioners of Farr, expressing his conviction that the maintenance of two kirks and two manse in the parish would be fatal to the establishment, whatever amount of funds might be raised to support them, and hoping that they will remain as they are, and that a faithful minister will continue with a pious congregation in the established Kirk.—In connection with the Kirk question, Dr. Chalmers in his valedictory address to his students last week, observed—"It is impossible to predict the issue of the crisis now at hand. Ere we meet again, the church of our fathers will have separated into two great parties; though it remains a question which of the two will be entitled to the name of the church of Scotland—the church minus the stipends, or the church minus the people. It now only remains for me to bid you farewell; but while I do so, I do not bid you a final farewell. I confidently look forward to our meeting again; and, though it may be in a college minus endowments, it is some consolation to think that we will not have to give

utterance to the complaint, which others will, that ours will be a college minus students."

Isle of Skye.—The Isle of Skye has within the last 40 years furnished for the public services—21 lieutenant-generals and major-generals; 45 lieutenant-colonels; 600 majors, captains, lieutenants, and subalterns; 10,000 foot soldiers; 120 pipers; 4 governors of British colonies; 1 governor-general; 1 adjutant-general; 1 Chief Baron of England; and 1 judge of the Supreme Court of Scotland. The generals may be classed thus:—8 Macdonalds, 6 Macleods, 2 Macallisters, 2 M'Cashills, 1 M'Kinnon, 1 M'Queen, and 1 Elder. The Isle of Skye is 60 miles long, and 20 broad.

Miscellaneous.

The Blessings of Peace.—During Sir Robert Peel's recent speech on the distress of the country, he alluded in remarkable language, to the exertions of Marshal Soult and the Duke of Wellington in order to counteract the efforts of the Paris papers to bring about a rupture between the two countries. After describing this feeling of hostility to England, he said:—"But, sir, at the same time that that feeling has certainly existed, it is a remarkable spectacle for the civilised world that the two men who hold conspicuous offices—the most conspicuous offices in the governments of their respective countries—are the two men the most distinguished in each for their military genius and fame. Those men have learned the art, and they have learned also the miseries of war in the fields of Toulouse and of Waterloo. They have stood opposed to each other in the plain of battle—

—Stetimus tela aspera contra
Contulimusque manus."

And those men, the best judges of the sacrifices which war imposes upon nations, are now exerting all their influence in the two countries to incite lessons of peace. It is a glorious occupation for their declining years. The life of each has been protracted beyond the ordinary term of human existence, and may God grant that the life of each may be long preserved, that they may each in their own land exhort their countrymen to lay aside all national animosities, and enter into a more glorious and honourable competition for increasing the amount of human happiness. And, sir, when I compare the conduct and example of these men, who have seen the morning sun arise upon living masses of fiery warriors, to many of whom were to be laid low in the grave before that sun should set—when I see them teaching lessons of peace, and using their salutary influence to discourage their countrymen from war—when I contrast their object with that of the anonymous and irresponsible writers in the public journals, who are doing all they can to exasperate the differences that have prevailed, who misrepresent every action of two governments desirous of cultivating peace, who represent in France that the minister of France is the tool of England, and in England that the ministers of England are sacrificing the honour of England in fear of France—I do trust that the example of these two illustrious warriors will neutralize efforts such as those to which I have referred, efforts not directed by zeal for national honour, but to the base purposes of encouraging national animosity or promoting personal or party views."

Insanity.—It appears that within the last twenty years the above dreadful malady has more than tripled. The total number of lunatics and idiots in England is as follows: Lunatics, 6,806; idiots, 5,741; together, 12,547. But allowing for defective returns, the number may be taken at 14,000; an average of one to every thousand of the population. In Wales—lunatics, 133; idiots, 765: total, 896; and adding for parishes that have made no returns, they may be set down at 1,000; a proportion of one to eight hundred. Scotland has 3,652 insane persons, or one to about seven hundred. In Ireland the number of lunatics and idiots exceeds 8,000. In one thousand male patients insanity has been supposed, by an eminent authority, to be traceable to the following causes relatively:—Drunkenness, 110; consequences of disease, 100; epilepsy, 78; ambition, 73; excessive labour, 73; born idiots, 71; misfortunes, 69; old age, 69; chagrin, 54; love, 47; accidents, 39; religious enthusiasm, 29; political events, 26; poisonous effluvia, 17; ill-usage, 12; crimes, remorse, and despair, 9; pretended insanity, 5; malconformation of the skull, 4; other and unknown causes, 115.

Law.

COURT OF CHANCERY.—*Attorney-General v. The Earl of Stamford.*—The Lord Chancellor delivered judgment in this case, which, he said, was one of great interest, as relating to the subject of education and the welfare of the Manchester School, which had afforded the means of training up many eminent men. His Lordship first disposed of the objection to the jurisdiction of the Court, that an order having been obtained under Sir S. Romilly's Act, the appeal lay only to the House of Lords. The Court would always interpose where an abuse existed, and here the Attorney-General had taken no part, and he must have an opportunity to attend the Master, and so far Lord Cottenham's order must be affirmed. His Lordship also agreed with his learned predecessor, in thinking that children of the most tender years must be admitted, the original foundation directing them to be taught their "A B C." The Lord Chancellor said he also agreed with Lord Cottenham, that the trustees must be chosen from Manchester alone; the original statutes enjoining that they should be "12 honest gentlemen and persons within the parish of Manchester." It was true, that a long practice had prevailed the other way, but the words were strict and must be so construed. No objection was made to the master taking boarders, so that it was unnecessary to remark on that subject. But by the order now appealed against, they were deprived of the benefit of the exhibitions to the university; a very probable motive for their being placed at this school, and it was a prohibition which defeated the object of allowing boarders to be taken at all. It was clear that no partiality was shown in selecting the candidates, and the fees had the power to alter the ordinances expressly conferred upon them by the founder of the school.

This part of Lord Cottenham's order must, therefore, be omitted, and the Master must inquire on what conditions boarders ought to be received. His Lordship said, it had been argued that the education at this school ought to be entirely of a commercial nature; but it would be lamentable indeed to arrive at such a conclusion. The tendency of classical literature was to soften and humanize the minds of men; and establishments like that under consideration afforded opportunities to the humbler classes, by the exercise of diligence, activity, and intelligence, to force their way to the highest stations in life; and thus to bind together, by the closest ties, all the various ranks and orders of society.

Welsh v. Gludstone.—This was a petition of appeal on a question of construction to be put on the will of Mr. Blundell, of Ince Blundell, which has before been noticed in this Paper. By a codicil to the will, the petitioner, Hall, who was Mr. Blundell's butler, took an annuity of 200*l.* a year; but at the death of the testator he was in possession of a sealed paper, which he had received some time before, with directions to present it to Mr. Blundell's bankers after the death of Mr. Blundell. This paper contained checks for 500*l.* in favour of Hall, and for 300*l.* in favour of the housekeeper. Sir Herbert Jenner, in the Ecclesiastical Court, admitted these checks to probate as testamentary papers; but the Vice-Chancellor, in the suit for the administration of the estate, declared that the executors were not bound to pay them, as he considered them to be revoked by a clause of revocation in the will, and also on a sound construction of the will itself. Hall then presented a petition of appeal. Mr. Roupel and Mr. Rolt, in support of this petition, argued that the Court of Chancery had no jurisdiction to take the course it had taken with respect to these two papers. The act of the Vice-Chancellor amounted to a declaration that the instrument which the Ecclesiastical Court had pronounced to be a good testamentary paper was in reality not so, for the decision of his Honour could not revoke the gift without annulling the paper. There was no pretence for saying that there had been a substitution, nor did the court say so: it merely declared that the gift was revoked; or, in other words, that the instrument giving it could not be held valid, although Sir Herbert Jenner, the competent authority in a court having exclusive jurisdiction in such matters, had declared the paper to be entitled to probate. It had been said there was a revocation, but, in point of fact, that was not so. The clause of revocation said that, "subject as aforesaid, and except as is hereinafter mentioned," the testator gave all his personal property in such and such manner. Now, the checks in question had been declared by the Ecclesiastical Court to be testamentary; and although neither a part of the will nor codicils, they came clearly under the head of exceptions made by the testator in the revocation clause. They submitted, therefore, that as the Ecclesiastical Court had decided in their favour, and would, if applied to, order payment of the checks, the Vice-Chancellor had no power to refuse it, by a declaration that the instruments were void. Mr. Stuart and Mr. Fleming supported the order of the court below, and cited a number of authorities to show that the court, in construing a will, had the power to say whether, in its opinion, a gift was not revoked or satisfied by substitution. Mr. Roupel, in reply, reminded his Lordship that the papers in question were clearly admitted to be testamentary, or else there could not have been an argument. The question was, could a court of equity say they had been wrongly admitted as such, for it could not say they had been satisfied. The Lord Chancellor said he thought the question had taken a shape of some delicacy and difficulty, and he must consider it.

SHERIFFS' COURT.—*Custom House Frauds.*—*The Queen v. Vidal and Hurel.*—A commission having been issued to the Sheriff of Middlesex, to inquire whether and what amount of debt in the shape of duties upon goods imported from foreign parts was due to her Majesty by Edward Vidal and Charles Hurel, the inquisition was held on Tuesday before Mr. Wilde and Mr. Burchell, who were appointed commissioners. It appeared from the statements of counsel, that the goods imported by the defendants were gloves, the duty upon which was very high, and it was, therefore, the bounden duty of Government to protect them. Those duties were of three classes—*as*, a dozen upon small-sized or ladies' gloves, 5*s.*; a dozen for men's gloves, and 6*s.* a dozen upon ladies' long gloves. The duty upon these articles being so very high, it was, of course, of considerable advantage to the public that it should be protected against such frauds. Mr. Vidal was a glove-manufacturer residing at Grenoble, and Mr. Hurel, the other defendant, who resided in the Old Jewry in this city, was his partner. They had been for a considerable time in the habit of importing large quantities of gloves from Grenoble, and the inquisition was held for the purpose of ascertaining the duty due and payable upon their importation. Mr. Bullock, a gentleman in the office of the Solicitor of Customs, deposed, that of three cases of goods brought by the Harlequin, in 1840, one which held 704 dozen pairs of gloves, and should have paid 176*l.* duty, only paid 41*l.* 7*s.* 6*d.*, the amount of duty on 185 dozen pairs, thus causing a loss to the Crown of 134*l.* 12*s.* 6*d.*; and another which held 924 dozen pairs, and which ought to have paid 231*l.* duty, in reality only paid 70*l.* 12*s.* 5*d.*, by which the Crown lost upwards of 160*l.* Again, that upon several cases of goods, which were received by the Belfast and William Jolliffe vessels, the duty payable was 492*l.*, the duty paid 130*l.* 7*s.* 2*d.*, thus cheating the Crown out of 362*l.* 13*s.* 10*d.* On the 11th of January, 1841, the defendants cleared from the Belfast goods on which the duty payable was 185*l.*, but on which they did not pay more than 43*l.* 4*s.* 4*d.* The inquiry was adjourned to Thursday, when after a long inquiry Mr. Commissioner Wilde summed up at considerable length. He explained the nature of this proceeding. He said it was instituted by the Crown to ascertain the exact amount due. It was a preliminary step to a proceeding elsewhere. This was the way in which the verdict would affect the parties. If they returned one for the Crown the defendants were at perfect liberty to plead to the action and offer whatever defence was in their power. But if their verdict was against the Crown, it would be an estoppel to any further proceeding. After pointing out the issue in dispute to the jury, they retired, and in half an hour returned a verdict in favour of the Crown for 5,328*l.*

CENTRAL CRIMINAL COURT.—*James Dawson*, a sailor, was charged with the wilful murder of a person unknown, at Zanzibar, in the dominion of the Imam of Muscat, on the 26th August, 1842. It appeared that the prisoner, then a sailor belonging to the Earl of Clare, and one or two others, were drinking at the house of an Arab, and that some disturbance had arisen. Shortly after this, the prisoner, who had left the house some time previously, returned, saying, that he had stabbed a native who had made an assault on him. On search, the body of the dead man was found; but the Imam of Muscat, who is a close ally of the British Government, preferred delivering Dawson up to be tried by the authorities in England. The evidence was not such as to warrant a conviction, and the prisoner was accordingly acquitted.

ASSIZE INTELLIGENCE.—**NORFOLK CIRCUIT.**—(Norwich).—*Barker, Clerk, v. Birch, Esq.*—This was an action by way of appeal from the decision of Mr. Matthew, one of the tithe commissioners, allowing a *modus* of 6*s.* in lieu of the tithes of 660 acres of land, in the parish of Shipham, the property of the defendant. Mr. Matthew considered that *modus* to be satisfactorily established, and the plaintiff brought the present issue to try the validity of his determination. The Solicitor-General appeared for the defendant. The plaintiff is rector of the parish of Shipham, and defendant is a gentleman of large fortune, and owner of a considerable estate in the same parish. The lands in respect of which the *modus* is payable form a portion of that estate, and were in very ancient times a park, though in comparatively modern times they had been brought into cultivation as a farm. The plaintiff traced up the existence of the lands as a park to the time of Edward VI. In the fifth year of that reign the Bishop of Ely granted a lease to one Barrow of the site of the manor of Shipham, with the lodge, park, and lord's close, parcels of the

demesne west of the park, and a certain pond in the park. Between that year and the third of Elizabeth the estate passed out of the Bishop of Ely into the Crown, she having in that and a subsequent year of her reign granted the lands to the Wodehouse family at a fee-farm rent of 21*l.* 6*s.* 5*d.* During the Commonwealth the Parliament bethought themselves of raising money by the sale of this fee-farm rent, and in the particulars of sale it was stated to be charged upon these lands, which were described in the same terms in which they are mentioned in the Bishop's lease. The estate, having remained in the Wodehouse family for some years, became vested in the noble family of the Townshends, from whom it passed in 1815 to the late Marquess Cornwallis, the last possessor of that title. In 1824, the trustees of the Marquess sold it, together with other property, by auction. Amongst the property so sold was the advowson of the rectory of Shipham. In the particulars of sale the lands covered by the *modus* were described as free from the payment of tithes in kind, and liable to a *modus* not exceeding 10*s.* It was, however, added, that the purchasers must take the advowson and these lands as they found them, and not require any covenant as to the title-exemption. At this sale the plaintiff became the purchaser of the advowson, and the defendant of the estate in question; and it is not unreasonable to suppose, that the sum paid for the living was less than it would otherwise have been had not these lands been covered by this small *modus*, and that Mr. Birch, on the other hand, paid a higher price for the lands in consideration of such *modus* than he would have done had they been subject to the payment of the tithes in kind. Indeed, the advowson of the living, which is said to be worth 1,000*l.* a year, was purchased by the plaintiff for 9,000*l.* In order to prove the exemption from tithes, it was shown by defendant that in 1707 one Mr. Townshend was the incumbent, having been presented by his relation, Lord Townshend; that he was succeeded by Mr. Coleby Bullock, his son-in-law, in 1754; he by Dr. Edridge, in 1804; and the reverend doctor by the plaintiff in 1826, about two years after the time of his purchase. The names of the successive occupiers of the lands so often mentioned, which are at this day respectively called the Park Farm, Cordy's Farm, and Peck's Farm, were then shown; and a series of accounts in the hand-writings of Mr. Townshend and Mr. Bullock was then given in evidence, by which they, the then rectors, acknowledged to have received the sum of 6*s.* from 1744 to 1804 for tithes of the lands formerly the ancient Shipham Park. The amount was uniform, and the payment made year by year by the respective occupiers. One of the occupiers, who was also tenant of other lands, held under a title derived from Sir Ralph Hare, paid tithes for those lands, and the receipt for such tithes was acknowledged in the same accounts which contained the entry of the 6*s.* The same thing also took place as to the "Lord's close," which was leased with the park by the Bishop of Ely in the reign of Edward VI., and is titheable. A letter, written in 1799 by Mr. Bullock, the then rector, was also proved and read. It was written to an agent of Lord Townshend, then owner of this estate, and stated that the lands held under the title from Sir R. Hare, and also the "Lord's close," were subject to tithes in kind, but that he understood that the lands in question formed a portion of the ancient Shipham Park. The *modus* was said by defendant to be payable annually at Lammas, and that fact was shown by one of the rectors' receipts. The boundaries of the ancient park were very clearly defined and described, and the site of "the pond in the park," mentioned in the Bishop's lease, is still traceable, though now a pond no longer. Sir T. Wilde, at great length, addressed the jury on behalf of the plaintiff, contending that the case of his opponent had failed in every particular which it behoved him to prove, in order to deprive the rector of the right to tithe in kind, to which he was entitled at common law. Lord Chief Justice Tindal summed up the evidence with great minuteness, and left the jury to say whether it satisfied them that the *modus* in question had been paid from the time of legal memory, to the amount and at the period at which the tithe commissioner had decided it to be payable; observing, that *prima facie* the incumbent was to be considered as entitled to receive tithe in kind, and that it was on the defendant to establish the *modus* relied upon by clear evidence. The jury found a verdict for the defendant, thus establishing the validity of the *modus* claimed.

WESTERN CIRCUIT.—(Exeter).—*The Queen v. Ames.*—This case, which has been so long pending, without the possibility of bringing it to trial, was brought on last week, and, after a considerable delay, it was found that only six special jurors were present. The absent jurors were fined 10*l.* each, and the defendant not agreeing to have a common jury, withdrew the record. This is the fourth time that this cause has come to these Assizes for trial, and in one instance only has a verdict been returned. The first time, the case was abruptly closed on the termination of the plaintiff's evidence; the learned judge (Coleridge) who presided, being obliged to leave immediately to open the Commission in Cornwall. On the second occasion, a verdict of Guilty was returned, thus determining the right of the public to use the foot-path in dispute; an application was then made for a new trial, which was granted, and was to have taken place at the last Assizes, but the pressure of business at that time prevented its coming on, and it was made a *remand*. In order to guard against the recurrence of such a contingency, the judges, on this occasion, made this the last place on circuit, thus securing to themselves the whole of the interval before the commencement of Easter Term. But a misunderstanding arose as to the exact day on which the judge would take the case, and although Sir T. Wilde, and other counsel, were brought down on purpose for the trial, it is again postponed. This matter has now become even of more serious importance than it previously was, because old witnesses die off, as many are said to have done, and in addition to this, where a pathway is in question, and a view is had, of course every few months will tend to diminish the traces of its existence, and in this case the defendant has inclosed the whole of the ground, so that no one can use the path, and the public are entirely excluded. Another remarkable circumstance is, that the prosecutors commenced their case; they must, therefore, have all their witnesses in attendance at first, whereas the defendant need not, in so long a case, bring them to Exeter for some days. It seems doubtful whether the case will ever be tried. Either the judges will not have time to take it, or there will not be a sufficient number of special jurors in attendance, because the juror would rather give 10*l.* than sit in a jury-box for a week, to say nothing of the amount of his tavern bill. In the meantime the path is closed, and the public have lost the use of it for four years, as these cliffs are to Lyme what the parks are to London.

NORTHERN CIRCUIT.—(Liverpool).—The trial of Mary Hunter, on a charge of murdering John Hunter, her husband, at Manchester, which commenced on Thursday morning, concluded on Friday, and ended in the prisoner's acquittal by the direction of the learned Judge, on the evidence of the medical witnesses, several of whom were examined; and which, coupled with the fact that no poison was detected in the stomach of the deceased, in his Lordship's opinion, left it too doubtful a matter to convict the prisoner. An acquittal was accordingly taken.

Wiltot Buckley was indicted for the wilful murder of his wife, Elizabeth Buckley, at St. Helen's, on the 27th November last. The particulars of this case were fully given in this Paper at the time. The facts were fully proved, and the Counsel for the prisoner contended that he committed the act under heated and excited feelings; that in proportion as the deceased was fond of her husband, in the same proportion would be her feelings of jealousy, for which, as the evidence demonstrated, she had too much reason. The learned Counsel proceeded to show that the field had a thoroughfare where the body was found, and was of all other places the most unlikely one which a deliberate murderer would select for the commission of the deed. The blow, too, was a left-handed one—another reason why it was not deliberate, but the result of instantaneous passion. The rag which was found in the neck was a proof that the moment he had com-

mitted the act he rushed to her assistance to stop the blood—to heal the wound. Mr. Baron Parke proceeded to sum up, stating his own belief that nothing had occurred to take the offence out of the category of murder. He proceeded, at great length, to read the evidence, which he commented on as he proceeded. The Jury found the prisoner guilty of murder, but recommended him to mercy on the ground of his own statement. His Lordship, in passing sentence, stated that he would forward the Jury's recommendation to the Secretary of State, but he could hold out no hope of life. He advised the prisoner to prepare for that end which in a few days he would have to meet. The prisoner, on the sentence being passed, appeared not the least affected by his situation, and walked away with the greatest composure.

SPORTING.

EPSON SPRING RACES.—The races on Friday commenced with 501, given by Sir G. Heathcote, added to a sweepstakes of 5 sovs. each; 3 yrs old 7st, and 4 yrs old 9st. One mile, 13 subs. Won by Mr. Gardner's Captain Flathooker (late St. Lawrence), 4 yrs, (Mann); beating Mr. Goodman's Maccabeus, 3 yrs. The following also started, but were not placed. Lord G. Bentinck's St. Jean d'Acre, 4 yrs; Mr. Greville's ch f by Ishmael out of Morelia, 3 yrs; Mr. Braithwaite's Courage, 3 yrs; Mr. Monk's Crocus, 3 yrs; Mr. Raworth's Conquest, 3 yrs (fell); Mr. Gray's Gander, 3 yrs; Mr. Werninck's Patchwork, 4 yrs; Gen. Wyndham's c by Velocipede out of Guerdon, 3 yrs; Sir G. Heathcote's Sirkol, 3 yrs; Mr. Smith's ch f Spiteful, 3 yrs (fell); and Mr. Balchin's Epaulette, 4 yrs (fell).

251, given by the Town and Neighbourhood, added to a sweepstakes of 5 sovs. each; 3 yrs, 6st; 4 yrs, 8st 4lb; 5 yrs, 8st 13lb; 6 yrs, 8st 5lb. Winner to be sold for 250l. Heats, 1 mile. 9 subs. Won by Sir G. Heathcote's Hydaspes, 4 yrs (A. Perren); beating Mr. Balchin's Dromedary, 6 yrs; Mr. Wreford's f by Camel out of Wadasthra, 3 yrs; Mr. Thompson's Tom Slape, 3 yrs; Capt. Willan's The Duke, 6 yrs; Lord G. Bentinck's Mustapha, 5 yrs; and Mr. S. Scott's gr c Grey Hercules, 3 yrs. Hydaspes cut out the work in every heat, losing the first by a head, and winning the others easily.

Sweepstakes of 3 sovs. each, with a purse added; 3 yrs, 6st 10lb; 4 yrs, 8st 12lb; 5 yrs, 9st 6lb; six yrs and aged, 9st 10lb; winners extra, &c. Won by Mr. Goodman's Chummy, 4 yrs (Kvans); beating Mr. J. Dockeray's Monarch (late Rough Robin), 6 yrs; Lord G. Bentinck's Mustapha, 5 yrs; and Mr. May's Little Fairy, aged. Chummy made all the running, and won in a canter by at least 40 yards.

TATTERSALL'S, THURSDAY.—DERBY.—6 to 1 agst Mr. Blakelock's A British Yeoman (taken, and afterwards offered); 20 to 1 agst Mr. T. Taylor's Gamecock (taken); 20 to 1 agst Lord Eglington's Aristides (taken); 20 to 1 agst Mr. Bowes's Cotherstone (taken, and afterwards offered); 25 to 1 agst Lord Chesterfield's Parthian (taken); 26 to 1 agst Mr. Bell's Winesour (taken); 26 to 1 agst Sir G. Heathcote's Amarino; 30 to 1 agst Duke of Richmond's Cornopene (taken); 33 to 1 agst Mr. Goodman's Maccabeus (taken); 35 to 1 agst Lord G. Bentinck's Gaper (taken); 35 to 1 agst Lord Westminster's Languish colt (taken); 35 to 1 agst Mr. Griffith's Newcourt (taken); 40 to 1 agst Colonel Peel's Murat (taken, and afterwards offered); 45 to 1 agst Lord Chesterfield's Progress colt; 50 to 1 agst Lord Exeter's Lucetta colt (taken); 50 to 1 agst Lord Orford's Mercy colt (taken); 50 to 1 agst Duke of Grafton's Cataract; 1000 to 1 agst Mr. R. Wood's Ely (taken); 100 to 1 agst Lord Bruce's Rosalie colt (taken); 400 to 100 agst Scott's lot (taken); 1000 to 100 agst Sir G. Heathcote's lot (taken); 2500 to 100 agst Colonel Peel's lot (taken).—**OAKS.**—7 to 1 agst Lord Westminster's Maria Day; 16 to 1 agst Lord Waterford's The Fairy.

MARK LANE, MONDAY, APRIL 10.—For this day's Market we had an increased supply of English Wheat from Essex, and the condition was improved; from Suffolk and Kent the quantity was moderate only; the Millers being bare of Stock were free buyers at an advance of 1s. to 2s. from this day's evening. We cannot report any improvement in the value of Foreign. Fine rye Malting Barley was in demand at last week's prices, but in rinding there is no alteration. Peas of all sorts are 1s. lower, and old Beans partake of a similar decline, whilst new sell on the same terms. Oats are a heavy sale at the currency of last Monday.

BRITISH, PER IMPERIAL QUARTER.			
	White	Red	40 to 46
Wheat, Essex, Kent, and Suffolk	40 to 46	White	40 to 46

GAZETTE OF THE WEEK.

BANKRUPTS.—W. Mott, Regent-street, lace-maker; J. Bowie, Shoe-lane, and grocer; F. Roberts, New Bond-street, coal-merchant; J. Cunningham, New Bond-street, coal-merchant; J. Hawking, Lisson-grove, upholsterer; J. M. Meppershall, Bedfordshire, farmer; M. R. Jenkins, Greenwich, Kent, vintner; F. Jenkins and J. H. Hardyman, Leve-lane, Eastcheap, merchants; W. Bates, Welbeck-street, Cavendish-square, auctioneer; H. Bentish, auctioneer; Kent, linen-draper; J. Stretch and R. Wharton, Nottingham, gentry; J. Harrington and W. Pattinson, Woodbank, St. Cuthbert, Cumberland, cotton printers; B. Sayle and T. Booth, Sheffield, iron-masters; J. A. Oswald, Kingsland, Middlesex, grocer; T. Pottinger, H. Howell, A. Oswald, Austin Friars, merchants; E. White and E. Leith, Workson, Nottinghamshire, machine-makers; E. Smith, Sheffield, innkeeper; G. Ratford, Sheffield, fender-manufacturer; W. G. Pitt, Cheltenham, banker; R. Bath, chemist; C. J. and J. Gausson, Liverpool, corn-factors; J. E. Benson, Liverpool, wine-merchant; A. Merga, Nantwich, Cheshire, watchmaker; W. Jones, Wolverhampton, draper; J. Johnstone, Manchester, banker; K. M. Lead and J. B. Wood, Liverpool, ship-chandlers; H. Savage, Coaley, Gloucestershire, spade-manufacturer; C. J. Morley, Liverpool, flour-dealer; Green, Oldbury, Shropshire, licensed victualler.

COTCH SEQUESTERATIONS.—J. Eddie, Aldridge, ironmonger; R. Ayton, Edinburgh, writer to the signet; Smith & Co., Dundee, china merchants; T. Mowbray, Tullibody, Clackmannan, distillers; W. Finlay, Drumsleed, Northeshire, farmer.

IRTHS.—On the 18th inst., at 24, Lowndes-street, the Hon. Mrs. Augustus Bell, of a daughter. On the 9th inst., at Brighton, the Lady Augusta Seymour, of a son. At Berry Hill, Taplow, on the 5th inst., the Lady Mabella de Kennaway, Bart., of a son.

MARRIED.—On the 10th inst., at St. Bernard's, Edinburgh, W. P. Andrew, 1, M.D., to Anne, eldest daughter of H. Itaburn, Esq., of St. Bernard's.

DECEASED.—On the 6th inst., at Escot, Devonshire, the lady of Sir v. Charles Eustace, to Laura, youngest daughter of C. T. Tower, Esq., of said-hall.

DECEASED.—On the 12th inst., at his house, Upper Gloucester-street, Dorset-hill, W. Montague, Esq., City Surveyor, in his 70th year. On the 12th inst., at his house, in Park-street, the Rev. G. Beckett, brother of Sir J. Beckett, Bart., rector of Epworth and vicar of Gainsborough. On the 6th inst., at Lenn Lodge, Hayling Island, Sir Francis Sykes, Bart., in the 43rd year of his age.

DECEASED.—On the 7th inst., in Great Portland-street, Mrs. Burkinshaw, aged 85.

WILLIAM MAY begs to announce that he can now supply the following new and showy plants, for the first time offered to the Public.

Bomaria (Alstrœmeria) s. d.	Buenos Ayres, bloom s. d.
pubescens (Pera) 5 0	four inches long, very
rubra (Pera) 5 0	splendid 21 0
Fuchsia Ballooni (May's) 10 6	Passiflora, new Mignon-
Tweedia rosea (per doz., 18s.) 2 6	ette-scented, not yet
Gesneria alba (of Tweedie) 2 6	named, very sweet
	(from Peru) 10 6

W. M. can also supply the following well-known favourite Plants, viz.—
Pentstemon miniata . . . 5 0
Cypripedium insigne (per doz. 18s.) . . . 2 6
Calceolaria, Lady Con- . . . 10 6
stable
Ismene peduncularis (per doz. 12s.) . . . 1 6
Fuchsias, 2d fine distinct hybrid varieties, for . . . 20 0
One Hundred sorts of showy Hardy Herbaceous Plants, named, of W. M.'s selecting, for 42s.
Hollyhocks, all warranted saved from double flowers, seeds in packets of 200 for 2s. 6d., 500 for 5s.
Hope Nursery, Leeming-lane, near Bedale, Yorkshire, April 5.

NEW SEED ESTABLISHMENT, 6, LEADENHALL-STREET.
HURST & M'ULLEN.—"The Hands" for many years in the house of Warner and Warner, 28, Cornhill—beg to return their grateful acknowledgments for the kind patronage they have already received from numerous Friends, and respectfully to inform them they can supply every variety of KITCHEN-GARDEN, AGRICULTURAL, and FLOWER SEEDS, of the very finest quality. All orders they may be favoured with will be carefully and promptly attended to.

General Catalogues of Seeds, Greenhouse Plants, Dahlias, and Pansies, may be had on application. Their List of new and choice Flower Seeds, &c., in *Harrison's Floricultural Cabinet* for April, will be found worthy of notice. Among them are the following:—
per packet—s. d. per packet—s. d.

Turnip.—Howard's Nonsuch . . . 0 6	

H. & M. M. beg at the present season to invite the attention of the Public to their very extensive assortment of Hardy Perennial Plants (of which they are in daily receipt of fresh supplies of all the best varieties), as well as choice Carnations and Picotees (named sorts), 1s. 6d. per pair. Pinks, 8d. per pair. Dahlias, Pansies, Chrysanthemums, Fuchsias, Roses (in pots), Cinerarias, Camellias, Pelargoniums, &c. &c.
To the lovers of that delicious fruit, the Strawberry, they beg to offer MYATT'S BRITISH QUEEN (true), at 10s. 6d. per 100. This kind by far surpasses any other for flavour, and is one of the most abundant bearers known.
Seeds and Plants carefully selected and packed for all climates.
—Fine mixed Grasses for lawns and permanent pasture.—Russia Mats, Knives, &c. &c.—Experienced Gardeners recommended.

S GIRLING'S Catalogues of ENGLISH and FOREIGN
DAHLIAS, PELARGONIUMS, PANSIES, VERBENAS, & FUCHSIAS, are ready, and can be had on prepaid application. The plants are healthy and strong; and the earliest orders will receive the first attention. Plants of most of the varieties can be had after the 20th of April; those cultivated by other growers procured, and forwarded the first week in May. Dane-Croft Nursery, Stowmarket, Suffolk.

SPLENDID NEW CACTUS "CONWAY'S GIANT."

P. CONWAY begs to inform those Friends who have favoured him with orders for the above that their Plants will be ready on the 10th of April. A few good Plants still to be disposed of, 2 guineas each.

CONWAY'S New Pelargonium "LANE," decidedly the best yet raised for early forcing, which is fully admitted by the principal London Florists who have seen it in bloom—7s. 6d. each. An allowance to the Trade where two plants are taken.

For description of these two new productions see advertisement in the *Gardeners' Chronicle* of March 11.
SCARLET PELARGONIUMS. The best varieties for potting and bedding out.—Old Brompton, March 29, 1843.

MARNOCK & MANLEY beg to announce that their CATALOGUE of NEW FUCHSIAS, VERBENAS, DAHLIAS, &c., is now ready, and may be had on application. They have on hand a few original packets, as imported, of GERMAN ASTER, STOCK, BALSAM, and other Choice Flower-seeds, at the lowest advertised prices.—Nursery, Hackney, April 13, 1843.

HENRY HAMMOND, NURSERY AND SEEDSMAN, Mundford, near Brandon, Suffolk, respectfully announces to the Nobility, Gentry, and the Public generally, that the late fine season for preserving his admired WHITE CAPE BROCCOLI enables him to offer it at 3s. 6d. a packet, which will contain half an ounce. The many orders already received from those who were purchasers last year justify H. H. in again offering it to the public. The flavour is not only equal to any Cauliflower, but it is as hardy as any of the Cabbage tribe. By sowing in March, the end of May, and August, a supply may be had nearly all the year. If any gentleman wishes for information respecting its quality, a reference to the undermentioned Gardeners will meet with an immediate reply.—Mr. Wylie, His Grace the Duke of Grafton, Euston Hall; Mr. Piper, Right Hon. Lord Walsingham, Merton Hall; Mr. Hammond, Sir Richard Sutton, Bart., Lyndon Hall; Mr. Brownly, John Angerstein's, Esq., Weeting Hall. Messrs. Flanagan, Seedsmen, Mansion-house-street, London, who can warrant the stock, and will carefully execute any orders entrusted to them.—Mundford, April 5, 1843.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to public competition, at the Auction Mart, Bartholomew-lane, on THURSDAY, April 20th, and following day, at 12 o'clock, a first-rate collection of CARNATIONS and PICOTEES; Choice DAHLIAS, FUCHSIAS, VERBENAS, PELARGONIUMS, PINKS, and a variety of Plants in bloom. May be viewed the morning of Sale. Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leytonstone.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.
Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25l. to 500l., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of **FREDERICK LAWRENCE**, Resident Secretary, 112, Cheapside.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.
N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

IMPROVED SYSTEM OF HEATING GREENHOUSES, MELON, PINE, AND CUCUMBER-BEDS, &c.
CALDWELL, PARKER, & Co., Iron-Founders, Scotland-Road, Warrington, Lancashire, most respectfully solicit the attention of the Nobility, Gentry, Seedsmen, Gardeners, &c. to the improvement which they have made in the system of HEATING HOTHOUSES by Water—a system which supersedes all others in producing the most healthy Plants in the shortest time, for which they can produce the most undeniable reference.

The improved system prevents the scorching of plants, so common to fires, and keeps the house in one regular temperature, with a saving of fuel and labour; and the Improvers warrant their system to be superior to any other, and ultimately, far less expensive.

HEATING WITH HOT WATER on all its improved Principles, for Horticultural and other purposes, by **JAMES M'LATCHIE**, Millwright and Engineer, Cottage-lane, Commercial-road East. J. M. returns his sincere thanks to those Noblemen and Gentlemen who have already honoured him with their favours, and hopes by his economical Prices and sound Workmanship to merit their lasting favours. N.B.—Attends personally to all Erections.

HORTICULTURAL BUILDING and HEATING by HOT WATER.

J. WEEKS & Co., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of BOTTOM-HEAT FOR PITS, by means of an open trough under the bed, is now being universally adopted.

References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS & Co., Architects, &c., Gloucester-Place, King's Road, Chelsea, Hothouse-builders and Hot-Water Apparatus Manufacturers, seeing that several parties pretend to lay claim to the Open Trough, Tank, or Gutter system of heating, J. W. & Co. here lay before the Horticultural world their practice respecting it, they having fixed and circulated water in open Troughs now upwards of 16 years; and their works are now to be seen that have been fixed that time, at DAVID PUGH'S, Esq., Welsh Pool, Montgomeryshire; the Duke of BEDFORD'S, Woburn; Sir EDMOND ANTHONY, Cheam; and up to the present time they could give a list of 200 names, where they have fixed that principle, or their improvement on it. The above sketch represents a pit, shewing the principle for the purpose of Bottom-Heat, which answers well. J. W. & Co. solicit an inspection of their improvements in Building, Heating, and Ventilating, at their Horticultural Manufactory, Gloucester-Place, Chelsea.

HOUSES, CONSERVATORIES, &c., Made and Fixed Complete in all parts of the Kingdom. One two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 11. 8s. Garden-Lights Made and Glazed from 1s. per foot, at JAS. WATTS, Sash Manufactory, Claremont-place, Old Kent-road.

*** Reference given.

AGRICULTURAL MACHINE WORKS, BEVERLEY, YORKS. CROSSKILL'S LIQUID MANURE CART, which received the Honorary Reward of the Roy. Agricultural Society.

The Body of the Cart is made of Cast-Iron, and holds about 200 gallons. A, The Brass Valve Lever. Without stopping the horse, the man pulls the Iron Lever, A, to let out the liquid upon the Spread-Board, C. B, Patent Iron Pump, which cannot possibly choke or get out of order. E, The Flexible Leather Pipe, 7 ft. long, with 3 ft. copper pipe at the end.—Price, delivered in Hull, 25s.

CROSSKILL'S PORTABLE MANURE DRILL, for drilling any quantity of soot, lime, salt, &c.—will contain 8 bushels of manure—price 12s. 12s.

PATRONISED BY THE NOBILITY AND GENTRY. AN IMPROVED GARDEN ENGINE (Registered); unequalled in Cheapness, Durability, and Effect. This Engine is adapted for every use, where a portable one is required, as in Greenhouses, in cleaning Shop-fronts, &c.; at the same time it can be applied to a variety of purposes. It can be so constructed as to be attached to a tank or well, and by an additional hose will draw water from the depth of 50 ft., and force it to the height of 50 ft. in a continuous stream. It would be found a useful article on board of small craft, for wetting the sails, &c.—Manufactured by P. JONES, High-street, Fulham. E. PARKS, sole agent, 140, Fleet-street, of whom also may be had every description of Garden Tool and requisite.

*** THE LARGEST AND BEST ASSORTMENT OF IRON AND BRASS BEDSTEPS.

POTTER'S ARTIFICIAL GUANO. — TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

*** Potter's Portable Farm-yard Manure, at 4s. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE,

BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON;
GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

BEE-HIVES.—GEORGE NEIGHBOUR and SON beg

to inform their Apian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Beehives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and SON have also Glass Hives and other articles connected with Bee Management, at their Apian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps inclosed.

*** "NUTT ON BEES" (5th Edition), now published.

BEES and BEE-HIVES for SALE.—The Owner

not now residing in the Country. The Hives are of various sorts; some on NUTT'S Principle, but of simpler make, and requiring less attention and management.

Enquire at 30, Redcross-street, Cripplegate, London.

BEE-HIVES, &c.—Illustrations of Apiaries, Bee-

hives, Feeding-Machines, and all the Apparatus connected with the Apiary; a Sheet-List, price 1s., published by J. MILTON, may be had of Messrs. PARKER, West Strand; also at J. MILTON'S, Italian Warehouse, 10, Gt. Marylebone-st., Wimpole-st.

"These are Illustrations referred to in the Practical Bee-Keeper," a Treatise on Bees now publishing. All letters prepaid.

COMPOUND DECOCTION OF SARSAPARILLA

—Scurvy, Scrofula, Eruptions on the Face, Roughness of the Skin, Chronic Rheumatism, Indigestion, Chronic Liver Affections, General Debility, particularly when caused by excess; the effects of taking Mercury are among the numerous diseases and affections for which this invaluable alterative is almost a specific. To those effected with, or predisposed to, any of the above disorders, a course, spring and autumn, is generally recommended by the Faculty. The preparation of this Decoction is, however, difficult, and its dose somewhat large. All its virtues are possessed in a portable and pleasant form, by the Concentrated Compound Decoction of Sarsaparilla, prepared by BENJ. MOXON and SONS, Chemists, Hull.

Sold in Bottles, at 4s. 6d., 12s., and 22s. (equal to 6, 16, and 32 pints of the Decoction), by all respectable medicine vendors.—London Agents: Barclay & Sons, Sutton, Edwards, Newberry, &c.; York, Dennis and Son; Dublin, at Butler's Medical Hall; Edinburgh, J. and R. Raines; Quebec, J. Musson.

BENEVOLENT INSTITUTION for the RELIEF

OF AGED AND INDIGENT GARDENERS AND THEIR WIDOWS.—A General Meeting of the Subscribers to this Institution will be held on THURSDAY, the 1st day of JUNE next, for the special purpose of Electing two PENSIONERS.

All Persons desirous of becoming Candidates are requested to forward their Testimonials on or before Saturday the 22d inst. (as after that time none can be received) to the Secretary, of whom Copies of the Rules and Lists of Subscribers may be obtained.—EDWARD R. CUTLER, Secretary, 97, Farringdon-st.

LITERARY GENTLEMEN, capable of furnishing

ORIGINAL ARTICLES on subjects connected with HORTICULTURE, are requested to communicate with A. B., by letter only, care of R. GROOMBRIDGE, 5, Paternoster-row, London.

GARDEN NET.—New Garden Net, viz., Herring

Net, one-inch mesh, made with machinery, 1½d. per yard, in any length or width. Old Fishing Net, properly mended up, in lengths, 30 or 40 yards, 8 and 10 feet deep, 3d. per yard square.

Woollen and Woisted Net, fine Blossom and Wasp Net, made from Hemp, Bunting, Screens, &c. &c. Woollen Tie for Flowers.

Also Sheep-folding Nets, Fishing Nets, Rabbit and Hare Nets.

Nets for Fences against Rabbits, Dogs, Poultry, &c., 2d. per yard; also for covering in Poultry-yards, Pheasants, &c., 2d. per yard.

Superior expanding Tents for Lawns, &c., 5l., 36 ft. round.

Tarpaulins for Waggon and Stack Covers, Garden-frames, &c., 2s. per square yard made up.

ROB. RICHARDSON, Net and Tent Maker, 21, Tonbridge-place, New Road, near Euston-square, London.

N.B.—1000 London Policemen's Capes for Farmers' Servants, 1s. 9d., 2s. and 2s. 6d. each.

ORNAMENTAL WIREWORK FOR THE GARDEN,

390, OXFORD-STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the

kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce

that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He

has in consequence prepared several Novel Designs in FANCY

WIREWORK, suited to the Flower-Garden and Greenhouse, and

again submits for inspection his Extensive Stock of Flower-

Baskets, Trainers, Borders, and Stands, with Garden-Arches,

Seats, Vases, and Temples; improved Garden and Hothouse

Engines, Syringes, Fumigating Bellows, and other Horticultural

implements. G. B. Thompson's Improved Waterpots, which

possess considerable advantage over all others, the smaller size

being peculiarly adapted for Ladies. Game and Cattle Fence in

great variety.

TO BE SOLD on reasonable terms, a number of

Succession and FRUITING PINE PLANTS, with a Frame

and Lights. To be seen at Burwood, near Cobham, Surrey.

TO FLORAL and HORTICULTURAL SOCIETIES.

TO BE SOLD, the STAGES, TABLES, BOTTLES,

DISHES, &c. belonging to the Warwickshire Floral and Horti-

cultural Society. Application to be made to Mr. EDWIN HILL,

Bordesley Park, Coventry-road, or to Mr. A. POPE, Handsworth

Nursery, Birmingham.

EASTER HOLYDAYS.—POLYTECHNIC INSTI-

TUTION.—A complete arrangement of COTTON SPIN-

NING MACHINERY, consisting of a CARDING, ROVING,

and SPINNING FRAME. Cary's NEW MICROSCOPE, mag-

nifying SEVENTY-FOUR MILLION TIMES. A NEW SERIES

OF DISSOLVING VIEWS. The SCIENCE OF ELECTRICITY

demonstrated by the COLOSSAL ELECTRICAL MACHINE at

a Quarter to Three Daily, and at Eight in the Evenings. Models

of STEAM-ENGINES and various kinds of MACHINERY IN

MOTION. Lectures Daily on CHEMISTRY and NATURAL

PHILOSOPHY, including the Steam Engine, by Dr. RYAN

and Professor Bachhoffner. The CLASS LECTURES are continued

as usual. Admission, One Shilling. Schools, half-price.

ROWLAND'S MACASSAR OIL.—Under the Spe-

cial Patronage of Her Most Gracious Majesty the QUEEN,

the Royal Family, and the several Courts of Europe. This Oil

is universally acknowledged to be the ONLY ARTICLES that will

effectually produce and restore Hair, prevent it from falling off or

turning grey, free it from scurf and dandriff, and will render it de-

lightfully soft and flexible. It will also preserve the coiffure in the

heated atmosphere of crowded assemblies. CAUTION.—

Much pernicious trash is now offered for sale as "MACASSAR

OIL;" it is therefore of great importance to purchasers to see

that the words "ROWLAND'S MACASSAR OIL" are engraven

on the wrapper. All others are "GROSS IMPOSITIONS." The

Proprietor's Signature is also engraven on the wrapper, thus:—

A. ROWLAND & SON, 20, HATTON GARDEN, LONDON;

Countersigned "ALEX. ROWLAND." Price 3s. 6d.—7s. Family

Bottles (equal to four small), 10s. 6d., and double that size 21s.

per bottle. Ask for "Rowland's Macassar Oil." Sold by them

and by Chemists and Perfumers.

IMPROVED WIRE FENCING.

J. W. GIDNEY begs to inform Noblemen and Gentle-

men that in consequence of the increased demand and

improvements in the machinery for producing his IMPROVED

STRAINED WIRE FENCING, coupled with the depression in the

Iron trade, he is enabled to offer the same at a considerably

reduced rate, and warrants this Fence, as constructed by him, to

stand against all kinds of cattle, and for neatness, strength,

durability, and cheapness, to excel all other kinds of Fencing.

List of Prices, with a sketch, may be had by applying at his

Manufactory, East Dereham, Norfolk.

WANTED, immediately, a steady, active Man, as

PROPAGATOR. He will be required to have a thorough

knowledge of the Propagation and Cultivation of Plants in

general.—Address, by letter, with terms, references as to capa-

bility, &c., to YOUNG & Co., Great Yarmouth Nursery, Norfolk.

April 13, 1843.

WANTED, a PLANT FOREMAN.—MR. W. E.

RENDLE is in want of a steady active young Man, of good

address, as PLANT-FOREMAN and PROPAGATOR. He will

be required to attend to visitors, and will grow and have the charge

of a choice collection of Exotics, Florist's Flowers, &c. None

need apply whose characters will not bear the strictest inquiry

as to ability and general good conduct.—Application, stating

terms, &c., to be made to the Union Road Nursery, Plymouth.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, Double or Single-handed, an active

married Man, aged 30, of perfectly sober and industrious

habits; has had extensive practice in all the various Depart-

ments; can have two years' Character from the gentleman he is

about leaving, and can also give good references to Noblemen

and Gentlemen with whom he has lived.—Direct to L. J. S., care

of Mr. CUTBUSH, Nurseryman, Barnet, Herts.

AS GARDENER, a Married Man, without incum-

brance, aged 43, who understands Pines, Grapes, Green-

house, Frames. Has a practical knowledge of his Business, with

10 years' character from the place he has just left. Direct

W. W., 8, Orchard-row, High-street, Camberwell.

AS GARDENER, a Married Man, aged 26, without

incumbrance. He thoroughly understands his business in

all its branches, and can have a good character from his last

situation; would have no objection to a single-handed place, or

to reside on the premises, and take charge of the poultry and all

the farming-stock; would prefer an engagement where one or

two men are kept. Direct to C. Z., at Mr. CORNWELL'S Nursery,

Barnet, Herts.

Printed by Messrs. BRADSHAW and EVANS, Lombard-street, Fleet-street, in the

Precinct of Whitechapel, in the City of London, and Published by them at

the OFFICE, 8, CHARLES STREET, COVENT GARDEN, in the County of Middlesex,

where all Advertisements and Communications are to be addressed to the

Editor.—Saturday, April 15, 1843.

FUCHSIA TODDIANA.

PLANTS of this **MAGNIFICENT FUCHSIA**, (the Flowers of which, in point of size, rival any other of its kind yet sent out, being nearly four inches in length) will be ready by the end of April, at 10s. 6d. each, with the usual discount where six are taken. For description, see *Gardeners' Chronicle* of the 11th inst. Agents for London, Mr. CHARLWOOD, Seedsman, Covent Garden; and Messrs. Lowe and Co., Clifton Nursery, at which places also drawings may be seen.—**THOMAS CRIPPS**, Tunbridge Wells Nursery, March 16, 1843.

N. GAINES, Florist, Surrey-Lane, Battersea, begs to inform the Nobility, Gentry, and others, that his **STOCK** of **PELARGONIUMS** now ready for sending out are strong healthy plants. The following are a few of his Seedlings, which have been proved, and can be recommended, viz.:

PELARGONIUMS.	
Gaines's Duchess of Sutherland	42s.
Land	63s.
" Pride of Surrey	63s.
" Orange Perfection	63s.
" Amulet	63s.
" Lady Sale	42s.
" Emperor Superb	42s.
Gaines's Lady Duncannon	42s.
" Loyal Adelaide	42s.
" Prince of Wales	42s.
" Countess Eldon	42s.
" Princess Royal	42s.
" Conspicuum	42s.

DAHLIAS.	
Gaines's Lord Prudhoe—dark crimson	10s. 6d.
" Lady Prudhoe—blush white	7 6
" Lady Duncannon—blush, shaded with lilac	10 6
" Lady of the Lake—Peach blossom	10 6
" Venus—clear white	10 6
" Surpass Primrose—fine large primrose	7 6
" Elegans—rosy purple	10 6
" Golden Yellow—bright yellow	7 6

Catalogues of Pelargoniums, Dahlias, Pansies, Calceolarias, Verbenas, Fuchsias, &c., may be obtained by applying as above. Feb. 2, 1843.

WILLIAM LYNN, NURSERYMAN, SEEDSMAN, and FLORIST, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a **GARDEN TOOL WAREHOUSE**, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. W. L. begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit-Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which, he trusts, with industry, punctuality, and attention, will secure to him general patronage.

W. L. solicits particular attention to his new **PEA**, LYNN'S **DWARF WRINKLED MARROW**, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn PEA ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, inclosing a postage-stamp.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON, and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842:—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards of York. This Flower was shown at the Royal South London Horticultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first rate. The following was the decision of the censors: Firm, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasional tinge of pink, class of quality, first-rate.—*From the Gardeners' Chronicle and Gazette.*

Also obtained the following prizes:—No. of Blooms Exhibited.	
1st prize at Hull, Aug. 30th	12
1st prize at Beverley, Sept. 7th	2
Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th	4
1st prize at Leeds, Sept. 21st	12
1st prize at Newcastle, Sept. 21st	6
1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th	6
1st prize at the York Floral and Horticultural Society, Sept. 28th	18
1st prize at the York Floricultural Society, Oct. 1st	12
1st prize in its class as the best white or blush, ditto.	

Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size, very constant, and a decided first rate show flower. Height, 4 ft.; Plants, 10s. 6d.

All orders addressed J. EDWARDS, Layerthorpe, Florist, Nursery and Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

CHOICE PANSIES.

J. HENCHMAN begs to inform Growers of the **PANSY** that he has still on hand a few healthy Plants of his best seedling varieties, at 21s. the collection.

J. H. has also a few choice varieties to offer at from 9s. to 18s. per dozen.

J. H. begs to state that there is, at present, a **VACANCY** in his Establishment (which comprises a general Nursery Stock) for a respectable Youth as **APPRENTICE**. A moderate Premium required.—Edmonton, London, April 13, 1843.

MITCHELL'S Unrivalled Variegated DAHLIAS.

viz. the BEAUTY OF SUSSEX and BLANCHE SHELLEY. JAMES MITCHELL begs to announce his intention of sending out in May the above Seedling Dahlias, which he can recommend with confidence to the most limited grower; they have been justly pronounced both by foreign and English growers to be the most beautiful and the most valuable acquisition ever offered to the public. J. M. will also have fine plants of Mrs. SHELLEY, which is first-rate and very scarce. The **BEAUTY OF SUSSEX**,—This Dahlia has been placed before any other two-coloured flower, at all the principal Shows in England, viz.—the Salt Hill, the Floricultural, the South London, Maidstone, and Tunbridge Wells Shows. Colour, delicate pink, strongly edged with Cherry; the petals are cupped, of firm texture, and well arranged, never confused; the general form is excellent, and rising well in the centre; a constant show flower—4 feet, 10s. 6d. **BLANCHE SHELLEY**, white, delicately tipped with purple, beautifully-cupped petals, superior form, and of great depth: a constant show flower—5 feet, 10s. 6d. Mrs. SHELLEY, delicate rosy pink, cupped petals, a constant show flower—4 feet, 5s.—The usual allowance to the trade, where a dozen plants are ordered.—Pittown Nursery, Maresfield, Uckfield, Sussex.

JOHN MILNE, NURSERYMAN, Stoke Newington, Middlesex, has now on Sale a fine Stock of that beautiful Creeper, *Scypanthus elegans* (Loasa volubilis), which he is enabled to offer at 3s. each, or 30s. per doz. Plants may also be had of **WARNER and WARNER, Seedsman, 29, Cornhill**, opposite the Exchange.—The usual allowance made to the Trade.

JOHN MILNE begs respectfully to offer to the Nobility, Gentry, and Public the following plants:—

A fine specimen of *Araucaria excelsa*, in pot, standing 8 ft. high, probably one of the finest in England, for sale, price 25l.

Ditto, 5 ft. high, 10l.

Fine specimens of *Rhododendron arboreum* (true), 8 ft. high, each, 7l. 7s.

Two very large *Bonapartia juncea*, 4l. 4s. each.

Lilium lancifolium album, 5s.; Do. do. *punctatum*, 7s. 6d. each.

Rosa Devonensis, 2s. 6d. each.

A fine collection of *Azalea sinensis*, *Camellias*, *Pelargoniums*, *Ericas*, *Epacris*, *Gesneras*, *Gloxinias*, *Achimenes*, &c. &c. Likewise a general collection of Greenhouse, Herbaceous, and Rock plants, too numerous to insert. J. M. can also spare 100 fine large plants of *Andromeda floribunda*, 10s. 6d. and 12s. 6d. each. **PLANTS FOR BEDDING OUT.**

<i>Alstroemeria</i> , 6 varieties, s. d.	
each	1s. to 1 6
<i>Bonvardia triphylla</i>	1 6
<i>Calceolaria</i> , 12 vars., p. doz.	9 0
<i>Campanula grandis</i> , each	1 6
<i>Catananche</i> , 2 vars., each	0 9
<i>Chelone barbata</i> , per doz.	6 0
<i>Fuchsia</i> , 25 varieties of the newest and most approved sorts, large plants, per doz.	12 0
Do. do., smaller, per doz.	9 0
<i>Fuchsia fulgens</i> , 2 varieties, per doz. 9s., each	1 0
<i>Gentiana</i> , 5 vars., per doz.	6 0
<i>Pelargonium</i> , scarlet and striped vars., p. doz., 4s. to 6 0	
<i>Heliotropium</i> , p. doz., 4s. to 6 0	
<i>Lantana Selovii</i> , p. doz.	9 0
<i>Lilium eximium</i> , each	1 6
" longiflorum	1 6
<i>Linum</i> , 4 vars., per doz.	6 0
<i>Lobelia</i> , 6 vars., per doz.	6 0
<i>Lychnis Bungeana</i> , each	1 0
" coronata	1 0
<i>Viola arborea</i> (new), each	3 6

CREEPERS FOR PLANTING OUT.

<i>Aristolochia siphon</i> , each	1 6
<i>Atragene austriaca</i>	1 6
<i>Bignonia capreolata</i>	1 6
" radicans (superb)	1 6
<i>Ceanothus azureus</i> and <i>pallidus</i>	1 0
<i>Clematis azurea grandiflora</i>	2 6
" double purple	1 0
" florida, single	1 0
" double	1 6
" montana	1 6
" Sieboldi	1 6
<i>Cobaea scandens</i> , per doz.	6 0
<i>Eccremocarpus scaber</i> , each	1 0
<i>Glycine frutescens</i>	1 6
" sinensis	1 0
<i>Honeysuckles</i> , in 6 vars., 0 9	
The above plants are all in pots; and a general supply may be had throughout the season.	

N.B.—Plants for Bedding or Creepers ordered to the amount of 20s. will be forwarded to any part of London carriage free; a reference or Post-office order will be required of unknown correspondents.—Albion Nursery, Stoke Newington, Middlesex.

UXBRIDGE NURSERY, Fourteen Miles from London, on the Oxford road, and Three Miles from the West Drayton station, on the Great Western Railway.

MESSRS. BROWN & ATTWELL, SEEDSMEN, FLORISTS, and GENERAL PLANTERS, Uxbridge, Middlesex, acknowledge with gratitude the liberal extension of patronage they have received, and beg most respectfully to assure their friends it will be their earnest endeavour to merit future approbation by offering nothing to their notice except such articles as they feel convinced will give satisfaction. With this view they introduce the following New Varieties of Splendid SEEDLING DAHLIAS, which they have purchased of the fortunate raisers; the description will prove faithful as received, and not highly coloured in order to procure a sale; and they believe them to be equal to any now offered. Should the season prove unpropitious to any of them, no charge will be made for such, where the selection has been left to B. and A.

They also avail themselves of this opportunity to inform their friends that they can supply all the varieties of other establishments of known respectability, at a trifling advance, to cover the expense of Carriage, &c.—Catalogues on application.

SEEDLINGS, 1843.

1. **GREAT MOGUL** (Attwell), colour bright garnet, petals shaded, cupped and stiff, full centre, form circular, full size, constant and fine show flower. 5 feet.—Plants, 10s. 6d.

2. **VENUS**, a pure white, great depth of cupped petals, form circular; first prize for best white at Crown and Anchor, 1841; first at Windsor, Wycombe, and several early shows in 1842; was so much affected by the thrip as the season advanced that it could not be exhibited with advantage. Plants, 10s. 6d.—First week in May.

3. **LADY OF THE MANOR** (Attwell), very light, delicately tipped with lavender, good shape and properties; every flower fit for show. 5 feet.—Plants, 10s. 6d.

4. **DREADNOUGHT** (Robertson), beautiful chestnut-brown, fine cupped petals, noble back-tier flower, excellent properties and shape. 4 to 5 feet. *Gardeners' Gazette*, second week in October (See Correspondence). 10s. 6d.

5. **LOCHIEL** (Robertson), beautiful glossy scarlet, cupped, constant and fine, in the way of Lee's Bloomsbury, but much finer. Stock, only four roots. Plants, 10s. 6d.

6. **MISS CAMERON** (Robertson), a very peculiar and elegant shaded rose, fine cupped petals, splendid habit and shape, and good show flower. Stock, two roots. Plants, 7s. 6d.

7. **CORONET** (Thompson), bright dark flame, bold back-tier flower, considerable depth of stiff cupped petals, well up, superior centre, and constant; every bloom fit for show. 4 ft.—Plants, 9s.

Brown & Attwell avail themselves of this opportunity to make it known that they have purchased from the executor of the late T. Hogg all the reserved and selected stock of **CARNATIONS** and **PICOTEES** of that renowned grower, and respectfully solicit a share of that patronage he so long and deservedly enjoyed; feeling assured that with this splendid addition to their own extensive stock, they will be enabled to execute orders to any extent, and to the entire satisfaction of those persons who may honour them with their commands.

Fine Border Carnations from 6d. per pair.

B. and A. have a few pairs of their **Goliath Carnation**, a Seedling **Scarlet Bizarre**, not always a show flower, but one of the largest and best stage flowers ever sent out, 5s. per pair.

A fine assortment of **Auriculas**, **Polyanthuses**, **Tulips**, **Pinks**, **Picotees**, **Carnations**, **Pelargoniums**, and **Pansies**.

Nearly 100 varieties of German Stock, Aster, and Larkspur, in packets from 12s. to 6d., as imported. All the new and old varieties of Annual Flower Seeds, in small and large packets. Weeden's celebrated **Black Spine Cucumber Seed**, in packets at 1s. and 2s. 6d.

B. and A. are now sending out a splendid Collection of Ten Seedling **PANSIES**, at 2l. 2s.; the **Princess of Wales** and **Radical Jack** alone, 7s. 6d. each. Fine scarlet **Intermediate Stock Seed**, 1s. per packet; Trade packets, 2s. 6d.

The Uxbridge Nursery is celebrated for its fine growth of Evergreens, &c.

MAGNIFICENT NEW VERBENA, "PRINCE OF WALES."

WILLIAM WOOD and SON, having obtained the entire Stock of the above very splendid **VERBENA**, beg leave to offer it to the Public, feeling assured that they can with the greatest confidence recommend it as worthy of especial notice. This desirable variety is a beautiful **Flesh colour**; the heads of Flowers measuring 3½ inches in diameter, and exceedingly fragrant. Plants of the above will be ready for delivery in May, at 3s. 6d. each; the usual discount to the Trade when six plants or more are ordered.

W. W. & SON would also solicit attention to their superb Collection of all the New **Verbenas**, **Fuchsias**, &c., and other spring Plants adapted for Bedding, Catalogues of which will be sent FREE on application.

Verbenas, consisting of the best varieties, and left to their own selection, in tin cases, per post, at 3s. per doz., or in pots at 4s. per doz. **Fuchsias**, per post, at 4s. per doz. **Petunias**, fine sorts, at 4s. per doz., in tin cases. All orders sent per post will be prepaid.

Please address—Woodlands Nursery, Maresfield, near Uckfield, Sussex. Agents in London, Messrs. WARNER and WARNER, 28, Cornhill; and Mr. CARTER, 238, High Holborn.

MESSRS. CORMACK & CO. beg to announce that their new **FUCHSIA CORMACKII** is now ready to send out at 7s. 6d. each. It was exhibited at the Horticultural and Floricultural Societies' Shows last season, when it was generally admired for its fine foliage and distinct flower. Applications to be made at the Bedford Conservatory, Covent Garden, and New Cross, Surrey.

J. CATTELL, NURSERYMAN, Westerham, Kent, begs to inform the Public that he will have five beautiful Varieties of **PETUNIAS** to send out in May next, at 2s. 6d. each, viz.: **SIR R. SALE**—very large rosy purple, extra. **LADY SALE**,—light fine dark pencilled Eye. **ENCHANTRESS**—very bright rose. **MAGICIAN**—light, shaded with rose, very large, superb—**JEWELS**—light, with fine dark Eye. The usual discount to the Trade if the five are taken.

The above have been selected from a Stock saved from some of the finest Varieties sent out last year, are all fine round Flowers, and cannot fail to prove a good addition to this beautiful tribe of Plants.

J. C. will also have ready in May, for bedding (in addition to a general Stock), Plants of *Pentstemon gentianoides splendens*, *Gentianoides Shepherdii*, and *Murphyana*, *Lobelia Marvatti*, *Delphinium Barlowii*, *Dianthus fimbriatus superbus*; fine pots of *Rhodantha Manglesii*; Tea-scented, *Isle de Bourbon*, China, Noisette, and other Roses, &c. &c., the prices of which may be had on application.—Westerham, April 19, 1843.

VERBENA FORMOSA ELEGANS.

THIS splendid and very distinct **VERBENA**—colour, bright Vermilion, with large white eye, renders it very showy and truly beautiful, and one of the very best sent out to the public.

Remarks of the Editors of the *Floricultural Cabinet*, October 1, 1842: "The Verbena sent by Mr. CROFT is the best of the bright-coloured ones we have seen."

Plants of the above will be ready early in May, at 3s. 6d. each; the usual discount when six plants are taken.—Please address G. CROFT, Torbury, Reading.

ORANGE, LEMON, AND CITRON TREES.

G. MARSANO has just landed from Italy Two Hundred of the above splendid TREES, in the best condition, from 6s. to 10s. each. One case contains 80 middling trees. The Trade will be supplied at 33 per cent. cheaper than any other house in London. Orders taken for French Pedestal Cupboards ornamented with Marble Tops, with Shelves inside, 2½ ft. high. Orders by post will be punctually attended to, by applying at G. MARSANO, No. 2, Beauchamp-street, Brooks'-market, Leather-Lane, Holborn.

HORTICULTURAL IMPROVEMENTS.

READ'S GARDEN SYRINGE (for the invention of which he has been honoured with the Silver Medal of the Royal Horticultural Society), also small Machines, Pails, Truck Machines, and Garden Engines of every description, on the most improved principle, which may be worked with half the labour required for any other Engines now in use, and are the best adapted for destroying those insects which make such deadly havoc on all choice Fruit-trees and plants at this season of the year, and which the Patentee, from 31 years experience in the science, can safely warrant. The valves are so arranged, that they are never liable to be out of repair. Likewise a **Portable FIRE-ENGINE**, upon an entirely new principle, will pass any common doorway, may be worked by two men, and will discharge 20 gallons per minute a distance of 60 feet; and by four men may be continued for any length of time. This Engine is so constructed, that by shifting a single pin, it may be worked by one man with ease for all Horticultural purposes. May be seen and proved at 35, Regent Circus, Piccadilly.

NOW ON VIEW, EAST INDIAN ORCHIDACEÆ FOR SALE BY AUCTION.

MESSRS. J. C. & S. STEVENS beg to announce they will sell by AUCTION, at their Great Room, 38, King-street, Covent-Garden, on MONDAY, 24th April, at 12 o'clock, a consignment of very valuable **ORCHIDACEÆ**, which have just arrived overland from India in the most perfect health, having been collected in the presidency of Bombay between the 20th and 25th February last.

The attention of collectors is respectfully invited to this unprecedented Sale. The Plants are now on view; and Catalogues may be had of the Auctioneers, 38, King-street, Covent-Garden.

TO GENTLEMEN, FLORISTS, and OTHERS.

MESSRS. PROTHEROE and MORRIS will submit to Public Competition, at the Auction Mart, Bartholomew Lane, on THURSDAY, April 27, 1843, and following day, at Twelve o'clock, A delightful Assortment of splendid **CARNATIONS**, **PICOTEES**, **PINKS**, **ROSES**, **DAHLIAS**, **PELARGONIUMS**, **FUCHSIAS**, **VERBENAS**; and a miscellaneous Assortment of varied and interesting Flowers, for the Amateur and Grower.—May be viewed the morning of sale; and Catalogues may be had at the Mart, and of the Auctioneers, American Nursery, Leventon-street.

TO GENTLEMEN, FLORISTS, AMATEURS, and OTHERS.

TO BE SOLD, for One-third the Cost, a **GREENHOUSE**, nearly 20 feet by 9, erected two years, stocked with about 200 of the best *Pelargoniums* in cultivation; also, about 100 Greenhouse Plants, Cactus, &c. &c., ready to bloom; will be parted with a bargain, the ground being wanted for building purposes.—For Cards to view, apply to Mr. SNARE, Nurseryman, opposite the Turnpike, New North-road, Hoxton.

TO FLORISTS and GARDENERS.

TO BE SOLD or LET, TWO **GREENHOUSES**, with a small **COTTAGE and GROUND**, in an eligible situation, with immediate possession. The only reason of parting with the property is in consequence of ill health. Apply at Mr. S. BROWN'S, Florist, opposite St. John's Wood-road, Edgware-rd.

HOLLY-HEDGE—TO BE SOLD, 40 Rods of a fine thriving **HOLLY-HEDGE**, about to be removed immediately for the purpose of throwing two fields into one. Apply to Mr. GEORGE WHITE, Cranford, near Hounslow.

TO BE SOLD on reasonable terms, a number of Succession and FRUITING PINE PLANTS, with a Frame and Lights. To be seen at Burwood, near Cobham, Surrey.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25l. to 500l., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of FREDERICK LAWRENCE, Resident Secretary, 112, Cheapside.

ECONOMIC LIFE ASSURANCE SOCIETY,
No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON.
Established 1823. Empowered by Act of Parliament, 3 William IV. LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE. That entitle the assured to participate in the profits, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium Per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The Bonus declared in 1834 amounted upon an average to 16l. per cent. on the premiums then paid; and in 1839 a second Bonus was awarded, amounting on the average to 31l. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam-vessel) from any one Port thereof to another during peace, to Assurers, not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice, are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.
By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

THE CONICAL HOT-WATER BOILERS invented by J. ROOPE, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine Apple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.
N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

PENN'S SYSTEM OF HOTHOUSE BUILDING, WARMING, and VENTILATING.—The superiority of the principle first introduced by JNO. PENN, Esq., for obtaining a more complete circulation of the atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the Nobility, Horticulturists, and the Public generally, that having, in conjunction with the Inventor, devoted much time and study to perfect the same in the construction of Conservatories, Stoves, Greenhouses, Pits, and other Horticultural Erections, and to heat them with IMPROVED HOT-WATER APPARATUS, to ensure any DEGREE OF TEMPERATURE, earnestly solicits their inspection of the working of this system at the Inventor's residence, Lewisham.

The peculiar advantages in Houses erected upon, or altered to, this principle, are—Free and rapid Circulation, Equality of Temperature, and safe and agreeable access, at all times, to the most delicate constitutions.

Churches, Chapels, Manufactories, or other large Public Buildings and Dwelling houses, warmed and ventilated. The Heating Apparatus, which is of the very best description, combining Durability and Simplicity with Economy in the Consumption of Fuel, is manufactured by and fixed under the superintendence of JNO. PENN, Esq., Engineer.

Reference is permitted to JNO. WILLIAMS, Esq., Isleworth, and numerous other Gentlemen, who are practically acquainted with the merits of W. HILL's mode of applying Mr. PENN's principle. Designs, and every information, may be obtained on application to W. HILL, Builder and Surveyor, Lewisham.

HOT WATER FOR BOTTOM-HEAT.

J. WEEKS & Co., Architects, &c., Gloucester-Place,
King's Road, Chelsea, Hothouse-builders and Hot-Water Apparatus Manufacturers, seeing that several parties pretend to lay claim to the Open Trough, Tank, or Gutter system of heating, J. W. & Co. here lay before the Horticultural world their practice respecting it, they having fixed and circulated water in open Troughs now upwards of 16 years; and their works are now to be seen that have been fixed that time, at DAVID PUGH'S, Esq., Welsh Pool, Montgomeryshire; the Duke of Bedford's, Woburn; Sir Edmund Antrobus, Chesham and up to the present time they could give a list of 200 names, where they have fixed that principle, or their improvement on it. The above sketch represents a pit, showing the principle for the purpose of Bottom-Heat, which answers well. J. W. & Co. solicit an inspection of their improvements in Building, Heating, and Ventilating, at their Horticultural Manufactory, Gloucester-Place, Chelsea.

HOT-WATER APPARATUS FOR HEATING
HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals required, and which may be seen at their Manufactory.

GUANO ON SALE,
BY THE IMPORTERS,
ANTHONY GIBBS & SONS, LONDON:
GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These Facts prove the superiority of the Artificial Guano.

** Potter's Portable Farm-yard Manure, at 4l. 15s. per ton; from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

MANURES.—Guano, Nitrates of Soda, and Potash, (pure), at the Importers' prices. Also Gypsum, Potter's Guano (superior to the Foreign), Urate, Bone-dust, Sulphate of Ammonia, and all other Chemical Manures, on the lowest terms for cash. Rock Salt and Agricultural Salt.—Sold by MARK FOTHERGILL, Merchant and Agricultural Agent, 40, Upper Thames-street.

** Pamphlets treating of the above may be had of Mr. F. Sole Agent for Watson's Granulated Compost.

GUANO MANURE.
THE genuine GUANO, of the best quality, may be had at 12l. per ton, by applying to W. SKIRVING, Queen-square, Liverpool, who will execute orders from the Importers' bonded stores, in Liverpool or London, as required.

W. S. has had constant and extensive practice with Guano ever since its introduction, and has now no hesitation in saying that he considers it the most valuable manure that has been introduced in his time, and, at the present price, by far the cheapest known. Guano is a strong natural manure, quite different to the artificial manures manufactured in this country; it is highly infected, not disinfected. Purchasers may have plain directions for the use of Guano, founded on two years' practice with it on garden and field crops of many kinds.

* N.B.—If ten tons or more are taken, a reduction is made in the price. Terms of payment—ready money.

GUANO.
GUANO having now fully established itself as the best and cheapest MANURE, J. & C. WHALLEY have purchased a stock from the best importation, of which they can deliver any quantity, direct from the Bonded Stores, on the lowest terms. J. & C. W. beg to inform the Trade that they have a small quantity of American Oak Acorns and choice Tree Seeds. Prices furnished on application.

Agents for Watson's Granulated Compost, which is very highly recommended.—12, St. George's Crescent, Liverpool.

GUANO ON SALE.—Any quantity of this VALUABLE MANURE can be had from the bonded Stores of the Importers, either in London or Liverpool, on application to COTESWORTH, POWELL, and PRYOR, St. Helen's Place, London; EDWARDS, DANSON, and Co., Liverpool; or Wm. Jos. MYERS and Co., Importers, Liverpool.

LIQUID MANURE.—PUMPS of a superior construction for Liquid Manure, portable and stationary. Garden Pumps, Hydraulic ditto, and for deep Wells; also for Ships, Barges, Tanners, Brewers, Soap-boilers, &c. Pumps kept for Hire, for Wells and Excavations.—BENJAMIN FOWLER, late GEORGE TURNER, 63, Dorset-street, Fleet-street.

TEGG'S LONDON MAGAZINE.
On Monday, the 1st of May, printed in a superior manner, on paper made for the purpose, to be continued monthly, price Eightpence, No. 1 of
TEGG'S LONDON MAGAZINE of KNOWLEDGE and AMUSEMENT, a Work calculated to promote the happiness and peace of society, advance the interests of religion, virtue, and humanity, and encourage a spirit of industry, economy, and perseverance amongst all classes.
** Prose communications in accordance with the objects and nature of the above work, to be addressed for the Editor to the care of the Publisher.
London: Printed for THOMAS TEGG, 73, Cheapside, and sold by all other Booksellers.

TO AGRICULTURISTS.—Now ready, price 1s. each.
AGRICULTURAL CHEMISTRY FOR THE USE OF YOUNG FARMERS. By C. W. JOHNSON, Esq., F.R.S.
2. **THE COTTAGE FARMER'S ASSISTANT.** By C. W. JOHNSON, Esq., F.R.S.

3. **EVERY MAN HIS OWN BREWER.** By Child.
4. **ON GUANO AS A FERTILISER.** By C. W. JOHNSON, Esq., F.R.S. price 1s. 6d.

5. **ON FERTILISERS IN GENERAL.** By C. W. JOHNSON, Esq., F.R.S. price 12s.

6. **SQUAREY'S AGRICULTURAL CHEMISTRY FOR THE PRACTICAL FARMER.** Price 5s.

7. **In the press. THE FARMER'S CALENDAR.** By C. W. JOHNSON, Esq., price 1s.

8. **A SUPPLEMENT to Mr. Morton's Work on the NATURE AND PROPERTY OF SOILS,** being a second Report of Whitfield Example Farm.
9. **MAIN'S PLANTER AND PRUNER'S ASSISTANT.** Price 6s., with plates.
10. **MAIN'S FARMER'S MANUAL.** Price 6s.
11. **SINCLAIR ON GRASSES.** Coloured plate. Price 30s.
JAMES RIDGWAY, Piccadilly, and all Booksellers.

Now ready, Vol. I., price 2l., cloth.
THE FLOWER-GARDEN OF ORNAMENTAL PERENNIALS, containing coloured Portraits, with Directions for the Cultivation, of Two Hundred and Sixty Perennial Herbaceous Plants, or such as die down in the winter to appear again in the Spring—including a large number of showy Flowers, not generally known, but which will grow freely in any Garden.
By Mrs. LONDON.

London: Published by WILLIAM SMITH, 113, Fleet-street; of whom may be had, by the same author.

THE FLOWER-GARDEN OF ORNAMENTAL ANNUALS; cloth, price 2l. 2s.

THE FLOWER-GARDEN OF ORNAMENTAL BULBOUS PLANTS; cloth, price 2l. 12s. 6d.

NEW LIBRARY OF USEFUL KNOWLEDGE. Price 6d. each.
BRITISH FOREST TREES: A Guide to the

Beauties of our Woods and Parks.
BOTANY: an Introduction to that fascinating Science.
VEGETABLE PHYSIOLOGY: a Treatise on the Structure and Functions of Plants.

THE FLOWER GARDEN, KITCHEN GARDEN, FRUIT GARDEN, and GREEN-HOUSE.
THE HORSE: its Habits, Diseases, Management, &c.
DOMESTIC BREWING, ENGLISH COOKERY, PRESERVING, and CONFECTIONARY.

THE FARM AND THE GARDEN: an account of Edible Vegetables. * 22 Numbers of this popular series are now published. Also in a Volume of nearly 200 pages, price 2s. cloth.

THE GARDENER'S MANUAL: containing Practical Instructions for the Cultivation and Management of the Flower, the Fruit, and the Kitchen Garden—the Hot-house Greenhouse, and Conservatory; adapted either to small or large gardens. London: CRADOCK & Co., 48, Paternoster Row.

THE AUTHENTIC HISTORY OF CHINA.
In 2 vols. 8vo., with a Chinese Map of the Empire, price 24s.
CHINA OPENED; a complete Display of the History—Customs—Manners—Arts—Religion—Commerce, &c. of the Chinese. By the Rev. CHARLES GUTZLAFF, Interpreter to the Chinese Expedition.

"The talented Author of this able work, from his many years residence in China, has gained a perfect knowledge of the language, and being gifted by nature with a Chinese countenance, has been enabled to travel as a native, through the whole of this interesting country, a privilege never obtained before by any European; the result is the production of the most authentic and complete account of this singular nation and people that has yet been given to the public, leaving the English reader nothing to wish for, and without any excuse for ignorance, on a subject in which we are now so particularly interested."—*London Review*.

London: SMITH, ELDER, & Co., 65, Cornhill.

NOVELTIES IN CHEMICAL APPARATUS.
Now ready, post-free, for 2d.

GRIFFIN'S ILLUSTRATED CATALOGUE OF CHEMICAL APPARATUS, Part II., containing 16 pages 8vo., with nearly 100 Engravings. RICHARD GRIFFIN & Co., Glasgow.

Also, a New Edition of Part I., 100 pages 8vo., with 500 Engravings. Post-free at 2s.

WORKS ON AGRICULTURE AND RURAL AFFAIRS,
PUBLISHED BY WILLIAM BLACKWOOD & SONS,
EDINBURGH AND LONDON.

THE BOOK OF THE FARM. By HENRY STEPHENS.
Vol. I., with Seventeen Engravings by Landseer and others, and nearly 200 Woodcuts. Price 30s. bound in cloth. The Second Volume is in course of Publication.

"Skillful practice is applied science." This fact is illustrated in every chapter of the excellent and comprehensive work now before us. * * * As a practical manual, for those who wish to be good farmers, it is the best book we know. It contains more of the practical applications of modern science, and adverts to more of those interesting questions from which past improvements have sprung, and from the discussion of which future ameliorations are likely to flow, than any other of the newer works which have come under our eye."—*Blackwood's Magazine* for April.

"The best practical book I have ever met with."—*Professor Johnston of Durham*.

ELEMENTS of AGRICULTURAL CHEMISTRY and GEOLOGY. By JAMES F. W. JOHNSTON, Esq., Reader in Chemistry and Mineralogy in the University of Durham, Author of "Lectures on Agricultural Chemistry and Geology." The Second Edition, price 5s.

"Of all the different works which have lately been published on the Chemistry of Agriculture, that now before us appears to be most likely to be of real service to the practical man."—*London's Gardener's Magazine*.

"By their easy style are likely to prove interesting to the least instructed."—*Blackwood's Magazine*.

STABLE ECONOMY. A TREATISE on the MANAGEMENT of HORSES. By JOHN STEWART. A New Edition in foolscap 8vo., with numerous Woodcuts, price 7s. 6d. bound in cloth.

"Worthy of the diligent perusal of every person who keeps horses, whether the owners of a stud of racers, or the more humble proprietor of a single hack."—*New Sporting Magazine*.

By the same Author,
ADVICE to PURCHASERS of HORSES. Tenth Thousand. Price 2s. 6d. bound in cloth.

ELKINGTON ON DRAINING. By JOHNSTON.
According to the most approved Methods, and adapted to the various Situations and Soils of England and Scotland; also on Sea, River, and Lake Embankments, Formation of Ponds and Artificial Pieces of Water. The whole illustrated by Plans and Sections. The Third Edition, 4to, price 19s. 6d.

AINSLIE'S LAND-SURVEYING, comprising the Theory and Practice in all its Branches; in which the use of the various Instruments employed in Surveying, Levelling, &c., is clearly elucidated by Practical Examples. Illustrated by 40 Copper-plates. With a Treatise appended on Trigonometrical Surveying, Levelling, and Railway Engineering. By WILLIAM GALBRAITH, M.A. In 4to, price 15s.

AN AGRICULTURAL TOUR in the UNITED STATES and UPPER CANADA. By CAPTAIN BARCLAY of Ury. In one Vol. post 8vo, price 7s. 6d.

Fifth Edition, 8vo 10s. 6d. cloth.

BAYLTON'S ART of VALUING RENTS and TILLAGES, and the Tenant's Right of Entering and Quitting Farms, explained. Adapted to the use of Landlords, Land Agents, Appraisers, Farmers, and Tenants. Re-written and enlarged by JOHN DONALDSON. With a Chapter on the Title Commutation Rent-Charge.

"A work equally valuable to the principal or the agent. The new statements and calculations incorporated will be found of great practical use. This work should be read and revised by every one having an interest in the soil, whether as landlord, tenant, or agent."—*Mark Lane Express*.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

RURAL CHEMISTRY.

Now ready, neat cloth, price 4s. 6d.,
An Introduction to the Study of the Science in Relation to AGRICULTURE.

By EDWARD SOLLY, Esq., Jun., F.R.S., F.L.S.
Experimental Chemist to the Horticultural Society of London,
Hon. Mem. of the Royal Agricultural Society, Lecturer on
Chemistry, at the Royal Institution of Great Britain,
&c. &c. &c.

Extracts from the Introduction:—

"A knowledge of the chemical composition of soils, and the various substances employed as manures, enables us to comprehend the mode in which the latter act; and a knowledge of the nature of those substances which plants require points out the best and most economical methods of restoring to the soil, by manures, those substances which plants remove from it."

"If the farmer knows what it is that gives the fertilizing powers to manure, and is aware of the nature of those substances, he will soon learn the best method of preserving and using them; he will then understand how to make the most of the various sources of manure at his disposal, and he will be enabled readily to save much, that, for the want of such knowledge, would otherwise be lost."

Index of Contents.

Acclimatizing	Cherry-tree gum	Growth of plants
Acid, benzoic	Chloride of sodium	Guano
Acid, carbonic	Chlorine	Gum
Acid, humic	Cider	Gum arabic
Acid, lactic	Citric acid	Gum, cherry-tree
Acid, muriatic	Clay	Gum, resin
Acid, nitric	Clay, burnt	Gunpowder
Acid, phosphoric	Climate, effects of	Gypsum
Acid, sulphuric	Clover, analysis of	Hair
Acid, sulphurous	Coal, ashes of	Hard water
Acid, uric	Coal gas	Hartshorn
Acids	Cocoa-nut oil	Heat
Acids, organic	Cohesion	Heat, latent
Acids, tests for	Coke	Hoofs
Action of plants on	Colour	Horns
the air	Colour of soil	Humates
Active principles of	Colours, changing of	Humic acid
plants	Colours of plants	Humus
Affinity	Colouring matter	Humus, decay of
Air	Combination	Hydrogen gas
Air, bad	Combining numbers	Hydrogen, carburated
Air, good	Combining weights	Hydrogen, sulphur-
Air, inflammable	Combustion	Hydrogen, sulphur-
Alabaster	Combustion, results	Hydrogen, sulphur-
Albumen, animal	of	Hydrogen, sulphur-
Albumen, vegetable	Common salt	Hydrogen, sulphur-
Ale, bottled	Composition of bodies	Hydrogen, sulphur-

Potatoes	Soap-making	Weed-ash
Pottery	Soap-boiling	White of egg
Protoxide of iron	Soda	White lead
Proximate animal	Soda, carbonate of	Wood-ashes
principles	Soda, muriate of	Woody fibre
Principles, active	Soda, nitrate of	Wool
Proportions	Soda, sulphate of	Yeast

London: 3, Charles-street, Covent-Garden; and may be ordered of all Booksellers.

Just Published, 12mo cloth, neat, price 3s.
A TREATISE ON THE GROWTH OF THE PEACH AND NECTARINE ON THE OPEN WALL. By JOHN SMITH, Author of a "Treatise on the Cucumber and Melon."
London: SIMPKIN, MARSHALL, & Co.; and all Booksellers.

MRS. MARCET'S CONVERSATIONS.
CONVERSATIONS ON LAND AND WATER. Second Edition, fcp. 8vo. 5s. 6d. cloth.
CONVERSATIONS ON CHEMISTRY. Fourteenth Edition, 2 vols. 14s. cloth.
CONVERSATIONS ON POLITICAL ECONOMY. Seventh Edition, 7s. 6d. cloth.
CONVERSATIONS ON NATURAL PHILOSOPHY. Tenth Edition, with 14 Plates, 10s. 6d. cloth.
CONVERSATIONS ON VEGETABLE PHYSIOLOGY. Third Edition, with Plates, 9s. cloth.

"Mrs. Marcet's Conversations have long been regarded as the best popular introductions to the science of nature."—*Spectator*.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

BOTANY, GARDENING, AND CONCHOLOGY.
A SCRIPTURE HERBAL; containing an Account of all the Plants, Drugs, Perfumes, and Gums, mentioned in the Bible; with an enumeration of Texts in which they are mentioned. By Lady CALCOTT. Square crown 8vo. with upwards of 120 Wood Engravings, 1l. 5s. cloth.

THE PRINCIPLES OF DESCRIPTIVE AND PHYSIOLOGICAL BOTANY. By J. S. HENSLAW, M.A., F.L.S., &c. &c. Fcp. 8vo. with Vignette Title and nearly 70 Woodcuts, 6s. cloth.

CONVERSATIONS ON BOTANY. With 22 Plates. 9th Edition, fcp. 8vo. 7s. 6d. cloth with Plates coloured, 12s. cloth.

POPULAR CONCHOLOGY; or, The Shell Cabinet arranged: being an Introduction to the Modern System of Conchology; with a sketch of the Natural History of the Animals, an Account of the Formation of the Shells, and a complete Descriptive List of the Families and Genera. By AGNES CATLOW. Fcp. 8vo. with 312 Woodcuts, 10s. 6d. cloth.

A PRACTICAL TREATISE ON THE CULTIVATION OF THE GRAPE VINE ON OPEN WALLS. By CLEMENT HOARE. Third Edition, with Additions, 8vo. 7s. 6d. cloth.

ENCYCLOPEDIA OF PLANTS; including all the Plants which are now found in, or have been introduced into, Great Britain, giving their Natural History, with such Descriptions and Figures, as may enable a beginner who is a mere English reader to discover the name of every Plant which he may find in Flower. Edited by J. C. LOUDON, F.L.S., H.S. &c. New Edition, with a New Supplement, one very large volume, 8vo. with nearly 10,000 Engravings on wood, 3l. 13s. 6d. cloth.
London: LONGMAN, BROWN, GREEN, and LONGMANS.

ADAPTED FOR SCHOOLS, PRIVATE TEACHERS, AND STUDENTS.

COOLEY'S ELEMENTS OF EUCLID, With Explanatory Appendix and Exercises. Price 4s. 6d. bound.

"The best edition of the Elements which has yet appeared,"—*Athenaeum*.

"Cannot be easily surpassed."—*Dublin University Magazine*.

COOLEY'S GEOMETRICAL PROPOSITIONS: a Key to the Exercises appended to the Elements. Price 3s. 6d. bound.

COOLEY'S FIGURES OF EUCLID, with Enunciations. Price 1s. 6d.
London: WHITTAKER and Co.; sold by all Booksellers.

NEW AND SUPERB PELARGONIUMS, CHOICE CALCOLARIAS, PANSIES, FUCHSIAS, and NEW VERBENAS, &c. &c. ALL CULTIVATORS of the above Plants are invited to apply for HANCOCK & Sons' Annual Catalogue, which contains accurate Descriptions of the Newest Varieties in Cultivation, with many other Choice Plants, and the whole at moderate Prices. Wear Nursery, Durham, April 17, 1843.

WIDNALL'S Catalogue of CHOICE DAHLIAS, PELARGONIUMS, PERENNIALS, and Greenhouse Plants, with full descriptions and reasonable prices affixed, is now ready for delivery. Application to be made at the Grantchester Nursery, Cambridge.

MINIATURE GREENHOUSES OF AN IMPROVED CONSTRUCTION. These BEAUTIFUL GREENHOUSES can be had of any form and size; round, square, hexagon, octagon, &c., glazed, japanned, and completely fitted up, at a moderate expense.

ZINC FLOWER-POTS. These novel articles are more handsome and durable than the old red clay pots, and the Plants flourish with increased vigour, owing to the current of Electricity generated by the Galvanic Circuit of Metal, Earth, and Water.

ZINC GARDEN LABELS in great variety. Garden Hand-frames, Cucumber-frames, &c., &c. All kinds of Horticultural Articles, suitable for Noblemen, Gentlemen, and amateur Gardeners on hand, or made to order, at HENRY HEWETSON'S Zinc Manufactory, 57, Cannon-street, London Bridge.

MOXON'S EFFERVESCENT MAGNESIAN APERIENT may be had of all respectable medicine-vendors throughout Great Britain and Ireland, and nearly every part of the civilised world. In all parts it has met with the sanction of members of the medical profession, who recommend it to their patients as the best *Family Purgative* ever discovered. It is of eminent service in pains in the Head, casual or habitual constiveness, Bilious Affections, Nausea, Sickness, Heartburn, Indigestion, Gout, Piles, Fistula, and as an aperient saline draught in all febrile affections. It is an effectual remedy for derangement of the stomach and head, resulting from excess either in eating or drinking. It possesses all the medicinal powers of the most approved saline aperients, without the disagreeable taste which distinguishes medicines of that class, and is so agreeable that even children can take it without dislike. Prepared only by BENJAMIN MOXON & SONS, Chemists, Hull. Sold in bottles at 2s. 9d., 4s. 6d., and 11s. Observe—the genuine medicine has "MOXON & SMITH (then co-partners), Chemists, Hull," engraved on the Government stamp.—Wholesale Agents, BARCLAY and SONS, &c., London.

[BY HER MAJESTY'S ROYAL LETTERS PATENT.]

10 NURSERYMEN, FLORISTS, GARDENERS, and OTHERS.

F. McNEILL & Co., Patentees of Improved Patent ASPHALTED FELT, beg to draw attention to their superior manufacture for ROOFING, which is now so extensively used in lieu of slates, tiles, thatch, &c., for Houses, Cottages, Out-buildings, Verandahs, Sheds, and, in fact, every description of building, and is particularly adapted, from its non-conducting qualities, as a covering and protection for plants, &c. This article is manufactured purposely for securing a perfectly tight roof against rain and snow, and for resisting the external heat of the sun, by its non-conducting qualities. It is impervious to wet, and not liable to crack with changes of temperature. The timber and woodwork may be extremely light, as the weight of the FELT is only 24 lbs. per 100 square feet; and thus, in timber alone, there is a saving of at least one-half; and the expense of the FELT, as compared with tiles, is considerably less than one-half; and with slating the difference is still greater. This article combines economy, durability, and neatness; it is manufactured 32 inches wide, and may be ordered for the length of any building, thereby preventing the necessity of many joinings; and any unpractised hand may roof a moderate-sized house in a few hours.—Parties sending to the manufactory, Lamb's Buildings, Bunhill-row, London, may have it immediately cut off from the machines, and furnished on the instant, so that they pay for no more than is actually required.

The price of Roofing Felt is only One Penny per Square Foot. * * * Samples, with full directions as to its application, sent to any part of the town or country, and orders by post immediately executed.

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row.

TO NURSERYMEN, FLORISTS, &c.—The SOCIETY for the ENCOURAGEMENT OF HORTICULTURE and FLORICULTURE in Manchester beg to announce that they will be glad to receive (carriage-paid), any new seedlings of Flowers, (cut specimens,) Plants, Fruits, or Vegetables, for the purpose of making them generally known, aiding their circulation, and giving that encouragement to merit which hitherto, from a want of personal inspection, has frequently been misplaced, much to the injury of the raisers of Seedlings. Parties desirous of availing themselves of such a means may forward their parcels addressed, "For the Floricultural Society, care of Mr. ROBINSON, Falsstaff Market-place, Manchester."

N.B.—The above Society meet every Saturday, so that specimens sent for their inspection ought to be delivered as above not later than 12 o'clock at noon on that day.

FOR 3l. 15s.
A SEVEN-GUINEA GARDEN-ENGINE, light, powerful, and of best make, with appurtenances complete: No. 12, Halton-street, Cross-street, Islington.

TO LADIES.

ROWLAND'S KALYDOR.—Under the special Patronage of Her Most Gracious Majesty the QUEEN and the Royal Family.—This elegant and fragrant preparation thoroughly eradicates all Pimples, Spots, Redness, Tan, Freckles, and other Defects of the Skin; heals Chilblains, and renders a chapped and rough skin pleasantly soft and smooth. It imparts a youthful rosy hue to the Complexion, and renders the Arms, Hands, and Neck delicately fair and soft. CAUTION.—Much pernicious trash is now offered for sale as "KALYDOR;"—it is therefore imperative on Purchasers to see that the words "ROWLAND'S KALYDOR" are printed on the wrapper.—All others are "GROSS IMITATIONS." * * * To protect the Public from Fraud, The Hon. Commissioners of Stamps have authorized the Proprietor's Signature to be engraved on the Government Stamp, thus—"A ROWLAND and SON, 20, Hatton Garden," which is affixed to each bottle. Price 4s. 6d. and 8s. 6d. per bottle, duty included. Ask for ROWLAND'S KALYDOR. Sold by them, and by Chemists and Perfumers.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

The Gardeners' Chronicle.

WHEN buildings for the shelter of plants in winter were first thought of, large rooms with upright windows were the means employed; and hence the old-fashioned conservatory (or hibernatory), such as still exists at Kensington Palace, Hampton Court, Kew, and other old gardens, and as was but a few years since contrived in the ditch of Windsor Castle terrace garden. But as gardeners gained a better insight into the nature of plants, they found that light was as necessary to healthy vegetation as protection from cold; and then arose the glass sheds with lean-to roofs. Afterwards, when Priestley, Senebier, and others, had explained the nature of the solar action upon plants, ingenuity was taxed to secure the greatest possible quantity of light in plant-houses; first, a southern aspect was regarded as indispensable; then was calculated the angle of slope which would enable the sunbeams to strike the glass roof most directly at all seasons; next, rafters of wood were regarded as too heavy, and iron was substituted; and then came curvilinear roofs, with all that lightness and beauty of appearance for which they are so well known.

But there has long been an opinion in the gardening world that span-roofed houses are in some respects better than lean-tos; probably because of the impossibility of turning to good account the back wall of a common greenhouse; and buildings of that description are now becoming common. It has even been doubted whether the large quantity of light, which modern inventions are specially directed to secure, is as advantageous to plants as has been supposed. But common sense tells us that under no circumstances can plants in glass houses receive so much light as nature would, with certain exceptions, give them out of doors; and experience shows that, with proper management, the health of plants is generally in proportion to the amount of light which they receive. Many plants, indeed, grow naturally in woods and secluded places, and to them bright sun-light is injurious; of this kind are Ferns and most Orchidaceous plants. But they form the exception, rather than the rule, and in no degree invalidate the law, that if plants are to be kept in the best possible health, they must have the greatest possible natural light.

It may, however, happen, that strong light is dangerous to all plants under particular circumstances, just as the most wholesome food may occasionally be prejudicial to the human system. We know, for instance, that plants that have been frozen, and which perish, when rapidly thawed by sudden sunshine, will not die if the thawing is slow and gentle. All gardeners are, or ought to be, aware of that fact; it has been certainly ascertained in so great a variety of cases as to admit of no doubt; it explains why tender plants thrive better within the shadow of north walls, or at the north side of a shrubbery, than when they are placed in warm and sunny nooks. The cause of the phenomenon has been discussed in a report on the Effects of the Frost of the Winter of 1837-8, published by the Horticultural Society (*Transactions, second series, vol. ii. p. 305.*) We find that Mr. James Macnab, the skilful curator of the Caledonian Horticultural Society's garden, has suggested that, on this account, span-roofed greenhouses which run north and south, and consequently face east and west, are better than lean-tos with a southern exposure. From an excellent report in the *Edinburgh Advertiser* we extract the following particulars.

In the opinion of Mr. Macnab the span-roofed house running north and south is not only better in summer, but is still more advantageous in winter.

For example, in a span-roofed house, extending north and south, during the stormy weather of winter air can be freely admitted, from whatever direction the wind may blow, there being always a lee-side where sashes can be opened. In frames and pits, where top air alone can be given, plants suffer greatly from damp; but in a span-roofed house, the circulation of air may be constantly kept up so as effectually to prevent damp. For such a greenhouse fire-heat is scarcely at all required; for if there be a free circula-

tion of air during the autumn and winter months, and if the tables or shelves be carefully kept dry and clean, and water be sparingly given to such plants only as require it,—cold, even though it should extend to the occasional freezing of the surface-soil of the pots, will do less injury to most plants than the application of fire-heat. Mr. M'Nab has found the same kind of plants to become soft, spongy, and drawn up, in the lean-to house, which continued hard, woody, and dwarfish in the span-roofed house. Last season he kept a number of fine Cinerarias and Pelargoniums in houses of both forms. After a severe frosty night in January, they presented in the morning much the same appearance in both houses, the leaves drooping and being covered with a white rime, resembling hoarfrost. By ten o'clock the sun shone forth. The plants in the lean-to house were subjected to the full influence of the mid-day rays; and, although air was given, they blackened and perished. In the span-roofed house, extending north and south, the influence of the sun was much less felt; for as he proceeded towards the meridian, the intercepting astragals and rafters necessarily formed a screen or shade; and air being given, the plants survived, and soon recovered.

"Amateur cultivators, who like to possess a small greenhouse, and to manage it for themselves, ought to prefer the span-roof form; and from Mr. M'Nab they may learn this important lesson—that by an early and anxious application of fire-heat, in a frosty night in the beginning of winter (a common fault), they not only incur unnecessary trouble and expense, but do real injury to their plants, which would suffer little from cold, provided air were made to circulate freely among them, and damp were guarded against. The beautiful tribes of Erica and Epacris will suffer little or nothing in a cold greenhouse, although the thermometer in the open air may indicate several degrees below freezing, while the sudden application of fire-heat will probably kill them.

"Mr. M'Nab mentioned that the superiority of the span-roofed form was strikingly exemplified in the Society's Garden about the middle of February last (1843), when the self-marking thermometer in the open air, during different nights, indicated 20°, 18°, and even 10°, Fahr. During these frosts no heat whatever was applied to the span-roofed house, which contained a general collection of soft and hard-wooded greenhouse plants. On the mornings of the 17th and 19th February, the mercury in the thermometer within the house stood at 25°, or seven degrees below freezing; yet only two or three plants, which were standing near the upright glass of the south end of the house, and were thus exposed to the mid-day sun, suffered from the intense cold to which they had been subjected. The temperature in the span-roofed house always remained much more equable than in the lean-to house. This was signally remarkable at 1 P.M., of the 14th February, when the thermometer in the open air indicated 56°, in the lean-to house 70°, and in the span-roofed house 43°. In the lean-to house, therefore, where the whole glass roof was fully exposed to the sun's meridian rays, the temperature thus becoming 14 degrees higher than the open air, and 27 degrees higher than in the span-roofed house.

"Having enlarged on the advantages of this form of greenhouse during winter, we shall only briefly state, in conclusion, that, in the warm weather of summer, the span-roofed house admits the freest possible circulation of air, by means of upright sliding sashes on both sides of the house; while the rafters and astragals of the glazed roof break and intercept the sun's rays, and help to shade the plants from their direct influence; and that in such a house the plants, instead of being drawn up and weakly, continue firm and bushy—that they remain much longer in flower—and that the colours of the flowers are generally brighter."

Although, as is apparent from the observations with which we introduced this matter, we do not feel disposed to assent to the justice of some of the latter statements, we freely concede that north and south span-roofed houses are very convenient, and that, in so far as abating the injury from frost is concerned, they are far better than lean-tos. But we must at the same time caution our readers against assuming, that, because such span-roofs have these merits, they may be applied to all purposes with advantage. We do not think they can be used at all for early forcing, and we much doubt whether they will suit any kind of stove plants, except Ferns and Epiphytes, or species with similar habits.

If the intersection of a country by good roads, formed upon correct principles, be—as it surely is—one of the greatest means of rendering the resources of a country available, and of civilising its inhabitants, so, on the other hand, is a universal and consistent construction of water-courses, to drain the land, second only to the former in importance. If the first enables the inhabitants to move their produce freely from point to point, the second places within their reach the means of obtaining the greatest attainable amount of

produce to be moved: if the one softens their manners by the facilities it gives to the spread of metropolitan refinements, the second no less efficiently contributes to their comforts by the removal of insalubrious vapours. The drainage of a country, however, not being attended by such self-evident advantages as its high-roads, is much more slowly appreciated; and it is only when the exhausted soil refuses to yield the tenant and the landlord their accustomed profits that its real importance begins to be felt. That people are now aware of it in this country is sufficiently shown by the many drainage associations which are rising into vigorous existence.

But in an old and densely-peopled country like England, it will always be found that the very best measures are thwarted by conflicting wishes or personal prejudices. If one man is enlightened enough to understand his real interests, his neighbours may not have arrived at the same point of information, and their opposition will then thwart his measures wherever co-operation is required of them. We have no right to do men good against their will, still less are we entitled to compel others to enter into plans which they dislike, however advantageous they may be to them. And hence a great difficulty in carrying out any general measure of public utility: so great, indeed, that nothing short of legislative interference can remove it.

The general drainage of the country is exactly such a case. A man who chooses to sow his garden with Blackberries can do so if he likes, and his crop will be neither better nor worse for his neighbours' acts. If he succeed, their assistance was not necessary to enable him to do so; if he fail, his ill success is nothing to them. Cropping, then, and all the general details of cultivating the soil, are without the pale of legal interference. But drainage is a very different affair. A man may be anxious to drain his garden, but his neighbour B cares nothing about the matter, or perhaps has a spite against him, and will neither help him nor allow him to do so. A's land is a little higher than B's, or B lies between A and the outfall, and then the opposition of B puts a stop to A's plans. A is an honest man, working hard for his living, and perhaps with a family suffering in health from the swampy nature of the soil. B, on the other hand, is a lazy careless fellow, and does not know the look of a doctor's bill; but B's acts compel A to put up with scanty crops and perpetual sickness. This is so manifestly unjust, and so frequent of occurrence, that the law has long since attempted to provide a remedy—with what ill success the state of the whole country can tell.

It is, then, to a general Drainage Bill that we should look for that assistance which the circumstances of the case demand—to some enactment of a comprehensive character, which should merge all private and petty interests in the greater exigencies of the state, and which, compensating those who suffer, and trenching unnecessarily upon no man's right, should secure the effectual intersection of the country by water-courses, that should be as much public property as the turnpike roads. Without pretending to go into the details of such a Bill, we may be permitted to state what we conceive should be its general features. A board of engineers should be appointed, to direct simultaneously all the works that are to be executed; they should determine the lines of new water-courses, and the improvement of old ones; they should have power to take up land wherever required for their operations, compensating the owners; and to compel commissioners of sewers, and other town authorities, to adjust their drains, wherever practicable, to those of the country. No applications from persons desirous of promoting drainage should be waited for; no deposits of money should be required: but the work should be carried on by public officers, for public interests, and at the public expense. No surveys would be required, for the Ordnance maps would supply all the data that are wanted. The cost of the operations might, in the first instance, be defrayed by Government, and be repaid by county rates, or by taxes levied upon those who make use of the public water-courses for their own advantage. The district surveyors might be charged with the duty of keeping all the water-courses in repair; and the cost of the operation might be defrayed upon the same principle as that now pursued with the high roads. If this were done, the whole island would be cut into a net-work of efficient public water-courses; and then the person who wished to drain his land might do so, while he who proposed to live in a quagmire would have the advantage of enjoying it without interference, and without the disagreeable compulsion of exchanging his own 30 bushels of Wheat an acre for his neighbour's 40.

It may, at first sight, appear unreasonable to levy a county rate to defray the expense of works which are only advantageous to those who have farms or gardens; but the benefit of general drainage would not be thus narrowly limited. Its inevitable effect would be to render all the drained districts more healthy, and to improve their climate: now this is a great advantage,

common to all, and one for which all should pay; besides, an increased productiveness of the land is a general, as well as a particular benefit. These are additional reasons why a general drainage, defrayed at the public expense, would, in our view, be preferable to all operations of a partial character, the whole cost of which would necessarily be thrown upon the land.

A bill which proposed such ends would be of inestimable value; and we had hoped that Mr. Pusey's, which has lately been brought into Parliament, would have been something of the kind. We regret, however, to find that it is of quite a different description. No general plan of drainage is proposed, but the work is to be executed in detail, according to the applications which may be made to a Board of Commissioners by parties interested. We greatly fear that the effect of this would be to increase the general expense and to diminish the general benefit; for it can be hardly possible to determine upon any consistent plan of operations where only a small part of a given district is to be acted upon. If, however, this fundamental error is left out of consideration, Mr. Pusey's bill appears to promise a certain amount of advantage. It is very carefully drawn, has evidently been extremely well considered, and shocks as little as possible those interests with which we suppose it is necessary to be gentle, if it is to be got through Parliament. Instead, therefore, of insisting any further upon our own views, we shall endeavour to point out in what manner Mr. Pusey's bill may, as we conceive, be improved in its details; for, in some respects, it seems open to practical objections, with reference to the very objects it is intended to attain. But this we must defer till another week.

WITHOUT interfering too much with the management of allotments as to cropping, which may generally be left to the good sense of the tenant, it may not be amiss to give a few hints, the result of experience, which may be useful to those who have never cultivated land on their own account.

The most natural course for an inexperienced labourer to pursue might be to imitate, on a small scale, the operations of a larger farm; but he will soon find that in this way he will have but a small profit, and, in fact, be poorly paid for his labour. He must raise such produce as he and his family can consume, and which will maintain some pigs. His crops must not occupy the ground long, and he must have several in succession the same year. Those which require minute attention, in weeding, hoeing, &c., and which the farmer cannot attend to so well, from a want of cheap labour, suit the labourer best if he has a family of children, who can do this for him without cost.

The nature of the crops must depend on the soil. Potatoes, Cabbages, and Turnips, can be raised in almost any soil which is well cultivated; the best of these can be consumed by the family, the remainder will feed the pigs. Beans and Barley may be raised in small quantities to fatten a pig for winter provision; there would not be much profit if they were sold. If Wheat is grown, it must be of the very finest sorts, carefully dibbled and hoed, and sold for seed, so as to sell much above the market-price. Flax may be advantageously sown, if he can manufacture it into thread at home, and have it woven for the use of the family; otherwise the labourer cannot compete with the manufacturer. Everything he sells should be of a superior kind, and have been raised with care by the minute attention which women and children alone can afford, whose time is of no value when they are not at work in the fields for the farmer. Let us suppose the soil to be a poor sand on a subsoil of gravel: this will probably not require draining, but may be too dry in summer. The ground should be trenched and well mixed at first, but afterwards it need not be stirred much, for this will only cause it to be too loose, and let the moisture evaporate. If clay can be procured near, whatever be its nature, it may be wheeled on, and will do good by consolidating it. Marl is still better, but this is more seldom at hand. If its texture cannot be improved by some such means, it must be frequently watered with the richest liquor at hand. Soapsuds, urine, the draining of a dunghill, will tend to consolidate it, while they will encourage the growth of whatever roots may be in the soil, which, decaying there, when dug up, will fill the interstices of the soil with organic matter, and soon improve it. The dung used should be well rotten and moist; that of cows will be the best, if it can be procured. The only Corn crops which may be sown on such a soil are Rye and Buck-Wheat, which will thrive in it. Turnips may be sown as soon as the Rye is cut, the ground being only slightly dug, or the stubble cut up by a heavy hoe. They must be watered carefully till they come up, and invigorated with liquid manure: a small tank is consequently essential; a good crop may thus be obtained of the quick-growing sort, called the nimble Turnip, before winter. The Buck-Wheat may be sown after early Potatoes; and if the seed

does not ripen, the haulm may be dug in before the flower is faded, and this will be almost as profitable, by giving a manuring for the next crop, as if the seed had come to perfection. Once in the way of raising successive crops, the labourer will soon find out himself what is most profitable.

A heavy tenacious soil, if more productive, requires much more labour in trenching, digging, ridging up for winter, and continual weeding; but it is more easily converted into a good mould than a loose sand, and the crops are surer. The great object is to dissipate the moisture by admitting the air as much as possible. Beans find here their proper soil, and so do Cabbages. Potatoes will succeed, after good cultivation, but not so readily as in a light mould; and as the crops are usually later, it is more difficult to have two in the same season. High beds, with deep intervals, are essential; for the surface of the beds should never be trod upon, unless it be in very dry weather. Choice sorts of Wheat and Oats may be raised for seed, with a little attention, and will soon be eagerly purchased by the farmers. Mangel Wurzel and Swedish Turnips may be planted in spring to produce seed, and the little children, by keeping off the birds when the crop ripens, will come in for their share in the labour. We suppose that the labourer has a small vegetable garden near his cottage, which serves his family, otherwise he must convert a portion of his allotment into a garden. It is too much the custom of the English labourer to live on bread and meat only, without much cooking or variety; whereas the Continental labourer has his vegetable soups and stews, which, eaten with bread, are wholesome and savoury, and much more economical than bread and meat alone. His garden supplies him with a variety of roots and vegetables which are unknown to the English cottager. The thick-leaved Beet, for instance (*Beta cicla*), which grows abundantly in the gardens in Germany, and the Leek, which is nearly allied to it, are a great resource to the cottager, as well as the close-headed Cabbages. With a small piece of salt pork, and plenty of these vegetables stewed slowly together, and properly seasoned, a most wholesome and palatable dish is prepared. We cannot enter into particulars, but Paxton's Cottage Calendar, with two cheap tracts published for distribution by the Royal Agricultural Society of England, one on the Management of Cottage Gardens, and another on Cottage Economy, may be recommended to those who have let allotments, and who are desirous of improving the condition of the Agricultural labourer.—M.

We perceive, by an advertisement in this day's paper, that a new Society has been organised in Manchester for determining the merits of seedling flowers. It can hardly fail to meet with encouragement, if it is conducted with fairness, and if its judges are not only well acquainted with the properties of flowers, but of unimpeachable integrity. This is the main point, attention to which may ensure success; but the neglect of which is certain to defeat the purposes for which the Society is established.

ON THE TREATMENT OF SCARLET PELARGONIUMS.

THE first week in March, I commence propagating scarlet Pelargoniums, by procuring cuttings from the extreme ends of the branches of old stunted plants, taking them off close below the fifth joint, and inserting them either in brick-dust or in equal proportions of finely-sifted leaf-mould and light loam, in shallow pans which had previously been plunged in a warm frame until their contents had a genial warmth and moisture. These, when filled, are immediately taken back to the frame without receiving any water, as I consider that to be the cause of their turning black at the surface of the soil, especially when the nights are long and cold, and the atmosphere saturated with moisture; they also strike root sooner without it.

Cuttings are often much injured by the vapour which condenses on the glass and falls down upon the leaves in large drops: to obviate this, I place coarse brown paper above the cuttings in the morning, when the sun's rays first strike upon the frame; the lights are then turned over, wiped, and tilted at the back. After being freely exposed, they are, when dry, reversed; the paper is taken out and placed upon the glass, and the lights are shut down tight, as a close, moist atmosphere is necessary. When, however, a continuance of dull or wet weather occurs, and the lights cannot be turned, coarse brown paper which absorbs the superincumbent moisture, is placed inside the frame. When firmly rooted, the plants are dipped in tepid water and planted singly in thumb-pots, in a soil composed of $\frac{1}{2}$ sand and the other half of finely sifted leaf-mould and light loam, which had been previously warmed in the frame. Moss is placed at the bottom of the pots, which are again plunged in a bed of the same temperature without receiving any water. As soon as the plants require shifting, the soil is shaken from their roots, they are dipped in water, and repotted in clean pots of the same size, and treated in precisely the same manner as before. By repeatedly shaking off the soil, a mass of fibres is obtained in small compass, and the soil used being poor, the plants grow little, although they make numerous rootlets. By placing Moss at the bottom

of the pots, the roots run freely amongst it, and are less liable to be broken; and by dipping their roots in water the soil adheres more firmly to them when they are fresh potted.

As soon as a mass of fibres is formed and the plants are to be shifted into 32-sized pots, they are planted without the mould being shaken from them, in a soil composed of equal portions of fresh green turf from an old pasture and half-decayed cow-manure, chipped with the spade and not sifted; plenty of drainage is given, with very little water at first; the shoots are all pinched off above the third leaf, and the plants are plunged again in bottom-heat until firmly rooted, when they are placed near the glass in a cold pit, and liberally supplied with strong liquid manure.

Towards the middle of June, the plants are plunged out of doors in a rather dry, sheltered spot, but freely exposed to the sun; here they will grow shorter jointed, and they can be more copiously supplied with liquid manure than in a wet situation. The required number for decorating the greenhouse is set apart from the rest, and the top shoot of each is trained perpendicularly, until three perfect leaves are formed; the shoots are then headed down to the third leaf, and the latter also are pinched off at every second; the plants are turned, in order that they may not grow one-sided, and the fibres are removed whenever they make their appearance through the holes in the bottom of the pots.

The plants for the flower-garden are trained so as to cover the greatest amount of surface; all above the third leaf are pinched off, and they are allowed to grow one-sided. In the second week of August they are taken up and placed on a hard surface, sheltered from strong winds and heavy rain, but freely exposed to the sun, giving nothing stronger than rain or pond-water, and pinching off the flower-buds as they appear. The ends of the branches are then allowed to grow, but the plants are treated in every other respect as in the two previous months. By the above mode of cultivation, they accumulate in one season the sap which they expend in bloom during the next; their stems become firm and woody, their leaves harder and less succulent, and they are better able to stand a severe winter without fire-heat, than when allowed to grow luxuriantly until they are placed in their winter quarters.

Upon the first signs of frost they are placed in rows at right angles on dry coal-ashes in a cold pit, with their tops one foot from the glass, and are protected from frost, first, with one mat tightened and supported one inch from the glass, with two wooden spars placed across the lights at top and bottom, upon which dry hay is laid to the thickness of six inches, and above that another wetted mat fastened securely down on all sides. In this way I found no difficulty in keeping out frost during the severe winters of 1839 and 1840. When the out-door thermometer stands about 40° in the shade, the lights are taken off, so that the wind may blow freely amongst the plants; all decayed leaves are taken off; and as this is their season of rest, little or no water is given. The sun is only allowed to shine on them for a short time, to dry up any dampness in the frame; in fact, the plants are kept as dormant as possible.

About the beginning of February, the greater part of the earth is washed from the roots of the greenhouse plants, by laying them on a hard oblique surface and pouring water upon the balls, from a watering-pot, held several feet above them. They are then planted in clean pots of the same size, in a soil composed of leaf-mould, light loam, and sand, in equal proportions, not sifted. The tips of the shoots are pinched off and the pots are plunged in gentle bottom-heat without any water being given. The dormant buds are then excited, and the plants become covered from bottom to top with leaves. When the pots are filled with roots, the plants are shifted into 6s, in a mixture of fresh green turf and half-decayed cow-manure, not sifted; plenty of drainage is given, and the pots are plunged in bottom-heat until they have rooted in the fresh soil. They are then placed in the greenhouse near the glass, and rain or pond-water is given with caution, until the pots are filled with roots, when they are liberally supplied with liquid manure. The soil is then suddenly allowed to become dry, to check the luxuriance of the plants and induce them to form blooming buds. When these appear, the tips of the shoots above them are pinched off, a top-dressing of sheep's-dung in a fresh state is given, and they are copiously supplied with strong liquid manure.

Early in April the roots of the plants for the flower-garden are washed and potted in poor, unsifted, sandy soil, and plunged in bottom-heat; when firmly rooted they are placed in a cold pit near the glass and liberally supplied with liquid manure. In the beginning of June they are planted out in the flower-garden, being laid on their sides with the fewest leaves undermost, pegged down to the surface, and so placed that the branches of one covers the space occupied by the roots of another. In this way they produce a striking effect, by having numerous heads of bloom standing at a uniform height above the foliage, and they are less subject to be destroyed by wind.

ON VEGETABLE MANURES.

By PROFESSOR CHARLES SPRENGEL. (Translated from the German.)

(Continued from page 244.)

h. Vetch-Straw.—100,000 parts of air-dried ripe Vetch-straw consist of 41,990 woody fibre, 1,320 parts of wax, and 56,990 parts of substances soluble in water, and diluted ley of potash. The hay of Vetches contains, according to Boussingault, in 100,000 parts, 1,570 parts of nitrogen; consequently, the straw will not contain more than 1,000 parts.

100,000 parts of Vetch-straw contain of mineral substances:—

0.442	parts of silica
1.955	lime
0.324	magnesia
1.810	potash
0.052	soda
0.015	alumina
0.009	oxide of iron
0.008	oxide of manganese
0.280	phosphoric acid
0.122	sulphuric acid
0.084	chlorine

5.101 parts of mineral substances.

100 lbs. of Vetch-straw contain, therefore, more than 4½ lbs. of those mineral substances which exercise the greatest influence on vegetation. If we consider, moreover, that in 1,000 lbs. of Vetch-straw there is 10 lbs. of nitrogen, we shall see that one acre of land will obtain from 3,000 lbs. of straw, besides the 135 lbs. of very important mineral substances, 30 lbs. of nitrogen, which cannot but assist the growth of crops planted after being manured with Vetch-straw. This straw, however, is too good a fodder to be used as litter, so that it is only the more woody parts, rejected by cattle, that will reach the dunghill. In the field, it is more quickly decomposed than Pea-straw.

2. *The Herbage of Potatoes.*—100,000 parts of the air-dried herbage of ripe Potatoes contain of mineral substances:—

0.801	parts of silica
2.918	lime
0.488	magnesia
0.138	potash and soda
0.052	alumina
0.058	oxide of iron
0.044	oxide of manganese
0.032	phosphoric acid
0.245	sulphuric acid
0.010	chlorine

4.786 parts of mineral substances.

Since 100 lbs. of ripe Potato herbage contain nearly 4 lbs. of mineral substances beneficial to vegetation, it follows that this kind of haulm is more valuable than it has been hitherto considered, and that it ought to be conveyed either to the stables or the dunghill, more especially as it is rich in nitrogen; Boussingault having found 23 lbs. of nitrogen in 1,000 lbs. of dry Potato-straw. Therefore, from 3000 lbs. of Potato haulm one Magdeburg acre of land will receive 69 lbs. of nitrogen, which, as we shall see under the head of mineral manures, is, by itself, a powerful manuring agent. The green herbage of Potatoes contains still more mineral matter, especially potash.

The woodiness of Potato-straw renders it difficult to decompose. If it is placed at the bottom of the dunghill, where it is too wet, and excluded from the action of the atmosphere, it will be taken to the land in an undecayed state. It is, therefore, better to pack it in the middle of the dunghill, so that it may become sooner decomposed by the heat of fermentation.

3. *Rape-Straw.*—100,000 parts of air-dried straw, with the shells of the ripe fruit, contain of mineral substances:

0.080	parts of silica
0.810	lime
0.121	magnesia
0.883	potash
0.550	soda
0.090	alumina, oxide of iron, and manganese.
0.382	phosphoric acid
0.517	sulphuric acid
0.440	chlorine

3.873 parts of mineral substances.

100 lbs. of Rape-straw, therefore, contain more than 3½ lbs. of powerful mineral manures. It is more especially valuable on account of its great amount of chlorine, soda, sulphuric acid, phosphoric acid, and potash, and therefore deserves to be at least added to the dunghill, if it is not used for litter. The proportion of nitrogen in Rape-straw has not been yet ascertained; but judging from analogy, we may assume, that it will not be less than that of Bean-straw. As the straw of Rape is very woody, and consequently difficult of decomposition, it is best to place it in the midst of the dunghill alternately with layers of dung.

(To be continued.)

AMATEUR'S GARDEN.—No. XVI.

As the article on the "one-shift system" of potting plants appears to be exciting attention, I think it right to state, that so far from recalling anything that I have written on the subject, I am daily more convinced of the superiority of the practice. The only point that I need notice in the remarks of "Observer" is his objection to the use of the small inverted pot in the draining of the large one. The same objection was urged against it by several of my friends before the article was written; but as I have used it during the last seven years, to the extent of some thousands of pots, and in various sizes, from large Orange-tubs to small cutting-pots, without in one instance finding a plant injured from being water-clogged, I think I am justified in recommending it. A few days back I had an opportunity of examining some Pine plants that in the autumn were drained with the inverted pots, as a guard against worms, and I never saw plants better rooted, or roots in a more healthy state. In this case the inverted pot was used without any other drainage, and the soil filled in to the bottom of the pot, and there was no appearance of stagnation of the water in the pot.

Indeed, I doubt whether we yet fully appreciate the utility of the inverted pot; and while Observer and others may remain sceptical, I am sanguine in being able to prove that small hollow cones, passing nearly through the soil, will be of the greatest utility in large pots.

While on this subject I may state that I did not recommend it as a cure for all sorts of evils, nor with the expectation that every one who tried would be successful. Certainly, the man who cannot grow a plant tolerably well in a small pot, or does not understand the why and wherefore of his proceedings in the management of the large one, will never perform any extraordinary feats with it; but I believe that any person who will take the trouble to make himself thoroughly acquainted with the principles upon which success is founded, as I have endeavoured to explain them in my former article, and as they are exemplified in some leading and other articles, will grow plants better than they can be grown in any other manner.

That many will fail, I am fully prepared to hear, and should a majority not succeed I should not be surprised, but this will not be from any fault in the system, but from its not being properly carried out. All good cultivators acknowledge that it is a good system for most plants; every day experience proves to us that plants grow the best when planted out; therefore, that system which approximates the nearest to nature, which gives a fine porous body of healthy but not stimulating material for the roots to work in must be the best, because it is the nearest approach to nature that we can make in our pot management. It is of the first importance that the pots should be properly drained, and the soil used rough and turfy. If these things are attended to, and the plants cautiously but properly watered, there is no fear of failure.

—W. P. Ayres.

TRELLIS FOR CLIMBERS.

TREATMENT OF ROSE DE LISLE FOR STOCKS.

ABOUT the first week in August cuttings of the half-ripened wood should be inserted in equal proportions of finely-sifted leaf-mould and sand, placed on a gentle hot-bed, and shaded from the sun. When firmly rooted, they should be potted into large sixties, in a soil composed of chopped turf, leaf-mould, and sand (in equal proportions, and not sifted), and plunged in bottom-heat in a close frame, giving them but little water, and completely shading them from the sun until they are firmly rooted in the new soil; air may then be given by degrees, with more water and less shading; and when the plants can bear the sun without their leaves becoming flaccid, they should be placed in a cold frame, from which the lights are removed during the day, and tilted, both at back and front, by night, when the weather is favourable.

Throughout the winter they will require protection in severe frost, and towards the latter end of April they should be planted out in rows in rather poor sandy loam, having their roots barely covered. The plants must then be pegged down, which will cause them to send up suckers; the strongest on each plant must be secured to stakes, and all the rest cleared away. The soil from both sides of the rows must be taken out about a foot in width, and two inches deep, close to the plants; its place must be filled with rotten dung, beat firmly down, and covered with soil.

Under this treatment the plants will grow freely, and make numerous fibres. Early in the succeeding spring, the tops of the branches must be cut back, more or less, and the ends of the young shoots pinched off, so as to cause numerous leaves at the extremity of the stocks. As soon as buds can be procured, and the bark separates freely from the wood, the stock should be budded in the common way; and three or four days after, the ends of

a cord to be fastened one foot below the inserted buds, and after the extremities of the stocks are bent down, the other end of the cord is to be affixed to them, so as to form a semicircle, with the buds in the centre on the upper side. By this concentration of the sap, the buds are almost immediately excited, and if neatly inserted and carefully bent, nineteen out of twenty will succeed. Two or more varieties can be grown with equal success on the same stocks, by merely giving them a wider circle.

When the buds have formed about five leaves, the head of the stocks should be cut off close to the buds; they may then be tied up perpendicularly. The young shoots must be compelled to form heads, by pinching off their extremities. The bandages should be loosened by degrees, to allow room for the stocks to expand.

As the De Lisle Rose is easily propagated, no lover of standards should be without it; it is, moreover, quite as hardy as the common Dog-Rose, but superior to it for the above purposes, as it can be budded from six inches to six feet high, with more certainty of success, and it is also less liable to send up suckers. It answers equally well for forcing, and for growing in the open air.—Robert P. Drummond, Foreman, Minto House, Roxburghshire.

ON THE CULTIVATION OF THE ORANGE-TREE IN FRANCE, IN THE 16TH, 17TH, AND 18TH CENTURIES.

DURING the eighteenth century, the art of gardening made considerable advances under the especial patronage of Louis XV. This prince, who was fond of botany, in which science he had acquired much knowledge, formed at Trianon a private garden, composed of valuable plants and shrubs, which he amused himself in cultivating. This taste in the king raised a spirit of emulation among the royal gardeners, which became of the highest service to the art. Every year, by his orders, seeds, new trees, and vegetables, were obtained from England, Holland, and various parts of the world; and France, perhaps, acquired more in this way during his reign alone than she had done under those of all his predecessors put together. He also established near Paris, and in all the provinces, royal nurseries, cultivated at the expense of the State; from whence, with the consent of the superintendents, were distributed gratuitously to private persons such seeds, plants, or trees, as were considered beneficial, or most proper to bring into general use. It was in his reign that the hothouse and the stove were first brought into full operation. These are sufficiently curious to deserve a more detailed account. The great expense of the war in 1781 caused many of the above establishments to be given up, that at Vincennes only remaining at the end of the eighteenth century.

The inhabitants of the South of Europe must of necessity rank first in the art of pleasure-gardening. Nature having given them a more serene sky, a milder temperature, a beautiful verdure, both early and continuous, seems to have left nothing to the attention or care of man but the taste for decoration. Thus, almost everything has been invented that could enhance the graceful or luxurious ornament of those delightful spots. But the more useful discoveries have been made in northern countries, and it is easy to conceive that the necessity experienced to struggle constantly against the severity of a cold climate and uncongenial soil required the greatest industry.

When the Orange-tree was first introduced into France and attempted to be cultivated, it became a matter of serious consideration as to the best means of protecting it from destructive frosts during the winter. It was then planted in tubs, in large boxes, or in glazed earthenware pans, which were placed in store-rooms or cellars as soon as the cold weather commenced. This mode, however, entailed considerable expense and inconvenience; and it had become so desirable to induce this fine tree to grow freely like others, without extraordinary care or attention, that some persons were found sufficiently enterprising to plant them in the open ground, in the form of groves or thickets. The warmth of the climate in the South of France caused these experiments to succeed. Beaujeu, in 1551, represents Provence, and especially the coast of Hières, to abound with Orange groves. The same custom still exists; the inhabitants of Hières, Grasse, Toulon, and several other districts on the sea-coast, cultivate Orange-trees as formerly, in the open ground; and it is said that those trees are able to bear a severe frost without sustaining any injury.

Those in the Northern Provinces who attempted the same cultivation found that much care was necessary, and that they must be protected under huts covered with mats, or under conical coverings made of cork. "Good gardeners," says Liebaud, "always took care, previously to covering them up for the winter, to cut off all the flowers, buds, and even the new and tender branches."

There were some groves of Orange-trees in the garden at Trianon, at the end of the seventeenth century, which had been planted there in the preceding century, and were considered great curiosities. La Quintinye observes, that they had succeeded in giving to the cases used in covering them forms and shapes of the most pleasing decorative character. Experience nevertheless proved that such means were not sufficient to protect the plants in hard winters, and that the case, besides the inconvenience of excluding the revivifying influence of the sun, had also the effect of smothering the plant, by entirely depriving it of air. It was not easy at first to find a remedy for these disadvantages. The Elector Palatine, however, in the sixteenth century, applied one of a very expensive character. He built a large movable wooden gallery in his gardens at Heidelberg, within which was inclosed the entire range of his Orange-trees: this gallery was furnished with glazed frames or sashes, through which the

sun could penetrate; and it was also heated by stoves in the German fashion. In the spring, when the weather became mild, this temporary erection was removed, and not replaced till the autumn. By this means he was enabled to enjoy an agreeable promenade amidst flowers and fruits at all times of the year. Liebaud and Olivier de Serres both speak highly of the invention, and describe it as most wonderful.

The former writer says, "Nothing of this kind was done at the Court of France; no doubt the low ebb of the finances of our kings, crippled as they were by foreign and civil war, was the reason. But he adds, that some of the nobility had movable or flying galleries, like the Elector at Heidelberg, less magnificent it is true, but constructed upon the same principle."

More economical methods were also employed, one of which is thus described by Liebaud:—"Plant your trees," says he, "near a south wall, which may be little better than 18 feet high; at 12 paces distance raise pilasters or stone columns, 13 feet high and 8 feet apart, connecting them by a small joist, by way of architrave; then cover the whole with an inclined roof, one end of which rests upon the joist, and the other against the wall. In the south it will suffice to close your Orangery on both sides, leaving the front facing the south entirely open. It would be better also to have small lights in the roof, in order to facilitate the entry of the sun; but in the north the whole building must be inclosed, and it must be heated either with a coal fire or small faggots of wood, which consumes without smoke, unless you choose to imitate the munificence of the Elector Palatine. At the return of spring you may remove this apparatus, and your trees may remain exposed."

P. Ferrari, an Italian Jesuit, after eulogising in his work the French people for their industry and skill in having found means not only to preserve their Orange-trees, but even to make them bear flowers and fruit in a climate not adapted for the tree by nature, adds, "In the month of October they were removed into a large building erected for the purpose, and protected from the cold by double windows—the exterior of glass, and the interior of paper. Attached to this building was a much smaller one, in which was built a fire-place, with a thin plate of iron let into the wall at the back; a fire being lighted in the grate, the iron plate gradually became hot, and a genial warmth was thus diffused over the entire building."

It is surprising that instead of the imperfect methods of heating already described, stoves had not been adopted, since they were in general use in Germany. They began to use them in France however towards the end of the seventeenth century. La Quintinye mentions them, but they were either found to be inconvenient, or their management was not understood; since he advises lighted lamps and torches to be kept in hot-houses, to keep up the necessary temperature. It is also still more astonishing that the French having adopted a kind of hot-house for preserving Orange-trees, did not employ it for other trees, for the purpose of producing early fruit. But it has been already said, that the Orange-tree was so highly prized among the nobility, was considered so luxurious and magnificent, that no expense was spared in its cultivation; whilst other plants requiring no extraordinary care and being within every body's reach, were thought nothing of. It must moreover be remembered that espaliers or wall-trees were not known, and the invention here mentioned could scarcely be applied to anything but espaliers; thus the use of both were adopted about the same time.

"When we wish to grow Fig-trees in boxes," says Quintinye, "in the month of January a pit is dug at the foot of a wall facing the south, in which the boxes are then placed; the whole is afterwards covered with large square glass frames seven feet high, placed against the wall, and these again covered up with great care, to prevent the frost from penetrating." This is truly a hot-house analogous to those now in use.

In the works of St. Gelais, 1719, will be found verses addressed to some ladies, with a present of Cherries on the first day of May. I am ignorant as to how they could procure such early fruit without the aid of hot-houses. I find only in Champier, (*De re cibaria*) that the inhabitants of Poitou sent every year to Paris, by coach, early Cherries; and that they procured them by putting lime to the foot of the tree, or by watering its roots with hot water. I can scarcely believe that such a proceeding would produce ripe Cherries by the end of April; but in any case, if they were thus procured by St. Gelais, he would have little reason to boast of an invention which makes a tree bear fruit at the same time that it kills it. It is only by the use of the hot-house that early fruit can be constantly obtained without injuring the tree.

After all, those who feel curious to know what art has enabled us to accomplish in later years, have only to compare it with what it was in the hands of Quintinye, who was the most skilful Gardener of his time, and had all imaginable assistance at his command. He boasts of having supplied the table of Louis XIV. with Strawberries at the end of March; Green-peas in April; Figs in June; Cabbages, Lettuces, and Asparagus, in December and January.

Among the good foreign fruits that have been made to grow in hot-houses, one of the first is the Pine-Apple. It was brought from our American colonies in the seventeenth century, and at first was transmitted from thence as a preserve. Labat speaks of it under the year 1694, in his *Voyage des Antilles*. Certain curious collectors finally procured some of the plants to be sent home; placed them under frames, and notwithstanding the expense connected with their cultivation, the gardens of the capital and its environs had so multiplied them, that Pines soon came to be sold even in the public markets.

The common opinion as to the Orange-tree is, that it originally came from China, and was introduced into our climates by the Portuguese. Several modern books, and particularly the "Dictionnaire d'Histoire Naturelle" states, that even now there may be seen at Lisbon, in the gardens of the Comte de Saint-Laurent, the first Orange-tree planted in Europe, which became the parent of all those we now possess. The fact is not absolutely impossible. Few trees live so long as this; and we know that about the middle of the eighteenth century there existed at Fontainebleau, the famous Orange-tree seized in 1523, from the Constable of Bourbon, when, after the defection of that Prince, his effects were confiscated. It is, however, unfortunate for the Portuguese story that we have evidence of their existence in France long before the Portuguese went to India. In a household account of the year 1333, belonging to the House of Humbert, is mentioned a certain sum paid for transplanting Orange-trees.

Henri IV. caused an Orangery to be built in the garden of the Tuilleries, which was not destroyed until the time of Louis XIV.; when Le Nôtre altered the plan of the garden and adopted that beautiful arrangement which is still so much admired. But Henri who had just established the silk-manufacture in France, and was desirous to encourage everything connected with that branch of commerce, originally intended this building, says Sully, "not to cultivate Orange-trees, but to raise silk-worms from eggs, which he had imported from Spain."

Louis XIV. was passionately fond of this tree, doubtless the first in our gardens for its elegance, its pleasing verdure, its perfume, its flowers, and its fruit. The magnificent Orangery that he built to preserve his trees during the winter is still considered as one among the many curiosities of Versailles. This building, from the designs of Mansart, formed a gallery of 480 feet in length and 38 feet in height, with two wings, each 360 feet in length. In the Spring, when the mildness of the season permitted the exposure of those delicate trees to the air, they were placed in low borders, composed of Roses, Honeysuckles, and Jasmine, which, hiding the boxes, and allowing only the tree with its head full of blossoms to appear, exhibited the appearance of an enchanted forest. Whenever the Monarch gave those brilliant fêtes in his gardens, which among foreigners made his reign almost as celebrated as his conquests, the directors, consulting his taste, always employed Orange-trees in decorating the vestibules, arbours, and similar embellishments. One of the principal ornaments of the grand Gallery of Versailles was Orange-trees, every partition between the windows held four of them, each furnished with a silver box and a foundation of the same metal. Some were also placed in the billiard-room; in fact, the Monarch would have them in his private apartments; and, to gratify him, the gardeners found out the secret of making them bear flowers all the year round. They selected for this purpose certain trees, which they allowed to shrink or wither for want of water; when the leaves had fallen off, they reanimated them by a secret and peculiar process; in a short time they began to put forth fresh leaves and flowers, and were then taken to the Palace. These could always be replaced, by employing 14 or 15 days of the same treatment to others.

Great lords and rich private persons adopted the same style of magnificence in their gardens. "We went to Clagny," says Madame de Sevigné, (in 1675,) "the palace of Armidus. The building progresses rapidly; the gardens are finished. You know the style of Le Nôtre; he has left a little dark wood, which has a pretty effect. He has a forest entirely of Orange-trees in large boxes, where persons walk in the shade; and in order to hide the boxes, there are on both sides palisades of the same height, decorated with Tuberoses, Roses, Jasmynes, and Carnations. It is assuredly the most beautiful, the most surprising, and the most enchanting novelty that can be imagined." The same lady (in 1679,) speaking of the marriage of Mlle. de Louvois, on the 24th November, says,—"They had made Spring return once more—everywhere abounded Orange-trees in full blossom, and flowers in boxes." At another fête, given the 9th February, 1680, at the Hôtel de Condé, she mentions "Orange-trees loaded with fruit and flowers." Indeed, the fashion became so universal, that among the infinite number of entertainments given by the nobility during the last 30 years of the reign of Louis XIV., and of which ample records still remain, there is not a single one in which this favourite decoration is not mentioned.

The Orange-tree still bears the same character: there are few gardens now without them; but the climate seldom allows the fruit to ripen. The Oranges sent from Languedoc and La Provence are of very inferior quality; while in our northern provinces they seldom gather anything but the flowers, which forms an excellent source of profit, being much used in preserves, pastilles, marmalade, comfits, ices, and liqueurs.

The Maltese Orange is now considered the best, and those from Portugal the next. The latter in the 17th century were so esteemed that a present of them was considered worthy of being offered to the King's children. "Monsieur (the King's brother) came to see me," says the Duchess of Montpensier, in her Memoirs, "and gave me some Oranges from Portugal." Moliere, in describing the comedy which formed part of the celebrated entertainments given at Versailles, in 1688, by Louis XIV., mentions that in the first scene appeared a magnificent display of Oranges from Portugal, and all sorts of fruits in 36 baskets.

De Serres observes, that in his time, even in Italy, only four different kinds of this fruit were known, viz., the Orange, the Citron, the Lemon, and the *poncire*, a variety of Lemon with very thick rind; "We may in strictness reckon a fifth, called Adam's Apple (Forbidden

fruit)," says he, "but it is not worth eating, and is only used to clean and scent the hands." This distinction still exists, but each of the four classes has its varieties. Porta, the Neapolitan, in his "Villæ," published in 1592, says that they reckoned in Italy only one sort of Poncire, two of Citrons, and three of Oranges—that is to say, the sweet, the bitter, and those which were neither one nor the other. L'Instruction facile pour connaître toutes sortes d'Oranges et de Citrons (in the year 1680) reckons in the four classes 80 varieties: we now reckon 126.

According to Lemery, 1705, the ladies of the Court, in the 17th century, carried in their hands sweet Citrons, of which they bit small pieces occasionally, in order to improve the vermilion hue of their lips.

In the play of "The Miser," by Moliere (1667), Harpagon, excusing himself to his mistress, who had come to his house, for not having prepared a collation, his son answers, "I have provided, my father, and have caused to be brought here some basins of China Oranges, some sweet Citrons, and some confectionery, that I have sent for on your account."

The students of the University were also in the habit of presenting to their Professors early in June a Citron, in which they had inserted six or seven crowns of gold. The offering was presented in a crystal glass, and was called *Laudat*, from the holiday granted to the students at the fair bearing that title, held at St. Denis, near Paris. This custom was abolished about 1700. — *Extracted from Grand d'Aussy's Vie privée des François.*

HOME CORRESPONDENCE.

Draining.—Your correspondent "J. J. M." has acted judiciously in regard to his own interest, and generously towards his tenant. I have no personal knowledge of that gentleman, but I probably am well acquainted with the farm to which he refers; and I am desirous to suggest to him and others a few remarks on the very important subject of draining. His difficulties are common to many others, having on his farm to deal with bottom as well as surface-water; with wet gravelly peat-soil, and with very tenacious clay; both circumstances requiring great judgment and care, and very different modes of proceeding. In the former case, wet gravels are seldom improved, except by deep drains placed on a firm bottom under the springs of water, often from 5 to 10 or more feet deep, and requiring a much larger tile placed upon a sole where the bottom is not sound, and it often happens that one drain so constructed will effectually drain several acres, costing much less than frequent top-drains. In the case of very tenacious clays as a subsoil, it is useless to place the pipe or tile in the body of the clay (into which the water will not percolate with sufficient readiness), and to be effectual they must be placed as near the plough as may be done with safety. And further, to prevent disappointment, it is sometimes absolutely necessary, and always judicious, to have the incline of the drains, directed by a spirit level, and not left to the eye of either master or labourer. I have, this spring, been deep draining some wet meadow land, and subsequently irrigating it under the direction of a person from Warwickshire; and the extreme accuracy and effect with which this has been done, both above and below, induces me, through your Journal, to invite your correspondent, "J. J. M." or any other gentleman to whom an inspection may be convenient. The expense of irrigation, when the water can be conveniently placed, or the plan of level floats is not more than from 2*l.* to 3*l.* per acre, and but a very trifling annual outlay is incurred. A two hours' ride by the Eastern Counties Railway to Witham will accomplish this object.—*Henry Dixon, Witham, April 19, 1843.*

Effect of Manures upon Insects.—In several of your leading articles you have alluded to the subject of manures. It appears to me, that in all discussions on this important subject, two points of great consequence have been omitted—or, perhaps I should say, one subject with two branches—namely, the effect which manures or artificial applications to the soil have on the insect world, whose sustenance is found in the different forms of vegetation. There can be no doubt of the correctness of the principle of returning to the soil such matters as form the chemical composition of the plant; but I am led to believe, that, whereas much of the failure of crops is due to the ravages of various insects, so will their success in a great degree depend on the defence afforded them from their tiny but powerful enemies; and I think this is effected in one of two ways, according to the description of application; and it is this point which you philosophers have not sufficiently noticed. It is my belief that many manures (as they are called) act principally with benefit to plants, by killing slugs, worms, and the countless myriads of nameless animalculæ that prey on the roots, branches, leaves, sap, flowers, fruit, &c., of plants; while another class of manures operates a diversion in favour of the vegetable, by offering something more to the taste of the feeder. In the former class are, I conceive, the various acrid salts, soot, lime, &c., and among the latter may be reckoned grains, malt-dust, oilcake, and even green crops, ploughed or dug in. Pray let us have a yarn from you on this subject.—*Woodend.*

Guano.—At p. 52, a correspondent suggests that guano might be procured on our own coasts. I fear your remarks on that subject are too true; my opinion is, that our climate is too moist, for which I will give the following reasons:—1. I planted, in the month of February, a few trees on a small island about 60ft. diameter, which, in the breeding season (from April to June), is literally covered with the nests of the smaller gull and duck. I found nothing on it but fine light and black vegetable mould, at least 15 inches deep, with a few Nettles, and

here and there a tuft of Grass like Cocksfoot.—2. An acquaintance of mine has an island in the next barony (Ennis), with a pool of fresh water on it, round which the wild geese gather and rest; the consequence is, that more than half an acre is spoiled; that is, the grass becomes so rank, that sheep will not touch it, and the sea is so rough, that they are the only stock which can be put upon it. Again, the rocks adjoining this island (the Stags), are covered with the gull-tribe in the breeding season; and yet in the autumn, when I was on them, you would only meet here and there with the Sea-Pink, and a species of Beet (*maritima*), which in the spring makes a nice Spinach, and when grown in a garden, serves as such for several years; each plant forming a bed 6 ft. square, and increasing by the joints like the Florin grass. It is also met with at Lambay. I may say the same of Downpatrick Head as of the Stags. Whatever guano there may be upon it, is soon washed away; and I should suppose the answer from your Scotch correspondents will be to the same effect.—*R. G., Ballina.*

Bees.—I send you the following plan for managing Bees in common straw hives, so as to obtain a portion of honey without destroying these useful insects, in the hope that it may interest some of your readers:—Put a swarm into a hive, having at the top a hole, closed with a large cork; nail a piece of wood, 4 in. long, 3 in. wide, and $\frac{1}{2}$ in. thick, to one side of the lower part of the hive, cutting a hole $1\frac{1}{2}$ in. long and $\frac{1}{2}$ in. high through the straw and wood. Attach a similar piece of wood to another straw hive, and insert in the latter a tin pipe, made of half a sheet of tin, punched full of small holes, about 2 in. in diameter, closed at the bottom by a round bit of wood, and secured at the top to a ring of wood 2 in. in diameter inside: a cover of wood, turned to fit the wooden ring, will effectually close the pipe, which is intended as a ventilator, and for the reception of a thermometer. Place the hives, with the pieces of wood in contact, on a board 3 ft. long, about 1 in. thick, and 18 in. wide, with a projection in front for the Bees to alight on; the board being movable, and resting on four posts about 2 ft. high. A slip of tin must be placed between the hives, to prevent the Bees from entering the second hive until the first, or breeding hive, is full. A canvas cover, 1 yard square, painted white, and nailed in front and at the back to wooden rods, should be spread above the hives; in this cover holes, 4 in. in diameter, must be cut, to correspond with the ventilator and cork in the top of the hives. These holes may be secured against wet by covers made like cones, with a heavy iron ring at the base, and a wooden knob at the top. The whole apparatus can be made by any person at the cost of about 8s., which will be a great saving, as Bee-boxes are too expensive for cottagers. In April, 1842, I fitted up, in the manner above described, a hive of Bees which swarmed in June, 1841. One swarm came off, which was fitted up in the same way as the parent hive. The parent hive was marked A, the swarm A a. In July I allowed the Bees to enter the side hives by withdrawing the slips of tin. The communication between the hives was cut off in September by replacing the pieces of tin. I then opened doors from the side hives into the open air, placing over them slips of wood with a small hole in them, covered on the outside with a piece of talc hanging by a thread. This tale formed a trap-door, which the Bees could easily push open in the hive as they endeavoured to escape, but which prevented any ingress from the outside. In a few hours all the Bees in the side or store hive of A made their escape, excepting 12, which flew out when I carried the hive into a room. From this hive I obtained 16 lbs. of the best honey, free from Bee-bread or young Bees, without destroying a single Bee. In the store hive of A, I found that the queen was staying, and I was therefore obliged to smoke her out. I nevertheless saved her, although many Bees died. From A, I obtained 10 lbs. of honey, equal in quality to that from A a. The trap-door of talc was a contrivance of Mr. Nutt, the author of the interesting work on Bees.—*Wilsen Brown, Egglestone, Barnard Castle.*

Bees.—At p. 174, "P. P." has stated that those who write on Bees in these pages would benefit by perusing the articles "Apiary" and "Bee" in the last edition of the *Encyclopædia Britannica*. It appears to me, however, that there are some things in the article on "Bees" contained in that work, which Mr. Rochet, the author, ought not to have countenanced. For instance, when speaking of the manner in which Bees collect pollen, he states, on the authority of Geoffroy, that "Bees first collect a certain quantity of pollen, which they knead together into a ball, and place at the middle joint of the hinder feet." This might lead one to think that the little balls were made ready by the Bees before being placed on their hinder legs (not their feet), instead of being accumulated a little at a time. I have shown how this curious process is done, in my work on Bees; the discovery of it cost me many a busy hunt. Mr. R. farther observes—"In order to gather large quantities at once, the Bees are sometimes observed to roll their bodies in the flowers, and then to brush the pollen from them into two masses, which they dispose of as before mentioned." This seems like the story of the hedgehog rolling itself amongst Apples, and carrying off all those which stick to him. The fact is, that Bees never collect pollen in that way. If they are dusted with it, it is only when they enter flowers which contain an abundance—the Hollyhock, for instance. It may be remarked, however, that there is a rare Bee, of the wild species, which collects pollen between the segments beneath its abdomen, which are admirably adapted for such a purpose. At present, want of time prevents me from proceeding farther with this subject. I shall, however, notice two more points. Mr. R. states, from Wildman, that "Long experience has taught him, that as he turns

up a hive, and gives some taps on the sides and bottom, the queen immediately appears, to know the cause of alarm, but soon returns again amongst her people." If this story were told to a cottager who understood Bees, he would probably say, "You would rap in vain, for no queen would appear, to answer your call." In giving credit to this story, Mr. R. betrays a want of apian knowledge. With regard to Bees closing their door-ways, the author mentions, from high authority, that Bees construct a thick wall, which barricades the entrance, and resembles a regular fortification—indeed, they often have recourse to a similar contrivance for protection against pillaging Bees. However plausible this may be, I have no hesitation in saying it is founded in some mistake, and that Mr. R. ought to have had better grounds for asserting that "This single trait in their history is a sufficient refutation of the theories which ascribe all their actions to the operation of a blind, indiscriminating instinct, and would exclude every species of foresight and reflection." To this I have little to say, but must leave the reader to form an opinion about it for himself.—*J. Wighton, Cossey Gardens.*

Blue Flowering Conservatory Plants.—The following is a list of blue flowering plants suitable for a conservatory, with the time of their flowering and native place:—*Mexico*: *Salvia patens*, Aug. to Oct.; *S. polystachya*, Oct. to Dec.; *Tradescantia pulchella*, July to Aug. *New South Wales*: *Comesperma gracilis*, April; *Solanum campanulatum*, June; *Westringia eremicola*, Sept. to Oct.; *Scævola suavelens*, Aug. to Sept.; *Dampiera stricta*, June to Aug.; *Patersonia sericea*, June to Aug.; *Sollya heterophylla*, July; *S. linearis*, June to Aug.; *Hardenbergia Comptoniana*, March to June; *Plagiobolus ilicifolius*, and *chorozemifolius*, March to July; *Orthrosanthus multiflorus*, June to July; *Scutellaria humilis*; June to July. *Plectranthus incanus*, July to Aug.; *Dianella longifolia*, Aug.; *Hovea celsi*, March to July; *Dracæna nutans*, July to Aug.; *Conospermum capitatum*, June to Aug. *Temperate Parts of South America*: *Tweedia cærulea*, July to Aug.; *T. versicolor*, July to Aug.; *Passiflora onychina*, Oct. to Dec.; *Stemodia chilensis*, Aug. to Oct.; *Sphacele campanulata*, July to Aug.; *Solanum myrtifolium*, July to Aug.; *Conanthera campanulata*, March; *Commelina gracilis*, July; *Psoralea glandulosa*, May to Aug.; *Witheringia pinnatifida*, June. *N. America*: *Clitoria Mariana*, Aug.; *Stokesia cyanea*, Aug.; *Ruellia biflora*, July. *Cape of Good Hope*: *Lobelia cærulea*, June to July; *Lightfootia tenella*, June to July; *L. Loddigésii*, July to Aug.; *Agathæa coelestis*, Feb. to Sept.; *Aster fruticosus*, March to July; *A. angustifolius*, May; *Selago fasciculata*, June; *Cyanella capensis*, July to Aug.; *Aristea capitata*, July to Aug.; *Agapanthus præcox*, Jan. to Aug.; *Státice cinerea*, June; *S. scabra*, May to July; *Roella filiformis*, June to Sept.; *Echium pyramidatum*, May to July; *Plumbago capensis*, Aug. *New Spain*: *Cælestina ageratoides*, July to Oct.; *Eryngium serratum*, Aug.; *E. comosum*, Aug.; *Viola Palmensis*, May to July. *Palma*; *V. arborescens*, April to May, *Spain*; *Goldfussia anisophylla*, June, *Sylhet*; *Státice arborea*, Aug. to Nov., *Teneriffe*; *Lobelia heteromalla*, Feb., *Dominica*; *L. begoniifolia*, June to July, *Nepaul*; *Linum Narbonense*, June to Aug., *S. of France*; *Phyteuma pinnatum*, June to Aug., *Candia*; *Anagallis monelli*, May to Sept., *Italy*.—*J. K. C., Althercliffe.*

Killing Insects for the Cabinet.—I don't see that "D. H. W.," p. 174, has given me a peg whereon to hang a reply. His proposed plan is just as feasible as the following, which I offer to his serious consideration:—On bringing the captives home, either "in thick letter-paper" or otherwise, persuade them to take hold of each other's hands, (their fore-legs,) and send a smart electrical spark through the whole!! As the fluid travels at a pretty decent pace, they will hardly have time to feel pain. In both cases the specimens may be a little spoiled, but that is of course a matter of small moment, as another trial may not be quite so disastrous; and after a few are unnecessarily though mercifully killed, the experimenter's cabinet may chance to get supplied. Sombre-coloured Coleoptera may, like a duke of former days, be drowned in a butt of malmsey (i. e. gin or whisky, for either would be rather more costly than Clarence's medium); only the specimens will soon become "greasy" when placed in the cabinet, and require renewal. I give "D. H. W." every credit for his motive in addressing me, but to be of use he must try again. I suspect the Millennium wont cast up to-morrow morning nor be expedited by any ethereal receipt for killing insects, and really your useful columns should not be considered as a mere arena for a verbal tilting-match.—*S.*

Vines.—I did not stop my Vines sufficiently early last year, and moreover, when I pruned them, I left the bearing-rod for this season too long; in consequence of which the lower buds this spring have broken very feebly. Finding that they continued weak, and my intention being in future to spur the Vines, I determined, in order to throw more strength into these weak shoots, to shorten the rods; and on the 5th inst., I cut off between two and three feet from each of the eight Vines. The Vines were in full leaf, with the branches stopped one joint above the blossom, and the blossom within about ten days of the period of its expansion. On the following morning, I found that the Vines had borne the operation well, with the exception of one, which was bleeding. I applied a hot iron to the wound, but in about ten minutes it broke out again; I repeated the operation, but met with the same result; I tried it a third time, having a lighted candle and a stick of sealing-wax in readiness, and the moment the iron was removed, while the wounded part was still dry and warm, I dropped some sealing-wax upon it, and pressed it down with my finger. I then put some more wax round the wounded part, pressing it close, so

as to form a small cap, about a quarter of an inch in depth, upon the end of the rod. This answered completely: not the slightest moisture again exuding. On the 7th, it appeared that two of the Vines had been bleeding a little in the night, but had dried up again without assistance. On the 8th, I found that one of the last-mentioned Vines had again bled a little during the night; I therefore applied the hot iron and sealing-wax with the same success as before. The wounds are now, April 10, all quite dry, and the Vines are already beginning to show that the operation will be of great service to them. The Vines are five years old.—*Guichenet.*

Shrivelling of Grapes.—"Jemsheed" complains, at p. 230, that his friend, by giving air to his Vinery when the Grapes were colouring, according to the advice of an "Old Gardener," lost half his crop by shrivelling. By this he seems to intimate that the shrivelling was caused by the air given; but in this I think he is mistaken. I consider that it resulted, not from the agent applied, but from the manner of applying it. It seems to have been the "Old Gardener's" opinion, that the temperature of the house was too high, and he consequently recommended the admission of a little air, which, if done with judgment, might have proved beneficial; but instead of this, I presume air was admitted so freely, as immediately to sink the temperature to a low degree, which, chilling the Vines and obstructing the flow of sap, produced shrivelling. If "Jemsheed," after living in the neighbourhood of the Equator, were transported immediately to Greenland, I doubt not but that he too would feel a shrivelly sensation.—*Tyro.*

Scotch and English Farmers.—At p. 209 a correspondent complains of the injustice done to the English by praising the Scotch Farmers so much as is now done, which he considers is only a fashion. He produces a long train of circumstances which he supposes to be conclusive that English farming is at least as good, if not better than that of Scotland. Into this controversy I shall not enter. I shall content myself, however, (after premising that, among all those he enumerates, he makes no allowance whatever for the inferiority of the climate of Scotland compared with that of England, and especially of the counties in the south, to which he seems principally to refer,) with adverting to three of the circumstances mentioned. While he states clearly the disadvantages under which the English Farmer labours, he does not once advert to the physical, and not moral, difficulty, against which the Scottish Agriculturist has perpetually to contend; nor does he seem to think it any merit that the latter has mastered by skill and perseverance this difficult achievement. Yet it has been accomplished; and the people of Scotland—with a naturally less-productive soil and a smaller quantity of arable land, in proportion to the population—depend less upon foreign supplies than the inhabitants of England. Your correspondent also says that, with the exception of the Lothians and the Carse of Gowrie, Wheat is not cultivated in any part of Scotland; but is abandoned as being unprofitable. Has he never heard of Stirlingshire, and of the tract of alluvial land on the banks of the river Forth, amounting to about 60,000 Scottish, or 75,000 statute acres, which grows Wheat profitably, and equal, if not superior, in quality to any grown in Scotland, and to much of that which is grown in England? The crop of last year ranged from 60 to 67 lbs. the bushel; and upon the average of years that which was brought to market ranged from 60 to 65 lbs. I also beg to state that four quarters per acre are accounted a bad crop; and if, in the spring, appearances indicate much less than this, it is usually ploughed down, and Barley or Oats substituted: that five quarters is not a good crop, that six is fair and fully an average, that seven is good, and eight superior; but that instances are known in which nine have been realised. I recollect that in the year 1826 a field of 30 acres, in the possession of Mr. Mowbray of Cambus, yielded upon the average of the 30 acres nine quarters and a bushel; and some particular spots, which were minutely attended to at the time, yielded at the rate of fifteen quarters an acre. As nine quarters and a bushel over a 30 acre field is certainly a very large crop and the truth of it may be questioned, I deem it necessary to explain that Mr. Mowbray was a distiller as well as a farmer, and fed with his grains great numbers of cattle. The urine of his stalls he collected (*mark this*), watered this Wheat, if I was rightly informed, with it twice during the season, and the consequence was the very heavy crop which I have mentioned. I may further observe that the same gentleman, the next year, treated a large field of grass for hay in the same manner, and he had a crop of three tons and a half. That such crops may become common I do not pretend to say. It shows, however, the capability of the soil. It is worthy of remark also that all this happened before the land was drained or subsoil-ploughed. Is this amount of crop excelled even in the south of England, upon a field of equal extent?—and yet this is neither in the Lothians nor the Carse of Gowrie. Not to go more minutely into this question, I may add that Wheat is profitably cultivated in 28 or 29 of the 33 counties in Scotland, and that not many years ago Wheat was exported from Rosshire, in the North Highlands, to London, and commanded the top price in Mark-lane. Your correspondent, moreover, says, "The Scotch Farmer may laugh at Turnips sown broadcast, as in the South of England; but he should remember that, owing to the warmer and drier climate, they will not grow in drills; and that even in Scotland last year there were many failures in consequence of the heat and drought." This is the first time I have heard of these failures, though living in the heart of Scotland, and seeing hundreds of farmers in the course of the season. When I mentioned the circumstance to several farmers, and asked if they

had heard of anything of the kind, they all denied any such knowledge. So that in whatever part of Scotland these failures occurred, they did not take place here. On the contrary, Turnips last year, sold in the field in small lots, brought from 14*l.* to 23*l.* per acre; according as they happened to be white, yellow, or Swedes. Our farmers of the South, however, wish that they had a share of the heat and drought which are blamed for broad-cast sowing in the south of England; and affirm that their Turnips, though drilled, always grew best in the warmest seasons. I shall notice one more circumstance. Your correspondent says that the Scotch ploughs exhibited at the meeting of the Agricultural Society of England at Liverpool and Bristol were found wanting because of their weight; in consequence of which they required about double the amount of horse-power to work them, and that the light English plough was preferred to them. Supposing this statement to be true, how does it happen that the heavy Scotch plough in Scotland is always wrought with only two horses, which are in general of lighter make than English horses; while the light English plough in England is frequently wrought with three or four horses? Will the Scotch horses eat as much and do the same work as three or four English ones? Certainly not.—*Not a Scotch Farmer, Stirling.*

Figs.—Your correspondent in the last *Chronicle*, "J. N. V.," says he finds no difficulty in growing Figs on the back wall of a Vinery. As I am so unfortunate as not to be able to succeed, after much trouble, and with two or three different gardeners; and as the same want of success is very general in my neighbourhood, "J. N. V." would be doing a great service if he would state the particular sort or sorts of Figs he prefers, and his mode of treatment. So completely have my gardeners failed in growing Figs against the back wall of a Vinery, that last year I did away with the trees, with the exception of a very small, delicate, pale-green Fig, which I have brought from the top of the back wall down the rafters, and in this way succeed in ripening my second crop late in the autumn; the first crop generally falls. But in this way, you will observe, it occupies the place of a Vine. The house is a late house, and the Vines are only now showing for fruit; the Figs have attained about two-thirds their size, but when ripe they seldom exceed an inch and a half in length. From my description, can you give me the name of the Fig?—*W. C.* [Your Fig is most probably the *Nerii*.]

Potters' Guano.—I used some of this valuable mixture on Celery last autumn, with very good effect. I also gave some of it to a gentleman's gardener, who used it on Celery, the latest row he planted, and strange to say, it was the first for use, and the finest in his garden.—*T. Brock, Barking.*

Laws of Farmers.—Ownership of Agricultural Fences.—Where there are two fields, separated by a hedge and ditch, the hedge, *prima facie*, belongs to the owner of the field in which the ditch is not; and if there are two ditches, one on each side of the hedge, then the ownership of the hedge must be ascertained by proving acts of ownership, *Guy v. West*, 2 Selwyn's Nisi Prius, 1827. An attempt was once made to establish a common law right in the owner of a bank and ditch, to have a width of eight feet from the interior line of the foot of the bank as the reasonable width; viz., four feet for the ditch, and four feet for the base of the bank, if there were no ditch; but it was decided no such rule about an eight feet width exists; and Lawrence Justice stated the rule about ditching to be this—"No man making a ditch, can cut into his neighbour's soil; but usually he cuts to the very extremity of his own land: he is, of course, bound to throw the soil which he digs out upon his own land, and often, if he likes it, he plants a hedge upon the top of it; therefore, if he cuts afterwards beyond the edge of the ditch, which is the extremity of his land, he cuts into his neighbour's soil, and is a trespasser," *Vowles v. Miller*, 3 Taunton's Reports, 137. Proof, therefore, of the ancient width of the ditch is evidence that the owner's land did not extend beyond the outer edge thereof. One tenant in common of a hedge may maintain trespass against his cotenant, if the latter grub it up; but a mere clipping of the hedge may be justified, *Voyce v. Voyce*, Cow. Rep., 201.—*C. K.*

Cellar for Potatoes.—Your correspondent "Totty," in last *Chronicle*, appears to have formed a very good plan for constructing a cellar for Potatoes, &c.; but pray allow me to caution him not to make it more than four or five feet wide, as I fear that the Potatoes will ferment if too many are crowded together in a mass.—*Omega.*

Yeast Plant.—The seed sent you by a "Lady" is that of *Carduus Benedictus*, or Blessed Thistle, with the virtues of which I doubt not but that you are acquainted.—*Thomas Abbott, jun.*—[Yes; and they are not the properties ascribed to the Yeast plant. We do not think the figure is intended for the Blessed Thistle, which is not known in North America, except as an introduced plant, and that very rarely.]

Soot as a Manure for Pines.—"Scrutator," at p. 209, inquires whether any one has used soot as a manure for Pines. I beg to inform him that I have seen it used, and that I apply it myself with success. When used fresh, it is an excellent material for preventing worms from entering the pots: but the drainage must be good, otherwise it will soon lose its volatility. If strewn over the crocks to the depth of a quarter of an inch, it will answer the above purpose; the roots of the plants will grow freely in it, and their extremities (as far as my experience goes) will have a clear white and healthy appearance. I have also used it mixed with the soil, and although I cannot positively say that it was beneficial (because I had not an opportunity of putting a plant in all respects alike and under the same circumstances, with the exception of

soot, alongside of it) yet I can confidently state that it is not injurious. The Pines under my care to which it is applied are of a very dark green colour, are stiff in habit, and produce good fruit.—*Polyphragmos.*—During a period of many years, I mixed soot regularly in my soil for Pines; and I consider it to be an excellent stimulant for giving those plants a dark green and healthy appearance. I used it in the following proportions for fruiting plants: four wheelbarrows of friable turfy loam, cut three or four inches deep from a common or old pasture, at least one year old before using it, and to be turned and chopped two or three times during that period; one barrowful of sheep's droppings gathered fresh from a common, and dried upon mats in an open shed, or out of doors, as the weather suited, and pounded fine with a quarter of a barrowful of soot. The whole were well mixed together, but not sifted, a week or two before being used. For succession plants, I added two barrowfuls of leaf-mould to the same proportions. In the above soils my Pines generally had a healthy appearance, growing freely and producing good fruit for their age, which seldom exceeded two years. By way of trying an experiment, in March, 1835, I cleared a number of succession plants from a small pit with a smoke flue running round the interior. I added a little fresh tan to the old, turned and mixed them together, keeping about six inches of the old tan on the top of the bed; I then selected 24 Queen Pines, which I expected would soon show fruit, turned them out of their pots, and arranged them in three lines on the tan, commencing first with the back line, sinking their balls about three inches in the old tan, and filling up the spaces between them one inch higher than the balls, with the same compost as above mentioned for fruiting plants, but not broken quite so fine as when used in pots. When planted, they received a moderate watering to settle the earth about their roots. The pit was kept rather close for a few days, until the heat rose in the tan; they were then frequently syringed overhead during the summer, but seldom required to be watered at their roots. In May, 22 of the plants had shown fruit, and by the end of September they were all cut, and weighed respectively from 3 lbs. to 4½ lbs. each. None of the plants were above two years old when the fruit was cut. The two plants which did not fruit were fine strong plants, but they had to be removed and potted when their more productive neighbours were cleared out.—*J. Alexander, Carlton Gardens.*—Permit me to say, in answer to "Scrutator" (p. 209), that we have for some time used soot as a manure for Pines at this place. We use it either by placing a layer immediately above the drainage, or as a top-dressing, by removing a small portion of the soil from the surface, spreading a layer of soot, and then replacing the soil on the top. Whichever way it is applied, the manner in which the roots seem to luxuriate in the layers of soot, and the rich dark green of the foliage, compared with that of plants not so treated, bear sufficient evidence of the benefit derived from the practice. It must, however, be added that, as a preventive to worms entering the pots, soot is not effectual; for although it acts as such at first, it soon loses its repulsive properties, and after it has been in the pot a short time the worms appear as much at their ease in the layers of soot as in any other part of the ball.—*Trentham Hall.*

Wild Flowers of Germany.—Mr. Howitt, in his "Rural and Domestic Life in Germany,"—a book full of curious and interesting information,—mentions, in his account of a visit he paid to the Wild Boar Park at Hütteldorf, near Vienna, where the Emperor of Austria keeps up with the greatest care the breed of the old German wild boar, of which he has there nearly two thousand head, that some were so tame as to come at the whistle of the keeper, and run eagerly as he shook one of the wild Cornel-trees, which grow plentifully in the forest. Mr. Howitt says "Those trees, unknown in England, are as large as Apple-trees, and in autumn are covered with fruit of a coral colour, as large as Cherries, but oblong. They make a beautiful show, and the fruit, of a sub-acid flavour, is used for dessert. The wild swine are particularly fond of this fruit, and as the trees were shook, and it pattered to the ground, they came running on all sides, and stood in the neighbouring thickets eager for our departure, when they rushed forward and ravenously devoured it." Can you inform me further respecting it, and whether it is to be procured in this country? Mr. Howitt talks much of the extreme beauty of the wild flowers in Germany: for instance, near Salzburg, where, he says, "By the road-side the most beautiful flowers common to our gardens hung from the banks or gleamed from the wood-sides, and tempted the hand. The leaves of the Christmas Rose were in abundance, shewing that in early spring its large white blossoms must have greatly beautified the scene. The Dog-tooth Violet started richly between the mossy stones. There were pretty kinds of white and yellow Daphne, a large blue Gentian, splendid blue and yellow Salvias, with very large flowers, and the rich Mountain Pinks grew in abundance." I think it would be very desirable if seeds could be procured of the Salvias mentioned, as a "splendid yellow Salvia" would be a great acquisition to our gardens here; as would also a handsome hardy blue Salvia, which the *Salvia patens* certainly is not in Scotland, as I have never succeeded in preserving it through the winter in the open air, although I have taken great pains to do so—and I do not live in a cold part of the country. The frost at Salzburg must be many degrees more severe than it is here.—*Christina.* [The wild Cornel is our Cornelian Cherry, or *Cornus mascula*, a common plant in nurseries. It was formerly grown a good deal in England, but has given way to other things. The Salvia with yellow flowers is probably *S. glutinosa*, also common in botanic gardens, and a showy species. No

doubt the Salzburg flora is very gay and rich; but people have not the same feeling for wild flowers when cultivated, as when they are hanging from their native rocks.]

Management of Home Manure.—I have lately read, with satisfaction, in the *Chronicle*, those articles which treat on the collection and management of Home Manure, and it is to be regretted that so little regard is paid to so important a subject. The attention of men of science has of late years been so much directed towards the new Manures, that farm-yard manure seems to have been lost sight of altogether, and farmers now are satisfied with little else but Nitrate of this, Sulphate of that, Guano, &c.; while, in the management of their farm-yard manure, they are as far back as they were fifty years ago. Cow-house and stable dung is thrown into the yard as if it were of no value; it is there allowed to be drenched by every shower that falls, and its very essence to run off in drains from the yard; or it is thrown up in the field in a slovenly manner, as if the more it was exposed to the weather the better it would be. From twenty years' experience in rural affairs, I am of opinion that the drier cow-house and stable manure is kept the better, and that it is as necessary for the farmer to keep his dunghill as secure from rain as his hay and straw. My attention was drawn to this subject some years ago, when in the service of a late nobleman, who allowed his principal labourers to keep a cow, with as much potato-ground as their cow's dung would cover. In consequence of some alterations in the labourers' outhouses, one of them had to house his cow in an old barn, and there being no convenient place to deposit the dung in, he piled it up in a corner of the barn. When the season arrived for planting Potatoes, this man's cow-dung was taken into the field with that of his neighbours, and their Potatoes planted within a few hours of each other. By the time the crop was fit to hoe, it was quite evident that the man's Potatoes whose cow-dung was kept dry were the best in the field; and not only that, but the spot upon which his manure was spread could be traced out for several years after.—*Colo.* [No doubt. But it will never do to keep stable litter dry; for if you do, how is it to be decomposed? We are persuaded that the true mode of managing it is that described in a leading article a few weeks since. When once made, if it cannot be used, the drier it is then kept the better.]

Iron Stake-holder.—The accompanying sketches are taken from an iron stake-holder, used here to support plants of *Epiphyllum truncatum*, grafted upon tall stocks of *Pereskia Bleo*, which I had found it very troublesome to secure by common stakes. This plan fully answers the purpose, and as I am not aware that anything like it is at present in use, it may probably be serviceable to those of your readers who may be similarly situated with myself. If made of suitable dimensions to accord to the stake or plant to be secured to it, it will, I think, be also equally useful for plants in the open air, such as standard and Pillar Roses, &c., which are often injured by the manner in which they are usually supported. The lower eye, *a*, is made with a female screw and a little smaller than the upper one, *b*, and to give it a firmer hold, the lower part of the stake (which may be a common one) should be cut in the form of a screw to suit the lower eye. Being passed through the upper and screwed into the lower one, the stake is supported without penetrating the soil; its utility will, therefore, be at once obvious, both as regards diminishing the risk of injury to the roots and the greater durability and strength of the support. The pot must be selected of a proper size, so that the holder fits tightly to it, and it should be placed in the pot when the plant is fresh shifted; *c* represents a front view of one of the side supporters; *d* a transverse section; and *e* a side view of ditto; *f* exhibits the stakeholder complete.—*John Webster, Gardener to Mrs. Huskisson, Earham.*

Coverings on Vine Borders.—I observe that in the "Calendar of Operations," at p. 231, Mr. Beaton states that the mulching may safely be removed from Vine Borders, and the latter exposed to the weather. My men, on the contrary, have been busy during the early part of the week, in giving the Vine-borders extra protection, by adding more fermenting material. What will my more northern neighbours think, who have followed the above advice, especially with their early houses? My registering thermometer came down the night before last (the 11th.) to 20°, and even the netting on the flued walls (with fire), had upon them a partial covering of snow. The thermometer fell last night to 27° with a cold wind N.N. by W. The hills around are covered with snow.—*James Roberts, Eshton Gardens, Skipton, Yorkshire.*

Properties of the Carnation.—I was not surprised to find a champion in favour of the very full flowers I so much condemned in the paper read by me on the 21st of March, before the Floricultural Society. I am, however, somewhat astonished that "C. K.," or any other person, should draw an inference the very opposite to that intended by the paragraph selected, at p. 230, from my paper. If he will re-peruse the paragraph, he will see that I found fault with Flora's Garland on account of the "irregularity of its marking." Had "C. K." read the remaining part of the paragraph referred to, he could not have supposed me to have meant that, because a Carna-

tion was very full, it must, of consequence, be imperfectly marked. What I said was this: "If the principal characters constituting a perfect flower, are hidden by its extreme fullness, then fullness is not a necessary property; but, on the contrary, highly objectionable." In my criterion of a Carnation, I have endeavoured to be as explicit on this point as possible, by saying that "each row of petals should be regularly and alternately arranged above the other, so as never to be crowded, nor, on the other hand, to have a loose and gaping appearance; in fact, the spaces should be only sufficient to display the colouring distinctly." "C. K." moreover inquires, whether "supposing a flower is regularly marked with good forms and petals, and in other respects desirable, its being extremely full would be objectionable?" It is easy to suppose a flower to have all the necessary properties which it should possess, but the "extremely full" flower which "C. K." has imagined, would, from that very extreme fullness, prevent the markings in the petal from being seen; so that he could only suppose them to be "regularly marked." In deciding upon the beauties of a Carnation, I never suppose anything; the beauties of a flower consist of that only which is apparent to the eye; and if it is so full as to prevent these the "principal characters" in the Carnation from being seen, I then say a Carnation may be too full, which is, I think, "a really substantial and valid argument against very full flowers."—R. Orson, 12, Hall-place, Kennington-lane. [Mr. Orson has here supplied the sentence referred to at a greater length than is given in our Report of the Floricultural Society; which, although abridged, nevertheless retains the meaning of Mr. Orson's words.]

The Gooseberry.—I have occasionally observed the Gooseberry growing freely and producing fruit on Pollard Willows and other trees in Cambridgeshire, where vegetable decomposition has afforded sufficient nourishment. They are likewise found on the summit of the Abbey-walls of this ancient town. A more remarkable instance, however, occurs in the garden of W. Dalton, Esq., where a healthy shrub is firmly rooted in the joints of the solid brick-work, three feet from the ground, and is regularly trained with other wall-fruit.—N. S. Hodson, Bury St. Edmunds.

Euphorbia jacquiniiflora.—I have adopted the following plan for restoring naked specimens of *Euphorbia jacquiniiflora*, having tried it with success, in February last, upon a plant under my care which possessed three long shoots or branches, trained up to stakes about 3 feet high, with scarcely a sound leaf upon them. I pinched back each of the three branches so as to leave only three or four buds on each shoot; these buds, with few exceptions, have all made young shoots; some of them are now six inches long, and all incline to a horizontal position. I again pinched off the top of the young shoot about ten days ago, and now I see they are forming flower-buds at the axil of every leaf. I expect soon to have a fine bushy plant in perfect flower. This was done previously to Mr. Beaton's plan of laying down the *E. jacquiniiflora* appearing in the *Chronicle*. My treatment was similar to that recommended by Mr. B., with the exception of laying down the plant.—J. M. K., Birdtown.

Planting in Ireland.—There seems to be a great impediment to planting in this country, from the want of tenacity in the soil; so that, after a wind, a hole is formed round the stem, which is frequently full of water; this is equally applicable to the Cabbage, and to large trees, and when the leaves or smaller branches touch the ground, it becomes like plaster, and keeps that appearance for a length of time. Such is the case with all the soils which I have met with. The Potatoes very often suffer severely from the early autumnal gales. Subsoiling and trenching does not seem to remedy it, as I have seen the same effect produced in a new garden where the ground was trenched nearly 4 ft. deep. Perhaps some correspondent might suggest a remedy; as delicate plants suffer severely from it.—R. G., Ballina.

Daniell's Manure.—It had occurred to me that this manure might prove a remedy for Wire-worm, but my expectations are disappointed. On Thursday last I placed some of these insects in a box of earth, seasoned with the manure, and on Saturday I found that out of ten, four were still alive. Hence I conclude that this manure is not to be relied on for the purpose. I perceive in Johnston's Lectures, March, 1843, p. 64, that a composition consisting of nearly the same materials as Daniell's Manure has been used as a manure, with striking success, although indeed other ingredients are added. In the early part of 1842, I persuaded a miller in an adjoining parish, to apply for a licence to manufacture the manure, which he accordingly obtained, and sold 2000 bushels in the autumn; but the accounts of its success have been discouraging. I manured 12 acres of wheat with it successfully, but the manure was ploughed in. The crops are not yet reaped. I speak only of their appearance to the eye, which is quite as pleasing as that presented by the land manured with lime.—Anthony.

FOREIGN CORRESPONDENCE.

Malacca.—This country is a subdued Rip Van Winkle sort of a place, situated close to the sea-shore, and divided into two parts by a brook, dignified by the name of river; the Flag-staff hill forms the southern bank of this river. The place is exceedingly quiet and dull, but green and calming, and excellently adapted for study. The country immediately about Malacca itself is open, and may be characterized as the Rice district, being open, generally quite flat, and throughout the flat parts decidedly swampy. From the Flag-staff hill, or, still better, from Booket Chine, a hillock higher than the other, and of considerable extent, the view embraces on the land-side a profusion of Cocoa-nuts, and strips or plains of Rice cultivation, ex-

tending inwards three or four miles, when the Great Forest commences, the districts between the two being occupied by tracts of Cajeputi trees (*Melaleuca leucadendron*), which, particularly from a distance, have a scraggy aspect, and constitute one of the botanical features of the province. The sea-view is extensive; to the south are seen the Water Islands, several in number, of which the largest is of some extent, and covered, especially the hilly parts, with dense forests. On the borders of the Rice-fields, generally buried in trees, the villages are situated, not adding to the diversity of scenery, except by the diversity of the foliage of the fruit-trees, by which they are generally surrounded. Altogether, however, I do not remember, excepting Moulmain, and one port near Mergui, a more pretty view than that from Booket Chine, which, I may mention, is the cemetery of the Chinese—for although in the distance there is too much jungle, yet some of the masses stand out boldly, and the foreground is beautiful, being cleared, presenting here and there a picturesque tree, and enlivened by the white unsepulchre-looking tombs. The highest point of this hill was made into a redoubt by the Dutch, and is crowned by a grove of indifferent *Pterocarpus*. The roads about the place are good, but narrow, generally lined by Cajeputis; they are made of some red stuff, obtained copiously from Booket Chine, and more like Keenka in colour than anything else. The botanical features may be represented as follows:—littoral cultivated thickets and jungles, between the two last of which the Malays positively discriminate, besides having different sorts of jungle. The littoral either consists of mud, producing Mangroves, which do not present any great variety—or of sand, producing a diversified vegetation, generally inclining to be shrubby. This is a very prominent feature about Tanfong Ching, a well-known place; the Mangrove tracts abounding to the south, or in the opposite direction. I do not remember many Mangrove plants with which I had not previously met; there is, perhaps, an undescribed species of *Rhizophora*, and certainly two, probably three, of *Avicennia*; and *Heritiera* did not appear to me common. The Malacca Mangrove tracts do not, like those of Mergui, produce many *Orchidaceæ*. The sandy littoral tracts give *Calophyllum inophyllum*, *Pandanus*, *Sideroxylon*, *Dodonæa burmanniana*, *Scaevola Taccada*, *Premna*, *Eugenia*, *Ximenia*, *Garcinia*, *Vaccinium* (I mean *Ericaceæ*, with an ovary inferum), *Leucopogon* (probably *Malayanus*), *Gmelina villosa*, *Areca littoralis*, *Acrostichum fuciforme* (a magnificent Fern), *Ophioglossum pendulum* (not an *Ophioglossum*). Of these, the only feature-giving tree is the *Eugenia*, which occasionally abounds, and in flower becomes very conspicuous. The herbaceous plants are *Euphorbia*, *Ipomœa pes tigridis*, *Convolvulus*, *Dolichos*, *Cyperaceæ*, *Vinca rosea* (local), *Spermacoce*. The botanical features dependent upon cultivation—for otherwise all would be usurped by *Melaleuca leucadendron*, are *Cyperaceæ*, as usual; also *Nymphæaceæ*, several *Utriculariæ*, a genus abounding in comparative species, *Phyllanthus lanuginosus* in profusion, *Jussiaea*, *Herpestes monnieri*, *Ceratopteris thalictroides*, and *Pontederia* &c.; among these, and dependent in many instances upon the lowness of the situation, a tall *Livistona*, which appears to be *L. rotundifolia*, although it does not agree with the characters, *Licuala spinosa*? *Sagrus*, and that most beautiful Malayan Palm, *Areca tigillaris*, the Nibong Malacca, &c. The thicket tracts, called by the Malays, I think, Olan Belookar, are much more varied, and probably take their origin in cultivation, although the features now are prominent enough. Of this sort instances occur about Pringitt, where Koenig gathered *Thottea grandiflora*, and about some parts of Booket Chine and St. John's Hill, and generally in all clearings. So that it would seem that forest trees are not the first which appear in spots cleared in forests, but on the contrary, shrubs, the localities of which, judging from the manner in which the eye recognises them, are probably at some distance. Belookar Jungle presents *Parkia* (commonly), *Castanea*, *Fagraea*, *Ficus*, *Mangifera* *Lanjoot*, &c., &c.; but its proper features are *Conarus*, *Cnestis*, *Congea*, *Croton*, *Sphenodesme*, *Phytocrene*, *Licuala spinosa*, *Stemonurus*, *Ancistrolobus*, *Rottlera*, *Gmelina villosa*, *Memecylon*, *Parinarium*, *Psychotria*, *Eurycome*, *Inga*, *Rhodamnia*, *Pternandra*, the same as and prior to *Blume's Ewyckia*, *Nelutris*, *Strophanthus*, with ringlets a span long, *Scitamineæ*, *Tunja*, *Dracæna*, *Thottea*, *Averrhoa simplicifolia*, *Uvaria*, *Hippocratea*, *Ixonanthes*, *Rottlera alba*, *Erycibe*, *Vitex arborea*, *Cansiera*, a remarkable Santalaceous genus with a rudiment of a calyx; another very like *Groudia*, &c. Then come the great, the primæval forests, which do not, so far as I know, present any features, save the grand one of the grandest vegetation. In this forest, probably five-sixths of the Malacca flora are to be found. I have not much knowledge of the trees, which are generally too big to be climbed, or to be cut down, with any convenience; but I remarked a *Melanorrhæa*, several *Dipterocarpi*, *Artocarpi*, *Fici*, *Sapindaceæ*, *Dilleniaceæ*; among them the greatest giant being a Milk-tree, and probably a *Ficus*. The under-stratum is not very thick but very varied, consisting of several Palms, *Tacca*, a host of *Scitamineæ*, *Rubiaceæ*, *Ardisiæ*, a *Melastomaceus* plant, with large, round, cordate leaves blood-coloured underneath, Ferns, &c. As partial features I may add the edges of Belookar Jungle, bordering or encroaching on swamps, characterised by a shrubby *Hypericum*, a queer *Grammatophyllum*, two undescribed genera of *Cunoniaceæ*, *Nepenthes*, two species, a beautifully-leaved *Guttiferous* shrub, *Lycopodium*, a beautiful suffruticose *Wormia*; and the fluvial tract, which, especially towards the sea, is mixed with the Mangrove; this a mile inland is remarkable for its *Pandani*, *Barringtoniæ*, *Sterculiacearum* nov. genus, *Cerbera manghas*, *Pothos*, *Tylophora*, and above all a large *Pancratium*-leaved

thing which I never saw in flower, *Nauclea*, *Stagmaria*. The cultivated trees which would, from the fondness of the Malays for shade and fruit, form a considerable feature, were the country more peopled, are *Semecarpus Anacardium*, the Mangosteen, Rambutan, *Sandoricum indicum*, the Seatool, Champedah a species of Jack, Douanne, Durio, (of which there are certainly two species,) Poolasan a sort of Litchi, *Num Num* (*Cynometra cauliflora*), Jambos, various kinds. Nutmeg grows to a considerable size, and is then very beautiful; here and there a Clove-tree, *Mimusops Kaki*, *Erythrina*, *Cocos nucifera*, and *pygmæa*, a remarkable dwarf kind, said to be distinct, *Areca Catechu*, *Areng sacchariferum* very fine, particularly in the interior; *Artocarpus incisa* does not come to any perfection; the *Pterocarpus Marsupium*, two opposite-leaved *Mangoes* of the same genus with the Burmese *M. oppositifolia*, but distinct species, *Carica Papaya*, *Mangifera foetida*, *Cassia Camang*, a very fine tree, &c., &c. Of these I will give a more detailed account in my next. The great families of the Malacca flora may be said to be *Scitamineæ*, and *Orchidaceæ*; but these latter are not very numerous, either individually or as species; *Palmæ* of which I have some forty species, mostly undescribed, *Rubiaceæ*, *Verbenaceæ*, *Sapindaceæ*, *Meliaceæ*, *Leguminosæ*, *Connaraceæ*, *Terebinthaceæ*. The families poorly represented are *Gramineæ*, *Acanthaceæ*, *Labiata*, *Compositæ*, &c. Of Ferns and Lycopodia, altogether I obtained about one hundred; but I do not know yet their proportion to the other families.—W. Griffith. [We would just ask our readers to compare this with the account in the "Encyclopædia of Gardening," by Mr. Main. Why the trees, which that author says give the greatest effect to the landscape there, are scarcely, if at all, to be met with.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

April 18. — R. H. Solly, Esq., in the chair. The Right Hon. Lady Dover, J. H. H. Atkinson, and J. F. Buller, Esqrs., were elected Fellows. Mr. Goode, gr. to Mrs. Lawrence, exhibited a collection of plants containing a magnificent specimen of *Dendrobium aggregatum*, covered with its drooping racemes of orange; the insignificant *Saccolabium micranthum*, bearing a spike of minute pink and purple flowers; *Cattleya Skinneri*, of a deep violet purple; *Lalage hoveiifolia*, a pretty greenhouse shrub, with yellow and chocolate-coloured flowers; *Cyrtocidium hastatum*, and fine clusters of the crimson *Combretum macranthum*: a Knightian medal was awarded for the *Dendrobium*, *Cattleya*, *Lalage*, and *Combretum*. From Mr. Feran, gr. to Lucy Lady Rendlesham, plants of *Erica micans* and *ovata*, *Correa speciosa*, and *Kennedya dilatata*, a Lemon-tree bearing fruit, and a dish of handsome Oranges, grown in a greenhouse. From Mr. Smith, of Kingston, *Azalea mirabilis* and *phœnicea alba*, with seven seedling *Azaleæ*. From Mr. Green, gr. to Sir E. Antrobus, Bart., 12 fine seedling *Calceolarias*, for one of which, remarkable for its beauty, and called *Ecypse*, a certificate was awarded, with four seedling *Cinerarias*, one being purple, with a well-defined circle of white surrounding the centre. From Messrs. Lane and Son, two seedling *Cinerarias*, a well-cultivated collection of *Roses* in pots, amongst which was a beautiful specimen of *Perpetual Albert*, and a collection of cut *Rose-blossoms*: a certificate was awarded for the collection in pots. From Mr. Hogan, gr. to H. Pownall, Esq., a *White Banksian Rose*, a fine plant of *Erica australis*, 7 feet high, and covered with bloom; a purple *Azalea*, and *Pichnia cordata*: a certificate awarded for the *Erica*. From Messrs. Chandler and Sons, a fine plant of *Rhododendron purpureum maculatum*, with purple flowers, very darkly spotted in the throat, and a plant of *Trillium grandiflorum*: certificate awarded for the former. Messrs. J. and H. Lee, of Hammersmith, exhibited two plants of a beautiful scarlet hybrid *Rhododendron*, called *Mars*; one white ditto, called *Venus*; a striped white and purple *Camellia* imported from Spain, and cut flowers of *Ribes Beaton*, described at p. 301 of 1842: a Banksian medal awarded for *Rhododendron Mars*. From Mr. Clarke, gr. to W. Block, Esq., an exceedingly fine specimen of *E. acris grandiflora*, with *Rhododendron Smithii*, *Templetonia glauca*, and *Tropæolum Jarrattii*: Banksian medal awarded for the *Epacris*. From Messrs. Veitch, of Exeter, a plant of *Cyrtopodium punctatum*, in which the bracts as well as flowers are beautifully spotted with pale brown and yellow. From Messrs. Locombe, Pince, and Co., a plant of *Epidendrum aurantiacum*. From S. Rucker, Esq., a well-bloomed plant of *Chysis bracteescens*, with white wax-like flowers, and a bright yellow labellum; and a specimen of *Epidendrum Stamfordianum*: a Banksian medal awarded for *Chysis bracteescens*. From Mr. C. Adams, gr. to Mrs. Morris, of the Retreat, Battersea, a fine plant of *Maxillaria aromatica*, forming quite a nest of sweet-scented yellow flowers; *Epidendrum aloefolium*, and *crassifolium*: Banksian medal awarded for the two former. From C. B. Warner, Esq., a plant of the beautiful *Epidendrum bicoloratum*. Mr. Carsons, gr. to W. F. G. Farmer, Esq., exhibited a seedling *Cineraria*. From the Very Rev. the Dean of Manchester were several blooms of his handsome seedling *Camellia*, called *lysanthia*, and described at p. 247: a certificate was awarded for it. Mr. H. Low, of Clapton, sent a plant of *Camellia Löwii*, a bloom of which was exhibited at the last meeting: the petals are regularly cupped, of a bright carmine colour, and more full in the centre than when last shown. A certificate was awarded for it. From Mr. Kinghorn, gr. to Alex. Murray, Esq., a seedling *Calceolaria*, named *Candidate*. From Mr. Doran, gr. to T. Hawes, Esq., a leath of Cucumbers and three magnificent *Hydrangeas*, with pale blue trusses, nearly a foot in diameter, and leaves nine inches long by eight inches wide: a certificate was awarded for the *Hydrangeas*. From Mr. H. Groom, a small plant of *Bossæa eriocarpa*. From W. Bromley, Esq., *Camellia* flowers cut from a plant which has been growing for four years without protection against a N. wall. From Mr. Conway, of Old Brompton, a seedling *Azalea* from Mr. Games, of Battersea, two hybrid *Rhododendrons* and a seedling *Cineraria*, called *Ne plus ultra*. Mrs. Lavater, of the Retreat, Deptford Lane, Peckham, exhibited the fruit of a small Palm-tree, inclosing the seeds, or nuts, from which a sort of Arrowroot is made in Mexico. From Mr. Hutchinson, gr. to E. J. Shirley, Esq., M.P., a dozen very fine Peaches from trees grown in pots in a Pine-stove: a letter, which accompanied the fruit, stated that the plants were introduced into the stove on Nov. 23, and that owing to the mildness of the weather, the temperature for the first week was kept at 55° without much fire; it was afterwards kept as near 60° as could be conveniently done, and when the sun shone, air was sparingly admitted on account of the Pines. During March, after the fruit was set, the temperature ranged by day from 80° to 85°; but when the Peaches were stoned, the house was kept very warm, and raised by day from 90° to 100°, and even 105°, but never higher than 60° or 62° by night. At this season, water was abundantly supplied to the roots, and the trees were syringed overhead with tepid water every morning. The soil used was light sandy loam and decayed sheep's dung, and the plants were shifted annually. Some of the trees were 16 years old, and showed signs of improvement, instead of having become weaker under this treatment. The number of fruit on 8 trees was stated to be 13 dozen; a Knightian medal was awarded for the Peaches. From R. Wrench, Esq., a dozen handsome fruit of the Hoary Morning Apple. Messrs.

Stevenson and Co. exhibited one of their improved double cylindrical boilers, of which a description is given at p. 87. From the Garden of the Society were a collection of plants, comprising *Epidendrum primulinum* and *Cattleya Skinneri*, fine plants of *Acacia marginata* covered with sulphur-coloured spikes, and *Grevillea longifolia*, having the under-surface of the leaves clothed with a substance resembling silk, and with its curious one-sided spikes of crimson flowers turned upwards; a pretty species of *Arbutus*, found in Mexico by Mr. Hartweg, and bearing large panicles of milk-white flowers at the extremity of every branch; with cut blooms of *Rhododendron angustum* and a fine deep rose-coloured hybrid variety, and four species of *Berberis*. A most beautiful and curious *Dendrobium*, from Manila, of the spatulate section, with straw-coloured flowers stained with lilac, exhibited by Mr. Loddiges, received the Banksian Medal. We understand that after the meeting was over, a box of Orchidaceous plants was received from Mr. Appleby, gr. to T. Brocklehurst, Esq., of the Fence, near Macclesfield, the presence of which, at the exhibition, would have been a treat to the lovers of Orchidaceae. Among the varieties that it contained, were a raceme of *Dendrobium discolor*, nearly two feet long, two varieties of *Dendrobium Pierardi*, in great beauty, *Maxillaria cristata*, *Schomburgkia crispata*, a red edged variety of *Gongora maculata*, and the larger variety of *Epidendrum aurantiacum*, all in a state of most vigorous health.

LINNEAN SOCIETY.

April 18.—The Lord Bishop of Norwich, President, in the chair. Dr. Armstrong, Dr. Charles Pope, Dr. Thomas West, and Mr. Nathaniel Buckley, were elected Fellows of the Society. Mr. Arthur Aikin, Mr. Horton Lloyd, and Mr. Youell, were elected auditors. Mr. Edward Forster exhibited a specimen of the trunk of an Ivy-bush, nearly a foot in circumference. A continuation of Mr. Griffith's paper, on the development of the ovulum of *Santalum*, *Loranthus*, &c., was read. The author regards the embryo as a development of the pollen tube, and could not confirm Schleiden's observation of the pushing in of the embryo sac by the pollen-tube. In this part of his paper, the author entered into several speculations with regard to the nature of the reproductive organs of Cryptogamic plants.

FLORICULTURAL SOCIETY.

At the usual meeting on Tuesday various prizes were offered for single specimens of Auriculas; but in consequence of the South London Society's Show having been appointed for the following day, with the extra attraction of the silver cup offered by Mr. J. Dickson, the number of specimens was very limited. Mr. Dickson exhibited three seedlings, which were considered good; and we have little hesitation in saying, that, if they had been only judged in comparison with some of the best of the old ones, instead of being submitted to the severe test and the minute and critical examination enforced by the forms adopted by this Society, as shown below, their values might have been apparently enhanced; but having once passed the ordeal, the credit is in proportion to the severity of the trial.

Dickson's	Tube.	Paste.	Ground colour.	Edge.	Pipe.	Stem.	Truss.	Observations.
Duke of Sussex, 1841.	Good.	Very good.	Dark and good, but feathery.	Greyish green, rather broader than the ground.	Size good, but petals narrow, and circle irregular.	Good.	12 pipe.	2d class.
Matilda 1842.	Rather large, but clean, and finely formed.	Paste good, and even.	Pink; good, and even.	Greyish green, even.	A slight roughness perceptible on the edges of the petals; but the flower circular, flat, and finely formed.	Good.	7 pipe.	1st class.
Comet, 1842.	Moderately good.	Very fine in quality, but starchy.	Crimson.	Bright green, and gold.	Flat, and shape good, edge very clear.	Good.	6 pipe of uniform size.	2d class.

(From another Correspondent.)—A first class prize for seedling Auriculas of the present year was awarded to Mr. Dickson for *Matilda*, a greenish grey-edged flower of fine properties; the tube is perfectly circular, and remarkably clean on the edge; the paste is dense, pure, and circular, with the violet colour in fine proportion; the pipe is circular, flat, stand well out, and there is every appearance of its proving a compact and fine trusser. The defects in the flower are trifling: the tube may be considered a little too large, and when severely examined a slight roughness is discernible on the margin of the flower; cultivation may probably have an influence on these imperfections—at present it promises to rank with our best varieties. *Comet*: fine second class flower; the paste is of fine quality, but angular; colour, bright chocolate, with the edge of a lively green; pipe, flat; and the margin remarkably smooth. *Duke of Sussex*: second class seedling of 1842; this also has fine paste, but the colour, which is very dark, is too feathery on the outward edge; it is a vigorous grower.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY.

First show for the season at the Horns Tavern, Kennington, Wednesday, April 19th.—The present exhibition was distinguished by a greater number of fine plants than we have seen at any spring show of this society. Among those shown by gentlemen's gardeners, the collection of Mr. Atlee, as usual, stood conspicuous, and contained a magnificent specimen of *Cytisus racemosus*, nearly 12 feet high; two plants of *Acacia armata*, of immense size, and literally covered with bloom; several Heaths, including *E. rubraecaulis*, fastigiata, lutescens, &c.; *Azalea indica alba*, *phoenicea*, &c.; *Correa ventricosa*, *Pimelea lancifolia*, and *Hoya carnosa*, all remarkably large and well-grown. The collection of Mr. Bruce was also of great beauty, although the plants were generally of a smaller size; they were, however, excellently grown, and blooming profusely, and consisted of *Eriostemon buxifolium*, *Dillwynia glycinifolia*, *Clivia nobilis*, *Polygala grandinosa*, *Hovea celsi*, *Elichrysum humile*, *Acacia diffusa*, *Geniera Cooperi*, *Polygala oppositifolia*, *Euphorbia splendens*, *Azalea indica alba*, and *Erica grandinosa*, aristata major, Hartnellii, and *Andromedaefolia*. The collection of Mr. Clark had, among others, fine specimens of a *Leschenaultia formosa*, covered with bloom, forming a ball of about two feet in diameter, the branches descending far below the edge of the pot; a very large *Kennedyia longiracemosa*, *K. monophylla*, *Tropaeolum Jarratti*, *Daviesia saligna*, *D. ulicina*, *Hovea celsi*, *Muraltia mixta*, *Azalea indica alba*, *A. Smithii coccinea*, and *phoenicea*, *Erica rubraecaulis*, and others. The fourth collection was shown by Mr. Coutts, and contained fine plants of *Chorozema cordata*, *Azalea phoenicea splendens*, *A. Danielsii*, *Podolobium Murrayanum*, *Scottia dentata*, *Kennedyia monophylla*, *Burchellia capensis*, *Gardenia radicans*, *Eutaxia myrtifolia*, *Cytisus canariensis*, *Azalea Hibbertii phoenicea*, *Genista Rhodopneæ*, *Franciscea Hopeana*, *Hovea celsi*, *Pimelea decussata*, *Tropaeolum Jarratti*, *Azalea indica alba*, and *Cytisus racemosus* elegans. The Nurserymen's Collections were from Mr. Jackson, of Kingston, and Mr. Haly, of Blackheath, both of which were good, though far inferior to those of the Gardeners' Class. Mr. Jackson's collection was chiefly remarkable for a number of handsome Heaths, these being plants of *E. aristata major*, vestita purpurea, physodes, trossula, and variegata; together with *Camellias Beana*, *Kellyana*, and *Chandleri*, *Tropaeolum tricolorum*, *Platylobium formosum*, *Correa speciosa*, *Cytisus fragrans*, and *Azalea indica alba* and *Addisonia*. Mr. Hally's contained *Azalea indica alba* on the same plant with *Phoenicea*, producing a very pleasing effect, *Smithii coccinea*, *speciosissima*, *macrantha*, and *Georgiana*; *Kennedyia Stirlingii*, *Elichrysum humile*, *Acacia armata*, *Hovea celsi*, *Chorozema varium*; and

Ericas vernix coccinea, *Patersonia*, and *Wilmoriana*. Among the plants shown as single specimens were, a very handsome plant of *Boronia pinnata* from Mr. Atlee, which was recommended for a prize. An *Azalea*, from J. Allnutt, Esq., and a very well-grown plant of *Erica aristata major*, from Messrs. Dickson, of Acre-lane. The part of the exhibition next in interest to these plants was the Auriculas, the best pairs of which were shown by Mr. Shröder, Mr. Chapman, and Mr. Lidgard among amateurs; Mr. Plant among gentlemen's gardeners, and Mr. Dickson and Mr. Gaines among professional florists. The successful pair shown by Mr. Shröder were Earl Stanhope and Hedge's Britannia; those of Mr. Chapman were, Page's Champion; Mr. Dickson's were, Dickson's Unique and Page's Champion; and Mr. Gaines's were Hudson's Apollo and Harris's Blucher. The best six Auriculas were shown by Mr. Chapman, and consisted of Oliver's Lovely Anne, Dickson's Duke of Wellington, Dickson's Apollo, Conqueror of Europe, Taylor's Glory, and Page's Champion. The best twelve were shown by Mr. Dickson, being Dickson's Duke of Sussex, Dickson's Earl Grey, Lawrie's Field Marshal, Chapman's Sarah, Conqueror of Europe, Gordon's Champion of England, Schol's Mango, Taylor's Glory, Grimes's Privateer, Dickson's Duke of Cambridge, Page's Champion, and one seedling. The second twelve, shown by Mr. Willmer, were Lancashire Hero, Conqueror of Europe, Hedge's Britannia, Smith's Waterloo, Smith's Britannia, Page's Champion, Lord Primrose, Stretch's Alexander, Riding's Junius, Page's Duchess of Oldenburgh, Privateer, and Popplewell's Conqueror. The silver cup given by Mr. Dickson for the best four Auriculas, was won by Mr. Shröder with Taylor's Glory, Conqueror of Europe, Page's Champion, and Smith's Mrs. Smith. The silver cup given by J. Chapman, Esq., for the best three, was taken by Mr. Dickson, with Page's Champion, Taylor's Glory, and Conqueror of Europe. The seedlings were, Mr. Dickson's Matilda and Comet, noticed in our report of the Floricultural Society's Meeting on the previous evening. There were several stands of Polyanthus, the best of which were shown by Mr. Bushell, of Kennington; Heartsease were neither numerous nor remarkably good. Mr. Thompson, of Iver, took the first prize for a stand of 24. The only fruit we saw was a box of Cucumbers from Mr. Cuthill, of Love Walk, Camberwell, exceedingly well grown, straight, long, stated to be grown by hot water, and certainly highly creditable specimens for the time of year. Collections of Vegetables were shown by Mr. Martin, of Millbank, and Mr. Wm. Gaines, of Battersea. A band of wind-instruments performed during the afternoon, and the weather being fine, the room was well filled with company.

COUNTRY SHOWS.

Canterbury Horticultural Society, March 30.—The first exhibition for the season took place at the Corn Exchange, and was numerously attended. The following is a list of the prizes:—FRUIT.—DESSERT APPLE, 1 and 2, R. Francis, Esq.; KITCHEN APPLES, Mr. R. Filmer; 2, J. P. Plumptre, Esq.; PEARS, 1 and 2, R. Francis, Esq. VEGETABLES.—CUCUMBERS, 1 and 2, E. Knight, Esq. KIDNEY BEANS, Rev. W. Brockman. RHUBARB, E. Knight, Esq. LETTUCES, Mrs. Marsh. ENDIVE, T. Dorman, Esq. BROCCOLI, E. Knight, Esq. SEAKALE, J. Cates, Esq. BEST BASKET OF SALADING, Mrs. Webb. ASPARAGUS, Mr. Filmer. MUSHROOMS, Mrs. Ramsay. FLOWERS.—BEST CHINA ROSE IN POT, the Rev. W. Brockman. BEST 3 SUMMER ROSES IN FLOWER, Mrs. Webb. BEST 3 STOVE PLANTS, J. G. Shepherd, Esq. BEST ORCHIDACEOUS DITTO, Mrs. Webb. BEST 4 GREENHOUSE PLANTS, G. Buckley, Esq. BEST 2 and 3 DITTO, T. Dorman, Esq. BEST 2 CORREAS, F. Sankey, Esq. BEST SINGLE DITTO, G. Buckley, Esq. BEST 2 ORANGE-TREES IN FRUIT, 1 and 2, Mrs. Webb. BEST SINGLE DITTO, T. Dorman, Esq. BEST 3 CAMELLIAS IN BLOSSOM, J. G. Shepherd, Esq.; 2, J. Godfrey, Esq. BEST PAIR, G. Neame, Esq. BEST SINGLE DITTO, G. Buckley, Esq. BEST 2 SUCULENTS IN FLOWER, J. G. Shepherd, Esq. BEST SIX DITTO, J. G. Shepherd, Esq. BEST 2 INDIAN AZALEAS, J. G. Shepherd, Esq.; 2, Mrs. Webb. BEST SINGLE PLANT, the Rev. Wm. Brockman. BEST 4 CAPE HEATHS, Rev. W. Brockman. BEST 2 DITTO, T. Dorman, Esq. BEST 2 CAPE BULBS, Mrs. Webb. BEST AMARYLLIS, J. G. Shepherd, Esq. BEST PERSIAN CYCLAMEN, T. Dorman, Esq. BEST 6 HYACINTHS, T. King, Esq. BEST 4 DITTO, T. King, Esq. BEST 4 SINGLE, T. King, Esq. BEST 2 DITTO, T. King, Esq. BEST 4 NARCISSUS, J. G. Shepherd, Esq. BEST 3 CINCERARIAS, G. Buckley, Esq. BEST 2 DITTO, the Rev. W. Brockman. BEST 2 WALLFLOWERS IN POTS, T. Dorman, Esq. CUT FLOWERS.—BEST CAMELLIAS, J. Godfrey, Esq.; 2, J. G. Shepherd, Esq. BEST BASKET OF SINGLE ANEMONES, Mrs. Webb. BEST BASKET OF CUT FLOWERS, G. Buckley, Esq. BEST 12 PANSIES, Mr. R. Filmer. EXTRA.—Hyacinths, E. Knight, Esq. Greenhouse Plants, Mrs. Webb. Camellia, J. G. Shepherd. Floral Device, J. Cates, Esq. Cut Out-of-door Flowers, Mr. Marsh. Mosses, Mrs. Grayling.—Canterbury Journal.

[Eating Cucumber Show and Dorking Exhibition, next week.]

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

BEICUM BICOLOR. Two-coloured Beicum. (*Greenhouse Shrub*). Labiate. Didymia Gymnospermia. Raised from Abyssinian seeds sent to the Horticultural Society, from Paris. It is a shrub with downy stems, ovate-lanceolate, serrated, slightly petiolated leaves, and verticillasters of beautiful flowers arranged in short spikes. The calyx has a broad upper lip, like that of an *Ocimum*; the lower lip is deep, truncate, bordered with a close fringe of white hairs, and terminated in front by a pair of feeble teeth. The corolla is large, white, with lilac veins, and nearly an inch long. It is a greenhouse plant, but coming from a warmer climate than many other kinds which we commonly find in greenhouses, it will not bear such a great degree of cold in winter. It will flower freely in the autumn and winter in a temperature of from 40° to 45°, and is adapted for conservatories which are kept about this temperature. When potted in any light common soil, it grows freely, and is very easily multiplied by cuttings.—*Botanical Register*.

OXYLOBIUM CAPITATUM. Headed *Oxylobium*. (*Greenhouse Shrub*). Leguminosae Papilionaceae. Decandria Monogynia. A greenhouse shrub of some beauty, imported from Swan River by Messrs. Lowe and Co., of Clapton, with whom it flowered in October last. It should be potted in light heath soil, mixed with a little leaf-mould and sand; the pot must be efficiently drained. When grown in the greenhouse, and subjected to the same treatment as the generality of these plants, it succeeds admirably, and remains in bloom for several months in summer and autumn. Like all plants of this kind, it requires an abundant supply of water during the growing season; but that quantity must be reduced at other times. It is easily multiplied by cuttings and seeds.—*Botanical Register*.

DENDROBIUM RHOMBICUM. Rhomb-lipped *Dendrobium*. (*Stove Epiphyte*). Orchidaceae Malaxaceae. Gynandria Monandria. This pretty species bears much general resemblance to *D. aureum*, from which however it differs in having smaller blossoms, a labellum without serratures, and the flowers in short racemes instead of pairs. It is a native of Manila, whence it was sent by Mr. Cuming to Messrs. Loddiges, with whom it flowered in August last. The imported specimen is less vigorous than it may be expected to become hereafter, in which case the number of flowers will probably be augmented.—*Botanical Register*.

PERISTERIA HUMBERTII. Humboldt's *Peristeria*. (*Stove Epiphyte*). Orchidaceae Vandeeae. Gynandria Monandria. For this noble plant, which has a pendulous raceme a couple of feet long, we are indebted to J. Wilmore, Esq., of Oldford, near Birmingham, who imported it from Porto Cahullo, in the province of Venezuela, about three years since. It flowered for the first time in March, 1842. In many respects it has the habit of *Peristeria Barkeri*, but the leaves have longer footstalks.—*Botanical Register*.

CAMPANULA LÆFLINGII. Læding's Bellflower. (*Half-hardy*

Annual.) Campanulaceae. Pentandria Monogynia. A beautiful little annual, found wild in sandy places all over Portugal, also near Madrid, and in the country round Mogador. "It grows from six to nine inches high, and requires a light rich sandy soil. The seeds should be sown either in August or March, and treated in the same way as those of *Rhodanthe Manglésii*, or similar half-hardy annuals. If sown in the autumn it should be potted singly, and kept in small pots placed in a dry situation free from frost during the winter; when sown in the spring they may be kept in a cold frame, but where they have plenty of air, as the plants are very delicate, and apt to damp off. The autumn-sown plants will flower about the end of May, those raised in the spring not before the middle of July. They continue a long time in flower. It may be grown in the open border, if planted in a warm and dry situation, after the danger of the spring frost is over.—*Botanical Register*

MISCELLANEOUS.

Royal Botanic Garden, Berlin.—A circular has just been addressed by Prof. Link to all the friends of this great institution stating that henceforward the correspondence, which has been entrusted to M. Otto, the inspector of the garden, will in future be conducted by himself (Prof. Link), or Prof. Kunth, the Vice-Director. It is requested that all letters, parcels of seeds, or other communications, may be addressed to Prof. Link, with the following words written on the lower left-hand corner of the direction:—"Königliche Garten, Sachen, (Service du Roi)."

The Respiration of Plants.—We extract the following popular explanation of this important process, from *Professor Henslow's 13th Letter* to the farmers of Suffolk:—*Function of Respiration*: I shall be obliged to draw a little more deeply upon your faith than was necessary in my last letter, whilst I endeavour to explain to you that function of the leaf which has been named "respiration." Still, I do hope to be able to set before you two or three very simple experiments, which may serve to convince you that botanists are not very far wrong in what they have asserted concerning this function. The function may be thus expressed—"that leaves decompose carbonic acid under the stimulus of light, the oxygen of this substance being discharged from the plant into the atmosphere, and the carbon fixed as an ingredient of that 'proper juice' by which all parts of the plant are nourished and developed." I shall first ask you to try a little experiment which may serve to remove a cause of error that might otherwise warp our judgment in estimating the actual effects produced by the function we are about to consider.—*Preliminary Experiment*: Place a tumbler full of spring or pond water before a fire, and another in the direct rays of the sun. As the water becomes warm, in each case, you will find a number of little bubbles will collect on the bottom and sides of the tumblers; and if you place in the tumblers a piece of stick, or metal, or other substance, bubbles will also collect upon these. If you place several tumblers of water in the direct rays of the sun, and put into them differently-coloured substances, you will find that bubbles will first make their appearance in those tumblers which have the darkest-coloured substances in them; because the darker the substance the more rapidly it will become heated, and so heat the water sooner. It is very evident that these air-bubbles have made their appearance in consequence of the heating of the water. But from whence do these bubbles proceed? They are derived from air which we may describe as being dissolved in the water, just as we find a piece of salt or sugar may be dissolved in water, and thus rendered invisible. When we boil water, all the air which is thus dissolved in it is driven off; and upon allowing it to stand exposed to the air it will again dissolve a certain quantity. Various gases, besides common air, may thus be dissolved in water—as carbonic acid, &c.; and many springs, upon issuing from their subterranean courses, give off into the atmosphere a portion of the gases which are dissolved in their waters, and which are retained in them so long as they remain underground. Whoever has been to Harrogate is acquainted with the offensive odour of the mineral waters of that place of public resort; and whoever wishes to have a good idea of it without going there, need only smell at a rotten egg, or wash out a recently discharged gun-barrel into a tumbler, and apply his nose to it. I have already observed in my seventh letter that common soda-water contains a large quantity of carbonic acid. I have used the term dissolved in these cases in rather an improper sense, but it will possibly serve to convey a general idea of what takes place. Carbonic acid is thus dissolved in all waters, and is also present everywhere in the atmosphere. Supposing, therefore, that leaves can act upon it, and decompose it under both circumstances, we may then be able to exhibit the result of their action upon that which is dissolved in water, even though we might not be able to do so upon that which is dispersed in the air; because in the former case, the oxygen which is set free would rise through the water in bubbles, and we shall see these, whereas, in the latter case it would be discharged as an invisible gas into the air. Let us try whether we can make this clearer by a simple experiment.—*Illustration of the Function of Respiration*: Fill 2 or 3 tumblers with pond or spring water, which will be sure, in either case, to hold some carbonic acid in solution. Place a leaf or two under the water in each tumbler. I find that common laurel leaves are well adapted to experiments of this sort, only from their size they require large glass jars, instead of tumblers, unless we cut them in halves. In order to place the leaves conveniently under the water, I make use of a split shot, or small piece of lead, with which I nip the edge of the leaf and leave it fixed there. This causes it to sink, and yet retain a vertical position. Place one tumbler in common daylight, and the others in the direct light of the sun. In the former you will observe no effect produced; but in the latter you will soon find numerous little bubbles making their appearance upon the surface of the leaves. I suspect these bubbles have not unfrequently been considered to be

oxygen which is escaping through the pores of the leaf, upon the decomposition of the carbonic acid contained in the water; but I now feel satisfied that we must ascribe them to the separation of the dissolved air, by the heating process as described above. Still I hope to show you a partial effect produced by the decomposition of carbonic acid by the leaf. Arm yourselves with a little of that gift of patience, so essential to all farmers and experimenters; and, of course, doubly essential when farmers become experimenters. In due time (perhaps in less than half an hour) you will be able to distinguish certain bubbles, which will make their appearance at the cut end of the leaf, or else here and there upon its surface. These will increase in size more rapidly than the rest, and at length rise to the surface. After one has risen, another will immediately begin to make its appearance at the same spot. A little attention will soon convince you that these bubbles have proceeded from the interior of the leaf, and we may, I think, allow them to be the oxygen which the leaf has separated from the carbonic acid introduced into it. The interior of the leaf is composed of little invisible bladders filled with fluid; and these bladders are so packed together as only to touch each other here and there, and thus to leave open spaces between them, which are filled with air or some other sort of gas. Especially in the under part of the leaf the bladders are so loosely packed that a very large portion of air or gas is retained there. This is the cause why the under surface of leaves is generally the palest; but if the air is expelled, as I shall presently describe how it may be, and water be allowed to enter, the under surface will then become as dark as the upper. Plunge a leaf into hot water, and the air which it contains will escape in bubbles from the cut end, and also from a few points on its surface. Sometimes a bubble thus driven out will be seen to adhere to the surface for a few seconds, and then be suddenly re-absorbed into the leaf. When we place leaves in water, under an air-pump, the air they contain escapes in bubbles with great rapidity, from the cut end of the leaf-stalk. If you allow the leaves to soak for a few hours in the tumblers, the water will gradually insinuate itself, either through the cut end of the leaf, or through the part pinched by the split shot, or through some accidental rupture in the skin. The water will thus displace the air, and the under surface will first appear to be blotched with dark spots, wherever it has penetrated, and at length the whole will become uniformly dark coloured. I refer especially to laurel leaves. It is after these leaves have been soaking for two or three days that I have witnessed the stimulating effects of light in exciting the functions of respiration in the most illustrative and convincing manner. The oxygen will often issue in a continued stream of little bubbles, even with a distinct noise, from the cut end of the leaf, or from some point or other upon its surface. If the hand, or any solid substance, be interposed between it and the sun, so as to cast a shadow over the leaf, the effect ceases; but it is immediately renewed upon the removal of the obstacle. Even whilst the leaf continues to be shaded, the stream of bubbles may be caused to issue afresh by throwing a gleam of reflected light upon it from a looking-glass. When we happen to get a leaf into such good humour for these experiments, they become very amusing and instructive; indeed, the information you may thus draw from a common tumbler, is far more satisfying and enduring than any fleeting gratification that could be afforded you by the best shilling's-worth of brandy and water which it ever yet held. Only try these simple experiments, and think a little about them, and the knowledge you will thus acquire will wonderfully assist your conceptions of the manner in which these functions of the leaf are carried on. When the leaf has become thoroughly saturated with water, it is very curious to see the under surface gradually recovering its pale tint as soon as the tumbler is placed in the light of the sun. When I wish to give the water a good dose of carbonic acid, I fill a vial with this gas, twist a piece of lead round its neck, and let it float in the tumbler or glass jar, with its mouth downwards. In a few hours, the water will have taken up all the carbonic acid, a large portion of which will, however, soon escape from the water into the air; still, there will be enough of it retained to cause the function to be renewed with fresh vigour, after it had ceased from want of fresh supply. I have had a little aquatic plant growing in a glass jar full of water for the last six months, on the table of my study, and whenever the sun falls upon it, up rise several little streams of bubbles of oxygen from the edges of some of the leaves which happen to be torn; but I do not perceive that any oxygen can be detected escaping from the surface of the sound leaves. I feel a little sceptical about the manner in which it is commonly asserted that carbonic acid is admitted within the leaf. That some portion of carbonic acid must be introduced with the moisture imbibed by the roots, seems to be undeniable; but that other portions are introduced through the very pores by which the steam is exhaled and the oxygen discharged, appears to me to be still open to further inquiry. This, however, is a subject for Botanists to look into, and one that is not suited to these letters: only you will observe that what I have said in illustration of the functions of respiration is no way affected by this part of the theory. It is usual to treat the effects we have ascribed to 'exhalation' and 'respiration' as the results of a twofold action, both excited by the same stimulus of light; but I question whether it would not be preferable to consider them as the common effect of a single function which might be appropriately termed the 'function of organisation.' What we really observe is the simultaneous discharge of water and oxygen from the leaf. This effect is attended by the fixation of the elements of water (oxygen and hydrogen) with carbon, in the form of or-

ganic matter. But I must suppress an inclination I feel to discuss the subject more fully. I have before noticed the fact, and I cannot resist again alluding to it, that plants are engines or laboratories employed by the Creator in the great work of combining a few elements into a nutritious material, which is to serve for the development of the whole animal creation. I am not acquainted with any natural law which impresses me with a greater sense of wonder than this 'function of organisation.' Here we see mere crude matter brought under subjection to the living principle. It is wonderful to view the effects of gravity retaining the planets in their orbits! it is wonderful to witness the magic changes which chemical affinity can work in compounding and decomposing a variety of mineral substances! but to me it seems far more wonderful that man, and all other animals, are entirely dependent upon the leaves of plants for manufacturing materials for those bodies of corruption in which, for a little while, they are destined to live, and move, and have their being. As the hopes of the agriculturist are so much dependent upon the healthy performance of this important function, surely he ought to know at least as much about it as the present ignorance of science may be able to teach him, if he would expect to be able to shape his practice in accordance with the laws of nature, and not needlessly to set himself in hopeless opposition to them. He will ever find nature a kind handmaid, and ready to minister to his wants whilst he woos her skilfully, but a very terribler when he resists her rudely."—From the "Bury Post."

West-Indian Cultivation.—We extract the following from the Third Annual Report of the St. Philip's Agricultural Society, on Manure applied to Sugar Canes, contained in the *Barbadoes Globe*:—"Manure being a costly article in our economy, my attention has been turned to ascertain what description would be most applicable to certain soils, and the discovery of the qualities of soils by chemical analysis. As there are few estates on which marl or loam may not be obtained, I now offer some remarks on marl, on which a certain author makes the following observation:—'That it may justly be called the prince of manures, both for its fertility and durability, as well as its being easily obtained and applied at a moderate cost.' Bryan Edwards asserts that 'marl is another manure of vast and general utility in Great Britain; it enriches the poorest land, opens the stiffest, and sweetens and corrects the most rank. Lands have been raised by the use of this manure from 2s. to 21s. per acre annual rent.' There is no country wherein a soft unctuous marl more abounds than in Jamaica, and I will venture to assert that marl can be obtained here of as good a quality and as plentifully as in any other country. I some time since saw marl applied as a manure on part of a field, the soil of which was a reddish brown, and the substratum a gritty clay; it was planted with Canes, and the result was a very fine first crop; the second crop did not realise my expectations, but this may have been from the unfavourable season. The land was subsequently planted with Yams, and, so far as marl had been applied, the return, compared with the other part of the field, was considerably greater; as well as the rotation crop, which was Potatoes. About 80lbs. was thrown into each hole of four feet square. I have seen a less quantity applied to the same kind of soil without success. An excellent and cheap compost may be made from the wash from our distilleries. I carted 20 loads of field trash to my still pond, with what herbaceous matter I could collect about the mill-yard, &c., and covered it with mould, and then saturated it with returns. I repeated it twice, and in three months I obtained a well-digested compost, without the aid of cattle, amounting to eighty or more cart-loads, and which, in my opinion, abounded with carbonic acid gas—the most valuable component part of manure. The canes which have had the above compost applied to them are now the most vigorous and healthy on the estate. Another course adopted by me for raising cheap manure is this:—I planted Indian Corn on my cane banks in June; the November following I covered it up in the cane holes; in January it was decomposed, and I drew it to the foot of the hole and set in the Cane plant. The year was unfavourable, but notwithstanding a great drought, the Canes were comparatively good. This I found to be the cheapest manure I ever applied, costing little more than the weeding of the field. At the September meeting, the following article was introduced, on imported manures, with the application of the same, as practised by a member on his estate. I have for a long time remarked that the quantity of manure annually produced on almost every estate in the island with which I was acquainted, had become, year by year, less and less; that the state in which it was applied was crude and undigested; and that the period of its application had become later and later. This seemed to me a defective system in our plantation management, and I became anxious in my inquiries as to its cause, and in comparing our present with the olden routine of agricultural economy. So long as our little isle was favoured with propitious seasons, manures of the lightest kind were found to be sufficient to give the Planter a satisfactory return. A more extended cultivation of the stable (no difficulty presenting itself in the supply of the nutriment required for the plant) was the consequence, and provision for the cattle, whether in food or grazing, was in a great measure neglected. During the favourable seasons to which I have alluded, such is the luxuriance of Tropical vegetation, it was possible to supply a maintenance, under such a system, for the stock of a plantation; but it was not possible to afford a return of manure through this medium at all proportionate to the necessities of a soil under so constant a taxation. So long indeed as the 'former and latter rain' visited us in their proper season, the impolicy of such

management would not manifest itself save in a gradual manner; but the effects would be found to be no less certain in the end, by the eventual diminution of our crops. Instead of a continuance of favourable seasons, three years of drought and trial have succeeded, and the consequence of the system pursued becomes at once visible. It must be admitted that the drought of the last three seasons has been materially instrumental in furthering the evil deplored, inasmuch as, in favourable weather, not only would a large quantity of matter be produced, but the very moisture would further its decomposition, and render the manure more actively beneficial. This system of mismanagement was brought under the notice of this Society, by the President, at an early stage of its operations, and a judicious remedial course was by him recommended, and has more or less been acted upon by members and other persons. This, however, was but a course of remedy, and some years must necessarily elapse ere its benefits could be felt. Estates having been for several years annually extending their cultivation, and decreasing their means of proper returns to their lands, could not in a single season recover all that seasons of overworking had taken from those lands; and it therefore occurred to me as likely to hasten the benefit of the system recommended by experimenting in some of the concentrated manures which have been found to act effectively, and which have been the means of improving the agricultural system of the mother country so greatly within the last few years. Their apparent cost, however, somewhat staggered me in my calculations, having at that time little idea of the outlay attending the home manufacture of manure. In order to satisfy myself, and to remove the objections that were stated, I instituted a strict scrutiny into the labour expenditure under this head, and I have found that scarcely less than thirty dollars will supply sufficient manure for an acre of Canes; and I therefore determined on writing to England for some Rape-dust, which had been recommended to me by a trial on my last crop, from which I had reaped a beneficial return. Almost at the moment of my receiving it, however, I met, in the English newspapers, with notices on "Guano," which had then just been introduced, and which I found to be the manure that had for centuries been used in Peru and Mexico—countries which I knew to be scarcely ever visited by rains, and whose only medium of moisture is the "dew of night." Shortly after meeting with these notices, a merchant of Bridgetown imported a quantity of this manure, and having a high opinion of it, as specially fitted for this country, I made up my mind to try it. Having a field of about six acres under preparation, I determined on manuring it with Guano alone, and it is gratifying to notice that the Canes in this field have suffered less from the drought to which they have been exposed than any others on either estate, whether manured with home-made manure, with Rape-dust, or with anything else. In a field on White River, consisting of nine acres, adjoining the estate on which the above trial was made, experiments have been made with "Guano," "Artificial Guano," "Daniell's Patent Manure," Rape-dust, and the cleanings of an old well on the estate, which had for the last half-century been the burying-place for dead stock; and I can only say that the Canes to which Guano has been applied, are not only higher, but more vigorous than those to which any other manure has been applied. The Rape-dust, from experience, I can speak of as a good manure, having reaped during the last crop, notwithstanding the drought, nearly 3 hhds. sugar from about 1½ acre, but it is more expensive than Guano, although not more so than our home manure. When, however, we call to mind the position of the West Indies, we must feel that the simplification of manual labour, whether by the introduction of machinery, or by purchase of manures at the same cost as the labour for the production would require, and that such a course would have all the effect of an increased agricultural population, by making more labour available for general purposes, I think no question can be raised as to the expediency of making trial of such a course as would be productive of such ends. But the objection has been raised that I can only speak of the comparative 'luxuriance of the growth of such Canes as have been manured with Guano, and that I have not yet tested the prices they will render?' True, I have not yet reaped any Canes that have been so manured; but if the more healthy development of the plant, followed by a continuance of vigour over those around, whether under the influence of favourable or unfavourable weather, give not some promise that the produce will be superior, I know not what argument I can use in support of my opinion, that Guano is a most excellent manure, and that it is well suited to our general requirements, and calculated to hasten the grand objects of every planter. Your Committee further state that the minutes of the Society contain two communications on Agriculture; one on "Flat Tillage," from J. Briggs, Esq., and the other on the "Use of the Plough," from J. King, Esq., as well as a paper from one of the Members, bearing out the former gentleman in the system of "Flat Planting." The first communication was as follows:—"With a view of assisting your annual report of improvements in Agriculture, I furnish you with an account of my system of flat tillage for Sugar-Cane planting. The whole of my this year's planting has been by relining my fields, making the site for each plant, and simply drilling for its insertion—not having turned up the soil more than was necessary for destroying weeds. From the land that I have planted, I removed the trash last year, and the lands that I intend for next year's planting I have not removed any trash from; so that this year's planting labours under bad privation. Otherwise, I have afforded my plants every advantage of manuring, that the property admitted

of—littering them lightly, except about five acres, with sour grass, green Indian Corn, and the trash of a field that I have thrown up Cane planting in. Throughout the late drought all my young Canes preserved a verdure superior to those of my neighbours; this may have been from a better time of planting, or from greater distance given to the plants; the plants that had no litter are more vigorous now than those of my neighbours, that had not the benefit of that manure; which proves that flat tillage can succeed, and gives strong grounds to imagine that it will be more productive in Sugar-cane cultivation than holing. My ideas of advantages to be derived from flat tillage, independent of saving the expense of holing and cross-holing, were, that the holes occasioned a great loss of moisture to the plants where most required, after the spongelets of the roots had proceeded a few inches from the stocks—the centres of the holes with moderate rains showing an interminable depth of moisture; whereas the banks where the feeders had entered show only a very superficial quantity; and from the larger surface of the earth through holing being exposed to the action of the sun and atmosphere, the general moisture of the fields was more rapidly evaporated than if the surface had been flat. That the centres of the holes where the plants were set, being the receptacle for all wet, was the principal cause of the loss of plants—damped off before they could vegetate. That forming the holes buried in the banks a large portion of the humus of the fields, below the reach of the feeders of the Cane. That in littering the fields to preserve moisture and keep down weeds, a certain quantity of trash would go farther on a flat than on a holed field. That in heavy rains more soil would get carried off the fields, where they were in loose banks than would get thrown down, and more of the soluble portions of the mould incorporated with the running water, than if the soil was not broken up—exemplified in the colour of the water that runs off a newly-holed field, and that of one that is not holed, when heavy rains occur. That Canes will be cut with greater facility on a flat field than where they are to be reached after in the bottoms of deep holes. That Canes will be carted off the fields with less labour where the fields are flat, when compared with what our starved cattle suffer, in hauling Canes across the Cane-holes. In addition to the above, I beg leave, in consequence of certain persons having lately fallen back to setting a Cane-plant to each eight square feet, or less, of land, instead of setting only one plant in each hole, to state, that to each of my growing Canes are allowed thirty-six square feet of land." The other communication was as follows:—"Mr. J. Briggs having, in Nov., 1841, expressed his intention of planting his Canes on the system above described, and knowing the success which attended his plans, however much at variance with those in general practice, I was induced to prepare half an acre of land by ploughing it entirely; the other parts of the field being formed into ridgelets. I found it particularly convenient in being able to cart the manure on the land, which was easily divided into basket-heaps, at 8 feet asunder, which marked the distance for setting in the Cane-plants, allowing one plant to 16 square feet of land. The remainder of the field (8 acres) was planted at the same time the last week in December, and trashed in March. On the half-acre planted without holing, (half of it is a black soil on white clay, the remaining half is a black soil on a white rock;) the Canes are generally as good as on any other part of the field. Under these circumstances I have been induced this season to plant 23 acres without forming holes, 15 of which I have ploughed as before mentioned, and 8 acres on Mr. J. Briggs's system. I have ventured thus largely with the fullest confidence of success. These expectations being realised, a new order of things will dawn on us. Many may say, Have we not succeeded highly by the formation of deep Cane-holes, and why these innovations? In reply, I may say, Has not British West India undergone the greatest change perhaps ever known amongst civilised nations, in the measure of Emancipation? and consequently measures must be carried out with respect to Agriculture, by adopting machinery, and substituting brute force for manual labour; then, and not till then, can we expect to be placed amongst the ranks of the free country of Europe. Being interested in the success of your Society, I have drawn up these remarks on Ploughing, for the benefit of Agriculturists generally. A field containing 16 acres of land was taken by me in November, 1841, and from the state in which it then was, I am certain that no manual labour could have cultivated it in the manner in which the plough did, so as at that late season of the year to pulverise the soil properly, and thereby make it yield a fair return. I ploughed the field in ridges at 4 feet distances, and afterwards cross-holed it by manual labour, allowing a labourer to dig 300 holes for 25 cents; I also allowed a ploughman and two drivers, the former at 40 cents per day, and the latter at 30 cents each, who ploughed me $\frac{2}{3}$ of an acre per day; consequently the expense of ploughing the 16 acres was 21 dollars, and the cross-holing 36 dollars 25 cents, making a total of 57 dollars 25 cents for the whole field. I would also remark that this work was not performed in a careless manner, but put out of hand in a masterly style, as will be observed by the Canes growing on the land; and I am sanguine, although we have suffered much from drought, that the return will not be less than 40 hds. sugar. My opinion as to what the field would have cost if prepared by manual labour, is, that the first cost of holing would have been 72 dollars 50 cents, allowing a labourer to dig 150 holes per day, at 25 cents; cross-holing, 300 holes to each labourer, would amount to 36 dollars 25 cents, making a total of 108 dollars 75 cents; added to which, the expense of weeding, which could not amount to less than 20 dollars, would make a grand total of 128 dollars 75 cents. Now the cost of ploughing and

holing amounts to 57 dollars 25 cents, which deduct from the 128 dollars 75 cents, leaves a balance in favour of the plough of 71 dollars 50 cents.

Hop-poles.—A voluminous paper, which had been furnished by an experienced friend of one of the members of the Maidstone Farmers' Club, was read at a late meeting. The writer confined his observations to the growth of Hop-poles, and recommended, in rich soils, the growth of Ash, Willow, and Chesnut mixed, as the roots of those plants derive their nourishment from different depths of the earth—the stocks being not less than 6 feet apart. He stated "that Ash is good for clay soils, and should be cut every 8 or 9 years; that exuberant shoots should be thinned out in the second year; that the Poles should always be cut upwards; that, in young plantations, it is a good plan to cover with Hop-bines, to keep down the weeds and retain moisture; that the Ash stocks, when planted alone, should not be less than from 6 to 8 feet apart; that care should be taken to carry off superabundant moisture by ditches. That Chesnut is best for light and sandy soils; being exceedingly durable, growing as fast as Ash in suitable soils, and not so susceptible of injury. That Willow is generally of little value, but that the Gull and Plumtree sorts may be grown on dry loamy soils, with Ash and Chesnut; that the Sallow grows rapidly on wet land, but that little expense in ditching would make most soils more valuable for growing Ash or Chesnut. That in wet and boggy soils, difficult to drain, Alder will sometimes grow well, where other sorts will not grow; that the Alder is an excellent wood for trunking in drains. That the Red Birch is considered in some places a good wood for Poles, and is very productive, although not so valuable as either Ash or Chesnut; and that the White Birch is not worth cultivating. That the Oak makes durable Hop-poles, but is liable to bend in the first year, and is of slow growth; but that, if grown with Ash and Chesnut, they draw it up much more rapidly than would otherwise be the case. That, generally, Beech is inferior for Poles, and produces little, where Ash, Chesnut, and Willow would produce more. That many of the natural woods of the country, which now grow an occasional stock of Ash, and are overrun with brambles, would pay well for grubbing and planting, either wholly with Ash or with a mixture; that when the stocks are planted 6 feet apart, the Poles grow quicker and the stocks last longer than when planted more thickly; that 6 feet apart will give 1,200 stocks to the acre, and that these will generally grow 6 or 8 Poles apiece; that all grass, weeds, brambles, and underwood should be cut away from the young shoots, which should be carefully thinned out in the second year, and the cut shoots left on the ground to prevent the fallen leaves from blowing away; that when the plantation is confined at the top, it is a good plan to cut off the lower branches to the height of 4 or 5 feet, to promote the free circulation of air. That the writer of the paper felt convinced, after 30 years' experience, that attending to these directions in planting and cultivating will enable a person to grow two good crops, where, and in the same time as, one inferior crop is grown at present." The following paper was also read by a member:—"The growth and improvement of woodland is more peculiarly a landlord's business, as few tenants have a term sufficiently long, or an interest great enough, to induce them to plant. Wise landlords, however, should, by taking the chief expense, have their woods constantly filled up every fall. They ought also to choose plants of the best growth, and of that sort of wood which thrives on the soil. November is the best month to plant in. No land is more neglected, and yet none would pay better in this part of the county of Kent. I have myself helped to plant land with wood, (not worth 10s. per acre to rent as arable,) which, by attention, and, of course, with some expense, has, from a nine years' growth, sold for 40l. per acre, and even more. The contrast between highly cultivated and bad woodland, is almost beyond conception. When wood is first planted, it ought not to be in foul, poor land, as it generally is, but in tolerably clean land. If foul when planted, let it, however, be kept clean afterwards, by digging and hoeing; and by Hop-bines, or by some other plan, let the land be manured. The first grand point is to choose that sort of wood which grows kindly on the soil; the next to keep the land clean. I have seen woods planted, which, from want of care and attention, after all the expense of planting, have been worth little more than they were at the time they were planted, though twenty years have passed. I have seen others make a comparatively quick return. I am now speaking of woodlands in this immediate neighbourhood, as, where Hops are not cultivated, and wood is grown for faggots, their expense or trouble may be thrown away. The land for Chesnut, where kindly for its growth, seems to need no other preparation than being tolerably clean, and not too poor. Weeds, &c., must not be allowed, however, to choke up the plants in succeeding years. Either cover the land with bines or hoe, and keep it clean. The English Nut grows better and straighter than the Spanish. Let landlords raise their own plants from the nut or keys, or in the best manner. On a soil not kindly for Chesnut, but kindly for Ash, I have often thought that it would be wise first to plant Plum-tree Willow, and then, as that decays, to fill up with Ash. I know this will be a work of time; still, the ground gets more kindly for Ash, from the leaf of the Willow, or some other cause, and the Willow pole is very good. If all Ash is planted, let the land be kept clean, or be covered with bines. There is a great difference in the value of poles; still, I think that land will pay best which is allowed to grow what wood it does grow kindly and freely, though the pole may not be worth so much. Many people, to avoid the expense of

planting, use layers or poles adhering to the stub, and laid in the earth. This, I think, is seldom successful, though I have known it to succeed in deep rich land. As a landlord I would always find plants and plant them too, on a yearly tenure. On a lease of any length, I would allow plants and have the tenants plant them at their expense, where a term of about 14 years exists, and Larch grows kindly. As a tenant, even if not having plants found, I would plant Larch. It is better, however, for landlords and tenants fairly and justly to consider the interest of each other. The growth of wood may be a national good. In France and Germany it is kept up for firing or for making charcoal, where coal is scarce and dear. Fir is, in many places abroad, indigenous, and the few hops grown are generally poled with Fir. Little pains, however, are taken to plant or keep the woods beyond what nature does. The timber is preserved in these woods, and as their value is not great, consisting of brush-wood, it does but little mischief. In many places timber grows tolerably well and supplies the navy, &c., but not like the stately Oak of England. Where timber is grown in England (save on poor clay soils) it ought to be grown more together, so that it may not destroy thrice its worth in crops of Corn, &c. In highly-cultivated rich land, an Oak or Elm will do this. Landlords cannot have timber and rent too. Though not a part of wood cultivation, or a very trifling one, let me refer to the growth of Pollards. In most old leases these useless and injurious things are inserted, and the covenants bind the tenants to preserve, to top, and top, instead of rooting them up as pests and nuisances to the tenant, without one shilling of profit to the landlord. Hedge-rows are, in my opinion, better grubbed up. The Poles grown on them are generally crooked, and they root out and injure the crops. Let woods be inclosed and like timber, kept together. There is one well-known fact about hedge-rows. When grubbed, however poor the soil, Corn or aught else grows well on the land for years without manure, whilst a wood of any size, if grubbed, is sterile for years. I mention the circumstance without endeavouring to account for it. How much more Corn might be grown, if landlords would allow, and tenants have the spirit to take up the waste hedge-rows, &c., and fill up many useless ditches! What a quantity of land now lies almost barren that might be made profitable, and how many hands might be employed that are now idle! Much has been said of draining, &c., as a means of employment. Here is another as useful. It is the duty of every man, be he landlord or tenant, to find employment for the labourer. Let him consider that he not only relieves and employs him, but he feeds his wife and children, and brings them up with honest and industrious habits. In what I have here stated I have only taken up the heads of wood cultivation, leaving to my brother farmers to enlarge and improve. If I have digressed, the object I have had in view was to call the attention of both landlords and tenants to other useful improvements." Here an interesting discussion ensued. On all hands it was considered that it would be best for landlords at least to provide the plants for filling up, even if they did not put them in. An instance was named where two plantations were separated by a hedge, lying on precisely similar soil. One had been well cultivated by the landlord, and after twelve years was worth from 40l. to 45l. per acre; the other was held by a tenant on a short term, and was not worth more than perhaps 5l. per acre. Many instances were mentioned where land, the fee-simple of which was not worth 5l. per acre, had in a few years produced a crop of Larch or Ash, worth from 30l. to 45l.; and considerable tracts of poor land in Kent and Sussex were supposed to be susceptible of similar improvement. In reference to the recommendation to plant as much as six or eight feet apart, it was said that when planted too distant the outer poles were curved at the bottom, and the best part of the pole was much wasted in sharpening. Instances had occurred, however, where, when planted too thickly, the plantations had fallen off after the first crop. It was the general opinion that plants ought to be planted in a good sized hole, and not deeply. Difficulties had been found in planting mixed sorts, as in some soils Willow had outgrown Ash, and both had greatly outgrown Chesnut. On the other hand it was contended that all our natural woods were of mixed sorts. In some clays, as at Nettlestead for instance, Chesnut had grown well, whilst in other clays it had not succeeded. Crop Willows on clays had been known to produce poles in six years. Cases were mentioned where Larch had been planted thickly, and alternate plants thinned out as it had grown, for poles and use pieces, the remainder being ultimately allowed to stand for timber, and to have become of great value. In selecting plants it was considered that Ash should not be less than six feet high, Larch about three feet six inches, and Chesnut about the same, with a good root. Larch plants, it was said, could be procured from Scotland at about 11s. per thousand. The following resolution was then adopted:—"That the improvement of woodland appears to this club to be a matter of greater importance than it is generally considered. That in selecting the sort of wood to be planted, the best criterion is to observe those which already grow best in the soil, and to plant similar sorts; that some members are in favour of planting mixed sorts, whilst others prefer planting only one sort. That the holes for planting should be large, and not too deep; that the after-cultivation should be carefully looked to, and if some manure, or a covering of Hop-bines is put on the land so much the better."—The following communication, which arrived too late to be read before the meeting, contains so many useful hints, that we append it to the report:—"It is generally said that a tenant is but little concerned in the management of woodland, as it is almost wholly in the hands of the land-

lord; but I believe every tenant-farmer to be more or less interested in the subject. When we consider the high price underwood sells at, and that at ten or twelve years' growth, upon the same soil, it varies in price from 10% to 50% per acre; surely it will be admitted that it is a subject worthy our serious consideration. I admit the tenant-farmer ought not to go to the expense of purchasing the plants to improve his woodland, but the landlord ought to give the plants, and the tenant to be at the expense of planting; and, in the event of his leaving his farm, the appraisement upon the underwood will amply repay him his outlay; I find woods, that have not been attended to by planting, require from 400 to 800 plants per acre to fill them up; and care must be taken to inform yourself what sorts of wood are best adapted to the soils; Chesnut I think the most profitable to plant upon sand or any dry soil. I would point out Cox-heath and Cressmill-heath, as a proof of the soil being adapted to their growth. I prefer plants that are raised from English Chesnuts to the Spanish Nut, as they generally grow straighter Poles, though they are not so luxuriant. I would always recommend selection of plants of all sorts from rather poor nursery ground, than from a rich soil; as they do not in such case receive such a check on being transplanted as when brought from a rich to a poor soil. Ash and Willow are also good to fill up woods with, where the soil is suitable, and they will thrive almost anywhere, unless there are many rabbits and hares, which are destructive to all underwood, but particularly to Ash. I find it best to mix Ash and Willows together, as the Ash will root upon or near the surface, and the Willow deeper in the soil. I will now describe my method of planting, which is the year after the wood has been cut, unless the wood can be cleared off in sufficient time to plant the same season, which I prefer. I strongly recommend planting by the side of streams and ditches Crop Willow as a profitable kind of wood; I usually put in a large Hop-pole, or use-pole, about 15 feet apart, by the side of the watercourse, leaving the top about 7 feet out of the ground, to secure it from the bite of cattle; it will then form a Pollard, which will produce Hop-poles and use-poles, to be cut every eight or nine years, and will be found to stand as long in a Hop-ground as other poles generally of the same age. The use-poles make good light sheep-gates, if they are put into immediate use and not suffered to stand in the wet. The Pollards should be topped in winter, and in spring the Hop-poles and use-poles will flay easily, which is much better than shaving them. I commence by digging my holes for planting in the woods 20 inches square and 1 foot deep; then, with the peak end of the mattock, grub down 6 inches more, which makes the soil loose for the roots to penetrate freely. The price of this is 2s. per hundred holes, and about 9d. or 10d. more for planting by a man and boy, the boy to hold the plant upright, the man to put the earth round the plant, and tread it in firmly about the roots again. I find those Ash plants best the tops of which have been cut off when removed from the seed-bed, as they grow stouter at the bottom and are not so top-heavy. Where a new wood is planted, the ground should be well trenched, the plants set four feet apart each way, and kept free from weeds. The second year the plants should be cut off close to the stub; each plant will then throw out several shoots. A crop of Potatoes may be taken the second year without injury to the plant. I would recommend particular attention to the cutting of Oak, as coppice, for bark in the spring, to see that the bark is cut through at the bottom or rind; for if stripped down the stub, lower than the wood is cut off, it is very injurious, and sometimes kills the stub. The bark should also be taken off as early as the season will permit. I have seen the wood much injured by cutting it too late, or near Midsummer. The price of Chesnut plants this year, from 3 to 5 feet high, is from 6s. to 8s. per 100; Ash plants of the same size are from 2s. 6d. to 5s. per 100."—*From the Maidstone Gazette.*

Treatment of Bees in Zante.—In a small vineyard by the road side, at a short distance from St. Leo, was a large apiary, consisting of perhaps 70 or 80 hives; and the proprietor, who was living with his family in a stone hut in the vineyard, was at that time employed in collecting the honey, which we tasted and found very rich. The hives generally consisted of a piece of the trunk of an Olive-tree, about 1½ foot high, hollow, with two cross sticks within placed horizontally to give support to the combs. They stood on flat stones, an inch or two from the ground, and were covered with a thin piece of stone brought from Langadachia, which from its slaty and porous texture must be a bad conductor of heat, and very well adapted for the purpose to which it was applied. There was a cistern in the vineyard, with small troughs to water the bees; the supplying them with water is the most important part of the whole economy, and demands constant attention: it kept employed two or three people.—*Davy's Notes on the Ionian Islands.*

GARDEN MEMORANDA.

T. Brocklehurst, Esq., The Fence Macclesfield.—At a late visit to this place I was so much pleased with the extensive collection of Orchidaceous plants so successfully cultivated here, that I am induced to send you an account of those in flower. On entering the houses the visitor beholds these interesting plants growing in various modes and situations; some suspended in rustic baskets and on logs of wood, others in neat copper-wire baskets, and in perforated or common pots. Some are clinging to branches of trees, reminding one of their native forests; others, more small, are placed upon a kind of rustic wooden tent, standing over a shallow cistern. The greater part, however, are grown in pots, standing upon others, inverted over shallow cisterns filled with water. The following were in flower: *Acanthophippium striatum*, a noble plant with five large pseudo-bulbs, nine inches long, and proportionably strong; *Aspasia lunata*, new and pretty; *A. epideioides* and variegata; *Aporum anceps*, *Batemannia Colleyi*,

Bifrenaria aurantiaca, a fine plant two feet in diameter; *Bromheadia palustris*, lately introduced from Mount Ophir, with pretty delicate Lælia-like flowers which, unfortunately, are of short duration; *Burlingtonia venusta*, white and almost transparent; *Brassavola angustata*, with neat greenish-yellow flowers; *Brassia maculata*, *Lanceana*, and *verrucosa*; *Blétia Shepherdii*, with several other species of less beauty. Of *Catasetum* there were many species, with singularly grotesque flowers; several plants of *Cyrtopodium Andersonii*, grown in a strong, rich compost, were in bloom; one variety having a more dwarf and branching stem. A large plant of *Cypripedium insigne* had fifteen of its large flowers expanded. *Dendrobium nobile* is just going out of bloom; I understood that there had been upwards of 100 flowers on each of the two large plants; *D. cœrulescens* is in full bloom, with *D. sulcatum*, bearing a strong spike of pretty flowers, medium size, and fragrant; *D. macrophyllum*, having a noble spike of 50 flowers, remarkable for their strong scent, resembling newly-ground Rhubarb root; *D. densiflorum*; *D. secundum*, and a variety with almost crimson flowers; *D. Jenkinsonii*, one of the finest plants in this country, having upwards of 30 blossoms upon it, the plant (on a log) being literally hidden by them; *D. discolor*, which, although not of a brilliant colour, is a fine species, and lasts in bloom a long time. Amongst the *Epidendrums* there are many species in flower; the most remarkable are *E. bicornutum*, *E. crassifolium*, with neat pink heads; *E. variegatum*, with seven flower stems; *E. aurantiacum*, and a variety of it which opens its blossoms better than the original species. The *Fernandezias* hung up in baskets form elegant plants, with small and pretty flowers: *F. robusta* is in the collection, but it is not yet in flower. There are many large *Gongoras*; *G. speciosa*, with dark flowers, is very fine. There is also a curious-looking species with the ribs of the pseudo-bulbs flattened; it is showing a spike of flowers, and is apparently new, being a native of Panama. *Govinia superba*, *Lælia cinnabarina*, *Maxillaria Harrissoniæ*, are blooming freely, with many *Oncidium*s, of which I shall only name the best: these are *O. lûridum guttatum*, *flexuosum* two var.; *O. papilio*, one variety, with larger and brighter flowers than the other; *O. ampliatum*, two vars.; *O. divaricatum*; *leucociliolum*, with a spike 11 feet long; *O. Baueri*, and a var. of *O. Cebolleta*; *O. stramineum*, and *O. pictum*; to these may be added *Pactonia rosea*; *Phaius Wallichii*; *Peristertia cerina*, with pretty wax-like cups; *Schomburgkia crispata*, and a variety of it with umbellate flowers, having white peduncles, dark sepals and petals, and a white labellum. An immense plant of *Vanilla planifolia* covers the back wall of one of the houses; it is 30 feet long, with numerous spikes of large greenish flowers. *Zygopetalum rostratum*, a free-flowering species, is also in bloom, with *Z. crinitum*. A new *Cyrtociliolum* is, moreover, showing a strong flower-stem 1½ inch in diameter, which has already reached 3 ft. in height; the leaves are 3 feet long, narrow and tapering; pseudo-bulbs, large, compressed, and slightly ribbed; it is a native of Mexico. Several *Cattleyas* from S. America are showing flower, and some are apparently new; *Colúmea Schiedeana* is flowering well, in a pot suspended near the glass: excess of light seems favourable to it, for the leaves and flowers are much higher coloured than usual. Two healthy plants of *Cephalotus follicularis* are growing in small pots, in a compost of reduced sphagnum, peat, and silver-sand, placed in larger pots, filled tightly round with moss, and covered with bell-glasses. A pretty species of *Dianella*, apparently new, from the warmer parts of Australia, and trained against a wall, is now in flower.—*W. Barnett, Chester-road, Macclesfield.*

Reviews.

The Indian Hand-book of Gardening.—By G. T. F. Speede. Calcutta. Thacker and Co. 8vo.

It is difficult for those who reside in Europe to judge correctly of the value of such a work as this, which relates to the details of gardening requisite in a tropical country. As it has reached a second edition, we presume it must have been found useful in India. To Europeans, it is interesting to know how gardeners in hot countries proceed in their management of the plants which are here known only in the hot-house; and such information is to be expected from a book like the present. We, however, cannot say that it satisfies our curiosity, or affords anything like that amount of evidence which we expected. For example, all the original matter that relates to the Pine Apple is the following, which, although useful enough as far as it goes, is much too succinct for our taste:—

"*Culture.* The plants should be put out in rows two feet asunder, the rows about four feet distant from each other, and the earth well drawn up to the stems; in the third year they will begin to produce fruit, and as soon as the blossoms appear, which will be in February, the roots must be laid open, and all side shoots and suckers carefully removed to plant out for a fresh supply of plants, if desired; a basket of rotted cow-dung should then be put to each plant, and above that, the like quantity of fresh stable dung, with the litter covering the whole; this will form a ridge about the stem, over which a thin layer of earth should be placed; a trench should then be dug on each side of the plants, which must be every day filled with water, a moderate quantity being also thrown from a fine rosed watering-pot, once a week, over the leaves and fruit. The fruit will ripen in May and June, and by pursuing the method here recommended, Pines may be obtained of as large size and as highly flavoured as the finest procurable, with the utmost care, in any part of the world.* The stem producing the fruit should be removed when the fruit is cut, and a new shoot encouraged, and no offsets should be allowed to remain round the base of the fruit, whilst it is growing, as they would draw off the nourishment, and deteriorate the flavour."

What limits the utility of Mr. Speede's book even more than his conciseness, is the want of a Table of Contents; and of an index to the supplementary matter; so that one never knows where to look for the native names of which that part is intended to explain the corresponding names in science. This is an oversight that should be corrected in another edition. It would be as well, too, that the spelling of the proper names should be revised with more care—*Ananas* for *Ananas*, *Macrocnemum* for *Macrocnemum*, *arjuriu* for *azureum*, *Hydœum* *bisput-lædis* for *Heaven* knows what, *cuncifolia* for *cuneifolia*, and so on—are sad blemishes. We cannot help thinking moreover, that the lists of ornamental plants recommended for cultivation in Indian gardens stand in need of great reformation. We suspect it would puzzle an Indian nurseryman—if there are such people—to supply *Orchisspectabilis*, *Satyrium carneum*, and *Disa grandiflora*! which Mr.

* In my brother's garden, in the years 1839 and 1840, Pines were grown weighing from 6 to 7½ lbs. each, exclusive of the top.

Speede recommends as perennial border plants. However, as we have already said, a second edition of the work has been called for in India, which shows that it has been found useful by those for whom it was intended.

CALENDAR OF OPERATIONS for the ensuing week.

In a short time the Gooseberry and other Caterpillars will commence their depredations; and unless we are previously prepared for their destruction, we shall have once more to recount their ravages. In consequence of what is stated in a leading article, vol. ii., p. 203, I was last season induced to try ammoniacal liquor from the gas-works for their destruction, and which I found the cheapest and easiest method yet resorted to. The liquor I employed only cost one penny per gallon, to each of which 10 gallons of pure water were added, to reduce its strength to a state in which it was harmless to tender foliage. I had thus 11 gallons of diluted liquor, every drop of which was sufficient to kill one caterpillar; and in this state it was freely poured over the Gooseberry-bushes through the rose of a watering pot, and the caterpillars were killed in a few hours. As the strength of the liquor varies at different gas-works, and as there is no standard by which we can ascertain the degree of strength, every one must find it out for himself, after the following manner.—Take a glassfull of the liquor, as it comes from the gas-work, and add six times the quantity of water; then pour the mixture over some useless plant with tender foliage when the sun is out; if the foliage is not hurt, try less water; if the contrary, add more. In this manner the proportion may soon be found. The liquor used by me would not hurt the foliage when eight gallons only of water were used to one of gas-liquor. But I found that ten to one was strong enough to kill the caterpillars. I may remark also that the undiluted liquor will only kill the leaves of woody plants; the young shoots are not affected by it, and insects of any kind are safe from its influence. I have taken shoots, crowded with green flies, and plunged them in the liquor without their being apparently the least disturbed by it. Judging from four or five months' experience, I think ammoniacal liquor will, at a trifling cost, render hard or spring water quite as fit for watering tender plants with as pond or river water, and the proportion need not be more than one gallon in the hundred. Where gas-liquor cannot be procured, a lump of sal ammoniac will probably answer as well, and be as cheap; but this and the last suggestion require the sanction of the chemist. The strength of salts, or saline manures, may be proved for practical purposes in the same way as the ammoniacal liquor.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—If the roots are in good condition, the usual course of watering, syringing, giving air, and slightly shading in the middle of the day, will form the routine in this department for some time to come.

VINERIES.—The Vines in the late house, or in the greenhouse, will probably now be so far forward that they may be trained up the rafters, if they have been laid in a horizontal position, to facilitate their breaking regularly. Keep the house moist by the syringe, and as there is no occasion to hurry late Grapes at this early stage, no fires will be wanted at night.

PEACH AND CHERRY-HOUSES.—These will require all the air that can be given to them; but the atmosphere may still be kept moist, to ensure the proper swelling of the fruit and healthy foliage.

FIGS.—The early crop will now be fully swelled; the plants, therefore, should have a drier atmosphere and less water at the roots; give them abundance of air, but shut up early in the afternoon.

MELONS AND CUCUMBERS.—Keep up a vigorous heat in the linings; look over and thin out the plants regularly and by degrees. Fertilise the Melon-blossoms until more than a full crop is set; they can afterwards be thinned out, when all danger of their damping off is over. During this stage keep the frames in a dry state, by admitting plenty of air.

MUSHROOM-HOUSE.—Woodlice are the greatest pests that can come into this house; they must therefore be kept down, by entrapping them in pots baited with cold boiled Potatoes, covered with moss, or by enticing them into dry corners and scalding them with boiling water. The atmosphere of this house must be kept moist.

STRAWBERRIES AND FRENCH-BEANS.—These must be carefully watched from this time, to see that the red spider does not infest them, as it will be difficult to keep down these insects in houses where fruit is ripe or ripening.

Continue to harden off Tobacco-plants, Capsicums, Tomatoes, Basil, &c., which should now be strong enough to stand in a cold, close frame, to be shut up early in the afternoon, for a week or two, after which they should have air night and day till they are fit for planting out.

Out-door Department.

While young crops are advancing in all parts of the kitchen-garden, the ground about them can hardly be stirred too often, to keep an open pulverised surface, and to destroy weeds. With the first warm rains the young crops after this time will advance rapidly, and unless such as require it are thinned out in time, they will soon be injured.

BROCCOLI.—Sow late spring Broccoli on a light border, and a few more about 10 days hence; at planting time you will have the choice of two sowings.

CALIFLOWERS may have the glasses removed from them altogether; and see that they do not want for water.

BET, SKIRRETT, SALSIFY, AND SCORZONERA, may be sown towards the end of the week, or in early situations; the two latter may be deferred for another week: if sown too early they are apt to run to seed.

KIDNEY-BEANS.—A few of these may now be planted on a warm border, for a first crop; but if they are sown in boxes about the second week in May, and transplanted when all danger of frost is over, they will come in sooner than those planted now in the open ground.

SUCCESSIONAL CROPS.—Peas, Beans, Spinach, Radishes, and other salads should now be sown oftener, as they will come more rapidly into use through the summer.

SEEDS of any sweet or pot-herbs, if not already sown, should be got in forthwith.

ORCHARD.—The best advice I can give this week under this head is to recommend a general system of killing wasps by offering so much a head or per dozen for them from this time until the end of May, or some stated time. It is needless to remark that every wasp now killed is as good as a nest destroyed next August; and if every proprietor of a garden in the kingdom would only spend a few shillings on the subject, our fruit might be in a great measure safe from their attacks. From the enormous stock of them last season, and the mildness of the winter, we may, if the summer is dry, expect them this year in increased numbers.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—An increased supply of water and a strong moist heat are beneficial to most stove plants at this time, by enabling them to make a free, healthy growth; they also require less air during this stage. If the expression is allowable, all sorts of plants under protection, with the exception of Heaths and perhaps a few other hardy tribes, should have a gentle forcing about this time; this would enable them to make an earlier growth, and would, as it were, lengthen the summer season for ripening their wood, which is one of the grand secrets towards obtaining healthy plants and abundance of flowers and fruit.

GREENHOUSE.—The above remarks apply also to this house, only in a different degree. See that the stimulus is not too great for these plants, as it would be more injurious than keeping them

too cold. Whenever they begin to "draw," they are either too warm or too much confined.

CONSERVATORY.—As very little syringing can be done here, on account of the flowers, and as flowers do not last so long in a dry atmosphere, some degree of moisture must be kept up by pouring water on the paths or under the stages. Blinds are now indispensable in the middle of the day.

PITS.—Increase, pot off, and harden your stock of flower-garden plants as fast as their different natures will permit; the sooner the better. Most of these plants are quickly injured to stand out in sheltered places, or under hoops covered over with mats; and the longer they are here the finer they will look after being planted out in the flower-garden.

Out-door Department.

FLOWER-GARDEN.—Order and neatness in all parts of the flower-garden are pleasing at all times, and the more so now, in anticipation of the approaching gay season. Late-laid turf and late planted trees and shrubs will require constant attention in being watered, so long as the weather is dry. If any of the flower-beds require a change of soil, let it be done without delay. Get through with any extra work in any part of the grounds, in order that the men may proceed with the regular garden work. —D. Bruton, *Shrubland Park Gardens.*

State of the Weather near London for the Week ending April 20, 1843, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.			THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 28th in 1841—thermometer 76°; and the lowest on the 25th in 1827, and 26th in 1835—thermometer 25°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending April 21, 1843.

THE MARKET. this week, contains some very good Hothouse Grapes, of the Black Hamburg kind, the imported ones being now, for the most part, considerably shrivelled, or decayed. Strawberries are likewise fine. Of Cucumbers there is an exceedingly varied assortment, many being large and handsome; while some, labelled at 6d. each are of a most miserable description. New Potatoes, of the Ash-leaved Kidney sort, are abundant, and particularly good. French Beans are tolerably good. The Easter Beurre Pears, the Lady Apple, and the Gloucester Pippin Apple have a handsome and sound appearance. There are also a few fine Peaches. Among the flowers *Chorozema cordatum*, *Erica Wilmoreana*, *Gardmia radicans*, and *Florida*, are the most noticeable; there being, besides, a great quantity of *Cinerarias*, *Pelargoniums*, *Azaleas*, *Cyclamens*, &c. The *Laurestinus*, grown in pots, has a pretty effect. There are cut flowers of *Erica Hartnellii*. The *Camellias*, carved in Turnip or other vegetable roots, are extremely beautiful. The flowers of the common Reed, dyed of various colours, are also ornamental. Punnets for fruit, enveloped in moss, and sparingly decorated with different-hued everlasting flowers, are exhibited in one or two stalls.

PRICES, SATURDAY, April 22, 1843.—FRUITS:—

Pine Apple, per lb. 6s to 10s	Lemons, per 100, 5s to 14s
Grapes, hothouse, per lb. 8s to 1s	Cucumbers, per brace, 1s to 4s
— Spanish, per lb. 1s to 1s 6d	Walnuts, per bush., 12s to 20s
— Portugal, 1s to 3s	Chestnuts, per peck, 4s to 7s
Apples, dessert, per bush., 6s to 14s	Almonds, per peck, 6s
— Kitchen, 4s to 7s	Sweet Almonds, per pound, 3s
Pears, dessert, per hf. sieve, 20s	Filberts, English, per 100 lbs. 55s to 65s
Strawberries, forced, per oz., 6d to 1s	Cob Nuts, per 100 lbs., 60s. to 70s.
Pomegranates, per doz., —	Nuts, per bushel—
Oranges, per doz., 1s to 2s 6d	— Brazil, 16s
— per 100, 6s to 12s	— Spanish, 14s
— bitter, per 100, 6s to 80s	— Baranona, 9d
Lemons, per doz. 1s to 2s	— Cob, 12s to 14s

VEGETABLES.

Savoy, per doz. 6d to 1s	Spinach, per sieve, 1s to 1s 6d
Cabbage, Red, per doz. 2s to 6s	Leeks, per doz. bun., 2s to 3s 6d
— plants, per doz. 1s to 3s 6d	Onions, per bushel, 6s to 8s
Broccoli, White, per bunch, 4d to 2s	— Pickling, per hf. av., 4s 6d to 5s
— Purple, 4d to 1s	— Green, p. doz. bun. 2s to 4s
Beans, Kidney, forced, p. 100, 1s to 2s	— Spanish, per doz. 2s to 3s
Potatoes, per ton, 40s to 70s	Garlic, per lb. 1d to 8d
— per cwt. 2s to 4s	Shallots, per lb., 1s to 1s 6d
— per bushel, 1s 6d to 2s 6d	Asparagus, forced lg., per 100, 6s to 8s
— Kidney, p. bush., 1s 6d to 2s	— Spruce, or Small, 1s 6d to 2s
— Scotch, per bushel, 1s 6d	Sea-kale, per punnet, 6d to 1s 6d
— New, per lb., 1s to 2s 6d	Lettuce, Cabbage, p. hf. sieve, 1s to 2s
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	— Cos, per score, 6d to 2s 6d
Turnips, per d. bun., 1s 6d to 2s 6d	Endive, per score, 6d to 2s
Red Beet, per dozen, 9d to 1s	Chervil, p. hf., (12 to 15) 6d to 2s
Scorzonera, per bundle, 1s 3d to 1s 6d	— Small, 1s 6d to 2s
Salsify, per bundle, 1s 6d to 1s 8d	— Small, 1s 6d to 2s
Cardoons, each, 1s	Corn Salads, per hf. sieve, 9d to 1s
Horse Radish, per bundle, 2s to 6s	Green Basil, per bunch, 1s
Radish, sp. ng. p. doz. hands, 9d to 1s	Watercress, per doz. am. bun. 4d to 6s
— Turn p. p. doz. hands, 1s 6d to 2s	Parsley, per half-sieve, 9d to 1s
Carrots, per d. bun. 1s 4d to 6s	Tarragon, per doz. bunch, 2s to 3s
— Young, per doz. bun. 1s 4d to 1s	Fennel, per doz. bun., 2s to 3s
Parsneps, per dozen, 6d to 1s	Mint, per d. bun. 2s to 3s
	Mushroom 4s, per pot, 3d to 1d

Notices to Correspondents.

MANURES.—*Anthony.*—Much obliged; as the letter has not appeared in our columns, although in type, we have thought it better to cancel it. —*A Subscriber.*—The soil from a hen-house will be found a strong manure; but it should be added to the compost heap, not used alone, as it is too strong. If employed in the Vine-border, it would be better to mix it with charcoal-dust, or cinder-siftings, or soot, if you have any. —*A. U.*—Nitrate of Soda, in a very weak solution, will push on your young Onions, but putrid urine and soap-suds are much better. —*A. M.*—If your seeds are not in contact with the guano, and you have not used too much of it, you will find advantage from it. You should water the beds well, so as to dilute the guano in that way. —*F. T.*—Plants obtain silex from the soil, where it is combined with some alkali, in which state it is soluble. It is stated by some writers that humate of lime is nearly insoluble; others recommend it as a means of rendering humus soluble. The great objection to adding quick-lime to decomposing animal matter is, that it expels the ammonia. Nitrogen is supposed to enter plants in the form of ammonia, a compound of nitrogen and hydrogen. Such plants as contain lime, Wheat and Peas, for example, in notable quantity,

no doubt require to find it in the soil. For the rest you had better study Mr. Soli's "Rural Chemistry," in which you will find full information. —*Bucks.*—We are endeavouring to obtain some good information about burning clay, and hope to furnish it shortly. —*A Countryman* inquires how to construct one of those Oat-kilns used by Oatmeal makers, and costing only 3*l.*, which are mentioned in the latter part of "Paxton's Cottager's Calendar." If this catches the eye of J. S., or any of his friends, perhaps he will favour us with information on the subject.

BUTTER.—*Poor Sarah Skimmer!* It really is a sad thing that churning should make your "lines and showdars" ache; and we suspect your master has given you a bad churn. It is of no use going to chemistry for help; you must trust to the engine maker, or to a good donkey, if you have one, to take the labour off your "lines."

MUSHROOMS.—*John Horticultor.*—Mushrooms may be grown on the sides of Cucumber-ridges in the open ground at the time the plants are put out, by burying small portions of the spawn an inch or two deep in the dung, after the heat has begun to subside, and covering the bed with dry soil, firmly pressed down. The period at which the Mushrooms will appear will depend entirely upon the state of the weather. They cannot be grown in the open air without an artificial bed of some kind.

PROTECTION.—*Rhodon.*—Old tan is good protection for the roots of plants; but injurious afterwards, unless it is wholly removed in the spring. Coal-ashes are better, and not injurious to plants afterwards. —*W. B.*—We recommend you the White Sweetwater, the Royal Muscadine, the Chasselas Musqué, and the White Nice. The last is the tenderest, the first the hardiest. —*R. E.*—If Vines were stopped at the length to which the shoots require to be pruned in winter, and presuming that they are sufficiently vigorous, they would burst those eyes along the shoots which only ought to push in the following season. Besides, the general vigour of the plant would be diminished in consequence of the privation of sap elaborated by the leaves on the leading shoot. It may be said that the leaves produced on laterals would supply the loss occasioned by the stopping of the leader; this, however, is not the case, for some time must elapse before these laterals can be produced. It will require three weeks before the surface of foliage on these laterals will equal that which would be produced of the leader, if not stopped in one week, so that here is the loss by a fortnight at a period of the season when the extension of roots, depending on the action of leaves, requires to be encouraged. But at a more advanced period of their growth, the shoots may be very properly stopped, because then the eyes below will not break; and, moreover, it has been proved by Mr. Knight, that leaves in a young state only elaborate for their own growth, or chiefly so; therefore, all the terminal part of the shoot that would only produce leaves which would never attain full size, or benefit the other parts of the plant, may be prevented from being produced by stopping the shoots, about the time the Grapes are full grown. The force that would have been expended in producing these terminals will be directed towards invigorating, without danger of bursting, the buds for next season. Stop one joint before the fruit. As your Vines are old and do not set their fruit well, your best plan will be to cut them well back, and train up young wood. —*J. A.*—It is said that the vapour from ammoniacal liquor is useful to Vines in houses; but we have no experience in the matter. It should be a good deal diluted, in trying the experiment, or it may do injury. —*Despair* not, but manage better in future. Your Vines are not attacked by insects, but are scalded by improper syringing and over-heating. A temperature of 70° at night is much too high; and if you allow the sun to shine on the foliage of your plants in a morning when covered with water, you can have nothing but mischief. The loss of your Strawberry crop is probably owing to similar causes, viz.: too much heat and too much water applied in the wrong way at the wrong time. —*H. R. M.*—The best means of obtaining a humid atmosphere in a stove, heated by smoke flues, is to place evaporating pans, sitting close to the flue, upon various parts of its surface. By filling these with water and increasing or diminishing their number, the atmosphere may be preserved in any desired state of humidity. —*F. T.*—Many causes concur to render plants in sitting-rooms unhealthy: the principal is the dryness of the air. Your night-smelling Stock is probably affected by this circumstance; its botanical name has been changed. Linnaeus called it *Cheiranthus tristis*; Robert Brown altered it to *Matholia tristis*, and it has probably been named *Hesperis tristis* by somebody else. Phillips's book is of no authority. —*Beech-Hedges.*—*A. U.*—It is better to let your Beech plants alone till they have been one year planted before you clip them. They ought to have been planted in the autumn. —*F. C.*—Eight annual creepers, for running over wire arches in a garden, may consist of—*Tropaeolum peregrinum*, *Convolvulus major*, *Lophospermum scandens* and *Hendersonii*, *Eccremocarpus scaber*, *Ipomoea rubro-cerulea* and *Quamoclit*, and *Scyphanthus elegans* (in a warm situation). —*Villager.*—We fear that Fir-trees, planted four feet from the south wall of a house, will, when they increase in size, be injurious to the building, in consequence of their roots undermining the foundation. —*F.*—It is stated by a correspondent at p. 621 of last year's *Chronicle*, that he has observed the common garden snail in the act of eating Laurel leaves: it is therefore probable that the leaves of your Laurels have been destroyed by the same animal. —*Vishnu.*—On no account syringe fruit-trees with suets until the blooms are set. —*P. A. K.*—The soil and situation which are suitable for *Paulownia imperialis* have already been detailed at p. 212. —*D.*—*Strelitzia reginae* bears curious orange and purple flowers. In a greenhouse it may be cultivated in a pot, in light sandy loam; but it is never seen in such perfection as when planted in the border of a conservatory. It requires an abundant supply of water when growing. —*A Cambrian Subscriber.*—Sow the seeds of *Portulaca splendens* on a slight hot-bed, and when the young plants are large enough, prick them out an inch or two apart into shallow pots. After they have fairly established themselves, transplant them two or three together into 48-sized pots. They should be grown in sharp, gravelly soil, and do best in a warm greenhouse. —*T. R. W.*—*Calypso borealis* is a hardy Orchidaceous plant, extremely difficult to cultivate. It prefers a shady peat border. The other plant we never heard of. —*H. R. M.*—The following are showy stove plants, of easy cultivation: *Euphorbia jacquiniiflora* and *splendens*, *Poinsettia pulcherrima*, *Franciscia uniflora*, *Eranthem pulchellum*, *Justicia coccinea* and *flavicomis*, *Ixora coccinea*, *Gesnera Suttoni*, *splendens*, *elongata*, *mollis*, and *zebrina*; *Gloxinia rubra*, *candida*, *caulescens*, *speciosa*, and *sp. alba*; *Goldfussia glomerata*, *Ardisia crenulata*, *Pancratium amnemon*, *Aphelandra cristata*, *Phaius grandifolius*, *Russelia juncea*, *Plumbago capensis*, *Epiphyllum truncatum*, *Allamanda cathartica*, *Begonia insignis*, *parviflora*, and *coccinea*, *Eschynanthus grandiflorus*, *Colúmea Schiedana*, *Geissomelia longiflora*, *Streptocarpus Rhexii*, *Vinca alba* and *rosea*. For climbers you may take *Passiflora Kermesina* and *phoenicea*, *Manettia cordifolia* and *bicolor*, *Jasminum Sambac*, *Ipomoea Horsfalliae*, *Combretum*

crimson; *Hume's Blush*, buff; *Fringed White*; *Franco-frutensis*, red; *Palmeri*, rose. The *Reticulata* will not do out, although protected during the winter, unless with a glass-frame. It requires to be kept close and warm during the growing season, to form the young shoots; any dry situation will suit them where the soil is not too stiff. —*S. A. M.*—As your *Pelargoniums*, for want of better soil, were potted in leaf-mould, you cannot expect them to throw up strong blooms. You may assist them by watering them alternately with rain and manure water. The latter turn purpureum, *Convolvulus pentanthus*, *Bignonia venusta*, and *Cereus grandiflorus*. —*Kanpukos.*—The best thing you can do with *Camellias* which have been injured by improper treatment, is to shake the soil from their roots, and repot them into the same sized pots, in a mixture of light turfy loam and heath-mould. Plunge the pots in gentle bottom-heat, shade the plants in bright sunshine, keep up a temperature between 50° and 60° by night, with a moist atmosphere, and then follow the directions given in former numbers. —*Rhodon.*—The following are about the best for form and colour combined, and are also good free-flowering kinds:—*Bealeii*, crimson; *Chandleri*, deep should not be given too strong, or it will perhaps injure the plants. —*Shrewsbury.*—As dwarf plants for the four divisions of a Maltese cross, to range scarlet, white, blue, and yellow, you may take *Verbena ignea*, *V. pulchella alba*, *Anagallis cerulea grandiflora*, and *Alyssum saxatile*. —*P. A. K.*—The following are arranged according to the various shades of colour, from white to the darkest purple:—*V. tenebrosa*, Queen, *pulchella alba*, *odorata alba*, *Thompsonii*, *variata*, *incisa*, *Hislopiana*, *tenebrosa carnea*, *Buësti*, *tenebrosa purpurea*, *t. Bartsii*, *t. rosea*, *t. Iveryana*, *Ingrami*, *Barnardii*, *Hylandsi*, *Burleyana*, *Tweediana*, *T. grandiflora*, *splendens*, *melindrés*, *m. major*, *sanguinea*, *ignea*, *rubra*, *élegans*, *scabra*, *triumphans*, *pulchella*, *Sabiniana*, *Grenvillii*, *purpurea*, *picta*, *Elfordiana*, and *Hendersonii*. The only yellow one is the old *sulphurea*, which is now nearly lost to the country. —*A. L.*—If it be possible to make them flower in the autumn, the most likely road to success is to keep them in an ice-house till you want to force them. They would probably grow, although in a dark place, if the temperature rose above 32°.

PEAT.—*T. R. E. R.*—As your garden consists principally of Peat, you may, in addition to *Phlox Drummondii*, plant clumps with the following dwarf Annuals:—*Sphenogyne speciosa*, *Clin-tonia pulchella*, *Nemophila insignis*, *Leptosiphon androsaceus* and *densiflorus*, *Lobelia ramosa* and *heterophylla*, *Nolana atriplicifolia* and *paradoxa*, *Collinsia grandiflora*, *Sanvitalia procumbens*, and *Kaulfussia amelloides*. *Campocaulis pulla* will do very well in peat. —*E. H. F.*—We have seen many quilled varieties of the *Cineraria*, and from their ragged appearance we think them not worth preserving. Your white variety is not equal to many we have seen. —*O.*—We have had the reports of the shows published in the *Chronicle* of last year carefully examined; the result proves that the numbers generally were understated in the list which appeared in No. 14; for instance, *Pickwick* was shown 149 times, *President of the West* 123, *Phenomenon* 111, *Maria* 93; still, as a guide to purchasers (for whom the list was inserted), it proves equally good, for it appears that the order in which the flowers were inserted in the list was but little disturbed by the examination. —*A. B.*—Nos. 1 and 3 are your best seedling *Cinerarias*; the colours are strong and the flowers showy; they are worth preserving, but they are not equal in form or size to some that are already in cultivation. No. 2 is not sufficiently clear in its colour. —*F.*—Of your seedling *Cinerarias*, No. 1 is the best; but they all want size and novelty to recommend them. The blue variety is very poor compared to many that we have. —*Metator.*—The plan of inserting the end of a scion of an Apple or Pear-tree into a Potato, in a manner similar to that of placing a cutting in the earth, so that it may strike root into the Potato, is not likely to succeed, except with the *Burknot* and Apples of that description, which strike readily from cuttings in the usual way. —*R. G.*—We entertain no doubt about this succeeding at the Cape of Good Hope. —*Omega.*—Those flowers which have the stamens large and the pistils small, are males; when the pistil is large and prominent, and the stamens dwarfish, they are females; when the two are equally balanced they are hermaphrodite. The *Victoria Strawberry* is pretty good; it may be had of any London nurseryman. —*Will I. N. V.* favour us with the temperature he maintained in his Vinerie, as mentioned in a late Number. A correspondent who grows his in a similar manner is unsuccessful. —*Metator.*—The Bread-fruit Potato is a good kind, and succeeds well in the alluvial soil around London. —*Nottingham.*—In a clayey loam you will do well to plant the White Bread fruit, which will thrive in soils that does not suit many others. The American Native, Regent, and Irish Cup, are also vigorous, productive, and of good quality. —*Richmond.*—Your enemy is a kind of scale insect, not an aphid, and is quite different from the pests of Peach and Nectarine trees. We know of no remedy for it except burning the individuals affected by it. We hope to have, in the course of the summer, some information respecting this and similar destroyers from our entomological friend "Ruricola." —*Rhodon.*—We presume your grub is the slugworm, described at p. 692 of 1842. —*C. W.*—We regret to be unable to give any advice about extirpating this beetle from Peas. It is a species of *Cercaria*; but we cannot say how it could be destroyed. —*R. E.*—If you give your Asparagus-beds a good soaking with a solution of common salt, it will not only kill the wireworm, but will likewise act as a manure. Repetitions will be advisable in order that successive generations may not escape. —*Vishnu.*—The best remedy with which we are acquainted for destroying this pest is to dust the bushes, when wet with dew, with genuine white Hellebore powder. See also Mr. Beaton's "Calendar" of to-day. —*W. B.*—We cannot assist you. The booksellers are the only persons who supply such works. —*J. W.*—The "Pictorial History of England" is, we think, on the whole, the best work of the kind. —*W. F. C.*—See p. 233. It is evidently an artificial compound. —*J. B.*—We fear you will obtain too much heat by mixing gas-water with Willow peelings, for all the substances to which the gas-liquor is added ferment violently—so far as our experience goes: however, we have not actually tried Willow peelings. There is no doubt that you will get an excellent manure by the operation. —*J. Fish.*—This is Poppy-seed, coloured blue. —*A Subscriber.*—There is no effectual method of scaring birds from fruit-trees; the ordinary means, such as scarecrows, rattles, &c., being only serviceable for a few days at first. Perhaps the cheapest is to shoot them. —*A Constant Reader.*—Gold and silver fish usually assume their natural colour when about a twelvemonth old, but this varies with the warmth of climate. There are species of the carp which are always brown. It is beneficial in ponds where they are kept to grow Water Lilies and other aquatic plants. The precaution which you took of clearing the mud from the bottom of your pond, may have been the principal cause of your not afterwards succeeding in increasing your stock of fish; and it is probable that the brown ones which show no signs of changing colour, are fish of a different kind; for the removal of which, as well as eels, we can recommend

no certain method; since, even if the pond were drained, some of their spawn might remain behind. It does not seem to be absolutely necessary that the ice upon the pond should be broken, but it is perhaps as well to use that precaution. You will find this subject treated of more at length in previous numbers. *—Monmouth.*—The way gold fish are sent from Covent-garden Market is in cans filled with water, and made for the purpose. *†*

MISCELLANEOUS.—*P. A. K.*—You must inquire of nurserymen respecting the plants you mention. *†—A Constant Reader.*—We cannot recommend any tradesman in particular. By looking amongst our advertisements you will see who deals in the article in question. *†—Lemon's* plant is *Syphocampylus bicolor*. *†—M. W. K.*—There are so many hybrid *Rhododendrons* similar to the one sent, that it would be useless to name it. *†—W. D. F.*—Your flowers are—1, *Narcissus moschatus*; 2, *N. odoratus*; 3, Double Jonquil; 4, Double Daffodil. You may increase your stock by applying to almost any nurseryman. *†—Dec.*—No. 1, *Cluytia pulchella*; it has only a calyx. 2, *Ribes speciosum*. These are all that your letter contained. *†—J. C. W.*—Out of print. *†—A Subscriber's* plant is *Illicium floridanum*. *†—Die.*—*Pyrus Aria*, the Beam-tree. *†—Rhodon.*—*Camassia esculenta* is in the Garden of the Horticultural Society; but only Fellows can obtain it. *†—P. R. W.*—1, *Veronica agrestis*; 2, *Scrophularia vernalis*. *†—Timothy.*—1, *Lamium incisum*; 2, *Linnaria spuria*; 3, *Lamium purpureum*. *†—J. M.*—The *Tropaeolum* is *brachyceras*; the *Epacris* is the same as one raised by Mr. Low in the same way as yours, and a very curious case it is.

RECEIVED, with thanks, R. Bishop, J. Anderson. *Lusor, J. R.* As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

THE brief allusion in our last to the illness of the DUKE OF SUSSEX, will scarcely have prepared our readers for the announcement of his Royal Highness's death, which took place yesterday soon after 12 o'clock. The Duke of Sussex was the most popular and the most accomplished of all the sons of George the Third, and although long suffering under the infirmities of 70 years, the intelligence of his decease, at once sudden and unexpected, will be received by the public with sincere and respectful sorrow. His Royal Highness retained his consciousness to the last; and expired in the presence of his brother the Duke of Cambridge, and of the greater part of his domestics who were admitted, by his own desire, to witness the last moments of their Royal Master. The Duke of Sussex was long known by his steady adherence to liberal opinions and by his open assertion of them on all occasions; he was also known as the constant supporter of every public charity, and there are few institutions of benevolence in this metropolis which have not received substantial benefits from his patronage.

The long-expected report of the Commission appointed to examine the various questions connected with the emancipation of the slaves in the French colonies has just been published. It sets out with adverting to the example of Jamaica, as a proof that a large slave population, when emancipated, is just as manageable as when in a state of slavery; and then develops a plan of emancipation, which, though rather long deferred, will doubtless be considered a great and final measure. The Commissioners propose that slavery shall cease in the French colonies on the 1st January, 1853, and that until that period the slaves are to continue in their present condition, with the enjoyment of certain civil rights, to be decided upon by Royal ordinances. A second report contains a plan for the progressive emancipation of the children of slaves born since 1838; this object it proposes to effect during twenty consecutive years, and by arrangements which leave the question of compensation to be settled at a future period. The marriage of the Princess Clementine of Orleans, daughter of King Louis Philippe, to the Hereditary Prince of Saxe Coburg, which was to take place on Thursday, is the only other topic of interest in the Paris papers. From Spain we learn that the Ministry sustained a signal defeat on the 10th inst., in a division on the validity of the elections of Badajoz. The Cortes decided by a large majority that the elections were illegal, and three leading members of the Ministerial party have consequently lost their seats. A resignation of the Cabinet followed this event, almost as a matter of course, and the Regent has sent to London for Gen. Sancho, the Minister at this Court, to undertake the formation of a new Cabinet. In Portugal the final answer of the British Government respecting the Tariff Convention is expected with some anxiety, and the British merchants at Oporto have petitioned against breaking off the negotiations on slight ground. From Malta we have the particulars of an important reduction of the quarantine, at the suggestion, it appears, of the Austrian Government. The effects of this relaxation will be highly advantageous to the mercantile shipping of this country, and will not be less welcome to all travellers in the Levant. The advices from Turkey relate chiefly to the differences on the affairs of Servia, but add nothing to what is already known on that long-agitated question. The conferences at Erzeroum on the affairs of the Persian frontier have been resumed, and apparently under more favourable auspices. From the United States we have the details of a long correspondence on the Ashburton treaty, between Gen. Cass, the American Minister at Paris, and Mr. Webster, the Secretary of State. Mr. Webster reprimands Gen. Cass in no ambiguous terms for his unnecessary interference, and denies that any concessions have been made on the right of visit, or on any other subject arising out of the

treaty, incompatible with an honourable adjustment of the questions at issue.

Home News.

COURT.—The Queen and Prince Albert, the Prince of Wales, and the Princess Royal, remain at Buckingham Palace, and are quite well. Her Majesty has enjoyed her usual daily walk in the Palace Gardens, and has taken several airings in an open carriage during the week. On Monday Prince Albert visited Sir R. Peel's collection of pictures, and on Tuesday honoured the Reform Club with a visit. The Archbishop of Canterbury, the Bishop of London, Sir R. Peel, the Lord Chancellor, Lord Wharncliffe, and the other Officers of State, have not been able to leave town for the recess, owing to the daily expectation of the Queen's accouchement. Every preparation has been made at the Home Office for the immediate transmission of the intelligence of that event, to the different authorities, both in the metropolis and in the provinces; and at the Foreign Office similar preparations are completed for forwarding despatches to the diplomatic representatives of her Majesty at the European courts.

Death of the Duke of Sussex.—Since our last notice of the illness of the Duke of Sussex, Dr. Chambers was called in to attend his Royal Highness, and met Dr. Holland and Mr. Copland, the other medical attendants. In the course of Saturday the following bulletin was issued:—"His Royal Highness the Duke of Sussex is suffering under an attack of erysipelas, which is not attended with any unfavourable symptom."—In the beginning of the present week, the bulletins were satisfactory; but on Wednesday the symptoms assumed an unfavourable character, and there was much general oppression, which considerably increased towards evening. On Thursday the bulletins announced that his Royal Highness had passed a restless night; and the worst consequences were anticipated. His Royal Highness gradually became weaker, and expired yesterday, at a quarter past 12. Although during the last two hours of his life he was evidently sinking, he retained his consciousness to the last, and was able to articulate within a few minutes of his decease. His Royal Highness was the sixth son of King George III., and was born Jan. 27, 1773; he was consequently in his 71st year.

Parliamentary Movements.—The nomination of candidates for the representation of East Suffolk took place on Tuesday, when Lord Rendlesham was proposed on the Conservative, and Mr. Shafto Adair on the Whig interest. The show of hands was declared to have fallen upon Mr. Adair, when a poll was demanded on behalf of Lord Rendlesham, and the proceedings were adjourned until yesterday, when the polling commenced, and will not be concluded until the afternoon of this day.—Two petitions have been presented against the return of Mr. Gisborne for Nottingham.

Foreign.

FRANCE.—The only part of the contents of the French papers of this week that presents any interest has reference to the labours of a commission entrusted with the examination of various questions connected with slavery and the political constitution of the French colonies. This commission, which was instituted in May, 1840, and composed of the Duc de Broglie, President, and of Messrs. Passy, D'Audifret, Rossi, de Mackaw, de Tracy, Jubelin, Bignon, Wustemberg, de Tocqueville, de Sade, de Sainte-Hilaire, Galos, and Mestrow, has accomplished its task, the result of which, forming a large volume, has just been printed and submitted by the Government to the Chambers. Of this elaborate report, drawn up by the Duc de Broglie, we shall notice the principal features, premising that nothing could be better calculated to make an impression on the public, favourable to a great and final measure. The report lays the greatest stress on the point which was most important to England, and is still so to Spain, though but in a small degree so to the French. We allude to the proof, that a large slave population, when emancipated, is just as manageable, and likely to give as little trouble to the police, as whilst in a state of slavery. The Duc de Broglie dwells at length on the great example of Jamaica. In Guadeloupe and Martinique, however, the French need have little fear of order being disturbed, since the great act of emancipation has taken place. The report proposes that slavery shall cease in the French colonies on the 1st January, 1853. Until that period, the slaves are to continue in their present condition, with some modifications which are specified, and to be decided upon by Royal ordinances. Thus, civil rights are to be conferred on the slaves during these ten years; but to exercise them in Courts of Law they must be represented by a guardian *ad hoc*. From the movable property they may possess, ships, boats, gunpowder, and fire-arms, are excepted. Goods or effects got by saving or industry, and the power of redemption are to be secured to them. The freed slaves are not to enjoy political rights; but children born free are not to be included in this exception. The freed slaves must, during 5 years, engage for one or more years in the service of one or several planters of the colony which they inhabit, and in which they will be obliged to reside 5 consecutive years. Their rate of wages is to be regulated every year within a maximum and minimum, by a resolution of the Governor in Council. The compensation to be given to the planters is reckoned by the commission at 150,000,000 francs. The interest on this capital is to be fixed at 4 per cent., and to be converted every half-year into a *rente* of the same denomination, for the benefit of those entitled to it. On the 1st of January, 1857, the capital and the interests thus capitalised are to be divided among the planters,

who shall respectively maintain, at their expense such slaves as they may happen to possess at that period, and as age and infirmities may render incapable of labour. They will be bound to supply them with food, clothing, shelter, and medical assistance. A second report contains a scheme for a partial and progressive emancipation, whereby all children born of slaves in the French colonies, since the 1st of January, 1838, are to be freed. The compensation suggested is to be 540 francs for children who shall have reached the age of seven. This law is to be executed during 20 consecutive years; and a year before the expiration of the 20th, the abolition of slavery and amount of compensation to be granted, are to be finally decided upon.—The marriage of the Princess Clementine was to take place on Thursday. The King and Queen of the Belgians, and the Prince of Saxe Coburg and his two sons, were expected at St. Cloud on Tuesday.

SPAIN.—We have advices from Madrid to the 10th inst., on which day the Ministry sustained a signal defeat. The Congress had been engaged in examining the validity of the elections, and those of Badajoz had given rise to a protracted and angry discussion, which ended in the defeat of the Cabinet. Those elections, whereby three conspicuous members of the Ministerial party—MM. Joseph Calatrava, Gonzales, and Lugan, had been returned, were annulled on the 10th by a majority of 80 against 55. The Infante Don Francisco attended the sitting, and, on voting against the elections, was cheered from the public galleries. It was generally expected that the triumph of the Opposition would shortly be followed by others still more decisive. Subsequent advices announce that Ministers have tendered their resignation to the Regent, who has sent to London for General Sancho. The late political chief of Barcelona, M. Gutierrez, has been appointed Director-General of the Post-office at the Havannah, with a handsome salary. Dr. Daubeny and Captain Widrington were at Madrid on a scientific excursion. They proposed, it is said, to visit Estremadura, in order to investigate the natural bed of phosphate of lime in that province, with a view to its use as a manure.

PORTUGAL.—We have Lisbon news to the 10th inst. The final answer of the British Government respecting the Tariff Convention was expected with some anxiety at Lisbon. It was known that among the further offers proposed on the part of the Portuguese to our Government, in place of the ultimatum sent from England, a reduction of duties to the amount of two fifths was proposed on brass manufactured goods. The British merchants at Oporto had petitioned against breaking off the negotiations on slight grounds. The Douro Wine Company Bill had passed the Peers without alteration, but it was expected that the Royal sanction would be deferred until the final result of the tariff negotiation was known.—Two British vessels were lost recently on or near the coast of Portugal. In one case, the *Feronea*, from Bristol to Palermo, was wrecked off Algarve on the 19th ult., and all the crew were drowned except three. The other case was that of the barque *Dale*, from Liverpool to New Orleans, which went down on the night of the 7th inst., while making for Lisbon, about an hour after she had been abandoned by her captain and crew, who were picked up by a Portuguese schooner from Terceira to Lisbon, where they arrived on the 8th, having been treated with great kindness by the Portuguese captain and his crew.

BELGIUM.—The trial of M. Caumartin before the Court of Assizes, for the murder of M. Sirey, noticed in this Paper at the time, commenced on the 12th. The *Courier Belge* gives the proceedings of the first two days, which occupy several columns in small print. On the first day after the indictment was read, M. Caumartin was interrogated at great length by the President. He persisted in declaring that M. Sirey had attacked him, and that he had no intention of killing him. The first witness for the prosecution was then called. This was M. Milard de Laville, a friend of M. Sirey, who was present on the unfortunate occasion. He declared that he did not see the blow struck, though he acknowledged the succeeding dispute, and had seen M. Sirey walk towards M. Caumartin, and threaten to throw him out of the window if he did not immediately withdraw. The second witness was Madlle. Heinefetter, the actress (22 years of age). On the 13th, ten other witnesses were examined. The trial continued during the whole of the 14th, and concluded on the 15th inst. in an acquittal. The Court, however, considering that M. Caumartin had carried prohibited arms, condemned him to all the expenses of the process.

HOLLAND.—The Dutch provincial papers contain a variety of details respecting some smart shocks of an earthquake which were very generally felt in the beginning of the present month, chiefly on the 6th. From the numerous notices of the event, it appears to have excited much alarm, but has not caused any very serious damage.

GERMANY.—The 5th inst. being the fiftieth anniversary of the Archduke Charles having received the Grand Cross of the Military Order of Maria Theresa, the whole garrison, to which two regiments bearing the name of the venerable Prince had been added, were reviewed by the Emperor in person; after which his Majesty decorated the Archduke with the Cross of Maria Theresa, amidst the acclamations of an immense concourse of spectators.—A volcano of a novel kind has broken out in the neighbourhood of Koenigshatte, in Silesia. For twenty years a slow fire, which occasioned no alarm, has burnt in the coal-mines of that district; but recently it has shot out immense volumes of flames, which threaten destruction to the surrounding buildings, and to the vast forests of the country. A steam-engine has been established for the purpose of discharging water into the mines; but this machine had been in action, at the last accounts, for 72 hours, without producing any effect.

ITALY.—We learn by accounts from Rome that a recent trial in that city has convicted the Count Mariano Alberti of wholesale forgery of works which he had professed to discover and publish as Tasso's. Some small portion of these works, which is considered to be genuine, he had interlarded with the rest, to give it the greater air of authenticity. In his lodging were found an immense collection of writing tools, inks of different kinds and tints, old copybooks, blank paper torn out of old books, and innumerable exercises in imitation of the handwriting of more than fifty eminent individuals of Tasso's time. The Count's sentence was not known on the 10th March. —From Naples we find that the traffic on the railroad from that city to Castellamare is increasing beyond all expectation. During the first two months it was visited by 116,912 persons. The railroad to Caserta was expected to be soon opened. The king desires to extend it to Gaeta, and subsequently to Terracina; and, finally, at some future period, to Rome. We learn also, that the works that have been commenced at Brindisi, under the superintendence of English engineers, the object of which is to clear and restore the port of ancient Brundisium, so celebrated by its extensive Grecian and Oriental commerce, promise fair to become of considerable advantage to the South of Italy. —We learn from Florence that quicksilver having been found in considerable quantity in the pits at Ripa, near Seravezza, it is intended to carry on the works upon a more extensive plan; and for that purpose a company has been formed under the auspices of some of the first banking-houses at Leghorn, with a capital of one million of lire, which may turn out very important to the Rothschild speculation at Madrid.

RUSSIA.—It is stated by the German papers, that the Emperor Nicholas intends to proceed to Berlin by sea, in the course of the approaching summer, and on his return to stop for a month in Warsaw, and administer in person the government of the kingdom of Poland.

MALTA.—On the 4th inst., John Nailor, the murderer of the late Dr. Martin, was brought to trial. No case establishing his guilt could have been clearer, but as one of the jurors considered that every man who kills another must be labouring under monomania, the prisoner, on being found guilty, escaped the capital punishment, and was sentenced to the galleys for life, with chains to his legs. Six out of the seven jurors pronounced the crime a deliberate act of murder, meriting death. The sentence created considerable surprise, though the judges could not award the capital punishment if all the jurors did not agree. —The Malta papers announce an important reduction in the quarantine, at the suggestion, it appears, of Austria. The quarantine from the Ionian Islands has been abolished, although arrivals from Athens or Syria are not included in the exemption. As regards arrivals from Egypt, the quarantine imposed on vessels and cargoes has not been reduced; but that inflicted on passengers has been reduced from 20 to 16 days. No reduction has been made as regards Turkey, either in passengers, vessels, or goods; but there is little doubt she will be shortly included in the list of exempted places. From Greece some indulgence is granted to merchant-vessels, for on their arrival in Malta, provided they are furnished with a certificate from Her Majesty's Consul to the effect that no disease reigns in the country, their quarantine is reduced to seven days, nor are they under the necessity of discharging their cargoes.

GREECE.—Letters from Athens of the 31st ult. state that the English and French Governments had replied to the demand of Greece, that they would pay the dividend of the loan guaranteed by them, which became due in March, but that the Greek Government must contrive to raise funds for the payment of the September dividend. The two cabinets had declined making any other advance to Greece. Russia, it was expected, would return a similar reply. These letters mention that the comet had been seen at Athens so early as the 5th ult., and that its extraordinary brilliancy had caused no little excitement, especially among the natives.

TURKEY.—The Levant mail has brought advices from Constantinople to the 29th ult. They relate principally to the differences between Russia and Turkey regarding Servia, and show that the statements put forth by some of the German prints were premature. Although the dispute was considered to be drawing to a crisis, the Russian Ambassador had not delivered his ultimatum on the 29th ult., nor were the despatches he had received from his Court a week before believed to contain any instructions of a decisive nature. The Erzeroum conferences appear to have assumed a more favourable aspect.

EGYPT.—Letters from Alexandria of the 25th ult. state that the British Consul in that city had declared that no British subject would conform to the monetary tariff established for the benefit of the bank. It was believed that the Austrian and Russian Consuls would adopt similar language. The Prince of the Wahabites, whom Ibrahim Pacha had made prisoner near Bagdad, and who had been since detained a prisoner in the citadel of Cairo, had effected his escape, and had not been recaptured. On the 21st, the officers on board the Cyclops war-steamer, lying at Alexandria, obtained a sight of the nucleus of the comet. On the 24th it was evidently fast receding from the earth. When at its greatest brilliancy the tail appeared to extend half across the heavens, and in the clear atmosphere of Egypt the sight was truly magnificent.

UNITED STATES.—The royal mail-steamer Columbia arrived at Liverpool on Saturday, after a voyage of 12½ days from Boston, and ten and a half from Halifax, having sailed on the 2d instant from Boston, and the 4th from Halifax. The Columbia, it will be remembered, carried out Sir C. Metcalfe and suite, who arrived at Boston on the 20th; at Albany, Sir Charles received kind at-

tentions from ex-President Van Buren, the officers of the State, and the State Legislature. Sir C. Bagot still lies dangerously ill; the last bulletin gives little prospect of his recovery. The New York papers contain a correspondence between Gen. Cass, the well-known American Envoy in Paris, and Mr. Webster, the American Secretary of State. It occupies twelve columns of the largest American papers. Gen. Cass complains bitterly of the "concessions" made to Great Britain, on the right of search question, by the terms of the late treaty and demands his immediate recal. Mr. Webster, in reply, reproaches Gen. Cass in terms not the most gentle, denies that America has conceded the "right of visit," and declares that the pretensions and principles asserted by both Powers in reference to this matter, remain as before the treaty. Gen. Cass is further reminded of the advantage which his interpretation of the treaty will give Great Britain in any future negotiation upon the subject. —The finding of the Court-Martial at the trial of Capt. M'Kenzie, of the brig Somers, for ordering Mr. Spencer and two other mutineers to be hung without trial, is said to be favourable to the accused. The *Baltimore Republican* mentions a rumour to the effect that Captain Voorhees, of the United States ship Vincennes, had shot the first lieutenant, Mr. Boyle, and letters received from the United States ship of war John Adams, announce a recent mutiny on board that vessel off the Cape of Good Hope. The men were all ordered on deck and asked what they wanted, when five who stepped forward and urged complaints were shot down, and the mutiny thus quelled; at least such is the statement in the letters received in New York. —An electro-magnetic telegraph is about to be established between Baltimore and Washington, under an appropriation from Congress.

WEST INDIES.—Letters have been received from Charleston, announcing that a sloop had arrived in that port from the West Indies, bringing advices of another severe shock of earthquake at Guadeloupe, on the 3d ult. The vessel was so much shaken that it was hardly possible to stand, and the captain reports that a dense cloud of smoke or dust rose above the town of Basseterre, which, he feared, had been reduced to a heap of ruins. All around Point-à-Pitre a pestilence prevailed, owing to the effluvia arising from the bodies of the dead, of which no less than 4,500 had been dug out. Two days after, a shock was felt at the island of St. Thomas, and again in the southern states of the Union on the 11th. Great alarm is felt throughout the West Indian Archipelago, owing to these frequent convulsions; and we may look forward with anxiety and apprehension for further particulars. —Another schooner from the West Indies reports that the town of Ponce, Porto Rico, was destroyed by fire early last month. —The Royal mail-steamer Medway arrived at Falmouth on Wednesday, with dates from St. Thomas's to the 26th March. Just as she was quitting Jamaica, her Majesty's brig Scylla arrived there, having on board General Boyer, President of Hayti. There was no time for the particulars relative to his visit to transpire, but it was inferred that the insurgents had carried their point—taken possession of Port-au-Prince (which was anticipated), and had compelled his deportation. Her Majesty's steam-vessel Megera, Lieut. Oldmixon, for Vera Cruz, was totally lost on the 4th March, on Barebath Key, off Old Harbour, Jamaica, and one boy drowned. A court-martial had been held on the commander, which resulted in his being simply reprimanded.

CITY.

Money Market, Friday.—Consols closed at 96½ to 97 for time, and 96½ to 97 for Money; Bank Stock, 183; Three per Cents. Reduced, 95½; Three-and-half per Cents. Reduced, 102; New Three-and-half per Cents., 102½; Exchequer Bills, at 2d. per day, 65s. to 67s. prem., and at 1½d. per day 68s. to 69s. prem.

Metropolis and its Vicinity.

Loss of the Solway Steam-ship.—The Lady Mary Wood, steamer, arrived at Southampton on Sunday from Lisbon, with the melancholy intelligence of the wreck of the Solway steam-ship, belonging to the West Indian Mail Company. The information has caused a great sensation in the City, and has thrown a gloom over the affairs of the Company, as this is the third ship they have lost since their establishment two years ago. The following statement of the circumstances under which the catastrophe occurred has been supplied by Mr. Lane, the purser, who was the first to bring the life-boat alongside the ill-fated ship. The detail is of a most painfully interesting character, and cannot fail to excite the warmest sympathies for the fate of the unfortunate sufferers:—The Solway left Falmouth on the 3d April, with the usual mails on board, and arrived at Corunna at twelve o'clock on Friday the 7th, having experienced heavy south-westerly gales in crossing the Bay of Biscay. She took in 81 tons of coal at Corunna, and left the harbour on her outward voyage at half-past nine o'clock the same evening. They passed the lighthouse about ten o'clock P.M., and were proceeding at full speed, when at about midnight the vessel struck on a sunken rock. The passengers were all in their berths at the time, but Captain Duncan and several of the officers were on deck. The shock was of the most tremendous character, and created the utmost consternation. Immediately on the vessel striking, Captain Duncan ordered the engines to be backed, and this having been done, she came off apparently easy, the violence of the concussion having probably caused her to rebound in some slight degree. Her head was now put towards the shore, and all speed made, in the hope of grounding the ship, and thus saving the passengers and crew. The injury she had sustained was, however, of too serious a character to allow

this to be accomplished, and within a very few moments of the ship striking, it became evident that she was setting fast by the head. Mr. Lane was asleep below at the moment the calamity occurred, and, in common with the passengers and crew, was awoken by the shock. He immediately ran up the fore-castle ladder, and found the vessel sinking fast. The scene is described by him to have been at this time of a most heartrending character. The female passengers were all on deck in a state of mind more easily conceived than described, every person expecting the ship to go down instantly. She had still good way upon her, the engines having apparently suffered no injury, when, while proceeding towards the shore as described above, a general rush was made to the pinnace, which hung at the davits on the larboard side; 25 persons got into her, and having seated themselves, cried out to those on board to "lower away." Captain Duncan, who evidently foresaw the great danger of lowering the boat while the vessel was proceeding at full speed, endeavoured to prevent this, but the confusion was so great on board, and his own attention so entirely devoted to the great object of getting the paddle life-boats afloat, and making the shore, that his opposition was of no avail, and the forward tackle was let fly by the run, and the bows of the boat dropped in the water. The situation of those who had made this their hope of escape was now perilous in the extreme. A cry of "For God's sake let go the after-tackle," was answered by some of the crew as soon as possible, and the pinnace fell into the water. The ship had still full speed upon her, and a heavy sea struck the boat as she floated for an instant, and swept every soul into the water. One or two sailors only, who hung on the tackle, succeeded in again reaching the vessel. Ten minutes only had now elapsed since the vessel first struck, during which every exertion had been made by the officers of the ship, with Captain Duncan at their head, to get the larboard life-boat afloat. While thus engaged the boiler suddenly collapsed, and an immense quantity of steam, dust, ashes, and flames, burst from the engine-room. All on board thought that the vessel was now about to blow up, and two or three persons were so much alarmed as to jump overboard. Throughout the whole of this trying period Captain Duncan is described to have acted in the most cool and seaman-like manner, endeavouring, while giving effect to his orders, to keep up the spirits of those on board less accustomed to the dangers of the ocean. By great exertion the larboard paddle life-boat was eventually capsized over, and in righting half filled with water. The gig had previously been lowered, and ten persons had got into her and rowed away. The first and second cutters were also afloat, each filled with the passengers and crew. Mr. Wilder, the chief officer, with Mr. Lane and two or three other officers, now lowered themselves into the life-boat, and brought her alongside the gangway. The engines had entirely ceased working from the moment the boiler collapsed. The water had now reached the fires, and the ship, it was evident, could not float many minutes longer. Captain Duncan and the other officers now handed the passengers into the life-boat, exerting themselves to the utmost to save all the female passengers. Fifty-two persons were already in the boat, and Captain Duncan was still handing in others, when a general cry rose of "She is going!" and giving one tremendous plunge, she went down head-foremost, leaving the life-boat, already half-filled with water, afloat. This fact is represented as perfectly miraculous, the suction arising from the vessel being abundantly sufficient to swamp a boat in a much more seaworthy condition than the life-boat was at this period. The screams of those on board were awful as the ship went down; and Mr. Lane states, that the last seen or heard of Captain Duncan was an order for all on board to "fly to the rigging," towards which he appeared to be making himself; and it is supposed that in getting up the companion-ladder towards the upper deck he sank with many others. His conduct appears to have been most noble; he appeared to have no thought for his own safety, and when called to by some of the officers, who told him that the ship was foundering under them, he refused to leave. The life-boat now drifted away, and so great had been the confusion arising from the hope to save all on board, that it was only then discovered that she had neither oar nor rudder. Shoes and hats were used to bail out the water with which she was more than half filled, and after drifting about for a quarter of an hour, she fell in with the second cutter, having Lieut. Hemsworth, the Admiralty agent, and several others on board. From this boat they obtained one oar, and Lieut. Hemsworth then returned to the wreck with the cutter; shortly after they fell in with the first cutter, which was greatly overloaded. They took several persons from her, and obtained a bottom-board, the cutter taking the life-boat in tow. The single oar obtained from the second cutter was now rigged over the starboard quarter of the life-boat with a grummet made of braces, and the bottom-board was similarly arranged on the larboard quarter with a silk handkerchief. By this means the boat was kept tolerably free, and drifted before the wind, Corunna-hill being all the time visible. It was still quite dark, and daylight was looked forward to with the most intense anxiety. The conduct of all on board was most praiseworthy; not a syllable of insubordination escaped, and all appeared to be resigned to the worst that might happen. The ladies especially (seven of whom were in the life-boat) behaved most heroically. Some of them had merely time to escape in their night-dress, and although seated in water up to their knees, not a murmur was uttered. At daybreak, the mast from the first cutter was stepped in the life-boat, and her lugsail set, when she steered towards Corunna, and on entering the harbour was met by a Spanish launch, which was coming out in search of the boats, having heard of

the catastrophe from those who escaped in the gig, which had made Corunna so early as five o'clock in the morning. The launch took the life-boat and cutter in tow, and brought them safely in, when the survivors were landed, and every attention paid to them by the authorities. Mr. Lane speaks in the highest terms of the admirable qualities of the paddle life-boat, through the instrumentality of which alone nearly 60 lives have been saved, under circumstances of the most extraordinary difficulty and danger. The French national steamer *L'Erebe*, Capt. Castaigne, was coming out of the harbour for the purpose of proceeding to the wreck as the life-boat entered. The chief officer, Mr. Wilder, went on board to accompany them, and at a short distance from the mouth of the harbour a signal was observed. The steamer bore down towards it, when it proved to be the pinnace, described above as swamped at an early period of the catastrophe. It contained a young man named Michael Bradley, a waiter on board, and the corpse of Mr. Hall, the midshipman. The steamer afterwards proceeded to the spot where the wreck took place, and succeeded in recovering several packages and trunks which were floating about. It appears that the ship sank in about fifteen fathoms of water, and about four miles from the shore. Eight or ten persons succeeded in reaching the rigging before she went down, and as the upper portion of the main and mizen masts were several feet above the surface of the water, they were enabled to hold on until daybreak, when their situation was observed from the shore, and some boats put off to their assistance. The following is a list of passengers who are lost: Mr. and Mrs. Fitzjames, four children and servant, Mrs. Haly, Mr. Montefiore, Miss Beadon, the Rev. Mr. Bascom, Mr. Le Main, Mr. Blake, and Mr. Burtchell, of the Royal Engineers; Mr. Hunter, Mr. Nicolle, and Mr. Cartwright—total, 17. The officers lost are, Capt. Duncan, Mr. Dicker, surgeon; and Mr. Hall, midshipman, died in the boat—total, 3. In the steward's department eight persons were lost. Mr. Fitzjames, who has perished with his wife and four children, was proceeding to the West Indies as arbitrator of the Mixed Commission. Among those who fortunately escaped was Captain Wentworth, R.E., with his wife and children, who was proceeding to Bermuda, to superintend alterations in the Government fortifications of that island. The Hon. Mr. Dalzell, who also escaped, is a brother of the Earl of Carnwath, and was on his way to Antigua. The Rev. Mr. Bascom, who was lost from the rigging, was a Protestant clergyman stationed at Barbadoes. His fate is described to have been most distressing. He had maintained his hold in the ship's rigging during the night, and until the first boat had reached within a few hundred feet of the wreck, when his strength entirely failed, and he fell backwards into the water and was seen no more. Lieut. Hemsworth, the Admiralty agent, had remained in the vicinity of the wreck during the night, in the hope of saving the mails; but his boat was quite full, and he was unable to render any assistance to the unfortunate creatures who still clung to the rigging. The weather was tolerably moderate, or the lives of the whole crew must inevitably have been sacrificed. Had any attempt been made to reach the shore, there can be little doubt that the boats would have been swamped by the breakers, and every soul lost. The *Solway* was a Scotch built boat, and her total cost, when put into working trim, amounted to 80,000*l.* She is in 15 fathoms water; and Mr. Lane is of opinion that in her present position it would be impossible for her to hold long together. She had only one box of specie on board, which contained about 1,300*l.* Captain Duncan is said to have been one of the most skilful Commanders in the service, and to have been thoroughly acquainted with the localities throughout the route.

The Easter Holidays.—The unusual fineness of the weather during the Easter week has been productive of the usual results, and for many years so large a number of holiday-folks has not been witnessed in the different places of attraction. On Monday from daybreak to a late hour in the evening, the Gravesend, Woolwich, and Greenwich steamboats were crowded with company for their several destinations. On some of these boats as many as from 400 to 500 persons were on board, so closely lodged that they could scarcely move, and the wharfs from whence they started were so crowded with people anxious to get on board, that in many instances the police were obliged to assist in preserving order. Greenwich seemed to be the most favoured resort; and although there were from 20 to 30 steamboats to carry persons to that place, they were not sufficient for the numbers. In the afternoon the pressure at the London-bridge wharf was so great that the large steamers began to take passengers for Greenwich, and the City of Canterbury, after landing her passengers from Margate, embarked 800 persons on her spacious decks, all bound for the fair. Up to seven o'clock, 30,000 persons had landed from the Waterman steamers at the floating pier at Garden-stairs, and the solid pier adjoining must have received double that number. The railway furnished its quota of visitors, and a great many who landed on the Tunnel pier, after visiting the Tunnel, came up the Rotherhithe shaft, and proceeded on foot down the lower road to Greenwich. At sunset, the park, the fair, and the town were crowded. Altogether such an Easter Monday was never known before; and the people of Greenwich were in high spirits. At eight o'clock, people were still flocking into the town, and thousands were returning home by the steamers and railway. On Monday, 5,785 persons visited the Painted Hall, and 4,476 the Chapel. On Sunday, 1,640 persons visited the Painted Hall, and 224 went into the Chapel, which was on that day only opened for inspection from 1 to 2 o'clock, divine service being performed there in the morning and

afternoon; 4,476 persons also went in on Monday. On Tuesday the Londoners were again flocking in immense numbers to Greenwich. It was thought that the metropolis had been well nigh exhausted of the holiday-folks on Sunday and Monday, and that the fair would be comparatively deserted on the second day, but the park, the fair, and the town, were nearly as full as on Monday, and the visitors to the Painted Hall of the Royal Hospital and its nobler corridors, wards, kitchens, and dining-rooms, were very numerous. Above bridge during Monday and Tuesday, the steamboats were filled with passengers; and Chelsea, throughout the day, was crowded with strangers. Notwithstanding this migration to the suburbs, all the public exhibitions were unusually well attended. The number of visitors at the British Museum on Monday, was 18,432; the number last year, on Easter Monday, was 14,320. Notwithstanding this large concourse of persons, not a single case of robbery or misconduct occurred, nor was any one refused admission on the ground of intoxication. From twelve o'clock on Sunday, to the same hour on Monday, 28,642 persons went through the Thames Tunnel, and since the opening, upwards of 320,000 have visited it. The holiday folks have given employment to three or four tollmen.

The late Explosion at Waltham Abbey.—An inquest was held on Saturday on the bodies of the five persons who were killed by the late explosion of the Government Powder-mills, which we noticed in our last. It seems that there were four separate explosions which followed each other in immediate succession, as but a few seconds elapsed between the first and the last. The corning-house is situated on the banks of a stream which runs through the meadows at Waltham Abbey, and is divided into two distinct parts, which are separated by a solid buttress, twenty feet thick. In the first of these buildings there were 2,300 lbs. of powder, and in the second 2,000 lbs. The explosion in the two chambers took place almost simultaneously, as the flames must have communicated through the fissures in the buttress, which was not blown down, but is much shattered and shaken. The men who lost their lives were all at work in or near to these two buildings. At about 170 yards from these buildings stood the granulating-house, which was also in two detached parts, separated by a buttress. Several men were at work in this building, when they were startled by the explosion in the corning-house. They rushed out, and had barely made their escape before flakes of fire from the ruins of the corning-house burst through the roof and came in contact with the powder, which exploded, and reduced the granulating-house to a heap of ruins. About 70 yards further on is the glazing-house, which contains a large quantity of powder, but this has fortunately escaped. These buildings, in common with others of their class, were built of very slight materials. If any massive masonry had been employed in their structure, or any considerable force been opposed to the exploding matter, the destruction would have been tenfold. All the witnesses bore testimony to the great precautions taken to prevent accidents, and to the frequent inspection of the machinery by superior officers. The chief workman examined stated that he was so satisfied with the precautions, that he should not have the slightest objection to work in the same mill under the same management were the works rebuilt; he was persuaded that there were fewer accidents at the Abbey Powder-mills than at any mills in the country. The jury returned a verdict of "Accidental death," accompanied by an expression of their unanimous opinion that the manufactory appears to have been conducted by Captain Tulloh, the inspector, with every possible precaution for the safety of the men employed under his superintendence. The deceased were all married men, and have left families.

Dinner at the Mansion-house.—The usual Easter dinner was given on Monday at the Mansion-house. Among the company were the Earl of Jermyn, Lord Dudley Stuart, the Bishops of Norwich and Llandaff, the French and Turkish Ambassadors, the American Minister and Mrs. and the Misses Everett, Baron Rolfe, the Vice-Chancellor Knight Bruce, and numerous other guests. The Count de St. Aulaire, the French Ambassador, addressed the company in French, and adverted to the construction of railways, which would still further facilitate the intercourse between France and England, and unite the two countries by a constant interchange of kindly feeling.

Easter Parish Elections.—On Tuesday, being Easter Tuesday, the election of churchwardens, overseers, and other officers for the several metropolitan parishes, took place, but the proceedings possessed a merely local interest. In several instances the opposition party were defeated. Church-rates and the new Poor-law were the principal topics of discussion.

The Chinese Ransom.—On Monday, six waggons, each drawn by four horses, arrived at the Mint with upwards of one million and a quarter dollars' worth of sycee silver, being the last moiety of the first instalment, namely 5,000,000 dollars, of the Chinese ransom. It arrived at Portsmouth about the middle of last week, in her Majesty's ship *Herald*, and one of the principal officers of the Commissary department of the Treasury immediately took charge of it. During Thursday and Saturday the *Herald* was unloaded, and on Monday the cargo was brought up to town by the Southampton Railway, under a strong military escort, and in the course of the day was safely deposited in the bullion storehouses at the Mint. The silver, as on previous occasions, was packed in strong wooden boxes, bearing the official seal of Sir H. Pottinger; and as the treasure passed through the City crowds of persons followed the procession to the gates of the Mint.

Metropolitan Improvements.—A few days since, by order of the Commissioners of Woods and Forests, several houses in Belton-street, Long Acre, and in Broad-street, St. Giles's, which are to be removed for the purpose of making the new line of street leading from Bow-street, Covent-garden, were disposed of by auction, so that in a short time the communication by this thoroughfare from Waterloo-bridge will be open to the new street that will connect Holborn and Oxford-street.

City Police.—Mr. D. W. Harvey, the City Commissioner, has presented a statistical report to the Corporation on the operations of the Police force under his command, during the past year. From this it appears that the number of persons taken to the different Station-houses in the City between the 1st January and the 31st of December, 1842, both inclusive, was 10,841. These are arranged by the report in two classes:—1. In the first there were apprehended—for offences against the person, 562; for offences against property committed with violence, 40; for offences against property committed without violence, 1,960; for malicious offences against property, 360; for forgery and offences against the currency, 249; for offences not included in the above classes, 1,831; Total, 5,002.—2. In the second class we find the following entries.—Charges not entertained for the reasons assigned on the occurrence sheets, 2,783; drunken persons discharged when capable of taking care of themselves, 973; destitute persons, 1,782; vagrants, 301; Total, 5,839.—Number of summonses taken out and prosecuted by the Police under the Carriage Act against public-houses and drovers, of which 1,098 were convicted, and 404 dismissed or withdrawn by order of the Magistrates, 1,502; number of lives saved by the Police, 36; number of fires discovered by the Police, 131; number of children found and restored to their friends, or sent to the work-house, 441; houses, warehouses, &c., found insecure, of which number 87 were untenanted, and 360 had no nightly resident, 1,892.—Value of property found on drunken persons, and restored on their liberation, 857*l.* 7*s.* 4*d.*; value of property stolen, 6,559*l.* 7*s.* 2½*d.*; value of property recovered, 1,241*l.* 8*s.* 9*d.*—Of the 5,002 persons in the first of the above classes, 2,682 were discharged by the Magistrates; 1,871 summarily convicted, and 449 committed for trial; of which latter, 111 were convicted and sentenced to transportation, and 243 to imprisonment for various periods. Of the remaining 95, 58 were acquitted, and 37 not prosecuted, or bills not found.—Mr. Harvey adds that there are two points in the above details which merit notice. Although the amount of depredations is comparatively trivial, yet the amount is greatly swelled by the exaggerated estimates of lost property. He states that it not unfrequently happens, that elderly gentlemen lose their watches or money at unseemly hours in the great thoroughfares of the City, when the value of the watch or the ring they have lost is sure to be largely over-rated; and that nearly all the great robberies are made upon premises which are entirely abandoned during the night, and the key of the outer door left with persons little entitled to confidence. He adds, that in all cases in which any person is aggrieved, and in which the assistance of the Police could be expected, a letter is addressed to that party from his office to inquire whether there is any cause for complaint; and he is able to state that of several hundreds of answers, but six persons have expressed themselves otherwise than entirely satisfied.

Mortality of the Metropolis.—The following is the number of deaths registered in the week ending Saturday, April 8:—West districts, 144; North districts, 156; Central districts, 180; East districts, 190; South districts, 185. Total, 855, (444 males, 411 females.) Weekly average for the last five years, 903, (461 males, 442 females,) and for the last five winters, 1004. A rumour has lately been current that an epidemic fever prevails in St. Giles's and other densely populated districts of the Metropolis. The College of Physicians, however, have issued a report announcing that "no epidemic is in existence;" and subsequent observations by individual physicians have been published, which show that the general health of the Metropolis is rather above its usual standard at this season of the year.

Provincial News.

Alverstone.—A vestry meeting was held on Thursday the 13th, at the House of Industry for this parish, Archdeacon Wilberforce, the Rector, in the chair, to consider the subject of the medical relief of the poor of the parish. The Archdeacon, in stating the object of the meeting, said, the plan then existing was, that there were two medical attendants in the parish, and that they wrote prescriptions which were made up at the chemist's, the charge for which it was calculated would not have exceeded 40*l.* a year. The plan had failed in this respect, that in less than half a year 36*l.* had been expended for drugs. It was evident that the matter must be considered, and he should have a plan to suggest to them on the subject. He would ask them to allot a salary to the medical attendants of the parish, and it would then remain to decide whether they should have two or one; there would be no difference in the expense. He thought two would be preferable. He should then propose to do away with the regulation as to prescriptions. He should suggest that it would be desirable to have two medical men at a salary of 50*l.*, to include medicine and attendance; labours and fractures to be paid for extra, according to the rules and scale of the Poor-law Commissioners. The question was not what had been formerly done, but what would be fair and just to enable right-minded men to do their duty to the poor. In the adjoining parishes the emolument was greater in proportion. The Poor-law Commissioners never allow more than 15,000 inhabitants under one surgeon, and if

the parish consist of a town and liberty, they recommend a division between two medical men. Those points applied to Alverstoke. Then as to the positive numbers requiring relief; 74 had been attended in a day, during the last six months. That would give 27,010 cases in a year. These at 1d. each would amount to 112l. 13s. The proposal of 100l. a year would therefore be 12s. 10s. below granting 1d. a day for each case. Now the only way in which any medical practitioner could afford to attend the parish poor was, by having wealthier patients in the same neighbourhood, who could pay him for his visits to the locality. But as no one man could see 74 poor patients in a day and also attend a private practice, it would be requisite to divide the parish between two. He felt that the sum proposed was the lowest humanity could allow. There could, he said, be no better citizen than the poor man struggling with misfortune and striving to keep his children from the poor-house. It is the poor sick man in his garret—the man who has been labouring in your shops or in your fields, but whom the visitation of God's hand has laid on a bed of sickness—who is willing to work from morning to night, but who is laid up, not by his own neglect or fault, but by God's providence,—it was this man whom the meeting had to consider; and he trusted they would not be misled into refusing that to which such a man is entitled by the law of the land, and by a much higher law—the law of Christian charity. And this would be the truest economy as well as the best charity. If a man be neglected in his sickness, he will be longer in recovery; and it would be miserable economy if you have to keep a family for three months because you have beat down from three halfpence to three farthings the remuneration to the medical man for that which under God's blessing would have recovered the health of the head of that family in a shorter period. Besides this, you may lead to a man's death, and you would thus have to keep the family because you had stunted the father of that which would soon have sent him back to maintain his family. He then moved that there should be two medical men, one for the town, and one for the liberty of the parish, at a salary of 50l. each: labours and fractures to be paid for extra, according to the rule and scale of the Poor-law Commissioners. Dr. Quarrier entirely concurred in the views and arguments of the Archdeacon, and cordially seconded the motion. An amendment was proposed by Mr. Hoskins that the 100l. a year should include every charge, but after a long discussion it was withdrawn, and the motion of Archdeacon Wilberforce was carried.

Barnsley.—On Friday last, shortly after the miners (40 in number) had descended the coal pit at Darley Maine, near this town, an explosion of a serious nature took place. The alarm was very great, as it was feared that a great number of lives must have been sacrificed. Fortunately, however, the miners almost entirely escaped injury, with the exception of two, who were so severely burnt that one of them has since died. It appears that the pit has not been in a working state for some weeks past, in consequence of having been filled with water; and this was the first morning of the colliers resuming their labour. The accident was occasioned by one of the men fastening an open candle against one of the props; he was in the act of taking off his jacket, when the draught of air produced by this movement disturbed and ignited the gas which had lodged near the top of the pit.

Bedford.—A woman residing at Wrestlingworth, called Sarah Dazely, was recently committed to the county gaol on a charge of having murdered her second husband, William Dazely, by administering arsenic in his food. In consequence of some circumstances which have transpired, the bodies of her first husband and child were exhumed last week, and conveyed from Tadlow to Wrestlingworth, to undergo a medical examination. By direction of the coroner for Bedfordshire, a jury was impanelled to investigate the circumstances attending the deaths of the deceased; but the inquiry was merely preliminary, very little evidence having been adduced, when the inquest was adjourned, to give the surgeons an opportunity of analysing the contents of the stomachs.

Carmarthen.—The local papers state that Rebecca and her Daughters are still at work in the lower part of the county, notwithstanding the exertions of the authorities to discover the parties implicated in their proceedings. About midnight of Friday, Rebecca and a numerous party of her daughters proceeded to Pwlltrap, near St. Clear's, and in less than ten minutes there was not a vestige of the gate or posts remaining. Rebecca and her children immediately disappeared, and the London police, who were in the neighbourhood at the time, had no intimation of what was going forward until their services could be of no avail. A second attack was made about 2 A.M. on Thursday, on the Prendergast toll-gate, near Haverford-west, by a party of about 24 men, who came down in a body from the Fishguard road. The first movement on arriving at the toll-gate was to appoint guards at the doors of the cottages near the gate, to prevent anybody from coming out to interrupt the operations. The mob did not desist till they had demolished the gate-posts and signboard to splinters; they then told the toll-keeper that they had fixed on that night for doing the work because it was bright moonlight, which would prevent them injuring their hatchets. On leaving they gave a hearty cheer, and carried away a portion of one of the posts in token of their triumph.

Deal.—On Monday afternoon the Goodwin Sands were the scene of another shipwreck, that of a fine American ship, the *Hewes*, belonging to New York, and bound for Hull. It appears that shortly after one o'clock the ship was observed by the Deal boatmen bearing down channel, with sails close reefed, the wind blowing a strong gale. By the colours flying at her mainmast, she could be dis-

cerned as an American trader, apparently running between six and seven knots an hour. Nothing occurred until about 3 o'clock, just as she had got abreast of Deal, inside the Sands, when it commenced snowing heavily. This for a time hid the ship from the shore; but when it cleared in the course of an hour, the vessel was discovered on the Goodwin Sands, with signals of distress hoisted. Several boats were launched to render assistance, and a smack belonging to Dover took the crew safely on board their vessel, and safely landed them at Deal. Efforts were made to save the ship, but during the night the wind got up, causing a heavy sea on the sands, sweeping every obstacle before it, and by daylight on the following morning the ship had disappeared.

Kendal.—It is stated by the local papers, that a Mr. Bird is now laying claim to Brougham-Hall and the adjoining property, which, until it came into the possession of Lord Brougham, was known by the name of "Bird's Nest." Mr. Bird is a gentleman from Ashton-under-Lyne, who says that he is the direct male descendant of the former possessors of Brougham-Hall. Notice had been given to the tenants some time previously, that no rent should be paid to any person except the claimant. Mr. Bird then left the neighbourhood for Ashton, and promised, if Lord Brougham took no notice of his proceedings, to return and sell up all the property on the farm for the rent, which he contends is due to him, as the legal heir to the estate, which was entailed, and could not be diverted by sale or otherwise from the heir-at-law.

Melton Mowbray.—The late robbery at the Earl of Wilton's at this place, during the race week, has been discovered; and a man called Bailey, formerly in his lordship's service, has been committed to take his trial for the offence. When apprehended at Sutton Bonnington on Monday, he had the gold watch and several of the jewels in his possession.

Oxford.—The Rev. Dr. Warneford, Rector of Bourton-on-the-Hill, and Honorary Canon of Gloucester and Bristol, has conveyed by deed, to trustees, an estate in the parish of Hellingley, in the county of Sussex, containing 737a. 7p., called the Broad Estate, and also his Improprate Rectory of the parish of Hellingley, and his Manor of Warlington, (altogether yielding a net income in future of 1,100l. per annum,) for promoting the special objects of the Radcliffe Lunatic Asylum, and for enabling the managers to admit a greater number of patients. Dr. Warneford has charged his donation with the annual payment of two sums, one not exceeding 50l., as a stipend to the Chaplain of the asylum, and the other of 20l. for the support of a Sunday-school at Hellingley. In 1813, when the undertaking was in its infancy, Dr. Warneford and his sister contributed 200l. each towards its support; in 1826, 300l. each; and in 1838 their donations altogether amounted to 7,250l.—On Wednesday, the 12th, an appeal came before Mr. Serjeant Manning, the Recorder, at the Borough Sessions, in which Mr. Hunt, a parishioner of St. Michael's, was the appellant, and the churchwardens and overseers of that parish the respondents. The circumstances under which the appeal arose were these:—the churchwardens had been directed by the guardians of the poor acting under the provisions of the Oxford Local Act to rate two colleges; viz., Exeter and Jesus. One of the churchwardens, however, being the cook, and the other an officer to the colleges, they went to the Principals and Fellows, and asked if the rating would be agreeable to them, and if the rate should be passed by the justices, as the guardians had directed. The heads of the colleges objected to the proposition, and they were omitted from the rate. The appellant therefore contended, through his counsel, that he had been overrated, inasmuch as Jesus and Exeter Colleges had been excluded from the rate, or greatly underrated. The college authorities now put in various papers, stating the grounds on which they considered that the Recorder had no jurisdiction; the case, notwithstanding, was proceeded with, and the rate was amended in accordance with the evidence. An application was made on behalf of the appellant for costs against the respondents, which the Recorder granted, and directed the Town-clerk to tax the same. The sum of 304l. 4s. was ultimately ordered by the court to be paid on account; and this will come out of the pockets of the churchwardens, unless they are indemnified by the University. It is expected that upon a distress being issued against the college property, to enforce the rate, some important proceedings will ensue.

Tunbridge.—The inhabitants of Tunbridge were alarmed on Friday, the 7th inst., by hearing a loud report, which was soon known to have been caused by the explosion of the gunpowder mills belonging to Mr. Burton, near this town. It appears that one of a double mill exploded at that time, and on the following morning, about 7 o'clock, the other mill exploded. No lives were lost, nor any serious mischief done, except the destruction of the mills.

Wallingford.—On Thursday afternoon the dinner of the agriculturists of Wallingford and the neighbourhood, which has excited some interest in the county of Berks for some days past, took place in this town. The recent county meeting held at Aylesbury had given a great impulse to the agriculturists, and it being well understood that the object of the present dinner was to gather the opinion of the agriculturists in the district upon the subject of the Corn Law, the attendance was more than usually numerous. The Town-hall was completely filled, as were also some of the adjoining rooms; and many of the visitors, being unable to procure accommodation, were compelled to dine at neighbouring inns, and were admitted after dinner was over. The member for the Borough, Mr. Blackstone, was in the chair, supported by Earl Stanhope, Viscount Barrington, Mr. Baillie Cochrane,

M.P., Mr. Pusey, M.P., the Mayor, Mr. Dick, M.P., Sir H. Willoughby, Bart., and many other supporters of full protection to agriculture. About 120 persons sat down to dinner, and several speeches were delivered, but the length to which the proceedings extended renders it impossible for us to give an abstract. The meeting is said to have been the largest which has taken place for many years in this district of Berkshire.

Windsor.—For a long time past the defective state of the drainage of Windsor has frequently occupied the attention of the local authorities, and also of the Commissioners of Woods and Forests, in order that some plan might be carried into effect to remedy the existing evils, of which her Majesty, during the residence of the Court at Windsor, has had just cause to complain. In the immediate vicinity of the town are several stagnant pools and extensive ditches (not unfrequently filled with dead dogs and other animals,) which emit their noxious exhalations around some of the most populous portions of the neighbourhood, to the serious injury of the health and comfort of the inhabitants. At a late meeting of the town council, a committee was appointed to inquire into the subject, and to report accordingly. At a meeting of the council, held a few days ago, Mr. Bedborough, an extensive builder of Windsor, stated that he had been requested by that committee to employ a competent professional person to survey the town, and report thereon; but, finding that the expense of doing so would be considerable, he thought it best to engage persons in his own employ, and then to make a report, which report would have been presented had he not ascertained that Government would send down their own engineers to survey the Crown property; and he thought it, therefore, better to defer his report until the nature of the steps the Government intended to pursue could be ascertained. The Commissioners of Woods and Forests having obtained an order from the Lords of the Treasury for the employment of surveyors, have determined that the necessary survey shall take place and be concluded at the earliest possible period; and Captain Tucker, of the Royal Engineers (in pursuance of the Treasury minute,) with Serjeant Smith, and a party of the Royal Sappers and Miners under his command, has arrived at Windsor and commenced operations. Their general instructions are, to prepare a map upon a large scale, with level lines, as a basis for an improved system of drainage for the Castle and town. In order to obtain this desirable information, it is expected that the time to be occupied by the survey will necessarily extend over a period of between one and two months. The result of this survey will, no doubt, cause some extensive alterations to be effected by the Woods and Forests, aided by the local authorities, so as to add materially to the comfort and convenience of the Royal inmates of the Castle, and to the improvement of the general health and prosperity of the town.

York.—A short time since we copied a paragraph from the local papers, stating that Mrs. Wood, the vocalist, formerly Miss Paton, had retired into a convent near York. The *Wakefield Gazette* announced last week that they were "authorized to state, that on Tuesday evening last she arrived at her husband's residence, at Woolley Moor; the pain and anxiety of being absent from husband and child being greater than her religious enthusiasm."

Railways.—A return to an order of the House of Commons, on the subject of railway taxation has just been printed, and contains some curious details. The return embraces a period of ten years, ending the 5th of January last. The total amount of tax paid on English railways in 1832 was only 639l., namely, 18l. by the Leicester and Swannington Company, and 621l. by the Liverpool and Manchester; whereas, during last year, one company alone (the London and Birmingham) paid 25,940l.; another (the Great Western), 25,804l.; a third (the Grand Junction), 13,545l.; and a fourth (the South-Western), 12,043l., being upwards of 77,000l. from four of the principal companies. In 1833 the Liverpool and Manchester tax had risen to 5,646l., and in the following year to 6,259l., between which amount and 8,105l. it has since fluctuated. In 1837 we find the Greenwich Railway paying 858l., and the Grand Junction and London and Birmingham, then appearing for the first time, the former at 5,005l., and the latter at 1,282l. They have since been as high as—Grand Junction (1840), 15,030l., and London and Birmingham (1841), 26,227l. The following figures, taken from the returns, exhibit a serious falling off in the amount of duty during the last year:—

	1840.	1841.	1842.
Birmingham and Derby	2,720l.	2,337l.	2,136l.
Birmingham and Gloucester	720	3,645	3,902
Grand Junction	15,030	14,066	13,545
Liverpool and Manchester	8,105	7,969	6,798
London and Birmingham	21,406	26,227	25,940
Midland Counties	2,562	2,280	1,834
Manchester and Leeds	3,042	2,233	2,301
North Midland	3,697	7,509	6,182

Most of the minor companies have suffered in a similar way. The diminution in the amount of tax is mainly ascribed to the commercial distress of the country during the past year. The only lines on which there was an increase in the amount of duty paid during the last year are these:—

	1840.	1841.	1842.
Eastern Counties	1,317l.	1,750l.	1,875l.
Great Western	10,966	21,814	27,841
London and Blackwall	1,031	2,367	2,721
London and South-Western	10,141	10,022	9,211
Newcastle and Carlisle	839	1,450	1,570
York and North Midland	1,967	2,722	3,300

The returns for Scotland show a similar falling off in last year. Thus:—

	1840.	1841.	1842.
Edinburgh and Dalkeith	613l.	502l.	511l.
Garnkirk and Glasgow	414	612	343
Glasgow and Ayr	1,777	3,860	2,765
The only increase is in the	1840.	1841.	1842.
Glasgow and Greenock	404l.	2,928l.	3,419l.

The Edinburgh and Glasgow line was not opened till last year, but already it has paid more for the time than any other Scotch railway, namely, 4,941*l*. The largest amount paid per annum to any of the companies for the conveyance of the mails appears to be to the Grand Junction—namely, 17,490*l*. The London and Birmingham receive 14,510*l*., the Birmingham and Gloucester 10,156*l*., the North Union and Lancaster and Preston 4,443*l*. and 4,745*l*. respectively, and the Chester and Crew, Midland Counties, and North Midland, about 2,600*l*. each. The Greenwich receive 50*l*. per annum, and the Blackwall (used on Tuesday and Friday mornings for the Dutch mail, and occasionally for the home mail) 5*s*. per trip. A "return showing the number of mail-bags lost, or detained through the carelessness of the servants of the railway companies entrusted with the charge of them," has "nil" in reference to bags "lost;" but as respects "detentions," the Grand Junction comes first in mismanagement. Thus: Grand Junction 11; South Western 6; Great Western 5; Birmingham and Gloucester 2; and North Midland and Liverpool and Manchester 1. These are the whole of the returns, and it is therefore to be presumed that, on the London and Birmingham, Birmingham and Derby, Midland Counties, and other lines not named, no detention has occurred.—On Monday afternoon, another of those extensive blasts of Dover Cliffs, which have excited so much interest, took place at Lydden Spout Coast-guard station, and proved proportionally successful in its effects to the former one, when, with the enormous quantity of 18,500 pounds of gunpowder, the destruction of Round-down Cliff was effected. The mass of chalk now operated on formed the base of the same cliff, the crown of which, to the depth of 90 feet, was blown off, by a blast consisting of 7,000 lbs. of gunpowder, on the 2d ult. The present blast consisted of upwards of 10,000 lbs. of gunpowder, which was placed in fifteen cells or chambers, at proper distances, along the base of the chalky cliff; and the conducting wires being properly placed, all were fired at once. This blast, like the others, was characterised by the absence of noise or smoke, the only difference being that on the present occasion a large quantity of chalk blocks and rubbish was projected through the air to a considerable distance seaward. The quantity of chalk removed is not ascertained, for so dense a fog overspread the abyss below that the eye could not penetrate from the top of the cliff to the bottom. It was clear, however, that the mines had done their duty, from the tremendous mass that has been thrown down. The shock was felt for hundreds of yards around, and large fissures were formed in the top of the cliff. Numerous steamers, crowded with company, were in the offing, and no accident occurred, although the cliffs were covered with spectators to the very verge.—It is reported, that another year will scarcely elapse without measures being taken for commencing the formation of a railroad connecting Holyhead with the Grand Junction Railway. Government have, it is rumoured, hinted their willingness to aid a project which will enable the London mails to reach Dublin in 16 or 17 hours.—At the last meeting of the Royal Agricultural Society, it was stated that the directors of the Midland Counties Railway had consented to supply any number of special trains on the occasion of the forthcoming show and meeting at Derby, at the usual fares for passengers, and at half the usual fares for cattle and farming apparatus.

IRELAND.

Dublin.—We noticed in our last the excitement occasioned by the transfer of the mail-coach contract from Mr. Purcell, of this city, to Mr. Croal, a gentleman of Scotland. In reply to the address of the Corporation on the subject, the Lord Mayor has received a letter from the Lord Lieutenant, stating that he has made a representation to the Home Secretary in reference to the address, and that "Sir J. Graham informs his Excellency that a deputation of Irish Members of Parliament had seen on that day (the 8th instant) Sir R. Peel and Mr. Goulburn on the subject, and that Mr. Purcell had been present. It appears to her Majesty's Government that Mr. Purcell has no well-founded ground of complaint; that the contract in question was made an open tender; that the lowest bidder has obtained it; that the contract with Mr. Croal has been signed unconditionally, and in exact compliance with the advertisement; and, finally, that the affair is closed, as far as official forms are concerned."—Notwithstanding this statement, a petition has been exhibited by the operative coachmakers, signed by 35,000 inhabitants of this city: it is intended for presentation in Parliament immediately after the Easter recess. Petitions have been also forwarded to Dublin, for transmission, from Thomastown, Kilkenny, Waterford, Slane, Dunleer, Drogheda, Navan, Lisnaskea, and other places.

Cork.—At a meeting of the Local Council held last week at Cork, it was resolved that the British Association should commence its session in this city on Thursday, the 17th August. The attendance is likely to be very large, as the meeting commences not only at the termination of the assizes, but just previous to her Majesty's contemplated visit to Ireland. The resources and hospitality of Cork will be thrown open to members and visitors, and Limerick, Bandon, and other large towns in the vicinity, are preparing for their accommodation. Those members who visit Dublin on their way to or from the meeting, will also be freely admitted to its public institutions and exhibitions on the presentation of their tickets. The local subscriptions are going on well. The Earl of Rosse, the President, has announced that his enormous reflecting telescope will be completed, and thrown open for the inspection of members.

Monaghan.—The *Northern Standard* announces that the unfortunate difference between Mr. Shirley and his

tenantry has been brought to an amicable adjustment. Mr. Shirley has reduced his bog rents 25 per cent., taken 20 per cent. off the price of lime which he gives his tenantry, and has taken upon himself the payment of the entire poor-rate assessed upon his estates. These concessions satisfied the tenantry; and it is stated that all the Shirley lands are let at rent in no instance exceeding the Poor Law valuation, which is considered a reasonable average.

SCOTLAND.

Edinburgh.—The *Edinburgh Evening Post*, in noticing the returns to the General Assembly of the Church of Scotland, says that a complete revolution has been made on the character of that body, and that the schismatics have been entirely defeated. The *Edinburgh Observer* says it is authorized to state that the Very Reverend Principal Macfarlane is to be proposed as Moderator of the ensuing General Assembly.

Glasgow.—At a recent meeting of the Institute of Civil Engineers, Mr. Mackain, engineer of the Glasgow Water-works, read a paper giving an historical account of the various plans projected and executed for supplying that city with water. It commenced the statement from the year 1755, at which period Mr. Gibson, in his history of the city, noticed the want of foot-pavements, street-lights, and a supply of water, &c., which was at that time drawn from wells in the streets. In 1780, it was proposed to bring, for the supply of the whole city, the water of a spring which is now found inadequate to the wants of a house of refuge since erected near it. At that period many plans were proposed, particularly one by Mr. H. Bell. He objected to steam-engines for pumping up the water, "because they would be a nuisance, and hurtful to surrounding property; and their consumption of coals would increase the price of fuel in the city." Mr. Telford was consulted, and on his recommendation two steam-engines were erected, with reservoirs. His estimate for the requisite supply for a population of 80,000 persons was 500 gallons per minute, supposing that 6000 families would become renters, and the produce, at 2*l*. each, would be about 12,000*l*. per annum. The population in 1842 was 300,000, and the annual income was about 30,500*l*., making the average payment about 9*s*. per annum for each family. The history was then given of the gradual increase of the works until they consisted of thirteen steam-engines, with their requisite filters, reservoirs, &c.; the fluctuation of the mercantile value of the shares, and the purchase of the Cranstonhill water-works, thus centering the whole supply in one company. The facts detailed were valuable for reference, and interesting as history. An appendix, containing an account of the reservoirs and filters, was promised for a future occasion.

THEATRICALS.

ITALIAN OPERA.—*Norma* was performed on Tuesday night at this theatre, and Mdle. Grisi, after a two years' absence, appeared as the Druid priestess. She was most cordially welcomed, and her efforts, during the whole opera, were attended with unceasing applause. None of her parts has been more frequently performed, or is more familiarly known to the public than that of *Norma*. It was not to be expected, therefore, that she would give it any new feature; but her personation of the character was, as it has always been, a wonderful display of impassioned energy, far surpassing anything that has been seen on the Opera stage since Mdle. Pasta's *Medea*. The opera received an entirely new feature from Mdle. Molteni's charming performance of *Adalgisa*, which gave interest and pathos to a character which, as usually represented, is wholly insipid. S. Mario sustained the part of *Pollio*, and the aged priest was worthily represented by S. Lablache. The opera was thus performed in a manner that could not easily be excelled. This was S. Lablache's first appearance this season; and continued plaudits, on his entrance, burst from every part of the house. The theatre was crowded, which has been the case every night since the commencement of the season.

DRURY-LANE.—The Easter Monday entertainments at this theatre were *Macbeth*, and an "entirely new and original Easter absurdity," called *Fortunio and his Seven gifted Servants*, founded on the familiar fairy tale, in which the young knight, *Fortunio*, overcomes every difficulty, no matter how insurmountable, by means of one servant who could eat everything, a second who could drink everything, a third who could carry everything, a fourth who could hear everything, a fifth who could see everything, and so forth. The only novelty in the cast of *Macbeth* was Miss Helen Faucitt's appearance as *Lady Macbeth*, during the temporary absence of Mrs. Warner. Both the play and the afterpiece was well received by a crowded audience, who, as usual on Easter nights, appeared determined to be pleased.

HAYMARKET.—This House opened for the season on Monday night. During the recess the theatre has been much altered and improved. It is now brilliantly lighted with gas, many parts have been remodelled, and the whole redecorated. The performances were the *School for Scandal*, and the burletta of *Riquet with the Tuft*. The cast of the former was the same, or nearly so, as last season; and, with Mesdames Vestris, Glover, Clifford, and Edwin Yarnold, and Messrs. Farren, Strickland, Brindal, Stuart, Charles Mathews, and Webster, to support the characters, the performances went off pleasantly and effectively, as a matter of course. *Riquet with the Tuft* is an old favourite, and the audience were so well pleased that the manager was called before the curtain to receive their applause. On Tuesday Miss Julia Bennett, a young lady, who has achieved a high provincial reputation, and the daughter of Mr. G. Bennett, of Covent Garden, made her

first appearance before a London audience at this theatre, as the *Widow Cheerly*, in the comedy of the *Soldier's Daughter*. She was, altogether, successful, and was called for at the conclusion of the comedy.

PRINCESS'S THEATRE.—An English version of *Tancredi* was performed here on Monday night. Two or three adaptations of Italian operas have been produced at this theatre in the course of the season with considerable success; but though *Tancredi* attracted a numerous audience, and received loud applause, yet the approbation appeared to be more owing to the great beauty of Rossini's music, and to the showy spectacle, than to the quality of the performance.

FRENCH PLAYS.—The new comedie vaudeville, *Les Memoires du Diable*, was produced at this theatre on Monday evening, and is likely to meet with nearly as favourable a reception here as it received in Paris, where it has been performed upwards of two hundred times. The afterpiece was the well-known comic vaudeville, *Le Pere de la Debutante*, in which M. Vernet represented the father of the *Debutante*, with a racy humour, the like of which is not to be seen on the English stage. His acting showed a genuine comic genius—a thorough perception of the ludicrous in character. The dress, the manner, the gesture, the gesticulation, the voice, everything was perfect. The house was in a state of the most joyous hilarity from beginning to end. M. Vernet was ably seconded by Mdle. Elise Forgeot, as the *Debutante*, and the other actors filled their respective parts with excellent effect. Every part of the house was full.

Miscellaneous.

New Houses of Parliament.—Mr. Barry has presented a report to the Royal Commission on the Fine Arts, in reference to the internal decorations of the New Buildings and other local improvements which have suggested themselves. After stating that the walls of the several halls, galleries, and corridors of approach, as well as the various public apartments throughout the building, should be decorated with paintings illustrative of the history of the country, Mr. Barry proceeds to show in detail that the employment of sculpture and architectural decorations may be advantageously combined with the proposed series of national paintings. He suggests that Westminster Hall should be made the depository, as in former times, of all trophies obtained in war with foreign countries; and that an addition should be made to the original plan of the New Houses for the purpose of inclosing New Palace Yard, and of thus obtaining a long and imposing front towards the abbey. By this means Westminster Hall, in accordance with the plans of the Ancient Palace of Westminster, would be placed in a quadrangle, and would be seen to the best advantage; and the New Law Courts, rooms for Commissions and other purposes might be provided in the sides of the quadrangle. He suggests also that the superstructure of Westminster Bridge should be rebuilt upon the old foundations, which are now in course of repair, under the superintendence of Messrs. Walker. On this point Mr. Barry observes—"As it is, in my opinion, of the utmost importance, both as regards the effect of the New Houses of Parliament, when viewed from the bridge, and the convenience of the public in passing over it, that the roadway should be made on the lowest possible level, I would recommend that the form of the arches of the new bridge should be pointed, by which great facility would be afforded for accomplishing that very important object, namely, by materially reducing the thickness of the crown of the arches, within what is considered necessary for arches of the circular form. I am induced also to recommend this form of arch, on account of another very important practical advantage which it offers, namely, the elevation of its springing above the level of high water, by which the water-way through the bridge will be the same at all times of tide; whereas, at present, the spandrels of the arches offer an impediment to the water-way at high water, nearly equal to one-twentieth of its sectional area, occasioning rapid currents with a considerable fall, and sometimes much danger to craft in passing through the bridge, under the influence of high winds. I consider it also of the greatest importance, in an artistic point of view, not only that the bridge should be materially lowered, but that it should be made to accord with the architecture of the new Houses of Parliament, in order that, both in composition as well as style, the *ensemble* should be harmonious and effective. Upon a rough estimate which I have formed of the cost of the new superstructure, I am satisfied it could be erected for about 120,000*l*. beyond the cost it will be necessary to incur to carry out Messrs. Walker and Burgess's design for widening the present bridge to the extent proposed." The embankment on both sides of the river, from Vauxhall-bridge to London-bridge, he considers next in importance to the rebuilding of the superstructure of Westminster-bridge. He says—"As there would doubtless be serious objections to a public road upon the embankment on the north side of the river, I confine my observations to the southern side, where, if a road could be obtained, it would afford a succession of fine views of London, and the best situation for views of the principle of the new Houses of Parliament. Having maturely considered the subject, I think it would be practicable to obtain a public road of ample width upon arches, from the termini of the South-Eastern and Dover and the Brighton railroads, at the foot of London-bridge, to the terminus of the South-Western Railway at Vauxhall. The road might be raised upon arches to a level that would coincide with the levels of the roadways of the several bridges which it would intersect, by which means the waterside frontages of the several wharfs need not be interfered with in any material degree; indeed, the extent

of such frontages might, by the means of docks of convenient form and size, be very considerably increased, and the archways might, to a great extent, be appropriated, if desired, to warehouses and other purposes of trade. By extending the archways to a sufficient depth to the south of this road, a frontage for building might also be obtained, particularly opposite Privy-gardens and the new houses of Parliament, where, if the houses were designed in masses, with reference to architectural effect, they would form an agreeable and striking view from the north side of the river, and effectually screen the present low and mean display of unpicturesque buildings on the Surrey side. The proposed houses, from being raised to a considerable elevation, would have a fine command of the river and the principal public buildings of the metropolis, and having, in addition to these advantages, a southern aspect, would form very agreeable residences, such as would probably be eagerly sought for by the owners of adjoining wharfs, either for their own occupation or that of their principal agents. Taking into consideration the private accommodation to the several wharfs, and the value of the new building frontage, the proposed work would probably yield a very considerable return for the capital expended upon it, and when effected would not only form one of the most striking improvements of an ornamental character of which the metropolis is susceptible, but would materially conduce to the convenience, the comfort, and recreation of the public. It would also perhaps render unnecessary the line of road that has been projected from the termini of the railroads at the foot of London-bridge through Southwark to the foot of Westminster-bridge for the convenience of the West-end of the town, as the distance to that part of London would be materially shortened by taking the proposed embankment road and passing over Waterloo-bridge. Of the local improvements immediately contiguous to the new houses of Parliament and the approaches, Mr. Barry remarks:—"Old Palace-yard is proposed to be considerably increased in size by the demolition of the houses which now occupy that site, as well as the houses on both sides of Abingdon-street, by which means a fine area for the convenience of state processions, and the carriages of peers and others attending the House of Lords, as well as a spacious landing-place adjoining the river, would be obtained. The Victoria Tower, as well as the south and west fronts of the building, would thus be displayed to the best advantage. The Chapter-house would be laid open to public view, and if restored, would form a striking feature in conjunction with the Abbey; and a considerable extent of new building frontage that would be obtained by this alteration might be occupied by houses of importance, in a style of architecture in harmony with the Abbey and the new houses of Parliament, by which a grand and imposing effect, as a whole, would be produced. As one means of improving the approaches, I propose that the noble width of street at Whitehall should be extended southwards, by the removal of the houses between Parliament-street and King-street, by which the Abbey would be wholly exposed to view as far as Whitehall-chapel. The houses on the north side of King-street should be removed, for the purpose of substituting houses or public buildings if required, of an imposing style of architecture. Milbank-street is proposed to be widened and improved, in order to make it a convenient and effective approach from Milbank-road to the Victoria Tower and Old Palace-yard. Tothill-street is also proposed to be widened and improved, in order that it may be made an equally convenient and striking approach to the Abbey, the houses of Parliament, and Whitehall, from the west end of the town. St. Margaret's Church, if suffered to remain in its present position, should be improved in its external decoration, in order that it may not disgrace, as it now does, the noble pile of the Abbey which rises above it." Mr. Barry concludes the enumeration of all the principal improvements he judges to be most effective to the building on which he is engaged, by the hope, that at no distant period the re-building of the superstructure, the embankments of the river, the inclosure of New Palace-yard, and the enlargement of Old Palace-yard, may be accomplished as "improvements of the utmost importance, whether as regards the beauty of the metropolis, the effect of the new houses of Parliament, or the convenience and enjoyment of the public."

Law.

CENTRAL CRIMINAL COURT.—George Goddard, hosier, assistant in a receiving house, pleaded guilty to an indictment charging him with stealing a post letter, containing a sovereign, the property of her Majesty's Postmaster-General. Mr. Justice Cresswell addressed the prisoner, and told him that from the serious nature of the offence which he had committed, the good character he had received would not avail to save him from a sentence of banishment from this country. So much mischief might ensue from even only the suppression or non-delivery of a letter, that it was absolutely necessary to inflict most severe punishment upon offenders like him. The sentence upon him was that he should be transported for ten years.

ASSIZE INTELLIGENCE.

NORTHERN CIRCUIT.—(Liverpool.)—Patrick Doran was indicted for setting fire to his house in Compton-street, in Liverpool, on the 26th September last. It will be recollected that a destructive fire took place in Liverpool on the 23d September, the particulars of which have been fully before the public. It appeared that the fire burned up to a wall that bounded the premises of the prisoner, and that in the course of it he used expressions to the effect that he had 500 tons of calcium which would make a famous bonfire, and was all insured, and he would not care if the whole of the old place was burnt down before the morning. Three days after a fire broke out in his premises, and it was sworn by a girl that he was there, and made use of expressions which tended to criminate him, but no positive act of incendiarism was proved against him. Mr. Wilkins addressed the jury for the prisoner, and opened an *alibi*, to prove that the prisoner was at the Amphitheatre, near St. James's-market, where a meeting was being held on the subject of Education in Ireland, in which the prisoner took great interest. The Jury stopped the case, and delivered a verdict of *Acquittal*.

Thomas Henry, a person of respectable appearance, was in-

dicted for setting fire to his dwelling-house, with intent to defraud the Phoenix Insurance Company. Our readers may remember that the accused carried on the business of a draper in St. James's-place, in this town; the circumstances under which the fire took place were described by us at the time. No new facts were elicited by the trial, which terminated in an acquittal. The verdict was received with a loud shout of applause from the people collected in the court.

Taylor v. Ashton and Others.—This was an action to recover compensation on account of loss sustained by the plaintiff, in consequence of the purchase of shares in the Commercial Bank of England at Manchester, in consequence, as was alleged, of certain fraudulent representations on the part of the defendants. The plaintiff, a professional man, residing in Liverpool, and the defendants were directors of the Commercial Bank at Manchester, and he sought to recover compensation for the loss he had sustained by certain false and fraudulent representations of the affairs of the establishment over which they presided, by which he was induced to become a purchaser of shares to the amount of 3,500*l*. The bank was set on foot in the year 1834. This was at a period subsequent to the failure of several joint stock banks, and a proposal was made to establish the one in question, which, availing itself of the experience derived from the sad experience of its predecessors, should combine the advantages they possessed and avoid the errors into which they had fallen. The defendants formed part of the provisional committee. In May, 1834, the deed establishing the company was executed. One of its provisions was, that the defendants, with a Mr. Joseph Slater, were appointed the first directors of Manchester directors. They were elected for three years, with very extensive powers. They appointed the manager and other officers, dismissed them as and when they pleased, and had, in short, the entire control of the establishment. They were, therefore, responsible for the acts of these their servants, done in conformity with their directions. The estimated capital of the concern was to be 100,000*l*, in shares of 5*l*, and it was set forth as part of the prospectus of the bank and its distinguishing feature, that all shares should be paid up, and should constitute a fund of real tangible capital, available for the banking purposes. The directors were to be possessed of 200 shares each. The present defendants were possessed of that qualification, having taken that number of shares and paid up the amount. This, however, formed a small part of the shares standing in their names, for it appeared that a system was introduced of allotting names to each other shares on what was called cash credit. Fifteen hundred were allotted to each, and with subsequent reserves of a similar kind, the total of the shares held by the defendants amounted to thirteen thousand. These shares, when so allotted, were paid for by a cheque on the bank. The bank cashed the cheque, and debited the private account of the directors with the amount. On this debit the party was charged five per cent. for the advance, but as at the same time the bank was paying a dividend of eight per cent., the directors to whom the shares were so allotted, reaped a clear profit of three per cent., without, in so fact, having advanced a farthing of the capital which those shares were intended to represent. The bank began business in 1834, and established branches at Liverpool, Birmingham, and elsewhere. The affairs of the whole establishment, however, were conducted by the Central Board at Manchester. To them reports were made weekly of the various branches, so as to enable them to form an estimate of the progress and present condition of each branch as well as of the entire concern. The first division of profits was, by the deed, to take place in February, 1836. A report was accordingly prepared, and an address to the shareholders and the public. In the report, the fact of the bank rejecting altogether the system of nominal capital not paid up, was pointed out as one of its chief characteristics, and it was stated that the directors, by their arrangements, had the means of knowing to a note the condition of the concern, and of every part of it every week. The report recommended a dividend of eight per cent., and gave a most flattering account of the state and prospects of the bank. To this report the defendants were all parties, and it was signed by Baucer in behalf of the rest. It would be shown that they were all present at the meeting at which it was adopted, and that although they were all engaged in putting forth these statements to the public, and were cognisant of the provisions of the deed, that dividends should be paid out of profits alone, they knew at the same time that the dividends were paid, not out of profits, but out of the capital of the bank. The report, however, had the effect for which it was intended. The shares rose in the market and became a favourite object of investment. The plaintiff, who, as already stated, was a professional man, a surgeon in Liverpool, heard of the prosperous position of the concern, in the first place, from a relation of his own, who, in his turn, had been told of it by a person of the name of Loughton, the then manager of the Liverpool branch. The plaintiff went to the bank. He received a copy of this report. He became a customer, and purchased 200 shares at 7*l* per share. The bargain was first made by the plaintiff with Langton at the rate of 6*l* per share; but, on the cheque being filled up at the office at Manchester, it was made 7*l* per share, being a premium of 1*l*. This was stated to be the market price at Manchester. The defendant was induced to conclude the bargain nominally on these higher terms at the recommendation of Langton, who said he would not doubt be glad to have more shares in so thriving a concern, and could be allowed the difference in his next purchase. He did accordingly purchase 200 shares more for 6*l*, for which he paid 1,000*l*, being allowed the 200*l*. extra which he had paid on the 200 shares, of which he became proprietor. He became, finally, possessor of 600 shares, which cost him altogether the sum of 3,500*l*. It appeared that while these matters were going on, one of the defendants, Ashton, sold 100*l*. shares, of which he was proprietor, for the sum of 700*l*. They were a part of his cash and credit for which, up to that time, he had not paid anything, but for which he then paid the bank at par, viz., 500*l*, putting the balance in his pocket. These cash credits, it appeared, were at once entered in the share-book, until such a measure became necessary, in consequence of Lord Althorp's motion for a return of the shares in joint-stock banks, and the amount of capital paid up. It was then the system was adopted of entering the shares as paid, and putting the amount to the debit side of the party's private account. After advertising to the annual reports of the directors, and to the subsequent proceedings of the company, the counsel for the plaintiff called witnesses in support of his case. On the second day of the trial, the Solicitor-General addressed the Jury for the defence. He was, he said, apprehensive lest, amid the great mass of evidence which had been given, he should not be able to fix their attention on the precise question they had to consider. It was one of great importance to and, in a pecuniary point of view, of the utmost importance to the defendants. If the plaintiff was entitled to the amount of these shares, there would be no end to the actions which would be commenced against Messrs. Turner and Ashton, who stood among the first of the merchants of Manchester, but who would be borne down by the multitude of actions which would be brought against them if the present succeeded. They had been charged with swindling and falsehood; but, to sustain the present action, it was necessary not only to state, but to prove, that they had been guilty of fraud and falsehood for the purpose of injuring others to benefit themselves. The defendants had unfortunately become connected with the Commercial Bank in 1836, and having mentioned the name of that Bank, the failure of which had caused so much distress, he trusted the Jury would dismiss all prejudice from their minds. The defendants had been directors of the Bank. The charge now made against them was, not that they had been negligent in the discharge of their duties, or in the inspection of the books, but they had made false and fraudulent representations, knowing them to be false, with intent to injure the plaintiff. This must be the charge, to make out the plaintiff's case, and how had it been established? Where were the profits

to the defendants—where the motive suggested for such conduct? Mr. Knowles, in his opening, had said that Mr. Ashton had sold shares, and pocketed 200*l*. by the transaction, but there was not a shadow of truth in that statement—it had not been established in evidence, and was wholly and entirely without foundation. The whole charge resolved itself into representations made by the general board of directors. The first was said to be made in February, 1836, and the others at annual and half-yearly meetings. There was no representation made by the defendants individually—all were made by the general board; and if this action were sustainable against the defendants, every member of the board was equally responsible. It was impossible, he submitted, to sustain the charge of fraud and falsehood, on the evidence which had been tendered. What was the constitution of the Bank? There was the head bank at Manchester, and 17 local branches. There was a local director, a manager, and an accountant at each branch, and there was an inspector of branches besides. The practice was, not for the directors to examine the books, but for the paid officer. By the provisions of the deed the directors were to make known to the shareholders on y so much as they might think right to make public. There was no concealment in the fact of the bad debts not being mentioned—the reserved fund was for the very purpose of covering such contingencies. As to the declaration of a dividend, what would have been the consequence to the plaintiff, and the other shareholders, if no dividend had been recommended? Why, the shares would immediately have become utterly unsaleable. He would show that the defendants, Messrs. Ashton and Turner, had struggled against the local directors with respect to the amount of the dividends, and that they possessed the power, if they pleased, of submitting a motion to the board to have the accounts audited. Yet these local directors attended the board constantly, they were aware of the state of the business at their respective branches, and the existence of bad debts, yet they were always anxious for the declaration of a high dividend, and never moved for an audit of the accounts. He would further show that when the accounts were audited in 1840 by hostile auditors, the defendants, Ashton and Supton, thought the bank in a prosperous state, and that it was fully able to pay a dividend of five per cent., for they had been told by the auditors that it was able to pay five per cent., and that they expected it would shortly be able to pay a higher dividend. He contended that Messrs. Turner and Ashton had no more motive or interest in the bank than would equally well apply to every other shareholder. The Solicitor-General then read several of the clauses of the deed, and proceeded to comment on the representations which had been made to the board in 1837, as well as on the composition of the board itself. He submitted the members of the board generally were incapable of fraud, swindling, and cheating, although to every one of them would the charge against the defendant be equally applicable. The only question in the case seemed to be whether fraud had been committed, as far as the shareholders were concerned, in the neglect to mention the bad debts; but it was to be remembered that Messrs. Ashton and Turner had never given an order as to the mode in which the accounts were to be furnished; that was regulated by Mr. Macarty and the clerks and managers, whom that gentleman appointed. He submitted that to charge the misconduct of Mr. Macarty upon the defendants would be exceedingly unjust. The Solicitor-General then commented upon the evidence of the various witnesses, contending that the directors had themselves been misled in taking the accounts in the representations of the acting officers; but this, though it might be negligence, was certainly not a fraud. He complained of the hardships imposed on the defendants in the preparation of their defence, and in not being allowed access to the books and accounts of the bank. He would read the report of Messrs. Panton and Edge, who were appointed auditors in 1840. Those gentlemen, men of experience, had examined the whole of the books, and recommended a dividend of five per cent., calculating that the profits of the bank were such, it could afford to pay five per cent. for the next four years, and upwards of five per cent. after that time. He asked whether the defendants were to discredit the testimony of experienced men, such as those who had fully examined the accounts, and presented the result of their investigations to the board. He submitted that the plaintiff had given no evidence either of his having become a shareholder in consequence of the report complained of in 1836, in which case he would have no shadow of a ground of action. After some further observations (the whole address occupying about two hours and a half), the learned gentleman concluded by stating his confident anticipation of a verdict for his client. Mr. Bailes addressed the Jury for two of the defendants (Messrs. Parlin and Bower) who, he said, had been utterly ruined by their unfortunate connection with the bank. His Lordship having summed up, the Jury, after an absence of a few minutes, returned into Court with a verdict for the defendants, at the same time expressing their opinion, that they had been guilty of gross and unpardonable negligence.

POLICE.—*British American Association.*—On Wednesday last, in consequence of the advice given by Lieut. Lean, the government emigration agent, Mr. Henry Fretwell, the captain of the Barbadoes brig, which some months ago left London with emigrants for Prince Edward's Island; and Mr. Duncan Campbell, the owner of the vessel, were summoned before the Lord Mayor, to answer the complaints of several of the unfortunate persons who had broken up their establishments in this country, and engaged to go to that country in the Barbadoes, under the sanction of the British American Association, whose proceedings we have often noticed in this Paper. The justice-room was densely crowded during the investigation, which lasted a great length of time. Capt. Fretwell, who was the first questioned by the Lord Mayor, manifested every desire to be as concerned. He said that he had been engaged at Gravesend to take command of the vessel to Prince Edward's Island, and he sailed from the Downs on the 1st November last, with 50 passengers—men, women, and children. When the vessel reached 42° W. long., she encountered heavy winds and seas, and was so dreadfully battered as to be obliged to put back to the nearest eligible port, which was Cork, a distance of about 1,300 miles. On the 22d December she reached Cork, where she remained until the 9th inst., when she sailed for London; leaving behind her in Cork some of the emigrants, but bringing to London about 30 of them, who were at the present moment lodging and boarding in her in the London Docks. The emigrants never expressed the slightest dissatisfaction at his conduct—on the contrary, they were convinced he had done all he could for their service; but they felt and expressed bitter disappointment at the manner in which they had been treated by the Association, and those who acted for that body. The Lord Mayor then questioned Mr. Duncan Campbell at considerable length. Mr. Campbell stated, that he was sole owner of the Barbadoes, subject to a mortgage to Mr. Soames of 375*l*. The persons who engaged her to take out the emigrants were the principal managers of the British American Association—Sir Rich. Brown, Sir Wm. Ogilvie, and Dr. Rolfe. The ship was chartered by him to these three commissioners to take out emigrants to Prince Edward's Island—all most respectable men, but not very rich, of course. They engaged him to provide the emigrants, at 8*l*. per man, and half-price for children, with food and passage out. He provided the ship by a contract with Messrs. Leslie and Smith, the extensive provision merchants, with meat, bread, flour, &c., at 2*l*. 10*s*. per head. Everything that was requisite for the voyage was, according to the Act of Parliament, was abundantly supplied. The cargo, which was valuable, was bought upon credit. But now the Association was broken up altogether, and he had never received a farthing. He had lost the ship and everything else. The Lord Mayor—I find in this printed paper a number of great names, the appearance of which was calculated to induce people to believe that the Association was a *bona fide* one. There are attached the names of a duke, 15 lords, and nearly 40 baronets. You are amongst the commis-

sioners, and the emigrants complain that you have not performed your contract. Mr. Campbell—It was impossible for me to perform it. The Association is completely broken up. There have been several executions put into the house in Bridge-street; and owing to what passed at the Mansion-house in October last, the Duke of Argyll, the President to the Society, has resigned. There are actions at this moment going on against the Duke of Argyll, the Marquess of Downshire, and Sir James Cockburn. The Lord Mayor—How much of the million capital has been paid up? Mr. Campbell—None at all. Nobody paid up at all. The Lord Mayor—Now, as you are a director, you can let me know what the plan was with respect to these emigrants, if you had got them out to Prince Edward's Island? Mr. Campbell—Twenty houses had been prepared by the Association to receive them, and they were afterwards to be located there by our agent, Mr. Goodman, jun., a gentleman on whose talents and qualifications we have the utmost reliance. They were to build more houses, and work in other ways, and to be regularly located; and there was a month's extra provision going out, so that they would be provided for a month after landing. The Lord Mayor—And then take their chance of starvation? That is certainly a frightful alternative. Those poor men have been deceived by the long list of high names, and are now thrown into the most serious difficulties. Mr. Campbell—I have been deceived myself most egregiously. As to the month's extra provision, the general practice is to give extra provision for only a few days after arrival. The Association in this adopted a most liberal plan. The Lord Mayor—Why, emigrants under such circumstances may die through sheer starvation. Mr. Campbell—So they may. Emigrants are not taken out to their destination on such liberal terms. The vessel was singularly unfortunate. The voyage is one of six weeks. If she had been a fortnight later, she would, I entertain no doubt, have made the voyage. Mr. George Henley and Mr. Taylor, two of the emigrants, and very intelligent men, here stood forward. They stated their great object in bringing the case before the Lord Mayor to be to ascertain upon whom the serious responsibility to them could be fixed. The Lord Mayor—Have either of you paid money for the voyage? Mr. Taylor said that he had paid 50*l.* for himself and his family of eight children, to the secretary to the Association. Mr. Henley stated that he was introduced by the British Association to Mr. Ha den, whom they acknowledged as their agent, and he engaged to pay thirty guineas for his passage, &c., by instalments, in the island. Mr. Taylor said he had seen in a newspaper an account of a meeting in Scotland, which had been attended by some of the most respectable individuals, representing the plan of emigration, and the advantages with which it abounded, and he was deceived into the belief that the whole was dictated by the most honourable feelings. Under these circumstances, he determined to go to Prince Edward's Island, and he made his arrangements accordingly. He had suffered, both mentally and physically, in an extreme degree. The case of all the emigrants was now becoming desperate. He was given to understand that it was the intention of the mortgagee to sell the ship and cargo, and to turn the emigrants, who had not one farthing in their possession, completely adrift. A representation had been made to the magistrates in Cork on the subject, and those gentlemen were of opinion that the owner was as liable as he would be in the case of a seaman's wages. He was reduced to pauperism with his large family, and could not afford to employ a lawyer. He had not only lost his passage-money, but had been obliged to expend the money he had put together to apply to the purposes of labour, in the cultivation of the land he expected to have held. The Lord Mayor—I shall persevere in this inquiry to render you as much service as I can. Pray, Mr. Campbell, how many shares did these Noblemen and Barons take? Mr. Campbell—None at all. The Duke of Argyll and Sir James Cockburn were the only two out of the whole list who signed their names for shares. They signed for shares to the amount of 500*l.* each. The Lord Mayor—And with this 1,000*l.* you start the association? Mr. Campbell—It was started long before I had anything to do with it. Mr. Henley requested that the Lord Mayor would postpone the case for a few days, in order that the attendance of the Secretary and a Mr. Andrews might be procured, and also that Mr. Campbell might be called upon to produce his books, which might explain the case more fully. Mr. Campbell objected to produce his books, and said he would not allow any one to overhaul them. The Lord Mayor—I shall postpone the case, certainly, and I hope that some satisfaction may be obtained. I am decidedly of opinion that you have a claim upon the ship, and that she is bound to leave you at the place of your original destination. Mr. Taylor said he should not now wish to emigrate without coming to a more clear understanding as to the power of the association. I understand they have not an acre of land in Prince Edward's Island. Mr. Campbell admitted that they have not a single acre, although they bargained to sell Mr. Henley 150 acres. The Lord Mayor—It is quite impossible that any of these individuals, whose names have been used in this list, could have known all this; it is a most decided and heartless fraud. I would send the concoctors of it to Prince Edward's Island with a month's provisions. I consider the emigrants the dupes of a conspiracy. Mr. Campbell—My Lord, I know nothing of these things. I have found them out to my heavy cost. I have lost my vessel and money, and there are twenty actions against me. The Lord Mayor then directed that all the parties should appear before him in a few days. Dr. Rolfe has since appeared at the Mansion House, and denied that he was one of the three commissioners; and it appears that Mr. Campbell himself was the commissioner.

SPORTING.

NEWMARKET CRAVEN MEETING.

MONDAY.—The *Craven Stakes*, of 10 sovs. each; for 3 yr-olds, 6 st; 4 yrs, 8 st 4 lb; 5 yrs, 8 st 13 lb; 6 yrs and aged, 9 st 5 lb. A. F. 5 subs. Won by Mr. Stephenson's Ma Mie, 4 yrs, Mann; beating Lord G. Bentinck's Discord, 6 yrs; Duke of Grafton's Utica, 3 yrs; and Mr. Baxter's Magna Charta, 3 yrs. Betting—5 to 4 agst Discord, and 5 to 4 agst Ma Mie, who won very easily by half a length.

Handicap Sweepstakes, of 20 sovs. each, and 5 forfeit if declared, for 3 and 4 yr-olds. D. M. 10 subs. 3 declared. Won by Col. G. Wyndham's Tom Thumb, 3 yrs, 6 st (Cassidy); beating Lord G. Bentinck's St. Jean d'Acre, 4 yrs, 8 st 7 lb, and Mr. Boyce's Cornelia, 4 yrs, 8 st 10 lb. The following also started, but were not placed: Mr. Thornhill's Equation, 4 yrs, 8 st 5 lb; General Yates's Canton, 3 yrs, 7 st 5 lb; Lord Exeter's The Buck, 3 yrs, 6 st 6 lb; and Mr. Greville's chf by Ishmael out of Morella, 3 yrs, 6 st 2 lb. Betting—5 to 2 agst Tom Thumb, 4 to 1 agst Canton, 9 to 2 agst Cornelia, 5 to 1 agst St. Jean d'Acre, and 6 to 1 agst Equation. Won by half a length.

Handicap Sweepstakes, of 25 sovs. each, 10 ft, for 4 yr-olds and upwards. T.Y.C. 7 subs. Won by Mr. J. Day's St. Lawrence, 6 yrs, 8 st 8 lb, (J. Day, jun.), beating Colonel Peel's Garry Owen, 6 yrs, 8 st 12 lb. The following also started, but were not placed. Duke of Bedford's Currycomb, 6 yrs, 7 st 7 lb; Mr. Boyce's Cornelia, 4 yrs, 7 st 3 lb; Mr. Osbaldeston's Edmond, 4 yrs, 7 st; and Lord Exeter's Abydos, 5 yrs, 6 st 12 lb. Betting—2 to 1 agst St. Lawrence, 5 to 2 agst Currycomb, and 4 to 1 agst Abydos. Won by a neck.

Sweepstakes of 50 sovs. each, h ft, for fillies out of unfriended mares, 7 st 7 lb each. T.Y.C. 3 subs. Won by Lord Maidstone's Titania (Nat), beating Captain Rous's Tyrolienne. Betting—6 to 4 on Tyrolienne. Won easily by a length.

The Duke of Bedford's Oakley, 5 yrs, 9 st (Robinson), beat Mr. Osbaldeston's Martingale, 3 yrs, 6 st. T.Y.C. 200 sovs. h ft. Won in a canter by four lengths.

The Riddlesworth Stakes, of 200 sovs. each, h ft. Ab. M. Won by Mr. Bowes's Cotherstone, by Touchstone, 8 st 4 lb (F. Butler); beating Lord Eglintoun's Pompey, by Emilius, 8 st 7 lb (Lye), and Mr. Thornhill's Elxir, by Emilius, 8 st 7 lb (Chifney). Betting—6 to 5 agst Cotherstone, 6 to 4 agst Pompey, and 7 to 2 agst Elxir. Won easily by three lengths.

Post Produce Match, of 200 sovs. each, h ft, for 3 yr-olds; colts 8 st 7 lb, and fillies 8 st 4 lb. D. M., one to the post. Colonel Peel's St. Valentine and br c Murat received forfeit from the Duke of Portland's f by Beiram, dam by Reveller, and f by Beiram, out of Tragedy.

Colonel Peel's St. Valentine received forfeit from Lord Kelburne's Uerslayer. 8 st 7 lb each. D. M. 200, h ft.

Post Produce Match, of 200 sovs. each, h ft, for 3 yr-olds; colts 8 st 7 lb, and fillies 8 st 4 lb. R. M., one to the post. The Duke of Portland's f by Beiram out of Souvenir, and f by Beiram out of Ruth, received forfeit from Colonel Peel's f (dead) by Slane out of Cara.

TUESDAY.—Sweepstakes of 100 sovs. each, h ft, for 3 yr-old fillies, 8 st 7 lb. D. M. 6 subs. Won by Mr. W. S. Stanley's f Cowslip, by Bizarre, 3 lb (W. Boyce); beating Mr. Thornhill's Extempore, sister to Euclid; Duke of Portland's f by Beiram out of Ruth, 3 lb; Colonel G. Wyndham's f Glance by Glaucus, 3 lb; and Lord Orford's f Barmad by Clearwell, 3 lb. Betting—2 to 1 agst Extempore, 5 to 2 agst Cowslip, and 7 to 2 agst Ruth. Won easily by a length.

The Riddlesworth Stakes, of 200 sovs. each, h ft, for 3 yr-old colts, 8 st 7 lb, fillies 8 st 4 lb. D. M. 5 subs. Won by Mr. Wrexford's br g by Camel out of Monimia (J. Day, jun.), beating Lord G. Bentinck's Fiddlestring, by Bay Middleton, 3 lb; and Lord Exeter's c by Reveller out of Velvet. Betting—7 to 4 on the gelding. Won by a length.

Sweepstakes of 100 sovs. each, for 3 yr-olds, &c. R. M. 7 subs. Won by Lord G. Bentinck's Gaper, 8 st 7 lb (Rogers), beating Duke of Grafton's Asop, 8 st 7 lb. 6 to 4 on Gaper, who won by several lengths.

Duke of Bedford's Edmund of Langley received forfeit from Lord Exeter's c by Beiram out of Marnella.

WEDNESDAY.—Sweepstakes of 100 sovs. each, h ft. D. M. 4 subs. Won by Mr. Balson's Rowland, 8 st 4 lb, beating Duke of Grafton's Asop, 8 st 4 lb. Betting 5 to 4 on Asop.

Sweepstakes of 50 sovs. each, for 3 yr-olds. D. M. 6 subs. Won by Mr. Watts's Pineapple, 8 st 9 lb (Scott); beating Captain Colquitt's Pickpocket, 8 st 9 lb (Marson); Mr. Batson's Wildrake, 8 st 9 lb; and Mr. Booth's Donnybrook, 8 st 9 lb. Betting—even on Pineapple, and 7 to 4 agst Pickpocket.

The Column Stakes, of 50 sovs. each. R. M. 34 subs. Won by Mr. Bowes's Cotherstone, by Touchstone, 8 st 4 lb (F. Butler); beating Colonel Peel's Murat, by Slave, 8 st 2 lb; Lord Albemarle's The Brewer, by Plenipotentiary, 8 st 7 lb; and Mr. Thornhill's Extempore by Emilius, 8 st 4 lb. Betting—5 to 2 on Cotherstone, 5 to 1 agst Murat, and 5 to 1 agst Extempore. Won in a canter by two lengths.

Subscription Plate of 50*l.* for 3 yr-olds 7 st, 4 yrs 8 st 7 lb, 5 yrs 9 st, 6 yrs and aged, 9 st 2 lb. T.Y.C. Won by Lord Stradbroke's Jeremy Diddler, 4 yrs (G. Edwards); beating Colonel Peel's Garry Ma Mie, 4 yrs; Lord G. Bentinck's Discord, 6 yrs; Mr. Stephenson's Ma Mie, 4 yrs; and Mr. Maule's Huntingdon, 3 yrs. Betting—2 to 1 agst Garry Ma Mie, 5 to 2 agst Ma Mie, 7 to 2 agst Discord, and 4 to 1 agst Jeremy Diddler.

Match, 100, h ft, 8 st 2 lb each. T.Y.C. Lord Stradbroke's Evenus (Nat), beat Captain Daintree's bro to African by 20 lengths. 2 to 1 on the winner.

Sweepstakes of 100 sovs. each, 60 ft; colts 8 st 7 lb, fillies 8 st 3 lb. D. M. 8 subs. Won by Lord Miltown's Bourra Tomacha (F. Butler); beating Duke of Grafton's Cataract; and General Grosvenor's Fisticuff. Betting—3 to 1 on Cataract, and 4 to 1 agst Bourra Tomacha. Won by a length, easy.

THURSDAY.—Sweepstakes of 200 sovs. each, h ft, for 3 yr-olds, colts 8 st 7 lb, and fillies 8 st 4 lb. D. M. 9 subs. Won by Lord G. Bentinck's Gaper, 3 lb (Rogers); beating Lord Chesterfield's New Brighton, and Duke of Bedford's Jerry Sneak (late Satan).

Subscription Plate, of 50*l.* D. M. Lord Albemarle's The Brewer, 6 st 12 (Chapple). Several others started. A dead heat. The plate was divided, and The Brewer walked over.

Sweepstakes of 100 sovs. each, h ft; colts 8 st 7 lb, fillies 8 st 4 lb, &c. D. M. Duke of Bedford's Edmund of Langley; Duke of Rutland's Cowslip; Colonel Anson's Armytage. A dead heat walked over.

Sweepstakes of 100 sovs. each; colts 8 st 7 lb, fillies 8 st 4 lb. R. M. 4 subs. Won by Mr. Greville's Portunus walked over.

Sweepstakes of 75 sovs. each, 50 ft; 8 st 7 lb. T.Y.C. 3 subs. Lord Miltown's Titania walked over.

Colonel Peel's c by Ion out of Malbran, 8 st 5 lb, received forfeit from Lord Kelburne's f by Voltaire out of Snowball, 8 st 3 lb; 99, h ft; no course mentioned.

Lord Chesterfield's Sir Harry received forfeit from Mr. Greville's Gunter, 8 st 7 lb each; B.C. 500, 200 ft.

MARK LANE, FRIDAY, APRIL 21.—The arrivals of English Wheat since Monday have been good, but the trade has ruled dull, and the parcels fresh up, or left over from that day are very difficult to dispose of, although offered at declining prices.—In Foreign, sales are quite of a retail character, and confined to the most needy buyers. The quantity of Barley offering is small; we observe no alteration in its value, or in that of Beans and Peas. Oats meet an improved demand, and a fair business has been done at Monday's quotations.

BRITISH, PER IMPERIAL QUARTER.

GAZETTE OF THE WEEK.
INSOLVENTS.—G. Wall, St. Giles, Oxford, Rope-maker.—S. Moore, White Lion-Court, Cornhill, baker.
BANKRUPTCIES SUPERSEDED.—B. Jones, Llanidloes, Montgomeryshire, banker.—H. Marklew, Henley upon-Thames, Oxford, innkeeper.
BANKRUPTS.—D. Ellis, jun., Haverhill, Suffolk, draper.—H. Walton, jun., Crowland, Lincolnshire, wheelwright.—W. Penn, Canterbury, Cabinet-maker.—R. W. Carpenter, Holloway, cheesemonger.—W. Fuller, Cliffe, Sussex, carrier.—N. Wegg, Greenwich, victualler.—G. Harris, Dorking, Surrey, tailor.—J. Pratt, Adelphi-street, Strand, of a son and heir.—On the 18th inst, mealman.—J. P. Davies, Davies street, E. Kensington, Liverpool, wine-merchant.—A. Morga, Nantwich, Cheshire, watch-maker.—C. Webb, Kingston upon-Hull, timber-merchant.—W. Peate, Shrewsbury, grocer.—J. Parker, Bolton-le-Moors, Lancashire, cotton waste spinner.—E. Austin, Paradise-street, Rotherhithe, apothecary.—D. Davis, Newington-causway, earthenware dealer.—M. Buchanan, Gt. dord, Surrey, brewer.—T. Walker, Poulton-in-the-Fylde, Lancaster, grocer.—T. Brooke, Liverpool, victualler.
SCOTCH SEQUESTRATIONS.—A. A. Simson, Edinburgh, insurance-broker.—W. Chivas, Mains of Blacktown, Aberdeenshire, cattle-dealer.

BIRTHS.—On the 20th inst, at No 43, Munster street, Regent's Park, the Lady of the Count de la Chatre, nephew and heir of the late Duke de la Chatre, late Ambassador of France in England, of a son and heir.—On the 18th inst, at Sydney, the residence of Vice-Admiral Mudge, near Plympton, Devon, the Lady of Zachary Mudge, Esq., of a son and heir.
MARRIED.—On the 20th inst, at St. Andrew's, Holborn, the Rev. Samuel Minn, of Darlington, B.A., to Cecil Mary, youngest daughter of W. H. Rosser, Esq., of Pentonville and Gray's Inn.—On the 20th inst, at St. George's, Bloomsbury, W. Hallows, Esq., solicitor, son of the late Col. Hallows, of Ashford, Kent, to Eliza, youngest daughter of Wm. Tooke, Esq., of Russell-sq.
DIED.—On the 15th inst, Lady Lucy Frances Lennox, third daughter of the Duke and Duchess of Richmond.—On the 11th inst, John M. Insh, Esq., at his residence, 26, Upper Berkeley-street, Portman-square, and of William, Portobello, aged 56.—On the 20th inst, at his son's residence, Dover-street, Piccadilly, George Parkin, Esq., late of H. M.'s Dockyard, Chatham, aged 68.

NOTICE—NOW READY,
BERDOE'S SUMMER VENTILATING WATER-PROOF FROCK.—This novel and gentlemanly garment has been adopted by a long list of the Nobility, Gentry, Professional Gentlemen, &c., and will prove well deserving the attention of all who regard a respectable and gentlemanly appearance, in opposition to slang, vulgarity, and meanness. Made to measure in the first style; but a large assortment always ready, of which an inspection is confidently invited. (Warranted waterproof, without confining perspiration.)
Made only by W. BERDOE, Tailor, Waterproofer, &c., 69, Cornhill (eight doors from Bishopsgate-street).

BOOKSELLERS' PROVIDENT RETREAT,

60, PATERNOSTER ROW.—Established April 6, 1843.
COMMITTEE.
JAMES NISBET, Esq., 21, Berners-street, Chairman.
THOMAS BROWN, Esq., 39, Paternoster-row, Treasurer.
COSMO ORME, Esq., 35, Fitzroy square.
JAMES DUNCAN, Esq., 37, Paternoster-row.
ANT. K. NEWMAN, Esq., 33, Leadenhall-street.
EDM. HODGSON, Esq., 192, Fleet-street.
Mr. R. BALDOCK, 85, High Holborn.
Mr. JAS. BIGG, 53, Parliament-street.
Mr. G. COPLAND, 17, Paternoster-row.
Mr. H. FOSS, 81, Pall Mall.
Mr. C. D. LEFTLEY, 37, Soho-square.
Mr. S. LOW, 42, Lamb's Conduit street.
Mr. FRED. MALCOLM, 37, Paternoster-row.
Mr. THOS. RODD, 9, Great Newport-street.
Mr. W. SHARP, 39, Paternoster-row.
Mr. T. B. SHARPE, 187, Piccadilly.

Mr. S. IVES, 14, Paternoster-row, Hon. Secretary.
This Society has been established for the purpose of providing a comfortable habitation for the aged Members, and Widows of Members, of the BOOKSELLERS' PROVIDENT INSTITUTION, being in the Receipt of an annuity from that Institution, and who may require such a residence. Every person subscribing One Guinea a Year, or giving a Donation of Ten Guineas at one time, is entitled to one vote at all elections, and so in proportion for every additional Subscription of One Guinea a Year, or Donation of Ten Guineas; and is also eligible to become a Member of the Committee of Management. The very general approbation which has been given to the formation of this Society, and the liberal support it has already received, afford the most encouraging assurance that the sanguine anticipations of its benevolent projectors will be crowned with ultimate success. The present Contributions amount to 1500*l.*; and the Committee feel assured that they have only to make the object more extensively known, in order to secure the sum which is necessary to complete this desirable undertaking.
Subscriptions and Donations will be thankfully received by THOMAS BROWN, Esq., Treasurer, 39, Paternoster-row; by Messrs. SMITH, PAYNE, and SMITH, Bankers, 1, Lombard-street, and by any Member of the Committee.

BEE-HIVES.—GEORGE NEIGHBOUR and SON beg to inform their Apian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Bee-hives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents, the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and SON have also Glass Hives and other articles connected with Bee Management, at their Apian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps inclosed.

*** "NUTT ON BEES" (5th Edition), now published.

BEE-HIVES, &c.—Illustrations of Apiaries, Bee-hives, Feeding-Machines, and all the Apparatus connected with the Apiary; a Sheet-List, price 1*s.*, published by J. MILTON, may be had of Messrs. PARKER, West Strand; also at J. MILTON's, Italian Warehouse, 10, Gt. Marylebone-st., Wimpole-st. These are Illustrations referred to in the Practical Bee-Keeper, a Treatise on Bees now publishing. All letters prepaid.

SLATE WORKS, ISLEWORTH, MIDDLESEX.
EDWARD BECK informs Horticulturists generally, that the Cisterns, Tanks, Shelves, Stages, Conservatory Tubs, Flower-Boxes, Edging for Garden-paths, &c., manufactured by him in Slate, may be seen in use at Worton Cottage, upon application to the Gardener (Sundays excepted).

FOUNTAINS, VASES, TAZZAS, FIGURES, &c., in Marble, Artificial Stone, and Parker's Cement, to be seen at WYATT, PARKER, and Co.'s WHARF, Holland-street, Surrey, foot of Blackfriars-bridge. Also a large Collection of Chimney Shafts, Pedestals, Capitals, Consoles, Trusses, &c.

CUCUMBER and MELON BOXES and LIGHTS.—For Sale, one, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom: two light Boxes and Lights complete, from 1*s.* 8*d.* Garden Lights made, glazed, and painted, from 1*s.* per foot. Sashes and Frames made, glazed, and hung complete, 1*s.* 8*d.* per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road.
*** Reference given.

STONE-COLOURED CEMENT.—FELIX AUSTIN, of the New Road, Regent's Park, begs to inform Architects, Builders, Plasterers, &c., that during the process of manufacturing a very superior Composition, which has greatly improved his well-known artificial stone ornaments, he has succeeded in making an excellent STONE-COLOURED CEMENT adapted to all building purposes, which he can supply at 2*s.* 6*d.* per bushel, at his Manufactory, near the Thames Tunnel, Rotherhithe. It is particularly suited for repairing decayed stonework.

WANTED, immediately, a steady, active Man, as PROPAGATOR. He will be required to have a thorough knowledge of the Propagation and Cultivation of Plants in general.—Address, by letter, with terms, references as to capability, &c., to YOUELL & Co., Great Yarmouth Nursery, Norfolk. April 13, 1843.

WANT PLACES.—All Letters to be post-paid.

AS GARDENER, a Married Man, aged 32, who has a thorough practical knowledge of early and late Forcing, Greenhouse, Hothouse, Pleasure Garden and Kitchen Garden. Reference given to a highly-respectable gentleman with a two years' character from last situation. Direct to A.B., MACPHERSON'S Nursery, Plaistow, Essex.

AS GARDENER, a Single Man, aged 30, who perfectly understands his business; can produce unexceptionable testimonials. Would have no objection to take charge of Land and Plantation. Direct to A.B., care of Mr. MILLS, Gunnersbury Park, Acton, Middlesex.

A CATALOGUE OF BOOKS,

PUBLISHED BY

CHARLES KNIGHT AND CO.,

FOR 1843,

MAY BE OBTAINED AT 22, LUDGATE STREET, AND OF RESPECTABLE BOOKSELLERS.

Several of the more important of the Serial Publications in the Catalogue are rapidly approaching to their completion. The limits of these Works, namely, the PENNY CYCLOPEDIA, the PICTORIAL EDITION OF SHAKSPEARE, the PICTORIAL HISTORY OF THE REIGN OF GEORGE THE THIRD, and the LONDON, have now been strictly defined, and will be rigidly adhered to by the Editors and the Publishers. The number of volumes, therefore, and the price of each completed Work, are given in the Catalogue, and the exact period is stated at which each will terminate.

It is requested by the Publishers that the order for any selection from their Catalogue may be given through a Bookseller.

THE PENNY CYCLOPEDIA

OF THE SOCIETY FOR THE DIFFUSION OF USEFUL KNOWLEDGE.

This important Work, which has been in course of publication during 11 years, under the direction of one Editor, will be completed in 27 volumes, in December, 1843. 25 volumes are already published, at 7s. 6d. each volume, bound in cloth. The price of the complete Work so bound will be TEN POUNDS; and half-bound in Russia, in 14 volumes, 12 guineas.

The name of the Penny Cyclopædia was derived from its original issue in a weekly sheet, when a work of much less magnitude was contemplated. A work of 14,000 pages was not in the first instance proposed. From its commencement it has been supported by a great body of contributors, eminent in their respective departments, and its articles, in many of the great branches of knowledge, are regarded as authorities, and have acquired celebrity wherever the English language is read. The character of the work has gradually, therefore, surmounted the prejudices which were excited in some quarters by its title; and the word "Penny" is now received as indicative only of its extreme cheapness. Every article in the Work is an original contribution, paid for at a rate to secure, as far as payment is concerned, the highest talent and knowledge, not only of this country, but of foreign states. The literary expenditure alone upon each volume has exceeded 1,200*l.*, making a total of 33,000*l.* In addition, the work is fully illustrated with woodcuts, the cost of which has amounted to more than 8,000*l.*—making a total cost for Literature and Art of more than Forty THOUSAND POUNDS. The Penny Cyclopædia may, therefore, as a standard work, enter into competition in the great essentials of fulness and accuracy with any existing Cyclopædia, whatever may be its cost. It is especially valuable as a work of reference, as all the arts and sciences are to be found according to their subdivisions in the alphabetical arrangement, and yet the subjects are so treated that the general principles and facts involved in each article may be traced in connexion with other cognate articles. The following are the names of the gentlemen by whose labours this undertaking has been carried on:—

Editor—GEORGE LONG, A.M.,

Late Fellow of Trinity College, Cambridge, and Professor of Latin in University College, London

CONTRIBUTORS.

- G. B. Airy, F.R.S., late Fellow of Trinity College, Cambridge, Astronomer Royal—Gravitation, etc.
 Rev. W. Aitken—General Literature

in autumn	272 c
Malacca, correspondence from	272 a

HORTICULTURAL SOCIETY OF LONDON.
EXHIBITIONS at the GARDEN.—The first Exhibition will take place on Saturday, the 13th of May; subjects for Exhibition must be at this office on Friday, the 12th of May, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition.

The gates will be opened at One, P.M. Tickets are issued to Fellows at this office, price 5s. each; or at the Garden in the afternoon of the days of Exhibition, at 7s. 6d. each; but only to Orders from Fellows of the Society. N.B. No Tickets will be issued in Regent-street on the day of Exhibition.

21, Regent-street.

ROYAL BOTANIC SOCIETY OF LONDON.
EXHIBITIONS of Plants and Flowers, for 1843, at the Gardens, Inner Circle, Regent's Park.

WEDNESDAY, MAY 24,
WEDNESDAY, JUNE 28,
WEDNESDAY, JULY 19, from 2 o'clock until 7.
The Prizes to be awarded are MEDALS and PLATE, varying in value from 10s. to 15l., the total amount being 600l. for Plants and Flowers, and 10l. 10s. for Microscopes. Open to all Competitors.

TERMS OF ADMISSION.
Fellows, Members, and Bearers of Ivory Tickets will be admitted upon entering their names or numbers in the Gate Book.

Visitors will be admitted by Tickets to be obtained at the Gardens by Orders from Fellows and Members only. Price, on or before the 6th of May, 4s., after that day, 6s.; and on the days of Exhibition after 2 o'clock, 10s.

Schedules of Prizes, with the Regulations for the observance of Exhibitors, and all other particulars, may be had upon application at the Gardens.

The Gates to be opened at 2 o'clock. Carriages to enter the Inner Circle of the Park by the road opposite the York Gate, and set down with the horses' heads to the east, and to take up at the Garden Gate opposite the road leading to Chester Terrace, by which road they will also leave the Circle.

By Order of the Council, J. D. C. SOWERBY, Secretary.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.—The Society's Show of Cattle, Implements, &c., will take place at Derby, on Thursday, the 13th of July next; and all persons intending to exhibit Stock, Implements, or other articles, are requested to observe, that all CERTIFICATES, or Entries, must be sent to or lodged with the Secretary, at the Society's House, No. 12, Hanover-square, London, on or before Thursday, the 1st of June, the Council having decided, that in no case whatever shall any certificate be received after that date. A List of the Prizes offered, and printed copies of the Forms of Certificate required, are to be obtained by applying to the Secretary at the above address, the parties specifying on their application the kind of Stock, &c., which they intend to exhibit, in order that the proper Certificate Forms for entry may be sent to them accordingly. By order of the Council, JAMES HUDSON, Secretary. London, April, 1843.

THE WEST KENT FLORAL AND HORTICULTURAL EXHIBITION will take place in the Grounds of VANBRUGH HOUSE, Maize Hill, Greenwich, on WEDNESDAY, May the 3d, 1843.—Admission free to Subscribers at 12 o'clock, to Non-subscribers at 2 o'clock, at 2s. each. Children and Schools half-price. Tickets may be obtained at the principal Libraries in the neighbourhood; at the Green Man Hotel, and at Mr. HALL'S Nursery, Blackheath.

The Royal Artillery Band will be in attendance.

MESSRS. LANE AND SON'S Catalogue of PELARGONIUMS, FUCHSIAS, HEARTSEASE, VERBENAS, &c. &c. for the season, may be had on application (inclosing a 2d. stamp) at the Nurseries, Great Berkhamstead, Herts. The heights and colour of Verbenas are given in this Catalogue for the purpose of assisting amateurs in arranging their beds.

12 Fine show varieties	12 0
12 Extra do.	16 0
12 Ditto, ditto, very superior	21 0

The selection being left to YOUELL & CO.

FUCHSIA ST. CLARE.

This magnificent Fuchsia was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last, it was submitted to Dr. Lindley for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month, as follows:—"Your seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

Messrs. YOUELL, in bringing this beautiful production into public notice, do so without the slightest diffidence, being fully assured of its giving the most entire satisfaction. It is of vigorous habit, fine foliage; and as a proof of its being a profuse bloomer, they have a plant in flower at the present time (September 15th) on one branch of which there are upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower-garden. YOUELL & Co. are now sending it out at 10s. 6d. per plant, free of postage, to any part of the United Kingdom; and all orders they may be favoured with will be executed in rotation. Orders for the Continent will receive every care in packing, so as to insure their safety. The usual discount to the trade, when not less than six plants are ordered.

Messrs. YOUELL have also much pleasure in announcing, that they are in possession of the entire stock of two beautiful new Verbenas, raised by Mr. Edmonds, gardener to John Lacon, Esq., of Ormesby Hall, which were kindly presented them by that gentleman,—the one named "Laconi," is a fine blue, delightfully fragrant, of vigorous but compact habit, and the heads of flowers measuring upwards of 3½ inches in diameter. The other, named "Princess Royal," is of the purest snowy white, the flowers remarkably large, and extremely fragrant; nothing can exceed the purity of the white in this beautiful variety, and it possesses that acquisition not to be found in any of its class—of retaining its clear white during fading. It would be as well to remark, that the petals of the flowers of the above meet so closely as to form a perfect ball. They are ready for sending out by post (free to any part of the United Kingdom, at 5s. 6d. per plant).

P.S.—Their Catalogue of Fuchsias may be had on application, and will be found to contain every variety worthy of cultivation.

Great Yarmouth Nursery, April 26, 1843.

JOHN MILNE begs respectfully to offer to the Nobility, Gentry, and Public the following plants:—

A fine specimen of *Araucaria excelsa*, in pot, standing 8 ft. high, probably one of the finest in England, for sale, price 25l.

Ditto, 5 ft. high, 10l.

Five specimens of *Rhododendron arboreum* (true), 8 ft. high, each, 7l. 7s.

album, 10s. 6d. to 20s. each.

Two very large *Bonapartia juncea*, 4l. 4s. each.

Lilium lancifolium album, 5s.; Do. do. punctatum, 7s. 6d. each.

Rosa Devonensis, 2s. 6d. each.

A fine collection of *Azalea sinensis*, Camellias, Pelargoniums, Lilies, Epacris, Gesneras, Gloxinias, Achimenes, &c. &c.

Likewise a general collection of Greenhouse, Herbaceous, and Rock plants, too numerous to insert. J. M. can also spare 100 fine large plants of *Andromeda floribunda*, 10s. 6d. and 12s. 6d. each.

PLANTS FOR BEDDING OUT.

Alstroemeria, 6 varieties, s. d.

each 1s. to 1 6

Bouvardia triphylla 1 6

Calceolaria, 12 vars., p. doz. 9 0

Campanula grandis, each 1 6

Catananche, 2 vars., each 0 9

Chelone barbata, per doz. 6 0

Fuchsia, 25 varieties of the newest and most approved sorts, large plants, per doz. 12 0

Do. co. smaller, per doz. 9 0

Fuchsia fulgens, 2 varieties, per doz. 9s., each 1 0

Gentiana, 5 vars., per doz. 6 0

Pelargonium, scarlet and striped vars., p. doz., 4s. to 6 0

Heliotropium, p. doz., 4s. to 6 0

Lantana Sellowii, p. doz. 9 0

Lilium eximium, each 1 6

" longiflorum 1 6

Linum, 4 vars., per doz. 6 0

Lobelia, 6 vars., per doz. 6 0

Lychnis Bungeana, each 1 0

" coronata 1 0

CREEPERS FOR PLANTING OUT.

Aristolochia siphocampylus, each 1 6

Atragene austriaca 1 6

Bignonia capreolata 1 6

" radicans (superb) 1 6

Ceanothus azureus and pallidus 1 0

Clematis azurea grandiflora 2 6

" double purple 1 0

" florida, single 1 0

" double 1 6

" montana 1 6

" Sieboldi 1 6

Cobaea scandens, per doz. 6 0

Eccremocarpus scaber, each 1 0

Glycine frutescens 1 6

" sinensis 1 6

Holcus scaberrimus, in 6 vars., 0 9

Roses, large plants, each 1 6

The above plants are all in pots; and a general supply may be had throughout the season.

N.B.—Plants for Bedding or Creepers ordered to the amount of 20s. will be forwarded to any part of London carriage free: a reference or Post-office order will be required of correspondents.—Albion Nursery, Stoke Newington, Middlesex.

CONWAY'S GIANT CACTUS, considered by Dr. LINDLEY by far the handsomest yet raised. A few strong plants still on hand, at 2 guineas each.

CONWAY'S NEW PELARGONIUM LANEI, undoubtedly the best yet raised for forcing; specimens exhibited at the Horticultural Rooms, Regent street, during the winter and spring; and magnificent plants now in flower, at the Nursery, Old Brompton-road. Plants, 7s. 6d. each. The usual allowance to the trade if two or more plants are taken.—April 28, 1843.

NEW AND CHOICE DAHLIAS AND FUCHSIAS, by F. & A. SMITH & Co., Florists, &c., Hackney, London. For May, 1843. NEW AND SUPERB SEEDLING DAHLIAS.

BIANCA, Wildman, pure white, cup petals, large size, the centre well up, very deep flower (having from 25 to 30 rows of petals), first-rate form, of excellent habit, and very free bloomer; has obtained four prizes, and was pronounced a first-class flower by the Horticultural Society of London. 4 ft.—10s. 6d.

DUKE OF WELLINGTON, Smith, rich scarlet crimson, fine cup petals, the centre well up, of great depth and substance, a first-rate flower, a very profuse bloomer, and quite new in colour; obtained a prize at the South Essex Show in Sept. 4 ft.—10s. 6d.

GENERAL SIR R. SALE, Smith, crimson purple, cup petals, well up in the eye, of good size, and great depth of petals, very profuse and constant bloomer, with long, upright foot-stalks, and is considered by competent judges the best flower of its colour yet offered to the public. It was pronounced a first-class flower by the Horticultural Society of London, Aug. 16, 1842, obtained a prize at Salisbury Plain, Aug. 31; a prize at South Essex, Sept. 8; a prize at Kingston, Sept. 15; a prize at Salt Hill, Sept. 16; a prize at Victoria Gardens, Steyne, Sept. 19; a prize at the Horticultural Society of London, Sept. 20; a prize at Sunbury, Sept. 22; a prize at Hammersmith, Sept. 27. 4 ft.—10s. 6d.

RIVAL YELLOW, Smith, deep golden yellow, fine cup petals, of great substance and depth, centre well up, of excellent form, very constant, and good habit. This Dahlia is warranted the best of its colour yet offered to the public. As the stock is very limited, early application is necessary to secure plants, many orders having already been received. No allowance on this variety. 4 ft.—10s.

RAINBOW, Smith, yellow, beautifully edged with rosy purple, of good form, very constant, free bloomer, and excellent habit, the flowers have long, straight footstalks; quite a new and distinct variety from any other in cultivation. The form of this flower improves as the season advances, sufficient to constitute it a show flower. 4 ft.—10s. 6d.

AMERICA, Drummonds', s. d. the centre well up, and s. d. fine purple, 4 ft. high. 2 6 of good habit. 4 ft. 10 6

Admiral Stoford, Trenchard, fine dark 4 ft. 3 6

Attila, Whale, light rose shaded 4 ft. 1 6

Alba purpurea superba, Bates, purple tipped with white 4 ft. 2 6

Alecia, Burdon, white tipped with bright crimson, fine form, 2 ft. 10 6

Beatrice Surprise, Shepherd, shaded purple, fine form 4 ft. 3 6

Beauty of Wakefield, white, edged with purple, 4 ft. 1 6

British Queen, Back, shaded bronze 3 ft. 2 6

Bride, Fawcett's, blush, tipped with rose, 3 ft. 1 6

Belsize Rival, Pipe, rosy blush, cup petals, very constant, of good form and habit 4 ft. 10 6

Blue hand, Brown, white and lavender 3 ft. 1 6

Burniana Hero, Coker, crimson red 4 ft. 1 6

Blanche Shelley, Mitchell, white, tipped with purple, good form, 3 ft. 10 6

Beauty of Sussex, Mitchell, pink, deeply edged with carmine 4 ft. 10 6

Conqueror of the Plain, spary, maroon, fine form 5 ft. 1 6

Compakta, Gaines, maroon 4 ft. 1 6

Candidate, Silverlock, dk. purple 1 ft. 1 6

Cyclops, Neville, dk. shaded with light crimson, 4 feet 2 6

Coronation, Smith, rosy scarlet 4 ft. 3 6

Coronation, Harrison, crimson shaded with purple 3 ft. 2 6

Confidence, Cook, shaded orange, good form, very constant 4 ft. 7 6

Competitor, Hodges, rose-shaded, fine form, 4 ft. 5 0

Duke of Cornwall, Low, bright rosy salmon, 4 ft. 2 6

Dweller Lady Cooper, Jackson, rose, fine form, 4 ft. 1 6

Eclipse, Catteugh, vermilion scarlet 4 ft. 1 6

Eden, Widnall, deep scarlet 5 ft. 1 6

Eudora, Ward, shaded purple 4 ft. 1 6

Empress of Whites, G. Smith, white, good form, very dwarf grower, 2 ft. 10 6

F. & A. Smith & Co.'s List of Superb Seedling Dahlias continued.

Princess Royal, Hudson, s. d. buff, tipped rose, 4 ft. 2 6

Princess Royal, Horwood, primrose 4 ft. 1 6

Princess Royal, Thomson, bright orange, tipped & edged with red 4 ft. 2 6

Phoenix, Hedley, scarlet, 3 ft. 2 6

Ploughboy, purple, large, and of good form, 4 ft. 2 6

Purpurea alba, Harris, purple with white stripe, 4 ft. 1 6

Queen of Lilacs, Appleby, deep lilac 5 ft. 1 6

Queen of the Isles, Low, white edged crimson, 3 ft. 10 6

Retriever, ruby crimson, fine form 4 ft. 10 6

Rose Unique, Ansell, rosy purple, fine form, 4 ft. 2 6

Stanley, Jones, blush tinted rose, fine form, 3 ft. 3 6

Sir F. Johnstone, Hellier, purple, good form, 3 ft. 2 6

Sultana, Appleby, deep maroon, sometimes striped with light purple 3 ft. 2 6

Collections of the above, if left to F. & A. S. & Co., from 6s. to 12s. per dozen.

VERBENA.

Speciosa, Kyle, bright vermilion, with blush or rosy eye, large trusses and very free bloomer, of strong upright growth. It obtained a certificate of merit at the exhibition of the Horticultural Society of London, July 9, 1842; in the *Gardeners' Chronicle*, page 425, the Editor's opinion is that the *Verbena* is handsome and very brilliant, and is, without doubt, a good variety; plants in May. 5s.

NEW DAHLIA, THE "UXBRIDGE RIVAL."

JAMES HOW, the fortunate raiser of KING'S "Grand Turk," CATTEUGH'S "Eclipse and Magnet," ATTWELL'S "Frederick the Great and Venus," now offers with the utmost confidence his "Uxbridge Rival," a Dahlia of first-rate pretensions, colour dark maroon, full size, great depth of smooth-edged stiff petals, fine rising centre, shape globular, habit splendid, 4 ft. Plants, May 16th, 10s. 6d., to be of J. How, Uxbridge; or, BROWN and ATTWELL, Uxbridge Nursery.

BROWN and ATTWELL'S Dahlia Catalogue can be had on application.

FUCHSIA MAJESTICA MULTIFLORA, and **MULTIFLORA COCCINEA**.—B. W. KNIGHT, Florist, begs to say he is now sending out the above magnificent Fuchsias at 7s. 6d. each, by post, prepaid, on receiving the amount with the order, also the following superb Dahlias: MILLER'S WINDMILL HILL HERO, and VAN AMBURGH, 10s. 6d. each, and KNIGHT'S SOUTHERN BEAUTY, 5s. for description, see advertisement of the 15th April. Also 12 superb seedling Pansies for 50s. B. W. K.'s list of Dahlias, Pelargoniums, Fuchsias, Verbenas, Pansies, Cinerarias, Phloxes, &c. may be had on application prepaid, which contains a description of the above. Superb Verbenas and Fuchsias, consisting of the best kinds, in tin cases, per post, Verbenas at 3s. 6s., and 12s. per dozen; Fuchsias at 6s., 10s. 6d., and 15s. per dozen. Agents in London, Mr. H. CLARKE, 86, High-st., Borough, and Messrs. W. and J. NOBLE, 152, Fleet-street.

Tivoli Nursery, near St. Leonard's on Sea, Sussex, April 26.

SEEDLING DAHLIA—DEWAR'S IMOGENE.—A beautiful bright lilac, fine cupped petals, good outline, and rises well in the centre, a most abundant bloomer, and very constant; flowers well above the foliage, on stiff foot stalks, height from 3 to 4 ft. It took prizes at the following shows:—1st, at the Great North of England, 8th Sept., 1841; first-class prize at Hexham, 3 blooms, 13th Sept., 1842; first class at the North of England, 12 blooms, 21st Sept.; first prize at Durham, 21st Sept.; first prize at Morpeth, 9 blooms, 22d Sept. It also obtained a prize at York, 28th Sept. In class showing it was placed first at Hexham and the North of England Shows, as being the best lilac. It was also placed as a first-class flower by the board of the Hexham Floral Society on the 7th Sept. Very fine plants are now ready to send out at 10s. 6d. each, and may be had of Mr. H. NEWTON, Nurseryman, Newcastle; Messrs. RONALDS, Nurserymen, Brentford; W. J. HARRISON, York; and H. DEWAR, Jesmond, Newcastle-on-Tyne.

SUPERB CARNATIONS AND PICOTEEES.

YOUELL & CO. have a few more Pairs to spare of that superb Rose Flake Carnation, WILSON'S HARRIET, and JOAN OF ARC, Red Picotee, for 15s., package, &c. included. The following are the prices from YOUELL & Co.'s extensive Collection, consisting of upwards of 800 varieties, of the most select sorts:—

25 Pairs of extra-fine and first-rate show-flowers	5 0 0
12 Do. Do.	2 10 0
12 Do., very fine	3 0 0
12 Do. Do.	1 10 0
12 Do., extra fine, and show Pinks	0 12 0

The selection being left to YOUELL & Co.
ARAUCARIA IMBRICATA.—Fine strong Plants, 8 inches high, 60s. per dozen; 10 inches, 94s.; 1 ft., extra fine, 21s. per plant. 30 packets of select flower seeds, 8s., sent free of postage. Great Yarmouth Nursery, Norfolk.

FUCHSIA BROCKMANII.—A few Plants of this fine variety may still be obtained upon application to the Raiser, Mr. PADDEN, Gardener, Beachborough, Hythe, Kent.

IN consequence of the numerous and liberal Orders received for FUCHSIA TODDIANA, no more than those already ordered can be promised before the 10th of May.—THOMAS CRIPPS, Tunbridge Wells Nursery, April 27.

PELARGONIUMS, AURICULAS, CARNATIONS, PICOTEEES, and SELECT PLANTS.

H. GROOM, Clapham-Rise, near London (removed from Walworth), by appointment Florist to Her Majesty, begs to inform the Nobility, Gentry, and Public, that his Catalogue of new and fine PELARGONIUMS, &c., is ready, and may be had on application.

WILLIAM WOOD AND SON have now commenced sending out their MAGNIFICENT NEW VERBENA "PRINCE OF WALES," for description of which, see *Gardeners' Chronicle* of the 22d of April, and have also ready for delivery at the same time, the following SELECT PLANTS.

Antirrhinum, 6 vars., each	0 6	Ipomoea bicolor	1 0
Achimenes longiflora	1 6	Kennedy, 6 vars., 1s. to	1 6
Azalea indica, 8 vars.	1 0	Lantana Selowii, per doz.	6 0

Ipomoea Learii	1 0		

Pelargonium Lady Webster, 21s. each.
Azalea indica Jennerii 21s. each.
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

HUGH LOW AND CO. have for Sale the following

Plants, which are all well deserving of cultivation:—
Achimenes grandiflora, very large, beautiful pink, s. d. small plants, each 15 0
Achimenes pedunculata (see Bot. Register) small plants, each 10 6
Achimenes rosea (see Bot. Register), each 2 6
" longiflora (see Paxton's Mag. of Bot.), each 2 6
Bridgesia spicata, new climber from Chile, each 7 6
Campanula grandis, each 1 6
Gesneria zebрина, strong tubers, each 2 6
Gloxinia macrophylla variegata, from Brazil 5 0
" speciosa, var. from Brazil, each 5 0
" tubiflora, flowers 3 to 4 inches long, pure white, strong tubers 21 0
Hardenbergia macrophylla 2 6
Kennedy's Marryatta 3 6
Manettia bicolor, beautiful climber 5 0
Nyphaea oblonga, beautiful dwarf plant, resembling a Gloxinia 10 6
Pan. ovina imperialis 7 6
Physolobium carinatum, fine 5 0
Siphocampylus betulaeifolius (see Paxton's Mag. of Bot.) 7 6
Seypanthus elegans (Loasa volubilis), beautiful creeper, will continue in flower from May till December (see Sweet's Flower Garden, and Pax. Mag. of Bot.) 8 0
Statice Dickensonii 10 6
Verbena Howardiana, the finest blush rose-coloured Verbena yet out, very fragrant 3 6

A reference to some House in London will be required from unknown Correspondents. The usual Allowance to the Trade. Clapton Nursery, London, March 29, 1843.

ORANGE, LEMON, CITRON, SHADDOCK, and FORBIDDEN-FRUIT TREES.—J. BUTLER has just received from Geneva about 200 of these Trees, in excellent bearing condition, the price from 8s. upwards; also some very fine Double Italian Tuberoses. To be seen at J. BUTLER'S Italian Warehouse, 155, Regent-street, London. Genuine Seltzer Water from the Rhine, price 8s. per doz. bottles.

J. KERNAN respectfully informs Ladies and Gentlemen that he can still supply them with most of the best and newest FLOWER and VEGETABLE SEEDS recently introduced, that are worthy of cultivation. The month of May is quite time enough for sowing hardy and half-hardy Annuals, and many half-hardy Annuals if sown earlier would require a little bottom-heat, which may now be sown in the open borders, where, if kept well thinned, one plant will grow to six times the size of those raised on heat and transplanted. Ladies and Gentlemen wishing such a selection, for autumn flowering, by naming the sum to which they would wish to go, J. K. flatters himself they will have no reason to regret, either in the choice of the selection, or on the score of price. Also the 24 sorts named as a mixture by Dr. LINDLEY, as suited for en

HORTICULTURAL SOCIETY of LONDON.—Four Lectures on CHEMISTRY, in its applications to Vegetable Physiology and the Arts of Cultivation, will be delivered in the Meeting-Room of the Society by Mr. E. SOLLY, F.R.S., &c., Experimental Chemist to the Horticultural Society, on THURSDAY, the 11th, 18th, and 25th of May, and 1st of June, at Three o'clock precisely. Fellows of the Society are admitted upon signing their names; all other persons by Tickets, which may be obtained at the Office of the Society, 21, Regent-street, price 10s. 6d. for the Four Lectures. By Order of the Council.

The Gardeners' Chronicle.

SATURDAY, APRIL 29, 1843.

	Royal Botanic 1 P.M.

THE objects which Mr. Pusey's Drainage Bill proposes to effect are more especially these: 1st, To grant powers to drain; 2ndly, To enable money to be raised for drainage purposes; and 3rdly, To strengthen the existing powers for enforcing the clearance of drains and ditches. It is to the first and third of these points that we shall at present confine ourselves.

1st, *To grant powers to drain.*—This is to be entrusted to a Board of Commissioners, who are to be memorialised by persons wishing to have their land drained. The memorialist is to deposit money in their hands for defraying the expense of preliminary inquiries; then, when the matter of the memorial is approved of, he is to deposit a further sum with the Commissioners, sufficient for defraying the expenses of making further surveys, schedules, maps, plans, drawings, sections, and estimates, &c. (c. 3). If the Commissioners, after making inquiry, should decide against the prayer of the memorialist (c. 6), or if all the conditions required by the bill, after the approval of the Commissioners shall have been signified, cannot be complied with, then the money that was deposited is to be applied to the discharge of the preliminary expenses incurred; and if the expense of inquiry, &c. is greater than the deposit, then the memorialist is to be sued at law for the difference (c. 30). A meeting of all persons interested is to be convened by public notice (c. 19). A sub-commissioner is to hear objections at such meeting, may alter maps, schedules, &c. (c. 11). Then the proprietors of three-fourths in extent (net value) of the land proposed to be drained must agree to the execution of it (c. 13); and, finally, the term proprietor is declared to include all persons having any indirect interest in the property to be drained (c. 14, 15).

Unless these clauses undergo very material alteration, they can hardly fail to render the bill inoperative, for the conditions are such as few people would take the risk of fulfilling. According to this bill, a person who would have an estate drained must undertake to incur a large and indefinite expense for preliminary inquiry, and a further expense—the limits of which it is, we conceive, impossible to foresee—in satisfying three-fourths of the varied interests that will be concerned in his memorial; and then, if he fail, he is not only to lose his deposit, but to be liable to an action for all the expenses beyond it to which the Commissioners and their agents may have put him. He must be a bold man who will take such a risk: for where is the indirect interest in works of drainage to stop? In the case of mill property, the effects of any extensive works may be felt at a very considerable distance, while rivers and their tributaries, never contemplated by the memorialist, may have to be included; and all the risk and cost of securing the good-will of half a county may thus be thrown upon the person who may present the first memorial. To use the words of a correspondent, the first application bearing upon or affecting the drainage of any particular water-course, involves a consideration of the powers, uses, and abuses of the whole length of that water-course.

It is true that the memorialist is to be repaid his preliminary expenses (c. 30), if he finally triumph over all obstacles; but, what if his plan, however beneficial, fail, through the opposition of interested parties? Why, then he is to be sued for all costs, as aforesaid. That will never do.

The only practicable course, as we conceive, in the case of an application to the Commissioners, would be of this kind: let the memorialist come before the Commissioners with maps and evidence, collected at his own expense by himself, and state his case. If he make it out to the satisfaction of the Commissioners, let them at once, without further expense to the memorialist, proceed to examine the matter for themselves, employ engineers, convene meetings, settle differences, and go through all the preliminary inquiries, charging the expenses upon the

parties coming forward to oppose the proposal, if the Commissioners are of opinion that the drainage ought to be executed, or proportionately upon all to be benefited by it, or merging it in the general expense of the drainage to be afterwards executed under their superintendence. We perceive no real difficulty in this; for the preliminary examination of a memorialist's case might be as searching as the Commissioners should think necessary. In the event of the drainage being decided against, after the hearing of interested parties, then the costs would have to be paid out of the funds to be provided for defraying the expenses of the Commission. Should frivolous memorials be apprehended, provided our suggestion were adopted, they might be prevented by requiring the memorialist to deposit a fixed sum (say 100*l.*) in the hands of the Commissioners prior to their proceeding in the inquiry, such sum to be forfeited in the event of the final decision of the Commissioners being adverse to the memorialist.

At all events, it appears to us indispensable that the complicated machinery to be put in action by this Bill, before any work of drainage can be commenced, should be worked and paid for by the Commissioners themselves, and not by the memorialists.

3dly, *To strengthen the existing powers for enforcing the clearance of drains and ditches.*—This is a point of no little practical importance, without the ready settlement of which any general drainage bill must lose much of its value. Mr. Pusey proposes that when an occupier refuses to clear out his ditches, it shall be lawful for the proprietor injured by such refusal, after 14 days' notice, to cleanse them at his own expense, and then to recover the amount so expended by suing the recusant before the Quarter Sessions. This seems to us an arrangement which can be productive of little real utility. People are not willing to bring actions against their neighbours; or if they are willing, they will be deterred from doing so by the uncertainty of the law, and the doubt they may reasonably entertain as to their power of satisfying a jury, who have not seen the ground, whether the cleansing the drains was necessary or not. We would submit that a far better mode of proceeding would be to authorize an appeal to a district surveyor, who should have power to summon a jury to view the drains, and to decide whether they require cleansing or not; their decision to be final. The expense of such a proceeding might be made to fall on whichever party failed in his appeal; the appellant paying if the jury decided against him, the respondent in the opposite case. We confess that we have a great aversion to law; and we are persuaded that a clause embodying such powers as those we have now mentioned, would be far more agreeable to the country than cleaning out ditches without authority, or suits at Quarter Sessions to recover expenses, and all the vexatious consequences to which such proceedings would inevitably give rise.

With respect to the power of raising money for the purposes of drainage, we have some observations in type which want of room compels us to defer till next week.

"My opinion," says a correspondent, "is, that large pots cannot be safely recommended in preference to small, except under certain conditions." As the reasons assigned for this opinion are different from those of "Observer," we print the writer's reasons *verbatim*.

"If large pots are employed, they must be filled with turfy soil, or with such other substances as will prevent the mass from becoming too compact. But some plants with delicate roots require a finer composition, others a compost rich with dung. Soils that will remain sufficiently open in a bed, or in a quarter of a kitchen garden, will nevertheless become too compact when employed in a pot. All soils, of which the particles have a greater degree of cohesion with each other than exists between them and the sides of the pot, will collapse, and become more compact than if they formed part of an extended mass. The inertia of a large mass prevents the portion at the circumference from being drawn towards the centre. If a

be the centre of a plot of ground in which a pot is plunged, filled with the soil of the same plot, the potted soil will be found more compact than it would have been had it not been inclosed by the sides of the pot: for, although the particles *b b* might tend to collapse toward *a*, yet they are equally drawn in a contrary

direction, in consequence of the adhesive force exerted by particles exterior to them, as at *c c c*. On this principle, the smoother the pot the more will the soil collapse.

"It was above stated to the effect that the inertia of a large broad mass prevents the portion near the outside from being drawn towards the centre, and it may therefore be said that, the larger the pot, the less will be the tendency of the soil which it contains to

become compact. This is in some degree the case; for if room could be found to admit of pots or boxes being made large enough, the soil contained would be in much the same condition as if lying in a bed or quarter of the open ground. But a collection of plants would occupy too much room, and would not be portable if grown in such large masses of soil. This, however, is not exactly to the point in question. A more important consideration is the fact, that before the roots could reach the outside, the soil there would have become wasted; all the particles in its composition that are readily miscible with water would be washed down, and the compost would not be in so good a state for supplying the plant with nourishment as when first prepared. If a Gooseberry-tree is planted in rich ground, and allowed to grow in the same place, the soil being undisturbed for many years, it does not produce fruit so large as that obtained by yearly trenching and otherwise preparing fresh soil immediately in advance of the roots, as is done by the prize-growers. So also by frequent shifting, and thus affording progressively a fresh supply of nourishment, a Vine in a pot, which had been struck from an eye, was grown by Mr. John Wilson, Gardener, at Millichope, to the length of 40 feet in the same season in which the eye was put in.

"It is true that although nutritive portions may be washed down, or otherwise changed, and although these may be again supplied artificially, yet the medium in which they are deposited, the bulk of the soil, is the same as it was when first introduced. It is doubtful, however, if what can be done in this way will equal the effect produced by a supply of fresh prepared soil. Turning up the soil has the mechanical effect of rendering it fit for the easy progress of roots, in quest of food; but it has probably others of a chemical nature of still greater importance. Principles that are lying quiet in a heap of compost or manure are roused into powerful activity when disturbed by turning the heap. Woody fibre that was previously suffering but little change is then soon broken up, in consequence of being subjected to the decomposing effects of fermentation. What takes place when a piece of ground is dug or trenched is not so evident; but doubtless something analogous does ensue. Portions of soil containing different substances that were before separated are brought into contact. Few soils are so homogeneous as not to contain different principles, the contact of which will occasion some degree of chemical action; and the result of such action plants seem not to fail in turning to good account."

The objections here taken by our new correspondent amount to this:—1st, That the soil on the outside of the pot will be exhausted by frequent watering before the roots can reach it. 2nd, That the system of shifting in pot-cultivation has some relation to that of digging in the open border, and is equally necessary. Both these difficulties may, we think, be easily answered. In the first place, the objections apply rather to cases where plants are never shifted than to such as we have contemplated; but it is not fair to argue against a thing from its possible abuse. If a plant in the open ground never has the ground about it disturbed, it will grow more slowly than if it has the advantage of occasional digging; and so, no doubt, it is with plants in pots. They will require to have the soil occasionally stirred and renewed: but that is quite different from the system of continual shifting from one pot into another a size larger, to which we and others so much object. Undoubtedly, the watering which is required by plants in pots will have a tendency—a great tendency—to remove from the outside of the ball the nutritious elements of the soil; but how much more must this be the case in small pots than in large ones? In fact, it is in part because that loss is diminished that we regard permanent large pots better than small ones used for a short time only. If the pots are sufficiently large, it will be long before the roots can reach that part which is impoverished by the washing away of soluble materials. When the roots in large pots shall have reached the outside, it will then be necessary, no doubt, to transfer the plants to still larger.

In conclusion, we may once for all point to what has been done, instead of speculating on what may be effected. The admirable specimen of the *larger bearded Heath*, exhibited at the last meeting of the Horticultural Society in Regent-street, from the garden of Lady Antrobus; and another of the *Transparent Heath*, shown on the same occasion, from Ealing Park, were grown without continual shifting, and were faultless.

We must still contend that the only real objection to the "one-shift" system is that it is too favourable for growth, and renders plants inconveniently large for most people's space and means.

CAPE BULBS.

Brunsvigia (Amaryllis) *Josephine* and *multiflora*, and *Ammocharis falcata*.

The proper treatment of these bulbs is a subject of frequent inquiry in the *Gardeners' Chronicle*, and the

invariable answer is, as in the *Chronicle* of Saturday last, that they require or will succeed best in a stove. It would be satisfactory if the person who gives that advice would say how many bulbs he possesses—how many years he has cultivated the plants, and how often during those years his several bulbs have flowered. I have made many inquiries among gardeners, and have seen many dozens of bulbs, but I never yet met with any one who had been able to flower them in the manner recommended; and I have known bulbs of both species cultivated in that manner for upwards of 20 years without producing flower.

Five or six years ago I received from the Cape a large box, containing, among others, six large bulbs of each of these species. I grew them for the first year in stove heat, and having more than I wanted, afterwards gave away three of each species. Anxious to see the flowers of those I retained, I requested the advice of the Rev. W. Herbert, now Dean of Manchester, as to their treatment, and following that advice, I had the satisfaction, within 18 months, of seeing flowers on one bulb of *A. Josephine* and one of *B. multiflora*; and one or other of my bulbs has since flowered every year, though two out of the six, one of each species, have been accidentally injured, and therefore do not flower. I reckon, therefore, upon being able to flower *A. Josephine* and *B. multiflora* every alternate year. If your correspondent who recommends the stove can do better, I shall be glad to have the precise details of his treatment. The management I have pursued under the instruction of Mr. Herbert is as follows:—

The bulbs are planted in sandy loam, in pots called 16s, well drained. In September, when they begin to grow, they are placed in a light situation in a light greenhouse. Here they remain till April or May, the thermometer during that period frequently being as low as 35°, and the greenhouse being habitually kept as cool as is consistent with the health of the hardest greenhouse plants; during this period they receive a moderate supply of water; about the beginning of May they are removed to a span-roofed pit, made for Cape bulbs, and a pan of sand is placed under each; this sand is kept constantly wet, and as the lights are never removed in summer, the thermometer ranges up to 130° in hot and bright weather. About the end of August or the beginning of September, the flower-buds appear and rise rapidly. I have had *Amaryllis Josephine* with a head of flowers 3 feet 3 inches in diameter, that is to say, nearly 10 feet in circumference. Under the like treatment a Cape imported variety of *Amaryllis Belladonna*, very high coloured and very fragrant, sent by Villet under the name of *A. longiflora*, flowers annually; and the affinity in constitution between *A. Josephine* and this species is very obvious.

Brunsvigia (Ammocharis) falcata is a plant of very different habits, and I have never succeeded in inducing it to flower. It rests in winter, not in summer, and appears to flower, from the figure in the Botanical Cabinet, No. 745, during its season of growth. I have never met with any one who cultivated it successfully, and I believe the Dean of Manchester and the Messrs. Loddiges are the only persons in England who have induced it to flower. The latter expressly state that the individual which flowered with them was cultivated in the greenhouse.

I ought to add that *Amaryllis Josephine* is planted at least half out of the ground; but *Brunsvigia multiflora* is covered up to the throat, and will not flourish if planted above ground.—*J. Rogers.*

ON THE CULTURE OF PERSIAN MELONS.

It can scarcely be denied that Persian Melons, when grown in full perfection, are far superior in flavour to the other kinds usually cultivated; yet it is seldom that we meet with the former, and still less frequently do we find them partaking of that rich and delicious flavour which is their peculiar characteristic. This arises in a great measure from their being treated in every respect like the more common kinds, whereas their very failure under such treatment is sufficient to show that they require a different system of management. The principal causes of want of success undoubtedly arise from a desire to obtain too great a quantity of fruit from a given space, and from an insufficiency of foliage being left upon the plants to elaborate the juices necessary to nourish and perfect fruit of so large a size as the generality of Persian Melons usually attain.

The late Mr. Knight, who is well known to have been a successful cultivator of this delicious fruit, has in the Horticultural Society's Transactions thus described his Melon-house and mode of treatment:—

"Having during several years observed that fine Persian Melons were preferred at my table to almost every other fruit, I was led to erect a small forcing-house for the almost exclusive culture of them by means of heat obtained from fire only, under an impression that in some seasons the power of commanding a dry atmosphere and high temperature would prove highly beneficial to the quality of the fruit. This forcing-house consists of a back wall nearly 9 feet high, and a front wall nearly 6 feet high, inclosing a horizontal space 9 feet wide by 30 feet long. The fire-place is at the east end, very near the front wall, and the flue runs to the other end of the house within 4 inches of the front wall, and returns back again, leaving a space of 8 inches only between the advancing and returning course of it. The front flue is composed of bricks laid flat, as I wished to have a temperate permanent heat, and the returning flue of bricks standing on their edges; the intervening space between the flues being filled with fragments of broken bricks, which absorb much water, and gradually give out moisture to the air of the house. Air is admitted through apertures in the front wall, 4 inches wide and 3 inches in height, situated level with the top of the flues, and 18 inches distant from each

other. The air escapes through similar apertures near the top of the back wall, which are opened or closed as circumstances may require. Thirty-two pots, each 16 inches wide and 14 inches deep, are placed upon the flues described above; but they are raised by an intervening piece of stone and brick out of actual contact with the flues. Into each of these pots one Melon plant is put, which in its subsequent growth is trained upon a trellis 14 inches distant from the glass: and each plant is permitted to bear one Melon only. Each might be made to bear more, but if the fruit should be as large as Ispahan Melons are when perfect, they would certainly be of inferior quality. The height from the ground at which the trellis is placed is such that I can with convenience walk under it, and discover the first appearance of red spiders or other noxious insects."

In the destruction of the red spider, Mr. Knight found sulphur applied to the under surface of the leaves, in the manner recommended at p. 164, 1841, more efficacious and less injurious to the plants than syringing them with water, which produced the most disastrous effects—upon one occasion destroying his crop of fruit. When spread or painted upon the flues, sulphur is more liable to be prejudicial to the plants, and to deteriorate the quality of the fruit. Care must, however, be taken for several days after the application of sulphur to the leaves, that the plants are partially shaded, and that the temperature of the house is not allowed to rise too high in bright sunshine. For this reason it is best, whenever practicable, to apply it in dull weather.

Many persons will no doubt say that it is not in their power to erect or devote a house exclusively to the culture of Persian Melons; and that consequently they must be debarred from making the attempt. I doubt not, however, that equal success would attend their cultivation in ordinary pits, if the principal points adverted to in Mr. Knight's account, as well as of their condition in their native country were attended to. In Persia the plants luxuriate in a high temperature, a dry atmosphere, and a humid soil; their aim should therefore be to obtain for them these three essential requisites. These would probably be attained by growing the plants in a hot-water pit, having a wire trellis about 9 inches distant from the glass, the interior being filled with tree-leaves, into which the pots, each containing one plant, should be plunged up to the rims. The roots would thus be kept in a more equable state with regard to heat and moisture; and by enlarging the apertures at the bottoms of the pots, they would, after filling the interior, be allowed free liberty to range in search of that humidity which is so essential in their native climate.

As it is only during one portion of the year that we can, in this country, ensure a sufficiency of light—one of the most essential points in the culture of Melons,—it is highly important that the plants should be brought forward early in the season, in order that they may be ready for planting out finally in pots towards the end of April. The plants and fruit will then be in a condition to receive the greatest possible amount of light, at a time when it will be most beneficial to them.

The soil in which they should be potted should consist of two-thirds of mellow hazel-loam, and one-third well-decomposed cow-manure and leaf-mould. The pots should be well drained, first with broken potsherds and afterwards with rough pieces of turf; and the soil should on no account be sifted, but be prepared roughly by hand.

Each plant should be trained up with a single stem until it reaches the trellis, before it is stopped; it should then be allowed to branch out in the same manner as Cucumber plants grown upon the same system. It should be borne in mind that the larger the extent of foliage exposed to light, provided that the foliage is in a healthy condition, the greater probability there will be of obtaining fine and well-flavoured fruit. The plants, while in a young state, should be frequently looked over and divested of blossoms; and not before they have acquired strength and nearly covered the allotted surface of trellis, should any fruit be allowed to set upon them. Then, however, three of the finest should be selected, and by the time that they become as large as pigeons' eggs it will be seen which of the three is likely to prove the largest; that should accordingly be chosen and the two others cut away, as one good fruit will be quite sufficient for each plant to bring to perfection.

A plentiful supply of moisture should be given to the roots, but none over the foliage, except in the form of vapour. When the weather has been dull for several successive days, the plants should not be exposed too suddenly to the direct influence of the sun's rays; at all other periods it is better to give a greater supply of air than to shade the plants. The interior of the pit should be kept as nearly as possible of uniform humidity; for if allowed to become too damp the stems will be liable to canker, and if too dry it will favour the increase of the red spider.—*R. A.*

ON VEGETABLE MANURES.

By PROFESSOR CHARLES SPRENGEL. (Translated from the German.)

(Continued from page 263.)

4. *The Leaves of Coniferous and other Trees.*—Dry leaves are, in many parts of Germany, the only litter used. In order to judge properly of the value of leaf-dung, it is desirable to know the constituent parts as correctly as those of the different sorts of straw.

Leaves are valuable to the agriculturist chiefly because they are much more rich in mineral substances than the different sorts of straw. The quantity, however, of mineral matter differs much in different sorts of foliage, on which account, they, like straw, are of a variable degree of value.

Whenever foliage is used as litter, it should always be collected immediately after it has fallen from the tree, and placed in some dry place; otherwise rain will wash out the saline parts, and so destroy much of their manuring properties.

Beech-Leaves.—100,000 parts of full-grown and air-dried leaves of the Beech contain of mineral substances:—

1.812	parts of silica
3.458	„ lime
0.407	„ magnesia
0.048	„ potash and soda (100,000 parts of young and dry foliage contain on the contrary only 2.570 (?) parts of potash and soda)
0.075	„ alumina
0.056	„ oxide of iron
0.270	„ oxide of manganese
0.129	„ sulphuric acid
0.440	„ phosphoric acid and traces of chlorine (young foliage, however, contains in 100,000 parts only 0.440 parts of chlorine)

6.695 parts of mineral substances.

Whether Beech-leaves contain much nitrogen has not yet been ascertained, but is probable; it will at any rate contain more than Rye-straw. 1,000 lbs. of the green dried leaves will certainly contain 20 lbs. of nitrogen; for the green leaves of the Oak (according to Boussingault) contain nearly 22 lbs.

Beech-leaves are, as we have seen, very rich in lime and phosphoric acid; on which account Beech-leaf manure will be especially adapted for soils which are deficient in those substances. If 3,000 lbs. of Beech-leaves (in the state of manure) are brought on one Magdeburg acre of land, the soil will obtain thereby 104 lbs. of lime and 13 to 14 lbs. of phosphoric acid, which must influence considerably all such plants as require such substances for their food. We know that 23 lbs. of sulphuric acid and 17 lbs. of lime (in the state of gypsum) will produce an extraordinary effect on that area.

As Beech-leaves do not easily decompose, it is necessary to mix them with decaying animal matter before they are brought on the land, in order to bring on fermentation, which will make them more tender and assist their decomposition. In order, indeed, to hasten their decay, it is expedient to heap them up wet before they are used as litter, because they will then heat and become soft. This will also destroy the tannin which may be in them.

Oak-Leaves.—100,000 parts of full-grown air-dried Oak leaves contain of mineral substances:—

1.515	parts of silica
2.307	„ lime
0.183	„ magnesia
0.001	„ potash and soda (100,000 parts of green leaves contain, however, 0.710 potash and soda)
0.085	„ alumina
0.024	„ oxide of iron
0.100	„ oxide of manganese
0.091	„ sulphuric acid
0.190	„ phosphoric acid and traces of chlorine.

4.496 parts of mineral substances.

Oak-leaves are less valuable than Ash-leaves for manure, because they contain, as we see, less mineral substances. With them, too, it is still more necessary they should be thoroughly rotted before being brought on the land; for they always contain tannin, which is detrimental to vegetation, and must be first destroyed.

(To be continued.)

AMATEUR'S GARDEN.—No. XVII.

PERHAPS the greatest error which we commit in the management of our Flower-gardens, is that of turning half-hardy plants out into the borders before the middle of May. In no case that I am aware of, can any advantage accrue from this practice; but it is well known that plants frequently sustain injuries which they are half the summer in recovering from. I may be told they are sooner in bloom, and this I grant, because the check they receive from the cold nights and dry parching winds, is favourable to the production of flowers;—but what is the bloom?—a few miserable spikes on a more miserable plant; and a bed not more than half furnished with foliage; in which deplorable state the plants remain, until the genial showers of June or July excite them into new growth.

If, instead of planting out thus early, we took more pains to prepare our plants and the ground properly, and if we deferred planting until the last week in May, or first week in June, at which time we might take advantage of a few dull days for the operation, we should find the plants materially benefited, and the appearance of our gardens, on the whole, signally improved. At that season we have the concurrent advantages of terrestrial heat and warm dewy evenings, which are of the greatest advantage to the development of vegetation. The preparation of plants for turning out has been adverted to in former articles; and, as a general rule, it may be stated, that no plant ought to be turned into the border, until it has been gradually prepared and inured to the open air for at least six weeks from the time it was taken from the cutting, or seed-pot.

Where beds are not stocked with spring-flowering plants, it will be of material benefit if they are dugged or forked over in the evening of warm days; by which means a considerable portion of heat will be worked into them, and the soil be brought into a state of more intimate comminution. In heavy soils, on a wet or retentive bottom, this kind of preparation is indispensable for such plants as

Lantana Sellowii and *Ruellia formosa*; and as most of the plants used for bedding out are natives of countries warmer than our own, there is no doubt but they would be benefited by the beds they are planted in receiving similar preparation.

Of the plants which require to be prepared now for autumn-flowering in the greenhouse or drawing-room, the *Chrysanthemum* is the principal one. Excellent directions for its management have been already given; but for the purposes of the Amateur, as being the least troublesome—to plant them out next month in rich soil, layer the tips of the branches in August, and pot the dwarf plants in September, as will be detailed at the proper time, is the best system of management. The *Chrysanthemum*, when properly attended to, makes an excellent covering for a low east, west, or south wall; and some of the earlier kinds will flower tolerably well on a north aspect in favourable seasons, and give, with a little protection, a good supply of flowers up to Christmas.

Propagate scarlet and other *Pelargoniums* for autumn-blooming in pots, and make a small sowing of *Primula sinensis*, for early flowering.

Rose-stocks for budding must now be looked over, and have all their superfluous branches removed; and those in pots would be benefited by being plunged in a gentle bottom-heat, to get the roots as well established as possible, before the plants are budded. The propagation of the Rose by cuttings I must defer until next week.—*W. P. Ayres.*

HOME CORRESPONDENCE.

[ERRATUM.—P. 265, col. 2, line 32 from the bottom, for "either" read "ether."]

Paulownia imperialis.—At page 212 of the *Gardeners' Chronicle* of the present year, a short notice is made of this ornamental tree, wherein it is stated that it may be propagated by cuttings, which is a fact, particularly if the young shoots are selected when they have advanced to about three or four inches in length; it may also be propagated by eyes, in the same manner as the Vine, on account of the young shoots being of large dimensions, therefore containing within themselves a sufficient quantity of organisable matter whereon to exist, whilst roots are forming to support the nascent branch; but what I would invite particular attention to, is, the manner in which it may be increased by divisions of the root, the smallest particle even having that power which very few plants possess, of generating adventitious buds. Individuals having plants in their possession in pots may easily divest them of a certain portion, selecting those of a moderate size, without the plants sustaining the least injury, provided they are repotted immediately, and placed in a shaded situation. The best time to perform the operation would be when the plants commence their vernal growth. Both eyes and roots should be potted in soil consisting of leaf-mould, peat, and sand, in equal proportions, and the pots containing them should be plunged to their rim in a dung-bed; any other fermenting material would answer the same purpose; where the atmospheric temperature averages from 75 to 80 deg., divisions of the root in particular will emit shoots at the expiration of three weeks, at the furthest. On account of the facility thus afforded, in a few years, particularly when its hardihood has been fully tested, it will rank amongst the greatest ornaments which we possess.—*George Bishop.*

Gold Fish.—Observing, in late Numbers of the *Gardeners' Chronicle* some entertaining notices of gold fish, and deeming myself a successful manager of those interesting creatures, I send some of the circumstances attending them. Five years ago I dug a tank six feet deep, twelve feet long, and six feet wide, and lined it with brick, well cemented all over. At a foot from the surface of the earth (and water) is a shelf all round, a foot wide; so that the lower five feet of the tank are, by that foot, smaller than at the surface. On that shelf are placed pots of the sweet-scented Rush, Buck-bean, and broad-leaved Water-lily. The top of the brick-work is even with the surface of the earth, and of the water, when the tank is full. A neat fancy iron palisading, about two and a half feet high, is carried all round the tank, outside the brick-work, affording room for pots of flowers, Balsams, &c., inside. The tank is situated about 10 yards in front of the house door, on an oval grass-plot, containing sundry flower-beds, or baskets, they being inclosed by movable, short, iron, basket-like fencing. The tank is thus a pleasing object from the house and grounds. It contains, I estimate, more than 2000 gallons of water. It was filled, five years ago, by a water-cask, from a neighbouring running ditch, and has never been emptied. In dry weather, six or eight casks of water are brought, to refill the loss by evaporation and absorption: this is done two or three times in the course of the summer. The tank was originally stocked with six red or gold fish, as many white or silver, and a dozen dark fish, of different sizes, from three inches to a foot long. In the second summer we observed five very small fish, less than an inch long; in the third, seven; in the fourth, five; and this spring, April, 1843, the last brood has increased to about a score, so that we have plenty of little ones. Those of the earlier broods are two, three, or four inches long. All retain their black, or dark, colour, except two, which we think are turning red. I may here remark, that all are born black, or dark; some turn red while small, others when large, others never. The red fish turn white; sometimes when small, sometimes when large, some never. Our largest red fish was dark, or black, last spring. We watched the progress of his turning, closely. White fish turn no otherwise than from a shining, healthy, to a dull, chalky colour. The tank is

now well stocked, for I have since brought half a dozen small red fish from Hungerford-market, where plenty may be had, for about 10s. a dozen. The male may be known from the female, by the back fin; in one it is a small fin, on the middle of the back; in the other it is long, reaching, lessening, to the tail. Our fish seem very healthy and happy. At one period of the year, early summer, sundry chasings of each other are observed; at first we thought them hostile, but now believe them amatory. Last summer the tank was much infested by frogs; we caught more than 40, large and small, with a hand-net, and removed them to some distance. Fearing they might destroy the spawn of the fish, or be otherwise unwelcome, I caused a slate, nine inches deep, to be carried all round, outside the railing. It is not unsightly, and has had the desired effect: one or two large frogs did, indeed, leap and creep over. A variety is observed, in some of the fish having three lobes to their tails, two being the usual portion. My tank cost me, on the whole, for digging, bricking, cementing, railing, &c., over 15l. It is a pleasing appendage to dressed grounds, near a house, affording daily amusement for half an hour, and is highly amusing to children. We occasionally take a piece of bread, which being broken over the water, brings the fish more to the surface. During winter they are seen but little; the ice is broken daily. Some of the fish die—two or three, perhaps, in a year, and sometimes float; our largest red fish did not float; he died in the third year, having showed symptoms of decay for some previous months; inactivity and transparent projections over the eyes were among them. I believe the plants before mentioned are very agreeable to the fish. Several neighbours have tanks or ponds stocked like mine, but I do not think any one, on the whole, more successful than I am.—*Suffolk.*

Saxifraga hypnoides for Edgings.—I beg leave, through the medium of your Journal, to direct attention to a very handsome hardy native plant admirably adapted for border-edging, viz., the *Saxifraga hypnoides*. My neighbour, J. Westgarth, Esq., 8, Maryfield, was the first in this quarter to apply this little plant to such a purpose. He found it growing plentifully among the rocky debris of Arthur's seat, hard by, and the idea struck him that it was well suited for an edging. He accordingly collected a few plants and made trial of it, and he found it answer the purpose so well, that he made it the subject of a communication addressed by him in April, 1842, to the Caledonian Horticultural Society. It excited some considerable attention at the time, and various gentlemen, members of the Society, visited Mr. Westgarth's grounds, and bore testimony to its excellent adaptation to the purpose to which he had applied it, though he had then cultivated the plant only for about 12 or 18 months, and of course before he had had time to test it sufficiently. Though I had heard a good deal about it, it was only within the last three or four weeks that I first examined it. Mr. W. showed it to me undressed and rough, just as it had stood the winter, and I was much struck with its beautiful uniform velvet-like outline of light but untarnished verdure. There were two edgings of it, one running parallel to, and shaded by, a south wall; the other, running parallel to the north wall, and fully exposed to the sun. Both had the same elegant, equal, unbroken surface, and though undressed since last summer, there were but few straggling shoots or tufts rising above or stretching beyond the general height or breadth. The height is not above two inches, and the breadth (I speak from observation merely), was then about eight or nine inches. I have again seen it since it was dressed, by which operation its breadth is reduced to six or seven inches, and I will venture to assert that a more elegant compact edging cannot be formed by any native plant whatever; but if so attractive now, its beauty, Mr. Westgarth mentions, is much increased when it comes into flower, which it does in May and June. The flower-stems then present an elegant radiating outline of about two inches above the foliage, densely crowned with its elegant white blossoms, delicately tipped with pink. The plant is of the easiest culture, and can be rapidly propagated by division of the roots, as well as by seeds. Mr. Westgarth very kindly supplied me liberally with both plants and seeds, and having mentioned to him that I considered the subject well worthy of being communicated to the public through your columns, he has sent me a copy of the communication made to our Caledonian Horticultural Society, to transmit herewith, together with a package of seeds, which I now beg to inclose. Mr. Westgarth has subjoined a P.S. to his communication, that he has since its date discovered from a passage in Withering, of which he had not before been aware, that the same species had before been applied to the same purpose.—*Isaac Anderson.* [The following is the account of the plant with which Mr. Westgarth has kindly supplied us]:—A few years ago I took a plant of the *Saxifraga hypnoides* from among the fragments of rock in a hollow on the south side of Arthur's seat, and put them in a shady corner of my garden. They soon covered several square feet; I then tried a few sprigs as a border-edging, placing them two or three inches asunder. In a short time they not only filled up the vacancies, but even required some paring. I was thus encouraged to extend them all along the borders, and they have turned out extremely well, flowering most abundantly, and presenting a very compact line. The last of these border-edgings was planted, I think, not above 12 or 18 months ago. They seem to require paring once in summer or autumn, and again in winter, or early in spring; and, instead of cutting them perpendicularly with a spade, I would recommend scraping off the extraneous shoots with a light weedock; at least, this mode should be followed on the side next the walk; and thus any scraggy or withered appearance after paring

is avoided. This diminutive plant forms a much more efficient edging than one would expect from seeing it in a wild state. It needs no nicety of management; on the contrary, it is very tractable, and (if I may so express myself), grateful for any little care bestowed on it. For winter, as an edging, its general hue is a refreshing green; nor has it a less pleasing appearance at times when its coral-shaped stems and leaflets are all covered with hoar frost. But it is in its greatest beauty in part of April, and in May, then exhibiting numerous white flowers, interspersed with rose-coloured buds. There is no difficulty in keeping it clear of weeds; for sods of it may, in wet weather, be turned over with the spade, and replaced without injury, after the weeds are rooted out. Again, it is so easily propagated, that little cuttings dropped or left on the border take root of themselves when the ground is moist. Lastly, this edging does not suffer much from being accidentally pressed or trod upon.—*J. Westgarth.*

Cellar for Roots.—Your correspondent "Totty," p. 245, asks for information as to the best method of constructing a root-cellar for Potatoes; I would caution him against trusting to his proposed thatch of furze, as I believe it will be a very poor defence against frost. Some five-and-twenty years ago, I was tempted, by the regular chamber-like appearance of a limestone-quarry, to use it as a winter receptacle for Potatoes. It had three sides, about seven feet deep, as smooth as a wall, and a good floor. I built an earth wall on the remaining side, of many feet in thickness, and for a roof I placed seven large waggon-loads of stubble; I deposited in it about 40 tons of Potatoes, and closed every opening as securely as possible. In the spring, on opening the repository, expecting to find my Potatoes kept in fine order, what was my disappointment at seeing the whole surface of the heap one mass of rotten Potatoes, to the depth of a foot or a foot and a half! I think not less than 10 tons were thus destroyed. I was for a time unable to account for the disaster, till one windy day, as I stood in the quarry, I felt the air coming strongly through the stubble roof, though it was several yards in thickness; the frost, of course, entered the same way, as the Potatoes were damaged on the surface of the heap only. Unless "Totty" can contrive to place a better non-conductor than furze between it and the straw thatch, such as dry sawdust, coal-ashes, or something of the kind, I fear his cellar will not be frost-proof; and I have doubts of the efficiency of double windows and doors, in keeping out severe continued frost. It does not need a very low temperature to injure the flavour of a Potato, probably not even so low as 32° Fah. I believe "Totty" will find a full description of the method of building in "Pisè," in the "Encyclopædia Britannica," or "Rees's Cyclopædia."—*Lusor.*

Insects.—The "nutritive" effects attributed by some to oils, and unguents, and tar, applied to the bark of old and sickly fruit-trees, are imaginary. The health thus restored is derived from the destruction of insects and their ova lodged in the bark, which they render diseased, and incapacitate for performing its proper functions. I know that distilled coal-tar will effectually destroy the "American blight" on the bark of Apple-trees; and I infer that the same application would prove a remedy for the "Aphides," which sometimes infest Rose-trees for a series of years. The time of application should be immediately after pruning.—*C.*

Pear-Trees.—In confirmation of the method of training my Pear-trees, noticed by you 25th March last, I now beg to inform you I have a Beurré D'Aremberg, planted, a very small tree, in 1837, which has on it 72 spikes of blossom, and a Glout Moreau, same age, with 140. Almost the whole of the blossom is on such wood as in the usual system of training and pruning would have been cut out.—*E. Corbett, Darnhall.*

Glazed Flower-pots versus porous ones.—The subject of glazed flower-pots having recently been revived in the pages of the *Chronicle*, I am desirous of offering a few arguments in its favour. There are many people who, because they have always performed certain operations after certain methods—whether founded upon rational principles or not—because "their fathers did so before them," have an aversion to the introduction of any improvement which may tend to explode the theory of their operations. This appears to be the case with those who assert that plants will not flourish in glazed pots—the fallacy of which idea there is sufficient evidence to prove. Many of your readers have no doubt noticed healthy *Pelargoniums*, *Fuchsias*, and other similar plants, in the window-conservatories of those whose limited means furnish them with no better place for their reception; and if the attention of the observer had not been entirely taken up with the luxuriance of their growth, he would have observed that many of these beautiful specimens were growing in highly glazed pots—even in China ones. Who is there that will not acknowledge these pots to have a far prettier appearance than the rough, dirty-looking porous ones? Even the half-dozen plants in the window of the humble amateur proves the theory of glazed pots to be correct. There we may behold them growing, not in ornamental China pots, but in a jug, a basin, or a tea-pot, minus a handle, a rim, or a spout. Let not those who oppose the question laugh; although mine are simple and not very philosophical arguments, they are facts not to be disputed. The comparative superiority, therefore, of glazed pots over porous ones is, that they are handsomer, and more easily cleaned; and being impervious to moisture, are, of course, considerably stronger; and with these advantages, who will object to their general use?—*Tyro.*

Thawing Plants.—I should suppose from "J. M.'s" remarks at p. 211, that he is incredulous as to what has been stated at p. 84 respecting the power which water

has of abstracting frost from plants. To substantiate his argument, he mentions that water when thrown on his Pelargoniums soon froze. I beg to state that this circumstance is, of itself, conclusive; for the water, being at 40°, although, in all probability, it might be higher in "J. M.'s" case, would be expanded until it fell to 32°, from the interchange of temperature going on in the water, air, and plants; as an example of which, let "J. M." take a cold bar of iron in his hand, and he will soon have a solution to the whole question. It is true that a degree of frost beyond what the water at 40° is capable of counteracting must be met by other means; but this does not disprove its efficacy in other cases. "J. M." might have expressed himself more to the purpose when writing about the temperature of the body of the house being higher than that near the glass. If by this he meant the sashes, he is correct; but it is very different in respect to the lights, it being the principle of heated air to ascend; the consequence of which is, that plants in the latter place are seldom frozen, if even a comparatively limited supply of fire-heat is applied. With respect to evaporation from pans of water by conduction, it is a tardy process of raising moisture compared with ebullition, without the surface exposed is great, and this is not generally applicable in connection with Apricot-trees. Even if it were so, it is probable that the evil which would result from it would counteract its good effects.—C.

Raphides.—In Lindley's Introduction to Botany, Mr. Quekett, in speaking of Raphides, mentions a conjecture that these crystals may have an important purpose to fulfil in the economy of the vegetable kingdom, by being deposits to be applied towards the skeleton of the plant as occasion may require. But these calcareous bodies being insoluble in vegetable acids, he considered it untenable. Does the discovery of Messrs. Wiegmann and Poldorff, which I lately met with in the *Gardeners' Chronicle*, make the interesting conjecture stand good? As plants are found capable of decomposing the silicates of the soil, can the same power act internally?—*Wyeside*.—[It is, we think, impossible to say to what extent the powers of vitality interfere with the rules of chemical action; and it is probable that some sorts, at least of Raphides, are soluble in vegetable acids. But upon the whole we incline to regard them as crystals thrown down in plants in consequence of their bases being in excess. The question is, however, open to investigation.]

Exhibiting Pelargoniums.—The Horticultural Society of London now offers a handsome prize for 12 new and first-rate Pelargoniums, and Amateurs may reasonably expect to find at the ensuing exhibitions specimens of the varieties which appear advertised at several guineas each, and which, if they prove equal in merit to the prices asked for them, will no doubt find numerous purchasers. It appears to me that Amateurs, like myself, in the country, will look very narrowly into the report of the exhibitions under the letter A, and will be influenced by it in their selection; so that it behoves Messrs. Gaines, Catleugh, Pamplin, and others, to show their choicest novelties. Private growers who exhibit have great advantages this season over previous ones: the gold medal for plants of moderate size leads me to hope that they will respond to the liberality of the society by producing twelve of a higher class of excellence than have hitherto appeared at these exhibitions. Many are inclined to think the committee have made a mistake in offering the best prize for the smallest plants; it lies with the exhibitors to prove that they have done wisely.—K.

Vines.—I must confess I was somewhat surprised at an article which appeared at p. 230, signed "James Roberts." It is there stated that Vines planted in 1839 are now (1843) carrying their fourth crop of fruit, and that these four crops are "not light, but heavy." It seems to me that this statement is calculated to mislead ignorant persons. Does Mr. Roberts mean that he planted young Vines, such as any one would ordinarily begin a new house with, and that these, planted in 1839, bore a "heavy" crop that year, and have continued to do so ever since? Although it may be true, I confess that I have never before heard of anything approaching to it. I cannot, therefore, forbear expressing my surprise, and wishing that Mr. Roberts would give us some idea of the peculiar treatment, by which the loss of time incurred in the erection of new Vineries may be so pleasantly avoided. If the Vines were old ones, or some that had been in bearing, and were merely removed to a fresh border, their producing fruit the same year would not be wonderful. I know that Mr. R. Crawshaw did the same thing, although his Vines were carried upwards of 100 miles. It would be as well if Mr. Roberts would favour us also with his system of spurring, by which he gets six bunches from one eye.—*A Subscriber, a Grape-grower, but no Wizard*.—[Our correspondent will find these questions fully answered in Mr. Roberts's Treatise on the Vine.]

Grafting-Wax.—I do not find, in the way I use it, any inconvenience from the stock or scion being moist. I have always applied a good deal of pressure in tying the grafts, and I found brown paper would not bear it; nor did calico or any other material answer when stretched, as the wax was injured by so doing. I therefore apply bast as usual, to tie the graft; then wrap spirally the waxed paper, cut about an inch broad, and in order to make all tight, I tie the whole round with bast. If any one should be puzzled how to make waxed brown paper a substitute for dirty clay, and at the same time bind sufficiently tight the grafts, perhaps this might not be unacceptable.—*Discipulus*.

Fruit-Trees.—The "Shade of Napoleon," now at Penryn, will feel obliged if an Amateur (who furnished an admirable Paper in your *Gardeners' Chronicle* some time ago, headed, "General Principles applicable to the Manage-

ment of Fruit-trees,") will explain what he means by the following—"As soon as the shoots intended to produce fruit-spurs or buds at their base have become furnished with five buds, the extremity may be pinched off." Now there are three buds at the base, nearly circular; does he include these three, and pinch at two buds above them, or at five buds above them?

Aucuba Japonica.—The fruit of this plant, according to Kämpfer, is a red oblong drupe, like a Laurel berry, with a white sweetish pulp, and a kernel with a bitter taste. In the abridged edition of Loudon's "Arboretum et Fruticetum Britannicum," p. 511, it is stated that only the female state of this plant is in British gardens, and that its berries, which ripen in March, have not yet been seen in England. You have also made a similar statement at p. 161 of the *Chronicle*, which induces me to send you a sketch made last season from a plant which has borne fruit at this place for several years past. The berries are considerably smaller than Kämpfer describes them to be, but in other respects they correspond with his account. The skin is red, like that of the Berberry; the flesh is dry and mealy, rather insipid, scarcely to be called sweetish, and of a yellowish white colour. The kernel is roundish oblong, tapering to both ends, and somewhat paler than the pulp. The inside is waxy, and bitter to the taste.—*Wm. B. Booth, Cardew*. [We have added a sketch of this fruit, with which we have never before been acquainted. It is all imperfect, the pericarp only being formed. The abortion of the seed, in consequence of the absence of the stamen, accounts for the fruit being so much smaller than it is described to be by Kämpfer.]

Guano.—Having noticed with some interest your valuable remarks on the cultivation of the Potato, I was last year induced to make some trials, which have resulted as follows:—

		lifted, st. lb.
1 row of each, of 140 yds. (rows 22 inches apart.)		
Common cut sets (say a Potato cut into 2 or 3, according to size)	planted in 1½ bushel gypsum	18 8
Do. do. in 9 cwt. good stable-yd. manure		58 11
Do. do. 9 lbs. guano with ½ peck charcoal		46 0
Small Potatoes, set whole	1½ bushel of gypsum	21 11
Do. do. 9 cwt. stable-yard manure		54 9
Do. do. do. mixed with		
Do. do. 1 bushel of gypsum		56 0
Small Potatoes, with all the eyes except 1 taken out, but not otherwise cut	1½ bushel of gypsum	18 2
Do. do. 9 cwt. stable-yard manure		51 5
Common cut sets, dropped into gypsum as cut	do. do. do.	60 0
Do. do. { do. do. do. mixed with 1 bushel of gypsum		59 13

The soil is light and sandy, on a gravelly bottom; and the gypsum used was calcined. The Potatoes were American Natives, planted from 10th to 15th May, and were lifted in the early part of November. The three rows where gypsum only was used in planting had twice a top-dressing with gypsum after showers of rain; they came up last, were always bad in colour, and stunted in growth. The guano row came up first, grew the most top, was best in colour, and appeared to be growing until November. There was so much top to this row, and the colour so distinct, that it might be perceived as far distant as the field could well be seen; and my impression is, that the weight of root would have been much greater if 8 inches more room had been given to the width of the row, it having been literally choked up with top. Of gypsum I used at the rate of about 3 tons per acre, costing 5/., which gave in weight of crop at about the rate of 7 tons per acre, costing 14s. 3d. per ton. Of guano and charcoal, about 4½ cwt. of the former, at 16s., and about 7 bushels of the latter, at 3s.—4l. 13s., gave 16 tons, at 5s. 10d. per ton. Of stable-yard manure, about 25 tons, at 8s.—10l.; gave 20 tons, at 10s. per ton. And where to the latter about 2 bushels of gypsum were used to cut the sets into, at an extra cost of say 3s. 6d., the weight of the crop was at the rate of about 21 tons per acre, costing 9s. 6d. per ton. The stable-yard manure was of course much more expensive to get on to the land than the guano, for which I have made no extra estimate above. These experiments, therefore, give an immense advantage in favour of guano; but whether the succeeding crop (Oats) will be equal to the stable-yard manured part remains to be seen, and is an important part of the question. Gypsum does not appear to do any good to my soil when applied as a tillage, having tried it on other crops; and I have never been able to

perceive the slightest effect from it. In sets I shall adhere to the old custom of cutting the good-sized Potatoes into two or three, according to the number of eyes and the size of the Potato. The application of dry gypsum on the cut part prevents its bleeding, and may, I think, preserve it from the attack of the worm. It neither takes up much time, nor is it costly, and I shall follow this practice in future; setting Potatoes whole, or with the eyes burnt or cut out—leaving one only, does not answer.—*One of your Readers, Cookridge, near Leeds, April 25, 1843*.

Ammoniacal Liquor.—On the 1st of May, last year, I caused two holes to be dug in a large heap of chalk, and the one was then filled with fresh Tanners' Bark, wet from the pit; the other with that tough Sea-weed which grows on the mud in Langton Harbour, which, though drier than the tan, was still moist. Both pits were now filled with strong ammoniacal liquor, and closed. On the 1st of November, both pits were opened; both appeared nearly as full of ammoniacal liquor as when first made, and the Bark and the Sea-weed were in the same state as when put in six months before.—*H. S., Bedhampton*.

Bees.—In answer to the inquiry of "a Bee-keeper," with respect to painting the interior of straw-hives, Dr. Bevan entirely disapproves of painting them either within or without. Straw hives are, in some degree, pervious, and so far as they are so, admit the escape of moisture, which constitutes one of the few advantages which they possess over wooden boxes; of this advantage painting would deprive them. The same objection will apply to coating a hive with Roman cement, as recommended by Mr. Savage, with whom, from some communications which he has received from Sir Charles Clarke, Dr. B. would be happy to open a correspondence.—*Llanferry, 17th April, 1843*.

Bees.—I perceive that "Pettigrew" has made some remarks on my communication of 18th March, respecting Bees' eggs being transmutable. I mentioned that Bees may have eggs in store that produce queens, though it is not likely. To this "P." observes, "I might have added, that the Bees could not sit upon them without hatching them." I think that the last word in my sentence shows that no addition was wanted. Bees do not hatch their young by incubation; the warmth of the hive alone brings the larvæ forth from the eggs, but if they were kept from the proper temperature, it is uncertain how long they would retain the principle of life. Hush, I think, says a whole winter, but I consider this to be very doubtful, for such tender substances would soon decay; indeed I found they did so, in one instance, in four days. "P." says one experiment will suffice to show that the change of gender takes place from something added to the eggs or grub by the Bees. If it were an egg or grub that ought to produce a male or drone Bee instead of a working one, then we might talk of changing the gender. The experiment of putting a headless swarm into an empty hive to make the Bees create a queen by changing the gender, shows, I think, that "P." does not quite understand the subject he has taken up. It would be better to study the subject seriously, and at the apiary, before pointing out "the great advantage Bee-keepers may derive from the knowledge of the transmutation of eggs." However interesting the subject may be to the curious naturalist, the practical Bee-keeper may be assured that the knowledge of it will neither add to nor diminish the produce of his hives.—*J. Wighton*.

Bees.—The effluvia arising from the dirt collected in Bee-hives during the winter having been pronounced by Bee-masters to be most prejudicial to the health of the little honey-makers, often causing destruction to the whole family, it may be worth trying the following plan as a means of clearing away the refuse, without disturbing the inmates. Let a drawer be attached to the ordinary wooden hives, (about an inch in depth,) which may be removed, when required, for the purpose of cleaning: to prevent the comb being cemented to the drawer, a light framework may be constructed and placed over it, with apertures about an inch square.—*W. W.*

FOREIGN CORRESPONDENCE.

The Niger or Quorra River.—At the entrance of this river the banks were covered with a rich vegetation, consisting of Palms and a great variety of majestic trees; but after advancing a short distance up the stream, these tribes of plants disappeared, and their places were usurped by the Mangrove. This tree covered the banks for about ten or twelve miles, after which it was accompanied by other kinds of trees and shrubs; while the Elais guineensis and a species of Areca began to be plentiful. The branches of the large trees are covered with Orchidaceæ and Ferns. Of the latter tribe, the genera Polypodium and Acrostichum predominate. As we proceeded onward, large timber-trees became more abundant, which in many instances were covered with beautiful climbing plants. The margin of the river was clothed with rank vegetation of grass; while, at intervals, near the villages, this herbage was cleared away, and the ground was found to be cultivated with Plantains, Bananas, Yams, Cassava, Ground-nuts, Goora-nuts, Eddoes, Indian Corn, Dourra, Capsicums, &c., and in many places Cocoa-nuts were plentiful. The river at this part is a comparatively narrow stream, with numerous collections of huts or villages on its banks, which are, to all appearance, densely populated by an inoffensive race of people, who flocked out in hundreds to look at the vessels belonging to the expedition. They were easily persuaded to come on board by the offer of presents. At most of these villages, the people appeared to be employed in making canoes, an operation performed by scooping out the trunk of a tree, and gradually bringing it narrower towards each end; some of these canoes we observed to be ornamented with flags.

Their arms consist of bows and arrows, guns, a few bayonets, spears, daggers, &c. The clothing worn by the lower class is nothing more than a cloth round the waist; but the chiefs and head men are distinguished by wearing a robe or dress of blue linen of native manufacture, brought from Egga and other towns situated higher up the Niger. The scene is enlivened by numerous birds, and by myriads of insects of the most gaudy colours, diversified at times by the chatter of monkeys, as they merrily leap from tree to tree. During the night, the croaking of reptiles and chirruping of insects, with the fire-fly occasionally darting across the path, serve to divert the mind of even the casual observer, and much more so that of a lover of Nature. As we approached towards Eboe, we found cultivation to be carried to a greater extent, and more especially that of Yams. At this part of the river, the Silk Cotton-tree forms a prominent feature in the vegetation. After passing Eboe, the hitherto narrow river expanded into a broad and noble stream, the banks being still beautifully wooded down to the water's edge. In several places the destruction of villages and the standing trunks of charred trees presented a melancholy example of the ravages of man. After getting about midway between Eboe and Attah, we came to a small range of hills, covered with healthy crops of Rice, Dourra, &c. The vegetation began at this part to be more scanty, and Palms were, comparatively speaking, rare to what they had previously been. We also found more traffic upon the river, many of the natives coming from the interior to the Kirree market. At this part of our journey, one or two expeditions, would frequently point to the banks, and inform us that a white man was buried there; but at this time the people of our expedition were in excellent health and spirits. After passing this range of low hills, we approached towards Attah, and in the distance before us we beheld the majestic Kong mountains, running from east to west, their summits towering to the clouds. The banks here began to be ornamented with the gigantic Baobab, or *Adansonia digitata*, used by the inhabitants on the banks of the Senegal (but I could not determine whether it was by the people up the Niger) in cases of fever, &c.; I should say not by those who live below the confluence of the Chadda and Niger; for the only answer that I could get in return to numerous inquiries respecting its properties was—No good—and a shake of the head from the informant. The beautiful *Spathodea campanulata* here grew luxuriantly; its fine habit and large terminal clusters of scarlet flowers make it a very desirable object for our large hothouses and conservatories. I believe it is in the possession of a few individuals in this country, having been raised from seeds brought home by Mr. Freeman, who gathered them when he was upon a mission to Coomassie, on the Gold Coast. Many of the villages were, at the time of our visit, under water, the people crossing from one hut to the other by means of canoes. This was more especially the case upon Lander's Island, lying opposite to Attah, the vegetation of which consisted of rank grass and a few small trees and shrubs. Water-fowl are there abundant; and I should suppose it is a place of resort for alligators, as they were seen floating past upon pieces of grass, apparently detached from the sides of the island by the strength of the current. The town of Attah lies on the right bank of the Niger, at a considerable elevation above the level of the stream. The huts are very compact and neat, presenting a pretty appearance from the river. Tobacco, of a good quality, is cultivated at this town to a great extent. On the opposite side of the river is situated the kingdom of Warpur, a fine wooded country, interspersed with cultivated grounds. Ferns and Orchidaceae were now no longer to be met with at this part of the river, and Palms were rare. As we proceeded onward, the country became more mountainous, and the scenery truly picturesque; the Niger gracefully winding its course among the hills, and the rich vegetation of its islands and fertile valleys, with the stupendous hills of Kong on the right and left, their peaks imbedded in clouds, created a sensation of pleasure too sublime to be described. Farther on, the vegetation on the sides of the mountains became limited to a few straggling shrubs, interspersed with the *Adansonia* and *Bombax*. Before arriving at the confluence, we met with a large fertile island (Beaufort Island), exhibiting a varied vegetation, amongst which was a lofty species of Fan Palm, growing to the height of fifty or sixty feet, and producing abundance of large yellow fruit. I had intended returning to this spot after the vessels left Stirling Hill, but I was prevented, by being taken with the fever soon after arriving at that point. The *Habzélia aromatica*, and a fine species of *Clerodendron*, several beautiful Leguminous plants, and a *Combretum*, ornament the water's edge, as well as a great quantity of aquatic or rather marsh plants, which had been forced from the sides of the river and were floating down with the current. As we approached towards the late town of Pundiaki, the Niger gradually began to increase in width, until at the junction of the Chadda it was not less than four miles across. On the right side it was thickly wooded down to the water's edge, which is far from being the case on the opposite side, as a large portion of the land about Pundiaki is of a poor sandy description, covered with a species of *Tephrosia*; this, with a coarse kind of grass, seems to be the only vegetation which thrives upon the plains. At the foot of the hills and by the margin of the water-courses which descend from the higher parts into the Niger, the vegetation partook of a richer character. In those situations, the *Spathodea* before mentioned flourished in profusion. The country Peach, *Sarcocœphalus esculentus*, was abundant, but it was not taken any notice of by the natives; a yellow Plum was also plentiful, which was sought after by the people as an article of food.

The ruins of Pundiaki are still standing; it appeared to have been flanked by a deep ditch, which at the time of our visit was nearly filled up. The vestiges of a rude bridge and gateway were, however, still remaining. The door or gate was thickly studded with large headed nails, greatly resembling English manufacture. The remains of the dye-works were also to be seen; this process appears to have been formerly carried on to a great extent at this town, before its inhabitants were obliged to leave it and seek protection from the predatory incursions of the Fellatas on the opposite side of the river. Towards Stirling Hill the soil improved a little, and cultivation was more extensively carried on. The greater part of King William's Mountains belong to that state. At a short distance below Stirling Hill, we came to a small village where the process of dyeing was still performed. The colouring matter which the people used was obtained from a species of *Tephrosia*. At this part, snakes of a yellowish colour and about four feet in length were numerous, as were also several kinds of lizards; and the hills formed by the termites, or white ants, were plentiful. I obtained some very good skeletons of birds and animals by breaking away the earth until I arrived at one of the chambers of these hills, where I deposited the specimen, the skeleton of which I wished to obtain, and in a short time I found that all the flesh had been eaten off. Birds were numerous; the parrots flew about in large flocks, screaming and making the most discordant noises; the Guinea fowl was plentiful, and was very destructive to the crops of Ground Nuts, Dourra, &c. Scorpions and centipedes also abounded. The river at this part was more lively, owing to the number of canoes which traded to the Rizee Market, Damuggoo, Eboe, and other towns, situated below the confluence; their cargoes consisting principally of ivory, beeswax, tobos, and blue cloths, and in some instances of slaves. Some of the canoes were laden with small but well-formed horses, which they were probably taking downward for sale. Parties of these traders would frequently approach the Amelia during the depth of night, and question us as to what we intended purchasing; but they always made us aware of their proximity by calling aloud as soon as they came within hail. At a small town on the right bank of the river, opposite to Pundiaki, the natives were in possession of some small pieces of cannon, which they frequently used to fire at intervals during the night.—J. A.

Calcutta, Jan. 27, 1843.—The Botanic Garden here is undergoing a great change under the superintendence of Mr. Griffith. The catalogue of the plants it contains is, I hear, finished; a nursery is laid out; a flower-garden is planned, and ground is trenching for the purpose of exhibiting the features of the systems of Linnæus, Jussieu, and others. As the grounds are very extensive, there is ample space for Mr. Griffith's plans, which, it is said, embrace the formation of medicinal and economical departments, neither of which at present exist. The whole number of species contained in the garden is about 3,800, which is not an advance of more than 400 since the publication of Roxburgh's *Hortus Benghalensis*. The head gardener is deranged, and a successor from Europe is talked of: if a thoroughly good man, he will be invaluable.

Frankfort, 13th April.—In my way to this place I paid a visit to the garden of Prince Salm, at Dyck, near Neuss, on the opposite side of the Rhine to Dusseldorf. There is certainly a very rich and curious collection of succulent plants there. They seem to be exceedingly well kept, and to flourish under the system of his gardener, which is, not to give much light, air, or stimulus of any sort till the summer, when they are all put out for five months. I saw the very curious *Opuntia Salmiana* in fruit. In the pleasure ground I observed growing in the turf, the first German Oxlips, *Primula elatior vera*, that I have seen on the west of the Rhine: this is also the most northern locality I know for that species. I arrived here too late for the flower-show; but I find the Azaleas, which are usually the best show-plants, suffered so from the drought of last summer, that they do not flower well this year. Three hybrid *Rhododendrons*, *Burcegrævanum*, (purple,) *Kronenbergianum* (white), and *macranthum* (pink), are fine plants. The Carmine red Azalea indica is also very handsome.—S.

PROCEEDINGS OF SOCIETIES.

BOTANICAL SOCIETY OF EDINBURGH.

This Society met on the 9th instant, Dr. Neill in the chair. Dr. Sellar was elected a resident Member. Numerous donations to the Library and Herbarium were laid on the table. The following papers were read: 1. Remarks on the Mode of Growth of the British Fruticose Rubi, &c. By Mr. E. Lees. 2. Continuation of Remarks on the Diatomaceæ. By Mr. J. Ralls, Penzance. 3. On *Fumaria micrantha* and *F. calycina*. By Mr. C. C. Babington, M.A. 4. On two new species of *Jungermannia*, and another new to Britain. By Thomas Taylor, M.D.; communicated by Mr. W. Gourlie, jun., Glasgow. 5. Notice of the new Fossil plant, *Lyginodendron Landsburgii*, Gourlie; by Mr. W. Gourlie, jun. Mr. James Macnab exhibited a magnificent cluster of the male catkins of a Palm, from one of the South Sea Islands, which Lady Hervey had obtained from the captain of a vessel, and kindly allowed to be shown to the Society. Its dimensions, when expanded, were about three feet by three feet and a half, and it somewhat resembled an ornamental grate screen formed of shavings. This being the anniversary of the Society's public institution, the members and others present adjourned, at the close of business, to the Café Royal, where they sat down to an elegant supper, Dr. Neill, the President, in the chair, supported by Sir William Jardine, Dr. Greville, Mr. Ball, of Dublin, Mr. Gourlie, of Glasgow, &c.—Professor Graham, croupier. After supper, the usual loyal and appropriate toasts were drunk, and the proceedings were farther enlivened by occasional songs.

The Botanical Society met on the 13th inst.,—Prof. Graham in the chair. Numerous donations to the Library and Herbarium were laid on the table. The attention of the Society was chiefly directed to a donation by W. Brown, Esq., R.N., consisting of a miscellaneous collection of plants and fruits from Canton River and Chusan, from the Cape and Prince's Island, including a collection of forty species of *Erica*, from Simon's Bay and Table Mountain. The following papers were read:—1. Two Botanical visits to the Reeky Linn, and Den of Airly, in April and June,

1842; by Mr. W. Gardiner, Dundee. 2. On the Diatomaceæ. No. VI. By Mr. Ralls.

COUNTRY SHOWS.

Dorking Horticultural Society, April 18.—This exhibition was held at the Red Lion Inn, and was attended by most of the gentry in the vicinity. Since the first establishment of this Society there has not been a more attractive display of beautiful flowers than the present meeting afforded: but as it would occupy too much space to particularise every plant worthy of individual notice, we shall merely observe that the collections of Greenhouse and of Miscellaneous plants, which obtained the first prizes, were worthy to form part of the unequalled Chiswick exhibitions. The other collections also contained good plants of *Tropæolums*, Indian Azaleas, *Cytisus racemosus*, &c. Some exceedingly well-grown specimens of *Cineraria* were exhibited, one of which, 'The King,' in the collection of J. B. Hankey, Esq., was a perfect specimen of culture. A very slow variety, called *Miss Hankey*, made its first appearance in public. The flowers are of great size, but starchy, resembling the Royal King in colour, but quite distinct. We observed several pretty varieties among the seedlings, but none particularly deserving of notice. Among the Heaths there were several very good plants; but, taking them as a whole, this tribe was decidedly inferior, neither were the *Hyacinths* and *Polyanthuses* equal to those of former years. The single specimens comprised a capital plant of *Isora cœcinea*, from the garden of J. B. Hankey, Esq., and another of *Tropæolum tricolor*, supporting itself on the bushy top of a young Larch-tree, from the garden of the Right Hon. H. Goulburn. *Fuchsia splendens*, from Mr. J. Gadd, and *Fuchsia cordifolia*, from the nursery of Mr. Westland, exhibited in perfection the merits of those vilified species. But the most beautiful object in the room was a plant of Smith's Scarlet Azalea, from the garden of the President of the Society, Charles Barclay, Esq., of Bury Hill. This plant trained in a natural, and therefore a pleasing form, not in the modern one, face-fashion was literally covered on all sides with its rich red blossoms. No prizes were offered for fruits or vegetables, with the exception of Cucumbers, of which a considerable number of fair quality were shown. Best Collection of 12 Plants, 1, Mr. Goodhew, gr. to J. B. Hankey, Esq.; 2, Mr. Heritage, gr. to the Right Hon. H. Goulburn; 3, Mr. Whiting, gr. to H. T. Hope, Esq. Best Collection of 6 Greenhouse Plants, 1, Mr. Scott, gr. to C. Barclay, Esq.; 2, Mr. Reid, gr. to — Smallpiece, Esq.; 3, Mr. Ivery, market-gardener, Wotton. Best Specimen Plant, 1, Mr. Goodhew; 2, Mr. Scott; 3, Mr. Heritage; 4, Mr. J. Gadd, market-gardener, Botchworth. Best Collection of 6 Heaths, 1, Mr. Scott; 2, Mr. Goodhew; 3, Mr. J. Gadd. Best Collection of 4 *Cinerarias*, 1, Mr. Goodhew; 2, Mr. Ivery; 3, Mr. Whiting; 4, Mr. Heritage. Best Seedling *Cineraria*, 1, Mr. Ivery; 2, Mr. Whiting; 3, Mr. Goodhew. Best 2 tall Cacti, 1, Mr. Heritage; 2, Mr. Scott. Best Pair of *Polyanthuses*, 1, Mr. Whiting; 2, Mr. R. Gadd, market-gardener, Dorking; 3, Mr. Heritage. Best 6 *Hyacinths*, 1, Mr. J. Gadd; 2, Mr. Whiting; 3, Mr. Heritage. Best Pair of *Auriculas*, 1, Mr. Ivery; 2, Mr. J. Gadd; 3, Mr. Scott; 4, Mr. Heritage. Best 24 Cut Flowers of *Pansies*, 1, Mr. Chandler, gr. to — Freshfield, Esq.; 2, Mr. R. Gadd; 3, Mr. Heritage; 4, Mr. Ivery. Best Brace of Cucumbers, 1, Mr. Whiting; 2, Mr. Scott; 3, Mr. J. Briggs; 4, Mr. Heritage; 5, Mr. Truelove, gr. to the Misses Carbonell. Extra prize to Mr. J. Gadd.

Ealing Cucumber Show, April 17.—This exhibition, which seems to have been got up by Mr. Mills, jun., was held at the New Inn, Ealing, and the fruit produced was of the finest quality. Eight brace were selected for competition, and the judges had a most difficult task in determining which was superior; however, it was evident that they gave the preference to size, and the prizes were awarded as follows:—1st prize, to Mr. Latter, of Ipswich; 2d, to Mr. Brown, Chiswick; 3d, to Mr. Doran, of Wandsworth. There was also some very handsome fruit that did not receive prizes, especially that of Messrs. Thomson, Weedon, and Chapman. These were finer in quality than those to which the awards were given, but not so large. The company was numerous and respectable.

Cambridgeshire Horticultural Society, April 19.—On Wednesday last this Society held their first show for the season, at the Town-hall. The display of flowers, fruit, and vegetables was extremely fine, and, for the period, respectable in quantity. There were some beautiful *Auriculas*, *Polyanthuses*, and *Primroses*, and some of the plants were very fine. Some of the vegetables were also as good as could possibly be expected. In accordance with the resolutions passed at the meeting of the Society in February, several judicious alterations in the conduct of the show have taken place, the exhibitor having now the power to claim his flowers, &c. after the exhibition. The hall was opened to the visitors at two o'clock, and the chair taken by H. J. A. cane, Esq., who briefly alluded to the changes which had taken place in the regulations. He trusted these alterations and others in contemplation would have the desired effect of restoring the society to health and vigour. The judges were the Rev. J. Huntley, of Kimbolton, the Rev. Alfred Newby, of Tilbrook, and Mr. Carter, jun., of Haverhill. The adjudication of the prizes was as follows: *AURICULAS* (4 best), 1st prize, Medal—Taylor's Glory (white), Standard (green), Seedling (grey), Lord Primale (self), Mr. R. Heady; 2nd prize—would have been awarded to Mr. Heady had he not gained the first prize; 3rd prize—Metropolitan, Simpson's Commander, Haylock's Mrs. Childers (unknown), Mr. R. Haylock. Seedling *Auricula*, Mr. R. Heady. *POLYANTHUSES* (4 best), 1st prize—Buck's George (the Fourth, Alexander, Gold Lace, unknown.—If entitled by the Society's Rules, but the judges suggested that in future there should be but one stand, and one specimen in each pot, Mr. Giddings; 2nd prize, Mr. Haylock. Seedling *Polyanthus*, Mr. Giddings. *Hyacinths* (6 best), 1st prize, Mr. Green; 2nd prize, Mr. R. Heady. *Primroses* (3 best pots), Mr. Giddings. Wall-flower, 1st prize, Mr. Widnall; 2nd prize, Mr. Catling. Plant in a Pot, 1st prize, *Tropæolum tricolorum*, Mr. Widnall; 2nd prize, *Gemsta canariensis*, Mr. F. B. Smith. Collection of Plants large, 1st prize, Mr. Widnall; 2nd prize, Mr. Green. Do. small, Messrs. Hudson. Collection of Cut Flowers, Mr. Ready. Basket of Vegetables, 1st prize, Medal, Messrs. Hudson; 2nd prize, Mr. Newman. Brace of Cucumbers, 1st prize, Mr. Newman; 2nd prize, Mr. Tomlin. New Potatoes, Ashtop, Mr. Newman. Rhubarb, 1st prize, Mr. R. Heady; 2nd prize, Mr. Green. Salad, 1st prize, Mr. J. Taylor; 2nd prize, Messrs. Hudson. EXTRA PRIZES: APPLES—Golden Knob, Mr. Newman. PEARS—Beurre Rance, Mr. Tomlin. COTTAGERS' PRIZES, 2s. 6d. EACH: Wall-flower, W. Clarke, Bourne; Cabbage, T. George, Shelford; Lettuce, John Cole, Shelford; Rhubarb, T. George, Shelford; Radishes, T. George, Shelford; Apples, W. Clarke, Bourne. COTTAGERS' EXTRA PRIZES: Basket of Vegetables, 1s. 6d., John Cole, Shelford; Ditto, 1s. 6d., T. George, Shelford.

Norwich Horticultural Society, April 19.—This meeting was held at the Corn Exchange. It appears from the report in the *Norwich Mercury* to have been unusually well attended. Prizes were thus awarded: MEMBERS' PRIZES.—FRUITS & VEGETABLES—Grapes, best, (Muscadine), C. Short, gr. to H. N. Burroughes, Esq., M.P., Hoveton. Strawberries, best, (Keen's Seedling), Mr. Stewart, gr. to W. Bage, Esq., M.P. Pears, best, 1, (Catillac), W. Rippingale, gr. to O. Morse, Esq.; 2, (Uvedale), S. Short, gr. to J. Stracey, Esq. Dessert Apple, best, (Brandy Apple), S. Short. Ribston Pippin, equal best, Rev. O. Mathias. Sauce Apple, best, (Bedford Soundling), S. Short. Rhubarb, best, (Myatt's Victoria), Rev. O. Mathias. Potatoes, best, (Early France), W. Rippingale. Lettuce, 1, (Black-seeded green Cos), J. Catton, gr. to the Rev. C. C. Lowes; 2, (Imperial Cabbage), Mr. R. Bensley. Endive, best, W. Kemp, gr. to Sir E. Stracey. Asparagus, W. Gale, gr. to H. N. Burroughes, Esq., M.P., Burroughes. Seakale, best, S. Short. Broccoli, equal best, S. Short and J. Catton. Cabbage, best, J. Catton. Kidney-Beans, best, (dum), Mr. Walton, gr. to R. Sanderson, Esq., M.P. Leeks, best, (flag), C. Short. Mushrooms, Mr.

Walton. *Salad*, 1, (*Black-seeded Cos*), W. Gale; 2, (*Cabbage*), J. Catton. *Beet*, best, W. Exelby, gr. to H. Birkbeck, Esq. *FLOWERS*.—*Azaleas*, collection of, best, C. Short. *Auriculas*, collection of, 12 best, J. N. Waite, jun., Esq. *Cactus*, (*Mallisoni*), single specimen, C. Middleton, Esq. *Pansies*, collection of, 24 best, Hon. R. Wilson. *Roses*, in pots, collection of, S. Short. *Mignonette*, Rev. J. Burroughes. *Cut Flowers*, collection of, J. N. Waite, jun., Esq., and Mr. Walton. *Calceolarias*, 1, collection of, best, W. Rippingale; 2, seedlings, best, C. Short; 3, 2nd best, Hon. R. Wilson. *Cinerarias*, 1, collection of, best, C. Short; 2, equal 2nd best, W. Exelby and C. Short; 3, 3rd best, Mr. Walton. *Greenhouse plants*, 1, collection of, best, W. Rippingale; 2, 2nd best, J. High, gr. to J. Longe, Esq. *Stocks*, ten weeks, Rev. J. Burroughes. *Hyacinths*, collection of, J. T. Kemp, Esq. *Anemones*, collection of, J. N. Waite, jun., Esq. *Tropaeolum tricolor*, C. Short; *Ditto grandiflora*, Mr. Walton. *Cyclamen Persicum*, Hon. R. Wilson. *Acacia Juniperoides*, W. Rippingale. *Clematis Sieboldii*, C. Short. *Deutzia scabra*, R. Emms. The principal plants exhibited by Mr. Bell were—*Epacris impressa*, do. *nivalis*. *Ericas*—*bonplandii*, *regiminans*, *pellucida*, *ardens*, *rubrocalyx*, *nigrita*, *scariosa*, *Pattersonia*, *Walkerii*, *Willmorea*, *Azalea indica alba*, do. *Smithii*, *Boronia serrulata*, *Chorozema Henchmanni*, do. *ilicifolia*, *Euphorbia splendens*, *Rhododendron Smithii punctatum*, *Cytisus racemosus*, *Cineraria splendens*, do. *King*, do. *cærulea*, fine new variety; *Petunia magniflora*, *Camellia colorata*, *Burchellia capensis*, *Pultenaea subumbellata*, *Eschynanthus grandiflorus*. Messrs. Mackie and Ewing exhibited:—*Azalea sinensis*, *Camellias*—*Doncklaerii*, *Carswelliana* (new), *Candidissima*, *Antwerpenensis* (new). *Tropaeolum tricolorum*, *Elichrysum splendens*, *Cineraria King*, do. *Inwoodiana*, *Erica speciosa*, do. *gracilis*, *Azalea floribunda*, *Lachenalia pustulata* (new), *Cytisus racemosus*, *Tea-scented Moirée Rose*, *Illicium floridanum*, *Acacia cordifolia*, *Cereus flagelliformis minor*, *Euphorbia splendens*, *Epacris grandiflora*, *Trillium grandiflorum*, *Dillwynia cinerascens*, *Oxalis carnosa*, *Pimelea nivea* (new).

MISCELLANEOUS.

Flora of Japan.—We have been favoured by a friend with the following information on this subject:—Last autumn Professor Zuccarini spent six weeks in looking over the Japanese Herbarium at Leyden, which is wonderfully rich, containing nearly 2,500 species, and, altogether, about 30,000 specimens. They are in a good state of preservation, and of almost gigantic size. We understand that Professor Zuccarini has, through the kindness of Mr. Blume, Director of the Leyden Museum, procured, amongst other things, specimens of a dozen new genera, some of which are very remarkable; for instance, a *Fumariaceae* plant with a regular corolla, 4 petals, and 4 unconnected stamens; an *Oleaceae* plant with a long-stalked three-celled ovary, containing numerous ovules arranged in two rows in each cell; and that that same gentleman has already drawn up a description of them, which will appear in the *Journal of the Munich Academy*. The *Flora of Japan* is very remarkable. Perhaps in no other country are tropical forms combined more intimately with those of the Temperate Zone. In contrast with 33 Coniferous plants are 15 species of Bamboo. Twelve species of Maple and nearly 26 of Oak are met with, associated with a crowd of Laurels of different genera. The *Orchidaceae* plants, of which, unluckily, the Dutch collection contains but few, are, for the most part, epiphytes. Amongst *Leguminosae* plants, there are several species of *Lespedeza*. *Ericaceae* plants are not only numerous, but extremely fine, comprising upwards of 10 species of *Rhododendron* and *Azalea*, if we distinguish, under the latter name, those species which have only 5 stamens. Nearly all the grasses have a tropical appearance, nevertheless they are accompanied by 25 species of *Carex*. Palms and *Cycadaceae* plants are less numerous; of these, however, there are a few, as well as of *Zingiberaceae*. Many very interesting things are met with in the Herbaria procured by Siebold from the native Botanists. Their specimens are well preserved, and amongst them are many plants collected in the central parts of Nipon, and upon the lofty mountains which no European has hitherto attempted to explore. The drawings made by Japanese artists also give a good idea of the plants which they are intended to represent.

Sale of Orchidaceous Plants.—We understand that the *Orchidaceae* from Bombay, which were sold last week by Messrs. Stevens and Co., produced altogether rather more than 170%. Two large specimens fetched 15% each; others went as low as 25%.

GARDEN MEMORANDA.

Messrs. W. Jackson and Co.'s Nursery, Cross-Lanes, near Redale. A splendid specimen of *Rhododendron campanulatum* is in flower here; five hundred and sixty-eight perfect blooms were grouped amongst the dark green foliage, and had a most imposing effect. The plant is five feet nine inches in height and eighteen feet in circumference, and is considered to be the finest specimen in Great Britain.

Reviews.

An Agricultural Tract for the Times. By J. West, Land Agent, &c., Collingham, Notts.

I HAVE lately obtained the above tract, and find it is written by a fellow-labourer with myself in a much-neglected field of improvement. As far as I am able to judge from my own experience, Mr. West's remarks on draining and subsoil-ploughing are very good. It is not his object to point out the mode of draining any land, but to call the attention of landed proprietors to the absolute necessity of the work being "immediately done." In this I fully agree with him. In my time I have done a great deal of draining; what I have done lately was not with tiles, but in the manner which is usually called wedge-draining, with a strong rusby turf on meadow or pasture land, from which, I doubt not, great benefit will be derived. My former experience was in making open drains in plantations, to a great extent. But, as I am more anxious to express my cordial concurrence with Mr. West upon another part of his pamphlet than upon this, I pass on to his chapter on the Appropriation and Management of English Timber.

His observations on these heads are excellent, and well deserve that landed proprietors should put them in practice without delay, if they really wish to benefit themselves and the public, and to find employment at home for the labouring population. But I fear that his recommenda-

tions, and especially those that refer to timber, will have but little effect upon the present generation of landlords: I have, humble individual though I am, laboured for years and years in vain, and may almost say, spent my strength for naught, in the same cause. For my own part, I cannot see why England cannot produce as good timber as other countries. Indeed, I am satisfied that she can do so, and in quantity sufficient for all domestic purposes, if the owners of timber would but see that it is properly trained in its infancy, and suitably treated afterwards. I fully agree with Mr. West that our native timber, much as it is decried—Scotch Fir, for instance, as well as almost every other kind that is grown—if it was peeled standing, and felled in the autumn or winter, would be greatly improved for building and other purposes, as it is proved to be the case with the Oak, Alder, and Larch. I am happy to say that some friends of mine have agreed to adopt my suggestion, and try some experiments with different kinds of trees, the results of which shall be made known.

But what will be the results of Mr. West's labours with reference to this pamphlet and the others books he has written? Probably neglect and pecuniary loss. It appears to be impossible to reach the minds of the great majority of the land-owners on the subject of their timber; and the man who attempts to do so engages in an unprofitable and hopeless task. It will be well, however, for the few who may meet with Mr. West's pamphlet to follow his advice.

Agricultural Chemistry rendered simple for Practical Purposes. By T. G. Tilley, Ph.D.: Longmans.

We should be more inclined to call this book *Agricultural Chemistry rendered puzzling, &c.* Take for example the following explanation of the nature of ammonia:—

"Ammonia is the same substance as hartshorn, and its carbonate is the common smelling salts of the shops. It is composed of carbon and nitrogen." We cannot waste either our own time or that of our readers by comment on such a book.

CALENDAR OF OPERATIONS for the ensuing week.

The new system of planting flower-gardens within the last 20 years has doubled the ordinary work to be done in this department in May, and instead of improving the appearance of the flower-garden by this change, we have, in nine cases out of ten, a mere blank, comparatively speaking, for five or six weeks from the middle of May. As our great patrons of gardening generally pass this time in London, the subject has not had that attention paid to it which it deserves. Instead of pointing out or suggesting a system by which the flower-garden might be as gay during this time as any other part of the season, I would rather invite communications from different parts of the country, detailing the way in which this is already effected, for we feel convinced that such information would be of essential service to amateurs; and, moreover, many amateurs are as likely to supply such information as professed gardeners.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—To keep the bottom-heat steady at all times is a good maxim, and more so at this season; too much bottom-heat is more dangerous than too little; but if the bottom-heat is let down at this time when the natural heat of the sun raises the temperature many degrees more than is necessary for the plants, a weakly growth will be the consequence; give large portions of air to all the stock, and shut them up early in the afternoon.

VINERY.—Little need be said now of early Grapes that are ripe or fast ripening; if they have plenty of sun and air they ought to hang a long time, and come to table or market with a fine bloom. As soon as every bud on the late Vines has grown a joint or two, they may be assisted by being shut up early in the afternoon. The front ventilators need not be used till the fruit is all set, but give large portions of air all along the top lights; you will thus have the top part of the house the coolest, and your Vines in an equal temperature throughout.

PEACH-HOUSE AND CHERRIES.—Light and air with moisture, according to the state of the fruit, and a sharp look out after insects or other enemies will be the routine here till the fruit is ripe.

Figs.—Continue, as stated for the last week or two; if the fruit appears to drop off or is stationary, without showing signs of ripening, have recourse to caprification, they never appear to drop under this simple process, and they ripen soon when thus treated.

MELONS AND CUCUMBERS.—The weather throughout April has been very favourable for early Melons, and if May proves as favourable, this fruit will come in, in better condition than we have had it for many years. Keep up a brisk heat by the linings, and unless your fruit is full swelled, keep the plants moist at the roots, there is a great demand on the plant while the fruit is swelling. If you intend to try a few plants of an early sort in the ridge or cold frame way, the seeds should now be sown, and, as soon as they are up, potted off, harden them by degrees till they can stand in a cold frame ready to be planted out.

Out-door Department.

The month of May is always a busy time in the kitchen-garden and orchard—young crops to be thinned out, others to be earthed up; some to be transplanted, watered, and shaded; and successional crops require to be now often sown. Thinning Grapes in the late Vineries is in many places a long and very particular job; while the host of insects and caterpillars, grubs, slugs, and worms, are busy at their work of destruction, and must have perpetual war maintained against them, to say nothing of the care and judgment necessary for regulating the young shoots on wall and espalier-trees.

ASPARAGUS.—In cutting these for use, see that the weak, spindling shoots are cut off at the same time, that they may not hinder their betters from coming regularly forward, by encouraging the sap away.

BROCCOLI.—These should now be sown for the main supply next winter and spring. The dwarf and tall purple sprouting Broccoli are the most economical and useful of all the Cabbage-tribe called "greens"; if these are sown now, and again about the end of the month, they will produce tender sprouts from next November till this time next year. No cottage-garden should be without this sort, which is far preferable to Borecole.

KIDNEY-BEANS.—Plant in boxes, to be protected a while, and also in the open ground, to take their chance of the season.

PEAS, BEANS, SPINACH, TURNIPS, AND SALADS, or any other sort under the head of "Successional Crops," must now be sown oftener, and in smaller quantities, till Midsummer, as they will come in faster during hot weather.

SEAKALE.—Clear away the litter and pots as the stools get past use; cut over the stools level with the ground, and dig over the beds; and if the stools throw up more shoots than can be fully exposed to the sun and air, you must thin them out.

ORCHARD.—Within the last three weeks the garden men have brought 45 wasps to me, for which they are regularly paid; the greatest portion were caught on the common Laurels. Plum and Pear-trees will now be ready to have some of the strongest young shoots stopped. The Apricot, Plum, and Cherry must be carefully looked over, to get at the mischievous little caterpillar, which is so unsociable as to shut itself up by twisting the young

foliage round his retreat; this caterpillar is never in great numbers, and is easily destroyed and kept under; soapsuds is the next best thing after Tobacco-water for killing the fly on the Peach-trees, and also on the Roses.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—Stove plants are now making their growth more freely than at any other period; the usual stimulants of heat, moisture, and, in some cases, liquid manure, may therefore be more freely administered to them. Young plants that are wished to become fine specimens should be watched, and as soon as their roots have reached the sides of the pots they must be fresh potted. Others, again, must be cramped at the roots, to induce them to make short flowering spurs. Many of the climbing plants so treated may be made to assume the character of shrubs, to suit particular situations and circumstances.

GREENHOUSE.—In the good old times it was a prevalent opinion that Heaths, Epacris, and such-like plants, would be ruined if touched with a knife; but now it is proved that no plants bear pruning better; and you may see men in the great nurseries cutting off the young tops of these in handfuls after the plants have done flowering; other free-growing plants have their tops regularly pinched off at every other joint, in order to get them into round bushy specimens.

CONSERVATORY.—Some of the Passion-flowers, Ipomœas, and other strong-growing climbers, should now be close pruned, if you wish for a late display in autumn. It is always a good plan to have duplicate plants purposely for this treatment; this is often done in Vineries, by planting two plants to each rafter, and cutting them down alternately every year.

PITS AND FRAMES.—Propagation by cuttings and grafts must be continued till a full stock is reared; tender annual seeds for late flowering may now be sown. Very many plants that are difficult to strike from cuttings may be easily increased by grafting on the roots of some allied species. All tender seedlings should be potted as soon as they can be handled.

Out-door Department.

Annuals to flower from the end of June should be sown now; those now half-grown should stand thin on the ground. One of the misfortunes of spring-flowering bulbs is, that they must often be removed, to make room for another crop, before they finish their growth. On the first wet day, see to these, and have them carefully taken up, and plant them in some quiet place, giving them a good watering, and placing their names or number-sticks against them; without this arrangement it is difficult to know the varieties of early Tulips, Narcissuses, &c., after they are out of flower and foliage. Not only the colour and height of every variety of these bulbs, but the very week it usually comes in flower, should be marked in the garden-book, otherwise, how are you to plant them next autumn?—D. Beaton, *Shrubland Park Gardens*.

State of the Weather near London for the Week ending April 27, 1843, as observed at the Horticultural Garden, Chiswick.

Average		29.977	29.911	60.4	32.4	45.9	45.9		.46

April 21. Very fine throughout; overcast at night.
22. Rain; showery; clear and frosty at night.
23. Fine, with light clouds; clear; frosty at night.
24. Fine; dry air with dusky haze; frosty.
25. Thickly overcast; cold rain; clear.
26. Large patches of sleet in the morning; cold rain; cloudy and fine; rain.
27. Clear; cloudy and fine; clear at night.
Mean temperature of the week 5° below the average! 1

State of the Weather at Chiswick during the last 17 years, for the ensuing Week ending May 6, 1843.

April and May.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp.	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 6th in 1830—thermometer 81°; and the lowest on the 6th in 1831—thermometer 28°.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending April 28, 1843.

THERE is a good supply this week of hothouse Grapes, of the Black Hamburgh kind, which are both well-coloured and of a tolerable size; the White Sweetwater are likewise of a very fair description. Foreign Grapes are much more abundant, and of a far superior quality, than they were last week. A few Peaches, moderately well ripened, are exhibited in the principal windows. Pine-apples are numerous, and some of them are of a very respectable character. There is a profuse supply of new Potatoes, at 6d. per pound. The Nonpareil and Golden Nonpareil Apples, as well as the June Pippin and the Normandy Pippin, are in excellent condition. Strawberries are large and abundant. Walnuts and Filberts, in a finely-preserved state, exist in large quantities, as also do Spanish Chestnuts, which are particularly good. Among plants, there are pretty small specimens of *Polygala grandiflora*, *Acacia verticillata*, and *Cytisus racemosus*, besides the more ordinary supply. The rarer sorts of cut-flowers are, *C. ianthus puniceus*, *Hovea Celsii*, *Lachenalia tricolor* (which is furnished, besides, in pots), the lovely and fragrant *Daphne Cneorum*, a large-flowered variety of *Nemophila insignis*, and *Rosa Devonensis*.

PRICES, SATURDAY, April 29, 1843.—FRUITS:—
Fine Apple, per lb. 6s to 10s
Grapes, hothouse, per lb. 6s to 12s
— Spanish, per lb. 1s to 1s 6d
— Portugal, 1s to 3s
Apples, dessert, per bush. 5s to 14s
— Kitchen, 4s to 8s
Pears, dessert, per h. sieve, 20s
— *St. Germain*, forced, per doz., 6d to 1s
Gamboge, small basket, 1s 6d to 2s
Apricots, per pot. 2s to 2s 6d
Pomegranates, per doz., —
Oranges, per doz., 1s to 2s 6d
— per 100, 6s to 13s
— Bitter, per 100, 6s to 20s

VEGETABLES.
Cabbage, Red, per doz. 2s to 6s
— plants, per doz. 1s 6d to 3s 6d
Cabbages, per doz., 6d to 1s 6d
Broccoli, White, per bunch, 6d to 4s
— Purple, 6d to 1s
Beans, Kidney, forced, p. 100, 1s to 2s
Potatoes, per ton, 40s to 70s
— per cwt. 2s to 4s
— per bushel, 1s 6d to 2s 6d
— Kidney, p. bush., 1s 6d to 2s
— Scotch, per bushel, 1s 6d
— New, per lb., 1s to 2s 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d
Turnips, per doz. bun., 1s 6d to 2s 6d
Red Beet, per dozen, 9d to 1s
Salsify, per bundle, 1s 6d to 1s 6d
Cardoons, each, 1s
Globe Radish, per bundle, 2s to 3s
Radish, spring, p. doz. hands, 9d to 1s
Spring Onions, per bunch, 6d
— *T. crisp*, p. doz. hands, 1s 6d to 2s
Spring Turnips, 2s to 3s
Carrots, per d. bunch, 4s to 6s
— Young Horn, per bunch, 6d to 2s
Spring Carrots, 1s 6d to 2s
Parsneps, per dozen, 6d to 1s
Lemons, per 100, 5s to 14s
— per doz. 1s to 2s
Cucumbers, per brace, 1s to 1s 6d
Walnuts, per bush., 1s to 20s
Chestnuts, per peck, 4s to 7s
Almonds, per peck, 6s
Sweet Almonds, per pound, 3s
Filberts, English, per 100 lbs. 55s to 60s
Cob Nuts, per 100 lbs., 60s. to 70s.
Nuts, per bushel—
— Brazil, 16s
— Spanish, 18s
— Barcelona, 24s
— Col., 12s to 14s

Notices to Correspondents.

FLORISTS' FLOWERS.—Now that the season for florists' flowers has arrived, we beg to state that we are ready to give our opinion of all novelties that may be sent us; not with a view to please the growers, nor for the sake of indulging any vanity of our own, but in order to satisfy the public. It is alleged that there is but one society in London which can be trusted upon this subject; that this society only meets occasionally, and then by candle-light, when it is impossible to judge correctly of the merits of the flowers that are examined. We are not of the same opinion; we believe that no better decisions than those of the Floricultural Society will ever be arrived at, and we wish it to be supported, because we know its decisions to be those of honest men, and skilful men. Nevertheless, in order to gratify those who look to some other tribunal, we take this opportunity of announcing that all florists' flowers that are addressed to our Office, 3, Charles-street, postage or carriage paid, will be examined, and their qualities declared under a separate heading in these "Notices to Correspondents." The opinion will be given by a gentleman entirely unconnected with the trade, thoroughly acquainted with the subject, but having no interest whatever to serve, except the truth. As all these judgments will be indexed at the end of the year, the buyers of new flowers will have a ready means of testing the value of the seedlings advertised. If they are found in our columns, their true character can be ascertained; if they are not found there it will be understood that the growers dare not submit them to such an ordeal.

ERRATA.—In consequence of an accidental transposition of type, in our last Number, the following answers, **STOVE PLANTS**, **PELARGONIUMS**, and **CAMELLIAS**, (*Rhodon*) are unintelligible, and are now reprinted.

STOVE PLANTS.—*H. R. M.*—The following are showy stove plants, of easy cultivation: *Euphorbia jacquiniiflora* and *splendens*, *Poinsettia pulcherrima*, *Franciscia uniflora*, *Eranthem pulchellum*, *Justicia coccinea* and *flavicomis*, *Ixora coccinea*, *Gesnera Suttoni*, *splendens*, *elongata*, *mollis*, and *zebrina*; *Gloxinia rubra*, *candida*, *caulescens*, *speciosa*, and *sp. alba*; *Goldschussia glomerata*, *Ardisia crenulata*, *Pancratium amoenum*, *Aphelandra cristata*, *Phaius grandifolius*, *Russelia juncea*, *Plumbago capensis*, *Epiphyllum truncatum*, *Allamanda cathartica*, *Begonia insignis*, *parviflora*, and *coccinea*, *Eschynanthus grandiflorus*, *Colmunia Schiedeana*, *Geissomeria longiflora*, *Streptocarpus Rhexii*, *Vinca alba* and *rosea*. For climbers you may take *Passiflora* *Kermesina* and *phenicea*, *Manettia cordifolia* and *bicolor*, *Jasminum Sambac*, *Ipomoea Horsfalliae*, *Combretum purpureum*, *Convolvulus pentanthus*, *Bignonia venusta*, and *Cereus grandiflorus*.

PELARGONIUMS.—*S. A. M.*—As your *Pelargoniums*, for want of better soil, were potted in leaf-mould, you cannot expect them to throw up strong blooms. You may assist them by watering them alternately with rain and manure water. The latter should not be given too strong, or it will perhaps injure the plants.

CAMELLIAS.—*Rhodon*.—The following are about the best for form and colour combined, and are also good free-flowering kinds: *Bealei*, *crimson*; *Chandleri*, *deep crimson*; *Ilume's Blush*, *buff*; *Fringed White*; *Francis-furtensis*, *red*; *Palmeri*, *rose*. The *Reticulata* will not do out, although protected during the winter, unless with a glass-frame. It requires to be kept close and warm during the growing season, to form the young shoots; any dry situation will suit them where the soil is not too stiff.

GRASS LAND.—*W. M.*—Without an inspection of the soil and an examination of the seeds of grass which may be left from the old turf, it is impossible to give positive advice as to the best mode of laying your land down to grass. You can scarcely expect a crop of hay this year; you had better consult some experienced farmer near you as to the best grasses to suit your soil. If it is loose, dry, and deep, nothing is more profitable than *Lucerne*. Whatever you sow, let it be sown in August, in a well-pulverised surface; put in plenty of seed, bush-harrow, and roll it well. The weeds which may be in your soil will do no great harm, unless your turf was very bad. With care and a good top-dressing early next spring you may have an excellent crop of hay next year. It is impossible for us to give minute directions where we have only an imperfect knowledge of all the circumstances; we can only give general hints.

BORHARA CLOVER.—*A. M.*—This will grow in any rich, loose, and deep soil, such as is suited for *Lucerne*. From the little we know of it, we have no very sanguine expectations of its use as fodder for cattle: both *Saintion* and *Lucerne* are far superior.

MANURES.—*M. W. K.*—Your gardener could not have done a more injudicious thing than to mix lime with the urine. He should have added water, allowed it to become putrid, and then added gypsum, or oil of vitriol, till effervescence ceased; or, which would have been quite as well, added soot, or some black soil, until all the fluid was soaked up, and then used it as compost for your *Camellias*, &c. It is still valuable, though injured, and may be employed like any other liquid manure.

DRAINING.—*T. J. M.*—We have, perhaps, not perfectly understood all the circumstances attending your mode of draining. We have never obtained pipes at so low a rate as tiles; nor did we understand that the bottoms of your drains were so narrow. To give a decided opinion of your plan, we should see it in operation. We shall be glad to hear of its success, and be obliged hereafter by a detailed account of the whole, including every expense.

NORTH WALLS.—*W. E. R.* inquires whether, by the use of large sashes in a wall, Peaches, &c. might not be grown on the north side of it, where circumstances prevent the south side being so used. In our view, success would be very doubtful by such an expensive plan, because the light and warmth of the sun are as essential to the roots of fruit-trees as to their branches. At least, the produce, in such a situation, would be by no means equal to that from a south wall, and very great care would be requisite in draining the border, and keeping the roots near the surface.

HOT-BEDS.—*T. A. N.*—A pit three feet deep, with a surface of three feet six inches by two feet nine inches, will, if filled with bark, certainly retain its heat long enough for raising tender annuals, and for striking *Rose* and *Fuchsia* cuttings, since, as its temperature declines, that of the open air will daily be increasing. The bark will likewise, by being turned and moderately watered, ferment a second time, and even a third, by the addition, at such periods, of a small quantity of fresh.

STEAMING HOUSES.—*Almost in Despair.*—It appears evident that the leaves of Vines, &c., which you have sent, have been scalded by the quantity of hot vapour which you have suffered to escape into your house. The exhalations from water kept in zinc cisterns could never injure plants; but the sudden cooling of an atmosphere loaded with vapour certainly would. Pines and *Orchidaceae* laying, mostly, leaves of a very firm texture, are not so easily harmed as plants with more tender foliage. Wherever, for the advantage of its genial moisture, houses are to be steamed, it is best to admit the vapour early in the evening, and, having done so sufficiently, at once to

shut off the supply, and not leave it to diffuse itself all the night. A night temperature of 71° is certainly too high, at this season, for Vines and Pines; 65° would be ample.

RUST ON GRAPES.—*J. W.*—We are not able to see the symptoms you point out. You may be right in part; but certainly are not in your idea that there is any adhesion of the calyx and pollen to the fruit. Such specimens as you have sent are ruined by the pressure of the post-bags.

FINES.—*Hopiana.*—Your Pine-plants have been over-heated by bottom-heat some time ago, the Bark-bed being previously to that time allowed to get exhausted of heat, and the plants starved for want of heat and water.

PEACH-TREES.—*A Subscriber* writes that his Peach and Nectarine-trees on a south aspect, which were last year perfectly free from blight and curled leaves, are at this time in a very unhealthy state, although tobacco-water has been applied as usual. He also remarks that Peach-trees on an adjoining west aspect show no symptoms of blight. [Tobacco-water will only prove a remedy for the evils arising from the attacks of insects, and not for those occasioned by the variable state of the weather—hot days alternating with frosty nights, such as have been lately experienced are particularly unfavourable for the early vegetation of the Peach; and the trees on the south aspect, from being farthest advanced, will be the most susceptible. Copping-boards would have proved very useful in this case. More healthy foliage will be produced when the weather becomes warmer, and all curled and blistered leaves may then be picked off. All that can be done in the meantime is to protect from cold as far as may be practicable, and keep the insects in check, either by means of tobacco-water, or sprinkling with tobacco-dust.]

CHICORY.—*Jersey.*—In order to cultivate Chicory for its roots to be used as a substitute for Coffee, seeds of the variety should be obtained which the French call *Chicorée-à-Café*, the roots of which are large and fleshy, like a White Carrot. As they will grow to two or three feet in length, the soil should be deep, rich, and rather light or sandy. The seed should be sown in April, in drills from 12 to 15 inches apart, according to the richness of the soil; and when the plants come up they should be thinned to 6 inches apart in the rows. Some may be sown in a bed for the purpose of being transplanted into any blanks that may occur. The roots are taken up in the autumn or winter of the same season; for, although they will live and continue increasing in size for many years, yet they become too woody for use.

ASPARAGUS.—*W. V.*—The Giant Asparagus is the same as the common Asparagus, only it is well grown. There is but one sort of Asparagus, and all the statements to the contrary are untrue.

TURNIPS.—*Thirsty.*—No doubt your land is thoroughly run out; give it a good dressing of rotten dung, and guano applied quite wet, and you will have plenty of good Turnips.

TREE-PRUNING.—*Flora.*—These are increased in several ways: but the best way, when the plant is large, is to take it up about the end of October, and shake all the soil from the roots; then with a sharp knife separate each stem that has any roots attached; then shorten their tops, and pot them in any good rich soil, and place them in a cold pit for the winter. If the plant is rather small, ring all the bottom branches one inch above and one below all the buds upon them, and lay them in the usual way in any light soil; they may be struck from the very young shoots, like Dahlias, but not with much certainty.

WATER-LILIES.—*A Lady.*—The best time for planting Water-lilies is in the autumn; they only require to be sunk, which is best done by putting the piece of root in a pot filled with any rich loamy soil, and dropping it into the water. The best sorts are—the White Water-lily (*Nymphaea alba*), the small Yellow do. (*Nuphar minima*), the common Yellow do. (*Nuphar lutea*), the Striped Yellow do. (*Nuphar advena*), the Yellow *Nelumbium* (*Nelumbium luteum*). The latter requires some bottom-heat, or it will not flower.

DAHLIAS.—*A. M.*—Very few of the Dahlias sent out in 1842 were exhibited in the neighbourhood of London, with the exception of *Dodd's Prince of Wales* (yellow) and *Hudson's Princess Royal* (light buff, tipped with crimson); these, with *Brown's Marquis of Lansdowne*, *Bedford Surprise*, *Lady Ann Murray*, and *Lady Harland*, maintained their characters. *Low's Duke of Cornwall* and *Winterton Rival* and *Horwood's Princess Royal* (primrose), promised well.

AZALEAS.—*Rhodon.*—*A. Herberti* is a very fine kind, but there are many as beautiful. It is quite hardy, and will do in the open peat border; but like all the hardy Azaleas, the flowers are often killed by late spring frost. The soil best suited for growing it is in fibry peat, to which should be added a small portion of well-rotted cow-dung and a little fine loam; the proper time to shift your Azalea is as soon as it has done flowering. Give your plant a good shift if it is healthy and strong; if weakly it probably does not want one.

ROSE TREES.—*T. A. N.*—It is quite possible that the curling in the foliage of your Rose-trees may have been due to liquid manure, if you have applied it too largely or in too strong a state. Cold winds will, however, produce a similar effect, and have done so in several instances this season.

PLATYLOBUM MURRAYANUM.—*A Subscriber.*—This plant would not, we should think, be regarded as a climber, however it might be treated; it being a decided shrub.

HOLLYHOCK SEED.—*A Constant Reader.*—The present is the best time for sowing it.

POLYANTHUS.—*A Subscriber.*—The Yellow Polyanthus *Narcissus* is by no means a certain flowerer, owing to some one of the following causes, viz.:—The bulbs may have been taken up the previous season too soon; they may have had their leaves cut off the previous season too soon; they may have been kept too dry, and too long before planting; or the soil you planted them in may have been too rich, and consequently too retentive of moisture during the winter.

CINERARIAS.—*A. B.*—When the Cinerarias have done flowering, cut off all the flower-stems and old leaves, and place them in a cold pit or frame, which must be kept rather close for two or three weeks to cause the plants to grow; afterwards admit air freely by day, but keep them close at night, then about the beginning of August divide the old plants into pieces and put them into small pots, filled with a mixture of good loam and sandy peat, to which may be added a small portion of well rotted dung. When potted, return them to the pit or frame, and keep them close; afterwards, as they grow, shift them into larger pots, and use a little manure-water, and finally as the danger of frost approaches remove them to the greenhouse, where they will bloom well all the winter and spring, if kept free from insects. The following are some of the best:—*Waterhouseana*, *Webberiana*, *Royal Blue*, *Rival King*, *Genl. Queen Victoria*, *Splendid*, *Eclips*, &c.

PRUNIA.—*W. Paul.*—Your seedling is very curious if it is permanent, and we should like to see more of it. You are, however, quite mistaken in your conjecture that it has been crossed with a Mallow. Do you think a crow would cross with a lap-dog?

PASSION-FLOWERS.—*A Well-Wisher* says that he has two Pinerias, in the corners of whose bark-beds is a brick partition, 2 feet square, in which are a *Passiflora edulis* at one end (growing and bearing fruit abundantly), at the other a *Passiflora quadrangularis*, the leaves of which are curled up and spotted, and appear quite unhealthy, the same thing occurs in each house, although both plants have the same treatment. The bark-beds were renewed in February. He is desirous of knowing what is the matter with the square stemmed *Passiflora*. Will any one have the kindness to give his opinion on the subject?

SEEDS.—*Chydron.*—Sow your Indian seeds directly in pots filled with a light soil, composed of loam and sandy peat, covering them in proportion to the size of the seeds. Then place the

pots in a cold pit or frame, which must be kept close until the seeds begin to come up, then they should have a little water and air by day. The Pine seeds should be sown in a warm, and not watered until they are fairly up. They will do in the same situation as the other seeds. *F. M. W.*—It is very likely that *Gladia* seeds cannot be bought; they are usually saved by Amateurs. The roots of such plants may be planted now, if you can procure them.

BOOKS.—*M. G.* will find Reichenbach's *Flora Excursoria* or Koch's *Flora Germanica* most useful books for reference during a tour on the Continent.

NETTING.—*D.* must give us his name before we publish his statement.

SEEDLING FLORISTS' FLOWERS.

CINERARIAS.—*J. D. Parks.*—There are several whites superior to the specimen you sent, which is small, and the petals very narrow. *—*Seedling.*—Yours is large and rich in colour, and if a free bloomer makes a showy variety. The single flower sent was imperfect, from the petals being irregularly placed round the disk; if this defect is common to the flower it is useless. *—*C. Whitbread.*—Your quilled sort is larger and superior to any variety of the kind we have seen; the construction of the flower is perfectly regular, and the ends of the petals uniformly expanded. *

POLYANTHUS.—*A Young Grower.*—Yours are nothing more than common border varieties. *

HEARTSEASE.—*A Young Grower.*—No. 5 is deficient in the centre, and the colour is very common. No. 6 is a superior flower, it is round, flat, of good substance, and the petals are finely proportioned; the border round the lower petals is uniform, and the eye bold and neatly defined. *—*T. Cross.*—Your *Lancashire Lass* is a fine flower, of good substance, fine form, with large, well-proportioned petals, white ground, deep mulberry upper petals, with broad band of the same colour round the lower petals, eye large, dark, and fine.

MISCELLANEOUS.—*Omey.*—Your inquiry should be addressed to a nurseryman. We cannot give prices, or do the work of dealers. *Phytolacca decandra* is a hardy herbaceous plant that will grow on any rubbish-heap. *—*E. S.*—None of your seeds are worth raising, except *Verbascum tomentosum*, *Symplocos racemosa*, *Clématis anemonefolia*, and *Viburnum malayanum*. They should be raised in a hot-bed, like other tender seeds. *—*Geyer.*—Your wishes shall be attended to. *—*Phenomenon.*—1, *Geum sanguineum* (very bad specimen); 3, *Polygala grandiflora*; 4, *Justicia flayicoma*; 5, *Eranthem pulchellum*; 7, *Pavetta indica*. *—*A Lady.*—What Musk-plant do you mean? The Musk-plant (*Mimulus moschatus*) is easily propagated, either by seeds or by portions of the underground stems, any time in the spring or autumn. You have nothing to do but throw the seeds down in a damp place, and they will spring up and take care of themselves. *Aster argophyllus* (the Musk-shrub), is increased by cuttings of the young wood put in sand and placed in a Cucumber or Melon-frame, and covered with a bell-glass any time when young wood can be procured from off the old plant. *—*F. B.*—1, *Lonicera tatarica rubra*; 2, *Pimelia rosea*; 3, *Muraltia Heisteria*; 4, *Rubus arcticus*; 5, *Caragana arborescens*; 6, *Helichrysum sesamoides*; 7, *Phenocoma prolifera*; 8, *Epacris grandiflora*; 9, *Cytisus ruthenicus*; 10, *Clinanthus puniceus*; 11, *Keria japonica*. *—*A Young Gardener.*—1, *Edwardsia microphylla*; 2, *Podalyria calyptrata*; 3, *Indigofera australis*; 4, an *Acacia*, without flowers. *—*A Subscriber.*—Your seed belongs to *Araucaria imbricata*, a hardy evergreen tree. For the mode of proceeding with it, see our Index for 1842. *Ipomoea Michauxii* is quite different from *Convolvulus major*; it is a perennial, with a great tuberous root. *—*J. Griffin.*—Your plant is *Leptotes bicolor*, and not a *Brassavola*. *—*Shropshire.*—We have your proposition under consideration; our opinion is the same as your own, but there are difficulties.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

HER MAJESTY'S ACCOUCHEMENT and the birth of another PRINCESS must be already known in all parts of the kingdom; we have, therefore, only to congratulate our readers on the occurrence, and to express our satisfaction that the daily bulletins give the most favourable reports of her Majesty and the infant Princess.—The funeral of the Duke of Sussex is understood to be fixed for Thursday next: it will take place, in accordance with the express desire of his Royal Highness, in the cemetery at Kensal Green. The ceremony of lying in state is at present fixed for Wednesday, but the order of the funeral procession does not appear to be finally settled. The Lord Chamberlain has given orders for the Court to go into mourning for three weeks, and the Earl Marshal has issued the usual notice for a general mourning for ten days, commencing from Sunday last.—In Parliament, the congratulations of both Houses on the birth of a Princess, and addresses of condolence on the death of the Duke of Sussex, have been unanimously voted to her Majesty. The leading Members of both Houses took advantage of the opportunity to bear testimony to the domestic virtues and example of the Queen, and to the memory of the Duke of Sussex, who during a long life had been the patron of science, literature, and the arts, and the warm supporter of every charitable institution. The proceedings in the House of Commons during the week have been chiefly of a routine character. Sir R. Peel announced on Tuesday, that the long-protracted negotiations with Portugal have been "interrupted" by the Portuguese Government; and that the mission of Mr. Ellis to the Court of Brazil for the re-adjustment of commercial relations has hitherto been unsuccessful. On the same night, Mr. Ricardo's motion for an address to the Queen, on the remission of the import duties, was negatived by a majority of 74. On Wednesday, Lord J. Russell moved the second reading of his Municipal Corporations' Bill, which was opposed by Sir J. Graham, and lost on a division, by a minority of 53. The second reading of the Ecclesiastical Courts Bill was carried last night by a majority of 82.

From France, we have the particulars of the marriage of the Princess Clementine to Prince Augustus of Saxe Coburg, and an announcement that the French Court will go into mourning next week for the Duke of Sussex.—In Spain, great uncertainty still prevails in regard to the organisation of the Cabinet, and nothing of a decisive character is yet known.—The German papers give long

accounts of an insurrection at Dantzic, which for some time assumed a formidable aspect; the troops, however, succeeded in suppressing the movement, and tranquillity is again restored.—The Servian question is still the absorbing topic in the Levant, and there is no longer any doubt that the Emperor of Russia will insist on a new election. The deposition of the present Sovereign is generally anticipated, and the restoration of Prince Milosch is mentioned as by no means an improbable event.

Home News.

ACCOUCHEMENT OF HER MAJESTY.—On Tuesday morning at four o'clock, the Queen was safely delivered of a Princess. In the room with her Majesty were his Royal Highness Prince Albert, Dr. Locock, and Mrs. Lilly, the monthly nurse; and in the rooms adjoining were the other medical attendants, Sir James Clark and Dr. Ferguson; and the Earl of Liverpool, lord steward of her Majesty's household. The news was immediately made known to the town by the firing of the Park and Tower guns; and the Privy Council being assembled as soon as possible, it was ordered that a form of thanksgiving for the Queen's safe delivery of a Princess be prepared by the Archbishop of Canterbury, to be used in all churches and chapels throughout England and Wales, on Sunday, the 30th inst., or the Sunday after the respective ministers shall receive the same. It appears that on Sunday morning, her Majesty and Prince Albert attended divine service in the chapel of Buckingham Palace, and after luncheon walked in the garden for more than an hour, without any appearance of fatigue. There were no guests at the Royal table that day, and the Queen retired at the customary hour. In the course of the forenoon on Monday, her Majesty gave audience to Sir R. Peel on official affairs, and in the afternoon visits of condolence on the death of the Duke of Sussex were paid by the Duchess of Kent, and other members of the Royal family. About nine o'clock her Majesty rose from table, and on leaving the saloon, the attendance of Sir James Clark was recommended. Sir James decided that Dr. Locock should be sent for; that gentleman arrived at the Palace soon after ten o'clock, and her Majesty retired to bed, enjoying some refreshing sleep until within a few minutes of three o'clock, when the symptoms of uneasiness having returned, Mrs. Lilly summoned Dr. Locock, and after the lapse of an hour, her Majesty was safely delivered of a daughter. Prince Albert, Dr. Locock, and Mrs. Lilly, were the only persons admitted, all the principal personages of the household being in the ante-chamber. The young Princess is reported to be a fine healthy child, the features somewhat larger, and the frame more fully developed than were those of the Princess Royal, her Majesty's first child. The news of her Majesty's safe delivery was communicated immediately to the Lord Chamberlain, and special messengers were despatched to the residences of the various members of the Royal Family, the Cabinet Ministers, the Lord Chancellor, the Archbishop of Canterbury, &c. charged with the bulletin announcing the event. Between seven and eight o'clock Sir R. Peel arrived at the palace, and was quickly followed by the Earl of Aberdeen, the Earl of Ripon, Lord Stanley, Sir J. Graham, the Chancellor of the Exchequer, the Duke of Buccleuch, and the Lord Chancellor, to offer congratulation on the joyful occasion. The intelligence had spread all over the metropolis before nine o'clock, at which time the Park and Tower guns fired royal salutes of 21 guns. The bells of the several churches rung a merry peal, and the shipping of all nations lying in the river displayed their respective ensigns. The immediate vicinity of the palace was thronged throughout the day by persons anxious to learn the state of her Majesty's health. From twelve till five o'clock the nobility and gentry were continually arriving to make inquiries, and leave their names at the Lodge. Queen's Messengers were despatched from the Foreign Office with despatches, announcing the event to the Kings of Hanover and Belgium. The bulletins since issued announce that her Majesty and the infant Princess are going on perfectly well. It is understood that the customary rejoicings incident to the accouchement of a Queen will, in this instance, be postponed until after the funeral of his Royal Highness the Duke of Sussex.

Form of Prayer.—The following is the form of prayer and thanksgiving to Almighty God for the safe delivery of the Queen, and the happy birth of a Princess: "O Merciful Lord and Heavenly Father, by whose gracious gift mankind is increased, we most humbly offer unto Thee our hearty thanks for Thy great goodness vouchsafed to Thy people, in delivering Thy servant our Sovereign Lady the Queen from the perils of childbirth, and giving her the blessing of a daughter. Continue, we beseech Thee, Thy fatherly care over her; support and comfort her in the hours of weakness, and day by day renew her strength. Preserve the infant Princess from whatever is hurtful either to body or soul, and adorn her as she advances in years with every Christian virtue. Regard with Thine especial favour our Queen and her Royal consort, that they may long live together in the enjoyment of all earthly happiness, and may finally be made partakers of everlasting glory. Implant in the hearts of Thy people a deep sense of Thy manifold mercies, and give us grace to show forth our thankfulness by dutiful affection to our Sovereign, by brotherly love one towards another, and by constant obedience to Thy commandments; so that passing through this life in Thy faith and fear, we may in the life to come be received into Thy heavenly kingdom, through the merits and mediation of Thy blessed Son, Jesus Christ, our Lord. Amen."

The Duke of Sussex.—The necessary arrangements for the funeral of his Royal Highness have been completed by the Lord Chamberlain. The express desire on the part of his Royal Highness that his remains should be deposited in the cemetery at Kensal-green, appears to have created some difficulty up to the present time; but, through the gracious permission of her Majesty, the only obstacle which might previously have existed to the entire fulfilment of the Duke's wish has been completely removed, and the ceremony is appointed to take place on Thursday, the 4th May, in the cemetery at Kensal-green. It has been arranged that the coffin should be deposited in the principal catacombs, under the western chapel, until a mausoleum can be erected for its reception. Her Majesty has further expressed her particular desire that no curtailment of the ceremony usually attendant upon royal funerals should take place in the interment of his Royal Highness, and the whole of the arrangements will, in consequence, be conducted on the usual scale of magnificence. Unlike royal funerals of late years, the present ceremony is appointed to take place at an early hour in the day. This arrangement will give the public an opportunity seldom met with, of witnessing the procession throughout the whole line of road, from Kensington to Kensal-green. The procession, after entering, will not leave the chapel, the entrance to the catacombs being immediately beneath the altar. The following fact, in connexion with his Royal Highness, may serve to explain his predilection for this cemetery. It appears that his Royal Highness has been in the frequent habit of visiting the grounds since their formation in 1832, and more particularly during the last three or four years. He generally came attended by few of his suite, and spent a considerable time in examining the various improvements and works in progress, in which he appeared to take great interest, and on more than one occasion he has remarked to the attendants that when it pleased Providence to call him he would certainly be buried there. Some time since, a German friend of the Duke's, named Count Von Schulenburg, died shortly after his arrival in the country on a visit to his Royal Highness. The Duke was much affected by his death, and himself selected his grave in the Kensal-green cemetery, where a neat monument, inclosed in an iron railing, has been erected. The ceremony of lying-in-state is at present fixed for Wednesday next, at Kensington-palace. The state apartments are now fitting up with the usual appurtenances, and it is expected that they will be completed this week. The public will enter through the court-yard of that portion of the building lately occupied by the Duchess of Kent, and proceeding through the hall, mount the grand staircase, which opens directly upon the state apartments. This room will be hung with black velvet and lighted with wax tapers. The next, and principal apartment, will contain the coffin, bearing the ducal coronet, and covered with a pall ornamented with the escutcheons of his Royal Highness. This room will also be hung with festoons of black velvet, and lead into a third apartment similarly decorated, from which visitors will pass through another suite of rooms into Kensington-gardens. By this arrangement every facility will be afforded to the public, who will be enabled to witness the ceremony without inconvenience.

General Mourning.—Orders have been issued by the Lord Chamberlain for the Court to go into mourning from Sunday last, the 23d inst., for his late Royal Highness the Duke of Sussex; to change the mourning on Sunday, May 7th, and to go out of mourning on Sunday May 14th. The Duke of Norfolk, as Earl Marshal, has issued an order for a general mourning, stating that it is expected that all persons do put themselves into decent mourning, for ten days, to commence from Sunday the 23d inst.—The Adjt.-Gen., and the Secretary of the Admiralty have given notice that Her Majesty does not require the Officers of the public services to wear any other mourning than a black crape round the left arm, with their uniforms.

The Levée.—The Gazette of Tuesday announces that the Levée intended to have been held by his Royal Highness Prince Albert, at St. James's Palace, on Wednesday last, has been postponed to Wednesday, the 17th of May, at 2 o'clock.

Parliamentary Movements.—The election for East Suffolk has terminated in the return of Lord Rendlesham; the numbers were for his Lordship 2,952; for Mr. Adair, 1,818; majority, 1,134.—A vacancy has occurred in the representation of Salisbury, by Mr. Brodie's acceptance of the Children Hundreds, and Mr. E. P. Bouverie has come forward as a candidate on the Liberal interest.

Chinese Missions.—The Bishop of London intends issuing a pastoral letter to the clergy of his diocese, directing that collections shall be made in every church and chapel on the Sunday after Ascension-day, in aid of the fund for providing religious instruction in conformity with the principles of the Church of England, in China. A similar course is likely to be adopted by the other bishops.

Foreign.

FRANCE.—The Paris papers bring no news of importance, and are occupied to a certain extent by the state of the vinegrowers of France, brought under the notice of the Chamber on Saturday by M. Mauguin. The principal item of the contents of these journals is the rejection of the appeal to the Court of Cassation of a Protestant clergyman, the Rev. M. Roussel, against a decision of the Court of Versailles, which had declared him disqualified to exercise his functions as pastor at Senneville, because of his having four years previously voluntarily ceased to perform his clerical duties. The Paris press is nearly unanimous in condemning this decree of the Court of Cassation. The Minister of Marine has asked for

240,000Z.—five millions of francs—for the expense of establishments at the Marquesas and Tahiti. He estimated the annual expense at 100,000Z. a year. The force to be sent was 1,200 men. The Minister referred to the missionaries as follows:—"For a long time English missionaries have been established in the Society Islands, and to their efforts, which preceded those of our own missionaries, is owing the more advanced state of civilization in Tahiti. The good which they have done, and may yet do, gives them a right to the protection of the French Government. This they shall have in all its plenitude. On the other hand, we are happy to think that French influence will find in these foreign missionaries auxiliaries devoted to the cause of civilization, which it is the great object to defend." The journals of Monday contain a letter addressed by Prince Louis Bonaparte to a provincial print, on the rumour reaching him that an amnesty to political offenders was contemplated on the occasion of the marriage of the Princess Clementine of Orleans, or of the King's fête. The contents of the epistle are, we regret to say, anything but calculated to shorten the period of his captivity. It concludes with the following paragraph:—"Banished for twenty-five years past, twice betrayed by fortune, I am acquainted with all the vicissitudes and sorrows of this life, and, having no more the illusions of youth, I find in the native air I breathe, in study, and in the repose of my prison, a charm which I felt not when I shared the enjoyments of foreign nations, and vanquished, drank in the same cup as the conquerors of Waterloo. In short, if the opportunity offered, I should repeat what I said before the Court of Peers, 'I will have no generosity, for I know what it costs the object of it.'"—The marriage of her Royal Highness the Princess Clementine with his Serene Highness the Prince Augustus of Saxe Coburg Gotha took place on Thursday evening, at the Palace of St. Cloud. The royal family and the witnesses having taken their places round a circular table, Baron Pasquier, Chancellor of France, read the civil-marriage ceremony, and, after having received from Prince Augustus and the Princess Clementine the declaration required by the civil code, declared, in the name of the law, that the Prince and Princess were united in marriage. The signatures to the certificate of marriage were then affixed. The august pair, their Majesties, the Princes and Princesses, and the witnesses, having signed, the certificate was completed by the President of the Council of Ministers, the Keeper of the Seals, the Minister of Foreign Affairs, the Chancellor, and the Grand Referendary. Immediately after the signing of the civil act, their Majesties, the Royal Family, and all the assembly, proceeded to the chapel, where the Bishop of Versailles performed the religious marriage ceremony. Prince Augustus is nephew of the reigning Duke of Saxe Coburg Gotha, of the King of the Belgians, of the Duchess of Kent, and of the Grand Duchess Anna Feodorovna, widow of the Grand Duke Constantine, brother of the Emperor of Russia. He is also brother of the King of Portugal, and the Duchess de Nemours, and cousin-german of Prince Albert. He is in his 24th year, having been born on the 13th June, 1818, and is about one year younger than his bride, who was born on the 3d June, 1817. The *Moniteur* announces that the Court will, on the 2d May, go into mourning for eleven days for his Royal Highness the Duke of Sussex.

SPAIN.—The accounts from Madrid are of the 17th inst. They state that the Cortes were still occupied in the verification of election returns. 99 deputies had been declared duly elected within the preceding two days, amongst them the celebrated Señor Prim, deputy for Tarragona, recently deprived of his commission of colonel, for his conduct during the late revolt at Barcelona. Nothing had been arranged relative to the formation of a new Ministry. A list, however, had been circulated, containing the names of M. Campuzano, as President and Minister for Foreign Affairs; M. Alonso, Justice; General Iriarte, the Interior; General Chacon, War; M. Pita Pizarro, Finance; General Capaz, Marine; M. Joachim Lopez, President of the Congress. It was believed that if Don Joachim Lopez should join the Regent's friends, a Ministry might be constituted which could carry on the government without difficulty. In the meantime the existing Ministers were not idle; they were preparing to introduce two important bills to the Chamber of Deputies; one to define the law of libel, the other, for the establishment of banks throughout the country; into which it was intended to introduce a provision to secure the capital subscribed by foreign capitalists, in the same manner as the property of foreigners vested in mining companies is protected. An immense harvest is expected throughout Spain, in consequence of the abundant rains during the spring months.—The Regent returned the visit of the Infante Don Francisco de Paula on the 9th. Their meeting appears to have been very cool. The Regent said to the Prince, "Our characters are reversed; I, a man of the people, am obliged to defend the throne; and you, an Infante of Spain, now side with the Opposition, arrayed against the Government and the Queen."

PORTUGAL.—We have accounts from Lisbon to the 17th inst., by the Liverpool steamer, which has brought home some of the officers and engineers belonging to the Solway steamer, lost off Corunna on the night of the 7th, who were taken to Lisbon by the French government steamer *Erèbe* and *Eglantine* gun-brig. It was known at Lisbon that the British Government had rejected the Portuguese proposals, at a Cabinet Council held on the 8th; and, in fact, the Portuguese Foreign Secretary had authorized the official journal to announce the "interruption" of the negotiations. The papers announced that a treaty had been signed at London between Portugal and the Ottoman Porte.

GERMANY.—Letters from Hamburg announce that serious disturbances broke out in Dantzic on the 12th and 13th inst., chiefly owing to the dissatisfaction of the lower classes at the late concessions made to Russia in the transit trade, without any relaxation of her prohibitive measures. Groups of several thousands marched through the town, committing various excesses, the police being unable to control them. The troops were called out on the 14th; a regiment of the Hussars was sent against the mob, one man was killed and many people were wounded. The movement altogether seems to have been most formidable, but tranquillity was restored at the date of the last advices.—The King of Prussia has made a proposition to the Diet of Posen, which has given general satisfaction. The proposition is, that the King, out of his private purse, will give the province the considerable sum of 600,000 dollars, for the purpose of improving public roads, on condition that the province raises the same sum, for the same purposes, within fifteen years from this time. The Diet has gratefully accepted this offer, and in this way the public roads in the province will gain an increase of about 400 English miles for the sum of 1,200,000 dollars, which will be no burden to the country.—From Vienna we learn that the report read at the last meeting of the Company for Steam Navigation on the Danube did not present satisfactory results. The expenses have exceeded the receipts upon the two lines of Orsova to Gallatz, and from that town to the sea.—A joint-stock company has been organised in the Rhenish provinces for the purchase of a considerable tract of land in the republic of Texas, in order to establish a new German colony.

SWITZERLAND.—A plot for overturning the government of Tessino has been defeated by the Piedmontese government, which seized at Arona a large quantity of guns and ammunition, sent from Lombardy, and intended to be despatched up the lake to be ready for the insurgents.—The principal hotel-keepers of Berne, Fribourg, Geneva, the Valais, &c., had a meeting on the 3d inst., at Zofingen, for the purpose of adopting some regulations for the establishment of a uniform rate of charges at the hotels in Switzerland. It was admitted by persons present, that a system of high charges was prejudicial to their interests, and a moderate tariff was agreed upon.

ITALY.—Letters from Rome mention the death of Cardinal Giustiniani, the Cardinal Chamberlain of the Papal States. His Eminence is succeeded by Cardinal Riaro Sforza, the late delegate of Pesaro and Urbino.—From Naples we learn that the number of passengers on the railway between that place and Castellamare increases daily. For the first two months this year the number amounted to 116,912. His Majesty seems much inclined to extend the Caserta railroad to Gaeta, which would be the first step to a farther continuation—first, to Terracina, and finally, to Rome. Although such a measure can hardly be expected to prove a profitable or important undertaking in a commercial point of view, it would afford so much accommodation and gain of time to travellers, that no doubt their number would soon increase to more than double the present amount.—A private company has lately been formed, and chartered by the Pope, for the purpose of constructing a railway from Rome to Porto d'Anzo, the ancient Volscian seaport of Antium, which is now undergoing extensive repairs and improvements by order of the Papal Government. Should this plan be put into execution, the distance being only about 36 English miles, over remarkably level grounds, it is feared that it will essentially injure the flourishing business of Civita Vecchia, and even of Leghorn. Twenty years ago Porto d'Anzo consisted only of a few hamlets, inhabited by poor fishermen, but through the energetic activity of Cardinal Gastaldi, treasurer under Pius VII. and Leo XII., it is now a flourishing town of upwards of 1,000 inhabitants, and promises fair to become the most important seaport, particularly for trade with Africa, within the Papal dominions.

DENMARK.—The Copenhagen papers state, that on Good Friday a deputation of upwards of 250 students of the University waited upon the celebrated sculptor Thorwaldsen, for the purpose of thanking him for his declared intention to commence immediately a colossal statue of Martin Luther for the cathedral in that city, which is already so rich in works of that great artist. The papers are full of discussions on the propriety and necessity of abolishing slavery in the Danish West India islands.

GREECE.—Letters from Athens of the 10th inst. state, that Russia had replied to the application for a loan made by King Otho, that the Emperor was determined not to incur any further useless sacrifices for the sake of the Hellenic Government. The outcry against the Bavarians and the system of administration was still loud and general throughout the country. On Palm Sunday the Bishop of Gibraltar, assisted by seven clergymen of the Church of England, consecrated the new Protestant church at Athens, in presence of the Duchess of Oldenburg, the Queen's sister, and a number of English residents and travellers.

TURKEY.—The Levant mail has brought letters from Constantinople of the 7th inst., which possess great interest, inasmuch as they confirm the statements of the German prints as to the critical aspect which the Servian question has assumed. The Emperor of Russia's ultimatum was communicated to the Porte on the 30th ult., its substance being as stern and its language as arrogant as had been represented. Nor have our German contemporaries erred in stating that the Austrian Government has determined on supporting the pretensions of Russia. A letter, dated Vienna, the 15th inst., has appeared in the Nuremberg papers, affirming that the European Powers were all agreed as to the Servian question, and that the Porte must, consequently, comply with the demand of

Russia for a new election. The opinion of the restoration of Prince Milosch gains ground, as equally acceptable to Austria and Russia. An insurrection in his favour has already been organised at Schaback.—The accounts from Syria state that Bishop Alexander has obtained from the authorities of Beyrout permission to go on with the building of the church he had commenced in the Holy City.

INDIA AND CHINA.—An extra Indian mail which left Calcutta on the 5th ult. has arrived, but it brings no news of importance. Major Frazer, who is one of the passengers, bears magnificent presents to her Majesty, from the King of Lahore, said to be in value 12,000l. There is little political intelligence by this arrival, except that Akbar Khan was again beginning to move, and meditated a descent upon the Sikh possessions beyond the Indus, Peshawur being considered in danger of a visit, in which case the British would have to assist their ally. The Barukzyes are now supreme in Afghanistan. The Candahar Sirdars have returned to their capital, Suftur Jung being a prisoner in their hands. The British Government have acknowledged, in Gwalior, Jeeabjee Rao Scindiah, the Raene's eldest son. From China there is no news whatever.

UNITED STATES.—By the New York packet-ship Independence, which arrived at Liverpool on Monday, we have New York papers to the 7th inst. They contain some long correspondence—first, between Mr. Webster and Mr. Everett, the American Minister in London, in which the American views with regard to the right of visit are discussed. Another correspondence also appears upon the seizure of an American citizen by a British officer, on the American side of the lately settled boundary; which, however, a short statement from Mr. Fox would appear to set at rest. The act appears to have been, on the part of the British officer, unsanctioned and officious, but gives Mr. Webster an opportunity of enlarging on the supposed infringement of one of the conditions of the boundary question.—There is no political news from Canada. Sir C. Bagot was still alive, but with slight hopes of ultimate recovery. Sir C. Metcalfe had entered on the duties of his government.

WEST INDIES.—The Medway steamer has arrived with some further particulars of the revolution in St. Domingo, which, as mentioned in our last, has at length come to a crisis in the flight of President Boyer. The ex-President, Jean Pierre Boyer, with 32 of his adherents, having sought shelter in one of Her Majesty's ships, arrived at Kingston on the 19th ultimo, on board the Scylla. He had been driven to this step by the resistance offered to the means he had adopted to get rid of the opposition to the measures of his Government in the National Legislature. At the head of this opposition was the Senator Dumelle, the representative of the province of Aux Cayes, who on five different occasions had been forcibly expelled from the Senate Chamber at the point of the bayonet, and on each occasion had been triumphantly re-elected by his original constituents. It is not known who is likely to be the new President of the Republic.—In regard to the late earthquake, the islands which have suffered are stated to be—Guadeloupe, Antigua, Nevis, Montserrat, Barbuda, St. Kitt's, St. Bart's, St. Eustatia, and St. Martin; the amount of British property destroyed is estimated at 3,000,000l. sterling; French, 1,000,000l.; Swedish, 300,000l.; and Dutch, 800,000l. Public thanksgivings had been observed in all the islands which had escaped the calamity.—The Medway was nearly lost off Saba Island, on her passage from St. Thomas. She was going at the rate of ten knots an hour, and was on the rock before it was discovered. Her engine was immediately stopped so as to reduce her speed and render her manageable, which saved her; otherwise, it is said, all hands might have perished.

Parliament.

HOUSE OF LORDS.

Tuesday.—The House sat this evening for the first time since the recess. The Schoolmasters (Scotland) and the Kensington Parish Bills were read a first time.

Lord MONTAGUE moved for a return showing the number of pauper lunatics in Ireland, and complained of the practice there of confining lunatics in the gaols. He recommended the Government to take care, in their measure for the improvement of the Irish Poor-law, that the confinement of pauper lunatics in the poorhouses should be prohibited.—The Duke of WELLINGTON promised that, in the measure to which Lord Montague referred, the fullest weight would be given to his suggestions, and the returns were ordered.

The Duke of WELLINGTON said—"Your Lordships have all heard the joyful event which has been announced to the public this day—I mean the birth of a Princess. I take the earliest opportunity, according to usage, of moving an Address of congratulation to her Majesty. I therefore move that an humble Address be presented to her Majesty to congratulate her Majesty on the birth of another Princess, and to assure her Majesty that every addition to her domestic happiness affords the highest satisfaction to the House of Lords."—The Address was agreed to without a dissentient word.

The Lord CHANCELLOR stated, in reply to questions by Lord Campbell, that he had prepared a Bill on the subject of the Plea of Insanity, which had also been considered by the law-officers of the Crown; but that he thought it better not to lay it on the table until the opinion of the Judges had been taken. He said that he had requested the Chief Justice of the Common Pleas to consult the other Judges as to the time when it would be convenient for them to attend, and had not yet received a definite answer. No delay would be had in consulting them on this subject, and on the question of the Irish Marriages.

Thursday.—The Duke of WELLINGTON moved an address of condolence to her Majesty on the death of the Duke of Sussex, and lauded the memory of the illustrious Prince, who had, during a long life, been the patron of science, literature, and arts, and the warm supporter of every benevolent institution.—The Marquess of LANSDOWNE seconded the motion, and in doing so, added his testimony to the character of his late Royal Highness.—The Marquess of NORTHAMPTON, on the part of the Royal Society, expressed concurrence in the address, and regret for the great loss which her Majesty and the country had sustained. The address was then agreed to unanimously.

Friday.—Lord WHARNcliffe laid on the table a copy of the convention between France and this country relative to the Post-office communications between the two countries.—Lord CAMPBELL moved the second reading of his bill for facilitating the conveyance of real property, by abbreviating the legal phraseology and processes. He proposed that solicitors should be paid according to the value of their services, and not according to length of documents. The Lord CHANCELLOR, Lords LANGDALE and COTTENHAM, opposed the bill, which was rejected without a division.

HOUSE OF COMMONS.

Monday.—The House of Commons re-assembled after the Easter recess. Sir J. GRAHAM gave notice that on Monday next he would state the alterations he intended to propose in the educational clauses of the Factories Bill. On that day, therefore, he should propose to go into committee *pro forma*, in order to be enabled to put the House in possession of the details of the proposed alterations.—The CHANCELLOR of the EXCHEQUER intimated his intention of making his financial statement on the 8th May.—Sir JAMES GRAHAM, in reply to Sir John Easthope, said that Church-rate returns from 10,000 out of the 12,000 parishes of England had been received, and would be shortly laid on the table of the House.—Lord STANLEY, in reply to Lord John Russell, intimated, that in a day or two he would state when he would be able to introduce the Canadian Corn bill. He promised also to supply the House with information on the subject of the duties imposed by the Assembly of Jamaica on the produce of the United Kingdom—a proceeding which he considered most objectionable.

On the motion for going into a committee of supply, Mr. WILLIAMS made a lengthened statement, with relation to the financial management of the Chancellor of the Exchequer, and in the course of which he argued that our colonies, especially those of the West Indies, were an enormous expense to this country.—Mr. BERNAL said that it was a mistake to suppose that our West India colonies were expensive to this country. They, in fact, contributed mainly to their own expenditure, in proof of which he adduced the fact, that his own property in Jamaica was taxed to an amount five times greater than the returns he received from it.—Lord STANLEY agreed with the general principle that colonies should be made to contribute as far as possible to their own expenditure; many of the colonies were already doing so to a great extent.—Sir HOWARD DOUGLAS complained of the insufficiency of funds in the colonies for the purpose of spreading the gospel. The Church Missionary Society was not only unable to send out additional missionaries, but could not even keep faith with those already sent out.

The Lord MAYOR made inquiry respecting the powers of the Government with respect to emigration, in reply to which—Lord STANLEY expressed the uneasiness he felt at the hardships to which the intended emigrants to Prince Edward's Island had been exposed, as evinced by the proceedings at the Mansion-house, which we noticed in our last. But the fact was, that the Government had interfered in this very case to the utmost extent of its powers. In October last they had received information which led them to suppose that in the case of the emigrants who were going out by the ship Barbadoes, some deception was going on, and the Government emigration agent had been directed to inquire into the matter, and to give every assistance to the emigrants. It turned out that the vessel was well found; that she had an abundant supply of provisions; and that, in fact, the requirements of the Passengers' Act had been carefully complied with. The British American Colonization Association had represented that they had purchased 72,000 acres of land in Prince Edward's Island; and as this land was alleged to have been purchased from private individuals, and not from the Government, there was no immediate means of ascertaining the fact. The emigration commissioners had even gone beyond their powers in this case. They remonstrated with the company; represented to them the period of the year which rendered the attempt extremely hazardous; but they were met by assurances that every possible precaution had been taken. The Government, however, had sent out information to the Governor of Prince Edward's Island, with instructions, that if the vessel should arrive, he was to afford every protection to the emigrants, and to compel the company to perform towards them the obligations which it had undertaken. The ship sailed on the 1st November, and on the 13th December was driven back to the Cove of Cork. The emigration agent in that port, on inquiry, had ascertained that it was the intention of the company to support the emigrants on board until the ship should again be ready for sea, and that it should be once more provisioned for the voyage. It had been represented in February that the vessel would sail in March, and yet at that very time the mortgage was in possession of the vessel. This was a distinct fraud. Application had been made to the Treasury for its interference, and the Crown Solicitor was employed; but on the dissolution of the company it was found impracticable to obtain a legal remedy. The company, however, had been sanctioned by gentlemen of high station, whose names must have concurred to enabling it to inflict the hardship and suffering which the sufferers had endured; and if not legally liable he trusted that they would at least feel the moral obligation they were under, to repair the mischief of which they had been the instruments.

The House then went into a committee of supply, proceeding with those estimates which remained over from before the recess. The votes for the expenses of the Governments of New Zealand, and of the West India Islands, raised some conversation, and on the grant for our consular establishments, after some remarks from Mr. WILLIAMS, Dr. BOWRING called attention to the great importance of rendering our consular representatives efficient for their duty by previous education, especially the necessity of a consul being able to speak the language of the country in which he is stationed.—Lord STANLEY admitted the importance of the subject, which was at present under the consideration of the Government. A number of votes passed, with some general conversation; but on the vote for the expenses of the steam navigation to India, by way of the Red Sea, after some remarks from Dr. BOWRING, Sir R. PEEL warmly culminated the liberal conduct of the Pacha of Egypt, who, under circumstances calculated to make him think that we were opposed to his interests, had manifested a very enlightened spirit, in the facilities he had afforded to our transit through Egypt, and across the Isthmus.—Sir C. NAPIER concurred in the compliment thus paid to the Pacha of Egypt. The remaining votes having been agreed to, the Chairman reported progress, and the House resumed.—The other orders were then disposed of.

Tuesday.—A large number of petitions were presented, the greater proportion of which were against the educational clauses of the Factories Bill. A private bill, the South Eastern and London and Croydon Railways Bill, occupied the House some time, but after a division the report was received.

Sir J. GRAHAM, in reply to Mr. MACAULAY, intimated his intention of introducing, during the present session, a bill for the better regulation of the medical profession.

Sir R. PEEL, in reply to Mr. EWART, took the opportunity of giving some account of our negotiations with Portugal and the Brazils, for the purpose of effecting commercial treaties. With Portugal, we had proposed to reduce our duties on wine, fruit, brandy, and other articles, in return for a corresponding reduction on our cottons, woollens, hardware, linen, glass, porcelain, &c., to about 10 per cent., *ad valorem*, on the more important articles, and 25 and 30 per cent., on others. But the long protracted negotiation had proved unsuccessful—a public announcement having been made by the Portuguese Government that it had been broken off. With the Brazils, that Government had acceded to our interpretation of the duration of the existing treaty, which, accordingly, will not terminate till November, 1844. But our proposals for a re-adjustment of commercial relations had been met by the Brazilian Government with a demand that the agricultural produce of the Brazils—sugar, tobacco, &c., should be admitted on terms equivalent to those levied on our

own colonial produce. When Mr. Ellis intimated his inability to comply with this demand, it was then required that the maximum of any differential duty should not exceed by ten per cent. the rates on our colonial produce. This also could not be conceded, and the negotiation was, therefore, suspended.—A short conversation followed on this subject; after which,

Sir R. PEEL, with a brief but kindly expression of regard for the character and virtues of the Duke of Sussex, moved an address of condolence and sympathy with her Majesty on the melancholy event.—Lord J. RUSSELL seconded the motion, adding his personal testimony to the character of his late Royal Highness.—The address was carried unanimously; and

Sir R. PEEL moved an address of congratulation to her Majesty on the birth of a Princess, adding a few words expressive of admiration of the domestic character and example of the Queen.—Lord J. RUSSELL seconded this; and it was carried unanimously.

Mr. RICARDO then brought forward his motion, that a humble address be presented to her Majesty, respectfully expressing the opinion of this House that it is not expedient that any contemplated remission of import duties be postponed, with the view of making such remission a basis of commercial negotiations with foreign countries. He quoted the opinions of Sir R. Peel on introducing the new tariff; pointed to the condition of our commerce, languishing for want of new markets; and cited the late Mr. D. Hume and Mr. Say, as condemnatory of all higgling about commercial treaties, instead of at once opening our ports to the productions of other countries, and leaving the imports and exports to balance one another. The failure of our efforts to accomplish commercial treaties with France, &c., was one proof of the inefficacy of such a policy, whilst its effect on trade was injurious, by paralysing the branches respecting which negotiations were pending. The great maxim of political economy, from Adam Smith downward, was, that we should buy as cheap and sell as dear as we could; that it was absurd for nations, as for individuals, to make at home what could be purchased cheaper abroad.—Mr. GLADSTONE, at considerable length, argued that the resolution, at any time objectionable, was at this moment, while many commercial negotiations were pending, more particularly so. He could not agree that all the investments of capital and labour in this country were to be overlooked, in order to establish a dogma of political economy.—Lord HOWICK desired to see us reduce our duties without regard to other countries, and to set the example of unconditional free trade, which he proposed, would be speedily followed by other countries, so that in a few years all hostile tariffs would vanish.—Lord SANDON reminded Lord Howick that foreign nations, instead of becoming more convincible to free trade, were growing less inclined to take any article of our manufacture which interfered with their own produce in the smallest degree.—Lord J. RUSSELL, considering that the continuance of the duties on certain excepted articles, at the period of the alteration of the tariff last year, was only defended by the Government on the ground of reserving them as means of obtaining favourable commercial concessions from other countries in negotiations then pending, and considering that these negotiations are now at an end, declared his opinion that now was the time to apply the general principle of the tariff to the excepted articles. He thought that we would stand in a better position with foreign nations if we made those reductions voluntarily, rather than as a subject of bargain and sale; and therefore supported the motion.—Mr. D'ISRAELI and Sir H. DOUGLAS opposed the motion, which was supported by Mr. EWART and Mr. VILLIERS, who said that Mr. D'Israeli had dwelt on the danger of a drain of the precious metals from this country. Such a drain took place when there was a sudden importation of foreign corn, as in 1839; but whenever a trade was established, we paid for our importations with manufactures, as was the case with our more recent importations of corn. Increase our imports, and our exports would follow; we had only to increase the amount of the luxuries and necessities for the general enjoyment of the people, and we would have no occasion to care for the policy of other countries.

Sir R. PEEL expressed his satisfaction with the admission of Mr. Villiers, that, even under a sliding scale, our importations of corn were paid for by manufactures. He would not go into detail on the present occasion, because it would be inconvenient to do so until after the Chancellor of the Exchequer had made his financial statement. But he objected to laying down an abstract principle, after a few hours' debate, affecting most important considerations of revenue. He was particularly surprised that Lord J. Russell should give his support to the motion; he who belonged to a Government which had laboured to bring about commercial arrangements with other countries, and had recently expressed his desire to see one effected with the United States. They had resumed those commercial negotiations with France which had been broken off by the affairs of Syria; were we now to stop short, and tell the French that we were about to effect reductions on their commodities, without reference to any reduction on ours? Would a direct intercourse with France or Portugal not be preferable to an indirect one?—and were we not more likely to excite a taste for our manufactures by obtaining facilities for their direct introduction? But the motion went to exclude them from waiting even for a month, or obtaining any equivalent concession for our reductions. He warned the House against parting with the power of obtaining practical concessions, even for the sake of extending what may be considered to be sound principles. Colonel Torrens, a well-known free-trader, had just issued a postscript to his letter addressed to himself, in which he said that he had mathematically demonstrated the ruinous consequences which would result from a reduction of duties without corresponding concessions; and these opinions Colonel Torrens had drawn from Mr. Ricardo's "Chapter on Foreign Trade." With such divisions amongst the advocates of free trade, the House should be cautious in adopting an abstract resolution.

Mr. CORNEW said that Mr. Ellis had gone out to the Brazils the representative of a monopolist Government; and a Brazilian senator had made a speech, in which he exhibited the people of this country as the slaves of a sordid oligarchy. It was a hopeless errand, also, to send to Portugal—a country too poor to help us. It was not reduction on luxuries, such as port wine, which we wanted, impairing the revenue by it. North and South America, with their corn and sugar, were the fields for this country, if the Government were really in earnest, and were not humbugging the people with pretended negotiations for commercial treaties.—Mr. RICARDO replied; and on a division there appeared—For the motion, 61; against it, 135. Majority, 74.

Tuesday.—After the presentation of a great number of petitions against the education clauses of the Factories' Bill, a petition of the Rev. W. Browne, the chaplain of Knutsford gaol, was ordered to be printed with the votes, and Mr. T. Duncombe gave notice that he would call the attention of the House to the subject on Monday next. The second reading of the Health of Towns' Bill was postponed to Wednesday, the 10th May.

The order of the day for the committee on the Player of Interludes' Bill was discharged with the concurrence of Mr. T. Duncombe, on the representation of Sir J. Graham that he had, in conjunction with Lord Mahon, devoted some attention to the matter, and that his noble friend had a measure in preparation which would probably meet the views of Mr. Duncombe.

Mr. M. GRISON put some questions relative to the recent negotiations with the Brazils and Portugal, which led to a declaration from Sir R. PEEL that he had given all the information he possessed on the subject, on Tuesday. The negotiation was broken off on the ground that Mr. Ellis was not authorized to treat upon the only basis proposed, namely, a differential duty of 10 per cent. In the course of the desultory conversation that ensued, the right hon. Baronet, in allusion to the treaties with Portugal, said the proper construction of the word used by the Portuguese Government with reference to the treaty, was that it had been "interrupted," not broken off. He could not answer for the future, but for the present there was an end of the negotiation.

Lord J. RUSSELL postponed the resolutions of which he had

given notice on the subject of education until Thursday next, as the Secretary for the Home Department intended to make certain amendments of importance in his Factories' Bill, and go into a committee *pro forma* for that purpose. As a great part of his resolutions referred to that bill, he proposed to allow them to lie over till the bill was before the House in its amended form, and till the House had decided on the provisions in a committee. He did not intend to oppose the bill going into a committee *pro forma*, nor when it went really into committee.

Lord J. RUSSELL then moved the second reading of the Municipal Corporations' Bill, and explained at length the objects which he proposed to effect by the measure. The bill had reference to those corporations of England and Wales which had been left untouched by the Municipal Corporation Act, and he trusted that Parliament would adhere to the principle which it had sanctioned by a large majority in legislating for the other corporations in 1835, and would substitute in those also the principle of popular control and of popular election for that of self-election, from which so many abuses had resulted. His wish was to make the change gradual so as to cause no alarm, but, at the same time, gradually put an end to all existing corporations which were formed on the principle of self-election.

Mr. W. WILLIAMS, in supporting the motion, congratulated the noble Lord for having, by his former bill, annihilated what he called those "nests of corruption and local mismanagement," and substituted for them new corporations, founded on the elective franchise. But he did not understand why the noble Lord had left untouched the corporation of the city of London, which exceeded all other corporations in corruption and profligacy. He cited various instances of its extravagance and abuses, and concluded by expressing a hope that it would not long be allowed to continue unreformed.—Sir J. GRAHAM opposed the motion, on the ground that the country was taken quite by surprise by this measure. He had reason to know, from information which he had received that morning, that there were corporate towns which it was intended to affect by the bill; that he had not the slightest notion that it was intended to propose a measure of this description. There were no petitions complaining of any abuses. The date of the report on which the noble Lord relied, was 1835, and immediately preceding the Municipal Reform Bill. The noble Lord had cognisance of these abuses for above eight years. This long delay, while the noble Lord held power, showed that he did not consider these things of which he now complained, to be crying evils; and it would appear that the idea of touching those corporations was at length but an idea taken up in haste. The noble Lord, in bringing forward this bill, relied particularly upon the abuses and corruption alleged to exist in Queenborough. Now he thought that these alleged abuses were such as demanded a searching inquiry, and he had to state further, that the law officers of the Crown were now investigating those charges, for the purpose, if it should seem to them necessary, that they should go before the Court of Chancery and file a bill of discovery against the corporation. With regard to the suggestion that the affairs of the city of London required the mending hand of legislation as much as others, he did not wish to enter upon that question at present; but he must say that there was such a thing as straining at a gnat and swallowing a camel, and that whilst the city of London was allowed to retain all its privileges untouched and unimpaired, it was not too much to ask that a few small boroughs should be also left unharmed. He concluded by moving, as an amendment, that the bill be read a second time this day six months.—The LORD MAYOR defended the corporation of the city of London from the attack made upon it by Mr. Williams; and after some further slight discussion, Lord J. RUSSELL replied. The House then divided.—For the original motion, 46; for the amendment, 99; majority, 53.

The Attorneys and Solicitors Bill went through committee, and the report was ordered to be received on Wednesday.—On the motion of Mr. FRENCH, a select committee was appointed to inquire into the state of the medical charities in Ireland, and to report what alterations appear necessary for the purpose of improving the system under which they are conducted.

Thursday.—After some routine business had been transacted, Mr. L. FOX gave notice that on the 11th May, he would call the attention of the House to the agitation now going on in Ireland upon the Repeal of the Union, and move that it is the duty of the Government to take steps for its immediate suppression.—Mr. GOSNOL gave notice that, on the same day, he would move for a select committee to inquire into public life insurance companies.

Mr. MACKINNON moved for a select committee to ascertain the revenue, expenditure, and condition of the harbours and light-houses on the coast from the Thames to Portsmouth.—Mr. CURTIS seconded the motion, which was supported by Mr. RICE, Capt. PEECH, Sir C. NAPIER, and Mr. HUME.—Sir R. PEEL and Sir E. KNATCHBULL opposed the motion, on the ground that a committee of the House of Commons was the worst tribunal which could be selected for inquiry into such a subject.—Major BERNESFORD moved as an amendment, that the inquiry should be extended to Longwood Fort and Portsmouth. Ultimately, the amendment being withdrawn, the motion was rejected by 79 against 34.

Returns relating to Petty Sessions in England and Wales were ordered, on the motion of Lord WORSLEY.—Mr. JERVIS obtained leave to bring in a Bill for improving the proceedings in the Supreme Courts in certain actions, for amounts not exceeding 20*l.*—Lord ELIOT obtained leave to bring in a Bill to amend and continue the laws relative to the registering of arms, and the importation, manufacture, and sale of arms, gunpowder, and ammunition in Ireland.—The Exchequer-bills Bill passed through committee.

Friday.—The debate on the second reading of the Ecclesiastical Courts' Bill, adjourned from before the Easter recess, was resumed. The bill was supported by Sir GEORGE GREY, the ATTORNEY-GENERAL, Mr. H. VERNON, and Dr. ELPHINSTONE, and opposed by Mr. ESCOTT, Mr. H. FITZROY, Mr. NEWDIGATE, Sir G. SINCLAIR, Mr. COLLETT, and Mr. T. DUNCOMBE.—Sir R. PEEL denounced the union of gentlemen of opposite views on ecclesiastical matters, in hostility to this bill, as unnatural. He said that the Government had undertaken the bill from the most conscientious motives, and in the fairest spirit.—Mr. LABOUCHERE, Mr. HUME, Capt. GLADSTONE, Sir W. H. BARRON, and Mr. ROEBUCK, having declared their intention of voting for the second reading, the House divided, when there were—for the second reading, 186; against it, 104; majority in favour of the bill, 82. It was then read a second time.

CITY.

Money Market, Friday.—Consols left off at 96½ to ½ for money, and 96½ to ½ for account; Three per Cent. Reduced Stock, 95½ to ½; Three-and-half per Cent. Reduced, 101½ to ½; New Three-and-half per Cent. Annuities, 102½ to ½; Bank Stock, 179 to 80; India Stock, 266 to 8; India Bonds, 75s. to 77s. prem.; Exchequer Bills, 66s. to 68s. prem.

Metropolis and its Vicinity.

Loss of the Solway.—All the returns relative to the loss of this vessel having been received, the following statement has been published:—Passengers of all descriptions—lost, 17; saved, 28. Persons belonging to the ship, captain, officers, seamen, engineers, &c.—lost, 18; saved 70. Total—35 lost, 98 saved. It is also announced that the Company's ships will no longer call at Corunna.

The New Library at Lincoln's Inn.—The first stone of the new buildings in Lincoln's Inn was laid on Thursday, the 21st inst., by Vice-Chancellor Knight Bruce,

assisted by Lord Lyndhurst, in the presence of a large assembly. After the ceremony was concluded, a dinner took place in the court of the Lord Chancellor.

The Tower.—For some time past labourers have been employed removing the mud-soil in the southern or river moat of the Tower, preparatory to the building of two extensive aqueducts for the troops. The moat which surrounded the Tower, and which in consequence of the stagnant water in it was sufficient to create an epidemic in the neighbourhood, is now in progress of being filled up, with a view of being converted into grounds for healthful recreation.

Embankment of the Thames.—At the Court of Common Council, on Thursday, the chairman of the Navigation Committee moved the adoption of the report recommending that the City's Seal should be affixed to certain licenses to embank portions of the river Thames, in conformity with the report unanimously approved of by the Court several months ago. The proposed embankments were all in strict accordance with the plan laid down by Mr. Walker and Captain Bullock, assisted by the harbour-masters and other officers of the navigation. After some discussion the report was unanimously adopted.

The late Accident at Blackwall.—On Thursday morning, shortly after two o'clock, as four men were proceeding down the river between Blackwall and Woolwich, in one of the Trinity-House lighters, they observed something floating on the Essex shore which had the appearance of a body. Two of them immediately put off in a small boat, and on nearing the object they discovered it to be the remains of a young man, answering in every respect to the description of Mr. Busfield. The body was floating with the ebb-tide towards Woolwich, and the men lashed a rope round it, and towed it towards Blackwall, where it was immediately recognised as the body of Mr. Busfield. An inquest was held on the same afternoon, when the jury returned a verdict of "Accidentally drowned," accompanied by a censure on the owners of the Blackwall-pier, for leaving it open and unlighted at night.

Easter Holidays.—The number of passengers and amount of receipts taken by the Greenwich Railway Company, during the Easter holidays, is as follows:—On Good Friday, 7,069 passengers, 219*l.*; on Easter Sunday, 8,874 passengers, 334*l.*; on Easter Monday, 24,744 passengers, 765*l.*; on Easter Tuesday, 16,325 passengers, 495*l.*; and on Wednesday, between 6,000 and 7,000 passengers, or 215*l.*; making a total of nearly 70,000 passengers, or 2,030*l.* The greater portion of the passengers availed themselves of the return tickets, which were issued at 1*s.* each. In addition to their having to contend with the steam-boat competition, the railway company had to cope with the rivalry of the omnibus proprietors, who carried passengers from London to Greenwich at the rate of 6*d.* each. The traffic on the railway during the corresponding period of last year, was, on Good Friday, 8,849 passengers, 255*l.*; on Easter Sunday, 8,902 passengers, 249*l.*; on Easter Monday, 19,875 passengers, 530*l.*; on Easter Tuesday, 16,337 passengers, 446*l.*; and on Wednesday, 6,000 passengers, or 210*l.*; making a total of about 64,000 passengers, or 1,780*l.*

Special Poor-Law Commission in St. Pancras.—On Friday Mr. Austen, the barrister—appointed, with the sanction of the Secretary of State, an Assistant Poor-Law Commissioner, for the purpose of inquiring into the case of a Creole pauper, John Jones—held his sitting at the Vestry-rooms, to proceed with the investigation. The attention of the House of Commons was drawn to the case shortly before the recess, Jones having been taken before the Clerkenwell magistrates by the parochial authorities for an alleged assault, whilst labouring under excitement from being refused to be allowed to see his wife, then lying in the Fever Hospital, or to see his child buried. The Commissioner having opened the proceedings, the man John Jones was first sworn, and proceeded to detail the treatment he had received whilst an inmate of St. Pancras workhouse. He said that, although he had committed no crime, he had been locked up in the oakum room with 38 other men, mostly refractory paupers; had his diet reduced to the extent of two ounces of meat per day, three days in a week, and slept in a close room where there were 13 beds, the men sleeping three in a bed, and the only entrance to which was through a trap-door, fastened with a padlock. On Friday, the 7th inst., his wife was removed from the workhouse infirmary to the Fever Hospital, and his child, which had previously died, was to be buried on that day. He applied to the Board for permission to visit his wife in the Fever Hospital, and to see his child buried, but was refused; and on his becoming excited, they ordered him to be turned out of the room, and to be confined in the black-hole. The beadle followed him to the oakum room for that purpose, when Jones drew a knife which he used in picking oakum, and threatened to do for the first that came near him, striking it with such violence on the table that it broke. He was subsequently taken into custody by the police, and conveyed before Mr. Combe, the magistrate, who was informed by Mr. Sparkes, the overseer, that the Board wanted him punished, but the magistrate discharged him. A nurse in the infirmary, and the superintendent of the oakum ward, were examined, and the latter gave Jones an excellent character, and said he never had to make a complaint against him. On the day he was taken before a magistrate he appeared much excited at not being permitted to go and see his wife or his child buried, but did not appear in the least intoxicated. The witness gave evidence as to the insufficient food supplied to paupers in the oakum room, and as to its general management. The investigation was then adjourned, and resumed on Saturday, when Mr. Sparkes, the overseer, was examined. He stated that Jones was extremely violent, both before the Board and after he had

left the room, and that it would be impossible to maintain order in an establishment where there were 1200 or 1400 people, if misconduct were not punished. The beadle confirmed this statement, and deposed that the man was so much excited, that danger was to be apprehended from his violence. The Commissioner said he should adjourn the inquiry in order to make an inspection of the oakum room, the black hole, and other portions of the workhouse, and to examine the director of the poor, and some of the inmates of the establishment. The investigation was then adjourned till Wednesday, when the examination of witnesses was concluded. The commissioner will report on the evidence in a few days.

Taking the Veil.—On Wednesday, two young ladies, Miss Cuddon and Miss Baxter, the latter the daughter of a gentleman residing at Bungay, "took the veil" at the convent of the Sisters of Mercy, in Bermondsey. The former took the name of Sister Mary Theresa, and the latter that of Sister Mary. A great number of Catholic clergy and others were present on the occasion.

Labourers' Friend Society.—On Wednesday, this society, established to ameliorate the condition of labourers, by encouraging the cultivation of allotments of land by the spade in their leisure hours, held its twelfth annual meeting in Exeter-hall, Mr. Thomas Hartley, of Peckham, in the chair. The report for the past year was very voluminous, and stated that in Kent and the southern counties the Society's agent had lately visited 3,000 allotments, cultivated by 3,000 families, among whom there was not one commitment to prison during the two past years. In the midland counties 700 acres were similarly laid out. In Derbyshire, Leicestershire, Northamptonshire, Nottinghamshire, Warwickshire, and Somersetshire, the allotments of land, varying from a rood to two acres, were attended with the most beneficial results to the labouring classes. In Hereford, 12 acres were divided into 48 allotments, and the branch society granted in loans to the cultivators of those patches of land, 2,550*l.*, upon which the borrowers paid 93*l.* 16*s.* 5*d.* interest. To the Bishop of Bath and Wells, Lord Grosvenor, Colonel Langton, of Breslington, the Rev. G. Rees, rector of West Narington, the Rev. B. Whitehead of Chard, and Captain Scobell, the society were greatly indebted for assistance and information. In West Kent there were 200 allotments under cultivation; and in every county where the system was adopted crime disappeared, and the people were mentally, morally, and physically improved. The receipts, including subscriptions and donations, amounted to 711*l.* 11*s.* 6*d.*, and the expenditure left a balance of 29*l.* 4*s.* 11*d.* The report having been adopted, several gentlemen spoke in the highest terms of the allotment system.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, April 15:—West districts, 136; North districts, 175; Central districts, 163; East districts, 166; South districts, 176. Total, 816—(424 males, 392 females.) Weekly average for the last five years, 903—(461 males, 442 females,) and for the last five winters, 1,004.

Provincial News.

Bedford.—The inquiry into the case of poisoning at Wrestlingworth, which we noticed in our last, was resumed and concluded on Friday. In the case of the husband, the surgeons deposed that the body had been exhumed and examined, but they had not discovered any trace of poison. The jury then returned a verdict that "there was no evidence to show whether his death was caused by natural causes or otherwise." The case of the child, Jonas Mead, was next proceeded with, and several witnesses were examined. It appeared that it was about a year old when it died, and was always neglected by the mother. The surgeon stated that he had attended the exhumation of the body, and had since analysed it. He should consider there must have been from two to three grains of arsenic in the body, judging from the quantity obtained by the tests employed; and he was of opinion that that would be sufficient to cause the child's death. He ascribed the preservation of the deceased's stomach to the effect of arsenic. The surgeon of the Bedford Infirmary said he took part in the analysis, and concurred entirely in this opinion. The jury, after an absence of about three quarters of an hour, returned the following verdict:—"That the deceased, Jonas Mead, died from the effects of arsenic, administered to him, with a guilty knowledge, by his mother, Sarah Dazely." The announcement of the verdict was received with evident satisfaction by the crowds assembled in front of the house where the inquest was held, a very strong and general feeling evidently existing against the prisoner.

Bradford.—Mr. John Nicholson, well known in this county by the title of the "Airedale Poet," left Bradford on Thursday evening week with the intention of visiting a relative who resides near Bingley. Having to cross the river Aire at Dixon's mill, near Shipley, it is supposed in the act of going over the stepping-stones, his foot slipped, and he fell into the water, but succeeded in gaining the opposite side, where, on Friday morning, he was found dead. Dr. Steel, of Baildon, examined the body, and gave his opinion that the deceased died of apoplexy, caused by the lower extremities being in the water. He has left a wife and nine children, and was in his 53d year.

Bristol.—We extract the following passage, describing an alarming accident which has happened to Mr. Brunel, from the *Bristol Gazette*:—"It is with deep regret we have to state that the valuable life of this well-known engineer has been placed in jeopardy by an accident arising out of an amiable wish to amuse the children of a friend. The father and Mr. Brunel pretended, by sleight-

of-hand, to pass money from the mouth to the ear, and *vice-versa*, when Mr. Brunel, placing a half-sovereign in his mouth, it unfortunately slipped into the trachea, where it stuck, and every effort to remove it proving ineffectual, Sir B. Brodie has been called in, and an operation, by making an incision in the thorax, determined upon, to be performed yesterday: the result had not to the great regret of his numerous friends in this city, been received when we went to press." We regret to state that the surgeons have not yet succeeded in extracting the coin, and that Mr. Brunel is in great danger.

Gloucester.—At the quarterly court of magistrates, held on Tuesday at the Shire-hall, the question of prison discipline was entered upon. The chairman stated that he had received from the Secretary of State copies of the reports of the commissioners appointed by Government to inquire into the causes which led to the death of the prisoner Beale, to investigate the charges made by other prisoners as to the treatment they had received, and to inquire generally into the management of the Northleach and the other houses of correction in the county. These reports were five in number, but as interest is chiefly attached to the opinions and recommendations of the commissioners in reference to Northleach, we will limit our notice to the report which relates to it. After enumerating the measures which the commissioners had adopted in order to procure evidence, they proceed to state the results. In regard to Beale, the commissioners censure the surgeon for not allowing him extra diet, and for not putting the governor on his guard against employing him on the treadmill. "It is doubtful," they say, "whether Beale's indisposition on his commitment, and in the early part of his imprisonment, was sufficiently apparent to justify our passing any direct censure on the governor for continuing to subject Beale to the labour of the treadmill for a period of more than two months without intermission; but we consider the surgeon to have been remiss in not having put Beale on an improved diet, and in not having paid attention to his clothing and the temperature of his cell during the early stage of the disease." The chairman said that a case of negligence had been made out against Mr. Bedwell, the surgeon, not only in the case of Beale, but in other cases brought forward by the governor in his journal, and he would, therefore, move that he be dismissed. On a division, four voted for dismissal, and a very considerable number for retention. Mr. Bedwell was therefore continued, but with an admonition as to his future conduct. The case of the governor was next taken into consideration, when it was resolved to reprove him and admonish him for the future. In regard to the visiting magistrates, the report stated:—"We are of opinion that the evils which we have described to exist in this prison may be traced to the absence of a salutary and perspicuous code of regulations; to the negligence of some of its officers; and, we feel bound to add, to the want of vigilant superintendence on the part of the visiting magistrates." After some discussion it was resolved, "That the Court were of opinion that the entries in the journal of the visiting justices apparently supported such a charge as that made against them by the commissioners, but that it was a ground of just complaint that they had been excluded from that part of the inquiry which embraced their conduct. Had they been present they would have shown that certain inspections had taken place of which no entry had been made." It was also resolved to substitute the dietary recommended by Sir J. Graham in his general circular to the magistrates of England and Wales, and some minor reforms recommended by the commissioners, such as the abolition of the practice of confining persons subjected to solitary confinement to a dark cell every fifth day, were ordered to be carried into effect. In connexion with certain opinions expressed by the commissioners as to abandoning some of the county houses of correction, as being small and ill-adapted for carrying out improved systems of discipline, the chairman said, that to carry into effect such a scheme would entail an enormous expense upon the county; he would, therefore, move that a committee be appointed to consider the propriety of adopting the following arrangement:—"The appropriation of all the houses of correction in the county to the accommodation of prisoners awaiting their trial at quarter sessions and assizes, and who are sentenced to periods of not more than three months' hard labour, and the reserving the County Gaol and Penitentiary at Gloucester for those who are sentenced to periods of imprisonment of more than three months. This suggestion was adopted, and a report by the visiting magistrates of Northleach was read in reference to the case of Richard Jones, who died the other week, shortly after he had left the house of correction, and whose death the coroner's jury attributed to overwork and ill-usage. It contained the evidence of one of his fellow-prisoners and of the officers of the establishment. The substance was that Jones when seized with illness attributed it to overwork, but that after he had been taken from the wheel he expressed himself pleased with the treatment he received. It is a curious fact that it was frequently referred to in the course of the discussion, that this Richard Jones was the only person in the infirmary at the time the commissioners visited Northleach, and that the entry they made of his case was, "Suffering from a catarrhal affection of a trifling nature."

Knutsford.—At an adjourned Quarter Sessions held last week, before Mr. Trafford and the Cheshire Magistrates, the Court proceeded to the consideration of the discipline of Knutsford gaol, and adopted a course which has created great sensation throughout the county. It will be recollected that, at the late Sessions at Chester, the consideration of the report of the visiting justices of Knutsford gaol, which recommended the dismissal of the chaplain,

was adjourned to these Sessions. Since then the visiting justices made another report, embodying evidence on the dietary and discipline of the gaol, and adhering to the recommendation to dismiss the chaplain. A letter had also been received from Sir J. Graham, reflecting in the strongest terms upon the misconduct of the governor of the gaol, and putting it to the justices whether, after the instances stated in the evidence of the reports, particularly as to the continuance of corporal punishment to a youth, when it had been expressly stopped by the surgeon in attendance, they could with confidence and safety continue him in his situation; and also containing an opinion that if death had ensued in consequence of such conduct, the governor would have been guilty of homicide. The charges against the chaplain made by the visiting justices were the most prominent part of the proceedings. The first and main one was, that during the inquiry his conduct had been most unsatisfactory. It appeared that the inspector, who had been sent down by Government to report on the case after Mr. Duncombe had made his charges against the governor in the House of Commons, examined the chaplain privately at Knutsford; and that the latter refused, when required, to state to the visiting justices what he had communicated to the inspector, because, as he alleged, he considered that communication to be confidential. This was held by the justices to be a ground of accusation against him. He was further charged with having kept a journal, which he declined to produce for the inspection of the justices, although an order had been made that he should report to them whatever he saw wrong before entering it in his journal, in order that the same might be investigated; and he was also charged with not having exclusively devoted his time to his spiritual duties, and with not having administered the sacrament to some of the felons. At the conclusion of the reading of the documents, which were of some length, Mr. Townsend moved that the chaplain be dismissed. Lord de Tabley seconded the motion, which was opposed by Mr. Wilbraham, Mr. Davenport, and the Right Hon. E. J. Stanley. After much discussion, the motion was adopted—the numbers, on a division, being—for it, 34; against it, 5. It was then arranged that the chaplain should leave forthwith, and be paid his salary up to the July quarter. The Court then proceeded to consider the charges contained in Sir J. Graham's letter against the gaoler, going through them *seriatim*. In some of them the magistrates exonerated the gaoler, though in others it was admitted that he had been in some degree blameable, but not to such an extent as to warrant them in withdrawing their confidence from him.

Leicester.—We learn from the *Mark Lane Express* that considerable excitement prevailed in this place on Monday and Tuesday week, caused by the election of deputies for each parish within the borough, to manage the "Freeman's Piece"—a space of ground occupying about 135 acres, divided among the resident freemen, born in the borough, or serving their apprenticeship therein. An unusual interest was excited in consequence of the candidates being divided into two parties; one body advocating the old system of grazing the land, and thus debarring the poor freeman from any benefit; the other side proposing the division of the land into allotments, and cultivating it for gardening purposes, by which each person would have between 500 and 600 square yards apportioned, and this he might either let, sell, or cultivate himself, as he pleased; by calculations made, it appeared that the latter scheme would raise about 2,000*l.* or 3000*l.* per annum, supposing potatoes alone were produced and sold at 1*s.* 6*d.* per strike; whilst the former will not only be limited and partial, but would also produce not more than 200*l.* or 300*l.* in the same period; each person holding land under the proposed allotment system is to pay 1*s.* per hundred, which is to be set aside as a fund for purchasing additional land. The result of the elections was as follows:—For the allotment system—St. Margaret's parish, 4; St. Mary's, 2; St. Leonard's, 1; St. Nicholas, 2; All Saints, 2; Total, 11.—For grazing the land—St. Martin's parish, 2.—Mr. Phillips, a member of the council, but not a freeman, warmly supporting the cause of the poor freemen, went to Birmingham on the 12th, and entered into a contract with a person to supply him with 500 spades, for the purpose of enabling the allotment party to break up the land next week; but application has been made, by the trustees appointed under the will of the testator, for an injunction to restrain the body, should they attempt any such invasion, and the result of the struggle is looked forward to with much anxiety.—On Saturday morning, the bank of Messrs. Clarke, Mitchell, Phillips, and Smith, of this city, stopped payment. The fact was communicated to the public in the following announcement:—"Suspension of Payment.—In consequence of a sudden pressure, caused by the malicious rumours which have been so industriously circulated, it has become necessary that a temporary suspension of the business of this bank should take place. The public may rest satisfied that no individual can sustain any loss, and that arrangements will be made for rendering the inconvenience resulting from the present step of as short duration as possible.—Saturday, April 22, 1843." It is generally believed that the suspension is temporary, and the allusion to malicious rumours is supposed in the city to refer to the state of party politics on the spot, as there seems to be a high opinion of the wealth and respectability of the members of the firm. Their London agents refused payment of their notes on Saturday, and the suspension at Leicester took place on the same day. Another failure of a banking-house, that of Messrs. Inkersole and Goddard, of Market Harborough, has been announced. This is a house of comparatively small importance, but from its proximity to the other, it will probably much increase

the inconvenience to the farmers, who hold the notes of the other bank to a large amount.

Lincoln.—A large meeting of the Lincolnshire farmers was held at Bourne, on Saturday, to take into consideration the alterations about to be recommended by Government for the admission of American and other foreign corn through Canada into this country. Sir J. Trollope, M.P. for the county, was called to the chair, and was supported by Lord Willoughby D'Eresby, Mr. Heathcote, M.P., General Johnson, M.P., and most of the influential farmers and graziers in the neighbourhood. The several speakers repudiated in the strongest terms the intended innovation. A petition to the Legislature was adopted, showing that the petitioners had, by the alteration of the Corn-laws and the tariff in the last session of Parliament, incurred a loss of 25 per cent. on their capital and annual receipts. That they considered the want of due protection against the introduction into this kingdom, through Canada, of corn grown in the United States of America likely to have a most prejudicial effect on the prices of agricultural produce, and most unnecessarily to depress them; and that the proposal to admit flour and wheat from the United States through Canada, at a nominal duty appeared to the petitioners a direct violation of the promise implied in the declarations of Ministers in the House of Commons, at the commencement of the present session, that no further alterations were contemplated by them in the Corn-laws. That the alterations proposed were likely to add greatly to the distress under which the agriculturists suffer, without any countervailing advantage to the manufacturing interests, inasmuch as the commercial regulations of the United States are more stringent than ever in discouraging, by the imposition of higher duties, the importation of the manufactures of this country. On these grounds the petitioners prayed that no law or regulation under the authority of Parliament might be passed to admit corn or flour from the continent of America at lower duties than those hitherto imposed. On the same day a meeting was held at Grantham, Mr. Turner, M.P., in the chair. A strong petition was adopted, which will be presented to the House of Commons by Mr. Turner, and to the Lords by the Duke of Rutland.

Oakham.—On Wednesday morning, during a severe storm, Exton church, in this county, was struck by lightning; large stones were carried from the church a considerable distance; and the roof laid completely open to the sky, the windows being mostly shattered to pieces. It will be long before the church can be in a state fit for divine service to be performed in it.

Southampton.—On the morning of the 22d inst., as the Exeter mail was proceeding from Exeter to join the mail-train, at this place, it was upset within two miles of Stony Cross, in consequence of the leaders taking fright at a cart which had upset, and ran up a steep bank, which caused the coach to fall over; and Cherry, the coachman, being undermost, was killed upon the spot. The guard and passengers escaped unhurt.

Wigan.—A man called Robert Taylor, who has obtained some local notoriety as the claimant of the title of Lord Kennedy, and has been frequently before the magistrates on various charges, was brought up last week on a charge of bigamy. After a long examination of no general interest, the charge was considered proved, and the prisoner was committed to take his trial at the next assizes.

Railways.—The following are the returns of the principal railways for the past week:—London and Birmingham, 14,988*l.*; Great Western, 13,128*l.*; South Western, 5,754*l.*; South Eastern, 2,124*l.*; Eastern Counties, 2,248*l.*; North Midland, 3,824*l.*; York and North Midland, 1,470*l.*; Greenwich, 2,284*l.*; Croydon, 381*l.*; Brighton, 3,355*l.*; Blackwall, 919*l.*; Hull and Selby, 1,054*l.*; Grand Junction, 7,010*l.*; Midland Counties, 2,438*l.*—The Norwich papers state that the Yarmouth and Norwich Railway commenced on Thursday, when the workmen proceeded to Postwick, and took possession of the ground marked out, by throwing down part of a hedge between the marshes and a field, the property of the Earl of Rosebery. It is said that the line was similarly commenced at Reedham, on land belonging to Mr. Cockerill.—A curiosity in railway engineering is now in progress in a meadow, at New Alresford, Dorsetshire, where Mr. Rodney, of the Scotch Fusiliers, is constructing a railway, at his own expense, in the form of a circle, measuring 400 yards. There is a tunnel 70 yards in length, and a locomotive engine and two carriages are building to traverse the line, which is to be used for local agricultural purposes, and is expected to be opened shortly.

IRELAND.

Dublin.—The *Mercantile Advertiser* contains the following statement:—"The census, which was simultaneously taken in every parish in Ireland, on a given day, in 1841, and which has occupied a considerable staff in its preparation for publication, will soon be printed and laid before Parliament. A variety of curious and interesting details will be supplied for the first time. The exact amount of the population, rated according to sex and age—the diseases which are most prevalent and fatal—the number of insane persons under restraint, with other statistical details, will, we understand, be given with a surprising degree of accuracy. The following is a return of the population:—Leinster, 963,747 males, 1,009,984 females; Munster, 1,186,190 males, 1,209,971 females; Connaught, 707,884 males, 711,072 females; Ulster, 1,161,846 males, 1,224,579 females. Total 4,019,667 males, 4,155,606 females. Total population, 8,175,273. In 1821, the population was 6,801,827; in 1831, it was 7,767,401; in 1841 it was 8,175,273. Increase between 1821 and 1831, 965,574; increase between 1831 and 1841,

407,872. "From this it appears that the increase during the ten years up to 1841 was 557,702 less than it had been in the ten years preceding. This extremely reduced rate of increase is a very remarkable and extraordinary fact. It is evident that, during the last ten years, there has been a very decided check to the progress of population in Ireland. The increase in England, during the ten years from 1831 to 1841, was 2,004,794, which was more than one-seventh upon the population of 1831. The increase in Ireland, during the same ten years, was 407,872, which was little more than one-twentieth of the population of 1831. The increase in England has been in the ratio of nearly 3 to 1, as compared with Ireland. This is the first time that Ireland has shown a less degree of increase than England."—The long-expected action brought by a military officer in the garrison, against a young lady of this city, for breach of promise of marriage, under circumstances which excited great attention some months since, has been settled by a compromise. The jury had been struck, and the lawyers were feed. But the officer has, it is said, accepted compensation in the shape of 550*l.* for the wounds inflicted upon his heart by the obdurate lady.

Waterford.—A Repeal banquet was given to Mr. O'Connell in this city, last week, the mayor in the chair. One city and one county member attended; but their colleagues declined, as did also Mr. W. Roche, the former representative for this city. The Roman Catholic Bishop of the diocese refused the invitation, and the only member of the clergy present, Dr. Kennedy, bishop of Killaloe, said that 'he could not prevail on himself to countenance the Repeal movement, until Mr. O'Connell's recent declaration of being ready and willing to accept a Parliament in Ireland dependent upon England.' Mr. O'Connell has since left for Kells, from whence he is to proceed to Carrickmacross, Monaghan, to attend repeal meetings.

SCOTLAND.

Edinburgh.—The *Gazette* of Tuesday announced that the Queen has appointed the Marquis of Bute her Majesty's High Commissioner to the General Assembly of the church of Scotland.—The Marquis of Breadalbane, having been applied to from various quarters to express his sentiments on the present crisis of the Church, has sent to the ministers of the parishes with which his estates are connected, a copy of a letter which he had occasion lately to address to Mr. Alex. Dunlop, Advocate. His Lordship says that, having fully considered the present position of the Church, he cannot but express his great desire that nothing should now be done to precipitate measures, or throw any obstacle in the way of that disposition, which, though not perhaps directly or publicly expressed, appears to be entertained by Her Majesty's Government to reconsider the question, with a view to legislative adjustment. "I cannot," he says, "allow myself to give up all hope that a consummation so devoutly to be wished for may still be carried into effect, and that the Established Church of Scotland may be spared to the country in its full integrity and purity. What appears most important at present is, to restrain the too ardent zeal and conscientious scruples of those who would precipitate the secession from the Church. There should be no leaving the establishment by any one minister. If there be a secession let it be in a body; but let us take care that the true time is really come. Let us rather tarry too long, and even incur the imputation of want of firmness (for what need honest men care for such imputations?) than that of having unnecessarily created rents and divisions, and a secession that must end in the downfall of the establishment. It is my firm conviction that we have allowed ourselves to be pressed on too fast, and goaded on too far, by the taunts of our opponents, and that there is now a danger of our leaving the field before the battle has been fully and fairly fought, and when the chances of victory are still on our side. For myself, I shall be one of the last to leave the field. I shall protest and contend to the end, and I do so because I shall be most likely in this way firmly to establish my principles. I care not for the taunts of my opponents. Firm in my own honest conviction, I swerve not to the right nor to the left, nor move one step faster than the true Presbyterian cause, guided by the principles of sound sense and consistency, tells me I should go. If, after such a trial, we must go out, I shall be prepared to lend my humble endeavours and assistance to vindicate the truth of my principles, and to take my part in any measures that may be thought necessary to promote the success of the dis-Established Church. I have already signed a declaration to the effect, that in the event of the Legislature not granting to the Church its just privileges, I have resolved to leave it; but I can do no further act with a view to secession till the Government and the Legislature have formally decided and rejected all means of adjustment. I think I shall best serve the cause of the Presbyterian Church, and best promote the true interests of the State, by using my humble endeavours to remove the obstacles that still appear to obstruct the course of legislation on this important question."—The local papers state that the late letters of the Duke of Sutherland to the people of Sutherlandshire have made a strong impression in that county, and it is understood that comparatively few of the people will go out with their ministers, if the latter quit the establishment. The extensive sheep-farmers and tenants are described as being almost to a man in favour of the establishment, and had declared so long before the Duke's sentiments were known.

Inverness.—Workmen are at present engaged in repairing the breach in the Caledonian canal. About 120 men are employed, but months yet must elapse ere the passage be free for vessels. The communication, however, is kept up once a week by the Glasgow steamers;

and by the 1st of May there will be vessels twice a week, performing the voyage between Glasgow and Inverness in two days. There are seven miles of interruption in the passage, but a boat is stationed at each end, and coaches will be ready to carry passengers from one to the other; so that no delay will take place in consequence of the accident.

Law.

COURT OF CHANCERY.—Mr. Serjeant Wrangham having obtained a patent of precedence, was called to take his seat within the bar. Sir Gregory Lewin, Mr. Talbot, Mr. Martin, Mr. Roebuck, and Mr. Watson, were also called within the bar as of her Majesty's counsel.

Parker v. Murchant.—This was a bill for the administration of the estate of the late Mr. Parker, a banker and solicitor of Maidstone, and two questions were raised on the construction of his will; one, whether money at a banker's passed under the term of ready money, and the other, whether a bequest to servants, without naming them, survived to a servant who had not continued to live in the service till the period of the testator's death. The Vice-Chancellor Bruce held that the term ready money covered a sum of 16,000*l.* in Child's, and of 6000*l.* in Hobhouse's bank, and that the legacy survived to the servant. The questions were argued on appeal before the holidays. The Lord Chancellor now gave judgment, and observed that the testator in his will had made a very marked division of his property into three parts; namely, his money and securities for money, his real estates, and his plate, carriages, and jewels; and after disposing of these, and giving several legacies to the extent of many hundred pounds to different objects of his bounty, he directed all the rest of his ready money to be applied in a particular manner. Now it was most important in deciding on the intentions of the testator, so as to put a proper construction on his will, to mark this division, and the language used in disposing of the residue, because the money actually in the house amounted to a very small sum, and the testator, by using the terms the "rest of my ready money," evidently had in contemplation some other and larger fund out of which debts were to be paid and legacies discharged. Looking, therefore, at the language of the will, his Lordship had no doubt that the testator intended everything in the shape of money to pass by this disposition in his will, and the question then was, what, according to the ordinary habits and dealings of mankind, was to be considered as ready money. Now everybody, when they had occasion to do so, spoke of money at their banker's as ready money. It was a customary form of expression to denote cash at a banker's. Men usually said, I have no money in the house, but I have money at my banker's. They placed their money there for security, but they placed it there also to be ready when they wanted it. The banker received it with the understanding that it was to be ready at all times when the owner demanded it; and in the ordinary acceptance of the term, and according to the general understanding of mankind, it was always so regarded. If, therefore, there was a clear intention on the part of the testator to pass the money at his banker's, the terms he made use of were, according to his Lordship's opinion, quite sufficient for that object. The authorities on the subject had been so much sifted in the course of the argument, that it was quite unnecessary to advert to them at any length. In *Carr v. Carr*, the question was whether a balance at the banker's of the testator would pass as a debt? Sir W. Grant decided, and justly decided, that it did pass under that name. In *Deveynes v. Noble*, five years afterwards, and after consideration, he expressed an opinion to the same effect. In *Sims v. Noble*, the Court of King's Bench, acting on this decision of Sir W. Grant, ruled that a balance at a banker's was not a loan, but a debt. It appeared, however, that Sir W. Grant, in the course of the discussion in the case of *Carr v. Carr*, intimated an opinion that a balance at a banker's would not pass as ready money. Now, assuming that the report of the case was a correct one—and his Lordship, in justice to the learned gentlemen now at the bar, saw no reason to question its accuracy—still there was nothing to show that if Sir W. Grant had been of opinion that it was the intention of the testator to pass his balance at his banker's under that name, he would not have given effect to such an intention. But the case of *Vesey v. Reynolds*, decided by Sir John Leach, was one expressly in point. In that case the testator gave all his book debts, money in hand, and stock in trade to his widow, and all his securities for money to his executrix. Sir John Leach held that the balance at the testator's banker's was money in hand; because in all just and reasonable sense, money at a banker's, which might be had when called for, or when a servant was sent to fetch it, must be so considered; and, surely, no one could say, that there was any real difference between money in hand and ready money. The present Master of the Rolls had also, in a case before him, decided that money at a banker's was, in the ordinary acceptance of the term, ready money, and so considered in all the dealings and transactions of mankind. It had been suggested by Sir Charles Wetherell, in his very able argument on the subject, that many difficulties and embarrassments must arise from allowing money at a banker's to be legally considered as ready money. His Lordship admitted that those suggestions of difficulties and abuses would well deserve consideration if there were any circumstances in the case which called them into action, or any doubt of the intentions of the testator. But no such circumstances existed, nor was there reason for any doubt. The balance at the banker's in the present case bore no interest, no conditions were annexed to the deposit, and it did not appear that, however large it might be, it was larger than this very rich individual had been in the habit of leaving with them. Being, therefore, of opinion that the intention of the testator was clear, his Lordship had no difficulty in affirming the decree of the Vice-Chancellor. With respect to the other point, it appeared that the testator gave legacies to three servants by name, and to the others generally under the description of his servants. No condition was, however, annexed to the gift, and, in his Lordship's opinion, they stood in the same situation as if they had been named in the will. On that point, also, the judgment of the Vice-Chancellor must, therefore, be affirmed.

VICK-CHANCELLOR'S COURT.—(Before Sir J. Wigram).—*Salter v. Farey.*—The testatrix, Mrs. Mann, by her will, expressed a desire to be buried in the nearest parish church to the place of her death; and she gave a pearl necklace to be sold, and the proceeds distributed amongst the poor of the parish in which her remains were deposited. Before her death she desired to be buried in the parish of Walcot, near Bath. The parish church of Bathwick was the nearest to the place of her death. She was buried at Walcot. The question was, whether the proceeds of the necklace, amounting to 250*l.*, should be distributed in Walcot or Bathwick. His Honour held that the proceeds of the necklace were given to the poor of the nearest parish, which was Bathwick.

Wood v. Wood.—This was another legatees' suit, under the will of the late Mr. Wood, of Gloucester; 6,000*l.* had been bequeathed to the "family" of a Mr. Samuel Wood. The only point in dispute was as to the form of the inquiry to be taken in reference to the term "family." His Honour said he should consider the expression to mean the children of the party named, and that it could not be extended to collaterals, as brothers and sisters, unless some special circumstances were shown to justify such an interpretation.

ASSIZE INTELLIGENCE.—(Gloucester).—*Montagu Clark*, stated to be 19 years of age, was charged with having maliciously shot at and wounded the Rev. Hugh Percy Rennett, with intent to murder him, at Evington, on the 11th February. There were several other counts, varying the charge. The case was fully reported in this Paper at the time, and the only new features elicited at the trial were contained in the evidence of the

prosecutor, who admitted that he had threatened the prisoner, who was his step-son, with a life-preserver which he carried in his hand, and that he had used violent language both to the prisoner and his wife. Mr. Alexander having addressed the jury on behalf of the prisoner, resting his case mainly on the plea that the pistol had been fired in self-defence, called a number of witnesses who had known the prisoner for various periods of years, and who gave him a most unexceptionable character for inoffensiveness and humanity. The Judge having summed up the evidence, the jury, after a short consultation, returned a verdict of Not Guilty.

POLICE.—The British American Association.—A curious scene took place before the Lord Mayor on Saturday, who appointed that day for entering fully into the investigation of the charges against the British American Emigration and Colonization Association, which we noticed in our last. Mr. Duncan Campbell, one of the commissioners of the association, upon appearing at the justice-room, according to his promise, was taken into custody upon a warrant charging him with having obtained fraudulent possession of a steam-engine from Mr. G. Scott, an engine manufacturer, in the Commercial-road. Mr. Taylor, Mr. Henley, and others of the emigrants, and numbers of their friends, occupied a great space in the justice-room. Mr. Lloyd, counsel, and Mr. Nettleship, solicitor to the Duke of Argyll and Sir James Cockburn, and Mr. Mellor, counsel to Sir Richard Broun, one of the Commissioners, appeared to justify the conduct of their respective clients. Dr. Rolph, who was named in the prospectus as one of the commissioners, in conjunction with Sir W. Ogilvie, Sir W. Dunbar, Sir Robert Barclay, Sir Allen Macnab, and Sir Richard Broun, were also present, as were Lieutenant Lean, her Majesty's Emigration Agent, and several gentlemen who appeared to be friends of the members of the Association and interested in the proceedings. The Lord Mayor having determined to hear the charge against Mr. Campbell before any other matter connected with the association, Mr. Goddard, solicitor to Mr. Scott, stated that he attended to charge Mr. Campbell with having obtained, by false pretences, a steam-engine from his client. In September last Mr. Scott was applied to for a steam-engine for driving a saw mill, to be the property of the British American Association. It was to be supplied to the order of Messrs. Hartshorn and Rees, and the terms were immediate payment. Mr. Scott having completed the order, sent the engine to the London Docks, but refused to sign the order of delivery, as the cash was not forthcoming. Mr. Campbell, however, having been introduced to Mr. Scott, made such representations as to the flourishing state of the association, the immense quantity of land they possessed, his own intimacy with the Duke of Argyll, and the influence of the members, that the engine was given up upon the receipt of two promissory notes, purporting to be the notes of the association, and signed by three of the commissioners. Upon these representations was founded the accusation. Here Mr. Goddard put in two promissory notes of the association for 3000l. each, signed "R. Broun, W. Ogilvie, and D. Campbell, commissioners;" and made payable at Glyn's banking-house, with five per cent. interest, on the 1st of October, 1844. After some discussion the Lord Mayor decided that he could not entertain the charge, the notes not being yet due, and the applicant having no reason to say that they will not be paid. Mr. Lloyd (the counsel for the Duke of Argyll) then stated the object which his Grace had in attending a meeting in June last, when the only resolution came to was, as a preliminary and in dispensable step, that a sum of 50,000l. should be insured as available for the purposes of emigration. The Duke's knowledge of the proceedings of the association did not extend beyond that information, and his Grace never entertained the most remote idea of sanctioning any act until that money should be raised, for his intention was to promote the most beneficial scheme of emigration, and in such a manner as to prove of the highest service to the poor persons who should emigrate. When, therefore, he perceived that his name had been used as a sanction to proceedings which he utterly repudiated, nothing could surpass his indignation and regret, and he immediately withdrew from the association upon hearing from the late Lord Mayor. By similar motives Sir James Cockburn was influenced. The Lord Mayor.—The Duke's name is published as president of the association. To a certain extent he certainly sanctioned their proceedings, and he ought to have taken care that men should be left behind him upon whose integrity and prudence reliance could be placed, in order that advantage might not be taken of the authority which such a name was calculated to give. Mr. Mellor spoke warmly in favour of Sir R. Broun, and called the Lord Mayor's attention to the prejudices raised against the association. It was true it consisted of persons not accustomed to act, but it was a bona fide association, and actuated by the most honourable motives. It was bad enough, he submitted, for his client to be out of pocket 7000l. or 8000l., and to find the association fail, without being designated as a person connected with a fraudulent undertaking. The men who complained, after all, did not leave employment to go out to Prince Edward's Island. The Lord Mayor.—They left their native country to go to a remote one to gain an honest livelihood for their families by industry and labour, and they were induced to go by the authority of the great names with which the prospectus abounds. Let them not be reproached with having lost nothing by going. They have suffered a vast deal, and I trust the association will take care that they shall not be able to complain that they have lost everything. Mr. Mellor—I contend, my lord, that it is hard that because these emigrants have failed in their speculation, the association should be covered with odium and execration. If a man become a bankrupt many others necessarily are involved. The Lord Mayor.—There cannot be the slightest analogy. Your association are not bankrupts. Now look at Mr. Taylor's case, and just form an estimate of what he has undergone, and what he may still undergo if his claims are neglected. He has eight children; he has paid 500l. to the secretary for their passage; he has expended the little money he had put together for the purpose of his occupation in Prince Edward's Island. Now this man was to have had twenty acres of country land and one acre of town land, and he went away with sanguine hopes of prosperity. He is brought back with his large family without the means of subsistence, and with starvation looking at him and his children in the face, and he is told that in a day or two he and his children are to be turned out of the ship, which was bound to take them to their final destination, and to look about amongst the unions for sympathy and protection. It is ridiculous to tell me that this man can be abandoned by an association of noblemen and gentlemen. Lieutenant Lean (the government emigration agent), said the question seemed now to be, whether the ship could be obliged to become the property of the emigrants, to convey them to their destination. He was in hopes, when he heard the investigation was to take place, that the members of the association had resolved to come to some arrangement for their advantage, for these members were at all events morally responsible. The Lord Mayor had spoken of the intervention of the government. He had mentioned to the government the state of the emigrants, and he had visited them at Gravesend. The government were acquainted with the state of the particulars; but as the question was one of civil process, and the existing law did not bear upon it, as it was one of the like of which never had been before heard of, it was thought better that the whole matter should be brought before the Lord Mayor for his decision. The Lord Mayor.—What absurd to leave the decision upon such a case to me. If I were one of the emigrants, I should certainly not abandon the vessel. Lieutenant Lean adverted to a publication issued from the offices of the association, purporting to be "official instructions from Sir Allan McNab, in which in a note was the following observations:—"These instructions apply to Upper Canada only, the association having already acquired estates in Lower Canada to the extent of 366,892 acres, in addition to large estates in Prince Edward's Island, and other colonies." It appeared from that

publication that the association sanctioned this unfounded report, that they were possessed of estates when they had not an acre. The Lord Mayor.—By whom is that paper signed? Lieutenant Lean.—By Mr. Andrews, who is said to be the chief-manager of the association. I trust, my lord, that you will suggest some mode of indemnifying these poor fellows, for bringing whom into such a condition the association are certainly responsible. The Lord Mayor.—I have no doubt whatever, after what has been stated about the injury sustained by the poor emigrants, and the whole of the transactions which have taken place, that the noblemen and gentlemen who formed this association, and who, as it has been just stated, authorized the use of their names, will come forward and at once subscribe 500l. each to place the sufferers in the condition in which they were before they entered into the agreement to the violation of which they were, at any rate, no parties. I appeal to these noblemen and gentlemen in their behalf, and I am sure that I shall not be disappointed. Mr. Lloyd declared that the Duke of Argyll would most heartily agree in any proposition for the benefit of the poor emigrants, but he denied that his Grace was at all responsible. Mr. Nettleship (the Duke of Argyll's solicitor), said he should at once give a check for the sum mentioned by the Lord Mayor for his Grace the Duke of Argyll. Mr. Leslie, who has a mortgage upon the Barbadoes, said he would not disturb the poor men and their families who were in the ship for a few days. He also stated that for 8,000l. he would most willingly undertake to pay off all the liabilities of the association. Mr. Mellor.—Nothing can more clearly prove that the association had no intention of doing wrong than that declaration of Mr. Leslie. They might have got 60,000l. or 70,000l. with ease by the sale of shares, if they pleased; instead of which, not a shilling has been got in that way. It was stated that the utmost extent to which the notes of the association were issued was 7,000l. The Lord Mayor said that this arrangement was a good commencement. He felt the highest degree of gratification in having had in his power to render service to the respectable men who had applied to him, and he trusted that they would soon reap the benefits of his interference. The whole of the association would be soon informed, through the great public channels of communication, of the arrangement proposed, and would, no doubt, without hesitation, agree to it. All the gentlemen who appeared in favour of the various members of the association applauded the result of the investigation, and the emigrants in the most grateful manner returned thanks to the Lord Mayor, to whose humanity and discernment the counsel and the Government Emigration agent also bore testimony. His Lordship advised that the money should be paid at Messrs. Masterman's banking-house, and that the Government agent should superintend the arrangements if any of the poor men should still desire to emigrate.

SPORTING.

TATTERSALL'S, THURSDAY. The only Derby bets laid were 4 to 1 and 7 to 2 agst Cotherstone, to nearly 2000l.; 825 to 100 agst A British Yeoman; 200 to 10 twice agst Parthian; 500 to 10 agst Bramble; 2,000 to 30 agst Gaper; 1,000 to 10 agst Captain Cook; and 1,000 to 7 agst the Earl of Richmond.—**THE OAKS.**—100 even laid between the Laura filly and the Lily, and 5 to 1 offered on the field.

MARK LANE, FRIDAY, APRIL 28.—We had a fair supply of Essex Wheat this morning, but that from Kent was moderate; there were also several runs from Suffolk; the trade opened very heavily, at fully 2s. decline, and some quantity was left unsold at the close.—The demand for Foreign was very limited, at 1s. decline. Barley is getting scarce, and is fully as dear. New Beans sell rather more freely at our quotations; old are a very heavy sale. Peas remain as last week. Although English and Scotch Oats rather improve in value, Irish, of which there is a large supply, are very flat.

BRITISH, PER IMPERIAL QUARTER.			
Wheat, Essex, Kent, and Suffolk	White	40 to 48	Red 40 to 46
Norfolk, Lincolnshire, and Yorkshire	White	40 to 44	Red 40 to 44

Jones, a carpenter.—J. Reynolds, Llandrindod, Denbigh, a draper.—W. Griffin, 61, St. Edmund, Oxford-street, pawnbroker.—W. D. Townsend, Little Russell-street, Covent Garden, pawnbroker.—B. Cruse, Craydon, Goswadder, G. Hammond, jun., Raynham, Southampton, common brewer.—N. Brimley, Little Bentley, a master.—H. Pearson, York, att. neg.—N. Tate, Liverpool, painter.—W. Carter, Bart. rd., Sadop, extle salop.—J. Flecker, Evesham, Worcester, painter.—J. Prince, Newcastle-upon-Tyne, master.—W. Moses, Rye, a Yorkshire, innkeeper.—W. Hussey, Nether Knutsford, Cheshire, a baker.—M. Jackson, East Hackley Steam-mill, Durlan, miller.—J. W. Shovel, Birmingham, bookseller.

SCOTCH SEQUESTRATIONS.—J. Carmichael, jun., Dundee, engineer.—J. Ewart & Co., Glasgow, West India-merchants.—J. Watt, Hazledean, Lanarkshire, farmer.

BIRTHS.—At St. Andrew's, on the 19th inst., the lady of Major Playfair, Provost of the city, of a daughter.—At Naples, on the 10th inst., the Hon. Lady Carson, of a son.—On the 19th inst., at Merton Vicarage, the wife of the Rev. George, of a daughter.—On the 21st inst., in Queen Anne street, the lady of Major A. Moore, of a son.—On the 20th inst., at Staple Fitzpaine, near London, the lady of the Rev. F. B. Periman, of a daughter.—On the 27th inst., at No. 26, Compton-terrace, Islington, the lady of R. Salomons, Esq., of a daughter.

MARRIED.—On the 22d inst., at Marylebone church, the Hon. A. E. D. D. and his son of the late Viscount Dillon, to Ellen, daughter of the late J. D. Addison, Esq.—On the 27th inst., at St. George's, Hanover-square, Captain the Adm. Sir R. B. Carr, R.N., to Mary Ann, only child of J. F. Maubert, Esq., Hon. M. L. Maubert Carr, R.N., to Mary Ann, only child of J. F. Maubert, Esq., of Norwood, Surrey.—On the 27th inst., at St. Pancras Church, Capt. George Moore Ellis, H.P., 54th Reg., to Judith, only daughter of the late Rev. Stregham Derbyshire Myers, formerly rector of Mitcham, Surrey.

DIED.—In South Audley-street, on the 23d inst., Gertrude Cecilia, the infant daughter of Lord Dinorben.—On the 20th inst., at the Crescent, Birmingham, aged 53, Mr. John Woolrich, Lecturer on Chemistry in the Royal School of Medicine, Birmingham.—On the 24th inst., very suddenly, Mr. G. Macfarren, Editor of the "Musical World," and author of several dramatic pieces.—On the 22d inst., at his seat, Nannau, near Dolgelly, in his 76th year, Sir R. Williams Vaughan, Bart., 44 years M.P. for the county of Merioneth.—On the 22d inst., at Dunbar, near Peterhead, Elizabeth, the wife of D. Quarrier, Esq., Deputy Lieutenant of the county of Hants, and Inspector of Hospitals and Fleets, niece of the late Admiral Sir I. Cochrane, Bart., aged 57.

TO PINE-GROWERS.
ABOUT 250 to 350 SUCCESSION and FRUITING PINE-PLANTS for Sale, Clean and Healthy, to be sold at Half their Value. For particulars, apply to **SAMUEL ROSLING**, Peckham-Rye Common, near London; where they may be seen.

TO BE SOLD on reasonable terms, a number of Succession and FRUITING PINE-PLANTS, with a Frame and Lights. To be seen at Burwood, near Cobham, Surrey.

ANNUITIES.—In the **AUSTRALASIAN COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY**, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of interest.

DIRECTORS.
Edward Barnard, Esq., F.R.S. C. E. Mangles, Esq.
Henry Buckle, Esq. J. B. Montefiore, Esq.
John Henry Capper, Esq. J. H. Ravenshaw, Esq.
Gideon Colquhoun, jun., Esq. William Walker, Esq.
BANKERS—Union Bank of London.
COLONIAL BANKERS—Bank of Australasia (Incorporated by Royal Charter, 1835), No. 2, Moorgate-street.
PHYSICIAN—Dr. Fraser, No. 62, Guildford-street, Russell-square.
SOLICITORS—Messrs. Swan, Stevens, & Co.
SECRETARY—Edw. Ryley, Esq.
Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, corner of Cornhill.

THE FARMERS' AND GARDENERS' HAIL-STORM INSURANCE COMPANY. Offices, Wellington-street, North, Strand, London.

This is a subject which deeply affects the interests of both landlord and tenant, the destruction by Hail Storms being equally fearful and frequently more extensive than damage by fire.

Wheat, Barley, Oats, Beans, Peas, and Tares, insured at 4s. per cent., inclusive of the stamp, subject to the conditions contained in the policy. The Stamp on the policy is paid by the Office.

All claims settled in the month of November in each year, and should any disputes arise, to be referred to arbitration.

Glass in hothouses, greenhouses, &c., insured at 15s. per cent., subject to certain conditions.

Prospectuses containing every information may be obtained of the Agents of the "FARMERS' FIRE AND LIFE INSURANCE INSTITUTION," who are appointed in all the principal towns in the kingdom, or by letter, pre-paid, forwarded to W. SHAW, Esq., at the Offices, Wellington-street North, Strand, London.

COMMERCIAL and GENERAL LIFE ASSURANCE, ANNUITY, FAMILY ENDOWMENT, and LOAN ASSOCIATION, 112, Cheapside, London.

Every description of Life Assurance entertained, premiums payable quarterly, half-yearly, or yearly; loans advanced from 25l. to 500l., for three or more years, on approved personal or other security, on the borrower assuring his or her life for a moderate amount.

Endowments for children to receive a stated sum of money on arriving at 14 or 21; in case of death the whole of the money returned to the parents. Annuities immediate or deferred. Prospectuses and every information to be had of **FREDERICK LAWRENCE**, Resident Secretary, 112, Cheapside.

HOT-WATER APPARATUS.
PALMER, GREEN, & CO., No. 146, NORTH-STREET, BRIGHTON, respectfully invite the attention of Horticulturists, &c., to their **HOT-WATER APPARATUS**, which is admirably adapted for Conservatories, Vineries, and Forcing-Houses, of every description. The Apparatus here referred to is exceedingly simple in all its arrangements, and moderate in cost; efficient and economical in its operation, very easily managed, and not liable to be injured, over-heated, or put out of order by accidental neglect.

P. G. & Co. can also, with great confidence, (founded on experience) recommend their **HOT-WATER APPARATUS** for warming and ventilating Churches and other Public Buildings, Shops, Warehouses, Factories, and Private Dwellings.

Further particulars will be promptly supplied on application as above, and reference given to most respectable persons on whose premises the Apparatus has been for many months in operation.

HORTICULTURAL BUILDING and HEATING by HOT WATER.

J. WEEKS & Co., ARCHITECTS, &c., Gloucester-place, King's-road, Chelsea, Hothouse-Builders and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the **BUILDING OF HORTICULTURAL ERECTIONS** of every description, and the **HEATING** of them by **HOT WATER**.

CONICAL and other BOILERS of all sizes; their largest consumes but a small quantity of fuel, only requiring attention once in 10 hours, and will heat a range of Forcing-houses 300 feet in length.

Their improved plan of **BOTTOM-HEAT FOR PITS**, by means of an open trough under the bed, is now being universally adopted. References may be had, and their works seen at most of the Nobility and Gentlemen's Seats in the country, nearly the whole of the London Nurseries, and a great variety of Horticultural Erections and Hot-water Apparatus, Models, Plans, Estimates, &c., at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—**STEPHENSON and Co., 61, Gracechurch-street,** Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1812, page 175, and February, 1843, page 87), renders it unnecessary to offer any remarks upon them beyond the following brief description:—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4l. 4s. and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Bedsteads, Wire-work, Garden Implements, &c. &c.
N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

HEATING WITH HOT WATER on all its improved Principles, for Horticultural and other purposes, by JAMES M'LATCHI, Millwright and Engineer, Cottage-lane, Commercial-road East. J. M. returns his sincere thanks to those Noblemen and Gentlemen who have already honoured him with their favours, and hopes by his economical Prices and sound Workmanship to merit their lasting favours. N.B.—Attends personally to all Erections.

PATRONISED BY THE NOBILITY AND GENTRY.

AN IMPROVED GARDEN ENGINE (Registered); unequalled in Cheapness, Durability, and Effect. This Engine is adapted for every use, where a portable one is required, as in Greenhouses, in cleaning Shop-fronts, &c.; at the same time it can be applied to a variety of purposes. It can be so constructed as to be attached to a tank or well, and by an additional hose will draw water from the depth of 50 ft., and force it to the height of 50 ft. in a continuous stream. It would be found a useful article on board of small craft, for wetting the sails, &c.—Manufactured by P. JONES, High-street, Fulham. E. PARKS, sole agent, 140, Fleet-street, of whom also may be had every description of Garden Tool and requisite.

*** THE LARGEST AND BEST ASSORTMENT OF IRON AND BRASS BEDSTEADS.

GUANO ON SALE, as Imported, of first quality, and in any quantity, direct from the bonded stores, either in Liverpool or London. Also, NITRATE OF SODA. Apply to H. ROUNTHWAITE & Co., Merchants, 6, Cable-street, Liverpool.

GUANO MANURE.

THE genuine GUANO, of the best quality, may be had at 12s. per ton, by applying to W. SKIRVING, Queen-square, Liverpool, who will execute orders from the Importers' bonded stores, in Liverpool or London, as required.

W. S. has had constant and extensive practice with Guano ever since its introduction, and has now no hesitation in saying that he considers it the most valuable manure that has been introduced in his time, and, at the present price, by far the cheapest known. Guano is a strong natural manure, quite different to the artificial manures manufactured in this country; it is highly infected, not disinfected. Purchasers may have plain directions for the use of Guano, founded on two years' practice with it on garden and field crops of many kinds.

N.B.—If ten tons or more are taken, a reduction is made in the price. Terms of payment—ready money.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 86 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Hildersham, near Cambridge. On Meadow Land, the Earl of Zetland got an increase of Hay of 18 cwt. 2 qrs. per acre, while by the Foreign Guano the increase was only 8 cwt. 2 qrs. under similar circumstances. These facts prove the superiority of the Artificial Guano.

*** Potter's Portable Farm-yard Manure, at 4s. 15s. per ton from 6 to 7 cwt. per acre.—Chemical Works, 28, Upper Fore-st., Lambeth.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

J. HARRISON, NURSERY and SEEDSMAN, York, begs to announce to his friends and the Public generally, that his Catalogue of DAHLIAS, PELARGONIUMS, FUCHSIAS, HEARTSEASE, VERBENAS, &c. for the present season may be had on application. The Trade liberally supplied per dozen with all the leading varieties of Dahlias of last and former years. J. H. can also supply the Trade with Dewey's Imogene, beautiful Lilac; Mountjoy's Virgil, Evans's North Midland, and Appleby's Sultana Dahlias. Early orders alone can secure plants of Imogene and North Midland, as the stock of these two varieties are limited.

THE FLORAL REGISTER.—Floricultural Societies, &c. &c., wishing to have their Shows inserted in the First Part of the FLORAL REGISTER for 1843, containing AURICULAS, POLYANTHUSES, and TULIPS, must send in their Lists immediately, addressed to the Floral Committee, at Mr. J. HARRISON'S, Mason's Arms, Market place, Middleton, near Manchester; or to Mr. READE, Black Boy, Old Millgate, Manchester. N.B.—The First Part of the FLORAL REGISTER will be published the last week in June. Price 1s. each Copy.

Societies, &c. &c., when sending in their Lists, will please state the Number of Copies wanted, as only a limited Number will be printed.

BOTANY, GARDENING, FOREST TREES.

Just published, in Foolslop 8vo., price 2s. cloth lettered, **THE BOTANIST'S MANUAL AND WOODLAND COMPANION**, containing a familiar Introduction to the Science of Botany and Vegetable Physiology, with the Natural History and various uses of British Forest Trees. The whole intended to awaken a taste for rural scenery, and pave the way to a sound and accurate knowledge of Botany. Designed for the use of Young People.

THE GARDENER'S MANUAL, containing Practical Instructions for the Cultivation and Management of the Flower, the Fruit, and the Kitchen Garden, with the Hothouse, the Greenhouse, and Conservatory, adapted to either small or large Gardens. New edition, in Foolslop 8vo., price 2s. cloth lettered.—London: CRADOCK & Co., 48, Paternoster-row.

CEMETERIES AND CHURCH-YARDS.

8vo., with 60 Engravings, 12s. cloth, **ON THE LAYING-OUT, PLANTING, and MANAGING OF CEMETERIES**, and on the IMPROVEMENT OF CHURCH-YARDS. By J. C. LONDON, F.L.S. &c., Author of "The Encyclopedia of Gardening," &c. London: LONGMAN, BROWN, GREEN, and LONGMANS.

Shortly will be published, price 5s.

A TREATISE ON "RENDLE'S TANK SYSTEM OF COMMUNICATING HEAT TO HORTICULTURAL BUILDINGS," will be ready in a few days, embellished with eight Engravings. Can be procured of Mr. W. E. RENDLE, Union Road Nursery.

EMIGRATION.

Now ready, price 3s., with Maps of Canada and New Zealand, **THE EMIGRANT'S HAND-BOOK OF FACTS, CONCERNING CANADA, NEW ZEALAND, AUSTRALIA, CAPE OF GOOD HOPE, &c.**, with the relative advantages each of the colonies offer for Emigration; and practical advice for intending Emigrants. By SAMUEL BUTLER, Esq., author of the "Hand-book for Australian Emigrants." An impartial, concise, and well illustrated Manual of Colonial facts.—New Zealand Journal.

N. H. COTES, 139, Cheapside, London; J. GADSBY, Manchester; G. PHILLIP, Liverpool; and W. R. M'PHUN, Glasgow.

STANDARD WORKS ON INDIA AND CHINA, By HUGH MURRAY, Esq., F.R.S.E., assisted by Eminent Authors. Now ready,

AN HISTORICAL AND DESCRIPTIVE ACCOUNT OF BRITISH INDIA, from the most Remote Period to the Conclusion of the Afghan War. With a Map and 26 Engravings. Fourth Edition. 3 vols. small 8vo. 15s.

AN HISTORICAL AND DESCRIPTIVE ACCOUNT OF CHINA, from the Earliest Ages to the Peace of Nan-king. With a Map and 36 Engravings. 3d Edition, revised and enlarged. Three vols. small 8vo. 15s.

OLIVER & BOYD, Edinburgh; SIMPKIN, MARSHALL, & Co., London.

TEGG'S LONDON MAGAZINE.

On Monday, the 1st of May, printed in a superior manner, on paper made for the purpose, to be continued monthly, price Eightpence, No. 1. of

TEGG'S LONDON MAGAZINE OF KNOWLEDGE and AMUSEMENT, a Work calculated to promote the happiness and peace of society, advance the interests of religion, virtue, and humanity, and encourage a spirit of industry, economy, and perseverance amongst all classes.

*** Prose communications in accordance with the objects and nature of the above work, to be addressed for the Editor to the care of the Publisher.

London: Printed for THOMAS TEGG, 73, Cheapside, and sold by all other Booksellers.

On the 1st of May, price 1s., No. V. of

THE ZOOLOGIST. This Number contains, in addition to twenty-three shorter communications, the following important Papers:—

On the Birds of Sussex. By A. E. KNOX, Esq., M.A.

On the Birds of Cornwall. By E. H. RENN, Esq.

On the Cayan. By CHARLES WATERTON, Esq.

On the Power possessed by Bees of raising a Queen from an egg intended to produce a Worker. By J. D. SALMON, Esq.

JOHN VAN VOORST, 1, Paternoster-row.

HOUSES, CONSERVATORIES, &c. Made and Fixed Complete in all parts of the Kingdom. One two, and three-light Cucumber and Melon-Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom; warranted best material. Two-light Boxes and Lights complete, from 1l. 8s. Garden-Lights Made and Glazed from 1s. per foot, at JAS. WATTS, Sash Manufactory, Claremont-place, Old Kent-road.

*** Reference given.

BEE-HIVES.—GEORGE NEIGHBOUR and Son beg to inform their Apiarian Friends that in consequence of the formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious Premises, numbered 127 in the same street. Their selection of Bee-hives for this season comprehends most varieties now in vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive," the "Ladies' Observatory Hive," the "Improved Cottage Hive," with Glasses, &c., from either of which the produce may be taken at any time without the destruction of the Bees. G. N. and Son have also Glass Hives and other articles connected with Bee Management, at their Apiarian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London. Letters of inquiry relative to the above must have Postage Stamps enclosed.

*** "NUTT ON BEES" (5th Edition), now published.

COMPOUND DECOCTION OF SARSAPARILLA.—Scurvy, Scrofula, Eruptions on the Face, Roughness of the Skin, Chronic Rheumatism, Indigestion, Chronic Liver Affections, General Debility, particularly when caused by excess; the effects of taking Mercury are among the numerous diseases and affections for which this invaluable alternative is almost a specific. To those effected with, or predisposed to, any of the above disorders, a course, spring and autumn, is generally recommended by the Faculty. The preparation of this Decoction is, however, difficult, and its dose somewhat large. All its virtues are possessed in a portable and pleasant form, by the Concentrated Compound Decoction of Sarsaparilla, prepared by BENJ. MOXON and Sons, Chemists, Hull.

Sold in Bottles, at 4s. 6d., 12s., and 22s. (equal to 6, 16, and 32 pints of the Decoction), by all respectable medicine vendors.—London Agents: Barclay & Sons, Sutton, Edwards, Newberry, &c.; York, Dennis and Son; Dublin, at Butler's Medical Hall; Edinburgh, J. and R. RAINES; Quebec, J. Musson.

ORNAMENTAL WIREWORK FOR THE GARDEN, 390, OXFORD-STREET, LONDON.

G. B. THOMPSON, in gratefully acknowledging the kind patronage which the Nobility and Gentry so liberally bestowed upon him last season, begs respectfully to announce that that encouragement has induced him to bestow more attention to this department of Ornamental and Useful Work. He has in consequence prepared several Novel Designs in FANCY WIREWORK, suited to the Flower-Garden and Greenhouse, and again submits for inspection his Extensive Stock of Flower-Baskets, Trainers, Borders, and Stands, with Garden-Arches, Seats, Vases, and Temples; improved Garden and Hothouse Engines, Syringes, Pumping Bellows, and other Horticultural Implements. G. B. Thompson's Improved Waterpots, which possess considerable advantage over all others, the smaller size being peculiarly adapted for Ladies. Game and Cattle Fence in great variety.

MECHI'S ELEGANCIES for PRESENTS and USE.—The greatest variety for Ladies and Gentlemen, both in price and choice, is at MECCHI'S MANUFACTORY and EMPORIUM of ELEGANCIES, No. 4, Leadenhall-street. Here may be suited the economist or the luxurious. Bagatelle tables, 3l. 10s. to 13l. 10s.; writing-desks, 10s. to 20l.; dressing-cases, 20s. to 100l.; work-boxes, 12s. to 20l.; leather writing-cases, with or without dressing-case, 18s. to 16l.; tea-chests, 7s. 6d. to 8l.; envelope-cases, 10s. to 10l.; inkstands, in wood, bronze, and papier-maché, 6s. to 6l. 6s.; splendid papier-maché work tables, 10l. 10s.; sets of tea-trays, 8l. to 20l.; work and cake baskets, 25s. to 50s.; card-racks, 26s. to 40s.; hand-screens, 18s. to 48s.; netting-boxes, 25s. to 27s.; card-boxes, 2l. to 5l. 5s.; pole-screens, 4l. 10s. per pair; ladies' folios, richly painted, 30s. to 3l. 3s.; ladies' companions, or pocket work-boxes, in pearl, shell, paper, and leather, at all prices; ladies' scent and toilet bottles, 7s. 6d. to 3l. 3s.; ladies' card-cases, 10s. to 5l.; elegant chess-boards, and ivory chessmen, various prices, to 10l. 10s.; watch-stands, 27s. each; gold and silver pencil-cases; ivory-handled and seven-day razors, from 25s. to 10l. 10s.; ivory-handled and Scotch strops, in every variety; sporting knives, from 10s. to 3l.; splendid Wharnclyffe knives; ladies' scissors, 5s. to 50s. per pair; cases of plated and silver desserts, to 25l.; cases of splendid table cutlery, to 40l.; and a variety of other articles; of which catalogues may be had, gratis.—As Mech's manufactures extensively on his own premises, the quality of every article is warranted.—Table Cutlery, Sheffield Plate, &c.

FOUNTAINS, VASES, TAZZAS, FIGURES, &c., in Marble, Artificial Stone, and Parker's Cement, to be seen at WYATT, PARKER, and Co.'s WHARF, Holland-street, Surrey, foot of Blackfriars bridge. Also a large Collection of Chimney Shafts, Pedestals, Capitals, Consoles, Trusses, &c.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.—The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

A LADY, an original Subscriber to the *Gardeners' Chronicle*, wishes to make known that she has an ALOE, 100 years old, which she expects to blossom soon; and it having grown too large for her greenhouse, wishes to dispose of it. For particulars, she refers to Mr. MILAND, Bookseller, Chapel-street, Grosvenor-place.

TO NURSERYMEN, FLORISTS, &c.—The SOCIETY for the ENCOURAGEMENT OF HORTICULTURE and FLORICULTURE in Manchester beg to announce that they will be glad to receive (carriage paid), any new seedlings of Flowers, (cut specimens,) Plants, Fruits, or Vegetables, for the purpose of making them generally known, aiding their circulation, and giving that encouragement to merit which hitherto, from a want of personal inspection, has frequently been misapplied, much to the injury of the raisers of Seedlings. Parties desirous of availing themselves of such a means may forward their parcels addressed, "For the Floricultural Society, care of Mr. ROBINSON, Falsstaff Market-place, Manchester."

N.B.—The above Society meet every Saturday, so that specimens sent for their inspection ought to be delivered as above, not later than 12 o'clock at noon on that day.

CAUTION.—Several Perfumers of apparent Respectability, for the sake of gaining a trifle more profit, basely attempt to impose their pernicious compounds upon the public as the real "MACASSAR OIL" for the Hair, and "KALYDOR" for the Complexion. They copy the bills and labels of the original articles, substituting either a fictitious name, or the word "GENUINE" in the place of "ROWLAND'S." To frustrate such imposition, it is necessary, on purchasing either article, to see that the word ROWLAND'S is on the wrapper, as follows, without which none are genuine. ROWLAND'S MACASSAR OIL, for the growth, and for Beautifying the Human Hair. Price 3s. 6d., 7s., or Family Bottles (containing four small) 10s. 6d.; and double that size, 21s. per bottle. ROWLAND'S KALYDOR, for the Skin and Complexion. Price 4s. 6d. and 8s. 6d. per bottle. A. ROWLAND AND SON, 20, HATTON GARDEN, LONDON, is written in red on the wrappers of the MACASSAR OIL and KALYDOR, and engraved on the Government Stamp affixed on the Kalydor. Be sure to ask for "ROWLAND'S" Articles. Sold by them and by respectable Chemists and Perfumers.

WATERER'S Splendid Exhibition of AMERICAN PLANTS will be open for Public View the Second Week in MAY, at the Nursery, King's-road, Chelsea.

WANTED, immediately, a steady, active Man, as PROPAGATOR. He will be required to have a thorough knowledge of the Propagation and Cultivation of Plants in general.—Address, by letter, with terms, references as to capability, &c., to YOUNG & Co., Great Yarmouth Nursery, Norfolk. April 29, 1843.

WANT PLACES.—All Letters to be post-paid.

AS HEAD GARDENER, or GARDENER and BAILIFF, a Married Man, aged 36, who thoroughly understands his business in all its departments of forcing, kitchen-garden, and fringing; can have an unexceptionable character from his last employer, with whom he lived four years.—Direct to A. B., Post-office, Stoke Newington.

TO NOBLEMEN AND GENTLEMEN.

AS GARDENER, or GARDENER and BAILIFF, a Single Man, upwards of 30 years of age, who thoroughly understands the business in every department; the most satisfactory reference can be given as to ability, integrity, &c. from a family of distinction, with other references if required. Direct Mr. Brown, gardener at Lord Southampton's, Whittlebury, Towcester.

AS GARDENER, DAVID RIDD, Gardener to the Countess of HARDWICKE, is about to leave his Situation, and will be glad to engage in a Nobleman or Gentleman's Service; he has had great experience in every department of Horticulture, and can be highly recommended by his present and former employers for strict integrity and a perfect knowledge of his profession in every department. D. R. is unmarried, and in the prime of life. Direct to D. R., Tittenhanger Hall, Barnet, Herts. N.B.—None need apply who do not employ several men.

AS GARDENER, or GARDENER and FORESTER, a respectable Young Man, aged 27, who has had much experience in good Families; he thoroughly understands his business in every department, and can have an unexceptionable character from the gentleman he has just left. Direct to C. B., 32, Cochran-terrace, Portland-town, St. John's Wood.

TO THE NOBILITY AND GENTRY.

AS PRACTICAL GARDENER, or GARDENER and FORESTER.—H. BOWERS, of Laleham, is now at liberty to engage with any gentleman in want of a Confidential Servant, as above. The advertiser has devoted all his life and energies to the practice of his profession on the most improved principles—particularly in the Cultivation of Pines, Grapes, and every necessary in the Forcing Kitchen, Fruit, and Decorative Garden, having acquired great experience in large establishments, and in serving distinguished families as Principal Gardener, Forester, Designer, and general Improver of Gardens and Estates, &c. is perfect master of his business, and equal to a very extensive charge. H. B. is married, aged 35; can be highly recommended by the most eminent Horticulturists, and the nobleman he has recently left. Letters addressed as above, or to the office of this Paper will meet with immediate attention. N.B.—Liberal wages expected, and the Management of a small Farm not objected to.

AS BAILIFF, or BAILIFF and FARMER, a respectable married man, 35 years of age (a native of Yorkshire) who fully understands the management of Arable, Meadow, and Pasture-land, the Rearing and Feeding of Stock, management of Plantations, &c.; can be highly recommended by one of the first Land-Agents in the country; has no objection to go into Ireland. Application to be made to Mr. MAY, Hope Nursery, Leeming-lane, Bedale, Yorkshire.

Printed by Messrs BRADSHAW and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 8, CHARLES STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, April 29, 1843.

FUCHSIA ST. CLARE.—This splendid Fuchsia, pronounced by Dr. Lindley as the "finest hybrid we have seen," is now being sent out by YOUELL and Co., Great Yarmouth Nursery, Norfolk, at 10s. 6d. per plant, free of postage, to any part of the United Kingdom.—Great Yarmouth, May 5, 1843.

MESSRS. LANE AND SON'S Catalogue of PELARGONIUMS, FUCHSIAS, HEARTSEASE, VERBENAS, &c. &c. for the season, may be had on application (inclosing a 2d. stamp) at the Nurseries, Great Berkhamstead, Herts. The heights and colour of Verbenas are given in this Catalogue for the purpose of assisting amateurs in arranging their beds.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

SUPERB CHRYSANTHEMUMS.

YOUELL & Co., in offering the following List of CHRYSANTHEMUMS to the notice of Amateurs, and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the list will be found highly satisfactory to those who may not only have the above object in view, as well as to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower.

They also feel much pleasure in announcing they have obtained the entire stock of an extremely beautiful seedling Chrysanthemum, from Mr. Wells, gardener to the Rev. J. Burroughes, of Lingwood Lodge, Norfolk. This splendid variety, named "THE DUKE," was exhibited at the Norwich and Norfolk Horticultural Society's Exhibition, where it obtained the First Prize as the Best Seedling; it also obtained First Prizes shown in the best stand of 25; ditto ditto, 15; ditto ditto, 20; and the judges pronounced it to be the best Chrysanthemum ever exhibited. The colour French white, changing to pure white; petals broad and beautifully incurved, forming a perfect ball of from 4 to 4½ inches in diameter. It will be ready for sending out the first week in June, at 7s. 6d. per plant, free of postage, to any part of the United Kingdom.

Belladonna	Goliath	Mirabilis
Campestris	Gouven St. Cyr	Perspicuum
Chancellor	Hero	Princess Marie
Changeable yellow	Imperial	Queen
Clustered ditto	Incurved pink	Rosalind
Colonel Combes	Insignis	Starry purple
Conspicuum	King	Sultana
Defiance	Louis Philippe	Surprise
Duc de Cagliosi	Lucidum	Tasselled lilac
Elegans	Madame Pompadour	Ditto yellow
Fletcher	Magnet	Triumphant
Formosa	Magnis	Vesta
Gem	Marchioness	Wheeleriana
Golden Lotus	Morillon	

The above will be sent free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, in the first week of June, at 12s. per dozen.

Great Yarmouth Nursery, May 5, 1843.

CHOICE FLOWER SEEDS.

J. CARTER begs leave to recommend the following FLOWER SEEDS, all adapted for present sowing, and during the month of May:—

	s.	d.
150 very fine Annual Flower-seeds	2	10 0
75 Do. do.	1	5 0
*100 Do. Perennial do.	1	0 0
*50 Do. do.	0	10 0
*25 Do. do.	0	5 0
*12 Do. Greenhouse Seeds	0	5 0
*12 Do. do. Climbers	0	7 6

Choice Assortments.—p. packet	Fine Mixed Seeds.—p. packet
16 German Aster	*Anagallis
12 Stock	*Anemone
15 Autumnal Stock	Balsam
12 Dwarf Larkspur	Calliopsis
8 Tall do.	*Campanula
*8 Scabious, new, large	*Carnation, German
20 Fine Zinnia elegans	* Do. double
10 Do. do.	Convolvulus major, 20 vars.
*36 Do. Hollyhock	*Hollyhock, 20 var.
20 Do. do.	Larkspur, dwarf, 12 vars.
*6 Brompton Stock	* Do. perennial
*6 Wallflower	Petunia, 6 vars.
*8 Antirrhinum	Phlox Drummondii
*8 Aquilegia	*Picotees, finest
6 Clarkia	*Polyantus
*10 Delphinium	*Chinese Primrose, 3 vars.
*12 Dianthus	Salpiglossis, 20 vars.
*10 Digitalis	*Scabious, large, new
12 Gaura	*Sweet William, 20 vars.
8 Larkspur	Thunbergia, 4 vars.
6 Enothera	*Wallflower
6 Nemophila	Zinnia elegans
*6 Papaver	" 5 sp.
*8 Potentilla	Those marked * are Perennials, and may also be sown in autumn, but if sown now, many of them would flower this autumn.
10 Schizanthus	
8 Senecio	
5 Venus' Looking-glass	

* * * Three Amaryllises, from Chili, 2s. each.
JAMES CARTER, Seedsman & Florist, 238, High Holborn, London.

SALT-HILL NURSERY, NEAR WINDSOR.

ALEXANDER JAMES STEWART, in recalling the attention of the readers of the *Gardeners' Chronicle* to his Advertisement of 15th April, folio 242, begs most respectfully to assure them that he can still furnish good plants of all the PELARGONIUMS, FUCHSIAS (his collection of which, his unprecedented success at the various horticultural exhibitions throughout the whole of last season—having invariably taken first-class prizes—proves to be unrivalled), PETUNIAS, CINERARIAS, CAMPELLIAS (to this last-named most splendid genus he has recently added some of the latest varieties known, including the Queen Victoria, &c. &c., each of which may be had upon very reasonable terms), DAHLIAS, and VERBENAS, enumerated; of the latter A. J. S. can now supply healthy young plants of very choice kinds, for bedding, if left to his own selection, at 1s. 1s. to 3s. per 100.

A. J. S. has to offer a considerable number of Mrs. Shelley, Great Western, Bedford Surprise, and several other first-rate DAHLIAS, in an extremely healthy and vigorous condition.—A general Catalogue may be had upon prepaid application.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

BEAUTIFUL AND DISTINCT FUCHSIAS.

YOUELL & Co., in submitting their Catalogue of Fuchsias for 1843, take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attend their mode of selecting last season's collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. are desirous of calling attention to their peculiar method of executing orders for this tribe of plants; namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, in collections, upon the following terms:—
Twelve fine Show Varieties, 12s. Twelve extra fine and very superior . . . 21s.
Twelve extra fine ditto . . . 16s.

The selection being left to YOUELL & Co.

DESCRIPTION OF FUCHSIA ST. CLARE.

This magnificent Fuchsia was raised by Mr. Meehan, gardener to Colonel Harcourt, at St. Clare, Isle of Wight, from whom Messrs. YOUELL obtained the entire stock. In May last it was submitted to Dr. Lindley, for his opinion, which will be found in the *Gardeners' Chronicle* of the 14th of that month, as follows:—"Your seedling Fuchsia is by far the finest hybrid we have seen, the flowers being three inches in length, with the tube and sepals of a bright carmine colour, and the petals of a rosy purple. If, as you say, it is a strong grower and a free bloomer, it will prove a valuable addition to this beautiful genus."

As a proof of its being a most profuse bloomer, Y. & Co. had a plant in flower Sept. 15, 1842, on one branch of which were upwards of 200 blooms, forming a splendid object for the greenhouse, conservatory, or flower-garden. Price 10s. 6d. per plant, sent free of postage to any part of the United Kingdom.

VERBENAS.

"Iaconii," a fine blue, delightfully fragrant, of vigorous but compact habit, and the heads of flowers measuring upwards of three and a half inches in diameter
"Princess Royal," of the purest snowy white, the flowers remarkably large, and extremely fragrant; nothing can exceed the purity of the white in this beautiful variety, and it possesses that acquisition not to be found in any of its class—of retaining its clear white during fading
[It would be as well to remark, that the petals of the flowers of the above meet so closely as to form a perfect ball. They are now ready for sending out by post, free, to any part of the United Kingdom.]

Great Yarmouth Nursery, Norfolk, May 5, 1843.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS at the GARDEN.—The first Exhibition will take place on Saturday, the 13th of May; subjects for Exhibition must be at this office on Friday, the 12th of May, or at the Garden before half-past Eight o'clock, A.M., on the day of Exhibition.

The gates will be opened at One, P.M. Tickets are issued to Fellows at this office, price 5s. each; or at the Garden in the afternoon of the days of Exhibition, at 7s. 6d. each; but only to Orders from Fellows of the Society. N.B. No Tickets will be issued in Regent-st. on the day of Exhibition.—21, Regent-st.

HIGH WYCOMBE HORTICULTURAL AND FLORAL SOCIETY.

The First Show will take place on WEDNESDAY, May 17, 1843. Open to the admission of the Public at One o'clock, by Members' Tickets, or by payment of 1s.

EXHIBITION OF TULIPS.

GROOM, Clapham Rise, (late of Walworth,) by appointment, Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that his extensive COLLECTION OF TULIPS is now in full bloom, will continue in perfection until the 20th of May, and can be viewed every day from 9 o'clock until 6, Sundays excepted. Admittance 1s.

WATERER'S SPLENDID EXHIBITION of AMERICAN PLANTS will open on THURSDAY, the 18th of May, at the Nursery, King's-road, Chelsea.

WILLIAM WOOD AND SON have now commenced

sending out their MAGNIFICENT NEW VERBENA "PRINCE OF WALES," for description of which, see *Gardeners' Chronicle* of the 22d of April, and have also ready for delivery at the same time, the following SELECT PLANTS.

s.	d.	s.	d.
Antirrhinum, 6 vars., each	0 6	Ipomoea ficifolia	1 0

Pelargonium Lady Webster, 21s. each.
Azalea indica Jennerii . . . 21s. "
Woodlands Nursery, Maresfield, near Uckfield, Sussex.

SPLENDID NEW PELARGONIUM, "NORTHERN BEAUTY."

JOHN HANCOCK & SON beg to inform their friends that they are now sending out Plants of the above beautiful variety, (a description of which has already appeared,) and they can with the greatest confidence recommend it as being a decided acquisition, and one of the finest Pelargoniums in its class ever offered to public notice. Price, per plant, 42s.

J. H. & Son beg to solicit attention to their Collection of NEW and SUPERB PELARGONIUMS, CHOICE CALCEOLARIAS, PANSIES, NEW VERBENAS, FUCHSIAS, &c. Descriptive Catalogues of which may be had on application. Their New List of Dahlias is also ready.

Achimenes longiflora . . . 12s. per doz.
Verbenas, fine sorts . . . 6s. "
Fuchsias, ditto . . . 6s. "
With many other plants for bedding out.—Durham, Apr. 29, 1843.

SEEDLING DAHLIA—DEWAR'S IMOGENE.

A beautiful bright lilac, fine cupped Petals, good outline, and rises well in the centre, a most abundant Bloomer, and very constant; flowers well above the foliage, on stiff foot-stalks, height from 3 to 6. It took prizes at the following shows:—1st, at the Great North of England, 8th Sept., 1841; 1st class prize at Hexham, 3 blooms, 13th Sept., 1842; 1st class prize at the North of England, 12 blooms, 21st Sept.; 1st prize at Durham, 21st Sept.; 1st prize at Morpeth, 9 blooms, 22d Sept. It also obtained a prize at York, 28th Sept. In class showing it was placed first at Hexham and the North of England Shows, as being the best lilac. It was also placed as a first-class flower by the board of the Hexham Floral Society on the 7th Sept. Very fine plants are now ready to send out at 10s. 6d. each, and may be had of Mr. H. NEWTON, Nurseryman, Newcastle; Messrs. ROBERTSON, Nurserymen, Brentford; W. J. HARRISON, York; and H. DEWAR, Jesmond, Newcastle-on-Tyne.

FUCHSIA LANEII.

MESSRS. LANE & SON, Great Berkhamstead, Herts, beg to announce that the above-named new Seedling is now being sent out (in rotation as ordered), at 7s. 6d. a plant.—Messrs. L. & S. beg leave to lay before the Public some of the grounds upon which they claim for this Seedling a decided superiority over every other hybrid extant, viz.,—The *Gardener's Gazette*, page 107, speaking of its exhibition at the Horticultural Society's Grounds at Chiswick, in July last, says:—"Messrs. LANE & SON exhibited several plants of a handsome hybrid Seedling Fuchsia, possessing many valuable properties, the flowers being large and well-shaped, sepals and petals distinct in colour, the latter being of a fine purple; the plants appeared to flower remarkably freely."

PAXTON, in his *Magazine of Botany* of August last, says of it—"The habit is dwarf and close; the leaves ample, with the elegance of the older species, and none of the coarseness of the more modern kinds; and the flowers are somewhat the shape of the old globosa, but more expansive, and singularly large. Their sepals are bright crimson, and the petals darker, or of a light purplish hue. It is one of the best hybrids we have seen."

HARRISON, in his *Floricultural Cabinet* of the same month, says—"The seedling Fuchsia sent by Messrs. LANE is the best of its class (the dark) we have ever seen; its immense size, good form, and colour will always render it attractive, and deserving a place in every collection. No doubt it will be much in demand."

This Fuchsia was the only Seedling of last season to which any prize was awarded by the Horticultural Society, and this was at the Show on the 16th of July; it was exhibited only at the above Show, at the Stamford Hill (Clapton) Show, on the 21st, and at the South London Floricultural Society's Show, Surrey Zoological Gardens, on the 26th of the same month, at both of which prizes were awarded to it.

It can be sent by post to any part of the United Kingdom.—The usual allowance to the Trade when six plants are taken. Berkhamstead Nurseries, May 4, 1842.

NEW AND CHOICE ROSES.

A. PAUL & SON, NURSERYMEN, &c., Cheshunt, Herts, in offering the following Select List of ROSES, beg to remind Rose Amateurs that May is the best month for planting out beds of Dwarf Roses. The Plants now offered are in No. 60 pots, good and healthy, and if planted out this month will bloom in the approaching autumn.

Don Carlos	1 6	Pactolus	1 6

Many persons preferring whole beds of Roses of one colour for the sake of effect, the following are well suited for that purpose, and grown in large quantities.

	each—s. d.	per doz.
Hybrid Perpetual Auberon, rose	3 6	or 30s.
Noisette Aine, lilac rose	1 0	" 10s.
" Euphrosyne, rose and yellow	2 0	" 18s.
Bourbon Queen, buff	1 0	" 12s.
" Armosa, pink	1 0	" 10s.
China, Fabvier, scarlet	1 0	" 10s.
" White	1 0	" 10s.
" Mrs. Bosanquet, flesh	1 6	" 15s.
Lawrenciana rubra, deep red	1 0	" 10s.

Also fine named varieties at the following prices, when the selection is left to A. P. & SON.

Hybrid Perpetual	24s. to 30s. per doz.
Noisette	12s. " 18s. "
China	12s. " 18s. "
Thea	18s. " 24s. "
Bourbon	18s. " 24s. "

For description of colours and further information, A. PAUL and Son beg to refer to their General Catalogue, which may be had on application at the Nurseries, inclosing 2 stamps for postage. Early orders are solicited, as many sorts are expected to be in great demand. A reference, or order on the post office at Waltham Cross, will be required from unknown correspondents. Cheshunt Nurseries, May 6.

WILLIAM LYNN, NURSERYMAN, SEEDSMAN, and FLORIST, late of Henley-on-Thames, Oxon, respectfully informs the Gentry and Public in general, that he is now carrying on the above business, and connected therewith a GARDEN TOOL WAREHOUSE, at the premises, No. 10, Church-street, Hackney, opposite Morning-lane. W. L. begs to state that his collection of Culinary, Garden, and Flower Seeds is of the very best quality, and true to kind; likewise his Fruit-Trees, Flowering and Evergreen Shrubs, Greenhouse Plants, Perennial and Bulbous Roots. His Garden Utensils are also of the best description, at prices which he trusts, with industry, punctuality and attention, will secure to him general patronage. W. L. solicits particular attention to his new PEA, LYNN'S DWARF WRINKLED MARROW, 2s. 6d. per quart, which is superior to the Knight's Marrows, and much more advantageous, especially in small gardens, its height being 3 to 4 feet; it is the most prolific summer and autumn Pea ever introduced—perpetual in its bearing, the pod quite full, and of delicious flavour, even when nearly ripe.—Catalogues of Seeds, Garden Implements, &c., may be had on application, inclosing a postage-stamp.

DAHLIA, "QUEEN OF THE ISLES." **HUGH LOW & CO.** beg to inform their Friends and the Public that, owing to the great demand for this variety, no more Plants will be sent out before the 20th inst. Parties to whom this arrangement may prove inconvenient are at liberty to cancel their orders.—Clapton Nursery, May 4, 1842.

SUPERB CARNATIONS AND PICOTÉES.

YOUELL & CO. have a few more Pairs to spare of that Superb Rose Flake Carnation, WILSON'S HARRIET, and JOAN OF ARC, Red Picotee, for 15s., package, &c. included. The following are the prices from YOUELL & CO.'s extensive Collection, consisting of upwards of 800 varieties, of the most select sorts:—

	£	s.	d.
25 Pairs of extra-fine and first-rate show-flowers	5	0	0
12 Do. Do. Do.	2	10	0
25 Do., very fine Do. Do.	3	0	0
12 Do. Do. Do.	1	10	0
12 Do., extra fine, and show Pinks	0	12	0

The selection being left to YOUELL & CO.
ARAUCARIA IMBRICATA.—Fine strong Plants, 8 inches high, 60s. per dozen; 10 inches, 84s.; 1 ft., extra fine, 21s. per plant. 30 packets of select Flower Seeds, 8s., sent free of postage. Great Yarmouth Nursery, Norfolk, May 5, 1842.

FUCHSIA MAJESTICA MULTIFLORA, and **MULTIFLORA COCCINEA.**—B. W. KNIGHT, Florist, begs to say he is now sending out the above magnificent Fuchsias at 7s. 6d. each, by post prepaid, on receiving the amount with the order, also the following superb Dahlias:—MILLER'S WINDMILL HILL HERO, and VAN AMBURGH, 10s. 6d. each, and KNIGHT'S SOUTHERN BEAUTY, 5s.; for description, see advertisement of the 15th April. Also 12 superb seedling Pansies for 50s. B. W. K.'s list of Dahlias, Pelargoniums, Fuchsias, Verbenas, Pansies, Cinerarias, Phloxes, &c. may be had on application prepaid, which contains a description of the above. Superb Verbenas and Fuchsias, consisting of the best kinds, in tin cases, per post, Verbenas at 3s., 6s., and 12s. per dozen; Fuchsias at 6s., 10s. 6d., and 15s. per dozen. Agents in London, Mr. H. CLARKE, 86, High-st., Borough, and Messrs. W. and J. NOBLE, 152, Fleet-street. Tivoli Nursery, near St. Leonard's on Sea, Sussex, April 26.

TULIPS.

W. & R. LAWRENCE beg to inform their Friends and the Public that their superb Collection are now in bloom, and will continue to be so for the next fortnight. Admission GRATIS.—Lion Hotel, Hampton.

ORANGE-TREES in FULL BEARING.—To be SOLD, a Choice Collection of ORANGE-TREES, in very fine condition, bearing Blossom and Fruit; seven years old, and standing about three feet high. The reason for parting with them is that their room is required. A specimen plant may be seen at Messrs. FLANAGAN & CO.'s, Seedsmen, opposite the Mansion House, Mansion House-street, City, where further particulars may be had.

EXHIBITIONS

AT THE GARDEN OF THE HORTICULTURAL SOCIETY OF LONDON.

The Exhibitions will take place on the following Days: viz., SATURDAY next, May 13; SATURDAY, June 17; and WEDNESDAY, July 13.

EXHIBITORS.—All persons will be at liberty to send subjects for exhibition.

DELIVERY OF OBJECTS FOR EXHIBITION.—Exhibitors are earnestly requested to notify in writing, previously to the day of meeting, what plants they intend to supply, in order that due provision may be made for the proper distribution of the specimens on the exhibition tables. The best places will be secured for those who comply with this request. As it is necessary that the Judges should proceed to consider the respective merits of the exhibitions by 10 A.M., and as it is absolutely indispensable that the tables should be arranged by that time, it has been determined that no subject for exhibition shall be admitted into the Garden after half-past eight o'clock in the morning; and if the owners of any locked-up boxes, or other cases, should not be in the exhibition-tent at the said hour, such cases or boxes must be excluded from competition for medals.

ADMISSION OF EXHIBITORS.—Exhibitors or other persons required to assist in bringing in the objects for exhibition, will be admitted before half-past eight at the Carter's Yard Entrance Gate. Every principal Exhibitor of subjects for which medals are specifically offered may be furnished with one pass ticket, which is not transferable, for which he is requested to apply before ten o'clock, at which hour the GARDEN WILL BE CLEARED OF ALL PERSONS not officially detained there. Exhibitors may re-enter the Garden after one o'clock, when they will be required to give up their pass-tickets at the Carter's Yard Gate.

FLOWER STANDS.—Exhibitors of cut flowers must SUPPLY THEIR OWN BOXES OR STANDS. No box or stand shall exceed eight inches in height at the back, or eighteen inches in depth from front to back. The lids of all boxes must either be loose or made to unhinge.

MEDALS AND REWARDS.—The Society distributes the following Medals and Rewards; namely,
C. The Certificate value £0 10s. 0d.
SB. Silver Banksian Medal " " 1 0 0
SK. Silver Knightian ditto " " 1 5 0
LS. Large Silver ditto " " 1 15 0
SG. Large Silver Gilt Medal " " value £4 0s. 0d.
GB. Gold Banksian ditto " " 7 0 0
GK. Gold Knightian ditto " " 10 0 0
LG. Large Gold ditto " " 20 0 0

SUBJECTS OF EXHIBITION.—No articles not of horticultural produce will be placed upon the tables. Exhibitors will IN ALL CASES BE REQUIRED TO SIGN A PRINTED FORM OF DECLARATION TO BE FURNISHED TO THEM IN THE GARDEN stating under what letter their plants are to be shown; and they are requested to take notice, that if errors in the awards should occur, in consequence of mistakes on the part of Exhibitors in filling up such declarations, the Society cannot undertake to rectify the errors afterwards.

Names fairly written are to be attached by Exhibitors to all Florists' flowers; and the Judges are restrained from awarding any Medal to such Exhibitions, whatever their merit may be, if this regulation is not complied with. By Florists' flowers are meant not only flowers usually so named, but also Fuchsias, Pelargoniums, Roses, and Calceolarias.

CLASS I.—FLOWERS, for which nurserymen and private growers exhibit independently of each other:—
A. Pelargoniums, in collections of 12 new and first-rate varieties, cultivated with superior skill, in pots of 24 to a cast, GB, SG, LS, SK.
B. Pelargoniums, in collections of 12 varieties, in pots of 12 to a cast, SG, LS, SK.
C. Pelargoniums, in collections of six varieties, in pots of 8 to a cast, LS, SB.
D. Rhododendrons, in pots; not fewer than 12 plants in 12 varieties. LS, SK, SB.
E. Roses, in pots, in collections of 25 distinct varieties, GB, SG, LS. N.B. It is the wish of the Society, in a future season, to require Roses to be shown exclusively in pots; and not to allow cut specimens to be exhibited at all.
F. Moss Roses in loose bunches, as gathered, so as to exhibit, as far as possible, the habit of the variety; in 12 varieties, SK, SB, C.
G. Other Roses, exhibited as in the last letter, and in 50 varieties, LS, SK, SB, C. N.B. No one who exhibits in this letter, can also compete in the following.

CLASS II.—FLOWERS; for which all persons are admitted to equal competition:—
H. Other Roses, exhibited as in the letter F, and in 25 varieties. SK, SB, C.
N.B. Higher Medals than those here offered for Roses cannot be given by the Judges. And if Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to be placed on the tables.

CLASS III.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
1. Miscellaneous collections of fruit, consisting of at least three different kinds. Peaches and Nectarines being considered as only one kind, GK, GB, LS.
N.B.—Cucumbers, Tomatoes, Gourds, and similar Kitchen Garden produce, are excluded from this letter.

CLASS IV.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
2. Grapes. SG, LS, SK, SB.
3. Pine Apples. SG, LS, SK, SB.
4. Peaches or Nectarines, in dishes of six specimens. SK, SB.
5. Miscellaneous fruit. SK, SB, C.

CLASS V.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
6. Grapes. SG, LS, SK, SB.
7. Pine Apples. SG, LS, SK, SB.
8. Peaches or Nectarines, in dishes of six specimens. SK, SB.
9. Miscellaneous fruit. SK, SB, C.

CLASS VI.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
10. Grapes. SG, LS, SK, SB.
11. Pine Apples. SG, LS, SK, SB.
12. Peaches or Nectarines, in dishes of six specimens. SK, SB.
13. Miscellaneous fruit. SK, SB, C.

CLASS VII.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
14. Grapes. SG, LS, SK, SB.
15. Pine Apples. SG, LS, SK, SB.
16. Peaches or Nectarines, in dishes of six specimens. SK, SB.
17. Miscellaneous fruit. SK, SB, C.

CLASS VIII.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
18. Grapes. SG, LS, SK, SB.
19. Pine Apples. SG, LS, SK, SB.
20. Peaches or Nectarines, in dishes of six specimens. SK, SB.
21. Miscellaneous fruit. SK, SB, C.

CLASS IX.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
22. Grapes. SG, LS, SK, SB.
23. Pine Apples. SG, LS, SK, SB.
24. Peaches or Nectarines, in dishes of six specimens. SK, SB.
25. Miscellaneous fruit. SK, SB, C.

CLASS X.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
26. Grapes. SG, LS, SK, SB.
27. Pine Apples. SG, LS, SK, SB.
28. Peaches or Nectarines, in dishes of six specimens. SK, SB.
29. Miscellaneous fruit. SK, SB, C.

CLASS XI.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
30. Grapes. SG, LS, SK, SB.
31. Pine Apples. SG, LS, SK, SB.
32. Peaches or Nectarines, in dishes of six specimens. SK, SB.
33. Miscellaneous fruit. SK, SB, C.

CLASS XII.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
34. Grapes. SG, LS, SK, SB.
35. Pine Apples. SG, LS, SK, SB.
36. Peaches or Nectarines, in dishes of six specimens. SK, SB.
37. Miscellaneous fruit. SK, SB, C.

CLASS XIII.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
38. Grapes. SG, LS, SK, SB.
39. Pine Apples. SG, LS, SK, SB.
40. Peaches or Nectarines, in dishes of six specimens. SK, SB.
41. Miscellaneous fruit. SK, SB, C.

CLASS XIV.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
42. Grapes. SG, LS, SK, SB.
43. Pine Apples. SG, LS, SK, SB.
44. Peaches or Nectarines, in dishes of six specimens. SK, SB.
45. Miscellaneous fruit. SK, SB, C.

CLASS XV.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
46. Grapes. SG, LS, SK, SB.
47. Pine Apples. SG, LS, SK, SB.
48. Peaches or Nectarines, in dishes of six specimens. SK, SB.
49. Miscellaneous fruit. SK, SB, C.

CLASS XVI.—FRUIT, for which market gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other. N.B. All fruit must be fully ripe and well coloured; if the contrary, it will be disqualified.
50. Grapes. SG, LS, SK, SB.
51. Pine Apples. SG, LS, SK, SB.
52. Peaches or Nectarines, in dishes of six specimens. SK, SB.
53. Miscellaneous fruit. SK, SB, C.

SEEDLING DAHLIAS FOR 1843.

MRS. JAMES RICHARDSON, and TODD'S LADY SALE.

REPORT OF THE LONDON FLORICULTURAL SOCIETY, SEPT. 20, 1842:—Six Blooms of a Seedling Dahlia of 1841, named "Mrs. James Richardson," were sent for opinion by Mr. James Edwards, of York. This Flower was shown at the Royal South London Floricultural Exhibition last week, and had an extra prize awarded; but on the present occasion was shown in much better character, the blooms being quite up in the centre, and decidedly first-rate. The following was the decision of the censors: Form, substance, and arrangement of petals, good; eye, good; depth, full; size, medium; general form, good; colour, white, occasionally tipped; class of quality, first-rate.—From the *Gardeners' Chronicle and Gazette*.

Also obtained the following prizes:—No. of Blooms Exhibited.
1st prize at Hull, Aug. 30th 12
1st prize at Beverley, Sept. 7th 2
Awarded an extra prize at the Royal South London Floricultural Society, Sept. 13th 4
1st prize at Leeds, Sept. 21st 12
1st prize at Newcastle, Sept. 21st 6
1st prize at Sunderland, as a superior first-class Seedling, Sept. 27th 5
1st prize at the York Floral and Horticultural Society, Sept. 28th 18
1st prize at the York Floricultural Society, Oct. 1st 12
1st prize in its class as the best white or bluish, ditto. Height, 4 to 5 ft. Plants, 10s. 6d.

Also recommended by the London Floricultural Society as one of the best Six New Dahlias coming out in 1843.

LADY SALE (TODD'S): Beautiful ruby carmine, fine clean-cupped petals, of good substance, rising well in the centre; of considerable depth and good size; very constant, and a decided first-rate show flower. Height, 4 ft.; Plants, 10s. 6d.

All orders addressed J. EDWARDS, Layerthorpe, Florist, Nursery and Seedsman, 7, New Bridge-street, York, will be strictly attended to; and the greatest care will be taken in sending out good plants at an early period, so as to ensure a good bloom during the season.—York, Dec., 1842.

ORANGE, LEMON, AND SHADDOCK-TREES.

G. MARSANO has just landed from Italy Two HUNDRED of the above splendid TREES, arrived in the best condition, from 6s. to 10s. each. One case contains 80 middling Trees. The Trade will be supplied at 33 per cent. cheaper than any other house in London. Orders taken for French Pedestal Cupboards, ornamented with marble tops, with shelves inside, 2½ ft. high. Orders by post punctually attended to by G. MARSANO, Olman, No. 2, Beauchamp-street, Brook's Market, Leather-lane, Holborn.

HORTICULTURAL SOCIETY of LONDON.

Four Lectures on CHEMISTRY, in its applications to Vegetable Physiology and the Arts of Cultivation, will be delivered in the Meeting-Room of the Society by Mr. E. SOLLY, F.R.S., &c., Experimental Chemist to the Horticultural Society, on THURSDAY, the 11th, 18th, and 25th of May, and 1st of June, at Three o'Clock precisely. Fellows of the Society are admitted upon signing their names; all other persons by Tickets, which may be obtained at the Office of the Society, 21, Regent-street, price 10s. 6d. for the Four Lectures. By Order of the Council.

HORTICULTURAL SOCIETY of LONDON.

Notice is hereby given, that no meeting of this Society will take place in Regent-street on Tuesday the 16th inst.

The Gardeners' Chronicle.

SATURDAY, MAY 6, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.

Tuesday, May 9 Zoological 8½ p.m.
 Wednesday, May 10 Geological 8½ p.m.
 Medical Botanical 2 p.m.
 Horticultural Gardeners 2 p.m.
 Saturday, May 13 Royal Botanic 4 p.m.

Wednesday, May 17 Microscopical 8 p.m.
 Friday, May 19 Botanical 8 p.m.

COUNTRY SHOWS, Tuesday, May 9, Heartscase, Hammersmith.
 Thursday, May 11, Cucumber, Ipswich.

"HAVING read," says a correspondent, signing himself 'Lexicon,' "the remarks of 'Agger,' in a late Number of the *Chronicle*, on the pronunciation of the names of flowers, together with the complications of a most extravagant character of the Greek and Latin languages used in naming them, I am tempted to offer my protest against the introduction of these complications into the English language, as is now attempted in the charming gardens of St. James's Park, where there is an arboretum of almost all specimens of native and foreign trees and shrubs that will exist in our climate, but which I regret to see lingering and drooping, in too many cases, from the smoky atmosphere they are doomed to breathe: there I find the Birch-tree called a *Betulineous* tree, the Chesnut a *Castanaceous* tree, and a Ribes a *Grossularious* shrub, &c.; thus endeavouring to engraft a series of villanous gardeners' compounds on our language. How our lexicographers may deal with them in their future dictionaries I know not, but I am sure they are calculated to puzzle the rising generation, with the tribes of governesses and nursemaids who frequent that delightful locality."

Upon this point we entirely differ from our correspondent, for the following reasons. It will, we conceive, be admitted that the object which the Commissioners of Woods and Forests have proposed in attaching names to the specimens of trees in the parks—namely, that of giving information concerning them to ignorant people, is highly deserving of commendation. It will also be conceded that the more information which is thus conveyed, the better. Now the mere name of a plant carries but little interest with it; the idlers in the parks will scarcely stop to observe whether a tree is called *Abies excelsa* or *Pinus ponderosa*; and if they do, they will care but little for the result of their investigation: but if they find other matters connected with it, their curiosity is gratified. For example: they see *Robinia pseudacacia* on a label; they find that it is also called the Locust-tree, that it is a native of North America—a fact which they would not have suspected, considering how common it now is in this country—and, finally, that it is a Leguminous plant. All these things put together form a little history which cannot fail to excite the interest of those who will use their powers of observation. Indeed, we do not suppose that "Lexicon" objects to anything in the system of marking plants we have just described, except so far as the term Leguminous is concerned. But what does Leguminous really mean? The idler in the Park in all probability does not know; inquiry is made of others, or books are consulted, and then it is ascertained that it is a technical collective term, indicating a particular kind of structure in the flowers and leaves, a certain manner of growth, a seed-vessel like the Pea-pod, and so on, circumstances which are also common to many other plants, called the Leguminous order. It further appears, that to that order belongs the Liquorice-plant, the Judas-tree, the Pea, the Clover, the Laburnum, and quantities of other familiar forms, all of which are members of the same large family. This we apprehend is a sort of information very far from useless.

"Lexicon," however, probably does not object to the knowledge thus conveyed—it is the word Leguminous that offends him. But how is such information to be put into a concise form except by some such term? We have no word in Johnson's Dictionary that will answer the purpose, and a new one must be invented. Leguminous may be passable, but what can be urged in favour of *Betulineous*? We answer, the necessity of the term, the utility of it, and custom. It is an expression having a definite meaning, signifying that the plant so named has

certain peculiarities, and so on, as before explained. Granted that "Lexicon" could coin a better, would it be desirable to do so, now that *Betulineous* has a recognised meaning, which is distinctly stated in books, and that it is in common use, although not among "Lexicon's" friends? We submit that it would not be desirable.

We think that the Commissioners of Woods and Forests deserve the greatest credit for the attempts they are making to render the Parks a source of information as well as recreation; and we are of opinion that the method of doing so which they have put in execution is well considered and judicious. The hideous stone candlestick, called a fountain, is the only offence against good taste that we can discover. But while we fully recognise the excellent intentions which have dictated the present mode of marking the trees in the Parks, we cannot conceal the fact that the utility of the plan is diminished by the negligence of the people entrusted with the execution of it. Information that is false does more harm than no information at all; and it is little creditable to those who were charged with the care of directing the preparation of the labels that such errors as calling *Populus* a *Betulineous* tree, instead of *Salicaceous*, or stating *Pyrus Michauxii* to be a North American instead of a Persian plant, should have occurred. It would, however, be unfair to object to the system because of such blemishes; and, for our own parts, we trust that the Commissioners will extend the plan to every place of public resort over which their authority reaches.

In endeavouring to find useful and profitable employment for Agricultural labourers, it should always be recollected, that, whenever there is a portion of them without employ, and consequently without pay, their resources will soon be exhausted; and that, in the end, they must be fed by the community, whether it be by voluntary charity, or a poor-law, or, what is much worse, by depredations on property. The public, and especially the owners and occupiers of land, suffer loss in consequence—with this additional disadvantage, that the moral condition of the labourer is deteriorated; that, when labour is abundant, habits of idleness prevent his doing his work with diligence; and dishonesty, the child of indigence, renders him less trustworthy. All this a very small comparative outlay might have prevented; and the loss which might have been incurred by giving work which did not fully repay the employer should be cheerfully submitted to, when the great advantage of industry and honesty in the labouring population, as it affects the employers, is taken into consideration.

If a committee of proprietors and occupiers of land, and of all those who employ labourers in a district, would meet occasionally to consider how the surplus population could be employed usefully, there is no doubt but the union-houses might become, what they should only be, refuges for destitute old age, helpless infancy, or bodily infirmity and mental incapacity. The sums now collected for the maintenance of men and women who are still capable of work would be far more usefully expended in paying them to keep roads and paths in repair, in clearing hedges and ditches of noxious weeds, collecting and mixing materials into composts for manuring the land, and many other useful employments suited to their strength or capacity, which are now seldom thought of. By such means as these, the rates of a parish with which we were connected were, even under the old and imperfectly-administered poor-laws, reduced more than one-half, so that we speak from experience. It is grievous to the farmer to pay a heavy tax from which he derives no advantage whatever; while at the same time he is surrounded by distress, caused by want of employment, and his charity is chilled by the thoughts of the heavy contributions he is called upon to pay for the support of the poor.

However useful it may be to the regularly-employed labourer to have a garden or allotment to cultivate in his spare hours, this is no remedy for total want of employment. We would not introduce the cottar system, with all its privations and waste of time; but we would show the proprietors and occupiers of land how they may find work for many more hands than are usually employed on a farm, without loss to themselves, and, sometimes with considerable profit. There are many operations on a farm which cannot be so perfectly done by the usual implements of cultivation as by manual labour; and although this last is more tedious, it is not more expensive in the end. Without superseding the plough by digging or forking the land, a much better tilth may be given by the spade, fork, and hoe, *after the land has been ploughed*. In heavy and wet clays, where the treading of the horses does much harm, a man working in the intervals between the stitches usually formed by the plough on such lands can readily pulverise the surface on each side by breaking clods with a hoe or rake, either before the seed is sown or afterwards. We suppose that all the essential im-

provements in levelling, draining, and deepening ditches and watercourses have been completed; for these employ many hands, and are sufficiently profitable not to require any strong inducement to undertake them. What we wish to suggest is, additional manual labour in the minute operations of tillage, by which crops may be increased or secured, so as fully to repay the additional expense; while the great object of giving employment to all industrious labourers is thereby fully accomplished. A little reflection will soon lead to innumerable operations, which may be extremely useful, without causing a very great outlay of capital. A few hints is all that we pretend to give.

If farmers would not disdain to take a lesson from the gardens and allotments of their labourers, the latter being generally on poor land, often taken out of wastes, and allowed to be inclosed because they were of little use to the cattle turned out, they would see the advantage of the spade, rake, and hoe after the ground has been dug. When the land is laid in regular beds of about a perch or pole in width, slightly sloping from the centre to the intervals, which are deepened by the spade, the crops are invariably better and more certain, even with less manure. The expense of doing this, after the land has been ploughed deep or subsoil-ploughed, is much less than would appear at first sight: there will be 160 perches in length to deepen after the plough has gone twice over it, and less than 160 square perches to rake and lay in a proper form. Before the labourers are accustomed to the work, they may ask much more per perch than will give them fair wages; but this is very soon brought to a proper adjustment. Suppose a farmer begins by allowing 1d. per perch for the work, well done, including both operations, this will be only an additional expense of 13s. 4d. per acre; but we maintain that, if the land be not very heavy, a labourer will earn excellent wages at 10s. per acre, and, where there is competition, perhaps for much less. Those who have experience in task-labour will be better able to fix the fair price at once; but any man, by giving a good price at starting, will soon find competitors for the work, who will lower the price to a minimum, according to the greater or less abundance of labourers and the usual wages of the neighbourhood. When the farmer walks over his field to look at his growing crop, and finds deep surface-drains at a perch apart all over it, besides the under-drains, which, if they were necessary, we suppose to have been made, he will not regret the 10s. or 12s. it may have cost him; and if he does, let him examine fields of similar soils which have been laid, as it is usual to find them, after the common operations of ploughing, harrowing, and rolling, and observe the difference. The greatest advantage will be found in cold heavy soils; but even in the lightest it will be evident that the mould dug out of the intervals, and spread evenly over the surface, will prevent too great evaporation and greatly strengthen the growing crop. As it is usual for the ploughman to begin by filling up the interval between two stitches or lands, as they are called, with two furrow-slices laid over one another, and so alternate the crown and furrow, it may appear that the furrow dug out to the depth of fourteen or more inches will leave a hollow in the crown of the stitch now forming. This is avoided by causing the sides of the furrow to be drawn in by means of a heavy hoe before the plough begins its work; that is, if only one ploughing is intended to be given; but if it is to be ploughed oftener, the new stitch can easily be brought to a proper form by the process called gathering, which every ploughman well knows. Thus a great depth of soil is deposited under the crown of the stitch, and cannot fail to improve the Corn which grows there.

At the first opportunity, when the land is cleaned for roots, or whatever is the substitute for the fallow, if the soil can be kept clean without it, and when a cross ploughing is introduced, as it is in all improved husbandry, the stitches are so set out, that what was the crown before shall be shifted a foot or two to either side. The new furrow between the stitches will now be dug out, and some of the lower portion of the soil brought up and spread evenly over the new stitch. After a few such operations, the whole of the field will have its soil deepened several inches, without at once bringing too great a portion of the subsoil to the surface. If a spit of 8 inches below where the plough reached be spread over a perch, there will be only half an inch of the subsoil laid over the surface; and however tenacious or barren this subsoil may be, it will be mellowed by the effect of the atmosphere, rains, and frost, and entirely amalgamated with the soil. It stands to reason that the subsoil must not contain substances injurious to vegetation, or else it cannot be safely mixed with the soil. This is not a fancy or new scheme invented at the moment, for it has been the practice in Flanders from time immemorial. (See "Outlines of Flemish Husbandry," published by the Society for Diffusing Useful Knowledge.)—M.

At the anniversary meeting of the Horticultural Society on Monday last it must have been gratifying to the friends of Horticulture to learn how much real and most essential service this truly great association is quietly rendering to Gardening. Exclusive of their ordinary expenses, the Society has been able within the year to publish a new edition of their invaluable Fruit Catalogue (at a price which places it within the reach of every journeyman gardener), and to lay out 721*l.* upon importing plants and seeds from foreign countries, 340*l.* upon the improvement of hothouses at the Garden, and no less a sum than 833*l.* in medals and other rewards to gardeners for their horticultural skill. These facts require no comment.

It was announced on the same occasion that Mr. Edward Solly's interesting lectures on the Chemistry of Vegetation are about to be resumed this year in a new form, and that, although the Society at large does not subscribe to the funds which defray the cost of the chemical experiments, yet all Fellows of the Society would be admitted to the lectures without charge.

In considering the money part of Mr. Pusey's Drainage Bill, we do not find anything to object to, so far as its provisions go; but we think it would be desirable to introduce some additional clauses. The bill enables the Commissioners to raise money for their own purposes, and afterwards to charge land with the amount expended in effecting their works; but we do not perceive any clause enabling occupiers or proprietors to borrow money for carrying out their part of the work after the operations of the Commissioners have terminated. The general want of floating capital among landlords and tenants is in itself a great bar to such expensive work as the under-drainage of land, after the main watercourses are constructed or improved, which, as we understand it, is all this bill contemplates; it will therefore be necessary that money should be borrowed for the purpose. But capitalists will be shy of advancing money, unless the security to be given them is of the best description; and they will scarcely regard tenancy-at-will, or, perhaps, tenancy of any kind, or heavily-mortgaged land, as satisfactory security in the actual state of the law. It therefore seems desirable that advantage should be taken of the present opportunity to enable both landlords and tenants to offer better terms to capitalists than they now can.

It should be remembered that where drainage has been effected, the value of property becomes *permanently* improved; all those persons, therefore, who now hold landed securities will find their position much improved by the operation. It would, therefore, be no hardship upon persons holding landed securities if a priority of claim were given to all loans lent for the purpose of draining. We would give a direct priority of security to a lender above any existing mortgage, and we would not allow the mortgagee to dispute the propriety of the outlay. That mortgagees will at first resist the measure is probable enough, for they may be alarmed at the idea of any increased burthen on the land; but if they were satisfied that the estate to be drained was improved to more than the extent of the money advanced for the purpose, they would hardly persevere in opposition. It seems to us that a mortgagee would be satisfied upon this point, provided the question of under-draining were decided by the Commissioners, and this warrant were necessary in order to enable a borrower to offer the security of his land. Were this condition required, it could hardly fail to be satisfactory to the mortgagee.

Then, as to tenants: It is possible that landlords may in many cases prefer to throw the expense of under-drainage upon their tenants; in that case there will be no chance of the money being raised, unless the tenant can offer the lender available security for the repayment of the money borrowed. We would therefore recommend the insertion of a clause providing that claims for money lent for drainage purposes should, in cases of bankruptcy or insolvency, be satisfied out of the property and stock of the tenant, be superior to that of the landlord for rent, and be made recoverable by similar process before all other creditors. In order to prevent the abuse of such a power, it should also be required that the sanction of the landlord should be given before the borrower could take up money for the purpose of draining; and the amount of annual instalments by which it would have to be repaid might also be made to depend upon the decision of the landlord.

Let these things be provided, and there will be no want of money for carrying out the objects of Mr. Pusey's bill; on the contrary, land will become, as it ought to be, a favourite object of investment; we shall find the general improvement of the country the great object of interest to steady capitalists; and dangerous speculations, such as foreign loans and foreign railway schemes, will be left to the attention of those gamblers of which all countries furnish a plentiful crop.

Did our space permit it, we might find a few more points to advert to, such as irrigation and the sewer-

age of towns; but, for the present at least, we must leave these matters to other and abler hands.

FIG-TREES IN VINERIES.

IN compliance with the request of your correspondent, "W. C.," I send you a short statement of the mode of treatment pursued with the Fig-trees in my Vineries; and as I am not able to say what the kind of Fig is, I forward to you a box containing a small branch, with several half-ripe Figs on it. I also inclose a branch with a bunch of black Hamburg Grapes, cut from the Vine which grows opposite to that part of the Fig-tree from which the branch was taken. The bunch of Grapes is the smallest of two which were on the same shoot, and it was to have been removed to-day at any rate. I send the Grapes, to show that I do not sacrifice my Vines for the sake of the Figs, and I shall be glad to hear if you think they denote a sufficiently healthy condition or not.

The Vinery was erected in 1826, and in that year the Figs were planted. They received no peculiar treatment for several years; but about five years ago my gardener partially root-pruned them, by cutting round them with a spade, at the distance of rather less than two feet from the stems, and he then top-dressed with leaf-mould and turf broken down. They now get a very liberal supply of liquid manure from the farm-yard every spring (as do also the Vines), and have daily a quantity of water till the fruit begins to ripen. Some of the small branches are trained back, which has a tendency to make them bear better. Since the plants were root-pruned they have made much less young wood than formerly, and at every eye a Fig is formed. Many fall off, but still numbers remain on, as the branch sent will show. The trees are never pruned. I may mention, further, that we have practised ringing on one of the trees with very great success. The houses are heated with the old flues. I omitted to state that we ripen the second crop also.—J. N. V. [Specimens of the Vines and Figs in question were sent with this communication, and it would be impossible to find either in more vigorous health.]

TRELLIS FOR CLIMBERS.

IMPROVEMENT IN VINE BORDERS.

Much has been written on the shrivelling and shanking of Grapes, and the rust upon them, and many are the opinions which have been offered as to the causes which have produced these diseases, if I may so term them. But all writers agree that a warm dry border is necessary for the well-being of the Vine; a knowledge of this fact has led to the adoption of several methods of rendering Vine-borders dry and warm, and when success has attended any method, the health of the Vines and the flavour of their fruit have always been improved, the wood has been well ripened, and the probability of a good crop every year made certain.

In some situations a simple excavation of a foot or two in depth, filled with a suitable soil, will be sufficient to make the Vine grow luxuriantly, and bear fine fruit. In other situations, every care in draining the border and in raising it above the surrounding level scarcely suffices, as far as it (the border) is concerned, to insure, especially in early forcing, a successful cultivation of the Vine.

The consideration of these circumstances suggested that an improvement might be made in Vine-borders, by forming a cavity underneath them of the whole length and breadth of the border, and to make the air of this cavity as warm, or warmer, than the air of the Vinery itself. Supposing the cavity to be three feet high at the side next the house, and two feet high at the front of the

border, if a small single hot-water pipe were carried round the front and two ends of this cavity, it would, I think, be quite sufficient to keep up a tolerable warmth in such a place. It would be necessary, perhaps, to raise the border three or four feet higher than the floor of the house, so that the bottom of the cavity might not be much lower than the bottom of the house, and also that one of the pipes in the house, say the lower or return-pipe, might be made to make the tour of three sides of the cavity, before it emptied itself into the boiler; or, instead of using one of the principal pipes, might not an independent pipe be brought from the boiler for the sole purpose of heating the cavity? But all Vineries are not heated by hot water; still, I think, the cavity might be heated with a smoke-flue as easily as with a hot-water pipe. The cavity being two or three feet in height, there would be room enough to allow a person to crawl in to examine the pipes or flue. It would be easy to make it deeper if it should be thought best to do so. Supposing that neither flue nor hot-water pipe were carried round the cavity, yet the air, to a certain extent, might be warmed if any communication could be made between it and the air in the Vinery; such communication might probably be made by openings in the front wall of the Vinery. The cavity might be either arched over with bricks, or covered over with large slabs of slate, or stone supported by pillars; it would be advantageous, perhaps, not to have the covering of the cavity too closely fitted together, as any interstices left between the stones would allow the heat from the cavity to reach the border above more readily. If slabs of stone were used, they might have holes drilled all over them; if a layer of stones were placed on the roof of the cavity before the soil was put on, it would help to disseminate the heat more regularly through the border. To remedy the ill effects which cold rain or snow would have, if allowed to fall on the border, I should recommend Mr. Appleby's method of putting a layer of long litter on the border, and over that a tarpaulin (see *Gardeners' Chronicle*, October 9, 1841.) If the air in the cavity below the border were kept very moist, there would probably be less necessity for watering the border above.

It must be understood that I speak of the early forcing of the Grape. In later forcing the cavity might be found useful during cold wet summers. I shall be glad to see the opinion of some of your experienced correspondents as to whether what I have suggested would be likely to be an improvement or not.—*Observer*.

AMATEUR'S GARDEN.—No. XVIII.

THE propagation of plants by cuttings is an operation more dependant upon art than any other which horticulturists have to contend with; for, in addition to the incipient plant being cut off from all communication with its parent, it is also deprived of all support, except the little matter it contains within itself, and which is necessary to the formation of roots. Therefore, it is obvious that it is not only requisite to surround it by circumstances favourable to the production of roots, but also to prevent, as far as possible, any injury it might sustain by the evaporation of its juices. Hence the indispensability of a humid atmosphere in propagating-pits, and of covering cuttings with hand or bell-glasses, to prevent the escape of moisture, when it is inconvenient to keep the whole atmosphere of a pit in a saturated state.

One of the greatest mistakes we commit in the propagation of hard-wooded greenhouse plants, is placing the cuttings in heat directly they are inserted in the cutting-pot. This ought never to be done, because the increased temperature and humid atmosphere cause the cuttings to grow, and, consequently, to expend that small quantity of matter which ought to go to the formation of roots; and hence, though the cuttings may appear fresh and vigorous for a few days, or even weeks, it will generally be found that after that time they will turn black at their bases, and ultimately die off. These remarks are applicable to the propagation of hard-wooded plants; but soft-wooded things, such as Petunias, Verbenas, Heliotropes, and Pelargoniums, which are more excitable, will root freely if put at once into strong bottom-heat; though it must be remarked that such treatment is not to be recommended for cuttings taken from plants in the open air or a cool greenhouse. The most certain way is to place the cuttings in a close moist atmosphere, the temperature of which corresponds with that in which they had been produced, until they have formed the "callus;" after which, if removed to a moderate bottom-heat, they will root with great freedom.

In the preparation of cuttings, great diversity of opinion exists among practical men; some advocating the removal of a part, if not all of the leaves, while others as strenuously exclaim "touch not a leaf." Under certain circumstances, both parties are right; because, if cuttings cannot be placed where all loss from evaporation is cut off, the more the evaporating surface is decreased the better, since it is better that the leaves should be removed at once than that they should remain upon the cutting until they have exhausted it of its juices, which they would do in very short time. But if a moist atmosphere can be kept round the cutting, then, I say, "touch not a leaf," except such as would make the cutting-pot crowded with foliage, because the leaves contain the matter out of which roots are formed, and are the laboratories for the preparation of other matter to form branches and flowers. I have before remarked that cuttings cannot be too short if they possess the parts necessary to form a plant; and this fact can hardly be too much insisted upon.

From the above the Amateur will be able to glean that the concomitants of success in the propagation of plants are, a moist atmosphere, a proper preparation of the

cutting, and a moderate degree of bottom-heat after the callus is formed.

After these remarks it is scarcely necessary to offer any on the propagation of the Rose; but I may observe, that, in the Rose nurseries, the plants are kept in a constant state of excitation, in a strong moist atmosphere, to which little or no air is admitted; and the cuttings, when of the proper length and sufficiently firm, are taken off and planted immediately in very small pots, and plunged in a congenial bottom-heat, in which they generally root in about three weeks. They are then transferred to 60-sized pots, and in a few weeks are ready for the market. This is the process of Rose-manufacture in the trade; and by it, it is no uncommon thing to raise from 500 to 1,000 young plants from a single old one in the course of twelve months. —W. P. Ayres.

HOME CORRESPONDENCE.

Gold Fish.—In your last Number is an interesting article, dated from Suffolk, on Small Artificial Ponds and Gold Fish. I also reside in Suffolk, and having a similar pond, but not quite so well filled as your correspondent's, shall be obliged by an answer to the following questions:—1st. Where did he get a plant of the "Nuphar minima?" for I have tried in vain both in Scotland and England, till, wearied with my repeated disappointments, I have relinquished a hopeless search. None of the London nurserymen have it. It is not at Kew—it is not now at High Clere, where it was; and though willing to pay a handsome sum for a plant, I cannot obtain one. 2dly.—Does not the stagnant water that for 4 or 5 years has been in the basin get putrid or discoloured? mine is quite brown at the end of the autumn with the fallen leaves, and I renew it every spring. Will the Gold Fish live in this water after it is saturated with vegetable substances that have been carried into it? 3dly.—Does the common white Nymphaea, when put in a pot, get dwarfed in its growth? otherwise, it being plunged only one foot in the water would not give room for the due expansion of its strong and elastic stems.—J. M.

Wasps.—I see in your last Paper, Mr. Beaton mentions that his men have brought him 45 female Wasps, the death of which will, of course, prevent 45 nests being made. But it strikes me that it is very doubtful whether any sensible diminution in the number of male Wasps in the autumn will be observed. The Wasp is a very strong, active, and powerful insect. Now, the hive-bee has been traced from 4 to 6 or 7 miles from his home, in quest of food; the London bees are seen at Hampstead and Hendon: if so, to argue from analogy, the Wasp would take as long or longer daily flight, and I can see no reason why Shrubland Gardens should not be visited by the Wasps from the grocers' shops at Ipswich. However, Mr. Beaton has a near neighbour, the Rev. Mr. Kirby, of Barham, who could give him full and clear information on this head.—J. M.

English and Scotch Farmers.—Your Stirling correspondent honours my letter with three objections only, from which I conclude he admits the correctness of the other portions. I find, however, that these objections are not directed to anything that I have said, but to little additions of his own, which he has neatly interwoven with my text. He makes a giant and kills him. He says—"Your correspondent writes that, with the exception of the Lothians and the Carse of Gowrie, Wheat is not cultivated in any part of Scotland." These words in italics are not in my communication—they are the interpolation of my Stirling friend. He proceeds to say, I state, when noticing Turnip crops, "That even in Scotland last year there were many failures in consequence of heat and drought." These italics are another interpolation; they are not in my letter. His third and last objection is to the following remark, where again it will be found that the words in italics are not in my communication. "Your correspondent says the Scotch ploughs exhibited at Liverpool and Bristol were found wanting because of their weight, in consequence of which they required double the amount of horse-power to work them, and that the light English plough was preferred." Thus your Stirling correspondent professes to take the general tone of my argument, yet quietly introduces the obnoxious passages, that he may have the pleasure to refute them; and these, his own passages alone, are what he has refuted. Is it not fair to say his logic is like the subject of our correspondence, founded on false premises, that lead to erroneous conclusions? In noticing the Wheat-growing districts, I ought certainly to have included the banks of the Forth; but I thought it unnecessary—the district is, as it were, but over the hedge from West Lothian. I, however, adhere to my original statement—that farmers generally throughout Scotland, save in these favourite districts, have very much discontinued to cultivate Wheat. The reason for doing so is stated in the following extract from the *Dumfries Courier* of this week, which gives the particulars of the great agricultural meeting for the counties of Dumfries and Kirkcubright, which was held on the previous week, where a farmer, addressing his brethren, makes these remarks; and that they may have their weight on those unacquainted with Scotland, it should be stated that Dumfriesshire is, next to the Lothian, the Carse of Gowrie, and the not-to-be-forgotten banks of the Forth, one of the best-tilled and productive counties in Scotland. This farmer remarks—"During a series of years, the crops of Wheat and Barley have been so miserably bad as, in many instances, scarcely to be marketable;"—"during some of these seasons, nearly as much Oatmeal was imported into Dumfriesshire as the value of all the grain exported from the two counties;"—"it may be asked, how were the rents paid under these circumstances? Why, chiefly from the profits arising

from breeding cattle, grazing, and turnip-feeding." So much for the great grain-growing counties of the South. But to my friend's letter. As it regards Turnips, I never said there were many failures of crop. My remarks were, that Turnips were "last summer as much injured by blight as usually they are in the south of England." My observations of the crops of last year extended to Roxburghshire, Dumfries, Lanark, and Galloway, where the farmers anticipated a total waste of their bulbs, which were abundant, from the injury done by blight, until the rains came in October, when a new foliage sprang from the crowns, and the bulbs were saved. On the subject of ploughs, your correspondent insinuates that my statement may be an untruth. This is not gentlemanly, nor handsome from one who has interpolated my remarks and censured me on the ground of these additions. But as I wish to stand fair with him I shall subjoin the particulars of the trials at Liverpool and Bristol*, only premising that in those trials, the weight of the Scotch plough was less than that of the English, but in draught required nearly twice the horse-power. The cause of this increased power your correspondent says I attribute to their extra weight, a remark not in my communication. The moment I saw that my letter was noticed, I had a vision of three or four horses drawing a plough. I knew they would be found somewhere in the reply, as it is a favourite subject of ridicule with Scotchmen; yet this English practice is a good practice, and one that Scotchmen might farther err than in imitating. Your friend should know that in the fens of Cambridge and Lincoln, a great many heavy horses are bred; these when young are sold to farmers in the midland and southern counties, where instead of eating the bread of idleness, as is the case with their brethren in Scotland, they are made to keep themselves by their labour during their minority. As this labour—were two only put to a plough—might injure these young creatures, three or four are attached, and thus they work until of proper age to be sold into the large towns for the cart and dray; the farmer having his work done whilst his team is improving in value, and ultimately sold at a considerable profit. The Scotch farmer, on the contrary, with his two matured horses, has his ploughing also done; the team, however, annually depreciate in value, and whether by death or sale, end in a loss to him. This English practice, however, is often abused in a few counties, where three or four mature horses are used; but the farmers say their heavy clay soil needs them. In conclusion I would remark, that I have not the most distant wish to detract from the character of Scotch farmers. I know them to be good ones. I would allow them to hold that station as agriculturists, where their merits place them, but not to have them carried over the heads of their English brethren by reason of extra merits that are not their due. Your correspondent's mis-statements afford an excellent elucidation of how this is usually done.—K. L.

The Pansy.—With other admirers of the Pansy, I have been a good deal puzzled as to which of the properties of this favourite flower are most important. All writers on the subject require, as the first property, that the Pansy should form a circle. This is simple enough; but no one has at present insisted, in so many words, that each petal shall contribute its proper share to make up this perfect whole; and the consequence has been, that flowers having large upper and middle petals, and (comparatively) a very diminutive lower petal, have been adjudged worthy of prizes, merely because the general result was a tolerable circle. I contend, with many others, that this is improper, and that, in addition to roundness, it should be laid down as an absolute rule that the eye should form the centre of the flower, which would prove that the petals were proportionate. Let any of your readers examine flowers having the eye in the centre, against the many top-heavy flowers which have been sent out at high prices, and I think they will allow the former to be infinitely superior in beauty and effect. Passing from form to colour, another difficulty arises. All seem to be agreed that the ground-colour of the three lower petals should be the same, and that the marks, if any, on the two side petals should be uniform. But supposing the ground-colour of the three lower petals to be white or yellow, would a blotch on the eye of the lowest be a disqualification? I am sure that, the Pansy season being now commenced, many of your readers would be glad to have some information on the points I have raised. Will you, therefore, allow me to inquire, 1st. Whether the judges of Seedling Pansies are or are not justified in refusing prizes to all flowers which do not form perfect circles, and in which the eye does not form the centre of the flower, whatever their good qualities as to colour may be? 2d. Whether a blotch on the lower petal alone, the two side petals having the same ground-colour as the lower one, is or is not a disqualification?—A Learner, Birmingham.

Double Yellow Rose.—I saw a very fine double yellow Rose at the Forres Flower-show, last summer it was exhibited by Mr. Gregor, Nurseryman. In 1841, a plant first flowered at Holme, but very few buds expanded perfectly. A plant of it produced two fine blooms in Novar Gardens, Rosshire, in 1832; and at Invergordon Castle, in 1833, it produced about 60 blooms, of which five only were perfect.—John Ross, Holme Gardens.

* I cannot lay my hand on the report of the Liverpool meeting, but find the trials at Bristol thus reported:—Howard's plough (English), weighed 220 lbs., and required the power of 22 stone to draw it. Wilkie's plough (Scotch), weighed but 125 lbs., and required the power of 44 stone to draw it. For your correspondent's information it may be stated, that the light lands of Scotland are much more easily ploughed than the heavy clay lands of England. For instance, it has been proved that a plough in sandy loam, which is the prevailing soil in Scotland, requires but a power of 17 stone for draught, whereas strong clay requires 47 stone, and clay loam 30.

A Black Hare.—Mr. Atkinson, of Lancaster, has in his possession a hare completely black. White and spotted hares are occasionally found, but this is the first black one which I have heard of. It has several peculiarities besides its colour: the head and general figure bear some resemblance to those of the feline race, and its ears are singularly situated. Its hair is short and shining, not unlike the fur of the cat. It was found lying dead on Lancaster Moor.—Facile.

Bees.—I think that "W." is mistaken in alleging that his Bees died by frequenting Dahlia flowers, for such are no favourites of the Honey-bee. Bees may at times enter single blooms, but seldom or never double ones; indeed, the latter, of all kinds of flowers having large petals, afford little nourishment for Bees. In autumn they shelter wild ones, but not enough to prevent their being benumbed with cold,—not "intoxicated by feeding from the flowers of Dahlias," as "W." says his hive-bees were. This curious story brings to mind an assertion of Dr. Barton's, that "Some species of plants yield a poisonous syrup, of which Bees partake without injury, but which has been fatal to man." He enumerates some of those plants, namely, Laurel, Kalmia, wild Honeysuckle, &c. This seems very doubtful; indeed it must be wrong, for Bees collect much honey from Laurel, if the common sort is meant; and boys know well that large Bummer Bees collect very good honey from Honeysuckle.—J. Wighton.—[The story relates to the poisonous honey of Trebizond, which has been notorious since the days of Xenophon. The Laurel in question is the Rhododendron, and the Honeysuckle the Pontic Azalea.]

Roses.—In your report of the exhibition at the Horticultural Society's Rooms, Regent-street, on the 18th inst., you mention a Perpetual Albert Rose as being exhibited by us; and as such name might mislead purchasers of Roses, we trust you will not think it too much trouble to give the Rose you speak so highly of its proper designation, i.e. Hybrid China Prince Albert; in colour a delicate pink, and of a very fine and perfect shape.—H. Lane and Son.

Net.—Having frequently observed in your *Chronicle* advertisements offering net at so much per square yard, I think your readers may not be aware of the custom of the trade (as stated to me by one of the advertisers) in measuring the nets. They stretch them through the hand both ways, and the consequence is that 100 square yards of net, according to their measurement, will not cover more than 50 square yards of ground.—K. L.

Wireworms.—I send you an account of destroying the Wireworm, which I have adopted for some years—my ground being full of them, so that I could neither grow Sweet Williams, Picotees, Bulbs, Lettuces, nor indeed any succulent plant, without their boring, running up, and eating the hearts out. Near these plants I now place half a Potato with the eyes cut out, to prevent its growing, and run a pointed stick through the middle of it and peg it into the ground, covering it over with about an inch of mould; and in a day or two I have pulled out by the tails from 15 to 30 of them from one piece of Potato.—Adan.

Ammocharis fulcata.—Your correspondent, "J. W. Rogers," in the *Chronicle* of last week, states that all his efforts to flower *Ammocharis fulcata* have failed; and as it flowers freely with me, I now give the treatment under which it expands its lovely blossoms. The bulb, while dormant, which is during winter, is kept in a cool greenhouse, in as dry and airy a place as possible, until it begins to show its leaves; it is then potted in three parts good turfy loam, one part leaf-mould, and a little silver sand, and placed so as it may have the full benefit of the light. When the leaves have grown to about 12 inches in length, it is plunged in a strong bottom-heat, and allowed to remain till the flower-stem pushes clear of the leaves, which will be in about four or five weeks. It must then be gradually hardened off, and returned to the greenhouse, there to expand its blossoms, which consist of an umbel of from 20 to 30 flowers. After flowering, every care must be taken of the foliage, by exposing it to the full influence of the sun, and giving plenty of water. When it shows an inclination to rest, water must be altogether withheld.—John Brewster.

Birds.—It may not be generally known that the nests of one of our smallest birds are sometimes occupied as winter habitations by perhaps one of the smallest of European quadrupeds, namely, the shrew-mouse (*Sorex araneus*): they commonly take up their quarters in holes under banks and among moss; but one during the past winter was determined to be a little more elevated than ordinary, and having found a wren's nest in a thorn-hedge, took possession of it. It was curious enough to see the little animal sporting about its mossy habitation from time to time, and no doubt it would be comfortable enough at night in its feather-bed.—Peter Mackenzie.

Cotton Coverings for Frames.—I have found the following a good composition for rendering waterproof the calico or linen used to cover frames, shades, &c.; viz., three pints of old pale linseed oil, one ounce of sugar of lead, and four ounces of white resin. The sugar of lead must be ground with a small quantity of the oil, and added to the remainder, incorporated with the resin, by means of gentle heat. The composition is to be laid on by a brush after the calico is nailed to the frames; one coat annually is sufficient. It dries in a short time when exposed to the air, and excludes as little light and heat as anything except glass, and does not become mildewed.—Devoniensis.

Gas-Lime.—The grass upon which I sowed the gas-lime has not recovered, nor is it likely to do so, although we have had fine rains for it. I have tried the lime as a

top-dressing for Wheat, and also for Tares, at the rate of one waggon-load per acre, consisting of one part of the lime to seven parts of mould; but find it turns them of a sickly colour, and I cannot see that it does them any good. It answers best for the bottoms of muck-heaps, mixed with about ten times its own bulk of mould, and turned over twice before the muck is put on; it certainly drives away the wire-worms and kills the seeds contained in the mould. I have now used it for Carrots and Barley, both of which look well.—*Jack Spratt.*

Dried Strawberries.—Last summer, by way of experiment, when Strawberries were plentiful, I attached threads to their stalks, and hung up a few which were over-ripe to dry. I placed them inside a window facing the south, where they have remained from June last until the present time (March 28th). They have just been tasted, and the result is most satisfactory. That sweet refreshing acid peculiar to the Strawberry is in full perfection; the flavour of the fruit, without any watery taste, is delicious: it dissolves in the mouth as slowly as a lozenge, and is infinitely superior to the Raisin, which so soon brings on a feeling of satiety. The Strawberry thus preserved is a stomachic. The experiment may be tried when the fruit is so ripe as to be scarcely worth gathering, without any further expense or trouble than being hung up.—*T. Allen, 190, Oxford-street.*

Amaryllis Belladonna in Pots.—I recommend any of your readers who wish to cultivate this plant in pots, to try the following experiment: Keep the plants constantly on a light shelf in the greenhouse, with a pan of wet sand underneath them, which should never be allowed to become quite dry, not even in summer, when the plant is dormant. By this treatment, some bulbs received from the Cape of Good Hope, which, if not *A. belladonna*, can hardly be distinguished from that species, have flowered regularly every autumn in great luxuriance. They should never be fresh potted, unless the roots split the pots, which some of mine have done, and of course the foregoing treatment must not be adopted till the bulbs have rooted themselves. This management was adopted accidentally as regards these bulbs, having been ordered, under the suggestion of the Rev. W. Herbert, for *Brunsvigia Josephina* and *multiflora*, which were received at the same time, and which now flower regularly every other year. For some fifteen years before, I never succeeded in getting any of them to flower. The ordinary cause of failure in the cultivation of *B. Josephina* is too much heat in winter, and want of moisture in summer.—*J. R.*

Drainage of Salt Marshes.—One of the most noble plans lately devised for this object was the inclosing of Morecambe Bay and the Estuary of the Duddon, in the north of Lancashire, which I am much afraid was put a stop to by party influence. It is highly deserving of the attention of Government, as the whole land, consisting of more than 52,000 acres, belongs to the Crown. A few years ago it was proposed to carry the great Caledonian railway through this bay, which would have effected a double purpose—that of connecting England and Scotland by the railway, and, by raising an embankment for its formation, would have separated these 52,000 acres of land from the sea. Persons ignorant of such matters might pronounce the thing impossible; but I am informed that engineers of the first character, who have examined the locality, report it can easily be accomplished. The soil of this immense tract is found to be of the finest quality for the growth of Wheat, being a favourable mixture of clay with sand and marine shells. Now that labourers are so lamentably in want of employment, seems a favourable time for adding it to the wealth of the country. The engineer's estimate for completing the embankment was 434,000*l.*, and the value of the land to be reclaimed was calculated to be worth 1,196,000*l.* The land belongs to the Crown, and is under the control of Government. When in office, the late Ministry agreed with the parties interested in forming the embankment and railway, to grant them the whole of the Bay, reserving to the Crown only one acre in every fifteen; and, moreover, offered to stand between the company and all other claimants. But this noble plan was set aside, because Sir F. Smith and the Parliamentary Commission, forming their opinion upon data since ascertained to be erroneous, decided that the railway ought to go through the barren hills of Westmoreland, where not an additional acre of land could be added to the national stock, while the cost of its formation would exceed by 300,000*l.* that of the embankment and railway put together. I do trust that some of the friends of the poor in the House of Commons may be induced to investigate this subject, and to press it upon the consideration of Government; for surely it is a great and worthy object to restore to the wealth of the country 52,000 acres of its best land; and the employment of thousands of starving labourers in effecting such a purpose must still more forcibly recommend it to the consideration of a statesman.—

FOREIGN CORRESPONDENCE.

Paris, April 27.—We have experienced sad weather here for the last fortnight; some days very hot, followed by chilling winds, rain, hail, &c. Fruit-trees of every kind have suffered considerably, particularly Apricots and Pears. Peaches are better off; indeed, they say that there will be a good crop of them, particularly on those trees that were pruned when the flower was fully expanded. I know a garden in an exposed situation where the trees are never covered, yet the crop of Peaches never fail, and the trees are pruned always during the time that they are in full flower. The Walnut-trees are generally frozen—I mean the young shoots, which will be a great loss, particularly to the small farmers, as the oil made from the nuts helped to pay their rents. The Vines have not escaped,

and in many places the *recolle* will be but trifling; at the same time, they say that in the famous year of the comet, 1811, when the wine was so excellent, they experienced exactly the same weather as at present—that the vineyards were partially frozen on the 8th and 10th of April in that year, and yet the wine was capital; therefore we have still hopes.

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

May 1.—At the anniversary this day, his Grace the Duke of Devonshire was re-elected President; T. Edgar, Esq., Treasurer, and A. Henderson, M.D., Secretary. Sir W. Hooker, J. Rogers, Esq., and J. R. Gower, Esq., retired from the Council; and the Earl of Auckland, Sir P. Egerton, Bart., and R. Hutton, Esq., elected in their places. A report from the auditors, to which we have elsewhere alluded, was read on this occasion.

May 2.—R. H. Solly, Esq., in the chair. Lord Beauvale, John Taber, and Francis Huthwaite, Esqrs., were elected Fellows of the Society. A communication was read from Mr. Feran, gr. to S. Majorbanks, Esq., M.P., Watford, Herts, regarding some fine Oranges which were exhibited on a former occasion. The tree which produced them is described as small, and as having been much neglected for a considerable time; lately, however, it was potted anew in a compost of loam, cowdung, horse-droppings, and road-scrappings, and kept in a common greenhouse, and it has borne 53 excellent fruit as the result. The cause of the fruit's superiority in flavour was not accounted for, and it was possibly owing to the variety being a particularly good one, or to some peculiarity of treatment yet unexplained. In consequence of the comparative nearness of the Chiswick exhibition, there was not so large a display of specimen plants as usual. A collection of rock plants from Mr. Wood, Nurseryman, of Norwood, drew much notice, and received a certificate of merit. There were 27 species in pots, most of them flowering, and all in the highest health. Among them was a pretty variegated-leaved Daisy (*Bellis variegata*), *Linaria hepaticifolia*, the Arctic Bramble (*Rubus arcticus*), not more than 2 inches high, and with fine crimson flowers; the very showy *Phlox subulata* and *nivalis*; the delicate *Cypripedium spectabile*; an extremely beautiful specimen of the white Forget-me-not (*Myosotis alba*), the pleasing and durable-flowered *Gnaphalium dioicum*, *Erinus alpinus*, *Veronica repens*, two or three interesting species of *Saxifrage* and *Thyme*, with the variegated *Arabis* and others. Mr. Cockburn, gr. to the Earl of Mansfield, Caen Wood, Highgate, sent a number of plants, among which was a tall specimen of *Acacia verticillata*, handsome in bloom; a large *Cytisus racemosus* (possibly *Genista canariensis*), loaded with showy yellow and fragrant blossoms; a good specimen of *Philibertia grandiflora*, with unusually dark flowers; *Houstonia cerulea*, an extremely attractive little plant, covering the pot with its pretty pale lilac flowers; *Chorozema cordifolia*, *spinosa*, *Hemichammii*, and *varium*, the latter in a tall state; and *Fabiana imbricata*. A certificate was given for the four *Chorozemas*; and it was stated that the *Fabiana* is perfectly hardy, having stood exposed through the last winter without any protection—it will therefore be a useful addition to our evergreen shrubs. From Mr. Goode, gr. to Mrs. Lawrence, Ealing Park, there was a very handsome specimen of the elegant *Chorozema* (*Dillwynia glycinifolia*), which, although difficult to cultivate, was grown to the greatest perfection; *Podochilus trilobatus*, showy and well managed, the charming *Cytisus filipes*, so prodigal of its sweet white blossoms in the spring months; a fine variety of *Oncidium papilio*; and two seedling *Azaleas*, one called *speciosissima*, with immense crimson flowers, richly spotted in the upper petals, and tolerably well formed, the other *conspicua purpurea*, equally large, of a darker tint, less spotted, and of a less perfect figure. A Banksian medal was given for the first of these and *Chorozema glycinifolia*. Mr. Gaines, of Battersea, sent a basket of *Ixias*, which, though introduced in great abundance, are seldom favourably grown; these, however, were dwarf, and full of flowers, and altogether so superior that they were distinguished by a Banksian medal. A specimen of the rare *Houllétia Brocklehurstiana* was shown by Messrs. Veitch and Son, of Exeter; it is very singular, and has large chocolate-coloured flowers, which are variously spotted or blotched. A Banksian medal was awarded for this. There was also from Messrs. Veitch a new Brazilian Gesneraceous plant, a dwarf stove shrub, with the aspect of a *Columnea*, but apparently a species of *Hypocyrta*; it has curious scarlet flowers, which are not very numerous. The Rev. F. Beadon sent a plant of a double yellow *Oxalis*, which is an example in which double flowers are not so showy as the single ones. It was obtained from Madeira, and is to be regarded more as a curiosity than as an ornamental plant. Mr. Cunningham, gr. to G. Atkins, Esq., of Twickenham, produced a seedling *Calceolaria*, named the Earl of Galway, which has a large and very deep rich reddish brown flower. Mr. Davey, gr. to G. Smith, Esq., of Colney Hatch, exhibited a seedling *Cineraria* (*pulcherrima*), with most intense purplish crimson blossoms, but chiefly noticeable for the colour of these. E. D. Davenport, Esq., sent a cut specimen of the *Sutherlandia frutescens*, which is something like *Clinanthus puniceus*, and almost equal to it. The Hon. and Very Rev. W. Herbert, communicated some beautiful seedling *Rhododendrons* and *Azaleas*; the first was *R. Seymouri*, obtained from seed of *Rhodora canadensis*, impregnated by *Azalea pontica*; another was raised between *R. ponticum* and *R. dauricum atrovirens*, and is remarkable for its loveliness. There were also some pleasing hybrids from *R. ponticum*, which had been fertilised with the pollen of *A. pontica*, and from having so much of the habit of the latter, they showed how the properties of the male type prevail over those of the female: the last was a splendid seedling from *A. pontica* and *A. sinensis*, the colour of the flowers being bright orange, with a deeper hue in the centre. Mr. Bedford, gr. to Mr. C. Abbott, market gr., Edmonton, brought a punnet of Black Hamburgh Grapes, which were particularly well coloured. The plants from the Gardens of the Society were the White Indian *Azalea* and the *A. i. phoenicea*, both a sheet of bloom; *Cattleya Forbesii* and *intermedia*, the latter having seven flowers on one of its spikes; the large variety of *Oncidium ampliatum*, in an unusually splendid state; *Epidendrum primulinum*; a hairy variety of *Acacia pulchella*, which is very distinct and showy; the dwarf *Chorozema varium*, so much preferable to the larger kind; and *Echium petreum*, a new herbaceous perennial, with showy pink and blue flowers; it is described as hard to grow, but was in excellent condition. Mr. Beck, of Isleworth, sent a round tin pan, divisible in the middle, and having a cavity in the centre for the purpose of admitting pots, intended to economize tobacco-water; when this is applied to plants, for the purpose of destroying aphides, it is generally wasted, and a great superfluous expenditure is thus incurred: by this contrivance the plants may be syringed or sprinkled, and the whole of the fluid will be caught again, to be strained for further use. It was announced that Mr. E. Solly, Jun., will deliver four lectures (on the 11th of May, and the three following Thursdays,) in the rooms of the Society, on the Chemistry of Vegetation. Fellows of the Society will be admitted free; and to others the course will be 10*s.* 6*d.* The following is the syllabus.—1st. The chemical nature of plants; the formation of organic matter illustrated by reference to inorganic substances; the changes which matter undergoes; and the effect of chemical affinity in altering the nature and properties of substances. 2d. The composition and properties of organic matter, the different characters yet similar composition of vegetable productions, the facility with which they are converted into each other; their proneness to decay, and the nature of fermentation. 3rd. The food of plants; air, water, and soil; their composition; the substances which they yield to plants; sources of carbonic acid and ammonia; changes which they undergo in the organs of plants. 4th. Effects of cultivation; conditions requisite to vegetation; influence of heat, light, and electricity on

plants; deterioration of soil; modes of preventing it; use of manure; its application and effects; relation of vegetation to climate; effects of plants on the atmosphere; connexion between the animal and vegetable kingdoms. It was also stated that there will be no meeting of the Society on the 16th inst., owing to the occurrence of the garden-show on the 13th.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

April 26.—T. R. Barker, Esq., in the chair. Twenty-five new Members were elected. Mr. Rodwell communicated the following account of specimens of Bokhara Clover he had presented to the Society, and the results of his experience in the garden cultivation of this plant. Specimen No. 1. The growth of 1841. Seed sown, April 21. The plant the growth of 138 days. First year's produce. Length 8 feet 11 inches. Specimen No. 2. The growth of 1842. Second year's produce from the roots of the former year. Pressed when in blossom. Growth of 125 days. Length 11 feet 4 inches. Specimen No. 3. Growth of 1842. Second year's produce from the roots of the former year. Pressed when in seed. Growth of 189 weeks. Length 12 feet 10 inches.—They were treated thus, beginning with April 21, 1841:—Seed sown in drills about 18 inches apart, each seed having a space of 6 inches in the drills. The soil a rich loamy mould, deep and dry. The subsoil, loamy craig, about 4 feet from land-springs. Preparation, deep digging and manuring after a crop of potatoes. Cultivation in May: hoeing and weeding in the usual manner. In June, its rapid growth (at the rate of an inch in 24 hours), and its disposition to throw out lateral shoots, requiring great care and attention in giving it support during some of the genial days in this month. In July, the same attention as in the preceding month. In September, the specimen No. 1 was gathered and dried when in full bloom. In October, the produce was carefully cut down, and applied for fodder to cattle. Horses not fond of it; cows and pigs prefer other food. 1842.—Early in the spring of this year the plants which had been carefully cut down in the autumn, began to exhibit their spring shoots long before the Lucerne shoots were visible; thus establishing two important points—early vegetation and great hardiness. The plant now required great care and attention in supporting the lateral branches, so as to prevent them falling. Early in June the blossoms began to make their appearance, and continued to make fresh bloom during the months of July and August, forming not only an ornamental but a very fragrant garden plant. In this state, the specimen No. 2 was taken as an average growth. In August and September the seed-pods were formed and began to ripen; and the seed gathered at the end of September, yielding eight pounds to the square rod. The specimen No. 3 was gathered at the same time. Upon the usefulness of this plant, I am at present unable to give any very favourable report, its properties for feeding cattle having no great recommendation, as it was found that a preference was always given to any other food, either in its green or dried state. It has shown itself with my mode of treatment a biennial plant, no vegetation having appeared during the present year; this, however, may possibly not be its characteristic with repeated cuttings in a green state; a point which I have not at present ascertained by trial.—Mr. H. Gibbs corroborated Mr. Rodwell's remarks, as to the unwillingness of animals to eat the plant when Lucerne could be had by them. Mr. Gibbs's idea was, to cut and stack the Clover in alternate layers with oat straw, and afterwards cut the two into chaff for use; also, to mix it with grass in haymaking, when there was the chance of damage from wet weather, so as to impart a good smell to the hay, and thereby give it the character of hay well got up. The Hon. R. H. Clive, M.P., gave notice that he should propose, at the next monthly meeting of the Council, that the annual country meeting of the Society should be held at Shrewsbury in the year 1845. Mr. Hillyard informed the Council, that he had had six small Hereford oxen, all of one person's breed, and divided as equally as possible, fed for sixteen weeks in his stalls; three of them on Mangold Wurzel and three on Swedish Turnips, a bushel and a half each daily, with a bushel and a half of cut hay, mixed with one quart of boiled linseed, and three quarts of barley-meal, for the purpose of testing the comparative feeding qualities of these roots. The Council adjourned to Wednesday, the 3d of May.

COUNTRY SHOWS.

Morningside Practical Gardeners' Society, April 11.—The general meeting of this Society was held in the school-room, Morningside, when prizes were awarded as follows:—*Auriculas*, 1st prize, to J. Young, gr. to T. Oliver, Esq., Newton Lodge. *Primroses*, 1st prize, to J. Downie, gr. to Gen. Robertson, Canaan Bank; 2d prize, to J. Johnston, gr. to A. Smilie, Esq., Viewforth. *Hyacinthus plants*, 1st prize, to J. Gould, gr. to — Adie, Esq., Canaan Cottage; 2d prize, to J. Young. *Hyacinthus*, 1st prize to H. Gibb, gr. to Mrs. Stark, Salisbury Green; 2d prize, to J. Fargie, gr. to Mrs. Gregory, Canaan Lodge. *Eschscholus*, 1st prize, to J. Young, 2d prize, to J. Downie. *Wallflowers*, 1st prize, to J. Downie; 2d prize, to J. Douglas, gr. to Sir Thomas Dick Lauder, Bart., the Grange House. *Heaths*, 1st prize, to H. Gibb; 2d, to J. Downie. *Camellias*, 1st prize, to J. Downie; 2d, to J. Young. *Polyanthuses*, 1st prize, to J. Young; 2d, to J. Johnston. *Rhubarb*, 1st prize, to T. Owens, gr. to A. Russell, Esq., Grange Bank; 2d prize, to J. Downie. *Seakale*, 1st prize, to J. Fargie; 2d prize, to T. Owens. *Asparagus*, 1st prize, to J. Douglas. *Spinach*, 1st prize, to R. Anderson, gr. at Borrowmuirhead; 2d prize, to T. Wood, gr. to A. Falconer, Esq., Falcon Hall. *Cabbages*, 1st prize, to T. Owens; 2d prize, to J. Johnston. *Broccoli*, 1st prize, to T. Owens; 2d prize, to J. Gould. *Wall-flowers*, Amateurs, to J. Robertson, Morningside.

St. Andrew's Horticultural and Floricultural Society, April 19.—The Spring Meeting of this Society took place in the Town Hall, and although so early in the season, almost every article required in the schedule was produced in excellent condition. The judges decided the prizes as follows: To W. Connacher, gr. at St. Fort—For the best Cactus, two greenhouse plants, two greenhouse plants (flowers cut), one hardy shrubby plant, three hardy shrubby plants (flowers cut), one bulbous plant, three double *Hyacinthus*, three single *Hyacinthus*, three *Polyanthus* *Narcissus*, one pot of *Mignonette*, two *Calceolarias*, one pot of Strawberries, two sorts Dessert Apples, bouquet, twelve forced Potatoes, two early Cabbages. For the second best two Stocks, six hardy spring flowers, three heads of Sea-kale, six stalks of Rhubarb, and four Carrots. To W. Smith, gr. at the Priory, St. Andrew's—For the best six stage Auriculas, four *Polyanthuses*, six *Pelargoniums*, two Double Stocks, six hardy spring flowers, one early green Cucumber, six stalks of Rhubarb (Victoria), four Scotch Leeks, twelve Asparagus, and four Carrots. For the second best Cactus, two greenhouse plants, six Heartsease, two *Cinerarias*, and a bouquet. To A. Poultie, gr. at Gilston—For the best six Heartsease, two *Cinerarias*, three double Wall-flowers, and four double Primroses. For the second best two *Calceolarias*, and two heads of Broccoli. To A. Scott, gr. at Lathallan—For the best two Petunias, three heads of Sea-kale, and six Onions of 1842. For the second best two greenhouse plants (flowers cut), three hardy shrubby plants, four double Primroses, three double Wall-flowers, and one pot of Strawberries. To J. Hardie, gr. at West Park, St. Andrew's—For the best Brussels Sprouts and two heads of Broccoli. For the second best four Scotch Leeks and two early Cabbages. **AMATEUR COMPETITION:** Mrs. Berwick, brewer, St. Andrew's—For the best four stage Auriculas, four *Polyanthuses*, and two Lettices. For the second best six Heartsease and three Scotch Leeks. Mr. G. Cruickshank, St. Andrew's—For the best three double Primroses, two heads of Broccoli (Chappel's), and two early Cabbages. For the second best four stage Auriculas and four *Polyanthuses*. Dr. Cook, West Park, St. Andrew's—For the best four stalks of Rhubarb. For the second best two single Wall-flowers, four Anemones, two heads of Broccoli, two early Cabbages, and two Lettices. Mr. W. Gibson—For the best three double Wall-flowers, two

single ditto, and four Anemones. Mr. J. Gibson, Woodburn—
For the best three Scotch Leeks. Mr. J. Thomson, St. Andrew's—
—For the best six Heartsease. COTTAGERS' COMPETITION: for
the best four Scotch Leeks, W. Morris, St. Andrew's. There were
shown from St. Fort three large specimens of the Nohl Schol, or
Turnip-rooted Cabbage, and one of triple-curved German green,
the largest and best we have seen. From the Priory—some fine
Pelargoniums and double Stocks, growing in pots, and a beauti-
ful pot of *Nemophila insignis*. From Grangemuir—some fine
specimens of the Bœurré Rance Pear.—*Fifeshire Journal*.

Hertford Horticultural Society, April 20.—The first exhibition for this season took place at the Shire Hall, where there was a crowded and fashionable attendance. The show surpassed most spring exhibitions. The collection of miscellaneous greenhouse plants exhibited by W. R. Baker, Esq., deserves particular notice. Mr. Baker also exhibited 12 Pelargoniums, which filled more than one-half of the centre stand in the assembly-room. A fine specimen of hybrid Rhododendron, and a collection of fine seedling Cinerarias were exhibited by Mr. Francis, nurseryman, of Hertford. Mr. Paul, of Cheshunt, also exhibited a select collection of plants. The show of fruit was not extensive—and in quality mediocre, as might naturally be expected, so early in the season. The exhibition of flowers, in wax, by Miss England, which occupied a large table in the Council Chamber, was a great point of attraction. The flowers were recommended by the judges for a prize. The following is a list of the prizes awarded:—*Pines*, 1st prize, Mr. Brown, gr. to Sir H. Meux; 2d, Mr. Hamp, gr. to E. Chuck, Esq. *Strauberies*, in dishes of 24: 1st prize, J. Hamp; 2d, Mr. Tinsley, gr. to S. Adams, Esq. *Cucumbers*, brace of: 1st prize, J. Brown; 2d, Mrs. Hanbury; 3d, Mr. Hamp. *Dessert Apples*, dishes of 6: 1st prize, Mr. Brown; 2d, A. Milne, gr. to C. S. Chauncy, Esq. *Kitchen Apples* (6): 1st prize, W. Parker, Esq.; 2d, J. Brown. *Specimen Plant*: 1st prize, Mr. J. Slowe, gr. to W. R. Baker, Esq.; 2d, Mr. Plumbly, gr. to C. J. Dimsdale, Esq.; Mr. J. Williams, gr. to J. Warner, Esq. *Greenhouse Plants* (24): 1st prize, Mr. J. Slowe; 2d, Mr. Plumbly. *Miscellaneous Plants* (24): 1st prize, Mr. Slowe; 2d, Mr. J. Williams. *Pelargoniums* (12): 1st prize, Mr. Slowe; 2d, Mr. T. Dawson, gr. to Earl Cowper. *Cape Heaths* (12: 1st prize, Mr. Plumbly; 2d, Mr. Slowe. *Auculacae* (6): Mr. J. Hudson, Warc. *Best seedling*, ditto: Mr. J. Hudson, Warc. *Polyanthus* (6): J. Williams. *Heartsease*, 30 varieties: 1st prize, Mr. Hurst, gr. to J. Batho, Esq., Cheshunt; 2d, J. Williams; 3d, Mrs. Hanbury, Poles. *British Plants*, 20 species: 1st prize, Mr. G. Spriggings, St. Alban's; 2d, Mr. D. Spriggings, Hertford. *Stove Plants* (6): John Slowe. *Orchidaceae*: C. B. Warner, Esq., Hoddesdon. *Cut Flowers*: 1st prize, Mr. J. Williams; 2d, Mr. Slowe; 3d, Mr. A. Milne. *Bouquet Flowers*: B. Williams, gr. to Mrs. Keeling, Broxbourne. *Cottagers' Prizes*.—*Fruit*: 1st prize, J. Farrow, Twinn; 2d, S. Twinn, Watford. *Flowers*: 1st prize, W. Cowler, Wadsworth; 2d, J. Farrow, Twinn. *Vegetables*: J. Farrow, Twinn. Extra prizes were awarded to Mr. T. Dawson, for *Hydrangeas* and *Kitchen Apples*: to Mr. A. Milne, for *Rhubarb*; Mr. Slowe, for *Cinerarias*; W. Parker, Esq., for *Dessert Apples*; Mr. Plumbly, for a collection of *Greenhouse Azaleas*; Mr. B. Williams, for *cut Flowers*; and *Dessert Apples*; C. G. Thornton, Esq., for *Filberts*, in excellent preservation; and to E. Taylor, cottager, for *Flowers*.

MISCELLANEOUS.

On Burning Clay.—Several correspondents having inquired about the best method of burning clay, a friend has kindly furnished us with the following information on the subject, which was printed in the form of a circular, in 1816. The first extract is from a letter of Mr. Craig, agent to A. Murray, Esq., of Broughton, Galloway, to E. Boyd, Esq., of Merton-hall. Mr. Craig observes, that "the general method of proceeding to work is, to make an oblong inclosure of the dimensions of a small house, say 15 feet by 10, of green turf sods, raised to the height of $3\frac{1}{2}$ or 4 feet. In the inside of this inclosure, air-pipes are drawn diagonally, which communicate with holes left at each corner of the exterior wall. These pipes are formed of sods put on edge, and the space between them so wide only as another sod can easily cover. In each of the four spaces left between the air-pipes and the outer wall, a fire is kindled with wood and dry turf, and then the whole of the inside of the inclosure or kiln filled with dry turf, which is very soon on fire; and on the top of that, when well kindled, is thrown the clay, in small quantities at a time, and repeated as often as necessary, which must be regulated by the intensity of the burning. The air-pipes are of use only at first, because, if the fire burns with tolerable keenness, the sods forming the pipe will soon be reduced to ashes. The pipe on the weather side of the kiln only is left open, the mouths of the other three being stopped up, and not opened, except the wind should veer about. As the inside of the inclosure or kiln begins to be filled up with clay, the outer wall must be raised in height, always taking care to have it at least 15 inches higher than the top of the clay, for the purpose of keeping the wind from acting on the fire. When the fire burns through the outer wall, which it often does, and particularly when the top is overloaded with clay, the breach must be stopped up immediately, which can only be effectually done by building another sod wall from the foundation opposite to it; and the sods that formed that part of the first wall are soon reduced to ashes. The wall can be raised as high as may be convenient to throw on the clay; and the kiln may be increased to any size, by forming a new wall when the previous one is burnt through. I have them so wide, as to afford a space for a horse and cart to turn upon them; but, when they are so broad, it requires the workmen to walk on the top of them when feeding with clay, which I would not recommend, because the more loosely the clay can be laid on, the more rapidly it will burn. I did not take all the trouble above stated with my kilns; having the advantage of a quantity of old moss, sticks, and tree-roots, which I split, and kindled a large parcel of them, and surrounded the fire with a quantity of dry turf; and as soon as it was well kindled, I built round a strong wall of sods, and went on, adding clay to the fire, and sods to the outer walls, when necessary, till the kilns were so large as to contain upwards of 100 loads of ashes. The principal secret in burning consists in having the outer wall made quite close and impervious to the external air, and taking care to have the top always lightly, but completely, covered with clay; because, if the external air should come in contact with the fire, either on the top of the kiln, or by means of its bursting through the sides, the

fire will be very soon extinguished. In short, the kilns require to be attended nearly as closely as charcoal-pits. Clay is much easier burnt than either moss or loam; it does not undergo any alteration in its shape, and, on that account, allows the fire and smoke to get up easily between the lumps; whereas moss and loam, by crumbling down, are very apt to smother the fire, unless carefully attended to. No rule can be laid down for regulating the size of the lumps of clay thrown on the kiln, as that must depend on the state of the fire; but I have found every lump completely burnt on opening the kiln, and some of them were thrown in larger than my head. Clay, no doubt, burns more readily if it be dug up and dried for a day or two before it be thrown on the kilns; but this operation is not necessary, as it will burn though thrown on quite wet. After a kiln is fairly set a-going, no coal or wood, or any sort of combustible is necessary; and it can only be extinguished by inattention, or the carelessness of the operator, the vicissitudes of the weather having hardly any effect on the fires, if properly attended. It may perhaps be necessary to mention that when the kiln is burning with great keenness, a stranger to the operation may be apt to think that the fire is extinguished. If, therefore, any person, either through impatience or too great a curiosity, should insist on looking into the interior of the kiln, he will certainly retard, and may possibly extinguish the fire; for, as I mentioned before, the chief secret consists in keeping out the external air from the fire." From perusing these remarks, Mr. Ormiston, of Bodyllton, observes, in a letter addressed to Sir W. W. Wynn, Bart., in the same circular, which was issued about two years after the date of the previous communication, that he "was induced to make a trial of ashes produced from burnt clay and vegetable substances as a manure. Accordingly, about the beginning of April, 1816, I set about the formation of the kilns for that purpose, close to a pit containing a quantity of peat moss, nearly in the centre of a field of about 100 acres, then under the operation of a turnip fallow. Having caused some hundred loads of the peat earth, together with a subsoil of strong adhesive blue clay, to be wheeled out of the pit around the kilns, I collected a quantity of old wood and roots of trees for the purpose of kindling the fires, and having done so according to the method described by Mr. Craig, and got them to burn well, I found one man equal to keep four kilns going. The kilns constructed by me were of larger dimensions than those described by Mr. Craig, being 30 feet long by 12 wide, inside the walls, and 2 feet high in the first instance, and increasing in height to 4 feet, as the work proceeded. Some hundred cart-loads of root-weeds, and rubbish of various descriptions, collected from the field before mentioned, were thrown on these kilns, and evidently produced superior ashes to those procured from the peat-earth and clay. The operation of burning not being finished till the end of July prevented my giving the ashes a fair trial that year, as I was, in consequence, unable to sow the Turnip-seed before the 10th of August, and the crop produced was very indifferent, which I impute entirely to the lateness of the season and the unfavourable state of the ground, from wet weather. The expense of burning, as nearly as I can calculate, was about one shilling per cart-load, making no allowance for cartage of weeds and rubbish from the field, as it would otherwise have been necessary to have removed them to some convenient place to be consumed in the usual manner. In the month of March, 1817, the fire in the remaining kilns was little more than extinguished. I then had the ashes carted out to an adjoining meadow, and laid them on at the rate of 50 cart-loads to an acre, where they have shown, both on the crop of hay and after-grass, a decided superiority over preparations of earth and lime compost, laid on at the rate of nearly 26 cubic yards to the acre, as an active manure for top-dressing. In April I put down a quantity of the ashes in the corner of a field intended for Swedish Turnips, and as soon as the ground was prepared for sowing, I manured a small portion of the field with them, at the rate of 50 cart-loads to the acre. The Turnips growing upon that part of the field are more luxuriant, and, seemingly, a heavier crop than those sown, with an ample quantity of good farm-yard dung; and even the place where the ashes were put down until they could be carted on the field, is most conspicuous for the luxuriance of the Turnips, although they were taken up as close as possible without removing part of the soil. I am decidedly of opinion that ashes thus produced are a most valuable manure as a top-dressing for pasture and meadow ground, particularly as they would not be subject to any loss from evaporation; and in that case all vegetable manure generally used as a top-dressing for meadows might be applied to the raising of green crops, where it would suffer no loss from evaporation, which, in general, is very great. In the application of clay-ashes as a manure for Turnips, I would not advise that they be put in the drills and covered, as is practised with farm-yard dung, but that after the ground is prepared for drilling, or ridging up, they should be spread upon the surface; and should the treading of the horses and carts in laying the ashes on, consolidate the ground too much for drilling, the scarifier might be run through it before the drills were formed; by so doing the young plants would come sooner in contact with the ashes than by putting them into the drills and covering them with the plough, as is usual in the application of common dung. From my practice of clay-burning, I am of opinion that it can be done without the aid of kilns, which must be a very considerable saving; besides, it often happens that earths of various kinds might be collected for burning, where it would be very inconvenient to obtain turf, or sods, to form the

kilns; and earths so collected, such as the scrapings of roads, mud of pits, and hog-earth of any kind, will undoubtedly produce superior ashes to clay, of whatever denomination. In burning clay or soil without the aid of kilns, it is only necessary to kindle a fire, and after it becomes sufficiently strong, lay the clay or earth upon it, and continue that operation directed in kiln-burning so long as a man is able to throw it upon the fire; by this mode, I conceive, a hundred or more cart-loads of ashes may be easily obtained in one heap. I would recommend in this mode of burning, a screen, similar to those used in burning charcoal, which could be shifted round, to prevent a high wind blowing the fire too much from any side of the heap. Having made the experiment, the result was as follows:—160 square yards, manured at the rate of 50 cart-loads per acre of clay-ashes, produced 1,834 lbs. of Turnips, without tops and tails; 160 ditto, ditto at the rate of 25 cart-loads per acre of farm-yard dung, produced 1,680 lbs. of ditto without ditto, 154 lbs. difference, being equal to 2 tons 1 cwt. 2 qrs. 6 lbs. per acre in favour of crop sown with clay-ashes; an advantage which may not appear great in this instance, yet it would be very considerable if obtained from every acre of Turnips grown upon this farm."

GARDEN MEMORANDA.

Messrs. Rolliſson's, Tooting.—The greenhouses in this nursery are now exceedingly gay with Azaleas, hybrid Rhododendrons, and the many dwarfier shrubs that flower at the present season, while the roof of the principal house is covered with the fragrant blossoms of the *Winstaria sinensis*. Among the Azaleas, there is a new seedling, with white flowers, which are much larger than those of *A. indica alba*; and the Rhododendrons comprise *R. hyacinthiflora*, which is a dwarf, compact-growing shrub, with shining narrow foliage, and rather small, semi-double pink-flowers; with *R. Rolliſsonii*, the new Himalayan variety, having wrinkled leaves, which are deep-brown on the under side, and dark scarlet blossoms, a little undulated, and having distinct pits or cells in the bottom, round the centre; and *R. Alberti*, a hardy hybrid, with pale and delicate flesh-coloured blooms, which are large, and a little spotted. The blossoms of the last are deep pink when first opened, and as an early and later cluster have both been developed on one plant, from the same bud; the effect is rather novel. In the stove, the noble *Franciscea latifolia* is blooming freely; *Gesnera reflexa*, a species remarkable for having both its stem and the individual flowers turned downwards; *Begonia hydrocotylifolia*, which adds to a neat and elegant habit a very agreeable odour; and *Centradenia rosea*, which is studded all over with its pretty rose-coloured blossoms. *Stephanotis floribunda* is developing numerous flower-buds on plants not more than six inches in height. Another greenhouse contains a plant which passes under the name of *Chorozema macrophyllum*, and which is a superior variety of *C. cordatum*, very ornamental, *Boronia viminea*, an interesting little shrub, which is lively with its numerous pink blossoms at all periods; *B. crenulata*, having rather a stiff or cramped appearance, but showy, with bright pink flowers; and *Zieria lævigata*, a rare species, which is clothed with pinkish white inflorescence throughout the spring months. Last, of this vineous, a new plant, with pink flowers, which are covered with glutinous matter, is also in blossom here. The Orchidaceous house has recently been rendered splendidly attractive by an immense plant of *Dendrobium fimbriatum*, which, elevated on a pedestal, and suffered to throw out its branches all round, in a drooping manner, has produced between two and three thousand of its lovely orange bloom, so the foliage long at the same time leafy and perfect, the plant formed an unusually grand spectacle. *Dendrobium Pierardi latifolium* is a variety with particularly large flowers, that retains its foliage while it is blooming, and blossoms much later than the species, it is now in perfection here. *Cytocochium stellatum* is producing a fine raceme of flowers, which though principally of a whitish tint, are specially conspicuous. *Coeleyne testacea*, new, and having drooping racemes of small, dull, brown flowers, is also in bloom. *Trigonidium ringens*, likewise blooming, is a curious species, with the scales thrown much further back than is common in the genus, their colour is a dingy brown. *Calanthe ochracea* and *leucata*, the former with yellowish-brown, and the latter with white coloured and white flowers, are flowering handsomely in a cooler house. They are considered hardy, and deserve general culture. The pleasing *Leptocelis bicolor* and the more specious *Dendrobium Jemaiense* are both blossoming abundantly, and are well adapted for growing on suspended logs of wood. *Vanda cristata*, with its singularly crested lip, which has two horns at the end, and when viewed from beneath, resembles an ox's head, has many flowers now open. Out-of-doors, *Aquilegia Skinneri* is in bloom, but the cold winds seem to have so weakened it that it has a comparatively insignificant appearance. *Viola palmensis*, a valuable shrubby species, which is nearly always blooming, is now gay with its purple flowers. In a bed at the back of one of the greenhouses some *Philodendrum* are cultivated in decayed moss and turfy soil, and *P. grandifolium*, a large white-flowered species, is a particularly creditable plant.—*E. K., April 29.*

Haggerstone Castle Gardens.—There is now in full bloom at this place a fine specimen of *Dorja*, the *exelsa*, the flower-stem of which is 10 feet high. A honed fluid crops from the plants. The plant has a very noble appearance, and the rarity with which it blossoms renders it deserving of notice.—April 29

Boxley Abbey, near Maidstone. There is at present in bloom here a beautiful specimen of *Chanthus parviflorus*, covering a south wall sixteen and a half feet long and seven feet high. It is quite a mass of flower, and in the richest health.—*G M*, May 1.

THE NATURALIST'S CORNER.—No. XI.

(Continued from page 142.)

40. *Anatomy of Animals.*—Galen, when studying human anatomy, was so struck with the perfection with which all the parts of the human arm and hand are adapted to one another, that he composed a hymn to the Deity, expressing his admiration of a piece of so much excellence. The more we extend our researches into the animal kingdom, the more shall we be struck with this extraordinary adaptation of the parts of living bodies to their respective uses; the more shall we be convinced, by our own imperfect knowledge, of the perfection of that Wisdom and Power, whose works are as marvellous as they are unbounded.

41. *Architecture of Birds.*—There is nearly as much difference between the comparative beauty of the nests of a wood-pigeon and of a bottle-tit, as between the hut of a North American savage and a Grecian temple. But although the savage, in the course of ages, may attain as much civilization as would lead him to the construction of a new Parthenon, the wood-pigeon will continue only to make a platform of sticks to the end of time. It is evident from a contemplation of all nature, that the faculties of quadrupeds, birds, insects, and all the inferior ani-

mals, are stationary; those of man only are progressive. But, within their limited range, the inferior animals perform their proper labours with an unwearied industry and an unerring precision which call forth our wonder and admiration. Elevated as our minds are in the comparative scale of nature, we may still take example from the diligence, the perseverance, and the cheerfulness, which preside over the architecture of birds.

42. *Bishop Heber* mentions, in his *Journal*, that two curious facts were told him in Kemaon respecting the forests and their productions. The one was, that fires often took place in the jungles during the dry season, by the mere friction of the cane-stalks against each other in high winds. A scene of this sort, and arising from this cause, is described in "Leyden's Scenes of Infancy." The other was, that the Boa Constrictor is frequently found, particularly in the wood between Bamoury and Dikkalee, under the immediate feet of the hills. These snakes are of enormous size, but not much feared by the natives; since, though they have, in their opinion, sufficient strength to master a buffalo, they are proportionably unwieldy. Many stories were told there of persons stepping on them by mistake for fallen trees, and being terrified on finding them alive.

43. *Sacred Tree of Hierro*.—In "Glass's History of the Canary Islands" we have the description of a peculiar tree in the island of Hierro, which is the means of supplying the inhabitants, man as well as inferior animals, with water—an island, which, but for this marvellous adjunct, would be uninhabitable and abandoned. The tree is called Til by the people of the island, and has attached to it the epithet garse, or sacred. It is situated on the top of a rock terminating the district called Tigulatre, which leads from the shore. A cloud of vapour, which seems to rise from the sea, is impelled towards it, and being condensed by the foliage of the tree, the rain falls into a large tank, from which it is measured out by individuals set apart for that purpose by the authorities of the island.

Reviews.

A Treatise on the Growth of the Peach. By John Smith. London: Simpkin, Marshall, and Co. 1843.

This little work consists of 112 pages, 56 of which are occupied with some account of the history and introduction of the Peach, and with descriptions of 19 varieties of this fruit, and 13 of Nectarines. This part requires little notice, beyond the observation that it appears to be a compilation chiefly from the "Guide to the Orchard and Kitchen Garden," which work has evidently afforded the basis of most of the descriptions; and in many instances slight changes in the phraseology constitute the only difference. Then follow some remarks on the modes of propagation, and kinds of stocks usually employed. On the subject of walls for Peaches, the author states, from his own experience, that straight walls are better than those built serpentine, or zig-zag; that the full south aspect is the best; and that the east is more suitable than the west. The directions for the formation of borders are, so far, very good; but for many subsoils it would have been proper to recommend a bottoming of concrete. The season of planting is stated to be from the "middle of October to the middle of March." Peaches may be planted thus late; but to delay beyond February is not to be recommended. The trees are also weakened by deferring the winter pruning so late as "from the latter end of February until the blossom-buds are nearly ready to burst." When the leaves have fallen, the operation of pruning cannot be too soon performed.

With regard to pruning and training, however, the system is good in principle, but is not so distinctly explained as could be wished. It has to be gathered from amongst details of various other systems, instead of being propounded in regular order, from the time of planting the tree till it is brought to its full and perfect form. The description of other systems occupies too prominent a position in the work, whilst the one recommended is mentioned incidentally. It partakes of those of Mr. Seymour and Mr. Errington. Like the former, it requires that one upright shoot be trained in summer and cut back in winter to furnish side branches; but instead of bearing-shoots being allowed to grow only on the upper side of these lateral branches, as in Seymour's plan, such are encouraged both on the upper and under sides, and consequently a greater distance must be allowed between the principal branches; and as the lower branches are apt to become weak, partly owing to their horizontal position, the ends of these are curved upwards, in order to induce a greater flow of sap, after Mr. Errington's plan, but to a less extent.

CALENDAR OF OPERATIONS for the ensuing week.

The gardening operations for this week about London will end in a great holiday among the patrons and lovers of the art, and in a severe contest among the best practical gardeners in the world, at the first exhibition of the season in the Horticultural Society's Garden. Gardeners in distant parts of the country who have never attended these exhibitions, can form no idea of the perfection to which the cultivation of plants is brought round London. It is not an uncommon occurrence for some of these gardeners to send 'up' part of their very best productions, confidently relying on taking a first prize; as, in their opinion, nothing in its way can be more perfect than their plants or fruit, as the case may be. Their confusion and loud complaints are therefore great, when they hear that not only no prize is awarded them, but that their efforts were hardly thought worthy of being mentioned in the reports of the day. I have had the good fortune to be present at these exhibitions for many years, and to have my expenses on such occasions paid by my employers, and I can safely affirm that I have learned more at these exhibitions than I have done by all my reading and thinking put together, and I know of no better way by which gentlemen can improve the appearance of their plants, than by allowing their gardeners to visit at least one of the three exhibitions in each season; and as gardeners are

seldom overburdened with money, to have their expenses paid would be a powerful inducement for them to make still greater exertions at home.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINES.—Continue to give liberal supplies of water to plants swelling their fruit, and keep up a moist atmosphere by a free use of the syringe; when a plant shows more than an average sized fruit, assist it by divesting it of its suckers, and by liquid manure. The young stock will require constant shading in the middle of the day.

VINERY.—In all the stages of the Vine till the Grapes begin to turn colour, a free use of the syringe is of much service when the weather is hot and dry. The routine now is thinning the fruit, stopping and tying up the advancing shoots. Whatever mode of training is followed, the shoots should always be kept thin, to allow light and air to pass freely among them.

PEACHES AND CHERRIES.—Abundance of air all day is essential to give a good flavour to these, and the houses should not now be quite closed up at night; no fruit is sooner affected by a close or damp atmosphere than the Peach.

Figs.—Continue the directions given for the last week or two. **MELONS AND CUCUMBERS.**—To have Melons in the best perfection that our climate will allow, this is the best time of the season to plant them in a tan-bed of about 90° bottom-heat; if, indeed, a pit with hot water is not already prepared for them. Having the best part of the season before them, if the shoots are kept thin and only a light crop aimed at, the fruit will come in under all the advantages that can be expected from our climate, and will be more wholesome than if planted earlier or later in the season.

STRAWBERRIES.—The late Vinery is now the best house to ripen off these, as all the top-lights are let down every day. See that those not yet introduced for forcing have large portions of liquid manure at every other watering; the last forced crop ought always to be in finer condition than the first few dishes from the open ground—not however where room is scarce.

KIDNEY BEANS.—Of all our forced crops these are the most wholesome, and also the most troublesome about this time, if they are kept long in the houses. The successions should now follow each other rapidly, and as soon as three or four gatherings are got from them, the plants should be placed out in a sheltered place to harden, and then turned out of the pots in light soil. Well watered and shaded for a while, they would produce several dishes, and thus help on the succession till the beginning of July, when those on the early borders may be expected to come in. One grand feature in their management in or out-of-doors is never to let them suffer for want of water.

MUSHROOM-HOUSE.—Like every other house, shed, pit, or frame, where plants of any description are now growing, the air must be kept in a moist state by pouring water on the paths, and spare places. Recollect the state of the weather when you used to ramble out of a morning in autumn to gather Mushrooms in the fields. Endeavour then to keep up a regular cool moist atmosphere in this house for the next three months, and gather your crops when they are fit, whether they are wanted or not.

Out-door Department.

We seldom have had finer weather at this time of year for all the out-door operations. I hear from several correspondents that the wall-fruit promises to be a large crop, and appearances warrant the same conclusion in regard to the standard fruit. A gentleman in Paris reports rather unfavourably of the appearance of the fruit there.

PEAS AND BEANS.—As soon as these show flower, pinch off their tops, and stir the ground well between or near to the rows. When you have time, give them a large portion of water, and before the surface dries throw a little dry soil over the wet parts, to prevent the earth caking or cracking.

Cauliflowers.—What is more vexing than to see a bed of nice young plants of these beginning to crowd each other, and the weather too dry to plant them out? You must, nevertheless, pull out the largest plants, otherwise the whole will be injured. You might try to pot two or three dozen of them in 48s, and keep them in a shady place, and watered, till they fill the pots with roots, and then they may be planted out, if the weather is ever so hot. Now, recollect this simple method may be turned to account through the season with many other things, as well as with Cauliflower plants.

SUCCESSION CROPS.—There is more danger that those already up and in different stages will now suffer from want of water, or thinning, &c. &c. than that the right time of sowing them should be forgotten; the state of the last sowing will always indicate the time for the next. Keep the soil well stirred between crops in rows, and see that no weeds get a footing among your crops.

ONIONS.—See that you have a bed or border prepared to plant out the thinnings by-and-by, and sow a bed of the silver-skinned in light poor soil some time soon, to come in for pickling.

CELERY AND LETTUCE PLANTS, lately pricked or planted out, indeed, any small plants which have lately been transplanted, will be now in danger from the dry weather, and must be as regularly watered as house plants in pots, and so must crops of Turnips and other seedlings as they are coming up.

ORCHARD.—All our hardy fruits come in under this head; the Strawberries require the first attention now, as, if this fine warm weather should continue through this month, the beds will soon get too dry, and no one thinks of watering all the Strawberry-beds, but everyone should mulch in between the rows with some sort of litter—short grass from the pleasure-grounds is the best: this will prevent radiation and keep the surface cool. Keep a regular eye over the wall-trees, and see that no insects or other vermin get established on them; and also the young shoots must now be well attended to. Never cut out, or otherwise prune, too much of the summer growth at once; it is much better to begin in time, and stop the strongest shoots only at first, and so on through the growing season.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—A liberal use of the watering-pot and syringe is the great point to be attended to this fine weather, and no plants should yet be shaded if they stand the sun; Orchidaceæ of course excepted.

GREENHOUSE.—A stranger entering a well-regulated greenhouse on an afternoon about the beginning of May might imagine the house was a stove: the plants had just been syringed, and the house closed up; every leaf and shoot, even the rafters, glass and all, were dripping, and you might think the plants were all forced for some unaccountable purpose; nevertheless this is the way these things are managed now-a-days at this time of the year.

CONSERVATORY.—The tables are turned here now; this house was kept much warmer all the winter than an ordinary greenhouse, and now it must or ought to be the coolest house about the establishment. After all you can do, the atmosphere of this house will be too dry for plants in a growing state; yet you must persevere, and pour quantities of water on the paths and under the stages early and late.

PITS AND FRAMES.—Many of these useful structures will now be getting empty, the plants being turned out to sheltered places to harden; and as pits cost money, as well as houses, they should never rest idle. Get them prepared for the next crop—some for Melons and Cucumbers, others for a fresh lot of young plants for late flowering out-of-doors in autumn; others, again, for turning out a host of greenhouse and even half stove plants; some of these, again, in many instances, are turned out of their pots and placed in suitable composts, and if only covered with thin white canvass they will be found to be the heatmost plants in the establishment by the end of August, when you will begin to take them up and report them for the winter. Of all the systems of growing plants into fine healthy specimens, this is by far the easiest and the best; just try it for a year or two against the

one-shift system, then you can follow whichever you find to suit you best.

Out-door Department.

What a pity that dry weather should ever do any harm, says the old adage; but it will do harm, and that to a very serious extent, to late-transplanted trees, to recently-laid turf, and perhaps to some crops in the flower-garden, unless they are regularly watered.

ANEMONES AND RANUNCULUSES are amongst the first of your flowers that will pant for rain; but it is no use naming "this, that, or the other," we must see that all are done justice to, according to our own notions of their worth; then, whatever our favourites, they will come in for the best share of attention. —D. Beaton, *Shrubland Park Gardens*.

State of the Weather near London for the Week ending May 6, 1843, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending May 6, 1843.

Among the principal novelties are Early Frame Peas, small Gooseberries, Frame Carrots, young Turnips, Lettuces of tolerable quality, and some Celery, which has apparently been planted late in the autumn, and not earthed up. Myatt's British Queen Strawberries occur sparingly, and are exceedingly fine. The hothouse Grapes improve greatly, both in size and colour; and Peaches are more numerous but small, and seemingly somewhat damaged by travelling. There are some good May-duke Cherries. There is still a profuse supply of unusually large Oranges; with some handsome Shaddocks. The display of flowers in pots now includes Hydrangeas, in a dwarf state, the showy doubled blossomed Furze, Coronilla glauca, Cereus speciosissimus, Epilypium speciosum and Ackermannii, Gentiana acaulis, Diosma uniflora and purpurea, with hardy hybrid Rhododendrons that have been potted and have a very gay appearance. The Lily of the Valley, now blooming naturally, is also of frequent occurrence. The cut flowers comprise some lovely Narcissi, Tropaeolum Moritzianum, Abutilon striatum, Moss Roses (which are abundant and fine, both in a cut state and in pots,) and Gentians, which are likewise to be had in both conditions, and are very brilliant. Bundles of dried flowers, which have been dried, have before been noticed; but there is now an addition of a kind of grass, which appears to be a species of Briza, and is particularly elegant.

PRICES, SATURDAY, May 6, 1843.—FRUITS:—

Pine Apple, per lb. 6s to 10s	Lemons, per 100, 4s to 14s
Grapes, hothouse, per lb. 6s to 12s	— per doz. 1s to 2s
— Spanish, per lb. 1s to 12d	Cucumbers, per brace, 1s to 2s
— Portugal, 1s to 3s	Walnuts, per bush, 12s to 16s
Apples, dessert, per bush, 5s to 18s	Chesnuts, per peck, 4s to 8s
— Kitchen, 4s to 8s	Almonds, per peck, 6s
Pears, dessert, per hf. sieve, 20s	Sweet Almonds, per pound, 3s
Strawberries, forced, per doz., 6d to 1s	Filberts, English, per 100 lbs. 5s to 6s
Gooseberries, small basket, 9d to 1s	Cob Nuts, per 100 lbs., 80s. to 70s.
Apricots, per pot, 1s 8d to 2s	Nuts, per bushel—
Pomegranates, per doz., —	— Brazil, 16s
Oranges, per doz., 1s to 3s	— Spanish, 18s
— per 100, 6s to 20s	— Barcelona, 24s
— bitter, per 100, 8s to 20s	— Cob, 12s to 14s

VEGETABLES.

Cabbage, Red, per doz. 2s to 6s	Shallots, per lb., 1s to 12d
— plants, per doz. 1s 6d to 3s	Asparagus, 4s to 6s
Cabbages, per doz., 9d to 1s 6d	— Spruce, or Small, 1s 6d to 2s
Cauliflowers, per dozen, 6s to 10s	Sea-kale, per punnet, 1s to 2s
Broccoli, White, per bunch, 2s to 4s	Lettuce, Cabb., p. hf.-sieve, 1s to 1s 6d
— Purple, 6d to 1s 6d	— Cos, per score, 8d to 2s
Beans, Kidney, forced, p. 100, 1s 6d to 2s	Endive, per score, 6d to 1s
Potatoes, per ton, 40s to 70s	Celery, p. hf., (12 to 15) 6d to 1s 6d
— per cwt. 2s to 4s	Rhubarb Stalks, per bale, 4s to 1s 6d
— per bushel, 1s 6d to 2s 6d	Small Salads, per punnet, 2d to 3d

Young Horn, per bunch, 6d to 1s	— Pickling, per hf.-sieve, 4s 6d to 5s
Spring Carrots, 1s 6d to 2s	— Green, p. doz. bun. 2s to 4s
Parsneps, per dozen, 6d to 1s	— Spanish, per doz. 2s to 3s
Garlic, per lb. 6d to 8d	

Notices to Correspondents.

FLORISTS' FLOWERS.—Now that the season for florists' flowers has arrived, we beg to state that we are ready to give our opinion of all novelties that may be sent us; not with a view to please the growers, nor for the sake of indulging any vanity of our own, but in order to satisfy the public. It is alleged that there is but one society in London which can be trusted upon this subject; that this society only meets occasionally, and then by candle-light, when it is impossible to judge correctly of the merits of the flowers that are examined. We are not of the same opinion; we believe that no better decisions than those of the Floricultural Society will ever be arrived at, and we wish it to be supported, because we know its decisions to be those of honest men, and skilful men. Nevertheless, in order to gratify those who look to some other tribunal, we take this opportunity of announcing that all florists' flowers that are addressed to our Office, 3, Charles-street, postage or carriage paid, will be examined, and their qualities declared under a separate heading in these "Notices to Correspondents." The opinion will be given by a gentleman entirely unconnected with the trade, thoroughly

acquainted with the subject, but having no interest whatever to serve, except the truth. As all these judgments will be indexed at the end of the year, the buyers of new flowers will have a ready means of testing the value of the seedlings advertised. If they are found in our columns, their true character can be ascertained.

MANURES.—*Jack Spratt.*—We do not conceive that there would be much advantage in sowing soot upon Potatoes when the leaves are about three inches out of the ground, unless the Potatoes are afterwards earthed up. Soot should be in contact with roots, to be of service, and rain will hardly wash it down to those of Potatoes unless your land is very light. — *Cuddehill.* — Guano is most advantageously applied in a state of mixture with water. Over a couple of pounds pour as much water as will fill a watering-pot, stir it up, leave it for a few hours, and then use it like liquid manure. It answers all purposes for all crops requiring manure. The time of applying it is when plants are beginning to grow, and in full growth. The best mode of using it is in small quantities at a time, frequently applied. We have not seen it used for Heartscase, but anticipate good effects from it. — *A Purchaser.*—See the last answer. — *B. A. D.* Sow the saline substances broadcast, and earth up afterwards; or, if it is more convenient to you, it may be done after earthing up; the rain will soon wash them down into the soil. They should not be applied to the leaves. — *J. O. U.*—We are not aware that Sugar-baker's scum has been used as a manure; but will inquire and let you know next week.

BACON.—*Discipulus porcinus.*—If you cure and keep your bacon properly, it will not rust; if it does rust, there is no remedy that we know of. For the mode of managing, see article "Bacon" in Martin Doyle's excellent Encyclopedia of Practical Agriculture.

SOIL OF GARDENS.—*A Subscriber.*—The best thing you can do in the meantime with your clay subsoil in the place where you intend forming a garden is to trench it, and at the same time mix with it plenty of long dung, litter of any sort, and lime-rubbish, if you can obtain such; in short, any substance that will keep it open. As you intend immediately to plant Potatoes, the surface-soil will require to be kept up; but as soon as the crop is obtained, the subsoil should be exposed to the action of the weather. The mellow present topsoil will next season admit of being mixed with the ameliorated clay in the proportion of, say 6 inches in depth of the latter to a foot of the former; and more by degrees can be thus incorporated at each trenching, which ought to be annually performed, till the required depth of good working soil is thus obtained.

PONDS.—*E. N. W.*—If we understand your description, you have nothing to do except to puddle the bottom and sides of your pond, for which purpose you must procure some stiff clay, and let it be applied two feet thick; any country labourer will show you how to do it.

LAWNS.—*J. T. W.*—You could not have done a worse thing than to cover your lawn during the winter with long litter. If you had given it a good dressing of soot in November, and had allowed it to remain uncut till the present time, it would probably have recovered; especially if the bare places had had some seeds sown on them in the previous October. Of what use was the lime? All you can now do is to get the surface into good tilth as quickly as you can, and then to lay it down again with fine bowling-green seeds, giving them a good dressing of soot as soon as they become green; and not mowing them till next spring.

GRASS LAWNS.—*F. A. P.'s* lawn, which has been freshly laid down, and is yet coarse, on account of the turf having been taken from a pasture, can only be improved by frequent mowing, and by often rolling it with a heavy roller, when it is damp.

FUMIGATION.—*A Subscriber.*—It is possible that you have injured your Vine-leaves by using Tobacco in too strong a dose; but it is probable that something else has produced the mischief. Tobacco-paper is the safest substance to use for fumigation.

BOTTOM-HEAT.—*Amateur.*—The best material for a small hotbed is hot water, and much the cheapest in the long run. All fermenting materials are either expensive or uncertain, and generally are cold when they should be warm.

TURF.—*T. A. N.*—Your heap of turf would be benefited and rendered more valuable by having a few pails of chamber ley or the drainings of a stable thrown over it; after that process it would be fit for potting Rose-trees or other plants in a month.

VINES.—*A Grape Grower.*—We hardly understand your complaint. We have not closed our columns to explanations from Mr. Roberts; on the contrary, we have opened them to discussion by printing your letter; and if any remarks are elicited, we shall be glad to publish them. We thought you would be glad to know that Mr. Roberts's book contains the information you seek for.

CAPE GOOSEBERRY.—*A. E.*—The scientific name of this plant is *Physalis edulis* or *peruviana*, for both species are employed for the same purpose, though the former is commonest. It is treated as an ordinary greenhouse perennial, and supported by a trellis, or by a few separate bushy stakes, being propagated by cuttings. It fruits abundantly during the summer; and might doubtless be induced to ripen its fruit against an open south wall, if planted out in the month of May.

FILBERT-TREES.—*A Subscriber.*—The soil in which your Filbert-trees are growing is probably too strong and rich, and consequently, they are disposed to grow luxuriantly to wood, instead of producing fruit; and if you prune them short, as is practised in Kent, they will only send up vigorous shoots, not adapted for bearing for many years. By leaving the shoots at full length, or nearly so, the laterals will soon begin to bear; but as they grow parallel to a west wall, they would become inconveniently high if so treated. You must, therefore, stop the shoots at Midsummer.

GRAFTING MULBERRY-TREES.—*A Subscriber.*—Your scions having been taken off in good time, you may succeed by waiting till the buds on the tree you wish to graft with a fruitful sort have fairly burst, but no longer; and then graft as you would an Apple or Pear-tree, by whip-grafting; only taking care not to injure the upper bud or shoot behind the scion till such time as it may be dispensed with, when the scion begins to push.

RADISHES.—*D. B.* complains that his Radishes, though large, are always hard and fibrous at all seasons, and asks the best mode of cultivating them. A warm, open spot, and light, rich soil, are the only requisites; as these will insure their growing quickly, which is the chief cause of crispness in all salads. Low, cold, and wet places should be especially avoided; and a border which lies open to the south, with such a fall to the front as to secure its thorough drainage, should be preferred.

ASPARAGUS.—*A Subscriber.*—You cannot expect much of the good effects of dressing your Asparagus beds last autumn to be apparent yet; it will only be after the first season of cutting that the salt and manure will tell. Next year you will see the advantage. We presume your leaves were put on in winter instead of spring, and so have become sodden. As soon as the weather becomes warm enough, the shoots will come up. Try the effect of uncovering a part of your bed. — *A. N.*—Your leaves should not have been put on before the month of April, and the Asparagus should find its way up from among them—at least, that is what happens in Spain. There is no means of destroying the flowers, except by picking them off when they are about to expand.

PRESERVING APPLES.—*A Tiny Side Subscriber.*—By all means keep your Apples in a dry loft, with open shelves, and see that the window and door are made thoroughly impervious to frost in winter, or furnish the apartment with a small stove or fireplace, to be employed in very severe weather.

CHERRY-TREES ON WALLS.—*G. B. M.*—We presume there is no sort of Cherry that will produce fruit only as a standard, and not against a wall. Yours being on the south aspect of a lone house, situated on a heath, doubtless suffers when in blossom from cold at night after being exposed to hot sun through the day. A thin canvass screen always kept on at night during the blossoming season, and when the sun is strong through the day, will protect the blossoms from those vicissitudes which occasion failure in setting the fruit.

PEARS.—*A Subscriber.*—The Broom Park is scarcely so desirable as the Monarch Pear; it partakes of the flavours of the Melon and Pine-Apple, and as it keeps till January, and being a hardy variety, it well deserves a place in a collection; but it cannot be said to equal the Beurré Rance, which ranks the highest among late-keeping Pears. Inconnue Van Mons is unknown to us; the Beurré Piquere has probably never been fruited in this country; in M. Jamin's Catalogue it is described as the best of Pears, and as being fit for use in December. The Sheldon Court is one of the many varieties raised by Mr. Knight; it is of a yellowish russet colour, of an obovate form, not large, but possesses a rich sugary flavour, and keeps till January or February. The Van Mons Léon Le Clerc is a large oblong Pear, buttery and rich; in season in October and November; it has fruited in this country as an open dwarf; but its introduction is too recent to enable us to state whether it will succeed generally in the open ground. Fondante d'Automne is as rich as Marie Louise, but ripening earlier; it does not keep so long after it is once fit for use.

APRICOT TREES.—*Emu.*—In removing your Apricot trees that were planted seven years ago against an east wall, in draining the border, and replanting the trees in two feet deep of good mould, with some bones, you have acted very properly. As they, notwithstanding, do not make healthy wood, nor prove fruitful, although a Nectarine tree on the same wall bears fairly, all you can do is to encourage the growth of your Apricot trees as much as you can between this time and the middle of July, by mulching and watering in dry weather. The portion of shoot produced under these circumstances will be sound and well ripened; whereas if its growth were stunted for want of moisture till later in the season, a rapid but unhealthy development would take place after heavy rains have thoroughly moistened the border.

FLOWER-SEEDS.—*T. A. N.*—Annual seeds will generally grow very well the second year, if they are kept in a dry airy place. **PENTSTEMONS.**—*G. H.*—Your question is too indefinite. The species and varieties of Pentstemons are so numerous, and of such different characters, that it would be impossible to give directions for culture which would include all. If you will state to what particular kinds you refer, we will endeavour to supply your desires.

GENISTA CANARIENSIS.—*A. B. C.* sends us specimens of this plant to inquire its name, and adds that he has planted it against an open wall, facing the west, where it stood the frost of last winter uninjured, with only a single plant to protect it.

FRENCH HONESTY.—*J. L.*—This plant is nearly the same as the Saintfoin, the one being *Onobrychis coronaria*; the other, *Onobrychis sativa*. If it is to be cultivated by the farmer, it must be treated in all respects as the Saintfoin itself, and no doubt will require chalk. The best plant for you to grow is Lucerne.

CAMELIAS.—*Vectis.*—We are quite unacquainted with any case like yours: they appear as healthy as possible, and yet the young shoots are dying near the base. Send us an exact description of your case, and we will publish it; when some one may be able to advise you.

AMARYLLIS LONGIFOLIA.—*A Subscriber.*—All plants require a season of rest; there is no exception to this. Your plant should grow in the summer and not in the winter; but if you have kept it growing all winter, you had better let it go to rest now.

CLIMBING PLANTS.—*F. A. P.*—The following climbers, of limited growth, would be suitable for your greenhouse. *Brachycomma latifolia*, *Kennedy's Marryatiana*, *Tropaeolum pentaphyllum*, *Clematis Sibboldii*, *Sollya heterophylla*, *Kennedy's longicarpa*, *Lophospermum scandens*, and *Clianthus puniceus*. The latter, though not strictly a climbing plant, can be treated as such.

GLOXINIAS.—*F. A. P.*—These plants will not flourish in the temperature of a greenhouse, as they require a warm and moist situation, such as is obtained from being plunged in fermenting bark.

FLOWER-GARDEN.—*J. O. R.*—A flower-garden laid out upon the Linnean system will be but a poor affair. Size and situation are unimportant; for if there is room for 24 plants there will be space enough; and half-a-dozen acres may be filled. If you consult the "Hortus Kewensis," or "Donn's Catalogue of Plants in the Cambridge Botanic Garden," or any old-fashioned systematic catalogue of garden plants, you will see what to procure, and your nurseryman will tell you the prices of them.

SEEDLINGS ON HOTBEDS.—*T. A. N.* desires some hints on the management of seedlings on a hotbed, in order to prevent their being drawn, or damping off. A moderate temperature, a due regulation of the supply of water and air, and the fullest exposure to light, are the principal preventives. Too much heat at the roots will be decidedly prejudicial, and to obviate it the hotbed should be prepared, and freely turned over and sweetened before the soil is put upon it. There should likewise be a layer of fresh turf placed with the grassy side downwards, between the fermenting materials and the soil.

ANNUALS.—*A Tiny Side Subscriber.*—*Brachycome iberidifolia*, *Antonia elegans*, *Limnanthes Douglasii*, and *Portulaca Helioscopia*, ought to be sown in a pot, and plunged in fermenting manure or bark, to germinate. When they have acquired two or three of their ordinary leaves, the pots can be removed to a cool house, or frame, or the window of a sitting room, and after a few days they may be planted in the open borders, in a sheltered and sunny spot, or potted into other pots, three in each, and kept in a greenhouse, or any similar place where they can have plenty of light. — *T. A. N.*—Your annuals, raised in a hotbed, should be hardened by being removed from thence to a cool frame, which can be kept close and partially shaded for a few days, and afterwards gradually thrown open to air and light. Unless they have come up very thinly, they should not be retained in the seed-pans, but potted, three in a pot, into small-sized pots; the proper stage of their growth at which they should be transplanted may then be determined by the season, as they will not be injured by being transferred from pots at any period; the best time is about the end of May. If, supposing they are two inches apart in the seed-pans, they be retained there, they ought to be planted out as soon as possible, or the roots will be greatly damaged by that process.

DAHLIAS.—*A Tiny Side Subscriber* has some Dahlia roots which she wishes to take with her to a new residence, to which she is going at Michaelmas, and inquires how this may be accomplished. If they are valuable enough, they had better be planted in pots, which can be kept in the open air, and the plants should be rendered dwarfish by stopping their shoots once or twice. Only one stem must be left to each. They can then be removed anywhere when required. If left out of the ground, as suggested, they will perish. — *John Scott.*—We recommend you to procure the following sorts: Dodd's Prince of Wales, Hudson's Princess Royal, Brown's Marquis of Lansdowne, Bedford's Surprise, Holwood's Princess Royal, and Mrs. Shelley.

OXLIPS.—*H. D.*—We see no reason to doubt your Essex plant being the true *Primula elatior* of the Germans and of Linnaeus.

POLYANTHUS.—*An Amateur.*—A list of the best Polyanthus was given p. 341 in last year's *Gardener's Chronicle*.

ORNITHOLOGY.—*A Subscriber.*—We have published occasional memoranda respecting the habits of birds, and shall be happy to continue to do so as they are furnished to us by our correspondents.

SNAKE MILLIPEDES.—*G. P.*, whose *Ranunculus* are infested by these insects, is referred to page 196 of the *Gardener's Chronicle* for 1841, where the methods of destroying them are given.

WIREWORM.—*J. D.*—You will not be able to eradicate the wireworm from your Tulip beds at this season of the year, but you may reduce their numbers considerably by burying under the surface of the soil slices of Carrots, &c., by which they will be attracted; the Carrots should be examined twice a day, and the insects destroyed. — *A Subscriber.*—We do not know whether spirits of tar will injure your Pinks and Carnations; probably not; it is worth a trial, when we hope you will favour us with the result.

INSECTS.—*Rhodod's* larva appears to belong to some *Tipula*, vide *Gardener's Chronicle*, vol. i., p. 612. If names are to be given to specimens of insects, they ought to be sent up packed carefully. Yours and many others were crushed to pieces. A quill stopped with a cork is generally guard enough from the injury of the letter-bags. — *A Subscriber's* insect injuring his Peach-trees, &c. is the *Othiorhynchus* (*Curculio*) *tenebri-cosus*, figured and described in the second Volume of the *Gardener's Chronicle*, p. 316. — *L.*—Your method of killing insects for the cabinet is too expensive and troublesome, even if it answered the purpose; besides, spirits of wine and corrosive sublimate always leave a white deposit where they touch the insect. The best way of destroying Coleoptera is to plunge them into boiling water. — *Mr. Wm. Cummings'* insect is the *Galeruca lineola*; the best means of destroying it is to hold a sieve or net under the infested Willows, and by shaking or striking the branches with a stick, the beetles will fall down, and may be killed with boiling water. — *A Subscriber.*—It is impossible to give any satisfactory answers relative to insects without seeing the specimens. If our correspondent will do us the favour to forward two or three of the grubs in a pill-box to Mr. Curtis, 11, Robert-street, Hampstead-road, without delay, he will give an opinion concerning them. R. SEEDLING FLORISTS' FLOWERS.

CINERARIAS.—*Sarpedon.*—Your Cinerarias are very pure in the white, but there is nothing to distinguish them from many sorts which are common. No. 1 is the best. — *A Bristol Subscriber.*—White Cineraria, like many we already possess. **CALCEOLARIAS.**—*A. K.*—The Calceolarias are small and common—not worth preserving.

PANSIES.—*A. K.*—Nos. 6, 7, 8, good border varieties, but deficient in the properties of show-flowers; the upper petals are out of proportion, being too large in all; edges too much serrated in 6, which, with 7, want texture; 8 is the best. — *W. Earl.*—A 43, a clear well-formed flower, with good eye, but deficient in texture. — *P. S.*—A large dark well-formed Pansy, with good eye—rather too thin for its size. — *J. R. Pearson.*—A compact and beautiful seedling; white ground, eye large and very dark, a band of dark bright blue round the lower petals, upper petals darker, with a purple tinge, the flower is round, petals large and finely proportioned, lying flat, and of good texture. — *Sarpedon.*—A large flower of good form and substance, ground colour a bright and clear yellow, good eye, purple upper petals, same round the lower; it is a showy variety, but is defective in having a space left where the sepals should meet above the eye. — *J. Kitley.*—*Lycopodium* *Vale* *trifol*—A large and fine flower, clear, bright, flat, and of good substance; ground pure white, fine eye, margin of bright blue round the lower petals, upper petals purple; the flower is round, and the petals finely proportioned. — *London.*—This is the largest Pansy we have seen; the petals are in good proportion, and of good substance; the colour is a deep rich malerry, very good; the band round the lower petals very broad, the eye is large and good, leaving but little white round it, the purple tinge softens too much into the white, giving it a rather dingy appearance.

MISCELLANEOUS.—*A B's* plant from Australia is *Sutherlandia frutescens*. — *Quandary's* queries were too late for our last Number. His specimen No. 1, is *Genista tuberosa*; No. 2 is probably a new species of *Ruchia*; but we shall be obliged by a better specimen. — *Merrill.*—*Merrill's* *patens*. — *Ternan.*—*Alyssum saxatile.* — *A. I. ad.*—1. *Ornithogalum nutans*; 2. *Leucodium aestivum*; 3. *Geum rivale*; 4. *Saxifraga granulata*. — *No Botanist.*—Your leaf will not enable us to recognize its name; you should have sent flowers with it. — *G. D.*—Your fungus is the young state of some plant allied to *Lyoperdon*, or *Geaster*. You should watch its further development. — *Fortis.*—*Chrysanthemum leucanthemum*, the Oxeye Daisy. You can only destroy it by cutting it down continually, and never allowing it to seed. — *Trey.*—*Seville Oranges* are of no use that we know of except for making marmalade and candied Orange peel. — *Diophas.*—We are unable to answer your question about Mr. H. — *Jonathan.*—Such *Acacias* must be in flower if they are to be correctly named. How does your *Ononis* differ from *O. flexuosum*? Your papilionaceous plant is not recognised; if you will furnish a better specimen, with its foliage we will see what it is. — *J. N.*—The seeds were received, but will not be reported in this Paper till the discoverer has had an opportunity of making his own statement respecting them. — *Salopian.*—*Grabamia aromatica* is the same as *Cephalophora aromatica*; it is a Chilean Composite plant, of little beauty. Probably the *e* is short in *Lonicera*; but custom makes it long. To us it seems that more courage is required to say *Anemone* than *Anemone*; for the quantity of that word is certain, and besides it is classical; we cannot forget the *δακρυα ταν ανευωναν*. Your note was mislaid, or it would have been answered long ago. — *An Irish Paddy.*—It is really impossible to name plants of which only leaves are sent, without flowers. — *R. G.*—A *Cleisostoma*, and apparently *C. roseum*. — *Organ Mountains.*—Next week. — *Caleb.*—The seedling you have sent is too much like the Yellow China for us to recommend your purchasing it.

As usual, a host of letters has arrived too late for answers this week.

NEWS OF THE WEEK.

The Overland Mail from India and China, which left Bombay on the 1st of April, arrived at Malta on the 29th ult., and the leading facts of the intelligence it brings have been received by telegraphic despatch. The Governor-General has declared that Scinde is annexed to the English territory, and thus that important country has become a province of our Indian Empire. Slavery is henceforth to be abolished in Scinde, and the navigation of the Indus is to be opened to all nations. Considerable treasure was found in Hyderabad after its capture by the British army, the amount of which is said to exceed 1,000,000 sterling. The news from China comes down to the 23d February, and is briefly mentioned as of a favourable nature, although it contains no important fact. — From France, we have the particulars of the Postage Convention recently concluded between the French and English Governments, the result of which will be a considerable reduction in the rates at present in force, both on letters and on pamphlets. The King's fête was celebrated on Monday, with the usual rejoicings, and without the slightest disturbance. — In Spain, M. Cortina has been elected President of the Chamber of Deputies by a large majority, and the draft of the address drawn up by a

committee of the Senate in reply to the Regent's speech at the opening of the Cortes has been the subject of animated discussion. The Senate, in calm but dignified language, assert the right of Spain to an independent judgment on her own affairs, and censure the assertion of M. Guizot in the French Chambers that the Queen should only marry a Bourbon, as an attempt to assume a tone of superiority to which they cannot submit.—From Portugal, we learn that the news of the interruption of the tariff negotiations has produced a great sensation in the wine districts, and that the authorities at Lisbon are at length beginning to manifest a disposition to bring the question to a satisfactory settlement.—From Italy, we have accounts of an attempt to assassinate the Viceroy of the Lombardo-Venetian Kingdom, which fortunately failed and proved to be the act of a lunatic who had imprudently been allowed to be at large.—From Turkey, we learn that the Servian question has been settled by an unconditional compliance on the part of the Turkish Government with the demands of Russia. The new Sovereign of Servia is to be deposed, his Ministers are to quit the Servian territory, and a new election is to take place which will doubtless restore the Sovereignty to Prince Milosch.

At home, the funeral of the Duke of Sussex in the cemetery at Kensal-Green—the details of which are given in another column—is the chief topic of public interest. In the House of Lords on Tuesday during a conversation on the Scotch Church, Lord Aberdeen said that Government had offered all that could be conceded, and that there was no intention of introducing any measure on the subject. In the Commons, on Monday, Sir James Graham explained the nature of the alterations proposed by Government in the Factories Bill, with the view of meeting the most prominent objections urged against it. On Tuesday, Mr. Hume's motion for a vote of thanks to Lord Ashburton for the treaty of Washington was carried, after an animated debate, by a majority of 238 against 96; and on Wednesday, Mr. Elphinstone's bill for the better regulation of Marriages and Divorce was negatived by a majority of 64. Last night the Government resolution for the endowment of additional ministers in populous places, was agreed to in committee without a division.

Home News.

Court.—Our readers will be gratified to learn that the following most satisfactory bulletin was issued on Thursday morning:—"Buckingham Palace, May 4, 1843, 9 o'clock, A.M.—The Queen is convalescent. The infant Princess is perfectly well. Her Majesty's recovery is so far advanced, that no more bulletins will be issued."—The daily papers state that her Majesty and Prince Albert, accompanied by the Prince of Wales, the Princess Royal, and the newly-born Princess, will probably leave Buckingham Palace for Claremont about the 20th inst., and that their stay at Claremont will be prolonged until within a few days of the period of the Ascot races, which will commence on Tuesday, the 13th June. Her Majesty is expected to proceed to Windsor about the 10th of June. No period has yet been fixed for her Majesty's visit to Dublin; but it is not expected that the Queen will leave England until the latter end of July, or the commencement of August.—His Royal Highness Prince Albert has graciously signified his intention of laying the foundation-stone of the Royal Naval School, at Counterhill, near Deptford, on the 1st June, the anniversary of Lord Howe's victory.

The late Duke of Sussex.—The Lying in State.—On Wednesday the public were admitted into Kensington Palace, to see the body of his late Royal Highness lie in state. At 10 o'clock the doors of the Palace were opened. Passing through the front hall to the inner hall, which was lined by his Royal Highness's footmen in state liveries, with crape hatbands, the company ascended the grand staircase, which was hung with black cloth, reaching to the ceiling from the landing. On this landing stood his Royal Highness's piper, in his state uniform, and wearing a crape scarf. From the landing, entrance was given to an ante-room, the same in which the Queen held her first council on her accession to the throne. On the present occasion the ceiling, sides, and floor of the apartment were completely covered with black cloth. The adjoining apartment, the saloon, contained the body, covered, except at the end, with a black velvet pall, adorned with escutcheons of his late Royal Highness's arms. Upon the coffin, on a velvet cushion, rested the coronet of his late Royal Highness, as one of the Princes of the Blood. On either side of the coffin were three gold candlesticks, with large wax lights. At the head of the corpse sat, as chief mourner, Capt. Sir W. H. Dillon, R.N., one of his Royal Highness's equerries. At the feet of the corpse stood the Richmond and Windsor Heralds, wearing their tabards and collars. Behind the heralds stood, on either side, the Hon. F. Byng and Capt. Courtenay Boyle, R.N., gentleman ushers. At eleven o'clock the Chester and Lancaster heralds relieved the other heralds; and Sir T. Noel Harris and Mr. Bainbridge relieved the gentlemen ushers. At 12 o'clock Colonel Wildman, K.H., one of his late Royal Highness's equerries, succeeded Sir W. Dillon as chief mourner. The Richmond and Windsor heralds resumed their stations, as did also the Hon. F. Byng and Captain C. Boyle, as gentleman ushers. At one o'clock Sir Archibald Macdonald, Bart., one of the equerries of the late Duke, sat as chief mourner in the room of Colonel Wildman, and the heralds and gentlemen

ushers were changed at the same time. Until the close of the ceremony the gentlemen in attendance relieved each other every hour, Colonel Wildman and Sir Archibald Macdonald officiating as chief mourners during the remainder of the day. Four o'clock having arrived, and the barriers extending to the gates of the palace being then filled with company, who had not obtained admission, the lord chamberlain allowed the ceremony to be prolonged; and so numerous was the assemblage, that although the outer barriers were closed, two hours were occupied in passing the visitors already within the barriers, it being six o'clock before the doors of the palace were closed. The greatest order and regularity were preserved within the approaches to the palace during the eight hours that the ceremony lasted.

Funeral of the Duke of Sussex.—The funeral of his Royal Highness took place on Thursday. As early as six o'clock the different roads leading to Kensington were thronged with persons anxious to obtain a sight of the solemn ceremony. All the shops were closed, and from many of the houses mourning flags and banners were displayed. From the Palace-gate to the extremity of the town a line of seats was erected, and the windows and house-tops were filled with spectators, the greater portion of whom were of the more respectable class, and attired in deep mourning. Shortly after seven o'clock, the carriages of the nobility and friends of the late Duke began to arrive at the Palace. At a few minutes before eight, the procession began to move from the Palace, headed by a detachment of the Horse Guards, and a military band playing the Dead March in *Saul*. Immediately afterwards followed 13 mourning-coaches, containing the personal attendants of his Royal Highness, the state-carriage containing the Coronet of his Royal Highness, and the hearse drawn by eight horses. After the hearse followed a mourning-carriage, in which was Sir Augustus d'Este; and then followed the private carriages of the nobility. After these came a mourning-coach, with six horses, in which was the Duke of Cambridge, as the chief mourner, attended by his two supporters, the Marquesses of Lansdowne and Breadalbane, followed by the carriages of the Queen, the Queen Dowager, the Duke of Cambridge, the Duchess of Gloucester, the Princess Sophia, the Duchess of Kent, the Princess Sophia Matilda of Gloucester, a mourning-coach, drawn by six horses, in which were the executors named in the will of his late Royal Highness, and private carriages, in which were the immediate personal friends of his Royal Highness, invited to attend the solemnity. The procession extended for nearly a mile in length, and the last of the carriages had left the Palace a few minutes after nine o'clock. The cortege having proceeded through the High-street, Kensington, to the old church, turned up Church-street and passed along Church-lane; each side of the road, all the way, being lined with a dense crowd of spectators. All, however, was most quiet and orderly, owing to the excellent arrangements of the police, who, being stationed all along the route, about three or four yards apart, maintained the most perfect discipline and order among the people. When the procession had reached the Swan, it turned into the Uxbridge-road. It then proceeded along the Queen's-road for some distance, and passed over the Great Western Railway, by the Bridge at Westbourne Green, near the mansion occupied by the late Lord Hill. It then entered the Harrow road, about a mile from its commencement at Paddington. At the turning into this road great crowds were assembled, and some difficulty was experienced in passing, by those who did not form an actual portion of the procession itself. At Kensal Green, as early as six o'clock, carriages began to arrive in rapid succession, and as soon as the gates leading to the cemetery were open, there was a rush made by those who had obtained tickets of admission from the directors of the company. From six o'clock to nine, at which time the gates were closed, there was a continual arrival of carriages. Shortly after nine o'clock a detachment of the First Regiment of Grenadier Guards, under the command of Colonel Stanhope, arrived, and acted as a guard of honour. The Lord Chamberlain; the Lord Steward; the Master of the Horse; the Bishop of Norwich; Garter King-at-Arms, and several officers of the Herald's College were in attendance, and gave the necessary directions as to the arrangements. The Cabinet Ministers arrived before 10 o'clock. The Duke of Wellington was the only member of the Cabinet who joined in the procession. The other Ministers met it at the chapel. All the Ministers and great Officers of State were attired in the Windsor uniform, with a black silk scarf, except Sir H. Hardinge, who wore a military dress. Amongst the first of the nobility who arrived were the Dukes of Bedford, Devonshire, and Sutherland, and the Earl of Arran, who supported the pall. The steps leading to the chapel were covered with black cloth. At half-past nine the chapel-bell began to toll, announcing that the procession had left the palace. His Royal Highness Prince Albert, accompanied by Prince George of Cambridge, the Marquis of Exeter, and other members of his Royal Highness's suite, arrived shortly before 10 o'clock. They were received at the entrance to the chapel by the officers of State and the guard of honour. The directors of the Cemetery Company conducted their Royal Highnesses into a waiting-room, which had been temporarily erected on the right wing of the chapel for the accommodation of the Royal family and their attendants. On the left wing was another temporary room, erected for the Cabinet Ministers and all those taking part in the ceremony. Exactly at half-past 10 the funeral procession entered the gates of the cemetery. Upon arrival at the chapel, the cavalry formed on either side of the portico. At the entrance to the chapel, the procession moved in the order arranged by the Lord

Chamberlain, the coffin being preceded by the personal attendants of his Royal Highness, the Heralds, the Bishop of Norwich, &c., and followed by Garter King-at-Arms, H.R.H. the Duke of Cambridge, as chief mourner, H.R.H. Prince Albert, H.R.H. Prince George of Cambridge, and the Hereditary Grand Duke of Mecklenburg Strelitz, all dressed in long black cloaks, with the Star of the Garter embroidered thereon. Their Royal Highnesses were followed by the Executors named in the will of the late Duke, the personal friends of his late Royal Highness, and the staff of the Artillery Company. On entering the chapel the body was placed on a platform, and the coronet and cushion laid upon the coffin. The Duke of Cambridge, as chief mourner, sat at the head of the corpse, the supporters standing on each side. Prince Albert and Prince George of Cambridge, with the Hereditary Grand Duke of Mecklenburg Strelitz, sat near the chief mourner. The Lord Chamberlain took his place at the feet of the corpse. The Dukes of Bedford, Sutherland, and Devonshire, and the Earl of Arran, as supporters of the pall, stood on each side of the body. The train-bearers stood behind the Princes of the Royal Family, and also the Executors of his Royal Highness. The Cabinet Ministers and other persons composing the procession were arranged on either side of the chapel, the Pages having filed off at the entrance. The part of the service before the interment being read, the corpse was deposited in the vault, and the Bishop of Norwich having concluded the burial service, Garter King-at-Arms pronounced the style of his late Royal Highness. The Bishop of Norwich read the funeral service in a most impressive and solemn manner; the responses were said by the Reverend Mr. Twigger, Chaplain of the cemetery. The Royal and distinguished personages present did not return to town in procession, but left the cemetery at different times, in their own carriages. The Duke of Cambridge left the cemetery in a private carriage immediately after the remains of his brother had been consigned to the tomb. The Chapel was exceedingly crowded, and a number of the directors were not able to obtain admission. The vault in which the remains of his late Royal Highness are deposited, until a suitable mausoleum can be erected, is situated about the middle of the catacombs, on the right of the chapel. It is a plain vault, containing two wooden tressels, on which the coffin of his Royal Highness has been deposited. Immediately on the conclusion of the ceremony, masons were employed to build a strong brick wall in front, closing in the remains of his late Royal Highness.

Parliamentary Movements.—The Sheffield papers mention that both the Members for that town are about to resign their seats. The failure of the Sheffield Bank, some months ago, is the cause of Mr. Parker's resignation; and Mr. Ward, it is said, feels the necessity of following the example of his colleague from considerations of a pecuniary nature. Colonel Thompson, and Mr. Bright, a Member of the Society of Friends, are spoken of as the new Members.—The nomination of candidates for the representation of Salisbury took place on Tuesday, when Mr. Ambrose Hussey was proposed on the Conservative interest, and the Hon. E. P. Bouverie on the Liberal interest. The show of hands was nearly equal, and a poll was demanded, the result of which was as follows:—Mr. Hussey, 262; Mr. Bouverie, 176. Mr. Bouverie resigned before the time fixed for the closing of the poll.

Official Appointments.—It is understood that Sir John Fitzgerald, at present residing at Toonah, in the county of Clare, has been appointed Governor of Bombay. At a special meeting of the Society for the Propagation of the Gospel on Friday, the 28th ult., the Rev. Ernest Hawkins was, on the recommendation of his Grace the Archbishop of Canterbury, elected secretary in the room of the Rev. A. M. Campbell, resigned.

Post-Office.—The following order has recently been issued by the Post-Office:—"General Post-Office, April, 1843.—Letters for China, the Australian settlements, New Zealand, the Mauritius, or other places beyond the territories of the East India Company, intended to be sent by the overland mails through India, must be addressed to the care of correspondents in that country, as it is understood that, under recent regulations, they will otherwise be detained at Bombay for payment of the transit and ship-letter postage due to the Indian Post-Office, for their conveyance to their destination. It is not necessary that letters for places within the territories of the East India Company, forwarded by the Indian mails, should be addressed to correspondents in India, provision being made for payment of the Indian postage above alluded to in those settlements."—A Parliamentary paper, published on Saturday morning, shows, that for the year ending January 5, 1843, the number of letters received inland was 209,611,508, and foreign and colonial 8,583,040. The gross amount of revenue of the United Kingdom, inland, during the same period, was 1,027,074l. 10s. 0½d.; and the expense of management, 913,061l. 14s.; showing a net revenue of 103,268l. 3s. 6½d.—after deducting 10,745l. 2s. 6d. for Parliamentary grants, &c., charged on the Post-Office revenue. The gross amount of revenue for foreign and colonial, and internal colonial, was 583,406l. 0s. 4½d.; the total expense of management, 696,445l. 19s. 4½d.; showing a deficiency of 113,039l. 19s.

Foreign.

FRANCE.—The bill for consolidating the new French colonies in Polynesia was discussed in the committees of the Chamber of Deputies on Saturday. From the proposed measure it appeared, that of the 5,800,000f. at which it estimates the outfit of the new settlements, 4,000,000f. are for the buildings and stores requisite for

the colonists, and 2,000,000*fr.* for the construction of steam-boats. The troops to be employed in those establishments are to consist of 1,185, of which 957 are to be composed of infantry and 228 of marine artillery. The bill was approved almost unanimously, for of nine commissioners, only one was opposed to it. At the same sitting, a bill was presented by the Minister of Finance, for enabling the French Government to pay the half-year's interest due on the portion of the Greek loan which it has guaranteed, in the event of the Greek Government not paying it. The sum required is 527,241 francs. The whole Chamber being aware of the condition of King Otho's treasury, the application was received with violent demonstrations of displeasure. One member wished to know whether the English Government were prepared to fulfil its share of the engagement?—but the Minister evaded the question. The *Moniteur* of Monday publishes the Postage Convention between France and England, signed April 3, 1843. The first chapter establishes towns of the two countries, from which letters for one another are to be despatched. The French towns are—Paris, Calais, Boulogne, Dieppe, Havre, Cherbourg, Granville, St. Malo, in the Channel. The English towns are—London, Dover, Brighton, Southampton, Jersey, and Guernsey. For the Mediterranean, the French post *bureau* of transmission are—Paris, Marseilles, the office at Alexandria, Smyrna, the Dardanelles, and Constantinople. The English are—Alexandria, Gibraltar, and Malta. The principal transmission of letters between the countries takes place between Dover and Calais six days a week; the French Government will send on the seventh day, weather permitting. By the eighth article, the post-boats will continue their services without interruption, even in time of war, until one of the Governments shall have signified its wish that the service should cease. In ports where regular Government steamers do not exist, private vessels and steamers may be employed to carry bags. For this purpose a post-box shall be put up on board the packet for the reception of letters. There is nothing new in the regulation of the Levant correspondence, which continues to be transmitted three times a month. Letters may be franked or not; and *lettres chargées*, or particularly recommended, may be sent in both countries. The English Post-office is to pay to the French two francs for every thirty grammes of letters not franked; and in the same case the French Post-office will pay the English a shilling an ounce. Letters from France to England, franked, will pay in France by the amount levied on French letters by the law of 1827. The letters from Paris, however, will pay but the tariff of Boulogne. Letters franked from England to France will pay fivepence per single letter, weighing half-an-ounce. (This, in addition to the tariff of Boulogne mentioned above, will make tenpence postage between England and Paris.) There are special charges for letters exchanged with St. Malo, Cherbourg, and Granville. Journals of either country are to be delivered at the port of the country to which they are addressed exempt from duty. Pamphlets may be sent by post from one country to another, paying in France as usual; in England, one penny for two ounces, and so on up to 16 ounces, which is the maximum allowed by the English Post-office.—The King's *fête* was celebrated with the usual rejoicings on Monday last, and the customary congratulatory addresses were delivered at the Tuileries, by the corps diplomatique, the Archbishop of Paris, the Presidents of the Chambers of Peers and Deputies, &c. Not the slightest disturbance took place.

SPAIN.—The accounts from Madrid are to the 30th ult. They state that no modification of the Ministry would take place until the Cortes was definitively constituted. M. Cortina was chosen President of the Chamber of Deputies on the 30th ult., by a majority of 36. It was reported at Madrid, that the Spanish Consuls at Bayonne and Perpignan had forwarded information to the Government that the Carlists were about to attempt another insurrection. This report, however, had not created any sensation. The papers publish the draught of the address prepared by the committee of the Senate, in reply to the Regent. It contains the following passage relative to the foreign relations of the country, to the late events at Barcelona, and to M. Guizot's somewhat hasty assertion that the Queen should only marry a Bourbon:—"It is a happy circumstance that our intercourse with foreign Governments has not undergone, in the period just elapsed, any notable change. The motives of disagreement which the occurrences at Barcelona have given rise to, as respects a friendly Cabinet, must, no doubt, have vanished; and your Highness must be assured that the incautious expressions which a statesman has used in a public assembly, on matters concerning us exclusively, will be attended with no consequence. The Senate hopes that dignity and independence, those precious requisites of every nation that esteems itself, will ever be respected in our external relations. The Spaniards who have fought for many thirty consecutive years, would, if need were, fight as many years more to secure them. It is for this purpose that your Highness is placed at the head of a magnanimous nation, invested with all its authority, and armed with all its force. Reason and justice are on our side, as well as public opinion, founded upon the common right of nations; for us, lastly, are the sympathies of nation to nation, sympathies which oppose the disturbance of harmony between two countries which no interest really national can incite to a rupture. It is, in short, not possible that your Highness should ever consent to any arrogating a right of settling our own affairs, whether important or not, according to their views—to any considering Spain as a fief and inheritance belonging to them—or to any, when our dearest interests are in question, venturing to hold a language of proud superiority, and much less to assume a

threatening tone." After alluding to the upright conduct of the magistracy, and insisting on the necessity of a reformation of the law, the address expresses a hope that financial documents may be prepared, and presented in time to admit of the budget being discussed this session. The address applauds the Regent for his active and effectual repression of the Barcelona insurrection, which "it was necessary to repress at all price," and concludes with a very forcible denunciation of the mode in which the Madrid press has been of late conducted, and points out the necessity of fixing the basis of representative Government. The debate on this address commenced on the 24th, and is not likely to be concluded for several days.

PORTUGAL.—We have Lisbon news to the 24th ult. There were strong indications of a disposition on all sides to bring the interrupted tariff negotiation to a satisfactory close. The British merchants in Lisbon engaged in the woollen trade were disposed to cede some portion of their just claims, and in the highest quarters the belief gained ground that this long-disputed question would be brought to a speedy settlement. Monsignor Capaccini had communicated to the Government the Papal confirmation of the Royal nomination of the Patriarch of Lisbon, Archbishop of Braga and Bishop of Leiria, together with the concession of the pallium to the two prelates first named. This decision had been formed in secret consistory at Rome, on 3d April. The processes of the remaining prelates had not then reached Rome. The reconciliation between the two churches was now complete, and there would be no difficulty in arranging the remaining terms of the Concordat. The complete endowment for the payment of the dividends on the foreign debt had been carried in the Deputies. A magnificent edifice, the ancient College of Nobles, now the Polytechnic School of Lisbon, had been burnt to the ground. The conflagration was most extensive, but all the adjoining houses had fortunately been saved. Three lives were reported to have been lost, and seven persons wounded. The news of the interruption of the tariff negotiations had produced regret and dismay at Oporto, and disturbances were apprehended.

ITALY.—The Milan papers of the 27th ult. announce that on the preceding afternoon, as the Archduke Viceroy of Italy was returning on foot after taking his usual promenade, accompanied by a single Chamberlain, he was accosted by an individual, who presented a petition to his Highness with one hand, whilst with the other he struck the Viceroy in the right side with an iron instrument, which, being blunt, produced merely a bruise. The maniac, as he afterwards proved to be, was instantly arrested and conveyed to the police-office amidst the hooting of an immense crowd, who loudly expressed their indignation at the attempt. On examination, the prisoner proved to be a porter, named Giovanni Sinelli, who had several times attempted to murder a person of rank whom he imagined to be his debtor for a large sum, and had been confined at various periods in the Lunatic Asylum.—From Rome we learn that the sale of Cardinal Pesch's celebrated gallery of pictures commenced on the 17th ult. The pictures put up for sale were of inferior value; they belonged to the French, Italian, and Flemish schools, and were most of them copies. Six hundred were sold. The best pictures will follow.

TURKEY.—We have accounts from Constantinople to the 12th ult. The Servian question was on that day decided in a Council of Ministers held in the presence of the Russian Ambassador. The following are the resolutions adopted:—"1st, Georgewitsch shall voluntarily abdicate; in the event of his refusing to do so, he shall be declared to have forfeited the Governorship of Servia. 2ndly, A new election of a Sovereign shall be proceeded with. 3rdly, Kiamil Pacha, Wutsitch, and Petroniewich, shall quit the Servian territory." These three resolutions are almost a *verbatim* repetition of the terms of the ultimatum of the Russia Cabinet, which, seconded in its views by that of Vienna, has thus obtained a conspicuous victory over the obstinacy of the Turks, and over all such as had striven to frustrate its designs. Under these circumstances, it is scarcely doubted that the new Sovereign about to be elected will be Prince Milosch, the father of Prince Michael, who is patronised by the Emperor Nicholas. Nadir Achmet Bey, who pretends to be a son of Mustapha IV., who was strangled in the seraglio in 1808, has been seized at Adana by the command of Izzet Pacha, and conducted to Koniah, whence he will arrive at Constantinople in a few days. This pretender to the Ottoman throne secretly left Constantinople in 1839, and proceeded to Malta, whence he departed to visit Europe. He had but recently returned. Nadir Bey had entered the service of the Pasha of Egypt, and is so thoroughly acquainted with the languages and customs of modern Europe, that it is generally supposed he is a Polish renegade. Private letters add that, with all his pretence, he is so insignificant that the Ottoman Porte cannot intend disposing of him by violent means.

EGYPT.—By advices from Alexandria we find that the Pasha of Egypt has acknowledged the receipt of a gold medal voted to him in London for his keeping open the Indian route during the perplexing year 1840, and for the protection which he has afforded to Englishmen. Boghos Bey, who writes the letter of acknowledgment, says:—"His highness could not fail to be extremely sensible of this expression of sentiments which show that, in the heart of the English nation, the constant aim of his efforts is not misunderstood, and that they appreciate the difficulties which he has surmounted to give a new development to those commercial transactions of which Egypt is the object, to extend the channels of European trade, and to restore to it the important route of the Red Sea, which a long time of barbarism has closed."—The Prussian scientific expedition, under the direction of Dr. Lep-

sus, has left the pyramids of Gizeh and Sacchara, where they made a stay of nearly three months, and has proceeded to Fayum, to commence its researches there. We may entertain a certain hope that this expedition will at last enlighten the world upon the Lake Moeris, and upon the labyrinth which has been so often sought for in vain.

INDIA AND CHINA.—The following intelligence in anticipation of the Indian Mail reached town on Thursday. "Malta, April 29. The Liverpool has just arrived with the Indian Mail, which left Bombay on the 1st of April. On hearing of the last successes of the British army in Scinde, the Governor-General declared that State annexed to the territory of the English empire, and appointed General Sir Charles Napier Governor of that new province. Slavery is to be abolished in Scinde, and the navigation of the Indus is to be opened to all nations. Considerable treasures, estimated at above 1,000,000*l.* sterling, had been found at Hyderabad. Agitation continued to prevail only in the Bundelkund and on the frontiers of Scinde. The news from China comes down to the 22d February. It is of a favourable nature, although containing no important fact."

Parliament.

HOUSE OF LORDS.

Monday.—Lord WHARNCLIFFE moved the second reading of the Registration of Voters Bill.—Lord BROUGHAM admitted the improvements which would be effected by it; but contended that the principle of annual registration was accompanied with all the evils, without the benefits, of annual election, a point upon which he commented at some length.—Lord DENHAM acknowledged the great value of the bill as an improvement of the law; but commented on the clauses directed against personation, which he considered to be objectionable in their provisions, and calculated to interfere with the freedom of election.—The Lord CHANCELLOR recommended that the discussion of the details of the bill should be deferred until it was in committee.—The bill was then read a second time.

Tuesday.—After the presentation of a petition by the Duke of Argyll, praying for a settlement of the differences of the Scotch Church, the Marquess of Breadalbane declared his conviction of the inadvisable mischief which would ensue, if some measure were not passed to settle the question. Eighty per cent. of the population would secede from the Church along with their ministers.—Lord BROUGHAM strongly insisted on the superiority of the law over the assumptions of the Scotch Church; and the Earl of ABERDEEN said that the Government had offered all that could be conceded, and that there was no intention of introducing any measure on the subject.

The second reading of the Townshend Peerage Bill raised a discussion on the peculiar nature of the case, and the remedy proposed. Lord COTTENHAM opposed the bill, as contrary to precedent, and without necessity, a legal remedy being open to the parties.—Lords BROUGHAM, DENHAM, and CAMPBELL, supported the bill, as a remedy for a wrong which could not be otherwise rectified, and the Earls of DEVON and WICKLOW opposed it, as being at once unprecedented and extreme.—The Lord CHANCELLOR supported the second reading. The case was a singular and extreme one, and if the facts were true, constituted a scandalous wrong, not only against individuals, but the peerage, and the privileges of the House of Lords, for which no adequate remedy was afforded in the courts below.—Lord COTTENHAM declined to press his opposition; the bill was read a second time; and counsel were called in, and an arrangement made for hearing evidence.

Wednesday.—The House was occupied for a great portion of the day in hearing evidence in the Townshend peerage case.—Lord BROUGHAM presented a bill for the amendment of the law relating to the appellant jurisdiction of the judicial committee of the Privy Council.—The Exchequer Bills bill was read a second time.

Friday.—The Registration of Voters Bill went through committee, and the Exchequer Bills Bill was committed.—Lord BEAUMONT brought the subject of Servia before the House, entering at considerable length into the question, and strongly condemning the conduct of Russia. The Earl of ABERDEEN opposed the motion, and Lord BEAUMONT withdrew it.

HOUSE OF COMMONS.

Monday.—Fully two hours were occupied in the presentation of petitions against the education clauses of the Factory Bill. Some few were also presented in favour of the Bill.—Lord STANLEY announced that on Monday week he will move a resolution with the view of introducing the Canadian Corn Bill.

Sir JAMES GRAHAM moved that the House should go into committee *pro forma* on the Factories Bill, in order that he might state the nature of the alterations proposed by the Government. He admitted the great degree of excitement which prevailed in the country on the subject, as evinced by the large number of petitions which had been presented against the bill; and pointed out what he considered to have been the checks in the bill, as it was originally proposed, against any perversion of the system of education to exclusive or bigoted purposes, one of which is the necessity of a local subscription being raised equal to one-third of the expense of building, with the accompanying appropriation involved. He then proceeded to state the changes which he proposed to make in the bill. The first would be the allowance of a liberty to the parents in the selection of Sunday Schools. Another would relate to the hours of attendance at the Statute School, for the purpose of instruction in the Catechism and Liturgy of the Church, which hours he proposed to arrange for the convenience of those who might desire to have their children exempted from that attendance. The parent would also be relieved from the perhaps onerous obligation which the bill in its present shape imposed upon him, of declaring that he had a ground of religious objection; and besides the Sunday, a time would be allowed on each week-day for the attendance of the children not belonging to the Church upon the instruction of the licensed minister or other authorized teacher whom their parents might wish them to attend. A provision would likewise be made for the Roman Catholics, who object to the reading of the Scriptures in their entire form. With respect to the trustees he would propose that instead of leaving the second churchwarden to be nominated by the clerical trustee, the bill should give a right of election to those persons who should have been donors or subscribers of a certain amount to the school. The remaining four trustees he proposed to constitute through the election of ratepayers assessed at 1*l.*; but in order to prevent the minority from being unrepresented, he would propose that no ratepayer should be allowed to vote for more than two of these four trustees. The appointment of the head-master of the school, he would leave with the Bishop, but all the assistants should be appointed by the trustees. He would give to any one trustee a power of appealing to the Committee of Privy Council against the acts of his colleagues, and he would suggest some enlargements in the powers of the Privy Council. The alterations which he had thus propounded were in strict consistence with the principle of the bill as he had originally opened it, as well as with the respect which was due to the conscientious feeling of the Dissenters. If this important measure, brought forward by a Government, and treated with singular forbearance by their opponents, should, with all these advantages, fail to obtain the public approval, he feared that the chance of concord and conciliation would be gone by, and that a spirit of antagonism and bitterness would long prevail throughout

this country. He deprecated such a controversy, and referred to the great Christian text, "that ye love one another;" but he feared that the scorners might in these days point to some professing Christians and say, "See how these men hate one another!" This bill was the olive-branch which he had to tender, and he trusted that the waters of strife would now be found subsiding.

Lord John Russell concurred in the hope that this bill would be discussed with calmness. Meanwhile he begged it might be remembered that when general education was first attempted in this country through the agency of Mr. Lancaster, the Protestant Dissenters were the foremost to aid it, both with their exertions and with their contributions. And yet he understood that one section of the Church was at this day treating those Dissenters with suspicion and obloquy; and under that sort of reproach it could not be matter of surprise if the education clauses in this bill were received with some alarm. He considered the alterations now proposed as being a more efficacious fulfilment of the original design of the Government rather than as any departure from that design; but for the present he must observe upon them, that the necessity of having the schoolmaster a member of the Church would, as to all the masters, amount to a test and a disqualification and that the principle of election just announced would still leave the Dissenting trustees in a minority at the Board, even though, as was the case in some of the manufacturing districts, their constituents might be a large majority of the rate-payers. He would, however, consider this bill with a hope of effectually accomplishing its objects, which were matter of much more importance to the poor of this country than to any political party.—Sir R. H. Inglis abstained from pronouncing any opinion at the present stage of the proceedings.—Dr. Bowring declared that the objections of the Dissenters would not be removed by the concessions already announced. Nothing short of the Government's providing secular instruction, and leaving religion to the people themselves, would satisfy them.—Mr. Ewart, Mr. Hawes, Mr. M. Gibson, and Mr. Hindley, expressed themselves still unsatisfied, and Mr. G. Knight, Mr. Borthwick, and Lord Duncannon prayed for a calm consideration of the proposals of Government.—The bill was read *pro forma*, and ordered to be printed; the further consideration to be taken on the 22d inst.

The House went into a committee of supply, and the vote for the expenses of the late special commission, which had been postponed until the return was made, was taken.—The House having again resolved itself into a committee of the whole House, a resolution was passed, on the motion of the CHANCELLOR of the EXCHEQUER, giving the Government power to advance from the Consolidated Fund such sums as might be necessary to defray the salaries and allowances of the Queen's Bench officers, in the event of the fees becoming deficient for that purpose.

Tuesday.—Mr. Hume brought on his motion for a vote of thanks to Lord Ashburton, for his management of the negotiations which ended in the conclusion of the treaty of Washington. He went over the history of the negotiations between Lord Ashburton and Mr. Webster, and the nature of those mutual boundary arrangements which have been already so amply and frequently discussed, contending that the treaty was conducive to the interests of the two nations, and honourable to the negotiator.—Dr. Bowring seconded the motion, remarking on the violence and injustice with which the treaty had been assailed, and arguing that Lord Ashburton had served the interests of this country.—Sir C. Napier moved, as an amendment, that the House do now adjourn.—Captain Berkeley seconded the amendment, disclaiming any wish to cast censure on Lord Ashburton, but not considering him entitled to thanks.—Mr. Escombe taunted the gallant officers with evading the question, instead of holding meeting the motion with a direct negative.—Mr. E. Buller, Mr. Vernon Smith, and Sir John Hanmer, opposed the motion, and Sir H. Douglas and Mr. Charles Buller supported it.

Lord Stanley said that the Government would not, in the ordinary course of business, have departed from precedent, in proposing the thanks of the House to a negotiator, however successful; but the ungenerous attack of Lord Palmerston was the moving cause of securing to Lord Ashburton the unprecedented honour of such a vote. Mr. Macaulay had contended that Lord Ashburton had cast a stain on British diplomacy; yet to-night it was admitted that the treaty was not so bad a one after all, and the only objection taken was to the unprecedent nature of the motion. There never had been a treaty concluded in the face of greater difficulties, or which had more effectually removed the chances of a disastrous war between two countries, every blow of which would recoil on both. In a few months Lord Ashburton had concluded the settlement of a dispute which Lord Palmerston for several years had successfully protracted; even the Madawaska settlement, about which so much was now said, was one of the objects which the noble Lord, when in office, had vainly offered, in order to induce the United States to accept the award of the King of the Netherlands. Lord Ashburton had entered on his task after the question had been embroiled by the management of Lord Palmerston, and after separate states were committing themselves on the subject by strong resolutions to support the claims of Maine and Massachusetts, and in six months he brought it to a conclusion. Nor had the noble Lord or the Government compromised the question of the right of search, though Lord Aberdeen did not imitate the supercilious style of Lord Palmerston, in addressing a people at once strong and sensitive, and on a subject of peculiar delicacy. The United States did not recognize the right of search, but they agreed that it might be exercised under certain conditions of remedy for injury. The very convention on this subject in the Ashburton Treaty was similar to a proposition made by Lord Palmerston in 1839, yet he now turned round, and said it was a step in the wrong direction! The case of *McLeod*, which the present Government, on entering office, had found to be so imminent and dangerous, had been successfully settled, and its recurrence provided against. Lord Ashburton had, in fact, obtained a better military boundary than under the award of the King of the Netherlands, he had procured the enactment of a law which would prevent the recurrence of irritating questions, and he made no concession dishonourable or disadvantageous to the country. He trusted, therefore, that the House would mark its sense of his high merits, and of the party attack which had been made on him, by supporting the motion of Mr. Hume.

Lord John Russell was surprised that the Government never thought of coming to the rescue of Lord Ashburton's reputation and honour, until a gentleman came to their aid, who was so little disposed to uphold the honour of this country that he was the correspondent of one of the chief rebels in the Canadian insurrection. The objections adduced by Mr. Hume for his motion were not very apposite; and it would appear as if the speeches of Lord Palmerston and Mr. Macaulay, on the former discussion of this subject, had produced so powerful an effect that they could only be met by resolutions passed without precedent by both Houses of Parliament. The right of search, asserted by this country and denied by America, had not been settled by the Ashburton Treaty—the very convention on the subject of repressing the slave-trade, which that treaty contained, had already been the cause of producing an excitement in France, which it required all the prudence of M. Guizot to allay. Without going into all the complicated details of the boundary question, he declared his conviction that the tone adopted in the negotiations was not only calculated to lower us in the estimation of the world, but had actually done so, and had produced the impression that our claims had only to be resisted in order to compel concessions. An ultimatum had been proposed and abandoned by Lord Ashburton, who had claimed the Madawaska settlement, and had required it, as well as the definite proposition of a river boundary, at the bidding of Mr. Webster, in a manner not calculated to sustain the honour of this country. Lord Ashburton was not unlike Moses in the "Vicar of Wakefield," whose successful bargain ended in a case of shagreen spectacles. One of the first results in America of the treaty of Washington was the passing of a bill to seize the Oregon territory—a plain effect of

the want of upholding the dignity of Britain. He was not disposed to censure with severity the expression of Lord Ashburton in terming Boston the "cradle of American liberty." He rather rejoiced that the Americans appreciated the noble struggles of their forefathers; but while he wished to see the bonds strengthened between the two countries, he did not think the treaty had done so.

Sir R. Peel censured the conduct of Lord Palmerston and Russell, and their friends, in endeavouring to ruin the character of Lord Ashburton, who, actuated by the purest motives, had undertaken this difficult negotiation. Mr. Hume's support had not always been so indifferent to the late Government. Was it creditable to public men to pursue the course which had been followed by the noble Lords? The Government was taunted with violating precedent by adopting the motion; but when Mr. Canning's policy with respect to Spain was questioned, he refused, contrary to his original intention, to permit the motion to be withdrawn without a definite expression of the opinion of the House. The question was not, on the present occasion, about the giving up of a Madawaska settlement, or of a particular boundary; it was one involving peace and war, on an irritating dispute which in spite of negotiation had lasted for half a century. As to the right of search, Lord Palmerston had authorized the capture of American vessels, which had produced so much excitement in the United States, and had rendered the question a difficult one; and the convention in the treaty secured for five years the co-operation of a joint squadron on the coast of Africa for the suppression of the slave trade. He believed that the Oregon dispute would be settled ere long, as well as that of the right of search; and, notwithstanding the efforts of individuals to excite animosities, he was satisfied that the treaty of Washington would lead to relations of amity and good-will between the two countries. He called on the House, therefore, viewing the difficulties which Lord Ashburton had successfully overcome, to depart from ordinary precedent in passing the vote of thanks to the noble Lord.

Lord Palmerston remarked that the present Government were rather partial to following the example of the late one, but in doing so they frequently did not see the principle on which they had proceeded, and therefore imitated them wrongly. The late Government had proposed a conventional line for the settlement of the disputed boundary, and it would have been well if it had been adopted as the basis of the treaty. He disclaimed all intention of insulting the American flag by using the phrase "a bit of bunting," which had reference not to the flag of the Union, but to piratical and fraudulent attempts to sail under it; and he explained the circumstances under which suspected American vessels had been captured on the coast of Africa by our cruisers. The convention in the treaty of Washington, for joint co-operation between the squadrons of the two countries, would not prove effectual for checking the slave trade. The Government had not stood up very manfully for their negotiator, in leaving him to the attentions of Mr. Hume; the principle on which he had proceeded, of concession for the sake of peace, had been repudiated by so great a lover of peace as Mr. Fox. Even admitting that the treaty of Washington was advantageous to the country, it remained to be shown that the merit was due to the negotiator, and there was no precedent for a vote of thanks to a diplomatist, which would lower the character of the House, by dragging a majority through the dirt, in approbation of an unwise and disadvantageous treaty.

Mr. Hume said a few words in reply. He did not think that any proceedings of his would have so stirred up the noble lords; and the spirit now evinced convinced him that, had they been in office, we should have been embroiled with America. On a division, the motion was carried by 238 against 96.

Wednesday.—After the presentation of a great number of petitions against the educational clauses in the Factories Bill, Mr. Colquhoun gave notice that it was his intention to move an amendment on the resolutions of Lord John Russell when they were submitted to the House.—Mr. Jarvis gave notice of motion for a select committee to inquire into the operation of the New Bankruptcy Act; and also, that he would move for leave to bring in a bill for the more easy recovery of small debts.—Sir James Graham, in reply to Mr. Smith O'Brien, who inquired whether the Government would enforce the production of papers relative to the working of the Poor-law in Ireland, stated that he had no power to enforce the production of those papers. The Poor-law commissioners were making every effort for their production, but the returns were most voluminous, and had not been yet completed.

Sir R. Peel, in reply to a question of Mr. P. Borthwick, relative to the detention of Don Carlos in France, repeated what he had stated three weeks ago, that the British Government, while it had no wish that Don Carlos should be subject to restraint, yet could not, considering what had passed relative to that Prince, consent to his unconditional liberation. Both the British and French Governments were, he thought, justified in this course, though he was quite sure that if an efficient guarantee for the future could be given, there could be no objection on the part of the latter to release Don Carlos.

Mr. Elphinstone moved, and Mr. Ewart seconded the second reading of the Marriages and Divorce Bill, which was opposed by Dr. Nicholl. On a division there appeared—For the second reading, 41; Against it, 105; Majority against the bill, 64.

Friday.—Mr. J. Fox deferred his motion on the Repeal agitation until Mr. O'Connell should be present.—The House went into committee, and Sir R. Peel brought forward his resolution for the Endowment of additional ministers in populous places; and proceeded to show, from authentic reports, the lamentable deficiency of church accommodation and pastoral care, under which many populous districts suffered, and then explained the remedy he proposed. He did not intend to ask for any parliamentary grant, but he asked to apply the funds derived from the ecclesiastical revenues to the removal of this destitution. The plan he proposed was to enable the commissioners of Queen Anne's Bounty to advance to the Ecclesiastical Commissioners 600,000*l.* on the security of the future revenues, which the Ecclesiastical Commissioners are certain to derive from reduced canonries, suppressed rectories, and appropriated estates of Deans and Canons, to be employed in the endowment chiefly of new livings. He proposed to apply this 600,000*l.* in annual payments of 30,000*l.* to the purpose of new endowments. At this rate the capital stock would be exhausted in seventeen years, and, consequently, in the year 1860, the whole of this sum would be applied to the endowment of new livings in populous manufacturing districts. He believed that this sum, added to what would be raised by voluntary subscriptions, would suffice for the purpose, and would do more to promote the real welfare of the Church than if he had asked for a large grant of public money. After a long discussion the resolution was agreed to, and leave given to bring in a bill founded on it.—The Irish Poor-law Amendment Bill was then read a second time.

CITY.

Money Market, Friday.—Consols left off at 96½ to 7 for money, and 96½ for account; Three per Cent. Reduced Stock, 95½ to 6; Three-and-half per Cent. Reduced, 101½ to 7; Bank Stock, 180 to 1; India Bonds, 74s. to 76s. prem.; Exchequer Bills, 65s. to 67s. prem.

Metropolis and its Vicinity.

Church Missionary Society.—The annual meeting of this society was held at Exeter Hall, on Tuesday, the Earl of Chichester in the chair, supported by the Bishops of Winchester, Chester, and Norwich, the Dean of Salisbury, and other dignitaries of the Church; Lord Sandon, M.P.,

and a large number of gentlemen. The 43d annual report stated that the committee entered on their duties at the beginning of the year shackled by a heavy debt. It became their pleasing task to announce that the society had now been all but relieved from financial embarrassment. The annual income had exceeded 115,000*l.*—a sum unprecedented in the history of any religious society in this or any other country. The Bishops of Barbadoes and of Guiana had become vice-presidents, and the King of Prussia a member of the society; His Majesty had contributed the sum of 100*l.* as a donation, and had become an annual subscriber of 25*l.* The missionary institution at Islington, under the superintendence of the Rev. C. F. Child, was progressing prosperously. The students were evidently still more attached than ever to the constitution and formularies of the Church. In New Zealand, the number of converts to Christianity had increased from 2,000 to 35,000, and the Bishop had rendered a highly satisfactory account of the extension of religion in that distant colony. In Eastern and Western Africa, Greece, India, and elsewhere, the missions were increasing. The call for missionary clergymen was more earnest than ever, and in a short time the society would turn its attention to China, towards a mission in which country an individual, who wished to be unknown, had presented the munificent sum of 6,000*l.* On the motion of the Bishop of Winchester, the report was adopted.

Wesleyan Missionary Society.—One of the largest meetings ever witnessed in Exeter Hall was held there on Monday, on the occasion of the annual meeting of this society. The Right Hon. Sir George Rose was to have presided, but a domestic affliction prevented his attendance; the chair was, therefore, taken by Mr. Plumptre, M.P., who was supported by numerous ministers of different denominations. The chairman having briefly addressed the meeting, the Rev. W. Beecham read the report, which was very voluminous; it spoke of the success of the society's missions in India, Ceylon, Wirtemberg, France, Gibraltar, Australia, Van Diemen's Land, New Zealand, Feejee, Western Africa, British North America, Canada, and Hudson's Bay. The effect produced by the distribution of the New Testament in the native language was one of the most interesting features of the efforts of the society in New Zealand. At Cloudy Bay, in the middle island, where 400 copies had been distributed, there were no less than 700 eager competitors, and nothing could surpass the expression of gratitude of the successful applicants to the British and Foreign Bible Society for its munificent grant. With respect to Hokianga, in the northern island, it was observed in reference to the Catholic priests that their people were daily leaving them, and many of them were beginning to attend the missionary services; scarcely a day passed without bringing to the missionary station a company of five or six Catholic converts, who went for the express purpose of conversing with the clergyman on religious subjects, "and begging books." The committee acknowledged another liberal grant of 5,000 copies of the New Zealand Testament from the British and Foreign Bible Society in addition to the 10,000 copies formerly voted (cheers); but even that number would fall far short of meeting the large demand made by the natives within the range of the society's missions. In the Friendly Islands, the missions were generally in a languishing state, resulting chiefly from that rigid economy which the straitened circumstances of the society's funds compelled the committee to practise. At Malta and in southern Africa the success had not been so great; whilst in the West Indies great loss had accrued to the society from recent earthquakes. Cape Haytien was entirely destroyed by an earthquake, May 7, 1842, and many thousand pounds would not repair the damage done to the chapels and mission buildings in Antigua, Dominica, Montserrat, Nevis, and St. Eustatius. The income of the society during the year, containing some princely donations, amounted to 98,253*l.* 12s. 9d., and the expenditure to 100,663*l.* 13s. 9d., being an increase over the receipts of 2,410*l.* 1s. 1d. There was, however, a surplus in 1841, of 2,933*l.* 14s. 7d., which left the sum of 523*l.* 13s. 6d. wherewith to commence the missionary labours of 1843. The debt of 30,000*l.* contracted in 1838, 1839, and 1840, was now nearly liquidated, only 6,653*l.* 2s. 1d. remaining to be paid. The Rev. Dr. Hannah moved the adoption of the report, which being seconded by Mr. Campbell, M.P., and supported by a Chippewa Indian, named Pah-ta-se-gay, who had been converted and christened Peter Jacobs, was carried unanimously. Eight other resolutions, in the course of which twenty speakers addressed the meeting, were agreed to.

King's College.—The annual general meeting of the governors and proprietors of this institution was held on Friday in the theatre of the college. His Grace the Archbishop of Canterbury in the chair, supported by the Bishops of London and Winchester, Lord Radstock, Lord Howe, Lord Dartmouth, Sir R. H. Inglis, Bart., and other gentlemen. The report stated that the number of matriculated students last term in all classes was 258, and of occasional students 113, in addition to 497 boys in the school. The students still maintained a high position for classical and literary attainments. At Oxford, of two undergraduates admitted into the first classical class at the last examination for degrees, one had been educated at this college, and two others obtained prizes in the second class. At Cambridge, at the last Bachelor of Arts' commencement, six former students of King's College were classed amongst the wranglers, and four amongst the senior optimes, whilst two were in the first and one in the second class of the classical tripos. The museum attached to the college was now completed, by the addition of a valuable set of instruments from the observatory at Kew, a gift of her Majesty; it likewise contained a

marble statue of George III., by Turnerelli, a present from H. Pownall, Esq. The hospital had relieved 12,248 patients, exclusive of mere casualties, during the past year. The report acknowledged the receipt of the bequest of the late Dean of Westminster of 1,000*l.* The receipts during the year were 20,369*l.* 7*s.* 3*d.*, and the disbursements 19,466*l.* 19*s.* 3*d.*, leaving a balance with the bankers of 902*l.* 8*s.*; and there remained in the Bank of England 4,000*l.* in Exchequer-bills. The total cost of the building, with its fittings and furniture, had been 133,346*l.* 0*s.* 7*d.* The report was adopted, and the officers for the ensuing year were re-elected.

University College.—The annual distribution of prizes and honours in the medical faculty of this College took place on Saturday, in the Botanical Lecture-room of the institution. The theatre was crowded with a fashionable and attentive audience. The Earl of Auckland presided, and was greeted, as were the several Professors, with loud applause. The business of the day was commenced by the Dean of Faculty reading a report on the Medical Department of the College. It stated that the Medical classes continued to maintain, with reference to other schools, their relative proportion of students, the number during the past session being 304, of whom 91 were new students. The business of the session had gone on in all respects satisfactorily; and of the rewards conferred by the University of London during the year, which consisted of two certificates of special proficiency, three scholarships, four exhibitions, fourteen gold medals, and one book prize, the students of the University College had carried off one certificate of special proficiency, two scholarships, one exhibition, and seven gold medals. Valuable and extensive additions had been made to the Medical Museum of the institution. A nomination to an assistant-surgeoncy in the East India Company's service had, through the kindness of Mr. Martin Smith, been placed at the disposal of the council for competition, and it had been determined that the examination for it should take place in the first week of July next year. The report also referred to the high standing in India of several of the old students of the College, particularly mentioning Mr. W. Griffith, and Dr. Mouatt. The prizes were then distributed as follows:—*Winter Term, 1842-43.*—Chemistry (Professor Graham).—Gold medal, Mr. John Newton, of London; first silver medal, Mr. W. B. Randall, of Southampton; second silver medal, equal, Mr. C. E. Goodman, of Northampton; Mr. T. F. Grimsdale, of Uxbridge; silver medal (essay), Mr. Charles Prentice, of Kingston-on-Thames.—Medicine (Professor Williams).—Gold medal, Mr. H. Fearnside, of Otley, near Leeds; first silver medal, Mr. J. Hakes, of London; second silver medal, Mr. F. J. Brown, of Rochester.—Anatomy and Physiology (Professor Sharpey, M.D.).—Gold medal, Mr. Robert D. Harling, of Chester; first silver medal, Mr. B. M. Eyre, of London; second silver medal, Mr. N. Brangwin, of Henley-on-Thames.—Comparative Anatomy (Professor Grant, M.D.).—Gold medal, Mr. F. W. Marshall, of Norwich.—Anatomy (Professor Quain).—Senior class, silver medals, equal, Mr. F. J. Brown, and Mr. N. Brangwin; third silver medal, H. Ververs, of Dormington; junior class, silver medal, Mr. W. Cadge, of Norfolk.—Materia Medica (Professor Thomson, M.D.).—Gold medal, Mr. Henry Sutherin, of London; first silver medal, Mr. Henry Ward, of Northampton; second silver medal, Mr. W. H. Colborne, of Chippingham, Wilts.—Midwifery (Professor Murphy, M.D.).—Gold medal, Mr. Thomas S. Lee, of Cambridge; first silver medal, Mr. Alfred J. Tapson, of London; second silver medal, Mr. Henry James Stokes, of London.—Surgery (Professor Cooper).—Gold medal, Mr. G. Y. Heath, of Westoe, Durham; first silver medal, Mr. Henry James Stokes; second silver medal, Mr. Thomas S. Lee.—*Summer Term, 1842.*—Pathological Anatomy (Professor Walshe, M.D.).—Gold medal, Mr. P. H. Williams, of Wem.—Botany, senior class (Professor Lindley, Ph.D.).—Gold medal, Mr. A. Jackson, of Portsmouth; silver medal, Mr. W. Brown, of Cornwall.—Medical Jurisprudence (Professor Thomson, M.D.).—Prize, Mr. Charles J. Tomkins, of Abingdon, Berks.—Zoology (Professor Grant, M.D.).—Silver medal, Mr. Edward Ballard, of London.—*Fellowes Clinical Medals.*—*Summer Term, 1842.*—Gold, Mr. A. J. Tapson; silver, Mr. T. S. Lee.—*Winter Term, 1843.*—Gold, Mr. Richard Tudor, of London. At the conclusion of the distribution, Lord Auckland addressed the meeting at great length, congratulating the proprietors on the increasing efficiency of the College, and on its high character as a Medical School.

Dulwich College.—On Monday, according to the statutes of Mr. Edward Alleyn, founder of the College of God's Gift, Dulwich, the churchwardens of the parishes of St. Saviour's, St. Botolph, Bishopsgate, and St. Luke's, with the master and four fellows of the college, in whom is vested the election of the warden, assembled at the college for the purpose of filling up the vacancy occasioned by the elevation of the late warden (a son of the bishop of Ely) to the mastership. At the close of the ballot the two gentlemen selected as candidates were Mr. Charles Allen, of Brazenose-college, Oxford, and Mr. J. G. Newton Alleyn, of Dover-street, who had come over from Dresden for the purpose of offering himself. As soon as this announcement was made, the candidates drew lots, in accordance with the accustomed formalities of the institution, when Mr. Newton Alleyn having been the successful competitor, he was declared to be duly elected warden of the college.

City Antiquities.—At the last Court of Common Council, Mr. Eagleton, chairman of the City Lands Committee, recommended that a portion of the Roman wall on Tower Hill should be given up to the Church Extension Society for the building of a new church there, which society had, through Sir R. Inglis and other gentlemen, petitioned

on the subject. Mr. R. Taylor deprecated the idea of demolishing that venerable vestige of ancient London. While other cities preserved with care their interesting remains of antiquity, the Corporation of London seemed bent upon accomplishing their destruction. The wall in question was not only valuable in a historical point of view, as illustrative of the occupation of London by the Romans, but as an ancient and authentic boundary-mark of the city. In both points of view he called for its preservation. He was aware there were parties capable of ridiculing these matters, and it excited his regret that they had not the taste and intelligence to appreciate such memorials. He therefore moved that the report be sent back for reconsideration. Mr. Lott seconded the motion of Mr. Taylor, and would say but little after the speech of that gentleman. Mr. R. L. Jones, Mr. Auderton, and other gentlemen, supported the motion for pulling down the wall, while Mr. Selson opposed it, on the ground that there were no less than eight churches in the neighbourhood, none of which filled. The report was finally adopted. It is generally supposed that it would have been better to have pulled down some of the old houses in the densely-populated neighbourhood, than to destroy a relic so interesting to antiquaries, and to all who are interested in the history of London.

City Chamberlain.—In consequence of the resignation of Sir James Shaw, an active canvass has commenced for the office of Chamberlain of the city of London. The candidates are Sir W. Heygate, Bart., and Sir John Pirie, Bart. The contest is expected to be a severe one, and the friends of both candidates are making great exertions to promote their success.

Anti-Corn-Law League.—The seventh weekly meeting of the League took place on Wednesday night in Drury-lane Theatre. The house was crowded in every part; long before the appointed hour not a spare seat could be obtained, and upwards of three thousand applications for tickets were refused, the whole of the admission cards being exhausted by three o'clock on Monday. The Chairman announced that it was the last time the League would meet in that Theatre, and that as they had once erected a hall in Manchester capable of containing 10,000 persons, in eight weeks, they could also erect one in London if required. The meeting was subsequently addressed by the Rev. Dr. Cox, Mr. Cobden, Mr. Lattimore, and Mr. Moore. The Chairman then announced that the next meeting would be held in the Victoria Theatre, and that next week another meeting would be held in the Hall of Commerce in the city.

Accidents.—Another of those alarming accidents which so frequently occur in firework manufactories took place on Monday afternoon, in Regent-street, Lambeth-walk, on the premises occupied by Mr. Fenwick, firework manufacturer, by which an old man named Field sustained such injuries as to cause his death on the following day; and two others, the one a son of Mr. Fenwick and the other a workman in his employ, were dreadfully burnt. The buildings were so completely destroyed by the explosion, that, when the engines arrived, very little water was required to extinguish the burning embers.

Mortality of the Metropolis.—The following is the number of Deaths registered in the week ending Saturday, April 22.—West districts, 150; North districts, 190; Central districts, 168; East districts, 210; South districts, 243. Total, 961—(505 males, 456 females.) Weekly average for the last five years, 903, for the last five springs, 854.

Provincial News.

Bristol.—The local papers announce that his Royal Highness Prince Albert has accepted an invitation to visit Bristol on the launch of the Great Britain, which was intended to have been in the month of May, but owing to some difficulty in the float, has been postponed to June.—We copy the following account of Mr. Brunel from the *Bristol Gazette*:—"The operation, to which we alluded in our last, was performed with remarkable skill and precision by Sir B. Brodie, assisted by three other eminent surgeons. Very little blood was lost by the incision in the windpipe, but coughing and irritation supervened in such violence, that the forceps could not be used, and the half-sovereign still remains in the trachea. The operation occupied a considerable time, and Mr. Brunel endured his sufferings with remarkable fortitude. We are glad to learn that the accounts received this morning are considered very favourable, the exact position of the coin having been ascertained, and its extraction by the forceps, when a necessary alteration has been made in the form of the instrument, is anticipated to be nearly certain."

Bridgend.—This neighbourhood has been for the last few days much agitated by the sudden death of a respectable farmer, a Mr. Howell, of Laleston, as was affirmed, of Asiatic cholera, followed immediately afterwards by the equally sudden death of a poor woman named Harvey, who had assisted in laying out the body. Further circumstances, however, invested the case with very extraordinary appearances, and an investigation was resolved on. The deceased Mr. Howell, it appears, was a bachelor, possessed of property to the amount of about 200*l.* per annum, and was about to be married to a Mrs. Lewis. To this match, the sister of the deceased farmer, a Mrs. Thomas, strongly objected, as it would be the means of alienating from her the property to which, if he died a bachelor, she would be entitled. Her remonstrances with her brother had, however, been fruitless, and the period for the marriage was fixed. On Friday se'nnight, Mr. Howell had occasion to send for some beer to the house of his intended bride, who resided at a short distance, and the servant was directed to take a jar and fetch it. On his way he called at the house of the sister, who is supposed to have taken advantage of the opportunity to

put arsenic in the jar. Mr. Howell died soon after he had drunk the beer, and the woman who was called in to lay out the body, died a few hours after she had partaken of the remainder. The bodies have been exhumed and examined by Mr. Herapath, the chemist, of Bristol, who has detected distinct evidence of arsenic in them. The sister, Mrs. Thomas, and her husband, have both been apprehended, and are now in custody until further evidence has been received.

Carmarthen.—The proceedings of "Rebecca and her Daughters" still continue unchecked. On Friday, at the Neath petty sessions, three workmen in the employ of the Abbey Iron Company were brought forward to answer to a charge of breaking and carrying away some gates at Neath Abbey on the 10th inst. The evidence in this case was clear and conclusive, as a police-sergeant caught them in the act of destroying the gates; but as the parties whose property had sustained injury did not appear to prosecute, the magistrates, on account of previous good character, deemed it expedient to dismiss the case.—The new steam-yacht built for Her Majesty's use at Pembroke dockyard was launched on Wednesday the 26th ult.; the ceremony of naming her was performed by the Countess of Cawdor. The length of the yacht is 225 feet, breadth 33, tonnage 1,049; and her engines are of 450 horse-power.

Cricklade.—A labouring man, named Isaac Litten, belonging to the parish of Eisey, with his wife and four children, having been ejected from their cottage, were sheltering, on the night of the 21st ult., in a hut they had constructed of hurdles and straw covered with a piece of cotton patchwork, in Golden Rose-lane, in the above parish, when about ten o'clock, the fire not being properly extinguished, the place ignited. Litten and his wife escaped unhurt, leaving three of the children, aged five, seven, and ten years, in the flames, without making any attempt to rescue them. Before any assistance arrived the children were burnt to death. On examining the ground where the fire took place, some blood was discovered. This excited suspicion, and on examination of the bodies, the skull of one of them was found to be fractured. This added to the suspicious nature of the circumstances, and the father was immediately apprehended. A coroner's inquest was held, and after a protracted deliberation, the jury returned a verdict, "That Isaac Litten wilfully set his tent or camp on fire, thereby causing the death of his three children." He was immediately committed to take his trial at the next assizes.

Hertford.—On Saturday last, Mr. Cobden went down to Hertford, for the purpose of addressing the agriculturists of that district on the repeal of the Corn Laws. The Shire Hall was originally fixed for the meeting, but, having been found too small, the meeting adjourned to the Plough Mead, a large field at one extremity of the town, where an assemblage of nearly two thousand persons, almost exclusively farmers, was collected—the outskirts of the crowd being flanked by a number of the principal landowners of the county on horseback—among whom were Baron Dimsdale, the Hon. W. Cowper, Sir Minto Farquhar, Bart., Mr. Bosanquet, and several others. Mr. Welford, the Chancery Barrister, who has a farm in the neighbourhood, having been called to the chair, Mr. Cobden proceeded to address the meeting on the usual topics of the Anti Corn-Law League. Mr. Bennett, a Bedfordshire farmer, and a Mr. Maydwell, moved resolutions in support of the Corn Laws, and expressive of a want of confidence in Ministers. Mr. Lattimore, a neighbouring farmer, moved an amendment in favour of total repeal, which, having been seconded, was carried by a large majority. Considerable interest was excited by the meeting, it having been expected that a strong opposition would have been got up by the gentlemen of the county. Everything, however, passed off quietly.

Liverpool.—On Thursday afternoon a fire broke out in the extensive warehouses belonging to the Trustees of the Duke of Bridgewater, which has destroyed a great quantity of cotton and grain, and done very considerable damage to the immense pile of buildings. The fire originated amongst some cotton in one of the upper rooms, and almost immediately burst into a volume of flame, threatening destruction to the whole property, which is estimated at the value of about 500,000*l.* The warehouses stand close to the Duke's Dock, not far from the Custom-house, and are built east and west. Fortunately the wind was blowing west, and only a very light breeze, or doubtless the fire could not have been got under. Three of the warehouses are nearly destroyed, and entirely so in the upper stories. The warehouses are seven stories high, and the different rooms are let off to merchants who have cotton, corn, and other goods consigned to them. The three higher stories of these warehouses are reduced to complete ruin, the roofs having fallen in soon after the fire began. The three lower rooms contained corn, a great portion of which is either destroyed by fire or considerably damaged by water. The lower story, principally filled with Burton and other ales, has escaped with comparatively little damage. The goods destroyed are the property of various merchants, but it is believed are nearly all insured, the building being the property of the Trustees of the Duke of Bridgewater, of which Lord Francis Egerton is the principal owner. No accurate estimate can at this moment be made of the loss, but it is calculated that about 15,000*l.* worth of property is destroyed.

Scar'port.—On Monday evening a fire, which destroyed a considerable amount of property, broke out at the cotton mill of Mr. T. Fearnley, situated on the south bank of the Mersey, and adjoining the Stockport viaduct of the Manchester and Birmingham Railway. The fire commenced in the upper larger spinning-room. It is supposed to have originated in consequence of the flame of a lamp coming in contact with some roving. The flames spread rapidly from floor to floor, and notwithstanding

the utmost exertions, the roof of the larger side of the building fell in half an hour after the commencement of the fire; and in about two hours the flames had spread to all the rooms in that part of the building, and floor after floor fell down. The entire building was completely destroyed, and several persons were seriously injured by the fall of the ruins. The damage is estimated at 10,000*l*.

Railways.—The following are the returns of the under-mentioned railways for the past week:—London and Birmingham, 15,859*l*; Great Western, 13,723*l*; South Western, 6,169*l*; South Eastern, 2,052*l*; Eastern Counties, 2,304*l*; North Midland, 4,133*l*; York and ditto, 1,596*l*; Greenwich, 773*l*; Croydon, 308*l*; Brighton, 3,435*l*; Blackwall, 682*l*; Hull and Selby, 1,085*l*; Grand Junction, 6,956*l*; Midland Counties, 2,545*l*.—Arrangements are making to accelerate the north railway-mails by Lancaster, and the Irish ones by Chester; the effect of which will be to save nearly two hours on the present time to all parties north of Lancaster. The change is expected to take place about the 1st July; but, as the various branch mails require readjustment, it may even be a little later before this important advantage can be attained.—By the report of the Parliamentary committee lately published, it would seem that the bill authorizing the construction of the branch railway to Northampton and Peterborough encountered a severe opposition while under consideration. The parties heard against the project were the Duke of Dorset and other landholders, who with the representatives of several trust interests alleged that the line, in consequence of the small population of the districts through which it is proposed to pass, could never yield a fair return in proportion to the capital required, and that therefore adequate compensation would not be afforded to those whose property was sure to be depreciated by the railway. Although this opposition was strong, the absence of any engineer on the part of the petitioners to impugn the calculations of Messrs. Stephenson and Bidder, the gentlemen called in support of the applicants, had considerable weight with the committee, who, after a special examination of General Pasley, expressed themselves favourable to the undertaking. General Pasley states his opinion against the circuitous route to Blisworth, the one which it is understood the Northern and Eastern Company propose to follow out when their works have advanced sufficiently northward; and in that case, he says, should the extension ever be carried out, the branch will then be confined to the traffic of the valley of Nene, along which it is to pass. The present line to Northampton and Peterborough is to be, in the first instance, a single line only, and on that head the committee observe enough evidence was adduced, showing that while there would be an effectual guard against accident, public convenience would be amply provided for. It is nevertheless to be constructed of sufficient width to admit of a double line of rails, should it hereafter be considered necessary; and the Board of Trade have the power of compelling the Company to lay down such double line if it appear to them that the convenience of the public demands it. The capital to be raised to carry out the undertaking is 500,000*l*, and the income expected to be received is 35,094*l*, while the expenses are stated at 14,600*l* per annum. Passenger traffic is estimated to realise 23,170*l*; goods, 8,750*l*; and parcels, 3,174*l*. The line will be 47½ miles in length. On Monday, a special meeting of the London and Birmingham Company, convened for the purpose of considering the measure, passed a resolution approving of the draft of the bill.—On Saturday, a fatal accident occurred on the branch railway at Blackwood, a few miles from Newport, occasioned by the blowing up of a locomotive engine used on the line of the Tredegar Iron Company, by which two persons were killed and two others seriously injured. One of the killed was Mr. Davis, a farmer, of Buttry-Hatch, in Monmouthshire; and the other was Mr. P. Williams, a tradesman living at Blackwood. Great damage was done to several houses in the town. The explosion is reported to have been caused by the engine-driver neglecting to open the valve after shutting off the steam when leaving the engine. The loss of property, engine included, is estimated at least at 1000*l*.

IRELAND.

Dublin.—No slight consternation was caused on Monday morning by the announcement that Mr. Finn, the City Treasurer, elected by the Reformed Town Council, had absconded in the course of Friday, taking with him corporate funds to the amount of 4,000*l* or 5,000*l*. He escaped in the packet for Liverpool, where he would be just in time to catch the New York packet. On the discovery of his absence instant pursuit was made, Sir D. J. Dickenson, accountant of the corporation, having left Dublin on Saturday night, in the hope of catching him, but it is supposed without success, as the Great Western was expected to sail from Liverpool at 9 o'clock on Saturday morning. Mr. Walsh, a wealthy merchant, and Mr. Nolan, a rich pawnbroker, are Mr. Finn's sureties to the amount of 2,000*l* each.—The repeal agitation is still in full operation. At the meeting in this city last week, Mr. O'Connell announced that on the 4th he would go to Sligo; on the 7th to the Curragh of Kildare; on the 14th to Mullingar; on the 23d to the Southern Riding of Tipperary; on the 25th to the North Riding. He was also invited to a dinner by the corporation of Drogheda; and on the 29th of June he would go to Dundalk. The Rent for the week, announced at the close of the proceedings, was 683*l* 9*s* 2½*d*. This is much the largest weekly return yet received.

Limerick.—The local papers mention as a proof of the little encouragement given to the new mail-coach contractors, and as a circumstance without precedent on the Dublin and Limerick mail-coach line, that the coach

arrived at the office in Limerick on Monday without a passenger, or even a single parcel, on the whole route from Dublin to Limerick. The way-bill was a perfect blank—not so much as the scratch of a pen on it.

Lab.

VICE-CHANCELLOR'S COURT.—(Before Sir Lancelot Shadwell).—*Evors v. the Commissioners for Building New Churches.*—This case, which was argued before his Honour during the sittings of this Court at Lincoln's-inn, immediately previous to the Easter recess, came on for judgment this week. The Vice-Chancellor said that he had read through all the pleadings and affidavits in the case, and it appeared to his Honour that many parts of the bill were utterly unintelligible, but as far as he could understand the case, it appeared that in 1834 there was a project for building a new church at Newtown, Montgomeryshire, which, however, was abandoned. In 1838, a new plan was set up for building a new separate church, which was not to interfere with the old parish church. The plaintiff, the Rev. Mr. Evors, made certain proposals to the defendants, the commissioners, with reference to the offer of a site for the new church and other things. Mr. Evors's site was not, however, conveyed, but in 1840 a site was granted by Mr. Pew. Mr. Evors wished to have a chancel provided for himself in the new church. The commissioners, it appeared, agreed to this, provided Mr. Evors paid the expenses necessary for its construction. In April, 1841, it would appear, however, that Mr. Evors swung round, as it were, and he thereupon sent a notice to the defendants, the commissioners, wherein he stated that he had taken the opinions of his friends, who considered that they (the commissioners) had no right to change the site of the old church, that their so doing would seriously affect his (Mr. Evors) ancient rights in the old parish church, and that he was determined to resort to all legal remedies to prevent the commissioners from so doing. In consequence, therefore, of Mr. Evors's refusal to advance the necessary expenses for building the chancel in the new church, that scheme was totally abandoned, and the plaintiff filed this bill, and prayed an injunction to restrain the commissioners from building the new district church in question, without their providing therein such accommodation for the plaintiff as would protect such rights as he claimed to have in regard of the old parish church. Now the commissioners, by their answer, denied that they ever threatened or ever intended to destroy or infringe any such rights as the plaintiff has in the chancel of the old parish church. They also stated that the building of the chancel in the new church was abandoned in consequence of the plaintiff's own act. The commissioners further denied that they ever threatened or intended to take down or remove any of the tombs, monuments, or monumental inscriptions now in existence in the old parish church. The commissioners did not say that they had determined to constitute the new district church a parish church, nor was it necessary that they should state what their determination on that question was. His Honour was clearly of opinion, taking all the pleadings and affidavits together, that no ground was made out by the plaintiff for an injunction in this case. His Honour had read through the eleven acts of Parliament referred to in this case, and from them it appeared to him the commissioners had no power to pull down or repair the old parish church, but they had power to build a new district church, and they had power which would enable them, at some future time, to constitute that which was a district church a parish church, or a parish church a quasi district church. Being, therefore, of opinion that the plaintiff's case had totally failed, this application for an injunction must be dismissed with costs.

COURT OF COMMON PLEAS.—(Sittings in Banco).—*Holloway v. Hare.*—This action was tried before Mr. Justice Patteson and a Special Jury at the last Lewes Assizes, and was brought by the plaintiff, a clergyman, and curate of the parish of East Dean, Sussex, against the defendant, the Archdeacon of Lewes, to recover compensation in damages for a libel contained in a letter written to a Miss Gilbert, imputing to the plaintiff that he had been guilty of immoral conduct, and had committed perjury when a witness in the case of "Greenwood v. Woodham," tried at the Taunton Assizes, in 1841. The jury found some of the issues for the plaintiff, and some for the defendant; but the finding was substantially in favour of the latter. Mr. Sergeant Byles now moved for a rule nisi to set aside the verdict and have a new trial, on the ground of misdirection and the misapprehension of evidence, which consisted of certain questions relative to letters which had been written by Miss Gilbert, in which she spoke of the plaintiff's conduct, the letters themselves not having been put in evidence.—Rule granted.

COURT OF EXCHEQUER.—(Sittings in Banco).—*Smith (quitam) v. Bond.*—This was an action for penalties under the statute of Ann, for keeping a gaming-house. The case was tried before Lord Abinger, at the sittings after Michaelmas Term, and a rule was afterwards granted to show cause why there should not be a new trial; which is still pending. The Solicitor-General now moved to stay the proceedings, on the ground of a fraudulent misrepresentation as to the name of the plaintiff. By the statute 2 William IV., c. 39, s. 17, the defendant was entitled to call upon the plaintiff's attorney to give the name and address of the plaintiff, under a Judge's order; and when such order was quashed, all proceedings were stayed until it was complied with. In the present case an order was obtained for the plaintiff's name and address, and it was apparently complied with, for the plaintiff's attorney gave the defendant the name of Thos. Smith, 32, Chapel-street, Grosvenor-square, artist, as his client. Inquiries were made at the house in question whether such a person resided there, and the answer was that he did, but was out of town. It appeared, however, on investigation, that this answer was untrue, that no person of the name of Thomas Smith, an artist, ever lived in the house in question, and that it was a deliberate fraud on the part of the real plaintiff and his attorney, to conceal from the defendant who the real plaintiff was. So far, the plaintiff had the benefit of his fraudulent misrepresentation. At the trial, some of the witnesses were asked if they knew the plaintiff Thomas Smith, and they replied, truly that they did not; in fact, there was no such person. If the name of the real plaintiff had been suggested, their answer must have been otherwise, and their connexion with him would have clearly appeared on cross-examination. As the order was made for the defendant's protection, and he was deprived of that benefit by the fraud of the plaintiff, the proceedings ought to be set aside. Lord Abinger saw no ground for setting aside the proceedings, as it did not appear the defendant had been prejudiced in his defence by the false name and address. No doubt the attorney, if he had wilfully given a false name and address, was guilty of a contempt of court, and liable to punishment, but it was too late now to stay the proceedings. The rest of the court concurred, and the rule was refused.

In the Matter of Francis.—The Solicitor-General moved for a rule to show cause why a prohibition should not issue to the Archbishops' Court of Canterbury in the matter of Francis. This was one of the cases to compel the making of a church-rate. A citation was served on Mr. Francis, who was a parishioner of St. George's, Norwich, but holding no office in the parish, and it concluded by stating that he was to appear in Michaelmas Term, there to answer certain articles touching his soul's health, and the reformation of his habits, and particularly in obstructing, or at least refusing to make, or to join in making a levy for repairing the church. The citation did not state that he had attended any meeting where it had been resolved not to make a rate, nor did it say that the church was out of repair. The party appeared under protest, and set out as the ground of protest that he was wrongfully cited, as it did not appear that he had been guilty of any offence, or that any vestry had been called for the purpose of making a rate. Notice of appeal had been given. This was

the first time in which any attempt had been made to proceed against any one individual parishioner. Whole parishes had been excommunicated, but no one individual had been attacked. This was a case which deserved consideration. Rule granted.

COURT OF QUEEN'S BENCH.—(Sittings in Banco).—*The Queen v. Feargus O'Connor and Others.*—A great deal of excitement had been created by the announcement that these defendants were to be brought up for judgment, and on the opening of the doors all the available seats of the court were immediately filled. The Attorney-General prayed judgment against the defendants, who had been convicted of unlawfully aiding and abetting others in doing certain acts charged as unlawful. Lord Denman said that the officer of the court had informed the Judges that some of the parties convicted at the assizes were not here. That made no difference with respect to the present proceedings. The court could proceed to pass sentence on those that were present, and they would have a right, notwithstanding the absence of their fellows, to say anything they might think fit in arrest of judgment. The following defendants answered to their names:—Feargus O'Connor, Richard O'Leary, G. J. Harney, William Hill, John Arran, William Aitkin, S. Challenger, Samuel Parks, D. Railton, William Woodruff (all of whom were convicted on the fifth count only), and J. Leach, C. Doyle, Jonathan Bairsow, J. Arthur, T. Cooper, R. Brooke, John Durham, James Fenton, James Mooney, and Frederick Augustus Taylor. Lord Denman said that there had been an acquittal on some counts, and an acquittal of some of the defendants. He wished to know whether there was any intention on the part of any of the defendants to move an arrest of judgment. Mr. Dundas, who appeared for R. Brooke, said he should move an arrest of judgment on the fourth and fifth counts on which his client had been convicted. These counts were read. The fourth charged the prisoners with having created alarm, &c., by stopping mills, and by these means intending to create great changes in the laws of this realm. The fifth count charged them with alarming the Queen's subjects, with intent to bring about great changes in the laws. Mr. Dundas then addressed the court. He began with his objection to the fifth count. There was no venue stated in it at all, and it was, therefore, bad upon the face of it. This was so plain, as not to require him to trouble the court with many observations. This want of statement of a venue was not a defect in this count alone. It appeared in many other counts. It was a defect which was not cured by a verdict, but made the count bad on motion in arrest of judgment. There must be a venue, to show that an offence had been committed within the county, for the jurisdiction ought to be clearly shown. The marginal venue would not do for this purpose. The only remaining question was, whether the 7th of George IV., c. 64, s. 20, at all cured this defect. That section was to this effect. In order "that the punishment of offenders may be less frequently interfered in consequence of mechanical mistakes, be it enacted that no judgment upon an indictment, &c., whether after verdict or outlawry, &c., shall be stayed or reversed for want of the averment of any matter unnecessary to be proved, nor for omitting to state the time at which the offence was committed, in any case where time is not of the essence of the offence, nor for the want of a proper or perfect venue, where the court shall appear by the indictment, &c., to have had jurisdiction over the offence." These words implied that a good venue had been laid, though not laid perfectly. Here no venue was laid as to the charge itself. The case of *Rex v. J. Minter Hart* (5 Carrington and Payne's Reports) was in point on this objection. The indictment there had been found by the London grand jury. The statement of the offence was, that the offence was committed in the parish of St. Mary-le-Bow, but that parish was not stated to be in London. It was true that that case was one where the objection was made before the verdict, but that did not affect the question. Lord Denman: We think that this is an objection which requires to be considered. Mr. Dundas then went on to the second objection. He contended that the statement of the offence was insufficient. It charged an attempt to persuade persons to do what they might lawfully do. The charge was to persuade the Queen's subjects to disaffection to the laws, and to leave their labour, and so to bring about a change in the laws. No conspiracy was charged. Lord Denman: This also is an objection worthy of being considered. Mr. Dundas then objected that the fourth count was defective in having no venue laid in the early part of it, and also that its statement of the offence was defective. It was stated that there had been unlawful meetings, but it was not stated where those unlawful meetings were held; yet that statement was material to be tried, and to be found by the jury; for it should be shown that the offence was within the jurisdiction, and the absence of it was not cured by the verdict. There could be no necessity to cite authorities to show that where there was a material fact triable by the jury, it was necessary to be alleged with time and place. Mr. Justice Buller had distinctly stated the principle in the case of *Rex v. Holland*, 6 Term Reports. The charge here was said to have been committed "at divers times and places," but there was no statement of those places. The expression "at the parish aforesaid" did not compensate for the want of the allegation of place in the early part of the count. Lord Denman: Suppose the count had stated that the defendant had aided and abetted certain persons, who, at a place previously named, had committed an offence. Mr. Dundas: that would be right; but for aught that appeared, the original offence here might have been committed in France or in India. The 6 George IV., c. 129, was in point on the subject of the offence, the committing of which these defendants were charged with having aided and abetted. The 3d section of that statute declared that the compelling of journeymen to leave their employment, or to return work unfinished, and the doing of certain other things, should be unlawful, but the 4th section expressly provided that meetings, for the sole purpose of settling the rate of wages to be taken, should not be illegal. On the face of this indictment the persons whom these defendants were charged with aiding and abetting did not appear to have been engaged in any other matter, and consequently did not appear to have been concerned in an indictable offence. The aiding and abetting of them was not, therefore, indictable; and the count not showing any other offence could not stand on a verdict, nor have a judgment entered up on it. Mr. Sergeant Murphy appeared for Durham, Bairsow, and Railton, to urge similar objections on behalf of his clients. The last of these defendants had only been convicted on the 5th count. He should not notice that count now. The 4th count was defective. It might be true that the aiding and abetting might be laid in the way suggested by the Court, so as to bring the parties within the penalties of the law; but that could only be where a conspiracy was charged. Here no conspiracy was charged. This was a mere charge that the parties had aided and abetted certain others in doing something which was not shown to be lawful. That was nothing, unless it was shown to be an aiding and abetting in the commission of an offence charged on the face of the indictment. The offence must be shown to have been a substantive offence, and the aiding and abetting must be shown to have taken place within the jurisdiction of the Court. Nothing of that sort was done here. Suppose the allegation had been here, that the peaceable subjects were residing in Scotland; that would clearly prevent the jurisdiction of the Court. It was clear that the aiding and abetting must be by a personal assistance. Then the parties charged were not charged with an offence within the jurisdiction. Mr. Justice Patteson—May not the venue in one part be supplied by the reference to another? Mr. Sergeant Murphy answered, that the venue could not be supplied by implication. In every indictment where there was a charge of aiding and abetting, there was always an allegation that the parties charged were then and there present aiding and abetting. That was to show that there was a personal offence committed within the jurisdiction. A person writing in England might, by counsels, aid and abet the offence in Scotland, but he could not be charged with the offence out of the jurisdiction. Suppose the original offence was a

to introduce to public notice a new Trough Pipe, for Orchidous or other Houses where vapour is constantly, or at inter-required, and which may be seen at their Manufactory.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained of any size from JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical. It may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pine App. place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HOT-WATER APPARATUS.

PALMER, GREEN, & CO., No. 146, NORTH-STREET, BRIGHTON, respectfully invite the attention of Horticulturists, &c., to their HOT-WATER APPARATUS, which is admirably adapted for Conservatories, Vineries, and Forcing-Houses, of every description. The Apparatus here referred to is exceedingly simple in its arrangements, and moderate in cost; efficient and economical in its operation, very easily managed, and not liable to be injured, over-heated, or put out of order by accidental neglect.

P., G., & Co. can also, with great confidence, (founded on experience) recommend their HOT-WATER APPARATUS for warming and ventilating Churches and other Public Buildings, Shops, Warehouses, Factories, and Private Dwellings.

Further particulars will be promptly supplied on application as above, and reference given to most respectable persons on whose premises the Apparatus has been for many months in operation.

HOT-WATER APPARATUS, for Horticultural and other Buildings.—STEPHENSON and Co., 61, Gracechurch-street, Inventors of the improved Conical and Double Cylindrical Boilers, respectfully acquaint the Nobility, Gentry, and Horticulturists, that they constantly keep in Stock a variety of sizes of these much-approved Boilers, suitable for Houses or Pits of any dimensions. The testimony of Dr. Lindley to the merits of these Boilers (see *Chronicle*, March, 1842, page 175, and February, 1843, page 87) renders it unnecessary to offer any remarks upon them beyond the following brief description.—They are complete without furnace or brickwork, movable at pleasure, very ornamental in appearance, and require attention only once in 14 or 15 hours, price 4*l.* 4*s.* and upwards. Further particulars, with estimates for heating any description of building, will be forwarded upon application. Iron Fencing, Hurdles, Broomsticks, Wire work, Garden Implements, &c. &c.

N.B.—The Trade supplied with Hot-water Pipes and fittings of every description.

PENN'S SYSTEM OF HOTHOUSE-BUILDING, WARMING, AND VENTILATING.—The superiority of the principle first introduced by JNO. PENN, Esq., for obtaining a more complete and healthy atmosphere in heated apartments, being now fully established, W. HILL respectfully acquaints the Nobility, Horticulturists, and the Public generally, that having, in conjunction with the Inventor, devoted much time and study to perfect the same in the construction of Conservatories, Stoves, Greenhouses, Pits, and other Horticultural Erections, and to heat them with IMPROVED HOT-WATER APPARATUS, to ensure ANY DEGREE OF TEMPERATURE, earnestly solicits their inspection of the working of this system at the Inventor's residence, Lewisham.

The peculiar advantages in Houses erected upon, or altered to, this principle, are—Free and rapid Circulation, Equality of Temperature, and safe and agreeable access, at all times, to the most delicate constitutions.

Churches, Chapels, Manufactories, or other large Public Buildings and Dwelling-houses, warmed and ventilated. The Heating Apparatus, which is of the very best description, combining Durability and Simplicity with Economy in the Consumption of Fuel, is manufactured by and fixed under the supervision of JNO. PENN, Esq., Engineer.

Reference is permitted to JNO. WILKINSON, Esq., Isleworth, and numerous other Gentlemen, who are practically acquainted with the merits of W. HILL's method of applying J. PENN's principle.

Designs, and every information, may be obtained on application to W. HILL, Builder and Surveyor, Lewisham.

IMPROVED SYSTEM OF HEATING GREENHOUSES, MELON, PINE, AND CUCUMBER-BEDS, &c.

CALDWELL, PARKER, & Co., Iron-Founders, Scotland-Road, Warrington, Lancashire, most respectfully solicit the attention of the Nobility, Gentry, Seedsmen, Gardeners, &c., to the improvement which they have made in the system of HEATING HOTHOUSES by Water—a system which supersedes all others in producing the most healthy Plants in the shortest time, for which they can produce the most undeniable reference.

The improved system prevents the scorching of plants, so common to fires, and keeps the house in one regular temperature, with a saving of fuel and labour; and the Improvers warrant their system to be superior to any other, and ultimately, far less expensive.

POTTER'S ARTIFICIAL GUANO.—TURNIPS, MANGEL WURZEL, &c. By the use of the above Manure, the enormous yield at the rate of 6 tons per acre was obtained of ORANGE GLOBE MANGEL WURZEL, by Mr. A. COTTON, of Holchester, near Cambridge. On Meadow Land, the Bar of Zetland got in 10 tons per acre, at 20*s.* per ton, while by the use of the above Manure, the yield was only 5 tons, under sun and rain. The above is a true and reliable article of Artificial Guano.

* * * Potter's Portable Farm-yard Manure, at 1*l.* per ton, from 6 to 7 cwt. per acre.—Chem. and Works, &c., Lambeth.

GUANO ON SALE, BY THE IMPORTERS, ANTHONY GIBBS & SONS, LONDON; GIBBS, BRIGHT, & Co., LIVERPOOL AND BRISTOL.

CHEAP GYPSUM for MANURE, fit for use, and put into carts or boats, at 20*s.* per ton, may be had of J. & E. STURGE, Chemists, 18, Wheelers-lane, Birmingham.

LIQUID MANURE.—PUMPS of a superior construction for Liquid Manure, portable and stationary. Garden Pumps, Hydraulic ditto, and for deep Wells; also for Ships, Barges, Tanners, Brewers, Soap-boilers, &c. Pumps kept for Hire, for Wells, and Excavations.—BENJAMIN FOWLER, late GEORGE TURNER, 63, Dorset-street, Fleet Street.

TO AGRICULTURISTS.—Now ready, price 1*s.* each.

where the grandest results may alone confidently be expected.

With some new Cases. By T. J. GRAHAM, M.D., &c.

"We have been particularly pleased with his cautionary remarks; they are reasonable and instructive. It will disabuse the mind of a great deal of prejudice on this now-important subject."—*County Herald*.

"There is such an air of sincerity and truth in the writings of this author, that he irresistibly wins our good opinion and confidence."—*Literary Journal*, March.

Published by SIMPSON & Co., Paternoster-row; and HATCHARD & Son, 187, Piccadilly.

EDWARD BECK invites the attention of Horticulturists to the different articles manufactured by him in

SLATE. They may be seen in use at WORTON COTTAGE, ISLEWORTH, upon application to the Gardener.—*Sundays excepted*.

MOXON'S EFFERVESCENT MAGNESIAN APERIENT may be had of all respectable medicine-vendors

throughout Great Britain and Ireland, and nearly every part of the civilised world. In all parts it has met with the sanction of

the medical profession, who recommend it to their patients as the best Family Purgative ever discovered. It is of

constant service in pains in the Head, casual or habitual costiveness, Bilious Affections, Nausea, Sickness, Heartburn, Indigestion, Gout, Piles, Fistula, and as an aperient saline draught in all febrile affections. It is an effectual remedy for derangement

of the stomach and head, resulting from excess either in eating or drinking. It possesses all the medicinal powers of the most

approved saline Aperients, without the disagreeable taste which distinguishes medicines of that class, and is so agreeable that

even children can take it without dislike. Prepared only by

BENJAMIN MOXON & SONS, Chemists, Hull. Sold in bottles, at

2*s.* 9*d.*, 4*s.* 6*d.*, and 1*l.* Observe—the genuine medicine has

"MOXON & SONS (then co-partners), Chemists, Hull," engraved on the Government stamp.—Wholesale Agents, BARCLAY and

Sons, &c., London.

BEE-HIVES.—GEORGE NEIGHBOUR and Son beg

to inform their Apian Friends that in consequence of the

formation of a new line of street, they have removed their business from No. 131, High Holborn, to more spacious and commodious

Premises, numbered 127 in the same street. Their selection of

Bee-hives for this season comprehends most varieties now in

vogue, including "Nutt's Patent Hives" (for the sale of which they are the only authorized agents), the "Single-Box Hive,"

the "Ladies' Observatory Hive," the "Improved Cottage Hive,"

with Glasses, &c., from either of which the produce may be

taken at any time without the destruction of the Bees. G. N. and

Son have also Glass Hives and other articles connected with

Bee Management, at their Apian Depot and Honey Warehouse, 127, High Holborn, corner of Southampton-street, London.

Letters of inquiry relative to the above must have Postage Stamps enclosed.

* * * "NUTT ON BEES" (5th Edition), now published.

TO NURSERYMEN, HORTICULTURISTS, &c.

PROPAGATING GLASSES.—White, 1*s.* 2*d.* per lb.

Green, 1*s.* per lb., or from 2*s.* 6*d.* to 2*l.* per doz. CUCUMBER-TUBES, all lengths, from 6*d.* to 4*s.* each; GRAPE-SHADES,

with holes, from 2*s.* 6*d.* each; FISH-BOWLS, from 1*s.* 6*d.* each; Fish-bowls, for fountains, with hole in bottom, 2*s.* 6*d.* per lb.;

at APSLEY PELLATT'S FALCON GLASS-WORKS, HOLLAND-STREET, BLACKFRIAR'S, where every description of Table-Glass and China is on sale. Days for viewing the Manufactory, Tuesday, Wednesday, and Thursday.

FOUNTAINS, VASES, TAZZAS, FIGURES, &c.

In Marble, Artificial Stone, and Parker's Cement, to be seen at WYATT, PARKER, & Co.'s WHARF, Holland-street, Surrey,

foot of Blackfriar's-bridge. Also a large Collection of Chimney Shafts, Pedestals, Capitals, Consoles, Trusses, &c.

SHADES FOR GREENHOUSES.

J. WEEKS & Co., ARCHITECTS, HORTICULTURAL BUILDERS, &c., Gloucester-place, King's-road, Chelsea.

The great simplicity of their improved plan of SHADING, by which the roof of the largest or smallest house can be instantly

covered with a sheet of Canvas, renders the principle an object of admiration. To be seen in use at most of the London Nurseries, and at their Horticultural Manufactory, Gloucester-place, Chelsea.

CUCUMBER and MELON BOXES and LIGHTS.

One, two, and three-light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two-light

Boxes and Lights complete, from 1*l.* 8*s.* Shades and Frames made, glazed, and painted, from 1*s.* per foot. Sashes and Frames made, glazed, and hung complete, 1*s.* 6*d.* per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road.

* * * Reference given.

ROWLAND'S ODONTO, or PEARL DENTIFRICE.

A Vegetable White Powder, prepared from Oriental Herbs of the most Delicacious Odour and Sweetness, and free from any mineral or pernicious ingredient—it eradicates Tartar from the

Teeth, removes decayed spots, preserves the Enamel, and fixes the Teeth firmly in their sockets, rendering them beautifully

white. Being an anti-scorbutic, it eradicates Scurvy from the Gums; strengthens, braces, and renders them of a healthy red; it

removes unpleasant tastes from the mouth, which often remain after levers, taking medicine, &c., and imparts a delightful

fragrance to the breath.—Price 2*s.* 9*d.* per box, duty included.

ROWLAND'S ALSANA EXTRACT immediately relieves the most violent Toothache, Gum-boils, Swelled Face, &c.; it is also

an excellent Stomachic, in cases of Flatulency, Spasmodic Affections, &c., and gives instantaneous relief.—Price 2*s.* 9*d.*, 4*s.* 6*d.*, and 10*s.* 6*d.* per bottle.

NOTICE.—A. ROWLAND & SON, 20, HATTON-GARDEN, LONDON, is engraved on the Government Stamp, which is

pasted on each article; also printed, in red, on the wrapper of the latter. Sold by them, and by Chemists and Perfumers.

[BY HER MAJESTY'S ROYAL LETTERS PATENT.]

TO NURSERYMEN, FLORISTS, GARDENERS, and OTHERS.

F. M'NEILL & CO., Patentees of Improved Patent

ASPHALTED FELT, beg to draw attention to their superior

manufacture for ROOFING, which is now so extensively used in lieu of slates, tiles, thatch, &c., for Houses, Cottages,

Out-buildings, Verandahs, Sheds, and, in fact, every description of building, and is particularly adapted, from its non-conducting

qualities, as a covering and protection for plants, &c. This article is manufactured purposely for securing a perfectly tight roof

against rain and snow, and for resisting the external heat of the sun, by its non-conducting qualities. It is impervious to wet,

and not liable to crack with changes of temperature. The timber and woodwork may be extremely light, as the weight of the

Felt is only 24 lbs. per 100 square feet; and thus, in timber alone, there is a saving of at least one half; and the expense of the

Felt, as compared with tiles, is considerably less than one-half; and with slating the difference is still greater. This article

combines economy, durability, and neatness; it is manufactured 32 inches wide, and may be ordered for the length of any building, thereby preventing the necessity of many joinings; and any

unpractised hand may roof a moderate-sized house in a few hours.—Parties sending to the manufactory, Lamb's Buildings, Bunhill-row, London, may have it immediately cut off from the

machines, and furnished on the instant, so that they pay for no more than is actually required.

The price of Roofing Felt is only One Penny per square foot.

* * * Samples, with full directions as to its application, sent to any part of town or country, and orders by post immediately executed.

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row.

WATSON'S GRANULATED COMPOST, decidedly

the Best and Cheapest Manure ever offered to the British Farmer. A single trial will demonstrate its superiority, both in

respect to its effect and its economy. It is sold in the very best possible form for immediate use; its composition is uniform, and its particles are not liable to cohere.

The GRANULATED COMPOST contains, in a concentrated form, all the ingredients which are essential to the growth of

plants; it not merely stimulates vegetation when first applied, but it has been found so rich and nutritious as to sustain the

heaviest crops till the latest period of growth, and to leave the soil in a better condition for a second crop than any Artificial

Manure yet offered to the Farmer.

For Winter Wheat it will be found most advantageous to apply it as a top-dressing early in the spring. For Spring Crops of all

kinds of grain it should be sown broadcast and harrowed in with the seed. For Turnips it may be drilled in with the seed.

For Grass or Hay it should be applied broadcast, early in the spring. The quantity recommended is from 4 to 6 cwt. per statute

acre, according to the crop and the previous condition of the land.

WATSON'S GRANULATED COMPOST is confidently recommended to Market Gardeners, as it has always produced the very

best effects when applied to the Onion and Turnip crops. It is offered to the Public at 10*s.* per cwt., or 10*l.* per ton. For the

accommodation of Florists and Amateur Gardeners, the GRANULATED COMPOST is sold in 20*s.* barrels, each containing 2 cwt., and in 5*s.* barrels, containing half a cwt. each.

Mr. MARK FOTHERGILL, 40, Upper Thames-street, Sole Agent.

DOGS.—The Largest and Handsomest description of the NEWFOUNDLAND Sort for Sale. Direct to A. B., Post Office, Poole.

WANT PLACES.—All Letters to be post-paid.

AS HEAD-GARDENER, a married Man, who has a

thorough knowledge of his business in all its branches; could take charge of a small Farm, and his Wife the Dairy and Poultry, if required. Can have an undeniable character from the gentleman he is about leaving.—Address to M. N., care of Mrs. COLLET, Post-office, Acton, Middlesex.

AS GARDENER, a married Man, aged 35, who

perfectly understands his business, and is well acquainted with the management of Land, Cows, or any other cattle. Can have four years' undeniable character from the gentleman he is leaving.—Direct to A. B., Messrs. PAUL & SON, Cheshunt, Herts.

AS GARDENER, a respectable married Man, without

encumbrance, aged 30, who perfectly understands his business, and would not object to superintend a small Farm or Cows. Can have a good character from the place he has just left.—Direct to C. H., Mr. FRYER's, Nurseryman, Camberwell.

HIGH WYCOMBE HORTICULTURAL AND FLORAL SOCIETY.

The Spring Show of the above Society will be held in the Town Hall, High Wycombe, on WEDNESDAY, the 17th of May next.

T. G. TATERN, and THOS. WHEELER, Hon. Secretaries. Of whom further particulars may be obtained.—High Wycombe, May 10, 1843.

UNDER THE ESPECIAL PATRONAGE OF HER ROYAL HIGHNESS THE DUCHESS OF GLOUCESTER, AND HIS ROYAL HIGHNESS THE DUKE OF CAMBRIDGE.

MESSRS. WATERER'S SPLENDID EXHIBITION OF AMERICAN PLANTS will open on THURSDAY, May 18, at the Nursery, King's Road, Chelsea. Admittance, 1s.

EXHIBITION OF TULIPS.

H. GROOM, Clapham Rise, (late of Walworth,) by appointment, FLORIST to HER MAJESTY, respectfully informs the Nobility, Gentry, and the Public, that his extensive COLLECTION OF TULIPS is now in full bloom, will continue in perfection until the 20th of May, and can be viewed every day from 9 o'clock until 6, Sundays excepted. Admittance 1s.

FUCHSIA ST. CLARE.

This splendid FUCHSIA, pronounced by Dr. Lindley as the "finest hybrid we have seen," is now being sent out by YOUELL and Co., Great Yarmouth Nursery, Norfolk, at 10s. 6d. per plant, free of postage, to any part of the United Kingdom.—Great Yarmouth, May 11, 1843.

J. KERNAN respectfully informs Ladies and Gentlemen

that he can still supply them with most of the best and newest FLOWER and VEGETABLE SEEDS recently introduced, that are worthy of cultivation. The month of May is quite time enough for sowing hardy and half-hardy Annuals, and many half-hardy Annuals, if sown earlier would require a little bottom-heat, which may now be sown in the open borders, where, if kept well thinned, one plant will grow to six times the size of those raised on heat and transplanted. Ladies and Gentlemen wishing such a selection, for autumn flowering, by naming the sum to which they would wish to go, J. K. flatters himself they will have no reason to regret, either in the choice of the selection, or on the score of price. Also the 24 sorts named as a mixture by Dr. LINDLEY, as suited for enlivening Shrubberies, sent by post for 6s. Also all the better Grasses, as a mixture for Lawns, and all the other Grasses for permanent pasturage, separate or mixed. Also, Lang's New Swede Turnip; Skirving's do.; Cox's do.; New Yellow Globe Mangel Wurzel; New Red do.; Fine selected Long Red do.; Agricultural White Carrot; together with Potatoes and Herbaceous plants, for planting out in May for autumn flowers, 4, Great Russell-street, Covent Garden.

J. CATTELL begs to inform the Public that he is now sending out his Fine Superb SEEDLING PETUNIAS (at 2s. 6d. each), as advertised in the Chronicle, page 258. Westerham, May 10.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

BEAUTIFUL AND DISTINCT FUCHSIAS.

YOUELL & Co., in submitting their Catalogue of Fuchsias for 1843, (for which, see their Advertisement in this Paper of last week), take the present opportunity of drawing the attention of admirers of the above elegant tribe of plants to their select and superb Collection. They have spared no expense in forming a selection of such as are really good, to the exclusion of many that are mere nominal varieties; and they would refer to the numerous testimonials of success which attend their mode of selecting last season's collections for Amateurs, for competition at the various Horticultural Exhibitions throughout the kingdom.

YOUELL & Co. are desirous of calling attention to their peculiar method of executing orders for this tribe of plants; namely, that they will deliver them free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, in collections, upon the following terms:— Twelve fine Show Varieties, 12s. Twelve extra fine and very superior . . . 21s. The selection being left to YOUELL & Co.

Great Yarmouth Nursery, Norfolk May 12, 1843.

NEW AND CHOICE ROSES.

A. PAUL & SON, NURSERYMEN, &c., Cheshunt, Herts, in offering the following Select List of ROSES, beg to remind Rose Amateurs that May is the best month for planting out beds of Dwarf Roses. The Plants now offered are in No. 60 pots, good and healthy, and if planted out this month will bloom in the approaching autumn.

CLASS I.—HYBRID PERPETUAL.

Those marked *, R. B. B. can supply wholesale orders at a fair trade price per dozen. Plants gratis, to compensate for distant carriage.

Hedenham Rosary is situated on the border of the county of Norfolk, and on the line of road leading from Norwich to Bungay, eleven miles from the former and three from the latter. Bungay is the nearest post town. A daily conveyance to the Eastern Counties Railway, thence to London.

JOHN MILNE begs respectfully to offer to the Nobility,

Gentry, and the Public, the following plants:—

A fine specimen of Araucaria excelsa, in pot, standing 8 ft. high, probably one of the finest in England, for sale, price 25s.

Fine specimens of Rhododendron hybridum now in flower, from 7 to 10 feet high, each 7s. to 10s. 10s.

Fine specimens of Camellia imbricata, from 5 to 6 ft. high, 5s. 5s.

" " " 3 to 4 ft. each 3s.

" " Correa speciosa 3 to 4 ft. each 2s.

" " Azalea Phoenicea 3 to 4 ft. ea. 7s. 6d. to 10s. 6d.

" " Danielsiana, 2 to 3 ft. 7s. 6d. to 10s. 6d.

" " Clematis Sieboldii, 10s. 6d.

" " Azulea grandiflora 10s. 6d. & 12s. 6d.

" " Cactus truncatus, gridd., 2 & 3 ft. high, 20s. to 30s.

The above are fine specimens for furnishing Conservatories.

A Fine collection of Azalea sinensis, Camellias, Pelargoniums, Ericas, Epacises, Gesneras, Gloxinias, Achimenes, &c. &c. Likewise a general collection of Greenhouse, Herbaceous, and Rock plants, too numerous to insert.

Hovea Celsii, per doz. 18s. to 24s.

Chorizema Henchmannii, per doz., 18s. to 24s.

TO GROWERS OF PELARGONIUMS.—Now in Bloom, a fine SEEDLING PELARGONIUM, named MAY-DAY, fine brass, from 8 to 10 pips, very dark top petals, colour well run in, with fine white eye and excellent foliage; one of the best Pelargoniums in cultivation, being a very free flowerer, and very early. A small stock of strong Plants for sale, price One Guinea each. Can be seen in bloom at HALL'S Harwood Nursery, Hampstead-road.

NEW AND CHOICE DAHLIAS AND FUCHSIAS, by F. & A. SMITH & Co., Florists, &c., Hackney, London. For May, 1843. NEW AND SUPERB SEEDLING DAHLIAS:—

BIANCA, Wildman, pure white, cup petals, large size, the centre well up, very deep flower (having from 25 to 30 rows of petals), first-rate form, of excellent habit, and very free bloomer; has obtained four prizes, and was pronounced a first-class flower by the Floricultural Society of London. 4 ft.—10s. 6d.

DUKE OF WELLINGTON, Smith, rich scarlet crimson, fine cup petals, the centre well up, is of great depth and substance, a first-rate flower, a very profuse bloomer, and quite new in colour; it obtained a prize at the South Essex Show in Sept. 4 ft.—10s. 6d.

GENERAL SIR R. SALE, Smith, crimson purple, cup petals, well up in the eye, of good size, and great depth of petals, very profuse and constant bloomer, with long, upright foot-stalks, and is considered by competent judges the best flower of its colour yet offered to the public; it was pronounced a first-class flower by the Floricultural Society of London, Aug. 16, 1842; obtained a prize at Salisbury Plain, Aug. 31, a prize at South Essex, Sept. 8; a prize at Kingston, Sept. 15; a prize at Salt Hill, Sept. 16; a prize at Victoria Gardens, Stepney, Sept. 19; a prize at the Floricultural Society of London, Sept. 20; a prize at Sunbury, Sept. 22; a prize at Hammersmith, Sept. 27. 4 ft.—10s. 6d.

RIVAL YELLOW, Smith, deep golden yellow, fine cup petals, of great substance and depth, centre well up, of excellent form, very constant, and good habit. This Dahlia is warranted the best of its colour yet offered to the public. As the stock is very limited, early application is necessary to secure plants, many orders having already been received. No allowance on this variety. 4 ft.—10s.

RAINBOW, Smith, yellow, beautifully edged with rosy purple, of good form, very constant, free bloomer, and excellent habit, the flowers have long, straight footstalks; quite a new and distinct variety from any other in cultivation. The form of this flower improves as the season advances, sufficient to constitute it a show flower. 4 ft.—10s. 6d.

AMERICA, Drummonds, s. d. the centre well up, and s. d. fine purple, 4 ft. high. 2 6

Admiral Stopford, Trenfield, fine dark 4 ft. 3 6

Attila, Whale, light rose shaded 4 ft. 1 6

Alba purpurea superba, Bates, purple tipped with white 4 ft. 2 6

Alicia, Burdon, white-tipped with bright crimson, fine form, 2 ft. 10 6

Bedford Surprise, Sheppard, shaded purple, fine form 4 ft. 3 6

Beauty of Wakefield, white, edged with purple, 4 ft. 1 6

British Queen, Back, shaded bronze 3 ft. 2 6

Bride, Fawcett's, blush, tipped with rose, 3 ft. 1 6

Bea-size Rival, Pipe, rosy blush, cup petals, very constant, of good form and habit 4 ft. 10 6

Bridesmaid, Brown, white and lavender 3 ft. 1 6

Burnham Hero, Coker, crimson red 4 ft. 1 6

Blanche Shelley, Mitchell, white, tipped with purple, good form, 5 ft. 10 6

Beauty of Sussex, Mitchell, pink, deeply edged with carmine 4 ft. 10 6

Conqueror of the Plain, Spary, maroon, fine form 5 ft. 1 6

Compacta, Gaines, maroon 4 ft. 1 6

Candidate, Silverlock, dk. purple 4 ft. 1 6

Cyclops, Neville, dk. shaded with light crimson, 4 feet 2 6

Coronation, Smith, rosy scarlet 4 ft. 3 6

Coronation, Harrison, crimson shaded with purple 3 ft. 2 0

Confidence, Cook, shaded orange, good form, very constant 4 ft. 7 6

Competitor, Hodges, rose-shaded, fine form, 4 ft. 5 0

Duke of Cornwall, Low, bright rosy salmon, 4 ft. 2 0

Dowager Lady Cooper, Jackson, rose, fine form, 4 feet 1 6

Eclipse, Catleugh, vermilion scarlet 4 ft. 1 6

Eclipse, Widnall, deep scarlet 5 ft. 1 6

Euclid, Ward, shaded purple 4 ft. 1 6

Empress of Whites, G. Smith, white, good form, very dwarf grower, 2 ft. 10 6

Earl of Leitrim, Ogilvey, deep shaded purple, cup petals, large, and of good form; has obtained several prizes 4 ft. 10 6

Fanny Waugh, Forster, deep lilac, of fine form; it has obtained a first class prize at Hexham, and was on the second stand of 18 and the second of 24 blooms at the same place; was placed first in its class at Corbridge, & second at the Great North of England Show at Jesmond, near Newcastle; this variety is very constant, of medium size, great depth of petals,

F. & A. Smith & Co.'s List of Superb Seedling Dahlias continued.

Princess Royal, Hudson, s. d. buff, tipped rose, 4 ft. 2 6

Princess Royal, Horwood, primrose 4 ft. 1 6

Princess Royal, Thomson, bright orange, tipped & edged with red 4 ft. 2 6

Phoenix, Hedley, scarlet, 3 ft. 2 6

Ploughboy, purple, large, and of good form, 4 ft. 2 0

Purpurea alba, Harris, purple with white stripe, 4 ft. 1 6

Queen of Lilacs, Appleby, deep lilac 5 ft. 1 6

Queen of the Isles, Low, white edged crimson, 3 ft. 10 6

Retriever, ruby crimson, fine form 4 ft. 10 6

Rose Unique, Ansell, rosy purple, fine form, 4 ft. 2 6

Stanley, Jones, blush tinted rose, fine form, 3 ft. 3 6

Sir F. Johnstone, Hellier, purple, good form, 3 ft. 2 0

Sultana, Appleby, deep maroon, sometimes striped with light purple

With all the older varieties, from 6s. to 12s. per dozen.

F. and A. S. can also supply all the new varieties of other Growers, if timely notice be given.

VERBENA.

SPECIOSA, Kyle, bright vermilion, with blush or rosy eye, large trusses and very free bloomer, of strong upright growth: it obtained a certificate of merit at the exhibition of the Horticultural Society of London, July 9, 1842; in the *Gardeners' Chronicle*, page 425, the Editor's opinion is that the Verbena is handsome and very brilliant, and is, without doubt, a good variety; plants in May. 5s.

FLORISTS TO HER MAJESTY THE QUEEN DOWAGER.

SUPERB CHRYSANTHEMUMS.

YOUELL & Co., in offering their List of CHRYSANTHEMUMS (for which see their Advertisement in this Paper of last week, to the notice of Amateurs, and those who intend competing at the autumnal exhibitions of the present season, beg to observe, they have taken such precautions for excluding varieties merely nominal, that they feel assured the list will be found highly satisfactory to those who may not only have the above object in view, as well as to those who are desirous of decorating their greenhouse and garden with this unsurpassed Autumnal Flower. The plants will be strong and healthy, and sent free of postage (on the receipt of a Post-office order), to any part of the United Kingdom, in the first week in June, at the rate of 12s. per dozen.

They also feel much pleasure in announcing they have obtained the entire stock of an extremely beautiful seedling Chrysanthemum, from Mr. Wells, gardener to the Rev. J. Burroughes, of Lingwood Lodge, Norfolk. This splendid variety, named "The Duke," was exhibited at the Norwich and Norfolk Horticultural Society's Exhibition, where it obtained the First Prize, as the Best Seedling; it also obtained First Prizes shown in the best stand of 25; ditto ditto, 15; ditto ditto, 20; and the judges pronounced it to be the best Chrysanthemum ever exhibited. The colour French white, changing to pure white: petals broad and beautifully incurved, forming a perfect ball of from 4 to 4½ inches in diameter. It will be ready for sending out the first week in June, at 7s. 6d. per plant, free of postage, to any part of the United Kingdom.—Great Yarmouth Nursery, May 12, 1843.

NEW FUCHSIAS.

JOHN SMITH, NURSERYMAN, Dalston, Middlesex, begs to announce that having executed the orders taken last autumn for his new SEEDLING FUCHSIAS, by persons who had seen them in flower, he has a few sets of good Plants (10 in a set) left, at 50s. the set. A Post-office order will be expected from unknown correspondents.—May 12, 1843.

SURREY-LANE, BATTERSEA.

N. GAINES begs to inform the Nobility, Gentry, and others, that his Collection of first-rate PELARGONIUMS, &c., are coming into flower; therefore takes the liberty of reminding those that wish to improve their collection, that the present would be a favourable opportunity.—May 11, 1843.

FUCHSIA DEANSIA, &c.

WILLIAM DEANS, NURSERYMAN and FLORIST, Jedburgh, N.B., begs to intimate to the admirers of this beautiful tribe of Plants, that the above MAGNIFICENT FUCHSIA, and the Five others advertised with it in the *Gardeners' Chronicle* of Feb. 11, and subsequently, are now ready for sending out in good strong healthy plants. Orders addressed to WILLIAM DEANS, Jedburgh; Messrs. HURST and M'MULLEN, 6, Leadenhall-street, and Messrs. CORMACK and Co., New Cross and Covent Garden, London; or to Messrs. RONALDS, Brentford, will be duly attended to. A remittance required from unknown correspondents.—Jedburgh, May 8, 1843.

MESSRS. LANE AND SON'S Catalogue of PELARGONIUMS, FUCHSIAS, HEARTSEASE, VERBENAS, &c. &c. for the season, may be had on application (inclosing a 2d. stamp) at the Nurseries, Great Berkhamstead, Herts. The heights and colour of Verbenas are given in this Catalogue for the purpose of assisting amateurs in arranging their beds.

NEW AND MAGNIFICENT SEEDLINGS.
DENYER, VICTORIA NURSERY, Battle, Sussex, having purchased the stock of the under-mentioned splendid SEEDLINGS, raised by Mr. A. JENNER, gardener to Lady Webster, Battle Abbey, begs leave to offer them to the public, and feeling assured of their superior merits, he can with the greatest confidence recommend them to notice.

AZALEA INDICA JENNERII,—magnificent brilliant rose-colour, beautifully studded with deep spots; form good, and blooms very freely.

LADY WEBSTER PELARGONIUM, deep rose, with a pure white centre, the upper petals well marked with a rich deep spot; flower large, and good form; habit first-rate.

The above have been seen by several competent judges, and are pronounced superb. Plants will be sent out the third week in May, at 21s. each; the usual discount to the Trade. A remittance will be required from unknown correspondents.

Agents in London, Mr. H. CLARKE, 39, King-street, Covent-garden, and Mr. H. CLARKE, 86, High-street, Borough. Country Agents, Messrs. WOOD & SON, Maresfield, Sussex; and Messrs. BUNYARD & SON, Maidstone, Kent.

TRUE WALCHEREN BROCCOLI.

CHARLES FARNES, 128, St. John Street, London, begs to inform the Public that they can be supplied with the Seed of the above valuable article, warranted true at 2s. 6d. per packet. C. F. has also a large and truly select variety of Biennial and Perennial Flower Seeds, at 6d. to 1s. per packet, including German Hollyhocks, Wallflowers, Carnations, Autumnal and Biennial Stocks, Mimulus, Verbenas, &c. &c.

SKIRVING'S IMPROVED SWEDE TURNIP AND GUANO MANURE.

W. SKIRVING, SEEDSMAN, Queen Square, Liverpool, begs to acquaint his Agricultural Friends and the Public, that the price for the present season of the GENUINE SEED of his IMPROVED SWEDE TURNIP is 1s. 6d. per lb.; the sort warranted the same as that for which he received the premium of the Royal Agricultural Society of England.

GUANO of the best quality on the lowest terms. Orders, with a remittance or reference, will be punctually and faithfully executed.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition at the Auction Mart, Bartholomew Lane, on THURSDAY, May 16th, and THURSDAY 18th, 1843, at 12 o'clock, a splendid assortment of PELARGONIUMS and other Plants in bloom. CHOICE DAHLIAS, NEW FUCHSIAS, VERBENAS, FANSIES, and a variety of other flowering Plants. May be viewed the morning of Sale. Catalogues may be had at the Mart and of the Auctioneers, American Nursery, Leytonstone.

TO MARKET-GARDENERS and Others.—To be DISPOSED OF, the Interest in a MARKET-GARDEN of 28 Acres, with a good Residence, Stables, and Out-houses; about eight miles from London; part of the Land, with the Premises, on Lease for seven years unexpired. Further particulars may be had by applying to G. CHARLWOOD, Seedsman, 14, Tavistock-row, Covent-garden.

AUSTRALASIAN COLONIAL AND GENERAL LIFE ASSURANCE AND ANNUITY COMPANY.
Capital £200,000, in 2,000 Shares.
DIRECTORS.

Edward Barnard, Esq., F.R.S. C. E. Mangles, Esq.
Henry Buckle, Esq. J. B. Montefiore, Esq.
John Henry Capper, Esq. J. H. Ravenshaw, Esq.
Gideon Colquhoun, jun., Esq. William Walker, Esq.

BANKERS—Union Bank of London.

COLONIAL BANKERS—Bank of Australasia (Incorporated by Royal Charter, 1835), No. 2, Moorgate-street.

PHYSICIAN—P. Fraser, Esq., M.D., 62, Guildford-st., Russell-sq.

SOLICITORS—Messrs. Swain, Stevens, & Co.

SECRETARY—Edw. Ryley, Esq.

The advantages offered to Emigrants to the Australasian Colonies by this Company are,—First, that no extra premium is charged for residence in any of the Australasian Colonies, except in New Zealand. Second, that no extra premium is charged, to those who assure for the whole term of life, for one voyage out to the Australasian Colonies, and for one return voyage; and that premiums may be paid and claims settled in those colonies.

And to all persons who wish to assure their lives the Company offers unusually favourable rates of premium, participation in profits, and the guarantee of an ample subscribed capital.

Prospectuses and full particulars may be obtained at the Offices of the Company, 126, Bishopsgate-street.

THE FARMERS' AND GARDENERS' HAIL-STORM INSURANCE COMPANY. Offices, Wellington-street, North, Strand, London.

This is a subject which deeply affects the interests of both landlord and tenant, the destruction by Hail Storms being equally fearful and frequently more extensive than damage by fire.

Wheat, Barley, Oats, Beans, Peas, and Tares, insured at 4s. per cent., inclusive of the stamp, subject to the conditions contained in the policy. The Stamp on the policy is paid by the Office.

All claims settled in the month of November in each year, and should any disputes arise, to be referred to arbitration.

Glass in hothouses, greenhouses, &c., insured at 15s. per cent., subject to certain conditions.

Prospectuses containing every information may be obtained of the Agents of the "FARMERS' FIRM AND LIFE INSURANCE INSTITUTION," who are appointed in all the principal towns in the kingdom, or by letter, pre-paid, forwarded to W. SHAW, Esq., at the Offices, Wellington-street North, Strand, London.

HEATING WITH HOT WATER on all its improved Principles, for Horticultural and other purposes, by JAMES M'LATCHIE, Millwright and Engineer, Cottage-lane, Commercial-road, East. J. M. returns his sincere thanks to those Noblemen and Gentlemen who have already honoured him with their favours, and hopes by his economical Prices and sound Workmanship to merit their lasting favours. N.B.—Attends personally to all Erections.

HORTICULTURAL SOCIETY OF LONDON.—Four Lectures on CHEMISTRY, in its applications to Vegetable Physiology and the Arts of Cultivation, will be delivered in the Meeting-Room of the Society by Mr. E. SOLLY, F.R.S., &c., Experimental Chemist to the Horticultural Society, on THURSDAY, the 11th, 18th, and 25th of May, and 1st of June, at Three o'clock precisely. Fellows of the Society are admitted upon signing their names; all other persons by Tickets, which may be obtained at the Office of the Society, 21, Regent-street, price 10s. 6d. for the Four Lectures. By Order of the Council.

HORTICULTURAL SOCIETY OF LONDON.—Notice is hereby given, that no meeting of this Society will take place in Regent-street on Tuesday the 16th inst.

The Gardeners' Chronicle.

SATURDAY, MAY 13, 1843.

MEETINGS FOR THE TWO FOLLOWING WEEKS.
Tuesday, May 16 Floricultural, (Tulips and Heartsease).
Wednesday, May 17 Microscopical 8 P.M.
Friday, May 19 Botanical 8 P.M.

Tuesday, May 23 Zoological 8 P.M.
Wednesday, May 24 Geological 8 P.M.
Saturday, May 27 Royal Botanic 4 P.M.

A CORRESPONDENT and subscriber in Essex requests us to follow up the subject of wood-paving, which was introduced some months since by Mr. Ainger, with an intimation that he would continue it by describing a good method of laying down such paving. Mr. Ainger's reason for not pursuing the matter was the doubt very generally felt that the slipperiness would be a fatal objection to the use of wood in any shape. Till this question is settled the mode of combining the blocks is certainly a premature consideration; yet this is the point involved in almost all the numberless patents and projects to which the interesting paper of Mr. Stead in the Transactions of the Society of Arts appears to have given rise. Although somewhat out of our province, we may stop to remark upon the nature and probable validity of the shoal of monopolies claimed by wood-paving schemers. Judging only by common sense, we should doubt whether, when a new material was suggested for a given purpose, it is allowable for parties to rush to the patent office and secure the exclusive use of well-known methods of combining such and similar materials. The different modes of *dowelling, pegging, grooving, tonguing, rebating, joggling, dovetailing*, and a host of other well-known contrivances, would no doubt be tried in succession upon wood-paving, as they have in other matters, and as they would be upon any new material which might seem better adapted than Fir or granite to supply those peculiarities which a perfect pavement demands. Mr. Stead's paper embraces, we think, all the essential principles on which the secure laying of wood-pavement depends. We doubt very much whether many of the pavement patents are worth a straw: and we imagine that, so soon as the expediency of wood-paving shall be established, any intelligent workman could devise twenty methods of laying it down effectually. The mode which appears hitherto to have been a favourite seems to us decidedly bad; it does not break joint on the upper surface, and consequently presents continuous lines of weakness, which, as may be seen in all the trying thoroughfares, wear rapidly into ruts. In order to give a colour to some of the proposed monopolies, the angle to which the wood must be cut is estimated within a fraction of a minute: a question probably of as much importance as the angle at which the sail of the flying ship is to be set.

Besides the patents for combining the blocks, there are some for making an anti-slippery surface; but these consist principally of large grooves which have been used for the same purpose in other substances time out of mind; and which, in regard to wood, have the further defect of impracticability. Fir is too soft to maintain a useful groove against such wear as is furnished by the busy streets of London: and the deeper the groove the more ruinously do its edges break down.

The great desideratum in wood-paving is some mode of obviating that *unctuousness* of surface which it acquires when abraded in a half wet state. Pounded Fir-wood seems essentially slippery in certain states of moisture; and we must, perhaps, look to the chemists for some method of altering this. We are not without suspicion that the common kinds of Firs are not quite hard enough to bear the work of Cheapside; and lastly, we entertain the greatest fear as to their becoming rotten very much sooner than the projectors represent or probably anticipate. But, meantime, the slipperiness is the point of attack: there's the rub; and our Essex friend suggests that the Government should offer a reward for a successful remedy. We think, however, with all respect and deference, that the prize is already sufficiently large to attract as much science and ingenuity towards the problem as would be excited by a Government grant.

There is one attempt to correct the slipperiness which deserves notice, and which, perhaps, has not had justice done to it, on account of its having been in the first instance connected with a scheme for *laying*

the blocks, which was an entire failure: we allude to the invention of Messrs. Esdaile and Margrave for capping the Fir-blocks with Elm. Elm appears to be much tougher and much less greasy than Fir, and if the union between the cap and the block can be secured, this contrivance promises better than anything at present before the public.

THERE are various means of employing labourers usefully on a farm when work is scarce, and labour consequently cheap, which many farmers neglect from a mistaken economy, but which, when judiciously done, are as useful and profitable as any of the usual operations of the farm. In every field there are headlands on which the plough turns; and at every ploughing some portion of the soil, which is pushed before the plough, or adheres to it, accumulates there, and in time raises it above the level of the rest of the field. If this were not occasionally removed, the headlands would gradually be raised, so that the water could not run over them into the ditches. In most fields a deep water-furrow is dug, at about a pole distant from the ditch, and parallel to it, and from this there are deep cuts here and there to let the water off. Most good farmers periodically dig up these headlands and mix them with lime or chalk, and throw into a ridge, which is afterwards carted off and spread on the land; sometimes stable or yard dung is brought to the ridge, and the whole well mixed into a compost. A double advantage is thus obtained: the mellow and enriched soil improves the spots on which it is laid; and by the removal of the superfluous soil a slope is produced, over which the water runs readily into the ditches without the necessity of grips or water-furrows. The surface may, perhaps, after the removal of the top soil, require stirring and manuring before the headland is restored to its fertility; but this again gives employment. It is very useful, as well as a sign of neat cultivation, when a field slopes all round towards the ditches by which it is bounded, and when, instead of unsightly balks full of rank weeds along the head of the ditch, where the plough cannot work, there are gentle slopes made with the spade and shovel, giving a clean rounded appearance to the borders of the field. When hedgerows are full of old stumps of trees, or of brushwood, which encroach on the land, these may often be grubbed up by labourers in winter for the value of the wood for fuel, leaving a cleared surface, which may generally be advantageously planted with Potatoes; or if the wood will not repay the labour, the workmen may be allowed to plant Potatoes for their own use, by which means the improvement will cost nothing to the farmer, and the labourers will have useful and profitable employment. Where labourers have no allotments of land it may be advantageous to give them headlands to cultivate for a crop or two, on condition of their clearing them of bushes and narrowing or levelling the banks where they are too wide and take up much room. Woodlands, from which all the timber and underwood have been cut, can often be cleared and brought into cultivation at a very small expense, when allotted for a time to labourers, who undertake to grub up all the roots, to level the surface, and to dig or trench the whole, merely for the fuel it affords them and the produce of one or two crops. It will always be found that men will work harder, and be satisfied with less wages, when the speculation is their own, than when they work by the day for a master; and a very little experience will teach both employer and labourer to make a fair bargain. There is not a farm in England on which some useful work may not be found by which it would be improved. But the farmers complain of a want of capital for this purpose, and doubt the benefit which will result from the proposed improvements: if they would allow the intelligent and industrious labourers to find out jobs for themselves, and let them be remunerated by having a portion of the benefit of the improvements, they would gradually bring their farms into high condition, while they kept all the industrious labourers usefully employed.

We will dismiss this subject with the few hints we have given, and leave it to the good sense of proprietors and occupiers of land to devise the means of improving the condition of the agricultural labourers, by stimulating their industry, and by showing that the labourer and the farmer have only one common interest, which is, to make the earth produce as much as possible by careful and assiduous cultivation.—M.

WE have on several occasions introduced into our columns extracts from some letters addressed to the Farmers of Suffolk, by the Rev. Professor Henslow. It gives us great pleasure now to announce that these letters have been collected, revised, and published, in the form of a two-shilling pamphlet, the profit upon the sale of which is to be applied to charitable purposes. They form the best preparation we know of for the study of Chemistry and Vegetable physiology in their relation to Agriculture; so that their intrinsic merit should secure for them public favour

quite independent of the desire which we all must feel to co-operate in purposes connected with parochial charity. May they have, what they well deserve, a large and rapid circulation.

PERSIAN MELONS.

A COMMUNICATION which appeared in the *Chronicle* of the 29th ult., on the culture of the Persian Melon, induces me to offer a few remarks corroborative of the justness of the writer's ideas, from some years' observation of the culture of the Melon in India. My observations are confined to the western side of India, and chiefly to that part of the Deccan or Mahratta country between the 16th and 21st parallels of latitude.

The time of sowing the seeds commences in the latter part of January, just after the height of the cold season is past, and is continued up to the beginning of March. Ripe Melons begin to appear in the latter part of April, and are in the greatest abundance and perfection throughout May, and even continue well into June, if the rains do not set in early, and destroy or wash the Melon-beds away. The period I have indicated comprehends the driest, and part of the hottest, time of the year. In February the days are temperately warm, and the nights generally chill. In March the hot season begins to be sensibly felt, the nights, however, remaining pleasantly cool. Throughout April and May there is a progressive accession of temperature, the thermometer ranging from 90° to 100° and upwards by day, accompanied with a dry, hot wind, and seldom falling below 80° at night.

The Melons are grown in the beds of rivers from which the water has receded, the stream at this period of the year being confined to a small part of the channel. The Melon-beds are perhaps not more than a foot above the surface or level of the stream, and hence there is an ample and constant supply of moisture at the roots; for, since the beds are composed of nothing but the shingle or loose gravel of the bed of the river, the water percolates freely beneath their whole extent.

The natives, as far as I have observed, take very little pains in the cultivation of the Melon, and grow all sorts promiscuously, apparently without any selection, and Melons and Cucumbers indiscriminately mixed together in the same beds. Hence, as might be expected from such a course of procedure, you meet with great numbers of very indifferent quality, more like half Melons half Cucumbers than anything else; others of very fair quality, and others again, in the same bed with the worst, of very superior excellence, sufficient to show what might be done with more attention, and that high temperature, dry air, and abundant moisture at the roots, are the conditions most favourable to ensure excellence.

The fault generally observable in frame-produced Melons I think is, that the flesh is of too firm or hard a quality, and perhaps deficient in sweetness and delicacy of flavour. The best Indian Melons I have met with are, on the other hand, of a rich, melting quality, abounding in saccharine juice, of a very fragrant flavour. I found, however, that these qualities became much altered when grown at another period of the year; having once made some experiments on the cultivation of the Melon in common garden-mould in the monsoon, or rainy season, in a part of the country where the rains are generally light, and that year they were more so than usual. At no time was there a continuous fall of rain for ten hours, and there were intervals of three weeks and upwards without any rain; but the general state of the air was moist, and the direct influence of the sun was often intercepted by light clouds, or a hazy state of the upper atmosphere, which, however, did not prevent the transmission of considerable heat from the sun to the earth. The thermometer averaged from 76° to 80° in the day, and 70° at night. The seeds had been taken from a very delicious Melon, and the change was therefore the more observable. The plants grew well, but perfected their fruit with some difficulty, some decaying at half-size. Those which ripened possessed much of the original fine flavour of the parent fruit, but the sweetness had nearly all disappeared, and the flesh had acquired the firm, hard quality which I have observed so much in our frame-grown Melons.

Besides the Melons grown in the hot season, there is also a variety grown in fields and gardens in the monsoon, or rainy season, which I take to be merely the former somewhat altered in its qualities and habits by culture at a very different season. These monsoon Melons are very hardy and of rapid growth, and their general character is akin to what I have stated above as the result of experiment, in the fruit being deficient in sweetness, and the flesh being either hard or mealy; but they often possess considerable flavour, which is heightened or brought out by the addition of sugar.

Happening to have some seeds of one of these monsoon Melons when I left India, I inclose a few, in case any of your correspondents should be curious to try them, for which there is abundant time yet, being of rapid growth and very hardy. The characters are marked on the paper containing them.—J. H., May, 1843. [The seeds are sent to the garden of the Horticultural Society, to the charge of Mr. Thompson.]

ON THE CULTIVATION OF CONIFERÆ IN POTS.

NOTHING can excel the beauty of some of the kinds of Pinus and Abies lately introduced from Mexico, when cultivated in this manner; particularly Pinus filifolia, pseudo-strobus, Devoniana, Russelliana, macrophylla, patula, Montezumæ, Ayacahuite, &c., and Abies religiosa, &c.; therefore a few hints on their management may prove interesting to some of the readers of the *Gardeners' Chronicle*. Commencing with the seed, the best time I

consider for sowing it is the autumn; however, in the case of imported seed the time should be determined, if possible, from the period of its ripening in its native country; for I feel confident that many foreign plants might be more readily acclimatized if attention were only paid to this one thing. How many plants are there that will not endure the rigour of our climate on account of the seeds not being sown in time to cause the young wood to ripen before the approach of winter. The soil for raising seedlings should consist of two-thirds loam and one of silver-sand, placing the pots or pans containing them in a dry and airy part of either house or pit, as near the glass as possible. The front of a curvilinear house would answer admirably for this purpose, observing to withhold water as much as possible until germination is apparent; seeds subjected to this treatment have been found to germinate, whilst others, differently placed, after receiving every attention, have failed. Provided seeds are sown in the autumn, two or three waterings would be sufficient until spring commences, when an increase of water will arouse the vitality they possess, and a fine crop of plants will soon make their appearance. Potting off should be attended to as soon as their cotyledons or seminal leaves are properly developed, making use of 60-sized pots. The soil at that period should consist of turfy loam, peat, leaf-mould, and silver-sand, in equal proportions, broken fine, placing the plants in a close frame for a few days, until they have re-established themselves, when air should be gradually admitted; and it appears to me from experience that the more the plants are stunted in pots of this size, the better they are hereafter; but the same thing would be prejudicial provided they were in those of a larger size. Any one having plants in the condition just mentioned should immediately remove them into 48-sized pots, using the same potting material as last described, but not broken so fine. Good drainage will now become of great importance; nothing is better than the roughest of the fibrous soil, placed on the potsherds at the bottom; in the space of six weeks, another shift would be required into 24-sized pots, increasing the quantity of loam a little; and, at the approach of autumn, place them in 8s, which will enable the plants, through the new spongelets they may form, to store up a sufficient quantity of matter in their interior to meet the demand when vegetation is again set in motion. The soil now required will be one-third turfy loam, one do. of peat, the other rotten dung and river-sand in equal proportions. In the spring of the ensuing year they should be again removed into 2s, making use of the same soil as last described. This will complete a period of 12 months' growth; wherein, if due attention has been paid, the plants will be objects of wonder. Thuja, Cupressus, Juniperus, Araucarias, &c., may all be included under this head. To enhance their beauty particular care should be taken to give them full exposure during the summer season, and to withhold fire-heat throughout the winter. How many wretched specimens are to be seen at various places from these important things not being attended to! If kept either in pits or houses, the sashes should be removed during summer. What would appear more ornamental in any part of a garden, particularly on a lawn, during that season, than those very plants? But great care should be exercised that the pots are often turned round, to prevent the roots penetrating through the hole in the bottom. Fancy can hardly picture a more beautiful object than *Pinus filifolia*, with its leaves from 1 ft. to 1 ft. 6 inches in length; and also the graceful *Abies religiosa*. After the largest-sized pots have been made use of, slate tubs, or those of any other material, should be substituted. And at a very trifling expense a building might be erected—covered with slate, tiles, or anything convenient; observing to make the front movable, so as to admit light, air, &c.—wherein the plants may be placed during winter. No doubt, some of the kinds above mentioned will endure the severity of our winters, if planted in the open air, in many parts of England, but it is not expected that others will do so.—*George Bishop.*

AMATEUR'S GARDEN.—No. XIX.

If the reader will examine the *Gardeners' Chronicle* of March 18, p. 173, he will there find some observations on the arrangement of Plants in Flower-gardens, according to their complementary colours. As the late rains have rendered the ground in a fine state for planting out, and as all danger from frost may now be considered as past, those remarks are particularly applicable at this time, when the plants should be bedded out as fast as possible. To render the grouping of colours as simple as practicable, I subjoin the following arrangement; and, if each colour is considered a bed of flowers, the reader may form a tolerably good idea of the appearance of a garden thus arranged. This arrangement is supposed to be on grass, and hence warm colours, as scarlet, purple, orange, and their shades, prevail; but had it been on gravel, which is a warm colour, the cold colours, as blue, yellow, and white, which for gardening purposes, take the place of green, would have been placed in the beds containing warm colours, and *vice versa*. The beds are supposed to decrease in size from the centre one to the sides, and consequently the tallest plants are placed in the beds numbered 1 to 12, and they gradually decline in height; so that, at the sides, the plants are little more than 6 inches high, and thus the whole garden forms a regular and beautiful group. Annexed is a list of plants adapted for this arrangement; some of them may not be of the exact colour, but they are as near as can be got. The numbers correspond with those in the arrangement. It will not be denied that colours thus arranged will have a far more imposing appearance than when thrown together at random, as is too frequently the case. Here each colour has its contrasting one close by; as

scarlet and white, purple and yellow, orange and blue, and so on of their different shades; and while they mutually enhance the brilliancy of each other, the group as a whole is far more imposing than it could be under an indiscriminate mixture.

In the planting of plants in groups there are three things which deserve particular notice. First, to place all plants with their tops pointing to the north; secondly, to plant all strong growing-plants very shallow, that is, with the ball little more than covered with soil; and thirdly, to plant weak-growing plants deep so as to make them grow luxuriantly.

These rules, simple as they are, are of considerable importance; for if plants are not placed with their tops to the north, the points of the shoots, when pegged down, will not assume an erect position; while, if luxuriant-growing plants are planted deep, they grow still more luxuriantly, and flower but little; and if delicate-growing plants are not planted deep, the roots get parched up and they quickly perish.

After the plants are planted, the beds should receive a thorough soaking of pond-water, so as to make the soil almost like a puddle; and then, the following day, be hoed and raked over, so as to leave the surface loose. The plants may then be pegged down, and will require little more attention unless the weather is very dry.—*W. P. Ayres.*

HOME CORRESPONDENCE.

Vines.—I beg to state, in reply to "A Grape-grower's" remarks at p. 286, as before, that the Vines at this place were planted in 1839, and at this time, 1843, are carrying their fourth crop of fruit—not light, but heavy crops; further, that the Vines when planted were neither old ones nor yet Vines that had been in bearing, but young two-year-old plants, and very weak, the strongest in the whole when planted did not exceed one-eighth of an inch in diameter. A leaf produced from one of the young canes the latter part of the season I forwarded to the *Gardeners' Gazette* office, which measured 17 inches across by 30 in. including the footstalk: the Editor's remarks were, "The leaf sent is of the most extraordinary dimensions we ever witnessed." In 1840 they bore from 6 to 12 lbs. of fruit on each Vine, varying in weight from near 7 lbs. to 1 lb. In 1841 they bore a heavy full crop—the Vines from the growth of two years invariably pruned to 16 or 17 feet. In 1842 they surprised all that saw them, some of them carrying from 50 to 60 lbs. weight of fruit. And now, (1843,) they are equally fine, which I hope will be a sufficient explanation of their carrying their fourth crop of fruit. It was my purpose, from the course of culture I intended to pursue after planting, to effect one object, viz., to bring them into a bearing state earlier than what was commonly practised (in conjunction with health and strength); which, I think, from the specimens of five varieties I showed in Regent-street, Sept. 7, 1841, with Dr. Lindley's remarks on them, will fully bear me out. They have only one fault (if it can be deemed a fault), viz., they are over-fruitful, which often tempts an avaricious mind to overburthen their too generous nature. I now come to explain how I get six bunches from one eye; few words will suffice:—by my system of disbudding and spurring (which will be found fully explained in my treatise) at and before winter-pruning, no more buds are left than are absolutely wanted, and from one of those buds left on the leading shoot, this season produced six perfect bunches, and many four and five. I mentioned at p. 230, in a second house, six Vines had shown 422 perfect bunches (bear in mind, grown over Pines). Yesterday I had the curiosity to count the spurs upon some of the said Vines, which are as follow:—Grizzly Frontignan, 20 spurs, showed 94 perfect bunches; White Muscadine, 21 spurs,

83 bunches; Black Hamburgh, 19 spurs, 63 bunches; and last (not least, but not included in the six before mentioned), Black Damascus, 15 spurs, 43 bunches. If your correspondent "A Grape-grower" cannot content himself with this explanation, I will be glad to see him at Eshton, to give him ocular demonstration. The houses for Pines and Vines at this place are 17 feet clear in width at the base, 11 feet high at the back, and 2 ft. 6 in. at the front.—*James Roberts, Eshton Gardens.*

Scotch and English Farmers.—In place of controverting your correspondent's statements (p. 301,) I shall give his own words in his first communication, in order that your readers may judge if I have overstated what he said. Concerning my first argument on climate, since your correspondent has not mentioned it at all in either of his communications, nothing need be said. Relative to my second, on Wheat, hear his own words:—"Then, as to Wheat, excepting in those favourite districts, the Lothians and the Carse of Gowrie, have not the Scotch farmers nearly given up its culture? Have they not found it a loss rather than a gain?" Does not this amount to what I have said? On my third, respecting ploughs—"Next," says he, "let me introduce their ploughs—their far-famed ploughs, of which they boast so much. Were they not tried at the great Agricultural meeting the year before last at Liverpool, and last year at Bristol, and in both instances found wanting—requiring nearly twice the draught of the poor despised English plough?" The word weight, I admit, is not here; but otherwise the meaning is the same. Again, with respect to Turnips, he says—"Witness the effect of last summer's heat on their roots in Scotland, where they were as much injured by blight as usually they are in the south of England; and, no doubt, were the Scotch farmers annually subject to such summers, they would be glad to resort to broadcast tillage to have a crop at all." Where is the difference between your correspondent's meaning and mine? I asserted, and do still assert, that the crops here, in the centre of Scotland, were good; nay, very good, and gave him proof of it. Now, in his last letter he says,—"My observations of the crops of last year extended to Roxburghshire, Dumfries, Lanark, and Galloway; where the farmers anticipated a total waste of the bulbs, which were abundant, from the injury done by blight, until the rains came in October, when a new foliage sprung from the crowns, and the bulbs were saved." What was only an anticipation in September, 1842, was not so in March, 1843, when your correspondent wrote. Besides, he should have kept in mind, that these four counties are but a small part of Scotland, while what he said applied to Scotland generally. These counties, moreover, do not contain the best soil in Scotland, which renders it still more unfair to compare them with the south of England. With respect to several other remarks in your correspondent's first communication, which I have passed over, and therefore he thinks I have nothing to say upon them; I beg now, to remark that, among these the size of the acre figures; but I must inform him that this is known to the landlord as well as the farmer, and paid for by the latter. To the English farmer the tithe and poor-rate are known, as well as to the landlord; and not paid above the rent by the farmer, any more than tiend (another name for tithe) is in Scotland. From the great competition in farming, I fear that land, both in England and Scotland, pays fully as much as it should do, and from this cause also it will not be cheaper in the one country than in the other for any length of time. Your correspondent in his last letter approves of the team of three or four horses; saying, in substance, that it is only training young horses. Now our Scotch farmer finds it more advantageous to work two mature horses, which do as much work, and yet do not consume so much food as three or four young inert ones. But this is not all; for he adds, "they require nearly twice the draught of the poor despised English plough." It follows then, that it requires from five to seven English horses to do the same work which two do in Scotland; and there is as stiff clay in the Carse of Stirling, as in any part of England. I say again, if this be true, the English farmer labours under a real disadvantage, requiring from five to seven horses to do as much work as the Scotch farmer gets from two; and horse-food is neither rent, tithe, poor-rate, nor tiend, but a real tax upon the farmer. At p. 209 he says, "I might go farther, and show the deficient practice of the Scotch farmer in breeding and feeding." Granted; but for this plain reason—he finds that without greater skill in breeding and feeding, "prime Scots" bring in Smithfield Market more money than English beasts, however skilfully bred and fed, and therefore he finds it labour in vain to attempt to improve upon the best. When this is needed, he may, perhaps, be able to meet the times. I conclude by saying, that tithe, poor-rate, tiend, large or small acres, &c., may figure well enough in a theory of rent, but they have no place in the practical question of paying it. Land, both in Scotland and England, like everything else, will bring to the landlord, and demand from the farmer, its true value, and it will do no more for any lengthened period, without injuring all parties. I once intended to say nothing upon draining, subsoil-ploughing, &c., but as your correspondent asks what great discoveries the Scotch farmer has made, I answer, that he has discovered this fact, that draining, &c., in order to be useful, must be put in practice; and he has done it, while the English farmer who, according to your correspondent, has known it for one hundred years, has dreamed over the knowledge of it all this time, until now that he is beginning to awake, he finds it more valuable than his dream. No man pretends to have discovered Christianity, yet every one who believes it as the discoverer enjoins, enjoys as much benefit from it as if he had discovered it; and this is the exact state of the Scotch farmer, and it is that which constitutes him a

good farmer, and the English one a bad farmer.—*Not a Scotch Farmer.*

The Parks.—I am much surprised to find by your most valuable Paper of Saturday last, that your correspondent "Lexicon" disapproves of the naming of the trees and shrubs in Kensington Gardens and St. James's Park; and I am much gratified to find that you are not of his opinion. I think that the naming of these trees and shrubs is a most laudable effort, on the part of the Commissioners of Woods and Forests, to render these delightful places of recreation as interesting and as instructive as possible. To Gardeners and Amateurs these names will be exceedingly useful; and to ladies who are attached to Botanical pursuits they will be a source of pleasing recreation. They will, I trust, also interest the youthful mind, so many of which class frequent these delightful breathing places. The Commissioners of Woods and Forests will, I trust, remove the hurdles which at present prevent the public from going among the named trees and shrubs, without which few of the names will be distinguishable from the walk. I am pretty sure that very little injury would be done to the plants by their doing this; for the public, I think, know better now-a-days. This I think is fully borne out by the little injury that has been done to Kew Gardens since they have been open to the public. I trust your correspondent "Lexicon" will clearly see from your interesting and plain explanation that the naming of these trees and shrubs will be of immense advantage to the public, though it may not be so to him; and that the Commissioners of Woods and Forests deserve the greatest credit, as you say, for having done what they have. I hope the so-called fountain, of which you complain, will be speedily removed, and something of a more artistical character and in harmony with the scene substituted.—*Ortolano.*

Bees.—"E. M. W." presents her compliments to the Editor of the *Gardeners' Chronicle*, and for the benefit of all apiarians who, like her, wish to manage their Bees themselves with the least possible trouble and risk, and to have the power of examining their interesting proceedings at all times, she has procured a sketch of the "Patent Bar and Frame-Hive," which, she believes, will considerably facilitate the experiments of Amateurs in general; and offer the easiest mode of taking the honey to those who keep Bees for profit as well as amusement. This hive was invented by Mr. Munn, of Throwley-House, near Faversham,—a gentleman whose apiarian taste has led him to spare no trouble nor expense, in order to procure a hive which might include the following advantages:—Perfect protection from wet in the open air; an equable temperature within, in winter and summer; a method of feeding the Bees without exposure to cold or attacks of other insects; protection from vermin and thieves, (being under lock and key;) cool store-room, and easy method of taking the honey; every facility for making artificial swarms, and performing every experiment that ever has been tried, and complete inspection of the entire hive, under every possible circumstance, without disturbing the Bees, or stupefying them with smoke. A hive on this construction may be seen at Mr. Milton's, 10, Great Marylebone-street, Wimpole-street.—*Rectory, April 28, 1843.*

["Patent Bar and Frame-Hive," containing eleven frames; one being drawn out to exhibit the comb in the glass observation-frame.]

Floricultural Society.—The remarks which headed your Notices to Correspondents in last week's Paper will be read with interest by the numerous class who cultivate Florists' flowers, as an earnest of your intention to follow up with renewed vigour the exertions you have hitherto made to gratify their tastes in common with those of your other readers. To those of your correspondents who would sacrifice a great general object on the shrine of disappointed personal vanity, or because their individual notions or private purposes cannot be carried into effect, I would offer a few remarks on the Floricultural Society. This Society was formed in consequence of the repeated demands of those who had seceded in disgust from the former Metropolitan Society; and having once been established by the exertions of a few, was soon joined by the great majority of well-known florists, both amateur and professional, its objects not being in opposition to any other Society, but principally directed to the examination and encouragement of seedlings. Many of these parties,

actuated by sincere and proper motives, have continued their support; but many, on the other hand, from causes which I do not now wish to scrutinize, have retired in disappointment, and expressed this by abuse. I would not attribute unworthy motives to all such, for even in the best of us there is a feeling which arises from disappointment, and often exercises an influence over our conduct of which we are not conscious—and this is especially the case when the parent-like affection we have for our own productions (particularly if our interest is also at stake) meets with any check. Hence has arisen the idea that the Society has been unnecessarily strict; and from this, amongst other circumstances, the Society, however steady in its advance in the estimation of the public and of all honourable men, has not been supported by some of those who would eventually be most benefited, with the vigour and cordiality which might have been expected, had their desire for a fair and impartial tribunal really been zealous. Another charge against the Society is, that they have refused to give private opinions, (which of course are forgotten if adverse, but, without fail, made public use of, if favourable,) and have thereby discouraged appeal from those who did not wish to have their names appear. This may to a certain, but very limited extent, be true; but the general advantage of the system is so great that it ought not to be sacrificed to a trifling exception, and after all, the test by which the Society must be judged is not whether they have pleased every one, for that is impossible, but whether they have acted up to the principles with which they started, and whether, allowing for the fickleness and uncertainty of the flowers, the merits of which they have been called upon to decide, and the fallibility to which all human judgments are occasionally subject, the result will prove that they have been guided by the honesty of purpose and the skillfulness for which you have given them credit. In regard to the Society's holding its meetings by candle-light, the convenience of the great majority of the members is thereby best consulted; and, but for this arrangement, too much of their valuable time would be sacrificed, or they would be altogether unable to attend.—*T. C. Wildman.*

Scotch Crops.—Through the medium of your Paper I take the liberty of asking a question of your correspondent of p. 265, signing himself "Not a Scotch Farmer." His account of the extraordinary crops of Wheat and hay obtained by Mr. Mowbray, of Cambus, chiefly, as I understand him, by the application of Liquid Manure, I do not disbelieve; but as an average produce of 9 quarters to the acre over a field of 30 acres, and in some places of that field of 15 quarters to the acre, and a crop of 3½ tons of hay to an acre, are results so far exceeding any I have ever heard of from the best farming on the best land in this country, I wish to inquire—in what proportion, and at what periods of the year, was the Wheat crop watered with the Liquid Manure; and what species of cart was employed?—*A Subscriber.*

Budding Roses.—As the plan which I adopt in budding Roses has been eminently successful, (scarcely one having failed out of a very large number of stocks operated upon last year,) perhaps you will allow me again to repeat it, for the benefit of my amateur brethren. I generally select the Bengalensis (or Blush Boursault, as some gardeners call it) in preference to the Wild Briar, which I find more apt to canker and become bast-bound. I commence my labours about the beginning of June, and continue till the middle of August; and I invariably leave a small piece of the wood, as a protection to the eye, using worsted for binding instead of bast. The rise of the sap is rapid and plentiful in the Bengalensis, which keeps the bud cool even in the hottest weather, which was satisfactorily proved last summer. Some of the stocks which I worked early in the year formed good ripe wood before the winter, and promise to produce a fine crop of blossoms this season. The propagation of the Bengalensis is exceedingly easy; and although it is rather capricious in flowering itself, it never fails to support a stranger in a most flourishing condition. The disappointment of amateurs in budding is occasioned too often by their attempting to deprive the bud of all the wood, which, unless it is very skilfully extracted, irreparably injures the bud. New wood must, of course, always be chosen in both cases.—*W. W.*

Scarlet Pelargoniums.—In noticing Mr. Drummond's remarks on these plants, I think he is a lucky man to have so much bottom-heat, other materials, and spare time,—which few gardeners can now boast of. I will offer a few simple hints as to how I manage to have plenty of good plants to turn out with little trouble; it may be acceptable to some one who is, like myself, short-handed. The readiest way is to raise them from seed. If, however, you have any particular sort, you must propagate by cuttings, which I manage in the following manner:—I turn all the plants I have to spare into the open border about the 21st of May; I thus get plenty of cuttings and seeds. The cuttings I take off about the middle of July, in an afternoon, and trim them ready for potting the next morning, cutting them close under the fourth joint, laying them thinly in the greenhouse or shed, to dry till the morning. I then get some wide-mouthed thirty-two-sized pots, and fill them about half full of crocks, with the rest silver-sand and leaf-mould, equal proportions, putting them close round the outside of the pot with a dibble, and pressing them firmly. I give them just a sprinkle of water, and place them in a two-light box, only filling one light, so that the light that contains the cuttings may be covered with a mat, and the sun be allowed to shine on the other; which will warm the frame. If the surface of the pots is dry in the morning, I give a gentle watering, giving air for half an hour to get the leaves dry if it is likely to be a dull day. I apply no water unless the cuttings look very flagged. They will be well rooted in a

month or five weeks. I then pot them in thumb-pots, setting them in the frame, shading from hot sun, and harden them to it by degrees, as they will bear it. As soon as they have filled the pots full of roots, they are shifted into sixty-sized pots, with more leaf-mould and less sand, and put into the frame again, where they are kept close for a week, till established with fresh roots. More and more air is then given, till I leave the light quite off. The plants are then set out thinly on coal-ashes, where worms do not get into the pots. Pinching off the tops, I let them stand out as long as they are safe from frost, and store them away where room can best be spared, giving as much air as consists with the safety of other plants. I have thus fine healthy stock plants to plant out, which require no layering to make them dwarf, and no shifting from the sixty pots; for I have now good plants raised in that way, showing three or four heads of flowers. The seed is easiest saved about the latter end of August, gathering the heads as they ripen, and laying them in the greenhouse or hothouse on paper, thinly, to dry. When dry, they should be well rubbed out, and sifted in a sieve of such a size that the seeds may pass through, leaving the seed-vessels in the sieve. Keep the seeds dry till March, and then sow them in pans, placing them in a cucumber-frame till they germinate. They must not remain there long, or they will damp off; take them to a vinery or hothouse, and place them near the glass till they have four leaves, then prick them out in pans or boxes till they are two inches in height, when they must be potted in thumb-pots. They should afterwards be potted into sixty-sized pots, and treated exactly as recommended for the cuttings. If there is plenty of room, and large plants are desired, they must be stopped and shifted into forty-eight-sized pots. But I find that the smaller the pots, the less likely the plants are to shed their leaves, as the Scarlet Pelargoniums do not root so freely as the other kinds. I have now about a thousand seedlings ready to prick off, and find it much easier than striking them by cuttings, besides the chance of getting improved varieties. I never heard before of potting the plants in fresh green turf;—will any of your correspondents say whether they have found it answer, as it seems something new?—*Caleb Diplock.*

Manures.—The very interesting and instructive experiments of your correspondent at Cookridge, near Leeds, seem to furnish an illustration of the principle in artificial manuring—that little benefit can be expected in employing a fertilizer, the components of which do not enter, or but in a very small proportion, into the composition of the plant it is intended to grow. On referring to the table given by Dr. Daubeny, in Vol. iii. of the Journal of the Royal Agricultural Society, entitled Table II.—of the Constituents of Crops—it will be seen, that of all the crops therein named, Potatoes contain the least lime, and but a few contain less sulphuric acid. The proportion which these two substances bear to one another is pretty nearly that of their representative numbers, so that it may be inferred that in the Potato root they are really present as sulphate of lime or gypsum. Another reason why gypsum alone was not likely to benefit the Potato is to be found in the fact, that almost all soils contain an appreciable quantity of this substance; and the Potato requiring but a very small supply, and being furnished with deep-striking roots, it would probably meet with a sufficiency in any soil not absolutely destitute of it. If this be so, the inutility of applying gypsum, in this case, as a manure is evident. Not so, however, with the alkalies; for the Potato, in its natural state, contains as much soda as dry Wheat grain, and more than one and a half times the quantity of potash.* This consideration is evidently the key to the fact of the great benefit effected on this root by wood-ashes (rich in potash), and sulphate of soda (glauber salts). I think it would be satisfactory to know with certainty whether or not the soil, in the experiment of your correspondent, does really contain sulphate of lime; and if he think so too, I shall be happy, gratuitously, to solve the question, if he will forward a sample to me, and I will let your readers know the result.—*W. H. Potter, Chemical Works, Fore Street, Lambeth.*

Gentianella.—(*Gentiana acaulis*).—This is seldom seen to flower well, and Doctors differ much about its treatment. I made a little square bed, in 1840, in which I planted 20 good-sized bunches, with good balls of earth attached to each bunch. They have flowered well every year since, and have been much admired by all who saw them. At the present time there is upwards of 350 blossoms upon them; the situation is very low, so that we lose many perennials in damp winters. The soil they are grown in is half common garden mould, which is very light, and half loam and leaf-mould, such as comes from an old Melon-bed; and every year the bed is top-dressed with loam and leaf-mould, in fine weather, in February or early in March. Neither spade nor fork is used among them, but when a weed appears it is taken away, and the top-dressing is done carefully between the plants.—*Winchester College Gardens.*

Frozen Plants.—Notwithstanding the soundness of "C.'s" arguments, I am still doubtful if the method prescribed at p. 84, has the effect of abstracting frost from plants. "Facts are stubborn things," and I have fully experienced that, when the plan is successful, the plants had received little damage. If "C." has determined it by actual experiment, I am bound to submit to his better judgment; and when occasion requires, I may still continue to practise it, against the evidence of my senses, on the faith of others. Indeed, one morning last month, when visited with both

* I would strongly recommend the leaves of the Beet (or, perhaps, those of Mangold Wurzel would do as well,) as a manure for Potatoes, as they contain much alkali.

frost and snow, I tried it on wall-trees, and Gooseberry-bushes, without any marked result. I am perfectly aware that frozen vegetables, of a hardy nature (possibly greenhouse plants likewise, which I mean to try the first opportunity,) if immersed in water soon recover; but they must not be exposed again to a freezing atmosphere in their wet state, or the frost would lay greater hold on them; and unless a plan could be devised to place the plants, immediately on watering, in a temperature above freezing, any benefit they received from the water would soon cease, should the water freeze upon them; which is more from the state of the atmosphere than from any secret interchange of temperature going on between the plant and the water, as it is well known water will not freeze, even if thrown upon ice, unless the temperature is below freezing (?). The analogy between a cold bar of iron in a warm hand and the present case does not hold good, since the effect produced by the process of interchange ceases immediately the hand is removed; so the watering, to have any effect, ought to be of sufficient quantity to prevent its congelation on the plants, or their texture would be more endangered than if they had remained dry. I am sorry I expressed myself so vaguely, that "C." should suppose me ignorant of the tendency of heated air to ascend; and that, consequently, the nearer the glass, the warmer it is. I thought I wrote near the front glass; my Pelargoniums stood on the floor of a vinery between the upright sashes and the flues which run along the middle of the house, and on a little higher elevation than where the plants stood; so that there is no inconsistency in the injury being sustained in that position. "C." is likewise in error as to the object for which I place pans of water under my Apricot-trees, which is not to create evaporation; but from the affinity which frost has for water, it is conjectured that the nitrous particles which will lodge on the dewy blossom would be diverted into the water.—*J. M.* [This last paragraph is above our comprehension.]

Birds.—Two or three years ago I witnessed a very surprising instance of parental affection in a very young bird, exemplified in the case of a Thrush, which had been taken from the nest about a fortnight and was just able to feed itself, and a couple of Blackbirds about three parts fledged, and as yet unable to feed without assistance. The latter were introduced into the Thrush's cage, and had not been there long before the Thrush, itself only just emerging from babyhood, took compassion upon their helplessness, and began feeding them with all the solicitude of a mother. From this time till they were able to feed themselves it constantly attended to them, and upon no occasion could it be tempted to swallow a morsel itself, however tempting, until its young companions were satisfied.—*Boughton Kingdon, Teignmouth.*

Vines.—Has guano been applied to Vines, and if so, in a liquid or dry state? My Vines show a quantity of blossom every year, and as regularly shank off; although for some years past I have never applied fire-heat to the house; the border is fully exposed to the sun, never having any crop on it, so that in this instance you would think that it could not arise from the cold at the roots and heat at the tops. I have tried guano with everything, and found everything benefited by it. I enabled a Greengage Plum last year to swell and ripen an enormous crop, solely, I am sure, by giving its roots a copious dose of guano in the middle of July.—*E. F. L.* [Guano should always be applied in a liquid state, and not too strong; a little and often is a good maxim to observe with it. It is not possible to say what causes your Grapes to shank without inspecting the place; but we entertain little doubt that the roots are wrong—perhaps in a cold wet subsoil.]

Bones.—I am rather surprised to find from Mr. Solly that boiled bones are so superior to unboiled. I have purchased both, and I find the former weigh 56 lbs. to the bushel, whereas the latter only weigh 28 lbs. This is a great difference; and I cannot comprehend how bones, as a manure, can be improved in value by having all their juice stewed out of them. Surely, 28 lbs. to the bushel of fat, grease, and glue, must be worth something. I am not prepared to prove the actual difference between the two as regards their effects on land.—*E. R., Halifax.*—[It is understood that the experience of farmers, especially in Cheshire, is in favour of boiled bones. Theory would possibly prefer them unboiled; but if facts are against it, theory must give way. Will you kindly report the result to us?]

Turnip-fly.—I have found that lime lightly strewed over Turnips (just up) before the dew is off the ground in the morning, most effectually and invariably preserves the crop from the Fly, &c. This I know will be useful to some of your readers.—*Rus.*

Seeds.—The Editor of the *Gardeners' Chronicle* agrees with me, that seeds sown in dry, pulverised soil, shortly afterwards moistened with rain, will be more likely to vegetate than seeds sown in soil already moist; the Editor does not, however, admit my reasoning upon the fact. In a late Number of the *Chronicle*, a grower of Scarlet Pelargoniums, who frequently repots his cuttings, shakes the soil from their roots, which he afterwards dips in warm water, before replanting, assigning as a reason, that the soil adheres more firmly to them when they are fresh potted. I know a lady who never fails of success in transplanting into pots for winter bloom, seedling plants of Mignonette. From the roots of these she shakes off all the soil, and replants them in puddled holes in pots of earth: I may be wrong in believing that success, in both cases, depends upon coating the roots with fine particles of soil, under circumstances which will secure its adherence: the Editor's explanation will be thankfully received.—*C.*—[It may be true that our correspondent's explanation of the behaviour of his roots is just; but it cannot hold good of seeds, because as soon as the radicle sprouts forth, it leaves that

surface to which particles of earth are said to adhere. The reason why it is best to sow seeds in what is called dry earth, is, that they may be very gradually, not suddenly, moistened; they then decompose the water as they get it, and are not suddenly gorged with fluid they cannot digest.]

Draining.—In your Number for April 15 I observe a communication signed "W. W.," strongly recommending a mode of draining by a movable mould, upon which the strong clay of Gloucestershire is forced down and packed, when the mould is withdrawn for another operation. Its cheapness at 1½d per yard, and its duration said to be proved for 18 years, would be great recommendations, but they will not justify the practice if it is ineffectual for the purpose intended. Drainers are very apt to imagine that their object will be attained by merely forming an underground passage through which the water will flow, and this is very well where a spring is to be caught and carried off, but where frequent or furrow-draining is the operation to be performed, the object of which is to collect and convey away the surface-water along the whole course of the drain, the plan under discussion will be utterly inefficient. It is painful to see a piece of good land covered with coarse swampy herbage, or bearing miserably-stunted crops for want of draining; but it is still more provoking to see a similar state of things from drains being badly executed, when the whole capital spent in their construction is literally buried with their materials; yet this often happens not only from the plan under discussion, where the very support of the drain depends upon its being made impervious to the water it is intended to carry off, but from the slovenly execution of frequent drains of tiles, stones, or other materials. It is commonly imagined that when the drain is laid the work is done, and that the most retentive soil may be heaped in and packed down above it; whereas laying the drain is but half the work, if an access-soil for the water from above is not retained by filling it in for a considerable depth with gravel, broken stones, or porous earth. And thus this most invaluable improvement is subjected to distrust, and a vast amount of capital is wasted for want of a little reflection or attention to practical rules.—*J. S. F.*

Wireworms.—Observing many inquiries in your Paper as to the best mode of destroying the Wireworm, I beg to tell you that last year I had been using some chloride of lime-water, and poured it over some grass, when it immediately killed the worms. I was from this success induced to try it on some very sickly Carnations infested with Wireworms, and had the satisfaction to find them recover rapidly. The proportion I used was about a table-spoonful to a pint of water, but this of course must depend on the quality of the soil.—*F. B. H.*

Pears.—In reply to "A Subscriber," I beg to inform you that the Pear "Inconnue (Van Mons)" was sent to me some six or eight years since, by M. Van Mons, of Louvain, as a seedling without name, with several others, also seedlings not named. To distinguish them, they had the above name attached to them, with the number in the catalogue. Thus, the above is "Inconnue Van Mons, 175:" several others, with different numbers, have not yet fruited. The above is a most excellent middle-sized melting Pear: shape, oblong; colour, green; keeping till February. Inconnue Van Mons, 219, will, I think, prove also a fine late Pear. I have reason to believe that Pear culture is yet quite in its infancy. I anticipate that we shall have as many fine varieties ripening in spring and early summer as we have now in autumn. To arrive at this, seedlings should be raised from some of the late Pears that keep through the year, such as Bellissime d'Hiver, Easter Bergamot, Bergamotte de Hollande, Poire Jalvie, and Rouse Lench. These have been preserved here in my fruit-cellar till June, and even later: if crossed with such sorts as Hacon's Incomparable, Beurré Rance, Winter Nelis, and Ne plus Meuris, some good melting very late Pears would probably be the result. I should recommend Rouse Lench to be fertilised with Winter Nelis, previously removing the stamens of the former; and this should be done before the blossom expands, by inserting sharp-pointed scissors. Easter Bergamot might be crossed with Ne plus Meuris, Bergamotte de Hollande with Hacon's Incomparable, and so on, according to the fancy of the cultivator. The object to attain is, to procure very late Pears with the high flavour of some of our earlier varieties.—*T. Rivers, Jun.*

FOREIGN CORRESPONDENCE.

New Plymouth, Taranaki, New Zealand, Dec. 1.—I have great pleasure in informing you that we have founded a Horticultural Society at this place. Although the first body of emigrants landed here so lately as March, 1841, we now muster between 40 and 50 Members, and had it not been for the lateness of the season when the Society was formed, should have enrolled a great number more, who have expressed their intention of becoming Members next year. Considering the many cares and difficulties attending a new settlement, I think it speaks very favourably for our population, that so many have taken an interest in the Society; and convinces me that although we have commenced on a very small scale, we shall prosper, and I trust sustain the character of the Taranaki district, of being the garden of New Zealand. We have a beautiful climate, and I hope we shall turn it to advantage, although some time must necessarily elapse, as we have everything to do.—*R. C.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

May 11.—Mr. Edward Solly delivered his first lecture on the Chemistry of Vegetation. After adverting to the progress that Organic Chemistry has made during the past year, and especially abroad, he proceeded to point out the fact, of all plants consisting of certain invisible elements, transparent, impalpable, and alto-

gether escaping ordinary observation. After experimentally explaining the nature of those elements, he adverted to the great difficulty of conceiving how the combination of such substances can produce all the varied forms recognised among the vegetable bodies surrounding us. A number of beautiful experiments was then made to show that an infinite variety of changes takes place by combinations of gaseous and fluid matters under different circumstances. Colourless fluids were shown, when mixed, to form colours: one kind of colour was changed into another; colourless fluids became coloured by merely passing through the air; solid metal was thrown down from colourless transparent fluids. Gases were then acted upon and shewn to behave in a similar manner, changing colour instantly upon combining with the oxygen of air. Solids were shown to change into gaseous matter, iron itself being converted into vapour. Gases were condensed into solid matter by their mutual action. Fluids were in like manner suddenly condensed into solids. Finally, solids were dissolved in air. After these preliminary observations Mr. Solly proceeded, in conclusion, to explain the manner in which they applied to the composition of Vegetable substances. By the analysis of the Spinach and Rhubarb leaves, he demonstrated experimentally the existence in those substances of Carbon, Oxygen, Hydrogen, and Nitrogen—the gaseous elements of Vegetation; Ammonia was then obtained in abundance from animal matter, in order to show the identity of the products thus obtained from both the animal and vegetable kingdoms. These experiments were very interesting, as proving the existence in plants of Nitrogen, thus confirming the statements of modern chemists upon that subject, and proving the great importance of this element to vegetation. Sulphate of copper was also introduced successfully as a beautiful and very sensitive test of the presence of ammonia; its white colour, when powdered, changing into deep blue, when acted on by very minute quantities of ammonia.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A monthly council was held at the Society's house, in Hanover-square, on Wednesday, the 3rd of May, the Earl of Hardwicke, President, in the chair. John Bell Crompton, Esq., Mayor of Derby, was elected a Governor, and sixty-two gentlemen Members of the Society. Mr. R. Barker, Chairman of the Finance Committee, reported to the Council that agreeably with the order of the Council, the Committee had purchased 1,000l. in the New 3½ per cents. in the name of the Trustees of the Society; the total amount of the Society's Stock in the funds now amounting to 7,700l., with a current cash balance at the bankers, at the end of the previous month, of 1,204l. The names of 49 Members, whose subscription was in arrear, were ordered to be expunged from the list of the Society. The Society's prize of 50 sovereigns for the best essay on the drainage of land, was unanimously adjudged to the essay of Mr. T. Arkell, of Pen Hill Farm, Cold Harbour, near Swindon, Wiltshire. Colonel Chaloner presented to the Council the report of the proceedings of the General Derby Committee, as well as of the Local Derby Committee, relative to the various arrangements for the meeting in July. This report was received and adopted by the Council, and its recommendation that the exhibition of implements should be open for admission to the public (at the same rate as in former years) on the Tuesday, as well as on the Wednesday preceding the general day of the show, confirmed. The Council then proceeded to the consideration of the question of the place of the Society's Annual Country Meeting of 1844; which, agreeably with the established routine in the succession of districts, must, for that year, be selected from the district formed of the following counties:—Middlesex, Surrey, Kent, Sussex, and Hampshire, including the Isle of Wight and the Channel Islands of Jersey, Guernsey, &c. Deputations from Maidstone, Southampton, and Winchester, had successively an interview with the Council, for the purpose of advocating the claims of the towns which they respectively represented. The members of each deputation laid before the Council the replies to the official queries transmitted to them on their original application; and they also gave the Council detailed information in reference to the communication of each place by railways, &c. The directors of the South-Western Railway, following the example of the directors of the Midland Counties Railway at Derby, and on the representation of Mr. Etwall, M.P. for Andover, on Friday last, also decided to convey to and from Southampton all the show-cattle at half fares, and further pledged themselves to give every facility for quick conveyance, and not to charge any additional fares for passengers. On the motion of Earl Spencer, the President was requested to direct a special council to be summoned for Thursday, the 11th of May, and a committee was appointed to report to the Council on that occasion. Agreeably with the standing regulations of the Society, the Council ordered that a preliminary impression of the Prize-Sheet for the next year should be prepared, and laid before the Members at the ensuing Anniversary Meeting on the 22d of May, for their revision and suggestions, previously to its final adoption and confirmation by the Council; on which occasion Mr. Charles Stokes gave notice that he should propose the first prizes in each class of Bulls to be raised from 30l. to 50l. Mr. Gibbs brought forward his motion on the subject of the date at which subscriptions shall be considered to become in arrear, which was seconded by Earl Spencer, and carried unanimously, namely:—"That all Members shall be considered to be in arrear, whose subscriptions, due in advance for each year on the 1st of January, remain unpaid by the 1st of June ensuing." Dr. Playfair returned thanks to the Council for his appointment as "Consulting Chemist" to the Society. Mrs. Davies Gilbert presented specimens of Bokhara Clover, and a statement of the progress of the Willington schools; the Rev. J. M. King presented a copy of his translation of Virgil's Georgics; Prof. Henslow, a copy of his Letters to the Farmers of Suffolk; Dr. Tilley, the numbers of his Agricultural Chemistry; Mr. R. Green, an account of his Under-Draining Plough; and Mr. Evans, copies of the *Farmer's Herald*. The Marquis Mazzarosa informed the Council of the meeting this year of the Italian Scientific Association at Lucca during the two last weeks of September. The Council then adjourned to Wednesday, 10th May.

LINNEAN SOCIETY.

May 2, 1843.—The Lord Bishop of Norwich, President, in the chair. M. Achille Richard and Prof. J. F. Schow, were elected Foreign Fellows. Dr. Salt was elected a Fellow, and Mr. Lanson an Associate. A present of Fruits collected by Mr. Backhouse in his late visit to Australia was exhibited; amongst others were the fruits of a species of *Cycas*, of *Callitris pyramidalis*, *Gulaidina Bonduc*, *Barringtonia speciosa*, &c. On account of the death of the Duke of Sussex, it was suggested by the President that the paper for the evening should not be read.

SOCIETY OF ARTS.

May 10.—Dr. Roget in the chair. A paper was read from Mr. H. Fardon, "On the Improvement of Agriculture." After allusion to the present state of distress in both the Agricultural and manufacturing districts, the author stated his conviction that much might be done for the improvement of the country by attention to the state of Agriculture. The great points to which he wished to call attention in this paper were the necessity of the outlay of capital in farming, the increase of labour, and the mode by which these objects might be effected. In the first place, he would observe that in no trade, art, or profession was there so much diversity, both in the mode of doing the work, as well as in the quality and quantity of the produce of the work, as in farming. Farmers' clubs, journals, and societies were doing much good, and bad plans were going out and good ones being adopted. Amongst the various systems adopted, there were certain general features by which they might be divided into low and high systems of Agriculture; the former prevailed in many parts of England, the latter in Scotland. The characters of the low system were, that the land was let from year to year; and, as a consequence of this, the tenant expended but little capital in its cultivation. The drainage was imperfect, the pasture-land extensive, the arable land in bad condition; the ploughing was shal-

low, not more than from four to six inches deep; no attention was given to the crops till harvest; three or four horses were employed in ploughing; the subsoil was hard, so that water passed off imperfectly, the soil not pulverised by rolling or harrowing; the crops were inferior; the quantity of stock was small, and manure deficient. This was the actual state of a great portion of the land of many counties in Great Britain. From this state to that of the high system of Agriculture there were all kinds of gradations. The high system was characterised by the land being let on long leases, and, as a consequence of this security, a large expenditure of capital on it. The land was thoroughly drained—the great proportion of it was arable. It was ploughed deeply, from six to eight inches, and the subsoil-plough was in frequent use to the depth of 18 inches; the soil was well pulverised by rolling, &c.; and only two horses were used at the plough. No water was allowed to accumulate; there was generally abundance of stock and plenty of manure. One object of the paper was to draw attention to the fact that the same kinds of lands, when cultivated on the low system, yielded small produce, small profits, low wages, and deficient demand for labour; whereas, when cultivated on the high system, the produce was large, the profit was large for the capital employed, and wages were higher. This statement was proved by a reference to the expenditure and profits on four farms, by which it was proved that where the largest amount of capital was expended there was the largest amount of profit realised. In one case the land was not worth more than 2s. 6d. per acre, and realised 16½ per cent. on the capital employed. In the other cases quoted, 19 and 20 per cent. were realised on better land. The author then went into details, proving that a capital of 1,000l. could be more profitably expended on 100 acres of land than on 200 or 300. The author then proceeded to show that spade-husbandry was more profitable for the amount of cost of labour than that of the plough. By this mode of cultivation, the soil was much better prepared for the growth of plants than by the plough. He then detailed the result of 27 years' cultivation of two acres of land alternately with Wheat and Potatoes. The cost of cultivation was 23l., whilst the produce had been worth 93l., thus leaving 70l. profit subject to a drawback of 17l. for rates, rent, and parochial charges. He referred to the paper of Dr. Yellowly in the 6th Vol. of the "Transactions of the British Association for the Advancement of Science" on spade-husbandry in Norfolk, as affording abundant evidence of the superiority of this mode of cultivating land. He also referred to the evidence afforded by allotments of the very much greater amount of profit attending spade-husbandry, and especially to the successful results of this system as seen on the estate of Mrs. Davies Gilbert. In conclusion, the author believed that the system of letting farms from year to year was the great obstruction to the necessary outlay of capital. If farms were let on leases of from 14 to 21 years, the superabundant capital of this country would soon find on the land a profitable outlay. Not only would the agricultural labourer be fully employed, but there would even be a demand for the superabundant population of the manufacturing districts; by the increased work and wages of the labourer, there would soon be a great demand for manufacturing produce, and in this way the country would again be in the way of regaining its wonted prosperity.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

CENTRADENIA ROSEA. Rose-coloured *Centradenia*. (Half-shrubby Greenhouse plant.) *Melastomaceae*. Octandria Monogynia.—A pretty half-shrubby greenhouse plant, introduced from Mexico by Messrs. Lucombe, Pince, and Co., of Exeter. When allowed to flower quietly in a cool greenhouse, it forms a deep green bush, studded all over with gay flesh-coloured flowers; but as the petals easily fall, the plant does not bear travelling well. It is a soft-wooded species, growing a foot or so high in sandy peat, and striking readily from cuttings. As far as can be judged from an experience of a few weeks it seems to require a sunny situation, but not a dry atmosphere. —*Botanical Register*.

CYCNOCHUS PENTADACTYLON. Five-fingered Swan-neck. (Stove Epiphyte.) *Orchidaceae*. Vandee. Gynandria Monandria.—This plant has in some respects so much the appearance of *C. maculatum*, that when first received from Mr. Veitch, of Exeter, in March, 1842, it was difficult to say whether it was a variety or a distinct species. A plant, however, obtained from Brazil direct by Messrs. Loddiges, has shown it to be the latter. It has a short raceme of much larger greenish-yellow flowers, with broad chocolate-brown blotches, and its lip is quite remarkable, having 5 finger-like lobes, and no more, instead of the lateral comb-like fringes of *C. maculatum*. —*Botanical Register*.

LISSOCHILUS ROSEUS. Rose-coloured *Lissochilus*. *Orchidaceae*. Gynandria Monandria.—A very remarkable terrestrial *Orchidaceae* plant, imported by S. Rucker, Esq., from Sierra Leone. It has large planted leaves, and rich rose-coloured flowers in a close raceme at the end of a scape between three and four feet high. Although the other species of the genus have flowers in which yellow is the predominant colour, this has scarcely any trace of it except in the middle of the lip. —*Botanical Register*.

DENDROBIUM RUCKERI. Mr. Rucker's *Dendrobium*. *Orchidaceae*. Gynandria Monandria.—Supposed to have been introduced from Manila. It has lately flowered with Mr. Rucker, and is sweet-scented, handsome, and distinguished by its clear yellow nankeen-coloured flowers, the lip of which is a little stained with rose-colour. —*Botanical Register*.

ECHITES SPLENDENS. Splendid *Echites*. (Stove Climber.) *Apocynaceae*. Pentandria Monogynia.—Introduced by Messrs. Veitch, of Exeter, from the Organ Mountains of Brazil. All the beautiful species of *Echites* seem to be eclipsed by this splendid plant. Its habit is luxuriant, and its leaves are of unusual size, while the flowers, which are borne in large clusters and expand only one or two at a time, are exceedingly lovely, their tint being a light blush, which deepens towards the margin and in the centre; but the variations are so gentle and gradual as to be highly delightful. The breadth of each blossom is from three to four inches. It will probably not require so high a temperature as some stove climbers, and may possibly succeed in a warm, close greenhouse. It should be planted in a small, uncovered, unshaded bed of prepared earth, and trained up the rafters, or over the roof, of the house. A loamy soil is best for it; but a little sandy heath-mould may be added with advantage. Being deciduous it will most likely be better for a little pruning in winter, and it should be kept in a state of rest during the months of November, December, and January. Cuttings of the young shoots will root with the usual treatment, though not very readily. —*Paxton's Magazine of Botany*.

MANETTIA BICOLOR. Two coloured-flowered *Manettia*. (Greenhouse Climber.) *Tetrandria*. Monogynia.—Another interesting plant, introduced by Messrs. Veitch, with stronger stems and broader leaves than *M. cordifolia*, but much smaller flowers. The pleasing combination of scarlet and deep yellow which they present renders them very attractive. It grows well in the temperature of a warm greenhouse, which is kept moist than is usually the case. The soil should consist of loam, heath-mould, and sand, in the usual proportions. The plant should be trained round a barrel-shaped trellis, about 2 feet high, or over a globular one of the same dimensions. Cuttings root with great readiness in a warm place. —*Paxton's Magazine of Botany*.

MISCELLANEOUS.

The Malloo.—The Malloo is a large creeper, growing abundantly throughout the district of Gurbwal, at the bottom of narrow and hot valleys, along the sides and precipices of rivers and in ravines; it is 40 or 50 yards in length, and of considerable thickness; from the bark of it a very strong rope may be made. The natives chiefly use it for tying up their cattle, and sew their straw mats with

the fresh bark; it also makes capital matches for guns, and muzzles for oxen and calves. The leaves, which are heart-shaped, and above a span in breadth and the same in length, are made into chattas, or are sewed together with twigs, to form baskets for holding turmeric, pepper, and ginger; great quantities of these baskets are sold, being used by the poor instead of dishes to eat off. The broad, flat seed of the pod is also eaten after being fried. This creeper is generally cut in July and August, but this may be done at all seasons. The outer bark being stripped off, is thrown away, and the inner coating, which is required for ropes, is soaked in water and twisted when wet. Before being used, the fibre is boiled and beaten with mallets, which renders it soft and pliable for being made into ropes. Although these ropes are strong, they are not very durable, but rot if kept constantly under water; they will last about eighteen months if occasionally soaked, and their duration is increased but little by coating them with tar. —*Transactions of the Agri-Horticultural Society of India*.

Raising the Currant from Seed.—To grow seedlings, it is important that the largest and best fruit should be selected. A strong and healthy plant should therefore be chosen, and if too full of fruit to prevent its attaining a good size, it should be thinned out, leaving only sufficient to bring the plant to the utmost perfection. As soon as the fruit is ripe, it should be picked, and the seeds washed out from the pulp; this may be easily done by bruising the seeds in water, passing the whole through a sieve, and afterwards spreading it out in a cool, shady, situation to dry; after which it may be placed in papers until the time of planting, in April. At that season a small piece of ground should be selected, and made fine by deep spading and raking the surface; the seed should be planted in drills about a foot apart, scattering it thinly, that the plants may not come up so crowded as to require thinning out to any extent. No other care is requisite than to keep the bed clear of weeds. The plants will produce fruit in the second or third year, when such as are worth preserving should be marked, and the remainder rooted up and thrown away. —*Hovey's Magazine of Horticulture*.

To boil Vegetable-Marrow.—Gardeners are apt to withhold their Vegetable-Marrow till it is not worth bringing to table. It should never exceed three inches in length. Under that size they may be boiled whole; but if as large, they must be divided once, and all the seeds be removed. Throw a little salt into the water to keep them green, and boil them in the same manner as Asparagus, serving them upon a toast with melted butter.

Poisoning by Snails and Coriaria myrtifolia.—A family of peasants living in the commune of Clermont, near Toulouse, fell a sacrifice to poisoning by snails. The physician who attended them communicated the following details to the *Journal de Toulouse*:—From what I collected concerning the circumstances which preceded the disease, and those which accompanied it, and from the symptoms which I myself witnessed, I had no difficulty in recognising a case of poisoning like those occasioned by narcotico-acrid vegetables, such as belladonna, hyoscyamus thorn-apple, &c. No doubt remained in my mind as to the cause of this terrible disease, as soon as I knew that the snails eaten had been collected in the bushes called in French *redout*, but in the *patois* of the country, *roudout* (*Coriaria myrtifolia*). Every one knows that the leaves and young shoots are a poison to the domestic animals which browse on them, and that they kill them, after causing giddiness and a kind of epileptic attack; but a fact which is not known, is, that the flesh of these animals may occasion the greatest danger, and even death itself. Symptoms like those which I have just witnessed are rare; but it is common to see among our peasants indisposition caused by snails, which comes from their eating them as soon as they are gathered. The example of the ancient Romans should be followed, and these animals should not be brought to table until they have been kept six months or a year, feeding them on bran and wild thyme. This is the way also to make them fatter and more savoury. —*Gazette Medicale*.

Action of Salts on Living Plants.—From the various experiments which M. Vogel, sen., has made on the action of salts on living plants, he has arrived at the following conclusions:—1st. That plants with their roots immersed in a solution of sulphate of copper totally absorb the salt, convert it into proto-sulphate, and die quickly. 2d. That acetate of copper produces the same effects, the salt absorbed becoming proto-acetate of copper. 3d. That plants absorb sulphate of magnesia, nitrate of potash, and iodide of potassium, and die more or less quickly. 4th. That the sulphates of zinc and manganese are absorbed by plants without suffering decomposition, and the plants die. 5th. That plants absorb nitrate of cobalt and nickel, without being able to absorb the whole of them from solution; but they die, and the same effect is produced by emetic tartar. 6th. That the oxalate and tartrate of oxide of chromium and potash are slowly absorbed by plants, and the bichromate of potash much more quickly. The *Datura stramonium* and *Galega officinalis* absorb the salt of chromium with the greatest rapidity; they become of a yellow colour and die. 7th. That plants absorb nitrate of silver; but they decompose it, and the oxide of silver is reduced to the metallic state. 8th. That plants absorb also, and totally, the protonitrate of mercury from solution, but the salt is decomposed. 9th. That corrosive sublimate is absorbed by plants; some of them decompose it into calomel, and others absorb it without decomposition. 10th. That plants slowly absorb acetate of lead; and it is decomposed by some plants and not by others. 11th. That plants which contain much carbonate of lime, such as the *Chara vulgaris* and the *Stratiotes aloides* do not absorb a salt

of copper from solution; the same also occurs with the *Cereus variabilis*. —*Journal de Pharmacie et de Chimie*.

A New Disease of the Plum.—The following account of a new disease of the Plum is given in "Hovey's Magazine," by Dr. Harris, of Cambridge, Massachusetts. In May, 1841, an undescribed disease made its appearance amongst the Plums in some gardens of this vicinity, and it has been observed again during the present season. Soon after the blossom had fallen, the fruit swelled rapidly, and in two or three weeks it had grown to more than ten times the size that it ordinarily attains in the same period. It was soft and compressible, as though it were puffed up with air, being filled with an elastic spongy substance of a whitish colour. In some of these inflated Plums no vestige of a kernel remained; in others, a little, soft, and empty shell was found. After growing from one-half to more than three-quarters of an inch in diameter, the fruit dropped, and by the middle of June no more of it was to be seen on the trees. The cause of this puffy swelling of the fruit, and abortion of the kernel, is a little thrips, several of which were found on almost all the diseased Plums. It is probable that they begin their attacks in the blossom, and that they prevent the fertilisation of the ovule or young kernel, by destroying the pollen; and, by subsequently puncturing the Plum, produce an irritation, which is followed by a rapid swelling and diseased condition of the fleshy substance of the fruit. Preternatural enlargements and distortions of the parts of flowers and of fruits are known to be occasioned by the attacks of other species of thrips. This may be seen in the blossom of the black Whortleberry (*Vaccinium resinum*), all parts of which, calyx, corolla, stamens, and ovary, are sometimes enormously enlarged, and entirely changed in texture and appearance, in consequence of the punctures of a kind of thrips.

Valley of Kieri.—Notwithstanding the extreme insalubrity of this valley, in which the pitch-springs are situated, it is not entirely uncultivated. The dry parts are planted with Olive-trees, which appear to flourish. Along the sides of the morasses, pretty extensive plantations of the Currant-Vine have been formed by ditching and draining,—and, as any one who pleases may cultivate the marsh, they are extending. We saw two men employed in reclaiming a piece of the swamp, to plant Vines in; they were labouring hard, with their heads uncovered, exposed to the mid-day sun, up to their knees in black fetid water, throwing up mud and decomposing vegetable matter, and forming at the same time a bed and a ditch. This cultivation is said to be very productive; but, as might be expected under such circumstances with so little regard to precaution, very unwholesome and hazardous; fever being almost inevitably the consequence of engaging in it. The enterprising and careless labourers do not live on the spot, but belong to the village of Kieri. The Currant Vine here, in this rich soil of vegetable matter, is very precocious, rapidly coming to perfection, and as rapidly decaying. It bears fruit, it is said, on the third year from its planting, and perishes in about 12 or 15 years; in the intermediate time, whilst in vigour, yielding a great profusion of fine fruit. —*Davy's Notes on the Ionian Islands*.

GARDEN MEMORANDA.

Mr. Groom's Nursery, Clapham Rise.—The magnificent collection of Tulips at this place is now in an excellent flowering condition, the blossoms having just expanded. The plants occupy a broad bed, of about 150 feet in length, and the foliage being in fine health, they produce altogether a most gorgeous effect. We understand that the Tulips of many growers suffered greatly during the late spring frosts; and some were so injured as to be deemed unworthy of shading now the blossoms are open; and this, too, notwithstanding they were covered with mats. Mr. Groom's plants, although sheltered thus, were much frozen; but he preserved them, and brought them to their present handsome state, by simply leaving on the mats during those days when there had been frost in the previous night, and thus preventing the sun from shining on them. This is an easy and safe remedy, proving, in the case under notice, particularly effectual. Among the principal flowers in the bed, we observed the following, which were extremely fine:—*Roses*: *Bacchus*, *Brulante*, *éclatante*, *Cataline*, *Claudiana*, *Lac*, *Ponceautes blanc*, *Lady Crewe*, *Comte de Vergennes*. *Byblamens*: *Claude*, *Imperatrix*, *Norme*, *Louis Seize*, *Michael Angelo*, *Merton*, *Queen Adelaide*, *Victoria Regina*, *Violet Alexander*. *Bizarres*: *Catafalque*, *Fabius*, *Marcellus*, *Duke of Devonshire*, *Garnick*, *Prince of the Netherlands*, *Pompe funebre*, *Nourri Effendi*, *Marshal Sout*. A large bed of *Hyacinths*, from which the blooms have recently faded, is grown in the open ground, and suggests regretfulness that the practice is not more common. The shelter of a garden-mat in severe weather, and during heavy rains that may occur while the flowers are in perfection, is all the attention requisite, if suitable soil be furnished. The pretty *Zephyr glabrata* was blooming most freely in a greenhouse; though trained round a few stakes, not more than nine inches high, it had from 20 to 30 large clusters of flowers. Of the dwarf variety of *Chorozema varium* there was an exceedingly beautiful specimen; it is one of the best of greenhouse plants. There was a good plant, likewise, of *Erica odorata alba*, with numbers of its pretty white bells depending around it, and sending forth a charming fragrance, *R. giddelia flammia*, so rare, so curious, and yet so interesting, was just about to develop its blossoms. This nursery is remarkable for its extensive collection of the noble Japan Lilies, including *L. japonicum*, and, more especially, *L. speciosum* and its varieties. These last are propagated very numerous, and grown in frames and greenhouses, being potted in a kind of bog-earth, which is mainly composed of decayed vegetable matter, and somewhat resembles leaf-mould in its appearance and texture. They have a very luxuriant aspect. More than 100 plants of *L. speciosum album* were planted last autumn in a prepared border, which is quite exposed, and they have existed there since without the smallest protection. Their leaves were a little damaged by the late frosts; but they have so entirely recovered as to look as if they had grown on unintermittedly. This experiment, conducted on so large a scale, is of considerable importance, as it demonstrates, at least, that the variety here alluded to is hardy enough to bear exposure around London, and to the south of it; while it is thus rendered highly probable that the other varieties of the same species will be found equally capable of standing our winters. Doubtless, from the strength of the plants thus treated, they will flower in a superior manner, and make a splendid display. —*E. K., May 6*.

Essenden Place, Hatfield, Herts.—The *Pinus insignis* is now flowering at this place; and may be considered a rarity, most of

the specimens of this species having been killed by the severe winter of 1837-8. The plant in question was not exposed till the June succeeding that period.—G. Plumby, May 9.

Reviews.

Beiträge zur Anatomie der Cacteen. Von M. J. Schleiden. (Contributions to the Anatomy of Cactaceæ, by Dr. Schleiden.)

THIS is a paper which appeared in the Transactions of the Imperial Academy of Sciences at St. Petersburg. In the commencement, the Author remarks that both in Zoology and Botany nature displays more of the secret of her operations in single abnormal forms than in the great mass of common phenomena. In this paper he undertakes the examination of the structure of the stem of Cactaceæ, as an example of singular organisation in the vegetable kingdom. The greater proportion of the observations were made on the *Opuntia monacantha*, although many other species were occasionally examined.

The paper is divided into three parts: the first treats of the structure of the parenchyma, or cellular tissue of the pith and bark; the second, of the external cortical layers, the epidermis, and bark (borke); the third, of the woody vascular tissues.

The cellular tissue of Cactaceæ has generally a loose character, so that, in most cases, it retains its globular form. In the external layers of the bark it is sometimes elliptical or cylindrical. It is only in the medullary rays, and near the bundles of vessels, that it assumes the form of polyhedral cells. On account of the looseness of the tissue the intercellular passages are large, and the cells are easily torn asunder. At the points of contact of the cells are observed round dots, which Meyen called great pores, but which the author considers only thickened portions of the cell. On these spots may be seen small pores, which may be made more evident by boiling the tissue in caustic alkali, adding to it a mineral acid and then iodine; the spots will be coloured blue by the iodine, and the pores will be clean. In many of the cells, cytoblasts are seen adhering to their sides. The contents of the cells consist of mucus, starch, and chlorophyll; the little globules of these substances may be frequently found adhering to the large spots in the cells above mentioned. The starch granules are very large in *Cereus tetragonus*. Besides the ordinary sized cells, larger ones are seen which are filled with vegetable jelly, which is arranged in forked lines, giving them a very beautiful appearance. They are best seen in *Cereus Curtisii* and *Opuntia imbricata*.

Crystals of oxalate of lime (raphides) are very common in the cellular tissue. In a dried specimen of *Cereus senilis*, they formed as much as 85 per cent. of the bulk of the plant. The crystals assume a variety of forms, and either exist as single crystals or in bundles, or form glands (drüses). Oxalic acid is frequently found free in these plants, and seen to act upon them injuriously, and hence probably the necessity for the existence of carbonate of lime in the soil in which they grow. Crystals of carbonate of lime exist also in the tissue of *Cereus triangularis*.

The cells are formed from cytoblasts. In some of them a remarkable dissepiment exists, dividing the cell into two parts. In the bark, the cells under the epidermis are thicker than ordinary. They seem at first filled with jelly, and at last become very hard. This tissue Schleiden proposes to call collenchyma. It exists before the ordinary layers, of the bark (borke) is more highly developed in Cactaceæ than any other plants, and consists of one or more layers in different plants. In old age it becomes continuous with the parenchyma, and in some species presents pores. Crystals are very frequent in this layer of tissue.

The cells of the epidermis present mostly a waved character, but in most instances are smooth. The stomates consist of two cells, placed opposite each other, and the order may be known by its imperfectly developed stomates. They are seen on the imperfectly developed leaves of *Opuntia*.

The parts of the Cactaceæ have a remarkable tendency to a spiral development, and not only are the setæ, spines, and hairs, developed spirally, but even the cells of the seta of *Cereus flagellaris* have this character.

The bark (or borke) or cork-layer of these plants is a late development, and appears at different points between the collenchyma and parenchyma of the liber. The cells are developed from without, inwards, and are truly an endogenous growth. It often bursts through the layers above, and is thrown off in scales. The process of its formation is very like that which takes place in the cicatrization of the wounds of plants, and may be compared to the callous formations on the soles of the feet of some animals.

The stems of Cactaceæ present great variety in the arrangement and course of the woody bundles, which include what is sometimes more especially called the vascular tissue. This variety is seen in passing from the stems of *Pereskia* with internodes, through the species of *Cereus* and *Opuntia*, to the hemispherical forms of *Mammillaria* and *Melocactus*. As the Cactaceæ grow all the year round, there are no regular circles of concentric growth, although some causes seem to act upon them that determine occasionally a suspension of growth. Thus, in a stem, 30 years old, eight circles could be counted.

The woody bundles (Holz-Körper) present great variety also in their internal form, from the simple elongated cell to the development in the interior of elongated tubes of complicated spiral fibres. The spiral vessels always contain air, and in no case has the author been able to detect within them fluid. He considers it highly unphilosophical to conclude, because in one or two instances fluid has been found in these vessels, that consequently these vessels universally are destined to convey fluid. Even in *Hoya carnosa*, a plant which contains

much fluid, the author could detect in its spiral vessels nothing but air.

The spiral tissue presents many forms. In *Pereskia* and *Opuntia* the cells have developed in them double spiral bands. Sometimes these bands are in the form of rings, and when the ring is broken, the double character of the band may be perceived. These bands are sometimes so broad as to leave only a small space in the cavity of the cell, so that they appear like disks with a little hole in their centre. The development of the spiral tissue is the same as that observed by the author in plants in general, and made known in his celebrated paper on Phytogenesis. The cells that become spiral cease to grow with the rest, their contents arrange themselves in a spiral manner, and they elongate. The surrounding cellular tissue is thus often destroyed and absorbed, so that the spiral fibres lie alone in the intercellular passages.

This paper is accompanied by ten beautifully lithographed illustrations, and quite sustains the high character which the author has obtained by his former contributions to our knowledge of the structure and functions of the vegetable kingdom.—E. L.

CALENDAR OF OPERATIONS for the ensuing week.

ON the average of seasons we seldom experience late frosts after the middle of this month; and having had so little spring frost and so much sunny weather, we may safely begin planting out half-hardy plants in the flower-garden. Beginning with the oldest and hardest sorts, if these plants have been properly managed in hardening them off—and we have seldom had a better season for this work—they ought now to be in good condition for turning out, unless perhaps in low, damp, or late situations. Make active preparations, therefore, to commence the work on the first wet or cloudy day, if the beds have been dug over lately, and your plants have firm balls of earth about their roots, you had better plant deeper than you would do on firm ground, as the fresh dug beds will settle a trifle. Every plant ought to have a good watering at the time of planting, and if the weather is dry they will require to be often watered till they are once established; but recollect that "water often and little at a time" is one of the worst precepts of the old school, even with pot-plants in winter—and how much more so if you apply the principle to out-door crops in summer. In nine cases out of ten slight surface-watering at this season does actual mischief, and plants are safer if left to take their chance than when submitted to such bad gardening. After you have watered a bed or border thoroughly, see that the surface is well stirred up with a hoe as soon as it gets dry, and your watering will have twice the effect. In the kitchen-garden endeavour to mulch as much of the crops as possible in rows, this being much better than watering. You will observe how well the Strawberry-beds look that are mulched with short grass; old tan, rotten dung, or half-spent linings from the hot-beds, or indeed any sort of litter, will do for this purpose. Nobody thinks of leaving a newly transplanted favourite tree unmulched the first season, and crops of Peas, Beans, &c. are just as much benefited by it as newly-planted trees. In the American ground most of the plants are from naturally shaded places, and they will luxuriate in the hottest seasons if the beds are thickly covered with grass, fern, moss, or any other sort of mulching: but I think I have said enough to draw the attention of the young amateur to the subject.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—As the fruiting-plants should have but just water enough to keep them alive after the fruit is fully swelled, their suckers often suffer at this season for want of nourishment. As soon, therefore, as each fruit is cut, encourage the suckers by cutting away the old bottom leaves on the stools and by a good watering. Shade, water, and syringe the other plants as before.

VINERY.—The principal work here is now of a more routine kind:—thin the bunches of Grapes, keep the growing shoots regularly tied up, give air early in the morning, and reduce it early in the afternoon after a good syringing, if the fruit has not changed colour; and as the houses are now getting clear of pot plants, keep all the paths, sills, walls, &c., in a clean tidy state.

PEACHES AND CHERRIES.—A dry atmosphere and a free current of air, with the fruit exposed as much as possible to the light, is all you can do now, if the trees are free from insects—which should never cost much trouble in these houses if well looked after in time.

FIGS.—As soon as the principal part of the first crop is gathered, increase the watering at the roots, to encourage the second crop; and probably some of the young shoots will have to be thinned or cut back. Fig-trees should be kept thin of wood in all situations, on account of their large foliage.

CUCUMBERS AND MELONS.—Of all the plants a novice takes in hand these he will find the most difficult to manage at first, not being aware of the importance of keeping the shoots well thinned from the beginning. Let the main shoots reach the sides of the bed before they are stopped, and, as a rough rule, two out of every three of the side shoots may be rubbed off with the finger as soon as you can see them, and the rest stopped above the first joint, as you stop the laterals on a Vine shoot, till a crop of fruit is set on them. The nearer the fruit sets to the main branches the better; and always let a joint or two grow beyond the fruit to carry up the sap. The plan is very near that of growing Grapes on the single-rod system.

CAPSICUMS, TOMATOES, and all half-hardy plants for the kitchen-garden, may now be planted out in early and favourable situations; but in cold exposed places a week or ten days hence will suit them better.

Out-door Department.

Every showery day should now be made the best of in the kitchen-garden, to plant out young crops, to thin and prick out others, and to look diligently after slugs and snails. Every moth and butterfly should be as carefully destroyed as wasps.

BROCCOLI, CAULIFLOWER, and other plants of the Cabbage-tribe from the early seed-beds, may now be planted for autumn use.

SUCCESSION CROPS, in all their stages, will now show, if your sowings have been judiciously timed. Endeavour to mark out any probable defects, and, if practicable, lose no time in rectifying them.

POTATOES.—The early ones will now be forward enough to have the soil well stirred between them, like all other crops in rows.

PEAS AND BEANS.—After you have pinched out the tops of the first crops of these, give them a good watering; and if done with any sort of liquid manure all the better, but do not yet use hard spring water, if you can help it.

ORCHARD.—All the trees on the walls will now require close attention. I think the system of nailing as many of the strong young shoots of Pear-trees as you can get in between the main branches a good one; and if you do not choose to leave them to bear you may begin to reduce them after the end of July. Peach-trees, like Melon-plants, are very apt to get into confusion about this time, unless they are carefully thinned. In my younger days wall-trees seldom had much attention paid them till all their breast-wood was nearly full-grown. They were then regularly pruned, and you could see where the pruner left off at night as plain as where the mowers left cutting a piece of Clover. But now-a-days, a man in looking over his trees only cuts out a few here and there at a time, and in this way he soon gets over a good deal of walling, and by the time he is all

round, some of his trees will want looking over again. Recollect as to the killing of the caterpillars.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVES.—Those who grow Orchidaceæ from the highlands of Mexico, and other elevated regions, on the cool system, have their plants now in that forward state when they may be safely taken to a hotter place—say to a temperature of 80° or 90° through the day, and 70° at night, or rather in the morning. Almost all stove-plants grow too freely; when well-managed, the point of the shoots should therefore be pinched off from time to time.

GREENHOUSE.—With the exception of the common routine of watering and syringing, the next thing of importance to greenhouse plants now in active growth is to form them into handsome specimens—some by training, others by pruning, or rather stopping, and all by being kept in a healthy, vigorous state. One of the greatest faults committed against young, promising specimens is to let them flower too early; if the plant is quite new there is no resisting this course, but in all other cases avoid it as much as possible.

PITS.—If you have a full supply of autumn flowering plants to succeed the annuals, you will now make use of these pits for something else. If you are fond of a good old Cabbage Rose, and would like to have one on Christmas-day, take up half a dozen pots from the reserve-ground, and plunge them in old tan, sand, or anything else in one of your cold pits, and treat them like Heaths till next August, when you may turn them out under a north wall; prune in September, and introduce to a forcing-pit on the 1st of October, and if you do not succeed I must be in the same predicament, for this is my first experiment in this way.

Out-door Department.

FLOWER-GARDEN.—Planting the beds here is the only topic that will be listened to now; but did you ever hear of any one who, by listening to a preceptor, or by any other mode of reasoning, could be induced to alter his own way of planting his beds? I never did, nor will I try to convince that one mode of arranging is better than another; the grand points are, after all, to have suitable soils in the beds; to have a succession of plants for replacing deaths, or those going out of flower; never to have gaps in the beds till the end of the season, and the whole to have a healthy, tidy appearance.—D. Beaton, Shrubland Park Gardens.

State of the Weather near London for the Week ending May 11, 1843, as observed at the Horticultural Garden, Chiswick.

REPORT ON COVENT-GARDEN MARKET.

For the Week ending May 12, 1843.

THERE is a great improvement in the hothouse Grapes this week, as they are particularly abundant and fine in the market. The bunches are of a very good size, as well as the Grapes, and the latter are finely coloured; they are principally of the Black Hamburg kind. Peaches are also much less scarce; and there are some tolerably large Nectarines. Cherries and Strawberries are of good quality. Gooseberries are more numerous. Apricots, being the thinnings of the trees, are plentiful. There are some Strawberries in pots, on growing plants, in good order. Asparagus is singularly frequent and fine. Peas are more common. Carrots and Turnips are to be had, both old and new. The old Carrots have been planted and started into growth; then pulled for the market. French Beans continue good. Some Sea Kale is shown in one of the stalls; but it is now getting greenish. Cucumbers, of all sizes, may now be had in profusion. Oranges are becoming dear. There is a great influx of new Cocoa-nuts. Of Cut-Flowers, there are Tree Pæonies, Dodecatheon media, Carnations, Caprifolium sempervirens, Fuchsia fulgens, and Kalmia latifolia; while of plants in pots, we noticed Fuchsia Chandleri, Ceanothus puniceus, Boronia pinnata, some very dwarf Hydrangeas, not more than six inches high, yet flowering well, Azalea sinensis, Cereus speciosissimus, and Lachnæa purpurea, that have not been mentioned before.

PRICES, SATURDAY, May 13, 1843.—FRUITS.—

Pine Apple, per lb. 6s to 10s	Lemons, per 100, 5s to 14s
Grapes, hothouse, per lb. 4s to 8s	Cucumbers, per brace, 1s to 3s
— Spanish, per lb. 1s to 1s 6d	Walnuts, per bush., 12s to 20s
— Portugal, per lb. 1s to 3s	Chesnuts, per peck, 4s to 8s
Apples, dessert, per bush., 8s to 10s	Almonds, per peck, 6s
— Kitchen, per bush. 6s to 10s	Sweet Almonds, per pound, 8s
Pears, dessert, per hf. sieve, 20s	Filberts, English, per 100 lbs. 50s to 55s
Strawberries, forced, per oz., 6d to 1s	Cob Nuts, per 100 lbs. 60s to 65s
Gooseberries, per peck, 6d to 1s	Nuts, per bushel —
Apricots, per peck, 1s 3d to 2s	— Brazil, 10s
Oranges, per doz., 1s to 2s 6d	— Spanish, 18s
— per 100, 6s to 18s	— Barcelona, 24s
— bitter, per 100, 6s to 20s	— Cob, 12s
Lemons, per doz. 1s to 2s	

VEGETABLES.

Cabbage-plants, per doz. 1s to 2s	Shallots, per lb., 1s to 1s 6d
Cabbages, per doz., 6d to 1s 6d	Asparagus, large, per hundred, 4s to 6s
Cauliflowers, per dozen, 6s to 12s	— Spruce, or Small, 1s 6d to 2s 6d
Broccoli, White, per bunch, 1s to 4s	Peas, forced, per half-sieve, 4s
— Purple, doz., 1s to 1s 6d	Lettuce, Cabb., p. hf. sieve, 1s to 1s 6d
Beans, Kidney, forced, per 100, 1s 6d to 2s 6d	— Cos, per doz., 9d to 2s
Potatoes, per ton, 50s to 80s	Endive, per score, 6d to 1s
— per cwt. 2s 6d to 4s	Celery, p. hf., (12 to 15, 6d to 1s 6d)
— per bushel, 1s 6d to 2s 6d	Rhubarb Stalks, per bundle, 4d to 1s 3d
— Kidney, p. bush., 1s 6d to 2s 6d	Small Radishes, per punnet, 2d to 3d
— Scotch, per bushel, 1s 6d	Green Basil, per bunch, 6d to 9d
— New, per lb., 1s to 2s 6d	Watercress, per doz. sm. bun., 4d to 6d
Jerusalem Artichokes, per half-sieve, 1s to 1s 6d	Parley, per half sieve, 5d to 1s
Turnips, per doz. bun., 3s to 5s	Tarragon, per doz. bunches, 8s to 3s
— Spring, per bunch, 6d to 1s 6d	Fennel, per doz. bunches, 2s to 3s
Red Beet, per dozen, 9d to 1s	Mint, per doz. bunches, 2s to 3s
Horse Radish, per bundle, 1s to 6s	Marjoram, green, per bunch 6d to 9d
Radish, spring, p. doz. hands, 6d to 1s	Mushrooms, per peck, 6d to 9d
— Turnip, p. doz. bunch, 9d to 1s	Spinach, per sieve, 1s to 1s 6d
Carrots, per doz. bunch, 6s to 7s	Leeks, per doz. bun., 4s to 5s
— Young Horn, per bunch, 6d to 1s	Onions, per bushel, 5s to 8s
Spring Carrots, per bunch, 1s 6d to 2s	— Spring per score, 4d to 6d
Parsneps, per dozen, 6d to 1s	— Pickling, per hf. sv., 4s 6d to 5s
Garlic, per lb. 6d to 8d	— Green, p. doz. bun., 2s to 4s
	— Spanish, per doz., 2s to 4s

Notices to Correspondents.

MANURES.—*I. O. N.*—We understand that sugar-bakers' scum has been found in Kent an excellent substance for Turnips; we are making inquiries, and hope soon to have some information for you. —*A. B.*—Liquid manure will do no harm in moderation: liquid guano is a powerful stimulant; it may possibly make your Dahlias run to leaf too much, but we have not seen it tried; your proportion may be a good one; better weak and often than strong and seldom. —*C. M.*—Cow-dung is excellent, the best manure for Rhododendrons and such plants; Daphnes prefer a barren, sandy, well drained soil, except Cneorum, which seems to prefer peat now is a capital time to apply the cow-dung, fresh or old will do equally well: your *Kalmia latifolia* has, in all probability, bad roots; we are afraid to recommend guano, its utility is very uncertain; if you try it be cautious. —*A Subscriber.*—Your pig-wash is good manure, though not very strong; if you have not any ready means of using it at once in a liquid form, add it to a dunghill, preventing its running away, or add it to a compost-heap; it should, however, be well fermented first; the fermentation will take place naturally in time, but you may hasten it by the addition of a little yeast; it will then be good stuff for anything. If your Vines are in want of manure, dig the solid parts into the Vine-border. —*J. T.*—Pelargoniums and Roses will bear any sort of liquid manure that is not too strong; cowdung steeped in water proves a good material; we would also try Guano (cautiously). But in all cases you must take care not to over-water such plants, or they will run to leaf and flower badly.

GAS-WATER.—*Narbour.*—Strong caustic gas-water will kill the leaves of trees; if diluted so as to be harmless, it will not kill insects; we do not therefore anticipate much advantage from using it in syringing.

TRANSPLANTING.—*Hesperus.*—We will soon give you the information in the form you wish in the meanwhile we may state that the Ilex, like all evergreens, may be transplanted at all seasons, if a damp atmosphere can be relied on for some time afterwards; that is the main point. The sap is never entirely dormant in evergreens, but is most so in the autumn and winter, which are the times we prefer transplanting all kinds of plants. You will find some information in previous volumes if you consult their indices.

GRAFTING.—*J. M.*—Flute-grafting is rarely practised. It is performed thus:—Head down your stock so as to have a few inches of clear bark next the cut; divide this longitudinally into strips, and gently turn them back so as to lay bare the wood; the strips will then adhere to the wood only at the lower end; then take a scion of the same length as the part of the stock that has been laid bare, gently twist the bark right and left till you have separated it from its wood, which may then be pulled out, and the bark left hollow like a flute, whence the name of the operation. Then slip the flute over the stock; if it fits exactly no further operation is required, if it is too large it must be split on one side and a strap must be cut out of it; but if it is too small and cannot be slipped on, then in that case, it must be split, applied to the stock, and the space on the stock that is left bare must be covered by one of the strips originally left upon it. All this done, the flute must be bound up and secured with grafting material of some sort, so that the eyes may not be covered up.

PLANTING NEAR HOUSES.—*Villager.*—As a Fir-tree may be expected to become 18 inches in diameter, we would not advise you to plant it nearer a wall than 6 feet.

GARDEN ENGINES.—*A Constant Reader.*—One of the best and cheapest water-engines with a tub that we have seen was made by Mr. Merryweather, of Long Acre, and cost about 14*l.*, the tub being of copper; it would throw water 60 or 70 feet. Smaller engines would of course cost much less, and the substitution of wood for copper would also make a difference. There are many excellent makers.

CANVASS COVERINGS.—*A. Grey* will find, in our last Number, p. 301, col. c, a description of the mode of preparing canvass as a substitute for glass in pits and frames.

VINES.—*A Tyro.*—You are perfectly right; a Vine should never be syringed when in flower.

GRAPES.—*A. C.*—The Malmsey Grape produces Malmsey Wine; but the variety has not been examined; it is probably a synonyme of something else.

PEACH TREES.—*A Subscriber* says he has covered these with netting this spring, and they are as much blighted as ever. If the word blight is intended to apply to insects, no netting will keep them away. But if it refer to the prejudicial influence of cold winds (to ward off which is the great object of all protection, whether by netting or otherwise), we cannot explain the reason of failure.

ORANGE TREES.—*G. W.*—The letter you allude to was fully reported; it was a very poor affair, and threw no light whatever on the subject: the Arabian Jasmine will not thrive in a house without artificial heat.

ORANGES.—*F. C.*—An excellent soil for Oranges, Lemons, and Citrons, will be obtained by mixing a rich loam with thoroughly-decayed manure and leaf-mould, in the proportion of two-thirds of the former to one-sixth of each of the latter.

PERSIAN MELONS.—*J. W. D.*—The exposure of these plants, especially in the early stages of their growth, is most injudicious. They should have all needful air, but never be entirely uncovered. Syringing in the afternoon will doubtless be beneficial; still, it should be regulated by the state of the weather, and the lights of your pits should certainly not be removed for the purpose during cold winds. We should consider your pits, from the description you give, exceedingly appropriate.

FIGS.—*W. C.*—As the specimens sent by J. N. V. were unripe, it was not possible to name the variety.

CUCUMBERS.—*E. E. E.*—The green fly which infests your plants may be easily destroyed by fumigating them with tobacco in the usual way. After the insects are killed, give as much air as possible, and syringe freely, in order to remove the scent of the tobacco.

RHUBARB WINE.—*W. J. Baker.*—For making this, to every pound of Rhubarb stalks, when bruised, put a quart of cold spring water, let it stand three days, stirring it twice a day; then press, and strain it through a sieve, and to every gallon of the liquor put 24*lbs.* of good loaf sugar; barrel it, and to every five gallons add a bottle of white brandy, hang a piece of isinglass in the vessel suspended on a string, and stop it up close; in six months, if the sweetness is off sufficiently, bottle it for use, otherwise let it stand in the cask a longer time.

POTATOES.—*A. C.*—As your Potatoes, set without manure, are now growing, you had better give them a top-dressing of Guano, at the rate of 3 cwt. an acre, or of a mixture of Nitrate of Soda and Sulphate of Magnesia, at the rate of 2 or 3 cwt. an acre, and earth them up afterwards. If the weather is rainy, these substances may be applied broadcast; but it is much better to use them in a fluid state.

ACAEY AMERICANA.—*Juba.*—We should not think this plant would be injured by being placed in the half of an oil-tub; but we decidedly recommend a wooden or slate tub that has shifting sides, as well for convenience as for ornament. These are so common that they may be easily procured. The proper soil for the plant is a common open loam; and the best way of transferring the specimen, if the tub in which it is now growing has not movable sides, is carefully to break away the tub from its roots, and then to lift it into the fresh one. No particular treatment is necessary, except keeping the plant in a rather shady place for a week or two after shifting it. It will be more likely to flower soon if it has plenty of light.

GENTIAN.—*J. Jackson.*—The common Gentian, or Gentianella, is *Gentiana acaulis*. The autumn season (perhaps the end of September) is the fittest time for dividing or removing it; and it should be planted in a situation which is fully exposed to the sun. The soil for it should be of a moist, but by no means wet nature, firm and adhesive in preference to being very porous

and friable, and rather poor than rich. Perhaps the most suitable earth is a somewhat poor and close loam, which should be rendered tolerably firm at the time of planting. We have, however, seen it grown finely in peat.

STRELITZIA.—*Marcia.*—As your seed is just ripe, it will no doubt grow if sown in a pan of light soil in a hot-bed. The plant is not at all particular in its habits. Only just cover the seeds with earth, and shade them till they begin to germinate. Hot water will do no good in this case.

FROMEA TYRIANTHINA.—*J. T. Henley.*—This is a very handsome plant, and has flowers of a peculiarly-rich crimson-purple hue, which it produces pretty abundantly in May and June.

FUCHSIAS.—*J. B. M.*—We here give you a few of the best new varieties of Fuchsia, viz., *Lancei*, *Standishii*, *Chandlerii*, and *formosa elegans*. You will find these dwarf, and fit for drawing-room culture.

ABIES DOUGLASSII.—*H. E. B.*—This tree fruited for the first time, we believe, at Dropmore, about two years ago. We have not heard, however, that any seed has been ripened.

WHITETHORN.—*A Subscriber.*—We do not understand your question.

OAKS.—*A Subscriber.*—These may be planted out at any age from one year to five; the best time is when they are 1½ foot high or thereabouts; they should be prepared for planting out by yearly transplanting, and their tap-root should be cut off when first removed.

LICHENS.—*Lichen's* plant is the *L. caninum*, now called *Peltidea canina*. We should think it would be destroyed, on his lawn, by watering it with diluted ammoniacal liquor.

GLADIOLUS SEED.—*If F. M. W.* will apply to Mr. Mackenzie, Blair Adam, N.B., he can be supplied. We also believe Mr. Carter, of Holborn, sells it.

AURICULAS (SEEDS).—*Andate.*—The following is a list of the principal self-coloured Auriculas grown in this part of the country. We have never seen either a white or green self:—Bury's Lord Primrose, dark chocolate; Bury's Lord Lee, crimson; Clegg's Blue Bonnet, blue; Dickson's Apollo, purple; Nelson's Funeral Car, black; Netherwood's Othello, black, first-rate, the only self that is not serrated in the outward edge; Pope's Cardinal Henry, light purple; Redman's Metropolitan, blue; Schole's Ned Lud, dark purple; Turk's Keyser, crimson; Grime's Flora's Flag, light purple; Whittaker's True Blue, blue.

HEDEGROES.—*E. F. L.*—This poor creature can do no harm in a garden; but it will be difficult to keep it there unless it is walled in.

WIREWORMS.—*Rus.*—The best known method of destroying these is described at pages 301 and 305 of the last Number.

BOOKS.—*A Young Gardener.*—We do not recommend the book, unless you can get it at less than half-price; you had far better lay out your money on Lindley's Theory of Horticulture.

BRIGHT ON ROSES.—*J. T.*—It is probable that the caterpillars which are injuring your Roses will be destroyed by good fresh white Hellebore powder dusted upon them. It is very poisonous to animals but will not injure the plants. It must, however, be fresh.

SEEDLING FLORISTS' FLOWERS.

HEARTSEASE.—*F. B.*—Your seedling Pansy with a yellow ground, although a flower of good form and substance, is injured from the marginal colour not being on the surface of the petals; this causes the flower to have a stained and dirty appearance. The seedling with a white ground is a large round flower of good substance; the petals are well formed and in fine proportion; the quantity of yellow shown in the eye increases the beauty of the flower; the border round the lower petals appears to be uncertain, and the side petals are rather too uneven on the upper part. When in perfection it is a fine flower and will look well in a stand. —*Subscriber, Nottingham.*—Your Pansies are good in their general form, but they are too small to be of use as show-flowers. —*J. F. Wood.*—The general form of your seedling is good, and the edging round the upper petals very perfect; but the eye is poor, and the flower very deficient in texture. —*S. Y.*—Your Pansy is rather deficient in texture; for as the flowers attain size the petals become rough on their edges, the lower one notched, and the marking irregular; in other respects the flower is good, as the white is clear, colours brilliant, and the eye black and fine.

CINERARIAS.—*Freemantle.*—Two seedlings, very pretty in colour, but the flowers are small, and the petals narrow. There are many like these; 1 is the best. —*A Young Gardener.*—Five varieties: No. 1, small and common; 2, flower moderate size, but faint; 3 and 4, very fine in colour, and equal in this quality to any we have seen; 5, large and showy flower, but the petals are rather narrow. No. 3 is the best in the collection; the flowers, though rather small, are well formed, and the colour is very brilliant.

PELARGONIUMS.—*A. C.*—*Othello* was the only flower that had not shed its petals, and is decidedly the best of the four; it is superior to the others in form, colour, and texture; the spot is very rich, and the margin clear and free from veins; the under petals are clear, and the salmon-colour rich. It so much resembles Garth's Wonder that the two could not be shown in the same collection. In *Seniorn* the upper petals are rich, but they are thin at the edge, and the spot softens too much, which deprives it of the brilliancy of *Othello*. *Amore*, although it somewhat resembles *Comte de Paris*, is not so good; the spot is not so intense, nor are the petals so even. *Medora* is rather coarse, and too veiny, both in the upper and lower petals; we consider this variety very inferior to the others. —*H. of B.*—The truss of your seedling was in too forward a state when cut, as all the petals had fallen from the flower-stalks. It is a rich-coloured and showy flower, but rather coarse, which is apparent in the veiny character of the lower petals. It is a flower of good substance, and the petals are well formed.

CALECEOLARIAS.—*G. Beard.*—These beautiful flowers have been so much improved lately in size and marking, that your seedlings are useless, being deficient in both these qualities. —*R. P. Bury.*—This collection contains some very fine varieties. We do not consider Nos. 10, 18, 22, worth keeping, there being larger and better in the collection in the same way. 1 is defective in form, being too long; and 4, 12, 14, 19, 20, are irregular in the outline; 9 is not a good form, but is a large and very showy variety; the same may be said of 14; Nos. 2, 3, 5, 6, 7, 8, 11, 13, 15, 16, 24, are decidedly fine varieties; 17, yellow and brown, well formed, large, and the most decided stripe we have seen, and if permanent a desirable variety; 23, yellow round the margin, and lighter in the centre, large, and very perfectly formed; 21, fine spot, and showy, but a little irregular in form.

MISCILLANEOUS.—*L. Duchess.*—Your plant is *Coronilla Emerus*; —*W. H. N.*—The "Scarlet Beaver Creeper" and the "Crimson Morant Creeper," which you have received from India, are not known in this country, by those names. —*J. W. F.*—Your specimens are, No. 1, *Corydalis nobilis*; 2, *Aubrietia deltoidea*; 3, we believe, *Orobanchium venosum*. The last specimen was too much crushed for us to determine it with accuracy. —*C. L.*—Much obliged; we will use the materials, if possible, next week. —*R. H.*—*Gesnera Douglasii*, *Hardenbergia monophylla*, *Tropaeolum*. —*O. S.*—1. *Fothergilla alnifolia*; 2. *Bignonia Pandorae*; 3. *Hardenbergia monophylla*; 4. *Eutaxia myrtifolia*; 5. *Indigofera australis*. —*H. C.*—The Bird Cherry, *Cerasus Padus*. —*J. F.*—Do not again send a box-full of specimens, as we cannot think of naming collections of plants. 1. *Bursaria spinosa*; 2. *Acacia hastulata*; 3. *Genista candicans*; 4. *Adephandra fragrans*; 5. *Pyrethrum canariense*; 6. *Saponaria Canabrica*; 7. *Veronica Loudon*. —*D. B.*—Your Verbenas were quite withered; so that we cannot speak of their merits. No. 2, however, seems to be the most distinct, and of a very bright colour. —*J. Andrews, Jun.*—Your seedling Cacti are both good. No. 1, with the character of *C. speciosus*, has a very large flower, which is of a deep pinkish crimson. No. 2, like
